"It was at this time," says Gen. McDowell, "that our adversary's re-enforcements came to his aid from the railroad train, understood to have just arrived from the valley with the residue of Johnston's army. They threw themselves in the woods on our right and toward the rear of our right, and opened a fire of musketry on our men, which caused them to break and retire down the hill-side. This soon degenerated into disorder, for which there was no remedy. Every effort was made to rally them, even beyond the reach of the enemy's fire, but in vain." According to the statement of the Confederate commander, it was not wholly "re-enforcements just arrived from the valley" viâ Manassas Junction —Elzey's brigade, under Gen. E. K. Smith—which at *this* critical moment "threw themselves on our right, etc.," with consequences described by Gen. McDowell. In fact, our extreme right was flanked by Early's brigade of Beauregard's forces, which, having been employed in partial execution of his plan of attack on the Union left and rear at Centreville, had been thus brought up when that plan failed by the miscarriage of his orders to Ewell (who was to begin the movement from his extreme right), coupled with the development of our attack on his left.

Enough has been written to show how greatly misrepresented and misunderstood has been this battle. It was one (and the first) of the few battles of the whole war deliberately *planned* beforehand, *executed* (except as to punctuality in time) in full accordance with its plan, and *successful* up to a point at which it was believed the final result must be decided. That the success so far accomplished did not, as it should have done, prove decisive, was due to causes inherent in the raw and otherwise unsuitable character of the attacking force for tactical movements and long-continued *aggressive* action. The battle was pronounced by the Confederate President, himself a soldier, who at Buena Vista had learned the meaning of such words, "a hard-fought field."

On the authority of Gen. Jordan, Beauregard's chief of staff, Ewell's, Longstreet's, Jones's, Holmes's, and half of Bonham's brigades, not engaged at all, Early's and Elzey's brigades and other regiments, some newly arrived—in all over 15,000 men—were "in excellent condition": the real obstacle to an advance after the battle was "the lack absolutely of one day's rations, coupled with insufficient transportation for the indispensable small-arms and artillery ammunition—as the advance would have been, not upon the Federal position at Arlington, but by crossing the Potomac somewhere about Edward's Ferry, and taking Washington in reverse." On the Union part, Miles's whole division, in reserve at Centreville, and Runyon's, 7 miles farther back, guarding communications, had been unengaged, while Howard's and Keyes's brigades were nearly

fresh. Both sides had received severe handling, and the language already quoted from Gen. Johnston shows the critical aspect and gloom on the Confederate side of the field up to the moment when the elation of scarcely expected victory came to dispel it.

And concerning the "panic" which, although *military* writers have generally been free from this injustice, has been so commonly held up as *the* picture of the battle, the instances even with armies of veteran troops like Napoleon's (Albuhera and Vittoria, etc.) are so numerous that the exceptional case of Bull Run, when the Union army was almost wholly made of three-months men, should excite no surprise: it was not such as to prevent a stand at Centreville, "the apparent firmness" of which, says Gen. Johnston, "checked our pursuit." The disorder and mob-like appearance was rather, as described by Major (afterward Major-General) H. J. Hunt, the result of "sheer fatigue." They were, says he, "footsore, hungry, and tired; but had we been attacked I have little doubt that a stout resistance would have been made." Revised by JAMES MERCUR.

Bull Run, Second Battle of: While the Army of the Potomac, under Gen. McClellan on the Peninsula, was operating against Richmond, Gen. Pope, June 26, 1862, took command of the troops in Northern Virginia, then unopposed by any forces N. of Richmond. To draw from Richmond some of Lee's army, and thereby relieve the Army of the Potomac of resistance to its operations against that city, Pope collected his scattered forces and placed them S. of the Rappahannock, along the Orange and Alexandria R. R. and from Sherryville to Culpeper Court-house, with directions for the cavalry to be rapidly pushed to Gordonsville and Charlottesville, and to destroy the railroad connecting those places with Richmond and the West. These movements, however, were so slow that Lee, informed of their purpose, hastened Jackson and Ewell to Gordonsville and thwarted them.

In the meantime the authorities at Washington decided to form a junction on the Rappahannock of the forces under McClellan and Pope, and, Aug. 3, ordered McClellan to transfer his army from Harrison's Landing viâ Acquia Creek to Falmouth, where Burnside's corps had arrived. To quickly withdraw the Army of the Potomac, with its very limited supplies of land and water transportation, involved abandonment to the enemy of thousands of sick and wounded, the destruction of enormous supplies of arms and ammunition, provisions, tents, etc., demoralization to the army, and injury to the Union cause. Without any loss of material the army as a body (some having gone) at the earliest moment (Aug. 14) moved to Yorktown and Fort Monroe, whence, for want of water transportation, it was slow to embark and reach its destinations. July 30 Pope joined his army in the field, and continued concentrating his forces, the advance of which (Banks's corps) had reached Cedar Mountain. Jackson, with Ewell, on Aug. 8 and 9, moved on Cedar Mountain, where, Aug. 9, he was attacked with great spirit by Banks, who, unsupported, was repulsed with heavy losses. Jackson, on the 11th, fearing attack by Pope's combined superior forces, withdrew to Gordonsville.

Lee, seeing the withdrawal of McClellan relieved Richmond of all danger, determined to crush Pope before he could be re-enforced by the Army of the Potomac, and, on the 13th and 14th, pushed forward the van of his army under Longstreet, Hood, and Stuart, and crossed the Rapidan on the 20th. Reliably informed of Lee's intentions, Pope retired behind the Rappahannock. Lee, unable to cut Pope off from Fredericksburg, moved up the river to turn his right flank. On the 22d Stuart crossed the river, passed through Warrenton to Catlett's Station, where he captured Pope's papers and baggage, and destroyed many wagons. On Stuart's return, informed of Pope's forces and locations, Lee commenced moving to Pope's right, sending forward Jackson and Stuart, 23,000 strong, to push across the mountains to Pope's rear, capture the dépôt at Manassas, and break communication with Alexandria—concealing his intentions by threatening Pope at river crossings with his main forces, 25,000 strong, under Longstreet. Jackson succeeded the night of the 26th. Pope, while on the Rappahannock, knew of a large body going to his right, but at 10 A. M. on the 27th did not know what force was in his rear other than cavalry, and "considered it doubtful if the enemy means to attack us or not," but that "he might attempt to keep us in check, and throw considerable force across the Potomac in direction of Leesburg." Up to this time Pope, then at Warrenton Junction, had been joined by corps and divisions under Reno, Reynolds, Heintzelman, and Porter, and the brigade of Pratt under Sturgis, making his total strength about 63,500 against Lee, then about 56,000.

Early on the 27th Pope decided to interpose between the enemy and Manassas, and form a line E. of Thoroughfare Gap, so as to be readily re-enforced from Washington and to fall upon the enemy's flank, or to retire behind Bull Run, if necessary. McDowell, at Buckland Mills, was ordered with Reynolds and Sigel to Gainesville that night, Reno and Kearny to Greenwich, where Porter at Warrenton Junction with Piatt was to follow on the 28th, when relieved by Banks. At 3 P. M. Pope withdrew along the railroad, following Hooker, who had been sent toward Manassas to reopen communication. Hooker, near Bristoe Station, encountered Ewell, who, after a short engagement, retired behind Broad Run and joined Jackson at Manassas. Pope joined Hooker at sunset, and then learned that Jackson and Stuart were between him and Washington. Pope determined to destroy Jackson or "to bag the whole crowd" before Lee could rescue him, and ordered Porter to march from Warrenton Junction at 1 o'clock and join him at daybreak on the 28th; Reno and Kearny to join him at dawn, and McDowell with Sigel to march on to Manassas with his right on Manassas R. R., and left extending N. Pope stated in orders to Porter: "The enemy has been driven back, but is retiring along the railroad. We must drive him from Manassas, and clear the country between that place and Gainesville, where McDowell is." The night was very dark, the road narrow and through timber, crossed by streams without bridges, and by a railroad with cars running, and also crowded by the entire wagon-train of the whole army Porter knew this, and that it was impossible to reach Pope (10 miles distant) any earlier by marching at 1 o'clock than at 3, and on arrival have his command in condition to pursue the retreating enemy 10 miles further.

Porter started at 3 A. M., and, though greatly obstructed, reached Pope at 8; was not wanted, and was twice ordered to remain at Bristoe, for "when wanted, you will be sent for." Jackson had retired from Manassas during the night, and on the 28th had his command strongly posted behind the railroad embankment between Sudley Springs and Groveton, prepared to resist attack and to await the arrival of Lee, who he knew was close by at Thoroughfare Gap. Pope, misled to the belief that Jackson was at Centreville by some of his troops going toward Centreville, followed with Heintzelman and Reno, and called McDowell to him, thus leaving open the road between Lee and Jackson. McDowell sent Sigel and Reynolds to Manassas as directed, but, knowing Lee was coming through Thoroughfare Gap, sent Ricketts's cavalry to resist his advance. Under subsequent orders he sent King up the Warrenton Pike toward Centreville, while he went to join Pope. King before dark had a severe contest with Jackson W. of Groveton. Having no instructions and no support, he moved that night to Manassas. Ricketts, repulsed by Lee, marched to Groveton viâ Greenwich and Manassas, reaching there at dark on the 29th. Lee (or Longstreet), thus unopposed, joined Jackson by 10 A. M. on the 29th, and was in position on his right at Groveton by 12 M. McDowell went to Manassas to advise Pope, but the latter had gone to Centreville. Hearing the sound of King fighting with Jackson, he started through the woods to find him, but got lost and did not join his command till the 29th.

On the morning of the 29th Jackson was strongly posted behind the railroad embankment and in the woods between Sudley Springs and Groveton. Longstreet had arrived at 10 A. M., and by 12 M. formed on Jackson's right, extending S. beyond Manassas Gap R. R. Sigel N. and Reynolds S. of Warrenton Pike, at Groveton, engaged Jackson with skirmishers and artillery at long range. They were joined by noon by Heintzelman and Reno, pushed forward by Pope at Centreville. Porter, N. of Manassas, was hastening under orders to Centreville, "where it was very important to be at an early hour. A severe engagement is likely to take place, and your presence is necessary," when at 9 A. M. he was ordered to take King, at Manassas, and "move on Gainesville." Ricketts, with Buford's cavalry, was *en route* from Gainesville, viâ Greenwich, to Manassas. Banks at Bristoe guarded the army trains. Porter reached Dawkin's Branch at 11.30 A. M., and found Longstreet taking position on the west bank twenty-four to thirty-six hours earlier than Pope announced his expected arrival. He was preparing to attack Longstreet when McDowell arrived

and, under authority, assumed command, stopped all offensive operation and, withdrawing King beyond support, retired, viâ Sudley road, to take position on Porter's right and "establish communication with the forces at Groveton," as ordered. Porter, knowing that Longstreet was more than twice his strength and well protected, and that whichever one attacked by crossing the open valley between them would meet with disaster, posted his forces to invite and risk attack, and, at times, threatened it—each with the object of holding Longstreet from attacking Pope or assisting Jackson. So successful was Porter that Longstreet, anticipating attack, drew Wilcox's division at about 4 P. M. from Jackson's support, and retained him till too late to support Hood when sent back. Porter all day and till 3.30 A. M. on the 30th held his troops facing Longstreet and protecting his flank and rear along the road to Bethlehem Church, constantly expecting information or orders from McDowell or Pope, but receiving none till too late to be executed.

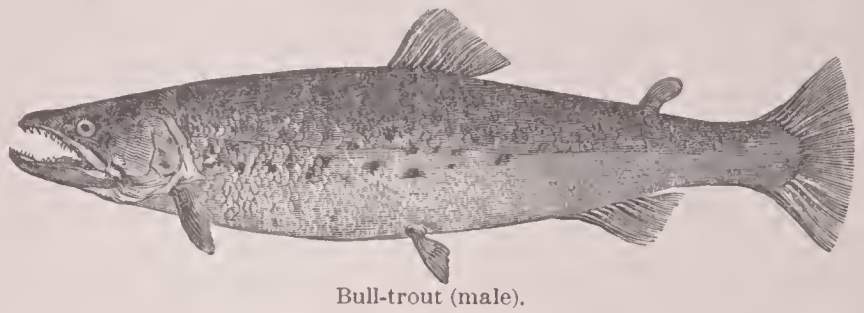
Pope at 1 P. M. joined the forces opposing Jackson and stopped the skirmishing and the artillery duels at long range going on all the morning and at 3 P. M. ordered Hooker to attack. Grover, of Hooker's division, vigorously attacked and broke Jackson's first and second lines and penetrated to the third, but, unsupported, was flanked and driven back with heavy loss. Hearing of McDowell's approach, Pope at 4.30 sent orders to Porter to attack Jackson in flank and, if possible, his rear, and in due time for simultaneous action directed Kearny to attack his left flank. Porter received his order at dusk, too late to execute, even if Longstreet had not been between him and Jackson. McDowell had not informed Pope of Longstreet's arrival, nor forwarded Porter's dispatches giving the state of affairs in his front. Kearny vigorously and gallantly attacked, but was repulsed with heavy losses. At sunset, on McDowell's arrival, Pope ordered him to push King's division after the "retreating" foe. The division was met by Hood advancing to attack and was badly defeated. Night closed the contest, each army holding its own ground.

Pope's army on the 29th was much cut up, weakened, had no hope of support, distant from food for men and horses, and all were greatly fatigued. Lee's army was re-enforced that night, making it stronger than Pope's, which till then was about its equal. Pope, however, determined to renew the struggle on the 30th, and by noon had gathered all his forces, Banks excepted, N. of Warrenton Pike, facing Jackson. Believing that "Jackson was retreating to the mountains to unite with Longstreet," who he would not acknowledge had arrived, Pope assigned "McDowell to the command of the pursuit," and ordered him "to push forward Porter's corps on the Warrenton Pike, followed by King and Reynolds, in pursuit of the enemy, and to press him vigorously during the whole day." Ricketts and Heintzelman were ordered to move on the road from Sudley Springs to Haymarket, held by Jackson on the 29th. Porter's advance, under Butterfield, vigorously assaulted Jackson, and at once developed the enemy's united army posted and prepared for any emergency, and turning Pope's unprotected left flank. Beyond driving the enemy behind the railroad embankment and developing their positions, Porter's attack accomplished nothing. As line after line advanced, the enfilading fire of the enemy's batteries on the left, together with the infantry fire in front, almost annihilated the attacking force and compelled withdrawal. Sykes went to the Henry Hill, and Butterfield, having expended his ammunition, to the rear. Warren, of Porter's corps, seeing Reynolds removed to the rear from the most important defensive point S. of the pike, and the flank exposed, at once hastened to reoccupy it with his small brigade, and, although almost annihilated by Longstreet's advance, held it long enough for Reynolds's and Ricketts's divisions and portions of Sigel's corps to form on his left and with Sykes's regulars on the Henry Hill to save Pope's line of retreat from seizure by Longtreet. This position was firmly held against vigorous attacks till, under cover of darkness, Pope's army retired unmolested across Bull Run and took position on the heights of Centreville. The army was withdrawn from Centreville the night of Sept. 1, and took position in the defenses of Washington, fighting *en route* with Jackson the battle of Chantilly. The command of the army was then transferred to McClellan. FITZ JOHN PORTER.

Bull's Eye: in architecture, the technical name given to a glass lens used for the purpose of concentrating the light of a given center upon an object. It is also applied to a circular window of plain glass. On shipboard the bull's eye is a small pulley in the form of a ring, with a rope spliced round the outer edge, and another sliding through a hole in the center. In rifle practice, the small black center in the circle on the target is called the bull's eye. In astronomy, the bull's eye is Aldebaran, a bright star in Taurus.

Bull-terrier: a dog bred by a cross, more or less remote, between the bulldog and some one of the terriers; frequently uniting in a remarkable degree the courage and strength of the bulldog with the docility, activity, quick scent, and intelligence of the terrier. This little animal is especially famous for its zeal and success in killing rats.

Bull-trout, Gray-trout, Whitling, or **Sewen**: names applied in England to the salmon trout (*Salmo trutta*); a



Bull-trout (male).

large trout found in the mouths of rivers approaching the salmon in size and habits, but inferior as food. The name bull-trout is applied in Oregon to the Dolly Varden trout (*Salvelinus malma*). D. S. JORDAN.

Bulnes, bool'-nĕz, MANUEL: Chilian general and statesman; b. at Concepcion, Dec. 25, 1799. When only sixteen years old he was imprisoned by the Spaniards for eight months, owing to his revolutionary ideas; released by the advance of San Martin, he joined his army (1818) and served as colonel in most of the battles of the Chilian revolution. From 1820 to 1823 he commanded a force against the Araucanian Indians, and completely subdued them; was made brigadier-general in 1831, and in 1838 commanded the Chilian army of 5,000 men sent against Santa Cruz in Peru; he took Lima, won the battles of Huarez and Puente del Bunin, and finally, in conjunction with Gamarra's Peruvians, routed Santa Cruz at the Pan de Azucar, near Arequipa (Jan. 19, 1839). This drove Santa Cruz from the country, and the Peru-Bolivian confederation was broken up. For this victory Bulnes was created marshal of Ancacho by Gamarra, and Chili made him a lieutenant-general. He was elected president of Chili in 1841, and re-elected 1846, serving for ten years; his administration was prosperous throughout, and marked by great material and intellectual progress. Gen. Bulnes was afterward senator and councilor of state. D. at Santiago, Oct. 18, 1866. HERBERT H. SMITH.

Bü'low, FRIEDRICH WILHELM, Baron von: b. on the paternal estate of Falkenberg, Prussian province of Brandenburg, Feb. 16, 1755; entered the army in 1769; was a lieutenant-general at the opening of the war of independence in 1813. Twice he defeated Oudinot in minor encounters, and by his victory over Ney at Dennewitz (Sept. 6, 1813) he prevented the French from pushing onward to Berlin. In the battle of Leipzig he took a conspicuous part; then drove the French out of Westphalia, Holland, and Belgium, joining the allies in Paris, where the Prussian king made him Count of Dennewitz and gave him estates worth $150,000. He also distinguished himself at Waterloo, finishing the campaign by occupying Montmartre at Paris. D. at Königsberg, Feb. 25, 1816.

Bülow, HANS GUIDO, von: musician; b. at Dresden, Jan. 8, 1830; studied law in Leipzig and Berlin; determined, under the influence of Richard Wagner and Liszt, to devote himself exclusively to music; studied under Liszt at Weimar 1851–53; settled in 1854 in Berlin, where he was made Professor of the Piano at the Conservatory of Music in 1855. Having made several concert-tours in Germany and Russia, and acquired a great reputation as a pianist, he removed in 1867 to Munich, where he became chapel-master to the king. After that time he made two concert-tours in the U. S., and also acted as orchestra conductor in Berlin, Hamburg, and other large German cities. Von Bülow was a man of great intellect, but eccentric and self-opinionated to the verge of insanity. His annotations of Beethoven's sonatas and of other older classical piano compositions are valuable. He

composed several pieces both for the pianoforte and orchestra, and wrote much for the *Neue Zeitschrift für Musik*, and both his compositions and his writings show enthusiasm for the ideas of Wagner. D. in Cairo, Feb. 13, 1894.

Bulwark (in Fr. *boulevard*): in fortification, a rampart or bastion; an outwork for defense; that which secures against an enemy; a shelter or means of protection. On shipboard a bulwark is the parapet raised round the deck for the purpose of protecting men and goods from slipping overboard, and of excluding the waves from the deck. In ships of war the bulwark is sufficiently high and solid to afford the crew some protection against the shot of the enemy.

Bul'wer, Edward George Earle Lytton (Baron Lytton): English novelist; b. in London, May 25, 1803; in 1826 graduated at Trinity Hall, Cambridge. He soon after visited France, and published after his return his novel of *Falkland* (1827), which was followed by *Pelham, or the Adventures of a Gentleman* (1828); *The Disowned* (1828); *Devereux* (1829); *Paul Clifford* (1830); *The Siamese Twins*, a poem, (1831); and *Eugene Aram* (1832). In 1831 he was returned to Parliament for St. Ives, and from 1832 to 1841 he represented the city of Lincoln. He published in 1833 *England and the English*; the same year visited Germany and Italy. He produced in rapid succession *The Pilgrims of the Rhine*; *The Last Days of Pompeii*; *Rienzi, the Last of the Tribunes* (1835); and *The Student*, a series of contributions to the *New Monthly Magazine*, of which he was for some time editor. His drama entitled *The Duchess of La Vallière* (1836) was not well received. In 1837 he brought out *Athens, its Rise and Fall*, and *Ernest Maltravers*, a novel, which was continued under the title of *Alice, or the Mysteries*. His dramas entitled *The Lady of Lyons* (1838) and *Richelieu* were very successful, as well as the comedy of *Money*, which came out soon after. His *Night and Morning*, a novel, published in 1841, was followed by *Zanoni* (1842); *The Last of the Barons* (1843); *Lucretia, or the Children of the Night* (1846); and *Harold, the Last of the Saxon Kings* (1848). His novels entitled *The Caxtons* (1850), *My Novel* (1851), and *What Will he Do with It?* (1858), first appeared in *Blackwood's Magazine*, to which Bulwer was a frequent contributor. *A Strange Story* came out in *All the Year Round* in 1861. Although his reputation rests chiefly on his novels, he distinguished himself in various departments of literature. His translations of Schiller's poems (1844) were received with favor, and he published original poems—*O'Niel, or the Rebel* (1827); *The New Timon* (1846); and *King Arthur* (1848). His novels have great popularity throughout the English-speaking world, as well as on the Continent of Europe, and have been translated into several languages. Bulwer was made a baronet in 1838, and in 1844, on the death of his mother, came into possession of the Knebworth estates and assumed the name of Bulwer-Lytton. He had published in 1835 a Liberal political pamphlet entitled *The Crisis*, which caused a great sensation. He was elected lord rector of the University of Glasgow in 1856, and in 1858 he held for a time the office of Secretary of State for the Colonies. He was made a peer in 1866, with the title of Baron Lytton. In 1827 he married Miss Rosina Wheeler, of Limerick (1802–82), who wrote *Chevely, or the Man of Honor* (1839); *Bianca Capello*; *The Budget of the Bubble Family*, etc. The union was unhappy, and the parties separated in 1836. D. at Torquay, Jan. 18, 1873.

Bulwer, Edward Robert: See Lytton, Edward Robert Bulwer-Lytton.

Bulwer, William Henry Lytton Earle (Baron *Dalling* and *Bulwer*): English diplomatist and author; a brother of Bulwer-Lytton the novelist; b. in London, Feb. 13, 1801; was elected to Parliament in 1830; sent as ambassador to Madrid in 1843, where he opposed Narvaez, who ordered him home. In 1849 he was transferred to Washington, where he negotiated the Bulwer-Clayton treaty guaranteeing the neutrality of interoceanic routes across Central America; in 1851 was created a Knight Grand Cross of the Bath. He became minister plenipotentiary at Constantinople in 1858. He was afterward ennobled. Among his works are *France, Social and Literary* (1834); a *Life of Lord Byron* (1835); one of Palmerston (1870); and *The Monarchy of the Middle Classes*. D. in Naples, Italy, May 23, 1872.

Bulwer-Clayton Treaty: See Clayton-Bulwer Treaty.

Bummalo'ti: the local name for *Harpodon nehereus*, a fish of the family *Synodontidæ*, abundant at certain seasons on the coast of India. It has a long body covered with thin, translucent scales, a thick head, wide mouth, and slender, recurved teeth. It is dried and exported in considerable quantities from Bombay and parts of the adjacent coast, being known in commerce as *bummalah* or Bombay duck.

Bum'stead, Freeman Josiah, M. D.: b. in Boston, Mass., Apr. 21, 1826; graduated at Williams College in 1847; studied medicine in Paris; became a practitioner in New York, where he was appointed Professor of Venereal Diseases in the College of Physicians and Surgeons; also surgeon to the Eye and Ear Hospital and the Charity Hospital. He published *Pathology and Treatment of Venereal Diseases* (1861), and valuable translations from Ricord and Cullerier. D. in New York, Nov. 28, 1879.

Bunce, Francis Marvin: naval officer; b. in Hartford, Conn., Dec. 25, 1836; graduated at the Naval Academy in 1857; became lieutenant in 1861, lieutenant-commander in 1863, commander in 1871, captain in 1883, commodore in 1895, rear-admiral in 1898. He participated in the capture of Morris Island July 10, 1863, in the attacks on the defenses of Charleston harbor, and in the assault on Fort Sumter of Sept. 18, 1863. In 1891–94 he commanded the naval training station at Newport, and then became a member of the inspection board. He was president of the naval examining board 1895–97. In 1897 he was in command of the North Atlantic station, and of the New York navy-yard.

Bunce, Oliver Bell: publisher and author; b. in New York, Feb. 8, 1828. He was for some years editor of *Appletons' Journal* and published a number of books, among which are *Bachelor Bluff* (1882) and *Don't* (1884), a manual of etiquette which has had an immense sale. D. in New York, May 15, 1890. Henry A. Beers.

Bunce, William Gedney: painter of Venetian scenes and landscapes; b. in Hartford, Conn., Sept. 19, 1842; pupil of William Hart, Andreas Achenbach, Düsseldorf, and P. J. Clays, Brussels; member of the Society of American Artists 1879. His pictures are notable for tender and delicate color-schemes, but are not realistic. He spends most of his time abroad, principally in Venice; has painted lately at Biarritz, France, and when in the U. S. has a studio in New York. William A. Coffin.

Bun'combe: a district of North Carolina. The phrase "talking for Buncombe," often heard among politicians, was first used by a member of Congress from that district. During a long speech which he made several members, who had not patience to listen, retired from the hall. He then told the remaining members that they also might go, for he "was only talking for *Buncombe*."

Bundelkhand', or **Bandelkhand**: territory of Central India; bounded N. E. by the river Jumna. It extends from lat. 24° to 26° 26′ N., and from lon. 78° to 81° 36′ E. Area about 10,241 sq. miles, of which about 8,700 sq. miles are subject to the British, while the rest of the country is governed by numerous native princes, who are tributary to the British. It is said to contain diamonds and rich beds of iron ore. The chief towns are Calpe, Banda, Jhansi, and Callinger. Pop. 1,403,000.

Bun'di, or **Boondee**: a native state, Rajputana, British India; between 24° 58′ and 25° 55′ N. lat., and 75° 23′ and 76° 36′ E. lon. Area, 2,300 sq. miles. It is generally hilly and wild, and is much infested by robbers. Principal crops, maize, wheat, pulse, and oil-seeds. It is watered by the Chambia and Nij. Pop. 255,000. British protectorate was assumed in 1818, and costs the chief $20,000 annually. Chief town, Bundi; pop. 31,000.

Bungay, George Washington: journalist; b. in Walsingham, England, July 22, 1818; removed to New York when nine years of age; was for a time on the *Tribune* with Horace Greeley; wrote many poems, the best-known being *The Creed of the Bells*; had a wide acquaintance with statesmen and authors; was a popular lecturer. D. July 10, 1892.

Bunion, or **Bunyon** [cf. *bunny*, lump, swelling]: a painful inflammation of the *bursa* or membranous sac of the joint which connects the great toe with its metatarsal bone. The pressure of a boot causes this bursa to inflame and swell, and this may go on to suppuration. Rest and poulticing are generally sufficient to subdue the attack, and wearing a shoe which is so constructed as to save the bunion from pressure will generally prevent a recurrence.

Bunka'ra, or **Blue River**: a stream of Colorado; rises near South Park, among the Rocky Mountains; unites with

the Grand river about 20 miles W. of Hot Sulphur Springs. Total length estimated at 100 miles.

Bun'ker, DENNIS MILLER: genre, landscape, and portrait painter; b. in New York, Nov. 6, 1861; d. in Boston, Dec. 28, 1890. He began his art education in 1878 in the National Academy schools, afterward attending the classes at the Art Students League; went to Paris in 1881, where, after spending three months in the Académie Julian and the class of Hebert in the École des Beaux-Arts, he became a pupil of Gérôme, and worked under his instruction until 1884, when he returned to New York. His first pictures were exhibited at the Academy and elsewhere in New York several years before he went abroad, and while he was a student he painted and sold a good many pictures. The first picture he exhibited after his study in Paris was a figure of a young man in a studio playing a guitar and entitled *Bohemia*. For this picture he received the third Hallgarten prize at the National Academy in 1885, and the same year was elected a member of the Society of American Artists. He was the principal instructor in the Cowles Art School in Boston from 1886 to 1889, and while there painted a number of excellent portraits. For his beautiful picture *The Mirror* (Society of American Artists, 1890) he was awarded the James W. Ellsworth prize of $300 at the exhibition of the Art Institute of Chicago (1890). His work, though not lacking in refinement and delicacy, is essentially robust and virile. In *The Mirror* (engraved in the *Century Magazine*, Feb., 1891) sincerity and grace are happily blended, and the picture is especially notable for elegance of line and beauty of expression. A portrait of the artist's wife, the last work he completed, is in the Metropolitan Museum, New York.

WILLIAM A. COFFIN.

Bunker Hill: a rounded eminence in Charlestown, now a part of Boston, Mass. It is about 110 feet high and connected by a ridge with another small eminence 700 yards distant called Breed's Hill. These two elevations are famous for the battle fought here between the British and American forces June 17, 1775. The American redoubt was on Breed's Hill, but by common usage the event is known as the battle of Bunker Hill.

After the stirring events of the spring of that year the troops organized in New England had taken up a line extending from Roxbury to Cambridge under command of Gen. Artemas Ward; Putnam, Starke, Prescott, Gridley, and Pomeroy were there, and by the middle of June not less than 20,000 men had assembled.

Gen. Gage was in chief command of the British at Boston, and had been recently largely re-enforced by Gens. Howe, Burgoyne, and Clinton.

It having been ascertained by the provincial army that Gage meditated seizing and fortifying Bunker Hill and the heights of Dorchester on the night of the 18th, it was determined by the Americans to forestall this design, and on the night of the 16th a detachment of 1,000 men, under command of Col. William Prescott, was dispatched from Cambridge to Charlestown for the purpose of fortifying Bunker Hill. They were joined at Charlestown Neck by Gen. Putnam and Major Brooks, and at a council it was decided to fortify Breed's Hill, not as high as Bunker Hill, but nearer Boston. By daybreak a formidable work had been thrown up on the spot now marked by the Bunker Hill Monument. This being discovered by daylight, the Lively opened fire upon it, which soon extended to all the shipping and the battery on Copp's Hill in Boston; the British troops were called to arms and preparations for an attack were made; Prescott meanwhile continued to strengthen his position and sent to Cambridge for re-enforcements. The entire American force engaged, however, did not probably exceed at any time 1,500.

A force of British under Gens. Howe and Pigot, covered by the guns of their shipping, had embarked in boats and landed at Morton's Point, E. of the foot of Breed's Hill. This movement produced the greatest excitement in Cambridge and re-enforcements were hastened to Charlestown, Gens. Warren and Pomeroy arriving at 2 P. M. at the moment Howe, whose force by this time had been increased to about 4,000, began his advance around the eastern slopes of Breed's Hill and along the Mystic river with the intention of gaining the rear of the American lines; but, this movement having been anticipated, Knowlton had taken up a position near Bunker Hill and thrown up a breastwork nearly 250 yards in length, and another line had been built in front of a stone and rail fence, between which was placed new-mown hay, and between the breastwork and the rail fence the artillery was placed. The Connecticut and New Hampshire troops were W. of the redoubt, and a force was posted at the foot of the southwest side of Breed's Hill, near Charlestown, and a work had been commenced on Bunker Hill. Gen. Warren, who was with Prescott in the redoubt, refused to take command from either Prescott or Putnam, saying he came to fight as a volunteer. Howe was foiled in his flank movement and compelled to make a direct attack, and, having ordered the guns of the shipping and the battery at Copp's Hill to open fire on the redoubt, moved forward under its cover up the slopes of Breed's Hill in two wings, the right under his own command, the left under Pigot: Gen. Howe with his command to carry the position at the rail fence, while Pigot attacked the redoubt. Prescott's orders to his men were to reserve their fire on the advancing columns till the whites of the men's eyes could be seen. The British opened fire when within gunshot, but no reply was heard from the breastworks till they were within close range, when volley after volley was poured into their ranks, causing them to fly in disorder toward their boats. Howe succeeded, however, in quickly rallying his troops, and being re-enforced by some 400 marines and provided with artillery, of which latter they were deficient in the first attack, a second advance was made over the same ground.

In the mean time re-enforcements had been sent to Prescott, but those sent from Cambridge were prevented from crossing Charlestown Neck by the severe fire of the batteries and shipping of the British, and but few additional troops reached the redoubt before the second attack.

As before, the Americans reserved their fire till the British line was at short range, when it was delivered with the same deadly effect.

Hot shot from Copp's Hill having meanwhile set fire to some houses in Charlestown, the whole town was soon in flames, and Gen. Howe hoped to storm the redoubt under cover of the smoke; but a light wind which had just sprung up cleared away the smoke and disclosed the advancing columns, which were again broken and driven in confusion by the fatal fire from the patriots within the redoubt. Howe was now re-enforced by Clinton, and a third attack was made upon this little band, whose ammunition was now nearly exhausted, and Howe, having discovered the weakness of this part of the line, attacked the position between the rail fence on the E. of the redoubt and the breastwork, sweeping it with his artillery and forcing its defenders within the redoubt. The ammunition of the Americans was now completely exhausted, and the British, advancing, scaled the work, but were met by the Americans with muskets clubbed, and a hand-to-hand conflict ensued. But the superiority of the British in numbers was too great, and Prescott was compelled to order a retreat, himself and Warren being the last to leave the works. Stark and Knowlton maintained their position at the rail fence until the retreat had been effected, when they retired slowly and in good order. Warren had hardly left the redoubt when he fell, shot through the head; Prescott escaped uninjured. Falling back across Bunker Hill, Putnam here made an ineffectual attempt to rally the retreating army within the partially finished works. The retreat continued across Charlestown Neck, where many were killed by a severe fire from the shipping and batteries; but the British did not continue their pursuit beyond this point.

The British loss in killed and wounded was about 1,050; the American loss was not over 450.

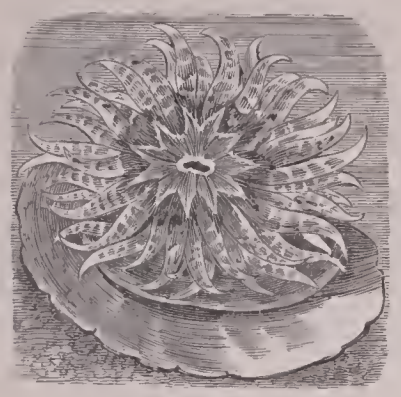
A granite obelisk, 221 feet in height, now marks the scene of this important struggle on Breed's Hill, and is known as Bunker Hill Monument. Gen. Lafayette laid the corner-stone June 17, 1825, and Daniel Webster delivered one of his most memorable orations on the occasion. The monument was completed in 1842, and was dedicated June 17, 1843, in the presence of the President of the U. S. and his cabinet, Daniel Webster being, as before, the orator of the occasion.

Bunker Hill: city (founded in 1836); Macoupin co., Ill. (for location of county, see map of Illinois, ref. 8–D); on Clev., Cin., Ch. and St. L. R. R.; 37 miles N. E. of St. Louis, Mo.; has seven churches, public school with high-school course, academy, military school, flouring-mills, and coal mine. The raising of grain, fruit, and cattle and dairy-farming are the principal industries of this section, which is the largest milk-producing point tributary to St. Louis. Pop. (1880) 1,441; (1890) 1,269; (1900) 1,279.

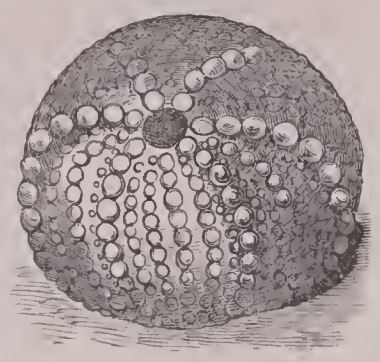
EDITOR OF "GAZETTE."

Bunner, Henry Cuyler: journalist and author; b. in Oswego, N. Y., Aug. 3, 1855. He was editor of the comic weekly *Puck* from its establishment in 1877 until his death. Published a volume of poems, *Airs from Arcady* (1884); and several novels, *A Woman of Honor* (1883); *The Midge* (1886), etc. D. at Nutley, N. J., May 11, 1896.

Bunodes gemma'cea: called in English *gem pimplet*: a species of Actinidæ (*q. v.*). When open it bears a striking resemblance to a flower, but when closed it assumes a



Bunodes, open.



Bunodes, closed.

spherical form, having the appearance of an echinus stripped of its spines. The generic name is from the Greek βουνώδης, signifying "resembling an eminence or a woman's breast" (referring to its form when closed); the specific name is from the Latin *gemma*, a "bud," or small protuberance, and has allusion to the wart-like protuberances on the exterior surface.

Bunsen, Christian Karl Josias, von, Ph. D., D. C. L., Chevalier: writer and diplomatist; b. at Corbach, in Westphalia, Aug. 25, 1791. He studied theology and the Oriental languages at Marburg and Göttingen, and especially in Paris; was appointed, at Niebuhr's suggestion, secretary to the Prussian embassy at Rome in 1818, where he remained many years and devoted much time to philology and historical research. In 1827 he succeeded Niebuhr as Prussian minister at Rome. In 1838 he was recalled, and in 1839 became Prussian ambassador to Switzerland. He was sent as ambassador to London in 1841, and acquired a greater influence and a higher position in English society than any German diplomatist had ever enjoyed. His principal works are *Die Verfassung der Kirche der Zukunft* (Hamburg, 1845); *Ægyptens Stelle in der Weltgeschichte* (5 vols., Gotha, 1845–57; Eng. trans. *Egypt's Place in Universal History*, London, 1848–67); *Christianity and Mankind* (7 vols., London, 1854); *Gott in der Geschichte* (3 vols., Leipzig, 1857–58; Eng. trans. *God in History*, London, 1868–70, 3 vols.); and *Vollesändiges Bibelwerk für die Gemeinde* (9 vols., Leipzig, 1858–70: only the first, second, and fifth were completed by him; the others are from his notes by Holtzmann and Kamphausen). He had a high reputation as an Egyptologist, and was liberal in religion and politics. He was recalled from the court of St. James in 1854, and was raised to the peerage as Freiherr (baron) in 1858. D. in Bonn, Nov. 28, 1860. A monument was erected to him at Corbach on Aug. 25, 1891. See *Memoirs of Baron Bunsen*, by his wife (2 vols., London, 1868).

Bunsen, Robert Wilhelm: German chemist; b. in Göttingen, Mar. 31, 1811; succeeded Wöhler in the Polytechnic Institution of Cassel; became in 1851 Professor of Chemistry at Breslau, and in 1852 at Heidelberg. He is the author of several works, the most important perhaps being on gas analysis. His investigations on organic compounds of arsenic, kakodyl, etc., in 1841, attracted much attention. He has invented important pieces of apparatus, several of which bear his name, as the Bunsen battery, gas-burner, photometer, filter pump, etc. His most brilliant discovery was probably that of spectrum analysis and the Spectroscope (*q. v.*), made in connection with Kirchhoff. This instrument established a new era in astronomy, and has already led to most valuable discoveries in chemistry. By its aid Bunsen himself discovered two new alkaline metals, *cæsium* and *rubidium*, and Lamy and Crookes discovered *thallium* and Riehe and Richter *indium*. He also devised a new system of analysis by flame reactions. His laboratory was a favorite resort for persons from the U. S. studying chemistry in Europe.

Bunsen Burner: a gas-burner; the invention of Robert Wilhelm Bunsen; intended to secure perfect combustion. By it air is caused to mix with the gas before ignition, thus producing a smokeless, sootless flame of little light, but of great heating power. The appliance has been much improved, and is of great importance in the laboratory, workshop, and kitchen.

Bunt: See Smuts.

Bun'ter Sand'stein (variegated sandstone): a German name for the "new red sandstone"; the lowest portion of the Triassic series; called *grès bigarré* by French geologists. As the Trias is more perfectly developed in Germany than in Great Britain, the German beds are considered the typical group of the Triassic period. Large quantities of bunter sandstein flank the Vosges Mountains. It is there generally a fine-grained, solid sandstone, useful as a material for building, and is often of a blue, red, or greenish tint. The most remarkable fossils of this formation are the remains of huge batrachians, including the *Labyrinthodon*.

Bunting: a name properly given to numerous small streaked sparrows of the genera *Emberiza*, *Euspiza*, *Plectrophenax*, etc. These birds are mostly European, but some are found in America. One of their number is the ortolan of Europe, so highly prized for the table. The bobolink is sometimes called rice-bunting, and several other birds are often improperly called buntings.

The cirl bunting (*Emberiza cirlus*).

Bunting, Jabez, D. D.: Wesleyan minister; b. in Manchester, England, May 13, 1779; entered the ministry 1799; gained distinction as an eloquent preacher; had so great influence in his denomination that he has been called "the second founder of Methodism." D. in London, June 16, 1858. See his *Life*, by T. P. Bunting and G. S. Rowe (London, 1887).

Bunyan, John: author of *Pilgrim's Progress*; b. at Elstow, near Bedford, England, in Nov., 1628 (baptized Nov. 30), and learned the trade of a tinker; enlisted in the army of the Parliament, probably (the point is curiously enough uncertain) about 1645; soon quitted the army, and married at about the age of twenty. After passing through severe spiritual conflicts, he attained inward peace and profound religious views. He joined the Nonconformists in 1653; in 1655 he removed to Bedford, and began to exhort; in 1657 he was regularly recognized as a preacher, but still continued to practice his trade. He conducted services in Bedford and other places. In 1660 for so doing he was confined in Bedford County jail, and there remained till 1672. In 1675 he was again in prison, but only for six months. It was during this time that he wrote the *Pilgrim's Progress*, which he published in 1678, and a second edition the same year, and a third in 1679, much enlarged. The second part appeared in 1684. His preaching tours were made from

Bedford, and were not without risk. He went frequently to London to preach, and wherever he went had large congregations. In the spring of 1688 he had the "sweating sickness"; later caught a severe cold by riding through heavy rain to London from Reading, whither he had gone to, and did, reconcile a father and son. In London he lay for a while sick of a fever, and finally died there Aug. 31, 1688. His masterpiece, *The Pilgrim's Progress*, is the greatest of allegories, and one of the religious classics of the English tongue, and by means of translations more widely spread than any book save the Bible. It betrays a mind fairly saturated with the Bible and such books as *Fox's Martyrs* and Bagley's *Practice of Piety*. While so simple as a story that a child can understand and enjoy it, it is so profound in its doctrines that the trained theologian best appreciates it. His second famous allegory is *The Holy War*, first issued in 1682. It has no rival in any language save his own *Pilgrim's Progress*. Among his other writings, which are numerous, many dating from his long imprisonment, should be mentioned *Grace Abounding to the Chief of Sinners* (1666), his spiritual autobiography, which recounts how he became a holy man from being a careless sinner; *The Life and Death of Mr. Badman* (1680); *The Jerusalem Sinner Saved* (1688), a remarkable sermon; *The Heavenly Footman* (1698). There are innumerable editions of these works of Bunyan, but no complete edition worthy of his fame has recently been printed. The life of Bunyan has been exhaustively treated by Rev. John Brown (London, 1885; 2d ed. 1887); readable is the shorter work by E. Venables (1888). SAMUEL MACAULEY JACKSON.

Bunyon: See BUNION.

Bunzlau, bŏonts'low: a town of Prussia; in Silesia; on the Bober; 28 miles by rail W. N. W. of Liegnitz (see map of German Empire, ref. 4–H). It has a normal school, and manufactures of woolen goods, hosiery, linens, etc. Pop. 11,600.

Bunzlau, Jung, yŏong'bŏonts'low (i. e. Young Buntzlau): city of Bohemia; on the river Iser; 37 miles N. E. of Prague. It has an old castle, a gymnasium, and manufactures of cotton and woolen fabrics, leather, and soap (see map of Austria-Hungary, ref. 3–E). Pop. (1890) 11,518.

Buoy, bwoi, or boi: a floating body usually intended as a mark for the guidance of mariners. It is made either of wood or metal, and is often hollow. Buoys are generally moored by chains to the bed of the channel. They are of various, shapes, sizes, and colors to distinguish them one from another, and indicate to the mariner each a specific instruction. Starboard buoys, usually red, are on the right of a vessel ascending the channel, or on the coast going with the flood-tide current; port buoys, usually black, are on the left in the same circumstances; spherical buoys, striped, indicate the end of a shoal; a hollow conical buoy is called a "can-buoy"; a double conical buoy is called a "nun-buoy"; a floating wooden spar is a "spar-buoy." The bell-buoy is a contrivance for rendering a buoy audible, whether it is visible or not; it is flat on top, where a bell is mounted, the clapper of which is set in vibration by undulations of the water. The Courtenay buoy is surmounted by a whistle connected with a hollow tube long enough to reach stiller water beneath. As the buoy rises and falls on the waves the water in the tube correspondingly changes, so that the air rushes in or out of the whistle as the air in the tube expands or is compressed. Lighter buoys are used to mark river channels. A common shape for buoys to be used to mark shoals in rivers or in other sheltered places is that of a frustrum of a cone. They are anchored point downward, with the name of the buoy on the top. In laying submarine telegraphs buoys are used when cables are cut and abandoned during rough weather, afterward to be picked up and repaired, when the work of laying the cable goes on as before the storm.

A buoy-rope on shipboard is the rope which connects the anchor with a buoy floating above it. It is simply intended to point out the locality of the anchor, but if it be strong it is useful in assisting to raise the anchor at times when the proper cable is cut or injured.

Buphaga: See BEEF-EATER.

Bupres'tis [from Gr. *βούπρηστις*, an insect whose sting is said to have caused cattle to swell up; *βοῦς*, ox + *πρήθειν*, puff up]: a genus of coleopterous insects of the family *Buprestidæ*, which includes more than 1,000 species. They are remarkable for the splendor and richness of their colors. They are found in North America, but are more abundant in tropical countries. The *Buprestis gigas*, of Cayenne, is

The giant buprestis.

about 2 inches long, and is larger than any of the North American species.

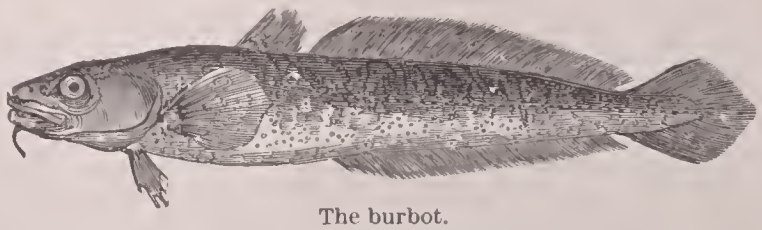
Bur: a rough, prickly covering (involucre) of the seeds of some plants, as the chestnut. The term is also applied to the flower-head or involucre of the *Arctium lappa* (burdock), the prickles of which are hooked at the point. In engraving on steel or copper, bur is a slight ridge raised on the edges of a line by the graver or the dry-point.

Bur'bage, RICHARD: actor; one of Shakspeare's associates; b. about 1567. He seems to have belonged to one of those companies of traveling actors which, under the name of "Englische Comödiachen," now and then visited the Continent, more especially North Germany, Holland, and Denmark; exercised considerable influence on the development of the drama and the theater in those countries; inherited a share in the Blackfriars, and, with Shakspeare, Heming, and others as partners, built the Globe theater, where he took leading parts in all sorts of plays until he died. He played Richard III. and other tragic *rôles* with great spirit. D. in London, Mar. 13, 1618–19. See Collier's *History of English Dramatic Poetry* (1879).

Bur'beck, HENRY: soldier; b. in Boston, Mass., June 8, 1754. He was a soldier in the Revolution, and was appointed captain under the Confederation May 1, 1787. In 1789 he was commissioned a captain of artillery, major in 1791, lieutenant-colonel in 1798, and colonel in 1802. He served with distinction in the Revolutionary war, in that of 1812 with Great Britain, and on frontier service. He was breveted brigadier-general 1813, and retired from the army June, 1815. D. in New London, Conn., Oct. 2, 1848.

Bur'bidge, GEORGE WHEELOCK, D. C. L.: Canadian jurist; b. in Canning, New Brunswick, Feb. 6, 1847; educated at Mt. Allison Wesleyan College; admitted to the bar in 1872; appointed queen's counsel in 1885. He practiced his profession at St. John; was secretary of the commissioners for consolidating the laws of New Brunswick; a commissioner to revise and consolidate the statutes of Canada in 1883; Deputy Minister of Justice for the Dominion from May, 1882, until appointed judge of the Exchequer Court of Canada Oct., 1887. This court, which consists of but one judge, has exclusive original jurisdiction in respect of any matter which might in England be the subject of an action against the crown. NEIL MACDONALD.

Bur'bot (*Lota lota*): a fish of the rivers and lakes of the arctic and subarctic regions of both hemispheres; is the only



The burbot.

fresh-water species of the family *Gadidæ* or codfishes. It reaches a weight of 8 or 10 lb. It has two dorsal fins, the

second of which is very long, and a very long anal fin. Its flesh is white, firm, and is not highly esteemed as food. It is capable of living a long time out of water. It is also known in the U. S. as eel-pout, cusk, and ling.

Bur'bridge, Stephen Gano: general of volunteers; b. in Scott co., Ky., Aug. 19, 1831; educated at Georgetown College and at Kentucky Military Institute, Frankfort; studied law in the office of the late Senator Garrett Davis at Paris, Ky. In 1849 he returned to Georgetown, D. C., and engaged in mercantile business till 1853, when he turned his attention to farming, and at the outbreak of the civil war was conducting a large farm in Logan co., Ky. He espoused the cause of the U. S., and raised the famous Twenty-sixth Kentucky, which he led until the battle of Shiloh, where he was promoted to be a brigadier-general of U. S. volunteers; fought to expel Bragg from Kentucky in 1862; ordered to join the expedition against Vicksburg; led the charge at Arkansas Post and at Port Gibson; commanded the military district of Kentucky, and drove John Morgan into Tennessee. For this service he was breveted major-general. Resigned in 1865. D. in Brooklyn, Dec. 1, 1894.

Burck'hardt, Jakob: See the Appendix.

Burckhardt, Johann Ludwig: Swiss traveler; b. in Kirchgarten, near Lausanne, Nov. 24, 1784. After studying at Leipzig and Göttingen he went to London in 1806, carrying with him a letter of introduction from the celebrated Blumenbach to Sir Joseph Banks, and entered the service of the African Association, which in 1809 sent him to explore the interior of Africa. He spent about two years in Syria; prepared himself by the study of Arabic and medicine, inuring himself to all kinds of hardships and privations. He traveled through Cairo and Nubia to Mecca, where he arrived in 1814. Disguised as a Moslem hâjî, he made a pilgrimage to Mt. Ararat and to Medina with peril to his life. D. in Cairo, Oct. 15, 1817, and bequeathed his Oriental MSS. to Cambridge University. His *Travels in Nubia* (in English, London, 1819); *Travels in Syria and the Holy Land* (1822); *Travels in Arabia* (1829); *Notes on the Bedouins and Wahabys* (1830); and *Arabic Proverbs; or the Manners and Customs of the Modern Egyptians, Illustrated from their Proverbial Sayings* (1830), are highly esteemed. See his *Life*, prefixed to his *Travels in Nubia*.

Burden, Henry: inventor and ironmaster; b. in Dumblane, Scotland, Apr. 20, 1791; removed to the U. S. in 1819; set up business as a farm-tool manufacturer, and made the first cultivators; in 1825 invented a process of making railroad spikes which greatly cheapened railway construction; in 1822 was an ironmaster, and eventually the head of one of the largest rolling-mills and iron and steel establishments in the U. S., located near Troy, N. Y.; especially famous for his machine which turns iron bars into finished horseshoes at the rate of sixty a minute; grew very rich; d. in Troy, N. Y., Jan. 19, 1871.

Burden of Proof: the obligation or necessity of proving the fact in dispute in an issue joined in a court of justice. The general rule is that the burden of proof rests upon the party who asserts the affirmative of the issue. The same rule is applied if he grounds his case on a negative statement or allegation. If, however, the proof by which this negative allegation may be disproved is peculiarly within the knowledge of the opposite party, a *prima facie* case is established by its simple assertion. In general, the party upon whom rests the burden of proof has the privilege of opening and closing the case. In most civil causes judgment must be given for the party establishing a preponderance of evidence, but in criminal cases the accused must be acquitted unless the jury are satisfied of his guilt beyond a reasonable doubt. Hence the rules concerning the burden of proof are of great importance in criminal prosecutions. The burden of proof is on the government throughout the whole case. Revised by F. Sturges Allen.

Burdett', Sir Francis: a popular and liberal English legislator; b. Jan. 25, 1770. In 1793 he married a rich heiress, Sophia Coutts. He was elected to Parliament about 1795; became an effective speaker; advocated parliamentary reform for a while, during which time he was twice arrested, once imprisoned and fined for criticisms of the Government; turned Conservative in 1835. He represented Westminster for many years (1807–37), and then Wiltshire until his death; was the idol of the London populace. D. Jan. 23, 1844.

Burdett-Coutts, Angela Georgiana, Baroness: daughter of Sir Francis Burdett; b. Apr. 21, 1814; gained distinction by the liberal use of her vast fortune. She built churches, among which is the beautiful St. Stephen's at Westminster; endowed the bishopries of Adelaide, Cape Town, and British Columbia; aided emigrants on a great scale, and provided a "Home" at Shepherd's Bush for such women as had lapsed into evil ways. In 1871 she was made a baroness in her own right. Ten years later she married William Lehman Ashmead Bartlett (b. in New Brunswick, N. J., in 1851), who took her name, whereby she lost some part of her inheritance.

Burdette, Robert Jones: humorist and journalist; b. at Greensboro, Pa., July 30, 1844; removed to Peoria, Ill., in his youth; enlisted in Forty-seventh Illinois Volunteers in 1862 as a private, and served through the war; became one of the editors of the Peoria *Transcript* in 1869; in 1874 associate editor of the Burlington *Hawkeye*, his humorous contributions to which made him famous. Licensed as a Baptist minister in 1887. He is popular as a lecturer, and has published *The Rise and Fall of the Mustache*; *Hawkeyes*; *Life of Wm. Penn*; *Innach Garden*; *Sons of Asaph*; and *Chimes from a Jester's Bells*.

Burdick, Francis M., A. M., LL. B., LL. D.: professor of law; b. at De Ruyter, N. Y., Aug. 1, 1845; was educated at Hamilton College and at Hamilton College Law School, Clinton, N. Y.; practiced law in Utica, N. Y., 1872–83, and was mayor of the city 1882–83; was Maynard-Knox Professor of Law and History in Hamilton College 1882–87; Professor of Law in Cornell University Law School 1887–91; and became Dwight Professor of Law in Columbia College Law School, New York, in 1891. Dr. Burdick has published *The Study of Law as a part of a General Education* (Albany, 1887), and *Cases on Torts* (New York, 1891; new ed. 1895). Received the degree of LL. D. from Hamilton College in 1895.

Burdock (*Arctium lappa*): a plant of the family *Compositæ*; has a globular involucre with imbricated coriaceous scales, each tipped with an abrupt and spreading, awl-shaped, hook-pointed appendage. This involucre, which is called a *bur*, catches hold of the clothes of persons who come into contact with it. The burdock is a native of Europe and naturalized in the U. S., growing as a weed in waste places, fence-corners, and near dwellings. It is used in medicine as a diuretic and diaphoretic.

Burdwan, or **Bardwan**: a town of Bengal, India; capital of a division and district of the same name; on the Dummodah, and on the Grand Trunk Road; 68 miles by rail N. W. of Calcutta (see map of N. India, ref. 7–I). It has manufactures of silk and cotton fabrics, and a large palace, but the houses are generally rather mean. Pop. 35,000.

Bure: See Buri.

Bureau Ver'itas: an institution for the classification of the steamships and sailing-vessels of all nations; used by underwriters, maritime insurance agents, etc. It was founded at Antwerp in 1828, by Charles Bal. During the revolution of 1830, which separated Belgium from Dutch rule, the Bureau Veritas was removed to Paris, France, where it was long known as the French Lloyd's. In the Franco-German war of 1870–71 the bureau was finally located at Brussels, in Belgium. Its surveyors and agents are found in the seaports of all maritime countries, and their ratings of vessels are the fruit of the utmost severity in examination.

Burg, bŏŏr*kh*: a town of Prussian Saxony; on the river Ihle; 17 miles by rail N. E. of Magdeburg. It was settled by French and Walloon colonists, and has been for many centuries celebrated for its manufactures of woolen cloth. Here are also manufactures of linen, machinery, pottery, etc. Pop. (1890) 17,572.

Burgdorf, bŏŏr*kh*'dōrf (in Fr. *Berthoud*): a town of Switzerland; canton of Berne; on the river Emmen; 13¾ miles by rail N. E. of Berne (see map of Switzerland, ref. 4–E). It has a castle and manufactures of ribbons and silk. Pestalozzi opened a school here in 1798. The Sommerhaus baths are in the vicinity. Pop. (1888) 6,876.

Bür'ger, Gottfried August: German poet; b. near Halberstadt, Dec. 31, 1747. He studied at Göttingen, and his literary career was greatly influenced by reading Shakspeare and *Percy's Relics of Ancient Poetry*. His works consist chiefly of ballads and songs, which, though very popular, did not relieve him from poverty. Among his best productions are *Lenore* (1772) and the *Wild Huntsman*. D. in Göttingen, June 8, 1794. See Pröhle's *G. A. Bürger* (Leipzig, 1856).

Bur'ges, Tristam, LL. D.: statesman and orator; b. in Rochester, Mass., Feb. 26, 1770; graduated at Brown University in 1796; studied law, which he practiced with success at Providence, R. I., and became a leader of the Federal party. He was for a time chief justice of Rhode Island, and afterward a professor in Brown University. In 1825 he was elected a member of Congress, in which he continued ten years, and gained a high reputation. He was eminently logical and terribly sarcastic. D. in Providence, Oct. 13, 1853.

Burgess, Alexander, D. D., LL. D.: Bishop of Quincy, Ill.; b. in Providence, R. I., Oct. 31, 1819; graduated at Brown University 1838, and the General Theological Seminary, New York city, 1841; ordained 1842; held parochial charges at East Haddam, Conn.; Augusta and Portland, Me.; Brooklyn, N. Y.; and Springfield, Mass. Consecrated Bishop of Quincy, May 15, 1878; published a memoir of his brother, the Bishop of Maine, carols, hymns, special sermons, charges, etc.

Burgess, George, D. D.: Bishop of Maine; b. at Providence, R. I., Oct. 31, 1809; graduated at Brown University in 1826; was a tutor there for a time; studied in Germany two years; rector of Christ church, Hartford, Conn. (1834–47); and was, Oct. 31, 1847, consecrated Bishop of Maine, acting also as rector of Christ church, Gardiner. He went to Haiti to found a mission, and died there of apoplexy Apr. 23, 1866. He published *Pages from the Ecclesiastical History of New England* (Boston, 1847); *The Last Enemy, Conquering and Conquered* (Philadelphia, 1850); a volume of sermons; a metrical version of the Psalms (New York, 1840); and other works.

Burgess, James, LL. D.: archæologist; b. in Kirkmahoe, Dumfriesshire, Scotland, 1832; went to Calcutta as Professor of Mathematics, 1855; engaged in educational work in Bombay 1861–73; published the monthly *Indian Antiquary* 1872–85; in 1873 was put in charge of the archæological survey of Bombay; in 1885 appointed director-general of the archæological survey of India, retiring in 1889. Editor of *Epigraphia Indica* and author of various works on the temples of India.

Burgess, John William, LL. D.: educator; b. at Cornersville, Giles co., Tenn., Aug. 26, 1844; educated at Cumberland University, Lebanon, Tenn., and Amherst College, Mass., whence he graduated in 1867; was admitted to the bar of Massachusetts in 1869; appointed Professor of English Literature and Political Economy at Knox College, Galesburg, Ill., in 1869; in 1871 studied history and public law at Göttingen, Leipzig, and Berlin; was appointed Professor of History and Political Science at Amherst College in 1873; Professor of Political History and Public Law at Columbia College, New York, in 1876, and of Constitutional and International History and Law in 1880.

Burgher and **Antiburgher**: See Associate Presbytery and Presbyterian Church.

Burgkmair, bŏork'mīr, Hans: a noted German painter and engraver on wood; b. in Augsburg in 1472. He was a friend of Albert Dürer. His paintings are in galleries at Munich, Berlin, Augsburg, and Vienna. In 135 wood-cuts he depicted *The Triumph of the Emperor Maximilian*, for which the emperor wrote the text. D. in 1531.

Burglary [Anglo-Fr. *burglarie*, origin obscure]: in criminal law, the act of breaking and entering into a dwelling-house of another or a church in the night-time, with intent to commit a felony therein. There are four circumstances necessary to constitute the offense, referring to place, time, the acts done, and the intent. The place is a dwelling-house or a church. It is not necessary, in order to constitute a "dwelling-house," that there should be any person residing in the house at the time. It is enough if it be habitually used as a dwelling, though it may at the time be closed, as in the case of a person having two or more residences. Difficult questions sometimes arise as to buildings connected with the house and within the curtilage, and as to the case of lodgers having separate rooms and entering by a common door. In the last instance the inquiry would be whether each lodger has a distinct dwelling-house. Consult Bishop or Wharton on *Criminal Law*.

As to time, the rule is that the offense must be committed by night. The better opinion is that both the breaking and entering must be by night, though the two acts, so far as they are distinct in their nature, may be committed on separate nights. It is held to be night when a person can not by the light of the sun clearly discern the face of another. This is quite indefinite, and as burglary is a heinous offense some fixed though arbitrary rule seems desirable. In some of the States the time is fixed by statute. The fact that the face can be seen by moonlight does not affect the question.

The acts to be done are breaking (actual or constructive) and an entry. The word "breaking" is not to be construed so as to require any great degree of force or violence. Unlatching a door or raising a window is sufficient. If a door or window be left open, an entry through them would not be a breaking, though the act of coming down a chimney would be. Any entry will suffice, such as thrusting the hand or an instrument to be used in the commission of a felony, through a broken pane of glass. The thrusting or forcing in of an instrument to be used in breaking only does not of itself constitute a burglarious breaking and entry. The act of discharging a loaded pistol or gun through a door or the glass of a window with a felonious intent would be both a breaking and an entry. It is sufficient if the entrance be procured through fraud or intimidation. It is doubtful whether the act of *breaking out* of a house will be sufficient, though the other ingredients of the offense, except breaking in, be present.

Finally, there must be an intent to commit a felony. If a felony be actually committed, the intent may be inferred. It will be immaterial whether the felony exists at common law or is created by statute. An intent to commit a trespass will not suffice.

The common-law ingredients of this crime have been modified in the U. S. by statute. Burglary is sometimes divided into degrees; some of these degrees would include breaking and entry in the daytime, or into buildings other than dwelling-houses and churches, or breaking out of a building, as well as into it. In some of the States, statute law makes the intent to commit any crime sufficient.

T. W. Dwight.

Burgomaster: the great ice-gull, *Larus glaucus*, of the aretic regions of both hemispheres.

Burgon, John William: Dean of Chichester, England; b. in Smyrna, Asia Minor, Aug. 21, 1813; educated at Worcester College, Oxford; B. A. 1845; wrote the Newdigate prize poem 1845; fellow of Oriel College 1846; took holy orders 1848; Gresham lecturer in Divinity 1868; vicar of St. Mary the Virgin, Oxford, 1863; Dean of Chichester 1876; author of *The Life and Times of Sir Thomas Gresham* (2 vols., 1839); *Petra, a Poem* (1846); *Oxford Reformers* (1854); *A Plain Commentary on the Four Holy Gospels* (8 vols., 1855; new ed. 4 vols., 1877); *Historical Notices of the Colleges of Oxford* (1857); *Plain Commentary on the Book of Psalms*, Prayer-book version (2 vols., 1857); *Inspiration and Interpretation* (1861); *Letters from Rome* (1862); *A Treatise on the Pastoral Office* (1864); *Ninety-one Short Sermons* (2 vols., 1867); *Disestablishment, the Nation's Formal Rejection of God and Denial of the Faith* (1868); *England and Rome: Three Letters to a Pervert* (1869); *The Last Twelve Verses of the Gospel according to St. Mark Vindicated* (1871); *The Athanasian Creed* (1872); *A Plea for the Study of Divinity in Oxford* (1875); *The Revision Revised* (1883); *Poems* (1885); *Lives of Twelve Good Men* (1888; 2 vols., 3d ed. 1889). D. in Chichester, Aug. 6, 1888. See his *Life* by E. M. Goulburn (London, 1892, 2 vols.).

Burgos, boor'gōs: a province of Spain, in Old Castile; bounded N. by Santander, E. by Biscay, Alava, and Logroño, S. E. by Soria, S. by Segovia, and W. by Valladolid and Valencia. Area, 5,651 sq. miles. It is drained by the Douro and the Ebro, which rises within its limits. The surface is partly mountainous. Gold, silver, copper, iron, and lead are found in it. Pop. (1887) 337,822.

Burgos (Lat. *Burgi*): a city of Spain; capital of province of same name; on the river Arlanzon; at the foot of the Sierra de Oca; 140 miles by rail N. of Madrid; lat. 42° 20′ N., lon. 3° 45′ W. It was formerly the capital of Old Castile, and was far more populous than it is now. It was founded in 844 A. D., and has many antique buildings. The court was removed from Burgos to Madrid in the sixteenth century, after which the importance of the former declined. The most remarkable edifice here is the cathedral of brown stone, which is one of the noblest specimens of Gothic architecture in Europe. This was commenced in 1221. Burgos is the seat of an archbishop, and has a college and some manufactures of woolen and linen fabrics. The rail-

way which connects Bayonne with Valladolid passes through this town. Pop. (1887) 31,301.

Burgos, Laws of: a system of laws for the regulation of Indian labor in America, promulgated at Burgos, Spain, Dec. 27, 1512. They were the result of an attempt by the Dominicans of Hispaniola to protect the Indians; the monks were opposed by the colonists, and King Ferdinand referred the question to a special junta which prepared these laws. They provided that the Indian laborers should have houses, land for planting, and a *peso* of gold annually to buy clothes; religious instruction was secured to them; regular inspectors of the mines were created, and it was forbidden that the Indian miners should be forced to work more than five months consecutively; every effort was to be made to attract the Indians by gentle means. These humane laws caused much dissatisfaction and soon became a dead letter.

Herbert H. Smith.

Burgoyne, John: British general and dramatist; b. Feb. 24, 1723; commanded a force which captured Alcántara, in Spain, in 1762; was sent to the American colonies in 1775; fought under Carleton to expel the insurgents from Canada. In the summer of 1777 he took command in Canada of an army of 8,000 men, which was ordered to enter New York State and advance to Albany to meet Clinton, who was to ascend the river, thus cutting the colonies in twain. He was repulsed at Stillwater in September, and was captured with his whole army at Saratoga in Oct., 1777, by the army under Gen. Gates; returned home in 1778, and wrote a vindication of his campaign entitled *A State of the Expedition* (1780). (See Saratoga, Battle of.) He wrote successful dramas called *The Maid of the Oaks* (1780); *Bon Ton*; and *The Heiress* (1786). D. in London, Aug. 4, 1792.

Burgoyne, Sir John Fox: field-marshal; son of Gen. John Burgoyne, and godson of Charles James Fox; b. in London, July 24, 1782; entered the Royal Engineers as second lieutenant in 1798. During a period of seventy-three years' service he slowly but steadily ascended, until at an age far beyond the scriptural limit of the life of man he reached that summit of his professional career which, in a published letter, dated Wilhelmshohe, Oct. 29, 1870, earned for him from the French emperor, Napoleon III., the designation of "Le Moltke de l'Angleterre." He served as commanding engineer under Gen. Frazer at the assault of Alexandria and siege of Rosetta, Egypt, in 1807; and under Sir John Moore in his Portuguese campaign and retreat in 1808. Through the Peninsular war he took a prominent part, as an engineer officer, in its greater sieges and battles, e. g. the siege of Ciudad Rodrigo, the two sieges of Badajoz; as commanding engineer at the desperate siege of Burgos and of that of Sebastian (shot through the neck in the assault), and the battles of Busaco, Salamanca, Bidassoa, Nivelle, etc. He came out of the Peninsular war aged thirty-two and the senior officer of engineers who had been engaged in the sieges of Spain. As commanding engineer under Gen. Pakenham he was present at the assault of Gen. Jackson's lines below New Orleans, Jan. 8, 1815, as also at the capture of Fort Bowyer (Mobile Point), Feb. 11. He was called again to the field (aged seventy-two) for the Crimean war. Against the opinion of the French engineers he pointed out at the beginning the Malakoff as the proper and decisive object of the siege operations. On his recall he resumed his position at the War Office as inspector-general of fortifications, to which place he had been appointed in 1845. His services in this capacity and his various reports and official writings were deemed to justify the publication of a work entitled *Military Opinions of Sir John Burgoyne* (London, 1859). After seventy years' service he retired in 1868 with promotion to the rank of field-marshal, and the appointment of constable of the Tower of London. Though then aged eighty-six, his physical powers were good and his mind unimpaired. He died Oct. 7, 1871, at the age of eighty-nine, and was buried in the historic Tower of London.

Bur'gundy (in Fr. *Bourgogne*; Lat. *Burgundia*): one of the most important of the former provinces of France; now forms the departments of Côte d'Or, Saône-et-Loire, Yonne, part of Ain, and part of Aube. The whole population of the departments of Ain, Saône-et-Loire, Côte d'Or, Yonne, Aube, Haute-Marne, and Haute-Saône amounted in 1891 to 2,477,921. The name was derived from an ancient German tribe called in Latin *Burgundi* or *Burgundiones*, who settled in this part of Gaul about 408 A. D. Gondemar, King of Burgundy, was defeated and killed in 534 by the Franks, who then obtained possession of Burgundy. The kingdom of Burgundy, re-established in 561, was much more extensive than the province of that name, and its extent varied in different periods. It included the provinces of Burgundy, Franche-Comté, Dauphiné, a part of Switzerland, Lyonnais, and nearly all the basin of the Rhône. In 879 A. D. Burgundy renounced its allegiance to the weak Carlovingian king, and became an independent state ruled by King Boso. It afterward in part belonged to the kingdom of Arles (933–1032). Upper Burgundy was a kingdom from 888 to 933. In these ages there were often several lines of princes claiming the title of King of Burgundy, and ruling over parts of the country. King Rudolf III., dying without male issue in 1032, bequeathed his kingdom to the Emperor Conrad II. Conrad's son Henry erected it into a duchy, feudal to Germany, sometimes called Little Burgundy. Meanwhile the northwestern portion of old Burgundy remained a fee of the French crown, governed by a line of dukes. This line became extinct in 1361, but John II. of France made his son, Philip the Bold, duke in 1364. After this Burgundy became an important state, which was much of the time virtually independent. Several of the dukes who reigned over it were powerful and famous princes. On the death of Charles the Bold, in 1477, the ducal line became extinct, and the duchy was annexed to France. From 915 to 1384 Franche-Comté was under a line of counts of Burgundy, but Philip the Bold made it a part of his dominions in 1384. See De Barante, *History of the Dukes of Burgundy* (13 vols., 1826); Dubois, *La Bourgogne depuis son Origine* (2 vols., 1867).

Burgundy, Dukes of: See Charles the Bold, Philip the Bold, and Philip the Good.

Burgundy, Louis, Duke of: Dauphin of France; b. in Versailles, Aug. 6, 1682; grandson of Louis XIV. and the father of Louis XV. He was a youth of violent passions and extremely haughty, but his character was, it is said, reformed by Fénelon, who was his preceptor. He married Adelaide of Savoy about 1698. On the death of his father he became dauphin and heir-apparent to the throne. D. of scarlet fever, Feb. 18, 1712.

Burgundy Pitch (*Pix Burgundica*): a resinous concrete exudation from the *Abies excelsa* or Norway fir. It is rendered commercial by melting it in hot water, by which process part of its volatile oil is separated from it. By straining it through a coarse cloth some impurities are removed. It is of a yellowish-white color, is hard and brittle when cold, but is softened by a moderate degree of heat. It has a pleasant resinous odor and a slightly bitter taste. It is used in medicine as an external application in the form of a plaster. The Burgundy pitch of commerce comes chiefly from the neighborhood of Neufchâtel, Switzerland.

Burgundy Wines: the name of French wines produced in the former province of Burgundy, the best coming from the range of hills called Côte d'Or, between Dijon and Châlons. These hills are about 800 to 1,000 feet high, and the finest vineyards are about half way up. The wines are celebrated for richness of flavor and perfume. The best red wines of Burgundy are called Clos-Vougeot, Chambertin, Romané-Conti, Volnay, Pomard, and Richebourg. The white wines of Burgundy are said to be the finest in France, but the quantity produced is less than that of the red.

Burhanpur', or **Barhanpur** (Hindi, *Barhanpura*): a city of Nimar district, Central Provinces, British India; the ancient capital of the Kandesh; on the river Tapti; 309 miles by rail N. E. of Bombay (see map of S. India, ref. 2–D). It is on the Great Indian Peninsular R. R. It is one of the largest and best-built cities of the Deccan, and has wide and regular streets and brick houses. Among the remarkable buildings is a mosque built by Aurungzebe, and an old royal palace which is nearly ruined. This city was taken by Akbar about 1600. It has manufactures of gold and silver thread for brocade. Pop. 30,017.

Bu'ri, or **Bure**: the first of the gods of the Norse mythology (Æsir). It is related that when the mythic cow Audhumla (whose name, from *audr*, desert, and *hum*, darkness, may be said to symbolize the original chaotic darkness) began to lick the frost-covered rocks of the primeval chaos, there came forth a beautiful and mighty being in human form called Buri, whose son Bör (that is born, and hence, like the Latin *natus*, signifying a son) was the father of Odin.

Buri: a species of palm; native of the Philippine islands. Its trunk is employed in the construction of houses; sugar and spirituous liquors are made of the sap; the pith yields a

valuable article of food (sago); and mats and sails are made from its fiber. This palm is the *Arenga saccharifera.*

Burial: See FUNERAL.

Burial Societies: See FRIENDLY SOCIETIES.

Bur'idan (Fr. pron. bü'ri-daăn'), JEAN: scholastic philosopher; b. at Béthune, Artois, France, about 1300. He was a pupil of Occam; lectured at Paris; belonged to the Nominalist school. He wrote commentaries on Aristotle's *Metaphysica*, and other works, and was the reputed author of a celebrated sophism called "Buridan's Ass," but it is not found in his books. The subject of this was an ass placed between two equidistant and equal bundles of hay, and starving on account of the equal balance of the two motives. For some unknown reason he left Paris for Vienna, and was instrumental in founding the university there. D. after 1358.

Bu'rin: a post-town and port of entry of Newfoundland; capital of district of same name; has a fine harbor on the west side of Placentia Bay, and a jail. Pop. 2,000.

Burins: See CHIZEROOTS.

Burke, EDMUND, LL. D.: statesman, orator, and writer: b. in Dublin, Ireland, Jan. 1, 1728, or, according to some writers, in 1730. At an early age he became the pupil of Abraham Shackleton, a Quaker of superior attainments and excellent character, who taught a school at Ballitore. Having entered Trinity College, Dublin, he devoted himself to history, philosophy, the classics, etc., not neglecting poetry and other works of imagination. He afterward studied law at the Middle Temple, London, but returned to Ireland in 1751, and took the degree of A. M. His *Vindication of Natural Society*, an ironical criticism of Lord Bolingbroke's attacks on Christianity, came out anonymously in 1756. This was followed by a *Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*, which was highly commended by Dr. Johnson. Burke married, in 1757, Mary Jane, daughter of Dr. Nugent, of Bath, and the union appears to have been a very happy one. Soon after this he formed an intimacy with Dr. Johnson and Garrick; the former, from his first acquaintance with Burke, felt the warmest admiration for his talents, and was accustomed to say that "no man of sense could meet Mr. Burke by accident under a gateway, to avoid a shower, without being convinced that he was the first man in England." In 1759 Burke became private secretary to William Gerard Hamilton, through whose influence chiefly he received a pension from the Government of £300 per annum; but finding that his political independence would be compromised by its acceptance, he threw it up at the end of the year. He was returned to Parliament for Wendover, in Buckinghamshire, about 1765, and re-elected in 1768. Having soon after purchased an estate, he wrote to his friend Shackleton: "I have made a push with all I could collect of my own, and the aid of my friends, to cast a little root into this country. I have purchased a house with 600 acres of land in Buckinghamshire, 24 miles from London." His *Thoughts on the Cause of the Present Discontent* came out in 1770, and in 1771 he was appointed agent of the colony of New York. In 1772 Sir Charles Colebrook, in the name of the directors of the East India Company, offered to Burke, who had already considerable knowledge of Indian affairs, "the first position in a supervisorship of three, empowered to trace out in detail the whole administrative system of India, and to remedy all they could find amiss." This offer he declined, feeling perhaps unwilling to leave Parliament at a time when American affairs were becoming more complicated, and the condition of France filled him with anxious forebodings. Soon after his return from a short residence in Paris, he said in a speech in Parliament, "I see propagated principles which will not leave to religion even a toleration, and make Virtue herself less than a name." In April, 1774, he made a speech on American taxation, and he appears to have been the only member of Parliament who fully comprehended the dangers which threatened the American colonies. In Nov., 1774, Burke represented the city of Bristol in Parliament, and in Mar., 1775, made an admirable speech in favor of conciliatory measures toward the American colonies. Fox said of this oration: "Let gentlemen read this speech by day and meditate upon it by night; they would there learn that representation was the sovereign remedy for every evil." In 1780 he delivered his speech *On the Economical Reform*, and in 1782 became a privy-councilor and paymaster-general of the forces under the Rockingham ministry. His speech on the East India Bill in Dec., 1783, is esteemed one of his best. Burke retired from office soon after the accession of Pitt as Prime Minister, and held no position afterward under the Government. In Feb., 1785, he made a speech on the debts of the Nabob of Arcot, which, says Prior, "was one of those outpourings of a fertile and vigorous intellect which on an unpromising theme seemed to combine all that could instruct, dazzle, and even overpower the reader." His prosecution of Hastings, the most arduous enterprise of his life, was commenced in Jan., 1786, and he conducted the impeachment. On Feb. 15, 1788, Burke made his memorable speech in Westminster Hall, in the presence of an immense assembly. Although a verdict of acquittal was passed in 1795, the noble efforts of Burke led the way to great reforms in the Government of India. In 1790 Burke published his *Reflections on the Revolution in France*, of which more than 30,000 copies are said to have been sold within a few months. It was translated into French, and received with enthusiasm in all parts of Europe. Soon after this he published *An Appeal from the New to the Old Whigs*, in which he refutes the charge brought against him by Fox of having abandoned the principles of his party. About 1795 Burke received considerable pensions granted at the desire of the king, and without solicitation on his part or that of his friends. His acceptance of these well-merited rewards exposed him to severe attacks upon his character, in reply to which he wrote his *Letter to a Noble Lord*, which was received with great favor. Burke's only son, Richard, a young man of great promise, had died in 1794, and this affliction probably hastened the father's death, which took place July 9, 1797. He was buried at Beaconsfield, near his estate. See Prior, *Life of Burke* (London, 1854): Dr. Geo. Croly, *Political Life of Edmund Burke*; Lord Jeffrey, *Miscellanies*; John Morley, *Edmund Burke* (1867).

Revised by C. K. ADAMS.

Burke, JOHN: genealogist; b. near Parsonstown, County Tipperary, Ireland, in 1786; settled in London, and published, besides other heraldic and genealogical works, a *Dictionary of the Peerage and Baronetage of the British Empire* (1826). The twentieth edition was published by his son. D. in Aix-la-Chapelle, Mar. 27, 1848.—His second son, Sir JOHN BERNARD BURKE, LL. D.: b. in London in 1815; became in 1853 Ulster King of Arms, and was knighted in 1854; governor of the National Gallery of Ireland 1874. He wrote many works on heraldry and kindred subjects, e. g. *Anecdotes of the Aristocracy* (1849–50); *The Landed Gentry*; *Reminiscences, Ancestral and Anecdotal.* D. in Dublin, Dec. 13, 1892.

Bur'leigh, or **Burghley**, WILLIAM CECIL, Lord: statesman; b. at Bourn, Lincolnshire, England, Sept. 13, 1520; graduated at St. John's College, Cambridge, studied law; married Mary Cheke, sister of the great humanist, in 1541, who died in three years, leaving an only son; and in 1545 Mildred, daughter of Sir Anthony Cook. In 1548 he was appointed Secretary of State. As he was a Protestant, he resigned office on the accession of Queen Mary in 1553, but by conformity to the Roman Catholic Church escaped persecution in that reign, although he succeeded in defeating a bill to confiscate the property of Protestant refugees. He was again appointed Secretary of State by Queen Elizabeth in Nov., 1558, and was virtually Prime Minister for forty years from that date. In 1571 he received the title of Baron Burleigh, and in 1572 became Lord Treasurer. According to Hume, "he was the most vigilant, active, and prudent minister ever known in England." D. in London, Aug. 4, 1598, and left no less than 300 landed estates. His tomb is in Westminster Abbey. From him through his second son have descended the Earls and Marquises of Salisbury. Lord Burleigh's government was in a critical time, and had to be carried on under a penurious and capricious queen, but one who had the discernment to keep him employed. He employed spies freely, was shrewd, tortuous, patriotic, and what political glory attaches to the reign of Elizabeth he is entitled largely to the credit of. See Arthur Collins, *Life of William Cecil* (1732); Motley, *History of the United Netherlands*, chaps. vi., viii., and xviii.; Froude, *History of England*, vol. v.

Bur'leson, RUFUS C., D. D., LL. D.: one of the earliest educators in Texas; b. near Decatur, Ala., Aug. 7, 1823; spent seven years in Nashville University; taught in Mississippi and in the Theological Institute, Covington, Ky.; graduated June 10, 1847. A few months later he became pastor of the First Baptist church, Houston, Tex. He filled that position three and a half years, and was then

unanimously elected president of Baylor University (*q. v.*). His great life purpose has been to elevate the Baptist denomination, and especially to found a great Texas Baptist university.

Bur'lingame: city and railroad junction; former capital of Osage co., Kan. (for location of county, see map of Kansas, ref. 6–I); 24 miles S. S. W. of Topeka. Coal is found in abundance here, also a fine quality of fire clay. The surrounding country is unsurpassed in productiveness. Pop. (1880), 1,370; (1890) 1,472; (1900) 1,436.

Burlingame, Anson, LL. D.: diplomatist; b. at New Berlin, Chenango co., N. Y., Nov. 14, 1822; graduated at Harvard in 1846. He became a lawyer and a resident of Boston, and represented the fifth district of Massachusetts in Congress from 1854 to 1860. For denouncing the assault made upon Senator Sumner he was challenged by Preston S. Brooks, and selected rifles for the weapon and Canada for the rendezvous, but Brooks refused to travel through the angry North. He acted with the Republicans, and gained distinction as an orator. In 1861 he was sent as commissioner to China, and in 1867 was appointed ambassador from China to the U. S. and the great powers of Europe, negotiating treaties of amity and commerce. D., while engaged in the Chinese service, in St. Petersburg, Russia, Feb. 23, 1870.

Bur'lington, England: See Bridlington.

Burlington: city, important railroad center, and river-port of Iowa; capital of Des Moines co. (for location of county, see map of Iowa, ref. 7–K); situated on the Mississippi river; 207 miles W. S. W. of Chicago, 250 miles by water above St. Louis, and 296 miles by railroad E. of Omaha. The river is here a broad, deep, and beautiful stream. The plan of the city is regular, and the houses are mostly of brick or stone. Many of the private residences are built on high bluffs which afford extensive views of river scenery. This place is the seat of Burlington University, and contains about twenty-five churches and numerous manufactories. Here occurs a valuable variety of carboniferous limestone. (See Burlington Limestone.) Burlington is sometimes called the "Orchard City." Pop. (1860) 6,706; (1880) 19,450; (1890) 22,565; (1900) 23,201.

Burlington: railroad junction; a city; capital of Coffey co., Kan. (for location of county, see map of Kansas, ref. 6–I); on the right bank of the Neosho river; 28 miles S. E. of Emporia and 65 miles S. of Topeka. It has an abundant water-power, a public-school house costing $30,000, and mills. Pop. (1880) 2,011; (1890) 2,239; (1900) 2,418.

Burlington: city and railroad center, of Burlington co., N. J. (for location of county, see map of New Jersey, ref. 5–D); on the Delaware river, nearly opposite Bristol; 20 miles above Philadelphia and 12 miles S. W. of Trenton. The river is here nearly a mile wide, and incloses an island of 300 acres. The city is the seat of St. Mary's Hall (an Episcopalian school for girls) and Burlington College; contains an opera-house, has gas and water systems, and a public library. The principal industries are the manufacture of shoes, canned goods, iron pipes of all sizes, stoves, heaters, and carriages. The town was settled as New Beverly in 1667; incorporated with its present name in 1784; has fine and shaded streets and many old mansions. Pop. (1880) 6,090; (1890) 7,264; (1900) 7,392.

Burlington: city; railroad center; county-seat of Chittenden co., Vt. (for location, see map of Vermont, ref. 4–B); on Burlington Bay of Lake Champlain; 40 miles W. from Montpelier, the capital of the State. It was incorporated as a city in 1865, and is the largest place in the State. Pop. (1840) 4,271; (1880) 11,365; (1890) 14,590; (1900) 18,640. Area of original township, 36 sq. miles; about two-fifths were included in the municipal limits, the rest forming a town called South Burlington.

The heaviest trade in the city is in lumber. The capital invested is over $1,000,000. There are large quarries of building-stone, of limestone, and of fine marble within or near the city limits; lime-kilns and brick-yards are in active operation, and three large cotton-mills, steam marble-mills, machine-shops, foundries, sash, chair, furniture, patent medicine, malt cereals, and shoe factories, paper-mills, and many smaller manufacturing trades are thriving. On the northeast limit of the city the abundant water-power of the Winooski is utilized for woolen and cotton mills, flour-mills, machine-shops, etc. A line of passenger steamers and a large fleet of tugs and barges ply between Burlington and other ports on the lake.

The University of Vermont and State Agricultural College is situated here; it was chartered in 1791, has a flourishing medical department, and ranks as one of the best institutions in the country. Since 1872 young women have been admitted to the classical and scientific departments on the same terms as young men. The college buildings stand on the crown of the hill on whose side the city is built, in a most beautiful and commanding position overlooking the lake. The library is in a handsome stone building; a massive structure of granite, brick, and terra cotta is devoted to laboratories and lecture-rooms; other edifices are a large five-story dormitory of rock-faced marble; a mechanical building; a gymnasium; a museum and art-gallery. A park of 7 acres lies in front of the college buildings, and the farm and buildings of the U. S. Agricultural Experiment Station, attached to the university, are in the rear. The city schools are under control of a board of commissioners elected by the people. The high-school building, erected in 1900 at a cost of $100,000, is one of the best in New England. There are also two large Roman Catholic schools and several private schools within the city limits. St. Mary's (Roman Catholic) cathedral is one of the finest church edifices in this part of the country. There are two orphan asylums—one Roman Catholic and one Protestant. The chief public buildings are the city-hall, the county court-house (a handsome stone building, erected in 1872), the county jail, the U. S. post-office and custom-house (a brick building, erected in 1858), and Y. M. C. A. building. The libraries are the University Library, Young Men's Christian Association Library, and the Fletcher Free Library, which last is under control of the city.

The city is supplied with water from the lake, raised by steam-pumps to a reservoir on the hill, which gives a head of 280 feet; the water-works are under the control of the city. Lakeview Cemetery, opened by the city in 1868, on the bluff overlooking the lake, is a beautiful spot, and Green Mount Cemetery, on the eastern side of the city, overlooking the valley of the Winooski, contains a monument to Ethan Allen, who was one of the early settlers and buried here—a shaft of granite surmounted by an heroic statue of Allen in marble, which was unveiled with imposing ceremonies July 4, 1873.

Electric trolley lines connect the city with the villages of Winooski and Essex Junction.

Burlington was first settled in 1775, but no permanent residences were made till the close of the Revolutionary war, and in 1800 the population was 800. The principal streets are 4 rods wide, laid out at right angles, many of them well shaded with elm and maple trees. The location of the city is unequaled in this part of the country, and the beauty of its scenery unsurpassed anywhere. The geographical position of the city, midway of the eastern shore of Lake Champlain, and the facilities for transportation by rail and water make the whole valley of the lake tributary to it in the way of business. Editor of "Free Press."

Burlington: village (settled in 1837); Racine co., Wis. (for location of county, see map of Wisconsin, ref. 7–F); on Wis. Cent. and C. M. and St. P. R. Rs., and on Fox river; 27 miles W. by S. of Racine. It has seven churches, a graded school, and manufacturing and agricultural industries. Pop. (1880) 1,611; (1890) 2,043; (1900) 2,526.

Burlington Limestone: a formation of the carboniferous period, occurring in Missouri and Illinois, adjacent to the Mississippi river. It affords a valuable building-stone, and is peculiarly interesting to naturalists. The upper bed is of a light-gray color, and is nearly pure carbonate of lime. The lower bed contains more magnesia. "It is," says A. H. Worthen, "exceedingly rich in fossils, especially Crinoidea, and has afforded a greater number both of species and individuals than all the other Palæozoic rocks of this continent combined."

Burma: the largest province of the British Indian empire; stretches from lat. 28° N., far up in the mountains of Tibet, southward in a long strip on the west coast of the Malay peninsula to lat. 10° N.; its greatest breadth is in lat. 21° 30′ from lon. E. 92° to 103°; bounded N.W. by Assam and Manipur, W. by Hill Tipperah, Manipur, and the Bay of Bengal, which also forms its southern boundary, E. by Siam, Tonquin, and China. Area, Lower Burma, 87,220 sq. miles; Upper Burma, 68,922; total, 156,142 sq. miles. Total pop. (1901) 9,221,161. Contains 35 administrative districts. Provinces of Lower Burma are Arakan, Irawadi, Pegu, and Tenasserim, covering the entire seacoast. The Mergui Archipelago

(see MERGUI) is part of, and lies off the lower coast of, Tenasserim. Portions of old Burma have not yet been incorporated into British India, but are frontier territory. Total area estimated at 280,000 sq. miles.

Physical Aspects.—The Yoma Mountains are a coast-range along the east boundary of Arakan, and form a continuation of the Barail and Patkoi range, an offshoot from the Himalayas. Blue Mountain, one of its peaks, is said to reach an elevation of 8,000 feet. On its west side lies the valley of the lower Koladan. E. of it is the basin of the great Irawadi, which receives the large affluent Kyen-duen about 80 miles below Mandalay. The Pegu Yoma range separates the Irawadi from the Sittang valley on the E.; and Poung-Loung range, which crosses the Shan States and has peaks about 7,000 feet high, divides the Sittang from the Salwin valley. The Tenasserim Mountains are on the eastern boundary of the province of the same name, rise 5,000 feet, and are covered with a dense and solitary jungle. The Mekong or Cambodia river passes across the eastern part of Upper Burma from N. to S. N. of the Pegu district the country slopes upward through a rolling country, broken here and there by ranges of hills for 300 miles, and then becomes mountainous, wild, and little known to geographers. The Irawadi and Salwin are the largest rivers: the former navigable for large vessels above Bhamo, 700 miles from the sea, and furnishing the highway of commerce to the Chinese border; the latter navigable for only 80 miles from the coast. The Kyen-duen, also known as the Chindwin, can be ascended 300 miles from its confluence with the Irawadi. All the Burman rivers are subject to great fluctuations of water, and in the dry season (December to July) navigation above the tide-reaches is much impeded. During the rest of the year the alluvial plains are subject to inundations, when the streams are covered with boats of every description and commerce is active. The upper river courses have a less overflow, though fed from the Himalayas, and they force their way through rugged and grand defiles. A canal runs from the Pegu to the Sittang river. Lakes are Thoo, Lahgyin, and Kandaugee. .

The rainfall on the coast exceeds at places 200 inches a year, but diminishes rapidly as the country is ascended, except that in the Shan States and at Bhamo it is excessive (from 80 to 100 inches). At Prome it is 42 inches. The rainy season lasts from five to seven months. The temperature is tropical, but the nights are cool and there are no siroccos. Going to the interior the temperature moderates with the ascent, but at Mandalay the dust and glare in the spring are oppressive. In the ruby district, 5,600 feet above sea-level, the summer heat is moderate (86° max.), and a sanitarium is here established for European troops.

Flora and Fauna.—The alluvial districts produce rice in many varieties (the staple of the country), maize, millet, wheat, tobacco, and sugar (mostly produced from a variety of the palm), cocoa, and in the hill country varieties of the tea plant. Cotton is widely cultivated, but chiefly on uplands. Indigo is indigenous, but is crudely made, and aniline dyes have destroyed its importance. The mango, orange, citron, yam, custard-apple, papaya, capsicum, and plantain are common. The forests are magnificent, and comprise all Indian varieties of trees. Teak abounds especially in Pegu, and stick-lac, with other lacquer gums, is sent down from the Shan and upper districts.

The forests are coverts for many animals. The elephant, and single and double horned rhinoceros haunt the jungles; the tiger, wild hog, and several species of deer are hunted; fish are abundant, and furnish a welcome dietary to the people; the abundant jungle fowl is domesticated; plumage birds enliven the forests; aquatic birds, as geese, ducks, adjutants, cormorants, waders, and sand-birds, are numerous. Domesticated animals are the ox, buffalo, horse, and a few elephants.

Minerals.—Burma is rich in mineral products, but the natural deposits are almost an unworked field. A binoxide of tin is common in the lower Tenasserim region, but the rich ore is crudely reduced. In the same region are coal and lead, antimony, and manganese. In Upper Burma placer gold is found; also silver, copper, tin, antimony, amber, bismuth, petroleum products, fine building-stones, and gems. Iron abounds to the N. of Pagan, the old capital; petroleum is an article of export; amber comes from the upper valley of the Kyen-duen. The gems of Burma are chiefly sapphire and ruby. The richest mineral districts are in Upper Burma toward the Chinese frontier, across which trade has passed for centuries. Jade comes from this border, and its production is farmed out. The sapphire district, some 70 miles N. E. from Mandalay, extends over an area of 100 sq. miles, and is worked from pits. The gems were a crown product, and, according to color, are sold as ruby, amethyst, topaz, and chrysoberyl.

People.—The inhabitants are chiefly Mongoloid. From their own name, Ba-ma as understood by Europeans, comes the name of the country. Generally they are well-formed, dark, active, with lank black hair and slight beards, like the Siamese. There are other tribes, as the Karens in the E., the Paloungs, the Kakhyens or Singphos, a predatory people on the N., and the Shans on the E., who change allegiance as suits their convenience. All are fond of arrack. Religiously the people in Lower Burma are divided in order of importance as Buddhists (the dominant faith), Mohammedans, Hindus, Christians, and about 4 per cent. diversified faiths. Their government was purely despotic, tinctured with a religious reverence for officials. The king's subordinates were provincial governors, equipped with arbitrary powers. They had no salaries, but lived by farming the revenues and by fees. Justice was lucrative to its dispensers. The administration was little better than Oriental extortion. Heredity counted for nothing. A kind of Chinese officialism fixed a man's precedence and authority with badges, costumes, buttons, and girdles, and this was carried to a great detail of color, form, and habit. The priests were mendicants, wore yellow garments; nuns were not bound by irrevocable vows. Theoretically all the people were slaves, and could not migrate without permission. Outcasts, lepers, executioners, pagoda slaves, and undertakers were treated with contempt and cruelty. Women were not secluded; their embraces might be sold for a time without dishonor, but prostitutes were infamous.

The people have a monosyllabic, flexible speech, used for secular purposes, written with circular letters of Indian and Buddhist origin, but Pāli is the sacred language. The literary form is almost wholly dramatic, and the plays are consonant with Occidental morals. Incident and scenic effects are merely suggested, but the production of a play spins out beyond any Greek trilogy. Monastic libraries are common; paper is of bamboo or palm-leaf production. Chronicles are of ancient composition, but unauthentic. Judson's *Dictionary* (1852) and Bastian's *Sprachvergleichende Studien* (1870) are the keys to the language. See also Col. Yule's *Narrative of a Mission to the Court of Ava* (1858).

Industrial Aspects.—Native taxes formerly repressed all industries, the rich paying an annual quit-rent and the poor suffering extortion. The houses are built upon piles in the inundated and most populous districts, and are of wood; brick is common in temples, and arches, pointed, flat, and circular, with domes, abound in public buildings, while carving, gilding, and fantastic ornamentation give them an appearance of barbaric gorgeousness. The loom lingers in families all over the country, and its products are silk fabrics and cotton goods. Porcelain, pottery, bells, lacquered ware, cutlery, personal weapons of steel, rice, and preserved fish are common products. The country exports much to China of the native products named, and receives artistic manufactures in return. In Lower Burma the principal products are rice, lumber, pottery, textile fabrics, salt, cotton, lacquered and gilt work, dyes, cutch, and gold and silver bowls. The British exports from Burma in 1890 were $17,701,325. There were then 1,092 miles of railway completed, Mandalay being connected with the coast thereby.

Weights and Measures.—Lead is used for small coins; money transactions are by weight; the coinage is in confusion. The ball and the dain are the purest silver coins.

(1) Weight: The seeds of a little black pea (*Abrus precatorius*) supply the unit, and weigh from 1 to 2 grains: 8 make a pae, 16 a mat, 64 a kyap, 100 kyaps a piessa or viss. The viss of Rangoon = 3·3333$\frac{1}{3}$ lb. av. = 1·511966 kilgm. Multiple, 150 viss = 1 eandy = 500 lb. av. = 226·7959 kilgm. Sub-multiples, $\frac{1}{100}$ viss = 1 tical; $\frac{1}{100}$ tieal = 1 moos.

(2) Length: The taim or cubit of Rangoon = 18 inches = 457·2 mm. Sub-multiple, $\frac{1}{18}$ taim = 1 paulgat = 1 English inch. Also, 22 paulgats = 1 saundaung, or royal cubit. For road-measure, 7 saundaungs = 1 dha or bambou; 1,000 bambous = 1 dain or taing = 2·4306 miles = 3·9115 km.

(3) Volume: Commodities of all kinds, liquid or dry, are sold by weight.

Government.—A chief commissioner, under the Viceroy of India, rules the province. Under him are eight deputies for as many districts, who are invested with police, judicial, and revenue powers. Beneath them are township officers, of like but

subordinate functions. The country is controlled by 20,000 troops, and a police officered by Indian and Burman leaders. Revenue is derived from the teak forests, a capitation tax, a land tax ranging from half a rupee (17 cents) an acre to 2½ rupees on rice lands, the industry that immensely surpasses all others. Revenue in 1890 nearly $16,000,000, and expenditures a little over $13,000,000.

History.—The early chronicles are not trustworthy. The dominant race probably came 2,000 years ago from Central Asia down the Irawadi valley. In the eleventh century the Bûddhists are known to have been established at Prome, a civilization was developed, and the cities of Pagan, Pegu, Sagain, Prome, and Ava were in an advanced architectural stage. The Shans and Talaings invaded the country, but did not destroy its monuments. European settlements began in the seventeenth century with French and English factories. In the middle of that century a native dynasty of peasant origin brought all Burma under one rule. When the British subdued Assam, friction arose on the Burman borders, and in 1824 Ava, with Arakan and Tenasserim, was ceded to Great Britain. In 1830, on pretext of harassed trade, Great Britain annexed Pegu. The final conquest came in 1885 in retaliation for King Thebaw's proposed alliances with China and his mulcts on a British trading company operating in Upper Burma. On Nov. 28 the Burmese laid down their arms at Ava; Mandalay capitulated, and Thebaw was carried captive to India. The next year all his dominions were annexed to the Queen's empire. See Forbes, *British Burma* (1876); Sir Arthur Phayre, *History of Burma* (1883); Wayland, *Life of Judson* (1853); Anderson, *Expedition to East Yunan viâ Bhamo* (1871); Scott ("Shway Yoe"), *The Burman, His Life and Notions* (1882), and *Burma as it was, is, and will be* (1886). W. W. H.

Bur'mann, Peter: philologist; b. in Utrecht, July 6, 1668; became Professor of History, Eloquence, and the Greek Language at Leyden in 1715; edited Horace, Ovid, Vergil, Quintilian, Lucan, and other classics, and wrote several works, among which is a treatise *On the Revenues of Rome* (De Vectigalibus Populi Romani, 1694). His writings were esteemed for their accurate erudition. D. in Leyden, Mar. 31, 1741.

Bur'meister, Karl Hermann Konrad: a German naturalist; b. in Stralsund, Jan. 15, 1807; educated at Greifswald and Halle; for a time Professor of Zoölogy at the University of Halle. In 1850 he resigned, and went to Brazil; returned to Europe; in 1856 again went to South America. In 1861 he was made director of the National Museum in Buenos Ayres, a position which he held until a severe accident compelled him to relinquish it, when he was pensioned by the Government. He published *Systematische Uebersichte der Thiere Brasiliens* (Halle, 1856); *Description physique de la République Argentine* (Paris, 1876); and *Annales del Muséo Público de Buenos Aires* (1864–74). D. in Buenos Ayres, May 2, 1892. F. A. Lucas.

Burmeister, Richard: See the Appendix.

Burmeister, Willy: See the Appendix.

Bur'naby, Frederick Gustavus: soldier and traveler; b. in Bedford, England, Mar. 3, 1842; author of *A Ride to Khiva* (3d ed. 1876); *On Horseback through Asia Minor* (7th ed. 1877); *A Ride Across the Channel* (1882), an account of a balloon trip. Fell in the battle of Abu Klea, in Nubia, Jan. 17, 1885.

Bur'nand, Francis Cowley: English humorist and journalist; b. Nov. 29, 1836; educated at Eton and at Trinity College, Cambridge, 1858; studied for the Church; became a Roman Catholic, and was called to the bar; since 1880 editor of *Punch*; author of numerous parodies, theatrical burlesques, and other facetiæ, the best known of which are his comedy *The Colonel*, a satire on the æsthetes; his travesty of Douglas Jerrold's *Black-eyed Susan*; *Happy Thoughts* (1868); *More Happy Thoughts* (1871). Henry A. Beers.

Burne-Jones, Edward: painter of figure subjects and designer of decorative work; b. in Birmingham, England, Aug. 28, 1833; pupil of Dante Gabriel Rossetti; belonged to the romantic school of English artists, and was noted more for his conceptions of his subjects and for his peculiar compositions in the treatment of them than for the possession of technical merits. He was elected an associate of the Royal Academy in 1885. At the Paris Exposition in 1878 his pictures, including the *Beguiling of Merlin* (1877), attracted much notice from continental critics, and at the exposition of 1889 he was awarded a first-class medal for the only picture he exhibited, *King Cophetua and the Beggar Maid* (1884). D. in London, June 17, 1898. W. A. C.

Burnes, Sir Alexander: traveler and Orientalist; b. at Montrose, Scotland, May 16, 1805. He entered the army of India in his youth, and by his knowledge of Oriental languages gained a rapid promotion. In 1832 he started from Lahore on an exploring expedition in Central Asia, and visited Balkh, Bokhara, Astrabad, Teheran, etc. Having returned to England in 1833, he published *Travels into Bokhara*. In 1838 he was sent on a mission to Cabul, where he passed some years as political resident. He was murdered there Nov. 2, 1842, by the Afghan insurgents.

Bur'net: the popular name of plants of the genus *Poterium*, belonging to the family *Rosaceæ*. The great burnet (*Poterium officinale*) is cultivated in Germany as a forage-plant, and yields a good crop on poor soils. A similar species grows wild in North America. The common burnet (*Poterium sanguisorba*) furnishes valuable pasturage for sheep on the English downs. It is sometimes seen in American gardens, and is used in salads.

Burnet: town; capital of Burnet co., Tex. (for location of county, see map of Texas, ref. 4–H); on Aust. and N. West. R. R.; 45 miles N. W. of Austin, and 10 miles E. of the Colorado river; has 6 churches, a high school, 2 gins, and a roller flouring-mill. Its interests are chiefly agricultural. Burnet was founded, about 1840, as Fort Croghan, but has been known as Burnet since 1852. Pop. (1880) 490; (1890) 1,454; (1900) 1,003. Editor of "Bulletin."

Burnet, Gilbert, F. R. S.: historian and prelate; b. in Edinburgh, Scotland, Sept. 18, 1643. He became Professor of Divinity in the University of Glasgow in 1669, resigned that chair in 1674, and removed to London. In 1679 he published the first volume of his *History of the Reformation in England* (3 vols., 1679–1714). He refused a bishopric which was offered to him by Charles II. He was a courageous and able asserter of civil liberty in the important crisis which preceded the revolution of 1688, and gained the favor of William III., who appointed him in 1689 Bishop of Salisbury. Among his works are a *Life of Sir Matthew Hale* (1682), and a *History of his Own Times* (2 vols., 1723–34), his most important work. See the biography by his son in the last-named work. D. in London, Mar. 7, 1715.

Burnett', Frances Eliza (*Hodgson*): novelist; b. in Manchester, England, Nov. 24, 1849; came to the U. S. at the close of the civil war, and lived in Knoxville, Tenn., until her marriage, in 1873, to Dr. L. M. Burnett, from whom she was divorced in 1898; married Stephen Townsend in 1900. Her *Little Lord Fauntleroy* (1886) achieved great popularity. Among her novels are *That Lass o' Lowrie's* (1877); *Haworth's* (1879); *Louisiana* (1880); *Through One Administration* (1883); *A Lady of Quality* (1896); *The De Willoughby Claim* (1899). A number of her stories have been successfully dramatized.

Burnett, James. See Monboddo.

Burnett, Peter H.: See the Appendix.

Burnett Prizes: founded by James Burnett, a philanthropist, born in Aberdeen, 1729; died there Nov. 9, 1784. He made a competence in stocking-weaving and salmon-fishing. By his will part of his estate was used for the benefit of the poor of Aberdeen and neighborhood; part was a fund to defray the expense of inoculation (later used for vaccination), and the remaining interest was to be allowed to accumulate for forty years or until £1,600 had accrued, and then to be paid in prizes of £1,200 and £400 respectively to the best and next best "treatises on the evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity, and this independent of written revelation and of the revelation of the Lord Jesus; and from the whole to point out the inference most necessary and most useful to mankind." The first award was made in 1815, when William Laurence Brown received the highest prize for his *Essay on the Existence of a Supreme Creator, possessed of Infinite Power, Wisdom, and Goodness* (2 vols., Aberdeen, 1816); and John Bird Sumner the second for *A Treatise on the Records of the Creation, and on the Moral Attributes of the Creator; with Particular Reference to the Jewish History, and to the Consistency of the Principle of Population with the Wisdom and Goodness of the Deity* (2 vols., London, 1816; 2d ed. 1818). The second and final award was in 1855, when Robert Anchor Thompson (*Christian Theism* 2 vols., London, 1855; n. e. 1863) and John

Tulloch (*Theism*, Edinburgh, 1855) were the prizemen respectively. Since 1883 the fund has been used to support a lectureship on natural theology in the University of Aberdeen, and no further prizes will be given.

Burnett's Disinfecting Fluid: a solution of considerable strength, containing, as its chief constituent, chloride of zinc and a comparatively small amount of iron, which is always diluted to the extent of about 1 to 5 gal. when used for disinfecting purposes. As a matter of fact it is not a true disinfectant, but only a deodorant and antiseptic, inhibiting the growth of disease germs, but not destroying them. For this reason it has been largely supplanted by chlorinated lime or corrosive sublimate for disinfecting purposes. It is sometimes used for the purpose of preserving timber, and this process is called burnettizing. Another name for Burnett's fluid is Crewe's disinfecting liquid.

Bur'ney, CHARLES, F. R. S., Mus. D.: composer; b. at Shrewsbury, England, Apr. 17, 1726; was a friend of Dr. Johnson and Edmund Burke; wrote, besides other works, a *General History of Music from the Earliest Ages* (4 vols., 1776–89), which is highly esteemed; a *Life of Händel*; one of *Metastasio*; composed *Alfred*, *Robin Hood*, and *Queen Mab* for Drury Lane theater. He was the father of Madame d'Arblay. D. in Chelsea Hospital, where he was organist, Apr. 12, 1814. His library was bought for $67,500 by the British Museum. See his *Life* by his daughter.

Burney, FRANCES: See D'ARBLAY, MADAME.

Burney, STANFORD GUTHRIE, D. D., LL. D.: minister in the Cumberland Presbyterian Church; b. in Robertson co., Tenn., Apr. 16, 1814; educated at Cumberland College, Princeton, Ky.; began preaching at the age of twenty. He was president of Union Female College, Oxford, Miss. (1852–62); Professor of English Literature and of Metaphysics in the University of Mississippi (1865–73); of Biblical Literature in Cumberland University (1877–80); and later Professor of Systematic Theology. He published *Baptismal Regeneration* (1881); *Atonement and Law Reviewed* (1887); *Soteriology* (1888); *Chart of Duty*; *Studies in Moral Science* (1890); *Studies in Psychology* (1890); *Studies in Theology* (1892). He has been active in movements for closer union with other Presbyterian churches.

Burnham, SHERBURNE W.: See the Appendix.

Burnham, WILLIAM H.: See the Appendix.

Burnham Industrial Farm: near Canaan Four Corners, Columbia co., N. Y.; on the borders of Lake Queechy; incorporated in 1887. The farm was a Shaker settlement which was purchased by Frederic G. Burnham, who gave it to be used as an institution for saving unruly boys. It is 580 acres in extent. Up to 1889 it was run on ordinary institutional lines. Not having been entirely successful it was then put in charge of Mr. W. M. F. Round, who had always been one of its trustees. Mr. Round conceived the idea of uniting the system of the Rauhe Haus in Germany and of that at Mettray, France. To accomplish this he organized the order of St. Christopher. This order is made up of consecrated young men of various religious denominations, who are in training for lives of institutional usefulness. Eight brothers are engaged in carrying on the work of the Burnham Industrial Farm, but after a period of three and a half years' training they may be sent by the director to take care of other institutions. Boys may be sent from all parts of the country to the farm in three ways—first, by renunciation of the boys by their parents; second, when committed by magistrate; third, by transfer from other institutions. They may be kept during their minority, but are ordinarily retained not more than two and a half years. They are taught simple trades, gardening, and farming. The farm has no endowment, but is entirely supported by voluntary subscriptions. The institution is planned to accommodate 1,200 boys, but a much smaller number are actually cared for.

Burning-bush: See SPINDLE-TREE FAMILY.

Burning-glasses and **Burning-mirrors**: glasses or mirrors so formed as to collect the sun's rays which fall on them into a point or focus, and thereby produce intense heat. The rays of light or heat may be concentrated either by refraction or reflection; in the former case they must pass through a transparent refracting substance, as glass formed into a proper shape; in the latter they fall on a concave polished surface of silvered glass or bright metal.

The method of exciting heat or producing fire by the concentration of the sun's rays was known from remote antiquity, as is proved by the very ancient although doubtful story that Archimedes burned by means of mirrors the Roman fleet in the harbor of Syracuse. The celebrated Buffon, with 168 mirrors, each about 6 inches square, set fire to planks of beech 150 feet distant, and this with the faint rays of the sun at Paris in the month of March.

In preparing a burning-glass the first thing to be considered is the figure necessary to collect all the rays into the smallest possible space. Descartes, in his *Optics*, showed that a disk of glass, convex on the one side and concave on the other, the convex side being a portion of an elliptic surface and the concave a portion of a sphere, would cause parallel rays falling on its convex side to converge in a single point. But as the practical difficulties of forming a glass accurately into this shape are insuperable, both sides are ground into portions of a sphere. In a lens the focal length depends on the curvature, or the radius of the sphere, and on the refractive power of the substance of which the lens is formed.

The proper form for a burning-mirror is the parabola, but as a parabolic curve is exceedingly difficult to obtain either upon metal or glass, opticians frequently rest content with a spherical curvature of long focus. Recently burning-mirrors have been constructed of glass upon the curved surface of which pure silver is precipitated by chemical means. By this plan the curved surface is produced upon glass, and thus becomes permanent, while the reflection is effected by the polished surface of the silver, which can be easily renewed from time to time. The focus of a burning-mirror is one-half of the radius of curvature.

Among those who have experimented in modern times upon the effects of burning glasses or mirrors are Baron Napier, the illustrious inventor of logarithms, Kircher, Dr. James Gregory, Sir Isaac Newton, and many others. The most powerful solid lens ever constructed was the work of Mr. Parker, an ingenious London artist. It was made of flint glass, was 3 feet in diameter, $3\frac{1}{4}$ inches thick at the center, its focal distance 6 ft. 8 in., the diameter of the burning focus 1 inch, and its weight 212 lb. The rays refracted by this lens were received on a second, the diameter of which in the frame was 13 inches, and its focal length 29 inches. The diameter of the focus of the combined lenses was half an inch; consequently, by the addition of the second lens, the burning power was increased 4 times. With this lens some of the most refractory substances were fused in a very short space of time: for example, 10 grains of common slate in 2 seconds; 10 grains of cast iron in 3 seconds; 10 grains of lava in 7 seconds; 10 grains of jasper in 25 seconds, etc. One account says "the most infusible metals were instantly melted and dissipated in vapor." This glass was afterward carried to China by one of the officers who accompanied Lord Macartney, and left at Peking. A remarkable lens, formed by bending or molding two plates of glass over a parabolic mold, and filling the cavity between with 90 qts. of spirits, was constructed by Rossini, of Gratz, in Styria. The diameter of the plates was 3 ft. 3 in., and they were united by a strong ring of metal. The whole was mounted on a heliostat. In its focus a diamond was instantly kindled and dissipated, and a piece of platinum 29 grains in weight was melted and thrown into violent ebullition. This lens now belongs to the French Government. In France, particularly, the practical application of burning-mirrors to the utilization of the sun's rays in driving heat-engines and in cookery has been extensively studied, with a view to the use of such devices in Northern Africa and other tropical regions. Revised by E. L. NICHOLS.

Burn'ley: a market-town of Lancashire, England; on the Brun; near its entrance into the North Calder; 20 miles N. of Manchester (see map of England, ref. 6–G). It is connected by railway with Blackburn, Liverpool, and other cities. It has manufactures of cotton and woolen fabrics, calico-printing works, brass and iron foundries, machine-shops, tanneries, and rope-walks. Its prosperity is partly derived from the collieries in the vicinity. Pop. (1891) 87,058; (1901) 97,044.

Burnouf, bür'noof', EUGÈNE: Indologist; b. at Paris, Apr. 8, 1801; one of the founders of the Société Asiatique; became its secretary in 1830; member of the Academy of Inscriptions in 1832; soon after Professor of Sanskrit at the Collège de France. His Sanskrit studies furnished him the key not only to the sacred language of Bûddhism, the Pali (*Essay on the Pali*, 1826), and to that of the Avesta (*Vedidad Sade*, 1829–43; *Commentary on the Yaçna*, 1833, etc.), but

led him also to the decipherment of the cuneiform inscriptions. His *Introduction to the History of Bûddhism in India* (1844) put the study of this great religion on a scientific basis. D. in Paris, May 28, 1852, his works, like his life, unfinished; but his masterful control of facts, coupled with the brilliancy of his imagination—in a word, his genius for discovery—and, above all, his self-forgetting love of truth, make him one of the heroes of "the heroic age of Oriental studies." See J. Mohl, *Vingt-sept ans d'histoire des études orientales*, i. 458–469. C. R. Lanman.

Burns, Anthony: a fugitive slave; b. in Virginia about 1830; d. in St. Catherines, Canada, July 27, 1862. Escaping from slavery, he was arrested under the fugitive slave law in Boston, May 25, 1854, an event which created an intense excitement, in which Theodore Parker, Phillips, Higginson, and other eminent citizens participated. A meeting was held in Faneuil Hall to protest against his rendition; the court-house was assaulted by a mob to rescue him; he was sent back South on a revenue cutter; afterward gained his liberty; studied at Oberlin; became a Baptist minister to a colored congregation in St. Catherines. The interest in the case grew out of the exhibition of the determination in the North to uphold the common law and State statutory safeguards of personal liberty against the fugitive slave law compromise, which transferred the trial of a Negro's freedom to the courts of the State where the claimant resided, and in slave States no such safeguards existed for a person of African descent.

Burns, Francis, D. D.: colored bishop of the Methodist Episcopal Church; b. in Albany, N. Y., Dec. 5, 1809; sent as missionary to Liberia, Africa, in 1834; taught in a school at Cape Palmas; joined the Liberia Conference in 1838; founded the Monrovia Academy in 1851; ordained bishop of his denomination in Liberia in 1858; and, after nearly five years of service, d. in Baltimore, Md., Apr. 18, 1863.

Burns, Sir George: baronet; one of the founders of the Cunard line of steamers; b. Dec. 10, 1795; entered into partnership with his brother James in Glasgow about 1818; co-operated with Samuel Cunard and others in founding the Cunard line of steamers in 1838, as the result of a general invitation from the British Government for tenders for the conveyance of American mails by steam-vessels; created a baronet in May, 1889. D. June 2, 1890, and was succeeded in the title and estate by his eldest son, Sir John Burns, of Castle Wemyss, Renfrewshire,

Burns, John: English labor organizer and leader; b. in Vauxhall, London, 1858, in very humble circumstances; attended school until he was ten, when he entered a candle-factory. He afterward apprenticed himself to an engineer at Millbank, and worked as foreman engineer for twelve months on the Niger in West Africa. On his return he made a six-months tour through Europe. During his youth he was an omnivorous reader, and is said to have imbibed his socialistic theories from a Frenchman who was employed in the same shop with him. He addressed audiences of workingmen for years, and was probably the most prominent labor agitator in Great Britain. In 1885 he was the socialist candidate for Parliament for the western division of Nottingham, but was defeated. He was prominent in the agitation of the unemployed in 1886. In 1887 he contested the right of public meeting in Trafalgar Square, and suffered six weeks' imprisonment for resisting the police. During the great dock strikes in London (Aug. 15, 1889–Sept. 14, 1889) he was one of the most influential leaders of the strikers, and was a member of the Mansion House committee of conciliation which brought about the settlement of the difficulties and the end of the strike. He was also prominent in the Scotch railway strike in 1891. Mr. Burns is a member of the London County Council, and was elected (July 6, 1892) a member of Parliament for Battersea. His sincerity and ability are unquestioned. C. H. Thurber.

Burns, Robert: the national poet of Scotland; b. near the town of Ayr, Jan. 25, 1759. His father was a yeoman farmer. Although his life seems to have been one long struggle with misfortune, Burns's father was at great pains to give his children a good education. When he was able he sent them to school; and not unfrequently when the day's work was ended he taught his children himself. Burns was early familiarized with those trials and hardships to which the poor are so often exposed, and to which he sometimes alludes with such power and pathos in his poetry. The poet had a robust frame and active body, as well as a strong intellect and acute sensibilities. He is said to have done at the age of fifteen the work of a man.

In the case of Burns, as in that of Sappho, it was love that taught him song. A little before he reached his sixteenth year he "first committed the sin of rhyme." A "bonnie, sweet sonsie lass" had been associated with him in the labors of the harvest-field. Her singing "made his heart-strings thrill like an Æolian harp," and first inspired him with the idea of writing songs. An irresistible attraction toward what he calls the "adorable half of the human species" was perhaps his most remarkable characteristic: and hence it was as an amatory poet that he was especially distinguished, though patriotism, friendship, conviviality, and the rural life of the Scotch peasantry are constant motives in his poetry. Unhappily, this remarkable susceptibility to the tender passion degenerated, under the influence of evil company, from its first purity, and led him into illicit amours, which were the cause of his principal misfortunes. In proportion as he cast off the restraints of morality, he seems to have lost his reverence for religion. With his other faults and vices, intemperance went hand in hand. But he had too much sense of right and too much feeling to be able to drown altogether the reproving voice of conscience.

He had formed in 1785 a *liaison* (which was, according to the usage of Scotland, virtually a marriage) with Jean Armour, a person somewhat above his own position in life. She bore him twins, and although he had previously given her a written acknowledgment of marriage her father was greatly incensed against the poet, so that he determined to leave Scotland and seek his fortune in the New World. But before quitting his native country forever, he resolved (1786) to publish his poems. The success of the experiment induced him to change his plans. He was encouraged to visit Edinburgh, where he made the acquaintance of many men at that time distinguished in literature, including Dugald Stewart and Dr. Blair, besides many others. It was during Burns's visit to the capital that Scott, then a very young man, had an opportunity of beholding and listening to the gifted stranger. He has left a very interesting account of Burns's appearance.

Among men of rank who interested themselves in the poet, Lord Glencairn was especially prominent. Burns always remembered his kindness with the most heartfelt gratitude, and afterward dedicated to his memory the beautiful and touching lines entitled the *Lament for James, Earl of Glencairn*. Soon after his visit to Edinburgh he published (1787) a new edition of his poems. In 1788 he openly declared his marriage with Jean Armour, and about this time was appointed an officer of the excise, with a salary of £50 a year; it was subsequently increased to £75. His intemperate habits, which had been aggravated by the excitement and irregularities of his recent life in Edinburgh, and his subsequent pecuniary distresses gradually gained a great ascendency over him, but rarely if ever to the extent of rendering him incapable of performing the duties of his office. He removed in 1791 to Dumfries, where he passed the remainder of his life. D. July 21, 1796. Nearly twenty years after his death a splendid mausoleum was erected to his memory in the churchyard at Dumfries, whither his remains were removed on June 5, 1815. See Lockhart's *Life of Burns* (1828); Currie's *Life of Burns*, prefixed to the *Correspondence* of the poet; A. Cunningham, *Life and Land of Robert Burns* (1840); Carlyle, *Miscellanies*; a *Life*, by Principal J. C. Shairp, in the English Men of Letters Series; and the complete collection of his works (1877–82, 7 vols.) by Douglas and Nichol.

Burns, Robert Ferrier, D. D.: Canadian clergyman; b. in Paisley, Scotland, Dec. 23, 1826; educated at Glasgow University and at New College, Edinburgh; removed to Canada in 1845, completing his course at Knox College, Toronto. Previous to his appointment as pastor of the Fort Massey Presbyterian church, Halifax, in 1875, he held pastorates in Kingston, St. Catherines, Chicago, and Montreal, in the order named. He was a delegate to the Pan-Presbyterian Council held at Philadelphia in 1880, and to that held at Belfast in 1884. Among his published works are *Maple Leaves for Grave of Lincoln* (St. Catherines, 1865); *Maine Law* (Halifax, 1875); *Modern Babylon* (1876); and *Confession and Absolution* (1883). His father, Robert Burns, D. D., was Professor of Church History and Apologetics in Knox College, and was the most distinguished minister of his time in Canada. Neil Macdonald.

Burns, William Wallace: general; b. in Coshocton, O., Sept. 3, 1825; graduated at West Point in 1847; became a brigadier-general of volunteers in 1861; major-general volunteers in 1862; and brevet brigadier-general U. S. army in 1865. He served in the Army of the Potomac until 1863. Reverting to his position as an officer in the subsistence department he served until Sept. 19, 1889, when he retired for age with the rank of colonel. D. suddenly at Beaufort, S. C., Apr. 19, 1892.

Burns and Scalds: in *medicine*, injuries caused by dry heat (burns), or by moist heat, such as that of hot water or steam (scalds). In both cases the results are quite similar. Various degrees of burns are described according to the depth to which the injury penetrates. Thus in cases of the first degree there may be merely redness and slight inflammation of the skin. In those of the second, third, or higher degrees the skin is destroyed, and the underlying tissue and muscles are implicated. Where large parts of the body exceeding half of the whole surface are involved death is almost inevitable. The immediate effect of the burn is great shock, followed by complete collapse if relief is not afforded. Occasionally disturbances of internal structures results from extensive burns, as, for instance, ulceration in the duodenum or Bright's disease.

The treatment consists in the application of soothing lotions or ointments, the use of anodynes for the pain, and stimulants in case of threatened collapse. A mixture of lime-water and sweet oil, which is generally known by the name of Carron-oil, is very useful. In slight burns the pain may be relieved by dusting baking-soda upon the surface.

W. P.

Burnside, Ambrose Everett: military officer and Governor; b. in Liberty, Ind., May 23, 1824; graduated at West Point 1847; as lieutenant of artillery served in war with Mexico 1847–48; on frontier duty in New Mexico 1849–50, engaged with Jacarillo Apaches (wounded); with Mexican boundary commission 1851–52; resigned Oct. 2, 1853; manufacturer at Bristol, R. I., 1853–58, of breech-loading rifles, which he had invented; cashier of land department Illinois Central R. R. Company 1858–59; treasurer Illinois Central R. R. Company 1860–61. In the civil war, as colonel of Rhode Island three-months volunteers, he served in Maj.-Gen. Patterson's operations about Cumberland, Md., and in the Manassas campaign, 1861, was engaged at Bull Run. Appointed brigadier-general U. S. volunteers, Aug. 6, 1861, and promoted to major-general May 18, 1862; he served in organizing the coast division and in command of department of North Carolina 1862; engaged at Roanoke island, Newbern, Camden, and Fort Macon; in command of Ninth Army-corps at Newport News and Fredericksburg 1862; in Maryland campaign engaged at South Mountain and Antietam, in command of left wing; in general charge of Harper's Ferry 1862; in command of Army of Potomac Nov. 7, 1862, to Jan. 28, 1863; defeated at Fredericksburg; in command of department of Ohio 1863; engaged against Morgan's raiders; captured Cumberland Gap; occupied East Tennessee after several actions and sustained a siege at Knoxville; in command of Ninth Corps in Richmond campaign 1864; engaged at Wilderness, Spottsylvania, North Anna, Tolopotomy, Bethesda Church, and Petersburg, including mine assault; resigned Apr. 15, 1865, from volunteer service. Civil engineer 1865–66; president of Cincinnati and Martinsville R. R. Company in 1865; of Rhode Island Locomotive Works in 1866, and of Indianapolis and Vincennes R. R. Company in 1867; Governor of the State of Rhode Island 1866–69. He was elected U. S. Senator from Rhode Island in 1875, and re-elected in 1880. D. in Bristol, R. I., Sept. 13, 1881.

Burnt Offerings: See Sacrifice.

Burnt Sienna: a pigment made by heating raw sienna to a high temperature. Raw sienna occurs in nature, and owes its color to the presence of compounds of iron. Both pigments are used in oil, water, and fresco.

Burnt Umber: a pigment made by heating raw umber to a high temperature. Umber was formerly obtained from Umbra, in the Papal States, whence its name. It is a compound of silica, iron, and manganese. Burnt umber is used in oil and water colors, and is highly valued.

Bur Oak, or **Burr Oak** (*Quercus macrocarpa*): a species of oak of medium size found in the U. S., principally E. of the Rocky Mountains. It is also called over-cup oak and mossy-cup oak. Its timber is valuable.

Burr, Aaron: scholar; father of the Vice-President; b. in Fairfield, Conn., Jan. 4, 1716; graduated at Yale in 1735; licensed to preach in 1736; settled over the Presbyterian church in Newark, N. J., in 1738; chosen president of the College of New Jersey, Princeton, N. J., in 1748; d. there Sept. 24, 1757. In 1752 he married Esther, daughter of the elder President Edwards. She died Apr. 7, 1758, in the twenty-seventh year of her age. They left two children—a daughter, who married Hon. Tapping Reeve, chief justice of the Supreme Court of Connecticut, and a son, Aaron, noticed below. Dr. Burr was a scholarly and eloquent man. He published a Latin grammar (1752) known as *The Newark Grammar*; a pamphlet on *The Supreme Divinity of our Lord Jesus Christ*, reprinted in 1791, and several discourses.

Burr, Aaron: politician and Vice-President of the U. S.; b. in Newark, N. J., Feb. 6, 1756; son of the preceding; graduated at Princeton in 1772; joined the provincial army at Cambridge, Mass., in 1775; served as a private soldier, and afterward as aid to Montgomery on the Quebec expedition; served on the staffs of Arnold, Washington (whom he disliked), and Putnam, becoming a lieutenant-colonel, and commanding a brigade at Monmouth. He resigned from the army by reason of ill-health in 1779; practiced law at Albany in 1782, and in New York city in 1783; became Attorney-General of New York in 1789; was a Republican U. S. Senator 1791–97. In 1800 he and Jefferson each had seventy-three electoral votes for the office of President of the U. S. The choice was thus left to Congress, which, on the thirty-sixth ballot, chose Jefferson for President and Burr for Vice-President. In 1804 he mortally wounded in a duel his rival Alexander Hamilton, and in consequence lost greatly in political and social influence, and soon after embarked in a wild attempt upon Mexico and, as was asserted, upon the southwestern territories of the U. S., thereby involving in ruin his friend Blennerhassett. He was in 1807 tried at Richmond, Va., on a charge of treason, but was acquitted. To escape his creditors he retired to Europe for a time, but returned to New York in 1812, and again practiced law. D. on Staten Island, Sept. 14, 1836. Burr was a man of much ability and very brilliant and popular talents, but his influence was destroyed by his unscrupulous political acts and his grossly immoral conduct in private life. See his *Life*, by M. L. Davis (1836–37); by James Parton (1857).

Burr, Enoch Fitch: mathematical and religious author; b. at Green's Farms, Fairfield, Conn., Oct. 21, 1818; graduated at Yale in 1839; spent several years in New Haven in scientific and other studies; was settled over the Congregational church in Lyme, Conn., in 1850. Since 1868 he has been a lecturer on the Evidences of Religion at Amherst College. He has published, among other works, *A Treatise on the Application of the Calculus to the Theory of Neptune* (New Haven, 1848); *Ecce Cœlum* (1867); *Pater Mundi* (1870); *Doctrine of Evolution* (1873); *A Song of the Sea* (an illustrated poem, 1873); *The Voyage* (1874); *Dio the Athenian* (1881); *Celestial Empires* (1885); *Universal Beliefs* (1887); *Long Ago* (1888); *Practical Relations* (1889); *Aleph, the Chaldean* (1891).

Burr, George Lincoln, A. B.: professor of history: b. at Oramel, N. Y., Jan. 30, 1857; educated at Cortland Academy, Cornell University, universities of Leipzig and Zurich, and the Sorbonne and the École des Chartes, Paris; instructor in History, Cornell University, 1881–84; engaged in historical study and research, mainly abroad, 1884–88; librarian of the President White Library, Cornell University, since 1878; Professor of Ancient and Mediæval History, Cornell University, 1892; author of *The Literature of Witchcraft* (New York, 1890); *The Fate of Dietrich Flade* (New York, 1891); *Charlemagne* (Heroes of History Series); and various magazine articles and reviews.

Burr, Jonathan Kelsey, D. D.: minister of the M. E. Church; b. at Middletown, Conn., Sept. 21, 1825; educated at Wesleyan University; filled some of the most important pulpits in the Newark and New Jersey conferences; author of *Commentary on the Book of Job*; and articles on *Incarnation* and *Krishna* in *McClintock and Strong's Biblical Cyclopædia*; member of the American Committee of Revision of the New Testament. D. at Trenton, N. J., Apr. 24, 1882.

Burr, William Hubert: civil engineer; b. in Watertown, Conn., July 14, 1851; graduated in 1872 at Rensselaer Polytechnic Institute, Troy, N. Y.; was Professor of Ra-

tional and Technical Mechanics at Rensselaer Polytechnic Institute 1876–84; engineer of construction and general manager of the Phœnix Bridge Company 1884–91; vice-president of Sooysmith & Co., contracting engineers, 1891–92. In Jan., 1893, he was appointed Professor of Civil Engineering in Columbia College, New York city. He is the author of *Stresses in Bridge and Roof Trusses, Arched Ribs and Suspension Bridges* (New York, 1879); *The Theory of the Masonry Arch* (1881); and *The Elasticity and Resistance of the Materials of Engineering* (1883).

Bur'rage, Henry Sweetser, D. D. (Brown Univ., 1883): Baptist minister and author; b. at Fitchburg, Mass., Jan. 7, 1837; graduated at Brown University 1861, at Newton Theological Institution 1867; studied at the University of Halle 1868–69; pastor of a church in Waterville, Me., 1870–73; editor of *Zion's Advocate*, Portland, Me., since 1873. Besides a large number of review articles and historical papers, Dr. Burrage published the following works: *The Act of Baptism in the History of the Christian Church* (Philadelphia, 1879); *History of the Anabaptists in Switzerland* (Philadelphia, 1883); *Baptist Hymn-writers and their Hymns* (Portland, 1888). In addition, Dr. Burrage has edited the following: *Brown University in the Civil War* (Providence, 1868); Rosier's *Relation of Waymouth's Voyage to the Coast of Maine, 1605, Gorges's Society* (Portland, 1887).

Burrampooter: See Brahmapûtra.

Burrard Inlet: narrow inlet in the southwest corner of British Columbia; 9 miles long; forms one of the best harbors on the Pacific coast. On its south shore is Vancouver, the western terminus of the Canadian Pacific R. R.

Burriana, boor-ri-aa'nă: a town of Spain; province of Castellon de la Plana; on the Rio Seco; near the Mediterranean (see map of Spain, ref. 16–I). It exports wine, oil, and fruit. Pop. 10,000.

Bur'rill, Thomas Jonathan, Ph. D.: botanist; b. at Pittsfield, Mass., Apr. 25, 1839; Professor of Botany in University of Illinois; published many reports and papers, principally on fungi. The more important are: *The Bacteria* (1882); *Parasitic Fungi of Illinois* (1885–87).

Charles E. Bessey.

Bur'ritt, Elihu: reformer and linguist; called The Learned Blacksmith; b. in New Britain, Conn., Dec. 8, 1811. He worked for many years at the trade of a blacksmith, and became a self-taught master of many ancient and modern languages. As a public lecturer he advocated temperance and peace in the U. S. and in England. Among his works are *Sparks from the Anvil* (London, 1848); *Thoughts on Things at Home and Abroad* (Boston, 1854); *Walk from John o'Groat's to Land's End* (London, 1864); *Walks in the Black Country* (1868); *Chips from Many Blocks* (1878). D. in New Britain, Conn., Mar. 7, 1879. See his *Life*, by Charles Northend (New York, 1879).

Burr Oak: See Bur Oak.

Bur'roughs, George: the only clerical victim of the Salem witchcraft delusion; b. about 1650; graduated at Harvard College in 1670; was a preacher in Falmouth (now Portland), Me., in 1676, and in Salem, Mass., 1680. In 1683 he went back to Falmouth, where he remained until the Indians sacked the town in 1690; returning to Salem, he was accused in 1692 of witchcraft, placed on trial, and, owing to the infatuation then prevailing, was declared guilty of exercising diabolical powers, and executed Aug. 19, 1692. At the scene of execution he declared his innocence, his appeal moving the spectators to tears; and though he repeated the Lord's Prayer, which no witch was supposed to be able to do without mistake, he was doomed to suffer.

Burroughs, John: essayist; b. in Roxbury, N. Y., Apr. 3, 1837. From 1863 to 1872 he was in the Treasury Department at Washington, and then a national bank examiner. Since 1873 he has resided at West Park on the Hudson, and has published many volumes of out-door papers, such as *Winter Sunshine* (1875); *Birds and Poets* (1877); *Locusts and Wild Honey* (1879); *Pepacton* (1881); *Fresh Fields* (1884); *Signs and Seasons* (1886). His sympathy with animal life is expressed in a charming style.

Henry A. Beers.

Burrowing Owl, called also **Coquimbo Owl**: a remarkable bird (*Speotyto cunicularia*), which, "disdaining all the traditions of its family," hunts for its prey (consisting chiefly of beetles and other insects) in broad daylight, facing the glare of the noonday sun without any inconvenience. It is a small, lively bird, and is found in many parts of America, being especially abundant W. of the Mississippi, and inhab-

Burrowing owls.

iting the same localities as the marmot (or prairie dog), whose dwelling it often shares, the rattlesnake sometimes also occupying the same abandoned burrows. Although the burrowing owl prefers to dwell in the holes already excavated by the prairie dog, it will, if obliged to do so, dig burrows for itself; but these are not so deep or so neatly made.

Revised by D. S. Jordan.

Bur'rows, William: a naval officer; b. near Philadelphia, Pa., Oct. 6, 1785. He entered the navy at the age of fourteen; served on the Barbary coast; on the outbreak of war with Great Britain (1812), while on his way to the U. S., he was taken prisoner. He reached home in June, 1813, and immediately resumed his duty. He commanded the brig Enterprise in an engagement with the British brig Boxer off Portland, Me., Sept. 5, 1813, during which he was mortally wounded. He lived, however, long enough to receive the surrender of the British vessel. His remains were interred in Portland by the side of Blythe (*q. v.*), the commander of the Boxer, who was also killed in the same action.

Burrstone, or **Buhrstone**: a cellular siliceous rock of fine texture, used for millstones. The siliceous material does not consist of grains cemented together as in sandstones, but appears to have been deposited from solution, either chemically or through the agency of minute organisms. The cavities giving the cellular structure are molds of small shells, shell fragments, or seeds which were dissolved out after the formation of the rock. Burrstone has been obtained from Eocene formations of France, Belgium, North Carolina, and Alabama. Its value for the grinding of grain depends on its open texture, which prevents the surface from becoming smooth by wear. The best grades are usually found only in small pieces, and a number of these are combined to make a millstone. They are fitted together, set in a matrix of plaster of Paris or other cement, and the whole bound with an iron hoop. Since the introduction of the roller process in flouring-mills the use of burrstone has diminished. The American quarries are not now worked, and the value of imported stones fell from a maximum of $125,000 in 1880 to about $18,000 in 1894. Certain standstones quarried in New York, Pennsylvania, Virginia, etc., are commercially known as burrstones, and these are still used for the grinding of the coarser grains.

Bursian, boor'si-an, Conrad: archæologist and classical philologist; b. in Mützschen, Saxony, Nov. 14, 1830; took his degree in Leipzig in 1852. After traveling in Greece and Italy for a number of years, he occupied professorships in Leipzig, Tübingen, Zurich, Jena, and finally in Munich, where he died Sept. 21, 1883. Among the most valuable of his numerous publications may be mentioned *Seneca Rhetor* (Leipzig, 1857); *Geography of Greece* (2 vols., 1867–72); *History of Classical Philology in Germany* (1883). He is also the author of excellent reports on the history of philology in the *Jahresberichte über die Fortschritte der classischen Alterthumswissenschaft*, of which he was the founder and editor. For an account of his life and a complete list of his writings, see *Biograph. Jahrbuch*, vi. (1883), p. 1–11.

Alfred Gudeman.

Burs'lem: a market-town of Staffordshire, England; 2¼ miles N. W. of Newcastle-under-Lyne; on an eminence near

the Trent Canal (see map of England, ref. 8–G). The occupation of the inhabitants is earthenware manufacture, and it is the principal place in the district called the Potteries. Pop. (1891) 30,862.

Burt, Armistead: b. in Edgefield co., S. C.; received a liberal education; admitted to the bar in 1823; settled at Abbeville, where he practiced law until his death. He was member of Congress 1843–53; during part of the Thirtieth Congress acted as Speaker to the House of Representatives. He was an ardent secessionist, and a member of the State Legislature in 1865 which enacted "the Black Code." In 1876 he took an active part in the revolution which made Hampton Governor. Mr. Burt was one of the ablest advocates in the State. D. Oct. 30, 1883.

Burt, William A.: b. in Worcester, Mass., June 13, 1792; became a surveyor of Erie co., N. Y.; in 1824 removed to Michigan; surveyed Northern Michigan (1840–47), introducing important improvements in surveying. At the World's Fair in London, 1851, he obtained a medal for his solar compass. He was for a time judge in one of the Michigan State courts, and one of the originators of the canal at Sault Ste. Marie. D. Aug. 18, 1858.

Bur'ton, Asa, D. D.: b. in Stonington, Conn., Aug. 25, 1752; graduated at Dartmouth College in 1777; Jan. 19, 1779, was settled over the Congregational church in Thetford, Vt., 1779, where he died May 1, 1836. He was the champion of the so-called "Taste scheme," in opposition to the "Exercise scheme" of Dr. Emmons, and conducted the controversy with great ability. Besides occasional sermons, he published at Portland, Me., in 1824, a volume of *Essays on Some of the First Principles of Metaphysics, Ethics, and Theology*. See his memoir by Thomas Adams.

Burton, Sir Frederick William, LL. D., R. H. A., F. S. A.: artist; b. in Ireland, 1816; educated in Dublin; from 1851 till 1858 was in Munich and Nuremberg. He exhibited often in London at the Royal Academy and at the Dudley Gallery. From 1874 he was director of the National Gallery. D. Mar. 16, 1900.

Burton, John Hill, LL. D., F. R. S. E.: historian and advocate; b. in Aberdeen, Scotland, Aug. 22, 1809; published, besides antiquarian books on Scotch law and history, *The Life and Correspondence of David Hume* (2 vols., 1846); *Political and Social Economy* (1849); and *The History of Scotland from Agricola's Invasion to the Revolution of 1688* (1867), which is highly esteemed; a *History of Queen Anne's Reign* (1881); and *The Book Hunter* (2d ed. 1882). D. near Edinburgh, Aug. 10, 1881.

Burton, Nathaniel Judson, D. D.: Congregationalist; b. at Trumbull, Conn., Dec. 17, 1824; graduated at Wesleyan University, Middletown, Conn., 1850, and at the Yale Divinity School, New Haven, Conn., 1853; pastor at Fair Haven, Conn., 1853–57; at the Fourth Congregational church, Hartford, Conn., 1857–70; the Park church, Hartford, Conn., from 1870 until his death there Oct. 13, 1887. Since his death a volume of his Yale lectures on preaching has been published. George P. Fisher.

Burton, Capt. Sir Richard Francis: traveler and Orientalist; b. in Hertfordshire, England, of Scottish parentage, Mar. 19, 1821. Having served many years in the East Indian army, he published in 1851 *Sindh, and the Races that Inhabit the Valley of the Indus*. Disguised as a Mussulman he performed a perilous exploration of Arabia in 1853, and published a *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (3 vols., 1856). He served in British consulates from 1861 until his death, chiefly in the countries of which he wrote. He also undertook extensive explorations in Central Africa, along the Congo, in the highlands of Brazil, etc., and published *The Lake Regions of Central Africa* (1860); *The Highlands of Brazil* (2 vols., 1869); *Zanzibar* (2 vols., 1872); *Two Trips to Gorilla Land and the Cataracts of the Congo* (1875); *The Gold Mines of Midian* (1878); *The Gold Coast* (1882). Capt. Burton's works, which number nearly fifty volumes, include, besides travels and grammars of several East Indian dialects, versions of the poems of Camoëns, and an important translation of the *Arabian Nights* (1885–88, 16 vols). D. in Trieste, Oct. 20, 1890. See his *Early Private and Public Life*, by F. Hitchman (2 vols., London, 1887).

Burton, Robert: clergyman; b. at Lindley, in Leicestershire, England, Feb. 8, 1576; educated at Brazenose College, Oxford. He became vicar of St. Thomas's, in Oxford, 1616; after 1630 rector of Segrave, keeping both benefices until his death. He was author of a quaint and popular work entitled *The Anatomy of Melancholy; what it is, with all the Kinds, Causes, Symptoms, Prognostics, and several Cures of it: Philosophically, Medicinally, Historically Opened and Cut up, by Democritus Junior* (1621). It is an amusing medley of quotations and reflections made by a man of rare genius and learning. D. in Oxford, Jan. 25, 1640. There are many editions of the *Anatomy of Melancholy*, the sixth, which contains changes by the author, was published shortly after his death. There is a more modern edition, in 3 vols., in which the quotations are translated.

Burton, William Evans: comedian and writer; b. in London, Sept. 24, 1804. He acted with distinguished success both in Great Britain and in the U. S. While in the former country he wrote a drama, *Ellen Wareham*, which for a time enjoyed a great popularity. He compiled the *Cyclopædia of Wit and Humor*. He was also very successful as a manager. He built the National theater in Philadelphia, and in New York purchased Palmo's opera-house, and afterward the Metropolitan theater on Broadway. D. in New York, Feb. 10, 1860.

Burton-on-Trent: a town of England; in Staffordshire; on the river Trent; 11 miles by rail S. W. of Derby (see map of England, ref. 9–H). The Trent is here crossed by a stone bridge of 29 arches, which in 1864 replaced one of 36 arches, and 1,545 feet long, built before the Norman conquest. Burton has large breweries of celebrated ale; also iron-works and manufactures of cotton goods. It is on the Grand Trunk Canal. Pop. (1891) 46,047; (1901) 50,386.

Buru, **Bouro**, or **Booro**: an island of the Malay Archipelago; about 60 miles W. N. W. of Amboyna; between lat. 3° and 4° S., and between lon. 126° and 127° E. Area, estimated at 3,284 sq. miles. The surface is mountainous, but the soil is fertile. It contains Mt. Dome, which is said to be 10,400 feet high. Cajeli Bay, on the north side, affords good anchorage. Pop. about 20,000, mostly Malays and Alfuros.

Burugird', or **Booroogird**: a town of Persia; province of Irak-Ajemee; in a fertile valley; about 184 miles N. W. of Ispahan and 74 miles S. S. E. of Hamadan. It has a castle and several mosques. It has an extensive trade in cotton goods, of which it is said to export over $200,000 worth annually. Pop. about 20,000.

Bury, ber'ri: a manufacturing town of Lancashire, England; on the river Irwell; 10 miles by rail N. W. of Manchester (see map of England, ref. 7–G). It is on a railway which connects it with Bolton and Liverpool. It contains more than twenty churches and Dissenting chapels, several public libraries and literary institutions. Here are important manufactures of cotton and woolen goods, machinery, and paper, also calico-printing works and dye-works. Mines of coal and quarries of good freestone have been opened in the vicinity. Bury returns one member to Parliament. The eminent statesman Sir Robert Peel was born near here. Pop. (1891) 57,206; (1901) 58,028.

Burying-beetles: certain beetles of the order *Coleoptera* and family *Sylphidæ*; famous for their habits of interring the bodies of dead animals. When the carcass of a mouse or other small animal is found, several of them collect around it, and by digging the earth from beneath gradually sink it several inches below the surface. In it the female deposits her eggs, and when the larvæ are hatched they find themselves in the midst of suitable food.

Bury St. Edmunds, or **St. Edmundsbury**: an ancient borough of England; county of Suffolk; finely situated on the river Larke; 26 miles by rail N. W. of Ipswich and 95 miles by rail N. E. of London (see map of England, ref. 10–K). It is well built and remarkably clean. It has a botanic garden, a guildhall, a fine Gothic church (St. Mary's), a celebrated grammar school founded in 1550, and some remains of a large Benedictine abbey (505 feet by 212), which was founded by Canute, and became the richest (except one) in England. Here is an old belfry or quadrangular tower about 85 feet high, which is one of the finest remains of Saxon architecture extant in Britain. Parliaments were held here in 1272, 1296, and 1446. Bury has a large trade in wool, butter, grain, and cheese. It returns one member to Parliament. Sir Nicholas Bacon was born here. Pop. (1891) 16,630.

Bus'becq, or **Busbecq**, Augier Ghislen, de (Lat. *Busbequius*): Flemish scholar and traveler; b. at Commines in 1522. He was employed on several important diplomatic missions, and was sent as ambassador from the Emperor

Ferdinand to Solyman II. of Turkey. He wrote a valuable account of this embassy, entitled *Legationis Turcicæ Epistolæ Quatuor* (1589). D. near Rouen, Oct. 28, 1592. See Forster and Daniel, *Life and Letters of Ogier Ghiselin de Busbecq* (London, 1880).

Busby, bŭz'bi, Dr. Richard: a famous schoolmaster; b. at Lutton, Northamptonshire, England, Sept. 22, 1606. He was head master of Westminster School for about fifty-six years (1640–95); was a very successful teacher and a strict disciplinarian. He is said to have educated a larger number of eminent men than any other teacher who ever lived. D. Apr. 6, 1695.

Büsch'ing, Anton Friedrich: geographer; b. in Schaumburg-Lippe, Germany, Sept. 27, 1724. He became in 1761 minister of a Protestant congregation in St. Petersburg; in 1766 removed to Berlin, where he was employed as director of a gymnasium; published a *Description of the Earth* (1754), which was the most complete work on geography that had then appeared; also a *Magazine of History and Geography* (25 vols., 1767–93). D. in Berlin, May 22, 1793.

Busen'to (in Gr. Πυξοῦς; Lat. *Buxentum*): a river of Italy; in the province of Salerno; empties into the Gulf of Busento at the city of Policastro. Upon the death of Alaric, the Visigoth king, his followers turned the course of the river, and after having buried him again led the river into its old course, thus covering all trace of Alaric's grave from the eyes of his enemies.

Bush, George: biblical scholar; b. in Norwich, Vt., June 12, 1796; graduated at Dartmouth College in 1818; studied at Princeton Theological Seminary 1820–22, in the same class with Albert Barnes; from 1824 to 1829 was pastor of a Presbyterian church in Indianapolis, Ind. He became in 1831 Professor of Hebrew and Oriental Literature in the University of New York; was converted to the doctrines of Swedenborg in 1847; left his professorship and was pastor of a New Church Society in New York 1848–52; stated supply of one in Brooklyn, N. Y., 1854–59. Among his works are a *Life of Mohammed* (New York, 1832); a *Hebrew Grammar* (1835); and *Bible Commentaries* (8 vols., 1840, *et seq.*). D. in Rochester, N. Y., Sept. 19, 1859. See his memoir by W. M. Fernald (Boston, 1860).

Bush-buck: See Bosch-bok.

Bushel (in Fr. *boisseau*): an English measure of capacity, containing 8 gal. or 4 pecks. Each gallon holds 10 lb. avoirdupois of distilled water, and measures 277·274 cubic inches; consequently the imperial bushel contains 80 lb. of distilled water, and is equal to 2,218·192 cubic inches. The old Winchester bushel contains 2,150·42 cubic inches. The State of New York, by statute of 1829, adopted the imperial bushel, but in the revised statutes of 1851 this was abolished and the Winchester bushel substituted. By law in some parts of the U. S., and in commercial usage, a bushel of grain and of other staple commodities is reckoned in pounds avoirdupois; a bushel of wheat has 52 lb. weight. See Gallon.

Bushire, or **Aboo-shehr**: a seaport of Persia; on the Persian Gulf; about 120 miles W. S. W. of Sheeraz; lat. 29° N., lon. 50° 50′ E. It is at the northern extremity of a sandy peninsula, and is the principal commercial emporium on the coast of Persia. The anchorage, which is the best on the coast, consists of an outer harbor, exposed to the N. W. winds, and a safe inner harbor. It has a large trade with British India, from which it imports rice, indigo, sugar, and English cotton goods. The chief articles of export are raw silk, shawls, horses, carpets, silk goods, grain, Sheeraz wine, pearls, dried fruits, etc. Pop. 27,000.

Bushmen, or **Bosjesmans**, bosh'ez-manz: a name given to some roaming tribes of savages who live in Southern Africa, along the Orange river. They are similar to the Hottentots; are very diminutive in stature, and of a dark-brown complexion. They build no houses and have no tents. They are malicious and intractable, and live by hunting and robbery.

Bush'nell: a city; McDonough co., Ill. (for location of county, see map of Illinois, ref. 5–C); on Chic., Bur. and Quincy and Tol., Peoria and West. R. Rs.; 70 miles N. of Quincy and 192 miles S. W. of Chicago. There are here good public schools, a normal college, manufactories of pumps, small hardware, and fine brick. The city has waterworks and electric lights. The city is situated in the midst of a high, rich, prairie agricultural district, and has ample supplies of timber and coal. Pop. (1880) 2,316; (1890) 2,314; (1900) 2,490. Publisher of "Record."

Bushnell, Horace, D. D., LL. D.: Congregational minister; b. in Litchfield, Conn., Apr. 14, 1802; graduated at Yale College in 1827; was tutor from 1829–31. Having previously studied law, he turned to theology, and was settled over the North church in Hartford, Conn., from 1833–59, when the failure of his health compelled him to resign his pastorate, though he was still able to do literary work and to preach occasionally. He was distinguished for the originality and boldness of his thinking, and for the brilliancy and vigor of his style. Among his published works are a Phi Beta Kappa oration in 1837 on *The Principles of National Greatness*; *Christian Nurture* (Hartford, Conn., 1847; n. e. New York, 1860); *God in Christ* (Hartford, Conn., 1849); *Nature and the Supernatural* (New York, 1858); *The Vicarious Sacrifice* (1865; revised in 1873); *Forgiveness and Law* (1874). He was also the author of numerous discourses and essays on theological and literary themes, all of which have the stamp of genius. His select works were published in New York in eight volumes (1876–77), and in 1881 three additional volumes of *Miscellanies* from his pen were issued. He exerted a stimulating and widely extended influence in the field of religious thought. He was one of the most attractive preachers of his day. With a vivid imagination and talents for speculation, he combined singular practical good-sense in every-day affairs. See his memoir by his daughter (New York, 1880). D. in Hartford, Conn., Feb. 17, 1876.

Revised by George P. Fisher.

Bushwhackers (in the language of the U. S. civil war) were those men who rarely or never wore a uniform, and claimed to be peaceful farmers or herdsmen when in presence of a superior hostile force, but had firearms concealed at a convenient distance, and did not scruple to use them on any opportunity to pick off from an ambush a soldier while he was moving in fancied security. Bushwhackers were especially murderous in Missouri, and were often treated, when they were captured, with unrelenting severity.

Business Colleges: schools in which young men and women are trained for business careers. Commercial teaching was first attempted in the U. S. in private schools established for the purpose. These have grown from scattered schools of little repute, for instruction in bookkeeping, writing, and arithmetic, to well-organized institutions, with courses adapted to training their pupils for every department of business activity. The time of study necessary for graduation in the business colleges of the U. S. is from four to twenty-five months in day courses and from four to thirty-six months in evening courses. The demand for stenographers and typewriters has much increased the attendance on the business colleges. Most of the colleges give the student practical knowledge of how business is transacted in the large cities in banking, insurance, real estate, and commercial houses, by means of the college bank, college jobbing-house, etc. The student is required to act as cashier, paying teller, receiving teller, shipping clerk, salesman, and bookkeeper. He buys, sells, makes deposits, draws checks, and sustains in general the same relation to the college bank and jobbing-house that the merchant has in the outside world. Commercial law, commercial calculations, and frequently the tariff laws of different nations, also form a part of the course. According to the annual report of the U. S. commissioner of education for the school year 1898–99, there were 320 business colleges, which had 1,781 instructors, 70,186 students (of whom 56,109 attended day schools and 14,077 attended evening schools), and 16,204 graduates of the year. The importance of commercial training has become so generally recognized that business courses are now provided in the regular systems of public education in many countries. The addition of such a course to the curricula of the higher public primary schools has been indorsed at several international educational congresses, notably at Paris in 1889. In 1898–99 there were 61,332 students in the commercial departments of city, normal, and secondary schools and colleges in the U. S. C. H. Thurber.

Busi'ris (in Gr. Βούσιρις): in Greek mythology, a fabulous personage; supposed to have been a son of Neptune, and a King of Egypt, who sacrificed all the foreigners entering his dominions, and was killed by Hercules.

Busken-Huet, Conrad: See Huet, Conrad Busken.

Buskin: a covering for the leg or for the ankle and foot; a shoe reaching up to the middle of the calf and tightly laced. The word buskin is used by English writers as a translation of Latin *cothurnus*, which was a high shoe worn by ancient tragic actors, and had thick cork soles. The term is also used to denote the tragic drama or tragic style, having been used in contradistinction to *soccus*, a sock or flat-soled shoe worn by comedians.

Bussang (also **Boossa**): a town of Central Africa; in the Sudan; on an island in the Niger; lat. 10° 14′ N., lon. 6° 11′ E. It is inclosed by a wall, and is within the limits of the British Niger protectorate. Pop. estimated at 12,000. Mungo Park died here.

Bus'sey, Benjamin: b. in Canton, Mass., Mar. 1, 1757; served in the Revolutionary army at Burgoyne's capture. He was a silversmith of Dedham, Mass., and afterward a very successful merchant of Boston. D. in Roxbury, Mass., Jan. 13, 1842, leaving $350,000 to Harvard University, half to found the Bussey School of Agriculture, and half to sustain the Law and Divinity Schools.

Busson, büs'sōṅ', Charles: landscape-painter; b. at Montoire, Loir-et-Cher, France, July 15, 1822; pupil of Rémond and of Français; first-class medal, Paris Exposition, 1878; officer of the Legion of Honor 1887. His work belongs to the style of the school founded on Poussin, and has little in common with modern landscape-painting as interpreted by the masters of the "Fontainebleau group" and their followers. It is not without dignity, and is sincere and more notable for composition than for actual truth to nature. William A. Coffin.

Bus'su Palm: the *Manicaria saccifera*, of the family *Palmaceæ*; a tree 15 to 20 feet high, with large, rigid, sub-erect leaves, which are at first entire. It is a native of the lower Amazon region. The large leaves are used by the natives of the region in building their huts, while the spathes are easily transformed into receptacles for containing food or other articles. The fruits have no economic value. This palm is related to the toddy-palm (*Caryota*), piassabe-palm (Attalea, *q. v.*), and Cocoanut (*q. v.*), with which it is associated in the sub-family *Ceroxylinæ*. It has long been grown in conservatories. See Palm Family. C. E. B.

Bust (in Ital. *busto*; Fr. *buste*): a sculptured representation of the head and upper part of the human body. Those made by the Greek sculptors are generally worked in the upper part of an upright block of stone or marble, usually of the height of a person of proportionate stature. The busts of later times are sometimes the complete representation of the head and body down to the line where it is cut off evenly; but more often they consist of the head and shoulders only, raised upon a somewhat ornamental base or foot. Portrait busts were extremely common under the Roman empire, and again in the fifteenth and sixteenth centuries. Russell Sturgis.

Bustamente, boos-ta-men'te, Anastasio: Mexican revolutionist and statesman; b. at Tiquilpan, province, now state, of Michoacan, July 27, 1780. He entered the Spanish army as a subaltern officer in 1808, and in the first struggles fought against the revolutionists; but in 1821 he joined Iturbide, commanded a division in the march on Mexico, and was a member of the provisional junta before Iturbide was declared emperor. With the fall of that chief (1822) he was sent for a time into retirement; but in 1829 he was elected vice-president in the Guerrero administration, and commanded the army. After a few months he revolted against Guerrero, heading the Centralist party, which aimed to overturn the federal form of government. The success of this movement made Bustamente acting president of Mexico in 1830. In 1832 Santa Anna headed a revolt against him; in the war which followed Bustamente personally led his troops in several actions, but was finally beaten and forced to resign; he was imprisoned, and in 1833 banished. The capture of Santa Anna in the Texas war (1836) brought the Centralists again into power; they called Bustamente back, and in 1837 he was elected president of Mexico. During his administration there was a brief war with France (1838), and disorders which broke out in 1840 finally forced Bustamente to give up the presidency to Santa Anna (1842). He traveled for some time, but returned to take part in the war with the U. S., and served with the army until 1848. D. at San Miguel Allende, Feb. 6, 1853.
Herbert H. Smith.

Bustamènte, Carlos Maria, de: Mexican politician and historian; b. in Mexico city in 1774. He studied law, became an advocate in 1801, and was editor of the *Diario de Méjico* from 1805. Taking part in the earlier revolutionary movements, he commanded a regiment under Morelos (1812), was captured and imprisoned at Vera Cruz; released by Santa Anna, he marched with him to the capital (1821). From this time he took a prominent part in political life, being member of congress, holding various offices, and writing so boldly that he was several times imprisoned. In the intervals he published various historical works on the war of independence and the subsequent period. As he was an eyewitness, and a fluent and careful writer, his works are of great value. Among them are *Cuadro historico de la Revolución de la América Méjicana* (1823–32, 6 vols.); *Historia del emperador Agustin de Iturbide*; and *Historia del gobierno del jeneral Santa Anna*. D. at Mexico, Sept. 21, 1848. Herbert H. Smith.

Bustard: a bird of the genus *Otis* and order *Grallæ*. The bustards have three toes, which are all directed forward, long naked legs, and bills of moderate length. They are mostly inhabitants of open plains, to which all their habits are adapted. Although they are capable of flying, they often endeavor to escape from danger by running. The great bustard (*Otis tarda*) is the largest of European land birds, and sometimes weighs 30 lb. It is found in the eastern and southern parts of Europe, and abounds in the open plains or steppes of Tartary. The plumage is of a pale chestnut color on the upper parts, finely variegated with black. The wings are diversified with black and white, and the tail is tipped with white. The male has on each side of the chin or neck a tuft of feathers nearly 9 inches long, under which is a spot of naked skin, and in the throat a sac or pouch capable of holding 3 or 4 pints of water. Their flesh is highly esteemed as food. The little bustard (*Otis tetrax*) is common in Southern Europe and Northern Africa, and is not half so large as the *Otis tarda*. South Africa produces a species called *Otis kori*, or Kori bustard, which is 5 feet high or more, and is a noble-looking bird. Its flesh is good. Macqueen's bustard is a fine Asiatic bird. Several other bustards are known, all Old World species, except one, which is Australian.

Bus'to Arsiz'io: a town of Italy; province of Milan; 23 miles by rail N. W. of Milan; on a fertile plain (see map of Italy, ref. 2–B). It has several churches, one of which is adorned with fine old frescoes by Ferrari. Here are manufactures of cotton thread. Pop. 13,500.

Butcher, Samuel Henry, LL. D.: professor of Greek; b. in Dublin, Ireland, Apr. 16, 1850; educated at Marlborough College; fellow and assistant tutor at Trinity College, Cambridge, 1874–76; fellow and lecturer at University College, Oxford, until 1882; was then made Professor of Greek at Edinburgh University. Joint author of *Translation of the Odyssey* (1879); author of *Demosthenes* (1881); and his inaugural address, *What we owe to Greece* (1882).

Butcher-birds: the *Laniidæ*, or *Shrikes*. See Shrike.

Butcher's Broom (*Ruscus asuleatus*): a biennial evergreen plant of the family *Liliaceæ*; has a stem from 1 to 3 feet high, and ovate, alternate, sharp-pointed leaves. The fruit is a red berry nearly as large as a wild cherry. It is indigenous in the south of Europe, and is cultivated for ornamental purposes. The root is aperient and diuretic.

Bute: an island of Scotland; in the Frith of Clyde; separated from the mainland by a narrow strait called the Kyles of Bute, which is about a mile wide. The island is about 15 miles long, and has an area of nearly 60 sq. miles. The mildness of the climate renders it a favorite resort for invalids. The chief town is Rothesay. Here are Rothesay Castle (in the burgh of Rothesay), and Dunnagoil, a vitrified fort on the southwest coast. The seat of the Marquis of Bute, called Mountstuart House, is on the east coast.

Bute, or **Buteshire**: a county in the southwest part of Scotland; comprises the islands of Bute, Arran, the Cumbraes, Holy isle, Pladda, and Inchmarnock. Area about 225 sq. miles, or 143,977 acres, of which 22,966 are cultivated. Pop. (1891) 18,408; (1901) 18,659.

Bute, Marquesses of: Earls of Windsor and Viscounts Mountjoy (1796); Barons Mountstuart (1761); Barons Cardiff (1766, in Great Britain); Earls of Dumfries (1633); Earls of Bute (1703); Viscounts of Ayr (1622); Viscounts Kingairth, Lords Mountstuart, Cumbrae, and Inchmarnock (1703); Lords Crichton and Cumnock (1633); Barons Crich-

ton of Sanquhar (1488, in Scotland), and baronets (1627, in Scotland).—John Patrick Crichton Stuart, the third marquess, b. Sept. 12, 1847, succeeded his father in 1848. In 1868 he joined the Roman Catholic Church. He published a translation of the *Breviary* (2 vols., 1879). D. Oct. 4, 1900.

Bute, John Stuart, Earl of: a minister of state; b. in Scotland in 1713; was educated at Eton; married a daughter of Lady Mary Wortley Montagu. He became groom of the stole to the Prince of Wales, who was afterward George III., over whom he acquired a great influence. In Mar., 1761, he was appointed one of the principal Secretaries of State; May 29, 1762, he became Prime Minister, and held office until the following April. His policy was peace with France and royal absolutism at home. He resigned because of his unpopularity, but for twenty years was suspected of and hated for a secret intimacy with the king. He traveled on the continent of Europe, then retired to his estate in Bedfordshire, and occupied himself with building and studies, astronomy and natural history. D. Mar. 10, 1792.

Bu'tea: a genus of handsome evergreen trees and climbing shrubs of the family *Papilionaceæ* (see Leguminosæ), nearly related to the beans proper (*Phaseolus*), and dedicated to John, Earl of Bute (*q. v.*), a patron of botany. The flowers are in racemes, scarlet or orange, and with a large keel and recurved banner. The leaves are trifoliate, and the leaflets large and ovate in outline. Some of the species yield lac and kino, while from their flowers a dye is made. Five species are known, all natives of Southeastern Asia. *B. frondosa* and *B. superba* are grown in conservatories, and are regarded as possessing high ornamental value. C. E. B.

Butin, bü'tăñ', Ulysse Louis Auguste: painter of genre, principally of the life of fishermen and sailors; b. at St.-Quentin in 1838; pupil of Lemâle, of Picot, and of Pils; second-class medal, Salon, 1878; Legion of Honor 1881. His pictures are notable for sound technique and truthfulness in the rendering of out-of-doors effects. *Burial of a Sailor at Villerville*, an excellent example, is in the Luxembourg Gallery, Paris. D. in Paris, Dec. 9, 1883. W. A. C.

But'ler: town; De Kalb co., Ind. (for location of county, see map of Indiana, ref. 2–G); on Lake Shore and Wabash R. Rs.; 72 miles W. of Toledo, O.; has Wabash R. R. repair-shops and a wind-engine factory. The surrounding country is fine agricultural land. Pop. (1880) 1,056; (1890) 2,521; (1900) 2,063. Editor of "Record."

Butler: capital of Bates co., Mo. (for location of county, see map of Missouri, ref. 5–E); on Mo. Pac. R. R.; in a fertile prairie, 75 miles S. by E. from Kansas City. Butler, which was founded in 1857, burned during the war of the rebellion and afterward rebuilt, has seven churches, good public schools, mills and grain-elevators, water-works, and electric lights. The principal industry is agriculture. Pop. (1880) 2,162; (1890) 2,812; (1900) 3,158.
Editor of "Bates County Democrat."

Butler: borough; on railroad; capital of Butler co., Pa. (for location of county, see map of Pennsylvania, ref. 4–B); on the Conequenessing creek; 31 miles N. of Pittsburg; has three extensive glass-manufactories (two for bottles and one for plate glass); natural gas is used in all of them. It has also a large planing-mill, several oil-well-supply manufactories, a number of flouring-mills, etc., and is the center of prolific oil-fields. It has a fine court-house and public-school buildings. Pop. (1880) 3,163; (1890) 8,734; (1900) 10,853. Editor of "Times."

Butler, Alban: Roman Catholic divine; b. at Appletree, in Northampton, England, 1710; studied at Douay, in France; was professor there; later president of the English Catholic College of St.-Omer, in France. D. at St.-Omer, May 15, 1773. He is best known in the world of letters by his *Lives of the Fathers, Martyrs, and other Principal Saints* (London, 1756–59, 4 vols.), a work of great learning and judicious criticism. See Charles Butler's *Life of the Rev. Alban Butler* (Edinburgh, 1799). John J. Keane.

Butler, Benjamin Franklin, LL. D.: lawyer, general, and politician; b. at Deerfield, N. H., Nov. 5, 1818; son of Capt. John Butler, who commanded a company of dragoons in the war of 1812, and served under Jackson at New Orleans. Reared by an excellent mother, B. F. Butler graduated in 1838 at Waterville College, Maine; in 1840 was admitted to the bar in Lowell, Mass., where he rapidly advanced to an extensive and lucrative practice, in which he acquired a considerable fortune. He served in the State militia through all grades from private to brigadier-general. A Democrat by inheritance and conviction, he took an active part in politics, and in 1853 represented Lowell in the Legislature, where he lent powerful aid to the bill for reducing the hours of labor in the factories of the State from thirteen to eleven. In 1853 he was a member of the constitutional convention; in 1859 a member of the Senate of Massachusetts. In the national Democratic convention of 1860 in Charleston, S. C., he voted over fifty times to give the nomination for the presidency to Jefferson Davis. On Apr. 15, 1861, upon a call for troops to hasten to the defense of Fortress Monroe and Washington, Brig.-Gen. Butler, who at 5 P. M. was in court in Boston trying a cause, issued the requisite orders for mustering the regiments of his brigade. Apr. 16, the Sixth Regiment left Boston, and on the 18th Gen. Butler, at the head of the Eighth, took his departure, having been ordered to proceed to Washington by way of Baltimore. Two regiments of his brigade had, in the meantime, sailed for Fortress Monroe, which they garrisoned and saved from falling into the hands of the enemy. Prevented from reaching Washington by way of Baltimore, in consequence of the burning of bridges, he seized Annapolis, repaired the railroad between that city and Washington, and thus the Eighth Massachusetts and Seventh New York reached the capital in time to prevent all attempts on the part of hostile forces to seize it. May 13, 1861, at the head of 900 men, he marched upon Baltimore, and encamped on Federal Hill, in the midst of the city, without opposition—a service immediately (May 16) rewarded by President Lincoln with the commission of major-general in the service of the U. S., and by assigning him to the command of Fortress Monroe, where he arrived May 22. He here refused to send back the runaway slaves to their masters, on the ground, originated by him, that the slaves were "property contraband of war." Feb. 23, 1862, he was assigned to the command of the troops, 18,000 in number, forming part of the expedition against New Orleans, Capt. Farragut commanding the naval force. After the heroic passing of the forts defending the Mississippi by Capt. Farragut, Gen. Butler (May 1, 1862) landed and took possession of the city, where he remained until Dec. 16 following, when he was relieved by Maj.-Gen. N. P. Banks. During Butler's administration of the department of the Gulf he taxed the wealthy Confederate citizens to support the thousands of inhabitants reduced to destitution by the war, enforced a thorough sanitary system, and governed the city with an ability and justice never surpassed. Nov., 1863, he was appointed commander of the department of Virginia and North Carolina. In the winter he conceived the project of attacking Richmond from City Point and Bermuda Hundred. On May 5, 1864, he occupied City Point and Bermuda Hundred, and intrenched himself upon that peninsula in a position strong for defense, but from which he could not advance, holding it with supplies, and subsequently aiding the movement of Gen. Grant upon Petersburg, after the repulse of the Wilderness and Cold Harbor. He went with a detachment of his forces in Nov., 1864, to New York during the presidential election, a rising being expected in that city by which the election was to be carried by the Democracy. With a small force he held the city in peace and quiet, and compelled an orderly election. He was sent against Fort Fisher in Dec., 1864, where he first exploded a powder-boat without effect; subsequently landed his troops for an assault after a severe bombardment by the fleet; but upon the advice of his chief engineer, who considered the works impregnable by assault, he withdrew his forces. Before the second expedition Gen. Butler was relieved of his command. In 1866 he was elected to Congress from the Essex district in Massachusetts. He was nominated Sept. 19, 1882, by Massachusetts Democratic Convention for Governor, and was elected Nov. 7, 1882; was defeated Nov. 6, 1883, and was "Greenback" candidate for President of the U. S. in 1884. He published *The Autobiography and Personal Reminiscences of Maj.-Gen. Benjamin F. Butler* (1892). D. in Washington, D. C., Jan. 11, 1893.
Revised by James Mercur.

Butler, Charles: nephew of Alban Butler; jurist and writer; b. in London, England, Aug. 14, 1750; was a Roman Catholic. He wrote, besides other works, *Horæ Biblicæ* (1797); *Life of the Rev. Alban Butler* (1799); *Historical Memoirs respecting the English, Irish, and Scottish Catholics* (1819–21). D. June 2, 1832.

Butler, Charles, LL. D.: See the Appendix.

Butler, Clement Moore, D. D.: divine and scholar: b. in Troy, N. Y., Oct. 16, 1810; graduated at Washington (now

Trinity) College, Hartford, Conn., 1833, and at the General Theological Seminary, New York city, 1836. He was ordained in 1836; rector of St. John's church, Georgetown, D. C., 1841–44; of Grace church, Boston, 1844–47; of Trinity church at Washington 1847–54; chaplain of the Senate of the U. S. 1849–53. He was subsequently rector of the Protestant Episcopal Church at Rome (in Italy) 1862–64; in the last-named year he was appointed Professor of Ecclesiastical History in the Episcopal Divinity School in West Philadelphia; resigned in 1884. Besides numerous sermons and lectures, Dr. Butler published *The Book of Common Prayer Interpreted by its History* (Boston, 1846; 2d ed. Washington, 1849); *Old Truths and New Errors* (New York, 1850); *The Flock Fed* (1859); *St. Paul in Rome* (Philadelphia, 1865); *Inner Rome* (1866); *Manual of Ecclesiastical History from the First to the Thirteenth Century* (2 vols., 1868); also a *Continuation of the same from the Thirteenth to the Eighteenth Century*; *The Reformation in Sweden* (New York, 1883); and various other works. D. in Philadelphia, Mar. 5, 1890.

Butler, Elizabeth Southerden Thompson: military painter of the contemporary English school; b. at Lausanne, Switzerland, of British parents about 1844. She received her art education at the South Kensington Museum Schools and in Florence, where she was a pupil of Giuseppe Bellucci. At the Royal Academy, London, she exhibited a picture entitled *Missing*, which attracted notice for its strong, vigorous painting, and followed it the next year with *The Roll Call*. She at once obtained a wide reputation as an artist of original and striking ability, and her work became popular in England. *The Roll Call* was purchased by the Queen, and is now at Windsor Castle. Miss Thompson married Major William Francis Butler of the British army in 1877, and has continued to paint, but has not exhibited much of late years. Her pictures are especially notable for their excellent composition and dramatic force. Some of her prineipal works, besides the two above mentioned, are *Remnants of an Army* (1879); *Scotland for Ever*; *Defense of Rorke's Drift* (1881); *Floreat Etona*; and *Charge of the Scots Greys at Waterloo* (1882). Studio in London.

William A. Coffin.

Butler, Frances Anne Kemble: See Kemble.

Butler, George B.: genre and portrait painter; b. in New York; contemporary; pupil of Couture, Paris; National Academician 1873; member of the Society of American Artists 1880; lived a number of years at Capri, Italy, and painted pictures there. He has devoted himself mostly to painting portraits. Studio in New York.

William A. Coffin.

Butler, Henry Montagu, D.D.: master of Trinity College, Cambridge; b. in Harrow, 1833; graduated at Trinity College, Cambridge, 1855; ordained 1859; head master of Harrow 1859–85; select preacher, Oxford, 1877–78, and 1878–80–82; Cambridge 1879–85; Dean of Gloucester 1885–86; master of Trinity College 1886; vice-chaneellor of university 1889. Author of *Sermons Preached in the Chapel of Harrow* (1861; 2d series, 1869).

Butler, Howard Russell: landscape, marine, and portrait painter; b. in New York, Mar. 3, 1856; pupil of Dagnan-Bouveret and of Gervex, Paris; member of the Society of American Artists 1889, and of the Architectural League, New York; honorable mention, Salon of 1886; Temple silver medal, Pennsylvania Academy, Philadelphia, 1888; third-class medal, Paris Exposition, 1889. As president of the American Fine Arts Society he devoted much of his time to the organization of that institution, which is composed of a union for exhibition purposes in its building in West Fifty-seventh Street, New York, of the Soeiety of American Artists, the Architectural League of New York, and the Art Students League; gradnated in the scientific course at Princeton College in 1876, and practiced law in New York before he began the study of painting in 1883.

William A. Coffin.

Butler, James Glentworth, D.D.: Presbyterian minister; b. in Brooklyn, N. Y., Aug. 3, 1821; studied at the New York University and at Union (1846–47) and Yale (1848–49) Theological Seminaries; was pastor of the Walnut Street Presbyterian church, Philadelphia, 1852–68; secretary of the American and Foreign Christian Union 1868–71; pastor in Brooklyn, N. Y., 1871–73. Of late years he has devoted himself to his great commentary *The Bible Work*, by which he is chiefly known. Of the New Testament part, vol. i. appeared in 1878, vol. ii. in 1879. On the Old Testament, vol. i. appeared in 1886, vol. ii. in 1888, vol. iii. in 1889, and vols. iv., v., vi. in 1892. Vols. vii. and viii. are nearly ready (1893). In 1890 he published *The Fourfold Gospel*.

Butler, John Jay, D.D.: a Free-will Baptist minister; b. at Berwick, Me., Apr. 9, 1814; graduated at Bowdoin College in 1837; studied theology at Andover, Mass., 1841–44; Professor of Sacred Literature in Whitestown Theological Seminary (1844–54); of Systematie Theology at the Theological School of New Hampton, N. H. (1854–70); Professor of Sacred Rhetoric and Homiletics in Bates College Theological Seminary, Lewiston, Me.; and sinee 1873 of Sacred Literature, Hillsdale College, Mich. For many years he was connected with the *Morning Star*, a religious paper of Dover, N. H. He published commentaries on parts of the Bible, and a work on natural and revealed theology. D. June 16, 1891.

Butler, Joseph: bishop and writer; b. at Wantage, Berkshire, England, May 18, 1692. About 1714 he wrote an able refutation of Dr. Samuel Clarke's celebrated *a priori* argument; graduated at Oriel College, Oxford, 1718: was appointed preacher at the Rolls chapel in 1719; obtained the rieh benefice of Stanhope in 1725; became chaplain to Lord Chancellor Talbot in 1733; Bishop of Bristol in 1738. In 1750 he was translated to the see of Durham. A sermon by Bishop Butler before the Soeiety for Propagating the Gospel in Foreign Parts awakened no little interest from its strenuous advocacy of the work of the society in the American colonies; while a MS. plan for the introdnction of bishops into America, written by him in 1750, and first published by the Rev. East Apthorp in a controversy with the Rev. Dr. Mayhew some years later, connects this distinguished prelate with the civil and ecclesiastical history of America. His chief work is *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature* (London, 1736). D. in Bath, unmarried, Jnne 16, 1752. See T. Bartlett, *Memoirs of the Life of Joseph Butler, Bishop of Durham* (London, 1839). The best edition of his works is that issued in two volumes from the Oxford University Press (1849), with a preface by Bishop Halifax.

Butler, Matthew Calbraith: U. S. Senator; b. near Greenville, S. C., Mar. 8, 1836; edueated at South Carolina College; admitted to the bar in 1857; served in the Confederate army during the war; elected to the Senate in 1876; re-elected 1882, 1888.

Butler, Nicholas Murray, Ph.D.: educator; b. in Elizabeth, N. J., Apr. 2, 1862; educated in the public schools of Paterson, N. J., Columbia College, N. Y., University of Berlin, and University of Paris; in 1887 organized the New York College for the Training of Teachers; in 1888 became Professor of Philosophy and Education in Columbia College; dean of the university faculty of philosophy since 1890; editor of *The Educational Review* 1891; author of *Horace Mann and American Systems of Education*, and essays on manual training and allied subjects. W. T. Harris.

Butler, Pierce Mason: son of William, a Senator named below; colonel, and former Governor of South Carolina; b. in Edgefield district, S. C., Apr. 11, 1798; entered the army in 1819 as second lieutenant of infantry; promoted to first lieutenant 1822; captain 1825; resigned from the army in 1829; president of a bank at Columbia until 1836; accepted the appointment of lieutenant-colonel in Goodwin's regiment of South Carolina volunteers, and served against the Seminole Indians in Florida. On his return was elected (1838) Governor of South Carolina; at the end of his term became Indian agent, and was acting as such at the outbreak of the Mexican war, when he was elected colonel of the "Palmetto regiment" of South Carolina volunteers, which he led to the seat of war, distinguishing himself at Cerro Gordo and subsequent battles; at Churubusco, Aug. 20, 1847, he eontinued to lead his men after being wounded, when he was shot a second time, through the head, and killed.

Butler, Samuel: an English poet; b. in Worcestershire, Feb. 8, 1612; was liberally educated, and became in early youth clerk to a justice of the peaee; afterward entered the service of Sir Samuel Luke, who is supposed to be the prototype of Hudibras. He published in 1663 the first part of *Hudibras*, a witty poem satirizing the Puritans, which obtained great popularity, and thus furnished a multitude of proverbial sayings, such as:

> He that complies against his will
> Is of the same opinion still.

The second part appeared in 1664, and the third in 1678. D. poor in London, Sept. 25, 1680.

Butler, THADDEUS J.: See the Appendix.

Butler, WILLIAM, D. D.: missionary of the Methodist Episcopal Church; b. in Dublin, Ireland, Jan. 31, 1818; graduated at Didsbury College, near Manchester, England, 1844; entered the ministry of the Wesleyan Church, and served in the New England conferences; became secretary of the American and Foreign Christian Union of the Methodist Episcopal Church 1869; resigned in 1873; founded Methodist Episcopal missions in India (1856) and Mexico (1873); author of Methodist Episcopal portion of *Cyclopædia of Missions*; *The Land of the Veda* (New York, 1872); *From Boston to Bareilly and Back* (1885); *Mexico in Transition from the Power of Political Romanism to Civil and Religious Liberty* (New York, 1892).

Butler, WILLIAM: b. in Prince William co., Va., in 1759; graduated as student of medicine at South Carolina College; became a lieutenant in Gen. Lincoln's army in 1779; was engaged at Stono; served in Pulaski's corps until the death of the latter; afterward served with Gens. Pickens, Lee, and Greene; became commander of a body of mounted rangers, and was engaged in many battles with the Tories. Shortly after the war he was appointed brigadier-general, and in 1796 major-general, of militia; member of convention in 1787 to decide on the adoption of the Federal Constitution; member of convention which adopted the constitution of South Carolina; member of the Legislature; M. C. 1801–11; commanded South Carolina troops in 1812. D. in Columbia, S. C., Nov. 15, 1821.

Butler, WILLIAM ALLEN: lawyer and poet; b. in Albany, N. Y., 1825; graduated at the University of New York in 1843. He wrote, besides other works, the very popular satirical poem, *Nothing to Wear, an Episode of City Life* (1857); also a biography of *Martin Van Buren* (1862), and *Domesticus* (1886), a tale of labor troubles.

Butler, WILLIAM ARCHER: philosopher; b. in Annerville, near Clonmel, Ireland, in 1814; educated at Trinity College, Dublin, where he became Professor of Moral Philosophy in 1837, and in the same year was ordained. In 1842 he became, in addition to being professor, rector of Raymoghy, and played a prominent part in the Roman Catholic controversy. He had brilliant gifts, and his fame, which was mainly posthumous, is permanent. He was admired as a preacher equally by the simple and the learned. His chief work is *Lectures on the History of Ancient Philosophy* (2 vols., 1856). Other works are *Sermons, Doctrinal and Practical* (Dublin, 1849; 2d series, Cambridge, 1856); *Letters on the Development of Christian Doctrine*, in reply to Newman (Dublin, 1850). (See his memoir in the first series of his sermons.) D. in Dublin, July 5, 1848.

Butler, WILLIAM ORLANDO: general; b. in Kentucky in 1793; served in the war of 1812 and the Mexican war; major-general in 1846. He was the Democratic candidate for Vice-President in 1848, but was not elected. D. in Carrollton, Ky., Aug. 6, 1880. See his *Life* (1848) by F. P. Blair, Jr.

Butler, ZEBULON: soldier; b. at Lyme, Conn., in 1731; served in the French war and in the expedition to Havana; became captain in 1761; settled at Wyoming, Pa., in 1769; was lieutenant-colonel of Connecticut troops serving in New Jersey 1777–78; became colonel Mar. 13, 1778. He commanded the small garrison at Wyoming, Pa., at the time of the massacre, July 3, 1778 (see WYOMING VALLEY); and served bravely in Gen. Sullivan's expedition against the Indians of the Six Nations at Newtown (now Elmira), N. Y., in 1779, and during the whole of that Indian war. D. at Wilkesbarre, Pa., July 28, 1795.

Butte, byut, **City**: county seat of Silver Bow co., Mon. (for location of county, see map of Montana, ref. 6–E); on Northern Pacific, Oregon Short Line, Great Northern, and B. A. and P. R. Rs. Was settled in 1863 as a gold-placer camp. Within 4 miles of the court-house are over 4,000 mining claims—gold, silver, and copper. It has 6 copper smelters and 1 sampling works, capacity about 6,000 tons per day; besides the smelter at Anaconda using 5,000 tons per day of Butte copper ore, and one at Great Falls using 4,000 tons per day. The city has a fine court-house, city-hall, 3 opera-houses, 30 miles street railway, telegraph and telephone service, gas, electric lights, etc., high school, and public library of about 30,000 volumes. Pop. (1880) 3,368; (1890) 10,723; (1900) 30,470. Mineral product of county, 1889, $9,135,728; 1900, $54,069,175. EDITOR OF "BUTTE MINER."

Butter [from Lat. *bu'tyrum*, from Gr. *βούτυρον*]: the fatty substance extracted from milk. In ancient times the Hebrews made use of butter as food, but the Greeks and the Romans used it only as an ointment in their baths; and it is probable that the Greeks obtained their knowledge of the substance from the Scythians, Thracians, and Phrygians, while the Romans obtained it from Germany. In Southern Europe, at the present time, butter is very sparingly used, olive oil often taking its place; and in Italy, Spain, Portugal, and Southern France it is sold by apothecaries as a medicinal agent for external application. In the East Indies the natives use *ghee*, which is butter clarified by boiling. Butter is usually made from cow's milk, which has the following average composition:

Fat (butter)	per cent.	3·50
Casein		3·80
Albumen		0·75
Sugar (lactose)		4·25
Salts (alkaline and earthy)		0·70
Water		87·00
Total		100·00

The composition varies widely with the food, breed, age, and individuality of the cow, the age of the calf, the time and frequency of milking. The last milk drawn at a milking is richer in butter than the first. (See MILK.) The casein, sugar, and the salts are in solution, while the fat is in suspension in the form of minute globules, which are readily seen by the aid of the microscope. They vary in size from $\frac{1}{10000}$ to $\frac{1}{20000}$ of an inch in diameter. They are quite transparent, refract light strongly, and give the milk its white color. It was formerly supposed that each globule was covered with a thin membrane or envelope, but this has been disproved by Von Baumhauer and F. Knapp, and by Dr. S. M. Babcock, who has shown that the fat globules of milk behave in all respects like the globules of artificial emulsions of other fats and oils. The globules are composed of a mixture of several neutral fats or glycerides, chiefly the liquid fat olein and the solid fats palmitin and stearin, with small quantities of butyrin, myristin, caproin, caprylin, and caprin. The small amount of these latter fats gives to butter its characteristic odors and flavors; beside these, it is pretty certain that many of the volatile fats of the food may pass directly into the butter globules without change. In this way not only are the delicate desirable flavors of the sweet-scented grasses and clovers transmitted to the butter, but also the less desirable ones that are characteristic of onions, turnips, cabbage, etc. Moreover milk, and particularly the fats in the milk, readily absorbs odors and taints from the atmosphere surrounding it; so that in order to make butter of the finest quality and flavor, not only must the animal be supplied with clean, wholesome food and water, but the atmosphere surrounding the animal and the milk during all the process of manufacture must be pure, and all surroundings and utensils kept as nearly absolutely clean as possible.

Cream.—Cream is that part of milk into which a large proportion of its fat has been gathered. It is composed of the same constituents as milk, but they are not in the same or any constant relative proportion. Analyses have shown from 8·17 to 70·2 per cent. of fat in cream. Dr. Voelcker gives the composition of cream as follows:

Fat (butter)	per cent.	33·43	25·40
Casein		2·62	7·61
Sugar		1·56	
Salts		0·72	2·19
Water		61·67	64·80
Totals		100·00	100·00

A cream containing 30 per cent. of fat is considered rich. Cream is separated from milk wholly as a matter of convenience. Butter may be made from whole milk as well as from cream. The separation is effected by means of the difference in specific gravity between the fat globules and the milk serum, but the separation is never complete. Some of the milk serum adheres to and is carried up with the larger globules, and some of the smaller globules are held back by the serum, which is always more or less viscous, so that the cream always contains some milk serum, and there is always some fat remaining in the skim milk. The completeness with which the fat is removed from the skim milk is one of the most important economies in the manufacture of butter, as under different systems of separation the loss of fat in the skim milk may be from 6 to 40 per cent. of the whole. In practice, the separation of the cream is effected either by the force of gravity acting upon the fat globules in the milk when set at rest, or by centrifugal force acting upon the

globules in a rapidly revolving cylinder constructed for the purpose. The oldest and still the most common way of separating the cream is to set the milk in shallow pans from 2½ to 4 inches deep, in a room at a temperature, if possible, not above 60° F. In the course of thirty-six to forty-eight hours the cream will have more or less completely risen to the surface and can be removed by skimming. Milk on standing becomes sour; that is, it undergoes a fermentation by means of which a part of the milk sugar is changed to lactic acid, and this acid acting upon the casein causes it to coagulate or thicken; when this thickening takes place any remaining fat globules are prevented from rising, so that the completeness of the creaming depends somewhat upon the length of time which the milk may be kept sweet after it is set. The difficulty in keeping the milk sweet for a time sufficient for all the fat globules to rise led to the practice of surrounding the milk, as it was set, with cold water, and it was subsequently found that when this was done the depth of the milk could be greatly increased. The practice of cold deep setting, as finally developed, is to place the milk, as quickly as possible after it is drawn from the cow, into cans 8 inches in diameter and 20 inches deep. These cans are set or even submerged in water which is as nearly as possible the temperature of melted ice. It has been found that under these conditions not only does the cream rise in a shorter time, but much more completely than when set in pans. Since it would ordinarily be expected that increasing the depth of the milk would increase the time required for the cream to rise, and also interfere with the completeness of the creaming, several theories have been put forward to account for this quicker and more complete creaming. The one most commonly held has been that the serum of milk being a better conductor of heat than the fat, it cools more rapidly when placed in contact with cold water, and this more rapid cooling, causing a greater contraction, would increase the difference in specific gravity between the fat globules and the serum, and so aid in their separation. But this has been shown to be fallacious, for, though it is true that water is a better conductor of heat than fat, the small size of the fat globules (their diameter being about $\frac{1}{5000}$ of an inch) renders it impossible that, under any circumstances, there can be more than a small fraction of a degree difference between the temperature of the fat and that of the milk serum. Moreover, within the limits of temperature practical for creaming (90° F. to 40° F.), the coefficient of expansion of butter fat is more than three times as great as that of water, so that, in order to maintain the same relative difference in their specific gravities when the temperature is falling, the milk serum must cool more than three times as rapidly as the fat. In other words, when the milk serum has cooled from 90° F. to 40° F., or through 50° F., the fat globules should have lost less than 17° F., and should still have a temperature of over 73° F. Such a condition is manifestly impossible; but any less difference than this would cause the fat to become relatively heavier than at first, and would operate against the creaming.

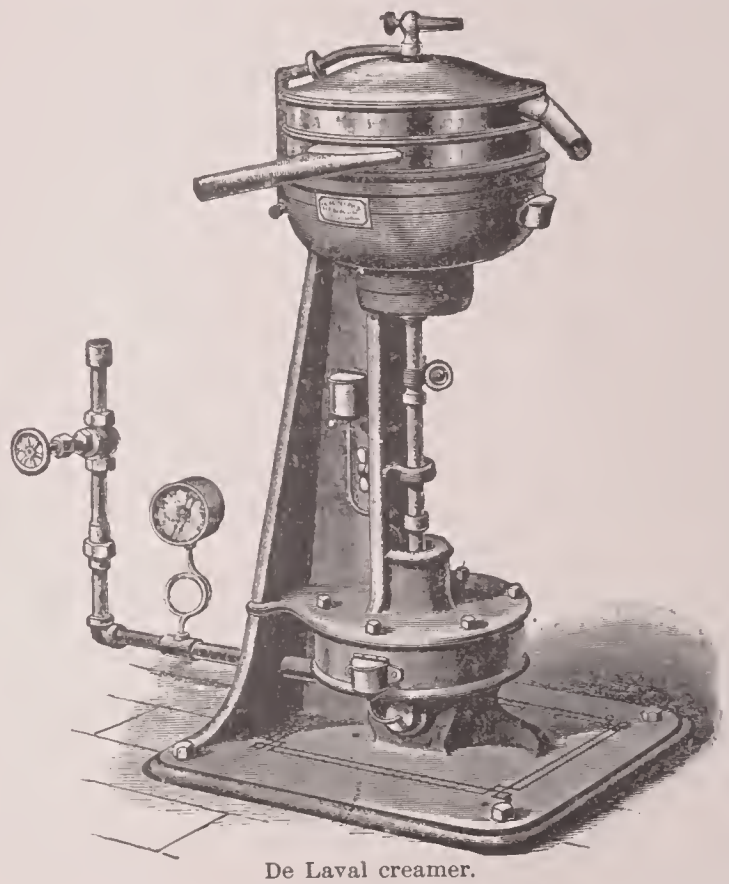
Dr. Babcock, by the discovery of fibrin in milk, has offered a more rational theory. Fibrin upon exposure to the air coagulates or forms clots, and it does this more readily at a temperature at or near blood heat. These clots forming in the milk tend to prevent the rising of the fat globules. The rapid reduction of the whole mass of the milk to a temperature below 50° F. prevents the formation of fibrin clots, and so renders the separation of the fat globules from the milk serum easier and more complete.

In 1877 a patent was granted to Lefeldt and Lentsch for a machine which should separate the cream from milk by centrifugal force. Since then the early machine has been much improved by De Laval and others, until at the present time the most effective means of cream separation is afforded by the use of these machines. Briefly, the machine is composed of a strong steel bowl or cylinder, so arranged that it may be made to revolve at a speed of 6,500 to 7,500 revolutions per minute. The milk being introduced at the center of the cylinder, the centrifugal force causes it to be carried to the sides, and, acting with greater force upon the heavier particles or serum of the milk, separates the milk in the bowl into a layer of skim milk next the wall and cream nearer the center. Exits are so arranged that any desired proportion may be constantly drawn off from both the skim milk and cream layers, and the whole milk constantly flowing into the bowl the operation is continuous. By regulating the speed of the machine and the rate of inflow the fat of the milk may be almost completely gathered into the cream, and only the very smallest globules left in the skim milk. For the best results the milk should be at a temperature of 86° to 90° F. The inflow should be regular, and the number of revolutions not fall below 6,500. The larger power machines have a capacity of 3,000 to 4,000 lb. of milk per hour, and smaller hand-power machines have a capacity of 250 to 350 lb. per hour.

Under ordinary conditions the comparative loss of fat in the skim milk by these different systems of separation will be about as follows with milk containing 3·5 per cent. of fat:

SYSTEMS OF SEPARATION.	Per cent. of fat in skim milk.	Total loss of fat, per cent.
By setting in shallow pans	0·70	20
" " " deep cans	0·56	16
" the centrifugal machine	0·14	4

Cream may be churned into butter as soon as it is removed from the milk and while it is still sweet. Such butter, known as sweet-cream butter, is of a peculiar flavor, and at the present time is only in limited demand in the markets of the U. S. The more usual practice is to "ripen" the cream before it is churned. By ripening is meant the development of a mild degree of acidity. The cream that is to be churned at one time is brought to a temperature of about 70° F., at which temperature it is kept for twelve to twenty-four hours.



De Laval creamer.

During this time it should be frequently stirred, and many believe that it is of great advantage if it can be freely exposed to a pure atmosphere. At the end of twelve to twenty-four hours lactic acid will have developed in sufficient quantity to cause a slight coagulation of the casein, and at the same time the characteristic flavors will have developed; the cream is then ready for the churn.

Churning.—By agitating cream or milk at a proper temperature, the fat globules may be made to unite and separate from the watery serum, which is called buttermilk. This is commonly done in a wooden vessel—a churn. Formerly the churn was simply a small barrel-shaped vessel supplied with a cover and a wooden dash or plunger. This is known as the dash-churn, and the agitation of the cream is effected by moving the dash or plunger rapidly up and down through the cream. Innumerable contrivances have been invented for effecting this agitation, and the Patent Office is filled with models of various sorts of churns; but there is no churn better than a plain box or barrel without inside dasher, floats, or contrivances of any sort. The necessary agitation is produced by the concussion of the particles of cream upon each other by either revolving the box or barrel, or swinging it from side to side. The matter of causing the fat globules to unite into butter is largely one of temperature, and, as has been shown by the churning of artificial emulsions of various

fats and oils, the proper temperature for churning bears a definite relation to the melting-point of the fat to be churned. Ripened cream may be churned at any temperature between 56° and 70° F., according to circumstances. In a great majority of cases 62° to 64° F. is the best temperature at which to churn. Sweet cream should be churned at a temperature six to eight degrees lower than ripened cream of the same character. If the churning temperature is too low, the fat globules are so hard that they will not stick together. If the churning temperature is too high, the fat globules are so soft that they do not readily unite, and the butter is of a very soft, oily nature. Below 50° and above 80° F. but very little butter can be obtained from churning; while above the melting-point of butter fat (93° to 96° F.) the fat globules, instead of uniting upon agitation, are broken up into still smaller particles. The time required for churning depends largely upon the temperature, the ripeness of the cream, and the rate of agitation. A high temperature and an advanced stage of ripeness shorten the process. A speed of about 700 feet per minute is considered to be the best. It is best to churn at such a temperature that from forty-five minutes to one hour will be required before the butter separates, or "breaks," as it is called. When the globules have united into masses the size of kernels of wheat, the churning should be stopped; the butter, being lighter, will rise to the top, after which the buttermilk may be drawn off. The butter should then be washed, until all traces of buttermilk are removed, in water at a temperature of 45° to 50° F. If too cold water is used in washing, the delicate flavoring-oils will be carried off in the wash water and the quality of the butter injured. After the butter is washed it should be salted with clean, fine, pure salt, usually an ounce to the pound, and the surplus water removed. The salting and removal of the moisture are done by working the mass thoroughly with a wooden paddle or lever upon a smooth wooden table. Various forms of workers are in use, but those are best which remove the moisture and work in the salt by means of direct pressure upon the mass rather than by a grinding motion. When the moisture is sufficiently removed, and the salt is completely dissolved, the butter is packed in tubs or printed in molds, and is ready for market. Working is best done at a temperature of 50° F. The complete removal of the buttermilk plays an important part in the keeping qualities of the butter. Pure butter fat may be kept for months without becoming rancid, but if any buttermilk is left in the butter, the casein of the buttermilk acts as a ferment upon both the sugar and the butter fat. The former is changed to lactic acid, and a little of the latter to free, fatty acids and glycerin. Salt tends to prevent this fermentation, and sometimes white sugar and saltpeter are added for the same purpose, but the complete removal of the buttermilk is of much more importance than the addition of preservatives. When freshly made from the milk of cows that are fed upon grass or succulent food, butter is of a golden yellow color and granular texture; but upon dry food, especially upon the poorer kinds, the butter is paler, even to whiteness. The texture depends upon the size of the granules when churning is stopped, and upon the care used in working. Certain breeds of cows, notably those of the Channel islands, Jersey and Guernsey, impart a high color to the butter made from their milk. The poorer and paler kinds of butter are often artificially colored, usually with an extract of annotto ground in oil. Butter varies very much in composition, mainly in the proportions of fat and water, and these are largely dependent upon the care taken in working it. Butter of good quality should have a composition about as follows:

Fat	per cent.	84
Casein		2
Ash (including salt)		3
Water		11
Total		100

The proportion of fat in butter may vary from 77 per cent. to 95 per cent.; it should not be less than 80 per cent., and the percentage of water should not exceed 15. Butter melts at from 93° to 96° F., and the melting-point or hardness is an important point in the quality of butter. The hardness varies with the varying proportions of olein, palmitin, and stearin in the butter, and these vary with the individuality and breed of the cow, with the kind of food, and with the length of time the cow has been in milk. With cows fresh in milk in the spring, and fed on fresh grass, the olein, stearin, and palmitin are usually found in the proportion of about 50, 30, and 20. Later in the season, when the cows are further advanced in milk, and the pastures drier and harder, the proportions may be found to have changed to 30 of olein, 50 of stearin, and 20 of palmitin.

The Butter Business.—The average yield of butter is 1 lb. from 22 to 25 lb. of milk. The average milk yield of the cows of the U. S. is from 3,000 to 3,500 lb. per annum. This would indicate a butter yield of 120 to 150 lb. per cow per annum, and is probably not far from the amount actually produced. There are, however, numerous dairies scattered through the whole country where the butter yield amounts to 300 lb. and over per cow per year, and individual instances are on record where single cows have produced 700, 800, 900, and in one case 1,153 lb. 15¾ oz. in a single year. Such records serve to show that the butter-producing capacity of the cows of the country is capable of a much higher development than that now attained. A great stimulus to the production of butter, and an important factor in the improvement of its quality, was the establishment of butter factories, or creameries, as they are called. They have been in successful operation now for about twenty years, and are scattered throughout the whole of the U. S., but are found in greatest numbers in the States of Wisconsin, Illinois, Iowa, and Minnesota. In these factories it is possible to make up the butter from a large number of cows owned by many patrons, under the supervision of a single man, with the greatest skill and with the most approved machinery. The direct effect is to remove from the farm, and particularly from the farmhouse, a large amount of drudgery, to economize the labor and minimize the cost of production, and to manufacture a product of a uniformly high quality. These factories are often co-operative, and so return to the patrons the largest possible net amount from the raw materials. In some of the factories the milk is brought to the factory and the cream separated by large centrifugal machines; in others, the milk is set for creaming at the farm, usually by a cold, deep-setting process, and only the cream taken to the factory by wagons that go about from farm to farm for the purpose of gathering it. The pooling of milk, and particularly of cream, from a large number of patrons, usually varying quite widely in quality, gave rise to some difficulty in the matter of making a just and equitable division of returns. At first, the milk was paid for, or the dividends made on the basis of the weight or measure of the milk or cream. This was soon found to be unsatisfactory, particularly to those patrons who furnished the best quality of either milk or cream, and various means were devised for quickly and easily determining the true butter-producing value of any given sample of milk or cream. None of these were entirely satisfactory, and it was not until 1890 that Dr. Babcock hit upon a means, partly chemical, partly mechanical, and known as the "Babcock test," by means of which the percentage of fat in milk may be easily, quickly, cheaply, and accurately determined. In a large number of factories this method is now used with the best satisfaction for determining the percentage of fat in each patron's milk each day, and the dividends are apportioned among the several patrons, not on the basis of the quarts or pounds furnished, but upon the pounds of fat present in the milk. While there is nothing about the process of manufacturing butter in large quantities in butter factories that of itself should make the butter of any better quality or even so good as can be made with the same care upon the farms where the milk is produced, still, from the fact that upon a large majority of farms sufficient care is not exercised, and because of the advantages which the factory has in marketing large amounts of butter of a uniform quality, the factory system is usually found to be the most satisfactory way in which the producer of the milk may turn it into butter with the largest recompense in money.

Fraudulent preparations are often widely advertised and extensively sold among the unsophisticated for largely increasing the yield of butter. These preparations are usually known as butter powders, and are largely composed of alum or some similar substance, whose effect is to coagulate the casein and enable the operator to mix it with the butter, forming a frothy mixture of sour curd and butter fat. The directions for the use of a certain one of these, composed of equal parts of alum and sugar, are typical of all: "To a quart of milk twelve hours old add 1 lb. of butter; warm by setting the churn in blood-warm water. Add a teaspoonful of the powder and churn as usual. You will have 2½ lb. of delicious fresh butter." It is needless to say that such a mixture is not butter at all, and is anything but delicious.

The *adulterations* most frequently found in butter are excess of water and salt. They may be detected and esti-

mated by melting a weighed quantity of the butter and allowing them to settle out. Lard and other inferior fats are sometimes mixed with butter by unscrupulous grocers, but are easily detected. The chief competitor, however, of butter is known as

Artificial Butter.—Artificial butter, whose base is suet, is usually known in the market as *oleomargarine*; that made from the fat of swine is called *butterine* or *suine*. (See Butter, Artificial, below.) With improved processes the production largely increased, and oleomargarine became a very serious competitor of real butter in the markets. While there is no doubt that it is a good and cheap substitute for the poorer grades of butter, still from the facts that impure and often diseased materials were used in its manufacture, that oleomargarine is believed by many to be less digestible in the human stomach than pure butter, and, most important of all, that oleomargarine was fraudulently put upon the market as pure butter, Congress, at the earnest solicitation of dairymen and against the most vigorous efforts of the oleomargarine manufacturers, on Aug. 2, 1886, passed a law, known as the Oleomargarine Act, the provisions of which were as follows: A special tax of $600 is levied on manufacturers, a tax of $480 on wholesale dealers, and a tax of $48 on retail dealers. Besides this, a stamp tax of two cents per pound is assessed on every pound, or package containing a fraction of a pound, manufactured in the U. S.; and upon that imported from other countries a tax of fifteen cents a pound is levied, besides any customs duty. For the fiscal year ending June 30, 1891, $1,077,924 were collected by the internal revenue department under this act. The effect of this law has not been such as was hoped by its framers—to prohibit the manufacture of oleomargarine—for the amount manufactured has actually increased since the passage of the act. The law, however, has not failed in noteworthy results. It has helped to raise the price of butter, especially that of good butter, by preventing oleomargarine from masquerading as a more expensive article. It has kept the price of oleomargarine down, greatly to the advantage of consumers, by compelling it to be sold under its own name. It has relieved that product from the reproach of being a fraudulent article, and has given it an honorable position in commerce as a legitimate means of utilizing waste products, and as a cheap, wholesome substitute for an expensive necessity. Besides the national act, many of the States have also passed laws governing the manufacture and sale of artificial butter, and some of them, notably New York, have gone so far as to actually prohibit them. The New York law has been in operation for several years; it was bitterly attacked by the manufacturers of oleomargarine, but has been declared constitutional by the highest State court.

Vegetable Butters.—The name "butter" is applied to several vegetable fats, such as palm, cacao, cocoanut, nutmeg, and shea butter. The latter is made from a nut like the olive, and is used in Africa as a substitute for butter.

Metallic Butters.—In chemistry the name butter was formerly applied to certain oily compounds which resembled melted butter; as the butter of antimony, bismuth, zinc, and tin, which were the chlorides of the respective metals. *Bog butter* is a fossil butter found occasionally in the Irish peat-bogs. It is believed to have been made by man. *Rock butter* is an iron alum which appears as a pasty exudation on alum slates.

Henry H. Wing.

Butter, Artificial, Butterine, Oleomargarine: mixtures of various fats prepared as substitutes for butter. A French chemist, Mége-Mouries, first devised a method of making artificial butter on the large scale, which he described in 1870 as follows: "The fat of best quality from recently killed bullocks is finely cut in a kind of sausage-grinder in order to break up the membranes. The fragments fall into a tank heated with steam, which for every 1,000 parts of fat contains 300 parts of water and 1 part of carbonate of potash, and two stomachs of sheep or pigs. The temperature of the mixture is raised to 45° C. After two hours, under the influence of the pepsin in the stomach, the membranes are dissolved and the fat melted and risen to the top of the mixture. The fat is next drawn off into a second tank, kept at a somewhat higher temperature, and 2 per cent. of common salt added. After two hours more the fat becomes clear and takes on a yellow color, and acquires somewhat the taste and odor of fresh butter. The fat is now drawn off into vessels and allowed to cool. It is then cut into pieces, wrapped in linen, and put in a hydraulic press and kept at a temperature of about 25° C. By pressure the fat is separated into two portions, viz.: stearin 40 to 50 per cent., and fluid oleo 50 to 60 per cent. The stearin remaining in the presses is used in candle-making."

Since 1870 many patents have been issued for the preparation of artificial butter, and large quantities are manufactured. All the methods have this in common, that they involve the use of animal fats other than butter. In some of them Cottonseed Oil (*q. v.*) is used. One of the largest manufacturers of artificial butter in the U. S. thus describes the process:

"The fat is taken from the cattle in the process of slaughtering, and, after thorough washing, is placed in a bath of clean, cold water, and surrounded with ice, where it is allowed to remain until all animal heat has been removed. It is then cut into small pieces, . . . and cooked at about 150° F. until the fat, in liquid form, has separated from the fibrin or tissue; then settled until it is perfectly clear. Then it is drawn into graining-vats and allowed to stand a day, when it is ready for the presses. The pressing extracts the stearin, leaving the remaining product, which is commercially known as oleo oil, which when churned with cream or milk, or both, and with usually a small proportion of creamery butter, the whole being properly salted, gives the new food-product *oleomargarine*. . . . In making butterine we use neutral lard, which is made from selected leaf lard in a very similar manner to oleo oil, excepting that no stearin is extracted. This neutral lard is cured in salt brine for forty-eight to seventy hours, at an ice-water temperature. It is then taken, and, with the desired proportion of oleo oil and fine butter, is churned with cream and milk, producing an article which, when properly salted and packed, is ready for market. In both cases coloring-matter is used, which is the same as that used by dairymen to color their butter. At certain seasons of the year, viz., in cold weather, a small quantity of salad oil made from cottonseed is used to soften the texture of the product, but this is not generally used by us."

It is the general opinion of those who have studied the subject that artificial butter is a wholesome article of food. Its composition is very similar to that of natural butter, and experiments have shown that the two are about equally digestible. The prejudice against oleomargarine is largely due to ignorance. Methods of analysis have been devised by which it is possible to determine whether a given specimen is natural or artificial butter.

Ira Remsen.

Buttercup: See Ranunculus.

But'terfield, Daniel: b. in Utica, Oneida co., N. Y., Oct. 31, 1831; educated at Union College; went into mercantile pursuits; became colonel of a militia regiment which he led to Washington and to Patterson's Shenandoah army on the breaking out of the civil war; was made brigadier-general of volunteers Sept., 1861; major-general Nov., 1862, and at the same time colonel of the Fifth Infantry in the regular army; took part in many actions under Gens. McClellan, Pope, and Burnside; was chief of Gen. Hooker's staff at Chancellorsville and Lookout Mountain, and in the campaign to Atlanta. He was breveted major-general in the regular army; resigned in 1869; sub-treasurer of the U. S. in New York; then in the express business. Published *Camp and Outpost Duty* (1862).

Butter-fish: a small silver flat-bodied fish of the family *Stromateidæ* (*Stromateus triacanthus*) found along the Atlantic coasts of the U. S. Its flesh is fat, whence the name, and it is much valued as food. The name is applied to other fishes, as the gunnel (*Murænoides gunnellus*) of the North Atlantic.

Butterfly: the common name of the *Rhopalocera* or day-flying Lepidoptera (*q. v.*). They are distinguished from the other Lepidoptera (moths) by the diurnal habits, the antennæ enlarged or clubbed at the tip, and by holding the wings, when at rest, folded vertically over the back. Other characters must be sought in entomological treatises. Butterflies are usually divided into five "families." In the *Hesperidæ*, commonly called skippers on account of their jerky flight, the antennæ are bent or hooked at the tip. These are mostly small, dark-colored forms, with large abdomens, more like those of moths than of other butterflies. In the four other families distinguished from one another by characters too technical for consideration here, the club of the antennæ is not bent. The *Papilionidæ* includes the swallow-tailed butterflies, large forms of remarkable beauty, of which about twenty-five species occur in the U. S. The larvæ of these are noticeable from the fact that they possess two pro-

trusible fleshy horns which emit a disagreeable odor, thus serving as organs of defense. The *Pieridæ* are smaller forms, white, yellow, or orange in color. Here belong the Cabbage Butterflies (*q. v.*). The *Lycænidæ* are still smaller, and our common species are usually divided into the blues, the coppers, and the hair-streaks, according to the color and ornamentation of the wings. There are about 125 species known in the U. S. The largest family of butterflies is the *Nymphalidæ*, the members of which vie with the swallow-tails in size. In these the fore legs are so reduced in size that they are of no use in walking. Most striking of the family are the large Morphos of Brazil, with an eyelike spot on each hind wing. The Heliconias of the same regions should also be mentioned. These are strong-flying, narrow-winged forms, which are protected from birds, etc., by their disagreeable odor and taste. In the same regions are numerous Pierids which have no such protection, but which so closely resemble the Heliconias in form, color, and mode of flight, that no bird having once tasted a Heliconia would be apt to take one of them. Some species of *Nymphalidæ* have a wide distribution. Thus the morning cloak or Camberwell beauty (*Vanessa antiopa*) is common to the north temperate regions of both hemispheres, while the *Vanessa cardui* occurs in all parts of the globe except South America and the Aretic regions.

A remarkable feature in the history of butterflies is the Di- or Polymorphism (*q. v.*) existing in many species. Thus the swallow-tail *Papilio ajax* of the U. S. passes the winter in the chrysalis state. Those which emerge from the chrysalis early in spring have the markings of the form earlier known as *P. marcellus*, while those that emerge in the summer are known as *P. telamonides*. Both of these lay eggs, from which are developed in the same season butterflies of the *ajax* type, and from these come the chrysalids.

In spite of their beauty butterflies must be regarded as pests, since their larvæ feed upon vegetation, and sometimes occur in such numbers as to do great damage. They have always been favorites with collectors. See Lepidoptera, and Kirby's *Synonymic Catalogue of Diurnal Lepidoptera* (London, 1871–77). J. S. K.

Butterfly-weed: the *Asclepias tuberosa*; an herbaceous plant which is indigenous in many parts of the U. S., and is sometimes called **Pleurisy Root**. It has nearly sessile leaves, varying from linear to oblong-lanceolate, and has showy, orange-colored flowers. The root is diaphoretic and expectorant, and has been used in medicine. See Asclepias.

Butterine: See Butter, Artificial.

Buttermilk: the part of milk that remains after the butter has been separated from it. It contains casein, sugar, water, and all the original ingredients of milk, except the greater part of oily matter. It is a nutritious beverage, and is extensively used in many places as food.

Butternut, or **White Walnut**: the *Juglans cinerea*, and its fruit, which is indigenous in the U. S. The tree grows to the height of from 50 to 75 feet, with gray bark and widely spreading branches, and has oblong-lanceolate downy leaflets, which are serrate, pointed, and rounded at the base. The petioles and branchlets are downy also, and have clammy hairs. The fruit is oblong and clammy, and contains an oily, eatable kernel. The nut is deeply sculptured and rough with ragged ridges, and is two-celled at the base. The wood is valuable in the arts, and contrasts finely with black walnut. The nuts, if gathered in June, can be made into fine pickles. The name *Butternut* is given also to a South American tree, *Caryocar nuciferum* (family *Ternstræmiaceæ*), which bears large drupes containing four one-seeded edible nuts. Revised by Charles E. Bessey.

Butter, Shea: See Bassia.

Butter-trees: species of East Indian trees of the genus *Bassia* and family *Sapotaceæ*, so named on account of the butter-like fat obtained from their seeds, and used as food. There are other fat-yielding trees which bear this name.

Butterwort: an herbaceous plant of the genus *Pinguicula* and family *Lentibulariaceæ*; distinguished by a two-lipped calyx, the upper lip trifid, the lower bifid; and a spurred corolla, two-lipped and gaping, the upper lip arched. The *Pinguicula vulgaris* is a small stemless perennial, growing in marshes and on wet rocks in Europe and the U. S. It has the power of coagulating milk, and is used for that purpose by the Laplanders. Revised by Charles E. Bessey.

But'terworth, Hezekiah: journalist; b. in Warren, R. I., Dec. 22, 1839. Became assistant editor of the *Youth's Companion*, Boston, in 1871, and has published much popular juvenile literature, such as *Zigzag Journeys* (1878–90) etc.

Buttlar, bŏŏt'lar, Eva, von: b. at Eschwege, in Hesse, in 1670; in 1687 married to De Vésias, a French emigrant who lived at the ducal court of Eisenach as dancing and fencing master and tutor to the pages; lived here for several years; in 1697, having met with the famous Pietist, Voekerodt of Gotha, she changed the whole character of her life, left her husband, and returned to her native town. Her religious enthusiasm soon degenerated into fanaticism and blasphemy. On Jan. 2, 1702, a new "Christian" congregation was formed at Allendorf, in Hesse, in which she was worshiped first as the Holy Ghost, afterward as the mother of the Lord, who should give birth to the new Christ. In spite of the public indignation aroused by many immoral practices, the congregation maintained itself for some twelve years. The movement cast reproach upon all Pietists. D. at Altona, near Hamburg, about 1717. See E. F. Keller, *Die Buttlarische Rotte* in Niedner's *Zeitschrifft für hist. Theologie* (1845); and M. Goebel, *Geschichte des christlichen Lebens in der rhein-westphäl. evang. Kirche* (2 vols., Coblenz, 1852, ii. 728–809); and her *Life* by Ludwig Christiany (Stuttgart, 1870).

Buttmann, boot'man, Philipp Karl: philologist; b. at Frankfort-on-the-Main, Germany, Dec. 5, 1764; was appointed secretary of the Royal Library of Berlin in 1796, and chief librarian of the same in 1811. He was a friend of Niebuhr, and an excellent Greek scholar. He edited several Greek classics, and published, besides other works, a *Greek Grammar for Schools* (1792); a large *Greek Grammar* (Ausführliche Griechische Sprachlehre, unfinished); and *Lexilogus, or Explanation of the Greek Words* (1818). D. in Berlin, June 21, 1829.

Bütt'ner, Christian Wilhelm: b. at Wolfenbüttel, Brunswick, Germany, in 1716; was for many years professor in the University of Göttingen; died at Jena in 1801. He traveled extensively, and made very comprehensive studies of languages and of natural history. He gave the first idea of a glossography, or geography of languages, and formed rich collections of natural history. In honor of him Leopling named a species of plants belonging to the sixteenth class of the system of Linnæus, and comprising several tropical shrubs related to the cocoa-tree, *Büttneria*.

Button [from O. Fr. *boton*, bud, knob, button: Ital. *bottone*: Span. *boton*; deriv. of O. Fr. *boter* > Mod. Fr. *bouter*, shoot, thrust, a word of Teutonic origin; cf. O. H. G. *bōzan*, beat; O. Eng. *bēatan* > Eng. *beat*]: an article of dress of various forms, used either for ornament or for fastening together the parts of a dress by means of a loop or worked buttonhole. Buttons are used for various articles of male and female apparel, and for hats, bonnets, shoes, and gloves. The word is also applied in *carpentry* to a flat oblong piece of wood or metal, turning on a nail or screw, to fasten doors and the like; and in *assaying* to a round mass of metal remaining in the cupel after fusion; but the use of the word in relation to articles of dress is the one of most importance. The button is generally considered a sign of civilization. The savage fastens his blanket or tunic, his leggings and moccasins, with strings, and has no idea of buttonhole or button; and it is only when a considerable degree of civilization is attained that we find buttons taking the place of strings or lacings, while fashion, in the artificial condition of society in great cities, requires a profusion of buttons, not so much for use as for ornament. Except the occasional use of a gem to fasten the toga at the neck, the Greeks and Romans seem to have had no idea of buttons, as indeed their flowing robes did not require them. They were first applied to dresses (probably in the thirteenth or fourteenth century) for purposes of ornament only, but somewhat later the buttonhole, an expansion of the idea of the loop, was invented, and the button became indispensable for the dress. In the beginning of the seventeenth century the manufacture of buttons had attained some importance in England, Birmingham being then, as now, its principal seat. These buttons were of cloth, covering a wooden disk, of gold, steel, and ivory, the last three the work of the goldsmiths, who were very expert in the arts of chasing and carving metals. Some of the steel buttons made at the Soho works about this time were sold at 140 guineas the gross, or almost $5 the button. About 1745 Matthew Boulton made many improvements in inlaid and steel buttons. Gilt buttons came into use soon after the accession of George III. in 1760, and John Taylor, of Birmingham, originally a cabinetmaker, patented many improvements in gilt, plated, and lacquered

buttons. The making of the shanks or eyes of these buttons was improved by Ralph Heaton, also of Birmingham, not far from 1800. This is still a separate branch of the business at Birmingham. From 1760 to the present time the manufacture of buttons has been a constantly growing industry in Great Britain, France, Switzerland, and the U. S. All descriptions of buttons may be classed under three distinct heads—viz., shank buttons, hole buttons, and covered buttons—but each kind is made of a great variety of materials and an almost infinite diversity of forms. The covered buttons, having a basis of wood, brass, zinc, or tin, have their covering of farmer's satin, prunella, broadcloth, brocade, velvet, silk, mohair, grenadine, twist, linen, cotton, and in short, every description of textile fabric. Both the shank and the covered buttons are to a considerable extent made on the *shell* plan—i. e. the face of the button is stamped out of a thin sheet of metal—and may have a flat, oval, or round surface, as desired; and the back or under surface is also stamped, and, its edges being turned, it is pressed into the upper shell and locked there by the pressure. The principle on which all shell buttons are made was first devised by B. Sanders, a Dane, who had lost most of his property in Copenhagen in the bombardment of that city in 1807, and removed to Birmingham, England, where he commenced the manufacture of buttons. He applied it only to covered buttons, which he made of sheet brass or tin in two parts, the upper blank or disk having its edge turned up and being covered with cloth, silk, or lasting, and the under blank, which was smaller than the upper and convex in form, having a wire shank, and the cloth and paper or cardboard which was to keep it in place put inside of it, and the two were pressed together, the turned edges interlocking so as to make a perfect button. An improvement was made in these by a son of Mr. Sanders, the lower blank having a circular hole in it (and receiving in consequence the name of "collet"), through which in the act of pressing the two blanks together a portion of the cloth or textile inside of the collet was thrust, so as to make a flexible cloth shank in place of the wire one. Other modifications were made by other inventors which reduced the price and greatly increased the facility of production. One of these was the production of what is known as the silk-back button, which dispenses with the collet, though it substitutes for it a round piece of sheet iron smaller than the upper blank. The so-called silk-back is a very thick heavy cloth having a silk face, which is cut out, of the proper size, by a die, its back having first been coated with a heavy sizing; a filling of soft spongy paper is placed upon this sizing, and the back is then gathered over the small blank of sheet iron and pressed into the upper blank or shell, which had previously been covered with the proper material, and the button is completed, no metal appearing upon either surface. In the shell-covered buttons sheet iron is now used for the blanks, and where the metal shows, as in the ordinary flexible shank buttons, it is lacquered. The process for making the metallic shell buttons is different, though the principle is the same. These buttons, whether of flat or oval surface, and whether figured or plain, are made from rolled brass plate; originally the flat buttons were solid and struck out as blanks from a thick plate, the eye or shank soldered on, and the whole finished, polished, and gilt, or silvered by the old cream-of-tartar process for silvering or the mercury amalgam for gilding. It was said that by this latter process six cents' worth of gold would suffice for gilding a gross of buttons. Both processes have been superseded by electro-plating. (See GILDING and ELECTRO-PLATING.) When buttons began to be made on the shell plan the upper blank was forced by the falling of a heavy weight into a finely engraved die of hardened steel, which gave it the oval form and the beautifully ornamented surface, and the under blank into another die, which stamped upon it the maker's name or trade-mark, and at a later date rivcted the shank (which before had been soldered to it) into this plate: a filling of stout paper or binder's board was then placed upon it. The two plates were then pressed together by a fly-press, and the button was trimmed and ready for the gilding. When gilt it was burnished and set on cards containing a dozen, when it was ready for market. Subsequent improvements have combined and simplified these processes, so that now a single machine completes the button except the gilding, burnishing, and carding; and the last process is also performed by a machine. Embossed buttons have been made of horn softened by heat, dyed, and pressed in a die of *bois brûlée* (sawdust and shellac heated), and of india-rubber and gutta-percha vulcanized, which were for some years very popular. These have now mostly given place to oval and flat buttons of ivory, bone, vegetable ivory, mother-of-pearl, and celluloid. The ivory, bone, and vegetable-ivory buttons are engraved and dyed in a variety of patterns and checks. The mother-of-pearl may be either of the ordinary color of pearl or what is known as smoked pearl. The celluloid buttons are made in molds and dies, like the vulcanite and horn. Those made of VEGETABLE IVORY (*q. v.*) are cut from slabs sawed out of the vegetable ivory-nut by bits attached to spindles and made to turn very rapidly, and are then turned, polished, dyed, and worked in figures in a lathe. They are then carefully sorted and put upon cards. The hole buttons, when made of ivory, vegetable ivory, pearl, malachite, onyx, etc., are cut by a tubular saw or bit revolving with great rapidity; the eyes are made by fine revolving drills. Pearl shirt buttons are made in great quantities both in the U. S. and Europe, and many of them are made of cheap substitutes for pearl. Agate or feldspar buttons for underclothing, as well as clay buttons, pressed into molds and baked and glazed like porcelain, are mostly made in Europe, requiring very cheap labor for their production. The greater part of the trouser buttons in use are made either from japanned iron stamped out by a heavy die or embossing swedge, or are made as shell buttons, with the back of paper or wood, and the whole button made by one machine and almost by a single blow. They are afterward japanned. Fancy and ornamental buttons for ladies' dresses are sometimes made of combinations of cloth and glass, or papier-mâché, pearl, metal, or choice woods, sometimes of vulcanite, glass, pearl, or Whitby jet, but oftener at the present day of silk, velvet, silk cords and figures, or what is known as passementerie, or of brocade and embroidered silk. These are usually made upon a wood foundation, especially if they are oval or of fanciful shape. Their manufacture is often carried on in connection with other dress trimmings.

The manufacture of covered buttons, except in its simpler forms of hand-made covered buttons, was not attempted in the U. S. earlier than 1825 or 1826. Samuel Williston, who was the founder of the covered-button business in his country, commenced covering buttons by hand at Easthampton, Mass., in 1826, and by the gradual introduction of machinery and a consolidation of his methods and machines with those of the Haydens at Haydenville in 1834 (the Haydens had been making buttons in a small way after the Sanders patterns from 1831), laid the foundations of the extensive works of the National Button Company, which employs 175 hands and can turn out 2,500 gross per day. Waterbury, Conn., was one of the early seats of the manufacture, but has been largely occupied with the production of metal buttons. In Great Britain five-sevenths of the manufacture are concentrated in Birmingham. France and Austria have great numbers of factories where dress buttons are made in connection with other dress trimming.

In China the knob of gold or of some precious stone worn at the top of the official hat is called a button, and is used to indicate rank. There are nine grades, each indicated by some special color or material. The highest is transparent red (a ruby); the second opaque red (coral); the third transparent blue (sapphire); the fourth opaque blue (lapis lazuli); the fifth transparent white (crystal); the sixth opaque white (stone); the seventh plain gold; and the eighth and ninth worked gold. These are again divided into two classes, distinguished as *principal* and *subordinate*, the latter having the Chinese character for "old age" engraved on them. The ninth button has two such characters engraved on it, and is the button worn by every one who has taken the siu-tsai, or bachelor's degree. Revised by R. LILLEY.

Button-bush (*Cephalanthus occidentalis*): a shrub of the *Cinchona* family, with a white flower in globose heads, whence its name. When in flower it is much frequented by bees.

Buttonwood: See PLANE-TREE.

Buttress [from Fr. *bouter*, thrust, push]: a projection built against a wall or other structure for the purpose of strengthening it, especially where exposed to a horizontal thrust or pressure, as in terrace-walls or in walls supporting heavy vaults or roofs. Rudimentary buttresses are found in Chaldæa, but the buttress never became an architectural feature until the introduction of vaulting by the Romans compelled them to thicken the masonry at the points where the thrust was exerted, and to carry the resisting mass above the roofs of the wings of the building, as in the great halls of the

thermæ. The Gothic architects developed from this device the *flying buttress* (Fr. *arc-boutant*), in which a half-arch, springing from a heavy pinnacled buttress on the line of the outer side-aisle wall, rises to the level of the nave-vaulting above the clerestory, and transfers its enormous thrust downward to the exterior buttress. The earliest buttresses were broad and simple; with the development of Gothic architecture they became narrower but deeper, were broken into receding steps or stages, adorned with gablets, and terminated in lofty pinnacles; while the flying arches became extremely elaborate in France, especially where the vaulting was loftier and bolder than elsewhere. In the perpendicular and flamboyant styles the buttress was sometimes richly paneled over its whole surface. A. D. F. Hamlin.

Butyr'ic Acid [from Lat. *bu'tyrum*, Butter (*q. v.*)] : occurs in the combination with Glycerin (*q. v.*), in the form of a fat in butter, and is one of the members of the series of so-called "fatty acids." When the fat of butter is treated with an alkali, it is saponified, and a salt of butyric acid is obtained. From this, by treatment with any one of the ordinary acids, the butyric acid can be set free. It is formed most readily by fermentation of sugar and of starch. Rancid butter contains it in the free condition together with other acids, and the peculiar odor and taste of such butter are due, to some extent, to the presence of these acids. Butyric acid is a colorless transparent liquid at ordinary temperatures. When cooled down to a very low temperature it solidifies. It is manufactured on the large scale for the purpose of preparing Butyric Ether (*q. v.*).

Butyric Ether: a substance belonging to the general class of Ethers (*q. v.*) which are formed by the action of alcohols on acids. Butyric ether is made by treating a mixture of butyric acid and ordinary alcohol with sulphuric acid, and heating. The ether separates as a layer that can easily be removed and purified. Like most of the substances belonging to the same class, this ether has an agreeable odor. The odor in this case is like that of pineapples, and the ether, which is a colorless liquid, is manufactured and sold under the name of pineapple oil. It is used extensively in perfumery. Whether the odor of pineapples is due to the presence in these of butyric ether has not been determined. The quantity present is, in any case, very small.

Buxbaum'ia: a genus of mosses (named in honor of J. C. Buxbaum, a German botanist), of which only two species are known. *Buxbaumia aphylla* occurs in Europe and America, and is apparently destitute of leaves; the part of it visible above the ground is merely the little capsule, surrounded with minute scales.

Bux'ton: a town and watering-place of Derbyshire, England; in a deep valley near the source of the Wye; 32 miles N. W. of Derby, and 160 miles N. N. W. of London (see map of England, ref. 8–G). Here are calcareous and chalybeate springs, which are annually visited by about 14,000 persons. Buxton is surrounded by beautiful scenery, has several good hotels, and baths which are regarded as among the finest in Europe. One of the Dukes of Devonshire expended £120,000 here in the erection of a pile of stone buildings called the Crescent. Buxton was once the residence of Mary Queen of Scots, then a captive. The inhabitants manufacture ornaments from alabaster and spar, and excellent lime is burned at the quarries near Poole's Hole, an immense stalactite cave about half a mile distant. Near this town is Diamond Hill, famous for its crystals. Pop. (1891) 7,424.

Buxton, Sir Thomas Fowell: philanthropic brewer; b. in Earl's Colne, Essex, England, Apr. 1, 1786; was the son of opulent parents; studied in Trinity College, Dublin. He married in 1807 Hannah Gurney, a sister of Joseph John Gurney and of Mrs. Fry; was elected a member of Parliament in 1818 by the voters of Weymouth, which he represented nineteen years; was made a baronet in 1840. He was an eminent advocate of the abolition of slavery, the improvement of prison discipline, and other humanitarian measures, and had much influence in public affairs. D. Feb. 19, 1845. See his memoir by his son, Sir Charles (London, 1848; n. e. 1872).

Bux'torf (in Lat. *Buxtorfius*), Johann: scholar; b. at Kamen, in Westphalia, Dec. 25, 1564; was well versed in the Hebrew language and rabbinical literature. In 1591 he became Professor of Hebrew at Basel. His chief works are a *Lexicon Hebraicum et Chaldaicum* (1607) and *Biblia Hebraica Rabbinica* (1618). D. at Basel, Sept. 13, 1629. See his *Life* by E. F. Kautzsch (Basel, 1879).

Buxus: See Box.

Buys-Ballot, bois'bäl'lōt, Christophorus Henricus Diericus, Ph. D.: meteorologist and author of the well-known *Buys-Ballot's Law*, expressing the relations of the wind-directions to the position of the storm center; b. in the small village of Kloetinge, province of Zeeland, Holland, Oct. 10, 1817. He obtained the degree of Ph. D. from the University of Utrecht, in which institution he soon became a professor (1847), remaining in this position for forty years. He was, in some sense, the creator of the Dutch meteorological service, of which he was the director until his death. On leaving his professional chair a special medal was struck in his honor. He was an honorary member of the Royal Meteorological Society and of the Austrian Meteorological Society, and knight or commander in orders in Austria, Holland, Portugal, and Russia. He was a prolific writer not only in Dutch, but also in English, German, and French. His earliest papers were upon chemistry and physics, but for the last forty years of his life they were devoted to meteorology. D. in Utrecht, Feb. 2, 1890.

M. W. Harrington.

Buzançais, bü'zään'sā' : a town of France; department of Indre; situated partly on the banks of the river Indre and partly on the islands in its channel; 46 miles S. E. of Tours (see map of France, ref. 5–E). Here are extensive iron-works. Pop. (1891) 5,027.

Buzzard: a bird of the genus *Buteo*, order *Raptores* and family *Falconidæ*; having a small bill, which bends from the base and is not notched. The buzzards resemble the eagle and falcon in form, but are inferior in size and courage. The common buzzard (*Buteo vulgaris*), a native of Europe, measures nearly 4 feet from tip to tip of the wings. It is sluggish and inactive compared with other birds of prey. The prevailing color of its plumage on the upper parts is brown, with a mixture of black. The rough-legged buzzard (*Archibuteo lagopus*) may be distinguished by its having the tarsi feathered to the toes. It is widely distributed in Europe and Africa, and is found in North America. Among the other species of this genus is the red-tailed hawk or chicken hawk of the U. S. (*Buteo borealis*), which often kills poultry. The American bird called turkey-buzzard belongs to the genus Cathartes (*q. v.*).

Buzzard's Bay: in the south part of Massachusetts; is 30 miles long; has an average width of 7 miles; contains the harbors of New Bedford, Fairhaven, and Wareham. It is sheltered from the ocean by the Elizabeth islands.

By-bidding: bidding at an auction sale by a person on behalf of the owner of the property sold, and with no intent of purchasing it. In the U. S. some authorities have held that a single by-bidder may be employed to prevent the property from being sacrificed below a given price, but that the employment of a number to create a false appearance of competition is a fraud. When there has been fraudulent by-bidding a *bona-fide* bidder may refuse to take property knocked down to him, or may claim property knocked down to the by-bidder when his own bid was the highest *bona-fide* bid. By-bidders are often called "puffers." See Auction.

Revised by F. Sturges Allen.

Byb'los, or **Byblus** (in Gr. Βύβλος): an ancient city of Phœnicia; on the Mediterranean; about 22 miles N. N. E. of Berytus; called *Giblah* by the Hebrew writers. It was near the base of Mt. Lebanon, and was said to be the native place of Adonis or Thammuz. This site is occupied by the modern town of Jubeïl and ruins of a Roman theater.

Byblos: an ancient town in the delta of Egypt; celebrated for its manufacture of papyrus, the chief writing-material of the civilized world. It stood in a marshy tract which produced in abundance the byblus or papyrus plant (*Cyperus antiquorum*).

Byerly, William Elwood, Ph. D.: b. in Philadelphia, Pa., Dec. 13, 1849; graduated at Harvard College 1871; received Ph. D. from same 1873; was appointed Assistant Professor of Mathematics at Cornell University 1873–76; held the same position at Harvard 1876–81; was appointed full professor there 1881. In 1878 he was elected fellow of the American Academy of Sciences. He has published *Elements of Differential Calculus* (1879); *Elements of Integral Calculus* (1881); and several syllabi of mathematical courses given at Harvard.

By'field, Nathaniel: b. at Long Ditton, Surrey, England, in 1653; removed to Boston, N. E., 1674, and became a

prominent merchant; was the principal settler of Bristol, R. I.; returned to Boston in 1724; became Speaker of the House of Representatives; was judge of the Bristol County court of common pleas for thirty-eight years, and of Suffolk County 1730–32; member of the council and judge of the vice-admiralty 1704–15 and 1729. D. in Boston, June 6, 1733.

By'ford, WILLIAM HEATH, M. D.: physician; b. in Eaton, Preble co., O., Mar. 20, 1817; was self-educated; became an active practitioner in Chicago; president of faculty and Professor of Clinical Surgery in the Women's Hospital Medical College; twice president of the American Medical Association; author of *Practice of Medicine and Surgery Applied to Diseases and Accidents Peculiar to Women* (rev. ed. 1871); *Theory and Practice of Obstetrics* (New York, 1870).

By-laws: originally laws (now usually called ordinances) made by a community or municipal corporation for the purpose of local government; by extension, rules or laws made by any corporation under authority conferred by its charter or by statute, or made by an unincorporated association with the consent of its members, for its own government or that of its members. It is a general rule that the power to make by-laws is incidental to the existence of a corporation. This power is sometimes expressly conferred upon the corporation in its charter, or vested in a select body, such as a board of directors. Where the charter is silent, however, the power appertains to the corporation itself, except in the case of charitable corporations which, in general, have no such implied authority. By-laws must be reasonable and consistent with law, and be enacted within the State where the charter is in force. A written entry is not essential to their validity, and their existence may be established by custom. The by-laws of a municipal corporation govern all persons within its jurisdiction; those of a private corporation have no force as such over persons not members, but the members are presumed to know them, and are bound by them. A penalty for their breach may be collected by an action at law. The by-laws of a municipal corporation are enacted in the exercise of a quasi-legislative capacity, and the corporation is not liable for damages resulting from the acts of citizens by whom they are broken.

Revised by F. STURGES ALLEN.

Byles, MATHER, D. D.: clergyman and wit; b. in Boston, Mass., Mar. 26, 1706. His father was a native of England; on his mother's side he descended from the Rev. Richard Mather and the Rev. John Cotton. He graduated at Harvard College in 1725; was ordained first pastor of Hollis Street church, Boston, 1733; soon attained eminence in his profession; also attracted considerable attention by his poetical talents. He continued happily with his parish till the excitement preceding the Revolution created a distrust against him, and he was accused of being a Tory and separated from his parish. Charges were afterward made against him that he prayed for the king and received visits from British officers, and in May, 1777, he was publicly denounced in town-meeting. On June 2 following he was placed on trial, pronounced guilty, and ordered to be confined on a guardship, and in forty days to be sent to England with his family; this sentence, however, was not executed, but he was confined to his own house, over which a guard was placed, afterward removed, but again replaced and again dismissed, causing him to say that he was "guarded, reguarded, and disregarded." His literary talent was recognized by many men of genius in England. He continued to reside in Boston, but was not again connected with any parish. D. in Boston, July 5, 1788.

Bylot's Bay: See BAFFIN'S BAY.

Byng, GEORGE: b. in Wrotham, England, Jan. 27, 1662–63; went to sea at the age of fifteen; in 1703 became rear-admiral of the red. Served in 1704 under Sir Cloudesley Shovel, and reduced Gibraltar; also distinguished for his services at battle of Malaga and off Messina, where, July 31, 1718, he dispersed the Spanish fleet. He was afterward made rear-admiral of Great Britain, member of the privy council, Baron Byng, Viscount Torrington, and Knight Companion of the Bath. In 1727 he became First Lord of the Admiralty. D. Jan. 17, 1733.

Byng, JOHN: admiral; son of Viscount Torrington; b. in 1704; gained the rank of admiral of the red in 1748. In 1756 he commanded an expedition sent to relieve Minorca, then blockaded by the French. He failed, and was accused of cowardice by the ministers, who sought to divert attention from their own inefficient measures by sacrificing him to the public indignation. He was tried by a court martial and shot on board the Monarque, at Portsmouth, Mar. 14, 1757.

Byng Inlet: a port of entry of the province of Ontario, Canada; on the north side of Georgian Bay, Lake Huron (see map of Ontario, ref. 1–C); has very extensive saw-mills, whence 20,000,000 feet of lumber are yearly sent to the U. S. It is visited in winter by dog-sledges, and in summer by regular steamers. Pop. about 200.

Byrd, WILLIAM: composer. See BIRDE.

Byrd, WILLIAM, F. R. S.: author; son of William Byrd, a wealthy collector of manuscripts; b. at Westover, Va., Mar. 16, 1674; studied law in London; long held important offices in Virginia. He was a patron of literature, and laid out in 1733 the towns of Petersburg and Richmond. He wrote many valuable sketches of his travels in Virginia. Some of his writings were published by Edmund Ruffin as *The Westover Manuscripts* (1841), and more completely in 1866 as the *History of the Dividing Line and Other Tracts*. They contain the *Records of the Virginia Company* (1619–24), purchased in England by him. D. in Westover, Va., Aug. 26, 1744.

Byron, GEORGE NOEL GORDON, Lord: poet; b. in London Jan. 22, 1788. He belonged to an ancient Norman family, whose name was variously written Burun, Biron, and Byron. JOHN BYRON (*q. v.*), the poet's grandfather, was a noted English admiral. Capt. Byron, the son of the admiral, married Catherine Gordon, a Scottish heiress, who had only one son, the subject of this notice. Capt. Byron was distinguished for nothing but his vices. Having squandered a large portion of his wife's property he deserted her, after which she retired to Scotland, and resided for some time at Aberdeen, where young Byron received the first rudiments of his education. Before he was seven years old, with his mother he visited the Highlands, the picturesque beauty of which, even at that age, made, it is said, a powerful impression on his mind. When he was ten years old he succeeded to the estate and title of his grand-uncle, William, fifth Lord Byron, who had resided at Newstead Abbey, where he died in 1798. The poet had a congenital deformity of his feet, which rendered him lame, and which was during his whole life a bitter mortification to him. When he was about twelve years old he was sent to school at Harrow. While here he became acquainted with Miss Chaworth, for whom he conceived a romantic and passionate love. She was the heiress of Annesley, which was adjacent to Newstead, the estate to which Byron had succeeded. This appears to have been one of the truest and deepest attachments of his life, and he seems to have fully persuaded himself that if he had married Miss Chaworth he would have been a far better as well as a happier man. He went in 1805 to Cambridge, which he left two years afterward without taking a degree. While at the university he published (1807) a volume of poems, *Hours of Idleness*, which was criticised in the *Edinburgh Review*. This critique was written by Mr. (afterward Lord) Brougham, but Byron always supposed that Jeffrey was the author. In retaliation he wrote *English Bards and Scotch Reviewers*, which may be said to have laid the foundation of his fame. This satire, though evincing great talent in its way, is in many parts egregiously unjust, as, for example, where the satirist speaks of Scott. It is but just to add that Byron himself afterward deeply regretted the publication of the poem, and did everything in his power to suppress it.

In 1809, in company with his friend Mr. Hobhouse, Byron commenced his travels through different parts of Europe—Spain, Portugal, European Turkey, and Greece. After an absence of about two years he returned to England, and published the first two cantos of *Childe Harold's Pilgrimage*, which were received with extraordinary favor, so that, as he himself informs us, he "awoke one morning and found himself famous." He soon after took his seat in the British House of Peers. At one time it would appear that he thought seriously of giving himself up to politics, but he soon changed his purpose, and turned his attention again to poetry. Within the next two or three years he produced several minor poems of exquisite beauty—namely, *The Giaour*, *The Bride of Abydos*, *The Corsair*, *Lara*, *The Siege of Corinth*, *Parisina*, and *The Prisoner of Chillon*. On Jan. 2, 1815, he was married to Miss Isabella Millbanke, only daughter of Sir Ralph Millbanke, afterward Noel. She was regarded as a great heiress. But, if Byron may be believed, his fortune was but little improved by this marriage.

He says: "All I have ever received or am likely to receive (and that has been twice paid back, too) was £10,000." The union was a very unhappy one, as well on account of Lord Byron's licentious habits as the incompatibility of temper of the two parties.

Lady Byron gave birth to a daughter, Ada, who became afterward the Countess of Lovelace. She was Lord Byron's only legitimate child; he addresses her in *Childe Harold* as "sole daughter of my house and heart."

Not long after the birth of Ada his wife left him, and, taking the child with her, went to her father's. He left England early in 1816, resolved never again to return to his native land. Passing through Belgium, he visited the field of Waterloo; he subsequently went to Switzerland, and resided near Geneva. Here he wrote the third canto of *Childe Harold*. He afterward abode some time in Venice. He next visited Ravenna, where he formed a *liaison* with the Countess of Guiccioli, whose sprightly and imaginative character, no less than her personal beauty, powerfully attracted him. While at Pisa in 1822 he experienced great sorrow in the tragic death of his friend, the poet Shelley. Early in 1822 Byron, Shelley, and Leigh Hunt were associated in the publication of a journal styled *The Liberal*, but Byron and Hunt quarreled soon after the death of Shelley, and *The Liberal* was discontinued.

While in Italy Byron wrote several of his most admired poems, including the fourth canto of *Childe Harold*, *Mazeppa*, *Manfred*, *Cain, a Mystery*, *Marino Faliero*, *The Two Foscari*, *Sardanapalus*, *Werner*, and *Don Juan*. He espoused with enthusiasm the cause of Greek independence, and in 1823 passed over from Italy to Cephalonia, where he spent several months. In the early part of 1824 he arrived at Missolonghi. He took, Apr. 9, a severe cold, which caused his death on Apr. 19, 1824.

Byron's poetic genius was of a very high order, but more distinguished for clearness and intensity than for breadth or versatility. His intellect partook in a remarkable degree of the character of his emotional nature. It was only under the influence of intense feeling or passion that he could put forth his poetical powers with any success. And hence it is that everything he has written is so strongly colored with his own personal feelings. He was perhaps the most intensely subjective of all the great poets that ever lived. This explains why he had no genius for dramatic composition. He could only represent successfully those characters which resembled his own. His soul was not capacious nor calm enough to reflect without distortion the infinitely varied pictures presented by the comedy and tragedy of human life. Wit and understanding, rather than imagination, were his leading intellectual traits. His most remarkable characteristic, as a poet, was his power of expressing intense passion, particularly of the darker and fiercer kinds. "Never," says Macaulay, "had any writer so vast a command of the whole eloquence of scorn, misanthropy, and despair." See Moore's *Life of Byron* (1830); *Recollections of the Last Days of Shelley and Byron*, by E. J. Trelawney (1858). Revised by Henry A. Beers.

Byron, Henry James: writer of burlesque dramas; b. in Manchester, England, 1834; was a lawyer by profession; contributed much to London *Fun*, of which he was for a time the editor. His principal works are travesties of various popular and standard dramas and operas—*Fra Diavolo*, his first effort (1858); *The Lady of Lyons*, etc.—but he produced several comedies, pantomimes, and novels—*Paid in Full* (3 vols., 1865); *Old Sailors*, first brought out in 1874; and *Our Boys* (1878). He also acquired distinction as an actor in London. D. in London, Apr. 11, 1884.

Byron, John: vice-admiral; grandfather of the poet; son of the fourth Lord Byron; b. at Newstead, Nov. 8, 1723; entered the navy; served in Anson's expedition of 1740; also against Louisburg in 1760; circumnavigated the globe (1764–66); fought D'Estaing off Granada, July 6, 1779, in the American war; was long known in the navy as "Foul Weather Jack," on account of the ill-luck attending his early service. D. Apr. 10, 1786.

Byssus: a bundle of silky or shining, semi-transparent, horny filaments by which many bivalve mollusks attach themselves to rocks or other fixed substances. These filaments are secreted by a gland at the base of the foot of the animal. They are guided to their place by the foot, and expand into a sort of disk at the point of attachment. An example of the byssus may be seen in common mussels. The *Pinna* of the Mediterranean produces long and strong filaments of a silky luster, which can be woven into cloth. This cloth is highly prized, but the *Pinna* has become so rare that it can not be produced in large quantities.

Byz'antine, or **Bezant** [from Byzantium, the old name of Constantinople]: in numismatics, is a term applied to a coin of the Byzantine empire. These coins were of gold, silver, and bronze; bore impressions distinct from the earlier Roman coins; were copied in several countries. They were current in the north of Europe, and even in India. The silver bezant was worth about 10*s.* sterling. The gold bezant was worth at one time £15 sterling.

Byzan'tine Art: the peculiar phase of art-development which originated in Byzantium. The city of Byzantium, or Constantinople, owing to its geographical situation was peculiarly open to mingled art influences, and developed out of Roman traditions, modified by the Greek taste and a liberal admixture of Oriental elements, a new art called Byzantine. It is the first distinctively Christian national art; is especially rich in decorative detail and in the use of color, and displays the failings as well as the merits incident to its transitional character. It flourished from the time of Constantine, 330 A. D., nearly to the fall of Constantinople in 1204, by which time, however, it had lost its original vigor and perfection. It strongly influenced the art of Venice and Northeastern Italy. Its architecture was based on a mingling of Roman and Oriental constructive principles, treated with Greek freedom, but it gave birth to few monuments of great size. Its noblest production, the Church of the St. Sophia (or Divine Wisdom) in Constantinople, now a mosque, was built in 532–538 under Justinian, and was the first great pendentive-domed church ever erected: it still remains one of the most imposing and beautiful structures in existence, resplendent with its unrivaled mosaics, superb columns of jasper and porphyry, and its majestic outlines. St. Mark's in Venice, though built nearly 500 years later by Byzantine architects, in imitation of the Church of the Apostles at Constantinople, is a magnificent example of a later phase of Byzantine architecture, and Ravenna is also rich in splendid Byzantine monuments. The dome is a distinctive feature of all Byzantine religious architecture. The most highly developed of Byzantine arts was that of mosaic; but ivory-carving, the illumination of MSS., and the production of splendid fabrics, were almost equally advanced. In Russia and Greece the traditions of Byzantine art are not yet wholly extinct. A. D. F. Hamlin.

Byzantine Empire; also called **Eastern** or **Greek Empire**: the name of a former empire of Europe which came into existence in 395 A. D., upon the death of the Roman Emperor Theodosius the Great, who divided his empire between his two sons, Arcadius and Honorius. While the latter received the western half as his portion, Arcadius became ruler of the eastern empire, then comprising Syria, Asia Minor, Pontus, Egypt, Thrace, Mœsia, Macedonia, Crete, and Greece, with the capital at Constantinople. The history of the Byzantine empire extends from 395 A. D. to 1453. During the reign of Arcadius ambitious politicians wielded an unlimited power, and oppressed the people to satisfy their rapacity. Arcadius was followed by his seven-year-old son, Theodosius II. (408–450), for whom a prefect ruled with wisdom and strength. In 415 he took his sister Pulcheria as co-regent, who from that time took charge of the entire administration. Peace and prosperity reigned during Theodosius's rule, and were only interrupted by a short war with Persia in 422, which led to the acquisition of a part of Armenia. But peace with Attila, King of the Huns, could only be purchased by large tracts of land on the Danube and large sums of money. Upon the death of Theodosius he was succeeded by his sister Pulcheria. She married the senator Marcianus, who reigned until 457. Under Justinian (527–565), who became famous by his legislation and the victories of his generals, Belisarius and Narses, the Byzantine empire gained great influence and power among the other nations, while in the interior the dissensions of the parties were quelled effectually. Under the nephew and successor of Justinian (Justinus II., 565–578) the empire suffered from invasions of the Lombards and Persians. In 718 Leo III. ascended the throne, and continued to sustain himself in spite of the contest concerning the worship of images which continued for over a century, and of the attacks of the Arabs. He died in 741, having wrested Phrygia from the Arabs, but lost the last rem-

nant of territory in Italy. Basilius I. Macedo, the founder of the Macedonian dynasty, ascended the throne in 867. He introduced reforms in all branches of the administration, and revised the laws of Justinian. He was succeeded by his son, Leo VI., who called upon the Turks to aid him against the Saracens, and thus opened the way for the Turks. After the extinction of the Macedonian dynasty in 1057 Isaac Comnenus was raised to the throne by the unanimous vote of the army. He introduced many reforms, and entered a monastery in 1059. Among his successors Alexius I., who began to rule in 1081, was the most important. He increased the area of the empire considerably. The dynasty of the Comnenian emperors continued to rule until 1204. In 1204 Constantinople was taken by the French and Venetians (called the Latins), who then became masters of the whole empire. They divided it into four parts, giving the first with the capital to Baldwin, Count of Flanders, who was made emperor, and whom the other participants in the expedition recognized as their sovereign. The Venetians received as their share the countries bordering on the Adriatic and Ægean Seas, a part of the Morea, together with several islands; Bonifacius, Count of Montferrat, received Macedonia and part of Greece; dukedoms, countships, principalities, etc., were established at various places; while a number of Greek princes maintained their independence. Under Theodorus Lascaris, who had been elected emperor at Constantinople, an empire was formed at Nicæa (Nice). In Trebizond Alexius Comnenus ruled with absolute power. One of his successors, John Comnenus, became Emperor of Trebizond. Neither Baldwin nor his successors could do anything to avert the impending ruin. Baldwin was taken prisoner by the Bulgarians, and died in 1206. His brother Henry ruled bravely and wisely till 1216, when the empire became a prey to utter anarchy.

The dynasty of the Palæologi began with Michael VIII. Palæologus, who, by the help of the Genoese captured Constantinople in 1261. Michael, the first of the Palæologi, was an able prince, but offended both clergy and people by an attempt to unite the Greek and Latin Churches. Andronicus III., a great-grandson of Michael, became emperor in 1328. During his reign the Turks took Nicæa and Nicomedia and devastated the European coasts. In the reign of his son, Johannes V., the Turks began to gain ground in Europe, and in 1362 Sultan Amurath had made Adrianople his capital. Under the following rulers the empire rapidly declined, giving way more and more to the advancing forces of Turks, until on May 29, 1453, with the capture of Constantinople by Mohammed II. and the death of Constantine XI., the Byzantine empire came to an end, and the Turkish rule was, after centuries of fierce warfare, firmly established in Europe. Revised by C. K. ADAMS.

Byzantine Historians: Greek writers who have treated of the history of the Byzantine empire. They fall into two groups, historians proper and chroniclers. The historians deal with contemporaneous events and special epochs, follow classical models, and write for a cultivated public. The chroniclers deal with universal history, write for the people, and dwell on matters that appeal to the popular taste, such as plague, pestilence, and famine, comets and earthquakes, great buildings, and famous chariot-races. The church makes itself felt throughout, and the language, if not exactly the language of the people, is one the people can understand. The historians constitute the best part of Byzantine literature, but they have no new critical method, no new conception of history. They move along the lines of old formulæ, and the old tradition persists in the representation of life as in the character of the language. They are not uncritical, as antiquity counted criticism, and they show a laudable desire to gather information from living sources. They do not neglect geography or ethnology, and, as many of them were men of high official station, there is no lack of original state papers, of original letters for the substantiation and illustration of the narrative. Despite the artificiality of the language, the character of the period is mirrored in the great space given to diplomatic and theological quarrels, and if the pressure of Byzantine despotism has proved fatal to veracity here and there, if the narrative is colored at times by personal sympathies and personal antipathies, yet on the whole there is a recognition of the historian's duty to be impartial and to be truthful. Of the multitude of authors, only a few can be mentioned here. Among the most important of the historians are Procopius, Agathias, Theophylactus, Constantine Porphyrogenitus, Leo Diaconus, Nicephorus Bryennius (see BRYENNIUS) and his wife, the famous Anna Comnena, all mentioned in their proper places. Among the chronielers may be noted Johannes Antiochenus, Johannes Malalas, Theophanes Confessor, Xiphilinus, and Zonaras. Much remains unpublished.

EDITIONS.—The Paris *Corpus*, edited by Labbé, 1648–1711, in 42 parts; reprinted with additions at Venice, 1729–1733; the Bonn *Corpus*, 1828–78, 49 volumes, much of which has been taken up into Migne's *Patrologia Græca*. See Krumbacher, *Geschichte der byzantinischen Litteratur* (Munich, 1891).

Byzantine Recension: a Greek text of the New Testament; used in Constantinople after it became a metropolitan see in the Eastern Church. It is cited by several Greek Fathers, and was used as the basis of the old Slavic version. It corresponded quite nearly with the present "received text" and with many existing MSS.

Byzan'tium (in Gr. Βυζάντιον): an ancient Greek city; situated on the Thracian Bosphorus, and on the site of the modern Constantinople. It is said to have been founded by a colony of Megarians in 667 B. C. It increased rapidly, and soon became an important commercial city. Few cities could boast so magnificent a position. Commanding as it did the two shores of both Europe and Asia, at the same time secure and advantageously situated for commerce, it had at its command the choicest gifts of nature and the most charming scenery. Byzantium was very evidently the site of extensive tunny-fisheries, the fishes visiting the port periodically in immense numbers, as they do at the present day. The fish were salted and exported. The name "Golden Horn," still applied to a part of the channel of Constantinople, was probably derived from the great revenue flowing from this fishery. The Byzantines also levied a considerable toll on vessels passing from sea to sea. The levying of these tolls once involved them in war with the Rhodians. They also derived much profit from their rich corn-fields not far from the city. On the S. it was bathed by the Propontis (Sea of Mármora), and on the N. by the waters of the Golden Horn. Having been captured by a general of Darius Hystaspis, it was liberated by Pausanias about 478 B. C. A few years later Byzantium became an ally or tributary of Athens, against which it revolted in 440 B. C. It was besieged and taken by Alcibiades in 408. Philip of Macedon besieged it in 340 B. C., but Demosthenes persuaded the Athenians to send a fleet which compelled him to raise the siege. This repulse of Philip was one of the proudest feats of the great orator, who often recurs to it in his speech *On the Crown*. Byzantium was for ages especially exposed to the attacks of barbarians, but the long wars did not beget much valor in the people. From their great commercial prosperity they early became corrupted, and they were proverbially indolent, cowardly, and luxurious. Byzantium was probably either a kingdom or the seat of a tyrannus; afterward it became an aristocracy, and later a crude democracy.

The Byzantians suffered much from the predatory incursions of the Gauls, and, being unable to resist them in battle, agreed about 279 B. C. to pay them an annual tribute. This city supported Pescennius Niger in the civil war against Septimius Severus, who captured it in 196 A. D. after a brave resistance of three years' duration. He then reduced it almost to ruin, but afterward relented and partially restored it. The name of *Augusta Antonina* was given to it in his time. The Greek Christians ascribe the foundation of the Byzantine Church to the labors of St. Andrew the apostle, but this statement is unsupported by trustworthy evidence. It is, however, certain that soon after 200 A. D. there were numerous Christians in the city. In 330 A. D. Constantine the Great selected this place as the capital of his empire, and founded a new city, which he intended should rival Rome, and to which he gave the name of New Rome. This city of Constantine was much more extensive than Byzantium, which occupied in all probability only the most eastern of the seven hills on which the modern capital is built. See CONSTANTINOPLE.

Bzo'vius, or **Bzowski**, bzhov'skĕe, ABRAHAM: a Roman Catholic historian; b. at Proczovie, Poland, in 1567. He was a zealous Dominican prior; was called to Rome by Pius V., where he wrote in Latin 9 volumes of a continuation of the *Annals of Baronius*; an *Ecclesiastical History* (2 vols. fol., Rome, 1616); and other historical works, besides numerous sermons and biographies of several popes. D. in Rome, Jan. 31, 1637.

C

: the third letter of most European alphabets; is in English either a palatal explosive, with the sound of *k*, a sound which it has before *a*, *o*, *u*, and the consonants (except *h*), unless marked with the cedilla, thus, *ç*, as in *façade* and other words, mostly from the French and Portuguese. When marked with the cedilla, or when occurring before *e*, *i*, or *y*, it has the sibilant sound of *s*. *Ch* has (1) the Spanish sound, as in the word *church*; (2) the French sound (equivalent to *sh*, the German *sch*), as in *chaise*; and (3) the hard sound, equivalent to *k*, as in *chord*. The German guttural *ch* is never used in English. C in music is the first note of the "natural" diatonic scale, which scale is so called because it requires neither flats nor sharps in its signature. In the ancient Greek system of tonality the scale of which C forms the initial note was called Ionic. C in Latin stood for 100, and also for the prænomen Caius. In chemistry it is the symbol of carbon; and *c. c.* is an abbreviation for "cubic centimeter."

Caaba: See KAABA.

Caaing-whale, kaw'ing-hwāl' [Scottish, driving-whale]: the *Globicephalus melas*; a large porpoise which abounds in herds on the coasts of Great Britain, North America, Iceland, etc. It takes its name from the fact that when one of the herd is stranded the rest all follow it, sometimes as many as 100 at once rushing to their own destruction in this manner. They are the source of rich booty to fishermen. Other species of the genus inhabit the Mediterranean, the Pacific, etc. It is one of the black-fish whales of North America, and is most frequently caught off the coasts of Scotland.

Cabal' [from Fr. *cabale* < Late Lat. *cabbala* < Heb. *gabbālāh*, tradition; hence the secondary meaning of *cabbala*, secret doctrine or art]: a secret council formed under the reign of Charles II. (1667); consisted of the following members: Sir Thomas, afterward Lord Clifford, Lord Arlington, the Duke of Buckingham, Lord Ashley, afterward Earl of Shaftesbury, and the Earl of Lauderdale. The Cabal was dissolved in 1674. The prevailing opinion that the word was formed from the initials of the names of its members is perhaps erroneous, as it had been used before to denote a secret cabinet, and is said to be derived from the Hebrew (see CABBALA), but this accidental association of the initial letters may have suggested this particular application of the name.

Caballero, kăă-băl-yā'rō, FERNAN (pseudonym of *Cäcilia Böhl von Faber*): Spanish novelist; b. of German parents resident in Cadiz, Dec. 25, 1796. She made a wide reputation by her stories describing the local customs of various parts of Spain. Among her novels the following are worth mentioning: *La Gaviota*; *Un Verano en Bornos*; *Pobre Dolores*; *Clemencia*; and the tales called *Relaciones* and *Cuadros de Costumbres*. D. Apr. 7, 1877. The best edition of her works is that of Madrid, 18 vols., 1855–67.

Cabañas, kăă-baa'nyas: a port of North Cuba, Pina del Rio province, W. of Havana. The bay resembles that of Havana in its formation. Its narrow entrance is overlooked by Fort Reina Amalia. Pop. 1,500.

Cabanel, kăă'ba-nel', ALEXANDRE: painter of genre, history, and portraits; b. at Montpellier, France, Nov. 28, 1823: d. in Paris, Jan. 23, 1889; was a pupil of Picot; won the Grand Prix de Rome in 1845; was a perfect type of the artist whose methods are founded on the classicism of David in his historical work, and only in his portraits, of which he painted a large number, did he show that he was affected by more modern influences. He was for many years one of the Professors of Painting in the École des Beaux-Arts, and among his pupils are some of the most famous French artists. His list of honors is a long one, including a first-class medal at the Paris Exposition of 1855; the medal of honor at the Salon of 1865; medals of honor at the Universal Expositions in 1867 and 1878; member of the Institute 1863; commander Legion of Honor 1884. His *Death of Moses* (1852) is in the Corcoran Gallery at Washington; his portrait of Miss C. L. Wolfe is in the Metropolitan Museum, New York; and five of his works, including the *Apotheosis of St. Louis* (1855) and the *Birth of Venus* (1863), are in the Luxembourg Gallery, Paris. In the Panthéon at Paris are his frescoes depicting the life and education of St. Louis. Many pictures and portraits by him are owned in the U. S. His portraits of men are lacking in virility and vigor, but his portraits of women are distinguished and refined, though often somewhat insipid. He was a graceful and accurate draughtsman. Replicas of his *Birth of Venus* are in the collections of John Wolfe, New York, and H. C. Gibson, Philadelphia. WILLIAM A. COFFIN.

Cabanis, kăă'ba-nee', PIERRE JEAN GEORGE: philosopher and physician; b. at Cosnac, Charente-Inférieure, France, June 5, 1757. He was a friend and political partisan of Mirabeau, whom he attended in his last illness. He was admitted into the Institute in 1796, and became Professor of Medicine in Paris in 1797. In the early part of his life he was an atheist. His principal work is the *Relations between the Physical System and Mental Faculties of Man* (Rapports du Physique et du Moral de l'Homme, 1802), in which he maintained that "the brain secretes thought as the liver secretes bile." But he afterward changed his opinions in this respect, and adopted theistic views. D. near Meulan, May 5, 1808.

Cabbage [from Old French *cabus*, dialectally *caboche*, a cabbage; from Lat. *caput*, a head]: a garden esculent of the mustard family. The cabbage in some of its forms has been cultivated from prehistoric times. It is a native of Europe, where the wild plant is still to be found upon certain seacoasts. *Brassica oleracea*, the species to which the cabbage belongs, is supposed to have given rise to the cauliflower, kales, and Brussels sprouts, and some botanists even suppose that some of the turnips have had a similar origin. In English there is no generic name to cover all these forms as there is in French in the word *chou*. The cabbages are commonly divided into two general groups, the common smooth sorts and the Savoys, which are characterized by blistered leaves. The common cabbages are again grouped according to the shape of the head, as spherical, oblong, conical, and flat; and there are also green and red varieties. Collards is a kale-like vegetable belonging to this same species, or sometimes young cabbage plants, which are used for "greens," are so called. The cabbage is an important crop in temperate climates. In 1890 77,094 acres were devoted to it in the truck-farms of the U. S., and 1,268 acres were devoted to the growing of seed. Seed for early cabbages is sown in hotbeds, but that for the late crops is sown in seedbeds in the open, or sometimes even planted in the position in which the plants are to grow. Cabbages demand a deep and rich soil, and one which is not liable to injury from drouth. Over 100 varieties are now known and cultivated in the U. S. L. H. BAILEY.

Cabbage Butterfly: any one of those butterflies the larvæ of which feed upon cabbage and allied plants. These are mostly confined to that group called *Pieridæ*, the prevailing color of which is yellow or white. Two of the most common species (*Pieris rapæ* and *Pontia protodice*) are natives of North America, but they seem to be lessening in numbers since the advent of the European form, *Pieris rapæ*, which was introduced some thirty years ago. They are difficult pests to deal with since the larvæ bore into the heads of the cabbage, and hence poisons can not be used conveniently.

Cabbage-fly (*Anthomyia brassicæ*): a fly of the same family with the house-fly, flesh-fly, etc., of which the maggots often do injury to the roots of cabbages. It is of the same genus with the turnip-fly, onion-fly, etc. They are found in America and Europe, and are very destructive. The larvæ are a dull-reddish color, and the round of metamorphoses is about eight weeks. Lime-water destroys them.

Cabbage-palm, or **Cabbage-tree**: one of several species of palm, the great terminal bud of which is eaten like cabbage, and also bears nuts of which the kernel is sweet. The

cabbage-palm of the West Indies is the *Euterpe oleracea*, which grows to the height of 120 feet or more. The palmetto (*Sabal palmetto*) is sometimes called cabbage-palm.

Cab'bala, or **Kabbalah** [Late Lat., from Heb. *gabbālāh*, what is received, tradition]: an ancient Jewish system of religious philosophy or theosophy. Those who have studied the subject with the greatest care are not fully agreed among themselves as to its origin and character. The Cabbala attempted to explain the nature of God and of the universe. Some of the late writers of this school taught that God has neither will, intention, desire, nor action, but that ten *Sephiroth*, or intelligences, emanated from God. The first *Sephirah* is called the *Inscrutable Height* (from which the second was derived, as the third from the second, and so on). The names of the other intelligences in order are wisdom, intellect, grace, power, beauty, firmness, splendor, foundation, and authority. As God became active in these *Sephiroth*, so these become externally manifested in the universe.

The psychology of the Cabbala teaches the doctrine of the transmigration of souls, but as the literature of the system is immense, and its teachings recondite and often puerile, it is difficult and unnecessary to state exactly what this philosophy taught. It probably was influenced by the Greek philosophy known as Neo-Platonism. According to recent authorities it originated among Jewish thinkers of the tenth century. See Knorr von Rosenroth's *Cabbala Denudata*, or its English translation, *The Cabbala Unveiled*, by S. L. M. Mathers (London, 1887), containing three books of the Zohar. Revised by W. T. Harris.

Cabbalists: those Jews who believe in the Cabbala, or traditional interpretation of the Pentateuch, said to have been received by Moses from God on Mt. Sinai. See preceding article.

Cabeiri: See Cabiri.

Cabell Court-house: See Barboursville.

Cabell, William: member of a family eminent in the annals of Virginia; b. in Licking Hole, Va., Mar. 13, 1730; eldest son of William Cabell, surgeon, who emigrated from England to America in 1723, and obtained extensive grants of land on the James river. William Cabell, Jr., was sheriff of Albemarle County 1751; "his majesty's presiding justice" and member of the house of burgesses 1757; commissioner for settling military claims 1758; member of the house of burgesses when the colonies revolted; member of the committee that prepared the "bill of rights"; first presiding magistrate for the U. S. after the Declaration of Independence; unanimously chosen presidential elector in 1789. He left an estate of 20,000 acres. D. at Union Hill, Va., Mar. 23, 1798.

Cabestaing. Guillem, de: a famous Provençal poet; lived and wrote in the second half of the twelfth century. Little is known of his life except the improbable tale of the end of it. This is, in brief, that having loved Margarida, wife of Count Raymond of Roussillon, he was slain by the latter, and his heart was offered by the angry lord to his wife to eat. She, having eaten of it, declared that it was the sweetest morsel she had ever tasted, and that she would never eat other food after it. So she threw herself from the turret of the castle and was killed. This tale was very widely known in the Middle Ages, and was used by Boccaccio. See Diez, *Leben und Werke des Troubadours* (2d ed. 1882); Franz Hüffer, *Der Trobador Guillem de Cabestanh, sein Leben und seine Werke* (1869); E. Beschnidt, *Die Biographie des Trobadors G. de C., und ihr historischer Werth* (1879). A. R. M.

Cabet, kăă'bā', Étienne: socialist; b. in Dijon, France, Jan. 2, 1788. He was a radical democrat in politics and a leader of the Carbonari. In 1842 he published a romantic work called *Travels in Icaria*, which was very popular among the workingmen of Paris. He planted in 1846 a colony on the communist system on the Red river in Texas, from which he and his followers removed in 1849 to Nauvoo, Ill., after that town had been deserted by the Mormons. D. in St. Louis, Mo., Nov. 9, 1856. His colony, which had never enjoyed much prosperity, was broken up in 1857.

Cabeza de Vaca: See Vaca, Alvar Nuñez, etc.

Cabin: a small room or inclosure; a cottage, small house, or rudely built temporary residence. Also an apartment in a ship or steamboat for the use of the officers and passengers. These apartments in steamboats are often called saloons. In ships of war the rooms of the admirals and captains are called cabins, and are fitted up with much elegance.

Cabinet: specifically, a body of counselors, generally composed of the heads of executive departments, on which the responsibility of government devolves. The name is taken from the cabinet or private apartment where a king was accustomed to meet his privy council in secret conference. Before the modern cabinet was developed the term was used reproachfully, as implying a government by intrigue of court favorites. It is not now a body known to the law in either the United Kingdom or the U. S. Under the Tudors and Stuarts the privy council was the council of state. The modern cabinet began under William III., who placed the ministry on a parliamentary basis and required party unity among its members, and he and Queen Anne were wont to preside over its meetings. Under the first two Georges, who scarcely understood English, the cabinet acquired independence of the crown, and no subsequent monarch has been able to regain control, so that it is a maxim of the British Government that the monarch shall not attend the discussions of his advisers. He may dismiss his ministry, however, and appeal to Parliament, and even to the country, but the proceeding has become hazardous and is not attempted. The Prime Minister selects from the chief officers of the Government, whose names he submits to the crown, those whom he will have in his cabinet, and he is not restricted as to their number nor their division between the two Houses of Parliament, except that prescription has fixed the number at not less than eleven, viz.: First Lord of the Treasury, Lord Chancellor, Lord President of the Council, Lord Privy Seal, Chancellor of the Exchequer, First Lord of the Admiralty, and the five Secretaries of State. This body is the responsible Government of the United Kingdom, and stands or falls together. Its meetings are secret, no record of its proceedings is kept, it is dishonorable to divulge its deliberations, each member is bound by its decisions or must resign his office in the ministry, and in practice he is a member of Parliament.

In the U. S. the cabinet is composed of the chiefs of the eight executive departments created by acts of Congress, viz.: the Secretaries of State, Treasury, War, Attorney-General, Postmaster-General (created in 1789), Secretary of Navy (1798), Secretary of Interior (1849), and Secretary of Agriculture (1889). Their meeting as advisers of the President is unknown to the law or constitution, and their conclusions in cabinet have no binding force, except that a dissenting member would resign office if he could not conform. By act of 1886 members of the cabinet in the order named, except the Secretary of Agriculture, succeed to the performance of chief executive functions when by removal, death, resignation, or disability, the offices of President and Vice-President are both vacant, until the disability is removed or a President is elected. In this event Congress must be assembled within twenty days. See Camarilla. C. K. Adams.

Cabi'ri, or **Cabeiri** (in Gr. Κάβειροι): ancient divinities worshiped in Samothrace, Phœnicia, Greece, and other countries. The myth of the Cabiri is obscure, and not well explained by ancient writers. Their worship was performed with much solemnity and mystery. The earliest mention of them in literature is in a drama by Æschylus, entitled Κάβειρος, in which they are represented as beneficent beings who mingle freely with the Argonauts during the visit of the latter to Lemnos.

Cable: a rope or a chain mostly employed on shipboard to connect the ship with her anchors. The name is often applied to wire ropes, especially such as are used in suspension bridges and to submarine telegraph lines, etc. Rope cables are made of the best hemp, of manilla, or of coir. The circumference varies from about 12 inches to 26. A number of yarns are twisted to form a *lissum*; three lissums, twisted in an opposite direction, form a *strand*; and three strands twisted in the direction of the yarns in a lissum form a *cable*. The strength of a cable varies according to the square of the diameter. On shipboard, cables receive the names of *sheet* cables, *bower* cables, etc., according to the anchor to which they are attached. Hempen cables have been superseded by chain. Chain cables consist of links the length of each of which is about six diameters of the iron of which it is made, and the breadth about three and a half diameters. See Ropes and Rope-making. Revised by S. B. Luce.

Cable, Electric: a conductor or set of conductors for the electric current, in which protection from injury is provided for by surrounding the insulating coat with a sheath or armor. Cables for use underground, where the chief sources of injury are of a chemical nature, are commonly surrounded

with a sheath of lead. Submarine cables, which are subject to continual abrasion, are incased in an armor of steel wire.

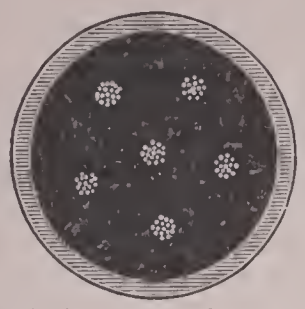


FIG. 1.—Underground cable, containing six-stranded conductors for electric lighting.

FIG. 2.—Submarine cable, with one-stranded conductor.

For the sake of greater flexibility, cables, even when they contain but a single circuit, are usually made up of many strands.

Cable, GEORGE WASHINGTON: novelist; b. in New Orleans, Oct. 12, 1844; served in the Confederate army during the civil war, after the close of which he returned to New Orleans; engaged in surveying, journalism, and various mercantile occupations until 1879, when he began to devote himself wholly to literature. He gave readings from his stories in Northern cities, and since 1885 has resided in Connecticut and in Northampton, Mass. His fictions relate mainly to Louisiana life, and illustrate Creole dialect and character. Among them are *Old Creole Days* (1879–83); *The Grandissimes* (1880); *Madame Delphine* (1881); *Dr. Sevier* (1885); *Bonaventure* (1888), etc. He also wrote essays on the penal systems and the condition of the colored race in the Southern States. HENRY A. BEERS.

Cabot, JAMES ELLIOT: b. in Boston, Mass., June 18, 1821; writer for *The Dial* in 1844; edited *The Massachusetts Quarterly* 1848–50; edited *Audubon's Birds of America*; contributor to the *Atlantic Monthly*, *The North American Review*, and other magazines; undertook on invitation of R. W. Emerson the editorship of his writings; published in 1887 *A Memoir of Ralph Waldo Emerson*. W. T. HARRIS.

Cabot, JOHN: a foreign merchant of Bristol who, after the discovery of America by Columbus, was placed in command of a fleet of five vessels, which sailed in the spring of 1497. They reached the coast of Newfoundland (according to Sebastian Cabot's map, found in the geographical cabinet of the National Library in Paris) on June 24, and were in England again in August. Nothing is heard of him after 1498, and he is supposed to have died about that time. The date of his birth is not known.

Cabot, SEBASTIAN: navigator; son of the preceding; b. in Bristol, England, 1477. He is supposed to have been with his father in the voyage of 1497, and there are some indications that he visited the North American coast in 1503. In 1517 he commanded an English expedition in search of a Northwest passage, discovering the entrance of Hudson's Bay and penetrating to lat. 67° 30′ N. Invited by Charles V. to Spain, he was made Grand Pilot of Castile (1518), and in this capacity commanded four ships which left San Lucar in Apr., 1526, to follow Magellan's route to the Moluccas. Touching on the coast of Brazil, he entered the Plata, ascended the Paraná and Paraguay to the site of Ascencion, and, abandoning the Molucca voyage, built the fort of Espirito Santo on the Paraná, thus founding the Spanish colonies in this region. Receiving no aid from Spain, he returned in 1530, leaving a garrison. He remained in the Spanish service until the end of 1546, when he went to England. Edward VI. granted him a pension, and he was influential in promoting English commercial enterprises, especially to the Baltic. D. in London, 1557. A map of the world, published in Holland in 1544, is aseribed to Cabot. See Biddle, *Sebastian Cabot* (1831); Harrisse, *Jean et Sebastien Cabot* (1882); Demersay, *Histoire du Paraguay*. HERBERT H. SMITH.

Cabra, kaa′brăa (anc. *Ægabrum*): a town of Spain; in the province of Cordova; 30 miles S. S. E. of the city of Cordova (see map of Spain, ref. 19–E). It has a college, a cathedral, a convent, and manufactures of linens, hats, soap, bricks, etc. The neighboring region is volcanic, and produces excellent wine. Pop. about 14,000.

Cabral′, PEDRO ALVAREZ, or PEDRALVEZ: Portuguese navigator; b. about 1460. In 1500 he commanded a fleet of eighteen vessels destined to follow the route to India which had been opened by Vasco da Gama. Obeying his instructions, he kept far out in the Atlantic, and thus, on Apr. 22, discovered the Brazilian coast about lat. 16° 20′ S. (See BRAZIL.) Continuing his route, May 2, Cabral soon lost four ships in a storm; with the rest he proceeded to Mozambique and Calicut. A fort which he founded at Calicut was destroyed; he then made an alliance with the sovereign of Cochin, loaded his vessels with spices, and, losing one more ship on his return, reached Lisbon, July 23, 1501. Of Cabral's subsequent life nothing is known; he probably died about 1526. See Capistrano de Abreu, *Descobrimento do Brasil* (Rio de Janeiro, 1883); Barros, *Decadas das Indias*. HERBERT H. SMITH.

Cabrera, kaa-brā′raa, Don RAMON: general and Carlist; noted for his cruelty; b. in Tortosa, Catalonia, Spain, Aug. 31, 1810. In the civil war which began about 1834 he fought for Don Carlos against the Christinos, and became a leader of guerillas. He gained a victory at Buñol in Feb., 1837, and took Valencia; but he was driven out of Spain by Espartero in 1840, and retired to France. He returned in 1848 and renewed the contest, but he was defeated and went into exile in Jan., 1849; supported the government of Alfonso XII. D. at Wentworth, England, May 24, 1876.

Cabrera Bobadilla y Mendoza, LUIS GERONYMO FERNANDEZ, de: fourth Count of Chinchon; Spanish administrator; b. about 1575. From Jan., 1629, to Dec. 18, 1639, he was Viceroy of Peru. His administration was a difficult one, owing to the constant demand from Spain for a larger revenue; he also had to deal with the Araucanian war in Chili, and with an insurrection of the Urus Indians of Lake Titicaca. The most memorable event of his term was the discovery of the medicinal properties of Peruvian bark, with which the viceroy's wife was cured of a fever. He died at his castle, near Madrid, in 1647. HERBERT H. SMITH.

Cabul, ka-bool′ (properly kaw′bo͝ol): a fortified city of Afghanistan; on the Cabul river, here crossed by three bridges; 80 miles N. N. E. of Ghazni; about 6,400 feet above the level of the sea; lat. 34° 30′ N., lon. 69° 6′ E. (see map of Asia, ref. 5–D). The climate in winter is very severe. The citadel, called Bala Hissar, includes the palace of the Khan, the government offices, royal gardens, and numerous dwellings. The streets are narrow; the houses are two or three stories high, and have flat roofs. The public buildings are not remarkable. Cabul is widely celebrated for the variety and excellent quality of its fruits, apples, pears, pomegranates, grapes, etc. It has an extensive trade as an entrepôt between India and Turkestan. The people of Cabul are Mohammedans and a mixture of several races. Under the Emperor Bâber, Cabul was the capital of the Mogul empire. It was taken by Tamerlane about 1400, and by Nadir Shah in 1738. The British captured it in 1839, but in Jan., 1842, the Afghans revolted and massacred the British army. Shere Ali took it from his revolted brothers in 1868; it was again captured in 1879 by Sir Frederick Roberts, in retaliation for the destruction of the British residency. Pop. 50,000 to 60,000.

Caca′o [Span. form of native Mexican name of the tree *caca-uatl*]: the fruit of the *Theobroma cacao*, a tree of tropical America; of the family *Sterculiaceæ*. Chocolate and cocoa are made of the roasted oily kernels of the cacao nut, which also yields cacao butter. This tree should not be confounded with the cocoanut tree, nor with the coca of Peru.

Cacao Butter: a fixed oil, hard and solid at ordinary temperatures; is yielded in large quantities by the fruit of *Theobroma cacao*. It is extracted by heat and pressure. It contains a very large proportion of stearin, with some olein and palmitin. It is largely used in the preparation of cosmetics, and is especially useful in pharmacy in the preparation of suppositories. The mafurra tallow which is brought from Madagascar closely resembles the above in chemical and physical properties. Cacao butter is not to be confounded with cocoa butter, which is a kind of palm oil, used in the manufacture of soap.

Cac′apon, or **Great Cacapon**: a river of West Virginia; rises near the south extremity of Hardy County; flows nearly northeastward through Hampshire and Morgan Counties, and enters the Potomac. Length about 140 miles.

Cáceres, kaa′thā-rās: a province of Spain; bounded N. by Salamanca, E. by Avila, Toledo, and Ciudad Real, S. by Badajoz, and W. by Portugal. Area, 8,014 sq. miles. It is intersected by the river Tagus. The surface is diversified by several ranges of mountains. Capital, Cáceres. Pop. (1887) 339,793.

Cáceres (anc. *Castra Cæcilia*): a town of Spain; capital of province of same name; situated on high ground, 25 miles W. by N. from Trujillo (see map of Spain, ref. 16–C). It contains an old castle, an episcopal palace, several convents and hospitals, a theater, a Jesuits' college, and a bull-ring which is one of the largest in Spain. It has manufactures of linens, woolen goods, hats, soap, wine, etc. Interesting Roman and Moorish antiquities are found here. Pop. about 15,000.

Caceres, Andres Avelino: Peruvian soldier and statesman; b. in Ayacucho, Nov. 11, 1838. He served as an officer under Castilla and Prado, and, on the overthrow of the latter, was imprisoned for a year. Under President Pardo he distinguished himself by quelling a mutiny. When the war with Chili broke out in 1879 he was a colonel. He served in most of the battles, became brigadier-general, and after the fall of Lima was chosen second vice-president in the provisional Calderon government, June, 1883. The captivity of Calderon and the absence of the first vice-president left Caceres as acting president of Peru. Supported by the interior provinces, he held out against the Chilians, and declared against Iglesias, whom they had made president at Lima. An attempt of Caceres to take the capital failed after a hard street-fight (Aug., 1884), but a second attempt succeeded without bloodshed (Dec. 1, 1885). Caceres then agreed with Iglesias to refer their rival claims to a general election. This resulted in favor of Caceres, who was inaugurated president of Peru, June 3, 1886. Under his administration the country began to recover from the ruin which had resulted from the war; the state railroads and guano beds were given up to a private company, which assumed part of the national debt. Gen. Caceres went as Peruvian minister to France and Spain in 1891. In 1894 he again became president. Herbert H. Smith.

Cáceres, Nueva, noo-ā′vāă (i. e. New Cáceres): a town of the Philippine islands; in Luzon; on its southeast coast, 184 miles S. or S. E. of Manila, a seat of a bishop (see map of East Indies, ref. 3–H). Pop., including suburbs, about 12,000.

Cachalot, kash′a-lot [from Sp. *cachalote*, by way of Fr. *cachalot*]: a book-name for the sperm whale (*Physeter macrocephalus*), the largest of the toothed whales and of the family *Physeteridæ*. It has a blunt head which forms nearly one-third of the total length; there is no back fin, but in its place a low hump; the paddles are short and squarish, and the tail or flukes broad and powerful. The right nostril is aborted, and the left opens by a long slit on the left anterior portion of the head, a conformation which causes the very characteristic "spout" of this species, resembling, as it does, a puff of smoke from a gun, and by which it may be readily recognized at a long distance. The upper jaw overhangs the lower and contains no teeth, although rudimentary teeth are present in the young, concealed beneath the gum. The two halves of the slender lower jaw are opposed for the greater portion of their length, and each contains about twenty-one conical teeth. The color is blackish, lighter beneath. Old males are said to attain a length of 70 feet, but 40 to 50 is the average size. The females are smaller and of more slender build; the year-old young is under 25 feet. The sperm whale is gregarious, associating in schools, or pods, of from four or five up to one hundred, or even more. The large schools are composed of females, young, and medium-sized males; the larger the individuals the smaller the size of the school, the very largest males being solitary in their habits. The males frequently indulge in combats with one another, and occasionally a whale is taken whose jaw is badly twisted out of shape as the result of some fight when young. The spermaceti, whence the species derives its name, is a whitish, oily liquid, hardening on exposure to the air, contained in a cartilaginous receptacle, the "case," in front of and above the skull. In large vessels the head is taken on deck, a hole cut in the "case," and the spermaceti bailed out with buckets. In small vessels the head is made fast alongside, and the operation performed there. Spermaceti is used in the manufacture of various ointments and cosmetics, and was formerly extensively employed for making candles. The blubber, or layer of fat surrounding the body, yields an excellent oil, and a grayish wax-like substance termed ambergris, the product of disease, is sometimes found in the intestine: it is of considerable value in the manufacture of perfumery. It possesses comparatively little odor in itself, and this is supposed to be in some way due to the squids on which the sperm whale feeds. It is, however, valuable as a basis for other perfumes, and has the important property of rendering them more lasting. One of the largest, if not the very largest, pieces of ambergris on record weighed 185 lb., and was sold for about $10,000. A very large whale may yield 10 barrels of spermaceti and 120 barrels of oil. The cachalot inhabits the warmer seas of the globe, favorite grounds being off New Zealand, the Cape de Verde islands, Hatteras, the Sooloo Sea, and Indian Ocean, where it was pursued by American whalers, the number of vessels engaged in the sperm-whale fishery being at one time over 300. The food of the species is fish and squids, and the existence of gigantic cuttle-fishes was known to whalers long before any entire specimens were discovered, from the fragments vomited up by whales in their death struggles. Quite recently several species of large squids, entirely new to science, were taken from a sperm whale killed near the Azores. The head and body of the whale bore marks of the large, toothed suckers with which the long arms of the squid are provided. The cachalot is a formidable adversary when wounded, not only striking with the tail, but biting with such terrible force that whaleboats have been cut in two at one stroke. Owing to the peculiar position of the jaw, the animal bites most effectively when lying on its back. The head is also used as a ram, and a few cases are on record where whale-ships have been attacked and sunk by large sperm whales, the most notable instance being that of the Essex. See the articles Ambergris, Oils, Spermaceti, Whale, and Whale-oil; and for statistics, see the article Whale-fishery. F. A. Lucas.

Cachao: See Hanoi.

Cache, kăăsh: a French word signifying a hiding-place; a name given in the Western U. S. to subterranean holes in which travelers and trappers hide provisions and other property, to preserve them from the depredations of the Indians and wild animals. They are made to closely resemble the surrounding earth. The name is also applied to marked mounds of stone on the shores of Arctic waters, within which whalers and explorers have deposited supplies of food for the use of distressed mariners.

Cache River: of Arkansas; rises near the northeast extremity of the State. It flows in a S. S. W. direction, and enters the White river near Clarendon. Length about 150 miles.

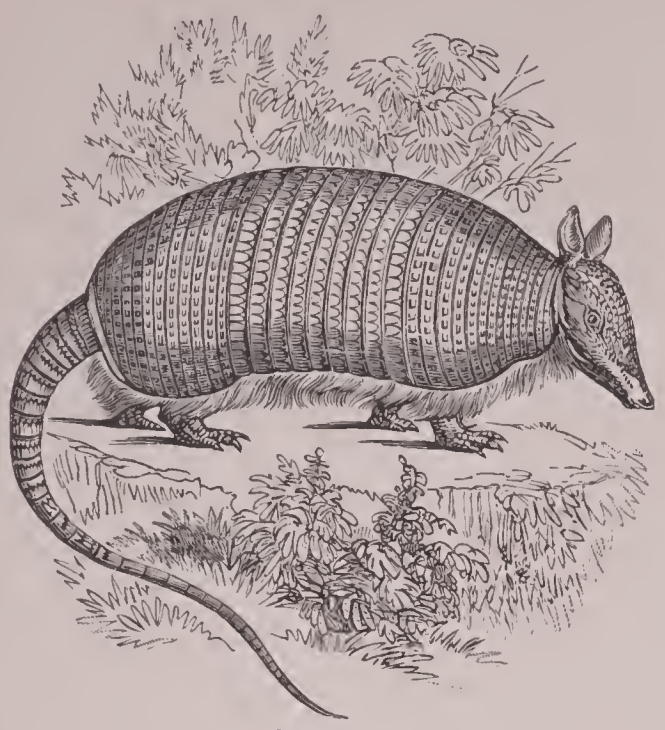
Cachet, Lettres de, letr′de-kăă′shā′: a term applied in France under the old *régime* to letters or orders signed with the private seal of the king and used as instruments of despotic power. Before the seventeenth century they were not often employed, but in the reign of Louis XIV. they became very common. Many persons were arrested by such warrants and imprisoned without trial in the eighteenth century. The chief of police kept forms of *lettres de cachet* signed and needing only the insertion of the name of the person to be arrested, and these were obtained by private persons in order to put out of the way troublesome relatives. About twenty such warrants were issued against Mirabeau. Sometimes they were used to shield offenders from proceedings before tribunals. It is stated that in the reign of Louis XV. *lettres de cachet* were sold by one of the mistresses of the king to any one who would pay money for them. They were abolished in Jan., 1790.

Cache Valley: a fertile valley of Northeastern Utah and Southeastern Idaho. It lies between northerly spurs of the Wasatch Mountains; is 60 miles long and from 10 to 20 broad; has a general altitude of 5,000 feet. The Bear river crosses it obliquely and receives a number of tributaries which are utilized for irrigation. Logan is the largest of its dozen villages.

Cachexia, kă-keks′i-a [from Gr. *καχεξία*, poor condition of body; *κακός*, bad + **ἐξία*, cf. *ἕξις*, condition; deriv. of *ἔχειν*, have, hold one's self]: a term applied in medicine to wasted and anæmic states of the system, due to various debilitating diseases. It is particularly applicable in cases of cancer or other malignant tumors, but in a general sense such terms as tuberculous cachexia, malarial cachexia, gouty cachexia, and the like may be employed. The features present an anxious and aged appearance; the skin is dry, harsh, shriveled, and of an ashy grayish hue; and emaciation is usually marked.

Cachicama, kăsh-i-kaa′ma, called also **Tatou-pe′ba**: the nine-banded armadillo (*Dasypus novem-cinctus*), an edentate mammal found from Texas to Paraguay. It is 16 inches long, and has a long tail. Both body and tail are

covered with plates, those of the tail in horny rings, and those of the body (in part) disposed in nine bands, so united as to admit of some motion. This animal can be readily



Cachicama.

tamed. Its food is principally ants, but it also is fond of vegetables and of carrion.

Cachina: See PUEBLO INDIANS.

Cacholong, kash′ō-long: a beautiful mineral, sometimes called **Pearl Opal**; is a milk-white variety of opal, nearly allied to hydrophane. It is opaque and pearly, has a conchoidal fracture, and sometimes has a reddish tinge. The name is derived from the river Cach, in Bucharia, where it was first discovered.

Cac′odyl, Cacodyle, Kakodyl, or **Kakodyle**; also **Cacodyl′ic**, or **Kakodylic Oxide** [from Gr. *κακός*, bad + *ὀδ-*, smell (cf. *κακωδία*, stink) + suffix *-yl*, substance]: an extremely poisonous organic compound of carbon, hydrogen, and arsenic (C_4H_6As). Correctly speaking, the *fuming liquor of Cadet*; belongs, as it was originally applied by Bunsen, the discoverer of this baneful series of bodies in 1837, to the latter compound, which is also called *alcarsine* (arsenical alcohol), though it is now known that the liquor of Cadet is always mixed with cacodyl itself. Cadet's liquor is obtained by distilling together white arsenic and potassic acetate. The mixed product is treated with hydrochloric acid, which gives cacodylic chloride, and this, treated in an atmosphere of CO_2, with metallic Zn, gives pure cacodyl.

Cacou′na: a post-village and parish of Temiscouata co., province of Quebec, Canada; on the southeast bank of the St. Lawrence (see map of Quebec, ref. 3–E); the terminus of the Rivière du Loup Division of the Grand Trunk Railway; a place of summer resort for salt-water bathing, and for fishing and hunting. Pop. about 1,000.

Cacta′ceæ: the CACTUS FAMILY (*q. v.*).

Cac′tus Family (*Cactaceæ*): dicotyledonous herbs, shrubs, or trees; stems mostly succulent; leaves minute or wanting (in a few cases with ample leaves); ovary inferior; stamens numerous; floral leaves (sepals and petals) usually many. They are related to the myrtles, evening primroses, mentzelias, etc., and are to be regarded as specially modified from this general type for growth in hot, dry climates. About 1,000 species have been described, all natives of the New World, with a single exception (*Rhipsalis cassytha*, variety *mauritiana*). Some species, however, have become naturalized in many countries of the Old World. The most important genera are *Mamillaria*, with spheroidal stems covered with tubercles; *Echinocactus*, with spheroidal stems vertically ribbed; *Cereus*, with elongated, ribbed stems; *Opuntia*, with flattened, articulated stems. CHARLES E. BESSEY.

Cactus-wrens: wrens of the genus *Campylorhynchus*; found in Texas, Arizona, Mexico, and Central America. They live among the cactuses on which they build their nests; hence the name.

Cadahalso, kaă-daal′sō, JOSÉ, de: Spanish poet and dramatist; b. in Cadiz, Oct. 8, 1741; killed at the siege of Gibraltar, Feb. 27, 1782. He was educated in Paris; traveled in Italy, Germany, and England; and entered the army after his return. He made his *début* in literature with *Sancho Garcia*, a tragedy (1771); followed the next year with *Eruditos á la Violeta*, a satirical epic which attracted much attention. A volume of poems appeared in 1773, and after his death his *Moorish Letters*, written on the model of *Lettres Persanes*. An edition of his collected works was published in three volumes in Madrid, 1818.

Cadam′ba, or **Kudum′ba**: an Indian rubiaceous tree which yields a handsome deep-yellow wood that is used for furniture and finishing. The different species to which the name is applied were formerly referred to the genus *Nauclea*, but that genus is now dismembered. The *Nauclea cadamba*, which is the tree to which the name cadamba is chiefly applied, now becomes *Anthocephalus morindæfolius*. *N. cordifolia*, another cadamba-tree, is now known as *Adina cordifolia*. These plants are closely related to the American button-bush, or cephalanthus.

Cada Mosto, kaa′daă-mōs′tō, LUIGI, da: navigator; b. in Venice in 1432. Having entered the service of Prince Henry of Portugal, he explored in 1455–56 the west coast of Africa as far as the mouth of the Gambia. He wrote a narrative of his voyage (1507). D. in 1480.

Cadas′tral Survey [*cadastral* is an adjec. deriv. of Fr. *cadastre*, from Late Lat. *capitastrum*, register of *capita* for taxation]: a survey made with great detail so that its results may be used in taxing property. Such a survey not only produces maps showing the roads, buildings, property lines, etc., but also books giving the names of the land-owners, the area of each parcel of ground, the character of the soil, its assessed value, and the tax payable upon it. A large part of the field work may be completed in connection with topographical surveying, but constant revisions of the cadastral books are necessary. These methods are carried to greatest perfection in Prussia and Saxony. The word cadastral is sometimes applied to any map on a large scale, e. g. the maps of the British ORDNANCE SURVEY (*q. v.*). M. M.

Caddice-fly, Caddis-fly, or **Case-fly**: a common name for insects of the order *Trichoptera*. (See ENTOMOLOGY.) The adult insects are moth-like in many respects, and are thought by many students to represent the ancestors of the *Lepidoptera*. They have four wings, with numerous longitudinal veins and but few cross veins, and are usually covered with hairs, which in some cases are scale-like, like those of the butterflies and moths. The mouth-parts are rudimentary, being neither well adapted for biting or for sucking. The common name comes from the peculiar habits of the larvæ. These are soft-bodied aquatic forms, which, for the protection of their whitish and delicate abdomens, spin tubes or cases of silk, strengthened by bits of stick or stones, and in these cases they live, crawling about like hermit-crabs or retreating into the tube at the approach of danger. Most larvæ are herbivorous, but some live on other insects. Some build nets to aid in catching their prey. The larvæ pass into a pupal stage, and from this into the adult. J. S. K.

Caddoan Indians: a family of North American Indians, the Caddos, whose name is said to be derived from a Caddo word, ká-ede, signifying chief.

The *Pawnee* and *Caddo*, now known to be of the same linguistic family, were supposed by Gallatin and by many later writers to be distinct, and accordingly both names appear in literature as family designations. The boundaries of the Caddoan family, as at present understood, can best be given under three primary groups—Northern, Middle, and Southern.

Northern Group.—This comprises the Arikara or Ree, now confined to a small village on Fort Berthold reservation, North Dakota, which they share with the Mandan and Hidatsa tribes of Siouan Indians. The Arikara are the remains of ten different tribes of "Paneas," who had been driven by the Dakotas from their country lower down the Missouri river. In 1804 they were in three villages, near their present location. According to Omaha tradition, the Arikara were their allies when these two tribes and several others were E. of the Mississippi river.

Middle Group.—This includes the four tribes or villages of Pawnee, the Grand, Republican, Tapage, and Skidi. The original hunting-ground of the Pawnee extended from the Niobrara, in Nebraska, S. to the Arkansas, but no definite boundaries can be fixed. In modern times their villages have been on the Platte river W. of Columbus, Neb. The

Omaha and Oto were sometimes S. E. of them near the mouth of the Platte, and the Comanche were N. W. of them on the upper part of one of the branches of the Loup Fork. The Pawnee were removed to Indian Territory in 1876.

The Skidi (Panimaha, or Pawnee Loup), according to Omaha tradition, formerly dwelt E. of the Mississippi river, where they were the allies of the Arikara, Omaha, Ponka, etc. After their passage of the Missouri they were conquered by the Grand Pawnee, Tapage, and Republican tribes, with whom they have remained to this day. De Lisle gives twelve Panimaha villages on the Missouri river N. of the Pani villages on the Kansas river.

Southern Group.—This includes the Caddo, Wichita, Kichai, and other tribes or villages which were formerly in Texas, Louisiana, Arkansas, and Indian Territory. The Caddo and Kichai have undoubtedly been removed from their priscan habitats, but the Wichita, judging from the survival of local names and the statement of La Harpe in 1719, are now in or near one of their early abodes. Sibley locates the Caddo habitat 35 miles W. of the main branch of Red river, being 120 miles by land from Natchitoches, and they formerly lived 375 miles higher up. The Wichita probably migrated from Northwestern Louisiana and Southwestern Arkansas to the Indian Territory.

Among the tribes which are included in this group is one known as the Adai. This name is from a Caddo word, *hadai*, meaning brushwood. From an examination of Dr. Sibley's vocabulary of about 250 words (gained at the beginning of this century), Gallatin reached the conclusion that the Adai language was distinct from any other known, an opinion accepted by most later authorities. The researches of the Bureau of Ethnology have assigned the Adai to the Caddoan family, instead of regarding them as constituting a distinct stock, which was before called the *Adaizan*. The first historical mention of the Adai appears to be by Cabeça de Vaca, who in his *Naufragios*, referring to his stay in Texas, about 1530, called them Atayos. In 1792 there was a partial emigration of the Adai to a site S. of San Antonio de Bejar, Southwest Texas, where they probably amalgamated with the surrounding Indian population, as they have disappeared. The Adai who remained in their old homes numbered 100 in 1802, according to Baudry de Lozières. According to Sibley, in 1809 there were only 20 men of them remaining, but more women. In 1820 Morse mentions only 30 survivors.

After comparing the recorded statements about the several tribes, it would appear that the original habitat of the southern group of the Caddoan Indians was a section of country now embracing Northeastern and part of Eastern Texas, and adjacent territory in Arkansas and Louisiana, its boundaries being the Red, the Sabine, and the Brazos rivers.

The principal divisions of this family are: A. Pawnee, Grand Pawnee, Tapage or Tappas, Republican Pawnee, Skidi (Pawnee Loup); B. Arikara (Ree, Ricara); C. Wichita (a confederacy); D. Kichai; E. Caddo (Kädo, a confederacy).

Population.—The present number of the Caddoan Indians is 2,123, of whom 416 are on the Fort Berthold reservation, North Dakota, and the rest are in the Indian Territory, some on the Ponca, Pawnee, and Otoe reservations, the others on the Kiowa, Comanche, and Wichita reservation. The population of the tribes officially recognized, taken from the *Indian Report for 1892*, is as follows: Arikara, 416; Pawnee, 798; Wichita (the leading tribe of the Wichita confederacy), 151; Towakarehu (a Wichita tribe, the Tawakoni) 133; Waco (a Wichita tribe), 41; Kichai, 51; Caddo, 530: total, 2,123.

Authorities.—Buschmann, *Spuren der aztek. Sprache*, pp. 424, 426, 441, 448 (1859); Gallatin, in *Trans. and Coll. Am. Antiq. Soc.*, ii., pp. 116, 117, 128, 306 (1836); Gallatin, in *Trans. Am. Eth. Soc.*, ii., pt. 1, pp. xcix., 77 (1848); Gallatin, in Schoolcraft, *Ind. Tribes*, iii., p. 402 (1853); Gatschet, *Creek Migration Legend*, i., pp. 41, 52 (1884); Hayden, *Contr. Eth. and Philol. J. Owen Dorsey.

Cade, Jack: an Irishman who called himself Mortimer; the leader of an insurrection which broke out in Kent in June, 1450. He marched with about 16,000 insurgents toward London, and encamped on Blackheath. Among their motives for rebellion was oppressive taxation. Having defeated a royal army which was sent against him, he entered London, in which he maintained strict order, but he caused Lord Say, a royal favorite, to be put to death. Many of his followers were induced to disperse by a promise of pardon. Cade fled, but was pursued and killed in Sussex, near London, July 12, 1450.

Cade, Oil of (in Fr. *huile de cade*): a thin tar distilled from the wood of *Juniperus oxycedrus*; used in the medical treatment of diseases of the skin.

Cadell, Francis: Australian explorer; b. at Cockenzie, near Edinburgh, in Feb., 1822; entered the service of the East India Company in 1836; became commander of a vessel in 1844. In 1848 he visited Australia, became convinced that the Murray river was navigable, and in 1850 returned to ascend that stream in a boat for several hundred miles. A navigation company was formed, and in 1853 and 1855 he made more extended explorations in a steamer, reaching a point 1,740 miles from the river's mouth. In 1858 he explored the Murrumbidgee river for a distance of 2,000 miles; in 1859 navigated the Darling river as far as Mt. Murchison. The company failed, and he took up farming, but returned to the business of trading, and during a voyage was murdered by a mutinous crew in June, 1879.

Cadence [Fr., from Ital. *cadenza* < Lat. **cadentia*, the proper Fr. representative of which is *chance*]: a fall, a decline, a state of sinking; a fall of the voice at the end of a sentence; a sound or tone. In horsemanship, an equal measure or proportion observed by a horse in all his motions.

Cadence: in music, "a harmonic formula or sequence of chords that expresses conclusion, finality, repose, occurring at the end of a phrase or period, and involving a clear enunciation of the tonality or key in which a piece is written." (*Century Dict.*). Cadences, in music, are four in number: 1. The complete (or perfect); 2. The half (or imperfect);

3. The interrupted (or deceptive); 4. The plagal (or ecclesiastical).

The appropriate use of these forms, in their various inversions, is to the composer what correct punctuation is to the literary workman. Popularly speaking, the perfect cadence (1) may be said to correspond to the "period"; the half or imperfect to the "comma" (2); and the deceptive (3) to various uses of "colons" and "semicolons," even including analogy with points of exclamation and interrogation. Technically, the perfect cadence, or complete close, is produced by the progression from the dominant to the tonic; the imperfect by progression to the dominant, and the deceptive by the unexpected rising of the bass a major or minor third instead of falling to the tonic a fifth below, or rising to it a fourth above. The plagal cadence in its two forms (4) is to be classified as another form of complete cadence. We have retained it from the ancient church modes. It is not common in modern secular music, unless some peculiar shade of feeling is to be expressed. It will be noted that the progression of the plagal cadence is from the fourth of the key (subdominant) to the tonic.

Dudley Buck.

Cadency: in heraldry, the method of distinguishing the escutcheon of one person from that of others who are entitled to bear the same escutcheon, as with the different sons of one father. No one of these would be entitled during the father's lifetime to bear exactly the same escutcheon as he, and their escutcheons are accordingly *differenced by marks of cadency*. During the early Middle Ages cadency, like other differencing, was often effected by a complete change, as in the tincture of the field or of the bearing. In later times it became customary to add some small bearing, and this system is still in force. The shield of the Black Prince is his father's shield charged with a label, and that of his younger brother, John of Gaunt, is the same shield, but with the label charged in its turn with ermine spots.

The differences used by the British royal family are found in some peerages. The label of the Prince of Wales is plain, while those of the other princes and princesses are charged with crosses, fleurs-de-lis, hearts, or other figures for the sake of distinction. Labels, crescents, mullets, martlets, etc., are the usual marks of cadency, and the rules governing their use are complicated and fanciful.

Caden'za: in music, an ornamental succession of notes in the nature of a flourish, introduced just prior to a final close. In a larger sense the cadenza appears in concertos and concert pieces for piano, violin, etc., at considerable length as a display point for the solo performer, making use of the principal themes of the work. This was formerly expected to be impromptu. Since Beethoven, most composers have written their own cadenzas, leaving nothing to the will of the performer. DUDLEY BUCK.

Cadet' [Fr. *cadet*, fem. *cadette*: Proven. *capdet*, as if from Lat. **capitettum*, inferior head, i. e. younger son; dimin. of *caput*, head; *cadee* and *caddie* are variants, and *cad* a clip-form of the same]: a younger son, younger brother; a military officer who is junior to another is a cadet in respect to him. The term is also applied in France and other countries to a student of the art of war and military science. The students of the Military Academy at West Point, N. Y., are called cadets, as are those of the Naval Academy at Annapolis. There are also medical cadets, recognized as of a distinct rank in the U. S. Army Regulations. See MILITARY ACADEMY (U. S.).

Cadet, Naval: the lowest grade of officer in line of promotion in the British navy. Cadets enter the naval service at thirteen to fourteen and a half years of age, and are nominated by the Admiralty, subject to the regulations for examination. They first pass two years on the training-ship in port to learn the rudiments of seamanship, and are thence transferred to sea-going ships. After the cadet has served one year at sea he is eligible for promotion to the rank of midshipman. By the act of Aug. 5, 1882, it is provided that all undergraduates at the U. S. Naval Academy shall "be designated and called 'naval cadets.'" See NAVAL ACADEMIES.

Ca'di, or **Kadi**: an Arabic word signifying judge or jurist; the title of an inferior judge among the Mohammedans. He must be chosen from the ranks of the priesthood, as the precepts of the Koran constitute the code of laws.

Cadillac': city; capital of Wexford co., Mich. (for location of county, see map of Michigan, ref. 5–H); on Gr. Rap. and Ind. and Tol., Ann Ar. and N. M. R. Rs.; 96 miles N. of Grand Rapids; has 9 churches, 5 schools, electric lights, water-works, and good sewerage. It is situated between two beautiful lakes (Big and Little Clam Lakes), in the midst of the largest belt of hard-wood timber in the U. S. In 1871 its site was a lumbering-camp. Pop. (1880) 2,213; (1890) 4,461; (1900) 5,997.

EDITOR OF "NEWS AND EXPRESS."

Cadiz (Sp. pron. kaa'dĕth): a province which forms the southwest extremity of Spain; bounded N. by Seville, E. by Malaga, S. by the Strait of Gibraltar, and W. by the Atlantic and Huelva. Area, 2,809 sq. miles. Capital, Cadiz. Pop. (1887) 429,872.

Cadiz (anc. *Gades*): an important city and seaport of Spain; capital of province of same name; on the Atlantic Ocean and northwest extremity of the isle of Leon; about 94 miles by rail S. by W. of Seville; lat. 36° 32′ N., lon. 6° 18′ W. (see map of Spain, ref. 20–C). Its site is a long, narrow isthmus or tongue of land surrounded by water on three sides, having on the N. and N. E. an inlet called the Bay of Cadiz, which forms a good and capacious harbor. It is accessible from the mainland by a tongue of land, which in some places is only 200 yards wide, and is strongly defended by several forts. The houses, built of white freestone, present a bright appearance from the sea. The streets are narrow, but well paved and regular. Among the principal edifices are two cathedrals, an old and a new, the lighthouse of San Sebastian, 172 feet high, and a hospital called Casa de Misericordia. The convent of the Capuchins possesses two excellent pictures by Murillo. The city contains two theaters, a medical school, a botanic garden, and an academy of fine arts. Cadiz is one of the first commercial cities of Spain, but is probably inferior to Barcelona in the value of its imports. The chief articles of export are sherry wine, olive oil, salt, metals, and fruits. Among the imports are tobacco, sugar, coffee, hides, indigo, cotton, dyewoods, fish, and coal. The commerce of this port is much less extensive than it was formerly. Cadiz is the southern terminus of a railway which connects it with Seville. The isle of Leon is separated from the mainland by a narrow channel, which is crossed by a bridge. Here are manufactures of mantillas, fans, glass, soap, cotton and silk stuffs, hats, etc. Cadiz, which is one of the most ancient towns of Europe, was founded by the Phœnicians, probably before the foundation of Rome. The Carthaginians became masters of it during the first Punic war, but the Romans obtained possession of it in 206 B. C., after which it became a city of great wealth and importance. It was taken and pillaged by the Earl of Essex in 1596, and was blockaded in 1656 by Admiral Blake, who captured two rich galleons. It was besieged by the French from Feb., 1810, until Aug., 1812, when the victories of Wellington rescued it. Pop. (1887) 62,531.

Cadiz: village; on railroad; capital of Harrison co., O. (for location of county, see map of Ohio, ref. 4–I); about 22 miles N. W. of Wheeling; 76 miles W. of Pittsburg. A branch railroad 8 miles long connects it with the Pan Handle route from Pittsburg to Cincinnati. It is the commercial center of a great wool-growing district. It has four national banks, doing a business of over $2,000,000, and is a noted money-lending center. Pop. (1880) 1,817; (1890) 1,716; (1900) 1,755. PUBLISHER OF "REPUBLICAN."

Cad'mium: a white metal having a slight bluish cast; discovered in 1817 by Stromeyer; also independently by Hermann; named from *cadmia fossilis*, a name given to an ore of zinc mentioned by Dioscorides and Pliny. The name is said by some to have come from that of Cadmus. Symbol, Cd.; atomic weight, 112; sp. gr. after fusion, 8·6; hammered, 8·7 (nearly). Cadmium is lustrous, takes a fine polish, and possesses a fibrous fracture. It tarnishes very slightly in the air, and only burns at a high heat. It is more tenacious than tin, though, like that metal, a bar of it gives a "cry" when bent. It melts below 260°, and volatilizes at about 360° C. It occurs in nature as the sulphide "greenockite" at Bishopstown, Renfrewshire, Scotland, and incidentally as a constituent of various zinc ores, as the carbonate, silicate, etc., as well as the sulphide in several localities. The zinc flowers in the flues of zinc-reducing furnaces contain even as much as 11 per cent. of cadmium. Commercial English zinc often contains cadmium. The metal is readily soluble in nitric acid, and but slightly so in other acids, except at a boiling temperature. It forms the oxide CdO. This varies in color from brownish to blackish yellow, according to the mode of preparation. It is infusible and not volatile. Its salts are mostly colorless, and when taken into the stomach act as emetics; their taste is disagreeably metallic. Cadmium is prepared by collecting the first products of distillation from the zinc ores containing it, and subjecting them, when mixed with charcoal, to two successive distillations in iron retorts at a low red heat. Instead of the last distillation, solution in acid and purification in the wet way are resorted to. The demand for cadmium is, however, so small that the working up of the furnace products containing considerable amounts of that metal has been discontinued in some places in Silesia. It is necessary, however, to remove it from the zinc, as it renders that metal brittle when 3 per cent. or more is present. Cadmium finds its chief application in the arts in the form of the sulphide, which has an intense yellow color, and is used for coloring soaps, and in paints, etc. It is known as cadmium yellow and *jaune brillant*. The iodide and bromide of cadmium are used in photography. The metal is used for forming a fusible alloy with lead, tin, and bismuth for filling teeth.

Revised by IRA REMSEN.

Cad'mus (in Gr. Κάδμος): in classical mythology, a son of Agenor, King of Sidon; a brother of Europa. After Europa had been carried off by Jupiter, Cadmus was sent in quest of her. According to tradition, he founded the city of Thebes, originally called Cadmeia, in Bœotia; sowed the dragon's teeth that sprang up into armed men; invented sixteen letters of the Greek alphabet, or introduced them from Phœnicia into Greece. He was the first who worked the mines of Mt. Pangæon.

Cadoudal, GEORGES: a leader of the Chouans; b. near Auray, in Brittany, Jan. 1, 1771. Taking up arms against the republic, he was captured in 1794 and imprisoned at Brest, whence he soon escaped to form an army in Brittany which withstood that of Hoche until 1796. After heading

an unsuccessful Bourbon conspiracy and revolt there in 1799–1800, he refused all Bonaparte's tempting offers, and escaped to England, where he plotted with Pichegru. Proceeding to Paris in 1803, he was condemned and executed June 25, 1804.

Cadu'ceus: in classic mythology, the symbol and winged staff of Mercury (Hermes), to whom it was presented by Apollo. From this staff Mercury derived the surname of *Caducifer*. The term caduceus was also applied by the ancients to a staff or rod of laurel or olive which was carried by ambassadors and heralds as a symbol of peace. It had the figures of two serpents twisted around it. Among the moderns the caduceus is used as an emblem of commerce, over which Mercury was supposed to preside. Still more frequently it is the emblem of health and of the healing art.

Cadwal'ader, Gen. George: b. in Philadelphia in 1804; practiced law; served as a brigadier-general in the Mexican war; was breveted major-general for services at Chapultepec. He was major-general of Pennsylvania troops 1861–62, and in 1862 became major-general of U. S. volunteers. D. in Philadelphia, Feb. 3, 1879.

Cadwalader or **Cadwallader**, John: soldier; b. in Philadelphia, Jan. 10, 1742. He served as a brigadier-general at the battles of Princeton, Brandywine, and Monmouth (1778); challenged and wounded Thomas Conway for conspiring against Washington's chieftainship. D. in Shrewsbury, Pa., Feb. 10, 1786.

Ca'dy, Daniel: b. in Chatham, Columbia co., N. Y., Apr. 29, 1773; admitted to the bar in 1795; practiced with great distinction for over sixty years; was several times a member of the Legislature of New York and of Congress; for eight years judge of the Supreme Court and the court of appeals of New York. His wife was a daughter of Col. James Livingston, an officer in the army of the Revolution, and one of his five daughters is Elizabeth Cady Stanton. D. at Johnstown, N. Y., Oct. 31, 1859. A sketch of his life by his son-in-law, Henry B. Stanton, is contained in vol. xviii. of Barbour's *S. C. Reports*.

Cæcil'idæ [deriv. of Lat. *cæcilia*, a kind of lizard (*caecus serpens*, Pliny); so named from smallness of its eyes; Lat. *caecus*, blind]: a family of *Batrachia* occurring in the tropics of both the Old and the New Worlds. They have an elongate, snake-like body, frequently ringed by the production of folds in the integument, and they differ from all other Batrachia in the recurrence of minute scales in the skin. The head is small, and the small size of the eyes gave rise to the name which implies that they are blind. Between the nose and eyes is a peculiar "tentacle," which is really the duct of certain glands. The habits and life-history have been most thoroughly studied by the cousins Sarasin in the Ceylonese species, *Epicrium glutinosum*. This lives a burrowing life in the earth, feeding upon earthworms, etc. It lays long strings of eggs, which the female keeps coiled about the body; and the young in the egg possesses rudimentary hind legs and three pairs of external gills, the latter of which are lost upon hatching. As soon as the larva escapes from the egg it takes to the water, where it lives for some time before beginning its subterranean life. The Cæcilians are good examples of Degeneration (*q. v.*), as their characters clearly show that they have descended from more typically constituted forms. They are sometimes referred to as *Gymnophiona*. J. S. Kingsley.

Cæcil'ius (in Gr. Καικίλιος), of Calacte, in Sicily: literary critic; friend and coadjutor of Dionysius of Halicarnassus about the beginning of our era; an important theorist, whose work is cited and criticised by (pseudo-) Longinus *On the Sublime*. B. L. G.

Cæcilius Sta'tius: a Roman comic poet of high reputation; a native of Milan, and a friend of Ennius. He wrote nearly forty comedies, of which only small fragments are extant. D. in 168 B. C. He was regarded by ancient critics as a comic poet of the first rank. See O. Ribbeck's *Comicorum Romanorum Fragmenta* (pp. 35–81).

Cæci'na Alie'nus, Aulus, or **A. Licinius Cæcina**: a Roman general who entered the service of Vitellius in 68 A. D., and obtained command of an army. In the year 69 Cæcina and Valens defeated the army of Otho at Bedriacum. He soon deserted Vitellius, and became an officer of Vespasian, but he formed a conspiracy against the latter, and was put to death in 79 A. D.

Cæcum [neut. of Lat. *caecus*, blind, sc. *intestinum*]: literally the "blind intestine"; a sac or branch of an intestine having only one opening. In man there is only one cæcum, not very large, at the beginning of the colon, being that portion into which the small intestine opens. It terminates in the *appendix vermiformis*. In the herbivorous Mammalia it is greatly developed, being extended from the lower end of the colon. The cæcum is wanting in the bear and weasel families. Birds have two cæca, generally long and capacious in those that are omnivorous or granivorous. Reptiles seldom have a cæcum. Fishes have the cæca attached to the intestine at its uppermost part. The number of these is extremely various; sometimes there are only two, and sometimes more than a hundred. The number is different even in nearly allied species. In some fishes, as the cod, the cæca divide into smaller branches.

Revised by D. S. Jordan.

Cædmon, kăd'mon: an ancient Anglo-Saxon poet; originally a cowherd attached to the monastery of Whitby, in England; when somewhat advanced in life he suddenly revealed poetic powers, became a monk in Whitby, and composed, professedly under divine inspiration, poems on religious subjects and (it is said) paraphrases of portions of Genesis, Exodus, and Daniel, which are thought to have influenced Milton in the composition of *Paradise Lost*. Some of these are the oldest extant specimens of Anglo-Saxon metrical composition. D. in Whitby about 680 A. D. Cædmon's works were first published by Franciscus Junius (Amsterdam, 1655); best edition by C. W. M. Grein, in *Bibliothek der angelsächsischen Poesie* (Göttingen, 1857; 2d ed. 1888); Eng. trans. by W. H. F. Bosanquet (London, 1860). His story is told by Bede, *Eccl. Hist.*, iv., 24.

Cæ'lius Aurelia'nus: medical writer who belonged to the school of Methodici; b. at Sicca, in Africa. The period in which he lived is uncertain. His diction is rugged and obscure. He wrote two Latin works, *De Morbis Chronicis* (On Chronic Diseases) and *De Morbis Acutis*.

Caen, kăn (Lat. *Cadomus*, or *Cadomum*): a city of France; capital of the department of Calvados; situated on the river Orne; 10 miles from the sea, and 148 miles by rail W. N. W. from Paris; lat. 49° 11′ 12″ N., lon. 0° 21′ W. (see map of France, ref. 3–D). It was formerly the capital of Lower Normandy. It has wide, regular, and clean streets, several fine public squares, and many noble specimens of ancient Norman architecture. The houses are generally built of an excellent cream-colored freestone which is quarried in the vicinity and is called Caen stone. Caen is connected with Paris by a railway, and with the sea by a navigable canal. Among its remarkable edifices are the Cathedral of St. Étienne, founded by William the Conqueror; the Church of La Trinité, or Abbaye-aux-Dames, founded by Queen Matilda in the eleventh century; and the Church of St.-Pierre, the tower or spire of which is much admired. The castle, commenced by William the Conqueror and finished by his son, Henry I., was partially destroyed in 1793. This city contains a large public library, a museum, a botanic garden, a custom-house, the hôtel of the prefecture, an academy of arts and sciences, a medical school, a normal school, and an asylum for deaf-mutes. It has manufactures of lace, crape, linens, cotton fabrics, porcelain, cutlery, flannels, hats, and gloves. Caen has long been celebrated for its manufacture of Angora and woolen gloves. This was an important place as early as 912, when it became subject to the Normans. It was the residence of William, Duke of Normandy, before he conquered England. In 1346 it was taken and pillaged by Edward III. of England. The poet Malherbe and Auber the composer were born here. Pop. (1891) 45,201; (1896) 45,380.

Cænogen'esis [from Gr. καινός, recent + γένεσις, origin, birth]: in biology, the changes which may occur in the embryological development of an animal by which this development differs from its ancestral development, these changes being adaptations to new conditions. The term is used in contradistinction to *palingenesis*, the repetition in the individual development of the stages of ancestral development caused by inheritance.

Caerleon, kĕr-lec'on (anc. *Isca Silurum*): an old town of England; in Monmouthshire; on the river Usk, here crossed by a bridge; 2 miles N. E. of Newport (see map of England, ref. 12–F). It is supposed to have been the capital of the Roman province *Britannia Secunda* (modern Wales), and, according to tradition, was a residence of King

Arthur. Many Roman antiquities and relics have been found here, as baths, altars, statues, coins, inscriptions, and aqueducts. Here is also a ruined amphitheater 222 feet in length by 192 feet in width, which indistinctly shows the tiers of seats. The remains of a Cistercian priory are still visible. Pop. (1891) 1,411.

Cæsalpin'ia: a genus of trees of the family *Leguminosæ*; the type of the sub-family *Cæsalpinieæ*. This sub-family is characterized by irregular flowers which are not papilionaceous, and mostly separate stamens. It comprises numerous species, some of which have purgative properties, as senna (*Cassia*). Others bear edible fruits, as the tamarind and the carob. Among the products of the sub-family are Copaiba, Logwood, and Barwood (*q. v.*). They are mostly natives of warm climates. The genus *Cæsalpinia* has pinnate or bipinnate leaves, and ten stamens in each flower. The red dyewood called sappan-wood is obtained from the *Cæsalpinia sappan*. Other species yield the Brazil-wood of commerce. Among the species of the above sub-family that grow wild in the U. S. are the redbud (*Cercis canadensis*), the honey locust (*Gleditsia triacanthos*), and the Kentucky coffee-tree (*Gymnocladus dioicus*).

Charles E. Bessey.

Cæ'sar [Lat., appearing in Germ. as *Kaiser*, Russ. *Tsar*]: the cognomen of a patrician Roman family of the Julia gens; one of the most ancient in the state; claimed a descent from Iulus, a son of Æneas. The first member of the family mentioned in history is Sextus Julius Cæsar, who was prætor in 208 B. C. After the family had become extinct (at the death of Nero), the succeeding Emperors of Rome assumed the name of Cæsar as a title. It subsequently became the title of the heir-presumptive to the throne.

Cæsar, Julius; or, more fully, **Caius Julius Cæsar**: soldier and emperor; one of the most remarkable men that ever lived; b. in Rome, July 12, 100 B. C.; belonged to the Julian tribe (gens Julia), which boasted its descent from Iulus (or Julus), son of Æneas. In 83 Cæsar divorced Cossutia and married Cornelia, the daughter of Cinna. This act offended Sulla (then in the height of his power), who commanded Cæsar to divorce the latter. He refused to obey and was proscribed. He was under the necessity of concealing himself for a time, but on the intercession of mutual and influential friends the dictator reluctantly pardoned him. Sulla is reported to have said, to some of his friends who interceded for him, that Cæsar would some day be the ruin of the aristocracy, adding, "In that young man there are many Mariuses." (Marius had proved himself the most formidable enemy that the aristocratic party had ever encountered.) Soon after, Cæsar went to Asia Minor, and served with distinction in the Roman army. Afterward, while on his journey to Rhodes with a view to study oratory under Apollonius Molo, he was taken by pirates. While detained by them he often threatened (in jest, as they supposed) that he would put them to death when he got his liberty. The required ransom having at last been paid, he manned some vessels, pursued and took the pirates, and crucified them all.

Having returned to Rome, he became a candidate for popular honors. He was elected quæstor in 68 B. C. This same year his wife Cornelia died, and the next he married Pompeia, a relative of Pompey the Great and a granddaughter of Sulla. This was done to ingratiate himself with Pompey, who, since the death of Sulla, was all-powerful at Rome. He was made an ædile in 65 B. C., and sought to render himself popular by the exhibition of public games which are said to have surpassed in magnificence everything of the kind ever before seen at Rome. He was elected pontifex maximus in 63 B. C. In 63 occurred the conspiracy of Catiline, and many suspected Cæsar of being accessory to it. When Cicero asked the opinion of the senate respecting the punishment which ought to be inflicted on the conspirators, all the senators gave judgment in favor of their death, until it came to Cæsar's turn to speak. He maintained that it was contrary to justice and highly inexpedient to put men of their rank to death without a full trial. His argument had great weight with the senators. But Cato followed in a powerful speech, accusing Cæsar of complicity with the conspirators, and carried a large majority of the senate with him. The conspirators were condemned to death; Cæsar himself narrowly escaped.

In 62 B. C. he was made prætor, and was sent the next year as proprætor to Spain, where he greatly distinguished himself both as a magistrate and general, and was saluted as *imperator* by the army. In 60 he was elected consul, L. Calpurnius Bibulus being his colleague. One of his leading measures was to propose an agrarian law, by which a considerable tract of the public land was to be divided among the poorer citizens, particularly those who had a number of children. This measure was carried, in spite of the opposition of Bibulus. With a view to strengthen his interest with Pompey, Cæsar gave him in marriage his daughter Julia, though she had already been affianced to S. Cæpio. He formed in 60 B. C., with Pompey and Crassus, a secret alliance known in history as the first triumvirate. Supported by such powerful influence, Cæsar was enabled to carry through the senate whatever laws or measures he pleased. The government of Cisalpine and Transalpine Gaul having been decreed to him for five years, he left Rome in the spring (of 58 B. C.), and before the ensuing winter he had ended successfully two important wars in Transalpine Gaul—one with the Helvetii, a nation inhabiting what is now Switzerland; the other with Ariovistus, the king of a powerful German nation who had a few years before crossed the Rhine (for his bridge, see Bridges), and established themselves in Gaul. In the next seven years he not only subdued the greater part of Gaul, but crossed over (55 B. C.) into Britain, defeated Cassivelaunus, one of the kings of that country, took hostages, and fixed the tribute the Britons were to pay to Rome.

Cæsar's daughter Julia, whom he had given in marriage to Pompey, had died in 54 B. C. The triumvir Crassus had been killed in the war with the Parthians. A coolness gradually arose between Cæsar and Pompey. The latter appears to have become jealous of the new favorite of fortune, since all his own exploits, splendid and unparalleled as they were at the time they were performed, had been eclipsed by the more recent and more glorious achievements of his great rival. Pompey had succeeded to the position of Sulla as the leader of the aristocracy, while Cæsar's policy had been from the first to cultivate the favor of the common people. The two parties became more and more hostile to each other. Some of the more violent of the patricians were determined to crush Cæsar at all hazards. It was at length proposed in the senate, in 50 B. C., by Marcellus, that Cæsar, the Gallic war having been brought to an end, should lay down his command and disband his army; but Curio, a tribune whom Cæsar had gained over to his interests, vetoed the decision of the senate; Cæsar, however, was deprived of two of his legions. But desirous, by the moderation of his conduct, to fasten upon his opponents the responsibility and odium of beginning the quarrel, he sent a proposition to the senate that he would agree to dismiss his army if Pompey would do the same. But the senate even refused to consider the proposal. It was afterward decreed that Cæsar should disband his army by a certain day or be considered a public enemy. This was virtually a declaration of war, for no one could believe that Cæsar would thus tamely abandon the contest. On learning the decision of the senate, Cæsar assembled his army, and in an eloquent harangue inspired them with his own indignant spirit. Accompanied by only 5,000 infantry and 300 cavalry (for his other troops were beyond the Alps), he advanced to the river Rubicon, which then marked the limit between Italy and Cisalpine Gaul. After revolving in his mind for some time his perilous enterprise, he at length exclaimed, "The die is cast!" He instantly crossed the river, and proceeded with rapid strides through Ariminum, Arretium, and Ancona toward Rome. Every town seemed ready to open its gates as he approached. In the general consternation, Pompey, with the two consuls and many of the senators, fled from the city toward Brundisium, closely pursued by Cæsar. He passed over into Greece, whither Cæsar, for want of ships, was unable to follow him. Cæsar soon after set out for Spain, where Afranius and Petreius, Pompey's lieutenants, had a formidable army under their command. Having compelled them to sue for and accept peace on his own terms, and captured Massilia (Marseilles), he returned to Rome, whence he proceeded to Brundisium. After some delay he evaded the vigilance of Pompey's fleet, and succeeded in transporting his army into Greece. In his first engagement with Pompey, near Dyrrhachium, Cæsar was worsted, and was obliged to retreat. He withdrew, pursued by Pompey, to Thessaly. At length the two armies met on the plains of Pharsalia. Cæsar had only 22,000 foot-soldiers and 1,000 horse, while the army of Pompey amounted to 45,000 infantry and 7,000 horse. The latter sustained a disastrous defeat; 15,000 men fell in battle, and upward of 24,000 were taken prisoners. Pompey escaped to Egypt, where he was basely assassinated. (See Pompey.) The power of his enemies having been utterly

broken in Greece, Cæsar followed Pompey to Egypt, where he was detained for a time, captivated by the charms of Cleopatra, whose pretensions to the throne of Egypt he supported against those of her brother Ptolemy. He next marched against Pharnaees, a son of Mithridates the Great, King of Pontus. Having defeated and destroyed the army of Pharnaces, he wrote to the senate his eelebrated letter of three words only—*Veni, vidi, vici*. He next turned his arms against the Pompeians in Afriea, who were under the eommand of Cato and Scipio, whose forees were defeated and almost exterminated at Thapsus, not far from Carthage (46 B. C.). Cæsar returned to Italy the undisputed master of the Roman world. But he had seareely time to eelebrate his recent triumphs when word was brought that the sons of Pompey, Cneius and Sextus, had eollected a formidable army in Spain. Cæsar advaneed to meet them with his usual eelerity. After a severe and bloody battle he gained a complete victory. He said afterward to his friends that he had often fought for vietory, but then only for his life.

Having thus risen to power on the ruins of the republic, Cæsar appears sincerely to have sought to promote the true interests of his country. He proeured the enaetment of several salutary laws. One of the subjeets whieh elaimed his earnest attention was the regulation of the calendar. His improvements have been adopted, with some modifieations, by all the European nations. (See CALENDAR.) He is said to have contemplated the preparation of a complete digest of the Roman laws, the draining of the Pontine marshes, and other important public works, when death put an end to all his sehemes. The senate had conferred upon him the title imperator (whenee our emperor), for life; he was also made dictator and præfeetus morum (ehief or ruler of manners or eustoms), and pontifex maximus. To these dignities he wished to add that of king, that he might transmit his power to his suecessor. Having no legitimate children of his own, he had adopted his grandnephew, Oetavius, the son of Attia, who was a daughter of Cæsar's sister Julia. On a certain public festival, the Luperealia (sometimes called in English the Lupereal), Antony, a zealous adherent of Cæsar, publiely offered him a regal erown, but he, pereeiving that it displeased the people, refused it, but very reluctantly, aeeording to some aeeounts. From the time of Tarquin the Proud the name of king had always been partieularly odious to Romans of every elass. Cæsar's evident desire to be a king stimulated the hostility of his enemies, who were encouraged to hope that the taking of his life would be approved even by many of the people. A conspiracy in which sixty persons were implieated was formed. Cæsar had many warnings, it is said, of his approaching fate, but as he scorned to live in constant terror of death, he disregarded all the admonitions of his friends, saying it was better to die at once than to suffer the anguish of death many times by constantly fearing it. It had been planned that when Cæsar came into the senate on the ides of March, Cimber, one of the conspirators, should present a petition to him, and that while the paper was being read the others should crowd around, as if very anxious that Cimber should obtain his request, and make an attack upon their victim all at once. At first Cæsar resisted with great spirit, but when he perceived the number of his enemies he resigned himself to his fate, and, wrapping his toga about him, fell at the foot of Pompey's statue, the base of whieh was bathed in Cæsar's blood. One account states that he resolutely defended himself until he saw the dagger of M. Brutus among those of the other conspirators, when, exclaiming "Thou, too, Brutus!" he yielded without any further struggle. He was assassinated 44 B. C., in the fifty-sixth year of his age. In person, Cæsar was tall and of a commanding presence. His eonstitution was naturally delicate, but by exercise and exposure he became so hardy that none of his soldiers could better bear the fatigues and privations incident to a military life. He was sometimes, though rarely, subject to attacks of epilepsy.

As a general, Cæsar was probably superior in genius to every other commander of whom history makes mention, excepting, perhaps, Hannibal alone. (See HANNIBAL.) In the fertility of his resources, indeed, he appears to have surpassed all other generals that ever lived. It has been said that Napoleon taught his enemies how to eonquer him, but Cæsar's enemies never learned how to conquer him, because he had not a mere system of tactics, but a new stratagem for every new emergency. He was not only a great general, but a pre-eminent statesman, and the greatest orator of his age except Cicero. Cæsar was also distinguished as a historian; he wrote the first seven books of the eommentaries treating of the Gallic war, and three books relating to the civil war. His style is remarkable for ease, clearness, and simplicity, and for its pure Latinity. A few fragments of his grammatieal work, entitled *De Analogia*, have been preserved.

Referring to those remarkable men in history who have compelled "nations unaeeustomed to control" to bow obedient to their will, Maeaulay observes: "In this class three men stand pre-eminent—Cæsar, Cromwell, and Bonaparte; the highest plaee in this remarkable triumvirate belongs undoubtedly to Cæsar. He united the talents of Bonaparte to those of Cromwell, and he possessed also what neither Cromwell nor Bonaparte possessed—learning, taste, wit, eloquence, the sentiments and manners of an aeeomplished gentleman." See Merivale's *Fall of the Roman Republic*; Mommsen's *History of Rome*, vol. iv.; Froude's *Julius Cæsar*; and Long's *Decline of the Roman Republic*, vols. iii.–v. Revised by C. K. ADAMS.

Cæsare'a (in Gr. Καισαρεία; anciently ealled *Turris Stratonis*): an aneient eity and seaport of Palestine, now in ruins; situated on the Mediterranean; about 37 miles N. of Jaffa, and 55 miles N. N. W. of Jerusalem (see map of Palestine, ref. 7–C). It was rebuilt by Herod the Great (22 B. C.), who ereeted here several magnifieent edifiees, and proteeted its port by a semieireular mole, whieh is said to have been one of the most wonderful works of antiquity. Cæsarea was the seene of several events reeorded in the book of Aets, espeeially that of Paul's Syrian imprisonment. (See Aets, chaps. ix.–xii., xxiii.–xxvii.) It was taken by the crusaders in 1101. The site is now eovered with shapeless ruins. Here Eusebius and Origen lived.

Cæsarean Operation: See HYSTEROTOMY.

Cæsare'a Philip'pi, or **Pa'neas**: an aneient town of Palestine; situated about 20 miles N. of the Sea of Galilee, and 45 miles W. S. W. of Damaseus (see map of Palestine, ref. 4–E). It is mentioned in Matthew xvi. 13. This site is now oeeupied by the village of Banias, in whieh some ancient ruins are visible. Inseriptions found here show that the god Pan once had a sanetuary in this plaee. It was embellished by Herod and his son Philip; was once the seat of a bishop, but is now a miserable village.

Cæ'sium [neut. of Lat. *cae'sius*, bluish gray]: an alkali metal diseovered with the spectroseope by Bunsen and Kirehhoff in 1860 in the water of some saline springs in Germany. Its chemieal symbol is Cs, and its atomie weight 132·7. The salt spring of Dürkheim contains 0·17 parts of the ehloride in 1,000,000. The hot spring of Wheal Clifford was found to contain 0·12 grains of the ehloride in a gallon. Cæsium is widely diffused in nature, though in exeeedingly small quantities; it has been found with rubidium in lepidolite (as at Hebron, in Maine), petalite, and some feldspars, and has never been isolated. The mineral *pollux* of Elba is reported to contain 34 per cent. of cæsium. In its chemieal relations cæsium is closely analogous to potassium and rubidium. A fused mass of cæsium chloride may be decomposed by the eleetric current, but the eæsium rises to the surfaee and burns with a reddish flame. Bunsen obtained it as an amalgam with mercury, but even in amalgam or alloy it absorbs oxygen with great rapidity. The platinochloride is more insoluble than that of potassium, and this fact has formed the basis of its separation from that element. The speetrum of eæsium is charaeterized by two blue lines. Revised by IRA REMSEN.

Caf'feine: an alkaloid existing in coffee, tea, Paraguay tea (*Ilex paraguayensis*), and guarana (*Guarana officinalis*, or *Paullinia sorbilis*); called also **Theine** and **Guaranine**. Chemieal formula, $C_8H_{10}N_4O_2$. It was diseovered by Runge in 1820, and almost simultaneously by Pelletier, Caventou, and Robiquet. Oudry in 1827 extraeted an alkaloid from tea which he supposed to be a distinet eompound, and called it theine, but in 1838 Jobst proved caffeine and theine to be identical. Stenhouse extracted eaffeine or theine from the leaves and twigs of Paraguay tea, while Martius extracted it from the dry pulp of the *Paullinia sorbilis* or guarana, and called it guaranine, but afterward proved the alkaloid to be identieal with eaffeine. Van Corput first showed that the leaves of the eoffee-plant, as well as the berries, contained caffeine. It probably also exists in other plants.

Caffeine occurs in the raw and also in the roasted coffee, the amount varying with the variety of coffee, the ripeness

of the sample, the season of the harvest, etc. The mean amount of caffeine, as determined by Stenhouse in samples of various coffees, was 0·8 to 1 per cent. Domingo coffee contains the least and Martinique coffee the most caffeine. Tea contains somewhat more caffeine than coffee, 2·5 to 3·4 per cent. It has been found in hyson tea, 2·2 to 4·1 in gunpowder tea, and 0·9 to 2·1 per cent. in various black teas. (*Stenhouse.*) Mean, about 2 per cent. The Paraguay tea used in several South American countries to prepare the drink known by the natives as *maté* contains 1·1 to 1·2 per cent. of caffeine. The guarana, which is a sort of chocolate, the seeds of the plant being roasted and ground to a paste with water, contains about 5 per cent. of caffeine. Guarana is used by the Brazilians to counteract dysentery, retention of urine, etc. Caffeine is supposed to exist in coffee-berries and tea-leaves, combined with tannic acid and potassa—i. e. as potassium caffeo-tannate.

When pure, caffeine appears in white silky needles having no odor, containing 8·4 per cent. of water of crystallization, which it parts with at 302° F.; sparingly soluble in cold water, and much more so in hot; less soluble in alcohol, and still less so in ether. It acts as a weak base, dissolving in acids, from which it may be crystallized by evaporation. Boiled with fixed caustic alkalies, it decomposes, giving methylamine. Heating with basic hydrate alters it to a stronger base—caffeidine. Boiled with an excess of nitric acid, and then evaporated at a gentle heat, it gives a red color, resembling that obtained from murexide, on the addition of ammonia, which is quite characteristic. Caffeine is used in medicine as a powerful stimulant to the respiration and circulation, and it increases the rapidity of thought. It is valuable as a drug in certain cases of cardiac and renal disease, and in opium-poisoning.

Revised by H. A. Hare.

Caffraria: See Kaffraria.

Caffres: See Kaffirs.

Cage-birds: See articles on the various birds, especially Parrot, Cockatoo, and Canary-bird. Birds have in all ages been kept in captivity for their song and plumage. They are favorite household pets everywhere, but should be kept in well-ventilated and uniformly heated rooms, and not exposed to draughts.

Cagliari, kaal′yăă-rĕĕ: one of the two provinces into which the island of Sardinia is divided; bounded N. by the province of Sassari, and E., S., and W. by the Mediterranean Sea. Area, 5,257 sq. miles. The ground is marshy and the climate unhealthy. The chief articles of export are grain, oil, almonds, sugar, molasses, and wine. Chief town, Cagliari. Pop. (1890) 447,807.

Cagliari (anc. *Calaris*, or *Caralis*): a city of Sardinia; capital of province of same name; on a spacious bay on the south coast; lat. 39° 13′ N., lon. 9° 7′ E. (see map of Italy, ref. 8–B). It has a large and secure harbor, which is defended by several forts, and is the emporium through which nearly all the foreign trade of the island passes. It contains a cathedral, about thirty churches, numerous convents, a public library, several hospitals, an arsenal, a mint, and a college. Here are manufactures of cotton fabrics, soap, gunpowder, leather, and furniture. Among the articles of export are grain, wine, oil, salt, saffron, and rags. Pop. 39,300.

Cagliari, Paolo: See Veronese.

Cagliostro, kăăl-yōs′trō, Alexander, Count: Italian charlatan and impostor, whose proper name was Giuseppe Balsamo; b. at Palermo, June 8, 1743. He learned a little chemistry and medicine in a monastery, where he was assistant apothecary. Having assumed the title of count and become a Freemason, he traveled through many countries, professing to be a physician and alchemist, and raising money by quackery and other forms of imposture. In some of his adventures he was attended by his wife, and traveled in his own coach in an ostentatious style. About 1780 he visited Paris, where he made many dupes among the higher classes, and revived an old Egyptian Masonic order, of which he became grand kophta. He was patronized by Cardinal de Rohan, with whom he was implicated in the affair of the "diamond necklace," and was imprisoned in the Bastile in 1785. Having been liberated in 1786, he visited England, where he obtained little success. He afterward went to Rome, where he was arrested in 1789 as a Freemason, and condemned to imprisonment for life. D. in the fortress San Leone, near Urbino, Aug. 25, 1795. See Carlyle, *Miscellanies*, vol. iv.

Cagnola, kăăn-yō′lăă, Luigi, Marquis: architect: b. in Milan, Italy, June 9, 1762. He became president of the Institute of Milan. His greatest works are two triumphal arches at Milan—viz., the Porto del Ticino (once called Porta di Marengo) and the Arco della Pace or Porta del Sempione, commenced in 1807 and finished about 1837. The latter is built of white marble, and is 78 feet high. D. in Inverigo, Aug. 14, 1833.

Cagots, kăă′gō′ [Fr., of uncertain etym., perhaps connected with Breton *cacadd*, leprous. The explanation from *ca* (= *canis*) + *got*, i. e. Gothic dog, is only a folk-etymology. Its mod. Fr. signif., hypocrite, is influenced by *bigot*]: a despised race of social outcasts (resembling in some respects the gypsies) who have wandered over parts of France for centuries, and were considered descendants of the Visigoths, whom Clovis nearly annihilated in battle in the fifth century. Before the great French Revolution they were bound by law to wear a peculiar dress, to live apart, to labor in none but menial occupations, and only to enter churches by a special door in each. The Revolution relieved them from all legal disabilities, but could not release them at once from social outlawry and general detestation. Of late, however, they would seem to have sunk out of sight, being either absorbed into the lower class of the peasants or dwindled to a handful. See Michel, *History of Outcast Races* (1847); J. Hack Tuke, in *Journal of the Anthropological Society*, vol. ix. (1880).

Cahors, kăă′ōr′ (anc. *Divona*): a town of France; capital of the department of Lot; on a rocky eminence on the river Lot: 57 miles N. of Toulouse (see map of France, ref. 8–E). It contains a large cathedral, a college, a theater, a public library, and a normal school; and has manufactures of glass, paper, woolen goods, etc. Here are remains of a magnificent Roman aqueduct. Pop. (1896) 14,502.

Caibarien, kī-baa-ri-en′: a Cuban port, on the north coast of Santa Clara province. The harbor is good. Pop. 5,000.

Caïcos Islands: the southeasternmost of the Bahama islands; associated, with Turk's island, with the government of Jamaica. Total area, 212 sq. miles. Pop. with Turk's island, about 5,000. Caïcos island proper is the easternmost of the larger Bahama islands; lon. 71° 50′ W., lat. 21° 45′ N.

Cailletet, Louis Paul: See the Appendix.

Caillié, kăă′ĕĕ′yā′, or **Caillé**, kăă′yā′, René: traveler: b. in Deux-Sèvres, France, Sept. 19, 1799. He gained a prize of 10,000 francs which the Geographical Society of Paris offered to the first traveler who should visit Timbuctoo. He performed the journey from Sierra Leone to Timbuctoo in 1827–28, and published a narrative of his adventures (1830). D. near Paris, May 20, 1838.

Cain: the eldest son of Adam and Eve; a cultivator of the soil; slew his brother Abel in a fit of jealousy, caused by the rejection of his own sacrifice and the acceptance of his brother's; was condemned to be a fugitive on the earth. He then retired to the land of Nod, and built there a city which was called Enoch, after the name of his eldest son.

Cain, William: civil engineer; b. at Hillsboro, N. C., May 14, 1847; graduated at North Carolina Military and Polytechnic Institute; practiced civil engineering eight years; after that was made Professor of Mathematics and Civil Engineering at the University of North Carolina. He is the author of *Theory of Voussoir, Solid and Braced Arches* (1874); *Maximum Stresses in Framed Bridges* (1878); *Solid and Braced Elastic Arches* (1879); *Symbolic Algebra* (1884); *Practical Designing of Retaining Walls* (1888); and of papers in Van Nostrand's *Engineering Magazine* and the *Transactions of the American Society of Civil Engineering*, among which may be mentioned *Theorem of Least Work* (1891) and *Transition Curves* (1892).

Caine, Thomas Henry Hall: novelist; b. of Manx parents at Runcorn, Cheshire, England, May 14, 1853; educated in Liverpool, and at fifteen was apprenticed to an architect and surveyor there. While still a youth he wrote much for the press, and contributed leading articles on building, land surveying, and architecture to the *Builder* and *Building News*. At twenty he returned to the Isle of Man and taught school for six months, but soon returned to Liverpool, where he worked until twenty-four. He then went to London and lived with Dante Rossetti until the poet's death in 1882. Has published *Sonnets of Three Centuries* and *Recollections of Rossetti* (1882); *Cobwebs of Criticism* (1883); *The Shadow of a Crime* (1885); *A Son of Hagar* (1886); *The Deemster* (1887); *The Bondman* (1890);

The Manxman (1894); *The Christian* (1897); and *The Eternal City* (1901). *The Deemster* was dramatized, as *Ben-my-Chree*, in 1889, *The Manxman* in 1895, and *The Christian* in 1898. In 1890 he traveled in Iceland, in 1892 in Russia, and in 1895 and 1898 in the U. S. and Canada. Ambassador of Authors' Society to negotiate Canadian copyright, 1898. He lived for a time at Bexley Heath, in Kent; later at Keswick, Cumberland, and now makes his home at Peel, Isle of Man.

Cain'ites, or **Cain'ians**: a Gnostic sect of the second century, who maintained that Cain was superior to Abel, since the latter was easily overcome by him. They also professed reverence for Judas and all the worst characters mentioned in the Bible.

Cainozoic: See CENOZOIC.

Caird, EDWARD, LL. D.: b. at Greenock, Scotland, 1824; educated at Oxford University; fellow in Merton College, Oxford; became Professor of Moral Philosophy in Glasgow University 1866; and succeeded Prof. Jowett as Master of Baliol College, Oxford, in Nov., 1893. He published in 1877 *A Critical Account of the Philosophy of Kant*; in 1883 a volume on Hegel in Blackwood's Philosophical Classics; in 1892 *Essays on Literature and Philosophy*, 2 vols.; in 1893 the *Evolution of Religion*. W. T. HARRIS.

Caird, Sir JAMES: agriculturist; b. at Stranraer, Scotland, in 1816; educated at the High School and University of Edinburgh; published in 1849 a treatise on *High Farming as the Best Substitute for Protection*, which attracted much attention; devoted himself to the investigation of questions connected with agriculture, and was engaged in many Government missions. As member of Parliament in 1864 he secured the passage of the bill providing for the collection of agricultural statistics in the United Kingdom. Author of *English Agriculture* (1852); *The Landed Interest*; *India, the Land and the People*, etc.; member of the new Board of Agriculture 1889. D. in London, Feb. 10, 1892.

Caird, JOHN, D. D., LL. D.: brother of Edward; b. at Greenock, Scotland, Dec. 15, 1820; graduated at the University of Glasgow 1845; ordained minister of Newton-on-Ayr 1845; and, after short pastorates in Edinburgh and Perthshire, settled over Park church, Glasgow, 1857. He was appointed Professor of Divinity in University of Glasgow 1862; principal of the university 1873. He published *Introduction to the Philosophy of Religion* (Glasgow, 1880; 2d ed. London, 1889); *The Religions of India, Brahmanism and Buddhism* (1881); *Spinoza* (Edinburgh, 1888). D. in London, July 30, 1898. W. T. HARRIS.

Cairn [Mod. Scotch < Gael. *carn*, heap]: applied to artificial and conical heaps of unhewn stones, which are frequently found in Europe on tops of hills. Many cairns are found near the circles of unhewn stone pillars which are sometimes called Druidical. In some cases the heaps of stones are girdled round by large unhewn stones set upright in the ground. It appears that the majority of them were raised as sepulchres and monuments for the dead. Human bones are often found buried under them, together with stone hammers, flint arrow-heads, flint axes, bronze weapons, etc. In Scotland and Ireland occur large cairns called "chambered cairns." The most remarkable of these is at New Grange, on the river Boyne, near Drogheda. It is 400 paces in circumference, about 80 feet high, and is supposed to contain about 180,000 tons of stones. It presents the appearance of a grassy hill partially wooded, but on examination the coating of earth is found to be superficial. An opening accidentally discovered is the external entrance of a gallery leading to a large cruciform chamber containing three granite basins or urns. The sides or walls of the chamber are formed of immense blocks of stone, some of which are covered with carved figures, supposed to be symbolical.

Cairnes, JOHN ELLIOT: economist; b. in Drogheda, County Louth, Ireland, Dec. 26, 1823; son of a brewer, in whose counting-room some of his youth was passed; graduated at Trinity College, Dublin, in 1848; was called to the bar; through Archbishop Whately's influence became in 1856 Professor of Political Economy in Trinity College; in 1857 published *Character and Logical Method of Political Economy*, expanding therein some of J. S. Mill's *Unsettled Questions*, and fixing the definition of law in economics; in 1861 became Professor of Economy and Jurisprudence in Queen's College, Galway; in 1865 was injured by a fall from his horse while hunting, and was made an invalid for life; in 1866 Professor of Political Economy in University College, London; retired as *emeritus* in 1872; d. in London, July 8, 1875. His *Logical Method* is the key-note to his speculations, and expands Ricardo's doctrine of rent (2d ed. 1875). He wrote for reviews on the depreciation of gold, showing that the losses would fall chiefly on raw materials and on labor; also on slave-labor, forecasting truly (1861) the issues of the civil war in the U. S.; produced *Political Essays* (1873) largely concerned with Irish problems. His remaining works are *Essays on Political Economy, Theoretical and Applied* (1873); *Political Economy and Laissez-Faire*; and his largest work, *Leading Principles of Political Economy Newly Expounded* (1874). He was one of the most acute and original thinkers of the English orthodox school. He insisted on the concrete-deductive method of economic studies, representing laws as only approximately true and in need of testing by facts; developed the incidence of the cost of production, expanding Senior's postulates; defined the limits within which competition was free by a real contribution to the progress of economics; and defended Mill's wages-fund theory earnestly, after its author had abandoned it.

C. H. THURBER.

Cairngorm Stones: a name given by jewelers to brown or yellow quartz or rock-crystal found at Cairngorm, in Aberdeenshire, Scotland. The color is produced by a little oxide of iron, or manganese. The yellow variety is often called topaz, but it is inferior to the true topaz in hardness and brilliancy.

Cairns, HUGH MCCALMONT, Earl: orator and lawyer; b. in Cultra, near Belfast, Ireland, in 1819. He was returned to Parliament for Belfast in 1852; appointed Attorney-General by Lord Derby in 1866. He was Lord Chancellor of England from Feb., 1868, until December of that year, and was leader of the Conservative party in the House of Lords in 1869; again Lord Chancellor from 1874 till 1880. D. in Bournemouth, Apr. 2, 1885.

Cairns, JOHN, D. D., LL. D.: Scotch theologian; b. near Ayton, Scotland, Aug. 23, 1818; educated in the universities of Edinburgh and Berlin; minister of United Presbyterian church at Berwick-on-Tweed 1845–76; became Professor of Apologetics and Systematic Theology in the United Presbyterian Theological Hall, in Edinburgh, 1867. He was the author of *Life of John Brown, D. D.* (Edinburgh, 1860); *Unbelief in the Eighteenth Century* (1881); and of numerous tracts, reviews, and encyclopædia articles. D. in Edinburgh, Mar. 14, 1892.

Caï'ro (called by the Arabs *Al Masr* or *Musr*; also *Al Kahireh* (or *Qahera*), i. e. the victorious): a famous city; capital of modern Egypt; situated in a sandy plain on the right (east) bank of the Nile; 5 miles S. of the Delta; lat. 30° 3′ N., lon. 31° 18′ E. (see map of Africa, ref. 2–F). Elevation, 40 feet above the level of the sea. The climate is warm, dry, and healthy, with a mean annual temperature of about 72° F. The mean temperature of summer is 85°, and that of winter 58°. Cairo is bounded on the E. by the ridge of Mokattam, and surrounded by stone walls with antique battlements. The old streets are narrow, crooked, and ill-paved. The houses, which are built mostly of brick, are substantial buildings of two or three stories, have flat roofs, and are famous for their window-lattices of extraordinary richness in *moucharabiyé*, or turned-work. The city is divided into quarters, occupied respectively by the Mussulmans, the Jews, the Christians, etc. These quarters are separated by gates, closed at night. Cairo is connected with Alexandria and Suez by railroad.

The architectural interest of Cairo centers in its mosques and tombs. Of the former, numbering some 350, the most ancient is that of Toulûn, built 879 A. D., although parts of the still older mosque of Amrû still stand. These two mosques are of the columnar type, with many aisles of columns and pointed arches. Another type, represented by the mosque of Sultan Hassan, consists of a huge open, vaulted chamber on one side of the great court, flanked by smaller chambers, schools, etc. The later mosques, from the fifteenth century down, are domed structures, executed sometimes in stone and sometimes in lath and plaster; but almost invariably of great beauty, and adorned with one or two minarets of singular grace and elegance. The mosque of Kaït-Bey is one of the finest of this type. The "tombs of the caliphs" and "of the mamelukes," in the same general style of architecture, are admirable specimens of Arab art. There are handsome public gardens with groves of orange, citron, and palm trees. Among the remarkable objects in

the vicinity of Cairo are the palace of the viceroy, the obelisk of Heliopolis, the old and celebrated Nilometer on the island of Rodah, a graduated column indicating the height of the inundations of the Nile, and most important of all, the Great Pyramids of Gizeh, about 15 miles S. W. of this city. (See PYRAMIDS.) Cairo has long been celebrated as a seat of Oriental learning and Mohammedan theology. It has a university or college which was attended in 1885 by about 7,700 students. There are numerous iron-foundries, calico-printing works, and extensive manufactures of cotton and silk fabrics. The Arabs are the most numerous of the races which compose the population. Cairo, which is supposed to occupy the site of the ancient *Latopolis*, was founded by the Arabs about 970 A. D., and was ruled by the Fatimite caliphs until 1171, when Saladin became master of Egypt. It was the capital of the Sultans of Egypt until it was captured by the Turks in 1517. Between the west side of the older city and the river Nile most of the ground has been laid out into building-lots, and much of it covered with regular rows of houses, forming the district of Ismaileeyah. New streets have been cut through the crowded districts of the city, and the Ezbekeeyah, its principal square, transformed into public gardens. The boulevard Mehemet Ali traverses the city nearly N. and S. Pop. (1897) 570,062.

Revised by A. D. F. HAMLIN.

Cairo, kā′rō: city, railroad center, and river-port of Illinois; capital of Alexander County (for location of county, see map of Illinois, ref. 12–E); situated at the southern extremity of the State, upon the point formed by the junction of the Ohio and Mississippi rivers, 175 miles below St. Louis. It is a market for the supply of a large portion of Southern Illinois, Southeast Missouri, and Western Kentucky, and is an important dépôt for the products of Northern Illinois, Iowa, and Wisconsin seeking Southern markets. Over 4,000 steamboats touch at its wharf annually. It has a considerable manufacturing industry, costly public-school buildings, and a fine custom-house. Pop. (1880) 9,011; (1890) 10,324; (1900) 12,566.

EDITOR OF "ARGUS."

Cairoli, kī-ro′lĕe, BENEDETTO: Italian statesman; b. at Pavia, Jan. 28, 1825; educated at the University of Pavia; fought against Austria in 1848 and 1859; wounded at siege of Palermo 1860; deputy and leader of the Left 1868; president of the ministry 1878 and 1879–81. On Nov. 17, 1878, he was severely wounded in preventing the assassination of King Humbert, who was riding in a carriage with him. D. in the royal villa, Lago di Monte, near Naples, Aug. 8, 1889.

Caisse: a French word, the primary meaning of which is a chest, box, case, or coffer. It has important applications in commerce, finance, etc. In mercantile business it signifies cash or cash-box. In anatomy, caisse is the drum of the ear. In financial affairs the term is applied to a fund; also to the pay-office. *Caisse d'épargne* signifies a savings-fund or savings-bank.

Caisson [Fr., large chest, deriv. of *caisse*, chest]: in architecture, a coffer, a sunken panel in a flat or vaulted ceiling, or in the soffit of a cornice. In civil engineering, an inclosure or large vessel in which the foundations of the piers of a bridge are built and gradually lowered to the bottom of a stream. Caisson is also a name given to a tumbril or ammunition-cart used in the artillery service. In maritime affairs it is applied to an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure which contains an air-chamber, and is sunk by letting water into it. After it has been placed under the vessel the water is pumped out, and the caisson rises with the vessel. See BREAKWATER and FOUNDATIONS.

Caite: See BRAGANZA.

Caith'ness: the northernmost county of Scotland; bounded W. by the county of Sutherland; by the ocean on the other three sides. Area, 697 sq. miles. The seacoast is bold and rocky, with many inlets or bays. The surface is nearly level, except a mountain-range formed of granite and gneiss, which extends along the western border, and rises to the height of 2,300 feet. A large part of the county is moorland, destitute of trees. The staple products of the soil are oats, potatoes, and turnips. Many of the inhabitants are employed in the herring, cod, and salmon fisheries, and over 150,000 barrels of cured fish are annually exported from this county. Chief towns, Wick and Thurso. In the Middle Ages the Kings of Norway ruled over this part of Scotland. Pop. (1901) 33,619.

Caithness Flagstones: a local name of the Old Red Sandstone as developed in Northern Scotland. The formation, which is about 16,000 feet thick, consists chiefly of argillaceous rocks, but includes also flaggy sandstones of considerable economic importance.

Ca'ius: See GAIUS.

Caius, keez (Lat. for *Kaye*, *Key*, or *Cay*), JOHN, M. D.: a learned physician; b. at Norwich, England, Oct. 6, 1510; educated at Gonville Hall, Cambridge, and at Padua in Italy; practiced medicine in Cambridge and London; was appointed physician successively to Edward VI., Queen Mary, and Elizabeth. In 1557 he obtained permission to enlarge Gonville Hall into Caius College, of which he became master in 1559. He wrote a *Treatise on the Sweating Sickness* (1552), etc. D. in London, July 29, 1572.

Caius Julius Cæsar: See CÆSAR, JULIUS.

Caivano, kī-vaa′nō: a town of Italy; province of Naples; 8 miles N. of Naples; was fortified in the Middle Ages. It has remains of its old walls and towers. It has a trade in wine, olives, cereals, and all sorts of fruit. Pop. 11,700.

Cajamarca, kăă-*kh*ăă-maar′kăă, or **Caxamarca** (i. e. a place of frost): a department of Peru; bounded N. by Ecuador, E. by Amazonas, S. by Libertad, and W. by Lambayeque and Piura. The department, with the exception of the extreme N., is crossed by mountain-ranges, in consequence of which the climate is cool and pleasant. It is irrigated by the Marañon, which flows along its eastern boundary. All products of the tropics and the temperate zones are raised here, as wheat, barley, potatoes, tobacco, etc. Chief town, Cajamarca. Area, 14,188 sq. miles. Pop. 244,895.

Cajamarca, or **Caxamar'ca**: town of Peru; capital of a department of same name; near the eastern foot of the Andes; about 83 miles N. N. E. of Trujillo (see map of South America, ref. 4–B). It has several churches, manufactures of cutlery and woolen cloth. Silver mines have been opened in the vicinity. Cajamarca is celebrated in the history of the Spanish conquest. The ruined palace in which Pizarro confined the inca Atahualpa is still to be seen. Pop. 12,000.

Caj'etan (It. *Cajetano* or *Caietano*; Lat. *Caëtanus*): the surname of THOMAS DE VIO; an Italian prelate; b. at Gaeta (Caieta), Feb. 20, 1469; entered the order of St. Dominic in 1484, and became its thirty-ninth general in 1508. He was made a cardinal in 1517, and was employed on various political and religious missions of importance. He was papal legate in Germany when Leo X. commissioned him to invite Luther to retract. The meeting took place at Augsburg in Aug., 1518, but was fruitless. In 1519 he became Bishop of Gaeta, and died in Rome, Aug. 9, 1534. He was a man of fervent piety and stainless life. He procured the election to the papacy of the Hollander, Adrian VI. Cajetan was a voluminous writer. His views on the interpretation of Scripture and the future condition of unbaptized infants met with much contradiction. Some eighty of his essays and theses were published in 1581 at Lyons, and in 1612 at Antwerp. The best known and most durable of his works is the famous commentary on the *Summa Theologiæ* of St. Thomas Aquinas, which appeared between 1496 and 1509 at Brescia and Rome; one of the best ancient editions is that of Venice, 1596. The last reprint is found in the Leonine (Leo XIII.) edition of the works of St. Thomas (Rome, 1882).

JOHN J. KEANE.

Caj'uput-tree (spelled also **Cajeput**): a tree 15 to 20 feet high of the genus *Melaleuca*, of the family *Myrtaceæ*. While there are about 136 species in the genus, the name is mostly restricted to *M. leucodendron*, a native of Australia and the adjacent islands. It bears spikes of white flowers on pendulous branches, and its leaves are narrowly lanceolate and somewhat curved. From the latter a valuable oil is obtained, known in pharmacy as oil of cajuput. It is highly stimulant, and is much esteemed in the East, being regarded as a panacea by the Malays. In the U. S. it is used for many disorders—e. g. toothache, rheumatism, gout, dyspepsia, etc. On account of its high price, it is sometimes adulterated by the addition of oil of rosemary, turpentine, etc. The addition of iodine to the unadulterated oil results in the formation of a coagulum, which may be dried into a greenish-brown, brittle mass, thus distinguishing it from that which has been adulterated.

C. E. B.

Cakchiquels: See INDIANS OF CENTRAL AMERICA.

Cake-urchin, or **Sand-dollar**: the test of the very much flattened forms of the group of sea-urchins, of the order

Clypeastridæ. *Echinarachnius parma* is the common sand-dollar of the Atlantic coast, while *E. excentricus* is the common cake-urchin of the Pacific coast from Monterey Bay to Alaska.

Calabar Bean: the seed of the *Physostigma venenosum*; a twining, half-shrubby leguminous plant; native of Western Africa. It belongs to the sub-order *Papilionaceæ*, and is nearly allied to the kidney bean. The bean is used as an ordeal among the Africans. It is very poisonous: fifteen of the beans have produced death in an hour. It is used by surgeons, in small amounts, to cause contraction of the pupil of the eye, the opposite of the effect of belladonna. It is also sometimes given in tetanus and some other diseases. It is a powerful depressant to nervous action.

Calabash: See Bottle Gourd.

Calabash-tree: an evergreen tree of the *Bignoniaceæ* or Bignonia family and genus *Crescentia*. It is notable for its large fruits, which are a foot in diameter, reminding one of the calabash or Bottle Gourd (*q. v.*). The common species (*C. cujeti*) is a native of tropical America, where the hard shells of the fruits are used as domestic utensils or carved into ornamental vessels, while its tough wood is useful for various purposes. The genus *Crescentia* contains fourteen species, all natives of tropical America. Some of these are occasionally grown in the larger conservatories. C. E. B.

Calabo'zo: city of Venezuela; in the state of Miranda, on the plains bordering the left bank of the river Guarico. Pop. in 1893 about 6,000. It is 327 feet above sea-level, and has a warm but not unhealthy climate. It is the center of a large grazing district, and has an important commerce in hides, cattle, mules, and horses. The exports are mainly by way of the Orinoco. Calabozo was founded in 1730.

Herbert H. Smith.

Cala'bria: the ancient name of the southeastern part of Italy, coinciding nearly with the modern province of Lecce. It was bounded N. E. by the Adriatic, S. W. by the Sinus Tarentinus (Gulf of Taranto), and N. W. by Apulia. Among its chief towns were Brundisium and Tarentum.

Calabria (anc. *Bruttium*): a region of Southern Italy; forming the southern part of the former kingdom of Naples; a long peninsula inclosed by the sea on all sides except the N.; separated from Sicily by the Strait of Messina. Area, 6,663 sq. miles. It is divided into three provinces, Cosenza, Reggio Calabria, and Catanzaro. It is traversed by the Apennines through its whole extent. These mountains, which are here nearly 4,000 feet high, are partly covered with forests of pine, oak, and beech trees. Between the Apennines and the sea are fertile and beautiful valleys, which produce wheat, cotton, rice, sugar, oranges, figs, grapes, and olives. This region is subject to earthquakes. Calabria has considerable fisheries of the tunny, swordfish, anchovy, and mullet. Agriculture is in a rude and barbarous state. Chief towns, Cosenza, Reggio, and Catanzaro. Pop. (1890) 1,309,554.

Calahorra, kăă-lăă-ōr'răă (anc. *Calagurris*): a town of Spain; province of Logroño; on the river Ebro; 19 miles E. S. E. of Logroño (see map of Spain, ref. 13–G). It has an old cathedral and some ancient remains. It is the seat of a bishop. Quintilian was born here. *Calagurris* was taken by Pompey or Afranius about 78 B. C., after a long and famous siege. The sufferings of the inhabitants were extreme; hence the Romans gave the name "Calagurritan famine" to any severe famine. Pop. about 8,200.

Calais, ka-lā' [Lat. *Caletum*, from the ancient tribe *Caleti*]: a fortified seaport-town of France; department of Pas-de-Calais; on the Strait of Dover; 122 miles by rail N. N. E. of Amiens, 19 miles N. E. of Boulogne, and 26 miles E. S. E. of Dover; lat. of the lighthouse, 50° 57′ 45″ N., lon. 1° 51′ 18″ E. (see map of France, ref. 1–E). The town and harbor are defended by a castle and several forts, and can be rendered inaccessible by land by flooding the adjacent ground, which is low and marshy. The harbor, which is formed by two moles, is nearly dry at ebb-tide. The town is regularly built, mostly of brick, and has wide, well-paved streets. It has a Gothic cathedral, a public library, and a theater. A large portion of the English tourists who visit the Continent pass through Calais, which has daily communication with Dover by steamboats. Calais is the terminus of a railway which connects it with Amiens and Paris. Here are flourishing manufactures of bobbinet, hosiery, soap, leather, etc. In 1347 this town was taken after a long siege by Edward III. of England, who was then persuaded by his queen, Philippa, to spare the lives of six devoted citizens of Calais. It remained in the power of the English until 1558, when it was taken by the Duke of Guise. It is connected with Great Britain by submarine telegraph. The terminus of the proposed tunnel beneath the English Channel is near the village of Sangatte, 6 miles W. of Calais. Pop. (1886) 58,969; (1896) 56,940.

Calais, kal'is: a city, port of entry, and capital of Washington co., Me. (for location of county, see map of Maine, ref. 7–G); on railroad and St. Croix river; at the head of navigation; 28 miles N. by W. from Eastport, and 264 miles N. E. of Portland. Bridges across the river connect it with St. Stephen's in New Brunswick. Calais derives its prosperity from the lumber-trade and ship-building. It has a public library, an academy, an opera-house, a dry dock, marine railways, machine-shops, foundries, and several shipyards. It is the southeast terminus of the St. Croix and Penobscot R. R. to Princeton. The river, which affords water-power, is part of the eastern boundary of the U. S. Pop. (1880) 6,173; (1890) 7,290; (1900) 7,655.

Calaman'der-wood: a valuable cabinet-wood which resembles rosewood, but is far more beautiful and durable. It is produced by the *Diospyrus hirsuta*, a tree of the family *Ebenaceæ*; native of Ceylon and Southern Hindustan; belongs to the same genus as the ebony and persimmon tree. This wood is very dense, takes an exquisite polish, and exhibits great richness and variety of colors, among which is chocolate or fawn color. It is said to be so hard that it can not be worked with edge tools. The tree has become rare in consequence of the wasteful operations of the Dutch and British. Several similar species are found in the Indian Archipelago.

Calamary: a cuttlefish of the order *Dibranchiata*. The term is also applied to the pen or cuttlebone, the internal shell of the cuttlefish. See Cuttlefish and Cephalopoda.

Calamat'ta, Luigi: a French engraver of Italian birth; b. at Civita Vecchia, June 12, 1802; engraved after Raphael, da Vinci, and Romano; was Professor of Engraving in Brussels and Milan. D. in Milan, Mar. 8, 1869.

Calamia'nes: a group of islands between Palawan and Mindoro in the Philippine Archipelago; extends between the parallels 11° 39′ and 12° 20′ N. and 119° 47′ and 120° 23′ E. They are mountainous and abound in valuable timber, are fertile and sparsely inhabited. Rice, wool, cacao, beeswax, and edible birds'-nests are the chief products. The climate is generally hot and unhealthy. The chief islands are Busuanga, Calamian, and Linacapan. Total area about 3,000 sq. miles. Pop. (1887) 14,291.

Calamich'thys [Gr. κάλαμος, reed + ἰχθύς, fish]: a ganoid fish found in the rivers of Western Africa. It takes its name from its slender, cylindrical form; is closely allied to the *Polypterus* of the Nile.

Cal'amine (*Lapis calaminaris*): an important and abundant ore of zinc; a native carbonate, containing, when pure, 52 per cent. of zinc. Crystals of this mineral are rare. It is opaque or translucent, has a vitreous luster, and occurs in kidney-shaped, botryoidal, cellular, and other imitative forms. It is found in veins, beds, and large deposits termed *pockets* in metamorphic limestone and in the Devonian and carboniferous formations. Large quantities of it are exported from Spain to the metallurgical districts of Europe. This ore is called Smithsonite by Dana and other mineralogists, who apply the term calamine to the silicate of zinc, the primary form of which is a rhomboid.

Calamint [M. Eng. *calament*, modified by false connection with *mint*; from Gr. καλαμίνθη, plant-name]: a plant of the genus *Calamintha* and family *Labiatæ*. The common calamint (*Calamintha officinalis*) is indigenous in England. It has serrated leaves, with an agreeable aromatic odor, and is used in domestic practice as a pectoral medicine. The U. S. have several species.

Calamite: the general name for certain great, tree-like fossil plants composing the order *Calamarieæ*, of which the principal genus is *Calamites*. They belonged to the class *Equisetinæ*, and were nearly related to the modern *Equisetum*, the horse-tails or joint-rushes. The remains of many species have been observed, chiefly in carboniferous strata (none later than the Permian) in both continents. These plants must have contributed largely to the production of coal.

Charles E. Bessey.

Calamus (Gr. κάλαμος): a Latin word signifying a reed, a stalk (of a plant); was used by the ancient Romans to denote an arrow, a musical pipe, and a pen which was made of a reed. This reed is supposed to have been the *Arundo donax*. Calamus also denotes the golden tube through which, in some church services, the eucharistic wine is taken.

Calamus: the sweet-flag. See ACORUS.

Calamus: a genus of *Palmaceæ* which yields a great part of the canes and rattans used in Europe and the U. S. for the seats of chairs and other purposes. Among the species of this genus are *Calamus rotang* and *Calamus viminalis*, which are natives of the warm or tropical parts of Asia. The *Calamus rudentum* has been found 500 feet long (Humboldt). *Calamus draco* yields the best dragon's-blood. Several species are climbers.

Cal'amy, EDMUND: an English divine; b. in London in Feb., 1600; educated at Cambridge; became an eloquent Presbyterian minister; in 1626 was appointed lecturer at Bury St. Edmunds, but when the order to read the *Book of Sports* was enforced (1636) he resigned; preached in London from 1639 till 1662. He was one of the authors of a famous treatise called *Smectymnuus*, from the initials of its authors, *S. M*arshall, *E. C*alamy, *T. Y*oung, *M. N*ewcomen, and *W. S*purstowe (1641), intended as a reply to Bishop Hall's *Divine Right of Episcopacy*. He took middle ground during the civil war; opposed the execution of the king; kept as private as he could under Cromwell. He promoted the restoration of the monarchy, and was offered the bishopric of Coventry and Lichfield. He declined, and soon afterward (1662) was ejected for Nonconformity. D. in London, Oct. 29, 1666.

Calamy, EDMUND: grandson of the preceding; divine; b. in London, Apr. 5, 1671; educated by various ejected divines; became Dissenting pastor in London 1692; d. there June 13, 1732. His fame will endure as the great biographical historian of Nonconformity. His first venture in the field which he made his own was by editing Baxter's *Narrative* (1696). This he abridged (1702), but in it he inserted his memorable account of the ministers and others who were ejected or silenced by the Act of Uniformity. This he afterward separately issued in revised and enlarged form (1713, 1727). See his *Historical Account of my own Life* (London, 1829, 2 vols.; 2d ed. 1830). Revised by S. M. JACKSON.

Calancha, FRAY ANTONIO, de la: Peruvian Augustinian friar; b. in Chuquisaca, 1584. He was rector of the College of San Ildefonso in Lima, where he died Mar. 1, 1654. He wrote the *Crónica moralizada del orden de San Agustin en el Peru*, which is essentially a chronicle of his order for the whole of South America, and is of great value for civil and geographical history. It was published in Barcelona in 1638. H. H. S.

Caland, kaa'lănt, PIETER: an engineer of Holland: b. in Zierikzee in 1826. His father, A. Caland, was an engineer-in-chief of the Waterstaat of Holland, and author of a work on dike-construction, embracing the methods of Dutch engineering as exhibited in the works of protection against the encroachments of the ocean and the inundations of rivers, etc. The son was educated at the Royal Military Academy at Breda; appointed a sub-engineer of the Waterstaat in 1845; passing through successive grades, became engineer-in-chief of the second class in 1867; in 1873 promoted over the intermediate grade to be inspector (the highest grade, of which there are but two) of the Waterstaat. He is author of a work (in French), *Étude sur l'Effet des Marées dans la Partie Maritime des Fleuves*; also (in Dutch) of a work on the protection of the coast against the encroachments of the sea, and of numerous reports; Knight of the order of the Netherlands Lion; vice-chairman of the Royal Institution of Engineers of Holland. He was a member of a commission on the "improvement of the water communication from Rotterdam to the sea," and the executive engineer of the work by which an existing mouth of the combined Rhine and Meuse was closed and another made, and a channel navigable for ships of the greatest draught created where before naught but light-draught vessels (10 to 12 feet) could venture under favorable circumstances of wind and tide. M. Caland's highest claim to fame as an engineer will be founded on the great seaport of Rotterdam, through the works giving an easy and direct water communication with the sea, in place of the tedious and circuitous ones before available. For this important work he received from the Vienna Exposition the first prize—a certificate of honor.

Calan'do [Ital., slackening; deriv. of *cala're* < Lat. *chala're*, *cala're*, slacken, from Gr. χαλᾶν, loosen]: an Italian musical term. It signifies diminishing gradually from forte to piano, and differs from *decrescendo* and *diminuendo*, as the tempo at the same time is slightly retarded, but not so much as in *ritardando*.

Cala'nus (in Gr. Κάλανος): an ancient Hindu philosopher; one of those whom the Greeks called Gymnosophists. According to Plutarch, his proper name was SPHINES. He passed some time in the camp of Alexander the Great in India. Having become sick at Pasargadæ, he was at his own request burned alive.

Calapooya Indians: See KALAPOOIAN INDIANS.

Calas, kă'laa', JEAN: a French Protestant victim of religious fanaticism; b. in Languedoc, Mar. 19, 1698. He was a merchant in Toulouse when, on the evening of Oct. 13, 1761, his eldest son committed suicide by hanging in his father's warehouse. Accusation was made that some one of the family had murdered the young man to prevent his conversion to Catholicism. Calas was sentenced to torture and death on the wheel, and the sentence was executed on Mar. 9, 1762, and the family were dispersed abroad, their property being confiscated. The widow interested Voltaire in the matter, and he proved that Calas was innocent, which was afterward officially declared, and Louis XV. gave the family 30,000 livres. See Coquerel's *Calas et sa Famille* (2d ed. 1870).

Calascibet'ta: a town of Sicily, about 60 miles S. E. of Palermo; on an isolated hill which rises nearly 2,500 feet above the sea. It is said to have been founded in 1080. Pop. about 5,000.

Calasio, kăă-laă-see'ō, MARIO, de: an Italian theologian and Hebrew scholar; b. in Calasio, Naples, 1550; d. in 1620. He studied Hebrew and biblical literature in a Franciscan convent, and was made a doctor of theology and professor of Hebrew in Rome. He wrote a Hebrew grammar and dictionary. He spent forty years in making his great work *Concordantiæ Sacrorum Biblorium Hebraicæ*, published in Rome in 1621, a less accurate edition of which was published in London 1747–49.

Calatabellota, kăă-laa'tăă-bel-lō'tăă: a town of Sicily; province of Girgenti; 25 miles N. W. of the city of Girgenti. It is very near the site of the ancient *Tricala*, and is on the ancient river *Crimisus*. Here is a fine mediæval church. Pop. 5,500.

Calatafimi, kăă-laa'tăă-fee'mĕc: a town of Sicily; province of Trápani; in a fertile valley 5 miles S. W. of Alcamo. Here in 1860 Garibaldi defeated the royalist troops. Pop. 10,964.

Calatanazor': a small town of Spain, in Old Castile, 10 miles S. W. of Soria. Here Al-Mansoor gained a great victory over the Christians in 1101.

Calatayud': a town of Spain; province of Saragossa; on the river Jalon; 45 miles S. W. of Saragossa (see map of Spain, ref. 14–H). It has an episcopal palace, a noble old castle, and several churches, convents, and hospitals; also manufactures of linen and woolen fabrics, paper, leather, etc. About 2 miles E. of this place is the site of the ancient *Bilbilis*, from the ruins of which Calatayud was mostly built. Pop. 11,512.

Calatrava, kăă-laă-traa'vaă, JOSÉ MARIA: Spanish statesman and eloquent lawyer; b. in Mérida, Feb. 26, 1781. He was a leader of the Liberal party and a member of the Cortes. He passed many years in exile between 1814 and 1830. D. Jan. 24, 1846.

Calatrava la Viega, -laă-vĕe-ay'*k*haă, or **Old Calatrava**: a ruined city of Spain; on the Guadiana river; about 12 miles N. E. of Ciudad Real: a strongly fortified place in the Middle Ages, but only a single tower now remains. Its defense against the Moors in 1158 is famous on account of its having originated the order of the Knights of Calatrava.

Calatrava, The Order of: founded in 1158 by Sancho III. of Castile, and confirmed by Pope Alexander III. in 1158. After the death of Sancho the knights elected as grand master Don Garcías de Redon. For a long period the war against the Moors was carried on almost entirely by the Knights of Calatrava. In 1197 the order was nearly exterminated through rashness in war; transferred its seat to Salvatierra, and grew to opulence. The influence exercised by the grand master in public affairs at length excited the jealousy of the king, and in 1523, by papal bull, the

grand-mastership was united to the crown, and the knights permitted to marry. Since 1808 the order has been one of merit.

Calave'ras: a small river in the north central part of California; rises at the foot of the Sierra Nevada, in Calaveras County; flows nearly southwestward, and enters the San Joaquin river about 15 miles below Stockton.

Calbur'ga, or **Kulburga**: a town of India; in the Nizam's Dominions; on an affluent of the Beemah; 110 miles W. of Haidarábád. It is now unimportant, but was formerly the capital of several Hindu and Mohammedan sovereigns.

Calcar, kăăl-kaar', Jean Stephan van: a Flemish painter; b. in Calcar, duchy of Cleves, in 1499. He was a pupil of Titian in Venice, and afterward studied Raphael. Some of his work has been ascribed to Titian. Among his best works is a *Mater Dolorosa*. D. in Naples in 1546.

Calcareous Spar, or **Calc-spar** [*calcareous* is from Lat. *calca'rius*; deriv. of *calx*, lime]: a common name of crystallized carbonate of lime; composed, when pure, of 44 per cent. of carbonic acid and 56 of lime. It is one of the most abundant of all minerals, and is found in every part of the world. The primary form of its crystals is a rhomb or rhombohedron. Its secondary forms are more numerous than those of any other mineral, and are said to amount to 700 or more. In a pure state this mineral is colorless and transparent, but it often contains impurities which render it red, green, brown, yellow, etc. Andreasberg, in the Hartz, and the Derbyshire lead mines are noted for fine large crystals. Some very fine crystals are from the Rossie lead mine of New York. The purest and most limpid variety of this crystal is called Iceland spar, which is found in Iceland, and exhibits double refraction in a remarkable degree.

Calcareous Tufa: See Limestone.

Calcasieu, kăl'ka-shoo: a river of Louisiana; rises in the western part of the State; flows in a general S. S. W. direction through Calcasieu parish, and enters the Gulf of Mexico. At its mouth stands an iron lighthouse 53 feet high; lat. 29° 45′ N., lon. 93° 17′ E. Length of river estimated at 200 miles, including Calcasieu Lake, which is an expansion of the river. The lake is about 18 miles long and 5 wide, and the foot of it is nearly 5 miles from the Gulf of Mexico.

Calceola'ria [deriv. of Lat. *calce'olus*, little shoe; dimin. of *cal'ceus*, shoe]: a genus of plants of the family *Scrophulariaceæ*, which comprises numerous species, natives of South America. They grow mostly on that part of the Andes which is more than 9,500 feet above the level of the sea; are herbaceous plants or shrubs with beautiful flowers. The corolla is two-lipped, and the lower lip is inflated, so as to form a bag which has some resemblance to a slipper. They are so abundant in some parts of Chili and Peru as to give a peculiar aspect to the scenery. Many species are cultivated by florists in Europe and the U. S., and are easily propagated by cuttings. Some of the species are used in South America for dyeing.

Cal'chas (Gr. Κάλχας): a Greek soothsayer who was present at the siege of Troy and demanded the sacrifice of Iphigenia. He is said to have died from vexation because Mopsus, another soothsayer, surpassed him in prophecy.

Calcite [from Lat. *calx*, lime + suffix *-ite*]: a general term under which are comprised all the varieties of carbonate of lime.

Calcium [mod. deriv. (Sir H. Davy) of Lat. *calx*, lime]: a very widely distributed and abundant metal (symbol Ca, and atomic weight 40). Among the more common substances containing it are limestone, calcite, chalk, marble, calcium phosphate, gypsum, or calcium sulphate. It was isolated by Sir Humphry Davy in 1808 in his great investigation on the action of the electric current on chemical compounds, in the course of which he discovered the metals potassium and sodium. It is a yellowish-white, malleable metal. Among the compounds of calcium that find extensive application are lime, made by heating the carbonate, and plaster-of-Paris, made by heating the natural sulphate.

Ira Remsen.

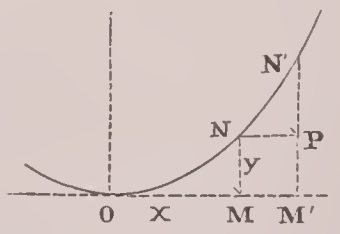
Calc-spar: See Calcareous Spar.

Calculating-machine: a machine for performing arithmetical operations, or for computing logarithmic or other mathematical tables in which the successive results are to be obtained by substituting, in an invariable formula, the consecutive numbers of a simple series, uniformly increasing. The two kinds of work here mentioned are essentially different, and require different machinery. For simple arithmetic the most successful machine yet constructed is that of M. Thomas, of Colmar in Alsace-Lorraine. For tabular numbers the computations are made by the "method of differences"; and the machines are called "difference-engines." Such are those of Babbage (which was never finished) and of the Messrs. Scheutz, of Stockholm, of which there is an example at the Dudley Observatory, Albany, and another in the office of the registrar-general, London. See Mechanical Calculation.

Calculus [Lat., pebble; stone used in reckoning, calculation; dimin. of *calx*, stone]: The term is derived from the ancient use of pebbles as *counters* or for making computations, and it, in general, denotes some particular method of performing mathematical investigations. Those, e. g., of arithmetic, algebra, logarithms, etc., have received the name of *Calculus*, as the *Arithmetical*, the *Algebraic*, the *Exponential*, the *Trigonometrical* (which latter, according to De Morgan, "contains that of *undulating magnitude*," or of *Circular Functions*). In modern usage it is applied to mathematical methods of peculiar power involving unusual refinements of reasoning, or reference to relations of magnitude, which may be styled "transcendental." Among such are the *Antecedental Calculus* of Mr. Glenie,* the *Calculus of Derivations* of M. Arbogast, the *Calculus of Probabilities* (*q. v.*), and the more modern creation of Sir William Rowan Hamilton, *Quaternions*. But, pre-eminently, by the word calculus is denoted the Infinitesimal Calculus, including under this head the complementary branches of "Differential and Integral," of the Leibnitz system of symbolization, or the "Fluxions" and "Inverse Method of Fluxions" of the Newtonian.

The calculi of Leibnitz and Newton are essentially the same, though the logical basis on which Newton places his method appears quite different from that of Leibnitz. The method of Leibnitz made its appearance before the public in 1684, earlier than that of Newton; but Newton's method of drawing tangents (wherein the method of fluxions was sufficiently explained) was communicated in a letter to a Mr. Collins in 1682. Upon the allegation that Leibnitz had seen this letter was based the charge (sustained by the Royal Society of London) that Leibnitz had plagiarized therefrom. This charge is now considered unfounded, and the glory is conceded to him of having been a contemporaneous discoverer of a calculus that has been styled "one of the greatest, most subtle, and sublime discoveries of this or perhaps of any age; opening a new world to us and extending our knowledge, as it were, to infinity, and carrying us beyond the bounds that seem to have been prescribed to the human mind; at least, infinitely beyond those to which ancient geometry was confined."

The logic on which the operations of the calculus rest is so intricate that even mathematicians were slow in accepting it, and the methods were sometimes objects of ridicule. Bishop Berkeley published a long paper criticising the method, and suggesting that differentials might be called the ghosts of departed quantities. At the present time, however, there is no real difference of opinion between professional mathematicians on the subject. We shall confine ourselves to such an outline of the first principles as may make them clear to the student.



Let O N N′ be a curved line of any form—a parabola, for example. Let N and N′ be two points upon the curve. If we take the horizontal and vertical lines going out from the point O as axes of co-ordinates, then, in the language of co-ordinates, O M will be the abscissa of the point N, and M N its ordinate. See Co-ordinates.

O M′ will also be the abscissa of the point N′, and M′ N′ its ordinate. If, as usual, we represent abscissas and ordinates respectively by the symbols x and y, then we may put

x = abscissa O M,
y = ordinate M N.

* James Glenie, F. R. S., of London and Edinburgh, invented this calculus in 1774; it was published in 1794. According to the writer in Rees's *Encyclopædia*, "both the differential and fluxional calculi may be derived from the doctrine of proportions (therein expounded) in a manner altogether unexceptionable."

We also put

$\triangle x$ = excess of abscissa O M′ over x = M M′;
$\triangle y$ = excess of ordinate M′ N′ over y.

Now, suppose the point N′ to move toward N, and let us study the ratio $\triangle y : \triangle x$. By trigonometry this ratio is the tangent of the angle which the straight line through N and N′ makes with the axis of abscissas O M. It is evident that the nearer N′ approaches to N, the more nearly the line N N′ will approach the position of the tangent at N. We might say that if the point N′ coincides with N, the secant N N′ will coincide with the tangent at N. But when the two points coincide we can have any number of lines through them, because they will form but one point. The difficulty then is simply this: so long as N′ is different from N, the secant will be different from the tangent; while if the two points coincide the secant will be indeterminate. To meet this difficulty the idea of an infinitesimal was introduced. It was supposed that the point N′ might be so near N that the distance between them would be smaller than any finite quantity whatever, while the two points would still be distinct. Then the secant would be considered as coinciding with the tangent. This idea of infinitesimal quantities as smaller than any finite quantities whatever is no longer entertained by the best writers, but in lieu thereof the idea of a limit is introduced.

The relation of the secant and tangent may be expressed as follows by the method of limits:

Let α be any angle whatever, as small as we please. Then the point N′ may be taken so near the point N that the angle between the secant and tangent shall be less than α. This completely determines the tangent, because there is only one line of which this can be true. For if any other line passed through N, making an angle β with the tangent on the opposite side from the secant, then the latter would always make an angle greater than β with this line, and in consequence we could not make α less than β, and so could not make it as small as we please. We are thus led to the method of reasoning adopted by Euclid to prove the equality of a cone to one-third of the circumscribing cylinder. If the cone differs from one-third the cylinder, he might say, let h be that difference. Take any value you please for h, and I will show that the difference is less than h; therefore, if you suppose the two quantities to differ at all, you are led to the absurdity of saying that the difference is equal to h and less than h at the same time; therefore the cone and one-third the cylinder do not differ at all.

Algebraically the matter may be expressed as follows:

Suppose the relation between x and y to be given by the algebraic equation

$$y = mx^2.$$

We then have

$$y + \triangle y = m\,(x + \triangle x)^2.$$

By developing the square and subtracting we easily find for the quotient $\frac{\triangle y}{\triangle x} = 2mx + m\triangle x$.

Now, it is evident that by making $\triangle x$ smaller and smaller we can bring this quotient just as near as we please to the value $2mx$. We express this fact by substituting the letter d for $\triangle$, and writing the equation in the form

$$\frac{dy}{dx} = 2mx,$$

which, when properly interpreted, is a rigorous equation, although $\triangle x$ is dropped out entirely. It is rigorous because it is regarded not as an equation between any actual values of $\triangle y$ and $\triangle x$, but only as expressing a limit toward which the ratio of these quantities approaches as they become smaller and smaller.

Besides the direct solution of problems, the calculus has been the most effective and indispensable of agents in widening the sphere of mathematical investigation, and in enhancing its power as an instrument. Most of the modern methods of analysis depend on it for their development.

The Calculus of Variations, originating with Lagrange, is but an extension of the methods of the calculus to the discovering of functions, in cases in which, instead of the law of growth, some condition (such as that of producing a maximum or minimum under certain conditions), which the function when found must fulfill, is given.

The Calculus of Operations is but an extension of algebra to the *symbols of operation* of the calculus: algebra itself being really a calculus of operations, since it deals only with symbols with a view to reduce the operations they indicate to their simplest expression.

The Calculus of Functions is a branch of modern mathematics concerned with the laws of functions of an imaginary variable.

The Calculus of Finite Differences, invaluable in the practical application of analytic formulæ to numerical calculations, for the summation of infinite series, and for Interpolation, is concerned with relations between finite increments or "differences," and is defined by Lacroix to have for its object "the determination of the values of increments, by deducing them not merely from the analytic expression of the functions, but also from their numerical (or particular) values, when that expression fails or is too complicated." Except a general similarity in notation and terms employed, it has little in common with the Differential Calculus: the fundamental element of the latter—the Differential Coefficient—having no place in it. Revised by S. Newcomb.

Calculus, or **Stone**: a hard concretion formed from the deposition of saline or other substances in various parts of the body. The most frequent position for calculi is the urinary tract, either in the pelvis of the kidney or in the bladder; but they are also found quite commonly in the gall-bladder or biliary ducts, and more rarely in other hollow tubes or viscera.

Urinary calculi are especially common in advanced life, and are more frequent in the male sex. A life of ease and luxury and sedentary habits strongly predisposes, and it is supposed that the character of water drunk in certain localities accounts for the greater frequency of stone in these places than elsewhere. Stone in the kidney is especially common in old men of gouty habit, and they are usually composed of uric acid or oxalate of lime. There may be merely small gritty particles which are passed from time to time, causing great pain and blood-stained urine. The terms renal sand and gravel are applied to this form. Larger stones are apt to lodge in the pelvis of the kidney and may set up inflammatory disturbances, and from time to time as they attempt to escape they may cause attacks of intense renal colic.

Stone in the bladder occurs in cases in which there is some inflammatory disturbance of the bladder-walls, or in which there is repeated or constant retention of urine. These stones most frequently are composed of phosphate of lime or ammonia-magnesium phosphate. They may occasion no symptoms at all, but more frequently there is great pain, especially during urination. Calculi of various other kinds occur in the kidney or bladder, but are comparatively rare and unimportant.

Biliary calculi are formed in the gall-bladder, where they may remain without producing disturbances for a long period of time. Sooner or later they tend to escape through the duct of the gall-bladder and occasion sharp pain in the right side with jaundice (hepatic colic). The stone may lodge in the gall-ducts and occasion permanent jaundice and great disturbances of the general health. Gall-stones are more common in women than in men, and are more frequent after the age of forty than in younger persons. They are composed of thickened bile, around which cholesterin crystals (one of the components of bile) gather.

Salivary calculi are small concretions formed in the ducts of the salivary glands. They may cause obstruction and cystic dilatation of the ducts. A similar form of calculi occurs in the pancreatic duct and generally leads to similar results.

Enteroliths or *intestinal stones* are formed in cases of constipation or catarrhal diseases of the intestines, and are composed of mucus and earthy constituents derived from the food. They are especially common in the vermiform appendix, where they are likely to play a part in causing appendicitis.

Lung-stones are formed in the bronchial tubes. *Phleboliths* are calcareous masses occurring in a vein as a result of clotting of the blood and secondary calcification of the clots. Stones are also found in the nasal chambers, in the tonsils, and even in the chambers of the heart.

In cases of calculi in any of the abdominal organs (kidney, gall-bladder, pancreas) attacks of severe pain or colic denote the attempt at escape of the stone, and such attacks are designated as colics. The pain is of great severity and prostrates the patient in a short time, and the appearance may be that of extreme collapse.

Opiates, chloroform, and hot baths may be required as relaxants and anæsthetics. The stone may escape through

the duct in which it is lodged, or may recede to its place of origin. Surgical treatment becomes necessary when a stone is too large to escape, or when serious results are imminent from its lodgment. There is little reason to believe that remedies or waters vaunted as having powers to dissolve stones often act in this way. Occasionally they may do so, but stones occasionally break up and disintegrate spontaneously. The formation of stones may, however, frequently be prevented. WILLIAM PEPPER.

Calcut'ta [Sanskrit, *Kalikâta*, dwelling of Kali, an Indian deity]: the capital of British India; province of Bengal; on the east bank of the Hugli, an arm of the Ganges; about 75 miles from the sea; lat. 22° 34′ N., lon. 88° 20′ E. (see map of North India, ref. 8–I). The city extends along the river about 6 miles, and has an average breadth of 1½ miles. The river, here a mile wide, is constantly full of shipping. In the southern part of the city, called Chowringhi, are the residences of the Europeans, which in a great part are finely built in Grecian style, and many of them surrounded by groves of fruit-trees. A quarter of a mile to the S. W. is Fort William, built at a cost of £2,000,000, the largest fortress in the British dominions, octagonal in form, requiring a garrison of 10,000 men and mounting 619 guns. Its usual garrison consists of one British and two native regiments. Between the fort and the city is the Maidân or glacis, a handsome park, and the Esplanade, on which is the Government House, a magnificent building surmounted by a dome, and in a line with it a row of handsome dwellings. The principal buildings of Calcutta are, besides the Government House, the mint, the town-hall, the cathedral, the Hindu college, and the hospital. Beyond Chowringhi is the native or "Black Town," mostly consisting of mud or bamboo cabins and narrow, dirty streets, here and there adorned with an idol of painted wood or plaster. On the other side of the river are situated the botanic garden, opposite Fort William, and the suburb Howrah, with the terminus of the East India Railway, opposite the Black Town. The river is crossed by a floating bridge constructed on pontons, forming a permanent connection between the city and the railway terminus, and affording a continuous roadway for passengers and vehicles. It was finished in 1874, and cost £222,000.

Down to 1686 Calcutta was nothing but a miserable Hindu village, but in that year the English merchants of Hugli, having been compelled by the Mogul chiefs to abandon their factories, moved 26 miles farther down the river and settled at the village of Sutánati, which now forms a part of Calcutta. In 1690 the Bengal servants of the East India Company took up their headquarters at Sutánati; in 1696 Fort William was built; and in 1700 the three villages of Sutánati, Calcutta, and Gobindpur were bought by the company and formed into one settlement. But half a century later, in 1756, the fort was captured and the city was sacked by the Nawab of Bengal. Most of the English residents escaped by vessels to the mouth of the Hugli, but those who remained (146 persons) were soon compelled to surrender, and were locked up in the guard-room, the "Black Hole," a chamber hardly 20 feet square, from which only twenty-three persons came out alive the next morning. In Jan., 1757, a British expedition from Madras, under the command of Clive, again took possession of the city, and a new and much stronger fort (the present Fort William) was built. From that time the history of Calcutta has been one of uninterrupted progress and prosperity. It is now one of the greatest commercial centers of Asia and the seat of the supreme administrative, judicial, and military authorities of the British-Indian Government.

The site of the city was admirably chosen so far as it affords excellent anchorage, the port extending for 10 miles along the bank of the river, and having easy water communication with the whole basin of the Ganges and the Brahmapûtra. Its disadvantages arose from its deltaic location, the insalubrity of the ground, and the possible silting up of the river. The drainage was found very difficult, as in many cases the surface of the ground is considerably below the level of the water. The works, however, though not yet completed, have proved very effective, the underground sewers discharging their contents by means of a gigantic pumping apparatus, operated at an annual cost of £3,000; and Calcutta is now not only the healthiest city of India, but compares well in this respect with the great cities of Europe and America. The mean temperature of the place is 79° F., with extreme temperatures of about 106° and 52°. The average rainfall is 66 inches. The cyclones are frequent, and often dangerous. The annual death-rate is 25.82 per thousand. Though the Hugli river has long ceased to be the main channel of the Ganges, it is still navigable for vessels of the largest tonnage, and immense exertions are made to prevent its silting up, which, of course, would be the death of the city. Its chief articles of export are opium, raw cotton, jute, grain, hides, etc.; of import, cotton fabrics, hardware, etc. In 1890 the University of Calcutta had 2,727 matriculated students. Pop. in 1891 (with suburbs), 840,130.
Revised by C. K. ADAMS.

Caldani, kaăl-daa′nĕe, LEOPOLDO MARCO ANTONIO: anatomist and physician; b. in Bologna, Italy, Nov. 21, 1725; studied in his native city, making a specialty of anatomy, and became Professor of Anatomy in the university there in 1755. He made a series of experiments to prove the insensibility of the tendons, publishing the results in 1757, under the title *Lettera sulla insensibilità ed irritabilità di alcune parti degli animali*, which work made him professionally famous throughout Europe. He met with great opposition in Bologna, however, and about 1760 he went to Venice. He afterward became Professor of Theoretical Medicine in the University of Padua, and in 1771 Professor of Anatomy, which professorship he held until his death, Dec. 30, 1813. He published, besides the work already named, a number of anatomical and physiological treatises, the most important being *Icones Anatomicæ* (4 vols., Venice, 1801–14), in the preparation of which he was assisted by his nephew, Florian.

Caldara, kaăl-daa′raă, ANTONIO: Italian composer; b. in Venice in 1678. He wrote a successful opera when he was only eighteen years old, and for many years was engaged in operatic composition. For a while he was instructor in music to the emperor Charles VI. in Vienna. His opera *Themistocles* failed in 1736, and thereafter he confined himself to the composition of sacred music. D. in 1763.

Caldara, POLIDORO (often called CARAVAGGIO): Italian painter; b. in Caravaggio in 1492. He studied in Rome under Maturino, and was employed by Raphael to paint friezes in the Vatican. His best work was in landscape, and he executed many historical pieces, the most noted being *Christ Bearing His Cross*. He was murdered by his servant in Messina in 1543.

Cal'das, or **Calde'tas** [from Lat. *ca'lidus*, *caldus*, warm]: a Spanish term applied to warm springs, and forming part of the name of many places in Spain. Among these the most noted is Caldas de Mombuy, 18 miles N. of Barcelona. Here are thermal baths and some antiquities.

Caldas Barboza, DOMINGOS: Brazilian poet; b. in Rio de Janeiro, 1740; d. in Portugal, Nov. 9, 1800. His mother was a Negro slave, and his color was always a source of pain to the poet. After serving in the Brazilian army until 1762, he went to Lisbon, where he became acquainted with the two Vasconcellos, great patrons of poetry. Through them he entered the best society, and became noted for his improvisations and songs accompanied by the viol (whence his appellation *cantor de viola*). He was elected to the Roman Arcadia, and was one of the founders of the Academy of Belles-Lettres (Nova Arcadia) of Lisbon. His success brought upon him many envious attacks—from Bocage among others. Of his works may be cited *A Doença* (1777); *Recopilação da Historia Sagrada* (3d ed. 1819); *A Vingança da Cigana, drama joco-serio* (1794); *Cántigas* (1806–07). A. R. MARSH.

Caldas, FRANCISCO JOSÉ, de: naturalist; b. at Popayan, Colombia, in 1771. He traveled with Humboldt in New Granada and Quito, and made many valuable botanical and geographical studies. Subsequently he was director of the astronomical observatory at Bogotá. His most important publications appeared in the *Semenario de la Nueva Granada*. When the revolution broke out he took service as an engineer in the patriot army; was captured and shot at Bogotá by order of Gen. Morillo Oct. 29, 1816.

Caldas Pereira de Souza, ANTONIO: poet; b. in Rio de Janeiro, Brazil, Nov. 23, 1762; studied at the University of Coimbra, Portugal, and spent most of his life in Europe, returning to Brazil in 1808. His writings were published in Paris in 1821, under the title *Poesias sagradas e profanas*, with a commentary by Gen. Stockler. They have a highly moral tone, most marked in an ode on *Man in the State of Barbarism*. A new edition was published in Coimbra in 1836. D. in Rio de Janeiro, Mar. 2, 1814.

Caldecott, kawl'de-cot, Randolph: artist; b. at Chester, England, Mar. 22, 1846. A bank clerk at Whitchurch 1861–67, and at Manchester 1867–72; was induced by his successful sketches in the London illustrated papers to remove to the metropolis and devote his life to the new calling. He excelled in depicting country life and in sketching animals; contributed to *Punch* and the *Graphic*; illustrated a series of *Caldecott's Picture-books*; Irving's *Old Christmas* (1875), and *Bracebridge Hall* (1877); Blackburn's *Breton Folk* (1880); Mrs. Ewing's *Daddy Darwin's Dovecote*, and *Jackanapes* (1884). D. at St. Augustine, Fla., whither he had gone in search of health, Feb. 12, 1886.

Cal'deron, Francisco Garcia: lawyer and statesman; b. in Arequipa, Peru, 1834. He was admitted to the bar before he came of age, and at twenty-one was professor of jurisprudence; soon after began to publish his important *Dictionary of Peruvian Legislation*; elected to Congress 1867; Minister of the Treasury in 1868. After the Chilians occupied Lima, Peru was left without a government. The citizens therefore made Calderon provisional president (June 6, 1883), and empowered him to treat with the enemy. The Chilians, however, seized him, and sent him as a prisoner to Valparaiso, where he was kept until the end of the war. During his captivity he was confirmed as president by the Peruvian Congress, but his term had expired before he could return. He was afterward (1886) president of the Senate, and was influential in arranging the Grace contract.
Herbert H. Smith.

Calderon, Philip Hermogenes: painter of figure subjects and portraits; b. at Poitiers, France, May 3, 1833; of Spanish descent, but a British subject; pupil of J. M. Leigh, of London, and of Picot, in Paris; Royal Academician 1867; first-class medals, Paris Expositions, 1867 and 1868; third-class medal, Paris Exposition, 1889; Legion of Honor 1878. First exhibited at the Royal Academy in 1853. Studio in London, at Burlington House. William A. Coffin.

Calderon, Serafin Estebanez, de: Spanish poet and novelist; b. in Malaga, 1801; educated at the University of Granada; appointed Professor of Rhetoric and Belles-Lettres there 1822; for a time practiced law; civil governor of Logroño 1836; of Seville 1837. Author of *El Solitario* (1830); *Cristianos y Moriscos* (1836); *Escenas Andaluces* (1847). D. at Madrid, Feb. 7, 1867.

Calderon de la Barca, kaăl-dā-rōn' de-laă-baar'kaă, Pedro: the most eminent representative of the national drama of Spain; b. at Madrid, Jan. 17, 1600. After having studied mathematics, philosophy, and jurisprudence in the University of Salamanca he entered the army in 1625, and served in several campaigns in Italy and the Netherlands. As early as 1630 Lope de Vega mentions him as the author of many popular plays. In 1635 Philip IV. called him to Madrid to supply the plays for the entertainments at court, and as a reward for such services made him Knight of the Order of Santiago. In 1650 he entered a religious confraternity; in 1653 he was made one of the chaplains of the "Chapel of the Kings" at Toledo; and in 1663 he returned to Madrid as one of the king's honorary chaplains. In the same year he was elected a member of the Congregation of St. Peter. D. May 25, 1681. His distinction among the Spanish dramatists lies in the novelty and ingenuity of his plots, the fervor of his emotions, the richness of his imagery, and the copiousness of his productions. While he is behind his predecessors, especially Lope de Vega, as regards the variety of metrical forms, he surpasses them in the melodious flow of his verse. Contrary to the more realistic Lope de Vega, Calderon was an idealist, and his plays are an idealized expression of the religious and chivalrous elements of Spanish life, characterized throughout by great purity of thought. The 400 plays of Calderon may be divided into the following six classes: (1) Religious dramas, e. g. *The Wonder-working Magician*, *The Constant Prince*, *Life is a Dream*; (2) mythological dramas, e. g. *Echo and Narcissus*, *The Bridge of Mantible*; (3) historical dramas, e. g. *The Alcalde of Zalamea*; (4) comedies of intrigue, e. g. *A House with Two Doors is Hard to Keep*; (5) romantic dramas; and (6) *The Autos Sacramentales*, a dramatic form which had grown out of the mediæval miracle-plays, and used to teach a moral or religious lesson by way of allegory. A convenient edition of Calderon's works is that of Hartzenbusch: Madrid, Rivadeneyra, 1872–74 (4 vols., containing 122 comedies and 75 autos); the best translation is one in German, *Schauspiele von D. Pedro Calderon de la Barca*, Uebersetzt von J. D. Gries (9 vols., Berlin, 1862). The most recent biography is by the Spaniard, Don F. Picatoste y Rodriguez. Henry R. Lang.

Calderón y Beltrán, kaăl-dā-rōn'ĕe-bel-traan', Fernando: Mexican poet and dramatist; b. July, 1809; regarded by Mexicans as one of their best lyric writers. His dramas also have been successful. His works have been published (1844; 2d ed. 1849), and are widely read in Mexico. D. Jan., 1845. A. R. Marsh.

Calderwood, kawl'der-wŏŏd, David: Presbyterian minister and historian; b. in Dalkeith, Scotland, in 1575; educated in the University of Edinburgh; became minister in Crailing 1604. He was banished for his opposition to episcopacy, and in 1619 retired to Holland, where he published a controversial work called *The Altar of Damascus* (on the polity of the Church of England), which was the great storehouse of Presbyterian arguments (Leyden, 1621; Latin trans., Leyden, 1623; 2d ed. 1708). He returned to Scotland in 1625; became minister in Pencaitland, East Lothian, 1640; and wrote a *History of the Kirk of Scotland*, published by the Wodrow Society (Edinburgh, 1842–49, 8 vols.). D. in Edinburgh, Oct. 29, 1650. See his life by T. Thomson, in his *History*.

Calderwood, Henry, LL.D.: b. in Peebles, Scotland, May 10, 1830; studied in Edinburgh University 1847–52, and in United Presbyterian Theological Hall 1852–56; was minister in Greyfriars church, Glasgow, 1856–68; Examiner in Mental Philosophy to the University of Glasgow 1861–64; conducted the class of Moral Philosophy in Glasgow University in 1866; in 1868 was appointed to the chair of Moral Philosophy in Edinburgh University; was chosen a Fellow of the Royal Society of Edinburgh, 1869; d. Nov. 19, 1897. Author of *The Philosophy of the Infinite* (London, 1854; 3d ed. 1874); *Handbook of Moral Philosophy* (1872; 14th ed. 1888); *On Teaching* (1874; 3d ed. 1881); *Relations of Mind and Brain* (1879; 2d ed. 1884); *The Parables of our Lord Interpreted in view of their Relations to each other* (1880); *The Relations of Science and Religion* (1881); *Evolution and Man's Place in Nature* (1893). Revised by S. M. Jackson.

Caldicott, Alfred J.: See the Appendix.

Caldwell: city; Sumner co., Kan. (for location, see map of Kansas, ref. 8–G); on Atch., Top. and S. Fé, Ch., Rk. I. and Pac., and St. L. and San Fran. R. Rs.; 53 miles S. by W. of Wichita; in a stock-raising region. Pop. (1880) 1,005; (1890) 1,642; (1900) 1,574. Publisher of "Journal."

Caldwell: village; on railroad; capital of Noble co., O. (for location of county, see map of Ohio, ref. 6–11); situated 35 miles N. of Maricttа; in the center of the Duck Creek oil-region. The vicinity yields coal and iron. Pop. (1880) 602; (1890) 1,248; (1900) 927.

Caldwell, Lake George P.-O.: on railroad; capital of Warren co., N. Y. (for location of county, see map of New York, ref. 3–J); situated near the head of Lake George; 62 miles from Albany. It has several hotels, and is a place of summer resort. Steamers ply upon the lake. Fort William Henry and Fort George were situated within the limits of this township. Pop. of township (1880) 1,223; (1890) 1,377; (1900) 1,465.

Caldwell: town; on G. C. and S. Fé R. R.; capital of Burleson co., Tex. (for location of county, see map of Texas, ref. 4–I); 85 miles E. by N. of Austin; has a male and female academy, good public schools, and four churches. It is in a fine farming region. Pop. (1880) 301; (1890) 1,250; (1900) 1,535. Editor of "Chronicle."

Caldwell, Charles, M. D.: physician; b. in Caswell co., N. C., May 14, 1772. He was for many years Professor of Medicine in Transylvania University in Kentucky. He wrote, besides other works, a *Life of General Greene* (1819). His last work was a report on mesmerism. D. in Louisville, Ky., July 9, 1853. See his *Autobiography* (Philadelphia, 1855).

Caldwell, Charles Henry Bromedge: commodore U. S. navy; b. in Hingham, Mass., June 11, 1828; entered the navy as a midshipman Feb. 27, 1838. In 1858, while attached to the sloop Vandalia, Caldwell had charge of an expedition against a tribe of cannibals inhabiting Wega, one of the Fiji islands, which he conducted with ability, defeating the Wegans in a pitched battle and burning their town. While commanding the steamer Itasca he took part in the bombardment of Forts Jackson and St. Philip, Apr. 24, 1862, but was unable to pass the forts with the rest of the fleet, "owing to a 42-pound shot entering the boiler, the steam

from which filled the fire and engine-room, driving every one up from below, and almost suffocating those on the quarter-deck." He participated in the action with the Grand Gulf batteries, Mississippi river, June 9, 1862, and in command of the ironclad Essex took part in all the operations at Port Hudson during the spring and summer of 1863. D. at Boston, Mass., Nov. 30, 1877.

Caldwell, MERRITT, A. M.: author and educator in the Methodist Episcopal church; b. in Hebron, Me., Nov. 29, 1806; graduated at Bowdoin College in 1828; became principal of the Maine Wesleyan Academy at Readfield in 1828; Professor of Mathematics and vice-president of Dickinson College, Pa., in 1834; Professor of Metaphysics and English Literature there in 1837. D. in Portland, Me., June 6, 1848. He was author of a *Manual of Elocution* (1846); *Philosophy of Christian Perfection* (1847); *Christianity Tested by Eminent Men*; *The Doctrine of the English Verb*; and of a large number of reviews.

Caldwell, SAMUEL LUNT, D. D., LL. D.: b. in Newburyport, Mass., Nov. 13, 1820; graduated at Waterville College (now Colby University), Me., 1839; teacher Hampton Falls Academy, New Hampshire, and Newburyport 1839–42; graduated at Newton Theological Institution 1845; pastor, Bangor, Me., 1846–58; First Baptist church, Providence, R. I., 1858–73; Professor of Church History Newton Theological Institution 1873–78; president of Vassar College, New York, 1878–85. D. in Providence, R. I., Sept. 26, 1889.

Cal'edon, EARL OF (1801): Viscount Alexander (1797), Baron Caledon (1789), all of the Irish peerage.—JAMES ALEXANDER, fourth earl, was born July 11, 1846, and succeeded his father in 1855.

Caledo'nia (in Welsh *celydd*, a woody shelter; but Isaac Taylor derived the name from Gael.): the name given by the Romans in the first century to that part of the island of Britain which lay to the N. of the Friths of Forth and Clyde, It included, of course, only the highlands of modern Scotland. Very obscure is the ethnology of the people, and various hypotheses have been applied to the fact, though it seems most probable that the Caledonians belonged to the hill Gaelic family. Pliny is the first author who mentions Caledonia. Tacitus describes the natives as having red or sandy hair, as living in tents without cities, as addicted to predatory warfare, and fighting in chariots. The Romans made several unsuccessful efforts to subdue these barbarians, who not only repulsed the invaders but harassed the Roman colonies in Britain by frequent inroads. The first Roman general who penetrated into Caledonia was Agricola, the lieutenant of Domitian and the father-in-law of Tacitus. He defeated the Caledonians under Galgacus at Mt. Graupius, a place of uncertain location, in 84 A. D. Galgacus is said to have lost 10,000 men in the battle. Nevertheless, in the following year Agricola was recalled to Rome, and soon after the Caledonians again began to harass the Roman colonies. To defend themselves against these inroads the Romans built in 139 A. D. the Wall of Antonine from the Frith of Forth to that of the Clyde, 31 miles across, a substantial work which can not have been without due effect in a war with barbarians. In 208 the Emperor Severus entered Caledonia with a great armament and fully determined to subdue the country. He also succeeded in reaching the northern extremity of the island—which, however, most probably meant nothing more than the coast of Aberdeenshire—but by disease, fatigue, and the perpetual guerrilla warfare waged against him he is said to have lost about 50,000 men, and was compelled to retreat southward. A league was then formed between the Caledonians and their southern neighbors, the Moata; but while preparing himself for a new campaign against the league, the emperor died at York in 210. A century later on the Picts are heard of for the first time, and in 367 Valentinian I. sent his lieutenants into Britain to defend the Britons against the Caledonians and the Picts. He succeeded, and once more laid the country between the Wall of Antonine and that of Hadrian under Roman rule. See SCOTLAND.

Caledonian Canal, THE: a canal in Scotland; connects the Atlantic Ocean with the North Sea near Inverness; built by TELFORD (*q. v.*); opened in 1823. It is 61½ miles in length, and is formed by cuts 120 feet broad at the surface, 50 feet at the bottom, and 17 feet deep, connecting the Lochs Ness, Oich, Lochy, and Eil. The combined length of the artificial portions is 23 miles. This canal saves vessels the stormy passage by the Hebrides, which takes nine or ten days longer. Ships of 600 tons can pass through. The highest part is Loch Oich, 94 feet above the sea-level.

Caledonia Springs: in Caledonia township, Prescott co., province of Ontario, Canada; 40 miles from Montreal, and 9 miles S. W. of L'Orignal. They are resorted to especially for the cure of cutaneous, scrofulous, and rheumatic diseases. There are four principal springs, all strongly alkaline, one with considerable iodine and bromine in its waters.

Cal'endar [from Lat. *calenda'rium*, account-book; deriv. of *calendae*, first of month, the day on which accounts were payable]: any systematic and comprehensive method of dividing, distributing, and reckoning time; also, a book or table exhibiting such a method. There are two natural divisions of time, or regularly recurring periods, which all calendars must recognize—the day and the year. The month seems to have been suggested by the period of the moon's revolution (29½ days nearly), to which in some calendars (as the Jewish and the Greek) it has been made closely conformable. The week is, approximately, one quarter of a lunation. It is found in the Oriental and Egyptian calendars, and in that of the Israelites, from whom we have received it, but it was not known to the Greeks or the Romans. The Greeks instead employed *decades* of ten days each, and the Romans periods of *eight* days, the last of which was called *nundinae* (*novem*, nine; *dies*, day), or ninth day; the count including both the nundine at the beginning and that at the end of the period. In the ancient calendars the nundine periods were distinguished by setting opposite the successive days the first eight letters of the alphabet (A to H inclusive), repeating these letters throughout the year. From this usage was derived that of the Christian calendar of marking the days by the first seven letters (A to G), similarly repeated. The manner of denoting days of the month was peculiar. The first day was always called *kalendae*, calends; the fifth or seventh, *nonae*, nones; and the thirteenth or fifteenth, *idus*, ides. The nones were the seventh, and the ides the fifteenth in March, May, July, and October, the first, third, fifth, and eighth months of the Roman year (easily remembered by associating them with the notes of the common chord in music); in the remaining months they fell on the fifth and thirteenth. Any other day was denoted by its distance counted backward from one of these points of reference, the reference-day itself counting one. Thus Mar. 31 is *Pridie* Kal Apr., or II. Kal Apr.; Mar. 30 is III. Kal Apr.; July 6 is Pridie Non. Jul.; the 5th, III. Non. Jul., etc. It is difficult to understand how so cumbrous a system as this could have maintained itself for centuries among a cultivated people.

In the regulation of the year we find the calendars of different peoples materially differing. The Egyptian year had 12 months of 30 days each, and counted five unallotted days at the end. It was too short by nearly a quarter of a day; and hence the beginning of the year went backward through the seasons once in 1,460 natural years or 1,461 Egyptian years. This was known as the SOTHIC PERIOD (*q. v.*). Because of this incessant movement the Egyptian year is called *vague* or wandering. The Greek year consisted of 12 lunar months of 30 and 29 days alternately. This made the length of the year 354 days, or 11¼ days too small. To compensate for the deficiency, an intercalary month of 30 or 29 days was introduced every alternate year, which made the average length seven days too great; for which reason the intercalary month was omitted once in about eight years. The earliest Roman year, attributed to Romulus, had only ten months, of which the first, third, fifth, and eighth (those in which, as above mentioned, the nones fell on the seventh and the ides on the fifteenth) had 31 days, and the rest 30 each. This year of only 304 days was shorter than the natural year by about one-sixth. Each Romulian year therefore began two months earlier in the season than the last, and the sixth came to an end at the same time with the fifth natural year. This circumstance, according to Niebuhr, determined the period of the lustrum. See LUSTRUM.

The months of the original Roman year were named Martius, Aprilis, Maius, Junius, Quintilis, Sextilis, September, October, November, December. Numa Pompilius, second King of Rome, added, according to Solinus, Januarius to the beginning and Februarius to the end of the year. This year was a lunar year of 354 days, but it was made a day longer, or 355, because there was supposed to be luck in odd numbers. To prevent displacement, an intercalary month of 22 and 23 days, alternately, was introduced every

second year. This made the year to consist in effect of 366¼ days. About the year 450 B. C. the decemvirs regulated the calendar once more, and placed February between January and March, both at the end of the year. The months were now—whether so settled by Numa or the decemvirs is uncertain—Martius, 31 days; Aprilis, 29; Maius, 31; Junius, 29; Quintilis, 31; Sextilis, 29; September, 29; October, 31; November, 29; December, 29; Januarius, 29; Februarius, 28. The intercalary month was inserted between the 23d and 24th days (as we count them) of February, or, in the Roman manner of speaking, before the sixth calends of March. The reason for so placing it was that the seventh calends of March, or Feb. 23, was the last day of a round year of 360 days, and was celebrated as the festival of Terminus, the god of limits, under the name Terminalia. The Romans, like the Egyptians, seem to have regarded the remaining five days as hardly belonging to the year, but as being a sort of interval between two years. The odd day added to the 354 for luck was not, however, intercalated in this place, but was introduced wherever it might be necessary to prevent the *nundinae* from falling on the calends of January or the nones of any month—such a coincidence being deemed inauspicious. The year on this system being, as we have seen, a day too long, added twenty-four days too much in twenty-four years. It was provided, therefore, that during the last eight years of this period these twenty-four days should be deducted in making the intercalations. The pontiffs, however, who had the control of the intercalation, used their powder capriciously for personal ends—sometimes to lengthen or shorten the term of a magistrate, sometimes to benefit or injure the farmer of the public revenues. As a natural consequence, the calendar fell into extreme confusion; so that in the time of Julius Cæsar the civil differed from the astronomical equinox by nearly three months. This powerful ruler resolved on a thorough reform. Under the advice of the astronomer Sosigenes he abolished the lunar year. He readjusted the months to their proper seasons by making the year 708 A. U. C. 445 days long, extending from Oct. 13, inclusive (according to our present count), to the 31st day of the second ensuing December. This year is known in chronology as the year of confusion. He reconstructed the months, giving 31 days each to the first, third, fifth, seventh, ninth, and eleventh, and 30 days each to the rest, except February, which had 29 only, but every fourth year received an intercalary day, making 30. The intercalation took place, for a reason already given above, immediately after the feast of Terminalia, and was made by repeating the *sexto Kalendas Martias*; whence the year in which it occurred came to be called bissextile. Finally, the beginning of the year was transferred from Mar. 1 to Jan. 1. To flatter the vanity of Octavius after he had secured the supreme power and had received the title of Augustus, a day was taken from February by a sycophantic senate and given to August, which had been named from him, for the frivolous purpose of giving to his month no less dignity in point of numbers than July, which had received its name from the first Cæsar. The lengths of the later months were then altered to prevent three long months from occurring consecutively.

The Julian year consisted of 365¼ days, and consequently differed in excess by 11 minutes 13·95 seconds from the true solar year, which consists of 365 days 5 hours 48 minutes 46·05 seconds. In consequence of this difference the equinox, in the course of a few centuries, fell back sensibly toward the beginning of the year. In the time of Julius Cæsar it corresponded to Mar. 25; in the sixteenth century it had retrograded to the 11th. The correction of this error was one of the purposes sought by the reformation of the calendar effected by Pope Gregory XIII. in 1582. By suppressing ten days in the calendar, Gregory restored the equinox to Mar. 21, the day on which it fell at the time of the Council of Nice in 325. This council determined that the Eastern churches should celebrate Easter at the same time as the Western—i. e. on the Sunday following the Paschal full moon, and not on the fourteenth day of the Paschal moon. The Gregorian rule of intercalation may be expressed as follows: Every year of which the number is divisible by 4 without a remainder is a leap-year, excepting the centesimal years, which are only leap-years when divisible by 4 after suppressing the two zeroes. Thus 1600 was a leap year; 1700 and 1800 were common years; 1900 will be a common year, 2000 a leap year, and so on. The length of the mean year thus fixed is 365·2425 days, or 365 days 5 hours 49 minutes 12 seconds, which exceeds the true solar year by 25·95 seconds, an error which amounts only to one day in 3,325 years. The intercalations might be so made as to make the calendar year correspond even more closely than it does now with the solar year, but no other method could be as convenient as the Gregorian.

The new calendar was received immediately or shortly after its promulgation by all Roman Catholic countries. The Protestant states of Germany and the kingdom of Denmark adhered to the Julian calendar till 1700; and in England the alteration was successfully opposed by popular prejudices till 1752. In that year the Julian calendar, or *old style*, as it was called, was abolished by act of Parliament, and the date used in all public transactions rendered coincident with that followed in other European countries, by enacting that the day following Sept. 2, 1752, should be called the 14th of that month. When the alteration was made by Gregory it was only necessary to drop ten days; the year 1700 having intervened, which was a common year in the Gregorian, but a leap-year in the Julian calendar, it was now necessary to drop eleven days. The old style is still adhered to in Russia and the countries following the communion of the Greek Church; the difference of date in the present century amounts to twelve days. For fuller information on this subject, see Delambre's *Astronomie Théorique et Pratique*, tom. iii., chap. xxviii.; Ideler's *Lehrbuch der Chronologie*; and Anthon's *Greek and Roman Antiquities*.

Ecclesiastical Calendar.—The adaptation of the civil to the solar year is attended with no difficulty, but the church calendar for regulating the movable feasts imposes conditions less easily satisfied. The festival of Easter commemorates the resurrection of our Lord, which momentous event having occurred near the time of the Jewish Passover was naturally associated in the minds of the early disciples with that anniversary, and its annual returns were made dependent upon the same calendar regulations. The Passover was observed on the fourteenth day of the moon—that is, near the full moon. The question what day is most proper for the observance of Easter became early a subject of warm controversy. In order to put an end to an unseemly contention, the Council of Nice ordered that Easter should be celebrated on the Sunday which immediately follows the full moon that happens upon or next after the vernal equinox. In order to determine Easter according to this rule for any year, it is necessary to reconcile three periods—namely, the week, the lunar month, and the solar year. To find the day of the week on which any given day of the year falls, it is necessary to know on what day of the week the year began. In the Julian calendar this was easily found by means of a short period or cycle of twenty-eight years, after which the year begins with the same day of the week. In the Gregorian calendar this order is interrupted by the omission of the intercalation three times out of four in the last year of the century. But, to render calculation unnecessary, a table is given in the prayer-books, showing the correspondence of the days of the year and the week for the current century. The connection of the lunar month with the solar year is an ancient problem, for the resolution of which the Greeks invented cycles or periods, which remained in use with some modifications till the time of the Gregorian reformation. See Delambre's *Histoire de l'Astronomie Moderne*, tom. i., liv. i.; De Morgan's *Companion to the British Almanac* (1845); Barnard's *How to Find the Church Festivals* (1872).

A new reform of the calendar was introduced in France during the Revolution by a decree of the National Convention passed Nov. 24, 1793. This took for its epoch the midnight next preceding the autumnal equinox of 1792, from which point of time the successive years were numbered I., II., etc., "of the French republic, one and indivisible." The year was divided into twelve months, each of thirty days, leaving, in ordinary years, five days necessary to complete the year, and in leap-year six. These days were placed at the end of the last month, and under the name *jours complémentaires* were celebrated as festivals. As during these celebrations the ordinary occupations of life were suspended, and the population were expected to give themselves up without restraint to pleasure in every form, they obtained the name of *sans-culottides*. Each period of four years terminating in a leap-year was also called a *Franciade*. The leap-year was also called an Olympic year. The names of the *jours complémentaires* were the following, with the dates as they occur in a leap-year: Primidi (dedicated to Virtue), Sept. 16; Duodi (dedicated to Genius), Sept. 17; Tridi (dedicated to Labor), Sept. 18; Quartidi (dedicated to Opinion), Sept. 19; Quintidi (dedicated to Rewards), Sept. 20; Sextidi,

á Jour de la Revolution, Sept. 21. On this last day every Frenchman was required to renew the national oath, *to live free or die*. In order that the corrections found necessary by the mathematicians of Pope Gregory might be embodied also in the new calendar, it was further provided that the Franciade terminating the century should have no Olympic or leap year except in the fourth century and in all subsequent centuries whose numbers are divisible by four, which latter were to retain the Olympic year until the fortieth century, which was to end without an Olympic year.

The months received names derived from their prevailing meteorological characteristics, or from the products of the earth maturing in them, the several seasons being distinguished by the peculiar terminations of the names, as follows:

Autumn.	Vendémiaire,	22 Sept.—21 Oct.,	inclusive,	Vintage month.
	Brumaire,	22 Oct.—20 Nov.,	"	Foggy month.
	Frimaire,	21 Nov.—20 Dec.,	"	Sleety month.
Winter.	Nivose,	21 Dec.—19 Jan.,	"	Snowy month.
	Pluviose,	20 Jan.—18 Feb.,	"	Rainy month.
	Ventose,	19 Feb.—20 Mar.,	"	Windy month.
Spring.	Germinal,	21 Mar.—19 Apr.,	"	Budding month.
	Floréal,	20 Apr.—19 May,	"	Flowery month.
	Prairial,	20 May—18 June,	"	Pasture month.
Summer.	Messidor,	19 June—18 July,	"	Harvest month.
	Thermidor,	19 July—17 Aug.,	"	Hot month.
	Fructidor,	18 Aug.—16 Sept.,	"	Fruit month.

The week was abolished. Instead of this, the month was divided into three *decades* of ten days each. The names of the days of the decade were Primidi, Duodi, Tridi, Quartidi, Quintidi, Sextidi, Septidi, Octidi, Nonidi, Decadi. The decadi thus fell on the tenth, twentieth, and thirtieth days of the month, which were called Decadi I., Decadi II., Decadi III. For distinction the intermediate days were described—rather awkwardly—as "before Decadi I.," "after Decadi I."; "before Decadi II.," "after Decadi II.," etc.

This calendar first went into operation Nov. 26, 1793, and was discontinued Dec. 31, 1805, when, in the second year of the empire, the Gregorian calendar was resumed.

F. A. P. Barnard.

Cal'endering [*calendar*, older *calander*; from Fr. *calandre*, Med. Lat. *calendra*, corruption under influence of folk-etym. of Lat. *cylindrus* = Gr. κύλινδρος, roller]: the process of finishing or of imparting a smooth polished or glazed surface to linen and cotton goods, paper, etc., by passing the material whose surface is to be finished between two or more closely set rolls or cylinders which are caused to revolve by hand or by the application of steam or other motive power. The domestic mangle in use in Great Britain is perhaps the simplest form of calendering-machine.

The finish given is of different kinds, according to the manner in which the machine is used. The first object of calendering is to smooth out and eradicate creases, lumps, knots, etc. With greater pressure the threads are deprived of their roundness and the material acquires an appearance of closeness and a silky luster. When to pressure is added friction, obtained by making the cylinders revolve with different velocities, an additional polish called glazing is imparted. If two folds of the material are passed through together a wiry appearance results, caused by the impression of the threads of one fold on the other. If a cylinder with a pattern is used the effect known as "watering" is produced.

The machine consists of several cylinders, generally from three to twelve in number, arranged vertically in a strong framework. The cylinders are connected with a long lever loaded with weights at the farther extremity, by which, or by means of screws, great force may be applied. Hollow cylinders of iron, brass, or steel are used when heat as well as pressure is required. They are heated by steam passed through the interior, or by gas, or by red-hot heaters. It is of importance that some of the cylinders should combine considerable hardness with elasticity. For this purpose cylinders made of solid paper or compressed cotton are used. Wood is also used, but it is liable to crack and warp.

Cal'ends [Lat. *kalendae*, deriv. of *cala're*, call; cf. Gr. καλεῖν, call; the day on which the pontiff proclaims the nones, fixing the calendar]: the first day of each Roman month, because, according to Macrobius, before Cn. Flavius the scribe, against the will of the patricians, made the *fasti* (propitious days—days when courts were open) known to all the people (about 300 years B. C.), it was the duty of one of the minor priests, on the first appearance of each new moon, to summon the plebeians to a place in the Capitol near the Curia Calabria, and there to announce the number of days before the nones (always five or seven, *including the day of calling and the day of the nones itself*), by so many times repeating the word *calo*. If the part of this statement which makes the beginning of each month dependent on direct observation of the moon is correct, it is impossible that the months of the early Roman calendar should have had the fixed and rather arbitrary lengths usually assigned to them. As to this question historians differ, some asserting that the Roman months were strictly lunar down to A. U. C. 448; others, as Censorinus, that their lengths were fixed by Numa, the second king. See Calendar.

Cal'enture [Lat. *calentura*; from *cale're*, to be hot]: a strange malady, said to occur in the tropics. It is characterized by fever, strong hard pulse, convulsions, and sudden, acute delirium. The patient imagines that he can see in the depths of the ocean green fields, the leafy branches of trees, etc., and he will attempt to throw himself into the waves. This irresistible impulse to cast one's self into the sea may be considered the special characteristic of calenture, in regard to the nature, identity, and even existence of which authorities differ.

Calfa, Guy Ambroise: Prince of Lusignan; Armenian scholar and writer; also known under the name of **Iusuf Bey**; grandson of that Prince Amaury of Lusignan who, under the name of Iusuf Bey, accompanied the French expedition to Egypt in 1799. He was born in Constantinople, Mar. 2, 1830: educated by the Mekhitarists in Venice. In 1848 he was sent to Paris as professor at the Collège Murat; but in 1854, a disagreement having arisen between the Mekhitarist leaders, he resigned his position and founded an independent national school at Grenelle, of which he was director for three years. Compelled by his delicate health to retire into private life, he developed a great activity as a writer, published a *Dictionnaire Arménien-Français* (1860); *Français-Arménien* (1866); translated various French works into Armenian, as, for instance, *Paul et Virginie*, *Télémaque*, etc.; and wrote a *Universal History*; a *Sacred History*; *Lecture pour tous* (1867); *Guides de la Conversation*, for several languages, etc.

Cal'gary: town; capital of district of Alberta, Canada (for location, see map of Canada, ref. 9–F); on main line of C. P. R. R. at junction of line running N. to Edmonton (192 miles), and S. to Macleod; situated on Bow river; 840 miles W. of Winnipeg, and 642 E. of Vancouver on Pacific coast. Calgary has a public school, and a convent school for girls; Anglican, Roman Catholic, Presbyterian, Methodist, and Baptist churches; court-house; two hospitals, one general and one conducted by gray nuns. It is the center of an agricultural and cattle-raching district. Its chief industrial establishments are tannery, soap-works, flour-mill, and brewery. It has electric lights, water-works, a sewer system, and telephone. It was originally a post of the Northwest mounted police, established in 1875; but was organized in 1884 as a town. Pop. (1880) 30; (1891) 3,876.

Editor of "Herald."

Calhoun, kăl-hoon', John Caldwell, LL. D.: statesman; b. in Abbeville district, S. C., Mar. 18, 1782; graduated at Yale College in 1804; studied law; was sent to Congress in 1811. He began his political career as a Democrat and a leader of the war party; supported the tariff of 1816 and the U. S. bank; in Oct., 1817, he became Secretary of War in the cabinet of President Monroe. He approved the Missouri Compromise of 1820; was elected Vice-President of the U. S. in 1824, in which canvass he was supported by the friends of Jackson and those of Adams. Having joined the Jackson party, he was again elected Vice-President in 1828, when Gen. Jackson was chosen President. About this time he became an advocate of free trade and of the doctrine of the sovereignty of the States. He was the author of the *South Carolina Exposition*, which affirmed that any State can nullify unconstitutional laws of Congress. Calhoun and Van Buren having become aspirants for the office of President of the U. S., Gen. Jackson, by promoting the nomination of the latter, incurred the enmity of Calhoun. He resigned the office of Vice-President in 1832, and was then elected a Senator of the U. S. for South Carolina. A convention held in South Carolina near the end of 1832 adopted what was known as the Nullification ordinance. Its object was to test the constitutionality of the protective tariff policy through the instrumentality of the State instead of the Federal courts, and to prevent the collection of duties on imports in that State under the act of Congress of 1832, levied, as was alleged, with a direct view rather to

the protection of the manufactures of the U. S. than the collection of revenue, until the protective principle, so called, should be so tested and decided by the State courts. This was in pursuance of Mr. Calhoun's peculiar doctrines, known as nullification. He held that under the Federal system the judiciary of each State had the reserved sovereign right to decide in the last resort upon the extent of the powers delegated under the Constitution by the States respectively. This ordinance was to go into effect on Feb. 12, 1833. The determined attitude of Gen. Jackson against these nullification doctrines caused general and serious alarm lest a conflict of forces should ensue between the Federal and State authorities. It was in this condition of affairs that Mr. Clay, as a mediator, came forward with his famous "tariff compromise" of 1833, which was founded upon the avowed principle of an abandonment of the protective policy after 1843. To this measure Mr. Calhoun gave his cordial support, and in this way the anticipated perils of the crisis were averted.

As a debater, Mr. Calhoun occupied the foremost rank among U. S. Senators, and was scarcely equaled by any of his contemporaries, except Mr. Clay and Mr. Webster. These three were known as "the Great Trio." The debate between Mr. Calhoun and Mr. Webster on the nature of the Federal government and the doctrine of nullification, so called, in Feb., 1833, was one of the most noted for ability and eloquence in the annals of this country. Mr. Calhoun retired from the Senate in Mar., 1843, and was appointed Secretary of State by Mr. Tyler in Mar., 1844. It was under his auspices that the "Tyler treaty," as it was called, for the annexation of Texas, was negotiated in the same year. He was re-elected to the Senate in 1845, and opposed the Mexican war in 1846. He continued in the Senate until his death at Washington, Mar. 31, 1850. His mind was eminently metaphysical, and his private character was without reproach. Among his writings are two posthumous works—one, a *Disquisition on Government*, and the other, *A Discourse on the Constitution and Government of the United States*. These are both held in high estimation by his admirers and men of his school of politics. See *Calhoun*, by H. Von Holst, in American Statesmen Series.

Revised by C. H. THURBER.

Cali, kaa'lĕe: a town of the state of Cauca, Colombia; 70 miles N. by E. of Popayan; on a western declivity of the Andes (see map of South America, ref. 2–B). It has two fine churches and an active trade. Pop. 12,700.

Calibre, or **Caliber** [viâ Fr., perhaps ultimately from Arab. *qālib*, mold; but deriv. from Lat. *qua libra*—of what weight?—is not impossible]: a French word which is also much used in English; signifies the diameter of the bore of a gun or any firearm. It is usually measured and described in inches or parts of inches. The cannon in which solid shot is used are often denoted by the weight of each shot, as a 24-pounder, but mortars which throw shells or hollow shot are usually designated by such terms as a 13-inch mortar, etc.

Calico: a kind of cotton cloth; said to be so named from Calicut, a city of India, where it was first manufactured. It was imported into England by the East India Company in 1631. See CALICO-PRINTING.

Calico-bass: a species of sunfish (*Pomocis sparoides*) found in the rivers of the Eastern U. S., so called from the coloration.

Calico-printing: the art of producing patterns on cotton cloth either by printing in colors, or in mordants which become colors when subsequently dyed. Cloth made from cotton and wool, when similarly printed, is known as mousseline de laine. Calico-printing originated in India in very ancient times. Pliny describes the art as practiced by the Egyptians. For a long time chintz counterpanes were imported into England from India. The art spread westward to Asia Minor and the Levant. It was imported into Holland by the Dutch East India Company, and spread into Germany. At the close of the seventeenth century Augsburg in Bavaria was noted for its printed linens and cottons. Calico-printing was introduced into England during the seventeenth century, but the development of the art was for a long time seriously retarded by the opposition of the silk and woolen weavers. At their instigation the importation of chintz from Calicut was prohibited, and a heavy revenue tax was placed upon English calicoes. Finally, in 1720, a law was enacted prohibiting the wearing of any printed calicoes whatever, whether of foreign or domestic origin. This law was repealed in 1736, but a duty of 6*d*. per yard was still levied. In 1831 all duties were repealed. Great Britain is now the largest producer of calicoes; the U. S. stand second. The finest calicoes are made in Alsace, at Mühlhausen. Calico-printing involves a variety of operations, some of which are peculiar to certain styles, while others are common to all.

Singeing.—The first operation is the removal from the surface of the cloth of the fibrous nap or down, which, if not removed, would seriously interfere with the uniform application of the colors. The removal of the nap is effected either by passing the cloth rapidly over a red-hot plate (Fig. 1) or between lines of gas-jets. A shearing-machine is also in use for this purpose.

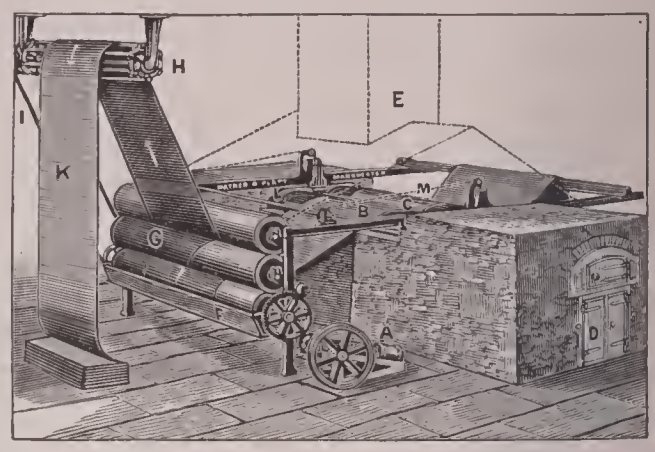


FIG. 1.—Hot-plate singeing: A, driving-engine; B C are semi-cylindrical red-hot plates of copper or iron; D is the furnace door; E is the ventilator; F, a wooden box filled with water, through which the cloth runs after singeing; G are three rollers which remove the excess of water from the singed cloth; H is the folding-reel, driven by a belt, I, from the lower roller, G; K is the cloth; L M is an arrangement of levers and steel chains to lift the cloth from the plates in case of stoppage.

Bleaching is then effected by boiling the cloth with lime, souring with sulphuric acid, boiling with soda-ash and rosin, boiling with soda-ash alone, treating with bleaching-powder, souring again, and finally washing thoroughly with water. See BLEACHING.

Calendering is sometimes resorted to in order to make the cloth smooth and even. It is effected by passing it between very heavy rolls.

Fixing the colors upon the cloth is effected (1) by the aid of mordants, substances which have an affinity for both fiber and color, as madder, logwood, Brazil-wood, artificial alizarine, etc., fixed by alumina, oxide of iron, oxide of chromium, etc., aniline colors, fixed by albumen, gluten, arsenite of alumina, tannate of antimony, etc. Sumach and cutch, which produce drabs and blacks with oxide of iron by the action of the tannic acid they contain, belong to this class. It is impossible to make a distinction between the action of true mordants and of agents which simply produce insoluble colors in the tissue of the cloth, as the two classes pass into each other by insensible gradations. These insoluble colors are produced by double or simple decomposition, by the successive treatment of the cloth with the necessary reagents. Thus Prussian blue is fixed on the cloth either by first applying an iron salt and then treating it with ferrocyanide of potassium, or it is produced by the decomposition of ferrocyanide of potassium alone, under the influence of certain acids. Chrome yellow is produced by the successive application of a lead salt and bichromate of potassa. Indigo is fixed by applying it in solution as colorless reduced indigo, and developing it as insoluble blue pigment by oxidation in the air. Brown oxide of manganese is formed by applying sulphate of manganese, withdrawing the sulphuric acid by an alkali, and oxidizing to a brown oxide by hypochlorite of lime. Aniline black is produced by the oxidation of an aniline salt in the cloth. (2) Colors are fixed by agents which, being first mixed with the color, are applied to the cloth and then rendered insoluble, when they hold the color upon the fibers either mechanically, as ultramarine blue, Guignet green, chrome yellow, madder lake, or mechanically and chemically, as aniline colors, fixed by albumen coagulated by heat.

Patterns are produced (1) by printing the mordant in figures, and subsequently producing the colors in the dye-liquors: *madder styles*; (2) by printing one component of the color, and then passing the cloth through a solution of

the other component, or of the agent necessary to develop the color: *padding*, *bronzing*, *indigo*, *pencil blue*, and *China blue styles*; (3) by printing the color together with the mordant or fixing agent, and rendering it insoluble, or developing it by air or steam. This is called topical or surface printing, and forms the most important branch of calico-printing: *steam colors*, *spirit colors*, *aniline black*, *aniline colors by albumen*, *pigment printing*, *metallic printing*; (4) by printing resist or reserve pastes, which protect certain portions of the cloth, and prevent the fixing of the color in the subsequent dyeing operations: *resist styles*; (5) by discharging the color from portions of the cloth previously dyed: *discharge styles*.

The *colors* most frequently employed in calico-printing are (1) the dyestuffs proper—madder in its various forms,

Fig. 2.—Block-printing by hand.

which at one time was one of the most important dyewares, and has been completely displaced by artificial alizarine; alizarine-orange, alizarine-blue, gallocyanine, alizarine-yellow, anthracene-brown, which are all artificial dyes prepared from coal-tar; logwood, Brazil-wood, sandal, cam, and bar wood, and fustic; quercitron bark, indigo, Persian berries, cochineal, and an almost endless array of aniline colors; (2) the astringents which contain tannic acid, catechu, sumach, nutgalls, etc.; (3) the pigments chrome yellow and orange, Prussian blue, Guignet green, ultramarine, Scheele's green, oxide of iron, oxide of manganese. For details, see each under its own name; also Dyeing and Dyestuffs.

The *mordants* most frequently used are salts of alumina, iron, chromium, tin, nickel, calcium, magnesium, caseine, albumen, gluten, tannic acid, and other astringents.

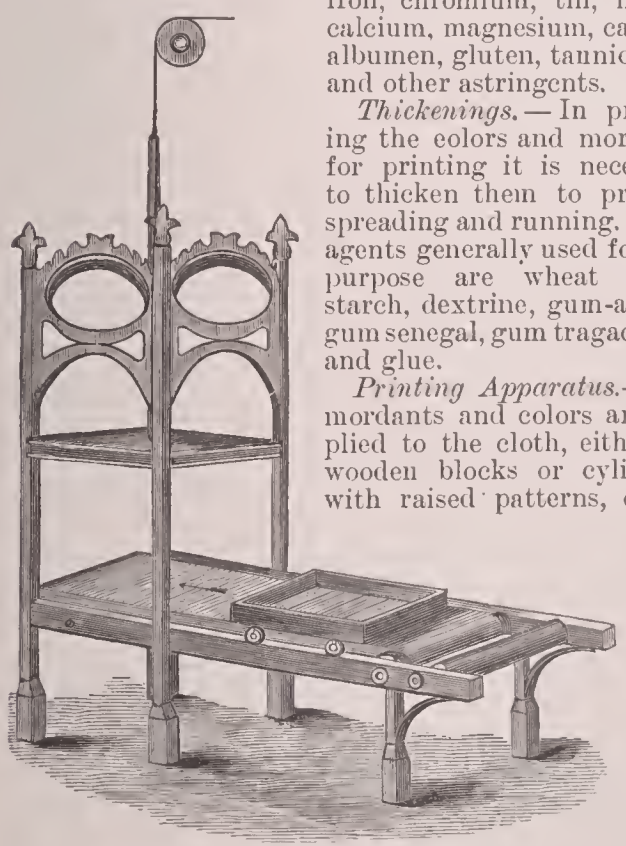

Fig. 3.—Press for block-printing.

Thickenings.—In preparing the colors and mordants for printing it is necessary to thicken them to prevent spreading and running. The agents generally used for this purpose are wheat flour, starch, dextrine, gum-arabic, gum senegal, gum tragacanth, and glue.

Printing Apparatus.—The mordants and colors are applied to the cloth, either by wooden blocks or cylinders with raised patterns, or by copper plates or cylinders with sunken patterns, the copper cylinders being most generally used for common calicoes. Each color or tint requires a separate block, plate, or cylinder. In the printing of cloth very nearly the same principles apply as in the printing of paper. Blocks are applied by hand (Fig. 2) or by presses (Fig. 3). The Perrotine is a machine for applying three blocks successively; it was invented by M. Perrot, of Rouen. The plombine (Fig. 4) was a machine invented by Ebinger, of St.-Denis, for the printing of calico by a continuous process with wooden relief cylinders. The introduction of copper cylinders or rolls upon which the pattern is engraved has led to a wonderful expansion of the calico-printing industry, and has almost entirely displaced all other modes of printing. Figs. 5 and 6 exhibit the disposition of the more essential parts in printing with engraved cylinders. The cloth, F, passes over a huge drum, B, against which the rolls, A, are pressed. Each roll is supplied with thickened mordant or color by a wooden cylinder, C, which dips into a vessel, E, containing it. A sharp-edged blade, D, called the *color doctor*, scrapes off the superfluous mordant or color from the unengraved portion of the roll; another blade, called the *lint doctor*, cleanses the roll as it leaves the cloth. By enlarging the drum the capacity of the machine may be increased from one to twenty colors by adding to the number of rolls. Fig. 7 exhibits a three-color machine; Fig.

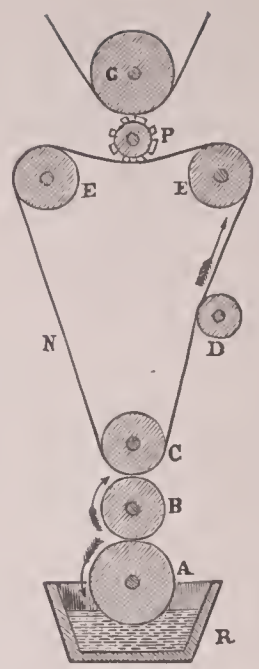

Fig. 4.—Plombine printing: R is the color-trough. The roll A applies the color to the roll B, which transfers it to the endless web N, by which it is applied to the relief cylinder P, which prints it upon the cloth as it passes over the drum G.

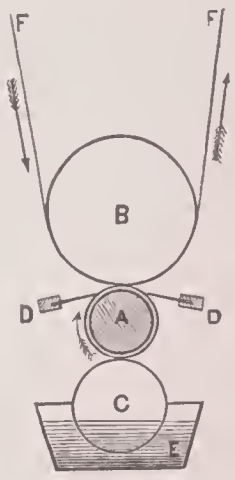

Fig. 5.—Single roll.

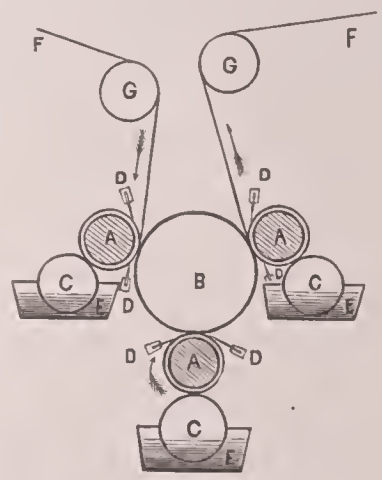

Fig. 6.—Three roll.

8 a twelve-color machine. The pieces of cloth, measuring each about 40 yards, are stitched together, and the process becomes continuous, miles of calico being printed without stopping the machine. A similar machine is now em-

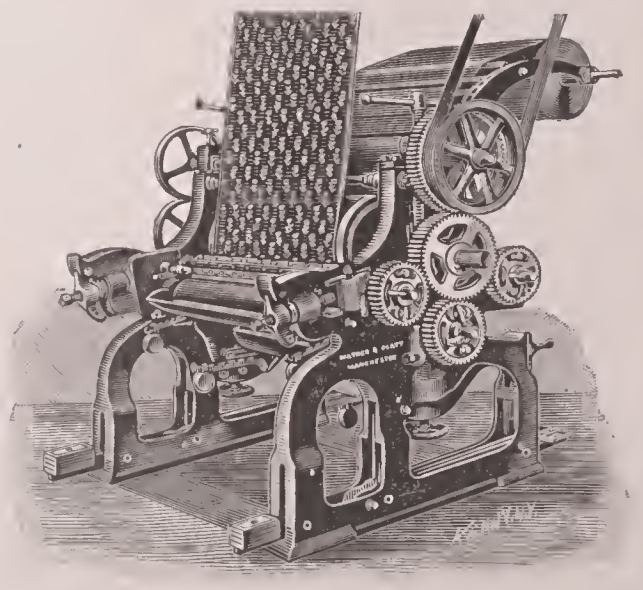

Fig. 7.—Three-color machine.

ployed in printing wall-paper. As each roll prints only a portion of the pattern, it is of course very important to regulate the tension of the cloth to secure the proper location of the parts of the figure. It is found that the cloth stretches in length, and consequently diminishes in width, in the machine, so each roll must be made to print a slightly narrower pattern than those which precede it. To prevent the running of the mordants or colors, the cloth passes directly from the machine to a heated drying-room or over steam-heated copper cylinders.

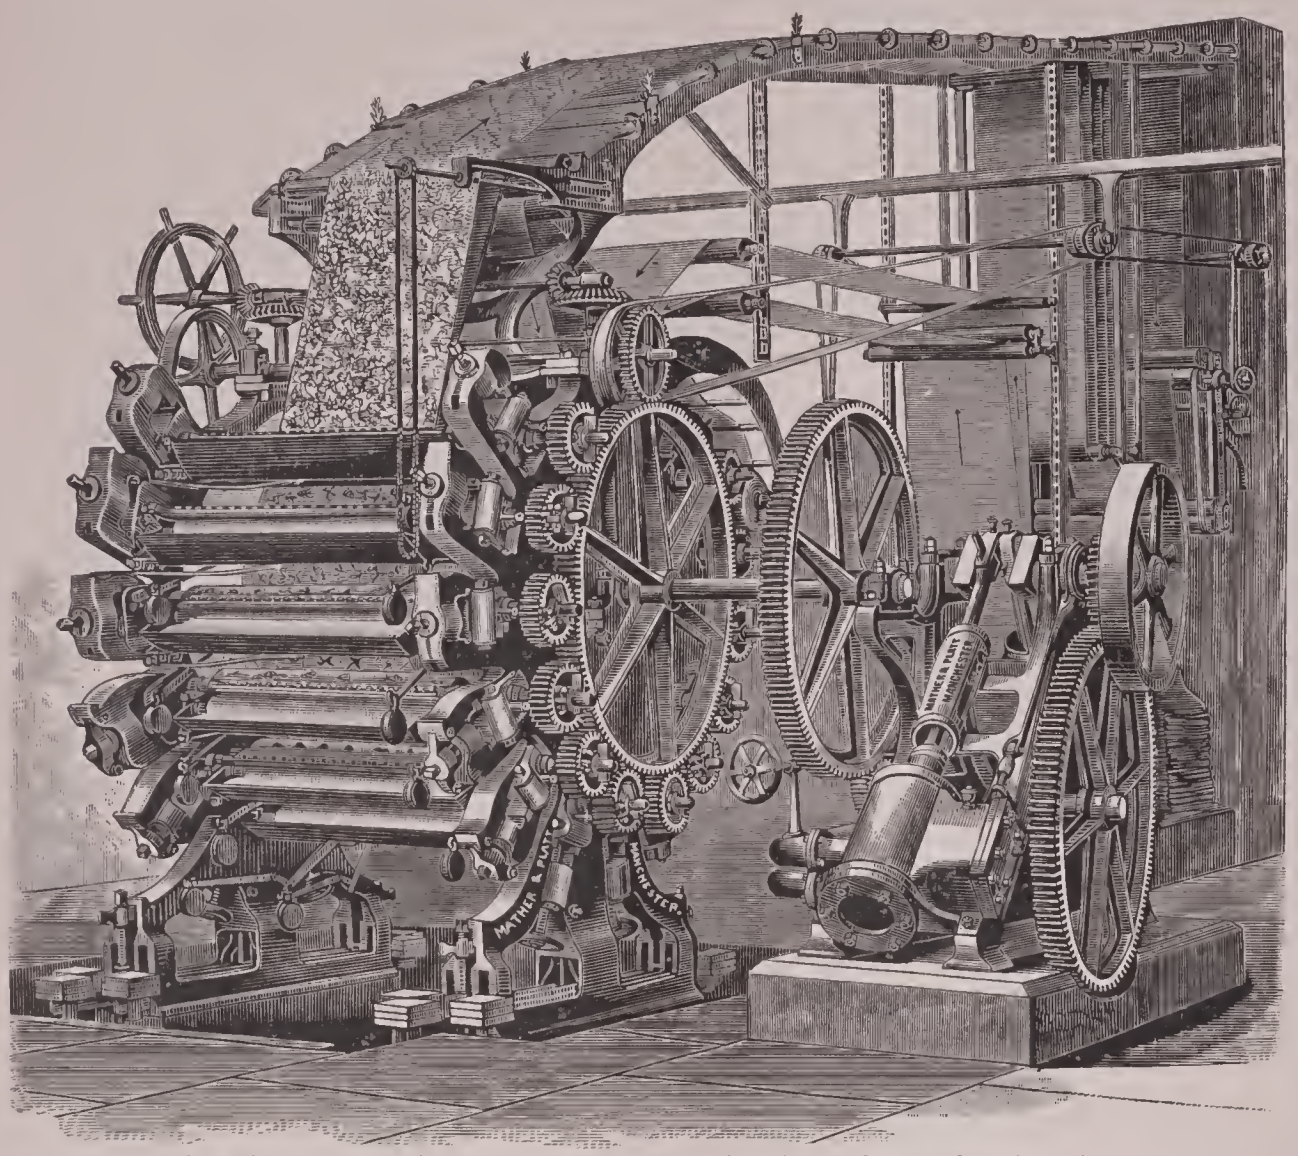

Fig. 8.—Twelve-color machine, with double-cylinder diagonal engine, and patent hot-air drying apparatus.

Madder Style.—Before the introduction of steam colors this used to be the most important and extensively practiced style of calico-printing, applicable not only to the coloring-matter from which it derives its name, but to nearly all organic coloring-matters which are soluble in water and capable of forming insoluble compounds with mordants. The thickened mordants are printed on the cloth, and the colors are produced by passing the cloth through the dye-beck, which contains the dyestuffs and water. For pinks the mordant employed is acetate of alumina; for reds, the same, more concentrated, with an addition of chloride of tin; for purple, acetate of iron; for chocolate, acetate of alumina, with a little acetate of iron; for brown, catechu, with a little nitrate of copper; for drab, catechu, with a little nitrate of copper and chloride of iron; for black, a strong solution of acetate of iron; for blues, grays, heliotropes, a chromium mordant; for orange, acetate of lead, chloride of ammonium, and chloride of tin. After the mordants have been printed on the cloth, it is run into the drying-room, and then exposed to the process of *ageing*. This has for its object the setting or rendering insoluble of the mordants. It is effected by hanging the cloth in a room where it is exposed to air, warmth, and a certain degree of moisture. The alumina loses most of its acetic acid, and passes into the condition of an insoluble basic salt; the iron loses acetic acid and takes up oxygen, passing into the condition of an insoluble basic salt of the sesquioxide. The goods are next exposed to a cleansing process called *dunging*. Formerly cow-dung was used for this purpose; it was mixed with water, and the goods were passed through the mixture and subjected to a kind of scouring. Phosphate of soda, arseniate of soda, and silicate of soda have now almost entirely displaced the dung. The effect of the treatment is to remove the excess of mordant, render what is left quite insoluble, and clear the unmordanted portions of the cloth. The next step is the dyeing, which is effected in the dye-beck. Water and the proper coloring-matters are introduced, and by means of steam the whole is heated to the proper temperature. The dyestuffs employed depend somewhat upon the tints to be produced. Alizarine alone is used for pinks; for reds, purples, chocolates, etc., a portion of the alizarine is replaced by Brazil-wood; for orange, Persian berries are added, with quercitron and fustic; for blacks, logwood; for a myrtle green, dinitroso-resorcinol. In order to brighten the colors, to render them more permanent, and to clear the whites, the cloth is next subjected to the *clearing* process. This consists in exposing it to a bath containing bran and soap, and then to a very weak solution of bleaching-powder, hypochlorite of lime. If the colors employed include Persian-berry orange, the cloth is passed through a very weak bath of chloride of tin. The cloth is then washed, starched, and calendered, when it is ready for market. Calico dyed in madder styles is the most durable, resisting the action of light and soap better than any other style. *Garancine styles* are mordanted in the same manner, but are dyed with garancine—madder which has been treated with sulphuric acid. (See Madder.) This is a more economical way of using madder. It is preferred for dark, heavy colors where the cloth is much covered. The soaping operation is omitted, and the colors are not as fast as those dyed with madder. Carbonate of lime, whiting, is added to the dye-beck, to neutralize the free acid in the garancine. Artificial alizarine is now extensively manufactured from anthracene, a hydrocarbon obtained from coal-tar. It has entirely displaced the various preparations of the madder root, both in the dye-beck and in topical printing. (See Alizarine.) *Padded styles* are specially adapted to mineral colors. Sometimes padding is resorted to for the production of a ground of a uniform tint, the figures to be subsequently applied by topical printing. In this case the cloth is first passed through a mordant, then dried, and passed through the dye. To produce a pale-blue ground the cloth is first passed through a weak iron solution, then dried, passed through chalk suspended in water to fix the iron, then through ferrocyanide of potassa to produce Prussian blue. To produce a design in chrome yellow the cloth is printed with a thickened solution of acetate of lead, dried, passed through a solution of carbonate of soda to fix the lead, and then through a solution of bichromate of potassa. A common padded style is iron buff, produced by passing through an iron solution and fixing by an alkaline bath. *Manganese bronzes* were once a favorite style. They were prepared by padding with chloride of manganese, then through caustic soda, and finally through hypochloride of lime. A uniform brown ground was thus produced. By printing figures with protochloride of tin mixed with pigments or decoctions the brown color was discharged, and colored patterns on a

brown ground were produced. *Topical printing* has displaced to a considerable degree the old madder styles. The colors and the mordant or fixing agent being applied to the cloth together, the operations of dunging and dyeing are rendered unnecessary, and a much greater variety of colors and shades can be employed; and as the colors do not come in contact with the whites, there is a great economy of materials. Woolen fabrics and de laines are always printed in this manner, as they are not well adapted for mordanting and dyeing in the madder style, owing to the affinity which wool possesses for most coloring-matters. *Steam colors* are produced by printing upon the cloth alizarine colors and dyewood extracts, mixed with the mordants, to fix them and to produce the desired tints, and properly thickened. On exposing the dried cloth to steam, an intimate union of the color, mordant, and fiber is effected. Such goods are very brilliant and permanent to light, and withstand hot soap-solution, which barely alters the shades. For steam reds, alizarine and various dyewood extracts, especially Brazil-wood, are employed. For reds and pinks, alizarine is mixed, in the form of paste, with solutions of acetate of alumina, acetate of lime, oxalate of tin, and a thickening composed of wheat starch, acetic acid, gum tragacanth, and olive oil boiled to a paste with water. For purples, pyrolignite of iron is used in place of acetate of alumina; for heliotrope, acetate of chromium replaces the alumina; for an orange, nitro-alizarine is used, and the print-color prepared otherwise as for a red with alizarine; for a yellow, alizarine yellow fixed with alumina, or a decoction of Persian berries with alumina and tin as mordant, or a decoction of quercitron bark with alumina as mordant. Alizarine blue with acetate of chromium gives a fine blue; alizarine green with the same mordant, a beautiful gray-green; gallocyanine and chrome, a fast violet; naphthazarine and chrome, a handsome gray, and mixtures of these an infinite variety of shades. Logwood and its preparations, fixed with acetate of chrome, give blacks; for chocolate, catechu, extracts of logwood, Persian berries, and acetates of chrome and alumina give a good steam color. *Aniline black* is a topical style, which has almost entirely displaced logwood and other blacks for certain kinds of styles. It is produced by printing a thickened mixture of aniline salt with a powerful oxidizing agent, such as chlorate of potassa, with chloride of ammonium, sulphate of copper, etc. The color is developed by ageing or a short steaming, and the goods are finally passed through a weak solution of carbonate of soda. When applied to large surfaces this black injures the strength of the fabric; its use is consequently restricted to light patterns showing a large proportion of white; for goods with a small proportion of white and consequently a heavy black the print-color has a different composition, the mineral acid of the aniline salt being neutralized by an addition of ferrocyanide of potassium or sodium. This black is also specially adapted for use with other topical styles. It is practically indelible. By substituting naphthylamine for the aniline salt the beautiful naphthylamine violet is produced.

Aniline Styles.—While the different aniline colors are more especially adapted to wool and silk dyeing and printing, they are nevertheless employed to a large extent in calico-printing, either in the dye-beck or by topical application as steam colors. In the former case the cloth is printed with (1) albumen, casein, gluten, or chloride of tin, followed by a nutgall decoction to produce insoluble tannates, and then passed through an acid solution of the aniline color; or the cloth is mordanted with either of the above-mentioned substances, the nutgall decoction printed on, and then passed through the acidulated color. Single tints are thus produced. For use as topical colors, to be fixed by steam, the aniline colors are mixed with albumen, gluten (either putrid or dissolved in soda-lye, weak acid, or saccharate of lime), caseine in lye or weak acid, glue, tannate of glue, tannic acid, oleo-sulphuric acid, shellac in borax, arsenious acid in glycerine (method of Alfred Paraf), or with a solution of arsenite of alumina in acetate of alumina. The last process, devised by Perkin and Schultz, is more extensively employed than any other, except perhaps that with tannin. Of course in topical printing any desired number of aniline colors may be used at the same time. *Pigment printing* involves the application of the pigments used in painting to the surface of the cloth by means of some cementing agent. Caoutchouc dissolved in naphtha was first employed with excellent results, but the danger of fire attending the use of naphtha has caused the substitution of albumen, caseine, or gluten for the caoutchouc. The pigments generally used are ultramarine, chrome yellow and orange, Guignet green, and lampblack for drabs. *Metallic precipitates*, as tin precipitated by zinc, are sometimes printed on cloth.

Indigo Styles.—Indigo is in some respects a very peculiar dye; it is insoluble in its ordinary blue form, $C_{16}H_{10}N_2O_2$, but is changed by reducing agents, such as grape-sugar in soda-lye, or protoxide of iron, produced by the action of lime on copperas, to colorless, soluble, hydrogenized indigo, $C_{16}H_{12}N_2O_2$. By passing the cloth through such a solution, and exposing it to the air, the indigo is oxidized and becomes blue again, being fixed as an insoluble pigment in the fabric. By repeating the treatment any desired shade is obtained. By the use of reserve pastes or discharges, with topical printing, white or colored figures on a blue ground are produced. *Pencil blue* is a name given to a style of calicoes which were prepared by printing on by hand, with a piece of wood called a pencil, the colorless reduced indigo. On oxidizing it produced figures in fast blue. *The China blue or pottery style* (so called from its resemblance to old china) was once very popular, but, owing to its cost and the ease of imitating it with Prussian blue, is now almost obsolete. The blue indigo was printed on the cloth, forming blue figures on a white ground. To render the color fast the indigo was worked into the cloth by treating it alternately with lime and copperas. *Resist styles* involve the use of a resist or reserve which protects the cloth in mordanting, dyeing, padding or covering, so that the mordant or color does not adhere. Some resists act mechanically, as clay, fat, oil, resin, wax, and sulphate of lead. Others act chemically, as citric, tartaric, or oxalic acid, or bisulphate of potassa, which are printed on cloth mordanted with alumina or iron to remove them and prevent the fixing of the color. Sulphate of zinc, sulphate and acetate of copper, and chloride of mercury are special resists used in indigo styles. *White resist*, for cylinder printing, consists of a mixture of acetate or sulphate of copper thickened with gum or dextrine. It is printed on the white cloth and allowed to dry. When the cloth is handled in the indigo vat containing the soluble colorless indigo it is dyed a uniform blue, the insoluble indigo being precipitated as insoluble blue pigment in the fibers, except where the resist has been applied. Here the copper salt having been changed to oxide of copper by the alkali of the vat, the colorless indigo is oxidized by the oxide of copper (which becomes sub-oxide), and deposited on the surface. On subsequently passing the dyed goods through dilute sulphuric acid, the sub-oxide of copper is dissolved and the indigo detached, leaving white figures on a blue ground. Often the resist is mixed so as to contain a mordant for some other color; thus the resist applied to cloth to be dyed in the indigo vat may contain an iron or alumina mordant; so that after the ground with the white figures is produced, the white becomes colored red, purple, or black in the dye-beck with madder, woods, or bark. This style is sometimes called *lapis*, from a remote resemblance to *lapis lazuli*.

Discharge Style.—After cloth has been uniformly dyed of one color, agents called discharges are sometimes employed to remove the color and produce a white pattern, or by adding to the discharge certain agents the original color is not only removed, but another color takes its place. By printing a mixture of tartaric acid with pipe-clay and gum on a piece of cloth dyed red or purple with madder or woad, or blue with indigo, and passing it through weak hypochlorite of lime, the color will be discharged, leaving a white pattern. Were a salt of lead added to the mixture, it would be fixed by the hypochlorite of lime, and on subsequently passing the cloth through bichromate of potassa, would develop chrome yellow in place of the whites. A modification of this style is the well-known bandanna style for handkerchiefs. Several folds of cloth dyed Turkey red with madder are placed between perforated lead plates, and firmly squeezed together in a hydraulic press. A solution of chlorine is forced through the perforations, destroying the color. This is followed by water, and on removing the cloth from the press it is found to present white figures on a red ground. Indigo is oxidized to soluble isatine ($C_{16}H_{10}N_2O_4.H_{20}$), which is removed by washing, by the action of chromic acid (applied in the form of bichromate of potash), or by a mixture of potash and ferricyanide of potassium. Reducing agents are also employed as dischargers, especially the protochloride of tin, or *tin salt*. When this compound comes in contact with oxide of iron, a soluble protochloride

of iron is formed, which is readily removed by washing, while at the same time the sesquioxide of tin (SnO,SnO_2) is fixed upon the cloth, and is ready to fix red or yellow dyes on the spots treated.

Combination Styles.—By combining two or more of the above styles the greatest variety of result may be obtained. Some of the finest French and English *cretonnes* exhibit the most elaborate designs and most pure and brilliant colors, and are really works of art. For further details, see Ure's *Dictionary of Arts, Science, and Manufactures*; Muspratt's *Dictionary*, especially the last German edition; Schützenberger's *Traité des Matières Colorantes*, especially the German edition; O'Neill's *Dictionary of Dyeing and Calico-printing*; and Krieg's *Theorie und Practische Anwendung von Anilin in der Färberei und Druckerei*; the annual volumes of Wagner's *Jahresbericht über die Fortschritte der Chemischen Technologie*. The following periodicals are especially devoted to dyeing and calico-printing: *Moniteur de la Teinture*; *Bulletin de la Société Industrielle de Mulhouse*; Reimann's *Färberzeitung*; *Die Musterzeitung für Färberei, Druckerei*, etc. See also Mousseline de laine and Silk-printing.

Revised by J. S. Ludlam.

Cal'icut, or **Kalikat**: a seaport-town of British India; presidency of Madras; on the Indian Ocean; 102 miles S. W. of Seringapatam, and about 570 miles S. S. E. of Bombay; lat. 11° 15′ N., lon. 75° 46′ E. (see map of South India, ref. 6–D). It was the first place in India visited by Vasco da Gama, who arrived here in May, 1498. It was then a populous and important city, and it continued to be for nearly two centuries a flourishing emporium. Its prosperity then declined, but has more recently revived; the anchorage is a roadstead. This town gave name to calico through the Portuguese. Pop. (1891) 65,700.

Califor'nia: the largest of the Pacific States; extending from 32° 28′ to 42° N. lat., and from 114° 30′ to 124° 45′ W. lon. It is bounded N. by Oregon, E. by Nevada and Arizona, S. by Lower California, and W. by the Pacific. It has a coast-line of more than 700 miles, and an average breadth of 200 miles. Area by the twelfth census (1900) 155,980 sq. miles, or 99,827,200 acres, nearly equal to New England, New York, and Pennsylvania.

Seal of California.

California, by census of 1890, ranked twenty-second among the States in population, twelfth in value of agricultural products, first in vine culture, and high in the second rank in value of manufactures.

Topography: Mountains, Lakes, and Rivers.—The topography consists of two mountain-ranges more than 100 miles apart, running from N. W. to S. E. through the whole length of the State, and with a broad valley, mostly fertile, lying between. These mountain-ranges are of varying width, sometimes consisting of three, two, or a single chain, and with spurs and outliers extending at some points nearly from one to the other. The name of the W. range is the Coast Range—not always appropriate—and its branches have many local names; the best known of these is the San Diablo range, 150 miles long by 50 broad; between this and the coast are lower ranges, as the Palo Scrito, Santa Lucia, San Rafael, and Santa Inez mountains. In Southern California this Coast Range spreads out in a confused mass of mountains extending across the State—the San Bernardino, San Jacinto, and other chains. The great E. range is the Sierra Nevada or Snowy Mountains, forming a boundary between California and Nevada for a part of the distance, but about the thirty-eighth parallel turning due S. and dividing into three parallel chains, and further S. uniting with the Coast Range in masses of mountains and hills in a wild, rugged, and desert region. There are many lofty peaks in both ranges, though the highest are in the Sierra Nevada—Shasta, Spanish Peak, Mts. Dana, Lyell, Brewer, Tyndall, Whitney, Lassen's Butte, Pyramid Peak, and others. Some of these have been, and perhaps still are, volcanoes. What is known as the California Valley, about 400 miles long and from 40 to 100 miles in width, lies between these mountain-ranges. There are also other large valleys, rich and fertile, as well as some which are waterless, barren, and deadly in their mephitic vapors. The most picturesque and remarkable of the valleys of California are the Yosemite (see Yosemite) and the Tuolumne Valley, which much resembles it. East of the Sierra is a series of lakes extending nearly the whole length of the State—Klamath, Goose, Honey, Owens, and others, some of them being alkaline, others salt, others dry most of the year, and Tahoe, one of the deepest, sweetest, purest, and most elevated lakes on the continent. In the S. E. and S. S. E. there are deep depressions (former lakes) like the Death Valley, 400 feet below the sea, and the bed of an ancient estuary, 600 feet below. In the California Valley are several important lakes, of which Clear, Tulare, and Kern are the largest. There is only one navigable river which discharges its waters directly into the ocean, the Salinas, at the Bay of Monterey; other mountain-torrents of moderate length, not navigable, are numerous. Two important navigable rivers—the San Joaquin from the S. E. and the Sacramento from the N. E.—as well as several smaller navigable streams, flow into the San Pablo, Suisun, and San Francisco Bays. Tulare Lake receives King, Kern, White, and Tule rivers. The harbors of California are San Francisco (the best on the Pacific coast), San Diego, San Pedro, San Luis Obispo, Monterey Bay, etc. There are numerous islands near the coast, some of them inhabited and cultivated.

Minerals.—Gold and silver have been found in paying quantities in many places—the gold pure, in scales, fine dust, nuggets, crystals, and combined with copper, silver, lead, zinc, cinnabar, arsenic, iron, sulphur, tellurium, iridosmine, etc.; silver native, in combination with lead, copper, sulphur, iron, etc.; copper native and in many forms; quicksilver abundantly as cinnabar, and occasionally native; platinum and tin not in large quantity; lead and iron almost everywhere; arsenic, tellurium, graphite, borax, salt, soda in several forms; sulphur, gypsum, barytes, antimony, ocher, alabaster, fluor-spar, corundum, and cobalt; diamonds, tourmalines, zircon, garnets, chrysolites, etc.; coal of fair quality, petroleum, and bitumen. The gold-mining is of three kinds—common placer-mining, now nearly abandoned; hydraulic mining, which is placer-mining on a large scale; and mining in quartz veins or lodes. The silver is mined only in veins; copper may be found native, but is generally an ore and in veins or lodes.

Irrigation.—The great Merced, Kern County, Fresno, and Tulare irrigation canals, which have cost $5,000,000, irrigate 1,000,000 acres of fertile land and furnish water-power, receiving an inexhaustible supply of water from the Kern, King, and Merced rivers. Other areas irrigated are in the Mohave and Colorado valleys of San Bernardino County, and Lassen and Butte Counties of the N. W. In these canals $30,000,000 are estimated to have been already expended, and the system is widely extended every year; about one-tenth part is done by artesian wells of an average depth of less than 300 feet.

Soil and Vegetation.—Most of the arable lands of California have a rich deep soil of wonderful fertility. Some of it requires to be quickened into activity by irrigation, but is then astonishingly productive. There are 48 genera and 105 species of forest-trees already known in California, mostly not only indigenous, but peculiar to the Pacific slope. Forty species are evergreens, including the two sequoias or giant redwoods (see Sequoia), the sugar and 15 other species of pine, 6 species of true fir, 12 of oak, white cedar, 4 species of cypress, manzanita, wild nutmeg, California laurel, chinecapin, maples, etc. There are many valuable shrubs and small fruits, only one native grape, but all the European and Eastern species and varieties flourish well, and California is already the vineyard of America. There are many nutritious grasses, but with few exceptions there is no sod, nor grass fit for hay. Alfalfa, wild oats, Hungarian grass, and millet are much used for feeding cattle. The flowers of California are abundant, fragrant, and beautiful.

Animals.—There are 115 species of mammals in California, 27 of which are carnivorous; they include the grizzly, black, and brown bear, raccoon, badger, 2 or 3 species of skunk, the wolverine, fisher, American sable or marten,

mink, weasel, California otter and sea-otter, cougar, jaguar, 2 species of lynx, raccoon-fox or mountain-eat, gray wolf, coyote, 5 species of fox, 3 or 4 of sea-lion, 2 of seal, and the sea-elephant. There are 2 of moles, 2 of shrews, 16 species of bats, 50 species of rodents, some of them (the squirrels) specially destructive to grain; of ruminants, the elk, 3 species of deer, the American antelope, and bighorn; of cetacea, 11 species. There are 350 species of birds native to California, including a great variety of each family, order, and tribe. There are many reptiles, but no saurians, and only one poisonous serpent, the rattlesnake, of which, however, there are 5 species. The fish are of 240 species, of which 185 are edible; 60 mollusks and 8 crustaceans.

Climate.—Prof. E. W. Hilgard classified the climate as follows: 1. Bay and coast climate: characteristics, small range of thermometer, extremes only 53° apart, means of summer and winter only 6° apart; no intense heat; frosts very rare; fogs from the sea in the afternoons of summer; rainfall averages 27·3 inches, of which about 25 are between December and May. 2. Climate of the great interior valley: characteristics, average winter temperature lower than the coast, though minimum temperature about the same; frosts rare; summer heat very high—above 100° F. many days of the season; nights warm, but the dry air is less oppressive than a moist one; extreme annual range, 76°; mean range, 23·6°; rainfall for year 21·50 inches, of which 19·80 is between December and May. 3. Climate of the slope of the Sierra Nevada: characteristics, considerable snowfall and much rain; cool summers, summer thunder-storms; winters often severe; mean winter temperature, 43·5°; mean summer temperature, 57·5°; mean range, 14°; rainfall, 57·24 inches. But, aside from these, there are many local climates. Even in Southern California, on the coast, the heat is not so great as in the interior valley, and the climate of Los Angeles, San Diego, and Santa Barbara is desirable for consumptive invalids.

Agricultural Products.—The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	35,934	52,894	47·2
Total acreage of farms	16,593,742	21,427,293	29·1
Value of farms, including buildings and fences	$262,051,282	$697,116,630	166·0

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1899:

CROPS.	Acreage.	Yield.	Value.
Corn	56,925	1,536,975 bush.	$922,185
Wheat	2,393,185	33,743,909 "	20,921,223
Oats	59,477	1,843,787 "	866,580
Rye	36,472	547,080 "	426,722
Barley	855,376	22,239,776 "	11,119,888
Potatoes	26,543	3,158,617 "	1,989,929
Hay	1,708,087	2,784,182 tons	22,273,456
Totals	5,136,065		$58,519,983

California is admirably adapted as regards both soil and climate for the cultivation of the grape. In 1890 200,000 acres were covered with grape-vines, the product in that year being 274,311 tons of grapes, 14,626,000 gal. of wine, and 1,372,195 boxes (20 lb. each) of raisins. Oranges, lemons, peaches, apricots, pears, plums, etc., superior in size and beauty, though not in flavor, to the fruits of the Eastern States, are shipped in large quantities to all parts of the U. S.

Manufactures.—The census returns of 1890 showed that 7,923 manufacturing establishments reported. These had a combined capital of $146,797,102, employed 83,642 persons, paid $51,538,780 for wages and $120,241,025 for materials, and had products valued at $213,404,096. The products include mining and agricultural machinery, lumber for building purposes and ornamental woods, tanning and dressing of leather and leather manufactures, woolen goods, flouring-mills, silk fiber and fabrics, the production of wine and brandy, refined sugar, sirup, and candies (from Sandwich islands sugar); grain-bags, dynamite, giant-powder, and chemicals for mining purposes. The beet-sugar industry is important, California having 8 establishments, with $10,139,780 capital, and making $3,499,996 worth of sugar in 1899.

Mineral Productions.—The production of gold in 1891 was estimated at 609,525 oz., value $12,600,000; silver, 750,000 oz., value $969,697; quicksilver, 22,904 flasks, value $1,036,386; copper, 3,397,405 lb.; metallic tin, 125,289 lb.; bituminous coal, 93,301 tons, value $204,902; petroleum, 323,600 bbl. (of 42 gal. each); granite, value $1,300,000; sandstone, value $100,000; limestone, value $400,000; and marble, value $100,000. In 1898 the gold production was estimated at $15,637,900. The values of other products in 1899 were borax, $2,000,000; petroleum and bituminous products, $2,976,356; mineral waters, $698,493; salt, $175,000; and building stones, $1,033,295.

Fisheries.—According to census of 1890 there were 5,338 persons employed in the fisheries of California, $2,684,210 invested as capital, and the product valued at $4,463,369. The whale and seal products were valued at $2,490,373; canned salmon at $464,232. The herring-fishery was next in value to the salmon of river and sea-fish, but the oyster trade exceeded both, and its products came to $509,175.

Railways.—The number of miles of railway operated in 1891 was 4,336; in 1899, 5,532·25.

Finances.—The assessed valuation of taxable property in 1900 was, real estate, $669,905,988; improvements, $272,447,321; personal, $184,380,015; railway, $47,711,755; total, $1,174,445,079. The original assessed value of mortgages is $156,444,755; the assessed value of university and other State mortgages, $1,180,985; the total county indebtedness is $3,629,379.40; of which $3,502,700 is funded.

Banking.—On Sept. 5, 1900, there were 38 national banks, with a combined capital of $10,997,610, surplus and profits of $5,398,828.53, and individual deposits of $35,195,139.72; 178 State banks, with combined capital of $26,981,973, surplus and profits of $20,584,066, and individual deposits of $85,881,584; 19 private banks, with capital of $890,142, surplus and profits of $240,107, and individual deposits of $1,629,687; and 53 savings-banks, capital $7,655,705, surplus fund $6,972,879, and $158,167,462 in deposits from 216,534 depositors.

Commerce and Navigation.—The number of American and foreign vessels entered at San Francisco and other ports in the year ending with June 30, 1900, was 1,172; tonnage, 1,153,542. The number cleared, 1,104; tonnage, 1,504,477. The value of the imports from foreign countries into California for the same year was $49,441,831; of exports of domestic merchandise, $42,469,837; of foreign merchandise, $891,241—total imports and exports, $92,802,909. The interstate and internal commerce of the State by railways and steamers is still greater, though exact figures can not be given. Lines of ocean-steamers ply to Alaska, Washington, Oregon, and the Mexican coast, Panama, Chili, Honolulu, China, and Japan.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	249	243	156,846	$2,627,950
Methodist Episcopal	337	351	25,527	2,053,371
Presb. in the U. S. of America	213	199	16,236	1,696,725
Congregational	182	181	11,907	1,014,975
Baptist	163	139	11,204	744,360
Protestant Episcopal	103	96	9,221	1,019,695
Methodist Episcopal South	175	132	7,497	446,010
Disciples of Christ	89	89	7,433	291,250
Jews, Reformed	8	8	3,835	303,000
Jews, Orthodox	7	7	2,344	93,000
Unitarian	16	18	3,819	366,040

Schools.—In the school year ending June 30, 1899, there were 350,124 children of school age, of whom 253,397 were enrolled in the public schools, with an average daily attendance of 203,248. There were 3,565 school-houses; value of school property, $18,682,634; number of teachers, 8,157—male, 1,722; female, 6,435. Average monthly salary of male teachers, $81.08; of female, $64.76. School was held 163·6 days; and the average expenditure per pupil based on the daily attendance was $30.33. The total revenue was $5,869,034, and the total expenditure $6,164,053. There are also the LELAND STANFORD JUNIOR UNIVERSITY (*q. v.*); the UNIVERSITY OF CALIFORNIA (*q. v.*); 5 normal schools and 4 normal departments; 13 other colleges, some of them having business or professional courses attached to them; 7 of these admit women as students, and there are many seminaries of high grade for women alone. There is also a school of engineering, 5 commercial and business colleges, 4 theological schools, 1 school of law and 3 of medicine, and a scientific institution of high character, the San Francisco Academy of Sciences.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 1,659 post-offices, of which 134 were presidential (5 first-class, 32 second-class, 97 third-class) and 1,525 fourth-class, with 1,026 money-order offices and 96 money-order stations. There were 112 daily, 1 tri-weekly, 19 semi-weekly, 460 weekly, 1 three times a month, 1 fortnightly, 8 semi-monthly, and 81 monthly periodicals; total, 683.

Population.—The population of California was (1850) 92,597; (1860) 379,994; (1870) 560,247, excluding tribal Indians; (1880) exclusive of tribal Indians, 864,694; (1890) 1,208,130 (white 1,111,558, colored 11,437, besides including 71,066 Chinese, 1,224 Japanese, and 12,355 Indians). There were 5,020 tribal Indians in 1890. The foreign population in the same year numbered 366,309, of whom 65,129 were German, 63,134 Irish, 46,662 from Great Britain, 26,028 Canadians, 22,389 Scandinavians, 15,495 Italians, 11,855 French, 9,859 Portuguese, 7,164 Mexicans, and 674 Hawaiians. Pop. (1900) 1,485,053.

The principal towns are San Francisco, the largest city, pop. (1900) 342,782; Los Angeles, 102,479; Oakland, 66,960; Sacramento, 29,282; San José, 21,500; San Diego, 17,700; Stockton, 17,506; Alameda, 16,464; Berkeley, 13,214; Fresno, 12,470; Pasadena, 9,117; Riverside, 7,973.

† Organized since census of 1890.

History.—Present State of California, discovered by J. R. Cabrillo, a Portuguese navigator in the Spanish service, in 1542; he named Cape Mendoza, now Cape Mendocino, and the Farallones islands. In 1578 Sir Francis Drake discovered and landed at Drake's Bay and took possession of the country, calling it New Albion. It was again explored by the Spaniard S. Viscayno in 1602, but no attempt made at settlement till 1769, when the Franciscan Fathers planted a mission at San Diego, and six others in the next seven years, the last—San Francisco—being established in 1776 as the Mission Dolores. Within fifty years they had founded twenty-one of these missions, had accumulated enormous wealth in live stock, gold and silver, and buildings and lands, and had reduced more than 20,000 Indians to slavery, treating them with the utmost cruelty; the Indians of the interior were left to themselves. With the downfall of the Spanish power in Mexico these missions waned, and were finally abolished and confiscated in 1845. Then came a great rush of immigrants from all quarters. In 1847 Com. Stockton captured California, and drove the Mexican forces out of the country. There was some conflict of authority between Com. Stockton and Gen. S. W. Kearny, but it was soon settled and Col. R. B. Mason appointed Governor. In Oct., 1849, a constitution was framed by a convention, and ratified by the people Nov. 13, 1849. After an angry debate in Congress over the slavery bearings of the Act, lasting from Dec. 22, 1849, the State was admitted to the Union Sept. 9, 1850. Gold was discovered in Feb., 1848, on the estate of Gen. Sutter in Coloma, and there was an instant rush thither, till, four years later, there were 250,000 men in the State, many of them energetic, daring, reckless persons, capable of almost any crime. Gambling, intemperance, licentiousness, theft, and murder were rife. A vigilance committee of the best citizens was formed in 1851, and a few of the worst villains were tried and hanged. In 1855 the ruffians had regained their power, and seized upon the courts and offices. The vigilance committee was reorganized and broke up the gang of villains, hanging four, driving one to suicide, and banishing about twenty. Since that time the State has been quiet and prosperous, though threatened with disorder in 1879 and 1880 on account of the Chinese. It bore an excellent record in the civil war in its contribution of men and means. The Union and Central Pacific R. Rs. were completed in 1869, and now the State is further connected with the East by the Southern Pacific and branches, the Atchison, Topeka and Santa Fé, etc.

GOVERNORS.

Spanish Rule.

Gaspar de Portala	1767–71	José J. de Arrillaga	1792–94
Felipe de Barri	1771–74	Diego de Borica	1794–1800
Felipe de Neve	1774–82	José J. de Arrillaga	1800–14
Pedro Fajés	1782–90	José Arguello	1814–15
José Antonio Roman	1790–92	Pablo Vicente de Sola	1815–22

Mexican Rule.

Pablo Vicente de Sola	1822–23
Luis Arguello	1823–25
José Maria de Echeaudia	June, 1825–Jan., 1831
Manuel Victorio	Jan., 1831–Jan., 1832
Pio Pico	Jan., 1832–Jan., 1833
José Figueroa	Jan., 1833–Aug., 1835
José Castro	Aug., 1835–Jan., 1836
Nicolas Gutierrez	Jan., 1836–Apr., 1836
Mariana Chico	Apr., 1836–Aug., 1836
Nicolas Gutierrez	Aug., 1836–Nov., 1836
Juan B. Alvarado	Nov., 1836–Dec., 1842
Manuel Micheltorena	Dec., 1842–Feb., 1845
Pio Pico	Feb., 1845–July, 1846

U. S. Military and Territorial Rule.

Com. John D. Sloat	July 7, 1846–Aug. 7, 1846
Com. Robert F. Stockton	Aug. 17, 1846–Jan., 1847
Col. John C. Fremont	Jan., 1847–Mar. 1, 1847
Gen. Stephen W. Kearny	Mar. 1, 1847–May 31, 1847
Col. Richard B. Mason	May 31, 1847–Apr. 13, 1849
Gen. Bennet Riley	Apr. 13, 1849–Dec., 1849

State Government.

Peter H. Burnett	Dec., 1849–51	George C. Perkins	1879–83
John McDougall (acting)	1851–52	George Stoneman	1883–87
John Bigler	1852–56	Washington Bartlett	1887
J. Neely Johnson	1856–58	R. W. Waterman	1887–91
John B. Weller	1858–60	H. H. Markham	1891–95
Milton S. Latham	1860	James H. Budd	1895–99
John G. Downey	1860–62	Henry T. Gage	1899–
Leland Stanford	1862–63		
Frederick F. Low	1863–68		
Henry H. Haight	1868–72		
Newton Booth	1872–75		
William Irwin	1875–79		

Revised by AINSWORTH R. SPOFFORD.

California: city; on railroad; capital of Moniteau co., Mo. (for location of county, see map of Missouri, ref. 4–G); 150 miles W. of St. Louis. It is the geographical center of the State; has fine county buildings, 9 churches, graded schools, public library, a woolen-mill, and 2 flouring-mills; is surrounded by a rich agricultural district, which also abounds in lead and other minerals. Pop. (1880) 1,427; (1890) 1,772; (1900) 2,181. EDITOR OF "DEMOCRAT."

California: borough; Washington co., Pa. (for location of county, see map of Pennsylvania, ref. 5–A); on Pa. R. R. and on Monongahela river; has a normal school, coal mines, etc. Pop. (1880) 1,009; (1890) 1,024; (1900) 2,009.

California, Gulf of, or **Sea of Cortes** (Sp. *Mar Bermejo*): an arm of the Pacific Ocean; separates the peninsula of Lower California from Sinaloa and Sonora. It is about 700 miles long, and 40 to 100 miles wide.

California, Lower or **Old**: a long, narrow peninsula; a territory of Mexico; bounded N. E. by the Gulf of California and S. W. by the Pacific Ocean. It is about 750 miles long, and varies in width from 30 to 150 miles. Its most southern point, Cape Lucas, is in lat. 22° 52′ N., from which it extends in a N. N. W. direction to lat. 32° 30′ N. It is a mountainous, arid region of volcanic formation, having a sparse population. Its pearl fisheries in the gulf and whale fisheries on the west coast have some value. Its other industries are silver-mining, salt from Carmen island, orchil from the interior, and the wines of El Patronicio. Capital, La Paz. This peninsula was discovered by Grijalva in 1534. Area, 58,328 sq. miles. Pop. (1890) 31,167.

California, University of: established by an act of the State Legislature approved Mar. 23, 1868. It was an outgrowth of the College of California, which was chartered in 1855, and maintained on a non-sectarian basis. Prof. Henry Durant opened its preparatory school at Oakland, and thus became one of the earliest pioneers of education in the State. In 1860 the college admitted its first class, and it graduated classes yearly, 1864–69. It had no president. Rev. S. H. Willey (Dartmouth, 1845) was vice-president 1863–69. Finding the college fettered by its want of endowments, and wishing to see a larger and stronger institution, the trustees in 1867 offered all their property to the State. This included a new, unoccupied site of 160 acres at Berkeley, 5 miles N. of Oakland and 9 miles from San Francisco. The State had accepted the Congressional provision for an agricultural college. A proposition to unite all interests in a university adequate to the wants and worthy of the name of the State was agreed to. The first board of regents, appointed in 1868, kept the college in existence another year. In 1869 the university received its first class, and in 1891 numbered 529 students at Berkeley and 918 including the professional colleges at San Francisco. A State tax supplements the income from its funds.

The first president of the university, elected in 1870, was Henry Durant, LL. D. President Daniel C. Gilman resigned in 1875, and was succeeded by John Le Conte, LL. D. In 1881 W. T. Reid became president; he was succeeded by Prof. E. S. Holden, later director of the Lick Observatory. Horace Davis, LL. D., was president from 1888 to 1890. Prof. Martin Kellogg, acting president from 1890 to 1893, president 1893–1900; Benjamin Ide Wheeler became president in 1900. Revised by Horace Davis.

Calig'ula, Caius Cæsar: Roman emperor; b. at Antium in 12 A. D.; son of Germanicus. His mother was Agrippina, a granddaughter of the Emperor Augustus. He succeeded to the throne 37 A. D., on the death of Tiberius, which he was suspected of hastening and against whose cruel jealousy he had guarded himself by habitual dissimulation. His reign was at first mild and popular, with an ostentation of generosity, squandering in one year the £5,625,000 accumulated by Tiberius; but he soon showed himself a monster of cruelty, banishing or murdering most of his kindred, making a paramour of his sister Drusilla, taxing, robbing, and executing his subjects with capricious frequency. He built a bridge of boats 3 miles long at Baiæ, and celebrated its opening by throwing many of his guests into the sea. His horse he invested with the priesthood and a consulship, and his palace he filled with prostitutes, whose embraces he had hawked upon the streets. He expressed a wish that all the Roman people had but one head, that he might decapitate them at one blow. He ordered that sacrifices should be offered to himself as a god. On Jan. 24, 41 A. D., he was assassinated in Rome by conspirators, four months after his return from a plundering expedition into Gaul.

Ca'liph [from Arab. *khalīfah*, successor]: the "commander of the faithful," the spiritual and temporal head of orthodox Mohammedanism—so called as being the "successor" of Mohammed. The caliphs are usually classed as follows: (1) The four "Arabian caliphs" of Medina, A. D. 632–661; (2) the fourteen "Ommyiades" of Damascus, 661–750; (3) the thirty-seven "Abbasides" of Bagdad, 750–1258; besides these there were rival caliphates; (4) in Egypt the "Fatimites," fourteen in number, 909–1171; and (5) in Cordova, 756–1031, there were twenty-two successive caliphs (Ommyiades) who had authority in Spain and Northwest Africa. The caliphate of Persia, representing the Shiite, or protestant, wing of Mohammedanism, dates from 1502; the caliphate of the Sultan of Turkey dates from 1517. Besides these caliphates there were, between the ninth and thirteenth centuries, thirteen Mohammedan dynasties—eight in Central Asia, three in Western Asia, and two in Africa.

Calisaya, Calisaya Bark: See Cinchona.

Calispel Indians: See Salishan Indians.

Calisthenics: See Callisthenics.

Calix'tines: the name given to a party of the Hussites, because they insisted on giving the cup (calyx) in the Eucharist to all who were not guilty of mortal sins. They defeated the Taborites (the other branch of the Hussites) in a battle at Lippau (1434). The Calixtines had been reconciled to the pope in 1433. The term Calixtines has also been applied to the adherents of G. Calixtus, a Lutheran Professor of Theology at Helmstedt. See Calixtus.

Calix'tus, originally **Callisen,** George: Lutheran theologian; b. at Medelbye, in Schleswig, Dec. 14, 1586. He studied at Helmstedt; became Professor of Theology there in 1614; was the first theologian to effect the separation of Christian ethics from dogmatics, and was especially distinguished for the attempts which he made to unite all Christian communions upon the basis of the Apostles' Creed. (See Syncretism). D. in Helmstedt, Mar. 19, 1656. See W. Gass, *George Calixt and Syncretism* (Breslau, 1846); E. Henke, *George Calixtus und seine Zeit* (Halle, 1853–60); W. C. Dowding, *Life of Calixt* (London, 1864).

Revised by Henry E. Jacobs.

Calixtus I. (Pope), Saint: succeeded Zephyrinus 219 A. D. D. 223.—Calixtus II. (Guido, Count of Burgundy); succeeded Gelasius II. in 1119. He concluded the concordat of Worms with the Emperor Henry V., which ended the difficulty with respect to investitures. D. Dec. 13, 1124. See his *Life* by U. Robert (Paris, 1891), who has also edited his *Bulls* (1891, 2 vols.).—Calixtus III. (Alonzo Borgia); b. in Valencia in 1379; succeeded Nicholas V. in 1455. He attempted to institute a crusade, without success. D. Aug. 6, 1458. An antipope created by Frederick Barbarossa set up in 1168 under the name of Calixtus III., and opposed Alexander III. for nine years.

Call, Wilkinson: U. S. Senator; b. in Russellville, Ky., Jan. 9, 1834; went to Florida in early life; elected U. S. Senator in 1865, but not allowed to take his seat; again elected in 1879, and served till 1897.

Cal'la: a genus of plants of the family *Araceæ*; characterized by a flat spathe, within which is a cylindrical spadix covered with naked flowers, appearing as a mere mixture of stamens and pistils, the latter with one-celled ovaries. The *Calla palustris* is a native of Europe and the U. S., growing in swamps and bogs. It has cordate leaves, a white spathe, and very acrid rhizomes, which are cooked for food by the Laplanders. The common "calla" of the greenhouses, often called *C. æthiopica*, is properly *Richardia africana*, a native of South Africa.

Cal'lander: village in Perthshire, Scotland; on the left bank of the Teith; 16 miles N. W. of Stirling (see map of Scotland, ref. 11–G). It is beautifully situated among mountains and lakes, and is much frequented by Highland tourists. From it Ben Ledi, the Trossachs, Bracklin Falls, and Lochs Lubnaig and Katrine are easily reached. Pop. 1,600.

Callao, kăăl-yaa'ō: a fortified town of Northern Peru; on the Pacific Ocean; 6 miles W. of Lima, of which it is the port; lat. 12° 4′ S., lon. 77° 13′ W. (see map of South America, ref. 5–B). It is connected with Lima by a railway, and has a commodious quay and a fine fortress. The harbor or roadstead, which is sheltered by the island of San Lorenzo, is the best on the coast of Peru. The chief exports are specie, copper, cotton, hides, and bark. The town was destroyed by an earthquake in 1746. Pop. 35,492.

Callcott, kawl'kot, Sir Augustus Wall: painter of the English school, who at first painted portraits and figure subjects, but afterward devoted himself to landscape, and is chiefly known by his work in that branch of art. He was often spoken of as the English Claude, and his pictures of English scenery were much admired and bought by British collectors at high prices. B. in Kensington, Feb. 20, 1779; d. there Nov. 25, 1844; Royal Academician 1810; knighted in 1837. Nine landscapes by him are in the National Gallery, London. William A. Coffin.

Callcott, John Wall, Mus. D.: English composer; b. in Kensington, Nov. 20, 1766; brother of Sir Augustus. He

composed many anthems, glees, and other pieces of music. He published a *Musical Grammar* (1805). D. near Bristol, May 15, 1821.

Callic'rates (in Gr. Καλλικράτης): an eminent Greek architect who flourished about the middle of the fifth century B. C. He was a contemporary of Pericles, and assisted Ictinus in the erection of the Parthenon at Athens. See ARCHITECTURE, ICTINUS, and PERICLES.

Callicrat'idas (in Gr. Καλλικρατίδας): a Spartan general who obtained command of the fleet in 406 B. C. He defeated the Athenian general Conon, and blockaded him at Mitylene. The Athenians soon sent to the relief of Conon another fleet, which defeated the Spartans at Arginusæ in 406 B. C. Callicratidas was killed in this action.

Callig'onum: a genus of thirty to thirty-five species of (mostly) evergreen shrubs of the Buckwheat family (*Polygonaceæ*), natives of dry regions in Western Asia and Northern Africa. *Calligonum pallasia*, the "pretty-face" of English gardens, is a shrub 3 to 4 feet high, with simple deciduous leaves, white flowers, and succulent acid and edible fruits. It is a native of the Caspian region.

Callig'raphy [Gr. καλλιγραφία; κάλλος, beauty + γράφειν, write]: the art of beautiful writing. The scribes who copied manuscripts before the invention of printing have been termed calligraphers or calligraphists. Their art consisted not merely in writing, but also in embellishing their work with ornamental devices. (See ILLUMINATION.) Some extant manuscripts, written in the early part of the Middle Ages, exhibit admirable specimens of the art, with letters of gold, vermilion, etc.

Callim'achus (in Gr. Καλλίμαχος): a Greek artist, whose exact epoch is unknown. Stories are told by Pliny, Pausanias, and other ancient writers, about his work, and he is especially celebrated as the supposed inventor of the Corinthian capital.

Callimachus: Greek poet and grammarian; native of Cyrene; lived 310–235 B. C.; was chief librarian of the Alexandrian Library under Ptolemy Philadelphus and Ptolemy Euergetes. He was a prolific writer of poetry and prose, an eminent teacher, author of the saying, μέγα βιβλίον μέγα κακόν, A big book, a big bore. He cultivated the epigram and the love elegy. Quintilian calls him *elegiæ principem*, and he was diligently translated and copied by the Roman poets, notably by Catullus in the *Coma Berenices* and Ovid in the *Ibis*. Extant are only six hymns and sixty-four epigrams. The epigrams are clever, sparkling, airy; the hymns are stiff with archaic words and learned allusions, and the meter is heavy. The hymns have been edited by Meineke (1861), Wilamowitz (1882). See Couat, *La Poésie Alexandrine*, pp. 111 foll., 191 foll. B. L. GILDERSLEEVE.

Calli'nus (in Gr. Καλλῖνος) **of Ephesus**: earliest of Greek elegiae poets; lived about 700 B. C. His one elegy extant is martial, and anticipates Tyrtæus. See Bergk, *Poetæ Lyrici Græci*.

Calli'ope (in Gr. Καλλιόπη): one of the Nine Muses; presided over epic poetry; was said to be the mother of Orpheus and Linus. She was represented as holding a tablet or closely rolled parchment in her hand.

Callippic Period. a correction of the Metonic cycle proposed by Callippus. The Metonic cycle was a period of nineteen solar years, at the end of which the new moons return again on the same days of the year. The period contained exactly 6,940 days. Now, 6,940 days exceed 235 lunations by only seven hours and a half. At the end of four cycles, or seventy-six years, the accumulated excess of seven hours and a half amounts to one day and six hours. Callippus proposed to quadruple the period of Meton, and to deduct a day at the end of it. It began 331 B. C.

Callip'pus, or **Calippus** (in Gr. Κάλλιππος or Κάλιππος). an ancient Greek astronomer; b. at Cyzicus; lived about 330 B. C. at Athens. He associated with Aristotle. He invented the cycle adopted by astronomers called the CALLIPPIC PERIOD (*q. v.*).

Calliseu, GEORGE: See CALIXTUS, GEORGE.

Callis'thenes (in Gr. Καλλισθένης): historian; b. at Olynthus, in Thrace; about 365 B. C.; was a relative and pupil of Aristotle. He accompanied Alexander the Great in his expedition against Persia in 334 B. C., and gained the favor of that prince, but afterward offended him by his boldness of speech, and was put to death on a charge of treason in 328 B. C. He left a history of Alexander's expedition against Persia, of which only fragments remain.

Callisthen'ics, or **Calisthenics** [modern formation, as if from Gr. *καλλισθενικά; κάλλος, beauty + σθένος, strength]: a system of exercises designed to promote beauty and strength; in other words, to impart grace of movement and physical strength at the same time. These exercises are better adapted to girls than ordinary gymnastics, as they do not subject the muscles to so violent a tension. The apparatus used in these exercises consists of a light wooden staff about 4 feet long, a pair of light dumb-bells, parallel bars, two square weights, and a short roller fixed in sockets near the top of an open doorway. See GYMNASTICS.

Callis'tratus (in Gr. Καλλίστρατος): an eloquent Athenian orator who lived about 380–360 B. C., and whose success is said to have excited the emulation of Demosthenes and induced him to cultivate the art of oratory.

Callis'tratus, Scolion of (see SCOLION): famous song in honor of the tyrannicides Harmodius and Aristogiton (*q. v.*), recorded in *Athenæus* XV. 695 A. It begins: ἐν μύρτου κλαδὶ τὸ ξίφος φορήσω, In a myrtle bough I will wear my falchion.

Cal'litris: a genus of trees of the family *Coniferæ*. *Callitris quadrivalvis*, a large tree of Barbary, called arar, yields a very hard, almost indestructible, fragrant wood, and the aromatic gum-resin called sandarach. The timber is highly prized, and is used for floors of mosques.

Callot, kăăl'lō', JACQUES: engraver; b. in Nancy, France, in 1592, of a noble family, who greatly opposed his pursuit of art as a profession. He studied at Rome, and attained great excellence, chiefly as an etcher and designer; was patronized by Richelieu and Louis XIII., for whom he executed battle-pieces. Among his works is notable the series of etchings *Les Misères de la Guerre*. His drawings are highly esteemed, and were executed with great care. D. in Nancy, Mar. 24, 1635.

Calluna: See HEATH.

Callus: the inflammatory exudation by which fractures of bones are repaired. Very soon after the formation of a fracture a varying amount of gelatinous material is exuded from the ends of the bone and unites the fragments at the point of fracture. In the case of long bones the cavity within is filled with callus, and there is a more or less abundant deposit exteriorly. If irritation occur from friction of the fractured surfaces the amount of callus may be considerably increased, and large tumor-like swellings may result at the seat of fracture. The complete healing of the fracture occurs by the conversion of the callus into true bone, and to this process the common expression "knitting" is applied. The name callus is also given to hardened portions of cuticle resulting from friction or pressure.

Calmar: See KALMAR.

Cal'met (Fr. pron. kăăl'may'), AUGUSTINE: a learned Benedictine commentator on Scripture; b. in Mesnil-la-Horgne, near Commerey, in Lorraine, Feb. 26, 1672. He became a Benedictine monk 1689; in 1728 Abbot of Senones, where he resided for many years. He published, in French, besides other works, a *Commentary on the Bible* (23 vols., Paris, 1707–16); a *Historical and Critical Dictionary of the Bible* (2 vols. folio, 1722; supplement 1728), which was translated into several languages (Eng. trans. London, 1732, 3 vols.; 6th ed. 1837, 5 vols.; latest abridged and revised edition 1856), a valuable book, long serviceable, but now superseded; and *Ecclesiastical and Civil History of Lorraine* (Nancy, 1728, 4 vols.; 2d ed. 1745–47, 6 vols.). See his autobiography in the last volume of his *History*, and the *Life* by A. Fangé (Senones, 1762). D. in Senones, Oct. 25, 1757.

Calms: *Equatorial Calms.*—A belt of calms, variable winds, sudden squalls, and tornadoes, and almost daily thunder-showers, situated about and somewhat N. of the equator, 4° to 6° of latitude in breadth, and separating the two bodies of N. E. and S. E. trade-winds. This is the region where the heated air at the equator ascends to return from the height of the atmosphere toward the poles.

Calms of the Tropics of Cancer and Capricorn.—Two belts of calms and light winds, almost rainless, situated in the neighborhood of, but outside, the tropics. They are found at the polar limit of the trade-winds, which they separate from the region of variable winds of the temperate zones. Each belt occupies but a few degrees in latitude, but the position and limits of both are less defined than those of the equatorial belt. The region of the calms of Cancer, in the

Atlantic, is called by mariners the *horse latitudes*. It is said that in colonial times the numerous vessels freighted with horses from New England for the West Indies were often long detained in these dreaded calms, under the burning rays of the sun of these latitudes, causing a great mortality among their living freight. Hence the name. See WINDS.

Revised by M. W. HARRINGTON.

Cal'mucks, or **Kalmucks** (called by the Tartars *Khalimick*, renegades): the largest of the Mongolian peoples; inhabiting large regions of the Chinese and Russian dominions. There are four tribes: the Choshots, ruled by descendants of Gengis Khan; the Sungars, in the seventeenth and eighteenth centuries the masters of the other races; oppressed by the Chinese, they migrated in great numbers in 1758 to Russia, but, finding the new yoke still more grievous, returned in 1770 to Sungaria; the Derbets, who dwell in the valleys of the Don and Ili; the Torgots, formerly united with the Sungars. The former in 1616 removed to the plains of the Volga, but a large part sought their native regions again. The Calmucks are a nomadic race. Their wealth consists in herds of horses, camels, sheep, and cattle. In Russia there are at present about 85,000, the greater part of whom are found in Astrakhan, and are Lamaists in religion. The European Calmucks are mostly Buddhists, but some are Mohammedans and some are Christians.

Calochor'tus: See MARIPOSA LILY.

Calogeri: See CALOYERS.

Calomar'de, FRANCISCO TADEO, Count: a Spanish minister of state; b. at Villel, Aragon, in 1775. He studied law; joined the Absolutist party; became in 1823 Minister of Grace and Justice. He persecuted the Liberals; favored the Jesuits; abused his power with cruelty. In 1833 he was disgraced and exiled in consequence of his abortive intrigues to raise Don Carlos to the throne. D. in Toulouse, France, 1842.

Calomel: the *Hydrargyri chloridum mite*, the mild chloride of mercury, of the U. S. Pharmacopœia: sometimes called the subchloride of mercury or mild mercurous chloride. It consists of a white, impalpable powder, which is without taste or odor, and which is permanent on exposure to the air. It is insoluble in alcohol, ether, or water, and in dilute acids which are cold. By strong heating it is entirely volatilized without melting, and when heated with dried sodium carbonate in a dry test-tube it yields metallic mercury. It is used in medicine chiefly for the purpose of stimulating the liver, especially in respect to its secretion of bile; also in the treatment of syphilis, by internal medication, by sublimation, or by hypodermic injection. In the condition called "biliousness," it affords one of the best means of producing relief. The dose varies greatly according to the object to be attained. Ordinarily, 1 grain, divided into powders of $\frac{1}{10}$th or $\frac{1}{6}$th of a grain, particularly if added to a little bicarbonate of sodium, is sufficient for ordinary individuals; but in the South, where, owing to the high range of temperature, there is apt to be greater torpidity of the liver, doses ranging even as high as 30 or 40 grains are frequently administered. Persistent administration of calomel will speedily result in excessive salivation, with tenderness of the mouth and gums. H. A. HARE.

Calophyl'lum [from Gr. *καλός*, fair + *φύλλον*, leaf]: a genus of evergreen large-leaved trees of the family *Guttiferæ*. They are natives of warm climates, where some of the species are of economic importance for their resin (tacamahac), heavy durable timber, and edible fruits. Two species, *C. calaba* and *C. inophyllum*, are grown in conservatories.

Calopo'gon [Gr. *καλός*, fair + *πώγων*, beard, in allusion to the bearded lip]: a genus of very pretty orchids, containing four or five species, confined to North America. *C. pulchellus* grows in bogs in the Northern U. S., and has large pink-purple flowers. C. E. B.

Caloric Engine: See HOT-AIR ENGINE.

Calorie, or **Calory**: the amount of heat necessary to raise 1 kilog. of water from 0° C to 1° C. For measurements of small quantities of heat, the *gramme-calorie*, or lesser calorie, is used. This is $\frac{1}{1000}$th part of the above, being the heat which will raise 1 gramme of water from 0° C to 1° C. See CALORIMETER, ENERGY, and HEAT.

Calorim'eter [from Lat. *calor*, heat + Gr. *μέτρον*, measure]: an instrument for the measurement of heat. To measurements involving differences of temperature merely, the term thermometry is applied. Calorimetry has to do with the quantity of heat developed when energy is expended, or with the quantity of heat which disappears when work is done. The following are the best-known types of calorimeters:

(1) Ice calorimeters (the ice-block calorimeter of Black, Bunsen's ice calorimeter, etc.). In these the heat of fusion of ice affords the means of measurement.

(2) Water calorimeters, in which the change of temperature of a known mass of water measures the heat developed or expended in the operation under investigation.

(3) Steam calorimeters, in which the heat of vaporization of water or of some other liquid furnishes the determination in question.

Instruments for the measurement of the heat generated in an electric circuit are called electro-calorimeters. See ENERGY and HEAT. E. L. NICHOLS.

Calorimetry: measurement of heat. See CALORIMETER.

Calorimo'tor [Lat. *calor*, heat + *motor*, mover]: a form of voltaic cell invented by Dr. Hare (1822). It is a zinc-copper element with very large plates compactly rolled together, as in the secondary batteries of Planté. On account of the small internal resistance marked heating effects could be produced in short wires; whence the name.

Calottistes (*Le Régiment de la Calotte*): an association of wits and satirists under the reign of Louis XIV. They were so called from their custom of sending to a public character who had made himself ridiculous a "patent," authorizing him to wear the *calotte*, a small cap, to protect the weak part of his head. The society was dissolved under the ministry of Cardinal Fleury.

Caloy'ers, or **Caloge'ri** [viâ Fr. from Ital. *caloiers* < Eccles. Gr. *καλόγηρος*, of fair old age; *καλός*, fair + *γῆρας*, old age]: a name applied to the monks of the Greek Church. They mostly follow the rule of St. Basil, but those at Mt. Sinai and Mt. Lebanon follow the rule of St. Anthony; from the caloyers the bishops and patriarchs are chosen. Among their numerous monasteries those of Mt. Sinai in Asia and Mt. Athos in Europe are the most celebrated.

Calpi, or **Culpee**: a town of India. See KALPI.

Calpur'nia: fourth wife of Julius Cæsar; married to him in 59 B. C. She was a daughter of L. Calpurnius Piso, who was consul in 58 B. C. She urged her husband not to leave home on the day of his assassination, the ides of March, 44 B. C.

Calpur'nius: a Latin poet, surnamed SICULUS, who, about the beginning of Nero's reign (54–68), wrote seven eclogues in imitation of Theocritus and Vergil, which are extant, and have some merit. The events of his life are unknown. See *Calpurnii et Nemesiani Bucolica*, rec. H. Schenkl (Leipzig, 1885); also edition with commentary by C. Keene (London, 1887); and translation by E. Scott (London, 1890).

Caltagirone, kăăl-tăă-jĕĕ-rō'nā (anc. *Calata Hieronis ?*): a city of Sicily; province of Catania; on the slope of a hill about 32 miles S. W. of Catania (see map of Italy, ref. 10–F). It is the see of a bishop, and has a college, a hospital, and several convents; also manufactures of cotton fabrics and pottery. The inhabitants are esteemed the best workmen in Sicily in the useful arts. Pop. about 34,000.

Caltaniset'ta: a province in the central part of Sicily; bounded N. by Palermo, E. by Catania and Siracusa, S. by the Mediterranean, and W. by Girgenti. Area, 1,455 sq. miles. Pop. (1881) 266,006; (1890) 304,444.

Caltanisetta: a fortified town of Sicily; capital of province of same name (see map of Italy, ref. 10–F). Here are mineral springs and extensive sulphur-works. This place is supposed to be the site of the ancient *Nissæ*. Pop. 32,000.

Caltha: the genus to which the marigold belongs. *Caltha palustris* is the systematic name of the marsh marigold, often called in U. S. "cowslip"; a plant of the family *Ranunculaceæ*, which grows in swamps and wet meadows in Asia, Europe, the U. S., and even in Alaska. It is boiled and eaten in the spring as a potherb, the poisonous properties which it is said to possess being destroyed by cooking.

Caltrop: a low herb of the genus *Tribulus*, growing in the south of Europe; its burs are armed with strong spines, which inflict wounds upon the feet of men and beasts if trodden upon.

Cal'umet [Norm. Fr. form of Fr. *chalumet*, parallel of *chalumeau*, pipe < Lat. *calamel'lus*, dimin. of *ca'lamus*,

reed]: the pipe of peace used by the North American Indians in the ratification of treaties. It is a tobacco-pipe, having a long stem made of hollow reed and ornamented with feathers. Some tribes of the aborigines appear to think that a treaty is not valid or complete until both parties have smoked the calumet together. See INDIANS OF NORTH AMERICA.

Calumet: township of Houghton co., Mich. (for location of county, see map of Michigan, ref. 1–E). It is traversed by the Mineral Range R. R.; about 15 miles northerly from Houghton; on Keewenaw peninsula; near one of the richest copper-lodes in Michigan. It contains the two villages of Laurium (pop. in 1900 5,643) and Red Jacket (pop. in 1900 4,668). Business is mining. Pop. of township (1880) 8,299; (1890) 12,529; (1900) 25,991.

Calusa Indians: See TIMUQUANAN INDIANS.

Calvados, kăăl'va'-dōs': a maritime department of France; formed of part of the old province of Normandy; bounded N. by the English Channel, E. by Eure, S. by Orne, and W. by Manche. Area, 2,132 sq. miles. The southern part is hilly, but extensive plains occur in other portions. The soil is fertile. The chief rivers are the Orne, Dromme, and Vire. Among the mineral productions are iron, coal, marble, and slate. Many horses, cattle, and sheep are raised here; the fisheries on the coast are extensive. Principal port, Honfleur; capital, Caen. Pop. (1881) 439,830; (1896) 417,176.

Cal'vart (Fr. pron. kăăl'vaar'), **Calvaert**, or **Calvert**, DENIS: known also as Dionisio Fiamingo; b. in Antwerp in 1555; went to Italy in his youth; studied with Fontana and Sabbatini, and established a school of painting at Bologna, which afterward became very celebrated. His best paintings are *St. Michael* and *Purgatory*. Guido, Domenichino, and Albani were among his pupils. D. in Bologna in 1619.

Calvary: a carved representation of the crucifixion of our Lord Jesus Christ between the two malefactors, or an artificial rock or hill on which three crosses are erected to bring to mind the hill of Calvary.

Calvary, Mt.: the scene of Christ's crucifixion. The word occurs but once in our authorized version of the New Testament (Luke xxiii. 33), the term in the Greek being Κρανίον, which means skull; the Hebrew word *Golgotha* has the same meaning. Monkish traditions place it in the Church of the Holy Sepulchre within the city. The identification of the spot is a matter of great difficulty. Of six hypotheses, the one now most favored is that which puts the crucifixion on the hill outside of the present Damascus Gate, on the north side of Jerusalem. The Greek name very well describes the hill. Recent explorations likewise help the hypothesis.

Cal'verley, CHARLES STUART: poet and humorist; b. at Martley, Worcestershire, England, Dec. 23, 1831. He was educated at Balliol College, Oxford, and Christ College, Cambridge, of which he became a fellow. His name was properly Blayds, which he changed to Calverley on leaving Oxford. He published several volumes of verse-translations, humorous poetry, and very clever *vers de société*, including *Verses and Translations* (1862), *Fly-leaves* (1871), and a metrical translation of *Theocritus* (1869). D. in Folkestone, Feb. 17, 1884. HENRY A. BEERS.

Cal'vert: on railroad; a city; former capital of Robertson co., Tex. (for location of county, see map of Texas, ref. 4–I); 130 miles N. N. W. of Houston; has first-class system of water-works, excellent public schools, etc. Pop. (1880) 2,280; (1890) 2,632; (1900) 3,322. EDITOR OF "COURIER."

Calvert, GEORGE and CECIL: See BALTIMORE, LORD.

Calvert, GEORGE HENRY: journalist; b. in Baltimore, Md., Jan. 2, 1803; a descendant of Lord Baltimore and of the painter Rubens. He graduated at Harvard in 1823; studied at Göttingen; became a journalist in Baltimore, and settled at Newport, R. I., in 1843. Besides many dramas, translations, and poems, he published *Scenes and Thoughts in Europe* (1846–52); *An Introduction to Social Science* (1856); *Life of Rubens* (1876); and *Biographic Æsthetic Studies* of Shakspeare, Goethe, Wordsworth, Coleridge, etc. D. in Newport, R. I., May 24, 1889.

Calvert, Sir HENRY: a descendant of the Calverts of Hertfordshire, England; served in North America under Clinton, Howe, and Cornwallis; was taken prisoner at Yorktown, Va., in 1781. He also served in the Netherlands in 1794 as aide-de-camp to the Duke of York; was made adjutant-general in 1799; aided in organizing the military colleges at High Wycombe and Marlow; became major-general in 1803, baronet in 1818, and a general about 1821. B. 1763 (christened March, 1763). D. at Claydon Hall, Middle Claydon, Buckinghamshire, Sept. 3, 1826.

Calvert, LEONARD: b. about 1606; d. June 9, 1647; brother of Cecil, second Lord Baltimore; first Governor of Maryland; led an expedition of mixed religionists in two vessels from Cowes (Nov. 22, 1633) to an island in the Potomac river (Mar. 25, 1634); founded St. Mary's City, of which little remains; had obstinate contests with Claiborne, who held possession of Kent island in Chesapeake Bay, and confiscated his property; attempted to found a landed aristocracy, but was defeated by the operation of the democratic features of the charter; went to England in 1643 for instructions; returned the next year to find Claiborne with new adherents in possession; was forced into refuge in Virginia; regained his province in 1647, but survived only a few months.

Calvi, kaal'vĕĕ: a seaport and fortified town of Corsica; on a peninsula of its northwest coast; 38 miles W. S. W. of Bastia (see map of France, ref. 2–J). It has a good harbor and a strong citadel. Calvi was besieged and taken by the English in 1794, but was retaken by the Corsicans in the following year. Pop. (1896) 2,132.

Calvi (anc. *Cales*): a decayed town of Italy; 7½ miles N. N. W. of Capua; a bishop's see (see map of Italy, ref. 6–F). It was formerly important, and was celebrated for its baths. Pop. 2,000.

Cal'vin [from the Latinized form *Calvinus* of the original French *Cauvin*, or *Chauvin*], JOHN: b. at Noyon, 67 miles N. N. E. of Paris, July 10, 1509. His grandfather was a wine-cask cooper in the neighboring village of Pont l'Évêque. His father, Gerard Cauvin, was apostolic notary, fiscal attorney of the county, proctor of the cathedral, and secretary of the Bishop of Noyon. His mother, Jeanne Le Franc, of Cambray, was noted for her personal beauty, as also for great religious fervor and strictness. John was the second of her four sons and six children. She died while John was quite young. His father destined him to the priesthood. He was kindly permitted to share in the lessons given by an able tutor to the sons of the noble family of De Mommor. When twelve years of age, his father's income being small, provision was made for him by securing a part of the revenue of the Chapel de la Gesine, in the cathedral at Noyon. He then (May 15, 1521) received the tonsure, but was never ordained. In 1523 he went with the young De Mommors to Paris, entering first the College of La Marche, where he studied Latin with Mathurin Cordier, and, shortly after, the College of Montaigu, where a Spaniard trained him in dialectics, and where, some years later, Ignatius Loyola also studied. He was an ardent and precocious scholar, bright, sharp, sedate, severe. His companions called him the *Accusative Case*, on account of his censoriousness. In 1527 he got the curacy of Marteville, which was exchanged in 1529 for Pont l'Évêque, where he sometimes preached. Near the close of 1527 he went to the University of Orleans, and the year after to the University of Bourges, to study law. At Orleans he heard the eminent jurist Pierre de l'Étoile, and was intimate with his relative Olivetan, whose French Bible appeared in 1535. At Bourges he was a favorite pupil of Andreas Alciati, then the most distinguished law professor in Europe, and came in contact with Melchior Wolman, a learned German Lutheran, who both taught him Greek and opened to him the Gospel. He so distinguished himself that he was often called upon to lecture in the place of his masters. In the summer of 1531, his father having died May 26, he returned to Paris, and in 1532 published there, with a commentary, the *De Clementia* of Seneca, aiming as yet at nothing higher than a reputation like that of Erasmus. In Nov., 1533, a speech prepared by him for his friend Nicholas Cop, rector of the university, upon the necessity of the reformation of the Church upon the basis of the New Testament, drove him out of Paris. Befriended by Margaret of Navarre, sister of Francis I., he lived for nearly a year in Angoulême, and there began the preparation of his *Institutes*. He returned to Paris toward the close of 1534, but only to flee again, and finally to leave the country, going to Strassburg in 1534 (Dec.), to Basel in 1535. Meanwhile what he calls his "sudden conversion" occurred in 1533. In 1534 he resigned his two benefices, and published in Paris his first theological work, *Psychopannychia*. His greatest work, the *Institutes* (1536), was at first only a catechism. He revised it for the last time in 1559. In Geneva he arrived

in the latter part of July, 1536, intending merely to stop over night, but Farel laid hold of him, and solemnly adjured him to remain as pastor of the feeble evangelical church there lately gathered, and he consented. Perceiving the imperative need of a strong moral government, he proceeded to give one, but the discipline he set up was too stern to be endured. He was banished Apr. 22, 1538; went first to Bern, then to Zurich, and then to Basel. In Sept., 1538, he settled as pastor in Strassburg, and there in 1540 he married the widow Idelette de Bure, with whom he lived happily nine years. In 1541 he returned in triumph to Geneva, being recalled by the united voice of the secular and religious authorities, with the general assent of the people. He arrived Sept. 13, went at once at work, and never ceased his beneficent activity. He ruled the city with an iron hand, and by his writings exerted a dominant influence upon the Reformed Church in all lands. His reform met with vigorous opposition from the so-called Patriots and Libertines, and for ten years he kept up the fight. He conquered at last. He opposed heresy as well, and his opponents, as Bolsec, Curio, Ochino, and above all Servetus, felt his resistless power. He was great as a preacher, unrivaled as a clear and profound thinker. He corresponded with the Protestant leaders in all lands. With Melanchthon he enjoyed peculiarly friendly relations. The French language owes him a debt like that which the German language owes Luther. Civil liberty the world over is likewise his debtor. He is the father of Presbyterianism, and the greatest of all Protestant commentators and theologians. There is but one blot upon his memory. The burning of Servetus for heresy (Oct. 27, 1553), though sanctioned even by Melanchthon, was a shocking tragedy. Calvin died in Geneva, May 27, 1564. The standard edition of Calvin's works is that of Amsterdam (1671, 9 vols. fol.). The exhaustive edition by G. Baum, E. Cunitz, and E. Reuss (Brunswick, 1863, *sqq.*, vol. xlviii., 1892) is not yet complete. There is an English translation nearly complete (Edinburgh, 1843–53, 52 vols.). Most accessible are his *Institutes* and *Correspondence*, 4 vols. (both pub. Presbyterian Bd., Phila.). The best biographies are by T. Beza, in Latin and French (Geneva, 1564); Paul Henry, in German (Hamburg, 1835–44, 3 vols.; partially translated, London and New York, 1881, 2 vols.); Henry abridged his book (Hamburg, 1846); T. H. Dyer, in English (London, 1850); E. Stähelin, in German (Elberfeld, 1863, 2 vols.); cf. especially Schaff, *Hist. Chr. Ch.*, vol. vii. (Reformation in Switzerland, pp. 223–844). The Roman Catholic scholar F. W. Kampschulte left unfinished at his death an excellent study of Calvin's Genevan activity (Leipzig, 1869). See the article Calvinism.

Revised and enlarged by S. M. Jackson.

Cal'vinism: Calvinism (like Pelagianism and Lutheranism) is a term used to designate, not the opinions of an individual, but a mode of religious thought or a system of religious doctrines, of which the person whose name it bears was an eminent expounder. It is synonymous therefore with what is technically called "the Reformed Theology." There have from the beginning coexisted in the Christian Church three specially well-marked and generically distinct systems of doctrine, or modes of conceiving and adjusting the facts and principles understood to be revealed in the Scriptures, under one or the other of which nearly every form of theological thought may be subsumed. One of these is the Pelagian, which denies the native guilt, pollution, and moral impotence of man, and makes him independent of the supernatural assistance of God. At the other pole is the Calvinistic system, which emphasizes the guilt and impotence of man, exalts God, and refers salvation absolutely to the infinite love and undeserved favor of God working in harmony with his justice, sovereignly selecting its objects, and saving them by the almighty power of grace. Between these comes the manifold and elastic system of compromise known in one of its earlier forms as Semi-Pelagianism, and in a more modern type as Arminianism, which admits man's original pollution but denies his native guilt, regards redemption as a compensation for innate and consequently irresponsible disabilities, and refers the moral restoration of the individual to the co-operation of the human with the Divine energy, the determining factor being the human will. The system to which this article is devoted was known historically, in its opposition to Pelagianism and Semi-Pelagianism, and is now designated more generally and indefinitely, by the title *Augustinianism*, from its earliest champion, the illustrious Augustine, Bishop of Hippo Regius in Northern Africa (395–430 A. D.); while the more modern and specific title is *Calvinism*, from the fact that it was developed into a perfect form, and infused into the creeds of the Reformed Churches, and into the life of modern nations, through the instrumentality of John Calvin, the Reformer, of Geneva (1509–1564). The authentic statement of its constituent doctrines is not to be drawn exclusively from the writings of either of the great men mentioned, but from the public confessions of those Churches which have professed this form of doctrine, and from the classical writings of their representative theologians.

The Reformed Confessions are very numerous—more than thirty in number—but they substantially agree in the system of doctrine which they teach. Those which have been most widely accepted as of symbolical authority are the Second Helvetic Confession, prepared by Bullinger, 1564, and adopted by all the Reformed Churches of Switzerland (with the exception of Basel) as well as by the Reformed Churches of Poland, Hungary, Scotland, and France; the Heidelberg or Palatinate Catechism, prepared by Ursinus and Olevianus, 1562, indorsed by the Synod of Dort, and accepted as a doctrinal standard by the Reformed Churches of Germany and Holland, as well as by their representatives in America; the Thirty-nine Articles of the Church of England; the Canons of the Synod of Dort, 1618–19, an Œcumenical Synod of the Reformed Churches; and the Westminster Confession, with its accompanying Larger and Shorter Catechisms, prepared by the famous Westminster Assembly, 1644–47, and accepted as a doctrinal standard by the Presbyterian Churches and by British Calvinists in general. The Canons of Dort are not so much a complete confession as a supplement to the previous confessions of the Reformed Churches, which was necessitated by the rise of the Arminian controversy. The Westminster Confession is the only Reformed creed of wide acceptance which was framed after this controversy; it was prepared with the intention of exhibiting the harmony of the Reformed Churches, and with œcumenical purpose and breadth; and it presents "the fullest and ripest symbolical statement of the Calvinistic system of doctrine" (Schaff, *Creeds of Christendom*, i., 788).

John Calvin remains the most representative theologian of Calvinism. Perhaps a list of representative theologians after him would include especially Bullinger, Aretius, Ursinus, Zanchius, Polanus, of the first age, with such others as Amesius, Voetius, Witsius, Heidegger, Turretin, and among English writers John Owen, John Howe, and Jonathan Edwards for the next age. Modern Presbyterian Calvinism "is best represented by the theological systems of Charles Hodge, W. G. T. Shedd, and Henry B. Smith" (Schaff, *History of the Christian Church*, vol. vii., p. 544). The *vade mecum* of the Reformed pastors was in early days Bucanus's *Institutiones*; this was supplanted later by Amesius's *Medulla*; and it in turn by Marck's *Compendium*; perhaps no handbook is more used to-day than A. A. Hodge's *Outlines*. Attempts more or less successful have been made to present the Calvinistic system from the writings of its representative theologians by, among others, Heinrich Heppe (*Die Dogmatic der evangelisch-reformirten Kirche dargestellt und aus den Quellen belegt*, Elberfeld, 1861); Alexander Schweizer (*Die Glaubenslehre der evangelisch-reformirten Kirche dargestellt und aus den Quellen belegt*, Zurich, 1844–47); and J. H. Scholten (*Leer der Hervormde Kerk, in hare grondbeginselen uit de bronnen voorgesteld en beoordeeld*, 1848–50).

It is proposed in this article to present, in necessarily meager outline, a statement (I) of the fundamental characteristics of the system; (II) of the history of its development and prevalence both before and after Calvin; and (III) of its practical moral influence upon individuals and upon communities.

I. *Statement of Principles.*—There is a very important distinction between the central, formative, or root principle of a system and its distinguishing features, which is not attended to when it is said, as it is sometimes said, that the "principle" of Calvinism is "the metaphysical principle of predestination." Predestination is rather a logical consequence of, and an essential element in, than the determining principle of, Calvinism. This is rather the glory of the Lord God Almighty. The formative idea of Calvinism is the conception of God; and it is its determination that God shall be and remain God in all its thought—to embrace God in the wholeness of His nature, and to do full justice to God in all His relations—which itself determines all those doctrines which have from time to time been mistaken for its "prin-

ciple." On the practical side this is equivalent to saying that it is the effort of Calvinism to do full justice to the essence of religion. "Since all religion springs from the relation in which God the Creator has placed us, His creatures, to himself, it follows that the greatest religious height will be reached by him who at every point of his horizon views God as God, by honoring Him in all things," as the Almighty Being who has created all things for His own sake, who is bound by nothing out of himself, and who determines for every creature both its being and the law thereof, both now and for eternity. And "as religion on earth finds its highest expression in the act of prayer," "Calvinism in the Christian Church is simply that tendency which makes a man assume the same attitude toward God in his profession and life which he always exhibits in his prayer. . . . Whoever truly prays ascribes nothing to his own will or power except the sin that condemns him before God, and knows of nothing that could endure the judgment of God except it be wrought within him by the Divine love. But while all other tendencies in the Church preserve this attitude so long as their prayer lasts, to lose themselves in radically different conceptions as soon as the amen has been pronounced, the Calvinist adheres to the truth of his prayer in his confession, in his theology, in his life, and the amen that has closed his petition re-echoes in the depths of his consciousness and throughout the whole of his existence." A. Kuyper, *The Presbyterian and Reformed Review*, ii., 378–382.

Those teachings which distinguish the Calvinistic from other systems of theology are simply the outgrowth of this fundamental attitude of mind. The Synod of Dort defined the distinguishing doctrines of Calvinism as over against Arminianism in five propositions, which have therefore since been called "the five points of Calvinism," though they are rather the Calvinistic response to "the five points of Arminianism" than an independent statement of the differentiating elements of Calvinism. These five points affirmed absolute predestination, particular redemption, total depravity, irresistible grace, and the perseverance of the saints. If a single distinguishing principle is to be discriminated among these, it will not be found in "predestination," but rather in "irresistible grace." Predestination is acknowledged by both parties, and is indeed a necessary postulate of natural religion; the difference between the parties here lies in the conception of the *ground* of the predestinating decree. The distinguishing mark of Calvinism as over against all other systems lies in its doctrines of "efficacious grace," which, it teaches, is the undeserved, and therefore gratuitous, and therefore sovereign, mercy of God, by which He efficaciously brings whom He will into salvation. Calvinism is specifically the theology of grace; and all are properly Calvinists who confess the absolute sovereignty of God in the distribution of His saving mercy. Two modifications of typical Calvinism have been attempted within the limits of the system, and have had considerable temporary and local influence. One of these, called Salmurianism from its place of origin (the theological school of Saumur, in France), sought to reconcile the sovereignty of grace with the doctrine of a universal atonement, which had been taught previously only by Pelagians and Arminians; this involved a modification of the doctrine of "particular redemption," and with it of the nature, purpose, and effect of the atonement, but left the doctrine of "irresistible grace" unaffected. The other modification sought to reconcile the sovereignty of grace with the Pelagian theory of the will and of man's power to the contrary; in its highest form (as taught by Bellarmine and certain Jesuit theologians) it has received the name of "the doctrine of congruity," and teaches that God adapts the amount and time of the persuasive influences of His Spirit to the foreseen state of mind of those whom He elects to salvation, and thus secures their free acceptance of His offers of mercy. This modification affects directly the doctrine of "irresistible grace," but remains Calvinistic so long as it makes God's selection of the recipients of the saving mercy entirely sovereign, and His application of grace to them certainly efficacious. Typical Calvinism, which remains the faith of the great body of those who hold this type of doctrine, teaches that "efficacious grace" is the creative efficiency of the Holy Spirit operating beneath consciousness, not by moral suasion but "physically," the soul remaining passive therein until it has been quickened and renewed by the Holy Spirit and thereby enabled to act in the powers of its new life.

The following is an exposition of the chief features of Calvinism as a system of doctrine.

A. *The Relation of the Creator to the Creation.*—There are three generically distinct views as to the relation of the Creator to the creation, each, of course, embracing many specific varieties under it. 1. The Deistical view, which admits a creation *ex nihilo*, and an original endowment of the elements with their active powers, and the subjection of the whole system of things to certain general laws, adapted to the evolution of certain fixed plans. The general plan and order of the creation is attributed to the Creator, and all events are referred to Him in a general sense as the indefinitely remote First Cause, who inaugurated the ever-onflowing line of second causes. This view, however, denies the continued immanence of the Creator in the creation, and the immediate dependence of the creature on the Creator for the continuance of its substance, the possession of its properties, and the exercise of its powers. 2. The opposite extreme is the Pantheistic mode of thought, which identifies God and the universe as His existence-form, or at least so confines Him to it as to deny His transcendence beyond the universe as an extra-mundane Spirit and conscious Person whose actions are rationally determined volitions. 3. Between these extremes stands Christian Theism. It emphasizes at once the transcendence of God beyond, and the immanence of God within, the world. He remains ever a conscious personal Spirit, without and above the world, able, in the exercise of His free volitions, sovereignly to exercise a supernatural influence (*potestas libera*) upon any part of that system of nature which He has established, ordinarily working through second causes, "yet free to work without, above, and against them at His pleasure." At the same time He continues to interpenetrate the inmost being of every element of every creature with the infinite energies of His free intelligent will, and His creatures momentarily continue absolutely dependent upon the energy of that will for substance and for the possession of the powers communicated to them as second causes in all their exercises.

All Christians, of course, are Theists in the sense thus defined; but the different schools of Christian theology take their points of departure here, as, on the one hand, they press the essential dependence of the creature upon the Creator in substance, properties, and actions, or as, on the other hand, they press the self-active power of second causes, and by consequence their self-sufficiency and independence. Here we have the ultimate antithetical grounds of Pelagianism and Augustinianism. Pelagius, who was characterized by a rationalistic habit of thought and a superficial religious experience, believing that power to the contrary is an inalienable attribute of every act of free will, necessary to render it responsible and therefore moral, maintained, in the supposed interests of morals, that every free agent is so adequately endowed by God as to be inalienably self-sufficient for action, each in a manner appropriate to his kind. Augustine, on the contrary, held that every creature exists and acts only as its substance is momentarily sustained, and its action conditioned, by the omnipresent and omnipotent energy of God. While affirming the free self-determining power of the human soul, he referred the moral character of the volition to the disposition which prompted it, and the persistence of the moral nature of man to the immanent influences of the Spirit of God. Even anterior to apostasy, therefore, the spirit of man depended for spiritual life and moral integrity upon the *concursus* of the Spirit of God, and the withdrawal of this would be the immediate cause of spiritual death and moral impotence. This Divine influence, in one degree and in one mode or another, is common to all creatures and all their actions. This view of Augustine was subsequently elaborated by his disciples into the theory of the "previous," "simultaneous," and "determining" *concursus* of the Thomists and Reformed theologians. See the *Summa* of Thomas Aquinas, 2. 1. 10., and Turretin, 6. 6. 6. and 7.

B. *The End or Design of God in Creation.*—Every intelligent Theist must regard the universe as one system, and must therefore believe that the Creator had from the beginning one general end, for the accomplishment of which the whole and all its parts were intended. This general end must have determined the Creator in every step he has taken in the evolution of the universe, and hence our conception of it will give shape to any speculations we may form with respect to the relations of God and His works. It is evident that no solution of this transcendent question can be reached by reasoning from *a priori* principles, or by generalizations drawn from the comparatively few facts at present accessible to our observation, and that it can be rationally sought

for only in a direct revelation. For the most part, this general end has been referred to the essential benevolence of God, prompting Him to confer the greatest possible amount of blessedness, in the highest forms of exeellence, upon innumerable objects of His love. Leibnitz, in his *Théodicée* (1710), which has exerted a wide influence on all modern speculation, lowered this view by emphasizing the "happiness" of the creatures as the great end of the creative goodness. The Scriptures, on the contrary, emphatically declare that the manifestation of His own glorious perfections is the actual and most worthy possible end of the great Designer, in all His works of creation, providence, and redemption; and hence likewise the final end of all His intelligent creatures in all moral action. The recognition of this great principle, and its application to the interpretation of all God's dealings with man, and of all man's duties to God, has always been an essential characteristic of Calvinism. Pelagians and Semi-Pelagians, with more or less decision, place the general end of the system of things in the well-being of the creature: Calvinists place it absolutely in the glory of the Creator, which carries with it, not as a *co-ordinate* design, but as a *subordinate* yet certain effect, the blessedness of all loyal creatures.

C. *The Relation which the Eternal Plan of God sustains to the Actual Evolution of Events in Time.*—Every Theist believes that the eternal and absolutely perfect intelligence of the Creator must have formed from the beginning a plan comprehending the entire system of creation and providence in reference to the great end for which they were designed. Pelagius himself admitted that the absolute foreknowledge of God embraced the future volitions of free agents, as well as all other classes of events, while he denied their foreordination. The Socinians, who have developed Pelagianism into a complete system, more consistently deny foreknowledge, as well as foreordination, since, if it is essential that a volition should be purely contingent in order that it should be responsible, it must be indeterminate before the event, and while indeterminate it can not be certainly foreknown. The Arminians (though not without exceptions, such as Adam Clarke and the late Dr. McCabe) admit foreknowledge, but deny foreordination. The Calvinists argue that, in an intelligent being, prevision implies provision; and that the admission of God's infinite foreknowledge therefore necessarily involves the admission of His eternal foreordination.

In this matter they maintain the following positions: 1. In the case of an infinitely wise, powerful, and free Creator of all things *ex nihilo*, it is obvious that the certain foreknowledge of all events from the absolute beginning virtually involves the predetermination of each event, without exception; for all the causes and consequences, direct and contingent, which are foreseen before creation are, of course, determined by creation. As Sir William Hamilton asserts (*Discussions*, Appendix 1, A), "the two great articles of foreknowledge and predestination are both embarrassed by the selfsame difficulties." 2. Since all events constitute a single system, the Creator must embrace the system as a whole, and every infinitesimal element of it, in one all-comprehensive intention. Ends more or less general must be determined as ends, and means and conditions in all their several relations to the ends which are made dependent upon them. Hence, while every event remains dependent upon its causes and contingent upon its conditions, none of God's purposes can possibly be contingent, because in turn every cause and condition is determined in that purpose, as well as the ends which are suspended upon them. All the decrees of God are hence called absolute, because they are ultimately determined always by "the counsel of His own will," and never by anything exterior to Him which has not in turn been previously determined by Him. 3. This determination, however, instead of interfering with, maintains the true causality of the creature, and the free self-determination of men and angels. The eternal and immutable plan of God has constituted man a free agent, and consequently can never interfere with the exercise of that freedom of which it is itself the foundation. However, according to the principles above stated, this created free will is not independent, but ever continues to have its ground in the conserving energies of the omnipresent Creator. Since the holiness of the created moral agent is conditioned upon the indwelling of Divine grace, and its turning from grace is the cause of sin, it follows that all the good in the volitions of free agents is to be referred to God as its positive source, but all the evil (which *originates* in defect, privation) is to be referred simply to His permission. In this view, all events, without exception, are embraced in God's eternal purpose; even the primal apostasies of Satan and of Adam, as well as all those consequences which have flowed from them. It is in view of these principles that Calvinism has been so often confounded with fatalism. It is, however, the antipodes of fatalism, preserving the real efficiency of second causes while subjecting their action to intelligent control. It teaches that the all-penetrating and all-energizing will of the personal Jehovah, who is at once perfect Love and perfect Light, constitutes and conserves our free agency, and through its free spontaneity works continually the ever-blessed counsel of His own will, weaving even rebellious volitions into the instrumentalities of His purpose, and making every consenting soul a conscious coworker with himself.

As to the bearing of this prineiple upon the question of the design of God in the application of redemption (predestination), see below.

D. *The Manner in which the Divine Attributes of Benevolence, Justice, and Grace are illustrated in the Scheme of Redemption.*—Arminians have generally held, with Leibnitz, that "justice is benevolence acting according to wisdom"—i. e. inflicting a lesser pain in order to effect a greater or more general happiness. The necessity for punishment therefore lies not in the essential and inexorable demands of righteousness, but in its being the best means to secure the moral reformation of the sinner, and the best motive to restrain the community from disobedience. Grotius maintained that the moral law is a product of the Divine will, and therefore capable of being relaxed by that will. In the gospel scheme, therefore, God, in the exercise of His sovereign prerogative, relaxes His law by forgiving sinners upon repentance and reformation, while as an administrative precaution He makes an exhibition of severe suffering in the person of His Son, in order that all other subjects of His moral government may be deterred from making the impunity of repentant men an encouragement to disobedience. The atonement, therefore, was an exhibition solely of the Divine benevolence, but not of justice in the ordinary sense of that word.

Calvinists, on the eontrary, hold that justice in the strict sense, as well as benevolence, is an essential and ultimate property of the Divine nature, and hence lies back of, and determines the character of, all the Divine volitions. By the perfection of God's nature He is always both benevolent and just in all His actions. The atonement accordingly was an act of infinite love, seeking and finding a way to be both just and yet the justifier of the sinner; it provides a Divine substitute for the sinner, who undertakes for him and bears his penalties, and works out a perfect righteousness in his stead, with regard to which God may accept the person of the sinner as (judicially) righteous in His sight. While Arminians in their view of the gospel emphasize benevolence, Calvinists in their view emphasize justice and grace.

E. *The Degree of Guilt and Moral Damage entailed through the Apostasy of Adam upon his Posterity.*—The answers respectively given to this question impose form and character upon all the various systems of theology.

1. Pelagius held that free will (*liberum arbitrium*), in the sense of an absolutely unconditioned power of choice between good and evil, is essential to responsible moral agency, and henee inalienable from human nature. Since, then, all men continue after the apostasy to be responsible moral agents, their nature in this essential respect must remain in the same condition in whieh it was created. The moral agency of a man at any one moment can not determine the character of his moral agency at any other moment, and he possesses throughout his entire existence ability to will and to do all that God has any right to require of him. Henee Pelagians deny—(1) All original sin or corruption of nature, because sinfulness can be predicated only of free acts, and man in order to be responsible must always possess plenary ability to will aright. (2) All original guilt or desert of punishment common to the raee, and prior to the actual transgression of the individual, since it would be a violation of justice to hold one moral agent responsible for the wrong volitions of another. (3) Hence men need redemption through Christ only to deliver them from the guilt of actual and personal transgression, and only those need it who have thus sinned. Those dying in infancy are therefore worthy of neither reward nor punishment, and can be benefited by Christ only by being raised to a higher plane of blessedness than that belonging to nature—to the *regnum cœlorum* as distinguished from the *vita æterna*.

2. Augustinians and Calvinists, on the contrary, maintain —(1) That the entire soul, with all its constitutional faculties and acquired habits, is the organ of volition, the agent willing. (2) That this soul possesses the inalienable property of self-determination, the moral character of which determination always depends upon the moral condition of the soul acting. (3) That the holy moral condition of the soul, and hence its spontaneous disposition to will that which is right, depends upon the indwelling of the Divine Spirit. The free agency of God is an absolute self-existent and self-sufficient perfection, self-determined to good and incapable of evil. The freedom of saints and angels confirmed in holiness is dependent upon Divine assistance, but, like that of God himself, it is the very opposite to the "liberty of indifference" or "power to the contrary," being a *non posse peccare*, a *felix necessitas boni*. Adam was created in fellowship with God, and hence with a holy tendency of heart, with full power not to sin (*posse non peccare*), but also, during a limited period of probation, with power to sin (*posse peccare*). He did sin. As a punishment the Holy Spirit was withdrawn from the race, and he and his descendants lost the *posse non peccare*, and retained only the *posse peccare*, which thus became the fatal *non posse non peccare*.

This *theological* doctrine of total moral inability has nothing whatever to do with the *psychological* theory of "philosophical necessity" as an attribute of voluntary action, which, since the time of President Edwards, has been too frequently regarded essential to the defense of Calvinism. It has been conclusively shown by Principal Cunningham (*Theology of the Reformers*, Essay IX.) that this metaphysical doctrine is not essential to Calvinism; while Sir William Hamilton (*Discussions*, Appendix 1, A) and Sir James Mackintosh (*Dissertations on the Progress of Ethical Philosophy*, Note O) propose to prove that it is absolutely inconsistent with Calvinism as historically taught. The phrases "bondage of the will," etc., so frequently used by all classes of Augustinian theologians, and above all by Luther in his treatise *De Servo Arbitrio*, are intended to apply only to the corrupt spontaneous tendency of fallen man to evil, which can be reversed only by a new creating energy from above. At the same time, every Calvinist holds devoutly to the free self-determination of the soul in every moral action, and is at liberty to give whatever psychological explanation of that fact may seem to him most reasonable. See *Confession of Faith*, ch. ix., and Calvin's *De Servitute et Liberatione Humani Arbitrii*.

Hence Calvinists hold—First: as to original guilt. (1) Human sin, having originated in the free apostatizing act of Adam, deserves God's wrath and curse, and immutable justice demands their infliction. (2) Such, moreover, was the relation subsisting between Adam and his descendants that God righteously regards and treats each one, as he comes into being, as worthy of the punishment of that sin, and consequently withdraws His life-giving fellowship from him. Some refer this responsibility of Adam's descendants for his apostatizing act to a purely sovereign "divine constitution" (New England view); others hold that we all were in our generic essence guilty coagents with him in that act (Realistic view); while the common opinion is that God, as the guardian of our interests, gave to us all the most favorable probation possible for beings so constituted, in Adam as our covenant representative (Federal view). The whole race, therefore, and each individual it embraces, is under the just condemnation of God, and hence the gift of Christ, and the entire scheme of redemption, in its conception, execution, and application, are throughout and in every sense a product of sovereign grace. God was free to provide it for few or many, for all or none, just as He pleased. And in every case of its application the motives determining God can not be found in the object, but only in the good pleasure of the will of the Divine Agent.

Calvinists also hold—Secondly: as to original sin. (1) Since every man thus comes into the world in a condition of antenatal forfeiture because of Adam's apostasy, he is judicially excluded from the morally quickening energy of the Holy Ghost, and hence begins to think, feel, and act without a spontaneous bias to moral good. (2) But since moral obligation is positive, and the soul is essentially active, it instantly develops in action a spiritual blindness and deadness to divine things, and a positive inclination to evil. This involves the corruption of the whole nature, and absolute impotency of the will to good; is, humanly speaking, without remedy; and necessarily tends to the indefinite increase both of depravity and of guilt. It is therefore said to be total. Some Calvinists hold original guilt to be conditioned upon original depravity (e. g. the advocates of mediate imputation). Others, including the large majority, of all ages, hold original depravity to be the penal consequence of Adam's apostatizing act, and therefore to be conditioned upon original guilt (hence immediate imputation).

3. The advocates of the middle scheme have, of course, varied very much from the almost Pelagian extreme occupied by many of the Jesuits and of the Remonstrants, to the almost Augustinian position of the Lutherans and of the great Wesleyan Richard Watson. The Semi-Pelagians admitted that the nature of man was so far injured by the fall that he could do nothing in his own strength morally good in God's sight. But they held that man is able to incline himself unto good, though he is not able to effect it; so that in every case of spiritual reformation the *first* movement toward good may be from the soul itself, while the performance of it is the result of the co-operation of Divine grace with the human will. They consequently denied the *gratia præveniens*, but admitted the *gratia co-operans*. The modern Protestant Arminians (Limborch, Episcopius, etc.) admit original *sin*, while they deny original *guilt*, and regard innate corruption rather as a vice or fault of nature than as a sin in the full sense of that term. Dr. D. D. Whedon (*Bibliotheca Sacra*, Apr., 1862) admits—1. That Adam and Eve by the apostasy morally corrupted their own nature and that of all their descendants; 2. That every child of Adam is born with an inherent tendency to sin which he can not remove by his own power; 3. That Adam and Eve were fully responsible for their apostasy, because they sinned in spite of possessing power to the contrary, and therefore might justly have been damned; 4. Nevertheless, their descendants, although corrupt and prone to sin from birth, are neither responsible nor punishable until there has first been bestowed upon them redemptively a gracious ability to the right; 5. After Adam sinned, therefore, only one alternative was open to Divine justice—either that Adam should be punished at once without issue, or that he should be allowed to generate seed in his own moral likeness, when equity required that an adequate redemption should be provided for all; 6. Hence Christ died for all men, and sufficient grace (including *gratia præveniens* and *gratia co-operans*) is given to all men, which is essential to render them responsible, and they become guilty only when they abuse (by failing to co-operate with) that gracious power to the contrary (*posse non peccare*) which has been conferred on them in the gospel. Quoting the dictum of President Edwards (*Will*, pt. 4, § 1), "The essence of the virtue or vice of dispositions of the heart and actions of the will lies not in their cause, but in their nature," Whedon says: "To this we oppose the counter-maxim, that in order to responsibility for a given act or state, power in the agent for a contrary act or state is requisite. In other words, power underlies responsibility." The only limit he allows to this principle is in the case of that moral inability which results from the previous abuse of freedom by the agent himself. This he declares is the fundamental ground upon which all the issues between Arminianism and Calvinism depend. Thus while Calvinism exalts the redemption of Christ, in its execution and in each moment of its application, as an adorable act of transcendent grace to the ill-deserving, Arminianism, in its last analysis, makes it a compensation brought in by the equitable Governor of the world to balance the disabilities brought upon men, without their fault, by the apostasy of Adam. This difference is the practical reason that Calvinism has such a strong hold upon the religious experience of Christians, and that it finds such frequent irrepressible expression in the hymns and prayers of evangelical Arminians.

F. *The Nature and Necessity of that Divine Grace which is exercised in the Moral Recovery of Human Nature.*—Grace is free sovereign favor to the ill-deserving. It is the motive to redemption in the mind of God. It is exercised in the sacrifice of His Son, in the free justification of the believing sinner on the ground of that Son's vicarious obedience and sufferings, and in the total change wrought in that sinner's moral character and actions by the energy of the Holy Ghost. While the word *grace* applies equally to the objective change of relations and the subjective change of character, it is used in this connection to designate that energy of the Holy Ghost whereby the moral nature of the human soul is renewed, and the soul, thus renewed, is enabled to act in compliance with the will of God.

Pelagius found in his system neither need nor room for

this Divine energy, and confined the conception of grace to objective revelations and educational and providential influences.

Semi-Pelagians admitted its necessity to help man to complete that which he had himself power to commence, and held that it is actually given to all those who had thus prepared themselves for it and made themselves worthy of it.

Arminians admit that it is necessary in order that the corrupt will shall be even predisposed to good; but they regard it as a universal compensation for the irresponsible defects of an inherited nature, which restores the native power for either good or evil; and they make all further effects depend wholly upon the use made of it by the soul in which it acts. This is styled the theory of Co-operation as held by the Arminians, and of "Synergism" as held by the followers of Melanchthon in Germany. Regeneration is the result of the coworking of two energies, but the determining factor is the human will. Hence grace is *sufficiens* in every case, and *efficax ab eventu vel congruitate*.

Augustinians and Calvinists, on the other hand, hold—1. That, for Christ's sake, and in spite of all human demerit, a gracious influence is exerted on the minds of all men of various intensities. This is "common grace," and is a moral and suasory influence on the soul, tending to good, restraining evil passions, and adorning the soul with the natural virtues; it may be resisted, and is always prevailingly resisted by the unregenerate. 2. But at His pleasure, in certain cases, God exerts a new creative energy, which in a single act changes the moral character of the will of the subject, and implants a prevailing tendency to co-operate with future grace in all forms of holy obedience. This is *gratia efficax*, "effectual calling," which is always effectual because it consists in effecting a regenerative change in the moral nature of the will itself. The change which this grace effects is the "new heart" of Scripture, the *conversio habitualis seu passiva*, of which God is the agent and man the subject, which as a new habit of soul lays the foundation for all holy activities. Augustine has been generally followed in styling this grace "irresistible," because it can not be resisted. Yet this is as incongruous a designation as it would be to call the creation of the world or the generation of a child "irresistible." Effectual calling consists in a new creative energy within the soul, making it willing, upon which it spontaneously embraces Christ and turns to God (the *conversio actualis seu activa*). It merges itself into the very spontaneity of the will, and enfranchises it from the corruption which had hitherto held it in bondage, and restores it to its normal equilibrium, in harmony with reason and conscience and the indwelling Spirit of God. 3. Afterward the Divine Spirit continues to support the soul, and prepare it for, and to concur with it in, every good work. This grace is now prevailingly co-operated with by the regenerated soul, and at times resisted, until the status of grace is succeeded by the status of glory.

Calvinists hold that this "grace" in all its stages is purely undeserved favor, and therefore sovereignly exercised by God upon whom and at what time He pleases; hence it is called *gratia gratuita et gratis data*, otherwise grace would be no more grace. It also works in its various stages progressively, except in the single regenerative act. It is at first the *gratia prævenians*, then the *gratia operans*, then the *gratia co-operans*, and finally the *gratia perficiens*, including the *donum perseverantiæ*, infallibly securing perseverance in faith and obedience, unto the complete redemption of soul and body in glory.

G. *The Relation which the Eternal Plan of God bears to the Application of Redemption to Individuals.*—Since the eternal plan, decree, or purpose of God includes all things that come to pass, none of which comes to pass without His prevision and provision, it includes also the destinies of all creatures. Predestination, in its restricted sense, is the term employed to express the purpose of God in relation to the salvation of individual men. Arminians maintain that this purpose of God is with reference to each man conditioned upon God's foresight of his possession or lack of faith and repentance; but Calvinists insist that since faith and repentance are the gifts of God and the fruits of His Spirit, their presence or absence can not be the condition of predestination, but must be rather its predetermined and graciously effected result. The primary efficient cause of predestination is therefore God Himself; the discriminating cause lies in the hidden counsels of His own will. Predestination therefore is the eternal, inscrutable, and unchangeable decree of God concerning the salvation of individual men; it consists of two parts—eternal election on the one side and eternal preterition on the other. It thus includes both the selection of one portion of the race to be saved and the leaving the rest to perish in sin. This act of discrimination is necessarily absolutely sovereign, and can find its cause on neither side in aught in the creature moving God to elect or pass him by; *ex hypothesi*, all stand in like condition before God prior to this act of discrimination, and what is common to the whole can not be the ground of discrimination between the parts. But the subsequent treatment to which each section is subjected is not sovereign, but is conditioned on the one side on God's purpose of love to His elect, and on the other on the guilt of the sin in which the non-elect are left. The decree of election to eternal life is followed therefore by the foreordination of all the means thereto. And the purpose to pass by the rest and leave them in their sin is followed by the ordination of them to dishonor and wrath for their sin. A discrimination is thus drawn between the sovereign act of preterition and the judicial act of reprobation; or, as they are otherwise called, between the sovereign act of "negative reprobation" and the judicial act of "positive reprobation." So far all historical schools of Calvinism agree. Adherents of what is known as the school of Saumur are equally explicit and decided in these points with typical Calvinists. (See e. g. Amyraldus, *Defense of Calvin*, ch. xiii., *Declaration against the Errors of the Arminians*, 1646, p. 6; and in this country James Richards, *Lectures on Mental Philosophy and Theology*, 1846, pp. 332, *seq.*; Henry B. Smith, *System of Christian Theology*, 1886, p. 508.) Accordingly the Œcumenical Reformed Synod of Dort (1619) and the broadly Calvinistic Assembly of Westminster (1644–47) so define the doctrine.

In the further development of the subject, however, diverging schools of thought emerge within the limits of Calvinism. The great majority of Calvinists have always been what has come to be known as Infra- or Sublapsarians—that is, they hold that God's predestinating decree contemplates man as already fallen and resting under the curse of the broken law. God is conceived of as, moved by ineffable love for man, selecting out of the mass of guilty sinners a people in whom to show forth the glory of His grace, and then as providing redemption for them in order to carry out His loving purpose in election. The "order of decrees," as it is technically called, stands in this view thus: Creation, fall, election, redemption by Christ, application of redemption by the Holy Spirit. A few Calvinists, whose inconsiderable number is balanced by their considerable learning and logical power, have always contended that on logical grounds it would be better to place the decree of election in the order of thought before that of the fall; they are therefore called Supralapsarians, and give the "order of decrees" thus: Creation, election (or even election, creation), fall, redemption, application. This question did not come into discussion until the close of the sixteenth century, so that the position upon it of Calvinistic writers before that date is usually in dispute. There seems no good reason to doubt, however, that Augustine and Calvin were essentially Infralapsarian in their fundamental conceptions. On the other hand, the Supralapsarian scheme was adopted by men of such mark and influence as Beza, successor to Calvin in Geneva; Gomarus and Voetius, the great opponents to the Remonstrants in Holland; Twisse, the prolocutor of the Westminster Assembly. Œcumenical Calvinism ranged itself explicitly as Infralapsarian in the Canons of the Synod of Dort (1619), and with less explicitness but no less reality, in the Westminster Confession (1644–47). The difference between the two views is, however, almost entirely a logical one, and has little or no theological importance. (See Twisse, *The Riches of God's Love*, etc., p. 35; Cunningham, *The Reformers*, etc., pp. 359–362; Dabney, *Syllabus on Systematic Theology*, p. 233.) On the other hand, a departure from typical Calvinism was proposed by the school of Saumur in the first half of the seventeenth century, in the opposite direction. In the effort to conceive of the work of Christ as having equal reference to all men indiscriminately, they proposed to place the decree of election subsequent in the order of thought to that of redemption, making the "order of decrees" the following: Creation, fall, redemption by Christ, election, application of redemption by the Holy Spirit to the elect. This change is of greater theological importance, as it involves an entirely different view of the nature of the atonement from that taught by typical Calvinism. It has exercised far more influence than

Supralapsarianism; but has left the great majority of Calvinists unaffected, chiefly on account of its inability to coalesce with a truly substitutionary doctrine of the atonement.

In all its forms alike Calvinism makes God the sole arbiter of the destiny of His creatures. But in no form does it make Him the author of sin, or the condemner of man irrespective of his sin. In all forms alike man is made the author of his own sin, and sin is made the ground of his condemnation. God positively decrees grace, and thus produces all that is good. He only determines the permission of sin, and punishes it because He forbids and in every way morally discountenances it. He elects of free grace all those He purposes to save, and actually saves them, while those whom He does not elect are simply left under the operation of the law of exact justice, whatever that may be in their case. Archbishop Whately, himself an Arminian, in his essays on *Some of the Difficulties in the Writings of the Apostle Paul*, honorably admits that the apparent harshness of Calvinism lies in the *facts* of the case as admitted by all Christians. It is obvious that all who are born sin and die, that all do not believe, and that all are not saved. Calvinistic "particularism" embraces the actual results of salvation in their widest scope, and refers all to the gracious purpose and power of God, but does not restrict it one iota within the limits determined by the facts themselves.

II. *The History of Calvinism.*—The Christian doctrines of sin and grace were, like other doctrines, brought to clear definition only through controversy. The intellectual energies of the Church were at first absorbed in the realization and definition of the doctrines of God and of the Person of Christ; and it was only after four centuries of controversy had brought these doctrines to clear expression that the Church could turn its attention to the more subjective side of truth. In the meantime all the elements of the composite doctrine of man were everywhere confessed: the evil consequences of the fall and the necessity of Divine grace for salvation were as universally recognized as the freedom of the will and the complete responsibility of man for sin. But the prevalent Gnostic and Manichæan heresies, which represented sin as a necessity of nature, led necessarily to a very special emphasis being thrown upon human freedom and responsibility by the Church teachers of the time. In necessary antagonism to these fundamental heresies, the early Fathers, especially Origen and his colleagues and followers of the Alexandrian school, were led to insist in a very unqualified manner upon the independent, self-determining power of the human will, and to maintain that sin is the product of that freedom abused. They universally held that human nature was morally ruined by Adam's sin, and that it was redeemed by the blood and restored by the Spirit of Christ; but they conceived of these great principles in a crude and indefinite manner, without determining their relations to each other. But in the special attention to the defense of human self-determining power as the basis of responsibility, which all were in a manner forced to give, it was inevitable that sooner or later some one would arise who should so one-sidedly emphasize this element of the truth as consciously to deny its other hemisphere. As a general fact, the Greeks were especially distinguished for emphasizing the autocracy of the will, though without denying the need of grace. And the anthropology of the Greek Church has continued to preserve the same characteristics to the present day (Athanasius, *Expos. in Psalmos*, Ps. l. 7; *Orthodox Confession of Peter Mogilas*, 1642). On the other hand, there was, during the third century, a marked tendency in the Latin Church to more profound views as to the moral and spiritual nature and relations of man. This characteristic was developed most obviously in Tertullian of Carthage (220 A. D.), who taught the propagation (*ex traduce*) of a corrupt nature from Adam to each of his descendants; in Hilary of Poitiers (368); and in Ambrose of Milan (397), the most explicit defender in that age of the sovereignty of God and the moral impotence of man, and the immediate teacher of Augustine.

The inevitable heresiarch came at the opening of the fifth century in the person of Pelagius (Morgan), a British monk, a man of pure life, clear, practical intellect, and earnest zeal for the moral interests of human life. He was the moral author of the system which bears his name, while its intellectual constructor was Cœlestius, a youthful Roman advocate; and its most effective advocate was Julian, the deposed Bishop of Eclanum in Campania. The central and formative principle of Pelagianism was the inalienable plenary ability of man to do all that can righteously be demanded of him; from this principle it inferred that men are fully capable in their own powers to attain and maintain entire perfection of life, that they come into the world without entailment of moral weakness or sin from the past, and that they need and receive no divine aid in the sense of inward renewal and sustaining grace, to enable them to do their full duty. It was this denial of the necessity and reality of the inward operations of God's grace which most outraged Christian hearts, and Augustine lays the chief stress in the controversy on the reality of grace, and its necessity as arising out of original sin. In opposition to Pelagianism, the distinctive features of the theology of grace were developed out of the Scriptures and his own deep experience by this profound thinker, Augustine (354–430), a native of Tagaste, in Numidia, the son of a heathen father and of the sainted Monica, in turn a prodigal, unbeliever, Manichæan, Platonist, disciple of Ambrose, Christian of profound experience, preacher and teacher of transcendent genius, Bishop of Hippio Regius from 395 to 430, and the greatest theologian of all time. The result of the controversy was not doubtful. The opinions of Pelagius were universally condemned by the whole Church, Eastern and Western, at the councils held at Carthage 412 and 418 A. D., at the Council at Mileve, 416 A. D., by the popes Innocent and Zosimus, and by the Œcumenical Council held at Ephesus, 431 A. D. This rapid and universal condemnation of Pelagianism, after making all due allowance for extraneous influences, proves that, however indefinite the views of the ancient Greek Fathers may have been, nevertheless the system taught by Augustine was in all essentials the common and original faith of the Church. In the history of the entire Church to the present moment, Pelagianism has never been adopted into the public creed of any ecclesiastical body except that of the Socinians (*Racovian Catechism*, 1605), and it has prevailed practically only among Rationalists, whose Christianity was disintegrating into Deism.

But Pelagianism did not so die as to leave no "remainders" behind it. Already in Augustine's lifetime (as early as 428) we hear of a body of monastic leaders in Southern Gaul seeking a middle ground between Augustinianism and Pelagianism by admitting inherited sin and the necessity of grace, but denying that this grace is either inevitable or necessarily prevenient. John Cassian, a disciple of Chrysostom, abbot of the monastery at Marseilles, was the leader of this middle system of compromise, whose advocates were at first styled Massilians, but during the Middle Ages and at present in the Romish Church Semi-Pelagians. His most influential supporters and followers were Vincentius of Lerinum (434), Faustus, Bishop of Rhegium (475), Gennadius, and Arnobius; and his opinions prevailed in France for a long time, and were confirmed by the provincial synods of Arles (472) and of Lyons (475). Against this party Augustine wrote his great works *De Prædestinatione Sanctorum* and *De Dono Perseverantiæ*, and he was ably represented by Prosper and Hilarius, and the unknown author of the great work *De Vocatione Omnium Gentium*, ascribed to Pope Leo I. (461); by Avitus, Archbishop of Vienna (490–523); Cæsarius, Archbishop of Arles (502–542); and by Fulgentius of Ruspe (1533). Semi-Pelagianism was condemned by the decree of Pope Gelasius (496), and finally in the synods of Orange and Valence (529), which were confirmed by the edict of Pope Boniface (530); from which time a modified and softened form of Augustianism became the recognized orthodoxy of the Western Church. It was taught by Gregory the Great, and held by the Emperor Charlemagne, the two persons who exerted the greatest influence in the reconstruction of Europe at the commencement of the Middle Ages. It was held throughout those ages by all the greatest Church teachers and ornaments, as the Venerable Bede (673–735), Alcuin (804), and Claudius of Turin (839). The history of the persecution and condemnation of Gottschalk, under the influence of Rabanus Maurus and Hinckmar, with which Scotus Erigena was involved (about 850), show, however, how deeply the ever-increasing Semi-Pelagian leaven was affecting the whole Church. All the most illustrious teachers of the scholastic age, making allowance for the extravagance of many of their speculations, preserved, however, more or less of the tone of Augustinian thought, as, for example, Anselm, Archbishop of Canterbury (910); St. Bernard, Bishop of Clairvaux (1140); Peter Lombard, *Magister Sententiarum*; Hugo de St. Victor; and, above all, Thomas Aquinas, *Doctor Angelicus* (1247); and Thomas Bradwardine, Archbishop of Canterbury (1348).

Thomas Aquinas fairly represents the result of the driftage of the Augustinian orthodoxy toward Semi-Pelagianism: his system is almost exactly intermediate between these two great types—with the one he affirmed that man since the fall had lost all ability to anything spiritually good, and without grace he could do nothing acceptable to God or which secured salvation; while with the other he represented original sin as rather a languor and a disease, and affirmed the power of fallen man to co-operate with grace. The distinctive point of Semi-Pelagianism is the denial of prevenient grace; the distinctive point of Thomism is the denial of "irresistible" grace—i. e. of prevenient grace conceived of as a *creative* energy of God. The Dominicans as a class followed Aquinas, while the Franciscans followed their champion, Duns Scotus (1265), *Doctor Subtilis*, and in that age the ablest advocate of pure Semi-Pelagianism.

The controversies then revived have continued to agitate the Romish Church up to the present time. The Council of Trent (1546) attempted to satisfy both parties by indefinite decrees, and accordingly both Augustinians and Semi-Pelagians, Thomists and Scotists, have claimed that their respective views were sanctioned. The Jesuit society, whose doctrines and casuistry were ventilated in the *Provincial Letters* of Pascal, has always advocated Semi-Pelagianism. The illustrious thinkers of Port Royal, Paris, called Jansenists from Jansenius, Bishop of Ypres (Tillemont, Arnauld, Nicole, Pascal, Quesnel, etc.), were at the same time devout Catholics, and in the matters of grace and predestination earnest Augustinians. They were persecuted by the Jesuits, and finally outlawed by the bulls of Popes Innocent X. and Alexander VII. (1653 and 1656 A. D.), and of Clement XI. (1713). The present pope, Leo XIII., has thrown the weight of his influence for Thomism, which indeed is as nearly as may be the doctrine of the decrees of Trent. This may be held, therefore, to be the formal doctrine of the Church of Rome.

The great evangelical teachers and forerunners of the Reformers in the century immediately preceding the Reformation were prevailingly decided Augustinians (Neander's *Hist. Doc.*, vol. ii., p. 609). This is most conspicuously true of Wickliffe (1384), Jerome of Prague, John Huss (1415), John of Goch (1475), John of Wesalia, Jerome Savonarola, a Dominican (1498), John Wessel (1499), "the Light of the World," and his disciple, the great Grecian, John Reuchlin, in his turn the teacher of Melanchthon, and Staupitz, vicar-general of the Augustines and the spiritual teacher of Luther.

The Reformation was in all its leaders and in all its centers as much a reaction from the growing Semi-Pelagianism as from the tyranny of the Papal Church. Zwingle of Switzerland, Luther of Germany, Calvin of France, Cranmer of England, and Knox of Scotland, although each movement was self-originated and different from the others in many permanent characteristics, were alike strictly Augustinian in doctrinal position. So that the Reformation was before everything else a great Augustinian revival—the forerunner in this of nearly all the great revivals which have refreshed the Church since. Melanchthon, in the earliest editions of his *Loci Communes* (1521), took extreme ground as to the moral impotence of the human will and absolute predestination, which, however, he gradually and radically modified in subsequent editions, until he finally assumed synergistic ground. The personal followers of Melanchthon excited the strong opposition of the stricter Lutherans, and the struggle came to an explosion in the Weimar Confutation (1558). The result was that grandest monument of Lutheran symbolism, the *Formula Concordiæ* (1580). This symbol sought to find a middle ground on the matter of predestination by teaching absolute predestination unto life (election), but denying predestination unto death (preterition): thus making the single predestination, as distinguished from the *prædestinatio duplex* of Augustinianism, confessional orthodoxy in the Lutheran Church. (See C. Hodge, *Syst. Theol.*, ii., 721, *seq.*; Francis Pieper, *Lehre und Wehre*, 36. 3.) In this illogical position the theologians of the Lutheran Church could not remain, and therefore, since Gerhard († 1637), they have cast off all remainders of Augustinianism and teach that predestination is based on foresight. A reaction led by a great theologian, C. F. W. Walther († 1887), has in our own day led the large Lutheran "Synodical Conference of America" (commonly called the "Missourians") back to the position of the *Formula Concordiæ*. In most other respects, as to the guilt, pollution, and helplessness of the condition into which all children are born, as to justification, and the necessity and the efficacy of regenerating and sanctifying grace, the *Formula Concordiæ* and Lutheran orthodoxy are at one with Calvinism.

By far the greatest of the Reformers, viewed either as a theologian, an interpreter of Scripture, as a social organizer and founder of churches and republics, was John Calvin. His *Institutes* (1530), written when he was twenty-seven years old, the greatest work of systematic divinity the world has seen, has recast Augustinianism in its final Protestant form, and handed it over to the modern world stamped with its great author's name. His *Commentaries* are acknowledged by the most advanced modern scholars of every school to be the ablest exegetical work achieved in his generation. His *Tractatus* consist of various controversial treatises in defense of the truth, and his *Epistolæ* consist of his voluminous correspondence with princes, nobles, and commoners, statesmen and churchmen in every part of the Protestant world, concerning the important movements then revolutionizing Europe, both in Church and state. By him Calvinism and its correlates, Presbyterianism in the Church and republicanism in the state, were not invented, but advocated and disseminated with transcendent ability and success. His doctrines have been most consistently developed and illustrated in the writings of such men as Bullinger, Martin Bucer, Theodore Beza, Diodati, Heidegger, Turretin, Witsius, Vitringa, Markius, De Moor, Pictet, John Owen, and Jonathan Edwards; in the deliverances of the international Synod of Dort (1618–19), of the national Assembly of Westminster (1648), of the French synods of Charenton and Alez, and in such creeds and confessions of the Church as the following: The Creed of the Waldensian pastors at Angrogne (1532), the two Helvetic, the Gallic, Belgic, and Scotch Confessions, the Thirty-nine Articles of the Church of England, the Lambeth Articles (1595), the Articles of Religion of the Dublin Convocation (1615), the Heidelberg Catechism, the Savoy Confession of the English (1658), and the Boston Confession (1680) of the American Independents. Calvinism is professed by all those Protestants of Germany who embrace the Heidelberg Catechism, the national (Protestant) churches of France, Switzerland, Holland, England, and Scotland, together with most of the Free Churches which have grown up in these lands, and the Reformed Churches of Hungary and Bohemia, the Independents and Baptists of England and America, as well as the various branches of the Presbyterian Church in England, Ireland, and America.

From the time of Archbishop Laud (1644) a large proportion of the clergy and influential writers of the Episcopal Churches have been Arminian, and it has even been disputed whether the Church of England was originally Calvinistic or not. The fact that the founders and leading ministers of that Church were thorough Calvinists during the first hundred years of its history, and that its creed (the "Thirty-nine Articles") remains such to this day, is as certain and as conspicuous as any other fact in history. The seventeenth article, "On Predestination," corresponds in spirit, design, and expression with all the other Calvinistic creeds. Tyndal, Frith, Barnes, who suffered under Henry VIII.; Hooper, Latimer, Ridley, who suffered under Mary; Cranmer, the real author, and Jewel, who gave the finishing touch to the Thirty-nine Articles, were all Calvinists. "The same is proved by the whole history of the proceedings connected with the Lambeth Articles, the cases of Baro and Barret (1595), the Irish Articles (1615), and the Synod of Dort (1619)." (*Cunningham.*) The sources of information, and the arguments on both sides of this controversy, may be found in the *Works of the Parker Society*, Richmond's *Fathers of the English Church*, the *Zurich Letters*, the works of Heylin, Winchester, Daubeny, Tomline, and Lawrence on the Arminian side, and the works of Prynne, Hickman, Toplady, Overton, Goode, Principal Cunningham, and Alex. F. Mitchell on the Calvinistic side.

Over this vast area of time, and under all these various conditions of national and ecclesiastical life, Calvinism preserves its essential identity as a system of theological principles. It has, of course, undergone within these limits very various modifications as to details of structure and modes of statement. In Germany it has been rendered less thorough and definite through the influence of the compromising school of Melanchthon, and more lately under the modern tendencies brought in by Schleiermacher. In Holland, England, and Scotland it has been modified in form by the "Federal Scheme" introduced by the West-

minster divines (1650) and the Dutch school of Cocceins. In France it was temporarily modified by the *Universalismus Hypotheticus*, or the universal impetration and limited application of redemption (1642), as held by Amyraldus, Daillé, and Placens on the Continent, and by Baxter, Davenant, and in modern times by Wardlaw and others, in England. In America it has been coerced through more radical and more transient transformations in the speculations of Hopkins, the younger Edwards, Emmons, N. W. Taylor, and others of the New England school. But its vitality is ever exhibited by its power to take upon it various forms, and to live through periods of depression, and to enter the hearts of men as a power and new life after long epochs of religious death. It was the inherent power of Calvinism which revived religious life in Switzerland in the early part of this century, in the humble teaching of Haldane and the powerful preaching of Malan, Gaussen, Merle d'Aubigny, and other colaborers. And our own days have seen a new exhibition of its power to awake to new life in Holland, through the steady testimony of the Christian Reformed Church and the great leadership of Dr. Kuyper. The history of Calvinism exhibits it not merely as a system with great inherent vitality, but as the system of truth in which abides the springs of religious life.

III. *The Practical Effects of Calvinism on Personal Moral Character, and upon the Social and Political Interests of Men.*—From the time of Cœlestius and Julian, in the fifth century, to that of Heylin (1659) and Tomline (1811), the *a priori* objection has been brought against Calvinism that its principles should lead either to licentious liberty or to abject subserviency, to discouragement in the use of means, and to undue disparagement and neglect of human reason. It is argued that the doctrine of the absolute moral impotence of man's will should destroy all sense of accountability, and that the doctrine of absolute decrees should cause the use of means to appear either unnecessary or ineffectual, and lead to despair upon the one hand or to licentiousness upon the other.

But the moral character of Calvinism is abundantly vindicated in two ways: 1. On the ground of reason. The recognition of the true (i. e. actual) condition of man's nature and relations to God, as this is revealed in Scripture and experience, must be more moral in its effect than the most skillful misrepresentation possible of that actual condition can be. The historian Froude, himself held by no trammels of sect or party, says in his well-known address at St. Andrews (1871): "If Arminianism most commends itself to our feelings, Calvinism is nearer to the facts, however harsh or forbidding those facts may seem." Archbishop Whately, himself an Arminian (in his essay on *Some of the Difficulties in the Writings of St. Paul*), acknowledges that the ordinary objections against the moral attributes of Calvinism are in effect objections to the open *facts* of the case. That standard of morals which places the ground of obligation in the supreme will of the All-perfect, instead of in a tendency to promote happiness, and which utterly condemns fallen man, is obviously higher, and therefore more moral, than a more self-pleasing one which either justifies or excuses him. The system which teaches the total depravity and guiltiness of human nature from birth, its absolute dependence upon Divine grace, together with the universal sweep of God's absolute decrees, at once maintaining the free agency of man and the infallibility of the Divine purpose, must of course empty man of self, make all men equal before the law, and exalt the all-wise and all-powerful Father to the control of all events; such a system must make the highest attainments the condition and the fruit of God's favor, and must raise even the weakest believer to the position of an invincible champion for God and the right, "a coworker together with God." 2. In the second place, Calvinists claim that on the ground of an illustrious and unparalleled historical record they can show that their system has been eminently distinguished by the effects produced by it upon all the communities which have embraced it in its purer forms, as to the following particulars: (*a*) the general standard of moral character practically realized in personal and social life; (*b*) the amount of rationally regulated liberty realized both in Church and state; (*c*) the standard of popular intelligence and education actually attained; (*d*) the testimony yielded to the power of the truth by the number and illustrious character of its martyrs; and (*e*) the zeal and devotion expressed in sustained missionary efforts for the extension of the kingdom of Christ.

1. As to the influence of Calvinism on the moral character of individuals, it is only necessary here to quote Mr. Froude's citation of the names of "William the Silent, Luther, Calvin, Knox, Andrew Melville, the regent Murray, Coligny, Cromwell, Milton, John Bunyan—men possessed of all the qualities which give nobility and grandeur to human nature." As to its effect upon the general moral character of communities, it will be sufficient to cite the Waldenses; the little radiant state of Geneva, whose Protestant reconstruction began with the establishment of a Court of Morals; the Huguenots as compared with their Catholic fellow-citizens; the Jansenists as compared with the Jesuits; the Dutch Protestants of their heroic period; the Scotch Covenanters; the English Puritans, whose very name signalizes their eminent moral character, in contrast with the corruption brought in at the Restoration (see Macaulay's *Essays on Milton* and Hallam's *Constitutional History*); and finally, all those sections of America settled by English Puritan New Englanders, by the Scotch and Scotch-Irish, and by Presbyterians from France and Holland. Mr. Froude (*Address*, p. 7) says: "The first symptom of its operation, wherever it established itself, was to obliterate the distinction between sins and crimes, and to make the moral law the rule for states as well as persons." Pascal, the sublime avenger of the persecuted religionists of Port Royal, shows in the first nine of his *Provincial Letters* the connection between the infamous morality of the Jesuits and their Semi-Pelagian views as to sin and grace. Sir James Mackintosh, in vol. xxxvi. of the *Edinburgh Review*, vindicates at length the morality of the theological doctrine of predestination by a general review of the history of its most conspicuous professors.

2. It appears superfluous to prove the tendency of Calvinism to promote freedom and popular government, both in Church and state. Its principles strip the ministry of all sacerdotal powers; they make all men and all Christians equal before God; they make God absolute and supreme over all, and the immediate controller and disposer of human affairs. Hence all Churches accepting Calvinism, unless prevented by external conditions, have immediately adopted popular constitutions, either Presbyterian or Independent. This is true of all the Churches of Switzerland, France, Holland, the Palatinate, Scotland, America, and the Free Churches of England and Ireland. The apparent exception is the English Establishment. The history of its political relations explains its prelatical character. Cranmer and the other Calvinistic founders of that Church held, as did Archbishop Usher, a very moderate theory of the episcopate, and submitted to the constitution actually established only for state reasons. Afterward, as Calvinism became more thoroughly incorporated in the public faith, Presbyterianism was established by the Long Parliament, and Independency by the Puritan army and Protector. It is a conspicuous fact of English history that high views as to the prerogatives of the ministry have always antagonized Calvinistic doctrine.

The political influence of Calvinism was at an early period discerned by kings as well as by the people. The Waldenses were the freemen of the ante-Reformation period. The republic was established at the same time with Presbytery at Geneva. The Hollanders, grouped around the sublime figure of William the Silent (*Calvus et Calvinista*), performed deeds of heroism against odds of tyranny unparalleled in all foregoing and subsequent history. This battle was fought by Calvinistic Holland, and the victory won (1590) completely, before the Arminian controversies had commenced. Add to these the French Huguenots, the Scotch Covenanters, the English Puritans in the Old and in the New World, and we make good our claim that Calvinists have been successful champions of regulated freedom among men.

Bancroft, the historian of the U. S., attributes the modern impulse to republican liberty to the little republic of Geneva and to its Calvinistic theology (vol. i., 266; ii., 461–464). He credits the molding of the institutions of North America chiefly to New England Independents, and to Dutch, French, and Scotch-Irish Presbyterians. "The Mecklenburg Declaration, signed on May 20, 1775, more than a year before that of July 4, 1776, signed in Philadelphia, was the first voice publicly raised for American independence. And the convention by which it was adopted and signed consisted of twenty-seven delegates, nine of whom, including the president and secretary, were ruling elders, and one, Rev. H. J. Balch, was a Presbyterian minister." Tucker, in his *Life of Jefferson*, says: "Every one must be persuaded that one of these papers must have been borrowed from the other"; and

Bancroft has made it certain that the Declaration of Jefferson was written a year after that of Mecklenburg. The correspondence between the representative system and the gradations of sessions, presbyteries, provincial synods, and national general assemblies, developed in the Presbyterian system, to the federal system of State and national governments in the Constitution of the U. S., seems too remarkable to have been accidental.

3. The relation of Calvinism to education is no less conspicuous and illustrious. The little republic of Geneva became the sun of the European world. The Calvinists of France, in spite of all their embarrassments, immediately founded and sustained three illustrious theological schools at Montauban, Saumur, and Sedan. The Huguenots so far surpassed their fellow-countrymen in intelligence and skill that their banishment, on the occasion of the Revocation of the Edict of Nantes (1685) quickened the manufactures and trades of Germany, England, and America, and for a time almost paralyzed the skilled industries of France. (See Weiss's *History of French Protestant Refugees*.) The fragment of marshy seacoast constituting Holland became the commercial focus of the world, one of the most powerful communities in the society of nations, and the mother of flourishing colonies in both hemispheres. The peasantry of Scotland has been raised far above that of any other European nation by the universal education afforded by her parish schools. The common-school system of Puritan New England is opening up a new era of human history. In this country, for the first two hundred years of its history, "almost every college and seminary of learning, and almost every academy and common school even, which existed, had been built up and sustained by Calvinists." See *New Englander*, Oct., 1845.

4. The martyrology of Calvinism is pre-eminent in the history even of the Church. We call to witness John Huss and Jerome of Prague, who perished for their adherence to this faith one hundred years before Luther. The Waldenses, of whom were the "slaughtered saints whose bones lie scattered on the Alpine mountains cold," the victims of the reign of "Bloody Mary," John Rogers, and Bishops Hooper, Ferrar, Ridley, Latimer, and Cranmer, and their fellow-martyrs, were all Calvinists; as well as Hamilton and Wishart, the victims of Claverhouse and the "Killing Time" of 1684 in Scotland, and the victims of the High Commission and of the "Bloody Assizes" of England (1685). Under Charles V. and Philip of Spain, Holland had been made a spectacle to all nations by her sufferings, and had surpassed all other Christian communities with the number and steadfastness of her martyrs. When the Duke of Alva left the Netherlands, Dec., 1573, he boasted that within five years he had delivered 18,600 heretics to the executioner. (Motley's *Rise of the Dutch Republic*, vol. ii., p. 497.) Moreover, Calvinists claim the victims of the Inquisition in Spain and Italy; the history of the Huguenots of France, from the martyrdom of Leclerc (1523) to the promulgation of the Edict of Nantes, 1598; the victims of the unparalleled atrocity of the massacre of St. Bartholomew, Aug. 22, 1572, when some 20,000 princes, noblemen, and commoners perished at one time by the hand of assassins; and all the hundreds of thousands of the very flower of France who fell victims either to the wars which raged with comparatively short exceptions from the Reformation to 1685, or to the dragoonings, the galleys, and the expatriation which preceded and followed that dreadful time.

5. Calvinism has been proved an eminent incentive to all missionary enterprises, domestic and foreign. It is of course acknowledged that several Christian bodies not characterized by what are generally regarded as the peculiarities of Calvinism have been in the highest degree distinguished by missionary zeal and efficiency. The most remarkable instances of this kind have been the Nestorians in Western and Central Asia from the fifth to the ninth century, the Moravians from 1732, and the Wesleyan Methodists from about 1769 to the present time. In the early Church, St. Patrick, the missionary of Ireland, fifth century; Augustine, the missionary of Gregory the Great to England; and Columba and his missionary college at Iona in the Hebrides, and his disciples the Culdees, in the sixth century, as well as the Lollards, the followers of Wickliffe, in the fourteenth century, were all of the general school of Augustine. In 1555, through Admiral Coligny, Calvin sent two ministers to the heathen in Brazil. Cromwell in the next century proposed to appoint a council to promote the Protestant religion, in opposition to the congregation *De Propaganda Fide* in Rome. One of the principal objects of the promoters of the Plymouth and Massachusetts colonies was the conversion of savages and the extension of the Church. The charter of the Society for the Propagation of the Gospel in Foreign Parts was granted by the Calvinistic prince, William III. It is to the Calvinistic Baptists that the impulse to modern Protestant missions is to be traced, and the Calvinistic Churches are to-day behind none in their zeal for a success in missionary work.

IV. Literature.—1. H. A. Niemeyer, *Collectio Confessionum in Ecclesiis Reformatis Publicatarum* (Lipsiae, 1840); Philip Schaff, *Creeds of Christendom* (3 vols., New York, 1877): George Benedict Winer, *Comparative View of the Doctrines and Confessions of the Various Communities of Christendom*, translated and edited by W. B. Pope (Edinburgh, 1873); A. A. Hodge, *A Commentary on the Westminster Confession of Faith* (Philadelphia, 1869); John Macpherson, *The Westminster Confession of Faith* (Edinburgh, 1881); A. A. Revised by B. B. Warfield.

Calvinis'tic Methodists: a body of Methodists in Great Britain which originated in a difference between Whitefield and Wesley respecting Calvinistic doctrines, and is in three divisions: (1) "Lady Huntingdon's Connection," dat-

ing from 1748; (2) "Whitefield's Connection," dating from 1741; (3) "Welsh Methodists," from about 1750. See the articles on those denominations.

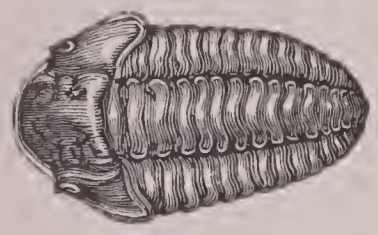
Cal'vus, Gaius Licinius Macer: a Roman orator and poet; b. in 82, d. in 47 B. C. In oratory he was an Atticist; in poetry he followed the Alexandrians, being a kindred spirit with Catullus. Only short fragments are extant. He was of diminutive stature, and feeble in body.

Calycan'thus [Gr. κάλυξ, husk, pod, bud (used here, however, in sense of cup; cf. s. v. *calyx*) + ἄνθος, flower; the bottom of the flower being cup-shaped]: a genus of plants of the family *Calycanthaceæ*; allied to *Ranunculaceæ*. It comprises only a few known species, which are natives of the U. S. and Japan, and are shrubs with square stems. The flowers, bark, and leaves are fragrant and aromatic. The *Calycanthus floridus*, a native of Carolina, called Carolina allspice and sweet-scented shrub, is cultivated in many gardens of the U. S. Its flowers are of a lurid purple or rich-brown color.

Cal'ydon (in Gr. Καλυδών): an ancient and celebrated city of Ætolia; on the river Evenus, a few miles from its entrance into the sea. It is often mentioned by Homer, and continued to be an important city in the historical period.

Calydo'nian Hunt, The: in classic mythology, was a celebrated enterprise against a wild boar which ravaged the dominions of Œneus, King of Calydon. Among the heroes who took part in this hunt were Meleager, Theseus, Jason, Nestor, and the heroine Atalanta, who drew the first blood.

Calym'ene: a genus of trilobites. A species of this genus, *Calymene blumenbachii*, described by Brongniart, is one of the most characteristic fossils of the upper Silurian formations in Europe. Its beauty and abundance led to its receiving a common name, "Dudley locust," suggested by its resemblance to the wingless body of a locust. A closely allied species (*C. senaria*) is found in the Niagara group of America. H. S. Williams.



Calymene blumenbachii.

Calyp'so (in Gr. Καλυψώ): a beautiful nymph and demi-goddess of classic mythology; according to Homer, a daughter of Atlas. She reigned over the island of Ogygia, on which Ulysses landed after he had been shipwrecked. She treated him kindly, and tempted him to marry her with the promise of immortality, which he declined for the sake of Penelope. But she detained him by her arts seven years, bore him two sons, and died of grief at his going away.

Calyp'so borea'lis: a rare and beautiful plant of the family *Orchidaceæ*; growing in cold bogs and wet woods of the Northern U. S. and Canada. The flower is variegated with purple, pink, and yellow. It has a single, nearly heart-shaped leaf.

Calyp'tra [Gr. καλύπτρα, veil, deriv. of καλύπτειν, cover]: the hood which covers the urnlike spore-case of certain mosses. It is the old archegone wall, enlarged, dried, and more or less ruptured.

Calyptræ'a [Gr. καλύπτρα, envelope, cover]: a genus of gasteropod molluscs comprising the forms commonly known as the bonnet-limpets. They resemble the true limpets (*Patellidæ*) in their habits and in the flattened wide-mouthed shells, but there are important structural differences, and hence the bonnet-limpets are placed in a separate group, the *Monotocardia*. (See Gasteropoda.) The shell is a flattened cone with a slight spiral, while on the inside is a small fold. About 12 living species and 30 fossil forms are known. Allied to the bonnet-limpets are the slipper-limpets (*Crepidula*), in which the shell is decidedly slipper-shaped. J. S. K.

Ca'lyx, plu. **Cal'yces** [Gr. κάλυξ, cover, husk, pod, bud, from same root as Lat. *occu'lere*, Germ. *hehlen*, hide. Being adopted into Lat. as *calyx*, it met there *calix*, cup (: Gr. κύλιξ). The blending of the two words in Late Lat. accounts for the modern use of *calyx* in the meaning of cup, flower-cup]: in botany, the flower-cup, or outermost of the proper floral envelopes, or of the circles of modified leaves which surround the organs of reproduction, and along with them constitute the flower. The leaves or separate parts of the calyx are called *sepals*. They are generally green, but in some cases are richly colored and *petaloid*, as in the *Mirabilis*, *Salvia splendens*, and *Fuchsia*. The calyx serves to protect the interior organs of the flower. If it falls off before the corolla, it is called *caducous*, and if it remains until the fruit is ripe it is called *persistent*. When the calyx is adherent to the sides of the ovary it is *superior*, and when quite free from the sides of the ovary it is *inferior*.

Cam, or **Granta**: a river of England; rises in Essex; flows northeastward through Cambridgeshire; enters the Ouse 3½ miles above Ely. Length about 40 miles. It is navigable from its mouth to Cambridge, which derives its name from it. The Cam is considered as a classic stream, on account of its associations with Cambridge University.

Cam [also spelled *camb*; loan-word from Fr. *came* or Dutch *kam*, cognate with Eng. *comb*, Germ. *Kamm* < Teuton, **kambas*, toothed implement; Gr. γόμφος, peg, tooth, Skr. *jambha-s*, same]: in machinery, a contrivance for converting a uniform rotary motion into a varied rectilinear motion. The end of a rod which is free to move only in the direction of its length is held in contact, by the action of a spring or weight, with the edge of an irregularly shaped mass which revolves uniformly upon an axis. A varied motion is thus communicated to the rod, which carries with it the machinery by which the motion is to be applied.

Cam, Diogo: a Portuguese navigator of noble ancestry; lived in the last half of the fifteenth century; and carried on under Alphonso V. the discoveries commenced by Prince Henry in Western Africa. He doubled Capes Gonçalvez and Catharina, and, having acquired great influence over the King of Congo, prepared the way in that country for Christianity. Cam was accompanied on his first voyage (1484) by Martin Behaim, the astronomer and cosmographer, and afterward explored as far as 22° S. lat.

Camaïeu: See Camayeu.

Camalduleu'sians, or **Camal'dolites**: an order of monks founded in 1012 by St. Romuald at Camaldoli, in the Apennines, about 30 miles from Florence. They are divided into two classes—Cænobites and Eremites—and follow the rule of St. Benedict. There are also a few houses of Camaldolite nuns, founded in 1086. The order was primarily noted for its extreme severity, but was after Romuald's death relaxed. It was injured by interior dissensions, and is now well-nigh extinct. The habit was white.

Camanche Indians: See Shoshonean Indians.

Camargue, kăă'maarg', **La**: a populous island of France; department of Bouches-du-Rhône; at the mouth of the Rhône, and inclosed on two sides by the arms of that river. It is an alluvial fertile delta, partly occupied by marshes. Area about 240 sq. miles. Large quantities of salt are obtained here.

Camaril'la [Span. dimin. of *camara*: Ital. *camera*: Fr. *chambre* < Lat. *camara*, *camera* < Gr. καμάρα]: a Spanish word (Span. pron. kăă-măă-reel'yăă), applied to the private chamber or cabinet of the King of Spain, or to his courtiers and confidential advisers, who usually had great power in the government and exerted a pernicious influence. The term is also used in other European countries and languages to denote the influence of courtiers and secret counselors, counteracting the opinions and policy of the legitimate ministers.

Camari'na: a celebrated Greek city of Sicily; on the southern coast; about 20 miles E. of Gela. It was founded by a colony of Syracusans in 599 B. C. It is said that no trace of it now exists.

Camas'sia [Latiniz. form of native Amer. name *camass*, or *quamash*]: a genus of plants of the family *Liliaceæ*; includes two species. *Camassia esculenta*, the quamash of the Nootka Indians, grows in swampy places in the U. S., W. of the Rocky Mountains, and produces bulbs which the savages use as food. *C. fraseri* occurs in the Eastern U. S.

Camayeu, or **Camaïeu**, and **Monochrome** are French terms used to denote a painting in a single color. Pictures of several tints, which do not represent the natural colors of objects, are said to be *en camayeu*. The same term may be properly applied to drawings in india ink and red chalk, as well as to engravings.

Cambacérès, kăăn'băă'sā'res', Jean Jacques Régis: Duke of Parma; French statesman and lawyer; b. at Montpellier, Oct. 18, 1753. He was elected in 1792 a member of the National Convention, in which he acted a cautious and moderate part. After the death of Robespierre (9th Ther-

midor, 1794) he was president of the committee of public safety, and opposed the continuance of the reign of terror. He became a member of the Institute about 1796. About the end of 1799 he was appointed second consul by Bonaparte, of whom he became a faithful adherent. He took a prominent part in the *rédaction* of the civil code. Under the empire he was arch-chancellor and president of the council of state, and in 1808 was entitled Duke of Parma. During the Hundred Days he was Napoleon's minister of justice. He held no office after the Restoration of 1816. D. in Paris, Mar. 5, 1824.

Cambay' (perhaps the *Camanes* of Ptolemy): a seaport-town of Hindustan; at the head of the Gulf of Cambay; 82 miles N. N. W. of Surat (see map of S. India, ref. 1–C). It is the capital of a small native state of the same name, which has an area of 350 sq. miles and a population of 86,000, chiefly Mohammedan. The city has a fine mosque, several Hindu temples, and a curious subterranean Bûddhist temple. Ruined palaces and mosques attest the former magnificence and extent of this town, which was once much more populous than it is now. One cause of its decline was the increasing shallowness of the gulf. It still exports cotton, grain, ivory, etc. Pop. 36,000.

Cambay, Gulf of: an inlet of the Arabian Sea: in the west part of Hindustan. It is about 75 miles long, and extends in a nearly N. and S. direction. The width of the entrance, which is the widest part, is 32 miles or more. It receives the rivers Nerbudda, Tapti, Mahi, and Sabbermutti. The tide here is very rapid, and rises about 30 feet.

Camber (Fr. *cambre*): a term applied by builders to the slight degree of arching which is usually given to beams or other parts of a frame in order to compensate the settlement of the various parts or the subsidence of the joints. Camber in ship-building signifies a curvature upward, or a convexity. A deck is said to be "cambered" when it is higher amidships than at the bow or stern.

Cam'bium: in botany, a supposed mucilaginous, viscid substance secreted between the liber (inner bark) and alburnum (outer wood) of exogenous (dicotyledonous) trees and other plants in early spring. There is, however, no such substance, hence the term is a misnomer. The supposed mucilaginous substance has long been known to be a layer of very thin-walled cells, which are easily ruptured. By their growth they produce on the one hand cells of the new layer of wood, and on the other of the bark. CHARLES E. BESSEY.

Cambo'dia, or **Camboja**: a country known under three different names: first, *Kampootcha*, which is given to it in the sacred books; *Youdra Skan*, the appellation by which it is best known to foreigners; and *Khamain*, the common name used among the natives themselves; a French province, lying on the middle Mekong river, with Siam on the N. and W., Annam on the E., and French Cochin-China and the Bay of Siam on the S. The country between Cambodia and Siam is an inclined plane falling off to the sea, beginning from the Khoa Dong Rêke, or the highland of Korat, which constitutes the first platform of the terraces that gradually ascend to the mountain-chain of Laos. Khoa Dong Rêke, the Cambodian Atlas, includes in its domain a magnificent and extensive forest, Dong P'hya Fai, or "the forest of the Lord of Fire," whence issue many beautiful streams to flow into the Pachim river. Its area is about 32,370 sq. miles. Its population in 1889 was estimated at 1,500,000. The religion is Buddhism, with a small but rapidly growing proportion of converts to Roman Catholicism. It is subdivided into Northern and Southern Cambodia, and the great province of Cancao on the S. E., and it teems with every species of mineral and vegetable wealth. Near the coast the country is covered with woods; a little farther inland, especially along the banks of the rivers and lakes, the land is well cultivated. But in the interior it abounds with impenetrable jungles, where elephants, lions, tigers, and wild buffaloes find shelter and afford excellent sport to the natives, who hunt them in large parties for their ivory and skins. Deer, hogs, goats, and a great many species of wild fowl abound in the forests, as well as in the more cultivated districts. The country abounds in iron, tin, precious stones, teak, sandal, and other wood, gamboge, and numerous other dyestuffs. The finest gamboge is produced by the tree *Garcinia gambogoides*. Bantabang is noted for its gold mines. Saigon annually exports quantities of pepper, rice, cardamoms, cotton, hides, horns, and cocoanut oil.

The climate is warm but wholesome, the scenery varied and beautiful; the navigation of the Gulf of Siam and the China Sea, along with such splendid rivers as the Mekong and the Saikong, magnificent forests of fine woods, endless crops of rice, Indian corn, sugar-cane, and tea, and vast plantations of mulberry trees for the rearing of silkworms, producing the finest article of silk, are some of the prospective advantages of the superb region to which Saigon is the key.

The kingdom of Cambodia was in its day not only independent, but powerful. As to its antiquity, two opinions prevail, one ascribing to it a duration of 1,300 years, the other 2,400. The native historians reckon 2,400 years from the building of the wonderful temples found in the neighborhood of Angkor, near the great lake Talasap. Angkor has even at this day sufficient proof, in its memorable ruins, that it was at some remote period the center of a wealthy, powerful, and highly civilized state. The ruins of Angkor Tom or Nakhon Wat are still in a tolerable state of preservation, and are composed of a central tower surrounded by four turrets and flanked by two other towers, all connected together by extensive galleries. At the top of the central tower are four immense heads in the Egyptian style, and every available space on these buildings is filled with exquisite sculptures in bas-relief. The scenes are drawn from the ancient mythological books of the Cambodians. There are here, also, several gigantic stone bridges of great magnitude and solidity. The bridge of Spean-Tenk is 470 feet in length.

During the reign of His Siamese Majesty Phra-Chow-Maha-Chakraphat, who reigned in Ayodhia, the ancient capital of Siam, in the Siamese civil era 900 (corresponding to 1540 of our Christian era), the Cambodians fitted out an immense army and attacked Siam, marched their forces as far as Bangnah and Phrakanong, ancient seaport-towns of Siam, which they pillaged and destroyed. The Siamese thereupon set out with a powerful army and took possession of Inthapataburee, the ancient capital of Cambodia, and remained masters of the citadel until the Emperor of Cambodia acknowledged himself penitent and willing to become tributary to Siam. During the last part of the eighteenth century dissensions among the reigning family led to weakness, and Cambodia fell under the control of the Annamites, who exacted heavy tribute, and at last, in 1809, unblushingly divided its provinces between themselves and the Siamese.

The name Cochin-China was applied to it by the Portuguese, who thought they saw a likeness in it to Cochin on the coast of Malabar. In 1471 it was reunited to the great province of Tonquin. In the sixteenth century it broke away, and in 1774, after a long and terrific war, Tonquin was reduced to submission and incorporated that fine country with the kingdom of Annam. It was about this time that European influence first began to be felt in this region. The first Christian missionary who entered the country was the Dominican monk Gaspar da Cruz, who labored there in the middle of the sixteenth century, and left some curious notes on the country. At that time not only the Portuguese, but also the Dutch and the English, had factories in the country, but their reciprocal jealousy seems to have left the Cambodian government completely independent of European influence. Meanwhile, the country was sorely pressed on one side by Siam, and on the other by Cochin-China. The Emperor of Cambodia, Chow Ngayen, felt the need of some support, and offered through a Christian missionary, who was a bishop in the country, to place himself under the protection of France. On this many French officers went to the new kingdom in the East, disciplined its armies, and took a share in the government. In 1820 the old-school Buddhists, in order to revenge the indiscriminate pillage of the French officers on the property of the simple inhabitants, instituted a ferocious persecution of the Christians. French fleets were at once sent out to demand indemnities and protect the Roman Catholic missionaries. Cambodia in 1863 agreed by treaty to a French protectorate. Its present status, however, is regulated by a convention dated June 17, 1894. The government is carried on in the name of the king, but the French resident presides over the council of state. See *Cambodia and its Races*, by G. Thomson; *Antiquities of Cambodia*, by J. Thomson; Crawfurd's *Mission to Siam and Cochin-China*; Fergusson's *History of Architecture*, vol. ii.; F. Garnier's *Excursions et Reconnaissances*, vols. viii. and xiii.; and *L'Indo-Chine Française*, by Bouinais and Paulus. Revised by M. W. HARRINGTON.

Cambon, kaăń'bōn, Joseph: statesman and financier; b. at Montpellier, France, June 17, 1754. He was elected to the National Convention in 1792; voted for the death of the king; became a member of the committee of public safety in 1793. He promoted the fall of Robespierre in 1794. As a member of the committee on finance he made several able reports, and is said to have laid the foundation of the modern financial system of France. He procured the adoption of the great book or register of the public debt. He held no office under the empire; was exiled in 1816. D. near Brussels, Feb. 15, 1820.

Cam'borne: a town of Cornwall, England; 11 miles N. W. of Falmouth (see map of England, ref. 15–B). Here is a church which has a stone inscription of the tenth century. Productive mines of copper, tin, and lead are worked in the vicinity. Pop. (1891) 14,700.

Cambray', Fr. pron. kaăń'brā' (in Lat. *Camaracum*): a fortified city of France; department of Nord; on the Scheldt; 45 miles by rail N. N. E. of St.-Quentin (see map of France, ref. 2–F); the seat of an archbishop; celebrated for its fine linens, called *cambrics*. Cambray is an ancient city, with gabled houses, handsome streets, and is surrounded by a wall with ancient towers and gates. It has manufactures of laces, tulles, leather, soap, etc. Pop. (1891) 24,122; (1896) 25,250.

Cam'bria: the ancient and Latin name of Wales, which the Romans called Britannia Secunda. Cambria is derived from *Cymry*, by which name the Welsh people have always called themselves.

Cambrian Period: the earliest division of geologic time characterized by a well-preserved fauna. The title *Cambrian* was first applied by Sedgwick to a system of rocks in North Wales (*Cambria*), and was subsequently adopted for the corresponding time division. It has had two rivals, some writers contending that the name *Taconic* should be used instead, others that the Cambrian period should not be separated from the *Silurian*. The resulting controversies, turning largely on questions of priority in the giving of names, have received attention beyond their deserts. In the U. S. rocks of this period have been found in New England, New York, thence southwestward through the Appalachian mountain-belt, in the States bordering on Lake Superior, in Missouri, in Texas, and at many points in the Cordilleran region. Although the Cambrian faunas are the oldest known, they include highly organized species, and do not exhibit the beginnings of life. Our knowledge of American Cambrian rocks is summarized by C. D. Walcott in *Bulletin No. 81, United States Geological Survey*. See Fossil Invertebrates and Geology, Historic. G. K. Gilbert.

Cam'bridge (anc. *Granta*; in Lat. *Cantabrigia*): a town of England; capital of Cambridgeshire; on both sides of the river Cam, and on the Eastern Counties Railway; 48 miles N. N. E. of London (see map of England, ref. 10–J). The site is level, and the town is embosomed among lofty trees. It is the seat of one of the great universities of England, and contains many noble edifices belonging to that institution. (See Cambridge, University of.) Among the remarkable buildings of the town are Trinity church and the Church of the Holy Sepulchre, which was built in the reign of Henry I., and has a round tower. It is said that Cambridge was destroyed by the Danes in 871 A. D. The Doomsday Book mentions it as an important place under the name of *Grentebrige*. It obtained a charter from King John in 1200. Jeremy Taylor was born here. Cambridge returns one member to Parliament, besides those who represent the university. Pop. (1891) 36,983.

Cambridge: capital of Henry co., Ill. (for location of county, see map of Illinois, ref. 3–C); on Rk. Is. and Peoria R. R., about 160 miles S. W. of Chicago. It is situated in a rich agricultural and stock-raising district, and is an important grain-market. It has excellent schools, a public library, handsome county buildings, and manufacturing establishments. Pop. (1880) 1,203; (1890) 940; (1900) 1,345.
Editor of "Chronicle."

Cambridge: town, on railroad; capital of Dorchester co., Md. (for location of county, see map of Maryland, ref. 4–F); on the south side of the Choptank river; 60 miles S. E. of Baltimore. The river is here about 2 miles wide. Cambridge is the western terminus of the Dorchester and Delaware R. R., which extends 33 miles to Seaford. It has academies for both sexes, excellent public schools, five churches, a flouring-mill, ice, phosphate, underwear, tobacco, and stave factories, and several canning establishments, and an oyster and lumber trade. Pop. (1880) 2,262; (1890) 4,192; (1900) 5,747. Editor of "Chronicle."

Cambridge: a city of Massachusetts; one of the capitals of Middlesex County (for location of county, see map of Massachusetts, ref. 2–H); is on the Fitchburg R. R., and the N. W. bank of the Charles river, which is here about a mile wide, and separates Cambridge from Boston. Cambridge, though incorporated as one city, was formerly divided into several villages, the local names of which still survive; these are Old Cambridge, Cambridgeport, East Cambridge, and North Cambridge. Harvard University is in Old Cambridge. Cambridgeport and East Cambridge contain many mercantile houses and manufactories, mostly of glass, furniture, organs, steam-engines, and boilers. East Cambridge, where the manufactories are chiefly located, is connected with Boston and Charlestown by bridges. West Boston bridge connects Cambridgeport with Boston. Extensive printing establishments exist here, and the first printing-office in America was located in Cambridge. Near Harvard University is a fine soldiers' monument, erected in 1869–70 at a cost of $35,000. The city-hall is in Cambridgeport. Cambridge is beautifully situated on a plain, contains some handsome public buildings, and a great number of elegant private residences, with spacious grounds ornamented with shrubbery and flowering plants. The city was founded in 1631 under the name of Newtown, and was much favored by the General Court, which in 1636 appropriated £400 to locate here a school which became Harvard College. Here Hooker, who founded Hartford, first lived (1633–36) in America. The city is furnished with water from Fresh Pond. In 1890 there were $20,259,747 invested in the manufactures of Cambridge, employing 14,000 persons and producing commodities valued at $35,490,389. Of these the principal industries were foundry and machine-shop products, $2,478,730; printing and publishing, $1,807,425; soap and candles, $1,303,870; musical instruments, $1,552,783; furniture, $756,740; confectionery, $684,875. Here are located the celebrated shops of the Clarks, the astronomical instrument makers. Pop. (1880) 52,669; (1890) 70,028; (1900) 91,886. See Harvard University.

Cambridge: village; Washington co., N. Y. (for location of county, see map of New York, ref. 4–K); on D. and H. R. R.; 28 miles N. E. of Albany. The village is attractively situated in a broad valley, with the Green Mountains on the E., and has excellent drainage, water-works, and electric lights, good public school, and a fine driving-park. There are here a foundry, machine-shop, tanneries, and seed-rooms. The Cambridge Valley Agricultural Society and Stock-breeders' Association have here extensive and well-equipped exhibition grounds, on which is held an annual fair, unexcelled by any other in the State. Pop. (1880) 1,482; (1890) 1,598; (1900) 1,578. Editor of "Washington County Post."

Cambridge: city; capital of Guernsey co., O. (for location of county, see map of Ohio, ref. 5–H); on Balt. and O. (Cent. O. Division), and Clev. and Mar. R. Rs.; 85 miles E. of Columbus, and 55 miles N. of Marietta; has 3 union schools, 8 churches, several mills, manufacture of roofing, and Clev. and Mar. R. R. general offices and shops, and electric lights. It is situated in a good agricultural and mining district, and is the center of an important coal-field; there are deposits of iron ore and limestone formations. There is natural gas for heating purposes. Pop. (1880) 2,883; (1890) 4,361; (1900) 8,241. Editor of "Guernsey Times."

Cambridge, George William Frederick Charles, Duke of: British general; son of Adolphus Frederick, sixth son of George III. (b. Feb. 25, 1774; d. July 8, 1850), and first cousin to Queen Victoria; b. in Hanover, Mar. 26, 1819; became a colonel in the British army in 1837, major-general in 1854; commanded two brigades in the Crimean war, 1854–56; became general in 1862, field-marshal in 1862, and was commander-in-chief of the British army from that year until Nov. 1, 1895, when he retired, and was succeeded by Field-Marshal Lord Wolseley. He was honorary colonel-in-chief to the forces and chief aide-de-camp to Queen Victoria.

Cambridge City: railroad junction; Wayne co., Ind. (for location of county, see map of Indiana, ref. 6–G); on the Whitewater river; 15 miles W. of Richmond. It has the car-shops of the Indiana Car Company and other manufactures. Pop. (1880) 2,370; (1890) 1,782; (1900) 1,754.

Cambridge Platform: a system of church government drawn up by a synod at Cambridge, in the colony of Massa-

chusetts Bay, in 1648. The Congregational churches of New England at that time differed somewhat in regard to discipline, some being inclined to Presbyterianism and others to Independency, while the majority avoided both extremes. The synod reaffirmed the doctrines taught in the Westminster Confession, but recommended a form of church discipline substantially the same as that which now prevails in the Congregational churches.

Cambridge Platonists: epithet given to Peter Sterry, the founder of the school, Ralph Cudworth, Henry More, John Smith, and Benjamin Whichcote, and their followers, who applied in the seventeenth century Platonic ideas to theology. They belonged to Emmanuel College, Cambridge, which was the Puritan college of the university. See Tulloch's *Rational Theology*, vol. ii.

Cam'bridgeshire: a county of England; bounded N. by the river Nen, E. by Norfolk and Suffolk, S. by Essex and Hertford, and W. by Bedford and Huntingdon. Area, 820 sq. miles. Pop. (1891) 188,862; (1901) 185,128. The surface is mostly flat, and about one-fourth of the county is occupied by fens or marshes. The northern portion is part of the Bedford Level (*q. v.*). The soil is fertile, and the inhabitants are mostly engaged in agriculture. Among the staple products are wheat, beans, hay, oats, butter, and cheese. It is intersected by the river Ouse, and also drained by the Cam. In the north part is a tract called the Isle of Ely. The chief towns are Cambridge, Ely, and Newmarket.

Cambridge, University of: one of the two ancient universities of England. In 1110 Joffrid, Abbot of Croyland, sent to his manor of Cottenham, near Cambridge, Gislebert, a professor in divinity, with three other learned monks. They in a short time drew together so great a number of scholars that in the second year no single building was able to contain them. When Alfred of Beverly was there, in 1129 A. D., there were no public halls, but each one lived in his own lodgings. About the year 1257 students began to live together in hostels, under a principal, at their own charges. The hostels were named after saints or the churches which they adjoined, or the persons who built them. Trinity hostel survived to 1540. The hostels were the beginning of the college system which distinguishes the universities of Oxford and Cambridge. In the year 1893 there were 17 colleges and 2 hostels, of which one was public and one private.

Before the close of the sixteenth century nearly all the foundations were endowed which now constitute the university. The predominance of the religious element in the discipline is to be attributed to the usage of the times in which the colleges were founded. There had been, from very early times, "religious houses," which were in many cases united with collegiate foundations, as, for example, the Dominicans, whose house is now Emmanuel College. The friars who lived in these convents kept their "acts" or exercises for degrees like other university men. To the same cause is traced the condition of celibacy, upon which, with scarcely an exception, the fellowships are tenable. With some exceptions, the fellows are obliged to take holy orders within a limited period or to vacate their fellowships.

A new code of statutes for the university was approved by the Queen in council in 1882. The great legislative assembly of the university is called the senate; it is composed of all those who have obtained the degree of doctor or master, and whose names are still on the register. All university laws are approved by the council, consisting of the vice-chancellor and sixteen members of the senate, before they are submitted to the senate. The executive powers are a chancellor, high steward, vice-chancellor, commissary, and assessor. There are three terms—Michaelmas, Lent, and Easter. Dissenters are not excluded from taking degrees, except in divinity.

There are four classes or orders of students—viz., fellow-commoners and noblemen, pensioners, sizars, and scholars on the foundation of their college. The first are so called from their dining at the fellows' table; they wear silk or embroidered gowns and pay heavier fees. The pensioners are the students not on the foundation, who pay for their own commons and for their chambers. The sizars are the poorer students, who are admitted at lower charges than the pensioners, but wear the same dress, and no longer perform menial offices, as they once did. St. John's and Trinity have very liberal endowments for sizars, and pecuniary assistance is given. All students coming to the university are entered in one of the above classes. The scholars are elected by examination from the pensioners and sizars; they have rooms and commons free, and other emoluments. The fellows are generally elected from the scholars. The fellowships are given to members of the college, and are not, as at Oxford, open to the whole university. Before a student can be admitted he must be sufficiently instructed in Latin, Greek, and mathematics.

When the undergraduate comes in he is called a "freshman"; in his second year, a "junior soph"; in his third year, a "senior soph." The degree of bachelor of arts requires usually nine terms, or three years of residence. The master's degree is conferred three years later. The candidates for degrees are called questionists.

The mathematical examination embraces the whole range of mathematics. The successful candidates are arranged in a tripos—i. e. in three classes, called respectively wranglers, senior optimes, and junior optimes; the first mathematician is called the senior wrangler. In the examination for classical honors the candidates are arranged in a tripos, and distinguished as first, second, and third class. The examinations for degrees are called the "great go." The previous examination, which comes in the second year of residence, is called the "little go." There is also a tripos for the natural sciences. The pecuniary value of the first place in either the classical or the mathematical tripos has been estimated at £10,000, for it secures to its possessor high social position, as well as lucrative employment. The next prizes are the fellowships, of which there are 430 tenable for life. The office of tutor is one of great honor and emolument. James I. granted to the university the privilege of sending two members to Parliament, which it has ever since enjoyed.

The following is a list of the colleges and hostels, with the dates of their foundation, etc.:

Founded.	COLLEGES.	Gross income.	Undergraduates.	Members of the senate.	Members on the books.
1473	Catharine	£5,465	59	111	206
1505	Christ's	14,721	139	349	673
1326	Clare	14,974	175	233	540
1352	Corpus Christi	8,799	100	263	464
1800	Downing	7,087	86	101	268
1584	Emmanuel	14,074	161	345	660
1348	Gonville and Caius	22,038	172	414	826
1496	Jesus	11,521	176	213	528
1441	King's	31,022	104	255	500
1519	Magdalene	4,257	62	126	230
1347	Pembroke	11,380	151	234	585
1257	Peterhouse	8,250	69	197	339
1448	Queen's	7,410	88	152	362
1595	Sidney-Sussex	7,837	58	118	241
1511	St. John's	40,713	247	1,045	1,647
1546	Trinity	77,545	614	2,201	3,681
1350	Trinity Hall	9,179	218	209	619

The Fitzwilliam Museum is the finest modern addition to the university. Viscount Fitzwilliam bequeathed in 1816 £100,000, the interest of which was to build and support a museum. He bequeathed also a valuable collection of books, paintings, etc. The university library is a fine mass of buildings of different periods, and contains at present more than 400,000 volumes and manuscripts, without reckoning those in the college libraries, some of which are very important. The geological museum contains the collection of Dr. Woodward, with recent numerous and interesting acquisitions. Besides this there are other valuable scientific museums. For full information about the university, see the *Cambridge Calendar*. Revised by C. K. Adams.

Camby'ses [Gr. Καμβύσης; in Old Persian cuneiform inscriptions, *Kabujiya*]: King of the Medes and Persians; a son of Cyrus the Great, whom he succeeded about 530 B. C. He invaded Egypt in 525; defeated Psammenitus, its king, in battle; captured Memphis, the capital of Egypt. Having completed the conquest of that country, he led an army to Ethiopia, but was compelled by famine to retire before he had conquered it. He afterward indulged in violent and capricious acts of tyranny and cruelty in Egypt, so that many believed him to be insane. Cambyses was an epileptic, but a man of strong though very cruel character. By his Egyptian subjects he was utterly detested. D. in Syria in 522 B. C. See Egypt, Ancient.

Camden: capital of Wilcox co., Ala. (for location of county, see map of Alabama, ref. 5–C); is about 4 miles S. of the Alabama river, and 80 miles S. W. of Montgomery. Pop. of Camden township (1880) 3,795; (1890) 2,624, including 545 in village; (1900) 2,139; village, 478.

Camden: railroad junction; capital of Ouachita co., Ark. (for location of county, see map of Arkansas, ref. 5–C); is on the right bank of the Washita river; 110 miles S. by W. from Little Rock. Steamboats ascend the river to this point, which is connected by navigable water with New Orleans, and for two-thirds of the year steamers ascend the river to Arkadelphia. It was once called *Écore à Fabre*. Pop. (1880) 1,503; (1890) 2,571; (1900) 2,840.

Camden: village of Knox co., Me. (for location of county, see map of Maine, ref. 9–D); on the west side of Penobscot Bay; about 8 miles N. N. E. of Rockland. It derives its support from the burning of lime, ship-building, commerce, and manufacture of cars, car-wheels, railroad spikes, and ship's furniture of various kinds. Pop., including Camden township (1880), 4,386; (1890) 4,621; (1900) 2,825.

Camden: city; an important railroad center and river-port of New Jersey; capital of Camden County (for location of county, see map of New Jersey, ref. 6–C); situated on a plain on the Delaware river opposite Philadelphia. Camden contains a court-house, municipal buildings, forty-eight churches, fine schools, including a school for manual training, several iron-foundries, and manufactories of machinery, chemicals, etc., and a large manufactory of steel pens; ship-building is an important branch of industry. Numerous steam ferry-boats connect Camden with Philadelphia. By census of 1890, $9,705,431 were invested in manufactures which employed 7,527 persons and produced goods valued at $15,041,113. Of these the principal products were textile fabrics, $2,632,774; ship-building, $1,132,820; oil-cloth, $973,500; boots and shoes, $814,402; chemicals, $797,200; lumber, $577,032. Pop. (1880) 41,659; (1890) 58,313; (1900) 75,935.

EDITOR OF "DAILY COURIER."

Camden: Oneida co., N. Y. (for location of county, see map of New York, ref. 4–H); on Rome, Wat. and Ogd. R. R., and terminus of Elmira, Cort., and Nor. R. R.; 33 miles from Utica, and 42 miles from Syracuse. There are here six churches, good schools, an academy, extensive furniture and chair factories, large knitting-mill, corn, vegetable, and fruit canning factory. It is in the center of a large agricultural section. Pop. (1880) 1,589; (1890) 1,902; (1900) 2,370.

EDITOR OF "ADVANCE-JOURNAL."

Camden: capital of Camden co., N. C. (for location of county, see map of North Carolina, ref. 2–K); 219 miles E. N. E. of Raleigh; is a port of entry on the navigable Pasquotank river. Pop. of township (1880) 1,987; (1890) 1,684; (1900) 1,453.

Camden: capital of Kershaw co., S. C. (for location of county, see map of South Carolina, ref. 5–E); is on railroad and the east bank of the navigable Wateree river; 33 miles N. E. of Columbia. It contains four academies, numerous churches, and has good water-power. The annual receipts of cotton are about 30,000 bales. Gen. Gates was defeated here Aug. 16, 1780, by Lord Cornwallis, and Apr. 25, 1781, Gen. Greene was defeated by Lord Rawdon at Hobkirk's Hill, near Camden. During the civil war this place was captured, Feb. 24, 1865, by the Federal forces under Gen. Sherman after a lively skirmish; 2,000 bales of cotton and a large quantity of tobacco were destroyed by burning. Nearly all the business portion of the town was also burned at that time. There are ancient Indian mounds near this town. Pop. (1880) 1,780; (1890) 3,533; (1900) 2,441.

EDITOR OF "JOURNAL."

Camden, MARQUESSES OF: Earls of Brecknock (United Kingdom, 1812); Earls Camden (1786); Viscounts Bayham (1836); Barons Camden (1765, Great Britain).—JOHN CHARLES PRATT; b. June 30, 1840; was member of Parliament for Brecon in 1866, and succeeded to the marquisate in the same year. D. 1872, when his infant son, John Charles Pratt, born the same year, inherited the title.

Camden, CHARLES PRATT, First Earl of: English statesman and lawyer; b. in 1713; son of a Devonshire man, Chief Justice Sir John Pratt; was called to the bar in 1738; became attorney-general about 1758; chief justice of the court of common pleas in 1762. His decision against the legality of general warrants, which he gave in the trial of John Wilkes, rendered him very popular. He received the title of Baron Camden in 1765, and was appointed Lord Chancellor, but he resigned that office in Jan., 1770. He afterward distinguished himself as a champion of constitutional liberty, and acted with Lord Chatham in opposition to the American policy of Lord North. In 1783 he became president of the council. He was created Earl Camden in 1786. D. in London, Apr. 18, 1794. "Among the names that adorn the legal profession," says Lord Brougham, "there are few which stand so high as that of Camden." On account of his liberal policy during the Revolutionary war his name became very popular in the U. S., and was given to several counties and many towns and villages.

Camden, WILLIAM: English antiquary; b. in London, May 2, 1551; graduated at Oxford. He went to London in 1571, and there was appointed second master of Westminster School in 1575. His most important work is a description of Great Britain in Latin, entitled *Britannia sive Regnorum Angliæ, Scotiæ, et Hiberniæ, ex intima Antiquitate Chorographica Descriptio* (1586; 6th ed. 1607; Eng. trans. 1610; last 1806). He published several new editions of it, enlarged and improved. Among his works is *Annals of the Reign of Elizabeth* (in Latin), highly commended by Hume. He became head master of Westminster School in 1593, but retired when made Clarenceux king of arms in 1597. His promotion to this position over the heads of all the College of Heralds led to many heart-burnings and recriminations, and embittered many years of the life of this worthy man, who has been called "the judicious Camden" and "the British Pausanias." He refused the honor of knighthood. D. in Chislehurst (afterward the scene of Louis Napoleon's death), Nov. 9, 1623, and was buried in Westminster Abbey. He endowed a professorship of history in Oxford. In his honor the CAMDEN SOCIETY (*q. v.*) was founded.

Camden Society: an association organized in 1838 in London for the purpose of publishing the MSS. of old British authors, historical documents of importance, old records, visitations, both heraldic and ecclesiastical, and other matter of antiquarian, literary, or historical interest relating to England. Some of their materials are not very ancient, but are published for their general interest. The results of their work are contained in about 160 (1893) volumes, which are, as a whole, of very great value.

Camel [from Lat. *came'lus* < Gr. κάμηλος, from the Semitic; cf. Hebr. *gāmāl*]: a common name for the two species of ruminants belonging to the genus *Camelus*, although often used in a restricted sense for the two-humped or bactrian

Bactrian camel.

camel only. Camels are characterized by having the knee free from the body, by large, soft, cushion-like feet, partially cleft and terminating in nails, and by having, according to the species, one or two humps on the back. The upper lip is divided, the nostrils are slit-like and oblique, the ears small, and eyes prominent. The neck is long and curved; legs comparatively long. There is a large callosity on the center of the breast, on which the animal rests when lying down, and the body is clad with soft brown hair, varying in thickness according to season and locality, but longest on the under side of the neck and about the knees. The single-humped camel, or DROMEDARY (*q. v.*), *Camelus dromedarius*, is found in Northern Africa, Syria, and Arabia. The two-humped or bactrian camel, *Camelus bactrianus*, ranges from the Black Sea, northward and eastward, into Siberia, Tibet, and China. Besides having two humps, it is further

distinguished from the dromedary by its slightly larger size. The wall of the first division of the camel's stomach is remarkable for the presence of numbers of large cells, like small pockets, into which water enters when the animal drinks. These cells, which, when full, may be 3 inches wide and as many deep, retain the water for some time, and constitute the "reservoir" which enables a camel to go without drinking for a considerable period. The large surface offered by the sole of the spongy foot adapts it for walking in sand, and this, coupled with the ability to endure long continued thirst, makes the camel particularly fitted for life in sandy deserts. The animal is still further able to undergo privation from the fact that it is able to subsist to some extent on the store of fat laid up in the hump. With these various adaptations it is not surprising that camels have been used as beasts of burden in arid, desert countries from time immemorial, and they are mentioned in Genesis and the book of Job. A camel will carry a load of from 500 to 1,000 lb., or for short distances somewhat more, but at a rather slow rate, from 2½ to 3 miles an hour. Some breeds of dromedaries, which are used only for riding, and are to the others what the race-horse is to the cart-horse, vastly surpass this, making as much as 75 miles in twelve hours. The gait of these animals, which is a pace, both legs on a side moving together, is extremely trying. Moreover, the camel kneels to be loaded, and its motions when rising are very violent. The popular idea of the docility of the camel is erroneous, for the animal complains bitterly when being loaded, each package added to its load calling forth fresh outcries: so far from being docile, the creature is obstinate and malicious. Its intelligence is small and its cowardice extraordinary, for the camel takes fright at any unusual sight or sound. The males are very vicious and fight savagely with one another, inflicting serious wounds with their sharp caniniform teeth. They also possess the very undesirable trait, common to the *Camelidæ*, of spitting upon persons whom they dislike. Camels have been used to a considerable extent in warfare, camel corps being attached to the British army in India, while they proved extremely valuable in the Sudan campaign. Besides being used as a beast of burden, the hair of the camel is woven into cloth, the hide is made into leather, and the dried dung used for fuel. Camels were introduced into Australia with a view to their use on the central deserts, but the experiment was only moderately successful. As early as 1701 a few were brought to Virginia, and in 1856–57 the U. S. Government imported a number with a view to their employment in Texas, Arizona, and New Mexico. They were stationed near San Antonio, Tex., and at the breaking out of the civil war were turned loose, and scattered over the country in twos and threes. In 1867 a few were captured by an enterprising ranchman and sold to showmen, and it is reported that a few are still to be found at large. Wild camels have been taken in Turkestan. See also CAMELIDÆ.

F. A. LUCAS.

Camel: a contrivance by which ships are floated over sandbars and shoals, or sunken ships are raised. A long caisson, or "camel," nearly filled with water, is fastened to each side of the ship; when the water is pumped out the caissons rise and lift the ship with them. The principle is more fully explained in the article DOCK (*q. v.*), for it is essentially the principle of all floating docks. Camels were formerly used at Nantucket and New Bedford, Mass.

Camel'idæ: a family of even-toed, ruminant mammals, containing the camels and llamas, distinguished by having the thigh largely free from the body, the canines of the lower jaw pointed and distinct from the incisors, and two pointed, canine-shaped incisors in the upper jaw. The stomach is imperfectly divided into four compartments, and the placenta is diffuse. See ALPACA, CAMEL, DROMEDARY, GUANACO, and LLAMA.

F. A. LUCAS.

Camel-insect: an insect of the genus MANTIS (*q. v.*).

Camel'lia [in honor of G. J. Kamel, D. D., a German Jesuit missionary to Luzon in the eighteenth century]: a genus of evergreen plants of the family *Ternstrœmiaceæ*, natives of China, India, and Japan; extensively cultivated in greenhouses in Europe and the U. S. for the beauty of their flowers. The most admired species is the *Camellia japonica*, a shrub which has ovate-elliptical, serrate, and shining leaves, and large, polypetalous flowers, which resemble a rose. Many others belong to *Camellia reticulata* and to hybrid varieties. In the wild state it bears red and single flowers, but the flowers of the cultivated varieties are generally double. Among their various colors are red, white, and yellow. Many of the varieties originated in China or Japan, and others have been raised by European and American florists. New varieties of them are annually produced. The value of the camellia is increased by the fact that it flowers in autumn and winter. The single camellia is propagated by seed, and the cultivated or double varieties by grafting, cuttings or layers. The proper soil for these is a loose, black mould. They should be protected from frost and liberally supplied with water, but are liable to be injured with an excess of moisture. It is important that they should receive a free access of fresh air and light. *C. oleifera* and *C. sasanqua* are cultivated in China for their seeds, which yield an oil similar to olive oil. Some writers refer all the camellias to the genus *Thea*, of which *T. sinensis*, the tea-plant, is the type.

Camelopard: See GIRAFFE.

Camelopardalis (the GIRAFFE): a constellation near the celestial pole. It contains only sparsely scattered stars. It is situated between Cassiopeia, Perseus, Ursa Major, etc. It was added by Hevelius to the list of constellations.

Camel's Hair is used by the Arabs and Persians, who weave it into stuff for tents and clothing. A fine quality of camel's hair is imported from Persia, and is used to make pencils for artists. Camel's hair was extensively worn by monastics in the Middle Ages for the mortification of the body. It was harsh and rough. Camel's hair is woven to some extent in Europe, but most of the goods now so called are of wool.

Camel's Hump, or **Camel's Back Mountain**: in Vermont; one of the highest peaks (4,188 feet) of the Green Mountains; 17 miles W. of Montpelier.

Camel's-thorn [Dutch, *kameel-doorn*, so named because camels eat its spring foliage]: the manna-tree, a shrub or undershrub of Western Asia and Northern Africa, belonging to the genus *Alhagi* and family *Papilionaceæ*. These shrubs have jointed pods, and are related to the forage plant sanfoin (*Onobrychis*). Only three species are now recognized by botanists: *A. camelorum*, of the region of the Caucasus; *A. græcorum*, of Greece: and *A. murorum*, of Northern Africa. From the last a gummy exudation takes place in hot weather, to which the name of manna has been given.

C. E. B.

Camenæ: general name of four prophetic nymphs of Roman mythology—viz., Antevorta, Postvorta, Carmenta, and Egeria. The Nine Muses were also called Camenæ by the Latin poets.

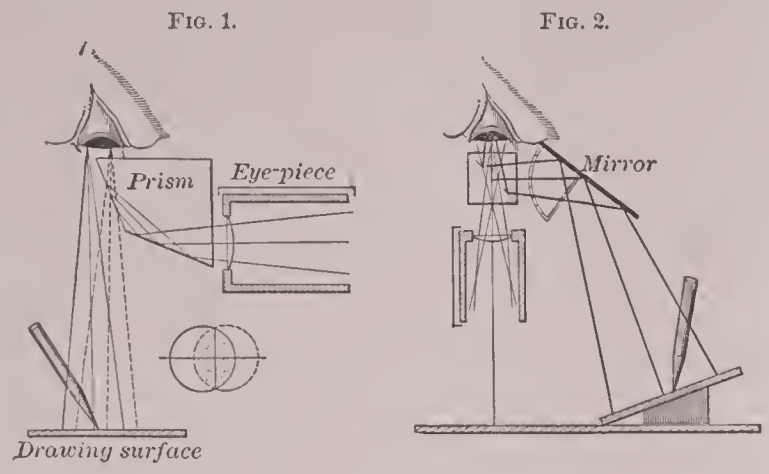
Camenz, kaa'ments, or **Kamenz**: a town of the kingdom of Saxony; on the Black Elster; 20 miles N. E. of Dresden (see map of German Empire, ref. 5–G). It has manufactures of earthenware, tobacco, starch, etc. Lessing was born here in 1729. Pop. (1890) 7,749.

Cam'eo [Ital. *came'o*, explained as from **gammæ'us*, gamma-shaped, cf. Lat. *gamma'tus*; or from **cammæ'us*, deriv. of *gemma*, precious stone, or as a Celtic loan-word]: a term applied to gems carved in relief, especially to diminutive pieces of sculpture, which are often formed of semi-precious stones having two strata or layers of different colors, the uppermost of which is partly removed so as to expose the lower stratum, which forms the background of the figure. The art of cutting cameos is of great antiquity, having been practiced by the ancient Egyptians and Babylonians. It was brought to great perfection by the Greeks, and practiced with success in ancient Rome. The cameos of the ancients were formed mostly of the onyx, agate, and sard, and of glass. The famous Barberini or Portland vase is a beautiful specimen of cameo in glass. The ancients used cameos as personal ornaments, and as cups, vases, and other articles. Many of the antique cameos now extant are marvelously beautiful in design and perfect in execution. Among the finest antique specimens are the Gonzaga cameo, which represents the head of a king and his queen, and is now at St. Petersburg; *The Judgment of Paris*, in the cabinet of Prince Piombino at Rome; and the onyx called *Apotheosis of Augustus*, which is now in Paris. The last is 12 inches high and 10 inches wide. The art revived in Italy in the fifteenth century, and was patronized by the Medici. Some specimens of this period are perhaps as perfect as the antique. The fabrication of cameos, both in *pietra dura* and in shell, has become in Italy an important branch of art.

SHELL CAMEOS are made from such shells as have layers of differently colored materials, such as the conch-shells of

the Bahamas. The art—a modern one—of cutting these shells has been carried to a high degree of perfection. These cameos began to be cut at Rome about 1805, and the best work is done there now; but many shells are cut at Paris, especially for exportation to England and America.

Camera Lucida [Lat., light chamber]: an apparatus for bringing into a single field of view two objects, only one of which is in the direct line of vision, so that they may be observed simultaneously with one eye. It is used chiefly as

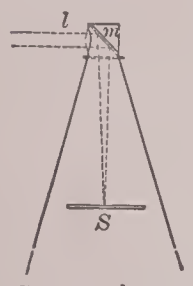


Camera lucida.

an attachment to the microscope to facilitate the drawing of microscopic objects. The original form, which was invented by Wollaston (1812), is shown in Fig. 1. It consists of a triangular prism placed in front of the eyepiece of a horizontally mounted microscope. The observer, looking past the edge of the prism, sees the drawing surface by direct vision and the microscopic image by total reflection from the prism. The image thus appears superimposed upon the drawing surface. Wollaston's camera lucida is not conveniently used with a vertical microscope. Another well-known form is that of Abbe (Fig. 2). In this instrument the microscope is vertical and in the direct line of vision, and the drawing surface is brought into the field of view by means of a mirror and a pair of prisms above the eyepiece. See, further, Gage, *Histology and the Microscope*, p. 47.

E. L. Nichols.

Camera Obscura [Lat., dark chamber]: a device by means of which a real image of distant objects or of a landscape is thrown upon a drawing surface within a darkened chamber for purposes of delineation. The device usually consists of a lens (*l*) of long focus and a mirror (*m*) mounted together in a hood and capable of revolution about a vertical axis. Rays passing the lens are brought to focus upon the plane surface S, where will be seen an image of that portion of the landscape toward which the hood is directed. The instrument is given many forms, according to the especial purpose to be attained. The figure shows a form of camera adapted for field-work. The camera of the photographer, which may be considered a development of the ordinary *camera obscura*, has almost completely supplanted the delineating camera. The name is likewise applied to any dark chamber used for the observation of "pinhole" images. The camera obscura is of early origin; it is usually ascribed to Roger Bacon (1214–92). See the article Photography.



Camera obscura.

E. L. Nichols.

Camera'rius, Joachim: German scholar; b. at Bamberg, Apr. 12, 1500. His proper name was Liebhard. His ancestors were chamberlains to the bishops of Bamberg; hence he took the Latin name Camerarius, which signifies a chamberlain. He was a friend of Melanchthon; president or principal of the University of Tübingen in 1535; rector of the University of Leipzig for many years after 1541. Among his works are a *Life of Melanchthon* (1566); *Commentaries on the Greek and Latin Languages* (1551). See Bursian's *Geschichte der classischen Philologie in Deutschland*. D in Leipzig, Apr. 17, 1574.

Cam'eron: Clinton co., Mo. (for location of county, see map of Missouri, ref. 2–D); on Han. and St. Joseph and Ch., Rk. I. and Pac. R. Rs.: 55 miles from Kansas City, and 29 miles from St. Joseph; is a distributing-point for hogs, cattle, poultry, and other farm products; is well built, with macadamized streets, electric lights, a public park, fine schools, fashionable churches, and the Missouri Wesleyan College. Pop. (1880) 2,109; (1890) 2,917; (1900) 2,979.

Editor of "The Sun."

Cameron, Angus: b. at Caledonia, Livingston co., N. Y., July 4, 1826; studied law in Buffalo; in 1857 removed to La Crosse, Wis.; served two years as representative, being Speaker one year, and four years as Senator in the Legislature of Wisconsin; regent of the University of Wisconsin 1866–75; was U. S. Senator from that State 1875–85. D. at Milwaukee, Wis., Mar. 30, 1897.

Cameron, Sir Charles Alexander, M. D., F. R. C. S.: b. in Dublin, Ireland, July 16, 1830; studied in Dublin and Germany; elected public analyst of the city of Dublin 1862; elected Professor of Hygiene or Political Medicine in the Royal College of Surgeons in Ireland 1867; knighted in 1886 "in recognition of his services in the improvement of public health, and his scientific researches." C. H. T.

Cameron, Donald, **of Lochiel**: a Highland Scottish chief who fought for the Pretender in 1745. He was born at Achnacarrie, Lochiel, perhaps in 1695. He was wounded at the battle of Culloden, and escaped to France in 1746. D. in 1748. He was the subject of Campbell's poem entitled *Lochiel's Warning*.

Cameron, Sir Duncan Alexander: b. about 1808; entered the British army as ensign in 1825; in 1854 became colonel; commanded the Forty-second regiment at the battle of Alma, and the Highland brigade at the battle of Balaklava, in the expedition to Kertch, the siege and fall of Sebastopol and assault of the outworks; was created a C. B.; officer of the Legion of Honor; received a medal with three clasps from his own Government, besides the Sardinian and Turkish medals. He was in command of the forces in New Zealand during the war of 1863–65, with the local rank of lieutenant-general, where he distinguished himself; was appointed colonel of the Forty-second Highlanders in 1863, lieutenant-general in 1868, and general in 1874; governor of the Royal Military Academy at Sandhurst 1868–75; was nominated a K. G. C. B. in 1873. D. June 8, 1888.

Cameron, Henry Clay, Ph. D., D. D.: b. at Shepherdstown, Jefferson co., Va., Sept. 1, 1829; graduated at the College of New Jersey in 1847, and at the Princeton Theological Seminary in 1855; was appointed Adjunct Professor of Greek in 1855, and professor in 1861, at the College of New Jersey; was licensed to preach in 1859, and ordained as an evangelist in the Presbyterian (O. S.) Church Feb. 1, 1863; was appointed a member of the board of visitors of the U. S. Military Academy at West Point in 1876, and has contributed largely to various magazines and periodicals.

Cameron, James: brother of Simon Cameron; b. at Maytown, Pa., Mar. 1, 1801; learned the trade of a printer; subsequently became an editor; studied law. He entered the army at the beginning of the civil war as colonel of the Seventy-ninth New York Highlanders. In the battle of Bull Run, July, 1861, he was killed while gallantly leading his men in a charge.

Cameron, James Donald: eldest son of Simon Cameron; b. at Harrisburg, Pa., May 14, 1833; graduated at Princeton College in 1852; has since been interested and identified with the development of the coal, iron, lumber and manufacturing interests of Pennsylvania; residing at Harrisburg; was cashier, and afterward president, of the Middletown bank; in 1861 was made vice-president, and in 1863 president, of the Northern Central R. R., which position he held until his resignation in 1874, being then succeeded by Thomas A. Scott. This road was of great service to the Government during the war (although several times cut by the Confederates) as a means of communication between Pennsylvania and the national capital viâ Baltimore, and after the war, under Mr. Cameron's administration, it was extended to Elmira, so as to realize its original purpose of forming a direct communication from the lakes to tidewater at Baltimore. He was always an active Republican; on May 22, 1876, was appointed Secretary of War in President Grant's administration, and in 1877 succeeded his father in the Senate; re-elected 1885 and 1890.

Cameron, John: leader of the Cameronites; b. in Glasgow, 1579; educated there; was professor and pastor in Bordeaux, 1600–18; Professor of Theology at Saumur 1618–20; principal of the University of Glasgow 1622; returned to Saumur 1623; Professor of Divinity at Montauban 1624. D. at Montauban, 1625. "He devised a method,"

says Mosheim, "of uniting the doctrines of the Genevans, as expounded at Dort, with the views of those who hold that the love of God embraces the whole human race." His adherents have sometimes been called Hypothetical Universalists.

Cameron, Matthew Crooks: Canadian jurist; b. in Dundas, Ont., Oct., 2, 1822; educated at Upper Canada College, and admitted to the bar in 1849. He was elected to the Assembly in 1861; entered the Sandfield Macdonald cabinet as Provincial Secretary and Registrar in 1863; in 1871 became commissioner of crown lands; and after the fall of the Government he led the Conservative opposition in the House for four years. He was appointed puisne judge, court of queen's bench, in 1878, and chief justice, court of common pleas, in 1884. Neil Macdonald.

Cameron, Richard: a Scottish minister; b. at Falkland; popularly considered the founder of the sect of Cameronians or "Covenanters," i. e. Reformed Presbyterians (*q. v.*), who disown the epithet. He was not a university-trained man, but was gifted with eloquence. His regular occupation was that of teacher till his licensure. He strenuously opposed the measures by which the Government endeavored to establish the Episcopal Church in Scotland, and persisted in preaching in fields, which was prohibited by law. In June, 1680, he, with about twenty armed adherents, entered the town of Sanquhar, and formally renounced their allegiance to Charles II. He was killed in a fight with the royal troops in Ayrsmoss, Ayrshire, July 22, 1680.

Cameron, Simon: a U. S. Senator; b. in Lancaster co., Pa., Mar. 8, 1799. His youth was obscure, but he learned the printer's trade; edited papers in Doylestown and Harrisburg; then became interested in the mineral industries and railway development of the region about him, acquiring great wealth. He was elected Senator of the U. S. by the Democrats in 1845; having joined the Republican party, he was re-elected a Senator in 1856. He was Secretary of War from Mar., 1861, to Jan., 1862, and as such advocated the military employment of slaves; was then sent as minister to Russia, from which he returned in 1863. In 1866 he was again elected to the Senate of the U. S., where he was retained until 1877, when a timely resignation secured the succession to his son, James Donald. His control of his party in Pennsylvania was nearly absolute. D. June 26, 1889.

Cameron, Verney Lovett: traveler; b. in Weymouth, Dorsetshire, England, June 1, 1844; entered the navy in 1857; was made a commander in 1879. From 1872 to 1876 he conducted, under the auspices of the Royal Geographical Society, a comprehensive exploration of the interior of Africa, and made important discoveries in the region of the great lakes. In 1878 he made a journey through Asia Minor and Persia, to ascertain whether a railway could be built from the Mediterranean to India. In 1882, with Sir Richard Burton, he made explorations in the African interior from the Gold Coast. He published *Across Africa* (1876); *Our Future Highway* (1880); *To the Gold Coast for Gold* (1883), with Burton; and books for boys. D. Mar. 26, 1894.

Camero'nians: the followers of Richard Cameron, who in 1680 made a public declaration that Charles II., by his suppression of civil and religious liberty, had forfeited all right to the crown. They were also called Covenanters, from their having demanded the strict observance of the Solemn League and Covenant received by the Parliament in 1643. The Cameronians still exist, both in Great Britain and in America, under the name of Reformed Presbyterians (*q. v.*). See also Presbyterian Church and Covenanters.

Cameronites: See Cameron, John.

Cameroons' (German, *Kamerun*): a colonial district, river, and group of mountains in tropical West Africa, on the Bight of Biafra. The district extends along the coast from Old Calabar in about lon. 7° E. to Cape Campo, about 2° 15′ N., making a coast-line of about 120 miles. On the northwest it joins the English Niger Territory, the boundary running from Old Calabar, or Rio del Rey, N. E. to Yola, on the Benue. The southern boundary follows the Campo river to its extreme southern bend, thence eastward on a parallel. The eastern boundary may be taken at the meridian 15° E. The area included is estimated at 130,000 sq. miles. It has been under German protection since 1884. The population is about 2,600,000. In 1890 there were 105 whites in the district, 65 being German. The country is fertile, and an active trade is carried on in ivory and palm-oil. The Deutsche Plantagen-Gesellschaft has recently established plantations for cacao and tobacco. The revenue for 1890, chiefly derived from a duty on imports, was $72,000. The chief towns are Cameroons (opposite Fernando Po island), Bimbia (near the preceding), and Batanga and Bakundu, farther south. Cameroons river is properly an estuary formed at the common mouths of the Mungo and other smaller streams. It is in lat. 4° N. The principal river of the district is the Mbam, which enters the Bight of Biafra, about one degree farther south. The Cameroons Mountains are an isolated group, the highest in West Africa, standing immediately on the coast to the north of the Cameroons estuary. They are volcanic, and culminate in twin peaks reaching a height of 13,000 or 14,000 feet.

M. W. H.

Camil'la: a fabulous Italian virgin celebrated for swiftness of foot; was said to be a daughter of the Volscian King Metabus, and aided Turnus against Æneas.

Camillus, Marcus Furius: Roman dictator and patrician, who became a tribune in 403 B. C. He was chosen dictator in 396, and soon captured Veii. About 390 he was exiled, and retired to Ardea. When Brennus and the Gauls had captured Rome in 390 B. C., Camillus was recalled and appointed dictator. According to the popular tradition, which is perhaps mixed with fable, he defeated the Gauls, and afterward gained victories over the Volsci and other enemies. In 367 he was chosen dictator for the fifth time. D. in 365 B. C. See Plutarch's *Life of Camillus*; Arnold's *History of Rome*.

Cam'isards: insurgent French Protestants who lived in the Cévennes, the mountain-range in the south of France, in the first decade of the eighteenth century; so named from the *camise* or loose outer garment which they wore. They strove to obtain the religious liberty which had been sacrificed by the Revocation of the Edict of Nantes, and they fought under the pressure of a religious hysteria which made them almost invincible. The plan of the Government was extermination, but the first marshal, Montrevel (1703), was only partially successful; the second, Villars (1704), tried diplomacy with good effect, and induced many to lay down their arms; while the third, Berwick (1705), by overwhelming force, desolated the province and drove the remaining insurgents into exile. The leader of the Camisards was Jean Cavalier, a journeyman baker, b. at Ribaute, Languedoc, Nov. 28, 1681; took command in 1702; after his crushing defeat in 1704 he entered the military service of the Duke of Savoy; lived in Ireland 1709–27, then in England, and died in Chelsea, near London, May 17, 1740. When Louis XIV., in 1715, announced the complete extinction of the heresy, a large portion of Languedoc had been transformed into a desert. See Mrs. A. E. Bray, *Revolt of the Protestants of the Cévennes* (London, 1870).

Camlet: a fabric originally made of camel's hair; in more recent times of the hair of the Angora goat. It is also made of wool, or a mixture of wool with other materials. Camlets are mentioned in Marco Polo's narrative as among the articles manufactured in Tibet.

Camoëns, kăm′ō-ens, or **Camœs**, kăă-moiñs′, Luis, de: Portugal's greatest epic and lyric poet; b. of a noble family, most probably at Coimbra, in 1524. From 1537–42 he studied the classics and modern literatures at the university of his native city, and it was during this time that he first conceived the idea of celebrating in verse the great deeds of the Portuguese nation. From Coimbra he went to Lisbon, where, a few years later, he was received at court, and by his uncommon attainments, his wit, and his poetical talent, bade fair to win for himself rapid advancement. But the enmity engendered by his passion and suit for Donna Catherina de Ataide, a noble lady in attendance upon the queen, caused his banishment from the city. He joined the army of Africa at Ceuta, and it was during this time that he lost the sight of his right eye. He returned to Lisbon in 1550, but owing to his imprudent conduct was forced to embark for India in 1553. A satire against the corruption of the Portuguese in India caused his banishment from Goa to Macao in 1556. While in this latter place he is supposed to have written the first six cantos of his great epic poem *The Lusiads*. In 1560 he was back in Goa, and in 1570, after an exile of seventeen years, during which the lady of his affections had died, he returned to his native land, with no other possession than the precious manuscript of *The Lusiads*.

Though the publication of his poem in 1572 was attended by great success, and his name was on the lips of all, he was allowed to pass his later years in the greatest poverty. D. June 10, 1580.

Camœs's merit as a poet is as great in his lyric productions as in his epic poem *The Lusiads* (Os Lusiadas), but it is by this latter work which, commemorating as it does the great achievements of the Portuguese nationality, constitutes the bond of the moral unity of the Portuguese people, that he has become the principal representative of Portuguese literature. The best edition of his works is by the Visconde de Juromenha, *Obras de Luis de Camœs* (Lisbon, 1860–69, 6 vols.). The best English translation is by Richard F. Burton, *Camœns: His Life and his Lusiads* (London, 1881, 2 vols.); and *Camœns: The Lyricks: Englished by R. F. Burton* (London, 1884, 2 vols.). The latest life is by Wilhelm Storck (Paderborn, 1890). HENRY R. LANG.

Camomile, or **Chamomile**: a name given to several herbs of the family *Compositæ*, but especially to *Anthemis nobilis* and *Matricaria chamomilla*. Both European herbs closely resemble each other, and are nearly identical in order and properties, though the latter is milder, and in Germany is more generally esteemed as a medicine. The one first mentioned is common in gardens in the U. S. Camomile is much used in domestic medicine, has tonic, stimulant, and diaphoretic powers, and was once used as a febrifuge. Its smell is agreeable, and depends upon the presence of a volatile oil. The camomile flowers imported from Great Britain are of the first, those from Germany of the second, species. They are largely, but illegally, used in the British islands in flavoring beer—a practice which is said to be injurious to health.

Camor'ra: the name of a secret society of outlaws and robbers called *Camorristi* who infested the former kingdom of Naples. This society had a rendezvous in every large town. Under the Bourbon dynasty its members openly presented themselves at markets and public spectacles, where they extorted a portion of the money that passed from hand to hand. They were also addicted to violent crimes, and could be hired to commit murder. The society was thoroughly organized and subject to strict discipline. Candidates for membership were not admitted until they had passed through a probation for a year, and given proofs of courage and obedience. They are said to have been tolerated by King Ferdinand II., but Francis II. vainly endeavored to suppress them. They aided the Garibaldians in expelling the Bourbons from Naples, but continued their depredations under the new government of Italy. See Umilta, *Camorra et Mafia* (Neuchâtel, 1878).

Camp [Fr. *camp*, from the Ital. or Picard form of Lat. *campus*, field, training-ground; cf. *Campus Martius*. The inherited Fr. form is *champ*]: in a general sense the ground (constructions included) upon which tents, huts, etc., are erected for the shelter of any collection of human beings; in a military sense, that occupied by an army under tents or temporary shelter in the field. It is usually distinguished from *bivouac* by the use of shelter (such as tents), as distinguished from passing the night in the open air (*à la belle étoile*). More exclusively yet, the ground and shelter of an army in *tents*; but in the *Army Regulations* of the U. S. a camp is the place where troops are established in tents, in huts, or in bivouac. The Roman camp (Lat. *castra*, a word which in the form of the termination *cester* or *chester* indicates the origin of numerous English towns, as arising from a Roman camp, and to which also are due the words *château* and *castle*), described with great detail in most cyclopædias, was in reality an *intrenched camp*. (See Bardin, *Dictionnaire de l'Armée de Terre*). Such were constructed in the heart of invaded countries to secure for the troops a place of retreat, to control the district, to provide secure dépôts for provisions of all kinds, and to protect the communications with the frontier. A Roman army might occupy its camp several winters. In the meantime it sallied forth to resume its operations. Most commonly, when the legions had thus vacated them to undertake long marches, *veterans* remained behind to guard the ramparts, and thus became a kind of permanent garrison, which, by intermarriage, gave origin to a town or colony; e. g. the English "Chesters" and the German Cologne or Köln (*Colonia*).

The Romans necessarily had, besides these, temporary camps, sometimes of huts, but more generally tents of skins of animals. The details of these Roman camps are of little interest (unless to antiquarians); neither indeed, except to soldiers, are those of the modern military camp. Its arrangements (as practiced in the U. S.) are set forth in the *Army Regulations*. Strictly speaking, the arrangements of a camp for a regiment of infantry or cavalry are governed purely by considerations of discipline and administration. The encampment of an army must indeed be sedulously governed by tactical considerations, such as the defense of the position and the formation of line of battle, the character of the issues, the approaches, etc. But these arrangements belong to "Tactics." An INTRENCHED CAMP (*q. v.*) is a fortified position of greater or less extent, usually of field-works to be occupied during a campaign or the duration of a war.

Campan, kăñ'păñ', JEANNE LOUISE GENEST: b. in Paris, Oct. 6, 1752; reader to the daughters of Louis XV., and a companion and friend of Marie Antoinette. After the Revolution she was a teacher, and head of the institution at Ecouen for the daughters of the officers of the Legion of Honor. D. May 16, 1822. She wrote, among other works, *Memoirs of the Private Life of Marie Antoinette* (1823) and *Correspondence with Queen Hortense* (1824).

Campana, FABIO: See the Appendix.

Campanel'la, TOMMASO: Italian philosopher and Dominican monk; b. in Stilo, Calabria, Sept. 5, 1568. He published, in Naples, in 1591, *Philosophy Demonstrated by the Senses*, which opposed the scholastic philosophy and gave offense to the partisans of Aristotle. On a charge of heresy and conspiracy against the Spanish Government he was in 1599 committed to prison in Naples, where he was confined about twenty-seven years, during which he wrote several works. Pope Urban VIII. procured his release in 1626. Campanella, after passing several years in Rome, retired to France in 1634, in order to avoid the renewed persecution of the Spaniards. He was kindly treated by Cardinal Richelieu. Among his important works are *Civitas Solis*, etc. (The City of the Sun, or the Idea of a Philosophic Republic, 1623); *The Five Parts of Rational Philosophy* (1638); and a *Discourse on the Spanish Monarchy* (in Latin, 1640). D. in Paris, May 21, 1639. His complete works were published in Turin 1854, 2 vols. His sonnets were translated by J. A. Symonds (in vol. with Buonarrotti, London, 1878). See his *Life* by M. Baldacchini (Naples, 1840) and L. Amabile (Naples, 1883, 3 vols.).

Campanha, kăăm-paan'yăă: a town of Brazil; in the state of Minas Geraes, about 156 miles N. W. of Rio de Janeiro (see map of South America, ref. 7–G). It has several churches, a hospital, and a theater. Gold is found in the vicinity. Pop. 7,000.

Campa'nia: a province of ancient Italy; bounded N. E. by Samnium, E. and S. by Lucania, S. W. by the Mediterranean, and N. W. by Latium. The Apennines extended along the northeast border. Between these mountains and the sea was an extensive and very fertile plain, which was the *Regio felix* of the Romans. It was traversed by the Appian Way (*Via Appia*), the greatest thoroughfare of ancient Italy. In all its conquests and mutations the basis of population remained Oscan, and hence came the present knowledge of that language. From its town Atella arose a popular form of ancient drama. (See ATELLANÆ FABULÆ.) Its principal cities were Capua, Pompeii, Neapolis (Naples), Cumæ, Salernum, and Herculaneum. Among its physical features was Mt. Vesuvius. It embraces the modern provinces of Benevento, Naples, Principato Citeriore, Principato Ulteriore, and Terre di Lavoro, with an area of 6,948 sq. miles and a population (1890) of 3,045,471.

Campanile, kăăm-pa-nee'lā [Ital., bell-tower, steeple, from Med. Lat. *campa'na*, bell]: a bell-tower; especially a detached belfry adjacent to a church. Italy possesses many such, some of them dating from the eighth century. They are often of brick, square in ground plan and capped by a low spire. Among the finest are the campanile of St. Mark in Venice, the "leaning tower" of Pisa, the exquisite marble tower at Florence, designed, in part at least, by Giotto, and the Giralda at Seville, Spain. A. D. F. HAMLIN.

Campanini, kăăm-pa-nee'nĕe, ITALO: singer; b. in Parma, Italy, in 1846. He was the son of a blacksmith. At fifteen he was a soldier in Garibaldi's army, serving in two campaigns, in which he was badly wounded. After the war he returned to the forge, and worked until he was eighteen years old. A singing-teacher who admired his voice gave him lessons. Campanini studied a year at the Parma Conservatory, and soon after appeared as the Notary in *La*

Sonnambula. He failed, and was laughed off the stage. He joined a traveling company, and saved a little money, which he devoted to taking lessons from Lamperti, the singing-teacher of Milan. He was engaged at La Scala, Milan, and sang in *Faust* with success. He appeared in London in 1872, and in 1873 visited the U. S. with the Nilsson Company, under the management of Strakosch, appearing in November at the Academy of Music in *Lucrezia Borgia*. He sung both in concert and in opera in the principal cities of the U. S. and of Europe, and for some years was considered the greatest of living tenors. Subsequently he suffered from an affection of the throat, which somewhat impaired his voice. He was an ardent, painstaking student. In one season he sang in opera 100 times, took part in a number of rehearsals, besides singing the *Stabat Mater* seven times and assisting at a number of concerts in Boston, New York, and Cincinnati. His voice was of large compass, and of singular purity and sweetness of tone. D. at his estate near Parma, Nov. 23, 1896. B. B. VALLENTINE.

Campanology: See BELL and BELL-RINGING.

Campan'ula [mod. dimin. from Med. Lat. *campa'na*, bell]: a genus of hardy herbaceous plants, the type of the family *Campanulaceæ*. The genus is characterized by a bell-shaped, five-lobed corolla, five stamens, the filaments of which are dilated at the base, and a top-shaped capsule, with two to five cells opening by lateral clefts. It comprises numerous species, with beautiful blue or white flowers, to many of which the common name of bell-flower is given. Among the remarkable species are the *Campanula medium* or Canterbury bell, a native of Europe, and the *Campanula rotundifolia*, or harebell, which is indigenous both in Great Britain and the U. S.

Campanula'ceæ: See BELLWORTS.

Campbell, ALEXANDER: theologian and author; the originator (with his father, Thomas Campbell) of the movement known as the "Disciples of Christ" or "the Current Reformation"; b. in the county of Antrim, Ireland, Sept. 12, 1788. After a course in Glasgow University, Scotland, he migrated to this country in 1809, and settled in Washington, Pa., where his father, who had preceded him two years, had located. Both were ministers of the Presbyterian Church, and united in pleading for Christian union and the restoration of primitive Christianity. By force of his learning and ability, Alexander Campbell soon became the recognized leader of the reformation. His bold renunciation of many of the cherished doctrines of the times brought him into conflict with many of the leading men of his day. He held religious debates with Robert Owen, the skeptical socialist; Archbishop Purcell, of the Roman Catholic Church; Dr. N. L. Rice, of the Presbyterian Church; all of which were reported and are among his published works. Besides these he held other religious discussions with less noted men. From 1823 to 1830 he published a monthly magazine called *The Christian Baptist*, and continued it from 1830 to 1863 as the *Millennial Harbinger*. Bethany College, of which he was president until his death, was founded by him in 1841 at Bethany, West Va. Among his numerous published works are *Christian System*; *Christian Preacher's Companion, or Infidelity Refuted by Infidels*; *Living Oracles*; *The New Testament, with Notes and Introduction*; *Christian Hymn-book*; *Christian Baptism, its Antecedents and Consequents*; *Popular Lectures and Addresses*; *Lectures on the Pentateuch*, etc.—in all, about sixty volumes. D. in Bethany, West Va., Mar. 4, 1866. At the time of his death the religious body which he and his father originated, and of which he was the leading spirit, numbered over 400,000 communicants. For the leading features of this movement, see DISCIPLES OF CHRIST.

J. H. GARRISON.

Campbell, Sir ALEXANDER: Canadian statesman; b. in Yorkshire, England, Mar. 9, 1822; removed to Canada when a boy; was educated at Kingston and the College of St. Hyacinthe; admitted to the bar in 1843, and became dean of the faculty of law in Queen's University in 1860. He represented Cataraqui in the Legislative Council of Canada from 1858 till 1867; was Speaker of that body 1862–63; commissioner of crown lands and member of executive council 1864–67; and a member of the Quebec conference in 1864. He was Postmaster-General from 1867 until 1873, when he became Minister of the Interior, a portfolio which he resigned the same year on the fall of the Macdonald government. He was appointed Postmaster-General in 1878; Minister of Militia and Defense Jan. 16, 1880; Postmaster-General Nov. 8, 1880; Minister of Justice May 20, 1881; and again Postmaster-General 1885–87. He was called to the Senate in 1867, and was leader of the Government in that body from 1879 until his retirement in 1887. He received the honor of knighthood in 1879; was chairman of the commission to consolidate and revise the statutes of Canada in 1883; and was appointed Lieutenant-Governor of Ontario June 1, 1887. He represented Canada in the imperial federation conference in London in 1887. D. in Toronto, May 24, 1892.

Campbell, ARCHIBALD: soldier and engineer; b. 1813 in New York; graduated at West Point 1835; served while in infantry at frontier posts till he resigned Sept. 30, 1836. Civil engineer 1837–44; chief clerk U. S. War Department 1846–49 and 1853–57; commissioner to establish the Northwestern boundary of the U. S. between Washington Territory and British America 1857–69, and to run 49th parallel from Lake of the Woods to Rocky Mountains 1872. D. July 27, 1887.

Campbell, BARTLEY: See the Appendix.

Campbell, CHARLES: See the Appendix.

Campbell, Sir COLIN (*Lord Clyde*): general; b. in Glasgow, Scotland, Oct. 20, 1792. He entered the army in 1808; served in the Peninsular war (1809–14), and was badly wounded at the passage of the Bidassoa. In 1842 he obtained the rank of colonel, having been on garrison duty in many parts of the world. He served with distinction in China 1842; in the Sikh war 1848; on the Peshawur frontier in India; was appointed in 1854 to the command of the Highland brigade, which he led at the battles of Alma and Balaklava in the Crimea, where his brilliant repulses of attacks on his front were of highest tactical value. In 1855 he was raised to the rank of major-general and created a Knight Grand Cross of the Bath. He was appointed in July, 1857, commander of the army in India, then fighting against the mutinous Sepoys. He reached Calcutta Nov. 17, 1857, with 4,700 men, relieved Lucknow on the 22d, and on Dec. 20, 1858, announced the end of the revolt. For his services in India he was raised to the peerage as Baron Clyde in July, 1858. On his return home he was made field-marshal and granted an annuity of £2,000. D. Aug. 14, 1863, and was buried in Westminster Abbey. See his *Life* by Gen. Shadwell (1881).

Campbell, DOUGLAS: lawyer and historical writer; b. July 13, 1840, at Cooperstown, N. Y.; educated at Union College, Andover Theological Seminary, Harvard Law School, and Albany Law School; captain of the 121st New York Volunteers in the Union army; practiced law with success in New York 1865–90, when he was compelled to retire on account of infirmities contracted in the war. His family has resided since 1741 in Cherry Valley, N. Y.; Col. Samuel Campbell commanded at the battle of Oriskany, and, in revenge for his services, the Indians and Tories perpetrated the massacre of Cherry Valley in 1778; William W. Campbell, father of Douglas, was a judge of the Supreme Court and author of *The Annals of Tryon County*. Douglas Campbell inherited a taste for historical study, which he always cultivated, and as the results of which he published in 1892 *The Puritan in Holland, England, and America*. D. in Schenectady, N. Y., Mar. 7, 1893.

Campbell, DOUGLAS HOUGHTON, Ph. D.: botanist; b. in Detroit, Mich., Dec. 16, 1859; educated in the universities of Michigan, Bonn, and Tübingen; Professor of Botany in Indiana University 1888–91; now Professor of Botany in Stanford University. He has written many papers on the structure and development of ferns and their allies, including *The Development of the Ostrich Fern* (1887); *The Development of Pilularia globulifera* (1888); *Development of the Prothallium and Embryo of Osmunda* (1892). In 1890 he published *Elements of Structural and Systematic Botany*.

CHARLES E. BESSEY.

Campbell, Sir GEORGE: statesman; b. in 1824; educated at Edinburgh, St. Andrews, and Haileybury; entered the civil service of India in 1842; has held various offices in connection with the Government of India; has served several terms as member of Parliament. Author of *Modern India* (1852); *India as It May Be*; *Handy Book of the Eastern Question* (1876); *White and Black in the United States*; and *The British Empire* (1889). D. in London, Feb. 18, 1892.

Campbell, GEORGE WASHINGTON: b. in Tennessee in 1768; graduated at Princeton in 1794; member of Congress 1803–

09; U. S. Senator (1811–14 and 1815–18); Secretary of the Treasury in 1815; minister to Russia in 1818. D. in Nashville, Feb. 17, 1848.

Campbell, James Valentine, LL. D.: jurist; b. in Buffalo, N. Y., Feb. 25, 1823; graduated at St. Paul's College, Long Island, 1841; admitted to the bar in 1844. He was elected a judge of the Supreme Court of Michigan in 1857, and continued there by re-elections until his death. For more than twenty years he was Professor of Law in the Law School of Michigan University. He was the author of the *Political History of Michigan*. D. in Detroit, Mich., Mar. 26, 1890. Henry Wade Rogers.

Campbell, John, Lord: Lord Chancellor of England; b. in Fifeshire, Scotland, Sept. 15, 1779; was called to the English bar in 1806; obtained an extensive practice. In 1830 he became a Whig member of Parliament, and in 1834 attorney-general. He was made chancellor of Ireland and a peer of the United Kingdom in 1841; appointed chief justice of the court of queen's bench in 1850; Lord Chancellor of England in 1859. He published *Lives of the Lord Chancellors and Keepers of the Great Seal of England* (7 vols., 1846), which obtained much popularity, notwithstanding that it was full of the author's prejudices and vanity—its inaccuracies were exposed by Sugden (Lord St. Leonards); and *Lives of the Chief Justices of England* (3 vols., 1849–57). D. June 23, 1861. See *Life* by his daughter (1881).

Campbell, John: Canadian Presbyterian minister; b. in Edinburgh, Scotland, June 18, 1840; studied at University of Toronto and at New College, Edinburgh; became minister of the Charles Street church, Toronto, 1868; Professor of Church History and Apologetics in the Presbyterian College, Montreal, 1873. He wrote *The Hittites* (New York, 1891, 2 vols.).

Campbell, John A.: jurist; b. in Washington, Ga., June 24, 1811; son of Duncan G. Campbell, a distinguished lawyer of that State. He was educated in the Georgia University, where he graduated with distinction in 1826, and was admitted to the bar by special act of the Legislature in 1829, some time before his majority. He moved to Alabama, where he soon took high rank in his profession; was appointed associate justice of the U. S. Supreme Court by President Pierce in 1853. This position he resigned in 1861, after the outbreak of the conflict between the two sections. While he had opposed the policy of secession, he yet believed in its rightfulness, and aided its promoters while in office in Washington. He was afterward appointed assistant Secretary of War of the Confederate States. He was one of the commissioners appointed by Mr. Davis to meet Mr. Lincoln and Mr. Seward at the Fortress Monroe conference in Feb., 1865. After the fall of Richmond and the surrender of the Southern arms, he was arrested and imprisoned for some time at Fort Pulaski, but was finally discharged on parole. He subsequently resumed the practice of law. D. in Baltimore, Md., Mar. 12, 1889.

Campbell, John Francis, of Islay: b. Dec. 29, 1822; educated at Eton and University of Edinburgh; held civil service offices; d. in Cannes, France, Feb. 17, 1885. He published *Popular Tales of the West Highlands* (4 vols., Edinburgh, 1860–62), a remarkable contribution to Gaelic folklore, and began in 1872 to issue Gaelic texts as *Leabhair na Feinne*. He was given also to mechanical inventions and experiments in physics, about which he published books.

Campbell, John McLeod: b. at Ardmaddy House, near Kilninver, Argyleshire, Scotland, May 4, 1800; d. at Rosneath, Feb. 27, 1872. He studied theology in University of Glasgow 1811–20: was licensed to preach in 1821; inducted to the parish of Row on Sept. 8, 1825; in 1831 was tried for heresy by the Assembly, convicted, and deposed, having preached the doctrine of unlimited atonement. He returned to Kilninver and preached there for some time, but began in 1833 an independent ministry at Glasgow, which he continued for twenty-six years, to 1859. The last years of his life he spent in studious retirement, partly at Glasgow and partly at Rosneath. His views of the atonement he set forth in his *Christ the Bread of Life* (1851; 2d ed. 1869); and *The Nature of the Atonement* (1856; 4th ed. 1873). He also wrote *Reminiscences and Reflections*, published after his death (1873), and referring to his ministry in the parish of Row. See D. Campbell, *Memorials of John McLeod Campbell* (2 vols., London, 1877). Revised by J. W. Chadwick.

Campbell, Lewis, M. A., LL. D.: professor of Greek; b. Sept. 30, 1830; educated at Edinburgh Academy and Glasgow University, and Trinity and Balliol Colleges, Oxford; at the latter under Dr. Benjamin Jowett; ordained 1857; Professor of Greek in the University of St. Andrews 1863; author of numerous works on classical subjects, the most important of which are *The Theætetus of Plato*; *The Sophistes and Politicus of Plato*; *Sophocles—The Plays and Fragments*; *Sophocles*, in Macmillan's series of Classical Writers (1879). Prof. Campbell is a cousin of Campbell the poet.

Campbell, Thomas: poet; b. in Glasgow, Scotland, July 27, 1777. He was educated at the university of his native city, and became a good classical scholar. He produced in 1799 his excellent didactic poem *The Pleasures of Hope*. During a visit to the Continent he witnessed the battle of Hohenlinden, Dec., 1800, on which he composed a lyrical poem of great celebrity. He soon afterward published short poems entitled *The Exile of Erin* and *Ye Mariners of England*. Having married his cousin, Miss Sinclair, he removed to London in 1803, and adopted literature as a profession, receiving a £200 pension from the Government. In 1809 he produced *Gertrude of Wyoming*, which is generally and greatly admired. He became editor of the *New Monthly Magazine* in 1820, and was elected lord rector of the University of Glasgow in 1827. He published, besides other works in prose, *The Life and Times of Petrarch* and a *Life of Frederick the Great*. Among his finest poems is *The Battle of the Baltic*. D. in Boulogne, June 15, 1844, and was buried in Westminster Abbey. See *Life and Letters of Thomas Campbell*, by William Beattie (3 vols., 1850).

Campbell, William Wilfred: See the Appendix.

Campbell-Bannerman, Henry: English public man; b. 1836; second son of Sir James Campbell of Stracathro; educated at the universities of Glasgow and Cambridge; assumed the name of Bannerman in 1872 in compliance with the wish of his uncle; entered Parliament 1868; financial secretary at the War Office 1871–74 and 1880–82; secretary to the Admiralty 1882; Chief Secretary for Ireland 1884–86; Secretary of State for War in Mr. Gladstone's cabinet in 1886 and again in 1892.

Campbellford: village of Northumberland co., Ontario, Canada; on Belleville branch of Mid. Div. of Gr. Tr. Ry.; 33 miles S. E. of Peterborough (see map of Ontario, ref. 3–F); has five churches, high school, foundry, cabinet-works, large woolen mills, and paper and grist mills. Pop. (1881) 1,418; (1891) 2,424; (1893) estimated, 2,200.

Editor of "Herald."

Campbellites: See Disciples of Christ.

Campbell's Station: on railroad; Knox co., Tenn. (for location of county, see map of Tennessee, ref. 6–I). Here Gen. Burnside's army was attacked Nov. 16, 1863, by the Confederates under command of Gen. Longstreet. The engagement lasted from noon till dark, the Confederates being repulsed. Pop. of dist. (1880) 2,116; (1890) 2,361; (1900) 2,095.

Campbeltown: a royal borough and seaport of Scotland; in the county of Argyle; near the south end of the peninsula of Cantire; 65 miles W. S. W. of Glasgow (see map of Scotland, ref. 13–D); has a good harbor on the east coast of Cantire, sheltered by Davarr island; is the chief town in Argyleshire; a favorite resort in summer. Here are more than twenty distilleries of whisky. Pop. (1891) 8,235.

Campeach'y, or **Campeche**, kăăm-pā'chā: a state of Mexico: bounded N. by Yucatan, E. by the Caribbean Sea, S. by Belize and Guatemala, and W. by the Gulf of Campeachy. Area, 18,087 sq. miles. Many ruins of ancient cities have been found in this province. Chief town, Campeachy. Pop. (1895) 88,121.

Campeachy, or **Campeche**: a city and principal seaport of Yucatan; situated on the Gulf of Mexico and the west coast of Yucatan peninsula; 90 miles S. S. W. of Mérida; lat. 19° 50′ N., lon. 90° 33′ W. (see map of Mexico, ref. 7–K). It contains many good stone houses, a college, about six churches, several convents, and a theater. The harbor is capacious, but shallow. Logwood, wax, cigars, and palm-leaf hats are exported from this port. Pop. 18,000.

Campeachy Wood: a name of Logwood (*q. v.*).

Camper, Pieter: b. in Leyden, May 11, 1722; d. at The Hague, Apr. 7, 1789. He received a liberal education, studied medicine, cultivated the fine arts, especially drawing and painting, and traveled in England, France, and Italy. In 1750 he was appointed Professor of Medicine at Franeker, in 1755 at Amsterdam, and in 1765 at Groningen; but in 1773 he resigned his post and retired into private life, re-

siding first on his estate near Franeker, afterward at The Hague, and devoting himself partly to scientific studies and partly to politics. His papers on anatomy, surgery, obstetrics, and medical jurisprudence are numerous and valuable. In 1761 he discovered the auditory organs of fishes, and in 1771 the presence of air in the bones of birds. He was the first to dissect an orang-outang, and wrote a book on the anatomy of the elephant. Very interesting are also those papers and treatises of his in which he applies his anatomical knowledge to art, more especially his *Dissertation physique*, in which he sets forth his theory of the facial angle, and applies it both to nature and to art.

Cam'perdown (in Dutch *Camperduin*, or *Kamp*): village of Holland; 27 miles N. W. of Amsterdam (see map of Holland and Belgium, ref. 4–E); famous for the victory gained off its coast by the British under Admiral Duncan, over the Dutch, commanded by Admiral de Winter, Oct. 11, 1797.

Campero, Narciso: Bolivian soldier and statesman; b. at Tojo, now in Argentina, 1815. He was educated partly in Europe, and traveled extensively; in the Bolivian army he attained the rank of brigadier, and was Minister of War for a short time in 1872. After the fall of Daza he was elected president of Bolivia, Apr. 9, 1880, and commanded the combined forces of Bolivia and Peru in the Tacna campaign; defeated at the battle of Tacna (May 26, 1880), he fell back with the Bolivian forces to La Paz. Campero's administration was a quiet one internally.

Herbert H. Smith.

Camphene, or **Camphine**: purified oil of turpentine, obtained by rectifying it over dry chloride of lime. Camphene has been burned in lamps for the purpose of illumination, but, many fatal accidents having resulted from its use, it has been superseded by coal oil or rectified petroleum.

Camphilene: a name that has been applied to two different things. One is a compound formed when hydrochloric acid gas is passed into oil of turpentine. This is a solid that resembles camphor in its odor, appearance, and volatility, and is hence called "artificial camphor." The other compound, called camphilene, is one of the "terpenes."

Cam'phogen [from *camphor* + *-gen*, producing (Gr. γεννάω), because obtained from camphor]: a synonym of Camphene (*q. v.*).

Camphor [Lat. form which has displaced the older *camphire*, viâ Fr. from Arab. *kāfūr*]: a stearopten or crude volatile oil possessing the nature of a ketome and obtained from *Cinnamomum camphora*, a handsome laurel from 25 to 30 feet in height, with evergreen, shiny leaves. Every part of the tree possesses a camphoraceous odor and taste, but gum camphor is obtained from the root, trunk, and limbs by hacking the wood into chips and then boiling these chips with water in a covered vessel lined with straw, and on this straw the gum camphor condenses. In commerce Japan or tub-camphor comes in tubs containing about 125 lb. It occurs in white granular masses, and these have a purplish or reddish tint. The camphor which comes from Formosa is usually packed in chests lined with lead. Refined gum camphor occurs in large, somewhat convex cakes with a round hole in the center made by the aperture of the vessel in which it is sublimed. The drug is soluble in alcohol. It is somewhat translucent yet opaque, and contains numerous fine fissures. It is quite tough, and can not be pulverized except it be moistened with alcohol, chloroform, ether, or some one of the volatile oils. Exposed to the air it rapidly evaporates, and if lighted burns with a very dense smoke. If a piece of camphor is thrown upon the surface of water it develops a peculiar rotatory motion, which is probably due to its rapid evaporation and slow solubility in water. Its chemical formula is $C_{10}H_{16}O$.

The word camphor has been applied to other crystallizing stearoptens derived from volatile oils. Under the name of *Oleum camphoræ* there was officinal in the U. S. Pharmacopœia of 1870 a camphor oil of Formosa obtained in the course of the preparation of crude gum camphor. This oil is a dark yellow or light brown in color, tasting and smelling something like camphor itself. Another form of camphor is Borneo or Sumatra camphor, sometimes called Barus camphor, which is found in cracks of the wood of *Dryobalanops camphora*. It differs in odor slightly from ordinary camphor. In order to obtain it the tree is cut down, and owing to the expense thereby incurred through the destruction of the camphor-trees this form of camphor is very costly, and is ordinarily not found in commerce. Under the name of Ngai camphor a camphoraceous substance is obtained from a tall weed of Southeastern Asia, which sells there at a higher price than that of ordinary camphor.

Camphor is sometimes taken internally as a nervous sedative or diffusible stimulant in the dose of from 1 to 3 grains, and generally in pill form. It is popular with some women as a lotion for the soothing of nervous sick headache either in the form of the spirit of camphor, made by dissolving gum camphor in alcohol, or the water of camphor, which is made by taking advantage of the slight solubility of camphor in ordinary water. These preparations are taken internally to relieve wind colic and other painful affections of the bowels and stomach. It is also used to prevent irritability of the genito-urinary organs and allay sexual excitement. H. A. H.

Campidoglio, Palazzo del, pa-laăd'zō del kăăm-pĕĕ-dōl'yō: the central palace of a group of three, designed by Michelangelo and completed by Della Porta, in Rome, on the site of the ancient Capitol, whence probably the name. It is one of the earliest examples of the "colossal order," i. e. very tall columns or pilasters. It is flanked by the palaces "of the Senators" and "of the Conservators," now used as museums of sculpture and painting.

Campimeter: See Recording Apparatus, Psychological, in the Appendix.

Campinas, kăăm-pee'nas, or **Sao Carlos**, sowñ kaar'lōs: a city of Brazil; in the state of Sao Paulo; about 65 miles N. of Sao Paulo (see map of South America, ref. 7–F). Much sugar is produced here. Pop. 35,000.

Cam'pion, or **Campian**, Edmund: a Catholic priest; b. in London, Jan. 25, 1539–40. He had a brilliant career at Oxford; became fellow of St. John's College and deacon in the Church of England, although a Roman Catholic. In 1569 he left Oxford, went to Ireland, and in 1571 was a student at Douay. In 1572 he visited Rome, and in 1573 became a Jesuit. He took part in the perilous English mission 1580, preached with great success, and by his *Decem Rationes*, 1581 (Ten reasons for denouncing the Protestant and embracing the Catholic religion, Eng. trans., n. e. London, 1827), he produced a great effect upon the educated classes. On July 17, 1581, he was arrested on the charge of treason, confined in the Tower, placed on the rack (July 30, Aug. 6, Oct. 31), forced to dispute with able divines in public, while enfeebled and disabled by the torture and without opportunity of preparation; and at last was tried and condemned Nov. 20, and executed at Tyburn, London, Dec. 1, 1581. He was a lovable and eloquent man, and a martyr to his convictions. He is one of England's worthies. Besides the *Ten Reasons*, he wrote a *History of Ireland* (1571; reprinted Dublin, 1809). See his *Life* by Richard Simpson (London, 1867).

Camp-meetings: religious gatherings, with preaching, in the open air, and prayer-meetings during night, generally lasting for several days and held in groves or secluded places, where shelter is provided for the people present, in tents or temporary houses. The first camp-meeting was probably that held in 1790 on the banks of the Red river, Kentucky, and conducted by a Presbyterian and a Methodist minister. The Presbyterian Church afterward abandoned the institution, while the Methodist Church not only retained it, but even developed it by buying suitable grounds and erecting the necessary buildings. In England camp-meetings were first introduced by Lorenzo Dow in 1807. They were disapproved by the Wesleyan Conference of the same year, but the disapproval led to the foundation of the Primitive Methodist denomination. In the U. S. they seem to be more common in the Western than in the Eastern States.

Campoamor y Campoosorio, Ramon, de: Spanish poet and statesman; b. in 1817. He was the first Spanish writer of the nineteenth century to show a reaction from Romanticism. In politics he has always been conservative and royalist in temper, devoted to Queen Christina and to Queen Isabel; and after the restoration of Alfonso XII. he was made counselor of state. As poet he has invented a new *genre*, much imitated by younger poets in Spain and Portugal, called "Doloras," little humorous pieces full of sentiment, and at the same time of moral or philosophic suggestion. The collection of these appeared in 1846, and since then more than sixteen editions have been published. Among his works the following collections of verse are notable: *Ayes del Alma* (1842); *Fábulas morales y políticas* (1842); *Ternezas y flores* (1840); *Colón* (1853), an epic. His

charming romances in verse are also decidedly important, among them: *El drama universal* (1873); *El amor y el rio Piedra* (1882); *El trén express* (1885). Campoamor has written also dramas and works upon philosophy. The former have been not too successful; of the latter several are well known even out of Spain, e. g. *Filosofía de las leyes* (1846); *Lo absoluto* (1865), his profession of philosophic faith; and *El idealismo* (1883). A. R. MARSH.

Campobas'so (formerly called **Molise**): a province of Abruzzi e Molise, Central Italy; bounded N. by Chieti, N. E. by the Adriatic Sea, S. E. by Foggia, S. by Benevento, and W. by Caserta. Area, 1,778 sq. miles. The country is mountainous and sterile, and there is very little industry. Chief town, Campobasso. Pop. (1890) 376,191.

Campobasso: a fortified city of Italy; capital of the province of Campobasso (formerly Molise); on the declivity of a mountain; about 55 miles N. N. E. of Naples (see map of Italy, ref. 6-F). It has a fine cathedral, a ruined castle, a college, several convents, and palaces of the nobility; also celebrated manufactures of cutlery and arms. Pop. 15,500.

Cam'pobel'lo: an island in Passamaquoddy Bay; 2 miles E. of Eastport, Me. (see map of Maine, ref. 7-H); is a part of Charlotte co., New Brunswick; is 8 miles long. Copper and lead ores exist in the island. The inhabitants are engaged in the herring, cod, and mackerel fisheries. On this island are some of the finest summer hotels on the Atlantic coast. Pop. 1,200.

Campoformio, -fōr'mĕē-ō, or **Campoformido**, -mee'dō: a village of Northern Italy; in Friuli; about 66 miles N. E. of Venice and 7 miles S. W. of Udine (see map of Italy, ref. 2-E). An important treaty of peace was concluded here between Austria and the French republic, Oct. 17, 1797. Alarmed by the recent victories gained by Bonaparte in Italy, Austria was inclined to peace, and negotiated with the French general this treaty, by which she ceded the Netherlands and recognized the independence of the Cisalpine republic, including Milan, Mantua, and other parts of Austrian Italy. In return for these concessions the French gave up a part of Venetia, with the capital, Istria, and Dalmatia to Austria. Pop. 2,500.

Campomanes, kaăm-pō-maa'nes, PEDRO RODRIGUEZ, Count; Spanish author and minister of state; b. in the Asturias, July 1, 1723. He gained a high reputation by his writings on political economy, and was distinguished for his probity and enlightened policy. He became president of the royal council of Castile in 1788, and afterward a minister of state. Author of a *Discourse on the Promotion of Popular Industry* (1774) and a *Discourse on the Popular Education of Mechanics* (1775). D. Feb. 3, 1802.

Campos, MARTINEZ: See MARTINEZ CAMPOS.

Campos, kaăm'pōs: a city of the state of Rio de Janeiro, Brazil; on the Parahyba river; 30 miles from its mouth, and 150 miles N. E. of the city of Rio de Janeiro (see map of South America, ref. 6-H). Small steamers ascend the river to the city. It is in a fertile plain, on which is grown much sugar-cane, producing a superior article of sugar. Pop. 40,000.

Camp Point: village of Adams co., Ill. (for location of county, see map of Illinois, ref. 6-B). It has two mills, a manufactory of agricultural implements, and a fine public-school building. Pop. (1880) 1,131; (1890) 1,150; (1900) 1,260. EDITOR OF "JOURNAL."

Cam'pus: a Latin word signifying a plain, an open field, any level surface, as of the sea. It was sometimes used to denote a field of battle, and was applied figuratively to a subject of discourse, a field of debate or speculation. The grounds about college buildings in some places are called the campus.

Campus Mar'tius (i. e. the field of Mars): a celebrated plain and open field of ancient Rome; on the left bank of the Tiber, outside of the walls of the city. It was the place in which the Roman youth performed military exercises and evolutions, and in which the *comitia* assembled for the purpose of enacting laws and electing magistrates. It was subsequently used as a public park or pleasure-ground.

Campveer, kaamp-vayr', **Kampveer**, or **Veer**: a decayed maritime town of the Netherlands; province of Zeeland; on the northeast coast of the island of Walcheren; 4 miles N. N. E. of Middleburg (see map of Holland and Belgium, ref. 8-C). It has a beautiful cathedral, and a townhouse with an elegant tower. The Scotch "Staple-port," owing to a marriage of the Lord of Campveer to a daughter of James I., was transferred from Bruges to Campveer in 1444, after which this town had peculiar trading relations with Scotland for several centuries.

Camwood: See BARWOOD.

Ca'na: a village of Galilee; the scene of Christ's first miracle (John ii.). Its site is supposed to be indicated by some ruins 6 miles N. of Nazareth (see map of Palestine, ref. 6 D). The natives call this place *Cana-el-Jelîl*.

Ca'naan [lowland, netherlands, with immediate reference to the low coastlands where the Canaanites dwelt]: the name of the youngest son of Ham (Gen. ix. 18); of the tribe descending from him (Hos. xii. 7); and, most frequently, of the land inhabited by that tribe—the "land of Canaan" (Gen. ix. 31). In the last sense it denotes the whole region between the Jordan and the Mediterranean, from the Negebh in the S. to Phœnicia in the N. The rulers of the Canaanites in 1400 B. C. used Babylonian as the official language of diplomacy, which would seem to prove that the Babylonians had previously conquered the country. Like the Phœnicians, they were a commercial people and lived in peaceful relations with the people who occupied the land before their arrival. They had, moreover, cities with walls and gates (Josh. x. 20), fortresses on the heights, and formidable chariots of iron (Josh. xi. 4). One of their cities was called Kirjathsepher—that is, "the city of books" (Judg. i. 11)—which shows that they were not illiterate. They were divided into several tribes, each governed by a king and a council of elders. Recent discoveries have demonstrated that the country was in 1400 B. C. a dependency of Egypt. Many of the cities had Egyptian governors called in the Authorized Version "kings," and all paid tribute. On the N. the Canaanites were threatened by the Hittites, on the S. and E. by predatory tribes. The people worshiped Baal and Astarte, practiced witchcraft and magic, and were idolatrous, superstitious, and licentious. See *Records of the Past*, vol. v. (1892). See PALESTINE.

Canada, Dominion of: all the British possessions in North America, except Newfoundland and its dependency in Labrador, lying N. and N. E. of the U. S., embracing the provinces of Ontario, Quebec, Nova Scotia, New Brunswick, Manitoba, British Columbia, Prince Edward Island, and the Northwest Territories; bounded on the N. by the Arctic Ocean, E. by Baffin's Bay, Davis's Strait, Labrador, and the Atlantic Ocean, S. by the Great Lakes and the parallel of 45° N. lat. east of the lakes and that of 49° N. lat. west of them, N. W. by Alaska, and W. by the Pacific Ocean; area, 3,456,383 sq. miles, of which 140,736 were water; population (1891) 4,833,239. The principal cities, with population in 1891, are Montreal, 216,650; Toronto, 181,220; Quebec, 63,090; Hamilton, 48,980; Ottawa (the capital), 44,154; St. John, 39,179; Halifax, 38,556; London, 31,977; Winnipeg, 25,642; Kingston, 19,264; Victoria, 16,841; and Vancouver, 13,685.

Physical Features.—The coast-line is broken on the E. by the Gulf of St. Lawrence, the Bay of Fundy, and the Bay of Chaleurs; on the N. by Hudson Bay, Baffin's Bay, the Gulf of Boothia, and Melville and Lancaster Sounds; and on the W. by the Straits of Juan de Fuca, the Gulf of Georgia, and Queen Charlotte Sound. The principal mountains are the Rocky Mountains, extending from the Arctic Ocean to the U. S., on the W.; the Cascade Mountains, between the Rocky Mountains and the Pacific Ocean; the Laurentian range, extending from Labrador along the N. of the St. Lawrence river; the Notre Dame Mountains in Quebec; and the North and South Mountains and the Cobequid Mountains, both in Nova Scotia. Vancouver and Queen Charlotte, on the W.; Prince Edward, Cape Breton, and Anticosti, on the E.; and the chain along the entire north coast, known as the Arctic Archipelago, are the principal islands. All of the region from the Atlantic to the northwestern boundary of Ontario was once a vast forest, and still contains the principal timber growths. Where the forest has been cleared the soil is well adapted to agriculture. The great wheat-growing region is between the northern boundary of Ontario and the Rocky Mountains, and contains the Red river valley and the Lake Winnipeg plateau. The north part, from the Rocky Mountains to Hudson Bay, is heavily wooded, contains large auriferous deposits, and is still the great fur-preserve of the world.

Lakes and Rivers.—The most important system is that of the ST. LAWRENCE (*q. v.*), through which Lakes Superior, Huron, Erie, and Ontario, lying partly within the Dominion, find their outlet to the sea. Its principal tributaries in its

lower course are the St. Maurice and the remarkable Saguenay. The St. John forms the N. boundary of Maine as far as Grand Falls, and then becomes the great river of New Brunswick. In the Northeast Territory the Koksoak or South river flows northward into Ungava Bay, while the Little and the Great Whale, the Big, the East Main, and the Rupert rivers enter Hudson Bay from the east. Albany river forms the greater part of the northern boundary of Ontario province, receives through a southern tributary the waters of Lake Nipigon, and empties into James Bay. The vast area between Hudson Bay and the Rocky Mountains is a region abounding in lakes and having intricate river systems. They may be divided into three parts, two of which are tributary to Hudson Bay and the other discharges directly into the Arctic Ocean. The most southern of these is the Nelson river. Its upper eastern course consists of Rainy Lake and river and Lake of the Woods, which discharge through the Winnipeg river, after it receives English river from the E., into Lake Winnipeg. The Red River of the North flows into the southern end of Lake Winnipeg. Its lower course lies in Manitoba, where it receives the Assiniboin, the great river of this province. The Saskatchewan supplies the principal drainage system of the territory of the same name and of Assiniboia, and finds its way through Cedar Lake into Lake Winnipeg, which also receives the waters of the very considerable Lakes of Manitoba and Winnipegosis on its W. This entire system discharges through the Nelson river into Hudson Bay. The second of the systems is that of the Churchill river, which forms the southern basin of the Northwest Territory, and is intermediate between the Saskatchewan and Athabascan waters. Its greatest lake is the Reindeer on the N., and it empties into Hudson Bay about 150 miles N. of the Nelson. The Mackenzie system is the most considerable, next to the Mississippi, of North America. It rises in Alberta Territory. On the W. the Peace river, which breaks through the Rocky Mountains, reaches it on the eastern boundary-line of Athabasca Territory, just below the inlet of Athabasca Lake. The united streams are now called Slave river until Great Slave Lake, in a complicated and extensive lacustrine basin, is reached. From the outlet of this lake the waters flow N. W. under the name of Mackenzie river, making a stretch of 900 miles. The largest lake entirely in the Dominion, Great Bear Lake, is tributary to the lower Mackenzie. On the Pacific coast the Kootenay and the north branches of the Columbia river, after forming great loops in the Rocky Mountains, unite near the southeastern boundary of British Columbia. Of this province the chief river is the Fraser, which rises in N. lat. about 57°, drains the basin between the Cascade and Rocky Mountains, flows southerly until near the southern boundary of British Columbia, when it turns to the W. and empties into the Straits of Georgia at Vancouver. Going N. the next considerable rivers of this province are the Skeena and Stickeen. The upper waters of the great Yukon river are in the Dominion. It is known as the Yukon below Fort Selkirk; above, the principal affluent is the Pelly river. Farther N. rises the Porcupine river, which forms another tributary to this Alaskan system.

Climate.—The climate of the Atlantic provinces resembles that of Norway; that of Ontario is considerably modified by the influence of the Great Lakes; and that of British Columbia, like the rest of the Pacific coast, is more equable than that of the Atlantic in corresponding latitudes. In general, the climate is much warmer in summer and colder in winter than in Great Britain. The mean summer temperature in ninety-nine places shows a range of from 48·7° to 69°, and the mean winter temperature a range of from −1° to 40·4°. The fall of rain and snow gives a total precipitation ranging from 10·41 to 71·44 inches.

Government.—The provinces were united under the British North America Act, which went into operation on July 1, 1867. It provided in substance that the constitution of the Dominion should be similar in principle to that of Great Britain, that the executive authority should be vested in the British crown and carried on in its name by a governor-general and privy council, that the legislative power should be vested in a parliament consisting of two houses to be called the Senate and the House of Commons. The Governor-General, who is appointed by the crown, has a salary of £10,000 per annum. The senators, of whom there are eighty, are nominated for life by the Governor-General; a senator must be thirty years of age, and have real or personal property of the value of $4,000. The members of the House of Commons (one for every 20,000 persons) are chosen by the people for a term of five years; there is a slight property qualification for the right of suffrage, varying in the different provinces and territories, except that in the Northwest Territory there is no property qualification. The provinces have also each a separate legislature and a lieutenant-governor.

Finances.—The total debt of the Dominion, incurred chiefly on account of public works, on June 30, 1899, was $345,130,754; the assets were $79,076,043; and the net debt was $266,054,711. The revenue was $46,741,249, June 30, 1900; expenditure, $41,903,500; and the surplus, $4,837,749.

Banking.—The Bank Act of 1890 provides that no bank shall be incorporated with less than $500,000 in capital stock; that all notes issued for circulation shall be redeemable at par in any part of the Dominion; that no bank shall issue circulation notes in excess of its unimpaired capital; and that the payment of circulation notes shall be the first charge on the assets of an insolvent bank, and any amount due the Dominion Government the second charge. The bank circulation Dec. 31, 1899, was $49,588,236, and the circulation of Dominion notes $27,076,309. The bank clearings in Toronto, Montreal, Winnipeg, Hamilton, Halifax, and St. John were $1,549,966,696. The discounts in chartered banks, Jan. 31, 1900, were $301,000,000. Under acts of 1867 and 1885 savings-banks were established in connection with the post-office department, and in 1899 contained $321,000,000 in deposits.

Industries.—Canada has large agricultural interests, but there are no reports for the whole of the Dominion. Lumbering is one of the most important industries. The fisheries, comprising cod, haddock, herring, mackerel, salmon, lobsters, etc., are extensive; the total product in 1899 was valued at $21,891,706. The principal mineral resources are coal, gold, iron, petroleum, asbestos, copper, silver, and nickel. Nova Scotia, British Columbia, Quebec, Ontario, and part of the Northwest Territories are the chief mining districts. The mineral production in 1899 had a value of $47,275,512. The census of 1891 showed 75,768 manufacturing establishments with a combined capital of $353,836,817, and products valued at $475,445,705.

Commerce.—The trade of the Dominion is chiefly with the U. S. and Great Britain. The principal imports from Great Britain are iron and cotton and woolen goods; the chief exports to Great Britain are breadstuffs, timber, cheese, cattle, and apples, and to the U. S. breadstuffs, lumber, cattle, fish, iron, and coal. The imports in 1900 were $183,209,273; exports, $175,656,947.

The South African War.—Canada contributed 3,000 troops and voted $2,000,000 for their transportation to South Africa, and for special remuneration in addition to their regular army pay. The Canadians were in service from Oct. 1, 1899, to Oct. 1, 1900, and lost 104 killed or died of disease, 180 wounded, and 52 missing.

Means of Communication.—The total mileage of canal, river, and lake navigation exceeds 2,700. The canals are designed principally to facilitate navigation between the Great Lakes and the St. Lawrence river. In 1899 they comprised the Welland, St. Lawrence system, Chambly, Ottawa, Rideau, St. Peter's, Trent Valley, and Murray, and had cost for construction and enlargement alone $92,036,524. All the systems belong to the Dominion Government. In 1899 there were 17,358 miles of railway in operation, with an invested capital of $964,699,784. The Dominion Government owned the Intercolonial, the Windsor Branch, and the Prince Edward Island railways.

Churches.—There is no state Church in the Dominion, each religious denomination being governed by its own laws. The census of 1891 gave the following statistics of the religious bodies: Roman Catholic, 1,992,017 adherents; Methodist, 847,765; Presbyterian, 755,326; Anglican, 646,059; Baptist, 302,565; Lutheran, 63,982; Congregational, 28,157; miscellaneous creeds, 108,013. The Roman Catholic Church was the strongest in Quebec, and the Anglican, Presbyterian, Methodist, and Baptist Churches were the strongest in Ontario.

Schools.—In 1890–92 there were 15,793 public and 1,011 high, normal, and model schools, with 883,266 pupils in the former and 114,207 in the latter. The annual expenditure exceeds $10,000,000. There were 14 universities, 10 colleges, 17 classical colleges, 6 colleges for women, 5 agricultural colleges, the Royal Military College at Kingston, and several schools for artillery and infantry instruction. The public-school system in Ontario is under the control of the Minister of Education; in other provinces it is under super-

intendents and boards of education, who report to the provincial secretaries. In Manitoba all public schools were made non-sectarian in 1890; in Quebec education is based on religious teaching; and in Nova Scotia, New Brunswick, British Columbia, and Prince Edward Island the schools are strictly undenominational.

History.—Jacques Cartier (*q. v.*) entered the St. Lawrence river in 1534 and again in 1535, and the first permanent settlement was made by a French colony under de Monts at Port Royal (Annapolis) in 1604. The French founded Quebec in 1608, after which numerous French colonists settled in Lower Canada, near the St. Lawrence river. The British general Wolfe captured Quebec in 1759, and the conquest of Canada was completed in 1760. Upper Canada was settled mostly by English and Scotch emigrants. In 1791 Canada was divided into two provinces, called Upper and Lower Canada (afterward called Canada West and Canada East, and later Ontario and Quebec). Both were disturbed by an insurrection in 1837, and reunited in 1840. By an act of the British Parliament, passed Mar. 29, 1867, and taking effect July 1 of that year, the Canadian provinces, Ontario and Quebec, and New Brunswick and Nova Scotia were federally united into one Dominion of Canada. The Legislature of Newfoundland declared in favor of joining the Dominion, but the people, in Nov., 1869, by a large majority, voted against it. From the Hudson Bay Company the Government of the Dominion purchased in the same year its vast territory. An insurrection of colonists and natives, who protested against having their land treated as a dependent territory, induced the Government to organize in 1870 that part of the newly purchased territory which is situated between lon. 96° and 99° W., and the U. S. boundary-line and lat. 50° 38′ N., as an independent province of the Dominion, under the name of Manitoba. The immense unorganized territory beyond the limits of Manitoba is called the Northwestern Territory. On Mar. 31, 1871, British Columbia was received into the Dominion. Invasions of Canada by armed Fenians from the U. S. were attempted in 1866 and 1870, but were repelled without difficulty. The long-pending controversies with the U. S. were mostly settled by the Washington treaty of 1871. In 1873 Prince Edward Island joined the Dominion. The Northwestern Territories were partly divided in 1882 into four provinces—Assiniboia, 95,000 sq. miles; Saskatchewan, 114,000 sq. miles; Alberta, 100,000 sq. miles; and Athabasca, 122,000 sq. miles. The half-breed and Indian rebellion in the Northwest Territories in the spring of 1885, led by Louis Riel, was put down in a few months. Riel was hanged the same year.

Authorities.—*Statistical Year-books of Canada*; *Annual Reports of the Geological Survey of Canada*; *Canadian Almanack* (annual); Selwyn and Dawson, *Descriptive Sketch of the Phys. Geog. and Geology of the Dom. of Canada* (1884); Silver's *Handbook to Canada* (1881); Morgan, *Canadian Parliamentary Companion and Dominion Annual Register and Review*; Bryce, *Manitoba* (1882); Chapleau, *Report on the Constitution of the Dom. of Canada* (1891); Greswell, *Geography of the Dominion of Canada and Newfoundland*; Smith, *Political History of Canada*; Adam, *Canadian Northwest and the Rebellions.*

Revised by Mark W. Harrington.

Canada Balsam (in Lat. *Balsamum canadense*): a turpentine or oleoresin obtained from the *Abies balsamea*, a species of fir which grows in Canada and the U. S., and is sometimes called balsam fir. It is a pale-yellow, transparent liquid, having a peculiar and agreeable odor and an acrid taste. When it exudes from the bark it has the consistence of honey, but by age and exposure to air it becomes solid. It was formerly used in medicine as a stimulant to check mucous discharges, and as a dressing for ulcers, but is now seldom used. It is valuable for a variety of purposes in the arts, in photography, in mounting objects for the microscope, and as an ingredient in varnishes.

Canada Goose, or **Wild Goose** (*Branta canadensis*): a goose of the family *Anatidæ*; 30 to 35 inches long; brownish above, lighter beneath, with the head, neck, bill, and feet black, a white patch on each cheek; inhabits North America, breeding at the N. and wintering in warmer regions. These birds usually fly in a >-shaped figure (though sometimes in a straight line), led by an experienced gander, who frequently gives utterance to his familiar *honk*. "Their spring migrations usually take place from Mar. 20 to the last of April, but are wholly dependent upon the state of the season. They breed at the N., and linger there till the hard frosts warn them that the lakes and streams will soon be frozen over."

Canada goose, or wild goose.

While performing their long journeys they usually fly at a great height, probably a quarter of a mile or more.

Canadian Literature: British Canada has literary men, perhaps in full proportion to her circumstances and opportunities; but she can not be said to have a national literature, as she has no distinct nationality. Her leading writers commonly publish in London, Edinburgh, or New York. Of her native authors some have gone to reside in other parts of the British empire or in the U. S. Some of her authors are not native. The late Sir Daniel Wilson was a conspicuous member of a group resident in Canada, but fully as much British as Canadian. French Canada, on the other hand, has a nationality distinct both from that of the British, with whom her people, though politically united, do not amalgamate, and from that of the French, from whom she has been not only severed by conquest, but estranged by the French Revolution, the effects of which she did not share. Her literature therefore may be said to be national, and forms a subject for separate notice.

Literature in Canada had its beginnings with the founding of the Catholic missions in the colony in the days of Champlain. From that period both the civil and the ecclesiastical history of the country date. The chief literary product of the era embraces Champlain's voluminous narratives of his voyages; Lescarbot's *History of New France*, to which is appended *Les Muses de la Nouvelle France*; Sagard's *Le Grand Voyage du Pays des Hurons*; and the famed *Relations des Jésuites*, a work replete with thrilling incidents, told with much simplicity of style, of missionary adventure. A collected and scholarly edition of Champlain's works, in six quarto volumes, appeared at Quebec in 1870, under the editorship of Abbé Laverdière. The crude records of the voyages of the early discoverers, Cartier, Roberval, and others, can hardly be said to belong to native literature, though Canadian reprints have been issued by the Quebec Literary and Historical Society.

The later writers of Old France identified with Canada prior to the conquest are also ecclesiastics, attached either to the Jesuit or to the Récollet order. Le Clerq is known by his work entitled *L'Établissement de la Foi*, which was published in France in 1691, and was translated with a memoir, by the late Dr. J. G. Gilmary Shea, of New York. The work gives an account of the author's missionary labors in the Gaspé region, and is chiefly notable for its satirical remarks on the Jesuits and their politic methods. A work held in some esteem by collectors is *Les Mœurs des Sauvages Ameriquaines*, by the Jesuit Father Lafitau, which consists of an intimate study of the Iroquois confederacy, among whom the author labored. Father Louis Hennepin's *Discoveries and Voyages* is valuable as the narrative of an enter-

prising traveler—the first European to visit the Falls of Niagara. In Charlevoix French Canada possesses the ablest and best informed of the writers of the era. His *History and General Description of New France* records the impressions of an accurate writer and trained observer who came to Canada in 1720 to inspect the Jesuit missions. Charlevoix personally traveled through the country from Acadia to the Gulf of Mexico. Baron La Hontan's *New Voyages in America*, though dealing with the important period of Frontenac and La Salle, is little to be trusted as a history of New France. The work was first published at La Haye in 1703.

The conquest was followed by a period of British military rule, little favorable to the intellectual activity of French Canada. When at last literature broke silence it was to engage in the political strifes and race jealousies which vexed the first fifty years of British occupation. Nor were matters mended by the promulgation of the Constitutional Act of 1791 and the division of the country into what was long known as Upper and Lower Canada. In these wrangling times history was rapidly made, though it did not find a chronicler until the union again brought the two races into an uneasy wedlock. Of this era the first author of note was Michael Bibaud, who in 1843 published a sober narrative of events dealing with the *Histoire du Canada et des Canadiens, sous la Domination Française*. In the following year the author brought out a new edition of his book, supplementing it with a history of Canada under English rule. Between 1845 and 1848 appeared a work of conspicuous merit, which the French-Canadians accept as their national history. This was F. X. Garneau's *Histoire du Canada*, of which an English translation, somewhat modified by its editor, Andrew Bell, appeared in 1866. The best edition of the original work, edited by Garneau, *fils*, with an introduction by Chauveau, was issued at Montreal in 1882. During the sixties two learned priests entered the field of French-Canadian authorship as historians, but their works, though alike valuable, are both incomplete, death in each case having arrested the writer's labors. The first in point of time to appear was *Cours d'Histoire du Canada*, par l'Abbé J. B. Ferland, continued to the conquest by l'Abbé Laverdière, who has the reputation of being one of the ablest scholars in the Canadian priesthood. The second of these two works is *Histoire de la Colonie Française en Canada*, by the Abbé Faillon, a Sulpitian priest from Old France, who spent a number of years in Canada. Abbé Ferland's narrative is in two volumes, and was published at Quebec in 1861–65. Of Abbé Faillon's work but three volumes appeared, which were issued in Paris in 1865–66.

Of the more recent writers of French Canada we have space to enumerate only those whose works are found in the chief public and private libraries. Among these are P. Bedard's *Histoire de Cinquante Ans*, Sulte's *Histoire des Canadiens-Français*, and Turcotte's *Le Canada sous l'Union*. The latter is an instructive work—from a French point of view, however—dealing with the political history of the two old provinces of Canada from the rebellion to confederation. Sulte's history is the work of an industrious and competent writer. David's *L'Histoire de la Rebellion de 1837–38* deals with the Papineau insurrection, from the point of view of a French-Canadian Liberal, opposed to the Tory oligarchy of the period. *Les Canadiens de l'Ouest*, by Joseph Tassé, consists, as its title imports, of a series of biographies of French pioneers in the West. To the list of these writers we have to add the names of two learned ecclesiastics, whose works are respectively held in deservedly high esteem in the French province. We refer to the accomplished philologist l'Abbé Tanguay, who has published an interesting work dealing with *La Généalogie des Familles Canadiennes*, and l'Abbé Casgrain, author of *Les Opuscules*, a series of papers which deals with incidents, historical and legendary, connected with early pioneering life in the Quebec province. Casgrain has also published *L'Histoire de l'Hôtel-Dieu de Quebec*, an account of one of the most interesting institutions of the Church in the ancient capital. Le Moine, who writes in both languages, is one of the familiar names in Canadian literature, and has done much to preserve from oblivion many of the more romantic legends and stirring events in French-Canadian history. His *Quebec, Past and Present*, and *Picturesque Quebec* are full of the military and ecclesiastical memories of the ancient city.

The writers of less grave cast are numerous, and their graces of style impart a charm to the literature of French Canada. One of the most popular of this class is Faucher de Saint-Maurice. Two of the best known of his works—*Les Provinces Maritimes* and *Promenades dans le Golfe St.-Laurent*—are light sketches of travel. *La Saguenay et la Vallée du Lac St. John*, by the pleasing *chroniqueur* Arthur Buies, treats of a region long dear to the Church, and now a resort of many tourists. Though the French province is rich in romantic history, little has been done in working up the material in the form of fiction. The novelette and light drama exist in plenty, but there is hardly anything of a sustained nature from the Gallic pen. *L'Intendant Bigot*, by Joseph Marmette; *Jean Rivard*, by C. M. Gerin-Lajoie; and *Charles Guérin*, by the Hon. P. J. O. Chauveau, are good examples of French-Canadian fiction, as are also Taché's *Forestiers et Voyageurs* and *Trois Légendes de Mon Pays*. Two others of Marmette's stories—*François de Bienville* and *Le Chevalier de Mornac*—have been dramatized, with acceptance by his fellow-countrymen. A more ambitious novel of an historical character is *Jacques et Marie*, by Napoleon Bourassa, M. R. C. A. It deals with the expulsion of the Acadians, and, of course, with French sympathy for the Neutrals.

French Canada, in spite of the rigors of nature, has ever been kind to the poets, of whom it is said she has close upon a hundred. Much of the work of these writers is ephemeral, but some of it is fairly entitled to more permanent rank as poetry. As a rule, its themes are Canadian, and from native subjects it takes its inspiration and local color. Generally it is fervently French, with frequent invocations to the muse of the Gallic motherland. The models of Old France are also closely followed. In the main, however, it is largely imbued with the spirit of its local home, and its subjects are drawn from the national history, with pictures of the religious and political life, and of the social and industrial pursuits. As a result of their light-heartedness and joyous temperament, not a little of the verse of the French-Canadian people is set to music. Three song collections have appeared, perhaps the best of which is *Chansons Populaires du Canada*, edited with the music, by Ernest Gagnon (Quebec, 1865). William McLennan's selected English version of these songs happily preserves much of the spirit and charm of the original (Montreal, 1886). The poets of the highest rank are Pamphile Le May, Octavie Cremazie, Louis Honoré Fréchette, and Benjamin Sulte. The first of the quartette is best known, perhaps, as the translator into French of Longfellow's *Evangeline*. Much of Cremazie's verse has the ring of true metal, though it is touched, in part, by the influences of a disappointed life. Sulte's verse has a national stamp, and in his volume entitled *Les Laurentiennes* he has given his compatriots reason for placing him high among the recognized poets of French Canada. Fréchette, as the crowned poet of the French Academy, holds the place of honor. His published works are *Mes Loisirs*, *Pêle-Mêle*, *Les Fleurs Boréales*, and *Les Oiseaux de Neige*. His themes are those which commend him as *par excellence* the national poet. His later work includes one or two dramas, many sonnets, and a profusion of lyrics, dealing with nature and life.

The early literature of English-speaking Canada is chiefly concerned with the varied aspects and resources of the country. The writers were, in the main, chance visitors from the motherland, or the more intellectual type of immigrant and settler. Sometimes we find among them a retired army or navy officer, a land surveyor, a schoolmaster, or a member of the office-holding class who had come to the country in the train of a colonial governor. At a still earlier era we find the writer either a Hudson's Bay factor engaged in the peltry trade, or some restless spirit whom loss of fortune or other accident had turned into the untrodden wilderness. The pursuit of the fur-trade, as we have hinted, led to exploration and discovery, particularly in the great hunting-grounds of the Canadian Northwest. Two of the more notable adventurers into the vast solitude of the Hudson's Bay Company appeared toward the end of the last century, the works of both being brought out in London. These were Samuel Hearne, a Hudson's Bay Company officer, who discovered the Coppermine river, and Alexander Mackenzie, a partner in the Northwest Fur Company, and the discoverer of the great Arctic river which bears his name. Mackenzie, who was knighted for his services, was the first white man to cross the Rocky Mountains to the Pacific. His work, entitled *Voyage from Montreal on the River St. Lawrence through the Continent to the Frozen and Pacific Oceans*, gives a valuable account of the fur-trade, and is rich in the results of geographical discovery. Hearne's work narrates his adventures on a *Jour-*

ney from Hudson's Bay to the Mouth of the Coppermine River, with some account of the Esquimaux and other tribal inhabitants of the region. The Red river country, in the heart of the continent, is full of the memories of Lord Selkirk's ill-fated colony at Fort Garry (now Winnipeg), an account of which is to be found in the nobleman's published *Narrative*, and in Prof. Bryce's recent work on Manitoba. The transfer in 1869 of the Hudson's Bay territories to the Dominion, and the subsequent carving out of Manitoba and the provincial districts of the Northwest, gave birth to a number of books on the country, of more or less interest. The chief of these, omitting English works, such as Milton and Cheadle's *Northwest Passage by Land* and Capt. Butler's *Great Lone Land*, are Prof. Hind's *Red River Exploring Expedition*, the same author's *Assiniboia and the Saskatchewan*, and the Rev. Principal Grant's *Ocean to Ocean. The Canadian Northwest: its History and its Troubles*, by G. Mercer Adam, may also be consulted for an account of the region, from the granting of the charter to the Hudson's Bay Company, through the troublous era of Lord Selkirk's conflict with the rival fur-trading corporation on the Red river, to the acquisition of the Territory by Canada, with the narrative of Riel's two rebellions and the military operations in suppressing them.

A new literature arose with the settlement of the British province of Upper Canada, which occurred shortly after the close of the war of independence and was largely recruited from the young republic by incoming bands of United Empire loyalists—that is, of the adherents of the British crown who preferred to live under the old flag even in the wilderness. At first this literature, as we have said, consisted chiefly of works of travel by old-country writers, then, as the provinces opened up, of works of a topographical and descriptive character; after which came the era of political agitation and of clamor for the reform of abuses connected with the autocratic form of colonial government which prevailed, together with a plentiful crop of political diatribes and other literary heralds of revolt. Prior to the political outbreak occurred the war of 1812, which called forth a number of works, in prose and verse, full of patriotic ardor. The more important of these are the works of David Thompson, Gilbert Auchinleck, and Col. Coffin. Students of the period should also be directed to Tupper's *Life and Correspondence of Sir Isaac Brock*. For an account of the youth of the province, including the raw materials of history, two works may be referred to: *The Loyalists of America and their Times*, by the Rev. Dr. Egerton Byerson, and *The Settlement of Upper Canada, with Special Reference to the Bay of Quinté*, by Dr. William Canniff, though the literary form of neither is good. Talbot's *Five Years' Residence in the Canadas*, Dunlop's *Statistical Sketches of Upper Canada*, and Bouchette's *British Dominions in North America*, belong also to the descriptive works of the period. *The Canadas*, by John Galt, the Scottish novelist, and *Sketches in Canada*, by Jameson, the English art-writer, and Col. Strickland's *Twenty-seven Years in Canada*, are to be added to the list of works which record the social annals of the time. *Roughing it in the Bush*, by Mrs. Moodie, sister of Agnes Strickland, the historian, is a narrative of a settler's trials.

The literary outcome of the political agitation on the reform side are Gourlay's *Statistical Account of Upper Canada* and the voluminous writings of William Lyon Mackenzie. On the Tory side are Sir Francis Bond Head's *Narrative of my Administration in Canada* and the *Report* of Attorney-General Robinson, the head of the Family Compact. An able state document, from an independent standpoint, and the chief fruit of this distracting political period, is Lord Durham's famous *Report* to the imperial Government on the affairs of the colony. This state paper, compiled, it is said, by Charles Buller, the Governor's able secretary, gives the result of Lord Durham's diagnosis of the political situation, and recommends enlarged measures of self-government to the colony.

The later works on the era of revolt and the political history of the times are numerous and for the most part controversial. *The Life and Times of William Lyon Mackenzie*, by his son-in-law, Charles Lindsey, and Dent's *History of the Rebellion* deal with the outbreak. The period is also historically treated of in MacMullen's *History of Canada*, the most notable repository of facts, carefully set forth from a Liberal standpoint, concerning native history. The distracting period between the revolt and the confederation is dealt with in Dent's *Last Forty Years* of Upper Canadian history; in Collins's *Life of Sir John A. Macdonald*, edited, with additions, by G. Mercer Adam; in Sir Francis Hinck's *Reminiscences*; and in Mackenzie's *Life of the Honorable George Brown*. The annals of the French province during the period of political agitation are to be found related in Christie's *History of Lower Canada*, the chief parliamentary and political text-book which deals with the half-century between the passing of the Constitutional Act and the union of 1841. Dr. William Kingsford's *History of Canada* is an industriously related repertory of facts, from the discovery of Canada to the conquest. The old province of Acadia has several annalists, the chief of whom are Murdock and Howe, in whose histories the political and social life of the maritime province may be traced. Annand's *Life and Times of the Hon. Joseph Howe* and the humorous works of Judge Haliburton ("Sam Slick, the Clockmaker") should be consulted by students of the local history of Nova Scotia. The constitutional history of Canada may be studied in the works of Todd, Bourinot, Watson, O'Sullivan, and Doutre. The prelections of the first two of these writers have found readers beyond the colony. *Canada and the Canadian Question*, by Goldwin Smith, embraces a brief history of the two older provinces of Canada, with chapters on the constitution and the economical questions of the time. Oliver Howland's *The New Empire* is an important work on the imperial and colonial system.

Confederation, which gave birth to the Canadian Dominion, brought to the front a number of writers, including not a few poets. Space forbids our doing more than enumerating the chief works of the period. Rattray's *The Scot in British North America* and Davin's *The Irishman in Canada* are more biographical than historical, though they set out to review important elements in the formation of national life and character. In the same category may be placed Dr. Bryce's *Short History of the Canadian People*. A popular text-book dealing with the annals of the Dominion is Dr. Withrow's *History*, as is also his illustrated handbook entitled *Our Country*. *Picturesque Canada*, edited by Principal Grant, is rich in the material descriptive of the social, industrial, and recreative life of the people. *Canada from Sea to Sea*, *Illustrated Toronto*, and *Illustrated Quebec*, by G. Mercer Adam, deal with picturesque features of the country. Dr. Scadding's valuable work *Toronto of Old* is of more antiquarian interest.

Fiction is not strongly represented in Canada, though the materials are plentiful. The three best known works of fiction are *The Golden Dog* (Le chien d'or), by William Kirby; *The Bastonnais*, by John Talon Lesperance; and *An Algonquin Maiden*, by G. Mercer Adam and A. E. Wetherald. The first deals with tragic incidents in the social life of Quebec during the French *régime*; the second treats of the Montgomery invasion of Canada in 1775; and the third is a romance of Upper Canada before the revolt, with types of character drawn from the French, English, and native races. In the department of *belles-lettres* Canada has produced several works dealing with criticism and the essay proper, a few of which may be mentioned. Among the more important of these are S. E. Dawson's *Study of Tennyson's Princess*, Dr. R. M. Bucke's *Study of Walt Whitman*, Prof. J. C. Murray's *The Ballads and Songs of Scotland, in View of their Influence on the Character of the People*, Prof. William Clark's *Savonarola*, Prof. Watson's *Treatise on Kant*, Sir Daniel Wilson's *Caliban*, Bourinot's *Intellectual Development of the Canadian People*, George Stewart's monograph on Frontenac, Morrison's *The Art Gattery of the English Language*, and Joseph Pope's *Jacques Cartier*. Biography is represented in Dent's *Canadian Portrait Gallery*, in Fennings Taylor's *Portrait of British-Americans*, in Hodgin's *Life and Times of the Rev. Dr. Ryerson*, the educationist, in Prof. Harrington's *Life of Sir William Logan*, in Collins's *Administration of the Marquis of Lorne*, and in Leggo's and in Dr. Stewart's histories of the administration of Lord Dufferin. Recent additions to the literature of biography include D. B. Read's *Life of Major-General Simcoe*, the same writer's *Lives of the Judges of Upper Canada*, and a memoir by William Buckingham and the Hon. G. W. Ross, of the late Hon. Alexander Mackenzie, Premier of Canada. G. Mercer Adam's *Life and Times of the Right Hon. John A. Macdonald* has been already referred to. Contributions to science are in the main scattered through the periodical press and the transactions of the several scientific institutions of Canada. Government blue-books and the series of valuable *Reports* of the Geological Survey of Canada en-

shrine other contributions. The many separately published works of Sir William Dawson on geology and the relation of science to theology, and those of the late Sir Daniel Wilson, president of Toronto University, dealing with questions connected with archæological and ethnological science, are worthy of special mention. Dr. McCaul's *Britanno-Roman Inscriptions* and Dr. Withrow's *The Catacombs of Rome and their Testimony to Christianity* are meritorious works in their departments. In military science, Col. G. T. Denison's Russian prize essay on the *History of Cavalry* has a high claim to notice.

We have already dealt with the chief poets of French Canada; those of the English-speaking province claim notice here, though necessarily brief must be their mention. At least four of the Canadian poets have found fame beyond the borders of Canada. These are Prof. Roberts, Archibald Lampman, Wilfred Campbell, and Bliss Carman. These names are not infrequently to be met with in the pages of Canadian and English magazines. *In Orion and other Poems* and *In Divers Tones*, Roberts deals largely with classical subjects, but a national ode is occasionally found. Lampman belongs, in the main, to the philosophical school. Wilfred Campbell's published work includes a volume entitled *Lake Lyrics and other Poems*. Charles Mair's drama entitled *Tecumseh* recounts an incident of the war of 1812 in connection with one of the Indian allies of Britain.

Other names deserving of mention among the poets of Canada include those of John Reade, author of *The Prophecy of Merlin*, etc; John Hunter Duvar, author of *Roberval and other Dramas*; Mrs. Kate Seymour McLean, author of *The Coming of the Princess and other Poems*; Heavysege's dramas of *Saul* and *Jephthah's Daughter* belong to the pre-Confederation period. To the same period belong Charles Sangster's volumes of collected verse, entitled *The St. Lawrence and the Saguenay* and *Hesperus and other Poems*. Miss Valancey Crawford has published *Old Spookses' Pass and other Poems* in dialect verse. *Marguerite*, by George Martin, takes its title from the heroine of a romantic legend of New France. *Pine, Rose, and Fleur de Lys*, by Mrs. Harrison, is a collection of verse characteristic of the combined national elements in the Canadian people.

The names of several other women writers, of Canadian birth and education, deserve mention. We refer to Miss Machar (*Fidelis*), Miss Sara Jeannette Duncan (now Mrs. Cotes), Miss Ethelwyn Wetherald, and Miss Pauline Johnson, the Indian poet.

GOLDWIN SMITH and G. MERCER ADAM.

Canadian River rises in the northeast part of New Mexico; flows through the north part of Texas into the Indian Territory. Its general direction is nearly eastward. After a course of about 900 miles it enters the Arkansas river about 50 miles W. of Fort Smith. The North Fork of the Canadian, sometimes called Rio Nutria, rises in northeastern New Mexico, flows E. S. E., and enters the Canadian about 50 miles from its mouth. Length about 600 miles.

Canajoharie: village; Montgomery co., N. Y. (for location of county, see map of New York, ref. 4–I); on the south bank of the Mohawk river and on the Erie Canal, and opposite Palatine bridge, on railroad, 55 miles W. N. W. of Albany; has a good school, a library of 800 volumes, a planing-mill, malt-houses, a large paper-bag-factory, refrigerator-factory, candy-factory, and three weekly newspapers. Pop. (1880) 2,013; (1890) 2,089; (1900) 2,101.

EDITOR OF "WIDEAWAKE COURIER."

Canal', Canale, or **Canalet'to**, ANTONIO: painter; b. in Venice, Oct. 18, 1697; studied in Rome; worked in his native city; painted many views of Venetian palaces, canals, etc., which are highly commended by some critics, but others charge him with mannerism. D. in Venice, Aug. 20, 1768.

Canal Dover: village (founded in 1807); Tuscarawas co., O. (for location of county, see map of Ohio, ref. 4–H); situated at junction of three railroads on a high level plateau on the banks of the Tuscarawas river and Ohio Canal, 100 miles from Pittsburg, Cleveland, and Columbus. Here are 6 churches, 2 large schools, electric lights, and electric street cars, baby-cab and track-sulky manufactories, galvanizing, tile, salt, and nut and bolt works, 3 grist-mills, rolling and sheet-iron mills, and an iron furnace. Iron-ore and coal deposits and fire-clay and building-stone are abundant in the neighborhood. Pop. (1880) 2,208; (1890) 3,470; (1900) 5,422. The rapid increase in population in the years 1890–93 is due to the establishment here of new industries.

EDITOR OF "IRON VALLEY REPORTER."

Canal Fulton: village; Stark co., O. (for location of county, see map of Ohio, ref. 3–H); on Ohio Canal, and on Clev., Lor. and Wh. and Pa. R. Rs.; 60 miles S. of Cleveland; has churches of six denominations, large public school, large tool-works, railroad-car and general repair-shops, and grist-mill. Stone, clay, and coal formations are abundant in the near neighborhood, and the surrounding region is agricultural. Pop. (1880) 1,196; (1890) 1,173; (1900) 1,172.

EDITOR OF "FULTON SIGNAL."

Canaletto, BERNARDO BELLOTTO: painter and engraver; b. in 1720; wrought in Rome, Brescia, Milan, and Dresden; celebrated for chiaro-oscuro, and for his views of buildings and environs of cities; was in England, and painted an interior for King's chapel, Cambridge. D. in Warsaw, Oct. 17, 1789. For his uncle Antonio, see CANAL.

Canal-locks: A canal-lock is a chamber with side walls and with gates at each end, and is intended to receive and enable a boat to pass from one level of a canal to another. Canal-locks were used in Holland and in Italy during the seventeenth century, and the invention is claimed in both countries.

The process of locking a boat from a lower to a higher level may be briefly described as follows: The water in the lock being at the same height as the water in the lower level, the boat enters the lock, and the gates at the lower end are closed. The boat being now in a comparatively water-tight chamber, valves are opened in the upper gates, and water from the upper level flows into the chamber until it is at the same height as that of the upper level. The upper gates are then opened and the boat passes out on the upper level. In locking from the upper to the lower level the process is reversed.

A lock may be divided into three parts—the chamber or part between the upper and lower gates; the head-bay or part above the upper gates; and the tail-bay or part below the lower gates. The side walls of the chamber are designed to withstand the pressure of saturated earth when the lock is entirely empty of water. Their width at the base is usually from four to five tenths the height. At the upper end of the chamber a wall, called the breast or lift wall, is built nearly to the height of the bottom of the upper level, and on it is placed the miter-sill, against which the lower part of the gates rests when closed.

The side walls of the head-bay are simply a continuation of the side walls of the chamber. Above the gates the walls of the head-bay set back from the face line of the chamber, forming the upper recess into which the upper gates fold back when open. This is of sufficient depth to allow the gates to fall entirely within the face of the chamber wall when they are open. That part of the recess in which the heel or quoin-post turns is called the hollow quoin. The recesses for the lower gates are within the lock chamber at the lower end, and are similar to those in the head-bay. Above the recesses the walls of the head-bay diverge somewhat, and are connected by twist walls to the slope walls of the canal.

The side walls of the tail-bay are also a continuation of the chamber walls for a distance about equal to the length of the gate recess, and then diverge as wing walls to join the slope walls of the lower level. The thickness of the masonry back of the lower hollow quoins is increased to withstand the pressure of the gates at that point. The bottom of the tail-bay, called the apron, is planked or paved for some distance to counteract the effect of the current caused by the discharge of water from the lock chamber.

The miter-sill is a triangular-shaped frame, usually of wood, from 10 to 12 inches high, which extends across the lock below each pair of gates, and against which the lower part of the gates rests when closed. The altitude of the triangle is usually from one-fourth to one-sixth the width of the lock.

A lock-gate is composed of two heavy upright timbers connected by several horizontal ones, and the whole covered on the upper side with heavy planks. The upright which fits in the hollow quoin and which acts as an axis for the gate is termed the quoin or heel-post. The opposite upright is called the miter or toe-post, and is beveled to fit tightly that of the opposite gate when the gates are closed. The horizontal pieces are called girts or cross-arms. The valves are usually placed between the two lower cross-arms, and are either operated by a rack and pinion or revolve about a horizontal or vertical axis. The levers or other arrangement for operating the valves are placed at the top of

the gate, and are reached by means of a wide board, termed the running-board, secured by brackets to the top of the gate. The balance-beam is a heavy timber extending from the toe-post over the heel-post, and several feet beyond. It is used as a lever to open and close the gate, and to partially balance the weight of the gate. The quoin-post rests upon a casting placed on the chamber floor called a step, which projects upward into a hollow casting called a thimble, fitted in the post. The top of the heel-post is held in position by an iron strap called the collar, which is fastened to anchor irons secured to the masonry.

Machinery is sometimes used to haul the boats into the lock, and is driven by a turbine utilizing the fall between the two levels.

In the larger locks of ship-canals the water is admitted to the lock chamber by culverts constructed in the lock masonry. These usually pass around back of the hollow quoin, and are provided with gates. Sometimes, however, the culvert passes underneath the lock chamber, and valves in the crown open into the lock bottom.

The locks on the Erie Canal, which are among the best of those used exclusively by canal-boats, are 110 feet long between miter-sills, 18 feet wide at the water surface of the lower level, and have a depth of 7 feet over the miter-sill. The lifts range between 5 and 15 feet. The locks, lengthened to admit two boats, have nearly the same dimensions, excepting the chamber length, which is 221 feet.

The locks of the Caledonian Canal in Scotland will admit the passage of frigates of the second class. They have a chamber length of 180 feet, a top width of 40 feet, and have a depth of 20 feet over the miter-sill. The lift is 8 feet.

The locks of the enlarged Welland and Lachine Canals have a chamber length of 270 feet, a width of 45 feet, and a depth over the miter-sill of 14 feet.

The locks on the St. Mary's Canal, on the Michigan side of St. Mary's strait, are, from the amount of traffic passing through them, perhaps the most important of any in the world. As originally built they consisted of two locks, with chambers 350 by 70 feet, and 12 feet deep. The lift of each lock was about 9 feet. They were completed in 1856. A single lock intended to take the place of those two was built alongside of them, and completed in 1883. This lock is 515 feet long in the chamber, 80 feet wide, but narrowing to 60 feet at the gates. The depth of water over the miter-sill is 17 feet, and the lift is 18 feet. At the time of its completion it was the largest lock in the world. The gates are operated by hydraulic power. A culvert connecting the upper and lower levels passes underneath the chamber, and water is admitted through apertures in the cut-stone lock bottom. The total cost of the structure was $1,071,000. A new lock is now being constructed on the site of the first two. It will have a total length of 1,200 feet, and a chamber 800 by 100 feet. The depth over the miter-sill will be 21 feet. The estimated cost of this structure complete, including the excavation, foundation, masonry, gates, and machinery, is $2,334,000.

Temporary locks for the Panama Canal were proposed by M. Eiffel. The chambers were to be 590½ by 59 feet, and the lifts were to be from 24¾ to 36 feet. The chamber walls were to be made of iron caissons, braced with cast iron, and filled with concrete. The gates were to be made of iron and slide directly across the lock, being suspended at the top to an iron drawbridge, which could be swung over one of the side walls when the gates were open.

On the Nicaragua Canal, now being constructed, there are six locks. The chambers will be 650 by 80 feet, and the lifts will vary from 21 to 42½ feet. The estimated cost is from $1,270,000 to $1,630,000 per lock.

The Eastham or tidal locks on the Manchester ship-canal have the walls made of concrete, with granite coping, fender courses, and hollow quoins. Three locks of different sizes are placed side by side to serve the different types of vessels. The chamber of the smallest is 150 by 30 feet; that of the next in size 350 by 50 feet. The largest, which is also the largest completed lock in the world, has a length of 600 feet between gates, and is 80 feet wide. The depth over miter-sill is 26 feet, and the walls are 49 feet high. The walls dividing the locks are 30 feet thick, and the filling and emptying culverts are built into each wall of the locks. The lock gates, unlike most gates for large locks, are built of wood instead of iron. The heel-posts are 26 inches in diameter. The gates are each 45 feet wide by 45 ft. 5 in. in height, and 5 feet thick at the center, and each contains 180 tons of timber. The total weight of a gate is 210 tons.

The literature of the subject is mostly found in reports made by engineers to canal companies and to governments. Stevenson's *Canal and River Engineering* (Edinburgh, 1872) and Hagen's *Wasserbaukunst* (Berlin, 1869) may, however, be quoted. For some of the attempts to avoid the use of locks, see Fulton's *Treatise on the Improvement of Canal Navigation* (London, 1796). See also the articles Canals, Ship-canals, and Inclined Planes.

John E. Ostrander.

Canals [Fr., from Lat. *cana'lis*, or Ital. *canale*]: artificial watercourses for drainage, irrigation, and especially for navigation. Whenever possible, advantage is taken of the natural river-courses for the purpose of canalization. A canal must be very nearly upon the same level. Whenever considerable elevations are to be overcome, it is usually accomplished by means of locks. Valleys are generally crossed by means of embankments, with openings called culverts for the passage of streams. Canal-boats are usually hauled by animals which walk upon a tow-path, upon one side of the canal.

Among the ancients, when civilization was confined almost entirely to the neighborhood of the ocean, inland navigation was very limited, and means of overcoming differences of elevation were unknown. The first canals were built for purposes of irrigation, and their enlargement to form navigable channels was an afterthought. The royal canal of Babylon, so enlarged about 600 B. C., is among the earliest recorded. Among the projects for connecting rivers and oceans by canals among the Egyptians, Greeks, and early Romans, we may mention the canal of Marius, B. C. 102 (see Fossa Mariana), connecting the lower Rhône with the Mediterranean; the canal of Alexandria, B. C. 332, by which the port of the new city founded by Alexander was put in navigable communication with the Nile, all the mouths of which were obstructed by impassable bars. About the Christian era the Emperor Claudius, on account of the obstruction of the port of Ostia, connected the Tiber with the Mediterranean by a short canal, and the new ports of "Claudius" and of "Trajan" were made at its termini. About the fourth century the Romans made improvements connecting rivers in Lombardy, and in the fifth century Odoacer built a canal from the sea to the Mentone, above Ravenna. Charlemagne in the eighth century began canals joining the Main and the Rhine with the Danube, and the ocean with the Black Sea. In China the Grand Canal, joining the Pei-Ho and the Yang-tse-kiang, 500 miles apart, was built in the thirteenth century. This great work, itself about 650 miles long, is a series of canalized rivers, and gives, with its connecting rivers, an inland navigation of nearly 1,000 miles. Its depth is 5 to 6 feet. Changes of level are surmounted by drawing the boats up inclined planes. The boats are either rowed or tracked along by men. Several canals were built in Holland and in Italy from the eleventh to the fifteenth century. About 1400 A. D., in Spain, the Moors built a canal from Granada to Cadiz, but after their expulsion internal improvements languished. In the early part of the sixteenth century the Ebro and Castile canals were partly built, but not completed. The spirit which dominated this nation is thoroughly exemplified in a decree of the council about 1680 regarding a project for improving certain rivers, which stated that "if it had pleased God that these rivers should have been navigable, he would not have wanted human assistance to have made them such; but that, as he has not done it, it is plain that he did not think it proper that it should be done. To attempt it, therefore, would be to violate the decrees of his providence, and to mend the imperfections which he designedly left in his works." In 1570 the Spaniards began a canal in South America, from Cartagena to the river Magdalena, 87 miles, including various lagoons on its route, and 14 miles of bay and harbor. It has been badly neglected, but efforts are being made to have it repaired.

In 1481 the invention of locks for passing from one elevation to another rendered canal navigation much more generally available. This invention, made by two engineers of Viterbo in Italy, at once gave an impetus to canal construction. Several important channels of communication were opened in Italy. The first French canal was that of Briare, built 1605–42. The Orleans Canal was built in 1675. The greatest work of that age was the Languedoc Canal, from Narbonne to Toulouse, 150 miles, its summit-level being 500 feet above the sea (built 1667–81). In 1700 Peter the Great began the immense system of canal navigation in Russia

which connects St. Petersburg with the Caspian Sea and inland districts, affording continuous navigation for 1,434 miles. Charlemagne conceived the idea of connecting the Danube and the Main by a canal, but the project was not carried out until 1836–46, by Louis I. of Bavaria. The canal is 108 miles long, and its summit-level is 650 feet above the Main and 270 feet above the Danube. The Danish Canal, 100 miles long, finished in 1785, unites the North Sea and the Baltic. In Prussia water-communication is had by canals and river improvements between Hamburg and Dantzic. The Gotha Canal in Sweden, one of the largest European works of this class, was planned in 1716, the first part opened in 1810, and completed in 1832. It crosses Sweden from Stockholm to Gothenburg, is 280 miles long, and at its greatest elevation is 308 feet above the sea. There are altogether 800 miles of canals in Sweden.

From a very early period extensive canals were used in India for purposes of irrigation. Some of these have in later times been enlarged for navigation. A canal for irrigation and for navigation by steamboats from Sunkelassa to Cuddapar, 190 miles, was built in 1861–71.

The oldest British canal, the Foss Dyke, in Lincolnshire, is a cut originally made by the Romans. Internal navigation was the subject of legislation in 1423, and there exist locks on the river Lee built in 1570. At Exeter, Hugh Courtenay, Earl of Devon, in 1316, in revenge for an affront, ruined the navigable approach to the town by dams in the river. Parliament passed an act for creating a navigable canal to the city in 1531, but the work was not begun until 1585, and was not completed until 1675. In 1758 the Duke of Bridgewater procured a grant for the construction of canals, and for forty years there was as great a rage for canals as in the second quarter of the nineteenth century for railroads. The canal excitement continued, somewhat subdued, however, for thirty years during that century. South of Durham no place in England is more than 15 miles from navigation. During the same period several short canals were constructed in Scotland. The Forth and Clyde Canal, first projected by Charles II., was constructed after plans of Smeaton in 1768–89. It is 35 miles long, and surmounts a summit of 160 feet by 39 locks. It is now in contemplation to make this a ship-canal with summit level 95 feet above tide, and 12 locks. The Caledonian Canal (*q. v.*) is properly classed under the head of *ship-canals*. In Ireland the Grand Canal, from Dublin to Ballinasloe, 164 miles in length with its connections, 40 feet wide and 6 feet deep, was built in 1765. Immense sums were thrown away in carrying this canal across the Bog of Allen. In 1792 the Royal Canal, from Dublin to Tormansburg, 92 miles, was built, of excessive size and nearly parallel to the Grand. The result is that neither of them has ever produced any revenue. In Great Britain 4,713 miles of navigable canals exist. Many of these canals have been bought by railway companies, and are operated in connection with the roads.

The first canal in America was built in 1793 around the falls of the Connecticut river at South Hadley, Mass., Benjamin Prescott, of Northampton, subsequently the superintendent of the U. S. armory in Springfield, being the engineer. The Middlesex Canal Company (for a canal from Boston to Lowell) was not incorporated until a year or more afterward. For this earliest work of internal improvement recourse was had—by no means an unusual case since then—to Holland; and this first placing of funds in canal-stocks in the U. S. returned as little interest as many subsequent larger operations. The boats were carried up and down an inclined plane in a car or caisson filled with water, and hauled by cables operated by water-wheels. The canal was subsequently lowered 4 feet, the cars and cables discarded, and the ordinary canal-lock introduced, under the direction of Ariel Cooley, a man of a great deal of energy and ingenuity. The canal around Turner's Falls, on the Connecticut river, was built by Capt. Elisha Mack in 1793–96. This canal is 3 miles in length. These works are now used only for water-power. The valley of the Mohawk, affording opportunity for connecting the lakes and the Hudson, early attracted attention. Gen. Washington examined it during the Revolutionary war. In 1792 the Western Inland Navigation Lock Company was formed, and by 1796 it had constructed locks around the rapids on the Mohawk river at Little Falls, and opened channels westward from Rome, making a passage navigable for 15-ton boats from Schenectady to Seneca Falls. The works and franchises of this company were purchased by the State of New York in 1812. In 1808 Simeon De Witt, the surveyor-general of New York, was directed to survey a route for a canal from the Hudson to Lake Erie. James Geddes, the first engineer appointed by him, made his report on Jan. 20, 1809, on canal routes from Oneida Lake to Oswego and to Lake Erie. On Mar. 13, 1810, the Legislature appointed a canal commission of seven members, at the head of which was Gouverneur Morris, to whom is attributed the first suggestion of the Erie Canal in 1803. These commissioners made several reports, but no decisive action was taken until Apr. 7, 1816, when a law was passed authorizing the construction of the Erie and Champlain Canals. The first ground was broken at Rome, N. Y., July 4, 1817, and the canal was opened on Nov. 4, 1825, from Buffalo to Albany, 352 miles. (See Clinton, De Witt.) As first constructed, it was 40 feet wide at top, 4 feet deep, and was navigable for 76-ton boats. Between 1835 and 1862 it was enlarged, and is now generally 70 feet wide, 7 feet deep, and navigable for boats of 240 tons burden. From 1884 to 1891 about half of the locks were lengthened so as to admit of the passage of two boats at once. The opening of the Erie Canal reduced the time between Buffalo and Albany from twenty days to ten days, and the cost of freight transportation from $100 per ton to $10, and later to $3 from Buffalo to New York.

During the second decade of the nineteenth century an immense impetus was given to the cause of internal improvements, and enormous projects were undertaken by several of the States. Pennsylvania and Maryland began to connect their tidewaters with the Ohio river; Virginia undertook the construction of two canals from Chesapeake Bay to the Ohio, Ohio and Indiana strove to connect the lakes with the Ohio river, and Illinois to join the lakes and the Mississippi.

Several canals in Pennsylvania had been undertaken by private companies between 1790 and 1816, but little was done by them. Between 1816 and 1824 the Union Canal, 82 miles long, from Reading to Middletown on the Susquehanna, was constructed. In 1826 the State began the construction of water-routes from Pittsburg to Philadelphia and to Lake Erie, and built 608 miles of canals and navigable feeders. The main route across the Alleghany Mountains was broken by a portage railroad 37 miles long, and the eastern terminus was on the Susquehanna, 82 miles from Philadelphia. The improvement of the navigation of the Lehigh river was caused by the necessity for cheap transportation of coal to tidewater. Two iron manufacturers at the Falls of Schuylkill, near Philadelphia, discovered in 1817 that anthracite coal could be made available for smelting, and to obtain a supply cheaply leased a large tract of coal-land near Mauch Chunk, and obtained a charter for improving the Lehigh river. This was done first by wing-dams, afterward by pools and sluices, the coal being carried in "arks," which were built in the woods and broken up at their destination. In 1827 the State began the Delaware Division Canal from Easton to Philadelphia, and the Lehigh Company constructed a slackwater navigation by dams and locks from White Haven to Easton. On June 4, 1862, a heavy freshet carried away eighteen out of twenty dams between Mauch Chunk and White Haven, and these have never been restored. Below Mauch Chunk the damage done was repaired. There were built altogether in Pennsylvania 974 miles of canal. The Pennsylvania R. R. purchased the Pennsylvania canal and used portions of it until 1890, and then abandoned its navigation. The Reading R. R. operates 153 miles of canals.

Ohio built two canals of limited capacity from the Ohio river to Lake Erie, and others of minor importance, 795 miles in all. Indiana, conjointly with Ohio, built the Wabash and Erie Canal from Toledo to Evansville, 461 miles. Mismanagement and neglect have brought much of this to ruin, and the lower portion of it has been for some years abandoned. In Virginia, a board of public works, established in 1816, furnished State aid to internal improvements. A favorite project since the days of Washington has been a water-route from the James river to the Ohio viâ the Kanawha. See James River and Kanawha Canal.

One of the very earliest projects was the connection of the Potomac and Ohio rivers by a navigable canal; and the improvement of the Potomac river (navigable by ships to Georgetown) to the foot of the Alleghanies was one of the first steps considered. In the year 1784 a charter was granted for this purpose by Maryland and Virginia conjointly; a company was organized, which up to the year 1822 had expended $730,000 in locks, dams, etc. The result,

however, was unsatisfactory, and after a prolonged investigation the substitution of an independent canal from Georgetown to Cumberland was recommended (1823) by the engineers, Messrs. Moore and Briggs, appointed by the two States. It was to be 182 miles long, 30 feet wide at surface, and 3 feet deep, with 63 locks, at an estimated cost of $1,575,094. About this time the general Government inaugurated its so-called system of internal improvements by act of Apr. 30, 1824, and a board of engineers was appointed, by whom the entire route to the Ohio at Pittsburg was surveyed, and the board rendered a report Oct. 23, 1826, estimating for 341 miles of canal from Georgetown to Pittsburg, to be 48 feet and 33 feet wide at surface and bottom, 5 feet deep, and to cost $22,375,081. The amount of money required was inordinate for that early day. In 1829 the eastern division was authorized to be built from Alexandria to Cumberland, Congress providing a subscription for 10,000 shares of stock; the city of Washington, 10,000; Georgetown and Alexandria, 5,000; and the States of Maryland and Virginia, 7,186 shares; the remainder being taken by individuals. The first blow struck for the actual construction was July 4, 1828, by the President of the U. S., John Quincy Adams. The dimensions were increased to 60 and 42 feet surface and bottom width, depth to 6 feet. The aqueduct by which it was carried across the Potomac at Georgetown, constructed (1832–40) under direction of Major Turnbull, U. S. Engineers, was one of the most important engineering constructions at that date undertaken in this country. The main portion consists of a wooden trunk resting on twelve masonry piers founded by coffer-dams on rock averaging 28 feet, and toward the western shore 40 feet, below the surface, covered by 15 to 20 feet of mud. Up to the year 1845 there had been expended on the canal $9,502,345, and subsequently about $1,500,000; besides, charges of interest, loss on sale of bonds, have carried the aggregate expenditure to $15,000,000 and upward. Its main business has been the transport of coal to tide-water at Georgetown. The "eastern division" (from Georgetown to Cumberland), as it now exists, follows the north side of the valley of the Potomac to the eastern foot of the Alleghany Mountains, at Cumberland, Md. It departs from the immediate valley of the river by a cut-off and a tunnel of 3,118 feet in length at Paw Paw Bend, 27 miles E. of Cumberland. The distance saved by this tunnel is about 6 miles. The Cumberland level is 613¾ feet, and is overcome by 74 locks, varying from 6 to 10 feet lift, with chambers 100 feet long and 15 feet wide. From Georgetown to Harper's Ferry, 60 miles, the canal surface is 60 feet wide, and from Harper's Ferry to Cumberland it has an average of 40 feet width, the depth throughout its length being 6 feet. The canal is supplied with water from the Potomac river by means of seven dams thrown across the river at suitable distances. The boats used on this canal are ordinary flat-bottomed boats from 90 to 95 feet long, and 14 feet wide, drawing 5½ feet when loaded. They carry from 110 to 115 tons of 2,240 lb. The terminus of the canal at Cumberland is 20 miles from the coal-field by the Cumberland and Pennsylvania R. R., its principal connection therewith.

In 1890 the company owed $1,699,500 in bonds and twenty-five years' interest on them, and after litigation the canal was handed over to the bondholders.

In the early years of Western settlement, when the great rivers formed the only vehicle of transportation, an obstruction to navigation so grave as that made by the rapids known as the Falls of the Ohio at Louisville could not fail to compel early attention. In 1825 the State of Kentucky authorized a private corporation to construct a lateral canal (known as the Louisville and Portland), which was completed in 1830 at a cost of about $1,000,000. Length, $1\frac{7}{10}$ miles; width, 64 feet; with three locks, each 200 feet long and 50 feet wide; lift, 8⅜ feet. In 1860 an enlargement, planned by T. R. Scowden, was undertaken, and $1,800,000 expended, the civil war interrupting the work. The Ohio being a great national highway, this work was deemed a proper object for governmental care, and in 1868 was placed in charge of the chief of engineers U. S. army, and carried on by appropriations of public money by Congress. A new enlarged canal was opened to navigation in Feb., 1872, and entirely completed Nov., 1873; the extra cost of enlargement (including the $1,800,000 already mentioned) was $3,250,000.

The present canal leaves the Ohio river in front of the city of Louisville, passes in a westerly direction around the falls, and enters the river just above Portland, Ky. Its length is $2\frac{1}{10}$ miles, and its general width 86½ feet. The upper entrance is 400 feet wide, and suitable turn-out basins are provided. A dam on the crest of the falls enables a minimum depth in the canal of 6 feet to be obtained. The depth depends upon the stage of water in the river; the least depth being 6 feet, and the greatest depth known about 42 ft. 8 in. The great expense of this work is due to the fact that its bed is cut through hard limestone rock, and its sides are protected by stone walls, above which rise earthen parapets to a height of 44 feet above canal bottom and 1⅛ feet above highest known flood. A set of guard-gates at the head provides for shutting off water when necessary. At the lower end are the old locks, still preserved as originally constructed, and the two new locks which form the outlet of a short branch have lifts of 12 and 14 feet; their length between miter-posts is 372 feet, available length 335 feet, width 80 feet.

The guard or flood gates at the head of the locks are 47⅔ feet long and 46 ft. 11 in. high. The upper lift-gates are 47⅔ feet long, 24¾ feet high, and built of a combination of oak and pine. The middle and lower lift-gates are 47⅔ feet long, 31 ft. 2¾ in. and 27 ft. 2 in. high, respectively. They are built entirely of oak, except planking, which is of pine. The upper lock was improved in 1890 by raising the lock walls and middle gates by building on them with timber 15 inches, increasing the practicable use of the canal 17 per cent.

Except during high water, when there are 10 feet or more at the head of the falls, the entire commerce of the Ohio river passes through the canal. During the year 1890–91 3,940 boats passed through the locks, and 3,878 down the river.

The Chesapeake and Delaware Bays were connected in 1824–29 by a canal through Delaware and Maryland nearly 14 miles long. The summit-level, 16 feet above mean tide and 10 miles long, is supplied by pumps. Surveys have been in progress for a few years for a new canal between these bays. This work was aided by the U. S. Government. In New Jersey the Delaware and Raritan Canal, built in 1831–34, 44 miles long, connects the Delaware and Raritan rivers, making an inland navigation from New York to Philadelphia. The first application of steam-power to operating locks was made in 1868 on this canal by Ashbel Welch, C. E., and increased the capacity of the canal 50 per cent. The Morris Canal, 101 miles long, built about 1830, connects the coal-regions of Pennsylvania with New York harbor. This canal was purchased by the Lehigh Valley R. R., but has been operated by it at a loss.

In the Southern States over 250 miles of canal have been built. Among the most important of these are the Chesapeake and Ohio, the Illinois and Michigan Canal and the James River and Kanawha Canal (*qq. v.*).

The speculation in canals which began in 1820–21 was checked by the introduction of railroads, and, of more than 5,000 miles projected and begun, less than 3,000 were built. A very small proportion of these have paid interest on the money invested. The New York State canals were built by the State Government. Of 906 miles built, 514 miles are operated by the State at an annual expense of about $700,000. No tolls have been collected since Jan., 1883. For the twenty-eight years 1862–90 the average tonnage was 5,714,170 tons. The actual expense of the canals to the State up to Jan., 1889, has been $39,851,986 in excess of all revenue derived therefrom. This sum represents the premium which the people of New York have paid in taxes to secure and encourage the use of these waterways for purposes of transportation. The annual cost for construction, maintenance, and operation from 1885–90 averaged $1,500,000.

The Ohio canals, built by the State Government, were a continual source of expense, and in 1861 were leased to private parties for an annual rental of about one-tenth of 1 per cent. on their cost.

The cause of the failure of through routes of canal transportation to be remunerative has apparently been the insufficient channel dimensions which for economy were given them, and the consequent small loads which could be carried. Experience has proved that with an enlarged section of canal prism, accommodating larger boats, the carrying capacity is three times as great, while the towing expenses are increased less than 50 per cent., making the cost per ton per mile on a large canal 41½ per cent. of what it is on a small one. The carrying capacity of a canal accommodating boats of a given size depends upon the number of lockages which can be made in a given time. Increase of

speed between the locks, while it lessens the time of transit on a canal worked to less than its maximum capacity, will not increase the volume of traffic. It is of the first importance, therefore, that the time of lockage should be decreased. Practically, the former consideration is first attended to, however, as no canals are as yet worked to their full capacity. The economical rate of speed for boats towed by horses is 2 miles per hour. The time lost by slowing up on approaching locks, the stoppage in locks, and the getting under way again, reduces the average rate of speed to 1·7 miles per hour. The first cause of detention at locks has been greatly overcome by the application of steam-power to the lock-gates, as designed by Mr. Ashbel Welch, previously mentioned. For lessening the second and third, the use of inclined planes instead of locks, up which the boats are drawn by machinery, and passing over a summit descend into the upper level with an initial velocity greater than the average, has been found effective on the Morris Canal in New Jersey. Inclined planes instead of locks were used in England on the Ketling Canal in 1789.

Hydraulic lifts in place of locks are used in some European canals. The first one was constructed in 1876 at Anderton on the river Weaver, England, with a lift of 50 feet. Two troughs, 75 by 15 by 5 feet, alternate in movement, are operated by two rams 3 feet in diameter under 520 lb. per sq. inch. In France there is the Fontinettes lift on Neufossé Canal, which connects North Sea ports with Paris. It supplements flights of five locks with a lift of 43 feet. It has troughs 130 by 18 by 7 feet in dimensions, accommodating 300-ton barges, and lifted by rams 6·6 feet in diameter; Louvière lift is in Belgium, on the Canal du Centre, connecting the waterways near Mons with those of Brussels, on which there is 293 feet fall in 17 miles, of which 213 feet is in 5 miles. There is one lift of 50·5 feet and there are five of 55·5 feet, with troughs 141 by 19 by 8 feet, taking 400-ton boats. The hydraulic rams are operated by turbines worked by water from the upper level. A boat of 400 tons can be passed up through the lift, and another boat passed down, every fifteen minutes.

High velocities between locks have not been attained, the chief obstacle thereto being the greatly increased traction force required.

In Middle France to this day boats of 60 to 110 tons burden are hauled by two men at a speed of 11 to 16 miles per day. A man and horse harnessed together travel about 18 miles per day. In Northern France the use of animal power is obligatory, and boats of 275 to 330 tons are hauled by two horses about 20 miles per day.

On some French canals boats are conveyed at a speed of 13 miles per day by being towed in floats of twenty to thirty boats, of 270 to 300 tons burden, by a tug on which is an engine driving a drum around which passes a chain cable laid on the bottom of the canal. This method is used especially in tunnels. A wire cable is similarly used on Belgian canals, and for ascending boats on rivers in Belgium and on the Danube between Linz and Vienna. In other cases an endless chain on the bottom of the canal is driven by stationary engines, and boats are attached to the chain.

It is alleged that this method can not be advantageously used on the U. S. canals, where the curves are much more frequent and sharp than in those of the countries where the system has been successfully applied. A trial on the Erie Canal in 1880 gave unsatisfactory results. On some Belgian canals boats are towed by a locomotive on the tow-path, running on a single rail. When two boats meet they exchange locomotives, the latter returning until another boat is met. On the Muscle Shoals Canal in Alabama, 15 miles long, boats are towed by a locomotive on a track along the bank. Screw propellers were used successfully on the Chesapeake and Ohio Canal 1872–80. In the U. S. steam propellers have been used for some years on the Delaware and Raritan Canal. In 1871 the New York Legislature offered rewards for the best motive-power other than animals for propulsion of boats on canals, excluding the Belgian system; 700 communications were received in reply, resulting in twelve steamers being placed on the canal for trial, of which three fulfilled the first test required. The result of experiments was so satisfactory that ninety-two self-propelling boats were placed on the State canals, having an average rate of speed of 2¾ miles per hour, including detentions. The total number of boats is 4,000.

The cost of transportation by steam on canals is now reduced to less than 3 mills per ton per mile. The cost of through transportation on railroads is 7 mills per ton per mile. These prices do not include the interest on capital, nor profits. Both may be reduced somewhat by good management, but the proportion between the two can not be much changed.

Canadian Canals.—In Canada there are many important canals, which may be classed under the following heads:

1. The St. Lawrence and lake navigation, including the Lachine Canal, the Beauharnois, Cornwall, Farran's Point, Rapide Plat, and Galops canals, commonly designated the St. Lawrence canals, on the river St. Lawrence, surmounting its rapids between Montreal and Kingston; and the Welland Canal, between Lake Ontario and Lake Erie, surmounting the falls and rapids of Niagara; to which may be added the Burlington Bay Canal, through a sandbar at the mouth of that bay, at the head of Lake Ontario.

2. The Ottawa and Rideau navigation, including St. Anne's Lock, the Carillon, Chute à Blondeau, and Grenville canals, surmounting the rapids of the Ottawa between Montreal and the city of Ottawa; and the Rideau Canal, connecting the river Ottawa with the St. Lawrence at Kingston, through the rivers Rideau and Cataraqui.

3. The Richelieu and Champlain navigation, being the St. Ours Lock and Chambly Canal, surmounting obstacles on the river Richelieu from the St. Lawrence to Lake Champlain.

4. The river Trent navigation, consisting of locks and dams on the river Trent, a large tributary of Lake Ontario, extending into the interior of the Newcastle district, originally proposed as a line of communication with Lake Huron.

5. The St. Peter's Canal, connecting the Bras d'Or, a bay of the sea in the interior of the island of Cape Breton, with St. Peter's Bay, on the south coast of the island.

Along with the foregoing may be noticed the following projected canals: The Caughnawaga Canal, to connect Lake Champlain with the river St. Lawrence above the Lachine Rapids; the Ottawa and Huron Canal, to form a direct and short route between Montreal and Lake Huron by the Ottawa and French river; a canal at Sault Ste. Marie; the Huron and Ontario, or Georgian Bay Canal; the Bay Vert Canal, from the Gulf of St. Lawrence to the Bay of Fundy; and the Shebandowan and Lake of the Woods navigation, forming 311 miles of the route from Lake Superior to Red river.

The total tonnage of all the Canadian canals, whether from or to Canadian or U. S. ports, amounted in 1879 to 2,690,737 tons, and the tolls levied on freight, vessels, and passengers, to $309,427. For the year 1889 the figures are 3,113,896 tons and $361,704. The tonnage of 1889 was classified as follows: 1,541,143 tons from Canadian to Canadian ports, 320,792 tons from Canadian to U. S. ports, 684,554 tons from U. S. to American ports, and 567,417 tons passing from U. S. ports to other U. S. ports.

For irrigating canals, see HYDRAULICS and IRRIGATION. For further general information regarding inland commerce by natural and artificial watercourses, see RIVERS; WATERWAYS; SHIP-CANALS, LACHINE, ST. LAWRENCE, ST. MARY'S RIVER, and WELLAND. J. JAMES R. CROES.

Canandai'gua: railroad center; capital of Ontario co., N. Y. (for location of county, see map of New York, ref. 5–E): 28 miles S. E. of Rochester; at the north extremity of Canandaigua Lake, which is navigated by daily lines of steamers. It is picturesquely situated on high ground, which commands an extensive view of the lake. The beautiful scenery of the lake and the fishing and boating accommodations make Canandaigua a popular pleasure resort. Canandaigua (or, as originally, *Canandarqua*, signifying in the Indian tongue the "chosen spot") is a beautiful village with wide, shaded streets, fine public buildings, and handsome residences. There are an academy for boys, boarding-schools for girls, union public schools, a library association and museum, various manufactures, two orphan asylums, an opera-house, 3 banks, 3 newspapers, 3 large hotels, a private lunatic asylum, a jail, and a fine court-house built jointly by the county and the U. S. Government. There are street-cars, electric lights, water-works, and a complete sewerage system. Pop. (1880) 5,726; (1890) 5,868; (1900) 6,151. EDITOR OF "TIMES."

Canandaigua Lake: in Western New York; mostly included within Ontario County. It is 15 miles long, and varies in width from ¾ of a mile to 1½ miles. It is surrounded by high banks which present beautiful and diversified scenery. The water is discharged at the northern extremity of the lake by an outlet which communicates with Clyde river, an affluent of the Seneca river. The surface of this lake is 437 feet higher than that of Lake Ontario, and 668 above the sea. The lake is navigable by steamers.

Cañár, kăăn-yaar′: a small highland province of Ecuador, lying in lat. 2° to 3° S., between the provinces of Chimborazo and Azuay. Pop. 64,014.

Cánara: See KANARA.

Canarese Language: See DRAVIDIAN LANGUAGES.

Cana′ries, or **Canary Islands** (anc. *Fortunatæ Insulæ*): a group of islands in the Atlantic Ocean: belonging to Spain; about 60 miles W. from the coast of Africa. They are between lat. 27° 49′ and 29° 26′ 30″ N., and between lon. 13° 25′ and 18° 16′ W. (see map of Africa, ref. 2–A). The names of the seven largest islands are Lanzarote, Fuerteventura, Gran Canaria, Teneriffe, Gomera, Palma, and Ferro (or Hierro); besides which there are several small islets. Their total area is 2,808 sq. miles. The Canaries are of volcanic formation, and have high rocky coasts. The surface is mountainous, and the highest point, the Pico de Teyde, in Teneriffe, rises 12,182 feet above the level of the sea. The climate is mild and equable, the heat being moderated by the sea-breezes. The vegetation is arranged in zones, according to the height above the sea. The first or lowest zone produces the date-palm, sugar-cane, etc.; in the second flourish the grapevine, olive, and maize. The highest summits are barren and naked rocks. Administratively the group is a province of Spain, to which the African possessions Rio de Oro and Adrar are subordinate. The largest island of the group is Teneriffe, which is nearly 60 miles long, and has an area of 877 sq. miles. Its chief town and port is Santa Cruz de Santiago, where the officers of the general government reside. Las Palmas, the former capital of the province, and the most populous of its towns, is on Gran Canaria. The Canaries have belonged to Spain since 1493, and the population is Spanish. The aboriginal race, called Guanches, was conquered in the latter year. The islands were known to the Romans, and have been described by the elder Pliny, who, however, states that at his time they were uninhabited. They are considered to be the Fortunate islands of the ancients. Incidentally rediscovered in 1334 by a French vessel, they were for a century and a half the prize of various French and Spanish adventurers. By the final conquest the native population, whose former history and ethnographical relations are entirely unknown, was nearly eliminated. The meridian of the island of Ferro (17° 39′ 51″ W. of Greenwich) is usually taken as the dividing line between the eastern and western hemispheres. It was considered by ancient geographers the most westerly point of the world, and they drew through it the first meridian. Longitude is still reckoned from it by some geographers. Pop. 287,728. See Olivia Stone, *Teneriffe and its Six Satellites* (1888).

Canarium: a genus of trees of the family *Burseraceæ*; natives of the East Indies; having compound leaves and diœcious flowers. The fruit is a drupe. The *Canarium commune* is cultivated in Java and the Moluccas for the sake of its fruit, which is edible and yields a lamp oil. This tree grows about 50 feet high, and is supposed to be one of the trees which produce elemi.

Canary Bird (*Serinus canarius*): a well-known singing-bird of the family *Fringillidæ*; native of the Canary islands. Its color in the wild state is gray above, with darker spots; the other parts yellow. In its domesticated form the whole bird is often yellow. In its wild state it builds on shrubs or trees, and produces five broods in a year. In confinement it seems to be contented, and breeds readily several times in a year. Its favorite articles of food are canary seed, hempseed, sugar, and bland green leaves, such as those of chickweed or lettuce. It has great imitative powers, and can be trained to sing various notes. Some of the wild canary birds are said to surpass the best-trained singers in loudness and clearness of note.

Canary-grass: the *Phalaris canariensis*; a short, erect annual grass with a large ovate spike, whose rather large seeds are used as food for CANARY BIRDS (*q. v.*). Although a native of Southern Europe, Western Asia, and Northern Africa, it has long been grown in other regions, and now grows spontaneously in many places in the U. S. When ground into flour the seeds form a valuable food for the inhabitants of some of the countries bordering on the Mediterranean Sea. A closely related species, *P. intermedia*, is a native of the Southern U. S., and may be called the native canary-grass. Another species of this genus is *P. arundinacea*, known in some places as the "wild ribbon-grass." It is a stout, perennial, broad-leaved grass, 2 to 4 feet high, with a branching panicle of large-flowered spikelets. It is found on wet grounds, and is widely distributed. Although a coarse grass, it yields a good deal of forage, which has some value in hay-making. C. E. B.

Canary-seed: the product of CANARY-GRASS (*q. v.*).

Canary Wine, or **Teneriffe Wine**: produced in the Canaries: so much resembles Madeira wine that it is often sold for that article. It is improved by a long voyage. The term Canary is properly applied to the Bidogue wine, which is the juice of grapes gathered before they are ripe, and is not good until it is rendered mellow by age.

Canastoga Indians: See IROQUOIAN INDIANS.

Canasto′ta: village; Madison co., N. Y. (for location of county, see map of New York, ref. 5–G); on N. Y. C. and H. R., West Shore, El., Cort. and North. and Canastota Nor. R. R., and on the Erie Canal; 22 miles E. of Syracuse. It has a high school, an academy, and five churches. The village has canning-factories and manufactories of glass, cutlery, furniture, knit goods, molders' tools, wagons, horse-rakes, agricultural implements, and novelties. There are sulphur and sulphur-and-iron springs within the village. Pop. (1880) 1,569; (1890) 2,774; (1900) 3,030.

EDITOR OF "JOURNAL."

Canaveral: See CAPE CANAVERAL.

Can′by, EDWARD RICHARD SPRIGG, LL. D.: soldier; b. in Kentucky in 1817; graduated at West Point 1839; major-general U. S. volunteers May 7, 1864, and July 28, 1866; brigadier-general U. S. A.; being in infantry till June 18, 1846, assistant adjutant-general to Mar. 3, 1855, and in infantry till July 28, 1866. He served in Florida 1839–42 on quartermaster duty; in emigrating Indians, garrison duty, etc., 1842–46; as adjutant Second Infantry 1846–47; in war with Mexico 1846–48, engaged at Vera Cruz, Cerro Gordo, Contreras, Churubusco (brevet major), and city of Mexico (brevet lieutenant-colonel); as assistant adjutant-general of Pacific division 1849–51; in adjutant-general's office, Washington, D. C., 1851–55; on Utah expedition 1857–60; and in command of Navajo expedition 1860–61. In the civil war he served in command of the department of New Mexico 1861–62, where, after the defection of his seniors, he displayed great energy and skill in defending the country at Fort Craig, Valverde (brevet brigadier-general), and Peralta against a formidable inroad from the South; on special duty in War Department at Washington and in suppressing New York draft riots 1863–64; in command of the division of West Mississippi 1864–65 (wounded on White river); in command of the expedition which captured Mobile and its defenses (brevet major-general), Montgomery, Ala., and received the surrender of the armies of Gen. R. Taylor and Gen. E. K. Smith; in command of various Gulf departments 1865–66, of department of Washington 1866–67. After the war he was placed on various important special duties, and when fatigued by a long and laborious career in 1869 he voluntarily consented to take command of the department of the Columbia, which he held till treacherously shot dead Apr. 11, 1873, by the chief "Jaek" while he was endeavoring to mediate for the removal of the Modoes from their rocky fastness on the northern border of California.

Cancella′ria: a genus of univalve mollusks of the class *Gasteropoda* and order *Prosobranchiata*. The shell is oval or turreted, the spire is prominent, the last whorl is ventricose, the surface reticulated, and the columella plicated. All the recent species are natives of tropical or sub-tropical seas. Numerous fossil species are found in the strata above the chalk.

Cancer: the typical genus of *Cancridæ*, or true crabs, in which the feet are constituted for walking. Species occur in Europe and America, the European, *Cancer pagurus*, being used as a food, which the American species rarely are.

Cancer [Lat. *cancer*, crab, malignant tumor. The same word viâ O. Fr. *cancre* (accus. *cancrum*) yields *canker*]: the popular name for *carcinoma*, a form of tumorous growth composed essentially of epithelial cells, which are usually arranged in nests or alveoli. The term cancer has been generally abused, being taken to signify any malignant or deadly growth, irrespective of its nature, and some writers are still inclined to use the term cancerous as synonymous with malignant. Much unfortunate confusion has arisen from this laxity, and of late careful writers prefer to use the term carcinoma as entirely definite. Cancer finds its most frequent seats in the uterus, the skin, the female breast, the

rectum, stomach, œsophagus, about the lips, the external genital organs, and less commonly in many other localities. There are two important forms—the ordinary or *glandular* cancer, such as occurs in the female breast, and which may be hard or scirrhous, soft or medullary; and the form called *epithelioma*, which is of epithelial nature, but not so distinctly after the type of glands—hence not glandular. Epithelioma was formerly and is still regarded as a tumor distinct from true cancer, though admittedly near this in nature. It is the form of cancer which affects the skin surfaces, especially about the lips and perineum, but also occurs on mucous surfaces, prominently the mouth of the uterus. The cause of cancer has been the subject of numerous investigations, but seems to be veiled in as much obscurity as ever. That heredity plays a part is admitted, but at the same time it is recognized that this is practically of little importance. The older pathologists believed that a certain dyscrasia or constitutional vice so alters the humors of the body that cancer and other tumors make their appearance. This is now rarely heard. Next it was maintained that injury could be found as the cause of cancer, and certain it is that mechanical agency does play a part in the production of "pipe-smoker's cancer" of the lip and many cancers of the female breast, but injury is by no means a constant occasion or cause. Most recently the parasitic theory has been applied to cancer, but there is as yet little proof of this. Certain animal parasites of the family *Sporozoa* (see PARASITES OF MAN) have been found in various forms of cancer with considerable regularity.

The dangers of cancer are (1) the local destructiveness; (2) the deterioration to the general health which results from interference with the functions of the organ, as the stomach, in which the cancer is situated, or from hæmorrhage or infection of the general system by poisons produced by ulceration of the cancer; and (3) metastasis to other parts of the body. The deterioration of the health is attended with a progressive form of anæmia, generally called Cancerous Cachexia, and this gave rise to the old view that an antecedent aberration of the general health causes the tumor, rather than, as we now know, the reverse.

Cancers are to be carefully distinguished from sarcoma, the other important form of malignant tumors. The latter is a more rapidly growing tumor; does not have as marked a tendency to infiltrate the neighboring structures, and hence is not attached so intimately to the overlying skin; is more vascular, and is not of epithelial character. Cancer occurs after forty years of age, sarcoma before forty, as a rule.

The treatment of cancer depends largely on its situation. Whenever possible it should be removed as soon as recognized, and before neighboring lymphatic glands (where secondary deposits first appear) have become involved. The outlook under these circumstances is to a degree favorable, but no great hopefulness is to be entertained. When secondary deposits have appeared, or when internal organs are affected, little but palliative treatment is to be thought of. If pain or hæmorrhages or wasting discharges add to the general deterioration of health, removal of the growth may be of temporary advantage. Cancers have been occasionally removed from internal structures, as the œsophagus and stomach, but without very favorable results.

WILLIAM PEPPER.

Cancer: the Latin word for *crab*. In astronomy it is the fourth sign of the Zodiac, and is denoted by the figure ♋. The sun enters this sign about June 21. The first point of Cancer is 90° distant from the first point of Aries, and is called the summer solstice. Cancer is also the name of a constellation of the Zodiac, which does not coincide with the sign just described.

Cancer-root, or **Beech-drops**: the *Epiphegus virginiana*; a parasitic plant of the family *Orobanchaceæ*. It is a native of the U. S., and grows on the roots of beech-trees. The plant is astringent, and the root has been reputed a remedy for cancer, but it has no such favorable effect.

Cancer, Tropic of: in geography, one of the lesser circles of the earth: a parallel about 23° 27′ N. of the equator. At the summer solstice (June 21) the sun is vertical over this line. There is a corresponding circle on the astronomical globe. This circle touches the ecliptic in the first point of the sign Cancer. Hence the name.

Cancionero: See SONG-BOOKS.

Cancrin′, GEORG, Count: a German financier; b. in Hanau, Dec. 8, 1774. He entered the service of Russia in 1796: became a councilor of state in 1811, and lieutenant-general in 1815. He was Russian Minister of Finance for twenty-one years (1823–44), and performed the duties of that office with ability and success. D. in St. Petersburg, Sept. 22, 1845.

Can′crinite: a silicate of alumina and soda with carbonate of lime; found in Norway and at Litchfield, Me. It is remarkable as an instance of a silicate containing carbonic acid.

Can′crum O′ris (also called *noma* and *gangrenous stomatitis*): an ulcerative process resulting in a mortification of the cheek, mostly observed in children. Impoverishment, poor hygienic surroundings, and debilitating diseases are the predisposing factors. Among the proximate causes are measles, scarlet fever, typhoid, whooping cough, dysentery, and severe inflammatory diseases generally; also an imprudent administration of mercurials. Usually but one cheek is affected. No special constitutional symptoms mark the onset. Locally a small vesicle shows itself, usually about half an inch or an inch from the angle of the mouth on the inner surface; this soon bursts, revealing a hard yellow area. This is soon followed by a well-marked induration in the cheek, extending rapidly; part of the skin becomes black, and a perforation generally results, accompanied by an extremely fetid odor and increased secretion of saliva. This destructive process may spread rapidly over the cheek, nose, eyelids, upper lip, neck, and jaw-bone, causing the teeth to fall out. The ordinary bacteria of suppuration are always present; a specific bacillus has been described by Lingard, but as yet its relation to the disease is considered doubtful. Hæmorrhages are rare. During the course of this destructive process the patient may be without fever, and even inclined to eat and play; malaise and intense thirst are common. In about one week fever will set in, depression takes the place of indifference, and aspiration pneumonia, severe diarrhœa, or gangrene of other parts and consequent collapse will hasten the usual fatal termination. Recoveries, although rare, have been observed. Among the best preventives are early attention in ulcerative inflammations of the mouth, restriction in the use of mercurials, and improvement in the condition of the poor. When developed, the diseased portions must be thoroughly cauterized by free application of pure nitric or hydrochloric acids, or actual cautery, always with anæsthesia. This should be followed by frequently renewed antiseptic dressings and repeated irrigation of the mouth with mild antiseptic fluids. Also a generous diet, stimulants per mouth or rectum, and tonic treatment generally are recommended. In case of recovery, plastic operations do much to relieve the discomfort of resulting cicatricial contractions.

A. JACOBI and F. E. SONDERN.

Candahar′, or **Kandahar**, called by the Afghans **Ahmed Shahee**: the capital of Central Afghanistan; in a fertile plain, 220 miles S. W. of Cabul (see map of Asia, ref. 5–D). It is well supplied with water by two canals. The houses are mostly mean and built of wood. Candahar has an extensive trade and some manufactures. About 2 miles N. of this town is a precipitous rock which is crowned by a strong fortress or citadel. Candahar is supposed to have been founded by Alexander the Great. It was captured by Tamerlane in 1384, and by Shah Abbâs of Persia in 1620. The British army occupied it in 1839–42. It was again occupied by the British in 1880, and several severe engagements took place in the vicinity. It is of great strategic importance, and a branch of the Indian railway system has been pushed beyond Quetta, the Kwaja Amran range has been tunneled, and the rails and all other necessary materials collected to carry the track into Candahar at any time. Pop. 30,000.

Candela′brum (Lat. plu. *candelabra*): a support for lamps. There were perhaps few articles in which the ancients so combined the beautiful with the useful as in their candlesticks and lamps. Candelabra usually were of wood, but marble and metals were used for their construction, and sometimes they were of great richness of material and workmanship. The base in many instances consists of three feet of a lion, goat, or other animal, real or imaginary. In addition to the various kinds of candelabra which seem to have stood on the floor, and which were often 4 or 5 feet high, the ancients had others intended to be placed on a table. These were small and low. The lamp was generally placed upon the flat top of the candelabrum, but other lamps were sometimes hung on the sides by rings or chains.

Candelaria, kăăm-de-la-ree'a: a town in the province of Pinar del Rio, Cuba, 65 miles from Havana, noted for its mineral springs and the excellence of the coffee grown in the neighborhood. Pop. 1,200.

Can'dia, or **Meg'alo-Cas'tro**: a fortified seaport and capital of the island of Crete; on the north coast; lat. 35° 21′ N., lon. 25° 8′ E. (see map of Europe, ref. 8–G). It contains several mosques, a cathedral, a pasha's palace, and an arsenal. Its massive fortifications and its cathedral were erected by the Venetians, who owned the island until it was captured by the Turks in 1669. Pop. 15,000.

Candia: See CRETE.

Candia, PEDRO de: soldier; so called from the Greek island of Candia, where he was born about 1470. He moved to America as a soldier in the Spanish army, and in 1527 was with Francisco Pizarro in the second expedition in search of Peru. In 1528 he was Pizarro's companion to Spain, and received the title of "Grand Pilot of the South Seas." After Pizarro's death he joined the rebellion of the younger Almagro. At the beginning of the battle of Chupas, Candia pointed his guns too high; and Almagro, suspecting treachery, ran him through with his sword (Sept. 16, 1542).

Candidate [from Lat. *candida'tus*, clothed in white]: the name given by the Romans to a person soliciting the office of quæstor, consul, etc., from his appearing in public dressed in a white (*candida*) toga. Among the early Christians converts newly baptized were called candidates on account of the white robes worn by them eight days after baptism. In Germany, at the present time, a theological student who has been approved before the highest authorities in the Church is called a candidate, and the term is generally given to any applicant for office, religious or secular.

Can'didus, WILLIAM: operatic tenor singer; b. June, 1840, in Philadelphia. During the civil war he served in the Union army. At its close he resided in New York, and became a member of the Arion and Liederkranz Societies. In 1866 he sang the part of Max in *Der Freischutz*. Then he went to Germany, and made a fine reputation as an opera singer. He was one of the members of the American Opera Company in 1886. D. E. HERVEY.

Candle [O. Eng. *candel*, an early loan-word from Lat. *cande'la*, deriv. of *cande're*, shine]: a cylinder of wax, fatty matter, or paraffin, through the axis of which runs a wick, used as a source of light. Though among the earliest forms of illuminants, the candle in its modern perfected form is an extremely ingenious device. It differs from the lamp in the fact that the combustible substance is solid at ordinary temperatures, while in the lamp it is liquid. As soon as the candle is brought into action, however, the solid combustible substance becomes liquid, and a receptacle for this liquid is formed automatically. A candle in action consists of some fusible, combustible substance through which an infusible, combustible substance — the wick — passes longitudinally. When the wick, which projects at one end, is lighted, the heat developed melts the material of which the candle is made, the melting taking place to a greater extent near the wick than near the outer edge of the candle. The result of this is that a small cup-shaped cavity is formed around the base of the wick, and this serves as a receptacle for the molten material. As the candle burns away, the conditions remaining the same, this receptacle remains, and thus the candle by its own action is converted into a miniature lamp. The liquid moves upward through the wick in consequence of what is called capillary action, and is soon converted into gases, which, burning, give the flame and the light. The earliest form of the candle was the *dip*. Dips were made on the small scale from refuse kitchen fat by melting this and dipping the wick into it. On the large scale, of course, the work was more carefully done, but the method was the same. Practically, all candles are now made by molding. Much depends upon the construction of the molds used. The wick is plainly a very important part of the candle, and much ingenuity has been displayed in bringing it to its present state of perfection. Until about 1820 the wicks were made of twisted cotton yarn. As the candle burned down the wick projected into the flame and seriously interfered with the combustion. It was necessary from time to time to remove the superfluous matter by means of snuffers. At present the wick is plaited, and this causes it to bend downward as it is released, and the outer end, thus coming in contact with the air, is burned off, so that snuffers are no longer needed. The burning off of the wick is further facilitated by "pickling" it—that is to say, by soaking it in a solution of some substance such as borax, niter, or sal ammoniac, that has the effect of causing the wick to burn in a clean way without smoke. The materials used for candles are at present palmitic and stearic acids and paraffin. Tallow, spermaceti, ozocerite, and beeswax are also used. Stearin candles contain some paraffin, and paraffin candles some stearin. IRA REMSEN.

Candle (in photometry): the practical unit of illuminating power. The standard candle of Great Britain, which is also legal in the U. S., burns 120 grains of spermaceti wax in an hour. The standard candle of Germany is otherwise defined. It has a diameter of 20 mm., is composed of paraffine wax, and must produce a flame 50 mm. in height. In France the practical standard of light is the Carcel, being the light produced by the lamp of that name. The relation between these standards of light is as follows:

1 Carcel = 9·5 standard candles (English).
1 Carcel = 7·5 " " (German).

See PHOTOMETRY; also Dibdin's *Practical Photometry*.

Candle, ELECTRIC: an early form of the electric arc-lamp, which was devoid of regulating mechanism. The best known is the Jablochkoff candle, which was extensively used in Paris in the early days of electric lighting. See ELECTRIC ARC and JABLOCHKOFF CANDLE.

Candle-fish: See OULACHAN.

Candlemas: a festival to commemorate the purification of the Virgin Mary; observed by the Roman Catholics on Feb. 2, when they form a procession with many lighted candles. On this day all the church candles for the year are blessed. The institution dates back to the reign of Justinian, 542. Candle-carrying on this day was customary in England till its abolition by order in council in the second year of King Edward VI.

Candle-nut (*Aleurites triloba*): a tree of the family *Euphorbiaceæ*: a native of Java, the Moluccas, and the Pacific islands. It bears a nut as large as a walnut, having a hard shell and a kernel which is edible when roasted. It yields an excellent bland oil, which is used for food and is burned in lamps. The natives of the Society islands arrange the perforated kernels on a string or rush and use them as torches.

Cand'lish, ROBERT SMITH, D. D.: preacher; b. in Edinburgh, Scotland, Mar. 23, 1806. He was educated in Glasgow, licensed as a minister in 1828, and began to preach in Edinburgh in 1834. He was one of the prominent leaders of the popular party, and co-operated with Dr. Chalmers in organizing the Free Church after the disruption which occurred in 1843. In 1847 he was chosen Chalmer's successor as Professor of Divinity in New College, Edinburgh, but declined to serve. In 1862 he became honorary principal of New College. He was particularly interested in education, and in movements looking toward the union of the various Presbyterian bodies outside of the Establishment. He acquired much distinction as a pulpit-orator and a debater in religious assemblies. D. in Edinburgh, Oct. 19, 1873. He published, among other works, *The Atonement, its Reality and Extent* (Edinburgh, 1845; new ed. London, 1861); *Examination of Mr. Maurice's Theological Essays* (1854); *The Fatherhood of God* (1865; 5th ed. 1870); *Expository Discourses upon Genesis* (3 vols., 1843–62; 2d ed. 1868); *John* (1866); and *Ephesians* (1875). See his biography by W. Wilson (London, 1880).

Candolle: See DE CANDOLLE.

Candy: a town of Ceylon. See KANDY.

Candytuft: a plant of the genus *Iberis* and family *Cruciferæ*; indigenous in the countries bordering on the Mediterranean. The flowers have unequal petals and grow in dense corymbs. Some of the species are cultivated in gardens for the beauty of their flowers.

Cane (Lat. *canna*): a name given to several species of plants, and to the stems of the smaller palms and the larger grasses. The canes or rattans of commerce, which are used in making cane-seats of chairs, etc., are the product of the palmaceous plants *Calamus rotang* and *Calamus viminalis*. The term cane is also applied to the *Arundinaria macrosperma*, an arborescent grass which grows in the Southern U. S. on the alluvial banks of rivers, and forms thickets called canebrakes, which are almost impenetrable. This

plant often grows to the height of 15 or 20 feet. See RATTAN and SUGAR.

Cane'a, called *Khani'a* by the modern Greeks: a seaport-town of Candia or Crete; on the north coast; about 70 miles W. of Candia (see map of Europe, ref. 8–G). It occupies the site of the ancient *Cydonia*. It is the most commercial town in the island, and has a safe but shallow harbor, which will admit vessels of 300 tons. It has a light-house, an arsenal, and a fort. Oil, soap, wax, etc., are the chief articles of export. Pop. 15,000.

Canel'la al'ba: a large tree which grows in Florida and the West Indies; also called wild cinnamon. It has fragrant flowers and an aromatic bark, which is sometimes used in medicine as a stimulant tonic. The genus *Canella* belongs to the family *Canellaceæ*.

Ca'nes Venat'ici (i. e., the Hunting Dogs): a constellation of the northern hemisphere. It is represented on the celestial globe by two dogs, Asterion and Chara, which are held in leash by Boötes, and appear as if pursuing Ursa Major.

Caney, kaa'nā: a Cuban town, 4 miles N. E. of Santiago de Cuba, scene of some of the hardest fighting (July 1, 1898) between the U. S. and Spanish forces in the battle of Santiago. Pop. 700.

Can'field, ARTHUR GRAVES, A. M.: b. in Sunderland, Vt., Mar. 27, 1859; educated at Burr and Burton Seminary, Manchester, Vt., Williams College, Universities of Leipzig, Göttingen, and Berlin, and at Collège de France; instructor in Modern Langnages University of Kansas 1883–87; Professor of French since then.

Canfield, JAMES HULME, A. M.: educator; b. in Delaware, O., Mar. 18, 1847; educated in the Polytechnic Institute, Brooklyn, N. Y., and Williams College, Mass.; admitted to the bar at Jackson, Mich., 1872; lawyer and superintendent of public instruction St. Joseph, Mich., 1872–77; Professor of History and Political Science University of Kansas 1877–91; has been president of the Kansas State Teachers' Association and of the National Educational Association; chancellor of University of Nebraska 1891–93; president of Ohio State University 1893–99; librarian Columbia University since 1899.

Cang, or **Cangue**: the Chinese *kia* or portable pillory.

Cangas de Tineo, kaan'gaăs-dā-ti-nā'ō: a town of Spain; province of Oviedo; 37 miles S. W. of Oviedo, on the Narcea (see map of Spain, ref. 12–D). Pop. 22,000.

Cangrande, or **Cane della Scala**: See SCALA.

Canicatti: a town of Sicily; in the province of Girgenti; on the river Naro; 15 miles E. N. E. of Girgenti (see map of Italy, ref. 10–E). It is well built, and has sulphur mines in the vicinity. Its principal business, however, is the cultivation of orange, fig, and almond trees and grape-vines. It dates back to the reign of the Saracens. Pop. 20,000.

Canic'ula (literally, little dog): Sirius, the dog-star; a star in the constellation Canis Major.

Canicular Year: the ancient year of the Egyptians; so called because its commencement was determined by the heliacal rising of Sirius (or Canicula). Their reason for computing time from the rising of that star was perhaps because it occurred about the same date as the annual inundation of the Nile. The common year of the Egyptians consisted of 365 days, and every fourth year of 366.

Canidæ [Lat. *canis*, a dog]: a family of carnivorous mammals containing the dogs, wolves, and foxes. The typical number of teeth is 42, I. $\frac{3}{3}$ C. $\frac{1}{1}$ Pm. $\frac{4}{4}$ M. $\frac{2}{3} \times 2$, but the molars may vary from $\frac{1}{2}$ to $\frac{4}{4}$. The feet are digitigrade, the claws non-retractile, and, save the Cape hunting-dog (*Lycaon pictus*), which has but four toes on the front foot, the toes are five in front and four behind, the first digit or thumb being small, and considerably above the level of the rest. The muzzle is long, ears somewhat variable, but generally erect and pointed, tail more or less bushy. The group is practically cosmopolitan, and its members, though carnivores, are usually fond of carrion and eat insects, berries, and vegetables. F. A. LUCAS.

Canienga Indians: See IROQUOIAN INDIANS.

Canina, kaă-nee'naă, LUIGI, Cavaliere: Italian architect and antiquary; b. at Casal, Oct. 23, 1795. He was Professor of Architecture at Turin; led the excavations of Tusculum in 1830 and of the Via Appia in 1833; and published, besides other works, *Ancient Architecture Described and Illustrated by Monuments* (9 vols., 1844). Much of his work was largely speculative, showing imaginary restorations of ancient buildings, of the plan of Rome, etc., and recent research has proved the worthlessness of this, so that his books have declined in estimation. D. in Florence, Oct. 17, 1856.

Ca'nines, or **Canine Teeth** [from Lat. *cani'ni*, belonging to a dog, deriv. of *canis*, dog]: four pointed teeth, placed between the incisors and bicuspidate teeth. Each jaw has two of these, which are sometimes called eye-teeth or stomach-teeth. In the *Carnivora* they are very large and adapted to tearing flesh and to holding prey; in the wild boar they constitute the long tusks.

Canis'ius, PETRUS, Blessed: a Dutch Jesuit; b. in Nimeguen, May 8, 1521. His proper name was PIETER DE HONDT. He was educated at Cologne, and entered the Jesuit order in 1543, the first German member of the society. He afterward founded Jesuit schools at Vienna, Prague, Innsprnck, Munich, Ingoldstadt, Freiburg, Dillingen, and Angsburg, and contributed much to stop the progress of the Reformation in Southern Germany. As court-preacher to Ferdinand I. he labored with still greater success for the suppression of the Reformation in Austria; indeed, Ferdinand allowed him to go to any length he wanted, and to use any means he chose. He became so hated that the friends of the Reformation in Germany called him "the Austrian dog," alluding to his name Canisius, de Hondt, "the Hound." He became in 1549 professor and rector of the University of Ingolstadt, and was also a prominent member of the Council of Trent in 1547 and in 1562. D. in Freiburg, Switzerland, Dec. 21, 1597. He was beatified by Pope Pius IX. Nov. 20, 1864.

He was the author of many polemical and homiletic works, and edited several of the Early Fathers. He is best remembered by his famous catechism, *Summa Doctrinæ Christianæ* (1554), which has been frequently translated and abridged, and is even yet considered by Roman Catholic theologians as a standard catechetical work. See his *Life* by V. Alet (Paris, 1865) and by F. Riess (Freiburg, 1865).

Revised by JOHN J. KEANE.

Ca'nis Ma'jor (i. e. the Greater Dog): a constellation which appears in the celestial globe under the feet of Orion. It comprises Sirius, the dog-star, which surpasses all the stars of the firmament in splendor and apparent magnitude.

Ca'nis Mi'nor (the Lesser Dog): a constellation adjacent to Canis Major and to Gemini. It comprises Procyon, a star of the first magnitude, which is nearly in a direct line between Sirius and Pollux.

Caniste'o: village; Steuben co., N. Y. (for location of county, see map of New York, ref. 6–E); on railroad and on the Canisteo river; 55 miles W. N. W. of Elmira; has public school, manufactures, electric street railway, and electric lights. Pop. (1880) 1,907; (1890) 2,071; (1900) 2,077.

Canister-shot: See CASE-SHOT.

Canker [from O. Fr. *cancre* < Lat. *cancrum*, accus. of *cancer*, crab, tumor. Eng. CANCER (*q. v.*) is a direct loan-word from Lat.]: in plants, a disease caused by a fungus (*Nectria distissima*). It occurs most commonly in fruit-trees which have undergone deterioration through being long generated by grafting and budding. Canker is also a disease of the horse's foot, causing a fetid discharge from the cleft of the frog. For canker of the human mouth, see MOUTH, DISEASES OF, and APHTHÆ.

Canker-worm: the larvæ of certain geometrid moths, of which many species occur in America and Europe. They are also called measuring-worms, from their peculiar locomotion. One common American species is *Anisopteryx vernata*. In this the female is wingless, but the male has four thin, silky wings, which have an extent of about an inch and a quarter when expanded. The moths come out of the ground principally in the spring, sometimes also in the autumn. The female lays from sixty to one hundred eggs, glued in clusters to branches of trees; they hatch in the early part of May. The larvæ then feed upon the leaves, especially of apple and elm trees, which they pierce with multitudes of holes. When fully grown the larva is nearly or quite an inch in length. After about four weeks of feeding, the larvæ descend, by crawling or hanging down by their threads, to the ground, burrowing generally to the depth of a few inches. Within twenty-four hours afterward they are changed to light-brown chrysalids. From these the moths emerge after a variable time. As the female canker-worms are wingless, trees may be protected from them by placing leaden troughs, containing tar or fish oil, around their trunks. It is also desirable to destroy as many

of the caterpillars as possible. Shaking the trees will often dislodge them.

Can'na [Lat., reed]: a genus of plants of the family *Scitamineæ*. The fruit is a capsule containing hard black seeds, which are called Indian shot. The flower has one fertile petal-like stamen, and a petaloid style. One or more species are extensively cultivated as ornamental plants. The starch of *Canna coccinea* is used sometimes instead of arrowroot, under the name *tous-les-mois*. The *Canna flaccida* is a native of the Southern U. S., near the coast.

Can'nabis [Gr. *κάνναβις*, hemp, a word probably of Scythian origin]: the typical genus of plants of the family *Cannabinaceæ*. The only known species of it is *Cannabis sativa*, or hemp, a tall dicœcious annual with elegant palmate leaves. It grows wild in India, and is cultivated for its fiber, etc. (See HEMP.) The intoxicating drug called *hashish* by the Arabs and *bhang* by the Hindus is procured from a variety called *Cannabis indica*. Under the name of *gunjah* the dried female flowering hemp-plants are sold in bundles for smoking. The resinous extract called *churrus* is swallowed for intoxicating effect. Several African tribes use it. There appears to be more of the active resinoid (*cannabin*) in the Indian than in the European variety, owing probably to the difference of climate. It has been proved by the experiments of Dr. H. C. Wood, of Philadelphia, that the extract of American hemp has the same kind of influence on the brain and nervous system as that from India. (Care should be taken to separate distinctly *Cannabis indica* of American growth, which is what Wood used, from *Apocynum cannabinum*, sometimes called American or Americo-Indian hemp, which is an intense irritant poison.) The effects of Indian hemp vary considerably with different persons. Usually they are agreeably exciting, the plant being known in India as the "increaser of pleasure," the "cementer of friendship," and the "laughter-mover." Some persons become violent under its use. The word *assassin* is derived from the Arabic *hashshāshīn*, one who drinks or smokes hashish. With many there is an exaggeration of ordinary impressions, so that slight sounds are taken for thunder, one's head seems as large as a house, etc. Others have their sensibility diminished or suspended by it. It does not, like opium, affect the secretions, and seldom produces nausea. There are no cases on record in which a cannabis-indica "habit" has developed in a European. What is quite as important is the fact that no death has ever been recorded from overdoses of the drug, and enormous amounts of an active preparation injected directly into the circulation fail to cause death.

The ancients possessed some knowledge of the narcotic powers of hemp. The Scythians made a vapor-bath of its fumes by throwing the seeds on red-hot stones. Dr. Royle suggests that it may have been the nepenthes (*φάρμακον νηπενθές*) which, according to Homer, Helen received from an Egyptian woman and gave to Telemachus in the house of Menelaus.

Extract of hemp (*Extractum cannabis indicæ*) is now used as a medicine for neuralgia and some other nervous affections. The variability of its effects, however, has hitherto interfered with its extensive employment. See Hare, *Practical Therapeutics* (3d ed. Philadelphia, 1892).

Revised by H. A. HARE.

Can'næ: an ancient Roman town in Apulia; on the river Aufidus (Ofanto); near its entrance into the Adriatic Sea. Here, on Aug. 2, 216 B.C., Hannibal gained a decisive victory over the Roman army commanded by C. Terentius Varro. According to Livy, the Romans on this day lost about 45,000 infantry and 3,000 cavalry. The site of Cannæ is occupied by a village called *Canne*, about 10 miles W. S. W. of Barletta.

Cannel Coal [generally explained as "candle-coal," with Lancashire pronunc. of *candle* as *can'l*]: a variety of bituminous coal which is very dense and compact, and breaks with an uneven or largely conchoidal fracture. It sometimes exhibits a brilliant waxy luster, and is generally of a brown or black color. It burns with a bright flame, and during the process of combustion splits and crackles without melting. This coal, which is found in England and the U. S., is used for fuel and is valuable for making gas. See COAL.

Can'nelton: the capital and principal town of Perry co., Ind. (for location of county, see map of Indiana, ref. 11–D); situated on a branch of L. E. and St. L. R. R., and on the Ohio river; about 68 miles above Evansville. Cannelton has 6 churches, 2 schools, water-works, a large cotton-factory built of sandstone (in which over 400 operatives are employed), 2 saw-mills, planing-mill, flour-mill, brick-yard, cooper-shop, and manufactories of draining-tiles, pottery, picks, and chairs. Bituminous coal abounds in the adjacent hills, and is supplied in large quantities to steamboats. An excellent quality of sandstone is quarried in large quantities. The walls of the Louisville Canal around the falls of the Ohio river are built of it. Pop. (1880) 1,834; (1890) 1,991; (1900) 2,188.

EDITOR OF "ENQUIRER."

Cannes, kăăn: a seaport-town of France; department of Alpes-Maritimes; on the Mediterranean Sea; 25 miles S. E. of Draguignan (see map of France, ref. 9–I). It has an old Gothic castle and a good quay. It is also the center of a large industry in raising fragrant and ornamental flowers. The mildness and salubrity of the climate render this a favorite winter resort for English families. Napoleon landed at Fréjus, near Cannes, after his escape from Elba on Mar. 1, 1815, and Lord Brougham died here in 1868. Pop. (1891) 19,983; (1896) 22,959.

Cannibalism [from the Span. *canibales*, deriv. of a variant of *Caribes*, a tribe in the West Indies]: the practice of eating human flesh. This has prevailed and still prevails among many savage peoples. It was in force among the aboriginal inhabitants of America. Modern sailors have found the custom in New Zealand, in Polynesia, in Malaysia, in the interior of Africa, and even in India. Having its origin in hunger, the habit has developed from the spirit of vengeance and the taste contracted for human flesh. Many tribes eat only the enemies who are taken prisoners. As prisoners of war were eaten, war was waged for the purpose of gratifying the appetite thus excited. In some cases superstition and even religion mingle with the custom. It is said that the inhabitants of New Zealand think that by eating an enemy's heart they assimilate his life and his courage, rob him of the protection of the gods, and gain double favor themselves. Among the Capanagugas of South America, cannibalism is said to take the place of burial. The Rhinderwas of India, in order to propitiate the favor of the goddess Kali, kill and eat those of their relatives who are attacked by an incurable malady, or whom old age has rendered infirm. The tribe of the Battas of Sumatra make cannibalism a part of the judicial system. Instead of condemning a man for certain crimes to be hanged, they sentence him to be eaten. In this case the condemned criminal is led out alive and those who have the right cut off in order the parts that they themselves prefer from the living victim. The custom is closely related to that of human sacrifices, and doubtless the latter in many instances gave rise to the former. Cannibalism as a custom among savage races must be distinguished from occasional acts of the kind committed under peculiar circumstances and even under the pressure of apparent necessity. With the advance of civilization this horrible custom is dying out in most of the places where it is still found.

C. H. THURBER.

Canniff, WILLIAM: See the Appendix.

Can'ning: See PRESERVATION OF FOOD.

Canning, CHARLES JOHN, Earl: statesman; son of George Canning, noticed below; b. Dec. 14, 1812: educated at Eton and at Christ Church College, Oxford. He became viscount on the death of his mother in 1837, and began his public life as a Conservative. In 1852 he became Postmaster-General in the ministry of Lord Aberdeen. He was appointed Governor-General of India in 1855. During his administration the great Sepoy mutiny (1857–58) occurred, which brought him obloquy for his clemency, but he is now seen to have shown courage and high judgment. In 1859 he was made an earl: D. in London, June 17, 1862.

Canning, GEORGE: statesman and orator; b. in London, Apr. 11, 1770. His father died in poverty when the boy was a year old, and his mother had hard work to live until an uncle took George's fortunes in care. He was educated at Christ Church College, Oxford, where he distinguished himself as a classical scholar. In 1793 he entered Parliament as a supporter of Pitt, who was then Prime Minister, and he became an Under Secretary of State in 1796. About 1797 Canning, Ellis, and others began to publish the witty and famous political satires called *The Anti-Jacobin*. He married a daughter of Gen. John Scott. After the resignation of Mr. Pitt, in 1801, Canning joined the opposition against the ministry of Addington, and in Pitt's last ministry, 1804–06, was treasurer of the navy. In Apr., 1807, he

became Minister of Foreign Affairs in the Tory cabinet formed by the Duke of Portland. He fought a duel in 1809 with Lord Castlereagh, Secretary of War in the same cabinet, because he opposed the Walcheren expedition. With the fall of the Portland government, 1809, he long ceased to be a cabinet minister. He advocated Roman Catholic emancipation in 1812, was returned to Parliament for Liverpool in that year, and became president of the Board of Control in 1816. In the latter part of his life Canning and Lord Brougham were considered the most eloquent and powerful orators in the House of Commons. On the death of Lord Castlereagh, in 1822, Canning succeeded him as Secretary of Foreign Affairs in the cabinet of Lord Liverpool. He infused a more liberal spirit into the cabinet, and rendered an important service to his country by pursuing a foreign policy that was not subservient to the interests and designs of the Holy Alliance. In Apr., 1827 he became First Lord of the Treasury as the successor of Lord Liverpool, who was disabled by paralysis. He formed a cabinet partly of Tories and partly of Whigs. D. in Chiswick, Aug. 8, 1827. See A. G. Stapleton, *George Canning and his Times* (1859); Rueder, *G. Canning, seine Leben, etc.* (1827); Lord Dalling, *Historical Characters* (1867).

Canning, Sir Samuel, C. E.: celebrated for his services in the laying of submarine cables; b. in Wiltshire, England, 1823; and has been engaged in laying the most important lines of cables, including the Atlantic cables of 1865, 1866, and 1869, and cables in the Mediterranean, North Sea, etc. He was knighted in 1866.

Canning, Stratford: See Stratford de Redcliffe.

Cannizzaro, kăn-nid-zaa'rō, S.: chemist; b. in Palermo in 1826. He was at first an artillery officer, and took part in the revolution in Sicily. In 1855 he became Professor of Chemistry in Genoa, in 1861 in Palermo, and in 1882 in the University of Rome. His influence had much to do in bringing the chemists of the world to recognize the value of Avogadro's law and of the law of specific heats as furnishing means for determining molecular weights.

Cannon: See Artillery.

Cannon-ball Tree (*Couroupita guianensis*): a large tree of the family *Myrtaceæ*; native of Guiana. It bears racemes of white and rose-colored flowers, and a fruit which has a hard woody shell and is nearly round. This fruit is about the size of a 36-lb. cannon-ball.

Cannon Falls: village; Goodhue co., Minn. (for location of county, see map of Minnesota, ref. 10–F); on Ch., Mil. and St. P. R. R., and on Cannon river; 25 miles W. of Redwing; has flouring and feed mills, foundry, machine-shop, etc. Pop. (1880) 942; (1890) 1,078; (1900) 1,239.

Cannstatt, kaan'stăt: a town of Würtemberg; in the beautiful valley of the Neckar; 2¼ miles by rail N. E. of Stuttgart (see map of German Empire, ref. 7–D). It is connected by railways with Carlsruhe, Heilbronn, and other cities. It has manufactures of cotton and woolen fabrics and an active trade, for which the navigable Neckar affords facilities. Here are many mineral springs, which are much frequented in the summer. In 1796 a battle was fought near the town between the Archduke Charles and Gen. Moreau. Pop. (1895) 22,590.

Cano, kaa'nō, Alonzo: a painter, sculptor, and architect; b. in Granada, Spain, Mar. 19, 1601. He studied painting under Pacheco and Juan de Castillo, and became the founder of the school of Granada; was put to the torture on a groundless accusation of destroying his wife. In 1638 he was appointed court-painter by Philip IV. Among his chief works is a *Conception of the Virgin*. His paintings may be seen in Granada, Seville, and Madrid. D. Oct. 3, 1667.

Cano, Juan Sebastian, del: Spanish navigator; b. at Guetaria, Guipuzcoa, about 1460. In 1521 he was commander of the Concepcion, one of the vessels with which Magellan passed the straits bearing his name and navigated the Pacific. After Magellan's death (Apr. 27, 1521), Carabello was put in command, but soon deposed. Del Cano was then elected to command the fleet, and he reached the Moluccas safely. Loading his two remaining vessels with spices, he crossed the Indian Ocean, where one more ship was lost; finally, with the Victoria he doubled the Cape of Good Hope, and reached Spain Sept. 6, 1522, being thus the first circumnavigator of the globe. He was generously rewarded, and granted a coat-of-arms on which was a globe with the inscription *Primus circumdedisti me*. Made second in command of Loaisa's expedition, sent to follow the same route, he died on the Pacific, Aug. 4, 1526.

Herbert H. Smith.

Canobus: See Canopus.

Canoe [the various forms *canoa, canow, cannow, canoo, canoe* are all ultimately derived from the native Amer. word, of which the Haytian form was *canoa*]: a rude boat made of the trunk of a single tree hollowed out. Canoes are generally open boats, propelled and steered by paddles. The length and other dimensions vary greatly. Eskimo canoes are made of whalebone frames covered with sealskins, which are drawn across as a deck, with only a hole large enough for one man to sit in. The Fiji canoe is sometimes 100 feet long and decked, as are others in the South Pacific islands. Stanley saw canoes carry 100 men on the Congo river. The name is also applied to boats made of birch bark, and to other rude craft, and of late to a pleasure-boat designed for long excursions by a single person. The modern cruising canoe of the clubs is fitted with metallic center-board, rudder, and sails. *The American Canoeist* is the periodical of the American Canoe Association.

Canon, or **Cannon** (in *billiards*): See Billiards.

Canon [from Gr. *κανών*, rule]: a term of various significations in theology, science, and art; means, in general, a law, rule, or standard. In ecclesiastical language it is applied to a law or rule of doctrine or discipline, or the decree of a general council; also to the genuine books of the Holy Scripture, called the *Sacred Canon*. The Roman Catholic Church recognizes as parts of the canon of Scripture the apocryphal books, which Protestants reject. In the canon of the New Testament the agreement of the Christian churches may be said to be unanimous. See Bible.

Canon [O. Eng. *canonic*, from Lat. *cano'nicus* = Gr. *κανονικός*, according to the canon (*κανών*)]: the name of a dignitary of the Roman Catholic and Anglican Churches. In each cathedral and collegiate church there are canons, who perform some parts of the services and receive a portion of the revenue of the church. In a collective capacity the canons are called a chapter, and once formed the council of the bishop. The chapter of an English cathedral still elects the diocesan bishop under letters from the crown nominating the man and threatening the penalties of *præmunire* if he is not chosen. It is a relic of the old authority and independence of the canons. Canons (in England) must reside at the cathedral for three months in each year. Canons were originally monks or priests who lived in a community or monastery. They are historically known as Canons Regular, and followed the rule of St. Augustine, St. Benedict, St. Anthony, etc. They were once the most numerous of the religious orders, and are still found in parts of Europe.

Canon [from Gr. *κανών*, rule]: in music, a species of composition whereby a melody announced by one part or voice is continuously answered in imitation by another or others throughout the piece. We have strict and free canons, according to the relative closeness and intervallic accuracy of the imitation referred to. There are many forms of canon of intricate nature. To comprehend these (and also the difference between canon and fugue), recourse must be had by the student to special treatises on the subject. See Albrechtsberger, *Counterpoint and Fugue*. For more modern and practical works, see E. F. Richter's *Fugue*; also J. F. Bridge, E. Prout, S. Jadassohn, etc. Dudley Buck.

Cañon, kăn'yŭn (Sp. pron. kăan'yōn'), or **Canyon** [Span. tube, pipe, cannon, liter., great tube: Ital. *canone*. The French form of this word is *canon*, from which Eng. *cannon*]: a narrow defile along a river-course. The typical cañon is a geologically young, water-cut valley, deep and steep-walled for a considerable distance along the course of the stream. A cañon is formed when an elevated plateau, uplifted in relatively recent geological times, is crossed by a large river: the river cuts down a narrow valley deep below the surface of the plateau. The steepness of the valley walls is favored if the rocks are hard and the climate dry, as the walls then waste with comparative slowness, while the stream rapidly deepens its trench-like valley, as in the cañons of the Colorado and of the Yellowstone (*q. v.*). Of the three factors, geological youth, resistant rocks, and climatic dryness, the first is the most important: for even with hard rocks in a dry climate a valley will in time lose its cañon form and become wide opened, while in a moist climate steep-walled cañons may be cut under favorable conditions; but in such cases their narrowness is geologically short-lived, and hence

they are comparatively rare. Cañon is also applied to a local narrowing of a valley, where a river cuts through a mountain-range or ridge, as the cañon of Weber river through the Wahsatch Mountains above Ogden, Utah; and in Western phrase the river is here said "to cañon." Gorge is often used for shorter defiles of this kind. See Colorado River, Yellowstone Park, River, and Gorge.

W. M. Davis.

Cañon City: capital of Fremont co., Col. (for location of county, see map of Colorado, ref. 4–D): a beautiful little city situated on the main line of two railroads and at the mouth of the Grand Cañon of the Arkansas, 5,280 feet above the sea-level. It is a celebrated resort for invalids, having hot and cold mineral springs, hot sulphur baths, a mild, healthful climate, and first-class hotel accommodations. Within one day's drive of Cañon City are many points the scenery of which is among the grandest in the Rocky Mountains. The river furnishes abundant water-power, and in the near vicinity are coal, iron, limestone, and oil-wells. The city is 162 miles from Denver, and is one of the oldest and most picturesque towns in the State. Pop. (1880) 1,501; (1890) 2,825; (1900) 3,775. Editor of "Record."

Canoness [*canon* + suffix *-ess*, but cf. Fr. *chanoinesse* and Mediæv. Lat. *canonissa*]: one of the members of certain religious orders of the Roman Catholic Church, who often took no monastic vows, though they lived in common and usually observed the rule of St. Augustine. Many noblemen sought well-endowed canonical livings for their daughters, who were at liberty to marry when they chose. The custom prevailed in Germany even after the Reformation, and there were many houses (*Stifter*) of Protestant canonesses, especially in Westphalia and Mecklenburg. See Nun and Sisterhoods.

Canonical Hours in the Roman Catholic Church are certain fixed times in the day for devotions. In the Church of England Bishop Cosin published a book of *Hours* for those who liked to use them. These hours are called noeturnes, matins, lauds, tierce, nones, vespers, and complines. The breviary has seven canonical hours, because the Psalter says, "Seven times in the day will I praise Thee." In England the hours between 8 A. M. and 12 M. are canonical, and until recently no marriage could take place in churches of the Establishment except in canonical time. Recent enactments extend the canonical hours to 3 P. M.

Canonical Virgins: young women who, in the early ages of the Church, remaining in their homes, took upon themselves vows of perpetual virginity. They were enrolled in a list or canon, whence their name.

Canon'icus: an American Indian; chief of the Narragansetts, who, though at first hostile to the Pilgrims who landed at Plymouth in 1620, subsequently became friendly to the whites, and especially to the inhabitants of the colony of Roger Williams. D. June 4, 1647.

Canonization: the act of declaring a person a saint; a ceremony in the Roman Catholic and Greek Churches by which deceased beatified persons are enrolled in the catalogue or canon of saints. In the Roman Catholic Church it takes place through a solemn and public declaration of the pope that the person in question is to be looked on as enjoying the vision of God, and to be venerated (not worshiped) and invoked throughout the whole Church. Regularly, canonization can not take place until fifty years after the decease of the servant of God, and is now always preceded by the act of beatification. (See Beatification.) The process of canonization is usually a long and minute one. It includes (1) a preliminary examination on the part of the local church authorities concerning the fact and antiquity of the local veneration, the reputation for sanctity and miracles, and the reality and frequency of the latter, both before and after the death of the person in question. (2) A protracted study of the same points by the Roman Congregation of Rites according to a procedure especially designed to prevent deception and error. Besides the preceding points, the orthodoxy of the writings of the *beatus* and the legality of any previous veneration are specially considered. It is at this stage that the promoter of the faith, usually called the devil's advocate, is obliged to urge all possible objections and the strictest compliance with the complicated procedure. (3) The solemn ceremony in St. Peter's, which includes a procession with banners decorated with the portrait of the new saint, and a special ritual. On this occasion the pope orders that the *beatus* be enrolled in the catalogue of the saints, and a day assigned in the calendar for the yearly celebration of his feast in the whole Church, in honor of the Holy Trinity, for the greater glory of the Catholic faith and the advancement of the Christian religion, by the power of Jesus Christ, by that of SS. Peter and Paul, and by his own. He also issues a bull, in which he informs the Church of the life, miracles, and canonization process of the saint. Frequently letters are issued to the nation of the saint, to the local episcopate, or to the public authorities. The first solemn papal canonization of which history speaks is that of St. Ulrich, Bishop of Augsburg, by John XV., in the Lateran Council of 993. In 1170 Alexander III. reserved to the holy see this right, formerly exercised by bishops or synods. In 1634 the reservation was renewed and strictly insisted on by Urban VIII., since which time it has remained the sole prerogative of the see of Rome. The great authority on canonization is Lambertini (Benedict XIV.), *De beatificatione et canonizatione sanctorum* (best ed. Venice, 1766, 7 vols.); partial trans. under caption *Heroic Virtue* (London, 1847, 3 vols.).

John J. Keane.

Canon Law: a system of rules for the discipline of the Church. It broadly divides into that of the Eastern and that of the Western Church. The former was finally compiled about 880 A. D. by Photius, Patriarch of Constantinople, and its principal documents are given in Beveridge's *Synodikon* or *Pandectæ* (2 vols., Oxford, 1672–82). The name in the West is especially applied to the rules of the early and mediæval Church, which are also in force to some extent in the churches of Roman obedience and of England, Scotland, and Germany. This system of laws is based largely upon decisions of ancient councils, and also shows marks of the influence of the Bible and of the Roman jurisprudence. It received frequent additions and other modifications from the decretals, bulls, and extravagants of the popes. The collected materials are known as the *Corpus Juris Canonici*, of which a standard edition was published by Gregory XIII. (see Freidberg and Richter editions, 2 vols., Leipzig, 1879). In England the kings and parliaments were always jealous of the introduction of foreign canons, but permitted to some extent their application in cases where they did not interfere with the statutes of the land. In this way the common law came to receive the influence of the papal decretals, which are sometimes cited as of authority in matters of marriage, divorce, inheritance, etc., since these affairs were under the control of the ecclesiastical courts. In Scottish jurisprudence the influence of canon law is very great, it having been originally received as of equal force with the statutes of the realm. In England the ancient canon law is in force in ecclesiastical causes so far as it does not conflict with the statutes of Parliament or later canons. Much of the code of 1603 has become obsolete, as incompatible with acts of Parliament, especially that one which transferred matrimonial and testamentary causes from ecclesiastical to secular courts.

In 1847, in New York, W. H. Odenheimer, afterward Bishop of New Jersey, published *An Essay on Canon Law . . . to which is appended An Index of the Canonical Code of the Primitive Eastern and Western Church*; and also *A Digest of the Canon Law of the Church in the United States*. In 1870 Dr. Francis Vinton published *A Manual Commentary on the General Canon Law and the Constitution of the Protestant Episcopal Church in the United States*. Later English works on this subject are *Principles of English Canon Law*, by John Brownbill (part i., *General Introduction*, London, 1883); *A History of Canon Law in Connection with other Branches of Jurisprudence*, etc., by the Rev. J. Dodd (1884); *Institutes of Canon Law*, by the Rev. Robert Owen (1884); and *The Elements of Canon Law*, by Oswald J. Reichel (1889). A great deal of information on the workings of canon law in England will be found in Hook's *Church Dictionary* and the two folio volumes of the *Ecclesiastical Courts Commission Report* (London, 1883), and incidentally in Bishop Stubbs's exhaustive volumes on *The Constitutional History of England* (1874–78). See Law.

W. S. Perry.

Can'onsburg: borough; Washington co., Pa. (for location of county, see map of Pennsylvania, ref. 5–A); on C. V. branch of P. C. C. and St. L. R. R.; 22 miles S. W. of Pittsburg; has important iron and steel works, coal-works, carriage-factory, and planing-mills. Here was founded in 1802 Jefferson College (now united with another to form Washington and Jefferson College), which was the first college

founded W. of the Alleghany Mountains. The borough is the seat of Jefferson Academy, and has a number of fine church buildings. Pop. (1880) 699; (1890) 2,113; (1900) 2,714. EDITORS OF "NOTES."

Cañon-wrens: wrens of the genus *Calherpes*, inhabiting the Southern U. S. from Texas to the southern and coast region of California. They live among cliffs, in the walls of cañons, and among rock formations; hence the name.

Canopic Vases: See EGYPT, ANCIENT.

Cano'pus: See EGYPT, ANCIENT.

Canopus, or **Cano'bus** (Gr. Κάνωπος): a very brilliant star of the first magnitude in Argo; a constellation of the southern hemisphere. It is never visible in the Northern or Middle U. S., being only 37½° from the South Pole.

Canopy [earlier *canape*, from Fr. *canape* and Ital. *canope* < Lat. *conope'um* < Gr. κωνωπεῖον, bed with mosquito curtains, deriv. of κώνωψ, mosquito]: an ornamental covering over a throne or bed; also a covering which is carried over the heads of kings on journeys, and over the holy sacraments in Roman Catholic processions. The latter is called BALDACHIN (*q. v.*). In architecture and sculpture, canopy is a magnificent decoration which covers an altar, throne, pulpit, or tribunal. In Gothic architecture, the term is applied to the rich coverings over niches and tombs.

Canosa, kăă-nō'săă (anc. *Canusium*): a town of Italy; in the province of Bari; on the declivity of a steep hill 14 miles S. W. of Barletta (see map of Italy, ref. 6–G). It has an ancient cathedral. Here are interesting ruins of the ancient *Canusium*, an important city of Apulia. In the subterranean tombs of this place were found painted vases and magnificent funereal furniture, with precious stones and jewels. Pop. 18,656.

Canos'sa: small town of Italy; 24 miles S. W. of Modena (see map of Italy, ref. 3–D); contains the ruins of the famous castle belonging to Matilda of Tuscany, before whose gates the German emperor, Henry IV., stood three days bareheaded and barefooted before Pope Gregory VII. would admit him to his presence.

Canova, kăă-nō'vaă, ANTONIO: sculptor; b. in Possagno, in Venetia, Nov. 1, 1757. He studied art in Venice and Rome, and aspired to restore the pure and classic style of the antique. Among his early works were a statue of Apollo and a group of *Dædalus and Icarus*. He settled in Rome in 1782, and acquired celebrity by his *Theseus and the Minotaur*. He did not adhere strictly to the severe simplicity of the antique, but modified it by a peculiar grace, which is apparent in his *Cupid and Psyche* and his *Venus and Adonis*. Having been invited by Napoleon, he went to Paris in 1802, and executed an admirable statue of that emperor. Among his other works are a *Venus Victorious*, a monument to Clement XIII., erected in St. Peter's church, a statue of Washington, and a *Perseus with the Head of Medusa*. In 1816 he received the title of Marquis of Ischia. He was the founder of a new school of sculpture, and was reputed the greatest sculptor of his age. D. at Venice, Oct. 13, 1822. See D'Este's *Biography* (Florence, 1864), and Henry Moses's outline engravings of his principal works (London, 1824).

Cánovas del Castillo, kăă'-no-văăs-dāl-kaăs-tĕĕl'yō, ANTONIO: Spanish statesman and writer; b. June 5, 1828; leader of the Conservative party in Spain. He entered the political field in 1852 as representative of Malaga to the Cortes. He belonged at this time to the Liberal party, and he nominally continued to belong to it until 1868, when internal divisions had completely broken it up. At this time he had made himself the leader of the group called Liberal Conservative. He was resolutely monarchist, and refused to accept the republic. He was one of the leaders of the movement which placed Alfonso XII. on the throne (Dec. 31, 1874). He was almost constantly (save for short intervals) Prime Minister during the life of this monarch: but upon his death (1885) was obliged to yield to Señor Sagasta, leader of the Liberal party. Cánovas del Castillo was in power, however, from 1890 to 1892, and (again replacing his great rival Sagasta) from 1895 till his own death. He was assassinated by an anarchist Aug. 8, 1897. He was a prolific writer on political and economical, and even on literary subjects. Worthy of mention are: *El Solitario y su tiempo* (2 vols., 1883); *Problemas contemporáneos* (2 vols., 1884); *Arles y Letras* (1887); *Estudios del reinado de Felipe IV.* (2 vols., 1888); *Obras poeticas* (1887), all published in the *Colección de Escritores Castellanos* (Madrid).
A. R. MARSH.

Canrobert, kăăṅ'rō'bār', FRANÇOIS CERTAIN: general; b. in St.-Céré, Lot, France, June 27, 1809. Having served many campaigns in Algeria, he became a general of brigade in 1850, and a general of division in 1853. He commanded a division in the Crimea in 1854, and was wounded at Alma. In Sept., 1854, he succeeded Marshal St.-Arnaud as commander-in-chief of the French army, and he began the siege of Sebastopol. He resigned the command to Gen. Pelissier in May, 1855, and was made a marshal of France in 1856. In June, 1859, he commanded a corps at Solferino. On the outbreak of hostilities in 1870, the Sixth Corps, under Canrobert at Châlons, was, immediately after the disasters of Forbach and Reichshofen, summoned to Metz to re-enforce Bazaine. As its commander, Canrobert took a prominent part in all the battles and events preceding and attending the investiture and capitulation of Metz (see BAZAINE), where he was made prisoner. At the trial of Bazaine the bearing and evidence of this veteran soldier excited popular admiration. He was a Bonapartist in politics, until the Prince Imperial was killed. In 1876 he became a senator of France. D. Jan. 28, 1895.

Can'so, Cape: See CAPE CANSO.

Canso, Gut of: a strait which separates Nova Scotia from the island of Cape Breton, and connects the Atlantic with the Gulf of St. Lawrence. It is 17 miles long, and has an average width of 2½ miles.

Canta'bri: a rude race of ancient mountaineers who lived in Cantabria, the northern part of Spain, near the Bay of Biscay. Their chief towns were Juliobrigas, Concana, and Vellica. They made a brave resistance to the Romans in the Cantabrian war (25–19 B. C.). They are said to have been of Iberian origin.

Cantabrian Mountains: a general name of several ranges in the northern part of Spain. They are connected with the Pyrenees, from which they extend westward to Cape Finisterre. The highest summits are estimated at 10,000 feet high. Several portions of these mountains receive the local names of Salvada, Ordunte, Peña, Anaña, Mellara, etc.

Cantacuze'nus, Anglicized as **Cantacuzene** (in Gr. Καντακουζηνός), JOHN: a Byzantine emperor and historian; was Prime Minister under Andronicus III. (who died in 1341), and he proclaimed himself emperor in 1342, fighting for his supremacy five years in a civil war with Anna, the wife of Andronicus III. He retired to a monastery in 1355 before Turkish inroads, and died in Gallipoli in 1383. He wrote a work on Byzantine history from 1320–57. His son, Matthias, was a colleague in the empire in 1353; abdicated with his father, and died in the same year with him.

Cantagal'lo: a town of the state of Rio de Janeiro, Brazil: 80 miles N. E. of the city of Rio Janeiro (see map of South America, ref. 7–G); on a small tributary of the Parahyba. Its gold mines were formerly of great importance, but seem to have become exhausted. Its inhabitants are now principally engaged in agriculture. Pop. 4,000.

Cantal, kăăṅ'tăăl': a central department of France; formed of the south part of the old province of Auvergne. It is bounded N. by Puy-de-Dôme, E. by Haute-Loire, S. E. by Lozère, S. by Aveyron, and W. by Lot and Corrèze. Area, 2,217 sq. miles. It is drained by the sources of the Dordogne. The surface is mountainous, and mostly occupied by the *débris* of extinct volcanoes. The soil is mostly sterile. Among the staple products are cattle, butter, cheese, and chestnuts. Capital, Aurillac. It is divided into four arrondissements. Pop. (1881) 236,190; (1896) 234,382.

Cantalonpe: See MUSKMELON.

Cantarini, SIMONE: painter. See CANTAVIUS.

Cantata, kăn-tăă'ta [Ital. deriv. of *cantare*, sing]: a vocal composition which consists of choruses, arias, and recitatives with instrumental accompaniment. While many cantatas are comparatively short works, some of them, more especially the modern ones, are of the caliber of the opera on the one hand, or the oratorio upon the other. The large secular *dramatic* cantata may as to style be defined as opera without scenery, costume, or stage-action, appealing solely to the imagination of the listener through a comprehension of the text, and a forceful and appreciative setting of the same by the composer. DUDLEY BUCK.

Cantavius, Simone, also called **Simone da Pesarese**: painter; b. at Oropezza, near Pesaro, in 1612; d. in Verona, 1648; was a pupil of Guido and a fellow-student with Domenichino. Pictures by him are found in Milan (a *Transfiguration*), Bologna (a portrait of Guido), Pesaro, and other places.

Canteen' [Fr. *cantine*, cellar, small shop, and in vulg. use a small vessel, from Ital. *cantina*]: a military term used in several senses: 1, a small tin or wooden vessel which each soldier carries and uses for holding water; 2, a small wooden or leathern chest or coffer containing the table equipage and utensils of an officer when he is in active service; 3, a public-house licensed in British garrisons and barracks for the sale of malt liquor, ardent spirits, and groceries, in order that the soldiers may obtain such articles without going beyond the precincts of the barracks.

Can'temir, Demetrius: historian; b. in 1673; a son of the Moldavian waywode; was early sent as a hostage to Constantinople, where he received an excellent education. He understood several Oriental and several European languages, and held positions of trust in the Turkish administration. In 1710 he was made waywode of Moldavia, but the conspiracy into which he had entered with Peter the Great miscarried, and in 1711 he fled to Russia, where he died in 1723. While there he wrote in Latin his *History of the Ottoman Empire* (English translation by Tindal, 1734).

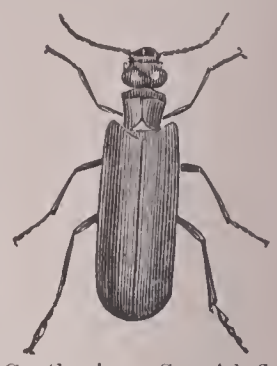
Can'terbury (anc. *Durovernum*): a city of Kent, England; on the river Stour; 56 miles E. S. E. of London, with which it is connected by railway (see map of England, ref. 12–L). It is the metropolitan see of England, being the seat of the Archbishop of Canterbury, who is Primate of all England and has precedence immediately after the royal dukes in court ceremonies. The archiepiscopal see or province of Canterbury comprises the dioceses of Canterbury, London, Winchester, Bangor, Bath and Wells, Bristol, Chichester, Ely, Exeter, Gloucester and Bristol, Hereford, Lichfield, Lincoln, Llandaff, Norwich, Oxford, Peterborough, Rochester, St. Albans, St. Asaph, St. David's, Salisbury, Southwell, Truro, and Worcester. Canterbury stands in a vale or level space between hills of moderate height. It contains fourteen old churches, mostly built of flint; also remains of St. Augustine's Benedictine abbey, and the ruins of a Norman castle. Among its institutions are several hospitals, a museum, and a theater. Canterbury returns one member to Parliament. It has manufactures of linen damask, and is noted for its brawn. St. Augustine became the first Archbishop of Canterbury in 597 A. D. About this time the town was the capital of the kingdom of Kent, and was called *Caer Cant* (i. e. city of Kent). Archbishop Cuthbert built here, about 740 A. D., a church which received numerous additions in succeeding ages. The choir having been destroyed by fire in 1174, it was soon rebuilt by William of Sens. This restored choir is probably one of the oldest parts of the cathedral, which presents a magnificent union of almost every style of Christian architecture. The central tower is 234 feet high, and the total exterior length of the cathedral is 545 feet. Immense numbers of pilgrims came here to worship at the shrine of Thomas à Becket, who was killed in the north transept in 1170. Pop. (1891) 23,026; (1901) 24,401. See Stanley's *Memorials of Canterbury Cathedral* (18th ed. 1883) and R. Jenkins's *Diocesan History of Canterbury* (London, 1880).

Canterbury: a provincial district of 14,040 sq. miles; on the east coast of the north island of the New Zealand group. Capital, Christchurch; Lyttelton is its chief port. The products are potatoes, oil, whalebone, gold-dust, and hides. Pop. (1891) 128,471.

Canterbury Bell: See Campanula.

Cantharides [plural of Cantharis (*q. v.*)]: the group of insects to which the genus *Cantharis* belongs. Also a medicinal preparation of Spanish-flies.

Can'tharis [*κανθαρίς*, the Greek name]: a genus of beetles (*Coleoptera*) belonging to the family of *Cantharidæ* or blister-beetles. The species, of which more than 200 are known, have elongate bodies, a rather large head bearing long slender antennæ, and long wing-covers, true wings being present. Most important of all the species is the so-called Spanish-fly, *Cantharis vesicatoria*. This is common throughout the warmer parts of Europe, where the adults feed upon the ash, elder, honeysuckle, maple, poplar, larch, and other trees. It is golden or bluish green, less than an inch in length, and appears in June, when it does considerable damage to the foliage. The female lays her eggs in the soil and the larvæ live as parasites on the bumble-bees. The adults are collected by beating the trees in the cooler hours of the day and catching the insects as they fall on cloths. They are usually killed by the fumes of sulphur or vinegar, and, when dried by heat, are ready for the market. They owe their use in therapeutics to a peculiar substance, cantharidin ($C_{10}H_{12}O_4$), which when placed on the skin produces blisters and when taken internally causes severe and even dangerous inflammation of the throat, stomach, kidneys, etc. On account of the presence of this poisonous principle the gathering of these insects is often accompanied with disagreeable results. They are used in various ways, the most common being in a plaster composed of the powdered beetles mixed with lard, etc., as alcoholic tincture, etc.



Cantharis, or Spanish-fly

Other members of the family *Cantharidæ* possess the same vesicatory properties, though possibly in a less degree. In the U. S. there are many allied species. The most common species belong to the genus *Epicauta*, and the adults feed upon the leaves of the potato and the pollen of the golden-rod. An aberrant member of the family is the "oil-beetle," *Meloe angusticollis*, so named from the oily fluid which exudes from the abdomen when the insect is handled. J. S. K.

Can'ticle [from Lat. *canti'culum*, little song; dimin. of *can'ticum*]: called in the common English version of the Bible **Solomon's Song**; in the Hebrew שיר השירים (i. e. Song of the Songs, of which the Vulgate *Canticum Canticorum* is a translation); a lyric poem with a dramatic arrangement in the form of a dialogue (as is evident from the change of number and, in the Hebrew, of gender). The subject is chaste love. The rabbis first began to interpret it allegorically of God and his people, and this interpretation was so established before the time of the Massoretes that they did not hesitate to recognize the book as canonical. The same method of interpretation passed into the Christian Church, only that the allegory was there accepted as referring to Christ and the Church. The more rude forms of this method of interpretation have been abandoned, but the effort is still made by types or symbols or other devices to give to the book another significance than that which it bears on its face. Not a syllable appears in the book to suggest any such hidden significance, and this interpretation rests on the assumption that, since the book is in the canon, it *must* be something more than it appears to be. The *Canticle* is still an unsolved riddle, but it is one of the finest products of Hebrew poetry, and unsurpassed in any poetry for genuine sympathy with nature and as a description of pure love, the strongest and holiest of human passions, a flame of Jehovah which can not be extinguished. This love in its purity and faithfulness is canonized by this book. Niebuhr replied to a young man, who regretted its place in the canon, that he would not consider the Bible complete as "the book of humanity" if it contained no representation of pure and faithful love. The book probably belongs to the time of Solomon, though there are no satisfactory data for deciding as to its date and author. The best modern commentaries on the *Canticles* are by Herder, who first fully appreciated its poetic and dramatic character; Umbreit (1828); Magnus (1842); Hengstenberg (1842); Hitzig (1855); Ginsburg (1857); Ewald (1867); Delitzsch (1875); Zöckler (1880); Oettli (1889); Griffis (1890). Comp. Driver's *Introduction to the Literature of the Old Testament* (1891), pp. 409, *sqq.*, and Cornill's *Einleitung in das A. Test.* (1892), pp. 238, *sqq.*

Revised by Philip Schaff.

Can'tilever: the part of a beam which projects out from a wall or beyond a support. A balcony in front of a window of a house is often supported by cantilever beams or brackets, and another example is that of the projecting beams which support a sidewalk placed outside of the trusses of a bridge. A beam supported at its middle point consists of two equal cantilever arms. When a beam is supported at one end and the other projects beyond the second support, the projecting part is a cantilever, and sometimes the whole beam is said to be a cantilever beam. A cantilever bridge is formed by two such cantilever beams or trusses extending out from opposite shores and united over the middle of the river by a short truss. See Bridges for a full account of

this important class of structures, which, although developed since 1882, is now applied to the longest spans.

MANSFIELD MERRIMAN.

Cantire, kăn-tīr', or **Kintyre**: a long narrow peninsula of Scotland; forms the south end of the county of Argyle. It is bounded on the E. by the Frith of Clyde or Kilbrannan Sound, and on the W. by the Atlantic Ocean. Its length is 40 miles, and its average width 6½ miles. It contains a large portion of arable land. A lighthouse stands at the southwest extremity, which is called the Mull of Cantire.

Can'to Fer'mo [Ital.], also **Cantus Firmus** [Lat.]: in music, the subject-song or theme. Every part that is the subject of counterpoint, whether plain or figured, is called canto fermo by the Italians. In church music this term means plain song or choral song in unison, and in notes all of equal length.

Can'ton [Fr. *canton*, from Ital. *cantone*, corner, district, deriv. of *canto* < Celt.* *cambitos*, corner, crook]: a small piece of territory; the name of each of the states or independent provinces which united form the federal republic of Switzerland, each retaining its autonomy in matters of internal administration.

Canton: in heraldry, a division of an escutcheon consisting of a square in the dexter chief. It is sometimes a bearing and sometimes is used to receive a special bearing.

Canton' [a corruption of *Kwangtung*, the Chinese name of the province; written by the Portuguese *Kamtom*; the native name of the city is Kwang-chow Foo]: a populous city; one of the greatest commercial emporia of China; capital of the province of Kwangtung; on the left (north) bank of the Canton or Pearl river; about 70 miles from its entrance into the China Sea; lat. 23° 7′ N., lon. 113° 14′ E. (see map of China, ref. 9–I). The mean annual temperature is 69° F. The city is inclosed by a brick wall about 7 miles in extent, and is entered by twelve gates. It is also defended by four strong forts, erected on the hills which rise on its northern side. Several islands in the river below Canton are also fortified. The city is divided into the old and new town, the former of which is occupied by Tartars and the latter by the Chinese.

The streets are crooked and narrow. The houses are built of brick, stone, or wood, and are seldom more than two stories high. Many thousands of people called Tankia, having no homes on the land, live on boats and rafts, and gain a subsistence by fishing and rearing poultry. Canton contains several many-storied pagodas, a Mohammedan mosque, and about 120 Bûddhist temples or monasteries, called joss-houses by foreigners. The most remarkable of these is on the island of Honam, opposite the city. This temple covers about 7 acres. Canton has extensive manufactures of silk, cotton, brass, iron, and wood.

Since the war between France and Great Britain on the one side, and China on the other (1857–61), the foreign merchants settled in Canton occupy the so-called *Sha-mien* or "sand-flats," an artificial island 2,850 feet long and 950 feet broad, surrounded with a substantial embankment of granite, and separated from the Chinese city by a canal 100 feet wide. The location is very advantageous, cool, healthy, and convenient for trade. The opposite suburb of the Chinese city is the seat of the wholesale trade.

The city has an advantageous position for foreign and internal trade, and access to the rich provinces of Kwangtung and Kwang-si by its large navigable river. The chief articles of export are tea and silk goods. Sugar, porcelain, and precious metals are also exported. All the legitimate foreign trade of China was confined to Canton before 1843, when the more northern ports of Amoy, Foochow, Ningpo, and Shanghai were opened to foreigners, since which time the importance of Canton has declined. The position, however, which it holds in the commerce of the world is still considerable. In 1891 the total imports amounted to $33,376,872, and the exports to $21,783,638. In the same year 1,900 vessels, with a tonnage of 1,711,488 tons, entered port, and 1,888, with a tonnage of 1,709,874 tons, cleared.

Portuguese vessels visited Canton in 1517; English in 1596. But the port was not formally opened to foreign trade until the close of the seventeenth century, and more than once the European powers have been compelled to use force in order to overcome the prejudices of the natives. In May, 1841, the British forces captured the defenses of Canton, but before they entered the city they were induced to retire by the payment of £6,000,000. The city was again occupied by the British and French armies 1857–61. Pop. (1891) 1,600,000.

Revised by R. LILLEY.

Canton: city of Fulton co., Ill. (for location of county, see map of Illinois, ref. 5–C); 28 miles W. S. W. of Peoria, 12 miles W. of Illinois river. The industrial establishments include one of the most extensive manufactories of agricultural implements in the West, 16 cigar-factories (employing about 600 persons), machine-shop and foundry, stove-foundry, 2 flouring-mills, tile-factory, several brick-yards, gun-factory, marble-works, broom-factory, cigar-box factory, gas-works, and electric-light works. Canton is the commercial center of one of the largest and richest counties of the great "corn belt" of Illinois, and has abundant, convenient, and cheap supplies of timber and brick and tile clay. There are coal mines within the city. Canton has a public library and a high school. Pop. (1880) 3,762; (1890) 5,604; (1900) 6,564.

EDITOR OF "REGISTER."

Canton: town (founded in 1797); on railroad; Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); 14 miles S. of Boston. Canton has manufactures of cotton and woolen goods, sewing-silk, machinery, copper and iron works, electric lights and town water-works; has seven schools, including a high school, and a public library of 7,000 volumes in the town-hall. Pop. of township (1880) 4,516; (1890) 4,538; (1900) 4,584.

EDITOR OF "JOURNAL."

Canton: capital of Madison co., Miss. (for location of county, see map of Mississippi, ref. 6–F); on the Illinois Central R. R.; 22 miles N. of Jackson; has 5 schools (2 for colored children), 8 churches (3 colored), 2 planing-mills, box-factory, agricultural-implement works, electric-light plant, and water-works. Pop. (1880) 2,083; (1890) 2,131; (1900) 3,404.

EDITOR OF "TIMES."

Canton: town; Lewis co., Mo. (for location of county, see map of Missouri, ref. 1–H); on St. L., K. and N. W. R. R., and on Mississippi river; 142 miles N. N. W. of St. Louis. It is one of the chief shipping-points of the county, and has lumber and planing mills, flour-mills, and agricultural industries. Canton has two public graded schools, and is the seat of Christian University, under control of the Christian Church of Missouri. Pop. (1880) 2,632; (1890) 2,241; (1900) 2,365.

EDITOR OF "NEWS."

Canton: capital of St. Lawrence co., N. Y. (for location of county, see map of New York, ref. 1–H); on railroad; 60 miles N. E. of Watertown; on Grass river, which affords valuable water-power, used in manufacturing lumber, flour, machinery, leather, castings, etc. Canton contains a court-house, jail, almshouse, good graded schools, and is the seat of St. Lawrence University (Universalist), having law and theological schools connected with it. Pop. (1880) 2,049; (1890) 2,580; (1900) 2,757.

Canton: city and railroad center; capital of Stark co., O. (for location of county, see map of Ohio, ref. 3–H); at the confluence of the east and west branches of Nimishillen creek. It contains woolen and flouring mills, and manufactures of mowers and reapers, printing-presses, safes, saws and springs, plows, watch-cases and movements, cutlery, wrought-iron bridges, steel saddlery, hardware hay-rakes, pottery, tiles, carriages, street-paving brick, building-brick and tile, revolving bookcases, paint, street-cars, etc. The city has water-works, and derives its prosperity chiefly from its manufactures, though the surrounding country is a very rich agricultural one. In 1890 there were $5,621,960 invested in manufactures, producing merchandise valued at $7,986,627. Of these $1,774,896 were the product of agricultural implement shops; $530,000 in roofing material; $493,550 in foundry and machine-shops; $388,206 in flour and grist mills; and $225,225 in saddlery and harness. Pop. (1880) 12,258; (1890) 26,189; (1900) 30,667.

EDITOR OF "DEMOCRAT."

Canton: borough; on Northern Central R. R.; Bradford co., Pa. (for location of county, see map of Pennsylvania, ref. 2–G); is 38 miles S. of Elmira, N. Y., and has foundry, lumber-mills, etc. Pop. (1880) 1,194; (1890) 1,393; (1900) 1,525.

Canton: city; capital of Lincoln co., South Dak. (for location of county, see map of South Dakota, ref. 5–J); on Ch., M. and St. P. R. R., and on Sioux river; 20 miles from Sioux Falls. Here are eight churches, Augustana College, excellent public schools, extensive manufactures, water-works, and an electric-light system. The river furnishes good water-power. Pop. (1880) 675; (1890) 1,101; (1900) 1,943.

EDITOR OF "SIOUX VALLEY NEWS."

Can'tonment (Fr. *cantonnement*): a military term applied to temporary resting-places of European armies. When troops are detached and quartered in several adjacent towns or villages they are said to be in cantonments. In India the term is applied to permanent military stations of the British army, or to regular military towns at a considerable distance from any city, and which sometimes contain magazines, public offices, etc.

Cantù, kän-too', Cesare: Italian historian; b. near Milan, Sept. 5, 1807; lectured in various Italian universities on history and literature. His *Universal History* (35 vols., 1834–42) has been translated into English, French, Danish, etc. He also wrote *The History of the Italians* (Turin, 1854); *The Last One Hundred Years* (Florence, 1864); *The Italian Heretics* (Turin, 1866–68), etc. D. Mar. 11, 1895.

Cann'sium (in Gr. Κανύσιον): an important and very ancient city of Apulia, in Italy; on the river Aufidus (Ofanto); about 15 miles from its mouth. It was probably founded by the Greeks. The inhabitants were called *bilingues* by Horace, because they spoke Greek and Latin. It was captured by the Romans in 318 B. C. Its site is occupied by the modern Canosa (*q. v.*). Here were found, about 1803, remarkable remains of ancient art, among which were painted vases, marble statues, and jewels of exquisite workmanship.

Canute', **Knut**, or **Knud**: King of Denmark; conqueror of England: son of Sweyn, King of Denmark, who died in 1014; succeeded to the English conquests of his father; fled before Ethelred to Denmark in 1014; returned next year, and overran the realm, except London; after the battle of Assandum, Edmund Ironsides divided the kingdom with him, retaining Wessex; on death of Edmund he became sole monarch, sending Edmund's infant sons out of the kingdom. He confirmed his power by mildness and prudent policy; placed Saxons in power; married Emma, widow of Ethelred; divided the kingdom into the earldoms of Mercia, Northumberland, Wessex, and East Anglia; inherited the crown of Denmark on the death of his brother Harold, 1018, and Norway on that of Olaf, 1030, and became the most powerful European monarch of his time. He founded monasteries, patronized minstrels, and wrote verses or ballads himself. D. at Shaftesbury, Nov. 12, 1035, leaving three sons, Sweyn, Harold, and Hardicanute. The story of his courtiers and the rising tide which would not recede at his command rests upon the authority of Henry of Huntington.

Canvas [M. Eng. *canevas* < Norm. Fr. *canevas*: Ital. *canavaccio* < Lat. **cannaba'ceus*, of hemp; deriv. of *can'nabis*, hemp]: a coarse hempen or linen cloth which is extensively used in the form of tents and the sails of ships. It is also the principal material on which artists paint oil-pictures. The word is sometimes employed as synonymous with sail. In Old English it meant also a straining-cloth or sieve.

Canvas-back (*Aythya vallisneria*): a species of North American duck, the flesh of which is highly prized for the table. It frequents the bays of the sea and the estuaries of rivers. The plumage is diversified with black, white, chestnut brown, and slate-color. The length is about 20 inches. These birds, after breeding in the northern parts of the continent, migrate southward about November.

Canzone: See Lyric Poetry.

Caonabó: a Carib who had been adopted by the Indians of Hayti. In 1492 he was cacique of Maguana, a region in the central and southern part of the island. He was married to the celebrated Anacaona. In 1493 he massacred the small colony which Columbus had left at Fort Navidad, and made war on Guacanagari, the ally of the Spaniards. In 1494 he headed a general league of the Indians against the whites. Attacking the fort of St. Thomas, he was repulsed by Ojeda, and finally with an immense army of Indians was routed by Columbus at the battle of the Vega Real (Apr. 25, 1495). Shortly after Ojeda penetrated to Caonabó's country with a small force, and pretended to treat with him. Gaining his confidence, Ojeda induced the chief to mount a horse, and suddenly seized and galloped off with him. He was sent as a prisoner to Spain, but died on the voyage (1496). Herbert H. Smith.

Caoutchouc, koo'chŏŏk, **Gum Elastic**, or **India-rubber** [caoutchouc is viâ Fr., from Caribbean *cahuchu*]: a valuable substance used in the arts for a great variety of purposes; the inspissated juice or sap of several species of plants of the families *Euphorbiaceæ*, *Moraceæ*, *Artocarpaceæ*, and *Apocynaceæ*. It is produced chiefly in tropical and subtropical countries, especially in the East Indies and South America. The milky juice of the tree is obtained by incisions in the bark, and is dried on clay molds over smoky fires, which gives it its usual black color. Pure caoutchouc is a hydrocarbon, C_8H_{14}. It is extremely valuable in the arts on account of its elastic and waterproof properties. When combined with less than 25 per cent. of sulphur, and exposed to a temperature of about 270° F., it is converted into soft vulcanized rubber, a substance much more valuable than the original caoutchouc. By adding 50 per cent. or more of sulphur, and heating to 300° F., it forms hard vulcanized rubber or ebonite. See India-rubber.

Capacity [from Lat. *capac'itas*, deriv. of *capax*, competent]: in law, ability or power to do a particular thing, such as to take or to hold land, to sue and to be sued, and the like. Capacity may sometimes exist to do one of these acts, and not to do another. Thus one may be able to take and hold land, and not have capacity to dispose of it, as in the case of an infant; or one may be able to take, and not have the power to hold against another, as in the case of an alien, who may at common law take land as between himself and his grantor, but can not hold it as against the state. Capacity may be conveniently considered under two general heads —capacity to have rights, and capacity to act. Some rules as to incapacity depend upon natural disabilities; others rest upon arbitrary grounds. This subject is closely connected with the doctrine of *status*, as treated by writers on public law. This has been shown by Maine in his work on *Ancient Law* to have had its principal origin in the early idea of the family. The arbitrary rules of archaic law have been, to a considerable extent, gradually supplanted by the modern idea of fixing one's relations to another by contract, so that the movement of modern progressive society has been from *status* to contract. This doctrine is well illustrated in the case of master and servant. In ancient law the position of the servant was fixed by an arbitrary rule, so that he was a slave. In modern times the relation depends on contract. Still, there always will be a class of cases where legal capacity is denied, as where persons, including infants, insane persons, and habitual drunkards, have not the mental power to enter into a contract, or where a supposed rule of public policy may intervene, as in the case of aliens. Aliens are still in some of the American States denied the power to hold land by purchase, or even to take it at all by descent. In fact, capacity to have rights largely depends on the general convictions of the people of a State, while the capacity to act is commonly determined by a desire to protect one who has rights from an improvident surrender of them.

T. W. Dwight.

Capacity, in electricity: the quantity by means of which is measured the charge of a condenser. The relation between capacity, potential difference, and electrical quantity is expressed by the equation

$$C = \frac{Q}{V_1 - V_2},$$

where C is the capacity and Q the quantity of electricity necessary to produce a difference of potential ($V_1 - V_2$) between the plates of the condenser. See Condenser and Electricity.

Cápac Ynpánqui: fifth sovereign of the Inca line of Peru; reigned from about 1320 to 1340. The Inca kingdom was then small, and he extended it only by subduing the Quichuas W. of Cuzco and the tribes southward to the border of the Titicaca basin. H. H. S.

Cape Ann: the eastern point of Essex co., Mass.; 31 miles N. E. of Boston. Here is a rocky headland, on which, at Rockport, valuable quarries of syenite are worked. Lat. 42° 38′ 3″ N., lon. 70° 34′ 2″ W. Two stone lighthouses stand on Thatcher's island, ¾ of a mile distant, each 112½ feet high, showing fixed white dioptric lights of the first class, 165½ feet above the sea.

Cape Ar'ago, or **Greg'ory**: a point at the south side of the entrance to Coos Bay, in Coos co., Ore. Its lighthouse stands on a small island, lat. 43° 20′ 38″ N., lon. 124° 22′ 11″ W., and shows a flashing light 75 feet above the sea.

Cape Bab-el-Mandeb: on the Arabian side of the strait of that name; lat. 12° 40′ N., lon. 43° 31′ E.; is a rock of basalt 865 feet high.

Cape Béarn, bā-aarn': a promontory of France; in the Mediterranean; lat. 42° 31′ N., lon. 3° 7′ 30″ E. Here is a lighthouse of the first class, 751 feet above the sea.

Cape Blanc: lat. 37° 20′ N., lon. 9° 48′ E. This is the most northern point of Africa.

Cape Blanco (i. e. White Cape): on the Atlantic; next to Cape Verde the westernmost point of Africa; lat. 20° 47′ N., lon. 17° 4′ W.

Cape Blanco, or **Orford**: on the Pacific; the most western point of Oregon; lat. 42° 50′ N., lon. 124° 32′ 29″ W. Its lighthouse shows a fixed white dioptric light of the first order, 256 feet above the sea.

Cape Boeo, bō-ā′ō (anc. *Lilybæum Promontorium*): the most western point of Sicily. It was in ancient times an important naval station, near which the Romans gained a great naval victory in the first Punic war. Lat. 37° 48′ N., lon. 12° 25′ E.

Cape Bojador′: a bold headland of Western Africa; the termination of a range of Mt. Atlas; in lat. 26° 7′ N., lon. 14° 29′ W.

Cape Bon, or **Ras Adder**: on the north coast of Africa; 58 miles N. E. of Tunis; lat. 37° 6′ N., lon. 11° 3′ E.

Cape Breton, brit'n: an island of North America; belonging to Great Britain, and forming a part of the province of Nova Scotia; in the Atlantic Ocean, and separated from the northeastern extremity of Nova Scotia by a narrow strait called the Gut of Canso. It is a rocky island of a very irregular shape, nearly divided by the lakes of Bras d'Or, which to the N. E. communicate with the sea, and with a surface much broken by various ranges of hills and covered with dense forests. It has an area of 5,365 sq. miles, but only about 200,000 acres are under cultivation. The chief articles of export are fish, coal, and lumber. It is noted for its fisheries of cod and mackerel. It is divided into four counties. Cape Breton, Inverness, Richmond, and Victoria. The climate is severe. Pop. about 90,000.

Cape Canav′eral: on the east coast of Florida; in Brevard County; lat. 28° 27′ N., lon. 80° 33′ W.; is nearly surrounded by dangerous shoals; has on its northeast pitch a revolving light of the first order, 139 feet above the sea.

Cape Canso: the most easterly point of Nova Scotia; has a lighthouse on Cranberry island; lat. 45° 19·5′ N., lon. 60° 55′ 3″ W. It is also a port of entry in Wilmot township, Guysborough County, having active trade and fishing interests. It has a U. S. consul. Gold has been found here. Pop. 1,500.

Cape Catoche, kăă-tō′chā: the northeastern extremity of Yucatan; on the Gulf of Mexico. This was the part of the American continent on which the Spaniards first landed; lat. 21° 34′ N., lon. 86° 57′ 51″ W.

Cape Charles, Va.: the southern point of the "Eastern Shore," a peninsula which separates Chesapeake Bay from the Atlantic Ocean. A lighthouse stands on Smith's island near this cape, with a flashing light of the first order; lat. 37° 07′ 08″ N., lon. 75° 53′ 12″ W.

Cape Clear: the most southern point of Ireland; in the county of Cork. Here is a lighthouse on a cliff 455 feet above the sea; lat. 51° 26′ N., lon. 9° 29′ W.

Cape Coast Castle: a British settlement and town on the Gold Coast, west coast of Africa; lat. 5° 6′ N., lon. 1° 15′ W. It is defended by several forts. The climate is unhealthy. The chief articles of export are palm oil, gold-dust, and tortoise-shell. Pop. 25,000.

Cape Cod, Mass.: a long and narrow sandy peninsula, which nearly coincides with Barnstable County. It is about 65 miles long, and from 1 to 20 miles wide. The form of it is similar to a man's arm bent at the elbow. On the northern extremity, Race Point, is a revolving light 47 feet above the sea; lat. 42° 03·7′ N., lon. 70° 14·3′ W.

Cape Colon′na (anc. *Sunium Promontorium*): the most southern point of Attica; on the Mediterranean; lat. 37° 39′ N., lon. 24° 2′ E. Its summit is crowned by the ruins of a marble temple 269 feet above the sea.

Cape Colony: a British colony, occupying the southern extremity of Africa; bounded N. by the Orange river, E. and S. by the Indian Ocean, and W. by the Atlantic. Area, 221,311 sq. miles. The interior of this region is described as a succession of plateaus and mountain-ranges, which increase in elevation as they recede from the coast. The highest mountains are estimated at nearly 10,000 feet above the level of the sea. The seacoast presents several comparatively safe and commodious harbors, among which the most frequented are Table Bay and Algoa Bay. Cape Colony has no rivers that are of much value for navigation. The climate is healthy, but the extremes of temperature have a wide range. But little rain falls in the interior. The vegetation of this region is peculiar, and rich in beautiful flowers, among which are the ixia, gladiolus, tritonia, strelitzia, pelargonium or Cape geranium, and xeranthemum. The characteristic vegetation of the vicinity of Cape Town consists of *Ericaceæ* (heaths), *Stapeliæ* or carrion flowers, and *Proteaceæ*. Here are about 400 species of *Ericaceæ*. Among the indigenous animals of Cape Colony are the elephant, giraffe, rhinoceros, lion, buffalo, panther, wild boar, hyæna, antelope, quagga, springbok, and ostrich. Many cattle and sheep are raised here. The soil in some parts is fertile, but a large portion of it is arid and barren without irrigation. Wheat and other cereals are cultivated extensively. The chief articles of export are wool, wine, copper, hides, horses, flour, aloes, fish, fruits, and maize. The value of the exports in 1890 amounted to £10,152,979, and that of the imports to £10,106,466. Wool is one of the principal articles of export.

The colony comprises Cape Colony proper, Griqualand West, Transkei, Griqualand East, Tembuland, and St. John's River Territory. Total pop. (1891) 1,527,224, of whom 376,987 are whites. Cape Town is the capital of the colony.

History.—The Dutch were the first Europeans who colonized this region. They founded Cape Town in 1652. The colony was captured in 1806 by the British, to whom it was formally ceded in 1815. The European colonists have been often disturbed by the hostility of the Kaffirs, a warlike race of Negroes. In 1836 the Boers (*q. v.*) left the country in great numbers, and founded the independent Transvaal Republic and Orange Free State. In 1866 British Kaffraria, in 1868 a part of the Basuto country, and in 1880 the province of Griqualand West, were annexed to the colony.

Revised by Mark W. Harrington.

Cape Com′orin: in the Indian Ocean; the southern extremity of Hindustan; lat. 8° 5′ N., lon. 77° 30′ E.

Cape Diamond: in Canada; at the confluence of the St. Charles river with the St. Lawrence. It is 333 feet above the river, to which it presents a precipitous bluff. On this point stands the citadel of Quebec.

Cape Disappointment, or **Cape Hancock**: the southwest point of the State of Washington and of Pacific County; at the mouth of the Columbia; lat. 46° 16′ 33″ N., lon. 124° 02′ 13″ W.; has a lighthouse 40 feet high, showing a fixed white light of the first order 232 feet above the sea.

Cape Duca′to, or the **Leuca′dian Prom′ontory**: sometimes called **The Lover's Leap**; the south point of the Greek island of Leucadia or Santa Maura; lat. 38° 34′ N., lon. 20° 32′ 45″ E. It is a perpendicular white cliff over 2,000 feet high, whence Sappho is said to have cast herself for love of Phaon. From this precipice the ancients once a year cast a criminal, first tying a great number of birds to him. If the man was carried to the sea alive by the birds, he was taken up in a boat and set at liberty. Mariners have always regarded this cape with dread.

Cape Elizabeth: a township of Cumberland co., Me. (for location of county, see map of Maine, ref. 10–B): 1 mile from Portland; contains a rolling-mill, oil-refinery, a dry-dock, manufactures: is a summer resort and the seat of a State reform school. The township takes its name from the cape, in lat. 43° 33′ 56″ N., lon. 70° 11′ 41″ W. It has two stone lighthouses, one with a fixed and one with a flashing light. Pop. of township (1880) 5,302; (1890) 5,459; (1900) 887 (part taken to form South Portland since 1890). Publisher "Sentinel."

Cape Farewell: the southern extremity of Greenland; in lat. 59° 49′ N., lon. 43° 54′ W.

Cape Fear: on the Atlantic; the southern extremity of Smith's island, N. C.; the most southern point of the State; lat. 33° 52·3′ N., lon. 77° 59·8′ W.

Cape Fear River: formed by the Haw and Deep rivers, which unite at Haywood in Chatham co., N. C. It flows southeastward; passes Fayetteville and Wilmington; enters the Atlantic near Cape Fear. The length, excluding the branches above named, is estimated at 200 miles. Steamboats can ascend it to Fayetteville, 120 miles.

Capefigue, kăăp′fēēg′, Baptiste Honoré Raymond: historian; b. in Marseilles, France, in 1802. He studied law in

Paris; joined the reconciliatory party, which came into power with M. de Martignac in 1827; took an active part in the political discussion of the day as editor of various papers and historical writer. Among his numerous works on French history are *Europe during the Consulate and the Empire* (1839–41); a *History of the Restoration* (1842); and (his best work) a *History of Philippe Auguste* (1831–34, 4 vols.). D. Dec. 23, 1872.

Cape Flattery: the northwest point of the State of Washington and of Clallam County. On Tatoosh island, half a mile distant, is a small lighthouse, in lat. 48° 23′ 20″ N., lon. 124° 43′ 48″ W. This is the most western point of the U. S., exclusive of Alaska.

Cape Florida: the south point of Key Biscayne; off the southeast point of Florida; has a lighthouse, lat. 25° 39′ 56″ N., lon. 80° 09′ 24″ W., with a fixed white light.

Cape Foulweather, or **Yaqui'na Head**: the westernmost point of Benton co., Or.; has a brick lighthouse 81 feet high, showing a fixed white light of the first order 150 feet above the sea; lat. 44° 16′ 33″ N., lon. 124° 05′ W.

Cape Français: See CAPE HAYTIEN.

Cape Gas'pé: the point of land at the north side of the entrance to Gaspé Bay, and the south shore of the mouth of the St. Lawrence river, Quebec, Canada. It is in lat. 48° 45′ N., lon. 64° 12′ W.

Cape Girardeau: a city (founded in 1793); Cape Girardeau co., Mo. (for location of county, see map of Missouri, ref. 6–K); on Grand Tower and Carbondale R. R., and St. Louis, Cape Girardeau and Fort Smith Ry., and on west bank of the Mississippi; 150 miles S. of St. Louis; is the seat of St. Vincent's College, a normal school, and an academy for young ladies. Its exports are cotton, plows, mineral paints, and flour. Pop. (1880) 3,889; (1890) 4,297; (1900) 4,815.

EDITOR OF "DEMOCRAT."

Cape Guardafui, gwaar'da-fwē, or **Gardafui**: the easternmost point of Africa; in lat. 11° 50′ N., lon. 51° 21′ E.

Cape Hancock: See CAPE DISAPPOINTMENT.

Cape Hat'teras: the eastern extremity of North Carolina; a point of a low sandy island separated from the mainland by Pamlico Sound. The navigation is dangerous in this vicinity, on account of shoals which extend far out into the sea; lat. 35° 15·2′ N., lon. 75° 30·9′ W. Two miles N. of the extremity stands the lighthouse, 190 feet in height, showing a flashing dioptric light of the first order.

Cape Haytien, hā'ti-*en*, or **Cap Français**, frăn'sā': often in everyday conversation called **Le Cap**, while its original Indian name was **Guarico**: a seaport-town of the republic of Hayti; on the northern coast of the island of San Domingo; in lat. 19° 46′ N., and lon. 72° 14′ W. (see map of West Indies, ref. 5–G). Its population now (1893) is estimated at 10,000, but in the middle of the eighteenth century, while under French rule, it was a flourishing city with over 30,000 inhabitants, a university, an academy of music, etc. In 1791 it was burnt by Toussaint l'Ouverture; in 1842 it was destroyed by an earthquake. Its trade is principally with the U. S.

Cape Henlo'pen, Del.: at the entrance of Delaware Bay; 13 miles S. S. W. of Cape May; lat. 38° 46·6′ N., lon. 75° 04·7′ W. It has a stone lighthouse, showing a fixed white dioptric light of the first order, 128 feet above the sea.

Cape Henry, Va.: at the entrance of Chesapeake Bay: 12 miles S. of Cape Charles. Here is a fixed light 129 feet above the level of the sea; lat. 36° 55·5′ N., lon. 76° 0·2′ W.

Cape Horn: the southernmost point of America; an island of the archipelago of Terra del Fuego: lat. 55° 59′ S., lon. 67° 16′ W. It received its name from the Dutch navigator Horn, or Hoorn, who discovered it nearly a century after Magellan had discovered the strait which bears his name. It is an exceedingly dismal place, the last, rugged, barren outpost of the Andes, with a perpetual antarctic climate. Nevertheless, vessels which pass from the Atlantic to the Pacific, or the reverse, usually double this cape, rather than pass through the Strait of Magellan.

Cape la Hague (Fr. pron. laă-aag'): a headland of France, in Normandy; on the English Channel; the northwest extremity of the peninsula of Cotentin; about 16 miles N. N. W. of Cherbourg. On the east side of Cotentin is Cape la Hogue, near which the English and Dutch fleets defeated the French in 1692. Lat. 49° 44′ N., lon. 1° 56′ W.

Cape'lin: a little marine fish (*Mallotus villosus*) allied to the smelt family; visits the coasts of Alaska, Labrador, and Newfoundland in vast shoals, furnishing bait for the cod-fishermen. Capelins are also taken and dried for the European market, and are very good eating.

Cap'ell, EDWARD: Shakspearean critic; b. at Bury St. Edmunds, England, in 1713. He published the works of Shakspeare in 10 vols. 8vo, 1767; *Notes and Various Readings of Shakspeare* (1775); and the *School of Shakspeare* (3 vols. 4to, 1783). D. Feb. 24, 1781.

Capel'la (i. e. the Kid); a bright star of the first magnitude in the constellation of Auriga; also called *α Aurigæ*. It is a double star.

Capella, MARTIA'NUS: a Latin writer, probably of the fifth century A. D.; from North Africa; b., according to Cassiodorius, in Madaura. His work written in prose, with an occasional admixture of verse, is a handbook of the seven liberal arts which then comprised the cycle of human knowledge. The whole is clothed in the form of an allegory. The first two books represent the marriage of Mercury to a nymph, Philologia. The liberal arts are personified as their courtiers. Book iii. takes up grammar, iv. dialectics, v. rhetoric, vi. geometry, vii. arithmetic, viii. astronomy, ix. music. In the Middle Ages the work was very popular. Best editions by Kopp (Frankfurt, 1836) and Eyssenhardt (Leipzig, 1866). M. W.

Cape Lookout: the southeast extremity of the islands off Carteret co., N. C.; has a lighthouse 150 feet high near its extremity; in lat. 34° 37′ 16″ N., lon. 76° 31′ 07″ W., with a fixed white light of the first order.

Cape May: (1) the southern extremity of New Jersey; at the entrance of Delaware Bay. Here is a revolving light elevated 152 feet above the sea, in lat. 38° 55·8′ N., lon. 74° 57·3′ W. (2) A city and watering-place; 2 miles E. of the lighthouse; on the seacoast; the terminus of the West Jersey R. R.; 82 miles S. of Philadelphia, with which it has daily communication by water; has two huge and many small hostelries and boarding-houses, capable of accommodating 25,000 guests; public graded schools, many churches; frequented for bathing, fishing, and gunning. Pop. (1880) 1,669; (1890) 2,136; (1900) 2,257. Between the lighthouse and the steamboat-pier on Delaware Bay (1,000 feet long) lies *Cape May Point*, a borough with a pop. (1900) 153, but a seaside resort accommodating 3,500 persons.

Cape Mendoci'no: a lofty headland of Humboldt co., Cal.; the westernmost point of that State. It has a wrought-iron lighthouse, with a flashing white light of the first order, 428 feet above the sea; lat. 40° 26′ 24″ N., lon. 124° 23′ 27″ W.

Ca'pen, ELMER HEWITT: Universalist scholar; b. at Stoughton, Norfolk co., Mass., Apr. 5, 1838; graduated at Tufts College in 1860; studied law one year in the Harvard Law School; admitted to the bar in 1863; elected to the Legislature in 1859, while still in college. After practicing law for a short time in his native town, he began the study of theology, and was ordained in Gloucester in 1865, where he preached for four years; then preached for one year at St. Paul, Minn., and in 1870 accepted a call to the First Universalist church in Providence, R. I. In 1875 he became president of Tufts College.

Cape North: promontory in the Arctic Ocean; northernmost point of Europe. It is the north extremity of the island of Magerö; separated by a narrow channel from the mainland of Norway; lat. 71° 10′ 12″ N., lon. 25° 46′ E.

Cape of Good Hope: a promontory near the southern extremity of Africa; the termination of Table Mountain; rising about 1,000 feet above the level of the sea; lat. 34° 22′ S., lon. 18° 30′ E. It is about 30 miles S. of Cape Town, but, though it is nearly half a degree to the N. of Cape Aguillas, the southernmost point of the African continent, it is in reality this point at which the course is changed from S. to E. on the voyage from Europe to India. This cape was discovered by Bartholomew Diaz in 1486, and was first doubled by Vasco da Gama in 1497.

Cape Pal'mas: the southern extremity of Liberia; lat. 4° 22′ N., lon. 7° 44′ W.; a high point with a lighthouse. It is also the popular name of that part of the country. It is included in the Liberian state of Maryland.

Cape-pigeon: a species of petrel (*Daption capensis*) common in high southern latitudes, and especially around Cape Horn and the Cape of Good Hope. The bird is about 14 inches long; is black, marked with white above and below. It will follow a ship for a long distance, and may be captured with a hook and line baited with salt pork.

It has an intensely strong, musty odor, and, when taken, ejects from its crop an oily, ill-smelling fluid.

F. A. Lucas.

Cape Pine: Newfoundland; lat. 46° 37′ 4″ N., lon. 53° 31′ 45″ W.; has an iron lighthouse with a fixed catoptric white light of the first order, 314 feet above the sea.

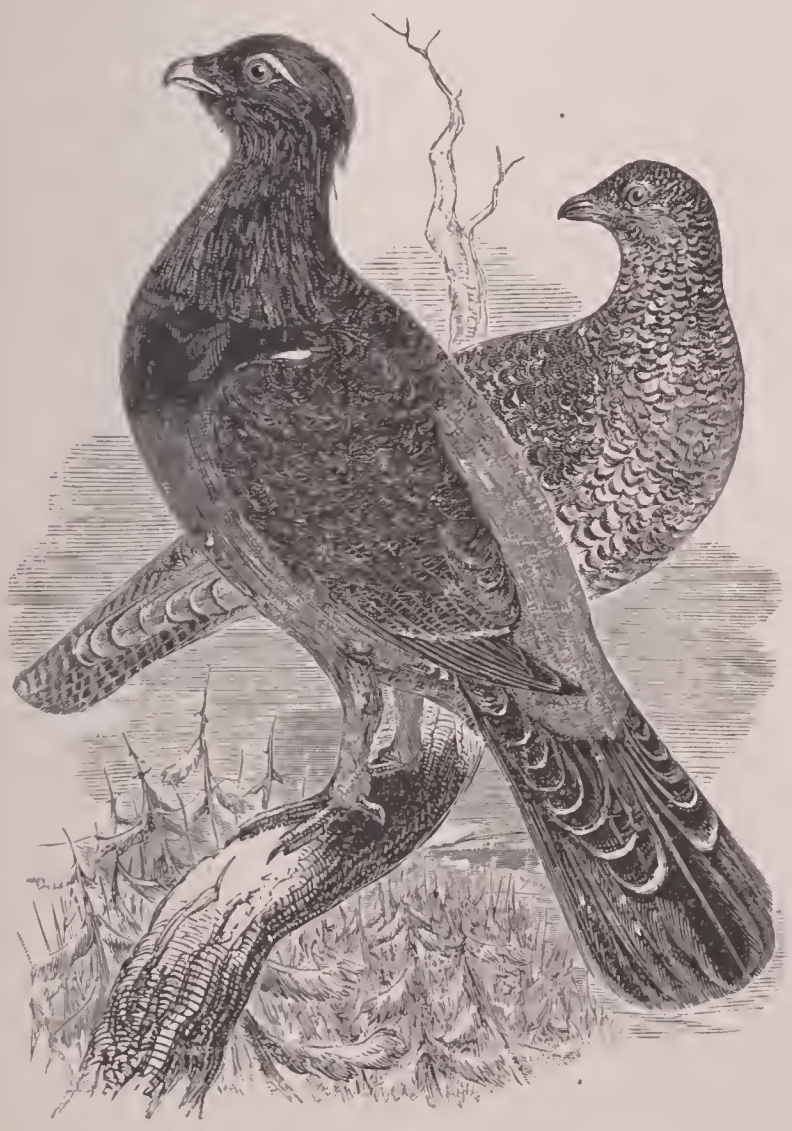
Cape Poge: the northeast point of Chappequiddick island; in Edgartown, Dukes co., Mass.; lat 41° 25′ 14″ N., lon. 70° 26′ 44″ W.; has a wooden lighthouse 36 feet high, with a fixed white light of the fourth order.

Cape Prince of Wales: the westernmost point of the American continent; on the east side of Bering Strait; lat. 65° 45′ N. lon. 168° 17′ W. It is a lofty headland, with dangerous shoals in the vicinity.

Caper: the common name of the pickled flower-buds of the *Capparis spinosa* of Southern Europe and Barbary. Several other species yield buds which are similarly used. It is a trailing shrub of the family *Capparidaceæ*, growing on rocks and walls, and extensively cultivated in Sicily and the south of France. The flowers are large and beautiful. Capers have an agreeable pungency of taste, and are used as a condiment and ingredient of sauces. They have medicinal properties, being anti-scorbutic, stimulant, and laxative. The buds are gathered every morning, and immediately put into vinegar. They are sorted and the best are sent to market in jars. Florida has two native species of the caper-tree, which are erect and not trailing. The plant called "caper" in England is the caper spurge, a *Euphorbia*.

Cape Race: near the southeast extremity of Newfoundland; lat. 46° 39′ 30″ N., lon. 53° 4′ 30″ W.; a point very dangerous to ships sailing in foggy weather between the U. S. and Europe. It has a revolving light 180 feet above the sea, established by the British Government, and (with Cape Pine light) is sustained by a tax upon all ships sailing from or to Great Britain to or from Canada and the Northeastern U.S.

Capercailzie, kăă-per-kāl′*ye*, or **Capercail′lie, Wood Grouse**, or **Cock of the Woods**: a large gallinaceous bird



The capercailzie.

(*Tetrao urogallus*); native of Europe; a species of grouse. The male sometimes weighs 15 lb. or more. The plumage of the male is variegated with black, brown, and white, and the chest is dark green. Above the eye is a scarlet patch of naked skin. The legs and feet are feathered to the toes. This bird is found in the pine-covered mountains of several countries of Europe and Northern Asia, and feeds on berries, seeds, insects, and young shoots of the fir and pine. It builds on the ground. The flesh is highly esteemed for food.

Caper′naum: an ancient city of Palestine; situated on the northwest coast of the Sea of Galilee (see map of Palestine, ref. 5–E). Some authorities identify it with the modern Tel-Hûm.

Cape Romain′: on Raccoon Key, Charleston co., S. C.; has a brick lighthouse 150 feet high, with a flashing light of the first order; lat. 33° 01′ 08″ N., lon. 79° 22′ 12″ W.

Capers, William, D. D: preacher and bishop of the Methodist Episcopal Church South; b. in St. Thomas parish, S. C., Jan. 26, 1790; educated at South Carolina College; studied law; entered the Methodist ministry in 1809; was sent as delegate to the Wesleyan Conference in England in 1828; Professor of Evidences of Christianity in Columbia College (South Carolina) 1835; editor of the *Southern Christian Advocate* 1836–40; missionary secretary of the M. E. Church 1840–44; and superintendent of Negro missions in the Southern States 1844. He took an active part in the proceedings of the Methodist General Conference of 1844, which resulted in the division of the Church, and was elected bishop by the Southern division in 1846. D. in Anderson, S. C., Jan. 29, 1855. He was author of an *Autobiography* (in Wightman's *Life of Capers*, Nashville, Tenn., 1859); *Catechisms for the Negro Missions*; and *Short Sermons and True Tales for Children*.

Cape Rubies: the name applied to the fine pyrope garnets found with the diamond in South Africa.

Cape Sable: the southwest point of Nova Scotia; in lat. 43° 26′ N., lon. 65° 38′ W. It has a lighthouse and is on Cape Sable island, in Barrington township, Shelburne County. The island had, in 1891, 2,117 inhabitants, mostly fishermen, descended from loyalists who left the U. S. during the Revolution. A ferry connects it with the mainland. The name Cape Sable island is also given to Sable island.

Cape Sable: the most southern point of the peninsula of Florida; lat. 25° 06′ N., lon. 81° 09′ W. It is sandy and low, and is the site of Fort Poinsett.

Cape San Blas: the southern extremity of Calhoun co., Fla.; has a brick lighthouse 96 feet high, with a flashing white light of the third order 102 feet above the sea; in lat. 29° 39′ 46″ N., lon. 85° 21′ 38″ W.

Cape San Lucas: the southernmost point of the peninsula of Old California; lat. 22° 44′ N., lon. 109° 54′ W.

Cape Spear: Newfoundland; lat. 47° 31′ 11″ N., lon. 52° 36′ 59″ W.; has a colonial lighthouse, showing a revolving catoptric light of the first order, 264 feet above the sea.

Cape St. George: the southernmost point of St. George's island, Franklin co., Fla.; lat. 29° 35′ 15″ N., lon. 85° 02′ 40″ W.; has a brick lighthouse 68 feet high, with a fixed white light of the third order 73 feet above the sea.

Cape St. Mary's: Newfoundland; lat. 46° 49′ 30″ N., lon. 54° 11′ 34″ W.; has a brick (colonial) lighthouse, with a flashing red and white catodioptric light of the first order, 300 feet above the sea.

Cape St. Roque: a promontory on the coast of Brazil; lat. 5° 28′ S., lon. 35° 16′ W.

Cape St. Vin′cent (anc. *Promontorium Sacrum*): the southwest extremity of Portugal; lat. 37° 3′ N., lon. 9° W. Near this cape the British admiral Jervis defeated the Spanish fleet on Feb. 14, 1797.

Ca′pet, Hugh: King of France; founder of the Capetian dynasty. He was a son of Hugh the Great, Count of Paris, and was born about 940 A. D. The throne having become vacant by the death of Louis V., the last Carlovingian king, in 987, Hugh assumed the royal power with the consent of many of the barons. He ruled with moderation, and selected Paris as the capital of France. He died in 996, and was succeeded by his son Robert.

Cape′tian Dy′nasty: third dynasty of French kings; founded by Hugh Capet, who ascended the throne in 987 A. D., and is said to have been the ancestor of thirty-two Kings of France. According to some authorities, the last of the direct line of Capetian kings was Charles IV., who died

in 1328, without male issue. He was succeeded by his cousin Philippe, who founded the house of Valois. The Bourbon line, from Henry IV. onward, were descendants of the youngest son of St. Louis, or Louis IX., and so of Capet.

Cape Titmouse (*Anthoscopus capensis*): a small bird belonging to the order *Insessores*, family *Paridæ*; found at Cape of Good Hope. It is remarkable for the ingenuity it displays in constructing its nest, which is made chiefly of

Cape titmouse.

cotton, and is shaped like a bottle, as shown in the accompanying illustration. While the female is hatching inside, the male, a most watchful sentinel, remains outside, resting in a pouch made for the purpose fixed to one side of the neck of the nest. But when his mate moves off, and he wishes to follow her, he beats the opening of the nest violently with his wing, and succeeds in closing it, in order to protect their young from enemies.

Cape Town: a seaport of South Africa; capital of Cape Colony; on the southwest shore of Table Bay; and between that bay and Table Mountain; lat. of observatory 33° 56′ 3·2″ S., lon. 18° 28′ 45″ E. (see map of Africa, ref. 10–E). It is intersected by several canals, is built on a regular plan, and lighted with gas. Close behind rise the huge granite walls of Table Mountain. The town contains an exchange, a college, an observatory, a public library, and a botanic garden. It is the see of a bishop of the Church of England. This port is visited by a large number of vessels, and is a convenient place for mariners to stop for rest and provisions in the voyage between Europe and India. The Constantia wine is produced in this vicinity. Cape Town was founded by the Dutch in 1652, and ceded to Great Britain in 1815. Pop. (1891) with suburbs, 83,718.

Cape Trafalgar: a headland of Spain; on the Atlantic Ocean, between Cadiz and Gibraltar; lat. 36° 10′ N., lon. 6° W. Near this cape, on Oct. 21, 1805, the English fleet gained a great victory over the French, and Lord Nelson, who commanded the former, was killed.

Cape Verde (Green Cape): the most westerly point of Africa; projecting into the Atlantic Ocean between the rivers Senegal and Gambia; lat 14° 44′ N., lon. 17° 33′ W.

Cape Verde (called also **Cape de Verde**) **Islands**: a group of islands belonging to Portugal; in the Atlantic, 320 miles W. of Cape Verde (see map of World, ref. 5–I). They are between lat. 14° 47′ and 17° 12′ N., and between lon. 22° 45′ and 25° 25′ W. Area, 1,650 sq. miles. The climate is hot. The group consists of fourteen islands, nine of which are inhabited—namely, Sal, Boavista, Mayo, Fogo, Brava, São Nicolão, São Thiago, São Antão, and São Vicente. They are all mountainous and of volcanic formation, and the highest point is the peak of Fogo, which rises 9,157 feet, and is an active volcano. They have mostly a fertile soil, and are covered with luxuriant vegetation. Sugar, cotton, coffee, maize, indigo, salt, and tobacco are the staples. The majority of the inhabitants are Negroes. The principal occupations are cattle-breeding and the making of salt from sea-water. The most important articles of exportation are coral, salt, physic-nuts, hides, and coffee; and of importation, cotton cloths, timber, glass, crockery, hardware, and wine. Pop. (1885) 110,930.

Cape Vincent: a port of entry of Jefferson co., N. Y. (for location of county, see map of New York, ref. 2–G); on Rome, Wat. and Og. R. R., and on the St. Lawrence river; 25 miles W. N. W. of Watertown. Extensive seed warehouses are located here. In the vicinity is good fishing, and the place is a favorite resort for summer tourists. Pop. (1880) 1,361; (1890) 1,324; (1900) 1,310. Editor of "Eagle."

Cape Wrath: the northwestern extremity of Scotland; projects from Sutherland into the Atlantic Ocean. It is a pyramid of gneiss about 600 feet high, and is remarkable for the wildness and grandeur of its scenery. Here is a lighthouse 400 feet above the sea, in lat. 58° 37′ N., lon. 4° 58′ W.

Ca'pias (Lat., you may take): in law, a common-law writ requiring the officer to take a person into custody. It assumes a number of forms, still designated by the leading words in the old writs, which were framed in Latin, such as (1) *Capias ad audiendum*, issued to bring up for judgment a defendant who has been found guilty of a misdemeanor or minor crime. (2) *Capias ad respondendum*, or, as it is frequently termed, simply *capias*, issued to the sheriff, commanding him to take and safely keep the defendant, and produce him in court on a certain day to *answer* the complaint of the plaintiff. This writ, which was formerly resorted to as a mode of commencing an action, is now, as originally, issued only as a part of the Mesne Process (*q. v.*). It has been much modified in England, and altogether abolished in most of the U. S. (3) *Capias ad satisfaciendum* (abbrev. *ca. sa.*), a writ of execution against the person, commanding the sheriff to take the person named, and have his body before the court on a specified day to *satisfy* the claim of the party resorting to it. The result is that the party is retained in custody until discharged by due course of law. The debtor could be released only by showing an irregularity in the writ, or by satisfying or reversing the judgment against him. Statutes abolishing imprisonment of debtors have much restricted its use. (4) *Capias in withernam*, issued in an action of replevin, and commanding the sheriff to take goods of a distrainor equal in value to other goods taken under a distress by the distrainor, and by him removed or concealed so that they can not be replevied by him. (5) *Capias utlagatum*, used to arrest an outlaw.

Revised by F. Sturges Allen.

Capibara: See Capybara.

Cap'illaries [from Lat. *capilla'ris*, of hair; deriv. of *capil'lus*, hair]: the minute blood-vessels intermediate between arteries and veins. They have but a single coat, consisting of a single layer of flat cells arranged edge to edge. In size they vary considerably, most of them being too small to admit the passage of more than one or two blood-corpuscles at a time. Their arrangement differs very much in the different tissues and organs. They can be examined only by the aid of the microscope, hence their existence was not known to the ancients. During life the capillary movement of the blood may be seen in the web of the frog, the tail of the tadpole, or the wing of a bat. The use of the capillaries is to subdivide and distribute the blood among all the organs and tissues of the body. Their importance in nutrition and in the performance of all the organic functions is very great. See Circulation of the Blood.

Cap'illary Action: primarily, the elevation or depression of liquids in fine hair-like tubes, as compared with the level of liquids in equilibrium in vessels or in wide tubes. If a clean wide open tube be plunged into water, nice observation will show an elevation of the fluid next the walls, both within and without the tube. If the tube be very fine the water within rises very considerably above its level outside, and the finer the bore the higher the rise. Careful examination will show that the upper surface of the water in the capillary tube is concave. The concavity of the "meniscus" is greatest in the finest tubes. If two glass plates are united at one edge, the opposite edges being slightly sepa-

rated, and the plates are placed in water with the united edges vertical, the water will rise between the plates, forming a curve which assumes the form of a right-angled hyperbola, of which the asymptotes are the common vertical edge and a line at right angles to this edge so drawn as to be equidistant from the two panes of glass. If mercury be substituted for water, the capillary action is reversed; the mercury not rising in the tube or between the plates, but being depressed. The meniscus, too, is convex in this case, and the hyperbola is likewise reversed. In the barometer and eudiometer it is necessary to make corrections for this capillarity.

The cause of capillarity is well understood, and its results can be mathematically explained. It depends on the adhesion which exists between the fluid and the material of the tube; while the degree of cohesion between the particles of the fluid itself must affect the result. As the size of tubes increases, the column within increases with the square of the diameter, while the attracting surface increases only with the diameter. Attraction is therefore relatively much greater in fine tubes.

The following table exhibits the relative capillary elevation of certain fluids in glass tubes 2 mm. in diameter at 0° C., according to Frankenheim:

Liquid.	Height of cap. column in millimeters.
Water	15·336
Acetic acid	8·510
Sulphuric acid	8·40
Oil of lemons	7·23
Oil of turpentine	6·76
Alcohol	6·05
Ether	5·40
Carbon disulphide	5·10

The temperature of the tubes and the liquid exercises an important influence upon capillarity. Heat diminishes the cohesion of the particles of the liquid among themselves, and hence greatly decreases capillary action.

Capillarity is, however, not confined to tubes, but is seen wherever a liquid surface comes in contact with a solid body. The principle is obviously the same as in the case of fine tubes. It has been proved that the principle of capillarity exercises a most important influence upon the circulation of nutritive fluids in both plants and animals.

Revised by E. L. Nichols.

Cap'ita [Lat., plural of *caput*, head]: in law, mostly used in the phrase *per capita*. See Succession.

Cap'ital [from Lat. *capita'lis*, pertaining to the head (*caput*)]: pertaining to the head or life; important, principal, chief; affecting life, as capital punishment; large, as capital letters. Capital crimes are those which are punishable with death.

Capital, in geography, the city or town which is the official seat of government in a country, state, or province, or of the courts of record of a county.

Capital [earlier, *capitell.* from Lat. *capitellum*; dimin. of *caput*. The Fr. cognate is *chapiteau*; Ital. *capitello*]: in architecture, is a term applied to the head or uppermost part of a column or pilaster. Each of the orders of ancient classic architecture—viz., Doric, Ionic, Corinthian, Tuscan, and Composite—had a peculiar form of capital. The capitals were the prominent characteristic features of the Corinthian and Ionic orders. They became more ornate in proportion to the development of art, the Doric, the most ancient, being very plain and simple compared with the Corinthian capital. See Corinthian, Doric, Ionic, etc., respectively.

Capital: in political economy, is "that part of a man's stock which he expects to afford him revenue" (Adam Smith). "What capital does for production is to afford the shelter, protection, tools, and materials which the work requires, and to feed and otherwise maintain the laborers during the process" (J. S. Mill). See Political Economy.

Capital Account: a term used especially in connection with railroad or other stock companies, as distinguished from the revenue account. It includes the money obtained for shares of stock and that borrowed upon mortgages (debentures) or the property of the company, and begins with the first preparatory operations of the company; whereas the revenue account commences with the returns from actual traffic or other productive business.

Capitalization (of words): the use of capital letters in beginning words. The practice of different nations varies, as in some small degree does that of individual scholars. The usages in English are, however, virtually uniform. Capitals are employed alike in MSS. and in print to begin a sentence and each line of poetry. The Germans begin all nouns and words used substantively with capitals, but not their derivatives (unless used substantively), even though derived from proper names. The general rule in English is to begin all proper names, and each separate word composing a proper name, with a capital. The rule is expanded to apply to the specific names of institutions, denominations, countries, towns, and in general to words and collections of words used to perform the function of proper nouns as a means of individualizing any single person or thing. Thus to write the "Reformation," or the "French Revolution," or the "Ascension," is to indicate a well-known specific event. Titles of books, churches, universities, works of art, and other styles embracing several words, have the principal, but not the connective or minor, words in initial capitals. Adjectives derived from proper names are begun with capitals in English almost universally, but a few scholars follow the French and German use, which refuses initial capitals to adjectives. The names of deities, of days and months, and all titles of honor begin with capitals. The personal pronouns relating to God, but not the relative pronoun nor the derivative personal pronoun, should be capitalized; e. g. *He*, *His*, and *Him*, but not *whom* or *himself*. The first word of a quotation preceded by a colon should also begin with a capital, but not when the quotation is virtually a part of the sentence. When a place-name is preceded by an adjective of location, the adjective is capitalized; e. g. Central New York. In the natural sciences the names of branches, orders, families, and genera are indicated by initial capitals, but when the specific is added to the generic name in this work the specific name, even when derived from a proper noun, begins with a small letter; e. g. *Aloe americana*, *Physalospora bidwellii*. All abbreviations of substantive words call for capital letters, except the names of weights and measures and the names of law writs; but not so the abbreviations of mere connective words, as A. D. for Anno Domini (though small capitals are frequently used in this case, as in this encyclopædia), LL. D. for Doctor of Laws, but *i. e.* for *id est*, *ib.* for *ibidem*, *circ.* for *circa*, *e. g.* for *exempli gratiâ*, etc.

Capital Punishment: the punishment of death (so called from the Latin *caput*, head, also life). As the penalty for murder it has prevailed from the earliest times in all parts of the world. In most nations treason or rebellion against lawful government has also been thus punished; and in England and elsewhere, down to a very recent period, the same has been true of counterfeiting, forgery, mail-robbery, and several other crimes. The manner of execution varies greatly. Military criminals, in modern times, are usually shot. In civil administration the modes most prevalent have been decapitation upon the "block," used for political criminals of rank in Great Britain; the Guillotine (*q. v.*) in France; in Spanish countries the Garrote (*q. v.*); and hanging. On June 4, 1888, hanging was abolished in the State of New York for all murders committed after Jan. 1, 1889, and death by electric shock substituted therefor. In China there are three degrees of capital punishment: *ling-chi*, or slow death by being cut to pieces, decapitation, and strangling. The last mentioned is preferred for many reasons. In Japan, for some offenses, the criminal was formerly condemned to take his own life by disembowelment in the presence of officials. See Hara-kiri.

In Christendom the tendency in modern times has been to limit capital punishment to the greatest crimes only, and many intelligent persons believe that it should be abolished altogether. The grounds upon which the question is argued are chiefly—1, common right; 2, Scripture; 3, expediency. The Marquis of Beccaría (*Essay on Crimes and Punishments*, 1775) denies the right of governments to take human life, under any circumstances, in punishment of crime. It appears to be evident, however, on any theory of society, that such a right exists in all cases in which the safety of the community requires it. As to Scripture, the Old Testament, in accordance with the words, "Whoso sheddeth man's blood, by man shall his blood be shed" (Gen. ix. 6), affords very numerous examples of its enforcement under Divine authority; and the New Testament contains no prohibition of it. It is urged, nevertheless, that the benevolence of Christianity and its high regard for human life oppose the continuance of the death-penalty. In William Penn's code

of laws for Pennsylvania it was prescribed for two crimes only—murder and treason. The chief reason for its retention in Christendom is perhaps its biblical injunction, especially as this injunction (as above) was given to Noah when he represented the whole human race, and is not therefore merely a Mosaic or Jewish statute, which might be supposed to be superseded, like the Mosaic system generally, by Christianity. It has been plausibly replied, however, that the Noachic law may reasonably be supposed to be subject to modification by the progress of the race, like the Mosaic; and that Christendom has practically recognized this fact by abolishing the capital punishment of *brutes*, which was enjoined in the same Noachic law that enjoins it for man, and without any discriminative qualification whatever. In the early training of the race such means of teaching the value of human life, it is argued, might be necessary; but as one part of the law is now deemed unnecessary, and its execution would be esteemed preposterous, it is inferable that the other is equally subject to change. Beccaría and many others deny the expediency of capital punishment, asserting that it does not lessen the amount of crime; but whether this be true or not, it is a fact that such public executions as formerly took place in England are brutalizing and injurious to public morality. Although some of the U. S., as Rhode Island, Maine, and Wisconsin, and some other governments, as Brazil, Holland, and Portugal, have abolished capital punishment, the effect upon the commission of crime has not been decided enough to prove such a step either advisable or unadvisable. See Basil Montagu's *On the Punishment of Death* (1809–13); *Memoirs of Sir S. Romilly* (1840); Jeremy Bentham's *Rationale of Punishment* (1830); E. G. Wakefield's *Facts Relating to the Punishment of Death in the Metropolis* (1831); F. Hill's *Crime: its Amount, Causes and Remedies* (1853); Bovee's *Reasons against Capital Punishment*; T. Pyne's *A Plea for the Abolition of Capital Punishment* (1845); *Report of Select Committee on Capital Punishment*, New York State Assembly (Albany, 1851).

Revised by R. Lilley.

Capitar'ida: city of Venezuela; in the state of Falcon; on the Gulf of Maracaibo. It has an important trade in tobacco. The climate is warm and unhealthy. Pop. (1893) 2,000. H. H. S.

Cap'itol [from Lat. *Capito'lium*]: the magnificent temple of Jupiter Capitolinus, which, together with the citadel or fortress and other buildings, occupied the Capitoline Hill (*Mons Capitolinus*), in ancient Rome. These edifices were founded by the Tarquins abont 600 B. C., and dedicated in 507 B. C. The temple was burned in the time of Sulla, in 83 B. C., was soon rebuilt, and was burned again in 69 A. D. Here was also the *Tabularium*, containing the public archives, and here the senate often met in both ancient and modern times. The steepness of the sides of the Capitoline Hill rendered it a natural fortress. On one side of it was the Tarpeian Rock, from which traitors and state criminals were thrown. The name *Capitolium* was often applied to the whole hill. The site of the Capitol is now occupied by the Church of S. Maria in Araceli, and the Palazzo del Campidoglio, built by Michael Angelo. More than twenty provincial cities of the empire are known to have had capitols modeled on that of Rome, and that of Toulouse has been the seat of authority for that city for centuries. The term Capitol is also applied to the imposing edifice in which the Congress of the U. S. holds its sessions at Washington, and to the State-houses which are erected at the capitals of the several States.

Capitoli'nus, Julius: a Latin biographer; one of the authors of the *Historia Augusta*; lived about 300 A. D. The biographies of the Emperors Antoninus Pius, Marcus Aurelius, Pertinax, Opilius Macrinus, the two Maximins, and others, are ascribed to him.

Capit'ularies [from Med. Lat. *capitula're* (subst.), *capitula'ris* (adjec.), pertaining to a chapter, deriv. of *capi'tulum*, small head, heading, passage or section of a book, synod]: the laws enacted by the Frankish Kings from the time of Childebert. These laws were general for all the states of the kingdom, while those called *leges* were issued for the several states. The most celebrated capitularies were those of Charlemagne and St. Louis. After Charles the Simple, in 922, they were no longer issued. The best collections of them are those of Baluze (Paris, 1677 and 1780); of Pertz, in the *Monumenta Germaniæ*, and of Boretius (Hanover, 1883).

Capitula'tion [Med. Lat. *capitula'tio*, deriv. of *capitula're*, draw up under heads, draw up articles of agreement, as for surrender]: the act of capitulating or surrendering to an enemy upon stipulated terms; a treaty of surrender to an enemy, which is concluded when the garrison or besieged force does not surrender at discretion or unconditionally. The treaty often consists of several specified conditions or articles, and those who surrender are sometimes permitted to retain their arms and to march out with the honors of war. The name is also applied to those agreements whereby citizens of one state residing in another are released from the jurisdiction of the country of their residence and placed under that of consular courts of their own nation, as is the case in Egypt and Japan.

Capo d'Istria, kaa'pō-dis'trēē-aă (anc. *Ægida*): a fortified seaport-town of Austria; in Trieste; situated on a rocky island in the Gulf of Trieste; 8 miles S. W. of Trieste (see map of Austria-Hungary, ref. 8–C). It was formerly the capital of Istria. It is connected with the mainland by a bridge about half a mile long. It is the seat of a bishop, has a cathedral and other churches; also manufactures of soap and leather. Pop. (1890) 8,646.

Capodis'trias, John Anthony, Count: b. in Corfu, Ionian islands, Feb. 11, 1776; d. in Nauplia, Oct. 9, 1831. His father practiced as a physician, and he began himself to study medicine, but entered afterward upon a political career and held a high position in the Government of the republic of the Seven United Islands, when, in 1807, by the Peace of Tilsit, that republic was incorporated with France. He obtained an appointment in the Russian diplomatic service, and was finally made Secretary of Foreign Affairs. The aid he thus was able to give his countrymen in their exertions for the establishment of an independent Greece induced them to elect him president of the Greek republic in 1827. But he was utterly unable to keep his course straight through the tempest of the moment, and while prosecuting Mauromichali for some criminal offense he was assassinated by two of Mauromichali's cousins, an incident deeply deplored by all friends of the great cause he served. See his *Life* (Berlin, 1864) by Mendelssohn-Bartholdy.

Caponière, or **Caponier** [Fr. *caponnière*; Ital. *capponiera*, a covered lodgment]: in fortification, a defensive outwork situated in the ditch of the main work. 1. A passage or communication covered from horizontal fire by a parapet on both sides (double caponière) or on one side only (single or half caponière). The parapets are usually 6½ or 8 feet high and are provided with a banquette. The superior slope usually forms a glacis and extends to the bottom of the ditch. 2. A casemated structure, situated at the middle of the face of a polygonal work to flank its ditch. These were formerly made with two or more tiers of fire, but in modern works they have but one. They have bomb-proof roofs and are protected from cannon fire by their location in the ditch.

Capon Springs or **Watson**: Hampshire co., W. Va.; 17 miles E. of Romney and 22 N. W. of Winchester (see map of West Virginia, ref. 6–L); has celebrated warm springs. The scenery is fine and the trout-fishing excellent. The hotels and bathing-houses are extensive. Pop. district (1900) 1,556.

Cappa, Carlo Alberto: See the Appendix.

Cappado'cia (in Gr. Καππαδοκία): an ancient province of Asia Minor; bounded N. by Pontus and Galatia, E. by Armenia, S. by Mt. Taurus (which separated it from Syria and Cilicia), and W. by Lycaonia. It was traversed by the river Halys. Among its chief towns were Comana, Ariarathia, and Tyana. It was conquered by Cyrus the Great of Persia, and was ruled by independent kings from the time of Alexander the Great until 17 A. D., when Tiberius reduced it to a Roman province. The greater part of it is included in the modern Karamania.

Cappel', or **Cappel'lus**, Louis, or Ludovicus: biblical critic; b. in St.-Elien, near Sedan, Oct. 15, 1585; educated at Sedan, Oxford, and Saumur; became Professor of Hebrew in the Protestant Seminary of Saumur 1613; of Theology there 1633. In his book *Arcanum punctationis revelatum* (Leyden, 1624) he proved that the vowel-points and accents are not a part of the original Hebrew text of the Old Testament. This work called forth a passionate controversy, in which the Buxtorfs took a leading part in behalf of the traditional opinion. Cappel followed up his attack in his *Critica Sacra* (Paris, 1650), in which he discussed various readings of the Hebrew text. He was in an important sense the founder of the science of biblical criticism. D. in

Saumur, June 18, 1658. See G. H. Schnedermann's *Die Controverse des L. Cappellus mit den Buxtorfen über das Alter der hebräischen Punctation* (Leipzig, 1879). C. H. Toy.

Capre'ra (literally, Goat Island): one of the Buccinarian islands; in the Mediterranean; 4 or 5 miles from the northeast coast of Sardinia; belongs to Italy (see map of Italy, ref. 6–C). It is nearly 6 miles long, and abounds in goats and rabbits. The patriot Garibaldi, after reaching middle life, often resided here. He built a house here about 1854.

Capri (anc. *Capreæ*): a charming island of Italy; in the Mediterranean; at the entrance of the Bay of Naples; 20 miles S. of the city of Naples (see map of Italy, ref. 7–F). It is about 4½ miles long and 3 miles wide. The shores of the island are steep and inaccessible. The town of Capri is the seat of a bishop. Upon this island is a remarkable cavern called the "Grotto of the Nymphs" or the "Blue Grotto." The Emperor Tiberius passed the last ten years of his life here, and built twelve villas or palaces, of which the ruins are still visible. Area, 19 sq. miles. Pop. 2,907.

Capriccio, ka-prit'chiō [Ital., freak, sudden start; borrowed into Fr. as *caprice*; deriv. of Lat. *caper*, goat]: a musical term applied to a species of free composition which is not subject to rule as to form or measure.

Cap'ricorn [Lat. *capricornus*, name of the constellation the Goat; liter., goat-horned; *caper*, goat + *cornu*, horn; Gr. *αἰγόκερως*, same]: the tenth sign of the Zodiac, which the sun enters at the winter solstice, about Dec. 21. It is denoted by this figure, ♑. Capricorn is also the name of a constellation which may be seen in the south during autumn.

Capricorn, Tropic of: in geography, one of the lesser circles of the earth; a parallel nearly 23° 27′ S. of the equator. At the winter solstice (Dec. 21) the sun is vertical over this line. There is a corresponding circle on the astronomical sphere. This circle touches the ecliptic in the first point of the sign Capricorn, which therefore gives name to this tropic.

Caprifo'lium: See Honeysuckle.

Caprimul'gidæ [Lat. *caper*, goat + *mulge're*, milk, suck]: a family of insectivorous birds of the order *Macrochires*. They have long wings, short legs, and toes united at the base by a membrane. The base of the bill is furnished with long stiff bristles. This family includes the goatsucker (*Caprimulgus*) and the American whippoorwill (*Antrostomus vociferus*), as well as the night-hawk (*Chordeiles virginianus*), the chuck-will's-widow, and the poor-will of the Western States (*Antrostomus carolinensis*).

Caprivi de Caprera de Monte-Cucculi, Gen. Georg Leo, von: German soldier and statesman; b. at Charlottenburg, Feb. 24, 1831; son of Julius Edward von Caprivi, who held a high legal office in Prussia. Entering the army in his eighteenth year, he won rapid promotion, and served with distinction in the campaigns of 1864 and 1866. In the Franco-Prussian war he served as chief of staff of the Tenth Corps. In 1883 he was appointed to the command of the Thirtieth Division at Metz. In the following year he was transferred to the head of the Admiralty, where he displayed rare adaptability to new modes of thought and lines of work. After the reorganization of the navy under the present emperor, Gen. von Caprivi again returned to the army, and received the command of the Tenth, or Hanoverian, Army-corps, one of the finest in the whole army. He succeeded Bismarck as Chancellor of the German empire and president of the Prussian Council Mar. 19, 1890. In 1892 he resigned the presidency, but retained the chancellorship: retired Oct. 26, 1894. D. Feb. 6, 1899. C. K. Adams.

Caps and **Hats**: the name applied to the political parties in Sweden which were formed under the reign of Frederick of Hesse, 1718–51. After the death of Charles XII. his sister Ulrikke and her husband, Frederick of Hesse-Cassel, were elected King and Queen of Sweden. The Swedish crown, however, had no real power. The power was in the hands of the nobility, of which one party, the Hats, leaned toward France, and the other, the Caps, toward Russia. It was this party division which afterward enabled Gustavus III. to break the power of the nobility.

Capsicin: an exceedingly acrid, soft, resinous alkaloid of a reddish color; obtained from the seed-pods of the *Capsicum annuum*, or Cayenne pepper, of which it is the active principle.

Capsicum [etym. doubtful; perhaps formed from Lat. *capsa*, case, i. e. pod]: a genus of plants of the family *Solanaceæ*; natives of the warm parts of America, Africa, and Asia. They are mostly annual or biennial plants, with more or less woody stems, and have a wheel-shaped corolla, with five convergent protruding anthers. The fruits of *Capsicum annuum*, *frutescens*, *fastigiatum*, *baccatum*, *grossum*, and *cerasiforme*, with perhaps those of other species, form, when pulverized, the Cayenne pepper which is extensively used as a condiment. It is extremely pungent, and is often employed with excellent results in medicines as a derivative and stimulant. The *Capsicum annuum* is a hardy plant, cultivated in the U. S., where pickles are made of its unripe fruit. It is stated that the fruit of *Capsicum toxicarium* of tropical America is a narcotic poison. The *Capsicum frutescens* grows wild in Florida, as well as in most warm countries. It is the true Cayenne pepper.

Capstan [Fr. *cabestan*, from a deriv. of Lat. *capis'trum*, halter]: a strong, massive column of timber, shaped somewhat like a truncated cone, and having its upper part pierced to receive bars or levers for the purpose of winding a rope round it, to raise heavy weights or otherwise exert great power. It is chiefly used in vessels for drawing in cables in order to raise anchors, etc. There are several improved forms in use on ships.

Capsule [Lat. *cap'sula*, small box, deriv. of *cap'sa*, box]: in botany, a dry, syncarpous, dehiscent fruit or seed-vessel. The term is applied to all dry fruits which are dehiscent, whether simple or compound, one-celled or many-celled, and whether they open by valves or by pores. The capsule or pod is a general name of dry-seed vessels which split or burst open at maturity. The capsule is the pod of a compound pistil. The poppy, lobelia, iris, and snapdragon afford examples of it.

Captain [Fr. *capitaine* (loan-word, cf. O. Fr. *chevetaine*), with Ital. *capitano*, Span. *capitan* from Lat. **capita'nus*, head-man, deriv. of *caput*, head]: a military term which in a general sense signifies a commander, a man skilled in war or the military art. In some countries the commander-in-chief is called captain-general. In a more limited and technical sense, captain is the title of an officer who commands a troop of cavalry, a company of infantry, or a battery of artillery. He is the next in rank below a major. In the U. S. army a captain is responsible for the camp and garrison equipage, the arms, ammunition, and clothing of his company. A captain of the U. S. marines is of a rank corresponding to that of a captain in the army and that of a lieutenant in the navy.

Captain (of the navy) is an officer of higher rank and holds a more responsible position than a captain of the land forces. He has the command of a ship, and is responsible for everything on board—all that relates to the *personnel* or the *matériel* of the vessel. The commanders of all British vessels, from first-rates down to ship-rigged sloops, are captains. A captain in the royal navy is the next in rank above a commander. A captain in the U. S. navy takes rank with a a colonel in the army, and next below a commodore. He rises by regular succession to the rank of rear-admiral. Before the civil war (1861–65) there was no legal rank in the U. S. navy higher than that of captain. (See Commodore.) The term captain is also applied to the master of a merchant-vessel. Revised by S. B. Luce.

Caption [from Lat. *captio*, a taking; in its application to a part of a legal instrument the English word means note of caption or taking]: in law, is that part of a legal document, such as an indictment or commission, which shows the time and place where, and the authority by which, it was made or executed. It is of considerable consequence in the case of indictments. While a caption is not strictly a part of an indictment, its absence or imperfection may be of serious import. Its office is to summarize the history of the case up to the time of the indictment, stating the style of the court, the time and place of its meeting, the time and place where the indictment was found, and the number of the jurors who found it, though their names need not be mentioned. When the indictment is removed into a higher court (see Certiorari) it is said that there must be enough in the caption to show that the inferior court had jurisdiction in the case. See Francis Wharton's *Criminal Law*; James Bassett's *Criminal Pleading and Practice*; and John F. Archbold's *Criminal Pleading and Evidence*, where useful forms of captions are given.

Revised by F. Sturges Allen.

Capture: See International Law.

Cap'ua (in Gr. **Καπύη**): an important city of ancient Italy; capital of Campania; situated on a plain about 2 miles from the river Vulturnus; about 18 miles N. of Naples (see map of Italy, ref. 6–F). It is supposed to have been founded by the Etruscans, who called it *Vulturnum*. It was probably nearly as ancient as Rome itself. Capua was the greatest and most opulent city of Italy about 350 B. C. It was conquered by the Romans in 340 B. C., but it continued to prosper under the Roman power, and in the time of the second Punic war was scarcely inferior to the great cities of Rome and Carthage. Capua was noted for its luxury and refinement. After Hannibal had defeated the Roman army at Cannæ in 216 B. C., the popular party of Capua, in hopes of rendering their city independent of Rome, opened their gates to the Carthaginians, who spent the winter in Capua and became enervated by its luxury. The Romans, having besieged the city and captured it in 211, punished its revolt with severity, nullified its political importance, and reduced it to the condition of a provincial town of the most degraded class. It continued, however, to be a popular city for several centuries, but it was taken and ruined in 456 A. D. by Genseric the Vandal. The site is now partly occupied by a town called Santa Maria di Capua, with 20,058 inhabitants. Here are visible the remains of a grand amphitheater.

Capua (anc. *Casilinum*): a city of Italy; province of Caserta; beautifully situated on the river Volturno, 27 miles by rail N. of Naples (see map of Italy, ref. 6–F). It is on the railway which connects Naples with Rome, and is a military station of the first class. It was considered one of the keys of the former kingdom of Naples. Capua contains a remarkable old cathedral, a college, and several convents. It was founded on the site of *Casilinum*, 2 or 3 miles E. of the ancient Capua, in 856 A. D. Pop. 13,860.

Capuchin' Friars [capuchin is viâ Fr. from Ital. *capucchino*, deriv. of *capuccio*, hood, deriv. of *cappa*; Span. *capa* (from which Eng. *cape*) < Lat. *cappa*, a head-covering]: a branch of the order of Franciscan monks which originated with Matteo di Basso, an Observantine Franciscan in the convent of Montefaleo, in Urbino, Italy, in 1525. They are the third of the chief branches of the Franciscans, the other two being the Observantines and the Conventuals. They are very strict in discipline; are committed to the most absolute poverty; and have rendered distinguished service upon the mission field. They spread with extraordinary rapidity, and reached their greatest extent in 1775, when they numbered over 31,000. Owing to political measures of suppression in many countries and the general decline in zeal for monasticism, they now number only some 8,000. They have a few convents in the U. S. At first they did not cultivate learning, but since the opening of the seventeenth century they have done so; yet there are few eminent names among them. Two persons of note in Church history were Capuchins, Bernardino Ochino (*q. v.*), twice elected vicar-general of the order; famous orator; became a Protestant at the age of fifty-six (1542); and Father Theobald Mathew (*q. v.*), the distinguished advocate of total abstinence. There is also an order of Capuchin nuns who are Franciscans of the strictest observance. It was founded in 1538 at Naples by Maria Laurentia Longa. They are properly Clares. Samuel Macauley Jackson.

Capuchin-monkey: a South American monkey (*Cebus capucinus*), which receives its name from the cowl-like appearance of the hairy covering of its head. Other species of the genus bear the same name.

Capudan' Pasha [capudan is a corruption of Ital. *capita'no*, captain]: the high admiral or commander-in-chief of the Turkish navy. He has the control of all naval affairs, appoints all the officers of the navy, and is governor of the Turkish islands in the Archipelago.

Ca'put Mor'tuum [Lat., dead head]: the inert residue of distillation and sublimation. When sulphate of iron is distilled at a red heat, it leaves a residue of red oxide of iron, which the alchemists called *caput mortuum vitrioli*. Its symbol was a death's head and cross-bones; hence *caput mortuum* signified also a "bugbear," a source of groundless terror.

Capyba'ra, or **Capiba'ra**, known also as the **Water Cavy**: the largest known quadruped (*Hydrochœrus capybara*) of the order *Rodentia*, and family *Caviidæ*. It is an aquatic animal, a native of South America, and feeds on vegetable food exclusively. Its dentition resembles that of the cavy, except that the grinding teeth are formed of many transverse plates, the number of plates increasing as the animal advances in age. It is inoffensive and easily tamed. The flesh is esteemed good food. It is somewhat smaller than the common hog.

Capybara.

Caquetá River: See Japurá.

Car: a vehicle for transporting freight or passengers, and usually running on wheels. Reference may be made to Railway Equipment for information concerning railway cars. As special kinds may be mentioned *push-cars*, *hand-cars*, *dump-cars*, *wrecking-cars*, *logging-cars*, etc. A velocipede-car for the use of foremen of railway sections has also been devised. Mine-cars for transporting ore and coal are sometimes made entirely of iron or steel. For the *motor-cars* of Electric Railways, see that article. Mansfield Merriman.

Velocipede-car.

Carabaño, kăă-răă-baan yō, Francisco: Venezuelan general; b. in Cumaná, 1783. He took an early and active part in the revolution of 1810, until 1814, when he was captured and sent to Spain. Returning in 1822, he was employed in various military and civil capacities; was elected to Congress in 1829, and in 1830 became Minister of War. In 1835 he was a leader of the attempted revolution called *de las reformas*, and on its failure in 1836 was banished. In 1844 he returned and was made commandant at Cumaná, where he was assassinated, Aug. 19, 1848. Herbert H. Smith.

Carabaya, or **Caravaya**: an eastern province of Peru; in the department of Puno; area, 12,000 sq. miles; pop. about 15,000, besides wild Indians. The Andes form the western frontier, with an eastern branch which divides the province into two parts; the mountains fall steeply to the Amazonian plains, which are covered with heavy forest extending far up the slopes; the climate is very moist and rainy, and warm in the plains. Carabaya was settled about 1543 by fugitives from the army of the younger Almagro; gold was discovered by them, and for two centuries this was one of the richest mining regions in South America, with several flourishing towns (Sandia, San Gaban, San Juan del Oro, and others). In 1767 these cities were destroyed by the Chuncho Indians, and even their sites are now unknown; not a single white man was left east of the mountains. The mines have remained abandoned, owing to the difficulty of communication, but the region is known to be very rich in gold, copper, and other metals, as well as forest products. The principal product at present is cinchona.

Herbert H. Smith.

Carab'idæ: a family of coleopterous or beetle-like insects, equivalent to the Linnæan genus *Carabus*. Its species are very numerous and of various habits. Most of them are voracious devourers of other insects and of worms; the larvæ have similar propensities. Some of them are more

than an inch in length, and with rather long legs, used in pursuing their prey. A few species have only rudimentary wings. Several have considerable beauty of color and luster.

Carabo'bo: a plain a few miles S. of the city of Valencia, Venezuela, on the western side of the river Paito; two roads cross on it. It is memorable for two great victories won by Bolivar. The first was on May 28, 1814, when with 5,000 men he completely routed 6,000 Spaniards under Captain-General Cajigal. The second was on June 25, 1821. The Spaniards had been reduced and discouraged by defeat, and their remaining army of 5,000 men, under La Torre, was stationed in the plain, the passes into it being difficult and strongly defended. Bolivar, advancing from Tinaquillo with 6,000 veteran troops, forced the passes and defeated La Torre, destroying or capturing most of his army. The brunt of the battle was born by the battalion of English volunteers under Col. Ferrier. This victory ended the Spanish domination in Venezuela, and insured the independence of Colombia and Ecuador. HERBERT H. SMITH.

Carabobo: the smallest state of Venezuela; on the northern coast; bounded N. by the Caribbean Sea, E. by Miranda, S. by Zamora, and W. by Lara. Area, 2,984 sq. miles. Pop. (1891) 198,021. Capital and principal city, Valencia. The coast-range mountains which cross it are interspersed with beautiful and fertile valleys, and agriculture is almost the only industry. The principal products are coffee, cacao, and sugar. Puerto Cabello is an important port, and Montalban, Nirgua, and Ocumare are thriving towns.

HERBERT H. SMITH.

Car'acal (*Lynx caracal*): a species of lynx found in the warm parts of Asia and in Africa, supposed to be the same animal as that which the ancients called lynx. It is larger than a fox, and is powerful enough to kill a hound

Caracal.

with ease. The fur of the upper part is of a deep brown or wine red, its ears being tufted with long black hair. It is naturally fierce, but is capable of being tamed, and has been employed in hunting.

Caracal'la, MARCUS AURELIUS ANTONINUS BASSIANUS: a Roman emperor; son of Septimius Severus; b. at Lyons in 188 A. D. On the death of his father, in 211 A. D., he ascended the throne, and caused his brother Geta to be murdered. He also massacred several thousand friends of Geta, including Papinian, the great jurist. His reign was disgraced by many acts of cruelty and infamy. He was assassinated near Edessa in 217 A. D., at the instigation of Macrinus, who became his successor. The baths of Caracalla are among the most striking ruins of Rome.

Caraca'ra, or **Caracara Eagle**: a rapacious bird of the genus *Polyborus*; peculiar to America; resembling in habit both the American vulture and the buzzard. The *Polyborus brasiliensis*, which is found in Brazil and other parts of America, has fine plumage, and measures about 4 feet from tip to tip of the wings. *Polyborus tharus* is common throughout South America, and is found as far north as Texas and Florida. Its principal food is carrion, yet it will attack new-born lambs, a fact which makes it much dreaded on the sheep-ranges of South America. Other species are known. Revised by D. S. JORDAN.

Caracas, kăă-raa'kas: capital of the republic of Venezuela; situated 12 miles S. of La Guayra, and nearly 3,000 feet above the level of the sea; lat. 10° 30′ 50″ N., lon. 67° 5′ W. (see map of South America, ref. 1–D). It is separated from La Guayra, its seaport, by a high mountain-range. It is liberally supplied with water by several streams which run through or near the city. The streets are narrow, straight, and well paved. Among the principal edifices are the cathedral and the Church of Alta Gracia. Caracas is the seat of a Roman Catholic archbishop, and contains a college and several hospitals. The climate is healthy, but the place is subject to earthquakes, one of which in 1812 destroyed about 12,000 people. The chief articles of export are cacao, cotton, indigo, coffee, hides, etc. Pop. (1881) 55,-638; (1888) 70,466. Caracas is in a "federal district," having an area of 45 sq. miles and a total population of 71,399. This district is surrounded by the state of Guzman Blanco.

Caracci, kăă-raat'chĕe, or **Carracci**, AGOSTINO: brother of Annibal Caracci; b. in Bologna in 1558; d. in Parma, 1602; assisted Annibal in his Farnese work; was an engraver of high merit; painted the *Communion of St. Jerome*, now in Bologna; had literary tastes.

Caracci, ANNIBAL, or ANNIBALE: painter; b. in Bologna in 1560. He was a pupil of his cousin, Ludovico Caracci, with whom he was associated as a founder of the Bolognese school of painting. The pictures which he painted in the Farnese Gallery in Rome, on which he expended eight years, are considered his best works. His *Three Maries* is in Castle Howard, England. He is generally regarded as the greatest painter of the Caracci family. D. at Rome in 1609. See Kugler's *Schools of Painting in Italy*.

Caracci, or **Carracci**, LUDOVICO: founder of the Bolognese school of painting; son of a butcher of Bologna; b. in 1555. Among his works are a *Transfiguration*, *The Preaching of John the Baptist*, and some *Madonnas*, all to be seen in Bologna. He was the founder of a school of painting known as Eclectic, which became famous for its adherence to nature and freedom from traditional methods; most famous as a teacher. He had several eminent pupils, including Domenichino and Guido Reni. D. in 1619.

Caraccioli, kăă-răăt-chiō'lĕe, CARMINE NICOLAS: a Neapolitan nobleman; fifth Prince of Santo Bono; lived in the latter part of the seventeenth century and the first of the eighteenth, and held high offices in Spain, to which Naples was then attached. From Oct. 5, 1716, to Jan. 26, 1720, he was Viceroy of Peru. H. H. S.

Caraccioli, FRANCESCO, Prince: admiral; b. in Naples in 1752. He entered the service of the Parthenopian republic formed at Naples in 1798, and obtained the command of a small fleet. He repulsed the Anglo-Sicilian fleet in 1799. After Naples had surrendered to the royalists, he was arrested and hung by the order of Lord Nelson June 29, 1799. See J. C. Jeaffreson's *Lady Hamilton and Lord Nelson* (1888).

Car'acole [Fr., deriv. of *caracol*, snail]: in horsemanship or the *manège*, a semi-round or half-turn. When cavalry advance to charge in battle they sometimes perform caracoles in order to perplex the enemy, and excite a doubt whether they will attack the flank or the front.

Carac'tacus, or **Cara'doc**: King of the Silures, a tribe of ancient Britons who lived in Wales. He resisted the Roman invading armies for nine years, but was at length defeated by Ostorius on the border of South Wales; fled to Cartismandua, Queen of the Brigantes, who betrayed him; was carried a captive to Rome in 51 A. D., where, according to tradition, he died in 54. His deportment in the presence of the Emperor Claudius was admired by the Romans, who treated him with clemency.

Carafa de Colobrano, kăă-raa'fa-dā-kō-lō-braa'nō, MICHELE: musician and composer; b. in Naples, Nov. 28, 1785. He became a resident of Paris about 1821. Among his works are operas entitled *Il Sonnambulo* and *Massaniello*. D. July 26, 1872.

Caraffa, GIOVANNI PIETRO: pope. See PAUL IV.

Caraites: See KARAITES.

Car'alis, or **Calaris**: the capital or chief town of ancient Sardinia; is said to have been founded by the Carthaginians

before the second Punic war. It had a good port, and was for many centuries an important place. The site of it is now occupied by Cagliari.

Carambo'la: an East India fruit produced by the *Averrhoa carambola*; a small evergreen tree of the family *Geraniaceæ*. The fruit is about as large as a hen's egg, and has five longitudinal ribs, with a thin, smooth, yellow rind. The pulp has an agreeable flavor (sweet or acid), and is used in making sherbets, tarts, etc. It is one of the most generally cultivated fruits in India, and is sometimes called Coromandel gooseberry. The tree has irritable or sensitive leaves, and exhibits in a remarkable degree the phenomenon called sleep of plants. The acid fruit called *bilimbi* grows on another species of *Averrhoa*.

Car'amel [viâ Fr. from Span. *caramelo*; etym. uncertain]: the dark-brown substance produced by burning sugar or exposing it to a great heat. It is also formed in the process of roasting coffee and malt. It is used to color wine and to adulterate coffee. Caramel is also a sort of confectionery.

Caramurú, or **Alvares Coelho**, Diogo: best known by the first of these, which was his Indian name; a Portuguese; in 1510 was shipwrecked on the coast of Brazil, near Bahia. His companions were killed, and, it is said, eaten by the Tupinambá Indians. There is a legend that Alvares awed them by killing a bird with a gun which he had saved; it is certain that he gained their respect and friendship, married the daughter of a chief, and lived among these savages as one of them for many years. When Bahia was settled by the Portuguese, Caramurú was the means of establishing friendly relations between them and the Indians, and he was greatly respected by both. D. near Bahia, Oct. 5, 1557. H. H. Smith.

Cara'pa: a genus of plants of the family *Meliaceæ*; natives of warm climates. *Carapa guianensis* is a large tree called anderaba, which grows in Guiana, and has large pinnate leaves. Its bark is reputed a valuable febrifuge, and is used in tanning. Masts of ships are made of the trunks. Lamp oil is obtained from the seeds of this tree, and from those of the *Carapa guineensis*, which is a native of Guinea. Its oil is used to protect the bodies of the natives from the bites of insects.

Car'apace [viâ Fr. from Span. *carapacho*; etym. uncertain]: the upper shell or dorsal shield of chelonian reptiles (turtles and tortoises) and of the *Crustacea Malacostraca* (crabs and lobsters). In the *Chelonia* it is chiefly an expansion of the ribs covered by a thick layer of horny substance. The latter is most peculiar in the hawk's-bill turtle, furnishing the tortoise-shell of commerce.

Caraquette, Lower: a port of entry in Gloucester co., New Brunswick; has a good harbor and extensive fisheries (see map of Quebec, ref. 3–I).—The settlement of Upper Caraquette is in the same parish. Pop. 1,000.

Carasco'sa, Michele: b. in Sicily; an officer successively in the armies of King Ferdinand, the Neapolitan republic, King Joseph, and Joachim Murat; signed the convention of Casalanza; was made Minister of War; placed himself at the head of the revolution; was defeated; fled to London, and fell there in a duel. His *Mémoires sur la Révolution de Naples en 1821* appeared in London in 1823.

Carat [Fr. *carat* from Ital. *carato* < Lat. *ceration* = Gr. κεράτιον, little horn (κέρας), a measure of weight. The Span. and Portug. forms *quilate*, *quirate*, come from the Gr. viâ the Arab. *qīrā't*]: a unit of weight used by jewelers in weighing gold and precious stones. For diamonds a carat is $3\frac{1}{6}$ troy grains, a "carat grain" being one-fourth of this. In assaying gold the term is equivalent to "$\frac{1}{24}$ part," and is used to designate the proportion of pure gold in an alloy with another metal or metals. That which contains $\frac{22}{24}$ of gold is said to be "22 carats fine." Eighteen-carat gold contains 18 parts of pure gold and 6 parts of alloy, while 14-carat gold contains $\frac{14}{24}$ of pure gold and $\frac{10}{24}$ of alloy. There is here no absolute designation of weight.

Carau'sius: Emperor of Britain 286–294 A. D.; a native of what is now the Netherlands; invited by the Britons to become their ruler, where he successfully resisted the Romans. He maintained himself for seven years as sovereign of Britain and of a maritime confederacy at the mouth of the Rhine, waging wars against the Romans on one side and the Scots and Picts on the other, and executed many important public works, traces of which still exist. He was assassinated at York by his minister Allectus in 294 A. D.

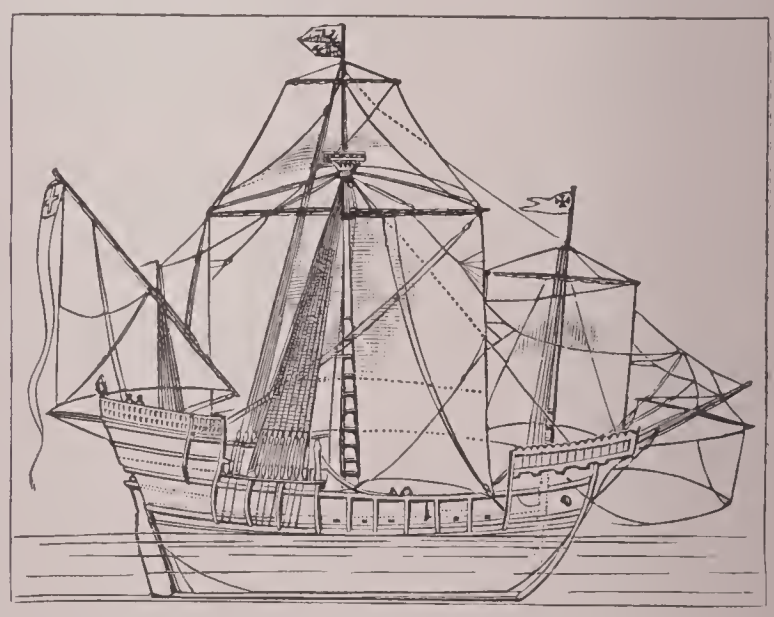
Caravaca, kă-ră-vaa'kă: a town of Spain; province of Murcia; on the slope of a hill 40 miles N. W. of Murcia (see map of Spain, ref. 18–H). It has an old castle, a college, and a fine church. Excellent wine is produced in the neighborhood. Pop. 15,017.

Caravaggio, kă-ră-vaad'jiō, Michael Angelo, da: an Italian painter; b. at Caravaggio in 1569. His proper name was Michael Angelo Amerighi (or Morigi). He imitated no model except nature, and formed an original style; lived a turbulent life; painted scenes from the lanes and alleys of a wild and gloomy nature; was effective and excelled in chiaro-oscuro and coloring. Among his masterpieces are a *Supper at Emmaus*, in the National Gallery, London, *The Fraudulent Gamblers*, in the Sciarra Gallery, Rome, and a *Burial of Christ*. D. near Rome of wounds and fever in 1609.

Caravan [from Pers. *kārwān*]: a company of merchants or pilgrims who associate together in order to traverse with greater security the deserts of Africa and Asia. The commercial intercourse of those regions has been from the remotest ages carried on chiefly by caravans of camels. In Mohammedan countries large caravans of pilgrims are annually assembled to perform the journey to Mecca. The most important regular caravans are those which annually travel to Mecca from the three following points—Damascus, Cairo, and Babylon.

Caravan'serai', or **Caravan'sary** [from Pers. *kārwān*, caravan + *sarāī*, inn]: also called **Khan**: an Oriental public-house or unfurnished inn for the shelter and lodging of travelers in Asia and Africa. The travelers in those regions usually carry their own food with them. Each of these inns is commonly a square building of four wings built round a courtyard, in which the beasts of burden are confined. There is always a well or spring of water in it. The wings are divided into small lodging-rooms, in which the traveler finds no bed or furniture but that which he carries with him. In many caravanserais the hospitality is gratuitous, their erection being a work of pious charity. It was in the stable of one of them (called *inns* in the Bible) that our Saviour was born.

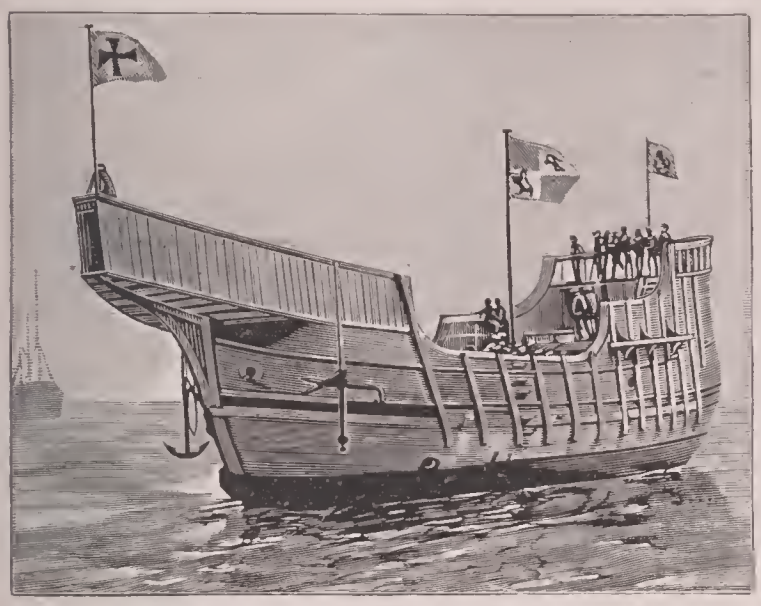
Caravel, or **Carvel** [Fr. *caravelle*; Span. *caravela*, or *carabela*, a caravel; Portug. *caravela*, deriv. of *caraba*: Mediæv. Lat. *carabus*, a kind of boat]: a vessel of from 100 to 150 tons, used by the Portuguese; a vessel of from 25 to 30 tons, used in Normandy and Picardy in the herring-fisheries. The mariners of Tunis and Algiers apply the same name to a frigate, and a large Turkish ship of war is also called a caravel (*garavela*). In the fifteenth and sixteenth centuries



The caravel Santa Maria.

a caravel was a galley-rigged bark, employed by the Spaniards and Portuguese for purposes of commerce and exploration, its lightness enabling it to run close to shore and to enter shallow harbors. The Portuguese made use of it in war, as well, on account of its swiftness and the ease with which it could be managed. The chief features of the caravel of that day, which was not unlike a Japanese trading-junk of the present time, were a single deck, a narrow and

very high stern, a broad bow, a cabin at stern and bow, three masts, lateen rigged, and a bowsprit. The vessels employed by Columbus in his different voyages were caravels, although one of the three, with which he made his first trip across the Atlantic, the Santa Maria, was, according to the nomenclature of that time, a carrack, being much larger than the average caravel. Late in the sixteenth century, however, it was customary to apply the term caravel to ships of large size. Reproductions of the vessels used by Columbus in 1492 were made in Spain in 1892, and played a very conspicuous part in the ceremonies attending the celebration of the discovery of America, both in the Old World and the New, and were an attractive feature of the World's Co-



The caravel Santa Maria (unrigged).

lumbian Exposition in 1893. The Santa Maria was 75 feet from stem to stern, was about 14 feet amidships, and drew 4 ft. 10 in. of water. She was 26 ft. 10 in. high at the stern, and 16 feet high at the bow; her breadth of beam was 25 feet, and her tonnage was 125·57. Her mizzenmast had a decided rake aft, her foremast a corresponding rake forward. Upon all three masts sails were bent to crossyards. Her mizzen rig resembled a lateen sail, and she carried a small triangular sail under her bowsprit. She had a double forecastle deck and a double deck aft. The Pinta, which closely resembled the flagship, was 52 feet long on her keel, 65 feet on her main deck, and had 23 feet breadth of beam; displacement, about 100 tons. The Niña was 46 feet long on her keel, 50 feet long on her main deck; her breadth of beam was 18 feet; all her sails were lateen.

Caraway [from Arab. *al-karawiyā*]: a plant (*Carum carui*) of the order *Umbelliferæ*; grows wild in Southern Europe and in some parts of Asia. It is cultivated in Europe and America for its aromatic seeds (carpels), which are used in medicine as a carminative and tonic. They are also used as a condiment by confectioners, pastry-cooks, and perfumers. Their aromatic principles depend on a volatile oil called oil of caraway, which is obtained by distilling the crushed seeds with water.

Carbajál, or **Carvajál**, Francisco, de: a Spanish soldier; b. of obscure parents at Aravalo, 1464. He served for forty years as a common soldier and subaltern in the Italian wars. At the sack of Rome (1527) he obtained some papers of value, and with the proceeds of their sale went to Mexico. Sent with others to aid Pizarro in Peru (1537), he speedily became known as one of the most skillful leaders there, and also the most cruel. For his services against Amalgro he received rich grants near Cuzco. As field-marshal under Vaca de Castro, he directed the battle of Chupas, in which the younger Almagro was overthrown (Sept. 16, 1542). Joining the revolt of Gonzalo Pizarro, he reduced Lima to submission (1544), and aided in the pursuit of the viceroy Vela to Quito. Pizarro then sent him against Centeno, who had declared for the viceroy in the south. He chased that leader for 200 leagues through the Collao, utterly scattered his army, and drove him to concealment (1546). Carbajál, though over eighty years old, showed such terrible energy and such remorseless cruelty in this pursuit that he nearly caused a revolt of his own soldiers. In the campaign of the succeeding year Carbajál's musketeers decided the second defeat of Centeno at Huarina (Oct. 26, 1547), and, as usual, he hung all the fugitives he could find, enlivening the proceedings with ghastly jokes. Faithful to Pizarro until the last, he was captured while trying to escape from the disastrous field of Caxiguana (Apr. 8, 1548), and was executed with his leader next day. He died with a joke on his lips.

Herbert H. Smith.

Carbine, or **Carabine**: See Small-arms.

Car'bo, Cneius Papirius: a Roman general who was elected consul in 86 B. C.; was a partisan of Marius in the civil war that ensued; commanded in a battle against Sulla at Clusium; soon after that event was defeated by Metellus at Faventia. Having fled to Africa, he was taken prisoner and put to death in 82 B. C.

Carbohy'drates: a large class of compounds consisting of carbon combined with hydrogen and oxygen, which elements are present in the same proportions as in water. They are classified under three heads:

1. *The Glucose Group*, which includes glucose, or grape-sugar, levulose, or fruit-sugar, and galactose. These substances have the composition $C_6H_{12}O_6$.

2. *The Cane-sugar Group*, including cane-sugar, sugar of milk, or lactose, and maltose. These sugars have the composition $C_{12}H_{22}O_{11}$.

3. *The Cellulose Group*, the principal members of which are cellulose and starch. The composition of these compounds is represented by the formula $C_6H_{10}O_5$.

The carbohydrates are among the most widely distributed and important compounds in the vegetable kingdom. Tollens has proposed to apply the name carbohydrate to all substances that show the following reactions: 1. Reduction of alkaline metallic solutions; 2. Rotation of polarized light; 3. Subject to alcoholic fermentation by yeast; 4. Formation of levulinic acid; 5. Formation of characteristic compounds with phenylhydrazine; 6. Certain color reactions; 7. Solubility, either before or after hydrolysis; 8. Decomposition by heat.

Recently some substances have been prepared that are plainly of the same kind as the natural carbohydrates, and these do not belong to any one of the three groups above given, and do not show all the reactions named; and it has been proposed to extend the term carbohydrate to include these new substances. Whether they be called carbohydrates or not, it is now known that they are related to the members of the glucose group in a very simple way. They have the general formula $C_nH_{2n}O_n$ with the common properties: 1. Sweet to the taste; 2. Optically active; 3. Reducing alkaline metallic solutions; 4. Yielding with phenylhydrazine characteristic crystalline compounds. Those containing three, or multiples of three, carbon atoms undergo alcoholic fermentation with yeast. The principal members are:

Triose, $C_3H_6O_3$ (glycerose); tetrose, $C_4H_8O_4$ (erythrose); pentose, $C_5H_{10}O_5$ (arabinose, xylose); hexose, $C_6H_{12}O_6$ (dextrose, levulose, galactose, mannose); heptose, $C_7H_{14}O_7$; octose, $C_8H_{16}O_8$; nonose, $C_9H_{18}O_9$.

Ira Remsen.

Carbolic Acid, called also **Phenic Acid**, **Carbol**, and **Phenol**: This derivative of coal-tar (C_6H_5OH.), obtained by distillation, is extensively employed as a disinfectant and germicide, for which purposes it is one of the most efficient agents used. It does not, however, act at all through the atmosphere, and it is essential that it be brought in direct contact with the body to be disinfected. It is also necessary that the solution of it be not less than 1 per cent., and for this strength of solution to act the contact must be maintained for many hours; ordinarily the solution of 5 per cent. should be employed, though the strength of the solution may be weaker than this when a prolonged immersion of the object is obtainable.

Carbolic acid acts upon the human system as an exceedingly powerful and quick poison. When in sufficient concentration it kills all tissue, so that it may paralyze the respiratory centers and the heart at once. Death has been produced by it in less than three minutes. The symptoms are violent burning pain in the œsophagus and stomach, with vomiting, stupor, distress of breathing, widespread paralysis, and finally complete unconsciousness and collapse. Sometimes there are convulsions. In the rapid cases unconsciousness and collapse occur immediately. In slow cases of poisoning, especially after the external use of carbolic acid, the urine becomes dark and may have the odor of the acid. Diluted sulphuric acid and soluble innocuous sulphates, such as the sulphate of sodium, are very efficient antidotes to carbolic acid. They have the power not only of neutralizing the acid in the gastro-intestinal tract before absorption, but of follow-

ing the poison into the blood and general tissues of the body, and there converting it into a harmless sulpho-carbolic acid. They therefore should be administered freely at any stage of the poisoning at which the patient is first seen. Half an ounce of carbolic acid taken by the mouth has caused death, while the free external use of the agent in surgery has sacrificed many victims. In internal medicine carbolic acid is of very little use, save only for its benumbing influence upon the gastro-intestinal nerves, and to check fermentation in the gastro-intestinal tract.

H. C. Wood.

Carbon [from Lat. *car'bo, -o'nis*, coal]: one of the elementary forms of matter. Its symbol is C, and its atomic weight 12. It is the principal constituent of all plants and animals, in which it occurs in a great variety of forms of combination. Among the most abundant natural substances of which it forms a part are cellulose, starch, sugar, the fats, albumin, fibrin, etc. It is also found in immense quantities in the solid portions of the earth in the forms of carbonates, of which limestone, chalk, and marble are the most common varieties. In the atmosphere of the earth it is present principally as carbon dioxide, which is commonly called carbonic acid; and this gas is also found dissolved in all natural waters. The different varieties of coal consist largely of carbon, the proportion of this element being largest in the hard coals. Further, carbon is the principal constituent of petroleum.

Carbon occurs in nature crystallized in two forms, diamond and graphite or plumbago. There are therefore three forms of the element, (1) diamond, (2) graphite, and (3) amorphous carbon, or charcoal. Of these, diamond is the purest. All three forms, though they differ so markedly from one another in some respects, have certain properties in common. They are all insoluble in all the ordinary solvents; they are all infusible; and all are converted into carbon dioxide, CO_2, when heated to a high temperature in air or oxygen. Lampblack, coke, and charcoal are impure forms of carbon. Lampblack is deposited from flames of burning oil; coke is formed when coal is heated so that it is protected from the air, as in the manufacture of gas; and charcoal is made by heating wood in kilns by which the action of the air is prevented, except so far as may be necessary to keep up slow burning.

Chemically carbon most resembles silicon, which is one of the most important constituents of the inorganic or inanimate portion of the earth. Ira Remsen.

Carbon: town; Carbon co., Wy. (for location of county, see map of Wyoming, ref. 11–J); on Un. Pac. R. R.; 140 miles N. W. of Cheyenne. The chief industry is agriculture. Pop. (1880) 365; (1890) 1,140; (1900) 634.

Carbona'ri [Ital., charcoal-burners]: a secret political society; founded during the French rule in Naples in the beginning of the nineteenth century. After the restoration of the Bourbons in Naples the society rapidly increased. In 1820 they organized branches in France, and after the defeat of the revolutionary party in Naples and Piedmont, Paris became their headquarters. After the revolution of 1830 the society disappeared, although as late as 1841 a society of Carbonari was found to exist in Southern France. In the revolution of 1848 they took no part.

Carbonated (or **Acidulous**) **Waters**: those waters which contain a large portion of carbonic acid gas. The term is applied to mineral springs, as those of Seltzer, Vichy, Pyrmont, Salzbrunn, Reinerz, Saratoga, etc. Such waters sparkle much when poured from one vessel to another. They are refreshing and exhilarating, and are useful in some disordered states of the stomach. See Mineral Water.

Carbonates: salts of Carbonic Acid (*q. v.*).

Carbon Bisulphide, or **Disulphide**: a heavy, clear liquid compound of carbon and sulphur; very volatile and very inflammable; obtained by passing the vapor of sulphur over red-hot charcoal. Its composition is expressed by the formula CS_2. While swallowed or inhaled it produces serious symptoms of poisoning, which may end fatally. It has great solvent power, and is largely used in chemistry and the arts as a solvent of caoutchouc and other organic matters, particularly for extracting oils from seeds and other substances. It has recently been used in boilers as a substitute for water in working engines. In contact with alcohol and potassic hydrate it produces potassic xanthate, which has been extensively used to destroy phylloxera. This compound is a sulphur acid, and when combined with sulphur bases it produces compounds of the class known as sulphocarbonates.

Car'bondale: city (founded in 1852); Jackson co., Ill. (for location of county, see map of Illinois, ref. 10–E); on Ill. Cent., Cairo Short Line and Grand Tower and Carb. R. Rs.; 57 miles N. of Cairo, 91 miles from St. Louis. Here are the Southern Illinois Normal University, 5 public schools, and 8 churches (4 colored). The principal industries are farming, fruit-growing, stock-raising, lumbering, and coal-mining. Pop. (1880) 2,213; (1890) 2,382; (1900) 3,318.

Editor of "Republican Free Press."

Carbondale: a city and railroad junction, Osage co., Kan. (for location of county, see map of Kansas, ref. 6–I); 67 miles S. W. from Atchison. It has extensive mines of coal. Pop. (1880) 710; (1890) 847; (1900) 625.

Carbondale: a city and railroad center of Lackawanna co., Pa. (for location of county, see map of Pennsylvania, ref. 3–I); settled in 1824, on the Lackawanna river. Principal industry, mining and preparing anthracite coal. The city has machine and car shops, foundries, grist-mills, wood-working factories, an electric street-railway system connecting it with the suburban villages, excellent waterworks, gas-works, electric lights, etc. It has fine mountain scenery and is a summer resort. Pop. (1880) 7,714; (1890) 10,833; (1900) 13,536. Editor of "Leader."

Carbone'ar: a town of Newfoundland; a port of entry on Conception Bay; 4 miles N. of Harbor Grace. Pop. 3,756.

Carbon'ic Acid: a name commonly given to the oxide of carbon of the formula CO_2, which is called *carbon dioxide* by chemists. Its occurrence in nature is referred to in the article on Carbon (*q. v.*). It is constantly formed by a number of natural processes, as combustion, respiration, and fermentation. All substances used for fuel contain carbon as one of the chief constituents, and when they are burned the carbon combines with the oxygen of the air to form carbon dioxide. In the process of respiration waste-products are exposed in the lungs to the action of the oxygen of the air, and they are burnt up very much as if they were put into a stove, the carbon contained in these waste-products being converted into carbon dioxide and given off from the lungs. There are many kinds of fermentation, this name being used to designate changes brought about by the action of minute organisms. One of the best-known kinds of fermentation is that by which sugar is changed to alcohol and carbon dioxide. This fermentation takes place naturally, and gives rise to the formation of large quantities of carbon dioxide. In 10,000 parts of the earth's atmosphere there are about 3 parts of carbon dioxide. Notwithstanding the fact that such large quantities of the gas are constantly being introduced into the air, the relative quantity remains practically constant. This is due to the fact that all plants make use of carbon dioxide as food, decomposing it, and building up from it the complicated compounds which form their tissues.

Carbon dioxide is a colorless gas, about half again as heavy as ordinary air. It has a slight taste and slight odor. In it the process of burning can not take place, nor can the process of breathing.

Carbon dioxide is easily made by bringing together limestone, marble, or any other carbonate, and hydrochloric or sulphuric acid. In general terms any carbonate gives off carbon dioxide when brought together with an acid.

At a low temperature and under high pressure the gas is liquefied, and when the vessel containing the liquid is opened at the ordinary temperature a part of that which escapes becomes solid, owing to the great absorption of heat caused by the conversion of a part of the liquid into gas.

Carbon dioxide dissolves in water at the ordinary temperature and under the ordinary atmospheric pressure to the extent of one volume of gas to one volume of water. Under higher pressure the amount which can be dissolved is much greater, and when the pressure is removed a large part of the gas escapes. The effervescent waters which occur in nature, and which are manufactured, owe their effervescence to the presence of carbon dioxide. This is true also of beers, champagne, and other similar beverages.

Liquid carbon dioxide is now obtainable in the market, and is used as a fire-extinguisher and for the purpose of giving life to beer.

It is frequently stated that the bad effects caused by breathing the air of badly ventilated rooms are due to the

presence of carbon dioxide. It has, however, been shown that air containing pure carbon dioxide to the extent of 5 per cent. can be breathed with impunity. The gases given off from the lungs contain volatile organic substances which are undergoing decomposition, and these are poisonous. If taken back into the lungs, bad effects follow.

All life on the earth is dependent upon the presence of carbon dioxide in the air; for all animals, either directly or indirectly, depend upon plants for food, and all plants in turn depend upon carbon dioxide. See CHOKE DAMP.

IRA REMSEN.

Carbonic Oxide, more commonly called **Carbon Monoxide**: a compound (CO) formed when carbon dioxide comes in contact with highly heated coal. It is therefore formed in the interior of every coal fire. It burns with a blue flame, and it is this flame that is always seen at the surface of a hard coal fire, as the carbon monoxide formed in the interior burns to carbon dioxide when it reaches the surface of the coal and finds air with which it can combine. It is a colorless gas of specific gravity ·967. It is extremely poisonous. It is contained in large quantity in the so-called water-gas, now so extensively used for illumination. It is therefore very important that the gas should not be allowed to escape into rooms occupied by human beings. As is well known, deaths have been caused not infrequently by the inhalation of illuminating gas. It should be said in this connection that ordinary coal gas is also poisonous. As has been said, carbon monoxide is produced in anthracite stoves and furnaces, and it is sometimes the cause of death in sleeping-rooms when the fire is checked by closing the damper between the fire and the chimney. This gas does not perform any active part in natural phenomena, but in the reduction of ores, as in the blast furnace, it is of the greatest importance. IRA REMSEN.

Carbonif'erous Period: a division of geologic time, preceded by the Devonian period, followed by the Jura-Trias. The name (literally "coal-bearing," from the Latin *carbo*, coal, and *fero*, bear) originated in Great Britain, where the coal-bearing strata belong to this period, but may also be applied in its etymologic sense in the eastern part of North America. In western North America and in all other parts of the earth rocks of carboniferous age contain little or no coal, and such rocks as do afford coal belong to later periods. During the earlier half of the period the greater part of the U. S. seems to have been covered by the ocean, but the extent of submersion afterward diminished, and at the close of the period all E. of the Great Plains was probably dry land.

The coal-bearing series of strata known as the coal-measures constitute the upper portion of the rock system in Nova Scotia, in Southern Michigan, and in three belts extending from Pennsylvania southwestward to Alabama, from Western Kentucky northwestward to Central Illinois, and from Eastern Nebraska southwestward to Texas. They consist of alternating shales and sandstones, for the most part formed in fresh water, with beds of coal, occasional strata of limestone, and bands of clay iron ore. Associated with the coal are fossil leaves, branches, trunks, roots, and even fruits, in great abundance, affording the most complete picture we have of a palæozoic forest. (See PLANTS, FOSSIL.) In Pennsylvania, and generally at the northeast, the series of rocks beneath the coal-measures are constituted of shales, sandstones, and conglomerates. Traced westward, they are found to undergo a gradual change in composition, and in the Mississippi basin consist chiefly of limestone. The underlying series have a larger area than the coal-measures, and serve to connect in a single great field the three belts mentioned above. In the far West limestone is the most abundant rock of the system, but there are also sandstones and shales, especially in the upper part. In the lower carboniferous limestones of Missouri and Kansas are important mines of zinc and lead, and many of the silver-lead ores of Montana, Idaho, Colorado, Utah, and Nevada are associated with limestones of this age. See COAL, COAL MEASURES, GEOLOGY, and PALEONTOLOGY. G. K. GILBERT.

Carbons: See ELECTRIC LIGHT.

Carborundum: See SILICIDE OF CARBON.

Carboy: a large globular bottle of green glass protected by basket-work or inclosed in a wooden box. Carboys are used to contain acids and other corrosive liquids. A carboy of sulphuric acid usually contains about 160 lb. of that acid.

Carbuncle [viâ O. Fr., from Lat. *carbun'culus*, a small coal, carbuncle stone, a tumor, dimin. of *car'bo*, coal]: a name applied by jewelers and lapidaries to certain kinds of fine red garnet, usually the *pyrope* and *almandine* varieties, when cut *en cabochon*, i. e. with a rounded convex surface. (See GARNET.) The carbuncle of the ancients seems to have been any transparent deep-red gem, whether garnet, ruby, or red spinel. Nearly all come from Siam, Pegu, India. They are also found in North Carolina, but generally are too defective for gems. Revised by G. F. KUNZ.

Carbuncle (for etymol., see above): the *anthrax* of surgical writers; a violent and painful inflammation, larger than a boil, on any part of the skin, most frequently on the back. The part swells and hardens, and, as the disease advances, assumes a livid redness. The cuticle often rises in blisters, and a number of small openings may occur, through which matter escapes. The origin of carbuncle seems to be constitutional, and it is usually attended by great suffering and considerable prostration. It is sometimes fatal, especially to old people. In its treatment, besides supporting the patient's strength and softening the skin by warm poultices, it is usual to divide the skin early and freely with a knife, or to destroy its surface with caustic.

Carcajente, kär-kä-*kh*en-tā': a town of Spain; province of Valencia; 22 miles by rail S. S. W. of Valencia (see map of Spain, ref. 17–I). It is on a fertile plain near the river Juncar, and is well built. Here are manufactures of linen and woolen fabrics. Pop. 12,102.

Carcassonne, kär-kas-sŭn' (anc. *Carcaso*): a city in the S. of France; capital of the department of Aude; on the river Aude and the Canal du Midi; 56 miles by rail E. S. E. of Toulouse (see map of France, ref. 9–F). The river is here crossed by a bridge of ten arches, and separates the old from the new town. The old town, which stands on high ground, is inclosed by walls of great solidity, has an ancient castle, and retains in a remarkable degree the aspect of a fortress of the Middle Ages. Carcassonne is the seat of a bishop, and has a cathedral, a town-hall, a theater, a public library with about 22,000 volumes, and a college. Here are extensive manufactures of fine woolen cloth, which have long been celebrated. This city suffered much in the crusades against the Albigenses. Pop. (1881) 27,512; (1886) 29,330; (1896) 29,298.

Carcel, or **Carcel-lamp**: a lamp burning vegetable oil (colza oil), the flame from which furnishes the standard of illumination employed in France. Uniformity of combustion is secured by means of a small pump driven by clockwork, which feeds the wick with oil. The standard carcel-lamp for photometric purposes consumes 42 grammes of oil in an hour, and should furnish a flame 40 mm. in height. See CANDLE; also PHOTOMETRY.

Carchi: a northern province of Ecuador; bounded N. and E. by Colombia, S. by Imbabura, and W. by Esmeraldas; area, 1,495 sq. miles; pop. (1890) 36,000; capital, Tulcan. It is mountainous, and is one of the poorest provinces in the republic; agriculture and grazing are the only industries. H. H. S.

Carcinoma: See CANCER.

Car'damom [from Gr. *καρδάμωμον*, name of the spice; *κάρδαμον*, a kind of cress + *ἄμωμον*, name of an Indian spice-plant]: the capsule and seed of several species of plants of the genera *Amomum* and *Elettaria* of the family *Scitamineæ*. The capsules are three-celled, and contain numerous seeds, which are aromatic and pungent, with a peculiar and agreeable taste. They are used as a condiment in Asia and Germany. Having mild cordial and stimulant properties, they are used in medicine and in combination with cathartics. The officinal cardamom of the U. S. and British Pharmacopœias is the seed of the *Elettaria cardamomum*, a native of India. The cardamoms of commerce are produced in India, Ceylon, Madagascar, and the Malayan Archipelago.

Car'dan (Ital. *Cardano*), JEROME: philosopher, author, and physician; b. in Pavia, Italy, Sept. 24, 1501; graduated as M. D at Padua in 1525, and became Professor of Mathematics at Milan. He also practiced medicine and acquired a wide reputation as a physician. In 1552 he visited Scotland and cured the primate of that country of asthma. He afterward resided successively at Pavia, Bologna, and Rome. He was an astrologer, and professed to be an adept in magical arts. In 1545 he published in his *Ars Magna* a formula for the solution of cubic equations, which is called "Cardan's Formula." He wrote numerous works on physics, astrology, medicine, astronomy, etc. Among them are *De*

Rerum Subtilitate (On the Subtilty of Things) and *De Rerum Varietate* (On the Variety of Things). D. in Rome, Sept. 2, 1576. See his autobiography, entitled *De Vita Propria* (1643); H. Morley's *Life of Jerome Cardan* (1854).

Cardboard is made by pasting and pressing together a number of layers of paper, making either three, four, six, or eight sheet boards. Bristol board, used by artists, is entirely of white paper; common cardboard is white on the outside only. Mill-board, employed in bookbinding, is composed of coarse brown paper, glued and pressed between iron rollers. The enameling of cardboard is effected by brushing over it a mixture of white lead (China or Kremnitz white) with size. After drying, the surface is lightly rubbed with flannel which has been dipped in powdered talc; it is then polished with a hard, fine brush.

Car'denas: a seaport-town on the north coast of Cuba. See the Appendix.

Cardenas, Fr. Bernardino: Peruvian ecclesiastic; b. in Chuquisaca, Charcas, about 1595. He entered the Franciscan order, and was a missionary to the Indians, imperiling his life among the wild Chunchos, and doing much to preserve peace with the whites. Made Bishop of Paraguay in 1640, he quarreled with the Jesuits, and was twice expelled. On the death of the governor Osorio, he was elected to fill his place (Feb., 1649), and at once drove the Jesuits from Asuncion. Deposed by the audience of Charcas, he refused to submit, and defeated a force sent against him, but was imprisoned and excommunicated in Oct., 1649. He was restored in 1662, and in 1666 made Bishop of Santa Cruz de la Sierra, where he died soon after. He wrote *Manuel y relacion de las Cosas del Reyno del Peru* (Madrid, 1634), a defense of his course. Herbert H. Smith.

Car'diac [from Gr. *καρδιακός*, pertaining to the heart, deriv. of *καρδία*, heart: Lat. *cor*, *cordis*: Eng. *heart* (approx.)]: belonging to the heart, or connected with or acting upon the heart. The "cardiac orifice" is the superior opening of the stomach.

Cardial'gia, or **Car'dialgy** [Gr. *καρδιαλγία* (Galen), heartburn; *καρδία*, heart + *ἄλγος*, pain]: literally, pain in the heart. The term is commonly applied, however, to the uneasiness (heartburn) connected with indigestion, the seat of which is really in the stomach, and which is called gastralgia. This painful affection may be of nervous origin—a form of neuralgia—or a clew to various organic diseases of the stomach. The pain comes on at various times, but usually when the stomach is empty, and may attain great severity.

Car'diff: a seaport-town of South Wales; capital of Glamorganshire; on the river Taff; 171 miles by rail W. of London (see map of England, ref. 12–F). It contains a town-hall, a fine old castle owned by the Marquis of Bute, a theater, and about thirty churches and chapels. Railways extend from this town to the mining districts of South Wales, the products of which are exported from Cardiff. It has a good harbor, improved by the construction of magnificent basins and docks. Coal and iron are the chief articles of export, and its coal exports exceed those of any port in the world. The Marquis of Bute owns enormous docks here. The opening of the canal from Merthyr Tydvil to the sea in 1796 has contributed much to the prosperity of the town. The cathedral city of Llandaff is a suburb, which is the see of an Anglican bishopric. The population has increased rapidly since 1870. Cardiff Castle, built in the eleventh century, is partly in ruins. Robert, Duke of Normandy, was confined in it about twenty-seven years by Henry I. Cromwell obtained possession of it in 1648 by stratagem, after he had bombarded it for three days. Pop. (1881) 85,378; (1891) 128,915; (1901) 163,844.

Car'digan: a seaport of South Wales; capital of Cardiganshire; on the river Teify; 240 miles by rail W. by N. from London (see map of England, ref. 11–C). It has an old and stately church, and the ruins of a castle which is supposed to have been founded in 1160. Romantic scenery is in the vicinity. Pop. 3,600.

Cardigan, James Thomas Brudenell, Earl of: an English general; b. Oct. 16, 1797; was obliged to leave the service when a lieutenant-colonel on account of bullying conduct toward a brother officer, but was restored to his rank; became known as a daring dragoon officer, and rose in India to be a major-general. At the battle of Balaklava Lord Cardigan led the famous charge of the "six hundred." D. Mar. 28, 1868.

Car'diganshire: a maritime county of South Wales; bounded N. by Merioneth, N. E. by Montgomery, E. by Radnor and Brecknock, S. by Carmarthen and Pembroke, and W. by Cardigan Bay. Area, 693 sq. miles. The surface is diversified with rugged hills, fertile valleys, and small lakes. The rocks which underlie this county are lower Silurian slates and shales, in which rich veins of copper, lead, and zinc occur. The chief articles of export are cattle, sheep, oats, barley, butter, slates, and pigs. Capital, Cardigan. Pop. (1881) 70,226; (1891) 63,467; (1901) 61,068.

Cardi'idæ: a family of lamellibranchiate bivalve mollusks; includes those species in which the mantle is open anteriorly for the foot, and has two orifices, one for respiration and the other for excretion, as the cockle (*Cardium edule*).

Cardim, P. Fernão: Portuguese Jesuit; b. at Vienna do Altivo, Alemtejo, 1540. He was sent to Brazil in 1599, and traveled over the known portion of the country. In 1601 he went to Rome as procurador of his order, and was there named provincial of Brazil; but on his return he was captured by English corsairs, and only released in 1604 on payment of a ransom. He then went to Brazil, where he was provincial until 1608, and subsequently rector of the Jesuit College at Bahia. He wrote *Narrativa epistolar de uma viagem e missão jesuitica pela Bahia*, etc., first published in 1847, and of great historical interest.

Herbert H. Smith.

Cardinal [subst. use of an adj. from Lat. *cardina'lis*, pertaining to a hinge, principal, deriv. of *car'do*, *car'dinis*, hinge]: the title of an ecclesiastic in the Roman Catholic Church. The cardinals are the highest dignitaries of the Church, except the pope, of whom they are the electors and the counselors. Their distinctive dress is the scarlet birretta, cape, and cassock. The scarlet hat is only symbolical, imposed once by the pope in person, and after death hung up in the titular church or the cathedral of the cardinal. Pope Urban VIII., in 1630, gave them the title of Eminence, which is still used. They are appointed by the pope. Those resident in Rome are said to be *in curia*, and are usually employed in the administration of the great congregations. The remainder are, as a rule, bishops of the more important sees of Christendom or men of mark in letters, Church administration, and the like. At present cardinals are rarely sent on foreign missions. The see of Rome conducts such business through its nuncios and ablegates, or the chief ecclesiastics of the different nations. The body of cardinals is called the Sacred College. The total number of these prelates has been for several centuries limited to seventy, of whom six are bishops of small suburban sees in the vicinity of Rome; fifty, styled cardinal-priests, hold their titles from parishes in Rome (many of them being at the same time bishops of foreign dioceses); and fourteen are cardinal-deacons, holding their titles from ancient diaconal churches of the city. The actual number of cardinals is often less than seventy. When the pope dies a successor is chosen by the cardinals, who are assembled in conclave at Rome, and who usually elect one of their own number to the vacant pontificate. During the election, which in the past was occasionally protracted several weeks or months by their inability to agree, they are confined in a certain building, formerly the Quirinal Palace, and debarred from intercourse with the public; even the door through which they enter the conclave is walled up, and only a small aperture is left, through which food is brought to them. Revised by John J. Keane.

Cardinal-grosbeak (*Cardinalis cardinalis*), called also **Redbird**: one of the finest of American song-birds; a native of the U. S.; remarkable for the beauty of its form and plumage. The bill is thick and broad, but not long. It belongs to the family *Fringillidæ*. The back of the male is a dusky red, and the rest of the plumage is a bright, vivid scarlet. It has on the crown long feathers erected into a conical or pointed crest, which it is said to raise and lower at pleasure. The total length is about 8 inches. It visits the Northern States as a summer bird of passage, and spends the winter in the Southern States, where some of them remain all the year.

Cardinal-flower [so called from its bright-red flowers, in color like a cardinal's hat]: the *Lobelia cardinalis*; a perennial herbaceous plant of the family *Campanulaceæ*; common in most parts of the U. S. in wet places, in the Atlantic region. There is a similar species or a new variety of it in Mexico. The color is a most intense red.

Car'dington: village; Morrow co., O. (for location of county, see map of Ohio, ref. 4–F); on east branch of Olentangy river, and on C. C. C. and St. L. R. R.; 38 miles N. E. of Columbus; in a rich agricultural section; has manufactories of furniture, wheat-cleaning machines, and poultry supplies; four churches, and an excellent union school. Pop. (1880) 1,365; (1890) 1,428; (1900) 1,354.

Cardin'ia: a genus of fossil *Conchiferæ*, of which over eighty-five species, ranging from the Silurian formation to the lower oölite, have been described. The shell is oval or oblong, attenuated posteriorly, has an external ligament, and is marked with lines of growth.

Cardiograph: See Recording Apparatus, Psychological, in the Appendix.

Cardi'tis: See Heart Disease.

Cardoon': a thistle-like plant (*Cynera cardunculus*) native to the south of Europe and the north of Africa. The artichoke is a cultivated derivative of the same species. The cardoon is cultivated (sparingly in the U. S.) for the stalks and midribs of the leaves, which are blanched before being eaten. It is spontaneous on the pampas of South America.

Cardo'zo, Isaac N.: journalist; b. at Savannah, Ga., June 17, 1786; became in 1816 editor, and some years later proprietor, of the *Southern Patriot*, a free-trade journal of his native town. In 1820 he published *Notes on Political Economy*. He established the *Evening News* in 1845. He was active in commercial affairs, and, though opposed to the tariff of 1828, was not of the extreme nullification party. He was drowned in Virginia Aug. 26, 1850.

Cards: See Playing-cards.

Cards [from Fr. *carde* = Ital. *carda*, teasel, deriv. of *cardo*, thistle < Lat. *carduus*]: a device for preparing the fibers of wool, cotton, or other textile material for the spinning process. The operation was formerly performed by hand-cards, but at present machines of surprising ingenuity are employed. The manufacture of cards is itself accomplished by wonderfully perfect mechanism. The subject is more fully discussed under Spinning (*q. v.*). Other forms of cards are employed for the purpose of currying or cleaning the hair of domestic animals. The operation of the common cards has often been compared to the combing and brushing of one's hair; and, indeed, the card combines the properties of the comb and the brush.

Carducci, kaär-doot'cheĕ, Giosué: an Italian poet; b. July 27, 1836; is also a critic and Romance philologist of unusual powers. In 1858, with some young fellow-poets, he founded *Il Poliziano*, a review for the advocacy of a poetry classic in form, though modern in significance. His first poetical success was his *Inno a Satana* (1863), published under the name *Enotrio Romano*. His *Poesie* have been many times republished, with constant additions. His *Odi Barbare*, written in new poetic forms of his own invention, have caused a real literary controversy in Italy. (See Chiarini's *I Critici italiani e la metrica delle Odi Barbare*, Bologna, 1878.) As critic he has published *Studii letterarii* (1874); *Bozzetti critici e discorsi letterarii* (1875). He has edited with commentary the *Poesie Latine di L. Ariosto* (1875) and the *Rime* of Petrarch (1879); also a collection of mediæval popular songs—*Cantilene e Ballate, Strambotti e Madrigali nei secoli XIII. e XIV.* (1871), besides other works too numerous to mention. A. R. Marsh.

Carduus benedictus: See Blessed Thistle.

Card'well, Edward, Lord: statesman; b. in Liverpool, England, July 24, 1813; entered Parliament 1842; joined the party called Peelites, and was president of the Board of Trade from 1852 to 1855. In the latter year he was returned to Parliament for Oxford. He became secretary for Ireland in 1859, and Secretary of State for the colonies in April, 1864. Having resigned with his colleagues in June, 1866, he entered the cabinet of Gladstone as Secretary of State for War in Dec., 1868. He was raised to the peerage in 1874 as Lord Cardwell. As Secretary for War he did much for the reorganization of the British army, abolishing the purchase of commissions by officers, and introducing the short-service system, with the view of forming a reserve. To him is also due the introduction of the localization principle of the military forces and the linking of battalions. D. Feb. 15, 1886.

Care or **Carle Sunday**: See Carling Sunday.

Carew', Thomas: English poet and courtier; b. in 1589. He was patronized by Charles I., in whose court he served as gentleman of the chamber. He wrote sonnets and short lyrical poems which are remarkable for elegance and ease. D. in 1639. See W. C. Hazlitt's edition of his poems (1870). The name Carew is by some English families of the name pronounced like Carey.

Ca'rex [Lat., sedge]: a genus of coarse grass-like plants of the family *Cyperaceæ*. They abound in temperate and cold climates, and are perennial herbs, often growing in dense tufts in swamps and wet places. The genus is characterized by male and female flowers, separated (mostly monœcious), with an ovary inclosed in an inflated sac called a *perigynium*. Stamens three, rarely two. More than 800 species of *Carex* have been described, and 289 species are enumerated by Bailey as natives of North America. The *Carex arenaria* is planted in Holland on the dikes for the purpose of binding the sandy shores with its spreading roots (rhizomes) and resisting the encroachments of the sea. Few of the species are good for pasture, but they tend to convert swamps gradually into fertile soil. In the U. S. they are harvested in large quantities from wet lands, but produce a poor quality of hay. See Sedge Family. C. E. B.

Ca'rey: village; in Crawford township, Wyandot co., O. (for location of county, see map of Ohio, ref. 3–E); on Pitts., Akron and W. and C. C. C. and St. L. and two other railroads; 16 miles from Findlay and 50 miles from Toledo; has six churches, public and church schools. Pop. (1880) 1,148; (1890) 1,605; (1900) 1,816. Editor of "Times."

Carey, Henry: poet and musician; illegitimate son of George Savile, the famous Marquis of Halifax. He composed many songs, operas, farces, and burlesques, but his most noteworthy productions were the popular ballad *Sally in our Alley* (1715) and the mock-tragedy *Chrononhotonthologos*, first performed at the Haymarket Feb. 22, 1734. D. by suicide in 1743. Henry A. Beers.

Carey, Henry Charles: son of Mathew Carey; political economist; b. in Philadelphia, Pa., Dec. 15, 1793. He became in 1821 the head of the firm of Carey & Lea, publishers. He advocated a protective tariff, and wrote besides other works, *The Principles of Political Economy* (3 vols., 1837–40); *The Past, the Present, and the Future* (1848); *The Principles of Social Science* (3 vols., 1858–59); and *The Unity of Law* (1872). He was the founder of a school of political economy, whose principles are anti-socialistic and more deductive than those of Smith, Ricardo, and Mill. His philosophy lies behind the speculations of Bastiat. Carey reversed the Ricardian theory of rent, and advanced new theories of wealth and value. He has been translated into German, and he opened the way to the methods of the new historical school. He was distinguished especially for the zeal with which he urged the principle of protection as opposed to that of free trade after his conversion from his earlier views. D. at Philadelphia, Pa., Oct. 13, 1879.

Carey, Joseph M.: U. S. Senator; b. in Milton, Del., Jan. 19, 1845; attended Fort Edward Collegiate Institute and Union College, New York; studied law at Philadelphia: admitted to the bar in 1867, graduating the same year at the law department of the University of Pennsylvania; is engaged in stock-growing; was appointed U. S. attorney for the Territory of Wyoming on the organization of the Territory in 1869; was an associate justice of the Supreme Court of Wyoming from 1871 until 1876; a member of the U. S. Centennial Commission 1872–76; was three times elected mayor of Cheyenne, serving 1881–85; was elected to the Forty-ninth and two succeeding Congresses as a Republican, and served in the U. S. Senate from 1890 till 1895.

Carey, Mathew: publisher; b. in Dublin, Ireland, Jan. 28, 1760; was the father of Henry Charles. He emigrated to Philadelphia in 1784, and became a bookseller. He published *The American Museum* (1787–93), wrote several political pamphlets and *Essays on Political Economy*, and had much influence in public affairs. D. in Philadelphia, Sept. 16, 1839.

Carey, William, D. D.: b. in Paulerspury, Northamptonshire, England, Aug. 17, 1761; was a shoemaker in early life, then preacher; but becoming impressed with the duty of giving the gospel to the heathen, he went to India in 1794 and founded the Baptist mission at Serampore, 13 miles N. of Calcutta; became (1801) Professor of Sanskrit, Bengalee, and Mahratta at the College of Fort William; published a Sanskrit grammar, a Bengali-English dictionary, and other works, besides assuming the principal labor in the transla-

tion of the Scriptures into several Oriental languages. D. in Serampore, June 9, 1834. He takes rank among the most distinguished of modern missionaries for his fidelity, success, and learning. See his *Life* by E. Carey (London, 1836) and by G. Smith (1885; 2d ed. 1887).

Carhart, Henry Smith: See the Appendix.

Ca'ria (in Gr. Καρία): an ancient province in the extreme southwest part of Asia Minor; bounded N. by Lydia, E. by Phrygia, S. by the Mediterranean, and W. by the Ægean Sea. The surface is mountainous. It was drained by the river Meander. The chief towns were Miletus, Halicarnassus, and Cnidus, which were founded by the Greeks. The natives of Caria were called *Cares*.

Cariam'idæ: a family of South American birds whose chief characters are long tarsus and elevated hallux, short

Cariama cristata.

wings, long and graduated tail, nostrils vertically oval, and forehead with erect crest. It embraces only the one genus, *Cariama*, and its two species, *C. cristata* and *burmeisteri*. They are about the size of the large blue heron, can be easily domesticated, and feed on insects and seeds.

Caribbe'an Sea: a grand inlet of the Atlantic Ocean; between North and South America, and separated from the Pacific by the Isthmus of Darien (or Panama) and by Central America. It separates the West India islands from South America, and communicates with the Gulf of Mexico by a passage about 120 miles wide, which divides Cuba from Yucatan, and is called the Channel of Yucatan. The water accumulated in the Caribbean Sea by an oceanic current flows continually into the Gulf of Mexico, from which it can only escape by the narrow passage between Florida and the Bahamas, thus forming the great Gulf Stream. The depth of this sea is generally more than 500 fathoms.

Car'ibbee Bark, or **Piton Bark**: bark obtained from the *Exostemma caribæum*; a small tree of Mexico, Florida, and the West Indies. It belongs to the cinchona tribe, and, though possessing none of the active principles of cinchona, it resembles it so much as to be sometimes substituted for it. The flower differs from that of the cinchona in having its stamens exserted, instead of their being included in the corolla.

Caribbee Islands: See West Indies.

Caribe: See Caripe.

Car'ibou (*Rangifer tarandus*, var. *Carabou*): the American reindeer; inhabits Maine, New Brunswick, and other cold regions of North America. The caribou is remarkable for the great development of the brow-antlers or branches, which extend in both sexes forward over the forehead. The color of its hair in summer is a rich reddish brown. The average weight of this animal is about 250 or 300 lb. Its flesh is much esteemed as food, and its skin is of value. The "barren ground caribou" (var. *Grœnlandicus*), also regarded as a variety of the European reindeer, is found farther N.

Caribou: village in Caribou township; Aroostook co., Me. (for location of county, see map of Maine, ref. 3–F); on the Vanceboro, Woodstock, and Edmundston Division of Can. Pac. R. R., and on Aroostook river, 150 miles N. by E. of Bangor (250 miles by rail). The village has churches of five denominations, high school, starch, carriage, and sash and door factories, foundry, grist-mills, lumber and shingle mills, woolen-mills, water-works, and electric lights. The principal industry of this section is agriculture. The first settlement here was made in 1844. Pop. of township (1880) 2,756; (1890) 4,087.

E. W. Wall, town clerk.

Ca'ribs: a race of Indians who, in the fifteenth century, occupied portions of the northern coast of South America from the Amazon to the Orinoco, and beyond and far up the latter river; they had driven the Arawaks from the Caribbean islands, and occupied most of them. The Caribs may be described as Indian freebooters; they were constantly at war with surrounding tribes, by whom they were much feared, and their incursions in canoes often extended for hundreds of miles. In battle they were very fierce and cruel, but treated their prisoners well, and often married the women; hence there was a constant change going on in the race. Cannibalism was practiced in their war-feasts, but its extent has been greatly exaggerated. The tribal ties were very loose, and the chiefs had only a nominal authority. At the time of the conquest they practiced agriculture. The Spanish courts condemned the Caribs to slavery as cannibals, but for a long time they were hardly molested, probably because they were dangerous foes and useless as workmen. The French and English occupation of their islands led to bloody wars with these Indians. Their last stronghold was St. Vincent, where they mixed with fugitive slaves, forming the race called black Caribs. They were conquered by the English, and the survivors, to the number of 5,000, were transported to the island of Ruatan in the Gulf of Honduras (1796); thence they passed over to the mainland, where their descendants now live and are esteemed as excellent workmen. A few hundred were allowed to return to St. Vincent, where they have a reservation, and there are a few others in the other islands. On the mainland some thousand live in a semi-wild state on the Orinoco and in Guiana. The early Spaniards applied the name Carib indiscriminately to any Indians whom they regarded as cannibals or very savage.

Herbert H. Smith.

Caricature [from Ital. *caricatura*, charge, loading, deriv. of *caricare*, to load]: a grotesque representation in art. Caricature is of two kinds: the first confines itself to giving merely an exaggerated prominence to deformities and physical infirmities; the second, which alone is worthy of serious consideration, while giving prominence to the grotesque aspects, is concerned more especially with man's vices, weaknesses, or passions. The first is a mere grotesque amusement; the second may become cruel personal injury, revengeful satire, or the most redoubtable means of public censure. Caricature, in the latter aspect, has unquestionably played no small part in political and social movements. Caricature is more than picturesque satire: it partakes of the character of the burlesque and of comedy. It is violent and unrestrained only in periods of social effervescence; but it is hardly just to say that it has no significance except in crises, for its *rôle* is less to reflect revolutions than to prepare the way for them.

Caricature was employed in remote antiquity to score and to ridicule vices. The Assyrians, the Egyptians, and the Greeks cultivated this branch of art successfully. The Greeks especially carried this species of satire so far that they did not even spare their gods. The most notable Greek artist in this line was Pozon. Egypt was as bold in caricature as Greece. The Egyptian Museum at Turin possesses the fragments of a papyrus which represents people by animals, which careful study has shown to be a caricature of an Egyptian sculpture of four women playing on musical instruments. The British Museum possesses a

papyrus of similar character. The Romans greatly enjoyed caricature. Cicero speaks in his *De Oratore* of pictures which so exaggerated certain physical deformities as to excite laughter. Caricatures were even painted on public monuments. Pliny speaks of a painter named Antiphilus, who conceived the idea of a picture represented in grotesque garb, to which he gave the name of Gryllus. This afterward became the common designation of pictures of that sort. A caricature of Æneas, Anchises, and Ascanus was found in the ruins of Pompeii, in which the three fugitive Trojans were represented with dog's heads. Numerous other caricatures are found in the same ruined city. The Jesuit Garruci found in the catacombs of Rome a caricature of the crucifixion of Christ which represents a man standing with his arms extended in an attitude of adoration before the cross, on which hangs a human body with an ass's head. Beneath is this ironical legend, "Alaxamenus is adoring God." The miniatures in manuscripts of the Middle Ages, even the most religious, are often caricatures of great skill and fineness of execution. During this period all art was colored with the spirit of caricature. Most of the sculptures that ornament the cathedrals with their burlesque and grotesque attitudes were true caricatures in stone. Very curious caricatures may still be seen on the portals of the cathedrals at Rouen, Amiens, Chartres, and elsewhere. After the Renaissance caricature reappeared in more vigorous form than ever in Italy. Leonardo Da Vinci was distinguished for his satirical compositions, as was also Carrache the Florentine and Baccio del Binco. The Venetian Pietro Belloti, and later in the eighteenth century the Roman Pierleone Ghezzi, were distinguished caricaturists. Caricature early spread among the countries of the north. In Germany Holbein became most distinguished. Among his principal works of this character are the *Dance of Death*, and illustrations for the *Praise of Folly* of his friend Erasmus. In France in the seventeenth century Callot was the leader in this art. The Fronde called forth innumerable caricatures, but they were less cruel than those that attacked Louis XIV. toward the close of his reign. Louis XV. was not spared. Hardly a day passed without an order to the police to discover and punish the authors of the caricatures with which Paris was flooded, the subjects of which were Louis XV. and his relations with Mesdames de Pompadour, Du Barry, *et al.* The revolution of 1789 stirred up caricature anew. The king and queen were especially attacked, and later all the different parties were assailed in their turn. The first emperor controlled caricature as everything else, but Louis Philippe was its special victim. His pear-shaped head was an admirable point of attack for the caricaturists. Charles Philipon founded Nov. 4, 1830, *La Caricature*, which was devoted to attacking and exciting the Government. To this succeeded *Charivari* and the *Journal pour Rire*. The most notable caricaturist of England was Hogarth. He is one of the most humorous and vigorous of all artists of this class. Gillray, Bunbury, and Cruikshank are also distinguished in this line in England. In no country of Europe has political caricature had such free play as in England. The most eminent Spanish caricaturist is Goya. In recent years Du Maurier in England has won great fame in the field of social caricature. In the U. S. caricature has had wide development and free scope. Perhaps its power as a political agent was never so fully illustrated as during the exposure of the Tweed Ring in New York, when public sentiment was very largely formed by the sketches of Nast in *Harper's Weekly*. Among the leading journals largely devoted to caricature are *Puck* and *Judge* in the U. S.; for the English, *Punch*; for the French, *Charivari*; for the Germans, *Fliegende Blätter*. C. H. Thurber.

Ca'ries [Lat., rottenness]: a Latin term signifying "rottenness," applied to a disease of the bones analogous to ulceration of the soft parts, as *necrosis* of bone is analogous to gangrene of soft parts. In caries as in ulceration the parts destroyed are cast off in small portions, "molecularly"; in necrosis large portions are removed at a time. Systematic writers define different varieties, according to extent, such as circumscribed and diffused; according to cause, as tubercular, syphilitic, etc.; but in all cases the process is much the same. A carious bone is lighter than a normal one, is fragile, of dark-gray or brown color, and presents hollows and cavities filled with the products of disintegration. The bone is usually insensitive, but there may be considerable pain in some cases. In all cases abscess forms around the bone, and usually discharges externally. Caries very frequently affects the vertebræ, and the weight of the trunk then produces curvature of the spine, either interior or lateral. (See Spinal Caries.) The small bones of the hands and feet and the ends of long bones are also frequently affected.

The causes of caries are (1) a predisposition, such as scrofula, syphilis, and various other diseases, which depress the general vitality, and (2) exciting causes, such as traumatism, which serve to localize the disease. The treatment is directed to the general predisposing condition and locally to the removal of the diseased portions. This may be accomplished by caustic substances or mechanically by scraping, gouging, and the like. Excision of joints and amputation may be necessary in some cases.

Caries of the teeth is a very common disease. It may be due to general conditions, such as indigestion or various other diseases, or to improper care of the teeth. It is now known that a micro-organism has a part in the causation of this condition. See Dentistry. William Pepper.

Carillon: See Bell-ringing.

Cari'na [Lat., the keel of a ship or boat]: in botany, the sharp thin ridge or keel of any organ; also the lower pair of petals of a papilionaceous flower, which are more or less united, and form a body somewhat like the keel or prow of a boat.

Carina'ria [from the Lat. *carina*, a keel]: a family of heteropodous gasteropods; characterized by having the heart, liver, generative organs, etc., protruded from the body, and incased in an extremely fragile and beautiful shell, which is sub-transparent, symmetrical, and compressed. The convexity of the shell is terminated by a single keel.

Carina'tæ [from Lat. *carina'tus*, keel shaped]: a group of birds, established by Merrem in 1817, comprising those with a keeled breast-bone. It includes all existing birds except the ostriches and related forms. The group is termed an order by Huxley, a sub-class by most ornithologists. F. A. Lucas.

Carini, kăă-ree'nĕĕ: a town of Sicily; in the province of Palermo; beautifully situated 10 miles W. N. W. of Palermo (see map of Italy, ref. 9–E). It has a Gothic castle. Near it are the ruins of the ancient *Hyccara*. Pop. 12,539.

Carin'thia (in Germ. *Kärnthen*): a division of the Austrian empire; bounded N. by Salzburg and Styria, E. by Styria, S. by Carniola and Italy, and W. by the Tyrol. Area, 4,005 sq. miles. It is intersected by the river Drave, the valley of which separates the Noric from the Carinthian Alps. It is mountainous, with the exception of the eastern portion, where the valley of the Drave opens out into a plain containing the two large lakes, the Wörthersee and the Ossiochersee. Of the surface, one-half is covered with dense forest; of the other half, the larger portion is occupied by pastures, the minor by meadows, grain-fields, and gardens. The mineral production comprises iron, lead, zinc, graphite, and coal. The population numbered 361,008 according to the census of 1890, of whom 30 per cent. were Slavs and the remainder mostly Germans. The German language is used in 255 schools, the Slavonic in 24, and both in 70. There are about 19,000 Lutherans; the rest are Roman Catholics. The principal town is Klagenfurth. There are in all 10 towns, 28 market-villages, and 2,911 hamlets. The name Carinthia is derived from the Cari, a Celtic people which inhabited the country when it was conquered by the Romans and incorporated with the province of Noricum. By Charlemagne it was made a margraviate, and by Louis the Bavarian the margraviate was bestowed on the Dukes of Austria.

Cari'nus, Marcus Aurelius: Roman emperor; a son of the Emperor Carus. On the death of Carus, in 284 A. D., Carinus and Diocletian became competitors for the throne. The former gained an advantage in Mœsia over Diocletian in 285, but was killed by his own soldiers, whom he had offended by his cruelty.

Caripe, kăă-ree'pāy, or **Caribe**: a town of Venezuela; 40 miles E. of the city of Cumaná (see map of South America, ref. 1–D); remarkable on account of the extensive caves in the neighborhood, stretching into the limestone rock for a distance of 2,800 feet, and with a height of 70 or 80 feet. The caves, which have been described by Humboldt, are inhabited by a peculiar species of night-hawk, whose young ones are killed in great numbers for the sake of the oil they contain. Pop. 4,000.

Caris'sa: a genus of plants of the family *Apocynaceæ*. The *Carissa carandas*, a thorny shrub found in India, bears edible berries, and is much used there for hedges.

Carlén', Emilie: Swedish novelist; b. (*Emilie Smith*) at Strömstad, Aug. 8, 1807. She published in 1838 her first novel, *Waldemar Klein*. She was married a second time in 1841 to a lawyer named Carlén, her first husband having been a musician named Flygarre, from whom she was divorced. Translated into English, among her works, are *Home in the Valley*, *The Lover's Stratagem*, *The Professor*, and *Woman's Life*. They were much read when they first appeared, but have now fallen into neglect on account of their sentimentality. D. at Stockholm, Feb. 5, 1892. See her *Reminiscences of Swedish Literary Life* (1878).

Carleton: a thriving suburb of St. John, New Brunswick, and within the city limits, but separated from the main city by the St. John river (see map of Quebec, ref. 6–H). Carleton has extensive fisheries. See St. John, N. B.

Carleton, Sir Guy, Lord Dorchester: a British general; b. at Strabane, in Ireland, Sept. 3, 1724. He became governor of Quebec in 1772, which he defended against the American Revolutionary army in Dec., 1775. He invaded New York in 1776, and fought a battle against Arnold on Lake Champlain. In 1777 he was relieved of the command, but he succeeded Sir Henry Clinton as commander-in-chief in North America in 1781. D. in Maidenhead, Nov. 10, 1808.

Carleton, William: Irish novelist; b. in County Tyrone in 1794. His first work was *Traits and Stories of the Irish Peasantry* (1830), which was received with favor. In 1839 he published *Fardorougha the Miser*, which was very successful. He described Irish life and manners with much vigor and accuracy in other works, among which are *Rody the Rover* (1846) and *Willie Reilly* (3 vols., 1855). D. Jan. 30, 1869.

Carleton, William: poet; b. at Hudson, Mich., Oct. 21, 1845; was educated at Hillsdale College, and engaged in journalism and lecturing, living first at Chicago and afterward in Brooklyn, N. Y. His poems of humble life have been widely read, especially his *Farm Ballads* (1873).

Henry A. Beers.

Carleton College: a Congregational institution; located in Northfield, Minn.; open to both sexes; founded in 1866; chartered in 1870; has about 20 instructors and 300 pupils; 15,000 volumes in library.

Carleton Place: town; Lanark co., Ontario, Canada; on main line of Can. Pac. Railway; 46 miles from Brockville, on the St. Lawrence, and 28 miles from Ottawa; on a navigable stream called the Mississippi river (see map of Ontario, ref. 2–H). It has superior schools, and manufactures of woolens and iron and extensive lumber-mills. In the vicinity are camping-grounds for summer pleasure-seekers. Pop. (1881) 1,975; (1891) 4,435.

Editor of "Central Canadian."

Car'li, or **Car'li Rub'bi**, Giovanni Rinaldo, Count: political economist; b. at Capo d'Istria, Italy, Apr. 11, 1720. He acquired a high reputation by an important work entitled *Delle Monete e delle Instituzione delle Zecche d'Italia* (On Italian Coins and the Institution of Mints in Italy, 4 vols., 1754–60). He was appointed president of the council of commerce and public economy at Milan. Among his other works is a treatise *On Italian Antiquities* (1788). D. Feb. 22, 1795.

Carlile, Richard: free-thinker; b. at Ashburton, Devonshire, England, Dec. 8, 1790; educated at the village school; converted to radical propagandism by Paine's *Rights of Man*; sold a large edition of Southey's *Wat Tyler*; was imprisoned eighteen weeks for reprinting Hone's *Parodies* and writing some imitations of them. For reprinting the works of Paine and similar writers he was tried and sentenced in 1819 to a fine of £1,500 and imprisonment for three years in the Dorchester jail. His influence for the freedom of speech and of the press was very great. D. Feb. 10, 1843.

Carling, John: Canadian statesman; b. in township of London, Middlesex, Ontario, Jan. 23, 1828; was educated at the common school there. He was receiver-general of Canada in 1862; a member of the Canadian Assembly 1857–67; at the latter date was elected to the Dominion Parliament, and held the seat up to 1874; was re-elected in 1878, and was returned to each succeeding Parliament up to that of 1891. He was Postmaster-General from 1882 till 1885, when he was appointed Minister of Agriculture, a portfolio which he held till 1891, when he was reappointed to the same office. He failed to secure re-election at the general election of 1891, but was immediately afterward appointed to the Senate. He also held the portfolio of Minister of Agriculture and Public Works in the government of Ontario 1867–71. Mr. Carling was a member of the firm of Carling & Co., brewers; a director of the Great Western Railway, and of the London, Huron and Bruce and London and Port Stanley Railways.

Neil Macdonald.

Carling Sunday: an English term for the fifth Sunday in Lent, or Passion Sunday; so called because a certain sort of pease, termed "Carles," were made into cakes and eaten on that day. A rhyming couplet, designating the Sundays in Lent, is still quoted in certain parts of England. The abbreviated words in it refer to portions of the old services of the Church:

> Tid, Mid, and Misera,
> *Carling*, Palm, and Pasch-egg day.

Carlinville: city; on railroad; capital of Macoupin co., Ill. (for location of county, see map of Illinois, ref. 8–D); on Ch. and Alt. and Jackson So. East. R. Rs.; 57 miles N. N. E. of St. Louis and 38 miles S. W. of Springfield. It is the seat of Blackburn University, connected with which is a theological seminary. Here are brick-works, file-works, large flouring-mills, and three coal mines. Its court-house is a fine building. Pop. (1880) 3,117; (1890) 3,293; (1900) 3,502.

Editor of "Enquirer."

Carlisle, kar-līl' (anc. *Luguvallio*, or *Luguvallum*): an ancient episcopal city of England; the capital of Cumberland; situated on an eminence at the confluence of the Eden and Caldew rivers, by which it is nearly surrounded. It is 301 miles by rail N. N. W. of London, 98¼ miles by rail S. of Edinburgh, and 12 miles E. of Solway Frith (see map of England, ref. 4–F). Several railways converge to this point, which also has communication by steamboats with Liverpool and Belfast. It has a cathedral founded by William Rufus, dedicated in 1101, greatly damaged by fire in 1292, and restored about 1854. The choir, which is 138 feet long and 72 feet high, is one of the finest in England. Here is a castle founded in 1092. Carlisle sends two members to Parliament. It has manufactures of ginghams and cotton checks, print-works, iron-foundries, etc. It was the residence of the ancient Kings of Cumbria, and was destroyed by the Danes in 900. During the wars between the English and Scotch it was an important fortified border-town, and was often besieged. Pop. about 40,000.

Carlisle: town (founded in 1816); capital of Nicholas co., Ky. (for location of county, see map of Kentucky, ref. 2–I); on Kentucky Central R. R.; 100 miles from Louisville and Cincinnati, and 36 from Lexington. Here are six churches, a good graded school, a large flouring-mill, two carriage-factories, and a creamery. Pop. (1880) 909; (1890) 1,081; (1900) 1,377.

Editor of "Mercury."

Carlisle: borough; capital of Cumberland co., Pa. (for location of county, see map of Pennsylvania, ref. 6–F); on Cumberland Valley and Reading R. Rs.; in the valley between the Kittatinny and South Mountains; 18 miles W. by S. from Harrisburg, and 125 miles W. of Philadelphia. It is well built, and has wide streets and a public square, fine schools and churches, water-works, electric lights, and many beautiful private residences. Its chief industrial establishments are a car-factory and machine-shops, engine, axle, and frog and switch works, silk-mill, steam-carriage works, 3 large shoe-factories, overall-factory, 2 carpet-factories, and novelty-works. Carlisle is the seat of Dickinson College, founded in 1783; of Metzger Institute for girls; and of a Government Indian training and industrial school, with about 1,000 Indian boys and girls in attendance. This place was shelled by the Confederates July 1, 1863. Four miles N. from the court-house is Carlisle Springs, where there is a mineral spring, much visited in summer. Pop. (1880) 6,209; (1890) 7,620; (1900) 9,626.

Editor of "Sentinel."

Carlisle, Earls of: Viscounts Howard of Morpeth and Barons Dacre of Gillesland (England, 1661).—George William Frederick Howard, seventh earl; b. in London, Apr. 18, 1802; educated at Eton and Oxford; chief secretary for Ireland 1835–41; succeeded to the peerage on the death of his father 1848; twice appointed by Lord Palmerston Lord-Lieutenant of Ireland, in 1855 and in 1859; author of a *Diary in Turkish and Greek Waters* and a volume of poems. D. Dec. 5, 1864, and was succeeded by his brother, William George Howard, rector of Londesborough, as eighth earl;

b. Feb. 23, 1808. He died Mar. 29, 1889, and was succeeded by GEORGE JAMES HOWARD as ninth earl, who was born in 1843; was M. P. for Cumberland 1879–85.

Carlisle, JOHN GRIFFIN: b. in Kenton co., near Covington, Ky., Sept. 5, 1835, where his father had a farm; began to teach school and read law; was admitted to the bar in 1858; practiced with great success in the Covington district; was member of the State House of Representatives 1859–61; elected State Senator in 1866 and again in 1869; delegate at large from Kentucky to the National Democratic Convention at New York in July, 1868; Lieutenant-Governor of Kentucky 1871–75; and member of the 46th, 47th, 48th, 49th, 50th, and 51st Congresses. He was elected Speaker of the 48th, 49th, and 50th Congresses. He was sworn in as U. S. Senator from Kentucky May 26, 1890, in place of James B. Beck, deceased; was Secretary of the Treasury 1893–97; removed to New York city to practice law 1898.

Car'lists: a political party of Spain, consisting of the followers of Carlos of Bourbon and his descendants. See CARLOS OF BOURBON and CHRISTINOS.

Car'loman, or **Karloman**: a French prince; son of Charles Martel, at whose death, in 741 A. D., he became King of Austrasia, Suabia, and Thuringia. He abdicated in favor of his brother, Pepin le Bref, in 747, and became a monk. D. in 755 A. D.

Carloman: a son of Pepin le Bref and a brother of Charlemagne; b. in 751 A. D. On the death of his father in 768 he began to rule over Neustria and Burgundy. D. in 771, and Charlemagne then obtained possession of Carloman's dominions.

Carlos, kaar'lōs, Don: infante of Spain; son and heir-apparent of Philip II.; b. July 8, 1545. He was a youth of violent temper and sickly constitution, and appears to have been deficient in intellect. He attacked or menaced the Duke of Alva with a poniard in 1567. The king regarded him with suspicion, and ordered him to be tried by the Inquisition, which pronounced him guilty. He died in 1568, but the cause and manner of his death are involved in mystery. He is the subject of Schiller's tragedy of *Don Carlos*. See Prescott's *History of Philip II.*

Carlos of Bourbon, Don: Count de Molina; b. Mar. 29, 1788; the second son of King Charles IV. of Spain. He was the heir-presumptive to the throne until the birth of Isabella in 1830. On the death of his brother, Ferdinand VII., in 1833, Don Carlos claimed the throne, under the Salic law introduced into Spain in 1713, and abrogated by Ferdinand on his marriage to Christina, and was supported by a party called Carlists, between whom and the partisans of Isabella a civil war ensued. The priests and absolutists mostly preferred Don Carlos, but his claim was rejected by the Cortes in 1836. The Carlist army, which drew its numerical and strategic strength from the Basque provinces, was defeated in 1839, and Don Carlos fled to France. He abdicated in favor of his son, Don Carlos, Count de Montemolin, in 1845. D. in Trieste, Mar. 10, 1855.

Carlos, DON: Count de Montemolin; son of the preceding; b. Jan. 31, 1818. After the death of his father he was a pretender to the throne of Spain, and was recognized as Charles VI. by the Carlists, who revolted in 1860, without success. D. in 1861.

Carlos, DON: Duke of Madrid: nephew of the preceding; son of Don Juan of Bourbon and grandson of Don Carlos, Count of Molina; b. Mar. 30, 1848. His father, Don Juan, abdicated in his favor on Oct. 3, 1868, and from that time he was recognized by the Carlists as Charles VII. He made, in 1870 and again in 1872, unsuccessful efforts to overthrow the Government of King Amadeus, and in 1873 waged war against the republican Government. He fled to France; put forth claims to the French throne in 1881; was obliged to seek refuge in London. His eldest son, Jayme, Prince of Asturias, was b. June 27, 1870.

Carlot'ta: former Empress of Mexico; b. in Brussels, June 7, 1840; the daughter of Leopold I. of Belgium; married MAXIMILIAN (*q. v.*), Archduke of Austria, 1857; accompanied him to Mexico 1864; returned to Europe in 1866 to seek in vain aid from Napoleon and the pope, and lost her reason on account of her failure and her husband's disaster. Lives in Brussels.

Carlovin'gian [for *Carlingian*, by analogy of *Merovingian*]: the name of the second dynasty of French or Frankish kings. The origin of the family is traced to Arnulph, Bishop of Metz, who died in 631. The dynasty derived its name from Charles Martel or his grandson, Charlemagne. Charles Martel became in 714 A. D. mayor of the palace and king in reality, but he permitted Childeric to retain the name and form of royalty. The Merovingian dynasty ended in Childeric, a *roi fainéant*, who, after a merely nominal reign, was deposed in 752 by Pepin le Bref, a son of Charles Martel. Pepin usurped the throne, and was the first Carlovingian who took the title of king. He was succeeded by his son, Charlemagne, who began to reign in 771, extended his dominions by conquest, was the most powerful European monarch of his time, and the founder of the Germanic empire. He was crowned as Emperor of the West by Pope Leo III. in 800 A. D., and died in 814. Under his descendants the empire continually declined in power. His son and successor, Louis le Débonnaire, divided his dominion among his three sons, Lothaire, Pepin, and Louis. Louis le Débonnaire, who died in 840, had another son, Charles the Bald, who became King of France. He died in 877, and was followed by a succession of feeble princes. The last of the Carlovingian dynasty was Louis V., who died in 987. Hugh Capet then assumed the royal power. This house included a number of German and Italian monarchs.

Car'low: a county of Ireland; in Leinster; bounded N. by Kildare and Wicklow, E. by Wicklow, S. E. by Wexford, W. by Queens County and Kilkenny. Area, 353 sq. miles. The surface is mostly level or undulating; the soil is fertile. The rocks found near the surface are granite and limestone. It contains many dairies, and exports grain, flour, and butter. Coal is mined near the western border of this county. Chief town, Carlow. Pop. (1881) 46,568; (1891) 40,899.

Carlow: a town of Ireland; capital of county of same name; on the navigable river Barrow; at the mouth of the Burren; 57 miles by rail S. S. W. of Dublin (see map of Ireland, ref. 11–H). It is well built, has two bridges, a Roman Catholic cathedral, a college for students of divinity, a lunatic asylum, and a handsome court-house; also extensive flour-mills. Here are the picturesque ruins of a large Anglo-Norman castle founded in 1180. This castle was taken and dismantled by the army of Gen. Ireton in 1650. Pop. 7,200.

Car'lowitz: a town of Austria; on the right bank of the Danube; 8 miles S. E. of Peterwardein (see map of Austria-Hungary, ref. 9–H). It contains a Greek cathedral, and is the seat of the Greek Archbishop of the Serbian nationality. It is noted for its excellent wine, the product of which sometimes amounts to 1,750,000 gal. in a year. An important treaty was concluded here in 1699 between Turkey on one side and Austria, Russia, and Venice on the other. Pop. 4,419.

Carls'bad, or (Germ.) **Karlsbad**, kaarls'baat (i. e. Charles's bath): a town in Bohemia famous for its hot springs; on both banks of the river Tepl; about 76 miles W. N. W. of Prague (see map of Austria-Hungary, ref. 3–C). It is in a narrow valley between steep granite mountains, and is surrounded by very beautiful scenery. It contains a theater, several reading-rooms, and over a thousand different hotels and pensions for the entertainment of guests. The city is, indeed, one vast hotel. There are seventeen different springs, the most famous being the Sprudel (discovered, according to tradition, by Emperor Charles IV. while hunting), the Schlossbrun, and the Mühlbrunn. The temperature of the waters varies from 85° to 166° F. The solid constituents of the waters are mainly sulphate of soda, carbonate of soda, chloride of sodium, carbonate of lime, and sulphate of potash, with traces of other salts. The waters also contain a large amount of free carbonic acid gas. The average number of annual visitors here is over 28,000. Carlsbad was a favorite resort of Goethe. A congress of German powers was held here in 1819. Pop. (1890) 12,033.

Revised by C. H. THURBER.

Carls'burg, or (Germ.) **Karlsburg**, kaarls'boorkh (anc. *Apulum*): a fortified town of Austria; in Transylvania; on the right bank of the Maros; 46 miles S. S. E. of Klausenburg (see map of Austria-Hungary, ref. 7–K). Saltpeter is manufactured here. It is the seat of a Roman Catholic bishop, and has a gymnasium, a theological seminary, a normal school, and several convents. Pop. 8,000, many of them Jews.

Carlscro'na, or (Sw.) **Karlskro'na** (i. e. Charles's crown, sometimes called in English **Carlscroon'**): a seaport in the south of Sweden; situated on several small islands, which are connected by bridges with each other and with the main-

land; 258 miles S. S. W. of Stockholm; lat. 56° 10′ N., lon. 15° 36′ E. (see map of Norway and Sweden, ref. 13–F). It has an excellent and safe harbor, with sufficient depth of water to float the largest ships, and is the principal station of the Swedish navy. The entrance to the harbor is defended by two strong forts. Here are dry docks blasted out of the granite rock, and a naval arsenal. It has manufactures of linen cloths, naval equipments, etc. Pop. (1891) 20,613.

Carl'seu, Emil: still-life and landscape painter; b. in Denmark in 1848. Removed to the U. S. in 1872 and studied painting in Boston. His works have often been seen in New York exhibitions, and he settled there about 1887. Since then he has lived for some time in San Francisco, and finally returned to New York in 1891. His landscapes are truthful and interesting in style, but he is more distinguished as a painter of still life. In this branch of art his work is marked by fine qualities of color and pictorial charm.

William A. Coffin.

Carlson, Frederick Ferdinand: a Swedish statesman and historian; b. June 13, 1811. Served as Professor of History in Upsala, and was twice a cabinet officer. Among his numerous historical works the most excellent and important is his *Sveriges Historia under Konurgarne af Pfalziska Huset*, which may be regarded as a continuation of Geijer's history. D. Mar. 18, 1887.

Carls'ruhe, or (Germ.) **Karlsruhe**, kaarls'roo-*e* (i. e. Charles's rest): a city of Germany; capital of the grand duchy of Baden; 46 miles by rail S. of Mannheim (see map of German Empire, ref. 6–D). It is connected by railways with all parts of Germany. The streets are arranged like the radii of a semicircle, converging toward a central point, which is occupied by the palace of the grand duke. Connected with this palace is a museum and the ducal library of 150,000 volumes. The town also contains a botanic garden, a mint, a theater, an arsenal, and several hospitals. Here are manufactures of carpets, jewelry, chemical products, carriages, etc. Carlsruhe was founded in 1715 by Charles William, Margrave of Baden. Pop. (1885) 61,074; (1895) 84,030.

Carl'stad: a town of Sweden; on the island of Thingvalla; in Lake Wener; about 141 miles W. of Stockholm (see map of Norway and Sweden, ref. 11–E). It is connected with the mainland by a large and handsome bridge. It has a cathedral, a college with an observatory, and a cabinet of natural history. Copper, iron, timber, and grain are exported from this town through Lake Wener and the Gotha Canal; suffered by fire in 1865, since which time the town has greatly improved in appearance. Pop. (1891) 8,716.

Carlstadt, Andreas Rodolphus Bodenstein: b. at Carlstadt, in Franconia, probably two years before Luther (1481); d. at Basel, Dec. 25, 1541; played a singular part in the history of the Reformation. He studied theology at various Italian universities, and was in 1513 appointed professor at Wittenberg, where he expounded the Christian doctrines in the usual manner of the Schoolmen. After an absence of some time on a visit to Rome, he found the whole theology of the university changed by Luther. He first offered some opposition, but then suddenly adopted the views of the Reformer and carried them to extremes. During Luther's stay at the Wartburg he caused great disturbance in Wittenberg by his violence and recklessness, and it cost Luther great exertions to restore order. Humiliated at his failure, Carlstadt began to attack Luther, and made himself the center of a circle of ill-advised enthusiasts. In 1528 he was banished from Saxony, and in 1530 he settled at Strassburg. Siding with Zwingli in the controversy concerning the Lord's Supper, he was appointed pastor at Basel, where he continued his attacks on Luther. (See his *Life* by Jäger, Stuttgardt, 1856.) A complete list of his works—mostly polemical, and often rather unsavory—has been given by Rotermund in his *Erneuertes Andenken* (Bremen, 1818).

Carlton, Thomas, D. D.: clergyman of the Methodist Episcopal Church; b. in Londonderry, N. H., July 26, 1808; began his ministry in the Genesee Conference in 1829; occupied important pulpits in Rochester, Buffalo, and other places for several years. His superior administrative and financial abilities led to his appointment as agent, for three years, of the Genesee Wesleyan Seminary, as presiding elder of important districts for seven years, and principal agent or publisher of the Methodist Book Concern in New York, and treasurer of the Methodist Missionary Society for twenty years (1852–72). D. in Elizabeth, N. J., Apr. 16, 1874.

Carludovi'ca Palma'ta: a tree or shrub of the order *Pandanaceæ*; grows in the tropical parts of South America. It produces the leaves of which panama hats are made. Those of the best quality are plaited from a single leaf without any joints. As this process requires several months, the price of such a hat is very high.

Carlyle, kar-līl′: capital of Clinton co., Ill. (for location of county, see map of Illinois, ref. 9–D); on railroad and on the Kaskaskia river; 48 miles E. of St. Louis; has fine churches, school-houses, and stores and a spoke-factory. The public library contains 5,000 volumes. There is a seminary for young ladies. Pop. (1880) 2,017; (1890) 1,784; (1900) 1,874. Editor of "Constitution and Union."

Carlyle, Alexander, D. D.: Scottish Presbyterian divine; b. at Prestonpans, Jan. 26, 1722; educated at the universities of Edinburgh, Glasgow, and Leyden; ordained as minister of Inveresk, near Edinburgh, 1748; moderator of the General Assembly 1770; dean of the Chapel Royal 1789. His *Autobiography*, edited by Burton in 1860 (London), excellently describes the society and events of his time. D. in Inveresk, Aug. 25, 1805.

Carlyle, Thomas: a distinguished British critic and historian; b. Dec. 4, 1795, at Ecclefechan, Scotland. He was of a family of peasants, "pithy, bitter-spoken bodies," and his father was a stone-mason. He was educated at Annan school—the "Hinterschlag (i. e. whip behind) Gymnasium" of *Sartor Resartus*—and at Edinburgh University. At school he made acquaintance—which ripened into a warm friendship—with Edward Irving, afterward the famous preacher and founder of the Irvingite communion. In 1814 Carlyle became mathematical master in Annan Academy, and continued to teach there and subsequently at Kirkcaldy till 1818. His first published book was a translation of *Legendre's Geometry* (1824). He began to contribute to the magazines about 1820, and set himself especially to the task of acquainting English readers with German literature through his translations and critical essays. His *Life of Schiller* was published in the *London Magazine* in 1823–24. His translation of *Wilhelm Meister* appeared in 1824, and *Specimens of German Romance—Tieck, Richter, Musæus, Hoffmann*, etc.—in 1827. He wrote for the *Edinburgh, Foreign*, and *Westminster Reviews* and *Fraser's Magazine* articles on Goethe, Werner, Novalis, Heyne, Richter, German playwrights, early German literature, the *Nibelungen Lied*, etc. His own style became gradually more and more tinctured with Germanisms. Richter had a particularly strong influence on him, and his imitation of that writer's whimsical, uncouth, and rhapsodical manner produced in time a vicious and affected diction in his imitator. In 1824 he went to London, married Jane Welsh in 1826, and after a short residence in Edinburgh removed to a solitary farm received by her as an inheritance, at Craigenputtoch, among the wild granite hills of Dumfriesshire. Here he was visited by Emerson, by Francis Jeffrey, the editor of the *Edinburgh Review*, with whom he had formed a close intimacy, and by others who were attracted by the power and originality of his writings. In 1833–34 he published in *Fraser's Magazine* his first great book *Sartor Resartus* (The Tailor Retailored). This was a satire on shams, conventions, the disguises and wrappings of the human soul. It purported to be the life and "clothes-philosophy" of Herr Diogenes Teufelsdröckh, Professor of Things-in-General in the University of Weissnichtwo (know-not-where), and was possibly suggested by a paragraph in Swift's *Tale of a Tub*: "A sect was established who held the universe to be a large suit of clothes," etc. In 1834 Carlyle removed to Chelsea, a London suburb, where he resided for the rest of his life. In 1837 he published his *French Revolution*, which is not so much a history as a series of vivid pictures. He conceived of history dramatically, and defined it as "the essence of innumerable biographies." His *French Revolution* is really a great tragedy acted out by a few leading characters, Mirabeau, Danton, and others. The MS. of the first volume had been lent to John Stuart Mill, and while in his possession was accidentally burned. Carlyle rewrote it with infinite pains, but he said of the new version, "I dinna think it's the same." *Chartism* (1839) dealt with a modern social and political problem. In *Heroes and Hero Worship* (1841) he repeated and developed most fully the political philosophy of *Chartism* and the ideas sketched in his three early essays, *Signs of the Times* (1829), *History* (1830), and *Characteristics* (1831). He took

issue with modern liberalism; with the utilitarians and their "greatest happiness" principle; with the conclusions of political economy, which he called the "dismal science"; and with the *laissez-faire* theory of government, which he said makes it the business of government not to govern, but to refrain from governing. Carlyle had no faith in democracy and universal suffrage; he sneered at the self-congratulations of the age, and the talk about unexampled prosperity, progress of the species, the march of intellect, etc. He called the American civil war "the burning of a dirty chimney," and wrote contemptuously about *The Nigger Question* (1849) and *Shooting Niagara* (1867). His doctrine of salvation through the hero was further illustrated in his *Cromwell's Letters and Speeches* (1845), which may be said to have revolutionized the general estimate of its subject, and his *History of Frederick the Great* (1858–65). The last-mentioned work gave evidence of an increasing admiration for mere despotic force, as *Past and Present* (1845) and *Latter-day Pamphlets* (1850) had shown a constantly growing eccentricity of style and pessimism of thought in their violent arraignment of modern society. The *Life of John Sterling* (1851) was of milder mood, and is one of Carlyle's pleasantest books. In 1866 Carlyle was honored with the rectorship of Edinburgh University, and made an address to the students. In 1875 appeared his *Early Kings of Norway*. After his death, Feb. 4, 1881, his *Reminiscences* were edited by J. A. Froude, and re-edited by Charles E. Norton in 1887. Mr. Norton also edited the *Correspondence of Thomas Carlyle and Emerson* in 1886, and the *Correspondence of Thomas Carlyle and Goethe* in 1887. (See also *Letters and Memorials of Jane Welsh Carlyle*, 1883.) The first collected edition of Carlyle's works was published in 1857–58; a second collected edition in 34 vols. was issued in 1870–82.

HENRY A. BEERS.

Carmagnole, kär-mäñ-yōl′: a political song of the Jacobins in the French Revolution; also applied to a popular dance of that period, and to a jacket which was worn by the revolutionists as a symbol of patriotism.

Car′man, ALBERT, M. A., D. D.: minister of M. E. Church; b. in Matilda, Ont., Canada, June 27, 1833; educated at Victoria University; president of Albert Seminary, College, and University 1857–74; bishop of the Methodist Church in Canada 1874–83, when he became general superintendent of the Methodist Church of Canada; author of *Guiding Eye* and various magazine articles.

Carman, BLISS: See the Appendix.

Carmar′then, or **Caermarthen** (anc. *Maridunum*, Welsh, *Caer Fyrddyn*): a seaport-town of South Wales; capital of Carmarthenshire; on the river Towy, 8 miles from its entrance into the Bristol Channel (see map of England, ref. 11–D). It has a picturesque situation, but the streets are steep and narrow. The Towy, which is here crossed by a bridge, is navigable for vessels of 200 tons from its mouth to this point. Tin plates, cast iron, timber, slates, lead ore, marble, and grain are exported from it. The famous prophet Merlin is said to have been born here. Pop. 11,000.

Carmar′thenshire, or **Caermarthenshire**: a county of South Wales; bounded N. by Cardigan, E. by Brecon, S. E. by Glamorgan, S. by the Bristol Channel (here called Carmarthen Bay), and W. by Pembroke. Area, 974 sq. miles. The surface in the northern and eastern parts is mountainous; the soil of the valley is fertile. It is bounded N. by the river Teify, and intersected by the Towy, which flows through the celebrated Vale of Towy, 30 miles long. Its mineral resources are copper, coal, iron, lead, slate, marble, etc. Capital, Carmarthen. Pop. (1891) 130,574; (1901) 135,320.

Carmathians: See KARMATHIANS.

Car′mel: town; capital of Putnam co., N. Y. (for location of county, see map of New York, ref. 7–K); on N. Y. and North. R. R.; 50 miles N. by E. from New York city, in the Croton water-shed. It is the site of Drew Ladies' College. The well-known summer resort of Lake Mahopac is situated in Carmel township. Pop. of township (1890) 2,912; (1900) 2,598.

EDITOR OF "PUTNAM COUNTY COURIER."

Car′melites, or the **Order of Our Lady of Mt. Carmel**: a monastic order of the Roman Catholic Church; founded on Mt. Carmel in 1156 by the crusader Berthold from Calabria; but the Carmelites claim to have been instituted by the prophet Elijah. They were compelled by the Saracens to wear a striped dress; but later their present brown habit, with white cloak and scapular, was adopted, and they were called "The White Friars." They were at first under the rule given them by Albert, Patriarch of Jerusalem in 1209. They were hermits at first, but when they passed into Europe in 1238, being driven out by the Mohammedans, they began to live in communities, and their rule was mitigated by Pope Innocent IV., and confirmed under the title "Order of Friars of Our Lady of Mt. Carmel" (1247). Carmelite nuns were instituted in 1452. St. Theresa in the sixteenth century reformed them, and the friars as well, and the strict Carmelites are called Discalced or Barefooted Carmelites. They are entirely independent of the former. Their manner of life is very austere. The Carmelite monks and nuns are found, both Mitigated and Discalceate, in almost every country, though in numbers they are much reduced. The pulpit orator Father Hyacinthe (Loyson) was superior of the Barefooted Carmelites in Paris.

Carmel, Mt.: a mountain-ridge of Palestine; extends from the plain of Esdraelon to the Mediterranean, and terminates in a steep promontory in that sea, about 9 miles S. W. of Acre; lat. 32° 51′ 10″ N., lon. 34° 57′ 42″ E. It is formed of limestone, with an admixture of hornstone. Its highest point is 1,740 feet above the sea, and it terminates in a bluff 480 feet above the sea. Oaks, pines, olives, and laurels grow on its summit and sides. Carmel is mentioned in Scripture as the place where the prophet Elijah slew the priests of Baal. He lived there hidden during the reign of Ahab, and the cave in which he found shelter is still shown. From the first passage of Scripture (1 Kings xviii. 19) in which the mountain is mentioned, it appears that it was considered a holy place, where altars were erected to Baal; hence the reason why Elijah selected it for his sacrifice. The exact place where the wondrous contest between Jehovah and Baal took place and the fires proved who was the true God (1 Kings xviii. 17–42) has not been identified. The meaning of the word Carmel in Hebrew is a *park* or *garden*. Near the top of the bluff is a monastery, the inmates of which, eighteen in number, are called CARMELITES (*q. v.*). The ORDER OF MT. CARMEL was a body of 100 knights, all of noble descent, instituted by Henry IV. of France.

Car′men Syl′va: pseudonym of Queen Pauline Elisabeth Ottilie Louise of Roumania; b. Dec. 29, 1843; married Nov. 15, 1869, to Prince Karl von Hohenzollern, proclaimed King of Roumania Mar. 14, 1881. It was not until after her marriage that Carmen Sylva showed her powers as a writer. Her childhood and youth were passed in close companionship with her father, Prince Hermann Karl von Wied, a man of serious and even philosophic mind. She knew also the aged Arndt, and interested herself in many languages and literatures. From 1880 on, however, she has given continual evidences of her own ability as a writer. In that year appeared her *Sappho*; in 1881, *Rumänische Dichtungen* and *Stürme*; in 1882, *Jehovah*, *Die Hexe*, and *Leidens Erdengang*; in 1883, *Pelesch Märchen*. Her lyric poems have been published under the title *Meine Ruh'* (4 vols. 2d ed. Berlin, 1886). Carmen Sylva is universally beloved in Roumania, owing to her efforts to improve popular education and her interest in the development of Roumanian industries. See Kremnitz, *Carmen Sylva* (Berlin, 1882); and Von Stackelberg, *Aus Carmen Sylva's Leben* (4th ed. 1886); Blanche Roosevelt, *Elisabeth of Roumania* (London, 1891).

A. R. MARSH.

Car′mi: city (founded in 1812); capital of White co., Ill. (for location of county, see map of Illinois, ref. 10–F); on L. and N. and C. C. C. and St. L. R. Rs., and on the Little Wabash river; 124 miles E. of St. Louis, Mo., and 38 miles W. of Evansville, Ind. It has 8 churches, good public schools, with school library and lecture course, 2 saw and stave mills, and 3 grist and flour mills. It is situated in the center of a very rich agricultural county, wheat and corn being the principal grains produced; there are large apple and peach orchards. Pop. (1880) 2,512; (1890) 2,785; (1900) 2,939.

EDITOR OF "COURIER."

Carmin′atives: medicines such as cardamoms, ginger, and the essential oils of peppermint and juniper, used for the purpose of remedying flatulence and colic.

Car′mine [from Fr. *carmin*: Span. *carmesí*: Ital. *carmesino* < Arab. *qermazī*, crimson, deriv. of *qermiz*, the cochineal insect; cf. CRIMSON, KERMES; ultim. from Sansk. *kṛimijā*, dye produced by an insect or worm (*kṛmi-*)]: a beautiful red pigment composed chiefly of cochineal, mixed with alumina and a little oxide of tin. It is employed by artists and silk-dyers, and is an ingredient in the best red inks. It is considered the most beautiful of all red pigments, and has been

in use since the middle of the seventeenth century. Under the name of *rouge* it is used by women to paint their cheeks. One of the processes by which it is prepared is as follows: Digest 1 lb. of cochineal in 3 gal. of water for fifteen minutes; add 1 oz. of cream of tartar: heat gently for ten minutes; add ½ oz. of alum, and boil it for several minutes. After the impurities have settled, the clear liquid is placed in clean glass pans or shallow glazed dishes, in which it is allowed to stand while the carmine is slowly deposited. Imitations of carmine are made of red sandal-wood, Brazil-wood, and other substances, and are often sold as *rouge*. See COCHINEAL.

Carmo'na (anc. *Carmo*): a town of Spain; province of Seville; picturesquely situated on a hill or high ridge 21 miles N. E. of Seville (see map of Spain, ref. 19–C). It is near the railway which connects Seville with Cordova. It contains a fine old Gothic church, a ruined castle, and a university. Here are manufactures of woolen fabrics, hats, soap, leather, and exeellent wine and olive-oil. It has a large annual cattle fair. Pop. (1887) 17,459.

Carnac: a village of France; department of Morbihan; 19 miles S. E. of Lorient (see map of France, ref. 4–B). On a wide plain adjacent to Carnac, and near the sea, is a remarkable monument, consisting of about 1,100 to 1,200 (formerly over 4,000) rude obelisks of granite, standing with their smaller ends on the ground, arranged in eleven parallel rows, and from 6 to 21 feet high. Most writers have called these remains Druidical or Celtic, but late authorities ascribe them to a prehistoric race. Pop. 2,900.

Car'nahan, JAMES, D. D., LL. D.: a Presbyterian divine; b. near Carlisle, Pa., Nov. 15, 1775; graduated at Princeton in 1800; was a tutor there 1801–04; licensed 1804. After holding several pastorates, he became in 1823 president of Princeton College, performing his duties with fidelity and wisdom till his resignation in 1854. D. in Newark, N. J., Mar. 2, 1859.

Carnahu'ba Palm, or **Caranai'ba Palm** (*Copernicia cerifera*): a beautiful palm which abounds in the north part of Brazil. It seldom attains a height of more than 40 feet. The

Carnahuba palm.

fruit is edible, and the timber is valuable for several purposes. The young leaves are coated with wax, which is collected, and, like the wax of certain other species of palm, is an article of commerce. Its timber is exported to Great Britain, where it is used for veneering.

Car'nallite: a hydrated chloride of potassium and magnesium, which occurs in coarse granular masses, mixed with rock-salt, near Magdeburg, in Prussia. It is used as a fertilizer of the soil.

Carnar'von, or **Caernarvon** (anc. *Segontium*): a seaport-town of North Wales; capital of Carnarvonshire; on the east side and near the southwest end of the Menai Strait, which separates it from the island of Anglesey (see map of England, ref. 8–D). It is 7 miles S. W. of the Menai bridge, and about 60 miles W. S. W. of Liverpool. The harbor will admit vessels of 400 tons, and steamboats ply between this port and Liverpool. Carnarvon is a much-frequented watering-place, and has beautiful scenery in the vicinity. Here is a castle founded by Edward I. in 1282, which now forms one of the most imposing ruins in the kingdom. It has thirteen embattled towers surmounted by turrets. Carnarvon is about half a mile from the site of *Segontium*, an ancient Roman town or station. Pop. 10,000.

Carnarvon, HENRY HOWARD MOLYNEUX HERBERT, Earl of: an English Conservative statesman: b. in London, June 24, 1831; succeeded his father as fourth earl in 1849. He was appointed Secretary of State for the Colonies in June, 1866, and he framed a plan for the confederation of the British North American colonies, which was approved by Parliament. He resigned in Mar., 1867, because he was opposed to the Reform bill which Disraeli introduced; resumed office under Disraeli in 1874; resigned in 1878. During the Conservative administration of 1885–86 he was Lord-Lieutenant of Ireland; author of *The Druses of Mount Lebanon* (1860), etc. D. June 28, 1890.

Carnar'vonshire, or **Carnarvon**: a county of North Wales; bordering on the Irish Sea; has an area of 577 sq. miles. It is bounded N. W. by Menai Strait and Carnarvon Bay, N. by the Irish Sea, E. by Denbigh, and S. by Merioneth and Cardigan Bay. The surface is very mountainous, and the scenery is remarkably grand. Here is Snowdon, which is the highest mountain in Wales, and rises 3,571 feet above the level of the sea. Among the minerals of this county are copper, lead, zinc, coal, and roofing-slate. The chief branch of rural industry is the rearing of black cattle for the dairy. Carnarvonshire is traversed by the Chester and Holyhead Railway, which crosses the Menai Strait. Capital, Carnarvon. Pop. (1891) 117,586; (1901) 125,654.

Carna'tion [from Lat. *carnatio*, fleshiness, deriv. of *caro*, *carnis*, flesh; but cf. Ital. *carnagione*, flesh-color]: This term is used in painting, and is applied to the flesh-tints or natural color of flesh; also to the parts of a picture which represent the nude human figure. The term is not in very common use at present; the phrase flesh-tints seems to have replaced it.

Carnation: the most popular ornamental plant of the pink family, known to botanists as *Dianthus caryophyllus*. The aboriginal form of the carnation is not certainly known, but it is pretty generally agreed that its wild prototype now grows in France and some other parts of Europe. The carnation has been cultivated for several centuries, and flowers were known in old times which were nearly 4 inches across. The species is immensely variable, in the color and shape of the flower, and in the character of the plant. The common

Carnation.

carnations are essentially greenhouse plants; but there is a tribe of outdoor or border varieties which deserves to be better known. Carnations are commonly classified into four groups distinguished by the markings of the flower: *Selfs*, or those having but one color; *picotees*, those having white

petals margined across the end by a band of color: *flakes*, with two colors in broad stripes running lengthwise the petals; and *bizarres*, with three colors disposed in stripes or spots. The common carnation is ordinarily treated as an annual. It is started from short cuttings in late winter, and the plants are commonly set in ground in the open during summer. They are taken up late in the fall and transferred to the glasshouse, where they bloom more or less continuously throughout the winter. One of the chief faults of the large carnations is their habit of bursting the calyx with expansion of the flower. Carnation-growers now desire varieties with short and broad calyxes which possess pouch-like expansions to take up and equalize the pressure.

L. H. Bailey.

Carne'ades (in Gr. Καρνεάδης): a Greek philosopher and orator; b. at Cyrene, in Africa, in 213 B. C. He opposed the doctrines of the Stoics; was the founder of a school called the New Academy, and maintained that man has no criterion of truth. He was distinguished for his subtle dialectic and powerful and specious eloquence. In 155 B. C. he was sent as ambassador from Athens to Rome, where he gained much applause by his orations. One day he eulogized justice, and the next day refuted himself by a sophistical argument tending to confound the distinction between justice and injustice. This offended Cato, who caused him to be expelled from Rome. D. at Athens about 129 B. C.

Carnegie, kar-nĕg'i, Andrew: manufacturer; b. at Dunfermline, Scotland, Nov. 25, 1835; removed with his family to the U. S. in 1845; settled at Pittsburg, and began his career two years later by attending a small stationary engine; became successively telegraph-messenger, operator, clerk of the superintendent of telegraph-lines of the Pennsylvania R. R. Co. at Pittsburg, and superintendent of the Pittsburg Division of the Pennsylvania R. R. While a clerk in the superintendent's office he aided in the introduction of the Woodruff sleeping-car, which gave him the nucleus of his present fortune. Subsequently he formed one of a syndicate which purchased the Storey farm on Oil Creek for $40,000, which in one year yielded over $1,000,000 in cash dividends. He associated with others in establishing a rolling-mill, which has grown to be the largest and most complete system of iron and steel industries in the world. Besides managing these great business enterprises, he has been the owner of a number of British newspapers, which are edited in the interests of Radicalism. He has spent large sums of money for educational and charitable purposes. In 1879 he established commodious swimming-baths for the use of the people in his native town; the following year gave $40,000 for a free library there; gave $50,000 in 1884 to the Bellevue Hospital Medical College for a histological laboratory; gave $500,000 in 1885 for a public library at Pittsburg; and in 1886 gave $250,000 for a music-hall and library at Allegheny City, Pa. In 1890 a large music-hall was erected in New York through his instrumentality. He has given $250,000 for a library in Edinburgh, $50,000 for a library at Ayr. In 1900 his gifts, mostly to public libraries and industrial institutions, aggregated about $5,000,000. He has contributed many articles to periodicals on social and economic topics, and is the author of *An American Four-in-hand in Britain* (1883); *Round the World* (1884); and *Triumphant Democracy* (1886). C. K. Adams.

Carneiro Leão', Honorio Hermeto: Brazilian statesman; b. at Jacahy, province of Minas Geraes, Jan. 11, 1801; studied law, and before he was thirty years old had attained high judicial honors. Elected deputy in 1830, he was successively re-elected, voting with the moderate liberals but retaining his political independence. By exposing a revolutionary scheme in 1832 he saved the country from great danger, but made many enemies. From Sept., 1832, to Mar., 1833, he was Minister of Justice. In 1836 he joined the new conservative party, and quickly became its chief. In 1841 he was chosen senator; shortly after was president of Rio de Janeiro; was Prime Minister Jan., 1843, to Feb., 1844; president of Pernambuco 1849, and envoy to the Platine states 1851; received the title of Viscount of Paraná July, 1852, and of Marquis of Paraná Dec., 1854, when he again became Prime Minister. He remained in power until his death at Rio de Janeiro, Sept. 3, 1856. Herbert H. Smith.

Carneiro de Campos, José Joaquim: Brazilian statesman; b. at Bahia, Mar. 4, 1768. He graduated in law at Coimbra, Portugal, and returned to Brazil in the fleet which carried the royal family to Rio de Janeiro. He was at once employed in important government offices, and in 1823 was a member of the Brazilian constituent assembly. In politics he was a moderate liberal, without strong party prejudices, and his probity and sincerity won him universal respect. He was three times minister, councilor of state, and from 1826 senator from Bahia. In 1826 he was created Marquis of Caravellas. On the abdication of the Emperor Pedro I., he was elected one of the three regents to govern Brazil during the minority of Pedro II. D. at Rio de Janeiro, Sept. 8, 1836. Herbert H. Smith.

Carne'lian, or **Corne'lian** [Fr. *cornaline*, deriv. of Lat. *cornu*, horn; the other form with *car-* is due to influence of Lat. *carnem*, flesh]: a name given to a fine variety of chalcedony; red or flesh-color, and rarely milky white. It has a conchoidal fracture. Beautiful specimens are found in Hindustan, where they are highly prized, and are manufactured into various ornamental articles; it is found also in Scotland and in many parts of Europe and America. The bright, clear red carnelian is most valued.

Car'nifex Ferry: over the Gauley river, Nicholas co., Va.; about 8 miles below Summerville; gives its name to the severe action on the north bank of the river near this ferry Sept. 10, 1861. The Confederates under Gen. Floyd, numbering about 5,000, had strongly intrenched themselves in this position, where they were attacked by the forces under Gen. Rosecrans on the afternoon of Sept. 10. Darkness terminated the battle of the day, and during the night Gen. Floyd, being largely outnumbered, escaped with his command across the Gauley river, destroying his bridge behind him, which prevented pursuit. All the camp equipage and munitions of war fell into the hands of the Federal forces.

Carnio'la (in Germ. *Krain*): a division or crown land of the Austrian empire; bounded N. by Carinthia, N. E. by Styria, S. E. and S. by Croatia, and S. W. by the Adriatic Sea and the Littoral province. It was formerly a part of the kingdom of Illyria. Area, 3,856 sq. miles. The surface is mountainous, and partly occupied by the Carinthian Alps. Among its remarkable physical features are Lake Zirknitz and the rock-bridge of St. Kanzian, which is 130 feet high. The chief river is the Save. Carniola contains the quicksilver mines of Idria, which are among the richest in the world. Iron, coal, and marble also occur. Among the products are flax, silk, honey, and wine. Pop. (1890) 498,958.

Carnival [from Ital. *carneva'le*, explained either by help of the Med. Lat. *carneleva'rium*, *carnileva'men*, as removal of flesh, or from a Lat. *currus nava'lis*, boat on wheels, from a supposed usage of the processions. The explan. from Ital. *carne*, flesh + Lat. *vale*, farewell, is mere folk-etym.]: a festival in the Roman Catholic countries of Europe just preceding Lent. It was formerly most brilliantly celebrated at Venice; later, especially in Rome. Like many other usages in modern Europe the customs connected with the carnival probably originated in the heathen spring-time festivals, as the Lupercalia and Bacchanalia of the Romans and the Yule-feasts of the Germans. During the Middle Ages costly banquets with the rich, and drinking-bouts among others, marked the time. The carnival at Rome sometimes lasts eight days, during which the whole city is given up to revelry, the center of which is the street called the *Corso*. In this all the houses are hung with crimson drapery, and each afternoon continuous lines of carriages and promenaders pass through it. Most of those who appear in the street are masked, and an incessant interchange of bouquets, *confetti*, and other harmless missiles makes a scene of extreme liveliness. At six o'clock, after the firing of cannon and the clearing of the Corso by troopers, a number of horses are let loose at one end of the street, and are urged by the shouts of the people to full speed. The last event of the Carnival week is the celebration of the *Moccoletti*. For this, after dark, all the revelers, on foot, in carriages, and at the windows of the Corso, provide themselves with a number of small lighted tapers, which each endeavors to preserve, while he puts out as many as possible of those of his neighbors. The political disturbances of Italy somewhat depressed these festivities from 1859 to 1870.

Carniv'ora [neut. pl. (sc. *animalia*) of Lat. *carni'vorus*, flesh-eating; *carn-em*, flesh + *vora're*, devour]: animals which prefer flesh and eat little or no vegetable food. They belong to the class *Mammalia*, the name *Feræ* being an earlier name for the same group. It is characteristic of them to have sharp cutting teeth, simple stomachs, very muscular bodies, and active habits. This order includes, among other

animals, all those quadrupeds which are properly called beasts of prey, excepting a few of the marsupials of Australasia, which are carnivorous in their habits, and resemble in their external characters certain animals of this order, which they may be said to represent in the native fauna of that region. Interesting fossil remains of carnivora are referred to the eras just preceding and just following the glacial period. The order is divided into several families, as Felidæ, Mustelidæ, Ursidæ, Canidæ, Phocidæ, etc. (*q. v.*).

Carnivorous Plants: See Insectivorous Plants.

Car'nochan, John Murray, M. D.: b. at Savannah, Ga., July 4, 1817; studied medicine at Edinburgh and various places on the continent of Europe; began practice in New York in 1847; soon gained distinction for his bold and successful surgical operations. Thus he excised the whole trunk of the second branch of the fifth pair of nerves for the cure of neuralgia, depending upon disease in the nerve. This nerve was cut out from the infraorbital foramen to the foramen rotundum, and consequently involved an operation through the malar bone to the base of the skull. In 1852 he tied the femoral artery, and thus ingeniously cured a disease of exaggerated nutrition, *elephantiasis arabum*, which operation has been accepted in Europe and extensively practiced. He also tied the primitive carotid artery on both sides for the cure of elephantiasis of the head-base and neck. He exsected the entire radius in 1853, the entire ulna in 1854, and also exsected the entire lower jaw and the calcaneum. In 1851 he became Professor of Surgery at the New York Medical College and surgeon-in-chief to the State Immigrant Hospital. He published many valuable professional monographs and lectures; a treatise on *Congenital Dislocations* (1850); a translation of Rokitansky's *Pathological Anatomy*, etc. D. in New York, Oct. 28, 1887.

Carnot, kär'nō', Lazare Hippolyte: a French radical republican; son of L. N. M. Carnot; b. at St.-Omer, Apr. 6, 1801. He was a member of the Chamber of Deputies from 1840 to 1848, and was Minister of Public Instruction from February to July of that year. In 1864–68 he was again a member of the Legislative Assembly. In 1871 he was again elected to the Assembly, where he voted with the extreme left. He wrote an able work on Saint-Simonism, and published the memoirs of his father (2 vols., 1860–64). D. Mar. 16, 1888.

Carnot, Lazare Nicholas Marguerite: soldier and statesman; b. in Nolay, Burgundy, May 13, 1753, of one of the oldest and most distinguished families of France. He was educated as a soldier and a military engineer, and at eighteen distinguished himself so greatly as to earn a second lieutenancy in the corps of engineers. He was honored with the laurel crown in 1783 for his eulogy on Vauban, and was sent to the legislature by the Pas-de-Calais, and later, as a member of the Convention, voted for the execution of Louis XVI. He took a prominent place among the revolutionists, and was regarded by his countrymen as the genius of victory, exhibiting the talents later illustrated by the German Von Moltke. He was Minister of War before the consulate was established, and voted against its extension, as well as against the empire; but, defeated, retired to private life in the early days of the latter. He died, proscribed, at Magdeburg, in 1823. R. H. Thurston.

Carnot, Marie François Sadi: President of the French Republic; b. at Limoges, Aug. 11, 1837; the son of Adolphe Carnot and grandson of L. N. M. Carnot, "the organizer of victory" of the time of the first Napoleon. He was a grandnephew of the famous "founder of the science of thermodynamics," the first Sadi Carnot, and was by profession an engineer. He was educated at the École Polytechnique and the École des Ponts et Chaussées, Paris, graduating at both with high distinction. He was immediately assigned to duty in the engineer corps and given tasks of considerable importance, which were admirably performed. His first active service was performed during the siege of Paris, 1871, when he was made Prefêt de la Seine-Inférieure, and discharged the duties of commissary-general under peculiarly trying circumstances with marked success. He took part in all important works of defense, and distinguished himself as much by his knowledge of the art of war as by his gallantry in the face of the enemy. He was a republican, and earnest in his republicanism. He was elected to the National Assembly in 1871 by the Côte-d'Or, and immediately became prominent in its discussions. In 1876 he became the secretary of the Chamber of Deputies, taking his seat as member for Beaune; became Secretary of Public Works in 1878, and there had ample scope for his engineering and constructive talent. He was promoted to the ministry of Public Works in the cabinet of 1881–82; made Minister of Finance in 1882 and again in 1886, with Brisson as Premier; and on the resignation of M. Grévy was elected by the Legislature, Dec. 3, 1887, to fill the president's chair.

In his message of Dec. 12 he outlined a policy of practical reforms, economical administration, peace with foreign nations, and the promotion of the efficiency of the army and navy—a policy which he followed with fidelity and success throughout his administration. He had many difficulties to contend with in the hostility of the different factions. The supporters of Boulanger, the socialists, and the anarchists were the most disturbing elements in the state, but he won the confidence of all conservative republicans. The attempt of his enemies to involve his name in the Panama scandal proved an utter failure. On the night of June 24, 1894, while attending an exposition at Lyons, he was stabbed by an Italian anarchist and died the following day. His successor in office was M. Casimir-Périer. R. H. Thurston.

Carnot, Nicholas Leonard Sadi: "founder of the modern science of thermodynamics"; b. June 1, 1796, in the smaller Luxembourg, where his father, the genius of the army in the days of the consulate, was living as member of the Directory. A year later they were obliged to flee in consequence of proscription. The boy, delicate in constitution and affected still more seriously by the vicissitudes of the life which his mother was compelled to lead, continued weak in body, but grew rapidly in power and strength of mind. His father returned to France during the consulate of Napoleon, and was made Minister of War, the child thus being brought into Paris, where he was educated, in part, in the presence of Napoleon. He was admitted to the Polytechnic School at sixteen in the year 1812. Two years later he left the school with the rank No. 6, and was sent into the field to engage in work on fortifications. In 1819 he was made a member of the staff, where he found large opportunities for scientific study, and devoted himself to it with enthusiasm and success. The outcome of this work was a small but now famous book, *Réflexions sur la puissance motrice du feu*, the first of modern works on thermodynamics, the science of heat and work transformations. In this little treatise, as subsequently brought to light by Sir William Thomson, Carnot anticipates all the great discoveries and principles of science of the later thermodynamists Rankine and Clausius, including the common efficiency of all working substances, the constant values of the specific heats, the thermodynamic cycle, and the idea of its reversibility. He even computed a rough measure of the "mechanical equivalent" of heat, and asserted the unchangeability of the aggregate energy of the universe and its transformability. He recognized the modern theory of the nature of heat-motion, but based his work on the older material theory in deference to the views of the scientific men of his time. Carnot's studies were interrupted by the revolution of 1830, into which he entered with enthusiasm. D. of cholera in Paris, Aug. 24, 1832. See *Réflexions sur la puissance motrice du feu* (Paris, 1824); also a translation by the writer (New York, 1890). R. H. Thurston.

Caro, kär'ō: capital of Tuscola co., Mich. (for location of county, see map of Michigan, ref. 6–J); on Mich. Cent. R. R. (Bay City Div.); on Cass river; 100 miles by rail N. N. W. of Detroit. Caro has five churches, new central school, new city-hall, flouring-mills, lumber and stave factories, water-works supplied by springs, and electric lights. The chief industries of the surrounding region are agriculture and stock-raising. Pop. (1880) 1,282; (1890) 1,701; (1900) 2,006.

Editor of "Tuscola County Advertiser."

Caro, kaa'rō, Annibale: b. in 1507 at Citta Nuova, near Ancona, Italy, in the Papal States; was for several years a tutor in the family of Lodovico Gaddi; entered after the latter's death (in 1543) the service of Lodovico Farnese, a natural son of Pope Paul III., and since 1545 Duke of Parma and Piacenza; accompanied in 1548 Cardinal Alessandro Farnese to Rome, where he died in 1566. His works occupy a foremost place in the Italian literature of the sixteenth century. They comprise a translation of the *Æneid*; *Rime* (1569); *Lettere familiari* (2 vols., 1572–75), etc. A collected edition appeared in 1757 in six volumes.

Caro, kär'ō', Elme Marie: French philosopher; b. in Poitiers, Mar. 4, 1826; lecturer in the École Normale of

Paris 1857; professor at the Sorbonne 1867; member of the French Academy 1876. His lectures in defense of Christianity were very popular, especially with women. Author of *L'Idée de Dieu et ses nouveaux Critiques* (7th ed. 1883); *La Philosophie de Goethe* (2d ed. 1880); *Le Matérialisme et la Science* (4th ed. 1883); *Études Morales sur le Temps présent* (4th ed. 1879); *Mélanges et Portraits* (1888). D. July 13, 1887.

Car'ob, or **Algaro'ba** [Arabic, *kharoob*]: a tree (*Ceratonia siliqua*) of the family *Leguminosæ*; a native of the countries around the Mediterranean. It has pinnate, evergreen leaves, with two or three pairs of large oval leaflets.

Carob.

The fruit is a brown pod, 4 to 8 inches long, having a fleshy or mealy pulp of an agreeable taste, which is extensively used as food by the Arabs, Moors, and Italians. This fruit or pod is supposed to be the same as the article translated "husks" in the parable of the Prodigal Son; and it is thought by some that the locusts eaten by John the Baptist were these pods. They are exported to Great Britain and the U. S. under the name of locust-beans; also called "St. John's bread." The wood of the carob is hard and valuable.

Caroli'na Mari'a: Queen of Naples; b. Aug. 13, 1752; a daughter of Francis I. and Maria Theresa of Austria. She was married in 1768 to Ferdinand, King of the Two Sicilies, over whom she obtained great influence. She persuaded him to join the coalition against Bonaparte, who expelled King Ferdinand from his kingdom in 1806. D. in Vienna, Sept. 8, 1814.

Carolina, North: See North Carolina.

Carolina, South: See South Carolina.

Car'oline Ame'lia Elizabeth: Queen of England; b. May 17, 1768; a daughter of the Duke of Brunswick and a niece of George III. of England. She was married in 1795 to the Prince of Wales, afterward George IV., who regarded her with aversion, and separated from her soon after the birth of their daughter, the Princess Charlotte. On the accession of George IV. in 1820 she was prosecuted on a charge of adultery, was defended by Mr. Brougham, and was not convicted. D. Aug. 7, 1821.

Caroline Books, The (*Libri Carolini*): exercised a decisive influence—at least so far as the Latin Church was concerned—on the settlement of the question of image-worship. The second synod of Nicæa (787) declared in favor of images, and Pope Adrian I., who had participated in the synod, accepted its decrees and communicated them officially to Charlemagne and the Frankish Church. Charlemagne, however, who at that moment was not on good terms with the Byzantine court and suspected the pope of playing false, determined to have not only the authority of the synod, but also the orthodoxy of its decrees thoroughly scrutinized by his own theologians; and the result of that scrutiny was the *Libri Carolini*. The work is divided into four books, or 120 chapters, and contains a very sharp criticism of the synod and its decrees. The principle which it tries to establish is this: Christian art must have full freedom in its representation of Christian ideas, but any superstitious misuse of such artistic creations must be rigidly excluded. It was sent to the pope, who received the rebuke with complete submission, and the further decisions of the synods of Frankfort (794) and of Paris (825) were based on it. The best edition of the work is that by Heumann (Hanover, 1731).

Caroline Islands: an archipelago of Micronesia; situated between the Philippines, the Ladrones, the Marshall islands, and New Guinea, and extending from lat. 3° 5′ to 12° N. (see map of World, ref. 5–C). Area, 560 sq. miles. They number about 500 islands. The greater portion of the inhabitants are of the Malay race. The islands were discovered in 1543, and named after Charles V. The Spaniards always claimed them as forming part of the Philippines. In 1885 the Caroline islands were claimed by Germany. The sovereignty of Spain over these islands was decided by the pope the same year, and admitted by Germany and Great Britain. Pop. 36,000.

Carolus-Duran, kăr'ō-lŭs-dü'raăn, Auguste Émile: painter of portraits and of figure subjects; b. at Lille, July 4, 1837; pupil of Souchon. He is universally known as Carolus-Duran, but his family name was Durand, and he was christened Charles A. E. His portraits of women are brilliant and are much in fashion. He is a painter of great technical skill and a colorist of genuine merit. One of the best of his portraits, the *Lady with the Glove* (1869), is in the Luxembourg Gallery, and a ceiling representing *The Triumph of Marie de Medici* is in the Salle Beauvais in the Louvre. He greatly admires Velasquez, and his own work possesses some of the qualities that distinguish the work of that great master, though not comparable to them in artistic value. He received the medal of honor at the Salon of 1879, and was created commander of the Legion of Honor in 1889. A number of contemporary American artists have been his pupils in his painting-school in Paris. He is a sculptor of considerable ability and a talented musician. Studio in Paris. William A. Coffin.

Carom: See Billiards.

Caron, Sir Joseph Philippe Réné Adolphe: Canadian statesman; b. in the city of Quebec in 1843. He graduated at McGill University in 1865; was admitted to the bar the same year, and became a member of the law firm of Andrews, Caron & Andrews, Quebec. He was elected to the Dominion Parliament in 1873, and to each succeeding Parliament up to and including that of 1891. He was appointed Minister of Militia Nov. 9, 1880, a cabinet appointment which he held up to Jan. 25, 1892, when he was appointed Postmaster-General. He was knighted in 1885, in recognition of his services in suppressing the Northwest rebellion. Neil Macdonald.

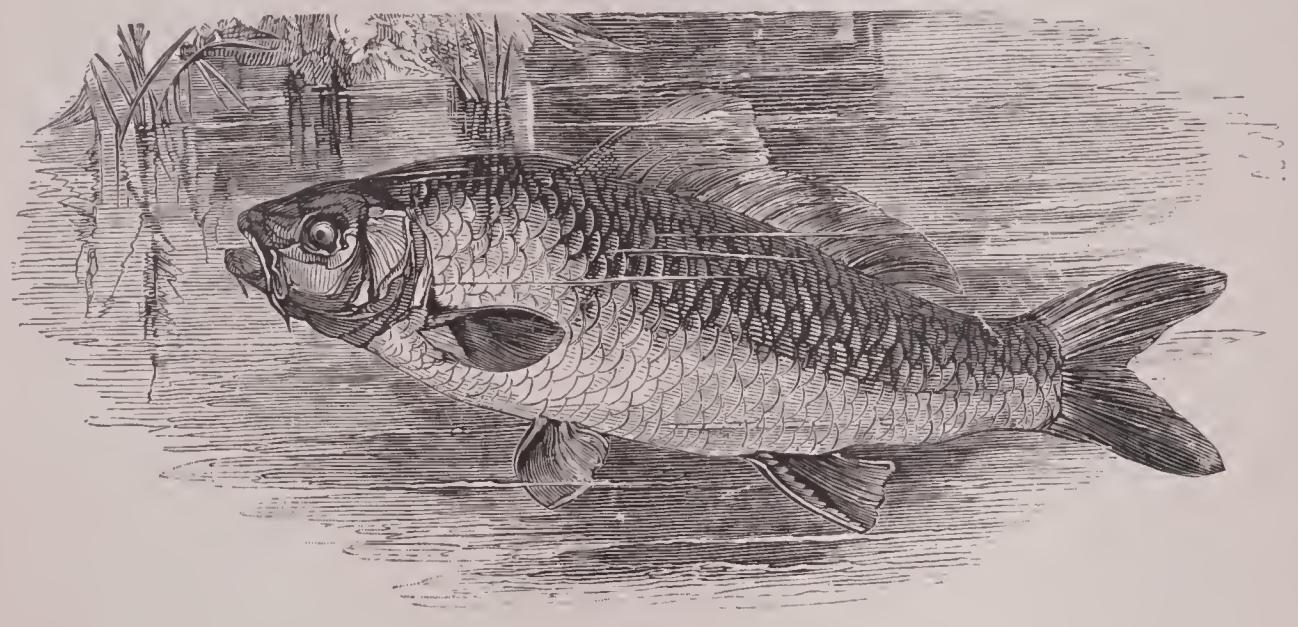
Carot'id Ar'tery [Gr. καρωτίδες, the carotid arteries, from καροῦν, to stupefy, because pressing upon them produces sleep (κάρος)]: the large artery which lies at the side of the neck and supplies blood to the head and brain. On the right side the primitive or common carotid artery is one of the branches of the innominate artery which springs from the arch of the aorta. On the left the common carotid springs directly from the arch of the aorta. Opposite the upper part of the larynx the common or primary carotid artery divides into an external and an internal branch, the former supplying the tissues of the neck, face, tongue, and other external parts with blood, the latter entering the cranium through the carotid canal and supplying the membranes and substance of the brain. The common carotid and the branches at their origin are comparatively superficial and may be readily felt. They may be wounded in stabs and in attempted suicide, though in the latter case the wound rarely penetrates deep enough to injure this vessel.

Frequently the carotids pulsate vigorously and visibly, especially in certain forms of heart disease and in anæmic persons. Aneurism of the carotid artery is occasionally observed, and has called for the operation of Ligation (*q. v.*). The circulation in the brain is not materially interfered with by it, on account of the free anastomosis of the smaller branches with those from the carotid artery on the other side. W. P.

Carouge, kaä′roozh′: a town of Switzerland; canton of Geneva; on the river Arve; 1½ miles S. of Geneva; beautifully situated, and surrounded by elegant villas and orchards (see map of Switzerland, ref. 7–A). It has manufactures of watches, leather, pottery, and thread. Pop. (1888) 5,703.

Carp (*Cyprinus carpios*): a fresh-water fish of the family *Cyprinidæ*; distinguished by its toothless jaws, its fleshy lips and small mouth with four barbels on its upper jaw, its stout teeth on the pharyngeal bones, its olive-brown color above shading off into yellow below, its excellence for food, the ease with which it is propagated, and the variety of conditions under which it will thrive. It will live for days with no other water than that afforded by wet moss, and it is said to attain at times to the age of 200 years. A carp weighing 10 lb. was found by Schneider to contain no less than 700,000 eggs. It thrives best in the quiet waters and soft, muddy bottoms of the southern temperate zone, though is is found in all the countries of Northern Enrope and in America, and is a favorite fish in China. The weight at five years old is from 3 to 6 lb. It is now becoming abundant in the lower Sacramento, where it has fallen under the displeasure of hunters and sportsmen, because it feeds upon and destroys the water-celery which makes a large part of the food of the canvasback-duck, and upon which the delicate flavor of that bird is supposed to depend.

Carp-culture.—The culture of carp for food has long been a very important industry in many parts of the world. This fish is common not only in most of the large rivers of South-



The carp.

ern and Central Europe, but has been grown in artificial ponds with extraordinary success. In point of ease of culture, rapidity of growth, and excellence of quality for the purposes of food, the carp has no superior. In the great cities of Central Europe, such as Vienna, Berlin, and Paris, where there is an abundant supply of the differents kinds of salt-water and fresh-water fish, the carp is a favorite, and, if we except trout and salmon, commands ordinarily a higher price in the market than any of the others. In addition to its excellence in point of quality it must be considered as one of the most important food-producers from an economic point of view. It destroys no valuable food matter, for its food consists for the most part of produets of nature whieh could not otherwise be of use. It is so easily satisfied with the soil and water in which it grows that it can easily be raised almost anywhere, and it grows so rapidly that under good management it brings a prompt and profitable return for the investment.

History and Varieties.—The carp, it is supposed, was originally introduced into Europe from Central Asia. But whatever its origin, it is now common in most of the rivers of Europe, and in many parts, especially in Austria and in Southern, Central, and Northern Germany, it has been domestieated by means of artificial culture. In Austria, where there are the most extensive carp-fisheries in the world, the culture can be traced back historically as far as the year 1227. A celebrated establishment for the culture of this fish was located early in the fourteenth century in the town of Wittengau in Bohemia. This estate, after suffering much from the Thirty Years' war, passed into the possession of the Princes of Schwarzenberg in the year 1670. At the present time it is said that artificial ponds for the culture of carp in these domains comprise an area of no less than 20,000 acres, with an annual product of about 500,000 lb. Carp are said to have been imported into England in the year 1504, and are now found in very many of the streams and ponds of Great Britain. Of the species most profitably cultivated there are three varieties, popularly known as the *scale-carp*, the *mirror-carp*, and the *leather-carp*. The first of these is characterized by regular, concentrically arranged scales covering nearly the whole of the body. The mirror-carp is so named on account of the extraordinarily large, brilliant scales which run along the sides of the body in three or four rows, leaving the rest comparatively bare. The leather-carp has on its back only a few scales or none at all, and is covered with a thick, soft, velvety skin. All three of these varieties are suitable for culture. Though the scale-carp is perhaps the most popular in market, the others are equally good for food, and the leather-carp has the advantage of being less liable to injury in transportation. The breaking of the scales from any aeeidental eause is liable to injure the fish so seriously as to produce its death. These species of carp are frequently crossed with related species, the result generally being the production of an inferior fish; and in stocking new ponds care should be taken to ascertain the genuineness of the species offered. There is a very common cross between the genuine carp and what is known as the Crucian carp, resulting in a very poor and bony fish which in Germany is often called the "poor man's carp." It should be well understood that sueeess in earp-culture depends very largely upon the care with which varieties are selected.

Adaptability to Artificial Culture.—For carp-culture it is of the greatest advantage that this fish is able to live and thrive in waters where other fish could not possibly exist—for example, in the pools of bogs and sloughs. The earp lives upon vegetable food as well as upon worms and larvæ of aquatic insects which it finds in the mud. It is easily satisfied with refuse from kitchens, slaughter-houses, and breweries, and even with the excrement of cattle and pigs. Added to these advantages is the fact that it takes no food from about the first of October until about the end of March. During this period each year it hibernates, and, though it eats nothing whatever during its winter sleep, it does not diminish in weight. In summer it grows rapidly. In the month of May a carp two years old increases in weight under good conditions about 15 per cent., while in June its increase is about 33 per cent., and in July about 36 per cent. If the weather is not unusually cold, a carp may be eounted upon to increase during the second year of its growth by about 110 per cent., reaching a weight at the third year of its age of about 3 or 4 lb. Under favorable conditions the fish grows steadily year by year until it reaches 15 or 20 lb., although the growth after the fifth or sixth year is less rapid than before. Carp weighing from 40 to 60 lb. each have been taken in some of the waters of Europe. These, however, are so unusual as to attract very general attention. The longevity of the fish is remarkable, individual specimens having been known to live more than 140 years. Not less remarkable is its extraordinary rate of inerease. A fish weighing from 4 to 5 lb. contains, it is said, on an average from 400,000 to 500,000 eggs. The eggs, after being deposited, develop themselves rapidly if assisted by warm water. About the twelfth or, at the latest, the fifteenth day the embryo fish breaks through its envelope. In colder waters as many as twenty days are sometimes required. The carp prefers stagnant or slowly running waters

with a muddy bottom, so that it can avail itself of aquatic plants as well as of seeds, worms, and the larvæ of water insects. It does not attack other fishes, and therefore on account of its harmlessness is an excellent fish for the culturist as well as for stocking large lakes and rivers in general.

Localities Adapted to Culture.—A rocky, gravelly ground is not advantageous for carp; neither is a sandy ground, unless it has with it a considerable admixture of clay and loam. A ground that contains some marl or some of the elements of humus is of the greatest advantage. The most successful carp ponds of Europe ordinarily have a yellow, muddy color, from the fact that the constituents of humus have been dissolved, and thus support a profuse number of microscopic beings which are consumed by larger creatures, thus becoming adapted to the wants of carp. While the humus of a mucky soil in sufficient quantity is desirable, too much is found to be injurious. Water running through boggy meadows or oak woods contains too much humic acid and tannin, and therefore is not advantageous. Mineral waters must also be avoided. The most favorable situations are those offered by rivers and brooks that have run through fertile fields and meadows, carrying with them the drainage of farms and villages. Spring water direct from the ground is not favorable. A stream running for a considerable distance through a low, undulating country, with only slight elevations or hills, where small valleys by means of dams are converted into ponds, gives the most favorable opportunities for the successful culture of carp. Where the business of carp-culture has been undertaken on a large scale it has been found that four different ponds are desirable: (1) a spawning-pond; (2) a raising-pond; (3) a stock-pond; and (4) a winter-pond. All the necessary details in regard to the construction of artificial ponds may be found in the publication of the U. S. fish commissioner entitled *Pond Culture*, by Carl Nicklas (Washington, 1886). See also *The Carp: its Culture in Rivers and Lakes, and its Introduction into America*, by Rudolph Hessel (Washington, 1881). C. K. Adams.

Carpa'thian (or **Karpathian**) **Mountains** (in Germ. *Karpathen*; anc. *Carpates*): a long curvilinear range of mountains, chiefly in the Austrian empire. It separates Hungary from Galicia, and Transylvania from Moldavia and Wallachia, and is nearly in the form of a semicircle, one end of which meets the Danube at Presburg and the other touches the same river at New Orsova. This chain, which is about 800 miles long, is divisible into two portions, called the Eastern and Western Carpathians, the latter of which extends along the north border of Hungary. The highest points of the Eastern Carpathians, which are of primitive formation, are Negui, 8,573 feet, and the Kuhhorn, 7,303 feet. Among the Western Carpathians the Eisthalerspitze rises 8,875 feet above the sea. Many of the Hungarian mountains are formed of limestone. The sides of the Carpathians are mostly covered with forests of pine, beech, and other trees. The vegetation presents four zones—that of the beech, to 4,000 feet above the sea; that of the Scottish fir, to 5,000 feet; that of the dwarf-pine; and that of the moss. Minerals, including gold, silver, copper, iron, and quicksilver, are abundant.

Carpeaux, kaär'pō, Jean Baptiste: sculptor; b. in Valenciennes, France, in 1827. He established his reputation in 1863 by the group *Ugolino and his Children*. His most celebrated works are a group representing *The French Empire spreading Light over the World, and protecting Agriculture and Sciences*, made for one of the pediments of the Flora Pavilion of the Tuileries in 1865, and another representing *La Danse*, made in 1869 for the New Opera. He was one of the most prominent representatives of the naturalistic school. D. Oct., 1875.

Carpel [from Gr. *καρπός*, fruit]: an ovule-bearing leaf in the cover-seeded flowering plants (*Angiosperms*), constituting the pistil, wholly or in part. When the pistil is composed of one carpel it is simple, but more commonly two or more carpels are united, the result being a compound pistil. Pistils are thus monocarpellary (as in beans), bicarpellary (as in mustard), tricarpellary (as in lilies), tetracarpellary, etc.

Carpenta'ria, Gulf of: a broad and deep indentation of the north coast of Australia; a portion of the South Pacific Ocean. It extends from Cape Arnhem to Cape York, and is about 500 miles long from N. to S. and 350 miles wide. It is mostly included between lat. 10° 40′ and 17° 30′ S., and between lon. 138° and 142° E. Its shores are generally low. It incloses numerous islands. It is visited by vessels for the *bêche de mer* which is found in its waters. It was named in honor of Peter Carpenter, who from 1623 to 1627 was governor-general of the Dutch possessions in the East Indies. It has been explored by Cook (1770); Flinders (1802); Stoke (1841); Leichardt (1845); Gregory (1856); Landsborough (1861–62); and McKinlay (1862).

Carpenter, Charles C.: naval officer; b. in Greenfield, Mass., Feb. 27, 1834; entered the navy as a midshipman Oct. 1, 1850. He was executive officer of the Catskill in the attacks on the forts of Charleston harbor of Apr. 7 and July 10, 1863. In command of navy-yard, Portsmouth, N. H., Apr., 1892. Retired as rear-admiral in 1896. D. Apr. 2, 1899.

Carpenter, Francis Bicknell: portrait-painter; b. at Homer, N. Y., Aug. 6, 1830. Began the study of painting under Sanford Thayer in Syracuse, N. Y., in 1844; associate National Academy, New York, 1852. His portrait of President Fillmore is in the City Hall, New York; that of President Lincoln in the Capitol at Albany; and his *Emancipation Proclamation*, painted in 1864, is in the Capitol at Washington. He was the author of a book called *Six Months in the White House with Abraham Lincoln*. D. in New York city, May 23, 1900. William A. Coffin.

Carpenter, Joseph Estlin, M. A.: English Unitarian scholar; b. in Ripley, Surrey, England, Oct. 5, 1844; educated at University College, London, and at Manchester New College (now at Oxford); vice-principal Manchester New College, Oxford; author of *Life and Work of Mary Carpenter* (1879); *The First Three Gospels* (1890); editor of *Ewald's History of Israel, vols. iii., iv., v.* (1871–74); translator of Tiele's *Outlines of the History of Religion* (1877); joint editor with Prof. T. W. Rhys Davids of the *Sumaṅgala Vilāsini*, vol. i. (1886); and the *Dīgha Nikāya*, vol. i. (1889). Prof. Carpenter's rank is with the highest as a Sanskrit scholar and New Testament critic.

Carpenter, Lant, LL. D.: theologian; b. in Kidderminster, England, Sept. 2, 1780. He studied in Glasgow College and entered the ministry in 1801. He published an *Introduction to the Geography of the New Testament* (London, 1806; 5th ed. 1824) and *Unitarianism, the Doctrine of the Gospel* (1809; 3d ed. Bristol, 1823). In 1817 he became minister of a Unitarian church at Bristol. He was a man of the most saintly character and philanthropic spirit, and he bequeathed the latter in full measure to his daughter, Mary Carpenter. The distinguished scientist Dr. William B. Carpenter was his son, and his son Philip was a Unitarian minister of unique ability and the loftiest spirit. See his *Life* by R. L. Carpenter (Bristol, 1842). He was drowned Apr. 5, 1840, in the passage from Naples to Leghorn.

Revised by J. W. Chadwick.

Carpenter, Louis G., C. E.: irrigation engineer; b. Mar. 28, 1861, at Orion, Mich.; graduated from the Michigan Agricultural College 1879, where he became Instructor and Assistant Professor of Mathematics and Engineering; pursued graduate studies at the University of Michigan and at Johns Hopkins University; Professor of Engineering at the Colorado Agricultural College, and meteorologist and irrigation engineer on the Agricultural Experiment Station 1888; organized the first course in irrigation engineering given in any American college; was special agent for Colorado and New Mexico in the congressional investigation relating to artesian wells 1890; founded the American Society of Irrigation Engineers 1891; member of the British Association for the Advancement of Science, fellow of the American Association for the Advancement of Science, etc.

Carpenter, Mary: eldest child of Lant Carpenter; b. in Exeter, Apr. 3, 1807; devoted her life to the elevation of the degraded and criminals both in England and India with singular energy and success. Her attention was first called to India by Rammohun Roy, the predecessor of Keshub Chunder Sen; and to the needs of the ragged urchins at home by Joseph Tuckerman (*q. v.*), the Boston philanthropist. In 1835 she began to work in earnest, and for twenty years was secretary of a "working and visiting society" in Bristol. She opened a reformatory school at Kingswood 1852, and a separate school for girls in Bristol 1854 (the famous Red Lodge). In 1866 she made her first visit to India, going again in 1868, 1869, and 1875. As results there have been many improvements in the jails and reformatory schools; also in the condition of women. She visited America in 1873. She published valuable books upon her chosen fields: *Reformatory Schools for the Children of the Perishing and*

Dangerous Classes (London, 1851); *Juvenile Delinquents, their Condition and Treatment* (1853); *Our Convicts* (1864; 2 vols. on the *Index Expurgatorius* of the Roman Catholic Church); *Six Months in India* (1868, 2 vols). See her *Life* by J. Estlin Carpenter, 1879. D. June 15, 1877.

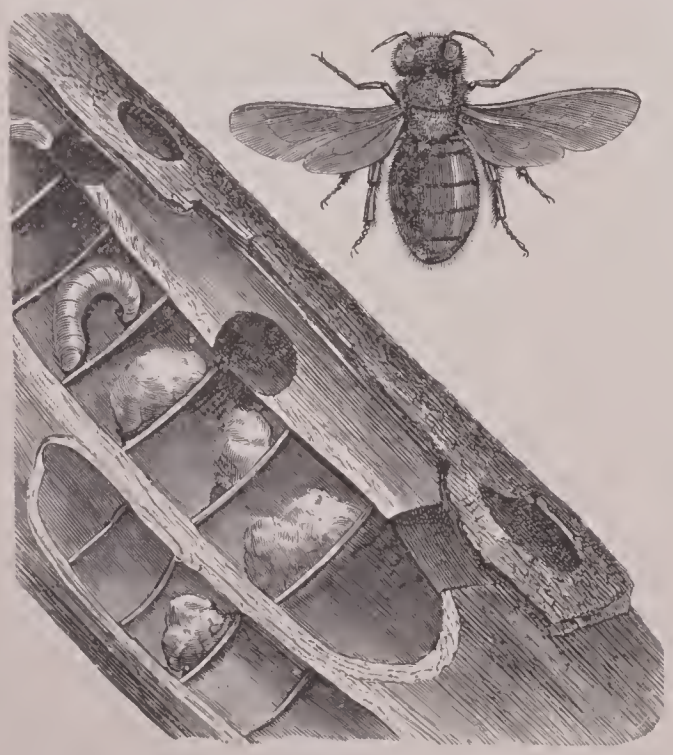
SAMUEL MACAULEY JACKSON.

Carpenter, WILLIAM BENJAMIN, M. D., LL. D., F. R. S.: physiologist; son of Dr. Lant Carpenter; b. in Exeter, Oct. 29, 1813; studied medicine and graduated as M. D. in Edinburgh in 1839. In the same year he published an important work entitled *Principles of General and Comparative Physiology*. His reputation was widely extended by an excellent work called *Principles of Human Physiology* (1846). This has gone through nine editions, and is considered by many to be the best work extant on that subject. He became Professor of Medical Jurisprudence in University College, London, and for many years edited the *British and Foreign Medico-chirurgical Review*. Among his works are *Zoölogy and Instincts of Animals* (2 vols., 1857); *The Microscope* (6th ed. 1881); and *Nature and Man* (1888). He had few living equals in acquaintance with natural science, capacity for original inquiry, and skill as a scientific writer. Some of his latest investigations have been in regard to oceanic currents. He was president of the British Association for the Advancement of Science in 1872. D. from accidental causes Nov. 19, 1885.—His son, PHILIP HERBERT, b. in London, Feb. 6, 1852, d. in London, Oct. 22, 1891, was educated at Eton and Cambridge; gave especial attention to deep-sea life; fellow of the Royal Society; worked on the U. S. survey in the Caribbean seas.

Carpenter, WILLIAM BOYD, D. D., D. C. L.: Bishop of Ripon, Church of England; b. in Liverpool, Mar. 26, 1841; graduated B. A. at Cambridge 1864; became bishop 1884. His publications consist mostly of discourses, but they include the Hulsean lectures, *The Witness of the Heart to Christ* (London, 1879), and the Bampton lectures, *Permanent Elements of Religion* (1889).

Carpenter, WILLIAM HENRY, Ph. D.: philologist; b. at Utica, Oneida co., N. Y., July 15, 1853; educated at Utica Academy, Cornell University, Leipzig, and Freiburg; Ph. D., Freiburg in Baden; fellow, by courtesy, Johns Hopkins University 1881–83; instructor in Rhetoric and lecturer on North European Literature at Cornell 1883; instructor in German and the Scandinavian Languages, Columbia College, New York, 1883–89; assistant professor 1889–90; and adjunct Professor of Germanic Languages and Literatures 1890. He has published *Grundriss der Neuisländischen Grammatik* (Leipzig, 1881); *Nikolas-drapa Halls Prests*, an Icelandic poem from A. D. 1400 (Doctor's dissertation; Halle, 1881).

Carpenter-bee: the popular name of hymenopterous insects of the bee family, which show great skill in working



Carpenter-bee.

wood. These insects, including some of the true bees, mostly inhabit warm countries. Perhaps the most celebrated of the tribe is the *Xylocopa violacea* of Southern Europe, a beautiful insect of a rich blue color, about the size of a large humble-bee. It attacks dry wood, especially when partly decayed, cutting a longitudinal canal about a foot deep and more than a third of an inch wide. After finishing one of these canals, it lays an egg at one extremity of the hole, and places near it a mass of pollen and honey as food for the future larva. The egg and its accompanying store of food are then hermetically sealed up by a thin wall composed of powdered wood, formed into a very hard compound by being mixed with a substance secreted by the insect. In this manner the mother bee divides her house into many little chambers with one egg in each. In due time the eggs hatch, each of the larvæ devours the food prepared for it, and then passes into the chrysalis state. At last, when the perfect insects are developed, they destroy the partitions made by the parent bee, and escape into the air; the one produced from the egg first laid escaping first, through an opening made for it by the mother, and the others following in order. The genus is also American. See BEE.

Carpentras (anc. *Carpentoracte*): a town of France; department of Vaucluse; on the river Auzon; 15 miles by rail N. E. of Avignon, and near the base of Mont Ventoux (see map of France, ref. 8–H). It is surrounded by walls which were built about 1365, and are flanked by towers, and is mostly well built. It has a Gothic cathedral, part of which was erected in the tenth century, and a public library of 25,000 volumes, containing also a large collection of medals and antiquities; also manufactures of cotton and woolen fabrics, brandy, etc. Here are remains of a Roman triumphal arch. Pope Clement V. removed the papal court to this town in 1313. Pop. (1896) 10,797.

Carpentry [deriv. of *carpenter*, viâ Norm. Fr. from Lat. *carpenta'rius*, carriage-maker; deriv. of *carpentum*, carriage, a word of Celtic origin]: the art of building structures in wood; and more especially the construction of wooden buildings, wooden bridges, and the framings of heavy machines. The labors of the carpenter are necessarily directed by some knowledge of the forces which may be brought to act upon the structure when completed; that is, by some knowledge of the principles of engineering.

The lesser and lighter works of wood, such as furnish the interiors of dwellings, are the products of another branch of labor, termed *joinery*.

The skill of the carpenter is directed toward giving two distinct qualities to the structures he builds—viz., *strength* and *rigidity* or stiffness. The first is secured mainly by *dimensions* assigned to the different parts, and the skill with which these parts are united; and the latter depends upon the *arrangement* of the several members.

Strength.—Timbers designed for structures are subjected to one or more of the following varieties of stress: transverse, tensile, compressive. A transverse stress is a force applied to a beam in a direction more or less perpendicular to its length; the timbers of a floor afford examples. A tensile stress is one that tends to elongate, and a compressive stress one that, acting in the direction of the length of the member, tends to shorten or crush it.

When the entire structure is of such dimensions that each member of it may be formed of a single stick of timber, the work of the artisan is comparatively simple, and is guided by plain and brief rules. But when by reason of the size of the entire work single parts are required of greater dimensions than can be supplied by single pieces of timber, then skillful joining of smaller parts must be relied upon to meet the emergency. Now, to so combine separate pieces of timber as to form a single member, and thereby employ the available strength of the component parts, at the same time to form such a connection with adjacent portions of the structure as to transmit properly the force assigned to the position, is to apply in the fullest sense the science of carpentry.

It may be remarked here that even in our most important bridges no special effort is made to secure solid timbers for the larger members, because the quality of thorough soundness can be more easily secured by a judicious selection of smaller parts, and then a proper combination can be made to insure the requisite strength.

When a beam is subjected to transverse stress the fibers upon the side that tends to become convex under the action of the strain are subjected to a tensile or pulling force, while upon the opposite side they are at the same time compressed. It becomes evident upon slight reflection—first, that the extreme upper and lower fibers are most severely strained;

and second, that the central portion of the stick is acted upon by forces comparatively slight. The obvious conclusion is that the portions of the timber most actively engaged in sustaining the force are those at the greatest distance from the middle of its depth, and consequently that beams acted upon by transverse forces should present considerable width in the direction of the bearing force. It is easily demonstrated that the strength of a beam of given length and breadth, to bear a weight between two supports, varies as the square of the depth of the beam. Floor-beams are accordingly made narrow and deep.

To secure depth of beam without employing material which is comparatively of little use the method has been employed of joining two sticks by blocks and bolts, as shown in Fig. 1.

It will readily be seen that the condition of providing material where the strains are greatest has been secured,

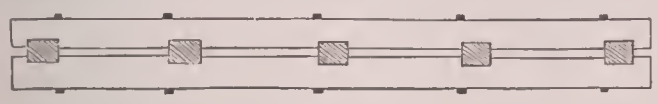


Fig. 1.

provided the combination when under strain acts as a single stick. The plan fails when through want of secure bolting there is any motion among the component parts. The chances of failure increase very rapidly as the halves of the compound beam are separated by larger space, as the point is soon reached where each half acts like a simple beam. Compound beams are most frequently made in the simple manner shown in Fig. 2.

The most common way of re-enforcing the strength of a simple beam is by the addition of iron rods, as shown by

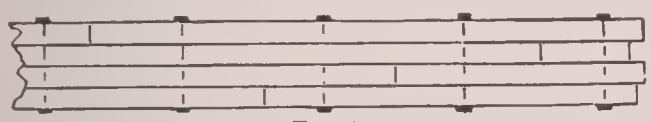

Fig. 2.

Fig. 3. The consideration of such a combination belongs to the subject of *trusses*.

When a stick of timber is employed so as to resist a tensile force the manner of connecting it with the portions of

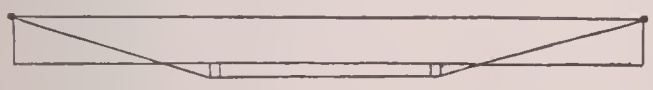

Fig. 3.

the structure through which or to which the force is to be transmitted becomes a matter of great importance. In the case of an iron rod, which can be furnished with a head, an eye, or a nut, the problem of attaching it so as to resist a tensile force is easily solved; but when the conditions require a wooden *tie-beam*, the problem of uniting the various parts so that the strength of the stick shall not be too largely sacrificed requires consideration, because to join timbers implies more or less cutting of their substance, and this in turn sacrifices material.

In the common king-post truss, as the combination represented in Fig. 4 is termed, the methods of uniting parts that fulfill different functions are employed. This truss is frequently employed in roofs, and also bridges of moderate span. In the latter case the flooring is sustained by the horizontal member or tie-beam; a large portion of the weight sustained is transmitted through the upright, and is received by the inclined pieces or *struts* and conveyed to the extremities of the tie-beam. The tie-beam and post are thus subjected to tensile, and the struts to compressive, strain.

In order that the tie-beam shall properly receive the thrust of the struts, the former must be notched to receive

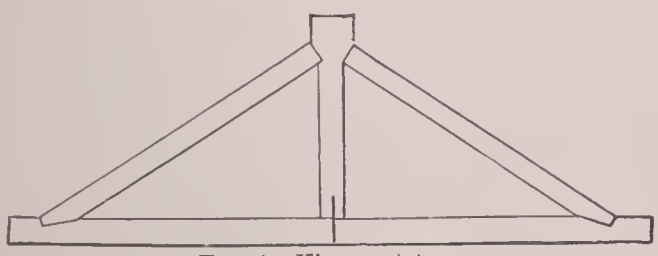

Fig. 4.—King-post truss.

the ends of the latter. Fig. 4 shows the method usually employed; an enlarged view of the ends of the strut and tie-beam is given in Fig. 5. In constructing this truss it is necessary to regard the tendency which the strut exerts to

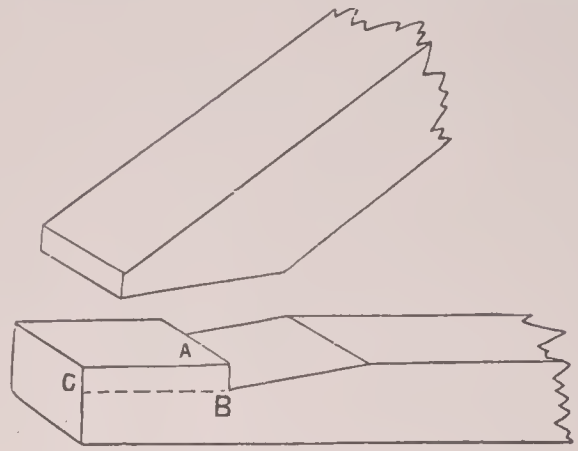

Fig. 5.—View of ends of strut and tie-beam.

split off the portion A B C. It is considered sufficiently secure in most kinds of timber if the length B C is ten times the depth A B, as, when this proportion is observed, the cohesion which resists splitting off is equal to that which resists the crushing of the fibers exposed to the direct pressure on the lesser surface. In modern bridge constructions it is quite common to substitute an iron rod for the upright post in the frame of Fig. 4, and also to employ a cast-iron shoe bolted to the tie-beam to receive the end of the strut.

When the length of the tie-beam is such as to require the uniting of two or more pieces, the skill of the carpenter is again called in requisition to produce such a joint as shall safely resist the forces to be met.

The simplest of all is the so-called *fish-joint* (Fig. 6), the strength of which depends partly upon the few fibers of the

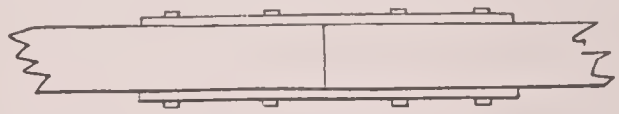

Fig. 6.—Fish-joint.

timber that bear upon the bolts, and partly upon the friction arising from the pressure of the fish-plates. These latter are made of iron, and are furnished with projections that are let or forced into the timber when bolted on.

Another and a common form is the *single-lock joint* or *scarf*, shown in Fig. 7, in which the resistance to direct ten-

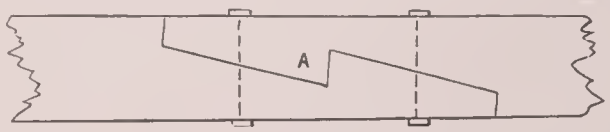

Fig. 7.—Single-lock joint.

sile strain depends upon the surfaces opposed to each other at A, and which may be one-third the sectional area of the beam. A modification of this method of scarfing is exhibited in Fig. 8, in which one-half of the beam is made available in resisting tensile strain, as the joints A and B are each one-fourth of the depth of the beam. The method of Fig. 8 has the advantage over Fig. 7 of greater strength, but it is also far more difficult of construction, as there are two bearing surfaces that must act together; the fitting of the joint therefore requires especial care. This difficulty is sometimes met by leaving spaces at A and B, into which wedges or keys are driven as the scarf is bolted together. Fish-plates are quite commonly used in connection with the methods

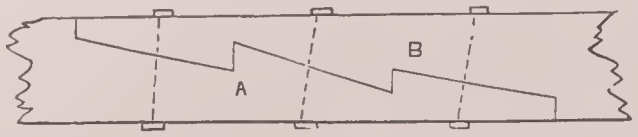

Fig. 8.—Modified single-lock joint.

represented in Figs. 7, 8, and 9. When a scarf-joint is employed in such a place as the lower beam of the frame represented in Fig. 4, the joining would obviously be made at the middle of the tie-beam.

Fig. 9 represents another form of scarf: the *key* at A is made of hard wood, and forced in so as to bring the surfaces of the scarf to a firm bearing. Of course this method of locking can be equally well applied to the methods shown in Figs. 7 and 8.

Many intricate forms of scarfing have been devised, and are exhibited in treatises on carpentry. They belong mostly to the time when but little iron was employed as an adjunct

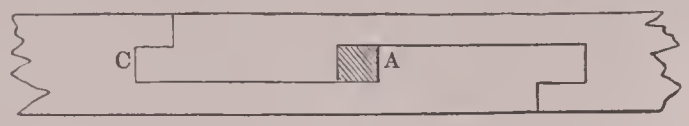

Fig. 9.—Scarf.

to timber construction; and even then most of the elaborate forms were rather fanciful than useful.

When timbers are united to resist thrust or compressive strain only, less skill is required than in the constructions just described. But little more is required than to bring the opposing surfaces fairly together, and secure them by the simplest possible means. Hence the "fished joint" shown in Fig. 6 will fully satisfy the conditions, and will employ the full available strength of the timber. Care must be taken, however, that the joint is not strained by a tendency which is manifested in long columns or struts to bend sideways when under pressure.

When a strut is joined to its neighboring member at an angle, as in the case shown in Fig. 4, the precaution is taken to so form the joint as to present either the whole of the end surface to the end pressure, as in the upper end of the strut of the king-post truss, or a part of it, as in the lower end shown more fully in Fig. 5. To prevent any displacement in such joints through accidental forces, they are secured by various methods, either a bolt, a notch, a tenon, or even a few nails, being employed according to the liability to lateral forces.

The *tenon* employed is exhibited in Fig. 10; the cut which receives it is called the *mortise*.

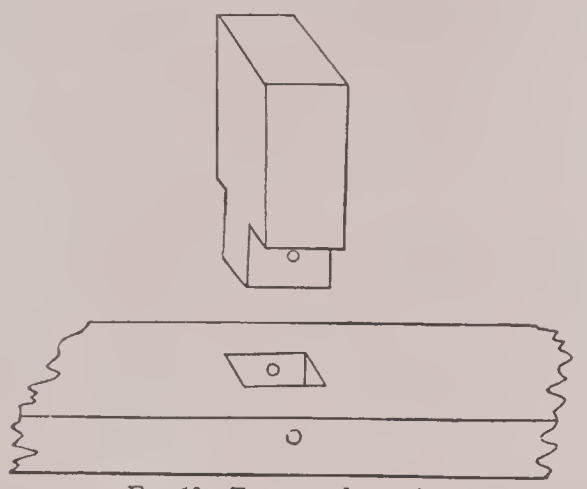

Fig. 10.—Tenon and mortise.

If the joint is liable to be urged by a force tending to pull it asunder, some security is obtained by the use of a stout

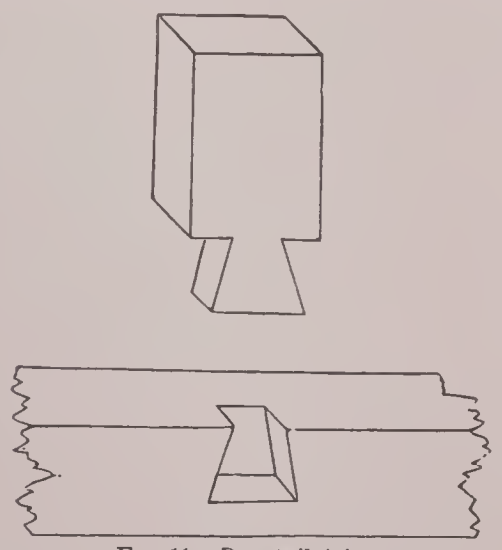

Fig. 11.—Dovetail joint.

pin through the tenon. A dovetail joint is also employed for the same purpose (see Fig. 11). This form is common in joinery.

Rigidity, a quality which was referred to as somewhat distinct from *strength* in structures, is secured by such a disposition of material that no change of form of the entire system can occur without bringing into action the tensile or compressive resistances of certain members of it. A plain square frame, fastened however securely at the corners, may be lengthened and shortened cornerwise without calling into action the strength of the materials of the framing, except such as is concerned in fastening the corners. If, however, a stick be firmly secured to the frame, diagonally across it, no change of form can take place without extending or compressing this added *brace*. A triangular frame will not admit of change of form without a change in the length of at least one of its sides. Hence diagonal braces are important members of timber framings, inasmuch as they insure stiffness or rigidity. The braces are secured by mortising, by iron straps, or more rudely by outside pieces fastened as in the joint in Fig. 6.

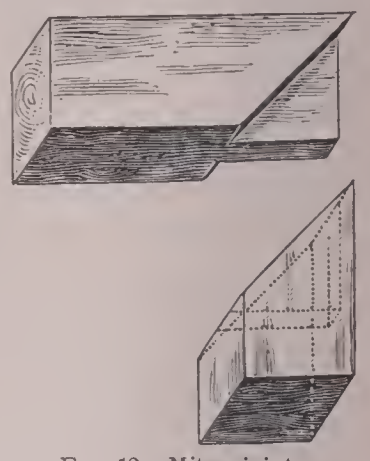

Fig. 12.—Miter joint.

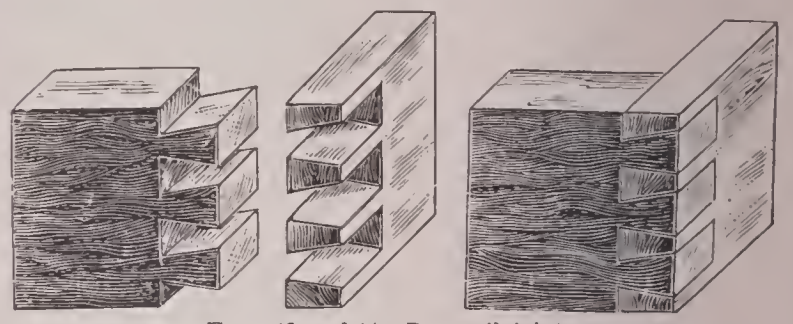

Figs. 13 and 14.—Dovetail joints.

Joinery may be considered here as comprehended under the more general term of carpentry. It is, however, usually restricted to the lighter constructions in wood, such as the subordinate parts of dwellings, especially the interior woodwork and the furniture.

The work of the joiner is directed toward effecting the closest and firmest practicable union between the component parts of constructions in wood. Stiffness is an essential quality in joinery, and it is mainly secured by the more or less intricate method of uniting the parts that meet at an angle. Some of the common forms are shown herewith.

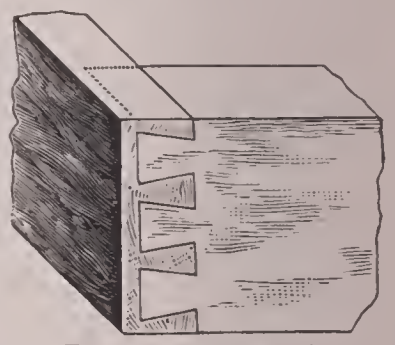

Fig. 15.—Lap dovetail.

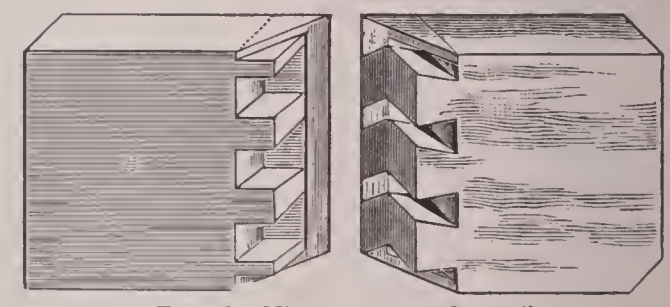

Fig. 16.—Miter or secret dovetail.

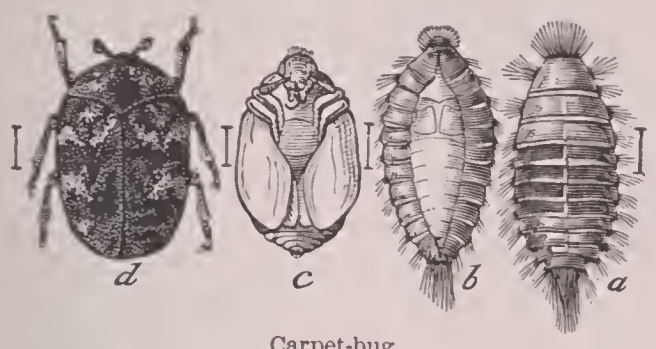
Lap and secret dovetails are employed when it is deemed desirable to partly or quite conceal the form of the joint. See Tredgold's *Carpentry*, by Hurst; also Davidson's *Drawing for Carpenters and Joiners*. Geo. W. Plympton.

Carpet-bagger: a term used in the U. S. to denote an adventurer without property interests in the State where he resided. In the West it has been applied to wildcat bankers. In the South it was used at one time to indicate a man, born and reared in the North or West, who went South with or after the Federal armies, planted himself in one of the States being reconstructed under military rule, who aided in organizing and drilling the Negroes to vote the Republican ticket. Of course the term originated with those of adverse politics, who applied it as a stigma and with considerable looseness, any one not a native of the South being denounced as a

"carpet-bagger" if an active Republican; if "native there and to the manner born," he was termed a "sealawag."

HORACE GREELEY.

Carpet-bug (*Anthrenus scrophulariæ*): a destructive beetle of the family *Dermestidæ*; popularly known as "the new carpet-bug," the name having been given to it when its ravages were first detected in the State of New York in the year 1874 and its difference from the larva of the carpet-



Carpet-bug.

moth observed. Although, if left uncheeked, it overruns houses and preys upon a variety of woolen and some other fabrics, its special home is beneath the borders of carpets, where, in the larva state shown at *a* in the figures (all enlarged), it eats large holes in the carpets, or, following the joinings of the floors, eats in straight lines through entire breadths. The cast skins of the larva, *b*, are found with the living forms in the summer months. The pupa, *c*, is formed in autumn within the split skin of the larva; and the perfect insect, shown at *d*, of a black color, marked with red along the back, and with red and white spots on the wing-covers, emerges in the winter, and may often be taken on the windows of infested rooms in the month of May. It is a very difficult insect to eradicate. Kerosene oil and benzine are probably the most efficient agents for destroying it in its earlier stages. It is of European origin, introduced many years ago into California, and by a later importation into New York. *A. lepidus* (Le Conte) is simply a Western variety of it.

J. A. LINTNER.

Carpets [M. Eng. *carpete, carpette, carpyte*, via Fr. from Ital. *carpita* (: Fr. *charpie*, lint), coarse cloth, or the dimin. *carpetta*; deriv. of *carpi're*, the Romance for Lat. *car'pere*, pluck, pull in pieces]: floor-coverings. The word carpet is by some supposed to be derived from "Cairo," probably because Egypt is the country credited with first using floor-coverings as articles of luxury in her ancient days of splendor.

As a commercial term, "carpet" or "carpeting" is the generic name for the various grades of goods in that line, whatever their material, mode of construction, or technical appellation. The original form of the carpet was that of a large rug, which was spread upon the floor when occasion required; and is still the custom in the East. The modern way of weaving carpeting in long, narrow strips, to be sewn together, doubtless had its origin in the greater convenience and cheapness which that form admits of through its adaptation to the ordinary loom.

Before the invention of the Jacquard loom, however, carpets were either of very simple pattern, or, if elaborate in their designs, necessarily very expensive. The Savonnerie, attached to the ancient royal manufactory of the Gobelins in Paris, has always occupied the first place in regard to artistic perfection. Some of the carpets produced there cost from 100,000 to 200,000 francs, requiring five to ten years for their completion. None of them have been for sale since the year 1791; they have been presented to the different sovereigns of Europe, and are only to be found in the palaces of courts. The invention of Jacquard, so peculiarly adapted to the weaving of various grades of carpets, together with the still more recent improvements in looms, has greatly facilitated the production of carpeting at once beautiful and durable, and at the same time cheap enough for persons of moderate means or economical tastes, so that the use of carpets has probably increased more during the last fifty years than that of any other commodity of equally ancient origin.

The U. S. is by far the greatest producer and consumer of carpets of all the nations of the world.

The principal grades of carpeting known to commerce (leaving out the Gobelins, Turkish, Persian, and others of similar rug-like make) are *Chenille Axminster*, *Wilton*, *Axminster*, *Moquette*, *Velvet*, *Brussels*, *Tapestry Brussels*, *Ingrain* (two or three ply), and *Venetian*, taking rank, as to value and general desirability, about in the order named.

Chenille Axminster, of which none is made in the U. S., is a very excellent carpet-fabric, of high cost because of the nature of its construction. It consists of strips of worsted chenille, so colored as to produce a pattern when woven together upon the face of a stout jute-backing. These goods are produced three-quarters of a yard wide in rolls and also in whole carpets, which may be designed to cover any style or size of room. Their importation into the U. S. is not very heavy, but shows a small, steady growth. The largest mill for their production is at Glasgow, Scotland. Several carpet-mills in the U. S. have produced chenille Axminsters in moderate quantity and good quality, but the demand for the domestic goods has never been sufficient to make it a profitable undertaking.

Domestic Axminster and Moquette are very similar in appearance and construction, and are made with a high tufted pile, thick and durable. The Axminster is finer in quality and usually made of better material than the Moquette. They are constructed with a firm groundwork of jute or cotton, upon which the pile containing the design is fastened in tufts of soft woolen yarn. As these tufts are supplied from a series of rollers corresponding in number to the picks or wefts completing one pattern, and in length to the width of the carpet, and in their action are entirely independent of the warp and woof composing the body of the fabric, the employment of an almost unlimited number of colors is admissible, and the designs in those grades are therefore generally of the most perfect and elegant description.

Wilton and Brussels are woven alike and of the same materials (linen back and worsted face); the face of both is formed by inserting wires between the warp threads in such a manner that on their withdrawal a series of raised loops of the worsted warp is formed, upon which the design appears. In Wilton these loops are cut open and sheared smooth, while in Brussels they remain uncut. The worsted portion of the carpet being exclusively in the warp, the threads of which are of continuous color throughout the piece, each particular color requires a special set of threads, worked in an independent manner by what is technically called "frame." This arrangement secures great perfection and clearness of design, for each color being brought to the surface entirely by itself, while the others are carried under or through the linen back until brought up in their turn, the work has the appearance of embroidery on canvas. But as the colors in the direction of the warp are usually limited to five (no larger number of frames being convenient), the designs in these goods are of necessity simple, and no patterns requiring elaborate shading can be attempted in them. From the number of colors thus employed the different qualities of these carpets receive the names of three, four, and five frame respectively.

Velvets and tapestry Brussels are also manufactured alike in a manner corresponding to Wilton and Brussels, with the difference that only one set of worsted warp threads is used, upon which all the colors are printed by means of color-rollers before the fabric is woven, and upon the correct proportioning of spaces of the various colors the perfection of the goods is in a great measure dependent. In designing patterns for these goods the artist is allowed free scope as to the number and arrangement of colors, and profuseness in that respect does not add very greatly to the cost; hence we find these goods usually much more elaborate of design and more lavishly colored and shaded off than Wilton and Brussels. The manufacture of tapestry (both velvet and Brussels) was commenced in England in 1842. It was soon after introduced into the U. S., but for twenty years, by reason of patent restrictions, two establishments monopolized the business. Since the expiration of the patents it has become the most important branch of carpet-manufacture in the country. Tapestry carpets are now used to an extent greater than that of all other grades combined, with the exception of ingrains.

The ingrain carpet (also called Kidderminster, after the city which formerly manufactured it largely) is the only kind of carpet made exclusively of all wool, and it may be worn on either side, though usually one side is more desirable in coloring than the other. The names "ingrain" and "three ply" are derived from the modes of their construction. The former is composed of two distinct thicknesses, interwoven or "ingrained" wherever the colors change or mingle; the latter of three layers, also interlacing each other. The design is very similar on both sides, but the

colors are reversed. Philadelphia has upward of 5,000 looms employed on ingrain carpets, and very large establishments in Connecticut, Massachusetts, and New York State turn out the better qualities. Venetian is the name given to a fabric composed of woolen warp and coarse hemp filling, usually striped in color, and made in widths suitable for stair-coverings. Philadelphia furnishes in that grade nearly all the cheap stair-carpets used throughout the U. S.

Floor oil-cloth is manufactured with a burlap foundation, upon which successive coatings of coarse paint are applied. On the face is a colored pattern printed with blocks. These blocks are made of wood, and are usually about 18 inches square. There is one block for each color applied; less than seven colors are generally used. Floor oil-cloths are made in many qualities and of various widths, ranging from 3 feet to 24 feet in width. Very much the larger business is done in the medium-weight narrow widths.

A floor-cloth with the coined name "linoleum," consisting of a mixture of oxidized linseed oil and finely ground cork pressed upon a backing of coarse burlap, is now very largely used. It is the invention of an Englishman, William Walton. Several large mills are manufacturing it in the U. S., the patents having expired, and its extended use has seriously curtailed the production of the heavier grades of floor oil-cloth.

The manufacture of carpets is confined to the States of Massachusetts, Connecticut, New York, New Jersey, and Pennsylvania. The number of factories in the U. S. in which carpets other than rag-carpets were manufactured in the year 1880 was 195. In 1890 the number had decreased to 175. But while the value of the product in 1880 was $31,792,802, in 1890 it amounted to $47,801,499. The value of land, buildings, and machinery devoted to the industry in 1890 was $18,915,634. In 1880 the average number of operatives employed was 20,371; in 1890 the number was 29,189. The total amount paid in wages in 1880 was $6,835,218; in 1890 it was $11,639,176. The cost of the materials employed in 1880 was $18,984,879; in 1890 it was $28,649,031.

WILLIAM BERRI.

Car'pi: a fortified town of Northern Italy; province of Módena; on the Canal of Carpi; 12 miles N. N. W. of Módena (see map of Italy, ref. 3–D). It is the see of a bishop, and has a citadel, a fine cathedral, a seminary for priests, and manufactures of silk. Pop. 18,856.

Carpio, MANUEL: Mexican poet; b. Mar. 1, 1791; well known in Mexico for his sacred poems, and for some others upon patriotic subjects. He was educated as a physician, and became in 1832 Professor of Physiology in the University of Mexico. He took an active part in Mexican politics, being a leader of the conservative party. He was deputy in 1825 and 1848; senator in 1851; councilor of state in 1853. As a poet he excelled in subjects like the *Destruction of Sodom*, the *Chastisement of Pharaoh*, the *Witch of Endor*, etc. His *Poesias* have been several times published—last in Vera Cruz and Paris, 1883. D. Feb. 11, 1860.

A. R. MARSH.

Carpmael, CHARLES, M. A.: superintendent of the meteorological service of the Dominion of Canada and director of the Magnetic Observatory at Toronto; b. at Streatham Hill, Surrey, England, Sept. 19, 1846; educated at Clapham Grammar School and St. John's College, Cambridge, England (where in 1869 he was classed sixth in the list of wranglers), and was elected fellow of that college in 1870. In Dec., 1870, he was a member of the British eclipse expedition to Spain. He was appointed deputy superintendent of the Canadian service and director of the Magnetic Observatory in 1872. In Feb., 1880, he became superintendent of the service. In 1882 he was appointed by the Marquis of Lorne a president of Section III. of the Royal Society of Canada. He was repeatedly elected vice-president of this society until 1886, when he became president. The meteorological service has been very prosperous under his administration. M. W. H.

Carpoc'rates, or **Car'pocras**: a philosopher in Alexandria in the reign of the Emperor Hadrian; founded a Gnostic sect about 130 A. D. He believed in the transmigration of souls, and maintained that the world was created by angels. He is accused of teaching principles that tend to subvert morality. His followers existed as late as the sixth century.

Carpogones: See CARPOPHYTES.

Car'pophytes [from Gr. *καρπός*, fruit + *φυτόν*, plant]: the fruit-tangles (*Carpophyta*); one of the branches of the vegetable kingdom, characterized by the production of antherids and *carpogones*, the latter after fertilization developing a *spore-fruit*. The carpogone consists essentially of a cell (in some cases of several cells) containing the protoplasm to be fertilized; except in the *Characeæ*, it is not surrounded by a cellular covering. Five classes may be distinguished, viz.: (1) Simple fruit-tangles (*Colechæteæ*), minute plants, with single-spored spore-fruits; (2) sac-fungi (*Ascomycetes*), degraded parasitic and saprophytic plants, with spores produced in sacs; (3) higher fungi (*Basidiomycetes*), degraded parasitic and saprophytic plants, with spores produced by protrusion from certain cells (basidia); (4) red seaweeds (*Florideæ*), mostly branching plants, with many-spored spore-fruits; (5) stoneworts (*Charophyceæ*), branching plants whose carpogones are covered by a cellular membrane, producing a one-celled spore-fruit.

CHARLES E. BESSEY.

Car'pus [Lat., from Gr. *καρπός*, wrist]: in anatomy, the series of bones between the forearm and hand. In man there are eight small bones in two rows; the upper row consists of the scaphoides, lunar, cuneiform, and pisiform; the lower, of the trapezium, trapezoides, magnum, and unciform. The upper row is articulated with the radius of the forearm; the lower with the metacarpal bones of the HAND (*q. v.*). The number and form of the bones of the carpus vary much in different animals, but rudiments of them, at least, appear in all mammals. They are quite distinct in the flipper or paddle of the whale, as well as in the foreleg of the ox and the horse.

Carp'zov: a Saxon family celebrated for learning, of which the most distinguished members were BENEDICT; b. in Wittenberg, May 27, 1595; professor at Wittenberg; author of *Definitiones forenses*, *Practica nova rerum criminalium*, *Jurisprudentia ecclesiastica*, and *Processus juris*—works which had an extended influence on German laws; d. in Leipzig, Aug. 30, 1666.—JOHANN BENEDICT; Professor of Theology at Leipzig; brother of the above, who wrote *Isagage in Libros Symbolicos*; b. in Rochlitz, June 22, 1607; d. in Leipzig, Oct. 22, 1657.—JOHANN GOTTLOB; b. in Dresden, Sept. 26, 1679; grandson of J. B.; Professor of Oriental Languages at Leipzig, whose *Introductio in Libros Canonicos* and *Critica sacra Veteris Testamenti* were epoch-making works that elevated biblical introduction to the rank of a special theological science. D. in Lübeck, Apr. 7, 1767.

Revised by HENRY E. JACOBS.

Carquines, kär-kee'nes, written also **Karquenas**: a strait of California; connects the Bay of San Pablo with Suisun Bay; lat. 38° 04′ 16″ N., lon. 122° 15′ 19″ W. It is from 1 to 2 miles wide and 7 miles long, and is navigable for steamboats. Large ships can ascend it to Benicia. The Carquines Strait forms the boundary between Solano and Contra Costa Counties.

Carr, EUGENE A.: soldier; b. in Erie co., N. Y., Mar. 20, 1830; graduated at West Point 1853; became colonel Sixth Cavalry Apr. 29, 1879. He served on frontier 1850–61; scouting against Lipan Indians 1854 (severely wounded in skirmish near Diablo Mountain); on Sioux expedition 1855, Utah 1858, and Kiowa and Comanche expedition 1860; engaged in several skirmishes. In the civil war became colonel Third Illinois Volunteer Cavalry Aug. 15, 1861; was promoted brigadier-general U. S. volunteers Mar. 7, 1862, serving in operations in Missouri 1861–62; engaged at Wilson's Creek; in command of division in pursuit of Price into Arkansas 1862; engaged at Pea Ridge (thrice wounded); in command of the army of Southwest Missouri 1862, and St. Louis district 1862–63; in command of division in Vicksburg campaign; engaged in operations against the place; at Port Gibson, Champion Hill, Edward's Station, Black River Bridge (brevet colonel), and capture of Vicksburg; in the department of Arkansas, commanding cavalry division on Camden expedition 1864, engaged at crossing of Little Missouri; in command of the district of Little Rock 1864 (brevet brigadier-general), engaged at Clarendon and Camden; in command of a division of the Sixteenth Corps in operations against Mobile 1865; engaged at Spanish Fort. Brevet major-general U. S. army Mar. 13, 1865, for gallant and meritorious services in the field; served on the frontier until promoted brigadier-general July 19, 1892; retired Feb. 15, 1893.

Carr, FRANK OSMOND: See the Appendix.

Carr, JOSEPH B.: general of volunteers; b. in Albany, N. Y., Aug. 16, 1828; educated at Troy, N. Y. On the out-

break of the civil war he was commissioned (Apr. 14, 1861) lieutenant-colonel of the Second New York Volunteers, and colonel May 10, 1861. The Second Regiment was the first volunteer regiment to leave the State. In 1862 Carr was commissioned a brigadier-general of volunteers; he was at the battle of Big Bethel, and bore a conspicuous part in all the battles of the Army of the Potomac up to the final surrender of Lee's army, Apr. 1865. He was breveted major-general Mar., 1865, and mustered out of service Sept., 1865. Engaged in the manufacture of chain-cable; elected to the office of Secretary of State for the State of New York, 1881, and re-elected in 1883. He was nominated for Lieutenant-Governor of New York by the Republican convention Sept. 23, 1885. D. in Troy, N. Y., Feb. 24, 1895.

Carr, Lyell: genre-painter; b. in Chicago in 1857. Pupil of Boulanger and Lefebvre, Paris. His later works have been scenes of life in the Southern U. S., and he has also painted landscape and figures at Greenwich, Conn., where he formerly resided. His pictures are notable for realistic truthfulness of effect, and are individual in method. Studio in New York. William A. Coffin.

Carr, Sir Robert: a British gentleman who was appointed by Charles II. in 1664 one of the royal commissioners to New England. He assisted in the capture of New Amsterdam from the Dutch, and changed its name to New York in honor of the Duke of York, afterward James II. D. June 1, 1667.

Carracci: See Caracci.

Car'rageen', or **Irish Moss** [from Carragheen in Southeast Ireland]: any one of several species of seaweed which are not mosses, but algæ. The species which yields the greater part of the carrageen of commerce is the *Chondrus crispus*, one of the red seaweeds (*Florideæ*). It is used as medicine and as an article of food, and is esteemed for its emollient and demulcent properties. It grows on the rocky coasts of several countries of Europe and on the eastern shores of North America. It is from 2 to 12 inches long, branched, cartilaginous, flexible, and reddish brown in color. It is considered easy of digestion. Jelly and blancmange are made by boiling the carrageen in water or milk, with an addition of sugar and spices. The Iceland moss (*Cetraria islandica*) is a wholly different plant, though used in a similar way. It is not true moss, but a lichen.

Carrara, kăa-raa'răa (anc. *Cararia*): a town of Italy; in the province of Massa-Carrara; on the Avenza; near the Mediterranean; 133 miles by rail N. W. of Pisa (see map of Italy, ref. 4–C). It has an old collegiate church, a ducal palace, and an academy of fine arts. Here are celebrated quarries of white statuary marble, which have been worked for two thousand years or more. Many foreign artists come here to work, in order to save the expense of transporting the marble. The quarries, of which there are more than thirty in the vicinity, are in high hills or mountains formed chiefly or entirely of marble. Pop. of commune, 30,143.

Carratra'ca Springs: a village of Plantagenet township, Prescott co., Ontario, Canada; has large hotel accommodations, and a copious mineral spring whose waters are very highly esteemed for their alterative effect. The county is bounded on the northern side by the Ottawa river. The township is of comparatively new growth.

Carrel, kăar'rel', Nicolas Armand: writer and leader of the Republican party; b. in Rouen, France, May 8, 1800. He served in the army in his youth. He gained distinction by an able *History of the Counter Revolution in England*. Carrel, Mignet, and Thiers became in 1830 chief editors of the *National*, a liberal daily paper of Paris. In 1830 Thiers and Mignet retired from the editorship, and Carrel obtained the control of the *National*, which he edited with great ability. He was an eloquent and popular writer, and by sound judgment and moderation was qualified to be the leader of a party. He was mortally wounded by Émile de Girardin in a duel, and died two days after, July 24, 1836.

Car'rell, George Aloysius, D. D.: Roman Catholic bishop; b. in Philadelphia, Pa., June 13, 1803; studied at Mt. St. Mary's College; became in 1829 a Roman Catholic priest; was stationed in Philadelphia, Pa., Wilmington, Del., and St. Louis, Mo., where he was a professor and afterward rector in the university 1845–48; in 1851–53 was president of the Purcell Mansion College at Cincinnati, O.; in 1853 he was consecrated Bishop of Covington, Ky. D. in Covington, Ky., Sept. 25, 1868.

Carreño, kăar-rān'yō, Teresa: pianist; b. in Caracas, Venezuela, South America, Dec. 22, 1853; first instructed by her father and next by Julius Hoheni. Appeared first in New York in 1862, and then took some lessons from Gottschalk, whose compositions she plays especially well. In 1866 went to Europe professionally, and while there married Émile Sauret, the violinist, from whom, however, she soon separated. Subsequently she married Giovanni Tagliapietra, the baritone, and later Eugen d'Albert the pianist. She has made many concert tours with success, and is a pianist of great merit. D. E. Hervey.

Carre'ra, José Miguel, de: Chilian revolutionist; b. at Santiago, Oct. 15, 1785. He entered the Spanish army and served in Europe for several years. Returning in 1811, he headed the Chilian revolution which had already broken out, and was elected first president of the country. He promulgated a constitution (1812), established schools and printing-presses, and opened an era of improvement. On the approach of a Spanish army from Peru (1813) he was deposed in favor of O'Higgins. The quarrels of these rival leaders greatly weakened the patriots, and though they finally united against the common foe they were defeated at the battle of Rancagua (Oct. 12, 1814). Carrera fled across the Andes, and in 1815 went to the U. S. In 1816 he returned to Buenos Ayres, intending to lead the invasion of Chili, but was forbidden by Pueyrredon to cross the border; his brothers, who tried to do so, were captured and shot (Apr., 1818). Maddened by this, Carrera engaged in a series of wild revolutionary attempts against the government of Buenos Ayres. For a time he was driven to take refuge among the Indians. Finally he was betrayed by his own men, and shot at Mendoza, Sept. 4, 1821. See Vieuña Mackenna, *El Ostracismo de los Carreras* (Santiago, 1857).
Herbert H. Smith.

Carrera, Martin: Mexican general; b. in Mexico city, 1807. He early entered the army and attained the highest rank. He was a member of the legislative junta in 1841, senator in 1843 and 1845, and was military and civil commandant of the federal district when Santa Anna fled in Aug., 1855, leaving the country on the verge of anarchy. In these critical circumstances Gen. Carrera accepted the post of acting president (Aug. 15, 1855), and did much to maintain order, but resigned Sept. 11, to prevent the continuance of civil war. Herbert H. Smith.

Carrera, Rafael: a Guatemalan general; b. in Guatemala city, 1814. He was a workman of mixed Indian and Negro blood, and entirely uneducated, but possessed of genius and energy. In 1837 he joined the revolt against Morazan and the federalists, rose to the command of the insurgents, and, though several times defeated, was finally victorious in 1840. On Mar. 9 of that year he was proclaimed dictator at Guatemala, and thenceforth ruled with absolute power. He was elected president in 1844, and president for life in 1854. Carrera was supported by the landholders and the Church party, and generally legislated in their interests. He recalled the Jesuits, who had been banished since 1767. In 1863 he interfered in the affairs of Salvador, and after several months of war deposed Barrios and made Dueñas president. D. at Guatemala, Apr. 14, 1865.
Herbert H. Smith.

Carriacou, kăr'i-a-koo': See Grenadines.

Carriages: wheeled vehicles of whatever kind used for carrying or conveying persons or things on land, including coaches, chariots, wagons, carts, cars, etc. The name, however, is now commonly restricted to vehicles for the conveyance of persons, on business or for pleasure. It is probable that the idea of a vehicle with wheels, to be drawn by animals, must have occurred to man soon after the domestication of the horse and the ox. The first attempts in this direction must have been very rude, much like the bullock-carts of India and South Central Africa of the present day—the wheels solid pieces of wood, thin slices of the trunk of a tree, and the axle a solid beam, with the ends rounded and thrust through the rude wheels, which creaked as they revolved. From this cumbrous axle a pole or shafts extended forward, while attached directly to it was the body of the cart or wagon, no springs or intervening elastic substance mitigating its inevitable jolting. The cart was undoubtedly of earlier origin than the chariot; but though progress in those days was slow, yet within 600 years after the flood the Egyptians, and probably the Assyrians also (for the two nations kept pace with each other in mechanical inventions),

were constructing both chariots and carts or wagons, which indicated a great advance in mechanical knowledge. They were at first, and indeed for several centuries, two-wheeled vehicles, but the wheels were no longer solid pieces of wood, but had a hub in which the axle was inserted, and at first four, then six, then eight, and finally (though not till near the close of the Assyrian or Medo-Persian monarchy) twelve spokes, the diverging ends of which were inserted in a rim of wood, which was bound with a tire of bronze. Whether this rim was originally whole or composed of several pieces or felloes is uncertain, but at the period of the Assyrian monarchy felloes were in use. The chariot was box-shaped, but opened in the rear, the front being about 4 feet in height. It was probably 300 or 400 years later that those intended as state carriages were provided with a back, and a seat in which the nobles or royal personages sat or reclined, while a charioteer stood in front and drove the horses.

The chariots were used for two purposes: first, as an evidence of the great dignity and exalted station of the king or prince who occupied them, as when Pharaoh made Joseph "ride in the second chariot which he had" (Gen. xli. 43), and as when the funeral procession for Jacob went up out of the land of Egypt, and "there went up with Joseph both chariots and horsemen," in token of the high rank of the deceased (Gen. l. 10). It is noteworthy that during the time which elapsed between these two incidents we find Joseph sending wagons (probably carts, or simple two-wheeled vehicles, drawn by oxen) from Egypt to Canaan for his brethren to bring their wives and children to Egypt (Gen. xlv. 19). A second use of these chariots was for war purposes. It is hardly probable that they were used in this way so soon as for regal pomp and display. There is a tradition that Erichthonius of Athens built the first war-chariot about 1586 B. C. At the time of the Exodus (B. C. 1491) Pharaoh had 600 war-chariots, and it is implied (Ex. xiv. 7) that besides these there were other chariots in Egypt which were employed for the same purpose. These war-chariots had on their sides cases for the bow and sheaf of arrows, and also for the spears or lances, and usually an archer or a spearman stood on either side of the charioteer, and shot his arrows or hurled his spears at the enemy as the charioteer drove furiously to the conflict. The Canaanitish kings and the Kings of Moab in the next 150 years after the Exodus are often spoken of as having numerous chariots of iron; by which is generally understood, not chariots constructed of iron, but with iron or bronze scythes attached to the axles of their chariots. These, driven at great speed against a force of footmen or cavalry, proved terribly destructive. The Israelites under the theocracy were prohibited the use of chariots, but in the time of David, and still more in that of Solomon, they began to accumulate them, and Solomon maintained a force of 1,400 chariots: these and the horses which drew them were mostly imported from Egypt at a cost of about 1,050 shekels for each chariot—about $650, or, reckoning the difference in the value of money then and now, equivalent to at least $3,000 of our money; so that his force of chariots must have been worth at least $4,200,000. But other items in the cost of these establishments were the richly embroidered housings and trappings for the horses and the cloths for the chariots, manufactured for a long period in Tyre or in some of its tributary states (Ezekiel xxvii. 20).

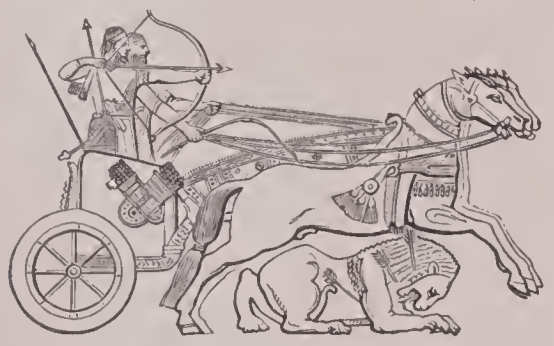


FIG. 1.—Assyrian war-chariot.

Until near the close of the Assyrian monarchy the chariot was generally drawn by three horses. At that time the third horse was withdrawn, but the Persians a little later drove four horses, attached, like our stage-horses, to the chariot in pairs. The chariot continued to be a two-wheeled vehicle until near the Christian era, when its use for war purposes was discontinued, and among the Romans, Greeks, and the sybaritic nations of the Orient it became the synonym of luxury and effeminacy. It was mounted on four wheels and drawn by four or six horses elegantly caparisoned, and the chariot itself was trimmed and cushioned with the most luxurious embroidered cloths of the East. Usually but two persons besides the driver occupied it, though there was often room for six. There were chariot-races in the Olympian and Isthmian games, and the nobles of Greece and Rome drove at full speed along the magnificent Roman roads and highways. It was probably in one of the more modest of these vehicles that the Ethiopian treasurer of Candace, Queen of Ethiopia, was returning to his country from his visit at Jerusalem when he met Philip (Acts viii. 27, 28). During the period of the later Roman empire and the decline of its power these richly decorated carriages multiplied, with the other indications of the luxury and effeminacy of the people. There was not, however, even in the most costly of these vehicles, anything answering to the springs of our modern coaches and carriages. Leather and steel of the best quality were both abundant, but the idea of using either for rendering the motion of these carriages easier did not occur to the carriage-builders of those days.

During the Dark Ages the roads were so rough and poor that carriages were almost entirely abandoned as a means for the conveyance of persons, the only method of land-travel being on horseback, and even the broad-wheeled heavy wagons or wains, used to some extent for the transportation of goods, moved over the highways with the greatest difficulty. On the Continent, asses, mules, and the large but slow and sure-footed Norman horses were used for the moving of goods from one country to another, the huge panniers on either side of the animal almost concealing him from sight. In 1280, according to Beckman, Charles of Anjou and his queen entered Naples in a *caretta*, a small but highly decorated chariot. Fourteen years later, in 1294, Philip the Fair issued an ordinance forbidding the wives of citizens to use carriages, or perhaps more accurately *cars*, probably open two or four wheeled vehicles, which seem to have come into use about that time. For the next 200 years their use was very infrequent, and seems to have been confined to royal personages. Yet in this time there had been introduced one change which was perhaps an improvement. The canopy (probably borrowed from the Oriental umbrella held over the monarch in his chariot), which had hitherto been sustained by four pillars, and had been open at the sides, now gave place to a close drapery which concealed the occupant from view except when looped up. The Emperor Frederic III. attended the council or diet at Frankfort in 1474 and 1475 in close or covered carriages, that of the latter year being magnificently decorated. Soon after this time the German princes seem to have entered upon a rivalry to outshine each other in the splendor of their equipages. In 1509, at a tournament in Rappin, the Electress of Brandenburg's carriage was completely covered with gold, and those of the other duchesses were ornamented with crimson and purple curtains and draperies of the richest satin. From this time the use of coaches by the nobility, and especially by the feudal lords, spread gradually over continental Europe; but, though the coaches were low and broad-wheeled, the condition of the roads was a serious obstacle to their use. In 1550 there were only three

FIG. 2.—Henry IV.'s coach.

FIG. 3.—Queen Elizabeth's state carriage.

coaches in Paris. In 1610 Henry IV. was assassinated in his coach. Rude carriages, called whirlicotes, two-wheeled vehicles without straps or springs, and having the horses attached to them by ropes, had been occasionally seen in England as early as the time of Richard II. (1377–99), and it is recorded that his mother was conveyed in one at the time of the rebellion of 1399. But the state coach was first introduced in the time of Queen Elizabeth, in the year 1555, it is said, by Walter Rippon, a Dutchman, who built one in that year for the Earl of Rutland, and in 1564 another for the queen, who made him her coachman. On page 92 we give an illustration of this coach, and of a later one built for her when attended by her maids of honor or her ministers, copied from Höfnagel's print of Nonsuch Palace. These coaches were without springs of any kind, though that of Henry IV., figured on same page, appears to have been suspended on heavy bands of leather or steel.

The English nobility soon set up their carriages, and, as Buckingham quaintly expresses it, "within twentie years there became a great trade of coachmaking." Some of the nobles increased the number of horses attached to these coaches to six, or even eight. The use of private carriages was confined to the aristocracy for the next hundred years, but a few hackney-coaches (so called from the French *coche-à-haquenée*, a vehicle with a hired horse) were kept for hire after 1625. Fifty years later there were twenty of these in

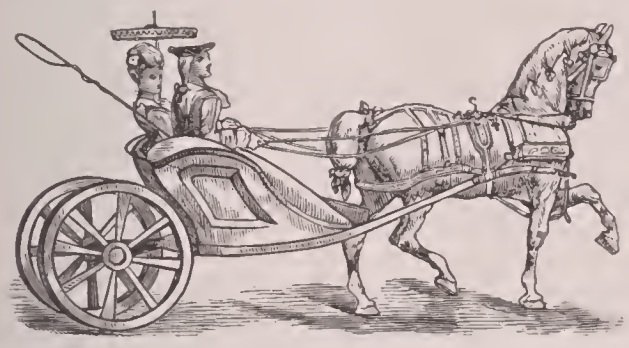

Fig. 4.—Private carriage of the seventeenth century.

Edinburgh, but such was the condition of the roads and streets that there was not much demand for them, and a hundred years later the number had dwindled to nine. During nearly the whole of the eighteenth century these hackney-coaches, the heavy and slow-going stage-coaches, and the post-chaises were the only vehicles in England for the accommodation of those travelers who did not own horses or coaches. There was, indeed, one other mode of traveling, very slow and inconvenient, which was resorted to by the common people, and sometimes by the middle classes. The huge broad-wheeled, covered wagons used for the transportation of goods, and drawn by six, eight, or twelve of the great Normandy horses, had a space partitioned off at the hinder end and strewn with straw, in which they could carry six or eight passengers, all of whom had to sit on the straw on the floor of the wagon. This was called "riding in the tail of the wagon." But even this limited accommodation was to be found only on the great thoroughfares, as away from these goods were carried on pack-horses. Even as late as 1750 the journey from London to Birmingham by stage-coach, a distance of 116 miles, occupied nearly the whole of three days and nights. In 1754 the first line of stage-coaches was established between London and Edinburgh, and the advertisement stated that "a two-end glass coach machine, hung on steel springs, exceeding light and easy, would go through in ten days in summer and twelve in winter, the passengers lying over during the Sabbath at one of the villages on the route." The distance between the two cities is about 400 miles, and it is now run by the ordinary fast trains of the Great Northern Railway in ten or eleven hours. The introduction of steel springs for coaches dates from about 1750, but these were not at that time the elliptic or the C spring, but a bow of steel, the two ends of which were secured to the axle, and the center reenforced by shorter strips of steel, much like the heavy springs to be seen on some of the passenger cars on the railways. The leather thorough-braces, whether attached to a crossbar, as they were at first, or to the C spring, as was done later, did not come into use till near the close of the eighteenth century.

The great improvement in the public highways in Great Britain, which was the result of the labors of Macadam, Telford, and other civil engineers at the close of the eighteenth century and the beginning of the nineteenth, and the reorganization of the postal arrangements, led to the establishment on all the principal thoroughfares of those lines of stage-coaches which De Quincey has so eloquently described as "the glory of England" and "the poetry of motion." These coaches were well built, strong, and so well provided with springs that their motion was easy, and did not weary the traveler even on long journeys. They were run by time-tables, and made ten miles an hour regularly. From about 1795 to 1835 these vehicles were the favorites of travelers, and carried hundreds of thousands of passengers annually; but when the railway lines were constructed between the large towns the stage-coaches began to fall into disuse, and they are now employed only on short and subordinate routes in the more sparsely settled localities. But with their decrease there has been a vast increase in the number of private carriages of all descriptions, varying in style and capacity from the skeleton or sulky for a single passenger, who is his own driver, to the family coach, phaeton, or carryall, into which from eight to a dozen can be stowed. The hackney-coaches have very generally given place to cabriolets or *cabs* (introduced about 1820), which are drawn by one horse and carry from two to four passengers besides the driver, and the hansom-cab, an invention dating from about the year 1835. Omnibuses were introduced about 1831 from France, and are very extensively used, notwithstanding the introduction of street railways.

In North America the prevalent mode of traveling for the first two centuries was on horseback, the roads preventing any very extensive use of wheeled vehicles. There were, however, even at the time of the Revolution and for some decades before, a few family coaches maintained by the wealthy and aristocratic families of the larger towns. These were heavy, lumbering affairs, drawn by six large horses, and seldom moved faster than a very slow trot. In New York, Pennsylvania, and New Jersey the great Conestoga wagon, broad-wheeled, and with its huge canvas-covered body elevated both in front and rear, drawn sometimes by Normandy horses, sometimes by four or six yokes of oxen, crept

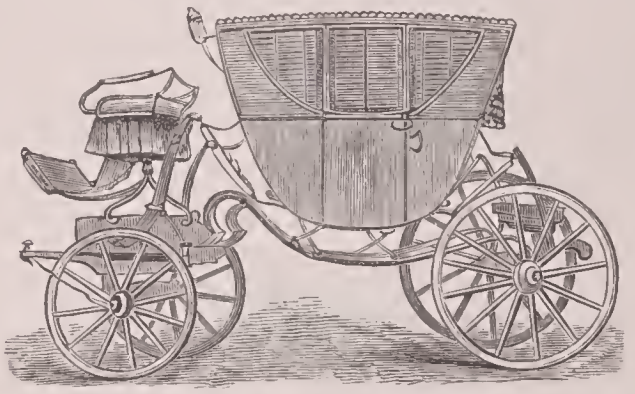

Fig. 5.—Washington's carriage.

at a slow pace over the rough roads to carry goods from the seaports into the rural districts. These same wagons in our times have been used in the Mississippi valley and on the Western plains, as well as in Western Pennsylvania, West Virginia, the mountain districts of North and South Carolina, Georgia, and East Tennessee, to transport both goods and emigrants, and have received the name of "prairie schooners." At the time of the Revolution the stage-coach was unknown in America. In 1791 there were only 1,905 miles of post-roads in the U. S., and over the greater part of these the mails were carried in heavy wagons, occupying three or four days in the trip from Philadelphia to New York, or making the round trip in a week, while they took ten days for the journey from New York to Boston. The improvements in the roads led to improvements in the vehicles, and on the great thoroughfares from 1810 to 1845 the stage-coaches were, of their kind, admirable vehicles. Accommodating nine inside, and usually six, including the driver, on the outside, with a good supply of baggage covered with a heavy leather boot in the rear, and drawn by four or six spirited horses, these vehicles, though not making quite as good time as the British stage-coaches, were the admiration of all beholders. Troy, N. Y., became celebrated for its coaches, as it has since for its cars for street-railway use, and the stage proprietor who could assure his customers that he used only the best Troy coaches was sure of ample patronage. For the travel in newer regions and over somewhat rougher roads what were called the Concord wagons or

coaches, originally made in Concord, N. H., were preferred. Most of the coaches in use in the Pacific States are of this description. They are furnished with strong brakes to check their too rapid descent of the mountain declivities.

The omnibus has not been used to any great extent except in cities and large towns, but in these, until the advent of the street railway, it was the favorite vehicle for public travel.

Modern Carriages.—Carriages may be classified in several ways, according as we regard the number of wheels, the method of entering, or the number of seats, and the method of seating the occupants. Among two-wheeled vehicles may be mentioned the cart, the gig, the sulky, the hansom-cab, the Irish jaunting-car, and the Japanese jinrikisha; among four-wheelers the wagon, the cab, coach, buggy, barouche, etc. Some are entered at the side, as the coach, the buggy, etc.; others at the rear, as in the omnibus, the wagonette, and the herdic. In some the occupants are seated facing one another along the sides, as in the street-car and the wagonette; in others they are back to back and face outward, as in the jaunting-car. But the usual way is to place the seats crosswise, with the occupants all facing one way, as in the break, the phaeton, the brougham, and the surrey, or back to back, as in the dogcart, or face to face, as in the ordinary family coach.

Two-wheeled Carriages.—Vehicles with only two wheels require shafts which are more or less rigid, as the horse has to bear part of the load. In four-wheeled vehicles the animals have simply to draw. Of the two-wheeled vehicles now in use in the English-speaking world the gig is probably the oldest and most typical. It is a one-horse conveyance, the body of which usually rests on two or more semi-elliptical springs, and may or may not have a hood. It is intended to carry only two persons. Its best-known varieties are the stanhope and the tilbury. The dogcart is also a two-wheeled vehicle for one-horse or for tandem driving, and accommodates four persons back to back. The body rests on half-elliptical springs, and is furnished with appliances for shifting the body or the seat so that the load may be balanced and the weight taken as far as possible from the horse's back. This form of conveyance was originally intended for hunting purposes and carried dogs, hence the name. The whitechapel cart is one of the best-known varieties of the dogcart. The trotting-sulky, like the trotting horse itself, is peculiarly a U. S. product. It is of very slight build, has two wheels, seats one person, and is generally used in speeding trotting horses. In 1892 the rubber pneumatic tire, so successfully used on the bicycle, was applied to the sulky and the trotting record at once lowered by about four seconds. The road-cart, which is constructed in a variety of forms, is a cheap modification of the sulky, with the addition in some kinds of conveniences for carrying articles of greater or less bulk. It is light in construction, is hung low, and is extensively used in the agricultural regions of North America. The Irish jaunting-car differs from almost all other two-wheeled vehicles in having very low wheels, over which the body is placed, the occupants being seated back to back and facing outward, thus traveling sideways. The hansom-cab is one of the most useful public conveyances, and is admirably adapted for the crowded streets of great cities, such as London, where it has had its chief development. It was invented in 1835 by an Englishman named Joseph Hansom. It has two wheels, with the body (with paneled hood) hung very low between them. The coachman's seat is behind and above the body, to enable the driver the more readily to control his horse, and the whole is so balanced that little if any weight rests on the horse's back. The jinrikisha, or "man-power carriage" of Japan, is but a miniature hansom-cab with a folding hood, without the driver's seat at the back, and with a man in the shafts instead of a horse. Hundreds of thousands of these handy conveyances are in every-day use in Japan, in China, and India. The invention has always been claimed by a Baptist missionary from the U. S. named Jonathan Goble. See Japan.

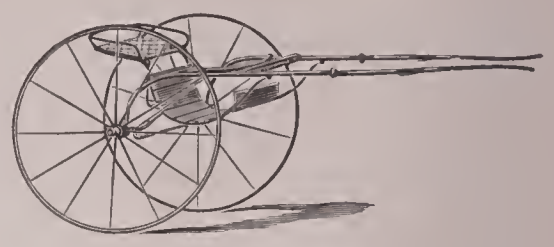

Fig. 9.—Road-cart.

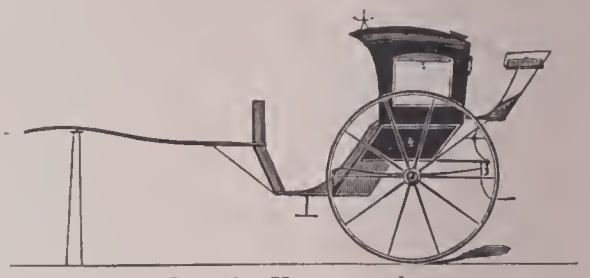

Fig. 10.—Hansom-cab.

Four-wheeled Carriages.—Among four-wheeled covered vehicles may be mentioned the coach, the landau, the brougham, and the rockaway. The coach is a family carriage with either full paneled body or with quarter panels, and is intended to carry four inside and two on the coachman's seat in front. The body is suspended on elliptical springs alone or in combination with curved C springs back and front. This latter method of suspension is called "double suspension." The coach is sometimes constructed with additional outside seats, and used with four horses as a road coach, and is then known as a "mail-coach," "drag," or "tally-ho." The landau is a carriage of the coach family and takes its name from the town in Bavaria, where it is supposed to have been first built. It differs from the coach only in having a falling top, made either entirely of leather, when it is called a "leather-quarter landau," or with glass quarters, when it is called a "glass-front landau," a "five-glass landau," or a "glass quarter landau," according to the number of the glasses. The brougham, named after Lord Brougham, for whom the first of this type of carriage is said to have been built, is a low-hung, close, paneled, straight

Fig. 11.—Berlin, or town coach.

Fig. 12.—Crown brougham.

Fig. 13.—High door curtain rockaway.

glass-front carriage, for two persons inside and a paneled seat for the coachman in front. Sometimes the body is extended to make room for two more persons inside. It is then known as an "extension-front" brougham. The French carriage of this kind, called the coupé, is sometimes made with curved glass front instead of straight. The clarence has a curved glass front and inside seats for two or four persons.

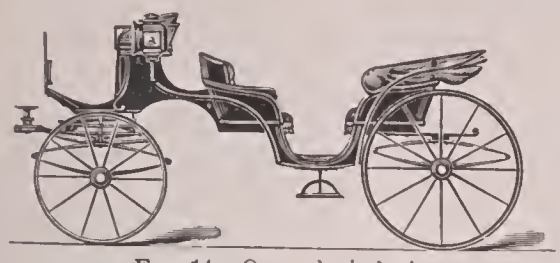

Fig. 14.—Osgood vis-à-vis.

The rockaway is a covered four-wheeler, with sides either curtained or paneled, the roof extending over the driver's seat, which is on the same level as the inside seats. It is made to carry four or six persons. The body is hung on two, three, or four elliptical springs. It was originally a cheap, light carriage made in Jamaica, N. Y., and is named after a popular resort on Long Island, in that State. It was afterward frequently called a "carryall" and a "germantown." This type of carriage has been greatly developed, and is now much used as a family carriage under the names of coupé rockaway and rockaway coach.

Fig. 15.—Cabriolet.

Hooded Carriages.—The barouche may be considered as a coach with the upper half of the body cut off, and furnished with a leather hood over the back seat. This carriage is now made without doors, and is called a *vis-à-vis*, or sociable. The cabriolet, originally an Italian gig, is now a leather-hooded carriage for two passengers, with a paneled driver's seat and no door. An English type of carriage, in all respects similar to the cabriolet, is the victoria, except that instead of a paneled driver's seat in front, the body is provided with iron loops which connect it with the front carriage. On these loops is constructed the driver's seat (an iron framework), and across them is stretched a wide leather dashboard. Sometimes the driver's seat is made to shift to the rear of the body, in which case it is called a "duc." The mail phaeton is a heavy square box-body carriage, with hooded seat for two in front and a seat for grooms behind. A modified form of the mail phaeton is known as the demi-mail phaeton and stanhope phaeton. The spider phaeton is used for the same purposes as the mail phaeton. The front seat is supported on two iron loops which connect with the hind carriage and aid in supporting the groom's seat, which is either an iron frame or paneled. The calèche, or calash, which is used to some extent in Canada, is a two-wheeled hooded vehicle, with a seat for two behind and a seat on the splashboard for the driver.

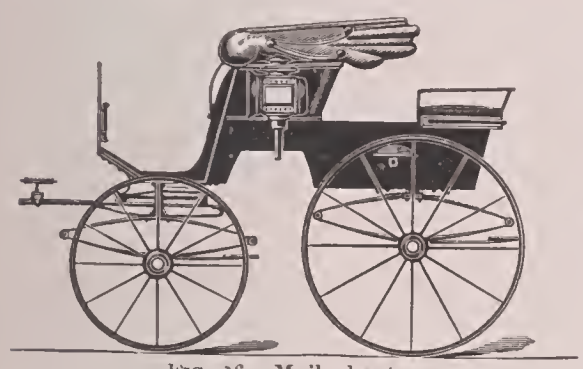

Fig. 16.—Mail phaeton.

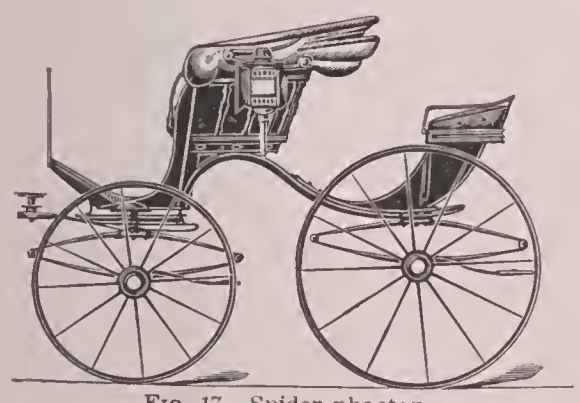

Fig. 17.—Spider phaeton.

Open Four-wheeled Vehicles.—The break, which is a member of the phaeton family, was originally used in Great Britain in "breaking" colts. The name is now applied to a heavy phaeton for gentlemen's driving, and seats from six to twelve persons, including grooms. The buggy is a peculiarly North American carriage, though the name is of Anglo-Indian origin (from Hindi, *bag*, pronounced bŭg, to move), and is used in India to designate "a kind of gig with a hood to screen the traveler from the rays of the sun." As used in the U. S. and Canada the name designates a light four-wheeled vehicle with one seat, drawn by one horse, and with or without a hood. Formerly the buggy was hung high on elliptical springs, and had a top-heavy appearance. As now generally made it is hung low on side-bars of wood, attached at their ends to semi-elliptical springs. A variety of the buggy called a buckboard is one of the simplest kinds of carriage, requiring hardly anything in its construction but the four wheels, the axles, a king-bolt, and a long springy plank. This plank is rigidly attached to the hind axle, and to a cross-bar in front to which the front axle is fastened by a king-bolt, about which the front axle swings in turning the vehicle. At a proper distance between the front and the back a box is placed on the springy plank, and upon that box rests the seat for the occupants. Born of necessity in the sparsely settled hilly regions of the New England and Middle States of the Union, when money was scarce and roads bad, the buckboard successfully met the demand for a vehicle of simple construction the constituent parts of which should, as far as possible, be home-made, and received its name from its ability to "buck" successfully against the rocks and inequalities occurring in the roads. It is now a somewhat fashionable conveyance in regions where roads are good and the country level. The surrey is another member of the buggy family. It is a side-bar vehicle intended to accommodate four persons, and is made in a great variety of styles. The body is suspended in the same way as the modern buggy, and is of three general patterns: one of longer gear to allow of stepping in and out between the front and back wheels; another coupled somewhat shorter in which entrance to the back seat is made by lifting half of the front seat; and a third made like the second, but with the additional convenience of dropping the back panel, and so shifting the back seat as to permit riding back to back when desirable. See Diligence, Droschky, Tarantass, etc., and Stratton's *World on Wheels*.

Carrical: See KARIKAL.

Carrickfer'gus: a seaport-town and borough of Ireland; on the north shore of Carrickfergus Bay or Belfast Lough; 10 miles by rail N. N. E. of Belfast; in the county of Antrim, but forms a county by itself, called "the county of the town of Carrickfergus" (see map of Ireland, ref. 4–J). The town extends about a mile along the shore of Belfast Lough. It has a fine old parish church, said to have been founded in 1164. It contains also Presbyterian, Methodist, and Dissenting meeting-houses, a Roman Catholic church, a town-hall, court-house, etc.; also several spinning-mills and manufactures of linen and starch. It was formerly a place of great strength. Here is a remarkable and picturesque castle, supposed to be 700 years old, standing on a high rock and on the sea, on which three sides of it are situated. It is used as an arsenal, barracks, and a fort for the defense of the harbor. King William III. of England landed here June 14, 1690, sixteen days before the battle of the Boyne. In 1760 it was surrendered to a French naval force under Thurot, who evacuated it on the appearance of the British squadron under Commodore Eliot soon after, which captured Thurot's squadron. Capt. Paul Jones captured the sloop-of-war Drake in Carrickfergus Bay Apr. 24, 1778, but made no attempt to seize the town. The surface of the county is generally hilly, and its chief crops are oats and potatoes. This locality has long been noted for its cheese. Carrickfergus has important fisheries, and is celebrated for its oysters, lobsters, and scallops. It has considerable trade with Liverpool, though its harbor is shallow and poor. The people are mostly Protestants of Scotch descent. A part of the ancient wall is still standing. The town is connected with Larne by railway. The rural district contains Lough Morne, which has an area of about 90 acres, and is situated at an elevation of 556 feet above the level of the sea. The port of Carrickfergus was for a long time the chief market on this part of the coast. It returns one member to Parliament. There are mines of salt in the vicinity. Pop. 10,000.

Carrickmacross': an inland town of Ireland; in the county of Monaghan, province of Ulster; 46 miles N. W. of Dublin (see map of Ireland, ref. 7–H). The town consists mainly of one long street. One of its churches serves as the cathedral for the Roman Catholic Archbishop of Clogher. The town has a savings-bank, a Presbyterian meeting-house, a house of correction, and a well-endowed grammar school, and has a fair, held five times a year. Pop. 7,000.

Carrick-on-Shannon: an inland town of Ireland; capital of County Leitrim, province of Connaught; situated on both sides of the Shannon river; 85 miles W. N. W. of Dublin (see map of Ireland, ref. 7–F). The town lies principally on the Leitrim bank of the Shannon; is connected by a bridge with that part of the town which is on the Roscommon side; is on the Midland Great Western Railway. It has a church, a Roman Catholic chapel, two Methodist meeting-houses, and a county infirmary and dispensary. It also contains the county court-house, jail, and house of correction, and has considerable trade, chiefly in provisions. A canal has been cut from this place to Lough Erne. Pop. 1,384.

Car'rick-on-Suir: an inland town of Ireland; in the south riding of the county of Tipperary, province of Munster; on the river Suir; 13 miles by rail E. of Clonmel (see map of Ireland, ref. 12–G). It has an old bridge, a parish church of high antiquity, a Roman Catholic chapel, a hospital, a convent, and a picturesque ruined castle built about 1310 by an ancestor of the Earl of Ormond. The town is situated near the junction of the counties of Tipperary, Kilkenny, and Waterford. Grain and other products of the soil are exported from this place by the navigation of the river. It has linen and woolen manufactures. Slate is extensively quarried in the neighborhood. Pop. 6,000.

Car'rick's Ford: a point on the Cheat river near St. George, Tucker co., West Va. The Confederate forces under Gen. R. B. Garnett, in retreat from Laurel Hill, where they had abandoned most of their artillery and stores, were here attacked by three regiments of Federal troops under Gen. T. A. Morris. A brisk engagement ensued, in which the Confederates were routed and Gen. Garnett killed. The Federals captured the Confederate wagon-train and one piece of artillery. This affair occurred July 13, 1861.

Car'rier, AUGUSTUS STILES, B. A.: Professor of Hebrew and the Cognate Languages in McCormick Theological Seminary; b. in Ripley, N. Y., Dec. 30, 1857; graduated from Yale College 1879, and took the theological course at Andover and Hartford Seminaries. He was pastor of a Presbyterian church in Bloomington, Ind., 1884–85; became instructor in McCormick in 1887, and professor in 1892. He published *The Hebrew Verb: a Series of Tabular Studies* (Chicago, 1891).

Carrier, kăăr'ri-ay', JEAN BAPTISTE: a Jacobin notorious for his cruelty; b. at the village of Yolai, near Aurillac, in Haute-Auvergne, in 1756. At the commencement of the French Revolution in 1789 he was only an obscure attorney, but was brought into notice by its progress, and was sent to the National Convention in 1792. He was sent to Nantes in Oct., 1793—where he found many Vendean prisoners—to assist in repressing the civil war commenced by the priests and royalists in La Vendée. He selected a committee in order to give the appearance of legal sanction to his cruelties, but took them from the lowest and most vicious class of the people. He soon dispensed with all formality, and executed his prisoners in large numbers at one time. He murdered multitudes of men, women, and children by various modes. Many of these victims were crowded into boats which were scuttled and sunk in the river Loire. This was called "Republican baptism." The cruelties and obscenities related of this worst of Jacobin leaders are almost incredible. More than 16,000 persons were put to death by him in a single month. Soon after the fall of Robespierre the public called for justice against Carrier, and he was finally recalled by the committee of public safety, and condemned by the revolutionary tribunal. He was guillotined Dec. 16, 1794.

Carrier, JOSEPH AUGUSTE: a French painter of portraits, miniatures, and forest scenery; b. in 1800 at Paris, and studied under Gros, Prud'hon, and the chevalier Saint. He first exhibited in 1824, won several medals, and in 1866 was decorated with the cross of the Legion of Honor. D. in Batignoles, Feb. 21, 1875.

Carrière, kăă'ri-ār', EUGÈNE: contemporary genre-painter of the French school; b. at Gournay-sur-Marne (Seine-et-Oise); pupil of Cabanel; second-class medal, Paris Exposition, 1889; Legion of Honor 1889. *The Sick Child* (1885), museum of Montargis, and *The First Veil* (1886) are two of his most important works. He paints in a general gray tone almost devoid of color, and envelops his figures in a misty sort of atmospheric effect. He has a considerable following among the younger French artists, but his methods have a pernicious influence, as they tend to eliminate both color and exactness of form. Studio in Paris.

WILLIAM A. COFFIN.

Carrière, MORITZ: German author; b. at Griedel, in Hesse, Mar. 5, 1817; studied philosophy at Giessen, Göttingen, Berlin, and in Italy. In 1849 he became Professor of Philosophy at Giessen, and after 1853 held that position at Munich. He published *Der Kölner Dom als freie deutsche Kirche* (Stuttgart, 1843); *Abälard und Heloise* (Giessen, 1844); *Die Religion in ihrem Begriff*, etc. (1841); *Die philosophische Weltanschauung der Reformationszeit* (1847); *Die letzte Nacht der Girondisten* (a poem, 1849); *Religiöse Reden und Betrachtungen für das deutsche Volk* (1850); *Das Charakterbild Cromwells* (1851); *Das Wesen und die Formen der Poesie* (1884); *Deutsche Geisteshelden im Elsass* (1871); *Die Kunst im Zusammenhang der Kulturentwickelung und die Ideale der Menschheit* (1863–71); *Geschmack und Gewissen* (1882); and other works. He defended Christianity, opposed Ultramontanism, and was of the liberal school. As an art critic he took a high rank. D. at Munich, Jan. 19, 1895.

Carrier Indians: See ATHAPASCAN INDIANS.

Carrier-pigeon: See PIGEON.

Carrières, kăăr'ri-ār', LOUIS, dc: a Roman Catholic theologian; b. in 1662 in Cluvilé, near Angers, France. He became a soldier, and in 1689 joined the Congregation of the Oratory. He became distinguished as a theologian, and published, at the request of Bossuet, a *Commentaire Littéral* (24 vols. 12mo, 1701–16). This work is very popular in France even at the present day. Most of the comments are made in the translated words of the Bible itself, and are interwoven with the text. It has been often reprinted, e. g. Paris, 1872, *seq.* D. in Paris, June 11, 1717.

Carriers, Common: those who undertake for hire to transport from one place to another the goods or persons of such as choose to employ them. They are distinguished from *private* carriers by this readiness to afford accommodation to the public generally, and are subjected in law to a different responsibility. They may be either carriers by land or carriers by water. Familiar examples of the former kind

are stage-coach proprietors, railway companies, express companies, wagoners, and teamsters, etc.; of the latter, the owners and masters of steamships, ferry-boats, and vessels of all kinds engaged in a general transportation business. The principles of law exhibiting the rights and duties of common carriers form a subordinate department under the general subject of BAILMENT (*q. v.*), and, as in other varieties of the same legal relation, the degree of care necessary in the custody and treatment of whatever is received by the bailee is not dependent in all respects for its determination upon the contract of the parties, but arises by force of established legal rules. The difference in these requirements, depending upon the circumstance whether there be a carriage of goods or a carriage of passengers, demands that these two branches of the subject be examined separately.

Common carriers of goods are placed under a responsibility of excessive stringency. They are held liable for all loss or damage which occurs during transportation except that occasioned by "the act of God or the public enemy." They are made virtually insurers of the goods against all perils except those arising from these two sources, and the infrequency of exemption must be so great as to afford relief but very rarely. The reasons for imposing a duty so severe grow out of considerations of public policy. The facility with which the carrier or those who may collude with him can purloin or injure goods intrusted to his oversight and disposal, and the difficulty of ascertaining the true cause of the loss, are thought to place the members of the community so entirely at his mercy that their interests demand the most ample protection. Moreover, the fact that the application of this rule has not proved detrimental to the growth and prosperity of transportation companies indicates that its apparent undue severity, while conducing greatly to the advantage of the public, has worked no practical injustice even to the carriers themselves. The phrase "act of God" is held to extend only to such inevitable accidents as occur without the intervention of human agency. Thus losses directly occasioned by winds, floods, lightning, and earthquakes properly would be included under this designation, and the carrier would be relieved from liability. But robbery, even if committed unexpectedly and by an irresistible force, or fire occasioned by some incendiary, wholly without the carrier's negligence or connivance, would be causes of loss containing that element of human agency which makes the exemption inapplicable. Damage resulting from natural causes, such as frost, fermentation, evaporation, the natural decay of perishable articles, or the inherent viciousness of animals, is placed upon the same footing as losses caused by the "act of God." By the phrase "public enemies" is meant those with whom the nation is at war or pirates on the high seas. Thieves, robbers, and mobs would not be included under this term.

It is a carrier's duty to receive for transportation all goods offered of the kind which it is his usual custom to carry. He may, however, demand the payment of freight in advance, and may refuse all articles of a dangerous quality. All persons who engage his services must be charged for the same service equably. Suitable vehicles for transportation must be provided, in charge of competent servants; the goods must be carried safely to the proper place of destination by the usual route and with all reasonable dispatch, and there delivered, or held ready for delivery, to the owner or consignee. Reasonable instructions given by the owner or his agent relative to the mode of carriage of the goods must be followed, unless compliance is impracticable. The carrier is also held accountable for all acts of his employees within the scope of their employment, even though they violate his instructions as to the mode of performance. He can not escape from his obligations as to the carriage of the goods by attributing default to his own agents.

The responsibility of common carriers begins upon the delivery of the goods for transportation. A delivery at the usual place of receiving freight or to the employees in the usual course of business is sufficient. But where goods are transferred to carriers with instructions not to transport them until further notice, the extraordinary liability already considered does not attach in the meantime, and it is only necessary that the ordinary care which is obligatory upon warehousemen be exercised until carriage really commences. The responsibility terminates when the goods have reached their destination and been actually delivered. But if, upon the lapse of a reasonable time after arrival, they are not claimed and removed, the carrier's liability is not entirely ended, but only modified in degree. It is then his duty to store the property in a safe and secure warehouse to await the owner's demand, and he is only accountable thereafter for ordinary care. Important distinctions are drawn between various classes of carriers in reference to the proper mode of delivery. These are rendered necessary by the different kinds of transportation adopted in the several cases. Thus express companies employ conveyances which can be readily sent from dwelling to dwelling, and they are consequently held bound to make actual personal delivery at the owner's place of business or residence. Carriers by water, on the other hand, can proceed no farther than the wharf. Hence, according to a well-settled usage clearly applicable to sea-going ships, no other delivery is demanded than can be made there; but the convenience of the consignee is still regarded, as far as practicable, by imposing upon the carrier the obligation, rendered necessary by the uncertain time of arrival, that notice be given when the vessel has reached her place of discharge of the cargo. In railway transportation, again, the circumstances are still different. The cars are confined to a given line, have a regular terminus, and trains are run uniformly in accordance with published time-tables. Hence, according to some authorities, personal delivery is so completely excused that not even notice of arrival is necessary. The better opinion seems to be that notice is required, and that the consignee has a reasonable time within which to take the goods before the strict liability of the carrier is modified into that of the warehouseman.

The purpose of these various regulations manifestly is that the interests of both carrier and owner be promoted. The "reasonable time" after arrival during which the carrier's heavy responsibility as insurer is to continue will be most speedily terminated when the owner has immediate knowledge that the goods lie at his disposal.

There are instances, however, in which delivery is sufficient to discharge the carrier, though not made to the owner himself. This occurs when several parties are engaged successively in the transportation of the same articles. The liability of each, in the absence of special circumstances, terminates when the next undertakes the duty of carriage. At least such is the doctrine upheld generally by the decisions of the American courts. In England, on the contrary, the rule is maintained that the first carrier who receives the goods, if he accepts them for a destination beyond his own route, continues liable until the entire journey is completed, and the subsequent parties, though the injury or loss may occur on their own lines of travel, are exempted from liability on the contract. This proceeds upon the notion that the contract for transportation is tacitly made with the first carrier. According to the prevailing opinion in the U. S., the cases in which these views should be followed are those in which the first carrier engages by special contract for the entire route. It should be added that there may be such a business connection between various parties concerned in continuous transportation as to make them all liable as partners for the entire transportation.

Questions of much importance arise as to how far a carrier's duty and responsibility may be modified by usage or custom, or by specific contract entered into with the owner, or by notice given him. It is well established that common usage, if uniform and reasonable, may be pleaded in justification of peculiar regulations adopted. Thus the nature of the goods which will be received or the route which will be generally pursued may be determined in this manner.

But these common modes of reducing responsibility are comparatively insignificant in view of those qualifications established by contract or notice. The policy of allowing the carrier to so limit his liability has been much questioned, but the validity of such agreements is now generally recognized. Bills of lading and instruments of an analogous character, given by the carrier on accepting goods for transportation, contain almost invariably stipulations in regard to exemptions from loss by fire and other enumerated perils, and are regarded as constituting a contract between the carrier and shipper. In like manner, notice brought home to the knowledge of the owner of the goods and assented to by him will have in general the same effect. At this point there is a great practical difficulty. The question is: What will be sufficient evidence of assent on the owner's part to a notice? It is plain, at least, that the notice must be so given by the carrier as naturally to attract the attention of the shipper, and must be so precise and clear that he can readily acquaint himself with its contents. Assuming this to be so, *can the carrier shake off his*

extraordinary responsibility by notice? It is now quite clear that he can not. He may make in this manner reasonable regulations in the nature of by-laws, pointing out the articles that he will carry, or requiring a statement of their value, so as to know what care will be properly demanded of him, and what reasonable charge he should make. But when all this is done he can not shake off his character of insurer by notice. To do this there must be a contract—some evidence of assent; and notice by the carrier is no evidence of assent by the shipper. He, by his silence, should fairly be assumed to insist on the carrier's common-law responsibility. The English courts held otherwise at one time, but the salutary doctrine here maintained is now substantially established in England by statute. Under its legislation the carrier may relieve himself to a considerable extent by notice, but can not escape entirely the consequences of his own neglect or misconduct. The notice must not only be really or presumptively known to the owner of the goods, but must also be reasonable in its character.

Common Carriers of Passengers.—These are not held to as stringent a liability as carriers of goods. They are not made insurers of the passenger's safety, but are nevertheless required to use the utmost care, and are responsible for even the slightest negligence. The reason for this difference is that they can have no such complete control over persons as over goods. Passengers must largely retain freedom of movement and self-direction. It is no more than just, therefore, that the carrier's duty should be correspondingly modified. Extreme vigilance may be demanded, but not the duty of preventing injuries to which the passenger's own heedlessness may expose him. In accordance with this principle, injuries occurring from any defect in the construction of machinery or vehicles which proper care should have guarded against, or from their unskillful management, subject the carrier to responsibility. He is answerable for the acts of his agents, whether negligent or willful, done within the scope of their employment. It is his duty to exclude lawless and disorderly persons from his conveyances, or, failing to do so, he may, according to some authorities, be held responsible for any violence they may perpetrate on the passengers.

When, however, the passenger's own negligence is the proximate cause of the injury the carrier is not liable. Thus if an attempt should be made to get upon a train while the cars were in motion, or a passenger's head or arm should be thrust from a window, and accidents occur in consequence, his own imprudence would be fatal to any claim for damages. This proposition leads to an important branch of the law termed "contributory negligence," which may be defined to be that negligence without which the injury would not have happened, while at the same time, on the part of the carrier, on being made aware of the passenger's negligence, there must be reasonable care used to avert its effects.

The common duties of passenger carriers are to receive all who offer to take passage as long as their vehicles suffice, to carry them the entire route, to treat all with civility and propriety, and bring them to their destination within the stipulated time. They are not, however, compelled to receive persons of offensive or disorderly conduct, or any who by reason of disease or disgusting habits are unfit associates for the other passengers. Reasonable regulations may be adopted concerning the control of passengers, such as that fares must be paid in advance, tickets must be exhibited when called for, and the like. Expulsion of persons in a suitable manner and without necessary force from their vehicles for refusing to comply with such rules are considered justifiable.

The liability of passenger carriers for baggage committed to their charge is in general the same as that of common carriers of goods. In other words, they are held bound as insurers. If, however, the passenger prefers to retain exclusive control of his own property, as a coat, an umbrella, or a satchel, the carrier's responsibility is modified. The liability continues until delivery is made, either to the owner at the final destination or to another carrier in a continuous line of transit, and the duty of storing and preserving goods is the same that has been already detailed in the ordinary case of carriage of goods. The effect of contract or notice is also similar. The obligation to convey baggage arises independently of any special agreement in relation thereto, being considered as incidentally connected with the undertaking to carry the passenger himself, and no additional payment is necessary. But some measure of relief is granted to the carrier on account of this lack of remuneration by defining his accountability more narrowly. He is only liable for articles properly denominated baggage, and not for everything which the passenger may choose to consider such. Articles of necessity or personal convenience are reasonably included within the meaning of the term, but not merchandise or large sums of money or silver plate, and the like. For instance, jewelry used for personal ornament, a reasonable amount of money for traveling expenses, the instruments of a surgeon required in practice in the course of his journey, have all been considered "baggage," and the carrier made accountable for the loss. But the samples of a traveler acting for a commercial house would not be baggage, but merchandise, unless the carrier was made aware of their nature, and then without objection received them as baggage. The principle governing this matter is that concealment of the true nature of the package presented as baggage is a fraud on the carrier. All inference of fraud is dispelled if the contents be disclosed, and there is no objection to the carrier accepting merchandise in trunks if he see fit.

Appropriate remedies exist in favor of carriers. They may detain goods for the freight. They have an action against strangers who interfere with their possession, and may even recover the full value of the goods, holding the surplus above their charges in trust for the owner.

In this brief summary of the rights and duties of common carriers attempt has only been made to exhibit common-law provisions and principles. Statutory enactments exist in the United Kingdom, and in various States, relating to the subject. The subject is treated in much detail in such works as Redfield *On Railways* and Angell *On Common Carriers*. The rules of damages will be found in Sedgwick or Mayne *On Damages*.

T. W. Dwight.

Carrillo, kaăr-reel'yō, Braulio: a statesman of Costa Rica; b. at Cartago, 1800. He was a member of the Federal Congress of Central America 1834, and twice president of Costa Rica (May, 1835, to Mar., 1837, and May, 1838, to Apr., 1842), his administration being marked by wisdom and prosperity. In 1836 he suppressed a rebellion. Carrillo's government was overturned by Morazan in 1842, and he was driven into exile. He was murdered at San Miguel, Salvador, in 1845.

Herbert H. Smith.

Car'rington, Edward: b. in Virginia, Feb. 11, 1749; commissioned lieutenant-colonel of Harrison's artillery regiment in the Revolutionary army Nov. 30, 1776; served under Gens. Gates and Greene, and became the quartermaster-general of the latter; commanded the artillery with success at the battle of Hobkirk's Hill, Apr. 24, 1781, and at Yorktown. He was a delegate to the Continental Congress from Virginia in 1785–86, and was foreman of the jury in Aaron Burr's trial for treason. D. Oct. 28, 1810.

Carrington, Henry B., LL. D.: b. at Wallingford, Conn., Mar. 2, 1824; graduated at Yale 1845; studied law at Yale Law School; professor in New Haven Collegiate Institute; in 1848 commenced practice of law in Columbus, O.; in 1857, being on the staff of Gov. Chase, aided in the organization of the State militia; at the opening of the civil war was made colonel of the Eighteenth U. S. Infantry, and soon after brigadier-general of volunteers. After the close of the war he joined his regiment, and served on the plains in the West until 1868; in 1869 was Professor of Military Science in Wabash College, Crawfordsville, Ind. Wrote *Absaraka, the Home of the Crows*; *History of the Battles of the American Revolution*, etc.

Carrington, Paul: brother of Edward Carrington, noticed above; b. in Virginia, Feb. 24, 1733; graduated at William and Mary College, Virginia; was engaged in 1736 in the expedition under Col. Byrd to establish the boundary line between Virginia and North Carolina; practiced law; was a member of the house of burgesses 1765–75, and voted against the Stamp-Act resolutions of Patrick Henry; was a member of the house of delegates, from which he passed to the bench of the general court in May, 1779; he became a member of the court of appeals, and held that office until 1811; was a member of the committee of safety throughout its existence, and in the Virginia convention voted for the adoption of the Constitution. D. June 22, 1818.

Carrington, Paul: son of the above; b. in 1764. He was distinguished as a Revolutionary soldier in the battles of Guilford Court-house and Green Spring; was a graduate of

William and Mary College, Virginia; member of the house of delegates and of the Virginia Senate; was judge of the superior court. D. Jan. 8, 1816.

Carrion Flowers: the flowers of several species of *Stapelia*, which smell like carrion. They are natives of the Cape of Good Hope.

Car'roll: town (founded in 1867); capital of Carroll co., Ia. (for location of county, see map of Iowa, ref. 5–E); on C. and N. W. R. R. (main line and 3 branch lines); 93 miles E. of Council Bluffs; has 9 churches, 4 schools, fine county buildings, and hotels. The town has manufacturing and wholesaling industries, but derives its support chiefly from agriculture. Pop. (1880) 1,385; (1890) 2,448; (1900) 2,882.
EDITOR OF "SENTINEL."

Carroll, BENAJAH HARVEY, A. M., D. D.: Baptist minister; b. in Carroll co., Miss., Dec. 27, 1843, and educated at Baylor University, Independence, Tex. He has been pastor of the Baptist church in Waco, Tex., since 1870, and is a noted orator of his denomination. Among his addresses may be mentioned: *Then—Now—Hereafter*; *The Good and True Orator*; *Philosophy of Composition*; *Discourses on Prohibition*; *Spurgeon Memorial*; *Personal Liberty*; *Missions of the Southern Baptist Convention*; *Canon of the Bible*; *The Manuscripts*; *Creeds*. The following are some of his published sermons: *Watching Christ on the Cross*; *Communion*; *The Dance*; *Repentance*; *Love*; *Two Plans of Salvation*; *God's Control of the Gospel*; *God's Order in the Gospel of his Son*; *The Agnostic*; *The Treasury*; *How I Escaped from Infidelity*.

Carroll, CHARLES, **of Carrollton**: an American patriot; b. at Annapolis, Md., Sept. 20, 1737. He inherited a large estate in land, and was regarded as the richest man in Maryland. He was chosen as delegate to the Continental Congress in 1776, and signed the Declaration of Independence. To distinguish himself from another man of the same name, he signed himself "Charles Carroll of Carrollton." He was elected to the Senate of the U. S. in 1788. He was of the Roman Catholic faith, and was a man of great dignity and worth. He was a lawyer by profession, educated in France and England, and was especially honored as the last survivor of the signers of the Declaration of Independence. D. in Baltimore, Nov. 14, 1832.

Carroll, HENRY KING, LL. D.: journalist; b. at Dennisville, N. J., Nov. 15, 1848; became assistant editor of the Methodist Episcopal *Hearth and Home*; religious and political editor of the *Independent* (New York, 1876); special agent of the eleventh census in charge of the division of churches; chief editor of *Papers and Proceedings of the Centennial Methodist Conference* (New York, 1885); *The Religious Forces of the United States* (New York, 1893), etc.

Carroll, JOHN, D. D., LL. D.: first Roman Catholic bishop of the U. S., and cousin of Charles; b. at Upper Marlborough, Md., Jan. 8, 1735; educated by the Jesuits in Belgium; ordained priest in 1759; from 1759 till 1771 Professor of Moral Philosophy in St.-Omer and Liège; became a Jesuit 1771; in 1773 prefect to the Jesuit college at Bruges, in Belgium, and when the pope suppressed the society that year went to England, and to America in 1774. In 1784 he was, at the instance of Franklin, appointed superior of the clergy of the U. S., and in 1790 he was consecrated as Bishop of Baltimore. In 1791 he founded Georgetown College. In 1808 his see was made an archiepiscopal one, and he became Archbishop of Baltimore. D. in Georgetown, D. C., Dec. 3, 1815.

Carroll, LEWIS: See DODGSON, CHARLES LUTWIDGE.

Carroll, WILLIAM: b. in Pittsburg, Pa., in 1788; emigrated to Nashville, Tenn., in 1810; captain and brigade inspector under Gen. Andrew Jackson Feb. 20, 1813; colonel and inspector-general Sept., 1813, to May, 1814; fought a duel in 1813 with Jesse, a brother of Col. Thomas H. Benton; major-general Tennessee militia Nov. 13, 1814, to May 13, 1815; famous for his services in defense of New Orleans, especially in the battle of Jan. 8, 1815; Governor of Tennessee 1821–27 and 1829–35. D. Mar. 22, 1844.

Carrollton: town; capital of Carroll co., Ga. (for location of county, see map of Georgia, ref. 3–F). It is on the Little Tallapoosa river, and that branch of the Central Ga. R. R. which runs from Savannah, Ga., to Chattanooga, Tenn.; has six churches, and public schools for all classes. Its principal interests are mercantile, and it has a large trade with the surrounding country. Pop. (1880) 926; (1890) 1,451; (1900) 1,998.
EDITOR OF "FREE PRESS."

Carrollton: city (founded in 1821); capital of Greene co., Ill. (for location of county, see map of Illinois, ref. 7–C); on Ch. and Alt. and Litch., Carr. and West. R. Rs.; 34 miles N. N. W. of Alton. It has a fine public school, handsome court-house, various manufactures, and an excellent system of water-works. Pop. (1880) 1,934; (1890) 2,258; (1900) 2,355.
EDITOR OF "PATRIOT."

Carrollton: city; capital of Carroll co., Ky. (for location of county, see map of Kentucky, ref. 2–H); on Cleve., Cant. and South. R. R., and on Ohio river at the mouth of Kentucky river; 80 miles from Cincinnati, O., and 62 miles from Louisville. Here are churches of five denominations, excellent graded school, court-house, large furniture-factory, woolen-mill, sawmills, grist-mill, pantaloon-factory. The city is situated in a rich agricultural region, and has a very large trade in leaf-tobacco. Pop. (1880) 1,332; (1890) 1,720; (1900) 2,205.
EDITOR OF "DEMOCRAT."

Carrollton: village (incorporated in 1869); Saginaw co., Mich. (for location of county, see map of Michigan, ref. 6–J); on three railroads, and on Saginaw river; 3 miles from Saginaw; has 2 churches, public school, and 3 lumber-mills. Pop. township (1890) 2,075; (1900) 1,952.
ROBERT J. ABBS, TOWNSHIP CLERK.

Carrollton: city; on railroad; capital of Carroll co., Mo. (for location of county, see map of Missouri, ref. 3–F); 66 miles E. N. E. of Kansas City; has 2 schools, mower and hay-stacker factory, furniture-factory, tile-factory, 3 cigar-factories, 2 flour-mills, a woolen-factory, etc. Pop. (1880) 2,313; (1890) 3,878; (1900) 3,858. EDITOR OF "DEMOCRAT."

Carrollton: on railroad; capital of Carroll co., O. (for location of county, see map of Ohio, ref. 4–I); is about 90 miles S. E. of Cleveland. Carrollton has five churches and a good school. Its principal industry is agriculture. There are large deposits of iron ore in the vicinity. Pop. (1880) 1,136; (1890) 1,228; (1900) 1,271.

Carronade: a short iron cannon for naval service, invented by Mr. Gascoigne, and named after the Carron ironworks in Scotland, where it was first made in 1779. It was lighter than the ordinary guns, and had a chamber for powder like a mortar. Carronades are now obsolete.

Carrot: a plant of the genus *Daucus* and order *Umbelliferæ*. The common carrot (*Dau'cus caro'ta*) is a biennial plant, a native of the East, but naturalized both in Europe and America. In many parts of the Eastern U. S. it has become a pernicious weed. Its leaves are pinnately compound; the flowers creamy white. The root of the cultivated plant is much thicker and more agreeable to the taste than the wild. It is largely given to cattle, for which, as well as for men, it is a wholesome and moderately nutritious article of food. The plant has some beauty, its leaves having been worn in England by ladies instead of feathers during the reign of Charles I. The root is also used for poultices. The cultivation of carrots is similar to that of beets.

Carruth'ers, ROBERT: b. at Dumfries, Scotland, Nov. 5, 1799; was apprenticed to a bookseller; became in 1828 editor, and in 1831 proprietor, of the Inverness *Courier*; published with Robert Chambers the *Cyclopædia of English Literature*, and alone an annotated edition of Boswell's *Journal of a Tour to the Hebrides*, etc. D. May 26, 1878.

Car'son, ALEXANDER, LL. D.: minister and author; b. in County Tyrone, Ireland, 1776; educated at the University of Glasgow; settled as pastor of the Presbyterian church at Tubbermore. Carson was so much affected by the notions of Haldane and Ewing that on Jan. 1, 1805, it was necessary for him to quit his place in the Presbyterian church and ministry. A large portion of the society to which he ministered followed him. In 1814 Dr. Carson was induced to examine the question and decided to quit the party of Ewing and Wardlaw, and to submit to immersion. After going over to the side of the Haldanes, he received pecuniary assistance from Robert Haldane. Throughout the remainder of his life he adopted the type of Sandemanian church order. The kiss of charity was observed every Sunday; there was weekly communion, and weekly exhortation by the brethren, in case any of them should desire it. At the time of his death he was claimed as an adherent by William Jones, the leader of the so-called Scotch Baptists in England. He was never in ecclesiastical fellowship with the regular Baptists of England. D. at Belfast, Ireland, Aug. 24, 1844. Of his books the best known is *Baptism, its Mode and Subjects* (Edinburgh, 1831; reprinted by the American Baptist Publication

Society, Philadelphia). See *Life of Alexander Carson, LL. D.*, by George C. Moore (New York, 1853).

WILLIAM H. WHITSITT.

Carson, CHRISTOPHER: trapper; commonly called KIT CARSON; b. in Kentucky, Dec. 24, 1809. He served as a guide to Fremont in his Rocky Mountain explorations. He was an officer in the U. S. service in both the Mexican war and the great civil war. In the latter he received a brevet of brigadier-general. D. at Fort Lynn, Colorado, May 23, 1868.

Carson City: capital of Nevada, and of Ormsby co., Nev. (for location of county, see map of Nevada, ref. 5–E); on Va. and Truckee R. R.; 15 miles S. W. of Virginia City, 3 miles W. of Carson river, and 12 miles N. E. of the picturesque Lake Tahoe. The city is situated in a plain surrounded by rugged mountains, some of them snow-capped during the entire year. There are here hot springs, which are resorted to by many invalids. In the quarries of the State prison fossil footprints of gigantic animals have been discovered, and are of great scientific interest. Carson was founded in 1858, and derives its support from mining, lumbering, and farming industries. It has State and U. S. public buildings. Pop. (1880) 4,229; (1890) 3,950: (1900) 2,100.

EDITOR OF "MORNING APPEAL."

Carson River, Nevada: rises in the Sierra Nevada; flows nearly northeastward; passes through Ormsby and Lyon Counties, and enters Carson Lake in Churchill County. Length, estimated at 150 miles. Carson Lake has no outlet, and is about 15 miles long.

Car'stairs, or **Carstares**, WILLIAM: b. near Glasgow, Scotland, Feb. 11, 1649. He became chaplain to William, Prince of Orange, who trusted him as a confidential adviser in affairs relating to Great Britain. Having been sent to England in 1682 as the secret agent of William of Orange, he was arrested as an accomplice in the Rye House plot, and was put to the torture, which could not extort from him any confession, although he was the depositary of important secrets. After the accession of William to the throne Carstairs had great influence in Scottish affairs, and was five times chosen moderator of the General Assembly. He became minister of Gray Friars church, Edinburgh, in 1704. D. Dec. 28, 1715. His virtues and abilities are highly extolled by Macaulay. See McCormick, *Life of W. Carstairs* (1774).

Cart: See CARRIAGES, etc.

Cartage'na: a city and fortified seaport of Spain; province of Murcia; on a bay of the Mediterranean; 27 miles S. S. E. of Murcia; lat. 37° 36′ N., lon. 1° 1′ W. (see map of Spain, ref. 19–H). It occupies the declivity of a hill and a small plain which is between the hill and the sea. The harbor, which is one of the best in the Mediterranean, is capacious enough to hold the largest fleets, and is protected from winds by highlands which inclose it on several sides. The entrance to the harbor is defended by a fortified island. Cartagena was formerly the chief naval arsenal of Spain. It has a Moorish cathedral, numerous churches and convents, a theater, and an observatory; also manufactures of sailcloth and glass. Red marble is abundant here, and is used for building. Mines of silver and lead have been opened in the vicinity. Pop. (1887) 84,171. The ancient *Carthago Nova* was founded by Hasdrubal in 242 B. C. See CARTHAGO NOVA.

Cartagena: a seaport-city of Colombia; capital of the department of Bolivar; on a low island of the Caribbean coast at the entrance of Cartagena Bay (see map of South America, ref. 1–B). It was founded by Pedro de Heredia in 1533, and during the colonial period was one of the most important ports and strongholds of Spanish America, having the monopoly of a vast commerce. It was several times sacked by buccaneers and English corsairs, and in the effort to make it impregnable the Spanish Government spent nearly $60,000,000 on its defenses. During the war of independence it was taken by the Spaniards, after sustaining an heroic siege of four months (1815). Cartagena is an episcopal city. It has a fine cathedral and several other churches, a hospital, theater, and many convents and other old buildings of historical interest. The city is surrounded by thick walls. The bay is a large and deep landlocked harbor, with two main entrances; of these the larger was artificially obstructed in the eighteenth century, and ships use the smaller one, which is very narrow and 8 miles distant from the city. There are two old Spanish castles at this entrance, and another within the harbor. Owing to its hot and often unhealthy situation, and the lack of good water, the prosperity of Cartagena has declined. A railroad to Calamar on the Magdalena river is in course of construction (1893). The principal exports are hides and tobacco. Pop. (1892) about 12,000.

HERBERT H. SMITH.

Cártago: a city of Costa Rica; near the center of the republic, in a valley at the foot of the Irazú volcano; 4,900 feet above the sea (see map of Central America, ref. 8–J). It was founded by Coronado in 1565, on the site of an Indian town, and was the capital of Costa Rica until 1823. It was nearly destroyed by an eruption of the volcano in 1723, and was ruined by an earthquake Sept. 2, 1841, but soon rebuilt. The streets are wide and well paved, and the houses substantial; the water-supply is excellent, with several fountains and separate pipes to dwellings. There are several churches, a college, large barracks, and a hospital. The railroad from Limon to Alajuela passes through Cartago. The hot mineral springs of Bella Vista, 3 miles distant, are much frequented by invalids. Pop. (1892) about 12,000. Cartago is the capital of a province of the same name, containing about 200 sq. miles; pop. (1888) 33,887. HERBERT H. SMITH.

Cartago: a town of the republic of Colombia; in the state of Cauca, and on the river Cauca, about 135 miles W. of Bogotá (see map of South America, ref. 2–B). It has a cathedral, and a trade in coffee, cocoa, dried beef, tobacco, etc. Pop. 7,696.

Carte, THOMAS: historian; b. at Clifton, near Rugby, England, in Apr., 1686; educated at University College, Oxford. He became a priest and Jacobite. During the rebellion of 1715 a large reward was offered for his arrest, but he escaped to France. His chief work is a *History of England* (4 vols., 1747–55), which is prized for its facts, but is not well written. Many volumes of his manuscripts are preserved in the Bodleian Library at Oxford. D. Apr. 7, 1754.

Car'tel [Fr., from Ital. *cartello* or Span. *cartel*, dimin. of *carta*, letter, card]: an Anglicized French word which in France signifies a "challenge." As a military term it is used to denote an agreement between two belligerents for the exchange of prisoners. A vessel used in exchanging prisoners or carrying proposals to an enemy is called a cartel-ship.

Car'ter, FRANKLIN, Ph. D., LL. D.: president of Williams College: b. in Waterbury, Conn., Sept. 30, 1837: educated at Yale College and Williams College, and in University of Berlin; Professor of Latin, Williams College, 1865–72; Professor of German in Yale College in 1872–81; president of Williams College 1881; has published an edition of Goethe's *Iphigenia*, *Study of Mark Hopkins* (1892), and articles and essays in various magazines.

Carter, JAMES C.: See the Appendix.

Carter, SAMUEL POWHATAN: rear-admiral U. S. navy; b. in Elizabethtown, Carter co., Tenn., Aug. 6, 1819; entered the navy as a midshipman Feb. 14, 1840. He served on the east coast of Mexico during the Mexican war. While attached to the steamer San Jacinto in 1856 he participated in the attack on the Barrier Forts at the mouth of the Canton river, China, which resulted in their capture. In July, 1861, Carter was ordered to report to the Secretary of War for duty, and proceeded at once to East Tennessee, where he organized the Tennessee brigade. He was appointed a brigadier-general of volunteers, and continued on active duty with the army during the entire war, doing most important and gallant service in Tennessee, Kentucky, Virginia, and North Carolina, and receiving the brevet of major-general for gallant and distinguished services. He was appointed a rear-admiral on the retired list May 16, 1882. D. May 26, 1891.

Carteret, JOHN: See GRANVILLE, EARL.

Carteret, PHILIP: navigator. Immediately after the return of Commodore Byron, George III. ordered a new expedition for the exploration of the southern hemisphere, and Aug. 22, 1766, the Dolphin, the Swallow, and the Prince Frédéric left Plymouth under the command of Capt. Samuel Wallis; Carteret commanded the Swallow. On Dec. 17 the fleet entered the Strait of Magellan; when it again sallied forth, Apr. 11, 1767, it was overtaken by a hurricane, and the Swallow was separated from the two other vessels. Carteret continued the voyage, discovered Pitcairn island, the island of Gloucester, the island of Queen Charlotte, and Solomon's islands, explored the strait between New Britain and New Zealand, drew a map of the western coast of the

Celebes, and reached Batavia June 3, 1768. On Jan. 6, 1769, he doubled the Cape of Good Hope, and on Sept. 20 he reached Spithead, having accomplished almost marvelous results in view of the small means at his disposal. See Hawkesworth, *An Account of the Voyages Undertaken by the Orders of His Present Majesty* (London, 1773).

Cartersville: city; capital of Bartow co., Ga. (for location of county, see map of Georgia, ref. 2–F); on Wilm., Colum. and Aug. R. R.; 48 miles N. N. W. of Atlanta; has six churches, schools for white and colored children, ocher and brick works and iron mines. Gold, copper, etc., are found in this vicinity. Among its industries are also the raising of cotton, corn, wheat, clover, and stock. Pop. (1880) 2,037; (1890) 3,171; (1900) 3,135.

PUBLISHERS OF "COURANT AMERICAN."

Carterville: city; Jasper co., Mo. (for location of county, see map of Missouri, ref. 7–D); on Mo. Pac. R. R.; 10 miles S. W. of Carthage; has 4 churches and 4 schools. Its chief industry is mining, and in the year 1892 there were produced 92,669,140 lb. of zinc ore and 6,217,380 lb. of lead ore, of a total value of $1,290,568. Pop. (1880) 483; (1890) 2,884; (1900) 4,445.

EDITOR OF "REPUBLICAN."

Carte'sian Philos'ophy: the system of philosophy brought forward by Réné Descartes (1596–1650), one of the most original thinkers of France or of any country. (See DESCARTES.) The scholastic philosophy which had prevailed in the Middle Ages, though based upon the teachings of Aristotle, had so far departed from the spirit of its great master as to have become almost vain and fruitless. What Descartes and his contemporary, Bacon, did, was, each in his own way, to help arouse a spirit of independent research in philosophy and in science. It must not be forgotten, however, that the independence of Bacon and Descartes was a result as well as a cause of this new spirit. The new current had begun to flow before their day, but they each contributed largely to swell that current.

Descartes proposed as a basis for his system, and as a ground for all knowledge, the act of conscious thought, as necessarily involving the idea of existence. His celebrated dictum, *Cogito, ergo sum*—i. e. I think, therefore I exist—is the starting-point of his philosophy. And although the dictum itself has been severely criticised, it may be fairly questioned whether the fault be not in the expression rather than in the thought intended to be expressed, and whether the appeal to our consciousness be not indeed the ultimate ground of philosophy. Those writers who deny the validity of the testimony of consciousness are nevertheless continually appealing to the same testimony when it serves their purpose. Descartes was a firm believer in the existence of a personal God, and attributed all the phenomena of nature to the continual and actual presence of an all-pervading Deity.

The great value of his philosophy has been in the grand stimulus of thought which it has given to others. It is a philosophy of method chiefly. Spinoza, Malebranche (*q. v.*), and even the modern German philosophers, are confessedly much indebted to him.

Revised by W. T. HARRIS.

Cartesians [from *Cartesius*, the Latin name of DESCARTES]: the disciples of Descartes, or those who adopted his system of philosophy. In the seventeenth century nearly all the philosophers of France were ranged under two parties, as Cartesians and Gassendists.

Car'thage (in Gr. ἡ Καρχηδών; Lat. *Carthago*): an ancient and celebrated commercial city of Africa, and the capital of the republic of Carthage; a Phœnician colony founded by emigrants from Tyre about 850 B. C. It was situated on a bay of the Mediterranean about 20 miles S. of Utica, and near the site of the modern town of Tunis. Lat. about 36° 47′ N., lon. 10° 6′ E. The Punic or native name of Carthage is said to have been *Carthada* or *Karth Hadtha*. According to a tradition which has been immortalized by the genius of Vergil, it was founded by Dido, a sister of Pygmalion, King of Tyre, and she purchased of the natives the site of the new city. Ancient authorities concur in affirming that it was founded many years later than Utica, which was also a Phœnician colony. No record of the early history of Carthage has been preserved. "This great city," says P. Smith, "furnishes the most striking example in the annals of the world of a mighty power which, having long ruled over subject peoples, taught them the arts of commerce and civilization, and created for itself an imperishable name, has left little more than that name behind it, and even that in the keeping of the very enemies to whom she at last succumbed. Vast as is the space which her fame fills in ancient history, the details of her origin, her rise, her constitution, commerce, arts, and religion, are all but unknown. Of her native literature we have barely the scantiest fragments left. The treasures of her libraries were disdained by the blind hatred of the Roman aristocracy, who made them a present to the Princess of Numidia, reserving only the thirty-two books of Mago on agriculture for translation, as all that could be useful to the republic." Our information respecting the Carthaginians is derived mostly from Roman historians, who were deficient in impartiality, and from Polybius, who has preserved some genuine Punic documents.

Carthage seems to have been almost from its foundation independent of Tyre, but friendly relations were maintained between the colony and the metropolis, and the religious supremacy of the latter was recognized by an annual offering to the temple of Hercules at Tyre of a tithe of all the revenues of Carthage. The Carthaginians gradually acquired a dominion over the other Phœnician colonies of Northern Africa, and also over the Libyans and Numidians or nomadic tribes who occupied this region before the foundation of Carthage. This city became one of the greatest commercial emporiums of the world before the first Punic war. During the period of her greatest prosperity Carthage was probably the greatest maritime power in the world. The population of the city amounted to about 700,000 in 150 B. C. The Carthaginian (or Punic) language resembled the Hebrew, and belonged to the Semitic or Aramaic family. The government was a republic or an oligarchy, in relation to which our information is very scanty.

A condensed summary of all that is known on this subject is given by Grote, from which we extract the chief points: "Respecting the political constitution of Carthage the facts known are too few and too indistinct to enable us to comprehend its real working. The magistrates most conspicuous in rank and precedence were two kings or *suffetes*, who presided over the senate. They seem to have been renewed annually, though how far the same persons were reeligible we do not know; but they were always selected out of some few principal families or *gentes*. There is reason for believing that the genuine Carthaginian citizens were distributed into three tribes, thirty curiæ, and 300 gentes. From these gentes emanated a senate of 300, out of which, again, was formed a smaller council or committee of thirty *principes*, representing the *curiæ*. . . . The purposes of government were determined, its powers wielded, and the great offices held—suffetes, senators, generals, or judges—by the members of a small number of wealthy families. In the main, the Government was conducted with skill and steadiness, as well for internal tranquillity as for systematic foreign and commercial aggrandizement. Within the knowledge of Aristotle, Carthage had never suffered either the successful usurpation of a despot or any violent intestine commotion."

At a period little later than her first distinct appearance on the stage of recorded history, Carthage possessed an imperial authority, in a greater or less degree, over the northern coast of Africa from the Pillars of Hercules to the Great Syrtis, a distance of about 16,000 stadia (2,000 miles). But the only part of this extensive territory that was entirely subject to the dominion of Carthage was the country which extended S. of the city about 90 miles, and the boundaries of which were nearly the same as those of Zeugitana, and the strip of coast along which lay Byzacium and Emporia. Like other great commercial states, Carthage found that her maritime enterprise led her on almost inevitably to engage in foreign conquests and to contend for the dominion of the sea. The first foreign province that she acquired appears to have been the island of Sardinia, which belonged to Carthage at the time of her first treaty with Rome, 509 B. C. This island was the principal emporium of her trade with Western Europe, and always ranked as the chief among her foreign possessions. Among the earliest objects of military enterprise of the Carthaginians was Sicily, then occupied by several Greek colonies. For the conquest of this island they sent a fleet of 3,000 ships, with an army of 300,000 men, commanded by Hamilcar. He was defeated by Gelon, tyrant of Syracuse, at Himera, in 480 B. C., and was killed in this action, which was one of "the decisive battles of the world," and was important in a degree which no contemporary could estimate. The Cartha-

ginians in 410 B. C. renewed the war against the Greeks of Sicily, and obtained possession of part of that island, where they were involved in a long contest with Dionysius of Syracuse. They planted colonies in Hispania (Spain), and derived much riches from the gold and silver mines of that peninsula; but their relations with the natives were peaceful, and they did not attempt to subjugate Spain before the Punic wars. Polybius states that all the islands of the Western Mediterranean belonged to Carthage at the commencement of the Punic wars, 264 B. C. In 509 B. C. a commercial treaty was concluded between Carthage and Rome. This celebrated document has been preserved by Polybius. The second treaty between these two powers was made in 348 B. C. It appears that the Carthaginians never came into hostile contact with the Athenian republic, although the latter was a great maritime power while Carthage was near the zenith of her prosperity.

The army of Carthage was composed chiefly of Libyan conscripts and slaves and foreign mercenaries. This defect in her military system was probably one of the chief causes of her ruin. This system could not afford the republic internal security, for the soldiers had little devotion to the cause for which they fought, and the enemies of Carthage found it their best policy to "carry the war into Africa." It would be an error to regard the Carthaginians as a merely commercial people. Agriculture was a favorite pursuit of the nobles, citizens, and colonists, and the soil of her African territory was extremely fertile. Her prosperity was also promoted by manufactures and mechanical arts. Gold and silver were the standard of value at Carthage, but we have no evidence that the republic coined money, as no Punic coins are now extant which were struck before the Romans conquered that state. Her merchant-ships passed beyond the Pillars of Hercules and made voyages to the British islands. The Carthaginians also carried on an extensive inland trade by caravans, which traversed the deserts to the valleys of the Nile and Niger.

Carthage and Rome were the two greatest powers of the world when their competition for the rich island of Sicily involved them in the first Punic war, 264 B. C. The Romans, who had no navy when the war began, suffered several defeats at sea, and one of their generals, Marcus Regulus, who invaded Africa, was taken prisoner. They gained a great naval victory near Lilybæum in 241 B. C., which ended the war. The Carthaginians obtained peace by ceding Sicily and Sardinia to the victors. Carthage was so impoverished by this long war that she could not pay her armies. The mercenaries revolted in 240 B. C., and were joined by most of the subject Libyans in a civil war which brought Carthage to the brink of ruin. After the suppression of this revolt the peace and stability of the state were menaced by a feud between Hanno and Hamilcar Barca, who became respectively the leaders of the aristocratic and democratic parties. The great abilities and sagacity of Hamilcar restored the prosperity of the republic by the conquest of Spain, which, says Heeren, "was then the richest country of the known world." He invaded Spain in 237 B. C., and gained several victories, but he subdued the Spaniards by kindness rather than force. Before he had conquered all the peninsula he died in 229, leaving the completion of the enterprise to his son-in-law, Hasdrubal, and his own son, the famous Hannibal. The latter succeeded to the chief command of the army in Spain in 221 B. C. His conquests provoked the hostility of the Romans, and he began the second Punic war by marching across the Alps and invading Italy in 218 B. C. After he had defeated the Romans at several places in Northern Italy, he gained a most signal and complete victory at the great battle of Cannæ in the summer of 216 B. C. The second Punic war seems to have been conducted by Hannibal rather than by the state, from which he received little aid or co-operation. By his military genius and personal resources he maintained himself in Italy for about fifteen years. (For the details of this war, which was ended by the victory of the Roman general Scipio at Zama in 202 B. C., the reader is referred to the article HANNIBAL.) The treaty which the victors dictated in 201 B. C. deprived Carthage of all her dominions outside of Africa. Hannibal, who soon obtained the ascendency in Carthage, made important reforms, which reduced the power of the aristocracy and the judges, but he was driven into exile by a hostile faction in 195 B. C. The Romans, who resolved to destroy Carthage, found a pretext to commence the third Punic war in 150 B. C. The Carthaginians made an heroic and desperate resistance, but their capital was taken and utterly ruined in 146 B. C. On the commanding site of the Punic Carthage Caius Gracchus founded in 122 B. C. a Roman town, which was called Junonia, but the colony did not prosper. In 29 B. C. the Emperor Augustus sent out another colony; the natural advantages of the site soon made themselves felt; and before long the new city stood as a rival to Alexandria and claimed rank as the second city of the empire. Herodian states that in his time it was next to Rome in population and wealth. In 439 A. D. it was taken by Genseric, who made it the capital of the Vandal kingdom in Africa. It was captured and finally destroyed by the Arabs in 647 A. D. Few vestiges of its ancient grandeur remain to indicate its site, except some broken arches of a great aqueduct which was 50 miles long. See Arnold, *History of Rome*, vol. ii.; Heeren, *Historical Researches into the Politics, Commerce, etc., of the Ancient Nations of Africa* (1824); Böttiger, *Geschichte der Carthager* (1827); Münter, *Religion der Karthager* (1821); Davis's *Carthage and her Remains*; Church, *History of Carthage* (New York, 1886); Smith, R. B., *History of Carthage* (1878). See also Freeman's *Historical Essays* (4th series, 1892).

Revised by C. K. ADAMS.

Carthage: city; capital of Hancock co., Ill. (for location of county, see map of Illinois, ref. 5–B): on Wab. and Ch., Bur. and Q. R. Rs.; 13 miles E. of Keokuk. It has a Lutheran college, electric lights, and water-works. Pop. (1880) 1,594; (1890) 1,654; (1900) 2,104.

EDITOR OF "REPUBLICAN."

Carthage: city and railroad center; capital of Jasper co., Mo. (for location of county, see map of Missouri, ref. 7–D); on Mo. Pac. and St. L. and San Fr. R. Rs., and on Spring river; in the center of the rich lead-regions of Southwest Missouri, with numerous manufactories, Presbyterian college, 2 public schools, 2 parks, and a public library. On the morning of July 5, 1861, a force of Confederates under Gov. Jackson and Gen. Price, numbering about 3,500 men, while retreating from the army of Gen. Lyon, were confronted about 7 miles E. of this town by a body of Federal troops under Gen. Sigel, numbering about 1,500. Gen. Sigel was superior in artillery, while the Confederates, largely outnumbering him, had the advantage also of a body of cavalry. Gen. Sigel, availing himself of his superior strength, opened fire with his artillery, which he continued, to the severe loss of the Confederates, for several hours, when, to avoid being outflanked by the Confederate cavalry, and to protect his baggage train, he was obliged to fall back, which he accomplished in good order, continuing his retreat to Carthage and to Sarcoxie, 15 miles eastward. The Federal loss was less than 50 killed and wounded, while the Confederate loss was reported to be 50 killed and about 150 wounded. Pop. (1880) 4,167; (1890) 7,981; (1900) 9,416.

EDITOR OF "BANNER."

Carthage: village (settled in 1794): Jefferson co., N. Y. (for location of county, see map of New York, ref. 2–G); situated on east side of Black river, at the head of Black river canal. It is the terminus of the Carthage and Adir. and Carthage, Wat. and Sack. Harb. R. Rs., and is on R., W. and Og. R. R.; 22 miles E. of Watertown. Here are churches of six denominations, public school, academy, extensive water-power, lumber-mills, furniture-factories, foundries, machine-shops, pulp-mills, marble-works, etc. Pop. (1880) 1,912; (1890) 2,278; (1900) 2,895.

EDITOR OF "TRIBUNE."

Cartha'go No'va [Lat. for New Carthage]: an ancient and celebrated city of Hispania (Spain); on the Mediterranean; was founded by Hasdrubal in 242 B. C. It had an excellent harbor, and became a great commercial city of the Carthaginians. It also derived much prosperity from its rich silver mines, in which 40,000 men are said to have been employed. In 210 B. C. it was captured by Scipio Africanus. Strabo tells us that in his time it was a great trading center. It was destroyed by the Goths before 550 A. D. The site is occupied by CARTAGENA (*q. v.*).

Car'thamin: a dyestuff obtained from the *Carthamus tinctorius*, a plant which is a native of India and Egypt, and is sometimes called saffron or safflower. This is the plant used in domestic medicine and known as saffron, but it is very different from the true saffron, or *Crocus sativus*. It is used to dye cotton and silk, to which it imparts a beautiful red color which is not very permanent.

Carthamus: See CARTHAMIN and SAFFLOWER.

Carthu'sians (in Lat. *Carthusiani*; Fr. *Chartreux*, fem. sing. *Chartreuse*): a monastic order founded by St. Bruno (*q. v.*) in 1084, in the wilderness of Chartreuse, France, 14 miles N. of Grenoble. It was sanctioned by the pope in 1170, and was propagated in Germany, Spain, England, and Italy. The original structures of Bruno were superseded by the present one of vast extent, known as La Grande Chartreuse, built in 1676. It is now famous as the place of manufacture of the liqueur which bears its name. The prior of this monastery is the head of the order; there is also a proctor-general, who resides at Rome. The monasteries of these monks in England, where they were established in 1180, were called Charterhouses, a corruption of the French *Chartreuse*. The very austerity of the rules was a great attraction, and by special enactment members of any of the mendicant orders were allowed to become Carthusians. But no Carthusian was allowed to exchange his order for any other. Carthusians are divided into monks (*patres*) and lay-brothers (*conversi*). The former live by themselves in separate cells. Their rules require them to perform manual labor; to abstain from eating flesh, but not from drinking wine; and to observe ascetic practices, among which is a vow of continual silence. Carthusian nuns made their appearance in the twelfth century. There are few houses of either monks or nuns now existing. The ordinary dress is white, but outside of the monastery a long black cloak with a hood is worn. See Charterhouse.

Cartier, kaär'ti-ay', Sir George Étienne, Bart.: Canadian statesman; b. at St. Antoine, P. Q., Sept. 6, 1814; educated at St. Sulpice College. He was admitted to the bar in 1835; aided the rebels in 1837; and entered Parliament in 1848. He was Provincial Secretary in 1855; Attorney-General for Lower Canada in 1856, and, with Sir John A. Macdonald, formed the Macdonald-Cartier Government in 1857. He was one of the most active promoters of Confederation, and in 1867 became Minister of Militia in the first Dominion cabinet. He was made a baronet in 1868. D. in England, May 20, 1873. A monument has been erected to him in the Parliament grounds, Ottawa. Neil Macdonald.

Cartier, Jacques: a French navigator; b. at St.-Malo, Dec. 31, 1494. He discovered the river St. Lawrence in 1534, and ascended it as far as the site of Montreal. He returned to France in 1536, taking with him Donnacona, an Indian chief, and several other Indian leaders, whom he treacherously carried off. He joined Roberval's expedition and sailed again in 1541, exploring the rapids above Montreal, but the next year he abandoned Roberval at St. John and sailed for St.-Malo. The King of France ennobled him for his discoveries. D. about 1554.

Car'tilage [from Lat. *cartilago*, gristle]: a variety of connective tissue of more or less elastic and translucent character and whitish or yellowish in color; commonly known by the name of gristle. In structure, cartilage presents two distinct varieties. One known as hyaline, the other as fibrous or fibro-cartilage. In the former there is found a homogeneous translucent matrix in which are embedded the proper cartilage cells. The latter are large ovoid or irregular-shaped cells, having a large nucleus and lying in groups of two to three or four inclosed within a capsule. In the case of fibro-cartilage the intercellular matrix contains a greater or less abundance of fibrous stroma, and in some cases the latter is largely composed of yellow elastic fibrils. Cartilage may be classified as *temporary* or *permanent*; and we may distinguish that which is connected with bone or which leads to bone formation, and that which is independent of bone or bone formation. Temporary cartilage is the basis of all ossification, and in an infant or youthful person the majority of all bones consists mainly of cartilage. As age advances the formation of true bone increases, and by the twentieth or twenty-fifth year the process is usually complete. There are left, then, only the cartilages which form the articular ends of bones. Even these may become partially ossified in advanced life. The sternum, the costal cartilages, the larynx, the cartilages of the nose, ear, and bronchi rarely become ossified. See the articles Bone and Histology.

Cartilag'inous Fishes: those fishes whose skeletons are destitute of true bone, as the sharks, skates, sturgeons, etc. See Fish.

Cartography: See Map.

Cartoon' [Fr. *carton*, from Ital. *carto'ne*, stout paper, augmentative of *carta*, paper]: in the fine arts, a design drawn on strong paper or other material, and used as a model for a picture to be executed in fresco, oil color, tapestry, or glass. The cartoon is drawn the same size as the picture to be executed, this method enabling the artist to alter the drawing or composition readily. The drawing is made either in chalk or distemper, and is sometimes primed or washed with ground-color. The cartoon is transferred to canvas or plaster, either by tracing the lines with a hard point or by pricking them with pins. In the first instance the back of the cartoon is first covered with some coloring-matter; in the second a bag of pulverized charcoal or colored powder is passed over the perforations, pouncing the design onto the surface to be worked on. If the picture is to be placed at a great distance from the eye of the spectators, allowance must be made for this in drawing the cartoon.

The use of cartoons is particularly important in fresco paintings, of which only a small portion can be executed at a time, because the plaster must be moist when the pigment is applied to it, and it would be impossible to sketch the whole design on the plaster in the first instance. Therefore the cartoon must be traced in compartments so small that the artist can finish one before the plaster becomes dry. The most famous cartoons at the present day are seven by Raphael which are preserved in the South Kensington Museum, London. These are a part of a set of twenty-five which were sent to Flanders to be copied in tapestry for Pope Leo X. After the fabrication of the tapestry, which is said to be extant in Rome, the cartoons lay neglected at Brussels, and many of them were destroyed. Seven were purchased by Rubens for Charles I. of England, representing the following subjects: 1, St. Paul preaching at Athens; 2, the death of Ananias; 3, Elymas, the sorcerer, struck with blindness; 4, Christ delivering the keys to St. Peter; 5, the sacrifice at Lystra; 6, the apostles healing the sick in the temple; 7, the miraculous draught of fishes. These have been engraved by Dorigny and Audran. When the collection of Charles I. was sold these cartoons were purchased for the nation by Cromwell's special command.

The full-page political sketches in comic papers also are called cartoons.

Cartridge [from Fr. *cartouche*, small paper bag, a roll containing a charge for a pistol, cartridge; Ital. *cartoccio*, deriv. of Lat. *charta*, paper]: a case containing the proper quantity of powder or ammunition required to charge a gun or firearm. Cartridges for muskets are usually paper tubes, each containing a small amount of powder and a leaden ball. These are called ball cartridges. The paper used for this purpose is strong, and is made into a tube by means of a mandrel. Thinner paper is applied to certain parts of the tube, so that the powder has two or three thicknesses of paper around it, but the ball has only one. Besides this form there are several patent cartridges. A cartridge which contains powder only is called a blank cartridge. Cartridges for cannon or large guns are chiefly made of serge or flannel sewed up in the form of a bag, which, filled with a given weight of powder, is tied around the neck and strengthened by iron hoops. Cartridges for pistols are usually copper cylinders, having at the base the proper amount of fulminating powder, which inflames the charge of gunpowder upon being struck by the hammer, and these cartridges are used in most breech-loading firearms. See Blasting.

Cart'wright, Edmund: clergyman; noted as the inventor of the power-loom; b. at Marnham, England, Apr. 24, 1743. He wrote *Armine and Elvira* (London, 1771; 9th ed. 1803) and other poems. He was rector of Goadby Marwood, Leicestershire, from 1779 to 1809. In 1785 he exhibited his first power-loom, the introduction of which was violently opposed by the operatives, who burned a mill containing 500 of his looms. In 1809 he received a gift of £10,000 for his invention. D. in Hastings, Oct. 30, 1823. See his *Life* by his daughter (London, 1843).

Cartwright, Peter, D. D.: Methodist preacher: b. in Amherst co., Va., Sept. 1, 1785. He began to preach as a "local" in 1801, labored with great success for upward of sixty years, and is said to have preached 18,000 sermons. Many stories are told of his dauntless courage and ready wit. He was defeated for Congress in 1846 by Abraham Lincoln. His labors were chiefly in the Mississippi valley. D. near Pleasant Plains, Sangamon co., Ill., Sept. 25, 1872. See his *Autobiography* (New York, 1856).

Cartwright, Sir Richard John: statesman; b. at Kingston, Ont., Dec. 4, 1835, and was educated at his native place

and at Trinity College, Dublin, Ireland. Engaging in politics, he represented Lennox and Addington in the Canadian Assembly 1863–67, and represented Lennox in the Dominion Parliament from 1867 till 1878, when he was elected for Huron. He was elected for South Huron in 1883, and has been returned for that constituency at all subsequent elections up to and including that of 1891; was Minister of Finance of Canada from Nov. 7, 1873, till October, 1878; was a delegate to Great Britain on public business in 1874, 1875, and again in 1876; and was knighted in 1879. Sir Richard began his political life as a Conservative, but through a disagreement with Sir John A. Macdonald he deserted to the Liberals. He has a high reputation as a parliamentary debater, and was at one time prominent in banking affairs.

NEIL MACDONALD.

Cartwright, THOMAS: Puritan controversialist; b. in Hertfordshire, England, about 1535: was forced to leave Cambridge University on account of his reformed doctrines; returned there on the death of Queen Mary and taught theology 1569. Cartwright took the extreme Puritan view, which insisted on Divine sanctions for his polity and which it was heresy to resist, demanding that the Established Church should conform to his teachings. He was deprived of his preferments by Whitgift, was several times in prison and in exile, and was pastor of a church in Antwerp. D. in Warwick, Dec. 24, 1603.

Carn'pano: a seaport-city of Venezuela; in the state of Bermudez (see map of South America, ref. 1–D). It is built almost entirely on a single street parallel to the water's edge, nearly 2 miles long and traversed by a tramway. The buildings are good, but unpretentious, generally of one story. The mean annual temperature is 81° F. The harbor is a safe one, but the entrance is obstructed by some dangerous banks. Back of Carupano there is a break or pass in the coast chain, giving access to the rich valleys of the interior. The principal exports are chocolate-beans and coffee. Pop. (1891) 12,389.

HERBERT H. SMITH.

Carus, kaa'roos, KARL GUSTAV: German physiologist; b. in Leipzig, Jan. 3, 1789. His lectures on comparative anatomy, delivered in his native town in 1812, attracted great attention, and still more his book on the circulation of the blood in insects. His publications include works on subjects belonging partly to science, partly to art—as, for instance, *Psyche*, *Physis*, *Natur und Idee*. He gathered about him in Dresden, where he lived as court-physician, a brilliant circle of scientists and artists. D. in Dresden, July 28, 1869. His *Lebenserinnerungen und Denkwürdigkeiten* appeared at Leipzig (1865–66, 4 vols.).

Ca'rus, MARCUS AURELIUS: Roman emperor; b. about 222; prætorian prefect under Probus, on whose assassination in 282 he was proclaimed emperor by the army. He conquered the Sarmatians, and continued the campaign against the Persians which his predecessor had begun. He died suddenly in 283 on the banks of the Tigris just as he was setting out on an expedition against Persia.

Carvahal, kaăr-vaă-*k*haal', TOMAS JOSÉ GONZALES: b. in Seville in 1753; d. in Madrid in 1834. He studied law, held an office in the financial department of the Government, and was in 1812 appointed director of the University of San Isidro. Having established there a chair of international law, he was imprisoned in 1815; released by the revolution of 1820 he was exiled by the counter revolution, but allowed to return in 1824. As a writer he is a pupil of Luis de Leon. His metrical translations of the poetical books of the Bible are very celebrated.

Ca'ry, ALICE: poet; b. Apr. 20, 1820, 8 miles from Cincinnati, O. When eighteen years of age she commenced writing for the press, both in prose and verse. In 1850, with her sister Phœbe, she published a successful volume of poems. In 1851 the first series of her *Clovernook Papers* appeared. In 1852 the two sisters removed to New York and devoted themselves to literature. Besides several volumes of poetry and a great number of contributions to periodical literature, she published two additional series of *Clovernook* (1853–54); *Hagar, a Story of To-day* (1852); *Married, not Mated* (1856); *Pictures of Country Life* (1857); *The Lover's Diary* (1867); *Snowberries* (1869); and several other works. She excelled in the description of simple domestic scenes. D. in New York, Feb. 12, 1871.

Cary, ANNIE LOUISE: operatic contralto; b. in Wayne, Me., Oct. 22, 1842; began her operatic career in 1867 in Europe, and for three years sang with great success there. In 1870 returned to the U. S. and sang in the principal cities under Strakosch's management; made a second European tour, and achieved additional triumphs, especially brilliant in St. Petersburg. On her return to her native country she married Mr. Raymond, a New York banker, and in 1882 retired from public life while her voice was in its prime, and has since been heard only in private and at a few charitable concerts.

D. E. HERVEY.

Cary, HENRY FRANCIS: English poet; b. in Gibraltar, Dec. 6, 1772; was educated at Oxford. He became in 1797 vicar of Abbots Bromley. His reputation is founded on an admirable translation of Dante's *Divina Commedia* (London, 1814), which is very accurate and expressive, and is generally considered an excellent translation of that celebrated poem. He was assistant librarian of the British Museum from 1826 till 1837. D. Aug. 14, 1844. See his *Life* by his son (London, 1847, 2 vols.).

Cary, PHŒBE: a younger sister of Alice Cary; b. near Cincinnati, O., Sept. 4, 1824. One of her earliest productions, written at the age of seventeen, was the well-known poem commencing *One sweetly solemn thought comes to me o'er and o'er*. Of the first volume of poems published by the two sisters, her share was much the smaller. She published *Poems and Parodies* (1854); *Poems of Faith, Hope, and Love* (1868); besides numerous hymns and occasional contributions to periodicals. D. in Newport, R. I., July 31, 1871. See *Alice and Phœbe Cary*, by M. C. Ames (1873).

Cary, SAMUEL FENTON: b. in Cincinnati, O., Feb. 18, 1814; graduated at Miami University 1835, at the Cincinnati Law School 1837; retired from law-practice in 1845, and became a farmer; was in Congress 1867–69, serving on important committees, and was the only Republican in the House of Representatives who voted against the impeachment of President Johnson; was nominated by the Independent party at Indianapolis, May 18, 1876, for Vice-President of the U. S., with Peter Cooper as candidate for President.

Caryat'ides (in Gr. Καρυάτιδες): the Latin plu. of *Caryatis*, i. e. a woman of Caryæ (a city of Laconia); or a virgin

Caryatides, from the Erechtheum at Athens.

dedicated to the service of the Caryan Diana. The term is applied in Greek architecture to female figures which were

used instead of columns to support a roof or entablature. They were usually dressed in long robes. The corresponding male figures are called Atlantes and Telamones.

Car'yocar [from Gr. *κάρυον*, nut + *κάρα*, head]: a genus of large trees of the family *Ternstrœmiaceæ*. They are natives of Brazil and Guiana, and are sometimes called pekea-trees and butter-trees. The fruit of *Caryocar nuciferum*, called butter-nut and souari-nut, is a large drupe containing four one-seeded nuts, which have soft, edible, and delicious kernels. The drupe contains, besides a kernel, a pulp which is like butter, and is used in cookery as a substitute for it. Oil of good quality is obtained from the kernels. The timber is good for ship-building.

Caryophylla'ceæ: See PINK FAMILY.

Caryop'sis [from Gr. *κάρυον*, nut + *ὄψις*, appearance]: in botany, a fruit in which the seed and pericarp are so closely united as to be inseparable and undistinguishable. The fruit or grain of wheat, barley, maize, and other graminaceous plants is a caryopsis. It is a one-celled, one-seeded, and indehiscent pericarp.

Caryo'ta: a genus of palms sometimes called the jaggery-palm or sugar-palm, growing in India and Ceylon. *Caryota urens*, a lofty, spreading tree, yields a large amount of fermentable juice (toddy) when its spathes are incised; this is boiled down to produce sugar. Its farinaceous pith resembles sago, and its fibers are used for making ropes. The quantity of sugar produced in India from this and a few other palm-trees is very great, but the quality is inferior. The cultivation of the jaggery-palm is entirely in the hands of a caste, or sub-caste, of Sudras.

Ca'rysfort Reef: a dangerous coral-reef at the edge of the Gulf Stream; near the south point of Florida; lat. 25° 13′ 15″ N., lon. 80° 12′ 45″ W.; has an iron-pile lighthouse 112 feet high, with a flashing light of the first order 106 feet above the sea.

Casale, kă-saa'lă̆y: a fortified town of Italy; in the province of Alessandria; on the river Po; 37 miles E. of Turin (see map of Italy, ref. 3–B). It has an iron bridge across the river, an old castle, and a cathedral founded in 1474; also several convents, a college, a public library, a theater, and two hospitals. Here are manufactures of silk twist. Casale is the seat of a bishopric, and was formerly the capital of the duchy of Montferrat. Many Roman remains are found here. Pop. about 29,000.

Casano'va de Sein'galt, GIOVANNI GIACOMO: Italian adventurer; b. in Venice, Apr. 2, 1725. He traveled extensively, passed his life successively in many European capitals, and mixed with aristocratic society. He fought several duels; was confined in the dungeons of Venice for nearly two years; professed to exercise occult powers. About 1790 he became librarian to Count Waldstein in Bohemia, at whose castle he died June 4, 1798. He is said to have been witty, dissipated, and greatly addicted to intrigues. He left autobiographic memoirs, which were published in 1828–38 (Leipzig; 6th ed. Brussels, 1876).

Casareep, or **Cassareep**: a condiment prepared from the evaporated juice of the cassava root or manioc root, the root of *Jatropha manihot*, a plant much cultivated in the tropics. To the thickened juice Spanish pepper is added, and this preparation is called casareep. It is used in sauces, but mainly for the preservation of meats in the form of the so-called *pepper-pots*. The poisonous hydrocyanic acid of the fresh juice is given off on evaporation. I. R.

Casas, kaas'ăas, BARTOLOMÉ, de las: Spanish ecclesiastic; b. in Seville, 1474; graduated at Salamanca, and, according to some, went to the West Indies with Columbus in 1498, returning in 1500. It is probable, however, that he first went to Hispaniola with Ovando in 1502. He was ordained priest in San Domingo in 1510, and shortly afterward accompanied Velasquez to Cuba, witnessing the conquest of that island. He became curate of one of the new settlements, and received an *encomienda* of Indian laborers; but, reflecting on the cruelties he had witnessed, he became convinced that the whole system of treatment of the Indians was wrong. He therefore gave up his *encomienda*, and after preaching vainly against Indian slavery went to Spain to intercede with the king (1515). Ferdinand died shortly after his arrival, but the regents, Cardinals Ximines and Hadrian, favored his suit. The office of protector of the Indians was created for him, and he returned to Hispaniola with some Jeronymite monks as coadjutors (Nov., 1516). His powers were considerable, but the opposition of the colonists and crown officers thwarted him. He therefore went again to Spain (1517) to plead the cause of the Indians with Charles V. and his ministers. He had to struggle against a thousand disheartening obstacles. It was urged that the colonies would be ruined if Indian slavery were prohibited. To meet this objection Las Casas recommended that African slaves should be sent to America—advice which he afterward deeply regretted. It is a mistake, however, to suppose that this plan originated with him, as Negro slaves had already been introduced into the colonies. He proposed to send Spanish laborers to the West Indies, and even collected and sent a number; but this plan failed through bad management and the machinations of his enemies. He was finally empowered to plant a colony on the coast of Cumaná, with the object of civilizing the Indians there. He succeeded in forming a small missionary station (1521), but the missionaries, provoked by the cruelties they had already felt, fell on the post during Casas's absence and destroyed it. Disheartened by this fresh blow, Casas retired to the Dominican convent in San Domingo and took the tonsure (1522). In 1530 he resumed active work, and successively visited Mexico, Guatemala, and Nicaragua, always in the interests of the Indians. He went three times to Germany to obtain interviews with Charles V., and published a series of fervid works against the cruelties of the Spaniards. Through his efforts strong laws in favor of the Indians were promulgated in 1542, but were received with an outcry of alarm. In Mexico the viceroy did not attempt to enforce them, and in Peru they caused the formidable rebellion of Gonzalo Pizarro; in the end they were repealed. In 1544, after declining the bishopric of Cuzco, Casas accepted that of Chiapa, hoping to advance his cause; but the opposition was so great that he resigned in 1547. Thereafter he generally resided at Valladolid, Spain. D. in Madrid at the end of July, 1566. Casas's works are all written with the object of promulgating his views, and have a tendency to exaggerate the cruelties of the Spaniards, and especially of the number of Indians slain by them. Making allowances for this, they are of high historical value. The best known is the *Brevissima relacion de la destruycion de las Indias* (Seville, 1552), published in English as the *Destruction of the Indias by the Spaniards* (London, 1583, 1625). It is one of a series of tracts on the same subject. The *Historia de las Indias*, a much larger work, was only published in 1875, but had long been used in copies. Several treatises remain in manuscript.

See Llorente, *Œuvres de Las Casas* (Paris, 1822, introduction); Quintana, *Vidas de Españoles Celebres*; Helps, *Life of Las Casas* and *Spanish Conquest*; Irving's *Columbus* (appendix); Fabié, *Vida y Escritas de Las Casas* (Madrid, 1879); Sabin, *Works of Las Casas* (New York, 1870).

HERBERT H. SMITH.

Casas Grandes (i. e. great houses), or **Casas de Montezuma**: a town of Chihuahua, Mexico; about 150 miles N. W. of the city of Chihuahua, and 35 miles S. of Llanos, celebrated for the ruins of ancient buildings (see map of Mexico, ref. 3–B). They are made of *adobe*, and face the cardinal points. The walls are still standing in part, and are from 5 to 30 feet high. The largest building was 800 feet long by 200 wide, with numerous courts, rooms, and closets, and apparently it consisted of several stories. Nothing historical is known about these structures. Similar ruins are found near the Gila, Salinas, and Colorado rivers. See MEXICAN ANTIQUITIES.

Ca'sas y Aragor'ri, LUIS, de las: Spanish general; b. at Sopuerta in Vizcaya, Aug. 25, 1745. He served under O'Reilly in Portugal and Louisiana, traveled in the American colonies shortly before the revolution, was in the Russian army 1775–77, and again with O'Reilly in the Argel campaign 1778. In 1779 he assisted in the siege of Gibraltar and the conquest of Minorca, and became general of division. From July 8, 1790, to Nov. 6, 1796, he was captain-general of Cuba, and he is remembered as one of the best and most enlightened rulers of that island. The first public journal of Havana was established by him; a careful census was taken; and he endeavored, though vainly, to remove the monopolies which weighed on the commerce of Cuba. Returning to Spain, he held various civil offices and was governor of Cadiz for some years. He died at Santa Maria, July 19, 1800. HERBERT H. SMITH.

Casati, kăă-saa'tĕĕ, GAETANO: African explorer; b. at Monza, Italy, in 1838; entered the Piedmontese army at

twenty-one; resigned in 1879, and in December of that year sailed for Africa under commission from the Soeietà d'Esplorazione Commerciale d'Africa. After various wanderings in the Bahr-el-Gazelle valley, where he joined his countryman, Gessi Pasha, and in the Niam-Niam country, he found himself shut in with Emin Pasha by the operations of the Mahdi. At the request of Emin Pasha he went to live as "resident" in the territory of King Kabba Rega, son of M'tesa of Unyoro, where a part of his duty was to act as Emin's postmaster. At first kindly treated by the king, he was afterward condemned to death, but managed to escape to the Albert Nyanza Lake, where, after undergoing great hardships and peril, and losing his notes and MSS., he was reseued by Emin Pasha in 1888.

Casau'bon, Isaac: b. in Geneva, Switzerland, Feb. 18, 1559; d. in London, July 1, 1614. After the publication of the edict of Jan., 1561, his parents, who were French refugees, returned to France, and his father was settled at Crest in Dauphiny as pastor of a Huguenot congregation. The circumstanees of the family were humble, and times beeame hard. Up to his nineteenth year Isaac reeeived no other instruction than what his father could give him; he had his first Greek lessons in a mountain-cave where the family was eompelled to hide from a Roman Catholic mob. In 1578 he was sent to the Aeademy of Geneva, and so great were his aeeomplishments that in 1582 he was appointed Professor of Greek there. He held that position till 1596, and in 1592 he published his annotated edition of Theophrastus's *Characteres*, which gives a good idea of his peeuliar style as a eommentator. But he laeked books in Geneva, and in 1596 he aecepted the ehair of professor at Montpellier. The offiee of teaching, however, was not congenial to him, and in 1600 he removed to Paris as librarian, having in the meantime published his most ambitious work, the revised and annotated edition of Athenæus. The ten years he spent in Paris were the busiest and the brightest time of his life, but he allowed himself to be dragged into the theological eontroversies of the period. After the death of Henry IV. he left Franee and took up his abode in London, where he was made prebendary of Canterbury and Westminster, and where he wrote his *Exercitationes contra Baronium*, whieh were left unfinished, and his *Ephemerides*, published by the Clarendon Press in 1850. See his *Life* by Mark Pattison (London, 1875).—His son, Meric (b. Aug. 14, 1599; d. in Oxford, July 14, 1671), was edueated at Oxford, where he also taught theology. He republished editions of Terence, Epictetus, and Marcus Aurelius.

Casca, Publius Servilius: Roman conspirator; tribune at the time he assisted in the assassination of Julius Cæsar, 44 B. C. According to Plutarch, he struck the first blow. He fought in the battle of Philippi, 42 B. C., and died soon after.

Cascade Range: a chain of mountains which stretches from Southern Oregon through Washington into British North America; nearly parallel with the coast of the Pacific Ocean, and a continuation of the Sierra Nevada of California. The direetion of the range is nearly N. and S. Its distance from the seaeoast is in Oregon about 120 miles. The Columbia river breaks through this range, forming the caseades from which the name is derived. The range is constituted ehiefly of voleanic rocks, whieh were spread in great sheets and afterward upheaved; and several peaks, including all the most lofty, are extinet voleanoes. Among the highest summits of this range are Mt. Logan, 19,500 feet; Mt. St. Elias, 18,001; Mt. Hood, which rises 11,225 feet; Mt. Adams, 13,258; and Mt. Rainier (also ealled Taeoma), 14,444.

Cascaril'la [Span.; dimin. of *cascara*, bark]: the bark of *Croton eluteria*, whieh grows in the West Indies. It is a shrub of 3 to 5 feet in height, and the stem is frequently as thiek as 4 to 8 inches. It is used in medicine as an aromatic tonie, and was formerly used in the plaee of cinchona bark in the treatment of malarial fevers. It is useful in the treatment of dyspepsia, indigestion, or flatulent colic.

Cas'co Bay: in Maine; washes the shore of Cumberland County; is about 20 miles long. The city of Portland is at the western extremity of this bay, which ineloses about 300 islands.

Case, in law: an action, cause, or eontroversy, either in law or equity, submitted for deeision to a court of justiee. In particular (1) a form of action called "an action on the ease," or, more fully, "special aetion of trespass on the case." (See Trespass.) This action did not exist in the early English law, but was introduced by a statute of the reign of Edward I. (Westminster 2d). It is founded on the peculiar eircumstances of the case, and supplies a remedy for such wrongs as can not be included under the term "trespass," and which are in their nature indirect and consequential. It applies to such wrongs either committed against one's person or property, whether real or personal. The aetion is sometimes called "trespass on the case," and at other times simply "case." Out of this aetion grew the modern action of "assumpsit," which is really instituted to reeover damages for breach of contract. (2) In U. S. constitutional law the term case is applied to a civil or criminal action, as distinguished from a *controversy*, which term is applied to a civil action only. (3) A written or printed statement of facts for the opinion of counsel or for the decision of a court or judge. A question of law. The faets are sometimes presented by agreement, and at other times after being submitted to a jury. This may be either a "ease reserved" or "ease made" by which questions of law arising in the course of a trial are submitted; a "case stated," where the faets are agreed upon and the qnestion of law is submitted for deeision without a regular trial; or a "case on appeal," by which the faets which occurred at a trial are presented to an appellate court for review. If the parties fail to agree on a statement of facts, the court before which the trial oeeurred passes upon them, and is thereupon said to "settle" the ease.

Revised by F. Sturges Allen.

Case, Augustus Ludlow: rear-admiral U. S. navy; b. in Newburg, N. Y., Feb. 3, 1813; entered the navy as a midshipman, Apr. 1, 1828. He served on the east coast of Mexieo during the Mexiean war, participating in the eapture of Vera Cruz and Tobaseo. Early in 1861 Commander Case was appointed fleet-captain of the North Atlantic blockading squadron, in whieh capacity he took part in the capture of Forts Hatteras and Clarke, Aug. 29, 1861, and in the operations in the sounds of North Carolina in the winter of 1862. In 1863, in command of the Iroquois, and assisted by the steamers James Adger and Mt. Vernon, he eut out the blockade-runner Kate, under the fire of the forts and batteries at New Inlet, N. C. He was ehief of the bureau of ordnance from Aug., 1869, to May, 1873; in June, 1873, he was appointed to the command of the European squadron. Retired Feb. 3, 1875. D. in Washington, D. C., Feb. 17, 1893.

Case-hardening: a process for covering artieles of cast iron, wrought iron, or steel with a eoating of steel. It is a rapid and partial proeess of cementation, the object of whieh is to combine ability to resist surface-wear with the tenacity due to the character of the original material, which still constitutes the bulk of the article after case-hardening. It consists in packing the articles in vessels filled with some substanee yielding carbon when exposed to a red heat. This carbon alloying with the surfaee of the article converts it into a steel-like skin. After it has been heated for a proper length of time the article is plunged into water. Formerly animal matter, like hoofs, horns, bones, skins, etc., were used as the case-hardening material. Now yellow prussiate of potash is almost exelusively employed. The coating of steel is usually very thin, seldom exceeding $\frac{1}{16}$th of an inch. C. K.

Ca'sein [mod. deriv. of Lat. *caseus*, cheese]: a nitrogenous organic substanee allied to albumen, found in milk, and most abundantly in that of flesh-eating animals. It is said to be oecasionally found in the fluid of cysts. It is also found (as legumine, and probably as amandine, both being regarded as identical with it) in pease, beans, almonds, and other seeds. Vegetable and animal caseins behave exaetly alike with chemical tests, and when pure can not be distinguished by the taste. The portion in cow's milk is about 4 per eent.; in dried pease, 25 per cent. Casein is coagulated (curdled) by acids or by rennet, and is the chief constituent of Cheese (*q. v.*). It also forms insoluble precipitates with corrosive sublimate, with nitrate of silver, and with aeetate of lead. Hence copious draughts of milk afford a ready antidote in cases of poisoning with either of the above salts. Casein is also used in calico-printing. The probable proportions of the constituent elements of casein in 100 parts have been given as follows: Carbon, 53·83 parts; oxygen, 22·52; nitrogen, 15·65; hydrogen, 7·15; sulphur, 0·85, with perhaps a little phosphorus; but its composition is not exaetly known.

Casemate [Ital. *casa*, house, *matta*, foolish, also dark, dark house or room; or Gr. χασμα, ditch]: originally, a ditch defense similar to a Caponière (*q. v.*); later, a chamber with a

strong roof, usually of arched masonry, covered with a considerable thickness of earth designed to render it bomb-proof. Casemates are usually built in the rampart of a fortification and sometimes partly below ground. They are used for quarters, hospitals, storerooms, magazines, etc., and also for gun-chambers, the guns being fired through embrasures pierced through the wall of the chamber. JAS. MERCUR.

Caser'ta, or **Ter'ra di Lavo'ro**: province of Italy; stretching along the Mediterranean, N. of the province of Naples; traversed by the Garigliano and the Volturno; comprises an area of 2,206 sq. miles, with 734,884 inhabitants. Its agriculture, cattle-breeding, and manufacturing industry are flourishing. Capital, Caserta.

Caserta: a town of Italy; capital of province of same name; on a plain about 21 miles by rail N. E. of Naples (see map of Italy, ref. 7–F). It has, besides numerous churches and a military school, a magnificent royal palace, which was built by Vanvitelli about 1755, and is one of the largest in Europe. Connected with the palace is a fine park and an aqueduct. Here is a royal silk-factory, in which about 700 persons are employed. Pop. 31,400.

Case School of Applied Science: See CLEVELAND, O.

Case-shot (in Fr. *mitraille*; Germ. *Kartätschenschuss*, i. e. cartridge-shot): a projectile consisting of several balls or bullets of lead or iron packed in a case. When the case is a cylinder of tin with a wooden bottom, the whole is called cylindrical case or canister. The number of shot in each canister varies from 40 to 126. Some armies use canister with an explosive charge in the center, but more commonly it has no such charge. When the balls are affixed to a central spindle without a case, or inclosed in a canvas bag, they are called grape-shot. This is especially used in garrison artillery. Against advancing lines the effect of grape and canister at close range is often terrible, but solid shot and shell are preferred against columns. Spherical case or shrapnel (so named from its inventor) is a thin cast-iron shell, containing a chamber with a light or bursting charge of gunpowder, around which are packed bullets of lead or iron. It should burst at least 40 yards in advance of the enemy. This missile is effective at three times the range of canister, but at long distances its effect is often lost from lack of precision in the aim or in the cutting of the fuse.

Ca'sey, SILAS: soldier; b. in East Greenwich, R. I., July 12, 1807; graduated at West Point 1826; Oct. 9, 1861, became colonel Fourth Infantry, and May 31, 1862, major-general U. S. volunteers. He served on Western and Northern frontiers 1826–36; in Florida war 1837–41; engaged at Pilaklikaka; on Northern frontier 1842–47; in war with Mexico 1847–48; engaged at Contreras and Churubusco (brevet major), Molino del Rey, and Chapultepec (wounded in leading assault, and brevet lieutenant-colonel); on the Pacific frontier 1848–54; on tactical and arms boards 1854–55; at Puget Sound post 1856–61; engaged in several Indian skirmishes. During the civil war he served in preparing volunteers for the field at Washington, D. C., 1861–62; in the Virginia peninsula 1862; engaged at Fair Oaks (brevet brigadier-general); as president of board for examination of officers of colored troops 1863–65; in command at Detroit, Mich., 1865–67; commissioner to examine war-claims of Ohio. Brevet major-general U. S. army, Mar. 31, 1866, for gallant and meritorious services. Compiled and edited a system of *Infantry Tactics* for the U. S. service (1862), and *Infantry Tactics for Colored Troops* (1863); retired from active service July 8, 1868. D. in Brooklyn, L. I., Jan. 22, 1882.

Casey, SILAS, Jr.: captain U. S. navy; b. in Rhode Island, Sept. 11, 1841; graduated at the Naval Academy in 1860. In 1861 he was attached to the steamer Wissahickon, South Atlantic blockading squadron, and participated in the first attack on Fort Sumter, and in various engagements with the forts and batteries in Charleston harbor; subsequently served in equipment bureau and on lighthouse duty; commanding the cruiser Newark in 1891.

Casey, THOMAS LINCOLN: b. at Madison Barracks, near Sackett's Harbor, N. Y., May 10, 1831; graduated at the U. S. Military Academy in 1852; assigned to the corps of engineers as brevet second lieutenant, rising to be chief of engineers, with rank of brigadier-general, in 1888; served as assistant engineer on fortifications and river and harbor improvements Delaware Bay and river until 1854; assistant instructor of practical engineering 1854–57; principal assistant Professor of Engineering at the Military Academy 1857–59; in command of a detachment of engineer troops department of Oregon 1859–61: on staff of general commanding department of Virginia June 11 to Aug. 16, 1861; in charge of construction of fortifications on coast of Maine and New Hampshire 1861–67, except while on special duty with fleet during the first expedition to Fort Fisher 1864; assistant to chief of engineers 1867–79; in charge of public buildings and grounds District of Columbia 1877–81; of construction of building for State, War, and Navy Departments; of Washington Monument 1877 till its completion in 1885; chief of engineers with rank of brigadier-general 1888; retired May, 1895. D. in Washington, D. C., Mar. 26, 1896.

Casgrain, kăăs'grăñ, L'Abbé HENRI RAYMOND: Canadian author; b. at Rivière Quelle, P. Q., Dec. 16, 1831; educated at Collège Sainte-Anne de la Pocatière; was ordained a priest in 1856; was a professor at St. Anne's College and afterward at the University of Quebec. He is a member of the Royal Society of Canada, Historical Society of Boston, and the Geographical Society of Paris. Among his works are *Légendes Canadiennes* (Quebec, 1861); *Histoire de l'Hôtel-Dieu de Quebec* (1878); *Un Pélerinage au Pays d'Evangeline* (1887); and *Montcalm et Levis* (2 vols., 1891).—His brother, CHARLES EUSÈBE, M. D., b. at Quebec, Aug. 3, 1825, is a Knight of the Order of the Holy Sepulchre; was called to the Dominion Senate in 1887. Another brother, PHILIPPE BABY, Q. C., b. in Quebec in 1827, was for many years a member of the Canadian Parliament; author of *Letellier de Saint-Just et son temps* (Quebec, 1889). NEIL MACDONALD.

Cash: the name in use among foreigners in the far East for the coin in common use among the Chinese, and by them called *Tsien* (pronounced *chen*). It is a disk of an inferior alloy of copper, is slightly larger than an English shilling or U. S. twenty-five-cent piece (but thinner and lighter), and has a square hole in the middle for convenience in stringing. A string of cash usually contains 500 or 1,000, according to locality, and presents something of the appearance of linked sausages, with 50 or 100 in each division, according to the custom of the locality. Each coin has a value of $\frac{1}{10}$ to $\frac{1}{14}$ of a U. S. cent, i. e. 1,000 to 1,400 equal one dollar, according to the rate of exchange.

Cash'el: a town of Ireland; County Tipperary; 105 miles by railway S. W. of Dublin, and 49 miles N. N. E. of Cork (see map of Ireland, ref. 12–F). It is built on the slopes of an isolated limestone hill, rising abruptly from a rich plain. Cashel was the residence of the Kings of Munster, and is now a bishop's see. The top of the hill called the "Rock of Cashel" is occupied by the most interesting ruins of Ireland. These consist of a round tower 90 feet high, the palace of the Kings of Munster, a chapel of Saxon and Norman architecture, and a cathedral which was founded in 1169. Pop. (1881) 3,976.

Cashew-nut [from Fr. *acajou* < Brazilian, *acajoba*]: a tree, the *Anacardium occidentale*, related to the sumach and poison-ivy, of the family *Anacardiaceæ*, native of the West Indies, but now widely distributed throughout tropical regions. The tree attains a height of 16 or more feet, and bears oval, entire, evergreen leaves, small, reddish, sweet-scented flowers, and edible, kidney-shaped fruits, the cashew-nuts of commerce. From these nuts a sweet oil, resembling olive oil, is expressed. These proper fruits are borne upon the yellow or red enlarged and fleshy ends of the stems, which resemble pears, and are edible and of a pleasantly acid flavor. The poisonous principle, which is so virulent in some other members of the family *Anacardiaceæ*, is not absent from the cashew-nut, as shown by the fact that the fumes of the roasting nuts often cause an inflammation of the eyes and face. C. E. B.

Cashgar: See KASHGAR.

Cashmere: See KASHMIR.

Cashmere (or **Kashmir**) **Goat**: See GOAT.

Cas'imir: the name of four kings of Poland.—CASIMIR I., or KASIMIERZ I., surnamed The Peaceful, b. 1015; was brought up in France, where his mother had been forced to take refuge; was recalled to Poland in 1041, and reigned prosperously till his death in 1058.—CASIMIR II., b. about 1138; succeeded Micislaus III. 1177; d. 1194 after a wise and just rule.—CASIMIR III., surnamed The Great, b. 1309; annexed Red Russia to Poland; founded the University of Cracow; and strove to promote education. D. 1370.—CASIMIR IV., b. 1427; fought with the Teutonic Knights, whom he forced to cede West Prussia to Poland in the treaty of Thorn 1466. D. 1492.

Casimir-Perier, Jean Paul Pierre: President of the French republic; b. in Paris, Nov. 8, 1847; the grandson of Casimir Perier, the Prime Minister of Louis Philippe (see Perier, Casimir), and the son of Auguste Casimir-Perier, Minister of the Interior under Thiers; served with honor in the Franco-German war, receiving the decoration of the Legion of Honor for bravery, and after the peace entered actively into politics, holding an important office in the ministry of the Interior, of which his father was then at the head. In 1874 he was chosen councilor-general by the electors of Nogent-sur-Seine, and in 1876 was elected to the Chamber of Deputies, to which he was successively re-elected. Though suspected of Orleanist sympathies, he voted steadily with the moderate republicans, won the confidence of his colleagues, and was elected vice-president of the chamber in 1890, having in the meantime held important posts in the ministry of Public Instruction and the ministry for War. In 1893 he became president of the chamber, and was re-elected in November of the same year, but resigned Dec. 3 to become president of the council. His ministry, which lasted till May 22, 1894, was marked by its stern attitude toward disturbers of the public peace, as exemplified in the passage of a law to punish indirect, as well as direct, incitements to crime in the public prints, and in general to strengthen the hands of the authorities against enemies of the Government. On June 27, 1894, he was chosen on the first ballot by the National Congress to succeed President Carnot (*q. v.*), but resigned suddenly Jan. 15, 1895.

Casino, or **Monte Cassino**: See Cassino.

Caspari, kăăs-paa'rĕe, Carl Paul, D. D.: Lutheran theologian; of Jewish origin; b. at Dessau, in Anhalt, Germany, Feb. 8, 1814; educated at Leipzig and Berlin; went to the University of Christiania, Norway, as Professor of Theology in 1847. He wrote many works on Arabic grammar, Old Testament exegesis, etc., and translated the *Book of Concord* into Norwegian; but his chief distinction lay in the important results he attained by his diligent researches into the history of the œcumenical creeds, especially the Apostles' and the Nicene. D. in Christiania, Apr. 11, 1892.

Henry E. Jacobs.

Cas'pe: a town of Spain; in Aragon; province of Saragossa; situated near the river Ebro; 53 miles S. E. of Saragossa (see map of Spain, ref. 14–I). It has three churches, a town-hall, and manufactures of oil and soap. Pop. 9,000.

Cas'pian Sea (in Lat. *Mare Caspium*, or *Mare Hyrcanium*; Gr. Κασπία Θάλασσα): a large inland sea forming part of the boundary between Europe and Asia. It is now within Russian territory, except at the southern end, where it is margined by Persia. It is about 690 miles long from N. to S., and has an average width of near 200 miles. The area is 169,381 sq. miles. The depth of water toward the S. is nearly 3,000 feet, but toward the N. it is shallower. A submarine ridge continues the Apsheron peninsula across the sea in an easterly direction, thus dividing it into two basins. The deepest sounding of the northern basin is about 2,500 feet, but the water is very shallow for a long distance out from the shore, especially from the mouth of the Volga, where more than 100 miles away the depth is only 72 feet. The depression of the surface of the Caspian below that of the Black Sea, according to the Russian surveys, is about 97 feet. The Caspian receives several large rivers—viz., the Volga, the Ural, and the Kura. It has no outlet, and its superfluous water can escape only by evaporation. That the Caspian and the Sea of Aral were once connected is rendered evident by the nature of the rocks in the vast plains which extend from them in several directions. Great numbers of sturgeons and salmon are caught in this sea, in which various other kinds of fish are also abundant. A communication has been opened between the Caspian Sea and the Baltic by a canal which connects the Volga with the rivers Tvertza and Schlina. Steam-packets navigate the Caspian, the commerce of which is mostly in the hands of the Russians. The chief ports are Astrakhan, Derbend, Petrovsk, Baku, and Krasnovodsk.

Cass, Lewis, LL. D.: statesman; b. in Exeter, N. H., Oct. 9, 1782. He studied law, which he began to practice at Zanesville, O., in 1802, where his father owned a large land-grant bestowed upon him for his military services. Lewis, having entered the army as a colonel in 1812, served in Canada under Gen. Hull; was taken prisoner, and used his influence to secure the court martial and degradation of Hull. He was raised to the rank of brigadier-general in 1813, and appointed Governor of Michigan Territory in 1814. After he had held that office sixteen years, and negotiated many treaties with the Indians, he was appointed Secretary of War by President Jackson in 1831. He was sent in 1836 as minister to France, where he succeeded in keeping France from joining the "quintuple alliance" intended to enforce British claims to right of search on the high seas. After visiting Mediterranean ports in a U. S. frigate he returned home in 1842, and was elected a Senator of the U. S. for Michigan in 1844. Having opposed the Wilmot Proviso, he was nominated as Democratic candidate for the presidency of the U. S. in 1848, but was defeated by Gen. Taylor, the Whig candidate, who received 163 electoral votes; Gen. Cass received 137 electoral votes. In Jan., 1849, he was re-elected to the Senate of the U. S. He supported Douglas's Kansas-Nebraska bill in 1854; became Secretary of State in Mar., 1857; resigned in Dec., 1860, because the President would not re-enforce the garrison of Fort Sumter. D. June 17, 1866. His published writings are not numerous, but are well written and display much ability. See H. R. Schoolcraft, *Life of General Cass* (1848); W. L. G. Smith, *Life of Lewis Cass* (1856); A. C. McLaughlin, *Lewis Cass* (Boston, 1891).

Cassagnac, Paul Granier, de: See De Cassagnac, Paul Granier.

Cassan'der (in Gr. Κάσσανδρος): a Macedonian prince; a son of Antipater, Regent of Macedonia. When Antipater died, in 318 B. C., Cassander and Polysperchon became competitors for the regency, and appealed to arms. Cassander was victorious, and, having taken Athens, restored the aristocracy under Demetrius Phalereus in 316 B. C. He married Thessalonica, a sister of Alexander the Great; obtained possession of Alexander's wife Roxana and her infant son Ægus, whom he put to death in 309, and usurped the throne. He joined Seleucus and Ptolemy in a coalition against Antigonus, whom these allies defeated at the battle of Ipsus in 301 B. C. He died in 297, and was succeeded by his son Philip.

Cassan'dra (in Gr. Κασσάνδρα): Trojan princess; a daughter of Priam; celebrated for her prophetic inspiration. According to the poetical legend Apollo was enamored of her, and taught her the secrets of fate, but he ordained that her prophecies should not be credited. During the siege of Troy she predicted the ruin of that city, but she was regarded as a lunatic by the Trojans. She was carried away as a captive by Agamemmon, and slain by his wife Clytemnestra.

Cassandra, Gulf of (anc. *Toronaicus Sinus*): a part of the Ægean Sea; in Macedonia, European Turkey; extends between two peninsulas, the extremities of which are called Cape Drepano and Cape Pailluri. It is nearly 25 miles long. The peninsula to the W. of the gulf and a cape on its western side have the same name.

Cassano, kăăs-saa'nō: a town of Italy; province of Calabria; 30 miles N. of Cosenza (see map of Italy, ref. 8–G). It stands in the concave recess of a steep mountain, in the midst of beautiful scenery. It has a cathedral, several convents, and an old castle; also manufactures of silk, linen, cotton, and leather. Pop. 9,216.

Cassareep: See Casareep.

Cassation: See Courts.

Cassatt, Mary: figure-painter; b. in Pennsylvania. She was one of the first artists in Paris to take up impressionistic methods, and exhibited excellent work in the first impressionist exhibition in Paris in 1878. She is an etcher of great talent, and her work in all mediums is highly appreciated by French collectors; member of the Society of American Artists 1880. Studio in Paris.

William A. Coffin.

Cassa'va: a West Indian name of the plant called manioc or manihot, and of the starch or fecula prepared from its root. It is known in the U. S. by the name of Tapioca (*q. v.*). See Manioc.

Cassay': See Manipur.

Cas'sel, or **Kassel** (anc. *Castellum Cattorum*): a city of Hesse-Nassau, Prussia; once capital of the electorate of Hesse-Cassel; pleasantly situated on both sides of the river Fulda; about 132 miles W. of Leipzig, and 28 miles S. W. of Göttingen (see map of German Empire, ref. 4–F). It is connected by railways with Leipzig, Frankfort, and other towns. It has several public squares, in the largest of which, called Friedrichsplatz, stands the palace of the Electors of

Hesse. Near this palace is a handsome museum which has a library of 165,000 volumes. Cassel contains an observatory, a valuable picture-gallery, a theater, several hospitals, a normal school, and academies of painting and sculpture. It has manufactures of cotton, silk, and woolen fabrics, lace, gloves, carpets, hardware, etc. In the environs of Cassel is the royal palace of Wilhelmshöhe, with beautiful gardens and fountains. This palace was occupied by the Emperor Napoleon III. while he was a captive in the autumn of 1870 and the ensuing winter. Pop. (1885) 64,088; (1890) 72,641; (1895) 81,752.

Cassel, Douglas R.: lieutenant-commander U. S. navy; b. in Ohio, Oct. 9, 1845; graduated at the Naval Academy as ensign in 1863. While attached to the steam-sloop Brooklyn he was slightly wounded at the battle of Mobile Bay, but remained at his quarters until the close of the action. He served in the Brooklyn during both the Fort Fisher fights, and led the seamen of the Brooklyn in the assault of Jan. 15, 1865, on the fort. He died at Germantown, Pa., June 20, 1875.

Casselton: railroad junction, Cass co., N. Dak. (for location of county, see map of North Dakota, ref. 3–F); on Northern Pacific R. R.; in Red River Valley of the North; in a fine hard wheat-producing region; has graded school, several churches, etc. Pop. (1880) 361; (1890) 840; (1900) 1,207. Editor of "Reporter."

Cas'sia [from Gr. *κασία*, a Semitic loan-word]: a fragrant bark mentioned in the Bible, and supposed to be the cassia-bark of the shops; a coarse variety of cinnamon from China, Annam, and other Eastern countries. It is generally sold as cinnamon, which it much resembles, though cheaper and generally inferior in quality. It yields the oil of cinnamon. "Cassia buds" are the dried flower-buds which are brought from China.

Cassia is also the name of a genus of leguminous herbs, shrubs, and trees, natives of both continents. Several African and Asiatic species are valuable for their leaves, which when dried constitute the drug *senna*. The U. S. have numerous species, one of which (*Cassia marilandica*) yields leaves which have the cathartic properties of senna in a milder degree. "Cassia pulp" or "purging cassia" comes from the pods of *Cassia fistula*, a tree of India and Egypt, now naturalized in most tropical countries. It contains a large percentage of sugar, and is used in making laxative conserves for medicinal use.

Cas'sian (in Lat. *Cassianus*), John: a monk noted as a promoter of monachism and as an opponent of St. Augustine; b. about 350 A. D. He founded a large monastery at Marseilles (about the year 415), which was a model for many others in Gaul and Spain. He differed from St. Augustine respecting grace, and taught doctrines which were called Semi-Pelagian. The distinction between him and St. Augustine and Pelagius is thus aptly put: St. Augustine regards man in his natural state as dead, Pelagius as sound and well, Cassian as sick. Among his works are the famous treatises on monastic institutions, *De Institutis Renuntiantium* and the *Collationes Patrum in Scithico eremo commorantium*. D. in Marseilles, about 445. His works are found in Migne, *Pat. Lat., XLIX.* and *L.*

Cas'sican: a name applied to the barita of Australasia and other birds, but properly a bird of the genus *Cassicus*, resembling the oriole. The best-known species is the *Cassicus cristatus* of South America, 20 inches long, which makes a large nest, exhibiting great skill in construction. The nests are often 3 feet long, and are hung upon the branches of trees. They are gregarious birds, and often build several of their huge nests upon the same tree.

Cas'simere [another form (also formerly written *kerseymere*) of *cashmere*, received through Fr. *casimir* or Span. *casimiro*]: a twilled woolen or cotton and woolen fabric, either plain or figured, much used for men's clothing. Cassimeres are largely woven in England and the U. S., but especially on the continent of Europe.

Cas'sin, John: ornithologist; b. near Chester, Pa., Sept. 6, 1813; d. in Philadelphia, Jan. 10, 1869; devoted himself to the technical description and systematic arrangement of birds rather than to their habits. In the words of Coues, "His distinctive place in ornithology is this: he was the only ornithologist this country has ever produced who was as familiar with the birds of the Old World as with those of America." Among his more important works are the *Mammalogy and Ornithology of the Wilkes Exploring Expedition*; *Ornithology of Perry's Expedition to Japan*; and *Illustrations of the Birds of California, Texas, Oregon, British and Russian America*. He and Mr. George N. Lawrence were associated with Prof. Baird in the publication of a monograph of the birds of North America N. of Texas, which appeared as vol. ix. of the *Pacific R. R. Reports*. F. A. Lucas.

Cassini, kăăs-see'nē. Giovanni Domenico: astronomer; b. near Nice, then an Italian city, June 8, 1625. He discovered in 1665 that Jupiter performs a rotation in nine hours and fifty-six minutes, and published in 1668 his ephemerides of the satellites of Jupiter. Invited by Colbert, he removed to Paris in 1669, and became director of the observatory of that city. In 1684 he discovered four satellites of Saturn, also explained the causes of lunar libration, and took part in measuring an arc of the meridian. His descendants for several generations were able astronomers. D. in Paris, Sept. 14, 1712. See his *Autobiography*; also Fontenelle, *Éloge de J. D. Cassini*.

Cassino: game at cards; played by two, three, or even four persons. Four cards are dealt each player, and four (the *lay-out*) are turned face up on the board; the hands are played one card each turn, beginning with the eldest hand; four more cards are then dealt each player; so on until the pack is exhausted. A card is played (1) by adding it to the layout; (2) by *taking* with it from the lay-out cards of the same denomination and (in the case of pip-cards) combinations such that the number of pips is that of the card played; (3) by *building*, i. e. combining it with cards in the lay-out so that the number of pips equals that of another card in the player's hand, the build being then treated exactly as a card of that denomination, except that it can not be built higher with merely lay-out cards, nor at all by the immediate builder; or (4) by *duplicating*, i. e. combining it with one or more cards or builds, so as to form two or more cards or combinations each equivalent to another card in the hand. A duplication may be further duplicated, but not built. A player who has a build or duplication in the lay-out can not make play No. 1 before taking it. Cards left in the lay-out after the last hand belong to the last player who made play No. 2. On being taken, big cassino (ten of diamonds) counts 2; little cassino (two of spades), 1; each ace, 1; the greatest number of cards, 3; the greatest number of spades, 1. Each sweep (play No. 2 leaving no cards in the lay-out) counts 1. Game is either the highest number of points scored in the deal or, more usually, 21 points, thus requiring several deals for one game.

In one variation of cassino the knave, queen, and king are treated as pip-cards, i. e. as the eleven, twelve, and thirteen, respectively.

Cassino, kăăs-see'nō: a town of Italy; in the province of Caserta; 49 miles by rail N. W. of Caserta (see map of Italy, ref. 6–E). Large ruins of Roman theaters and palaces are in the neighborhood. Just above the city, on a high mountain, is the celebrated monastery Monte Cassino, founded in 529 A. D. by St. Benedict, with a seminary, a gymnasium, and a large library containing many valuable manuscripts. A few monks still remain. Pop. of town, 12,200.

Cassiodo'rus, Magnus Aurelius: a Latin historian and minister of state; b. at Scylacium (Squillace, Calabria, the extreme southwest division of Italy), about 468 or 480 A. D.; entered service of Theodoric, King of the Ostrogoths, about 497; became his chief minister. He had a high reputation for ability and learning, and continued in power for many years. At the age of seventy he retired to the monastery of Viviers, in Calabria, which he had founded and endowed. There he instituted the practice, afterward so widely followed, of adding the copying of MSS. to the list of monastic duties. This practice has been of inestimable importance. To it we owe our knowledge of the classics. He had himself a large library which he transferred to his monastery. He wrote, besides works on grammar and rhetoric, a *History of the Goths*, now extant only in the abridgment of Jornandes; a valuable collection of state papers entitled *Variarum Epistolarum Libri XII.*, which was first printed in 1533, and the chief source of our knowledge of Italy in the sixth century. D. in Viviers about 568. See his works in Migne, *LXIX.–LXX.* Thomas Hodgkin published a condensed translation of the *Variarum Letters* (Oxford, 1886). See his *Life* by A. Franz (Breslau, 1872).

Cassiope'a, or **-pia**, **Cassiepe'a**, or **Cassi'ope** (in Gr. Κασσιόπεια, Κασσιέπεια, Κασσιόπη): in classic mythology, the

wife of Cepheus and the mother of Andromeda. She was said to have been transformed into a constellation.

Cassiopeia, or **Lady in the Chair**: a constellation in the northern hemisphere; has several stars of the second magnitude. It is represented on the celestial globe as a lady sitting in a chair. Five of its most conspicuous stars are arranged in a figure like a W. In 1572 a new and brilliant star suddenly appeared in Cassiopeia. It was observed by Tycho Brahe in November, and is said to have surpassed all the fixed stars in splendor. It disappeared in Mar., 1574, after a gradual diminution of luster.

Cassiquiare, kăăs-si-kē-aa′rē, or **Cassiquiari**: a river of South America; in Venezuela; a deep and rapid stream, forming the south bifurcation of the Orinoco. It issues from the Orinoco about lat. 3° 10′ N. and lon. 66° 20′ W., and, flowing southwestward about 130 miles, enters the Rio Negro near San Carlos. This remarkable river opens a navigable communication between the Orinoco and the Rio Negro, but above the middle rapids of both rivers. It is 600 yards wide at its entrance into the latter.

Cassiter′ides [name applied by Herodotus and later writers to the islands (Great Britain) whence were procured the early supplies of tin; deriv. of *κασσίτερος*, tin, a word probably of Assyrian origin. Cf. Assyr. *Kāsazatirra*]: the ancient name of certain islands, supposed by some to be the Scilly isles, and by others some little islands of Vigo Bay on the Spanish coast, from which the Phœnicians procured tin.

Cassit′erite [from Gr. *κασσίτερος*, tin + suff. *-ite*]: native peroxide of tin; composed when pure of 21·62 per cent. of oxygen and 78·38 of tin. It is the common ore of tin, and the only one from which the metal is obtained. It occurs massive (as tin-stone), disseminated and fibrous (as wood tin), in rolled pieces, and in grains as sand (stream tin); also crystallized in quadrangular prisms, terminated by four-sided pyramids. Its luster is splendent. It is obtained chiefly in Australia, Cornwall, the Malay Peninsula, Banca, the Black Hills of South Dakota, Virginia, and California.

Revised by C. Kirchhoff.

Cas′sius Longi′nus, Caius: Roman conspirator and general; a friend of Marcus Brutus, whose sister he married. He served as quæstor under M. Crassus, and distinguished himself in the expedition against the Parthians in 53 B. C. After the death of Crassus he defeated the Parthians. In the civil war that ensued he fought for Pompey against Cæsar, and after their defeat at Pharsalia was pardoned by the victorious Cæsar. He was one of the conspirators who killed Cæsar in 44 B. C., soon after which event he commanded with success in Syria. His army was subsequently united with that of Brutus. Brutus and Cassius, who were the principal leaders of the republican party, were defeated by Antony and Octavius at Philippi in 42 B. C., and then killed themselves. See Plutarch, *Life of Brutus*.

Cas′sius Parmen′sis, or **Ca′ius Cas′sius Seve′rus**: a Latin poet who wrote epigrams and elegies. He was one of the conspirators who killed the dictator Cæsar, 44 B. C. Having entered the service of Mark Antony, he fought against Augustus, by whose order he was put to death about 30 B. C. Only small fragments of his works are extant.

Cassivelau′nus, or **Cassibelau′nus**, sometimes Anglicized as **Cassib′elan**: a chief of the ancient Britons who ruled over the country N. of the Thames. He fought bravely against Cæsar when the latter invaded Britain in 54 B. C.; but Cæsar took his capital and compelled him to pay tribute.

Cassock: a tightly fitting garment as regards the body, but loose and flowing below, worn by ecclesiastics of all orders. It varies in color. In the Church of England the clergy of all orders wear black; bishops on state occasions frequently wear purple. In the Roman Catholic Church, priests, deacons, and sub-deacons, with persons in the minor orders, wear black cassocks; bishops wear purple. Scarlet cassocks were worn by doctors of divinity and civil law and are still part of the dress of cardinals. The Bishop of Rome alone wears a white cassock. The mediæval Church of England cassock was without buttons, and was usually gathered in at the waist with a girdle or cincture of the same material quite similar to that now in use.

Cassop′olis: capital of Cass co., Mich. (for location of county, see map of Michigan, ref. 8–H); on Mich. Cent. and Gr. Trunk R. Rs.; 98 miles S. W. of Lansing, and 100 miles E. of Chicago. The principal industrial enterprises are a flouring-mill, wooden-bowl factory, cooper-shop, lumber-mill, and a combination wire-and-slat fence factory. Cassopolis was founded in 1836, and is situated between Diamond and Stone Lakes in a fertile agricultural county. It is a place of summer resort. Pop. (1880) 912; (1890) 1,369; (1900) 1,330. Publisher of "National Democrat."

Cas′sowary: the common name of several large flightless birds of the genus *Casuarius*; related to the ostriches, but generally placed together with the emus in an order Casuarii (*q. v.*). The plumage is loose and coarse, the wings small, the quill feathers represented by four to six strong bare shafts. The inner toe bears a long, straight claw, which makes a formidable weapon, the more that the kick of one of these birds is sufficiently powerful to knock a man down. Parts of the head and neck are naked and colored bright red and blue or blue and yellow. The neck bears wattles, and the head is furnished with a conspicuous compressed helmet-like excrescence formed of very thin bone, covered with thin but firm horny skin. The ten or twelve members of the genus are confined to New Guinea and the adjacent islands; one species occurs in Northeastern Australia. They frequent dense thickets, are wary and fleet of foot, fond of fruit and berries, but eat worms and insects of various kinds. The nest is a mere depression amid fallen leaves; the eggs are green and usually five in number. The best-known species is the helmeted cassowary (*Casuarius galeatus*) from Ceram. Bennett's cassowary (*C. bennettii*) is from New Britain and *C. australis* from Australia.

F. A. Lucas.

Casta′lia, or **Cas′taly** (in Gr. Κασταλία): a fountain which issued at the base of Mt. Parnassus, near Delphi; was sacred to Apollo and the muses. The ancient poets imagined that it filled the minds of those who drank of it with poetic inspiration. All persons who visited the temple of Delphi for any religious object were obliged to purify themselves by bathing their bodies or their hair in this sacred fountain. It is now called the fountain of St. John.

Castalio, kăăs-taa′li-ō, or **Castel′lio**, Sebastian: b. at Chatillon, a village of Savoy, 1515; d. in Basel, Dec. 29, 1563. He pursued the common humanist studies of the time; acted for several years as a tutor in a noble French family; was in 1541, on Calvin's nomination, made rector of the Latin school in Geneva, but publicly dissented from Calvin on predestination, and resented the restraints put upon private liberty; was banished by the syndics for calumniating the clergy 1544; went to Basel, where in 1553 he was appointed Professor of Greek. His history of the Bible in the form of *Dialogues* was often reprinted and used as a text-book; translated into English under the title *Youth's Scripture Remembrancer* (London, 1743). His Latin translation of the Bible he dedicated to Edward VI. of England; his French translation to Henry II. of France. These translations are very characteristic for their humanist standpoint, but do not deserve the merciless criticisms which they received from the hands of Calvin and Beza. Castalio deserves to be remembered because he was one of the very few advocates of religious toleration in that age. His life was written by J. Mähly (Basel, 1862), and most elaborately by Ferd. Buisson (Paris, 1892, 2 vols.).

Casta′nea: the Latin name of the chestnut; also the botanical name of a genus of trees of the family *Cupuliferæ*. Three species of chestnuts are indigenous in the U. S.—viz., *Castanea sativa*, var. *americana* (chestnut-tree), the *Castanea pumila* (chinquapin), and the golden chinquapin, or chestnut of the Pacific coast, now referred to an allied genus, *Castanopsis* (*C. chrysophylla*). See Chestnut.

Cas′tanets [from Span. *castañeta*, deriv. of *castaña* < Lat. *castanea*, chestnut]: a musical instrument consisting of a pair of concave shells of ivory or wood, originally chestnut, which are loosely fastened together by a band which is passed over the thumb, and used in beating time to music and dancing, and much employed by the Moors and Spaniards as an accompaniment to the guitar. In most countries they have been introduced on the stage, especially in opera.

Castanheda, kăăs-tăăn-yā′dăă, Fernão Lopez, de: Portuguese historian; b. probably about the year 1500; d. in 1559; went to India with his father in 1528, and devoted many years to study, personal examination of local records and scenes of important events, and to the composition of

his valuable *Historia do Descobrimento e Conquista da India pelos Portuguezes*, the several books of which (as far as completed) were printed in different years from 1551 to 1561. The publication of the first and second books preceded that of the first decade of *Asia* of Barros, but by so short an interval that the work of Castanheda could hardly have been used by Barros, who no doubt derived his material chiefly from original sources. For some not obvious reason, the *Historia* of Castanheda seems to have made a greater impression on the European public than the more attractive labors of Barros, for the first book of the *Historia* was translated into French in 1553, and the whole work into English some years later, while Barros, we believe, has never been translated into either language, and even Camoëns is said by Portuguese critics to have drawn his historical facts altogether from Castanheda. Castanheda has the merits of fullness of detail, clearness of exposition, and fidelity to the best authorities, and, though inferior as a writer to his distinguished rival, he is by no means superseded as a source of information on his subject.

Castaños, kăăs-taan'yōs, Francisco Xavier, de: Duke of Baylen; general; b. in Madrid, Spain, Apr. 22, 1756. He obtained the command of a corps in 1808, and defeated the French general Dupont at Baylen in July of that year. Dupont then surrendered his army, amounting to 18,000 men, but Castaños was defeated the same year at Tudela by Lannes. He distinguished himself at the battles of Albuera, 1811, Salamanca, 1812, and Vitoria, 1813. He was appointed captain-general in 1823, and opposed the Carlists. D. Sept. 24, 1852.

Caste [from Span. Ptg. *casta*, race, breed; subst. use of fem. of adj. *casto* < Lat. *castus*, pure]: This term, though often used loosely to indicate a class distinction of any sort, was originally employed to denote divisions of the social system in India. The word is etymologically from the Latin (*castus*, pure); historically, a Portuguese equivalent of class-division. The earliest European settlers in India were from Portugal, and they gave the name to the social system found there. But that system was known and explained by Greek writers from the time of Alexander the Great. Our earliest information in regard to caste comes, however, from the Hindus themselves, who in the *Vedas* and in their law-books have first expressed the consciousness of the distinctions involved and then elaborately systematized the whole state of society according to formal divisions of occupation. Legend says that the highest god created four castes: the priest from his mouth, the warrior from his arm, the husbandman from his thigh, the slave from his foot. But the native Sanskrit word for caste is *varna*, color, and this alone sufficiently indicates the chief factor of distinction between the castes as originally organized. The distinction is historically this: The Aryan invaders of India were of a different type from the aborigines; the latter were dark, the former were light; the primary distinction of caste was no more than this, a separation of the two great bodies of inhabitants into two classes, the light-skinned Aryan conquerors and the dark-skinned natives, whom the former had subdued and reduced to slavery or driven into the hill country to live as savages. The consciousness of this racial difference is very strongly marked in the earliest literature (e. g. the Vedas), where indeed without caste designation there is even a stronger caste feeling in its literal sense than in later times, a greater hate of the un-Aryan native, and a more pronounced consciousness of racial difference. For, as time went on and the contest between the nation of the conquerors and that of the conquered grew less, inasmuch as custom and social usage tended to unite the two, national antagonism sank into social antipathy, and the position of conqueror and defeated became changed to that of master and servant. Such was in general the origin of the whole caste system. But other factors of great national importance came into play. The later rule makes out four regular castes and thirty-six lowest castes, the latter being too degraded and too recent in origin to be included among the "regular" form of the system. In point of fact the rise of new plebeian industries was the real cause of producing many of the new "low" castes, for, as caste was inseparable from occupation, each new industrial development gave rise to a new social order. This fact is commonly stated incorrectly, in that the new caste is assumed to give rise to the new occupation, which is the unhistorical native point of view.

The four castes of the completed system were: 1. The *Brāhmana*, or *Brahmin*; 2. The *Kshatriya*, or warrior; 3. The *Vaiçya* (Vaisya), or farmer and husbandman; 4. The *Çûdra* (Sudra), or slave. All other castes were either "mixed," or "outcasts," i. e. degraded members of the four castes who had been expelled from society. Of the four castes here enumerated we find in the early period of the *Rig-Veda* no formal mention, yet not a few indications that caste feeling was already beginning to meet us in various passages of this same work. Thus the distinction between the priest (Brāhmana) and king as representative of the warrior (Kshatriya) caste is clearly marked, and, as stated above, the general antagonism to the "robber" and "slave" makes it evident that the three first classes of priest, warrior, and husbandman regarded themselves as a group apart from the fourth class, which later became incorporated into the caste system as the Çûdra (Sudra) or slave caste. But the only formal recognition of four social divisions to be found in the *Rig-Veda* is the sentence quoted above on the origin of the priest from the mouth of the god, Brahmā, etc. Before describing the duties and privileges of these castes, however, it is necessary to show how the third caste arose, for, as already said, the distinction between priest and warrior was already so strongly felt in the earliest time that the difference amounted practically to a caste differentiation, although it was not yet sufficiently established to preclude a warrior from exercising priestly functions or a priest from entering battle as a participant in the fray.

The third caste of Vaiçyas (Vaisya), or husbandmen, arose gradually. No trace of such a class as a caste meets us in the *Rig-Veda*. It is firmly established in the next period, that of the Brāhmanas. Whence arose the caste? Although nothing save a rather absurd tradition is extant in the way of historical evidence, the real genesis of the Vaiçya (Vaisya) caste is not difficult to discover. It is, in fact, not a caste formed by separation from the two higher castes, but the result of eliminating these castes from the working body politic, the residuum of the Aryan people left by the self-exclusion from the general body of those who arrogated to themselves the rights of priest and warrior respectively, thus leaving to all those not entering these ranks the duties and privileges of the working-classes. This development came as a result of the gradual settlement of the country. When the Aryans first entered India they did so as an invading army; every man was for himself warrior and cattle-lifter. The conquerors drove before them the native barbarians, settled down and became a cattle-raising, ultimately an agricultural people. It was at this juncture that those of the people at large who had more taste for war than for peaceful pursuits began to segregate themselves as a warrior caste, a standing army at the service of the king; and in the elimination of the warrior and the gradual separation of the priests from all the other castes is to be found the origin of the so-called caste of husbandmen; they were the people divested of priestly and fighting elements, and it was mainly from this caste that the "mixed" castes naturally arose.

These four castes, partially foreshadowed in the era of the early Vedic songs, were established and their position formulated in the next period, that of the first prose writings (the Brāhmana period).

(1) *The Brāhman, or Priest.*—His duty was to make sacrifices, to teach members of the three upper castes, and to study. His privilege was to take gifts in return for making sacrifice, and receive daily alms of members of the pure castes. In the early period he was permitted to be a soldier, but later this is forbidden, except in case of necessity, when it is even enjoined upon him to bear arms. His person is regarded as sacred, and he is even identified with the god whom he worships. He may not change his mode of life, unless in danger of starvation, in which case he may temporarily assume the life of a workingman. He is regarded as the sole authority in all questions of law and right, and in later times is often found as minister and judge. He is not responsible for his acts to any one, according to the traditional list of his privileges; but since the law provides fines, and even imprisonment, for a priest who has offended against the laws, this statute is clearly nugatory. It was, however, at no time permissible to put a Brāhman to death; and the king is expressly forbidden to tax his property.

(2) *The Warrior.*—His one duty was to fight. He was the king's soldier, lived at the king's expense, and was liable at any time to be called into the field. His rights, so far as caste goes, were to study the *Vedas*, a very highly esteemed privilege, and command the two lower castes.

Like the priest, in case of necessity the warrior may assume the manner of life of the lower castes, but in no case may he exercise the duties of a priest. Yet interchange between the two castes was not unknown prior to the period of formal law. In war the personal reward of the warrior, besides his monthly pay, is the possession of whatever he wins in battle, arms, jewels, etc., after the "king's share" has been deducted.

(3) *The Husbandman.*—The third caste shared with the two upper castes the privilege of studying the sacred writings (see SANSKRIT LITERATURE) and attendance on sacrificial rights; otherwise his position was practically much lower than that of the priest and warrior. He tended flocks, tilled the land, paid a large share of his gains into the king's treasury to support the military caste, and was in person superior only to the Çûdra (Sudra), or slave-caste, with which caste he seems often to be on more familiar terms than with his Aryan brothers of the upper castes. In the Epic period, which represents the completed caste-system, he is the prey of the king's officers, and retains little more than a nominal superiority to the lowest orders.

(4) *The Slave Caste.*—The Çûdra (Sudra) was the slave of every caste above him, but was regarded as more particularly the servant of the priest. He had no rights whatever. His slightest offense against the upper classes was severely punished, often with death. He could possess no property save what was given him by his master, and that was liable to be taken away without redress by any member of the pure castes. In distinction from these pure castes, called regenerate, or *twice-born* (the "second birth" being the formal initiation as a member of the pure castes), the Çûdra (Sudra) was called unregenerate, or "once-born." He was not permitted to study or even hear the *Vedas* recited. As the descendant of the barbarian native he was regarded as outside the pale of society, and was permitted to come into contact with it only to serve its necessities. The mixed castes, resulting from intermarriage of the slave with the regenerate castes, were regarded as too low even to serve the "twice-born." They lived apart, practiced the lowest trades, and mingled with the upper castes only as soldiers, herded together under the command of a real "warrior." It is not till the later literature that they make any figure in the social scheme, and they are then mentioned only to be disparaged. The "outcasts," or Pariahs, consisted of all the members of the pure castes who for any reason had been expelled from the social world into which they were born. The usual cause was *mésalliance* with a lower caste; and while the offspring of the *mésalliance* were Pariahs, the descendants of the Pariahs themselves were usually incorporated into a "mixed caste." Yet there was practically no distinction between outcast and lowest caste.

WASHBURN HOPKINS.

Castelar', EMILIO: statesman and author; b. in Cadiz, Spain, Sept. 8, 1832. He was appointed Professor of Philosophy and Literature at Madrid in 1857; and in 1864 founded a radical journal called *La Democracia*, wherein he developed his political principles. Involved in the insurrection of June 22, 1866, he was obliged to flee to France. Upon his return to Spain two years later he was elected a member of the Cortes, and became one of the most eloquent parliamentary orators. After the abdication of Amadeus in 1873 he took charge in the cabinet of Foreign Affairs. From Sept. 9, 1873, to Jan. 2, 1874, he was president of the Spanish republic with dictatorial power. During this time he put down with energy an uprising of the communists at Cartagena, and effected a reorganization of the army. Since 1875 he had been the leader of the Posibilistas, or the moderate faction of the Republican party. The following are some of his more important works: *La civilisación* (1865); *Questiones politicas y sociales* (1870); *El ocaso de la libertad* (1877); *Tragedias de la historia* (1883); and a *Life of Columbus*, printed in the *Century Magazine* for 1892. D. in Pueblo, Spain, May 25, 1899. HENRY R. LANG.

Castelbuono, kăăs-tel-boo-ō'nō (i. e. good castle): a town of Sicily; in the province of Palermo; in the Madonian Mountains, 4 miles S. S. E. of Cefalú (see map of Italy, ref. 9–F). It has mineral springs, and a trade in manna. Pop. 9,062.

Castel'-Gandol'fo: a village of Italy; picturesquely situated on the northwest side of Mont Albano; about 13 miles S. E. of Rome (see map of Italy, ref. 6–E). Here are numerous villas and the pope's summer residence. Pop. 2,000.

Castellamare del Golfo: a seaport-town of Sicily; in the province of Trápani; on a gulf of its own name; 20 miles E. of Trápani; near the site of the ancient *Segesta* (see map of Italy, ref. 9–E). It exports cotton, wine, fruit, and manna. Pop. 16,600.

Castellama're (i. e. fortress on the sea) **di Stabia**: a fortified city and seaport of Italy: in the province of Naples; finely situated on the Gulf of Naples; 17 miles by rail S. E. of Naples (see map of Italy, ref. 7–F). It has a royal palace, a cathedral, several convents, a military hospital, and a royal dockyard; also manufactures of cotton, linen, silk, and sailcloth. The castle from which the town takes its name was built in the thirteenth century by the Emperor Frederic II. It is near the site of the ancient *Stabiæ*, where Pliny was killed by an eruption of Vesuvius in 79 A. D. Pop. 34,064.

Castellanos, kăăs-tel-yaa'nōs, JUAN, de: a Spanish priest and poet of the sixteenth century; b. in Seville. He was curate at Tunja, in New Granada, where he probably died. His *Elejías de varones illustres de las Indias* is an account in verse of the exploits of Christopher and Diego Columbus, Bobadilla, Aguirre, and others, and is of historical value and considerable poetical merit. The first part was published at Madrid 1589, the second part some years later, and a reprint with the third part added 1847–50. A fourth part is lost, as is the *Historia Indiana* of the same author, in prose.

HERBERT H. SMITH.

Castellar, COUNT OF: See CUEVA, BALTAZAR DE LA.

Castellon, kaas-tel-yōn': a town of Spain; capital of the province of the same name; in an extensive and fertile plain; about 2 miles from the Mediterranean, and 40 miles N. N. E. of Valencia, with which it is connected by a railway (see map of Spain, ref. 16–I). It is well built, with wide and straight streets, and is supplied with water by a magnificent aqueduct. It has a handsome episcopal palace, a theater, a hospital, and several convents; also manufactures of linen, woolen, and hempen fabrics, sailcloth, paper, firearms, glass, soap, etc. Francisco Ribalta, the famous painter, was a native of this town. Pop. (1887) 25,193.

Castellon' de la Pla'na (dăy-lăă-plaa'năă), or **Castellón**: a province of Spain; bounded N. by Tarragona, E. by the Mediterranean, S. by Valencia, and W. by Teruel. It is a wild mountainous region, and contains many mines and mineral springs. Area, 2,447 sq. miles. Capital, Castellon. Pop. (1887) 292,437.

Castelnau, FRANCIS, Count: a French traveler; b. in London, 1812. From 1837 to 1841 he traveled in Canada, the U. S., and Mexico. In 1843 he undertook an exploration of South America under the auspices of the French Government. He was accompanied by M. Eugène d'Osery, mineralogist, M. Hugues Weddell, botanist and physician, and M. Émile Deville, taxidermist. Starting from Rio de Janeiro he traveled through Minas Geraes to Goyaz, explored the upper Tocantins and Araguaya, went overland to Cuyabá, whence he visited the upper Tapajós and explored the Paraguay to the frontiers of Brazil; then, passing through Bolivia and Peru, he descended the Ucayali and Amazon. M. Weddell undertook a separate exploration of Bolivia, and M. d'Osery, who was descending to the Amazon by another route, was killed by his Indian canoemen. Returning to France in 1847, Count Castelnau published his *Expédition dans les parties centrales de l'Amérique du Sud* (Paris, 1850–51, 6 vols. 8vo. including a volume by M. Weddell). This work is rich in geographical and ethnological information, as well as very interesting. The atlas and the scientific results were published separately. Count Castelnau subsequently traveled on the coast of Arabia, and was successively consul at Bahia, Cape of Good Hope, and Singapore, and consul-general at Melbourne, Australia, where he died Feb. 4, 1880. HERBERT H. SMITH.

Castelnau, kăăs'tel'nō', MICHEL, de: diplomatist and general; b. in Touraine, France, 1520; fought against the Protestants at Rouen, Dreux, etc., 1562–63; executed numerous and important diplomatic missions for Henry II. and Charles IX., and was minister to England 1574–84. D. at Joinville in 1592. His *Memoirs* (1731) are impartial and accurate.

Castelnaudary, kăăs'tel'nō'dăă'ree' (anc. *Sostomagus*): a town of France; department of Aude; on an eminence near the Canal du Midi; 22 miles W. N. W. of Carcassonne (see map of France, ref. 9–F). It has manufactures of silk and woolen fabrics and earthenware. The canal here expands

into a commodious basin 1,300 yards in circumference. This town was founded on the site of *Sostomagus* by the Visigoths, who called it *Castrum Novum Arianorum*. It was taken by the English Black Prince in 1355. Pop. (1896) 9,720.

Casteltermini: a town of Sicily; in the province of Girgenti; 16 miles N. of the city of Girgenti (see map of Italy, ref. 10–E). It has mines of rock-salt and sulphur. Pop. 9,842.

Castelvetrano, -văy-traa'nō: a town of Sicily; province of Trápani; 23 miles S. E. of Trápani (see map of Italy, ref. 9–E). It has several convents and an old castle and cathedral. Articles of coral and alabaster are made here. Pop. 20,100.

Casti, kaas'tĕe, Giovanni Battista, or Giambattista: Italian poet; b. at Prato, 1721; took orders, but after being presented to Joseph II. of Austria about 1769 devoted himself to court life; poet-laureate of Austria 1782–90; author of forty-eight spirited but somewhat licentious *Novelle Galanti* in verse (1793); the political satire *Gli Animali Parlanti* (1802); and various comic operas. D. at Paris, where he had lived since 1798, Feb. 6, 1803.

Castiglione, kaăs-tĕel-yō'naȳ, Baldassare: Italian statesman and author; b. at Casatico, near Mantua, Dec. 6, 1478; became a favorite at the court of the Duke of Urbino, by whom he was sent as envoy to Henry VII. of England in 1505, and whose interests he represented with Popes Leo X. and Clement VII.; employed by Clement on an embassy to Charles V. of Spain 1525. Author of *Il Cortegiano* (1528); several Latin and Italian poems; and two volumes of *Letters* (Padua, 1769–71). D. at Toledo, Feb. 2, 1529.

Castiglioni, -nĕe, Carlo Ottavio, Count: an Italian philologist; b. in Milan, 1784; known as the editor of Ulfila's Gothic Bible (1819). He also wrote a memoir upon the history of the Arab cities of Africa (1826). D. in Genoa, Apr. 10, 1849. See his *Life* by Biondelli (1856).

Castile (in Sp. *Castilla*, the land of castles): a former kingdom of Spain; occupied the central table-land of the peninsula, and was the nucleus and central seat of the Spanish monarchy. It first became an independent country in 762, and remained so until 1028, when it was conquered by Sancho III., King of Navarre. The kingdom of Castile was founded about 1035 by Ferdinand I., who conquered Leon and annexed it to Castile. By the marriage of Ferdinand the Catholic with Isabella of Castile in 1469, Castile and Aragon were united into one kingdom. The Castilians have long been distinguished for their pride or haughtiness. The Castilian dialect is considered purer than the dialects spoken in other parts of Spain. Pop. (1887) 3,205,114. Castile was divided into two portions, geographically as well as politically, New and Old Castile (*q. v.*).

Castile, kaăs-tīl: village; Wyoming co., N. Y. (for location of county, see map of New York, ref. 5–D); on N. Y., L. E. and W. R. R.; 57 miles S. E. of Buffalo; has four churches, and manufactories of agricultural implements and salt. Its principal industry is farming. Castile is situated on the highest point of the Erie R. R. between New York and Buffalo, is noted for the beauty of the scenery in the vicinity, and has a well-known sanitarium for women. Pop. (1880) 965; (1890) 1,146; (1900) 1,088. Editors of "Castilian."

Castile, New (Sp. *Castilla ta Nueva*): old province of Spain; the south portion of the kingdom of Castile; has an area of 20,178 sq. miles. Former capital, Madrid. It is a table-land, bounded N. by the Sierra Guadarrama and S. by the Sierra Morena. This range of mountains is rich in minerals. The soil of this region is partly sterile and not well watered. The plains receive little rain, and are nearly destitute of trees. Large flocks of sheep are raised here. New Castile is divided into four provinces—viz., Madrid, Toledo, Cuença, and Guadalajara. Pop. (1887) 1,487,712.

Castile, Old (Sp. *Castilla ta Vieja*): old province of Spain; bounded N. by the Cantabrian Mountains, E. by Aragon, S. by New Castile, and W. by Leon. Area, 25,408 sq. miles. The surface is diversified by several ranges of mountains and high table-lands, which are arid and nearly destitute of forests. The soil in many parts is rendered sterile by deficiency of water. The chief rivers of this region are the Douro and the Ebro. Sheep and cattle constitute the principal riches of the inhabitants. Old Castile is divided into the provinces of Burgos, Valladolid, Palencia, Avila, Logroño, Segovia, Santander, and Soria. Pop. (1887) 1,717,402.

Castilho, kaăs-tĕel'yō, Antonio Feliciano: Portuguese poet; b. in Lisbon, Jan. 26, 1800; began even as a student of law at Coimbra to write verses of an idyllic character, *Cartas de Echo e Narciso* (1821); *A Primavera colteção de poemetos* (1822). During the rest of his life he published many translations from ancient and modern tongues, distinguished more for style than for accuracy; and also several volumes of original verse: *Amor e metancotia, ou a novissima Heloisa* (1828); *A Noute do Castello e os Ciumes do Bardo* (1836); *Excavacões poeticas* (1844); *Mit e um Mysterios, Romance dos Romances* (1845); *O outono* (1863). See Th. Braga, *Historia do Romantismo em Portugal* (1880); and *Memorias de Castitho* (1881), by his son Julio de Castilho. D. in Lisbon, June 18, 1875. A. R. Marsh.

Castilla del Oro, or **Castilia del Oro**: a name first officially given to the part of Central America between the Gulf of Urabá (Darien) and Cape Nombre de Dios, which was granted to Nicuesa in 1508. It was later transferred to that portion of the South American coast lying between the Gulf of Urabá and Santa Martha, the interior extent being undefined. The name frequently appears in works and maps of the sixteenth century, but was merged later into that of New Granada. Herbert H. Smith.

Castilla, Ramon: Peruvian soldier and statesman; b. at Tarapaca, Aug. 30, 1796. He joined the Spanish army in 1816, and fought against the revolutionists in Chili until captured by them at the battle of Chacabuco (Feb. 12, 1817). Taken to Buenos Ayres he was soon released, returned to Peru, joined the patriots in 1821, and was a colonel at the battle of Ayacucho (Dec. 9, 1824), where he was wounded. Following the fortunes of Gamarra, he was exiled in 1835; returned with Gamarra and the Chilians in 1837, and was one of the principal generals in the campaign against Santa Cruz (1837–38). In 1841 he marched with Gamarra to invade Bolivia, and was taken prisoner at the fatal battle of Yugavi (Nov. 20, 1841), where Gamarra was killed. On his release (June, 1842) he found Peru distracted by civil wars between the factions of Menendez, La Fuente, Torrisco, Vidal, and Vivanco, the latter having possession of Lima. Castilla declared for Menendez, the constitutional acting president. Gathering an army in Southern Peru, he captured by a ruse the force which Vivanco sent against him (Oct. 28, 1843), defeated a second army at Carmen Alto (July 17, 1844), entered Lima, and restored Menendez to his post of acting president. A congress was then called, which elected Castilla president of Peru, with the title of grand marshal (Apr. 20, 1845). Disorders at once ceased, a general amnesty was declared, and an era of prosperity was opened. After a peaceful term Castilla was regularly succeeded by Echenique in Apr., 1851. The unpopular and arbitrary measures of Echenique led to revolts, and after much hesitation Castilla consented to head the armed opposition. He gathered forces at Cuzco and Arequipa, took the title of provisional president, decreed the liberation of Negro slaves and the abolishment of Indian tribute, defeated Echenique's army at the battle of La Palma (Jan. 5, 1855), and occupied Lima, Echenique leaving the country. The congress which was at once called re-elected Castilla president (July 14, 1855), and confirmed his emancipation decrees. His second term was disturbed only by a local rebellion at Arequipa, which was put down after some fighting. The revised constitution was ratified in 1860, and is still in force (1893). Succeeded by San Roman in 1862, Castilla lived in retirement until 1865, when he was made president of the senate. Owing to a quarrel with the president, Pezet, he was banished soon after. Returning, he declared against Prado, who had seized the presidency, and was preparing to march against him when he died suddenly in the desert of Tarapaca, May 30, 1867. Herbert H. Smith.

Castillo, Bernal Diaz del: See Diaz del Castillo, Bernal.

Castillo, kaăs-teel'yō, P. Francisco, del: Peruvian Jesuit; b. at Lima, Feb. 9, 1615. He entered the order in 1632, and his life was devoted to charitable works. He was one of the most reverenced preachers in Spanish America, and his influence over some of the viceroys was very great. D. at Lima, Apr. 11, 1673. See his biography by P. José de Buendia. H. H. S.

Castine, kăs-teen': a port of entry of Hancock co., Me. (for location of county, see map of Maine, ref. 8–E); on the east side of Penobscot Bay; at the mouth of the Penobscot river; 34 miles S. of Bangor. It is 9 miles E. of Belfast. It has a good harbor, a custom-house, and manufactures of boats, ships, and ship furniture, cordage, brick, etc. It has

a State normal school. Pop. of Castine township (1880) 1,215; (1890) 987; (1900) 925.

Castings: See Metallurgy and Molding.

Casting Vote: the vote of the president or chairman of a public assembly, or of the Speaker of a legislative body. This vote decides the question whenever there is a tie—i. e. when the votes of the assembly are equally divided. The Vice-President of the U. S. never votes except in case the Senators are equally divided. The Speaker of the British House of Commons never votes except in a similar contingency. In the U. S. Congress the Speaker votes on ballot as representative of a district, and on a tie vote as presiding officer. It is usual for the Speaker to give a casting vote in such a way that the House will have an opportunity of reconsidering its decision.

Cast Iron: See Iron.

Castle [from Lat. *castellum* (> Fr. *château*), dimin. of *castrum*, fort]: a fortified residence; especially applied to a class of structures erected by the feudal lords and princes of the Middle Ages, and to certain palaces and manor-houses of the early Renaissance in which the plan or forms of the feudal castles were retained. The Normans were the great castle-builders of the eleventh and twelfth centuries, maintaining themselves in the conquered territories of France and England by means of strongly intrenched and massive structures resembling fortresses rather than residences. In the twelfth and thirteenth centuries the baronial castle became a most formidable and elaborate mass of buildings; but its further development was checked in the fourteenth century by the growth of the royal power and that of such princes as the Dukes of Burgundy, Orleans, and others. Castles were then built in which the idea of the palace begins to assert itself prominently. The feudal castle usually occupied a bluff or hill, difficult of access, or in some cases an island in a lake. The earlier type consisted of a massive tower or "donjon," sometimes circular, sometimes square, or even of irregular plan, standing in the middle or at one side of a court or bailey, surrounded by a high wall with an exterior moat, crossed at the one fortified entrance-gate by a drawbridge. The gate, defended by towers, was closed by a "portcullis" raised and lowered by chains and weights, in addition to its iron-bound doors or valves. In the thirteenth century the circuit-walls were made of exceeding strength, with numerous towers, and the gates, posterns, barbicans, and advanced works were planned with great skill and shrewdness to resist the prevailing methods of attack, while interior walls and trenches furnished a second stand, and the donjon a final refuge in case the besiegers carried the gates. With the dawn of the Renaissance the castle becomes a palace, but retains many of the detailed arrangements of the feudal structures, such as the moat and drawbridge. The castles of Coucy, Pierrefonds, and Chambord, in France, and Rochester, Warwick, and the earlier manor-houses in England, illustrate the stages of this development, while in Germany one may trace them all in the beautiful castle of Heidelberg on the Rhine.

Many of the castles of robber-barons and rebel lords were destroyed by the growing power of the monarchy, and their imposing ruins are among the most picturesque objects in European landscapes. See Fortress.

A. D. F. Hamlin.

Castle (in Latinized form *Castellus*), Edmund: Orientalist; lived about 1606–85: a member of the group of men who adorned English scholarship in the second half of the seventeenth century. His life was spent mainly in the compilation of his *Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Samaritanum, Æthiopicum, Arabicum et Persicum* (London, 1669), of which the Syriac part (ed. J. D. Michaelis, Göttingen, 1788) is still valuable; and he aided Walton in the preparation of his *Polyglot*. C. H. Toy.

Cas'tlebar: a town of Ireland; capital of the county of Mayo; on the Castlebar river; about 160 miles W. N. W. of Dublin (see map of Ireland, ref. 7–D). It has an old castle, once a stronghold of the De Burgh family; also manufactures of coarse linen. The Earl of Lucan has a county-seat near this town. Castlebar was taken by the French under Humbert in 1798. Pop. 3,500.

Castle Garden: a building at the southern extremity of New York city, which was originally a fort, but has served successively as a public garden and play-house and a landing dépôt for immigrants. It was built in 1807 by the U. S. Government as a fort at a point then 300 yards from the shore, but this space is now occupied by made land. Castle Clinton, as the structure was then called, was ceded to New York city in 1822, and subsequently was leased to private parties, who transformed it into an indoor garden and theater, and renamed it Castle Garden. Here Jenny Lind made her first appearance in America under the management of P. T. Barnum. In 1855 the immigration authorities obtained the building for use as a landing dépôt for immigrants, and kept it for that purpose till Dec. 31, 1890, when it was formally surrendered to the city, and placed in the control of the park commissioners. It has since been turned into an immense aquarium with a number of very large tanks for large fishes, and numerous smaller ones.

Cas'tlemaine: a city in Australia; province of Victoria; in the neighborhood of rich gold mines; connected by rail with Melbourne, 70 miles distant (see map of Australia, ref. 8–H). Pop. (1891) 6,082.

Castle Peak, California: a peak of the Sierra Nevada; about lat. 38° 10′ N. Its height is estimated at 13,000 feet.

Castlereagh, kăs'l-rāy, Robert Stewart, Viscount: Marquis of Londonderry; Tory statesman; b. in County Down, Ireland, June 18, 1769. He was the eldest son of the first Marquis of Londonderry; entered the House of Commons in 1794, and efficiently promoted the union of Ireland with England in 1800. In 1802 he was appointed president of the board of control by Mr. Pitt; became Secretary of State for the Department of War and the Colonies in 1805; fought a duel with George Canning in 1809. About this time he was the favorite leader of the Tory party, and a political rival of Canning. He entered the ministry of Lord Liverpool as Secretary for Foreign Affairs in Feb., 1812, and as such was a powerful director of the coalition against Napoleon. He represented Great Britain at the congress of Vienna, 1814, and the congress of Paris, 1815. On the death of his father, in 1821, he inherited the title of Marquis of Londonderry. He committed suicide, Aug. 12, 1822, and left no issue. See *Lord Castlereagh's Correspondence and Dispatches*, by Sir Charles Stewart (12 vols., 1847–53).

Castleton: village; Rutland co., Vt. (for location of county, see map of Vermont, ref. 7–B); on Del. and Hud. Canal Co.'s R. R., and on Castleton river; 11 miles W. of Rutland; is the seat of a State normal school; has manufactures of plows, marbleized slate, carriages, and cheese; good public school and four churches. Fort Castleton commanded the valley in 1775, and here Ethan Allen mustered his forces for the capture of Fort Ticonderoga. Pop. of township (1880) 2,605; (1890) 2,396; (1900) 2,089.

Abel E. Leavenworth, A. M.

Castletown: ancient capital of the Isle of Man (see map of England, ref. 6–D). Castle Rushen, now used as a prison, stands on the site of an old Danish fortress destroyed by Robert Bruce in 1313. King William's College is also located here. Pop. 2,200.

Castor: See Beaver.

Castor: a remarkable binary or double star of the second magnitude in the constellation of Gemini; called also α Geminorum. The two stars rotate around their common center of gravity.

Castor and **Pollux** (in Gr. Κάστωρ and Πολυδεύκης), heroes of classic mythology; called also **Dioscu'ri** [Gr. Διός, of Jupiter, κοῦρος, κόρος, boy, son]: were twin-brothers and the offspring of Leda by Jupiter, who visited her in the guise of a swan. According to one version of the myth, Leda brought forth two eggs, from one of which the two immortal babes, Pollux and Helen, were born, and from the other the mortal, Castor and Clytemnestra. The principal exploits of the twin-brothers were their expedition to Attica to rescue their sister Helen from Theseus, their participation in the hunting of the Calydonian boar and in the Argonautic expedition, and their combat with the sons of Aphareus. Castor was killed in the combat, and when Pollux found him dead he implored Jupiter that he too might die, in order to be together with his brother. Jupiter was moved with compassion for Pollux, and, according to Homer, restored life to Castor on the condition that both of them should on alternate days descend to Hades, or, according to another version of the myth, placed them both together among the stars. Generally the Dioscuri are represented in art as mounted on fiery steeds, with egg-shaped helmets ornamented with stars and spears. They presided over the public games; Castor was the god of equestrian exercise, Pollux of boxing. But they were also the patrons of

hospitality, ready to befriend any one who approached them with sincerity. They were chiefly worshiped by people of Dorian descent, and Max Müller thinks that the deification of some of the Tyndaridæ forms the true nucleus of the whole myth. They were also worshiped with great devoutness in Rome, where they had a magnificent temple in the Forum.

Castor and Pollux: the name given to an electrical meteor which sometimes appears at sea, attached to the extremities of the masts of ships, under the form of two balls of fire. Sailors consider this phenomenon a sign of fair weather, but a single ball, which is called Helena, is supposed to portend a storm.

Casto'reum, or **Cas'tor**: a substance secreted in glandular sacs closely connected with the reproductive organs of the beaver (*Castor fiber*). Each beaver produces two of these sacs or pouches. This substance is used by perfumers, and was formerly esteemed a valuable remedy for hysteria, catalepsy, and other diseases. It is an anti-spasmodic.

Castor Oil: a fixed oil derived by expression from the seeds of *Ricinus communis* or castor-oil plant. This plant frequently grows, in the East Indies and in Africa, to the height of 30 or 40 feet, forming a tree, but in the U. S. and countries possessing a similar climate it practically never reaches a size greater than that of a shrub. The seeds, which are oval and very smooth and shining, marbled, and of an ashy color, possess a rather agreeable nutty taste. They are, however, distinctly poisonous, as they contain a substance known as ricinoleic acid or ricin, which is capable of producing severe inflammation of the stomach and bowels in man and the lower animals. The oil itself probably depends for some of its purgative properties to a slight extent upon the presence of small quantities of ricinoleic acid, but does not possess enough of this irritant ever to produce any irritation in the gastro-intestinal tract of man. On the contrary, castor oil is recognized as being a gentle purgative in cases where the bowels are inflamed or irritated. The dose for ordinary purgative purposes varies from one to two tablespoonfuls. Very little of the castor oil used in the U. S. is imported. In addition to being used in medicine, the lower grades abstracted by processes, which also extract the irritant properties of the castor-oil bean, are used as lubricants, particularly for light-running wagons. H. A. H.

Castor-oil Plant: a well-known and widely cultivated plant of the Spurge family (*Euphorbiaceæ*), known to botanists as *Ricinus communis*. Its nativity is doubtful, but it is now held by De Candolle to have been originally native to tropical Africa. It was early cultivated by the Egyptians under the name of *kiki*, and the seeds have been found in their tombs. It is immensely variable, and several species have therefore been made of it; but botanists are now generally agreed that the genus *Ricinus* is monotypic. Several of these reported species, differing in stature, shape, and color of leaves, are in cultivation for ornament. The chief use of the castor-oil plant is the oil contained in the handsome variegated seeds. For this purpose it is grown in nearly all tropical countries, and in the U. S. it is grown to an important extent in Kansas, Illinois, and Missouri. The plant was early introduced into the West Indies, and in Jamaica it was called *agno casto* by the Portuguese, having in some way become confounded with *Vitex agnus-castus*, a shrub of the verbena family. The English planters are said to have made "castor" out of *casto*, and thus the present English name of the plant arose. Castor-seed pomace is valued as a nitrogenous fertilizer. L. H. B.

Castrén, Matthias Alexander: a Finnish linguist and ethnologist; b. in Tervola, Dec. 2, 1813; d. May 7, 1852. He traveled extensively to gather materials for a Finnish mythology and for his translation of *Kalevala*, published in 1841. He died before he had time to utilize the valuable materials collected on his travels. This was afterward done by Anton Schiefner, the German translator of *Kalevala*, in a series of volumes entitled *Castrén's nordische Reisen und Forschungen* (1853–62). Castrén also published grammatical treatises, particularly concerning Uralaltaic languages. R. B. Anderson.

Castres, kaast''r: an ancient town in the south of France; department of Tarn; on the river Agout; 34 miles by rail N. E. of Castelnaudary (see map of France, ref. 9–F). It is the most populous town in the department, and is the seat of a Protestant consistory, having been one of the strongholds of the early Huguenots. Castres has important manufactures of cassimeres, military clothing, cotton goods, paper, soap, and copper-ware. Pop. (1896) 28,204.

Castro Andrade y Portugal, Pedro Antonio Fernandez, de: tenth Count of Lemos; Spanish nobleman; b. in 1634. In 1666 he was made Viceroy of Peru, and reached Lima Nov., 1667. In 1668 he went with an armed force to put down disturbances which had broken out in mining towns near Lake Titicaca. The offenders were treated with great severity, over forty being executed, and one of the towns was razed to the ground. On his return to Lima his confessor expostulated against these acts as needlessly harsh and cruel. Struck with remorse, the viceroy had masses said for his victims and even performed public acts of penance. He died at Lima, Dec. 6, 1672.

Herbert H. Smith.

Castro, Inez de: See Inez de Castro.

Castro, Dr. José Maria: a statesman of Costa Rica; b. at San José, Sept. 1, 1818. He graduated at the University of Leon, Nicaragua, and from 1842 held high positions under the government of Costa Rica. Was vice-president and acting president in 1846. Elected president in 1847, he put down an incipient rebellion, but proclaimed an amnesty for the offenders. In 1848 Costa Rica finally withdrew from the Central American states, and a new constitution was promulgated. Dr. Castro resigned the presidency in Nov., 1849; held various diplomatic positions, and was again president from May, 1866, to Nov., 1868, when his government was supplanted by Jiménez. He received the title of "Founder of the Republic of Costa Rica," with the military grade of general of division. Herbert H. Smith.

Castro del Rio, del-ree'ō: a town of Cordova, Spain; on the river Guadajoz; 21 miles S. E. of Cordova (see map of Spain, ref. 18–E). The streets are mostly wide and regular, and lined with well-built houses. It has a spacious church with a high tower, 2 colleges, 2 hospitals, and several convents; also manufactures of linen and woolen fabrics, brandy, wine, etc. Pop. (1887) 11,290.

Castro Giovanni, jiō-vaan'nēē (anc *Enna*): a town of Sicily; in the province of Caltanisetta; on a fertile plateau 4,000 feet above the level of the sea; 14 miles N. E. of Caltanisetta (see map of Italy, ref. 10–F). Here is a feudal fortress of Saracenic origin. The ancient *Enna* was the site of the most famous temple of Ceres, and was supposed to be a favorite resort of that goddess. Pop. 19,800.

Castro, Guillem, de: Spanish poet; b. in Valencia in 1569; a friend and imitator of Lope de Vega. He has left us nearly forty plays, of which two are responsible for most of the poet's fame, both being devoted to the *Youthful Adventures of the Cid* (*Las Mocedades del Cid*; *Las Hazañas del Cid*). From these plays Corneille got the hint and much of the matter for his play *Le Cid*. D. July 28, 1631.

A. R. Marsh.

Castro, João, de: general: b. at Lisbon, Portugal, 1500; became proficient in mathematics and languages; commanded a vessel in Noronha's expedition to India 1538; aided in the exploration of the Red Sea 1540; headed a small expedition to the Indies 1545, and gained a brilliant victory over the Moors at Diu; Viceroy of India 1547. D. June 6, 1548.

Castro, Lope Garcia, de: Spanish lawyer and administrator; member of the council of the Indies, and from Sept., 1564, to Nov., 1569, governor and captain-general of Peru. His term was uneventful, and after his return to Spain he resumed his seat in the Indian council. The dates of his birth and death are unknown. H. H. S.

Castrovilla'ri: a fortified town of Italy; province of Cosenza; 32 miles N. of Cosenza (see map of Italy, ref. 8–G). It has an old castle, and a trade in silk, manna, and wine. Pop. 11,800.

Casua'rii [pl. of Mod. Lat. *casuarius*, a cassowary]: an order of birds related to the ostriches and containing the Cassowaries and Emus (*q. v.*); characterized by the absence of a keel to the sternum, and the extreme reduction of the wings. Neither the ischia nor pubes unite below. The feathers have long aftershafts, and the toes are three in number, directed forward. F. A. Lucas.

Casuari'na: the beefwoods or cassowary trees; a genus of trees of the family *Casuarinaceæ*, usually considered as somewhat related to the oaks, galeworts, etc., but probably having affinities rather with the gymnosperms. They are

mostly natives of Australia; some of them are large trees, producing hard and heavy timber of excellent quality, which is called beefwood, from its resemblance to the color of raw beef. One species, the *Casuarina equisetifolia*, grows wild in the South Sea islands, the peninsula of Malacca, and other places. It is a lofty tree, valued in India for its timber, which is very durable and hard. All the trees of this genus have a peculiar appearance, having long, slender, creeping or drooping branches, which are jointed, and bear scales instead of leaves. The flowers have neither calyx nor corolla, and the stamens and pistils are in separate flowers.

Revised by CHARLES E. BESSEY.

Casuistry [deriv. of *casuist*, to Lat. *casus*, case]: means the application of juridical methods of reasoning to moral questions, or, better, to special cases of practical morality. It may develop spontaneously as the necessary result of given circumstances. It thus developed among the Jews. As the Greeks never learned the absolute distinction between morals and æsthetics, so the Jews never knew the absolute distinction between morality and legality. Their moral code and their civil law were one and the same thing. In that preliminary stage of civilization casuistry became necessary to guide people to a strict fulfillment of the law. It can, however, under other circumstances, develop as the result of moral decadence, and its latent purpose is then to help people to circumvent the authority of conscience. It thus developed in the Græco-Roman civilization during the first two centuries of the Christian era, when treatises on the right to commit suicide, on the possible collision between the duties of citizenship and friendship, etc., began to engage attention. But its most characteristic development it received from the hands of the Jesuits. Traces of casuistry are met with very early in the history of the Christian Church, and the *De Mendacio* and *Contra Mendacio* of St. Augustine of Hippo may be classed as treatises on casuistry. A great impulse was given to this art by the Lateran Council, 1215, which directed confession of every mortal sin to be made to a priest, who was supplied with a penitential book. It crept into the Church through the sacrament of confession; it found its recognition in the *Libri pœnitentiales*; it molded the form of the whole mediæval treatment of sins as a science of moral theology; and it still prevails in the Roman Catholic Church. Traces of it may be found in the Reformed Churches, as in the writings of Jeremy Taylor and Amesius. (See also Melanchthon's *Concilia* and Perkins's *Cases of Conscience*.) But all this is simply the casuistry of unripeness, after the Jewish type. A new development came with the Probabilism of the Dominican MOLINA (*q. v.*) in the sixteenth century, which received great expansion in the eighteenth century at the hands of LIGUORI (*q. v.*), on whose treatises most modern manuals in use are based. He was especially followed by Seavini, Gury, Lehmkuhl. For writers of the seventeenth century, see Escobar's *Moral Theology* (1646) and *Cases of Conscience* (1626), and Caramuel de Lobkowitz.

Ca'sus Bel'li (a case of war, or, in other words, a case justifying war): a Latin phrase used to denote an act or event which involves war or justifies its declaration.

Cas'well, ALEXIS, D. D., LL. D.: b. in Taunton, Mass., Jan. 29, 1799; graduated at Brown University 1822; taught the classics in Columbian University, Washington, D. C., 1823–27; ordained in Baptist denomination and held pastorates in Halifax, N. S., and in Providence, R. I.; was a Professor of Mathematics, and later of Natural Philosophy, which at the time included the whole scientific curriculum of the college, in Brown University from 1828 to 1864; was president of that institution from 1868 to 1872; also of the board of trustees of the Newton Theological Seminary; one of the incorporators of the National Academy of Sciences. He gave much attention to meteorological investigations. D. in Providence, R. I., Jan. 8, 1877.

Cat [O. Eng. *cat*: O. Norse *köttr*: (fem. gender) O. H. G. *chazzā* > Mod. Germ. *Katze*. The Norm. Fr. also brought the word to Eng., N. Fr. *cat*: Fr. *chat*: Ital. *gatto*: Span. *gato* < Lat. *cattus*, also *catta*, late Gr. κάττος, κάττα. The word makes its appearance in Gr. and Lat. after Chr. era, and may have been introduced from Teutonic]: any member of the family *Felidæ*, including the lion, tiger, lynx, etc., but the name is sometimes limited to the smaller species of that family.

The original abode of the domestic cat (*Felis domestica*) is not certainly known, but probably it is descended from the domestic cat of ancient Egypt, which was considered an object of veneration, and the records of which run back to a very early period. It not unfrequently escapes to a wild state, but no properly wild species exactly resembles it. The cat is scarcely mentioned in the authors of ancient Greece,

European wild cat.

Rome, and Judæa, and it is known that in the earlier mediæval period of Europe cats were comparatively rare and costly animals. They seem to have been long known in China, which affords a fine variety with a soft and beautiful fur and pendulous ears. Among the more remarkable varieties are the Manx or Cornish cat, with a merely rudimentary tail; the Angora cat, with long hair; the Maltese and Chartreuse cats, of a bluish-slate color, etc. See St. George Mivart, *Cats* (1880), and Mrs. Hoey's translation of Champfleury's *Cats, Past and Present* (1885).

Revised by D. S. JORDAN.

Catacaus'tics [Mod. formation from Gr. κατά, down, back + καυστικός, deriv. of καίειν, burn]: the caustic curves formed by the reflection of rays of light, and so called to distinguish them from the diacaustic, which are formed by refracted rays. See CAUSTIC.

Cat'acombs [from Ital. *catacomba*; etym. obscure]: a series of subterranean sepulchral galleries; especially the series in Rome supposed to have been excavated by the early Christians from Nero's time to the fall of Rome, and used by them not only for burial, but as chapels for worship and refuges from persecution. Their total aggregate length amounts to hundreds of miles, and they are said to contain the bones of 6,000,000 persons, mostly placed in niches or *loculi*, cut in the sides of the galleries. It is in the catacombs that we observe the beginnings of Christian art in the mystic symbols, figures of the Good Shepherd, etc., which adorn the sarcophagi and chambers or chapels. The catacombs have been made the object of careful researches, and abound in archæological interest.

Catacombs also exist in Egypt, Naples, Sicily, and elsewhere, and the name is also applied to certain ancient subterranean quarries in Paris, which have been used since 1786 as ossuaries or charnel-houses. See Rossi, *Roma Sotteranea Christiana* (1864, *seq.*): Kip, *The Catacombs of Rome* (1854); Northcote and Brownlaw, *Sotteranea* (1879).

A. D. F. HAMLIN.

Catalani, kăa-tăă-laa'nĕe, ANGELICA: Italian singer; b. at Sinigaglia in 1779. She had a voice of immense volume, range, and flexibility. Having made her *début* in Venice, Italy, in 1797, she afterward performed with great applause in Paris and London, and amassed large sums of money. She was married to a Frenchman named Valabrègue, with whom she resided some years in Paris. In 1827 she retired from the stage; settled in Florence in 1830, and gave free instruction to girls of musical ability. D. in Paris, June 13, 1849.

Cat'alan Language and Literature: the language and literature of CATALONIA (*q. v.*). After the consolidation of the different political jurisdictions of Spain into a single state was consummated under Ferdinand and Isabella, near the close of the fifteenth century, the predominance of Castile completely overshadowed the other provinces, and gradually threw into obscurity their languages and their litera-

ture. The local dialects were sooner or later abandoned to the populace, and Castilian became the almost universal language of culture and of public life. But the independent and insubordinate Catalans long held tenaciously to their native tongue; it was not till the close of the seventeenth century that Castilian supplanted it, and there are instances of its employment, not only for literary but for official purposes, for a century later. It has now, however, followed the fate of the other provincial dialects, and though still spoken in a great variety of forms by the inferior classes over a wide range of territory, and not unfrequently employed as a vehicle for *belles-lettres* dilettanteism, it can no longer be said to have a living status in the literature of Europe.

Considered simply as an object of linguistic study, Catalan shares with the other dialects of the Hispanic peninsula the advantage of having an approximately known origin and date. For, notwithstanding the opinion of Pers (*Historia de la lengua y de la literatura catalana*, Barcelona, 1857), who holds it to be an indigenous speech, there is no room for doubt that it originated in the dialect of the Roman camps and public officers, and of course its history begins with the Roman conquest. Hence it, as well as the other Spanish provincial tongues, is essentially younger and less primitive than the numerous local dialects of Italy, many of which are probably as old as Latin itself. Of course, Catalan, like Castilian, Galician, and the other provincial tongues, was developed under circumstances peculiar to itself, and, like them, has maintained in all its multifariousness a marked individuality. The linguistic affinities of the Catalan, or as, since the beginning of the thirteenth century, it has often been called, the Lemosin, with the Provençal, and in some points of structure even with Northern French, are greater than with Castilian, although its vocabulary, with certain wide orthoepical, orthographical, and inflectional differences, is the same as that of this latter dialect. The frequent dropping or contraction of the inflected endings shortens the words to that degree that a Catalan original ordinarily covers not more than three-fourths as much letterpress as a literal Castilian translation, and monosyllables are so common that Ballot cites a poem in ninety-six verses, each of seven words of a single syllable. The brevity of the words and their frequent consonantal endings in Catalan necessitate an abruptness of utterance and an *accent* or rhythmic modulation much less agreeable to the ear than the pronunciation of the sonorous Castilian, but this disadvantage is compensated by a simplicity, a directness, and a logical precision of periodic structure which give to it, at least as a vehicle of prose composition, a decided superiority over the periphrastic and cumbrous language of Castile.

So large a proportion of the early monuments of the Catalan and Valencian speech—for the shades of distinction between the two are slight, and we must treat them as practically one—remain still unpublished, and have not yet been subjected to thorough critical examination, that the chronology of the dialect and its literature is not definitively established. Doubtless it existed for centuries only as a spoken tongue, but its most ancient written relic yet discovered is said to be a document of the year 1037, in which Catalan words and phrases are intermixed with the Latin text. As a literary language it can not be said to have become fairly established until toward the close of the thirteenth century. At the beginning of the fourteenth century the various very closely allied dialects then grouped under the general name of Catalan composed the vernacular of so large a population in Northern Spain and Southern France that Ramon Muntaner, writing in 1325, can hardly be charged with exaggeration in affirming (*Cronica*, cap. xxix.) that "in no nation are there so many who use one and the same language as of the Catalans." The important commercial and political relations of the Aragonese kingdom with the other Spanish Moslem and Christian states, with France, with Italy, with Sicily, and finally with Greece, brought the Catalans constantly into friendly or hostile contact with all these nations, and their literary men imbibed more or less of the intellectual culture of all of them. The writings of Raimon Lul and other writers show traces of a familiarity with Arabic, and the Italian poets were studied, imitated, and translated by Catalans in the very infancy of Italian literature. But though the native character, sentiments, and habits of thought were never entirely obliterated, yet most of the Catalan poets have too little individuality and originality to make them really worthy of study for the general purposes of literary culture.

In our survey of this literature our limits of space must confine us to its published and generally accessible monuments, and as the works of Catalan and Valencian poets who either wrote in Provençal or followed Provençal models belong rather to the history of that school than to that of the native literature of Northeastern Spain, we shall but very briefly notice their productions.

Apart, then, from the linguistic interest of Catalan as a distinct and peculiar offshoot from the ancient Italic stock, its prose, and especially its historical literature, forms its chief and almost only claim to attention of the foreign general student. The oldest published work of this class we possess is the *Cronica del Rey En Pere e dels seus antecessors*, by Bernat d'Eselot. This very interesting and valuable chronicle covers the period between the early part of the twelfth century and the death of King Don Pedro in 1285, in which year it is supposed to have been written. (See D'Esclot.) The spirited and justly celebrated *Cronica Catalana* of Ramon Muntaner embraces the same period, but comes down to 1328. (See Muntaner, Ramon.) Of not inferior interest to either of these, supposing it authentic, is the *Libre dels Feyts . . . d'En Jacme lo Conqueridor*, or autobiography of King Don James the Conqueror, which, though considered genuine by the patriotic criticism of most native investigators, is thought by many foreign scholars to be a production of about the middle of the fourteenth century. (See Jacme.) The *Cronica del Rey En Pere* (Peter the Cruel, Peter the Punctilious), by himself, is, we believe, of undisputed authenticity, and carries the history down to 1380. The *Libre dels Feyts d'Armes de Catalunya*, by Mossen Bernat Boades, continues the military annals to 1420. Many original historical documents of earlier and later periods are contained in the *Colección de Documentos inedítos del Archivo-general de la Corona de Aragon*, now in course of publication at Barcelona, of which over forty octavo volumes have appeared. The principal Catalan historians since the invention of printing are Tomich, *Historia dels Reys de Arago é Comptes de Barcelona* (Barcelona, folio, 1495); Carbonell, *Chronica de Espanya* (folio, Barcelona, 1546); and Pujades, *Chronica General de Catalunya* (parte prim., Barcelona, 1609, folio; the following parts are in Castilian). The Catalan prose-writer whose name is oftenest noticed abroad is Raimon Lul (A. D. 1235–1315), a very voluminous philosophical and mystical author, best known by his *Ars Magna*, or *Lulliana*, in Latin. A Latin religious romance by him was translated into Catalan and published at Valencia in 1521 under the title *Blanquerna, qui tracta de cinq estements de persones*, etc. Many of the Latin writings of Lull are contained in an edition published at Mayence (1721–42) in i.–vi., ix.–x. volumes. His works in his own tongue remain chiefly in manuscript, though Konrad Hofmann printed in the *Transactions* of the Royal Bavarian Academy (xii. B. iii. Abth. 1872) an apologue by Lull in the original, with a German translation. This is one of 365 tales narrated in a huge work entitled *Libre de Maravelles*, and is a new, or rather old, version of the story of *Reynard the Fox*, agreeing, however, with the French and Dutch fables only in subject. The *Libre de Maravelles* has recently been again printed in the *Biblioteca Catalana* mentioned below, as well as the *Libre del orde de cavayleria*. Lull's Catalan poetry was published by Rossello at Palma in 1859, and his proverbs by Morel-Fatio in the *Romania*, vol. xi. 188. (See Lul, Raimon.) Translations of parts, at least, of the Bible into Catalan were made at an early date, and there exist several romances of chivalry in the same dialect, one of which, *Tirant lo Blanch*, professedly translated from English into Portuguese, and from Portuguese into Valencian, by Juan Martorell, was published at Valencia in 1480. It has been reprinted lately in the *Biblioteca Catalana* mentioned below.

To what we have said of the general character of Catalan poetry the works of Ausias March (*circa* 1400–60) form a conspicuous exception. They were indeed, if not inspired, certainly suggested by the poems of Petrarch and the Provençals, but they are generally simple, unaffected, tender, and graceful, and not wanting in originality. (See March, Ausias.) The *Libre de les Dones* of Jayme Roig also possesses interest, if not high literary merit.

In the present generation much has been done by private individuals and by literary associations to revive the cultivation of the native tongue by the republication of old works and by original composition, and French and German scholars have essentially aided this movement. Buchon published in 1841 a translation of Muntaner, and in the same volume the origi-

nal text of d'Esclot; Lanz printed an edition of Muntaner in Catalan at Stuttgart in 1844; Bofarull, an edition of the same chronicler at Barcelona in 1860, and of the *Cronica de Don Pedro el Ceremonioso* at Barcelona in 1850. The beautiful *Biblioteca Catalana*, now in course of publication by Verdaguer at Barcelona, is devoted to the publication of old rare or inedited works, and deserves warm encouragement. Briz has printed (Barcelona, 1867) a *Libre dels Poetas*, or anthology of poems of the twelfth to the eighteenth centuries, an edition of Ausias March (Barcelona, 1864), and with Caudi and Salto a collection of *Cants Populars Catalans* in 5 vols. 8vo (Barcelona, 1866–77). Of modern original authors in this dialect we may cite Ros Carlos, *Rondalla de Rondalles* (Valencia, 1776); Balaguer, *Poesias Catalanas* (2 vols., Barcelona, 1814); *Los nous Trovadors* (a collection), by Bofarull (Barcelona, 1858–59, 2 vols.), and the *Proceedings* of the Catalan Academy, *Jochs Florals* (Barcelona, 1859–73, 15 vols. 8vo). Much interest has recently been shown in the collection and publication of Catalan folk-lore: for popular tales, see Fr. Maspons y Labros, *Lo Rondallayre* (Barcelona, 1871–75, 3 vols. 8vo); P. Bertran y Bros, *Rondallistica* (Barcelona, 1888, 8vo); for popular poetry, besides Briz, mentioned above, see J. Wolf, *Proben portugiesischer und catalanischer Volksromanzen* (Vienna, 1856); Milá y Fontanals, *Romancerillo catalan* (Barcelona, 1882); finally, for riddles and children's games, see Briz, *Endevinallas populars catalanas* (Barcelona, 1882); and Maspons y Labros, *Jochs de la infancia* (Barcelona, 1874). There are also two periodicals devoted to the same subject: *Folk-lore Catalá* and *Annari de la associació d'excursións catalana*, now in their ninth and eighth years respectively.

For more detailed information, see, besides general works on Spanish literature, Fuster, *Biblioteca Valenciana* (Valencia, 1827–30, 2 vols., folio); Torres Amat, *Memorias para ayudar á formar un Diccionario critico de los escritores Catalanes* (Barcelona, 1836, 1 vol. 8vo), and supplement by Corminas (Burgos, 1849, 1 vol. 8vo); Ballot, *Gramatica y Apologia de la Llengua Cathalana* (Barcelona, 1814, 12mo); Bofarull, *Estudios, Sistema Gramatical y Crestomatia de la Lengua Catalana* (Barcelona, 1864, 12mo); Cambouliù, *Essai sur l'Histoire de la Littérature Catalane* (Paris, 1858, 8vo); and especially Helfferich, *Raymund Lull und die Anfänge der Catalonischen Literatur* (Berlin, 1858, 8vo). The various French and German journals devoted to Romance literature may be consulted with advantage, and especially Körting's *Encyklopädie und Methodologie der romanischen Philologie* (Heilbronn, 1886, 3 vols. 8vo, vol. iii., p. 479), and Gröber's *Grundriss der romanischen Philologie* (Strassburg, 1886, 8vo, vol. i., p. 669). The latter work is to be in two vols. (See also ROMANCE LANGUAGES.) An account of modern Catalan language and literature, with copious bibliography, may conveniently be found in E. Vogel's *Neucatalanische Studien* (Paderborn, 1886), based on F. M. Tubino's *Historia del renacimiento literario contemporáneo en Cataluña, Baleares y Valencia* (Madrid, 1880, 8vo). Perhaps the best dictionary is that of Labernia, Catalan, Castilian, and Latin, and Castilian, Catalan, Latin (Barcelona, 1839, 4 vols. 8vo). Revised by THOMAS F. CRANE.

Catalau'nian Plain (Lat. *Campi Catalaunici*): the ancient name of the wide plain surrounding Châlons-sur-Marne, in France. On this plain the Roman general Aëtius and his ally, Theodoric the Visigoth, gained a great victory over Attila in 451 A. D.

Cat'alepsy [Med. Lat. *catalepsia*, from Gr. *κατάληψις*, deriv. of *καταλαβεῖν*, seize upon]: a condition which occurs in various diseases, and is characterized by a certain rigidity of the muscles, so that the patient retains any position in which he is placed. Formerly this was regarded as a special disease, but is now known to be a symptom of several. Most frequently the cause is *hysteria*; in other cases it may be grave mental disease, as *melancholia atonita*, or *katatonia*; in children, and more rarely in adults, it may occur in various general diseases; and lastly catalepsy is one of the phenomena obtainable in HYPNOTISM (*q. v.*). The most striking cases are those due to hysteria, and these may be accompanied by partial or complete loss of consciousness and by insensibility to pain or other sensations. The person may stand with the arms stretched out horizontally for an hour without apparent fatigue, the limb sinking very slowly at last. The condition may develop gradually, though more often after hysterical convulsions, and it may constantly recur, so that the patient is almost continuously cataleptic for weeks at a time. In such cases the body remains motionless, the mouth often open, the expression apathetic; the heart and respirations are normal in frequency and regularity, and generally the bodily functions may be unimpaired, the patient being fed by a tube passed into the stomach. The appearance of death in such cases is usually only superficial, and not deceptive, except to careless examination. Catalepsy without the trance-like loss of consciousness is more rare, though cases are recorded; and most rarely a single limb has been affected, the rest of the body remaining normal. The cataleptic state developed by hypnotism may be decided, and by "suggestion" attitudes may be assumed which are indicative of different occupations; but too close a scrutiny can not be accorded such cases to eliminate the possibility of fraud.

The definite cause of catalepsy is still mysterious, and its treatment depends upon the condition with which it is found associated, though fortunately, from the rarity of its occurrence, treatment is rarely required. In the severer cases associated with hysteria and insanity regular feeding by the stomach-tube must be practiced from the beginning.

WILLIAM PEPPER.

Catali'na: a port of entry of Newfoundland; on the north side of Trinity Bay; has an excellent harbor, though difficult to approach. It has a lighthouse and a fine Anglican church. Pop. 1,300.

Catalo'nia (Sp. *Cataluña*): an old province of Spain; bounded N. by France, E. by the Mediterranean, S. by Valencia, and W. by Aragon. Area, 12,483 sq. miles. Pop. (1887) 1,838,799. Capital, Barcelona. The Pyrenees extend along the northern border of this region, which is extremely mountainous. The highest summits are covered with perpetual snow. The soil of the valleys is fertile, and this is said to be the best-cultivated part of Spain. The orange, the olive, the grape, and cereal grains flourish here. The principal rivers are the Ebro and Llobregat. Among its minerals are copper, cobalt, lead, zinc, coal, sulphur, and marble. Catalonia surpasses every other province of Spain in the importance of its manufactures, the chief products of which are cotton, silk, and woolen fabrics, paper, firearms, cordage, and leather. Catalonia is divided into the provinces of Barcelona, Tarragona, Lerida, and Gerona. The Catalans speak a peculiar language, different from the Castilian, and nearly related to the Provençal. They surpass the other Spaniards in energy and industry. This region was in ancient times a Roman province called *Hispania Tarraconensis*. The Goths and Moors successively became masters of it. In 1137 it was united with Aragon by a marriage of the sovereigns, and in 1460 they both were united with Castile by the marriage of Ferdinand and Isabella. See CATALAN LANGUAGE.

Catal'pa [from the Indian of Carolina]: a genus of trees of the family *Bignoniaceæ*. The *Catalpa bignonioides* and *C. speciosa* (Western catalpa) are indigenous in the Southern and Central U. S., and are planted for ornamental and other purposes in the Northern States and in Europe. They have large cordate and pointed leaves, and showy flowers in open compound panicles. The fruit is a pod which is often a foot long, and usually remains on the tree all winter. The seeds are winged on each side, the wings cut into a fringe. The wood of the Western catalpa is durable, and is used for fence-posts, rails, etc. Revised by CHARLES E. BESSEY.

Catal'ysis [Gr. *κατάλυσις*, dissolution; *κατά-*, down + *λυειν*, loose]: action by contact. The conception came into prominence in chemistry early in the nineteenth century, and for a time what was called the theory of catalysis was accepted by many of the leading chemists. According to this theory certain substances have the power by their simple presence in mixtures, and without being changed themselves, to cause the other constituents of the mixtures to act upon one another. The theory is too elastic to be of service. I. R.

Catamaran' [Tamil, *kaṭṭamaram*, tied tree; *kaṭṭa*, tied + *maram*, wood]: a sort of raft used by the Hindus of the Coromandel coast; formed of three planks or pieces of wood lashed together. The middle piece is longer than the others. The catamaran, which is propelled by a paddle, is used by the people of Madras to maintain communication between the shore and ships where the surf is so violent that ordinary boats are unsafe. A catamaran carrying a sail is also used on the coast of Brazil. The name was also given to the fire-boats prepared by the British in 1804 to destroy the French vessels which Napoleon gathered for the invasion of England; used again to denote any craft with two hulls having their inner sides parallel, however it may be propelled.

Catamar'ca: a province or department of the Argentine Republic; bounded W. by the Andes and Rioja, S. and E. by Cordova, Santiago, and Tucuman, N. by Salta and Bolivia. The western part is mountainous or desert, but elsewhere the soil is fertile, producing grain, cotton, and cattle. Copper is mined in the province. Area, 31,500 sq. miles. Capital, Catamarca. Pop. (1895) 89,645.

Catamarca, San Fernando de: capital of the Argentine province of Catamarca; about 650 miles N. W. of Buenos Ayres (see map of South America, ref. 7–D). Pop. about 7,500.

Catame'nia, pl. [from Gr. *καταμήνια*, menses, monthly; deriv. from phrase *κατὰ μῆνα*, by the month]: monthly sanguineous uterine discharges. They commence in hot climates usually at the age of ten or eleven, and considerably later in colder regions. In a state of health each period commonly lasts from three to six days. The final cessation occurs, with some exceptions, at the age of forty-five or fifty.

Catamount: See Puma.

Catania, kăă-taa'nĕĕ-ăă: a province of Sicily, Italy; bounded E. by the Mediterranean, N. by Messina, W. by Caltanisetta, and S. by Noto. Area, 1,970 sq. miles. The surface is partly mountainous. Among its prominent features is Mt. Etna. Capital, Catania. Pop. (1890) 633,249.

Catania (anc. *Catana*): a city of Sicily; capital of the province of Catania; beautifully situated on the east coast at the foot of Mt. Etna; 31 miles N. N. W. of Syracuse; lat 37° 28′ N., lon. 15° 5′ E. (see map of Italy, ref. 10–G). It presents a noble appearance from the sea, and is internally handsome, being well built, with wide and straight streets, which are paved with lava. Some of the public buildings also are constructed of lava. It has been several times nearly ruined by earthquakes and eruptions of Mt. Etna, but it has risen again with greater beauty and splendor, and is now perhaps the finest city of Sicily. The most remarkable edifices are the cathedral, rebuilt after the great earthquake of 1693; the town-hall; the university, founded in 1445; and the grand Benedictine convent and Church of San Niccolò. Catania has about fifty churches, several hospitals, and a college of arts. In a fine square adjacent to the cathedral is a statue of an elephant formed of lava. The harbor, which was formerly good, has been partly choked by lava from Mt. Etna. This city has manufactures of silk and linen fabrics, and of articles and wares formed of amber and lava. The chief articles of export are grain, wine, silk, olives, manna, figs, soda, and snow from Mt. Etna. The ancient *Catana* was founded by the Phœnicians or Greeks, and was nearly as old as Rome. It was taken by the Athenian general Nicias about 413 B. C., and was an important city under the Romans, who adorned it with magnificent edifices. The remains of an aqueduct, a temple of Ceres, and a large amphitheater are still visible here. Catania was severely injured by earthquakes in 1693, 1783, and 1818. Pop. 98,335.

Catanzaro, kăă-tăăn-zaa'rō (formerly called **Calabria Ulteriore II.**): a province of Calabria, Southern Italy; bounded N. by the province of Cosenza, E. by the Gulf of Taranto, S. by the province of Reggio, and W. by the Mediterranean Sea. Area, 2,307 sq. miles. The soil is fertile and the climate healthy. The chief products are wool, cotton, linen, cheese, butter, hemp, oil, silk, wine, and lumber. Pop. (1890) 455,290. Chief town, Catanzaro.

Catanzaro: a city of Italy; in province of the same name; finely situated on a mountain near the Gulf of Squillace; 33 miles S. S. E. of Cosenza (see map of Italy, ref. 8–G). It has an old castle of the Norman period, a cathedral, a large college, and a royal academy of sciences. Many of its public buildings were destroyed by the earthquake of 1783. Here are manufactures of velvet and of silk and woolen fabrics. Pop. about 29,000.

Cataplasm: See Poultice.

Catapult [Lat. *catapulta*, from Gr. *καταπέλτης*, an engine for hurling missiles, connected with *κατα-πάλλειν*, hurl]: an engine of war used by the ancients for discharging arrows. We are not able, from any descriptions the ancients have left us, to form any exact idea of either the catapult or the ballista. It appears that in the catapult a rope, suddenly freed from great tension, gave impulse to an arrow placed in a groove. There were great catapults, fixed upon a scaffold with wheels, which were used in sieges, and small ones, carried in the hand, which were employed in the field. Originally ballistæ were employed to throw stones, and catapults to shoot darts; but the terms were often confounded by the later Roman writers.

Cataract: an opaque state of the crystalline lens of the eye, of its capsule, or both; called *cataract* because the ancients believed that a kind of opaque veil fell down within the eye, obscuring vision. Cataracts are thus lenticular, capsular, or lenticulo-capsular. Various other kinds are enumerated, such as hard cataract, in which the nucleus of the lens is large; soft cataract, in which the nucleus of the lens is small or wanting; and liquid cataract, in which there is a liquefaction of the cortical matter of the lens. Cataracts are also designated by their color as black, white, amber, etc. A cataract is either partial and stationary, or progressive and becomes complete, and is classified as senile, congenital or juvenile, secondary or complicated, and traumatic. The most common variety of cataract is the ordinary senile cataract, which is rare before the forty-fifth year. It begins in a gradual impairment of vision, and its growth from incipiency to full maturity may consume from one to three years or longer. If the cataract is uncomplicated, the patient can perceive light, and is able to recognize the flame of a candle and indicate the direction in which it is coming. The color of the pupil is dull, gray, or even white, according to the degree of maturity and the hue of the opacity. Often, however, the pupil is dark, and the absolute diagnosis depends upon the use of the ophthalmoscope. One or both eyes may be affected. Congenital cataract appears in the form of a complete or partial opacity of the lens, and is "soft," as all cataracts are which develop under the age of thirty-five. When it is complete, it is often of a bluish-white color. Cataracts of similar color, not congenital, sometimes develop in young people without known cause. The chief varieties of partial congenital cataract are the lamellar, central, and pyramidal cataract—names which describe the character of the opacity. Medical treatment for cataract is useless. Its removal by surgery is of frequent occurrence, and the methods of performing the operation are numerous. Hard cataracts are removed by one or other of the methods of extraction; soft cataracts by linear extraction, the needle operation, or the suction method. The function of the crystalline lens must be supplied by a kind of spectacle, called a cataract glass, and after a successful operation sight is to a great degree restored.

George E. de Schweinitz.

Cataracts, or Waterfalls [*cataract* is from Lat. *cataracta*, from Gr. *καταρράκτης*, deriv. of *καταρραγῆναι*; *κατα*, down + *ῥαγῆναι*, fall, rush; or *καταράκτης*, deriv. of *κατταράσσω*, fall headlong; *κατά* + *ἀράσσειν*, dash]: places of more or less sudden descent in the course of a stream or river, where the water leaps or rushes in its course. All such inequalities are gradually reduced to rapids, and finally destroyed by the action of the river in deepening its channel; hence falls indicate relative immaturity of river-life, or the occurrence of some disturbance in the regular course of river development by which a fall is introduced. Falls of the simplest type are those made in the course of normal valley cutting, as the Shoshone falls (190 feet) in the Shoshone or Snake river of Idaho, where a narrow gorge is cut down through a heavy series of horizontal lava-beds, and the river falls from one bed to another. The Great Falls of the Missouri in Montana plunge over beds of sandstone: in consequence of the geologically recent elevation of the region to a greater height above sea-level than before, the river is cutting a deep valley across the plains, but it has not yet cut back all the hard strata. The small cascades or waterfalls, so numerous in the Appalachian plateau, are of as simple origin, but they occur here only on the smaller streams, as the larger rivers have long ago worn back their falls up-stream to the branching head-waters. All these falls leap from higher to lower levels in valleys of their own making. Other falls leap into valleys made by other processes; thus the lofty falls of the Yosemite valley (Yosemite fall, 1,600 feet, and many of less height) plunge over cliffs in whose formation they have had no share; the Staubbach (900 feet) of Switzerland leaps over a cliff in which it has as yet hardly cut a notch, and is scattered to spray before reaching the bottom. Rjukanfos (900 feet) and other lofty falls of Norway are similar to these. Falls of still another class are those which are formed where rivers deepen their channels and discover the uneven foundation on which the strata of the region lie; thus the several cataracts or rapids of the Nile occur where the river has locally trenched through the weak desert sandstones in which its valley is eroded and found hard crystalline rocks beneath. The uneven distribution of glacial and

river drift has frequently diverted rivers from their former courses by a greater or less distance, and turned them over buried spurs or ledges, where falls are subsequently developed; thus the falls of the Rhine at Schaffhausen (60 feet), the rapids of the St. Lawrence, and all the water-powers of the Merrimack and other New England rivers have been produced. The greatest of such falls is NIAGARA (*q. v.*).

W. M. DAVIS.

Catarrh' [older spellings *cathar*, *catarr*, *cattar*, etc.; from Fr. *catarre*: Ital. *catarro*: Span. *catar* < Lat. *catarrhus*, = Gr. *κατάρρους*, a running down, discharge; *κατά*, down + *ῥεῖν*, flow]: a condition characterized by hyperæmia (or congestion) of the blood-vessels of any mucous surface, with great increase of the proper secretion of the part. Thus there may be catarrh of the nose, the throat, the air-passages, the bowels, the vagina, the bladder, or the urethra; but in popular language "catarrh" designates either a "cold" in general, a "cold in the head," or a chronic catarrh of the posterior nares (nostrils) and throat. Catarrhs in general arise from exposure to cold and wet, and to sudden atmospheric changes. They are most common in persons who are ill-fed, and who are not accustomed to out-of-door exercise, and in children. The latter are especially apt to suffer when they are of the habit called scrofulous, and the long-standing nasal catarrhs of children are generally of this nature. The variety of catarrh known as a "cold" is by no means always easy of cure. The popular belief that "a cold must have its run" has some foundation. Hot foot-baths, laxatives, sedatives, demulcents, mild stimulants, or diaphoretics may, however, prove useful in many cases. Judicious exercise, bathing, and life in the open air tend to overcome the morbid inclination to take cold from which some patients suffer. Chronic catarrh of the posterior nostrils is an obstinate disease, best treated by systematic exercise and attention to other hygienic conditions, and by the use of salt water as a nasal douche. See NOSTRILS AND THEIR DISEASES, and THROAT DISEASES.

Catarrhi'ni [from Gr. *κατά*, downward + *ῥίς*, gen. *ῥινός*, nose]: a collective name for the apes and monkeys of the Old World, on account of the narrowness of the nasal septum and the consequent downward direction of the nostrils: the character shared by man also, but not found in the New World monkeys, in which the septum is very broad.

Catasau'qua: borough of Lehigh co., Pa. (for location of county, see map of Pennsylvania, ref. 5–I); situated at junction of Cat. and Fog., N. J. Cent. and Leh. Val. R. Rs.; on Lehigh river; 3 miles N. of Allentown. Catasauqua has 10 churches, 14 schools, electric lights, water-works, machine-shops, rolling-mills, 5 blast-furnaces, 2 silk-mills, horseshoe works, and car-works. Pop. (1880) 3,065; (1890) 3,704; (1900) 3,963. EDITOR OF "DISPATCH."

Catastomidæ: same as CATOSTOMIDÆ (*q. v.*).

Catastrophe [Gr. *καταστροφή*, overturning, sudden turn, close; *κατά*, down + *στρέφειν*, turn]: the final event of a drama or romance, to which the other events are subsidiary; a disastrous revolution or event; a calamity; an unfortunate conclusion. The term is used by geologists to denote a violent convulsion or physical revolution, causing the elevation or subsidence of portions of the globe, and the destruction of large tribes or multitudes of animals.

Catawba: the name of an excellent wine of a rich muscadine flavor; produced in various parts of the U. S. It is made of the Catawba grape (*Vitis labrusca*), which originated probably near the Catawba river in North Carolina. This grape, which is highly esteemed for eating, is red or copper-colored. The first person who cultivated it extensively for wine was Nicholas Longworth, of Cincinnati, whose vineyards covered the southern slopes of the hills in the environs of that city. The Catawba grape flourishes in the Middle, Southern, and Western States. A large quantity of this wine is produced in the Ohio valley, the climate and soil of which are especially adapted to the culture of the grape. The best sparkling Catawba is considered nearly equal to champagne.

Catawba, or **Great Catawba**: a river which rises in McDowell co., N. C.; flows nearly eastward to Iredell County. It afterward runs southward into South Carolina, and forms the E. boundary of York and Chester Counties. Below Rocky Mount it is called the Wateree, which unites with the Congaree to form the Santee, their outlet to the Atlantic Ocean. The Little or South Catawba enters the Catawba on the W., a few miles above Charlotte, N. C. Its length from its source to Rocky Mount is 250 miles.

Catawba Indians: See SIOUAN INDIANS.

Catawissa: borough; Columbia co., Pa. (for location of county, see map of Pennsylvania, ref. 4–H); situated at the mouth of Catawissa creek; on the east bank of the north branch of the Susquehanna river, and on the Pa., Phil. and Read. and Del., Lack. and West. R. Rs.; 150 miles from Philadelphia. It has fine schools and churches of four denominations. The principal industrial establishments are fiber and paper mills, machine-shops, a foundry, shoe-factory, and a novelty manufactory. There is a good system of water-works. The original grant for Catawissa was from the proprietaries of Pennsylvania to the Shippen brothers Feb. 14, 1770. It was then known as "Catawassey or Lawpaughpeton's [an Indian chief] Town," and the grant covered 282¼ acres. In 1778 William Hughes acquired title to 92¼ acres of the tract, which he plotted and sold in town lots. The town was incorporated into a borough in Dec., 1892. Pop. (1880) 1,427; (1890) 1,809; (1900) 2,023.

EDITOR OF "NEWS ITEM."

Cat-bird (*Galeoscoptes carolinensis*): a song-bird common in the U. S.; of the family *Turdidæ*; related to the mocking-bird, which it resembles in its vocal powers. It derives its common name from a note or cry which it utters. It occurs in the Middle States as a summer bird of passage, and breeds in gardens or in the vicinity of dwelling-houses. The color of its upper plumage is dark gray or slate-color, the head is black, and there is a conspicuous reddish patch on the under-tail coverts. It is serviceable to man in devouring insects and worms. It sometimes imitates the song of other birds, and is remarkable for its boldness and vivacity.

Catchfly: a popular name for many species of *Silene*; a genus of pinkworts (*Caryophyllaceæ*). The name refers to the fact that insects are frequently caught in the viscid exudation from certain belts upon the stems.

CHARLES E. BESSEY.

Catean-Cambresis, or **Le Catean**, le-kăă'tō': a town of France; department of Nord; on the river Selle; 14 miles E. S. E. of Cambrai (see map of France, ref. 2–F). It is well built, and was formerly fortified. It has manufactures of shawls, merinoes, and calicoes. The important treaty of Cateau-Cambresis was concluded here between Henry II. of France and Philip II. of Spain, in 1559. Pop. (1896) 10,451.

Catechet'ical Schools: a name given to the ancient Christian schools of theology, of which the principal were those of Alexandria (160–400 A. D.) and Antioch (from 290 A. D. through the fifth century). The most noted teachers in the great school of Alexandria were Clement and Origen.

Catechism [from Lat. *catechis'mus*, as if from a Gr. **κατηχισμός*, cf. *κατήχησις*, instruction by word of mouth; *κατά*, down, thoroughly + *ἠχεῖν*, ring, sound]: an arrangement of questions and answers, generally designed to teach religious doctrine to the young. Catechetic instruction has long prevailed among the Jews, and in the early Christian Church the *catechumens* (or persons receiving instruction preparatory to baptism) constituted, according to several of the Fathers, a separate order in the membership of the Church. This order comprised both the children of believers and adults from heathen society who desired admission into the Church. What would now be called catechisms were used to some extent in those remote times. Catechisms were used in the Middle Ages by the Waldenses, and later by the Bohemian Brethren. It has been said that the catechisms of Luther (1518–29) were the first which received this name, but this point is not quite certain. The Roman Catholic Church had long used catechisms, though called by other names. Kero of St. Gall in the eighth century prepared one of the earliest in the German language. The principal catechisms of later times have been those of Luther (the Exposition of 1518, the Catechism of 1520, the Smaller and Larger Catechism of 1529), still extensively used in the Lutheran Church; Calvin's catechisms, the Smaller and Larger (1536–41); the Heidelberg Catechism (1563) (Reformed); that of Œcolampadius (1545); of Erasmus (1547); of Leo Judæ (1553); the Tridentine Catechism (1566), a standard in the Roman Catholic Church; the Anglican catechisms—the Larger (Latin, 1570), the Shorter or Middle Catechism, and the Smaller, which, with a few changes, is published in the Book of Common Prayer; the

British Presbyterian catechisms—the Shorter (1647) and Larger (1648), which, with the Westminster Confession (1646), are standard books with most Presbyterian churches in the U. S. and Great Britain. The Greek Church has the *Orthodox Confession of the Eastern Church* (1643), by Peter Mogilas, metropolitan of Kieff, the father of Russian theology; while its subdivision, the Russian Church, has a *Primer for Children* (1720) and a "Shorter" and "Longer Catechism" (1839). Besides these may be mentioned the three Wesleyan catechisms prepared by Richard Watson, and the three Methodist Episcopal Church catechisms (New York, 1852). The number of symbolical or authorized standard catechisms of the various churches is quite large, besides an immense number of private or unauthorized works of the kind. P. Schaff, *History of the Creeds of Christendom* (3 vols., New York, 1876), gives much information upon the general subject. Revised by S. M. Jackson.

Cat'echu: an extract which is obtained from the wood of *Acacia catechu*, according to the U. S. Pharmacopœia, or from the leaves and young shoots of *Uncaria gambir*, according to the British Pharmacopœia, which has entirely substituted the latter drug for true catechu. True catechu, such as is most commonly employed in the U. S., is derived chiefly from the East Indies, and comes in masses of various shapes, sometimes in balls or in flattened pieces, or in sausage-shape circular cakes with irregular edges. Its color is rusty brown and its hue may be light or dark. It is without odor, but has an astringent, bitter taste, which is also slightly sweet. Very frequently it contains a large amount of contaminating material, such as small pieces of wood and sand. It also contains an extractive which is called catechin. The source of true catechu is a tree, varying from 30 to 40 feet in height, which bears pale-yellow flowers arranged in dense cylinder-like spikes, about 3 inches in length. The wood of this tree is very heavy and durable, and contains a dark heart-wood which is reddish brown or blackish brown in color. This heart-wood, having been cut into chips, is boiled in water until the decoction thereby obtained is sufficiently strong, when it is strained and evaporated until the watery extract is of such a consistency that when poured into a mould it hardens into the irregular cakes we have described. Catechu is used in medicine for the purpose of producing an astringent effect in cases where there is relaxation of the mucous membranes, particularly of the stomach and intestines, and has been most largely used probably in the treatment of serous or watery diarrhœa, under which circumstances it is generally administered in the dose of one or two teaspoonfuls of the preparation, which is official in the U. S. Pharmacopœia under the translated name of compound tincture of catechu. The drug has also been used in the form of an infusion as an injection in the treatment of leucorrhœa, gleet, and other inflammations of the mucous membrane of the genito-urinary tract, and has been employed as a gargle and mouth-wash in the treatment of spongy gums, relaxation of the soft palate and uvula, and in chronic sore throat. The name is derived from Malay *cachu*.
H. A. Hare.

Catechumens: See Arcani Disciplina and Baptism.

Cat'egory [from Gr. *κατηγορία*, accusation, assertion; deriv. of *κατηγορεῖν*, accuse]: In philosophical terminology the categories are the ultimate classes in which all objects of knowledge can be systematically arranged. Philosophy and science, acknowledging the impossibility of knowing all things individually, reduce objects to classes: and when we gain knowledge of the class, we have a formal or general knowledge of its constituent objects. This attempt to render knowledge in some sense universal has been made in the philosophy of all ages, and has given rise to various systems of categories—literally, things that may be affirmed. Aristotle seems to have been the first of the Greeks to make anything like a complete classification of them. He makes them ten in number—viz., substance, quantity, quality, relation, place, time, position, possession, action, passivity. This system was unquestioningly received for a long time, but modern criticism has shown that there may be many predicates which could not be contained in any of these categories. Accordingly, Kant and others have attempted to make better classes. Kant makes twelve categories, in four classes of three species each—viz., singularity, plurality, and universality; reality, unreality, and indefiniteness; substance, dependence, and reaction; possibility, existence, and necessity. Various other arrangements have been proposed, but criticism has shown that thus far, perhaps, none is perfect. It is remarkable that the categories of the Hindu philosopher Kanâda are almost identical with those of Aristotle. Kanâda probably lived before the time of Aristotle. See Max Müller's paper on *Indian Logic*, appended to Archbishop Thomson's *Laws of Thought*.

Cate'na [Lat., chain > Fr. *chaîne*, whence Eng. *chain*]: in biblical literature a commentary made up of selections from various writers. The number of catenæ is very considerable, and some are of great antiquity. Perhaps the most celebrated is the *Catena Aurea* (i. e. Golden Chain) of Thomas Aquinas.

Cat'enary [from Lat. *catenā'rius*, pertaining to a chain (*cate'na*)]: the curve formed by a cord or flexible chain of uniform density and size when suspended or allowed to hang freely from two fixed points. This curve was first noticed by Galileo, but he imagined it to be the same as the parabola. Its true nature was first demonstrated by James Bernoulli. It has several remarkable properties, one of which is that its center of gravity is lower than that of any curve of equal perimeter and with the same fixed points for its extremities. It is interesting on account of the light it throws on the theory of arches, and by reason of its application to the construction of suspension bridges.

Caterina da Siena, Santa (*St. Catherine of Sienna*): an Italian saint and writer; b. in Siena, Mar. 25, 1347; she was the twenty-third child of the dyer, Giacomo Benincasa; early inclined to a mystical religious life, and showed herself to belong to the tradition which St. Francis of Assisi represented in the preceding century. She joined the Dominican nuns, and gave herself up to asceticism. As time went on, however, her horror at iniquities in Church and state led her to mingle in the most important affairs. She appeared at Avignon before the consistory (1376) to demand reform and the return of the pope to Rome. The next year she went to Florence as Gregory XI.'s ambassador to reconcile the Florentines to him. In 1378, at Pope Urban's request, she went to Rome to live. There she died Apr. 29, 1380. In 1461 she was canonized, and Apr. 30 was made her day. We have from her a collection of 373 letters, and a tractate later given the title *Dialoghi della Serafica Santa Caterina da Siena*, probably composed in 1378. We have further a series of twenty-six prayers. See her *Opere* (5 vols., Lucca and Siena, 1707–17); *Le Lettere* (ed. N. Tommaseo, 4 vols., Florence, 1860); K. Hase, *Katherine von Siena, ein Heiligenbild* (Leipzig, 1864); M. A. Mignaty, *Cathérine de Sienne, sa vie et sa rôle dans l'Italie du 14e siècle* (Paris, 1886); É. Gebhart, *L'Italie Mystique* (1890). A. R. Marsh.

Caterpillar: See Entomology.

Catesby, kayts'bi, Mark, F. R. S.: naturalist; b. in England in 1679. He visited the U. S. and the Bahamas in 1712–19 and 1722–26, during the war between the Carolinians and the Catawbas on the one side and the Tuscaroras on the other, and after his return to England published a *Natural History of Carolina, Florida, and the Bahama Islands*, with colored figures drawn and etched by himself; also *Hortus Britanno-Americanus*, and work on the fauna of the isle of Providence. D. in London, Dec. 23, 1749.

Catfish: any one of several species of *Siluridæ*, so called in allusion to the presence of long fleshy barbels about the mouth, suggesting the whiskers of a cat. All the catfishes are scaleless, and have stiff spines in the dorsal and pectoral fins. They are among the most conspicuous inhabitants of sluggish streams and ponds in the regions they inhabit. See Siluridæ and Wolf-fish. D. S. Jordan.

Catgut: a material employed for the strings of violins and other musical instruments, for the cords used by clockmakers, for bow-strings, fishing-lines, and for belt-stitching in mills, etc. It is generally prepared from the intestines of sheep, and sometimes from those of the horse and ass. It is prepared by an elaborate process, and preserved from putrefaction by treating it with a dilute solution of alkali. The best violin-strings are manufactured in Italy, and are called Roman strings. Catgut is much used in surgery for suturing wounds. Revised by H. A. Hare.

Ca'tha: a genus of plants of the family *Celastraceæ*. The *Catha edulis*, which the Arabs called *khât*, is a shrub; a native of Arabia; has narcotic and stimulating leaves, which are eaten by the Arabs. They also make a decoction of the leaves, which is used as a beverage.

Cath'ari [from Gr. *Καθαροί*, the pure (ones)]: a name applied at different times to various sects of Christians, such

as the Novatians of the third century, and to the Paulicians, who in Thrace were known as Bogomili, to the Albigenses, Patarenes, Waldenses, and others in the twelfth century. The name is analogous to "Puritans," and was apparently in some cases assumed, and in others ironically conferred in consequence of their professed aim at greater purity of life than was ordinarily attained. The Cathari proper were Dualists, and were perhaps of Slavonic, possibly of remote Gnostic, origin. They appeared in Italy in the eleventh century, and attained their greatest prosperity in Southern France, where they were confounded with the Albigenses, and were exterminated with them in the thirteenth century. The strict Cathari held no property, abstained from marriage, war, and the killing of animals, and rejected water-baptism. See S. R. Maitland, *Facts and Documents on the History of the Albigenses and Waldenses*, and Schmidt, *Histoire et Doctrine de la Secte des Cathares* (Paris, 1849).

Catharine Archipelago: See ALEUTIAN ISLANDS.

Catharine (Russ. *Ekaterina*) **I.**: Empress of Russia; b. of poor parents at Ringen, near Dorpat, in Livonia, Apr. 15, 1684; at first bore the name of Martha; brought up by a Lutheran pastor in Marienburg. Her first husband was a Swedish dragoon. She was taken a captive by the Russians in 1702; became the mistress of Prince Menschikoff; then of the Emperor Peter the Great, who married her in 1707, and avowed it 1711. Peter, having invaded Turkey in 1711, was reduced, it was once said, by want of provisions to a critical position, from which he was extricated by Catharine, who bribed the Turkish vizier, but the story lacks evidence. She was crowned as empress in 1712, and on the death of Peter in 1725 was acknowledged as empress; was sustained by Menschikoff; fell into dissolute practices. D. May 17, 1727. Her daughter Elizabeth became empress.

Catharine II.: Empress of Russia; b. at Stettin, May 2, 1729; daughter of the Prince of Anhalt-Zerbst. She was married in 1745 to Peter, a nephew and heir of Elizabeth, Empress of Russia. They soon quarreled and became estranged from each other. On the death of Elizabeth in 1761 he ascended the throne as Peter III. In July, 1762, he was assassinated by conspirators, of whom Catharine was probably an accomplice, and she assumed sovereign power, for which she was qualified by superior talents; but she was a woman of very dissolute character. She administered the government with energy and success, and increased both the extent and power of the empire. She co-operated with Austria and Prussia in the partition of Poland in 1772, and in the second partition of 1793. The Russians were victorious in a war against the Turks, which was ended by the treaty of Kainardji in 1774. Her principal paramour was POTEMKIN (*q. v.*). She was a liberal patron of scientific men. D. Nov. 17, 1796, and was succeeded by her son, Paul I. "Her capacity," says Lord Brougham, "was of an exalted order. Her judgment was clear and sure. The history of princes affords few examples of such force of character on a throne perverted to the working of so much mischief." (*Statesmen of the Time of George III.*) See Tooke, *History of Catherine II.* (1803); Castera, *Vie de Catherine II.* (1796); Tannenberg, *Leben Catherinens II.* (1797).

Catharine de' Medici, dĕ-med'i-chē [Fr. *Catherine de Médicis*]: Queen of France; b. in Florence in 1519. She was a daughter of the Duke of Urbino, who was a nephew of Pope Leo X. She was married in 1533 to a son of Francis I. of France, who ascended the throne as Henry II. in 1547. On the death of her son Francis II., in 1560, she became regent of France during the minority of Charles IX., who was her son. She was ambitious, crafty, perfidious, and made bad use of her power. Her intrigues promoted the civil or religious war by which France was for many years afflicted. She also appears to have been one of the instigators of the massacre of St. Bartholomew, Aug., 1572, though the exact extent of her participation is uncertain. D. at Blois, Jan. 5, 1589. See Eugenio Alberi, *Vita di Caterina de' Medici* (1834); La Ferrière's *Lettres de Catherine de Médicis* (Paris, 1880–85).

Catharine Howard: See HOWARD, CATHARINE.

Catharine of Aragon: Queen of England; daughter of Ferdinand and Isabella of Castile; b. Dec. 5, 1485. In 1501 she was married to Arthur, who was the eldest son of Henry VII. of England, and who died in 1502. She was married in 1509, under a papal dispensation, to Arthur's brother, Henry VIII., who was six years younger than herself. She gave birth in 1516 to a daughter, Mary, who alone survived of five of her children and became queen. The king, who had conceived a passion for Anne Boleyn, about 1527 expressed doubts of the legality of his marriage with Catharine, and applied to the pope for a divorce. The disagreement between the pope and Henry VIII. on this subject was one of the causes of the prevalence of Protestantism in England. Cranmer declared the marriage void in 1533; she went to live at Ampthill, in Bedfordshire, and then at Kimbolton Castle, Huntingdonshire, where she died Jan. 7, 1536. See CRANMER and HENRY VIII.

Catharine of Braganza: the queen of Charles II. of England; b. in 1638; daughter of John IV. of Portugal; brought in dower Tangiers and Bombay. She had been religiously bred, and the licentious customs of the English court she found strange. After the death of Charles (1685) she returned to Portugal in 1693, and was made regent by her brother Pedro in 1704. D. Dec. 31, 1705.

Catharine of Valois, văl wăă': queen of Henry V. of England; daughter of Charles VI. of France; b. Oct. 27, 1401. Her hand, together with the right of succession to the French throne, was given to Henry by the treaty of Troyes. After the death of the king, Catharine became the wife of Owen Tudor, a Welsh gentleman, and from them the Tudor dynasty was derived. D. Jan. 3, 1437.

Catharine Parr: sixth wife of Henry VIII. of England; b. in 1512. She was married to Edward Borough, and then to Lord Latimer; after his death became in 1543 the queen of Henry VIII. She was a woman of considerable learning and no little tact. After the death of the king she was married to Sir Thomas Seymour. D. Sept. 30, 1548.

Catharine, SAINT: a legendary character, said to have been an Alexandrian of noble descent; put to death in 307 on a wheel by Maximinus for confessing Christ at a public sacrificial feast. Her festival falls on Nov. 25. The legend further credits her with the conversion of many scholars who tried to win her back to paganism, and with a heavenly vision in which she was betrothed with a ring to Christ, a theme favorite to artists, who represented Christ as in infant form. Some think a basis of these legends is to be found in the story of HYPATIA (*q. v.*) of Alexandria.

Cathar'tes au'ra: same as TURKEY-BUZZARD (*q. v.*). See also CATHARTIDÆ.

Cathar'tics: drugs which possess the power of producing active movements of the bowels with copious fecal dejections. Some persons employ the term cathartic as equivalent to purgative, but a cathartic is a drug which has more powerful effects than the average purgative has. Jalap is a typical cathartic when given in ordinary dose, while castor oil or an ordinary amount of Epsom salts, or of sulphate of magnesia represents what might be called purgatives. Nearly all cathartics act upon the bowels in two ways: first, by stimulating or irritating its mucous membrane, and, second, by causing a reflex irritation of the nerves and nervous centers governing peristalsis, which are chiefly found in connection with the so-called splanchnic nerves. Catharties, as a rule, are to be employed only in cases where there is obstinate constipation, or in instances where it is considered necessary to cause a determination of blood from other parts to the abdominal cavity, or again when it is desired to remove dropsical swellings by producing large watery movements.

Cathar'tidæ [derived from Gr. καθαρτής, cleanser, i. e. by consumption of the unclean, in allusion to the scavenger habits of the group]: a family of *Accipitres* containing the condor, turkey-buzzard, and other vultures of the New World. They have the head and neck bare and sometimes carunculated, the wings long and ample, the inner toe small and on a level with the other toes, the nails blunt, the oil gland without a tuft, and the nostrils not separated by an imperforate bony septum. Other technical characters separate these birds widely from the vultures of the Old World, with which they were formerly associated, while these latter birds are now placed in the family *Falconidæ*, with the hawks and eagles. See CONDOR, KING VULTURE, and TURKEY-BUZZARD. F. A. LUCAS.

Cathar'tin is the supposed active principle in senna. It can be isolated as a yellowish-red uncrystallizable substance, which is deliquescent, and has a very bitter taste, a characteristic odor, and purging powers, causing nausea and griping. Three grains of cathartin are a full dose. It is not much used, and is perhaps not a definite compound. The same name is given to a purgative principle obtained from buckthorn berries.

Cathay′, or **Kathay′**: the name by which China was known to Europeans during the Middle Ages. In its Oriental form, *Khitai*, it is applied to China by all or nearly all the nations which know it from the direction of Inner Asia, including the Russians, the Persians, and the nations of Turkistan, yet it originally pertained to a people who were not Chinese. The Khitán or Khitát were a nation allied (it is supposed) to the modern Tungnses, whose chiefs, after making themselves supreme over all the tribes from the Sea of Korea to the Altai, in the early part of the tenth century overran the Chinese provinces N. of the Yellow river, and established their empire over them also, under the name of Liao or the *Iron* dynasty. This Khitán empire subsisted for two centuries, terminating in 1123, when it was in turn subverted by a new invasion from the N.

The Nyuché, or Chúrché, a tribe akin to the modern Manchus, displaced the Khitán, and reigned under the name of Kin or *Golden* dynasty. They about a century later (1214–34) were displaced by those more famous warriors, the Mongols of Chinghiz Khan. The conquest of the Kin empire was completed by Okkodai, the son of Chinghiz; but not till the third generation, and sixty years after the capture of Peking, was the Mongol conquest extended over Southern China, in the reign of Kublai. This southern empire, under its Chinese sovereigns holding their royal residence (*King-szé*) at the great city now called Hangchow, was known to the northern conquerors as *Mantzi*, a name often exchanged or confounded by Western Asiatics with *Máchín*—i. e. the Hindu *Mahá-Chín* (Great China).

The flood of Mongol conquest spread westward as well as eastward, leveling all political barriers, sweeping over Slavonic Europe, and threatening Christendom with annihilation. And when Western Europe had recovered from the alarm of this brief but terrible invasion (1240–42), Asia lay open as it never did before or has done since, and the accidents of war, commerce, and opportunity carried a number of persons in various ranks of life, and from almost every country in Europe, to its remotest regions. Missions also went to the Tartar courts from the pope and the princes of Europe, and among others John of Piano Carpini (1245–47), a native of Umbria, and William dé Rubruquis (1253), a Frenchman, both Franciscan monks of superior intelligence, who have left us narratives of high interest. And these brought to Western Europe the revived knowledge of a great and civilized nation occupying a country in the extreme East, on the shores of the ocean, which bore the name, then first heard in Europe, of Cathay. Rubruquis was acute enough to discern that these Cathayans must be the Seres of classic fame.

The first actual European visitors to Cathay of whom we know are the Polos (see Polo, Marco), regarding whom we need say nothing here. But just as they were reaching Venice (1295) after their absence of twenty-six years, the forerunner of a new band of travelers was entering China by the route of the Indian seas. This was John of Monte Corvino, another Franciscan, who was plunging into the ocean of paganism to preach the gospel. After years of uphill work, others joined him, and the Catholic mission flourished at Cambaluc, or Peking, under the patronage of the Great Khan himself. Friar John was made archbishop in Cambaluc with patriarchal authority, churches and houses of St. Francis were founded at Yangchow (on the Grand Canal), at the great ocean-port in Fuh-kien which the Westerns called Zayton and the Chinese called T'swanchow, and elsewhere. Among the monks whose duty carried them to Cathay during the interval between 1300 and 1328, several have left letters or narratives. We have letters from the archbishop himself (1305–06); a letter from Andrew, Bishop of Zayton (1326); and the narrative of Friar Odoric.

The narrative of Odoric is the only one that mentions Canton, known to him and the Westerns of that age by the name of Chín-kalán (i. e. Great China, a Persian rendering of the Indian Mahá-chín). He landed there on arriving from India, and describes it as a city as big as three Venices, standing on a great river, one day's voyage from the sea. Thence he traveled through Fuh-kien, visiting the cities of Zayton and Foochow, and then to Cansay or Kinsay (*King-szé*—i. e. Hangchow), the vastness of which in extent, population, and wealth made the same extraordinary impression upon him as upon Marco Polo and all the travelers who speak of it. Several of the stories told by Odoric that were probably regarded as fictions by his contemporaries are remarkably characteristic of China.

But the exchange had its emissaries at this time to Cathay as well as the Church. This commercial intercourse can not have begun till some years after 1300. For Monte Corvino, writing in 1305, says that he had not heard any news for twelve years. Yet even on his first entrance into China, Friar John had been accompanied by "Master Peter of Lucolongo, a faithful Christian man and a great merchant," who purchased a piece of ground for the mission-church opposite the palace gate at Peking. Twenty-one years later Bishop Andrew, of Zayton (1326), quotes the opinions of the Genoese merchants at that great mart touching a question of exchange value. Odoric, dictating his travels in 1330, refers for corroboration of the marvels of Kinsay or Cansay to the many persons at Venice who had themselves been witnesses of all that he asserted.

But the most distinct and notable evidence is to be found in the work of Francesco Balducci Pegolotti, written about 1340, the first two chapters of which are devoted to information for the merchant bound to Cathay. Particulars are given as to the investments and exchanges proper to the journey, and especially as to the paper money then forming the currency of China. The extent of dealings contemplated may be judged from the example, which the author assumes for illustration, of a merchant carrying goods to the value of some 25,000 gold florins (say $60,000). Little was to be taken to Cathay except silver in ingots, and the purchases contemplated there were silk and rich silk textures.

A striking feature of this early intercourse was the facilities of movement allowed to foreign visitors in the interior. But it was not of long duration. As the Mongol chiefs in Central and Western Asia one after another adopted Islam, the power of bigotry revived, and with it the old obstacles. Thus already in 1339 we find a merchant, William of Modena, along with certain friars, put to death for the faith at Almalik. About the middle of the century the house of Chinghiz in China began to totter, and its fall in 1368 closed all communication with the Western World. The last notices we possess are contained in a work (strange to say) on Bohemian history by John Marignolli, a Florentine monk who had been sent as envoy to the last of the Mongol emperors by Pope Benedict XII. He had gone by the usual land-route, and after spending about four years (1342–46) at Peking, returned by the sea-route to India, on his way visiting Ceylon, where he was wrecked. In 1370, the pope, probably in ignorance of the changes in the East, nominated one Friar William of Prato to be archbishop of Cambaluc, but we know not if he ever reached his see. He certainly can not have succeeded.

With the downfall of the Mongol dynasty in China, this curious phase of history came to a close. The new and native rulers reverted to the old policy, and kept all foreigners at arm's length, while Mohammedanism entirely recovered its grasp over Middle Asia, and the Nestorian Christianity, which had acquired considerable sway, as rapidly dwindled and expired. A dark mist descended on the further East, covering Mantzi and Cathay, with those cities of which the mediæval travelers had told such wonders, *Cambaluc* and *Kinsay*, *Zayton* and *Chín-kalán*. And when the veil rose, a century and a half later, before the Portuguese and Spanish navigators, those names were heard no more. In their stead men spoke of *Peking* and *Hangchow*, of *Chinchew* and *Canton*. Gradually new missionary priests went forth from Rome—Jesuits now. New converts were made, and new vicariats were constituted; but the old Franciscan churches, and the Nestorianism with which they had battled, had disappeared. In time, however, slight traces of the former existence of Christian churches came to the surface; and when Marco Polo's book was read by intelligent men, one and another began to suspect that his Cathay and the new China were identical.

But it was a very long time before this was thoroughly or generally understood. Cathay had been the aim of the first voyage of the Cabots in 1496, and it continued to be the object of many adventurous voyages, English and Dutch, to the N. W. and N. E. till far on in the sixteenth century. At least one memorable land-journey also was made by Englishmen, of which the investigation of trade with Cathay was a chief object—that in which Anthony Jenkinson and the two Johnsons reached Bokhara by way of Russia in 1558–59. The country of which they collected notices at that city was still known to them only as *Cathay*, and its great capital only as *Cambaluc*.

Cathay as a supposed separate entity may be considered to come to an end with the journey of Benedict Goës, a lay Jesuit, who had been sent through Central Asia in 1603 to determine whether the Cathay of old European

writers and of modern Mohammedans was or was not a distinct region from that China of which parallel marvels had now for some time been recounted. He died at Süchow, the frontier city of China, but not before he had ascertained that China and Cathay were one. See CHINA. H. YULE.

Cathcart', WILLIAM SHAW, Earl of: general and diplomatist; b. in Petersham, England, Sept. 17, 1755; educated at Eton and University of Glasgow; served in the Revolutionary war of the American colonies as an officer of dragoons, and as an aide to Sir Henry Clinton; commanded Tarleton's British Legion; wounded at Brandywine and Monmouth; returned from the siege of Charleston, 1780, to England; joined the Walcheren expedition, 1793, as brigadier-general; became a major-general in 1794; was sent on a mission to the court of Russia in 1805. He commanded the land forces which, with the aid of the fleet, captured Copenhagen in 1807. In 1813 he was sent as ambassador to St. Petersburg. He was raised to the rank of earl in 1814. D. near Glasgow, June 16, 1843.

Cathedral [from Med. Lat. *cathedra'lis*, pertaining to the bishop's chair, deriv. of *ca'thedra* = Gr. καθέδρα, seat; Lat. *cathe'dra* > Fr. *chaire*, whence Eng. *chair*]: the principal church of a diocese, containing the bishop's throne or *cathedra*. The cathedral is usually, though not invariably, the most imposing religious edifice in the diocese. Gothic architecture received its chief impetus and development in the designing of cathedrals and abbeys, and in the course of the Middle Ages evolved from the early Christian basilica the typical cathedral, with its nave, transepts, and choir, three-aisled or five-aisled; with or without exterior chapels; with its towers and spires, its lofty clerestory, and its ribbed vaulting of stone. The English cathedrals are noted for their extreme length, square easterly termination, rich vaulting, and, in some cases, their secondary transepts. Among them may be mentioned Durham, Peterborough, Lincoln, and Ely, begun in the Norman period (eleventh and twelfth centuries); Canterbury, Salisbury, and York, principally belonging to the thirteenth and fourteenth centuries; and Winchester, rebuilt in the fifteenth century. Among the French cathedrals, which differ from the English in being shorter, much loftier, and broader (having often four side aisles besides chapels), and in their apsidal easterly terminations encircled by chapels and called *chevets*, the most important are those of Notre Dame at Paris, begun under Philippe Auguste; Chartres, celebrated for its stained glass and its majestic simplicity; Rheims, Rouen, Bourges, Sens, Troyes, Beauvais, and Amiens, the last named being the largest of all, 133 feet high, and covering 70,000 sq. feet. In Germany the most magnificent is that at Cologne, completed in 1883, nearly 640 years after its commencement. It is 511 feet long, with two towers 500 feet high at the western end. In Italy the Duomo at Florence, begun by Arnolfo di Cambio (or di Lapo) in 1298, and completed by the erection of its colossal dome in 1444 by Brunelleschi, is, with one exception, the largest Gothic cathedral, covering 84,000 sq. feet, the cathedral of Milan alone exceeding it with its area of 107,000 feet.

The Renaissance produced the cathedral, or more properly the basilica, of St. Peter at Rome, the greatest of all churches, 602 feet long internally, and covering 240,000 sq. feet, and the Cathedral of St. Paul at London, Wren's masterpiece. Both are domed structures. St. Peter's is not, strictly speaking, the cathedral of Rome, this distinction belonging to the ancient basilica of St. John Lateran. In the U. S. the most important cathedrals are St. Patrick's (Roman Catholic) and the Protestant Episcopal Cathedral of St. John the Divine, both in New York. The corner-stone of the latter was laid Dec. 27, 1892.

A. D. F. HAMLIN.

Cathelineau, kăă'te-lĕĕ'nō', JACQUES: Vendean general; b. at Pin-en-Mauge, Jan. 5, 1759; a linen merchant; at the outbreak of the Vendean revolt in 1783 he put himself at the head of a small band of royalists, and soon became famous for his talents and success. After the victory at Saumur, June 13, 1793, he was made general-in-chief, but was mortally wounded in the attack on Nantes, June 29, and died July 11.

Catherine: See CATHARINE.

Catherine of Alexandria, SAINT: See CATHARINE.

Catherine of Sienna, SAINT: See CATERINA DA SIENA.

Catherine, SAINT (of Sweden): See BIRGITTA, SAINT.

Cath'eter [from Gr. καθετήρ, anything let down into, deriv. of καθ-ιέναι, let down]: a surgical instrument used for insertion into mucous canals, particularly the urinary passage or urethra. Catheters made of metal have been found among relics of primitive peoples, and have been in use among civilized nations for many centuries. The ordinary urinary catheter differs somewhat for the two sexes. That used for the male being 10 to 12 inches in length, and having a sharp arc or curve at the end; that for the female being from 4 to 6 inches in length, and having but a slight curve. The caliber varies considerably, but is usually from $\frac{1}{5}$th to $\frac{1}{3}$d inch in diameter. The catheters in ordinary use are made of silver or of rubber. The latter may be either entirely flexible or somewhat rigid, and their form may be determined by a stylet of wire which can be withdrawn after insertion of the instrument. Many varieties of catheters have been devised for use in special diseases. Œsophageal, Eustachian, aural, nasal, uterine, and rectal catheters of various forms are in use in the treatment or investigation of diseases.

Cathion: See KATHION.

Cathode: See KATHODE.

Catholic Apostolic Church: a body of Christians popularly known as the **Irvingites**; followers of the Rev. EDWARD IRVING (*q. v.*), who died in 1834. They are distinguished by their claim to the exercise of the spiritual gifts enumerated in 1 Cor. xii., such as prophecy, unknown tongues, and the miraculous healing of disease. They receive the Apostles', the Nicene, and the Athanasian creeds. They are further distinguished by their claim to possess the fourfold ministry of apostles, prophets, evangelists, and pastors, mentioned in Eph. iv., and have in addition deacons, under-deacons, and deaconesses. Each church is under the rule of a bishop (or angel, as he is termed). Their ritual is very full and impressive, combining many features of those of other branches of the Christian Church. The movement originated in London in 1830, and churches have been established throughout Christendom. They deny that they are a sect, and have taken the name of the Catholic Apostolic Church only because it is the common heritage of Christians generally. They lay great stress upon the immediate personal coming of Christ, but are not on this account to be confounded with the Second Adventists, notwithstanding that they have been disappointed in that Christ has not come as soon as they expected. Their churches are supported by tithes and offerings, the payment of which is a matter of conscience. See the Liturgy of this church and E. Miller, *History and Doctrine of Irvingism* (2 vols. London, 1878).

SAMUEL MACAULEY JACKSON.

Catholic Church [*catholic* is from Gr. καθολικός, universal, deriv. of phrase καθ'ὅλου, on the whole, as a whole]: is not found in ancient Greek, but is first used by Polybius (*Hist.* vi. 5. 3) in the sense of "general"; first used of the Church by Ignatius of Antioch (*Ad Smyrnæos*, chap. viii.). The phrase Catholic Church is equivalent to "universal church," and can not properly be limited to any particular sect or body. It was once employed to distinguish the Christian Church from the Jewish, the latter being restricted to a single nation, while the former was intended for the world. Afterward it served to mark the difference between the so-called orthodox Church and the sects which sprang from it, such as the Arians, Gnostics, etc. The name has been especially claimed by the Church of Rome. Protestant divines have been careful to deny its applicability, yet the term Catholic is still popularly used as synonymous with ROMAN CATHOLIC (*q. v.*).

Catholic Emancipation: in British history, the measure enacted Apr. 13, 1829, by which the political disabilities previously resting upon Roman Catholics were chiefly removed. These disabilities weighed most heavily upon the Roman Catholics of Ireland.

After the subjugation of Ireland in 1691 by the forces of William III., the whole people were disarmed; priests were banished the country; no Roman Catholic could act as guardian for any child; after 1704 a son turning Protestant could dispossess his father and take his estate; a Roman Catholic heir to landed property was to be set aside in favor of the next Protestant heir; no office, military or civil, could be held by a Roman Catholic; he could not vote or marry a Protestant wife; his son might force him to settle an allowance upon him (the son) at the discretion of a court of chancery; no Roman Catholic could practice law or teach school; no Protestant lawyer could marry a Roman Catholic wife; a

priest marrying a Roman Catholic and Protestant was to be hanged. Many of these measures became obsolete in practice, and more were repealed by the Irish Parliament of 1790; and at the union (1800) Mr. Pitt pledged himself to secure an act of emancipation, but through the opposition of George III. he failed. Subsequently, in consequence of the agitation of O'Connell and the Catholic Association, the subject was again taken up, was brought forward in Parliament by Mr. Peel, Home Secretary in the Wellington Ministry, Mar. 5, 1829, and a repeal of the severest penal restrictions was carried by large majorities in both Houses. The only disabilities left upon Roman Catholics were their exclusion from the regency, the chancellorship of England or Ireland, the viceroyship of Ireland, and from the offices and patronage of the Anglican Church, the universities, and the Church schools; the prohibition of episcopal titles, the public use of clerical insignia, the extension of monasticism, and the increase of the number of Jesuits. These latter prohibitions are, however, practically overlooked. See W. J. Amherst, *History of Catholic Emancipation* (2 vols., 1886).

Catholic Epistles: certain epistles of the New Testament addressed not to particular churches or individuals, but to the Church universal or to a large and indefinite circle of readers. Originally the Catholic Epistles comprised only the first Epistle of John and the first of Peter, but as early as the fourth century the term was applied also to the Epistle of James, of Jude, the second of Peter, and the second and third of John. These seven thus constitute the Catholic Epistles.

Cathol'icos: title of the patriarchs or chief ecclesiastics in the hierarchy of the Armenian Church; also of the prelates of the Christians of Georgia and Mingrelia.

Catholic University of America: an institution of learning located at Washington, D. C. In 1884 Miss Mary Caldwell offered the sum of $300,000 for the purpose of establishing a superior institution of ecclesiastical learning. Her proposition was accepted by the Roman Catholic bishops of the U. S. assembled the same year in plenary council at Baltimore, and it was further decided that this first donation should be made the nucleus of a university fund, and that around the divinity school, for which it was intended, should be grouped the other faculties of philosophy, medicine, and law.

In Nov., 1885, the university was incorporated under the laws of the District of Columbia, and in 1887 it was formally approved by Pope Leo XIII., who also granted it the power of conferring degrees. Nov. 13, 1889, the faculty of theology was opened, and is now fairly under way with a corps of ten professors. The endowment of chairs has been made possible by the liberal contributions of Miss Caldwell and her sister, the Misses Andrews, the Misses Drexel, Messrs. Eugene Kelly, M. P. O'Connor, and others. In addition to regular courses, weekly lectures on subjects of interest are given by competent scientists.

So far only post-graduate students, i. e. those who have made a four or five years' course of philosophy and theology, are matriculated. Each is free to choose his own line of work, both in the way of lectures and of practical exercises in the academies (seminaria). At the end of two years the degree of licentiate is conferred on those who have passed written and oral examinations successfully. For obtaining the doctorate in theology two years of additional study, either in the university or elsewhere, a printed dissertation, and public defense of theses are required. No honorary degrees are conferred.

Essentially the same regulations will apply to the other faculties. In 1891 Rev. James McMahon, of New York city, donated $400,000 toward the philosophical department. The McMahon Hall of Philosophy was erected, and courses in that department were opened in Oct., 1895.

The university is governed by a board of directors chosen from the episcopate, the clergy, and the laity. The office of chancellor, attached to the archiepiscopal see of Baltimore, is now held by his Eminence Cardinal Gibbons.

J. J. Keane.

Cat'iline (*Lucius Sergius Catilina*): Roman demagogue and conspirator; b. about 108 B. C. In his youth he was a partisan of Sulla in the civil war. He was elected prætor in 68 B. C., and afterward aspired to the office of consul. He was notorious for his crimes, and was ruined in fortune, but his talents and his audacity combined to render him a popular favorite of a large party, many of them insolvent debtors and desperate adventurers. Having been defeated in the election for consul, he formed a conspiracy against the state. It appears that he and his numerous accomplices proposed to massacre the senators and the friends of order, and to involve Rome in a general conflagration. The leaders of this plot met on Nov. 6, 63 B. C., and made arrangements for its speedy execution; but the secret was revealed by Fulvia, the mistress of one of the conspirators, who were baffled by the vigilance and energy of Cicero. On Nov. 8, Cicero uttered in the Senate his first oration against Catiline, who was present and attempted to reply, but his voice was drowned by cries of "Traitor!" and "Parricide!" Catiline left Rome in the next night, and went to the camp of Manlius, who was his accomplice and was at the head of an army in Etruria. Lentulus and other conspirators who remained in Rome were put to death in Dec., 63 B. C. The army of the senate encountered that of Catiline near Pistoria (now Pistoia) in 62 B. C. He stimulated the courage of his soldiers with an eloquent harangue, and a desperate battle ensued, in which Catiline was defeated and killed, with about 3,000 of his partisans. See Sallust, *Bellum Catilinarium*; Rose, *History of Catiline's Conspiracy* (1813); Cicero, *Orationes in Catilinam*.

Cat'kin, A'ment, or (Lat. form) **Amen'tum**: in botany, a form of inflorescence of which the willow, poplar, birch, and alder afford examples. It is a close spike of numerous small, unisexual flowers, destitute of calyx and corolla, and furnished with scale-like bracts. The plants which bear catkins form the order *Amentales*.

Cat'lettsburg, or **Cattletsburg**: village; capital of Boyd co., Ky. (for location of county, see map of Kentucky, ref. 2–K), on Ches. and Ohio R. R. and on the Ohio river, at the mouth of the Big Sandy, about 150 miles E. N. E. of Frankfort. It has a graded high school, a trade in lumber, various manufactures, electric street cars, electric lights, and waterworks. Pop. (1880) 1,225; (1890) 1,374; (1900) 3,081.

Editor of "Central Methodist."

Cat'lin, George: traveler and artist; b. in Wilkesbarre, Pa., in 1796. He passed eight years (1832–39) among the North American Indians, and published *Illustrations of the Manners, Customs, and Condition of the North American Indians*, with engravings (2 vols., 1841); *Last Rambles among the Indians* (1868), etc. He exhibited in Europe his Indian gallery and collection. D. in Jersey City, Dec. 23, 1872.

Catmint, or **Catnip** (*Nepeta cataria*): an herbaceous plant of the family *Labiatæ*, a native of Europe; a common weed in the U. S., but not indigenous there. It has cordate and crenate leaves, which are whitish, downy underneath, and emit a peculiar odor. Cats are extremely fond of this plant, which they eat with avidity and signs of excitement.

Ca'to, Dionysius: the supposititious name of the author or compiler of a small collection of moral precepts, each in two hexameter verses, entitled *Disticha de Moribus ad Filium*. The date of composition or compilation was perhaps the third century A. D. The name Cato probably arose from the reputed wisdom of the precepts; the name Dionysius is perhaps explained by the fact that in an ancient MS. mentioned by Scaliger (*vetustissimus codex Bosii*), but now lost, Priscian's translation of the *Periegesis* of Dionysius stood by the side of our work (see Haupt, *Opusc.* iii., 376). In the Middle Ages it was supposed that Cato Uticensis was the Cato intended, but this is impossible in fact. At any rate, the book was for many centuries one of the most read and cited of all Latin works. It was translated into many tongues, and led to the general exaltation of the name and fame of Cato which is to be noticed in the older authors of the modern world. See the edition by F. Hauthal (Berlin, 1869); also F. Zarncke, *Der deutsche Cato* (Sitz. Ber. der Wiener Akad. xxxvi., 211, 1852); J. Nehab, *Der altenglische Cato* (1879); M. O. Goldberg, *Der Englische Cato* (1883); Jonckbloet, *Die dietsche Catoen* (1845); A. Beets, *De Dist. Cat. in het middel-nederlandsch* (1885); A. Tobler, *Die altvenezianische Übersetzung der Sprüche der sog. dist. Cat.* (abh. der Berl. Akad. 1883); also Warton's *History of English Poetry*. A. R. Marsh.

Cato, Marcus Porcius (often called *Cato Censorius*, i. e. Cato the Censor): Roman statesman and patriot; b. of a plebeian family at Tusculum in 234 B. C. He was surnamed The Elder (Major), to distinguish him from his great-grandson, Cato Uticensis. As a young man he fought against Hannibal in the second Punic war, after the end of which he settled upon a small Sabine farm, adopted a simple and frugal mode of life, and became a model of austere and pristine Roman

virtue. Having removed to Rome, he gained distinction as an advocate in the courts of justice, and was elected prætor in 198 B. C. He was chosen consul in 195, and commanded an army in Spain, where he displayed superior military talents, and was so successful that he received a triumph on his return to Rome. In the year 184 he was elected censor, in which capacity he acted with uncommon rigor. He was a zealous asserter of old-fashioned principles, and opposed the growing tendency to luxury, and all innovations, good or bad. In 191 he acted as a military tribune in the war against Antiochus, and contributed his part to deliver Greece from the encroachments of the East and bring her into closer and more intimate relations with the West. Greece was at that time possessed of a much more developed and much more refined, but also much more artificial and much more corrupted, culture, and she could not fail in exercising a decisive influence on her conquerors. Cato saw it, and did his utmost to resist the invasion of Greek manners, tastes, ideas, and vices, but in vain. He was an implacable enemy of Carthage, and often repeated in the senate the phrase *Delenda est Carthago* (Carthage must be destroyed). He wrote, besides other works, a treatise on agriculture (*De Agri Cultura*), which is extant, and contains much curious information on the domestic habits of the Romans of his age. Of his *Origines*, a kind of history of Rome, and of his *Orations*, only fragments have come down to us. D. in 149 B. C. His *Life* was written by Cornelius Nepos and Plutarch, but some of the most intimate notes on his character and opinions are found in the works of Cicero and Livy, and are included in the *De Viris Illustribus* ascribed to Aurelius Victor. Best ed. of the *De Agri Cultura*, by H. Keil (Leipzig, 1884); of the *Fragments* by H. Jordan (Leipzig, 1860).

Revised by M. Warren.

Cato, Marcus Porcius, surnamed The Younger, or Uticensis, i. e. of Utica: Roman patriot and statesman; b. in 95 B. C.; a great-grandson of Cato Censorius. He studied and adopted the doctrines and discipline of the Stoic philosophers. In 72 B. C. he served in the campaign against Spartacus, but appears to have taken little satisfaction in warfare. Having been elected quæstor (treasurer), he effected reforms in the treasury department. He became tribune of the people in 63 B. C., and heartily co-operated with Cicero, who was then consul, in his efforts to defeat the treason of Catiline and his accomplices. He opposed the triumvirs, Cæsar, Pompey, and Crassus, after they had formed a coalition. In 54 B. C. he was chosen prætor, and used his power to prevent bribery in elections. He was an uncompromising opponent of corruption, and inflexible in his adherence to what he considered the right and the patriotic policy. As a candidate for the consulship he was defeated, because he declined to gain votes by bribery and other means which were customary, but not strictly lawful. In the civil war which began about 49 B. C. he adhered to the side of the senate and of Pompey, who had withdrawn from the triumvirate and become reconciled to the aristocracy. He was left in charge of Pompey's camp at Dyrrhachium during the battle of Pharsalia, and after that event escaped into Africa, where he was elected commander by the partisans of Pompey, but resigned the command to Metellus Scipio. The republican cause was ruined by the defeat of Scipio's army at Thapsus in April, 46 B. C., and Utica, which Cato had been defending, in the same year fell into the hands of the enemy. He refused to save his own life by flight, but to avoid capture by the enemy stabbed himself with his sword. Utica erected a statue to his memory, and Cæsar bewailed his death. Like his great-grandfather and the whole family to which he belonged, Cato was a man of sour temper, unconquerable pride, and despotic habits. But the roughness and uncouthness of his nature had been considerably softened by his adoption of Stoicism, and he was regarded as a model of pure and disinterested virtue. See Drumann, *Geschichte Roms*; Plutarch, *Life of Cato the Younger*.

Catop'trics [from Gr. *κατοπτρικός*, of a mirror; deriv. of *κάτοπτρον*, mirror]: that subdivision of geometrical optics which treats of the phenomena of light produced by the falling of a ray of light upon the surface of a body and its being reflected from it. See Reflection of Light.

Cator'ce: a mining town and district in the northern part of the state of San Luis Potosí, Mexico. The name means fourteen, and alludes to a band of fourteen robbers who were once the terror of the neighborhood. The silver mines are in the neighboring mountainous region, and for many years were among the richest in the republic. They are now partially exhausted. Much of the ore is reduced at the neighboring town of Cedral. It contains sulphur, and requires to be roasted. During the French invasion a mint was established at Catorce, which up to 1867 coined over $52,000,000. Former population of the town 20,000. At present it varies with the productiveness of the mines from 8,000 to 15,000. Herbert H. Smith.

Catostom'idæ [from *Catostomus*, the typical genus of the family; from Gr. *κατά*, down + *στόμα*, mouth]: a family of fresh-water fishes of the order *Eventognathi*; containing the suckers, carp-suckers, and buffalo-fishes of North America and Asia. The body is usually lengthened and nearly cylindrical, but in the carp-suckers is high and compressed; the scales are of rather large size, and smooth; the lateral line is generally present and decurved; the mouth is usually on the lower side of the head, and provided with fleshy lips; teeth are wanting in the jaws, but a row of numerous comb-like teeth is developed on a pair of sickle-shaped bones (the pharyngeal bones) located in the back of the mouth; the gill openings are restricted to the sides; branchiostegal rays three on each side; pectoral fins inserted low on the sides; ventral fins abdominal; the intestinal canal is very long; the stomach simple and destitute of pyloric cæca; the air-bladder is large, unprotected by an osseous capsule, and divided by transverse constrictions into two or three regions. The family is a very characteristic one, and is richly developed in the fresh waters of the North American continent, but a few species are also found in Northern Asia (Siberia, China, and Japan). About fifty species of the family have been described. They are among the most abundant fishes in the regions where they occur, and sometimes, in favorable localities, and when they are exempt from the attacks of enemies, they literally swarm, and cover the bottom of the waters with their compact masses. The mouths of the typical species are small and protractile, and well fitted for sucking in the aliment upon which they feed. Many of the species are quite apathetic, and remain basking in the sun or suspended almost motionless in the waters for a long period of time; and this habit is taken advantage of by boy-anglers, who attach a stiff loop to the end of a pole and drawing it over a fish toward the middle, suddenly jerk it from the water.

Revised by David S. Jordan.

Ca'tron, John: b. in Wythe co., Va., in 1778; was admitted to the bar in Tennessee in 1815; served under Gen. Jackson during one campaign; became state attorney for his circuit; removed to Nashville, Tenn., in 1818, and was prominent as a chancery lawyer; became judge of State Supreme Court in 1824; was chief justice 1830–36; in 1837 became a justice of U. S. Supreme Court. He opposed secession in 1860–61, and was driven from Tennessee, but returned in 1862. D. at Nashville, Tenn., May 30, 1865.

Cats, Jacob: Dutch poet; b. in Brouwershaven, Nov. 10, 1577; has had extraordinary popularity among the Dutch middle class, being known as "Father Cats." He was educated at Leyden, but received the doctor's degree at Orleans in France, and spent some time at Paris, perhaps more in pleasures than in studies. Then he settled at The Hague as an advocate, and obtained marked success. In 1622 a professorship at Leyden was offered him, but declined. About the same time, however, he became pensionary at Middelburg; in 1624, at Dordrecht. In 1636 he obtained the highest political preferment, becoming grand pensionary of Holland. This office he held till 1652. He was twice sent as ambassador to England. Nevertheless his political powers were anything but remarkable, and his successes seem to have been due in the main to his convenient colorlessness and his readiness to further the policy of the stadtholders. His last years were spent in retirement upon his estate, Zorgvliet, near Scheveningen. There he died Sept. 12, 1660.

Both as a man and as a poet Cats reflected to a remarkable degree the ideals of the Dutch *bourgeoisie*. As a man he was a curious combination of piety and thrift; as a poet he was unimaginative, prolix, didactic, though also often shrewd and even witty. His poetic purpose, as he expressed it himself, was to "draw from all kinds of things teaching that should make him better"; and elsewhere, "to furnish his countrymen simple and good reading, and so to prepare them for household and civic life and for a happy end." Having this in view, he cared little for poetic form and condensation, and his productivity was very great. Perhaps his most noted and at the same time characteristic work is *Het Houwelick* (*Marriage: that is, the whole course of the married state, divided into six heads, maid, sweetheart,*

bride, wife, mother, widow; contains also the corresponding duties of the husband, 1625). Other works are *Sinneen Minnebeelden* (1618); *Spieghel van den ouden en nieuwen tijd* (1632); *Trouringh* (1637); *Alle de Wercken, so oude als nieuwe* (1658). He has left a quaint rhymed biography in his *Tweeëntachtig-jarig leven* (first published in Leyden, 1732). The best edition of Cats's works is that of R. Feith (19 vols., Amsterdam, 1790–1800). Another is that of Van Vloten (2 vols., Zwolle, 1856–62). A. R. MARSH.

Cat's-eye: a very hard semi-transparent precious stone which when cut in a particular way presents a chatoyant appearance. The Oriental or true cat's-eye is found in Ceylon and Brazil, and is highly prized. It is a precious variety of CHRYSOBERYL (*q. v.*), in which the ray of light is due to the twinned structure in the crystal, or to included impurities. The line of light appears when the stone is cut *en cabochon*, traversely, or across the prism.

The quartz cat's-eye (of little value) consists of quartz containing asbestos, amianthus, or other fibers; and when the mass is cut *en cabochon*, across them the line of light appears. This variety is found in Ceylon and at Hof, in Bavaria.

The tiger-eye variety is the result of a natural alteration of crocidolite, a fibrous silicate of iron, by heated silicious water, which has removed part of the iron and coated each fiber with chalcedonic quartz. It is plentiful and inexpensive, and is found in the Orange river region, South Africa. GEORGE F. KUNZ.

Cats'kill: capital of Greene co., N. Y. (for location of county, see map of New York, ref. 6–J); on West Shore R. R., and on west bank of the Hudson river; at the mouth of Catskill creek; 34 miles below Albany, and 109 miles by rail N. of New York. There are 5 steamboat-lines connecting Catskill with New York city, Albany, and intermediate points. Here are a union public school with a high-school department, 2 hosiery mills, and 3 brick-yards, with total annual output about 16,000,000 bricks. Pop. (1880) 4,320; (1890) 4,920; (1900) 5,484. EDITOR OF "RECORDER."

Catskill Group: the uppermost division of the Devonian system of North America. The rocks of the group are situated on the eastern side of the Appalachian region, typically in Eastern New York, on the flanks of the Catskill Mountains, from which the name was derived, and extending south as far as Virginia. They are sandstones and shales, with predominance of the former which often are coarse and in places are conglomerates and of gray or red color. Palæontologically they are characterized by the occasional presence of fish-bones, scales, or teeth, and of plant remains, with the very rare appearance of certain lamellibranchs, which are believed to have been of brackish or fresh-water habitat. Stratigraphically they succeed the highest marine-fossil bearing strata of the Devonian, which generally in the more typical exposures are of Chemung age, but further E. are of Hamilton or even as early as Oriskany age, and are succeeded by the earliest formations of the carboniferous system, thus corresponding to the "old-red sandstones" of Great Britain, to which the early New York State geologists referred them. See GEOLOGY. H. S. WILLIAMS.

Catskill Mountains of New York: a group of the great Appalachian system; included mostly in Greene County. The highest summit, Slide Mountain, has an altitude of 4,205 feet. The summits of the mountains command extensive and beautiful prospects. The completion of several mountain railroads, which penetrate the very heart of this group, has opened up this section to the great tide of summer travel, and the Catskill Mountains have become a favorite resort. Many large and elegant mountain-houses have been erected on the eastern terraces. The scenery of this group is diversified by cascades, rocky precipices, small lakes, and deep ravines. The slopes and even the tops of the mountains, generally, are wooded.

Cat's-tail Grass: the *Phleum pratense*. See TIMOTHY.

Cat-tail, or **Cat's-tail** (*Typha latifolia*): an aquatic herbaceous plant of the family *Typhaceæ*; indigenous in the U. S. and Europe. It bears flowers in a long and very dense cylindrical spike terminating the stem. Its leaves have been employed with success in France as a material for paper-making.

Cat'taro: a seaport-town in Dalmatia, Austria; on the Gulf of Cattaro; about 37 miles S. E. of Ragusa (see map of Austria-Hungary, ref. 12–G). It is situated at the base of a steep limestone hill; is strongly fortified, and is surrounded with walls. It has a castle on a precipitous rock, a cathedral, and several churches. It was formerly the capital of a small republic of the same name. Pop. (1890) 5,432.

Cat'taro, Boc'ca di (i. e. Gulf of Cattaro): a tortuous inlet of the Adriatic; at the southern extremity of the coast of Dalmatia; is 30 miles long. It is protected from winds by high mountains on several sides, and forms the best harbor in the Adriatic. The entrance from the sea into this gulf is about 1½ miles wide.

Cat'tegat, or **Kattegat** (anc. *Codanus Sinus*): a part of the ocean which separates Denmark from Sweden and washes the eastern side of Jutland. It communicates with the Baltic by three channels—the Great Belt, the Little Belt, and the Sound. On the other side the Skager-Rack connects it with the German Ocean. It is about 150 miles long and 85 miles wide. Dangerous sand-banks occur in it.

Cat'termole, GEORGE: painter in water-colors of genre and historical subjects; b. at Dickleborough, Norfolk, Aug. 8, 1800; d. at Clapham Common, July 24, 1868. He studied architecture as well as painting, and was a well-known illustrator. A picture in oils painted by him, *A Terrible Secret*, was exhibited at the Royal Academy, London, in 1862. He received a first-class medal at the Paris Exposition of 1855. W. A. C.

Cattle [Norm. Fr. *catel* < Low Lat. *capta'le* < Lat. *capita'le*, capital, deriv. of adjec. *capita'lis*, belonging to the head (*caput*); *chattel* from centr. O. Fr. *chatel* is a doublet of *cattle*]: in Old English, property, goods, chattels; whence (because in ancient times a man's cattle were his principal goods) comes the modern use of the word as a collective term which in its widest sense includes all domestic animals, and in the usage of some writers includes also deer and other wild grazing animals. Among agriculturists, however, it is very generally limited to beasts of the species *Bos taurus*, the domestic ox, the neat cattle or black cattle of British writers. There are many varieties or breeds of cattle, some of which, as in Southern Asia, are distinguished by a large hump or mass of fat upon the shoulders. The original wild stock from which cattle are descended is not well known. The principal breeds in the U. S. are of British origin. The old native stock is of extremely mixed descent, but of late years much attention has been paid, with the best results, to the rearing of pure-blooded and grade stock. The best are the short-horn or Durham breed, which produces excellent beef-cattle, and is extensively reared in the U. S., chiefly for fattening purposes; the Herefords, for beef; the beautiful Devons, for working oxen; the Ayrshires, prized for milking qualities; the Jerseys or Alderneys, which yield extremely rich and excellent milk. The continent of Europe has many fine breeds which are little known in the U. S. The Texas cattle are descended chiefly from Spanish stock.

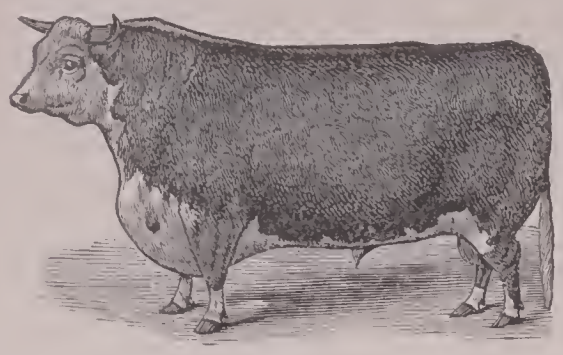
Great attention is paid in the U. S. to the improvement of cattle, and hence the best breeds of Great Britain especially, and to some extent of other parts of Europe, are largely introduced and mingled with the native stock. A brief description of some of the most noted is given below. The British cattle, by reason of long, careful, and scientific breeding, are undoubtedly the best in the world. Youatt, an eminent authority, classified the most remarkable breeds among them as the Long-horns, the Middle-horns, the Short-horns, and the Polled, or Hornless, cattle. Modern writers designate them as the English and the Scotch breeds, the former embracing the Devon, Sussex, Hereford, Long-horns, Short-horns, and Polled Norfolks; while the latter include the Ayrshires, the Polled Angus or Aberdeen, the Polled Galloways, and the West Highland or Kyloe breeds.

The Long-horns, an ancient and once famous breed of Lancashire and Westmoreland, England, are not bred in the U. S. A few are still bred in some English districts.

The Devons claim the first place among the *Middle-horns*. They are an old breed, of medium size, and so symmetrical as to appear small; their distinctive color is red. The head is small, the muzzle delicate; the horns are clear, smooth, and symmetrically curved upward. As working cattle they are not excelled for activity, docility, intelligence, and hardiness. The cow is gentle, feeds well on scanty pastures, and gives a moderate yield of rich milk. The flesh of this breed is excellent. It is probable that the first cattle imported into the U. S. were either pure or grade Devons.

The Sussex cattle resemble the Devons. They are red, and are larger and coarser than the Devons. They have been much improved in recent years.

The Hereford breed undoubtedly traces to the same source as the Devon and Sussex. The Herefords are of a medium or dark red color, with white faces and sometimes white on throat, back, and bellies. They are not excelled for grazing, and make beef of the best quality.



Hereford.

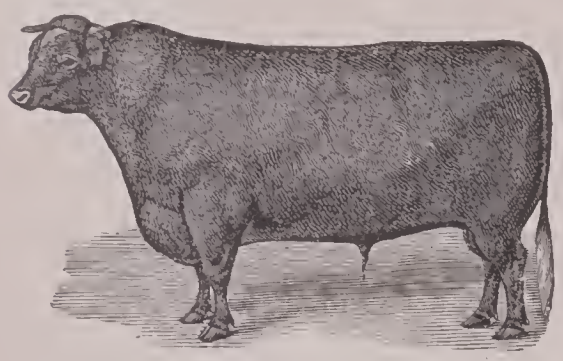
The Welsh cattle are smaller than the preceding, but are highly esteemed for practical uses. They vary somewhat in different localities, and different local names are applied to them.

The West Highland, or Kyloe, originally found in the Hebrides and the county of Argyle, seem to have retained most of their aboriginal character. They have remained unchanged, or improved only by selection, for many generations. They are a beef rather than a dairy breed. They are of varied colors—dun, red, black, brown—but never particolored.

Ayrshire cattle originated in Ayrshire, Scotland, and have for many years been considered as a leading dairy breed. The Ayrshire cows are of medium size, with wedge-shaped body, slim neck, a small head, and graceful upturned horns. In color they vary considerably, red and white spotted or mottled being the most common. Brown and white is a favorite combination with Ayrshire breeders. Ayrshire milk is better adapted to cheese-making than to butter.

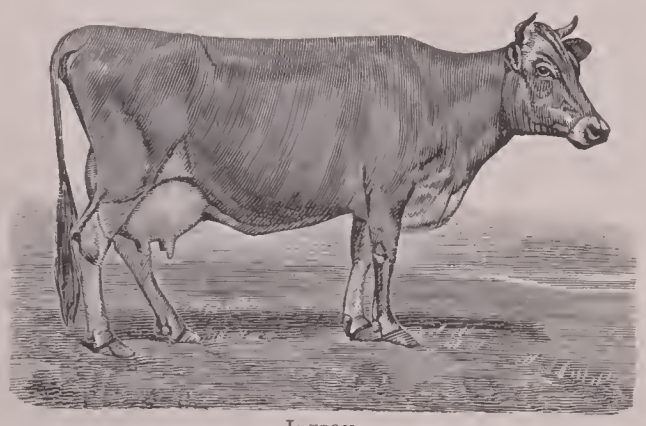
The Kerry cow of Ireland—sometimes called "the poor man's cow," from her moderate size, hardiness, good milking qualities, and docility—has a neatly formed head, upturned horns, lively and expressive eyes, and a body but little more than 3 feet high. Black is the common color.

Short-horns.—This justly celebrated breed has been prominent in the counties of Durham and York, England, since the latter part of the seventeenth century. They have been bred with great care and skill since 1780. See SHORT-HORNS.



Short-horn.

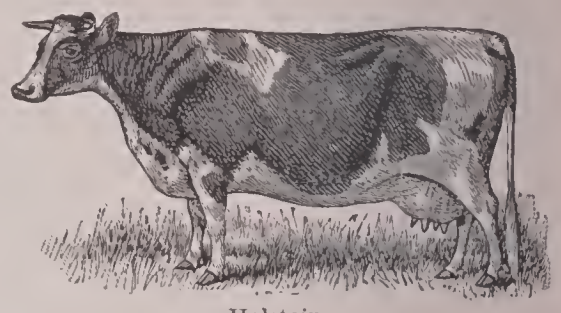
The Channel Island cattle from the islands of Jersey and Guernsey, in the British Channel, have long been noted for their superior value in the production of milk rich in butter properties. Many of them have been exported from Jersey, the largest island of the group, and in the U. S. they are generally known by the name of Jersey, though formerly they were often called



Jersey.

Alderney. The Jersey has a small deer-like head; muzzle fine and dark and encircled by a light color; horns small, crumpled, and of an amber color; chest inclined to be narrow; tail fine; udder full in form, well up behind, and running well forward; milk-veins prominent; escutcheon or milk-mirror high and broad, and full on thighs. They give a moderate amount of milk rich in butter fat of a deep yellow-color. Fawn is a common and favorite color. Fawn and white and gray are also quite common. The Jersey is not excelled as a family cow. Small, docile, and easily kept, she in a marked degree combines beauty with practical uses. The Guernseys are larger and hardier than the Jerseys, but have the same general characteristics.

Holstein-Friesian Cattle.—This famous breed takes its name from a region in the northern part of the German empire, but it is found in greatest perfection in the provinces of North Holland and West Friesland in the kingdom of the Netherlands. They are large, heavy animals with form indicating milking quality, muzzle black, colors black and white spotted or mottled in greater or less inequalities of proportion on the body. They are a hardy breed and large feeders. Holsteins are remarkable rather for the quantity of their milk product than for its richness, and have been thought better adapted to the manufacture of cheese than to that of butter. Recently, however, attention has been called to the large yield of butter from some of the best specimens of this breed. Many of these cattle have been exported to the U. S., where, like the Jerseys, they have reached a higher development than in their original habitats.



Holstein.

Polled or Hornless Cattle.—The most prominent are the Galloway and the Aberdeen or Angus, both Scotch breeds, and the Norfolk or Suffolk, an English breed deriving its name from Norfolk. The Aberdeens and the Galloways are black, the Norfolk red. The first have been housed and fed better than the second, and have become smoother, finer animals of most excellent feeding quality.

Revised by H. H. WING.

Cattle-plague: See RINDERPEST.

Cat'tleya: a genus of remarkably showy orchids; natives of tropical America, especially of Colombia, and numbering about twenty species, which have under cultivation given rise to numberless varieties. Many of the flowers are of great size, often 7 to 8 inches in diameter, and of rich and varied colors, and are much grown in greenhouses. The plants are epiphytic, and form thickened bulb-like enlargements upon their leaf-stalks (pseudo-bulbs), which serve as reservoirs of food material. Among the notable species are *C. gigas, C. guttata, C. intermedia, C. labiata, C. mossiæ, C. trianæ, C. warneri.* CHARLES E. BESSEY.

Cattol'ica: a town of Sicily; province of Girgenti; 14 miles N. W. of the city of Girgenti (see map of Italy, ref. 10–E). It is situated in the center of a very extensive sulphur-mining region. Pop. 7,000.

Cat'ty (deriv. of Malay *katī*): name given in commerce to a Chinese weight known also as "kin," or pound. The weight equivalent fixed at the Chinese custom-house is 1·3316 lb. avoir., or 0·60453 of a kilogramme.

Catul'lus, GAIUS VALERIUS: a Roman lyric poet of high reputation; b. at or near Verona about 87 B. C. He became in early life a resident of Rome, and enjoyed the society of Cicero and Cæsar. He was the first Roman who excelled in lyric poetry. He wrote, besides numerous lyrics and epigrams, an heroic or narrative poem entitled *The Nuptials of Peleus and Thetis*, which is his longest work; and a poem called *Attis*, in galliambics, which shows great power. One hundred and sixteen of his poems are extant. They are admired for the exquisite grace and beauty of their style, and for their intensity of feeling, but are in part grossly licentious. D. about 54 B. C. See R. Ellis, *A Commentary on Catullus* (2d ed. Oxford, 1889); text, with prolegomena, etc., 1878. M. W.

Cat'ulus, QUINTUS LUTATIUS: a Roman general and writer. He was chosen consul and a colleague of Gaius Marius in 102 B. C. Catulus and Marius commanded two armies,

which united and defeated the Cimbri near Vercelli in 101 B. C. The first was a partisan of Sulla in the civil war. Having been condemned to death by the Marian party, he killed himself in 87 B. C. His works are lost, except two epigrams.

Cauca, kow'kăa: a river of Colombia, South America; rises in the Andes; flows nearly northward through Popayan, Cauca, and Antioquía. After a course of 680 miles it enters the Magdalena in lat. 9° 25′ N. The valley of the Cauca is one of the most fertile and populous districts of South America.

Cauca: the largest department of Colombia, occupying the whole southern portion and a strip on the western side extending from Ecuador to the department of Panama, with a short coast on the Caribbean Sea; area, by official estimate, 257,424 sq. miles, but this includes a vast region claimed by Brazil and Ecuador. Pop. (1892) estimated at 700,000, including 200,000 wild Indians. Capital, Popayan. It is naturally divided into the mountainous western portion, about a tenth of the whole, but containing all the civilized population, and the great plains of the southeastern part. The first includes the valleys of the upper Cauca and Atrato, with the western Cordillera of the Andes between them, and a lower coast range. Southward, where the western Cordillera unites with the central and eastern branches, the whole country is mountainous, with several volcanic peaks and elevated basins similar to that of Quito. The higher valleys are cool and healthful. Lower down the valleys and coasts are hot and often sickly. Rains are abundant, and on the Pacific coast there is no well-marked dry season. Forest growths are extensive. The most important products are coffee, tobacco, cacao, cinchona, rubber, and hides. The gold and silver mines, especially of Chocó (the northern portion), are very rich, but are imperfectly worked. Southeastern Cauca is included in the great plain of the Amazon and Orinoco. It is one of the least-known regions of South America, covered in great part with forest, crossed by unexplored rivers, and peopled only by scattered tribes of wild Indians. HERBERT H. SMITH.

Cauca'sia: the Russian territory between the Black and Caspian Seas, on each side of the Caucasus Mountains. It consists of ten provinces, of which three (Kuban, Stavropol, and Terek) are in Europe and form Cis-Caucasia, or Northern Caucasia, while the seven others (Kutais, Tiflis, Elizabethpol, Baku, Erivan, Daghestan, and Kars) form Trans-Caucasia, or Caucasia in Asia. The area of Cis-Caucasia is 89,497 sq. miles; pop. (1897) 3,786,900; Trans-Caucasia, area, 91,346 sq. miles; pop. (1897) 5,936,653.

Cauca'sian (i. e. pertaining to Caucasus): an epithet somewhat loosely applied to the principal white races of mankind. The Circassians and Georgians dwelling at the foot of Mt. Caucasus have been taken as the type of the Caucasian race, and suggested the name. According to Blumenbach, the Caucasian race is the principal of the five divisions of the human family, and the original stock from which the other races have sprung. It also forms one of the three varieties of Cuvier. It comprises the most enlightened and powerful nations of the earth, including, besides the Aryan races (see ARYAN), the Hebrews, Phœnicians, and Arabs. But the inhabitants of the Caucasus, so long held to be types of the European variety, are now by some excluded from it altogether, and classed with the Mongols. The question of their relationship is a very obscure one. The basis upon which the theory of the Caucasian type was formed is thus stated by Latham: "Blumenbach had a solitary Georgian skull, and that skull was the finest in his collection, that of a Greek being the next. Hence it was taken as the type of the skull of the more organized divisions of our species. More than this, it gave its name to the type, and introduced the term Caucasian. Never has a single head done more harm to science than was done in the way of posthumous mischief by this well-shaped head of a female from Georgia." As commonly used, the term Caucasian is objectionable, as confounding under one name nations (as, for example, the Arabs and Germans) who have at best a very remote relationship; while it has often led to a still greater error—that of separating, on trivial and superficial grounds, nations who are unquestionably closely related, such as the dark-complexioned Hindus and the light-complexioned Teutons and Celts.

Cau'casus (Gr. *ὁ Καύκασος* or *ὁ Καύκασις*): a lofty mountain-range which extends between the Black Sea and the Caspian, and lies along the boundary between Europe and Asia. It is 690 miles long, and extends from the peninsula of Taman on the Black Sea, in an E. S. E. direction, to the peninsula of Apsheron on the Caspian. Connected with this central chain are several branches or transverse ridges on both sides. The culminating point of the Caucasus is Mt. Elburz, which is near the middle of the central chain, and has an altitude of about 18,570 feet. Its base is 7,660 feet above the sea-level. The next highest is Mt. Kasbek, 16,552 feet, E. of which is the Dariel Pass. This is said to be the only pass by which carriages can cross the Caucasus. The highest summits of this chain are formed of trachyte or porphyry, below which occur granite, syenite, etc. Limestone, slate, and other stratified rocks appear at the base and on the sides of these mountains. The limit of perpetual snow is here about 11,000 feet above the level of the sea. Some parts of the Caucasus are destitute of trees, but the secondary ranges near the Black Sea are covered with magnificent forests of oak, beech, ash, maple, and walnut. The cereal grains flourish 7,000 feet above the level of the sea, and the lower valleys produce rice, cotton, indigo, and the grape. The principal rivers that rise among these mountains are the Kuban, Kur, and Terek. The scenery of this region is said to be very beautiful and picturesque. Among its minerals are copper, iron, and lead. The inhabitants of the Caucasus comprise a variety of tribes, who speak different languages and are subject to Russia. Among these tribes are the Circassians, Georgians, and Lesghians. They are noted for their love of freedom; and to maintain their independence they waged a long war against the Russian invaders, which was terminated by the capture of their leader, Schamyl, in 1859. See CAUCASIAN.

Cauchy, kō'shee', AUGUSTIN LOUIS: mathematician; b. in Paris, Aug. 21, 1789. He gained a prize of the Institute in 1815 for his *Memoir on the Theory of Waves*. At Prague, where he resided as tutor to the Comte de Chambord, he published a *Memoir on the Dispersion of Light* (1837). He became a member of the Academy of Sciences and Professor of Mechanics in the Polytechnic School in 1816. He published, besides other works, *Lectures on the Differential Calculus* (1826), and succeeded Biot as professor of astronomy in 1848, but, refusing the oath of allegiance to Napoleon III., was retired under his empire. D. in Paris, May 23, 1857. See his *Life* (Paris, 1868) by Valson.

Caucus: a meeting of citizens for the selection of candidates to be supported at a pending election, or of legislators or others to confer and decide upon party measures or policy. The word originated in Boston during the popular discontent and agitation which culminated in the Revolutionary struggle—Boston, the cradle and focus of this agitation, being then a straggling maritime village, mainly supported by commerce and the seaboard fisheries, which gave importance to the arts subsidiary to navigation. The *calkers* of vessels were thus relatively numerous: they were robust, active citizens in the prime of life, and they were enlisted, heart and soul, in the patriot cause. Their work was done at the North End, where but few houses had yet been built, and their dwellings were mainly in that neighborhood. If they had a place of meeting as a craft, it would naturally be chosen for their political gatherings as well; and the Tories or loyalists, seeing these convened at the calkers' headquarters, would call them *calkers'* meetings, implying that none but low-bred mechanics and their like were hostile to the royal cause. *Caucus*—at first a corruption of *calkers*—thus became the received designation of a political meeting, especially if held with closed doors. The word first appears in the diary of John Adams, under date of Feb., 1763, as follows: "This day found that the *Caucus Club* meets at certain times in the garret of Tom Dawes, the adjutant of the Boston (militia) regiment." Adams adds that the town-officers and representatives were first chosen in this club before they were elected in town meeting. Gordon's *History of the Revolution* asserts that the caucus dates back at least to 1725, and that Samuel Adams's father and some twenty others devised and employed it to concentrate the power of the town in their own hands. He adds that Samuel Adams was first made representative of Boston through the instrumentality of the caucus, which thenceforth formed an important part of the machinery whereby the Revolution was incited and maintained.

That the majority of a legislative body should hold a caucus for the selection of the officers of that body can not be reasonably gainsaid, the minority being at perfect liberty to

do likewise; while any member of the majority, dissatisfied with its choice, may claim and exercise, if he will, the right to bolt. But when, about 1804, a caucus of the Republican (Jeffersonian) members of Congress was held expressly to recommend persons to be supported at the polls by Republicans living in districts represented by Federalists, thus giving to the people of those districts no voice in the selection of their candidates, the legitimacy of the assumption involved in such nominations was gravely questioned. Yet the candidates of the caucus continued to be chosen—with docility, if not with alacrity—until 1824, when the system broke down ignominiously upon William H. Crawford, of Georgia, being nominated for President, with Albert Gallatin, of Pennsylvania, for Vice-President. This ticket was badly defeated, the friends of John Quincy Adams, Gen. Andrew Jackson, and Henry Clay, forming two-thirds of those elected to either House, uniting in a public recommendation that the fiat of the caucus be disregarded—in fact, defied. Mr. Crawford received less than a fourth of the electoral votes, the vote standing—Jackson 99, Adams 84, Crawford 41, Clay 37. This sent the election to the House of Representatives, which elected Adams by a coalition of the supporters of Adams and Clay; the vote standing—for Adams, 13 States; Jackson, 7; Crawford, 4. This was the last caucus of members of Congress which assumed to nominate candidates for the people, and legislative caucuses with like purposes also have been discarded by all parties, though caucuses continue to be held for the choice of candidates to be supported by the body whose members make the nomination.

Presidential Conventions.—The first nominating national convention was held in 1832 by the Anti-Masons, who presented William Wirt, of Maryland, for President, with Nathaniel Ellmaker, of Pennsylvania, for Vice-President. In 1836 the Democrats held a like convention, which nominated Martin Van Buren, of New York, for President, with Richard M. Johnson, of Kentucky, for Vice-President. The Whigs held their first national convention at Harrisburg in Dec., 1839, and presented Gen. William Henry Harrison, of Ohio, for President, with John Tyler, of Virginia, for Vice-President. These were elected over Van Buren and Richard M. Johnson, the Democratic incumbents, who had triumphed four years previously. Each and every national party has since selected its candidates mainly by a delegated convention.

The local caucus for the selection of candidates for local offices, and especially for the selection of delegates to conventions that will nominate the more important State and national candidates, probably has been the chief field for fraud and oppression. The voters as a rule have taken little interest in such caucuses, but generally have left them to be managed by the local politicians, who, by simply notifying their followers to be present, have easily commanded a majority. Where, however, there has been the probability of a contest, shrewd managers have not hesitated to call a meeting to order by fast watches; to get to the appointed place with their followers before the appointed time, and then bar the door against their opponents; to call the meeting on short notice, or in an obscure place; and by other similarly unfair means they have tried to get the better of their opponents and to secure the regular delegation to the nominating convention. If their opponents sent a contesting delegation, the convention usually has seated the delegation favoring the wishes of the majority. See NOMINATING CONVENTIONS.

All members of the party are supposed to have the right to vote in caucus; and in rural districts and in the smaller cities the right has generally been freely granted. In the larger cities, however, especially in New York, it has been assumed by the party managers that a list of their voters is necessary in order to prevent fraud. The result has been that, practically, a society has been formed which limits its own membership, admitting only those whose names are presented by members, and who pledge themselves to follow the guidance of the central committee, and to support the candidates nominated by the society. By these means it has happened that not more than one-tenth of the members of either of the great parties could take part in the nomination of the regular candidates. See article *Caucus* in Lalor's *Cyclopædia of Political Science*: also article by A. C. Bernheim, *Party Organizations and their Nominations to Public Office in New York City*, in *Political Science Quarterly*, vol. iii., p. 99.

To avoid these evils some States have passed laws providing for *primary elections*, in which the members of each party are registered and vote by ballot under practically the same laws that obtain at a general election. The candidate receiving the highest number of ballots then becomes the regular candidate of his party. This system, however, only throws the informal caucus back one step, and it will still be held to select candidates for the primary elections. See PRIMARY ELECTIONS.

Perhaps no better method of purifying the caucus has been suggested than to insist upon all legal nominations being made by petition of a comparatively few voters, and to have the names of all candidates so nominated printed upon the election ballot without party designation. It is doubtless true, however, that no perfect mode of selecting candidates for the popular suffrage has yet been devised. See BALLOT REFORM.

Revised by JEREMIAH W. JENKS.

Cau'dine Forks (Lat. *Furculæ Caudinæ*): two narrow mountain-gorges or defiles near the town of Caudium, in ancient Samnium. They are celebrated in connection with a humiliating disaster which the Roman army suffered in 321 B. C. A large army commanded by the consuls Titus Veturius and Spurius Postumius were marching against the Samnites. According to Livy, this army, supposing the Samnites to be far distant, marched through one gorge or pass into a small valley inclosed by high mountains, and soon found that both of the passes were blocked up with trees and stones. The Romans were compelled by famine to surrender unconditionally to Caius Pontius, the Samnite general, who required them to pass under the yoke, and then permitted them to return to Rome. Caudium was on the Appian Way, 21 Roman miles E. of Capua. Niebuhr expresses an opinion that the Romans must have been defeated in battle before they were shut up between the two passes, and Cicero twice alludes to the battle and defeat of the Romans at Caudium. In one place he says, "Cum male pugnatum ad Caudium esset." (*De Officiis*, iii., 30.)

Caul: the thin membrane which sometimes covers the head of the child at birth. This is part of the general membranous sac enveloping the child in the womb, and its appearance over the child's head is due to unusual place of rupture of the sac. In ancient times it was considered a highly propitious circumstance to be born with a caul, and the person purchasing a caul thereby secured for himself various happy prospects. The caul was of particular value to advocates, who by its possession thought to obtain eloquence, and to seamen to secure them against drowning, and in consequence large sums were at times offered for the charm. This superstition has continued to the present day as far as seamen are concerned, and advertisements of cauls, so common in the newspapers of the last century, are still occasionally seen.

WILLIAM PEPPER.

Caulaincourt, kō'lăn'koor', ARMAND AUGUSTIN LOUIS, de: Duke of Vicenza; diplomatist of the first empire; b. at Caulaincourt, a village in the department of Somme, France, Dec. 9, 1772; d. in Paris, Feb. 19, 1827. He entered the army in 1787; was made a general in 1805; was sent in 1807 as ambassador to St. Petersburg. His position there was in the beginning rather difficult, as the Russian nobility believed him implicated in the capture of the Prince d' Enghien, and declined to hold any intercourse with him. The Emperor Alexander, however, who had great confidence in him, fully exonerated him. Unable to prevent the breach between Alexander and Napoleon, he resigned his position in 1811, but was in 1813 made Minister of Foreign Affairs, and as such was present at the Congress of Chatillon, 1814. It was due to his influence on Alexander that the island of Elba was granted to Napoleon. During the Hundred Days he was again Minister of Foreign Affairs. Under the Bourbons he lived in retirement.

Cauliflower [based upon the Latin form of Fr. *choufleuri* (flowered cabbage; cf. Germ. *Blumenkohl*), *cauliflora*, with adaptation to Eng. *flower*]: a plant of the mustard family and of the same species as the CABBAGE (*q. v.*). The edible portion is a head composed of the transformed flowers and flower-stems. The cauliflower is esteemed as one of the choicest vegetables of temperate climates. The head is cooked in various ways after the manner of preparing cabbage. The plant is cultivated in different methods in different parts of the U. S. In some regions it is grown as an early crop, in which case the seed is sown in hotbeds or cold-frames, and the crop is cultivated in essentially the same manner as early cabbages. In other places, as upon Long Island, N. Y., it is treated as a late or fall

crop. The cauliflower demands a rather moist soil and humid atmosphere, and it is therefore not adapted to much of the interior of America where the summers are very hot and dry. The seacoast regions, as the coast of New England, Long Island, and the Puget Sound region, are thought to be particularly adapted to the plant. The head is usually bleached, or rather protected from sun-scorching, by breaking the leaves over it when it is nearly grown. Cauliflower seed is mostly grown in Europe. The raising of it, however, has been undertaken with gratifying success in the neighborhood of Puget Sound, Washington. Broccoli is a large and late type of cauliflower. L. H. Bailey.

Caulo'nia: an ancient Greek city and seaport of Italy; in Bruttium, between Locri and the Gulf of Scyllacium. It was an important city about 500 B. C. According to Porphyry, Pythagoras sought refuge in Caulonia after his expulsion from Crotona. The people of Caulonia formed a league with those of Crotona and Sybaris. In 389 B. C. Dionysius the Elder invaded Magna Græcia with a large army, and besieged Caulonia, which he took. He then removed the inhabitants to Syracuse.

Caulopteris [Gr. καυλός, stem + πτερις, fern]: a generic name for certain fossil trunks of tree-ferns, chiefly Paleozoic, with roundish, separate, petiolar scars in quincuncial rows, each scar having a U-shaped or oval vascular bundle similar to that in the related living *Cyatheaceæ*.

Caupo'lican: an Araucanian Indian of Chili; b. about 1520, and elected *toqui* or chief of his tribe in 1553. He renewed the war on the Spaniards, forced them to abandon Arauco and Tucapel, and, aided by the advice of Lautaro (*q. v.*), defeated and killed the governor, Valdivia, who was hastening to the relief of Tucapel (Dec. 31, 1553). For several years the Araucanians carried on a successful war, until Imperial and Villa Rica were the only Spanish posts left in Southern Chili. In 1557 Caupolican was twice defeated by the governor, Hurtado de Mendoza, and was at length captured by the Spaniards and impaled alive at Cañete (1558).
Herbert H. Smith.

Caus, kō, or **Caulx**, Salomon, de: a French engineer; b. in Dieppe in 1576; a Protestant who lived much in Germany and England; considered by Arago to be the inventor of the steam-engine. He published in 1615 a work on motive-powers entitled *Les Raisons des Forces mouvantes*, etc., which gives a theorem on the expansion and condensation of steam. D. in Paris, June 6, 1626.

Cause: in law, an action, suit, or controversy in a court of justice: a case; a question tried before a judge. The term cause refers more particularly to the subject matter in dispute, while the terms action and suit refer more particularly to the legal procedure. Revised by F. Sturges Allen.

Cause: in Ontology (*q. v.*), any principle which in any way whatever embraces the Ground (*q. v.*) or Reason (*q. v.*) why anything diverse from itself exists. The principle correspondent with *this* principle is called Effect (*q. v.*), and the relation which exists between cause and effect is *causality*.

Causes have been divided into five classes (four by Aristotle): I. The *efficient* or operative cause. Its activity may be intransitive—that is, *immanent*—or transitive or transient—that is, *emanent*. The *efficient* cause is by pre-eminence *the* cause, and is usually meant if the word *cause* is not qualified. There may be *requisites* or *conditions*, even to the degree of *sine qua non*, and there may be *occasion*, but these ideas are not to be confounded, as they often are, with that of cause. Efficient causes are subdivided into primary and secondary; universal or general, and particular; principal and instrumental; univocal and equivocal; causes *per se* and *per accidens*; adequate and inadequate; free and necessary; physical and moral; proximate, remote, and ultimate; relative and absolute. There is in the train of causes a *subordination*, and this is material or formal. See Material Cause and Formal Cause.

The ontological principles deduced are: There is no effect without a cause; out of nothing nothing comes; nothing can be the efficient cause of itself; two things can not be the reciprocal cause of each other; the effect and the cause are *always* proportioned to each other; whatever is in the effect must in some sense be in the cause; the cause of the cause is also the cause of the effect; the same causes always produce the same effects; the cause must be present, either immediately or mediately, with that which it effects.

II. The Material; III. The Formal; IV. The Exemplary (Plato); and V. The Final Cause.

The names most distinguished in connection with the philosophical theories of cause are Heraclitus and Protagoras (denial of the notion), Plato (idea, matter, operative principle; immediately evident, free and physical: conditional and absolute), Aristotle (fourfold division; first cause of motion), Bruno (principle, internal; cause, external; first cause, final), Hobbes (potency and act), Descartes (assistance), De la Forge, Malebranche (occasional causes), Spinoza (adequate cause; cause of divine acts identical with cause of divine existence), Locke (appearance of changes), Leibnitz (pre-established harmony), Hume, Brown (observation of sequence, habit, not by, but *after*, natural instinct, apart from reason, blind belief), Kant (a fundamental, synthetical, *a priori* judgment, a postulate of pure reason, category of relation), Reid, Stewart (intuition), De Biran, Cousin (self-consciousness, personal causation), Fichte (positings of the Ego, self-originated subjective modification), Schelling, Hegel (spontaneity, all *being* has in it the internal impulse and power to *become*), Hamilton (the conditioned; mental impotence), Schopenhauer (the occasion for the phenomenon of Will). Among later points made, the most important is that each sphere of nature is controlled by a specific modification of the law of causality. All the views are reducible to two: the conception of cause is either *a priori* or *a posteriori*, and each of these is either original or derivative. In the application of the idea of cause arise the terms causal principle, causal judgment, causal nexus, causal connection, causal union, causal relation.

One of the most specious and widely accepted fallacies is that *cause precedes* effect. Cause and effect are absolute correlates, so that in point of *time* cause can not be *before* effect, but the two sides of the relation come into simultaneous being. Nor can cause, as such, exist without effect. As a term of relation, cause is as dependent on effect as effect on cause. The order of priority is therefore purely logical and mental. Nor is it true that a thing must be (*in time*) *before* it becomes a cause. It is only necessary that it shall be *when* it becomes a cause. Hence the thoughts of an eternal mind, the acts of an eternal being, may be eternal. In the world about us all that *becomes* cause *exists in deed* before it *becomes cause*, but the reason of this is that every source of cause, in our sphere, is also an effect, and must *be* as an effect before it can *act* as a cause. Nevertheless, it becomes cause strictly *simultaneously with* the effect, not *before* it. The true conception of cause therefore is demonstrably not that of sequence in time, as Hume contends, but the one we have given—to wit, that cause is that which contains the reason of the effect, and hence that the relation is a necessary one, and is as certain where we can not observe its result as where we can. Innumerable instances can be given of the invariable sequence, *in time*, of one thing which is not the effect of another.

That in virtue of which a causal agent can become cause, we call power. Some of the postulates which hold good as to cause and effect in the *inorganic* world are not demonstrably valid in the inorganic, and seem to fail entirely in the sphere of freedom and of intellect. So complete is the mind's recognition of the nature of cause that on a statement of any number of purely *hypothetical cases* it will at once decide which of the two terms is cause, which is effect, if the statement is such as to help the mind to see which of the terms must contain the reason of the other.
Revised by W. T. Harris.

Causes célèbres, kōz say'lebr': celebrated causes or trials, particularly certain French state trials of the seventeenth and eighteenth centuries, the reports of the decisions of which are contained in two collections, one by Gayot de Pitival and another by Des Essarts. In general, any trial which is especially interesting or remarkable in its incidents is called a *cause célèbre*, as the Tichborne Trial (*q. v.*).
F. Sturges Allen.

Caussin de Perceval, kō'săñ'de-pārs'vaăl', Armand Pierre: French Arabic scholar, 1795–1871; Professor of Modern Arabic in Paris. His most famous work is his *Essais sur l'histoire des Arabes avant l'Islamisme* (Paris, 1847–48), a monument of learning and good judgment. His father, Jean Jacques, was also a Semitist of merit. C. H. Toy.

Caustic [from Gr. καυστικός, capable of burning, deriv. of καίειν, burn]: a substance which exerts a disintegrating or destructive effect upon animal tissues. Caustics usually produce a sensation as of burning, whence the name. "Lunar caustic" is the silver nitrate, so called because *luna* (the moon) is the old alchemical name for silver.

Caustic lime, potash, soda, and magnesia are in effect like substances when pure, so called to distinguish them from their less active carbonates. Many other chemical reagents are used in surgery as causties, notably the nitric, chromic, and arsenious acids and bromine.

Caustic, in optics, is a term applied to curved lines formed by a series of points where (from the intersection of reflected or refracted rays) the heat and light are most intense. Reflected rays produce catacaustics—refracted rays, diacaustics. The study of caustic surfaces and curves is of the greatest importance in the construction of lenses and mirrors. For example, it has been found that the caustic by reflection from a paraboloid of revolution is reduced to a point when the incident rays are parallel to the axis of the paraboloid. For this reason parabolic reflectors have been introduced with great success into many optical instruments.

Cautery [from Gr. *καυτήριον*, branding-iron, deriv. of *καίειν*, burn]: in surgery, the application of a red-hot iron. White heat should rarely if ever be used, as it permits bleeding afterward. It is otherwise called "actual cautery," to distinguish it from "potential cautery," or the application of a chemical reagent as a caustic. "Cautery" is also the small iron instrument which is heated and applied in this operation. The actual cautery is useful in destroying certain morbid and gangrenous tissues, in staying hæmorrhages, and in relieving severe local pain. It has a valuable derivative effect in many cases, and when properly applied after thorough freezing of the part by ice and salt produces comparatively little pain. It is sometimes used to produce a slight, and sometimes a profound, local effect. The actual cautery is a favorite method of treatment in certain spinal affections. Galvano cautery is a platinum wire heated by a galvanic current to the required temperature. See Moxa.

Revised by William Pepper.

Cautin': a province of Chili; created in 1887 from a part of Araucania. It is on the river Cautin or Imperial, in lat. 39° S. Capital, Temuco. Area, 3,126 sq. miles. Pop. (1895) 78,221.

Cavaignac, kaă'vān'yaăk', Godefroy: a French Republican journalist: son of Jean Baptiste Cavaignac (1762–1829); figured in the revolution of 1830; b. in Paris in 1801. He was driven into exile in 1835, returned in 1841, and became one of the editors of *La Réforme*. He was one of the most popular leaders of the Liberal party. D. May 5, 1845.

Cavaignac, Louis Eugène: general and statesman; brother of the preceding; b. in Paris, Oct. 15, 1802. He served with distinction in Algeria, where he was sent in 1832; became a colonel in 1841, and governor of the province of Oran in 1847. In Mar., 1848, he was appointed governor-general of Algeria, and in the next month was invited by Lamartine to go to Paris and defend the Government against the mob. He reached that capital on May 17, and was then appointed Minister of War. He displayed much energy, skill, and presence of mind in his operations against the socialists and communists, who began a great insurrection in Paris on June 23, and were defeated in a battle which lasted three days. About June 28 he was chosen *chef du pouvoir exécutif*, or president of the republic, by the National Assembly. He was a moderate republican, and used his power with clemency. In the autumn of 1848 he was a candidate for the office of president, and received 1,448,302 votes, but was defeated by Louis Napoleon. He retired from power on Dec. 20, and took his seat in the National Assembly. He was excluded from political life by the *coup d'état* of Dec., 1851, and by his refusal to take the oath of allegiance to Napoleon III. D. near Tours, Oct. 28, 1857. See Henri Montfort, *Biographie du Général Cavaignac* (1848); Deschamps's *Life* (Paris, 1870).

Cavaignac, Jacques Marie Eugène Godefroy: French politician; son of the above; b. May 22, 1853; educated at the Lycées Charlemagne and Louis le Grand; served in the Franco-Prussian war; afterward studied in l'École Polytechnique and l'École des Ponts et Chaussées; elected to the Chamber of Deputies 1882; Under Secretary of State in the Brisson cabinet 1885; a prominent figure in the exciting scenes connected with the Panama revelations 1892–93; author of *L'État et les Tarifs des Chemins de Fer* (1883); *Formation de la Prusse contemporaine* (1891).

Cavaillon, kaa'vă'yōn' (anc. *Cabellio*): a town of France; department of Vaucluse; on the river Duranee; 16 miles S. E. of Avignon (see map of France, ref. 8–H). It has an old cathedral and remains of a Roman triumphal arch. Here are manufactures of silk twist and vermicelli. Pop. (1896) 9,405. *Cabellio* was a city of the ancient Cavares, and Pliny calls it an *oppidum Latinum*.

Cavalcanti, kaă-vaăl-kaan'tĕe, Guido: Italian poet; b. probably in Florence between 1250 and 1255; d. Aug. 28 or 29, 1300. His family, though apparently not originally noble, was one of the most eminent in Florence in the thirteenth century, and belonged first to the Guelph party, then to the Cerchi and to the Bianchi. The poet's father, Cavalcante Cavalcanti (died before 1280) fought in the battle of Monteaperti (1260), and took a prominent part in the affairs of his party. He is placed by Dante in the *Inferno* because of his Epicurean philosophy and his denial of the future life (*Inf.*, x. 52, *seq.*). The son, Guido, was one of the group of young men in Florence who, under the influence of Brunetto Latini and inspired by the Bolognese Guido Guinicelli, made the great advance in poetry to what Dante called *il dolce stil nuovo*. Dante himself, though somewhat younger, belonged to the group, and had a deep affection and admiration for Cavalcanti. He called him *queslo mio primo amico* (*Vita Nuova*, xxiv.), and elsewhere (*De Vulg. Elog.*, xiii.) named him with Lapo Gianni, Cino da Pistoia, and another (himself), as alone of the Tuscans excellent in the vulgar tongue. Furthermore, we have a poetic correspondence between Dante and Cavalcanti, full of tenderness and intimate solicitude on both sides (see especially Dante, Canzoniere, Sonetto I.). To Cavalcanti also, among others, was sent, according to Dante, the first sonnet of the *Vita Nuova*, written in the poet's nineteenth year, the first of his poetic efforts that have been saved to us. Cavalcanti replied with a sonnet of his own, so kindly and sympathetic that the friendship of the two at once began (*Vita Nuova*, iii.). After the death of Beatrice, Dante confided to his friend his plan of bringing together the poems written in honor of his dead love; and when this project was somewhat delayed by the perturbations of Dante's spirit and a certain reckless forgetfulness that came over him, he was chidden by Cavalcanti (Cavalcanti, Sonetto xxix.). This friendship certainly endured until the older poet's death, although at the very end, we are told by Dino Compagni (if only we could be sure of the authenticity of his much-discussed chronicle), Dante, as one of the priors of the city, had to participate in an act that must have been very grievous to Cavalcanti; for the latter had allowed himself to become engaged in the bitter feud between the Cerchi and the Donati, largely owing to his dislike of Corso Donati (see Dino Compagni, I.); and in June, 1300, after a violent outbreak of mutual hate, it became clear that the only hope of peace was to exile from Florence the heads of both these parties. The adherents of the Cerchi were sent to Sarzana, and with them Guido Cavalcanti. The exile was not a long one, for in August, on pretext of malaria at Sarzana, the Cerchi were recalled. But Cavalcanti had fallen really ill, and lived but a few days after his return.

As a poet, Guido Cavalcanti shows two somewhat distinct tendencies. He feels the philosophizing influence of Guido Guinicelli, which had transformed the chivalric and amorous ideals of Provence and France into doctrines of the spiritual life. He feels also, however, the charm of the simple and direct passion, the naïve loveliness, of the popular song of the Florentines. Hence his style is at once direct and intellectual. His influence upon Dante must have been great from this very fact.

Cavalcaselle, kaă-vaăl-kaă-sel'lăy, Giovanni Battista: Italian art historian; b. in Legnago, Jan. 22, 1820; embroiled in the revolution of 1848, he went with J. A. Crowe (*q. v.*) to London, and in collaboration they published *Early Flemish Painters* (3d ed. 1879); *History of Painting in Italy* (London, 1864–71); *Titian* (1876); *Raphael* (1883). He returned in 1858 to Rome and became inspector of the art department in the ministry of public instruction at Rome. D. in Rome, Nov., 1897.

Cavalier' [Fr., from Ital. *cavaliere* < Late Lat. *caballa'rius*, orig. one who has care of a horse, deriv. of vulg. Lat. *caba'llus*, horse. *Chevalier* is the proper Fr. representative of *caballa'rius*]: a horseman, a knight, an armed horseman, a gentleman (attendant on a lady), a gallant, a

soldier who fights on horseback. This name was given as a designation to a member of the party which fought on the king's side in the contest between Charles I. of England and the Parliament, their opponents being called Roundheads. It was at first a nickname and term of reproach, whence cavalier as an adjective came to be synonymous with rude or contemptuous, a meaning still perpetuated. But afterward it implied respect and was used as a title of honor. In the reign of Charles II. it remained in use until the extinction of the Cavalier Parliament in 1679.

Cavalier, John (1681 to 1740): often styled the "baker's boy of Anduze," because at one time apprenticed to that trade; the son of a Protestant peasant of the Cévennes, of the village of Ribaute near Anduze, Gard; in his early youth served as a shepherd lad or herdsman. When the Cevenol uprising in defense of the Protestant religious rights broke out in Languedoc in 1702, Cavalier, who had fled in 1701 for safety to Geneva, returned to share the lot of his persecuted brethren, and soon after was recognized as their military commander-in-chief.

His greatest engagement was that of Nages, Apr. 16, 1704. Upon this field, surprised through the physical prostration of his men, and surrounded by six or seven to his one, Cavalier extricated himself, defeated the finest soldiery in France and foiled the plans of their best commanders. Although he enjoyed the triumph of treating with Villars, Cavalier capitulated under stipulations for his own personal benefit, without insisting upon reliable guarantees in behalf of his religious brethren. There is no question but that Villars and Louis both deceived the Cevenol leader. He took part in the invasion of France in 1707, and finally entered the British service, in which he was elevated to the rank of major-general, and appointed governor of Jersey, which office he held when he died in Chelsea, England, May 17, 1740.

It is admitted that the effect of the Cevenol-Huguenot insurrection, in which Cavalier was the prominent figure, had a momentous effect on the fortunes of the war elsewhere, on the prospects of Louis XIV., and on the future of France. See Camisards.

Cavalli, kăă-vaăl'leĕ, Francesco: composer; b. near Venice, 1600; chapel-master of the Church of St. Mark from 1668 till his death; chiefly known as a dramatic composer, producing thirty-eight successful operas between 1637 and 1669; among them *La Didone* (1641); *Il Giasone* (1649); *Alessandro* (1651); and *L'Artemisia* (1656). D. 1676.

Cavalry [from Fr. *cavalerie*, from Ital. *cavalleria*, deriv. of *cavallo*, horse < Vulg. Lat. *caballus*]: that class of troops which serve mounted. It is recognized in modern warfare as one of the three great arms of service, and in earlier times, when war consisted more of predatory expeditions than of regular campaigns, it occupied the chief place. But even among the ancients it appears that this arm was not used to any extent in the earliest wars of which we have any record. The Egyptians, who were the first to organize a standing army, had no cavalry, its place being supplied by armed chariots. It is true that, on the monuments left by this people, pictures of mounted men are to be found, but there is every reason to suppose that these men were used only as messengers or couriers. Later, the Carthaginians in the organization of their armies gave a prominent place to the cavalry, which was made up of the most noble and distinguished citizens. Besides this body of picked troops, furnished by the city, Carthage employed vast numbers of Numidian horsemen, who rode not only bareback, as did all cavalry at first, but without bridles, guiding their horses in all their evolutions with the voice alone. It was to the great superiority of his cavalry that Hannibal, in his memorable campaigns against the Romans, was chiefly indebted for his success. His first five battles show the reliance he placed on this arm, and the efficiency with which he used it. At Cannæ his cavalry turned the issue of the day, and he owed his defeat at Zama to the superiority of Scipio's horse. In Asia an organized army was established among the Medes and Persians about 700 B. C., and in this the lancers, archers, and cavalry were placed in separate divisions. This force was rendered effective under Cyrus, and its main strength consisted in its cavalry. Leaving the East and turning to the West, we come to the military systems of Macedonia and Greece as the first organized, and upon which most others of antiquity were formed. In their armies both infantry and cavalry were used. The latter, as well as the former, was divided into heavy and light, and there was also another class which fought either mounted or on foot. In the heavy, which was composed of citizens, horse and rider were clad in mail. Their arms were long spears pointed at both ends. Mercenaries armed with javelins and arrows made up the light cavalry. These wore no mail, nor did their horses, which in all cases were ridden barebacked. The organization of the Greek cavalry approached that of modern times in many particulars. Their *ile*, corresponding to our troop, consisted of 64 men; the *hipparchy*, equivalent to our regiment, contained 512; while their largest formation, an *epitagma*, had 4,096, being about equal to a modern division of eight regiments. Philip and Alexander employed cavalry with great success, especially the latter, who was indebted to this arm for many of his most splendid victories. He won that of the Granicus with his cavalry, and in his two great battles with Darius, those of Issus and Arbela, his judicious use of his horse secured the victory, though he had in the latter not more than 8,000 to oppose 40,000 of the Persians. Among the Romans, even as early as the time of Romulus, each of the three tribes was required to furnish, besides its quota of infantry, 100 horse. In addition to this legionary cavalry there were 300 which constituted the body-guard of the king. In the formation of the legion it was customary to allow one mounted man to every ten of foot. Thus the numbers to make up the legion, as at first constituted, were 3,000 infantry and 300 cavalry. Servius Tullius increased these numbers to 4,000 infantry and 400 cavalry, and he raised his cavalry to 2,400 men. This force was made up, as with the Greeks, of the most noble citizens. The Roman cavalry was trained to fight on foot as well as mounted, and the light-armed infantry would sometimes spring up behind the horsemen, dismounting when the enemy was reached. Horses were furnished by the state. The cavalry was generally divided into ten parts; thus when 300 of this arm were attached to a legion, they were divided into ten *turmæ* or troops, and were formed in three, or sometimes six, ranks. Their defensive arms were helmet, cuirass, and shield; their offensive, a sword fit for striking only, a dagger, and a lance. Cæsar found that the Gauls used for their cavalry a very broad sword, suitable for cut and thrust. The order of battle among the Romans, though changed at different periods in many particulars, always preserved the system of keeping the flanks covered by cavalry. Sometimes a strong force of this arm was stationed in rear of the center, which was always held by a Roman legion; and on the repulse of the enemy the infantry opened to allow the cavalry to pass through in pursuit. On the march the head and rear of the column were protected by cavalry. In the feudal system the mail-clad knights, with their men-at-arms, made up the great body of cavalry and constituted the chief strength of all armies in the field. Their arms consisted of lance, battle-axe, and sword, the latter being generally straight and double-edged. Later, the Germans borrowed the curved sword from the Saracens, and they too invented the spur. In the earlier stages of the cavalry service, as has been mentioned, saddles were not used, but these were subsequently introduced, the first being a mere cushion, which has been developed into the almost countless styles of saddles now in use. During the wars of the Middle Ages the cavalry were used in heavy masses, which by their mere weight and superiority in arms could generally ride down the ill-armed and lighter infantry; but with the invention of gunpowder a new era in warfare commenced. The changes worked by this agent were very gradual, for it was used for many years only for heavy artillery. As soon, however, as it was applied to small-arms, the whole system of warfare underwent a radical change. Heavy defensive armor was discarded as useless; strategy and tactics overcame mere weight of numbers, and war became a science. To be enabled to perform the great movements dictated by strategy, and to employ properly the tactics requisite on a battle-field, it was necessary to have disciplined troops; and from this need grew up the standing armies of modern times. In all of these cavalry occupies a prominent position, as a glance at the various military systems of modern times will show. In Prussia the army grew out of the body-guard established by the elector Frederick I. This force was increased and disciplined under his successors, especially the great elector, and Frederick III. had a body of 36,000 admirable troops. But it was to Frederick the Great that the army owed its discipline, its organization, and its fame. Soon after his accession to the throne he issued his military regulations, and in

his efforts to perfect the efficiency of his army he paid special attention to his cavalry. To his reign belong two of the ablest and most brilliant cavalry leaders of history—Ziethen, who formed the Prussian hussars, and Seidlitz, who framed the cavalry tactics. So desirous was Frederick to bring this arm of the service to the highest perfection that he called to his aid the most distinguished Hungarian cavalry officers to drill and discipline his troops; and so efficient did they become that under the great leaders just named they gained some of his most important victories. Some of these battles give the happiest illustration of the efficiency of cavalry when properly used and ably handled. In that of Rossbach, Seidlitz threw his troopers against the French columns, broke them, and never allowed them to rally again. So brilliant were his services on this field that Frederick conferred on him the order of the Black Eagle—the highest mark of favor—and made him lieutenant-general. On the bloody field of Zorndorf it was reserved for the same gallant leader to save the day, for when the Prussian infantry gave way he charged the advancing Russians, broke both their cavalry and infantry, and sabered thousands of them. Ziethen, too, Frederick's other great leader of cavalry, contributed largely to the success of the Prussian army in Frederick's campaigns, especially on the field of Torgau, which was won by him.

The Prussian cavalry has well sustained the reputation it won during the wars of Frederick the Great, and it has been regarded as among the finest in the world. It is divided into cuirassier, dragoon, hussar, and Uhlan regiments. The first are armed with long straight swords; the others, with curved sabers, and all with carbines and lances. Each regiment is made up of 616 men—636 in those of the guards—and is composed of four squadrons.

The Austrian cavalry is made up of dragoons, hussars, and Uhlans. The regiments are composed of five squadrons with a total of 935 mounted officers and men, but there are some differences in arms and organization. In time of war one squadron is in dépôt to serve as a nucleus for recruiting and to train new men.

The Russian cavalry is made up of the cuirassiers, dragoons, lancers, and hussars of the guard, the regular regiments of dragoons, the localized regiment of Finland and that of Crimean Tartary. Besides these is her force of Cossacks.

The regular regiments are made up of 4 squadrons, each of 6 officers and 175 men, and are armed with the Berdan cavalry rifle with bayonet, and the saber. The lancers or Uhlans in the front rank are armed with the lance, those in the rear rank with carbine; all carry the saber. The 10 regiments of the guard, 2 localized, and 48 regular regiments make up a force of 57,464 men, and the 53 regiments of Cossacks, containing 11 squadrons of about 150 men each, and 275 sotnias, of about 135 men each, contain a total of 154,014 men, both on a war footing. In peace the Cossack troops are reduced, but the others are not.

Among the French the cavalry is divided into cuirassiers, dragoons, *chasseurs à cheval*, hussars, *chasseurs d'Afrique*, and the irregular African troops, spahis, etc. The regiments are made up of five squadrons, one of which is at the dépôt during war.

The dragoons, hussars, and chasseurs are armed with carbines, and the cuirassiers with revolvers in addition to their sabers, etc. In France, as well as in most other European nations, each squadron has a certain number of mounted pioneers trained in destroying bridges, etc., and carrying tools and materials for this kind of work.

The French cavalry seems to owe its origin to Charles VII., who about the middle of the fifteenth century took into his pay fifteen companies, as they were called, each of 500 men. In the reign of Louis XII. the cavalry appears to have been first organized in a separate body, with its own general officers and staff. Napoleon used his cavalry with terrific effect, and he called to its command some of his most distinguished lieutenants, though the ablest in this arm of the service was Murat. The battle of Marengo was converted from a defeat into a victory by the charge of Kellermann at the head of a small force of cavalry; and one of the most extraordinary exploits ever achieved by this arm was performed as Napoleon approached Madrid in 1808. Near the city, in the mountain-pass of Sorno-Sierra, were posted 20,000 men and 16 guns, which force checked the advance of the French. The emperor, after a personal reconnoissance, ordered a small body of Polish lancers to charge the formidable works, which they did with complete success. This is one of the most striking instances on record to show not only what can actually be accomplished by cavalry when properly directed, but the powerful moral effect produced by this arm when used with celerity and boldness.

The cavalry of Great Britain consists of life guards, which are cuirassier regiments, composed of eight troops of fifty to sixty men each—arms, straight sword; dragoon guards, same strength as life guards—arms, straight sword, pistols, and carbine; heavy and light cavalry—arms, saber, pistols, and carbine; and lancers—arms, saber, pistols, and lance. The British cavalry is the best in the world, having proved itself generally superior in the field.

The organization of the cavalry in the smaller states of Europe is very similar to that of the great powers already given, and we therefore do not deem it necessary to enter into details regarding it. In the East, too, especially among the Turks, an effort is being made to conform to European organization, armament, and drill. Ismail Pasha, Khedive of Egypt 1867–79, made rapid progress in this direction, and had for a number of years in his service several officers who served in the Confederate and Federal armies during the civil war in the U. S.

In the U. S. military system the organization of the cavalry is, with some slight modifications, the same general one which prevails in Europe. A regiment consists of twelve companies or troops of sixty-three men each; two troops form a squadron. All the cavalry in the U. S. should be classed as dragoons, their arms being saber, pistol, and carbine. During the civil war, when large masses of cavalry were brought together, they were formed into brigades, divisions, and corps, a brigade being composed of several—generally four or five—regiments; a division, of two or more brigades; and a corps of all the divisions serving with any army. When in active service it is usual to attach batteries of horse artillery to the cavalry, allowing generally one battery to each brigade. The cannoneers are all mounted for this service, and the guns used are usually light rifled pieces.

During the civil war the cavalry was used on both sides to picket all approaches, to cover all movements, to protect advances or retreats, and to make reconnoissances. The character of the ground on which the armies operated prevented as active participation in the great battles of the contest as is usual in European warfare, but the history of the war, when fully and impartially written, will show that on both sides this arm was not inferior in courage, discipline, soldiership, and achievements to any other.

During this war, however, the cavalry arm was not employed in the same manner or with the same effect as it has been in European armies in the great battles. In point of fact, as one of the "three arms," it was comparatively ineffective on the great battle-fields. Cavalry charges in actual battle were seldom made, except in cavalry combats, although on a few occasions they were employed against infantry. Most of the notions prevailing on the subject were found inapplicable to the actual conditions. Hence the use of cavalry was little more than to serve as mounted infantry; that is, for the purpose of conveying men rapidly from point to point, for the purpose of striking some sudden isolated blow or making what is called a *raid*. In most of the battles, however, the cavalry were dismounted and fought as infantry, often taking an important part. Two most notable instances of the kind occurred—one at the fight at Ream's Station, Aug. 25, 1864, where the dismounted Confederate cavalry carried a line of breastworks held by infantry; the other at Five Forks, where the Federal cavalry performed the same feat. During the civil war, 1861–65, there were many instances in which dismounted cavalry fought with the constancy and discipline of the best infantry, and despite the circumstances which prevented their use in heavy masses on the great battle-fields, many of the most gallant actions were performed by this arm of the service. The circumstances under which the war was fought, particularly the topographical features of the battle-fields, were such as to make it difficult to bring cavalry to bear in mass.

Revised by JAMES MERCUR.

Cav'an: a county of the province of Ulster, Ireland; area, 746 sq. miles; bounded by Fermanagh and Monaghan on the N. E., and Leitrim, Longford, Westmeath, and Meath on the W. and S. The surface is partly hilly and partly occupied by bogs. It is drained by the rivers Erne and Woodford. About three-fourths of the land is arable, but the soil is mostly poor, except near the rivers. Among

the rocks found here are clay-slate, gray-wacke, and carboniferous strata. It contains, coal, iron, copper, and lead. There are many mineral springs, and numerous highly picturesque lakes. There are some linen manufactures. The county returns two members to Parliament. The principal towns are Cavan, Cootehill, Belturbet, and Bailieborough. Capital, Cavan. Pop. (1881) 129,008; (1891) 111,679.

Cavanilles y Centi, kăă-văă-neel'yās-ĕe-thān'tĕe, Don Antonio: historian; b. in Coruña, Galicia, Spain, in 1805; became in 1841 a member of the Royal Academy of History, and soon after also a member of the Academy of Moral and Political Sciences. His *History of Spain* (5 vols., Madrid, 1860–64, not finished) is among the best historical works of Spanish literature. D. Jan. 2, 1864.

Cavatina [Ital.]: in music, a short operatic melody, simpler than the aria, without second and *da-capo* parts, a distinction, however, not uniformly observed by composers. A specimen is to be found in Meyerbeer's *Roberto il Diavolo*.

Cave, Cavern: an underground hollow space, more or less in communication with the surface. The largest caverns in the world are formed by the solvent action of subterranean waters on limestone rocks. The Mammoth Cave of Kentucky, Luray and other caverns of Virginia are the most noted in the U. S.; many others of less size are known. Percolating waters, carrying carbonic acid gas from the surface soils, may enter a cavern surcharged with limestone in solution; some of the limestone is then deposited owing to the acquisition of carbonic acid from the water. When the water flows on the walls or floor, it forms a calcareous incrustation. When dripping from the roof of a cave, it forms a pendant deposit called a stalactite, while a corresponding deposit, called a stalagmite, is built upward from the floor. These two forms may unite by convergent growth, building massive columns from floor to roof. Forms of great variety and beauty are thus produced, sometimes white, but generally yellowish, from a small amount of iron oxide. With the progressive wasting away of the land surface above, the roof of a cavern may be more or less completely removed, and the floor disclosed, while a remnant of the roof forms a rock arch through which a stream flows, as at the Natural Bridge of Virginia. Tubular caverns are found in lava flows, where the congealed surface of the flow stands as a roof while the liquid lava within has escaped. These are common on the Hawaiian islands. Caves of moderate depth are cut where strong sea waves beat on a bold rocky coast, eating away the weaker parts of the rock at water-level more rapidly than the cliff above retreats by weathering on its face. These always extend horizontally into the land mass, seldom for more than 50 feet. Fingal's Cave, Scotland (*q. v.*), is the most noted of this kind.

Plants do not grow in caverns, but a few species of fish, crayfish and crickets, nearly colorless and with undeveloped eyes, inhabit these dark regions; they are the degenerate descendants of similar species from the adjacent open country. Various caverns in Europe (Kirkdale, Kent, Brixham, and Dream caves in England, the Perigord caves in France, and Gailenreuth in Franconia, Germany, are among the most noted in this respect) have yielded numerous remains of extinct animals, such as the bear, hyæna, mammoth, horse, reindeer, rhinoceros, and others, their bones being found in the deposits that have been washed into the cave from above, or in the calcareous incrustation on the floor. Human remains have been found in such caves, associated with the bones of extinct animals. See Cave-dwellers.

W. M. Davis.

Cave, Alfred, D. D.: Congregationalist divine; b. in London, England, Aug. 29, 1847; graduated at London University 1872; became Professor of Hebrew and Philosophy at Hackney College, London, 1880, and principal and Professor of Theology 1881. He wrote *The Scriptural Doctrine of Sacrifice* (Edinburgh, 1877; 2d ed. 1890); *An Introduction to Theology, its Principles, its Branches, its Results, and its Literature* (1886); *The Inspiration of the Old Testament Inductively Considered* (1888).

Cave, Edward: printer; b. in Newton, Warwickshire, England, in 1691; founder of the *Gentleman's Magazine*, first issued in 1731. He was a friend and patron of Dr. Johnson. D. Jan. 10, 1754.

Cave, William: scholar; b. in Pickwell, Leicestershire, Dec. 30, 1637. He was educated at Cambridge; became vicar of Islington 1662; rector of All Hallows, London, 1679; canon of Windsor in 1684; and vicar of Isleworth in 1690. He published *Primitive Christianity* (London, 1672); a *History of Christ and the Apostles* (1676); *Lives of the Fathers of the Church in the Fourth Century* (1682); and *Historia Literaria* (1688–98, 2 parts), which were highly esteemed. D. in Windsor, Aug. 4, 1713.

Ca'veat [Lat. subjunc. pres. third sg., let him beware; deriv. of *cave're*]: in law, a formal caution or notice given to a court, judge, or ministerial officer to stay the performance of certain acts. It is used to prevent the enrollment of a decree in chancery; the issuing of a commission of lunacy; the admission of a will to probate; the grant of letters-testamentary to an executor; the issuing of letters-patent. A caveat in patent law is a written notice to the Patent Office of a person's claim to an alleged invention, to prevent the granting of letters-patent to another person while the caveat is in force, without notice to the caveator. The caveat papers must comprise, besides the petition, a specification and oath, and a drawing when the nature of the case permits, and must be limited to a single invention or improvement. Less particularity of description is required in a caveat than in an application for a patent, but it must set forth the object of the invention and its distinguishing characteristics with precision sufficient to enable the Patent Office to judge whether there is a probable interference in the case of a subsequent application for a similar invention. A caveat is filed in the confidential archives of the Patent Office, and preserved in secrecy, and is operative for a year. The caveator is entitled to notice of any application for an invention which would interfere with the invention as set forth in the caveat, and to the suspension of such application for three months after the notice. Within this time the caveator must file his own application, if he would avail himself of his caveat. A renewal of a caveat may be obtained by a written request and the payment of a second fee. Caveats may be filed by aliens who have resided in the U. S. for the year next preceding, and have made oath of their intention to become citizens. The U. S. patent laws, and laws relating to the registration of trade-marks and labels, and the rules of practice in the Patent Office may be obtained by application to the Commissioner of Patents.

Revised by F. Sturges Allen.

Ca'veat Emp'tor [Lat., let the purchaser beware]: an important rule in the law of sales of personal property. Its general meaning is that a purchaser must judge for himself of the quality of goods purchased. He will accordingly have no remedy against the seller if the goods turn out to be of an inferior character and of much less value than the price paid. The common law of England differs widely from the civil or Roman law, where the rule prevailed that a "sound price warrants a sound article." The rule (*caveat emptor*) must be confined to the *quality* of the goods. In the case of failure of the *title* to chattels sold by a person in possession, there is, according to the American decisions, an action against the seller, on the theory of an implied warranty. To the general doctrine of *caveat emptor* there are important qualifications. (1) The rule does not extend to cases of fraud. Where there is positive or active fraud, this is extremely clear. There is more doubt in the case where there is only concealment on the part of the seller. A distinction has here been taken between intrinsic and extrinsic defects. The latter would refer to cases where external circumstances affect the value of a chattel, as the outbreak of war or the conclusion of peace. The rule in such cases is that concealment is not a legal fraud, unless there is an active attempt to mislead. In the case of intrinsic defects there is great diversity of opinion. Some authors of repute hold that "the seller may allow the buyer to cheat himself *ad libitum*, but that he must use no effort to mislead." It is to be regretted that a view of the law should be taken so widely at variance with the dictates of common morality, and an effort should be made to find some satisfactory ground upon which they can be reconciled. It is believed that the seller is bound, *in law*, to disclose any facts within his knowledge of the nature referred to which can not be discerned by the exercise of ordinary observation and good judgment on the part of the buyer, and which materially affect the value of the chattel in ordinary estimation. To use a familiar illustration, if a seller knew that a horse which he exposed for sale in the ordinary manner had a secret defect not discernible by a careful purchaser, it would be a fraud on his part not to disclose it. Of course, this conclusion would not be arrived at

if he expressly stated that the sale was "with all faults," etc. (2) When a sale is made by a manufacturer for a special purpose, the better opinion is that the rule in question has no application. In other words, there is an implied warranty that the chattel is reasonably fit for the purpose for which it is bought. Some authorities of weight maintain that there is an implied warranty in all sales by manufacturers that there is no defect in the *process of manufacturing*, though they would not extend the doctrine to the materials used. (3) Wherever the reason on which the rule is founded fails, the rule itself gives way. The only rational ground of the doctrine of *caveat emptor* is that when a purchaser has an opportunity to examine goods he should act in the way in which a prudent man usually manages his affairs, and should notice such defects as he may be able to discover. Where there is no such opportunity for inspection, or where the seller takes the burden of selection upon himself, there is no room for the application of the rule. Accordingly, it does not apply to a true sale by sample; that is, where the bulk of the commodity is not present. In this case the seller impliedly warrants that the bulk of the commodity is equal to the sample. The purchaser must examine the sample for himself. If, however, that course is not open to him, the bulk of the commodity must be equal to the *apparent* qualities of the sample. Thus if an article like madder were sold by a sample contained in a sealed bottle, the bulk must equal the sample as it appears to the eye. The same general rule would apply to so-called executory contracts of sale, as where goods are sold at sea "to arrive" at a prescribed time. In the special case where the selection is made by the seller, the rule also fails. The distinction is put by one of the British judges in an apt form. He says: If the buyer says to the seller, "Sell me *a* gray horse to ride," there must be a horse supplied which the purchaser can ride. If, however, he had said, "Sell me *that* gray horse to ride," pointing to a particular animal, there would be no remedy, in the absence of fraud, if the horse were unfit to ride. In these cases another view might be taken. There is really no contract if the stipulated article is not supplied, the minds of the parties not having met. It seems very clear that if A proposes to sell B wheat by sample, and he furnishes on delivery wheat that does not correspond with the sample, there has been no agreement to buy the thing furnished, and it may accordingly be returned to A when its true character is discovered. (4) There is an exception to the rule in American law resting upon peculiar grounds, and it may be maintained though there be no fraud or other special circumstances. This is the sale of provisions for *domestic use*. There is an implied warranty that the goods are wholesome. The exception is not extended to sales by one dealer to another. It may be added that there is a corresponding rule (*caveat venditor*) applicable to the seller, who is bound in like manner to be on his guard in dealing with the purchaser, though this would also give way in cases of fraud. An instance is where the buyer, having learned that a war has ended, takes advantage of his superior knowledge to make purchases. Such a purchase would be legally valid, though if he misled the seller the fraud would vitiate the transaction. T. W. Dwight.

Cave-dwellers, or **Cave-men**: a term applied in European archæology to a population inhabiting certain portions of Western Europe in the palæolithic period of the stone age, and by extension to similar populations in other localities. In all ages men have sought shelter in natural caverns and in the protection afforded by overhanging cliffs, and have frequently artificially excavated such; but the cave-dwellers of the ancient period referred to appear to have selected such habitations for the seats of their densest population and most active industries. The remains of these industries, together with the refuse of their kitchens and workshops, usually became amalgamated with the cave mud, with the stalagmitic droppings from the ceiling, clay, pebbles, and charcoal, into a firm breccia, sometimes filling the original floor to a depth of 20 or 30 feet in successive layers. By carefully removing these layers and noting the contents of each, a correct opinion can be formed of their relative ages and the character of the civilization which the cave-dwellers of various ages enjoyed.

The caverns occupied by the cave-dwellers were not such as are chosen by wild beasts for their lairs. The latter are dark and narrow, while those selected as the abodes of men were more in the nature of rock-shelters, admitting light and air, and in convenient proximity to streams of water. The entrances are usually wide, the roof high, and the cavity not deep. Sometimes the walls were left in their natural state, but often they show signs of having been carved or dressed to render the cave more agreeable as a dwelling or more readily defensible against enemies.

The most characteristic caves of this period have been discovered in Southern Belgium, along the valley of the river Meuse, and in the valley of the Vezère, a branch of the Dordogne, in Southwestern France. About 1860 much attention was excited by the exploration of a cave near Aurignac, in Southern France, by M. Lartet, who was among the first to define clearly the traits of this ancient population. In England the cavern of Kent and others in Devonshire have yielded similar remains, and others on the Clyde and in Wales have been claimed by some to present the oldest specimens of man's handiwork yet discovered in Great Britain, referable even to a period before the glacial epoch. While all have not allowed this claim, there is no doubt that many English caves were inhabited in early palæolithic times. On the borders of Switzerland, the contents of a cave on Mont Salève, near Geneva, and the celebrated Kessler-hole in the canton of Schaffhausen, prove that the typical cave-dwellers extended that far to the east. To the south, near Mentone, at a locality called Baoussé-Roussé, remarkable caverns have been explored which were occupied by human beings at a most remote epoch; in Spain, near Santander on the northern coast and along the slope of the Sierra Nevada on the southern, evidences of like character have been exhumed.

The relative antiquity of the cave-dwellers has been ascertained by the close association of their relics with the remains of animals now extinct either altogether or in the locality. To the former class belong the cave bear, the saber-toothed tiger—a most formidable animal—the woolly rhinoceros, the Irish elk, some species of hyænas, and especially the hairy mammoth. Of animals which then lived in Southern Europe, but disappeared from there before the dawn of history, may be especially mentioned the reindeer and the musk ox, whose bones are found in large quantities in the caves, and the presence of which testifies to the prevalence at the time of a climate in Southern France almost as cold as that of Lapland to-day. Bones of a small species of horse are abundant, but it was evidently merely regarded as game, and was killed for food. No remains of dogs have been found, showing that at that early day this companion of man in so many climes had not yet been domesticated. The abundance of fish-bones indicates that the cave-dwellers depended on the water for a large part of their subsistence; while the relative scarcity of the remains of birds, as well as the character of the weapons found, point to the inference that they had little skill in securing flying animals. Nothing indicating the practice of agriculture or the domestication of animals has been discovered. In French archæology the general type of culture of the cave-dwellers is called the "Moustérien," from the cave of Le Moustier, a station which has been peculiarly rich in characteristic objects.

The cave-dwellers were acquainted with the use of fire, which was indeed necessary in their rigorous climate; but they had not acquired the art of pottery, nor that of polishing or boring stone. They were accustomed to cook their food, as the condition of the bones testifies. Their weapons and utensils were of bone, stone, horn, and doubtless wood, though the latter have perished. Countless arrow and lance heads of flint and other hard stones, knives, scrapers, and gouges of the same material, have been exhumed, many of them of symmetrical form and fine workmanship. The presence of bone needles and awls justifies the inference that they were used in sewing skins together for raiment, and therefore that the cave-dwellers went about clothed. Whistles or hunting-calls, made of the bone of the hind foot of the reindeer, were evidently employed in the pursuit of that animal. Small pebbles having a cavity on one side, and which are believed to have been used for paint-pots, indicate that they were given to decoration in colors. This is corroborated by the frequent discovery of ornaments made from ivory or by perforating the teeth of animals in order that they might be arranged on a string. Perforated marine and fresh-water shells, and flat pieces of ivory similarly bored, were doubtless esteemed as badges or gorgets. Remarkable artistic skill is indicated by the figures cut or scratched on many of the pieces of bones and horns exhumed in the caves. They represent, often with surprising

life and fidelity, the outlines of fishes, deer, horses, and human beings, and, what is more extraordinary, the hairy mammoth with its long mane, curved tusks, and pendant trunk. Some few small figures carved from bone or horn have been reported, showing that with their imperfect tools they sought to represent the forms of the animals around them.

The cave-dwellers were not cannibals. Among the many bones which remain as relics of their repasts none have been found of human beings. They appear to have had extremely dim religious impressions; few or no objects have been discovered which can be held to be idols or amulets. Nor do they appear to have had funeral rites; they neither buried nor burned the dead. In a few instances the bones of some of these ancient people have been preserved through accidents, as the sudden falling in of the roof of a cave. One such deposit occurs in the celebrated cave of Cro Magnon, in the south of France. This enables the modern anatomist to speak of their physical appearance. The skeletons of Cro Magnon belonged to a tall race, both men and women nearly 6 feet high, powerfully built, with long, narrow skulls, broad faces, and powerful jaws. The shin bones were flattened, as occurs in some of the lower races to-day. Similar investigations in the Belgian caves lead to the belief that they were occupied by a much smaller race, but with symmetrical bodies and well-shaped heads.

Cave-fish: See Amblyopsis.

Caven, William, D. D.: Presbyterian divine of the Dominion of Canada; b. in Kirkcolin, Wigtonshire, Scotland, Dec. 26, 1830; studied privately; received the degree of D. D. from Queen's University, Kingston, in 1875. He was pastor of St. Mary's and Downie 1852–65, and from 1865 Professor of Exegetical Theology and Biblical Criticism in Knox College, Toronto; in 1873 principal of the college; supported the successive acts of union by which the Presbyterian Church throughout the Dominion of Canada has become one.

Cav'endish: See Devonshire, Dukes of.

Cavendish, Frederick Charles, Lord: the second son of the seventh Duke of Devonshire; b. Nov. 20, 1836; graduated at Trinity College, Cambridge, 1858; sat in Parliament for the West Riding of Yorkshire 1865–82; private secretary to Lord Granville and Mr. Gladstone; held a lordship in the Treasury 1873–74; Financial Secretary of the Treasury 1880–82; Chief Secretary of Ireland 1882. On May 6, the day of his arrival in Dublin, he and his under secretary, Mr. Burke, were assassinated in Phœnix Park. The affair caused great excitement. Three of the conspirators turned state's evidence, and the other seventeen were punished, five of them being hanged.

Cavendish, Henry: chemist and physicist; b. in Nice, Italy, Oct. 10, 1731; d. in Clapham, London, Mar. 10, 1810; studied at Peterhouse, Cambridge, but took no degree. He was the possessor of a large fortune, and devoted himself to the natural sciences, particularly chemistry and physics. By his discovery of hydrogen in 1766 he contributed essentially to the overthrow of the phlogiston theory, which had long controlled the thoughts of chemists, and thus laid the foundation of pneumatic chemistry. He discovered that water is a compound of oxygen and hydrogen in certain proportions. The "Cavendish experiment" was a device of his for determining the earth's density. He was distinguished for the precision and accuracy of his processes, in spite of the rude appliances of his times. His *Electrical Researches* were edited and published by J. Clerk-Maxwell in 1879. He lived in extraordinary seclusion, as if dreading the face of man. See his *Life* by G. Wilson (London, 1846).

Cavendish, Sir Thomas: navigator; b. at Trimley St. Martin, Suffolk, England, about 1555; studied at Corpus Christi College, Cambridge, but left it without a degree; fitted out a ship and went to Virginia in 1585 with the expedition commanded by Sir Richard Grenville. After his return to England, Cavendish sailed from Plymouth July 21, 1586, with three small vessels, destroying, on the coasts of Chili, Peru, Mexico, and California, nineteen ships, including the Santa Anna, which belonged to the King of Spain and had an immensely valuable cargo. Cavendish returned to England by way of the Cape of Good Hope, having thus become the third circumnavigator of the globe. For this he was knighted by the queen. He afterward discovered the harbor of Port Desire, on the east coast of Patagonia, while attempting again to sail round the world. D. off Ascension island in 1592.

Cavendish, William: Duke of Newcastle; b. in 1592; son of Sir Charles Cavendish; educated at Cambridge; won honor and titles from James I. and Charles I., and in 1638 became governor to the latter's son, afterward Charles II. In the war with the Parliament he aided the king munificently and commanded the royal forces N. of the Trent, with regal prerogatives. He resided on the Continent during the commonwealth; became Duke of Newcastle in 1665. D. Dec. 25, 1676. He wrote a treatise on horsemanship and some poor comedies. See his *Life* by his second wife (n. ed. London, 1886).

Cavern: See Cave.

Cavery, kaw'ver-i, or **Cauvery** (anc. *Chaberis*): a river of India; in the Deccan; rises in the Ghats, about lat. 13° N. and lon. 76° E. It flows southeastward through Mysore, and after a course of about 470 miles enters the sea by many mouths. Its delta is mostly in the district of Tanjore. It is eminently available for irrigation and useful in agriculture.

Caviar, kăv'i-ăar, or **Caviare**, ka-veer': the prepared and salted roe of the sturgeon; made chiefly in Russia, the Caspian fishery alone sometimes yielding several hundred tons annually. There are six or seven species of sturgeon caught for their yield of caviare—species chiefly living in the Caspian and Black Seas and their tributary streams. The roe of the sterlet (*Acipenser ruthenus*) is the best, and its caviare is reserved for the imperial court. Caviare is proverbially disagreeable to the uneducated palate, though highly esteemed by the initiated. It is now manufactured quite extensively in the U. S.

Cavite, kăă-vĕĕ-tay': a fortified seaport-town of Luzon, one of the Philippine islands; on the Bay of Manila; 3 miles S. W. of the city of Manila (see map of East Indies, ref. 3–G). It was formerly the chief naval dépôt of the Spanish possessions in the East. It was captured by Commodore Dewey, May 3, 1898. Pop. about 6,500.

Ca'vo, Andres: Mexican Jesuit and historian; b. in Guadalajara, 1739; a missionary among the Indians until the expulsion of his order from Mexico in 1768. He wrote a history of the conquest and Spanish dominion, first published by Bustamente, with the title *Los tres siglos de Méjico durante el gobierno español* (Mexico, 1836). Cavo probably died at Rome some time after 1794. H. H. S.

Cavour, kăă-voor', Camillo Benso, Count di: statesman; b. in Turin, Italy, Aug. 10, 1810; of an aristocratic Piedmontese family; son of the Marchese Michele di Cavour and his wife Adelaide Syllon d'Allamar, an accomplished Swiss lady. Camillo, a younger son, was destined for the army. In the military academy at Turin he showed such proficiency in mathematical studies that he was made an engineer officer at the age of sixteen, and given responsible commands. Military life was repugnant to his tastes, and he entertained radical opinions which he did not hesitate to utter, and thereby displeased the king, Charles Albert. He therefore left the army in 1831, and turned his attention to agriculture, taking part also in the reform agitations of the time. He pursued a zealous inquiry into social and industrial questions, visiting England and France for that purpose. He was one of the founders of the Associazione Agraria, an energetic reform society, and started the liberal journal *Il Risorgimento* in 1847. When in 1848 the liberal party came into power and a constitutional frame of government was accorded to Sardinia, Cavour stood at the head of the moderate republican press, and, elected to the Chamber, he took an important part in the debates, supporting the moderate ministry of D'Azeglio and opposing the violent demands of the Left, whereby he lost in great measure his popularity. In 1850 he was appointed minister of commerce, in 1851 of finance, and in 1852 he became premier, accomplishing a fusion of the Right Center with the Left Center under Ratazzi. From that time forth he conducted the policy of Italy, bringing about finally its political consolidation amid stormy internal commotions and foreign complications. He promoted free trade and religious toleration, and opposed the encroachments of the papal power. His idea was "A free Church in a free state." Full freedom should be secured for the Church in all spiritual

affairs, and for the state in all civil affairs. The radicals, who proposed to confiscate all the estates of the Church, he opposed as decidedly as the Ultramontanists, who hoped to make the state a mere tool in the hands of the Church. The grand aim of his diplomacy was to promote the union of the Italian peoples and the liberation of Italy from foreign domination, and his first moves in that direction were the formation of an alliance with France and Great Britain and the participation in the Crimean war. When the audacious scheme proved successful, an Austrian diplomatist said, with good reason, that it was a pistol-shot fired in the face of Austria. At the congress of Paris in 1856 he succeeded in bringing the Italian question on the *tapis*, and provoked the hostility of Austria. In 1858 he made a secret treaty with Napoleon III. involving a plan to drive Austria from Italy, and the Franco-Sardinian war followed the next year. The Austrians were defeated, and obtained peace by ceding Lombardy, which was annexed to the Sardinian states. Cavour resigned office in July, 1859, because he disapproved the provision of the treaty of Villafranca, which allowed Austria to retain Venetia, but he resumed the position of prime minister in Jan., 1860. In consequence of the victories of Garibaldi and the general uprising of Italian patriots in 1859 and 1860, nearly all Italy was liberated and united. Cavour was prime minister of the new kingdom of Italy when he died on June 6, 1861. He was never married. He left the reputation of being one of the greatest statesmen of modern times. See *Reminiscences of the Life of Cavour*, translated from the French by Edward Romilly (1863); Edward Dicey, *Cavour, a Memoir*; Bianchi, *La Politique de Cavour* (Paris, 1885); and the biographies by Massari (Turin, 1873) and Mazade (Eng. trans. London, 1877).

Ca'vy [from the native Guiana name *cabiai*]: the name of various South American tailless rodent mammals, closely related to the porcupine family, and by most naturalists referred to the family *Caviidæ*. There are four molar teeth in each jaw, and in the genus *Cavia* these are compound; there are four toes on each of the fore feet, and three on the hind feet, the feet not being webbed. The females have only two teats. One species, *Cavia cobaya*, has long been domesticated as a pet and plaything of children. It is called usually the "Guinea pig," although it is neither a pig nor a native of Guinea. Other related species are very numerous in parts of South America. See GUINEA PIG.

Cawnpur', or **Cawnpore**: a town of Hindustan; on the right bank of the Ganges, which is here nearly a mile wide; about 96 miles S. W. of Lucknow; lat. 26° 29′ N., lon. 80° 25′ E. (see map of N. India, ref. 6–F). It is an important British military station, having cantonments which accommodate about 7,000 men. Connected with the cantonments are several hundred bungalows for the officers, which are fitted up luxuriously and have large gardens. During the mutiny in 1857, Nana Sahib massacred here a number of British captives, including 125 women and children. A handsome monument to their memory has been erected over the well into which their bodies were thrown. Pop. (1881) 119,603; (1891) 182,310.

Caxamarca: See CAJAMARCA.

Caxamarquilla: See YUNCAN ANTIQUITIES.

Caxias, kăă-shee'ăăs: a city of the state of Maranhão, Brazil; on the east side of the Itapecurú river: about 250 miles S. of the city of Maranhão; population about 10,000. Steamboats ascend the river to this point, and it is the commercial center of a large agricultural and grazing district. Caxias grew from the old Indian village and Jesuit mission of Aldeas Altas. It was made a city in 1836. In 1839 it was taken and sacked by the *Balaios* rebels. H. H. S.

Caxias, kăă-shē'-as, DUKE OF: See LIMA E SILVA, LUIZ ALVES.

Cax'ton, WILLIAM: merchant; b. in Kent, England, about 1422; was the first to introduce printing into England. In 1464 he was employed to negotiate a treaty of commerce between Edward IV. of England and the Duke of Burgundy. He translated from the French a *History of Troy*, which he printed in Bruges in 1474. This is said to be the first book ever printed in the English language, as his *Dictes and Sayings of the Philosophers* is the first book, so far as known, published in England, 1477. After he had resided for some time at the court of the Duchess of Burgundy, he returned to England and established a printing-office in Westminster in 1476, where he printed several other books. D. about 1492. Most of his books were of his own translation, were in folio, and may be called "black-letter" books. See his *Life* by Blades (1861–63), also his *Biography and Typography of Caxton* (2d ed. London, 1882).

Cayambe, kī-ăăm'băў, or **Cayambe-Urcu'**: a mountain in Ecuador; a peak of the Colombian Andes; is directly under the equator, and about 45 miles N. E. of Quito. It has a beautiful conical form, and an altitude of 19,386 feet. It is covered with perpetual snow, and forms one of the most remarkable landmarks on the globe.

Cayenne, kā-yen', or kī-en': a seaport-town of South America; capital of French Guiana; on the Atlantic, and on an island of same name; at the mouth of the Cayenne river; lat. 4° 56′ N., lon. 52° 13′ W. (see map of South America, ref. 2–F). It has a shallow harbor, and is defended by a fort and batteries. Considerable quantities of coffee, sugar, cotton, indigo, and cacao are exported from this place. The imports are French wines, spirits, liqueurs, and vinegar, silk and cotton stuffs, tobacco, hardware, glass, earthenware, and clothing, preserved meat, fish, vegetables, maize, flour, hay, etc. For many years the import trade has been steadily increasing and the export trade is steadily decreasing. Cayenne island is about 30 miles in circumference, and is separated by a narrow channel from the mainland. Cayenne is a penal colony to which criminal offenders are transported. Yellow fever and other fevers often attack the residents, probably originating from the vast swamps which surround it on two sides. Pop. (1886) 12,524.

Cayenne Pepper: See PEPPER, RED.

Cayes, kay: a seaport-town of Hayti; on its southern coast; 92 miles W. S. W. of Port-au-Prince (see map of West Indies, ref. 6–F). Pop. 3,000.

Cay'ley, ARTHUR: mathematician; b. at Richmond, Surrey, England, Aug. 16, 1821; graduated at Trinity College, Cambridge, 1842; became a barrister and conveyancer, but at an early age devoted himself to mathematics, which subject he enriched by a series of memoirs continued without cessation from 1841 until his death in London, Jan. 26, 1895. In 1861 he was appointed Sadlerian Professor of Pure Mathematics in the University of Cambridge. In 1882 he lectured in Johns Hopkins University, Baltimore. SIMON NEWCOMB.

Cayman, kay'man: the name applied in many parts of South America to any of the alligator family, or even to the crocodiles. In a scientific sense it is restricted to certain species of the genus *Caiman*, inhabiting Central and South America. They are distinguished from other crocodilians, other than the jacares, by an armor of bony plates on the under side of the body, and from the jacares by having the bony part of the eyelids smooth, and by the absence of a bony ridge between the orbits. See CROCODILE.

F. A. LUCAS.

Caymans, The: three small islands in the Caribbean Sea; belong to Great Britain; 130 miles N. W. of Jamaica (see map of West Indies, ref. 5–C). Chief product, turtles. Area, 225 sq. miles. Pop. 2,400. They are politically attached to Jamaica.

Cayu'ga: a post-town of Ontario, Canada; capital of Haldimand County; on railroad and Grand river, which is navigable; 14 miles from its entrance into Lake Erie, and 25 miles S. of Hamilton (see map of Ontario, ref. 5–D). It has a heavy trade in grain and plaster. Pop. about 1,000.

Cayuga Indians: See IROQUOIAN INDIANS.

Cayuga Lake: a beautiful lake of New York; on the boundary between Cayuga and Seneca Counties; is about 38 miles long. Its width varies from 1 to 3 miles, and its greatest depth is supposed to be above 500 feet. The surface is 387 feet above the level of the sea. Its banks are formed of Silurian and Devonian rocks. Whitefish and many other species of fish are caught in it. Steamboats ply daily between Cayuga Bridge and Ithaca, which is at the head of the lake. The outlet of this lake flows into Seneca river, a tributary to Lake Ontario.

Cayuse Indians: See WAHLATPUAN INDIANS.

Cazal, MANUEL AYRES, de: Portuguese historian; b. in 1754. He took orders, and for many years was prior of the town of Crato, in Goyaz, Brazil. He spent his leisure in studying the history and geography of the country, and published the results with the title *Corographia Brasilica, ou relação historica-geographica do reino do Brazil* (Rio de Janeiro, 1817; 2d ed. 1845), a work of great value. Cazal returned to Portugal in 1821, and died soon after.

HERBERT H. SMITH.

Cazalès, kăă'zăă'lĕs', Edmond, de: b. at Grenade-sur-Garonne, in the department of Haute-Garonne, Aug. 31, 1804; d. at Rennes, Jan. 28, 1876. He studied law and received some appointment at the tribunal of Provins. But his interest was entirely occupied by the religious questions of the time—the possibility of effecting a reconciliation between the Roman Catholic Church and the French Revolution. In 1829 he gave up the legal career; in 1843 took holy orders; in 1845 was appointed director of the Ecclesiastical Seminary of Montauban; in 1848 took a prominent part in political affairs, and again in 1871–72. Besides a great number of articles in various periodicals and some devotional books, he published *Étude historique et critique sur l'Allemagne contemporaine* (Paris, 1853) and *Nos maux et leurs remèdes* (Paris, 1874), which latter book attracted much attention.

Cazalla de la Sierra, kăă-thaal'yăă-dā-lăă-sĕĕ-er'răă: a town of Spain; province of Seville; 39 miles N. N. E. of the city of Seville (see map of Spain, ref. 19–D). It is on a declivity of the Sierra Morena, and in a district which abounds in silver, copper, iron, and marble. It has manufactures of linen, machinery, etc. Here are several ruined villas and Roman and Arabic antiquities. Pop. 8,322.

Cazem'be, or **Kasembe**: properly the hereditary name of an African chief whose territories lie E. of and adjoining Lake Moero, and N. of Lake Bemba, or Bangweolo; in lat. 7° to 10° S. The dynasty was formerly very powerful, but has steadily declined, until the name Cazembe is now limited to a native town near the southern end of Lake Moero, in about lat. 9° S., long. 29° E.

Cazeno'via: village (founded in 1793): Madison co., N. Y. (for location of county, see map of New York, ref. 5–G); on E. C. and N. and West Shore (Chenango Branch) R. Rs., and on a lake 4½ miles long; 18 miles S. E. of Syracuse. It has churches of five denominations, and a graded school; and is the seat of Cazenovia Seminary. There are here a few manufactories, but the village is supported chiefly by agriculture. Numbers of summer visitors are attracted to the village by its beautiful situation. Pop. (1800) 1,918; (1890) 1,987; (1900) 1,819. Editor of "Republican."

Cazin, kăă'zăń', Jean Charles: contemporary artist of the French school; b. in Samer, Pas-de-Calais, about 1840; pupil of Le Cocq de Boisbaudran; first-class medal, Salon, 1882; officer Legion of Honor 1889. Though he is most properly classed as a landscape-painter, Cazin has also a decorative side in his painting, and frequently introduces figures, sometimes even making them the subjects of his pictures, but never treating them as the chief element, and never concentrating the interest in them at the expense of their surroundings. His *Judith* (1883), *Ishmael* (1880), *The Flight into Egypt* (1877), *Tobit* (1880), and other pictures contain figures, but they possess only equal importance with the landscape. His figures and his landscape are treated as units in an harmonious ensemble, each color-note holding its proper place, and each modification of "value," or strength in light and shade, maintaining the needful force. His pictures are tender and beautiful in color. He has a studio in Paris and another at his country home at Bourron, near Fontainebleau. William A. Coffin.

Cazotte, kăă'zot', Jacques: French poet; b. in Dijon, 1720; educated by the Jesuits; author of the *Roman d'Olivier* (Paris, 1762); *Le Diable Amoureux* (Paris, 1772), etc. His style resembled that of Voltaire. Executed as a Royalist, Sept. 25, 1792.

Ccápac Yupánqui, or **Cápac Yupánqui**: fifth sovereign of the Inca line of Peru; reigned in the second quarter of the fourteenth century. Under him the tribes immediately west of Cuzco were subdued and conquests were carried southward to the Vilcañota Mountains, on the edge of the Titicaca basin. H. H. S.

Ceano'thus america'nus, New Jersey Tea, or **Redroot**: a shrubby plant of the family *Celastraceæ*; a native of the U. S. It is about 2 feet high, and has ovate, serrate leaves, which were used as a substitute for tea during the Revolutionary war. It has small white flowers in clusters, which are crowded in dense panicles. The beautiful native shrubs called in California wild lilac belong to this genus.

Ceará: city. See Fortaleza.

Ceará: a northeastern state of Brazil; bounded N. by the Atlantic, E. by Rio Grande do Norte and Parahiba, S. by Pernambuco, and W. by Piauhy; area, 40,240 sq. miles. Pop. officially estimated (1888) at 952,625, which is probably above the truth. Capital, Fortaleza. The interior forms part of the Brazilian plateau, from 2,000 to 3,000 feet high, but with numerous valleys. It is abruptly cut down to a strip of low land, 15 to 50 miles wide, along the coast. The so-called mountains of Ibiapaba, Baturité, etc., are simply the edges of the plateau. The rivers are small, and most of them disappear in the dry season. The land is either open or covered with scrubby *cerrado* growth; the only true forest is along the edge of the plateau. The heaviest rains are from January to April. From May to October the state is absolutely rainless, and vegetation dries up except in the valleys and near the plateau escarpments. Over large districts water can be obtained only by digging in the river-beds. The soil is fertile, but owing to the lack of water little of it can be used for agriculture. It affords excellent pasturage, and grazing is the principal industry, the cattle being kept on the high lands during the rains and driven to the river-bottoms in the dry season. Ceará is subject to periodical droughts, when the rains are suspended for one, two, and sometimes three or four years. These cause great loss and suffering. In the great drought of 1877–80 half the population died of famine and pestilence, the herds were nearly destroyed, and the interior was practically deserted. Attempts have been made to avoid these evils by forming great reservoirs and irrigation systems. The whites, who constitute the better class of Ceará, are intelligent and enterprising. The peasantry are a peculiar race of mixed white, Indian, and Negro blood, very ignorant and dirty, but excellent herdsmen and capable of great endurance. The whole coast is surf-washed and without harbors. Vessels anchor in roadsteads, and passengers and freight are transported through the surf on sailing rafts called *jangadas*. The exports are hides, Ceará rubber, sugar, and coffee.

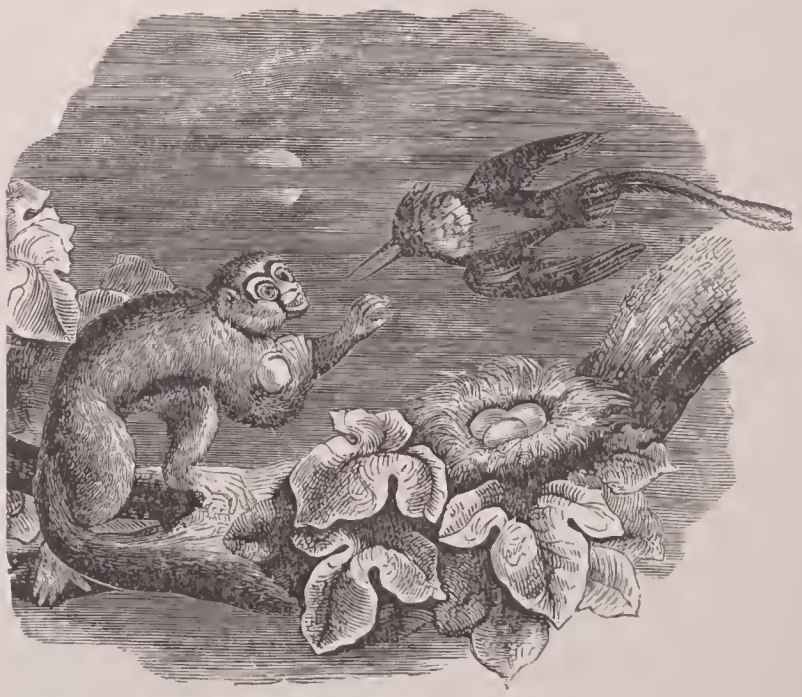
Ceará was the first Brazilian province to free her slaves, mainly by private subscription in 1883 and 1884.

See Pompeo, *Ensaio Estatistico da Provincia do Ceará* (1863); T. A. A. (Alencar Araripe), *Historia da Provincia do Ceará* (Recife, 1867); Koster's and Gardner's travels; Rodolpho Theophilo, *Historia da Secca do Ceará* (Fortaleza, 1883); Theberge, *Esboço historico sobre a provincia do Ceará* (Fortaleza, 1870). Herbert H. Smith.

Ceballos, Pedro de: See Zeballos.

Ce'bes of Thebes: a disciple of Socrates who figures in the *Phædo* of Plato. The *Picture of Cebes* (Πίναξ Κέβητος), an allegorical description of life, was for centuries exceedingly popular. As the Peripatetics are mentioned in c. 13, the author of this performance can not be the Socratic Cebes, if he is a Cebes at all, and the work belongs in all probability to the first or second century after Christ. Ed. by Drosihn (1871); by Kraus (1882); Parsons (Boston, 1887).

Ceb'idæ [deriv. of Gr. κῆβος, monkey]: a family of American monkeys, characterized by the want of an external



Cebus, or Sajou monkey.

bony auditory meatus, widely separated nostrils, and thirty-six teeth (molars, $\frac{3}{3}$; pre-molars, $\frac{3}{3}$). They represent in trop-

ical America the monkeys of the Old World. They feed chiefly on fruits, but also on eggs, insects, worms, and mollusks. The family includes most of the South American monkeys. The typical genus is *Cebus*.

Cebú: See ZEBÚ.

Cecidomyia, ses-i-dō-mī'i-a [from Gr. *κηκίς*, *-ίδος*, gall-apple, + *μυία*, fly]: a genus of two-winged insects (*Diptera*) or true flies, the members of which are sometimes called gall-gnats. They are minute flies with downy wings, long antennæ with whorls of hairs on each joint, and slender legs. Over sixty species from Europe have been described, and there are probably as many in the U. S. On account of their small size they readily escape notice, but on account of the damage they do some forms are serious pests. The eggs are laid on various kinds of plants, and the larvæ, sucking the juices, produce injuries. In some cases the result is the formation of enlargements or galls; in others the vitality of the plant is sapped, and in certain grains the crop is seriously injured. The most injurious forms are the clover-midges, one of which prevents the formation of seed, the barley-midge, the wheat-midge, and the so-called HESSIAN-FLY (*q. v.*). J. S. K.

Cecil, ses'il, or sis'il, RICHARD: an evangelical clergyman of the Church of England; b. in London, Nov. 8, 1748. In early life he was skeptical and profligate, but, converted, he resolved to enter the ministry; studied at Oxford, graduated B. A. 1777; held country livings; became minister of St. John's chapel, Holborn, London, 1780. D. in Belle Vue, Hampstead, Aug. 15, 1810. His works were published (London, 1811) in 4 vols. 8vo. The fourth volume, containing his *Remains*, is considered the most valuable. There is also an American edition (New York, 1845) in 3 vols. 8vo. *Original Thoughts in Holy Scripture* appeared London, 1848. See his memoir by his widow (London).

Cecil: See BURLEIGH.

Cecil, Lord ROBERT: See SALISBURY, MARQUISES OF.

Cecil'ia, SAINT: a Roman virgin who is supposed to have suffered martyrdom under Marcus Aurelius. The legend runs that her pagan parents betrothed her to young Valerian, she being secretly a Christian. He and his brother soon suffered martyrdom together. Refusing the imperial sacrifice she was thrown into a boiling caldron, but emerged apparently unscathed. Thrice the terror-stricken executioner struck to behead her, and then fled. Three days after the girl died and was buried in the catacomb of Callistus. In 821 Pope Paschal placed her bones in the new Church of St. Cecilia in Rome. She is regarded as the patroness of musicians and the inventor of the organ. Numerous musical societies in Europe and elsewhere have been named after her. Raphael (canvas in Bologna), Domenichino (in the Louvre), Rubens (in Berlin), and other great artists painted pictures of her, and Dryden wrote a celebrated *Ode for St. Cecilia's Day*. Her festival is Nov. 22, and in Rome is celebrated with fine music. She must not be confounded with St. Cecilia of Africa, who is said to have been starved to death under Diocletian, and whose calendar day is Feb. 11.

Cecilius: See CÆCILIUS.

Cecro'pia: a genus of forty or more species of soft-wooded diœcious trees of the Nettle family (*Urticaceæ*), natives of tropical America. They contain a milky juice which contains caoutchouc, and bear large, alternate, long-petioled peltate and lobed leaves. The flowers, which are apetalous and inconspicuous, are followed by compound, edible fruits resembling a raspberry, which in some species they are said to resemble in flavor. The best-known species is *C. peltata* of the West Indies, an evergreen tree 40 feet in height with leaves a foot in diameter, green above and white below. It is called smoke-wood, or more commonly trumpet-wood, musical instruments being made from its hollow branches. It is somewhat grown in conservatories as an ornamental, broad-leaved evergreen. In its native country its tough bark is used for cordage. C. E. B.

Cecropia Moth: a lepidopterous insect of the family *Bombycidæ*; nearly related to the silkworm. The systematic arrangement of this family is unsettled, but of the numerous names proposed for this insect perhaps *Platysamia cecropia* is the best. This is the largest North American moth yet known. When expanded it often measures 6½ inches across. It is of a dusky gray color, variegated with white, black, and various neutral tints. It appears in the U. S. in June, and is a most striking and beautiful object. Its larva is over 3 inches long, of a light-green color, with red and yellow warts armed with bristles. The cocoon is of a very strong silk, which is abundant in quantity, but can not be reeled. It has, however, been carded and spun into an excellent thread, and but for the delicate character of the larvæ, which are hard to raise, it would become an important article of commerce. The *Telea polyphemus*, an American relative of this moth, has attracted much attention from the excellence of its silk and the hardiness of its young. The ailanthus silkworm of China also closely resembles the larva of the cecropia moth. From the fact that the common silkworm has become subject to several destructive diseases, the scientific world is much interested in the effort to find another silkworm which shall be hardy and productive of useful cocoons.

Ce'crops, or **Kekrops** (in Gr. *κέκροψ*): a semi-fabulous hero of the Pelasgian race; called the first king and legislator of Attica. According to tradition, he instituted marriage and instructed the Athenians in agriculture, navigation, religion, etc. The people of Attica were sometimes called Cecropidæ.

Cedar [deriv. of Lat. *cedrus*, Gr. *κέδρος*]: the common name of several species of evergreen trees of the family *Coniferæ*, which afford durable and valuable timber. The name red cedar is given to the *Juniperus virginiana*, a native of the U. S., which is prized for its durable, compact, and odorous wood, and is used by cabinet-makers. It grows mostly in dry and sterile soils. In the Western States it attains the height of 70 feet or more, but in the Eastern States it is a small tree. The American white cedar (*Chamæcyparis sphæroidea*), an evergreen tree, abounds in the swamps of the Eastern U. S., and grows from 30 to 90 feet high. The timber of this tree will remain for a long time under water without decaying, and is an excellent material for posts of fences and for shingles. Various other coniferous trees are called cedars in the U. S. The name white cedar is given in the U. S. to the wood of *Chamæcyparis sphæroidea* and *Thuya occidentalis*—the latter throughout the Northern States. The cedar of Lebanon is the true and original cedar. It is not, like the American cedars, related to the cypress, but to the pine and larch, the foliage resembling that of the latter, but evergreen as in the former. The cones are similar to those of the larch, but are larger and very broad. *Cedrus*, the cedar genus, consists of three species, which are by some supposed to be geographical varieties of one—viz., *Cedrus libani*, confined to Lebanon, the Caucasus, etc.; *C. atlantica*, of the Atlas Mountains; and *C. deodara*, the deodar of the Himalayas. The character of the light reddish, fragrant, and durable timber is the same in all these. They thrive in England, and even in Scotland, but not in any part of the Atlantic U. S. They grow well on the U. S. Pacific coast. Of the celebrated cedars on Mt. Lebanon eleven groves still remain. The famous B'Sherreh grove is ¾ of a mile in circumference, and contains about 400 trees, young and old. Perhaps a dozen of these are very old; the largest, 63 feet in girth, is thought by some to have attained the age of 2,000 years. The name of cedar also is applied to the wood of a few trees which are not related to the *Coniferæ*, the color and odor being somewhat similar. Spanish cedar, of which cigar-boxes are made, and which is used for wardrobes and sometimes for lead-pencils (as a substitute for red cedar), is the wood of *Cedrela odorata*, a West Indian tree of the mahogany family.

Cedar-bird, or **Cherry-bird** (*Ampelis cedrorum*): a species of wax-wing (*Ampelidæ*); abundant in America; a graceful little bird, of a soft-brown color, not musical, feeding upon insects and fruits.

Cedar Creek: a creek which gives its name to one of the most brilliant actions of the civil war in the U. S. It rises in Shenandoah co., Va., and flows into the North Fork of the Shenandoah river, about 4 miles below Strasburg. On Oct. 19, 1864, Sheridan's army was encamped along this creek, the Eighth Corps forming its left about ¾ of a mile from the North Fork, the Nineteenth Corps, Sixth Corps, and the cavalry continuing the line to the right. Sheridan was temporarily absent from his army, having been called to Washington for consultation, and Gen. Wright was left in command. Reconnoissances upon both flanks on the 18th discovered no signs of an early movement on the part of the enemy, and no immediate attack was expected. At daybreak (about five o'clock) the Confederates, who by a night march had placed themselves upon the left and rear of the Union line, attacked the left wing in flank and rear, com-

pletely surprised and routed the Eighth Corps, and, following up the attack, forced back the Nineteenth Corps in some confusion.

Gen. Wright, with the Sixth Corps, part of the Nineteenth, and a force of cavalry, succeeded at about 9 A. M. in making a stand just N. of Middletown, which temporarily checked the Confederates and compelled them to reform their lines. This was accomplished very slowly, owing to the men being engaged in plundering the captured camps of the Eighth and Nineteenth Corps. Wright, selecting a more favorable position about a mile farther to the rear, caused his troops to fall back and occupy it, placing the mass of his cavalry on his left, the Confederates following up and taking a position in its front preparatory to an attack.

Sheridan, who, at Winchester, had heard of the fight, arrived upon the field and took command, placing additional troops upon the line and preparing to meet the Confederate attack, which was made with but little spirit and was easily repulsed. Sheridan's ride from Winchester, his enthusiastic reception by his army, which caused the retreating troops to face about and march to the front, and the new life infused into his troops when he rode along their front, all combined to form one of the most dramatic scenes of the war.

The repulse of Early's last attack took place at about 1 P. M. At about 4 P. M., Sheridan, having made the necessary arrangements, made a vigorous attack upon the Confederates, breaking first their left wing and successively their whole front, following up his advantage so sharply that the Confederates were forced back in great confusion entirely off the field, and driven back to Fisher's Hill by nightfall, losing in their retreat all the guns and camp equipage previously captured, about 24 guns of their own, 56 ambulances, and a large number of flags. The losses on the Union side were about 6,000 in killed, wounded, and prisoners. The Confederates admitted a loss of about 3,100 men. This was the last important battle in the Shenandoah valley. See SHERIDAN. JAMES MERCUR.

Cedar Falls: a city of Black Hawk co., Ia., on Cedar river, and B., C. R. and N., Ch. and Gt. West., and Ill. Cent. R. Rs. (see map of Iowa, ref. 4–I). It has good schools, and a State normal school. There are here a very large wood-pump factory, oat-meal mill, 2 flouring-mills, 2 feed-mills, paper-mill, planing-mill, foundry, etc. Pop. (1880) 3,020; (1890) 3,459; (1900) 5,319.

Cedar Keys: on railroad: a seaport of Levy co., Fla. (for location of county, see map of Florida, ref. 4–H); on the Gulf of Mexico and on Way Key; a small island; 154 miles S. W. from Fernandina. Its harbor is formed by a group of keys, or small islands, which give name to the town. It has a lighthouse on Seahorse Key; lat. 29° 05′ 49″ N., lon. 83° 04′ 46″ W. It shows a revolving light 75 feet above the sea. Cedar Keys has several cedar sawmills, an ice-factory, a large pine-lumber mill, etc., and is remarkable for extreme healthfulness and equable climate. There is an extensive trade in lumber, cedar pencil-wood, fish, and oysters. Pop. of the group (1880) 1,458; (1890) 1,869; town (1900) 739.
EDITOR OF "GULF VIEW."

Cedar Mountain, Va.: about 2 miles W. of Mitchell's Station, Culpeper County; on the Orange, Alexandria and Manassas R. R.; was the scene of a desperate and sanguinary conflict on Aug. 9, 1862, between the forces of Gens. Banks and Jackson, in which the Federal forces were outnumbered and defeated with a loss of nearly 2,400—killed, wounded, and missing—and a large quantity of war material; the Confederate loss was about 1,300.

Cedar Mountains: of South Africa; in Cape Colony; extend nearly parallel with the Atlantic. The highest summits rise about 6,590 feet above the level of the sea. They are partly covered with forests of cedar.

Cedar Rapids: a city and railroad center of Linn co., Ia. (for location of county, see map of Iowa, ref. 5–J); on Cedar river; 219 miles W. of Chicago, 310 miles N. of St. Louis, Mo., and 265 miles S. of St. Paul. It is the headquarters of the Iowa R. R. Land Company, and other land and coal companies, and of the Bur., Cedar Rapids and Nor. R. R. and all its branches. The railroad machine-shops employ about 1,000 men. The city has a valuable water-power, large oatmeal and flouring-mills, steam-bakeries, foundries, planing-mills, manufactories of furniture, confectionery, pumps, windmills, oil and lint, beer, woolens, knit-goods, agricultural tools, wagons, carriages, door-latches, etc. Pork-packing is very extensively carried on. The wholesale trade is important. The city is lighted with gas and electric light, has electric street railroad, and is supplied with water by the Holly system. Pop. (1880) 10,104; (1890) 18,020; (1900) 25,656.
EDITOR OF "REPUBLICAN."

Cedar (or **Red Cedar**) **River**: a stream of Iowa; rises in the southern part of Minnesota; flows nearly southeastward through Mitchell, Floyd, Bremer, Black Hawk, Benton, Linn, and Cedar Counties of Iowa; then turning to the S. W., it enters the Iowa river. Total length estimated at 350 miles.

Cedar Springs: village (in Nelson and Solon townships); Kent co., Mich. (for location of county, see map of Michigan, ref. 7–H); on Gr. Rap. and Ind. and Tol., Sag. and Musk. R. Rs., and on Cedar Creek; 21 miles N. of Grand Rapids; has churches of four denominations, fine large public school, large planing-mill, saw-mill, shingle-mill, stave-factory, stock-farm, and water-works. The village was first platted in 1860, and was incorporated in 1871. Pop. (1880) 1,141; (1890) 1,035; (1900) 950.
EDITOR OF "CLIPPER."

Cedartown: capital of Polk co., Ga. (for location of county, see map of Georgia, ref. 2–F); on Chattanooga Div. of Cent. R. R. of Georgia and East and West R. R. of Alabama; about 60 miles W. N. W. of Atlanta. Cedartown has 7 churches (4 white and 3 colored) and public schools for white and colored children. Its principal industrial establishments are iron mines, furnaces, foundries, machine-shops, lumber-yards, and fruit-farms. Pop. (1880) 843; (1890) 1,625; (1900) 2,823, the increase being largely due to extension of the corporate limits.
EDITORS OF "STANDARD."

Cefalu, chay-fä-loo′ (anc. *Cephalœdium*): a town of Sicily; in the province of Palermo; situated on the Mediterranean; 40 miles E. S. E. of Palermo (see map of Italy, ref. 9–F). Here is a fine cathedral of Norman architecture. The town is situated at the foot of a mountain or high rock, on which are the ruins of an ancient Phœnician structure and of a Saracenic castle. It has marble-quarries and sardine-fisheries. Pop. 14,774.

Cehegin, thā-ā-*k*heen′: a town of Spain: province of Murcia; 35 miles W. N. W. of the city of Murcia (see map of Spain, ref. 18–H). It has manufactures of cloth, paper, soap, and pottery, and a trade in wine and fruits. It is partly built of marble quarried in the vicinity. Pop. 9,760.

Ceiling [indirectly connected with Lat. *cælum* > Fr. *ciel*, Ital. *cielo*, sky; later, canopy, vault, roof]: the covering or upper surface of a room. Ancient ceilings, whether of wood or stone, usually consisted of horizontal beams or lintels, supporting flat slabs richly painted. Two sets of intersecting beams, forming panels or *lacunæ*, often were used; and this style of ceiling was extensively imitated and elaborated in the Renaissance. The Romans were the first to make general use of arched or vaulted ceilings, especially in their temples and *thermæ*; these were usually of brick or concrete, heavily stuccoed, and the stucco wrought into rich panels or painted; they were of three kinds—barrel vaults, groined vaults, and domes. While the East elaborated the domical ceiling, the West, throughout the Middle Ages, was perfecting the groined vault with ribs. Modern ceilings are usually flat, finished in wood or in plaster. Those divided into deep panels are called *coffered*; those in which a curved surface intervenes between the flat portion and the wall are called *coved* ceilings.
A. D. F. HAMLIN.

Cel'andine: the *Chelidonium majus* of the Poppy family (*Papaveraceæ*); a biennial or perennial herb native of the temperate portions of the Old World, but now more or less cultivated everywhere. It is the sole representative of the genus, which is related to the California poppy (*Eschscholtzia*), from which it differs in its nodding flower-buds, two-lobed stigmas, and orange juice. It attains a height of 2 or 3 feet, and is a smooth, branching, leafy and soft-herbaceous plant, with small, yellow, umbellate flowers, which blossom all summer. In the Old World this plant has borne the name of "swallow-wort," because it blossoms when the swallows arrive in the spring. It has long been used in medicine, the whole plant being dried, and then constituting the drug "chelidonium." It is an acrid purgative, and is also diuretic and expectorant.
C. E. B.

Celano Lake: See FUCINO.

Celastraceæ: See SPINDLE-TREE FAMILY.

Celaya, sā-laa′yaä: a city of Queretaro, Mexico: on the Rio Grande de St. Iago; 150 miles N. W. of the city of Mexico

(see map of Mexico, ref. 7–G). It has a large trade, and manufactures of cotton, wool, and saddlery. Pop. (1889) 24,670.

Cel'ebes (native, *Negri-Orang-Bugis*): a large island of the Malay Archipelago; about 75 miles E. of Borneo, from which it is separated by Macassar Strait (see map of East Indies, ref. 7–G). It extends from lat. 1° 50′ N. to 5° 30′ S., and is mostly included between lon. 119° and 125° E. It has a very irregular form, being divided by deep bays into four peninsulas, one of which (called Menado) is about 400 miles long and very narrow. These peninsulas are formed by chains of mountains radiating from the central part of the island, and in the N. there are lofty volcanoes, recently active, and still giving rise to earthquakes. The highest summit (Bonthain) rises 9,994 feet above the level of the sea. Though the area of Celebes is only 71,150 sq. miles, it has a coast-line of nearly 2,500 miles. The peninsula of Menado is bounded N. by the Sea of Celebes, S. by the Bay of Tomini. The two southern peninsulas are separated by the large Bay of Boni. The fauna comprises some animals peculiar to the island, as the tailless baboon, the babiroussa, the cuscus, the sapi-utan or wild cow, several species of starlings, and magpies. The vegetation is luxuriant, and the island is partly covered with forests of oak, teak, palm, cedar, and upas trees, and partly by vast grassy champaigns which are used in common by the natives. The nutmeg, the clove, and the bamboo also flourish here. Among the minerals are gold, copper, tin, and iron. Coffee, rice, sugar, indigo, and manioc are cultivated. The most cultivated district of the island is Minahassa, its coffee culture being in government control. Chief town, MACASSAR (*q. v.*). The pretty town of Menado is the seat of a Dutch residence. Celebes is partly occupied by a race called Bugis, who are strong and well built, revengeful in character, and fond of the chase. The tribe of Wadjus are an intelligent race who pursue commerce; the Arafuras inhabit the central regions, and are the aborigines of this archipelago. This island was visited by the Portuguese in 1512. The Dutch expelled the Portuguese in 1660, and planted there colonies, which they still possess. Pop. of Celebes (1890) 762,284. See Lahure, *L'île de Célèbes* (Paris, 1879).

Revised by M. W. HARRINGTON.

Cel'ery [properly *selery* or *sellery*, as in Early Modern English; from Lat. *selinon*; Gr. σέλινον, a kind of parsley]: a plant of the parsley family (*Umbelliferæ*), which is widely cultivated in temperate climates for its leaf-stalks, which are bleached by various means. One form, the *celeriac* or *turnip-rooted celery*, is grown for the swollen subterranean part. Celery is native to damp places in the Old World, ranging from Sweden to the Caucasus, and even to the higher parts of India. Its technical name, *Apium graveolens*, records the heavy scent of the foliage. The acrid principles of the plant are greatly mollified by cultivation and bleaching, and the tissues also become more tender and brittle. A variety of celery called *celeriac* is raised in Europe for its root.

The cultivation of celery in the U. S. has increased rapidly in recent years. In 1890 there were 15,381 acres devoted to the crop in the truck-gardens of that country, besides a large area in smaller gardens. The increase in celery cultivation is largely due to recent improvements in methods of growing the crop. Formerly it was grown in drills from 6 inches to a foot deep, a method which was thought to be necessary to insure the proper bleaching of the leaf-stalks. It is now grown in level culture, the bleaching being performed by heaping earth against the plants or by the use of boards, paper, or other material: or the plants may be set so thickly as to bleach themselves, as in the so-called "new celery culture." In many celery-growing localities banking with earth is giving place to bleaching by means of boards. Boards about a foot wide are used, one being placed on edge against either side of the row. The lower and moister lands are ordinarily devoted to celery culture, although the plant grows well upon rich and friable upland. Alluvial deposits along rivers, as at Kalamazoo, Mich., and reclaimed bogs and marshes usually make good celery lands. Celery is nearly always started in hotbeds or cold-frames, or the late crop may be started in seedbeds in the open. The plants are set in the field when about 6 inches high, in rows from 3 to 4 feet apart and a foot or less apart in the row. The crop often follows some other early crop, as beets or early cabbages. Bleaching is delayed until the plants are well grown, the late crops not being "handled" until late in fall. The late varieties can be stored in pits until spring, and most varieties will keep until the holidays. Nearly fifty varieties are known in the U. S. Revised by L. H. BAILEY.

Céleste, sā'lest', MADAME: a dancer; b. in Paris, Aug. 6, 1814; became in childhood a pupil at the Conservatoire in that city. When fifteen years old she removed to the U. S., and soon after married a Mr. Elliot. After her husband's death she went to England, where she met with great professional success. Subsequently she passed several years in the U. S. (1834–37 and 1865–68), where she was received with great enthusiasm. Most of her life was spent in England, where she was successful as an actress and a theatrical manager. D. in Paris, Feb. 20, 1882.

Cel'estine, or **Cœlestine** [from the Lat. *cœlum*, the sky, in allusion to its color]: a mineral which is essentially sulphate of strontia, with occasional mixture of sulphate of baryta and carbonate of lime in small proportions. Its color is often a beautiful indigo blue. It resembles heavy spar, but is not quite equal to it in specific gravity. Fine specimens of crystallized celestine are found in Sicily. It is useful as a source of strontia. The finest crystals of celestine are found on Strontian island, Lake Erie.

Cel'estine (or **Cœlesti'nus**) **I.**, SAINT: a native of Rome; became pope in 422 A. D.; promoted the meeting of a council which deposed Nestorius; d. in Rome, July 26, 432, and was succeeded by Sixtus III.—CELESTINE II., Pope: originally GUIDO DI CASTELLO; b. in Tiferno, Tuscany; succeeded Innocent II. in 1143; d. in Rome, Mar. 8, 1144.—CELESTINE III. (GIACINTO ORSINI): elected pope in 1191 as the successor of Clement III.; promoted the first crusade; excommunicated Leopold, Duke of Austria, for detaining Richard Cœur de Lion in prison; d. in Rome, Jan. 8, 1198, aged about ninety-two years.—CELESTINE IV. (GOFFREDO CASTIGLIONE): succeeded Pope Gregory IX. Oct. 25, 1241; d. Nov. 10 of the same year.—CELESTINE V., St. (PIETRO DA MURRONE or MORONE), Pope: b. in Isernia, Italy, 1215; was elected July 5, 1294, as the successor of Nicholas IV. Before that event he had founded an order of hermits called CELESTINES (*q. v.*). He abdicated the office after a disastrous reign, of his own volition, but with universal approval, Dec. 13, 1294; returned to the monastic life; was succeeded by Boniface VIII., who confined him in the Castle Fumone, near Anagni, and there he died May 19, 1296. Dante put him at the entrance to hell because of his abdication. He was canonized in 1313.

Celestines: an order of hermits or monks founded in 1254 by Pietro da Murrone, who became Pope Celestine V. (1294). This order spread rapidly in France, Italy, and Germany between 1264 and 1400, but it is now nearly extinct. They were at first called Hermits of St. Damian or of Morone, and after 1294 Celestines. Their costume is white, with black hood and scapulary. These monks followed the rule of St. Benedict, and preferred a contemplative life.

Celibacy [deriv. of Lat. *cælebs*, unmarried]: the condition of a person never married; applied often to the voluntary life of abstinence from marriage assumed by religious devotees and the clergy of some churches, such as the Roman Catholic. Practiced in ancient Rome in the case of the vestal virgins, in Judæa by the Essenes, and in the East by the priests of Bûddhism, it possibly took its origin among them in the belief that the material body is the source of evil and the prison of the soul. Among Christians it was the natural outcome of the ascetic teachings and spirit of the Gospel, as well as of the example of Christ himself. It showed itself at once with the new doctrine as a higher form of life, and spread with it all over the world. Virginity was held in peculiar honor in the early Church, the priesthood especially being urged to celibacy by the example of Christ, and by the motives suggested 1 Cor. vii. 32, 33. But it is certain from the inscriptions found in the catacombs, from passages in the canon law, and from the positive testimony of history, that celibacy was not enforced from the beginning, even among the higher clergy. Commencing as a counsel and as a custom, it gradually developed into a law, which was much more strictly enforced in the Western or Latin than in the Oriental Churches. Thus the Council of Tours (566) suspended from their functions for one year all secular priests and deacons with wives; whereas in 692 the third Council of Constantinople allowed sacred orders to be given to those who had been married but once; and in parts of the Greek Church their marriage is compulsory, though bishops and patriarchs are celibates. In the West, decretals were from time to time issued against the marriage of the clergy, lead-

ing to many struggles within the Church. These struggles culminated in the eleventh century, and the point was finally settled by the vigor and determination of Gregory VII. in 1074, positively forbidding the marriage of the clergy. The Council of Trent (1563) confirmed (sess. xxiv., can. 9) the discipline in practice for several centuries. There is, however, an exception made in favor of priests and deacons of the Eastern rites, who are allowed to retain their wives if married before ordination. See *History of Sacerdotal Celibacy*, by Henry C. Lea (1867); Roskovány, etc.

Revised by John J. Keane.

Celi'na: village, capital of Mercer co., O. (for location of county, see map of Ohio, ref. 4–C); is in Jefferson township; on L. E. and Louisville R. R.; 105 miles W. N. W. of Columbus, and 30 miles S. W. of Lima; is at the northwestern corner of the Great Reservoir. It has several manufactures. Pop. (1880) 1,346; (1890) 2,702; (1900) 2,815.

Cell [from Lat. *cella*, a small apartment]: in biology, the structural unit of plants and animals. Most plants and animals of the lowest divisions, the protophytes and protozoa, consist of a single cell, while the bodies of higher animals and plants are made up of masses of cells and the products of these cells. The cell is also the physiological unit. The life of an organism is the sum of the activities of all its individual cells. In the single-celled animals all the physiological activities are carried on by a single cell, while in the multicellular animals different groups of cells, the *tissues*, are specialized to perform more perfectly some one of these processes, and by this "physiological division of labor" a better organization is effected with more perfect results. The recognition of the great importance that the cell holds has brought to it the most careful study in recent years. This study is at the present time very active, and is rapidly adding to our knowledge of its structure and properties. At present a typical cell is considered to be a portion of living matter usually of from $\frac{1}{300}$ to $\frac{1}{1000}$ of an inch in diameter, the actual sizes extending through a much greater range, surrounded by a wall of its own formation, the *cell-wall*, the contents consisting of a central part, the *nucleus*, imbedded in a surrounding mass, the *protoplasm*. The protoplasm consists of at least two substances, a network of somewhat firm material which will stain with certain reagents called by some authors *spongioplasm*, containing in its meshes a more liquid material, the *hyaloplasm*. Imbedded in this latter there may be particles of various other substances, such as oil globules, food granules, or pigment grains. The protoplasm may show spontaneous movement called "amœboid movements," and always makes use of oxygen with the production of carbonic acid. In the single-celled organisms the protoplasm possesses general physiological properties, such as secretion, respiration, digestion, motion, and sensitiveness to stimuli.

In the higher animals, in which different kinds of cells are grouped together as tissues, the protoplasm of the cells of each group possesses in a more particular degree some one of these properties, or specializations under them; for example, the cells of the salivary glands that of secreting saliva, or the muscle cells that of motion.

While the *nucleus* has not yet been demonstrated in all cells, it is thought by the majority of investigators to be essential to the activity of the cell. Two substances are recognized in the nucleus, one staining with reagents, the *chromoplasm* or nucleoplasm, and the other not so staining, the nuclear matrix, also called achromatin. The most obvious function of the nucleus is that of governing the reproduction of the cell. The cell multiplies by division of the whole into two cells. The process begins at the nucleus, which is at this time very active. The nucleus may divide without showing any other changes, *direct division*, or the division may be preceded by a complicated series of changes and movements of the chromoplasm, *indirect division* or *karyokinesis*. At the end of the process of nuclear division the protoplasm of the cell becomes divided, each mass surrounding the new nucleus, the result being two cells. These typical methods have many variations in detail. Different authors have claimed in addition other functions for the nucleus, such as the control of the nutrition and growth of the protoplasm. The forms of cells vary greatly according to their particular function and position.

In plants the majority of the tissues are generally composed wholly of cells whose walls are in contact. In the higher animals this condition exists in some as in the epithelial and secreting tissues, while in others the cells have formed a large amount of material deposited between them, called *intercellular substance*, which may take the form of fibers, as in connective tissue, or an elastic padding, as in cartilage, or of a rigid solid, as in bone.

For the details of how, with the cell as origin (as the ovum in both animals and plants) and remaining always the active unit, the whole of the tissues of plants and animals are built up, the reader must be referred to special works in structural botany, animal histology, and embryology.

O. P. Jenkins.

Cell (plant): See Histology, Vegetable.

Cell, of an electric battery: See Battery, Voltaic or Galvanic.

Celle, tsel'le, or **Zelle**: a town of Hanover, Germany; on a sandy plain on the river Aller; at the head of navigation; and on the Hanover and Brunswick Railway, 28 miles N. E. of Hanover (see map of German Empire, ref. 3–E). Here is a noted Government breeding stud. The town has an old castle, a gymnasium, and a library of 60,000 volumes; also manufactures of wax candles, printer's ink, thread and yarn, pianofortes, tobacco, matches, etc. The place was from the fourteenth century the seat of a branch of the Brunswick-Lüneberg family. Here Sweden in 1679 acceded to the treaty of Nimeguen. Pop. (1890) 18,901.

Cellier, Alfred: musician; b. at Hackney, England, Dec. 1, 1844, of a French father and an English mother. From 1855 to 1860 he was a chorister of the Chapel Royal, St. James, under the Rev. Thomas Helmore. In 1862 was organist of All Saints', Blackheath; in 1864 director of the Ulster Hall concerts, Belfast; in 1868 organist of St. Alban's, London; 1871–75 conductor of the Prince's theater, Manchester: 1877–79 conductor of the Opera Comique, London. His compositions include a cantata to Gray's *Elegy*, some songs and pieces for orchestra and pianoforte, and a number of operas and operettas, prominent among which are *The Tower of London* (1875); *Nell Gwynne* (1876); *Bella Donna* (1878), all produced at Manchester; *The Masque of Pandora* (Boston, 1881); *The Sultan of Mocha*; *Dorothy* (1886); and *The Mountebanks*, libretto by Gilbert, which was produced in London, Jan. 4, 1892, just a week after the composer's death, which occurred on Dec. 28, 1891.

D. E. Hervey.

Cellini, chel-lee'nĕe, Benvenuto: Italian artist; b. in Florence in 1500. He was a skillful engraver, gold-worker, and sculptor; was in Rome in 1527 when it was attacked by the army of Constable Bourbon, and according to his own statement he killed that commander on that occasion. He was a man of passionate and quarrelsome temper, and much inclined to egotism. Among his patrons were Pope Clement VII., Francis I. of France, and Cosimo de' Medici. He worked in Rome, Paris, and Florence, produced, besides other works, the bronze of *Perseus with the Head of Medusa*, now in the Loggia dei Lanzi, Florence. His interesting autobiography, marked by its naïve disclosures, was translated into German by Goethe and into English by Roscoe (1822) and J. A. Symonds (1887). Cf. the artistic works upon him by Eugene Plon (Paris, 1882–84, 2 vols.). D. in Florence, Feb. 25, 1571.

Cellular Tissue, more properly **Areolar Tissue**: in animals the soft, elastic, filamentous substance which underlies the skin and the serous and mucous membranes, and which fills the spaces between muscles and between their fibers, and indeed surrounds almost all important organs, such as nerves, glands, blood-vessels, etc., throughout the body. It normally contains a small quantity of serous fluid, which in certain diseased conditions becomes increased, constituting anasarca or widespread dropsy.

Cellular tissue in botany is simply non-vascular substance (parenchyma) composed entirely of untransformed cells.

Cellulitis: See Phlegmasia.

Celluloid [Lat. *cel'lula*, dimin. of *cella*, cell + suffix *-oid*, having appearance of]: the trade-name for a plastic material composed of guncotton and camphor. The guncotton, or nitro-cellulose, is made by treating tissue-paper with a mixture of nitric and sulphuric acids. The product is mixed with camphor and various pigments to produce the desired color, and the materials are thoroughly incorporated by means of heated rolls. It is subsequently submitted to great pressure. It is afterward molded into form by means of heated dies, under pressure. Celluloid is applicable to the greatest variety of purposes, such as imitation ivory for billiard-balls, handles for hair-brushes, mirrors, umbrellas,

etc.; piano-keys, etc.; imitation coral for jewelry, imitation tortoise-shell for combs, and for rims for eye-glasses, etc.; imitation amber for beads and mouthpieces for pipes; imitation porcelain for dolls' heads, for mounting artificial teeth, in place of hard rubber, for imitation collars, cuffs, and shirt-fronts, which are waterproof. It is very hard and elastic, and takes a high finish. Liquoid is a similar material. See ZYLONITE.

Cellulose [Late Lat. *cellulo'sus*, full of *cellulæ*, little cells, dimin. of *cella*] $n(C_6H_{10}O_5)$: the substance which forms the mass of the cell-membranes of plants. Cellulose forms the framework or skeleton of all plants; next to water it is the most abundant substance in the vegetable kingdom. During the early stages of the development of the plant the cell-walls consist entirely of cellulose, but as the plant grows the walls become intergrown with resins, coloring-matters, and other substances. Some tissues consist almost entirely of cellulose, as the pith of the Chinese rice-paper plant (*Aralia papyrifera*) and the vegetable ivory. Cotton, linen, hemp, and unsized paper consist of almost pure cellulose.

The following percentages of cellulose are found in some of the most common vegetable matters in the air-dry state:

	Per cent.		Per cent.
Potato tubers	1·1	Timothy hay	23·0
Wheat kernels	3·0	Red clover hay	34·0
Maize kernels	5·5	Oat straw	40·0
Oat kernels	10·3	Wheat straw	48·0
Buckwheat kernels	15·0	Rye straw	54·0

Cellulose is said to exist in the animal kingdom in the mantle of Mollusca (*Tunicata*) and the integuments of insects and *Crustacea*. It is more probable, however, that these tissues consist of the nitrogenized body CHITIN (*q. v.*). Virchow (*Comptes Rendus*, xxxvi., 492, 860) found cellulose in degenerated human spleen and in the brain. De Luca (*Comptes Rendus*, lii., 102, lvii., 43) found cellulose in the skin of the silkworm and of the serpent.

Preparation.—Owing to the insolubility of cellulose in water, alcohol, ether, dilute alkalies, and dilute acids, it is generally prepared by subjecting vegetable tissues to the successive action of these agents, by which all foreign substances—sugar, starch, gum, resins, oils, fats, etc.—are removed. It may then be bleached by the action of chlorine water. Thus prepared, it retains more or less perfectly the structure from which it was obtained. Skeleton leaves, which are made up into the beautiful "phantom bouquets," consist of nearly pure cellulose. They are prepared either (1) by boiling the leaves in a dilute solution of caustic soda till the epidermis and parenchyma separate readily, removing them to a vessel of cold water, and carefully rubbing them with the fingers, and then bleaching by immersion in a solution of hypochlorite of lime, to which a little acid has been added; or (2) by adding to a pint of nitric acid, of a specific gravity of 1·1, an ounce of potassium chlorate in fine powder, and suspending the leaves in the mixture for from ten to twenty days. They are then thoroughly washed and dried between sheets of blotting-paper. In the conversion of rags, straw, wood, etc., into paper the cellulose is rendered nearly pure by treatment with caustic soda, hypochlorite of lime, and sulphuric acid. Swedish filter-paper is almost chemically pure cellulose. Common paper receives an addition of a considerable proportion of kaolin (china clay), and is sized on the surface. (See PAPER.) In bleaching the textile fibers—cotton, flax, and hemp—the process has for its object the purification of the fibrous cellulose by the removal of resinous and coloring-matters. See BLEACHING.

Composition.—Cellulose usually contains about 10 per cent. of moisture, which may be removed by drying. It then contains, in 100 parts, carbon 44·44, hydrogen 6·17, oxygen 49·39. Its composition is represented by the formula $n(C_6H_{10}O_5)$. This is also the composition of starch, a body possessing totally different properties. Sugar and gum are nearly allied to cellulose in composition. All these bodies are called *carbohydrates* (*q. v.*), because they consist of carbon in combination with hydrogen and oxygen in the proportions in which they exist in water, H_2O.

Properties.—When pure, cellulose is fibrous or spongy, white, and translucent, and often silky. Under the microscope the fibrous varieties appear like spun glass. It is tough and elastic. Its specific gravity is 1·5. When pure it is unalterable in the air, but when associated with albuminous and other easily alterable bodies, it gradually decomposes (decays) in moist air, undergoing a slow combustion, and changing to a yellow or brown friable substance called touchwood, and then finally to humus. (See FERMENTATION and PRESERVATION OF TIMBER.) Cellulose is insoluble in water, alcohol, ether, and oils—both volatile and fixed. It is not sensibly affected by boiling in water unless it has been derived from a very soft or imperfectly developed portion of a plant, when it becomes pulpy; and in the case of cellulose from Iceland moss, which is easily disintegrated and finally converted into soluble dextrine. Mulder observed that on boiling Swedish filter-paper with water under pressure at 400° F. a little glucose was produced. Another property is that of swelling when wet; hence cellulose from cocoanut fiber is now used in the construction of war-ships, being packed in a coffer-dam at the water-line, extending all around the ship, where it serves to close any aperture before much water enters.

Solution of Cellulose.—An ammoniacal solution of oxide of copper was discovered by Schweitzer to dissolve cellulose without changing its character. The solvent is prepared by dissolving cupric hydroxide in ammonia, or partially immersing copper turnings in ammonia. The cellulose is precipitated from the solution in amorphous flakes by boiling, diluting, or the addition of acids in excess. By dipping paper or cotton or linen fabrics in the copper ammonia solution, and then passing them between rolls, they are rendered waterproof. Several layers of such sheets or cloths pressed together form an artificial wood of great strength. A plastic mass can be prepared of this material suitable for the manufacture of water-pipes, gas-pipes, hats, clothing, boats, etc.

Action of Acids, etc.—Cold dilute acids and alkalies have little action on cellulose. Long boiling with dilute hydrochloric or sulphuric acid converts cellulose into glucose. In concentrated hydrochloric and sulphuric acids it dissolves, exhibiting different products according to the temperature and the duration of the treatment: (1) disaggregated, dissolved cellulose, precipitated by dilution; (2) an amyloid body; (3) dextrin, which differs from starch dextrin in having little action on polarized light. Strong boiling hydrochloric acid converts it into a fine powder, without change of composition. Boiled for a short time with dilute sulphuric acid, it is converted into a pulpy mass, still exhibiting the composition of cellulose, and not sensibly soluble in water. By dipping unsized paper for a few seconds into a mixture of 2 volumes of sulphuric acid and 1 volume of water, and then thoroughly washing with water and dilute ammonia, it is converted into "parchment-paper," a substance of the appearance and properties of animal parchment. Neumann proposed to make cotton and linen fabrics stronger, more compact, and waterproof by subjecting them to the above treatment and pressing between rolls. Parchment-paper is an excellent material for the septa used in dialysis. (See ENDOSMOSIS.) If cellulose is ground with concentrated sulphuric acid, without allowing the mixture to become heated, it forms a pasty mass, and this when largely diluted deposits an amorphous body which is blued by iodine, and is hence called *amyloid*. Longer digestion with sulphuric acid converts cellulose into dextrin, and, on diluting with water and boiling, into glucose. Strong nitric acid, or a mixture of nitric and sulphuric acids, or of niter and sulphuric acid, converts cellulose into nitro-substitution products, such as GUNCOTTON (*q. v.*). Moist chlorine gas and warm solutions of hypochlorites rapidly cause the oxidation of cellulose. For this reason care must be observed in bleaching paper-stock and fabrics by chlorine. See BLEACHING and ANTICHLORE.

Cellulose in its more compact forms is not rendered blue by iodine until it has been disintegrated by sulphuric acid or caustic alkalies. Some lichens and algæ—Iceland moss, for example—give the blue color after being boiled with water. Heated in close vessels, cellulose in all its forms undergoes destructive distillation, yielding charcoal, which remains behind, and combustible gases, tar, and a mixture of water, acetic acid, and methylic alcohol, all of which distill over. See ACETIC ACID, CHARCOAL, and TAR.

Digestibility of Cellulose.—Although wood and straw are not easily digestible by most animals, the cellulose of young and succulent stems, leaves, and fruits is digested to a large extent; and therefore cellulose, which forms a large proportion of the food of herbivorous animals, contributes directly to their nutrition. *Fungin*, from fungi, and *medullin*, from the pith of various trees, are mere modifications of cellulose. *Hordein*, from barley, is a mixture of cellulose with starch and a nitrogenized body.

Cel'sius, Anders: mathematician; b. in Upsala, Sweden, Nov. 27, 1701; nephew of Olof Celsius, Professor of Theology at Upsala and author of *Hierobotanicon*. His father was Professor of Mathematics at Upsala, and at the same university Anders became Professor of Astronomy in 1730—a position which he left in 1732 in order to pursue the study of astronomy where he could have the advantages of an observatory and instruments. He remained some time at Nuremberg with Doppelmayer, in which city he published *Observationes luminis borealis*. He then visited Rome, determining with greater exactitude the meridian drawn by Bianchini and Maraldi. Here he made observations upon the intensity of light, and established the true size of the ancient Roman lineal measures. In 1734 he went to Paris, and with Maupertuis went to Lapland to determine the measure of a degree of latitude. He afterward returned to Upsala, wrote *De observationibus pro figura telluris determinanda in Gallia* (1738), and worked out a theory regarding Jupiter's satellites. At his instance the observatory at Upsala was constructed. A centigrade division of the thermometer called the Celsius scale, which divides the difference of temperature between freezing and boiling water into 100 equal parts, was proposed by him. It differs from the centigrade scale in that it places zero at the boiling-point and reads downward, while the centigrade scale begins at the freezing-point and reads upward. D. in Upsala, Apr. 25, 1744.

Cel'sus, Aulus Cornelius: an eminent Latin medical writer who is supposed to have lived at Rome in the reign of Tiberius. The events of his life are mostly unknown, except that he wrote works on various subjects, including philosophy and rhetoric. These are all lost except his excellent work on medicine, *De Medicina*, in eight books, the style of which is remarkably elegant and pure. He adopted most of the medical doctrines of Hippocrates. The first English translation of his works appeared in 1756. Best edition by C. Daremberg (Leipzig, 1859).

Celsus: the oldest literary opponent of Christianity; of uncertain date and origin; the author of *The True Discourse*, to which Origen replied, giving copious extracts, and thus preserving our only knowledge of the treatise. It is divided into four parts, preceded by an introduction in which the general character of Christianity and its divisive character are touched upon. Part i. is an historical refutation of Christianity from the standpoint of Judaism, a Jew being the alleged speaker, apparently from literary considerations, for Celsus was far from being a Jew. In this part Celsus concerns himself with the life and work of Jesus. Part ii. is a general refutation from the standpoint of philosophy. Part iii. opposes certain special doctrines of Christianity from the standpoint of the history of philosophy. Part iv. is an attempt to convert the Christians to the worship of the heathen divinities. The extracts of the treatise will be found translated in connection with Origen's refutation in vol. iv. of the American edition of *The Ante-Nicene Fathers*, pp. 395–669 (New York), and as put together in German by Theodor Keim, *Celsus' Wahres Wort* (Zurich, 1873), which is the authoritative edition. Keim dates the treatise A. D. 178.

Samuel Macauley Jackson.

Celt [from Late Lat. *celtis*, a stone chisel]: the name given by archæologists of Europe to certain instruments of stone or bronze which were used by prehistoric peoples. Similar stone tools are found in the U. S., but are not often called "celts." They are generally of a kind of chisel-shape, but vary greatly in this respect, some being extremely rude and simple; others, especially the bronze ones, are sometimes ornamented with some taste with cut lines. In length they vary from 2 inches to 2 feet. They often had handles, and seem to have served for axes and domestic utensils, as well as for weapons of war and the chase.

Celtibe'ri, or **Celtibe'rians**: an ancient and powerful people who inhabited the northern or northeastern part of Spain. They are supposed to have been a mixture of indigenous Iberians with Celtic people who came from Gaul. Their country was called *Celtiberia* (Gr. Κελτιβηρία). They were a warlike nation, and were subdued by Hannibal with great difficulty. In the second Punic war they fought for the Carthaginians. They made a brave and long resistance to the Romans, who conquered them about 143–133 B. C., and they renewed the war under Sertorius. Among their chief towns were Segobriga and Numantia. Celtiberia proper comprised the southwestern part of Aragon, Cuença, Soria, and the greater part of Burgos, but the name was sometimes applied by the Romans to a larger region.

Celtic Church: See England, Church of.

Celtic Languages: These languages are steadily declining, two only of their branches having living representatives to-day—(1) the Irish or Gaelic (*Goidelic*), divided into the Irish in Ireland, the Gaelic in Scotland and the western islands, and the Manx of the Isle of Man; (2) the Britannic, divided into the Welsh (Cymric) in Wales and the Bretonic (Armoric) in the French Basse-Bretagne, which was settled in the fifth and sixth centuries A. D. by immigrants from England. To this branch belonged also the Cornish of Cornwall, which became extinct in the eighteenth century, and was closely allied with the Bretonic. It is also proposed to call this second group Brythonic, from a native name for Welsh. The Celtic-speaking population of the world, i. e. the number of those *able* to speak Celtic, was estimated in 1880 at about 3½ millions. The most of these, however, spoke a second language, the English or the French. Since that time the Celtic has certainly declined still further. The only one of its languages that now possesses actual vitality is the Welsh.

In antiquity the race and tongue of the Celts (Gr. Κελτοί and Γαλάται, Lat. *Galli* and *Celtæ*) held sway over a much more extensive territory, spreading itself over a large portion of the European mainland. Its center of distribution seems to have been the western part of Central Europe, Northern France, the central Rhine, and the upper Danube. As early, however, as the sixth century B. C. it had occupied the western part of the Iberian peninsula. About 400 B. C. nearly the whole of upper Italy (*Gallia cisalpina*) was occupied by Celtic tribes, which soon after made their appearance also in Southern France. They pushed their way at the same time also toward the E., into what is now Austria, and into Illyria, and followed the course of the Danube as far as the Dobrudscha. One body of them founded in Asia Minor the principality of Galatia. At what period the Celts first entered the British isles we do not know, but the various branches of speech represented there show that several different migrations occurred.

The downfall of the Celtic power and the consequent decline of the Celtic language on the mainland was occasioned by the twofold pressure from north and south; on the north the Germans, who as early as Cæsar's time bordered the Rhine, were pushing their way forward, and from the south the Romans were subjugating one after another of the Celtic lands. The latest authentic evidence of the existence of the Celtic tongue in Gaul dates from about 400 A. D. In the British isles also the Celtic has been steadily displaced by the English, and yearly is losing ground.

The linguistic remains of continental Celtic are extremely scanty, consisting of about thirty inscriptions from the two Gauls, mostly in Greek or Roman writing, and a large number of proper names in the ancient writers and in Latin inscriptions. These have been collected in Holder's *Alt-celtischer Sprachschatz* (from 1891). They suffice to show it is essentially the same language as the island-Celtic, though it is impossible to determine therefrom the entire structure of the language. The Irish-Gaelic and the Britannic branch we know more fully, both through the surviving dialects and from the literature, which extends back into the Middle Ages. (See under the different languages.) Concerning a third Celtic branch on the British isles, the Pict, we have only the most meager information; it had become extinct before the year 1000.

After the discovery of the Indo-European family of speech, Prichard (1831) and Pictet (1837) were the first to assert on the basis of etymologies that the Celtic belonged to it also. Definite proof was furnished by Bopp (1838) on the basis of the grammatical structure. It has ever since been accepted as fully established that the Celts are to be regarded as brothers of the Italians, Greeks, and Germans, the Slavs and Lithuanians, the Hindus, Iranians, and Armenians. The solid foundations of Celtic philology were laid by J. C. Zeuss in his *Grammatica Celtica* (1853; 2d ed. by Ebel, 1871). This work treats of the grammar of all the Celtic languages studied from their earliest documents. Since this the history of the different languages, pre-eminently of the Irish and Bretonic, has been the subject of diligent investigation.

Characteristic of the Celtic family is (1) the loss of Indo-Eur. *p*- (initial); Ir. *athir*: Lat. *pater*, father: (2) the change of *ē* to *ī*; Gall. *catu-rīx*, battle-chief: Ir. *rī*: Lat. *rēx*; (3) the masc. genitive in *-i*, Gall. *Dannotali* (nomin. *-talos*). The passives and deponents with *-r*, Ir. *sechidir*: Lat. *sequitur*, he follows, unite with other things to show that among the

Indo-Europeans the Italic tribes (the Latins, Umbrians, Samnites, etc.) held the closest relation to the Celts. The languages of the island Celts lack an infinitive proper, and have preserved but one of the original participles.

Among the Celts, the Britons and the Gauls have generally been regarded as closely related, and some considerations favor this view; thus Gall. and Brit. *p* for Ir. *c* (< i. e. *q*), e. g. Gall. *Tetru-corii*, Welsh *pedwar*, four, but Ir. *cethir* (: Lat. *quattuor*). In other points, however, the Britannic unites with the Irish, so that it seems to occupy a mean position between the two. Whether the Celts of the Iberian peninsula were closely related to the Irish is uncertain, as too little remains of their language. The island-Celtic (neo-Celtic) languages of MSS., since the eighth century, hold a relation to Old Celtic and Gallic similar to that of French to Latin—almost all the final syllables have disappeared. The Irish branch is, however, more primitive in type than the Britannic, the former retaining the noun inflection, while the latter from the earliest period uses but one form for the singular and one for the plural. The Old Irish vocabulary is also purer than the Britannic, as the latter under the Roman sway adopted many Latin words; cf. Loth, *Les mots latins dans les langues brittoniques* (1892). Both branches are remarkable for the variation of the initial element of words; thus Irish *bard*, bard, according to the word immediately preceding it, is also pronounced as *ward* and *mard*; Welsh *penn*, head, also *benn*, *fenn*, and *mhenn*. In other respects the two branches are strongly differentiated, but the subdivisions of both are closely connected among themselves. Welsh and Bretonic too were earlier, but little differentiated. In the course of the centuries, however, they have followed distinct courses, the former adopting much English, the latter much French material. A journal especially devoted to Celtic philology is the *Revue Celtique* (since 1870), in which a discussion of the more recent literature will be found. R. Thurneysen.

(Translated by Benj. Ide Wheeler.)

Celtic Literature: See Gaelic Literature and Kymric Literature.

Celts, or **Kelts** [Lat. *Celtæ*, Gr. Κελτοί, Κελται (Strabo), a name, like most names of peoples, of doubtful origin]: one of the great divisions of the Indo-European family of mankind, itself divided on the basis of language into three groups: the Gaelic, Britannic, and Gallic. The Gaelic division of languages comprises the Irish, the Scotch-Gaelic and the Manx (of the Isle of Man). The Irish and the Scotch Gaelic have been differentiated only since the eighth or ninth century. The Britannic comprises the Cymric or Welsh, the Cornish (extinct since early in the nineteenth century), and the Bretonic (Armoric) of Brittany. The Gallic, or the language of ancient Gaul, is known only from a few inscriptions and coins, and Celtic names quoted by Latin and Greek writers. (See Celtic Languages.) But the Celtic blood is much more widely diffused than those relics of their language would seem to indicate. Almost all France (Gallia) was inhabited by Celts. The Belgæ are thought to have been partially Cymric, as the ancient Britons undoubtedly were. The name *Celtiberi* indicates that in Spain the Celtic was probably long ago mixed with the Basque or Iberian blood. Northern Italy was long so entirely Celtic as to be called Cisalpine Gaul. The Celts under Brennus invaded Greece. In Asia Minor they settled and gave name to Galatia. In Germany the Boii gave name to Bohemia and Bavaria. In Great Britain the Cymri long had sway in Cornwall, Cumberland, and Strathclyde. It is probable that the present Cymric element of Northwestern France, though generally traced to immigration from England, is partly of direct Gaulish descent. Many of the Latin and Germanic races have a strong infusion of Celtic blood.

The ancient Celtic religion was a rude polytheism, the mythology and doctrines of which are now for the most part unknown. The priestly caste of Druids were lawgivers, poets, and prophets as well. Human sacrifices were common. The common people were grossly superstitious and ignorant. Weakened by the workings of their rude social system of clans and septs, oppressed by the exactions of their priesthood, and harassed by the constant inroads of Rome and the Germanic tribes, the Celts, after the dawn of history, are almost constantly seen to be the losing race. But they yielded nothing except to force, and among all the races none was ever more distinguished for valor. Among their other characteristics may be mentioned profound religious feeling and acute sensibilities.

The Celtic literature is of very ancient origin, all the old Celts having a literary class called "bards," sometimes of noble and sometimes of sacerdotal rank. The ancient Irish wrote in a rude alphabet called the Ogham. The people of Gaul have left comparatively few inscriptions, and these are often much Latinized. The chief existing Celtic literature consists of the hymns, martyrologies, annals, and laws of Ireland (see Gaelic Language and Ireland); the Welsh poems and laws, and many historical and theological works, mostly of a somewhat later date than the Irish, with the *Mabinogion*, a collection of tales. There are also extant a few Cornish religious dramas. The Manx literature is not extensive, and is quite recent. The number of people speaking the Irish, Manx, and Gaelic languages is rapidly diminishing, while the number of persons of Celtic blood seems to be increasing. The English language is fast displacing the others in Ireland, Scotland, and the Isle of Man. In Wales, however, the use of the Cymric language is probably much more extensive now than for many centuries past. Intense national feeling and systematic, persistent, and widely sustained effort have caused the old language to maintain its ground. See Celtic Languages, Irish Language, Irish Literature, Welsh Language, Welsh Literature, Manx, Cornish, Gaelic, and Bretonic.

Cem'bra Pine, or **Swiss Stone Pine**: the *Pinus cembra*; a noble and stately forest tree of Asia and Europe; cultivated to some extent in parks and arboretums in the U. S. It is prized for its seeds, which, though hard to extract from the cone, are very agreeable, and are used for dessert, and with those of *Pinus pinea* (the stone pine of Southern Europe and Barbary) are sold under the name of pine-nuts. The Cembra pine yields also a thin fragrant turpentine, called Riga balsam, Carpathian balsam, or balsam of Lebanon. It is caught in bottles as it flows from the wounded twigs, and is used in medicine.

Cement [from Lat. *cæmentum*, for *cædimen'tum* (cf. *prū'dens* < **providens*, *aetas* < **ae'vitas*, *auceps* < **aviceps*); deriv. of *cæ'dere*, hew, lit., chipped stone, broken stone, applied to broken stone used in setting mortar, so, finally, mortar]: any fluid, semi-fluid, or plastic substance capable of uniting solid bodies together when interposed between the surfaces, and afterward solidifying. There are many kinds of cement, animal, vegetable, or mineral, used separately or in combination with each other.

Glue is a cement of animal origin in common use. It is a hard, brittle, brownish gelatine, obtained by boiling to a soft jelly the skins, hoofs, etc., of animals. When heated gently with water it becomes viscid, and is employed for uniting solid bodies, mostly wood. In drying it becomes very tough and hard, but is easily softened again by water. Marine glue is formed by dissolving 1 lb. of india-rubber in 5 gal. of coal-naphtha, and adding to this solution an equal weight of shellac. The mixture is then placed over a gentle fire, and thoroughly incorporated by stirring. This glue is insoluble in water, and is very tenacious and adhesive. A cement for iron pipe, etc., is made as follows: Mix together in a mortar 2 oz. of muriate of ammonia in powder, 1 oz. of flowers of sulphur, and 16 oz. of cast-iron filings, and keep the mixture dry for use. When the cement is to be used, take 1 part of this mixture, 20 parts of clear iron borings or filings, pound them together in a mortar, mix them with water to a proper consistency, and apply the compound between the joints. A good cement for resisting moisture is made by mixing 8 parts of melted glue, of the consistency used by joiners, with 4 parts of linseed-oil, boiled into varnish with litharge. This cement hardens in 45 to 50 hours, and renders the joints of wooden cisterns and casks air and water tight. A good cement for coating the outside of buildings consists of linseed-oil, rendered dry by boiling with litharge, and mixed with porcelain clay or well-dried pipeclay in fine powder, to give the consistency of stiff mortar. Oil of turpentine added in small quantity to thin the cement aids its adhesion to stone, brick, or wood. A cement designed to improve the composition of artificial stone, stucco, etc., is made by dissolving 1 lb. of gum shellac in 3 to 4 oz. of concentrated alkali in aqueous solution. This mixture is then diluted with water, and used for mixing up the materials—hydraulic cement, lime, and sand—of which the artificial stone or stucco is made. The water required to mix 1 cubic foot of the materials should contain 1 to 2 oz. of gum shellac. Shellac dissolved in a concentrated solu-

tion of borax gives a good cement for uniting broken stone. Singer's cement for joints between brass and glass is made by melting together 5 lb. of rosin, 1 lb. of beeswax, 1 lb. of red ocher, and 2 tablespoonfuls of gypsum. Ure recommends for cementing voltaic plates into wooden troughs, and for similar uses, a cement made of 6 lb. of rosin, 1 lb. of red ocher, ½ lb. of gypsum, and ¼ lb. of linseed-oil; the ocher and gypsum to be calcined beforehand, and added to the other ingredients while in fusion. French plumbers employ for the joints of glazed pottery pipes, used for distributing water, a cold cement made of quicklime, cheese, milk, and the white of eggs, or a hot cement made by melting rosin, beeswax, and lime together. There are a great variety of cements composed of vegetable, mineral, and animal substances mixed, which it is not deemed necessary to mention.

There is a class of cements of which plaster-of-Paris or gypsum is the basis, the hardening of which is due to the union of the plaster with water, and not to the formation of silicates, as in the hydraulic cements hereinafter described. Plaster-of-Paris, however, never attains sufficient hardness and tenacity to be used with water alone. It may be advantageously combined with alum. Keene's cement is made by mixing powdered gypsum with an aqueous solution of alum, then heating the mixture until the water of combination is driven off. It is then finely ground in a suitable mill, and slaked with a solution of 1 part of alum to 12 or 13 parts of water by weight. Martin's cement differs from Keene's in adding to the original mixture a portion of carbonate of soda or of potassa. It is burnt with a higher degree of heat. In Parian cement borax is used instead of the carbonate of soda or of potassa.

Cement—Common Lime, Hydraulic Lime, and Hydraulic Cement.—Considered as materials for use in the builder's art, the products derived from the calcination of pure and impure limestones are classified into common or fat lime, hydraulic lime, and hydraulic cement. Common lime is sometimes called air lime, because a paste or mortar made from it requires exposure to the air to enable it to "set," or harden. The hydraulic limes and cements are also called water limes and water cements, from their property of hardening under water.

Common Lime.—The limestones which furnish the common lime of commerce are seldom if ever pure, but usually contain, besides the carbonate of lime, from 3 per cent. to 10 per cent. of impurities, such as silica, alumina, magnesia, oxide of iron, oxide of manganese, and traces of the alkalies. Lime, common lime, quicklime, or caustic lime (synonymous terms), is a protoxide of calcium, and is produced when marble or any other variety of pure or nearly pure carbonate of lime is calcined with a heat of sufficient intensity and duration to expel the carbonic acid. It has a specific gravity of 2·3, is amorphous, highly caustic, has a great avidity for water, and when brought into contact with it will rapidly absorb nearly a quarter of its weight of that substance, accompanied and followed by a great elevation of temperature, the evolution of hot and slightly caustic vapor, the bursting of the lime into pieces, and finally its reduction to a powder, of which the volume is from two and a half to three and a half times that of the original lime. In this condition the lime is said to be slaked, and is ready for use in making mortar. The purer the limestone the larger is its *growth* or increase of volume in slaking. The paste of common lime is unctuous and impalpable to the sight and touch; hence these limes are sometimes called *fat* or *rich* limes, as distinguished from others known as *poor* or *meager* limes. These latter usually contain more or less silica in the form of sand, and a greater proportion of other impurities than the fat limes, and in slaking exhibit a more moderate elevation of temperature, evolve less hot vapor, are seldom reduced to an impalpable, homogeneous powder, yield thin paste, and are characterized by less *growth* of volume. They are less valuable for mortar than the fat limes, but have an extensive application as a fertilizer. When used for building purposes they should, if practicable, be reduced to powder by grinding, in order to remove all danger of subsequent slaking.

Common lime, when mixed into a paste with water, or when slaked with sufficient water to produce a paste, may be kept for an indefinite time in that condition without deterioration, if protected from contact with the air so that it will not dry up. It is customary to keep the lime-paste in casks, or in wide, shallow boxes in which it was slaked, or heaped up on the ground, covered over with the sand to be subsequently incorporated with it in making mortar. It is convenient, for some purposes, to keep the slaked lime on hand in a state of powder, which may be done in casks under cover, or in bulk, in a room set apart for that purpose. Most common limes contain impurities which prevent a thorough, uniform, and prompt slaking of the entire mass, and hence the necessity of slaking some days before the lime is to be used, to avoid all danger to the masonry by subsequent enlargement of volume and change of condition.

A paste or mortar of common lime will not harden under water, or in continuously damp places excluded from contact with the air. It will slowly harden in the air, from the surface toward the interior, by desiccation and the gradual absorption of carbonic acid gas, by which a subcarbonate with an excess of hydrated base is formed, or $CaO.CO_2 + CaO.HO$.

The pastes of fat lime shrink, in hardening, to such a degree that they can not be employed as mortar without a large dose of sand. In other situations they have a very extensive application, possessing as they do a great advantage in economy over the hydraulic limes and cements, on account of the large augmentation of their volume in slaking, their extensive distribution over the surface of the globe, and the simplicity attending their manufacture. For masonry constructions of importance, and particularly upon our public works, a mortar or a concrete containing common lime only as the cementing medium is seldom used at the present day. Hydraulic lime or hydraulic cement is usually added, to a greater or less extent, in order to hasten the induration and secure greater ultimate strength and hardness.

The Hydraulic Property.—A lime is said to possess *hydraulic* properties when, after being calcined, reduced to powder, and made into a paste with water, it will harden or set under water, or in damp places excluded from contact with the atmospheric air. If the calcined stone can be slaked to powder in the presence of water, it is customary to call it *hydraulic lime.* The *cements* possess the hydraulic property to a greater degree than the hydraulic limes, and are reduced to powder by grinding. In both initial and ultimate strength and hardness, the hydraulic mixtures are greatly superior to those of common lime, even when the latter are employed under the most advantageous circumstances, but their maximum strength is not reached under a period of several years. The best cements, when mixed to a paste without sand, attain during the first month, or month and a half, fully one-half their greatest ultimate strength and hardness. After the first two years, the increase in strength and hardness proceeds very slowly, and at the end of three years the monthly increment requires the use of delicate instruments for its measurement. This principle of slow and gradually diminishing induration is characteristic of all hydraulic mortars, whether derived from the cements or the hydraulic limes, either natural or artificial. The most *active* hydraulic limes or cements, or those which set the most quickly, are not necessarily those which attain the greatest ultimate strength and hardness. The latter are characterized as possessing the greatest hydraulic *energy.*

The *argillaceous hydraulic limes* of commerce are generally derived from limestones containing from 10 to 20 per cent. of clay, homogeneously mixed with carbonate of lime as the principal ingredient. Traces of the alkalies, and a small percentage of the oxides of iron and carbonate of magnesia, are also present in most cases. The clay ingredient usually contains from 1½ to 2 of silica to 1 of alumina. During the burning, which is conducted at a heat just sufficient to expel the carbonic acid, all the silica and alumina is neutralized by entering into combination with a portion of the lime, forming both the silicate of lime and the aluminate of lime, leaving in the burnt product an excess of quick or caustic lime, which induces slaking, and becomes hydrate of lime when brought into contact with water. As this lime is burnt at a low heat, the double silicate of lime and alumina, which is formed only at a high heat, is not produced. The silicate of lime is first formed, and the alumina, reacting upon the quicklime as an acid, produces aluminate of lime. When slaked by sprinkling, the quicklime alone is hydrated.

Argillaceous hydraulic lime is therefore composed of—

Anhydrous silicate of lime	$SiO_3.3CaO$, or	Silica	23
		Lime	43
Anhydrous aluminate of lime	$Al_2O_3.3CaO$, or	Alumina	17
		Lime	22
And hydrate of lime	$CaO.HO$, or	Lime	34
		Water	11

When argillaceous hydraulic lime is mixed into a paste with water or made into mortar, the anhydrous silicate and aluminate of lime form hydro-silicates and hydro-aluminates of lime by combining with six equivalents of water, and subsequently undergo a species of crystallization technically called *setting*. This setting will ensue under water, and constitutes the hydraulic property.

If, in the general case, more than 20 per cent. of clay be present in a homogeneous limestone, a larger proportion of the lime will combine with silica or alumina during the burning, leaving insufficient quicklime present to induce slaking; and such stone may be expected to furnish a hydraulic cement. Some heterogeneous limestones, however, containing as high as 30 to 35 per cent. of clay, will slake more or less thoroughly after burning, for the reason that the ingredients are not in sufficiently close contact to combine in the kiln in the formation of the hydraulic elements. In such cases the burnt product contains an excess of lime, of silica, and of alumina, and, after slaking as much as possible, there still remains a lumpy residue.

Limes containing 10 per cent. of clay are *moderately hydraulic*. If made into a paste and immersed in water in small cakes, they will harden so as to resist crushing between the thumb and finger in from twelve to fifteen days. The *eminently hydraulic limes*, derived from homogeneous stones containing from 18 to 20 per cent. of clay, will harden under water in from twelve to twenty hours. If the stone contains more clay than this, and still yields hydraulic lime by slaking, the excess of clay does not combine with lime, and therefore confers no additional hydraulic energy. On the contrary, it impairs the strength and value of the lime for building purposes.

In consequence of their peculiar properties, the hydraulic limes can not be kept on hand in a state of paste, like common lime. They are preserved in casks or sacks in the condition of powder, and in using them for mortar or concrete, especially those that are eminently hydraulic, it is not well to mix more than one day's supply in advance. The lime and the sand may be mixed together dry, and kept on hand a long time in that condition if protected from the weather, but the water should not be added until a few hours before the material is to be used, whether for mortar or concrete.

The method usually pursued in manufacturing hydraulic limes is as follows: The stone, after being quarried and broken up into pieces not exceeding generally 12 or 15 lb. in weight, is burnt in any suitable kiln at a heat just sufficient to expel the carbonic acid, and then, after being drawn from the kiln and while still warm, is sprinkled with from 15 to 20 per cent. of its own weight of water. The slaking soon begins, and the stone falls to pieces, some of it in fine powder, and the rest in unslaked lumps of various sizes. The mass is then thrown together in large heaps, where it remains undisturbed for six or eight days, in order that the slaking may be completed by the steam evolved. It is then screened through fine wire-cloth to get rid of the unslaked lumps, packed in sacks or barrels, and sent to market.

It is not known that any deposits of argillaceous limestones capable of furnishing good hydraulic lime exist in the U. S. It is manufactured in several localities in France, notably at Seilley, about 70 miles from Paris. The Seilley lime is exported to the U. S. in small quantities for use in making artificial stone. When fresh it weighs about 50 lb. to the struck U. S. bushel, loosely measured. If made into a stiff paste, it will set in the air in ten or twelve hours, and will resist crushing between the thumb and finger in from twenty to twenty-four hours. It is not active enough for laying masonry under water, but will harden under water after the initial set has taken place in the open air.

The *siliceous hydraulic limes* are generally derived from siliceous limestones containing from 12 to 18 per cent. of silica, less than 90 per cent. of carbonate of lime, with a small proportion of alumina and oxide of iron. The process followed in their manufacture is similar, in all essential respects, to that described for producing argillaceous hydraulic lime. They owe their hydraulic property, when mixed to a paste with water, to the crystallizing energy of the anhydrous silicate of lime, formed during the calcination: $SiO_3.3CaO = \begin{cases} \text{Silica, } 23. \\ \text{Lime, } 23. \end{cases}$ The best type of siliceous hydraulic lime is derived from the quarries at Teil on the river Rhône, department of Ardèche, France. It is known as hydraulic lime of Teil. The raw stone contains from 11 to 15 per cent. of silica, from 1 to 2 per cent. of alumina, from 80 to 84 per cent. of carbonate of lime, and a trace of oxide of iron. When newly made this lime weighs about 56 lb. to the struck U. S. bushel, loosely measured, but if exposed to the air it absorbs moisture so that its weight is considerably augmented. In initial hydraulic energy the Teil lime does not materially differ from the lime of Seilley, but in ultimate strength and hardness it is believed to be superior to it. Analyses of the Teil hydraulic lime after burning, by Prof. Rivot, gave the following composition:

Lime	78·29	.....	73·60	
Silica	18·20	.....	17·20	
Alumina	1·80	21·70....	1·70	20·50
Quartz sand	1·70	.....	1·60	
Oxide of iron	traces	.....	traces.	
Water and carbonic acid	....	.....	5·00	
	99·99		99·10	

The elements of hydraulic energy in this lime may be stated to be 60 per cent. of the whole immediately after calcination, as indicated below, neglecting a small quantity of alumina and oxide of iron:

Silicate of lime	66	Silica	23	$SiO_3.3CaO$.
		Combined lime	43	
Free lime	34		34	CaO.
	100		100	

Heavy, Slow-setting Argillaceous Cement (*Portland Cement*).—When a homogeneous, argillaceous limestone contains so large a proportion of clay, usually exceeding 20 per cent., that it will not slake after calcination, it may be expected to furnish some grade of hydraulic cement. The stone from which the celebrated Portland cement is derived contains from 20 to 22 per cent. of clay and 78 to 80 per cent. of carbonate of lime. The clay itself is composed of 1½ to 2 parts of silica to 1 of alumina. When calcined at a high, long-continued heat, all or nearly all the silica and alumina of the clay combines with a portion of the lime, producing both silicate of lime, represented by the formula $SiO_3.3CaO \begin{cases} \text{Silica, } 23, \\ \text{Lime, } 43, \end{cases}$ and double silicate of lime and alumina, as expressed by the formula

$$SiO_3(Al_2O_3 + CaO)_3 \begin{cases} \text{Silica,} & 15, \\ \text{Alumina,} & 51, \\ \text{Lime,} & 28. \end{cases}$$

The burnt product does not contain any uncombined, and therefore inert, silica and alumina to adulterate the cement and impair its hydraulic properties; while the quantity of uncombined lime is not sufficient to cause the mass to slake to powder in the presence of water. After calcination the cement is therefore reduced to powder by grinding between ordinary millstones.

Good Portland cement, when made into paste and formed into small cakes, will set under water in from two to four hours, so as to resist crushing between the thumb and finger. When stone suitable for Portland cement is calcined at a low heat, barely sufficient to expel the carbonic acid, the silicate of lime (as above) and the aluminate of lime ($Al_2O_3.3CaO$) are formed, and a light quick-setting cement is usually the result, greatly inferior to Portland cement in weight as well as in ultimate strength and hardness.

The superior quality of Portland cement appears to depend in a great measure upon the presence of the double silicate of lime and alumina, which is formed only at a high heat. The weight of Portland cement, as well as its hydraulic energy and its ultimate strength and hardness, is increased by augmenting the intensity and duration of the heat employed in burning, within the limit of vitrification. The initial hydraulic activity, however, is diminished by high burning, so that the best Portland cements are slowest in setting. A cement weighing 100 lb. to the struck U. S. bushel may be burnt to weigh 125 lb. to the bushel, and its strength will be nearly doubled thereby.

Artificial Portland Cement.—Fully nineteen-twentieths of all the Portland cement used in Europe is artificial. It is made by thoroughly mixing together, in suitable proportions, clay and finely pulverized carbonate of lime (either chalk, marl, or compact limestone), burning the mixture in kilns at a high heat, and then grinding the burnt product to fine powder between ordinary millstones. There are two methods of manufacture, both well adapted to the char-

acter of the materials employed, and known respectively as the "wet proeess" and the "dry proeess."

Portland Cement by the Wet Process.—The works in the vicinity of London, England, employ the wet proeess. The carbonate of lime is furnished by both the white and gray chalks of the neighborhood. The clay procured from the shores of the Medway and Thames, and from the adjoining marshes and inlets, eontains about 2 parts of silica to 1 of all the other ingredients, eomprising alumina, oxide of iron, soda, carbonatc of lime, etc.

First. The clay and chalk are mixed together with a large quantity of water in a eireular wash-mill or basin, provided with heavy harrows attached to the horizontal arms of a revolving vertieal shaft. By this means the ehalk is thoroughly pulverized and ineorporated with the elay in a semi-fluid state. The proportions are about 1 of elay to 3 of chalk, by weight. Seeond. When a thorough mixture of the ingredients is thus effeeted, the liquid mass, resembling whitewash in appearanee, is conducted into large reservoirs, called *backs*, where it is left to settle. When the heavier material, or raw eement, has settled to the bottom, and the surplus water has become clear on top, the latter is drained off. By subsequent evaporation the drying proeess is continued until the raw eement has attained the requisite stiffness. During the time the mixture remains in the backs samples of it are taken from time to time and made into eement by burning in sample kilns, in order to test the accuracy of the proportions. If any error in this respeet is discovered, it is eorrected by conveying from the wash-mills additional material containing an excess of either elay or chalk, as the ease may require. Sometimes the needed eorreetion is secured by mixing together the contents of two or more backs. Third. When, by evaporation, the raw cement mixture has attained the consisteney of butter, or rather of stiff clay, it is taken out of the baeks by shovelfuls, and in that form and condition is removed to rooms artificially heated, or spread out around the tops of the kilns, and further dried. Fourth. After being dried, although it is not neeessary to expel all the moisture, the cement is burnt in suitable kilns with nearly a white heat, just below the point of incipient vitrification. The kilns may be intermittent or perpetual, the latter being most eeonomical in eurrent expenses, though somewhat more costly in original outlay for construetion. When properly burnt, the pieees of eement, called *clinker*, are of a greenish-brown eolor, contorted and much shrunken from the effect of the heat. Fifth. The cement clinker is then finely ground between ordinary millstones, packed in barrels, eaeh containing 400 lb. net, and sent to market.

Portland Cement by the Dry Process.—By the dry proeess any of the eompaet limestones, as well as the ehalks and marls, may be used in making Portland eement. First. The raw materials—the earbonate of lime and the elay—are kiln-dried at 212° F., in order to expel the moisture and prevent caking in the kiln, and otherwise faeilitate grinding and sifting. Seeond. After drying, the clay and the earbonate of lime are mixed together in suitable proportions, and redueed to a fine powder. In most localities the proportion will vary from 20 to 23 per eent. of elay and 80 to 77 per eent. of the carbonate. One kind of machine will not suffice for grinding the raw material eeonomieally. In Germany, whenee most of the artifieial Portland cement made by the dry proeess is derived, three maehines are used, viz.: (1) A stone-breaking maehine of the kind usually employed in breaking stone for roadways or for eoncrete. Through this the dried and mixed materials are passed, issuing therefrom in pieces varying from the size of a pea to that of a hen's egg. (2) A further reduetion is effeeted by a vertical mill or edge-runner. (3) The material is then finely ground between horizontal millstones. Third. The powdered material is then tempered to a rather stiff paste in a briek-making maehine, and made into bricks of a suitable size for burning. During this mixing the material is kept warm by coils of steam-pipe or otherwise, and the water used for tempering is rendered strongly alkaline by adding 3 to 6 per cent. of calcined soda, and an equal amount of newly burnt slaked lime. Fourth. The bricks are dried by artificial means, and are then burnt at a high heat and ground to a fine powder, as in the wet proeess. The same number of mills is necessary for grinding the cement as for pulverizing the raw materials. The clinker is first put through a stone-breaking machine, then into a vertical mill or edge-runner, and lastly is ground to an impalpable powder in a horizontal mill.

American Portland Cement.—The manufaeture of Portland cement in the U. S. began in 1875, and it is now produced at Coplay, Pa., Egypt, Pa., Jordan, N. Y., and other places. In 1886 the U. S. imported 650,000 and manufactured 150,000 barrels of Portland eement. The growth of this industry is due to the discovery of argillaeeous limestone possessing the requisite properties. The stone is broken into small pieces by a crusher, and then into an impalpable powder by a finer crusher. This powder is tested, and, if necessary, marl or clay is added in proper proportions. The whole mass again is passed between millstones to more thoroughly ineorporate the different parts, after which it is taken to a pug-mill where water is added in suffieient quantity to produce a stiff paste, and this is taken in barrows to a drying-floor and spread out over the floor to a depth of about 4 inehes, when a workman lays a scaled strip upon it, and with a large spade-like blade fastened in a handle at right angles with the eenter, cuts the mass into brieks; another workman with a shovel follows and overturns or up-ends them, giving them an opportunity to dry out. After drying, boys pile them up for further kilning. These brieks are now put into another furnace or kiln, alternately with layers of coke, and fired for three days. The result is a clinker and refuse, and the elinker is again crushed and ground in another set of millstones, after which it is bolted through a mesh of 2,500 parts to the square ineh. The eement is now taken to a storehouse, and barreled or put up in sacks for shipment.

Light, Quick-setting, Argillaceous Cements.—When an argillaceous limestone, eontaining more than 23 per cent. of elay homogeneously mixed through the mass, is burnt with the great intensity and duration of heat neeessary to produee Portland eement, it generally fuses into a speeies of slag or glass, in eonsequence of the large amount of silica present, and beeomes nearly destitute of hydraulic energy. But if the caleination be kept below the point of vitrification, it may be expected to yield a quiek-setting hydraulic cement, weighing about 70 lb. to the struek bushel, loosely measured. In the burning, a portion, and in some eases all, of the lime enters into combination with a portion of the siliea and alumina of the clay, produeing silicate and aluminate of lime, leaving generally an excess of uncombined elay, but more espeeially of siliea, whieh, being inert, adulterates the cement, injuring its hydraulie energy, and eonsequently impairing its strength. Cements of this elass, if mixed into a paste and immersed in water, will set so as to lose their plastie condition in ten or fifteen minutes, but are far inferior in ultimate strength and hardness to Portland cement of average quality. Some of these contain as high as 10 or 15 per eent. of the oxides of iron, the proportion of elay in such eases being generally below 23 per eent.

The eement of Vassy, Grenoble, Camp Rond, and Corbigny, in Franee, and the English and French Roman eements made from nodules of septaria, belong to this elass. No deposits of this type of argillaceous limestones have been diseovered in the U. S.

This grade of eement may also be produeed artificially, by burning at a low heat a mixture of lime and clay, and was manufaetured largely in England and Franee by this method before the superior and peculiar qualities of the Portland eement were diseovered.

Argillo-magnesian Cements.—All the natural hydraulic cements of the U. S. are made from argillo-magnesian limestones—that is, limestones of whieh the prineipal ingredients are earbonate of lime, earbonate of magnesia ($MgO.CO_2$), and clay. The Rosendale eements, from the valley of Roundout creek, in Ulster co., N. Y., and those found at Shepherdstown, Va., Cumberland, Md., Louisville, Ky., and at different points on the line of the Erie Canal, and at Sandusky, O., Utiea, Ill., and other loealities in the West, belong to this elass. The process followed in their manufaeture is essentially the same for all. The stone is quarried, and then broken up into pieces of irregular size, seldom exceeding 12 or 15 lb. in weight, and burnt in an ordinary kiln (either intermittent or perpetual), with either wood or coal as fuel. Where coal is used the perpetual method of burning is usually followed, the kiln being filled, in starting, with alternate layers of eoal and stone, and then fired with wood at the bottom. As the burning proeeeds, the charge settles down, the burnt stone is drawn at the bottom of the kiln, and alternate layers of eoal and stone are added at the top. The burnt cement is then erushed up into small fragments by suitable machinery, ground between ordinary millstones, packed in barrels of 300 lb. each, and sent to market.

In burning the argillo-magnesian cement both the lime and the magnesia combine with the silica and alumina of the clay. The result is the formation of the silicate and aluminate of lime and magnesia—compounds which become hydrates when water is added, and are capable of undergoing the species of crystallization or hardening under water called *setting*. The argillo-magnesian cements can not be burnt with that intensity and duration of heat necessary in making Portland cement without fusing into slag, destitute of hydraulic energy. Those manufactured in the U. S. are all quick-setting, and their weight does not ordinarily exceed 70 lb. to the struck bushel, loosely measured. The Rosendale cement is regarded as the most valuable of them all, but even this will never attain, under the most favorable circumstances, more than one-third the ultimate strength and hardness of the best Portland cement.

The elements of hydraulic energy in limes and cements are composed as follows, the proportions being given by weight:

Silicate of lime, $SiO_3.3CaO$	Silica	23
	Lime	43
Aluminate of lime, $Al_2O_3.3CaO$	Alumina	17
	Lime	28
Silicate of alumina, $2SiO_3.Al_2O_3$	Silica	30
	Alumina	17
Double silicate of lime and alumina, $SiO_3.(Al_2O_3+CaO)_3$	Silica	15
	Alumina	51
	Lime	28
Silicate of magnesia, $SiO_3.3MgO$	Silica	23
	Magnesia	30

Magnesian Cement.—Pure carbonate of magnesia, called magnesite, when burnt in a heat of moderate intensity, about cherry-red, ground to a fine powder, and made into a paste with water, possesses considerable hydraulic energy. This calcined magnesite has been patented under the name of Union cement. Its characteristic property, however, upon which it depends for its peculiar value, is not developed when mixed with water alone, for in that case the induration or setting is due to the crystallization of the hydrated magnesia or oxide of magnesium. But if the burnt and pulverized magnesite, or Union cement, be mixed up with the chloride of magnesium—for which the bittern water of seaside salt-works has been found to be a cheap and suitable substitute—a chemical combination takes place between the oxide and the chloride of magnesium, and oxychloride of magnesium is formed. This is a very remarkable hydraulic cement, being greatly superior to any other known cement in strength and hardness, not excepting even Portland cement.

Dolomite, or the double carbonate of lime and magnesia, when burnt at a low heat, reduced to powder, and made into mortar, also exhibits hydraulic properties. But if the heat be carried sufficiently high—say about 400° C.—to reduce the carbonate of lime also, thus forming caustic or quicklime, the addition of water causes slaking, and the hydraulic energy is destroyed or impaired by the presence of the hydrate of lime.

Any magnesian limestone containing as high as 60 per cent. of carbonate of magnesia may be presumed to be capable of yielding hydraulic cement of greater or less value, if properly underburnt, no matter whether clay be present or not. If clay exists as one of the principal ingredients, there are formed in the kiln silicate and aluminate of magnesia, as well as silicate and aluminate of lime. All of these compounds become hydrated when brought in contact with water, and are then in condition to undergo that species of crystallization called setting.

Mortar.—Mortar is a mixture of the paste of lime or cement with sand. The paste may be made before adding the sand, or the materials may be incorporated dry, and afterward tempered to a plastic condition with water. In common mortar the cementing substance is common lime. Hydraulic mortar may be made by mixing a paste of hydraulic lime or cement with sand, or by adding hydraulic materials to common mortar.

Common Mortar.—As a paste of common lime hardens or *sets* very slowly, even in the open air, unless it be subdivided into small particles or thin films, it is important that the volume of lime-paste in common mortar should be but slightly in excess of what is sufficient to coat all the grains of sand and fill the voids between them. If this limit be exceeded the strength of the mortar will be impaired. With most sands the proper proportion will be from $2\frac{5}{10}$ to 3 volumes of sand to 1 volume of lime-paste. Generally, if either less or more sand than is herein indicated be used, the mortar will be injured; in the former case from excess of lime-paste, and in the latter from porosity.

Hydraulic Cement Mortar.—A paste of good hydraulic cement hardens simultaneously and uniformly throughout the mass, and its strength is impaired by any addition of sand. For ordinary use, however, it is customary to add as much sand as possible without making the mortar porous: 1 barrel of cement, as packed for market, to 3 barrels of sand is the proportion usually followed. The usual practice is to mix the cement and sand together dry, and afterward temper to a plastic condition with water.

TENSILE OR COHESIVE STRENGTH OF MORTAR PER SQUARE INCH, IN POUNDS.

COMPOSITION OF THE MORTAR.	One month old.	Two years old.
Portland cement mixed to a paste without sand	300 to 400	500 to 600
Good Portland cement, 1 vol.	50 to 80	200 to 230
Sand, 3 "		
Rosendale cement mixed to a paste without sand	80 to 100	180 to 220
Rosendale cement, 1 vol.	15 to 20	75 to 85
Sand, 3 "		
Portland cement paste, $\frac{1}{2}$ vol.	.....	95 to 110
Fat lime paste, $\frac{1}{2}$ "		
Sand, 3 "		
Rosendale cement paste, $\frac{1}{2}$ vol.	.....	45 to 60
Fat lime paste, $\frac{1}{2}$ "		
Sand, 3 "		
Teil hydraulic lime dry, 3 vol.	25 to 35	120 to 160
Sand, 5 "		
Good common mortar		
Common lime-paste, 1 vol.	.....	40 to 60
Sand, 3 "		

CRUSHING STRENGTH OF CEMENTS AND MORTARS, FROM TRIALS UPON CUBES AND PARALLELOPIPEDONS OF VARIOUS SIZES, IN POUNDS PER SQUARE INCH OF TOP SURFACE.

COMPOSITION OF THE MORTAR.	Six months old.	Two years old.
Portland cement without sand	4,500 to 5,300	5,000 to 6,000
Dry Portland cement, 1 vol.	1,500 to 2,200	2,000 to 2,600
Sand, 3 "		
Mixed to a stiff mortar		
Dry Portland cement, 1 vol.	1,200 to 1,600	1,600 to 2,000
Sand, 5 "		
Mixed as above		
Rosendale cement, without sand	1,500 to 1,800	1,800 to 2,000
Dry Rosendale cement, 1 vol.	450 to 600	550 to 700
Sand, 3 "		
Mixed to a stiff mortar		
Good hydraulic lime, like Teil, 3 vol.	450 to 590	550 to 600
Sand, 5 "		
Common lime-paste, 1 vol.	.....	400 to 500
Sand, 3 "		
Poor common lime-mortar	.....	200 to 250

Cement and Lime Mortar.—When it is desirable, from any cause, to lessen the cost of cement mortar, the best way is to add a portion of common lime to the cement, rather than to increase the quantity of sand, as this last method produces a porous mortar. The volume of the cementing paste, whether of pure cement or a mixture of cement and lime, should be slightly in excess of what is theoretically necessary to coat all the grains of sand and completely fill the voids. A mortar of cement and sand loses about four-tenths of its strength if one-half of the cement paste is replaced by an equal volume of common lime-paste, but is then quite suitable for ordinary work.

Tests for Hydraulic Cements.—The methods of testing hydraulic cements recommended by a committee of the American Society of Civil Engineers in 1885 are now widely used, and may be regarded as standards. They have had the effect of greatly improving the quality of many varieties of cements sold in the market. These tests are three in number; first, for fineness; second, for cracking or checking; and third, for tensile strength. The following is an outline of the methods of making them:

The strength of a cement depends greatly upon the fineness to which it is ground, especially when mixed with a large dose of sand. It is therefore recommended that the tests be made with cement that has passed through a No. 100 sieve (10,000 meshes to the square inch), made of No. 40 wire, Stubbs's wire gauge. The results thus obtained will indicate the grade which the cement can attain, under the condition that it is finely ground, but it does not show whether or not a given cement offered for sale shall be accepted and used. But the finer the cement, if otherwise

good, the larger dose of sand it will take, and the greater is its value.

The tests for checking or cracking are conducted by making two cakes of neat cement 2 or 3 inches in diameter, about $\frac{1}{2}$ inch thick, with thin edges, and noting the time in minutes that these cakes, when mixed with water to the consistency of a stiff plastic mortar, take to set hard enough to support a wire $\frac{1}{12}$ inch diameter loaded with $\frac{1}{4}$ lb., and $\frac{1}{24}$ inch loaded with 1 lb. One of these cakes, when hard enough, should be put in water and examined from day to day to see if it becomes contorted, or if cracks show themselves at the edges, such contortions or cracks indicating that the cement is unfit for use at that time. The remaining cake should be kept in the air and its color observed, which for a good cement should be uniform throughout, yellowish blotches indicating a poor quality; the Portland cements being of a bluish gray, and the natural cements being light or dark, according to the character of the rock of which they are made. The color of the cements when left in the air indicates the quality much better than when they are put in water.

The tensile tests are to be made on briquettes having an area of 1 sq. inch at the smallest cross section. These are made in molds, kept in air for a designated time, and then put under water until used in the testing-machine. For a quick test the briquettes may be kept in air one hour, or until set, and be broken twenty-four hours after being made, and in such case only neat cement would be used. But for tests of seven days or upward the briquettes may be kept one day in air before being put under water, and a mixture of 1 part cement to 1 part of sand, for natural cements, and 3 parts of sand for Portland cements, be used in addition to trials of the neat cement. The quantities used in the mixture should be determined by weight. To secure the best comparative results the crushed quartz used in the manufacture of sandpaper was recommended by the committee, the degree of fineness to be such that it will all pass through a No. 20 sieve and be caught on a No. 30 sieve. The sand and cement should be mixed dry, and all the water be added at once. The mixing should be rapid and thorough, and the mortar, which should be stiff and plastic, should be firmly pressed into the molds with the trowel, without ramming, and struck off level: the molds in each instance, while being charged and manipulated, to be laid directly on glass, slate, or some other non-absorbent material. The molding must be completed before incipient setting begins. As soon as the briquettes are hard enough to bear it, they should be taken from the molds and be kept covered with a damp cloth until they are immersed. For the sake of uniformity, the briquettes, both of neat cement and those containing sand, should be immersed in water at the end of twenty-four hours, except in the case of one-day tests. The briquettes should be put into the testing-machine and be broken immediately after being taken out of the water, and the temperature of the testing-room should be kept between 60° and 70° F. The stress may be applied at a uniform rate of about 400 lb. per minute, starting each time at 0. With a weak mixture one-half the speed is recommended.

Similar standard methods of testing hydraulic cements and mortars have been formulated by associations of architects and engineers in European countries. The Pennsylvania Railroad Company specifies regarding tensile strength that neat Portland cement one day old shall exceed 102 lb. per square inch, and as follows concerning longer tests:

AGE OF CEMENT.	Neat.	1 sand to 1 cement.	2 sand to 1 cement.
One week	303	160	126 lb.
One month	412	225	163 lb.
Six months	468	347	279 lb.

The New York Aqueduct Commission requires neat Portland cement one day old to exceed 110 lb. per sq. inch, seven days old to exceed 300 lb. per sq. inch, and twenty-eight days old to exceed 400 lb. per sq. inch, and that the fineness should be such that 20 per cent. would be retained on a sieve of 10,000 meshes per sq. inch.

AUTHORITIES.—See Gillmore's *Treatise on Limes, Hydraulic Cements, and Mortars* (1863); Reid's *Portland Cements* (1885); and Baker's *Treatise on Masonry Construction* (1890). See also the articles CONCRETE, LIME, MASONRY, POZZUOLANA, and STONE.

Cementation of Steel: See FURNACE.

Cemetery [also *cœmitery, cimitery*, from Lat. *cœmite'rium* or *cimite'rium*, acc. to Late Gr. pronunciation of κοιμητήριον, resting-place, deriv. of κοιμᾶν, lull to sleep]: The ancient Germans interred their dead in consecrated groves; the Egyptians interred them in vast catacombs or pyramids; the Hebrews usually selected for this purpose ornamental gardens, fertile valleys, or grottoes, and they still designate them, with a sad emphasis, as the "house of the living"; the Greeks discouraged interments within their cities, consigned their dead to shaded groves, and called them "places of repose." The Romans erected monuments to the dead on the sides of their spacious roads, in the midst of trees and ornamental walks, placing therein the ashes of their great citizens. The Appian Way was crowded with columns and obelisks in memory of their heroes, and at every turn the short and touching inscription met the eye—*Siste, viator* (Pause, traveler). It is probable that the modern idea of a cemetery was derived from the Turks, for Constantinople is almost environed with cypress groves filled with sepulchral stones.

The term *cemetery* was applied by the early Christians to their usual places of interment, which were extra-mural, but after some centuries the desire to lie under the religious sanction of the Church led to the transferral of burial-places to consecrated grounds and crypts of sacred edifices. "God's acre" was usually the churchyard, and these places rapidly became populous with the dead. One of the earliest of modern cemeteries is that of Père la Chaise, in Paris, laid out in 1804, and at that time beyond the walls. It was named for the confessor of Louis XIV., and contained 200 acres. The earliest in the U. S. is Mt. Auburn, near Boston, where, at the instigation of Dr. Jacob Bigelow, a park of 625 acres was opened for burial uses in 1831. Soon after, Laurel Hill was established on the Schuylkill river above Philadelphia. Greenwood followed in 1838, and was long a place of sepulture for New York, although it lay on the S. of Brooklyn, L. I., where it commanded a view of the sea. In 1843 Chadwick, in a parliamentary report, arraigned the unhealthfulness of interments in churches and cities, and from that time the substitution for them of extra-mural burial-grounds has gone on with rapidity until every considerable town in Great Britain and America is provided with them. In France every city and town is required to provide burial-grounds beyond its barriers, on rising ground if possible, and to keep them in ornamental cultivation. In Paris the practice prevails of burying forty or fifty corpses at a time in the *fosses communes*; the poor gratuitously and others at a small charge. When the *fosse* is filled its surface is leveled, left undisturbed for five years, then covered with 4 feet of earth, when interments begin again. Pit-burials are usual in Naples, and in other cities of continental Europe. In 1874 Paris was provided with a cemetery of 1,200 acres on the plain of Méry-sur-Oise, 16 miles N. of the city, reached by a special railway line. Near Liverpool the St. James's Cemetery utilizes an old quarry, which is entered by a tunnel. On the face of the escarpment roads are cut leading to the openings of a sort of catacombs excavated in the rock.

The dominant motive to the establishment of the modern cemetery was a consideration of public health, but that was speedily seen to be compatible with beautiful grounds and the gratification of the reverent respect civilized men feel for their dead. It was a fortunate thing that the first examples were governed by cultivated men; they inaugurated a taste for fine planting that culminated in a general demand for ornamental grounds.

A rich vegetation exercises a powerful influence in preventing the escape of deleterious miasmata, though this is not to be feared where graves are single and of a depth of 7 or 8 feet, as they always should be. Trees should neither cover a large space with their branches, nor give so much shade as to prevent the growth of grasses. All the arbor-vitæ family, the junipers, yews, hollies, a few species of oaks, magnolias, and in general the trees of middle size suitable to the climate meet these requirements.

How to lay out a cemetery is an important topic. It should conform to the character of the ground and be made as cheerful as possible. The so-called landscape plan has no inclosures, the lots are marked by a sunken post at each corner, there is but one monument in the center, and the interments surround this on all sides; the advantages claimed are a park-like appearance and more open space,

with more facility for neat keeping. Bricked vaults of greater or less size under ground are not uncommon, and a more general desire for those above the surface is observable. The latter should never be allowed unless provision is made effectually to seal the crypts in which bodies are deposited. Granite is much used as a curbing; this suffices for the inclosure, and marks the possession of each family, and is the most enduring; the best burnt bricks for underground structures are also lasting; marble or other veneering gives out, and should be avoided, as the introduction of water in the interstices, which in freezing opens them with great force.

The best material for monuments is granite, either the expensive Aberdeen or the American. Italian marbles are not adapted to a cold climate; they inevitably split and crumble, while the American will do the same if not laid in the position of its natural bed.

Cenci, chen'chĕe, Beatrice: a Roman lady: b. Feb. 12, 1577. Her father, Francesco, the son of a cardinal who left him vast wealth, was very depraved and extravagant, and treated his children with cruelty. Finally, Francesco was found dead under suspicious circumstances; Beatrice, her brother, and her stepmother were accused of his murder, and for that crime were executed at Rome Sept. 11, 1599. Her story is the subject of one of Shelley's tragedies (1819) and of a novel by Guerrazzi (1854). The long current story, with its well-nigh incredible details of ferocity and depravity, is derived from the *Annales* of Muratori, and has been familiarized in these romantic forms. But there is no proof that Beatrice was beautiful, nor that her father committed incest with her, as her defender asserted in her behalf at the trial; while the picture by Guido Reni in the Palace Barberini in Rome can hardly be hers, surely not if by Reni, because he did not paint in Rome until nine years after Beatrice's execution. For these facts, see A. Bertolotti, *Francesco Cenci e la sua Famiglia* (Florence, 1877; 2d ed. 1879).

Cenis, Mont: See Mont Cenis.

Cenozo'ic, or **Cainozoic Era** [Gr. *καινός*, recent + *ζῷον*, animal]: the latest of the greater divisions of geologic time, including the Tertiary and Quaternary of earlier classifications, and co-ordinate with Mesozoic, Palæozoic, and Proterozoic. In this era are included the Eocene, Neocene, and Pleistocene periods. See Paleontology.

Censer [O. Fr. *censier*, short form for *encensier* (cf. Eng. *encenser*), as if from Lat. **incensarium*, deriv. of *incensum*, incense, deriv. of *incen'dere*, kindle]: a vase or other vessel used for burning perfumes and incense in temples and churches. Censers were used by the ancient Hebrews and Greeks, and are now employed in the Roman Catholic Church at mass, vespers, and other services; also in some services of ritualistic Protestant Episcopal churches. The censer now in use is suspended by chains which are held in the hand, and is tossed or swung in the air. It is frequently called the Thurible (*q. v.*).

Censor [Lat. *censor*, to *cense're*, rate, value, estimate, pass judgment]: the title of two magistrates in ancient Rome, who were appointed to take the census—i. e. to make an enumeration of the citizens and a valuation of their property—also to inspect and regulate their manners and moral conduct. In the early ages of the republic these duties were performed by the consuls, and no special magistrates were elected for the purpose until 443 B. C. The censors were originally chosen for a term of five years (which was soon reduced to eighteen months), and only patricians were eligible to the office. In 339 B. C. a law was enacted that one of the censors must be a plebeian, and in 131 both the censors elected were plebeian. The censorship (in Lat. *censura*) was regarded as the highest dignity in the republic except the office of dictator. The power of the censors was in a great measure undefined and irresponsible, especially in the regulation of morals (*regimen morum*). They had power to expel a senator from the senate for a misdemeanor, and to punish with marks of ignominy those whose conduct did not accord with their own ideas of rectitude. They could degrade persons from a higher to a lower rank, and fill vacancies in the senate. Among their duties was the administration of the finances of the state and the erection of new public buildings. As a general rule, the only persons eligible to the office were those who previously had been consuls. No person could be elected censor for a second term.

Censorship of Books: term applied to interference by a government with the freedom of the press, exercised formerly over books alone, but since the rise of journalism extended to periodicals also. The censorship of books did not come into operation until the invention of printing (except that heretical books were prohibited by the Church). It soon became common to all European countries, Great Britain included. The censorship of books was established by act of Parliament in 1662, and renewed from time to time; but its renewal was refused in 1693. In 1766 it was abolished in Sweden; in 1770 in Denmark; in 1791 in France, where it was restored in 1805, again abolished in 1814, and after having again been in turn restored and abolished, was finally suppressed in 1827, but has since been from time to time, to some extent, revived. In Germany and Austria freedom of the press was promised in article 18 of the Federal Act (1815), but not established until 1848. In Germany, however, censorship exists at the present day, in Russia it is very rigorous, and in some other countries the police authorities have a supervision of books and periodicals. In the republics of North and South America a censorship of books has never been known.

The Church of Rome has long claimed the right of censorship over books. Some of the early provincial councils prohibited the reading of suspicious or heretical works, but the first catalogue of the kind now known was issued in 494 A. D., in the time of Pope Gelasius. The authoritative lists of that Church have a continuous history from the time of the Council of Trent, and are known as the two collections, *Index Librorum Prohibitorum*, which forbids the reading of the book named at all, and the *Index Expurgatorius*, which requires the elimination of certain paragraphs before the book named can be read by the faithful. See Index Librorum Prohibitorum.

Census [Lat., registration of Roman citizens according to birth, age, family, and property; the census-list; the sum total of property disclosed]: an official account of population or wealth. For a discussion of the origin and progress of statistical inquiry in general, see Statistics.

I. The Census of Antiquity has but little bearing upon the modern census. There are allusions in historical records, of greater or less validity, to censuses taken in early ages in China and Japan. The book of Exodus (xiii. 11–13; xxii. 29; xxx. 12–16) contains ordinances prescribing donations for religious purposes, which, based as they were upon the numbers of men and of beasts among the Hebrew tribes, required for their due observance an occasional enumeration. In Ex. xxxviii. 26; Num. i. 2, 3; xxvi. 63–65; 2 Sam. xxiv. 1–9; 1 Chron. xxi. 1–7, 14; xxvii. 23, 24 are found accounts of several of these enumerations, the most notable being that of King David, which is stated to have been followed by a pestilence that destroyed 70,000 men. It is not safe to conjecture whether this succession of the plague to the census became the cause of the widespread aversion to enumeration of inhabitants found later among Christian and Mohammedan nations, or whether superstition, pre-existing in the minds of the Hebrew people, caused the pestilence, when it occurred, to be considered the direct and proper result of the enumeration which had immediately preceded it. The censuses which are referred to in the New Testament did not originate with the people of Judæa, but were initiated and conducted under Roman authority. By the Solonian laws an official determination of the individual wealth of all citizens, and their classification according to four grades in this respect, was made a part of the constitution of Athens. This classification, based upon wealth, had both a fiscal and a political purpose, the higher classes not only paying taxes at a greater rate upon their property, but possessing larger political privileges.

In Rome, whence we derive the word, the census was at once a political, a military, and a fiscal agency. Its institution is attributed to Servius Tullius (555 B. C.). The first object sought was the classification of citizens according to the quantity of land owned by each. There were five classes of freeholders upon this basis, the non-freeholders (*proletarii*) paying no taxes, having no vote, and being excluded from military service. The enumeration and consequent registration were accompanied by religious ceremonial and sacrifices for the purifying of the people (*lustration*). As the census was taken quinquennially the word *lustrum* came to signify a term of five years. The census was conducted first by the kings, afterward by the consuls, until, in 443 B. C., two officers, whose powers were of the highest in the state, were chosen at first solely from the patricians, to be called censors, by whom this duty was to be discharged. The ex-

tension of the powers of the censors to the supervision and correction of morals and social relations, and even to the purging of the senate of unworthy members, carried the Roman censorship far outside the limits assigned to the census of any modern nation. In addition to this periodical enumeration, births, deaths, divorces, and possibly, also, marriages, were required to be registered at Rome upon their occurrence. Notwithstanding the successive enlargements of the citizenship geographically, the census of citizens continued to be taken in Rome only, and by the censors alone; consequently, the roll of citizens became more and more inadequate to the facts. As the republican spirit declined the census became irregular in occurrence. When Octavius, in his sixth consulship, numbered the Roman people, there had been no census for forty-two years. The next two censuses took place at intervals respectively of twenty and twenty-one years. While thus the Roman census proper lost accuracy and validity with the lapse of time, owing largely, it is probable, to the exemption of citizens from the land-tax, with a view to which, in great measure, it had been originally instituted, a species of official enumeration sprang up with reference to the provincials wherever the land-tax was extended, which more nearly approached than the census had ever done to the modern forms of statistical inquiry. The accounts relating to the provincials were not dignified by the name of *census*, but bore that of *professio*; they were not taken in Rome, but in the region to which they related; they were not conducted by the censor, but by the proconsul; they were sanctified by no religious ceremonies or sacrifices; they were not even coincident, of necessity, with the census of citizens. They contained, however, a greatly superior amount of information, extending not only to the number of freemen and slaves, of women and children, of cattle of every description, of houses and holdings, but to the acreage of every farm, to the amount under tillage, in pasture, or in wood, and even to the number of vines and of olive and other fruit trees. "It was," says Mr. Merivale, "from the precise information contained in these official registers that Augustus, toward the close of his reign, drew up the complete survey of the Roman empire, which he placed in the hands of the vestal virgins, to be delivered to the senate and his successor after his death. To this table of statistics he gave the name of *Breviarium* or *Rationarium*. It was the ledger of his household; but his household comprehended half the human race."

II. The Modern Census.—With the dissolution of the Roman empire the census as a statistical agency disappears from history. During the Middle Ages the word was at times used, but in application almost exclusively to the record of landed property or the assessment of taxes. Charlemagne in 780 A. D. undertook an economic survey of his vast dominions, appointing commissioners whose duty it was to report upon the condition of the people, the soil, and the products of the several provinces. The *Domesday Book* of England, compiled by command of William the Conqueror in 1081, contains the quantity of land within each county of the kingdom, the name of each Norman or Saxon proprietor of land, and the number of slaves and of cattle belonging to each. Several other statistical works, of an uncertain value, appeared in the long interval between the last Roman census and the seventeenth century of the Christian era.

Sweden.—To Sweden is attributed the honor of first establishing a systematic plan for recording important facts concerning population. By an ecclesiastical law of 1686, still in force, the clergy were required to keep a register of births, marriages, and deaths, with many accompanying particulars; a record of all removals out of or into each parish; a list of inhabitants by homes and by families; and an account of all extraordinary accidents occurring during the year. In 1746, in consequence of a memorial presented to the diet by the Academy of Sciences of Stockholm, schedules of questions concerning the movement and the condition of population were distributed among the parishes, with instructions that returns should be made embracing the previous twenty-five years, which was done in 1749. These returns were, however, at first deemed confidential, and the disclosure of the number of inhabitants was forbidden under heavy penalties. It was not until 1762 that permission was given to publish extracts from the official returns. Out of the facts thus obtained Dr. Richard Price constructed those life-tables which formed the basis of his great work on reversionary payments, and of which he wrote: "I can not hesitate to pronounce that they exceed in correctness every-thing of this kind which has been hitherto offered to the public, and that nothing is wanting to make our knowledge in this instance complete but similar observations in other kingdoms." From 1749 to 1751 the Swedish reports of population were made annually; from 1754 to 1772, triennially; from 1775 to the present time the census has been taken in that country once in five years. In towns the schedules are filled up by the heads of families and collected by the police; in the rural districts the census is still taken by the pastors as a part of their regular duties.

Great Britain.—In the British isles vital statistics had their origin in the record of deaths made while the plague was raging in London in 1592. The practice fell into disuse, but in 1603 a weekly account was ordered to be kept of all burials and christenings in the city, which was regularly done thereafter. The writings of Sir William Petty, between 1661 and 1686, first attract attention to these records as a mine of valuable information. This eminent writer on political arithmetic made use of the bills of mortality in London and Dublin to compute the population of those cities at various dates, the rate of the multiplication of mankind, and also as the subject of certain "natural and political observations," with reference to government, religion, trade, growth, air, disease, etc. Sir William Petty had sought to reach the facts of the living population by computation based on the bills of mortality. In 1743, no progress whatever having been made in Great Britain toward the development of statistical science, Dr. Webster undertook, and in 1755 completed, through his own labors, an approximate account of the population of Scotland. Inspired, doubtless, by this example, Sir John Sinclair began in 1791 the herculean task of obtaining returns relating to population, agriculture, trade, and industry from all the clergymen of the Established Church of the kingdom; his schedule of interrogatories comprised 160 items. Persevering against untold discouragements, this remarkable man succeeded so far as to secure 900 voluntary contributions to his census, and in 1798 published his results in a work of twenty-one volumes, which remains a monument of industry, zeal, and assidnity. Both his example and his direct appeals aided in securing the attention of Parliament to the need of a systematic periodic collection of statistics, and on Dec. 21, 1800, was passed the act providing for a general official enumeration of the population of England, Wales, and Scotland in the following spring, and every tenth year thereafter.

The first census was taken through the overseers of the poor on Mar. 10, 1801, in both England and Wales, a later date being adopted in Scotland owing to the inclemency of the weather. The single census schedule required the following information: The number of houses, inhabited and uninhabited; the number of families; the number of inmates, distinguished as male or female; occupations according to three divisions—viz., agriculture, trade, manufactures, or handicraft; all other avocations; the number of baptisms and burials each tenth year 1700 to 1800, and the number of marriages from 1754 to 1801. In the census of 1811 the same schedule was used, except that only the occupation of the head of the family was entered. In 1821 a most important addition was made—viz., the classification of ages. In 1836 a change was made in the laws of the kingdom, which, though not effected in the interests of the census, has yet caused a marked improvement in every enumeration since that date. This was the establishment of a system of registration uniform throughout England and Wales, which were for this purpose divided into districts and sub-districts, with permanent paid officials, all under the control of the registrar-general. Through this agency marriages, births, and deaths are recorded at the time of occurrence, with severe penalties, promptly enforced, in case of omission. To this staff of trained officials, having a permanent tenure, was committed the work of taking the decennial census, the overseers of the poor being thereafter relieved of that charge. The British census of 1851, like the U. S. census of the previous year (to be hereafter spoken of), marked a great advance in statistical science.

The growing interest throughout Europe in sanitary and sociological inquiry had increased the demand for positive information regarding the numbers and condition of population, and the magnificent work of M. Quetelet, the Belgian statistician, had given intelligent direction to that demand. Accordingly, great efforts were put forth to render the sixth census of England, Wales, and Scotland, in 1851, superior in results to preceding enumerations. The special

law enacted for the purpose provided that the census should be taken on one and the same day—Mar. 31—in the three countries; 30,610 enumerators were appointed, with the authority of the registrar-general, by the 2,190 district registrars of England and Wales. Only as much territory was assigned to each enumerator as could be canvassed by one person. There being no uniform system of registration in Scotland, the thirty-two sheriffs of that country were authorized to appoint 1,010 temporary registrars—generally parochial schoolmasters—and 8,130 enumerators; the Government appointed 257 enumerators for the smaller islands. Some days before the census-day the enumerators delivered to every occupier of a house or tenement a "householder's schedule," containing inquiries as to the name, the head of family, condition, sex, age, occupation, and birthplace of every person in Great Britain, and also as to the number of blind, deaf, and dumb. For the use of the lower classes of Wales schedules were printed in Welsh. The schedule was to be filled up with reference to the night of Mar. 30–31 No one present on that night was to be omitted, except workingmen and others performing night labor away from their habitations. Travelers were enumerated at the hotels and houses at which they arrived on the following morning. Simultaneously with the household schedules the enumerators distributed in the proper quarters forms for collecting information respecting places of worship, scholastic establishments, and miscellaneous institutions. The schedules were taken up by the enumerators on Mar. 31. The collectors filled up those parts which persons had neglected or were unable to fill. They also were required to note all the unoccupied houses and buildings in course of construction. The floating population—that is, such persons as spent the night named in barges or boats on canals or small streams, in barns, sheds, tents, and the like—the enumerators were required to estimate according to the best information they could obtain. Special notice was to be taken of all extraordinary assemblages of people anywhere at the time of the census. The enumerators were allowed one week for the transcription of their schedules and the completion of summaries and estimates called for. The revision of the returns by the district registrars had to be completed in a fortnight. The returns were subjected to another revision by the superintendent-registrars before they were transmitted to the census office. The custom-house officers took the census of sea-going vessels in port. Persons belonging to the navy and commercial marine were also separately enumerated by the proper authorities. The Government furnished the statistics of the army, half-pay officers, and pensioners, the civil service, the civilians and Europeans in the East India Company's service, and British subjects living in foreign parts, as far as they could be ascertained through consular and diplomatic organs.

The British census of 1851 was the most successful statistical operation, as regards both quickness and accuracy of execution, performed up to that time in any country. The census of England and Wales was taken in 1861, in 1871, and in 1881 as of date Apr. 3. In the last year named 34,711 persons were employed in distributing, collecting, and copying the householders' schedules. To these must be added 2,175 registrars and 630 superintendent-registrars, making altogether 37,516 directly engaged in the local collection of the required particulars.

The Census Act of 1890 introduced some new features: providing that inquiry be made concerning the language spoken by persons enumerated in the principality of Wales; adding columns to the householder's schedule, to enable persons to be returned either as employers, as employed, or as neither employers nor employed; also the number of rooms occupied by a person in possession of less than five rooms. The whole country was divided into about 40,000 enumeration districts. The householders' schedules were distributed during the week ending Saturday, Apr. 4, and were collected on Monday, Apr. 6, with the required information respecting "every living person who abode in every house on the night of the census day" (Sunday, Apr. 5). The census act required the publication of the preliminary census report within five months from Apr. 5.

The establishment of a permanent system of registration in Scotland in 1855 has given to the subsequent censuses taken in that country (1861, 1871, 1881, 1891) similar advantages to those derived by the English census from the Registration Act of 1836. The history of the census in Ireland begins in 1811, coincidently with the second British census. The attempt resulted in a decided failure. The census of 1821 was of doubtful accuracy; the census of 1831 had subsequently to be corrected according to new data. The censuses of 1841 and of 1851, taken by the members of the constabulary force, attained great perfection, the reports of the latter year, in seven immense volumes, constituting a monument in the history of public statistics. The famine of 1846–47 gave to the results of this census a peculiar and painful interest.

France.—In France the census did not find a place in the government until after the Revolution. Vauban, indeed, the great engineer of Louis XIV. in his project for equalizing taxation, addressed to the king in 1707, strongly urged the necessity of an enumeration of the population, wealth, and industry of France. "There is," he said, "no battalion in the kingdom, however insignificant it may be, that is not subject to at least a dozen reviews and inspections during the year. Of how much greater importance is it to enumerate and review the condition of the great body of the nation from which the king draws all his glory and his riches!" Whether from repugnance to the idea of a census, or from the offense given by a project of just and equal taxation in the days of the old *régime*, the work of Vauban was by royal decree ordered to be seized and publicly burned—an indignity closely followed by the death of the illustrious author. During the reign of Louis XV. some useful statistics were collected by the minister of commerce. In 1784 the gifted Neckar, a minister of Louis XVI., published his treatise on the finances of the kingdom, the views and proposals of which were based on the fullest and most authentic information regarding the state of the several parts of the kingdom which could be obtained without special agencies of enumeration. Before the close of that century a law was passed requiring prefects of departments to prepare from the civil registers exact annual abstracts of births, marriages, and deaths; this law, with some modifications, is still in force. A general census was taken in 1801, and again in 1806. The next succeeding enumeration was in 1821, since which time the census has been regularly taken once in five years.

Belgium, the country to which the science of statistics owes so much, has carried to a high point the art of enumeration. Immediately upon the achievement of Belgian independence a special statistical service was created—viz., in 1831. In 1841 a central commission was established, with which M. Quetelet was from the first connected. In 1843 provincial statistical commissions were instituted throughout the kingdom. In 1856 a new law was enacted regulating the mode of taking the census and keeping the civil register. It provided that a general census should be taken every ten years throughout the kingdom, and that the population returns should form the basis of representation. The census was to be taken in such a manner as to give the actual as well as the legal population. The prescribed inquiries included name, sex, age by year and month, birthplace, civil status, occupation or condition, habitual domicile, and town and country population. Both the distribution and the collection of schedules were to be made in one day. Temporary census bureaus were established, one for each province, which were to receive the returns of the agents after they had been revised by the communal juries—bodies appointed for each community, and consisting of officials and private citizens. The statistics of schools and public institutions were taken by means of special schedules. The military authorities were charged with the army census. The refusal to give information was punishable by fine and imprisonment. The central statistical commission receives the results of the successive censuses, yearly abstracts from the civil registers, and the results of special occasional inquiry, and prepares the same for publication.

Prussia obtains population reports through a central bureau established in 1805. The labors of the bureau are directed to—1, general statistics; 2, births, marriages, and deaths; 3, schools and churches; 4, medical statistics; 5, statistics of mechanical trades and manufactures. From 1805 to 1820 these inquiries were made annually, but since the latter date the information relative to the first, third, and fourth subjects has been collected but once in three years. When the customs union of 1834 was established, triennial censuses of population were authorized, and have been taken regularly since. At first the inquiries related to the *numbers* of the actual population, according to the sex, age, birthplace, religion, immigration, and emigration. In 1840 the enumeration was required to be made *by name*, which resulted immediately in a large increase in the population re-

turns. In 1846 the number of families was determined, and in 1849 the distribution of the population by habitations. In 1858 the persons of the two sexes between seventeen and forty-five years of age were returned in five classes. In 1861 the unmarried and widowed were specially classified. With the census of the same year an inquiry was added in reference to the language spoken and the social condition and occupations of the population. The Prussian census is taken every five years (1885, 1890) by civil officers, in the month of December, on one day, by means of printed schedules. In addition to the statistics of population, many statistics are obtained showing the nature, extent, and distribution of real property, wages and salaries, insurance, aid and co-operative societies, and the numerical strength of the Catholic and Protestant churches.

Austria.—During the last half of the eighteenth century and the first half of the nineteenth no censuses were taken in Austria except those connected with military conscription. Separate systems of enumeration prevailed in the different provinces, and the materials for a general knowledge of the whole population of the empire were very meager. In 1828 a central bureau of statistics was created. A uniform enumeration was made throughout the empire for the first time in 1851, but its results were so imperfect that in 1855 a commission of high administrative officers was appointed for the preparation of a new census law, which received the imperial sanction in 1857. The military needs of the state were no longer the main motive for a census, but statistics of population, wealth, and industry were to be obtained as a basis for the safe conduct of public affairs. A census based on the actual population was to be taken once in six years, exclusively by the civil authorities. Printed schedules were to be filled up by the heads of families, owners of tenement-houses, and those in charge of convents, schools, and public institutions. Those that intentionally failed to furnish the desired information were to be punished by fine and imprisonment. The schedules called for information under the following heads: Composition of families, including servants; age; sex; names and titles; civil status; social condition; religion; occupation; marriages, births, and deaths; the number of cities, towns, hamlets, villages, dwellings, and renters. The number of Austrian subjects living in foreign parts was to be obtained through the imperial legations. The census of the naval and military population was to be separately taken by the proper authorities. The census is now taken every ten years (1880, 1890).

Russia.—Partial censuses were taken by the Russian Government in 1700, 1704, 1705, and 1710. In 1718 Peter the Great required all landed proprietors to make a declaration of the number of serfs belonging to each. The same year he organized a special commission to visit the separate provinces of his empire for the purpose of making a general census. No enumeration of females was made in these early censuses, which were taken solely for the purposes of revenue and military conscription. A decree of 1772 directed that a census should be taken once in twenty years, but this interval of time was not regularly observed. In 1802 a central bureau of statistics was organized, reorganized in 1852 under the name of the statistical commission. The commission has taken censuses in 1812, 1815, 1834, 1850, 1860, 1870, 1880, 1886, and 1897. The census is taken by means of printed schedules distributed by the local authorities. The work of consolidating and publishing devolves upon the statistical commission.

Norway.—A decennial census was instituted here in 1815, and has continued up to the present time, comprising inquiries as to age, sex, civil status, number of families and habitations, useful domestic animals, and the territorial area of each district. A bureau of statistics superintends all forms of public statistics except those pertaining to the administration of justice, public education, and financial administration. Inquiries are made once in five years in regard to the condition of industry. Annual exhibits are made of births, marriages, and deaths, of commerce and navigation, of the administration of justice, and of the population suffering from physical and mental disabilities.

Spain paid but little attention to public statistics after her census of 1798 until 1856, when a central statistical commission was organized, under whose supervision a general census was taken in 1857, and since then once in three years. The census is taken in one night by Government officials charged with the collection, verification, and consolidation of the returns. A final revision is made by the statistical commission.

Switzerland.—The original constitution of the Swiss federation required a census once in twenty years. Most of the inquiries were conducted by the several cantonal governments. The returns were not uniform, and were generally inaccurate. In 1860 a law of the Federal assembly prescribed a decennial census for the whole federation, and instituted a federal bureau of statistics under the direction of the interior department. The first census under the new law was in 1860. The inquiries included sex, age, civil condition, origin, birthplace, domicile, religion, language, physical disabilities, immigration, the distribution of real property, the number of families, and the number of habitations and other buildings. The cantonal statistics collected by the local governments are consolidated and published by the central bureau. Until a few years ago the different cantons followed different methods in the collection of vital and mortuary statistics, but at the instance of the bureau they have now adopted a uniform plan. In 1866 the central bureau initiated the census of live stock, and later collected very full statistics of railways, savings-banks, and fire-insurance companies.

Italy.—Soon after the founding of the modern kingdom of Italy in 1859 and 1860, a bureau of statistics was created with ample powers. The first general census, which was to afford the basis of representation in the national parliament, was taken Dec. 31, 1861, under a law prescribing general enumerations once in ten years. The census is taken in one day by means of previously distributed schedules. Since 1861 the central bureau has been charged with additional inquiries relative to mutual-aid societies, savings-banks, public charities, industrial corporations, libraries, and institutions of education.

Greece.—The census in modern Greece dates from her last struggle for independence. The first general enumeration of the people was made in 1836. From that date censuses were taken annually until 1845, since when they have been taken at irregular intervals—viz., 1848, 1853, 1856, 1861, 1879, 1889, 1896.

III. The Census of the United States is, in its latest development, unique, differing widely from the European type, the reason for which will hereafter appear.

During the colonial period the British Board of Trade attempted several partial enumerations for administrative uses; but the results were often flagrantly inaccurate, especially in the Southern colonies. In the census of New York, attempted by Gov. Hunter in 1712, the superstition already alluded to* entered seriously to affect the completeness of the returns. This feeling was so strong as to deter the governor of New Jersey, a few years later, from attempting the census of that colony. So defective were the colonial censuses in general that Mr. Bancroft, for the purposes of his *History*, constructed in preference a table of population projected backward to 1750 from the first U. S. census—that, namely, taken in 1790. Several efforts were made during the Revolutionary war and during the continuance of the government of the Confederation, but without success, to secure an enumeration of the population of the several States, with a view to apportioning requisitions for men and supplies. In these schemes, various estimates and computations were made use of, all subsequently ascertained to have been in a considerable degree erroneous.

By the Constitution of 1787 a decennial census was made a constituent part of the political system of the U. S. M. Moreau de Jonnès has attributed great credit to the U. S. on this account, declaring that they present a phenomenon unprecedented in history—"that of a people who instituted the statistics of their country on the very day when they founded their government, and who regulated, by the same instrument, the census of inhabitants, their political rights, and the destinies of the nation." The fact is, however, that this provision of the Constitution was not in the least degree of a philosophical origin. It was a necessity of the federal representative character of the government then established, in which both representation and direct taxation were required to be apportioned according to population. The first census law was passed Mar. 1, 1790, and the first census was taken under it as of date Aug. 1 of that year. Nine months was the period allowed for the completion of the enumeration. The work was to be conducted by the mar-

* When a proposition to institute a census was before the British Parliament in 1753, the member for Newcastle-upon-Tyne stated that "the people looked upon the proposal as ominous, and feared lest some public misfortune or an epidemical distemper should follow the numbering."

shals of the several judicial districts, who were authorized to appoint as many assistants as should be required, each of whom should have an assigned district, to be personally enumerated by him. Lists of inhabitants were to be set up at two places of resort within each district for public inspection. All persons sixteen years of age and upward were required, under penalties, to give all needed information to the census-takers. The inquiries were six in number for each family: (1) name of the head of the family; (2) number of free white males sixteen years and upward; (3) number of free white males under sixteen years; (4) number of free white females; (5) number of all other free persons; (6) number of slaves.

The results of the first enumeration caused much disappointment, owing to overstrained expectations based on the extravagant estimates that had prevailed, as is usual in the absence of authentic information; and Mr. Jefferson, then Secretary of State, in sending copies of the census report to the ministers of the U. S. in foreign lands, carefully explained that the enumeration was largely defective. The results of subsequent censuses, however, established the substantial accuracy of the count made in 1790.

In 1800 two learned societies memorialized Congress on the subject. The American Philosophical Society, Thomas Jefferson president, represented that the decennial census offered an occasion of great value for ascertaining sundry facts highly important to society, and not otherwise to be obtained. It therefore prayed that the next census might be so taken as to present a more detailed view of the inhabitants of the U. S. under several different aspects, such as the effect of soil and climate on human life; the increase of population by birth and immigration; and the conditions and vocations of the people. To gain the first of these ends, the society suggested that the population should be much more minutely analyzed with respect to age. To gain the second, it was proposed that a table should be used presenting in separate columns the respective numbers of native citizens, citizens of foreign birth, and aliens. To reach the third end, it was proposed that the number of free male inhabitants of all ages engaged in different professions and pursuits should be ascertained, such as merchants, agriculturists, handicraftsmen, mariners, etc. The other memorial, to a similar effect, came from the Connecticut Academy of Arts and Sciences, Timothy Dwight president. Both memorials were presented to the Senate Jan. 10, 1800, and were referred to the committee already charged with drafting a census bill. By the law of 1800 the schedule was somewhat extended. It registered the name of the head of each family; the number of free white males under ten years of age; of free white males of ten and under sixteen; of free white males of sixteen and under twenty-six; of free white males of twenty-six and under forty-five; of free white males of forty-five and upward. The last five inquiries were duplicated in reference to females. All other persons, except Indians not taxed and slaves, were also enumerated, but without distinction of age. The general direction of the census was placed in the Department of State, where it remained until 1850.

In 1810 the population schedule of 1800 was retained without modification, but by a supplementary act (May 1) the scope of the enumeration was extended to embrace an account of all the manufacturing establishments. The construction of the schedule was left to the Secretary of the Treasury. The results of this new statistical effort proved to be of little value.

The census of 1820 presented no new features of marked importance. The population schedule discriminated between foreigners naturalized and not naturalized, while slaves and free colored persons were classified with respect to age. A new manufacturers' schedule was introduced, which was an improvement upon that of 1810. It comprehended fewer details, but was more discriminating in inquiries and more scientific in arrangement. This part of the work, however, was so imperfectly done by the census-takers that the results obtained possessed little value.

In the census of 1830 no attempt was made to obtain industrial statistics of any sort. The schedule made a more minute classification of population. The number of the deaf and dumb and blind in the three classes of white, free colored, and slave population was ascertained as far as practicable in conducting a new experiment.

In 1840 still other statistics of population were collected—the number of insane and idiotic people, the number of persons engaged in the great industries, such as agriculture, manufactures, and commerce; likewise the number of Revolutionary pensioners. Several columns were added to the schedule for educational statistics—the number of scholars in schools, together with the number of white persons over twenty years of age who could not read and write. The attempt to obtain statistics of industry was renewed, and an extended though badly arranged list of questions was incorporated. As there was no penalty for refusing to answer these questions, in some localities the people refused to answer them, on the ground that they were illegal and inquisitorial. The industrial statistics obtained, however, were the most valuable yet procured.

As the time for taking the seventh census drew near, the subject began to attract an unusual degree of attention. A census board, consisting of the Secretary of State, the Attorney-General, and the Postmaster-General was created by an act approved Mar. 3, 1849. This board was charged with the duty of preparing forms, schedules, etc., for taking the next census, but was instructed not to incorporate into the schedules more than 100 questions of all kinds. At the next session of Congress the Senate raised a special committee on the census, and imposed upon it a similar task. The law, as passed, greatly extended the sphere of the census. The act, approved May 23, 1850, is entitled "A general act providing for the census of 1850, and for every subsequent census." It created a census office in the newly created Department of the Interior. The six schedules incorporated in the law bore the following names by number: 1, "Free inhabitants"; 2, "Slave inhabitants"; 3, "Persons who died during the year ending June 1"; 4, "Productions of agriculture"; 5, "Products of industry"; 6, "Social statistics." Several important new features were incorporated in the first schedule, viz., the name, age, sex, and color of each person, together with the place of birth.

The third or mortality schedule contained a class of inquiries wholly new in the census. The fourth, fifth, and sixth schedules related to subjects that had received some attention in previous censuses, but without adequate provision for the collection of the statistics required. The census of 1850 was a great improvement on all its predecessors. The addition of general statistics of manufactures and of agriculture was a gain of the highest importance. Others of the new features of the act of 1850 never became practically valuable.

The census of 1860 was taken on the same plan as that of 1850, with but few modifications.

Before the census of 1870 was taken an attempt was made to procure a new law which should provide new machinery and remodel the old schedules. An elaborate bill, drawn largely by the late President Garfield, passed the House of Representatives, but failed to receive the sanction of the Senate. The census of 1870 was taken under the law of 1850. Some important additions to the inquiries were made by authority of the Secretary of the Interior. In consequence of the abolition of slavery the old schedule relating to statistics of slaves was dropped. To meet the requirements of the fourteenth amendment to the Constitution two columns were added to the population schedule—the first to obtain the number of male citizens of the U. S. in each State of twenty-one years and upward; the second to obtain the number of such citizens whose right to vote is denied or abridged on other grounds than rebellion or crime. The results of this special inquiry were of little value. Many changes were made by the census office in the forms of the inquiries, by which they were rendered more definite and more easily understood. Besides the inquiries concerning "place of birth," two columns were added requiring a statement of the parentage of each person. This has provided a way for ascertaining the number of citizens born of foreign parents. An inquiry was also added concerning the public debt of towns, cities, counties, and States. A striking feature was added in the publication of results by the construction of engraved maps, illustrating the various classes of statistics.

In preparation for the tenth census (1880), Congress passed an act (Mar. 3, 1879), supplemented by the act of Apr. 20, 1880, under which that census was taken, and under which, unless new legislation shall be had, "a census will hereafter be taken every ten years."

By the act of 1879 the census system of the U. S. was greatly changed, both as to the agencies of enumeration and as to the subjects of inquiry. The most important of these will be now indicated.

1. *Agencies of Enumeration.*—(*a*) By the act of 1879 the

superintendent of census becomes an officer appointed by the President and confirmed by the Senate, instead of merely a "superintending clerk," appointed by the Secretary of the Interior. (*b*) No other important change is necessarily wrought by the new law in the organization of the census bureau as an office for revising, digesting, compiling, and publishing the results of the enumeration. (*c*) Instead of the marshals of the several judicial districts (sixty-four in 1870), officers especially appointed for the purpose, termed "supervisors of census," are intrusted with the charge of the enumeration. The appointment of such officers, not to exceed 150 in all nor fewer than one for any State or Territory, is authorized. The full number authorized were appointed in 1880, the numbers in the several States varying from one to eleven (New York). The creation of a special body of officers for the purpose, presumably appointed with reference to their qualifications for the work, and directly responsible to the department charged with the general direction of the census, in the place of intrusting this duty, as under the act of 1850, to officers previously appointed for altogether different duties, responsible to a department which has nothing to do with the census and already fully burdened with regular official duties, in connection with the U. S. courts—duties which are not of a nature to be avoided or postponed—constitutes a great advance toward a proper enumeration. (*d*) Instead of the appointment by marshals of assistant marshals to perform the actual work of enumeration, without any control thereof by the central office, as under the act of 1850, the appointment of the actual canvassers—called by the new law "enumerators"—is by the act of 1879 made subject to the veto of the census office. (*e*) The population of districts to be assigned to any enumerator is reduced from an estimated maximum of 20,000, as by the law of 1850, to a maximum of 4,000, according to the results of the next preceding enumeration. The subdivision of supervisors' districts and the arrangement of enumerators' districts are also made liable to the veto of the census office. The result of these provisions in 1880 was to increase the actual number of enumerators from about 6,400 in 1870 to 31,265. By this means not only is the earlier completion of the work made practicable, but a higher degree of local knowledge and personal acquaintance is secured—elements of the highest importance, as affording security against defective and erroneous returns of population. (*f*) While the enumeration continues to be taken as of the same date (June 1) as by the act of 1850, the time allowed for the completion of the work is reduced from five months to one month, while in cities of over 10,000 inhabitants (according to the next preceding census) the enumeration is required to be completed within two weeks. (*g*) The rules regulating the compensation of enumerators are greatly changed in the direction of allowing a closer correspondence of pay to work than was possible under the inflexible rule laid down in the act of 1850. (*h*) Instead of committing to each enumerator the collection of the manufacturing and social statistics of his own district, the superintendent of census may in his discretion "withdraw the schedules for manufacturing and social statistics from the enumerators of the several subdivisions, and may charge the collection of these statistics upon experts and special agents, to be employed without respect to locality." Under this provision special agents were appointed at the census of 1880 to collect the manufacturing statistics of 279 cities and large towns. Special agents were also appointed to collect the statistics of certain industries for the U. S. at large, such as iron and steel, woolen, silk, and cotton goods, glass, coke, interchangeable machinery, etc., and of all the mining industries. Special agents were also appointed to collect the statistics of the deaf and dumb, blind, insane and idiotic, of criminals, and of paupers, never before properly enumerated, although embraced in the act of 1850; also to collect the statistics of the factory system, the social statistics of cities, the statistics of schools, colleges, museums, and churches, of public indebtedness, of valuation and taxation of property, etc. (*i*) The superintendent of census is authorized in his discretion to employ "prior schedules," so called—that is, schedules to be left with heads of families in advance of the enumeration, and to be taken up on or after the legal date of the census. No use was made of this provision, however, at the tenth census.

2. Regarding the points of inquiry by the act of 1879 in comparison with the act of 1850, it may be said that several entirely new subjects of enumeration were introduced by the later law, such as railroads, telegraphs, fire, life, and marine insurance, etc.; while the amount of detail required respecting the traditional subjects of enumeration is vastly increased in the agricultural schedule.

An act providing for taking the eleventh census (1890) was approved Mar. 1, 1889, and was, with some slight amendments, a re-enactment of the law of 1879. No change was made in the general plan for enumeration. The salary of the superintendent was raised from $5,000 to $6,000. A new official, entitled the "disbursing clerk," was provided for, and also ten "chiefs of divisions." The number of supervisors' districts was increased from 150 to 175, and, as in 1880, the full number of supervisors authorized was obtained. The number of enumerators appointed in the eleventh census was 47,975. Five important changes in the scope of the investigation were introduced by the law of 1889. (*a*) A special schedule of inquiry was introduced for the purpose of obtaining the names of all surviving persons who had served in the army, navy, or marine corps in the U. S. during the civil war (1861–65), as also the names of all surviving widows of such soldiers, sailors, or marines. (*b*) A special inquiry was added in the population schedule by which Negroes might be classified, as "full-blooded Negroes," "mulattoes," "quadroons," and "octoroons." (*c*) Provision was made for the collection of statistics relating to the recorded indebtedness of private corporations and individuals, and for this inquiry Congress made a special appropriation in addition to the regular census appropriation. (*d*) By the law of 1879 Indians paying taxes were the only ones subject to enumeration, but the law of 1889 provided for a complete census of all living Indians, which should record both the Indian and English name of every Indian in tribal relations, and contain full data as to age and occupation, and for classifying Indians as "those paying taxes" and "those free from taxation." (*e*) The law further made provision for the collection of statistics of the population, industries, and resources of the district of Alaska.

The scope of the law was also extended by an amendment approved Aug. 14, 1890, which required that unincorporated express companies as well as incorporated express companies should respond to schedules presented—an amendment which was necessary in order to secure any information respecting the express business, since with one exception all express companies in the U. S. are joint-stock associations. The census of 1890 paid special attention to the collection of data pertaining to the nativity of parents, to the relative fecundity of native and foreign born mothers, and to the expectation of life of children born of native and foreign parents. Certain questions respecting naturalization and the ability of persons enumerated to read and speak the English language were also introduced. The eleventh census for the first time made use of "prior" schedules in facilitating the work of enumeration, and of electricity as an agency for tabulation. The result of the employment of the electric tabulator is regarded with great interest by statisticians, for, if successful and trustworthy, it renders possible statistical compilations which have heretofore been regarded as too complicated and laborious to be undertaken by the ordinary methods.

The census bureau as originally organized was divided into twenty-three divisions, as follows: Appointments; Disbursements and Accounts; Geography; Population; Vital Statistics; Church Statistics; Educational Statistics; Pauperism and Crime; National and State Finances; Farms, Homes, and Mortgages; Agriculture; Manufactures; Mines and Mining; Fish and Fisheries; Transportation; Insurance; Printing and Stationery; Statistics of Special Classes; Supervisors' Correspondence; Alaska; Statistics of Indians; Social Statistics of Cities; Revision and Results. The number of divisions was on Apr. 1, 1892, reduced to nine, embracing the divisions of Population; Manufactures; Agriculture; Farms; Homes and Mortgages; Vital Statistics; Social Statistics; Wealth, Debt and Taxation; Printing and Stationery, and Revision and Results.

It was said that the census of the U. S., in its present state of development, is unique, differing widely from the European type; the justification of this statement has been given above. The European census is a mere count of inhabitants, individually and by families, with certain personal particulars as to age, sex, color, conjugal condition, occupation, place of birth, etc. Whatever statistical information beyond this government requires is obtained either by registration, by boards or commissioners, or by other agencies wholly independent of the census proper. The

U. S. census since 1850 has been, in the phrase of the act of 1879, "a census of population, wealth, and industry." The amount of statistical detail collected in the U. S. decennial enumeration is greater than that obtained in any other country through the same agency, and is vastly greater than the sum of the statistical details collected in any other country through all agencies combined. The reason for thus imposing upon the census inquiries which in European countries are made, if made at all, through other agencies, has been found mainly in the indisposition of Congress to raise the question whether, under the Constitution, the U. S. Government can institute or conduct purely statistical investigations affecting private persons, and enforced by penalties in the event of refusal to give information, except in connection with the decennial enumeration expressly authorized and required by the Constitution. Were this consideration set aside, there can be little question that the statistical work of the country could be better done by agencies very differently organized.

The publications of the successive censuses of the U. S. have been as follows:

1790.—*Return of the Whole Number of Persons within the Several Districts of the United States, etc.* (8vo, 52 pp., 1792).

1800.—*Return of the Whole Number of Persons, etc.* (folio, 78 pp, 1801).

1810.—(1) *Aggregate Amount of each Description of Persons, etc.* (oblong folio, without date); (2) *A Series of Tables Showing the Several Branches of American Manufactures, etc.* (4to, 170 pp.).

1820.—(1) *Census for 1820, etc.* (folio, 164 pp., 1821); (2) *Digest of Accounts of Manufacturing Establishments, etc.* (folio, 100 pp., 1823).

1830.—*Fifth Census of Enumeration of the Inhabitants of the United States* (folio, 163 pp., 1832). This work was so badly compiled and printed that Congress directed a republication. Even the latter is honeycombed with errors.

1840.—(1) *Compendium of the Enumeration, etc.* (folio, 378 pp., 1841); (2) *Sixth Census or Enumeration of the Inhabitants of the United States* (folio, 470 pp., 1841); (3) *Statistics of the United States, etc.* (folio, 410 pp., 1841); (4) *Census of Pensioners of Revolutionary and Military Service, with Names, Ages, and Places of Residence, etc.* (4to, 196 pp.).

1850.—(1) *The Seventh Census of the United States* (4to, 1022 pp., 1853); (2) *Statistical View of the United States* (8vo, 400 pp., 1854); (3) *Mortality Statistics, etc.* (8vo, 304 pp., 1855); (4) *Digest of the Statistics of Manufactures* (8vo, 143 pp., 1859).

1860.—(1) *Preliminary Report of the Eighth Census* (8vo, 294 pp., 1862); (2) *Population* (4to, 811 pp., 1864); (3) *Agricutture* (4to, 464 pp., 1864); (4) *Manufactures* (4to, 963 pp., 1865), (5) *Mortality and Miscellaneous Statistics* (4to, 650 pp., 1866).

1870.—(1) *Population and Social Statistics* (4to, 854 pp., 1872); (2) *Vital Statistics* (4to, 700 pp., 1872); (3) *Industry and Wealth* (4to, 843 pp., 1872); (4) *Compendium* (8vo, 949 pp., 1872).

1880.—Omitting the *Census Bulletins*, which were a marked feature of the census of 1880, the final volumes published are the following: Vol. i. *Population* (4to, 961 pp., 1883); vol. ii. *Manufactures* (4to, 1198 pp., 1883); vol. iii. *Products of Agriculture* (4to, 1149 pp., 1883); vol. iv. *Agencies of Transportation* (4to, 869 pp., 1883); vol. v. *Cotton Product*, part i. (4to, 924 pp., 1884); vol. vi. *Cotton Product*, part ii. (4to, 848 pp., 1884); vol. vii. *Valuation, Taxation, and Public Indebtedness* (4to, 909 pp., 1884); vol. viii. *Newspaper and Periodical Press* (446 pp.), *Alaska, its Population, Industries, and Products* (189 pp.), *Seal Islands of Alaska* (188 pp.), *Ship-building Industry* (276 pp.) (4to, 1884); vol. ix. *Forests of North America* (4to, 612 pp., with extra volume for map, 1884); vol. x. *Petroleum and its Products* (318 pp.), *Manufactures of Coke* (114 pp.), *Building-stone* (393 pp. exclusive of plates) (4to, 1884); vol. xi. *Mortality and Vital Statistics*, part i. (4to, 763 pp., 1885); vol. xii. *Mortality and Vital Statistics*, part ii. (4to, 803 pp., 1885); vol. xiii. *Precious Metals* (4to, 541 pp., 1885); vol. xiv. *United States Mining Laws* (4to, 705 pp., 1885); vol. xv. *Mining Industry*, exclusive of precious metals (4to, 1022 pp., 1886); vol xvi. *Power and Machinery Emptoyed in Manufactures*, part i. (4to, 874 pp., 1885); vol. xvii. *Power and Machinery Emptoyed in Manufactures*, part ii (4to, 788 pp., 1885); vol. xviii. *Social Statistics of Cities*, part i. (4to, 915 pp., 1886); vol. xix. *Social Statistics of Cities*, part ii. (4to. 843 pp., 1887); vol. xx. *Statistics of Wages in the Manufacturing Industry* (567 pp.), *Average Retail Prices of Necessaries of Life* (117 pp.), *Strikes and Lockouts* (28 pp.) (4to, 1886); vol. xxi. *Defective, Dependent, and Delinquent Classes* (4to, 581 pp., 1888); vol. xxii. *Power and Machinery Employed in Manufactures* (11 pp.), *Machine Tools and Woodwork Machinery* (294 pp.), *Steam-pump and Pumping-engines* (64 pp.), *Wool and Silk Machinery* (27 pp.), *Manufacture of Engines and Boilers* (66 pp.), *Marine Engines and Steam-vessels* (106 pp.), *Ice Industry in the United States* (41 pp.) (4to, 1888). In addition to the above, two octavo volumes entitled *A Compendium of the Tenth Census* were published, containing 1771 pages.

1890.—The complete report of the eleventh census comprises thirty-nine volumes, published as follows: *Compendium*, part i. *Population* (1892); part ii. *Vital and Social Statistics, Educational and Church Statistics, Wealth, Debt, and Taxation, Mineral Industries, Insurance, Foreign-born Population, Manufactures* (1894); part iii. *Population, Agriculture, Manufactures, Fisheries, Transportation, Wealth, Debt, and Taxation, Real Estate Mortgages, Farms and Homes, Proprietorship and Indebtedness, Indians* (1897); *Abstract* (2d ed. 1896); *Vital Statistics of the District of Columbia* (1893); *Report on Education* (1893); *Report on Manufacturing Industries* (2 vols., 1894); *Report on Transportation Business* (1893); *Vital Statistics of New York and Brooklyn* (1894); *Report on Agricutture by Irrigation* (1894); *Vital Statistics, Boston and Philadelphia* (1895); *Report of the Social Statistics of Cities* (1895); *Report on the Mineral Industries in the United States* (1892); *Report on Wealth, Debt, and Taxation* (2 vols., 1892–95); *Report on Indians Taxed and Indians not Taxed* (1894); *Report on Statistics of Churches* (1894); *Report on Population of United States* (2 parts, 1895–97); *Report on Insurance Business* (2 parts, 1894–95); *Report on Transportation Business* (2 parts, 1894–95); *Report on Manufacturing Industries* (3 parts, 1895); *Report on Vital and Social Statistics* (4 parts, 1894–96); *Report on Crime, Pauperism, and Benevolence* (2 parts, 1895–96); *Report on Insane, Feeble-minded, Deaf and Dumb, and Blind* (1895); *Statistics of Agricutture, Agricutture by Irrigation, Statistics of Fisheries* (1895); *Report on Real Estate Mortgages* (1895); *Report on Farms and Homes* (1896); *Statistical Atlas* (1898).

The Twelfth Census.—The law authorizing the taking of the twelfth census was passed by Congress Mar. 3, 1899, and President McKinley appointed William R. Merriam director. The enumeration began June 1, 1900. It is the first census in which the counting of returns is to be done by mechanical means. Congress stipulates that the four principal reports—on population, mortality, agriculture, and manufactures—must be ready for publication on July 1, 1902. The members of the field force, nearly 40,000 in number, forwarded their data to headquarters in Washington, where it is compiled and prepared for publication by a staff of 3,000 clerks. Each of the 76,000,000 cards used, on which are punched the statistics concerning each person, are numbered to correspond with the numbers opposite the names in the schedules. They contain 228 symbols, each of which is an abbreviation representing some fact within the range of the census enumeration. They are punched by means of a machine similar to a typewriter as a clerk reads from the schedule the required information to the operator at the keyboard. In this way 700 cards can be disposed of in one day by one clerk. From the punching machine the record cards go to the electric tabulating machine, which collects all the information they convey and puts it into systematized form. One machine does the labor of 20 clerks under the old system. From here the record slips pass to a force of 1,000 clerks, who make up the tables and prepare copy for the printers.

IV. State Censuses.—In many of the States of the Union a census is required at some time within the interval between each two national censuses. These provisions are very various, but there is even greater range in the manner in which the provisions are executed.

By the twenty-second section of the act of Mar. 3, 1879, it was provided that any State or Territory taking a census during the median year (1885, 1895, etc.) between two national censuses should receive, on the deposit of the returns and reports of such census with the Secretary of the Interior, from the Secretary of the Treasury a sum equal to fifty per centum of the amount that was paid to the supervisors and actual enumerators within such State or Territory at the U. S. census next preceding, increased by one-

half the percentage of gain in population in such State or Territory between the two censuses next preceding: "*Provided*, that the blank schedules used for the purposes of the enumeration herein provided for shall be similar, in all respects of form and size of heading and ruling, to those used in the census of the U. S." Whether this effort to promote State censuses intermediate between the national censuses will have any more effect than the provisions for State censuses now found in the constitution or on the statute-books of many States remains to be seen. See map of CENTER OF POPULATION, in article UNITED STATES.

FRANCIS A. WALKER. Revised by H. C. ADAMS.

Cent [*cent.* in the phrase *per cent.* represents Ital. *cento* (in *per cento*) or Fr. *cent* (in *pour cent*) < Lat. *centum*, hundred; *per centum* is merely a mistaken Latinization of the Ital. In the sense of a hundredth of a dollar cent was first used in the U. S. late in the eighteenth century, probably as clip-form of Fr. *centime* or Ital. *centesimo*]: a coin of the U. S. of the legal value of the one-hundredth part of a dollar, or nearly one halfpenny sterling. It is now coined of an alloy of copper, tin, and zinc, and is legal tender for the payment of sums not exceeding twenty-five cents. The Dutch cent is the one-hundredth of a guilder, and its value is about one-third of that of the American cent. The French cent (*centime*) is one-hundredth of a franc.

Cen'taurs [from Gr. *κένταυροι*; Lat. *centau'ri*]: fabulous animals which the ancient Greek poets imagined to be half men and half horses, the head and anterior part being human. They were supposed to be the offspring of Ixion and a cloud, and to have lived in Thessaly. The battle of the centaurs with the Lapithæ was celebrated in Greek mythology, and was a favorite subject of ancient art.

Centau'rus (the Centaur): a constellation of the southern hemisphere; contains two stars of the first magnitude designated respectively as α Centauri and β Centauri, which do not rise in latitudes of the U. S.

Centenéra, MARTIN DEL BARCO: Spanish ecclesiastic and poet; b. at Logrosán, 1535; went to the Rio de la Plata in 1572; was archdeacon of Paraguay, and traveled extensively in the Platine provinces and Peru. After his return in 1576 he resided in Portugal, where he published his poem, *La Argentina* (Lisbon, 1602). It is a versified chronicle of the Spanish conquests, and is esteemed only for its historical value. D. at Lisbon, 1604. H. H. S.

Centennial Exhibition, or **Exposition**: See INTERNATIONAL EXHIBITION and PHILADELPHIA.

Cente'no, DIEGO: Spanish soldier; b. at Ciudad Rodrigo, 1504; went to America; passed to Peru with Pedro de Alvarado in 1534, and soon became known as one of the most skillful leaders there. He fought against the elder Almagro at Las Salinas (Apr. 26, 1538), and against the younger Almagro at Chapas (Sept. 16, 1542), and was rewarded with rich grants in Charcas. At first he supported the revolt of Gonzalo Pizarro, but subsequently declared for the king. Carvajal, who was sent against him, defeated him several times, and he was forced to hide in a cave near Arequipa (1546). On the arrival of Gasca he emerged and collected an army for him in Charcas, but was again defeated by Pizarro and Carvajal at Huarina, near Lake Titicaca (Oct. 26, 1547). He escaped, and was present at the final rout of Pizarro, near Cuzco (Apr. 8, 1548). He died suddenly, with suspicion of poison, at La Plata, in Upper Peru, in 1549.

HERBERT H. SMITH.

Center, or **Centre**: originally a "point"; hence the point of a compass which remains fixed while the other is moved round to describe a circle. The center of a circle is a point within it equally distant from every part of the circumference. The center of a sphere is a point equally distant from every point of the surface. In war, the term *center* is applied to the main body of an army located between the two wings. In French politics the *Center* is used to designate a party of moderate royalists or conservatives who support a policy intermediate between that of the *Droit*, "right," and that of the *Gauche*, "left"; in German politics it is applied to the representatives of the Roman Catholics.

Centering: a temporary framework built for the purpose of constructing a stone arch or vault. For the arches of common windows or door the centering is made of boards with their upper surfaces cut to the required curve. In building arched bridges the centering is a trussed framework of timber, or of timber and iron combined. The centering is not removed until the mortar of the masonry is well set, and especial care is necessary that it be removed without subjecting the structure to shocks. Arched iron bridges are also usually built upon a timber centering.

Center of Gravity: the point in a body which is always in the line of the resultant of the weights of all the particles composing that body, no matter in what position the body be placed. Each particle of a body held above the surface of the earth is acted upon by gravitation, and we may look upon the gravitation of each particle as being one of a system of parallel forces, and the gravitation of the whole as a resultant of those forces. Whatever be the direction of these forces with respect to the mass, the resultant will always pass through a fixed point within the mass, which point is the center of gravity for the body. Every mass which is supported above the earth must have its center of gravity so placed that a line drawn from it perpendicularly downward will fall within the base; otherwise the body will fall. The center of gravity of many bodies may be found by geometrical rules, but with the supposition that the bodies are of homogeneous or uniform specific gravity—a condition which is not often found exactly fulfilled in practice.

Center of Magnitude: that point of a geometric figure which would be its center of gravity were it a mass of uniform density throughout.

Center of Oscillation: See PENDULUM.

Center of Percussion: See PENDULUM.

Centerville: See CENTREVILLE.

Centerville: city; capital of Appanoose co., Ia. (for location of county, see map of Iowa, ref. 7–H); on Ch., Rk. I. and Pac. and K. and K. and Iowa Cent. R. Rs.; 125 miles W. S. W. of Muscatine. The city is a coal-mining center for Southern Iowa and Northern Missouri, and is in the heart of the blue-grass region of Iowa. It has various manufacturing industries. The surrounding country is a well-watered agricultural region, with plenty of stone and timber. Pop. (1880) 2,475; (1890) 3,668; (1900) 5,256.

EDITOR OF "APPANOOSE IOWEGIAN."

Centigrade Thermometer [*centigrade* is viâ Fr. from Lat. *centum*, hundred + *gradus*, step; i. e. having a hundred steps]: a thermometer having its scale between the freezing and the boiling point of water divided into 100 equal parts, or degrees (hence the name); the freezing-point being taken as zero, and the boiling-point as 100°. The reversed scale (with zero at the boiling-point and reading downward) was invented about the year 1741 by Prof. Anders Celsius, of Upsala, in Sweden, and through a failure to note this difference the centigrade thermometer is often called Celsius's thermometer. Its use was for many years mostly limited to Sweden and Russia, but it is now the scale generally used in France; and its excellences so commend it that it will probably come into almost universal use. In Germany it is rapidly superseding the scale of Réaumur, while in England, Holland, and the U. S., where Fahrenheit's scale is more generally known, the centigrade is used in chemical and other scientific operations, and thermometers are often marked with both scales, one on each side of the mercurial column. The advantages of the centigrade scale are that its zero and its hundredth degree can always be redetermined with ease, and, above all, that its divisions are in harmony with the decimal system of measurement. The objection to the centigrade, that its degree is too large, is obviated by dividing the degree into decimals, which are marked on the scale, thus greatly increasing its precision. One degree centigrade is equal to 1·8 Fahrenheit, or, conversely, 1° Fahrenheit nearly equals ·55 of a degree centigrade. See THERMOMETER.

Centipede [Fr., from Lat. *centi'peda*, the hundred-footed; *centum*, hundred + *pes*, *pedis*, foot]: a popular name for various insects of the order *Myriapoda*, but properly given to those of the sub-order *Chilopoda*, and especially to the family *Scolopendridæ*. They have long slender bodies, and twenty-one to twenty-three pairs of feet. Some tropical species are nearly a foot long. The bite of many species is poisonous, and even dangerous. *Scolopendra castaniceps* is the largest U. S. species, and is found in the Southern States. See MYRIAPODA.

Centlivre, sent-liv'er, SUSANNA (*Freeman*): English actress and playwright; b. probably in Ireland about 1680. Her third husband (1706) was Joseph Centlivre, Queen Anne's head-cook. She wrote about twenty comedies, in-

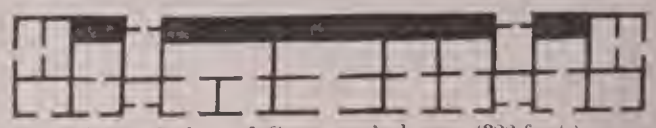
cluding *The Busybody* (1709); *The Wonder* (1713); and *A Bold Stroke for a Wife* (1718). Her works were reprinted with a biography in 1872. D. Dec. 1, 1727. H. A. Beers.

Central America: See America.

Central American Antiquities: The architectural remains which exist in such numbers in Central America may be divided into three groups, differing in character, location, and construction. Much the most important of the three was that found within the area occupied by the Maya linguistic stock, and undoubtedly the work of the ancestors of that people. Fewer in number, but presenting some unique examples of stone work, were the remains left by certain Aztec or Nahuatl colonists, who at an early period settled in various parts of Central America. Finally, in Costa Rica there are numerous relics attesting a comparatively high civilization left by a tribe or by tribes belonging to stocks different from either of those above mentioned. We shall examine each of these in turn.

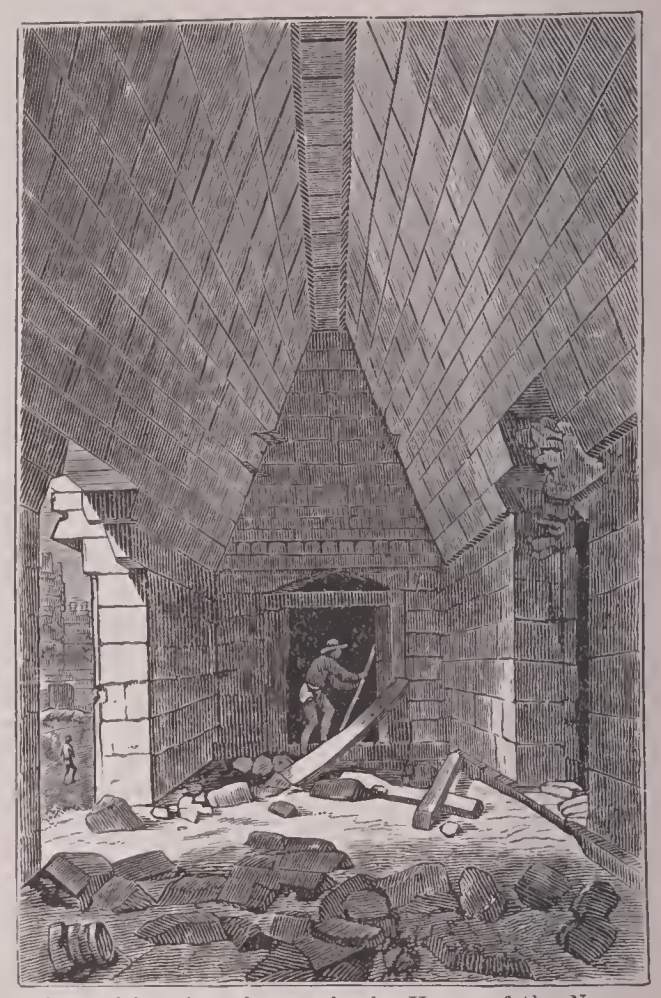
Maya Antiquities.—Although all the remains found within the area of the Maya stock of tribes present certain general similarities, they offer special traits which suggest their division into two sub-groups; the one including those within the area of the Mexican states of Chiapas and Yucatan, the other in the republics of Guatemala and Honduras. The principal sites in the former of these sub-groups are—Palenque, situated on the small river Otolum, a branch of the Usumacinta, in Chiapas, containing five remarkable structures; Comacaleo, N. W. of Palenque, near the coast; Mayapan, the ancient native capital of Yucatan, S. E. of Merida; Uxmal, S. W. of Mayapan, presenting some of the vastest monuments of American architecture; Kabah, Nochacab, Chunhuhu, Mani, and many others, nearly forty in all, within a radius of 50 miles from the capital, Mayapan. Further E. are Izamal and the singular agglomeration of buildings called Chichen-Itza; on the eastern coast the city of Tuloom, fortified with strong walls and surmounted with square towers; and on the island of Cozumel numerous edifices of smaller proportions, visible from the sea. In the south of the peninsula are the well-preserved structures of Tikal, not far from Lake Peten, and on the Usumacinta river a large mass of ruins, which has been named Lorillard City.

In the architectural remains discovered in these localities certain resemblances are found which show them to have been the work of the same people, and which separate them from similar relics of native civilization seen elsewhere. It is evident on the other hand, from their state of preservation, that they are of widely diverse ages. Palenque was undoubtedly an abandoned city when Cortes conquered Mexico, as he passed almost within sight of it and never heard of its existence. Even at that time there were massive ruined cities in Yucatan, covered with a forest of seemingly primeval growth. Such a one was Tiho, on the site of which Mérida now stands, and whose materials served to build the present city. Others again were in process of construction when the Spaniards arrived. The usual material of the buildings is the limestone which underlies the surface soil in most parts of the country. The blocks were shaped by stone tools and laid in a mortar of admirable temper, which has become exceedingly hard. The plumb-line and square were unknown, the masons guiding themselves by the eye and by the use of long, straight reeds. The general plan of all these edifices was that of a walled building, erected on the summit of an artificial mound or pyramid. The structure of the pyramid varied. Sometimes it was merely a heap of rubble and earth, kept in place by an external layer of



Ground-plan of Governor's house (322 feet.).

stone; elsewhere the foundation walls of the superstructure extend down through the pyramid to the original soil, the mound being constructed around them. The base is generally rectangular, though rarely accurately so, and the sides are occasionally terraced into one, two, or three platforms. The area of the ground plans and the height vary

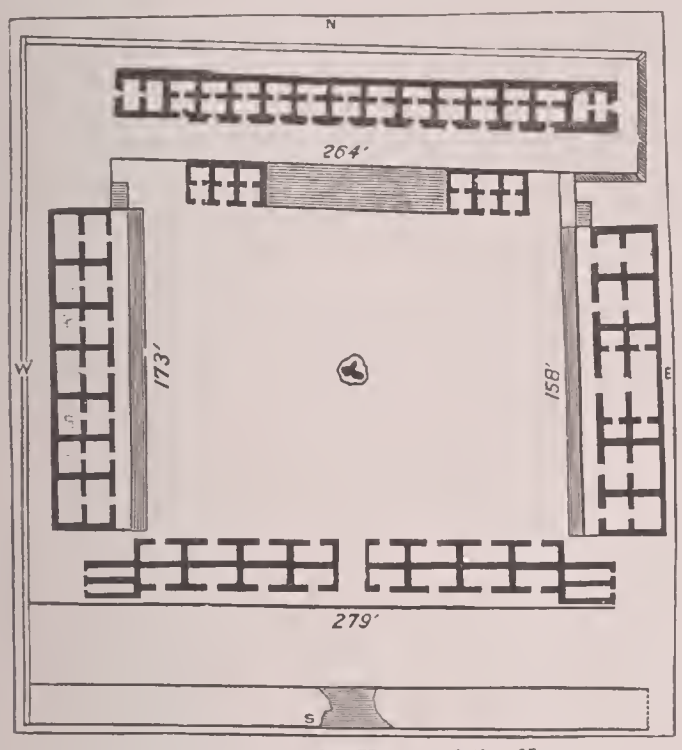


Part of interior of room in the House of the Nuns.

greatly. What is called the palace at Palenque has a base area of 260 by 310 feet, with a height of 40 feet; the Governor's house ("Casa del Gobernador") at Uxmal has an irregular base about 600 feet on each side. From these, which are among the maximum dimensions, the base area descends to that of small pyramids supporting single rooms, as in the island of Cozumel. An exception to the usual plan of utilizing the pyramid is seen in the ruins of Kabah and Zayi. Here, instead of being the support for the foundation of the superstructure, it serves as a central nucleus around which the house, with receding stories, one above the other, is constructed. The first story is built upon the ground, its rear wall being the face of the pyramid; the second story is built in the same way on the platform of the first terrace of the mound; and so on to the top. This reminds one somewhat of the structure of some of the pueblos of New Mexico. In such an instance we

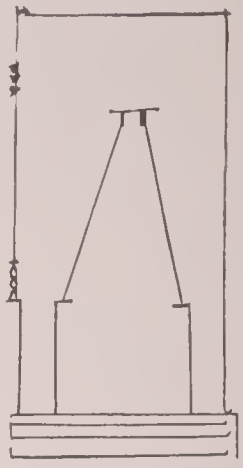
The Governor's house at Uxmal.

may suppose that we have an example of domestic or residential architecture; but this was certainly not the purpose of most of the examples of this group of Maya remains. The pyramids usually have steep sides; the steps are narrow and often 2 feet in the rise, with narrow treads. The buildings which surmount them have entirely inadequate accommodations for residence; and finally we are clearly told by the first explorers that the native houses were of light wood, leaves, brush, mats, and similar perishable materials. There is no doubt but that the destination of most of these structures was for religious or ceremonial purposes, and not as dwellings. They are divided into small and dark rooms, rarely communicating. In that known as the "House of the Nuns" at Uxmal there are eighty-eight of these small rooms looking on an interior stone-paved court. But such examples are not frequent. The decorations of many of the buildings are extremely elaborate, both exter-



Ground-plan of the House of the Nuns.

nally and internally, and evidently largely symbolic. The faces of the walls are elaborately carved in designs extending across the whole elevation, sometimes in fixed patterns, as intricate meanders and *grecques*, often to represent more or less conventionally the figures of animals. Of these the serpent seems to have been the favorite, but other animals and the human figure are also frequent. The assertion of some writers that the elephant is among the species thus depicted is incorrect, a recurved ornament on the angles of the structures having been mistaken for the trunk of the animal. Officials in ceremonial costumes are sometimes represented performing religious rites, surrounded by inscriptions in low relief in the peculiar hieroglyphic character of the Mayas, known as the "calculiform." The most celebrated example of this is seen in the altar slabs from Palenque, where several figures are depicted in the act of making offerings to a central object shaped like the Latin cross. The Latin, the Greek, and the Egyptian cross, or *tau*, were evidently sacred symbols to this ancient people, bearing some religious meanings derived from their own cult. This fact has no further significance, as these and other such simple figures were connected with the religious symbolism of many primitive peoples. The interior of the buildings was usually covered with hard stucco, sometimes itself molded by hand into ornamental elements, and more frequently serving as a ground for color work. In this manner, especially in Chichen-Itza, scenes from life are depicted with bold, free-hand drawings, and in strong crude coloring on the interior surfaces of the walls. The doors were rectangular, with lintels of stone or of wood. That some of the latter still remain in place is evidence that the buildings in which they are can not claim any vast antiquity. The roofs were sometimes of stones, laid the one overlapping the other, or of wooden beams plastered with cement inside and out. The latter have not withstood the attacks of time, but descriptions of them have been left by early travelers. The use of pillars as supports was not generally understood, although various examples are met with. On the other hand, the arch as an architectural element had received a higher development in the Maya countries than elsewhere in America. Its early form is seen at Palenque. Here it is simply formed by two walls which approach each other, the stones on each side being laid to project toward the center. At the top a single flat stone is laid across the aperture to close the approaching walls. In the buildings of Uxmal and elsewhere in Yucatan the edges of the overlapping stones are neatly polished off and the surface covered with stucco, so that the technical plan is concealed; while at Comacalco the Palenque method is maintained. At Palenque also we find examples of a more complicated arch, somewhat resembling that known as the Moorish, though properly called the trefoil arch. Nevertheless even this appears to depart from the true definition of this element, as it terminates in an architrave, and not in a keystone.



Cross-section through one apartment, showing early form of arch.

The other sub-group into which we have divided the Maya antiquities includes the area of Guatemala and the adjacent territory of Honduras. The most celebrated sites are Utatlan, the capital of the ancient Quiches, in Western Guatemala; Iximche, the capital of the Cakchiquels, neighbors of the Quiches on the east, both of them powerful nations at the time of the conquest and with well-developed civilization; and the enigmatical ruins of Copan, on the banks of a river of the same name in Honduras, but only some 10 or 12 miles from the Guatemala line. Like Palenque, Copan had been abandoned by its inhabitants long before the conquest, and when first heard of was a mass of ruins. Some writers maintain that it can lay claim to being the oldest city in America. It presents an elevated rectangular area about 900 by 1,600 feet, surrounded by solid stone walls and inclosing a number of structures, especially one principal group designated as the "temple." This is of massive blocks of cut stone, with walls 25 feet in thickness. The ground plan measures 624 by 809 feet. The adjacent soil is covered with sculptured obelisks, pillars, and idols, with finely dressed stones, and with blocks ornamented with skillfully carved figures of the characteristic Maya hieroglyphs, which, could they be deciphered, would doubtless reveal the story of this strange and solitary city. Both Utatlan and Iximche were occupied by their builders and owners when the country was conquered by Alvarado in 1524, and we have slight descriptions of them by the historians of his expedition. At present, however, they are nothing more than mounds of *débris*, the cut stones of which they were constructed having been carried off by the European settlers to serve as building material. Several pyramids remain at Utatlan; one, called the "Fortress," is about 120 feet high, its summit surrounded by a stone wall plastered with stucco. Another pyramid, supposed to have been a temple site, is ascended by a staircase of nineteen steps, each 8 inches broad and 19 inches high. The foundation wall of what is called the "palace" shows it to have been a building with dimensions of about 1,100 by 2,200 feet. Iximche was not inferior in its ancient splendor, but now scarcely more than its solidly paved and cemented streets and the foundations of its large communal residences can be seen.

The second and third groups of Central American antiquities may be briefly treated. The Nahuas at an early date moved southward from Central Mexico, some colonies remaining in Guatemala under the names Pipiles and Alaguilacs, and others moving on to Nicaragua, where they settled between the lake of that name and the Pacific, and on the island in the lake called Ometepec. They brought with them their long-acquired skill in dressing stone and in erecting tumuli, and such are found in these localities which they occupied. The most celebrated of such relics are the sculptures of Cozumel-hualpa in Guatemala, extraordinary carvings in bas-relief, evidently funereal in character, specimens of which have been taken to various museums in North America and Europe. The sculptures from Ometepec have also deservedly attracted the attention of the students of American antiquities. There can be no doubt of the Nahuatl origin of these ancient specimens of art.

In Costa Rica the traveler finds many mounds of large size, proving to be funeral monuments, from which have

been taken thousands of small images in gold known as "Chiriqui ornaments." They appear to have been the work of one of the tribes dwelling near the Gulf of Chiriqui at the time of the conquest. A few structures in stone have been reported from Costa Rica, but there is some doubt whether they can be attributed to native art of a date anteceding the advent and influence of the Europeans.

AUTHORITIES.—*Travels in Yucatan*, by John L. Stephens; *Travels in Central America, Chiapas, and Yucatan*, by the same; A. S. Maudsley in *Proc. Royal Geog. Society* (1888); D. Charnay, *The Ancient Cities of the New World*; H. H. Bancroft, *The Native Races of the Pacific Coast.*

D. G. BRINTON.

Central City: city; capital of Gilpin co., Col. (for location of county, see map of Colorado, ref. 2–D); is situated among the Rocky Mountains, on Union Pac. R. R.; 40 miles W. by N. from Denver. It derives its prosperity from its gold mines, and has quartz-mills, manufactures of mining machinery, a fine school building, and churches of four denominations. The city was founded in 1859, and is the oldest gold-mining camp in the State. Pop. (1880) 2,626; (1890) 2,480; (1900) 3,114.

EDITOR OF "GILPIN COUNTY OBSERVER."

Central City: railroad junction: on Platte river; capital of Merrick co., Neb. (for location of county, see map of Nebraska, ref. 7–J); has Nebraska Central College. Pop. (1880) 648; (1890) 1,368; (1900) 1,571.

Central Falls: city (incorporated 1895); formerly part of town of Lincoln, Providence co., R. I. (for location, see map of Rhode Island, ref. 7–N); on Worcester Division of N. Y., N. H. and H. R. R., and on Blackstone river; about 6 miles N. of Providence; has 7 churches, 7 public schools, public library, 3 parks, cotton and woolen mills, thread-mills, hair-cloth manufactory, copper-refinery, foundries, and machine-shops. Pop. (1900) 18,169.

EDITOR OF "RECORD-VISITOR."

Central Forces: in mechanics, those forces which radiate from a point or center. A body impelled by a constantly acting force toward a fixed center will move up to that point with a constantly increasing velocity; but if it have an initial motion in a direction toward some point other than the center, the constantly acting central force will deflect it from its original path, but will not draw it to the center of force. The resultant path will be a curve. The straight line from the moving body to its center of force is called a "radius vector," and it is found, mathematically, that the radius vector of a body moving in a curve under the influence of a central force will pass over equal areas in equal times, whatever the rate of motion. It is found, also, that the velocity of such a body is at all times inversely proportional to the perpendicular from the fixed point on the tangent to the curve at the point considered. Therefore, if the motion be uniform, the path of motion is a circle. If the path be an ellipse, and the center of force be the center of the curve, the central force is directly proportional to the distance; but if the center of force be at a focus of the ellipse (or of a hyperbolic or parabolic path), the force acts with an energy inversely proportional to the square of the distance.

Centra'lia: a city and railroad junction; Marion co., Ill. (for location of county, see map of Illinois, ref. 9–E); 252 miles S. of Chicago. It has machine-shops of the Illinois Central R. R. Company, two coal mines, iron and steel works, an iron-foundry, and various other manufactories. There are in Centralia several parks, a public library, a high school, and graded schools. It is a center of trade for the famous fruit-belt of Southern Illinois. Pop. (1880) 3,621; (1890) 4,763; (1900) 6,721. EDITOR OF "DEMOCRAT."

Centralia: city; Lewis co., Wash. (for location of county, see map of Washington, ref. 5–C); on Northern Pac. R. R.; 94 miles N. of Portland, Ore. Its industries are agriculture, coal-mining, and lumbering. Pop. (1890) 2,026; (1900) 1,600.

Centralia: city; Wood co., Wis. (for location of county, see map of Wisconsin, ref. 5–D); on Ch., Mil. and St. Paul and other R. Rs., and on Wisconsin river. It has abundant water-power and many important manufactures. Pop. (1880) 806; (1890) 1,435; annexed to Grand Rapids since 1890.

Centralia: town; Boone co., Mo. (for location of county, see map of Missouri, ref. 4–G); on Wabash and Chicago and Alton R. Rs.; 124 miles N. W. of St. Louis. It is in an agricultural and grazing region. Pop. (1880) 703; (1890) 1,275; (1900) 1,722.

Central Provinces of India: one of the great administrative divisions of British India; situated between lat. 18° and 24° N., and between lon. 77° and 83° E. Area, 86,501 sq. miles. They were formed into a chief commissionership in 1861, and they are divided into 4 commissionerships and 18 districts. The line of railway connecting Bombay with Calcutta passes through these provinces, and has completely altered the condition of the country, which up to the time when it was formed into a chief commissionership was almost unknown. The traffic that passes through the capital, Jabalpur, is larger than that of any other city in India, except Bombay. The revenue of the provinces in 1880 amounted to £1,293,130. Pop. (1901) 9,845,318.

Centrarch'idæ [from *Centrarchus*, the name of a genus, from Gr. *κέντρον*, spine + *ἀρχός*, anus]: a family of fishes of the order *Acanthopteri*, peculiar to North America. They constitute a very characteristic type in at least the Eastern and Mississippi regions. The body is oblong and compressed, and divided into nearly equal and corresponding halves by a longitudinal axis coincident with the commencement of the lateral line and the middle of the caudal fin; the scales are well developed, and generally ctenoid; the lateral line is continuous; the head is compressed, and covered with scales on the opercula and cheeks; the eyes are lateral. The species are quite numerous (about fifty having been described), and generally among the most common fishes of the waters which they frequent. They are all carnivorous, and mostly quite bold and gamy fishes. In the breeding season they generally select a spot, which they clear of weeds and obnoxious substances, for depositing their eggs; these the male and female guard with zealous care, rushing boldly forward to drive away any intruder not too large for their powers. It is to this family that the black bass, as well as rock-bass, sunfish, crappie, etc., belong. Several distinct types of structure are exemplified by the species. See SUNFISH.

THEODORE GILL. Revised by DAVID S. JORDAN.

Centre College (Danville, Ky.): chartered as a State institution in 1819. Under the long presidency of Dr. J. C. Young (1830–57) the college rose to great eminence among Western schools. It retained both its numbers and its reputation until the civil war, when the number of students was reduced from 200 to less than 50. At the close of the war the synod of Kentucky was rent asunder, and the smaller body, and with it Centre College, adhered to the General Assembly. The libraries of the college contain about 20,000 volumes. Facilities for instruction in the sciences are good and increasing. The endowment yielding an income amounts to about $175,000; the buildings and grounds are estimated at $85,000 additional. Instructors (1900) 30; students, 350.

Centreville: See CENTERVILLE.

Centreville: town; capital of Queen Anne co., Md. (for location of county, see map of Maryland, ref. 2–G); on Phil., Wil. and Balt. R. R.; 30 miles E. by N. from Annapolis; is situated in a large peach-growing region. Steamboats connect it with Baltimore. It has an academy for boys and one for girls, an agricultural-implement factory, and a foundry. Pop. (1880) 1,196; (1890) 1,309; (1900) 1,231.

Centrip'etal and **Centrif'ugal**: terms used in botany, and applied to two modes of inflorescence. When the terminal flower-bud is the first to expand, the inflorescence is said to be centrifugal. When the expansion begins with the bud which is nearest the base of the floral axis (or nearest the circumference in a cyme or corymb), and proceeds toward the terminal or central bud, the inflorescence is centripetal.

Centripetal and **Centrifugal Forces** [*centripetal* is from Lat. *centrum*, center + *pe'tere*, seek (Newton used the Mod. Lat. *centri'petus* and *centri'fugus*); *centrifugal* is from Lat. *centrum*, center + *fu'gere*, flee]: If we suppose a body to move in a circle with a uniform velocity, it is shown by the laws of motion that it must be acted upon continually by a uniform force directed toward the center; which force expends itself each instant in deflecting the moving body from the straight line in which it would normally move, this line being a tangent of the circle in which motion takes place. The force with which the body is impelled toward the center is called *centripetal*; the equal and opposite reaction of the body against this impulsion is the *centrifugal* force. Both together are the *central* forces. Each is equal to the mass of the body multiplied by the square of the velocity, and divided by the radius of the circle round which the body moves.

Centumalus: the name of a plebeian family of the *Gens Fulvia*.—One member, Maximus Centumalus, was legate to the dictator M. Valerius Corvus in the Etruscan war, 301 B. C., and consul in 298 with L. Cornelius Scipio, when he gained a brilliant victory over the Samnites near Bovianum.—Another, Cn. Fulvius Centumalus, was consul in 229, and triumphed in the following year, having dispersed the troops of the Illyrian queen, Teuta, and shut her up in the fortress of Rhizon. This was the first triumph over Illyrians occurring in the history of Rome.—His son, Cn. Fulvius Centumalus, was consul in 211 together with P. Sulpicius Galba. His command was prolonged beyond the term of his consulship, but in 210 he was defeated by Hannibal near the town of Herdonsa in Apulia. He himself and eleven tribunes perished in the battle.

Centum'viri: among the Romans judges appointed, three out of each tribe, to decide common causes. The extent, however, of their power is uncertain.

Centuries of Magdeburg: the first Church history by the Protestants, the preparation of which occupied many eminent scholars for a long period. The plan of an extended work, which should reveal the deviations of the Roman Church from the practices of the early Christians, was first conceived by Matthew Flacius of Magdeburg in 1552. The labor begun by him was carried forward by Johann Wigand, Matthew Judex, Basil Faber, Andreas Corvinus, and Thomas Holzhuter, and the means therefor were provided by the evangelical princes and great men. The work appeared in Basel in 13 folio volumes, each volume covering a century (1559–74), but the headquarters of the enterprise was Magdeburg, whence the name. A second edition, edited by Ludwig Lucius, appeared in Basel, 1624 (6 vols. fol.); a new edition of the first five centuries, edited by L. J. Baumgarten and J. S. Semler, at Nuremburg (1757–65, 6 vols.); while a German translation of the first four centuries, by the original authors, appeared at Jena (1560–65, 2 vols.). The materials are arranged under sixteen different heads—doctrine, government, heresies, ceremonies, missions, councils, etc. The arrangement is mechanical, and the style (the book is written in Latin) is cumbersome and affected. But the amount of criticism brought to bear on the subject is considerable. The *centuriatores*, as the authors were called, never brought it down in printed form beyond the year 1300; but Wigand prepared the parts for the fourteenth, fifteenth, and sixteenth centuries, and the MS. is now preserved in the Wolfenbüttel library. The work has been severely criticized by Protestants as partisan, in the interests of strict Lutheranism. But as a pioneer work it deserves great honor. It stirred up a vigorous Roman Catholic opposition, the result of which was great gain to the study of Church history. It was in refutation of the *Centuries* that Baronius wrote the *Annales Ecclesiastici* (Rome, 1588–1607, 12 vols.).

Revised by Samuel Macauley Jackson.

Century [from Lat. *centu'ria*, a division consisting originally of a hundred (*centum*)]: a company of 100 men in the Roman army; also a civil division of the Roman people formed for the purpose of voting. According to this division, which was founded on property, the people voted in the *comitia centuriata*. (See Comitia.) Servius Tullius divided the citizens of Rome into 193 centuries. In modern times the term is used mostly to denote a period of 100 years.

Century Plant: See Agave.

Cepe'da, Diego: Spanish lawyer and judge; b. in Tordesillas, Valladolid, about 1495. He was *oidor* or administrator of the Canary islands, and in 1543 was one of the judges of the royal audience which was sent to Peru with the viceroy Blasco Nuñez Vela. He led the judges in their opposition to Vela's measures and his imprisonment. Subsequently he became the adviser and tool of Gonzalo Pizarro, fought on his side at the battle of Anaquito (Jan. 18, 1546), counseled Pizarro not to accept Gasca's offers of amnesty, but finally deserted him on the field of Sacsahuana (Apr. 8, 1548). Gasca sent him to be tried in Spain, and he died in prison at Valladolid, probably by his own hand.

Herbert H. Smith.

Cephalas'pis [from Gr. κεφαλή, head + ἀσπίς, shield]: a genus of fossil fishes armed with rhomboidal ganoid plates of enameled bony structure. Several species are found in the Upper Silurian and in the Devonian rocks. They had large heterocercal tails, and appear to have been rapidly moving, predaceous fishes. The name is derived from the large plate which covered the head.

Cephalization [derived from Gr. κεφαλή, head]: a term introduced by Prof. James D. Dana to denote simply the degree of head domination in the structure of the body. The following are some of the ways or methods in which it is manifested:

1. With *superior* cephalization—that is, as species rise in grade or rank—more and more of the anterior part of the body or of its members render service to the head; with *inferior*, less and less. In many cases, part of the organs that serve as feet in the lower tribes serve as jaws in the higher, or, in other words, are transferred from the locomotive to the cephalic series, and thus the structure indicates higher cephalization.

2. With *superior* cephalization the structure of the head or of the anterior portion of the body becomes more and more compacted, perfected, and condensed or abbreviated; with *inferior*, the same portion becomes more and more lax in its parts or loosely put together, and imperfect in the parts or members themselves, and at the same time the whole is more and more elongated and spaced out or enlarged.

3. With *superior* cephalization the posterior portion of the body becomes more and more compacted, or firmly put together and abbreviated; that is, as concentration goes on *anteriorly* there is abbreviation *posteriorly*. Even the tail shows grade; for great length or size or functional importance is actually a mark of inferior grade, other things being equal.

4. With *superior* cephalization there is an upward rise in the head extremity of the nervous system; and this reaches its limit in man, in which it becomes *erect*. With *inferior*, there is the reverse condition, and the limit is seen in the *horizontal* fish.

5. With *inferior* cephalization there is not only a less and less concentrated or compacted and perfected state of the whole structure before and behind, but in its lower stages the degradation of the structure extends to an absence of essential parts, as teeth, members, senses; and often also to a gross enlargement of the body beyond the size which the system of life within can properly wield, and in this case the body is stupid and sluggish.

Revised by David S. Jordan.

Cephalo'nia (anc. *Cephallenia*; in Gr. Κεφαλληνία): the largest of the Ionian islands; one of the nomarchies of the kingdom of Greece; in the Mediterranean, near the west coast of Greece. It is about lat. 38° N. and lon. 20° 30′ E. The greatest length is 32 miles, and the area 302 sq. miles. The surface is mountainous, the climate is pleasant, and the soil is mostly thin. The highest summit rises about 5,000 feet above the level of the sea. The chief articles of export are currants and olive oil. The principal towns are Argostoli and Lixuri. There are many ancient ruins upon the island. This island was called *Samos* by Homer. Pop. (1879) 80,543; (1896) 83,363. See Ionian Islands.

Cephalop'oda [from Gr. κεφαλή, head + πούς, ποδός, foot]: the highest class of the *Mollusca*, including cuttlefishes, squids, octopods, sepias, *Nautilus*, and *Argonauta* (paper-nautilus). The class is characterized by having a distinct head and by possessing a circle of arms surrounding the mouth. The arms are regarded as homologous to the fore part of the "foot" of other mollusks. The arms are provided with suckers, the efficiency of which is in most cases greatly increased by numerous fine hooks arranged around their margins.

The body is covered with a mantle, which is in the shape of a bag or cone, from the open mouth of which project the head and arms. This covering contains much muscular tissue. It is attached to the rest of the body along the dorsal line. The water can pass freely into the mouth cavity around the collar; but when the mantle contracts, by a peculiar arrangement it may fit so closely to the neck that the water can not return by the same way, but is forcibly expelled through a tube called the siphon, connecting with the mantle cavity. By this means the animal may be projected backward through the water, sometimes with great rapidity. By means of these movements the water is also driven over the gills which project into the mantle chamber, and thus respiration is accomplished. In some forms, as in the squids, the mantle may be raised into folds, which constitute the so-called fins which aid in directing the movements through the water.

The nervous system is highly developed and greatly centralized. The eyes are very large and conspicuous, and in

many forms are remarkably like those of vertebrates, although differing from them in very important particulars, both in structure and manner of development. The ears, two in number, consist each of a single sac imbedded in the head, containing a watery liquid in which is a single otolith.

A cartilaginous skeleton is present which surrounds certain of the nerve centers, supports the eyes and ears, and serves for the attachment of muscles. The mouth possesses two jaws very much resembling the beak of a parrot.

In some forms an external shell is developed, e. g. in the nautilus; in others a shell more or less rudimentary is imbedded in the mantle, and is known as the "pen" in the squid and "cuttlebone" in the cuttlefish; while still others, e. g. octopi, are devoid of both.

There is present in most forms an ink-sac, which opens by a duct within the anus. It contains a black fluid which the animal discharges into the water, thereby rendering it so cloudy that it may escape when attacked by enemies. The contents of the ink-sac of certain forms is the india ink or sepia of commerce.

The cephalopods are marine and carnivorous in their habits. They are placed in two orders. The first, *Tetrabranchiata*, are those which have four gills, a chambered shell, and a siphon not closed into a tube. They also possess numerous tentacles surrounding the mouth. The only living forms are of the genus *Nautilus*, found in the Pacific and Indian Oceans. Members of this order were very numerous throughout geological times, from the Lower Silurian upward. Their shells are characteristic of certain geological formations. The most common are those of the genera *Orthoceras*, *Baculites*, *Goniatites*, *Ceratites*, and *Ammonites*.

The second order, *Dibranchiata*, are those which have two gills in the mantle-chamber, bear eight or ten arms with suckers, and have the siphon formed into a tube. In one group, the *Decacera*, or *Decapoda*, there are ten arms, two differing materially from the others. This group includes the cuttlefishes, the squids, spirula, and the fossil Belemnites. The other group, *Octopoda*, includes the various forms commonly known as octopi, or devil-fish.

DAVID S. JORDAN.

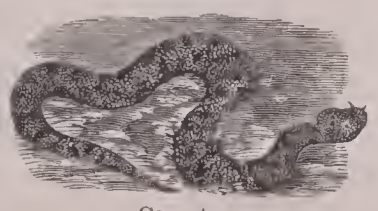
Cephren: See KEPHREN.

Ceram', or **Zeram'**: an island of the Malay Archipelago; the largest of the Moluccas except one. It is between Buru and Papua, about 3° S. of the equator (see map of East Indies, ref. 8–I). Its length E. and W. is nearly 200 miles, and its area about 6,950 sq. miles. Pop. 200,000. It is partly occupied by mountains, the highest point of which, Nusa Keli, rises about 11,000 feet above the level of the sea. The vegetation here is luxuriant, and the highlands are mostly covered with forests. The clove and nutmeg grow wild in Ceram, which also produces the sago-palm in abundance. The lowlands are peopled by Malays, who are bold sailors. The mountains are inhabited by fierce Alfuros. The Dutch claim the sovereignty of this island.

Ceramics: See KERAMICS.

Cerami'cus [Gr. Κεραμεικός, deriv. of κέραμος, earthenware]: name of a region at Athens, partly without and partly within the walls, and connected by the Dipylum gate. Inner Ceramicus extended over the Agora, or market-place. Here popular assemblies and the senate met for business, and the district was adorned with porticoes, the Prytaneum, the Theseum, and other public buildings. Outer Ceramicus was a suburb, where funeral eulogies were made over those who had died in battle and where their ashes were inurned. Here the Athenians erected inscribed statuary to celebrate their heroes.

Ceras'tes [Gr. κεράστης, horned, horned animal, deriv. of κέρας, horn]: a genus of venomous serpents, the horned vipers, of Northern Africa and India, having a flattened head, two rows of plates under the tail, and keeled but not spinous scales. The nostril is small and semi-lunar. Its name is derived from the horned scale which grows upon the eyelids of the male. Several deadly species of *Clotho* of West and South Africa have somewhat similar horns, and are by some included in this cognate genus.



Cerastes.

Ce'rates [from Lat. *cera'tum*, wax-plaster, deriv. of *cera*, wax; cf. Lat. *cero'tum*, wax = Gr. κηρωτόν]: unctuous preparations consisting of oil or lard, which have their consistency increased by the addition of wax, resin, or spermaceti, in order to prevent too great a diffusion of the ointment when it is applied to the skin. Cerates are employed to soothe irritation of the skin, or to bring in contact with it some powerful medicinal substance, such as cantharides.

Cerati'tes [from Gr. κέρας, κέρατος, horn]: a genus of the fossil cephalopods, of the family *Ceratitidæ*: characteristic of the Triassic and Permian rocks. The shell is coiled in a vertical plane, and is distinguished by having the lobes of the sutures serrated, while the intervening curves toward the aperture are simple.

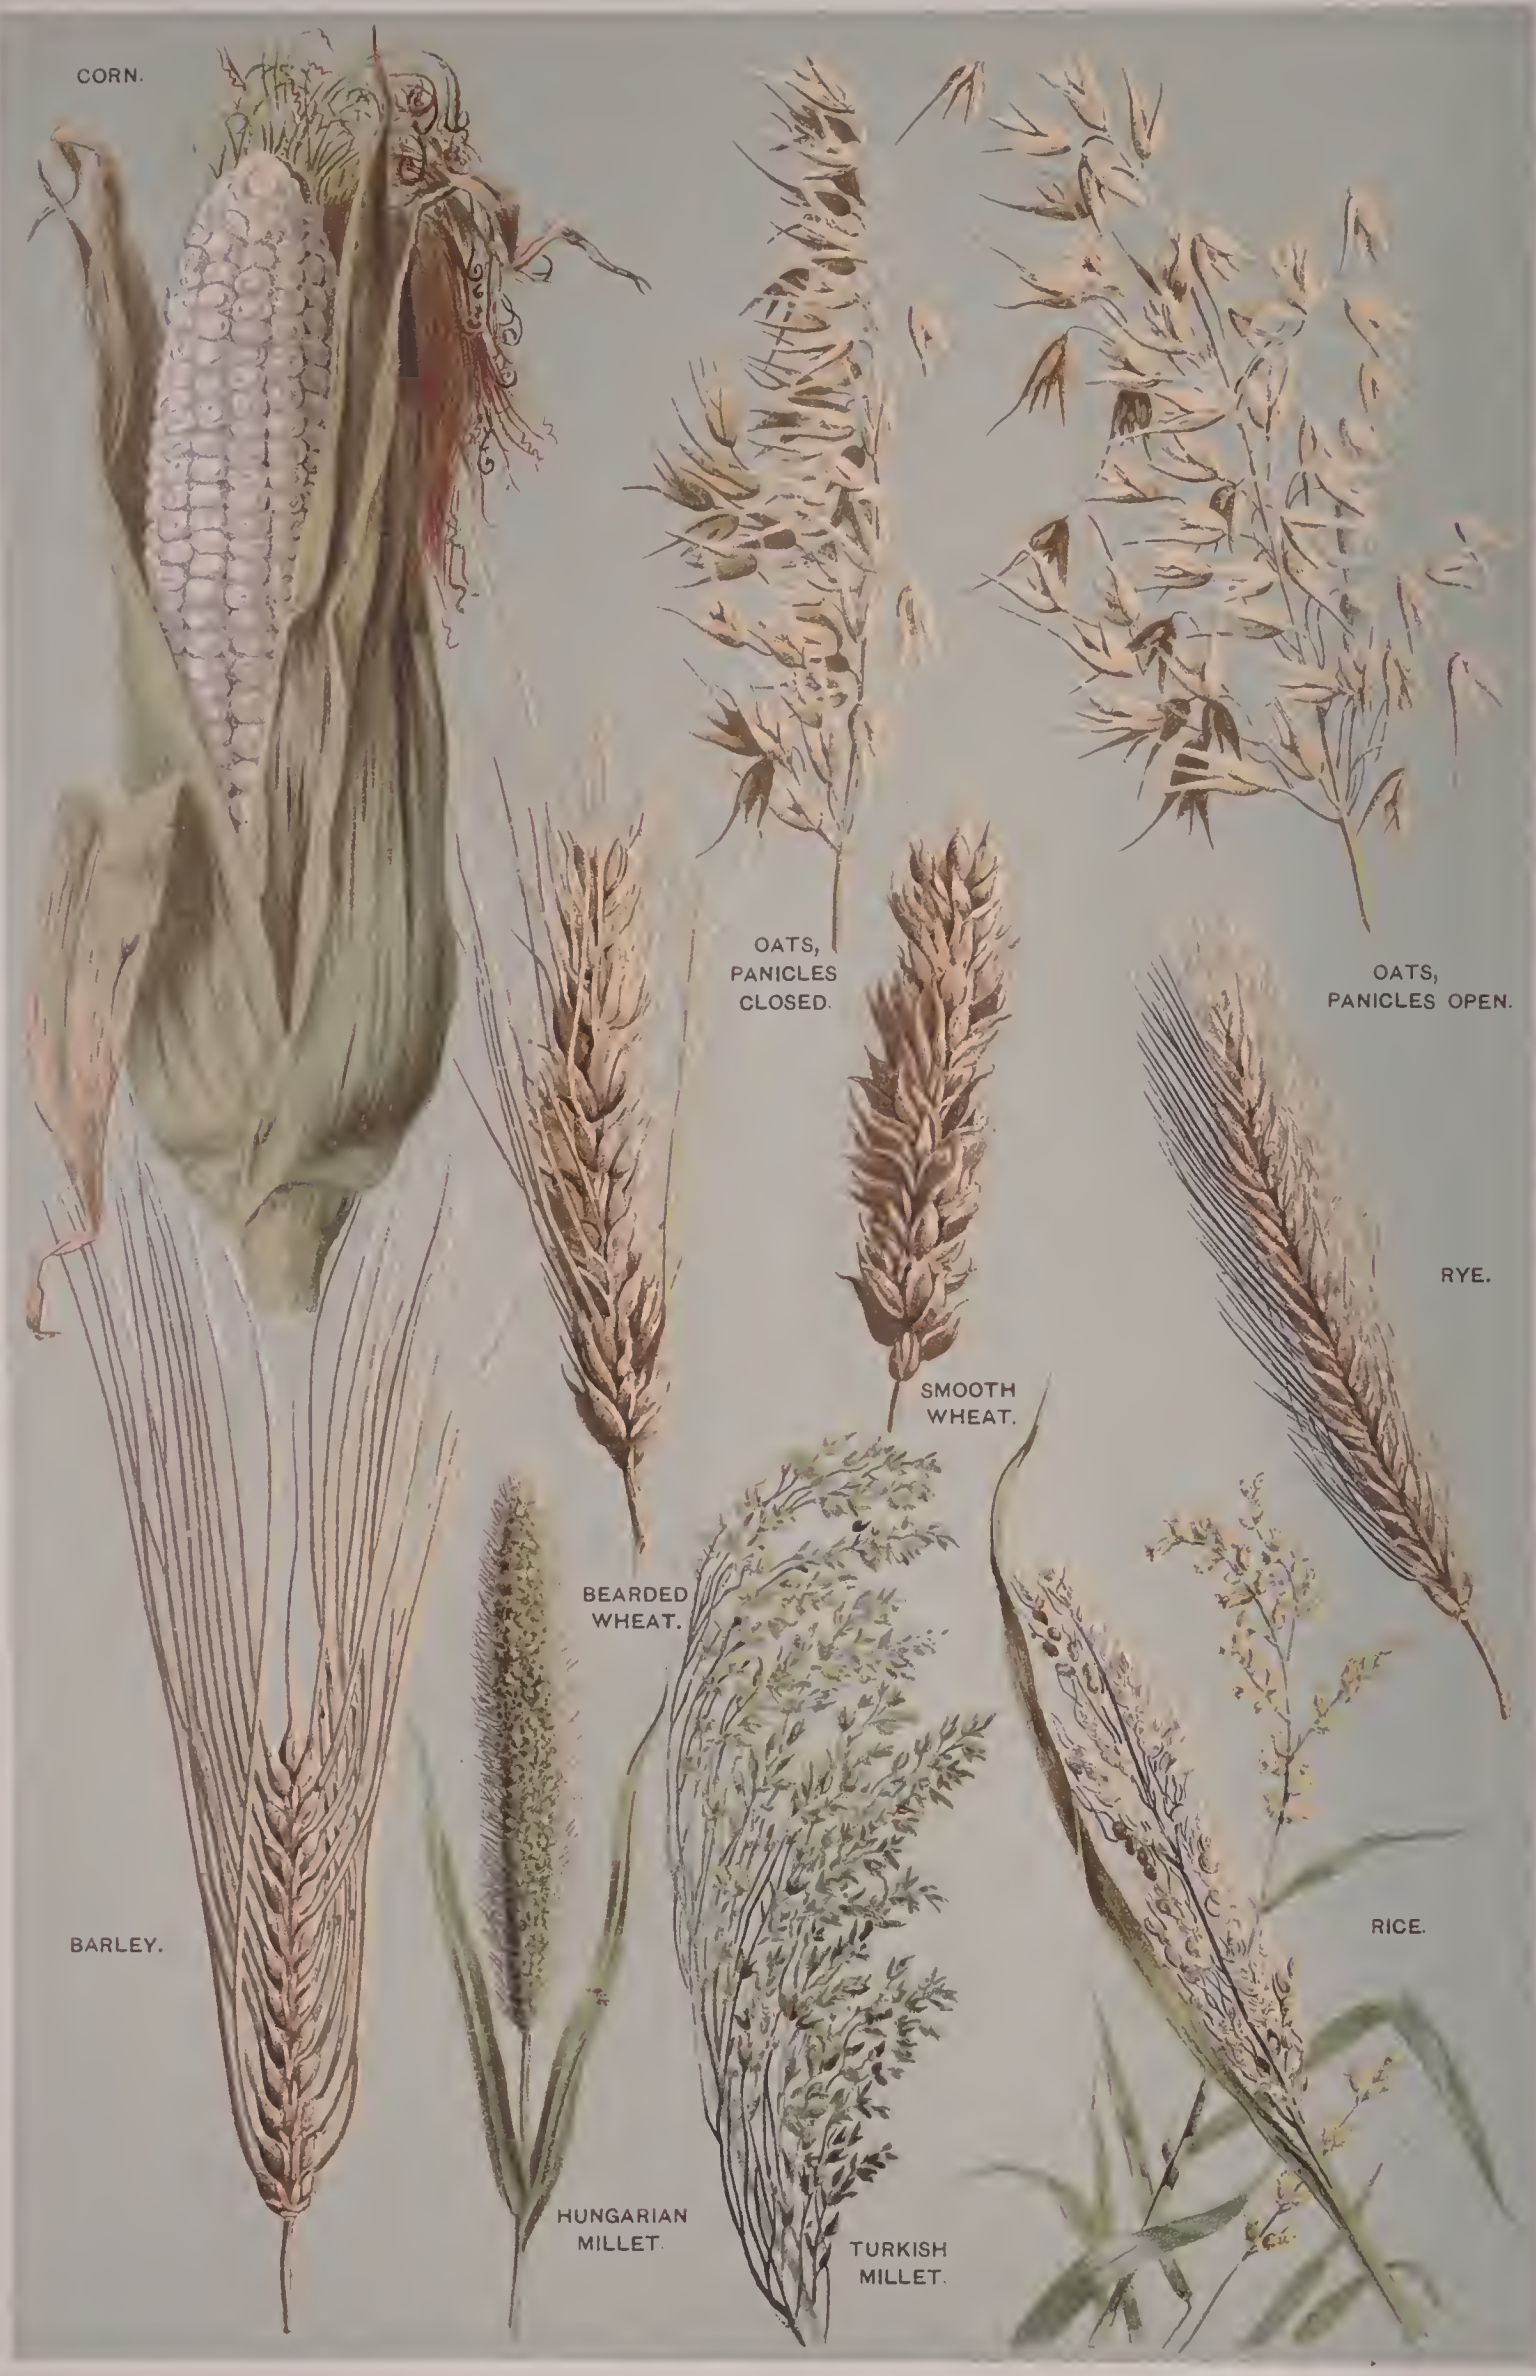
Ceratodon'tidæ [from Gr. κέρας, -ατος, horn + ὀδούς, ὀδόντος, tooth]: a family of fishes of the order *Sirenoidei*, supposed, until recently, to be extinct, but lately discovered to be represented by living species in certain Australian rivers. The discovery of these living forms is one of the most important, if not actually the most important, of modern additions to ichthyology. The body is elongated, and of nearly equal height from the head to the post-ventral region, but thence tapers backward toward the tail; the scales are large, oblong, and are regularly imbricated; they have the surfaces sculptured with several concentric lines of growth, and the margins are rounded, entire, and membranaceous. The anatomical peculiarities are numerous, but can not be here signalized. Previous to the discovery of the most noteworthy characters of the living *Ceratodontidæ*, it had been supposed that the representatives of the family were characteristic of the Secondary epoch, and that they had not survived beyond the Triassic period. It was with great astonishment, therefore, that the discovery of living species in the fresh waters of Australia was hailed. The living forms have even been generally regarded as actually congeneric with the Triassic species; but this seems to be questionable, and the differences between the dental laminæ of the living and extinct species are sufficiently great to warrant generic differentiation independent of any hypothetical considerations. For the living forms the name *Neoceratodus*, proposed by Castelnau, may be retained. The only *certainly* known living species (*N. fosteri*) was first discovered in 1870 by Mr. Girard Kreft, curator of the Australian Museum at Sydney, in a river of Queensland, but has since been found in other streams. The fish is said to frequently leave the water and go on the land at night. It feeds chiefly, if not entirely, on vegetable matter, such as the leaves, etc., of various plants. It attains a length sometimes of about 6 feet. The extinct species of the family flourished chiefly during the deposition of the Jurassic and Triassic formations in Europe and America, and were among the most abundant and characteristic of the fishes of those epochs. Until the discovery of the living forms they were supposed to have been shark-like animals; thus the finding of the Australian species has not only greatly extended the range in time of an ancient type, but has enabled us to recognize the affinities of the later, and, in connection with them, of a long series of other extinct forms.

THEODORE GILL.

Ceratonia: See CAROB.

Cer'berus (in Gr. Κέρβερος): the triple-headed dog which, as the ancient Greeks imagined, guarded the portal of the infernal regions. He was represented as having a mane and tail composed of serpents; the poets gave him as many heads as they wished. He resisted only those who attempted to come out of Hades. Orpheus charmed him with his lyre, and Hercules is said to have overpowered him and dragged him out. The name Cerberus was given by Hevelius to a northern constellation.

Cerca'ria [from Gr. κέρκος, tail]: the larval form of various trematode worms (*Distoma*, *Bilharzia*, etc.). The adult worm of *Distoma hepaticum*, the liver-fluke, a parasite in the liver of many mammals, deposits thousands of eggs in the liver, which find their way through the bile duct into the intestines, and from these pass out, and are finally washed by rains into pools, where they develop into free swimming embryos, which in a short time find their way into the tissues of a snail, *Limnea truncatula*. These embryos further develop into a form called *Redia*. The *rediæ* give rise to the *cercaria*, the typical larvæ of the worm. The *cercaria* finally escape from the snails when the latter make excursions on land. They become encysted on the



CEREAL GRAINS.

grass, and are swallowed with the food of cattle or sheep. They develop in the intestines of the host, and pass to the liver, where they live till they deposit eggs, and the cycle again begins. The liver-fluke is found in many animals, including man. It is injurious, and may be fatal to its hosts. See TREMATODA. D. S. JORDAN.

Cer'cis canaden'sis, Redbud, or Judas-tree: a small tree of the family *Leguminosæ*; a native of the U. S.; cultivated as an ornamental tree. It has cordate, pointed leaves, and red-purple flowers in umbel-like clusters. It flowers early in the spring, before its leaves are opened. See JUDAS-TREE.

Cercoce'bus [from Gr. *κέρκος*, tail + *κῆβος*, monkey]: a genus of long-tailed African monkeys, collectively called

Cercocebus fuliginosus.

"mangabeys" by Buffon. They are remarkable for their ludicrous antics, their almost constant grotesque grinning, and their general good temper. The sooty monkey (*Cercocebus fuliginosus*) is the best known.

Cercopithe'cus [from Gr. *κέρκος*, tail + *πίθηκος*, ape]: a genus of small, long-tailed African monkeys, the type of

Cercopithecus cynosurus.

the family *Cercopithecidæ*. The species are very numerous. They have mostly long hair, and long and large tails, which they carry over the back. They are collectively called guenons by some authors. One of the best known is the malbrouck (*Cercopithecus cynosurus*), or dog-tailed monkey.

Ce'real [from Lat. *cerea'lis*, pertaining to *Ceres*, the goddess of agriculture; cf. *cerea'lia*, the festival of *Ce'res*, the grains]: Bread or grain was once called *cerealia munera* (cereal gifts, or gifts of Ceres). In modern language, cereal as an adjective means pertaining to edible grain or breadstuffs, as wheat, rye, maize, and barley; as a noun it denotes those articles of food.

Cerea'lia, or Cereal Plants: the plants which produce edible grains, and are cultivated for seeds, which are used as breadstuffs. They belong to the order *Graminæ* (true grasses), although buckwheat, a member of the knot-weed family, is sometimes classed with cereals, but differs widely in structure and characters. Having been cultivated from a very remote antiquity and modified by cultivation, their original forms and native countries can not be ascertained. Difficulty is found in arranging the numerous varieties in their proper species. The most important cereal grasses are wheat (*Triticum*), barley (*Hordeum*), maize (*Zea*), rye (*Secale*), rice (*Oryza*), and oats (*Avena*). Rice is the chief food of a greater number of the human family than any other grain, but wheat is generally admitted to be superior as a material for bread to all the other cereals. Maize will thrive in regions which are too warm for wheat. The cereal grains are extensively used in the manufacture of fermented and distilled liquors. Revised by L. H. BAILEY.

Cerebel'lum [Lat., dimin. of *ce'rebrum*, brain; used in class. Lat. only in sense of small brain, but used by mediæval translators of Aristotle and Galen to render Gr. *παρεγκεφαλίς*, hinder brain, hence its modern use]: the little brain, or the lobe back of and above the medulla oblongata. See BRAIN.

Cerebro-spinal Fluid: a serous liquid, of alkaline reaction, containing a small percentage of saline and animal matters. It fills the subarachnoid space, between the arachnoid membrane and pia-mater, both within the skull and the vertebral canal. It prevents injury from concussions and shocks, and perhaps prevents undue pressure upon the brain by withdrawing itself into the spinal canal at times when the brain contains more blood than usual. In certain diseases it is secreted in great excess.

Cerebro-spinal Meningitis: See MENINGITIS.

Cereop'sis: a genus of Australian geese, of which there is but one known species, *C. novæ hollandiæ*, remarkable for its very short and thickened bill. Unlike other geese, it seldom seeks the water. It is large and easily domesticated, but is quarrelsome, and when tamed is so fierce that it has not been generally bred.

Ce'res: the Roman name of the goddess of agriculture, whom the Greeks called Demeter, and to whom men were supposed to be indebted for the gift of breadstuffs. She was said to be the daughter of Cronos (Saturn) by Rhea, and the mother of Proserpine, known also as Cora in the Eleusynian legends. Like the other children of Cronos, she was devoured by her father; but he gave her forth again after taking the emetic which Metis had given him. By her brother Zeus she became the mother of Persephone (Proserpine). The most remarkable part of the myth of Ceres was the abduction of her daughter by Pluto, and the long search which Ceres made for her. Persephone, while gathering flowers in Nysia, Asia, was carried to the lower world by Pluto (the Latin legend puts the rape at Enna, Sicily); the mother searched long for her, and on discovering her abode left Olympus in anger to dwell among men, diffusing blessings of civilization and plenty where she abode. Zeus eventually released the daughter, and she and her mother went again to dwell on Olympus, and the earth renewed her fertility. But Persephone, having eaten part of a pomegranate in Hades, was decreed to dwell there for a third part of each year. These are legends denoting the cycle of vegetable growth. Though the details of the story vary considerably, nevertheless, as a whole, it not only suggests the main idea embodied in Demeter, but also directs our attention to Eleusis, the principal seat of her worship, on which were based the ELEUSYNIAN MYSTERIES (*q. v.*). The Greeks revered Demeter as the source of the practical arts which had their origin in agriculture. Her chief festivals were the Eleusinia and the Thesmophoria. Her cult came to Rome through Sicily; her great Latin festival was the Cerealia; her temple at Rome was made the archives of the state. See PROSERPINE.

Ceres: an asteroid discovered by Piazzi at Palermo in Jan., 1801. It was the first asteroid ever discovered. Its apparent size is nearly equal to that of a star of the seventh magnitude.

Ce'reus [from Lat. *ce'reus*, waxen, deriv. of *ce'ra*, wax; in allusion to the columnar or taper-like form of one species]: a genus of plants of the family *Cactaceæ*. It comprises about 200 species, some of which have beautiful flowers. The *Cereus speciosissimus*, a native of Mexico, is cultivated in greenhouses. Its flowers are large and of a fine scarlet

color, and its fruit, when well ripened, is delicious. The night-blooming cereus (*Cereus grandiflorus*), a native of South America, bears large, beautiful, and fragrant flowers, which expand and fade in a few hours. It has been used in medicine as an antispasmodic.

Cerignola, chā-rēēn-yō'lăă: an episcopal town of Italy; in the province of Foggia; 24 miles S. E. of Foggia (see map of Italy, ref. 6–G). It has a college and several convents; also manufactures of linen. The Spaniards gained here a decided victory over the French in 1503, and the French commander, the Duke of Nemours, was killed in that action. Pop. 25,400.

Cer'igo (anc. *Cythera*; in Gr. Κύθηρα): one of the Ionian islands; now constituting, with the neighboring small islands, an eparchy of the nomarchy of Argolis and Corinth, in the kingdom of Greece; is in the Mediterranean, and is separated by a narrow strait from the Morea (see map of Greece, ref. 18–K). Area, 110 sq. miles. The surface is mountainous and rocky. The soil is not rich, but produces some wheat, olives, grapes, etc. Here are two remarkable stalactitic caverns. The ancient *Cythera* was sacred to Venus, and said to be her favorite residence. Capital, Capsali. Pop. 13,250.

Cerin'thus: the founder of one of the earliest heretical sects in the Christian Church; according to Irenæus, a contemporary of the Apostle John; flourished, according to Eusebius, under the reign of Trajan, 98–117. He was a converted Jew, born and educated in Egypt, but afterward removed to Asia Minor, where he propagated his ideas. His system is decidedly Gnostic. He taught that the world was not made by the supreme God, but by a certain power which was separate and distinct from God, though an emanation from him. He also taught that Jesus was not born of a Virgin, but was the natural offspring of Joseph and Mary; that after his baptism the Christ came down into him in the form of a dove, and that toward the end the Christ again flew away from Jesus. The Gospel of John was once said to have special reference to Cerinthus, but the error never had any foundation.

Ce'rium [so named by Hisinger and Berzelius, who isolated it in 1803, after the recently (1801) discovered asteroid Ceres]: a rare metal which is obtained from cerite. Chem. symbol Ce; atomic weight 92. It is not employed in the arts and manufactures, but its oxalate is a valuable antiemetic medicine in certain cases. Combined with oxygen, it forms two oxides. It is difficult to procure it in a separate or metallic state.

Cernuschi, Enrico: economist; b. in Milan, Italy, 1821; fought as a revolutionist 1848–49; in 1850 engaged in banking at Paris. On account of the hostility of the communists he left France 1871–73, traveling in Egypt, China, and Japan; visited England in 1876 and the U. S. in 1877. He was an advocate of bimetallism; author of *Mécanique de l'Échange* (1865); *Illusions des Sociétés co-opératives* (1866); *Discours* (1871); *Silver Vindicated* (1876); *Le Bimétallisme à quinze et demi* (1881); *Anatomie de la Monnaie* (1886); and numerous other works. D. at Mentone, May 11, 1896.

Cerreto Sannita, chăr-rā'tō-săăn-nee'tăă: a town of Italy; in the province of Benevento; on a slope of the Apennines; 22 miles N. E. of Capua (see map of Italy, ref. 6–F). It has a cathedral with fine paintings, a collegiate church, and manufactures of coarse woolen cloth. Pop. 5,450.

Cer'ro de Pas'co: a city of Peru; capital of the department of Junin and of the province and district of its name; situated in a bleak mountain valley, 14,280 feet above the sea (see map of South America, ref. 5–B). Pop. in 1889 about 14,000. It is built on very irregular ground, the streets are narrow and crooked, and the houses have no architectural pretensions. Owing to the great elevation the climate is very severe; hail and snow are common in August and September, and from October to April there are violent rainstorms. The population varies greatly with the season and with the yield of the silver mines which gave rise to the town. These extend over a large tract of mountain land, and are among the richest in the world; there are said to be over 2,000 veins, and many hundred mines have been opened. The silver was discovered in 1630 by a Quichua shepherd, and the yield since that time has been nearly $500,000,000. During the nineteenth century it decreased greatly, not because the deposits were exhausted, but from lack of labor and proper mining appliances. The Cerro de Pasco mines are still the principal source of the Peruvian silver-supply, the annual output being about 1,750,000 oz. In 1891 118 mines were worked. In 1889 the mines were ceded for a long term to the "Peruvian Corporation," represented by Michael Grace. The Oroya R. R. is to be continued to Cerro de Pasco, which at present (1893) has a short local railroad.

See A. D. Hodges, *Notes on the Topography and Geology of the Cerro de Pasco*, in *Trans. Amer. Inst. of Mining Engineers* (1888); Paz Soldan, *Diccionario geografico-estadistico del Peru* (1877). Herbert H. Smith.

Cer'ro Gor'do: a celebrated battle-field and mountain-pass in Mexico, through which the National road from Vera Cruz to the city of Mexico passes. Here Gen. Scott defeated a greatly superior force of Mexicans under Santa Anna, Apr. 18, 1847. Following up his success at Vera Cruz, Scott's army had arrived at Plan del Rio, a small plain 50 miles from Vera Cruz, when intelligence reached him that the pass of Cerro Gordo had been fortified by Santa Anna. The level ground terminates at Plan del Rio, from which the road ascends in a long circuit among lofty hills, whose commanding points had been fortified by the enemy. His right rested on a precipice overhanging an impassable ravine, his intrenchments extending to the road, on which was placed a battery. On the other side the lofty and difficult height of Cerro Gordo commanded the approaches in all directions. Half a mile to the rear of this height the Mexican army, numbering upward of 13,000, with five pieces of artillery, was encamped. Resolving to attempt to turn the enemy's left and attack in rear while threatening his front, Scott caused daily reconnoissances to be made in the hope of finding a route by which to reach the Jalapa road and cut off the retreat of the Mexicans. A road was made through difficult slopes and over chasms, and was only abandoned when a further prosecution of the work would have brought on an action. Scott now determined to gain the Jalapa road by assaulting and carrying the height of Cerro Gordo, and on the night of Apr. 17 issued his plan of battle, which was successfully executed. Twiggs was re-enforced during the night by Shields's brigade, consisting of one New York and two Illinois regiments. In selecting their ground for bivouacking and an opposing height for a battery, a sharp combat took place, but the height was occupied and a battery of three 24-pounders placed thereon. During the night an 8-inch howitzer was with great difficulty and labor placed opposite the enemy's right battery.

Early on the 18th the general attack commenced. Pillow's brigade twice assaulted the enemy's line of batteries on the left; but, though unsuccessful, they served to distract their opponents; Twiggs's division, storming the strong and vital point of Cerro Gordo, pierced the center, gained command of all the intrenchments, and cut them off from support; Riley's brigade of infantry pushed on against the main body of the enemy, and, the guns of their own fort being turned on them, they fled in confusion; Shields's brigade bravely assaulted the left, carried the rear battery of five guns on the Jalapa road, and rendered important aid in completing the rout of the enemy. At an early part of the engagement Gen. Shields received a severe but not fatal wound, being shot through the lungs. The moment the fate of the day was decided the reserve forces were pushed on toward Jalapa in advance of the pursuing columns of Twiggs's division and Shields's brigade (the latter now under Col. E. D. Baker), and Gen. Patterson was sent to take command. The rout was complete; 3,000 prisoners were taken, 4,000 or 5,000 stand of arms, and 43 pieces of artillery. Gen. Scott's loss in the two days was 431, of whom 63 were killed. The immediate result of this important battle was the occupation of Jalapa the next day.

Cerro Gordo de Potosi': a famous mountain of Bolivia; immediately S. W. of Potosi. It contains rich silver mines. Altitude, 16,150 feet. See Potosi.

Cerro Largo: a northeastern department of Uruguay; between the Rio Negro and the Lagoa Merim, and separated from Brazil by the river Jaguarão. Area, 5,753 sq. miles. Pop. (1890) 25,041. Capital, Melo. It consists of rolling or hilly grass lands, well suited for stock-raising, which is the principal industry. There are considerable establishments for salting and drying meat. H. H. S.

Cer'ros or **Ced'ros Island**: a large island belonging to Mexico; off the west coast of Lower California; lat. 28° 5′ to 28° 35′ N.; forming the western inclosure of the great bay of S. Sebastian Viscaino (see map of Mexico, ref. 3–A). Area, 120 sq. miles. The island is very mountainous; the southern part barren; the northern more fertile and covered with

cedars and pines. Goats and rabbits abound, and there are a few deer. It is said to be rich in minerals. The climate is very dry, but it is subject to cloudbursts.

Certaldo, chär-tăăl′dō: a town of Italy; province of Florence: picturesquely situated on the Elsa; 15 miles S. W. of Florence (see map of Italy, ref. 4–D). It was the birthplace of Boccaccio, whose house is still preserved. Pop. of commune 8,000.

Certificate [from Med. Lat. *certifica′tum*, deriv. of *certifica′re*, certify; *certus*, certain + *fa′cere*, make]: in law, a legally authenticated written statement made by a court, judge, officer, or other duly authorized person, giving notice of the existence of certain facts; as the certificate in which a judge states whether the title to real property came in question at a trial; a vessel's certificate of registry or certificate of clearance, etc. Revised by F. Sturges Allen.

Certiora′ri [Lat., to be informed, certified; the expression occurs in the opening of the writ to which it gives the name]: a writ issued from a supreme court to an inferior court or a special body having judicial powers, such as commissioners, magistrates, assessors of taxes, etc., acting in a summary manner or in a method different from the common law, commanding the latter to return the records of a matter depending before it to the superior court. Its object is to bring the entire record of the inferior tribunal before the superior court to enable the latter to determine whether the former had jurisdiction, or had failed to proceed according to the essential requirements of the law. It is applicable to either civil or criminal cases. When used as a means of review of an actual decision or determination made by the inferior tribunal, its office is to correct errors made in point of law, rather than to reconsider the subject on matters of fact. Thus if a board of assessors of taxes should decide that a bank could be taxed under State authority upon that portion of its property which is invested in the bonds of the U. S. Government, it would decide a point of law which might, by means of a writ of *certiorari*, be submitted to the various State courts, and finally to the Supreme Court of the U. S. This writ may also be resorted to for the purpose of supplying any defects in the return of its proceedings by the inferior tribunal to the superior court. It may be considered in this aspect as auxiliary to the main purpose of removing the record itself. In the U. S. the issuance of the writ is generally provided for by statutes. But if the statutes make no provision for it, and no other mode of review is provided from the decisions of an inferior jurisdiction, a superior court exercising general original common-law jurisdiction has inherent authority to revise the proceedings by *certiorari*, unless it is expressly forbidden to do so. The writ issues only to inferior courts and officers exercising judicial functions, and when the act to be reviewed is judicial in its nature and not ministerial or legislative.
Revised by Henry Wade Rogers.

Certo′sa di Pavi′a, La: a celebrated Carthusian monastery; 5 miles N. of Pavía, Italy; province of Pavía; in the Gothic style; founded in 1396 by Giovanni Galeazzo Visconti, the first Duke of Milan. It is no longer a monastery but a Government property. Here is a magnificent church 235 feet long, adorned with fine paintings, sculptures, and mosaics.

Cer′umen [Mod. Lat., deriv. of *cera*, wax]: the ear wax. It is a yellowish, oily secretion of certain small glands lying in the skin of the external meatus of the ear. These glands are analogous to the sebaceous glands of the skin, and their secretion is similar to the sebum. It serves to attach and cause the removal of foreign bodies which enter the auditory meatus, and also to make the skin pliable and soft.

Ce′rusite, or **Cerussite**: native carbonate of lead; occurs in fibrous, compact, and earthy masses, and in numerous crystalline forms which may be referred to a right rhombic prism. When pure, it consists of 16·42 per cent. of carbonic acid and 83·58 of oxide of lead, or 77 per cent. of metallic lead. When perfectly pure, it is colorless and transparent, with an adamantine luster, which is resinous on fractured surfaces. Next to galena, cerusite is the most common ore of lead.

Cervantes Saavedra, Miguel, de: the most celebrated Spanish author; b. at Alcalá de Henares in Oct., 1547 (baptized Oct. 9). Very little is known of his youth. In 1568 we find him at Madrid, and in the following year he was taken to Rome by the papal legate Giulio Acquaviva, a friend of letters. In 1571 he took part in the naval battle of Lepanto, in which he lost the use of his left arm, and on his return home in 1575 he was captured by Algerine pirates. Ransomed in 1580, he returned to Spain and here served in the campaign against Portugal and the Azores. In 1583 he retired from the service in Portugal. In the next year he published the pastoral romance *Galatea*. This work he is said to have written to win the hand of D. Catalina de Palacios Salazar y Vozmediano, whom he married Dec. 12, 1584. In the years 1585–92 Cervantes wrote for the stage. Of the twenty or more plays which he is reported as having produced only *Numancia*, *El trato de Argel*, and a number of *entremeses*, published in 1615, have come down to us. During the imprisonment to which for some unknown cause he was subjected from 1599 to 1601, Cervantes composed the principal work of his life, the social romance *Don Quijote* (*q. v.*), the first part of which was printed in 1605, the second in 1616. This work made its author famous not only in Spain but in the whole of Europe. After the publication of the first part of his *Don Quijote*, Cervantes wrote, under the title of *Novelas Ejemplares* (published 1613), a series of novels of adventure, in imitation of the Italian novel of this kind. The best of these tales are *La Gitanita*, *La Ilustre Fregona*, and *El Casamiento Engañoso*. His last work was another pastoral romance, entitled *Los Trabajos de Pérsiles y Sigismunda*. Cervantes died Apr. 23, 1616 (Gregorian calendar). The best Spanish biography of Cervantes is still Navarrete's *Vida de Miguel Cervantes Saavedra* (Madrid, 1819); a late English work is by James Fitzmauriee-Kelly (London, 1892). Henry R. Lang.

Cervera y Topete, Don Pasquale, de: rear-admiral of Spanish navy; b. Feb. 18, 1839; graduated at the naval academy of San Fernando; was commissioned to foreign service in 1859. In 1898 in the war between the U. S. and Spain he commanded a squadron in the Atlantic. In an engagement off Santiago de Cuba, July 3, 1898, all his ships were destroyed and Cervera himself was taken prisoner, by a U. S. fleet under the command of Rear-Admiral Sampson.

Cer′vidæ [Mod. Lat., deriv. of Lat. *cervus*, deer]: a family of mammals of the order *Ungulata* and sub-order *Artiodactyla*, containing the deer and related types. The genera of the family are grouped as follows: (1) *Moschus*; (2) *Hydropotes*; (3) *Cervulus*; (4) *Pudu*, *Furcifer*, *Coassus*, *Blastocerus*, *Cariacus*, and *Capreolus*; (5) *Hyelaphus*, *Rucervus*, *Rusa*, *Cervus*, *Elaphurus*, and *Dama*; (6) *Rangifer*; and (7) *Alces*. See Deer.

Cervin, Mont, mōn′săr′văn′ (in Germ. *Matterhorn*): a peak of the Pennine Alps, between the canton of Valais, in Switzerland, and Piedmont, in Italy; 12 miles W. N. W. of Monte Rosa. It rises 14,705 feet above sea-level. Within 3,000 feet of the top it is exceedingly steep, resembling an obelisk of rock. The summit was first reached by the artist Whymper with three companions and three guides, on July 14, 1865, when several of the party were killed.

Cesalpino, chăy-săăl-pee′nō, often Anglicized as **Cæsal′pin**, Andrea: physiologist and botanist; b. in Arezzo, Tuscany, in 1519. He was Professor of Medicine and Botany at Pisa, and physician to Pope Clement VIII. He wrote *Ars Medica* (1601), and an important work *On Plants* (De Plantis, 1583), in which he propounded an improved system of botany. He was the first who proposed a natural system of classification on philosophical principles. D. in Rome, Feb. 23, 1603.

Cesari, chay′zăă-rĕe, Giuseppe: painter; sometimes called Il Cavaliere d'Arpino and Giuseppino (Fr. *Le Joséphin*); b. at Arpino or Rome, Italy, about 1568; pupil of Motta and Orsi. He worked mostly in Rome; was patronized by several popes, and was very successful and popular. He was the chief of the conventional school, opposed by the naturalists, the Caracci, the Caravaggio, and their scholars. His works display much skill in execution, but are deficient in simplicity. The best of them are historical scenes in the Capitol. D. in Rome, July 3, 1640.

Cesarot′ti, Melchiore: poet; b. in Padua, Italy, May 15, 1730; educated at the university of his native city, and early became professor there of rhetoric, and in 1768 of Greek and Hebrew. When Italy was invaded by the French he advocated their cause and was made Knight of the Iron Crown by Napoleon I. He made metrical translations of the *Iliad* (entitled *La Morte di Ettore*) and of Macpherson's *Ossian* (1763). Cesarotti wrote *On the Philosophy of Language* and *On the Philosophy of Taste*, etc. D. Nov. 3, 1808. His works were published in 42 vols. 8vo. (1800–13).

Cesena, chăy-zay′năă (Lat. *Cæsena*): a town of Italy; in province of Forlì; on the railway between Bologna and Ancona; 15 miles by rail E. of Forlì (see map of Italy, ref. 4–E). It is situated on the slope of a hill which is close to the river Savio. It has a cathedral: a Capuchin church, in which is a fine painting by Guercino; a library founded in 1452; and several convents. It has sulphur mines in the vicinity. Pop. 39,500.

Cesnola, ches′nō′lăă′, Luigi Palma, di: archæologist; b. near Turin, Italy, July 29, 1832; received his education at the Royal Military Academy; was in the war for Italian independence, and in the Crimean war; removed to the U. S. in 1860; volunteered in the military service of the U. S.; was made colonel of the Fourth Regiment of the New York Cavalry, and served with distinction. After the war he received the brevet of brigadier-general, and was appointed U. S. consul to Cyprus. During his residence in this island Di Cesnola made excavations resulting in remarkable discoveries of statuary, pottery, jewelry, and other objects of art, which were purchased for the Metropolitan Museum of Art in New York, and constitute the Cesnola collection. In 1873 he returned to Cyprus and made other important discoveries. On his return to New York in 1877 he was made director of the museum; in 1880 Columbia College conferred on him the degree of LL. D. In 1878 he published *Researches and Discoveries in Cyprus*. See Cyprus.

Ces′pedes y Bor′ges, Carlos Manuel, de: Cuban revolutionist; b. in Bayamo, Apr. 18, 1819; studied law at Havana and at Barcelona, Spain, and in 1843 was banished from Spain for taking part in the conspiracy of Gen. Prim. Returning to Cuba in 1844, he practiced law in his native town, and was a leader of those who secretly endeavored to secure the independence of the island. In 1868 he headed an insurrection near Yara, and was soon joined by several thousand men, a great part of the rural population adhering to him. A congress of fifteen representatives met at Guaimaro in Apr., 1869, promulgated a republican constitution, and proclaimed Cespedes president. He had already issued a proclamation freeing the slaves. The first successes were followed by reverses. Cespedes was driven to the mountains, where he was shot while resisting an attempt to capture him, Mar. 22, 1874. Herbert H. Smith.

Cespedes, or **Razzionere**, Pablo, de: b. in Cordova, Spain, in 1538; educated at Alcalá de Henares; studied theology and Oriental languages there; went to Rome on leaving the university and studied painting under Federigo Zucchero, especially the works of Raphael and of Michael Angelo. Cespedes returned to Spain, and in 1577 was installed in a prebend of the cathedral at Cordova. He was noted as a poet, painter, architect, and sculptor; and executed the frescoes in S. Carlo in Corso, in Ara Cœli, and Trinitá di Monti. A *Last Supper*, at Cordova, is his best picture; wrote poem on *Art of Painting*. D. in Cordova, July 26, 1608. See his *Life* by Turino (Madrid, 1868).

Cesspool: a well for the reception of the sewage and drainage of a house. Its location should be at some distance from the house, and its walls should be cemented, in order to prevent the contamination of the soil. In a limestone region the cesspool is often carried down into the rock until fissures are found, and the sewage and water then run away. Usually, however, the cesspool is not deep, and its bottom is cemented, like the sides, so that its contents must be removed once or twice a year. Such a cesspool should be ventilated by free communication with the open air, in order that gases may not be driven back to the house. In small towns such methods of disposing of the sewage of houses are common, and many cases are on record of the pollution of wells and cisterns thereby. In cities cesspools are usually forbidden by law, and each householder is required to connect with the public sewer. (See Sewerage.) In order to ascertain if air from a cesspool enters a house a small quantity of the oil of peppermint may be thrown into it, when if such is the case the odor will soon be perceived in the house.
Mansfield Merriman.

Ces′tius, Pyramid of: an antique Roman monument standing close to the Porta San Paolo of Rome; is 125 feet high. It is built of brick and tufa, faced with Carrara marble. The internal walls were decorated with paintings. This pyramid is supposed to have been erected before the Christian era.

Cestoid Worms [*cestoid* is from Lat. *cestus*, girdle (from Gr. κεστός, girdle, liter., embroidered, stitched (sc. ἱμάς), deriv. of κεντεῖν) + suffix *-oid*, like; in allusion to the ribbon-like form of many species]: the *Cestoidea*, an order of parasitic flatworms (Plathelminthes, *q. v.*), the more common or better-known species of which are known as tapeworms. In all the body is elongate and is without mouth or alimentary canal, and in many forms it is divided by transverse constrictions into joints or proglottids. On the anterior end are hooks or suckers for fastening the worm to the lining of the intestine of the infested animal. A large proportion of vertebrates are subject to these parasites. The histories of but few, except those that infest man and the domestic animals, have been worked up. Many of the cestoids which infest the invertebrates are not jointed, but in those of man proglottids are produced by a division of the body. These proglottids are scarcely more than sexual sacs, and as they mature they are loosened from the rest, while new joints are constantly forming in front. The separated proglottids are carried with the fæces out of the body, and then discharge the eggs which they contain. These may be carried about by wind or water, and falling on grass, etc., be eaten by other animals—e. g. cow or pig. The eggs hatch in the stomach of this new host into a larva (ciliated in the *Bothriadæ*), the subsequent history of which presents many variations. In many the embryo swells up into a bladder (cysticercus), in one side of which the head, with its fixing armor, becomes inverted, just as one might push the finger of a glove into the palm. This cysticercus finds its way into the flesh of this host, where it may remain for a long time without further alteration. Meat like pork so infested is called "measly," and when eaten the cysticercus or bladder-worm is set free, and, fastening itself by its hooks and sucking disks to the wall of the intestine, grows into the perfect worm. Many families and several hundred species are known, but few are of general interest. Those affecting man are described in the article Tapeworm (*q. v.*). J. S. Kingsley.

Cestracion: See Heterodontidæ.

Cestui, ses′twĕ, or set′wĕ [Norm. Fr., he, that one]: a word used in law in several phrases: (1) *Cestui que trust*, he who has the beneficial interest in property the legal title to which is vested in a trustee. (See Trust.) (2) *Cestui que use*, he who has the right to the profits of lands or tenements the legal estate in which another holds as feoffee to uses. (See Use.) (3) *Cestui que vie*, the person during whose life an estate granted to another is to continue. F. Sturges Allen.

Ces′tus [Lat., girdle; see Cestoid Worms]: a girdle or band which women wore round the waist in ancient times. The cestus of Venus was supposed to have the power of exciting love. The gauntlet used by ancient pugilists to protect their hands was called *cestus* or *caestus*.

Ceta′cea, or **Cetaceans** [mod. deriv. of Lat. *cētus* = Gr. κῆτος, whale]: an order of mammals characterized by a fish-like form, adapted to strictly aquatic life, and a tail which spreads horizontally. Like other mammals, they have warm blood, respire by the lungs, and the young are born alive and nourished by the mother's milk. There are two existing sub-orders—the toothless cetacea (*Mysticete*) and the toothed cetacea (*Denticete*). The former comprises the *Balænidæ*, or right-whale family, and the *Balænopteridæ*, or fin-backs; the latter, the *Physeteridæ*, or sperm-whales, the *Ziphiidæ*, the *Delphinidæ*, or true dolphins, the *Iniidæ*, and the *Platanistidæ*, or fresh-water dolphins. Another sub-order (*Zeuglodonta*) was represented by certain Tertiary forms. See Cachelot, Dolphin, Physeteridæ, and Whale.

Cetewayo: See Zululand.

Cetot′olites [Gr. κῆτος, a whale + οὖς, ὠτός, ear + λίθος, a stone]: a term applied to the fossil ear-bones of whales. These occur so plentifully in the red crag (Pliocene) of Suffolk, England, that being rich in phosphates, they are ground up for manure. F. A. L.

Cetraria: See Iceland Moss.

Cette (on the ancient *Mons Setius*): a fortified seaport of France; department of Hérault, on the Mediterranean; on a strip of land between the sea and the broad inlet of Thau, the outlet of the Canal du Midi; on the railway to Bordeaux; 18 miles S. W. of Montpellier (see map of France, ref. 9–G). It has a good harbor and a considerable coasting and inland trade, large fisheries, manufactures of made wines, perfumery, glass, soap, etc., large ship-yards and salt-works, and the extensive export trade of the Canal du Midi, of which it is the port, and with which it is connected by the canal of Cette across the tongue of land. The harbor is protected by two large moles and a breakwater. The city

was founded in 1666. It forms a half circle about the cliff-like hill, on which is the fortress. Pop. (1896) 32,729.

Cettinje, set-tecn′yā, or **Cettigno**: capital of the principality of Montenegro; 19 miles E. of the Austrian town of Cattaro; 2,470 feet above the sea (see map of Austria-Hungary, ref. 11–G). It contains a convent which was founded in 1458 and is the residence of the bishop, the state prison, and the palace of the prince. Pop. estimated at 1,500.

Ce′tus [Lat., whale, from Gr. *κῆτος*]: a great constellation; one of those called southern by Ptolemy. It contains the variable star Mira, or *o* Ceti.

Ceu′ta (Sp. pron. thaў-oo′taă): a fortified seaport-town (anc. called *Septa* or *Septum*; Moorish *Sebta*) on the north coast of Africa; on the Mediterranean opposite to Gibraltar, which is 17 miles distant (see map of Africa, ref. 1–B). It is in Morocco, but it has belonged to Spain since 1580. The castle occupies the summit of a mountain which is the ancient *Abyla* and one of the Pillars of Hercules. Ceuta is the chief of the Spanish *presidios* on the African coast. It is the seat of a Roman Catholic bishop, and has several convents and a convict establishment. It occupied the site of the old Roman colony *Ad Septem Fratres*. It was strongly fortified by Justinian, but was taken by the Goths in 618. Through Ceuta Count Julian brought the Saracens into Spain in the eighth century. Under Arabic rule the town was noted for its manufacturing industry; it is said to have had the first paper-mill ever constructed and operated in the West. It was conquered from the Moors in 1415 by King John I. of Portugal. Pop. 9,700.

Cevallos, Pedro de: See Zeballos.

Cévennes, saў′ven′ (anc. *Cebenna Mons*): a mountain-range in the south of France; forms the watershed between the Rhône and the Garonne. It extends from the vicinity of Carcassonne in a N. N. E. direction to the Canal du Centre. The central mass of the Cévennes is in the departments of Ardèche, Lozère, and Haute-Loire. The highest summit is Mont Mezin or Mézen, which has an altitude of 5,764 feet. Some of the peaks are extinct volcanoes. These mountains were a stronghold of the Protestants called Camisards, and were the scene of several religious wars. See R. L. Stevenson, *Travels in the Cévennes* (1879).

Ceylon, sē̆e-lon′ (native *Singhala* or *Sinhala*; anc. *Taprobane*): an island of Asia, belonging to the British; in the Indian Ocean; about 55 miles from the southern extremity of Hindustan, from which it is separated by Palk Strait. It lies between lat. 5° 55′ and 9° 51′ N., and between lon. 79° 41′ and 81° 54′ E. Length from N. to S., 266 miles; greatest width, 140½ miles. Area, 25,364 sq. miles. The southern and eastern coasts are bold and rocky, and present a very picturesque appearance, which is increased by the luxuriant tropical vegetation, the verdant slopes of its mountains, and groves of noble palms draped in perennial green. The surface is finely diversified by mountains, valleys, and plains. The highest summit is Pedrotallagalla, which rises 8,260 feet above the level of the sea. The celebrated mountain called Adam's Peak is 7,420 feet high, and is remarkable for its conical form and the sacred associations with which it is connected. The Singhalese have a tradition that Buddha ascended to heaven from this peak. The mountains of Ceylon are mostly formed of gneiss and granite, and dolomite occurs in the more level parts of the island. Among the minerals are iron, tin, coal, plumbago, and salt. Many sapphires, rubies, amethysts, and other precious stones are found here. The climate is humid and hot, but more pleasant and moderate than the adjacent mainland of India. The average annual rainfall is about 80 inches.

Ceylon is remarkable for the luxuriance and variety of its flora. Among its indigenous trees are the cocoa-palm, palmyra, and other species of palms, the coral-tree (*Erythrina indica*), the breadfruit, the cinnamon, the satinwood, and ebony. The bo-tree or pipal (*Ficus religiosa*) attains a great age, and is deemed sacred by the natives. Coffee, cotton, rice, tobacco, and pepper are cultivated here. The chief articles of export are coffee, cinnamon, cocoanuts, cocoanut oil, coir, hides, pearls, and plumbago. Among the wild animals found here are the buffalo, bear, deer, leopard, and elephant. The last are very numerous.

The native population is composed mostly of Singhalese, whose historical records, extending back through many centuries, are partially corroborated by existing ruins of cities and temples, which indicate that Ceylon in a remote antiquity was inhabited by a numerous and civilized people. The most celebrated among its monuments is the cave-temple of Dambula, which was built about 100 B. C., and is profusely adorned with images and sculpture. It was dedicated to Buddha. Buddhism is still the prevailing religion of the island. The principal religious creeds numbered, in census of 1891, 1,877,043 Buddhists, 615,932 Hindus, 211,995 Mohammedans, and 302,127 Christians. The native Christians are mostly Singhalese and Tamils. Among the remarkable antiquities of Ceylon are numerous colossal ruined tanks, constructed for the irrigation of the soil.

Ceylon has three harbors—Point de Galle on the south coast, Trincomalee on the northeast coast, and Colombo on the southwest coast. The harbor of Trincomalee is one of the finest in the world, and is capable of admitting a number of the largest ships. It is the principal British naval-station in the Indian seas. The Oriental mail-steamers, which ply between England and Calcutta, touch at this island, which has an extensive commerce. The value of the exports from Ceylon in 1890 was (in round numbers) $17,000,000; of imports $21,000,000. The revenue for the same year was $5,400,000; the public expenditure $5,100,000. On Dec. 31, 1890, the public debt amounted to $12,577,000. In ancient times it was visited for the purpose of traffic by the Egyptians, Greeks, and Romans. The value of coffee exported in 1879 was $15,005,375, but in 1890 it was only $1,739,110. On the other hand, the export of tea increased in value from $600 in 1887 to $10,540,015 in 1890. Ceylon is divided into seven administrative provinces, called the Western, North Central, Central, Southern, Northern, Northwestern, and Eastern provinces. Capital, Colombo. Kandy, Trincomalee, Point de Galle, Jaffnapatam, and Singapadaya are also important cities. Ceylon had 181 miles of railway and 734 miles of telegraph in 1889.

History.—The aborigines, or Yakkhos, were conquered by Singhalese 543 B. C.; Malabars conquered Ceylon about A. D. 1200, but the Singhalese partly recovered it in 1235. The Portuguese came in 1505; were driven out by the Dutch 1658, and these by the British in 1795. Ceylon was annexed to the British crown in 1802, and the whole island was conquered 1815. It is one of the most prosperous of British colonies.

Population (1891) 3,008,466; of these the native tribes number 2,031,167; they are Singhalese, emigrants from Hindustan 543 B. C., and Buddhists; Kandyans, or Highlanders, and Malabars, both Brahmans; Moormen, originally Persians or Arabs, Mohammedans; Veddars or outcasts, of the lowest scale, without religion. The remainder are Eurasians or burghers, Romanists or Protestants, and Europeans, mostly Protestants. See Sir James E. Tennent, *Ceylon, Physical, Historical, and Topographical* (1859); J. Ferguson, *Ceylon in the Jubilee Year* (1887); Lady Gordon-Cumming, *Two Happy Years in Ceylon* (2 vols., 1892).

Revised by Mark W. Harrington.

Chabaneau, shaă′baă′nō′, Camille: French philologist; b. at Nontron, Dordogne, Mar. 4, 1831; since 1879 Professor of Romance Languages in the University of Montpellier. He has published many papers in the *Revue des langues romanes* and other learned journals. Among his works may be cited *Grammaire limousine*; *Phonétique* (1876); *Poésies inédites des troubadours du Périgord* (1885); *Les biographies des troubadours en langue provençale* (1885); *Sainte Marie-Madeleine dans la littérature provençale* (1887).

A. R. Marsh.

Chabrias, kay′bri-as (in Gr. *Χαβρίας*): Athenian general; had command of an army in 392 B. C. In 378 he commanded in a war against the Spartans; gained a naval victory at Naxos in 376; was killed at the siege of Chios, where he commanded a fleet in 357 B. C. He invented a famous manœuver, which consisted in receiving a charge in a kneeling posture, with shields resting on the ground and the spears pointed against the enemy.

Chabrier, Alexis E.: See the Appendix.

Chacabu′co: a western spur or branch of the Andes in Chili, about lat. 33° S., forming the northern boundary of the great central plain. During the revolution in Spanish South America, the patriot army of San Martin crossed the Andes, and approached Santiago by a pass, also called Chacabuco, in these mountains. The pass was defended by about 4,000 Spaniards under Brig.-Gen. Maroto. It was carried by a brilliant charge, led by the Chilian Gen. O'Higgins. As a result of this battle the patriots occupied Santiago, and ultimately secured the independence of Chili.

Chachapoyas, chaă-chaă-pō′yaăs: a province of Northern Peru; in the department of Amazonas; area, 4,300 sq. miles.

Capital, Chachapoyas. It contains a fertile valley between mountain-ranges, and to the north borders on the gorge of the upper Maranon. The mineral resources, believed to be extensive, have not been developed. Chachapoyas, formerly much larger, was an important district of the Incas. It was conquered by Alonso de Alvarado in 1535. Pop. about 20,000. H. H. S.

Chachapoyas: a city of Northern Peru; capital of province of the same name; near the river Utcubamba; 7,600 feet above the sea (see map of South America, ref. 5–B). It is the episcopal city of a diocese of the same name which embraces all Northeastern Peru. Chachapoyas is well built and attractive. Besides the cathedral, it contains several churches, barracks, and other public buildings. The town was founded by Alonso de Alvarado in 1540. Pop. about 5,000. See Orton, *The Andes and the Amazon*, p. 398.
HERBERT H. SMITH.

Chaco, El Gran: See GRAN CHACO, EL.

Chaco, or **Gran Chaco**: a territory of Argentina; W. of the Paraná and Paraguay, and extending from the river Salado to the frontiers of Bolivia; estimated area, 240,000 sq. miles; civilized population, a few thousand, gathered about the military frontier posts. There are supposed to be about 40,000 wild Indians. The portion north of the river Bermejo is separated as the Chaco Boreal, or Territorio del Bermejo. The whole region is included physically in the plains of the GRAN CHACO (*q. v.*). H. H. S.

Chacornac, shăă'kōr'năk', JEAN: astronomer; b. in Lyons, France, June 21, 1823. During the years 1853–54 he was in charge of the observatory of Marseilles, and in the latter year was appointed astronomer of the Paris Observatory. He was an astronomer of reputation, and distinguished for his discoveries of asteroids, as well as for his writings on the planetary systems. Napoleon III. made him chevalier of the Legion of Honor in 1858. He contributed the atlas to the *Annals of the Observatory of Paris* (1858 and 1863). D. in Paris, Sept. 26, 1873.

Chad, or **Tsad**: a large, shallow African lake, full of islands, but fluctuating in size with the season; lying in Central Sudan; on the southern margin of the Sahara Desert. It is little but an immense swamp overgrown with great reeds and swarming with tropical animals. The waters are fresh, though it has no outlet. The elevation is 1,150 feet above the sea, and the area varies from 10,000 to 50,000 sq. miles. Its principal tributaries are the great Shari river, which comes in from the S., and the little-known Komadugu from the W. The Bahr-el-Ghazal comes in from the E., and, though usually dry, sometimes brings in large quantities of water. Lake Chad has Kanem on the N. E., Bagirmi on the S., and Bornu on the S. W. The northern shores are sterile and thinly populated. An important caravan route runs along the western shore to the town of Kuka, which lies on the coast in the wet season, but 10 miles from it in the dry. M. W. H.

Chad'bourne, PAUL ANSEL, LL. D.: b. at North Berwick, Me., Oct. 21, 1823; educated at Williams College; studied theology in the Hartford Theological Seminary; was appointed principal of the high school at Great Falls, and then Professor of Chemistry and Natural History in Williams College (1853–67) and in Bowdoin College (1859–66). He was elected president of the University of Wisconsin and Professor of Metaphysics in the same (1867–70). He published *Natural Theology* (1867) and *Instinct in Animals and Men* (1872). He was editor-in-chief of *The Wealth of the United States*; chosen president of Williams College in 1872; in July, 1880, tendered his resignation, to take effect at the end of the next college year, and became president of Massachusetts Agricultural College 1882. D. in New York city, Feb. 23, 1883.

Chad'ron: city (founded in 1885); capital of Dawes co., Neb. (for location of county, see map of Nebraska, ref. 8–B); on Fremont, Elk and Mo. V. R. Rs.; in Northwestern Nebraska; 126 miles E. of Orin Junction, Wyoming. Chadron has numerous elegant public and private buildings, including five churches, a public school, and Chadron Academy. Here are the U. S. land-office for Chadron district (including Dawes, Sheridan, and Sioux Counties), a roller-mill, a large dairy, and four banks. Chadron has a large wholesale trade, and is an important shipping-point for cattle. Pop. (1890) 1,867; (1900) 1,665. MANAGER OF "DAWES COUNTY JOURNAL."

Chad'wick, GEORGE W.: musician; b. in Lowell, Mass., 1854; educated in Leipzig under Jadassohn and Reinecke, following with a course of conducting under Rheinberger and Abel. While a student at Leipzig he composed his *Rip Van Winkle* overture, to which were awarded the highest honors. He also composed ten string quartets, which were successfully performed. Upon his return to the U. S. he conducted at the Boston Händel and Haydn Society's festival in 1880, and he also directed his *Rip Van Winkle* overture at the Worcester festival. Several of his symphonies and overtures have been performed by the Boston Symphony Orchestra. He has also composed some short choral works, but he is best known as a composer for orchestras. He composed the music for the *Columbian Ode* for the dedication ceremonies of the World's Fair in Chicago, Oct. 21, 1892. D. E. HERVEY.

Chadwick, JAMES READ, A. M., M. D.: gynæcologist; A. B., Harvard, 1865; M. D., Harvard Medical School, 1871; Clinical Instructor in Gynæcology in Harvard Medical School 1878–88; secretary American Gynæcological Society 1875–82; became librarian Boston Medical Library Association, 1875; president Massachusetts Cremation Society 1892.

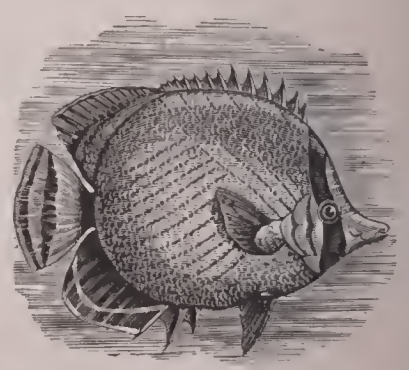
Chadwick, JOHN WHITE, A. M.: Unitarian minister of the radical school; b. in Marblehead, Mass., Oct. 19, 1840; educated at Exeter Academy and Harvard University; graduated at the Divinity School 1864; ordained Dec. 21, 1864, and at the same time installed as pastor of the Second Unitarian church in Brooklyn, N. Y., in which position he still (1901) remains. He has taken an active part in all denominational discussions, and has been a diligent contributor to periodical literature and to the daily press, mainly on biographical lines. Author of *Way, Truth, and Life*; *The Bible of To-day*; *The Faith of Reason*; *The Man Jesus*; *Some Aspects of Religion*; *Belief and Life*; *Origin and Destiny*; *A Daring Faith*; *Faith on the Earth*; *The Revelation of God and other Sermons*; *The Power of an Endless Life*; *A Book of Poems*, the 8th ed. of the latter including *In Nazareth Town and other Poems* first published as a separate volume; and *A Legend of Good Poets*, delivered before the Phi Beta Kappa Society of Harvard in 1886. A select volume of his sermons has been translated into German as *Religion ohne Dogma*. He has contributed largely to the present edition of *Johnson's Universal Cyclopædia*.
C. H. THURBER.

Chære'mon: Greek tragic poet who flourished at Athens about 380 B. C. He belonged to the group whose pieces were better suited for reading than for acting. Besides tragedies, Chæremon composed a dramatic medley of meters called *Centaurus*. Fragments in Nauck's *Fragmenta Tragicorum Græcorum*, pp. 781–792.

Chære'mon of Alexandria: a Stoic philosopher and historian of the first century, who went from Alexandria to Rome in order to take charge of the education of Nero. He wrote a work on hieroglyphics and one on the history and religion of Egypt. The fragments, not without interest, are collected in Müller's *Fragmenta Historicorum Græcorum*, iii., pp. 495–499.

Chærone'a (in Gr. Χαιρώνεια): an ancient town of Bœotia; 5 miles N. of Lebadea; the native place of Plutarch. Here Philip of Macedon gained an important victory over the Athenians and Thebans in 338 B. C., and Sulla defeated the army of Mithridates in 86 B. C. The site is occupied by the modern village of *Kapurna*. A few years ago a colossal lion was excavated from the mound which was raised in honor of the Thebans who were killed in battle here in 338 B. C. This lion is described by Col. Mure as a "noble piece of sculpture, and the most interesting sepulchral monument in Greece."

Chætodon'tidæ [deriv. of *chætodon*, from Gr. χαίτη, hair + ὀδούς, ὀδόντος, tooth]: a family of the spiny-rayed marine fishes, with very slender toothbrush-like teeth and the fins closely covered with scales. Most of the species are brilliantly colored, and they abound especially about coral-reefs. They are excellent food-fishes. The chief genus is *Chætodon*. They abound in the West Indies, rarely reaching the coasts of the U. S. or of Europe. DAVID S. JORDAN.



Chætodon.

Chætog'natha [from Gr. χαίτη, hair + γνάθος, jaw]: a group of small marine worms, so named from the slender, claw-like processes on either side of the mouth which serve as jaws. They are known as arrow worms on account of their elongate body, which bears on each side a fin-like structure suggestive of the vane of an arrow. The body terminates in a flattened tail. The *Chætognatha* are transparent, rarely exceed an inch in length, have a simple, straight alimentary canal, and are hermaphrodite. Eyes are present on the head, and numerous hairs, which serve as organs of touch, are scattered over the body. The group is widely distributed, and its two genera, *Sagitta* and *Spadella*, are divided into a considerable number of species. While the *Chætognatha* resemble the Nematode worms and the *Oligochæta* in many points of structure, their development is peculiar, and they are usually considered as forming a separate class of the sub-kingdom *Vermes*, or Worms (*q. v.*). F. A. Lucas.

Chætop'oda [from Gr. χαίτη, hair + πούς (gen. ποδός), foot]: an order of Annelids (jointed worms) most of which are characterized by the possession of regularly arranged bristles upon every segment of the body. In some, as the earthworms, these bristles are unsupported, but in others they are surrounded by a fleshy outgrowth (parapodium) on either side of each segment. In the *Archiannelida* (a group of small forms by some regarded as very primitive, by others as degenerate) the bristles are absent. The *Chætopoda* are divided into (1) *Archiannelida*; (2) *Polychætæ* (containing forms with many bristles in each segment, and in turn divided into *Errantia*, or forms which live free lives, and *Tubicola*, or those which build tubes); (3) *Oligochætæ* (see Earthworms); (4) *Echiurida*. J. S. Kingsley.

Chaffee, Adna R.: See the Appendix.

Chaffinch [*chaff* + *finch*, i. e. a species of finch which searches for its food in the chaff; cf. Late Lat. *furfu'rio*, deriv. of *furfur*, bran]: a common European, Asiatic, and African song-bird, *Fringilla cœlebs*, which devours not only seeds, but young plants, yet is very valuable as a destroyer of noxious insects. It is esteemed for the table in Southern Europe, and in Germany is prized for its loud song. See Nests of Birds.

Chafra: See Khafra.

Chagos (chaa'gos) **Archipelago**: a scattered group of small islands in the Indian Ocean; a southward extension of the Maldives; between lats. 6° 40′ and 9° 40′ S., and lons. 72° 22′ and 74° 48′ E. It is a dependency of the British colony of Mauritius. It consists of eight or ten separate clusters of islands, among which the Oil islands are most important. The largest of the latter, and of the archipelago, is the island Diego Garcia, lat. 7° S., lon. 72°–73° E., 12½ miles long, 6¼ broad, with 700 inhabitants, mostly Negro laborers from Mauritius. It is an important coaling-station, and annually exports about 50,000 gal. of cocoanut oil. It possesses a spacious harbor, and is on the route of the Australian and Red Sea steamers.

Chagres, chaa'gres: a small seaport-town of Colombia; on the Isthmus of Panama and on the Caribbean Sea; at the mouth of the Chagres river; about 9 miles W. S. W. of Aspinwall (see map of North America, ref. 11–H). It is a miserable collection of huts, with a shallow harbor.

Chagres: a river of Colombia; in the Isthmus of Panama, flowing into the Caribbean Sea; length, 102 miles, of which about 60 are navigable for small craft. It has been known to rise 40 feet in the rainy season. The line of the projected Panama canal is partly in the valley of the Chagres, crossing the river about a dozen times. It was proposed to utilize the water and avoid the danger of floods by immense regulative reservoirs. H. H. S.

Chagrin Falls: village; Cuyahoga co., O. (for location of county, see map of Ohio, ref. 2–H); on railroad and the Chagrin river; 17 miles E. S. E. of Cleveland. It has an iron-foundry, grist and paper mills. Pop. (1880) 1,211; (1890) 1,243; (1900) 1,586.

Chaillu, Paul du: See Du Chaillu.

Chain, or **Gunter's Chain**: in surveying, a measure 22 yards long, composed of 100 iron or steel links, each of which is 7·92 inches long. Ten square chains make an acre = 4,840 square yards. The chain now most commonly used by surveyors is 100 feet long, the ruder ones having 100 links, while the more precise ones are merely thin bands of steel with the distances marked upon them. See Surveying.

Chained Bible: See Bible, *Modern Versions*.

Chain Cable: See Cable.

Chain-mail: a fabric of small metal rings or links, interlinked together so that four or more links pass through each separate link and form a flexible material of which garments can be made. Armor made of chain-mail was rare in antiquity but common in the Middle Ages.

Chains and **Chain-making**: A *chain* consists of a series of links, usually elliptical, occasionally oval or circular, and in a few instances of rectangular or other forms, each interlocked with its adjacent neighbors in such manner as to form a continuous strong and flexible metal line, capable of sustaining heavy loads while "rendering" around a barrel or a wheel, or wrapped about any convenient object as a support. The chain is of unknown antiquity. It is especially familiar in literature of early date as a form of cable by which the anchors of ships were most safely held. It is commonly made of iron; but chains of brass, of bronze, gold and silver, and various other alloys and metals are often used as ornaments, and for some special purposes for which iron would be unsuitable as being too easily corroded and injured in appearance or in strength. Chains should be made of metal having ductility combined with strength and elasticity in the highest possible degree. In fact, brittleness is an irremediable defect; as all chains are at times subject to such sudden stresses, and such heavy surges of their loads, as could not safely be withstood if they were not elastic and ductile, and capable of taking up a considerable amount of energy of impact. Iron intended for such use must have not only excellent quality, as respects strength and ductility, but must also be capable of welding easily and strongly. Special grades are therefore selected for this purpose, and are often distinctively known as chain-irons.

Heavy chains, as those for ship's cables, are usually made with a cross-bar, or "stud," set between the two sides to hold them apart, and to prevent the sides closing in when subjected to great stress. Such are called stud-links. The proportions of links vary from 5 to 6 diameters' length, the diameter of the bar being taken as unity; the stud-link being longest to give space for the introduction of the stud. Their widths vary, similarly, between 3, 4, and 5 diameters of the bar.

The strength of the metal varies with its size, being much greater in the smallest than in the largest sizes of bar. Thus good cable-iron in rods of 1 inch diameter, as found in the market, should have a tenacity of about 60,000 lb. per square inch, while bars of 2 inches diameter yield at about 50,000, and similar iron, in shafting of 4 to 6 inches diameter, falls to about 45,000 lb. On the other hand, in smaller sizes, as drawn into wire, such iron rises in tenacity to 100,000, and even to 120,000 lb., per square inch. (See *Materials of Engineering*, by the writer, vol. ii., arts. 230, 231.) The best chain-iron is of rather soft quality, free especially from sulphur and phosphorus, and with just enough silicon to give good welding properties.

The process of manufacture consists in (1) cutting off the right length of bar for a link; (2) heating the body of the piece to a forging temperature, and bending it to shape with the aid of a good former and pattern, leaving, however, the ends of the piece separated sufficiently to permit the later manipulation of welding; (3) heating these ends and forming the surfaces for welding; (4) welding the link and giving it its final shape; (5) bringing it to gauge and smoothly finishing the surfaces, at the same time, if the stud is used, introducing it and closing down the link firmly upon it. The welding process is preceded by the introduction of the adjacent link of the chain. Sometimes quantities of links are made independently, and the intermediate links are afterward made and introduced between pairs of such, to constitute the continuous chain.

Chain-making machines, of which there are many known forms, commonly follow substantially the same programme of work; first heating and cutting off the piece of bar of the length required for the link, the cuts being made at the right angles to give the bevel required for the scarf of the weld; next heating and bending around the former or mandril to give them approximately the form of the finished link; the next link is then introduced and the new link welded, at the same time introducing the stud, if one is used. Each operation is performed by the machine, and in part automatically. The hammer in such machines is usually either operated by steam-pressure or is a modified

hydraulic press, and the action is that of a single pressure rather than a succession of blows. In addition to the standard forms of chains and cables the chain-making machines produce a great variety of forms of chain, some of which are given their peculiar shapes as a matter of economy and convenience in manufacture, others as being ornamental, especially when the precious metals are employed.

The link, to be satisfactory, should have not less than about 160 per cent. of the strength of the original bar, but it can not be expected to possess more than about 170 per cent. The average for good work is found by experience to be not far from 165. Proving stresses, as adopted by the U. S. Navy Department, range from 34,000 lb. on a 1-inch chain to 71,000 on 1½-inch and 121,000 on the 2-inch cable. These differences of quality between the bar and the link are due to the process of heating and working, which eliminates some of the hardening elements, reducing strength to some extent, while increasing ductility, and to the imperfection of welds, it being impossible to secure absolute certainty and thoroughness of union.

R. H. Thurston.

Chain-shot: a name of missiles formerly used in naval warfare, consisting of two balls, or half balls, which were connected by a chain about 8 inches long, and were discharged from a cannon.

Chalatenan'go: a city in the northern part of Salvador; capital of a department of the same name; beautifully situated at the foot of high mountains. It has an active trade, especially in cattle and indigo, and there are regular market-fairs. Pop. of the town about 8,000; of the department 55,000. H. H. S.

Chalcedon, kăl-see'don (in Gr. Χαλκηδών): an ancient Greek city of Bithynia; on the Bosphorus, opposite to Byzantium, from which it was about 1½ miles distant. On all the coins of Chalcedon the name is written Καλχηδών. It was founded 685 B. C., and became a large town, containing numerous temples. The Romans obtained possession of it in 74 B. C., and under the Roman empire it was a free city. The philosopher Xenocrates was born here about 396 B. C. In 451 A. D. a general council of the Church was held at Chalcedon, on the subject of the doctrinal disputes of the Nestorians and Monophysites. This, the fourth œcumenical council, condemned the heresy of Eutyches.

Chalcedony, kăl-sed'ō-ni [from Lat. *chalcedonius*, from Gr. χαλκηδών: so called because found near the ancient Chalcedon (Χαλκηδών), on the Bosphorus]: a name given to the crypto-crystalline varieties of quartz or silica, and comprising those from the translucent to semi-transparent kinds, many of which are beautiful ornamental stones. The opaque varieties are called Jasper (*q. v.*). Chalcedony is found in trap and other rocks in many regions, and in the gravels, etc., derived from their decomposition. It presents a variety of colors—white, gray, bluish, often red or brown, rarely yellow or green, and is frequently variegated or banded. The toughness and fine grain of all the varieties of chalcedony have made them the favorite material for gem-engravers from the earliest time to the present. Among the principal varieties that have distinct names are the following—(1) those of uniform color:

Carnelian, or *cornelian* (the latter form a deriv. of Lat. *cornu*, horn, the former a modif. due to false connection with Lat. *carneus*, flesh-like), includes fine semi-transparent varieties, usually light or dark red, also white, and sometimes yellow, the latter occasionally called *Ceragate*. Most of the red carnelian of commerce is chalcedony artificially stained by boiling in nitric acid and then subjecting to great heat. Formerly large natural pieces were highly prized, especially the bright clear red. Fine specimens are found in Hindustan, and are wrought into ornamental articles. Among the ancients it was also much used. *Chrysoprase* (from Gr. χρυσός, gold + πράσον, a leek, in allusion to its peculiar tint) is a green chalcedony, rare and highly valued as an ornamental gem. It is largely imitated in modern jewelry by staining chalcedony with salts of the protoxide of nickel. Choice specimens of chrysoprase have a fine apple-green tint. The color is liable to fade by long exposure to light, but dampness favors its retention, and chrysoprase is frequently kept in moist cotton. It is found in Lower Silesia, California, and Oregon, and fine examples line the walls of a chapel in the Church of St. Wenzel, at Prague. The stone called chrysoprasus by the Greeks and Romans is not certainly identified by modern authorities. *Plasma* (from Gr. πλάσμα, an image) is a deeper green variety, much used by the ancients and frequent in collections of antiques, but not much esteemed at present. *Sard* (from Lat. *sarda*, Gr. σάρδιον, stone, from Sardis in Lydia) is a rich deep-red variety, darker than carnelian and less semi-transparent, but of a fine blood-red color by transmitted light. Nearly all modern sard is artificially stained chalcedony, and ranges from cherry red to chocolate brown, erroneously called sardonyx by many jewelers (see below, under *Agate*).

(2) Banded and striped varieties. *Agate* (Gr. ἀχάτης, said to be named from the river Achates, in Sicily, where the stone was anciently found) is a name used for chalcedonies that are veined, layered, or variegated, presenting different colors or shades. This structure is due to their formation in successive layers on the walls of cavities, usually in trappean or volcanic rocks. Agate proper is clouded or has many fine layers, parallel, concentric, or angular; those with fewer and thicker layers are called onyx and sardonyx (see below), and are used particularly for cameo work. Agates occur in nearly all countries, though the greater part of those now used are brought from Uruguay and Brazil, and are taken to Oberstein and Idar, in Germany, to be cut and polished for articles of ornament. This industry, originally brought from Italy, has been an important one at these points for over three centuries, and now employs some 15,000 people. Great skill is shown in this work, and also in artificially coloring the stones. It is possible now to stain gray or bluish chalcedony any color, and restain it into onyxes of any color, a result only possible in ancient times through natural processes. The ancients used to cover sard, carnelian, or other stones with soda, and then on calcining a layer of white was formed by the alteration of surface. Agates in all ages, owing to their beauty and variety, have been a favorite material for seals, rings, pins, etc., and for costly vases, *coupes*, and ornaments, as well as mortars for chemists. *Agatized wood* is a natural replacement of wood by agate or chalcedony deposited by siliceous waters, whereby the ligneous matter is removed, but the form and structure retained. It is a beautiful material, frequent in the "petrified forests" of Colorado and of States of the American Union lying W. and S. of Colorado. The finest in the world occurs at Chalcedony Park, in Apache co., Arizona. *Fortification-agate* is a term applied to those agates in which the colored lines run in several directions and make sharp angles in their course, like the redoubts and bastions of a fort. *Moss-agate*, *moss-carnelian*, or *Mocha-stone* (from Mocha, in Arabia, whence it is often obtained), is a striking variety in which a white or light chalcedony contains dark, tree-like, or moss-like markings, sometimes almost resembling landscapes. These are due not to any vegetable growth, as often supposed, but to an infiltration of oxide of iron or of manganese, which has crystallized in these minute "dendritic" or tree-like forms, as frost does upon window-panes. Fine Mocha-stones come from India and Arabia, and they abound in some parts of Wyoming. *Onyx* (from Gr. ὄνυξ, a finger-nail, a veined gem) consists of parallel layers of different-colored chalcedony, generally some shade of red or brown alternating with white. If one or more of the layers are of a brown red or pink the stone is called *sardonyx*. These varieties were highly prized by the ancients, and were much valued for ornamental work when cameos were in vogue. In modern times they are artificially colored to heighten the contrast of the layers, and all the black and white onyx is of this kind. The stone is boiled in blood, sugar, molasses, etc., and some of the layers absorb the organic matter, while others do not. By immersion in sulphuric acid the organic matter is then carbonized, and remains as a black coloring-substance in the absorbent layers. Of late an entirely black chalcedony, thus stained and called black onyx, has almost displaced the use of jet in jewelry. *Chalcedonyx* is a name sometimes given to onyx or sardonyx in which one or more of the layers are transparent quartz or chalcedony. The term onyx belongs only to these varieties of banded chalcedony, though it is often wrongly applied to other striped minerals, especially in the name "Mexican onyx," which denotes an entirely different stone—a form of aragonite (carbonate of lime). See Mexican Onyx. When the lower layer is black and the upper white, if the white is ground very thin it gives a gray appearance to the onyx, which is then called *Nicolo*.

George F. Kunz.

Chalcedonyx: See Chalcedony.

Chalcid'idæ [from Gr. χαλκίς, a kind of lizard]: a family of lacertilian reptiles found in warm regions in both hemispheres. They are popularly considered snakes, having no

visible legs. They have movable eyelids, small ears, and a short thick tongue.—Also the name of a family allied to the ichneumon flies, which are of great service in the destruction of noxious insects upon which their larvæ feed.

Chalci'dius: a writer, probably of the fourth century, who translated into Latin the *Timæus* of Plato in part, adding a voluminous commentary, which is dedicated to a certain Osius, perhaps the Bishop of Cordova. He was probably a Christian. See ed. by I. Wrobel (Leipzig, 1876).

M. W.

Chal'cis: the name of three cities. 1. Chalcis, or Egrypo (Ital: *Negroponte*), the chief town of the island of Eubœa in Greece; 18 miles N. E. of Thebes; on the Strait of Euripus (at this point only 40 yards wide), and connected with the mainland by a bridge (see map of Greece, ref. 16–K). Is said to have been colonized from Athens. Aristotle died there 322 B. C. It was taken by the Venetians 1205 A. D., by the Turks 1470, and by the Greeks 1821. Pop. 6,900. It is the only town in Greece where any Mohammedans remain. 2. An ancient city of North Syria; 10 or 12 miles S. of Chalybon (modern *Aleppo*), on the old caravan route to Heliopolis (*Baalbek*); said to have been founded by Seleucus Nicator (312–280 B. C.). In 638 A. D. it was destroyed by the Arabs under Abu Obeidah, and its name was changed to *Kennisrin*. The ruins are extensive. 3. An ancient city of Cœle-Syria, mentioned repeatedly by Josephus in connection with the Herods. Its ruins, nearly a mile in circuit, now called *Anjar*, are close to the post-road between Beirut and Damascus.

Revised by R. Lilley.

Chalco: town of Mexico, state of Mexico; on the east shore of Lake Chalco (see map of Mexico, ref. 7–4). It was an ancient Aztec city, subject to Montezuma II., but the chiefs joined Cortez with their forces in 1521, and aided in the siege of Mexico. Pop. in 1893 about 3,000. H. H. S.

Chalco: one of the group of lakes surrounding Mexico city; about 12 miles S. E. of it, and separated from Lake Xochimilco only by a narrow causeway. Area about 40 sq. miles. It has two islands, one of them an extinct volcanic cone with a nearly perfect crater. The water is fresh; masses of grass and reeds float on the surface, somewhat resembling the Aztec *chiampas*, or floating gardens. This lake was formerly united to the others around Mexico.

Herbert H. Smith.

Chalcon'dylas, Demetrios: humanist of the early Renaissance; b. in Athens in 1428; removed to Italy shortly before the fall of Constantinople in 1453. After leading the restless life of an itinerant teacher in Padua, Perugia, Rome, and other Italian cities, he was finally called, about 1471, by Lorenzo de Medici, to the chair of Greek in Florence, where he lectured with extraordinary success. Pope Leo X. was one of his pupils. Shortly after the death of Lorenzo (in 1492), Chalcondylas went to Milan, where he died at the age of seventy-two. To him we owe the first printed edition of *Homer* (1488), of *Isocrates*, and of the *Lexicon of Suidas*. See H. Hodius, *De Græcis illustr. linguæ Græcæ, etc., instauratoribus* (London, 1742, pp. 211–226).

Alfred Gudeman.

Chaldæ'a: See Babylonia.

Chaldæ'an Christians, Syro-Chaldæans, or **Syro-Orientals**: a branch of the Church of Rome, consisting of those Christians in Assyria, Mesopotamia, and a part of Persia, who acknowledge the pope. They are of the Eastern rite, and are under the Patriarch of Babylonia, who resides in Mosul, and thirteen bishops, of whom five have archdioceses and three reside in Persia. They number about 90,000 souls, and are most numerous in the dioceses of Mosul and Bagdad. The Syro-Chaldaic is their liturgical language.

Chaldee Language, or **Eastern Aramaic**: See Aramaic.

Chaleurs (shăă-loorz') **Bay**: an inlet of the Gulf of St. Lawrence, Canada; separates Quebec from New Brunswick. It extends E. and W. about 90 miles; is about 22 miles wide at the broadest part. It affords good anchorage, and can be navigated without danger. It has important mackerel fisheries.

Chalice [O. Fr. < Lat. *calix*, cup: Gr. κύλιξ, cup]: the cup used in the celebration of the Holy Communion. The chalice has four parts—the foot, the stem, the knop, and the bowl. The foot or base should extend considerably beyond the bowl, to prevent upsetting. On one division of the foot it is usual to engrave a representation of the Passion, which should be always turned toward the celebrant. The stem unites the foot to the bowl, and on it is fixed the knop for holding the bowl of the chalice. The knop is variously enriched with enamel, jewels, tracery, and tabernacle-work. The stem is often engraved or enameled. The bowl should have a plain rim of about an inch, below which it may be enriched with engravings, inscriptions, and chasings.

W. S. Perry.

Chalk [O. Eng. *cealc*; O. H. Germ. *chalch* > Mod. Germ. *Kalk*, a common West Germ. loan-word from *calx*, lime. The limitation of meaning to chalk is peculiar to the English]: a calcareous earth; a soft variety of limestone or carbonate of lime. Its color is generally white. It is friable, easily pulverized, has an earthy fracture, and is very meager to the touch. In geology it is a sedimentary rock of great extent and importance, and a member of the cretaceous system. Chalk is abundant in England and France, and has recently been found to occur extensively in Texas and Arkansas. The strata often contain flint nodules, distributed in layers like chert or hornstone in the limestone. They are more or less rounded, and are all of concretionary origin. Chalk is of animal origin, and is mostly composed of the shells or carapaces of microscopic marine animals. According to Ehrenberg, a cubic inch of chalk often contains more than a million of microscopic organisms, among which far the most abundant are the rhizopods (called also foraminifera). Chalk is extensively used in the preparation of lime, and is commonly employed by carpenters to mark boards. The material sold under the name of whiting or Spanish white, and used to make putty, is chalk in a purified state. Purified chalk, also known as Vienna white, is employed by artists in pastel-work and crayon as a basis of pigments, and is administered in medicine as an antacid. Black chalk (a clayey formation), French chalk (a soapstone), and red chalk (ocher) are not chalks at all. See Cretaceous Period. G. K. G.

Challe, shaal, Michangelo: historical painter of eighteenth century; member of the Academy of France; painted the ceiling of the hall in the New Louvre where the Academy met.

Challcuchima, chaăl-koo-chee'maă, or **Chalicuchima**: an Inca general of Peru, native of Quito, and said to have been the uncle of Atahualpa, in whose army he served. He was prominent in the war with Huascar, and is said to have shown extreme cruelty in his treatment of the conquered provinces. Shortly after the seizure of Atahualpa by the Spaniards, Hernando Pizarro met Challcuchima at Xauxa, and induced him to go to Cajamarca under pretense that Atahualpa had sent for him. He was imprisoned there, and carried with the army on their march to Cuzco. At Chaquichaguana, 5 leagues from Cuzco, he was accused of inciting an Indian insurrection, and after a form of trial was burned alive (Nov., 1533). Herbert H. Smith.

Challemel-Lacour, shaăl'mel'laă'koor', Paul Armand: French senator; b. at Avranches, May 19, 1827: graduated at the Normal School in Paris 1849; banished after the *coup d'état* of 1851; returned to France after the amnesty 1859; prefect of the Rhône, Sept. 4, 1870; administered the affairs of the city of Lyons at the time of great excesses; elected deputy in the radical interest Jan. 7, 1872; senator Jan. 30, 1876; ambassador to the Swiss Confederation 1879; ambassador to London 1880–82; Minister of Foreign Affairs in the Ferry cabinet 1883; president of the senate 1893; elected to the academy 1893; editor *République Française*. D. at Paris, Oct. 26, 1896. C. H. Thurber.

Challenger Expedition: a scientific exploration of the Atlantic, Southern, and Pacific Oceans instituted by the British Government 1872–76. The corvette Challenger, of 2,306 tons, was placed at the disposal of a body of naval surveyors and scientists, headed by Capt. Nares and Prof. Wyville Thomson respectively. Investigations were made at 362 stations, and in its circuitous circumnavigation of the globe the vessel cruised over 68,900 nautical miles. See the *Reports on the Scientific Results of the Voyage of H. M. S. Challenger*, edited by Sir Wyville Thomson and Dr. John Murray (1880–89) in 37 volumes, of which 2 are devoted to a *Narrative*, 30 to *Zoölogy*, 3 to *Physics and Chemistry*, and 2 to *Botany*. C. H. Thurber.

Challoner, Richard: a Roman Catholic prelate; b. in Lewes, Sussex, England, Sept. 29, 1691; educated at Douay, where he was a professor until 1730; sent to London as a missionary priest; bishop *in partibus* 1741; Vicar Apostolic of London district 1758; d. in London, Jan. 12, 1781. His

works were both controversial and devout. In answer to Conyers Middleton's *Letters from Rome* he published *Catholic Christian Instructed*. His *Garden of the Soul* is still a *vade mecum* for devotional minds, and his version of the Douay Bible the standard one for English-speaking Roman Catholics. He published a martyrology of Roman Catholics in Great Britain from 1577 to end of reign of Charles II. (1741, 2 vols.), and *Britannia Sancta*, containing lives of British and Irish saints.

Chal'mers, Alexander: writer; b. in Aberdeen, Scotland, Mar. 29, 1759. He is noted as the author of a *General Biographical Dictionary* in 32 volumes (1812–17), and as the editor of a well-known edition of Johnson's British poets, with notes, and a still valuable collection of *British Essayists* in 45 volumes. D. in London, Dec. 10, 1834.

Chalmers George: antiquary and lawyer; b. in Fochabers, Scotland, in 1742; practiced law in Baltimore, Md., 1763–75; returned to London and was clerk to the Board of Trade from 1786 to 1825. His greatest work is entitled *Caledonia: An Account, Historical and Topographical, of North Britain* (3 vols., 1807–24), which displays profound research and much erudition (n. ed. Paisley, 7 vols., 1889). Among his other works are a *Life of Mary Queen of Scots* (1818) and a *Collection of Treaties* (1790). D. in London, May 31, 1825.

Chalmers, George Paul, R. S. A.: British artist; b. in Montrose, 1833; in 1853 began study under Scott Lauder in Edinburgh; first attracted notice by his *Favorite Air* (1854); is best known for his portraits and landscapes, among which are the *End of the Harvest* (1873) and *Running Water* (1875). D. in Edinburgh, Feb. 28, 1878.

Chalmers, Mackenzie Dalzell: See the Appendix.

Chalmers, Thomas, LL. D., D. C. L.: divine; b. at Anstruther, Fifeshire, Scotland, Mar. 17, 1780; educated in the University of St. Andrews. In 1803 he was ordained minister of the Fifeshire parish of Kilmany. His favorite studies for some years before and after this event were mathematics and natural philosophy. He published in 1808 an *Inquiry into the Extent and Stability of the National Resources*. While composing an article on Christianity for *Brewster's Encyclopædia* in 1809, he examined the evidences of its truth, and acquired convictions which rendered him a more earnest and devout preacher of the gospel. He married Miss Grace Pratt in 1812, and was elected minister of the Tron Church, Glasgow, in 1815. He soon gained distinction as an eloquent and powerful pulpit orator, and delivered a series of discourses on astronomy in connection with religion, which were published in 1817 and had wide circulation. In 1819 he became minister of St. John's parish, Glasgow, especially established for him to try his social and religious experiments in. He established schools and made strenuous efforts to improve the morals and economic condition of his parishioners. His scheme was the prototype of that now familiar as "charity organization," viz., that of restoring the neighborly methods of the old kirk, getting rid of official relief, reopening the natural springs of affection and kinship, and of employing a large number of deacons or volunteers in the duty of befriending, counseling, and restoring the poor to self-maintenance. He was appointed Professor of Moral Philosophy in the University of St. Andrews in 1823, and obtained the chair of Theology in the University of Edinburgh in 1828. He published in 1832 a work entitled *Political Economy*, and in 1833 his Bridgewater treatise *On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, which was received with great favor. Dr. Chalmers was the leader of the Evangelical party, which was involved with the "Moderate" party in a contest in relation to patronage. This contest resulted in the disruption of the Church of Scotland in May, 1843. Dr. Chalmers and 470 other clergymen then seceded and organized the Free Church. He expended the latter years of his life in perfecting his *Institutes of Theology* and in officiating as principal and Professor of Theology in New College, Edinburgh, instituted by the Free Church. He was an orator and a practical worker rather than a speculative theologian. He is probably no longer read, except in his Bridgewater treatise and some sermons, but he lives on in the Free Church of Scotland, which links his name with the greatest names in Christendom. He published his works in 25 volumes (Glasgow, 1836–42), and 9 volumes were published after his death (Edinburgh, 1847–49). See his *Life* by W. Hanna, his son-in-law (Edinburgh, 1849–52, 4 vols.; n. e. 1878, 2 vols., repr. New York), and by Donald Fraser (London and New York, 1881). D. in Edinburgh, May 30, 1847.

Revised by S. M. Jackson.

Chal'on, Alfred Edward: portrait-painter in water-colors; b. in Geneva, Switzerland, Feb. 15, 1781; d. in London, Oct. 3, 1860; went to England with his parents, who left France owing to reverses of the Revolution in 1789; pupil of Royal Academy, London; was appointed portrait-painter in water-colors to Queen Victoria.

Chalon, John James: landscape and genre painter; b. in Geneva, Switzerland, Mar. 27, 1778; d. in London, Nov. 14, 1854; pupil of Royal Academy, London; Royal Academician 1841; distinguished in his time as a water-color painter; elder brother of Alfred E. Chalon.

Châlons-sur-Marne, shăă'lōn'sür-maarn' (anc. *Catalauni* or *Catalaunum*): a city of France; capital of the department of Marne; on the right bank of the Marne, and on the railway from Paris to Strassburg; 107 miles E. of Paris (see map of France, ref. 3–G). It is situated in a fertile plain, which is part of the former province of Champagne, and has a stone bridge across the river. It is a bishop's see, and contains a fine cathedral, a botanic garden, and a public library of about 25,000 volumes; also manufactures of cotton, linen, and woolen fabrics. Champagne wine is produced in the vicinity. In the Catalaunian Plain adjacent to Châlons the Roman general Aëtius and Theodoric the Visigoth gained a great victory over Attila in 451 A. D. In the early part of the Dark Ages Châlons was one of the most important commercial cities of Europe, and had about 60,000 inhabitants. In 1857 the celebrated Champ de Châlons was established near Châlons, in which always one or two French army corps were kept for drilling; it was evacuated by the French in Aug., 1870, and entirely abandoned in 1871. Pop. (1891) 25,863; (1896) 26,630.

Châlon-sur-Saône, -sōn' (anc. *Cabillonum*): a town of France; department of Saône-et-Loire; on the right bank of the Saône; on the railway from Dijon to Lyons; 77 miles by rail N. of Lyons (see map of France, ref. 5–G). It is at the head of steamboat navigation, and has an active trade, being the eastern terminus of the Canal du Centre, which connects the Saône with the Loire. The chief public buildings are a cathedral founded in the thirteenth century, St. Peter's church, and the town-hall. It has a theater and a large public library; also manufactures of glass, jewelry, hosiery, linen fabrics, pottery, etc. Pop. (1896) 26,288. It is identified with the ancient *Cabillonum*, which became the capital of Burgundy under Gontran, King of Burgundy, who died in 593 A. D.

Chalybeate, kā-lib'ĕe-āt [from Gr. χάλυψ, steel, hardened iron; so named from the Chalybes, a people to the S. E. of the Black Sea]: that which contains iron in solution; applied to waters which are impregnated with iron. There are two kinds of chalybeate water—the carbonated, which contains carbonate of iron, and may be recognized by forming an ocherous deposit of red oxide of iron on the stones near the mouth of the spring; and the sulphated, which contain sulphate of iron (copperas) in solution. See Mineral Waters.
