PECULIAR PHONETIC SYMBOLS

USED IN THE WRITING OR TRANSLITERATION OF THE DIFFERENT LANGUAGES.

ā, ē, etc.: long vowels; in the Scandinavian languages the accent (*á*, *é*, etc.) is used to denote length.

ą: a nasalized *a*; so used in the transliteration of the Iranian languages.

å: labialized guttural *a* in Swedish.

æ: open *a* of Eng. *hat*, used chiefly in O. Eng.

aí: used in Gothic to denote *e* (open), in distinction from *ái*, the true diphthong.

aú: used in Gothic to denote *o* (open), in distinction from *áu*, the true diphthong.

bh: in Sanskrit a voiced labial aspirate (cf. *ch*).

ƀ: voiced bilabial (or labio-dental?) spirant, used in discussions of Teutonic dialects.

ç: voiceless palatal sibilant, similar to Eng. *sh*, used especially in transliteration of Sanskrit.

č: frequently used, e. g. in Slavonic languages, to denote the sound of Eng. *ch* in *cheek*.

c: voiceless palatal explosive, commonly used in transliteration of Sanskrit and the Iranian languages.

ch: as used in the transliteration of Sanskrit, a voiceless palatal aspirate, an aspirate being an explosive with excess of breath; as used in German grammar, the symbol for a voiceless palatal or guttural spirant.

dh: voiced dental aspirate (cf. *ch*) in Sanskrit.

ḍ: voiced cerebral explosive, so used in transliteration of Sanskrit.

ḍh: voiced cerebral aspirate (cf. *ch*) in Sanskrit.

đ: voiced dental (interdental) spirant, equivalent to Eng. *th* in *then*; so used in the Teutonic and Iranian languages and in phonetic writing.

ë: a short open *e*, used in Teutonic grammar, particularly in writing O. H. G.

e: the short indefinite or "obscure" vowel of Eng. *gardener*; used in the reconstruction of Indo-Eur. forms, and in transliterating the Iranian languages.

gh: in Sanskrit a voiced guttural aspirate (cf. *ch*).

ǥ: voiced velar (back-guttural) explosive, used most frequently in Indo-Eur. reconstructions.

ȝ: voiced guttural (or palatal) spirant, equivalent to Mod. Greek *γ*, and used in transliteration of Iranian languages and O. Eng.

ḥ: a voiceless breathing, the Sanskrit *visarga*.

hᵛ: a labialized *h*, similar to *wh* in Eng. *what*; used in transliteration of Gothic and the Iranian languages.

ḥ: voiceless guttural (or palatal) spirant, equivalent to German *ch*, and used in transliteration of the Iranian languages.

i̯: the semi-vowel *y*, or consonant form of *i*; used in phonetic writing and reconstructions of Indo-Eur. forms.

j: in the transliteration of Sanskrit and the Iranian languages a voiced palatal explosive; in the Teutonic languages a semi-vowel (= *y*), for which in Indo-Eur. reconstructions *i* is generally used.

jh: in Sanskrit a voiced palatal aspirate (cf. *ch*).

kh: in Sanskrit a voiceless guttural aspirate (cf. *ch*).

ƚ: the guttural ("thick" or "deep") of the Slavonic and some of the Scandinavian languages.

l̥: vowel *l*; used in transliterating Sanskrit, in reconstructing Indo-Eur. forms, and in other phonetic writing.

n̥: nasal vowel; used in reconstruction of Indo-Eur. forms and in phonetic writing.

ṇ: in Sanskrit the cerebral nasal.

ñ: in Sanskrit the guttural nasal (see following).

ŋ: the guttural nasal, equivalent to Eng. *n* in *longer*; used in transliteration of Iranian languages.

ñ: palatal nasal, similar to *gn* in Fr. *regner*; used in transliterating Sanskrit and in phonetic writing.

ö: palatalized *o*; used in German and in phonetic writing.

ǫ: short open *o* in Scandinavian.

ø: short palatalized *o* (ö) in Scandinavian.

ph: in Sanskrit, voiceless labial aspirate (cf. *ch*).

q̡: voiceless velar (back-guttural) explosive; used in reconstructions of Indo-Eur. forms and in other phonetic writing.

r̥: vowel *r*; used in transliterating Sanskrit, in reconstructions of Indo-Eur. forms, and in other phonetic writing.

š: voiceless cerebral sibilant, equivalent to Eng. *sh*; used in transliterating the Iranian languages and in phonetic writing.

ṣ: voiceless cerebral spirant; used in transliterating Sanskrit.

th: in Sanskrit a voiceless dental aspirate (cf. *ch*).

ṭh: in Sanskrit a voiceless cerebral aspirate (cf. *ch*).

ṭ: in Sanskrit a voiceless cerebral explosive.

ţ: a form of dental spirant used in transliterating the Iranian languages (represented in Justi's transliteration by ṭ).

þ: voiceless dental (interdental) spirant, equivalent to Eng. *th* in *thin*; used in Teutonic dialects and in phonetic writing.

u̯: consonant form of *u*; used in phonetic writing.

ž: voiced cerebral sibilant, equivalent to *s* in Eng. *pleasure*, and to *j* in Fr. *jardin*; used in Iranian, Slavonic, and in phonetic writing.

ʒ: a symbol frequently used in the writing of O. H. G. to indicate a voiced dental sibilant (Eng. *z*), in distinction from *z* as sign of the affricata (*ts*).

EXPLANATION OF THE SIGNS AND ABBREVIATIONS USED IN THE ETYMOLOGIES.

>, yielding by descent, i. e. under the operation of phonetic law.
<, descended from.
=, borrowed without change from.
: , cognate with.
+, a sign joining the constituent elements of a compound.
*, a sign appended to a word the existence of which is *inferred*.

ablat.	ablative
accus.	accusative
adjec.	adjective
adv.	adverb
cf.	compare
conjunc.	conjunction
deriv. of	derivative of
dimin.	diminutive
fem.	feminine
genit.	genitive
imper.	imperative
impf.	imperfect
indic.	indicative
infin.	infinitive
masc.	masculine
nomin.	nominative
partic.	participle
perf.	perfect
plur.	plural
prep.	preposition
pres.	present
pron.	pronoun
sc.	scilicet, supply
sing.	singular
subst.	substantive
vocat.	vocative

Anglo-Fr.	Anglo-French
Arab.	Arabic
Avest.	Avestan

Swed.	Swedish
Teuton.	Teutonic

KEY TO THE PRONUNCIATION.

aa..... as *a* in *father*, and in the second syllable of *armada*.

aă..... same, but less prolonged, as in the initial syllable of *armada*, *Arditi*, etc.

a..... as final *a* in *armada*, *peninsula*, etc.

ă..... as *a* in *fat*, and *i* in French *fin*.

ay or ā.. as *ay* in *nay*, or as *a* in *fate*.

aў or *ā*.. same, but less prolonged.

ã..... as *a* in *welfare*.

aw..... as *a* in *fall*, *all*.

ee..... as in *meet*, or as *i* in *machine*.

ĕe..... same, but less prolonged, as final *i* in *Arditi*.

e..... as in *men*, *pet*.

e..... obscure *e*, as in *Bigelow*, and final *e* in *Heine*.

ė..... as in *her*, and *eu* in French *-eur*.

i..... as in *it*, *sin*.

ī..... as in *fire*, *swine*.

ī..... same, but less prolonged.

ō..... as in *mole*, *sober*.

ō..... same, but less prolonged, as in *sobriety*.

o..... as in *on*, *not*, *pot*.

oo..... as in *fool*, or as *u* in *rule*.

o͝o..... as in *book*, or as *u* in *put*, *pull*.

oi..... as in *noise*, and *oy* in *boy*, or as *eu* in German *Beust*.

ow..... as in *now*, and as *au* in German *haus*.

ö..... as in *Göthe*, and as *eu* in French *neuf*, *Chintreui*.

ŭ..... as in *but*, *hub*.

ŭ..... obscure *o*, as final *o* in *Compton*.

ü..... as in German *süd*, and as *u* in French *Buzançais*, *vu*.

y or *l*.... see *l* or y.

yu..... as *u* in *mule*.

yŭ..... same, but less prolonged, as in *singular*.

ch..... as in German *ich*.

g..... as in *get*, *give* (never as in gist, congest).

hw..... as *wh* in *which*.

*k*h..... as *ch* in German *nacht*, *g* in German *tag*, *ch* in Scotch *loch*, and *j* in Spanish *Badajos*, etc.

ṅ..... nasal *n*, as in French *fin*, *Bourbon*, and nasal *m*, as in French *nom*, Portuguese *Sam*.

ñ or n-y.. Spanish *ñ*, as in *cañon*, *piñon*, French and Italian *gn*, etc., as in *Boulogne*.

l or y.... French *l*, liquid or mouillé, as (-i)ll- in French *Baudrillart*, and (-i)*l* in *Chintreuil*.

th..... as in *thin*.

th..... as in *though*, *them*, *mother*.

v..... as *w* in German *zwei*, and *b* in Spanish *Cordoba*.

sh..... as in *shine*.

*z*h..... as *s* in pleasure, and *j* in French *jour*.

All other letters are used with their ordinary English values.

NOTE.

The values of most of the signs used in the above Key are plainly shown by the examples given. But those of ö, ü, *c*h, *k*h, ñ, and *v*, which have no equivalents in English, can not be sufficiently indicated without a brief explanation, which is here given.

ö. The sound represented by this symbol is approximately that of -u- in *hurt* or -e- in *her*, but is materially different from either. It is properly pronounced with the tongue in the position it has when ā is uttered and with the lips in the position assumed in uttering ō.

ü. This vowel is produced with the lips rounded as in uttering oo and with the tongue in the position required in uttering ee, into which sound it is most naturally corrupted.

*c*h and *k*h. These are both rough breathings or spirants made with considerable force, *c*h being made between the flat of the tongue and the hard palate, and *k*h between the tongue and the soft palate. *c*h approaches in sound to English sh, but is less sibilant and is made further back in the mouth; *k*h is a guttural and has a hawking sound.

l or y. These are both used to represent the sound of French l mouillé, in (-i)ll- and (-i)l, which resembles English -y- in *lawyer*. Final *l*, that is, (-i)l, may be approximated by starting to pronounce lawyer and stopping abruptly with the -y-.

ñ or n-y. The consonants represented by ñ (Spanish ñ, French and Italian gn, etc.) are practically equivalent to English -ni- or -ny- in bunion, bunyon, onion, etc., and, except when final, are represented by n-y. Final ñ, as French -gn(e), may be produced by omitting the sound of -on in the pronunciation of *onion*.

v. This may be pronounced by attempting to utter English v with the use of the lips alone.

See PREFACE (vol. i., p. xli.) and the article PRONUNCIATION OF FOREIGN NAMES.

THE
UNIVERSAL CYCLOPÆDIA.

Bhagavad-Gītā, bha'ga-vad-gĕĕ-taa' (song of the Exalted One, i. e. of Krishna or Vishnu): a Sanskrit theosophic poem, very celebrated in India, which is loosely interpolated into the MAHA-BHARATA (*q. v.*). Its authorship is unknown; its date is perhaps not very far either way from the time of Christ. It teaches the unity of the Supreme Spirit, and inculcates devotion thereto by renunciation of all worldly attachments and aversions. It has much that is lofty and spiritual, but is in nowise a coherent system. Its correspondences with the New Testament are indeed striking, but of no necessary significance. Edited by Schlegel and Lassen (1846). English translations by Davies (Trübner's Oriental Series) and by Edwin Arnold (metrical, Boston, 1885). See SANKHYA KARIKA. C. R. LANMAN.

Bhamo, or **Bhanmo**: See the Appendix.

Bhandara, bŭn-dăă-raa': a district and town of Nagpur, Central Provinces, British India; about midway across the peninsula, between parallels 20° and 22° N., and meridians 79° and 81° E. It abounds in small lakes and tanks, and hence is called the lake region of Nagpur. It is not well watered otherwise, but these afford means of irrigation. Area, 3,922 sq. miles, one-third of which is under jungle and uncultivated. The agricultural products are rice, wheat, pulses, pease, sugar-cane, oil-seeds, and cotton. Native cloth, baskets, and brass-ware are the chief manufactures. The climate is unhealthy; fever, smallpox, and cholera are common. Pop. about 700,000, of whom 84 per cent. are Hindus. The inhabitants are rude, unpolished, and unthrifty. The aboriginal Gonds are common. The chief town is Bhandara, 38 miles E. of Nagpur city; pop. 12,000. M. W. H.

Bhartpur, bŭrt-poor', or **Bhurtpore**: a "protected" state of British India; between 26° 30′ and 27° 50′ N. lat., and between 77° and 78° E. lon. Area, 1,974 sq. miles. Good crops of cotton, sugar, and grain are produced. The heat in summer is extreme. Pop. about 800,000.

Bhartpur, or **Bhurtpore**: a large town of India; capital of state of same name; in a plain 33 miles W. of Agra; lat. 27° 12′ N., lon. 77° 33′ E. (see map of N. India, ref. 6–D). Pop. (1891) 67,560. It was formerly fortified by a mud wall, and a ditch which could be filled with water from a lake.

Bhar'tri-ha'ri: Hindu poet, referred doubtfully to the first century A. D.; reputed author of the *Three Centuries* or *Hundreds* of Sanskrit apothegms on love, wise conduct of life, and renunciation of the world, the concern respectively of youth, manhood, and old age. Best edition by K. T. Telang, in the Bombay Sanskrit Series (see BÜHLER). Translations by C. H. Tawney, metrical (Calcutta, 1877), and B. H. Wortham (London, 1886).

Bhaunagar': feudatory state and city of Kathiawar, Bombay, British India. The state lies just W. of the Gulf of Cambay (see map of S. India, ref. 2–B). Area, 2,860 sq. miles. Pop. 400,000. The city of Bhaunagar lies on the west shore of the gulf. Pop. (1891) 55,640.

Bhawalpur, baw-ăăl-poor': a feudatory state of the Western Plains district, Punjaub, British India; S. of the Indus and Sutlej rivers; from 69° 30′ to 73° 58′ E. lon., and from 27° 41′ to 30° 25′ N. lat. It is remarkably level, except for numerous sandhills 50 or 60 feet high. The cultivable part is confined to a strip along the above-named rivers, about 10 miles wide. Beyond this is a desert of loose, moving sands, almost devoid of vegetation, though the empty beds of great rivers can still be traced. Total area, 17,285 sq. miles; only one-sixth part cultivable. The principal products are woolen, cotton, and silk cloths, indigo, cereals, alum, and saltpeter. The rains are very scanty and the wells deep. The state has prospered greatly under British management. Pop. (1881) 573,494; (1891) 648,900, mostly Mohammedans, consisting of Jats of Hindu descent, Baluchis, and Afghans. The city of Bhawalpur, the capital, is situated on a branch of, and not far from, the river Sutlej (see map of N. India, ref. 5–B); pop. 14,000. Other principal towns are Ahmadpur, Uch, and Khanpur. M. W. H.

Bhilsa: same as BILSA.

Bhooj: same as BHUJ.

Bhopal: A British political agency, native state, and city of Central India. The agency comprises 31 native administrations, with a total population of 1,900,000. The state is one of the dependencies under this agency, in lat. 22° 32′ N. to lat. 23° 46′ N., and between lons. 76° 25′ and 78° 50′ E., N. of the Nerbudda river. Area, 6,764 sq. miles. The surface is mountainous, being traversed by the Vindhya range, and inclines to the N. The population is about 700,000, including many of an aboriginal tribe called the Gonds. The principal crops are wheat, maize, oil-seeds, pulses, and opium. Bhopal was founded in 1723 by Dost Mohammed Khan, an Afghan invader. Since 1818 it has been steadily loyal to the British. The city of Bhopal, capital of the state, in lat. 23° 20′ N., lon. 77° 20′ E., is inclosed by a dilapidated stone wall, outside of which are some large pools and a fort. Pop. (1891) 70,630. M. W. H.

Bhuj, booj: a fortified town of Hindustan; capital of Cutch; 170 miles S. E. of Haidarabad (see map of N. India, ref. 7–A). It contains a beautiful mausoleum of Rao Lakka, a former ruler of Cutch. Its manufactures of gold and silver are widely celebrated. Pop. 25,000.

Bhurtpore: See BHARTPUR.

Bhutan, boo-taan', or **Bhotan** (also *Bootan*): a state in the Eastern Himalayas, India; bounded N. by the Himalaya Mountains, which separate it from Tibet, E. by Tibet, and S. and W. by Bengal. Area about 16,800 sq. miles. The Peak of Shumalari on the north border rises about 27,000 feet above the sea. Wheat, barley, rice, and maize are cultivated here. The religion of Bhutan is Buddhism. The people practice polyandry and polygamy. Pop. about 200,000.

Biaf'ra, Bight of: a bay of the Atlantic Ocean; on the west coast of Africa; is the eastern portion of the Gulf of Guinea, and lies between Cape Formosa and Cape Lopez.

Bialystok: same as BIELOSTOK (*q. v.*).

Bianchini, bĕĕ-ăăn-kee'nee, FRANCESCO: Italian astronomer and antiquary; b. at Verona, Dec. 13, 1662. He spent several years in an effort to draw a meridian line from the Adriatic to the Mediterranean, but failed to complete it. He succeeded in drawing a meridian line through the Church of Santa Maria degli Angeli. D. in Rome, Mar. 2, 1729.

Biarritz, bĕĕ'ăăr'rĕĕts': a village and fashionable watering-place of France; on the Bay of Biscay; department of

Basses-Pyrénées; 5 miles S. W. of Bayonne (see map of France, ref. 9–C). Here are several curious grottoes and mineral springs. The situation is pleasant and healthful. This was once the summer residence of Napoleon III. Pop. (1896) 11,869.

Bi'as: one of the Seven Sages of Greece; a native of Priene, and a contemporary of Crœsus, King of Lydia. He lived about 570–550 B. C. He was distinguished for eloquence as well as wisdom, and was employed as a legal and political adviser or advocate. Besides other pithy sayings is ascribed to him this: "I carry all my goods (or riches) with me."

Bib, called also **Pout** or **Whiting Pout** (*Gadus luscus*): a fish allied to the cod and haddock; is found on many parts of the British coasts and farther N. It is seldom more

The bib.

than a foot long, and is remarkable for the depth of its body, which equals one-fourth of its length. It is esteemed for food.

Biband, bē̆'bō', François Marie Uncas Maximilien: Canadian author; b. in Montreal in Nov., 1824; son of Michel Biband, the historian. He has been for many years Professor of Law in the Jesuit College of Montreal. Among his works are *Discours historique sur les races sauvages de l'Amérique* (Montreal, 1846); *Dictionnaire historique des hommes illustres du Canada et de l'Amérique* (1857); *Tableau historique des progrès matériels et intellectuels du Canada* (1858); and *Panthéon Canadien* (1858).

Neil Macdonald.

Biband, Michel: b. at Côté des Neiges, near Montreal, Canada, Jan. 20, 1782; was educated at College of St. Raphael, and wrote much in defense of the nationality of Canada and for the conservation of the French language. He wrote the first French history of Canada since its British conquest. D. in Montreal, Aug. 3, 1857.

Bibb, George M.: b. in Virginia in 1772; graduated at Princeton in 1792; became a prominent lawyer of Kentucky: was several times chosen chief justice of that State, and once chancellor; was U. S. Senator (1811–14 and 1829–35); Secretary of the Treasury under Tyler. He published four volumes of Kentucky *Law Reports* (1815–17). D. in Georgetown, D. C., Apr. 14, 1859.

Bibb, William Wyatt, M. D.: b. in Virginia, Oct. 1, 1780; member of Congress from Georgia (1806–13); U. S. Senator (1813–14); Governor of Alabama Territory (1817–19); and first Governor of the State of Alabama (1819–20). D. near Fort Jackson, Ala., July 9, 1820.

Biber, bee'ber, George Edward, LL. D.: a clergyman of the Church of England; b. at Ludwigsburg, Würtemberg, Sept. 4, 1801, and educated at the University of Tübingen; formerly associated with Pestalozzi in educational enterprises; was author of several pedagogic works. He took an active part in Church controversies, publishing a number of volumes, the most important of which were *The Standard of Catholicity* (1840); *English Church on the Continent* (1846); *Sermons, Occasional and for Saints' Days* (1846); *The Seven Voices of the Spirit* (1857); *The Communion of the Faith Essential to the Celebration of the Holy Eucharist* (1863); *The Veracity and Divine Authority of the Pentateuch Vindicated* (1863); *The Supremacy Question* (1865); *On the Unity of the Church* (1871). This last work was an English version of a Latin correspondence with Dr. Michaelis, one of the leaders of the Old Catholic movement, previously published in the original. D. at his rectory of West Allington, near Grantham, Jan. 19, 1874. W. S. Perry.

Biberach, bee'ber-ăăk'h: a town of Würtemberg; in a charming valley, and on the river Riss; 23 miles by rail S. S. W. of Ulm (see map of German Empire, ref. 8–E). It has a Realschule, a beautiful church, built in 1110, manufactures of paper, linen goods, leather, etc. Pop. 8,263. The French general Moreau here defeated the Austrians under Latour in Oct., 1796, and the Austrian general Kray in 1800. In 1803 it was deprived of its imperial freedom, and it was transferred to Würtemberg in 1806. The poet Wieland was born near Biberach.

Biberich, bee'ber-ich, or **Biebrich**, bee'brich: a village of Prussia; province of Hesse-Nassau; on the right bank of the Rhine; 3 miles S. of Wiesbaden (see map of German Empire, ref. 6–D). It has a ducal residence which is said to be the finest palace on the Rhine. The river-scenery here visible is almost unrivaled. Pop., including Mosbach (1890), 11,023.

Bibiru: See Bebeeru.

Bible [from Fr. *bible* < Late Lat. *biblia*, fem. sing. < Class. Lat. *biblia*, neut. pl. = Gr. *τὰ βιβλία*, the books], popularly known also as the **Holy Bible** and **Holy Scriptures** in (Gr. *ἡ γραφή, αἱ γραφαί*; Lat. *Scriptura sacra*): a collection of ancient writings, from the age of Moses down to the death of the apostle John at the close of the first century, thus embracing fourteen centuries. It is divided into two parts, the Old and New Testaments; the first is regarded by the Jewish Church, and both are regarded by the Christian Church, as the inspired record of divine revelation. With respect to the more precise definition and character of the Bible, the views are diverse in the different Churches. The Greek and Roman Catholic Churches put ecclesiastical tradition, as determined by general councils and creeds, on a par with the Bible as a rule of faith and conduct, and claim the sole right of authoritative explanation. The Protestant Churches make the Bible the only and sufficient rule of faith, and give to tradition a subordinate place. They are generally agreed in regarding the Scriptures—1, as of divine authority; 2, as containing all knowledge necessary to salvation; 3, as the appropriate form of a divine revelation (as opposed to tradition or the inner light); 4, as the heritage of all Christians—i. e. it is the right and duty of all to read and become acquainted with the teachings of the Bible. As regards inspiration, opinions are divided between the theories of verbal or literal, plenary, and dynamic inspiration. The creeds and confessions of faith teach or imply the *fact* of inspiration, but do not define the *mode* and the *degrees*. The first theory was prevalent in the seventeenth century, but is now abandoned by the great majority of Protestant divines; the last is advocated by most German divines.

Old Testament.

The Old Testament was originally written in Hebrew (some portions in Aramaic), but of course the Hebrew manuscripts which we possess are separated by a long interval and many vicissitudes from the original handiwork of the authors. The oldest complete codex dates from the year 1009.

The History of the Hebrew text is briefly as follows: I. *First Period* (536–180 B. C.)—The Babylonian captivity (from 586, the chief deportation, to 536, the first return) forms an epoch in the history of the Jews. It is a gulf dividing the independent from the subject position of the nation. It was under the former that they had original and productive power and a living revelation. After the captivity, when the Jewish nation had been purified by adversity, they turned back to them with new interest. They were able to see that Isaiah and Jeremiah had been the only men of their times who had truly had "the mind of the Spirit." They desired to restore the ancient law, worship, and traditions. To this end the collection and preservation of the ancient writings, which served as the authority for, or bore witness to, the former observances, became an object of great interest and importance. With this movement, however, the nation entered on a new stage. Its work was not original and creative, but preservative and reconstructive.

In the work which now began Ezra had a prominent part. He is called a second Moses and the restorer of the law. He was the first "scribe," and raised the scribe above the priest. He collected and arranged the ancient writings, and so laid the foundation of the canon (see below, section on the *Canon*); and from this point the history of the written codex begins. The books were at this time written in the ancient Phœnician characters which appear on some ancient Phœnician inscriptions, on the Moabite Stone, on some coins of the Asmoneans, and in the Samaritan Pentateuch. The letters

had no variation of form or shape for capitals and small letters, and neither words, verses, nor chapters were marked off in any way. Some of the books which now appear separately were then united, and a few which are now found in the canon had not yet been written. The work, however, which was now to be done extended beyond the collection, arrangement, and preservation of the ancient Scriptures. The Hebrew language was already a dead language. The popular dialect was the Aramaic, and the Hebrew of Moses, David, and the prophets had become a sort of classical and sacred language, known only to the oldest and to the learned. It was an object of academical acquisition. It was therefore necessary to explain and translate or expound the writings. This task naturally devolved upon such as possessed the requisite knowledge, and they constituted an informal body for this purpose. So much is no doubt true, and it forms the historical basis of the rabbinical tradition about the "Great Synagogue" which was said to have done this work.

When this much is said of the commencement of this period, we have in fact told nearly all which is known about it. We can only infer, from what we know of its beginning and what we find at its close, that the following movements were in progress: 1. The college of interpreters, though not a formally or legally constituted body, and though their business was primarily literary or academical, were gaining in authority and dignity, and acquiring a certain official character from general consent. The "elders" came to have civil and judicial authority from the lack of others to fill these functions. Possibly the Sanhedrin was an outgrowth of this body. 2. The canon (see below) was being formed; the idea of *Holy* Scripture was being elaborated and formulated; the respect for the traditional writings, and the disposition to set them by themselves, were gaining ground; the doctrine of inspiration took its rise. At the close of this period the canon is formed and these doctrines are established dogmas. 3. The form of the letters was undergoing a change. At the period referred to, the square letters which are represented in our printed texts had become established in use.

II. *Second Period* (180 B. C. to 500 A. D.).—The "schools" begin with Simon the Just, in 180 B. C. These schools produced the Talmud (i. e. body of doctrine, from *lamad*, to teach), an immense work in a dozen folio volumes, containing a commentary on the Mishna, which is itself a "repetition" of the "Law." It was completed in the fifth century. The Talmudic scholars developed intense zeal for the text of the Scriptures—a zeal which, though frivolous and fanatical in many of its manifestations, has been of immense value to biblical scholarship. They spent unwearying labor in the establishment of the consonant text; they separated the words by spaces (but characteristically ordained just how great the space should be). They probably also introduced the verse-mark (:), and therefore the division into verses. The preservation of the text from corruption in copying was secured by counting the letters or by other devices, and by crabbed, rigid, and minute rules. This work exercised its legitimate influence on the characters of those who did it; it made them punctilious about trifles and negligent of "the weightier matters"; but it preserved the Old Testament text from corruption, and handed it down to us in a comparatively pure and trustworthy form. In their exegesis the Talmudists were generally guided by arbitrary rules, by dogmatic prepossessions, by a view of the Bible which made it a storehouse of occult wisdom, only to be unlocked by cabalistic and allegorical treatment. It is asserted by some who are well acquainted with the Talmud that it contains valuable geographical, ethnological, historical, and exegetical information for the elucidation of the Bible, but the commentaries of Jews and Christians alike fail to bear witness to the truth of the assertion.

The Targums.—One result of the zeal of the Jews for the original Hebrew was the publication of paraphrases in the Aramaic or popular dialect, which were called *Targumim* (from a root signifying to "interpret). They present the rabbinical and traditional interpretation of the Scriptures. Their origin is very obscure. See TARGUM.

III. *Third Period* (500–1488 A. D.).—The Talmud, having grown by the work of successive generations for three or four centuries, closed about the year 500—i. e. the last of the commentators whose sayings are included in it lived at that time. Then a new work began. The Jewish nation had long been broken up and dispersed. Christianity had grown into a powerful opponent. The latter fact had led the Jews to abandon the Septuagint Greek version of the Old Testament (see below, on the *Versions of the Old Testament*), and the former fact made it necessary to provide still further for the preservation of the Hebrew text. The pronunciation of a language written only with consonants must, of course, be very uncertain; that of the Hebrew had been preserved in the rabbinical schools by tradition. There seemed to be danger that it would now be lost if no means of recording it were devised. The Syriac language had shortly before been provided with points to designate the vowel sounds, and to make the written language a complete representation of the spoken. The chief seats of rabbinical learning at this period were Tiberias, in Galilee, and Sora, in the Euphrates valley, and the scholars are known as the Massoretes. The Massorah was a mass of notes, comments, emendations, and corrections of various kinds, which the Talmudists had adopted, committed to memory, and handed down by tradition, but which they had not ventured to mark in any way upon the pages of the sacred text. The Massoretes now undertook to do this. They marked in the text—1, the vowels, the shades of pronunciation of the consonants, and the diacritical points which distinguish two sounds expressed by one character; 2, the accents, which are partly marks of pronunciation, and partly serve the purpose of musical notes, marking the intonations of the chant; 3, the emendations and corrections which the Talmudists had adopted. These they mark on the margin by a peculiar device, which leaves the consonants as they were, but suggests those which should be read. Here, again, the superstitious reverence of the rabbis for the text served the purpose of a true biblical science, since their proposed amendments are still open to criticism and review. It is difficult to pass a summary judgment on their emendations, but perhaps in a majority of cases modern scholars retain the original reading and reject the Massorah.

The work of the Massoretes did not begin before the sixth century, and it was finished before 1109, the date of the oldest manuscript now known to exist. This manuscript presents the Massoretic text. The work certainly covered a long period, and was done by many different hands. It was not possible, even with the minute and stringent rules which were adopted, to prevent errors in copying, and our manuscripts, all of which belong to the period between 1106 and 1488, offer many variants. The Jews continued to use in the synagogues copies of the Scriptures containing only the consonant text.

IV. *After the art of printing* was invented some books of the Old Testament were printed separately. In 1488 the first edition of the whole Hebrew Bible was printed at Soncino. The second, based on the first, was published at Brescia in 1494. This was the one used by Luther. An independent text appeared in the Complutensian Polyglot, 1520. A collection of variants was made from 615 manuscripts by Kennicott, Oxford, 1780, and a better one by De Rossi, 1788. The Hebrew Bibles in use are scarcely more than reproductions of the two first printed editions. They possess some critical advantages, but generally the excellence of a subsequent edition over the former consists in typographical accuracy and neatness. A satisfactory critical edition, with a full account taken of the variants, is yet to be prepared. The best editions are those of Hahn, Theile, and especially Baer (with preface by Delitzsch, Leipzig, 1869, *sqq.*). The most complete collection of Massoretic material is by Ginsburg, *The Massorah, Compiled from MSS., Alphabetically and Lexically Arranged* (London, 1880–86, 4 vols.).

V. *The Old Testament in the Christian Church.*—The Church of the first and second centuries based the authority and truth of its doctrines on the Old Testament, just as it is used in the New Testament. The Church of the third and fourth centuries wavered between acquiescence in the authority ascribed to the Old Testament by our Lord and his apostles, and hatred and suspicion of all things Jewish. No Christians save converted Jews knew Hebrew, and of these very few were of the class who "knew the Law." The Septuagint Greek version (see below) was the form in which the Christians became acquainted with the Old Testament. The first Christian scholar who undertook to learn Hebrew was Origen (d. 254 A. D.). He prepared a *Hexapla*, containing the Hebrew and five versions, which unfortunately is lost, except some fragments. We possess, however, his commentaries, which show that he had borrowed from the rabbis, but especially from Philo of Alexandria, the allegorical and mystical methods of interpretation. He is counted

among the Fathers of the Eastern Church, and is the first biblical scholar of whom that Church can boast.

Jerome (d. 419 A. D.) endeavored to learn Hebrew of a Jew, and did learn as much as his teacher could or would teach him. His method of treating the Old Testament shows the influence of his teacher. Through him the rabbinical ideas of inspiration, etc., found their way into the Western Church. His translation of the Scriptures (see *Vulgate*, in the section below on the *Versions*) was regarded as a finality, and all interest in the original text died out. In 1311 Clement V. ordered that Hebrew should be studied at the universities, but no results followed. Nicholas de Lyra (1340) was, perhaps, a converted Jew. At all events, he knew Hebrew and used the Jewish commentators. His commentaries carried great authority among Christians, and influenced Luther so much that a popular saying arose: "If Lyra had not played the lyre, Luther would not have danced." (*Si Lyra non lyrasset, Lutherus non saltasset.*) But the father of Hebrew learning among Christians is Reuchlin (d. 1522), who wrote the first Hebrew grammar and dictionary, 1506 (on the basis of Kimchi). The Reformers returned with zeal to the study of the Hebrew. That pursuit participated in the general revival of learning, and in the most recent times it has been wonderfully advanced by the development of philological and historical science. It is probably not too much to say that the Hebrew language is more at the command of this generation than of any other since the Babylonian captivity.

It follows from the above—1. That the only text we can hope to establish on manuscript authority is that of the Massoretes, but it can be greatly improved from the Septuagint. 2. We have no manuscript, even of this text, older than 1009. We shall see below, under *Versions*, what means we have of learning what the text was at an earlier date. 3. The vowel-points, accents, word, verse, and chapter divisions are all many centuries more recent than the original writings. Even the consonant text has been transliterated. The chapter divisions were made in the thirteenth century, and applied to the Vulgate. In the sixteenth century it was asserted that the vowels, etc., were of later origin than the text. This assertion was considered heterodox, as it was inconsistent with the prevailing theory of inspiration. It is only in the most recent times that this fact has been admitted, and it is now undisputed. 4. The crude and superstitious theories of inspiration which have prevailed to some extent in the Christian Church are of rabbinical manufacture. They were introduced into the Christian Church first as attaching to the Old Testament, and then extended over both in their purest and most original form. See W. Robertson Smith, *The Old Testament in the Jewish Church* (London and New York, 1881; 2d ed. 1892), and especially Ludwig Diestel, *Geschichte des Alten Testaments in der Christlichen Kirche* (Jena, 1869).

VI. *The Canon and the Apocryphal Books.*—As we said above (A, I.), when the period of creation and production was ended, and the period of conservation and reflection and application began, one of the first ideas which was elaborated from the crude into the dogmatic form was that of the Scriptures in their sacred character and divine authority. Hence the terms Holy Scripture, Word of God, etc. When this doctrine was established, the necessity of defining and limiting its application at once made itself felt. What books come under this designation? What is the standard by which they must be tested in order to answer this question? It is certain that these questions never received any authoritative answer. Ezra made a collection of books, but he did not include those books which were not yet written. The Hebrew Bible as we now possess it is divided into three parts: 1, the Torah (i. e. Law—Pentateuch); 2, the Nebiim (Prophets, including Joshua, Judges, First and Second Samuel, and First and Second Kings); 3, the Chetubim ("Writings," "Hagiographa," including the poetical and all the other books in the English Version of the Old Testament). The addition of the third part can not be historically accounted for. The form of the collection, as a whole, bears witness to successive collections and successive gradations of authority. This gradation may be traced still further. Besides and beyond the Chetubim were a number of books which were on the line, not accepted and not definitely rejected. Still again, beyond these were others which were positively set aside. The translators of the Septuagint included in their collection a number which do not appear in the Hebrew collection (they form the Apocrypha of the English Bible). The Ethiopic version contains others which belong even to the class of the totally rejected. Thus one who knew only the Septuagint version would find the book of Exodus and the book of Tobit side by side, presented to him as of equal authority. Ethiopian Christianity would give the same authority to the book of Adam as to the book of Genesis. Thus it is certain that, when these versions were made, the strict definition of the books to which standard authority belonged was not yet established. Fürst has even shown from the Talmud (*Kanon des Alten Testament*, p. 25) that this idea of the canon was not so definitely established at the time of our Lord but that the rabbis ventured to propose to exclude the book of Ezekiel from the canon, on account of its contradiction to the Pentateuch. Here, then, we have the idea of the canon. It is the limited collection to which, and to which only, authority as the inspired word of God appertains. The works which were in circulation, and to which this authority was denied, were called *apocryphal*, from a Greek word meaning "to withdraw," because they were withdrawn from use for public instruction. The third class, the *pseudepigraphs*, were so called because many of them bore names which were forged. In 2 Maccabees ii. 13 we read: "The same things are narrated in the writings and memoirs of Nehemiah, and how he collected the books about the kings and prophets, and those of David, and the letters of the kings in regard to offerings." The Pentateuch had been restored to authority and use by Ezra in 444 B. C. (Nehemiah viii). Nehemiah added the "Nebiim," which are distinctly described in this passage ("kings and prophets"), and the Psalms, which are the nucleus of the Chetubim. The "letters" are those of the Persian kings, such as we find in the books of Ezra and Daniel. The subsequent omission of these letters from the canon bears witness to the soundness of the standard by which its formation was governed. The Massoretes were finally called upon to decide what books they would recognize as canonical, but in this, as in other things, they no doubt confined themselves to the establishment of the tradition which they had received. In the Christian Church the influence of the Septuagint secured the introduction of the Apocrypha with full canonical authority. Jerome translated all into the Latin Vulgate. They thus remain in authority in the Greek and Roman Churches. Luther adopted the Hebrew canon, but translated the apocryphal books, setting them by themselves, and giving them a heading which recommended them for edification, though not for dogmatic definition. The English translators followed the same policy. Of late, however, the Apocrypha have been omitted from the popular editions of the English Bible, because the presence in the volume of works which formed a grade between it and ordinary works seemed to detract from the supreme and isolated position of Holy Scripture.

The Apocrypha and Pseudepigrapha are both quoted in the New Testament. See Jude 9 (Translation of Moses); Jude 14 (Book of Enoch); 1 Corinthians ii. 9 (said by Origen to be from a lost apocryphal writing under the name of Elijah). Compare also James iv. 5, John vii. 38, and Luke xi. 40—citations which we can not identify with passages in any known book.

It appears from the above—1, That the canon was fixed only after long experience, and by the general consent of successive generations, who bore testimony, by their esteem and veneration for particular books, to their intrinsic authority and profitableness. 2, There is no broad and distinct line of demarkation between the canon and the Apocrypha. If we allow ourselves to form estimates of the comparative value of various books we shall find that the first book of Maccabees compares very favorably, as an edifying religious history, with the book of Esther, and that the book of Jesus the son of Sirach compares favorably with Ecclesiastes as a book of religious instruction. On the Jewish canon see the works of Fürst (1867); Samuel Davidson (1877); Wildeboer (1889); Buhl (1891); and H. E. Ryle (*The Canon of the Old Testament*, London, 1892).

VII. *The Order of the Books of the Old Testament.*—In the arrangement which has been adopted there appears to have been an effort to conform as far as possible to chronology, not only in regard to the historical, but also the legal and prophetic portions. The following are the principal divisions:

1. Law (in Hebrew, תורה, *Torah*; Gr. *νόμος*) or Pentateuch (Gr. *πεντάτευχος*), because it consisted of five parts.

2. Prophets (Heb. נביאים; Gr. *Προφῆται*).

3. Holy Writings or Hagiographa (Gr. *ἁγιόγραφα*), called in Heb. כתובים, *Chetubim*—i. e. the "writings," *par excellence*.

The Law included—1, Genesis or "origin"; 2, Exodus, or the "going out"; 3, Leviticus, or the book relating to the Levites; 4, Numbers, so called because Moses was commanded to "take the sum of all the congregation of the children of Israel" (Numbers i. 2); 5, Deuteronomy (from the Gr. δεύτερος, "second," and νόμος, "law"), because it was the second laying down (or the repetition) of the Law.

The Prophets were divided into the Former or Earlier (*Priores*), including Joshua, Judges, First and Second Samuel, First and Second Kings; and Later (*Posteriores*), comprising the greater prophets (except Daniel), viz., Isaiah, Jeremiah, and Ezekiel, and the twelve minor prophets, Hosea, Joel, Amos, etc.

The Holy Writings, or Hagiographa, included the Psalms, Proverbs, Job, The Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, First and Second Chronicles. For a more particular notice of the different books the reader is referred to their respective heads.

VIII. *Versions of the Old Testament.*—As we saw above, the oldest manuscript of the Hebrew Scriptures which we possess dates from 1009 A. D., and presents the Massoretic text. If we wish to go back of this to reach something nearer to the original work of the authors, and to eliminate errors which may have crept in, we have one means of doing so—viz., the ancient translations which were made from the text at a remote date.

1. The first and most important of these is the Greek version, called the *Septuagint* (LXX.).—Passing over the fables of the Jews and early Christians in regard to this version (such as that it was made on a set occasion by seventy-two men, six from a tribe, chosen by the high priest, and sent to Egypt for the purpose—that they each separately translated the whole, but that, by virtue of divine inspiration, the seventy-two translations were identical), we state only the best-assured facts in regard to it. The Pentateuch was translated by Alexandrian (not Palestinian) Jews, but by how many is unknown. It was a result of the enlightened interest of the Ptolemies (Lagus and Philadelphus) in all literary and scientific progress. It was made about 285 B. C. The work thus begun was carried on by various persons at various times until all the canonical and apocryphal books were translated. Some originally written in Greek were added. The parts vary in fidelity to the original and in literary excellence. Job and Isaiah are so poorly translated that one must know Hebrew to see the sense of the Greek; Ecclesiastes is faithfully and correctly rendered. At this time Greek was the language of popular intercourse. The Jews of the time of Christ neglected the Hebrew, and generally relied on the Septuagint version. It is the form in which the Old Testament is quoted by Mark, Luke, Peter, and, for the most part, by Paul. Matthew, John, and Paul show acquaintance with the Hebrew, but they also use the Septuagint. Its influence was at this time paramount. It passed into the Christian Church as the authoritative form of the Old Testament. It soon began to be asserted, however, by the Jews, when the Septuagint was quoted in controversy by the Christians, that it was not a faithful rendering of the original. Hence the Jews abandoned it and returned to the Hebrew, and the most scholarly of the Christians attempted to acquire that language. Nevertheless, the Septuagint remains the authority of the Greek Church to this day. Other Greek versions which need only be mentioned are those of Aquila, Theodotion, and Symmachus. The best editions of the Septuagint are by Tischendorf, Lagarde, and Swete; but a thoroughly critical edition with textual apparatus is still a desideratum.

2. *The Peshito* is a Syriac version, whose name signifies "simple" or "faithful," because it is a literal translation, not a paraphrase. It includes the New Testament. Its origin is obscure. It was in use in the time of Ephraim Syrus (378 A. D.).

3. *The Vulgate.*—Augustine says (*De Doctr. Chris.*, ii. 11), in regard to the early Latin versions, that "in the first days of the faith, if any one obtained a copy of the Greek Scriptures, and gave himself credit for any knowledge of the two languages, he ventured to translate." He recommends only one of the versions existing at the time—viz., the Itala. This is now lost, except in fragments as quoted by the earlier Latin fathers, but seems to have been made from the Septuagint. Jerome (d. 419) undertook to learn Hebrew, in order to make a new translation from the original. History repeats itself with regard to all new translations of the Bible. This one was made avowedly in order to meet the wants of the common people, and it was called the "Vulgate" because written in the popular Latin. It was met by the most violent opposition, by all the arguments of tradition and prescription, and by all the considerations of policy and expediency, which suggest themselves in such a case. It was finally adopted, and now it has itself become sacred in the Latin Church. The Council of Trent (1546) put it on a par with the original. The text of the Vulgate became so corrupt by repeated copyings that, on the invention of printing, the true text seemed lost in a chaos of variants. An attempt to revise it resulted in an arbitrary decree of Sixtus V. (1598) deciding what it should be, and this text is now the "received text" in the Roman Church. A text having critical and scientific authority is still a desideratum.

New Testament.

With the advent of our Lord the fountain of divine revelation once more began to flow. Mankind once more received an original and creative revelation, not whimsical traditions or weary reflections on the record of past thought and life. The Greek language, which, as we saw above, was at this time the medium of popular and literary intercourse, became the vehicle of the new revelation. The Gospel of Matthew was probably originally written in Aramaic, but the remainder of the New Testament was certainly Greek from the very hands of the authors.

I. *History of the Greek Text.*—The original handiwork of the writers soon perished. We have no record or tradition of the original manuscripts, and no tradition to bear witness to any care for them. Copies were made from them, and by the middle of the second century the interest in them had become so great as to lead to extensive multiplication of copies. The oldest manuscripts which we possess date from the fourth century. (See articles Codex Bezæ, Codex Sinaiticus, etc.) From that time on the number of manuscripts which we possess increases as we come down, but as the copies increase in number so also do the variants. When printing was invented one of the first uses to which it was put was the printing of the Greek Testament. This art gave ground to hope that the text-copies might be multiplied for the future without the errors inseparable from manual copying. The first printed text was contained in the Complutensian Polyglot, prepared under the patronage of Cardinal Ximenes, at Alcalá (the ancient Complutum), in Spain, in 1514, but not published till 1520. It is not known what manuscript served as copy for this edition. Erasmus prepared a very faulty text, published at Basel in 1516. These two editions from late manuscripts taken at hazard served as the basis of succeeding ones (Stephanus, 1546; Beza, 1565; Elzevir, 1624, 1633). The last of these (chiefly on account of its convenience of form and typographical beauty) became the "received text." The doubt between various authorities was settled in this case, as in so many others, not by thoroughly investigating the matter, but by giving arbitrary sanction to one. The Elzevir remained supreme until the time of Griesbach (1812). Here again we come to a department in which the credit for what has been done belongs chiefly to German scholars. Griesbach, and after him Lachmann (1854), and Tischendorf have prosecuted the tedious labor of comparing the variants and weighing the authorities. They were followed in England by Tregelles, Scrivener, Westcott and Hort. The effort can not be defined as one to re-establish the text of the apostles, for that may be pronounced hopeless, but to recover the text to which the oldest and best manuscripts bear witness. The scholars mentioned form a succession in which this aim has been prosecuted with intelligence, zeal, and consistency. The best attainable text is presented by Tischendorf's eighth critical edition (with apparatus and the *Prolegomena* of Gregory), and by Westcott and Hort (the Harper ed., with introduction by Schaff, 1881; third revision 1892).

The dialect of Greek in which the New Testament is written is what is called the Hellenistic. It was based upon the Attic dialect, and was spoken by the Jews with a strong infusion of a Hebrew spirit and Hebrew modes of speech. Hence the Hebraistic character of the Septuagint and the Greek Testament. Though differing from classical Greek in grammatical purity and accuracy, this dialect was best adapted to express the ideas of the Christian revelation to the primitive Christians, and has an undying beauty and force of its own.

The order of the books in the Greek differs from that in the English version, in that the catholic Epistles follow the Acts.

II. *Respecting the Separate Books of the New Testament.*—The following account includes such facts as can be relied on, omitting questions involved in controversy.

The Gospels.—We possess a fourfold record of the life and teachings of our Lord. It strikes the attention of the reader at once that the first three contain many passages which are almost identical. On the other hand, each differs from each in a manner equally remarkable. From the earliest times efforts have been made, without much success, to harmonize them into one consistent narrative. Within a century these phenomena have again been examined with great zeal. The question is raised: Do not these resemblances point to an interdependence between the synoptical Gospels? If so, which is the original? If one served as the original, how is it that the authors of the others, in using it, failed to transfer passages of high interest? In fact, the phenomena of identity and difference are so perplexing that these questions seem unsolvable. The prevailing opinion of scholars at the present time appears to be that the Gospel of Mark presents the nearest approach to the original of the synoptical Gospels; that Matthew was originally written in Aramaic. That Luke is a subsequent compilation of the gospel-material is certain. It was written before the year 70 or 80. Before the historic interest in the Gospels arose, and before the movement toward a New Testament canon began, the Gospels no doubt exerted great influence on each other.

The Gospel of John is clearly independent of the others in its material, scope, and purpose. It takes up the life of our Lord not so much pragmatically as philosophically and mystically—in its religious rather than its historical aspect. It has been vigorously attacked by the negative and rationalistic school of critics (especially by Baur and his followers), and is held by them to be the product of an anonymous Christian Plato after the middle of the second century. These opinions, however, rest chiefly on philosophical and historical dogmas which are set up as postulates; and one who refuses to admit the necessary *a priori* truth of these postulates finds that the true critical grounds on which this opinion rests are meager and insufficient. The recent discoveries of Tatian's *Diatessaron* (1888) and of a fragment of the Gnostic Gospel of Peter (1892) prove the existence and use of John's Gospel before the middle of the second century. Conservative scholars of every grade (Meyer, Lange, Weiss, Beyschlag, Godet, Lightfoot, Westcott, Salmon, Sanday, Gloag, and many others) admit the authenticity of the book. One of the ablest defenses is Ezra Abbot's *Authorship of the Fourth Gospel* (1880, republished in his *Critical Essays*, Boston, 1888).

III. *The Canon.*—The first century of the Christian era produced a large number of literary works beyond those contained in the New Testament. The idea of the canon therefore came to be applied here once more (see above, *Canon of the Old Testament*). Such of these works as were of genuine apostolic origin, or were faithful representatives of Christian truth, must be separated and recognized apart from all others. Here once more the same phenomenon appeared as in the Old Testament. There was no distinct dividing line to be drawn. The division did not make or suggest itself. The whole body of works might be graded from the Gospel of Matthew down to the most gross and contemptible product of superstition, but the stages were gradual all the way. Different persons differed in their comparative estimate of a few (e. g. the Epistle of Barnabas and the Epistle of Jude, the Shephard of Hermas and the Epistle to the Hebrews), though they agreed in the general range of estimate. Down to the middle of the second century the Christians used the Old Testament for their apologetics and their polemics. Moreover, the tradition was still so fresh that literary authority was not needed. We do not find in any writers earlier than Irenæus (d. 202) references to the New Testament writings as authoritative, or as inspired in any such sense as the Old Testament was believed to be inspired. From this time on the chief interest of the Christian Church is rapidly transferred to the New Testament. The books are collected and studied and compared. Their respective authority is determined. The informal verdict of the Church accepted certain books and rejected others, but there were a number which were on the line or in doubt. These were the Epistle of Jude, the Second of Peter, Second and Third of John, the Epistle to the Hebrews, the Shepherd of Hermas, and the Epistle of Barnabas. In the third century considerable disfavor to the book of Revelation was manifested in the Western Church, though earlier it had been very popular. To go into details of various authorities would lead us too far. Eusebius (d. 340 A. D.) bears witness that the matter stood, in his time, in just about the position above described. Not only the above-mentioned doubtful books, but others also which had become familiar and gained a footing in popular affection, were retained, as the Apocrypha is still sometimes retained in our Bibles. The Synod of Laodicea (360) made the first official list (omitting the Apocalypse), and forbade the public reading of uncanonical books. The Councils of Hippo (393) and Carthage (397) under the influence of St. Augustine fixed the canon as it now stands and is accepted by all the Churches. On the canon of the New Testament, see the works of Reuss, Westcott (6th ed. 1889), and Zahn (1890).

Literature.—The literature on the Bible is immense. On the general questions discussed in this article, see the historico-critical introductions to the *Old Testament* by De Wette (8th ed. by Schrader, 1869); Bleek (revised by Wellhausen, 5th ed. 1885); Reuss (2d ed. 1890); Keil (3d ed. 1873); Riehm (1869); Reusch (1875); Kuenen (Dutch, 1885); Cornill (2d ed. 1892); Wright (2d ed. 1892); and Driver (3d ed. 1892). On the *New Testament*, Hug (Rom. Cath., 1820); De Wette (8th ed. by Schrader, 1869); Bleek (4th ed. by Mangold, 1860); Reuss (6th ed. 1887; Eng. trans. 1884); and Salmon (7th ed. 1894); and especially Weiss (2d ed. 1889; Eng. trans. 1888) and Holtzmann (3d ed. 1892). The last two represent the latest state of New Testament criticism—Weiss on the conservative, Holtzmann on the other side. Prof. F. Godet, of Neuchâtel, issued in French an *Introduction to the New Testament* (1893, *seq.*, 3 vols.; Eng. trans. 1894, *seq.*). See also Schaff, *Companion to the Greek Testament and the English Version and Revision* (New York, 4th rev. ed. 1892), and the articles Hexateuch and Higher Criticism.

Revised by Philip Schaff.

Modern Versions of the Bible.

English.—The earliest known version in a Teutonic language is the Mœso-Gothic of Ulphilas, made from the Greek in the fourth century; extant portions are the Gospels and various fragments. The English have a better right than the Germans, the Dutch a better right than either, to claim this as the first version in their language. The early English or Anglo-Saxon versions are from the Vulgate, the earliest extant being the paraphrase of Cædmon. The earliest recorded translators are Aldhelm and Guthlac, each of whom made a version of the Psalms, probably now lost; Bede, who translated the Gospel of John, and King Alfred, who prefixed to his laws an abridged translation of the Ten Commandments, and is said to have been engaged on the Psalter at the time of his death. In the tenth century or a little later a large number of books were translated, the Gospels apparently in three distinct versions. In the ages following the Norman Conquest considerable portions were translated into Norman French. The most memorable and conspicuous is the version completed by John de Wycliffe in 1382, with the subsequent aid and revision of several others. Many manuscripts remain exhibiting great variations. It was not printed till 1850, when an edition was published at Oxford presenting two texts in parallel columns with variants from some sixty manuscripts. The first English translation from the Greek and the basis of all subsequent ones was the New Testament of William Tyndale (martyred in 1536). This was printed in 1526 at Cologne. The books were burned at Oxford and London, and six editions were dispersed before 1530. In 1535 the first complete English Bible, by Miles Coverdale, was printed, probably at Antwerp. Next followed *Matthew's Bible* (Thomas Matthew a pseudonym for John Rogers); then in 1539 Richard Taverner's *The Great Bible*, so called from its size, was revised mainly by Coverdale from preceding versions, sometimes called *Cranmer's Bible*, and sometimes *The Chained Bible*, because chained in churches for public reading. The *Genevan Bible*, the sweetest of all English versions, was produced at Geneva by the exiles sent over by "Bloody Mary" in 1557. Its expense was defrayed by John Bodley, father of the founder of the Bodleian Library. It was the most popular Bible till superseded by the authorized version, and was that brought to America by the Pilgrim Fathers; sometimes called the *Breeches Bible* because of the rendering of Genesis iii. 7, which says that Adam and Eve "sewed figge-tree leaves together, and made themselves breeches." This rendering, however, occurs in several earlier versions. The *Bishops' Bible*, under Queen Elizabeth's license, was printed in 1568, favored and in part made by the bishops. Some editions of it are called the *Treacle Bible*, reading "treacle" for "balm" in

Jeremiah viii. 22. Another name, *The Bug Bible*, from Psalm xci. 5, belongs to several versions. The *Douay Bible* (1609) was translated by the Roman Catholics from the Vulgate, and owes much to Tyndale and other versions, often called the *Rosin Bible*, from Jeremiah viii. 22. In 1611 the *Authorized Version*, or King James's, appeared, prepared by various companies under the king's instructions, in two editions, better known as the "He" and "She" Bibles from the different renderings in Ruth iii. 15. Various editions have been termed *The Vinegar Bible* from the misprint vinegar for vineyard in the page-heading at Luke xx.; the *Wicked Bible*, which omitted the *not* in the Seventh Commandment. Since the issue of the authorized version a large number of versions have been printed, among which the most notable are *The Revised Version of the New Testament*, published in 1881, the whole Bible in 1885 (see BIBLE REVISION below), and the Baptists' versions, using the word *immersed* instead of *baptized*. Among other versions used in Great Britain may be mentioned the Welsh, dating back to 1527, the standard version being completed in 1604. It was the demand for this Bible that occasioned the institution of the British and Foreign Bible Society in 1804. The Gaelic version for the Highlanders of Scotland dates back to 1767; a Roman Catholic translation in 1796. The first New Testament in Erse was early in the fourteenth century; a number of later versions have been published. A Manx version was published in the latter part of the eighteenth century.

French.—There have been a great number of French versions, all (Protestant as well as Roman Catholic) based on one made from the Vulgate by Jacob Faber Stapulensis, at Antwerp, 1512–30. The most important versions are Olivetan's, of which the most prominent edition was called the *Geneva Bible*; Martin's version and Osterwald's revision. Of Roman Catholic versions the most important are De Sacy's, Orsini's, and Lassere's. The last, published in 1887, under the authority of the Archbishop of Paris, has reached more than twenty editions. These are all in the standard French; other versions are in the Vaudois, Provençal, and Mauritius dialects. Akin also to the French are the Breton and Basque versions, the last in three forms—French, Spanish, and Guipúzcoan. The Flemish version used in Belgium dates back to the year 1477. Later revisions and editions have been published at Louvain, Cologne, and The Hague.

Dutch.—The first complete edition of the Scriptures in Dutch was published in 1526. Lutherans of Holland still use a translation according to Luther's version, published in 1648. Others have followed, including a revised edition circulated at the present time.

German.—In Germany, after the version of Ulphilas, there were a large number of glosses and translations of single books. The earliest translation of the whole Bible was probably about the beginning of the fifteenth century, and early in the sixteenth century fourteen different editions had been published. These were all replaced by Luther's version, 1522–32, which has remained the standard until the present day, a revision of it having been completed in 1892.

Other European Versions.—Akin to the German also are Danish, Icelandic, and Swedish versions. There is also a Gospel of Matthew in Finnish. The Wends have the Scriptures in the Upper, Lower, and Hungarian dialects, and in Eastern Switzerland there are three versions of the Romansch Scriptures, the Upper and Lower Engadine and the Oberland. In Eastern Europe there are numerous Slav versions based entirely upon the Slavonic version of Cyril's translation, the most ancient manuscript of which is the Ostromirov's Gospel, written in 1053 for a Russian prince. The various dialects in which these have been supplied are the Czech or Bohemian, dating to the latter part of the fifteenth century; the Slovak, Servian, Croat, Slovenian, Ruthenian, Russian, and Bulgarian. The present Russian versions are one completed early in the present century under the auspices of the Holy Synod, and one prepared by the British and Foreign Bible Society, completed in 1876. The best of Slavonic versions is the Bulgarian, prepared by Dr. E. Riggs, missionary of the American Board in Constantinople, Turkey. The Magyars, or Hungarians, and the Roumanians each have versions in their own language, as have also the Lithuanians, Letts, and other members of the Finnish race, one of the most prominent being the Esthonian, recently prepared by the American Bible Society. There are also versions in Albanian. Versions of the Bible in the modern Greek or Romaic date back to 1638. Several revisions have followed, the latest having been completed early in the nineteenth century.

In Southern and Southwestern Europe there are versions in Italian, Spanish, Portuguese, and Gitano. That in Italian dates from 1471. The most important translation was that of Diodati, published at Geneva in 1607, and which has been the basis of all subsequent revisions. The Spanish versions also date from the middle of the fifteenth century, in the Castilian and Lemosinian dialects; the most important versions are those of De Reyna, Valera, and Scio. There have been revisions, especially with reference to use in Spanish America, and one is now (1893) being completed under the auspices of the American Bible Society.

Asia.—In Western Asia the three most important versions for Moslems are the Arabic, Persian, and Turkish. The earliest Arabic version was made by John, Bishop of Seville, in 750; then followed that of Rabbi Saadia and others. The most important was that begun in Beyrout by Dr. Eli Smith, of the American Board, in 1837, and completed by Dr. C. V. A. Van Dyck in 1864; published by the American Bible Society, and circulated wherever the Arabic language is known in Asia or Africa. There is another version prepared by the French Roman Catholic priests, published in Beyrout, and said to be excellent. The earliest Persian version known was published in Constantinople for Persian Jews, early in the sixteenth century. Different translations have been made, one of the New Testament by Henry Martyn, and of the Old Testament by Archdeacon Robinson and the Rev. W. Glen. A revision of Henry Martyn's version, under the auspices of the Church Missionary Society and the American Presbyterian Board, has been made. There are a large number of Turkish versions in dialects used in Russia, Siberia, and Central and Western Asia. In Osmanli Turkish, spoken by the Turks of the Ottoman empire, there were two translations about the middle of the seventeenth century, by Seaman and Ali Bey respectively. The latter was revised early in the present century by Mr. Redhouse, the Turkish scholar and lexicographer. A practically new translation has been prepared by the missionaries under the auspices of the British and American Bible Societies. The work was begun by the Rev. Dr. W. G. Schauffler, and completed by a committee. There are also editions in the Armenian character, called Armeno-Turkish, and in the Greek character called Græco-Turkish or Caramanlija, from the province of Asiatic Turkey where it is chiefly used. A complete translation into Azerbaijan-Turkish, the dialect used in the Caucasus and Northern Persia, has also been prepared. The Armenians use an ancient version prepared by Mesrop in the fifth century. Various editions of this have been issued, and a revision is now (1893) in preparation under the auspices of the American Bible Society. The first edition in the modern language was published in Paris in 1825; another edition by Dr. E. Riggs, at Constantinople in 1845, subsequently revised by him. Portions have been translated into the Kurdish, used by the mountaineers between Turkey and Persia. A Georgian version dates from the eighth century. It was revised in the eighteenth century, and is now printed in the common character by the Moscow and the British Bible Societies. The Nestorians and Syrians of Mesopotamia still use the ancient Peshito in their churches. A modern Syriac version was prepared by Dr. Justin Perkins, revised later by the Rev. Dr. Benjamin Labaree.

In British India the Bible has been translated in whole or in part into almost all the languages and dialects of the empire, the impulse toward translation being chiefly given by the labors of Carey at the beginning of the nineteenth century at the Danish settlement of Serampore. His early editions have been largely set aside by subsequent revision and translation. Only a few of the more important can be noticed. A Sanskrit version was published at Serampore in 1818, an improved translation in 1873. It is in three forms—Bengali, Devanagari, and Uriya. There are versions in Punjabi, or Sikh, and some of the associated dialects. The Hindi Scriptures include the Standard—those in the Hindi language—prepared originally by Carey and subsequently revised in 1883 by a large committee. Allied to this are the versions in the Hindustani or Urdu, originally by Schultze. There are also several other dialects allied to the Hindi-Bengali. A version in the Standard was prepared by Dr. Carey, subsequently revised, and now (1893) in the hands of a revision committee. The Mussulman-Bengali version was begun in 1855, but not completed for several years. There are important versions also in Marathi, Gujarathi, Sindhi, Telugu, Tamil, Santal, and a large number of other dialects. For the Burmans there are versions in the Burman and Karen languages, prepared by the Baptist missionaries. The

Karen versions are in four forms—Bghai, Sgau, Pwo, and Paku. There are also versions in Siamese, Lao, Shan, and Annamese, all prepared by the missionaries. In Ceylon there are the Sinhalese and Pali versions. In the Indian Archipelago there are versions in the various Malayan dialects—the standard and low Malay, the Batta, Java, Sunda, and other dialects. There are also two versions for the Dyaks.

No translations of the Scriptures have required more scholarship or been a more eloquent tribute to the work of missions than those for the Chinese. While portions seem to have been translated by the earlier Roman Catholic missionaries, all of those now existing belong to the nineteenth century. The classical versions are Dr. Marshman's, 1806–22, published at Serampore; Morrison's and Milne's, 1807–23, published at Malacca; the Delegates' version, by a committee of delegates from the several missions in China, and published at Shanghai in 1852. Unfortunately unanimity in regard to the terms for *God* and *Spirit* could not be secured; soon after the completion of the Delegates' version, what is known as the Bridgman-Culbertson version was begun by the Rev. E. C. Bridgman and M. S. Culbertson and others, and completed in 1863. These different versions are in what is called Wên-li, or the "book-style," and can be understood only by persons of fair education. A version of the New Testament in "Easy Wên-li" has been prepared for the National Bible Society of Scotland by Dr. Griffith John, of Hankow, and now committees have been appointed to select three corps of revisers to make a standard version for China (1) in the Wên-li or ordinary book-style, (2) in Easy Wên-li, a simplified book-style, and (3) in the Mandarin colloquial, the every-day speech of three-fourths of the people of China proper. These versions are to take the place of all existing versions that are not mere dialectal versions, of which there are many both in the Chinese characters and in Roman letters. There are also two Mandarin versions of the New Testament, one by Dr. Medhurst, called the Nanking or Southern Mandarin, and another by the late Bishop Schereschewsky, called the Pekingese or Northern version. There is also a Manchu version, and in Central Asia there are several Mongol versions—the Literary, prepared by the missionaries of the London Missionary Society; the Northern or Buriat; the Southern or Kalkhas; and the Western or Kalmuk. The only complete and usable Japanese version is that prepared by a committee of missionaries, chiefly from the U. S., completed in 1888, the expense being shared by the American Bible Society, the British and Foreign Bible Society, and the National Bible Society of Scotland. Dr. Bettelheim, a missionary who had settled in the Loo Choo islands, had previously prepared a Japanese version of the Gospels and Acts of the Apostles, which was printed at Vienna, but it proved to be of little value.

In the Pacific, translations of the Scriptures have been made for most of the islands—Polynesia, Melanesia, and Micronesia—by the missionaries of Great Britain and the U. S. Among the most prominent are the Hawaiian, Samoan, Tahiti, Tonga, Maori, Aneityum, Tanna, Eromanga, the Gilbert islands, the Ruk, and many others.

Africa.—In Africa the Arabic versions of the Scriptures are very largely used. The Copts of Egypt have their ancient version used in their churches, made probably in the second or third century. The Abyssinians use the Amharic. A "Jesuit" version is spoken of in the seventeenth century, but the one in use now was published early in the present century by the British and Foreign Bible Society, revised by Dr. Krapf. There are also versions in Tigre, Bogos, and Falasha-Kara, and the Galla. The latter is in three forms. Portions have also been prepared in a number of Central African dialects. In the South there are the Zulu, Kaffir, Tonga, Hottentot, and other dialects, all prepared by missionaries, many of them requiring the reduction of the language to written characters. The same is true of the dialects of Western Africa. Among the more important are the Congo, Yoruba, and Benga. While there is no completely accurate list, there are certainly sixty versions in these African dialects, and the number is being increased every year.

America.—On this continent the work of translating the Scriptures and of providing the Bible for the Indian tribes began with the labors of Eliot, "the Apostle to the Indians," and has been carried on by various missionaries engaged in the work. Twenty-six different versions are in use in the U. S. and Canada, and eleven in South America, all produced by the missionaries, and published by the Bible societies of Great Britain and the U. S. There are also three versions for the Esquimaux of Greenland, Labrador, and Hudson's Bay, the first having been prepared originally by Hans Egede at the beginning of the eighteenth century, since revised and published by both the Danish and the British Bible Societies. E. M. Bliss.

Bible Christians, or **Bryanites**: a Christian sect, followers of William O'Bryan, of Cornwall, England, a Wesleyan local preacher, who on account of his being a married man could not be received as an itinerant minister among them, and seceded about 1815. The first society formed was in a farm-house in Shebbear, Devon, when twenty-two gave in their names; these all had hitherto been constant attendants at the parish church. The first conference was held at Baddash, Launceston, Cornwall, Aug. 17–26, 1819, and was attended by twelve preachers. Their doctrines are identical with those of the Wesleyan body; their government and methods are similar to those of the Primitive Methodists, and, like them, they license women to preach. They had in Great Britain in 1891, 180 ministers, 1,463 lay preachers, 584 chapels, and 27,121 communicants; besides scores of churches and thousands of members in Australia, Canada, Prince Edward Island, and in Ohio and Wisconsin.

Bible Communists, or **Perfectionists**: See Oneida Community.

Bible Revision: such changes in any version of the Bible as may be called for by changes in the language of the version itself, or by the advance of scholarship. The greatest modern revision of the English Bible was inaugurated on May 6, 1870, when the Convocation of Canterbury appointed a committee of eminent biblical scholars and dignitaries of the Church of England to revise the Authorized English Version of 1611, and to associate with them representative biblical scholars of other Christian denominations using that version. This committee was divided into two companies—one for the Old Testament and one for the New—which held regular meetings in the Jerusalem Chamber in the deanery of Westminster, London. On the invitation of the British committee, a committee of U. S. scholars and divines was organized in 1871, and began active work in Oct., 1872. This was likewise selected from different denominations, and divided into two companies, which met once a month for several days in their own rooms in the Bible House at New York. Virtually, these two committees formed one organization, with the same principles and objects, and were in constant correspondence with each other. The intention was not to furnish a new version, but simply to adapt King James's version to the present state of the English language, without changing the idiom and vocabulary, and to the present standard of biblical scholarship, which, since 1611, has made very great advances in textual criticism, in Greek and Hebrew philology, in biblical geography, and in archæology. The two committees consisted of 79 members—52 in Great Britain, and 27 in the U. S. The first result of their labor, the revised New Testament, was published in 1881. The revised Old Testament was published in 1885. See Bible and Revised Version.

Revised by R. Lilley.

Bible Societies: societies for the dissemination of the Holy Scriptures. While the sixteenth century is distinguished for the labor spent upon numerous translations of the Holy Scriptures into the languages of Christian nations, the nineteenth is no less memorable for the multiplication of Bible societies as a means of securing the widest diffusion of the Bible, not only in civilized lands and among Christian communities, but throughout the world. Priority of date belongs to the Canstein Bible Institute in the Orphans' Home in Halle, which was founded in 1710 by Karl Hildebrand, Marquis of Canstein, for the purpose of putting the Word of God into the hands of the poor at a low price. Before the death in 1719 of the founder, 40,000 Bibles and 100,000 Testaments had been printed. During the first century of its existence more than 3,000,000 copies of the Scriptures, in different languages, had been distributed, and its total circulation up to the year 1879 was reported to be 6,100,000. The British and Foreign Bible Society was established in London, Mar. 7, 1804. Previous to that time eight societies in Great Britain had been engaged in publishing or distributing Bibles, though only three, the Naval and Military Bible Society (1780), the Dublin Association (1792), and the French Bible Society (1792), had made this their principal work, and these, it is believed, did not long survive. The great destitution which was found to prevail in the princi-

pality of Wales in 1802, and the utter inability of existing societies to supply the demand for Bibles, led to the organization of the British and Foreign Bible Society, with the sole object of encouraging a wider dispersion of the Scriptures, first in the British dominions, and then, according to its ability, in other countries, Christian, Mohammedan, and pagan. Three hundred persons of different religious denominations united in organizing it, and £700 were at once subscribed. Its entire receipts the first year fell a little short of £5,600.

The American Bible Society was founded in the city of New York, May 11, 1816, with the sole object, as announced in its constitution, of encouraging "a wider circulation of the Holy Scriptures without note or comment." This society had, however, been preceded by fifty or sixty others, which had come into being at one point and another in the U. S. after the organization of the British and Foreign Bible Society. The first of these was founded at Philadelphia in 1808; the second at Hartford, Conn., in 1809. Next came the Massachusetts Bible Society, at Boston, the New York Bible Society, and the New Jersey Bible Society, at Princeton. Such local societies accomplished much good within their own bounds; but, having no bond of union, their operations lacked efficiency and economy, and it soon became apparent that a combination of effort was essential for thorough work. Thirty-five local organizations sent delegates to the convention which founded the American Bible Society, and eighty-four became auxiliary to it during the first year of its existence. Among the delegates were representative men of the leading denominations—Baptist, Congregational, Reformed Dutch, Methodist Episcopal, Protestant Episcopal, Presbyterian, and the Society of Friends; but, every sectarian jealousy and party prejudice being laid aside, all united with perfect harmony and cordiality in the single object of "disseminating the Scriptures in the received versions where they exist, and in the most faithful where they may be required." The announcement of this organization brought from the British and Foreign Bible Society the expression of their warmest congratulations, and the offer of a gift of £500. At an early date Bible societies were formed on the Continent of Europe, as at Basel (1804) and Berlin and Ratisbon (1805), and nearly fifty others, chiefly in the north of Europe, before 1816. At that time, also, two had been established in Africa, five in Asia, and others in Nova Scotia, Canada, and the West Indies. About seventy principal societies may be named as having been actually engaged in the manufacture and publication of Bibles. Auxiliary and branch Bible societies and associations have been very extensively formed, with a view of enlisting local sympathies, collecting funds from churches and individuals, maintaining depositories, and looking after the circulation of the Scriptures among the needy. The American Bible Society has more than 2,000 auxiliary societies, and with them are connected nearly 5,000 branches. Such societies are expected to supply the wants of their field from their own resources, if possible, though receiving aid from the national society when necessary, and paying over their surplus funds annually into its treasury. The British and Foreign Bible Society has also not far from 1,200 auxiliaries and branches, as well as 3,134 Bible associations, in the management of which women have a principal part. Besides these home institutions it has many colonial auxiliaries, and also foreign agencies superintending its depositories of Bibles in the chief cities of Europe. Not far from 16,000 smaller organizations are thus connected with the two principal Bible societies of the world; and when it is remembered that many of the continental societies also have adopted the auxiliary system, it is very clear that this multiplication of associations for the distribution of the Scriptures is one of the phenomena of the age.

The National Bible Society of Scotland, the third in importance, was formed in 1861 by the union of Edinburgh Bible Society with the leading Scottish societies of the time. It has issued nearly ten million copies or portions of the Bible.

The American and Foreign Bible Society was founded in New York in 1836 by representatives of the Baptist denomination, owing to the refusal of the American Bible Society to apply its funds to print and circulate versions of the New Testament made by American Baptist missionaries, in which *βαπτίζειν* and its cognate terms were literally translated, not transferred. The American and Foreign Bible Society, thus inaugurated, instructed its translators "to endeavor to ascertain the exact meaning of the original text, to express that meaning as literally as the nature of the languages into which they should translate the Bible would permit, and to transfer no words which were capable of being literally translated." Some of the members of this society were earnest advocates of the publication of a new version of the English Scriptures on the same principle as that which governed its translations into foreign tongues; and on its refusal to authorize such a revision the American Bible Union was formed (1850)—a society which has published a revised version of the New Testament, Psalms, Job, Genesis, and other portions of the Old Testament in conformity with the principle indicated—translating *βαπτίζειν* by "to immerse," etc. Although some of the most eminent scholars among the Baptists have been employed on the versions of this society, it has never received the support of the great body of American Baptists.

In general, several characteristics of Bible societies are to be noted. They are voluntary associations, being neither close corporations nor under ecclesiastical direction, and the privileges of membership are secured by the payment of money. They are unsectarian, inviting all men to common efforts on the simple basis of the Scriptures of the Old and New Testament without note or comment. They are Protestant organizations, however, because the rules of the Roman Catholic Church are opposed to the free circulation of the Scriptures without admixture of comment. They are strictly benevolent societies, publishing not for profit, but at prices as low as possible, and making large grants, as their receipts may allow, for the supply of the destitute. Their work is exceedingly helpful to Sunday-schools and to various forms of missionary effort at home and abroad; and their influence has been most happy in promoting Christian union, and presenting a form of religious activity in which all denominations might participate without the sacrifice of principle.

The work of Bible societies has constantly encountered difficulties of one sort and another. The circulation of the Bible in all lands creates a demand for new versions, the preparation of which involves many nice points, while the revision of existing versions can hardly fail to occasion complaint. Even the determination of the canon of the Scripture is not universally agreed on. The most violent controversy in the British and Foreign Bible Society turned upon the question whether the Apocrypha should be published and circulated. The controversy continued for years; and when in 1826 it was finally decided to withhold all aid from associations circulating the uncanonical books, fifty auxiliaries on the Continent withdrew from the parent society. The Edinburgh society, which had earnestly opposed the circulation of the Apocrypha, also withdrew and stood aloof. The proposal to combine men of different persuasions in Bible effort, and to circulate the Bible without the Book of Common Prayer, encountered some opposition in England at an early date, which after a few years died away. The Russian Bible Society at St. Petersburg (founded 1813) flourished until 1826, when its operations were summarily suspended by the Emperor Nicholas, on the ground that it belonged to the Church, rather than to a secular society, to furnish the people with the Word of God.

In the American Bible Society differences of opinion concerning the principles which should govern translations into foreign tongues led to the formation of the American and Foreign Bible Society in 1836; and at a later period (1858) its harmony was again imperiled for a time in consequence of dissatisfaction at some attempted modifications (numerous though generally slight) in the English editions of the society—a dissatisfaction which was allayed by abandoning the proposed changes.

The work accomplished by Bible societies in the nineteenth century is vast in extent and of unspeakable usefulness. In 1892 the receipts of the American Bible Society for the year ending Mar. 31, applicable to its general purposes, were $556,527.29. The same year it had issued 1,298,196 volumes, including Bibles, Testaments, and integral portions of Scripture. The British and Foreign Bible Society reported its issues for 1892 as 3,989,215 volumes, of which 823,313 were Bibles. Its total issues from 1804 to 1892 are 131,844,796 volumes, and the total issues of the American Bible Society from 1816 to 1892 are 55,531,908. It is a low estimate that 235,000,000 volumes of the Bible or separate books of the Bible have been issued by Bible societies since the tears of a little girl in Wales in 1802 led Thomas Charles to ask what could be done to secure Welsh Bibles for his congregation. The aggregate number of volumes issued by no

means measures the results of Bible society work. From motives of benevolence the prices of Bibles have been determined by the cost of materials and of manufacture, without regard to profit. The British and Foreign Bible Society has its work done by contract; the American Bible Society manufactures its publications on its own premises, and in so doing gives constant employment to about 250 persons. Besides the books which are sold at unremunerative prices a large part of the publications each year are given away to destitute families and individuals, to charitable institutions, Sunday-schools, missionary societies, soldiers, seamen, immigrants, travelers, prisoners, and other classes of persons. Four times in seventy-six years the American Bible Society and its auxiliaries have made an extensive canvass of all parts of the U. S., in the effort to reach every destitute family in the land with the offer of a Bible, and they are now engaged in a similar effort to supply every Sunday-school scholar with a Bible. It also has twelve agents in foreign lands, under whose direction 323 persons were employed in 1891 to distribute the Scriptures. It has distributed the Scriptures in about eighty different languages and dialects, and in many new versions which have been made in the present century. The circulation of the Scriptures has been promoted by the British and Foreign Bible Society in about 300 languages and dialects.

For further information respecting Bible societies reference may be had to the following works: Owen's *History of the British and Foreign Bible Society* (1817); Browne's *History* of same (1859); Dudley's *Analysis of the System of Bible Societies* (1821); *Jubilee Memorial of British and Foreign Bible Society* (1854); *Jubilee Commemoration at Bombay* (1854); Strickland's *History of American Bible Society* (1856); *Jubilee Memorial* (1866); *Manual of American Bible Society* (1887); Memoirs of S. H. Turner, Gardiner Spring, and John C. Brigham; numerous controversial pamphlets; *Bible Society Record*, and *Annual Reports* of each Bible society. E. W. Gilman.

Bib'lia Pau'perum [a Latin term signifying "the Bible of the poor"]: the work known to bibliographers under this name is one of the earliest "block books" printed before the use of movable type, probably about 1420. The work consists of a series of thirty-four to fifty cuts illustrating the history of our Lord, each with representations of those Old Testament events which were considered to have been their types. The descriptive text is in abbreviated Latin. It has different titles, but Heineken gave it the name which he found attached to a copy which he described. It would seem ill adapted to the wants of the ignorant laity of that time, when few among them were equal to the task of deciphering the letterpress, and without this the engravings would have been meaningless. There seems good reason for the opinion of Jackson and Chatto (*History of Wood-engraving*) that the work was prepared to aid the mendicant friars in their preaching—the text forming the topic for their sermons, and the pictures an excitement for their imaginations. Facsimile reprints have appeared, London, 1859, 1877, 1884; and from a German original, Vienna, 1890.

Biblical Archæology: See Archæology, Biblical.

Bibliog'raphy [from Gr. *βιβλιογραφία*; *βιβλίον*, book + *γράφειν*, write]: the science which treats of books in all their aspects; therefore peculiarly the science of booksellers and librarians. Pure bibliography concerns itself with the external features of books; applied bibliography takes cognizance of their contents. A bibliography is also a classified list of the works in some particular department of knowledge, as a bibliography of political economy. The first book published on this subject was the *Bibliotheca bibliothecarum*, by the Jesuit P. Labbé (Paris, 1664). Conrad von Gesner compiled the *Bibliotheca Universalis* (4 vols., Zurich, 1545–55); to-day, so far from any one attempting a "universal" bibliography, it is sometimes the work of a lifetime to trace the history of a single book or series of books. Of general bibliographies, some of the most important are Brunet's *Manuel* (9 vols., incl. supplement, Paris, 1860–80); Graesse, *Trésor* (7 vols., Dresden, 1859–69); Ebert, *Allgemeines bibliographisches Lexikon* (2 vols., Leipzig, 1821–30; Eng. translation by A. Brown, 4 vols., Oxford, 1837); Watt, *Bibliotheca Britannica* (4 vols., Edinburgh, 1824). The *American Catalogue* (3 vols., N. Y., 1890–91) gives under an author and a title index the titles of all books published in the U. S. on sale in 1876, and which appeared up to June 30, 1890, and is supplemented by an annual volume. The new books are noted as they come out in the *Publishers' Weekly* (N. Y.), from which the *Catalogue* is made up. Works published in Great Britain are found in the *English Catalogue* (1835–89), with annual supplements, and in the weekly *Publishers' Circular*; for French literature the *Catalogue de la libraire française*, by Lorenz, is the standard. It extends from 1840 to the present time, and the periodical *Bibliographie de la France* has been published since 1811. German authorities are Hinrichs, *Verzeichniss*; Heinsius, *Bücherlexikon* (1700–89); Kayser, *Vollständiges Bücherlexikon* (1750–1890); and the *Gesammt Verlags Katalog des deutschen Buchhandeles*. Dutch literature has been catalogued in the periodical *Nederlandische Bibliographie* since 1854, the best catalogues being those by Brinkmann; Belgium has had the periodical *Bibliographie de Belgique* since 1875; the *Bibliographie Nationale* covers the ground since 1830. There are also special catalogues in all the other leading modern tongues. English periodical literature is catalogued in the great *Index* of W. F. Poole (first published in 1853; new ed. Boston, 1882; supplements published every five years, first in 1888). This is supplemented by the *Co-operative Index to Periodicals*, edited by W. I. Fletcher, published quarterly in New York since 1885. Every department of learning, as well as every nation, has its special bibliography. In this cyclopædia a brief bibliography is appended to all the leading articles. Pure bibliography is closely related to library management. (See Library.) An index society was founded in London in Dec., 1877, for the purpose of forming indexes to rare and important books, and a bibliographical society in 1892. Petzholdt's *Bibliotheca Bibliographica* (1864); Vallée's *Bibliographie des Bibliographies* (1883), with supplement (1887); British Museum *Hand-list of Bibliographies* (1881); Wheatley's *How to Form a Library* (1886).

C. H. Thurber.

Bibliomancy [from Gr. *βιβλίον*, book + *μαντεία*, divination]: a mode of divination used in both ancient and modern times by opening the Bible and observing the first passage which occurred, or by entering a church and taking note of the first words of the Bible heard after entering. It seems to have originated with the pagans, who employed Homer or Vergil in like manner, and to have been adopted from them by the Eastern Christians. The application either depended upon the sound of the words or upon the signification of the passage. Prayer and fasting were used as a preparation for consulting the divine oracles. Bibliomancy was prohibited, under pain of excommunication, by the Council of Vannes, 465 A. D., and by succeeding councils. It continued, however, to prevail for many centuries thereafter. It came into use in the Gallican and Greek Churches in the choice of bishops, and prevailed in some places for centuries. Many eminent Protestant Christians have made use of this practice in times of perplexity, for instance John Bunyan and John Wesley.

Bibliomania [from Gr. *βιβλίον*, book + *μανία*, madness]: the passion for acquiring and possessing books. Bibliomaniacs are governed in their selection by all sorts of curious fancies, for books of a certain binder, of a certain press, early and rare editions, *éditions de luxe*, uncut copies, illustrated copies, etc. Extraordinary prices are often paid: Bernard Quaritch paid what is said to be the largest sum recorded for a single volume, £4,950 for the *Psalmorum Codex*. Over $10,000 was paid for a copy of the first dated *Decameron*. In 1884 a Mazarin Bible (one of the twenty-five copies of the first printed Bible, date 1450, known to have belonged to Cardinal Mazarin) brought £3,900. High prices are often paid for books containing certain faults or misprints. The bibliomaniac is governed in his choice mainly by incidental and often trifling considerations; whereas the bibliophile, or book-lover, collects books with some specific literary or scientific purpose, seeking to bring together everything pertaining to a given author or subject. Dibdin, *Bibliomania* (1811); Andrew Lang's *Books and Bookmen* (1887). C. H. Thurber.

Bibliothe'ca [Lat. from Gr. *βιβλιοθήκη*: *βιβλίον*, book + *θήκη*, chest, repository]: the Latin word signifying library, a collection of books; often used, like our word "library," as a name for publications of various kinds, as *Bibliotheca Hispana*, *Bibliotheca Sacra*, etc.

Bice [from Fr. *bis*, dark-colored, brown; Ital. *bigio* < a deriv. of Lat. *bombyx* = Gr. *βόμβυξ*, silkworm]: the name of two blue and green pigments; native carbonates of copper, used by painters from very early times. The blue bice is sometimes called mountain-blue and ongaro. The syno-

nyms of green bice are Hungarian green, verdetto, malachite green, mountain green, etc.

Bi'ceps [Lat., double-headed; *bi-*, twice + *caput*, head]: the large round muscle lying upon the front of the arm. Above, it consists of two portions or heads—whence its name—one being attached to the coracoid process of the scapula, the other to the margin of the shallow socket for the head of the humerus. The former is the short, the latter the long, head of the biceps. They unite to form a fleshy belly, which terminates in a rounded tendon inserted into the tubercle of the radius. The action of the biceps is to bend the forearm. Another biceps is found on the outer and posterior aspect of the thigh. Its long head arises from the tuberosity of the ischium; its short head, from the *linea aspera* of the thigh-bone. Its tendon is the outer hamstring.

Bicêtre: the name of an old castle, a hospital, and a fort in the department of Seine, in the southern environs of Paris. The castle, which is very large, has been converted into a hospital for old men and for lunatics. Here the prisoners sentenced to death or to the galleys were formerly kept until the sentence was executed. But in 1837 this prison was transferred to La Roquette. Situated on an eminence, it commands a fine view of Paris and the Seine. Here are accommodations for about 900 male lunatics, who receive gentle treatment. The name is said to be a corruption of *Winchester*. Its castle was founded in 1290 by John, Bishop of Winchester.

Bichat, Marie François Xavier: French anatomist and physiologist; b. at Thoirette, in Jura, Nov. 11, 1771. In 1797 he began to lecture on anatomy, surgery, etc., in Paris. He published *Researches on Life and Death* (1800), and an excellent and profound work entitled *General Anatomy Applied to Physiology and Medicine* (4 vols., 1801). He simplified anatomy and physiology by reducing the complex structures of the organs to the simple or elementary tissues, and he was the first to recognize the importance of the distinction between the organic functions and the animal or vital functions. Having impaired his health by close application, he died before the age of thirty-one, July 22, 1802.

Bickaneer: same as Bikanir.

Bick'erstaff, Isaac: Irish dramatist; b. in Ireland about 1735; was in his early life an officer of marines. He produced several popular comedies and comic operas, among which are *The Maid of the Mill*; *The Padlock*; *Love in a Village* (1763); and *The Captive*. D. after 1787. Steele's *Tatler* was published under the assumed name of Isaac Bickerstaff, which often occurs in the papers of that work.

Bick'ersteth, Edward: an English theologian; b. in Kirkby Lonsdale, Westmoreland, Mar. 19, 1786. He took orders in the Anglican Church (1815), and was sent by the Church Missionary Society to Africa in 1816 to reorganize their mission stations. On his return the same year he was chosen secretary to that society, and ably served it until 1830, when he became rector of Watton, in Hertfordshire. He was one of the leaders of the Evangelical party in the Church of England, and one of the founders of the Evangelical Alliance in 1845. Among his works, which are highly esteemed, are a *Help to the Study of the Scriptures* (1814); *The Christian Student*; *A Treatise on Baptism*; and *The Promised Glory of the Church of Christ*. D. at Watton, Feb. 28, 1850. His collected works were published in 16 vols., 1853. See T. R. Birks, *Memoir of the Rev. E. Bickersteth* (2 vols., 1851).

Bickersteth, Edward Henry, D. D.: a poet and bishop of the Church of England; b. at Islington, Jan. 25, 1825, and was educated at Trinity College, Cambridge. Ordained deacon in 1848, and priest the following year. He was consecrated Lord Bishop of Exeter, Apr. 25, 1885, in St. Paul's Cathedral, London. He has published, besides numerous other works, *Poems* (1849); *The Rock of Ages* (1859); *Yesterday, To-day, and For Ever* (1866; 18th ed. 1886), which has had a great success; *The Two Brothers, and Other Poems*; and *The Hymnal Companion to the Book of Common Prayer*, of which numerous editions have appeared.

Bick'more, Albert Smith, Ph. D.: naturalist; b. in St. George's, Me., Mar. 1, 1839, and graduated at Dartmouth in 1860. He studied under Agassiz at Cambridge, and in 1865 sailed for the Dutch East Indies for the purpose of collecting shells. He also traveled in China, Japan, Manchuria, Siberia, and Russia. He became in 1870 Professor of Natural History in Madison (now Colgate) University, and has devoted much time to the Museum of Natural History founded by him at the Central Park, New York, and of which he is superintendent. He has published *Travels in the East Indian Archipelago* (1869).

Bick'nell, George Augustus: jurist; b. in Philadelphia, Pa., Feb. 6, 1815; graduated at the University of Pennsylvania, and from the Yale Law School. In 1876 and 1878 he was elected a member of Congress from Indiana. In 1881 he was appointed commissioner of appeals in the Supreme Court of Indiana. From 1861 to 1870 he was Professor of Law in the Indiana State University. D. in New Albany, Ind., Apr. 11, 1891. Henry Wade Rogers.

Bicycle [from Lat. prefix *bi-*, having two + Gr. κύκλος, wheel]: a form of velocipede which began to appear in England in 1867 with two wheels arranged one in front of the other, and which is kept upright by its own motion. The wheels differ in diameter, from the earlier forms, when the trailing-wheel had less than a third of the diameter of the driving-wheel, to the safety with both wheels of like dimension. They are propelled by pedals moved by the feet, and acting sometimes directly upon a crank, and again by gearing. They have rubber tires of varied character, and are very light, strong, and swift. See Cycling and Velocipede.

Bidar, bee'dar: a fortified city of Hindustan; capital of a native state of the same name; near the Manjira river and in the Nizam's Dominions; about 75 miles N. W. of Haiderabad (see map of S. India, ref. 3–D). It was formerly an important place, but is now chiefly remarkable for the manufacture of tutenag wares of an alloy of tin and copper.

Bidassoa, bĕe-daăs-sō'ăă: a small river forming part of the boundary between France and Spain. It rises in Spain, and enters the Bay of Biscay at Fuentarabia. On the Isle of Pheasants, in this river, the treaty of the Pyrenees was concluded in 1659. In Aug., 1813, Wellington defeated the French marshal Soult at San Marcial on the Bidassoa.

Bid'deford: a city and railroad center, York co., Me. (for location of county, see map of Maine, ref. 11–B); on Saco river, 9 miles from its mouth. It was named from the city of Bideford, England. The first settlement was made at the "Pool" (at the mouth of the river) by Richard Vines in 1616–17. It was settled by a patent to John Oldham and Vines in 1630. York County originally embraced all of the province of Maine, and while settlements were made at a very early date along the seacoast (none earlier than this) to the Piscataqua river, Bideford or Biddeford for a long series of years was the chief settlement and center. Here are inexhaustible ledges of granite, which ranks among the best in the world, and is largely exported. The business of the place is principally the manufacturing of cotton cloth. A large amount of lumber is also manufactured. Pop. (1880) 12,651; (1890) 14,443; (1900) 16,145. Editor of "Journal."

Bidding-prayer [the original meaning of *bidding* was "praying"; cf. *beads—bidding*; cf. O. Eng. *biddan*, beg; Germ. *Bitten*; Goth. *bidjan*, now confused with descendants of O. Eng. *bēodan*; Germ. *Bieten*; Goth. *biudan*, offer, proclaim, command]: a formula of public prayer found in the ancient Greek liturgies, in the Gallican liturgy, and in the English service-books, in which the priest recites in detail what the people are to pray for, and closes with the Lord's Prayer, in which all the previous petitions are considered to be summed up. Canon 55 of 1603 (the Church of England) directs that before all sermons, lectures, and homilies, not delivered in the course of divine service, the preacher shall move the people to devotion by the use of the bidding-prayer, a form of which is given. In Dr. Henderson's *Manuale et Processionale ad Usum Insignis Ecclesiæ Eboracensis*, App. x. (Surtees Soc., 1874–75), are forms of bidding-prayers from the eleventh to the fifteenth centuries, and a sixteenth-century form is given among the *Preces in Dominicis dicendæ* (*Manuale*, etc., p. 123). Notes and illustrations of the York bidding-prayers are found in Canon Simmons's *Lay Folks' Mass-book* (Early Eng. Text Soc., 1879). See Rock, *Church of our Fathers*, ii. 352–378; Maskel's *Mon. Ritualia*, iii.; and Wheatley on *Bidding of Prayers before Sermons . . . an Hist. Vind. of the 55th Canon* (new ed. 1845). William Stevens Perry.

Bid'dle, Clement: a soldier; b. in Philadelphia, May 10, 1740. He was appointed deputy quartermaster-general of the militia of Pennsylvania and New Jersey; fought with the rank of colonel at the battles of Trenton, Princeton, Brandywine, and Monmouth; quitted the army in 1780; became quartermaster-general of the State Sept. 11, 1781.

He was a friend and correspondent of Gen. Washington, who appointed him marshal of Pennsylvania. D. in Philadelphia, July 14, 1814.

Biddle, Edward: brother of Nicholas Biddle: b. in 1739; was an officer in the French war (1756–63), and became a noted lawyer of Reading, Pa.; was member and speaker of the Assembly, and was a delegate from Pennsylvania to the Continental Congress 1774–76 and 1778–79. He was a leading advocate of independence. D. Sept. 5, 1779.

Biddle, George W.: See the Appendix.

Biddle, James: a naval officer; b. in Philadelphia, Feb. 28, 1783; educated at the University of Pennsylvania, and entered the navy in 1800. He served against Tripoli, where he was a prisoner nineteen months. In the war of 1812 he served with distinction in several engagements, and while commanding the Hornet captured the brig Penguin, receiving a wound in the action Mar. 23, 1815. For his services he received a gold medal from Congress, besides other honors. He became a captain in 1815. He was afterward commissioner to Turkey, China, etc., and held other important positions. D. in Philadelphia, Oct. 1, 1848.

Biddle, John: an early English Unitarian: b. at Wotton-under-Edge, in Gloucestershire, in 1615 (baptized Jan. 14); graduated at Oxford, and became an eminent tutor there; then in 1641 a schoolmaster in Gloucester. He was prosecuted about 1645 for the expression of heterodox opinions respecting the personality of the Holy Spirit, and after a formal trial by Parliament was condemned to imprisonment for five years. While in prison he published in 1648 a *Confession of Faith Concerning the Holy Trinity*. He was liberated about 1652, and gathered a congregation of his fellow-believers. He was subsequently persecuted and imprisoned twice during the Commonwealth. He was protected by the friendliness of Cromwell, whose toleration was equal to the widest differences of belief. At the Restoration his persecution was renewed, and he died in prison in London, Sept. 22, 1662. See his *Life* by Joshua Toulmin, London, 1789.

Biddle, Nicholas: a naval officer; b. in Philadelphia, Sept. 10, 1750. He entered the royal navy in 1770, and once served in a ship of which the famous Nelson was mate. He obtained the rank of captain in the U. S. navy in 1776, and took several prizes from the British. Early in 1777 he took command of the Randolph, a frigate, which encountered the Yarmouth, a 64-gun ship, Mar. 7, 1778, near Charleston, S. C. During the action that ensued the magazine of the Randolph exploded, and killed Capt. Biddle, with nearly all his crew.

Biddle, Nicholas, LL. D.: financier; a nephew of Nicholas Biddle; b. in Philadelphia, Jan. 8, 1786. He was a son of Charles Biddle, who was vice-president of Pennsylvania in 1786–87; graduated at Princeton in 1801; was elected to the Legislature of Pennsylvania in 1810; appointed a director of the U. S. Bank by President Monroe in 1819. In 1823 he became president of that bank, the affairs of which he managed with great ability and success for many years, so that it supplied the country with a sound and uniform currency. The bill to recharter the bank having been vetoed by President Jackson in 1832, the bank was closed in 1836 by the limitation of its charter. He was soon elected president of a new State bank, called "The United States Bank," which was chartered by the Legislature of Pennsylvania. This bank became insolvent in the financial crisis of 1841. He was president of the trustees of the fund ($2,000,000) which Stephen Girard left to found a college for orphans. "To his exertions alone," says Judge R. T. Conrad, "the country owes one of the most beautiful structures of modern times, the Girard College. He proposed the present plan, and in the midst of wild political excitement and opposition persisted firmly, and secured a building which every citizen now not only approves, but applauds." D. in Philadelphia, Feb. 27, 1844. See a *Memoir of N. Biddle*, by R. T. Conrad, in the *National Portrait Gallery*, vol. iv., 1839.

Biddle, Richard: lawyer and writer; a brother of the preceding; b. in Philadelphia, Mar. 25, 1796; practiced law at Pittsburg; a member of Congress (1837–41), and wrote a *Memoir of Sebastian Cabot, with a Review of the History of Maritime Discovery* (1831). D. in Pittsburg, July 7, 1847.

Bid'eford: a seaport-town of Devonshire, England; on the river Torridge; 1½ miles from its entrance into the estuary of the Taw; 30 miles N. W. of Exeter (see map of England, ref. 13–D). It has a stone bridge of twenty-four arches, about 680 feet long, a town-hall, a hospital, and manufactures of ropes, sails, earthenware, and leather. Among the articles of export are linen and woolen goods, iron, sails, and naval stores. Vessels of 500 tons can go up to the center of the town. It had a great trade in the sixteenth and seventeenth centuries. Pop. (1891) 7,918.

Bidpai, bid'pī: See Panchatantra.

Bidwell, Daniel D.: general of volunteers; b. at Black Rock, now part of Buffalo, N. Y., Aug. 12, 1816; held important local offices; identified with the militia organizations of the city for many years. On the outbreak of the civil war he enlisted as a private soldier; promoted to be captain in the Sixty-fifth, and subsequently colonel of the Forty-ninth New York volunteers. He was engaged in the various actions of the Peninsula campaign, in the battles of South Mountain and Antietam, Fredericksburg, and Chancellorsville, and before Richmond and Petersburg, being most of the time in command of a brigade. In July, 1864, he was commissioned a brigadier-general of volunteers, and assigned to a command under Gen. Sheridan in the Shenandoah Valley, participating in the battle of Cedar Creek, Oct. 19, 1864, where he was mortally wounded while leading his brigade.

Biebrich: See Biberich.

Bie'dermann, Aloys Emanuel: a German rationalistic theologian; b. at Oberrieden, Mar. 2, 1819. He studied at Basel and Berlin: became professor extraordinary of Theology at Zurich 1850; ordinary 1864. D. at Zurich, Jan. 25, 1885. He wrote *Die freie Theologie* (Tübingen, 1844); founded the *Kirche der Gegenwart* (1845; 2d ed. Berlin, 1884–85, 2 vols.); published in 1869 at Zurich his *Christliche Dogmatik* (2d ed. 2 vols. Berlin, 1884–85), one of the most important emanations of recent rationalistic theology.

Biedermann, Friedrich Karl: German journalist and author; b. at Leipzig, Sept. 25, 1812; became Professor of Philosophy there in 1838, but was dismissed in 1845 on account of his advanced political opinions; played a conspicuous *rôle* in the Parliament at Frankfort 1849; was reinstated as professor, but was again dismissed in 1853 for political reasons. From 1863–66 he edited the *Deutsche Allgemeine Zeitung*; also founded and edited several other liberal papers. Among his works are *Wissenschaft und Universität* (Leipzig, 1838); *Die deutsche Philosophie von Kant bis auf unsere Tage* (1842–43, 2. vols.); *Vorlesungen über Socialismus und sociale Fragen* (Leipzig, 1847); *Erinnerungen aus der Paul's Kirche* (Leipzig, 1849).

Biel, Gabriel: erroneously called "the last of the Schoolmen"; b. at Spire, in Germany, after 1442; studied at Heidelberg and Erfurt; became cathedral preacher in Mainz; provost of Urach 1477; was adviser in the establishment of the University of Tübingen which occurred about this time; became Professor of Theology there 1484. D. in Tübingen, 1495. Although a devout and earnest Catholic, he sided with the Council of Basel against the pope, and deplored the corruptions and abuses of his time. He is worthy of note as having rejected the doctrine of sensible and intelligible species so widely prevalent among the Schoolmen.

Revised by W. T. Harris.

Biel: See Bienne.

Bie'la, Wilhelm, Baron von: German astronomer; b. at Roslau, Prussia, Mar. 19, 1782; discovered in Josephstadt, in Bohemia, in 1826, the comet known by his name. D. in Venice, Feb. 18, 1856.

Biela's Comet: a comet of short period (6¾ years); discovered by Baron von Biela in 1826. It was observed apparently unchanged at various returns, but at its return in 1845–46 it was found to have separated into two parts, both of which were observed in 1852. It was due in 1865, and again in 1872, but no trace of it could be found; in November of the latter year the earth crossed its path, and a shower of meteors was observed, which is now supposed to have been due to fragments of the lost comet.

Bielau: See Langenbielau.

Bielaya, bĕĕ-ăy-lī'a, or **Bielaia**: a river of Russia; rises in the Ural Mountains; flows through Orenburg, and, after a very tortuous course of about 650 miles, enters the river Kama.

Bielaya Tserkov: a village of Russia; one of the principal commercial centers of the government of Kiev; 44 miles S. S. W. of the city of Kiev. It has eleven annual fairs, three of which last for ten days. Great quantities of

grain and cattle are disposed of by these fairs. Pop. about 12,000.

Bie'lefeld: a town of Prussia; in Westphalia; finely situated on the Minden and Cologne Railway; 20 miles S. W. of Minden (see map of German Empire, ref. 4–D). It has manufactures of woolen stuffs, leather, soap, and meerschaum pipes. Its principal industry, however, is linen-weaving. It is, indeed, the center of the whole Westphalian linen-trade. The origin of this industry dates back to the thirteenth century, but it was greatly extended during the sixteenth and seventeenth centuries by refugees from Holland. Here is the old castle of Sparrenberg, now used as a prison. Pop. (1880) 30,679; (1890) 39,942.

Bielgorod, bĕĕ-el'gō-rod (i. e. White Town): a Russian town; in the government of Kursk; on the Donetz; 80 miles S. of Kursk (see map of Russia, ref. 9–D). There are three annual fairs here. Pop. 22,000.

Bie'litz: a town of Austrian Silesia; on the river Biala, and opposite the Galician town Biala; 48 miles S. W. of Cracow, with which it is connected by rail (see map of Austria-Hungary, ref. 3–H). It has an active trade in woolen cloths and cassimeres. Here is a castle of Prince Sulkowsky. A bridge across the river connects Bielitz with Bialia, in Galicia. Pop. (1880) 13,060; (1890) 14,499.

Biella, bĕĕ-el'la: a town of Italy; in the province of Novara; on the Cervo: 38 miles by rail N. E. of Turin (see map of Italy, ref. 3–B). It has manufactures of paper, hats, and woolen goods. Pop. 15,000.

Bielopoli, bĕĕ-ăy-lō'pō-lĕĕ: a town of Russia; government of Kharkof; on the Vira; 118 miles N. W. of Kharkof (see map of Russia, ref. 9–D). It is on the railway from Orel to Kiev. It has a considerable trade and several distilleries. Pop. 12,256.

Bielostok, bĕĕ-ay'-lō-stok (in Pol. *Bialystok*): a fortified town of Russia; government of Grodno; on the river Bialy; 52 miles by rail S. W. of Grodno (see map of Russia, ref. 7–B). It is well built and handsome, has several churches, and a palace with a park, which have been called the "Versailles of Poland." Here are a gymnasium and manufactures of woolen goods, hats, leather, and soap. It is on a railway from Warsaw to Grodno. Pop. (1897) 63,927, a large proportion being Jews.

Bielozero, bĕĕ-ayl'ō-zay'rō (the White Lake): a lake about 25 miles long and 20 miles broad in the government of Novgorod, Russia; lat. 60° 10′ N., lon. 37° 30′ E. Its bottom of white clay gives to the water during stormy weather a milky appearance which was doubtless the cause of its name, White Lake. It receives many small streams; is of considerable depth; abounds with fish. It is connected by the Sheksna river with the Volga and united by canals with the Onega, Sukona, and Dwina. The old town of Bielozersk, situated on the south shore of the lake, was formerly the capital of an ancient principality bearing the same name, and has considerable trade in cattle, corn, and pitch, also manufactures of candles. Pop. (1882) 5,982.

Bienne, bee'ne (Germ. *Biel*): a town of Switzerland; in the canton of Berne; at the northeast extremity of the Lake of Bienne; 13 miles W. S. W. of Soleure (see map of Switzerland, ref. 4–D). It is beautifully situated at the foot of the Jura; is inclosed by old walls, and is connected by railways with Berne and Lausanne. Here are manufactures of watches, cotton goods, etc. Many Roman coins have been found at Bienne, which is a place of great antiquity. Pop. (1897) 19,237, communal.

Bienne, Lake of: in the Swiss canton of Berne. It is 10 miles long, 3 miles wide, and 250 feet deep; is near the base of the Jura Mountains, and has an elevation of 1,419 feet above the sea. The Thiele passes through it before joining the Aar. It incloses the island of St. Pierre, which was the residence of J. J. Rousseau in 1765. In digging peat, which is extensively procured from its marshy border, the remains of a prehistoric village of lake-dwellings have been found on the southeast side of the lake.

Biennial Plants: all plants which live longer than annuals, and not so long as perennials. They grow the first season without flowering, and produce flowers in the second season, at the end of which they die. Such are the turnip, parsnip, beet, and many other plants which are cultivated. Many biennials, if sown early in the spring, will flower in the summer or autumn of that year, and become annuals.

Bienville, bi-ăn'veel', Jean Baptiste Lemoine, de: a French officer and pioneer; b. in Montreal, Feb. 23, 1680; was a brother of Lemoine d'Iberville. He accompanied the latter in an expedition to the mouth of the Mississippi in 1699, and was three times appointed colonial governor of Louisiana. He founded New Orleans in 1718. D. in France in 1768.

Bierstadt, beer'staăt, Albert: landscape-painter; b. in Düsseldorf, Germany, Jan. 7, 1830. He was brought by his parents when he was only a year old to New Bedford, Mass., where he lived until he went to Düsseldorf in 1853, to continue the study of painting, which he had taken up by himself at home. He visited Rome also, and returned to the U. S. in 1857. He then began to paint pictures of Rocky Mountain scenery, making frequent visits to the West, and has returned to Europe for short visits a number of times. His name is widely known, and his pictures have been exhibited in all the important cities of the U. S. His *Discovery of the Hudson River* is in the Capitol at Washington. Most of his works are of large size and are often panoramic in style. He has received various medals at exhibitions in Austria, Germany, and Belgium, and the Legion of Honor at the time of the Paris Exposition in 1867. He was elected a National Academician in 1860. Studio in New York.

William A. Coffin.

Bies-Bosch: a marshy lake of the Netherlands; between the provinces of North Brabant and South Holland, and formed in 1421 by an inundation which destroyed 72 villages and 100,000 people. It forms the part of the estuary of the Maas which is called Holland's Dip, and contains a number of islands.

Bi'frost: in Scandinavian mythology, the trembling way; the beautiful many-colored bridge which the asas built between heaven and earth. It is the rainbow. The red in it, says the Younger Edda, is fire, which keeps the frost-giants away from it. In Ragnarok it breaks.

Bi'ga (or **Bigæ**, a plural form with the same signification): a term applied by the ancient Romans to a vehicle drawn by two horses abreast; a two-horse chariot used in processions and games. Like the Greek war-chariot, it had two wheels, was low and open behind, and higher and closed in front. Figures of the bigæ are often found upon ancient coins.

Bigamy [Fr. *bigamie*, deriv. of *bigame*, from Lat. *bi'gamus*; *bi-*, twice + Gr. *-γαμος*, wedded]: the offense of contracting a marriage while a former marriage is still subsisting. The more proper term for this offense is "polygamy." It is governed by statute. It is usual to provide that if a husband or wife shall remain absent for a specified number of years (generally seven) without being heard from or being known to be living, and the other party shall marry again, no crime will be committed, though the absent party be alive. A party who has obtained a divorce from the bonds of matrimony is free to marry again as if no previous marriage had existed; the conditions upon which the divorcee may remarry vary in different States. Bigamy, it is generally held, consists in the act of marrying; so that if the parties marry in one State and cohabit in another, the crime is committed solely in the place of the marriage, and can only be prosecuted there; but the State laws differ on this point. In a prosecution for bigamy, an *actual* marriage must be established. Evidence of reputation, or even of cohabitation, will not suffice. It does not follow that proof of a ceremonial marriage is necessary. The laws of the States differ upon that point, some holding that a case may be established by proof of consent before witnesses, without any ceremony. Such is the law in New York.

George Chase.

Big Bethel: the name given to the action of June 10, 1861. Gen. Butler, who had taken possession of and fortified Newport News a few days previously, found the Confederates under Gen. Magruder in possession of all the commanding points in his front; he accordingly directed a reconnoissance in force to be made, with the object of surprising and capturing the position called Little Bethel; and to make the expedition more certain of success two regiments, Duryea's Zouaves and the Third New York under Col. Townsend, were to start about midnight of the 9th, and gain the rear of the position to prevent retreat, while a battalion of Vermont troops, Col. Phelps, and a New York regiment, Col. Bendix, were to be ready to attack in front by daybreak of the 10th. Though various precautions had

been taken against mistake, the commands of Cols. Bendix and Townsend approaching each other near daybreak, Col. Bendix's command opened fire on the Third New York, killing two men and wounding a considerable number, and throwing the whole command into confusion before the mistake was discovered. The Confederates, being thus notified, retreated to Big Bethel, where they hastily threw up breastworks behind a deep creek. Gen. Pierce, who was in command of the Federal expedition, after being re-enforced, and finding Little Bethel deserted, advanced toward Big Bethel, a few miles to the N., where he found a Confederate force, estimated at 1,800, under the command of Col. J. B. Magruder, a graduate of West Point, protected by the hastily constructed earthworks. Gen. Pierce ordered an attack, which was continued nearly four hours, during which time the Federal troops were exposed to a deadly fire, while the Confederates were almost entirely protected. Later in the day a more general assault was made, led by Maj. Theodore Winthrop, in which he was instantly killed while encouraging his men to the assault. Gen. Pierce finally ordered a retreat, which was effected in good order, the Confederates following at some distance with cavalry. Lieut. John T. Greble, of the Second U. S. Artillery, was killed while covering the defeated troops. The Confederates, fearing re-enforcements of the Federals from Fortress Monroe, fell back that night to Yorktown. The Federal loss in killed and wounded was about 100 men; the Confederate loss was said to be only 1 killed and 7 wounded.

Big Black: a river of Mississippi; rises in Choctaw co., flows southwestward, and enters the Mississippi at Grand Gulf. Length about 200 miles. It is navigable for steamboats for 50 miles. Gen. Grant's army, moving to the siege of Vicksburg, defeated the Confederates on the Big Black, nearly 15 miles E. of that town, May 17, 1863. The morning after the battle of Champion Hills, May 16, 1863, found the Confederate forces under Pemberton strongly posted on both banks of the Big Black river. The works were successfully assaulted, and all the troops on the east bank, with seventeen pieces of artillery, captured, the remainder of Pemberton's army retreating to the fortifications of Vicksburg.

Big Black River: See BLACK RIVER.

Big Bone Lick: a salt "lick" or spring in Boone co., Ky., which takes its name from the fossil bones of the mastodon and other animals which are thought to have resorted to this place to "lick" the salt earth, and to have perished in the marshy soil, where their bones are now found.

Big'elow, ERASTUS BRIGHAM, LL. D.: inventor; b. in West Boylston, Mass., Apr. 2, 1814. While a mere boy, he invented a loom for suspender-weaving and other machines, and wrote a book on shorthand writing. He subsequently invented looms for counterpanes (1838–40), another for coach-lace, and in 1839 brought out his well-known carpet-loom. He was one of the principal manufacturers in Clinton, Mass. He published *The Tariff Question* (1862) and other works. D. in Boston, Dec. 6, 1879. Memorial sketch by R. C. Winthrop in 1886.

Bigelow, FRANK HAGAR, A. M., B. D.: student of terrestrial magnetism and allied subjects; b. at Concord, Mass., Aug. 28, 1851; educated at the Boston Latin School, Harvard College, and Episcopal Theological School at Cambridge, Mass., and has taken orders as a clergyman. He was for some years assistant astronomer at the Argentine National Observatory at Cordoba, then Professor of Mathematics at Racine College, Wisconsin, then assistant in the *Nautical Almanac* office in Washington, and finally (1891) Professor of Meteorology in the U. S. Weather Bureau, which position he now (1893) holds. His name is especially associated with an instrument for the photographic record of the transit of stars and with some novel studies by which the solar corona, the aurora, and terrestrial magnetism are shown to be associated. The theory involved, though still (1893) new, has met with a favorable reception in scientific circles. He has published many articles on the solar corona, terrestrial magnetism, the aurora, and astronomical instruments and photography. The most important is a monograph on the solar corona, published by the Smithsonian Institution in 1889. M. W. HARRINGTON.

Bigelow, JACOB, M. D., LL. D.: physician and botanist; b. in Sudbury, Mass., Feb. 27, 1787; graduated at Harvard in 1806. He became Professor of Materia Medica and Clinic Medicine at Harvard, and president of the Massachusetts Medical Society. He practiced medicine in Boston many years, founded the Mt. Auburn Cemetery, and laid out the grounds with much taste. Among his works are *American Medical Botany* (3 vols. 8vo, 1817–21); an able *Discourse on Self-limited Diseases* (1835); *Nature in Disease* (1854); and *History of Mt. Auburn* (1860). D. in Boston, Jan. 10, 1879.

Bigelow, JOHN, LL. D.: an author and diplomatist; b. in Malden, N. Y., Nov. 25, 1817; graduated at Union College in 1835. He contributed many articles to the *Democratic Review*, and in 1850 became managing editor of William C. Bryant's journal, the *New York Evening Post*. Having visited Jamaica in that year, he published *Jamaica in 1850, or the Effects of Sixteen Years of Freedom on a Slave Colony*. He was appointed U. S. consul at Paris in 1861, and minister plenipotentiary at that court in Apr., 1865. He resigned his position in 1866, and was Secretary of State for New York 1867–68. He published in Paris *Les États-Unis d'Amérique en 1863*. He has also edited the *Autobiography of Franklin* (1868), from the original manuscript which he found in France. Among his other works are *Some Recollections of Antoine Pierre Berryer* (1869); *France and Hereditary Monarchy* (1871); *The Wit and Wisdom of the Haytians* (1877); *Molinos the Quietist* (1882); and a *Life of William Cullen Bryant* (1890). In 1885 he published *The Writings and Speeches of Samuel J. Tilden*; and in 1888 *The Complete Works of Benjamin Franklin*.

Bigelow, MELVILLE M., Ph. D.: legal author and teacher; b. in Eaton Rapids, Mich., Aug. 2, 1846. He received his education at the University of Michigan and at Harvard. For a number of years he has been a lecturer on law in the Boston, Northwestern, and Michigan University law schools. He has written a number of legal treatises, the more important of which are those on estoppel, fraud, and torts. He is the American editor of *Jarman on Wills*.

Bigelow, TIMOTHY: b. in Worcester, Mass., Aug. 12, 1739; a blacksmith who became a member of the Provincial Congress of 1774–75; entered the Revolutionary army as captain of minute-men in 1775; was captured at Quebec, became a colonel of Massachusetts troops, serving at Stillwater, Valley Forge, etc. D. in Worcester, Mar. 31, 1790.

Big'ger, SAMUEL: b. in Warren co., O., about 1800; educated at Athens University; studied law at Lebanon, and commenced practice in Indiana; was member of Congress 1834–35; and subsequently judge of the circuit court; elected Governor of Indiana for 1840–43 by the Whigs. D. at Fort Wayne, Ind., 1845.

Big-horn, or **Rocky Mountain Sheep** (*Ovis montana*): a large sheep native in the Rocky Mountains. It has enormous horns about 4 feet long and from 18 to 20 inches in circumference. It is about 4 feet high, has coarse hair, and moves with great agility.

Big Horn: a river of the U. S.; the largest affluent of the Yellowstone. It rises in the State of Wyoming, among the Wind River Mountains; flows in a generally northward direction; crosses the southern boundary of Montana; enters the Yellowstone at Big Horn City, in Montana. Entire length, estimated at 450 or 500 miles. The upper part or head stream of it is called Wind river.

Biggs, ASA: b. at Williamston, Martin co., N. C., Feb. 4, 1811; educated at an academy; studied law; was admitted to the bar in 1831; was elected member of the constitutional convention of North Carolina in 1835, and of the State Legislature in 1840, 1842, and 1844. He was a member of the Twenty-ninth Congress, and in 1850 was one of the commissioners appointed to revise the statutes of the State. In 1854 he again became a member of the State Senate; elected a Senator in Congress in 1854 for six years; resigned in May, 1858, and was appointed judge of the U. S. district court of North Carolina. D. in Norfolk, Va., March 6, 1878.

Big'ler, JOHN: b. in Cumberland co., Pa., Jan. 8, 1804; a brother of Gov. William Bigler of Pennsylvania; became a printer, a journalist, and subsequently a lawyer. He removed to Illinois in 1846, and to California in 1849, where he was a prominent Democratic politician, and was known as "Honest John Bigler." He was Governor of California (1852–56). D. Nov. 13, 1871.

Bignon, bĕĕn'yōṅ', LOUIS PIERRE ÉDOUARD: a French statesman and historian; b. at La Meilleraye, Jan. 3, 1771. He was elected to the Chamber of Deputies in 1817, and be-

came a peer of France in 1837. He wrote a *History of France from the 18th Brumaire to the Peace of Tilsit* (7 vols., 1827–38), and other works. Napoleon I. bequeathed him 100,000 francs. D. in Paris, Jan. 5, 1841.

Bigno'nia [named by Tournefort in honor of the Abbé Bignon, the librarian of Louis XIV.]: a genus of plants, the type of the family *Bignoniaceæ*, natives of the tropical and sub-tropical parts of America. Many of them are climbing plants, with compound leaves terminating in a tendril, and handsome trumpet-shaped or bell-shaped flowers, which are five-lobed, or rather two-lipped. The *Bignonias* are probably the handsomest twining plants known. The trumpet-creeper or trumpet-flower of the U. S. is the *Bignonia radicans* (or *Tecoma radicans*). It has a large and showy orange and scarlet corolla, funnel-shaped and five-lobed, with four stamens.

Bignonia Family (*Bignoniaceæ*): mostly trees and shrubs (often climbing), dicotyledonous, gamopetalous, with superior ovaries. They are related to the *Acanthus* family, the figworts, bladderworts, etc. There are about 460 species known, natives, mostly, of warm climates. *Bignonia*, *Tecoma*, and *Catalpa* are representative genera. CHARLES E. BESSEY.

Big Rapids: city and railroad center: capital of Mecosta co., Mich. (for location of county, see map of Michigan, ref. 6–I); on the Muskegon river, 56 miles N. of Grand Rapids and 55 miles N. of Muskegon. It has Holly waterworks, extensive water-power (the river being dammed in two places), a heavy lumber trade, and manufactories of furniture, coiled elm hoops, and sash, doors and blinds. Pop. (1880) 3,552; (1890) 5,303; (1900) 4,686.

EDITOR OF "PIONEER."

Big Sandy River: an affluent of the Ohio; the boundary between West Virginia and Kentucky. It is navigable for more than 100 miles for steamboats. Its main stream, or Tug Fork, rises in the S. of West Virginia. Its West Fork flows through Eastern Kentucky. Its valley abounds in coal, timber, and mineral wealth.

Big Spring: town (founded in 1882); capital of Howard co., Tex. (for location of county, see map of Texas, ref. 3–E); on Texas and Pacific R. R., 270 miles W. of Fort Worth; has churches of five denominations, graded public school, private school, and shops of Tex. and Pac. R. R. The industries of the town are principally farming, sheep-raising, and cattle-raising. Pop. (1890) 1,158; not returned separately in 1900. EDITOR OF "PANTAGRAPH."

Big Trees of California: See SEQUOIA.

Big Vermilion River: See VERMILION RIVER.

Big Wood (Boisé or Boisée) River: of Idaho; rises in or near the Salmon Mountains; flows westward, and enters the Lewis or Snake river on the line between Idaho and Oregon. Gold is found near this river.

Bihar, bĕĕ-haar': a county of Hungary; bounded N. by the counties of Hajduken, Szabolcs, and Szatmar, E. by Szilagy and Klausenburg, S. by Arad, and W. by Bekes. Area, 4,279 sq. miles. The eastern part is mountainous, while the western is a plain, consisting alternately of swamps, sandy plains, and fertile ground, traversed by numerous small rivers. All kinds of grain abound, especially wheat of an excellent quality. Wine and tobacco are also raised in great quantities. Pop. (1890) 516,853. Chief town, Grosswardein.

Biisk, beesk: a fortified town of Siberia, in the government of Tomsk; 300 miles S. of Tomsk (see map of Asia, ref. 3–F). Pop. 17,560.

Bijapur, bĕĕ-ja-poor', or **Bejapoor** (i. e. the victorious or unconquerable city): a city of India; in the presidency of Bombay; 245 miles S. E. of Bombay (see map of S. India, 4–D). It was formerly the populous capital of the powerful Hindu kingdom of the same name, which was founded by Tusnef (d. 1510); conquered by Aurungzebe in 1686; and afterward a part of the empire of the Grand Mogul. According to tradition, it contained 100,000 houses, but is at present in ruins. It presents a magnificent external show of domes and minarets, temples and mausoleums, some of which display exquisite workmanship; and lofty walls of hewn stone inclose this scene of splendid desolation. Among the ruins, which are of great extent, is a mausoleum of Mahmud Shah, the dome of which is visible at a distance of 14 miles. Here are several brass cannon of enormous size.

Bikanir, bik-a-neer', or **Biekaneer**: a native state of Rajputana, British India; situated between lat. 27° 30′ and 29° 55′ N., and between lon. 72° 30′ and 75° 40′ E. Area, 23,340 sq. miles. The soil is poor, consisting almost entirely of deserts. The inhabitants are mostly Rajputs. Pop. 510,000.

Bikanir, or **Bickaneer**: a fortified town; capital of state of same name; in an arid and desolate tract 240 miles W. S. W. of Delhi; lat. 28° N., lon. 73° 22′ E. (see map of N. India, ref. 5–C). It is surrounded by a battlemented wall 3½ miles in circuit, and has a citadel, several temples, and lofty buildings, but the streets are dirty and most of the houses mean. Pop. (1891) 55,640.

Bikelas, DEMETRIOS: modern Greek poet and translator; b. in 1835; has translated into modern Greek Shakspeare's *Romeo and Juliet*, *Hamlet*, *Macbeth*, *Othello*, *Merchant of Venice*, and *Lear*. He has published a romance, *Loukis Laras*, 1879, and has written much upon mediæval Greek history and literature. His best-known historical work is *Les Grecs au Moyen Âge* (French translation, 1878). A collection of his poems appeared in 1862; another in 1885.

A. R. MARSH.

Bilaspur, bĕĕ-las-poor': a district of Chhatisgarh division, Central Provinces, British India; between parallels 21° 45′ and 23° 16′ N., and meridians 81° 30′ and 83° 15′ E., forming the upper half of the basin of the Mahanadi river. Area, 7,798 sq. miles. It is inclosed by ranges of hills, except on the south, where it is open and easily accessible. It has abundant natural waters, and also abounds in tanks. Rice, wheat, oil-seeds, and cotton are the chief agricultural staples, and it is so productive that it is popularly called the "land of plenty." Cotton and silk cloths are manufactured in considerable quantities. The climate is relaxing, but not oppressive. Cholera, fever, and smallpox prevail. Pop. 1,000,000, of whom 61 per cent. are Hindus, and 38 are members of aboriginal tribes. Among the Hindus the Chamars, or shoemaking caste, here form a separate religious body. A similar religious body is that of the Pankas, or weaver caste. Both have customs which now distinguish them from the Hindus. Bilaspur is also the name of a native hill state in the Punjaub. Area, 448 sq. miles. Pop. 90,000. MARK W. HARRINGTON.

Bilbao, bĕĕl-baa'ō (often written in English **Bilbo'a**): a seaport-town of Spain; capital of the province of Biscay; on the river Nervion, near the Bay of Biscay, and 28 miles N. W. of Vitoria; lat. 43° 15′ N., lon. 2° 54′ W. (see map of Spain, ref. 13–G). It is partly inclosed by high mountains, and is well built. Small vessels can ascend the river to this point, which is here crossed by several bridges. Bilbao has a cathedral and a number of convents; also manufactures of hardware, hats, leather, paper, and earthenware. The chief articles of export are grain and flour, iron, oil, and fruits. This town was founded in 1300, and was first called *Belvao*, and about 1500 was the seat of a famous commercial tribunal. It has steam communication with London and Liverpool. Was besieged by the Carlists in 1835 and 1874. Pop. (1887) 50,772.

Bilberry, or **Whortleberry**: the fruit of various small shrubs of the genera *Vaccinium* and *Gaylussacia*, and of the natural order *Ericaceæ*, natives of North America and Northern Europe. These fruits, under the name of huckleberries and blueberries, are extensively used in the Northern U. S. and Canada.

Bilderdijk, bil'dĕr-dīk, WILLEM: Dutch poet and philologist; b. in Amsterdam, Sept. 7, 1756; a man of great erudition and versed in many languages and sciences. He studied law and practiced as an advocate at The Hague. About 1805 Louis Bonaparte appointed him secretary of the Institute of Holland. He was the author of many poems, tragedies, and prose works, which had a high reputation and display a remarkable mastery of form. Among his poetical works are *Het Buitenleven* (1803); *Holland's verlossing* (1813); *Vaderlandsche uitboezemingen* (1815); and the fragment of an epic entitled *De ondergang der eerste wareld*. Among his philological works, his *Taal- en dichtkundige verscheidenheden* (4 vols., 1820–23) and *Nieuwe taal- en dichtk. verscheidenheden* (4 vols., 1824–25) are of value. His *Geschiedenis des vaderlands* (13 vols., 1832–53) has considerable importance, though written from the absolutist point of view. Bilderdijk's works appeared in Haarlem, 15 vols., 1856–59. See Isaac da Costa, *De mensch en de dichter Bilderdijk*, 1859. D. in Haarlem, Dec. 18, 1831.—W. Bilderdijk's wife, KATHARINA WILHELMINA BILDERDIJK, b. in The Hague, July 3, 1777, d. in Haarlem, Apr. 16, 1830, was also a well-known poet. See her *Dichtwerken* (3 vols., 1858–60). For further details, see Gorter, *Bilderdijk* (Amsterdam, 1871). Revised by A. R. MARSH.

Bile (Lat. *bilis*): the secretion of the liver in animals. In all vertebrates it is formed chiefly from the blood of the portal vein, which is mingled, however, to some extent with that of the hepatic artery. It is secreted slowly during the intervals of digestion, attaining its maximum (according to Dalton) about an hour after eating. It is in man a golden-red, viscid fluid, with a bitter taste and a peculiar smell. In carnivorous animals it is brownish yellow; in herbivorous, greenish. From 20 to 50 ounces of it are secreted daily in a man. A portion of bile is commonly detained in the gall-bladder, where it becomes more dense by the loss of water and the addition of mucus.

Bile contains certain coloring and saline and other constituents. The "bile salts" consist of cholic (glycocholic) and taurocholic acids, combined in man with soda. These acids are formed in the liver, not being present in the blood, unless from absorption after their elaboration in the liver. Cholesterin, the only alcohol existing free in the body, is present in notable quantity. It is found in the blood in small quantity. Of the bile pigments, *bilirubin* and *biliverdin* are the principal, and are derived from the coloring-matter of the blood.

Entering by the common biliary duct into the duodenum, the bile aids in the digestion of food, especially of fat, and the greater part of it is then reabsorbed from the small intestine. A portion, however, is excreted with the fæcal discharge. Bile stimulates the peristaltic muscular action of the bowels, being the natural laxative. It acts also as an antiseptic to the almost putrescent contents of the large intestine. Solidification of the components of the bile (especially of cholesterin) causes gall-stones, the passage of which through the duct often produces extreme pain.

The bile of salt-water fishes contains potash in place of soda, although from their being surrounded by much common salt (chloride of sodium) in the sea-water, we should naturally expect to find soda in abundance; and the bile of land and fresh-water animals contains soda, while, considering diet and habitat, potash might more naturally be looked for.

Revised by WILLIAM PEPPER.

Bilin, bĕĕ-leen′ (in Lat. *Belina*): a town of Bohemia; beautifully situated in the valley of the Biela; 17 miles W. of Leitmeritz (see map of Austria-Hungary, ref. 2–D). Near it are the celebrated mineral springs which are much frequented, and from which about 2,000,000 bottles of the well-known Sauerbrunnen water are annually exported. The well-known polishing-powder of Bilin is *Bergmehl*. Pop. (1890) 6,493.

Bilious Colic: See LIVER, DISEASES OF.

Bilious Fever: See FEVER.

Bill, or **Beak** (in Lat. *ros′trum*; Fr. *bec*): the hard, horny mouth of birds, consisting of two parts called the upper and lower mandibles, which may be regarded as mere extensions of the upper and lower jaws. Among existing birds the bill is never furnished with teeth, but in a number of fossil forms teeth are present. The bill is the principal weapon of offense and defense of many birds, and is an important character in the classification of the group. The forms of bills are especially adapted to the nature of the food on which the bird subsists, and to the operations by which that food must be procured. In birds of prey (*Raptores*) the upper mandible is hooked and sharp, and the whole bill is adapted for seizing animals and tearing their flesh; birds that feed on seeds have short, strong, and conical bills; while humming-birds have long, straight, and slender bills, fitted to insert into long, tubular corollas. Many aquatic birds, as ducks and geese, have broad, obtuse, and comparatively soft and sensitive bills, with laminæ on the inner margin in order to strain the mud in which they find their food.

Bill: in law, a formal statement or declaration in writing. It is commonly used in connection with some descriptive word, as in the phrases bill in equity, bill of credit, bill of exchange, bill of rights, bill of sale, etc. (*q. v.*). The principal uses of the word without other words of description are as applied to (*a*) a draft of a proposed law pending before a legislature, as "bills for raising revenue." After such a bill becomes a law, it is usually termed an "act" or "statute." (*b*) One of the forms of pleadings by which a common-law action was anciently commenced, answering to the modern declaration or complaint. Also the statement of facts and prayer for relief of the complainant in a suit in equity, usually called a bill in equity (*q. v.*). (*c*) An itemized statement of the claims of a creditor.

Revised by F. STURGES ALLEN.

Bil′lerica: town (founded about 1650); Middlesex co., Mass. (for location, see map of Massachusetts, ref. 2–H); beautifully situated 20 miles from Boston; on B. and M. R. R. Pop. of township (1880) 2,000; (1890) 2,380; (1900) 2,775.

Billet, bĕĕ′*la*′, PIERRE: contemporary French painter of landscape and figures, and of the life of fisher-folk, whose work is marked by simplicity of drawing, good color quality, and virile technique; b. at Cantin, Nord; pupil of Jules Breton; second-class medal, Paris Salon, 1874; second-class medal, Paris Exposition, 1889. Studio at Cantin.

W. A. C.

Billfish: any one of several fishes with jaws elongated into a bill or beak. Among these are species of the genus *Tylosurus*, known also as "garfish" and "needlefish," very common along the Atlantic coast of America; also the fresh-water garfishes of the genus *Lepidosteus*, common in the larger streams of North America, and the spearfish, *Tetrapturus albidus*, allied to the common swordfish.

Bil′liards [Fr. *billard*; Norman French, *billiart*: the stick or staff with which the ball is struck, from Fr. *bille*, a block of wood, hence *billet*]: an indoor game played by driving balls, usually of solid ivory, according to certain rules over the surface of a specially adapted table, called a billiard-table.

Origin and Early Development.—This game, which is now practiced by the people of all civilized countries, was developed out of an outdoor game played upon the grass or ground with two round stones; later with balls of lignum vitæ or other hard, heavy substance. A cone and port were also used, and afterward a cone and an iron or ivory loop, arch, or port, the balls being driven with a mace through the loop, arch, or port, and around the cone and port, in a way similar to the game of croquet. Afterward the game was played indoors in a similar form upon a table. The outdoor game was probably a modification of the ancient game of "bowls," which was played upon the ground with round stones thrown from the hand.

Billiards was known in England in the Middle Ages, having been introduced by the Knights Templars on their return from the second crusade, and the game was common in the monasteries of Europe. It was introduced into France during the reign of Louis XI. (1461), and into America by the Spaniards who settled in St. Augustine, Fla., in 1565.

The earliest authentic mention of the game appears in Reilly's English translation of the Abbé McGeoghegan's *History of Ireland*, in which is given the substance of the will of Cathire More, a sub-king of Ireland, who ruled the district of Leinster in the early part of the second century A. D. The following is a quotation from his will: "To Drimoth I bequeath fifty billiard-balls of brass, with the pools and cues of the same material."

In Great Britain there were added to the loop, arch, or port, and the post and king, three pockets of netting, all on one side of the table, two at the corners and one midway. Then to the square table was added a fourth pocket, and the pockets were placed one in each corner. Later the table was made oblong, and an additional pocket (or sometimes more than one) was placed midway of each long or side cushion-rail, making six pockets, as in the pool-tables of the present day. During the eighteenth century the loop, arch, or port, and the post and king were discarded, and the game was played wholly by pocketing the object-ball, each player playing in turn and taking but one stroke. The practice of each playing until he fails to score is an innovation of more modern times.

In France a hole was cut through the center of the bed of the table and the object-ball was driven into it by causing the ball to rebound from a cushion or by "banking" the cue-ball to a cushion, so that on the rebound it would strike the object-ball and drive it into the hole, from which a groove conducted the ball under the table to an opening at the side. Later no hole was cut in the center of the bed of the table, but six holes were cut in the bed, one at each corner and one midway of each of the long or side cushions. These holes were cut immediately in front of the cushions, but did not extend through the cushions, as do the pockets in the present style of pool-table. The game as played upon these tables was called "doublet," and long continued to be its most popular form in France.

Two white balls were generally used in all countries, the object in playing being to pocket or "kill" the ball of the opposing player. Each player had three "lives," and to the player who remained in the game the longest was awarded

the victory. In the U. S. this game was known in later times as "two-ball pool."

A further improvement in the game was made by the French shortly after the middle of the eighteenth century by the introduction of a third or red ball called the carambolet, thus inventing the carom game. In France with the introduction of the third ball the play was called a *carambole* or *carombolage*; in Great Britain *cannon*, and in the U. S. *carom*. Upon the introduction of the third ball, the game consisted of "both hazards" (i. e. pocketing the balls and making caroms on both object-balls), and was at that period the popular game in France. Soon afterward it became the game of winning and losing hazards and caroms in Great Britain, and this game now (1893) remains the standard there.

Cues and Cue-playing.—In the early part of the eighteenth century cue-playing was first introduced into France and England, the ball being struck with the flat end of the cue. With the flat-pointed cues, however, the cue-ball had to be struck exactly in the center, or a "miscue" would result. The first departure from the flat-pointed cues was the use of cues having a beveled end for striking the cue-ball below the center. Soon, however (about 1790), the end of the cue was rounded off, as it was found that so there was less chance for a miscue, and that certain extraordinary effects could be produced by striking the ball with a rounded cue-point.

From thus rounding the cue-point the side-stroke, twist, or "English" was developed, and soon chalk was applied to the rounded wooden ends of the cues, thus lessening the chance of the cue-point slipping, and the players were able to accomplish better and more remarkable effects.

About 1807 cue-tips were invented by a Capt. Mingaud, a Frenchman who had been imprisoned on account of some political offense. During Mingaud's imprisonment he was allowed the use of a billiard-table, and he experimented for the purpose of devising a covering, or tip, for the end of his cue to obviate the frequent disappointment caused by the wooden point of the old-fashioned cue slipping from the ball, and he soon invented a cue-tip with which he could twist and "draw" the cue-ball in an astonishing manner, so that it seemed to defy all laws of motion. When liberated from prison, Mingaud visited the cafés of Paris and astonished the frequenters of those places with his marvelous execution. Thus was the game of billiards revolutionized, and Capt. Mingaud's cue-tips soon superseded the old-fashioned implements previously used, and rapid improvement in the game soon followed. These cue-tips were introduced into the U. S. about 1823, but as their fame had long preceded them, some of domestic make were already in use.

Soon after the introduction of cue-tips in France the carom-game became popular, and the scoring of hazards or pockets was gradually abolished, and carom-tables were there introduced. These have the carom-rail continuous on the sides and ends, and are without pockets.

The game of billiards is played in the U. S. almost exclusively upon the carom-table, while tables with six pockets, one at each corner and one at the center of each side, and those with four pockets, one at each corner, are used for fifteen-ball pool.

Billiard-tables.—The present shape and construction of billiard-tables are the result of much experiment and observation. They have been made square, round, oval, octagonal, and last and best in the shape of an oblong rectangle. The frames are made of hard wood, as rosewood, walnut, maple, oak, etc.

The beds were at first made of wood, soft pine being used, then oak and other hard woods, the beds being made in small panels to prevent warping. When they became indented after considerable use the cloths were taken off and the beds planed down. About 1827 marble beds were introduced, but marble was soon superseded by slate, which, not being porous, does not gather moisture and rot the cloth, and is also not so brittle as marble, and therefore not as liable to be broken.

Generally three or four slabs, an inch in thickness, are used, and over this bed is stretched fine, green Simonis broadcloth. The table being made perfectly level, this gives a smooth, even surface for the balls to roll upon. Around this bed, and rising about 2 inches above it, are rails bearing the cushions, the top surface of which is 34 inches above the floor. The edge of the cushion where the ball comes in contact with it is $1\frac{7}{16}$ inches above the slate, and is, or should be, slightly pitched to prevent the ball from jumping and to permit the cue to strike the ball at the proper point. This height is adapted to the billiard-ball of regulation size. For balls of a different size the elevation of the cushions should be changed so that they come about a quarter of an inch above the center of the ball.

Upon the cushion much of the success of the stroke depends, and to insure the best results it should be made as nearly perfect as possible, combining qualities that will assure durability and accuracy; it should possess that nice degree of elasticity, the exactness of which requires long experience to learn, that will insure a proper angle when the ball rebounds; it must be unaffected either by damp or dry weather or by changes of temperature.

In 1835 cushions of india-rubber were introduced into both Great Britain and the U. S., which, on account of their elasticity, created great enthusiasm.

No other notable improvements were made until about thirty years later, when a vulcanized cushion (which was a combination of pure elastic and hard rubber) was introduced, the hard rubber being set on the front of the cushion to stiffen its face against the impingement of the balls. These cushions, on account of the correctness of the angles at which the balls rebounded and their elastic and wearing qualities, became a complete success, and are now in general use.

Since 1855 numerous improvements have been made in the construction of billiard-tables; and the skill of the manufacturers of the U. S. now leaves little further to be desired.

For a 5 by 10 table the cross-arms of the gas-pendant should measure from light to light 28 inches, and the long arms 56 inches. The standard size of the billiard-table used by the experts of the U. S. for all match games is 5 feet wide by 10 feet long, but for private houses and public billiard-rooms the smaller table, $4\frac{1}{2}$ by 9 feet, has become more popular and the 4 by 8 feet table is frequently used. In Great Britain the standard size of table is 6 by 12 feet, the balls used on them are $2\frac{1}{16}$ inches in diameter, and the pockets are $3\frac{5}{8}$ inches wide where the slate is cut away.

Billiard-rooms.—An apartment to accommodate a billiard-table should be of sufficient size to afford space for the free exercise of the cue. For tables 5 feet by 10 feet the room should be at least 15 feet by 20 feet. Architects in their plans for modern mansions now make suitable provision for this amusement. The light, if possible, should come from above, so as to prevent any shadow being thrown from the balls or cushions. The gaslight should be raised about 3 ft. 2 in. from the bed of the table and supplied with horizontal burners, as by such an arrangement no shadow is thrown from the pipe.

Modern Billiards.—As a game for both sexes billiards, as now played, is one of the best of all indoor pastimes. Its attractions are enhanced by the fact that it may be played by more than two persons, for billiard-games are varied, and several have been invented to accommodate party-playing. The use of the cue brings into gentle action all the muscles of the body, and it is said that an active player will walk a mile or two during the playing of a single game.

Proficiency in playing billiards calls for a quick eye, a steady hand, an exact measurement of distance and angles upon the table; it requires a deft and delicate touch in order to manipulate the cue and the cue-ball; great judgment is required in properly estimating the strength of stroke to be delivered to accomplish the different shots which present themselves, and correct judgment in this respect is as important as is correctness in the aim. The necessary force of stroke also depends upon the humidity of the atmosphere, as in damp days the cloth absorbs moisture and offers greater resistance to the ball. Scholars may in playing the game find mathematical, geometrical, and algebraic problems constantly arising before them for their solution.

The original American game was known as the American four-ball game of caroms and hazards, and was played on a 6 by 12 six-pocket table. This game was played in France before it was known in the U. S., and was called "The game of the Revolution." Variety was probably the aim of those who devised the game and it was a combination of the French game and the Russian game of "Carline." The former was composed of caroms and hazards and was played with three balls, while the Russian game was composed of hazards and caroms and was played with five balls: a clear white ball, a spotted white, a yellow or black ball, which was called the "Carline" and which was spotted in the center of the table; a red ball, which was spotted at the foot of the table, as in the American and French games, and a blue ball which was spotted at the head of the table.

The American four-ball game of caroms and hazards is played with two white balls (one of which has a small black spot to distinguish it from the other white ball), a light-red and a dark-red ball. The light-red is "spotted" at the head of the table and the dark-red ball at the foot of the table. The game is opened by "stringing" for the lead and choice of cue-balls. The player who strikes his ball from within the string-line, i. e. all that part of the table behind the spot at the head of the table, causes it to hit the cushion at the foot of the table, and lands it nearest the cushion at the head of the table, wins the lead and the choice of balls, and can choose the first shot or compel his opponent to play first. The white ball of the non-striker can be rolled down the table, through a stroke with the cue, past the dark-red ball at the foot of the table, and must come to a rest below that ball, or the non-striker may place his ball upon the white-ball spot at the foot of the table, 5 inches from the foot cushion and directly on a line with the other spots. In opening the game the player must strike his opponent's white ball before striking any other ball with his own. In the early American game a carom from white to red or from red to white counted two; from red to red three; from white to red, then to the other red, five, or *vice versa*; pocketing the opponent's white two; pocketing the red three; pocketing both reds six; pocketing the white and both reds eight; pocketing the three object-balls, after making a carom on all three, scored thirteen for the striker. Should the white cue-ball go to pocket from the white object-ball, or either before or after striking a red ball, the striker forfeited two; should the white cue-ball go to pocket off a red ball, the striker forfeited three. The game consists of 100 points. Playing the "spot-ball," i. e. scoring a succession of pockets without a miss, or without resorting to a carom, had been so perfected by the experts of the time (previous to 1854) that runs in the hundreds were common, and Lynn Higham, of Albany, N. Y., professionally known as the "Albany Pony," was credited with a run of 2,400 points off the spot-ball, scored without resorting to a carom and counting three for each pocket. In the fifties it became popular to make it conditional in regard to pocketing the red ball off the spot, and the play was limited to three strokes off the spot; then a carom was required. Later once off the "spot" became a common requirement among the better class of players. About this time the expert amateur and professional players abolished the pocketing of balls from the American four-ball game and resorted to caroms altogether, and in 1861 6 by 12 foot four-pocket tables were introduced, and the American four-ball carom game continued to be the common game of billiards in the U. S. until 1876. In April of that year the final public championship contest was played at that particular game.

As an offset to spot-ball play, the nursing of balls became so perfected by the great experts of the sixties and the early seventies, and such extraordinary runs were scored, that a game of 1,500 points was never held safe by a player who might, perhaps, be in the lead by several hundred points. In April, 1869, the American four-ball, bar-push game was inaugurated through a tournament which was held in Irving Hall, New York. Four changes were made in the rules in this tournament: The "push" shot was officially excluded; the table was reduced in size from 6 by 12 to 5½ by 11. The table was, as before, a four-pocket, but the size of the jaws of the pockets was made to measure 4 inches, and not more than three successive caroms could be made with the balls in the jaw. The system of counting and scoring the game was so changed that each single carom counted three and each double carom six, where formerly from white to red had counted two and from red to red three, and what was known as the "Diamond Cue Championship" was established through this tournament.

Further changes in the playing of the game occurred in 1873. The expert amateur and professional players had been favoring and gradually in their practice-playing drifting toward the three-ball carom game, and match contests at three-ball carom billiards, played on 5 by 10 tables, had become matters of record. In June, 1873, the first tournament for the championship at regular three-ball billiards on 5 by 10 table was inaugurated in Irving Hall, New York, and what became the "Challenge Cup Championship of the World" was inaugurated. A new set of rules to govern three-ball billiards was approved of by practical critics and experts, which, upon being submitted to a congress of experts and the players who were to participate in the tournament, were adopted as the standard rules to govern contests for the cup trophy which was to become emblematic of the championship of the world at regular three-ball billiards. All games were to be played on a 5 by 10 table. Each carom was made to count one; the crotching of balls was barred, and object-balls whose centers were both within a square of 4½ inches at either corner of the table were considered to be within the line. When the object-balls were so within a square three counts only would be allowed, unless at least one of the object-balls was forced out of it. In case of failure by a player to dislodge an object-ball from the square, his hand was out and the next player played with the balls as he found them.

Regular three-ball billiards was so mastered by the great experts that in 1880 a record at run-getting was established by Vignaux, in a match contest in Paris, of 1,531. In 1879 restrictions were placed upon the rail-nursing of balls, through the introduction of triangular spaces in each corner of the table, through a line drawn upon the surface of the cloth from a point on the face of the end cushions measuring 14 inches out from the corner of the cushions to a point on the face of the side cushion measuring 28 inches out from the corners. But three strokes were permitted with both object-balls within any of these triangular spaces without driving at least one ball out. These spaces were first used, but in a diminutive form, in the Vignaux (New York) tournament of 1874, they measuring in that tournament 5½ inches out on each cushion rail from the corners of the cushions. The games in the tournament with the larger triangular spaces (14 by 28) established a championship at "The Champions' Game," as it was called, but the game was short-lived, and there were but four public contests for the trophy emblematic of the championship of that game.

Meantime the amateurs of the world continued to practice the regular game of three-ball billiards, and mostly upon 4½ by 9 tables, and amateurs left to the professional experts the restricted games of billiards where lines and spaces were marked out on the cloth.

In 1883 the balk-line game came to the front through a professional tournament in Chicago. The lines in this tournament were made 8 inches from the cushions, and were drawn lengthwise of the table and across the table at the ends. Eight restricted spaces were thus formed, four being in the corners of the table and four along the side and end cushions. But two counting-strokes were allowed with both object-balls within any of these restricted spaces. The 8-inch balk-line game was, however, soon mastered by the great experts of the day, and in order to bring the non-nursing experts, who were known as "cushion-carom" players, and the nursing experts of the time together on equitable terms it was thought advisable to inaugurate a tournament at 14-inch balk-line billiards, and in Apr., 1885, the 14-inch balk-line game was formally introduced to the public. It was not until Dec., 1890, that a championship was established at 14-inch balk-line billiards, and this special restricted game of billiards remains the standard game for the expert "professional" players. Amateurs practice the regular three-ball carom game throughout the U. S. and Canada, France, and some other countries, and without regard to the restricted balk-lines.

For the rules of billiards and pool in all games, and for instructions how to play the games, see *Modern Billiards*, published by the Brunswick-Balke-Collender Company, New York.

MORTIMER T. HUMPHREY.

Bill in Equity: a statement of the plaintiff's case in a suit in court of equity, corresponding to the "declaration" or "complaint" in the common law. The defendant's reply is called the "answer." It is not necessary to adhere to a prescribed form in drawing up a bill in equity, as it is in the case of a common-law complaint; and the essence of a bill in equity is the statement of the facts and the prayer for relief or otherwise. (See PLEADING.) A bill is either original or not original. An original bill initiates the suit; a bill not original, as a cross-bill, a supplementary bill, etc., is used to controvert or suspend or revise a proceeding in the cause, as a decree or order, or for cross-litigation. In particular suits the bill receives special names, such as "bill of peace," "bill of interpleader," "bill of discovery," "cross-bill."

Revised by F. STURGES ALLEN.

Billings: city; capital of Yellowstone co., Mon. (for location of county, see map of Montana, ref. 6–H); on Northern Pacific R. R., and Yellowstone river, which furnishes water-power; chief distributing and shipping point for the great stock-ranges of Eastern Montana and Northern

Wyoming, and the wool-market of Montana. It is the terminus of a railroad to the largest and best coal-field in Montana, and has fine stone-quarries. Pop. (1890) 836; (1900) 3,221.

Billings, John Shaw, M. D., LL. D., D. C. L.: surgeon; b. in Switzerland co., Ind., Apr. 12, 1838; graduated at Miami University 1857; at the Ohio Medical College 1860; appointed acting assistant surgeon in the U. S. army 1861; served through the war, being with the Fifth Corps at the battles of Chancellorsville and Gettysburg; from Dec., 1864, connected with the surgeon-general's office in Washington; appointed surgeon, with the rank of major, in the regular army Dec., 1876; retired in 1895; in the same year became Pepper Professor of Hygiene in the University of Pennsylvania, and in 1896 was appointed director of the New York Public Library (Astor, Lenox, and Tilden foundation). He is the author of *Report on Hygiene of the United States Army* (1875); *Principles of Ventilation and Heating* (1884); *Mortality and Vital Statistics of the United States* (2 vols., 1885); *Index Catalogue of the Library of the Surgeon-General's Office* (12 vols. royal 8vo, 1880–92); *The National Medical Dictionary* (2 vols., 1889); *Description of Johns Hopkins Hospital* (1890); and of numerous papers in scientific and medical periodicals.

Billings, Josh: See Shaw, Henry Wheeler.

Bil'lingsgate: a wharf and fish-market of London; below London bridge; was made a "free and open market for all sorts of fish" in 1699. It is the only wholesale fish-market in London, and all fish, fresh or cured, if imported in British vessels, are admitted free of duty. All fish are sold here by tale, except salmon and eels, which are sold by weight; oysters are sold by measure. No fish are sold on Sunday, except mackerel. The women who vended fish here were formerly notorious for ribaldry and vituperative personalities, so that "Billingsgate" became a synonym of vulgar and foul expressions.

Billion: in the French system of enumeration, in use in the U. S., a thousand millions. In Great Britain a billion is a million millions—1,000,000,000,000.

Billiton, bi-lē̆e-ton', or **Billeton**: a Dutch island in the East Indies; situated between Borneo and the southeast end of Sumatra, and separated from Banca by Clement's (or Gaspar) Strait. It is about 3° S. lat., and 108° E. lon. (see map of East Indies, ref. 7–D). Area, estimated at 1,860 sq. miles. Iron ore and good timber abound here. Trepang, tin, birds' nests, and tortoise-shells are exported from it. Pop. (1890) 37,803, of which about 10,000 are Chinese and 100 Europeans.

Bill of Attainder: a legislative enactment declaring the attainder of one or more persons. (See Attainder.) Formerly persons were often attainted of high treason in England by act of Parliament, and during the war of the Revolution bills of attainder were frequently passed in this country. The Constitution of the U. S. provides that neither a State nor Congress shall pass bills of attainder. Such a bill is usually opposed to sound legislation in four principal respects: It is adopted by the legislature, instead of being a sentence by the judiciary; it departs from judicial rules in establishing the commission of the alleged criminal act, having no regular methods of trial or rules of evidence; it may declare an act to be a crime which was not so when committed; and it admits of the infliction of cruel and unusual punishments. Thomas Wentworth, Earl of Strafford, was attainted in 1641, but the matter ceased to be important in Great Britain by Acts of Parliament, 1870.

Bill of Credit: in law. (1) In mercantile law, a letter written by one person to another authorizing or requesting him to give credit to a third or his order, or to bearer. Such a letter is general when addressed to any one who may see fit to give the proposed credit, and who on giving credit may have recourse to the writer of the letter. On such a letter several persons may successively give credit. The letter is special when addressed to specified persons, so that they alone can give the credit. (2) The U. S. Constitution provides that no State shall "emit bills of credit." This expression is construed by the courts to mean instruments issued for the payment of money—issued on the credit of the States as such, payable at a future day, and intended to circulate as money. The clause does not prevent a State from issuing bonds for the payment of its indebtedness, payable at a future day; nor does it prohibit the creation of banks which issue currency. The provision aims at the use of the credit of the States in their corporate character, and was made in pursuance of the general policy which took from them the power to coin money, and restricted their power over the legal tender.

Revised by F. Sturges Allen.

Bill of Exceptions: a formal statement in writing of exceptions taken to the judge's opinion, decision, or direction upon matters of law during a trial. It sets forth the proceedings at such trial, the decision or ruling made, and the exception thereto, signed and sealed by the judge in testimony of its correctness. The object of a bill of exceptions is to bring the alleged error of the judge before the proper court for review, and it usually contains only such portion of the proceedings and evidence taken at the trial as is necessary for that purpose. Formerly the right to a bill of exceptions did not exist in cases of treason or felony, but now the defendant has this right in most of the United States.

Revised by F. Sturges Allen.

Bill of Exchange: an open letter of request, whereby one person requests another to pay a third or his order, or to bearer, a sum of money, absolutely and at all events. The person who writes the letter is called the *drawer*; the one to whom it is addressed is termed the *drawee*; and the person who is to receive the money is the *payee*. A bill of exchange is either inland or foreign. Where the parties are in the same State, it is inland; where the drawee resides in a State or country different from that of the drawer, or in any case where the bill is drawn in one State upon a person in another, it is foreign. A bill may be considered under the following heads: 1, its nature; 2, indorsement; 3, acceptance; 4, presentment for payment, and steps to be taken to charge drawer and indorsers.

1. A bill of exchange having all the requisites referred to in the definition as above given is *negotiable*, unless some other requisite is prescribed by statute, as is sometimes the case. Thus in some of the U. S. the receipt of a valuable consideration must be expressed. By this word is meant that a transfer of it in good faith before maturity will give the purchaser a right of action in his own name in a court of law, as distinguished from a court of equity; and he accordingly takes a title free from defenses that may have existed between the original parties. But if any of the qualities referred to in the definition are wanting, *negotiability* does not exist. The paper becomes assignable, and the defenses between the original parties are let in. Negotiability, however, assumes that the instrument has a legal existence as to its outward form, and is accordingly executed by a person competent to contract. A bill of exchange drawn by or upon a married woman or an infant would not create a valid obligation even as to a purchaser in good faith; nor if the instrument were declared void by statute, as is sometimes the case when infected with usury or given for a gaming consideration. Under these rules, if an instrument otherwise in the form of a bill of exchange were payable in something other than money, or upon a contingency, or from a special fund, or to a particular person, without the addition of the words "order" or "bearer," it would not be negotiable. The law presumes that a bill is given for a valuable consideration. Evidence may be offered as between the original parties, and as to all who can not insist upon the protection of negotiability, that there is no consideration. An important distinction thus arises between what may be called business paper and accommodation paper. The former is given for a valuable consideration as between the original parties, such as for money lent or goods sold. In accommodation paper there is no such consideration, but the person who makes it intends to lend his credit to some person. Every party to a bill may hold this relation to it. Thus there may be an accommodation acceptor, drawer, or indorser. This kind of paper must be distinguished from that which is simply without consideration, in which there is no *intent* to have the credit of the party who makes it used. A single illustration will show the distinction. If a person should draw a bill in favor of his friend on account of his affection, it would be simply without consideration; if under the same circumstances it was drawn with intent to have it discounted by a bank, it would be "accommodation paper." In the one case, if a purchaser should acquire it with knowledge of all the circumstances, he could not enforce it, while in the other case he could, by reason of the intent. When accommodation paper has been acquired for value, it is substantially equivalent, as far as the holder is concerned, to business paper. Between the original parties it would have no validity, and could

not supply the basis of an action. On the contrary, if an accommodation party to the bill is obliged to pay, he has his remedy against the party in whose favor he acted, either on the bill or on an implied contract, as the case may be. Thus an accommodation acceptor could not bring an action *upon the bill* against the drawer whom he had accommodated, but would be driven to an action on an implied contract on the part of the drawer to repay money which had been paid for the drawer's use and benefit. When one party gives his acceptance to another in return for the other's acceptance, it is not a true case of an accommodation acceptance, though sometimes so called. These "cross" acceptances are based upon a consideration, the one promise being a consideration for the other. They are certainly dangerous contracts, as either party may be called on to pay to a holder not only his own acceptance, but that of the other party. Without further pursuing this distinction, attention should be called to a peculiarity in this branch of the law which shows its close connection with the subject of currency. It is a well-settled general rule of the common law that a person having no title to goods can transfer none, even to a purchaser in good faith. A thief or a finder, for example, can create no better title than he possesses. There is a marked exception to this rule in the case of money. One who has stolen money may give a perfect title to one who takes it in good faith and for value. This exception is demanded by the necessities of commerce. The rule is extended to negotiable paper, payable to bearer, or even to order, when so indorsed as to pass from hand to hand without further indorsement.

It is plain that a bill when drawn imposes no obligation upon the drawee. It is necessary that he should assent to it in some legal form before he becomes liable. This act is termed "acceptance." Before acceptance the only person liable to the payee is the drawer. His liability is a contingent one, and implied by law. There is thus a marked distinction between the liability of a drawer and acceptor—one is implied, and the other is express and created by contract. The implied obligation of the drawer is created by the custom of merchants, and is conditional. It requires certain acts to be performed as a condition precedent to recovery of the amount of the bill, such as presentment either for acceptance or payment, and due notice to be given of a failure to accept or pay, as the case may be. This distinction between the *implied* liability of the drawer and the *express* contract of an acceptor is of great consequence, and must be carefully attended to. The same remark may be made as to the liability of an indorser. This is also implied and conditional. The nature of a check upon a bank should be referred to. It resembles a bill of exchange, though it is not precisely equivalent to it. The check, according to the better opinion, creates no obligation against the bank in favor of the holder without acceptance. In mercantile phrase, a check when accepted by the act of an officer, such as a teller, is said to be "certified." The bank after such an act is liable to the holder. The drawer of a check having funds on deposit has an action against the bank for damages for a refusal to honor his check, on the ground of an implied obligation to pay checks according to the usual course of business. While checks are usually drawn payable immediately, they may be made payable at a future day (being then called "post-dated checks"), when their resemblance to a bill of exchange is still more close.

2. *Indorsement.*—The payee of a bill may transfer it by writing his name upon the back of it. He is then termed an indorser. When the name is simply written the indorsement is said to be "in blank"; when some person is pointed out to whom payment is to be made, it is said to be "in full." When a bill is indorsed in blank, it will pass from hand to hand, as though payable to bearer; when indorsed in full, an indorsement by the person to whom it is tranferred will be necessary to its further transfer. There may be a series of indorsers, called first, second, third, etc., indorsers. Under these rules no holder can claim a title to a bill payable to order except through an indorsement made by the very person to whom it is payable, or some one holding under him, such as his executor, administrator, or assignee in bankruptcy. Accordingly, if it should come into the possession of another person of the same name as the owner, but acting without authority, he could give no title to one acting in good faith. When an owner of a bill indorses it for value, he can impose upon the purchaser no valid restriction preventing its further transfer. The right of sale is an inseparable incident to ownership. On the other hand, if a person indorse a bill to an agent, he may place valid restrictions upon the agent's authority to sell. These, if incorporated in the indorsement, will bind all purchasers. Where a bill is payable to several persons, all must, in general, unite in an indorsement. The regular effect of an indorsement is twofold; one consequence is to transfer the indorser's interest, and the other is to create an implied obligation on his part to pay the bill in case that the drawee does not accept or pay at maturity, and proper steps are taken to charge him. In an accommodation indorsement, as there would be no ownership, the sole effect would be to create an obligation to pay. This obligation closely resembles that of suretyship. Thus when a bill is accepted the acceptor is primarily liable, and the indorser is, as it were, a surety. The rules governing suretyship may in the main be invoked in his favor. An indorser may avoid this liability by making use of suitable words in his indorsement, such as "without recourse." The indorsement would then simply operate as a transfer of such interest as he might have. Indorsers are commonly liable in the order of time of their indorsements. Thus if there were three indorsers, if the third (or last) was compelled to pay, he would be entitled to sue the second or first, and recover in full. A holder need not pursue any prescribed order as between the indorsers. He may select any one, who, if he pays, will be entitled to proceed in the same way as to any one preceding him. If, however, the bill is made payable to several payees, who indorse, they are liable jointly and not successively, and each, as between themselves, would be liable only for their respective shares. Every indorsement is a new contract. One of the consequences of this rule is, that though the original bill may be void, the indorser will still be liable, as if the bill be void for usury or be made by a married woman. Another consequence is that the rules of private international law may cause a different effect to be given to the respective indorsements. Thus if A should indorse in one State or country, and B should indorse the same bill in another, each indorsement would be governed as to its effect by the law of the State or country where it was made. The mere act of writing one's name is not an indorsement; there must also be a delivery. Accordingly, if one should write his name and die before delivery, an executor could not deliver the bill so as to make a valid "indorsement." The proper course would be for the executor to indorse it in his representative character.

3. *Acceptance.*—The object of acceptance is to show the assent of the drawee of the bill to pay it according to its terms. Without such assent he would not be liable. He is allowed a reasonable time after the presentment of a bill within which to decide whether to accept it or not, which time has been held to be twenty-four hours. The regular and formal method of acceptance is to write the name of the drawee upon the front of the bill. But no particular mode of acceptance is necessary. It may be made by a writing separate from the bill or orally. It may sometimes be implied, as, for example, by a detention on the part of the drawee beyond a reasonable time. It may be either absolute or conditional. A conditional acceptance may be illustrated by one purporting to be made "on the consignment of goods to the drawee." A holder could not collect in such a case if there was no such consignment. An acceptance should not differ from the terms of the bill. A holder may decline to take such an acceptance, and treat the case as though there was no acceptance. Should he assent to it, he would thereby discharge the drawer and existing indorsers. It is not always necessary that there should be presentment for acceptance as distinct from one for payment, though in some cases it is requisite. Where a bill is payable a fixed number of days "after sight," the word "sight" means acceptance, and it would be necessary to present it once for acceptance, and, if that act took place, again for payment. If, on the other hand, the bill were payable a certain number of days "after date," it would only be necessary to present it once for all for payment, though it would usually be an act of prudence to present it for acceptance, as the holder would, in case of acceptance, have an additional person to whom he could have recourse, and in case of non-acceptance he could take immediate steps to charge the other parties to the bill. There has been great controversy on the question whether bills payable "at sight" must be presented for acceptance as well as payment. In some of the States the doubt is settled by legislation. The effect of acceptance is to make the drawee the

principal debtor. The other parties stand in relation of sureties, and if they are compelled to pay, they have their remedy over against the acceptors. This is clearly the case in business paper; in the case of an accommodation bill the position of the parties is of course reversed, so that the acceptor, as already explained, has his remedy on an implied contract against the person to whom he lent his credit, though as to the holder of the bill he holds the place of a principal debtor. Under these rules an acceptor is bound to know the handwriting of the drawer, and if that be forged he is still liable to the original holder. If acceptance is refused, the proper course, in the case of foreign bills, is to have a protest made, and prompt notice sent to the drawer and indorsers. In case of inland bills, protest is not essential, though presentment and notice are. Statutes usually allow protest in case of inland bills as a convenient medium of proof that the necessary steps have been taken to charge the parties to the bill. The term "protest" is applied to an official act by an authorized person (notary public), whereby he affirms in a formal or prescribed manner, in writing, that the bill has been regularly presented for acceptance or payment, as the case may be, and that it has been refused. It is used as presumptive evidence at a trial to establish the facts in question. The office of a "notice" is to give immediate information to the drawer or indorsers of failure of acceptance, so that they may take such steps as they deem necessary for their protection. The protest and notice are thus entirely distinct acts for different purposes, and must not be confounded. Assuming that acceptance has been refused and due protest made, mercantile law allows any person to intervene and accept a bill "for the honor" of a drawer or indorser. A holder is not bound to take such an acceptance, though it is valid if assented to. It takes place before a notary public, and is termed an acceptance "*supra protest*." The person thus intervening states for whose honor he accepts. In case he pays, he becomes the creditor of that party, and may also have recourse to all who precede him on the bill, in opposition to the general rule of law that one can not become the creditor of another without his consent. When the bill matures it is again presented to the original drawee for payment, who may in the meantime have been placed in funds, and may now be willing to take up the bill. Should he again refuse, it is protested and presented to the acceptor *supra protest* for payment, and if he then refuses to make payment, another and final protest will be necessary to charge drawer or indorsers.

4. *Presentment for Payment.*—It is a general rule that as between debtor and creditor no presentment for payment is necessary. It is the duty of the debtor to seek the creditor, and if the day for payment elapses without it there is an immediate remedy by action. The better opinion in the U. S. is that this rule applies to an acceptor of a bill of exchange, even where it is payable at a particular place, such as a specified bank. On this view it would not be necessary for the holder to prove a presentment, but the acceptor might show in his defense any facts that would relieve him or diminish liability, such as that he had left funds with the bank, which had failed. But to charge drawer and indorsers the case is entirely different. These enter into no absolute engagement, but only into an obligation implied by law. It is a part of the implied contract that presentment for payment shall be made, and protest, where that is necessary, and notice given. These acts must be alleged in the pleadings, and proved at the trial as conditions precedent to a right of recovery. The modes of performing these various acts branch out into much detail, and only the leading ones can be brought within the compass of this article. The general rule is that the bill, when payable without designation of place, must be presented, when it matures, to the acceptor, either at his residence or place of business, and, if at the place of business, within business hours. If a particular place, as a bank, is designated, presentment must be made there within the usual hours devoted to banking business. This duty continues, though the place of business be closed or the acceptor be notoriously insolvent. In the case of an accommodation acceptance no presentment is necessary in behalf of the person to whom the accommodation is given, since he could have no action against such an acceptor. The duty of presentment, as well as of the performance of the succeeding acts, may be waived by a party to the bill by appropriate acts. This waiver may take place either before or after maturity of the bill. An instance would be a writing on the bill, "I hereby waive demand of the within bill," or "I hereby waive notice of demand." The latter expression would be imperfect, since a waiver of notice does not dispense with the necessity of presentment, while a waiver of demand is, from the nature of the case, a waiver of notice.

A bill does not ordinarily actually mature on the day on which it apparently falls due. Three days are allowed, termed "days of grace." These have become so fully a part of the contract that the presentment before the last day of grace is nugatory. Should the last day fall on Sunday or a public holiday, the bill matures on the preceding day, except in New Jersey, where it falls due the day after. This matter is sometimes regulated by statute. If presentment is made and refused, protest should take place in the case of foreign bills, as already explained in reference to non-acceptance, and notice given to the parties to be charged. The subject of notice requires a fuller explanation than what has been given in connection with non-acceptance. The object of notice is to give information to the respective parties, to the end that they may protect themselves from loss. The test of its sufficiency is whether it gives the requisite information. No particular form is necessary. It may be either oral or written. It is a common practice to reduce it to writing, and either to give it to a party personally, or to send it to him by mail. By the general rule of law the mail can only be used for the purpose of transmission, and, accordingly, can not be resorted to where the holder and the person to be notified obtain their letters from the same post-office, though it is in some instances otherwise by statute. The law requires extreme diligence in dispatching the notice. It should be sent as early as the next day, and some authorities require by the first convenient mail on the next day. If the notice is properly sent by the mail, it will suffice, though never received. Any indorser receiving notice has a day to send it to one preceding him. After notice the rights of the holder are fixed, and it is not necessary for him to bring his action any earlier than he would be required to do by the statute of limitations. Delay to collect the bill from the acceptor does not of itself discharge the drawer and indorsers. If, however, a bargain (based upon a consideration) is made between the holder and acceptor, whereby the time of payment is extended, the drawer and indorsers are discharged, unless their consent is obtained. The drawer is not only liable for the face of the bill, but for damages incidental to non-payment. These damages are in some cases fixed by statute. It is sometimes necessary to take into account the difference in exchange between two countries; as, if a bill drawn in New York were payable in London, exchange being in its favor, and the action on the bill were brought in New York, and it cost a certain per cent. to place the funds in London, that amount should be included in the recovery. See PROMISSORY NOTE and EXCHANGE.

T. W. DWIGHT.

Bill of Lading: the written evidence of a contract for the carriage of goods by water. It is usually signed by the master of the vessel, either in duplicate or triplicate, acknowledges the receipt of the goods from a person (called the consignor), and undertakes to deliver them to a designated person (the consignee) or his assigns at a specified place, for the compensation and on the conditions therein specified. An indorsement of the bill of lading transfers the title to the goods, and, if made in good faith and for a valuable consideration, cuts off the right of stoppage *in transitu*. For most purposes, a bill of lading is assignable, and an assignee takes it subject to any defense existing between the original parties. For the single purpose of shutting out the right of stoppage *in transitu* it is negotiable. (See STOPPAGE IN TRANSITU.) This instrument consists of two parts—a receipt and a contract. That portion of it which is a receipt can be contradicted, as between the original parties, by parol evidence. For example, if it were stated that the goods were in good order, evidence may be adduced to show the contrary. This proposition would not extend to a person who had made advances on the faith of the statement, as he could invoke the doctrine of estoppel. (See ESTOPPEL.) The part of the bill which is a contract can not be contradicted by parol evidence, even as between the original parties. Although the term was originally applied only to a memorandum of a contract for transportation by water, it is now frequently used to denote the memorandum given by *any* carrier of the terms on which he agrees to carry the goods received.

T. W. DWIGHT.

Bill of Pains and Penalties: a special act of the legislature declaring a person guilty of some offense, without

any conviction in the regular course of judicial proceedings, and inflicting upon him some punishment less than death. It differs from a strict bill of attainder in that the punishment inflicted by the latter is death. Bills of pains and penalties are within the provision of the U. S. Constitution that neither Congress nor a State shall pass a bill of attainder or an *ex post facto* law. Thus a law of Congress disqualifying all attorneys of the Supreme Court who refused to take an oath that they had not been engaged in rebellion was accordingly held to be void. *Ex parte Garland*, 4 Wallace, R., 333. Revised by F. STURGES ALLEN.

Bill of Particulars: a written statement of the particulars of the demand for which an action at law is brought, or of a defendant's set-off against such a demand.

Bill of Peace: a bill in equity by which a person seeks to prevent a multiplicity of suits involving the same point, brought by a numerous class insisting upon the same right or by an individual attempting to establish an unsuccessful claim. An injunction is granted on the principle that equity will grant relief to prevent useless or oppressive litigation or irreparable mischief. A bill of peace is analogous to a bill *quia timet*, but is generally distinguished from it by the fact that it is brought only after the commencement of adverse proceedings. F. STURGES ALLEN.

Bill of Rights: an English statute enacted at the time of the accession of William and Mary to the throne. It declared, among other things, the right of the subject to petition the king, freedom in the election of members of Parliament, and freedom of speech in Parliament. It affirmed that standing armies without the consent of Parliament are illegal, that the king had no power of suspending or dispensing with laws, nor of levying taxes without the consent of Parliament. It provided that excessive bail should not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted, and for the right of Protestant subjects to bear arms for their defense. The provisions of this act have had great influence in the U. S., and are deemed of high consequence, as securing liberty to the individual. A number of them are literally inserted among the amendments to the U. S. Constitution, and are also found in State constitutions. Bills of rights were favorite enactments of the conventions in France following the revolution of 1789. The phrase "bill of rights" is frequently employed in the U. S. to designate all those portions of a constitution, State or national, designed to secure liberty to the individual.

Bill of Sale: a writing under seal conveying the title to goods and chattels. The seal by the common law is conclusive evidence of consideration. Accordingly, a bill of sale formally executed passes the title without any consideration or delivery of the property. Where there is no seal, there must be a consideration or delivery. A delivery without consideration would amount to a gift. A bill of sale may pass a title which would be valid as between the parties, and yet not of force as to creditors or purchasers, as if one who was indebted should make a bill of sale without actual consideration, or should sell, even with consideration, and still retain possession of the goods. The transaction might be regarded as infected with fraud, even though there were no fraudulent intent actually embodied in it. (See FRAUD.) English cases speak of the transfer of the ownership of a ship at sea by the assignment of the "grand bill of sale," but no distinction is made in the U. S. As to the general law concerning sales of chattels and the requisites to their validity, see SALE. In a more popular sense, a bill of sale is any written instrument, though not under seal, executed as evidence of a sale.

Revised by F. STURGES ALLEN.

Billroth, bil'rōt, CHRISTIAN ALBERT THEODOR: German surgeon; b. in Rügen, Apr. 26, 1829; studied at the universities of Greifswald, Göttingen, and Berlin, taking the degree of M. D. at the latter in 1852; professor and director of the surgical clinic, University of Zurich, 1860–67; after 1867 he held the corresponding chair in the University of Vienna. His contributions to professional literature are very numerous and important, and have been translated into all the leading modern languages. D. Feb. 6, 1894.

Bil'ney, THOMAS: English martyr; b. about 1495; ordained 1519. He was a fellow of Trinity Hall, Cambridge, and preached there and in London and many other places. He opposed the Schoolmen's formal "good works" and the worship of saints and relics, and he converted Hugh Latimer and others to these views. Arraigned in 1527, he recanted and escaped with a year's imprisonment in the Tower; but having begun to preach again in the fields of Norfolk, he was condemned and burned at Norwich, Aug. 19, 1531.

Biloxi: city; on railroad; Harrison co., Miss. (for location of county, see map of Mississippi, ref. 9–H); 79 miles E. N. E. of New Orleans, and on Biloxi Bay; lat. 30° 23·8′ N., lon. 88° 53·1′ W.; is a place of summer and winter resort. It has an iron lighthouse, with a fixed white light 62 feet above the level of the sea. Biloxi is a manufacturing and shipping point, and, besides fruit and vegetable canning industries, has an oyster-packing business second in extent only to that of Baltimore. Fine schools, numerous churches, electric lights, artesian water-works, and over 25 miles of shell-roads are among the advantages of the city. The first settlement made upon the Mississippi by white men was made here in 1699 by Pierre Lemoyne d'Iberville. Pop. (1880) 1,540; (1890) 3,234; (1900) 5,467.

EDITOR OF "HERALD."

Biloxi Indians: See SIOUAN INDIANS.

Bilqula Indians: See SALISHAN INDIANS.

Bil'son, THOMAS: English prelate; b. in Winchester in 1546–47; studied at Oxford; became a prebendary of Winchester 1576; Bishop of Worcester 1596; translated to Winchester the year following. Bilson was a man of great learning, and a zealous defender of the Church of England against the Puritans. He was, along with Miles Smith, the final reviser of the Authorized Version of the Bible, and prepared the chapter headings. He wrote, among other works, *The True Difference between Christian Subjection and Unchristian Rebellion* (Oxford, 1585), prepared at Elizabeth's command in answer to W. Allen's *Defense of English Catholics*, and *The Perpetual Government of Christ's Church* (London, 1593; n. e. Oxford, 1842), which is considered an able defense of the doctrine of apostolic succession; but his *magnum opus* was *The Survey of Christ's sufferings for Man's redemption and of his descent to Hades or Hell for our deliverance* (1604). D. in London, June 18, 1616.

Bils'ton: a market-town of Staffordshire, England; 2 miles by rail S. E. of Wolverhampton (see map of England, ref. 9–G). It forms part of the parliamentary borough of Wolverhampton, and is an important center of the hardware trade. It is situated between numerous iron and coal mines, and has large manufactures of japanned ware. Pop. (1891) 23,453.

Biluchistan: See BALUCHISTAN.

Bi'mana [quasi-Lat., from Lat. *bi-*, double + *manus*, hand]: an order of mammals proposed for the reception of man (see HOMINIDÆ) as distinguished from the apes and lemurs (*Quadrumana*). See QUADRUMANA and MAN.

Bimetallism: See MONETARY STANDARDS.

Bin, băn, JEAN BAPTISTE PHILIPPE ÉMILE: historical and decorative painter; b. in Paris, Feb. 10, 1825; pupil of Gosse and of Léon Cogniet; Legion of Honor 1878. His *Prometheus Chained* (1867) is in the museum at Marseilles. Decorated the Polytechnicon in Zurich (1865–70). Style academic and formal. Bin has taken an active part in Paris politics, and has been mayor of the Eighteenth (Montmartre) Arrondissement. WILLIAM A. COFFIN.

Binary Stars: See BINARY SYSTEM and DOUBLE STARS.

Binary System: a pair of stars revolving around a common center of gravity. The only distinction we can make between an ordinary double star and a binary system is that motion has been detected in the case of the latter, whereas in the case of the former the relative position of the two bodies appears to remain invariable. There can be no doubt, however, that all double stars, properly so called—that is to say, all stars which are actually very near together—revolve around each other; their mutual attraction alone would necessarily change their relative position. But the period of revolution is usually many centuries, frequently several thousand years. Hence when first discovered no change can be observed, but the longer observations are continued the greater are the number of cases in which some change is found to be going on.

The first exact estimates of the relative positions of such objects were made by Sir William Herschel toward the close of the last century, and the next by Struve, of Dorpat, about the first quarter of the nineteenth century. As ob-

servations of the bodies noted by Herschel and Struve are continued, more and more of them are found to be in motion. The most remarkable binary systems are those which are discovered by the spectroscope, in cases where the motion is too small to be detected by any other means. Thus it is found that the star Algol has an invisible companion revolving around it, which partially eclipses it at every revolution. See ALGOL. S. NEWCOMB.

Binary Theory: See CHEMISTRY.

Bindrabund: same as BRINDABRAN.

Bindweed Family (*Convolvulaceæ*): herbaceous, shrubby, or rarely arboreous dicotyledons, gamopetalous, with superior ovaries. They are related to the nightshades, borages, phloxes, etc. There are 800 species, mostly natives of warm climates. *Ipomœa*, the morning-glories, and *Convolvulus*, the bindweeds, are representative genera. *Cuscuta*, the dodders, is a genus of degraded parasitic species.

CHARLES E. BESSEY.

Binet, bē̆'nay', VICTOR JEAN BAPTISTE BARTHÉLEMY: contemporary landscape-painter; b. at Rouen, March 17, 1849. First-class medal, Paris Exposition, 1889. A realistic painter, whose work is notable for good drawing and truth of atmospheric effect, but is lacking in color quality. *The Plain at St. Aubin-sur-Quillebœuf* (1886) is one of the best of his pictures, and is in the museum at Amiens.

Bing'en (anc. *Vin'cum* or *Bin'gium*): a town of Germany; in Hesse; finely situated on the left bank of the Rhine; at the mouth of the Nahe; 20 miles by rail W. of Mentz (see map of German Empire, ref. 6–D). The Nahe is here crossed by an old bridge supposed to have been built by the Romans. Wine of superior quality is produced in the vicinity. Near Bingen the Rhine passes through a narrow channel called *Bingerloch* (i. e. the hole of Bingen), in which the rocks and rapid current once rendered the navigation dangerous, but in 1834 the obstruction was mostly removed. Bingen is opposite Rüdesheim, from which it is separated by the Rhine. It has manufactures of flannel, fustian, and leather. Here are interesting ruins of an old castle, Klopp, originally founded by Drusus, and of the celebrated chapel of St. Roch on the Rochusberg. A little farther to the south, between Bingen and Bingerloch, rises in the middle of the stream a high rock, the so-called tower of Bishop Hatto. An heroic statue of *Germania* in the Niederwald commemorates the German victories of 1870–71. The surrounding scenery is highly picturesque. Pop. (1890) 7,654.

Bing'ham, Rev. HIRAM: b. in Bennington, Vt., Oct. 30, 1789; graduated at Middlebury College in 1816; at Andover in 1819; and was one of the first Congregational missionaries sent to the Sandwich islands, where he long exercised a powerful influence. He returned to the U. S. in 1841. D. in New Haven, Conn., Nov. 11, 1869.

Bingham, JOHN A.: politician; b. in Mercer, Pa., in 1815; removed to Ohio. He was elected a member of Congress by the Republicans of the Western Reserve in 1854, and was often re-elected. He conducted the prosecution of the assassins of President Lincoln, and was chairman of the managers who conducted the impeachment of Andrew Johnson in Apr. and May, 1868. He was again elected to Congress in 1870. Was U. S. minister to Japan (1873–85). D. in Cadiz, Ohio, Mar. 19, 1900.

Bingham, JOSEPH: Church of England antiquary; b. in Wakefield, Yorkshire, in Sept., 1668; d. at Havant, near Portsmouth, Aug. 17, 1723; studied at Oxford and became a fellow of University College (1689), but in 1695 was compelled to give up his fellowship and leave the university on account of a sermon he preached on the meaning of the word "person" when used by the Fathers, and which brought upon him the false charge of heresy. In the same year, however, he was made rector of Headbourn Worthy, whence he was transferred to Havant in 1712. His great work *Origines Ecclesiasticæ; or, The Antiquities of the Christian Church*, first appeared in English (London, 1708–22, 10 vols.). It has often been reprinted, and has not yet been superseded. The best edition is that included in the complete edition of his works by Richard Bingham (London, 1821–29, 9 vols.; n. e. by J. R. Pitman, 1838–40; reprinted Oxford, 1855, 10 vols.). The *Antiquities* are separately published in the Bohn Series (1845, 1852, 2 vols.). It was translated into Latin by Griscovius (Halle, 1724–38, 10 vols.), and into German, but in the interest of the Roman Catholic Church (Augsburg, 1788–96, 4 vols.). See his *Life* by Richard Bingham, Jr., in his complete works. Revised by S. M. JACKSON.

Bingham, KINSLEY S.: b. at Camillus, Onondaga co., N. Y., Dec. 16, 1801; studied law; went to Michigan in 1833; was a judge of probate; elected in 1837 a member of the Michigan legislature, he continued for eight years a member of that body, and for three years was its Speaker; member of Congress (1849–51), Governor (1855–59), and U. S. Senator (1859–61). D. at Green Oak, Livingston co., Mich., Oct. 5, 1861.

Bing'hamton: city and railroad center; capital of Broome co., N. Y. (for location of county, see map of New York, ref. 6–G): was incorporated as a city in 1867. It is pleasantly situated in a hilly, agricultural country, devoted principally to the dairy industries. The altitude of the city at the rivers is 859 feet above tide-water. The Susquehanna and Chenango rivers form a junction within the city. The Susquehanna is spanned by three iron carriage bridges and a foot bridge; the Chenango is spanned by three handsome and wide full-deck wagon bridges, which unite sections of the principal business streets. All the carriage bridges are crossed by electrical street railroads. The land slopes gently toward the rivers from all directions.

The national census of 1890 showed 702 establishments carrying on 93 industries, including the manufacture of leather, boots, shoes, clothing, cigars, chairs, wagons, carriages, cutters, children's carriages and sleighs, scales, furniture, glass, combs, buttons, brushes, engines, machinery, carriage and harness trimmings, barrels, doors, sash, blinds, flexible shafts, soap, and refined oils. The capital invested in manufacturing industries was in 1890 $9,022,851, and $4,306,862 was paid to 10,077 employees. The cost of materials used was $7,583,413, and the finished products were worth $14,932,001.

Among the conspicuous buildings, besides the business blocks, are 8 large churches, Central High School, county court-house, Municipal Building, Federal Government court-house and post-office, State armory, State insane hospital, 9 large ward-school buildings, opera-house, and 2 orphans' homes. The new Stone opera-house is one of the finest theaters in the State, having a front of 70 feet width, of brown-stone, and a depth of 200 feet. The insane hospital consists of the very large building erected for an inebriate asylum, and a cluster of smaller buildings, all capable of accommodating about 2,000 patients. The city is well equipped with first-class hotels.

Binghamton is at the intersection of two trunk lines (New York, Lake Erie and Western, and the Delaware, Lackawanna and Western). The D., L. and W. has branches to Syracuse and to Utica. The Albany and Susquehanna R. R., owned by the Delaware and Hudson Canal Company, connects here with the other roads.

The incorporated limits of the city contains 6,400 acres. There are 83 miles of streets, lighted by a private electric plant. The bonded debt is $668,500. The total property valuation for 1900 was $21,280,753, and the city taxes were $320,877.89.

There is a very efficient volunteer fire department, having 3 steamers, 1 chemical engine, an aërial truck, and 7 hose-carriages and trucks.

There are 17 public schools, good private schools, Protestant and Catholic, and a fund of $80,000 has been left by will for the establishment of an industrial school. The public library contains 7,827 volumes.

The city contains 34 churches and several chapels.

Water is supplied by the Holly system. The capacity of the works is 18,000,000 gal. in 24 hours. There are 50 miles of water-pipes. The works are valued at $1,500,000.

The financial institutions consist of 1 national bank, representing the consolidation of 3 former banks, with a capital of $400,000, 1 State bank, 1 trust company, 2 savings banks, and 1 private banking house. There is also 1 safe deposit company.

Ross Park, containing about 100 acres, is equipped with driveways and summer buildings. Bennett Grove, of about 50 acres, owned by private parties, is thrown open to the public for a park. The Binghamton Association Driving Park and the Stow Park and Exposition ground are also private property devoted to public use. Annual fairs are held upon the Exposition ground.

There are 33 miles of street-car lines running out to 12 suburbs, consolidated under the Binghamton Railroad Company, and operated by electricity. The rapid growth of the city between 1880 and 1890 is attributable largely to rapid-transit facilities as well as to the prosperity of local indus-

tries. The workingmen live largely in cottages of their own, built upon lots 50 feet front and from 100 to 200 feet deep.

Pop. (1870) 12,692; (1880) 17,317; (1890) 35,005; (1900) 39,647. WM. F. SEWARD, MANAGING ED. "REPUBLICAN."

Bing'ley: a town in the West Riding of Yorkshire, England; situated on an eminence on the river Aire; 15 miles W. N. W. of Leeds (see map of England, ref. 6-G). The Leeds and Liverpool Canal passes by it. Here are manufactures of worsted goods, paper, etc. Pop. (1891) 10,023.

Bin'ney, AMOS, M. D.: naturalist; b. in Boston, Oct. 18, 1803; graduated at Brown University in 1821; was the owner of an ample fortune. He was a liberal patron of artists and men of science, and was president of the Boston Society of Natural History. He wrote *Terrestrial and Air-breathing Mollusks of the United States* (finely illustrated). D. at Rome, Feb. 18, 1847.—His son, W. G. BINNEY, is also a distinguished conchologist.

Binney, HIBBERT, D. D.: b. in Nova Scotia, Aug. 12, 1819; educated in London and Oxford, graduating at the latter university in 1842. In 1851 he was consecrated Bishop (Anglican) of Nova Scotia and Prince Edward Island, which was the first bishopric founded by England in her colonial dependencies, originally including not only Nova Scotia and Prince Edward Island, but also New Brunswick and parts of Lower Canada. Bishop Binney was a visitor at the General Convention of the Protestant Episcopal Church held at Chicago in 1886. D. in 1887.

Binney, HORACE, LL. D.: lawyer; b. in Philadelphia, Jan. 4, 1780. He graduated at Harvard College in 1797, and divided the first honors with his classmate, the late Judge White, of Salem, Mass. Having studied law with Jared Ingersoll in Philadelphia, he was admitted to the bar in 1800, and rose in a few years to the highest rank in his profession. He declined high judicial positions which were offered him, but as a lawyer he took a prominent part in important cases in the higher courts of Pennsylvania, and was several times called to the Supreme Court of the U. S. Elected to Congress in the latter part of Jackson's first administration, he distinguished himself by his eloquence and ability. In 1843 he made his celebrated argument in the Supreme Court of the U. S. in the case of Vidal *versus* the mayor of Philadelphia. This admirable argument is often cited by the bench and bar of the U. S. as authority on questions involving the law of charitable uses, and has been referred to by eminent English jurists in the highest terms of praise. Mr. Binney appeared for the last time before his legal brethren on the occasion of the death of his friend, the Hon. John Sergeant, whose character he delineated in terms of deep feeling and eloquence. Mr. Binney's principal works, besides the argument in the Vidal case, are *An Inquiry into the Formation of Washington's Farewell Address* (1859); eulogiums on Chief Justice Tilghman (1827), and Chief Justice Marshall (1836); and *Reports of Cases in the Supreme Court of Pennsylvania* (6 vols.). D. in Philadelphia, Aug. 12, 1875.

Binney, THOMAS, D. D., LL. D.: an English Dissenting minister; b. at Newcastle-upon-Tyne, Apr., 1798; educated at the Theological Seminary at Wymondley, Hertfordshire; became pastor in Newport, Isle of Wight, 1824; pastor of King's Weigh-house chapel, London (1829–69); wrote many controversial papers, *Conscientious Clerical Nonconformity*; *Service of Song*; and several books for young men, besides several volumes the products of a controversy with the Bishop of Adelaide, and the familiar hymn *Eternal light! eternal light!* D. in London, Feb. 24, 1874.

Binnie, ALEXANDER R., F. G. S., F. R. M. S.: engineer to the London County Council; b. in London in 1839; educated at private academies; pupil and assistant to the celebrated J. F. La Trobe Bateman, F. R. S.; in early life was engaged in railway construction in England and Wales. By public competition he entered the Public Works Department of India in 1868, where he remained six years, discovering coal in the Central Provinces. He designed and constructed the works for supplying Nagpur with water, and for a short time was acting secretary of the department. He was engineer to the Bradford Corporation in England for fifteen years, designing and constructing many large works, among them a reservoir embankment 125 feet in height. He also designed a large extension of the water-works in the Nedd valley. He designed and is now constructing a tunnel under the Thames at Blackwall, to be built by means of a shield through water bearing ballast, and lined with brick inside of a heavy cast-iron shell. Author of a paper on Nagpur water-works, which obtained from the Institution of Civil Engineers the Telford medal; lectures on water-works at Chatham; and *Heat in its Relation to Coal*, an address as president to the Bradford Philosophical Society. WILLIAM R. HUTTON.

Binocular Telescope [*binocular* is from Lat. *bini*, two each + *o'culus*, eye]: a combination of two telescopes the distance of whose parallel central axes is equal to that between the eyes, so that both eyes may be applied at once. An object may then be observed with both eyes at the same time, one looking through each tube. There are also binocular microscopes, having two tubes, one for each eye. In some kinds of work they possess superior defining power.

Binomial [formed from Lat. *bi-*, having two + *no'men*, name, term]: in algebra, an expression having two terms joined by the sign + or −. The "binomial theorem" has for its object the expression of the law for the formation of any power of a binomial. By means of this theorem any power of $x + a$ can be at once written down without going through the actual multiplication. The older mathematicians were acquainted with this method of finding such powers, but Newton first demonstrated the universality of its application. This is considered one of his greatest discoveries, and the formula was placed upon his tomb. It is usually written thus:

$$(x + a)^m = x^m + \frac{max^{m-1}}{1} + \frac{m(m-1)}{1.2} a^2x^{m-2} + \frac{m(m-1)(m-2)}{1.2.3} \times a^3x^{m-3}, \text{ etc.}$$

BINOMIAL COEFFICIENTS: the coefficients of the powers of quantities which occur in the binomial theorem, as

$$\frac{m(m-1)}{1.2}; \frac{m(m-1)(m-2)}{1.2.3}, \text{ etc.}$$

Binomial Nomenclature: the system of naming animals and plants introduced by Linnæus near the middle of the last century, and now in universal use among scientific men. In this system the species or different kinds of animals or plants are gathered together in larger groups or genera. The name of the genus is a Latin substantive, that of the species is adjective or a noun having the force of an adjective.

The genus may contain one or many species, and with the progress of exact knowledge of species the tendency has been to split the genera into smaller and smaller groups by more rigorous definition.

Examples of binomial nomenclature are *Quercus alba*, the white oak; *Felis leo*, the lion; *Sparisoma abildgaardi*, Abildgaard's parrot-fish; *Abies pectinata*, the balsam-fir of Eastern North America. D. S. JORDAN.

Bintang' (Malay *Bentan*, called by Marco Polo *Pentam* and by Camoens *Bintão*): an island on the south side of the Straits of Singapore; central lat. 0° 52′ N., long. 104° 26′ E.; surrounded by rocks and small islands, making navigation dangerous. Area, 440 sq. miles. It is low and swampy, and produces much gambir, for which it is visited by Malay and Chinese traders. It was formerly a nest of pirates, but is now claimed by the Dutch, who founded on it a port, Rhio or Riouw, intended to have been a rival for Singapore.

Binturong' (*Arctictis binturong*): one of the largest of the *Viverridæ*, or civet-cat family; a native of Borneo, Java, Sumatra, and Malacca. Its body and tail are covered with harsh, bristly, black fur. It possesses a long, tapering prehensile tail, which exceeds in length that of any other of the *Æluroids* (cats, civets, and hyænas) except the tiger. D. S. JORDAN.

Bio-Bio, bee'ō-bee'ō: the largest river of Chili; rises in the Andes, and enters the sea at Concepcion, after a course of 200 miles.

Bio-Bio: an interior province of Chili; in lat. 37° S.; on a river of the same name; between Argentina and Arauco, with Concepcion and Nuble on the N. and Malleco on the S. Area, 4,158 sq. miles. It is traversed by a north and south railroad. Capital, Angeles. Pop. (1891) 122,729.

Biogen'esis [from Gr. *βίος*, life + *γένεσις*, birth]: the origin of living organisms from living organisms by some form of reproduction either asexual or sexual; a term used in opposition to *abiogenesis*, or the origination of living things from non-living matter. The term is also applied to that body of doctrine pertaining to the reproduction and development of living things, both with reference to the individual and with reference to the race, of which the fundamental doctrine is held to be that "ontogeny," the history of the

development of the individual, is a short recapitulation of the history of the race, which is called in turn "phylogeny." In other words, the individual in coming from the ovum to the adult stage passes through a series of forms which indicate in a more or less abbreviated way the ancestral forms along the line of its descent. Biogenesis includes investigations of the development of organisms from this doctrine as a basis. D. S. Jordan.

Biograph'ical Dictionaries: The earliest known book at all resembling our modern biographical dictionaries is the *Elucidarius carminum et historiarum*, compiled by Herman Torrentinus (Van Beeck), and published in Deventer in the year 1498. Its popularity during the sixteenth century is attested by more than forty editions. Meanwhile improved dictionaries, likewise containing geographical and other articles, as well as biographies, were made by Robert Estienne (1st edition 1541), by Charles Estienne (1553), and by Louis Moreri (1674). Moreri's book passed through more than twenty revised editions, and remained the standard work for nearly a century, the volumes of Bayle (1697), Chaufepié (1750–56), and Marchand (1758–59) being avowedly but supplements to it. The first comprehensive dictionary exclusively biographical was a meager and inaccurate compilation by the Abbé L'Avocat, published in 1752. It was soon superseded by the *Nouveau Dictionnaire Historique Portatif*, purporting to be compiled by "une société des gens de lettres," and to be published at Amsterdam. In fact, its sole author was the French Benedictine Dom Chaudon, who wished to avoid the press-censorship, and the book was actually printed at Avignon in 1766. Chaudon's work, frequently revised, maintained its position as *the* biographical dictionary until the beginning of the present century. The earliest important English work was *The New and General Biographical Dictionary* of 1761 in 11 volumes 8vo. Upon a later edition of this book was founded *The General Biographical Dictionary*, edited by Thomas Chalmers (1812–17, 32 vols. 8vo), which, in spite of the publication in 1840–47 of *A New General Biographical Dictionary*, by H. J. Rose (in 12 vols. 8vo), remains to this day one of the best comprehensive biographical dictionaries in English. Among its chief rivals are *The Imperial Dictionary of Universal Biography* (Glasgow, 1865, 3 vols. 8vo), and Dr. J. Thomas's *Universal Pronouncing Dictionary of Biography* (Philadelphia, 1886, 2 vols. 4to), which are later and more concise than Chalmers. But none of these books approach in merit either the *Biographie Universelle Ancienne et Moderne*, published by Michaud (first edition 1811–53, 79 vols.; second, greatly improved edition, 1843–65, 45 vols. 8vo), or the *Nouvelle Biographie Générale* (1852–77, 46 vols. 8vo), edited by Dr. Hoefer, but frequently called by the name of its publisher, Didot. The more important of the above mentioned books are indexed in Phillips's *Dictionary of Biographical Reference* (third edition, Philadelphia, 1889), which contains 100,000 names. Even more comprehensive, but likewise exceedingly brief, is Oettinger's *Moniteur des Dates* (Leipzig, 1869–82, 2 vols. 4to). Extensive and valuable biographical dictionaries are also included in the chief encyclopædias, as Appletons' *Universal Cyclopædia*: likewise Knight's *English Cyclopædia* (1861–62); *Appletons' American Cyclopædia* (1881); *Chambers's Encyclopædia* (1888–93); Larousse's *Grand Dictionnaire Universel du XIX^e^ Siècle* (1866–78); and in the *Conversations-Lexica* of Brockhaus and of Meyer.

In addition to the general biographical dictionaries there are numerous excellent books confined to biographies of persons: (1) of a single nation, e. g. Englishmen; (2) of a single period, e. g. the present century; or (3) of a single class, e. g. musicians. Among the more important books of the first class are the following: For Americans, *Appletons' Cyclopædia of American Biography*, edited by J. G. Wilson and J. Fiske (1886–89, 7 vols. 8vo), which has superseded the earlier books by Drake (1872) and Allen (3d ed., 1857). For Great Britain, the *Dictionary of National Biography* (in 60 vols.), begun in 1885 under the editorship of Leslie Stephen, and completed in 1900 by Sidney Lee. For Scotchmen, see J. Irving's *Book of Eminent Scotsmen* (1881); for Irishmen, A. Webb's *Compendium of Irish Biography* (1878); for Germans, the *Allgemeine deutsche Biographie*, begun in 1875, and now (1893) extending in 34 vols. 8vo to the letters "Spa"; and for Austrians, Wurzbach's *Biographisches Lexikon des Kaiserthums Oesterreich* (1856–91, 61 vols. 8vo). The following are the editors of the chief biographical dictionaries for the countries mentioned: for Holland, Van der Aa; for Belgium, the Brussels Royal Academy; for Denmark, Bricka; for Sweden, Pambald; for Russia, Vengerov, also Gennadi; for Spain, Antonio. For Frenchmen the best books are Michaud and Didot. There is no satisfactory book for Italians.

Of books about persons of a single period the most useful are: Dr. William Smith's *Dictionary of Greek and Roman Biography and Mythology* (1844–49, 3 vols. 8vo); Smith and Wace's *Dictionary of Christian Biography* (1877–84, 4 vols. 8vo), reaching to 800 A. D.; and Chevalier's *Répertoire des Sources Historiques du Moyen Âge*: *Bio-Bibliographie* (1877–88, 2 vols. 8vo), which gives no biographies itself, but indexes the biographical material contained in several thousand volumes in various languages so far as it refers to persons living in the Middle Ages. For contemporary and recent biography the best works are: L. C. Sanders's *Celebrities of the Century* (1887, 8vo); *Men and Women of the Time* (15th ed., by V. G. Plarr, 1899); *Who's Who* (English, 53d ed., 1901; American, 1st ed., 1899); *Canadian Men and Women of the Time* (1898); Vapereau's *Dictionnaire des Contemporains* (6th ed., 1892–93); and Boase's *Modern English Biography* (1st vol. 1892). The biographical reference books for persons of single classes include:

For authors, S. A. Allibone's *Critical Dictionary of British and American Authors* (1858–73, 3 vols. 8vo, and supplement by J. F. Kirk, 1891, 2 vols.); De Gubernatis, *Dictionnaire International des Écrivains du Jour* (1888–90, 2 vols. 8vo); and Brümmer's *Deutsches Dichter-Lexikon* (1876–77, 2 vols. 8vo).

For artists, Champlin and Perkins's *Cyclopedia of Painters and Paintings* (1887, 4 vols. 8vo), and M. Bryan's *Dictionary of Painters and Engravers* (new edition by Graves, 1888, 2 vols. 8vo).

For musicians, Grove's *Dictionary of Music and Musicians* (1879–89, 4 vols. 8vo); Champlin and Apthorp's *Dictionary of Music and Musicians* (1890, 3 vols. 8vo); and Fétis's *Biographie Universelle des Musiciens* (second edition, 1860–65, 8 vols. 8vo, with supplement by Pougin, 1878–81, 2 vols. 8vo).

For medical men, Thatcher's *American Medical Biography* (1823, 2 vols. 8vo, with supplement by S. W. Williams, 1845); Atkinson's *Contemporary Physicians and Surgeons of the United States* (1878); and Hirsch's *Biographisches Lexikon der hervorragenden Aerzte aller Zeiten und Völker* (1880–89, 9 vols. 4to).

For theologians, W. B. Sprague's *Annals of the American Pulpit* (1865–73, 11 vols. 8vo); Philip Schaff and S. M. Jackson's *Encyclopædia of Living Divines* (1887, 4to, being a supplement to the Schaff-Herzog *Cyclopædia of Religious Knowledge*, 1882–85, 3 vols. 4to, which also contains biographies); F. Lichtenberger's *Encyclopédie des Sciences Religieuses*, tome 13, containing a *Dictionnaire des Contemporains* (1882, 8vo).

In general those biographical dictionaries are most satisfactory which contain signed articles, and indicate sources of further information. Consult on biographical dictionaries *Quarterly Review*, vol. clvii., pp. 187–230, and *Library Journal*, vol. xiv., pp. 7–20. C. H. Hull.

Biography [from Late Gr. βιογραφία, or formed from Gr. βίος, life + γράφειν, write]: literature which treats of the lives of individual persons. Anciently, the leading incidents of a man's life were narrated in their historical sequence, without elaborate attempts to analyze character. Ancient biography was possessed of a stately dignity, colored but sparingly with eulogy or censure. Modern biography, on the other hand, like modern history, is often full of criticism and disquisition. Of strictly biographical works, the most valuable that have come to us from the ancient Greeks are the *Memoriabilia* of Xenophon and the *Lives* of Plutarch. Roman literature also possesses an admirable *Life of Agricola*, by his son-in-law, Tacitus. Besides these may be mentioned the *Lives* ascribed to Cornelius Nepos; the writings of Suetonius; the *Life of Alexander the Great* by Curtius; *Lives of the Sophists* by Philostratus; and a *Life of Plato* by Olympiodorus. Later, we encounter the *Lives of the Fathers* by St. Jerome and others, while biographies of saints, martyrs, etc., are scattered profusely through ecclesiastical literature. The monks of the Middle Ages worked at the manufacture of biographies in which the hunger for the marvelous was gratified. For modern compilations, see the article on Biographical Dictionaries.

Biol'ogy [from Gr. βίος, life + λόγος, discourse, -λογία, doctrine, science]: that branch of the study of nature which

treats of organized beings under their diverse relations, in contradistinction to mineralogy, which relates to the inorganic or mineral substances; its subjects are therefore animals (zoölogy) and plants (botany or phytology), living and extinct. These agree with each other, and differ from minerals in (1) the physical and chemical characteristics of their primitive constituents or cells, and the concomitant phenomena of life exhibited under certain conditions; in (2) the perpetual change during life in the organism by loss of substance proportioned to the demands on the system of exertion or existence, and the renewal of substance by derivation and assimilation of nutriment from without; in (3) the segregation and specialization, when the demand for rapid growth has been fulfilled, of certain portions of the organism as reproductive organs, differentiated as receptive and procreative (female), and impregnating and vivifying (male); from the former of which (after the conjunction of the two under certain conditions) an organism originates essentially like that from which it proceeds; in (4) the existence, for a vaguely determinate period, of the organism, and finally a disturbance of the equilibrium or conditions of existence, death and dissolution; and in that (5) originating as above indicated, the offspring repeats the same cycle of phenomena as the parent, and in turn contributes to the perpetuation of the race. Our limits will only allow us to briefly consider, in the order indicated, these characteristic features of the great empire of organic nature.

(1) The animal or vegetable organism is in the main constituted of four elements, three of which are separately known in a gaseous state—*oxygen*, *hydrogen*, and *nitrogen*—and one—*carbon*—in a simple condition is only known in a solid form. From this predominance of gaseous elements results the degree of molecular mobility of the constituents of the organism, and, according to Herbert Spencer, "that comparative readiness displayed by organic matters to undergo those changes in the arrangement of parts which we call development, and those transformations of motion which we call function." The same author has also insisted on facts that (1) the elements in question (except oxygen) have affinities which are narrow in their range, but low in their intensity; (2) that in all allotropism (or the ability to assume different states) is inherent; and (3) that they all present certain extreme antitheses (as, for example, between oxygen and nitrogen as to chemical affinity, and between carbon and the gases as to molecular mobility); and that these extreme contrasts "fulfill, in the highest degree, a certain further condition to facility of differentiation and integration." The primary form into which these elements enter is a fluid substance called protoplasm, which may or may not be nucleated, but in most organisms assumes the nucleated condition (that is, of cells); of such elements, more or less modified and disguised according to circumstances (i. e. specialization and complexity of parts), the entire organism is built up.

(2) By the absorption or ingestion of extraneous substances the organism derives a nutriment which is assimilated and converted into its own substance, and supplies the material (1) for the power for work, (2) the repair of the system, and (3) for direct growth. Every action and exertion is attended with a loss of substance, and hence exists the necessity for a corresponding supply of nutriment. For a certain length of time (according to the species or race), in addition to the preservation of an unstable equilibrium, there is also a demand for supply for increase of bulk, or growth, of the organism. The period and extent to which this is carried is, within certain limits, constant for each species.

(3) When the full stature or phase of development has been more or less nearly attained, the organs of reproduction become functionally developed, and provision for the perpetuation of the race is made. In plants, the female element is termed a seed; in animals, an ovum or egg. The male and female elements may be united in the same individual, as in most plants and many animals, but in the highest animals the sexes are always differentiated in distinct individuals. In mollusks, hermaphroditism is almost of ordinal value, but not more, and in at least one case (*Valvatidæ*) hermaphroditism occurs in an order of which the other members are diœcious. Among vertebrates, true hermaphroditism is only known (as an exceptional development) in certain fishes (*Serranidæ*); it is entirely unknown in the higher forms (mammals, etc.), all the reported cases to the contrary being referable to males with the genitalia in an embryonic condition, or females with the clitoris hypertrophied. The homologies of the male and female organs render it impossible that there shall be a union of the sexes in the same individual in the mammals. Actual fecundation of individual germs (seeds or eggs) by the male element is necessary, in most cases, for their development, but in exceptional cases (e. g. certain insects, crustaceous mollusks), females produce broods of young without having had direct previous intercourse with the male. This peculiar capability has been designated *parthenogenesis*; the unimpregnated eggs (in some forms) produce only females. The question of the determination of sex is still involved in obscurity.

(4) After a certain period, if the individual has escaped all the liabilities to death that occur from enemies, accidents, and disease, there is a decline in the activity of the functions, the system becomes disordered, and death ensues. This period, like those of growth and development of the reproductive power, is also, within certain limits, a constant term, and all reports of extreme longevity—such as the reputed ages of H. Jenkins (169 years), T. Parr (150 years), the Countess Desmond (140 years), and others—are either based on very unsatisfactory evidence or demonstrably false.

(5) The offspring, although as a rule very similar to the parent, is never exactly like it, being always distinguishable by some more or less obvious difference or *individuality* of character. Occasionally, however, the offspring differs very markedly in some one character, which may or may not be co-ordinated with other correspondingly important differences. The newly developed peculiarity is apt to be transmitted either to the immediate offspring or to a succeeding generation, and sometimes in an exaggerated degree. But such peculiarities, if the individuals so distinguished pair with those not exhibiting them, generally disappear in their descendants after a longer or shorter course. If, however, the individuals thus characterized are set aside, and their immediate and remote descendants selected in ratio to their possession of some peculiarity, that peculiarity will be indefinitely perpetuated, and a new race distinguished thereby will be thus originated. By means of such *artificial selection*, unintentional or studied, the various races of domesticated animals have been produced. And as, in most cases, there is an obvious fitness of organized beings to the conditions under which they are found, it has been assumed that such relations are the result of the survival of beings possessing characteristics which may have spontaneously arisen, and which have gradually become (relatively) perpetuated in the "struggle for existence"; and hence the hypothesis of *natural selection* has originated. Inasmuch, also, as no offspring is exactly like the parents, it follows that no generation is exactly like the preceding; and although there must be a certain unstable equilibrium, resulting from constant interbreeding, in the incessant surge of variations, the descendants must necessarily depart more and more from their progenitors. While in an historical epoch no very obvious changes may be perceptible, eventually (unless by the interposition of miraculous agency) there must be a contrast between the extremes of a lineage, and the exhibition of such must be merely a question of time, determined to a greater or less degree by the changes of condition. The assumption of this hypothesis, and the inductive evidence furnished by various departments of science, have culminated in the theory of *evolution*, and for an explanation of the *modus operandi* of evolution, natural selection (or Darwinism) has been evoked. The evidence relied upon is chiefly derived from morphology (and the contrast between it and teleology), embryology, the geological succession, and the geographical distribution of organisms.

While animals and plants differ from minerals, and agree with each other in all the characters thus specified, there are no such salient differences between themselves. It is, indeed, easy to distinguish the higher animals and plants, and they are, to a certain extent, antetypes and complementary to each other. On the one hand, plants derive their nourishment by absorption from the inorganic world through the external surfaces of their roots and leaves, and (under most conditions) decompose carbonic acid gas, assimilate carbon (and nitrogen), and eliminate oxygen. On the other hand, animals derive their nutriment, immediately or mediately, from plants, and ingest it either through a provisional or specialized alimentary cavity, imbibe oxygen, and exhale carbonic acid gas. The mode of taking nutriment is the most characteristic feature, and specialization especially tends to that end, but supplemented, in the animal,

by a specialization of other systems to guide it in the selection and pursuit of its food. Some rather high animals (e. g. certain Entozoa) take their nutriment through their external surfaces, but this is rather a teleological modification co-ordinated with atrophy of the intestinal tube, superinduced by peculiar conditions of life. In view of the slight differences between animals and plants, and their contrast with minerals, it is evident that the ternary division of natural objects into animals, plants, and minerals does not express the degree of the relations between them; and hence the animal and plant kingdoms have been combined in an *organic empire* or realm on the one hand, and on the other minerals have been denominated an *inorganic empire*. The impossibility or great difficulty of discriminating the lowest plants and animals has also led some naturalists to separate them from the animal and vegetable kingdoms, and combine them in a peculiar one, which has received, with some varying limits, numerous names—e. g. Infusory world (Infusorienwelt), règne de Zoöphytes, règnes Psychodaire, règne chaotique, règne Plantanimal, regnum Amphorganicorum, règne organique Primitive, kingdom of Protozoa, regnum Primigenium, kingdom of Primalia, and Protistenreichs. Such propositions, however, do not remove the difficulty, but only shift and complicate the questions, and obscure the recognition of the tendencies of the two antitypically functional divisions of nature. It need only be added that there is also, to some extent, a contrast in respect to individuality in the respective kingdoms, numerous individuals (flowers) being developed from the outgrowth of the contents of a single seed, while in all except some of the lower animals a single individual only originates from one egg. The subject of individuality, however, is a somewhat obscure one, and has provoked much discussion; and the question has been involved by the confusion of potential and actual individuality. For more detailed information respecting the various subjects of biology consult Evolution, Hermaphroditism, Longevity, Morphology, Paleontology, Parthenogenesis, Teleology, Zoölogical Geography, and Zoölogy and Botany, and their respective subdivisions. Theodore Gill.

Bi'on (of Smyrna): Greek bucolic poet of the third century B. C.: contemporary and imitator of Theocritus. The longest and most admired of his poems is the *Lament for Adonis* (Ἐπιτάφιος Ἀδώνιδος). The language is beautiful, the tone tender. Reflexes of it are to be seen in the *Adonais* of Shelley. Ed. with Theocritus and Moschus by Gaisford (1821); Ahrens (1855); Meineke (1856); translated with the same by Andrew Lang (1889).

Biondo, bē̆e-ōn'dō, Flavio (1388–1463): the greatest archæologist of the Italian Renaissance; author of *Roma instaurata*, *Roma triumphans*, and *Italia illustrata*, three bulky encyclopædias of archæological information which have constituted the basis of all subsequent dictionaries of Roman antiquities. Contemporary critics severely censured his careless style ("probitas laudatur et alget"). See Alfred Masius, *Flavio Biondo und seine Werke* (Leipzig, 1879); J. A. Symonds, *Renaissance in Italy*. A. Gudeman.

Biot, bē̆e'ō, Edouard Constant: Chinese scholar; son of Jean Baptiste Biot; b. in Paris, July 2, 1803; was first interested in the introduction of railroads in France, but retired from public service on account of poor health, and devoted himself to study of the Chinese; member of the Academy 1847; author of articles on Chinese subjects in the *Journal Asiatique*; *De l'Abolition de l'Esclavage Ancienne en Occident* (1840); and *Dictionnaire des Villes, etc., de l'Empire Chinois* (1842). D. Mar. 12, 1850.

Biot, Jean Baptiste: natural philosopher and astronomer; b. in Paris, Apr. 21, 1774. He became in 1800 Professor of Physics in the College of France. In 1803 he was admitted into the Institute, and in 1805 published *An Elementary Treatise on Physical Astronomy* (2 vols.). An enlarged edition of this appeared in 5 vols., 1841–57. Having been appointed a member of the bureau of longitudes, he was sent to Spain with Arago to measure the arc of the meridian. He contributed many able articles to the *Biographie Universelle* and the *Annales de Chimie et de Physique*; published, besides other works, a *Treatise on Experimental Physics and Mathematics* (4 vols., 1816), which is highly esteemed; and *Researches in Ancient Astronomy* (1829). In 1840 he received the Rumford medal of the Royal Society of London for his researches on the circular polarization of light. He was admitted into the French Academy in 1856. D. in Paris, Feb. 3, 1862.

Bi'otite, called also **Uniax'ial**, or **Magne'sian Mi'ca** [named for *Biot*, a French physicist, 1774–1862]: a mineral occurring in six-sided tubular prisms, having a perfect basal cleavage; generally dark green, brown, or nearly black in color. It has a vitreous luster, varies from transparent to opaque, is sectile, flexible, and elastic when reduced to thin laminæ. It consists chiefly of silica, alumina, magnesia, and oxide of iron, with some potassa.

Bi'pont Edi'tions: certain editions of the Greek and Latin classics, the publication of which was begun in 1779 at the German town of Zweibrücken (Deux-Ponts), called in Latin *Bipontium*.

Bir, beer (anc. *Bir'tha*; Turk. *Bireh-jik*): a town of Asiatic Turkey; on the left (east) bank of the Euphrates; 74 miles N. E. of Aleppo (see map of Turkey, ref. 6–H). It has about 2,000 houses, a citadel or castle on a steep rock, and several mosques. Caravans from Aleppo to Diarbekir and Bagdad cross the Euphrates at this point. Pop. about 6,000.

Birch: a tree or shrub of the genus *Betula* and family *Cupuliferæ*; native of temperate and cold regions in Asia, Europe, and America (several species are found among the Himalayas). The genus *Betula* is distinguished by ten to twelve stamens and winged seeds (achenia); has alternate, simple leaves, and flowers in scaly catkins. The common birch of Europe and Asia (*Betula alba*) is a handsome tree with triangular or deltoid leaves, which are doubly serrate. The bark is smooth and chalky white, and separable in thin sheets or layers. This bark is very durable, and is used for tanning, dyeing yellow, and other purposes. In some countries hats, shoes, and boots are made of it. The wood is firm, tough, and valuable, and is much used by coopers, turners, and wheelwrights. The sap is esteemed as a beverage in Scotland, both in a fresh state and fermented. Europe produces a graceful variety called weeping-birch (*B. penduta* of some botanists), which attains a height of 60 feet, and has very slender and pendulous branches. The American white birch (*B. populifotia*) is a small, graceful tree with tremulous, deltoid, and shining leaves, but is not valuable for timber. Among the other species indigenous in the U. S. are the *B. tenta* (sweet or black birch), and *B. lutea* (yellow birch) and *B. papyracea* (canoe or paper birch). The *B. lenta* is a rather large tree, the bark of which is aromatic, yielding an essential oil identical with that of *Gaultheria*, and the timber is fine-grained and valuable for cabinet-work. The *B. papyracea* grows in the Northern States to the height of about 70 feet, has a fine-grained wood, and a very tough, durable white bark, splitting freely into thin layers, which have been used as paper. The Indians make canoes of this bark. The *B. lutea* sometimes attains a height of 80 feet, and is remarkable for the brilliant yellow tint of its bark or epidermis. The leaves are from 3 to 5 inches long. Besides the above and several less important species, the U. S. have the *B. nigra*, or river birch, which grows on the banks of streams and has remarkably tough wood. Russia leather is tanned with birch bark. "Russian oil" is a tar-like, empyreumatic substance obtained from birch-wood in Russia, and is useful in certain skin diseases.

Birch, Charles Bell, A. R. A.: sculptor; b. at Brixton, England, Sept. 28, 1832; educated at Somerset House School of Design and Berlin Royal Academy; won prize of £600 for his group *A Wood Nymph* (1864); exhibited *The Last Call* (1879); and executed many busts and statues. He contributed drawings on wood and stone to various publications, especially the *Illustrated London News*. D. in London, Oct. 16, 1893.

Birch, Samuel, LL. D.: b. in London, Nov. 3, 1813; was educated at Greenwich and Blackheath; afterward at Merchant Taylors' School, which he left in 1834, and was first employed under the commissioners of public records. In 1836 he was appointed assistant in the department of antiquities of the British Museum, from which he rose to be assistant keeper in 1844, and in 1861 keeper of the Oriental and Egyptian antiquities and ethnographical collections. He was considered one of the best modern Egyptologists; was the author of nearly all the last volume of Bunsen's work on Egypt, which contains the only English translation of the *Book of the Dead*; published a treatise on *Hieroglyphics* (1857); the *Rhind Papyri* (1866), etc. In 1878 he edited Wilkinson's *Manners and Customs of the Ancient Egyptians*, and was editor of *The Records of the Past* from 1873 to 1880. D. in London, Dec. 27, 1885.

Birch, Thomas, D. D., F. R. S.: biographer and historian; b. in London, England, Nov. 23, 1705. He took orders in the Anglican Church (1730), and became rector of parishes in London (1744) and in Depden, Essex (1761); was fellow of the Royal Society from 1735 and its secretary 1752–65. Among his numerous works, besides editions of Cudworth, Robert Boyle, Spenser, Sir Walter Raleigh, the prose works of Milton, and Bacon's *Letters and Speeches*, are *The General Dictionary, Historical and Critical* (10 vols., 1734–41); a *Life of Archbishop Tillotson* (1752); *Memoirs of the Reign of Queen Elizabeth* (2 vols., 1754); and a *History of the Royal Society* (4 vols., 1757). D. in London, Jan. 9, 1766.

Birch, Thomas: portrait and marine painter; b. in London, England, in 1779; d. in Philadelphia, Jan. 3, 1851. He came to the U. S. in 1793 and painted portraits in Philadelphia until about 1807, when he took up marine-painting. Some of his works represent naval battles of the war of 1812.

Birch-Pfeiffer, Charlotte: actress and dramatic writer; b. at Stuttgart, June 2, 1800; married Dr. Birch, of Copenhagen, in 1825. She attained success as a performer and a writer. Among her dramas are *Die Günsttinge*; *Hinko*; *Dorf und Stadt* (1848); and *Anna of Austria* (Anna von Oestreich, 1850). D. in Berlin, Aug. 25, 1868.

Bird, Arthur: See the Appendix.

Bird, Edward: genre-painter; b. in Wolverhampton, England, in 1772; apprenticed to a maker of japanware; became a drawing-teacher in Bristol; in 1809 he exhibited *Good News* in the Royal Academy, and soon after *The Choristers Rehearsing*; in 1814 was appointed painter to Princess Charlotte; the next year became a Royal Academician. D. in Bristol in 1819. His most famous canvas was *The Day after the Battle of Chevy Chase*. He painted some historical and scriptural pictures, among which was *The Death of Eli*; but his reputation rests on his genre work, as *The Village Politicians* and *The Blacksmith's Shop*.

Bird, Frederic Mayer: hymnologist; b. in Philadelphia, June 28, 1838; graduated at University of Pennsylvania 1857, and Union Theological Seminary, New York, 1860; Lutheran minister 1860–67; chaplain in the U. S. army 1862–63; ordained deacon Oct. 25, 1868; some time a rector in Iowa City and in Waterloo, Ia. In Feb., 1881, was appointed chaplain and Professor of Psychology, Christian Evidences, and Rhetoric in Lehigh University, South Bethlehem, Pa., which post he resigned in 1886. He edited *Charles Wesley seen in his Finer and Less Familiar Poems* (1867); with Rev. Dr. B. M. Smucker, *The Lutheran Ministerium Hymns* (1865; revised 1868 as General Council's *Church Book*); revised, with Bishop Odenheimer, *Songs of the Spirit* (1871). He contributed a monograph on the *Hymnody of the Church* to Bishop Perry's *History of the American Episcopal Church*. Editor of *Lippincott's Magazine* (1891–). He is a contributor to encyclopædias and magazines, and engaged in literary pursuits.

Bird, Robert Montgomery: father of F. M. Bird; novelist and journalist; b. in Newcastle, Del., in 1805; studied medicine in University of Pennsylvania; wrote dramas *Oratoosa*; *The Broker of Bogota*; and *The Gladiator*, in which Edwin Forrest won distinction. His first novels were concerned with the Spanish conquest of Mexico, and W. H. Prescott commended them for their antiquarian accuracy. They were *Calavar* (1834) and *The Infidel* (1835). All his books were published in Philadelphia. His most popular novel was *Nick of the Woods* (1837), a tale of frontier Kentucky. *Peter Pitgrim* is a collection of tales. In 1847 he became an editor and joint proprietor with Morton McMichael of the Philadelphia *North American and United States Gazette*. D. in Philadelphia, Jan. 22, 1854.

Bird, Isabella L. (*Mrs. Bishop*, of Edinburgh): traveler; b. in England; has undertaken many long and adventurous journeys in various parts of the world, of which her graphic published accounts have been very popular; author of *The Englishwoman in America* (1858); *Six Months among the Palm Groves of the Sandwich Islands* (1875); *A Lady's Life in the Rocky Mountains* (1879); *Unbeaten Tracks in Japan* (1880); *The Golden Chersonese* (1883).

Bird-catching Spider (*Mygale avicularia*): a large spider; native of Surinam. Its body is nearly 2 inches long, and its legs when stretched out occupy a space almost a foot in diameter. Its mandibles work vertically instead of laterally, and are very strong. It does not construct a net or web for the capture of its prey, but it obtains it by the chase, and hunts only in the night. This spider and other species of *Mygale* are said to attack and kill small birds. It is asserted

Bird-catching spider.

that in some tropical countries there are spiders which feed upon birds caught in their webs.

Bird Cherry: in England the *Pru'nus pa'dus*; a small tree growing wild in Europe, and called *bayberry* in Scotland. It bears racemes of small drupes of a sweetish and bitterish taste, which are used in the north of Europe to make spirituous liquors. In the U. S. the wild *Prunus pennsylvanica* also is called bird cherry.

Birde, or **Byrd**, William: English composer of church music; b. probably at Lincoln, about 1538; and was appointed organist of Lincoln about 1563, and of the Chapel Royal, London, 1569, in conjunction with Thomas Tallis, to whom with him Queen Elizabeth in 1575 granted a monopoly to print and sell music. He produced, among other works, *Cantiones Sacræ* (Sacred Songs) and a magnificent canon entitled *Non Nobis, Domine*. D. probably at London, July 4, 1623.

Birdlime (in Lat. *vis'cus*): a viscous adhesive substance placed on the branches of trees to catch birds which may perch there. It is prepared by boiling the middle bark of the holly (*Ilex*), the mistletoe (*Viscum album*), or other glutinous plants, and concentrating the decoction by evaporation. The gluten of wheat flour is sometimes used as a substitute for birdlime. A tame bird in a cage is sometimes employed to decoy the birds to the tree on which the birdlime is smeared.

Bird of Paradise: any one of several species of birds of the genus *Paradisea* and kindred genera, of the order *Passeres*; natives of Papua and the neighboring islands, remarkable for the beautiful form and splendor of their plumage. The name was originally applied to the *Paradisea apoda*, which was supposed to be destitute of feet, because the skins, which are exported to Europe, are usually deprived of wings and feet. The older naturalists imagined that they passed all their lives floating in the air and feeding on ethereal food or nectar. For these fabulous and fanciful ideas science substitutes the prosaic truth that they are nearly allied to the *Corvidæ* (crow family), and are omnivorous. The value of these birds arises chiefly from the extraordinary development and light and beautiful structure of the plumes which grow from the scapular and lateral portions of the body. The plumage of the males is remarkable not only for brightness of tints, but also for a velvety texture and brilliant

metallic reflections. Tufts of feathers growing from the shoulders are so prolonged that they extend even beyond the

Bird of paradise.

tail, and they constitute the most beautiful part of the plumes of the bird of paradise, which are a highly prized article of commerce. The principal species of this genus are the common bird of paradise (*Paradisea apoda*), the royal bird of paradise (*Cicinnurus regius*), the red bird of paradise (*Paradisea rubra*), the magnificent bird of paradise (*Diphyllodes magnifica* or *speciosa*), and the six-threaded (or golden) bird of paradise (*Parotia sexfilata*), from the head of which grow six long and thread-like feathers, each ornamented with an ovate black raeket, three on each side. The common bird of paradise is about as large as a jay, and is mostly of a einnamon color, with a throat of emerald green, whence it is sometimes called the emerald bird of paradise. The royal bird of paradise has two long feathers or filaments, which extend behind the tail and terminate in disks, like the tail-feathers of a peacock. The red bird of paradise has two very long filaments, extending far beyond its rich and beautiful tail-feathers. Birds of paradise are generally gregarious, and they sometimes fly in flocks from one island to another. It is stated that they ean fly more easily against than with the wind. In confinement they are lively and bold, and bestow great care on their plumage. About twenty-five species are now known.

Red bird of paradise.

A writer, referring to what he calls "the supremely glorious members of the feathered tribe which have by common consent been termed birds of paradise," observes that "the plumage of these birds is wonderfully rich and varied, and not even the humming-birds themselves present such an inexhaustible treasury of form and color as is found among the comparatively few species of the birds of paradise." See Wallaee, *Malay Archipelago.* Revised by Charles H. Gilbert.

Birds (*Aves*): a class of oviparous vertebrate animals; definable as air-breathing vertebrates with a coating of feathers, with the two anterior limbs or wings adapted for flying or swimming, the two posterior limbs or legs adapted for walking or swimming; respiration never effected by gills or branchiæ, but after leaving the egg by lungs which are connected with air-cavities in various parts of the body. Reproduction by eggs fertilized within the body, and hatched externally either by incubation or by exposure to the heat of the sun; the shell calcareous, hard, and brittle. The sole really diagnostic character is this: all birds have feathers, and no other animal has feathers. No other character can be found by which the birds as a whole, living and extinct, can be separated from the reptiles. The plumage serves as clothing, and assists in motion through the air. The feathers entangle among their fibers a considerable quantity of air, and are well adapted to protect the bird from extremes of cold and heat. The internal temperature of birds is from 105° to 112° F., much higher than that of man or mammals generally. Their buoyancy and muscular energy are increased by numerous air-cells which are connected with the lungs. (See Air-cells.) The general form of birds is adapted to aërial navigation, and the body is somewhat boat-shaped. The number of vertebræ in the neck varies from ten to twenty-six, and is always greater than is found in any mammal. Among their peculiar organs are the toothless jaws, covered with a hard, horny sheath, forming the beak or bill. (See Bill.) The head is articulated to the neck by a single condyle. The number of toes of each foot is generally four, of which three extend forward and one backward; but the climbing birds have two before and two behind. The sternum or breast-bone is very large and strong, with a prominent keel, except in the ostrich and its relatives, serving for the attachment of the powerful muscles which move the expanded wings. The wing of a bird is the homologue of the arm of a man, and is composed of bones which correspond to those of a human arm or the fore leg of a quadruped. The wing is furnished with numerous feathers, called quills, which display an admirable combination of strength and lightness. The names of the several varieties of wing-feathers are *primaries*, *secondaries*, *tertiaries*, and *coverts*. The primaries are quill-feathers arising from the first or terminal joint—i. e. the part of the wing which corresponds to the hand and fingers of a man. The form of these indieates the bird's capacity of flight, and birds of powerful flight have long and firm primaries. Next to these are the secondaries, which are attached to the middle bone, the homologue of man's forearm. The tertiaries grow from the part of the wing between the elbow and the shoulder. The leg of a bird is formed of bones which are homologous to those of mammalia, but are subject to modifications. The thigh-bone is very short, and is so concealed within the skin that it is not apparent as a part of the leg on a superficial view. The next division, often mistaken for the thigh, is the *tibia* or proper leg-bone, which is always the largest bone of the limb, the *fibula* being rudi-

mentary. This joint is followed by one usually called the "tarsus," composed of tarsal and metatarsal bones fused together. The "tarsus" is covered with scale-like plates, the arrangement of which furnishes important characters in classification. The feet vary according to the habits of the birds, some of which have strong, hooked claws, fitted for seizing prey; others are adapted for swimming by a membrane which unites their toes; still others for climbing. The perching of birds is facilitated by an interesting adaptation in the structure of the legs, the tendons connected with the toes passing over the leg-joint, so that the bird's weight, by bending the latter, mechanically closes the toes.

The digestive apparatus is modified in accordance with the nature of the food. Birds do not masticate their food, which passes from the mouth into the crop or craw, which is merely an enlargement of the gullet. The *crop*, or first stomach, is present in birds of prey, and also in the larger birds which feed on grain and seeds. It serves to soften the food, and in the pigeons secretes a cheesy substance with which the young are fed. The second stomach, or *proventriculus*, is largest in those birds in which the crop is small or wanting. The third and principal stomach is the *gizzard*, which is a powerful grinding apparatus, especially in those birds which feed on grain and swallow gravel and pebbles, as the common domestic fowl. The sense of sight in this class is exceedingly keen, and is remarkable for its perfect adaptation to near or distant objects. The swallow, when darting through the air with a swiftness which has become proverbial, is capable of accommodating its sight to the insect which it pursues, even in the short time which is occupied by its swoop at its victim. Some birds of prey have an acute sense of smell, and nocturnal birds, such as owls, have sensitive organs of hearing. Birds are distinguished among all dumb animals for their musical powers, and song-birds are doubtless sensitive to sound and differences of pitch. All the best singing-birds belong to the *Passeres*.

Among the most interesting subjects connected with birds are their migrations and the instincts and ingenuity which they exhibit in building nests. (See NESTS OF BIRDS.) The number of eggs in a state of nature varies from one to twenty, and birds generally breed only once a year, which is in spring. Many species of birds are gregarious, but large rapacious birds are quite solitary in their mode of life. They all moult—i. e. change their feathers once a year—and the summer plumage of many birds is very different from the winter dress. The plumage of the males is generally richer and more brilliant than that of the females. Their flesh and eggs are valuable as food for man, and many species render him great service by checking the increase of insects.

The earliest traces of the existence of birds on the globe have been supposed to be the so-called birds' tracks in the Triassic sandstones of the Connecticut valley; but it is now generally conceded that most if not all these tracks were made by reptiles and amphibians. It is especially noteworthy that the earlier birds (Jurassic and Cretaceous) had true teeth in their jaws. In the lithographic slates of Solenhofen (Jurassic) have been found a feather and two nearly complete bodies of birds exhibiting some remarkable features, and representing a peculiar order (*Saururæ*) that is supposed to form a kind of connecting link between birds and reptiles. (See ARCHÆOPTERYX.) The remains of birds have been found in the greensand of England, the Eocene of the island of Sheppy, and the Paris basin, as well as in the more recent Tertiaries at various European localities. In America fossil birds were unknown until quite recently; they have now been found, however, in the greensand of New Jersey, the cretaceous beds of Kansas, and the Tertiary deposits of Wyoming and Idaho. The Cretaceous birds, according to Prof. O. C. Marsh, belong to two distinct orders named *Odontormæ* and *Odontolcæ*. The most important of his discoveries in this branch of palæontology is that of birds with teeth in the Cretaceous beds. In the superficial deposits of New Zealand and Madagascar the remains of several kinds of extinct birds have been met with, some of which far exceed in dimensions the largest now living. The great bird of Madagascar is called *Æpiornis maximus*. It is supposed to have been at least 12 feet in height, and very massive. The egg of this bird was over a foot in length. The contents of one of these eggs were equal to those of six ostriches' eggs or 148 hens' eggs. The largest extinct birds of New Zealand have been described under the name of *Dinornis* by Prof. Owen. They were from 6 to 10 feet in height. See ORNITHOLOGY.

Revised by CHARLES H. GILBERT.

Birdsall, WILLIAM RANDALL, M. D.: b. at Greene, Chenango co, N. Y., Jan. 1, 1852; pursued special scientific studies at the University of Michigan; entered the medical department of that institution, and in 1876 graduated M. D.; removed to New York city the same year; began practice with Dr. Seguin; prosecuted neurological studies in Europe; engaged as a clinical teacher on diseases of the nervous system at different medical colleges and hospitals in New York; for two years lecturer on helminthology at the American Veterinary College, New York. He is the author of a work on *Electro-therapeutics and Electro-diagnosis*, and is a contributor to several medical journals, principally on neurological subjects. D. in New York, June 7, 1892.

Birdsboro: borough; Berks co., Pa. (for location of county, see map of Pennsylvania, ref. 5–I); on Schuylkill river and Phila. and Reading, Wilmington and Northern, and Pennsylvania Railroads; 9 miles S. E. of Reading. Principal industry, iron manufactures. Pop. (1880) 1,705; (1890) 2,261; (1900) 2,264.

Bird's-eye Limestone: a compact, dove-colored stone, with whitish crystalline points, belonging to the lower division of the Trenton group of the lower Silurian strata of North America, apparently corresponding to the Llandeilo flags of Wales. It contains many orthoceratites of enormous size, and fossil brachiopods.

Bird's-eye View: a term used in the fine arts to denote a picture or view arranged according to the laws of perspective, in which the point of sight or situation of the eye is placed at a considerable height above the object. If the eye is considered as looking perpendicularly down while it sweeps over each point of the scene in succession, we have an exact ground-plan, no object covering another, and horizontal angles being exactly delineated. This is a convenient method of representing battles, or of depicting a large city or a small tract of country. In sketching a locality for military purposes this kind of perspective is used. The common kind of bird's-eye view differs from ordinary perspective only in that the horizontal line is placed considerably above the picture.

Bird's-foot: a plant of the genus *Ornithopus* and family *Leguminosæ*; which derives its name from the resemblance of the curved pods to birds' claws. One species, the *Ornithopus sativus*, an annual plant, a native of Portugal, is cultivated in that country, and affords a nutritious green fodder for cattle.

Bird's-foot Trefoil: a plant of the genus *Lotus* and family *Leguminosæ*: native of the temperate and cold regions of the Old World; so called because a cluster of its pods resembles a bird's foot. The *Lotus corniculatus*, common in the pastures of Great Britain and introduced into the U. S., is eaten with avidity by cattle. It bears yellow flowers, which have a honey-like smell, and leaves which are trifoliate, like those of clover. A larger species or variety, called *Lotus major*, is also a native of England.

Revised by CHARLES E. BESSEY.

Birds' Nests: See NESTS OF BIRDS.

Birds' Nests, EDIBLE: the nest of the sea-swift (*Collocalia esculenta*), of the Malay Archipelago, a bird of the size of a common martin. It builds its nest of a glutinous substance which it is said to derive from a seaweed. This weed is swallowed and partly digested, and then disgorged and fashioned into a nest as large as a common coffee-cup. When fresh these nests are of a waxy white color, and are said to be worth twice their weight in silver in the markets of China, where alone they are sold. The poorer sorts bring $5 or more a pound, according to the age of the nests. The taste of dishes prepared from these nests is said to be insipid, but the Chinese prize them, not perhaps so much for their taste as for their supposed tonic and aphrodisiac powers.

Birds of passage: birds which are migratory, passing instinctively and habitually from one country or latitude to another, following the change of the seasons. The migration of birds is in general along north and south lines. Spending the summer in the temperate or polar regions, they leave on the approach of cold weather for the south, where they pass the winter. Migratory birds which breed in the U. S. are called summer birds of passage with reference to those States. They return in autumn to warmer regions, and are winter birds of passage in the countries where they pass the winter. Wild geese and other waterfowl that breed in the Arctic regions in summer annually visit the U. S. and

Great Britain in autumn, and return northward in the spring. Several other species that are not aquatic, as the woodcock, fieldfare, and snowbird, pass the winter in the temperate parts of Europe or the U. S., and spend the summer in a more northern latitude.

Bird-tick: a small insect, regarded as a degraded fly; parasitic on numerous species of birds. *Olfersia americana* is a common species.

Birdwood, Sir George Christopher Molesworth, M. D., LL. D.: b. in Belgaum, Bombay, Dec. 8, 1832; M. D., University of Edinburgh, 1854; appointed to the medical staff of the East India Company the same year; appointed acting Professor of Anatomy and Physiology in Grant Medical College, Bombay, 1857, and retained his connection with the college in various chairs until he left India in 1869; appointed to the companionship of the Star of India Jan. 1, 1877; knighted in 1881; was mainly instrumental in establishing the Victoria and Albert Museum and the Victoria Gardens in Bombay. Author of very many articles on India. C. H. Thurber.

Biren, bee'ren, **Biron**, bee'ron, or **Buren**, boo'ren, Ernest John: Duke of Courland; b. in Kalnzeem, Nov. 12 (22), 1690. He gained the favor of Anna (a niece of Peter the Great), who became Empress of Russia in 1730, and gave him the title of duke. He abused his power during her reign by the execution of many innocent persons. On the death of Anna in 1740 he became regent, but he was exiled to Siberia in 1741. When Elizabeth ascended the throne in 1741 she permitted him to return to Russia, and in 1763 the duchy of Courland was restored to him. D. Dec. 28, 1772. See Ruehl, *Geschichte E. J. von Biron* (1764).

Biretta, or **Birretta**: a cap worn by some Western ecclesiastics. The ordinary Roman biretta is a square stiff-sided cap, with curved ridges, and a tassel at the top, commonly made of the same material as the cassock. It is usually of black for priests, violet for bishops, and scarlet for cardinals. There are also academic forms of it to be seen in use in some parts of Europe. W. S. Perry.

Birgitta, **Brigitta**, or **Bridget**, Saint: a Swedish mystic and religious reformer; b. at Finstad, 1302 or 1303. Her father, Birger Persson, was "lawman" of Upland, and her mother, Ingeborg, was related to the royal family. At the age of fourteen Birgitta married a young nobleman, Ulf Gudmarsson, by whom she had eight children. On the death of her husband in 1344 she retired to the convent of Alvastra and gave herself up to a life of devotion, though she appears never to have joined any religious order. From this time till her death she regulated her conduct entirely according to revelations which (as she believed) were at frequent intervals vouchsafed her from on high. In one of her trances she received from Christ directions for the establishment of a new monastic order. Securing large gifts from the king and queen, as well as from the Swedish nobility, she made arrangements for the erection of a monastery at Vadstena, and in 1349 set out for Rome with her confessor, her eldest son, and a few other companions. Arriving in the jubilee year, 1350, she opened a hospice for Swedish pilgrims and students. Henceforth she devoted all her energies to attacking the corruption of the Church, to urging the restoration of the papal residence from Avignon to Rome, and to securing the pope's authorization for the new order. The influence that she exerted by means of her revelations, which were published from time to time, and in which she did not hesitate to attack the highest ecclesiastical dignitaries, was very great, and no doubt had its part in inducing Urban V. (pope 1362–70) to take up his residence in Rome in 1367. Aug. 5, 1370, just a month before Urban was forced to return to Avignon, she obtained a bull authorizing her order and the foundation at Vadstena. This foundation consisted of sixty sisters and twenty-five brothers, living in different buildings but under the same rule (a modification of the Augustinian). In 1372–73 Birgitta performed a pilgrimage to Jerusalem. Soon after her return to Rome she died (July 23, 1373) in the convent of the nuns of St. Clare at Panisperna. Her bones were carried to Vadstena in 1374. In 1391 she was canonized by Boniface IX.

The *Revelations of St. Birgitta* occupy an important place in the mysticism of the later Middle Ages. They were written down by her from time to time in Swedish, but only two leaves of the original version have been preserved. Her confessor, Peter Alvastra, turned them into Latin, and they were edited by Alfonso the hermit (previously Bishop of Jaen), and in part also by Mathias, Canon of Linköping. Before 1400 they were translated back into Swedish (*Heliga Birgittas Uppenbarelser, efter gamla Handskrifter utgifra af G. E. Klemming*, 5 vols., Stockholm, 1857–84), and from this version into Danish. The Latin text was first printed at Lübeck in 1492, and has been often reissued. From the Latin entire or partial translations were made into Low German (printed between 1484 and 1494), Dutch (printed 1491), High German (printed 1502), French (printed 1624), Italian (printed 1518), Spanish (printed 1676), and English (printed about 1530; another selection London, 1873). A Polish and a Bohemian version exist in MSS. of the fourteenth century. Though vehemently attacked from many quarters, the genuineness and orthodoxy of the *Revelations* were confirmed by the Councils of Constance and Basel.

The monastic order founded by St. Birgitta, known officially as the *Order of the Holy Saviour*, but popularly as the *Birgittine Order*, had great success in the North, especially in Sweden and Denmark, and, from its principle of circulating works of devotion in the vernacular, exercised a powerful influence on mediæval Swedish and Danish literature (*q. v.*). The rule spread to other European countries till there were at one time in all no less than seventy-four establishments professing it (among them several in Spain, and one, Sion House, in England), but it is now almost extinct. The first abbess of the Vadstena convent was the daughter of St. Birgitta, St. Catherine (Katarina) of Sweden, b. about 1335; d. 1381; canonized 1489.

Klemming, *Birgitta-Literatur*, appended to his edition of *Heliga Birgittas Uppenbarelser*, vol. v. (Stockholm, 1884), pp. 179–275.

G. L. Kittredge.

Birgittine Order: See Birgitta, Saint.

Birk'beck, George, M. D.: English educational reformer; b. in Settle, Yorkshire, Jan. 10, 1776; educated at Edinburgh; Professor of Natural Philosophy in the Andersonian Institution at Glasgow 1779; gave free courses of lectures to the mechanics of Glasgow 1801–04; prominent in founding the London Mechanics' Institute, of which he was made president for life, 1823; d. in London, Dec. 1, 1841. The Birkbeck Institution was rebuilt 1883–84. See his *Life* by J. G. Goddard (London, 1884).

Birk'enhead: a seaport-town of Cheshire, England; on the left bank and near the mouth of the Mersey; opposite Liverpool, and 15 miles N. N. W. of Chester, with which it is connected by railway (see map of England, ref. 7–F). It is about 1½ miles S. W. of Liverpool, and is the residence of many merchants who do business in that city. Steamers cross the river between these places every few minutes, and a railway tunnel to connect them, 1,230 yards long, was opened in 1886. Birkenhead was only a small fishing-village as recently as 1824; it has since increased rapidly in consequence of the construction of extensive docks and important public works. It has wide streets, a fine public park, a college called St. Aidan's (designed for the education of young men for the Anglican ministry), and many handsome villas. One of the docks occupies 120 acres. Shipbuilding is extensively carried on, and here the Confederate cruiser Alabama was built. There are vast works here for turning out iron bridges and other heavy constructions for engineers. Pop. (1881) 83,324; (1891) 99,857; (1901) 110,906.

Bir'mingham: one of the great manufacturing cities of England; in the county of Warwick; on the river Rea; 79 miles by rail S. E. of Liverpool, and 130 miles by rail N. W. of London (see map of England, ref. 7–G). It is built on the eastern slope of three undulating hills, and has a gravelly foundation. Its suburbs extend into Staffordshire and Worcestershire. It returns seven members to Parliament. Birmingham is the chief town of Great Britain for the manufacture of hardware and metallic products made of gold, silver, brass, iron, steel, and mixed metal, including fire-

arms, swords, jewelry, buttons, tools, steel pens, locks, steam-engines, and all sorts of machinery. From a very early period Birmingham has been a seat of manufactures in metal, and from the close of the seventeenth century it became one of the principal centers of that industry, partly on account of its easy access to cheap coal and iron, and partly on account of its freedom, there being no guilds or companies, or restrictions of any kind. The chief variety is the brass-working trade, in which more than 10,000 people are engaged, and which annually consumes more than 50,000 tons of metal. Next comes jewelry, gold, silver, and gilt. Then follow small-arms of all kinds, some of the larger factories being able to turn out 2,000 stand per week. Further specialties are buttons, hooks and eyes, pins, and other articles of dress; screws and nails, of which trade Birmingham has a kind of monopoly; steel pens, of which there are produced about 20,000,000 a week; electro-plating, which was first established there in 1848; bell-founding, the making of steel toys, etc. Here are also extensive manufactures of glass and papier-maché. The city of Birmingham contains about 100 churches; Queen's College, connected with the London University; a free public library; the schools of Edward VI.; a botanic garden; a Roman Catholic cathedral; and a town-hall, which is a handsome edifice with a very fine organ. Among the charitable institutions are an asylum for the deaf and dumb and an asylum for the blind. Pop. (1881) 400,757; (1891) 478,113; (1901) 522,182.

Birmingham: city; capital of Jefferson co., Ala. (for location of county, see map of Alabama, ref. 3–C); one of the most important manufacturing cities of the "New South." It is situated at the foot of "Red Mountain," a formation holding, besides vast limestone deposits, an iron hematite ore vein of remarkable extent and easily accessible to miners, and almost touching the Great Warrior coal-field of 7,800 sq. miles, the Cahaba coal-field, 400 sq. miles, and the Coosa coal-field, also about 400 sq. miles. Iron and steel are manufactured here under the most favorable conditions. Six trunk railway lines (Louisville and Nashville; Queen and Crescent; Southern (two lines); Georgia Central; Kansas City, Memphis and Birmingham) cross each other in this city, giving it as good railway facilities as any interior Southern city.

Birmingham has 32 churches (20 for white and 12 for colored people); 14 public schools (10 for white, 4 for colored children), with school property valued at $500,000; an extensive water-work system, the reservoir on Shade's Mountain, 225 feet above the city, having a capacity of 28,500,000 gal. Birmingham has adopted the Waring system of sewerage, and has about 21 miles of storm-water and 37 miles of sanitary sewers. Suburbs are made accessible by 100 miles of street railroads, 85 miles of which are operated by electric power and 15 miles by steam. Coal, iron, cotton, and lumber industries are the foundation of Birmingham's prosperity. In 1900 there were 300 establishments, employing 5,100 hands and $25,450,000 capital, and producing goods valued at $10,740,000. Of this output, the iron and steel manufactures employed 3,100 hands and turned out goods valued at $6,764,342, to which the foundries and machine-shops added $1,482,314. Area of city proper, 3·19 sq. miles. Pop. (1871) 800; (1880) 3,086; (1890) 26,178; (1900) 38,415; including suburbs about 76,500.

EDITOR OF "NEWS."

Birmingham: manufacturing borough of New Haven co., Conn. (for location of county, see map of Connecticut, ref. 11–F); on railroad and the Housatonic river; at the mouth of the Naugatuck; 9 miles W. of New Haven. A bridge across the Naugatuck connects it with the village of Old Derby, on railroad. It has several rolling-mills, and manufactures of augers, chains, pins, and carriage-axles and springs, pianos and organs. Here is the first pin-factory established in the U. S. Pop. (1880) 3,026; (1890) 4,413. Part of Derby since Jan. 1, 1894. See DERBY.

Birmingham: a former borough of Alleghany co., Pa.; on the left (west) bank of the Monongahela river; 1 mile S. of Pittsburg, with which it is connected by a bridge 1,500 feet long. It derives its prosperity chiefly from manufactures of glass and iron. In 1872 it was united to Pittsburg.

Bir'ney, DAVID BELL: general; b. in Huntsville, Ala., May 29, 1825; son of James G., the Free-soiler; practiced law in Philadelphia. He became a brigadier-general of Union volunteers in 1861; served at Fredericksburg, Dec., 1862. He was raised to the rank of major-general, and commanded a division at Gettysburg in July, 1863, and Gen. Sickles's corps after that officer was wounded, and was at the head of the Tenth Army Corps in several battles in Virginia in 1864. D. in Philadelphia, from disease contracted in the service, Oct. 18, 1864.

Birney, JAMES GILLESPIE: an anti-slavery leader; b. in Danville, Ky., Feb. 4, 1792; graduated at Princeton in 1812, and became a lawyer in Danville, and then a planter in Huntsville, Ala. In the Kentucky and Alabama Legislatures he endeavored to obtain constitutional enactments restricting the slave-trade and providing for emancipation. He served the Colonization Society until the Texas policy of Andrew Jackson convinced him that the methods of that society were inadequate. Then he resolved to attempt to array Kentucky on the anti-slavery side. He had emancipated twenty-one inherited slaves, when he returned to Danville to publish a paper, which he was compelled to print in Cincinnati. Violence led him to remove to the latter city, where he continued his anti-slavery paper, called *The Philanthropist*. His office was several times attacked by a mob, which threw his press into the river, but he maintained his ground and secured toleration for free speech there. Having become secretary of the American Anti-Slavery Society, he removed to New York city about the year 1836. He was nominated in 1840 for the presidency of the U. S. by the Liberty party, which also supported him in the election of 1844. D. in Perth Amboy, N. J., Nov. 24, 1857.

Birney, WILLIAM: lawyer; b. near Huntsville, Ala., May 28, 1819; son of James G. While a student in Paris, he took an active part in the revolution of 1848; and afterward he was appointed, on public competition, professor of English Literature in the college in Bourges. He entered the U. S. volunteer service as a captain in April, 1861, and rose through all grades to the rank of brevet major-general. Lawyer in Washington since 1874. Attorney for District of Columbia. Has written a life of his father.

Biron, bĕĕ'rōñ', CHARLES DE GONTAUT, Duke de: French general; b. in 1561; a son of Armand (d. 1592). He served with distinction at Ivry 1590; became a favorite of Henry IV.; marshal of France in 1595; appointed governor of Burgundy. He was convicted of forming a treasonable plot with the Duke of Savoy, for which he was beheaded July 31, 1602. See De Thou, *Historia sui Temporis*; Martir-Rizo, *Historia de la Vida del Duque de Biron* (1629).

Birrell, AUGUSTINE: See the Appendix.

Birthmarks: See NÆVUS.

Birthworts (*Aristolochiaceæ*): a small family of 200 species of herbaceous (rarely shrubby), mostly climbing dicotyledonous flowering plants. They have inferior ovaries, and a single, often gamophyllous, perianth. Their affinities are difficult to make out, and it is at present impossible to assign them definitely to their proper position among dicotyledons. Many species of *Aristolochia* are cultivated for their odd flowers. Several species of *Aristolochia* and *Asarum* are natives of the U. S. CHARLES E. BESSEY.

Bis'cay, or **Biscaya**, bis-kī'a (Sp. *Vizca'ya*): one of the four Basque provinces of Spain; bounded N. by the Bay of Biscay; E. by Guipúzcoa, S. by Alava, and W. by Santander. Area, 849 sq. miles. It consists partly of mountains and partly of level plains. The chief products are wine, fruits, walnuts, chestnuts, figs, and grain. Pop. (1887) 235,659. Capital, Bilbao.

Biscay, Bay of (in Fr. *Golfe de Gascogne*; anc. *Gal'licus Oce'anus*, or *Aquitan'icus Si'nus*): a portion of the Atlantic Ocean bordering on France and Spain; extends from the French island of Ushant to Cape Ortegal. The depth, which is greatest near the coast of Spain, varies from 20 to 200 fathoms. The southern or Spanish coast is bold and rocky, but the east coast, from the Adour to the mouth of the Gironde, is low and sandy. The largest rivers that flow into this bay are the Loire and the Gironde. The principal ports on it are Nantes, Bordeaux, Bayonne, La Rochelle, the new port La Pallice, and Rochefort in France, and Bilbao and Santander in Spain. Violent currents and winds render the navigation of this bay difficult.

Bisceglia, bĕĕ-shāl'yăă (Lat. *Vigiliæ*): a fortified seaport-town of Italy; province of Terra di Bari; on the Adriatic; 25 miles W. N. W. of Bari (see map of Italy, ref. 6–G). It has a cathedral, a college, and several churches and convents. Excellent currants and olives are raised in

the vicinity. It is connected by rail with Foggia and all the points along the coast S. of Barletta to Brindisi. Pop. 25,127.

Bischof, Karl Gustav: German chemist and geologist; b. in Wörd, near Nuremberg, Jan. 18, 1792; educated at Erlangen; Professor of Chemistry in Bonn in 1819; d. there Nov. 30, 1870. In 1840 he published a prize-essay on the means of avoiding explosions in mines, experimented on inflammable gases, and improved safety-lamps. He wrote treatises on mineralogy, dynamic geology, and chemistry, his principal work being *Elements of Chemical and Physical Geology* (Bonn, 1847–54; 3d ed. in 1866, and supplement in 1871).

Bischoff, Theodor Ludwig Wilhelm: a German physiologist and anatomist; b. in Hanover, Oct. 28, 1807. He became Professor of Anatomy at Heidelberg in 1836, at Giessen in 1843, and obtained a chair at Munich in 1854. He gained distinction by his researches in embryology, on which he wrote several treatises. D. in Munich, Dec. 5, 1882.

Bischweiler, bish'vīler: a town of Alsace; on the river Moder; 14 miles by rail E. N. E. of Strassburg. It has manufactures of linens, coarse woolen cloths, gloves, and earthenware. It is the center of the hop-trade in Lower Alsace. Near it is a rich mine of iron. It was formerly fortified. Pop. (1890) 7,005.

Biscuit [French spelling of older *bisket* (seventeenth century), O. Fr. *bescoit*: Ital. *biscotto*, as if from Lat. **biscoc'tum* (sc. *panem*); *bis*, twice + *co'quere*, cook]: a hard kind of unfermented bread formed into small cakes or flat pieces, and sometimes called ship-bread or sea-biscuit. It is composed of wheat flour, water, and salt, and is rendered hard and dry by baking, in order that it may be preserved for a long time. Biscuits are exposed to the heat of an oven for about twelve minutes, and afterward dried in a warm room for two or three days. "Captain's biscuit" is prepared with butter, in addition to the ingredients mentioned above, and sometimes contains milk. Water or hard biscuits are made of flour, water, with variable quantities of butter, eggs, and sugar. Soft biscuits contain increased proportions of butter and sugar. Several varieties of fermented biscuits are manufactured. Meat biscuit consists of wheat flour, combined with the essential or soluble part of beef, so that the nutritive qualities of the meat may be preserved for a long time. To prepare this biscuit large pieces of beef, with water sufficient to cover them, are subjected to slow ebullition. The fat is skimmed off, the liquor is reduced by evaporation to the consistency of sirup, and is then mixed with wheat flour, rolled out to the thickness of ordinary ship-biscuit, and cut, baked, and dried in the same manner as common biscuits. One pound of meat biscuit contains about one-half pound of flour and the soluble part of 5 lb. of meat. It is used in the form of soup, which is made by boiling the biscuit in twenty times its weight of water for half an hour. See Pemmican.

Biscuit, in pottery, is applied to porcelain and earthenware after it has been hardened in the fire, and before it has received the glaze. In this state it is porous and permeable to water. Biscuit in sculpture is a species of porcelain, of which groups and figures in miniature are formed, which are twice passed through the furnace or oven.

Bishop [O. Eng. *biscop* = O.H.G. *biscof*, an early loan-word from vulg. Lat. form of Lat. *episcopus* = Gr. ἐπίσκοπος, overseer. Adopted in Rom. langs. as Ital. *vescovo*, O. Fr. *vesque*, Mod. Fr. *évêque*, etc.]: an ecclesiastic of the highest rank in the Christian Church—all patriarchs, archbishops, metropolitans, and the pope himself belonging to the order of bishops. In many Protestant denominations the order of bishop is held to be identical with that of presbyters or elders; and in such sects these names are used in preference to that of bishop. The Eastern, Roman, and Anglican Churches, with some minor sects, claim for their bishops, by direct succession, an authority derived from the twelve apostles. Lutherans, Presbyterians, and other denominations also claim a tactual succession for their orders, but do not draw the same dogmatic inferences from it. The principal churches recognizing the superior rank of bishops are the Greek, the Roman Catholic, the Armenian, Coptic, Abyssinian, Nestorian, and Jacobite, the churches of the Anglican communion, the Moravian, the Catholic Apostolic (Irvingite), the Old Catholics, and a part of the Lutheran churches. The Methodist Episcopal churches and some others give their bishops a superiority of office, but not of order. In the Roman Catholic and Anglican Churches bishops have the title of "right reverend," while archbishops and metropolitans are addressed as "most reverend." In Great Britain bishops of the Church of England are called lord bishops. In England and Wales the two archbishops and twenty-four diocesan bishops have seats and a vote in the House of Lords; but the Bishop of Sodor and Man, the bishops of Scotland, Ireland, and of newly created dioceses and suffragan bishops, do not have seats with the peers or court precedence, but are called lords by courtesy. See Vicar Apostolic.

The bishop is required by the ancient canons to be consecrated by three bishops. Consecrations by a single bishop, though valid, are deemed irregular. It pertains to the office of a bishop to administer, ordain, confirm, consecrate churches, etc., and to share in legislating for the church in conjunction with convocations, councils, and conventions, as the canons of the respective churches may direct. His vestments are properly cassock, alb, girdle, rochet, amice, tunic, dalmatic, chasuble, cope, mozzetta, chimere, gremial, and buskins. Anglican bishops use only a portion of these vestments. The bishop's distinctive *ornamenta* are the miter, ring, and pastoral staff. The black or purple chimere (red for convocation) and the white rochet, which with the square cap form the usual episcopal robes of Anglican prelates, were, it is probable, the walking-attire of the bishops during the reign of the Tudors. See Vestments, Ecclesiastical; also Apostolic, Archbishop, Investiture, Ordination, etc.

W. S. Perry.

Bishop, Anna: singer; b. in London in 1814; daughter of Mr. Rivière, an artist. In 1831 she married Sir Henry Rowley Bishop (see below), who was a widower, but eloped from him in 1839 with Robert Nicholas Charles Bochsa, an Italian harpist (b. in Montmedy, France, 1789; d in Australia, 1855). Her *début* was made in 1837. She won the highest distinction in Europe, the Americas, and Australasia, as a singer in classical music and modern opera. She married Martin Schultz, of New York, in 1858. In 1868 she lost her voice. D. in New York, Mar. 19, 1884.

Bishop, Sir Henry Rowley, Mus. D.: English composer; b. in London, Nov. 18, 1786. He produced numerous popular operas, which are commended for their long flowing melodies and animated style. Among them are *Guy Mannering*; *Maid Marian*; *Native Land*; and *The Virgin of the Sun*. His glees are very fine. He was knighted in 1842, and was appointed Professor of Music in the University of Oxford in 1848. D. in London, Apr. 30, 1855.

Bishop, William Henry: novelist; b. at Hartford, Conn., Jan. 7, 1847; graduated at Yale College in 1867; studied architecture in New York and Washington; edited a newspaper at Milwaukee. Resided in New York, 1877 to 1888; Professor of French and Spanish at Yale since 1893. Among his novels are *The House of a Merchant Prince* (1883); *The Golden Justice* (1886); and *Writing to Rosina*. A book of travel, *Old Mexico and her Lost Provinces*, was published in 1884.

Henry A. Beers.

Bishops Suffragan (as distinguished from suffragan bishops, every diocesan bishop being a "suffragan" of his metropolitan where "provinces" are established): bishops consecrated in England under the Act 26, Hen. VIII., enacted to supply the place of the earlier bishops *in partibus* who formerly assisted the incumbents of English sees. Under this act twenty-six places are named as "the sees of bishops suffragan." To these the Act 50 and 52 Vict. permits additions to be made under orders in council. The diocesan presents two spiritual persons to the crown. The crown selects one of the two to be bishop of a suffragan see, and presents him by letters patent under the great seal to the archbishop of the province for consecration. Until the present generation eighteen consecrations appear to have taken place under the act of Henry VIII. The present Bishop of Dover, consecrated in 1890, is the fifth of that title, his predecessor of the Reformation period being Richard Rogers, Dean of Canterbury, and suffragan to Archbishop Parker. A suffragan holds his commission at the will of the diocesan, at whose death it lapses. But the lapse or voluntary resignation of such commission does not affect the "style, title, or dignity" of the suffragan see. James Kemp, D. D., was consecrated suffragan to Bishop Claggett, of Maryland, with jurisdiction of "the Eastern Shore," Sept. 11, 1814. On Bishop Claggett's death he succeeded him as Bishop of Maryland. Suffragans are not allowed in the Protestant Episcopal Churches in the U. S. Dr. Brett's

treatise on *Suffragan Bishops and Rural Deans* (1711) has been republished with notes by James Fendall (1858).

WILLIAM STEVENS PERRY.

Bismarck: city; capital of N. Dakota and Burleigh co. (for location of county, see map of North Dakota, ref. 3–D); very advantageously situated on Northern Pac. R. R. and on east bank of Missouri river. The Missouri is navigable for boats of 250 to 700 tons for 1,200 miles above Bismarck, which contains an immense river-warehouse; 15,000,000 to

State Capitol, Bismarck, North Dakota.

25,000,000 lb. of freight shipped viâ river annually. Bismarck contains the Capitol, which cost over $500,000; the penitentiary, fine court-house, high-school building, water-works, electric light, a large flouring-mill, extensive brewery, etc. The bridge across the Missouri river cost $1,500,000. Pop. (1880) 1,758; (1890) 2,186; (1900) 3,319. EDITOR OF "TRIBUNE."

Bismarck Archipelago: a group of islands off the north coast of the eastern end of New Guinea, including islands formerly called New Britain, New Ireland, New Hanover, and Duke of York group. It was appropriated by Germany in 1884 and 1885 and assigned to the New Guinea Company. Area, 18,200 sq. miles. Pop. estimated at 188,000, of whom only 61 were Europeans, in 1891. New Britain was in 1885 rebaptized as New Pomerania; New Ireland as New Mecklenburg, and the Duke of York group as New Lauenburg.

Bismarck-Schönhausen, bis'maark-shön-how'zen, HERBERT, Prince von: German diplomat; son of Prince Otto Bismarck; b. at Berlin, Dec. 28, 1849. Prince Bismarck is a major in the German army; has served as secretary to the embassy in London and as minister at The Hague. He sits in the Reichstag for Schleswig-Holstein, and was (1886–90) at the head of the German Foreign Office, but retired upon the resignation of his father. His marriage, June 21, 1892, to Countess Margaret Hoyos, in Vienna, was the occasion of a great popular demonstration in favor of his father, who attended the wedding.

Bismarck-Schönhausen. OTTO EDUARD LEOPOLD, Prince von: Prussian statesman and the unifier of Germany; b. on the knight's estate of Schönhausen, near Stendal, in Prussian Saxony, Apr. 1, 1815. His father's family belonged to the lower order of Prussian nobility, and several of his paternal ancestors distinguished themselves in war and diplomacy. His mother was the daughter of Ludwig Menken, a liberal-minded privy counselor of Frederick the Great. A year after Bismarck's birth his father moved to one of his estates near Stettin in Pomerania, and it was there that the future statesman received his first impressions of life. At the early age of six he was sent to the boarding-school of Herr Plamann at Berlin, where, as he afterward said, he had "elastic meat with parsnips as the invariable dish," and where in matters of discipline "a spurious Spartanism was the rule." At twelve he went to a gymnasium, where he fell under the influence of Dr. Prevost and Dr. Bonneil, both of whom seem to have had much influence on his methods of thought and life. History was his favorite study, though he acquired at this time such thorough knowledge of the elements of English and French that he ever afterward used these languages with ease, and surprised both Napoleon III. and Beaconsfield with his mastery over them. During this period, and especially in his vacations, he devoted himself to all kinds of manly sports, and thus developed those remarkable physical powers for which he was afterward so famous. In 1832, at the age of seventeen, he was entered as a student of law at the University of Göttingen. That he did not devote himself very assiduously to study may be inferred from the fact that in the course of three semesters he fought twenty-eight duels, in all of which he drew blood from his opponent, while in one only did he receive a scar, the one observable on his left cheek. In 1833 he went to the University of Berlin, where a little later he passed the requisite examinations for professional life. But instead of entering upon the practice of law he returned to Pomerania, and devoted himself to the care of his estates and the life of an energetic country squire. It was not until 1847 that he was elected to the Prussian House of Burgesses. He remained a member until 1851, when he was chosen a representative of the Germanic Diet. It was here that his remarkable public career began, for immediately after he appeared in the Diet he outlined the characteristics of all the most important of his political doctrines.

At the beginning of the nineteenth century there was about as little representative government in Germany as in Asia. The Napoleonic campaign which shattered Prussia at Jena, however, led to many reforms under the inspiring leadership of Von Stein. Frederick William III. not only issued an edict of emancipation, but a little later he also promulgated at the Congress of Vienna an ordinance promising his people a written Constitution and a representative Assembly. It was largely from the inspiration of these edicts that Germany aroused herself to throw off the Napoleonic yoke. But a reaction soon came on under the baleful influence of Metternich. In all the German states the prospect of constitutional government grew less and less as the years went on. In Prussia the reign of Frederick William IV. seemed to give no hope whatever. It was owing to the general feeling resulting from the faithless promises of royalty that the Revolution of 1848 took so strong a hold in Germany. Though Bismarck entered the Prussian Parliament in 1847, it was not till he entered the Germanic Diet in 1851 that he exerted strong influence. From the first, however, he not only opposed all revolutionary measures, but demanded that in the Diet Prussia should have the same rights as Austria. He remained at Frankfort till 1859, when he was sent as minister to St. Petersburg. His diplomatic experience, begun in Russia, was continued in France, whither he was sent in 1862 in order that he might obtain an insight into the politics of the Tuileries. In the autumn of the same year he was recalled to take the portfolio of foreign affairs, and became president of the cabinet. A period of turbulent parliamentary disagreements ensued. The Government was unable to induce parliament to make the needed appropriations for a reorganization of the army, whereupon parliament was repeatedly dissolved, after being told that the king would be obliged to act without its sanction. In this way the reorganization of the army went on in spite of parliament. The death of the King of Denmark soon afforded the opportunity for showing Prussian strength. The Schleswig-Holstein duchies were claimed for the Duke of Augustenburg by Prussia, with a view to detach them from Denmark and incorporate them with Germany, and Bismarck was adroit enough to enlist in behalf of the claim the general sympathy of the empire. Austria and Prussia soon came to dissension over the occupation of these duchies, with the result that the conflict was brought to a crisis at the battle of Königgrätz in 1866, where Austria was so disastrously defeated that Prussia was able to place herself at the head of the North German Confederation, from which Austria was excluded. The war had carried Prussia to the very front of military nations, and Bismarck was universally recognized as the leading spirit in the movement. The result of the war was disastrous, however, to the friendly relations of France and Prussia. The French people saw the aggrandizement of their old foe with great alarm, and seized upon the first pretext for declaring war. The events of 1870–71 afforded Bismarck the opportunity he desired. The military prestige of France was humbled, if not broken; but, what to him was doubtless of far more consequence, the result intensified the national feeling among the Germans to such an extent that the new German empire was established, with the King of Prussia at its head. Bismarck himself was given the rank of prince, and made chancellor of the empire. At his dictation France was obliged, at the Treaty of Frankfort, May 10, 1871, to cede to Germany the greater

part of Alsace-Lorraine, and pay an indemnity of $1,000,000,000.

At the close of the war Bismarck entered upon what was in many respects the most remarkable part of his career. Having accomplished the consolidation of the German states into a federal union, he saw that the welfare of the country demanded that development of German resources which could only come from a long term of peace. He held that the sentiment of France was such that there could be no security against another outbreak of war except the general belief that an attack by France could have no chance of success. In order to secure this end he sought, on the one hand, by all the means at the command of diplomacy to isolate France, and on the other to form strong alliances between Germany and other European powers. In both of these efforts he was signally successful. While he made it impossible for France to form any advantageous union, he succeeded in uniting Germany with Austria and Italy in the firm bond of a triple alliance. He also strengthened the German army so far as to make it obvious that even a hostile alliance between France and Russia would not be able to cope with the combined forces of Germany, Austria, and Italy. Meanwhile, for the purpose of developing home industries, he secured the adoption of a law establishing a high protective tariff on foreign goods. In this and in many other ways he fostered the German spirit of solidarity and independence. This was done, however, at the expense of much opposition. He desired to make every party and power in the state subordinate to the general interest, and therefore incurred the violent opposition of the Liberal party on the one hand and of the Ultramontanes on the other. But his parliamentary skill was equal to the task of playing one party against another, and thus defeating all his enemies. When it became apparent that the reign of William I. was near its end, the hopes of the Liberals were very much encouraged by the political attitude and sympathies of the Crown Prince Frederick. But the prince, when he ascended to the throne, was too ill to urge his policy with success, and his death, which soon occurred, left the power of Bismarck apparently unshaken. The turmoils of Frederick's short reign, however, made a deep impression on the vigorous mind of the crown prince unfavorable to the chancellor, and when William II. succeeded his father it became apparent that the emperor and the chancellor were not in harmony, so the latter resigned Mar. 18, 1890. On his retirement he received many honors at the hands of the emperor. D. July 30, 1898. See *Prince Bismarck*, by Charles Lowe (2 vols., London, 1885); *Our Chancellor*, by Moritz Busch (2 vols., New York, 1884); *Bismarck and the Franco-Prussian War*, by Moritz Busch (New York, 1878); *The Two Chancellors* (Gortschakoff and Bismarck), by Julian Klaczko (London, 1876). Bismuth [loan-word from Germ., which has also the form *Wismuth*]: a brittle metal (symbol Bi; specific gravity about 9·8; atomic weight 208) of a crystalline texture and of a grayish-white color, with a red tinge; occurs native in Australia, Germany, France, Cornwall, California, Texas, and Sweden. It is also found in combination with oxygen, sulphur, and arsenic. It fuses at about 500° F. When strongly heated it burns with a bluish-white flame, and is rapidly oxidized. This metal is not often used in the arts in a pure state, but its alloys are of considerable importance. Some of them are extremely fusible. A compound of 8 parts of bismuth, 5 of lead, and 3 of tin melts in boiling water, and is called *fusible metal*. Other alloys are even more fusible. Bismuth is an ingredient of some kinds of stereotype metal. The most important of several compounds it forms with oxygen is the trioxide (Bi_2O_3), which is employed in the manufacture of porcelain as an agent for fixing the gilding and for increasing the fusibility of fluxes. The sub-nitrate is a tasteless, heavy powder of pure white color, called pearl white, pearl powder, blanc de fard, etc. This is used as a cosmetic. As a medicine it acts as a tonic and antispasmodic. Revised by Ira Remsen.

Bismuthine: a trisulphide of bismuth, composed of 81·6 per cent. of bismuth and 18·4 of sulphur. It occurs in lodes and beds in the older rocks with ores of arsenic, copper, iron, and lead, either crystallized in acicular prisms or massive with a foliated structure. It is a rare mineral.

Bison: a genus of animals of the order *Ungulata* and family *Bovidæ*; nearly allied to the ox; natives of Europe and North America. The bisons have short horns, which are curved inward at the point. They are distinguished from the ox by an additional pair of ribs (having fourteen pairs), and by long woolly or shaggy hair, which covers the neck and shoulders of the males. They differ from the true buffaloes in having a hump upon the back, and in the absence of the dewlap. The buffaloes have cavities in their horns communicating with the nasal passages—bisons have not; the horns turn outward in the true buffaloes and inward in the bisons. (See Buffalo.) At least six species of fossil bison have been discovered. (For the European bison, see Aurochs.) The American bison (*Bison americanus*) is known in the U. S. by the incorrect name of buffalo. This is the only species of the ox family indigenous to America, except the musk ox. It is similar to the European bison, but the fore parts are more shaggy, and it is a powerful and ferocious-looking animal. The color of its hair is mostly brown. Vast herds of bisons formerly roamed over the plains and prairies between the Mississippi river and the Rocky Mountains, feeding on grass and brushwood. They were generally inoffensive and would not attack men, but preferred to run rather than to fight. During their migration they moved in herds, which were innumerable and irresistible. Great numbers of them were killed by Indians, who pursued them on horseback and subsisted on their flesh. Their hides were also valuable, and under the name of buffalo robes were an important article of commerce. The flesh of the cows was highly esteemed and similar to beef, being very juicy and savory. The bisons are swift in running, and have so keen a sense of smell that the hunter found difficulty in approaching them. The Indians sometimes circumvented them by setting fire to the prairie grass on several sides, and thus drove them in confusion toward a central position. They also drove them over precipices in large herds, the momentum of which was such that the leaders could not stop or retreat, being forced forward by the mass behind them. The chase of bisons was attended with some danger, as they sometimes turned upon an assailant, who was liable to be trampled under the feet of the herd. Numerous tribes of aborigines were mainly dependent on bisons for their food and clothing. The skins, which are covered with soft hair or fur, were much used for blankets, and their flesh and fat were converted into pemmican, the favorite food of the fur-hunters and *voyageurs* of North America. Bisons are nearly extinct, and only a few small herds now exist in North America. The largest of these, in Yellowstone Park, is reduced to fifty. Experiments in crossing the bison with domesticated cattle have led to no practical results.

Bison.

Bissagos, bis-saa'gōs, **Islands**: a group of small volcanic islands in the Atlantic; near the west coast of Africa, between lat. 10° and 12° N., and between lon. 15° and 17° W. (see map of Africa, ref. 4–A). They have several good ports. Some of them are densely peopled with a savage Negro race, who cultivate maize, bananas, etc., and raise cattle. Bissao, an island of the above group, is a settlement of Portuguese who formerly traded in slaves, and who export hides, wax, and rice. It has about 8,000 inhabitants.

Bissell, Edwin Cone, D. D.: Congregationalist; b. at Schoharie, N. Y., Mar. 2, 1832; graduated at Amherst College 1855, and at Union Theological Seminary 1859; pastor successively at Westhampton, Mass. (1859–64), San Francisco, Cal. (1864–69), Winchester, Mass. (1870–73); missionary in Austria, sent by the A. B. C. F. M. (1873–78); professor in Hartford (Congregational) Theological Seminary from 1881 until 1892, when he became professor in the McCormick (Presbyterian) Theological Seminary, Chicago, Ill. He commanded company K, Fifty-second Massachusetts, in the civil war, 1862–63. He was the author of *The Historic Origin of the Bible* (New York, 1873), a critical work; revised translation and commentary, in the Lange Series, on *The Apocrypha of the Old Testament* (1880); *The Pentateuch, its Origin and Structure* (1885); *Biblical Antiquities* (Philadelphia, 1888; 2d ed. 1892); *A Practical Introductory Hebrew Grammar* (1891); *Genesis printed in colors, showing the original sources from which it is supposed to have been compiled, with an introduction* (Hartford, 1892). D. in Chicago, Ill., Apr. 9, 1894. George P. Fisher.

Bissell, William Henry Augustus, D. D.: second Bishop of Vermont; b. at Randolph, Vt., Nov. 10, 1814; graduated at the university of his native state in 1836. He was ordained deacon 1839, priest 1840, and held charges at West Troy, Lyons, and for nearly twenty years at Geneva, N. Y. He was consecrated bishop of the diocese of Vermont June 3, 1868. D. at Burlington, Vt., May 14, 1893.

Bissell, Wilson Shannon: lawyer; b. in New London, Oneida co., N. Y., in 1847; at five years of age accompanied his parents to Buffalo, N. Y., where he has since resided. Graduating at Yale in 1869, he took up the study of law in the office of Laning, Cleveland & Folsom, in Buffalo; was admitted to the bar in 1871, and in the following year entered into partnership with Lyman K. Bass. Mr. Grover Cleveland joined the firm in 1874, and remained senior partner until his election as Governor of New York State in 1882, Mr. Bass retiring in 1876. After Mr. Cleveland's withdrawal Mr. Bissell headed the firm. He was chiefly interested in railroad litigation, and became president of some of the smaller branches of the Lehigh Valley system. In 1893 he was appointed Postmaster-General in Mr. Cleveland's second administration, but resigned in Feb., 1895, and resumed his law practice.

Bis'sen, Herman Vilhelm: a Danish sculptor; b. in Schleswig, Oct. 13, 1798. He went to Copenhagen in 1816, where he made such wonderful progress in his studies that he took the great gold medal in 1823, and was sent to Thorwaldsen in Rome. His works are numerous, and he ranks second only to Thorwaldsen in Denmark, and, inasmuch as he devoted all his time and talents to his native country, his influence upon Danish art has been even greater than that of Thorwaldsen. In 1850 he became director of the Academy in Copenhagen, and there died Mar. 10, 1868.

R. B. Anderson.

Bissextile [from Lat. *bis(s)ex'tilis*, deriv. of *bis(s)extus*; *bis*, twice + *sextus*, sixth]: the year which contains 366 days; usually called in English Leap-year (*q. v.*). In the Julian calendar the length of the year was fixed at 365¼ days, about 11 minutes more than the actual length. In order that the year should always begin with the beginning of a day, it was directed that every fourth year should contain 366 days, and the other years 365. The additional day was given to February, and was inserted next after the 24th, which the Romans called *Sexto Kalendas Martii*. This was reckoned twice, and the repeated day was *Bis Sexto Kalendas*; hence the name *bissextile*. See Calendar.

Bistineau, bis-te-nō': a lake in the northwest part of Louisiana; forms the boundary between Bienville and Bossier parishes. It is about 25 miles long, and has a mean width of nearly 2 miles. Its water is discharged through a short outlet into Red river. It is navigable by steamboats.

Bistort (*Polygonum bistorta*): a perennial herbaceous plant of the family *Polygonaceæ*; a native of Europe and Asia. It bears flowers in a dense terminal spike. The whole plant is astringent, containing much tannin. The tortuous root is one of the most powerful vegetable astringents, and is used both internally and externally.

Bister, or **Bistre**: a pigment of a warm brown color, or reddish brown; used by painters in water-colors. It is prepared from the soot of wood, especially the beech.

Bistritz, bis'trĕts: a town of Transylvania; situated in a beautiful valley on the Bistritz river; 52 miles N. E. of Klausenburg (see map of Austria-Hungary, ref. 6–L). It has two monasteries, a gymnasium, and several large cattle-fairs every year. Near it are the ruins of an ancient castle, the former residence of the family of Hunïades. It was of great commercial importance in the fifteenth and sixteenth centuries. Pop. 9,150.

Bit, or **Bitts**: two short but strong vertical timbers fixed upon the deck of a ship. They are used for fastening the cable when the ship rides at anchor, and for "leading" the principal ropes of the rigging. To "bit the cable" is to fasten it round the bit. "Topsail-sheet-bits" are for belaying or fastening the topsail-sheets. To resist strains, the bits are strongly bolted to the beams that support the deck.

Bithur, bē-thoor': a town of India; in the Northwestern Provinces; on the right bank of the Ganges, about 12 miles N. W. of Cawnpore (see map of N. India, ref. 6–F). It has numerous pagodas, and is visited by multitudes of pilgrims. During the mutiny of 1857 it was a stronghold of Nana Sahib, and was taken by Gen. Havelock in Aug., 1857. Pop. about 8,000.

Bithyn'ia: an ancient country of Asia Minor; bounded N. by the Pontus Euxinus (Black Sea), E. by Paphlagonia, S. by Galatia and Phrygia, and W. by the Propontis (Sea of Mármora), which separated it from Europe. The chief towns were Nicomedia, Chalcedon, Nicæa, Prusa, and Heraclea. Bithynia was annexed to the Persian empire in 543 B. C., but afterward became an independent kingdom. Nicomedes I. began to reign over it in 278 B. C., and d. in 246. Prusias II. was King of Bithynia in the time of Hannibal, who sought refuge at his court. In 74 B. C. Bithynia became a province of the Roman empire. Nicomedia was for a long time the capital of the kingdom. In 1298 the Turks conquered the country, and in 1328 made Prusa the capital of their whole empire.

Bitlis', or **Betlis'**: a town of Turkish Armenia; on the Bitlis river; a sub-tributary of the Tigris; on the northern slope of the Armenian Taurus, a few miles southwest of Lake Van. It is on very rough ground, and the houses are scattered and surrounded by gardens and orchards. In the center is a very steep eminence, on which stands an ancient fortress, now in ruins. The dancing dervishes have twelve monasteries in the place. Gold and silver ware, cotton cloth, carpets, and tobacco are manufactured here. The town is said to have been founded by Alexander the Great; it came into the possession of Turkey in 1514, and for about three centuries has been held as a fief of a powerful Kurdish family. Pop. about 25,000, one-fourth Armenian.

M. W. H.

Bitonto, bē-tōn'tō (anc. *Butuntum*, or *Bituntum*): a town of Italy; in the province of Bari, 11 miles W. of Bari (see map of Italy, ref. 6–G). It is well built, and has a fine cathedral and several monasteries. Good wine is made in the vicinity. The Spaniards gained a decisive victory over the Austrians here May 25, 1734. Pop. 27,000.

Bitsch, beech (in Fr. *Bitche*; Lat. *Bicina*): a small fortified town of Lorraine; in a pass of the Vosges, about 36 miles N. N. W. of Strassburg, and 64 miles E. of Metz (see map of German Empire, ref. 6–C). Here is a citadel that is nearly impregnable, on a steep isolated rock. The town was originally a countship held by the Counts of Alsace and Flanders, but was given to the Duke of Lorraine by Frederick III., and finally passed to France with the duchy of Lorraine in 1738. It was in the French department of Moselle until 1870, when possession was taken of it by the Germans at the general cession of the country; for, in spite of a long siege and bombardment, it was not surrendered. Pop. (1890) 2,764, one-quarter military.

Bittenfeld, Herwarth von: See Herwarth von Bittenfeld.

Bitterfeld, bit'ter-felt: a town of Prussia; province of Saxony; on the Mulde river; 20 miles by rail N. of Leipzig. It is on the railway from Berlin to Leipzig, with branches to Halle and other places. It has important manufactures of cloth, iron, machines, etc. Pop. (1890) 9,047.

Bitter-king (*Soulaurea amara*): a shrub or small tree of the family *Polygalaceæ*; derives its name from its intense bitterness. It is a native of the East Indian islands, has large oval leaves and axillary racemes of regular flowers. It is used as a remedy for fevers and other diseases.

Bittern [from same source as *bitter*, adj.]: the mother-liquid remaining after the removal of common salt from brines which have been partially evaporated. The bitter taste is due to the magnesium salts present. Sea-water and many salt-wells yield a bittern which is valuable in the production of Epsom salts (sulphate of magnesia), and especially of bromine.

Bittern [from O. Fr. *butor*; of uncertain origin]: a wading-bird allied to the heron; belonging to the genus *Botaurus* and family *Ardeidæ*. It has a long, straight, and sharp bill, long legs, and a long neck; frequents marshy fens and reedy shores of rivers and lakes, where it lies hid during the day, and feeds by night on frogs, fish, etc. The common bittern of England is widely diffused in Europe, Asia, and Africa. It utters a peculiar hollow and booming sound, which is noticed in Goldsmith's line, "The hollow-sounding bittern guards its nest." When assailed it

Bittern.

defends itself bravely with its sharp bill, which is about 4 inches long. In the U. S. are found two bitterns similar in habits to *Botaurus stellaris*—viz., *Botaurus lentiginosus* (bittern or bog bull) and *Ardetta exilis* (least bittern).

Revised by D. S. JORDAN.

Bitter Root River: in the State of Montana; rises in the Rocky Mountains; flows northward, and enters Clark's river in Missoula County. Length, estimated at 110 miles. Gold is found near it.

Bitter-rot: See ROT.

Bitters: certain medicines, simple or compound; chiefly of vegetable origin, characterized by a bitter taste, and for the most part having tonic virtues. There are two classes: *aromatic bitters*, having a fragrant odor, due to volatile oils, and *simple bitters*, which possess no peculiar properties beyond their bitterness. "Bitters," as popularly used, are generally compounds of dilute alcohol with various drugs, as aloes if a cathartic effect be desired; if a tonic effect is sought, the bitters used are calisaya bark, gentian, quassia, columbo, and others. An aromatic is often added.

Bitter Spar: a variety of DOLOMITE (*q. v.*) of easy cleavage. It usually occurs in obtuse rhombohedrons, and consists of about 55 per cent. of carbonate of lime and 45 of carbonate of magnesia. Fine transparent crystals of it are found at Gap in France and Traversella in Piedmont.

Bitter-sweet, or **Woody Nightshade** (*Solanum dulcamara*): a perennial plant with a shrubby stem, nearly allied to the potato; is a native of Europe and Asia, and is naturalized in the U. S. It has ovate, heart-shaped leaves, the upper ones halberd-shaped or with two ear-like lobes at the base, and purple flowers. The fruit is a poisonous red berry. The stems or twigs gathered in autumn are sometimes used in medicine in chorea and some cutaneous disorders.

The name bitter-sweet is frequently given in this country to a climbing woody vine, the *Celastrus scandens* of the family *Celastraceæ*, which grows wild in the Northern and Atlantic States. This vine is also called wax-work and staff tree. It has been used in medicine, and is popularly believed to have great virtues as an alterative.

Bitter-sweet Family: See SPINDLE-TREE FAMILY.

Bitterwood: a name given to several trees and shrubs of the genus *Xylopia* and the family *Anonaceæ*; natives of Brazil and the West Indies. They are remarkable for the bitterness of their wood. The fruit of *Xylopia sericea* is aromatic and pungent like pepper. The term is also applied to the *Picræna excelsa* and *Quassia excelsa*, the wood of which is used in medicine as a tonic. See QUASSIA.

Bit'tle, DAVID FREDERICK, D. D.: founder of Roanoke College; b. in Frederick co., Md., Nov. 19, 1811: graduated at Pennsylvania College 1835; studied theology at the seminary of the Lutheran Church at Gettysburg, Pa.; pastor in the valley of Virginia, and afterward in Middletown, Md.; president of Roanoke College, Salem, Va., from 1853 until his death, Sept. 25, 1876.

Bitu'men (Lat. *bitu'men*): generically, a term applied to a variety of substances, from natural gas through naphtha, petroleum, and mineral tar, to solid asphaltum, containing for the most part carbon and hydrogen, with more rarely oxygen, nitrogen, and sulphur. No general chemical formula can be assigned to it.

Bitumen has been known to man in all its varied forms from the dawn of history. The Hebrew word translated "slime" in Gen. xi. 3 is rendered ἄσφαλτος in the Septuagint and bitumen in the Vulgate.

Geographical Distribution.—Nearly all forms of bitumen are very widely distributed over the surface of the earth. On the Western continent a basin in the central and northern portion of the Mississippi valley, said to embrace 200,000 sq. miles, yields natural gas and petroleum in enormous quantities. In the central valleys of the eastern slope of the Rocky Mountains, from the mouth of Mackenzie river to Mexico, outcrops of maltha and asphalt occur at intervals. They occur in the valley of the Mackenzie for a distance of 1,500 miles. Along the Athabasca river a mass of asphaltic sand outcrops in bluffs 150 feet high for 60 miles. In Western Louisiana and Northeastern and other parts of Texas maltha and asphalt are frequently met. In Southern Central Texas an extensive deposit of calcareous asphalt has lately been reported similar to that of Val de Travers. In Eastern Mexico asphalt and maltha are of frequent occurrence. In Utah extensive deposits of ozokerite and gilsonite occur. On the Pacific coast of California, from San Luis Obispo to San Diego, but chiefly in the valley of the Santa Clara river, springs of asphaltum, maltha, and petroleum are very numerous.

In the islands of Cuba, Barbadoes, and Trinidad asphaltum and petroleum in commercial quantities have long been known as Cuban asphalt, Barbadoes tar, and Trinidad asphalt, from the celebrated pitch lake. On the mainland in Venezuela another and larger "pitch lake" is known, and in Peru and Bolivia petroleum occurs in large quantities.

On the Eastern continent a line of bituminous outcrops occur from Hanover on the North Sea through the Carpathians, the peninsula of Taman, the Caucasus, the peninsula of Apsheron at Baku, the table-lands of Armenia and Persia, the environs of the Dead Sea, the valleys of the Tigris and Euphrates, the mountains of Baluchistan and Hindustan, Burma, and the islands of Java and Sumatra. Petroleum occurs in China and Japan, Egypt, Italy, the Ionian islands, Sicily, and the Pyrenees. Asphalt and maltha occur in Dalmatia, on the eastern shores of the Adriatic, and in many localities in France. In the Val de Travers, in Switzerland, and in the Tyrol and Sicily a peculiar limestone occurs impregnated with asphalt, which is widely used for pavement under the name of asphalte. The magnificent avenues of the city of Washington are covered with this material and asphaltum from the island of Trinidad. In England petroleum springs have been observed yielding small quantities of oil, but not in commercial quantity.

Geological Occurrence.—There are two well-marked geological eras noted for the occurrence of bitumen, although it may be said to occur from the Silurian up to the Tertiary. On the North American continent, east of the Mississippi river, the Devonian in Pennsylvania, the sub-carboniferous in Eastern Ohio and West Virginia, the upper Silurian in Tennessee and Kentucky, and the Trenton limestone in Western Ohio, Indiana, Michigan, and Canada, form an ellipse around the Cincinnati anticlinal, from which these newer formations slope upon all sides. In this ellipse occur the great petroleum and natural-gas regions of Canada and the U. S. At Great Manitoulin island, in the northern part of Lake Huron, and in the peninsula of Ontario, lying between Lakes Huron and Erie, petroleum has been observed. In Western New York, from Lake Erie as far east as Canandaigua Lake, natural gas is abundant, especially at Fredonia, where it has been used to light the town since La Fayette's visit in 1824. Near the boundary line between New York and Pennsylvania the oil regions of Pennsylvania commence, and extend through the western counties of that State, reaching into the eastern counties of Ohio, and extending southwestward into West Virginia and Kentucky. At one place in Wood co., West Va., a sort of asphalt called grahamite, that has been described as hardened petroleum, was mined until the deposit was exhausted. A similar mineral called gilsonite has lately been found in Utah. The formations throughout this region, inclosing the oil and gas, range from the Devonian in the northern portion to the sub-carboniferous in the southern portion, everywhere lying beneath the coal or coal-measures, if they are present. Through all the eastern counties of Kentucky into Tennessee petroleum and gas are frequent, as also along a line extending through Central and Western Kentucky into Indiana. Although both oil and gas occur at many points throughout these last-named regions, the developments are as yet unimportant, the oil and gas issuing for the most part from the upper Silurian. Asphalt also occurs in Tennessee in small quantity. In Northwestern Ohio and Northeastern Indiana, around Lima, a very prolific oil and gas field has been developed within the last ten years from the Trenton limestone. Limestone impregnated with petroleum occurs near Chicago, Ill., and throughout the southern peninsula of Michigan oil in small quantities is of frequent occurrence. Natural gas everywhere accompanies the petroleum, and many localities, both within and along the borders of this area, yield gas without oil, usually under an enormous pressure, at which no doubt the gas exists in a liquid state in the containing rocks. So far as is known, the deposits of the central valleys are cretaceous, the asphalt deposit of Texas lying in the Permian. The deposits of California, the West India islands, and South America are, so far as is known, in the Tertiary.

On the Pacific coast of California all forms of bitumen, from petroleum to half-decayed asphalt, occur, issuing from Miocene rocks, and gradually passing from the liquid to solid forms under the influence of the sun and rain. On the coast near Santa Barbara veins of asphalt mixed with very

fine sand occur in the Quaternary, apparently injected from below into crevices formed by some upheaval.

In Cuba asphalt is mined from veins in rocks supposed to be cretaceous. The great pitch lakes of Trinidad and Venezuela lie in the Tertiary, and the petroleum of South America issues from rocks of that age.

The small amount of petroleum observed in England has sprung from the coal-measures. In France the extensive deposits of asphalt occur in relation to what has been called by the French geologists an *époque asphaltique*, which has been assigned to the cretaceous. The vast region embracing the Carpathians, the Caucasus, and the table-lands of Persia yields every known form of bitumen from Tertiary formations. The petroleum of Italy and asphalt of Dalmatia and Albania also proceed from the Tertiary. But little is known of the geology of the occurrence of bitumen in other and less important localities.

Chemistry.—Bitumens consist of various mixtures of hydrocarbons, usually of very complex nature. A few are simple substances, having a definite chemical composition, and for the most part contain oxygen. Natural gas consists largely of marsh gas. With this are mixed in various proportion free hydrogen, and the members of the series next below marsh gas with traces of carbonic acid and carbonic oxide. The petroleums of the New York, Pennsylvania, Ohio, and West Virginia regions consist of the marsh gas or paraffine series, ranging from marsh gas in the dissolved gas to the solid paraffines. The lightest of these oils are yellow or red in color (amber oils), through brown and dark green to black. The more dense and dark oils hold in solution in small quantity solid substances, containing but little hydrogen, of high boiling-point and coloring power, only a few drops of which added to a colorless oil suffice to give the oil a high fluorescence. The Burmese oils contain in addition notable portions of the benzole series. The Russian oils contain the additive compounds of the benzole series. All of these varieties contain also more or less of the olefine series. The initial members of these several series are as follows:

Marsh gas.....	$CH_4 - C_nH_{2n+2}$.
Olefiant gas.....	$C_2H_2 - C_nH_n$.
Benzole.....	$C_6H_6 - C_nH_{2n-6}$.
Hexa benzole.....	$C_6H_{12} - C_nH_{2n-6} + H_6$.

Many varieties of petroleum have been studied very little, if at all. It is observed, however, that some are very permanent in the air, undergoing no change when exposed in masses or flowing upon the ground or water, while others soon become dark-colored and viscid, passing into maltha, and finally into asphaltum. The petroleums from Tertiary formations are mainly of this character. Those from the cretaceous are of uncertain composition, and, while very widely distributed, are of minor importance. The Tertiary petroleums that form asphaltum rarely contain paraffine, except in the Carpathians, where immense quantities of native paraffine, called ozokerite, occur in masses in the rocks. In Utah ozokerites occur, not associated with other forms of bitumen. Asphaltum usually occurs in beds, where petroleum or maltha has flowed over the surface, and gradually gives up hydrogen to the oxygen of the air until the asphaltum, with a large excess of carbon, becomes solid and firm, in many instances resembling splint coal. Other forms of asphalt occur in veins, where they have apparently been intruded in a pasty or semi-fluid form at a high temperature and have become solid upon cooling. The material contained in these veins is identical only in a general manner. The albertite of New Brunswick, the grahamite of West Virginia, and gilsonite of Utah yield on distillation the paraffine series; but veins occurring in the region of Tertiary bitumens yield products, and partake of the characteristics of those substances. As a rule, asphalts of all kinds are soluble in benzole, but there are a few exceptions. The asphaltic sands of the Athabasca river are really petroleum sands, as the mass is not solid, but may be cut like marmalade. These natural mixtures of bitumen and sand are more complete than can be made by any artificial means, and for that reason are preferred to artificial mixtures for some purposes. When subjected to the action of chlorine, California petroleum may be converted into asphalt with liberation of hydrochloric acid. California petroleum contains a notable quantity of nitrogen, which appears to be a constituent element. Other petroleums contain sulphur, but it appears to be an accidental impurity rather than a constituent. Such petroleums are often very difficult to refine, as the sulphur forms substitution compounds at high temperatures.

The word naphtha is of Arabic origin, and in Persia the native name is used to designate the most fluid variety of petroleum, often nearly colorless. In the U. S. the word has no similar meaning, but is always applied to some artificial product, usually the most volatile products of the distillation of petroleum.

The Origin of Bitumen.—This is a subject of pure speculation, but a careful study of the occurrence of bitumen in various parts of the world leads to conclusions well-nigh final.

Some of the most distinguished chemists of recent years have succeeded by very elaborate and ingenious experiments in producing from materials entirely inorganic oily fluids resembling petroleum. Reasoning from these results, they have assumed that nature's laboratories furnish the alkali metals, metallic iron, spiegel eisen, fluoborates, etc., and that the reaction of steam and carbonic acid at a white heat upon these produces the forms of bitumen as they appear at the earth's surface. Too much is required of nature's laboratories not sustained by observed phenomena to warrant the acceptance of such theories.

The occurrence of geodes filled with petroleum or other forms of bitumen, including anthracitic residues, in strata filled with fossil remains of animals, leads to the conclusion that in some instances the bitumen is the product of the decomposition of animal remains *in situ*, probably under great pressure and at a comparatively high temperature, perhaps beneath a deep sea. Large orthoceratites (an animal that may be compared to an uncoiled nautilus) have been observed with the cavities filled with fœtid petroleum. Many facts observed in the vicinity of the pitch lake of Trinidad lead to the conclusion that the bitumen there is the product of the decomposition of wood or other vegetable matter under conditions that render the product wholly different from that of ordinary decay.

An examination of those regions that furnish bitumen in its various forms in greatest abundance, and particularly petroleum, leads irresistibly to the conclusion that by far the larger portion of the petroleum of the world is a distillate produced by natural causes. The Pennsylvania oil regions furnish oil from deposits of coarse sandstone and quartz conglomerate often consisting of water-worn pebbles of white quartz, of a lenticular or nearly spherical form, connected only at their points of contact, leaving the interstitial spaces open. The surrounding rock does not contain petroleum, and the rocks overlying these deposits are very hard silicious shells that hermetically seal the petroleum beneath them. It is impossible that the oil should have passed downward or laterally against such pressure, nor could it have penetrated the shells. The pebble sand is entirely destitute of organic remains, or of anything that would suggest them. The coarse sandstone of the Bradford field contains a few fossil shells. In seeking a source for the petroleum, it is found below in the immense deposits of shale that underlie that entire region, from 1,000 to 1,500 feet in thickness. At Erie, Pa., the shales come to the surface, and are there found to contain enormous quantities of fossil seaweeds. They have been made to yield 50 gal. to the ton of an oil resembling crude petroleum, and also hold petroleum in small quantities in their deeper layers. The cubic miles of this formation that underlie the oil region in Northern Pennsylvania and Southern New York and the black shales of Kentucky furnish a perfectly adequate source from which the vast supply of this material might be drawn. This theory is further strengthened by all of the facts observed in the destructive distillation of organic material in the arts. The hydrocarbons found in the more liquid forms of bitumen have also been found in artificial distillates from wood, bituminous coal, a lime soap made with menhaden oil, peat, shale, and other substances of organic origin. The lower the temperature at which such distillation is made, especially when steam is injected into the still, the closer is the resemblance between the distillate and the forms of bitumen. It is impossible that distillation could proceed from any natural cause, except it be at the lowest possible temperature and accompanied by all the possible effects of the presence of steam. As is the case when artificial distillates are produced from various organic materials and at different temperatures, we find that the various bitumens found in different formations and at different geological epochs partake in many respects of the peculiar composition of the organic remains from which the distillation proceeded. In

illustration it may be mentioned that the simple vegetable remains (*fucoids*) found in the shale on the western slope of the Alleghanies have furnished a distillate made up of the pure hydrocarbons of the paraffine series, rich in hydrogen and almost entirely free from nitrogen and sulphur. On the other hand, the Miocene formations of Southern California, inclosing remains of animals, furnish a bitumen consisting of compounds rich in carbon and containing nitrogen and sulphur. Again, the petroleum of Galicia, which issues from formations lying upon the slopes of the Carpathians, where the rocks contain both animal and vegetable remains, possesses the characteristics of both the Palæozoic and Tertiary petroleums of the American continent.

Bitumen is one of the most permanent substances in nature. It resists decay in nearly all its forms, and has remained unchanged in its natural deposits often through countless cycles of geological time. In the constructions of mankind in various parts of the world it forms a part of the oldest existing monuments. It was used to cement in their places the magnificent sculptured slabs of alabaster that adorned the temples and palaces of Babylon and Nineveh. The cisterns in the rock-hewn city of Petræa of unknown antiquity (perhaps three thousand years) are still intact. Cisterns and silos in Egypt, perhaps older than Petræa, might still be used. It was employed in the vineyards of the Levant, in building boats on the Tigris and Euphrates, in the perpetual fires of the Guebres and Parsis, and for other purposes; and the "fire wells" (natural gas) of China are mentioned in the oldest records of that ancient country. In the Middle Ages it was of considerable importance in Persia, Italy, and Sicily, and nearly all travelers overland to India from Europe mention the fire-worshipers of Baku. Peruvian mummies prepared before the conquest also attest the universality and antiquity of its use.

In modern times all forms of bitumen have become of great importance in ministering to the wants of man, and have assumed an influence scarcely to be estimated upon the civilization of the last half century.

The amount of natural gas produced and marketed in the U. S. in 1899 was valued at $20,024,873. The production of petroleum reached 57,070,850 bbl., valued at $64,603,904; of asphaltum and bituminous rock, 75,085 short tons, valued at $553,904. Total value of bituminous minerals for 1899, $85,182,681.

See ALBERTITE, ASPHALT, NATURAL GAS, GILSONITE, GRAHAMITE, HYDROCARBONS, MALTHA, NAPHTHA, OZOKERITE, PARAFFINE, and PETROLEUM. S. F. PECKHAM.

Bituminous Coal: See COAL, COKE, and GAS.

Bitzius, bit'si-oos, ALBERT (*Jeremias Gotthelf*): Swiss author; b. in Murten, canton of Freiburg, Oct. 4, 1797; educated for the church at Bern, and from 1832 till his death, Oct. 22, 1854, pastor of Lützelflüh in Emmenthal. He is very popular among the Swiss for his masterly tales of Swiss life, among which are *Käthi die Grossmutter* (1847); *Uli der Knecht* (1841); *Uli der Pachter* (1849); and *Erzäldungen und Bilder aus dem Volksleben der Schweiz* (1852–55.) Translated is his *Joys and Sorrows of a Schoolmaster* (London, 1864; 2d ed. 1867). See his *Life* by C. Manuel (Berlin, 1857).

Bivalve [formed from Lat. *bi-*, double + *valvæ*, double or folding doors]: a shell which consists of two concave calcareous plates or valves joined together by a hinge and an elastic ligament, as the oyster.

BIVALVE SHELLS, or BIVALVES, are those coverings of mollusks which consist of two concave plates or valves, united by a hinge. (See CONCHOLOGY.) A majority of recent bivalve shells belong to the acephalous or lamellibranchiate Mollusca. There are also worm-like animals of the class Brachiopoda which possess bivalve shells. The structure and chemical composition of the shell, however, is different in the two classes. A very large proportion of the bivalve shells of the older fossiliferous rocks belong to the class Brachiopoda. In the Brachiopoda one valve is ventral and the other dorsal; in the Lamellibranchiata both are lateral.

Bivouac, biv'wăk [Fr. *bivouac*, prob. originally loan-word from Swiss Germ. *Beiwacht*, supplementary night-watch]: a French word signifying an encampment of soldiers by night in the open air, without tents, or the system by which soldiers on a march, or in expectation of a battle, remain all night in the open air, resting with their arms by their side and ready for action. This practice is said to have been common among the crusaders. The generals of the French Republic or the First Empire introduced the plan of dispensing with the use of tents and passing the night *en bivouac*. The same system was adopted by the other great powers on the Continent of Europe. In recent times it has been common for soldiers on the march to use the *tente d'abri*, or shelter-tent.

Bixby, JAMES THOMPSON, Ph. D.: Unitarian minister; b. at Barre, Mass., July 30, 1843; educated at Harvard College and Harvard Divinity School; held various charges in the Unitarian Church in Massachusetts and Maine 1870–79; Professor of Religious Philosophy in Meadville Theological School 1879–83; traveled in Europe 1883–85; became pastor of the Unitarian church at Yonkers, N. Y., 1885; received degree of Ph. D. at Leipzig, 1885; author of *Similarities of Physical and Religious Knowledge* (1876); second edition under the title *Religion and Science as Allies* (Chicago, 1889); and *The Crisis in Morals* (Boston, 1891).

Bixin: the coloring principle of annotto, the paste obtained by bruising the seeds of *Bixa orellana*.

Bizerta, bĕe-zăr'ta, or **Benzert**, ben-zărt' (anc. *Hippo Zarytus*): a fortified seaport of Tunis, and the most northern town of Africa; about 38 miles N. W. of Tunis (see map of Africa, ref. 1–D). The port, which was formerly good, has been filled up, so that it will now admit only small vessels. It is surrounded by walls and defended by two castles, but is commanded by the adjacent heights. This place was fortified by Agathocles about 308 B. C. Pop. 8,000.

Bizet, bĕe'zay', ALEXANDRE CÉSAR LÉOPOLD: commonly called *Georges Bizet*; b. Paris, Oct. 25, 1838; best known as the composer of the popular opera *Carmen*; studied under Halévy, whose daughter he married in 1869. He gained the Prix de Rome for composition, and was a brilliant pupil of the Paris Conservatory from 1848 to 1857. His operas include *Vasco da Gama* (1863); *Les Pêcheurs des Perles* (1863); *La Jolie Fille de Perth* (1867); *Djamileh* (1872); *Carmen* (1875), his last work. He also completed Halévy's opera *Noé*. He died quite suddenly near Paris, June 3, 1875.
D. E. HERVEY.

Bjerregaard, byār're-gaărd, HENRIK ANKER: a Norwegian poet; b. Jan. 1, 1792. His national songs represent the enthusiasm of the new-born nation in the early part of the century. His drama *Fjeld-eventyret* is still very popular. D. Apr. 7, 1842.

Björneborg, byör'ne-bōrg, or **Biornborg**, byōrn'bōrg: a seaport of Finland; at the mouth of the Kumo; 115 miles S. of Vasa; lat. 61° 29′ N., lon. 39° 23′ E. (see map of Russia, ref. 4–B). It has various manufactures and a considerable trade. Pop. (1888) 9,632.

Björnson, byörn'son, BJÖRNSTJERNE: dramatist and novelist; b. Dec. 8, 1832, in a lonesome and dreary parsonage in Kvikne, Northwestern Norway, where his father was a minister. He was educated in the Latin School at Molde, from which he went to the University of Christiania in 1851. But in the next year he broke off his scientific education and turned his attention to literature. His first book, published in 1857, was a little novel, *Synnøve Solbakken*, descriptive of peasant life in Norway. It made a very deep impression. The plot was simple, but at every movement it touched the deepest laws of life. The characters were pure psychological developments, never marred by explanations or comments from a merely individual moral point of view. The style was the short, pithy sentence of the saga, with all its power of signification, all its strength of passion, and all its sweetness of feeling. The effect of this book was wonderful, and the impression it made was both deepened and widened by the novels which followed, *Arne* (1858); *En glad gut* (A Happy Boy, 1859); *Fiskerjenten* (The Fisher Lass, 1868), etc. In spite of the great variety of characters and situations which they depict, they are all so singularly alike that in the reader's mind they melt into one book, into one charming picture of life in Norway. Alternating with the novels he wrote dramas, and in this field he experienced some opposition. When his first tragedy, *Halte-Hulda*, was published in 1858, there were people who felt that a dramatic genius had arisen, but the Scandinavian theaters were at first singularly unwilling to try the new author. Moreover, the young poet had not yet learnt to say unimportant things in an unassuming manner. His next drama, *Kong Sverre* (1861), was better in this respect, but it was not until he published his great trilogy, *Sigurd Slembe* (1862), that the public thoroughly felt the greatness of his dramatical powers. *Sigurd Slembe* is a grand conception, executed in

a masterly way; and when in 1865 the Royal theater in Copenhagen presented his lovely little comedy, *De Nygifte* (The Newly Married), and in 1867 his tragedy, *Maria Stuart* (published 1864, translated in *Scandinavia*, Chicago, 1883–84), the impression was irresistible. With 1870 the first period of his literary activity may be said to have closed. Between this year and 1875 he underwent a great mental and spiritual change, due in the main to the influence of foreign literature and thought, to the study of which he devoted himself with ardor. He was particularly affected by the works of Darwin, John Stuart Mill, and Taine, as well as by the "modern" movement in Danish letters. In his second period, which begins with 1874, he appears as the foremost Norwegian advocate of republicanism in politics, and of free thought in religion. His principles have found expression not only in a succession of pamphlets, newspaper articles, and public addresses, but in a series of remarkable dramas dealing with social, religious, and political problems. These are *Redaktøren* (The Editor, 1874); *En Fallit* (Bankruptcy, 1875); *Det ny System* (The New System, 1879); *Kongen* (The King, 1879); *Leonarda* (1879); *En Hanske* (A Glove, 1883); *Over Evne* (Overstrained, 1883). Björnson's activity as editor and political leader has been of much importance. He has always been an earnest advocate of Norwegian independence, and his influence as the greatest popular orator of Norway has been especially marked since his American tour in 1880–81. Of the non-dramatic works of his second period the following deserve mention: *Magnhild* (1877); *Kapitejn Mansana* (1879); *Det flager i Byen og paa Havnen* (1884); *Paa Guds Veje* (1889). See Georg Brandes, *Moderne Geister* (1882, pp. 389–436).

Björnstjerna, byörn-styär'na, Magnus Fredrik Ferdinand, Count: Swedish general and author; b. in Dresden, Oct. 10, 1779. He fought against the French in 1809–13, and negotiated the treaty by which Sweden and Norway were united. He was ambassador at London for many years (1828–46). Among his works is *The Theogony, Philosophy, and Cosmogony of the Hindoos* (1843). D. in Stockholm, Oct. 6, 1847.

Blacas, blăă'kaa', Pierre Louis Jean Casimir, Duke of: a French statesman; b. at Aups, in the department of Var, Jan. 12, 1771; a faithful adherent of the Bourbons. He negotiated the concordat of 1817, and was employed on various important embassies. He founded the Egyptian Museum in Paris, and became a member of the Institute. D. in the castle of Kirchberg, Lower Austria, Nov. 17, 1839.

Black: color. See Dyestuffs and Paints.

Black, Adam: publisher; b. in Edinburgh, Feb. 20, 1784; with his nephew, Charles Black, established the publishing-house in Edinburgh which gained control of the *Encyclopædia Britannica* in 1829, and of Scott's novels in 1851. Mr. Black was provost of Edinburgh 1843–48, declining the honor of knighthood; Liberal M. P. for his city 1856–65. D. in Edinburgh, Jan. 24, 1874.

Black, Jeremiah Sullivan: jurist and Democratic politician; b. in Somerset co., Pa., Jan. 10, 1810; became a judge of the Supreme Court of Pennsylvania in 1851; Attorney-General in the cabinet of Buchanan in 1857; and Secretary of State in 1860, where he exerted himself to keep the Government from disruption by the secessionists. He was retained in many celebrated cases. D. in York, Pa., Aug. 19, 1883.

Black, Joseph: chemist; of Scottish extraction; b. at Bordeaux in 1728. He graduated as doctor of medicine at Edinburgh in 1754, and became Professor of Anatomy at Glasgow in 1756. His reputation is founded chiefly on the theory of latent heat, which he propounded between 1759 and 1763. He obtained in 1766 the chair of Chemistry in the University of Edinburgh, where he lectured for thirty years, and acquired great popularity. D. in Edinburgh, Dec. 6, 1799. His *Lectures on Chemistry* were published in 1803 (2 vols. 4to).

Black, Warren Columbus, D. D.: minister of M. E. Church South; b. in Copiah co., Miss., May 24, 1843; educated at Centenary College, Jackson, La.; joined the Mississippi Conference in 1871; has filled pastorates at Raymond, Madison, Camden, Natchez, Meridian, and Jackson; author of *Temperance and Teetotalism* (1886); *Christian Womanhood* (1888).

Black, William: Wesleyan divine; b. in England in 1760; removed to Nova Scotia in 1775; founded there the Wesleyan Church. He was subsequently general superintendent of the Wesleyan missions in British America. His purity of life and eminent services to his denomination made him one of its most memorable characters. D. Sept. 8, 1834.

Black, William: novelist; b. in Glasgow, Scotland, in 1841; educated at private schools; studied for a short time in the Government school of art, Glasgow, but soon engaged in journalism for the *Glasgow Weekly Citizen*: in 1864 went to London and wrote for magazines; in 1865 was attached to the staff of the *Morning Star*, and was its special correspondent in Prusso-Austrian war of 1866; afterward wrote numerous novels, among which are *In Silk Attire* (1869), descriptive of peasant life in the Black Forest; *Monarch of Mincing Lane*; *A Daughter of Heth* (1871); *The Strange Adventures of a Phaeton* (1872); *A Princess of Thule* (1873); *Macleod of Dare* (1878); *White Wings* (1881); *In Far Lochaber* (1888); *New Prince Fortunatus* (1890). His books range from Bohemian art life in London to outdoor sporting life and Scotch scenes and characters. He was for several years assistant editor of the *Daily News*. D. Dec. 10, 1898.

Black, William Henry, D. D.: minister in the Cumberland Presbyterian Church; president of Missouri Valley College, Marshall, Mo.; b. in Centreville, Ind., Mar. 19, 1854; educated at Waynesburg, Pa., and the Western Theological Seminary, Pittsburg; pastor in Pittsburg and in St. Louis. He was moderator of General Assembly at the age of thirty-four. He has published *God our Father* (Nashville, Tenn., 1889); *Womanhood* (1890); *Sermons for the Sabbath School* (1892). W. J. Beecher.

Black Acts: the acts of the Scottish Parliaments passed between 1425 and 1586—so called because they were printed in the characters known as *black letter*. In English law books the term "black act" is applied to the 9 Geo. I. c. 22 (1722), because it was occasioned by the outrages committed by persons whose faces were blackened. They destroyed the deer in Epping Forest, and committed other offenses. The act was repealed in 1827.

Black Art: See Magic.

Black Band: a variety of clay ironstone or compact carbonate of iron, containing 25 or 30 per cent. of carbonaceous matter. It occurs abundantly in the coal-fields of Scotland, and is the ore almost exclusively used for the production of certain grades of iron in that country. It is not very rich, but it is easily reduced. Black band also occurs in the coal-measures of Ohio, and is used to a moderate extent for the production of iron.

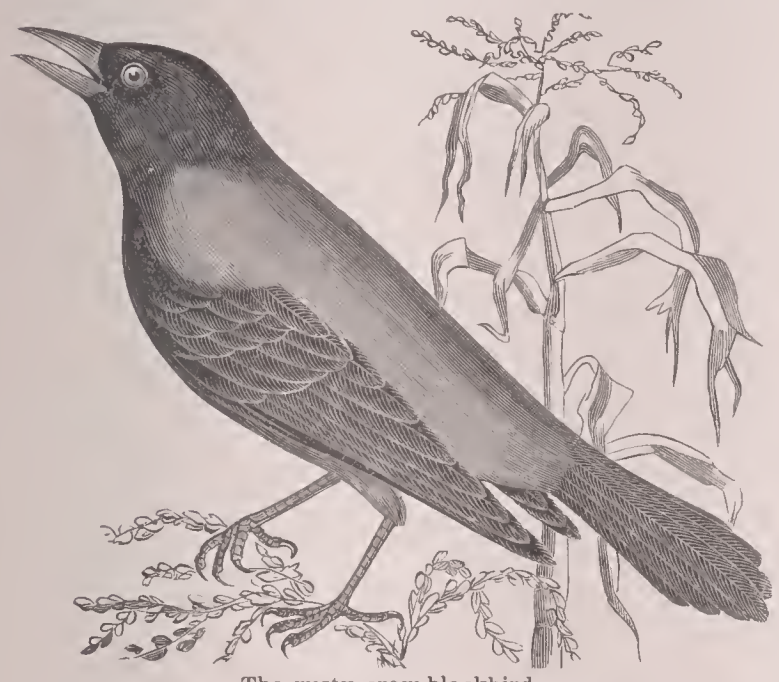
Black-bass: a common name for two American fishes of the genus *Micropterus*; highly esteemed as game-fishes. The small-mouthed species is now known as *M. dolomieu*, and the large-mouthed one as *M. salmoides*. The two species are well known to anglers, and are found in almost all streams of the U. S. east of the Rocky Mountains. The small-mouthed species abounds in clear or swift streams; the other in sluggish waters or lakes. See Bass.

Black'berry: one of several brambles belonging to the family *Rosaceæ*; the drupelets adhere to the receptacle or "core." The common blackberry of America, which is the most important commercial species, is *Ru'bus villos'us*, a native over a large part of the country. In a wild state it is exceedingly variable, and many of the cultivated varieties are simply selected wild variations. The greater part of the garden sorts belong to the variety *Sati'vus sativus*; certain early and lower growing small-leaved varieties, as the Early Harvest, belong to the var. *frondo'sus*; while the "white" blackberry is the var. *albi'nus*. The blackberry first began to attract attention as a market fruit about fifty years ago. The New Rochelle (or Lawton) and Dorchester were the first prominent sorts introduced. The latter was brought to notice in 1841. For the trailing blackberry, see Dewberry.

Blackberries bear their fruit upon the canes or stems of the preceding year's growth, and these canes bear but one crop. It is therefore necessary to cut them out after they have borne, either immediately after the fruit is picked or sometime before growth begins the following spring. In the meantime new canes for the next crop are growing from the crown or root of the plant, and their tops are cut off when they reach a height of 3 or 4 feet, in order to increase their strength and productiveness. This heading-in induces the formation of lateral branches, which are usually cut off to a length of a foot or 18 inches the following fall or spring. Blackberries grow readily from root-cuttings (see Cuttings),

or the sprouts which spring naturally from old plants may be used. The plants are set in rows 8 or 9 by 4 to 5 feet apart. A good blackberry plantation will last from eight to twelve years. The greatest drawbacks to blackberry culture are borer insects which attack the canes, drouth at fruiting-time, and the orange-rust. The latter is a fungus (*Cæo'ma lumina'tum* or *C. ni'tens*). This appears as an orange-red coating upon the leaves. There is no remedy but to destroy the plants. Leading varieties of blackberry are Wilson, Snyder, Taylor, Kittatinny, Agawam, Ancient Briton. L. H. Bailey.

Blackbird, or **Merle**: a popular name in the British islands of the *Merula merula*; a species of thrush which abounds in Europe. In size it is intermediate between the song-thrush, or mavis, and the missel-thrush. The plumage of the male is all deep black, but that of the female is brown. It has a powerful voice, and its song is more mellow than that of the song-thrush, but inferior in compass and variety. The blackbird is often kept in cages, and is



The rusty crow-blackbird.

very easily trained. It feeds on worms, insects, and fruits, and frequents hedges, woods, and thickets. Its nearest American relative is the common robin, from which it differs little except in color. Quite distinct from this bird is the blackbird of the U. S. (*Quiscalus quiscula*), sometimes called "crow-blackbird," or purple grackle. The "rusty crow-blackbird" (*Scolecophagus ferrugineus*) is a rather less common bird of the U. S. It is a great depredator of corn-fields. The swamps and meadows of the U. S. are frequented by the *Agelaius phœniceus*, or red-winged blackbird. It is gregarious, and feeds on insects and grain. Several other related species are also called blackbird in America. Revised by D. S. Jordan.

Black'burn: a manufacturing town of Lancashire, England; situated in a barren district on a small stream called "The Brook"; 24 miles by rail N. N. W. of Manchester (see map of England, ref. 7–F). It has a beautiful Gothic parish church, a fine new exchange, also in the Gothic style, and numerous chapels of the Dissenters, a grammar school founded by Queen Elizabeth, a hospital, a theological academy, and a theater. The principal business of the town is the manufacture of cotton stuffs, chiefly coarse calicoes and muslins, in which 10,000 or more persons are employed. Coal and lime are abundant in the vicinity. James Hargreaves, who invented the spinning-jenny in 1767, was born here. Railways extend from this point in various directions. Blackburn sends two members to Parliament. It has a public park which is 700 feet above the level of the sea. Pop. (1881) 104,012; (1891) 120,064; (1901) 127,527.

Blackburn, Joseph Clay Styles: U. S. Senator; b. in Woodford co., Ky., Oct. 1, 1838; graduated at Center College, Danville; admitted to the bar in 1858; served through the war in the Confederate army; entered Congress as a Democrat in 1875; four times re-elected; elected Senator from Kentucky Feb. 4, 1884.

Blackburn, William Maxwell, D. D.: b. at Carlisle, Ind., Dec. 31, 1828; graduated at Hanover College, Ind., in 1850, and at Princeton Theological Seminary 1854. He was Professor of Biblical and Ecclesiastical History in the Presbyterian Theological Seminary at Chicago 1868–81, when he became a pastor in Cincinnati, O. President of University of North Dakota 1884–85: from 1885 president of Pierre University, North Dakota. He published *William Farel, or The Swiss Reformation* (1865); *Aonio Paleario* (1866); *Ulrich Zwingli* (1868); *Admiral Coligny and the Rise of the Huguenots* (1869); *St. Patrick and the Early Irish Church* (1869); *History of the Christian Church from its Origin to the Present Time* (1879). D. Dec. 29, 1898.

Blackburn's Pendulum: a device for tracing the curves resulting from the composition at right angles of two simple harmonic motions. (See Wave-motion.) It is a pendulum the rates of vibration of which in two planes at right angles to each other are independent and variable within certain limits at the will of the experimenter. When these rates are adjusted to any exact ratio, the Lissajous figure for that ratio is traced by the bob, which carries a pencil or point.

Blackcap, Blackcap Warbler, or **Fauvette** (*Curruca atricapilla*): a European bird of the family *Sylviidæ*; nearly allied to the nightingale, which it rivals in sweetness of song. Its note is rich in tone, and has a great variety of sweet and gentle modulations. It is a summer bird of passage in Great Britain, which it enters in early spring, and from which it migrates in September. It is highly prized as a cage-bird, not only for its song, but for its pleasant manners and temper.

Blackcap is also the name applied to a species of raspberry (the *Rubus occidentalis*), of which several varieties have recently been introduced for cultivation into gardens in the U. S.

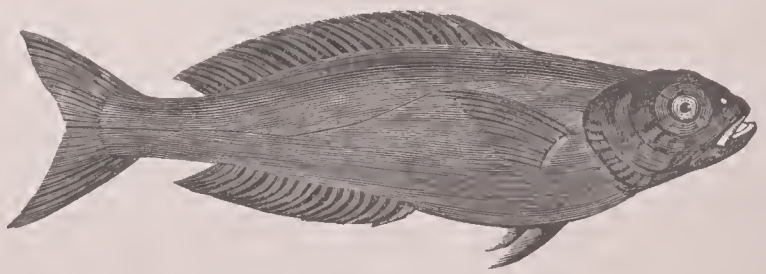
Blackcock, Heath-fowl, or **Black Grouse** (*Lyrurus tetrix*): a bird of the family *Tetraonidæ*; abundant in Scotland and the north of England. It also occurs in the mountains and marshy parts of the continent of Europe, and abounds in Scandinavia and Russia. Its favorite haunts are moors, bogs, and morasses covered with rank herbage. The male, which weighs nearly 4 lb., is of a shining bluish-black color, with a conspicuous white bar on the wings below the ends of the great wing-covers. The female is of a rust color, and is called the "gray hen." This species of grouse is gregarious, but in winter the males and females form separate flocks. They build nests of very simple construction on the ground, and lay in each six or eight eggs, which are about 2 inches long. Their food consists of seeds, berries, insects, and the young shoots of the pine, fir, and birch. Their flesh is highly esteemed for food.

Black Death: See Plague.

Black Duck (*Anas obscura*): one of the best known and most highly prized of American wild ducks; breeds abundantly throughout the Eastern U. S. from Texas to Labrador. Its range is known to extend westward to Kansas and Iowa. It is of a generally blackish-brown color, with white lining to the wings, the speculum or wing-patch violet bordered with velvety black.

Blackfeet Indians: See Algonquian Indians, Siouan Indians.

Blackfish: (1) the blackfish or tautog of the Northern U. S. (*Tautoga onitis*); a species of the family *Labridæ*, of an oblong form, with smooth scaly skin. It is one of the chief market-fishes of New York. (2) In Great Britain the



European blackfish.

Centrolophus pompilus, a species of the family *Stromateidæ*; found most abundantly in the Mediterranean and contiguous waters. The name blackfish is also applied to cetaceans of the genus *Globicephalus*—e. g. *G. melas* of the Atlantic coast, and *G. scammoni* of the Pacific coast, of the U. S.

Black Flags: a name given to the more desperate survivors of the Taiping rebel army who, on its defeat, took refuge in Tonquin. In 1868 they were in possession of the valley of the Red river as far as Hanoi, but soon after were

repressed to the upper part of the valley, where they have settlements and chiefs of their own. They have usually promoted Chinese interests in Tonquin. The Black Flags were called upon by the Tonquinese in 1873 to aid in expelling the French from Hanoi, and under their leader, Liu Yung-Fu, they defeated a sortie under Garnier, and killed that commander. In 1882 they inflicted a like disaster upon Rivière in the same locality and under similar circumstances. In 1885, China having become engaged in the war for the expulsion of the French from Tonquin, the Black Flags, with Chinese troops from Yunnan, held the passes above Tuyen-Kivan for nearly a month against repeated assaults, and until negotiations put an end to the war. The previous year the Black Flags became notorious everywhere because of their destruction of French mission stations and the appalling massacre of priests and native Christians, of whom it was estimated that nearly 10,000 fell victims. The Black Flags number about 5,000, and the Yellow Flags are regarded as twice as numerous. The latter are peacefully disposed; the former comprise many desperadoes, and are given to pillage.

Black Flux: a mixture of potassium carbonate and finely divided carbon or powdered charcoal. It is prepared by mixing in a crucible one part of niter with two or three parts of crude cream of tartar, and deflagrating the mixture by ignited charcoal; or by heating in a covered crucible cream of tartar or potassium bitartrate, when the tartaric acid is decomposed and charred, forming carbonic acid, which remains in combination with the potash. It is a valuable flux in reducing ores. The metal potassium can be obtained by heating this flux in iron vessels.

Black Forest (Germ. *Schwarzwald*; anc. *Hyrcinia Sylva*): a mountainous and wooded region in Baden and Würtemberg, with a chain of mountains which extends about 85 miles, and separates the basin of the Rhine from that of the Neckar. It was a part of the ancient Hercynian Forest. This region is remarkable for its extensive forests and its mines of silver, copper, zinc, lead, and iron. The highest point of this chain is the Feldberg, which rises 4,903 feet above the level of the sea. The Danube, Neckar, Kinzig, Murg, and Elz rise in the Black Forest. A number of small lakes are found here at elevations of 2,500 to 3,500 feet. Granite and gneiss form the foundations of these mountains, and porphyry occurs on their sides, which are also covered with abundance of fir-trees. The descent is precipitous on the western side, but the eastern slope is very gentle. A valley called Murgthal, situated in this forest, is famous for its beautiful scenery. In the vicinity of Neustadt is the mountain-pass of Hölle, which was celebrated in connection with Moreau's retreat in 1796. The soil of these highlands is not adapted to tillage. The inhabitants are extensively employed in the manufacture of wooden clocks and toys.

Blackfriars: a term applied, on account of the color of their garments, to the Dominican order of monks, who first went to England about A. D. 1220, and settled at Oxford. Their second house was the Blackfriars in London, and from it the district still bears the name of the order, which had nearly sixty houses in England and Wales at the time of the abolition of monasteries. See DOMINICAN.

Black Fungi (*Pyrenomycetæ*): an order of degraded plants of the class *Ascomycetes* (*q. v.*), often of a black color (whence the name) and usually of a hard texture. They are essentially parasitic plants, although many are saprophytic. They number fully 7,000 species, which are distributed among a number of families, viz.: (1) *Sphæriaceæ*, of which *Valsa* and *Hypoxylon* are common genera; (2) *Hypocreaceæ*, represented by *Claviceps purpurea*, the ergot of rye; (3) *Dothidiaceæ*, of which the best-known representative is *Plowrightia morbosa*, the black knot of plum-trees; (4) *Microthyriaceæ*, minute parasitic fungi, scarcely represented in U. S.; (5) *Lophiostomaceæ*, minute parasitic fungi, with few representatives in U. S.; (6) *Hysteriaceæ*, represented in U. S. by many species of *Hysterium* and *Hysterographium*; (7) *Laboulbeniaceæ*, microscopic, greatly degraded black fungi, which are parasitic upon insects. CHARLES E. BESSEY.

Black Grouse: See BLACKCOCK.

Blackguard: It is said that when the Kings of England made a progress with the court from one royal residence to another, it was customary for the scullions and other menials to follow with loads of kitchen utensils, and even coals; and from their dirty appearance they received the derisive name of *blackguard*, which has come to be applied to any person of a vile character, or one who uses vulgar or ruffianly language. See Trench, *English, Past and Present*.

Black-gum: a popular name of the *Nyssa multiflora*; an American tree, sometimes called pepperidge, hornpipe, tupelo, and sour gum. It has oval or obovate leaves, commonly acuminate, which turn bright crimson in autumn. The fruit is a bluish-black drupe, the wood close-grained, tough, and very difficult to split. It is used for cog-wheels, hatter's blocks, and wheel-naves. It belongs to the family *Cornaceæ*.

Black Hawk: city; on Union Pacific R. R.; Gilpin co., Col.; 36 miles W. of Denver (for location of county, see map of Colorado, ref. 2–D). It contains, and is adjacent to, rich mines of gold and silver. It has numerous quartz-mills and also smelting-works. Pop. (1880) 1,540; (1890) 1,067; (1900) 1,200.

Black Hawk: an American Indian; chief of the Sac tribe; b. in Kaskaskia, Ill., 1767. He waged war against the U. S. in 1832 for the recovery of lands which certain chiefs of the Sacs and Foxes had ceded to the whites. D. on the Des Moines river, Oct. 3, 1838. See J. B. Patterson, *Life of Black Hawk* (1834); also one by W. J. Snelling.

Black'heath: an elevated open common in the county of Kent, England; 5 miles S. E. of London, adjoining Greenwich Park; a favorite holiday resort for Londoners. It commands an extensive view, and is bordered by numerous handsome villas. The Roman Watling Street crosses this heath, which is the site of Morden College. This heath was the scene of the insurrections of Wat Tyler and Jack Cade, and was formerly infested by highway robbers.

Black Hills: an oval group of low mountains lying chiefly in South Dakota, but partly in Wyoming. The summits rise from 2,000 to 3,000 feet above the surrounding plains, and the culminating point, Mt. Harney, has an altitude of 7,400 feet. The hills are due to a local uplift in the form of a flat dome, from which erosion has removed the cretaceous strata of the plains and laid bare in successive rings carboniferous and Cambrian rocks, with a nucleus of crystalline schists. In 1875 the hills were ceded to the U. S. by the Dakota Indians, and an important mining industry immediately sprang up. The Black Hills district in South Dakota produced in 1898 gold to the value of $5,699,700, and silver to the value of over $196,913. Deposits of tin have been discovered. G. K. G.

Black Hole: the name of a small dungeon or cell in Calcutta, which was the scene of a nefarious crime committed by the nabob Suraja Dowlah in June, 1756. Having captured the English garrison of a fort at Calcutta, he confined the prisoners, 146 in number, in a cell 20 feet square, with only two windows. They suffered great agonies from thirst, heat, and foul air, and 123 died from suffocation in the first night. The twenty-three survivors were taken out the next morning. One of them, John Z. Holwell, published a narrative of their sufferings.

Black'ie, GEORGE STODART, A. M., M. D., Ph. D.: b. at Aberdeen, Scotland, Apr. 10, 1834; educated at the universities of Bonn, Paris, and Edinburgh, graduating A. M. and M. D. at the last in 1855; obtained the gold medals for botany and his thesis; removed to the U. S., and became Professor of Natural History at the University of Nashville 1856–61; served in the civil war as surgeon, medical inspector, etc.; has been Professor of Botany in Tennessee College of Pharmacy, and of Chemistry in Nashville Medical College since 1875; held prominent positions in Masonry, among them that of grand commander of the State; has published *Cretins and Cretinism* (Edinburgh, 1855); *Botany the Ally of Medicine* (Nashville, 1859); *Medical Flora of Tennessee* (Nashville, 1859); *History of the Knights Templar* (Nashville, 1871); besides numerous other works; and edited the *Nashville Medical Journal* 1858–70, and the *Masonic Record* 1870–71.

Blackie, JOHN STUART: Scottish classical scholar; b. in Glasgow, July, 1809; studied at Edinburgh and Göttingen; Professor of Greek in the University of Edinburgh 1852–82. He translated Goethe's *Faust* into English verse (1834), and produced in 1850 an able translation of the works of Æschylus. He contributed to the *Encyclopædia Britannica* and the *Imperial Dictionary of Biography*. Among his other works are *Lays and Legends of Ancient Greece* (1856; 2d ed. 1880); *Lyrical Poems* (1860); *Homer and the Iliad*, with a translation in ballad meter (4 vols., 1866); *War Songs of the Germans* (1870); *Lays of the High-*

lands and Islands (1872); *The Wise Men of Greece* (1877); *Natural History of Atheism* (1877), a plea against Agnosticism; *Lay Sermons* (1881); *Altavona* (1882); *The Wisdom of Goethe* (1883); *Life of Robert Burns* (1887); and *Essays on Subjects of Moral and Social Interest* (1890). Through his efforts a chair of Celtic was established in the University of Edinburgh. D. in Edinburgh, Mar. 2, 1895.

Black-jack: the name given by miners to blende (sulphide of zinc). It is also a popular name of a small species of American oak (*Quercus nigra*), sometimes called barren oak and iron oak. Its wood is very hard and makes a good firewood, but is rather perishable.

Black Lead: See GRAPHITE.

Black Leg: See BLACK QUARTER.

Black Letter: a term applied to the Gothic or Old English types or letters, which were used in the typography of the first books ever printed in England. Books printed before 1500 are generally in this character, which was commonly used in manuscripts by Europeans long before the invention of the art of printing. A form of type similar to this is still used by the Germans.

Black-letter Days: (1) Holy days recorded in the calendars of the service-books in "black-letter" type, rather than in the same type printed in red, consequently holy days of an inferior dignity. (2) In the English Prayer-book the black-letter days are days of observance for which no special collects or services are provided.

Black List: the name familiarly applied in Great Britain to printed lists of bankruptcies, assignments, dissolution of partnership, decrees in absence, judgments for debt, protested bills, and other matters affecting the credit of firms and individuals, issued weekly and circulated for the guidance of the mercantile community. These lists, which serve an important purpose, are well known by commercial men in the United Kingdom. Similar information is furnished in the U. S. and Canada by commercial agencies in the "Reports" and "Weekly Correction Sheets." See MERCANTILE AGENCIES.

Blackmail: an impost formerly submitted to in parts of Scotland and the north of England as a compromise with robbers. A class of men, often belonging to families in good standing, levied a tax upon their neighbors (generally about 4 per cent. of the rental of their property), on the pretext of protecting them from cattle-thieves. The celebrated Rob Roy was one of these blackmailers. The practice ceased in Scotland after the rebellion of 1745. It had already been long extinct in England. In modern usage, blackmail signifies money extorted from a person by threats of accusation or exposure in the public prints. Those who practice this extortion are said to "levy blackmail."

Blackmore, Sir RICHARD: a court-physician of William III. and of Queen Anne; a voluminous writer of prose and verse; b. in Corsham, Wiltshire, about 1650. He was the object of the satire of Pope and of the ridicule of the wits of his time. His chief works are *Prince Arthur* (1696) and *The Creation* (1712). D. in Boxted, Essex, Oct. 8, 1729.

Blackmore, RICHARD DODDRIDGE: novelist and poet: b. at Longworth, Berkshire, England, in 1825. He graduated at Exeter College, Oxford, in 1847, and practiced law in London. *Lorna Doone* (1869), a romance of Exmoor in the seventeenth century, is the most successful of his novels, among which are *The Maid of Sker* (1872); *Cripps the Carrier* (1876); *Erema* (1877); *Springhaven* (1877), and others. Besides several volumes of original verse, he has published a translation of Vergil's *Georgics* (1871). D. in London, Jan. 21, 1900.

HENRY A. BEERS.

Black Mountains: a group of mountains in Yancey co., N. C., a few miles W. of the Blue Ridge. It derives its name from the forests of dark balsam firs which crown its summits. It has the shape of a horseshoe. The highest of its peaks rises to 6,688 feet, and is called the Black Dome, Mt. Mitchell, or Mitchell's High Peak, in honor of Dr. Mitchell of the University of North Carolina, who perished while exploring this inhospitable region, and was buried on its top. This is the highest point of the U. S. east of the Rocky Mountains.

Black Oak: a large tree of the U. S.; common E. of the Mississippi; now considered a variety (*tinctoria*) of the scarlet oak (*Quercus coccinea*). It is a handsome tree, affording useful timber, but is best known for its thick yellow bark, which is prized for tanning purposes, and yields quercitron, a valuable yellow dye. It is also called yellow oak and dyer's oak.

Blackpool': a municipal borough of Lancashire, England; incorporated in 1875 and extended in 1879 (see map of England, ref. 6–F). It is situated on the Irish Sea; 20 miles by railroad W. of Preston; has an electric railway, and is much frequented for sea-bathing. Pop. (1891) 23,846.

Black Quarter, Quarter Evil, or **Black Leg**: a disease which attacks animals, especially thrifty young neat cattle, which are kept on fertile but undrained land. It is characterized by swelling of a joint, leg, or quarter, diarrhœa, extravasation of blood, and formation of abscesses. It is usually fatal. It is probably the same disease which is known in man as malignant pustule. Its causes are not well understood. It is a disease hard to cure, but stimulants, free incision in the affected part, with the application of weak solutions of chloride of zinc and carbolic acid, may prove useful. The best preventive is thorough underdrainage of pastures.

Black River of Louisiana: that part of Washita river below the mouth of the Tensas river, and between it and Red river, is sometimes called Black river.

Black River, or **Big Black River**: in Missouri and Arkansas; rises in Iron co., Mo.; flows nearly southward to the north line of Arkansas. It afterward runs southwestward, and enters the White river at Jacksonport, Ark. Length about 350 miles. It is navigable by steamboats 100 miles, except when the water is low.

Black River of New York: rises in Herkimer County; flows in a general N. W. direction, and enters Lake Ontario about 6 miles below Watertown. The whole length is about 125 miles. It falls 63 feet near Turin, in Lewis County.

Black River of Wisconsin: rises in Marathon County; flows southward and southwestward through Clarke and Jackson Counties, and enters the Mississippi about 15 miles above La Crosse. Its length is about 225 miles.

Black River of Vermont (Indian name *Kaskatuac*): rises in ponds in the town of Plymouth, Windsor co.; flows S. by E., and empties into the Connecticut river. It furnishes abundant water-power, which is employed in numerous manufactories.

Black River Falls: city; capital of Jackson co., Wis. (for location of county, see map of Wisconsin, ref. 5–C); on railroad and on Black river, 50 miles N. of La Crosse. It has a large flouring-mill, wagon-factory, sash and door factory, water-works, and electric lights; has one of the best water-powers in the U. S. Iron-ore deposits have been found in the vicinity, but with the veins badly faulted. There are many sawmills in the vicinity. Pop. (1880) 1,427; (1890) 2,261; (1900) 1,938. EDITOR OF "BADGER STATE BANNER."

Black Rock (Conn.): See BRIDGEPORT (Conn.).

Black Rood (OF SCOTLAND): a cross of gold which was alleged to contain a piece of the true cross: brought into Scotland in 1067 by Margaret, sister of Edgar Atheling, queen of Malcolm III. It was regarded as a national palladium. It was taken twice, at least, by the English, who after 1346 kept it in Durham Cathedral. It disappeared at the Reformation.

Blacksburg: town (founded in 1879); York co., S. C. (for location of county, see map of South Carolina, ref. 4–D); situated at junction of Rich. and Dan. and Chas., Cin. and Ch. R. Rs.; 1,500 feet above the sea-level, 221 miles N. of Atlanta. It has a heathful, invigorating climate, and is sheltered from severe north winds by the mountains. There are here deposits of magnetic and hematite iron ores, baryta, plumbago, and silver; and sulphur, lithia, and magnesia mineral springs. The industrial establishments of the town are mostly connected with the development of its natural resources, and include iron-works, furnace, foundry, machine-shops, railroad repair-shops, cotton-mill, wood-working factory, brick-yard, etc. There are here 4 churches, 2 graded schools, and 4 hotels. The surrounding country is one of the best developed agricultural regions of the State. Pop. (1880) 145; (1890) 1,245; (1900) 1,285.

EDITOR OF "NEWS."

Black Sea, or **Eux'ine** (anc. *Pontus Euxinus*; Turk. *Kara Diegis*): a large inland sea between Europe and Asia. It extends from lat. 40° 45′ to 46° 45′ N., and from lon. 27° 30′ to 41° 50′ E. The extreme length is about 700 miles, and its greatest breadth about 380 miles. Area, estimated at 185,000 sq. miles. It communicates with the Sea of Már-

mora by the Bosphorus, and with the Sea of Azof by the Strait of Kertch. The shores of this sea are high and bold on all sides except the N. W., between the Crimea and the mouth of the Danube. In the middle of it no soundings were obtained at 160 fathoms. It incloses no islands except a few small ones at the mouth of the Danube, and the Symplegades, near the Bosphorus. The largest rivers that flow into it are the Danube, Dniester, Bug, Don, Dnieper, Kuban, and Kizil Irmâk. This sea has no tide, but strong currents are produced by the influx of the large rivers, in consequence of which the water is fresher than that of the Mediterranean. The navigation of the Euxine is not dangerous, except during violent storms. It is supposed that this sea once extended much farther E. than it does now. In ancient times it was an important highway of commerce. The Turks excluded the ships of all foreign powers from it until 1774, when the Russians obtained the right to navigate its waters. By the treaty of Paris, 1856, this sea was neutralized—that is, the Russians and Turks were not permitted to keep ships of war in it. In 1871 the Russians again were permitted to have men-of-war on this sea.

Black-snake, or **Blue-racer**: a species of snake (*Bascanion constrictor*) common in nearly all parts of the U. S. Its length varies from 4 to 6 or 7 feet. It is remarkable for agility, climbs trees with ease, and moves along the ground very swiftly. It feeds on frogs, mice, lizards, eggs, birds, etc. Although it is harmless and has no poison-fangs, it will sometimes attack or resist its human enemies.

Blackstone, Sir WILLIAM: jurist and eminent commentator on law; b. in London, July 10, 1723. He was admitted to the bar in 1746, but obtained little practice. In 1758 he became Vinerian professor of law at Oxford, of which he was a graduate; in 1761 was elected to Parliament. He was appointed solicitor-general in 1763, and a justice of the court of common pleas in 1770. His principal work is *Commentaries on the Laws of England* (4 vols., 1765–69), which acquired a high reputation and is extensively used by students of law. His style is clear, ornate, and graceful, but his method is not scientific, and he was not well qualified to judge of the law from a legislator's point of view. D. Feb. 14, 1780. His *Commentaries* were severely criticised by Bentham. According to Horne Tooke, his work is "a good gentleman's law-book—clear, but not deep." See Clitheroe, *Life of Sir W. Blackstone* (1780); Foss, *The Judges of England*.

Blackstone, or **Blaxton**, WILLIAM: clergyman of the Church of England; the first white inhabitant of Boston, Mass.; settled at Shawmut, now Boston, in 1623, but left the place in 1634, not liking his Puritan neighbors. An account of Blackstone's sale of the land on which the city of Boston now stands will be found in the *Mass. Hist. Soc. Coll.*, 2d series, iv. 202. See also *The Memorial History of Boston*, vol. i., and Perry's *History of the American Episcopal Church*. D. in Rehoboth, Mass., May 26, 1675.

Blackstone River of Massachusetts: rises in Worcester County; flows southeastward into Rhode Island, and enters through Providence river into Narragansett Bay. The name Pawtucket river is given to that part of it which is below the town of Pawtucket. It affords abundant water-power, and flows through several manufacturing villages.

Blackthorn: See SLOE.

Black Tin: tin ore ready for the process of smelting.

Black Vomit: the hæmorrhagic discharge from the stomach peculiar to YELLOW FEVER (*q. v.*)

Black Wad: a name sometimes given to the native black oxide of manganese. See MANGANESE.

Black Walnut (the *Juglans nigra*): a valuable timber tree of the U. S.; belonging to the family *Juglandaceæ*; growing from Florida northward, and especially westward, being rare at present in New England. It is a handsome tree; produces a nut which, though edible, is less so than that of the European walnut, while its timber is even more valuable. The wood is employed for gunstocks, furniture, the finishing and flooring of rooms, and a great variety of purposes.

Black Warrior: a river of Alabama; formed by the junction of the Locust Fork and Mulberry Fork, which unite near the S. extremity of Walker County. It flows southwestward, and enters the Tombigbee about 2 miles above Demopolis. Its length is estimated at 175 miles. Steamboats ascend this river from its mouth to Tusealoosa. Bituminous coal is found on this river.

Black Water: See RED WATER.

Blackwell, ANTOINETTE LOUISA (*Brown*): preacher and reformer; b. in Henrietta, Monroe co., N. Y., May 20, 1825; graduated at Oberlin 1847; preached on her own orders; in 1853 became pastor of orthodox Congregational churches in Wayne co., N. Y.; became a Unitarian; champion of women's rights; married Samuel C., a brother of Dr. Elizabeth Blackwell, in 1856. Among her published books are *Shadows of our Social System* (New York, 1855); *Studies in General Science* (New York, 1869); *The Market-woman* (1871); *The Island Neighbors* (1871); *Sexes Throughout Nature* (1875); *Physical Basis of Immortality* (1876).

Blackwell, ELIZABETH, M. D.: b. in Bristol, England, 1821; the first woman who ever obtained the degree of M. D. in the U. S. She came to the U. S. with her parents in 1831, and taught school at Cincinnati from 1838 to 1847. Having studied medicine in private, she applied for admission to the medical colleges of Philadelphia, New York, and Boston, without success. She was at last admitted by a unanimous vote into the College of Geneva, N. Y., in 1847, and graduated as M. D. with honor in 1849. She afterward studied midwifery in Paris, and began to practice in New York city in 1851. In 1854, with her sister Emily, she opened the New York Infirmary for Women and Children. In 1859 she delivered a course of medical lectures in London, and in 1868 settled there in connection with the Women's Medical College. She wrote *Laws of Life* (1852); *Counsel to Parents on the Moral Education of their Children* (1879).

Blackwell's Island: in the East river; a part of New York city; has a lunatic asylum, workhouse, almshouse, penitentiary, smallpox, charity, and fever hospitals, one for incurables, one for epileptics and paralytics, and an asylum for the blind, all city institutions. The island has an area of 120 acres, and was named from a family which long owned it. At its north end is a stone lighthouse, with a fixed red light, which is 54 feet above the sea; lat. 40° 46′ 15″ N., lon. 73° 56′ 08″ W.

Blackwood, WILLIAM: Scottish publisher; b. in Edinburgh, Nov. 20, 1776; was the founder of *Blackwood's Magazine*. He began business as a bookseller in 1804, and issued the first number of his magazine in 1817. It obtained speedy success and a high reputation, to which the writings of Scott, John Wilson, and J. G. Lockhart greatly contributed. Its editors advocated the political creed of the Tories with powerful sarcasm and considerable virulence. Mr. Blackwood was chief manager of the magazine until his death, Sept. 16, 1834.—His son JOHN, b. in 1818, d. Oct. 29, 1879, succeeded him in the business.—He was succeeded by WILLIAM; b. in Lucknow, India, July 13, 1836; son of Major William Blackwood. He was educated at Edinburgh University, College de Sorbonne, Paris, and Heidelberg University. Entered the publishing business in 1857.

Bladder: a musculo-membranous sac contained in the anterior part of the pelvis, containing the urine or secretions from the kidneys. It is absent in all invertebrate animals. A few cartilaginous fishes possess it; so do *Batrachia* (frogs, etc.) and *Chelonia* (turtles). No birds have it, although the ostrich and cassowary have a dilatation of the cloaca somewhat resembling it. It is present in all mammalia. In man the bladder is nearly triangular when empty, oval when full. The ureters (one on each side) convey the urine to it from the kidneys; and this is voided, by the contraction of the bladder, through the urethra. The entrance to the latter is guarded by a valve, partly muscular, called by some anatomists the *sphincter vesicæ*. Distention of the bladder (retention of urine) from any obstruction of the urethra is a very painful and sometimes dangerous affection. It may be spasmodic, but it is more often the effect of a stricture or contraction of the passage from local disease. In low fevers it is not uncommon for a kind of paralytic distention of the bladder to occur. In either of these cases the removal of the urine by means of a catheter is of great importance. The bladder is also liable to inflammation (*cystitis*) and to chronic irritability. For stone in the bladder, see CALCULUS.

Bladder-nut: a popular name of several plants of the genus *Staphylea* and family *Sapindaceæ*. They are so called because the fruit is a bladdery, membranous, and inflated capsule, inclosing hard, bony seeds. They are shrubs or small trees with pinnate leaves, five stamens, and five

petals. The *Staphylea pinnata* is a native of Europe, and is planted as an ornamental tree in British shrubberies. Another species, the *Staphylea trifolia*, or American bladdernut, is a native of the U. S. It is a shrub about 10 feet high, having three ovate leaflets. The seed of these species is aperient, and the wood is suitable for turning.

Bladderwort: an aquatic plant of the genus *Utricularia* and family *Lentibulariaceæ*, which comprises numerous species abounding in tropical and temperate parts of both hemispheres. Their flowers adorn the surface of lakes, ponds, and stagnant or shallow waters. Seventeen species are found in the U. S. They are remarkable for a provision by which the plant, which is ordinarily submerged in water, is raised to the surface, in order that the flowers may expand in the air. The leaves and stems are furnished with little bladders or vesicles, which become filled with air at the time of flowering. The air is afterward removed, so that the plant sinks again, and ripens its seeds at the bottom. A few species which do not grow in the water have no bladders. It has been discovered recently that these bladders act as traps for minute water animals, and it appears probable that the plants are benefited by absorbing the juices of the decaying organic matter. See INSECTIVOROUS PLANTS.

Revised by CHARLES E. BESSEY.

Blagoweshtshensk, blăă-gō-ves-chensk′ (i. e. good news): the capital of the province of Amoor, in Siberia (see map of Asia, ref. 3–H). It was founded in 1858, and consists mostly of government buildings. Some trade is carried on here between the Chinese and the Russians. Pop. (1888) 20,212.

Blai'kie, WILLIAM GARDEN, D. D., LL. D., F. R. S. E.; a minister of the Free Church of Scotland; b. at Aberdeen, Feb. 5., 1820; graduated at Aberdeen; ordained in the Scotch Kirk, but came out at the Disruption in 1843 and became pastor of the Free Church at Pilrig, Edinburgh, 1844; Professor of Apologetics and Pastoral Theology, New College, in 1868; president of the meeting of the Alliance of Churches of the Presbyterian order, Toronto, 1892. Between 1849 and 1883 he was editor successively of the *Free Church Magazine*, the *North British Review*, the *Sunday Magazine*, and the *Catholic Presbyterian*. Among his best-known works are *Bible History in Connection with General History* (London, 1859; rev. ed. 1882); *Better Days for Working People* (1863, 1882); *Heads and Hands in the World of Labor* (1865); *Counsel and Cheer for the Battle of Life* (1867); *For the Work of the Ministry* (1873; 4th ed. 1885); *Personal Life of David Livingstone* (1880; 4th ed. 1884); *Public Ministry and Pastoral Methods of Our Lord* (1883); *Leaders in Modern Philanthropy* (1884); *The First Book of Samuel*; *The Second Book of Samuel*; *The Preachers of Scotland, from the Sixth to the Nineteenth Century* (1888), etc. D. in North Berwick, June 10, 1899.

Blaine: city; Whatcom co., Wash. (for location of county, see map of Washington, ref. 1–C); on Gt. Nor. R. R. and on Gulf of Georgia; 24 miles S. E. of New Westminster, British Columbia; has fishing industry, sawmills, and a canning-factory. Pop. (1890) 1,563; (1900) 1,592.

Blaine, JAMES GILLESPIE, LL. D.: statesman; b. in West Brownsville, Pa., Jan. 31, 1830; graduated at Washington College in 1847; soon after removed to Maine, where he became editor of the *Portland Advertiser*. Chosen to Congress in 1862, he immediately achieved distinction as a debater, and was five times re-elected. His position and influence in the House are indicated by the fact that he was chosen Speaker in 1869, 1871, and 1873. During all this period he exerted a powerful influence in shaping the legislation of Congress. The encouragement of railroads in the West by governmental appropriations was one of the means by which he believed the country was to be most successfully developed; and his interest in this method of internal improvement brought him into intimate relations with many of the great railroad enterprises of the time. His vigorous methods aroused many animosities. In 1876 he was charged with having received $64,000 from the Union Pacific Railway Company for legislative services rendered; but he produced letters from officers of the company declaring that he had never received a dollar from the company for any purpose whatever. He was accused of having received bonds from the Little Rock and Fort Smith R. R. as a gratuity, and that lands had been sold through the Union Pacific Railway Company for his benefit. To this he replied that all the bonds of that company he ever possessed he had bought at the market price, and had held at a pecuniary loss. He was charged with having received a certain gift of bonds of the Kansas Pacific R. R., and that he had been party to a suit concerning them in one of the courts of Kansas. To this charge he replied that his name had been confounded with that of a brother who had held stock in that railroad for many years. A resolution was adopted in the House of Representatives to authorize a committee to investigate the alleged sale of certain bonds of the Little Rock and Fort Smith R. R. to the Union Pacific. Evidently the investigation was aimed at Mr. Blaine. The committee ascertained that an extended business correspondence had for many years been carried on between Mr. Blaine and Mr. Warren Fisher, of Boston, and that a number of important letters, constituting a part of this correspondence, had fallen into the hands of a clerk by the name of Mulligan. This clerk was summoned to Washington; but on his arrival Mr. Blaine obtained possession of the letters, and on June 5, 1876, produced them in the House of Representatives. A memorable scene followed. Asserting that the letters were private, and that the House had no right to them, he held them up and exclaimed: "Thank God, I am not ashamed to show them. There is the very original package; and with some sense of humiliation, with a mortification I do not attempt to conceal, with a sense of outrage which I think any man in my position would feel, I invite the confidence of forty-four millions of my countrymen, while I read these letters from this desk." After reading the letters Mr. Blaine asked the Speaker if he had received a dispatch from Josiah Caldwell, one of the originators of the Fort Smith R. R., who was familiar with the whole transaction. The Speaker gave an answer which was considered evasive. Mr. Blaine then exclaimed: "Within my positive knowledge you received such a dispatch, completely and absolutely exonerating me from this charge, *and you have suppressed it.*" The effect of this charge was electric. Seldom in the history of the House has so tumultuous a scene been witnessed. This event occurred on June 5, 1876. On the following Sunday, just as Mr. Blaine was entering church, he was prostrated with extreme heat, and his condition for a time created serious alarm. At the National Republican Convention, held during the same week, he was earnestly supported by his friends as candidate for the presidency, and up to the eighth ballot led all other candidates. On the seventh ballot he lacked only twenty-eight votes of a majority. But at that point his opponents united, and gave the nomination to Gov. Hayes, of Ohio.

Soon after the convention, Senator Morrill, of Maine, resigned his place in the Senate to accept the secretaryship of the Treasury, and Mr. Blaine received the appointment as his successor. In the Senate his power as a debater gave him great prominence. He was an ardent supporter of the Republican policy in the South; and there, as in the House of Representatives, he advocated with great power the policy of generous appropriations for the assistance of railroads and other means of internal improvements. As the presidential convention of 1880 approached, he was once more a prominent candidate for the Republican nomination. His most formidable opponent seemed to be Gen. Grant, who was now put forward for a third term. On the first ballot Grant received 304 votes, Blaine 284. The convention continued through six days. On the thirty-sixth ballot the friends of Blaine and the other opponents of Grant united on Gen. Garfield, and gave him a majority.

On the election of Garfield, Blaine took the position of Secretary of State. It immediately became evident that his administration of this department of the Government would be characterized by two important lines of policy. He endeavored in the first place to secure and preserve peace throughout this continent. His second purpose was to extend commercial relations, and cultivate close habits of trade and intercourse between all the nations and peoples of the New World. For the accomplishment of these ends he proposed the assembling of a Universal Peace Congress at Washington. The project met with great favor. The letter of invitation, issued Nov. 29, 1881, called for a meeting on Nov. 24, 1882. But the assassination of President Garfield interrupted all plans for the meeting, and on Dec. 19 Mr. Blaine resigned his position. His successor reversed his policy after nearly all the powers had accepted the invitation, and the congress had to be abandoned.

The leisure afforded Mr. Blaine by his retirement from the cabinet gave him opportunity for literary work. He now entered upon an elaborate historical composition, which

was published in two volumes in 1884 and 1886, under the title *Twenty Years of Congress*. The work was brilliantly written and had a wide sale. As the time of the National Republican Convention of 1884 approached it became evident that he would once more be a popular and powerful candidate. On the first ballot he received 334½ votes, only about 70 less than a majority. On the fourth vote he received 541 out of 813. But the canvass that followed was one of peculiar bitterness. The "Mulligan letters" played a conspicuous part in the campaign. Mr. Blaine entered personally into the canvass, speaking in Ohio, Indiana, and New York. The result depended upon the vote in New York, and New York voted for Mr. Cleveland by a majority of 1,047. In 1888 Mr. Blaine declined to be a candidate for the presidency and took no active part in the campaign, but on the election of President Harrison he once more became Secretary of State. He now had the opportunity of developing the policy he had advocated in the first months of the presidency of Garfield. He pursued a vigorous policy in regard to the "Fisheries Question," and also to the protection of the sealing industry off the coast of Alaska. (See Bering Sea Controversy.) In accordance with his former purpose, he brought about a congress at Washington of all the American powers, for the purpose of encouraging a more friendly commercial intercourse. But the most important of his measures was his advocacy of the doctrine of commercial reciprocity. When the McKinley Tariff Bill was before Congress, Mr. Blaine took the ground that, although he was earnestly in favor of fostering the industries of the U. S. by means of a protective tariff, yet he believed the interests of those industries would be best subserved by a policy of reciprocity, by which it should be in the power of the Government to admit free of duty staple goods of those nations which made equivalent concessions in imposts upon the products of the U. S. In consequence of Mr. Blaine's advocacy a provision was adopted in the McKinley Tariff Bill authorizing the President, under certain restricted conditions, to waive the operations of the protective measures of the statute. (See Reciprocity.) Mr. Blaine's administration of the affairs of state increased his popularity to such an extent that in 1890 and 1891 it seemed certain that he would be nominated by the Republican party in 1892. In the autumn of 1891, however, he published a letter positively withdrawing his name from consideration. Whether this withdrawal was due to a sense of loyalty to President Harrison, or whether it was owing to the precarious state of Mr. Blaine's health, was the subject of much speculation during the winter and spring before the convention of June, 1892. On June 3 he unexpectedly resigned, in order, it was alleged, that he might be free to accept the presidential nomination if offered to him, as his friends confidently expected it would be. Unquestionably he could have received the nomination if he had not positively declined to be a candidate. His subsequent resignation subjected him to the charge of finesse and insincerity. The nomination, after a short contest, was given to President Harrison. During the summer Mr. Blaine's health was precarious, and he abstained from active participation in the political canvass. It was popularly supposed that his relations with President Harrison were not friendly; but this supposition seems to have had very little foundation. At the end of the summer he returned from his summer home in Maine to Washington, where, after many weeks of severe illness, he died on Jan. 27, 1893.

Mr. Blaine throughout his political career was remarkable for the personal charm of his manners, the breadth and readiness of his knowledge, and the magnetic fascination which he exercised over those with whom he was associated.

C. K. Adams.

Blainville, blăn'veel', Henri Marie Ducrotay, de, M. D., F. R. S.: French zoölogist and anatomist; b. at Arques, near Dieppe, Sept. 12, 1777. He studied comparative anatomy under Cuvier, who employed him as his assistant; in 1808 received the degree of doctor of medicine; was appointed Professor of Anatomy and Zoölogy in the Faculty of Sciences of Paris in 1812; admitted into the Institute in 1825. In 1832 he succeeded Cuvier as Professor of Comparative Anatomy in the Museum of Natural History. He acquired a high reputation as a teacher and writer. Among his works are *Lectures on General and Comparative Physiology* and *Osteography, or a Comparative Iconographic Description of the Skeleton and Dentary System of the Five Classes of Vertebrated Animals* (unfinished). D. May 1, 1850.

Blair: city and railroad junction: capital of Washington co., Neb. (for location of county, see map of Nebraska, ref. 10–H): about 25 miles N. of Omaha: in a beef, pork, and grain raising district. Pop. (1890) 2,069; (1900) 2,970.

Blair, Andrew George: See the Appendix.

Blair, Francis Preston, Jr.: lawyer; b. at Lexington, Ky., Feb. 19, 1821. He graduated at Princeton in 1841; was elected a member of Congress by the Free-soil Party of St. Louis, Mo., in 1856, after which he acted and voted with the Republicans for several years. He joined the Union army in 1861, and obtained the rank of major-general. In 1864 he commanded a corps of Sherman's army in the campaign which resulted in the capture of Atlanta. Having joined the Democratic party, he was selected as a candidate for the vice-presidency by the convention which nominated Horatio Seymour for the presidency in 1868. He was chosen a U. S. Senator for Missouri in Jan., 1871. D. at St. Louis, Mo., July 8, 1875.

Blair, Hugh, D. D.; Scottish divine; b. in Edinburgh, Apr. 7, 1718; licensed as a minister of the Church of Scotland in 1741. In 1743 he became one of the ministers of the Canongate church, Edinburgh, and in 1758 was transferred to the High church of Edinburgh. His sermons were admired for their polished style, but were not remarkable for originality or profoundness. In 1760 he was appointed Professor of Rhetoric and Belles-Lettres in the University of Edinburgh (regius professor 1762). He published five volumes of sermons (1777–1800), which were once very popular, but their reputation has declined. His *Lectures on Rhetoric* were published in London 1783 (2 vols.), on his retirement from his professorship, and were used in many schools. D. in Edinburgh, Dec. 27, 1800. See his *Life* by James Finlayson (1801).

Blair, James, D. D.: b. in Scotland, probably in Edinburgh, 1656; entered the Anglican ministry; removed to America in 1685; in 1689 became commissary of the Bishop of London for Virginia and Maryland; was founder and first president of William and Mary College (charter granted Feb. 14, 1692, but he did not enter formally on his duties as president till 1729), and rector of Williamsburg, holding all these and other important offices till his death, in Williamsburg, Va., Aug. 1, 1743. Another account gives the date of the commissary's death as Apr. 18. Besides other works, he published a commentary on the *Sermon on the Mount* (4 vols., 1722), highly commended by Waterland, Doddridge, and Bickersteth. A second edition was issued in 1732.

Blair, John: jurist; b. at Williamsburg, Va., in 1732. He graduated at William and Mary College, and studied law in London. Having previously filled several high offices, he was appointed by Washington judge of the Supreme Court of the U. S. (1789); resigned in 1796. D. Aug. 31, 1800.

Blair, John Insley: See the Appendix.

Blair, Montgomery: lawyer and politician; b. in Franklin co., Ky., May 10, 1813; graduated at West Point in 1835, serving in artillery in Florida war till he resigned, May 20, 1836; counselor-at-law in St. Louis, and U. S. attorney for the district of Missouri 1839–43; judge of the St. Louis court of common pleas 1843–49; solicitor of the U. S. in the court of claims 1855–58; counselor-at-law in Montgomery co., Md., 1853–61, and since 1863, being counsel for plaintiff in the famous Dred Scott case; president of the Republican committee of Maryland 1860; and Postmaster-General of the U. S. 1861–64. D. in Silver Spring, Md., near Washington, D. C., July 26, 1883.

Blair, Robert: Scottish poet; b. in Edinburgh, 1699: a relative of Hugh Blair. He was ordained minister of Athelstaneford in 1731. He wrote a poem of undoubted merit, entitled *The Grave*, which was not printed until after his death. D. in Athelstaneford, Feb. 4, 1746.

Blairsville: borough and railroad junction; Indiana co., Pa. (for location of county, see map of Pennsylvania, ref. 5–C); on the Conemaugh river, 56 miles E. of Pittsburg. Grain, pork, lumber, and coal in great quantities are shipped here. Pop. (1880) 1,162; (1890) 3,126; (1900) 3,386.

Blake, Edward, LL. D.: Canadian statesman; b. in township of Adelaide, Middlesex, Ont., Oct. 13, 1833. He was educated at Upper Canada College and University of Toronto, where he took first-class honors in classics, and received the degree of M. A. in 1858. He was admitted to the bar in 1856; appointed queen's counsel in 1864; was for a short time an examiner and lecturer on equity law for the Upper Canada Law Society. He was elected for South Bruce, in the Liberal

interest, for the Ontario Legislative Assembly in 1868; was leader of the opposition in that body from 1867 till 1871, when he became Premier of Ontario; resigned that office and his seat in the Assembly in 1872. He was a member of the Mackenzie cabinet 1873–74; Minister of Justice 1875–77; and president of the Council 1877–78, all of which portfolios he resigned before the expiry of his term of office. He was elected leader of the Liberal party in 1880; represented South Bruce and West Durham in the Dominion Parliament; and in July, 1892, was elected to represent South Longford, Ireland, in the British Parliament. He was elected chancellor of Toronto University in 1876. His father, the late Hon. William Hume Blake, jurist, was solicitor-general of Upper Canada, and subsequently chancellor of that province.

NEIL MACDONALD.

Blake, ELI WHITNEY, LL. D.: manufacturer and inventor; b. in Westboro, Mass., Jan. 27, 1795; graduated at Yale in 1816; became associated with his uncle, Eli Whitney, in the manufacture of arms on the plan of machine-made and interchangeable parts, which revolutionized the art of manufacturing complex constructions. (See ELI WHITNEY.) Established a pioneer factory of domestic hardware near New Haven, Conn., 1834, and introduced many of those improvements in metallic house-furnishings which have given to American hardware its acknowledged superiority; invented (1857) the "Blake crusher," his most important invention, now in general use throughout the world. In this machine for reducing stone and ores to small fragments, he devised a new mechanical principle, that of crushing between upright convergent jaws, having a short and quick vibration. The machine may be said to have introduced a new era in road-making and mining industries. Mr. Blake was the author of numerous scientific papers. Received the degree of LL. D. from Yale in 1879. D. at New Haven, Conn., Aug. 17, 1886.

C. H. THURBER.

Blake, GEORGE SMITH: commodore, U. S. navy; b. in Worcester, Mass., in 1803. He served in the Mexican war. Was superintendent of the U. S. Naval Academy at Annapolis and at Newport, R. I., from 1857 to 1865. D. in Longwood, near Boston, June 24, 1877.

Blake, ROBERT: b. in Bridgewater, Somersetshire, England, in 1599; elected to Parliament in 1640; when the civil war began in 1642 raised a troop with which he fought against the royalists. He gained distinction by his defense of Taunton in 1645. In 1649 he was appointed "general of the sea." He destroyed or captured nearly all of Prince Rupert's fleet in the Tagus in 1651. In 1652 he became chief admiral, and in May of that year gained a victory over Van Tromp, who attacked Blake in the ensuing November near Goodwin Sands. Blake was defeated, but in Feb., 1653, he attacked Van Tromp and gained a victory in a running fight of three days. In 1654 he chastised the Dey of Tunis. He destroyed the Spanish plate-fleet at Santa Cruz in 1657. D. at Plymouth, Aug. 17, 1657.

Blake, WILLIAM: poet and artist; b. in London, England, Nov. 28, 1757. In 1783 appeared *Poetical Sketches by W. B.* This was printed and published in the ordinary way, and was without illustrations. In 1789 came *Songs of Innocence*; in 1793 *The Gates of Paradise*; in 1794 *Songs of Experience*; and later several volumes of poetic rhapsody. All these were published by the author, and all were illustrated. Both text and illustrations were engraved, and when printed off Blake tinted both text and border in a style of his own, making each page a picture. Much of his loveliest and sublimest work is in these illustrations. But he produced so much that a mere list of his engravings, water-colors, and drawings in distemper would fill a page of this work. He is best known to the public by his *Canterbury Pilgrims*, his *Inventions to the Book of Job*, and his designs to Blair's *Grave*. D. in London, Aug. 12, 1827. *Life* by Alexander Gilchrist; Cunningham's *Lives*; *William Blake*, by A. C. Swinburne. *The Poetical Sketches* and *The Songs of Innocence and Experience* were reprinted in 1874. *The Inventions to the Book of Job* have been reproduced by heliotypy by James Osgood (Boston, Mass.).

Blake, WILLIAM PHIPPS, A. M., Ph. B.: b. in New York city, June 1, 1826; graduated at the Sheffield Scientific School, New Haven, Conn., in 1852. In 1853 he was mineralogist and geologist for the U. S. Pacific R. R. exploring expedition in California, in connection with which he wrote several reports; was editor of the *Mining Magazine* 1859–60; he was, 1861–63, mining engineer for the Japanese Government, and with his associate, Mr. Raphael Pumpelly, organized the first school of science in Japan under the auspices of the Japanese Government. Returning to America by the way of China, the Aleutian islands, and Sitka, he accompanied a Russian expedition up the Stickeen river, and described a series of glaciers not before known. In 1863 he engaged in explorations in California and Nevada; became Professor of Mineralogy, Geology, etc., in the College of California, and geologist to the State board of agriculture; in 1867 was commissioner of California to the Paris Exposition; removed in 1867 to New Haven, Conn.; was chosen executive commissioner of the Centennial Commission, and in 1873 went as special agent to the Vienna Exhibition; made a series of reports to the U. S. commission for the Centennial Exhibition; was the chairman of the committee on classification and member of the special committee for the selection of judges. He was also appointed by the Smithsonian Institution director of the U. S. mineral collection in 1876. In 1878 he attended the Paris Universal Exposition as commissioner of the U. S., as secretary of the additional commissioners, and as one of the jurors, receiving from the French Government the cross of the Legion of Honor. He also co-operated in the exhibition of 1889 by securing an official and representative series of minerals and ores from the U. S. He was called to Chicago to advise in regard to the system of classification for the Columbian Exposition, and drafted the grouping which was adopted by the commission. He has been actively engaged in the exploration of the chief mining regions of the U. S., and is the author of numerous professional reports and opinions, and of papers of general scientific and practical interest, which may be found in the pages of the *American Journal of Science* and in the *Transactions of the American Institute of Mining Engineers*. He is the inventor of an automatic roasting furnace, which has been successfully applied in metallurgical operations. Among his published works are *Silver Ores and Silver Mines* (1861); *California Minerals* (1863); *Production of the Precious Metals* (1867); *Iron and Steel* (1873); *Ceramic Art and Glass* (1878); *History of the Town of Hamden, Conn.*; *Life of Captain Jonathan Mix*, etc.

C. K. ADAMS.

Blake, WILLIAM RUFUS: b. at Halifax, Nova Scotia, in 1805; studied medicine, but in 1825 (after playing some time in the theater at Halifax) he appeared at the old Chatham Street theater, New York. He soon attained the first rank as a comedian, excelling particularly in eccentric characters. D. in Boston, Apr. 22, 1863.

Blake'ley, JOHNSTON: naval officer; b. near Seaford, County Down, Ireland, Oct., 1781. He removed with his parents to the U. S.; graduated at the University of North Carolina in 1800; entered the U. S. navy Feb. 5, 1800, and obtained command of the sloop Wasp in 1813. In June, 1814, he captured the British sloop-of-war Reindeer, and in the ensuing September defeated and sunk the sloop Avon. The Wasp never returned to port, and the fate of Capt. Blakeley and his crew was never ascertained.

Blakelock, RALPH ALBERT: landscape-painter; b. in New York, Oct. 15, 1847. His father was a physician and he was destined for the same profession, but his strong taste for music and the arts induced him to take up painting, and he began without instruction from a master. His work is notable for its general aspect, which is striking on account of strong color-schemes which he sometimes succeeds in harmonizing with considerable truth to nature's forms. Studio in New York.

WILLIAM A. COFFIN.

Blakes'ley, JOSEPH WILLIAMS, D. D.: Dean of Lincoln; b. in London, Mar. 6, 1808; graduated at Trinity College, Cambridge, 1831; fellow of Trinity College 1831–45; select preacher 1840–43; Canon of Canterbury 1863; member of the New Testament Company of the Bible Revision Committee 1870; Dean of Lincoln 1872. Author of *Thoughts on the Recommendations of the Ecclesiastical Commission* (1837); *Life of Aristotle* (1839); *Conciones academicæ* (1843); *Four Months in Algeria* (1859); and edited *Herodotus* in 2 vols. (1852–54). D. at Lincoln, Apr. 18, 1885.

Blanc, blăṅk, AUGUSTE ALEXANDRE PHILIPPE CHARLES: critic of the fine arts; b. at Castres, France, Nov. 15, 1813. He was a brother of Louis Blanc. Besides many valuable contributions on subjects connected with the fine arts to various French journals, and the text of several important books of art illustration, he was the most important contributor to the *History of the Painters of all the Schools*, a very complete and extensive work begun in 1849 by Armen-

gand, and continued till its completion in 1859, under the editorship of Blanc, with the assistance of able writers, such as Delaborde, Mantz, Silvestre, and P. Chasles. Blanc was twice director of fine arts in France—once in 1848, when he replaced M. Garraud, and again in 1871. D. in Paris, Jan. 18, 1882. Revised by Russell Sturgis.

Blanc, Jean Joseph Louis: a French historian and radical; b. in Madrid, Oct. 28, 1813; educated in France. He founded in Paris in 1839 the *Revue du Progrès*, which advocated social and political reform. In 1840 he published an able work on the *Organization of Labor*. His next important work was a *History of Ten Years—1830–40*, which had a very damaging influence on the popularity of Louis Philippe. He was a member of the provisional government formed in Feb., 1848, and was very popular with the socialists and workingmen of Paris, who revolted and were defeated in June, 1848. He then went into exile, and resided in England for many years. Early in 1871 he was elected to the National Assembly by the voters of Paris. Among his works is a *History of the French Revolution* (12 vols. 8vo, 1847–62), the style of which is eloquent and dignified. D. at Cannes, Dec. 6, 1882.

Blanc, Paul Joseph: genre-painter; b. in Paris, Jan. 25, 1846; pupil of Bin and Cabanel; Grand Prix de Rome 1867; first-class medal, Paris Salon, 1872; Legion of Honor 1878; first-class medal, Paris Exposition, 1889. One of his most celebrated works is a decorative composition depicting the consecration, baptism, and triumph of Clovis.

Blanchard, Albert G.: See the Appendix.

Blanchard, blaăn'shaar', François: French aëronaut; b. in Andeleys in 1753; noted for his mechanical ingenuity. He constructed a balloon with wings and a rudder, with which he ascended in Mar., 1784. In 1785 he crossed the Channel in this balloon and landed in England, for which exploit the King of France gave him a pension. He made many other ascents. D. Mar. 7, 1809. His wife, who had been his companion in several aërial voyages, was killed in consequence of the burning of her balloon in 1819.

Blanche of Castile: Queen of France; daughter of Alphonso IX. of Castile; b. in 1187. She was married in 1200 to the dauphin of France, who became King Louis VIII., and she acquired much influence in affairs of state. When Louis died in 1226, she became regent of the kingdom, which she governed with ability during the minority of her son, St. Louis. She was eminent for virtue and wisdom. D. Dec. 1, 1252. See Macheco, *Vie de Blanche de Castile* (1820); T. Nisard, *Histoire de la Reine Blanche* (1842).

Blanching [from Fr. *blanche*, white]: a process by which gardeners arrest the progress of secretions in the leaves of plants, in order to render them more wholesome and palpable as food. Celery, sea-kale, and other plants are usually blanched by the exclusion of light from them, which deprives them of their natural green color and of certain bitter properties. The blanching is effected in various modes, as heaping up the earth against the growing plants, or covering them with boxes or blanching-pots made of earthenware and perforated with many holes.

Bland, Richard Parks: Congressman; b. near Hartford, Ky., Aug. 19, 1835. By working during the summer and attending school in winter he finished his academic education; studied law; moved West, and in 1860 became treasurer of Carson co., Nev.; returned to Missouri in 1865 and settled at Rolla; elected to Congress as a Democrat in 1873, and was regularly returned till the time of his death. In 1875 he became chairman of the committee on mines and mining. Silver coinage having been discontinued in 1873, he introduced into Congress in 1878 the famous "Bland Bill," providing that the Secretary of the Treasury should purchase sufficient bullion to coin the minimum amount of $2,000,000 a month in silver dollars of 412½ grains each, and that these dollars should be legal tender. He was an active champion of the free coinage of silver. D. in Lebanon, Mo., June 15, 1899.

Bland, Col. Theodoric, M. D.: b. in Prince George co., Va., in 1742; was an uncle of John Randolph, of Roanoke; studied medicine in Edinburgh, Scotland; opposed Gov. Dunmore under the pen-name of *Cassius*. He entered the army in 1777, and gained the confidence of Washington, who employed him in several important affairs. In 1780 he was elected a member of Congress, in which he remained till 1783, and was again chosen a member of that body in 1789. D. in New York, June 1, 1790. The *Bland Papers* were collected and published by Charles Campbell (Petersburg, 1840).

Bland, Theodoric: b. in 1777; was for twenty-two years chancellor of Maryland. He commenced his judicial life as judge of the county court of Baltimore, and afterward became judge of the U. S. district court of Maryland; published *Reports of Cases Decided in the High Court of Chancery, Maryland*. D. in Annapolis, Md., Nov. 16, 1846.

Blane, Sir Gilbert, F. R. S.: physician; b. in Blanefield, Ayrshire, Aug. 24, 1749. He became private physician to Lord Rodney, who took command of the fleet in the West Indies in 1780. Dr. Blane served as chief physician to that fleet during the war, and published in 1783 *Observations on the Diseases of Seamen*. He was physician to St. Thomas's Hospital, London, from 1785 to 1795, and became first physician to William IV. in 1830. Among his works is *Elements of Medical Logic* (1819). D. in London, June 26, 1834.

Blank Verse: the heroic verse of five iambic feet without rhymes. Blank verse is peculiar to the Italian, English, and German languages, having been imported into the two latter from the first. In Italian the line is of eleven syllables, and is used invariably in the drama, and frequently in serious poetry, epic or didactic. In England it was first adopted by the Earl of Surrey in his translation of the fourth book of the *Æneid* (1547); first applied to dramatic uses by Lord Buckhurst in his tragedy of *Gorboduc* (1561); popularized by Christopher Marlowe in his tragedy of *Tamburlaine* (1585). It has since been the accepted meter of English dramatic and heroic verse. The Miltonic verse is constructed with closer attention to the melody of the cadence and cæsura than the dramatic; it admits also less frequently of the eleventh syllable, which in English poetry must be regarded as a sort of license; while Shakspeare and other dramatists occasionally double the short syllable at the end, and thus extend the number to twelve. Blank verse fell into comparative disuse in England after the Restoration (1660), and was revived by John Philips in his *Splendid Shilling* (1703) and *Cider* (1706), and by James Thomson in his *Seasons* (1726–30). Among the most successful of modern writers of blank verse are Bryant in *Thanatopsis*; Tennyson in his *Idyls of the King*, *Ulysses*, and *Tithonus*; and Aldrich in *Wyndham Towers*.

Henry A. Beers.

Blanqui, blaăn'kee', Jérôme Adolphe: French political economist; b. at Nice, Nov. 20, 1798. He became in 1833 Professor of Economy in the Conservatory of Arts and Trades in Paris. He advocated free trade. Among his works are a *Summary of the History of Commerce and Industry* (1826) and a *History of Political Economy in Europe from the Ancients to the Present Time* (2 vols., 1837–38), which is highly esteemed. D. in Paris, Jan. 28, 1854.

Blanqui, Louis Auguste: communist: a younger brother of the preceding; b. in Paris, Feb. 7, 1805. He was a member of the Society of Political and Moral Sciences. He studied for the law; affiliated with the rabid members of French revolutionary societies; underwent his first imprisonment at the age of twenty-one. A year later he took part in the insurrection of Rue St.-Denis, receiving his first wound. In the revolution of 1830 he took up arms against Charles X.; was again wounded; received the decoration of July; became an active member of the Society of Friends of the People; tried for participating in the "conspiracy of the Nineteen," and incarcerated for a year; accused in 1835 of a conspiracy to manufacture gunpowder for revolutionary uses; sentenced to imprisonment for two years and to pay a fine of 3,000 francs, but was amnestied in 1837. The insurrection of the Montagnards, with Blanqui and Barbes at their head, followed, and upon its prompt suppression Blanqui was condemned to death. The sentence was, however, commuted to perpetual imprisonment. The revolution of 1848 set him free, and he immediately organized the Central Republican Society, productive of the great popular agitation resulting in the three days' insurrection and an attempt to dissolve the National Assembly, May 15, 1848. Blanqui was sentenced to ten years' imprisonment at Belle Isle. At the age of fifty-three he returned to France, but in less than a month he was in exile again. He ventured back to Paris, and his incarceration followed; upon his release was conveyed to the frontier. Again he was an exile for a period of eight years. In 1870 Blanqui was once more in Paris, the editor of a journal whose influence

culminated in the Commune. He was captured by the Versaillists; the communists offered in exchange for him the Archbishop of Paris, but he was considered too dangerous a man to be released. He was sentenced to transportation for life to New Caledonia, but in consideration of his old age and his feeble health he was imprisoned at Clairvaux instead. In 1880, while still a prisoner, Blanqui was returned to the Chamber of Deputies by the radical Republicans of Bordeaux, but the chamber refused to ratify this election. He was soon afterward released, and lived in seclusion till his death, which occurred in Paris, Jan. 1, 1881.

Blantyre, blăn't'r: a mission station in East Africa; in the valley of the Shire river, S. of Lake Nyassa, and about 10 miles S. W. of Lake Shirwa; lat. 16° S., lon. 35° E (approximate). It was founded in 1876 under the auspices of the Established Church of Scotland, and has become a center for British colonization and trade, though it is close to the boundary of Portuguese East Africa. It is named after Blantyre, in Lanarkshire, Scotland, the birthplace of David Livingstone.

Blar'ney: a village and castle of Ireland; in Munster; on a rivulet of its own name; 4 miles N. W. of Cork, and surrounded by beautiful scenery. The castle and groves of Blarney are celebrated in song. The castle, which once belonged to the Earls of Clancarty, stands on a steep rock, at the base of which is a deep valley. Among the relics of this ruined castle is the famous "Blarney stone," which, according to the popular opinion, imparts to those who kiss it a peculiar style of eloquence, or great skill in the use of complimentary speech.

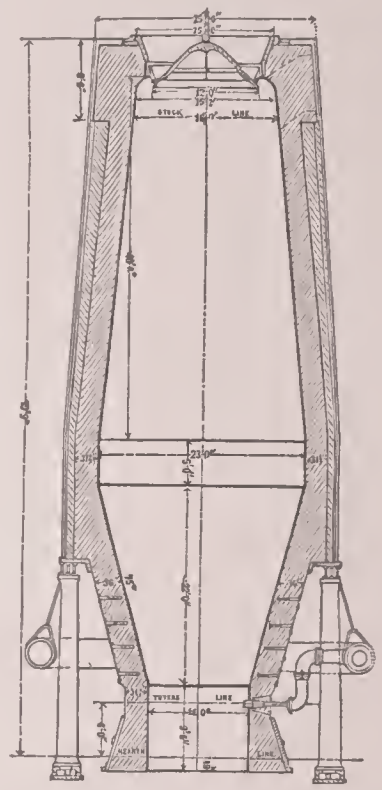
Blash'field, Edwin Howland: genre, historical, and portrait painter; b. in New York, Dec. 15, 1848; pupil of Léon Bonnat, Paris; National Academician; member of the Society of American Artists (1882); of the American Water-color Society and the Architectural League, New York; third-class medal, Paris Exposition, 1889. He has done excellent work in decorative painting, and is well known as an illustrator and writer of descriptive articles for *Scribner's* and other magazines. His works, such as *The Emperor Commodus Leaving the Amphitheater at the Head of the Gladiators* (1878) and *Roman Ladies—a Lesson in the Gladiators' School* (1879), are scholarly and well painted. His color-schemes are harmonious, and his work in general is remarkable for good drawing and pleasing arrangement. He spent eleven years in Paris, from 1867 to 1878, and passed three years in Paris and Italy (1889–92), when he painted, among other works, a large composition called *Christmas Bells*. Studio in New York. William A. Coffin.

Blasphemy [viâ Fr. and Lat. from Gr. βλασφημία, slander. *Blaspheme* and *blame* are doublets, the former representing the learned, the latter the popular, adoption into French of Lat. *blasphema're*]: an indignity offered to the Deity or to religion. According to Blackstone, it is denying the being and providence of God, contumelious reproaches of our Saviour Christ, and profane scoffing at the Holy Scriptures, or exposing it to contempt and ridicule. It has been otherwise defined to be the act of wantonly uttering or publishing words casting contumelious reproach or profane ridicule upon God, Jesus Christ, the Holy Ghost, the Holy Scriptures, or the Christian religion. If the words were written or printed, there might be a case of blasphemous libel. If oral, the case would be one simply of blasphemy. The law does not brand as a crime serious discussion or the promulgation in a temperate manner of opinions opposed to Christianity. Blasphemy is an offense punishable as a misdemeanor at common law. In many of the States the crime is punishable by statute.

Christianity is declared by the courts to be a part of the common law, which recognizes that the good morals and orderly conduct of the community are closely connected with a respect for religion, and that insults to the Author of Christianity and malicious attacks on his religion tend to the dissolution of civil government.

Blass, blaas, Friedrich Wilhelm: Greek scholar; b. in Osnabrück, Jan. 22, 1843; professor at the University of Kiel; called to Halle in 1892; author of *Die Geschichte der attischen Beredsamkeit* (3 vols.); *Die Aussprache des Griechischen* (Eng. trans. by W. J. Purton, 1890); *Criticism, Hermeneutics, and Palæography* (in J. Müller's *Handbuch d. class. Alterth.* (vol. i. 2); editor of *Antiphon, Andocides, Hypereides, Demosthenes*, Aristotle's Πολιτεία 'Αθηναίων, and some of the *Lives* of Plutarch. Alfred Gudeman.

Blast Furnace (Germ. *Hochofen*; Fr. *haut fourneau*): In its primary signification the term blast furnace implies an elevated shaft lined with a refractory material, designed for the reduction of metals from their ores. The shaft is open at the top, where the ore, fuel, and fluxes are charged, and supplied with a blast of air near the bottom, where openings are provided for removing the metal and cinder. In its essential details a blast furnace consists of a stack in whole or in part of masonry, surrounding a vertical chamber or shaft of circular section. The diameter of the shaft usually increases from the top downward and from the bottom upward. The lower part of the furnace is called the *hearth*, and has the smallest diameter. At its upper part are one or more openings through which the blast of air is introduced, and in the lower part, or *crucible*, the molten iron and cinder collect. The hearth is prolonged toward the front of the furnace, and is closed by the *dam*, and covered in on top by the *tymp-arch*. The dam is formed of firebrick or other refractory material. It slopes inward toward the interior of the furnace, and has its outer vertical face covered with a cast-iron plate, called the *dam-plate*. At the bottom of the dam is a channel communicating with the interior of the furnace, through which the molten iron is tapped off, and on its upper edge is a notch, called the *cinder-notch*, over which the cinder flows. The tymp-arch is covered by the *tymp*, a long, hollow casting, through which water constantly circulates. The blast is supplied through *tuyeres*, from one to eight in number, which are set into the masonry of the furnace. They are hollow truncated cones, supplied with a constant current of water to prevent the bronze or iron of which they are composed from melting. Into these *water-tuyeres* are fitted the *nozzles* of blast-pipes, which are connected with the *blast main* which encircles the furnace. The sloping walls connecting the hearth with the widest part of the furnace are called the *boshes*. This term is very generally, though incorrectly, used to express the greatest diameter of the furnace. In many cases there is no sharp line of demarkation between the hearth and the boshes, the former being simply a continuation of the curved walls of the boshes.



Edgar Thomson furnace "F," 1886.

In constructing a blast furnace, the upper portion is built on iron pillars, and is entirely independent of the boshes and hearth, which can be removed and reconstructed without interfering with the body of the stack. The top or *mouth* of the furnace, where the materials are charged, is provided with an arrangement which closes the furnace except during charging, when it is opened by some simple mechanism. The gases of the furnace, which were formerly allowed to escape and burn at the mouth, are now almost universally utilized. This is effected by making openings in the walls near the top of the furnace, and conducting the gases by suitable channels to the boilers and hot-blast stoves, where they are burned.

The essential accessories of a blast furnace are the blowing-engine, hot-blast stoves, and hoist. There are three varieties of blast-engines in use: the vertical-beam engine, the horizontal, and the upright. The latter have the steam cylinder either directly above or below the blast cylinder. They are rapidly gaining in favor, owing to their compactness and efficiency. The blast, on leaving the blowing cylinder, passes to the hot-blast stoves. These consist of a series of cast-iron pipes, through which the blast passes, heated on the outside by the combustion of the gases of the furnace. The gases are usually burnt in a combustion chamber under the chamber containing the pipes. In this way the heat is more uniformly distributed, and there is less danger of the pipes being injured by the heat. Re-

cently Siemens's system of regenerative heating in many different forms is generally superseding the cast-iron pipe stoves. In this system the gases are burned in a chamber, and the products of combustion pass through a network of firebrick, which becomes intensely heated. The gases are then caused, by means of valves, to pass into a second stove like the first, and burned as before, while the blast is conducted through the first stove. The blast and gases are made to alternate in this way at regular intervals. The temperature of the blast as it enters the furnace varies within wide limits. There are very few furnaces at the present day driven with cold blast, the temperature employed varying from 800° to 1,500° F. With the firebrick stove above mentioned a temperature of from 1,500° to 1,600° F. has been attained. The blast on leaving the stoves passes through the main to the furnace, and is there distributed to the tuyeres. The pressure employed varies with the kind of fuel used. Charcoal furnaces usually are blown with ½ to 1½ lb., though sometimes as high as 4 lb. are used. Coke furnaces are blown with 6 to 10 lb., while anthracite furnaces require 7 to 10 lb.

Hoists or lifts serve to raise the ore, fuel, etc., from the ground to the level of the mouth of the furnace, where they are charged. There are many varieties, as the pneumatic, hydraulic, and steam hoist.

The illustration shows a section of a modern furnace at Pittsburg. Its height is 79′ 9″; greatest diameter, 23 feet; yield, 3,000 tons iron per week. The gases are taken off at the top of the furnace, and descend by a vertical flue, then by an underground channel to the boilers and hot-blast stoves. The contrivance for closing the mouth of the furnace is known as the cup and cone, or bell and hopper. This arrangement is one of the simplest, and the one most generally adopted.

The blast furnace of the present day is an outgrowth of the small primitive furnaces still to be met with in Eastern countries for reducing iron ores. It differs from them, however, in three essential particulars. The low furnaces produce an unmelted mass of soft iron, and a cinder rich in oxide of iron, and the process is intermittent. A blast furnace produces a compound of iron and other substances, principally carbon, which is fluid at the temperature of the furnace; the cinder is composed of earthy ingredients, and is almost entirely free from iron, and the process is continuous.

The history of the development of blast-furnace construction for the last half century is almost entirely a record of increasing dimensions, both in height and diameter, having for a consequence greater yield, and, within certain limits, greater economy of fuel. During the past decade progress in blast-furnace practice has developed in the direction of faster work, closer watchfulness of details, and more careful study, chemically, of stock and of product. The flat boshes of the older furnaces and the rapid narrowing upward toward the mouth have been generally replaced by steeper boshes and wider mouths. There have been, however, no universally accepted principles of blast-furnace construction developed, as far as regards the interior outline. The Cleveland district of England affords a striking instance of the growth of furnaces in height and capacity. Furnaces were built

In 1851,	42	feet	high,	15	feet	diameter,	capacity	4,566	cubic	feet.
" 1861,	62	"	"	20	"	"	"	12,778	"	"
" 1870,	90	"	"	30	"	"	"	41,149	"	"

Since then a reaction has taken place against an increase in the dimensions, and furnaces 75 to 85 feet high are now the standard.

The Blast-furnace Process.—The charge introduced into the mouth of a blast furnace consists of iron ore, which varies greatly in richness and purity in different regions; fuel, either anthracite, raw bituminous coal, coke, or charcoal, and, ordinarily, limestone, the latter serving to unite with the earthy matters of the ore and form a fluid slag or cinder. The action of the furnace, expressed in its simplest form, is as follows: Air is blown through the tuyeres, and comes in contact with incandescent fuel. The oxygen of the air is speedily converted into carbonic oxide gas, which, together with the nitrogen of the air, rises through the descending charge. The reaction of the carbonic oxide and oxide of iron of the ore results in the formation of metallic iron and carbonic acid gas; the latter, ascending, escapes at the mouth of the furnace, while the former descends to the hottest part of the furnace, where it melts and drops into the hearth. The earthy matters of the charge fuse likewise, and collect in the hearth, floating on top of the molten iron. At regular intervals the slag and iron are tapped off: the former is thrown away, and the latter is cast in molds of sand or iron, and forms "pigs," or is conveyed in large ladle cars, in a fluid state, to adjoining steel-works. Although this simple statement of the blast-furnace process is correct as far as the end result is concerned, yet the reactions which occur in the furnace are, in reality, very complex and dependent on many conditions. The reducibility of different varieties of ore is very dissimilar: while some varieties require a high temperature and long exposure to an atmosphere rich in carbonic oxide gas, other varieties yield up their oxygen at a comparatively low temperature and short exposure to an atmosphere relatively poor in carbonic oxide. According to Sir Lowthian Bell, a gaseous mixture of 40 to 45 volumes of carbonic acid to 100 of carbonic oxide fails to exert any appreciable effect on Cleveland ironstone at a temperature of melting zinc (782° F.), but the same mixture possesses decided reducing power at a red heat. Again, some ores are rapidly reduced with the above gaseous mixture at a temperature at which Cleveland ironstone is unaffected.

The reduction of iron ores, or the removal of the oxygen of the oxide of iron, does not simply consist in the abstraction of oxygen by carbonic oxide. The investigations of Bell prove that reaction of carbonic oxide and oxide of iron is a very complex one. The first effect is the formation of some carbonic acid and some metallic iron. The further action of carbonic oxide on the metallic iron thus formed causes the carbonic oxide to break up into carbonic acid and carbon, the latter being deposited in the form of a black powder on the reduced metal. This combined process of reduction and carbon deposition continues until the iron is nearly all in the metallic state; but absolute reduction is never attained by the action of the carbonic oxide alone. As this product, composed of iron and carbon and some oxide of iron, descends into the hotter regions of the furnace, the carbon thus deposited is partially removed by the carbonic acid, but it is not until the point of fusion is reached that the last traces of oxygen are removed. It is probable that the carbon found in the pig iron is a part of the carbon deposited in the ore. The amount and rate of carbon deposition depend on the temperature and the relative amount of carbonic acid present in the gases. It may begin as low as 392° F., but decreases rapidly as soon as a red heat is reached. The most favorable temperature is between 752° F. and 842° F. The temperature of incipient reduction of sesquioxide of iron by carbonic oxide is variously given by different observers. Bell's determination is the lowest by far—viz., 284° F.—while the oxidation of metallic iron, according to the same observer, does not begin below 752° F.

It is evident that the economical production of iron in the blast furnace is mainly a matter of the amount of fuel used. A saving of the fuel in the process can be effected in two ways: first, by increasing the heat of the descending charge; and, second, by increasing the heat of the ascending blast. The first of these conditions is realized by adding to the height or diameter of the furnace; in other words, increasing its capacity, so as more effectually to intercept the heat of the escaping gases; and the second condition is accomplished by direct heating of the air forced into the furnace. It was long considered that there was no limit to the saving that could be effected by increasing the capacity of the furnace and temperature of the blast, but Bell has shown that the profitable limit has probably been attained in both instances, at least in so far as the smelting of Cleveland ore is concerned. The practical limit of capacity in a blast furnace is reached when the gases which are given off at the mouth no longer have the power to abstract oxygen from the ore—a condition dependent on the temperature of the gases and the relative amount of carbonic oxide they contain. But gases which are inactive on one ore at a given temperature may still have power to reduce another ore at the same temperature; consequently the height and capacity of a blast furnace are dependent on the kind of ore smelted in it.

The cause of the great economy of fuel effected by the hot blast—say, on an average, 10 to 11 cwt. per ton of iron—has long puzzled metallurgists, and the subject can not be said to be yet entirely removed from the sphere of speculation. The researches of Bell in England and Åkerman in Sweden have, however, thrown great light on the subject. The following considerations show where the principal

sources of economy lie; in other words, why the combustion of a given amount of fuel, outside of the furnace and conveyed through the blast, is more than equivalent to the same amount of fuel burnt in the furnace itself. The fuel burnt before the tuyeres is oxidized merely to carbonic oxide, and gives per unit of carbon only 2,400 heat-units; while the fuel in the hot-blast stoves is burnt to carbonic acid, and gives, per unit of carbon, 8,000 heat-units, or more than three times the amount in the first instance. Although not more than one-half of this heat is available, owing to loss by the chimney and by radiation, yet there is still a gain from this source. The principal source of saving, however, is to be found in the fact that the heat brought into the furnace by the blast is unaccompanied by any increase in the bulk of the gases in the furnace; whereas the same amount of heat produced by the combustion of the fuel before the tuyeres would have been accompanied by the amount of air necessary for its combustion. This decrease in the bulk of the gases, consequent upon the use of hot blast, acts, first, by diminishing the rapidity of the upward current, thus allowing longer contact of the gases with the ore; and, second, as there is less gas escaping from the furnace, less heat will be carried off in this way.

As the reduction of the ore is dependent upon the temperature and composition of the gases, it is evident that the amount of heat which we may supply by the blast has a limit, for this heat is unaccompanied by the production of carbonic oxide. When, therefore, the fuel used in the furnace has been so far reduced in amount as only to supply the minimum amount of carbonic oxide needed for the reduction of any given ore, further increase of the temperature of the blast can be of no advantage, as the heat thus conveyed to the furnace will either escape at the mouth, or it will, by increasing the heat of the furnace, cause a loss of fuel by enabling the escaping carbonic acid to take off another equivalent of carbon.

The product of the blast furnace is *pig* or *cast iron*. Its composition is dependent on the ores and fuel used, the principal constituents being carbon, silicon, manganese, sulphur, phosphorus, copper, and titanium. It always contains 3 to 4 per cent. of carbon, and in some varieties as high as 5 per cent. The carbon exists in two forms in pig iron—chemically combined, and in the form of graphite. The darker and more highly graphitic varieties are formed at the highest temperatures. The higher the temperature the more silicon will be reduced and unite with the iron, and its presence induces the segregation of carbon in its graphitic form.

Sulphur is more readily removed in the cinder at an elevated temperature, while the total phosphorus of the charge goes almost entirely into the pig iron, whatever the temperature may be. The presence of manganese, copper, and titanium depends upon their occurrence in the ore.

The production of a blast furnace depends on its capacity, the richness and reducibility of its ores, the nature of the fuel, and the volume and temperature of blast. While some small furnaces yield but 3 tons daily, the production of some of the modern furnaces of the U. S. is 400 tons daily, American practice having in this respect far outstripped the records of iron-makers in other countries. The composition and character of the cinder or slag from a blast furnace depends on the nature of the ore and the temperature of the furnace. It consists mainly of a double silicate of lime and alumina.

Blasting: The use of gunpowder in quarrying stone probably dates back almost to the invention of that explosive. In ordinary practice the blocks of stone are separated from the mass in the quarry by means of one or more *blasts*, each blast being made by first drilling a hole into the rock by the use of a *drill*, operated either by hand or—as is now the general practice in large works—by machinery driven by steam or compressed air.

In removing very large masses of rock quickly, to make way for a railroad, to furnish stone in sufficient quantities for the rapid construction of an important breakwater, or to prepare the site for a fort, it has become the custom to run galleries into the rock, and to place in chambers prepared for the purpose very large charges of powder of sufficient power to bring down the whole face of a cliff or side of a mountain, as was the case at Dover and Holyhead in England, at Lime Point, entrance to San Francisco Bay, Cal., and at Hell Gate, New York harbor.

In hand-drilling the operation is performed by means of a *drill* or *jumper*, which is formed from a bar of steel, or of iron tipped with steel at one end, which is flattened out into a fan shape, with a sharp cutting edge extending on each side a little beyond the body of the drill, so that the drill may have free play in working. The drills are of lengths suited to the depths of the holes to be drilled, it being customary to use a short drill in commencing a hole, and longer ones in succession as the hole is deepened. Their diameters also vary, generally with the depths of the hole, but are also much modified by the kind of explosive used, blasting powder requiring much more space for the charge than nitro-glycerine and its compounds. To prevent the cutting edge of the drill becoming heated, and thereby softened, water is frequently poured into the hole. From time to time the fragments and powdered stone have to be taken out of the drill-hole by means of a *spoon* or *scraper*.

The next step, after finishing the drilling and removing the chips, powdered stone, etc., from the bottom of the drill-hole, is to determine the *strength of the charge*. In former times an inferior kind of gunpowder, called blasting powder, was generally used, and is still employed in many quarries in preference to the quicker and stronger explosives.

The necessity for a more active agent for use in mining, and in excavating railroad tunnels and large cuttings in solid rock, has brought into use more powerful explosives. Nitro-glycerine, first invented and used in Europe, was introduced at the Hoosac tunnel by Prof. Mowbray, in 1868.

Nitro-glycerine, chemically known as tri-nitro-cellulose, is glonoin oil, $C_6H_5N_3O_{18}$, made by treating glycerine with nitric and sulphuric acids at a low temperature. It is very rarely used in the pure state, the general practice being to mix it with an inert or with a chemical absorbent material, which renders it perfectly harmless so long as exudation of the oil does not take place. The generic term for these mixtures is *dynamite*, although originally that term was applied to the nitro-glycerine powder in which infusorial earth was employed as the absorbent. When increased strength is required, explosive bases, notably guncotton, are added. Atlas, Dualine, Forcite, Tonite, Rendrock, Hercules, Rackarock, and Vulcanite are different dynamites largely in use.

After the strength of the charge has been determined, and all moisture removed from the bottom of the drill-hole by means of wisps of straw, hay, or bits of rags, the powder is either poured in from a can, or inserted as a cartridge. A wooden rod is used to press down the powder and to dislodge any grains that may have attached themselves to the sides of the hole.

The method now generally practiced is to use the cartridge, from which projects the copper *priming-needle*. Above the powder, around the needle, and filling up the hole, a very soft, clayey material, called tamping, is rammed gas-tight by a copper-tipped "*tamping-bar*." After the needle has been withdrawn a "*fuse*" is inserted, which, when ignited, fires down into the powder. The "*fuse*" or "*squib*" is a thread of powder wrapped in tarred hemp or in cotton, and waterproofed outside. Though not essential, it is the practice in many localities to have the end of the fuse in the cartridge fitted with a fulminating cap, which fires the powder by detonation. Dynamite is charged in cartridges with a safety fuse or electric wire and cap slightly tamped. All high explosives are now fired with the use of strong detonators, and it is the general practice to arrange several holes for simultaneous firing. This synchronous firing can only be well attained by electricity. The holes are charged, the fulminating cap is inserted, two wires take the place of the fuse, and slight tamping is done. The different holes are connected in series, and a current of electricity is sent through the wire by means of a small, portable hand-power dynamo or frictional machine.

Steam Drilling-machines.—The length of time required, as well as the great labor and expense of drilling by hand, has led to the introduction, in large private and public works, of drilling-machines driven by steam or compressed air. Sommeiller invented a machine which was used with success at the Mont Cenis tunnel. This was driven by compressed air conveyed into the headings in pipes, the compressors being situated near the east and west entrances to the tunnel. Subsequently the Burleigh drill, similar to the above, was patented in the U. S., followed by the Rand, Ingersoll, and Sergeant, which are the types that have survived the active competition in this country. Broadly, the mechanism consists of a power cylinder, sliding in a guide bed-

plate, mounted on a tripod or column, and a cutting tool clamped as an extension of the piston rod. The apparatus must possess the mechanical provisions for carrying out these movements: the blow of the cutting tool, the rotation of the cutting tool through a small arc to produce a round hole, so as to prevent rifling and jamming, and the advancement of the cylinder and boring tool to follow the growing depth of the drill-hole, and to admit of withdrawing it. The principal distinguishing feature between the different drills in use is the method of moving the valve of the power cylinder. The older system is that of causing the valve to oscillate by means of tappets, which being a positive movement is considered safer in the hands of unskilled labor. The other system is that of a steam-moved valve, which admits of a higher rate of speed. The rotation of the drilling tool, which usually has an X-shaped bit, is in nearly all modern American machines accomplished by a fluted bar and nut, constituting a ratchet. The feed is done by hand, the power cylinder and the drilling tool sliding in a guide-way, the movement being controlled by a screw. Usually steam is employed above ground, while compressed air, which possesses incidental advantages as concerns ventilation, is adopted for underground work, the pressure ranging between 50 and 80 lb. per sq. inch, while the average speed is 200 blows per minute. The conditions under which drilling is done vary so widely that it is impossible to make any specific statement concerning the work performed. It is a fact acknowledged by all authorities that high explosives and power-drilling have led to a marked lowering in the cost of mining and tunneling, and have greatly increased the rapidity of working.

The diamond drill has been used very little in mining and tunneling for drilling blasting holes, being employed chiefly in prospecting. See MINING.

Efforts have been made recently, chiefly by the late C. Van Depoele and by H. N. Marvin, of Syracuse, N. Y., to introduce electric percussion drills, the reciprocating motion being produced by the solenoid. There is still a good deal of uncertainty concerning their successful introduction, from an economical point of view.

Blastoderm: See EMBRYOLOGY.

Blastoi'dea [from Gr. *βλαστός*, sprout + *εἶδος*, form]: an order of extinct Crinoids, in which the head is armless, on a short stalk, its general form like that of a closed lily-bud. The chief genus is *Pentremites*, which occurs in the Upper Silurian. The blastoids are most abundant in the Carboniferous measures.

Blatchford, SAMUEL, LL. D.: son of Richard M.; b. in New York city, Mar. 9, 1820; graduated at Columbia College, New York city, in 1837; in 1839 became private secretary of Gov. William H. Seward, of New York; in 1845 practiced law in Auburn, N. Y.; in 1854 removed to New York city; practiced law and continued the publication of reports of cases in the circuit courts of the U. S. in the second circuit, which he had commenced publishing in 1852; in May, 1867, became judge of the district court of the U. S. for the southern district of New York; in Apr., 1878, became circuit judge of the second judicial circuit; and on Mar. 27, 1882, was appointed by President Arthur an associate justice of the Supreme Court of the U. S. D. July 7, 1893.

Blathwayt, or **Blathwayte**, WILLIAM: politician; b. at St. Martin-in-the-Fields, London, about 1649. He was in the English diplomatic service as early as 1668, was clerk of the privy council, and an important witness in the libel trial of the seven bishops in the reign of James II. in 1688. Under William III. he was a member of the board of commissioners of trade and plantations, created by the king in May, 1696, for the purpose of making the colonies "most useful and beneficial to England," and to aid in "diverting them (the colonies) from trades which may prove prejudicial to England." Blathwayt drafted a new charter for Massachusetts. Many of his manuscripts have been preserved in the British Museum and elsewhere. D. in August, 1717.

Blau'velt, CHARLES F.: genre-painter; b. in New York in 1824; pupil of the National Academy and of Charles L. Elliot; National Academician 1859; made Professor of Drawing at U. S. Naval Academy at Annapolis in 1878. W. A. C.

Blauw-boc, blow'bok [Dutch, blue buck; so named from its blue-black color]: the *Antilope leucophæa*; an exceedingly swift antelope whose habitat extends from Cape Colony to Senegambia. It is 6 feet long and 3½ feet high. It fights when at bay, and is then dangerous. Its flesh is poor. The name is also given to the pygmy antelope (*Cephalophus*

The blauw-boc.

pygmæa), which is only a foot high. It is found in South Africa, and is of a bluish slate color.

Blavatsky, Madame HELENA PETROVNA: founder of the Theosophical Society; b. in Ekaterinoslaw, Russia, in 1831; daughter of Col. Peter Hahn, and of noble descent on both her father's and her mother's side; married when seventeen Nicephore Blavatsky, forty-three years her senior, a councilor of state; separated from him after three months by mutual agreement. An ardent love of travel and a thirst for curious knowledge then led her to travel to all parts of the world. In the course of her travels she succeeded in 1855 in entering Thibet. In 1858 she met with an accident in which she sustained a fracture of the spine by being thrown from her horse, which caused a strange psychological experience, and for eighteen months she led a complete dual existence. In 1873 she visited New York, where she remained for six years, and founded in 1875 the Theosophical Society, with which her name has since been closely associated. Author of *The Secret Doctrine, the Synthesis of Science, Religion, and Philosophy*; *The Key to Theosophy*; *The Voice of Silence*; *Isis Unveiled, a Master Key to the Mysteries of Ancient and Modern Science.* D. in London, May 8, 1891.

C. H. THURBER.

Blazonry: See HERALDRY.

Bleaching [deriv. of vb. *bleach*; O. Eng. *blæcan*; Germ. *bleichen*]: the process by which the natural colors of various substances are discharged, so as to whiten them. Bleaching is extensively applied to the textile fibers; linen, cotton, wool, and silk; and to straw, paper-stock, ivory, wax, animal and vegetable oils, etc. Until the close of the eighteenth century the agents employed were air, light, and moisture, aided by weak alkalies and acids. More recently the process has been wonderfully hastened by the use of such powerful agents as chlorine and sulphurous acid. Numerous other agents possessing bleaching properties have been from time to time recommended, but they have not as yet been used to any extent. Such are bromine, ozone, permanganates, chromates, etc. The selection of the bleaching agent depends as much upon the properties of the article to be bleached as upon the coloring-matters to be removed. Cotton, flax, and many other vegetable fibers, being composed of cellulose, one of the most permanent of all organic bodies, are capable of withstanding the action of acids, alkalies, and chlorine, while the animal fibers, silk and wool, being of very different composition, are destroyed by these agents, and must be bleached by the milder sulphurous acid.

Modern bleaching includes much more than the mere application of chlorine or sulphurous acid. The goods are subjected to certain preliminary cleansing processes, such as washing in cold or hot water, boiling with alkaline lyes or soaps, and treatment with acids. By these operations many resinous, fatty, and other impurities, either natural or in-

troduced during the preparation of the yarn, cloth, etc., are removed from the fiber. The more powerful agents are then used for removing the last traces of coloring-matter.

Special Methods.

Bleaching Linen.—This is a very ancient art. We read in the Scriptures of "fine linen, white and clean." The old method, still practiced in some localities, consisted in the alternate treatment of the cloth with alkaline and acid liquids, and exposure on the grass to air, light, and moisture. Holland long enjoyed the reputation of possessing the best bleacheries. The brown linen of Scotland was sent over early every spring to be bleached, and on its return in the late autumn was sold under the name of "Hollands," a name still retained in the trade for certain kinds of bleached linen. The word "lawn" is another name of similar origin, having been applied to a finer quality of linen cloth bleached on better grass-plots, or lawns. The Dutch process lasted from March till September, and consisted of the following distinct operations, often repeated: (1) Steeping in water four or five days, or in an alkaline lye forty-eight hours. (2) Bucking or bawking, boiling in an alkaline lye. (3) Crofting, or exposing on the grass for several weeks, and sprinkling from time to time with water. (4) Souring with buttermilk. After every dipping the cloth was washed with soap, then with water. The process was necessarily very expensive and laborious. In 1749 the Dutch method was introduced into Scotland, where it was considerably shortened by the employment of dilute solutions of sulphuric acid in place of buttermilk. In 1784 Berthollet investigated chlorine, publishing his results in 1787, and announcing the bleaching properties of this element. Prof. Copeland introduced this agent at Aberdeen. Chlorine was first used in aqueous solution, then in alkaline solution, and finally, in 1798, Charles Tennant, of Glasgow, introduced chloride of lime, which has been almost exclusively used ever since. Bleaching linen is still a tedious operation, as the fibers are heavily incrusted with impurities; the actual loss during the operations of bleaching being one-third the original weight, while cotton loses only one-twentieth. Steeping, washing, bawking and crofting are still found necessary, and are several times repeated. Souring is effected with hydrochloric or sulphuric acid. The goods are then chlorinated with hypochlorite of potash, made by mixing chloride of lime with carbonate of potash. Washing, souring, soaping, scalding in soap-suds and weak lye, and crofting complete the operation. A fortnight is the shortest time in which the bleaching can be effected, and often a much longer time is necessary.

Bleaching Cotton.—Cotton is either bleached in the yarn or in the cloth. The following description of the process employed in American print-works will sufficiently illustrate the methods in common use: The cloth is (1) "singed" by a shearing-machine or by passing over a red-hot roll or over a series of gas-flames; (2) it is "limed," boiled for a night with milk of lime; (3) washed; (4) soured with dilute sulphuric acid; (5) washed; (6) bawked, boiled for a night with soda-ash and rosin; (7) washed; (8) bawked with a weak soda-ash lye for seven or eight hours; (9) washed; (10) chemicked with a weak solution of chloride of lime; (11) washed: (12) soured with dilute sulphuric acid; (13) washed—the entire series of operations being completed in three or four days.

Bleaching Wool.—Wool is (1) washed on the sheep, to remove sweat and much of the dirt, including a peculiar substance called suint, which is a neutral salt of potash with a peculiar organic acid. Owing to the high price of potash, this suint has recently attracted considerable attention, and a special industry has been established in the French wool districts for its preservation and utilization. The wool contains from 15 to 33 per cent. of suint, a 9 lb. fleece containing 20 oz. of suint, or 6 to 7 oz. of potash. This can be recovered from the water in which the sheep are washed. It is estimated that 3,000,000 lb. of potash can be manufactured annually in the French districts alone. (2) The wool is steeped in soap and water, weak alkaline lye, or putrid urine to remove a peculiar lime-soap which it contains, and other impurities. It is then oiled for spinning, and finally cleansed and bleached, either in the yarn or in the cloth. The operations consist in passing it (3) through a weak warm solution of carbonate of soda and soap; (4) washing with lukewarm water; (5) exposing to sulphurous acid gas. Operations 3, 4, and 5 are sometimes repeated once or twice. The goods may then be blued with carmine of indigo in a weak solution of soap containing a little hydrate of alumina.

Silk Bleaching.—Raw silk contains about 40 per cent. of gummy matter, consisting of albumen, gelatinous substances, wax, fat, resin, and yellow coloring-matter. This is removed by boiling the silk in a solution of soap, and washing with pure water. Bran is sometimes added to the soap to neutralize by the lactic acid it yields any free alkali present. When the silk is to be left white, or dyed or printed with very light colors, it is exposed for a few hours to sulphurous acid gas.

Bleaching Paper-stock.—Cotton and linen rags are bleached in the same manner as cotton yarn and cloth. Old paper is treated with caustic soda to loosen the ink, then with soap-suds, and finally with chloride of lime. Tow and straw are treated with caustic soda and lime, and finally bleached with chloride of lime.

Bleaching Straw.—For the manufacture of hats, bonnets, etc., straw is bleached by (1) exposing it on a meadow to air, sunlight, and dew, with occasional turning; (2) steaming; (3) fumigating with sulphurous acid gas.

Jute is bleached by caustic soda and a chlorine bath made by mixing chloride of lime and sulphate of magnesia in equivalent proportions, and dissolving them in cold water. *Human hair* is said to be bleached on the head to a blonde by the action of hydrogen dioxide, or peroxide. *Feathers* are bleached by immersion (1) in a dilute solution of potassium bichromate containing a little nitric acid, and (2) in a weak solution of sulphurous acid. *Sponges* are bleached by immersion in a warm solution of caustic soda, followed by washing in water and treatment with a hyposulphite of soda solution, to which a little hydrochloric acid has been added. *Ivory* is bleached by rubbing it with pumice-stone and water, and placing it under a glass shade in the sun. It may also be bleached by immersion (1) in a solution of sodium carbonate, (2) in pure water, (3) in a solution of sodium sulphite; (4) to the sulphite is added dilute hydrochloric acid (5) in pure water. *Beeswax* is bleached by exposure to air, sunlight, and moisture in thin ribbons. *Animal and vegetable oils* are often bleached by heating them with a little caustic alkali, by which a small quantity of soap is formed, which settles to the bottom, carrying with it some of the coloring-matter. They are also bleached by exposure in shallow vessels to the sun under glass. *Old engravings* which have turned yellow may be cleansed or bleached by exposure to ozone, generated in a capacious vessel, by a stick of phosphorus partly immersed in water. Immersion for a minute in Javelle water, hypochlorite of soda, is said to answer equally well, though, to prevent injury to the paper, it must be subsequently dipped in water containing hyposulphite of soda.

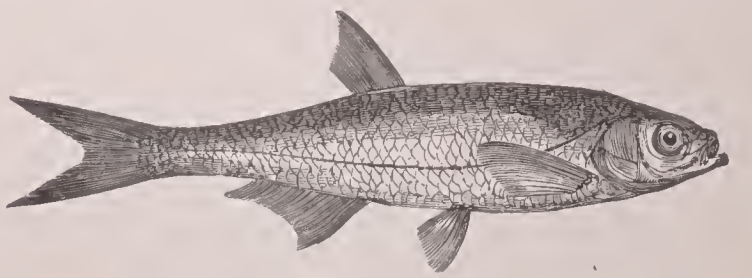
The Chemistry of Bleaching.—The exact chemical character of the changes which occur in bleaching is not fully established. When the coloring-matter is absolutely destroyed, it is probable that it is generally due to the action of active oxygen, ozone, formed by the agents employed. In some cases, however, sulphurous acid unites with the coloring-matter, forming a colorless compound, the color of which can be restored again. A red rose bleached by this agent returns to its original color when placed in dilute sulphuric acid.

Antichlore.—If free chlorine is allowed to remain in the articles bleached, it is liable to injure their strength and damage the metallic parts of machinery. To prevent this, substances such as hyposulphite or sulphite of soda, stannous chloride, coal-gas, etc., are employed, but the first mentioned is generally used. These are called Antichlore (*q. v.*).

Revised by Ira Remsen.

Bleaching-powder: See Hypochlorites.

Bleak (*Alburnus alburnus*): a small and beautiful fresh-water fish of the family *Cyprinidæ*; allied to the minnow and



The bleak.

dace. It is about 6 inches long, is found in many European rivers, and is esteemed as a delicate article of food.

Bled'soe, Albert Taylor, LL. D.: metaphysician and teacher; b. in Frankfort, Ky., Nov. 9, 1809; graduated at West Point in 1830; served as lieutenant of infantry at Fort Gibson till he resigned Aug. 31, 1832. He was Adjunct Professor of Mathematics and teacher of French in Kenyon College, O., 1833–34; Professor of Mathematics in Miami University, O., 1835–36; counselor-at-law in Springfield, Ill., 1840–48; Professor of Mathematics and Astronomy in University of Mississippi 1848–53; Professor of Mathematics in the University of Virginia 1853–61; and during the civil war Assistant Secretary of War of the Southern Confederacy. He was author of an *Examination of Edwards on the Will* (1845); *A Theodicy, or Vindication of the Divine Glory* (1856); *Philosophy of Mathematics* (Philadelphia, 1862), and other works; contributor to the principal literary, scientific, and theological reviews of the U. S.; principal of a female academy at Baltimore, Md., and editor of the *Southern Review* (Methodist). D. in Alexandria, Va., Dec. 1, 1877.—His daughter, Sophia McIlvaine, b. in Gambier, O., Mar. 26, 1837, married James Burton Herrick, of New York, in 1860, and became distinguished as a writer for magazines on microscopical botany.

Bleeder: See Hæmophilia.

Bleeding, or **Hæmorrhage** [*hæmorrhage* is from Gr. αἷμα, blood + ῥεῖν, flow]: in surgery, the escape of blood from the vessels which normally contain it. When the escape takes place into the tissues it is called "extravasation." Hæmorrhage into an internal cavity is said to be "concealed." A slight cut through the integument is usually followed by loss of blood, chiefly from the capillaries. Capillary bleeding will in many cases cease spontaneously, or it may require compression or the application of medicines, such as persulphate of iron or tannic acid. These medicines are called hæmostatics or styptics. Arterial bleeding is recognized by the fact that the blood escapes in jets, and is of a bright-red color. Arterial bleeding tends spontaneously to grow less, both from the feebleness of the heart's action which naturally follows, and from the retraction and contraction of the arterial walls, and the consequent formation of a clot of blood, which plugs the wound; but it may be necessary to resort to ligation or tying, to acupressure or compression of the artery by needles, or to pressure, mechanical or by hand, upon the course of the artery between the heart and the wound. A handkerchief may be tied around and then twisted with a stick. The wounded part should be elevated if possible. Venous bleeding is not generally very formidable. It may be recognized by the steady flow of dark blood. A great source of danger when large veins are cut is that air may enter the circulation; in which case death may immediately follow.

Hæmorrhage from an internal and inaccessible surface may be treated by astringents, as gallic acid, or by ergot, which is especially important in hæmorrhage after childbirth. Some individuals have what is known as the hæmorrhagic diathesis—a disposition to bleed excessively even after a slight injury. (See Hæmophilia.) A tendency to hæmorrhage from the mucous surfaces is characteristic of some diseases, such as typhoid fever.

Bleeding, or **Blood-letting**: the abstraction of blood from the circulation as a means of curing or preventing disease. This operation is performed either by opening a vein (venesection or phlebotomy), by abstraction from the capillaries by means of leeches or cups, or more rarely by opening an artery (arteriotomy). Bleeding was formerly in extensive use in the treatment of many diseases, and no doubt was greatly overused. The striking results obtained in certain cases and ignorance concerning many physiological and pathological processes led to this abuse of an agent which in cases, now much better discriminated, is capable of the greatest good. Thus in the early stage of a pneumonia, when the lungs are surcharged with blood, the right heart distended, the general venous system overfilled, judicious letting of blood may alter materially the progress of the case. The reaction which set in when attention was first directed to the evils of bleeding has, however, overshot the proper mark, and physicians are still loath to practice a procedure which they feel is called for but which popular opinion condemns. New procedures, as also popular opinion concerning them, always thus overshoot the level on the side of the sanguine, only to swing back, pendulum-like, to the opposite extreme when doubt is raised; but always at the end judicious afterthought establishes the place of rest.

William Pepper.

Bleek, blayk, Wilhelm Heinrich Immanuel: philologist; son of Friedrich (1793-1859), the New Testament commentator; b. in Berlin, Mar. 8, 1827; settled in Cape Town in 1856, where he became librarian of Sir George Grey's valuable library. He wrote, among other works, a vocabulary of the Mozambique languages (1856); a *Handbook of African, Australian, and Polynesian Philology* (London, 1858); *Comparative Grammar of the South African Languages* (vol. i., 1862); *Reynard the Fox in South Africa, or Hottentot Fables and Tales* (1864); and *Ursprung der Sprache* (1868). Bleek was probably the first to suggest a rational explanation of grammatical gender. D. in Cape Town, Aug. 17, 1875.

Blende [loan-word from a deriv. of Germ. *blenden*, deceive]: the native sulphide of zinc, which British miners call blackjack. It abounds in primary and in secondary rocks, and occurs both massive and crystallized in octahedrons and rhomboidal dodecahedrons. Pure blende is composed of 67 per cent. of zinc and 33 of sulphur. It is a valuable ore, but is more difficult to reduce than calamine. This is the chief ore employed in the important zinc industry of Illinois, Missouri, and Kansas. The term is sometimes applied to sulphides of antimony and of manganese, the former of which is a rare mineral called red antimony. Revised by C. Kirchhoff.

Bléneau: a village in the department of Yonne, France; about 29 miles W. S. W. of Auxerre; famous as the place where Turenne defeated the Prince of Condé in 1652. Pop. (1891) 2,084.

Blenheim, blen'im, Germ. pron. blen'hīm, or **Blindheim**, blint'hīm: the name of a small village of Bavaria, near the Danube; 23 miles N. N. W. of Augsburg. From it the English have named the famous battle which occurred at the neighboring village of Hochstädt, Aug. 13, 1704. Here the allied armies, commanded by the Duke of Marlborough and Prince Eugène (who had about 52,000 men), attacked the French and Bavarians (about 56,000 men), who were commanded by Tallard and the Elector of Bavaria. The Duke of Marlborough and Prince Eugène gained a decisive victory, and took about 13,000 prisoners, including Tallard. The French and Bavarians also lost nearly 10,000 killed and wounded, besides many that were drowned in the Danube. The French and Germans call this the battle of Hochstädt. The name Blenheim is also given to the estate at Woodstock, Oxfordshire, and the palace, conferred by Parliament on John Churchill, first Duke of Marlborough.

Blenheim, blen'im: village of Harwich township, Kent co., Ontario, Canada (for location, see map of Ontario, ref. 6–B); 12 miles from Chatham and 75 from London. Has churches of seven denominations, large public school, a mechanics' institute, large flour-mills, bending and planing mills, fire department, good streets, electric lights, and water-works. There is a large supply of natural gas 3 miles away, which is now (1893) being piped to the village. The surrounding country is settled by wealthy farmers, and Blenheim is the chief bean-market in Canada. Pop. (1881) 1,212; (1891) 1,708.

Editor of "News."

Blenheim-dog, or **Marlborough-dog**: a small and beautiful variety of spaniel. It closely resembles the cocker in form and appearance, but is generally white, with spots and markings of a red color. The muzzle is also fuller. It derives its English name from Blenheim Palace, in Oxfordshire, where the breed has been preserved since the beginning of the eighteenth century.

Blennerhassett, Harman: a victim of Aaron Burr; b. in Hampshire, England, Oct. 8, 1764 or 1765; educated in London and Dublin; settled on an island in the Ohio river, below Parkersburg; gave his time to scientific recreation and luxury; supplied Burr with a rendezvous and equipment for his Southern schemes; involved in litigation and confiscations; tried in vain to recover his fortunes in Canada and England; d. in Guernsey, Feb. 1, 1831. His wife wrote some books, and died in the U. S. while endeavoring to recover losses from the Government. See *Blennerhassett Papers* (New York, 1864).

Blennorrhœa [from Gr. βλέννος, mucous + ῥοία, -ρροια, flux]: an abnormally copious discharge from any mucous membrane. In discharges termed blennorrhœal there is a mixture of epithelial scales in large quantities from the mucous membrane, with numerous pus-cells. After inflammation of the urinary mucous membrane a gleety discharge frequently continues for a long period. The treatment consists in establishing health by tonics, fresh air, and careful

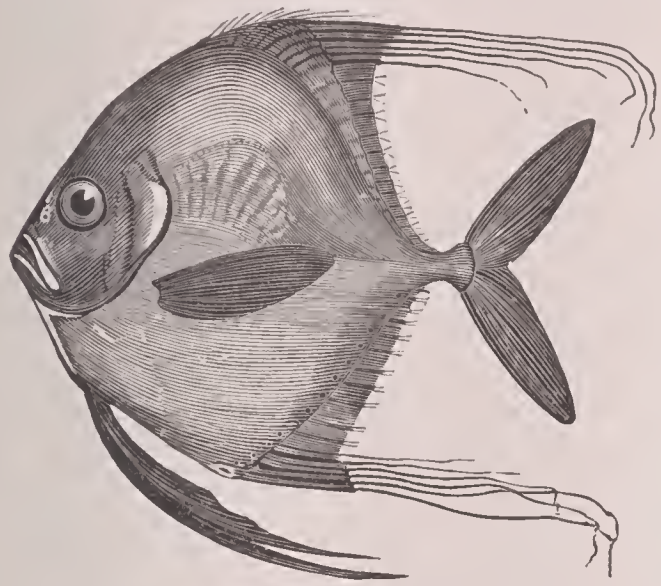
regimen, with astringent lotions to lessen the secretion, and occasional local stimulants to alter the depraved condition of the mucous membrane.

Blenny [from Lat. *blennius*, name of a fish; Gr. βλέννος, slime]: a fish of the genus *Blennius*, order *Acanthopteri*, and family *Blenniidæ*. The true blennies are small, naked fishes, often gayly colored, abounding in seaweeds, tide pools, and among rocks near the shore, especially in warm regions. They are seldom used as an article of food, but are in request for the aquarium, on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. The eyed-blenny (*Blennius ocellaris*), called also the butterfly-fish, has a large and prominent dorsal fin, in which is a spot resembling an eye. This fish is common in the Mediterranean.

Eyed-blenny.

Some of the blenny family retain their eggs within the oviduct until they are hatched, so that the young are produced alive, and capable of seeking food for themselves. Several blennies are found on the American coasts.

Bleph'aris [Gr. βλεφαρίς, eyelash]: a genus of fishes of the family *Carangidæ*; with a short, deep body, and long



Blepharis crinitus.

streamers on the fins. The American species (*B. crinitus*) reaches the length of a foot or more, and is found in warmer parts of the Atlantic.

Bléré, blāy'ray' (Lat. *Bliriacum*): a town of France; department of Indre-et-Loire; on the river Cher; 16 miles E. S. E. of Tours. It has a bridge built about 1150. Pop. (1891) 3,272. Near it is the château of Chenonceaux, which Henry II. of France gave in 1535 to Diana of Poitiers, who, having sumptuously embellished it, was compelled to transfer it to Catherine de Médicis. In 1733 it was purchased by M. Dupin, the wit and beauty of whose widow caused it to be frequented by Fontenelle, Voltaire, Buffon, Rousseau, and others. The castle is in good preservation.

Bles-bok (*Damalis albifrons*): an antelope of South Africa. Its name is derived from the *blaze* (Dutch, *bles*) of white in its face.

Blessed Thistle (*Cnicus benedictus*): a plant of the family *Compositæ*; a native of Europe, sparingly naturalized in the U. S. It was formerly regarded with great veneration on account of its supposed medicinal virtues, which are celebrated by Burton in his *Anatomy of Melancholy*, and by Shakspeare, under the name of *Carduus benedictus*. It is tonic and diaphoretic.

Bles'sington, Margaret Gardiner, Countess of: an accomplished and beautiful Irish lady; b. near Clonmel, in Tipperary County, Sept. 1, 1789. Her maiden name was *Power*. She was married in 1818 to the Earl of Blessington, who was her second husband. She traveled with him extensively on the Continent, and after he died in 1829 she lived in Gore House, London, where her soirées were attended by many literati and other eminent persons. She published *Conversations with Lord Byron* (1834); *The Idler in France*; and other works. D. in Paris, June 4, 1849. See R. R. Madden's *The Literary Life and Correspondence of Lady Blessington* (3 vols., 1855).

Blicher, blee'cher, Steen Steensen: Danish poet and writer of tales; b. Oct. 11, 1782. His tales, the first of which appeared in 1824, deal chiefly with life in Jutland, where he was pastor for many years. They are remarkably true to life, and have had no small influence on Danish literature. A collected edition was published in 1882 (*Samlede Noveller og Skizzer, ordnede efter Tidsfølgen af P. Hansen*, 4 vols.). He translated Macpherson's *Ossian* into Danish. He wrote also in the Jutland dialect. D. Mar. 26, 1848.

G. L. Kittredge.

Blida, blee'dăă: a town of Algeria; province of Algeria; about 30 miles S. W. of Algiers. It is pleasantly situated on the border of the Metidjah, is a station on a railway, and is said to be very flourishing. It has been occupied by the French since 1838. Pop. (1891) 23,686.

Bligh, blī, William: an English naval officer; b. of a Cornish family in 1753. He commanded the ship Bounty, with which he was sent to Tahiti in Dec., 1787, to procure plants of the breadfruit tree, in order to plant them in the West Indies. During his voyage for Jamaica with a cargo of these plants a part of his crew mutinied, Apr. 28, 1789, on account of his harsh treatment. The captain and eighteen of his men were sent adrift in the launch, and after much suffering arrived at the island of Timor in June, having traversed 3,600 nautical miles in an open boat. The mutineers settled on Pitcairn's island. Bligh was appointed governor of New South Wales in 1806, but his conduct was so tyrannical that he was expelled in 1808. D. in London, Dec. 7, 1817.

Blight: a name given to many parasitic fungi and to the diseases which they produce. It has been particularly applied to the *Erysipheæ*, a family of *Ascomycetes*, which are in some publications called "the blights," but latterly these have borne the much better name of powdery mildews. (1) *Apple blight* is a disease of apple-trees affecting the twigs, leaves, branches, and even the trunk. When the twigs are affected the leaves suddenly turn brown and die, and a gummy exudation appears here and there upon the bark. On the larger branches and the trunk the blight appears in the form of dead and sunken patches of bark. It has been demonstrated within the past few years that this blight is due to the presence of bacteria, *Bacillus amylovorus*, or, according to some, *Micrococcus amylovorus*. Inoculations, made by inserting these bacteria into the living tissues of apple twigs, are followed by the development of blight. The bacteria live upon the cell-substances, and, by robbing the cells, finally cause their death. (2) *Pear blight* is identical with apple blight. (3) *Pear-leaf blight* appears upon the leaves, producing yellowish or reddish spots, marked in the center by minute black pimples. It attacks the fruit also, causing it to crack open and become stunted. This disease is due to *Entomosporium maculatum*, one of the so-called "imperfect fungi," of the order *Sphæropsideæ*. The fungus appears to pass the winter upon the fallen leaves. (4) *Quince-leaf blight* is identical with pear-leaf blight. (5) *Strawberry-leaf blight* produces upon the leaves red spots, which develop later into larger diseased, whitish areas, bordered with red. This is caused by *Sphærella fragariæ*, one of the black fungi (*Pyrenomyceteæ*) of the family *Sphæriaceæ*. Here again the fungus appears to pass the winter in the dead leaves. (6) *Tomato blight* forms rusty brown patches on the under side of the leaves, followed by wilting and death. It is caused by *Cladosporium fulvum*, one of the "imperfect fungi" of the order *Hyphomyceteæ*. Most of these fungus diseases are prevented by spraying with solutions of copper sulphates or carbonates. (7) *Grape blight*, see Mildew. (8) *Potato blight*, see Rot.

Charles E. Bessey.

Blim'bing, or **Bilimbi** (variously written also *blimbi* and *bilimby*): the native name for the berries of an East Indian tree (*Averrhoa bilimbi*) belonging to the *Oxalideæ* or Sorrel family. They are extremely acid, but are esteemed and much used as a preserve and a pickle. The juice is used as a remedy for certain diseases of the skin. *Averrhoa bilimbi* and its congener *Averrhoa carambola* have been introduced into cultivation in the West Indies. They exhibit to a moderate degree the phenomena of "sleeping" and "waking," exhibited by other members of the same order.

Blind, Education of the: Previous to the eighteenth century no systematic effort was made to educate the blind

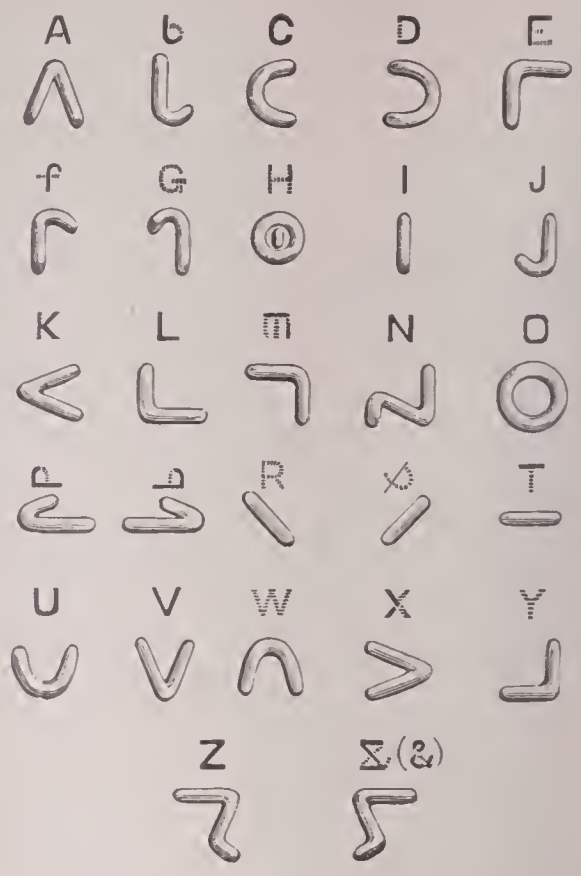
as a class. In 1646 an Italian published a book drawing attention to their condition, and in 1670 Lana Terzi, a Jesuit of Brescia, discussed the possibility of their education. In the latter part of the seventeenth and early part of the eighteenth centuries two causes tended especially to awaken thought on this subject—viz., the philosophical discussions of Locke, Leibnitz, and Reid concerning blindness and the appearance of a few blind persons of remarkable talent, whose achievements were greatly admired, of whom Saunderson, Blacklock, and Theresa von Paradis are illustrations. The first school for the blind was organized and taught by Valentine Haüy in 1784 at Paris; similar schools were soon instituted in Great Britain, Russia, and other European countries. The first in the U. S. was established by legislative enactment of Massachusetts at Boston in 1829, and schools of this character are now in operation in most of the principal States in the Union. They are essentially a part of the school system of the respective States in which they are situated. Dr. Samuel G. Howe was the pioneer in the work in this country. Others who have labored in this field are Messrs. Chapin, Williams, Wait, Lord, Little, Morrison, Huntoon, and Anagnos, the son-in-law of Dr. Howe.

The U. S. Government has shown interest in this work; and Congress in March, 1879, passed an act to promote the education of the blind, by virtue of which $250,000 was set apart as a perpetual fund, the interest of which should be appropriated to the purchase of suitable books and apparatus to be distributed annually among the various institutions for the blind in the U. S. The American Printing-house for the Blind, situated at Louisville, Ky., has charge of this fund, and is constantly sending forth excellent books and maps adapted to the use of the blind. Prescott's *Conquest of Peru*, Motley's *Peter the Great*, Steele's *Chemistry*, Perry's *Political Economy*, and other similar works, are among the books made available by this admirable institution. Music adapted to the use of the blind is also published by this house. The Perkins Institution publishes books from the Howe Memorial Press, and a few books are printed by various other institutions in the country.

An organization known as the American Association of Instructors for the Blind holds a meeting biennially in some part of the U. S. to discuss methods of teaching, and to consider other questions connected with their work. The most noted schools for this class in foreign countries are at Paris, Amsterdam, Vienna, Berlin, Copenhagen, and London. At London is the Royal Normal College for the Blind, the principal of which is a blind man who was born and educated in the U. S.

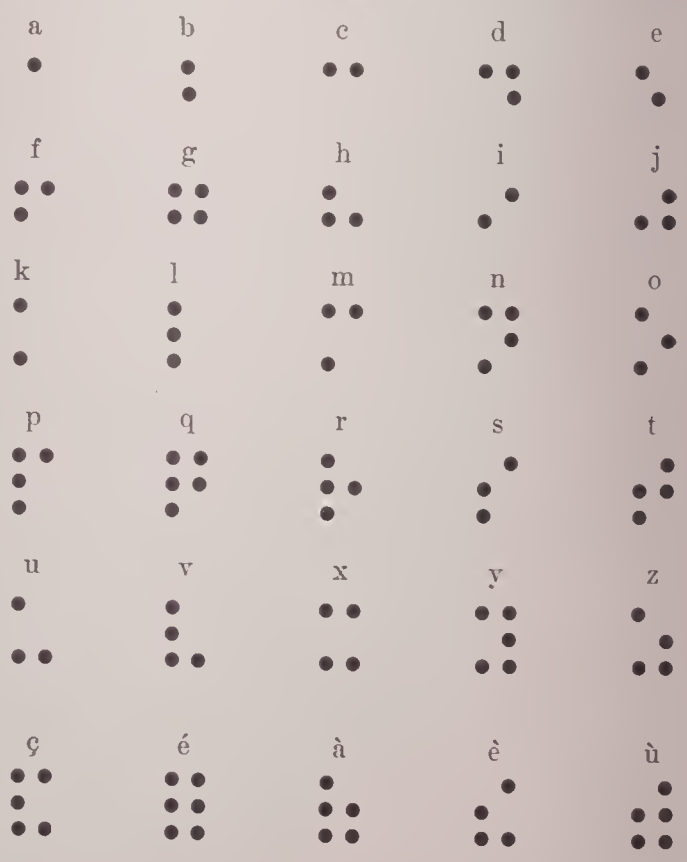
In Great Britain there are many societies organized for the purpose of alleviating the condition of those devoid of sight. The Association for Promoting the General Welfare of the Blind, founded in London by Miss Gilbert in 1856, has for one of its objects the teaching and training of blind persons who on account of age or other cause are not eligible for admission to the schools. Outside of schools more is done for the sightless in Great Britain through the medium of this and similar societies than in other countries.

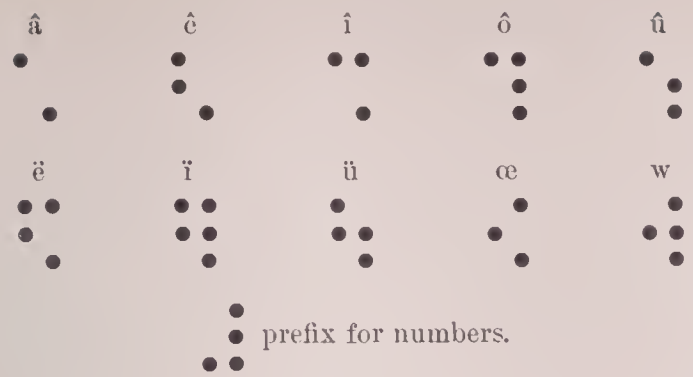
Beginning with the little school of Haüy at Paris, the idea of educating the blind has become cosmopolitan. In most of the schools there are three departments—viz., literary, musical, and industrial. The education in the literary department is about equal to the English course in academies. In teaching reading various alphabets have been used. In Edinburgh two blind men invented and used a string alphabet, by which the different letters were designated by the form and distance of knots on a cord, on which events could be recorded or letters written and the manuscript rolled into a ball and preserved or sent to a friend, as the occasion might demand. The alphabets commonly used, however, consist of letters, or characters representing letters, raised about one-thirty-second of an inch above the level of the page and read with the tips of the fingers. Stenographic systems have been invented, but not extensively used. The Moon type—so called from the name of the inventor, Dr. Moon, of Brighton, England—is extensively used, especially in Great Britain. The alphabet consists of six Roman letters unaltered and twelve with parts left out; the others are designated by new but simple forms. The Scriptures and many volumes of history, science, poetry, and biography have been issued in this type. The following large shaded characters are the Moon Alphabet for the blind. The dotted marks of the letters printed over this alphabet show what portions of the common letter are taken away in order to lay the characters open and clear to the touch. The large shaded characters when printed for the use of the blind are in relief (embossed), without ink:



The Roman letter and the point or dot system are the most popular. There are two methods of distinguishing letters by points, the Braille and the New York, in use both for literary and musical composition. In Boston only the Roman letter is employed in printing. At the American Printing-house for the Blind the Roman letter and the New York point are used. In foreign countries both books and music are embossed in the Braille point. The Braille system has also been successfully adapted to the needs of the blind of China by the Rev. William H. Murray, of the National Bible Society of Scotland, Peking, China. In Japan the katakana form of the forty-eight letters of the Japanese syllabary has been modified somewhat in the Moon fashion, but in a less degree, and introduced successfully by Dr. Henry Faulds and another, and portions of the Scriptures and other books have been produced.

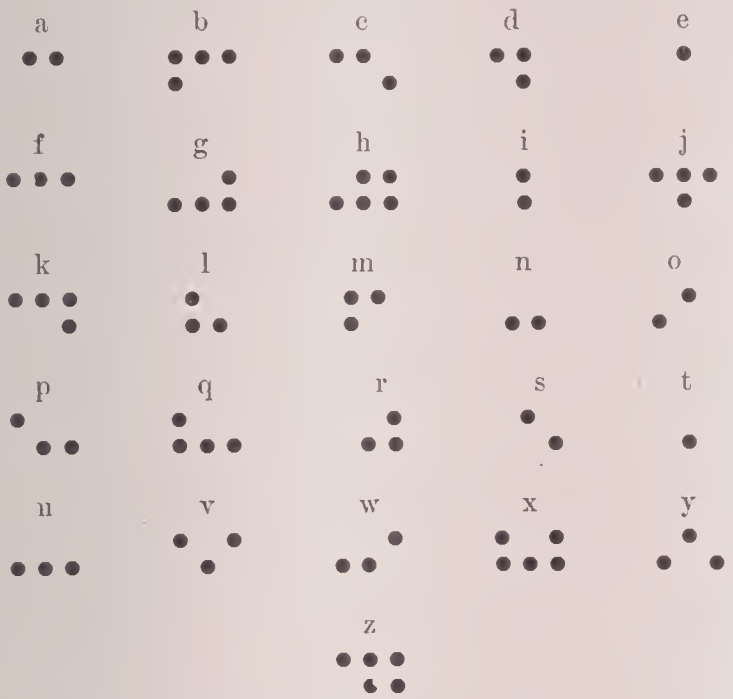
The following is the Braille Alphabet as employed in France, Switzerland, Germany, and other foreign countries:



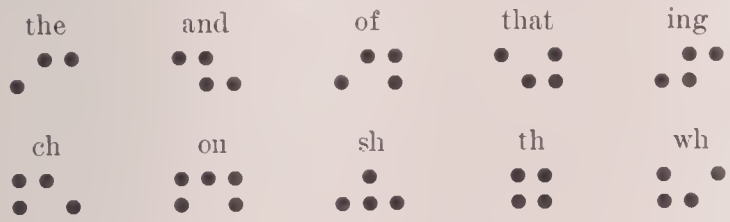


The characters for the first ten numerals in this system are the same as those for the first ten letters of the alphabet.

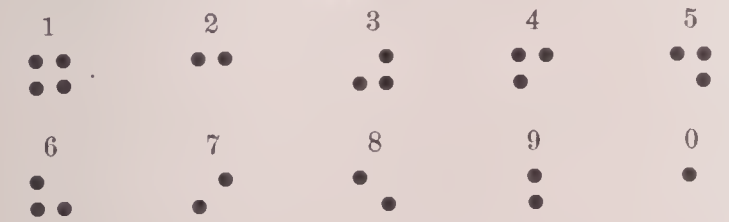
The NEW YORK POINT ALPHABET is as follows:



Word and Part-word Signs.



Numerals.



Prefix indicating that the characters which follow are numerals:  The decimal point is  The capital letters are derived from the small letters by suffixing to each of them *as many points* as will form a new character *four points* in length, in the following manner: 1st. When the small letter ends with a point in the upper row, as in the letter "a," add the suffix in the lower row; 2d. When the small letter ends with a point in the lower row, as in "c," or in both upper and lower rows, as in "d," add the suffix in the upper row.

Both methods are used by pupils in the schools of the U. S. in taking notes and for the purpose of correspondence. The Braille, as used in the U. S., is, however, somewhat modified. The apparatus for writing the point-system consists of a board with a grooved surface, over which a frame is fitted. Sheets of paper are placed over the board, and the points are made with a stiletto through a rule of perforated metal. The writing is done from right to left, as the sheets are reversed when read. An improvement on the form of stiletto which was originally used has facilitated this method of writing. It attaches a sliding-bar supplied with small keys to the rule, which upon being pressed marks the points on the paper below. An instrument has been invented by M. Pephan, director of a school in Paris, which is of use to blind people. It is a small press which enables them not only to print the raised characters which they read with their fingers, but also the ordinary ink characters, on the same sheet of paper, at the same time. By its use they are able to communicate by letter with their friends without asking the assistance of others. Several instruments for writing point print, which are similar in construction to typewriters, have been invented in the United States, and will be of invaluable service to the blind in acquiring their education.

Every well-equipped school for the blind contains a great variety of articles for object-teaching; the propriety of having such a collection is apparent when it is considered that the blind acquire a great deal of knowledge through the sense of touch, and many quite common objects will escape their attention unless they are allowed to handle them. Blind persons who are endowed with musical capacity are taught to become organists, teachers of singing, instructors on the pianoforte, cornet, or other instruments. They are taught to tune pianos, in which they are especially successful. The pianos of the public schools in Boston are tuned by pupils of the Perkins Institution. The industries taught the blind are basket-making, broom-making, mattress-making, carpet-weaving, sewing, knitting, and crocheting. There are individual cases on record where blind men have learned the trades of clockmaker, wagonmaker, and other mechanical pursuits.

The education of blind children is often seriously neglected at their homes before they attain an age (usually about nine years) suitable to begin their study in an institution especially adapted to their wants, sometimes not even being taught to wash, dress, and feed themselves.

At Hubertsburgh, in Saxony, there is a preparatory school for young blind children from which the institution at Dresden receives them, having been properly cared for and taught in early childhood. There is a school of similar character in Copenhagen. In 1886 a kindergarten with a like purpose was opened in Boston, Mass., where children receive training before they enter the Perkins Institution. This is the only one of its kind in the U. S., and its establishment is due to the efforts of Mr. Anagnos. It is hoped that more such schools may soon be organized. In the U. S. there are about 3,000 blind pupils in the schools established for their education. ARTHUR G. CLEMENT.

Blind, blint, KARL: a German liberal politician; b. at Mannheim, Sept. 4, 1826; had a prominent part in the revolutions of 1848 and 1849, and in 1852 took refuge in London. Having been pardoned by the Government of Baden in 1867, he returned to Germany, where he has since distinguished himself as a zealous opponent of the policy of Bismarck. Besides writing biographies of Ledru-Rollin, Déak, and Freiligrath, he has been a student of the sagas and published many articles on Scandinavian folk-lore.

Blindage, in fortification: a term applied to a screen made of timber and earth, or any fixture designed to shelter the garrison or conceal their operations from the enemy. The blindage is sometimes formed of fascines, placed on the inner crest of a battery and continued over the top of the embrasures. Other blindages, used to protect the gunners of a battery from a vertical fire, consist of plain and strong timbers, one end of which is placed on the inner crest of the parapet and the other end on the ground.

Blindfish: any fish of the genus AMBLYOPSIS (*q. v.*).

Blindheim: See BLENHEIM.

Blindness: the absence of the sense of sight, caused by disease, defect, or injury of the eye, of the optic nerve, of the optic tracts, or of the cortical centers of vision in the brain. Blindness may be congenital or acquired, complete or incomplete, and transient or permanent. Congenital blindness may be due to absence of the globes (anophthalmos), deficient development of the globes (microphthalmos), excessive development of the globes (megalophthalmos), complicated cataract, inflammation of the choroid coat, atrophy of the optic nerve, degeneration of the retina, anomalies of the cornea, tumors, and undetermined conditions. Among the last are classed those cases of blindness which occur

from deficient development of the nervous apparatus. The most important idiopathic diseases of the eye which may produce permanent blindness are ophthalmia of the newly born, granular lids, inflammations of the cornea, iris, choroid, and retina, atrophy of the optic nerve, glaucoma, and tumors of the eye and its vicinity. Blindness the result of injuries may be due to a wound of the eye, to unsuccessful operations, to injuries of the head, and to sympathetic inflammation. Blindness may be produced by general diseases—for example, scrofula, syphilis, inflammation of the brain and its membranes (including insanity and epilepsy), disease of the spinal cord, the various eruptive fevers, intermittent fever, heart disease, Bright's disease, and toxic influences (lead, tobacco, alcohol).

Amblyopia and Amaurosis.—Both of these terms signify dimness of vision, the former being used to describe obscurity of sight, and the latter the more advanced condition of loss of vision. Modern methods of examination have greatly lessened the number of instances to which older writers applied the words amblyopia and amaurosis. Amblyopia is a symptom, and describes the defective vision from which the patient suffers. This may be due to functional disturbance, or to disease of the visual apparatus (retina, optic nerve, or visual centers), and may be unassociated with changes in the eye; or there may be atrophy of the optic nerve. Amblyopia and amaurosis may be congenital or acquired, temporary or permanent, and symmetrical or non-symmetrical. Congenital amblyopia is a term generally applied to instances of defective vision uncomplicated by evident disease of the coats of the eyes. The faulty vision has always existed, and often there are high grades of farsightedness and astigmatism, and clear images have never been focused on the retina. Squint is usually present in eyes of this character. Sometimes the amblyopia is present only for colors, and is then known as *color-blindness*. Other causes for amblyopia are injuries, the toxic action of certain drugs (alcohol, tobacco, quinine, sulphide of carbon), and various diseases—for example, Bright's disease, diabetes, and malaria. A curious form of amaurosis occurs in connection with hysteria. Blindness is sometimes simulated by those who desire to escape distasteful duties (malingering).

Night-blindness (*Nyctalopia*, often incorrectly termed hemeralopia).—This is a functional complaint consisting in an imperfect adaptive power of the retina, due to exposure of the eye to strong light, together with a debilitated and often scorbutic state of the system. It affects residents in tropical countries, often soldiers and sailors, and has been occasionally observed in large schools, usually in the early spring or summer. It prevails as an endemic in certain countries, especially in Russia during the Lenten fasts. The patients are unable to see well in the dusk, or even on dull days, although their vision is good enough in a bright light. Night-blindness is also a symptom of a very serious disease of the retina which is called pigmentary degeneration, quite distinct from the functional disorder which has just been described.

Day-blindness (*Hemeralopia*, often incorrectly termed nyctalopia).—This is an affection characterized by the fact that its subjects see better on dull days and in the dark than in a bright light. Sometimes it is a symptom of diseases of the retina and of the optic nerve; sometimes it is found in certain congenital faults of the eye, particularly albinism, and sometimes it is an idiopathic affection, and may develop in those who have long been excluded from the light. Among noeturnal animals, as owls, bats, etc., it is the normal condition. George E. de Schweinitz.

Blindstory: See Triforium.

Blindworm: a popular name of *Anguis fragilis*, which is not blind, nor is it a worm. It is a lizard, closely related to typical forms, differing in the snake-like body and in the absence of external limbs, but having shoulder-bones and pelvis in a rudimentary state. It is found in nearly all parts of Europe, is inoffensive and timid, and moves very slowly, and is sometimes called slowworm. Its length varies from 10 to 15 inches. Its eyes are small but well developed, with movable lids. Its tail is very brittle, hence the popular name of glass-snake for the American species of *Anguidæ*. See Glass-snake.

Bliss, Cornelius Newton: See the Appendix.

Bliss, George: See the Appendix.

Bliss, Philemon: jurist; b. in Canton, Conn., July 28, 1814; educated at Hamilton College, Clinton, N. Y. In 1861 he became chief justice of Dakota, and afterward a judge of the Supreme Court of Missouri. For a number of years he was dean of the Law School of the State University of Missouri. He was the author of a work on code pleading. D. in St. Paul, Minn., Aug. 25, 1889.

Henry Wade Rogers.

Bliss, Philip Paul: b. at Clearfield, Pa., July 9, 1838; received instruction in music from George W. Root; became the chorister of the First Congregational church of Chicago, and superintendent of the Sunday-school; joined afterward in the lay evangelistic labors of Maj. Whittle, and perished at the Ashtabula, O., railway accident, Dec. 29, 1876. His hymns *Hold the Fort*, *Hallelujah, 'tis done!*, *More to Follow*, etc.—of which he generally composed both text and melody—became very widely used.

Bliss, Porter Cornelius: journalist and diplomat: b. on the Cattaraugus reservation of Seneca Indians, Erie co., N. Y., Dec. 28, 1838; studied at Hamilton and Yale Colleges; traveled in Maine, New Brunswick, and Nova Scotia 1860–61, investigating the condition of the Indian tribes in behalf of societies at Boston; was employed for some months as clerk in the Indian bureau, and subsequently in the post-office department at Washington 1861; took part in volunteer organizations for the defense of the capital; visited England the same year; accompanied Gen. J. W. Webb as private secretary on his mission to Brazil 1861–62; was commissioner of the Government of the Argentine Republic for the exploration of the Indian country called the Gran Chaco 1863; edited at Buenos Ayres a monthly periodical, *The River Plate Magazine* (1864); was appointed by President Lopez historiographer of Paraguay; became secretary to Hon. C. A. Washburne, U. S. minister to Paraguay, 1866; aided him in collecting materials for his *History of Paraguay* (2 vols., 1871); was imprisoned by command of Lopez on a charge of treason and conspiracy for his assassination Sept. 10, 1868; rescued by a U. S. squadron Dec. 10, 1868; appointed translator to the State department at Washington, Mar., 1869; editor of the Washington *Chronicle* 1869–70; secretary of legation in Mexico 1870–74, and acting minister several months 1872–73. He afterward resided in New York, and was vice-president of the American Philological Society and an editor of the *New York Herald*. D. in New York, Feb. 1, 1885.

Bliss, William Wallace Smith, A.M.: soldier; b. in Whitehall, N. Y., Aug., 1815; graduated at West Point in 1833; assistant adjutant-general (rank of major) July 7, 1846. He served in the Cherokee nation, 1833–34; assistant professor at the Military Academy 1834–40; in the Florida war 1840–41, being chief of staff to commanding general; assistant adjutant-general at headquarters of Western military departments 1842–45; chief of staff of Maj.-Gen. Taylor in the military occupation of Texas 1845–46; in the war with Mexico 1846–48; in command of the Western division 1848–49; engineer at Palo Alto, Resaca de la Palma (brevet major), Monterey, and Buena Vista (brevet lieutenant-colonel); private secretary of President Taylor, Mar. 4 to July 9, 1850; assistant adjutant-general of the Western division, headquarters at New Orleans, La., 1850–53. D. in East Pascagoula, Miss., Aug. 5, 1853.

Bliss'field: village (founded in 1825); Lenawee co., Mich. (for location of county, see map of Michigan, ref. 8–J); on L. S. and M. S. R. R. (old line); 23 miles W. of Toledo; has 2 graded schools, 6 churches. Its only industry is farming. Pop. (1880) 1,222; (1890) 1,132; (1900) 1,268.

Editor of "Advance."

Blistered Steel: See Steel.

Blisters [in Early Modern English also *blyster* and *bluster*; from Middle English *blister*; perhaps from Old French *blestre*, *blostre*, a swelling]: a term applied in *medicine* either (1) to thin vesicles filled with serum produced upon the skin by certain applications, or (2) to the applications themselves. The material most frequently employed is cantharides or Spanish-fly (*Cantharis vesicatoria*), which may be mixed with oily substances, or, incorporated in collodion, painted upon the surface. Ordinarily from four to six hours are required for a satisfactory blister, but in persons with delicate skin a shorter time may suffice, and it is well in such cases to have a thin sheet of gauze between the skin and the application. Poultices over the blister hastens its action. Ammonia is also useful in some cases, but the resulting blisters are more severe.

Blizzard [of doubtful etymology]: a storm characterized by a high wind, extreme cold, and an air filled with fine,

hard, sharp crystals of snow. Blizzards generally follow an unusually deep "low" or storm-area of winter when the pressure rises rapidly. They appear first in the plains of Canada E. of the Rocky Mountains and pass into the U. S. through Eastern Wyoming, North Dakota, and Minnesota, and rarely pass E. of the region of the Great Lakes, unless the ground has a continuous covering of snow. They are very destructive to unprotected stock, and are dangerous to human beings exposed to them. The fine snow fills the air and prevents the traveler from seeing his way and stings the skin, the mind becomes confused, and the sufferer may perish even within the hearing of a call from his own door. Fortunately, severe blizzards are rare, and when they occur they seldom continue more than a day or two. M. W. H.

Block: a heavy piece of timber; a massy body, solid and heavy; the piece of wood on which criminals are beheaded; the wooden mold on which a hat is formed; any obstacle or obstruction; also a continuous row of buildings. The term is applied in New York and other cities to the space and buildings between two consecutive streets.

Block: in the rigging of a ship, is the part of the apparatus for raising sails and yards, tightening ropes, etc. The uses of blocks are very numerous on shipboard, and to subserve these uses they are distributed about the masts and yards. The block comprises a *shell* or exterior, a *sheave* or wheel on which the rope runs, a *pin* on which the sheave turns, and a *strap* to fasten the block in its place. A single block contains only one sheave; a double block, two; and so on. Besides the designation of blocks according to the number of sheaves they contain (as single, double), they receive other names—such as cheek block, clew-garnet block, clew-line block, etc. Elm is used for blocks, and lignum vitæ for sheaves.

Until 1781 ship's blocks were made by hand. But it required unusual skill and practice to fashion the pieces and put them together so as to possess the requisite strength and facility in working. More than 1,400 blocks were required for one of the old seventy-fours, and a proportionate number for other vessels. In 1781 a Mr. Taylor began to make the sheaves and shells of blocks by machinery for the British navy. Sir M. I. Brunel in 1801 invented machinery for making blocks, which was put into successful operation in 1808. Thomas Blanchard, an American mechanician, invented most ingenious machines for block-making. For his invention and superintending the work, Brunel received from the British Government £20,000.

Block, Moritz: a French writer on statistics and political economy; b. in Berlin, Feb. 18, 1816. Among his works are *Statistics of France* (2 vols., 1860); *Europe, Political and Social* (1869, both in French); *Die Bevölkerung des Französischen Kaiserreichs* (1861); and *Die Bevölkerung Spaniens und Portugals* (1861). Since 1856 he has published the *Annuaire de l'économie politique et de la statistique.*

Blockade': the act of shutting out all trade by sea with certain specified ports or coasts of one belligerent by another. It is a war right only, arising not from the theory that one state by occupation of certain waters of another has acquired sovereignty over them, but from the right which either party in a war has of weakening his enemy's power of resistance by cutting off his neutral trade. Being a recognized belligerent right, there exists a corresponding duty on the part of the neutral to observe it. This duty, however, the neutral government is not bound to enforce through its municipal law, for this burden is held to lie upon the shoulders of the blockading power, the neutral merely warning its subjects of the fact of blockade and its penalty. Blockade, unlike siege, implies no attempt to gain possession of a port or town; it is rather an act of prevention, restricting trade from within as well as from without the blockaded waters. By comity, at the commencement of a blockade a certain delay is usually granted to enable ships inside either already loaded or in ballast to leave the country. In the U. S. Civil War this delay was fifteen days. Neutral men-of-war on a diplomatic errand and ships driven in by stress of weather may also be granted the privilege of entrance in spite of blockade. When a navigable river like the Rio Grande is a boundary between two states, the enemy of one of them can only apply his blockade to the trade of that one; vessels bound for a neutral port up river must be allowed passage. Declaration of blockade is an act of sovereignty which is rarely delegated to the subordinate officers of a state. Being a serious limitation of the neutral's right to trade freely with *his* friends, that neutral has insisted that due notice of it shall be given him, and that the declaration of blockade shall be substantiated by the stationing of a suitable force at the blockaded point. There are then three essentials to a valid capture for breach of blockade. (1) Due notification must have been given. (2) The blockade must be effective. (3) There must be an attempt to break it.

I. *Notification of Blockade.*—This may be given in two ways: by diplomatic announcement to all neutral powers, or by a warning at the blockaded port inscribed upon the register of the ship trying to enter. The diplomatic notice after a reasonable length of time implies presumptive knowledge of the blockade on the part of all ship-owners, particularly now when the telegraph is so freely used in commerce. The notice at the blockaded port may precede the other or supplement it, as when the blockade of Southern ports was instituted by the Northern fleet during the war of rebellion in the U. S. By proclamation all ports of the Confederacy from South Carolina to Texas were put under blockade Apr. 19, 1861, and a week later the ports of Virginia. But since there was not at first force enough to make this effective, the special notice at the harbor's entrance was allowed for a while also. This was loose practice, savoring of paper blockades, and an injustice to the neutral shipper, who was warned away from *all* Southern ports, while some only were actually closed. He did not lose his ship, it is true, since she was granted the special notice, but he was likely to lose his voyage, because he could not know for a while which ports were still open.

The French rule is to give both these notifications—the diplomatic one and that communicated to the vessel at the mouth of the harbor—and at no stage of the operation to neglect the latter. M. Molé, Minister of Foreign Affairs, wrote in 1838 to another French minister of state: "I will not recall here the reasons why, independently of the official and diplomatic notice of a blockade, every ship showing itself before the blockaded port ought to receive the warning from the commanding squadron." The French, however, hold, if we are not mistaken, that at the outset of a war, before notice has had time to travel over the commercial world, a simple warning to a ship is sufficient, and that an attempt to break through into the port after this would expose the vessel to seizure and trial. The English and our own rule does not require the double notice. It is enough to send the diplomatic notice to all neutrals, and only at the very commencement of a war, especially before notice has had time to fly abroad, to warn off any approaching vessel. If, meanwhile, a vessel should seek to enter the blockaded harbor under the plea of ignorance, the length of its voyage and other circumstances must decide whether the plea is just. The diplomatic notice must be sent everywhere, and if only common fame has carried it to a particular country, that is not sufficient to involve in guilt a vessel of that country when seeking the blockaded port. If we compare the two rules, we shall give the preference to the English. The diplomatic notice is intended to prevent voyages, which may be useless or losing, to places in an actual condition of siege. Should a vessel now appear at the harbor's mouth with the claim of not knowing the state of facts, the presumption is against the story, and she must prove her words as she can. But why give a new warning here, any more than to a burglar at your door? It is highly criminal to break blockade; the purpose to do it is a hostile purpose, and no indulgence is called for by such traffic.

If a blockade is raised even temporarily by the approach of the enemy's fleet, for instance, or by any cause except stress of weather, and then resumed, a new diplomatic notice is necessary, and no captures are valid at that point until such notice can have been received and spread. Here again we notice loose practice in the blockade of 1861, for on certain occasions several days elapsed between the departure of the blockading ship from its post and the arrival of the relieving one, but no new notice was given. In case a blockade is abandoned, notification of the fact should be given as widely and publicly as of its commencement.

II. *Effective Blockade.*—The amount of force necessary to make blockade legal and effective is somewhat indefinite. The fourth rule of the Declaration of Paris of 1856 is that "blockades, in order to be binding, must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy."

This definition of "effective blockade" is a little misleading. It does not mean that occasional evasions of a block-

ade will vitiate it. It is enough if there is so great risk of capture as to make blockade-running very dangerous. The rule of the Declaration of Paris was aimed at those abuses of the right which are called cabinet or paper blockades, of which the best known examples occurred at the beginning of the present century. Prussia had treacherously seized Hanover, and closed her ports against Great Britain. Great Britain soon after declared the coast from the Elbe to Brest under blockade. This was not, and could not be, made effective by force. Napoleon in reply, by a decree dated Nov. 21, 1806, at Berlin, laid the whole British coast under blockade. Then by a British order in council the European coast from the Elbe to Italy was put under blockade, and France in turn renewed the Berlin decree with fresh penalties. Such a blockade on Napoleon's part was ridiculous, except for the fact that occasionally the penalty could be exacted for its breach from a neutral ship touching at some British port and then trading with the continent; and the blockade of all the European seaports was far beyond the power of the English fleet. Both sets of orders bore very hard upon the neutral, who saw his legitimate trade ruined, not by the exercise of a belligerent right, but by the mere threat of it, a threat impossible of execution. The growth of the neutral interest secured the abrogation of such a species of blockade in 1856, and as the U. S. has consistently professed the same doctrine, it may be considered maritime law to-day.

III. *Breach of Blockade.*—Lastly, there must appear an attempt to break the blockade after it has been announced and made effective. This may be inferred by the court from the lading-papers, course of the ship, the owner's instructions, any attendant circumstances, even at the outset of the voyage. By the doctrine of continuous voyages, even if a ship is bound for a neutral port, in case her real eventual destination is clearly proven to be a blockaded port, it may be considered one continuous voyage and the penalty attach. But on account of the extreme difficulty of inferring this eventual destination, great fault has been found with courts applying this principle.

The penalty for breach of blockade is confiscation of the ship first and then of the cargo, unless it can be removed from complicity in the act of the ship.

The presumption is against the innocence of the cargo, for it will probably be for the sake of the cargo that the ship makes the venture. If both belong to the same owner, the guilt of the cargo is conclusive. This penalty rests on the vessel until the end of the return voyage. No punishment can be visited upon the crews of blockade-runners. The restrictions of a blockade are paramount to the rights acquired under a license to trade granted by the same government.

On the proclamation of peace, or from any political or belligerent cause, the continuance of the investment may cease to be necessary, and the blockade is then said to be *raised*. The blockading force then retires, and the port is open as before to all other nations.

Revised by T. S. Woolsey.

Blockade: in military art, an operation and an effort to reduce and capture a fort or town without a bombardment or regular siege, relying solely upon the stoppage of supplies. The attacking party throws up redoubts or other works on the neighboring heights and roads. A part of the investing army sometimes remains in a temporary camp, ready to repel a sortie of the garrison. Forts built on steep and rocky eminences may be reduced more easily by blockade, because the roads or paths by which supplies can be received are few, and can be guarded by a small force.

Block Books: books printed from blocks of wood on which the letters have been cut in relief. Previous to the invention of printing, besides the calligraphists and illuminators who prepared and adorned the books of scholars and clerics, there existed a separate guild for the fabrication of school-books and books of devotion, as well as calendars and popular medical books for the lay public. These were ornamented with rude paintings. The card-painters were identical with this craft until the beginning of the fifteenth century. As the demand for the products of their art increased, they invented the process of block-printing, cutting into blocks of wood, and sometimes plates of metal, so as to leave the letters and pictures standing out, and applying colors to these and taking impressions. In these xylographic books sometimes one, sometimes both sides of the sheet were printed

Block-house: a wooden redoubt or temporary fort; it is always covered. It is usually rectangular, is built of logs, and has two stories, one of which is sunk several feet below the surface of the ground. The upper story projects a few feet beyond the lower on all sides. It is loopholed for the use of muskets. Block-houses have been much employed in the U. S. as a defense against Indians. If exposed to the fire of artillery they should be formed of double rows of logs, 3 feet apart, with well-rammed earth between them.

Block Island: an island belonging to the State of Rhode Island; situated between Montauk Point, the east extremity of Long Island, and Point Judith (see map of Rhode Island, ref. 12–M). It constitutes the township of New Shoreham in Newport County. It is 8 miles long and from 2 to 5 miles wide. Block island light, at the north extremity, is in lat. 41° 13′ 46″ N., lon. 71° 34′ 17″ W. Pop. (1880) 1,203; (1890) 1,320; (1900) 1,396.

Blockley: a former township of Philadelphia co., Pa.; on the west side of the Schuylkill river; is now included in the city of Philadelphia. It is the site of the Blockley Insane Asylum, and of a large almshouse occupied by the paupers of the city.

Block-printing: See Block Books and Printing.

Block System: a method of controlling railway trains which are moving in the same direction on the same track, so as to prevent rear collisions. The name originated either from the blocking of the track by stopping the trains, or from the fastening or blocking of the handle of the signal which was used when the system was first introduced. The system, however, does not depend upon any particular kind of signals, or upon any especial mode of transmitting messages. It can indeed be operated by men using flags and lanterns alone, although this would require numerous block stations and hence be very expensive. Usually the block stations are several miles apart, and communication between them is made by the electric telegraph.

To operate the block system a railroad is divided into sections *AB*, *BC*, *CD*, etc., of equal or unequal length, as may be most convenient, and a signalman is stationed at

each of the signal stations *A*, *B*, *C*, etc., who is able to communicate with the signalmen at the two adjacent stations. If a train is on the section *BC* a danger signal remains displayed at *B* until the train has passed *C*. The signalman at *C* then informs the signalmen at *B* and *D*, the danger signal is lowered at *B*, and one is displayed at *C*, and so on in succession; thus only one train can be upon one section at the same time. If a train should be derailed between *C* and *D* the train next following would be stopped at *C*, and this would cause the danger signal to be put out at *B*, so that the third train would stop there. The system, therefore, keeps a certain space interval between all trains on the track, and thus prevents rear collisions if its rules and regulations are observed by the signalmen and enginemen.

The block system as just described is often confounded with the automatic block system. The latter may be defined as an attempt to perfect the former by the use of signals electrically controlled and working automatically, so as to remove as far as possible the danger due to the fallibility of human agencies. For instance, in the simple block system a train might be derailed between *C* and *D*, and the signalman at *C* might turn his danger signal to safety, dreaming perhaps that *D* had given this order; then the following train would go on and collide with the derailed one. In the automatic system, however, the signals are so connected or interlocked that it is impossible for the danger signal at *C* to move until the track is clear between *C* and *D*. This system, moreover, by passing the electric current through the rails, can be made to display a danger signal at *C* if a rail should be broken or a switch be opened between *C* and *D*.

The principles of the block system were enunciated by Sir W. F. Cooke in 1842, in a pamphlet entitled *Telegraphic Railway*, but it was first practically applied in 1851 on the South Eastern Railway of England, and it is now extensively used on European railways. In the U. S. the block system is still in its infancy, and is used only on a few leading railroads, but every rear collision emphasizes its importance, so that its introduction is now rapidly going on. The "absolute block system" is that where the rules absolutely forbid more trains than one on the same section at the same time.

as described above. The "permissive block system" is that where a second train is permitted to enter upon the section, with a warning that it is already occupied and with instructions to go cautiously. The permissive system is manifestly far less secure than the absolute, but is still often used, particularly under the pressure of extra traffic.

According to the statistics kept by the *Railroad Gazette*, the only ones obtainable for the U. S., there occurred during the year 1892 a total of 2,327 train accidents, of which 1,062 were collisions. The latter are classified as 485 rear collisions, 25 butting collisions, and 326 crossing and miscellaneous. In these train accidents 672 persons were killed, of which number 362 perished in the collisions. As the railway mileage is constantly increasing, the total number of train accidents per annum also increases (the number of collisions alone having doubled since 1885), so that the attention of the traveling public is every year more forcibly directed to the necessity of insisting upon an efficient system of protection by means of the block system. See *American Practice in Block Signaling* (New York, 1892) and *Railway Equipment* under RAILWAYS. MANSFIELD MERRIMAN.

Block-tin: a name of a variety of tin which is inferior in quality to grain-tin. During the process of melting or reduction in a reverberatory furnace the purest tin first fuses, and is withdrawn. The residue, being melted at a higher temperature, is poured into molds, and is called block-tin.

Blodg'et, LORIN: scientist and writer; b. in Chautauqua co., N. Y., May 23, 1823. In 1851 he became assistant professor at the Smithsonian Institution at Washington. He may be said to have laid the foundation of American climatology. In 1855 he published a quarto volume of climatological observations, and in 1857 *Climatology in the United States*, a work extensively circulated and very favorably received in Europe. He was editor of the *North American*, published in Philadelphia, and secretary of the Philadelphia Board of Trade from 1858 to 1864. He contributed articles on finance to the *North American Review* in 1866 and 1867, besides making contributions to various other publications.

Blodgett, HENRY WILLIAMS, LL. D.: jurist; b. in Amherst, Mass., July 21, 1821. His parents removed with him to the State of Illinois in 1838. He studied for a time in the Amherst Academy. In 1842 he began the study of law in Chicago, and was admitted to the bar in 1845. In 1853 he was a member of the House of Representatives of the Illinois Legislature, and in 1858 he was a member of the State Senate. In 1870 he was appointed judge of the U. S. district court for the northern district of Illinois. In June, 1892, he was appointed one of the counsel to represent the U. S. before the board of arbitrators between the U. S. and Great Britain in regard to the fur-seal interests in the Bering Sea.

Bloemfontein, bloom-fon'tīn: the capital of the Orange Free State, in South Africa; on a tributary of the Modder, in about lat. 29° 10′ S., lon. 26° 40′ E. (see map of Africa, ref. 9–F). It is the see of a large diocese of the Church of England. Pop. about 3,459 whites and 1,000 blacks.

Bloemfontein was the scene, May 31, 1899, of a conference between Sir Alfred Milner, in behalf of the British Government, and the Presidents of the two Boer Republics, looking toward a settlement of the grievances of the Outlanders. The conference resulted in no agreement, and in the war that followed upon the subsequent negotiations the Free State cast its lot with the Transvaal. The town was taken by Lord Roberts March 13, 1900, and made his base of supplies for the movement on Johannesburg and Pretoria. The Orange Free State was proclaimed the Orange River Colony of Great Britain, May 28, 1900.

Blois, blwăă (anc. *Ble'sæ*): a town of France; capital of the department of Loir-et-Cher; finely situated on high ground on both sides of the Loire, and on the railway from Orleans to Tours; 36 miles by rail S. W. of Orleans, and 112 miles by rail S. W. of Paris (see map of France, ref. 4–E). It has a fine cathedral, a college, a public library, a botanic garden, an episcopal palace, and a town-hall. Here is the celebrated castle of Blois, the scene of many interesting historical events, and once the favorite residence of the Kings of France. Francis I., Henry II., and Charles IX. held their courts in this castle, which has been inhabited by many princes. Blois is a place of great antiquity, and was once more important than it is now. It has manufactures of gloves and porcelain, and a trade in brandy, wine, and timber. Here is an aqueduct cut in the rock by the ancient Romans. Pop. (1896) 23,542.

Blomfield, CHARLES JAMES, D. D.: a learned English prelate; b. at Bury St. Edmunds, in Suffolk, May 29, 1786; graduated at Trinity College, Cambridge, B. A. 1808, and was elected a fellow. He edited several dramas of Æschylus and the works of Callimachus (1815), and of Euripides (1821). He became Bishop of Chester in 1824, and Bishop of London in 1828. He was an efficient promoter of the erection of new churches in London. D. at Fulham, Aug. 5, 1857. See G. E. Biber, *Bishop Blomfield and his Times* (London, 1857); A. Blomfield, *Life of C. J. Blomfield* (1863).

Blom'maert, PHILIPPUS: Belgian author and philologist; b. in Ghent, Aug. 27, 1808; an eager advocate of the revival of the Flemish language and of a Flemish national life. He published editions of old Flemish poems (*Theophilus*, 1836; *Oude vlämische gedichten*, 3 vols., 1838–51), and translated parts of the *Nibelungen* into Flemish iambics. His most important work is a history of the Belgians, *Aloude geschiedenis der Belgen of Nederduitschers* (1849). D. in Ghent, Aug. 14, 1871. Revised by A. R. MARSH.

Blood: the principal nutritive fluid of the body. It consists of a clear liquid, the *plasma* or *liquor sanguinis*, and numerous small bodies, the *corpuscles*, also nearly transparent, but of different refractive power from the plasma, and therefore the two commingled make an opaque mixture. In most of the invertebrates and in the amphioxus, a fish of low type, the blood is clear and transparent. In many invertebrates it is colored, red, green, or yellowish. The red fluid seen when the head of a fly is torn off or crushed is not blood, but comes from the eyes. In vertebrates only are corpuscles found. There is usually a faint odor characteristic of the animal.

In man the blood is light red in the arteries, and is designated as *arterial*; in the veins it becomes dark bluish or even blue-black, and is called *venous*. The color is due to an organic substance, *hæmoglobin*, which is contained in the red corpuscles. The oxygen of the air entering at the lungs combines with this substance, and gives rise to the bright red color of arterial blood. In the tissues the oxygen is consumed, the hæmoglobin becoming "reduced"—that is, deprived of oxygen—and the bluish color of the venous blood results. The temperature of the blood is about 100° F. in the deep-seated vessels, but becomes rapidly cooled in those of the exterior. Its specific gravity is about 1·055, but varies in different conditions of health and disease.

The plasma is an albuminous fluid containing various substances, including carbonates, phosphates, sulphates, and chlorides of sodium and potassium, sulphates and phosphates of lime and magnesium, certain organic salts, and undetermined "extractives." Sugar occurs in small proportion in the venous blood, especially that leaving the liver. Urea, urates, carbonic acid gas, and various other substances meant for excretion are also found in the blood in small quantities.

The corpuscles are the red, the white and the blood plaques or plates. The *red corpuscles* are small bi-concave disks about $\frac{1}{3200}$ of an inch in diameter, of amber color when seen separately, but when in mass of the red color characteristic of the blood. In the lower vertebrates they are of oval or elliptical outline, and often nucleated; in man and the mammals, excepting the camel tribe, the outline is circular. The *white corpuscles* or *leucocytes* vary in size, but are generally somewhat larger than the red. The leucocyte consists of a protoplasmic mass, possessed of amœboid motion, and containing one or more nuclei. They are much less numerous than the red, the proportion being variously stated at from 1 : 250 to 1 : 700. Besides these two well-defined corpuscles there is a third form, the *blood plaques* or *plates*, small circular disks, pale amber in color, and about half the size of the red corpuscles. They are by some considered young red corpuscles, but their true nature is much in doubt.

The blood is a peculiar tissue in that its cells are not reproduced from the pre-existing ones, but supplied by certain blood-making organs, among which the bone marrow, the spleen, and the lymphatic glands are important. At the same time destruction of corpuscles also occurs in various places, but principally in the spleen and liver.

The functions of the blood are distributed among its different elements. The plasma, aside from the mechanical purpose of furnishing a circulating medium, serves to con-

vey *to* the tissues the various nutritive substances derived from digestion, and *from* them the excrementitious products of tissue waste and oxidation. The red corpuscles consist largely of the substance called *hæmoglobin*, the coloring-matter of the blood. This substance, chemically albuminous and containing iron, has the property of readily uniting with oxygen and setting this free again. It thus accomplishes the chief purpose of the red corpuscle, that of carrying oxygen from the lungs to the tissues. The functions of the white corpuscles are more obscure, but they doubtless bear a close relation to the processes of growth and tissue repair.

When blood is let it rapidly undergoes clotting or coagulation, certain chemical substances uniting to produce fibrin which catches red and white corpuscles in its meshes to produce a clot or *crassamentum*.

The so-called diseases of the blood are not such, strictly speaking, but rather diseases of the blood-making organs or other structures, whereby the blood becomes deteriorated secondarily. The general term *anæmia* includes a number of such conditions. (See Anæmia, Chlorosis, and Leucæmia.) Excessive amount of blood or *plethora* was formerly regarded as of great importance and very common in those of full habit; but we are at present inclined to attach much less significance to the amount of blood in these cases. See Histology. William Pepper.

Bloodbird (*Myzomela sanguinolenta*): a beautiful little species of honeysucker which receives its name from the rich scarlet color of the head, breast, and back of the male. It inhabits the thickets of New South Wales.

Bloodflower: a bulbous plant of the genus *Hæmanthus* and family *Amaryllidaceæ*; native of South Africa; so called from the red color of the flowers. Bloodflowers are cultivated in greenhouses for the beauty of their flowers, which grow in heads or clusters. The leaves of some species are linear, and those of others nearly round. The inspissated juice of *Hæmanthus toxicarius* is used by the natives of South America to poison their arrows.

Bloodhound [so called because formerly employed to track wounded game by their blood]: one of several varieties of dog, distinguished for the keenness of their scent and the persistency with which they will follow the track of game. They have been employed in many petty wars to track small forces of partisans, also to follow escaped prisoners, etc., as in time of peace they have been trained to hunt felons, poachers, and fugitive slaves. When kept for these purposes they acquire a peculiarly ferocious and bloodthirsty character, but when employed for the chase they are sagacious and trusty. The Cuban and Russian hounds are celebrated for their ferocity. They differ much from the English hounds, but like them have pendulous ears and lips and a compact and muscular build.

Blood-letting: See Bleeding.

Blood-money: the reward for betraying a criminal to justice. More commonly, however, the compensation by a slayer to the slain person's next of kin. With primitive peoples, who can not understand how taking a life is compensation for life, the practice prevails of paying a fine to surviving relatives in cases of homicide. The amount is fixed by custom or law. The laws of the ancient Germanic races which settled in the various countries of Europe elaborately fix the fines for homicide of different degrees.

Blood-poisoning: the condition produced by the absorption of injurious substances from a wound, from a local disease, or from an intact mucous membrane. Using the word in its broadest sense the condition occurs in almost every disease, certainly in all infectious diseases. In every disease and in every wound there are substances produced which are absorbed into the blood, and which, when present in sufficient amount, or when sufficiently virulent, manifest their action by the production of fever and other disturbances of the general constitution. The substances which are absorbed may be of the most varied character. They may be living micro-organisms which are capable of multiplying in the blood, or they may be chemical substances which are produced by the bacteria or by the local inflammatory or degenerative processes. Ordinarily the word is not used in such a general sense, but only to denote the constitutional disturbances which result from the absorption of injurious substances from *wounds*. A number of terms have been used to designate the various diseases so produced, which have reference chiefly to the nature of the substances absorbed. They have been divided into two groups, with the distinction that in one, *septicæmia*, no abscesses are produced in distant localities, in the other, *pyæmia*, abscesses are produced.

Under septicæmia three conditions have been distinguished. (*a*) *Fermentative fever*. This is the simplest of the wound complications. It is due to the absorption of fibrin or other ferments from effused blood or from the products of dead tissue. It is seen in perfectly aseptic, non-suppurating wounds, as after a simple fracture of a bone. It is present in every wound if it is sufficiently large and if the conditions favor absorption. Open wounds, where the products can easily escape, are naturally not so liable to be followed by fever as wounds in which the products are retained. The fever is of greater or less intensity and the constitutional disturbance is slight. (*b*) *Sapræmia*, or *putrid intoxication*. This is the condition produced by the absorption of the chemical products of bacteria. They may be the chemical substances known as ptomaines, which are produced by the vital activity of the bacteria in the same way as alcohol is produced by the yeast fungus, or they may be albuminous substances (toxic albumen) resulting from the action or degeneration of the bacteria themselves. There are numerous examples of poisoning by the absorption of such substances when taken in with the food: ice-cream poisoning, meat poisoning, etc. The products of the different bacteria vary greatly in virulence. The violence of the symptoms is in direct ratio to the amount of the material absorbed and its virulence. There are usually severe chills at the onset, followed by fever reaching 103° or more. (*c*) *Progressive septicæmia*. The condition produced by the entry of bacteria into the blood and their multiplication there. The bacteria may enter the blood either through the walls of the blood-vessels or by the lymphatics. They multiply in the blood, and after death are found in the various organs. The symptoms resemble those of sapræmia. (*d*) *Pyæmia*. In this abscesses are produced in various parts of the body. The manner of their production is as follows: In a suppurating wound the blood-vessels become filled with clots which contain bacteria. When portions of these clots break off they get into the general circulation, and if they are too large to pass through the capillaries they become lodged in various organs, and produce suppuration. These abscesses are called metastatic, or secondary. The difference between progressive septicæmia and pyæmia is probably due to the association of the bacteria with the blood clot. There is marked constitutional disturbance, and the onset is noted by severe rigors. W. T. Councilman.

Blood-root (*Sanguinaria canadensis*): a plant of the family *Papaveraceæ*; growing wild in many parts of North America. It is one of our most beautiful early spring flowers. It takes its name from the orange-colored sap of the root, which contains the alkaloid sanguinaria, remarkable for the fine red color of its salts. The root of this plant is a valuable stimulant expectorant, but its use requires caution, for its administration has been followed by the symptoms of acro-narcotic poisoning.

Blood-stone: See Jasper.

Blood-sucker: See Leech.

Bloom: waxy or resinous matter frequently developed on the surfaces of leaves and other parts of higher plants. It may consist of (1) a continuous layer, or (2) of multitudes of vertical rods, or (3) of minute rounded grains, or (4) of needles scattered irregularly over the surface. Bloom is common upon many fruits, as grapes and plums; it is abundant upon the leaves of the cabbage, and is well developed upon the young stems of blackcap raspberries (*Rubus occidentalis*). Its use is not certainly known. In some cases it appears to preserve the surface from wetting, and possibly may prevent too great a rise in the temperature of the underlying tissues. Charles E. Bessey.

Bloomary, bloom'a-ri, **Bloomery**, or **Blomary** [deriv. of *bloom*, mass of iron < O. Eng. *blōma*; prob. same as word for flower; but history of the signification unknown]: a furnace for converting pig or cast iron into malleable or "wrought" iron, or for producing malleable iron from iron ore directly. In the latter case it differs from the Blast Furnace (*q. v.*), in reducing the ore and producing the iron in a mass or "bloom" without melting it, while the blast furnace produces an impure molten iron, which is tapped off and cast into pigs; the blast furnace working continuously, the bloomary (in many cases) interruptedly. The

change of cast into malleable iron by the bloomary process is generally superseded by puddling, but the former is used to a very limited extent in the U. S. and Sweden in the production of the better kinds of metal. Bloomaries for the direct production of iron are of various forms. The process is one of the oldest known in metallurgy, and rude forms of it are at present used in many barbarous countries. The two best known modern forms of the bloomary (the Catalan furnace and the German bloomary) are at present used in Spain, Sweden, Russia, and parts of the U. S. for the reduction of ores, chiefly by means of charcoal. Only the richest ores can be profitably used, and the loss of iron is much greater than by the blast furnace. In the true Catalan forge the charcoal, with a great part of the charge of iron ore, is heaped on the small square hearth opposite to the tuyere, fine ore and charcoal being thrown in from time to time. A moderate blast is maintained, and the whole is stirred at proper times; and in about six hours the iron is removed, and forged at once into a bloom. In the ordinary or German bloomary the ore is first made fine, and then thrown in small quantities upon a charcoal fire with a blast. See IRON (*Manufacture*). Revised by C. KIRCHHOFF.

Bloom'er, AMELIA: a dress reformer whose maiden name was *Jenks*; b. in Homer, N. Y., May 27, 1818; married Dexter C. Bloomer in 1840, and settled at Seneca Falls, N. Y.; Jan. 1, 1849, established *The Lily*, a semi-monthly publication, which attained a circulation of over 4,000. From 1855 until her death, Dec. 30, 1894, she resided in Council Bluffs, Ia., where she took part in the woman's suffrage work of that State. Mrs. Bloomer did not originate the costume which bears her name, but after seeing it worn by Elizabeth Smith Miller, daughter of Hon. Gerrit Smith, she, with Elizabeth Cady Stanton, Lucy Stone, and others, adopted it.
SUSAN B. ANTHONY.

Bloom'field: town (founded in 1834); capital of Greene co., Ind. (for location of county, see map of Indiana, ref. 9-C); on branch of L., N., A. and C. R. R. and E. and I. R. R., 80 miles S. W. of Indianapolis. Bloomfield has a high school, four churches, steam flouring-mill, and a sawmill. It is situated in an agricultural district, 10 miles W. of the mining district of Greene County, and has an active trade. There are hereabouts abundant unworked deposits of iron and coal. Pop. (1880) 988; (1890) 1,229; (1900) 1,588. EDITOR OF "NEWS."

Bloomfield: city; railroad junction, and capital of Davis co., Ia. (for location of county, see map of Iowa, ref. 7-I); has manufactures of plows, wagons, and furniture. It has a high-school building costing $30,000, and is the center of a rich farming district; has a public library and a large trade. Pop. (1880) 1,531; (1890) 1,913; (1900) 2,105.

Bloomfield: township; Essex co., N. J. (for location of county, see map of New Jersey, ref. 2-D); 4 miles N. N. W. of Newark; on branch of D., L. and W. R. R. and N. Y. and Greenwood Lake Ry.; has superior high school, nine churches, a German Presbyterian Theological Seminary, extensive manufactures of woolen cloth, tissue and photographic paper, hats, shoes, safety-pins, saddlery hardware, rubber goods, church pipe-organs, cabinet-organs, mantels, and perfumery; here are also brass rolling-mills. Bloomfield was founded as early as 1685, under the name of Watsesson; named Bloomfield in 1796 from Gen. Joseph Bloomfield. Pop. (1880) 5,748; (1890) 7,708; (1900) 9,668.
EDITOR OF "RECORD."

Bloomfield, JOSEPH: b. at Woodbridge, N. J.; studied law; entered the Revolutionary army in the Third Regiment of New Jersey troops as captain, serving bravely throughout the war; became attorney-general of New Jersey; Governor of New Jersey (1801–12); brigadier-general in the war with Great Britain (1812–15); and an influential Jeffersonian member of Congress (1817–21). D. in Burlington, N. J., Oct. 3, 1823.

Bloomfield, MAURICE, Ph. D.: philologist; b. at Bielitz, Austrian Silesia, Feb. 23, 1855; removed to the U. S. with his parents 1867; studied at the University of Chicago; A.M., Furman University, Greenville, S. C., 1877; studied Sanskrit and comparative philology at Yale 1877–78; fellow of Johns Hopkins University 1878–79; Ph. D. 1879; studied in Berlin and Leipzig 1879–81; associate in Johns Hopkins University 1881, where he now is professor of Sanskrit and comparative philology. He has edited from the MSS. the ritual book of the *Atharva-Veda*, the *Kāuçika-Sūtra*, and published some forty *Contributions to the Interpretation of the Veda*, besides numerous papers on the history, religion, mythology, and literature of ancient India, on Sanskrit, Latin, and Greek comparative grammar, and on the science of religions.

Bloomfield, ROBERT: English pastoral poet; b. in Honington, Suffolk, Dec. 3, 1766; worked as a shoemaker in London, and wrote in a garret *The Farmer's Boy* (1798), a rural poem which obtained great popularity, and was translated into French, Latin, and Italian. Among his other works are *Wild Flowers* and *Ballads and Songs*. D. Aug. 19, 1823. See *Pursuit of Knowledge under Difficulties*, vol. ii.; *Blackwood's Magazine* for June, 1822; W. H. Hart, *Selections from Correspondence* (1871).

Bloomfield-Zeisler, FANNY: See the Appendix.

Bloom'ington: a city and railroad center; capital of McLean co., Ill. (for location of county, see map of Illinois, ref. 5-E): 60 miles N. N. E. of Springfield. It has manufactures of stoves, furnaces, grain-separators, ice, flour, and plows; car-works and repair-shops (employing some 1,200 hands), a coal mine, elevators, tile-factories, brick-yards, and several furnaces. Ten nurseries and twenty-five firms of horse importers are located in Bloomington and Normal. Ten miles of electric street railway are in operation, and 15 miles of the streets are paved with brick. It is connected by a street railroad with Normal, 2 miles distant, which is the seat of the State Normal University and the Soldiers' Orphans' Home. Bloomington is the seat of the Illinois Wesleyan University and a Roman Catholic college. Pop. (1880) 17,180; (1890) 20,484; (1900) 23,286.

Bloomington: city; railroad junction, and capital of Monroe co., Ind. (for location of county, see map of Indiana, ref. 8-D); 51 miles S. W. of Indianapolis. It is the seat of the State University: has important limestone quarries and manufactures of hard wood, and contains large tanneries. Pop. (1880) 2,756; (1890) 4,018; (1900) 6,460.

Blooms'burg: town (incorporated as such in 1870); capital of Columbia co., Pa. (for location of county, see map of Pennsylvania, ref. 4-H); on Del., Lack. and W. and Phil. and Reading R. Rs., and on north branch of Susquehanna river, 56 miles S. W. of Scranton. Iron and limestone abound in the vicinity. The town has a State normal school, 3 public schools, 8 churches, iron furnaces and foundries, silk-mill, carpet-factory, brass and copper tube-works, furniture and desk factories. Pop. (1880) 3,702; (1890) 4,635; (1900) 6,170.
EDITOR OF "COLUMBIA COUNTY REPUBLICAN."

Blossburgh: borough; Tioga co., Pa. (for location of county, see map of Pennsylvania, ref. 2-F); on railroad and Tioga river, 41 miles S. of Corning, N. Y.; has mines of semi-bituminous coal and of iron. Pop. (1880) 2,140; (1890) 2,568; (1900) 2,423.

Blouet, bloo'ay', PAUL (*Max O'Rell*): author; b. in Brittany, France, Mar. 2, 1848; educated in Paris (A. B. 1864; B. Sc. 1865); commissioned in French army 1869; taken prisoner at Sedan in Franco-Prussian war 1870; was badly wounded in fighting against the Commune; newspaper correspondent in England 1873; head French master in St. Paul's School 1876–84; lectured much in Great Britain and the U. S. 1887–90. Author of *John Bull and his Island* (1883); *John Bull's Daughters* (1884); *Drat the Boys* (1886); *Jonathan and his Continent* (1889). C. H. THURBER.

Blount, blŭnt, WILLIAM: Senator; b. in North Carolina in 1744; member of the Continental Congress; in 1790 became governor of territory south of the Ohio. In 1796 he was elected a U. S. senator for Tennessee, and in 1797 was expelled from the Senate on a charge that he was implicated in a plot to surrender a part of Louisiana to the British. D. in Knoxville, Tenn., Mar. 21, 1800.

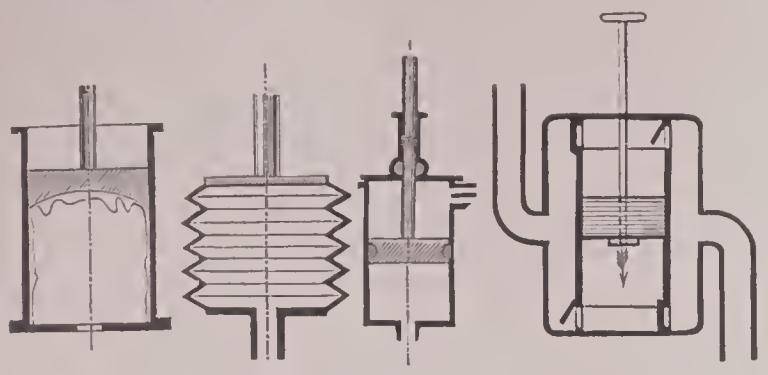
Blow, HENRY T.: legislator; b. in Southampton co., Va., July 15, 1817; graduated at the University of St. Louis, Mo.; prominent Unionist and anti-slavery man before the civil war; U. S. minister to Venezuela (1861–62); member of Congress (1863–67); minister to Brazil (1869–71). D. in Saratoga, N. Y., Sept. 11, 1875.

Blow-fly: a large fly; black and steel-blue in color; attracts attention by its loud buzzing; is readily attracted by the smell of meat, on which it lays its eggs or "fly-blows." *Caltiphora vomitoria* is the common species. See FLESHFLY.

Blowing-machines: machines for producing blasts of air, as for a fire or furnace, or for exhausting air or other gases, as for ventilation.

Probably the earliest form was a bag of skin or leather. From this was developed the common blacksmith's bellows.

(See Bellows.) A form of bag-blower, in which the bag is inclosed in a cylinder and operated by a piston, is shown in Fig. 1, a form of bellows in Fig. 2, and a double-acting piston-blower in Fig. 3. These are shown in an elementary form without valves.



Figs. 1 to 4.

It is stated by Reuleaux in his *Konstructeur* that, contrary to Wilkinson and Ewbank, the bellows shown in the Egyptian wall-paintings have not flap-valves, but the inlet is closed by the heel of the workman, and in the bellows used in India to-day the heel or thumb of the operator serves for an inlet valve.

Piston-blowers.—The modern piston blowing-machine is essentially a pump, with inlet and outlet valves, as in Fig. 4. Such machines are commonly called blowing-engines, and they may, like pumps, be driven by a crank and pitman from a rotating shaft or wheel, such as an overshot water-wheel, or by a steam-cylinder, either directly or through the medium of gearing. When designed to furnish air at high pressures, as for pneumatic transmission to drive rock drills or other machinery, the blowing-machine becomes an "air-compressor." The construction of a blowing-engine and of a compressor is practically identical, except that the latter is provided with a water-jacket or with a spraying apparatus in the air-cylinder for cooling the air heated by the compression.

Prior to about 1870 the cylinders of blowing-engines for blast furnaces were made of great size, and run at a low speed, say ten to fifteen double strokes per minute. When driven by a steam-engine they were either horizontal, in which case they were driven through cog-wheel gearing, the steam-cylinder having a higher speed than the blowing-cylinder, or vertical, in which case the engine was a beam-engine, with the steam-cylinder at one end and the blowing-engine at the other end of a huge walking-beam. The valves were usually large flap-valves of leather, backed with wood or metal. Since 1876, however, the direct-acting vertical blowing-engine has come into almost universal use, with smaller valves, allowing the use of much higher speeds, fifty double strokes per minute for an engine of 4-feet stroke being not uncommon. It is customary to place the blowing-cylinder above the steam-cylinder.

Fig. 5 shows a modern blowing-engine of this type, built by the Weimer machine works, Lebanon, Pa. The valves are of sheet rubber, perforated with slots, and rest upon iron seats having alternating slots. They lift against iron guards having slots corresponding to those in the valves. As these valves work equally well on any plane, they may be placed horizontally, vertically, or obliquely, and may therefore be so disposed as to secure the maximum area of opening. The blowing cylinder-heads are devoted to the inlet valves placed in the sides and bottoms of recessed segmental boxes. The outlet valves are placed in the periphery of the cylinder, and work against vertical slots in its shell of such length as to give the desired area of opening into the air-jacket surrounding the cylinder.

Engines of the type shown in Fig. 5 are built as large as 48 inches stroke, with steam-cylinder 42 inches and air-cylinder 84 inches in diameter, discharging 307 cubic feet per revolution, or 15,350 feet per minute, at a speed of 50 revolutions per minute, and an air-pressure as high as 14 lb. per square inch.

In the ordinary form of vertical blowing-engine the air and the steam piston are on the same rod. In the steam-cylinder, when the steam is cut off before the end of the stroke, in order to realize the economy due to expansion, the pressure on the steam-piston is highest during the earlier portion of the stroke, and lowest at the end of the stroke; while in the air-cylinder the pressure increases from the pressure of the atmosphere at the beginning up to a maximum at that portion of the stroke at which the air-discharge valves open, that is at the pressure in the air-receiver or main, and continues constant during the remainder of the stroke. The fluctuations of energy during a stroke, due to the differences in pressure upon the air and steam pistons,

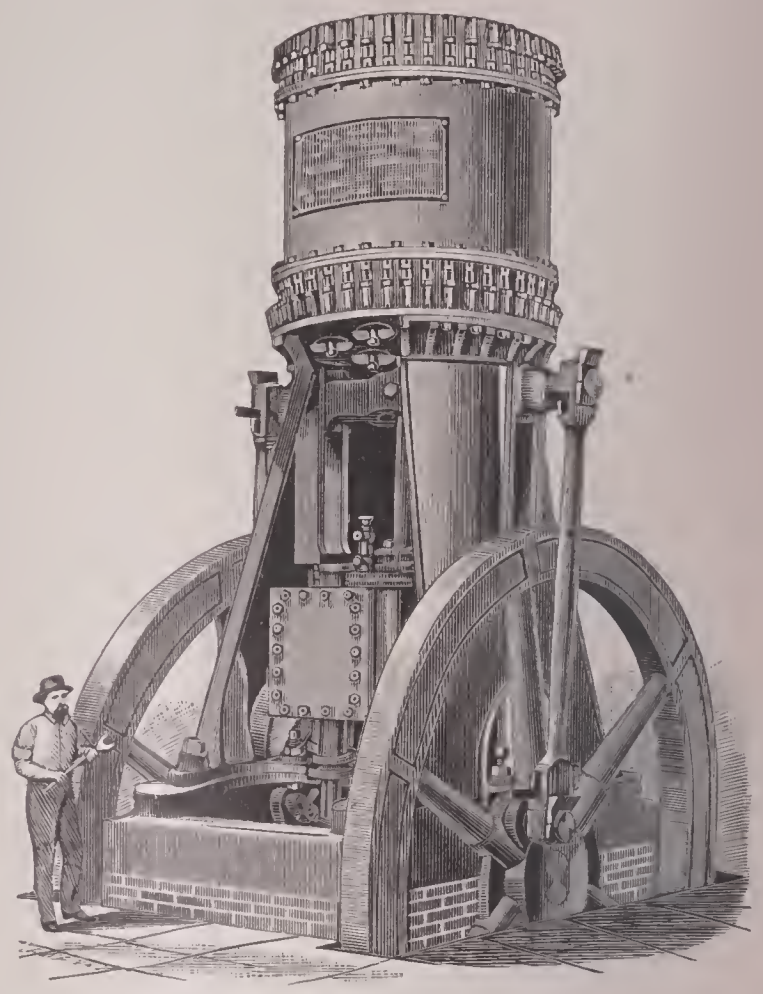


Fig. 5.—Direct-acting piston-blower.

are absorbed and then given out by two large and heavy fly-wheels, which alternately receive force from and give it back to the reciprocating piston-rod through two pitmans connected with a heavy cross-head, which is rigidly attached to the piston-rod. The massive fly-wheels and their connections make this form of blowing-engine a very heavy and costly piece of apparatus relatively to the horse-power developed by it, although not so heavy or costly as the earlier forms of engines which it has displaced. It is likely ere long to be displaced by a compound engine, with cranks at 90 or 120 degrees, carrying the initial steam-pressure to a greater distance in each cylinder, thus more nearly equalizing the strains, balancing the fluctuations in energy through the crank-shaft instead of storing and restoring it by means of heavy fly-wheels, and at the same time realizing the economy of steam due to compounding.

Rotary Blowing-machines.—The blowing-machines above described may be classed as reciprocating machines, being driven by the to-and-fro motion of a piston or of a bellows-frame. Another class is that of rotary machines in which the apparatus is driven directly by a rotating shaft. Of this type there are three sub-classes, viz., disk-blowers, fans, and positive blowers. Disk-blowers are used for moving large quantities of air at the lowest pressures, as for exhausting air from heated rooms or for ventilation. A form of such blower is shown in Fig. 6. It is built in various sizes, from 12 to 96 inches in diameter. A 12-inch fan, driven at 1,000 to 2,000 revolutions per minute, will absorb $\frac{1}{16}$ to $\frac{1}{4}$ horse-power, and will exhaust from 1,500 to 3,000 cubic feet of air per minute, while a 96-inch fan, driven from 200 to 300 revolutions per minute, will require from 4 to 10 horse-power, and will exhaust from 60,000 to 90,000 cubic feet per minute. The operation of a disk-blower in air is similar to that of a screw propeller in water.

A fan is somewhat similar to a rotary disk-blower, but the wings or vanes are parallel with the shaft, and are inclosed in a sheet-metal box or case, which has an opening at the axis to receive the air and another at the periphery of the case to discharge it. For a further description, see Fans.

Root's rotary positive blower is shown in section in Fig. 7. It consists of an oblong metal case closed at the ends, con-

taining two parallel shafts geared together at each end outside of the case, and each carrying what is known as "revolvers." The action of these revolvers, in taking air from the lower half of the case and pushing it outward and upward through the exit, is clearly shown in the cut.

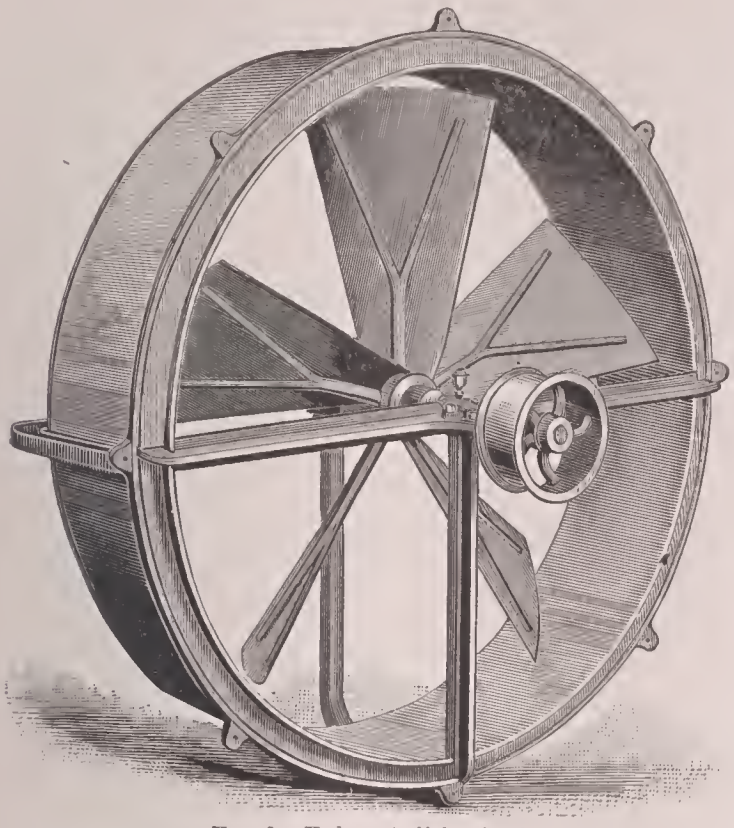

FIG. 6.—Exhaust disk-wheel.

The Baker positive blower is composed of three drums, each of which is a single casting, turned and balanced. The upper drum to which the pulley or engine is attached does all the work of blowing or exhausting. The two lower drums are merely valves for the purpose of preventing the air from escaping or returning.

Both fans and positive blowers are used for blowing cupolas for melting iron. Positive blowers are capable of giving much higher pressures than fans, while the fans, being run at higher rotative speeds, are cheaper in first cost for a given quantity of blast.

Steam-jet Blowers.—Steam escaping at high pressure through a small nozzle creates induced currents in the surrounding atmosphere, on the principle of the injector, and a steam-pipe of small diameter inserted in an air-pipe of considerably larger diameter, which is open at both ends, makes a simple form of blower. Such an apparatus is occasionally used to increase the draft in steam-boilers by blowing a forced blast under the grate-bars. A steam-pipe inserted into a chimney, and discharging steam in a vertical direction, constitutes the steam-jet blower commonly used in locomotives and steam fire-engines for producing a powerful draft. For this purpose the steam-nozzle requires to be given a proper shape and dimensions, depending upon the size and shape of the chimney pipe and the quantity of the chimney gases. For blowing air into furnaces certain shapes of nozzles and of air-pipes have been found advantageous. A furnace-blower of the steam-jet type, known as the Korting, is shown in Fig. 8.

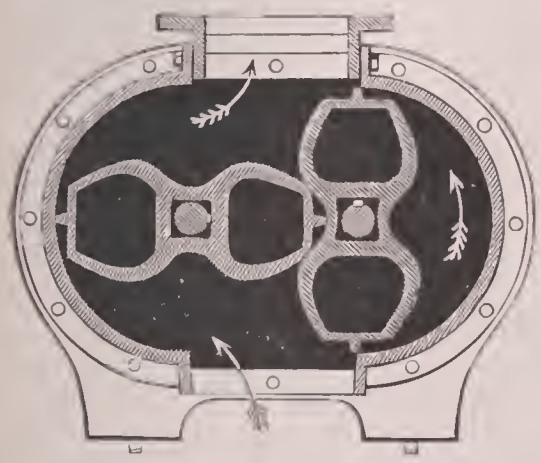

FIG. 7.—Root's positive blower.

Water-blast Blowers.—A jet or falling stream of water may also be used to create a blast of air by means of induced currents. The *Trompe*, described in early works on metallurgy of iron, is an apparatus based on this principle. In it a stream of water falls through a vertical wooden tube into a large air-tight chamber below. Numerous small holes are cut in the tube, through which air is drawn by the descending stream, which air is set free in the chamber, whence it is led by a pipe to the furnace. The efficiency of this apparatus is much lower than that of a blowing-machine driven by a water-wheel.

A more efficient form of water-blower, applicable in situations where the quantity and fall of water bear proper relations to the quantity and pressure of air to be supplied, consists of two air-tight tanks placed at the level of the tail-race, which are alternately filled through tubes from the head-race. While being filled the air displaced in them is forced into the blast main, and while being emptied a valve admits air from the external atmosphere.

The *D'Aubisson Oscillating Cylinder* is a peculiar form of blowing-machine of limited application. It comprises a barrel with a diaphragm, central through the entire length and of nearly the whole diameter, and two valves alternately aspiring and expiring. In its normal position the diaphragm is vertical; the barrel is filled half full of water, and is then set in slow oscillation by means of a crank and pitman. During each oscillation the water passes from one half of the barrel to the other, drawing air into the emptying half and expelling it from the other.

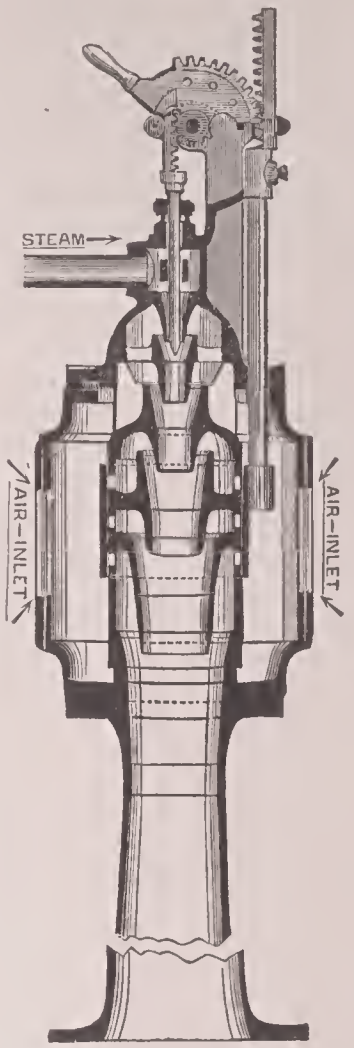

FIG. 8.—Steam-jet blower.

WILLIAM KENT.

Blowpipe (in Fr. *chalumeau*; Germ. *Löthrohr*): a tube bent at right angles and terminating in a fine nozzle, for directing a current of air from the mouth across the flame of a lamp, candle, or gas-jet. It produces a conical-pointed flame, intensely hot, which can be readily directed upon small objects by the operator. It is constantly used by the jeweler in soldering, but in the hands of the chemist and mineralogist it is the basis of a distinct and comprehensive system of analysis, both qualitative and quantitative. By using a gentle current of air, and not permitting the nozzle to enter the flame, the entire flame is brought into a horizontal position, but its chemical character is not changed; it is still composed of combustible gases rich in carbon; and as these, when directed upon many metallic oxides, reduce or liberate the metals, this flame is called the *reducing* flame. If, on the other hand, a more powerful current of air is blown into the interior of the flame, a sharp-pointed jet of a blue tint is the result. Many metals, placed just beyond the point of this flame, are rapidly oxidized; hence it is called the *oxidizing* flame. The chemist is thus enabled by the aid of the blowpipe to expose small quantities of minerals or other substances either to a reducing or an oxidizing influence. By holding the substance in platinum-pointed forceps its fusibility can be determined, or it may communicate to the flame some characteristic color. By placing it upon charcoal many important facts can be learned with regard to it; i. e. it may produce white or colored deposits upon the coal, or evolve a characteristic odor, etc. By subjecting it at the same time to the action of carbonate of soda it may yield metallic globules or powder, with or without a coating. By the aid of a loop of platinum wire the body under examination may be exposed to the action of borax or salt of phosphorus, when glassy beads of characteristic colors may result. Thus with the aid of the blowpipe the analyst subjects the substance to a series of tests, by which its exact character is revealed. By the use of the balance, clay crucibles, cupels of bone-ash, and a great variety of reagents, the percentages of certain metals can be determined, such as copper, cobalt, nickel,

gold, and especially silver. The art of keeping up an uninterrupted current of air through the blowpipe is easily acquired. See Eldeshorst's *Manual of Blowpipe Analysis*, and Plattner's *Manual of Qualitative and Quantitative Analysis with the Blowpipe*; also OXYHYDROGEN BLOWPIPE.

Blowpipe-and-Arrow, called also **Gravata'na-and-Pocu'na**: a weapon used by some of the Indians of South America, both in war and for killing game. It is a straight tube, in which a poisoned arrow is placed and forcibly expelled by the breath. The tube, etc., is from 2 to 12 feet long, the bore not large enough to admit the little finger. It is made of reed or of the stem of a palm. The arrows are from 1 or 2 to 18 inches long, made of the spines of a palm, sharp, notched so as to break off in the wound, and their points covered with curare or other poison. A little down is twisted round each arrow, to fit the tube. In the hand of a practiced Indian it is a very deadly weapon. As his weapon makes no noise, the hunter often does wonderful execution.

Blubber: the cellular membrane in which the oil or fat of the whale is inclosed; the layer of fat which lies just beneath the skin of the whale. A single whale often contains 30 tons of blubber, from which about 20 tons of oil are extracted. The blubber serves to protect the whale from cold and to diminish its specific gravity. It is an important article of food to the Esquimaux.

Blücher, blü'cher, GEBHARD LEBERECHT, von: Prince of Wahlstadt; Prussian general; b. at Rostock, Dec. 16, 1742. He entered the service of Prussia in 1760; became a captain in 1771, and a colonel in 1790. In 1794 he distinguished himself as a cavalry officer in the war against the French, and was raised to the rank of major-general. He led the vanguard at the battle of Auerstadt (1806), from which he retreated to Lübeck. He was defeated and taken prisoner near Lübeck in Nov., 1806. When the war between the allies and Napoleon was renewed in Mar., 1813, Blücher was appointed commander-in-chief of the Prussian army, which he led at Lützen and Bautzen. He defeated Macdonald at the Katsbach in August, and took many prisoners. On Oct. 16 he gained a victory over Marshal Marmont at Möckern, and then formed a junction with the allied armies, which, with his co-operation, defeated Napoleon at the battle of Leipzig, Oct. 17–19, 1813. He was raised to the rank of field-marshal in 1813, and led the Prussian army, about 60,000 strong, which invaded France early in 1814. Between Feb. 10 and 15 he was defeated by Napoleon at Champaubert, Montmirail, Veauchamps, etc., and lost about 15,000 men, but he defeated the same enemy at Laon, Mar. 9, entered Paris at the end of that month, and here received from his king the title of Prince of Wahlstadt. On the renewal of the war in 1815 he took command of the Prussian army, and was defeated at Ligny, June 16, but reached Waterloo in time to decide the victory, June 18, 1815. D. in Krieblowitz, Silesia, Sept. 12, 1819. He was noted for his energy and rapid movements, and was surnamed Marshal Vorwärts (Forward). In 1826 a large bronze statue by Rauch was erected to him in Berlin, and another in Breslau in 1827. See Foerster, *Blücher und seine Umgebung* (1821); Pischon, *Blüchers Leben, Thaten, und Ende* (1842); Varnhagen von Ense, *Blüchers Lebensbeschreibung* (1827); *Life and Campaigns of Blücher* (London, 1815); Scherr, *Blücher, seine Zeit und sein Leben* (2 vols., 1862); Bieske, *G. L. Blücher von Wahlstadt* (1862); and Chesney, *Waterloo Lectures* (1874).

Blue: one of the three primary colors, and one of the seven prismatic colors, of which the complementary is orange. The *blue coloring-matter of flowers* has been called anthokyan or cyanine; little is known of its chemical constitution. *The blue pigments* are (1) ultramarine, obtained originally from lapis-lazuli, now manufactured artificially; (2) Prussian or Berlin blue, the sesquiferro-cyanide of iron; (3) smalt, glass colored blue by oxide of cobalt; modifications of this pigment are called azure blue, cerulean blue, indigo blue, deep blue, king's blue, etc.; (4) Thenard's or cobalt blue, a compound of alumina and oxide of cobalt; (5) verditer or Bremen blue, mountain blue, etc., a basic carbonate of copper; (6) blue ochre or iron blue, native Prussian blue, is a phosphate of protoxide of iron found in many places.

The blue dyes are (1) indigo. This is applied as Saxon blue, or indigo extract, a solution of indigo in fuming sulphuric acid. Chemic, or chemic blue, is the very acid solution; indigo carmine is the extract neutralized by an alkali, as the indigo vat, indigo reduced to a colorless solution by protoxide of iron or grape-sugar, which becomes blue again in the air. (2) Prussian blue, already mentioned as a pigment. (3) Logwood blue, produced by logwood extract on goods mordanted with alum and cream of tartar. (4) Azuline, or phenol blue, prepared from phenol or carbolic acid. (5) Aniline blues, (*a*) bleu de Lyons, triphenylrosaniline; (*b*) Nicholson's, or alkali blue, etc. (6) Toluidine blue. (7) Diphenylamine blue. (8) Quinoline blue, etc. C. F. C.

Blue-Beard (Fr. *Barbe-bleu*; Germ. *Blaubart*): the epithet applied to the central figure of a famous popular tale, first given literary form by Charles Perrault in his *Contes de ma mère l'oye* (1697). The story runs that a certain rich nobleman, named Raoul, distinguished by a blue (i. e. blue-black) beard, married a young and innocent wife. Soon after, going away for a time, he left with her the key to a chamber, which he forbade her to enter. Curiosity made her disobey, and she found in the room evidences of the murder of his six previous wives. Raoul returns, discovers what she has done, and is about to slay her also, when her two brothers arrive upon the scene, kill the husband, and save her life. Since Perrault this tale has had universal currency, both as a nursery tale and as a literary theme. Its origin has been sought in very different places. Perrault seems to have obtained his material from local Low Breton sources. Hence attempts to find the original theme among Celtic traditions. K. Hofmann thinks he has found it in the tale of Aristor and the sister of Percival in the prose Grail. Others point to the story of Cômor, a Breton king of the sixth century, and St. Triphine. The most elaborate theory, however, identifies Blue-Beard with Gilles de Laval, Marshal de Rais RETZ (*q. v.*), who, after winning great renown as a soldier and comrade-in-arms of Jeanne d'Arc, fell into the depths of depravity, and enticed into his power a great number of young boys and girls, whom he debauched and then murdered. See the Abbé Bossard's work, *Gilles de Rais dit Barbe-Bleue* (Paris, 1886). A. R. MARSH.

Bluebell: the name in Great Britain of two widely different wild flowers: (1) the *Hyacinthus non-scriptus*, a hyacinth with beautiful blue flowers, and a root which was formerly gathered for the starch it contains; (2) the *Campanula rotundifolia*, the harebell, very common throughout Europe, and having a wide range in Asia and North America. This and other blue-flowered species of *Campanula* are sometimes called "bluebell" in the U. S., where the name is also in some places incorrectly given to the blue-fringed gentian.

Bluebird (*Sialia sialis*): a bird of the family *Turdidæ*; a general favorite in the U. S., which it visits as a summer bird of passage, and is welcomed as a harbinger of spring. It prefers the vicinity of human habitations, and often

The bluebird.

builds in orchards and gardens. The upper part of it is a rich sky-blue color; the breast and throat are a reddish chestnut. Its song is a mellow, sweet-toned, and agreeable warble. This bird lays about five pale-blue eggs. The male and female both defend their nest and young with remarkable courage when attacked by serpents or other animals. They generally build their nest in the hollow limb of a tree or in a box about the house or garden kindly provided by the farmer, whom they repay partly by the

cheerfulness of their song, partly by the multitude of injurious insects which they daily destroy. In the summer their food consists of insects and spiders; in the winter, of berries. In the month of October their song changes, and the pleasant warble shrinks into one single plaintive note. Even after the trees are stripped of their leaves they still linger for a short time over their native fields. Two other species occur in the U. S., *S. arctica* in the northwest and *S. mexicana* in the southwest.

Bluebooks: the term applied in Great Britain and the U. S. to certain official government publications, the name alluding to the fact of such books in Great Britain usually have blue paper covers. In Great Britain the bluebooks are reports and other papers printed and issued under the authority of Parliament, or the Privy Council, or other chief department of government, primarily for the information of Parliament. As applied to the official publications of the U. S., the term is generally restricted in meaning to (*a*) the publications containing the rules and regulations for the general government of the U. S. navy, and (*b*) to the published official list of the names and salaries of all the government employees. The term is therefore popularly used also as the name for any list of names of an exclusive character, either financially or socially. The official publications containing the reports of the heads of departments, etc., in France have yellow and blue covers, in Italy green, and in other countries various other colors, but they are all popularly designated as bluebooks.

Bluebreast: See Bluethroat.

Blue Earth City: village; capital of Faribault co., Minn. (for location of county, see map of Minnesota, ref. 11–E); on C., M., St. P. and O. R. R., and on Blue Earth river, 120 miles S. S. W. of St. Paul; has a fine school, seven churches, and an opera-house. There are manufacturing, milling, and extensive farming industries. Pop. (1880) 1,066; (1890) 1,569; (1900) 2,900.

Editors of "Post."

Blue-eye (*Entomiza cyanotis*): sometimes called *Blue-cheeked honey-eater*; a beautiful bird abundant in New South Wales. It is a species of honey-sucker, and feeds on insects and honey, which it obtains chiefly from the blossoms of the *Eucalyptus*. It is gregarious, and remarkable for its graceful movements.

Bluefield: village; Mercer co., West Va. (for location of county, see map of West Virginia, ref. 11–F); on Norf. and West. R. R.; 100 miles W. of Roanoke; has 3 graded schools, 6 churches, machine-shops, electric lights, and water-works. A street-railway company has now (1893) been organized. Bluefield is a center of trade for the soft-coal region of the Virginias. Pop. (1890) 1,775; (1900) 4,644.

Editor of "Journal."

Bluefields, or **Blewfields**: a river of Nicaragua, in the Mosquito Territory; flows eastward, and enters the Caribbean Sea at the town of Bluefields, which has a good harbor, and is in lat. 12° N., lon. 83° W. (see map of Central America, ref. 6–J).

Bluefish (*Pomatomus saltatrix*): a fish of the family *Pomatomidæ*; allied to the mackerels. It derives its specific name from a habit of leaping out of the water. It frequents the coasts of the U. S. in spring and summer, is very swift and voracious, and preys on the weakfish and other fishes. It weighs from 5 to 10 lb., and is a fine fish for the table.

Blue Gowns: an order of paupers formerly existing in Scotland. They received annually from the king a largess of alms on condition that they prayed for his welfare; hence also called the king's *bedesmen*, or beadsmen. Every year after his accession to the throne the king elected a member of the order. The alms consisted chiefly of a blue gown or cloak (hence the name), and a purse containing as many Scotch shillings, equivalent to pennies sterling, as the years of the king's life, besides a pewter badge bearing the words "pass and repass," which gave them protection against the laws interdicting mendicity, and gained them among strangers alms or a night's lodging. They continued to be appointed up to 1833, but the order did not become finally extinct until 1863.

Blue Grass, called also **Green Meadow Grass** and **June Grass**: a species of grass (*Poa pratensis*) which is a native of both Europe and America; distinguished from other species of its genus by its flat panicles, smooth culms and sheaths, and short, blunt ligules. Though common in many regions, this grass attains its chief value in that part of Central Kentucky which is called the "blue-grass region," where it is considered to afford the most important crop that can be raised by farmers. It is chiefly cultivated for pasturage and lawns, though on certain soils it makes excellent hay. To this grass Kentucky owes her great reputation as a stock-raising State.

Blue-gum: See Eucalyptus.

Blue Laws: laws of puritanical strictness in religious or sumptuary matters; in particular, certain fanatical and meddlesome laws said to have once existed in the colony of New Haven, now a part of the State of Connecticut. They are the fabrication of Samuel Peters, an Episcopal clergyman, and are found in *A General History of Connecticut, from its first Settlement by George Fenwick, Esq.*, which was written by Peters, and published in London in 1781. (See Peters, Samuel.) The book was not generally well received at the time, and a review of it said: "We . . . observe in it so many marks of party spleen and idle credulity that we do not hesitate to pronounce it altogether unworthy of public attention." It has, however, been quoted as authentic by numerous writers, not without prominence, even so late as 1870. Blue was a symbol of constancy in Chaucer's time, and in his *Court of Love* he speaks of "folke that knele in blew . . . in signe they ever were and ever will be true." Later the phrase true blue came to be applied to rigid adherence to one's convictions, and then to bigotry and fanaticism. The laws of the New Haven colony had been called "blue laws" in New York early in the eighteenth century, undoubtedly in allusion to the strictness of its religious and moral laws, and to the fact that only church-members could vote or hold offices. By the laws of the first constitution and code of Connecticut the penalty of death was inflicted for witchcraft, blasphemy, idolatry, adultery, rape, kidnaping, and cursing and smiting one's parents; and it was a penalty punishable by fine to play at shuffle-board, to be an idler, to lie, to indulge in profane swearing, to take tobacco in public places, to tarry in a tavern longer than half an hour, or later than 9 o'clock P. M. According to the alleged laws of Peters, "No one shall run upon the Sabbath day, or walk in the garden or elsewhere, except reverently to and from meeting." "No woman shall kiss her child on the Sabbath or fasting days." "No minister shall keep a school." "No one shall read Common-Prayer, keep Christmas or Saints' days, make mince pies, dance, play cards, or play on any instrument of music, except the drum, trumpet, and jew's-harp." "Every male shall have his hair cut round, according to a cap," etc. This will serve to illustrate the character of the real and the fictitious blue laws. See J. Hammond Trumbull's *True Blue Laws of Connecticut and New Haven, and the False Blue Laws invented by Samuel Peters* (8vo, Hartford, 1876).

F. Sturges Allen.

Blue Light: See Bengal Light.

Blue Monday: so named from an ancient custom in some parts of Europe of decorating churches with blue on the Monday before Lent, this particular Monday, and afterward all Mondays, being considered holidays for men whose business obliged them to work on Sundays. This practice led to riotous excesses still traditionally remembered, and it was generally suppressed by legal enactments.

Blue Mountain, Pennsylvania: See Kittatinny.

Blue Mountains: a range in the eastern part of New South Wales, and N. of the Australian Alps. It is nearly parallel with the seacoast, from which it is about 100 miles distant. The highest peaks of this range rise over 4,000 feet above the level of the sea. The range long formed a barrier between the settlements on the coast and the interior. In 1815 a road was opened through these mountains to the rich pastures of Bathurst Plains; and now a railroad connects Sydney and Bathurst, crossing the Blue Mountains at an elevation of over 3,000 feet.

Blue Nile: See Bahr-el-Azrek.

Blue Pill (called also *Blue Mass*, or *Massa Hydrargyri*): a drug made by rubbing up metallic mercury with liquorice and other excipients. Each grain of the mass contains one-third grain of mercury, and the dose of the mass is from one to twenty grains. It is used in medicine for the purpose of stimulating the liver to greater secretion, and so increases the flow of bile. In Great Britain, the mass is mixed with both liquorice and confection of roses. In the U. S., the use of a saccharine fluid, such as honey, is recommended in place of the confection of roses.

Blue Ridge: the range of the Appalachians which is nearest to the Atlantic Ocean. It extends in a N. E. and S. W. direction through Pennsylvania, Maryland, Virginia, North Carolina, and Georgia. The part of this ridge in Pennsylvania is called the South Mountain. In Virginia it forms the S. E. boundary of the Great Valley, and is remarkable for beautiful scenery. The Peaks of Otter, which are the highest points of this ridge in Virginia, rise about 3,993 feet above the level of the sea. From North Carolina southward the name of Blue Ridge is invariably applied to the watershed which divides the waters flowing into the Atlantic from those of the Gulf of Mexico.

Blue River, Africa: See BAHR-EL-AZREK.

Blue River, Col.: See BUNKARA RIVER.

Blue River: of Indiana; rises in Henry County, in the east part of the State, and flows southwestward. After it has united with several streams it receives the name of Driftwood or East Fork of White River.

Bluestocking (in Fr. *bas bleu*): a term applied to literary ladies, and generally with the imputation of pedantry. It originated in England in Dr. Johnson's time, when there existed bluestocking clubs, at which literary ladies met to converse with distinguished literati. According to Boswell, they were so called because Mr. Stillingfleet, one of the prominent members, always wore blue hose.

Blue Sulphur Springs: a post-village of Greenbrier co., West Va.; 22 miles W. of the famous White Sulphur Springs. The springs afford a copious supply of valuable saline chalybeate waters, useful in the treatment of many diseases.

Bluethroat, sometimes called **Bluebreast**, or **Blue-throated Rob'in** (*Phœnicura suecica*): a beautiful bird of the family *Sylvidæ*; is common on the continent of Europe as a summer bird of passage, and is supposed to pass the winter in Africa. It resembles a redbreast in form, but is rather larger, and has a brilliant sky-blue plumage on its throat, below which is a black bar. It sings sweetly, and imitates the notes of many other birds. This is one of the birds which the Italians calls BECCAFICO (*q. v.*).

Blue Vitriol: the sulphate of copper. See COPPER.

Bluewing-duck, or **Bluewing-teal**: a species of duck (*Anas discors*); an abundant game-bird of America. Vast numbers spend the winter in the marshes near the mouths of the Mississippi, to which they congregate both from the North and the East; the summer migrations of the species extend as far N. as the 57th parallel, and it is plentiful on the Saskatchewan in the breeding-season. It breeds also in the marshes of the South, and is common in Jamaica, where it is a permanent resident. No duck is in higher esteem for the table. In the summer plumage of the male the upper part of the head is black; the other parts of the head are of a deep purplish blue, except a patch of pure white before each eye; the plumage on the upper part is brown mixed and glossed with green, except that the wings exhibit various shades of blue, the lesser wing-covers being of a rich ultramarine, with an almost metallic luster; the lower parts are reddish orange spotted with black; the tail-feathers are short and pointed. It is a bird of extremely rapid and well-sustained flight.

Bluff: a high bank or cliff presenting a steep or abrupt front toward a river, lake, or sea. The term is often applied to the high banks of the Mississippi and other Western rivers. Between the bluff and the river sometimes occurs a flat tract of considerable width called a bottom. On the Mississippi below Lake Pepin the bluffs of magnesian limestone rise about 350 feet above the river.

Bluff'ton: city and railroad junction; capital of Wells co., Ind. (for location of county, see map of Indiana, ref. 4–G); on L. E. and W. and T., St. L. and K. C. R. Rs., and on Wabash river; 25 miles S. of Fort Wayne. Bluffton has 3 schools, 7 churches, city water-works, natural gas, electric lights, and macadamized streets. It has planing-mills, corn-planter manufactory (steam), barrel manufactories, foundries and machine-shops, stave and heading factories, flouring-mills, furniture-frame factory, furniture-factory, boot and shoe factory, washing-machine factory, and a large grain, lumber, and stock trade. Pop. (1880) 2,354; (1890) 3,589; (1900) 4,479.

EDITOR OF "BUGLE."

Bluffton: village; Allen co., O. (for location of county, see map of Ohio, ref. 3–D); situated at junction of Lake Erie and West., and Pitts., Akron and West. R. Rs. Bluffton has flouring and saw mills and lime-kilns, and horse-breeding and poultry-raising farms. There are outcropping magnesium-limestone formations, and extensive and valuable quarries have been developed. The surrounding farming region is populated by one of the largest exclusively German settlements in the U. S. Pop. (1890) 1,290; (1900) 1,783.

EDITOR OF "NEWS."

Bluhme, bloo'me, FRIEDRICH: German jurisconsult; b. in Hamburg, June 29, 1797; d. at Bonn, Nov. 5, 1874. He studied law at Halle, Göttingen, and Jena, and made in 1821 an extensive tour in Italy, the results of which are found in his essay, *Die Ordnung der Fragmente in den Pandektentitlen*, in the *Zeitschrift für geschichtliche Rechtswissenschaft*, vol. iv., in his edition of Gaius, his *Iter Italicum* (Berlin, 1824–37, 4 vols.), etc. He successively filled the chairs of jurisprudence at Halle, Göttingen, and Bonn, and published *Das Kirchenrecht der Juden und Christen* (Halle, 1826; 2d ed. 1851); *Grundriss der Pandektenrechts* (Halle, 1829; 2d ed. 1843), and *Encyclopädie und System der in Deutschland geltende Rechte* (Bonn, 1847–58, 3 vols.), his chief work.

Blum, bloom, ROBERT: democrat and popular orator; b. of poor parents at Cologne, Nov. 10, 1807. He founded the Schiller-Verein (Schiller Society) at Leipzig in 1840, and the German Catholic Church at Leipzig in 1845. In 1848 he was the master-spirit of the Saxon liberals or democrats, and a member of the Frankfort parliament, in which he was the leader of the Left or moderate opposition. Having been sent by this party to Vienna, he joined the insurgents of that city, which was soon captured by the Austrian army. Blum was arrested and shot at Vienna, Nov. 9, 1848. See Eduard Duller, *R. Blums Leben und Tod*, 1848; E. Franke, *Leben des R. Blum*, 1848.

Blum, ROBERT FREDERICK: figure-painter; b. in Cincinnati, O., July, 1857; studied in New York, Italy, Holland, and Spain. Member of the Society of American Artists (1882) and of the American Water-color Society; associate National Academy, New York; third-class medal, Paris Exposition, 1889. He first exhibited in New York in 1879, is well known as a water-color and pastel painter, and is a talented American illustrator. Aside from various single figures and compositions painted in oil, the most notable feature of which is harmonious and delicate color, he has painted a number of pictures of Venice and of life in Italy and Spain. His picture of *Venetian Bead Stringers* was awarded a prize of $2,500 at an exhibition held under the auspices of the American Art Association at New York in 1889. He is one of the most brilliant technicians among American water-color painters. Studio in New York.

WILLIAM A. COFFIN.

Blumenbach, bloo'men-bäk'h, JOHANN FRIEDRICH, M.D.: naturalist; b. at Gotha, May 11, 1752. He graduated as M. D. at Göttingen in 1775, and wrote for that occasion a remarkable thesis *On the Varieties of the Human Race*. In 1778 he became Professor of Medicine and Anatomy in the University of Göttingen, where he lectured for fifty years. He published a *Manual of Natural History* (1780), often reprinted. He may be said to have first placed natural history on the scientific basis of comparative anatomy. Among his works is a *Manual of Comparative Anatomy* (1805), which was translated into many languages. He advocated the doctrine of the unity of the human species, which he divided into five races—the Caucasian, Mongolian, Malay, American, and Ethiopian. D. Jan. 22, 1840. See C. F. H. Marx, *Zum Andenken an J. F. Blumenbach* (1840).

Blumenthal, bloo'men-täl, JACOB, von: composer; b. at Hamburg, Germany, Oct. 4, 1829; studied music there and at Paris and Vienna; became an excellent pianist. In 1848 he took up his residence in London, where he has since remained and is known as Jacques Blumenthal. His compositions are entirely of a light class, and include brilliant and effective parlor piano pieces and many songs which have become extremely popular.

D. E. HERVEY.

Blumenthal, LEONARD, von: b. in Schwedt, July 30, 1810; educated at the military academies of Culm and Berlin; entered the Prussian army as second lieutenant at seventeen; became first lieutenant in 1846; captain in the general staff in 1849, and in the same year captain in the general staff of the Schleswig-Holstein army; was made colonel in 1860; was distinguished in the war against Denmark; became major-general in 1864, serving with distinction in the war with Austria, and was appointed chief of

the general staff of the crown prince at the beginning of the war with France. He was appointed field-marshal in 1888. D. at Cassel, May 15, 1892.

Blumhardt, bloom'haart, CHRISTIAN GOTTLIEB: b. in Stuttgart, Apr. 29, 1779; d. in Basel, Dec. 19, 1838. He studied theology at Tübingen; was appointed secretary of the German Missionary Society in Basel in 1803; pastor of Bürg 1809, and director of the missionary school in Basel in 1816. Since 1816 he edited the *Missionsmagazin*, from 1828 also the *Heidenbote*, and published *Versuch einer allgemeinen Missionsgeschichte der Kirche Christi* (Basel, 1828–37, 5 vols.).

Blunt, GEORGE WILLIAM: hydrographer; b. in Newburyport, Mass., Mar. 11, 1802; educated in New York city. He was the author of various charts, *Atlantic Memoir*; *Sheet Anchor*; *Harbor Laws of New York*; *Plan to Avoid the Center of Violent Gales*; and compiler of the *American Coast Pilot*. He was a commissioner of emigration (1852–54), a pilot commissioner in 1845, and became a harbor commissioner in 1867. D. in New York, Apr. 19, 1878.

Blunt, JAMES G., M. D.: general; b. in Trenton, Me., July 20, 1826; took degree of M. D. in 1849, and practiced in Ohio till 1856, when he removed to Kansas; was appointed in 1861 brigadier-general and commander of the department of Kansas; major-general in 1862. In 1863 he commanded the army of the frontier. D. in Washington, D. C., in 1881.

Blunt, JOHN HENRY, M. A., D. D., F. S. A.: a clergyman of the Church of England; b. in Chelsea, England, Aug. 25, 1823; educated at University College, Durham; filled various curacies in the dioceses of Durham, Oxford, Exeter, and Ely; appointed Rector of Beverton, Gloucestershire, in 1873. He was a very prolific writer, especially of books of an encyclopædic character. Most widely known perhaps are *A Dictionary of Doctrinal and Historical Theology* (1870) and *A Dictionary of Sects, Heresies, Ecclesiastical Parties, and Schools of Religious Thought* (1874). Among his other works are *Directorium Pastorale* (1864), a volume on the principles and practice of pastoral work in the Church of England; *Household Theology* (1865), a handbook of religious information; *The Annotated Bible* (1878), in three large 8vo vols.; *The Annotated Book of Common Prayer* (1866), an historical, ritual, and theological commentary on the devotional system of the Church of England; *The Reformation of the Church of England, its History, Principles, and Results* (2 vols.), the sixth edition of which appeared in 1885. D. in London, Apr. 11, 1884.

Bluntschli, bloont'shlĕe, JOHANN KASPAR: b. in Zurich, Mar. 7, 1808; d. at Carlsruhe, Oct. 21, 1881. He studied jurisprudence in his native city, and in Berlin under Savigny, and was appointed Professor of Law at Zurich in 1833 and at Heidelberg in 1859. He took a very active part in the politics of both Switzerland and Baden, but always as a conservative. His writings are partly historical: *The History of Zurich* (1838, 2 vols.); *The History of Uri, Schwyz, and Unterwald* (1847), etc., partly juridical; *Geschichte des algemeinen Rechts* (1864); *Das moderne Kriegsrecht* (1866); *Das moderne Völkerrecht* (1868); *Die Lehre vom Staat* (1875), etc. He presided over the congress of jurists in Dresden in 1861, and enjoyed a great reputation in the juridical world.

Blythe, SAMUEL: a British naval officer; b. in 1784; commanded the brig Boxer in an engagement off Portland, Me., with the U. S. brig Enterprise, Sept. 4, 1814, during which he was killed by a cannon-ball. His remains were interred in Portland with the honors of war by the side of Lieut. Burrows, who commanded the Enterprise, and was also killed.

Bo'a: a genus of large non-venomous serpents; devoid of poison-fangs, they kill their prey by constriction. They are all natives of the warm parts of America, the similar large serpents of Asia and Africa forming the genus *Python*, though formerly the name was applied without any distinction to both genera. The family *Boïdæ* (containing the *Pythons*, etc., of the Old World, as well as the true *Boas*, anacondas, etc., of the New) is almost exclusively tropical, and nearly all the species are of great size and strength. It is related by Livy that a serpent 120 feet in length devoured several soldiers and caused alarm to a Roman army in Africa; the skin is said to have been long preserved at Rome. Their teeth are long and directed backward, to prevent the escape of the prey, which is first seized by the mouth, and then the serpent, with a rapidity of motion which the eye of the observer fails to follow, coils itself around it; the muscles of the body afterward compress it, so that in a few minutes life is extinct. Deglutition then takes place, accompanied with a flow of saliva, not only for lubrication, but to hasten the process of digestion. The food is always swallowed entire, and the process seems to require no small effort. The neck is distended to an enormous degree as the prey passes through. After a repast these serpents spend a considerable time in a state of torpidity—several weeks elapsing before they require a new supply—and in this state they are easily killed.

The lungs consist of two lobes, one much larger than the other, and at the extremity of the larger is a capacious air-bag, supposed to serve for the aëration of the blood during deglutition. There are two claws, one on each side of the anus, which are the representatives of the hinder limbs of the superior vertebrate animals, and which, on dissection, are found to be connected not only with strong muscles, but with bones entirely concealed within the serpent. The head, which has great prehensile power, is thick and somewhat elongated; the eyes small; the tail blunt; the scales numerous and rather small; the colors in many species bright and elegantly disposed. The true boas have the plates under the tail single, while in the pythons they are double. They are of four species. The *Boa constrictor* is far from being one of the largest, seldom obtaining a length of more than 12 feet. It is common in parts of South America, where its skin is used for making boots and saddles. Uric acid is prepared in Europe from the excrement of the boa. The name boa constrictor is, however, popularly extended to any very large non-venomous serpent. The only members of the boa family in the U. S. are two or three small species found in Arizona and neighboring regions.

Revised by DAVID S. JORDAN.

Boabdil, bō-ăăb-deel' (properly *Abu-Abdallah*): last Moorish King of Granada; wrested the throne from his father 1481; defeated by the Castilians and made to pay tribute 1483; weakened by contest with his father and uncle; finally surrendered Granada to Ferdinand of Aragon 1491; soon after crossed to Africa, where he died in battle.

Boadice'a, written also **Voadica**: a warlike British queen; wife of Prasutagus, King of the Iceni, who died about 60 A. D. Soon after this date she and her subjects, exasperated by the rapacity and outrages of the Roman soldiers, took arms against them. The Britons took the Roman colonies of Camalodunum and Londinium (London), and killed about 70,000 Romans. She was defeated in 62 A. D. by Suetonius Paulinus, and then killed herself. See Tacitus, *Annales*.

Boar: the male of the *Sus scrofa*, or swine. When applied to the wild stock of swine found in various countries, the term is used without particular reference to the sex of the animals. The native country of this species is in the Old World, where the wild stock abounds in parts of Europe, in Asia, and in Africa. The wild boars found in the Southern States (especially in Florida) are descended from the domestic swine; but have reverted quite to the wild type in respect to the form of the body, ears, and tusks, the bristly crest on the back, the black or red color, and the striped young. Most writers make all the domestic breeds of swine descendants of the wild stock. Others think the small native pig of the Pacific islands is of a separate species; but it is asserted by some that no swine were known on these islands till after they were visited by European ships, which certainly left swine and other domestic animals in many parts of Polynesia. A few writers regard the East Indian boar as of a distinct species. Swine with solid hoofs have been long known, the variety being produced through the coalescence of the last joint of the foot with the hoofs of the middle toe. No true swine are native to America or Australia. Boar-hunting has long been regarded as one of the most exciting sports of the chase. It is practiced in Europe, India, and Syria—in some places with toils or nets, in others with dogs, which bring the boar to bay, when he is dispatched with a spear or long knife. In India he is hunted on horseback and killed with a boar-spear. It is held unsportsmanlike to shoot the boar. When at bay the wild boar is a very dangerous animal.

Board: a piece of timber sawed thin; if more than 1½ inches thick, it is called a plank. The word *board* has many other meanings, e. g., a table; entertainment or food; the deck of a ship or vessel; a table at which a council or court is held; a body of public men constituting a quorum in

session. Board is a general term applied to persons in a collective capacity who have the management of some public office or department, bank, etc.; thus the directors of a bank or railroad are called the board of directors; the British lords of the treasury, the board of treasury. In nautical language, board is the space or portion of sea over which a ship passes on one tack when beating.

To go aboard or on board is to enter a vessel, to embark in it. The mast is said to go by the board when it carries away and falls into the water.

To board, in naval warfare, signifies to enter a ship by force in order to capture it. The assailants sometimes throw on the enemy's deck combustibles, etc., in order to confuse the crew, and then board the ship, armed with boarding-pikes, pistols, and cutlasses. Some of the most desperate naval conflicts have been determined by boarding, as in the case of the Bon Homme Richard and Serapis.

Board'man, George Dana: Baptist missionary; b. in Livermore, Me., Feb. 8, 1801; graduated at Waterville College (now Colby University) in 1822, and at Andover Theological Seminary in 1825. He sailed for Burma July 16, 1825, and distinguished himself by his zeal and devotion to the work among the Karens, being practically the founder of the Karen mission. D. near Tavoy, Feb. 11, 1831. His widow, Sarah Hall, married Adoniram Judson, June 10, 1834.

Boardman, George Dana, D. D., LL. D.: Baptist minister and author; son of the preceding; b. at Tavoy, in Burma, Aug. 18, 1823; graduated at Brown University (1852), and at Newton Theological Institution (1853). He has been the pastor of the First Baptist church in Philadelphia since 1864. Dr. Boardman has held positions as president of the American Baptist Missionary Union, president of the Christian Institution and Peace Society of America, secretary of the Society for Providing Christian Literature for the Blind, chaplain of the University of Pennsylvania, overseer of Columbian University, and trustee or manager of numerous other corporations, institutions, and societies. He has published *Lectures on the Creation Week* (1878); *Studies in the Model Prayer* (1879); *Epiphanies of the Risen Lord* (1879); *Studies in the Mountain Instruction* (1880); *The Divine Man* (first volume of expected *Life of our Lord*, 1887); *University Lectures on the Ten Commandments* (1889); besides numerous sermons and articles in reviews.

Boardman, Richard: one of Wesley's first missionaries to America; b. in England in 1738; joined Wesley's conference in 1763; volunteered for America in 1769; preached in New York and generally through the Middle States till 1774, when he returned to England, and continued his itinerant ministry till his death at Cork, Ireland, Oct. 4, 1782. He is esteemed as one of the founders of Methodism in the U. S.

Board of Admiralty: the commissioners for executing the office of Lord High Admiral of the United Kingdom of Great Britain and Ireland. James II. declared himself Lord High Admiral, and took the management of the navy in his own hands. But by Act 2, William and Mary, 1690, his Majesty was moved "to constitute a commission of admiralty of persons of known experience in maritime affairs, that for the future all orders for the management of the fleet do pass through the admiralty that shall be so constituted."

The board as now constituted consists of six members and three secretaries, as follows: First lord, a civilian, member of the cabinet, and responsible to the crown and to Parliament for the management of the navy. His assistants are: First naval (or sea) lord, who has general supervision of maritime defenses, mobilization of fleet, and the direction of its military movements, etc. Second naval lord, *personnel*, mobilization of naval reserves, etc. Third naval lord and controller, general supervision of *matériel*. Junior naval lord, transport service, victualing, etc. Civil lord, Works Department, buildings, etc. See Admiralty.

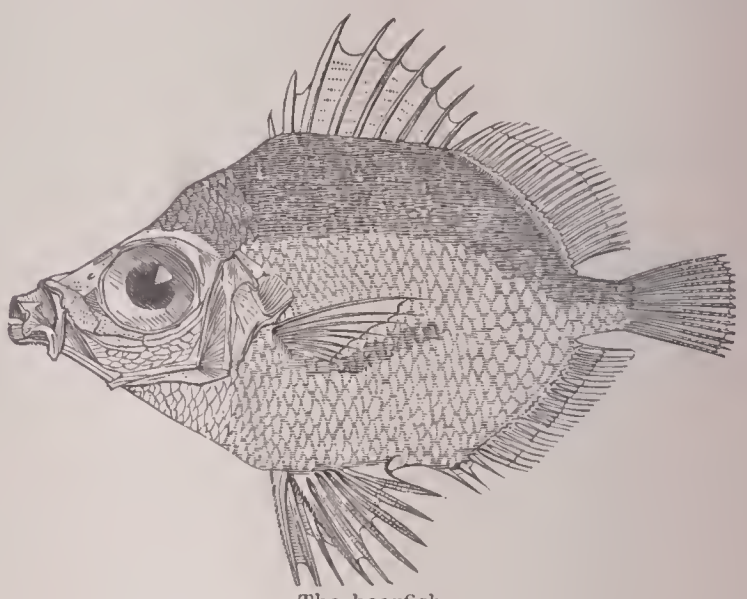
S. B. Luce.

Board of Ordnance: See Ordnance Department.

Board of Trade: in the U. S. a voluntary association of business men of a city to promote the commercial interests of the place; also called chamber of commerce. In 1868 a national board of trade was organized, consisting of delegates from the local boards, holding annual meetings for the discussion of questions of general interest. Local boards of trade or chambers of commerce have even more importance and more legal recognition in Europe than in the U. S. See Chambers of Commerce.

In Great Britain the Board of Trade is a branch of the Government dealing with commerce and statistics. It is controlled by a president, who is an important member of the cabinet, and two general secretaries. One of its departments deals with general trade questions; another with railway appliances, accidents, and, since 1888, with railway rates; a third, and most important, with harbors, shipping, officers' certificates, and marine accidents; a fourth with financial and commercial statistics. A. T. Hadley.

Boarfish: a fish of the genus *Capros* and dory family, or *Zeïdæ*; differing from fishes of the genus *Zeus* in the



The boarfish.

still more protractile mouth (the resemblance of which to the snout of a hog is supposed to have given origin to the name), in the want of spines at the base of the dorsal and anal fins, and of long filaments to the dorsal spines. The body has the usual oval, much-compressed form of the family. The common boarfish (*Capros aper*) is a well-known inhabitant of the Mediterranean, rarely caught on the coasts of England. The flesh is little esteemed.

Boas, bō'ăs, Franz, Ph. D.: ethnologist; b. in Minden, Westphalia, Germany, July 9, 1858; pursued his education from 1877 to 1882 at the universities of Heidelberg, Bonn, and Kiel, and in the latter year prepared at Berlin for an Arctic voyage. In June, 1883, he sailed to Cumberland Sound, Baffin Land; traveled in that region until Sept., 1884, and returned by way of St. John's, Newfoundland, to New York. Assistant in the Royal Ethnographical Museum at Berlin, and privat-docent of geography at the University of Berlin 1885–86, making, however, a journey to British Columbia in the winter of 1885–86 for the purpose of studying the Indians of that region; assistant editor of *Science* 1886–88; and teacher of anthropology at Clark University, Worcester, Mass., 1889–92. During these years he made repeated journeys among the Indian tribes. His principal publications are *Baffin Land* (Gotha, 1885); *The Central Eskimo*, in Sixth Annual Report of the U. S. Bureau of Ethnology (Washington, 1888); *Indians of British Columbia*, Reports to the British Association for the Advancement of Science (London, 1888–92); *Volkssagen aus Britisch Columbien*, Verh. der Ges. für Anthropologie, Ethnologie und Urgeschichte in Berlin (Berlin, 1891).

Boat: any kind of water craft, but, in a particular sense, a small open vessel propelled by oars, sails, steam, or electricity. The name is variously compounded, as steamboat, canal-boat, etc. The boats used on board ship are the launch (both sailing and steam), longboat, barge, pinnace, cutter, yawl, jollyboat, dinghy, gig, lifeboat, whaleboat. There are also quarter-boats, waist-boats, and stern-boats, according to the place where the boat is habitually carried. A *carvel*-built boat has the planking running fore and aft, with flush joints; *clinker*-built, the planking running fore and aft, and lap-jointed. The *diagonal* built has the planking running diagonally, the direction of the inside planking crossing that of the outside, and flush-jointed. The seats for the crew of a boat are called the thwarts; a *single-banked* boat has one rower or oarsman to a thwart; a *double-banked* boat has two. The strips running fore and aft on which the thwarts rest is the *rising*. The *stern-sheets* is the space abaft the after thwart; the *fore-sheets*, the space forward of foremost thwart. The spaces in the wash-streak for the oars are the

rowlocks. The *frames*, *knees*, *hooks*, *stern*, and *stern-posts* of wooden boats are generally of oak; the planking of cedar. Oars are made of ash. The *blade* of the oar is the flat part that goes in the water; the *loom* is the rounded part, at the inner extremity of which is the *handle*. The rigs for boats are the *sloop-rig*, *sliding-gunter*, sprit, and lug. In the U. S. navy the barge is for the exclusive use of the commander-in-chief; the gig for the commanding officer of the ship. All other boats are for general service of the ship, such as conveying passengers to and fro, bringing off stores, etc. For military operations all the boats of a ship are put in requisition for landing the naval brigade formed of the ship's company; also, as many as may be necessary, for "cutting out" expeditions; and, organized as a fleet, for the practice of naval tactics. In these and similar operations the sailing launch carries a Howitzer, and the entire flotilla is often taken in tow by the steam-launch. It is now the practice to allow an admiral a steam-barge; when that is not the case his barge is a large double-banked 32-foot boat, with twelve or fourteen oars. The gig is a light, narrow, single-banked boat, about 30 feet long, built for speed. In addition to the foregoing is the *barge*, a large flat-bottom boat for carrying freight; the racing *shell*, built of veneering or paper; the gondola, dory, wherry, skiff, the *Sam-pan* of China, etc.

For an exhaustive treatise on boats, their uses, and management, see *Luce's Seamanship* (New York, 1891). S. B. L.

Boatbill: the *Cancroma cochlearia*, a bird of the order *Grallatores* and of the heron family. It differs from the heron chiefly in the form of its bill, which is very broad, and somewhat similar in shape to a boat. The mandibles have been compared to the bowls of two spoons placed one upon the other. It is found in the tropical parts of South America, and feeds on fish.

Boat-fly, or **Water-boatman**: an aquatic insect of the genus *Notonecta* and order *Hemiptera* and sub-order *Heteroptera*. It derives its name from the form of the body, which resembles a boat, and is well adapted to movement in the water. The boat-flies have the remarkable peculiarity of always swimming on their backs. The *Notonecta glauca*, called water-boatmen, is common in Great Britain, and is about half an inch long. It can fly well, but seldom uses its wings.

Boating: See Rowing and Sculling.

Boat-racing: See Rowing and Sculling.

Boatswain, commonly pronounced by sailors bō'sn [*swain* here means lad, servant, and is a Scandin. loan-word, Icel. *sveinn*]: an officer on a ship of war who has charge of the sails, rigging, cables, anchors, and cordage. He must frequently examine the masts, yards, sails, and ropes, and report their condition. It is also his duty to summon the crew to their work, and to assist in the necessary business of the ship and in relieving the watch. In the performance of his duties he is assisted by a boatswain's mate.

Boatswain: a name applied to the tropic-birds (*Phaëthon*) and to the jagers (*Stercorarius*), in both cases in allusion to the elongated tail-feathers, resembling marline-spikes, "the emblem of the boatswain." See Tropic-bird and Jaeger.

Bobadilla, bō-baă-deel'yaă, Francisco, de: a governor of Hispaniola and knight of Calatrava; sent in 1500 by Ferdinand and Isabella with plenary powers to investigate the affairs of that colony. He immediately put Columbus, who was then governor, in irons, and sent him to Spain. Columbus was, however, well received at court and by the nation, and was sent back on his fourth voyage, arriving there on the day when Bobadilla started to return to Spain, for he had been recalled. Bobadilla's government had been very disorderly and unfortunate, and hardly had he left the port when his ship was lost in a hurricane, and he was drowned, June 29, 1502.

Bobbin: a cylindrical piece of wood, or a wooden roller, flanged at each end, used to hold yarn, which is wound on it, preparatory to warping, in the weaving of cloth. In throstle-spinning bobbins are an essential part of the machinery, as they receive the thread from the rollers. The number of bobbins used in the various branches of business is enormous. In the thread manufacture alone in Great Britain it is stated that 2,000,000 gross are used annually. Thread-bobbins are turned by a self-acting lathe, which turns out 100 gross in ten hours, a saving of sixteenfold as compared with hand-turning; the attendant has to feed the machine by dropping blocks into a hopper, from which they pass into the lathe, where they are finished.

Bobbinet' (i. e. *bobbin-net*): a sort of lace or net-fabric woven by machinery, and usually made of cotton. It is a fine and elegant textile fabric of a peculiar texture, which consists in the interlacing of a set of long threads, representing the warp in common weaving with a set of cross ones, in such a manner as to form a mesh texture. Bobbinet is made at Nottingham, England, and in France.

Bobcaygeon, bob-kay'jŭn: a post-village of Verulam township, Victoria co., Ontario, Canada; on an island in Sturgeon and Pigeon Lakes, 18 miles from Lindsay (see map of Ontario, ref. 3–E). The town is divided by a canal which, with its locks, cost $150,000. It has a large trade in lumber, and has daily lines of steamboats, except in winter. Pop. 1,000.

Bobolink, bob'ō-lingk', **Reedbird**, or **Ricebird** (*Dolichonyx oryzivorus*): a beautiful American migratory bird of the order *Passeres* and family *Icteridæ*. It passes the winter in the West Indies or in Southern lowlands. It comes northward early in spring, and arrives in May in the latitude of New York State, in which latitude it breeds. It builds its nest in meadows among the grass, and renders service to farmers by the destruction of insects and worms. In May

The bobolink.

and June the male is very musical, singing in the air with great volubility and hilarity, and rising and falling as if by a series of jerks. "He chants out," says Wilson, "such a jingling medley of short variable notes, uttered with such seeming confusion and rapidity, that it appears as if half a dozen birds of different kinds were singing all together." The summer plumage of the male is mostly black, variegated with white on the scapularies and tail-coverts, and yellow, which it exchanges in July or August for a plumage like that of the female. This is marked with several shades of brown or dull yellow. Its length is 7½ inches. About the end of June the birds cease to sing, become gregarious, and move in large flocks to the Middle States. They are called reedbirds in Pennsylvania, where many of them are shot for the table in autumn. In the latter part of autumn immense flocks of them attack the rice-crops of South Carolina, where they receive the name of ricebird. Many of them are kept in cages for their song, but they do not sing in autumn or winter.

Bobruisk, bō-broo-ĕesk': a town of Russia; on the Berezina; in the government of Minsk, and 110 miles S. E. of

Minsk; was formerly fortified (see map of Russia, ref. 8–C). It is connected by steamboat with the towns on the river. Pop. (1897) 34,820.

Bob-white (*Colinus virginianus*): a very common small game-bird of the U. S., belonging to the family *Tetraonidæ*, and hence allied to the European partridge. The species is usually known as quail in the Northern States and as partridge in the South. The name bob-white is given for its peculiar call. See QUAIL.

Boca del Rio: See BAGDAD.

Bocage, bō-kaa'zhăy, MANOEL MARIA BARBOSA, du: Portuguese poet; b. in Setubal, Sept. 15, 1765; gave his early youth to military service; in 1790 settled in Lisbon and associated himself with the poets of the so-called Nova Arcadia, with the name Elmano Sadino. In 1791 his *Rimas* won applause, and from this time on he produced continually, much of his work being purely occasional, but all having the traces of that poetic talent which made him the true forerunner of Almeida-Garrett and Castilho. In opinion he was an adherent of the Revolution, and in 1797 he was imprisoned for so-called atheistical and seditious utterances. The best edition of Bocage's works is that edited by Th. Braga (7 vols., Porto, 1876). See Th. Braga, *Vida de Bocage e sua epoca litteraria* (1876, *seq.*). D. Dec. 21, 1805.
A. R. MARSH.

Boca Tigris, bok'a-tee'gris (in Chinese, *Hu-mên* or *Humŭn*, i. e. mouth of the tiger): the entrance of the Canton river into the Outer Waters, or Lintin Bay, called also the *Bogue*. On A-nung-hoy Point, on S. Wang-tong and Tiger islands, are the remains of a number of forts and batteries called "Bogue forts," which guard the entrance to the river, and were stormed by the British in 1841 and 1857.

Boccaccio, bok-kaat'chō, GIOVANNI, or **Boccaccio da Certaldo**: celebrated Italian poet, novelist, and scholar; b. in Paris, 1313; the illegitimate son of an Italian merchant and a French mother. His father wished to make a merchant of him, and about 1330 he went as such to Naples. He wasted six years thus, as he used to say; then was permitted to study canon law, on which he wasted other six years. His call was to poetry and to learning. In Naples he felt the full force of two impulses which were to make him famous—the one, that of admiration for the ancients and longing to know their works; the other, that of imaginative creation. His importance to the world is in these two directions; he was, with Petrarch, a founder of humanistic studies and of modern classical learning; as poet and novelist he was one of the great creative influences of early modern literature. Before he left Naples he had carried far his studies in classical mythology, and he had besides written several works of importance in the Italian tongue. The immediate occasion for the latter was his passion for Maria, natural daughter of King Robert of Naples (the *Fiammetta* of his works). In her honor he wrote *Il Filocolo* (wrongly called *Filocopo*), a prose romance upon the story of Floire and Blanchefleur; also *Il Teseide*, used by Chaucer for his *Knight's Tale*, and probably the first important poem in *ottave rime*; *Il Filostrato*, the tale of Troilus and Griseida; *Il Ninfale Fiesolano*. In 1341 he left Naples for a time and went to Florence. There, under the melancholy of absence from his mistress, he wrote the *Ameto*, or in full *Il Ninfale d'Ameto*, in prose alternating with lyrics; *L'Amorosa Visione*, a dream in which the poet, led by his lady, sees the lovers and heroes of the past; the *Fiammetta*, a romance in prose. In 1344 he returned to Naples, and began writing those tales in prose which were afterward put into the mouths of Florentine ladies and gentlemen, and called the *Decamerone*. Most of these were probably written between 1344 and 1350. In 1349 or 1350 Boccaccio was called back to Florence by the death of his father, and was received with great distinction by the Florentines. In Florence probably, in 1354 or 1355, he wrote his *Corbaccio*, or *Labirinto d'amore*. The rest of his life, however, was devoted for the most part to classical studies. He eagerly admired Petrarch, and wished to imitate him. He longed to study Greek, and did actually take lessons of a Greek, Leonzio Pilato, who at his request translated Homer into bad Latin, so that Boccaccio probably first of moderns read that poet. He himself toiled laboriously at works of encyclopædic scholarship: *De Genealogia Deorum Libri XV.*; *De Montium, Silvarum, Lacuum, et Marium nominibus liber*: *De Casibus Virorum et Feminarum Illustrium libri IX.*; and *De Claris Mulieribus*. These works are now unreadable, but the impulse given by them to European scholarship was very great, and they were much drawn upon (especially the *De Casibus*) by later writers for their imaginative material. In 1373 the Florentines appointed Boccaccio to the new chair established by them for the exposition of Dante. He had already written a *Life of Dante*, and now he prepared a commentary upon a little more than sixteen cantos of the *Inferno*. In 1374, however, he went to Certaldo, the home of his father's family, to live, and there he died Dec. 21, 1375. The literature about Boccaccio is very extensive. The following works, however, will suffice, the more so since they contain further bibliographical information: M. Landau, *G. Boccaccio, sein Leben u. seine Werke* (1877); G. Koerting, *Boccaccio's Leben und Werke* (Leipzig, 1880); A. Hortis, *Studj sulle Opere Latine del Boccaccio* (Trieste, 1879); M. Landau, *Die Quellen d. Decamerone* (2d ed. Stuttgart, 1884); A. Bartoli, *I Precursori del Boccaccio e alcune delle sue Fonti* (Florence, 1876); G. Voigt, *Die Wiederbelebung des classischen Alterthums* (2d ed. 1880); A. Gaspary, *Geschichte der Italienischen Literatur* (vol. ii. 1888).
A. R. MARSH.

Bochart, bō'shaar', SAMUEL: Protestant Orientalist and theologian; b. at Rouen, France, May 30, 1599; studied Arabic, Chaldee, and Syriac under Erpenius at Leyden, and excelled in philology. He became in 1625 pastor of the Protestant church at Caen, where he remained forty-two years, and gained a high reputation as a preacher and writer. His most important works are a *Sacred Geography*, in Latin (Caen, 1646), and *Hierozoicon*, or an account of the animals mentioned in the Bible (London, 1663). D. at Caen, May 16, 1667. His *Geographia Sacra* displays great learning and sagacity. His complete works appeared Leyden, 1675, 2 vols.; 3d ed. 1712, 3 vols. See Étienne Morin, *De Vita et Scriptis S. Bocharti*, prefixed to edition of his works (1692); Edward H. Smith, *S. Bochart: Recherches sur la Vie de cet Auteur illustre* (1833).

Bochnia, bo*kh*'nĕĕ-a: a town of Austria; in Galicia: 23 miles by rail E. S. E. of Cracow (see map of Austria-Hungary, ref. 3–I). It has several churches. Here are mines of salt which yield about 15,000 tons annually. Pop. 9,000.

Bochold, bo*kh*'ōlt, or **Bocholt**: a town of Prussia; in Westphalia, on the Aa; 42 miles W. S. W. of Münster (see map of German Empire, ref. 4–D). It has a castle, and manufactures of silk fabrics, hosiery, and cotton stuffs. Pop. (1890) 13,034.

Bochum, bo*kh*'oom: a Prussian town in Westphalia; 31 miles by rail N. E. of Düsseldorf (see map of German Empire, ref. 4–C); has manufactures of woolens, paper-hangings, hardware, iron, and tobacco, and important mines of coal. Pop. (1880) 33,440; (1890) 47,618; (1895) 53,842.

Bockenheim, bok'en-hīm: a town in Prussia: province of Hesse-Nassau; 3 miles N. W. of Frankfort-on-the-Main (see map of German Empire, ref. 5–D). It has manufactures of ironware, jewelry, and pianos, and a large cattle-market. Pop. (1890) 18,675.

Böckh, bök, or **Boeckh**, PHILIPP AUGUST: philologist and classical antiquary; b. at Carlsruhe, Nov. 24, 1785; educated at Halle; became in 1809 professor in the University of Heidelberg, and obtained in 1810 the chair of Eloquence and Ancient (or Greek) Literature in the University of Berlin, where he taught for forty years or more. His lectures comprised archæology and the history of ancient literature, philosophy, politics, etc. Among his greatest works, which have formed an era in archæology and philology, are *The Political Economy of the Athenians* (2 vols., 1817), which Sir George Cornewall Lewis translated into English; *Investigations Concerning the Weights, Coins, and Measures of Antiquity* (Berlin, 1830); and *Records of the Maritime Affairs of Attica* (1840). He commenced in 1824 the great work called *Corpus Inscriptionum Græcarum* (4th vol., 1867), which he destined to comprise all existing Greek inscriptions, whether printed or not. D. Aug. 3, 1867. Cf. Bursian, *Gesch. d. class. Philol. in Deutschland*, pp. 687–705.

Bodenstedt, bō'den-stet, FRIEDRICH MARTIN, von: German poet and translator; b. in Peine, Hanover, Aug. 22, 1819; through residence in Moscow as tutor (1840, *seq.*) became an enthusiastic lover of Slavic literature. In 1844 he went to Tiflis, where he remained two years, devoting himself to the study of the peoples of the Caucasus and of Oriental languages. In 1848 his work *Die Völker des Kaukasus* showed the outcome of this study. In 1845 his translations

of poetic tales in the Little Russian dialect, *Die poetische Ukraine*, made some stir in Germany. In 1849 appeared his *Tausend und ein Tag im Orient*; in 1851 his most famous book, *Die Lieder des Mirza Schaffy*, which in 1887 had reached its 126th edition, and was widely translated in other countries. At first these poems were taken to be translations, but eventually it appeared that Mirza Schaffy had been the poet's friend and teacher in Tiflis, to whom the poems were simply dedicated out of grateful remembrance. From the year 1851 Bodenstedt has published incessantly both original works and translations from the Oriental tongues. His *Gesammelte Schriften* appeared 1865–69 in twelve volumes. Since 1869 have been published *Einkehr und Umschau* (1873); *Verschollenes und Neues* (1877); *Aus Morgenland und Abendland* (1882); *Neues Leben* (1866); *Sakuntala* (1888). In 1881 he traveled in the U. S., and in 1882 described what he had seen in his *Vom Atlantischen zum Stillen Ocean*. In 1855 he published a translation of the poems of Puschkin; in 1877 one of the poems of Hafiz; in 1881 one of Omar Khayyam. He also busied himself much with the Elizabethan period of English literature: *Shakspeare's Zeitgenossen u. ihre Werke*, in his *Charakteristiken u. Uebersetzungen* (3 vols., 1858–60); *Shakspeare's Sonnette* (4th ed. 1873); *Shakspeare's Frauencharaktere* (1874). More recently his *Erinnerungen aus meinem Leben* (2d ed. 1888) have excited great interest. D. in Wiesbaden, Apr. 19, 1892.

A. R. Marsh.

Bode, bō'de, Johann Ehlert: astronomer; b. at Hamburg, Jan. 19, 1747; d. in Berlin, Nov. 23, 1826. At the age of twenty-five he became astronomer of the Berlin Academy, a position which he held for more than fifty years. He shortly afterward commenced the celebrated ephemeris afterward known as the *Berliner Astronomisches Jahrbuch*, the publication of which he conducted for more than fifty years. He was the author of several astronomical works of a more or less popular character, but his name is best known from his announcement of the law which, before the discovery of Neptune, was supposed to govern the distances of the planets from the sun. (See Bode's Law.) It is found, however, that this law should really be ascribed to Titius, another German astronomer, who published it in 1766.

Simon Newcomb.

Bode's Law: an empirical formula which marks quite closely the relative distances of the planets, Neptune excepted, from the sun. See Asteroids.

The law may be thus exhibited: Under the names of the several planets in the order of their distance set the number 4. Then below this row of fours write in order the numbers 0, 3, 6, 12, 24, 48, and so on, the 0 falling under Mercury, the 3 under Venus, and so on. Adding the several columns thus obtained, we have the following result:

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
4	4	4	4	4	4	4	4	4
0	3	6	12	24	48	96	192	384
4	7	10	16	28	52	100	196	388

The numbers thus obtained correspond closely with the relative distances of the planets, except only in the case of Neptune. The real distances, calling the earth's distance 10, are as follows:

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
3·9	7·2	10	15	27·5	52	95	192	300

It will be seen that the distance of Neptune falls far short of that which Bode's law would assign to a trans-Uranian planet. It does not therefore express any general law of nature, and fails entirely in the cases of the satellites.

Bo'die: Mono co., Cal. (for location of county, see map of California, ref. 7–F). Here are the noted "Bodie" and "Standard" gold mines. Pop. (1880) 2,712; (1890) 595.

Bodin, bō'dăn', Jean: French political writer; b. in Angers in 1530. He published in 1576 a treatise on government entitled *De la République*, and in 1586 a Latin version of the same. He advocated a limited monarchy as the best form of government. In the latter part of his life he was an adherent of Henry IV. D. in Laon in 1596. His *Heptaplomeres de abditis rerum sublimium arcanis* is considered one of the most interesting books of that age.

Bodle'ian Library: the principal library of Oxford University; was founded by Sir Thomas Bodley (see below), who in 1597–98 offered to restore to its former use the old room which once had held a collection of books. He expended some £10,000 of his own money in the purchase of books on the Continent, and secured the co-operation of his numerous friends; and so as the idea of making the library worthy of the university found favor, the collection was already quite large when the building was thrown open to the public by James I., Nov. 8, 1603, who gave the library Bodley's name. Since 1610 it has been entitled to receive a copy of every book published in the United Kingdom. Private donors have added to its stores. It contains now 550,000 printed volumes and over 30,000 manuscripts. The building contains also art treasures—e. g. the Pomfret and Arundel marbles, the Hope collection of portraits (200,000 engravings), and is connected with the "Camera Bodleiana" or "Radcliffe," a circular structure where the more modern books are kept. The first catalogue was published in 1605. Bodley left a large amount of money for the endowment of the library. See W. D. Macray, *Annals of the Bodleian Library* (Oxford and New York, 1868; 2d ed. 1890).

Bod'ley, Sir Thomas: an English diplomatist; b. in Exeter, Mar. 2, 1544; graduated at Oxford in 1566. He was sent by Queen Elizabeth on diplomatic missions to France, Denmark, and Holland. He expended much money in collecting rare and valuable books, and endowed the great Bodleian Library (*q. v.*). D. in Oxford, Jan. 28, 1612.

Bodmer, bōt'mer, Johann Jakob: Swiss critic and poet; b. near Zurich, July 19, 1688. He founded in 1721, after the model of the *Spectator*, a literary journal called *Discurse der Maler*, which promoted a reform in German literature, and waged a literary war against Gottsched. A great admirer of English poetry and especially of Milton, he revolutionized literary criticism in Germany by æsthetic doctrines derived from his English models. His writings had great influence upon the rising generation of German poets like Klopstock and Wieland. He was also among the first who appreciated the poetry of the German *Minnesong*. Even Goethe paid homage to the old patriarch on one of his early visits to Switzerland. Among his numerous works (which lack originality) is the *Noachide* (1752). He was Professor of History at Zurich for fifty years. He translated *Paradise Lost* into German. D. in Zurich, Jan. 2, 1783. See Mörikofer, *Die schweiz. Lit. des 18 Jahrh.* (Leipzig, 1861); Servaes, *Die Poetik Gottscheds* (Strassburg, 1887); Braitmaier, *Geschichte der poet. Theorie*, etc. (Frauenfeld, 1889).

Revised by Julius Goebel.

Bod'min: a town of England; capital of Cornwall; 26 miles W. N. W. of Plymouth (see map of England, ref. 14–C). It consists chiefly of one long street in a valley between two hills; it was once an important place. It now contains a court-house, a jail, an ancient priory, and a grammar school founded by Queen Elizabeth, and is one of the stannary towns of Cornwall. Pop. (1891) 5,151.

Bodrum: See Budrún.

Bødtcher, böt'cher, Ludvig Adolf: Danish lyric poet; b. in Copenhagen, Apr. 22, 1793; d. there Oct. 1, 1874. Bødtcher wrote little, but his poetry, much of which is erotic, is remarkable for beauty of form and exquisite finish. See Gosse's *Northern Studies* (1879).

Body, George, D. D.: canon missioner of Durham; b. at Cheriton, Fitzpaine, Devonshire, Jan. 7, 1840; graduated at St. John's College, Cambridge, 1862; ordained 1863. Author of *The Life of Justification* (1870; 6th ed. 1884); *Life of Temptation* (1870; 7th ed. 1891); *Mission Tracts*; *The School of Calvary* (1890; 2d ed. 1891).

Body Color: in *painting*, color which is so mixed for application as to be thick and to form a coating upon the surface to be painted. The term is especially used in water color to distinguish color made opaque by the mixture with it of white, from transparent or translucent color, which merely stains the surface. See Water-color Painting.

Body's Island: the long, low, sandy strip of land between Roanoke and Albemarle Sounds and the Atlantic Ocean N. of Oregon inlet. Body's island lighthouse, 2 miles N. of Oregon inlet (lat. 35° 48′ 47″ N., lon. 75° 33′ 20″ W.), is a brick tower with a granite foundation and an iron top, 150 feet high, showing a first-order dioptric white fixed light, 156 feet above the sea. The island is here 2 miles wide, and is in Dare co., N. C.

Boece, bois, or **Boyce**, or **Boethius**, Hector: historian; b. at Dundee about 1465. He studied and graduated at the University of Paris, where he became in 1492 Professor of Philosophy. In 1498 he went to Aberdeen, where he became later principal of King's College. He was a friend of Erasmus. His chief work is a *History of Scotland* (in Latin, Paris, 1526; Eng. trans. reprinted Edinburgh, 1821), which is highly esteemed. D. in Aberdeen, 1536.

Bœhme'ria [from G. R. Böhmer, a German savant]: a genus of plants of the family *Urticaceæ*; formerly included in the genus *Urtica* (nettle). The fibers of several species of this genus are used to make ropes, twine, nets, and cloth. The beautiful fabric called China grass-cloth is made of the fibers of *Bœhmeria nivea*, a perennial herbaceous plant, with broad ovate leaves, without stings, cultivated by the Chinese, who call it *choo-ma*. It can be propagated by seeds, and thrives best in shade and moisture. It grows naturally in China, Sumatra, and Burma, and other parts of the East Indies. The Malays call it *ramie*. The cultivation of ramie has been tried in some of the Southern U. S., with decided success. Nepaul produces an important species, *Bœhmeria frutescens*, which grows from 6 to 8 feet high, the fiber of which is said to be equal to flax. The natives call it pooee, yenki, or kienki. This fiber also makes excellent paper, and will probably become an important commercial product. There is one native species in the U. S. See Ramie.

Boeo, Cape: See Cape Boeo.

Bœo'tia (in Gr. Βοιωτία): a country or state of ancient Greece; bounded N. by Locris, N. E. and E. by the Enbœan Channel, S. by Attica and Megaris, S. W. by the Corinthian Gulf, and W. by Phocis. Area, estimated at 1,100 sq. miles. It may be described as a hollow basin, inclosed, on the N. by Mt. Parnassus and the Opuntian Mountains, on the E. by a continuation of the Opuntian range, on the S. by Mt. Cithæron and Mt. Parnes, and on the W. by Mt. Helicon. The surface is diversified by other mountains and several valleys and plains. It contained a large lake named Copais (now Topolias) which had no outlet except subterranean channels in the limestone mountains. These channels, now called *Katabothra*, were not sufficient to carry off the water of the lake, which sometimes inundated the surrounding plain. To obviate this evil the ancient Bœotians constructed two tunnels through the rock. One of these tunnels was nearly 4 miles long, with twenty vertical shafts let down into it. These two great works are perhaps the most remarkable monuments of what is called the heroic age. The largest rivers of Bœotia were the Asopus and the Cephissus, the latter of which rises in Phocis and enters Lake Copais. The Asopus flowed eastward through the southern part, and entered the Euripus. Instead of the pure and transparent air of Attica, the air of Bœotia is rendered damp and heavy by vapors rising from lakes and marshes. The winters were very severe, and the snow sometimes lay on the mountains for many days. The soil, which is mostly a rich mould, was very fertile and produced in ancient times, as well as in the present, abundant crops of grain. The plain of the Copais is especially remarkable for its fertility. Bœotia was famous for meadow and pasture land, on which were raised the excellent horses of the Bœotian cavalry. The grape and other fruits flourished in this region. Among the other productions was the auletic or flute reed, which grew in the marshes of Lake Copais, and had an important influence on the development of Greek music.

The most remarkable tribes that inhabited Bœotia in the heroic age were the Minyæ, who lived at Orchomenus, and the Cadmeans, or Cadmeones, who lived at Thebes. At the commencement of the historical period the Minyans and other tribes had nearly disappeared, and the country was occupied by the Bœotians, who are supposed to have come from Thessaly. The principal cities formed a confederacy under the presidency of Thebes. Orchomenus was the second city in importance. Among the other towns were Coroneia, Haliartus, Thespiæ, Tanagra, Platæa, and Anthedon. The Bœotians were regarded as a dull, unintellectual people, and less refined and polished than most of the Hellenic tribes. Their natural dullness was ascribed to the dampness and ungenial quality of their climate. According to Cornelius Nepos, they paid more attention to the development of their physical powers than the cultivation of their minds. Yet this state produced a few great men—Epaminondas, Hesiod, Pindar, and Plutarch. See Forchhammer, *Hellenika* (1837); Leake, *Travels in Northern Greece* (1835); Klutz. *De Fœdere Bœotico* (1821); Mure, *Travels in Greece*. See also Attica.

Boerhaave, boor'haă-ve, Herman: Ph. D., M. D., F. R. S.; a Dutch physician; b. at Voorhout, near Leyden, Dec. 31, 1668. He studied the ancient languages and history at Leyden, where he took the degree of doctor of philosophy in 1689. He began the study of medicine in 1690, and graduated as M. D. at Harderwick in 1693, after which he practiced at Leyden. In 1701 he was appointed Lecturer on the Theory of Medicine in the University of Leyden, and adopted the method of Hippocrates. He afterward deviated from that method, and substituted mechanical and chemical hypotheses to explain diseases. He published in 1708 an excellent systematic work called *Medical Institutes* (Institutiones Medicæ in Usus annuæ Exercitationis Domesticos). He became in 1709 Professor of Medicine and Botany at Leyden, where he acquired great popularity as a teacher. Among his important works are *Aphorisms on the Diagnosis and Cure of Diseases* (Aphorismi de Cognoscendis et Curandis Morbis, 1709), which is a model for style and other merits, and *Elements of Chemistry* (1724), which some persons consider his capital work. His reputation extended to every part of Christendom, and patients came to consult him from every country of Europe. He received, it is said, a letter from a Chinese mandarin, addressed "To Boerhaave, physician in Europe." D. Sept. 23, 1738.

Boers, boorz [recent loan-word from Dutch, but closely connected with *boor* and Germ. *Bauer*, peasant]: the farmers in South Africa of Dutch descent. After the annexation of Cape Colony by Great Britain, troubles arose between the Government and the Boers, and in 1836 many of them left the colony and founded the Orange Free State and also the Transvaal Republic. In 1858 they gave themselves a constitution, and after a time the commonwealth was recognized. But in 1877 the Cape Government, fearing an outbreak which might lead to a general rising of the natives, took possession of and annexed the territory. In Dec., 1880, the Boers took up arms, but a treaty of peace ensued in 1881 under which British suzerainty was recognized as to foreign affairs. In 1884 this treaty was modified, and the suzerainty was practically given up by the British Government. The Boers are sturdy, independent, and mostly farmers; they use an antiquated Dutch and are little given to refinements. For South African War see Africa.

Boe'thius, or **Boetius**, Anicius Manlius Torquatus Severinus: Roman philosopher and statesman; b. in Rome, after 475 A. D. He was liberally educated; became a good Greek scholar; was chosen consul in 510, and gained the confidence of Theodoric, King of the Goths, who reigned at Rome, and appointed Boethius *magister officiorum* in his court. His political influence was exerted for the benefit of the country, but his probity and virtues provoked the enmity of powerful courtiers whose corrupt or oppressive conduct he had opposed. He was accused of treasonable designs, was confined in prison, and finally executed by the sword by order of Theodoric in 525 A. D. Whether he was a Christian or not is a matter of uncertainty. He was considered such in the Middle Ages, and the Bollandists gave him the position of a saint, and his works are included in Migne's edition of the Latin ecclesiastical writers (vols. lxiii., lxiv.). Several theological tracts are attributed to him, and were included in the Leyden edition (1671) of his *Consolation of Philosophy*. But there is a predominance of argument in favor of the opinion that he was not, in any proper sense, a Christian, and that the tract on the Trinity was from another hand, probably from a monk of the same name, although Peiper maintains that it was a work of the early years of Boethius. Boethius holds a place in the history of scholastic philosophy from the fact that a passage from his commentary on the *Isagoge* of Porphyry gave rise to the long-continued discussions between the Realists and the Nominalists. While he was in prison he wrote, partly in verse, *De Consolatione Philosophiæ* (On the Consolation of Philosophy), which is his greatest work, and was very popular in the Middle Ages. It was translated into Anglo-Saxon by Alfred the Great and into English by Chaucer. It contains no allusions to Christianity—a fact which can hardly be reconciled with the hypothesis of his being a Christian, considering the circumstances under which it was written. See Barberini, *Exposizione della Vita de Boezio* (1783); Dom Gervaise, *Histoire de Boëce* (1715); Heyne, *Censura Ingenii Boethii* (1806); *Life of Boethius*, prefixed to Ridpath's translation of the *De Consolatione Philosophiæ*

(1785), English translation in Bohn's Library; Rudolphus Peiper's edition of the *Consolatio* (Leipzig, 1871). The mathematical and musical treatises of Boethius have been edited by J. Friedlein (Leipzig, 1867).

Revised by W. T. Harris.

Boethius, Hector: See Boece.

Bœuf, Bayou, bī'oo-bef: a river or creek of Arkansas and Louisiana; fed by water which it receives from the Mississippi river during inundations. It extends from Chicot co., Ark., southwestward into Louisiana, and unites with the Washita river at the south extremity of Franklin parish. Steamboats can ascend it 100 miles or more during high water.

Bofarull y Broca, bō-faa'roo-lee-brō'kaă, Antonio: Spanish and Catalan historian and philologist; b. Dec. 4, 1821; director of the archives of Barcelona. He has been an ardent participator in the new Catalan literary movement, and has published many poems in the revived tongue under the pseudonym of *El Coblejador de Moncada*. He is best known, however, for his *Historia crítica civil y eclesiástica de Cataluña* (9 vols., 1876–78), and his *Historia crítica de la Guerra de la Independencia en Cataluña* (1886–87). Worth mentioning also is his *Estudios, sistema gramatical y crestomatia de la lengua catalana* (1864). A. R. Marsh.

Bog [Gael. *bog*, soft; in compos., bog]: a swamp or tract of wet land, covered in many cases with Peat (*q. v.*). Bogs, called mosses in Scotland and swamps in America, often contain the well-preserved trunks of trees, especially of the oak in Ireland, and of the cypress in America. In many cases these tracts are higher than the surrounding country, and may thus be easily drained, when they often become very fertile land. See Drainage.

Bog: River of Russia. See Bug.

Bogar'dus, Everard: second minister of New York (then New Amsterdam); b. in Holland; came to America in 1633, and obtained by marriage in 1638 with Annetje Jansen (or, as she is commonly called, Anneke Jans) a farm (the "Dominie's Bouwerie") of 62 acres, now owned by the Trinity church corporation, an estate in much litigation, but with the title confirmed to Trinity church. Having much trouble with the magistrates and people, he resigned in 1647, in answer to charges against him before the classis of Amsterdam, and sailed for Holland, but was wrecked on the English coast, and with Gov. Kieft and many others was drowned, Sept. 27, 1647.

Bogar'dus, James: b. at Catskill, N. Y., Mar. 14, 1800. In 1814 he was apprenticed to a watchmaker. He made important improvements in cotton-spinning in 1828; invented a gas-meter (1832); a machine for engraving (1836); a pyrometer, and many other mechanical improvements. In 1847 he built in New York the first iron building in the U. S. D. in New York city, Apr. 13, 1874.

Bo'gart, John: civil engineer; b. in Albany, N. Y., Feb. 8, 1836; educated at Albany Academy and at Rutgers College, N. J. During the civil war he was attached to the engineer corps. Later he had charge of the Brooklyn park system, designed the Albany park, the State grounds at Nashville, Tenn., and the improvements in New Orleans park. From 1870 to 1877 he was chief engineer of the department of parks of New York. From 1877 to 1890 he was secretary and librarian of the American Society of Civil Engineers. In 1888 he was elected State engineer of the State of New York, and held the office for four years. He is now consulting engineer of the Cataract Construction Company, engaged in developing the water-power of the Niagara river.

Bogatzky, bō-gaat'skee, Karl Heinrich, von: a German devotional writer and pietist; b. at Jankowe, Silesia, Sept. 7, 1690; studied at Jena and Halle; lived in literary retirement, on Franke's invitation, in the famous orphanage in the latter city from 1746 until his death, June 15, 1774. He wrote *The Golden Treasury* (orig. Breslau, 1718; 58th ed. Halle, 1885; Eng. trans. n. e. 1888). See his *Life*, by J. Kelly (London, 1889).

Bog-butter: a substance which is found in peaty earth in some of the bogs of Ireland. In composition and qualities it exhibits the general properties of a fat, and melts at 124° F. It is probably fossil butter.

Bogenhausen, bō'gen-how-zen: a village of Bavaria; on the Iser, 2 miles N. E. of Munich. Pop. 1,000. Here is the royal observatory of Munich, which was erected in 1817, and is one of the best in Europe; lat. 48° 8′ 54″ N., lon. 11° 36′ 22″ E.

Boggs, Charles Stuart: U. S. admiral; b. in New Brunswick, N. J., Jan. 28, 1811; entered the navy as a midshipman Nov. 1, 1826, became a passed midshipman in 1832, a lieutenant in 1837, a commander in 1855, a captain in 1862, a commodore in 1866, a rear-admiral in 1870, and retired from active service in 1873. He commanded the Varuna at the passage of Forts St. Philip and Jackson and capture of New Orleans. D. at New Brunswick, N. J., Apr. 22, 1888.

Bøgh, böch, Erik: Danish man of letters; b. Jan. 17, 1822. He is a popular poet and play-writer, but is most remarkable for his short stories and humorous sketches. Besides several volumes of plays, *Dramatiske Arbejder* (7 vols., 1858–71); *Udvalgte Dramatiske Arbejder* (1885 ff.); and of poems, he has published, among other works, *Syv Forelæsninger* (Seven Lectures, 1858); *Jonas Tværmoses Ærgrelser* (J. T.'s Troubles, 1864–75); *Udvalgte Fortællinger* (Selected Tales, 1876); *Billeder paa Vers og Prosa* (Pictures in Verse and Prose, 1891); and a series of feuilletons (1860, etc.) called *Dit og Dat* (Odds and Ends). G. L. Kittredge.

Boghead Coal: a highly bituminous variety of the cannel coal of Scotland; from Boghead, in Linlithgowshire. The varieties of cannel pass into shale by insensible gradations, so that it is impossible to draw a line which shall properly limit the use of the term coal. The boghead is one of these substances, more valuable for gas-making, and for the oils and paraffine obtained from it by distillation, than for fuel. Dr. Fife found a picked specimen to yield on analysis 70 per cent. of volatile matter and 30 per cent. of ash.

Bog Iron Ore: a mineral of variable composition, in which the peroxide of iron often amounts to 60 per cent., the water to 20, phosphoric acid from 2 to 11 per cent., while silica, clay, and other substances make up the rest. Bog iron ore occurs in alluvial soils, in bogs, lakes, etc. It is of a yellowish or blackish-brown color. Some varieties are earthly and friable; some are in masses of an earthy character, and some compact, with conchoidal fracture. It is abundant in the northern countries of Europe generally; also in various parts of the U. S.

Revised by C. Kirchhoff.

Boglipoor: same as Bhagalpur.

Bogomiles [so named from their leader, the Bulgarian priest *Bogomil*, middle of tenth century]: a dualistic-manichæanistic sect of Thrace, Macedonia, and Bulgaria, originating in the early part of the tenth century. It spread over Servia, Bosnia, Dalmatia, and Croatia. In the latter countries it was called Patarenes, but by itself the Bosnia Church, and had many adherents among the aristocracy. It survived persecution, but when the Turks overran the country (1463) its members almost to a man became Mohammedans. Its principal doctrines were the origin of evil in the declension from God, the good principal; docetic views of the person of Christ in that they affirmed that Christ saved men by his teaching; the rejection of the sacraments; and the use of images in worship, and all the Old Testament except the Psalms, and to the New Testament they added certain apocrypha.

Bo'gos: a Negro tribe; inhabiting the highlands N. of Tigré, Abyssinia; have become known by the explorations of Werner, Munzinger, and Th. Heuglin. The flora and the fauna of the country of the Bogos are exceedingly rich. Mighty sycamores and tamarind trees, and lions, elephants, buffaloes, and antelopes, as well as the rhinoceros and many varieties of beasts of prey, are found here. The total population is estimated by Munzinger at 10,000 persons, of whom only one-third are true Bogos, who speak the Belen language. The rest are tribes subject to them, who speak the Tigré. The Bogos are well formed, and profess Christianity, but have very little religious knowledge. For several years they have paid a small annual tribute to Abyssinia. The Bogos have suffered much from the invasions of the inhabitants of Barla.

Bogoslof, bō-gō-slōf': a small volcanic island of the Aleutian Archipelago; lat. 53° 58′ N., lon. 168° W. Previous to 1795 its site was occupied by a group of reefs and low rocks. In that year began a period of eruption resulting in a craggy peak about 450 feet high. In 1883 a broader peak of the same height, Grewinck, was thrown up from the sea at a distance of a mile, and the two were connected by a spit.

G. K. G.

Bogotá, bō-gō-taa′ (formerly Santa Fé de Bogotá): a city of South America; capital of the republic of Colombia; pleasantly situated on the San Francisco river, which here joins the Rio de Bogotá, and at the foot of two mountains (see map of South America, ref. 2–B). It is on an extensive plateau, which is about 8,700 feet above the level of the sea, and enjoys a mild and genial climate like a perpetual autumn. Lat. 4° 35′ 48″ N., lon. 74° 13′ 45″ W. The adjacent table-land is very fertile, and is inclosed on several sides by high peaks of the Andes. Bogotá is well built, but, as it is subject to earthquakes, the houses are generally only two stories high. No vehicles are used in the streets, which are all narrow. It is the seat of an archbishop, and contains a cathedral and numerous churches, a palace of the president, a university, a national academy, a public library, and a theater. It has several public squares adorned with fountains, and some very good institutions for higher education. Mines of coal, salt, and precious stones occur in the vicinity. A few miles below the city is the great Cataract of Tequendama, where the Bogotá river has a perpendicular fall of 475 feet. Bogotá was founded in 1537. It has several times suffered considerably from earthquakes. Pop. (1886) 120,000.

Bogra, bōg-raa′: a district of Bengal, British India; between lat. 24° 20′ and 25° 20′ N., and meridians 88° 56′ and 89° 49′ E.; on the right bank of the Brahmaputra river. Area, 1,498 sq. miles. Pop. 750,000, 80 per cent. of whom are Mohammedans and 19 per cent. Hindus. It is a level plain intersected with streams and dotted with jungles. It is nearly all cultivated; the eastern portion is low, subject to inundations, and yielding heavy crops of rice. The western portion is higher, and is also devoted to rice, but of a finer quality. Fishing is also an important industry. The climate is oppressive, except in winter. The annual rainfall is about 80 inches.

Bogue, David, D. D.: a Scottish preacher; called the founder of the London Missionary Society; b. in Hallydown, in Berwickshire, Feb. 18, 1750; educated at Edinburgh; after teaching he became pastor in Gosport to an Independent church; was the first editor of the *Evangelical Magazine*, and wrote an *Essay on the Divine Authority of the New Testament* (London, 1801). He was author, in conjunction with James Bennett, of a *History of Dissenters from 1689 to 1808* (1808–12, 4 vols.; 2d ed. 1833). He and others founded the London Missionary Society in 1795. Yale College gave him a D. D. in 1815. D. in Brighton, Oct. 25, 1825.

Bohe′mia (in Lat. *Bohemia*; Germ. *Böhmen* and *Böheim*): a former kingdom of Europe, now a part of Austria-Hungary. It is bounded N. by Saxony and Prussian Silesia, E. by Moravia and Prussia, S. by Lower Austria, and W. by Bavaria. It is between lat. 48° 33′ and 51° 3′ N., and between lon. 12° and 16° 46′ E. Its area is 20,060 sq. miles. It is inclosed on all sides by four chains of mountains, which constitute its natural boundaries—namely, the Erzgebirge (Ore Mountains), which separate it from Saxony on the N. and N. W.; the Riesengebirge (Giant Mountains), which extend along the N. E. frontier; the Moravian Mountains, which separate it from Moravia on the S. E.; and the Böhmerwald (Bohemian Forest), which extends along the S. W. border. The Schneekoppe, which is the highest peak of the Riesengebirge, rises 5,275 feet above the level of the sea. The surface of Bohemia is mostly undulating, and belongs to the basin of the Elbe, which rises in the northeast part. The other principal rivers are the Moldau, which rises in the Böhmerwald, flows northward, and enters the Elbe; and the Eger, which flows through the northwest part into the Elbe. The Moldau and Elbe are navigable for steamboats. The climate is healthy, and mild in the valleys or lowlands. The mean annual temperature at Prague is 49° F. The soil is generally fertile. The staple productions are rye, oats, barley, flax, and wheat. The grapevine is also extensively cultivated. Nearly one-third of the country is covered with forests. Large numbers of cattle and sheep are raised in some parts of the country. Bohemia is rich in minerals, which are found chiefly in the mountains. Among its mineral resources are copper, tin, iron, lead, cobalt, silver, nickel, zinc, arsenic, sulphur, coal, cinnabar, alum, and precious stones. Here are also quarries of marble, granite, and sandstone. Famous mineral springs occur at Marienbad, Carlsbad, and Töplitz. The manufactures of Bohemia are very important and varied, the principal products being linens, cotton goods, woolens, glass, and paper. The manufacture of damask, cambric, lawn, and other linen goods employs about 400,000 flax-spinners and 50,000 weavers. Over 500,000 spindles are employed in the production of cotton yarn. Beet-sugar is extensively manufactured. The number of paper-mills is over 120. Bohemia has long been celebrated for its glass-works, which employ about 30,000 persons. A considerable quantity of iron is manufactured here. Railways extend from Prague in several directions, connecting it with Dresden, the cities of Bavaria, and those of Moravia. The chief towns are Prague, Pilsen, and Budweis. Bohemia has one university (Prague), twenty-three gymnasia, as well as numerous Realschulen, and other institutions of learning. A large majority of the inhabitants belong to the Roman Catholic Church, that being the established religion, but other churches are tolerated. The number of Protestants in Bohemia in 1880 was 120,120. Pop. (1890) 5,843,094, of whom about three-fifths are Czechs, and two-fifths Germans.

Bohemia derives its name from the *Boii*, a Celtic people who settled here before the Christian era, and were expelled by the Marcomanni in the time of the Roman Emperor Augustus. It was conquered by the Cechi (or Czechs), a Slavic race, who first established themselves in Bohemia in the second half of the sixth century, and in 630 A. D. made themselves independent. For several centuries the family of the Przemyslides ruled with varying success until in 1310 the kings of the House of Luxemburg ascended the throne, and ruled until 1437. John Huss effected a religious reformation in this country (1400–14), and was burned by the Catholics. The consequence was the sixteen years' war of the Hussites. In 1526 Bohemia was annexed to the dominions of Ferdinand I. of Austria. The majority of the Bohemians in the sixteenth century were Protestants, who, for the assertion of their religious liberty, revolted against the Emperor of Austria, and in 1619 elected as their king Frederick, the elector palatine. He was defeated near Prague in 1620 by the Austrians, who then commenced a cruel persecution of the Protestants, and almost exterminated them. The population was reduced in twenty years (1617–37) from 3,000,000 to 780,000. In recent times the country has been agitated by a strong political antagonism between the Czechs and the Germans, the former demanding the re-establishment of a kingdom embracing Bohemia and Moravia, and enjoying the same autonomy in point of administration which has been conceded to Hungary. See Austria-Hungary. Revised by C. K. Adams.

Bohemian Brethren, or **Moravian Brethren**: the name of a sect of Christians. The followers of Huss (*q. v.*) were divided into Calixtines and Taborites; the former approached the doctrines of the Roman Church, but the latter rejected all the distinctive ones, but at first united with the Calixtines in opposing the invasion by the Roman Church. But later the Calixtines, through the Compactata of Basel (1433), made peace with the Church; and so the Taborites were defeated. Ruined as a political power, they still lived as a sect. Under the name of "The Brethren and Sisters of the Law of Christ" they put themselves under the leadership of Gregory, the nephew of Rokyzana, the great Calixtine chief, and lived in apostolic simplicity at Lititz, in Bohemia. Later they changed their name to "The Unity of the Brethren" (*Unitas Fratrum*). Briefly, they held to these views: The three orders of the ministry; diocesan synods for local affairs; association of all the bishops in a general council for general affairs; permission of marriage to the clergy; rejection of purgatory, Mariolatry, and saint-worship; acceptance of only two sacraments and of infant baptism; church discipline of the most rigorous character. They found many sympathizers and converts, but were persecuted by the Roman Church and their former brethren, the Calixtines. When the Protestant movement began they numbered in Bohemia and Moravia about 200,000. They corresponded with the Reformers, learned much from them, but did not coalesce. In 1549 persecution drove them in large numbers to Poland, where they flourished. In 1620 the fate of the Brethren was sealed at the battle of the White Mountain, and they well-nigh vanished. Many were killed, many became members of the Roman Church, and many joined either the Lutheran or the Reformed bodies. In 1656 the Polish branch was similarly destroyed and absolved; but in 1722 the remnants of the sect, which had secretly and very obscurely existed all these years, came together on the domain of Count Zinzendorf at Berthelsdorf, near Zittau, about 60 miles S. E. of Dresden, on the border between Saxony and Bohemia, and then arose the renewed Moravian Brethren (*q. v.*). See C. A.

Pescheck, *Reform and Anti-reform in Bohemia* (London, 1845, 2 vols.); A. Gindely, *Geschichte der Böhmischen Brüder* (Prag, 1857); E. De Schweinitz, *History of the Unitas Fratrum* (Bethlehem, Pa., 1885). SAMUEL MACAULEY JACKSON.

Bohemian Forest, or **Böhmerwald**, bō'mer-vält: a chain of mountains in Germany, which forms the boundary between Bohemia and Bavaria, and separates the basin of the Danube from that of the Elbe. It extends in a S. E. and N. W. direction, and is about 130 miles long. The rocks of which it is formed are granite and gneiss. The highest summits of this chain are the Aber, 4,848 feet, and the Rachelberg, 4,743 feet, above the level of the sea. A large portion of these mountains is covered with dense forests. A railway extending from Bavaria to Prague crosses this range through the valley of the Cham.

Bohemian Language: See SLAVIC LANGUAGES.

Bohemian Literature: See CZECH LITERATURE.

Bo'hemond (Lat. *Bohemun'dus*) **I.**: a famous leader of the first crusade; b. about 1056; son of Robert Guiscard, Duke of Apulia and Calabria. He joined the crusade with a large army in 1095, and took part in the capture of Antioch in 1098. He remained at Antioch while the other crusaders marched to Jerusalem, and he reigned there as Prince of Antioch. He waged war with varying success against the Greek Emperor Alexis, and married a daughter of Philip I. of France. D. in Italy in 1111.

Bohemond II: a son of the preceding; was a minor at his father's death. He became Prince of Antioch in 1126, and fought against the Saracens as an ally of Baldwin, King of Jerusalem. He was killed in battle in 1130.

Böhl, böl, EDUARD, Ph. D., D. D.: Professor of Reformed Dogmatics and Symbolics, and of Pedagogics, Philosophy of Religion, and Apologetics, in the Protestant faculty of Theology at Vienna, Austria; b. at Hamburg, Nov. 18, 1836; educated at the universities of Berlin, Halle, and Erlangen, taking his present position in 1864. He is the author of a large number of exegetical, critical, and theological works in Latin and German, and has contributed in English to American reviews and periodicals. His position is extremely conservative, especially in the line of deprecating all revision of existing creeds. W. J. BEECHER.

Bohlen, bō'len, PETER, van: German Orientalist; b. in Oldenburg, Mar. 9, 1796. He became Professor of Oriental Languages at Königsberg in 1826; published, besides other works, an able treatise on Indian antiquities entitled *Das alte Indien* (2 vols., 1830). D. Feb. 6, 1840. See his *Autobiography* (1841).

Bohlen Lectures, THE: a series of lectures established by John Bohlen, a layman of the Protestant Episcopal Church in the U. S. (d. Apr. 26, 1874), who bequeathed to trustees $100,000 to be distributed to religious charities in accordance with the testator's wishes. On June 2, 1875, the trustees paid over to "the rector, churchwardens, and vestrymen of the Church of the Holy Trinity, Philadelphia," a sum of money for certain designated purposes, out of which fund $10,000 was set apart for the endowment of *The John Bohlen Lectureship*, for the delivery and publication of at least 100 copies of two or more lectures on subjects within the terms of the will of the founder of the Bampton Lectures, "or on any other subject distinctively connected with or relating to the Christian religion." These lectures have been delivered as follows: Rev. Alexander H. Vinton, D. D., *Inaugural Series*; Bishop Fred. D. Huntington, *The Fitness of Christianity to Man*; Rev. Phillips Brooks, *The Influence of Jesus*; Rev. John S. Howson, Dean of Chester, England, *The Evidential Value of the Acts of the Apostles*; Bishop Thomas U. Dudley, of Kentucky, *The Church's Need*; Bishop Samuel S. Harris, of Michigan, *The Relation of Christianity to Civil Society*; Rev. Alexander V. G. Allen, Cambridge, Mass., *The Continuity of Christian Thought*; Rev. Joseph F. Garrison, *The American Prayer-book*; Bishop William Stevens Perry, of Iowa, *Constitutional History of the American Church*; Rev. W. R. Huntington, *The Peace of the Church*.
W. S. PERRY.

Böhler, bö'ler, PETER: a theologian and Moravian bishop; b. in Frankfort-on-the-Main, Dec. 31, 1712. He is recognized in Methodist history as having given a decisive impulse to Wesley's opinions and career. He removed to America in 1738, and in 1740 founded the town of Nazareth, Pa. D. in London, Apr. 27, 1775.

Böhm, böm, THEOBALD: musician; b. in Munich, Apr. 9, 1794; d. there, Nov. 25, 1881; noted for an improvement in the construction of the flute. The Böhm flute is more accurate and even in tone, and more easily fingered, than those formerly in use. He also introduced improvements in other instruments, and composed musical pieces.

Böhme, bö'me, or **Böhm**, böm, or **Behmen**, bay'men, JAKOB: German mystic; b. near Görlitz, in Upper Lusatia, in 1575. He learned the trade of a shoemaker, worked at his trade at Görlitz, and became a member of the Lutheran Church. He had a very fertile imagination and a remarkable faculty of intuition, and professed to be divinely inspired and illuminated. His first work was entitled *Aurora, or the Morning Redness* (about 1612). This was condemned by the ecclesiastical authorities of Görlitz. He published several other works, which were admired by some eminent men, but they appear visionary and unintelligible to the generality of persons. D. at Görlitz, Nov. 24, 1624. His works (10 vols., 1682) were translated into English (2 vols. 4to, 1864) by William Law, who was an admirer of Böhme. He was a religious genius of great depth, and can be understood only by people of strong religious feeling and some religious experience: to them he is as sublime as he is obscure to others. See La Motte-Fouqué, *Notice sur J. Boehm* (1831); Fechner, *Jakob Böhme, sein Leben und seine Schriften* (Görlitz, 1857); Geiss, *Jakob Böhme, der Deutsche Philosoph* (Leipzig, 1860); also Rhys Evans's translation of Martensen's *Jacob Boehme*. Revised by W. T. HARRIS.

Böhmerwald: See BOHEMIAN FOREST.

Böh'misch-Lei'pa: town of Bohemia; on the Polzen; 56 miles N. of Prague (see map of Austria-Hungary, ref. 3–D). It has a gymnasium, and manufactures of woolen and cotton cloths, glass, and hardware. Pop. (1890) 10,406.

Bohn, HENRY GEORGE: bookseller, of German extraction; b. in London, Jan. 4, 1796; promoted the popularization of good literature by publishing translations from ancient and modern languages; made several useful compilations, and wrote a *Handbook of Pottery*. D. at Twickenham, London, Aug. 24, 1884.

Bohras: See ISMAEELIAH.

Böhtlingk, böt'lingk, OTTO: Russian Orientalist of German extraction; b. at St. Petersburg, May 30, 1815. After studying at Bonn he returned to St. Petersburg in 1842, and was made a member of the Imperial Academy in 1845. At the age of twenty-five he published an edition of one of the most difficult books of all literature, the Sanskrit grammar of PANINI (*q. v.*). There followed the *Çakuntala* of KALIDASA (*q. v.*), text and translation (1842); *Sanskrit Chrestomathy* (1845); Vopadeva's *Grammar* (1847); Hemachandra's *Dictionary* (1847); a volume *On the Language of the Yakuts* (1851); a collection of over 7,600 Sanskrit proverbs (*Indische Sprüche*, 3 vols., 2d ed. 1870–73), with critically edited text and German translation. In 1852 he began with RUDOLF ROTH (*q. v.*) the publication of the Sanskrit-German dictionary of the Imperial Academy, a great seven-volume folio, which they brought to a successful completion after twenty-three years in 1875. This dictionary gives the historical development of the meanings of the words, and illustrates them by citations excerpted often from works existing at the time in manuscript only. It is the greatest single contribution to Indology that has ever been made, and also the most fundamental. In 1879 Böhtlingk began to publish alone a *Sanskrit Wörterbuch in kürzerer Fassung*, which is an abridgment of the first, but is also a supplement thereto. This he completed in seven folio volumes in Jan., 1889. In 1886–87 he published a new edition of Panini, with translation, etc.; in 1889 the *Chandogya Upanishad* and the *Brihad Aranyaka Upanishad*; and in 1890 Dandin's *Poetics*, all three works in text and translation. Besides the above he has published some other books and many minor treatises. He is remarkable for having left none of his great undertakings unfinished. He is a text-critic of the first rank. Every one of his works marks a distinct advance of science. C. R. LANMAN.

Bo'hun U'pas [Malay, poison-tree]: the *Antiaris toxicaria*, a tree of the Malay and Philippine archipelagoes, of the family *Artocarpaceæ*. Many grossly exaggerated reports of its fatal qualities have been published. Its poison appears to be of an acrid, not a narcotic, character. The stories of the upas valley in Java, where nothing can grow but the upas-tree, probably arose from the now well-ascertained fact that certain close mountain-ravines in that

island so abound in poisonous volcanic gases that no plant, not even the upas, can live there. Besides the above, another bohun upas, the *Strychnos tieute*, is found in that region. It abounds in strychnine, and is even more deadly than the other.

Boiardo, bō-yaar'dō, Matteo Maria: Count of Scandiano; Italian poet; b. at Scandiano about 1434. He was patronized by Borso and Ercole d'Este, and became governor of Módena in 1481. His chief work is the romantic chivalrous poem *Orlando Innamorato*, which he left unfinished, and which was published in 1495. After his death, Niccolò degli Agostini, a poor poet, continued it, publishing three additional books (1506–14–24). Boiardo treated his material in a somewhat burlesque and satirical style; but in 1541 Francesco Berni (*q. v.*) published his *Rifacimento* of the poem, in which, by means of exquisite polish and point, the satiric effect is greatly heightened. The *Rifacimento* was so popular that it nearly supplanted the original, the subject of which was also continued by Ariosto (*q. v.*) in his *Orlando Furioso*. Curiously enough a second *Rifacimento*, by Lodovico Domenichi (1545), later superseded that of Berni.

Bibliography.—A. Panizzi, *Boiardo, Orlando Innamorato*; *Ariosto, Orlando Furioso*, with an essay on the *Romantic Narrative Poetry of the Italians, Memoirs, and Notes* (9 vols., London, Pickering, 1830); J. Boghen, *Matteo Maria Boiardo e l'Orlando Innamorato* (Ferrara, 1879). D. in Reggio, Dec. 20, 1494. Revised by A. R. Marsh.

Boies, Horace: politician; b. on a farm near Aurora, Erie co., N. Y., Dec. 7, 1827; educated in the common school and academy of the county; studied law; member of New York Assembly 1858; removed to Waterloo, Ia., 1867; having been a Republican in politics, he left that party in 1883 on account of objections to its attitude on the tariff and prohibition, and became a leader of the Democratic party in that State. Elected Governor of Iowa 1889; re-elected 1891. Candidate of the Iowa delegation for the presidency in the National Democratic Convention at Chicago 1892.

C. H. Thurber.

Boi'i: an ancient Celtic people; emigrated across the Po and occupied Umbria, where they waged war for several centuries against the Romans. They were defeated by the Romans in 283 B. C., and became allies of Hannibal when he invaded Italy in 218 B. C. Many years later the Romans expelled them from Umbria and drove them beyond the Alps. A portion of the Boii migrated to the country on the north side of the Danube and founded the kingdom of Boiohemum (Bohemia), from which they were expelled by the Marcomanni in the time of Augustus. From them also Bavaria takes its name.

Boil (in Lat. *furunculus*): a hard, painful, inflammatory swelling on the surface of the body, which begins as a point of a dusky red color, and is hot, aching, and throbbing. These symptoms increase in severity for several days, when the swelling is of a conical form, with a broad, firm base, and has on the apex a whitish point, which contains a little matter; this opens, and after a few days more there is discharged a slough of cellular tissue, and the cavity left heals, leaving a depressed scar. Boils often attack young and plethoric persons, and their appearance is not incompatible with robust health, although they may be so numerous as to greatly reduce the strength. Men in training for athletic exercises, or others who have suddenly changed their habits, are subject to them. Sometimes boils continue to succeed each other for a length of time. The treatment of boils is simple. The intestinal canal should be cleared by laxative medicines and the digestive powers improved by tonics and antacids. The tincture of perchloride of iron is often a useful remedy. The skin should be kept healthy by frequent washing, while the inflamed point should be poulticed. Wet lint is a sufficient application after the core has been thrown off. Free incision of the boil greatly hastens its course.

Boïldieu, bō'ĕĕl'dyö', or **Boïeldieu**, bō'yĕĕl'dyö', Adrien François: a French composer; b. at Rouen, Dec. 15, 1775. He went to Russia in 1803, and was there appointed chapel-master to the Emperor Alexander; but he returned to Paris in 1811. Among his works are the operas *La Dame Blanche*, *Jean de Paris*, and *My Aunt Aurora*. D. Oct. 8, 1834. See Réfuveille, *Boieldieu, sa Vie et ses Œuvres* (1851).

Boileau, or, more fully, **Boileau-Despréaux**, Nicolas: poet and satirist; b. near Paris, Nov. 1, 1636. He was liberally educated, and followed no profession but that of an author. He began his literary career in 1660 or 1661 by composing a satire for recitation to his friends, among whom were Racine, Molière, and La Fontaine. This satire (subsequently cut in two, *Adieux d'un poète à Paris* and *Les Embarras de Paris*) was so successful that the young author composed others, five in number, between 1661 and 1665. In 1666, moved by a surreptitious publication of them in Holland, he issued them himself in a volume. Among his best works are the *Lutrin* (Reading-desk, 1674) and the *Art of Poetry* (L'Art Poétique, 1674), which is an exquisite performance, and is considered by some French critics as equal to Horace's *Art of Poetry*. Hardly less successful were the *Réflexions sur Longin* (1693), the outcome of the famous quarrels as to the relative merits of the ancients and the moderns, in which Perrault was Boileau's chief antagonist. The *Epîtres*, written at long intervals between 1669 and 1701, show us the poet maturer, calmer, but also colder than in the *Satires*. His extensive *Correspondance* with his friends is full of interesting material for the literary history of his time. Boileau was admitted into the French Academy in 1684. He had an immense influence on French literature, being for many years the literary legislator of France. He made war on the survivors of the tedious and pedantic school of Ronsard, upon the one hand, on the followers of Malherbe, now declining into Marinism and other puerilities, on the other. He laid down the following as the basis of all sound poetic doctrine:

> Aimez donc la raison; que toujours vos écrits
> Empruntent d'elle seule et leur lustre et leur prix.
> Rien n'est beau que le vrai, le vrai seul est aimable.

This doctrine, however, confirmed the French in a tendency already visible in them—the tendency to prose in preference to poetry. D. in Paris, Mar. 13, 1711. See D'Alembert, *Éloge de Boileau*; Desmaizeaux, *Vie de Boileau* (1712); Daunou, *Éloge de Boileau* (1787); L. S. Auger, *Éloge de Boileau-Despréaux* (1805); É. Deschanel, *Boileau et Charles Perrault* (1888). A. Ch. Gidel, *Œuvres complètes de Boileau* (with *Life*), 4 vols., Paris, 1870–73.

Revised by A. R. Marsh.

Boiler: See Steam-boiler.

Boiling-point: the temperature at which the elastic force of the vapor of any liquid is equal to the pressure of the atmosphere. When a vessel containing water is heated, the temperature rises and vapor silently passes off from the surface; but at 212° F. or 100° C. (the barometric column standing at 30 inches at the sea-level) steam begins to be formed in bubbles at the bottom, and rising through the liquid throws it into commotion. If the steam is allowed freely to escape, the temperature of the water rises no higher. The water is then said to *boil*, and the temperature at which it remains is its *boiling-point*. Every liquid has a boiling-point of its own.

TABLE OF BOILING-POINTS AT 76 CENTIMETERS PRESSURE.

LIQUID.	Degrees (centigrade).	Authority.
Nitrogen	−194·4	Olszewski.
Carbon monoxide	−190·0	"
Oxygen	−181·4	"
Methane	−164·0	"
Nitrogen dioxide	−153·6	"
Ethylene	−102·5	"
Nitrogen monoxide	−87·9	Regnault.
Carbonic acid	−78·2	"
Ammonia	−38·5	"
Chlorine	−33·6	"
Sulphur dioxide	−10·0	"
Ether	+34·9	"
Carbon disulphide	+46·2	"
Chloroform	+60·2	"
Alcohol	+78·3	"
Water	+100	"
Oil of turpentine	+159·1	"
Phosphorus	+287·3	Pisati.
Mercury	+357·25	Regnault.
Sulphur	+448·5	"

The boiling-point of liquids depends upon the pressure to which they are subjected. When the barometer stands at 30 inches, showing an atmospheric pressure of 15 lb. on the sq. inch, the boiling-point of water is 212° F. (100° C.). When part of the pressure is removed it boils before coming to 212°, and when the pressure is increased the boiling-point rises. Thus in elevated positions, where there is less air above the liquid to press on it, the boiling-point is lower than at the level of the sea. An elevation of 510 feet makes a diminution of 1° F.; at higher levels the difference of

elevation corresponding to a degree of temperature in the boiling-point increases, and a method is thus furnished of measuring the heights of mountains. At the city of Mexico, 7,471 feet above the sea, water boils at 198·1° F. (92·2° C.); at Quito, 9,541 feet, at 194° F. (90° C.); in the Himalayas, at the height of 18,000 feet, at 180° F. (82·2° C.). Boiling water is thus not always equally hot, and in elevated places many substances can not be cooked by boiling. Under the receiver of an air-pump water boils at lower and lower temperatures as the pressure diminishes, until at last, if proper precautions be taken to dispose of the vapor as rapidly as it appears, the liquid may be converted into ice by the cold due to its own evaporation. It will freeze while still in a state of violent ebullition.

This effect of diminished pressure is largely turned to account in sugar-boiling, in preparing extracts, in distilling vegetable oils, and in other processes where the substances are apt to be injured by high temperature. By increasing the pressure, on the other hand, water may be heated to any degree without boiling. Papin's digester is formed on this principle. Under a pressure of two atmospheres the boiling-point rises to 120° C. (248° F.), at three atmospheres to 180° C. (356° F.). See the articles HEAT, STEAM, and LIQUIDS; also Balfour Stewart's *Elementary Treatise on Heat*; Tait, *On Heat*; and Maxwell's *Theory of Heat*.

Revised by E. L. NICHOLS.

Bois d'Arc, popularly pronounced *bō'dock*; Fr. pron. bwăă'daark' (Fr., bow-wood): the Osage orange-tree (*Maclura aurantiaca* or *Toxylon pomiferum*, family *Artocarpaceæ*). It is often used for a hedge-plant. As a tree its timber is tough, elastic, and extremely useful. It is a near relative of the fustic-tree, and its wood yields a yellow dye. It was used by the Indians for making bows and arrows. For its use in hedge-fences, see OSAGE ORANGE.

Bois de Boulogne, bwăă'de-boo'lōñ': a grove or public park in the environs of Paris; on the right bank of the Seine, about 3 miles W. of the city. It is nearly 3 miles long and 1 mile wide. It was the finest promenade in the vicinity of Paris, but many of the trees were cut down and burned when that city was besieged by the Germans in 1870. It is during the afternoon the rendezvous of the elegant society of Paris, and in the height of the season presents a sight of unequaled splendor.

Bois-Duval, bwăă'dü-văăl', JEAN ALPHONSE: b. at Ticheville, department of Orne, France, June 17, 1801; studied medicine and natural history at Rouen and Paris, and did excellent service as a physician during the first invasion of cholera in 1835. He wrote several valuable works on botany and entomology: *Flore française* (1828, 3 vols.), in which the plants are arranged according to natural families; *Histoire des lépidoptères et des chenilles de l'Amérique septentrionale* (1829–47); *Les chenilles d'Europe* (1832, *et seq.*, 2 vols.); *Histoire de lépidoptères de la Californie* (1852), written in conjunction with M. A. Guenée; *Essai sur l'entomologie horticale* (1866); *Histoire naturelle des insectes* (1874). D. in Ticheville, Dec. 30, 1879.

Boise, JAMES ROBINSON, Ph. D., LL. D.: b. in Blandford, Hampden co., Mass., Jan. 27, 1815; graduated at Brown University in 1840; tutor of Latin and Greek in that college from 1840 to 1843, and Professor of Greek till 1850. From 1852 till 1868 he was Professor of Greek in the University of Michigan. Thereafter he filled the same position in the University of Chicago. D. in Chicago, Feb. 9, 1895. Prof. Boise published several classical text-books, among which are editions, with English notes, of Xenophon's *Anabasis* and the first six books of Homer's *Iliad*.

Boise, OTIS B.: musician; b. in Cleveland, O., in 1844; and very early showed great inclination toward music. Sent abroad by his father, he entered the Conservatory at Leipzig, remaining there three years, studying under Wenzel, Richter, and Hauptmann, and then went to Berlin, where he studied the piano under Kullak. After his return to the U. S. he busied his leisure hours in composing, and he completed *In Memoriam*, a motet on the *Thirteenth Psalm*, a large work for organ and orchestra, played in Trinity church, New York; a *Concertstück*, for piano and orchestra, performed by Hamerik's orchestra in Baltimore; a piano concerto in G minor; a festival overture, and a trio for violin, piano, and violoncello, etc. He has given up the musical profession and gone into business.

D. E. HERVEY.

Boisé City: capital of Idaho and of Ada co. (for location of county, see map of Idaho, ref. 9–A); in the southern portion of the State; on Union Pac. R. R. and on Boisé river, 50 miles above its confluence with the Snake, in the Great Snake river valley; lat. 43° 34″ N., lon. about 116° W. It is surrounded by a fine agricultural and grazing country, and derives large support from the rich placer and quartz mines in the mountain districts within 50 miles N., S., and E. The principal business houses are fire-proof brick. The city has a U. S. assay-office, a penitentiary, high school, and various mechanical industries. Two large ditches, bringing the water from Boisé river, give an abundance of water-power, and side ditches for irrigating purposes carry the water to every lot in the city. Pop. (1880) 1,899; (1890) 2,311; (1900) 5,957.

EDITOR OF "STATESMAN."

Boise River: See BIG WOOD RIVER.

Boisgobey, bwăă'go-bay', FORTUNÉ, du: French novelist; b. in Normandy, 1824; army paymaster in Algeria; began to write in 1868. Author of *L'Homme sans Nom* (1872); *L'As de Cœur* (1875); *Le Crime de l'Opéra* (1880); *Le Secret de Berthe* (1884). D. in Paris, Mar. 4, 1891.

Bois-le-duc, bwăă'le-dük (in Dutch *'S Hertogenbosch*, i. e. duke's wood): town of Holland; capital of North Brabant; at the junction of the rivers Aa and Dommel; 30 miles S. S. E. of Utrecht (see map of Holland and Belgium, ref. 7–F). It is a clean and well-built town, intersected by several canals and defended by a citadel and two forts. It has a fine cathedral, a college, an academy of art, an arsenal, and a grammar school in which the celebrated Erasmus studied. Here are manufactures of cutlery, ribbons, woolen goods, linen thread, etc. It was founded in 1184 by the Duke of Brabant in a wood while hunting; hence its name. Pop. (1891) 27,302.

Boisserée, bwăă'se-ray', SULPIZ: architect and antiquary of French extraction; b. at Cologne, Aug. 2, 1783. He devoted himself to the collection of specimens of early German art, in which he was aided by his brother Melchior (1786–1851). They collected about 200 pictures, which were purchased by the King of Bavaria, and are called the "Boisserean Collection." He published *Monuments of Architecture on the Lower Rhine from the Seventh to the Thirteenth Century* (1830–33), and *Views, Plans, and Details of the Cathedral of Cologne, etc.* (1823). D. in Bonn, May 2, 1841.

Boissier, bwăă'si-ay', MARIE LOUIS GASTON: French scholar; b. in Nîmes, Aug. 15, 1823; Professor of Latin Oratory in Collège de France 1861; elected a member of the French Academy June 8, 1876. Author of *Une étude sur Terentius Varron: Ciceron et ses Amis*; *La Religion Romaine d'Auguste aux Antonins*; and many papers in the *Revue des Deux Mondes* and the *Revue de l'Instruction Publique*.

Boissonade, bwăă'sō-năăd', JEAN FRANÇOIS: classical scholar; b. in Paris, Aug. 12, 1774. He became Professor of Greek in the University of Paris in 1812; admitted into the Academy of Inscriptions in 1813; became Professor of Greek in the Collège de France in 1828, which position he held until a few days before his death. He edited several Greek prose authors, and published *Sylloge Poetarum Græcorum* (24 vols., 1823–26). He acquired a high reputation as a Hellenist, and gave a powerful impulse to the study of classical literature. D. Sept. 8, 1857.

Boissy d'Anglas, bwăă'see' dăăn'glaa', FRANÇOIS ANTOINE, Count de: a French statesman; b. in Saint-Jean Chambre, Ardèche, Dec. 8, 1756. He became a moderate member of the States-General in 1789; of the Convention in 1792. He was a member of the Committee of Public Safety in 1794; chosen president of the Tribunate in 1802; created a senator and count by Napoleon in 1805, and a peer of France by Louis XVIII. He wrote several political essays and a *Life of Malesherbes* (1819). D. in Paris, Oct. 20, 1826.

Boito, bō-ee'tō, ARRIGO: poet and composer; b. in Padua, Italy, Feb. 24, 1842; early acquired a taste for poetry, music, and art; studied at the Milan Conservatory, and during this time composed several numbers of his opera *Mefistofele*, of which he wrote his own libretto. During the years which followed up to 1867 he busied himself with literature, and wrote poems and novels. In the Garibaldian insurrection Boito took part, and after it was over went to Paris to become a French journalist. In the meantime, however, he continued to work leisurely on his *Mefistofele*. The manager of La Scala, Milan, hearing of this, induced him to complete it, and announced it for production in the season of 1867–68, and the first performance took place

on Mar. 5, 1868. Although the performance lasted nearly six hours, the work was a success, though it aroused such a furious opposition that it was withdrawn. He revised and largely rewrote it, and the new version was produced on Oct. 4, 1875. He wrote the librettos of *Ero e Leandro* and *Nerone*, and composed the music, but not being satisfied with them gave the former to Bottesini, who composed and produced it, and locked the latter up in his desk. He has also composed and written another opera, *Orestiade*, which likewise he retains unproduced. He has written numerous librettos for other composers, including *Amleto* (Faccio), *Gioconda* (Ponchielli), *Alessandro Farnese* (Palumbo), *Tram* (Dominiceto), *Otello* and *Falstaff* (Verdi), besides translating several of Wagner's opera-texts into Italian. His poems, found in *Il Libro dei Versi*, are very highly praised. Since 1867 he has lived in Milan, and is one of Verdi's most cherished friends. He is a great admirer of Bach, Beethoven and Wagner. He married Erminia Borghi-Mamo, who sang in the 1875 production of *Mefistofele*.

D. E. Hervey.

Boivin, bwăă'văń', Marie Anne Victoire Gillain, M. D.: French midwife; b. Apr. 9, 1773; educated in a nunnery, and afterward studied the elements of medicine. She married in 1797, but was soon left a widow with one child. To gain a living she worked in the Maternité Hospital, in Paris, of which she became superintendent in 1801. The King of Prussia gave her the civil order of merit, and the University of Marburg the degree of M. D. She wrote valuable professional works. D. May 16, 1841.

Bojador, Cape: See Cape Bojador.

Bo'ker, George Henry: poet; b. in Philadelphia, Oct. 6, 1823; graduated at Princeton, N. J., in 1842. He published *The Lesson of Life and other Poems* (1847); *Calaynos*, a tragedy (1848), which was performed with great success in England; *Plays and Poems* (1856); *Poems of the War* (1864); *Königsmark* (1869); *Book of the Dead* (1882); and *Sonnets* (1886). He was minister to Turkey 1871–75, and to Russia 1875–79. D. in Philadelphia, Jan. 2, 1890.

Bokha'ra (Lat. *Bucharia*; anc. *Sogdiana* and *Transoxiana*): also called *Uzebekistan*; a Russian vassal state of Central Asia; N. of the upper Oxus river; between Russian Turkestan and Afghanistan, between the meridians 62° and 72° E. and parallels 37° and 41° N. Area, estimated at 92,254 sq. miles. The high mountain-range of Hindu Kush extends along the southern border of Bokhara, the east part of which is occupied by offsets from the Bolor Tagh, but the greater part of the country is level. This level tract resembles the dry steppes and sandy wastes of the basin of the Caspian. The largest rivers of Bokhara are the Amu (Oxus), the Jihun, and the Samarcand river, or Kohik. Along the banks of these rivers there is arable and fertile land, which is about one-tenth of the whole country. The climate is moderate. Gold is found in the sands of the Oxus, but Bokhara is deficient in metals and timber. Among the products of the soil are cotton, rice, wheat, barley, silk, tobacco, and abundant fruits. The inhabitants raise great numbers of camels, sheep, goats, and horses. They manufacture silk stuffs, firearms, cutlery, shagreen, gold and silver ornaments, sabers, etc. This country derives commercial advantage and importance from its position between Russia and the south of Asia. The population is composed of a mixture of races, who mostly profess the Mohammedan religion. Bokhara partly corresponds to the ancient *Bactria*. It was conquered by Jengis Khan in 1219. The Uzbegs became masters of it in 1505. In 1864 the Russians moved up the Syr-Darya, captured several important cities, together with the northern half of Bokhara, and formed the government of Turkestan. Between 1866–68 the Russians conquered the cities of Samarcand and Katty Kurgan, with the territory belonging to them. Since then Bokhara has become more and more dependent upon Russia. In 1870 Russia conquered Badakshan and gave it to Bokhara, and in 1873, owing to the victory of the Russians over Khiva, the Amu was made the boundary between Khiva and Bokhara. The Transcaspian railway to Samarcand now runs through Bokhara. Trade is rapidly passing into Russian hands. The Amir Sayid Abdul Ahad, b. in 1860 and educated in Russia, succeeded his father in 1885. He gave 100,000 roubles for the relief of the distress by famine in S. E. Russia in 1892. The capital is the city of Bokhara. The other chief towns are Karshi (pop. 25,000), Hissar (10,000). Total pop. estimated at 2,500,000.

References.—Burnes, *Travels in Bokhara* (1839); Vambéry, *History of Bokhara* (1873); Curzon, *Russia in Central Asia* (1889). Revised by M. W. Harrington.

Bokhara (i. e. treasury of sciences): a city of Central Asia; capital of Bokhara; situated on a plain near the river Sogd or Zerafshan; 138 miles W. S. W of Samarcand (see map of Asia, ref. 4–D). The streets are very narrow and ill paved, the houses are small, have flat roofs, and are built of sun-dried bricks. Bokhara is probably the most important commercial town of Central Asia, and has numerous extensive bazaars, in which nearly all kinds of goods can be procured. Among the articles exported from it are silks, cotton, wool, coarse chintzes, lapis-lazuli, and dried fruits. This city is said to have 360 mosques, some of which are beautiful structures. It has long been famous as a seat of Mohammedan learning, and is said to contain over 100 colleges, with about 10,000 students. Among the principal edifices is the palace of the khan, which is inclosed by a wall about 65 feet high. Bokhara was ruined by Jengis Khan in 1220, and was rebuilt at the end of his reign. It was pillaged again by his successors in 1273 and 1276. The railway station for the Transcaspian road is at New Bokhara, about 10 miles from the old city. Pop. 70,000 to 100,000.

Bokhara Languages: See Iranian Languages.

Bo'lan (bō-laan') **Pass**: a pass in the mountains of Baluchistan; is 50 miles long, and is on the route from Sind to Kandahar and Kelat. The highest part of the pass is 5,793 feet above the level of the sea. The average ascent is 90 feet in a mile. The Bolan river rises here. In 1839 a small British army with heavy artillery marched through this pass from Sind to Afghanistan.

Bo'las [Span., plur. of *bola*, ball]: a Spanish-American name for a missile used by the Indians of the South American plains, and borrowed from them by the gauchos. It consists of a pair of balls (formerly made of clay by the Indians, but now often of iron) fastened together by a thong of hide. The bolas are hurled with great precision at the ox, horse, guanaco, or ostrich, and, entangling the legs of the animal, detain it till it can be captured or killed. Sixty feet or more is a moderate range for the bolas, which are thrown from the saddle.

Bolbec': a town of France; department of Seine-Inférieure; on a small river of its own name; 20 miles by rail E. N. E. of Havre; on the railway which connects Paris with the latter place (see map of France, ref. 2–D). It is well built, and is adorned with fountains. Here are manufactures of cotton, linen, and woolen fabrics, and chemicals, and three annual fairs doing considerable business. Pop. (1891) 12,028.

Boldini, bōl-dee'nĕĕ, Giovanni: contemporary painter of genre and of portraits, who, though born at Ferrara, Italy, has long resided in Paris, and is identified with the French school. He is an artist of the rarest talent, and one of the most wonderful technicians in modern art. His pictures are generally of small size and of minute finish, but possess a breadth of handling that gives them extraordinary value in the eyes of artists and connoisseurs. His portraits are treated much more synthetically than his small pictures, and some of them, notably those painted in pastel, are remarkable for their elegance of aspect and beauty of style. His pictures are well known in the U. S., and two exquisite examples of his work, *Ladies of the First Empire* and *The Parisians*, are in the collection of Mrs. W. H. Vanderbilt, New York. He was awarded a medal of honor at the Paris Exposition, 1889. Studio in Paris. William A. Coffin.

Bole [from Lat. *bolus*, from Gr. *βῶλος*, clod]: a hydrous silicate of aluminium, classified by Dana as one of the varieties of halloysite (so called in honor of the Belgian geologist J. B. J. d'Omalius d'Halloy, 1783–1875). Dana's classification was made with some reserve, however, for he states that more investigation is needed before it can be definitely determined that bole is not a mere mixture. It is a soft, colored, unctuous, compact, claylike substance, occurring in amorphous masses, has a conchoidal fracture and a greasy luster, is highly absorbent, and carries more or less oxide of iron and about 24 per cent. of water. The iron gives it a brownish, yellowish, or reddish color. It is found in Armenia, Italy, Java, France, Scotland, Ireland, and Germany. Savage tribes in South America eat bole when starving. It was at one time used in medicine, and the Armenian bole has been employed in veterinary practice. Under the names of English red and Berlin red it is used in Germany as a pigment. French bole and

Lemnian bole are of a pale red color; Bohemian bole is reddish yellow; Silesian bole, pale yellow; and Blois bole is yellow.

Bolero, bō-lay′rō: a Spanish national dance; generally in the time of a minuet, and with a peculiar rhythm. It is accompanied with the music of the guitar and castanet, and with songs. The dancer seeks to represent by pantomime the successive symptoms and emotions of amorous affection, with its various moods of jealousy, despair, triumph, etc. Adopted by the ballet-masters, it made its tour all over the world.

Bole′tus [Lat., from Gr. βωλίτης]: a genus of fungi of the order *Hymenomyceteæ* and family *Polyporaceæ*. It comprises several species, which resemble the mushroom (*Agaricus*) in form, but instead of having gills the under side of the cap (*pileus*) is occupied by a layer (*hymenium*) quite distinct from the body of the pileus in substance, and pierced by pores, so as to be composed of numerous small tubes united together. *Boletus edulis* is used as food in France and Germany, where it grows on the ground in woods and mossy places. In moist, warm summers it is very abundant, and sometimes very large (a foot in diameter). The part which is eaten is the flesh of the cap, which is firm, white, and delicate. Several other species are edible.

Boleyn, bŏŏl′en, or **Bul′len**, Anne: Queen of England: b. in 1507; daughter of Sir Thomas Bullen, afterward Earl of Wiltshire. Her mother was a daughter of the Duke of Norfolk. She was educated at the French court, and became about 1525 one of the maids of honor to the English queen, Catherine. Henry VIII., attracted by her beauty, applied to the pope to obtain a divorce from Catherine, and married Anne privately early in 1533. She became the mother of the Princess Elizabeth in September of that year. She showed favor to the cause of the Reformation. Having been supplanted in the favor of the king, she was accused of criminal intercourse with several men, was condemned by a jury of peers, and beheaded in the Tower of London May 19, 1536. Some writers think that her crime was not proven. See Froude, *History of England*, vol. ii.; Miss Benger, *Memoirs of Anne Boleyn*; Miss Strickland, *Queens of England*.

Bolgrad, bōl-graad′: a town of Russia; on Lake Yalpukh; 30 miles N. of Ismail, and near the frontier between Russia and Roumania (see map of Russia, ref. 10–B). In 1856 it was ceded by Russia to Turkey, but in 1878 it was ceded to Russia. It is a station on the railway from Galatz to Koshinef, and has excellent professional schools. Pop. 9,000.

Boli, bō′lĕĕ: a town in Asiatic Turkey: in Kastamuni; 85 miles N. W. of Angora (see map of Turkey, ref. 4–F); inhabited by Turks and Armenians. The manufactures are gold ornaments and leather. Pop. about 10,000.

Bolingbroke, bol′ing-brŏŏk, Henry St. John, Viscount: author and statesman; b. at Battersea, England, Oct. 1, 1678. He was educated at Eton and Oxford, and was extremely dissipated in his youth. Having entered Parliament in 1701, he soon became a prominent orator of the Tory party, and was appointed Secretary of War in 1704. He lost this office when the Whigs obtained power in 1708, but he continued to be a favorite counselor of Queen Anne, who dismissed the Whigs in 1710, and placed Harley at the head of a ministry in which St. John was Secretary for Foreign Affairs. He received in 1712 the title of Viscount Bolingbroke, and in 1713 concluded the treaty of Utrecht, which ended a long war between England and France. He quarreled with Harley (Earl of Oxford), and supplanted him as prime minister in July, 1714. His ambitious hopes were blasted by the death of Queen Anne (Aug., 1714), which also frustrated his designs and schemes to restore the Stuart dynasty. He was attainted in 1715, but he had escaped to France, and entered the service of the Pretender as his prime minister. In 1724 he was permitted to return to England, but not to enter Parliament. He wrote for the *Craftsman* many articles against Walpole, and published, besides other works, a *Dissertation on Parties* (1739) and *Remarks on the History of England* (1743). D. at Battersea, Dec. 12, 1751. He was brilliant and versatile, but not profound. His collected works, which have little merit except style, were published by David Mallet in five volumes (London, 1754). See Goldsmith, *Life of Lord Bolingbroke*; G. W. Cooke, *Memoirs of Lord Bolingbroke* (London, 1835); J. C. Collins, *Bolingbroke, an Historical Study* (1886).

Bolintineann, Dimitrie: poet and journalist; b. at Bolintina, Wallachia, in 1826; educated at Bucharest; studied in Paris; edited in 1848 a revolutionary paper, and was banished by Prince Stirbey; settled once more in Paris, but returned home under Prince Cuza; edited another journal, and received a high governmental position after the *coup d'état*, May 2, 1864. A French translation by himself of some of his poems was published under the title *Brises d'Orient* (Paris, 1866). D. in Bucharest, Sept. 1, 1872. An edition of a part of his works (*Poesii*) appeared in 1877 in two volumes at Bucharest, with a preface by G. Sion.

Revised by E. S. Sheldon.

Bolivar: city; capital of Polk co., Mo. (for location of county, see map of Missouri, ref. 6–F); 110 miles S. W. of Jefferson City. It has a fine high-school building, a woolen-mill, cotton-gin, flouring-mill, and other manufactories. Pop. (1880) 516; (1890) 1,485; (1900) 1,869.

Bolivar, bol-i-vaar′: capital of Hardeman co., Tenn. (for location of county, see map of Tennessee, ref. 7–B); 1 mile S. of Hatchie river; 28 miles S. of Jackson, and 68 miles E. of Memphis; in an excellent cotton region, with fine water-power and plenty of timber. It has a foundry, steam saw and grist mill, four academies, and the West Tennessee Hospital of the Insane. Pop. (1880) 1,043; (1890) 1,100; (1900) 1,035. Editors of "Bulletin."

Bolivar, bō-lee′var: a colony of Venezuela: near to and E. of Caracas; in the state of Guzman Blanco. In 1881 it obtained independent political rights. Area, 8 sq. miles. Pop. (1890) 855.

Bolivar: a state of Venezuela, the northern boundary of which is formed by the rivers Orinoco and Apure from the Caroni river (lon. about 63° W.) to lon. 70° W. The eastern boundary is the river Caroni; on the S. are Brazilian Guiana and Alto Orinoco; on the W. the latter, with Colombia and Armisticio. The name has been applied to several different territories in Venezuela, but the present outlines were established in 1884. Area, 88,701 sq. miles. Pop. (1890) 60,097. M. W. H.

Bolivar, or **Ciudad** (thĕĕ-oo-daad′) **Bolivar** (formerly *Angostu′ra*): a town of Venezuela; largest in the state of Bolivar; on the right bank of the Orinoco; 240 miles from its mouth (see map of South America, ref. 1–D). It is situated near a pass or narrows of the river, hence the last name. It can be reached by vessels of 300 tons, and considerable trade is carried on here, chiefly in cocoa, sugar, cotton, jerked meat, hides, and a medicinal bark called angostura. Pop. 11,686. M. W. H.

Bolivar: a central-plateau province of Ecuador; perhaps the smallest of the sixteen provinces of the republic. Pop. 43,000.

Bolivar: one of nine departments of the South American republic of Colombia; bounded N. by the Caribbean Sea, E. by Magdalena and Santander, S. by Antioquia, and on the W. by Cauca. Area, 21,345 sq. miles. Besides the Magdalena, which flows along its entire west boundary, the only river of importance is the Cauca. The principal towns are Cartagena, the capital, and Mompos. Pop. 280,000.

Bolivar (Sp. pron. bō-lee′var), Simon, or **Bolivar y Ponte**, bō-lee′var-ĕĕ-pōn′taĕ: surnamed The Liberator; a South American patriot; b. at Caracas, July 25, 1783; inherited an ample fortune. He studied law at Madrid, and afterward joined the patriots who revolted against Spain in 1810. He served as an officer under Miranda in several battles. Having obtained the command of a separate army, he defeated the Spaniards and entered Caracas in triumph in Aug., 1813, soon after which he was appointed dictator. He was defeated and driven out of Venezuela in 1814, but again rallied to the standard of liberty near the end of 1816, and gained several victories over the Spanish general Morillo in 1817. In Feb., 1819, a congress was opened at Angostura, and Bolivar was chosen president. In Dec., 1819, Venezuela and New Granada were united to form the republic of Colombia, of which Bolivar was elected the first president. He gained a victory at Carabobo in June, 1821, and in 1822 led an army into Peru, which he liberated from the Spaniards. He became dictator of Peru in 1823, and made a tour through that country, in which he was received with triumphal demonstrations. In honor of him the southern part of Peru was named Bolivia, and erected in 1825 into a separate state, of which he became president for life. He was also re-elected president of Colombia in 1826. In 1829 Venezuela seceded from the republic of Co-

lombia, which was much disturbed by faction. D. in San Pedro, near Santa Martha, Dec. 17, 1830. See Ducoudray-Holstein, *Mémoires de S. Bolivar* (1829).

Bolivar Point is at the north side of the entrance to Galveston Bay, Tex.: in Chambers co.; lat. 29° 22′ 02″ N., lon. 94° 45′ 34″ W. It has an iron lighthouse 110 feet high, with a white fixed light 117 feet above the sea.

Boliv'ia (Sp. pron. bō-lee'vĕe-a): a central country of South America, between Brazil and Argentina on the N., E., and S., and Chili and Peru on the W.; extending from about lat. 8° to 23° 15′ S., and from lon. 57° 20′ to about 73° W. Area about 567,240 sq. miles. The Atacama region of the Pacific coast was ceded to Chili after the war of 1879. Pop. 2,019,549, besides wild Indians.

Topography.—Primarily, Bolivia is divided into the high or Andean region, occupying the southwestern half, and the lowlands of the east and north, which lie in the great depressions of the Paraguay and Madeira. The Andean portion, taken as a whole, is the highest region of its size in America, averaging 13,000 feet or more. It may be described as a table-land capped by mountain-chains, of which the principal are the Andes and the Eastern Cordillera, each with an average elevation of about 15,000 feet, and with peaks rising above 20,000 feet. The Andes skirt the western frontier; the Eastern Cordillera (called *Cordillera Real* toward the north) is roughly parallel to the Andes, and about 125 miles farther inland. The space between these ranges is occupied by two great elevated basins, separated by a cross range of mountains about lat. 19° 50′ S. The northern basin is that of Lake Titicaca and the Desaguadero river, and extends a little way into Peru. (See Titicaca.) The southern basin, partly in Argentina, is a little-known region of arid lands, salt marshes, and isolated mountains, called the *Desertos de Lipes.* The average height of these basins is not less than 12,000 feet. The highest mountains of Bolivia are in the *Cordillera Real* (Eastern Cordillera). The Nevado de Sorata, or Illampu, in that range, is an imposing mass, formerly supposed to be the highest in America, but recent estimates make it under 22,000 feet. The twin peak of Illimani, near it, is almost as high. Eastward from the Eastern Cordillera a great number of branches or spurs spread over the highlands, inclosing valleys which are the finest parts of Bolivia. As the mountains subside eastward a kind of terrace is reached which drops abruptly to the lowlands. This terrace and the outlying Llanos de los Chiquitos in Eastern Bolivia resemble the Brazilian table-land, and probably were once a part of it. The eastern lowlands include a portion of the Gran Chaco (see Gran Chaco), passing northward into plains which are partly covered with forest; some isolated low mountains are found here, and the region is hardly separated from the great Madeira depression of the north (see Paraguay River and Madeira), a vast expanse of damp tropical forests and plains which are very imperfectly explored. The forests extend for some distance up the eastern mountain-slopes and valleys; but except on this border the highlands of Bolivia are without forest growth.

Climate.—The lowlands are hot, with heavy rains, especially from October to April; there is a marked dry season only in the Paraguayan basin. Above these there is every gradation to the snow-limit, which in Bolivia is at about 15,000 feet. Five zones of climate are commonly distinguished: *Yunga*, the plains and valleys to 5,000 feet; *Valle*, or *Medio Yunga*, 5,000 to 9,000 feet; *Cabezera de Valle*, high valleys from 9,000 to 11,000 feet; *Puna* and *Puna brava* above, the latter cold and sterile. Some parts of the great elevated basins southward are almost rainless.

Lakes and Rivers.—Titicaca, on the borders of Peru, is the largest lake in South America, and the highest large body of water in the world; it discharges southward by the deep and rapid Desaguadero river, 150 miles long; this flows into the Aullagas lake or swamp, where it is lost. (See Titicaca.) The great rivers are in the lowlands, the Pileomayo flowing S. E. to the Paraguay, and the Mamore, Beni, and Madre de Dios northward to the Madeira; the headwaters of the Purús are in the northern forests of Bolivia, but the river has been explored only from the Amazon. The branches of the Madeira offer the most promising outlet for the future commerce of Bolivia.

Geology.—Very imperfectly known. Portions of the Eastern Cordillera and the Titicaca basin contain palæozoic rocks, and there are tertiary beds bordering the Gran Chaco. The Andes range is largely volcanic and several of the peaks are active. Earthquakes are frequent in the mountain regions, but there have been few severe ones.

Minerals.—In minerals Bolivia is probably the richest country in South America, and heretofore they have formed the chief product. Silver is the most important metal, still constituting two-thirds of the value of exports. The former output of the Potosi and Porcos mines would seem fabulous were it not well attested (see Potosi), but there is little doubt that it may be equaled or exceeded with proper management. There are rich mines of gold and copper; tin, lead, and mercury are extracted from some of the silver ores, and beds of coal and iron are known.

Plants.—The richest rubber region of the world is probably about the river plains of Northern Bolivia. The cinchona trees of the mountain-slope forests are said to be nearly exhausted; but the other forest riches of Bolivia are untouched. Coca grows wild on the highlands, but is also cultivated and exported; wheat is exported, principally from Cochabamba, and coffee-raising is growing in importance in the *medio yunga* region. The soil of Bolivia is everywhere rich except in the *puna-brava* zone, and almost any temperate or tropical plant can be grown in some part. Among crops raised for home consumption are mandioca, plantains, tropical fruits, and maize in the lower lands, and potatoes, quinoa, and barley in the *puna* zone.

Animals.—The lowlands have the usual forest and prairie animals of the neotropical region (see America, South), including tapirs, jaguars, pumas, ant-eaters, armadillos, sloths, American monkeys, ostriches, and a great variety of birds, insects, etc. Among the animals peculiar to the highlands are bears, condors, and the wild llamas called *guanacus* and vicuñas. Tame llamas are raised as beasts of burden, and alpacas for their fleece. Sheep and cattle raising is growing in importance.

Inhabitants.—Nearly all the civilized population is in the highlands, and three-fourths are pure Aymará Indians, speaking their own language and retaining some of their customs; they are nominally Catholics and form the best portion of the laboring class, besides being excellent soldiers. Spanish is spoken in the towns. The largest city is La Paz (40,000 inhabitants). Other towns are Suere or Chuquisaca, the capital (20,000), Cochabamba (20,000), Potosi (12,000), Santa Cruz (10,288), Oruro (10,000). The principal settlements of the lowland are mission villages of Indians, formed by the Jesuits, and now (1894) in a state of decadence. Large portions of these plains are unexplored, and peopled only by small tribes of wild Indians. The total number of these Indians probably does not exceed 150,000.

Government, etc.—The executive power is invested in a president, who is now elected for four years; Congress consists of a Senate and House of Representatives, chosen, like the president, by universal suffrage. There is a small standing army, and the national guard includes all able-bodied men. Primary education is free and obligatory, but there are few good schools: four universities are well patronized. The recognized religion is Roman Catholic, but other sects are tolerated. The public debt is about $5,000,000, and is said to be diminishing.

Railways, etc.—The great want of Bolivia has been good means of external communication, by which her magnificent resources can be made available. Attempts to use the natural highways of the northern rivers have failed through bad management or lack of capital, and trade is mainly through Chili and Peru to the Pacific. A railway from the Chilian port of Antofagasta is now (1893) completed to Oruro, 500 miles of the line being in Bolivia; it will be continued to La Paz, thus opening up the great elevated basins. Another railway runs from La Paz to Lake Titicaca, and many more are projected. Great improvements have been made in the common roads. The telegraph system is very incomplete, generally following the railways.

History.—Probably the oldest civilized empire in America existed in the Titicaca basin, but we know of it only by vague tradition and by the ruins at Tiahuanacu and other places. (See Incan Antiquities.) It appears to have been broken up about the eighth century; the Collas or so-called Aymarás remained in the Bolivian highlands and retained some civilization. They were subdued in the fourteenth century by the Incas of Cuzco. (See Incas.) After the Inca empire had been overturned by Francisco Pizarro, he sent his brother Hernando to annex this southern region (1538), and in 1559 it was formed into the *audiencia* of Charcas, or Upper Peru. It was governed by judges who

resided at Chuquisaca (the modern Sucre), and at first were subject to the Viceroy of Peru; but in 1776 Charcas was made a province of the new viceroyalty of Buenos Ayres. The rich silver mines gave this region a special importance with Spain; but here as elsewhere the colonists, and especially the Indians, had much cause for discontent. A revolt in 1809 was speedily crushed, and patriot invading armies from Buenos Ayres (1811–1815) and from Peru (1821) were repulsed by the Spaniards. Thus Charcas was the last region in South America to be freed from Spanish troops. This was effected after the great victory of Ayacucho in Peru; early in 1825 Bolivar sent Sucre into Charcas, and the remaining Spaniards were speedily subdued; Bolivar himself followed a little later, formed or approved a constitution, and the same year the old province of Charcas was declared an independent country, taking the name of Bolivia in honor of its founder. Sucre, the first president, was obliged to resign in Sept., 1828. His successor, Marshal Andres Santa Cruz, interfered in the affairs of Peru (1835), and in 1836 a federal republic was formed, consisting of three states, North Peru, South Peru, and Bolivia, each governed by a president and Congress, with Santa Cruz as supreme protector. Malcontents from Peru, aided by an invading army from Chili, overthrew Santa Cruz in 1839, and the confederation was dissolved. In 1841 Gamana, president of Peru, made war on Bolivia, but was defeated and killed at the battle of Yngavi (Nov. 20, 1841), and peace was made next year. After 1845 most of the presidents were military adventurers who held their places by force of revolutions; but there were exceptions, as Dr. Linares, elected in 1858, and Col. Adolfo Ballivian, whose election in 1873 promised to put a stop to the disorders, but who died shortly after. Chili declared war on Bolivia in 1879 to uphold her seizure of the nitrate regions of Atacama; Bolivia and her ally, Peru, were beaten in the war, and Atacama was given up, leaving Bolivia without a seacoast. During this war the president of Bolivia, Gen. Hilarion Daza, was deposed by his own troops on account of cowardice, and was succeeded by Campero. Since the war Bolivia has been quiet, and the period of military revolutions seems to be past; but lack of external communications has retarded the natural development of the country.

(Paris, 1851); Mathews, *Up the Amazon and Madeira Rivers* (London, 1879); Wappaus, *Mittel und Sud Amerika* (1871); the works of Aramago, Cortes, and Von Tschudi; Markham, *The War between Peru and Chili* (London, 1883). There is a good map in Markham's *History of Peru* (Chicago, 1892), and reports by Minister Anderson on the Bolivian gold and silver mines may be found in *U. S. Consular Reports*, Feb. and Mar., 1892.

Herbert H. Smith.

Bolivian Literature: See Spanish-American Literature.

Bolkhoff, bol-*k*hoff′: a town of Russia: government of Orel; on the Nugra; 30 miles N. of Orel (see map of Russia, ref. 8–D). It is built mostly of wood, and has about twenty churches; also manufactures of gloves, hoisery, hats, and leather. Hemp, hides, oils, and tallow are exported. Pop. (1883) 26,395.

Bol'landists: certain Jesuits who compiled, and are compiling, a voluminous work called *Acta Sanctorum*, or *Lives of the Saints* (53 vols., 1643–1794). They derived their name from John Bollandus. (See Bollandus.) After his death the work was continued by a number of men, among whom were Daniel Papebroek, Conrad Janning, P. van den Bosche, Suyskens, and Hubens. In 1837 a new Bollandist association was formed by the Jesuits in Belgium, who have continued the work of publication. The sixty-first volume, published in 1887, comes down to the saints of Nov. 3. The earlier volumes were reprinted in Paris 1863–83. See L. P. Gachard, *Mémoire historique sur les Bollandistes* (Ghent, 1835).

Bollan'dus, or **Bol'land**, John: a Flemish Jesuit; b. in Julemont, near Liège, Belgium, Aug. 13, 1596. In conjunc- with Godfrey Henschen, he published in 1643–58 five volumes of the *Acta Sanctorum*. D. in Antwerp, Sept. 12, 1665. See Bollandists.

Bol'ler, Alfred Pancoast, A. M., C. E.: civil engineer; b. in Philadelphia, Pa., Feb. 23, 1840; graduated at University of Pennsylvania in 1858, and from Rensselaer Polytechnic Institute, Troy, N. Y., in 1861. He has been engaged in many railroad and bridge constructions as chief and consulting engineer, among which are the Hudson River R. R.; West Side and Yonkers R. R.; Manhattan Elevated R. R.; the Arthur Kill bridge, Staten Island; the Thames River bridge at New London, Conn.; and the department of public works, New York city. He is the author of *Iron Highway Bridges* (1876) and *Report on Thames River Bridge* (1890). See Bridges.

Bologna, bō-lōn′yaă: a province of Emilia, Italy; was previous to 1860 a legation, that is, was ruled by a cardinal. It is bounded N. by Ferrara, E. by Ravenna, S. by Florence, and W. by Módena; area, 1,392 sq. miles. The southern part is mountainous; the soil is mostly very fertile. Among the staple products are silk, wine, grain, olive oil, hemp, flax, and rice. Pop. (1890) 482,219. Capital, Bologna.

Bologna (anc. *Felsina* and *Bononia*): a famous city of Italy; capital of province of same name; situated in a fertile plain near the northern foot of the Apennines; 23 miles by rail S. E. of Modena and 83 miles by rail N. of Florence; lat. 44° 30′ N., lon. 11° 21′ E. (see map of Italy, ref. 4–D). Several railways extend from this point to Ferrara, Ancona, Modena, and Florence; that which connects it with Florence crosses the Apennines by numerous tunnels. Bologna is a handsome city with well-paved streets, lined with rich and varied colonnades, which afford shelter from the rain and sun, and it is adorned with many beautiful churches and fine palaces of the nobility, richly furnished with paintings of the old masters. Among the remarkable edifices are the Palazzo del Podestà; the Palazzo Maggiore del Publico; the leaning tower of Asinelli, built about 1110, and 256 feet high; the cathedral, rich in works of art; the Church of San Stefano, one of the oldest in Italy, and containing Greek frescoes of the twelfth century; the Church of San Petronio, a noble specimen of the Italian Gothic style, adorned with many masterpieces of painters and sculptors; and the Church of San Domenico, in which may be seen sculptures by Michael Angelo and paintings by Guido, L. Caracci, and Colonna. The number of churches in Bologna is about seventy-four.

Bologna is one of the great centers of learning in Italy. Its university, said to have been founded as early as 425, is the oldest in the peninsula. This school attained great celebrity, and was attended by thousands of students from all parts of Europe. The number of its students about the year 1260 is said to have amounted to 10,000. Several women have occupied chairs as professors in this institution. The library of the university has about 160,000 volumes and 1,000 valuable MSS. Bologna has an academy of fine arts and several theaters. Here are important manufactures of silk goods, velvet, crape, chemicals, paper, musical instruments, and sausages. This city was the native place of many eminent painters, including Albano, the three Caracci, and Guido; also of Pope Benedict XIV., Galvani, and Malpighi. A town called *Felsina*, founded here by the Etruscans, was perhaps as ancient as the city of Rome. The Romans, who obtained possession of it in 189 B. C., changed its name to *Bononia*. It was taken by Charlemagne in 800 A. D., and was the capital of the most powerful Italian republic from 1118 to 1274. It was annexed to the Papal States in 1514, and to the new kingdom of Italy in 1859. Pop. 120,000 (147,000 in the commune in 1891).

Bologna, Giovanni: sculptor; b. in Douai, 1524. His real name was Jean Boulogne, afterward Italianized. The equestrian statue of *Cosimo I.*; the well-known group the *Rape of the Sabines*, in the Loggia dei Lanzi; and the *Flying Mercury*, so called, in the Uffizi Museum, all in Florence, are among his more important works. D. in Florence in 1608.

Bologna Stone: a radiated, globular variety of barite or heavy spar, sulphate of baryta, found in a bed of clay in Mt. Paterno, near Bologna, Italy. In 1602 a shoemaker, V. Casciorolus, noticed that it possessed the property of becoming phosphorescent when heated with charcoal. It is also known as Bolognian or Bononian phosphorus.

Bolom'eter [from Gr. βολή, stroke, ray + μέτρον, measure]: an instrument for the measurement of radiant energy by means of the change in electrical resistance of a

metallic strip or wire. It is one of the most delicate instruments used in actinometry. The strip, which should be of very small mass, is exposed to the rays to be measured. It forms one arm of a Wheatstone's bridge, the balance of which is determined by a galvanometer of great sensitiveness. The metal employed is usually iron or platinum. By means of this instrument in the hands of its inventor, Prof. S. P. Langley, heat-measurements previously considered to be entirely below the range of direct experiment have been made. The most striking instances are the determination of the heat of the moon's direct and reflected rays and the exploration of the spectrum of the light of the Cuban firefly. Prof. Knut Angstrom, of Upsala, with a similar instrument has determined the radiant efficiency of such feeble sources of illumination as the electric glow in vacuum tubes, while Prof. B. W. Snow has explored the bright line spectra in various metals, and of the voltaic arc. See WHEATSTONE'S BRIDGE, ELECTRIC DISCHARGE, GALVANOMETER, and HEAT; also the *Proceedings American Academy of Arts and Sciences*, vol. xvi. (1881); *Professional Papers of the Signal Service, No. 15* (Washington, 1883); *Transactions of Academy of Sciences of Upsala* (Sweden, 1892), or *Physical Review* (vol. i., 1893). E. L. NICHOLS.

Bolsena, bol-say'năa (anc. *Volsinii* or *Volsinium*): a town of Italy: on the north shore of Lake Bolsena; about 20 miles N. N. W. of Viterbo (see map of Italy, ref. 5–D). It is now a small and mean village, but in ancient times it was an important Etruscan city and the capital of the Volsci. It was taken and destroyed in 280 B. C. by the Romans, who built here another city. This was the native place of Sejanus. Pop. 3,000. The lake was celebrated in the Middle Ages for its eels. Pope Leo X. was accustomed to visit the island in this lake, on which ruins of beautiful castles, built by the Farnese, are still visible.

Bolt: a dart or pointed shaft, a thunderbolt; also a cylindrical metal pin. Iron bolts are often used to fasten doors and protect houses against robbers. Metallic bolts, with a head at one end and a screw-thread and nut at the other, are used, in building ships and houses, to bind together timber or masonry. Bolts in ship-building are usually either iron or copper, and are of various forms and sizes, some being many feet long.

Bolton, HENRY CARRINGTON: See the Appendix.

Bol'ton-le-Moors': an important manufacturing town of Lancashire, England; on the Croal; 11 miles by rail N. W. of Manchester (see map of England, ref. 7–G). Several railways extend from this place to Liverpool, Manchester, and Blackburn. Bolton returns two members to Parliament. It is one of the principal seats of the cotton manufacture, and is the birthplace of the inventors Arkwright and Crompton. The chief products of its manufactories are muslins, fine calicoes, counterpanes, dimities, cotton shawls, and fustians. Here are also paper-mills, foundries, and machine-shops. Numerous coal mines are worked in the parish of Bolton. The manufacture of cotton and wool was introduced into this place by the Flemings about 1337. Pop. (1881) 105,422; (1891) 146,487; (1901) 168,025.

Bolus [Lat. *bolus*, from Gr. *βῶλος*, clod]: a dose of medicine given in a mass larger than a pill, yet small enough to be swallowed. The bolus is now seldom used.

Bolzano, bōl-zaa'nō, BERNHARD: b. in Prague, Oct. 5, 1781; d. there Dec. 18, 1848; studied theology and philosophy; took holy orders, and was in 1805 appointed professor in the university of his native city. Somewhat influenced by Hermes, he tried, like him, to represent the dogmas of the Roman Catholic Church as a complete and consistent system perfectly in harmony with human reason. He made a great impression on the students; but the curia suspected him, and, though protected by his archbishop, he was in 1820 deposed, and even suspended from his priestly functions. His principal work is *Wissenschaftslehre* (Sulzbach, 1837), besides a number of minor essays on mathematical subjects.

Bo'ma: capital of the CONGO FREE STATE (*q. v.*); on the right bank of the Congo river; has considerable trade (see map of Africa, ref. 6–D).

Bomarsund, bō'mar-soond: a fortress of Russia; on the southeast side of the island of Aland, which forms one of the principal links in that chain of fortifications which guard St. Petersburg from the sea side, and may be called an outwork of Cronstadt; lat. 60° 12′ 40″ N., lon. 20° 15′ E. This important fortress was taken by the allied English and French fleets in Aug., 1854, and was afterward blown up by the allies.

Bomb, bom or bŭm, or **Bomb'shell** [viâ Fr. and Span. from Lat. *bombus*, Gr. *βόμβος*, a humming, buzzing]: a kind of shell; a hollow ball of cast iron which, filled with powder or other explosive substance, is discharged from a mortar or heavy ordnance, and explodes when it strikes the ground or before it falls. The powder in it is usually exploded by a fuse or hollow tube filled with a slow-burning compound, which is ignited by the discharge of the mortar. The largest bomb in ordinary use is 13 inches in diameter, weighs about 195 lb., and is charged with 7 or 8 lb. of powder. Bombs are thrown at angles varying from twenty to forty-five degrees. See MORTAR.

Bom'ba: a surname or nickname given to Ferdinand II., King of the Two Sicilies, in consequence of his cruel bombardment of Messina, Sept. 2–7, 1848.

Bom'bard: a name applied during the Middle Ages to a war-engine resembling the ballista. After the invention of gunpowder the name was applied to all kinds of firearms; but at the beginning of the fifteenth century it was restricted to short pieces of large caliber, firing stone projectiles.

Bombard'ment: the firing from mortars of *bombs* (that is, shells or incendiary projectiles) into a fortress or place to compel, or aid in compelling, its surrender. "Bombardments," says Bardin (*Dict. de l'Armée*), "are an impolitic and barbarous means, since it attacks non-combatants, and is rather a warfare against the inhabitants than against the armed defenders, exasperating the people and *nationalizing* the strife." Among recorded bombardments may be mentioned that of Genoa in 1684; of Tripoli in 1685, 1728, and 1747; Barcelona, 1691. Brussels was bombarded in 1694 by Louis XIV. ("3,000 bombs and three times as many red-hot shot" were thrown in); Prague was bombarded in 1759; Breda, Lille, Lyons, Maestricht, Mayence, in 1793; and Menin, Valenciennes, Le Quesnoy, Ostende, Nieuwpoort, and Lécluse in 1794. Some resisted—as Lille and Mayence—others succumbed. That of Lille is most noted, this small place being subjected for 140 hours (six days and nights) to the fire of 12 mortars and 24 cannons. During the siege in 1832 of Antwerp 31,689 shells were thrown into the citadel without material effect in accelerating the surrender. Glogau, Breslau, and Schweidnitz were bombarded by the French in 1806 and 1807. During the long two years' blockade, 1809–10, of Cadiz, by the French under Marshal Victor it was found impossible to reach the city from the lines with shells from ordinary mortars: long bronze howitzers of 10 inches caliber were cast at Seville (one of which is now to be seen as a trophy (see Fig. 1) in St. James's Park near the Horse Guards, London), and called *à la Villantroys*, from the French colonel of artillery who had proposed them. These, elevated 45 degrees, threw their projectiles 5,000 meters (3 miles) into the heart of the city; but to attain this range it was found necessary to load the shells (already weighing 95 lb.) with lead, to the exclusion of most of the bursting-charge. In bursting they produced no effect, and it is stated that the inhabitants were "scarcely aware of the bombardment."

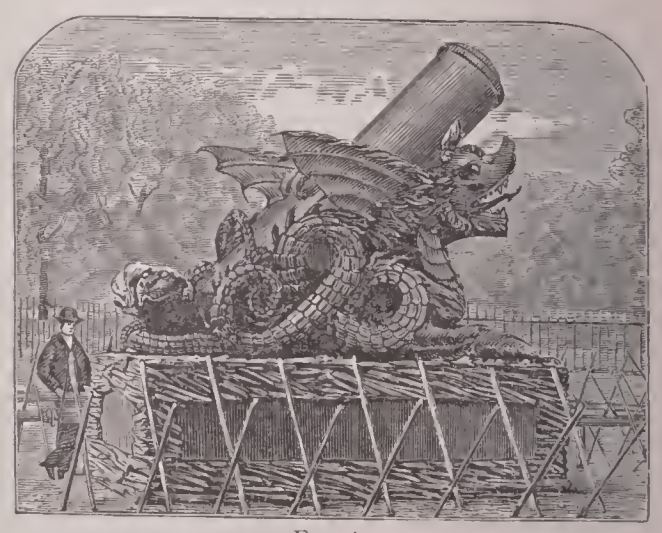


FIG. 1.

At the siege of Antwerp a mortar of 60 cm. (24 inches) caliber, weighing 7,000 kilog. and throwing a shell of 500 kilog. (1,100 lb.), designed by Col. Paixhans, was used. It threw fifteen shells in the last two days of the siege. It

was thought that if one fell on a magazine it would destroy it; but the shells actually thrown caused no serious damage. (*Spectateur Mil.*, 1833.) It was fired with 8 kilog. of powder, but its full charge was 13 kilog. Fired subsequently with this charge it burst.

At the siege of Vera Cruz by Gen. Scott in Mar., 1847, three mortar batteries, each containing four (10-inch) mortars, and a battery of eight large (8-inch) howitzers were established bearing upon the quarter called "La Merced." On the 23d Gen. Scott summoned the place and a conference was had; it proving fruitless, the twelve mortars opened on that day and the howitzer battery the day following. The fire continued throughout the 25th, 26th, and 27th. The La Merced quarter soon became ruinous—200 persons are said to have been injured. The fears of an assault caused Gen. Morales to surrender on the 27th. A shot from the Fort St. Juan entered one of the mortar batteries on the 22d, killing by its "wind" (for though knocking off his cap, the skin was not broken) Capt. John R. Vinton, Third Artillery.* During the bombardment our fleet kept up a cannonade on the fort, which, though intact, surrendered a few hours after the city.

De Blois (*Capitaine d'Artillerie*) published in 1848 a *Traité des Bombardements* to maintain that this means has not, as asserted, fallen into disuse; that bombardments reduce places with much less loss of time, munitions, and blood than regular sieges; and, finally, to defend the system "against the unjust reprobation cast upon it in characterizing its employment as an act of barbarity."

The cases cited by him, nearly all of which have been referred to in this article, scarcely sustain his thesis; still very recent examples go to prove that it is an agent which will continue, under certain circumstances, to be resorted to. Grivel (*La Marine dans l'Attaque des Fortifications et le Bombardment des Villes*, Paris, 1856) maintains that in the use of *curved* fires, combined with direct ones, naval armaments will in future find the most effective method of attacking fortified places. By the term *curved fires* he includes fire by which projectiles from rifled guns (or even smoothbores) can, by elevating the piece, be sent, at long ranges, into the interior of a place. The increase of caliber of modern artillery, and more especially the introduction of the rifled principle, has made such fires as effective as that from mortars, and the term "bombardment" is now extended to such.

At Odessa this species of bombardment was first effectively employed in 1854. The results attained there suggested to the allies the advantages to be derived from this application of floating artillery, and the subsequent bombardment of Sweaborg was provided for, in 1855, by adding to the fleet twenty-one mortar vessels which were towed to within about 2 miles (3,400 meters) of the center of the Russian arsenal, while the gunboats of the squadron, keeping in constant motion, approached to distances of 2,000 or 3,000 meters. The fire was maintained forty-five hours, during which 4,150 projectiles (2,828 of which were mortar shells) were thrown into the place, killing and wounding 2,000 men and destroying magazines, supplies, and shipping.

At an early period of the civil war in the U. S. the project of capturing New Orleans was mooted. The reduction of Forts Jackson and St. Philip seemed a necessary preliminary. For this object a fleet of twenty mortar vessels, each bearing one of the new model 13-inch mortars, weighing 11,500 lb., was prepared, and, under command of Commander (afterward Admiral) David D. Porter, added to Admiral Farragut's fleet. These vessels were moored to the right bank of the river at distances of 3,000 to 4,000 yards from the forts, their positions being screened from view by the woods. The bombardment began on Apr. 18, 1862, continued six days and six nights, during which time 7,500 bombs were fired, of which 1,080 exploded in the air and 1,113 were afterward counted as having fallen upon the fort and solid ground of glacis and levees, and 3,339 were computed to have fallen in the wet ditches and overflowed lands surrounding the fort (for the levees being broken by the shells the site was overflowed). At the end of this bombardment Admiral Farragut forced the passage with his fleet, and, destroying the Confederate flotilla of ironclads and gunboats, the forts surrendered.

Fort Jackson has a portion of its guns in casemates of the curtains; the arches were of brick of very moderate thickness, roofed with concrete, affording at the crown a thickness of 3 feet of masonry. These were covered by the earthen parapet and terreplein. In the flanks of the bastions were flanking casemates, the brick arches of which were not only destitute of earth covering but of the usual concrete covering. All the guns of Fort St. Philip were "en barbette." An engineer officer (Gen. Weitzel) examined the work immediately after its capture, and states:

"Fort St. Philip stands with one or two slight exceptions to-day without a scratch. Fort Jackson was subjected to a torrent of 13-inch and 11-inch shells during 144 hours. To an inexperienced eye it seems as if this work were badly cut up. It is as strong to-day as when the first shell was fired at it. The garrison did not bomb-proof the citadel" (i. e. had not placed earth over the heavy timber blindage spanning the walls for that purpose) "consequently the roof and furring caught fire. This fire, with subsequent shells, ruined the walls so much that I am tearing it down and removing the *débris* to the outside of the work. Three shot furnaces and three cisterns were destroyed. At several points the breast height walls were knocked down. One angle of the magazine on the north side of the postern was knocked off. Several shells went through the flank casemate arches (which were not covered with earth), and a few through the other casemate arches (where two or more struck in the same place). At several points in the casemates the 13-inch shell would penetrate through the earth over the arches, be stopped by the latter, then explode and loosen a patch of brickwork in the soffit of the arch about 3 feet in diameter and three-quarters of a brick deep, at its greatest depth. . . . To resist an assault, and even regular approaches, it is as strong to-day as it ever was." Gen. Abbott subsequently examined Fort Jackson, and reports that in one case a curtain casemate arch was broken through where there was 3 feet of masonry and 6½ feet of earth (the earth being a very pervious river formation). It does not appear that otherwise the forts were much injured or that the efficiency of their fire upon the fleet was seriously impaired. Doubtless, however, the loss of *morale* in the garrison which induced the surrender was due not merely to the successful passage and the destruction of the floating defenses, but to the physical exhaustion arising from the six days' bombardment and subsequent furious artillery contest with our fleet; and the bombardment is not therefore to be reckoned as without influence in the final result. This conclusion has an important bearing; for the writer, in calling for the use of mortars, in a memoir prepared for the Navy Department, did not maintain that the passage could not be forced, but contended that "to *pass* these works with a fleet and appear before New Orleans is merely a raid—no capture. New Orleans and the river can not be held until communications are perfectly established."

Mortar vessels as well as improvised ironclads were at an early date provided for our fleet in the upper Mississippi. After the fall of Forts Henry and Donelson and the evacuation of Columbus, the agency of bombardment (in conjunction with the fire of the cannon of the fleet) was first brought to bear upon the fortified position of Island No. 10 in the Mississippi, a short distance below New Madrid (Missouri). The bombardment was kept up from Mar. 16 to Apr. 8 (1862), the mortar vessels at one time numbering sixteen. The works and troops being disseminated over an extensive area (the island being over a mile long and 1½ miles

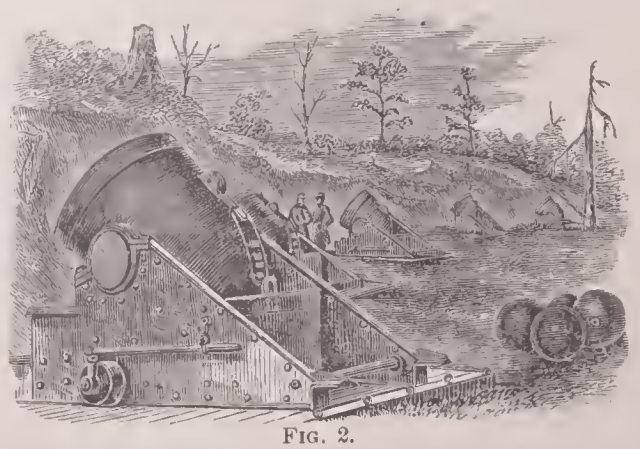

FIG. 2.

wide), neither the cannonade nor the bombs appear to have had much influence in causing the surrender. A similar remark is applicable to Fort Pillow, situated on the Mississippi, about 100 miles above Memphis.

*The facts are undoubtedly as stated. Whether death resulted from the "wind," from heart disease, or from other organic trouble, may be an open question. J. M.

When the course of events decided the establishment of a siege before Yorktown, in Apr., 1862, the Assistant Secretary of the Navy, Mr. Fox, notified Gen. McClellan that ten of the new 13-inch mortars which had been provided for naval purposes would be placed at his disposal. As easy water communication made their application practicable, they were accepted and put in battery on the margin of a navigable arm of Wormley creek, at about 2,500 yards distance from the ramparts of the town.

Besides the above there were established a battery of ten 10-inch siege mortars at 2,000 yards, another of five 10-inch seacoast mortars at 2,500 yards, and another of five 10 and five 8 inch siege mortars at 1,600 yards. The place was evacuated before our siege and mortar batteries opened.

Fort Pulaski, situated on Cockspur island, mouth of Savannah river, Ga., and defending the river approach to Savannah, was captured by bombardment and breaching Apr. 11, 1862, by the U. S. forces under command of Gen. Gillmore. The fort is pentagonal in form, with brick casemates on all sides and brick scarp-wall. It mounted one tier of guns in embrasure and one *en barbette*.

The artillery of the besiegers consisted of thirty-six pieces, distributed in eleven batteries along the shore of Tybee island, at various distances from the work, as follows (see Fig. 3):

1.	3 heavy 13-inch mortars	3,400	yards	distant.
2.	3 " " "	3,200	"	"
3.	3 10-inch columbiads	3,100	"	"
4.	3 8-inch "	3,045	"	"
5.	1 heavy 13-inch mortar	2,790	"	"
6.	3 heavy 13-inch mortars	2,600	"	"
7.	2 " " "	2,400	"	"
8.	3 10-inch columbiads, 1 8-inch "	1,740	"	"
9.	5 30-pdr. Parrott rifles, 1 48-pdr. James rifle (old 24-pdr.)	1,670	"	"
10.	2 84-pdr. " " (old 42-pdr.), 2 64-pdr. " " (old 32-pdr.)	1,650	"	"
11.	4 10-inch siege mortars	1,650	"	"

Batteries 8, 9, and 10 were designed to breach the scarp-wall of the work, and all the other batteries to keep down its fire and destroy its barbette armament. Some of the 13-inch mortars were served with the view of breaching the casemate arches.

The bombardment began about 8 o'clock on the morning of Apr. 10, 1862. By 9.30 A. M. all the batteries were in active operation, and were so maintained until the dusk of evening, a period of about ten hours. Throughout the night firing was kept up with two 13-inch mortars, one 10-inch mortar, and one 30-pounder Parrott rifle, the object being to prevent the garrison's making any arrangement for their protection by piling sandbags behind that portion of the wall selected for breaching or against the wall of the magazine, which would be exposed to direct fire as soon as the breach should be effected in the scarp-wall. During the first day's firing the breach was fairly begun in the pan-coupé connecting the south and southeast faces. On the morning of the 11th, a little after sunrise, all the batteries were again opened, the breach was rapidly enlarged, and by

FIG. 4.—Fort Pulaski: front view of breach, from opposite side of ditch.

2 o'clock in the afternoon the scarp-wall for a length of about 45 feet had fallen into the ditch. The fire from the breaching batteries passed freely through two of the casemates, endangering the safety of the powder-magazine on the opposite side of the work. At 2 o'clock the fort raised a white flag and surrendered.

The wall was found to be greatly shattered, much beyond the limits of actual breach, so that 100 feet of its length had to be replaced by new brickwork.

The number of shots fired is shown below:

From mortars: 1,144 13-inch shells and 588 10-inch shells.
10-inch columbiads: 203 shots and 321 shells.
8-inch " 298 " " 428 "
84-pdr. James rifles (old 42-pdr. rifled): 190 shots and 207 shells.
64-pdr. " " (" 32-pdr. "): 380 " " 16 "
48-pdr. " " (" 24-pdr. "): 133 " " 116 "
30-pdr. Parrott rifles: 150 shots and 1,101 shells.

It was estimated that 110,643 lb. of metal thrown from the breaching batteries struck the breached portion of the wall, equal to 2,458 lb. per lineal foot of wall, the average distance of the breaching gun from the work being 1,687 yards. With small smooth-bore guns at 500 yards distance, used during the Peninsular war in Spain, it was estimated by Sir W. Dennison that 2,544 lb. of metal was expended per lineal foot of wall, in breaching good rubble masonry backed by earth.

FIG. 3.—Map showing the position of the batteries used by the U. S. forces in the reduction of Fort Pulaski, Apr. 10 and 11, 1862.

The barbette armament of Fort Pulaski was so much injured during the first day as to render it unserviceable. No injury was inflicted upon the arches by mortar shells. Not more than one-tenth of the 13-inch shells fired fell inside the work.

Only twenty pieces of ordnance of the fort bore on the besiegers' batteries on Tybee island.

The recapture of Fort Sumter and the occupation of Charleston were from the first deemed by the Federal Government as of urgent importance.

Fort Sumter was a strong casemated brickwork of five faces, designed to mount a total armament of 135 guns, two tiers in embrasure and one *en barbette*, located on a shoal on the south side of the entrance to the inner harbor, at its narrowest point, and 3½ miles from the nearest part of Charleston city. The scarp-wall was 7½ feet thick and

40 feet high above the enrockment from which it rose. The embrasures of the second tier had never been finished, and before the siege began had been walled up with brick. The fort never received its full armament. The nearest land is the north end of Morris island, nearly due S. about 1,400 yards distant from the fort, and from this point the island —a narrow strip of sand—stretches across the coast in a southerly direction for a little more than 3½ miles. When siege operations began the Confederates had possession of the whole of Morris island, and had erected a strong and heavily armed earthwork—Fort Wagner—1,300 yards from the north end of it, and 2,700 yards from Fort Sumter, with the object of holding at least the northern half of the island, in order to prevent the establishment of batteries thereon, within effective breaching distance of Fort Sumter. They also had defenses on the south end of the island to prevent its capture. The plan of attack agreed upon comprised:

1. The capture of the south end of Morris island by assault.
2. The siege and capture of Fort Wagner.
3. The demolition of Fort Sumter by batteries established on the north end of Morris island; and
4. The entrance of the monitors into the inner harbor, and their passage up to the city of Charleston.

This programme was carried out with the following results:

On July 10, 1863, the south end of Morris island and the several batteries erected for its defense were captured by a brigade of infantry, which approached in small boats and landed under fire.

Two open assaults of Fort Wagner—on July 11 and 18 respectively—demonstrated the impracticability of carrying the position by that method of attack.

The plan of operations was then changed so as to give the demolition of Fort Sumter precedence, in point of time, over the capture of Fort Wagner, in order not to delay unnecessarily the entrance of the fleet and the capture of Charleston, for although Fort Wagner, in the hands of the besieged, was intended to prevent the erection of effective batteries against Fort Sumter, it did not protect the channel of approach by Fort Sumter to the inner harbor, or any of the channel obstructions erroneously supposed to exist there.

First Bombardment of Fort Sumter.—The demolition of Fort Sumter over the heads of the garrison of Fort Wagner was then the next step in the modified plan.

The armament placed in position for this purpose, and their several distances from Fort Sumter, are shown in the following table:

1.	2 8-inch Parrott rifles	3,516	yards distant.
2.	3 6·4-inch " "	3,447	" "
3.	2 6·4-inch " "	3,428	" "
4.	2 8-inch " " and 2 80-pdr. Whitworth rifles	3,938	" "
5.	1 8-inch Parrott rifle	4,172	" "
6.	1 8-inch " " and 2 6·4-inch " "	4,272	" "
7.	2 6·4-inch " "	4,278	" "
8.	1 10-inch " "	4,290	" "

Firing from these batteries commenced on Aug. 17, 1863. Its first stage ended Aug. 23. The firing from the most advanced of these batteries, which were less than 900 yards distant from Fort Wagner, was seriously interfered with and at times partially suspended, by the galling fire from that work to which the cannoniers were almost constantly exposed. The combined fire of mortars and light pieces, aided by the gunboats and ironclads, failed to subdue it, and it was necessary occasionally to turn the breaching batteries upon it. The result of this seven days' bombardment is thus given in the official report of the chief of artillery of the siege.

The fire from the breaching batteries upon Sumter was incessant, and kept up continuously from daylight till dark, until the evening of the 23d. For five days all the guns were directed upon the gorge wall, and had resulted in bringing it down to such an extent that on the evening of the 21st a practicable breach had been accomplished. On the morning of the 22d the fire from Batteries Nos. 1, 2, and 3 was directed upon the southeasterly face or right flank of the work, with the view of dismounting the guns on the barbette of this face, which commanded the entrance to the harbor, as well as to destroy the guns on the northeasterly face, which this fire would take in reverse. The fire upon the gorge had, by the morning of the 23d, succeeded in destroying every gun upon the parapet of it, and, as far as could be observed, had disabled or dismounted all the guns upon the parapet of the two faces looking toward the city, which it had taken in reverse. The parapet and ramparts of the gorge were, for nearly the entire length of the face, completely demolished, and in places everything was swept off down to the arches, the *débris* forming an accessible ramp to the top of the ruins.

There being nothing further to gain by a longer fire upon this face, all the guns were directed this day upon the southeasterly flank, and continued an incessant fire throughout the day. The demolition of the fort at the close of this day's firing was complete, so far as its offensive powers were considered. Every gun upon the parapet was either dismounted or seriously damaged; the terreplein for the entire circuit of the place must have been shattered and plowed up by our projectiles, hundreds of which had been seen to strike upon it. The parapet could be seen in many places, both on the sea and channel fronts, completely torn away down to the terreplein. The place, in fine, was a ruin, and effectually disabled for any immediate defense of the harbor of Charleston.

Having accomplished the end proposed, orders were accordingly issued on the evening of the 23d for the firing to cease, having been continuously sustained for seven days. There had been thrown 5,009 projectiles, of which about one-half had struck the fort. The weight of metal thrown during the seven days ending Aug. 23 was 289,986 lb., omitting that expended by the four rifles in the naval battery (No. 4), say 20,000 lb. The enemy remained in possession of the work, having constructed a system of subterranean galleries within the ruined casemates of the fort.

Second Bombardment of Fort Sumter.—Fort Wagner was captured on the morning of Sept. 7, thus giving the besiegers possession of the whole of Morris island. Heavy guns bearing upon Fort Sumter were at once established in Fort Wagner and on the north end of the island. Up to this time the gorge wall only had been breached. The southeast face, the only one seen from Morris island except the gorge, remained standing, although badly shattered in many places. Reports having been made by reconnoitering parties that the garrison were attempting to remount guns on this face, it was determined to cut down that face with the rifled guns established in Fort Wagner and on the north end of this island, so that the fire of the besiegers passing over the *débris* of the gorge and northeast face would take the casemates of the opposite or channel fronts in reverse, and prevent the mounting of guns there.

Fire was opened on the southeast face on Oct. 26. The armament used for this purpose comprised one 10-inch, two 8-inch, and nine $6\frac{4}{10}$-inch rifles, one 10-inch columbiad, and four 10-inch seacoast mortars. The distances of these several guns from Fort Sumter varied from 2,500 to 1,300 yards.

In a few days the southeast face was more completely a ruin than the gorge wall. The *débris* formed a continuous and practicable ramp, reaching from the water to the summit of the breach. The two faces of the work seen from Morris island were both in ruins, many of the casemate arches of the channel fronts had fallen in from the reverse fire, and the entire armament of the work had been destroyed or removed to prevent destruction.

FIG. 5.—Fort Sumter, Nov. 1, 1863, after the second bombardment.

The Franco-Prussian war of 1870 furnished numerous examples of a resort to bombardment as an auxiliary to siege or blockade, of which the most conspicuous are the sieges of Strassburg and Paris. The former city, fully invested on Aug. 8, was attacked by regular siege approaches and sur-

rendered (Sept. 27) only after, its walls breached, it became exposed (according to Gen. Ulrich) to the "doubtful chances of sustaining an assault." But a bombardment from Krupp guns, howitzers, and mortars commenced Aug. 18, and threw shells into the streets of the city, to the serious injury of the venerable and magnificent cathedral.

Paris was invested soon after the surrender at Sedan; and it was doubtless believed that its surrender would follow. No attempt at regular siege was ever made, and it was not until late in December (probably owing to the difficulty of collecting siege artillery, the Strassburg and numerous minor sieges employing all available) that from the heights of Chatillon a cannonade was opened upon the southern forts. Early in the following January shells commenced to be thrown from the same point into the southern quarters of Paris, and this was continued till the 27th. On Jan. 21 a violent cannonade and bombardment was opened upon the detached forts of St.-Denis and also upon the town, 120 shells falling there in one hour (22d), and many hitting the ancient cathedral. The population took refuge in Paris. At the time (1840–48) the defenses of Paris were constructed the extreme range of projectiles did not exceed 2½ miles; and it was in relation to the artillery service of the day that the forts were located. Hence they did not perfectly protect Paris from bombardment, which, however, had no important effect. The distance from the Prussian batteries on the heights of Chatillon to the nearest fort (Vanvres) was about a mile—to the nearest part of the *enceinte*, 2¼ miles; to the populous regions of the southern quarters, 3 miles; to the Palace of Luxembourg, Panthéon, Hôtel des Invalides, and the "monumental" portions of Southern Paris, 3½ miles. Hence the modern rifle (Krupp's guns of the Prussians) extended its range (with high elevation) to all these regions.

It is computed that in thirteen days, from Jan. 5 to 18, about 500 shells a day fell in Paris, hitting and wounding 308 persons, a fourth of them mortally, i. e. an average of 25 persons each day and 25 shells for each person hit. The number of private edifices hit averaged 50 a day, double the number of persons hit. The surface over which the bombardment extended was about 2,000 hectares (5,000 acres), or one-fourth the total area of Paris, chiefly on the left or south bank of the Seine. The population of this portion may be estimated at about 500,000. The Panthéon, the Museum, the Hôtel des Invalides (with its church and tomb of Napoleon) are among the monumental structures of this portion of the city. All were more or less injured.

It is asserted (L. Simonin, *Revue des Deux Mondes*, Feb., 1871) that from a military point of view the bombardment by itself was wholly inefficacious.

Nevertheless, though a city so extensive as Paris may endure a protracted bombardment, the destruction of life and property is something serious, and it must especially be so in *small* fortified towns; hence the increased range and accuracy of hollow projectiles have rendered the old system of closely surrounding a town with a continuous rampart or *enceinte* both useless and dangerous unless supplemented by a system of detached forts sufficiently in advance to keep an enemy's artillery beyond that distance, from which he might destroy the place by his shells. The fortifications of Paris are now supplemented by a second and much farther removed cordon of detached forts.

Small forts, by *themselves*, may, however, very safely defy bombardment, if reasonably provided with casemates or bomb-proofs. Fort Jackson, subjected to vertical fire only, was materially intact after a six-days bombardment, though doubtless the surrender was in *some* degree due to it. Fort Pulaski surrendered because its walls were thrown down and its magazines exposed, by the agency of *direct* fire. Fort Sumter was reduced to a ruin by breaching fire directed against its exposed vertical walls, but it never surrendered; while the little sand work, Fort Wagner, defied both direct and curved fire for two months, and was finally evacuated. An attempt to destroy by shells the bomb-proof or timber blindage covered with sand which sheltered its garrison—the exposed end of which could be seen over the parapet—signally failed, the sand running in quite as fast as it could be blown away by shells.

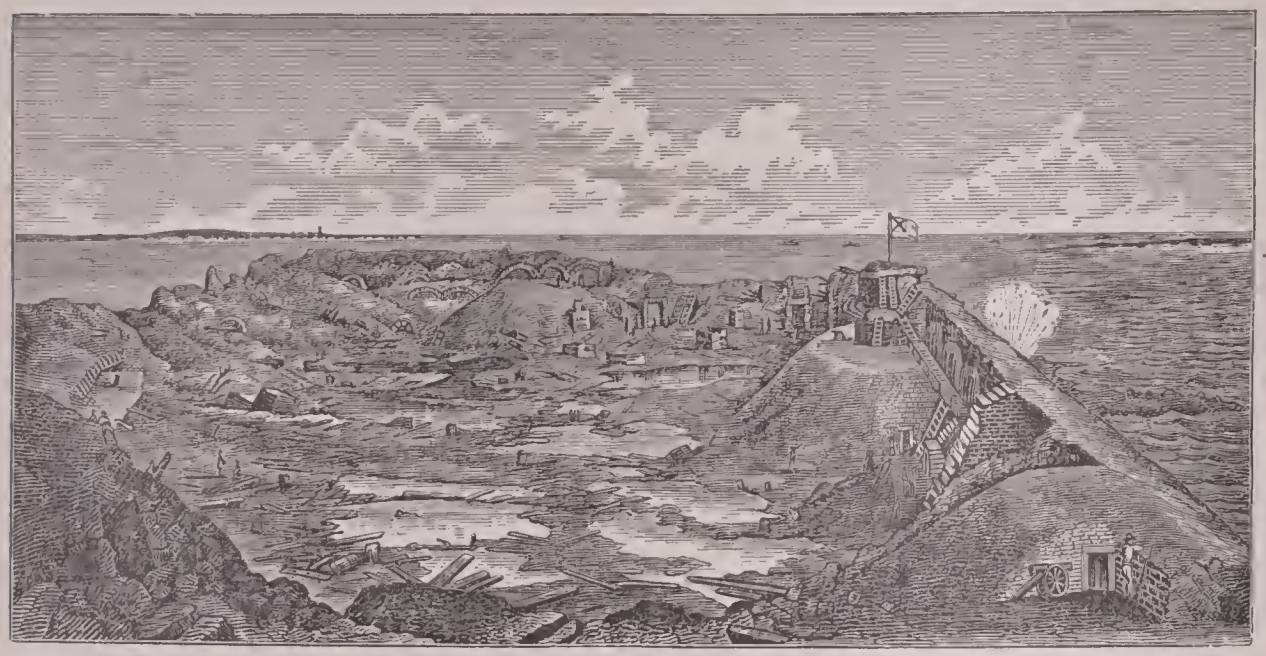

FIG. 6.—Fort Sumter, Dec. 9, 1863. Interior view from the southwest angle—from a drawing made by the Confederates. The original bears the autograph approval of the Confederate general commanding the Department of South Carolina, Georgia, and Florida, and may therefore be assumed to be correct. Morris island and the U. S. fleet are seen on the right, and Sullivan's island and Fort Moultrie on the left. The right of view shows the gorge face and the top of the adjoining face looking down the harbor. Both were breached by the Morris island batteries, although oblique to the line of fire. The *débris* formed an easy ascent from the water to the crest. The left and foreground show the other faces, in ruins from the reverse fire from Morris island. The interior slopes were subsequently made much steeper by the besieged than shown in the view, and were revetted with gabions. Bomb-proof quarters were also constructed under the ruins for the garrison. These quarters consisted of a continuous gallery all around in the ruins, protected on top and on the side next Morris island by thick embankments of earth. Throughout the autumn of 1863 the ruins contained no mounted guns. It was simply an infantry outpost. It repulsed a naval assault from small boats Sept. 8, 1863, and was held until Feb., 1865. On Apr. 14, 1865, the fourth anniversary of its capture by the Confederates, the U. S. flag was again raised over the ruins with imposing ceremonies.

Hence though the fortification of capitals, great naval or military dépôts, must, if attempted at all, be undertaken on an immense scale, yet the applicability of modern rifled guns (in place of *mortars*) to the purposes of bombardment, and the increased range of their curved fire, has not destroyed the utility of small forts as elements of the outer cordon of great fortified places; or, used isolatedly, for the special purposes of guarding great military routes, railroads, or water approaches.* See the article FORTIFICATION.

Revised by JAMES MERCUR.

Bom'bax [Late Lat., corruption of Lat. *bombyx*, silkworm, silk, cotton]: a genus of large soft-wooded trees of the family *Sterculiaceæ*; nearly related to the baobab-tree. They are natives of tropical climates, especially America. They yield great quantities of cotton, but the fiber is short, does not spin well, and is not durable. Nevertheless, in India cloth is made of it to a small extent. It would probably make good paper.

* The development of rifled mortars and howitzers, with an effective range for the larger calibers of nearly 8 miles and extreme accuracy of fire, with a capacity to throw torpedo-shells containing large charges of high explosives, has materially increased the strength of arch and thickness of cover required by bomb-proofs to withstand their effects.

This increased protection for men and materials is attainable at a reasonable expense by the use of concrete and sand. For the heavier guns it presents a more difficult problem, the only practicable solution seeming to be the use of iron and steel, at great cost.

The same problem is, however, presented to the attack, since the heavy artillery of the defense has advanced *pari passu* with that of the attack, and is correspondingly efficient against the siege-works, etc. The rapid fire and machine guns of the defense can be protected against the bombardment in the bomb-proofs, and will retain their full efficiency against a subsequent assault. J. M.

Bombay': a presidency of British India; bounded W. by the Indian Ocean and Baluchistan. Area, including Sind, 125,394 sq. miles. A large part of the surface is mountainous. The long range of the Western Ghats extends parallel to the seacoast in a direction nearly N. and S. Between this range and the sea is a narrow tract called the North and South Konkans, the climate of which is very hot and moist. The annual rainfall in the Konkans is more than 100 inches, in consequence of the vapors of the southwest monsoon being intercepted by the Ghats. This province is intersected by the Nerbudda and Tapti rivers, which flow westward into the Gulf of Cambay, and is also drained by the sources of the Godavari and the Krishna, which run in the opposite direction. The Indus crosses the western part. The soil of the valleys and plains is fertile. Cotton and rice are the staple productions of this region, which contains the richest cotton-fields of India. Sugar and indigo are also raised here. Among the indigenous plants are the cocoa-palm and the teak-tree. Bombay has important manufactures of silk stuffs and of woolen and cotton cloths. In 1880 it had over 1,800 miles of railway in operation. The administration of this country is vested in a governor and three councilors, subject to the superintendence, direction, and control of the Governor-General of India in council. It is divided into the northern division with 10 districts, the southern divisions with 9 districts, and Sind with 4 districts, and contains within its limits many feudatory states, the most of them very small. To this province belongs the naval force for all the presidencies. The annual revenue for the fiscal year 1890 amounted to 13,086,288 rupees, or $4,700,000; expenditures, 8,888,721 rupees, or $3,200,000. Pop. (1901) 18,584,496. Capital, Bombay.

Bombay [Eng. form of native name *Mambai* or *Bambai*]: a city and seaport of British India; capital of presidency of same name. It is situated on the south end of the island of Bombay and on the Indian Ocean; lat. 18° 56′ N., lon. 72° 54′ E. (see map of S. India, ref. 3–C). It has an excellent harbor, affording good anchorage for ships of the largest size, and is favorably situated for commerce, being in a direct line between Calcutta and Aden. It is the west terminus of railway systems connecting it with Delhi and Peshawar, Calcutta, and Madras. The mean temperature is 82° F. At the southern end of the island, which is 8 miles long and 3 miles wide, is the fortified European town, and a mile north of that is the Black Town, in which the Hindus and Mohammedans reside. The density of the population of this part of the city is more than three times that of the most populous districts of London—namely, 759 persons on an acre (according to the census of 1882), while the extreme ever reached in London is 222. Between these two towns is the esplanade and the barracks. Among the most remarkable buildings are the town-hall, mint, cathedral, the custom-house, the library of the Asiatic Society, the Elphinstone Institution, the missionary houses, the Grant Medical College, the great Hindu temple of *Momba Dêvî*, and the Jamsetjee Hospital. The Bombay water-works, among the largest in the world, were formally opened by the Viceroy of India in 1892. These are capable of supplying 31,000,000 gal. of water daily, and cost 15,000,000 rupees. The dam which forms the reservoir is 2 miles long, and there are 61 miles of tunneling, ducts, and pipes. The chief articles of export are raw cotton, shawls, opium, coffee, pepper, ivory, and gums. Bombay imports raw silk, sugar, and silk stuffs from China, and cotton yarn, cotton cloth, hardware, glass, copper, etc., from England. The sum of foreign imports for the fiscal year 1891 was 653,716,000 rupees, or about $235,000,000. Bombay, excepting Calcutta and Canton, is the greatest commercial emporium of Asia, and is the chief Indian port connected with the establishment of steam-navigation between India and the British islands. There is now a regular communication by steamers between Bombay and Europe through the Red Sea and the Mediterranean. Steamers also ply between this port and Point de Galle in Ceylon. Among the races that compose the population of Bombay the Parsis, descended from the Persian fire-worshipers, are distinguished for their respectability, wealth, and commercial enterprise. They are extensively engaged in ship-building, which is one of the most important interests of the city. The most flourishing and important industry in Bombay is the manufacture of yarn and cotton cloth, for which it has numerous large steam spinning and weaving mills. Area, 22 sq. miles. Pop. (1881) 753,000; (1891) 821,764.

Bombay Hook Island: Delaware; a part of Duck creek hundred, Kent County, separated from the mainland by Duck creek. Its north end (lat. 39° 21′ 46″ N., lon. 75° 30′ 19″ W.) has a brick lighthouse 36 feet high, with a fixed white light 46 feet above the water.

Bom'berger, John Henry Augustus, D. D., LL. D.: writer on theological and biblical subjects; b. in Lancaster, Pa., Jan. 13, 1817; graduated from Marshall College and from the Theological Seminary at Mercersburg, Pa. He served in the pastorate in several churches from 1838 to 1884. He was president of Ursinus College, Collegeville, Pa., from 1870 till his death there Aug. 19, 1890. He was editor of a condensation of the Herzog *Encyclopædia*, of which the first volume appeared in 1858 and the second in 1860. He edited the *Reformed Church Monthly* 1868–75. Other works are a translation of the *Handbook of Church History*, by Kurtz (2 vols., 1860–62); *Infant Salvation and Baptism* (1860); *Revised Liturgy* (1867); *Reformed not Ritualistic* (1867). W. J. Beecher.

Bomb-lance: an explosive missile used in the whale-fishery; consists of a cylindrical shell of iron armed with a sharp and heavy point of a triangular form. It is charged with powder, introduced through an opening at the rear end of the shell, and the opening is afterward stopped by melted lead. The lance is discharged from the barrel of a musket, and is exploded by a fuse after it has penetrated the body of the whale.

Bom'ford, George: soldier; b. in New York in 1780; graduated at West Point in 1805; chief of ordnance, U. S. A., May 30, 1832, with the rank of colonel. He was engaged as an engineer upon the construction of fortifications till 1812, when he was placed on ordnance duty. To the skill and inventive talent of this officer the country was largely indebted preceding and during the war of 1812–15 with Great Britain, he being almost the only one well informed as to the manufacture of ordnance and ordnance stores; he also introduced the bomb-cannon under the name of "columbiads." Breveted lieutenant-colonel Dec. 22, 1814, for meritorious services in the ordnance department. After 1842 he was on inspection duty, and made many ingenious and valuable experiments on the best forms for heavy artillery. D. in Boston, Mass., Mar. 25, 1848.

Bo'na [in Fr. *Bône*; anc. *Hippo Regius*; called by the Arabs *Beled-el-Arab*]: a fortified seaport-town of Algeria; province of Constantine; on a bay of the Mediterranean; 74 miles N. E. of Constantine; lat. 36° 54′ N., lon. 7° 48′ E. (see map of Africa, ref. 1–D). It is finely situated at the foot of a hill near the mouth of the river Seibous or Sebus; and is defended by Fort Cigogne, which is on the top of the hill. Bona was occupied by the French in 1832, since which it has been much improved. It has new markets, bazaars, and reading-rooms; also manufactures of tapestry, saddles, and native clothing. Wool, hides, grain, and coral are exported from it by steamboats. Near Bona are the ruins of the great city of *Hippo Regius*, once the see of St. Augustine. It was destroyed by the Arabs in 646 A. D. Pop. (1881) 19,687; (1891) 30,806.

Bona, Giovanni: a cardinal of the Roman Church; b. at Mondovi, Piedmont, Oct. 10, 1609; made cardinal in 1669; d. at Rome, Oct. 25, 1674. His principal works are *De Divina Psalmodia* (1663) and *Res Liturgicæ* (1671). He was equally distinguished for piety and learning.

Bo'na De'a (i. e. good goddess): a Roman divinity; the sister or wife of Faunus; was worshiped only by the Roman women, who concealed her name from the men. According to some authorities, she was identified with Ops. Her annual festival was celebrated on May 1, in the house of the consul, with mysterious rites, from which all males were strictly excluded. Her symbol was a serpent.

Bo'na Fi'de [Lat.; a legal term derived from the civil law, and meaning in good faith, without fraud or deceit, innocently]: A *bona fide* purchaser is one who purchases for a valuable consideration, without notice of opposing interests of third parties. This subject is of great importance in equity jurisprudence. It is a general rule that a court of equity will grant no relief against a purchaser in good faith. If, on the other hand, the purchaser has notice, actual or constructive, of the equitable rights of others, he will stand in no better position than the person from whom he acquired his title. Thus if a mortgage of land were canceled through mistake by a mortgagee, a purchaser in good faith from the mortgagor would hold free from the mort-

gage. On the other hand, if he had notice of the facts, a court would set up the mortgage against him as well as against the mortgagor. (See NOTICE.) The same question is presented in the case of bills of exchange, promissory notes, and other commercial paper. If the acceptor or maker has a defense to it as to the payee, it will in general be shut off as to a purchaser in good faith before maturity. But if the purchaser had notice of the defense before the purchase, he would stand in the same position as the payee. A contract not entered into in good faith is voidable at the option of the innocent party. The question of good faith is often of importance in actions for slander or libel, where it is frequently the case that certain acts if done *bona fide*, or in good faith, are not actionable, but are if done with malicious intent. Revised by F. STURGES ALLEN.

Bonaire, bō′nār′, or **Buen-Ayre**, bwen′ī′raĕ (i. e. good air): one of the Dutch West Indian islands; N. of Venezuela and E. of Curaçoa; lat. 12° 20′ N., lon. 68° 27′ W. (see map of West Indies, ref. 9–I). It is 20 miles long by 6 broad. Area, 129 sq. miles. Pop. 4,700; about 400 white. The climate is dry and the soil poor. Salt and chareoal are manufactured. Aloes, divi-divi, guaiaeum, Brazil-wood, and live stock (donkeys and cattle) are exported.
M. W. H.

Bonald, bō′naal′, LOUIS GABRIEL AMBROISE, Vicomte de: an eminent French publicist and ultra-royalist; b. near Milhau, Oct. 2, 1754. He emigrated in 1791, and published a *Theory of Political and Religious Power* (3 vols., 1796). Having returned to France about 1806, he was elected to the Chamber of Deputies in 1815, and acquired much influence under the Bonapartes and the Bourbons. He advocated absolutism and the infallibility of the pope. In 1823 he became a peer of France. Among his works is *La Législation Primitive*. D. in his castle near Milhau, Nov. 23, 1840. See Henri de Bonald, *Notice sur le Vicomte de Bonald* (1841).

Bonan′za [Span., fair weather, prosperity: Ital. *bonaccia*: Fr. *bonace*]: in the mining districts of California and Northern Mexico, an abundance of metal or an ore-body. The mines of Northern Mexico are principally what are called "pocket-mines," with thin veins of poor metal connecting the pockets. When a pocket of rich ore is struck the mine is said to be in *bonanza*. When the veins run out without leading to pockets, the mine is said to be in *borra* (i. e. useless words), from the verb *borrar*, to rub out or to blot out.

Bonaparte, CARLO: a Corsican lawyer; b. in Ajaccio, Mar. 29, 1746; the father of Napoleon I. He married in 1767 Maria Letitia (Letizia) Ramolino, and had five sons and three daughters. He became counselor and assessor of Ajaccio in 1773. D. in Montpellier, Feb. 24, 1785.

Bonaparte, CAROLINE MARIE ANNONCIADE: Queen of Naples; a daughter of the preceding; b. at Ajaccio, Mar. 26, 1782. She was married in 1800 to Joachim Murat, who became King of Naples in 1808. She was the mother of two sons and two daughters. After the death of her husband she took the title of Countess of Lipona. D. in Florence, May 18, 1839.

Bonaparte, CHARLES LUCIEN JULES LAURENT: Prince of Canino; a son of Lucien Bonaparte; b. in Paris, May 24, 1803. He was distinguished as an ornithologist, and took little part in political affairs. His wife was a daughter of Joseph Bonaparte. He resided in Philadelphia (1822–28) and Italy, and published *American Ornithology, or a History of the Birds of the United States*. D. in Paris, July 30, 1857.

Bonaparte, JERÔME: King of Westphalia; a brother of Napoleon I.; b. at Ajaccio, Nov. 15, 1784. He entered the French army in 1800, and during a visit to the U. S. married, in 1803, Miss Patterson, of Baltimore, without the consent of Napoleon. This marriage was annulled by order of Napoleon in 1805. (Madame Jerôme Bonaparte, *née* Elizabeth Patterson, b. in Baltimore, Md., Feb. 6, 1785: d. there Apr. 4, 1879.) Jerôme served as general of brigade against the Prussians in 1806, and was crowned King of Westphalia in 1807. In the same year he married a daughter of the King of Würtemberg. He lost his throne in Oct., 1813, and led a division at Waterloo in June, 1815. After many years in exile he became a marshal of France in 1850. D. in Villegenis, near Paris, June 24, 1860.

Bonaparte, JERÔME NAPOLÉON: a son of the preceding by his first wife; b. in Camberwell, England, July 7, 1805; graduated at Harvard in 1826. He greatly resembled Napoleon I. in appearance. He left two sons, Jerôme and Charles Joseph. D. in Baltimore, Md., June 17, 1870.

Bonaparte, JERÔME NAPOLÉON: soldier; grandson of Jerôme Bonaparte, King of Westphalia; grand-nephew of Napoleon I.; b. in Baltimore, Md., 1830; graduated at West Point in 1852; and till his resignation of his lieutenancy in the Mounted Riflemen, Aug. 16, 1854, served on frontier duty. He entered the French imperial army Sept. 5, 1854, as second lieutenant of the Seventh Dragoons, became chef d'escadron Third Cuirassiers Aug. 15, 1855, and was transferred Mar. 16, 1857, to the Dragons de l'Impératrice. He served in the Crimean war against Russia (1854–55); engineer at Balaklava, Inkerman, Tchernaia, and the siege of Sebastopol; for all of which active and distinguished services he was decorated by the Sultan of Turkey with the Medjidie Order, made knight of the Legion of Honor of France, and received the Crimean medal from the Queen of England. He was in the Algerian campaign in 1856–57; engaged in several actions with the Kabyles; in Italian campaign against Austria 1859; engaged at Montebello, Solferino, and various outpost affairs, receiving for his gallantry the French "médaille d'Italie" and the decoration of "Military Valor" from the King of Sardinia; in garrison at various posts 1859–67, and in the guard of the Empress of France 1867–72. On the fall of the empire he with difficulty escaped from the hands of the Commune in Paris. He was exiled in 1886. D. Sept. 3, 1893.

Bonaparte, JOSEPH: King of Spain; the eldest brother of Napoleon I.; was born in Corte, Corsica, Jan. 7, 1768. He studied law, married Julie Marie Clary, and was elected to the French Council of Five Hundred in 1797. He negotiated the treaty of Lunéville with Austria in 1801, and that of Amiens with England in Mar., 1802. On these and other occasions he showed considerable talents for diplomacy. Urged by the imperious will of Napoleon, he accepted the throne of Naples in 1806, though he does not appear to have been ambitious of such a position. He was transferred in May, 1808, to the throne of Spain, against the will of the majority of the Spanish people, who obstinately resisted the domination of the French. During his nominal reign many battles were fought between the French and the allied English and Spanish armies, who expelled him from Spain in June, 1813. In 1815 he emigrated to the U. S., and lived at Bordentown, N. J., under the name of the Count de Survilliers. D. in Florence, Italy, July 28, 1844. See A. du Casse, *Mémoires et Correspondance du Roi Joseph* (10 vols., 1854); Thiers, *History of the Consulate and the Empire*.

Bonaparte, LOUIS: a brother of Napoleon I.; b. at Ajaccio, Sept. 2, 1778. He entered the army in youth, and served at Areola and Rivoli (1797). In compliance with Napoleon's will, he married Hortense de Beauharnais in 1802, and became King of Holland in June, 1808. He and his wife separated about 1807, in consequence of their incompatibility. As nominal King of Holland he was not able to pursue the policy which he preferred, but was compelled by Napoleon to sacrifice the interests of the Dutch to the designs of the emperor, who was offended because Louis was not sufficiently subservient. Louis abdicated the throne in 1810, after which he resided in Italy. He was the putative father of Napoleon III. D. at Florence, June 29, 1846. See Thiers, *History of the Consulate and the Empire*; also his *Mémoires sur la Cour de Louis Napoléon et sur la Hollande* (Paris, 1828).

Bonaparte, LOUIS NAPOLEON: See NAPOLEON III.

Bonaparte, LOUIS LUCIEN: a son of Lucien and a nephew of Napoleon I.; b. in Mongrove, Worcestershire, England, Jan. 4, 1813. He was elected to the French National Assembly in 1849, became a senator in 1852, and grand officer of the Legion of Honor in 1855. He is distinguished for his labors in philology and chemistry. D. in Fano, Italy, Nov. 3, 1891.

Bonaparte, LUCIEN: Prince of Canino; a brother of Napoleon I.; b. at Ajaccio, May 21, 1775. He was an active and energetic republican in the French Revolution. In 1795 he married Christine Boyer, a woman of obscure birth. He was chosen in 1798 a member of the Council of Five Hundred, in which he opposed the Directory. On the 18th Brumaire (Nov., 1799) he displayed great resolution, and efficiently promoted the success of Napoleon. Lucien became Minister of the Interior in Dec., 1799, ambassador to Spain in 1800, and a tribune in 1802. Having lost his first wife, he married in 1803 a widow named Jouberthon with-

out the consent of Napoleon, who was angry at the match. Lucien went into exile, and refused the throne of Italy, which Napoleon offered him on condition that he should divorce his wife. He was in France during the Hundred Days, 1815, and actively supported Napoleon in that crisis. He passed the latter part of his life in Italy, and died at Viterbo, June 29, 1840, leaving five sons and six daughters. With the exception of his brother Napoleon, he was undoubtedly the most eminent and talented member of his family. See Lucien Bonaparte's *Autobiographic Memoirs* (1836).

Bonaparte, Lucien Louis Joseph Napoleon: second son of Charles Lucien; b. at Rome, Nov. 15, 1828. He entered the priesthood, and on Mar. 13, 1868, was made a cardinal priest. D. in Rome, Italy, Nov. 19, 1895.

Bonaparte, Marie Ann Élise: Princess de Piombino; a sister of Napoleon I.; b. in Corsica, Jan. 3, 1777. She was married in 1797 to Felix Baccioehi, a Corsican officer, and received in 1805 the title of Princess of Lucca and Piombino. She was for about six years (1809–14) Grand Duchess of Tuscany, which she ruled with ability. D. Aug. 7, 1820.

Bonaparte, Maria Letizia Ramolino: mother of Napoleon I.; b. in Ajaccio, Corsica, Aug. 24, 1750. She was considered a beauty, and had an uncommon intellect. According to her son Napoleon, "she had a great character, with much energy, elevation, and pride." She was married to Carlo Bonaparte in 1767. In 1804 she received the title of Madame Mère on the establishment of the empire. D. Feb. 2, 1836.

Bonaparte, Napoleon: See Napoleon I.

Bonaparte, Napoléon Joseph Charles Paul: prince; a son of Jerôme, King of Westphalia; b. at Trieste, Sept. 9, 1822. His mother was a daughter of the King of Würtemberg. As a professed democrat he was elected to the French Constituent Assembly in 1848. In 1852 he received the title of prince, and was recognized as the heir of his cousin, Napoleon III., in case the latter should die without issue. He married Clotilde, a daughter of King Victor Emmanuel. His features resembled those of his uncle, Napoleon I. He was called Plon-Plon. He was banished from France in 1873 and again in 1886. D. in Rome, Mar. 17, 1891.

Bonaparte, Pauline: Princess Borghese; b. at Ajaccio, Oct. 20, 1780; was the most beautiful of Napoleon's sisters. In 1801 she became the wife of Gen. Leelerc, who died in 1802. She was married in 1803 to Prince Camille Borghese, an Italian, from whom she soon separated. A statue of Pauline, executed by Canova, is said to resemble the Venus of Praxiteles. D. in Florence, June 9, 1825.

Bon'ar, Horatius, D. D.: hymnologist and religious writer; b. in Edinburgh, Scotland, Dec. 19, 1808. He graduated at Edinburgh University; was minister at Kelso from 1838 to 1866, and afterward of the Grange Free church, Edinburgh. He was a prolific author of tracts, sermons, and other religious literature, but is most generally known as a hymnologist. Among his publications in this kind are *Hymns of Faith and Hope* (3 vols., 1857–71); *Hymns of the Nativity* (1878); and *Selected Hymns* (1879). D. in Edinburgh, July 31, 1889. See his *Memorial* (New York, 1889).
Henry A. Beers.

Bona'sa: a genus of gallinaceous birds of the family *Tetraonidæ*, and one of the genera included in the popular term "grouse." It comprises the hazel-grouse, a European bird, the *Bonasa bonasa*. This bird, which is about as large as the common partridge, is prettily mottled with gray and reddish brown. It prefers the deep solitude of the forests. Its flesh is highly esteemed. Another species of this genus is the American ruffed grouse (*Bonasa umbellus*), which is about 18 inches long, and is called the pheasant in Pennsylvania and the partridge in New York and New England. The male has on each side a large shoulder tuft or ruff. In the breeding season it struts with erected ruff and tail like a turkey-cock. The loud thumping or "drumming" sound heard in the localities frequented by this bird is produced by the bird beating on its sides with its wings. It is heard most often in the morning and evening. This bird makes its nest on the ground in the forests. Its flesh is excellent as food.

Bonaventu'ra, Saint Giovanni Fidanza: scholastic theologian; called The Seraphic Doctor; b. in Bagnorea, States of the Church, 1221. He became a Franciscan monk, studied and afterward taught theology in Paris, became general of the order of Franciscans in 1256 and a cardinal in 1273. He had great influence in the Church, and was venerated for his ascetic piety and the miracles ascribed to him. Bonaventura was one of the most eminent of the Schoolmen. "His great mind," says Neander, "grasped the whole compass of learning as it existed in his time." Among his numerous works are *Breviloquium*; *Biblia Pauperum* (Poor Man's Bible); and *Itinerarium Mentis in Deum* (Progress of the Mind toward God; Eng. tr. in vol. xxi. *Jour. Spec. Philos.*). D. in Lyons, July 15, 1274; was canonized in 1482, and was made a doctor of the Church in 1587. His complete works have been often reprinted; best ed. Florence, 1844, *sqq.*, 15 vols.; Eng. trans. of his *Life of St. Francis of Assisi* (London, 1868); and *Life of Christ* (1881). See his life by A. M. da Vicenza; Germ. trans. from the Italian, Paderborn (1874); also Scholasticism. Revised by W. T. Harris.

Bonavis'ta: a port of entry and capital of Bonavista district, Newfoundland, and one of the oldest towns on the island. It has rather a poor harbor, a jail, and a fine Anglican church. Its people are mostly fishermen, but agriculture is also carried on. Pop. 3,500. The lighthouse on Cape Bonavista (lat. 48° 41′ 56″ N., lon. 53° 5′ 20″ W.) is a catoptric revolving white and red light, 150 feet above the sea.

Bonchamp, bōn′shaň′, Charles Melchior Artus, Marquis de: b. at Jouverdeil, France, May 10, 1760; was one of the most distinguished royalist generals in the Vendean war in France, in which he was mortally wounded at Chollet, Oct. 17, 1793. His soldiers were about to massacre 5,000 republican prisoners to avenge him, but at his dying request they were spared.

Bonchut, bōn′shü′, Ernest: French specialist in children's diseases; b. May 16, 1818; M. D. 1842; member of the Medical Faculty of Paris 1842; number of his published works exceeds 100, among them being *Traité des maladies des nouveaux-nés, des enfants à la mamelle et de la seconde enfance* (7th ed. Paris, 1879); *Hygiène de la première enfance; Nouveaux éléments de pathologie générale* (4th ed. 1882); *Traité de diagnostic et de séméiologie* (1883). D. in 1892.

Bond [same word as *band*, and from the root of the verb *bind*]: in law, an instrument in writing, sealed and delivered, whereby a person binds himself to pay a sum of money. It is also called a deed. It is either simple or with a condition. A bond is said to be simple when the engagement to pay is absolute. An instrument in the form of an ordinary promissory note becomes a simple bond if executed under seal. The most common form of bond is one executed under a condition. The instrument in this case consists of two parts —the engagement to pay, and the condition upon which the engagement to pay will become inoperative and void. The condition may be either for the payment of money or the performance of an act, such as the faithful execution of the duties of a public office or of agency or other authority. When for the payment of money, it is usually called a "money bond." In this case it is common to make the engagement to pay, called the penalty, double the amount expressed in the condition of the bond. The penalty will not, however, necessarily limit the amount of the recovery. In other words, in certain cases more may be recovered than the amount named in penalty of the bond; as, for example, the real debt and the interest accruing from delay in payment. At an early day, if the money named in the condition was not paid punctually, the whole penalty could be recovered. Courts of equity, however, regarded this result as in the nature of a forfeiture, and confined the recovery to the debt and the interest. When the bond is given for the performance of an act, the recovery is limited to the damages sustained by non-performance. The person who enters into the bond is called the *obligor*; the person to whom the engagement is made is termed the *obligee*. When it is executed by two or more persons, they may be either "joint" obligors or "joint and several"; that is, they may either bind themselves collectively, or both collectively and separately. An execution of the instrument by two persons simply would be joint. Express words should be used to create a "joint and several" obligation. This is an important distinction where some of the obligors are sureties, as is usual in bonds executed by incumbents of a public office. In the case of a *joint* bond, if one of the sureties should die, his estate would be discharged both in law and equity. This would not be the case had it been both *joint* and *several*, since the individual obligation would remain, though that which is joint would be at an end. A bond is otherwise termed a specialty. It is of a

higher grade than an ordinary contract, which is termed a simple contract. Accordingly, if A should owe money to B for goods sold or services rendered, and should give his bond for the amount, the original claim would be merged in the bond, and if the debt were not paid an action could be brought only on the bond. This would not be the case if A had given B his promissory note, or other engagement not under seal, for the amount of the claim. If the note were not paid at maturity, the original cause of action would remain. A bond, as a general rule, is not negotiable, but assignable. A purchaser would take it subject to the equities between the original parties. (See ASSIGNMENT.) The obligor of the bond commonly professes not only to bind himself, but his heirs, executors, administrators, etc. However, if these words were omitted, his obligation would be transferred to these successors in interest to the extent of the assets received from the obligor, it being a general rule in the U. S. that a debtor's property, both real and personal, is liable for his debts in the hands of heirs and other successors in interest.

T. W. DWIGHT.

Bond, EDWARD AUGUSTUS, C. B., LL. D., F. S. A.: English scholar; b. at Hanwell, Middlesex, England, Dec. 31, 1815; entered the British Museum as assistant in the department of manuscripts in 1838; librarian of the Edgerton MSS. in 1852; assistant keeper of the MSS. in 1854; keeper of the department in 1866; principal librarian of the British Museum in 1878; resigned in 1888; in 1870 founded the Palæographical Society, of which he was president. Edited many works for the library and the Government. D. Jan. 2, 1898.

Bond, GEORGE PHILLIPS: astronomer; b. at Dorchester, Mass., May 20, 1825; graduated at Harvard in 1845. He aided his father, W. C. Bond, in the observatory at Cambridge, and in 1859 succeeded him in the directorship of the observatory. He wrote several works, among which is an article *On the Construction of the Rings of Saturn*, and a work on Donati's comet. D. in Cambridge, Mass., Feb. 17, 1865.

Bond, THOMAS EMERSON, D. D., M. D.: physician and Methodist writer; b. at Baltimore, Md., in Feb., 1782. He became a professor in the Medical College of Maryland, and afterward a local Methodist preacher. He edited the *Christian Advocate and Journal* for twelve years, and wrote important pamphlets in defense of his Church. D. in New York city, Mar. 14, 1856.

Bond, WILLIAM CRANCH: astronomer; b. at Portland, Me., Sept. 9, 1789, and became a watchmaker. He was the first director of the observatory of Harvard University. He distinguished himself by his observations on Saturn, and discovered a satellite of that planet. D. Jan. 29, 1859.

Bondage: originally, the villeinage or basest form of tenure of the Old English feudal law. The term is now used for a species of tenure existing in Scotland and the north of England, by which the tenant of a cottage on a farm is bound to work at certain seasons for the farmer under whom he holds the cottage. Such a tenant is called a bondager.

Bonded Warehouse: See WAREHOUSING SYSTEM.

Bön'der: the yeomanry of Sweden and Norway. The bönder often claim an aristocratic origin. They have many virtues as a class, and constitute a large majority of the population.

Bonds: See SECURITIES, in the Appendix.

Bondu', or **Bondou**: a small district or kingdom of Western Africa; in Senegal; about lat. 14° to 15° N., and lon. 11° to 13° W. It is bounded on the E. by the river Falemé, which separates it from Bambuk. The surface is mostly level; the soil is fertile, well watered, and extensively covered with forests. The staple productions are cotton, indigo, maize, tobacco, and millet. Among the forest trees are the baobab and acacia. Iron is abundant here, and wild animals are numerous. The Fulahs are the most numerous of the tribes which inhabit Bondu. It is now under French protection. Capital, Bulibani, a mean town on the Falemé. Pop. estimated at 1,500,000.

Bône, a town of Algeria: See BONA.

Bone [O. Eng. *bān*: Germ. *Bein*: Swed. *ben*]: the substance of which the hard internal skeleton or framework of most vertebrate animals is formed. In the embryo the bones, with few exceptions, are preceded by masses of cartilage, or gristle, which in the course of development are replaced by true osseous tissue forming the skeleton; in some of the low fishes no such substitution takes place, the cartilage persisting as the adult skeleton. In addition to contributing the supporting framework, in many animals bone occurs in other localities; thus bony plates are found in the integument of armadillos, turtles, lizards, and certain fishes, in the heart of ruminants, in the diaphragm of camels, in the eye of many animals, in the tongue of certain birds and fishes, and in other organs. In animals below the vertebrates there is no true bone, osseous tissue here being substituted by amorphous incrustations and hardened excretions, composed principally of calcium carbonate.

Bone consists of two parts: (1) an *organic portion*, composed of a "matrix" of closely interwoven connective-tissue fibers, united by a homogeneous "ground-substance," containing cellular elements, the "bone-cells," within interfibrillar spaces, and yielding gelatin on boiling; and (2) *earthy matter*, which impregnates the ground-substance and produces the characteristic hardness of the tissue. If a bone be soaked in dilute hydrochloric acid for a sufficiently long time, the organic matter, called "ossein," or "bone-cartilage," alone remains, retaining the form of the original bone, and being flexible, tough, and translucent. If, on the other hand, a bone be burned in a hot fire with a strong blast of air, the animal matter is all burned away, leaving the earthy or inorganic matter a white, brittle mass, with just the form of the original bone. It consists of calcium phosphate (which constitutes more than half the weight of the whole bone), together with calcium carbonate and fluoride, magnesium phosphate and sodium chloride, with traces of other elements. The proportions vary in different parts of the skeleton, in the same bone at different ages, in various diseases, and in the corresponding bones of different species. Living bone is of a reddish-white tint externally, and is of a much deeper red within. Its physical properties include a specific gravity of 1·87–1·97, toughness and some elasticity, with a strength equal to twice that of oak; a cubic inch of bone will support 5,000 lb. Bones are usually covered at their ends or in some other part by cartilage; but the surface, with the exception of portions forming joints, is covered by a tough, fibrous membrane, the "periosteum"; hollow bones have a similar membrane within, the "endosteum." These membranes are of the utmost importance in the growth, nourishment, and repair of bones. The endosteum also nourishes the marrow, a substance filling the cavities of bones, and occurring in the adult in two forms—red and yellow marrow. (See HISTOLOGY.) In the young bones all marrow is red, but in after life the red marrow is confined to the vertebræ, ribs, certain small and flat bones, and the ends of the larger long bones. These forms of marrow differ principally in the lessened vascularity and increased quantity of fatty tissue contained in the yellow variety. The red marrow is of especial consequence as an important source of new red blood-cells throughout life.

From the periosteum, arteries and nerves enter the bone, traversing the longitudinal "Haversian canals," which are from $\frac{1}{200}$ to $\frac{1}{250}$ of an inch in diameter, and lined with a delicate membrane resembling periosteum. Each canal is surrounded by concentric layers of bone, constituting an "Haversian system," between the concentric lamella of which lie connective-tissue cells, the "bone-cells," each occupying a cavity called a "lacuna." The lacunæ send out lateral branching, freely communicating canals, the "canaliculi," $\frac{1}{1400}$ to $\frac{1}{2000}$ of an inch in diameter. Osseous tissue is arranged to form compact and cancelous bone, but the two differ only in relative density and the relative size of the contained cavities. For full account of structure of bone, see HISTOLOGY.

Osseous tissue is liable to several diseases, such as caries, necrosis, rachitis (rickets), osteomalacia, periostitis, osteomyelitis, caneer, exostosis, etc., each described under its own name. For descriptions of the several bones and of their relations to each other, see OSTEOLOGY and the names of particular bones, such as CLAVICLE, HUMERUS, etc.

Revised by GEORGE A. PIERSOL.

Bone-ash: the residue of burnt bones; it amounts to about 66 per cent. of the weight of the original bones. It consists of the earthy salts of the bone. Bone-ash is largely exported from South Ameriea. It is used as manure, for the manufacture of superphosphates, phosphorus, and cupels, and is an important constituent of English china. Also called BONE-EARTH.

Bone-black, or **Animal Charcoal**: the residue left on calcining bones in close vessels. The bones are placed either in retorts, like those used in making coal-gas, or in iron pots. On the application of heat destructive distillation

takes place. Combustible gases escape, accompanied by vapors which condense to ammoniacal water and offensive oils. Bone or Dippel's oil is thus produced. The residue in the vessels amounts to about 50 per cent. in weight of the original bones. It is passed between rollers, and separated by sieves into different sizes. Bone-black usually contains, after exposure to the air, from 1 to 6 or 7 per cent. of moisture. The average composition of dry bone-black, in 100, is carbon, containing nitrogen, 10; phosphate of lime, including a little phosphate of magnesia, 88; carbonate of lime, 8; sulphate of lime, 0·2; alkaline salts, 0·8; oxide of iron, 0·1; and silica, 0·3.

Animal charcoal possesses to a high degree the property of absorbing gases, and also of absorbing various substances from solutions. Its action is not limited to any one class of substances. It absorbs vegetable bases, bitter principles, astringent bodies, coloring-matters, iodine, metallic oxides, salts, etc. Its chief application in the arts is for the purification of sugar. The raw sugar is dissolved in water, more or less completely freed from suspended impurities by the aid of blood, and filtered through bags of cotton cloth, and then passed through high cylinders of iron containing the bone-black. It is thus almost completely decolorized, and at the same time freed from lime and other salts, and from certain organic substances which interfere with crystallization. On subsequently concentrating the solution in the vacuum-pan it readily yields perfectly white loaf sugar. (See SUGAR.) By washing with warm water, and subjecting to a red heat in suitable retorts, the black is *revivified*, when it may be used again. Sometimes it is also purified by fermentation and treatment with small quantities of dilute acids or alkalies. By repeated reheatings, however, the black becomes greatly condensed, owing to the semi-fusion of the phosphate of lime, and its decolorizing and purifying power is reduced to such a degree that it must be replaced by fresh black. This exhausted black, as well as the fine dust which is not suited for sugar-refining, finds a ready market for the manufacture of superphosphates to be used as fertilizers, for the manufacture of phosphorus, etc. In France, pulverized bone-black in fine powder is often boiled with the raw sugar before it goes to the bag filters.

When bone-black is to be used for decolorizing acid solutions, the phosphate of lime is first removed from it by dilute hydrochloric acid. Bone-black is sometimes employed to remove lime from highly calcareous waters. Many other forms of charcoal possess these properties, but none of them have been found so well adapted for the use of sugar-refiners as bone-black. Under the name of ivory-black animal charcoal is used as a pigment, especially for the preparation of shoe-blacking.

Bone-dust: a name applied to various bone fertilizers characterized by very fine division of the particles. The term is used for the finely ground product of dry and clean bones, or for the product of fresh or soft bone, meat, and other animal material, which are by-products in other industries or the refuse of slaughter-houses. If the bone has been heated before grinding, much of the nitrogen may be lost. In common with all bone fertilizers, the particular value of bone-dust lies in its phosphorus, although the nitrogen contents may run from 2 to 6 per cent.

Bonefish: a name applied to the ladyfish, *Albula vulpes*.

Bone-gelatin: See GELATIN.

Boner, JOHN HENRY: poet; b. in Salem, N. C., Jan. 31, 1845; educated privately. In 1867 edited *Salem Observer* and *Asheville Pioneer*. In the following year he was appointed assistant secretary to the North Carolina Constitutional Convention, and was made chief clerk of the House of Representatives for 1869–70; was for sixteen years in the civil service at Washington. In 1887 removed to New York, where he served on the editorial staff of the *Century Dictionary*. Subsequently became literary editor of the *New York World*, which position he resigned to join the editorial staff of the *Standard Dictionary*. In 1883 he published a volume of poems, entitled *Whispering Pines*. He is a contributor to the magazines and is a member of the Authors' Club.

Boneset: the *Eupatorium perfoliatum* (fam. *Compositæ*), an herbaceous plant, a native of the U. S., growing in low or moist places. It is a bitter weed, having hairy leaves, which are united at the base around the stem, and are serrate, very veiny, and wrinkled. An infusion of the leaves is used as a tonic, diaphoretic, etc.

Bon'gar: the native name for *Bungarus fasciatus*, a poisonous snake of the East Indies, related to the famous cobra, but having the neck less dilatable. It is of a light color, banded with black, and attains a length of 4 or 5 feet.
F. A. L.

Bonghi, bon'gee, RUGGIERO: Italian scholar and statesman; b. at Naples, Mar. 21, 1826; Professor of Philosophy, Academy of Milan, 1859; entered Italian Parliament 1860; Professor of Greek Literature at Turin 1864; of Latin at Florence 1865; and later of Ancient History at University of Rome; Minister of Public Instruction in Minghetti cabinet 1874–76; founded *La Cultura* (1881). Editor and translator of classics, and author of *Frati, Papi e Re* (1873); *Leone XIII. e l'Italia* (1878); *Francesco d'Assisi* (1884); *Vita di Gesù* (1890). D. near Naples, Oct. 22, 1895.

Bon'ham: town; capital of Fannin co., Tex. (for location of county, see map of Texas, ref. 2–I); on railroad; has numerous churches, Carlton College, Bonham Masonic Female Institute, and several handsome public school-buildings, etc.; also very fine flouring-mills, railroad machine-shops, manufactures of carriages, wagons, tobacco, brooms, mattresses, etc. In the cotton season 1890–91, 26,200 bales of cotton, and large quantities of flour, oats, corn, cotton-seed, etc., were shipped. Pop. (1880) 1,880; (1890) 3,361; (1900) 5,042.
EDITOR OF "NEWS."

Bonham, MILLEDGE L.: statesman and soldier; b. in South Carolina, May 6, 1815; graduated at South Carolina College in 1834; became a lawyer; and served in the Mexican war. He was solicitor for the southern circuit 1848–50, and a member of Congress from 1856 to 1860; was appointed major-general of South Carolina troops, and afterward brigadier-general in the Confederate army. Having been elected to the Confederate Senate he withdrew from the army, and became Governor of South Carolina 1862–64, after which he resumed his position in the army, and held it at the time of Lee's surrender. D. Aug. 27, 1890.

Bonheur, bo-nür', FRANÇOIS AUGUSTE: painter of animals and landscape; b. at Bordeaux, Nov. 4, 1824. D. in Bellevue, Feb. 22, 1884. Though less famous than his sister, Rosa Bonheur, he achieved a high reputation in the artistic world, and his work is marked by most serious and meritorious qualities. He was a pupil of his father, Raymond Bonheur, and received a first-class medal at the Paris Salon 1861; Legion of Honor 1867. One of his very best works, a fine landscape with cattle, *Environs of Fontainebleau*, is in the Metropolitan Museum, New York. WILLIAM A. COFFIN.

Bonheur, MARIE ROSA: eminent painter of animals, whose pictures are widely known in Europe and America; b. at Bordeaux, Mar. 22, 1822. She was a pupil of her father, Raymond Bonheur, and began her studies by copying pictures in the Louvre. She first attracted public notice by the exhibition of two pictures at Bordeaux in 1841, and since then produced a large number of works which placed her in the front rank of artists in the field to which she devoted herself. She received a first-class medal at the Paris Salon in 1848; was exempted by a special decree in 1853 from having her works passed upon by the Salon jury; received a first-class medal at the Paris Exposition 1855, and the Legion of Honor in 1865. *The Horse Fair*, painted in 1853, is perhaps the best, and is the most celebrated of her pictures. It was sold in the A. T. Stewart collection in New York in 1887, and presented by the purchaser, Cornelius Vanderbilt, to the Metropolitan Museum, New York, where it now is. A replica of this picture, of smaller size, is in the National Gallery, London, and a fine work, *Plowing in the Nivernais*, is in the Luxembourg Gallery, Paris. Her painting is exceedingly robust and vigorous in style; and, as may be seen in *The Horse Fair*, which was painted when the artist was in her best period, she possessed a fine talent for composition. D. in Fontainebleau, May 25, 1899.

Bo'ni: a state in the southwest peninsula of the island of Celebes; on the west side of the Gulf of Boni. It is about 80 miles long, and produces rice, sago, and cassia. The natives manufacture cotton cloth and articles of gold and iron. Area, 450 sq. miles. Pop. estimated at 200,000. Capital, Boni.

Boni, Gulf of, called also **Bughis** (boo'gĕes) **Bay**: separates the two southern peninsulas of Celebes. It is nearly 200 miles long, and from 40 to 80 miles wide. It is dangerous to navigation from its numerous reefs.

Bon'iface (Lat. *Bonifacius*): several popes have borne this name: (1) ST. BONIFACE I.; elected in 418 A.D. St.

Augustine dedicated several works to him. D. in 422. (2) Boniface II., a Goth; b. at Rome; succeeded Pope Felix IV. in 530. D. in 532 A. D. (3) Boniface III. was chosen pope in 607, and died the same year. He was the first to whom the title of "universal bishop" was given by the Greek emperor (Phocas). (4) Boniface IV., pope; b. at Valeria in Italy; succeeded Boniface III. in 608. He converted the pagan Pantheon of Rome into a church. D. in 615. (5) Boniface V., a native of Naples; became pope in 619. He died in 625, and was succeeded by Honorius I. (6) Boniface VI., a native of Rome; succeeded Formosus in 896, and died fifteen days after his election. He was an abandoned character. (7) Boniface VII., considered by some authors an anti-pope; was elected in 974 as a rival of Benedict VI. He was driven out of Rome in 975, and was starved to death in prison in 985. (8) Boniface VIII., Cardinal (Benedetto Gaetani); was born at Anagni about 1228. He became pope in 1294. He issued a bull forbidding all the clergy to pay any tax on ecclesiastical property, by which he was involved in a contest with Philip the Fair of France. He excommunicated Philip, who accused the pope of heresy and simony, and besieged him in his own palace. Boniface was skilled in both civil and canon law, and published the sixth book of *Papal Decretals*. He died Oct. 11, 1303. (See Dante, *Inferno*, canto xxvii.; W. Drumann, *Geschichte des Papstes Bonifacius VIII.*, 2 vols., 1852; Luigi Tosti, *Storia di Bonifazio VIII.*, 1847.) (9) Boniface IX. (Pietro Tomacelli) succeeded Urban VI. in 1389. He was a despotic ruler, and was accused of selling benefices and indulgences. He died Oct. 1, 1404, and was succeeded by Innocent VII.

Boniface, Saint Winfrid: called The Apostle of Germany; b. in Kirton, near Exeter, England, 680. He began in 716 to preach in Germany; converted a great number of people and founded schools and monasteries. He was made bishop by Pope Gregory II. in 723, and in 732 Gregory III. made him archbishop and primate of all Germany. In 718, in 723, and again in 738, he visited Rome. He became Archbishop of Mainz 745. June 5, 755, he was assassinated by a pagan mob at Dokkum in West Friesland, and his remains were finally taken to the famous abbey of Fulda, founded by him. See his works, edited by J. A. Giles, London, 1844, 2 vols., and in Migne, *Pat. Lat. LXXXIX.*; the original life is in Latin, by his pupil, Willibald, Germ. trans. Berlin, 1856; modern lives by G. W. Coxe, 1853; A. Werner, Leipzig, 1875; G. Pfahler, Regensburg, 1880; O. Fischer, Leipzig, 1881; A. Ebrard, Gütersloh, 1882.

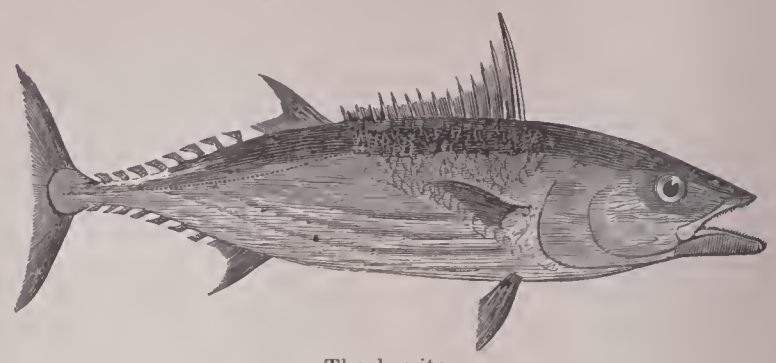
Bonifacio, José: See Andrada e Silva.

Bonifacio, bō-nĕĕ-faa'chō, **Strait of** (anc. *Fretum Gallicum*): the channel which separates Corsica and Sardinia. The narrowest part is only 7 miles wide. On the top of a white calcareous rock on the north stands the town of Bonifacio, which has a good harbor.

Bo'nin (or **Uninhabited**) **Islands** [from Chinese *Wuh nin*, without men]: islands in the Pacific Ocean; about 500 miles S. of Japan. They extend from lat. 26° 30′ to 27° 44′ N., and are about lon. 142° E. (see map of World, ref. 5–C). They are divisible into three groups, the most northern of which are called Parry islands, and the most southern Baily islands. Area, 38 sq. miles. Peel island, which is one of the middle group, is occupied by a small number of European and Polynesian colonists, the only inhabitants of the group. Japan now owns the group, and calls it Boninshima, i. e. Bonin islands.

Bon'ington, Richard Parkes: painter; b. at Arnold, near Nottingham, England, Oct. 25, 1801; d. in London, Sept. 23, 1828. Pupil of Baron Gros, though he began his studies by copying pictures in the Louvre, having been taken to Paris by his father, who was a portrait-painter, about 1816. Bonington painted landscapes chiefly, but also essayed figure subjects and marine views. He was in sympathy with the new movement in landscape painting originated by Constable, and his work was highly appreciated by French artists and critics. His influence on the new school forming in Paris, headed by the "men of 1830," was considerable. His work is notable for great truth of observation and refined quality of color. His *Column of St. Mark's, Venice*, is in the National Gallery, London, and *Francis I. and Duchess d'Étampes* and *The Park of Versailles* are in the Louvre. William A. Coffin.

Bonito, bō-nee'tō: one of several fishes of the family *Scombridæ*, allied to the mackerel. One of these, *Gymnosarda pelamys*, is a native of warm seas. It is a beautiful fish, about 2½ feet long, and resembles a mackerel in form. The color of its back and sides is a brilliant steel-blue.



The bonito.

Four dark lines extend along each side of the belly, from the throat to the tail. Its flesh, though rather dry, is eaten and relished by many. The term bonito is still more frequently applied to a related species (*Sarda sarda*) found on both shores of the North Atlantic, and distinguished from the preceding species by its strong teeth. On the Pacific coast is another bonito (*Sarda chilensis*).

Revised by D. S. Jordan.

Bo'nitz, Hermann: Platonic and Aristotelian scholar, and a high authority in educational matters; b. in Langensalza, July 29, 1814. Professor in the University of Vienna 1849–67; reorganizer of the Austrian school system; professor in Berlin till his death in that city, July 25, 1888. Wrote *Platonische Studien*; *Index Aristotelicus*; *Latin Commentary on Aristotle's Metaphysics* (Bonn, 1849), with a German translation published after his death by E. Wellmann; *Ueber den Ursprung der homerischen Gedichte* (1881, 5th ed.); and numerous critical contributions. See Th. Gomperz, *Biogr. Jahrb.*, vii. (1888), pp. 53–100.

Alfred Gudeman.

Bonn (anc. *Bonna*): a city of Rhenish Prussia; beautifully situated on the left bank of the Rhine; 19 miles by rail S. S. E. of Cologne (see map of German Empire, ref. 5–C). It is on the railway which connects Cologne with Coblentz. It has an ancient cathedral, which is a fine specimen of the Romanesque style. Here are manufactures of cotton goods, earthenware, and soap. Bonn is the seat of a celebrated university founded in 1818, which has a library of 250,000 volumes and is attended by over 1,200 students. Connected with it are an observatory, a botanic garden, and a museum of natural history. The buildings of this institution are excellent and very extensive. Niebuhr, A. W. Schlegel, Hermes, Simrock, and other eminent men have been professors in this university. Here are several large and elegant hotels for the accommodation of tourists, who are attracted by the picturesque scenery of the vicinity. Bonn is a very ancient town. *Bonna*, which was an important Roman station, is said to have been rebuilt by the Emperor Julian in the fourth century. It was conquered by the French in 1802, and annexed to Prussia in 1814. It is the native place of Beethoven, and a statue was erected to him in the Münsterplatz in 1845. Niebuhr is buried in the cemetery outside of the Sternthor, where there is a monument to him, erected by Frederick William IV. Pop. (1890) 39,805.

Bonnat, bon'naa', Léon Joseph Florentin: one of the most eminent painters of the contemporary French school; b. at Bayonne, June 20, 1833; pupil of Federico de Madrazo and Léon Cogniet. He is highly esteemed by his fellow-artists, and since the death of Meissonier is the recognized head of the art world of Paris. President of the Society of French Artists. He is most famous as a painter of portraits, but has also painted a number of historical and religious compositions, and numerous genre-pictures of Italian peasants. As a young man he spent several years in Spain and Italy, first gaining recognition at the Paris Salon in 1861, when he received a second-class medal. The list of his honors is a long one, including the medal of honor at the Salon of 1869. In the Legion of Honor he was made chevalier in 1867, officer in 1874, and commander in 1882. Member of the Institute and one of the three professors of painting at the Government École des Beaux-Arts. He has painted the portraits of many distinguished persons, including those of Thiers, Victor Hugo, Presidents Grévy and Carnot, Cardinal Lavigerie, Rénan, and Alexandre Dumas. He has also painted numerous Americans, and his portrait work is well known in the U. S. Some of his principal works are *St. Vincent de Paul taking the place of a Galley Slave* (1866);

Christ on the Cross (1874), in the Palais de Justice, Paris; *Jacob Wrestling with the Angel* (1876); *Job* (1880); *The Youth of Samson* (1891); and *Martyrdom of St. Denis* (1885), in the Panthéon, Paris. His *Job* and the portrait of his master, Léon Cogniet, are in the Luxembourg Gallery. At the Metropolitan Museum, New York, is a portrait by him of John Taylor Johnston, a founder and at the time of his death (Mar. 24, 1893) honorary president of that institution. *Italian Girl* is in the collection of Mrs. August Belmont, and *Arab Plucking a Thorn from his Foot* in that of Mrs. W. H. Vanderbilt, both in New York. Bonnat's portraits are characterized by great truthfulness to the sitter and fine drawing and modeling. He is not remarkable as a colorist.

WILLIAM A. COFFIN.

Bon'ner, EDMUND: an English prelate notorious as a persecutor; b. in Hanley about 1500. He was educated at Oxford; gained the favor of Henry VIII., who about 1532 sent him on a mission to the pope, and appointed him Bishop of Hereford in 1538 and Bishop of London in 1539. Having showed himself hostile to the Protestant cause, he was deprived of his bishopric in 1549 and imprisoned in the Marshalsea prison in London until the accession of Queen Mary in 1553, when he was restored to his office. He was the principal instigator of the bloody persecutions which disgraced the reign of Mary. Refusing to take the oath of supremacy on the accession of Elizabeth in 1558, he was imprisoned in the Marshalsea, London, where he died Sept. 5, 1569.

Bonnet: in fortification of the old school a small defense-work constructed at salient angles of the glacis or larger works. It has only two faces, with a parapet 3 feet high and 10 or 12 broad. A larger kind, with three salient angles, is called a priest's bonnet.

Bonnet, bon'nā', CHARLES, LL. D., F. R. S.: Swiss naturalist and philosopher; b. at Geneva, Mar. 13, 1720. He made discoveries in the reproductive and other functions of insects, etc., which he announced in his *Treatise on Insectology* (2 vols., 1745). He published in 1754 a valuable work *On the Use of the Leaves of Plants*. His sight having become impaired by the use of the microscope, he turned his attention to philosophy. Among his other works (all in French) are *Considerations on Organized Bodies* (1762) and *Philosophical Palingenesis* (3 vols., 1769), in which he argued that the Christian revelation is true. D. at Genthod, on Lake Geneva, May 20, 1793. The genus *Bonnetia* was named in his honor. See H. B. de Saussure, *Éloge historique de C. Bonnet* (1787); J. Trembley, *Mémoire de la Vie de C. Bonnet* (1794); A. Lemoine, *C. Bonnet de Genève, Philosophe et Naturaliste* (1850).

Bonne Terre: village; St. François co., Mo. (for location of county, see map of Missouri, ref. 5–J); on Miss. Riv. and Bonne Terre R. R.; 32 miles S. by W. of St. Louis. Its principal industries are lead-mining and smelting. Pop. (1890) 3,719; not returned separately in 1900.

Bonnet-head: a shark (*Sphyrna tiburo*), allied to the hammer-head, but with the head rather kidney-shaped than hammer-shaped. It reaches a length of 6 feet, and is found in tropical seas.

Bonneval, bon'vaăl', CLAUDE ALEXANDRE, Count de: a French adventurer; b. in Limousin, July 14, 1675. He deserted from the French army and entered the service of Austria, in which he distinguished himself by several daring exploits, and obtained the rank of general. Having quarreled with the governor of the Low Countries, he was condemned to death by a court martial about 1724, but the penalty was commuted to exile. He entered the Turkish army, took the name of Achmed, and became a pasha of three tails. D. in Constantinople, Mar. 27, 1745. See D. Fassmann, *Leben des Grafen von Bonneval* (1740); *Memoirs of the Bagshaw Count Bonneval* (London, 1750).

Bonneville, Lake: an extinct Pleistocene lake that twice occupied the now desert interior basin of Utah. Its shore-lines, contouring around the inclosing mountain-slopes, have been noticed by many explorers. Its history has been deciphered by Gilbert (Monograph I, U. S. Geol. Survey). The area and depth of the lake at its various levels are indicated by the shore-lines above mentioned. When at its greatest expansion its surface measured almost 20,000 sq. miles, and its depth was nearly 1,000 feet. The sediments corresponding to the shore-lines are found to lie on gravels, thus indicating that before the lake existed its basin was a dry interior depression as now. Moreover, the litoral and bottom deposits are separated by a series of gravel beds, indicating an arid period between two periods of high water. When at its highest level in the second period, forming what is called the Bonneville shore-line, the waters of the lake overflowed northward across Red Rock pass to a branch of the Shoshone river, and thus reached the Pacific. The pass was cut down about 370 feet, and at this level the waters lingered long enough to cut a second series of shore-lines, called the Provo shore. Then loss by evaporation overcame rainfall supply; overflow ceased, and the lake dwindled away, revealing its bottom as a desert plain. The variation in the area of the ancient lake indicates climatic changes from drier to moister conditions; and these alternations are apparently coincident with the alternations of glacial climates of Northeastern North America. Since the waters of the lake have dried away the shore-lines have been slightly warped out of level, as if owing to the relief of the weight of the water on the land. See GREAT SALT LAKE and LAHONTAN.

W. M. DAVIS.

Bon'ney, CHARLES CARROLL: president of the World's Congress Auxiliary of the World's Columbian Exposition; b. in 1831 in Hamilton, N. Y.; removed to Peoria, Ill., 1850; admitted to the bar 1852; removed to Chicago 1860; president of the Illinois State Bar Association 1882; has been president of the International Law and Order League, which he helped to found, since 1885; has been active in works of practical reform; author of the scheme for a series of world's congresses in connection with the World's Columbian Exposition of 1893 "to promote future progress by the fraternal co-operation of the enlightened minds of all countries."

C. H. THURBER.

Bonney, THOMAS GEORGE, LL. D.: author, scientist, and divine; b. in Rugeley, July 27, 1833; educated at St. John's College, Cambridge, where he took his B. A. degree in 1856; fellow St. John's College, Cambridge, 1859; elected Professor of Geology at University College, London, 1877; president Geological Society 1884–86. He has translated Pierotti's *Jerusalem Explored* (2 vols., 1864); Pierotti's *Customs and Traditions of Palestine*. Author *The Holy Places of Jerusalem* (1864); *Outline Sketches in the High Alps of Dauphiné* (1865); *Testimony of the Primitive Fathers to the Truth of the Gospel History* (1867); *Four Sermons* preached before the University of Cambridge (1868); *The Alpine Regions of Switzerland and the Neighboring Countries* (1868); *The Coast of Norway* (1870); *Vignettes, Alpine and Eastern* (1873); *The Bernese Oberland* (1874); *Lake and Mountain Scenery of the Swiss Alps* (1874); *Elementary Geology* (1874); *Welsh Scenery* (1875–76); *Sketch of the Geology of Cambridgeshire* (1875); *English Lake Scenery* (1876); *Elementary Physical Geography* (1877); *Sermons on some Questions of the Day* (1878); *The Influence of Science on Theology*, Hulsean Lectures (1885); contributor to the *Transactions of the Royal Society*, the *Journal of the Geological Society*, and other scientific publications.

W. S. PERRY.

Bonnivard, bon'nĕĕ'vaar', FRANÇOIS, de: writer and politician of Geneva; b. in France, 1496; educated at Turin; succeeded to the priory of St. Victor, near Geneva, 1510; sided with Geneva against the Duke of Savoy, by whose agents he was arrested and imprisoned in the castle of Chillon 1530; was liberated 1536, when his countrymen captured Chillon; wrote the chronicles of Geneva (1546–52); left several works in MSS. His books, given to the city, formed the nucleus of the public library of Geneva. His imprisonment is the foundation of Byron's poem, *The Prisoner of Chillon*. D. in Geneva, about 1571.

C. H. THURBER.

Bon'nycastle, CHARLES: b. at Woolwich, England, in 1792; son of John, noticed below. He was one of the professors brought over by Mr. Jefferson for the University of Virginia in 1825. He at first occupied the chair of Natural Philosophy, and afterward that of Mathematics. He published a treatise on *Algebra*, one on *Inductive Geometry*, and various scientific papers. D. at Charlottesville, Va., Oct., 1840.

Bonnycastle, JOHN: mathematician; b. in Whitchurch, Buckinghamshire, probably about 1750. He was Professor of Mathematics at the Royal Military Academy at Woolwich from 1782 to 1785, and published, besides other works, *Elements of Geometry* (1789) and *Elements of Algebra* (2 vols., 1813), which were highly esteemed. D. May 15, 1821.

Bonnycastle, Sir RICHARD HENRY: son of the foregoing; b. in 1791; served in Flanders and afterward in Cana-

da against the U. S. (1812–15); became in 1848 lieutenant-colonel of British engineers. Most of his life was passed in British North America. He was knighted for services in defense of Kingston, Canada, in 1837, and published *Canada as it Was, Is, and May Be*, and other works on Canada, and also one on *Spanish America* (1818). D. in 1848.

Bonpland, bōn'plăn', Aimé: French botanist; b. at La Rochelle, Aug. 22, 1773. He studied medicine and botany at Paris, and formed a friendship with Humboldt. In 1799 he accompanied Humboldt in a scientific expedition to South America, where they traveled about five years. After their return to France he published a splendid work entitled *Equinoctial Plants collected in Mexico* (2 vols., Paris, 1808–16, with 140 plates). He had collected 6,000 species of plants, of which 3,500 were entirely new. He became Professor of Natural History at Buenos Ayres in 1816, and departed in 1821 on an excursion to the Andes, but as he was passing through Paraguay he was arrested by order of Dr. Francia, who detained him as a prisoner nearly ten years. After his release in 1831 he resided for many years in Uruguay. D. in Santa Anna, May 11, 1858. Humboldt, Bonpland, and Kunth published a work called *Nova Genera et Species Plantarum* (7 vols., 1815–25, with 700 plates).

Bo'nus [orig. a jocularly inaccurate use of the Lat. adjec. good, as if meaning "a good thing"]: a sum or consideration given or paid beyond what is statedly or properly due. Specifically: (*a*) an extra dividend or allowance paid to the shareholders of a stock company, holders of insurance policies, etc., out of accumulated profits; (*b*) a premium for a loan distinct from the interest, and hence a premium paid for a charter or other privilege granted to a corporation or individual.

Bony Fishes: See Fish.

Bonvin, bōn'văn', François Saint-: French genre-painter, whose pictures are highly appreciated by artists and amateurs of art; b. at Vaugirard, near Paris, Sept. 22, 1817. He was self-taught, and began his art studies by copying the works of the Dutch masters in the Louvre. He exhibited frequently at the Paris Salon, and received a second-class medal in 1851 and the Legion of Honor in 1870; but his works did not gain for him a popular reputation. His pictures are now much sought for by collectors, and are justly valued for their sobriety but richness and depth of color, and their quiet, unobtrusive technique. His work has much in common with that of the great Dutch painters of the seventeenth century, but is distinguished by marked personal qualities. D. at Saint-Germain-en-Laye, Dec. 18, 1887.

William A. Coffin.

Bony-pike: a ganoid fish of the genus *Lepidosteus* (originally spelled *Lepisosteus*); found in America; especially remarkable as being examples of a type of fishes now almost extinct, but which in the old red sandstone period were extremely numerous. To the same genus belong the gar-pike and the alligator-gar of the U. S. The latter is sometimes 6 feet in length, and derives its name from its wide flattened head, which suggests that of an alligator. See Lepisosteidæ.

David S. Jordan.

Bonze, bonz: a name sometimes applied by foreigners to the Buddhist monks of China and Japan. The word may be a corruption of the Japanese *bozu*, a Buddhist monk, or of the Chinese *fan sŭng* (pronounced in Japan *hon* (or *bon*) *zo*), "an ordinary member of the assembly," i. e. of the monastic order founded by the Buddha. See Buddhism and Gautama.

Booby: one of several species of aquatic birds of the same genus as the gannet (*Sula*) and family *Sulidæ*. They are found on the coasts of tropical and sub-tropical countries. They seldom swim, but are birds of powerful wing, and feed on fish, which are caught near the surface of the water by a sudden plunge. They are remarkable for stupidity and slow movement on the land, and will remain motionless when approached. The boobies are persecuted by the frigate-bird, which sometimes compels them to give up the fishes they have caught, and even to disgorge those they have devoured. The name is more commonly applied to the darker species of the genus, the white ones being known as gannets. The commonest species in the U. S. is *Sula leucogastra*, which is very abundant along the South Atlantic and Gulf coasts.

D. S. Jordan.

Booddha: See Bûddha.

Boofarik, boo-faă-reek', or **Boufarik**: a town of Algeria. See Bufarik.

Book: a treatise written or printed on any material and put together in any convenient form. The materials and form have varied greatly among different nations and at different periods. The ordinary writing material of the ancients was papyrus. Parchment, thin leaves of lead and copper, ivory tablets, linen, etc., were also used. Leaves joined end to end and rolled up on a small roller made a "volume" (Lat. *volumen*, from *volvere*, to roll). Books in a square form came in later. Such a book was called a codex. Books were copied by hand down to the invention of printing, were frequently illuminated—i. e. adorned with sketches and miniatures in colors—and were rare and expensive. From the seventh to the eleventh centuries books were so scarce that often not one could be found in an entire city, and even rich monasteries possessed only a single mass-book. The introduction of paper into Europe about the thirteenth century, and the invention of printing in the fifteenth century, made possible the great accomplishments of modern bookmaking. Books printed before 1500 are known as incunabula (Lat. *incunabulum*, cradle). Scarcity of parchment led in the Middle Ages to the practice of washing or scraping off one writing to make room for another. A manuscript so treated was called a Palimpsest (*q. v.*). The terms folio (fol.), quarto (4to), octavo (8vo), duodecimo (12mo), etc., applied to books, indicate in a general way the size, folio being the largest. Books are printed on large sheets of paper; when these sheets are folded once, making each two leaves and four pages, the book is a folio; when folded twice, so as to make each four leaves and eight pages, the book is a quarto; folded so as to make eight leaves and sixteen pages, octavo, etc. See Bibliography, Bookbinding, Copyright, and Palæography.

Bookbinding: the art of fastening together and inclosing the leaves of a book for preservation and use; practiced for many centuries. Long before the invention of printing the written leaves of missals and other books were united together, and inclosed in covers of wood, parchment, and other materials. Much labor and expense was bestowed on a single volume, and the covers were frequently decorated with jewels and ornaments of gold and silver. Some of these volumes are still preserved in the monasteries and museums of the Old World, and are objects of interest and study.

Since the invention of printing, and especially from the beginning of this century, the rapid advancement of the mechanical arts, the extension of education, and the general diffusion of knowledge have made books as much a necessity of life as food and clothing, and their preservation is therefore an object of importance.

The modern operations of bookbinding may be grouped in two main divisions—"forwarding" and "finishing," the first comprehending what is necessary for the preservation of books, the latter pertaining to their embellishment. In each of these departments there are various subdivisions, which may be noted. The sheets are generally received from the printer in bundles containing a thousand, more or less, of one kind.

The first operation is to fold the sheet, by means of a thin piece of ivory or bone, about 9 inches long, called a "folder." The object of this is to bring the pages together in regular order, and on the care with which the folding is done much of the appearance of the book depends. The next process is "gathering" and "collating." Gathering consists in putting together one each of the various sheets of which the book is made, and collating is the examination of the numbers 1, 2, 3, etc., which are placed at the foot of the outside page of the folded sections, and which are called "signatures."

The next thing required is to make the book solid. This is done by placing it either in a hydraulic press or under some other form of pressure, such as the nature and size of the book may require. After being pressed the book is prepared for sewing by having indentations made in the back of the sheets by passing them over rapidly revolving circular saws. They are now sewed on a frame called a "sewing-bench," each sheet being sewed around twine bands, which are afterward fastened to the boards. Much of its durability depends on the sewing being well done, and all large work is improved by having the sections at the beginning and end of the book cross or "whip stitched."

The greater part of the labor has so far been done by women, who by practice acquire great dexterity in the performance of the various processes involved. Machinery is

used with considerable success in folding, and a machine has been introduced for sewing, but all the work in the early stages is still in great measure done by hand-labor. In the more advanced stages of binding machinery is used extensively, and our description will be in accordance with the methods pursued where large quantities are constantly being bound, and where machinery is used to facilitate production. The book, after being removed from the sewing-bench, and having about an inch of the twine left on either side to fasten to the pasteboard cover, has the end leaves applied. These are of colored, white, or marble paper, as the nature of the work may require. The book is now "cut" by being fastened tightly in a cutting-machine, and a vibrating knife is brought down on the edge, which is cut off smoothly at the point desired. The edges are either left white, are colored by being sprinkled with color thrown on finely with a brush, or are marbled, which is done by dipping the edge on colors which float on the surface of gum-water. The "comb edge" so much used is made by a comb being drawn through the colors on the surface of the gum-water before the book is dipped. If the book is to have gilt edges, it is placed in a press and a coating of red color applied. The edges are then sized with white of egg, and gold-leaf laid over the size. When the sizing is thoroughly dried the gold is burnished with agate or bloodstone.

A coating of glue is now applied to the back, and when partially dry a round is formed in the front and back by a slight hammering on the back. The book is then fastened firmly between iron clamps in a backing-machine, and a roller is then pressed heavily across the back, which turns part of the back over either side of the clamps, making a groove to hold the board of which the inside of the cover is made. The piece of silk braid or colored cloth which projects over the leaves of the back inside the cover, and is called the "head-band," is now fastened with glue, and the whole back has a lining of cloth or strong rope paper firmly applied to it with glue and paste. The open or spring back is now made by applying two thicknesses of paper, open in the center, but fastened at the edges—one thickness of the paper being attached to the back of the book, and the other thickness to the leather or other material of which the outside cover may be made. The book is now ready for the cover, the outside of which may be of muslin, sheepskin, calf, Turkey morocco, or such other materials as may be desired. The cover, or "case," is made by boards being cut larger than the leaves of the book, over which the outside material is fastened by glue or paste, a space being left between the two boards large enough to fit the back of the book in, the boards being required to fit nicely into the grooves made in backing. Much of the material used for boards of common books is straw, but all good work should have a hard, smooth board made of rope. The edge of the board is frequently ground off on a rapidly revolving emery wheel, which makes a beveled edge, now much used.

After the cover is dry the embellishment is done by stamping in gold, blank, and colors. If in gold, the leather or cloth is sized with albumin, and gold-leaf laid on with oil. The ornamental die or lettering being fastened in an "embossing-press" and heated, it is brought with sufficient pressure on the cover to make the gold-leaf adhere. The surplus gold being brushed off, leaves the impression of the die. The dies are cut in brass or steel, and very elaborate and beautiful designs, which formerly would have taken many weeks to execute by hand-labor, are now produced almost instantly by the embossing-press.

The cover having received all intended ornament, the back of the book is glued and fitted into it, the end-papers are pasted to the inside of the cover, and the book is placed in a press to remain till dry. When removed from the press it is ready for the publisher and the public.

"Half binding," much used for library and reference books, is that style of binding where the back and corners are covered with leather, and the sides with cloth or paper.

The old process of "forwarding" by hand, in which each book is backed by a hammer and cut singly by press and plow, and the book finished by the slow method of former years, is still followed to some extent in small binderies, but requires no minute description, as the system is almost obsolete for books in quantities.

Machinery is now much used in bookbinding, and large editions are produced in a style of great elegance and durability, and at prices so moderate as to be within reach of all classes of the community. JAMES SOMERVILLE.

Bookkeeping: the art of recording, in a regular and systematic manner, the transactions of merchants or other persons engaged in pursuits connected with money. There are two modes of keeping books of account—the one by what is termed *single*, and the other by *double entry*. Both are in general use. The system of single entry is the simpler mode of bookkeeping, and consists of only a day-book and a ledger. In the day-book the dealer enters his sales and purchases, and in his ledger he carries the former to the debit of his customers, and the latter to the credit of the merchants who supply him with goods. By making at any time a list of the sums due to him by his customers, and of those due by him to others, the dealer may, after adding to the debts due to him the value of his stock on hand, arrive at an approximation to the real state of his debts and assets. This, however, is but an imperfect method of bookkeeping, and in the case of wholesale mercantile business, where extensive and multifarious transactions have to be recorded, recourse is had to the system of *double entry*. This system possesses all the advantages of single entry, besides being so complete and comprehensive in its principles, and so certain in its results, as to admit of universal application.

No authentic accounts exist of the origin of bookkeeping. The double-entry system appears to have been first practiced in Italy in the latter part of the fifteenth century.

The objects of bookkeeping are to exhibit transactions in the most minute detail and in the most condensed form; advancing from the earliest stage to the latest by such clear and lucid steps as to admit of every fact being traced in its progress, so as to be secured at every step against error.

The three principal books required under the system of double entry are a cash-book, journal, and ledger. In the first of these every transaction is recorded where money is one of the elements. The journal forms a most important part of the system. It exhibits a narrative of every transaction of which an actual transfer of money does not form one of the elements, arranging the facts in as simple a form as correctness and intelligibility will admit of; and the results of those entries in the journal are afterward introduced into the ledger, which thereby becomes a key to the history of every transaction. In like manner cash transactions are often introduced into the journal, and are at stated periods classed and arranged in a condensed form and transferred to the ledger. The journal is advantageously ruled with four columns—two for entries debtor, and two for entries creditor; and all the transactions being connected either with personal and property accounts or with nominal accounts, such as charges, profit and loss, and so forth, they are classed accordingly in the columns on the debtor or creditor side of the journal respectively; and as the debit entries are at all times equal to the credit entries, the aggregate of the two columns on the debtor side must tally with the aggregate of the two on the creditor side of the journal. Experience and practice are occasionally suggesting minor improvements upon the forms of the cash-book, journal, and ledger to suit particular cases; and indeed an intelligent bookkeeper may accomplish much by a judicious classification of the facts in auxiliary books; but the fundamental principles of the double-entry system of bookkeeping remain perfect and unchanged, and may be regarded as the best hitherto discovered.

Book of the Dead: See RITUAL OF THE DEAD.

Book-plates: See the Appendix.

Boole, GEORGE: b. in Lincoln, England, Nov. 2, 1815; Professor of Mathematics, Queen's College, Cork, Ireland, and published, besides treatises on mathematics, *An Investigation into the Laws of Thought, on which are Founded the Mathematical Theories of Logic and Probabilities* (London, 1854). D. in Cork, Dec. 8, 1864.

Boolgarin: See BULGARIN.

Boom, bōm: a town of Belgium: province of Antwerp; on the river Rupel, at its junction with the Brussels Canal, 9 miles S. of Antwerp (see map of Holland and Belgium, ref. 9–E). It has a gymnasium and extensive brick and tile works, tanneries, ropewalks, and manufactures of sailcloth. Pop. (1890) 14,080.

Boondee: feudatory state and town of Rajputana, India. See BUNDI.

Boone: on railroad; a city; capital of Boone co., Ia. (for location of county, see map of Iowa, ref. 5–G). Immense

quantities of coal are shipped from here, and the adjacent timber lands are among the best in the State. The river affords a good water-power. The town of Boonsboro was annexed to Boone city before the census of 1890. Pop. (1880) 3,330; (1890) 6,520; (1900) 8,880.

Boone, DANIEL: a pioneer and hunter; b. in Berks co., Pa., Feb. 11, 1735. He emigrated to North Carolina, where he married. In 1769, with five companions, he penetrated into the forests of Kentucky, which were then uninhabited by white men. He was captured by Indians, but escaped, and continued to hunt in that region for more than a year. Having returned home early in 1771, he moved with his own and five other families to Kentucky in the autumn of 1773. To defend his colony against the savages, he built, in 1775, a fort at Boonesborough, on the Kentucky river. The Indians attacked this fort several times in 1777, but were repulsed. Boone was surprised and captured by them in Feb., 1778. They took him to Detroit, and treated him with lenity, but he soon escaped, and returned to his fort, which he defended with success against 450 Indians in Aug., 1778. He removed in 1795 to a place which is nearly 45 miles W. of St. Louis, Mo., and found there a new field for his favorite pursuits. He had received large land grants in Kentucky and Missouri which involved him in litigation, and most of his property was wrested from him. D. on his Missouri farm, Sept. 26, 1820, but his remains were removed in 1845 by the State of Kentucky and interred near Frankfort. See Sparks, *American Biography*, vol. xiii., second series; W. H. Bogart, *Life of Daniel Boone* (1857).

Boone, WILLIAM JONES, D. D.: first missionary bishop of the Protestant Episcopal Church to China; b. at Walterborough, S. C., July 1, 1811; graduated at College of South Carolina 1829; studied law and was admitted to the bar in 1833, but relinquished the practice of this profession to take holy orders. Having devoted himself to foreign missions, he took a course in medicine, receiving the degree of M. D. from the South Carolina Medical College. He was ordained Sept. 18, 1836, sailing for China July 8, 1837; consecrated bishop to China Oct. 26, 1844. D. at Shanghai, China, July 17, 1864. His published writings were mainly connected with the translation of the Bible into Chinese.—His son, WILLIAM JONES BOONE, D.D.; b. in Shanghai, China, May 17, 1846; graduated at Princeton, 1865, and ordained in 1868; became himself missionary bishop in China, after many years of service there, succeeding Bishop Scherechewsky, who had resigned on account of failing health. He was consecrated Bishop of Shanghai, having jurisdiction in China, Oct. 28, 1884. D. at his post Oct. 5, 1891. W. S. PERRY.

Boonesborough, Iowa: See BOONSBORO.

Booneville: See BOONVILLE.

Boon Island: 10 miles E. of the harbor of York, Me.: is in lat. 43° 07′ 16″ N., lon. 70°, 28′ 16″ W. It has a granite lighthouse 123 feet high, showing a fixed white dioptric light of the second order, 133 feet above the sea.

Boonsboro, or **Boonsborough,** Ia.: See BOONE.

Boon'ton: Morris co., N. J. (for location of county, see map of New Jersey, ref. 2–D); on railroad and the Rockaway river; about 30 miles from New York city. It has iron-works among the largest in the U. S.; the rolling-mills, nut-mills, plate-mills, nail-mills, and blast furnaces covering at least 50 acres of land. Pop. of township (1880) 2,682; (1890) 3,307; (1900) 4,710; town (1900) 3,901.

Boon'ville: town; capital of Warrick co., Ind. (for location of county, see map of Indiana, ref. 11–B); on L. E. and St. L. R. R.; 9 miles from Ohio river and 17 miles from Evansville. It has 8 churches (2 for colored people), 3 schools (1 for colored people); agriculture is the chief occupation, but coal is abundant and mined everywhere. Timber is abundant in the surrounding country. The town was founded about 1818. Pop. (1880) 1,182; (1890) 1,881; (1900) 2,849.

Boonville, or **Booneville**: a city and river port; capital of Cooper co., Mo. (for location, see map of Missouri, ref. 4–G); on J. C. B. and L. branch of Mo. Pac. R. R., and M. K. and T. R. R., and on the right (S.) bank of the Missouri river; 227 miles by water and 187 miles by railroad W. by N. of St. Louis. It stands on a bluff about 100 feet above the river, is very healthy, and has an advantageous position for trade. The railroad bridge which here crosses the river is one of the most costly that spans the Missouri. Boonville has excellent schools, public and private; its manufactures are few, the inhabitants being generally well to do. The town was founded in 1818. During the civil war a Confederate camp was established at this place. On June 16, 1861, Gen. Lyon reached Rockport, opposite Boonville, and on the following day attacked the forces in camp at Boonville under Col. Marmaduke. The Confederate force, amounting to only about 2,500 poorly armed raw troops, was routed, abandoning two guns and a large quantity of clothing, camp equipage, etc. Pop. (1880) 3,854; (1890) 4,141; (1900) 4,377.

Boonville: village; Oneida co., N. Y. (for location of county, see map of New York, ref. 4–H); 35 miles N. of Utica, on the Rome, Watertown and Ogdensburg R. R., and on Black River Canal. Here are 6 churches, an academy, Erwin Library and Institute, chair-factory, foundry, and 3 grist-mills. This neighborhood is a popular place of summer resort. Pop. (1880) 1,677; (1890) 1,613; (1900) 1,745.

Boorhanpoor: city of the Central Provinces, India. See BURHANPUR.

Booro: a large island in the East Indies. See BURU.

Booroogird: a city of Persia. See BURUGIRD.

Boossa: African town on the Central Niger. See BUSSANG.

Bootan: native state in the Himalaya Mountains. See BHUTAN.

Boö'tes [Gr. Βοώτης, i. e. plowman]: a name of PHILOMELUS; son of Ceres and a brother of Plutus. He is said to have invented the plow, and used it in cultivation of the soil. To reward him for this service he was translated into a constellation, under the name of Boötes.

Boötes: a northern constellation; represented on celestial globes as a man holding in one hand a club, and in the other a leash by which he leads two hunting-dogs. This constellation comprises Arcturus, a star of the first magnitude. Boötes is bounded N. by Draco, E. by Corona Borealis and Serpens, S. by Virgo, and W. by Canes Venatici and Coma Berenices.

Booth, ABRAHAM: b. at Blackwell, Derbyshire, England, May 20, 1734; from 1769 till his death pastor of the Baptist church in Goodman's Fields, London. He was author of *The Reign of Grace* (London, 1768) and *Pædobaptism Examined* (1784; 2d ed. 2 vols., 1787). The latter work was republished in 4 vols. 8vo in 1829. D. Jan. 27, 1806.

Booth, BARTON: actor and dramatist; b. in 1681. He first appeared in 1698 at Dublin, Ireland, in Thomas Southern's *Oroonoko*. In 1701 he first acted in London as Maximus in Lord Rochester's *Valentinian*. Thenceforward his career was prosperous and distinguished. He left the stage in 1728. D. in Hampstead, May 10, 1733. He acted well as Hotspur, Antony, Othello, and Henry VIII., and was noted for his personal beauty. He wrote a masque entitled the *Death of Dido* (1716).

Booth, EDWIN THOMAS: actor; son of Junius Brutus Booth; b. in Belair, Md., Nov. 13, 1833; d. in New York city, June 7, 1893. As a boy he traveled with his father, and first appeared on the stage, at the Boston Museum, Sept. 10, 1849, as Tressel in *Richard III.*, his father playing Richard. His first appearance before a New York audience, was as Wilford in *The Iron Chest*, at the National Theater, in Chatham street, Sept. 27, 1850. He afterward played with a Baltimore stock company, then went with his father to California, in July, 1852. He made an unprofitable trip to Hawaii and Australia in 1854, and in 1856 returned to the Eastern States, where he was everywhere welcomed and honored as a worthy successor of his famous father. His success extended in almost an unbroken line from that time till his death. From 1862 till 1867 he played chiefly at the Winter Garden Theater, New York. On March 23, 1867, the theater was burned with all its contents, Booth losing his entire wardrobe, together with many relics of his father. There was no insurance, and the entire loss fell upon Booth, who had recently bought out J. S. Clarke, his partner in the enterprise. He opened Booth's Theater Feb. 3, 1869, and in 1871 became its sole owner. The panic of 1873–1874 swept him into bankruptcy. He set out at once to free himself of this debt, and the profits of his work from Oct., 1875, to May, 1877, enabled him to pay off the entire obligation. He played in the Haymarket Theater, London, in 1861, but the civil war in the U. S. drew greatly from his popularity. He revisited England in 1880, and again in 1882, meeting with an enthusiastic reception in all the larger cities. He also played in Berlin, Hamburg, Hanover, Bremen, and Vienna. His notable parts were those of Hamlet, Macbeth, Lear, Othello, Iago, Wolsey, Richard III., Shylock, Richard II., Benedick, Petruchio, Richelieu, Payne's Brutus, Ruy Blas, and Don Cæsar de Bazan. In Jan., 1888, he procured the incorporation of The Players, and presented the club with a completely fitted club house,

No. 16 Gramercy Park, New York, on which he had expended $175,000. See his *Life*, by Winter (1886).

Booth, Henry Matthias, D.D.: Presbyterian minister and author; b. in New York city, Oct. 3, 1843; graduated at Williams College (1864) and at the Union Theological Seminary (1867); pastor in Englewood, N. J., 1867–91; president of Auburn Theological Seminary from Oct., 1893, until his death, Mar. 18, 1899. He published *The Heavenly Vision and other Sermons* (New York, 1885); *The Sunrise, Noonday, and Sunset of the Day of Grace* (1888). W. J. Beecher.

Booth, Junius Brutus: actor; b. near London, England, May 1, 1796; first appeared on the stage, Dec. 13, 1813, at Deptford, England, as Campillo, in Tobin's *Honeymoon*, and within four years became famous in London as Richard III. and Sir Giles Overreach. These and Pescara were his great parts. He first acted in the U. S., July 13, 1821, at Richmond, Va., as Richard III. His career on the U. S. stage was one long triumph—marred, however, by intemperance and incipient insanity. He died on a Mississippi river steamboat, Nov. 3, 1852, and was buried at Baltimore, Md. His wife was a Miss Holmes, of Reading, England. His children were Junius Brutus, Rosalie Anne, Edwin Thomas, Annie Sydney, Joseph Addison, Henry Byron, Mary, Frederick, Elizabeth, and John Wilkes. See *The Elder and the Younger Booth* (1882) in the American Actor Series.

Booth, Mary Louise: writer and journalist; b. at Yaphank, N. Y., Apr. 19, 1831; published a *History of the City of New York* (1859–67; 2d ed. New York, 1880), and over thirty volumes of French translations, among which are the works of De Gasparin, Cochin, and Laboulaye on the American civil war, and Henri Martin's abridged *History of France* (1880). From its beginning in 1867 until her death in New York, Mar. 5, 1889, she was editor of *Harper's Bazar*.

Booth, Newton: b. in Salem, Washington co., Ind., Dec. 25, 1825; graduated at Asbury University in 1846; studied law in Terre Haute, and was admitted to the bar in 1850; went to California soon afterward, and engaged in business in Sacramento; returned in 1857 to Terre Haute, and practiced law till 1860, when he went back to California. In 1863 he was elected to the California State Senate; in 1871 was elected Governor of California, but resigned in Mar., 1874, when elected U. S. Senator. He served from Mar. 9, 1875, till Mar. 3, 1881. D. in Sacramento, July 14, 1892.

Booth, Robert Russell, D. D.: Presbyterian minister; b. in New York city, May 16, 1830; graduated at Williams College (1849), and at Auburn Theological Seminary (1852). Previous to his present pastorate in Rutgers Riverside Presbyterian church in New York city, he was pastor successively in Troy, N. Y., Stamford, Conn., and of the Mercer Street and University Place churches, New York city. He has published many pamphlets and discourses, and is a trustee of Williams College, a director of Princeton Theological Seminary, a member of the Presbyterian Board of Foreign Missions, etc. W. J. Beecher.

Booth, William: general of the Salvation Army; b. in Nottingham, England, Apr. 10, 1829; educated at a private school in that town; became a minister of the Methodist New Connection in 1850; resigned from the Conference in 1861 to enter upon evangelistic work. In July, 1865, he started "The Christian Mission" in the East End of London. This mission grew rapidly, and was organized on military lines. In 1878 Mr. Booth gave to it the name of "The Salvation Army," of which he became general and absolute commander. His entire family have shared with him in this work. He has published several hymn-books; *Salvation Soldiery*; *Training of Children*; *Letters to Soldiers*; *In Darkest England*, the latter containing a scheme, subsequently put in operation at great expense, for the enlightenment and industrial support of the lowest classes. In 1880 Gen. Booth established the *War Cry* as the weekly gazette of the army. This is now (1897) published in some twenty-eight different languages, with a total circulation of about 600,000. See Salvation Army. C. H. Thurber.

Boothbay Harbor: town; Lincoln co., Me. (for location of county, see map of Maine, ref. 10–D); on Atlantic Ocean; 14 miles from Knox and Lincoln R. R., and 16 miles from Bath, from which it is reached by steamer. The town has two churches, a high school, bone-phosphate, canning, and cold-storage industries, two marine railways, steam lumber-mill, and a boat-manufactory. The fine bathing, sailing, and fishing to be had here, and the romantic scenery in the neighborhood, have made this place a popular summer-resort. This town was separated from Boothbay Feb. 16, 1889. Pop. of Boothbay township (1880) 3,575, including Boothbay Harbor; (1890) 1,718; (1900) 1,766. Of Boothbay Harbor (1890) 1,699; (1900) 1,926. Editor of "Register."

Boo'thia Fe'lix: a peninsula or island of North America; in the Arctic Ocean; extends from lat. 69° to 75° N. It is bounded on the E. by Boothia Gulf. It was discovered by Sir John Ross, and named in honor of Sir Felix Booth. It contains the north magnetic pole.

Boots: articles of dress worn on the feet, and reaching up the legs sometimes above the knees. They were developed from the sandal by slow stages, and appeared in England during the reign of Edward II. as part of a knight's costume. The Greek *cothurnus* or buskin was sometimes a boot reaching to near the knee, and made with thick soles to increase the stature of actors. The Roman patricians wore leather shoes, the color of which indicated rank. A senator's shoes were red. In the time of Charles I. a wide-topped boot of Spanish leather came into use, and this in turn was superseded by an elaborately adorned French boot. In the cavalry service this article of apparel became a matter of regulation by the government, and was known as the jack-boot, a high-topped heavy boot worn with spurs. In the eighteenth century a yellow-topped boot was fashionable in Great Britain, and copied thence in France. The Hessian boot followed; was worn over the trousers, and was decorated with a tassel. This gave way to modifications known as the Blücher and the Wellington boots. These forms are giving place to the modern Shoe (*q. v.* for the processes of manufacture).

In Scotland the name *boot* was applied to an instrument of torture in use until late in the seventeenth century. It consisted of a wooden or iron case, was placed on the lower part of the leg, and then tightened by driving in wedges with repeated blows of a mallet, and at times with such force as to crush the bones and muscles. It was employed by the privy council in putting a man to the question, and especially used upon the Covenanters. A milder form of the boot consisted of a wet leather or parchment envelope bound closely on the leg, and then shrunk by drying.

The *boot* of a carriage is a covered receptacle, placed either beside the driver or behind the body of the coach, in which baggage is carried; also a leather apron attached to the dash-board, and used as a protection against stormy weather.

Booty [deriv. of *boot*, profit < O. Eng. *bōt*: Germ. *Busse*]: in international law, personal property captured on land by a public enemy in time of war. It differs from prize, which is captured at sea. (See Prize.) In the case of prize the ownership of the property does not pass to the captor until condemnation by a prize court. Booty belongs to the captor after an undisturbed possession of twenty-four hours, and the right of *post liminium* is at an end. (See Postliminy.) In strictness of law, booty belongs to the sovereign, and not to the individual soldier who captures it. It is quite common for the sovereign power to bestow a portion or the whole of it upon its subjects. This matter, however, is not governed by international rules, but by the municipal law of the captor.

Bopp, Franz: German philologist; b. at Mentz, Sept. 14, 1791. He studied languages in Paris and Göttingen, and became in 1821 Professor of Philology at Berlin. He published a *Glossarium Sanscritum* and a *Critical Grammar of the Sanskrit Tongue*. He was an efficient promoter of the study of Sanskrit, and is regarded as the founder of the science of comparative philology. His most important work is a *Comparative Grammar of the Sanskrit, Zend, Greek, Latin, Lithuanian, Old Slavonian, Gothic, and German Languages* (1833; 2d edition, 3 vols., Berlin, 1857–61), which has been translated into English and published at Oxford (3 vols., 1845–50). D. in Berlin, Oct. 23, 1867. See Preface to the French translation of Bopp's *Comparative Grammar*, by Bréal (Paris, 1866–72, 4 vols.), and Lefman's *Franz Bopp, sein Leben und seine Wissenschaft* (Berlin, 1891).

Bo'ra, or **Boh'ren,** Kathrina, von: a German nun, who became the wife of Martin Luther; b. in Bitterfeld, Saxony, Jan. 29, 1499. She was converted to the Lutheran doctrines, and escaped from her convent in 1523. She was married to Luther, June 13, 1525, and bore him three sons and three daughters. After Luther's death (Feb. 18, 1546) she continued to live at Wittenberg, but in 1552 the plague drove her to Torgau, where she died Dec. 20, 1552. See her *Life*

by C. W. F. Walch (Halle, 1751–54, 2 vols.); F. G. Hofmann (Leipzig, 1845); A. Stein (Halle, 1878; 3d ed. 1886).

Boraç'ic (or **Bo'ric**) **Acid** occurs native in certain lagoons of Tuscany, and in a crater in the island of Vulcano (Volcano), N. of Sicily. It is of great commercial importance for the manufacture of borax. The acid has the composition $B(OH)_3$. When heated it loses the elements of water and forms the oxide B_2O_3, which is frequently called boracic acid. I. R.

Bo'rage: a short-lived annual or biennial herb (*Borago officinalis*), a foot or two high, native of Europe, long cultivated in gardens, and now escaped to waste ground and rubbish heaps. Its pretty blue flowers are quite ornamental, and yield nectar to bees, and are thus of value to bee-keepers. It was formerly used in medicine as a demulcent, refrigerant, and diaphoretic, but it is now regarded as of secondary value only, and has fallen into disuse. C. E. B.

Borage Family (*Boraginaceæ*): mostly rough, hairy herbaceous dicotyledons, with gamopetalous corollas and superior four-lobed ovaries. There are about 600 species, which are widely distributed in temperate climates.

Charles E. Bessey.

Bo'rax [from Arab. *bōraq*, *būraq*, borax] (also called *sodium tetraborate*): a compound ($Na_2B_4O_7 + 10H_2O$) of boracic acid and soda; found native as a saline incrustation on the shores of lakes in Persia, Thibet, and India. The impure borax collected on these shores is called *tincal* or crude borax, which is also found in Peru, Chili, California, Nevada, and other regions. Borax is also prepared from boracic acid by solution in boiling water, and the addition of a boiling solution of sodium carbonate (Na_2CO_3). It is also prepared from borate of lime, a salt largely procured from Chili, Peru, etc. Borax is a white salt of a sweetish taste, soluble in twice its weight of boiling water. It is useful as a flux in promoting the fusion of metallic mixtures and producing fusible silicates in assaying and in welding iron. As an agent in experimenting with the blowpipe it is valuable for the readiness with which it forms colored glasses with various metallic oxides. It is also used in medicine, and as a detergent in the laundry. More than 4,000,000 lb. are annually produced from native boracic acid in Italy, hot springs affording the heat necessary in the manufacture. The annual production on the Pacific coast has varied widely, declining from 5,180,810 lb. in 1876 to 1,584,966 lb. in 1879, but rising again to 11,000,000 lb. in 1887. In 1888 the product was 7,589,000 lb., valued at $455,340. See Boracic Acid. Revised by Ira Remsen.

Borax Lake: a small lake in Lake co., Cal., the water of which is a strong solution of borax. Crystals of borax are also found in large numbers in the muddy sediment at the bottom. Many hundreds of tons of these have been collected and sent to San Francisco.

Borda, bōr'daa', Jean Charles, de: French mathematician and astronomer; b. at Dax, department of Landes, May 4, 1733. He served as an engineer in the army, and became a captain in the navy. As a naval officer he fought for the U. S. in 1778–82. He wrote several scientific works, contributed much to the progress of nautical science, and invented or improved the reflecting circle. Aided by Delambre and Méchain, he measured an arc of the meridian from Dunkirk to the Balearic isles. D. in Paris, Feb. 20, 1799.

Borde, or **Boorde**, bōrd, Andrew: English physician and writer; b. at Boord's Hill, near Cuckfield, in Sussex, about 1490. Educated at Oxford, he became a Carthusian monk in London; became suffragan bishop of Chichester, 1521; but, finding the order too severe, he obtained a dispensation from his vow in 1528 and studied medicine on the Continent and at Glasgow; traveled much, and was for a time patronized by Henry VIII.; d. in 1549, after spending a little time in the Fleet prison. Author of a *Dyetary*; the *Fyrst Boke of the Introduction of Knowledge* (edited by Dr. Furnivall, 1870); and various books of travel, including an *Itinerary of England*.

Bordeaux, bōr'dō': a city and seaport of France; capital of the department of Gironde; finely situated on a plain on the left bank of the river Garonne; 58 miles from its mouth and 364 miles by rail S. S. W. of Paris; lat. 44° 50′ N., lon. 0° 34′ W. (see map of France, ref. 7–D). It has a capacious harbor, and is accessible by vessels of 600 tons at all stages of the tide. The river, which is here about 650 yards wide, is crossed by a noble bridge of seventeen arches. Bordeaux is an archbishop's see. It is connected by several railways with Paris, Toulouse, Marseilles, and other towns. It is probably the most commercial city of France, except Marseilles. The harbor is large enough to admit 1,200 vessels of the largest size. Its commerce extends to all parts of the world. The newer portions of the city have wide streets and pleasant promenades lined with trees. Among its remarkable edifices are the Gothic cathedral, consecrated in 1096; the church of St. Croix, which belongs to the tenth century; the town-hall; the Hôtel de la Marine; the bridge, which cost about $1,300,000; and the Great theater, which is one of the finest in Europe, and was built by Louis XVI. Bordeaux contains a mint, a college, a university or *Académie Universitaire*, a normal school, a school of navigation, and a public library of 190,000 volumes. Here are extensive manufactures of wine, brandy, chemicals, printed calicoes, woolen goods, carpets, hats, paper, etc. The chief articles of export are wine, brandy, vinegar, dried fruits, turpentine, and glass bottles. Wine of superior quality, called Médoc, claret, or Bordeaux wine, is produced in this vicinity. The principal merchants of Bordeaux are engaged in the wine-trade. The Canal du Midi affords a communication with the Mediterranean. Pop. (1886) 240,582; (1896) 256,906. Bordeaux, called in ancient times *Burdigala*, was founded before the Christian era, and was the capital of the Bituriges Vivisci. It became the capital of Aquitania Secunda in the reign of Hadrian. In 1152 it was transferred to the crown of the English kings by the marriage of Henry of Anjou (afterward Henry II. of England) with Eleanor of Guienne. It received important liberties and privileges from the English. The famous Black Prince held his court here. It has belonged to France since 1451. Among the remains of the ancient city is a palace of Gallienus. During the revolution of 1789 this city was the headquarters of the Girondists, and suffered terribly at the hands of the Terrorists. In consequence of the damage to its commerce by the continental system of Napoleon, Bordeaux was one of the first cities to declare for the Bourbons. On Dec. 10, 1870, the seat of government was transferred to Bordeaux, while Paris was besieged by the German armies and several members of the provisional government were shut up in the metropolis. The provinces were then subject to the authority of Gambetta and his colleagues, who, after they had been driven from Tours by the approach of the enemy, removed to Bordeaux. The National Assembly, elected in Feb., 1871, met first in this city, but removed to Versailles in March of that year.

Revised by M. W. Harrington.

Bordeaux Wines: a general name for several sorts of French wine produced in the department of Gironde. The red wines of Bordeaux are commonly called claret in the U. S., to which they are largely exported. The average quantity produced annually in the Gironde is about 31,500,000 gal., the ravages of the phylloxera having diminished the vintage. Among the best of these wines are the Médoc, which is red, and the Graves, which is white. No French wines except champagne are so largely exported.

Bordentown: borough; Burlington co., N. J. (for location of county, see map of New Jersey, ref. 5–D); on Amboy Division of Pa. R. R., and on Delaware river; 30 miles N. E. of Philadelphia and 6 miles S. E. of Trenton. Two passenger steamboats run daily to Philadelphia. Bordentown is the terminus of the Delaware and Raritan Canal, and is about 60 feet above the river. It has three female colleges, a military institute, a park, water and gas works, an opera-house, a very large steam-forge, and several foundries and manufactories. Bordentown was the home of Francis Hopkinson, signer of the Declaration of Independence, and is the seat of a mansion built by Joseph Bonaparte, ex-King of Spain. Pop. (1880) 4,258; (1890) 4,232; (1900) 4,110.

Publisher of "Register."

Bordes, bōrd, Ernest: contemporary painter of history and figure subjects; b. at Pau; pupil of Bonnat and of Cormon; second-class medal, Salon, 1886; second-class medal, Paris Exposition, 1889. Obtained a solid reputation as a painter of serious merit by the exhibition of a picture, *The Death of Bishop Proetextatus*, at the Salon of 1886, now in the museum at Reims. Studio in Paris. W. A. C.

Bore, called also **Ea'gre** [etymology unknown]: In estuaries into which large rivers flow, the struggle between the ascending tidal wave and the opposing current of the stream produces the imposing phenomenon of a huge wave, which, like a moving wall of water, advances with great rapidity

and a deep roaring noise up the river, often for hundreds of miles, to the limit of tide-water. This is called the *bore*. In the Hugli river, one of the main mouths of the Ganges, the bore rushes up the river with great impetuosity. In the Chinese river Tsientang it rises to 30 feet in height, and travels at the rate of 25 miles an hour, sweeping everything before it. In the Amazon river, at the time of the equinoxes, bores of 15 feet in height follow each other in quick succession, and within the space of 200 miles five such mighty waves may be seen traveling simultaneously up the river. The Indians call it *pororóca*.

Bo'reas: in Grecian mythology, the personification of the north wind, the brother of Hesperus, Zephyrus, and Notus; was imagined to dwell in the caves of Thrace, and represented with snow-covered wings, hair, and beard.

Borecole: See KALE.

Borel'li (in Lat. *Borellus*), GIOVANNI ALFONSO: physician and astronomer; b. at Naples, Italy, Jan. 28, 1608. He is called the founder of the iatro-mathematical school, which proposed to apply mathematics to medicine. He resided for many years in Rome, and was patronized by Queen Christina of Sweden. His most remarkable work is *De Motu Animalium* (1680). D. in Rome, Dec. 31, 1679.

Borers: a name applied to the larvæ of many insects which feed upon trees and vegetables, in which they eat holes. Their ravages are very great. The peach-tree borer is the larva of *Ægeria exitiosa*, a lepidopterous insect; and species kindred to the last named attack the pear-tree, the currant bush, and many other useful plants. The locust-tree borer is the larva of a coleopterous insect, the *Clytus pictus*, which, with other larvæ, has seriously diminished the supply of this valuable timber tree. The apple-tree is especially attacked by the grub of the *Saperda bivittata*. Borers are most easily destroyed by a wire or gouge while they are in their holes; and though many plans have been devised for preventing their ravages, none as yet are very successful.

Bor'gerhout: a flourishing town of Belgium; a suburb of Antwerp. It has bleachfields, dye-works, woolen factories, and corn-mills. Pop. (1891) 29,818.

Borghese, bōr-gā'zā, CAMILLO, Prince: b. in Rome, July 19, 1775. He served in the French army in his youth, and married in 1803 Pauline, a sister of Napoleon. He was in 1806 created Duke of Guastalla. He sold the Borghese collection of antiquities and artistic treasures to Napoleon for 13,000,000 francs, but some of them were restored to him after the fall of the emperor. These had been collected by his father, Marc Antonio. D. in Florence, Apr. 9, 1832.

Borghesi, bōr-gā'zĕe, BARTOLOMMEO, Count: an Italian antiquary and numismatist; b. at Savignano, June 11, 1781. He formed a rich collection of medals and coins, and distinguished himself by his successful efforts to illustrate the military, political, and municipal institutions of ancient Rome. His chief work is *Nuovi Frammenti dei Fasti Consolari Capitolini* (2 vols., 1818–20). D. in San Marino, Apr. 16, 1860.

Borgia, bōr'jăă, CESARE, Duc de Valentinois: Italian cardinal and soldier; a natural son of Pope Alexander VI.; b. in Apr., 1476. He was raised to the rank of cardinal in 1492, and received from Louis XII. of France the title of Duc de Valentinois in 1498. He married a daughter of the King of Navarre in 1499. With the connivance of the pope, his father, he waged with success an aggressive war against several princes of the Romagna who were feudatories of the Roman see. He was guilty of many acts of cruelty and treachery, and procured the death of several persons by poison. He made himself master of the duchy of Urbino, but his prosperity was ruined by the death of Pope Alexander VI. in 1503, and the accession of Julius II., who was an enemy of Cesare Borgia. The latter was arrested and imprisoned in 1504, but he escaped in 1506 and joined the army of the King of Navarre. He was killed in battle, at Mendavia, Spain, Mar. 12, 1507. See Tomasi, *Vita del Duca di Valentino* (1655); *Leben des C. Borgia* (Berlin, 1782).

Borgia, LUCREZIA: b. in Rome, 1480; renowned for beauty, talents, and vices; a sister of Cesare Borgia, noticed above. She was married in 1493 to Giovanni Sforza, Lord of Pesaro; was separated from him, and given in 1498 to the Duke of Bisceglia, a son of the Duke of Ferrara, who was assassinated two years later; and then she married in 1501 Alfonso, Duke of Ferrara, of the house of Este. She patronized Bembo and other literati, who complimented her in their works. She was accused by contemporaries of incest and poisoning, but several modern writers maintain that the charges against her character are greatly exaggerated. D. in Ferrara, June 24, 1519. See Gilbert, *Lucretia Borgia, Duchess of Ferrara* (2 vols., London, 1869); F. Gregorovius, *Life of L. Borgia* (Stuttgart, 1874, 2 vols.; 3d ed. 1875).

Borgne, bōrn: a lake or bay in the southeast part of Louisiana; 12 miles E. of New Orleans. It is 60 miles long, and 25 miles wide at the broadest part. It communicates with the Gulf of Mexico on the E., and is connected with Lake Pontchartrain by the Rigolets Pass, which is 10 miles long. The lake is surrounded to a great extent by marshes and cane-brakes, separated from it by a narrow ridge of shells. Steamers plying between New Orleans and Mobile traverse this lake.

Borgu': a kingdom in Central Africa; W. of the Niger; in about lat. 10° N., now in part in the British Niger protectorate (see map of Africa, ref. 4–C). The banks of the Niger are fertile and thickly populated, producing rice, indigo, grain, cotton, yams, lemons, bananas, honey, and game in abundance. The sorghum-fields yield five hundred-fold. The forests are full of elephants of immense size. The population consists of the original inhabitants and Fulahs, and a Mohammedan conquering tribe speaking a language cognate with the Yoruba tongues. The government is an hereditary monarchy.

Borissoff': a town of Russia; on the Berezina; government of Minsk; 46 miles N. E. of Minsk (see map of Russia, ref. 7–C). Near this place the army of Napoleon suffered a great disaster in its passage of the Berezina in Nov., 1812. Pop. 6,500.

Bor'land, SOLON: general in the Confederate army, and former U. S. Senator from Arkansas; b. in Virginia, studied medicine and settled in Arkansas. In the Mexican war he served as major of volunteers, and was taken prisoner. He was elected to the U. S. Senate 1849, appointed U. S. minister to Central America 1853; and it was on his return home that the inhabitants of Greytown attempted to arrest him for having given asylum to an accused person, and for which the town was destroyed by Com. Hollins, U. S. N., acting under instructions of his Government. In Apr., 1861, and previous to the secession of Arkansas, he organized a force and captured Fort Smith; was appointed brigadier-general in the Confederate army. D. in Texas, Jan. 31, 1864.

Borlase, bōr'las, WILLIAM, F. R. S.: English antiquary; b. in Cornwall, Feb. 2, 1695; educated at Oxford; became vicar of Ludgvan, near Penzance, 1722, to which he added the vicarage of St. Just 1732; was a friend and correspondent of Pope. Author of *Observations on the Antiquities of Cornwall* (1754); *Natural History of Cornwall* (1758); and several religious treatises. D. in Ludgvan, Aug. 31, 1772.

Born, bōrn, BERTRAN, de: Count of Hautefort; b. before 1140; one of the most renowned Provençal poets of the Middle Ages, called by Dante (*de Vulg. Eloq.* ii. 2) the poet of arms in the great triumvirate of troubadours, of which Arnaut Daniel and Guiraut de Borneil are the other members. He was, however, a poet of love as well, and his songs in honor, first, of Mathilde ("Maeuz" of the poems), wife of Talairand of Montignac, and later of a far more famous Mathilde, sister of Richard Lion-heart, wife of Henry the Lion and mother of the Emperor Otto, are not below the best level of such verse. In his war poetry, however, we undoubtedly get him at his best—an entirely mediæval character, passionate for war and arms and blood. Fortune enabled him to use his poetic art in affairs of great importance. He had a large and, on the whole, harmful influence in the struggles of the sons of Henry II. of England—Henry, Geoffrey, and Richard Lion-heart—against their father and then among themselves. Dante in a famous passage (*Inferno*, xxviii. 118, *seq.*) depicts the poet as compelled to carry in his hand his own head separated from his body, as he had himself separated a son (young Henry) from his father (Henry II.). Later, Bertran was for a time a violent adherent of Philippe Auguste in his struggles with Henry II. and Richard Lion-heart. Still later, however, he is found full of admiration for Richard and of scorn for Philippe Auguste. His sirventeses, or political poems, are therefore indispensable for the student of the social and political condition of the twelfth century. In his old age the poet en-

tered the monastery of Dalon. D. *circ.* 1215. See *B. de Born, sein Leben und seine Werke, herausgegeben v. A. Stimming* (1879); *B. de Born, poésies complètes* (publ. by A. Thomas, 1888); Diez, *Leben und Werke der Troubadours* (2d. ed. 1882); L. Clédat, *Du rôle historique de Bertrand de Born* (1878).

A. R. Marsh.

Bör'ne, Ludwig: satirical writer; b. of Jewish parents at Frankfort-on-the-Main, May 18, 1786; studied at Berlin and Heidelberg; adopted the Protestant faith in 1817; edited the liberal *Wage* and *Zeitschwingen*; published in 1826 his celebrated *Denkrede auf Jean Paul*. After 1830 he lived in Paris, was correspondent of the *Allgemeine Zeitung*, and edited *La Balance*. His *Briefe aus Paris* and other writings on political and æsthetical subjects are eloquent and witty, and display a singularly delicate critical sense, but are marked with bitterness of political feeling. *Sämmtliche Werke* (12 vols., 1862–63). D. in Paris, Feb. 13, 1837. See biographies by Beurmann (1841), and Gutzow (1840), and *Heine über Boerne*.

Borneil, bōr'nāl', Guiraut, de: Provençal poet; reckoned by Dante (*de Vulg. Eloq.* ii. 2) one of the three great troubadours, Arnaut Daniel and Bertran de Born being the other two. Dante also calls him the poet of uprightness, "rectitudinem." The precise dates of his career are not known, but it certainly fell between 1175 and *circ.* 1220. He was chiefly remarkable as a poet because of his profound belief in the art of poetry and in the chivalric ideals of his time. See F. Diez, *Leben und Werke der Troubadours* (Zwickau, 1829; 2d ed. Leipzig, 1882); also the Provençal life of the poet from the Cheltenham MS. 1910, printed in the *Revue des langues romanes* (3e série, v. 275).

A. R. Marsh.

Bor'neo (called by the natives *Pulo-Kalamantin*): an island in the Malay Archipelago; extends from lat. 7° 1′ N. to 4° 10′ S., and from lon. 108° 50′ to 119° 2′ E. (see map of East Indies, ref. 6–E). Its length is 807 miles, and it is about 600 miles wide. The area of the island proper is 283,400 sq. miles; with the small islands adjacent, 284,500 sq. miles. Next to New Guinea (303,000 sq. miles), it is the largest island on the globe. The interior is traversed by chains of mountains not yet fully explored by Europeans. Near the northern extremity of the island is a peak called Kinibalu, which rises 13,680 feet above the sea. The maritime parts of the island are mostly marshes or low plains covered with dense forests. It is probable that a large portion of the interior consists of fertile valleys and plains. The outline is nowhere deeply indented by inlets. It is thought by many that the form of Borneo was formerly similar to that of Celebes, but that the bays have been filled up in the course of time, and now form those marshy districts on the coasts so unhealthy to the inhabitants. Borneo is watered by numerous navigable rivers—viz., the Kapuas, Barito, Mahakkam, Redjang, and others. These mostly enter the sea through extensive deltas, and their mouths are so obstructed that large vessels can not enter them; but they afford facilities for inland navigation. The climate in the low grounds is hot. The rainy season begins about October, and continues till April, during which period heavy rains fall. In the higher lands of the interior the climate is moderate and healthy. The mountains are chiefly formed of granite, syenite, limestone, and quartz. Among the mineral resources are gold, tin, antimony, zinc, diamonds, iron of fine quality, and coal, which latter is very abundant and is excellent and easily mined. The principal commercial supply of antimony is at present from Borneo. Diamonds are widely disseminated in the soil, at a depth of several feet. One diamond found in Borneo weighed 367 carats. The vegetation of Borneo is exceedingly luxuriant. Among the forest trees are the teak, the ironwood, the gutta-percha-tree, the ebony, the cocoa-palm, and various sago-trees. The island produces also cinnamon, camphor, betel, pepper, ginger, cotton, rice, and yams. The forests and jungles are infested with tigers, bears, leopards, buffaloes, and orang-outangs. The elephant also is found here. The population (estimated at 1,734,000) is chiefly of four races—Malays, Dyaks, Bugis, and Chinese. The Malays, who mostly occupy the maritime parts, are partly Mohammedans and partly pagans. The Dyaks, who live farther inland, are the aboriginal inhabitants, and are the most numerous of all the races in the island. They are divided into many tribes, and subsist mostly by hunting, fishing, and piracy. "They are not all," says Craufurd, "in an equally abject condition; for while some are mere naked hunters, the majority have fixed abodes, and have made some progress in the useful arts. . . . With respect to religion, they have neither priests nor temples, nor do they pray or fast."

Borneo was in 1892 divided into the following governments: (1) *British North Borneo*, the northern end of the island from the Padas river on the west coast to the Sibuco river on the east coast. Area, 31,106 sq. miles, with a coastline of over 900 miles. Pop. 200,000, consisting of the aboriginal tribes inland and Mohammedan and Chinese settlers on the coast. The interior is mountainous; the most of the surface is covered by jungles. The territory is under the jurisdiction of the North Borneo Company. The laws are based on the Indian code and the Mohammedan law. The Government issues its own copper and paper money, which is in American dollars. Tobacco is planted on a large scale, and there is a flourishing timber-trade. Chief town, Kudat in the extreme north. (2) *Brunei*, a native sultanate, under British protection, on the west coast from British North Borneo to the Barram river. Area, 8,100 sq. miles. Pop. 50,000. It is similar to the territory to the north. Chief town, Brunei or Borneo. (3) *Sarawak*, a sultanate occupying the west coast from Brunei to Cape Datu and extending inland to the central mountain chain. It is under British protection. Area, 41,000 sq. miles. Pop. 320,000. It resembles North Borneo. Coal exists in large quantities, as well as gold, silver, and other metals. An Englishman, Sir James Brooke, obtained control of Sarawak as rajah in 1841. He was succeeded by his nephew, Sir Charles Johnson Brooke, in 1868. (4) *Dutch West Borneo* includes the southwestern part of the island S. of Sarawak and W. of about lon. 117° E., with all of the basin of the Kapuas river. Area, 59,700 sq. miles. Pop. 414,000. (5) *Dutch South and East Borneo*, including the parts of the island S. of North Borneo and E. of Brunei, Sarawak, and West Borneo. Area, 143,500 sq. miles, or more than all the rest put together. Pop. 750,000. The chief towns of Dutch Borneo are Pontianak (west coast, on the Kapuas river) and Banjermassin (South Borneo, on the Barito river).

History.—Borneo was discovered in 1518 by the Portuguese, who formed a settlement at Bandjermassin in 1690. The Dutch, who first visited the island in 1598, made a treaty of commerce with the Sultan of Sambas in 1609. They erected a fort and a factory at Tatis in 1643, and another at Pontianak in 1778. The first British settlement was at the northeast angle in 1756. Sir James Brooke first visited the island in 1838. The island has never, since known to geographers, had any political unity, and has, therefore, no proper history.

References.—*Handbook to British North Borneo* (1890); Temple, *Private Letters of Sir J. Brooke* (1853); Wallace, *Malay Archipelago* (1865); Posewitz, *Borneo, its Geology and Mineral Resources* (translated from the German, 1892).

M. W. Harrington.

Bornu', or **Bornou** (native *Kanowra*): a state of Central Africa; in the Sudan; bounded N. by the Sahara Desert, N. E. by Lake Chad, E. by Bagirmi, on the S. by Adamawa, and on the W. by Sokoto (see map of Africa, ref. 4–D). Area about 50,000 sq. miles. The surface is mostly level; the soil is fertile, producing maize, millet, rice, cotton, indigo, pulse, etc. Cattle, horses, and sheep form a large part of the riches of the Bornuese. The climate is excessively hot, the thermometer often rising to 105° F. in the shade. The rainy season lasts from October to April. The principal rivers of Bornu are the Shari and Yeon, which flow into Lake Chad. A large portion of the country is inundated in the rainy season. Lions, panthers, and other beasts infest the forests, which occur only in the vicinity of the rivers. Minerals are said to be rare in Bornu. The natives manufacture cotton cloth and coats-of-mail, which they use in warfare. The chief exports formerly were slaves and gold-dust. The dominant race, called Shonas, are of Arab descent and are bigoted Mohammedans. Chief town, Ngornu. Pop. about 5,000,000.

History.—Bornu was formerly a part of the kingdom of Kanem, which, founded in the ninth century, rose to its highest point of power in the twelfth. At the end of the fifteenth century, King Ali-Dunamâni founded Bornu. It attained its greatest power under Edrîss Alaoma (1571–1603), who conquered all the surrounding tribes, and even extended his territory to the shores of the Atlantic. Under his peaceful and extravagant successors the power of Bornu again declined, until in 1808 it could no longer resist the continued attacks of the Fellatah, who took and de-

stroyed the old capital, Birni. The king then established himself at Kuka. An Arab from Fezzan, however, soon defeated the Fellatah at Ngornu. His son Omar removed the old dynasty, and ascended the throne himself in 1835. Although not as strong and determined against his neighbors as his father, his rule has been extremely beneficial for the country, as he has encouraged trade and industry. He also assisted, as much as was in his power, the European travelers who visited his country, among them Denham, Clapperton, Beurmann, and Rohlfs, the last of whom says in his account, "No European prince could have assisted a traveler more than Omar, the Negro prince of Sudan, assisted me, the white Christian."

Revised by M. W. HARRINGTON.

Bo'ro Bud'ur, or **Bo'ro Bo'do**: an ancient Buddhistic temple of Java; on the river Probo; 25 miles N. W. of Yugyakarta; believed to be the most elaborate specimen of Bûddhist architecture now existing, and to have been built in 1350 A. D. It is a square pyramid, with nine terraces or stories (116 feet high, in all) and 400 feet square at the base, each terrace covered with cells or small houses for monastics, and the whole covered with profuse carvings.

Borodin, ALEXANDER P.: See the Appendix.

Borodino, bō-rō-dee'nō: a village of Russia; government of Moscow; on the Kolocza river; 70 miles W. S. W. of Moscow (see map of Russia, ref. 7–D). It is celebrated as the scene of a great battle between the army of Napoleon (125,000 strong) and the Russian army, of about 130,000 men, commanded by Gen. Kutusof, Sept. 7, 1812. The French remained masters of the field and claimed the victory, but they lost nearly 30,000 men. The loss of the Russians was still greater; some say 50,000 killed and wounded. The French took Moscow a few days after this battle, which they call the battle of the Moskwa, a river near the field.

Bo'ron [Mod. Lat., formed from *borax*]: an element which Sir Humphry Davy discovered about 1808 by exposing boracic acid to the action of a galvanic battery. Its chemical symbol is B; atomic weight 11; and specific gravity about 2. Combined with oxygen and hydrogen it forms boracic acid, and it occurs in nature only in combination with oxygen, generally in the form of that acid or of BORAX (*q. v.*). Boron is obtained in the form of an olive-brown powder, which is infusible, and has neither taste nor smell. It is not used in the arts in a separate state. It may also be obtained in a graphitoidal form in six-sided crystals. Crystallized boron is one of the most unalterable and indestructible of all simple substances. Wöhler and Deville have obtained boron by heating in a crucible a mixture of pure dry boracic acid with the metal aluminium, when the latter unites with the oxygen, leaving the boron as minute quadratic octahedral crystals, called boron diamonds. These rival the real diamond in luster and refractive power, and are scarcely inferior to it in hardness. They scratch glass and the corundum. No acids, pure or mixed, have any effect upon the boron diamond, nor can it be oxidized even when raised to a high temperature.

Revised by IRA REMSEN.

Borough: in England, formerly, a fortified town; an incorporated town; any populous place or a town in general. By a gradual restriction of sense the term borough has come to be used only to designate a town possessing a municipal corporation, and a town which returns one or more members to Parliament. There are often municipal and parliamentary boroughs of the same name, but differing in territorial extent. In Scotland the borough is called a burgh, which term is now used to designate a town having a charter of incorporation. There are royal burghs, with a charter from the king, burghs of regality, with a charter from a lord of regality, and burghs of barony, with a charter from a baron. Of these formerly only royal burghs sent members to Parliament. The citizens or freemen of a borough (called burgesses) formerly might become such by birth, marriage, apprenticeship, and various other ways, according to the custom of the borough. The privileges of the burgesses, which were of very considerable value, and varied with the locality, included such as the right of participation in the income of the corporation, the exclusive right of trading, etc. The possession of these privileges, the restrictions upon the right of citizenship, and the power acquired by the guilds gave rise to corruption and flagrant abuse in government, and they have been swept away by the Reform Act of 1832, the Municipal Corporations Act of 1835, and other subsequent acts. Burgesses are now simply the electors of municipal corporations, and the statutory qualifications necessary to entitle a person of age to become a burgess are, in general, the occupation of a house or other building and residence within the borough for a stated time, and the payment of poor and borough rates. The representatives of a borough in Parliament are often called burgesses, and by analogy in some of the American colonies the members of the lower house of the legislature were called burgesses. In the U. S. the term borough has no technical meaning except in Connecticut, Minnesota, New Jersey, and Pennsylvania, where it designates an incorporated town or village of a lower grade than a city, and in New York, as applied to the divisions of New York city. In New Jersey and Connecticut the borough is a part of the township, but in Pennsylvania and Minnesota the boroughs have independent municipal organizations.

F. STURGES ALLEN.

Borough English: a custom existing in some boroughs in England by force of which the youngest son of a person dying intestate inherits all the realty which belonged to his father within the borough. A special modification exists in some boroughs by which land descends to the younger son if he be not of the half-blood, and if he be, then to the eldest son. This custom obtains in the manor of Lambeth, Surrey, in Hackney, St. John of Jerusalem in Islington, Heston, and Edmonton, and in Middlesex, and in other counties.

Borromean Islands: a group of four small islands of Northern Italy; in Lago Maggiore. They derive their name from the family of Borromeo. In 1671 Count Borromeo covered them with soil, and converted them from barren rocks into gardens. Their beauty is such that they are sometimes called the "Enchanted Islands." The largest of them is named Isola Madre, and is covered with orange-trees and exotic plants. The most celebrated of the group is the Isola Bella, occupied by a beautiful palace of the Borromeo family, and a garden which rises in ten terraces, presenting the form of a truncated pyramid. Many tropical flowers are cultivated here.

Borromeo, bor-rō-may'ō (in Lat. *Borromæus*), CARLO, Saint: b. at Arona, on Lago Maggiore, Oct. 2, 1538; a nephew of Pope Pius IV.; appointed a cardinal and archbishop of Milan in 1560. His diocese was haunted by all the vices of the Church of Rome and vehemently stirred up by the invasion of the Reformation, whose ideas were poured into the country from Switzerland and found ready acceptance among the excited population, but, placing himself at the head of the Roman Catholic reaction and supported by the Jesuits, he succeeded in reforming his clergy and suppressing the Reformation. He also distinguished himself by the purity and devoutness of his personal life, and was in 1610 canonized by the pope. He wrote several religious works (5 vols. fol., Milan, 1747). D. in Milan, Nov. 3, 1584. See his biography by G. P. Giussano (Rome, 1610; Germ. trans. Regensburg, 3 vols., 1837); C. A. Jones (London, 1877); Charles Sylvain (Milan, 3 vols., 1884).

Bor'row, GEORGE HENRY: author; b. in East Dereham, near Norwich, England, July 17, 1803. He became master of several modern languages, for learning which he had remarkable talents. In his youth he associated with the gypsies. As an agent of the British and Foreign Bible Society he traveled through many countries of Europe. He published in London in 1841 *The Zincali, or an Account of the Gypsies in Spain*, and in 1843 *The Bible in Spain, or Journeys, Adventures, and Imprisonment of an Englishman in an Attempt to Circulate the Scriptures in the Peninsula*, which is a graphic and interesting work (n. e. 1892). His next work, *Lavengro, the Scholar, the Gypsy, and the Priest* (3 vols., 1851), is regarded as an autobiography, and to it as sequel he added *The Romany Rye* (1857); *Wild Wales* (1862), etc. D. at Oulton, July 30, 1881. See Theo. Watts, *Reminiscences of George Borrow* (*Athenæum*, Sept., 1881).

Bor'rowstounness', or **Bouess'**: a seaport-town of Scotland; in Linlithgowshire; on a low peninsula in the Frith of Forth; 17 miles W. N. W. of Edinburgh (see map of Scotland, ref. 11–H). It has a safe harbor, and manufactures of soap, salt, malt, vitriol, and earthenware. Here are coal mines which extend under the bed of the Forth. Limestone and ironstone are found in the parish, which is traversed by the Roman wall of Antoninus. Pop. (1891) 4,579.

Borsip'pa (in Gr. Βόρσιππα): an ancient city of Babylonia (according to Strabo), but there has been much doubt as to its exact situation. Stephanus calls it a city of the Chaldæans. It was probably situated near Babylon. Strabo states that it was sacred to Apollo and Diana. Some mod-

ern writers believe that Borsippa is represented by the remarkable mound called Birs-Nimrud, 5 miles S. W. of Hillah, the site of Babylon proper. See BABYLON and BABEL.

Borsod, bor'shod: a county of Hungary; bounded N. by the counties of Torna and Gömör, E. by Aba-Ujvar and Szabolcs, and S. and W. by Heves. Area, 1,370 sq. miles. The county consists chiefly of vineyards and wooded hills, except in the S. E., which is a plain traversed by several small rivers, while the Theiss forms the eastern boundary. The chief products are fruit, hemp, tobacco, and wine. Copper, iron, and coal are found in the mountains. Pop. (1890) 217,166. Chief town, Miskolcz.

Borthwick, JOHN DOUGLAS: See the Appendix.

Bory de Saint-Vincent, bō'ree'de-săn'văn'saăn', JEAN BAPTISTE GEORGE MARIE, Baron: French naturalist and traveler; b. at Agen in 1780. He explored the island of Mauritius about 1800, and published a *Voyage among the African Islands* (3 vols., 1804). He afterward served as a captain in the army at Austerlitz and in other battles, and became an exile in 1815. With the aid of Van Mons he edited at Brussels the *Annales des Sciences Physiques*, 8 vols. He had the chief command of a scientific expedition which the French Government sent to Algeria in 1839. D. in Paris, Dec. 22, 1846. See Héricart de Thury, *Notice sur le Baron Bory de Saint-Vincent* (1848).

Bos [Lat. ox, cow]: the systematic name for the genus of ruminant animals which comprises the ox, buffalo, etc. See BOVIDÆ and OX.

Bo'sa: a seaport-town of the island of Sardinia; on the west coast, at the mouth of the Termo; in the province of Cagliari; 30 miles S. of Sassari (see map of Italy, ref. 7–B). Its harbor is safe, but admits only small vessels. It is the seat of a bishop, and has a cathedral, an old castle, and several churches. Pop. 6,706.

Bosc, LOUIS AUGUSTINE GUILLAUME: naturalist; b. in Paris, Jan. 29, 1759; educated at Dijon; was an earnest student of botany; held office for a time, but shortly after the fall of Robespierre set out to explore the natural riches of America. He edited the *Dictionnaire raisonné et universel d'agriculture*, and was one of the editors of the *Annales de l'agriculture française*. D. in Paris, July 10, 1828.

Boscan, bōs-kaan', JUAN: poet; b. at Barcelona about the year 1493. Of his early life little is known, except that he first followed the military career and afterward traveled for several years, spending a considerable part of his time in Italy, devoted to the study of literature and the humanities. In his early poetical efforts he used the Castilian meter, but after 1526, through the influence of his friend Andrea Navagero, then Venetian ambassador to Spain, he began to use the measures of Petrarca, the sonnet and the canzone, and thus introduced the Italian measures in Spanish poetry. His poetical works were published by him in 1543, and embrace his verse in Castilian measure written before 1526, his sonnets and canciones dating from 1527–37, and his larger compositions, such as *Leandro y Hero*, in Italian blank verse, *La Allegoria*, in the octave stanza. Navagero also induced Boscan to translate into Spanish Castiglione's important didactic prose work *The Courtier* (Il Cortegiano). Boscan died in Apr., 1542. The best edition of his poetical works, with a good biographical account, is by W. T. Knapp, *Las Obras de Juan Boscan* (Madrid, 1875). HENRY R. LANG.

Bos'cawen, EDWARD: English admiral; son of Viscount Falmouth; b. Aug. 19, 1711. He served with distinction under Anson at Cape Finisterre, May, 1747, and commanded an expedition to the East Indies in 1748. He became a vice-admiral of the blue in 1756, was sent to North America, and gained several victories over the French in 1758. In Aug., 1759, he defeated the French fleet in the Bay of Lagos. He received for this service an annual pension of £3,000. D. in Hatchlands Park, Surrey, Jan. 10, 1761. See Campbell, *Lives of the British Admirals*.

Bosch-bok [Dutch, bush-buck; *bosch*, wood, bush]: the *Tragelaphus sylvaticus*, a South African antelope; almost always found in thick underbrush which is not easily penetrated by man. When surprised in the open country it is easily caught, and is prized for its fine venison. It is about 4 or 5 feet long, and has a voice like the barking of a dog. Several other African antelopes have this name.

Bosch-vark [Dutch, bush-pig; *vark*: O. H. G. *farh*: Eng. *farrow*; cf. Lat. *porcus*]: a wild hog of Southern and Western Africa; in size and habits much resembling the common hog. It has long, pointed ears, a long tail, and is of a dull red color, with white marks. It goes in herds, and the stroke

Bosch-vark, or Guinea hog.

of the boar's tusks is much dreaded. It is the *Potamochœrus africanus*.

Bos'cobel: city: Grant co., Wis. (for location of county, see map of Wisconsin, ref. 7–C); on railroad and Wisconsin river; 70 miles W. of Madison. Pop. (1880) 1,428; (1890) 1,570; (1900) 1,637.

Bos'covich, RUGGIERO GIUSEPPE, F. R. S.: astronomer and natural philosopher; b. at Ragusa, in Dalmatia, May 18, 1701. He entered the order of Jesuits in 1725; became Professor of Mathematics and Philosophy in the Roman College in 1740. He was one of the first on the Continent who adopted the Newtonian philosophy. His Latin poem *On the Eclipses of the Sun and Moon* (1764) was much admired. He wrote various scientific works, among which may be mentioned *Philosophiæ Naturalis Theoria* (1758) and *Opera Pertinentia ad Opticam et Astronomiam* (5 vols., 1785). The latter is a collection of treatises on optics and astronomy. D. in Milan, Feb. 12, 1787. See Fabroni, *Vitæ Italorum doctrina excellentium*; Ricca, *Elogio storico dell' Abate R. G. Boscovich* (1789).

Bosio, bō'zĕe-ō, FRANÇOIS JOSEPH, Baron: sculptor; b. at Monaco, Mar. 19, 1767. He worked in Paris, and was patronized by Napoleon I., for whom he executed busts of Josephine and her daughter Hortense; also the bas-reliefs of the column of the Place Vendôme. Among his masterpieces are the *Hyacinth*, in the Luxembourg, *Cupid Darting Arrows*, and the *Nymph Salmacis*. His works are remarkable for grace and harmony. He was a member of the French Institute and director of the Academy of Fine Arts. D. in Paris, July 29, 1845.

Bosjesmans: See BUSHMEN.

Bosna-Serai: See SERAJEVO.

Bos'nia: a province of Turkey in Europe; inhabited by a Slavonic tribe akin to the Servians; formerly an independent kingdom; from 1522 to 1878 a province of Turkey, and since that time under the administration of Austria-Hungary; bounded N. by the river Save, E. by the Drin, S. by Albania, and W. by Dalmatia. Area of Bosnia and Herzegovina, 23,262 sq. miles. The surface is for the most part mountainous, and the Dinaric Alps extend along the western border. Some peaks of this range rise about 7,000 feet above the level of the sea. The largest rivers, besides the Save, are the Bosna, the Verbas, the Narenta, and the Drin (or Drina). The mountain-slopes are covered with forests of oak, beech, chestnut, and other trees. The soil of the plains and valleys is fertile, and produces good crops of maize, wheat, hemp, and various fruits. Cattle-grazing is an important industry. Bosnia is rich in coal, iron, lead, and other metals, but the mines are not worked to a great extent. This province has few manufactures except fire-arms, sabers, and knives. There are 342 miles of railway and 1,743 miles of telegraph lines. The population is a mixture of Bosnians, Croats, Morlaks, Turks, Illyrians, Jews, gypsies, etc., the majority being of the Slavic race. Capital,

Sarajevo; other important towns, Mostar and Baniäluka. Pop. in 1885, 1,148,517, and of Herzegovina, which is generally associated with it, 187,574, making a total of 1,336,091, of whom 492,710 were Mohammedans (not Turks, but Bosniacs, or of Slavonic race), 571,250 Bosniacs of the Greek Orthodox Church, 265,788 Roman Catholics, and 5,805 Jews. Jan. 1, 1888, the population was estimated at 1,404,000.

History.—Settled by Slavs in the fifth or sixth century, it was under the sway of the Byzantine empire for several centuries; at one time a powerful kingdom, it was, both before and after, in turn the prey of Hungary, Servia, the German empire, and the popes; its inhabitants, largely Protestants, repelled the attempts of all to convert them, and maintained their own faith amid terrible persecutions, till at last, in sheer despair, they surrendered to the Turks in 1463 to 1483, and their children were made Mohammedans by force. In the Russo-Turkish war of 1877–78 they opposed Turkey, and were finally annexed to Austria. See *Through Bosnia and the Herzegovina*, by A. J. Evans.

Revised by C. K. Adams.

Bos'phorus, or **Bos'porus** [Gr. Βόσπορος; popularly, if not properly, interpreted as ox-ford]: the strait which connects the Black Sea (Pontus Euxinus) with the Sea of Mármora (Propontis); forms part of the boundary between Europe and Asia. It is about 16 miles long, and varies in width from ½ a mile to 2 miles. The Bosphorus is deep, and flows between high shores and cliffs which present much picturesque scenery, the beauty of which is enhanced by many ancient ruins. Constantinople stands at the southwest end of the Bosphorus, which is sometimes called the Strait of Constantinople. It was also called the Thracian Bosphorus, to distinguish it from the Cimmerian Bosphorus, the modern name of which is the Strait of Yenikale.

Bos'phorus, Cimme'rian (Gr. Βόσπορος Κιμμέριος): the ancient name of the Strait of Yenikale (or Strait of Kaffa); connects the Black Sea with the Sea of Azov (Palus Mæotis). The width of the narrowest part is about 3½ miles. On the west side of it was a Milesian colony and the city of Panticapæum, which was the capital of a kingdom founded by the Archæanactidæ in 480 B. C. This kingdom endured several centuries under various dynasties, whose dominions were on both sides of the strait. A bridge across the Bosphorus from Scutari to Stamboul was projected in 1892.

Bosquet, bos'kā', Pierre François Joseph: French general; b. at Mont de Marsan, Nov. 8, 1810. He served in many campaigns in Algeria, became a general of brigade in 1848 and a general of division in 1853. In the Crimean war he commanded a division at Alma, and rendered important services at Inkermann 1854, for which he received the thanks of the British Parliament. He was disabled by a wound at the siege of Sebastopol, Sept., 1855, but was, on account of his great merits, made a senator and marshal of France in 1856. He took, however, no part in politics. D. Feb. 5, 1861.

Boss, Lewis: astronomer; b. at Providence, R. I., Oct. 26, 1846; graduated at Dartmouth College in 1870; in 1872 became astronomer of the U. S. northern boundary commission, a position which he held during four years. His duty was to prepare the data for a very accurate determination of the latitudes of the various points of observation on the boundary line, and in order to do this he prepared a catalogue of the declinations of 500 of the principal fixed stars. This work was done with such thoroughness and ability that it at once gave the author, who was previously unknown, a European reputation, and has since been adopted as the standard by the office of the American Ephemeris. In 1876 he was appointed director of the Dudley Observatory, Albany, N. Y., where he undertook the preparation of one of the catalogues of stars which were being prepared by co-operation among several of the leading observatories of Europe. He pushed this work with such energy that, although he was the last to enter the field, his completed work was the first to be published. In 1882 he went to Santiago, Chili, as chief of the U. S. party to observe the transit of Venus. In 1889 he was elected a member of the National Academy of Sciences, and in 1890 an honorary foreign associate of the Royal Astronomical Society.

S. Newcomb.

Bossi, bos'sĕe, Luigi: Italian antiquary and historian; b. in Milan, Feb. 28, 1785. He was appointed prefect of the archives of the kingdom of Italy by Napoleon. Among his numerous works are a *History of Italy* (19 vols., 1819–23) and an *Introduction to the Study of the Arts of Design.* D. in Milan, Apr. 10, 1835. See G. B. Carta, *Cenni biografici intorno al Cavaliere L. Bossi* (1835).

Bossuet, bos'sü'ay', Jacques Bénigne, D. D.: French pulpit orator and theologian; b. at Dijon, Sept. 27, 1627. He entered in 1642 the College of Navarre in Paris, where he studied Greek, Latin, philosophy, and theology. In 1652 he was ordained a priest, received the degree of doctor of divinity, and became Canon of Metz. Having become renowned as a pulpit orator, he was appointed to preach the Advent sermons before the king and court in 1661. In the ensuing years he preached in many churches of Paris, and converted Marshal Turenne to the Catholic communion. He was appointed Bishop of Condom in 1669; preceptor to the dauphin in 1670; and Bishop of Meaux in 1681. For the dauphin he wrote a *Discourse on Universal History* (Paris, 1681; latest Eng. trans. London, 1810), which marks a new stage in the study of the philosophy of history. He was also the author of four articles which were adopted by an assembly of French clergy in 1682, and which secured the liberties of the Gallican Church against papal aggression. Against the Protestants he wrote his eloquent *Exposition of the Doctrines of the Catholic Church on Subjects of Controversy* (1671; latest Eng. trans. London, 1841), but his principal polemical work against the Protestants is his *History of the Variations of the Protestant Churches* (2 vols., 1688; latest Eng. trans. Dublin, 1836, 2 vols.). It is an attempt to argue from the alleged contradictory teachings of Protestantism, as shown in the various confessions of the sixteenth and seventeenth centuries, in favor of the Church of Rome, which has doctrinal stability. But the polemic is often partisan. He was involved in a controversy with Fénelon, whom he censured for his defense of Madame Guyon and her quietism, and whom he treated in an arrogant and supercilious way without understanding him. He applauded the Revocation of the Edict of Nantes (1685). He was very learned, and particularly well read in the Bible. D. in Paris, Apr. 12, 1704. Among his most admired compositions are his *Funeral Orations* on the Prince of Condé, on the two Henriettas of England, and other eminent persons (Eng. trans.). His complete works were published at Bar-le-Duc in 10 vols., 4to, 1877; and some recently discovered at Paris, 1883, 2 vols. See L. F. de Bausset, *Histoire de Bossuet* (4 vols., Versailles, 1814; 2d ed. Besançon, 1846, 3 vols.); l'Abbé François le Dieu, *Mémoires et Journal sur la Vie et les Ouvrages de Bossuet* (4 vols., Paris, 1856–57); A. Floquet, *Études sur la Vie de Bossuet, jusqu'à son entrée en fonctions en qualité de précepteur du dauphin 1627–1670* (3 vols., 1855); same author, *Bossuet précepteur du Dauphin et Évêque à la Cour 1670–1682* (1864); H. Bossut, bos'sü', Charles: French geometer; b. near Lyons, Aug. 11, 1730; was a friend of Fontenelle. He was admitted into the Academy of Sciences in 1768. Among his works are a *Treatise on Mechanics and Dynamics* (1763); a *Complete Course of Mathematics* (7 vols., 1795–1801); and an *Essay on the General History of Mathematics* (2 vols., 1802). He published an edition of Pascal's works. D. Jan. 14, 1814. See J. B. J. Delambre, *Éloge de Bossut.*

Bostan, Al: See Albistan.

Boston: a complex but exceedingly interesting game of cards, played with two packs, which count as in whist. The players bid in turn for the privilege of undertaking to do any one of fifteen different things, which rank in the order of difficulty, and vary from taking all the tricks to playing with hand open on the table and taking no tricks. There are, consequently, no poor hands, as in whist. For the somewhat complicated details of the game, see *Hoyle's Games.*

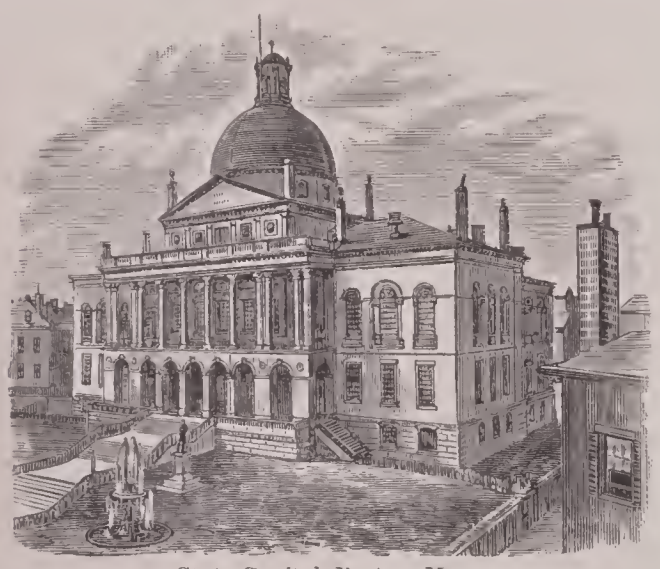
Boston [perhaps degenerated from Botolph's Town]: an ancient borough and seaport of Lincolnshire, England; is on both sides of the river Witham (see map of England, ref. 8–J). It is on the Great Northern Railway; 107 miles by rail N. of London. Vessels of 300 tons can ascend the river to this place, which is supposed to be identical with Icanhoe, where St. Botolph founded an abbey in 654 A. D. About 1200 Boston was one of the chief seaports of England. Here is the parish church of St. Botolph, built in 1309, 245 feet long, with a tower 290 feet high, surmounted by a lantern which is visible nearly 40 miles at sea. Boston has

manufactures of canvas, iron, brass, ropes, hats, leather, etc. Pop. (1891) 14,593.

Boston: the capital of Massachusetts, in Suffolk co. (for location, see map of Massachusetts, ref. 3–I), and the metropolis of New England; situated at the west extremity of Massachusetts Bay, about 450 miles by railroad N. E. of Washington, and 232 miles N. E. of New York; the State-house is in lat. 42° 21′ 27·6″ N., lon. 71° 3′ 30″ W. Founded in 1630 by Puritan colonists from England under the lead of John Winthrop and Thomas Dudley.

Original Site.—The site was originally a pear-shaped peninsula, in its extreme length less than 2 miles, and its greatest breadth a little more than 1, bounded N. and W. by the Charles river, expanded into a broad estuary in its northwest sweep into the deep water of the harbor. The peninsula was attached to the mainland at Roxbury by a narrow stem or neck a mile in length, between tide-washed flats often submerged. The water on the N. of this isthmus was an inlet of the Charles river nearly a mile wide, called the Back Bay, and that on the S. was an inlet of the harbor, called the South Bay. The peninsula was indented by coves and bordered by salt-marshes, and its surface was abrupt, irregular, and diversified by three hills. Such essentially were the natural features of Boston till after the Revolution, with narrow, crooked streets, lanes, alleys, and detached buildings, only four being of stone, of which King's chapel yet remains, and comparatively few of brick, the latter including Faneuil Hall, the Town (now Old State) house, Christ church, and the Old South meeting-house, still treasured landmarks. At the Revolution it was the richest and most populous city in the U. S., yet it contained only 2,000 buildings and less than 20,000 inhabitants.

Modern Changes.—Excepting three ancient burying-grounds and a few old buildings, not a vestige of the town as it appeared a century ago remains. The original site has been completely transformed. Every part has been graded, the steep hills having been reduced or wholly removed. The highest remaining eminence, Beacon Hill, crowned by the State-house (the old part, or "Bulfinch Front," so called from its architect, Charles Bulfinch, built in 1795; the extension, or "State-house Annex," 1889–97), rises now but 110 feet, its original height having been 138 feet. The coves, inlets, creeks, and marshes of the northerly borders



State Capitol, Boston, Mass.

have been converted into solid land covered with thoroughfares and business blocks, and fringed with wharves and docks; the broad bays on the opposite side have been filled; and thousands of acres and flats on the E., W., and S. have been reclaimed and covered by streets, squares, warehouses, and dwellings; so that where the area was the narrowest it has become the widest, and the original 783 acres of solid land comprised in the old peninsula have become 1,829. By the annexation of neighboring cities and towns, and the reclamation of the flats of what are now South Boston and East Boston, districts earlier absorbed, additional territory has been acquired, increasing the aggregate area within the city limits to 23,707 acres (37·04 sq. miles)—more than 30 times the extent of the original area. The extreme length of Boston from N. to S. is now 11 miles, and the breadth E. to W. 9 miles. South Boston was formerly Dorchester Neck, a part of Dorchester, annexed to Boston in 1804, and East Boston was Noddle's island. The other territorial acquisitions were the city of Roxbury, annexed in 1868; the town of Dorchester in 1870; and the city and towns of Charlestown, West Roxbury, and Brighton, in 1874.

Streets and Buildings.—The watercourses around Boston proper are spanned by numerous bridges, East Boston only being reached by ferry, that the harbor may be open to the navy-yard in the Charlestown district. Washington Street (originally a series of streets bearing different names), now extending from Haymarket Square to and through the Roxbury district, has always been the main thoroughfare. Tremont Street, from Scollay Square also to Roxbury, is an-

The City Hall.

other important artery. State Street is the financial center. Atlantic Avenue, 100 feet wide, extends along a portion of the water-front at the head of the principal wharves. Many of the old streets have been straightened, widened, and extended at enormous expense; and in place of the waters of the Back Bay has grown up the "Back Bay quarter," a region of broad streets and stately avenues, costly and often elegant dwellings, noble churches, fine public and private buildings, famous institutions, great hotels and apartment-houses: remarkable especially for the taste displayed in its embellishment and the richness and variety of its architecture. Beacon Street, sweeping over Beacon Hill, for years the finest residential quarter, is now continued across the Back Bay into the Brighton district as a broad boulevard. Commonwealth Avenue, 250 feet wide, with a mall in the center, also extending through the Back Bay section to and through the Brighton district, is one of the finest boulevards in the world. Near the heart of Boston proper is the Common, set apart for public use by the first settlers, a rare old park (48⅝ acres), with broad malls and pleasant by-paths shaded by elms, lindens, and other graceful trees; and beyond, separated from it by a single street, is the Public Garden (24¼ acres), the gateway to the Back Bay quarter. In these parks and other public places are numerous statues and monuments, of which the most noted are the Robert G. Shaw monument, by Augustus St. Gaudens, on the Common; the statues of Benjamin Franklin and Josiah Quincy in front of the City Hall; the equestrian statue of Washington, by Thomas Ball, in the Public Garden; and the statues of Alexander Hamilton, General John Glover of Revolutionary war fame, William Lloyd Garrison, and Leif Ericson, in Commonwealth-avenue parkway. The greater public-park system consists of a chain of parks beginning with the Back Bay Fens, and extending through parkways to the Arboretum (223 acres) and Franklin Park (527 acres) in the West Roxbury district, and along the shores of Dorchester Bay to the Marine Park at South Boston. The system also includes an embankment along a part of the city shore of the Charles river, and various independent parks. It embraces in all an area of 2354·67 acres. The amount expended by the city for land and construction, from the institution of the system to 1901, is upward of $16,600,000. The street electric railway system is one of the largest in the world under a single man-

agement. The Subway, an underground roadway, in part four-track and in part two-track, carries the street-car traffic through portions of the heart of the city. It was built by the municipality, under the direction of a Transit Commission, in 1897–99, at a cost of $4,400,000, and leased to the local street railway company for a period of twenty years at a rental of 4½ per cent. of its cost. An elevated system between the Roxbury and Charlestown districts, completed in 1901, is connected with the Subway. The steam railways radiating from the city, formerly 5, subsequently consolidated into 3 great systems, connect Boston with all parts of New England, and the far West, South, and East. They enter two great stations, the Union Station at the north, and the South, or Terminal, Station, at the south. The latter is claimed to be the largest railway station in the country.

Public Free Schools and Libraries.—The system of public schools comprises kindergarten, primary, grammar, high, Latin, normal, and special schools, in which in 1901 86,719 pupils were taught by 1,970 teachers. There are 226 school-houses. The total school expenses, exclusive of school building, repairs, etc., for 1900–01 were $2,977,282. The system is wholly supported by money drawn from the general tax levy of the city. The school board is composed of 24 members, 8 elected annually by the citizens for three years. Women, qualifying for the purpose, are eligible to election to the board. The supervision of the schools is exercised by a superintendent and 6 supervisors, salaried officials. In the number and extent of its libraries Boston stands at the head of American cities. The Boston Public Library, opened in 1854, is wholly free, and is supported by the city at an annual expense of about $255,000. It is the largest library in the world for free circulation. With its 10 branches it contains 746,383 volumes, and the annual circulation is over 1,250,000 volumes. Its executive force consists of 140 persons. A new public library building on Copley Square, Back Bay, costing upward of $2,225,000, was built in 1888–95. It is a monumental structure, of elegant proportions, the interior especially enriched by some of the best of modern decorative work. Among other notable libraries are those of the Boston Athenæum (founded in 1807), the Massachusetts Historical Society (1791), the N. E. Historic-Genealogical Society (1845), and the State Library. Conspicuous among the higher institutions for instruction are the Massachusetts Institute of Technology, the Boston University, the Boston College (Roman Catholic), the medical and dental schools connected with Harvard University, the Massachusetts Normal Art School, and the New England Conservatory of Music. The Boston Museum of Fine Arts (organized 1870) ranks among the most important in the world.

Commerce and Finance.—Boston has been from the first a leading commercial city. Its advantageous situation upon a harbor, deep, secure, unobstructed by sand-bars, and containing nearly 60 sq. miles of anchorage, was early appreciated by the people, and the shipping interests were steadily extended. It is the principal mart of the country for the sale of wool, shoes, and leather, and the business and financial center of most of the manufacturing establishments of New England. The first bank in America was established in Boston, in 1686, and the first savings institution, in 1816. In 1901 there were 43 national banks with a total capital of $38,500,000; 13 trust companies, $8,500,000; and 17 savings-banks. The valuation of taxable property in Boston, May 1, 1900, was $1,129,175,832; the tax levy, $16,928,136; the tax rate, $14.70. The net debt in 1900 was $51,385,764. The current expenses for the same year were $30,000,000.

History.—Boston was named (Sept. 17—7 o. s.—1630) for old Boston in England, in honor of leaders of the Winthrop company who came from that place. The newcomers first called it Trimountain, from the three peaks which Beacon Hill originally showed. Its Indian name was Shawmut. It remained for nearly two centuries under the simple form of a town government by all the citizens assembled in "town-meeting." The city charter was granted in 1822. The present government is composed of a mayor, a board of 13 aldermen, and a common council of 72, the mayor elected biennially, and the aldermen and councilmen annually, the 13 aldermen chosen in 11 aldermanic districts. There are commissioners for fire, water, health, streets, parks, public institutions, and police, and boards for various other departments of the public service. In and near Boston were enacted the first scenes of the drama of the Revolution. From the old town the British troops went out to meet the "embattled farmers" at Lexington and Concord, and to fight the battle of Bunker Hill, the site of which is now within the city limits; then followed the "siege of Boston" and the evacuation by the British, forced by Washington, Mar. 17, 1776. On the evening of Nov. 9, 1872, the great Boston fire broke out and destroyed the most substantial business portion of the city, sweeping over 65 acres, and involving a loss of upward of $75,000,000. In a little more than two years the whole "burnt district," with widened and improved thoroughfares, was again covered with solid business edifices. Pop. (1800) 24,937; (1880) 362,839; (1890) 448,477; (1900) 560,892. Revised by Edwin M. Bacon.

Boston University: chartered by the Legislature of Massachusetts in 1869, is in organization and in its affiliations unique. There are two departments, admission to which does not presuppose a preliminary collegiate education, and these are called the Colleges of Liberal Arts and Agriculture respectively. There are three for students who have completed a course in the liberal arts—viz., the Schools of Theology, Law, and Medicine. All these colleges and schools have separate faculties and separate administrations. There is also a department of general post-graduate study in language, philosophy, and science, known as the School of All Sciences. The university council consists of the president of the university and the deans of all the colleges and schools. The university senate consists of all members of the university council, together with all regular professors in the different faculties. The corporation consists of not less than ten nor more than thirty trustees, each elected for a term of five years. Property to the amount of $1,492,000 is held by this body. The three original corporators were Isaac Rich, Esq., the Hon. Lee Claflin, and the Hon. Jacob Sleeper, all of whom had held responsible positions in the government of one or more of the older New England colleges, and the last of whom had served as a State-appointed overseer of Harvard University for twelve years. Sixty-four free scholarships in the College of Liberal Arts have been established in honor of Isaac Rich, first founder and the chief benefactor of the university. Two fellowships and more than 200 other scholarships have been founded in the university. The place of the College of Agriculture is supplied by the Massachusetts Agricultural College, at Amherst, Mass. By virtue of a special arrangement, the faculties of the National University, at Athens, and of the Royal University, at Rome, are so associated with the School of All Sciences that students in the latter can receive instruction in those universities without charge, and on returning and passing the requisite examination be promoted to advanced degrees in Boston University. W. F. Warren.

Bos'tra, or **Bots'rah**, sometimes spelled **Boz'rah**: formerly a great city of Arabia, now in ruins; in an oasis of the Syrian desert, about 75 miles S. of Damascus, and about 40 miles E. of the Jordan. It was in the southern part of the district of Auranitis, the modern Hauran, of which it was the capital in the Middle Ages. It was beautified by Trajan, who made it the capital of the Roman province of Arabia about 105 A. D. The Roman Emperor Philip gave it the title of *Metropolis*, probably because it was his native place. It was described as a great and populous city about 300 A. D. The important ruins of Bostra are described by Burckhardt in his *Travels* and Robinson in his *Biblical Researches* (vol. iii.). *Bostra*, though sometimes called *Bozrah*, must not be confounded with the Idumean city of that name. See Bozrah.

Bos'well, James, of Auchinleck: biographer of Dr. Johnson; b. at Edinburgh, Oct. 29, 1740. He studied law, and in 1763 became acquainted with Dr. Johnson; in 1773 was chosen a member of the literary club established by the latter in London. He diligently noted and recorded the sayings, opinions, and actions of Dr. Johnson, of whom he was an intimate associate. His *Life of Samuel Johnson* (2 vols., London, 1791) is a remarkable, and in many respects an admirable, biography; best ed. by George Birkbeck Hill, 1887, 6 vols. D. in London, May 19, 1795. See Macaulay's review of Boswell's *Life of Johnson* in the *Edinburgh Review* for 1831, and *Life* by Percy Fitzgerald, 1891, 2 vols.

Boswel'lia (named in honor of John Boswell, a physician): a genus of trees of the family *Burseraceæ*, natives of India, Persia, and Arabia. The flowers have five petals and a crenulated granular disk. The fruit is a triangular capsule with three valves, three cells, and one seed in each cell. The number of known species is small. The *Boswellia serrata* is a large tree with pinnate leaves, each of which has

about ten pairs of hairy, serrate leaflets and one odd leaflet. It has small pink flowers in axillary racemes. This tree yields the fragrant resin called *olibanum*, which is believed to be identical with the frankincense of the ancients. See OLIBANUM.

Bos'worth: a market-town of Leicestershire, England; on an eminence 10 miles W. of Leicester (see map of England, ref. 9–H). On a moor near this town was fought in Aug., 1485, the battle of Bosworth, or Bosworth Field, in which Richard III. was defeated and killed. This battle terminated the civil war of the Roses, and raised Henry VII. to the throne.

Bosworth, JOSEPH, D. D., F. R. S.: philologist; b. in Derbyshire, England, 1789; took degree of M. A., and later LL. D., at Aberdeen; studied at Trinity College, Cambridge; was ordained priest 1815; became vicar of Horwood Parva, in Buckinghamshire, 1817; resided in Holland as British chaplain 1829–40; became vicar of Waith, Lincolnshire, 1840; rector of Water Shelford, Buckinghamshire, 1857; Rawlinson Professor of Anglo-Saxon, Oxford, 1858. D. at Water Shelford, May 27, 1876. He devoted much time to the study of Anglo-Saxon, and published a *Dictionary of the Anglo-Saxon Language* (1838), an enlarged edition of which, by T. N. Toller, is now being published at Oxford (1882–1892).

Botanic Garden: a garden in which collections of growing plants are reared for the purpose of instruction or scientific study. Such collections have been made and temporarily maintained from time to time in the past. It is said that Mithridates and Attalus established botanic gardens in Pontus and Pargamus more than 2,000 years ago, in which poisonous plants were reared and experiments made with others as antidotes to poisons. Modern botanic gardens are usually connected with universities, or are under government control for economic purposes. The most noted are the Royal Gardens, at Kew, near London, which originated about 200 years ago on a private estate, afterward becoming a royal property, which was transferred to the Government in 1841 with the present title. Other botanic gardens are now maintained in Cambridge, Oxford, Edinburgh, and Dublin, the whole number in Great Britain being 11. In France there are 19 botanic gardens, of which the Jardin des Plantes in Paris is the most noteworthy. Germany has 25, nearly every important city or university town maintaining one. Austria-Hungary has 14; Switzerland, Belgium, Holland, and Scandinavia, 4 each; Italy, 21; Russia, 2; Roumania and Portugal, 2 each; Greece, Servia, Spain, and Denmark, 1 each. The total number in Europe is about 125. In many of the British colonies botanic gardens are maintained by the Government, there being in the West Indian region 3; in the Cape region, 8; Australian, 6; East Indian, 8; Canada, 1. The Dutch Gardens at Buitenzorg, in Java, are noted. There are 5 botanic gardens in South America—viz., in Rio de Janeiro, Quito, Lima, Santiago, and Buenos Ayres.

In the U. S. there are many considerable collections of plants grown for instruction and study, but few bear the name of botanic gardens. Many of the larger universities, and usually all of the agricultural colleges, have such collections, which are, in fact, botanic gardens in everything but the name. Some of the public parks, e. g. in Boston, New York, and Chicago, contain excellent botanic gardens, although they do not bear that name in published reports. The botanic garden and the Arnold Arboretum of Harvard University, the botanic gardens of the U. S. Department of Agriculture at Washington, and the Missouri Botanic Garden in St. Louis are the most extensive plant collections in this country. CHARLES E. BESSEY.

Botany [formed from Gr. *βοτάνη*, plant]: the science of the vegetable kingdom. It includes all inquiries as to the structure, physiology, development, classification, and distribution of all those living (or once living) things which we call plants.

Plant Defined.—It is no easy task to trace the line which separates plants from animals. They are unlike enough in their higher forms, but many of the lower plants and animals are so much alike that naturalists are by no means agreed as to whether they are to be placed in this or that kingdom. We can not at present frame a definition which will certainly include all plants and exclude all animals. The most we can do is to bring together those characters which separate the greater number of plants from animals, and then to associate with the plants so set off such of the remaining organisms as appear to be more plant-like than animal-like. Accordingly, we may say that, for the most part, plants are cells inclosed in walls of cellulose, or aggregates of such cells, all or part of which contain chlorophyll, by means of which they are able to appropriate carbon from inorganic matter (carbon dioxide). The organisms so set off constitute the bulk and mark the principal divisions of the vegetable kingdom.

There are, however, many plants which have suffered more or less degeneration through having become parasitic or saprophytic; these are colorless, and are incapable of appropriating carbon from carbon dioxide; they are often greatly reduced as to their vegetative organs, and in many cases even their reproductive organs have suffered great degeneration. These degraded plants must be assigned to such positions in the vegetable kingdom as will best show their relationships. It may be remarked in passing that in many attempts to define plants the true relation of these degenerated ones has been overlooked, and they have been treated as though they represented separate types instead of degradations from chlorophyll-bearing types, thus leading to no little confusion of ideas, and to a serious misunderstanding of the true nature of plants.

Anatomy and Physiology.—If we examine under a microscope some of the green slimy coating growing on the north side of a tree or wall, we find it to be composed of minute balls of soft matter (here colored green), each surrounded by a harder coat. The soft matter is known as protoplasm and its cover as the cell-wall; the protoplasm and wall are called a cell. Similar examination of a bit of compressed yeast will show similar roundish balls of soft matter, each surrounded by a cell-wall. Here, however, the protoplasm is not green, and we find on further investigation that plant protoplasm is itself not green, and that the green color is imparted by a stain to which the name chlorophyll has been given. These cells, whether green or not, freely absorb watery solutions, which are transformed into cell-matter by the protoplasm. Green cells supplied with water and carbon dioxide make the carbon compound, starch, ($C_6H_{10}O_5$) when in the sunlight, and this is afterward transformed into cell-matter. Colorless plants can not make starch, and are dependent upon other organisms for their supply of carbon. Thus while the green cell supplies itself with carbon in the starch which it makes, the yeast cell is dependent upon the starch in flour (made by some cereal). See CELL and PROTOPLASM.

Now, all plants are made up of cells having essentially the structure of those here described. In many plants all the cells are green, and able to make starch; in many others some of the cells are green, while the remainder are colorless, in which case the latter are dependent upon the former for their carbon; in still others all the cells of the plant are colorless, resulting in the complete dependence of the plant upon some other organism (parasitically or saprophytically).

In few-celled plants the cells may be alike in form and function, but as the number of cells is increased there is always a differentiation both in form and function. In the higher plants we have masses of similar cells occupying particular portions of the plant body, and having similar functions. Such cell-masses are known as tissues, and may be briefly designated as follows:

I. Soft tissue (*parenchyma*), of short, thin-walled cells.

II. Thick-angled tissue (*collenchyma*), of elongated cells whose angles are thickened.

III. Stony tissue (*sclerenchyma*), of short, thick-walled cells.

IV. Fibrous tissue, of elongated, usually pointed, thick-walled cells.

V. Milk tissue (*laticiferous tissue*), of elongated cells, or rows of cells, containing a milky fluid.

VI. Sieve tissue, of rows of enlarged and elongated cells, connected by perforated walls.

VII. Tracheary tissue, of enlarged and elongated cells with their walls thickened in rings, spirals or reticulations.

Soft tissue may be regarded as typical plant-tissue, inasmuch as it constitutes the essential part of every plant. All assimilating, growing, and reproductive organs are composed of parenchymatous cells. The other tissues are accessory, and serve to protect, strengthen, or connect the masses of soft tissue.

The simplest plants are composed entirely of soft tissue, although even here the cells may show some differentiation. In large plants there must be some means for supporting and strengthening the plant-body. This is accomplished by

the development of fibrous or stony cells, that is, by thick-walled cells, which may be long or short. These may develop in the boundary region, or in the axial. In the simplest cases these strengthening cells form poorly defined bundles of elongated cells with thickened walls, as in many brown seaweeds, red seaweeds, liverworts, and mosses; but in most ferns and flowering plants the well-developed fibers are associated with tracheary and sieve vessels, where they constitute the *fibro-vascular bundles*. A still higher structure is exhibited in those plants in which the bundles join one another at regular intervals, thus constituting a *fibro-vascular system*; and this union of the bundles may become so perfect as to form a solid woody-vascular cylinder, as in large, strong herbs, and in shrubs and trees. See HISTOLOGY, VEGETABLE.

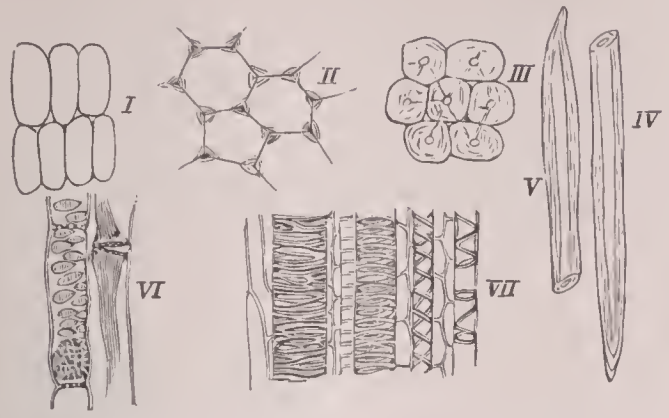

FIG. 1.—Illustrations of tissues, highly magnified: I. Soft tissue from a leaf; II. Thick-angled tissue; III. Stony tissue from hickory nut; IV. and V. Fibrous tissue in longitudinal section; VI. Sieve tissue from squash stem; VII. Tracheary tissue of various forms.

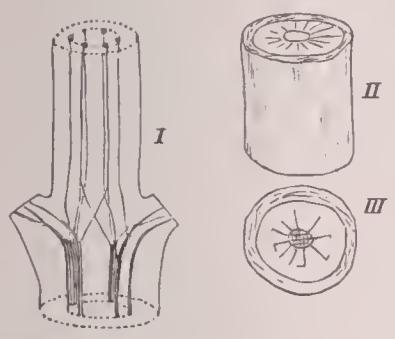

FIG. 2.—Illustrations of fibro-vascular systems: I. Diagrammatic figure showing the courses of the bundles in an herbaceous stem; II. and III. Fibro-vascular system in a woody plant, consisting of a woody cylinder with pith in the center, and surrounded by bark.

The *plant-body* in the simplest plants is the cell itself. Where the plant consists of a row of cells, there is very commonly a distinct base which is prolonged into root-like "hold-fasts," while the opposite end of the cell-row is as distinctly apical in structure. The cell-layers or masses (*thallomes*), branched or not, so common in the lower water-plants, and in some terrestrial plants, e. g. liverworts, have a marked axial polarity, and usually are distinctly bilateral. The plant-body in higher plants (*shoot* and *root*) exhibits axial polarity, and is usually polysymmetrical.

The plant-body is thus either (1) a *cell*, (2) a *filament*, (3) a *thallome*, or (4) a *shoot* (with *root*).

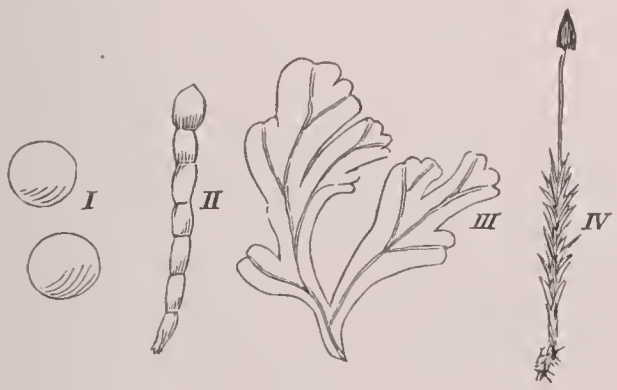

FIG. 3.—Illustrations of the plant-body: I. Simple cell of Protococcus, magnified; II. A filament, or chain of cells of Œdogonium, magnified; III. A thallome of Marchantia, natural size; IV. A shoot of a moss, slightly reduced.

All these types of plant-body may remain simple, or they may become more or less branched. Moreover, the line of demarkation between one and the other is very poorly defined. Thus a few cells may be feebly connected, forming a weak filament which very easily breaks up into separate cells. In like manner a number of filaments may cohere into a kind of weak thallome, and the thallome by lateral lobing (forming *leaves*) may approach and gradually merge into the shoot.

Terminology.—In the accurate description of plants it is necessary that many terms should be used with fixed and exact meanings. This has given rise to a myriad of technical terms which constitute the glossology or terminology of the science. It is unfortunate that these terms have been needlessly multiplied, each branch of the vegetable kingdom having, to a great extent, its special terminology. It would be out of place in this article to attempt to give a complete account of the terms used in all departments of botany. Nor is it desirable to take up those only which relate to the flowering plants, as is so frequently done, inasmuch as it would tend to confirm the too common impression that botany is essentially the study of flowering plants.

Branching.—In the branching of the plant-body there are two types, viz., terminal and lateral. In the first the

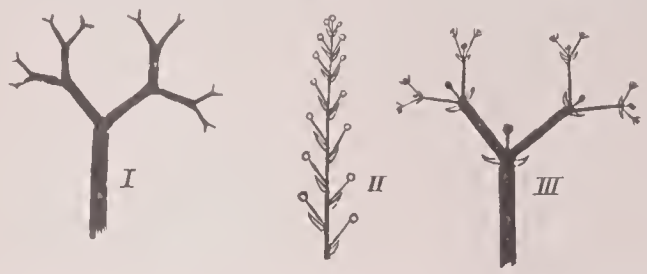

FIG. 4.—Illustrations of branching: I. Terminal (dichotomous) branching; II. and III. Lateral (monopodial) branching; II. Indefinite (or racemose); III. Definite (or cymose).

branches arise at the growing apex of the body, usually in twos (dichotomous branching), or occasionally in threes (trichotomous), or even in fours (tetrachotomous). In the second (monopodial) the branches always arise on the sides of the body, but even here they usually originate near to the growing apex. In a series of branches on the side of the plant-body those toward the base are usually the oldest, while those nearest the apex are the youngest. Occasionally a branch originates, and after a short growth ceases to develop further for a considerable period, even after the neighboring branches have become well grown. When such "latent" branches renew their growth they are apparent, but not real, exceptions to the rule that branches arise acropetally.

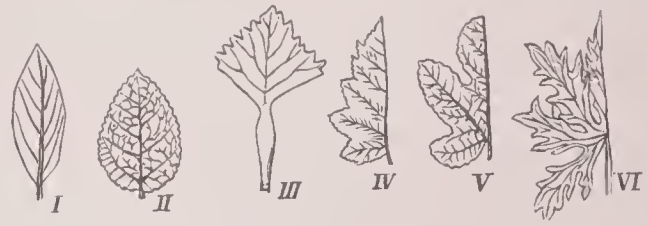

FIG. 5.—Illustrations of the branching of flat structures: I. Entire margin; II. Serrate; III. Dentate; IV. Incised; V. Lobed; VI. Parted.

In many plants where lateral branches arise, the apex of the original plant-body, or axis, continues to grow, thus producing an *indefinite* branching system (a *racemose* system); in other cases the apex soon ceases to grow, producing a *definite* branching system (a *cymose* system). All forms of both terminal and lateral branching are subject to unsymmetrical development, thus partially obscuring the plan of growth.

FIG. 6.—Illustrations of compound leaves: I. Palmately compound (three leaflets); II. Palmately compound (seven leaflets); III. Pinnately compound, with terminal leaflet; IV. Pinnately compound, with tendril at the end.

The branching of flat structures, as thallomes and leaves,

has given rise to a multitude of terms. When such structures have made no beginning in branching, the margins have an *entire* outline. When branching has barely begun, the margin may be *sinuate*, or *serrate*; when the branches have grown further, the margins may be *dentate*; or still further, *incised*; or more still, *lobed*, then *parted*, and *divided*.

In leaves where the branching has gone so far that the leaf-branches are distinct and separable, we use the term *compound*. Where the leaf-branches arise very near together, the leaf is said to be *palmately compound*; where they arise at considerable intervals, it is *pinnately compound*.

Surfaces.—In plants consisting of cell-masses the external cells are always more or less modified by contact with the surrounding medium. They usually contain less protoplasm, and quite commonly have thicker walls; this is especially true of terrestrial plants, although it may be seen in aquatics to a less degree. This outer layer is known as the epidermis. It is frequently *smooth* externally, the outer walls of the contiguous cells forming an even surface. In other cases the cells may project more or less, or they may develop short points which project above the surface and make it *rough*. These projections may be so extended as to form a *hairy* surface.

It frequently happens that a mass of cells in or beneath the epidermis grows out into a sharp, broad-based point, a prickle, as in the roses and raspberries, whose stems are

Fig. 7.—I. Prickles on a rose-stem, superficial, not connected with the woody part of the stem; II. A thorn on a plum-stem, evidently a reduced branch.

prickly. Prickles are to be distinguished from spines and thorns, the former of which are allied to hairs, being essentially superficial in structure, while the latter are stunted stem-branches, pointed and usually leafless.

Shoots.—The stem with its leaves is the shoot. It is clearly derived from, and in its simplest cases merges into, the thallome. In higher plants the stem (*axis* or *caulome*) and the leaves (*phyllomes*) are distinct, but among mosses and scale-mosses, as well as in still lower plants, this is not always the case. Where the leaves are distinct from the stem they arise as lateral outgrowths upon its growing apex, observing the law of acropetal development. As the axis elongates, leaves grow upon its newest portions. The youngest leaves are at the summit of the stem, simply because that part of the stem is the youngest.

When the stem grows rapidly in length at the same time that the leaves are growing, the latter are soon separated by considerable distances, but when the stem-growth is slow the leaves are more or less crowded. Most stems elongate rapidly during a part of the growing season, in which case the leaves are farther apart, but when the stem-growth is retarded, as it is later in the season, the leaves meanwhile continuing to grow, the result is the formation of a more or less compact cluster of leaves, termed a *bud*. A bud is thus a condition of a shoot, brought about by a retardation of stem-growth. When the stem-growth is resumed, the bud gradually disappears. See Bud.

It remains to speak briefly of the anatomy of leaves which grow in the air. The greater part of the leaf is composed of cells of soft tissue (parenchyma) containing chlorophyll. These are loosely arranged, so that there are many intercellular spaces between them. The outer cells constitute a close sheet (the epidermis) in which occur many pores (stomata). These pores may close entirely, when the interior cells of the leaf are completely cut off from the external air, or they may open, allowing free communication between the interior and exterior. The framework, which gives stiffness to the leaf, is composed of fibro-vascular bundles, which are continuous with the bundles in the stem. In the leaf the bundles are variously disposed, dependent mainly upon its shape and mode of growth. The details of the bundle-arrangement (called *venation*, from vein (Lat. *vena*), which name the bundles usually have) need not be taken up here. See Leaf and Venation.

Roots.—True roots exist only in the flowering plants and the fernworts. In the mosses, the lower part of the stem produces hairs which have the function, but not the structure, of roots. Some of the algæ have hold-fasts which approach roots in structure, and possibly are to be regarded as the foreshadowings of them.

A root is an axial structure closely allied to the stem, of which it is often the downward extension. It is always of a simpler structure than the stem, and its tissues are usually

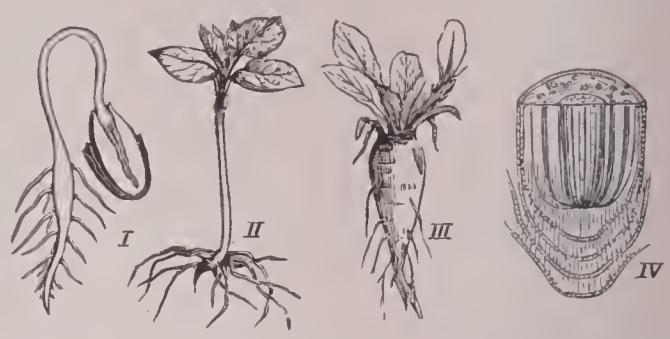

Fig. 8.—Illustrations of roots: I. Root and rootlets of young castor-oil plant; II. Roots of melon; III. Root of turnip; IV. Diagrammatic section of the tip of the root of the screw-pine (*Pandanus*), showing the root-caps in several layers.

less well marked. The boundary layer of cells (epidermis) is not as well marked as is usually the case in the stem. The absence of leaves and the rarity of shoot-buds are also noteworthy. The development of a mass of cells, the root-cap, in advance of the growing tip, is perhaps the most characteristic structure of the root.

Physiology of Larger Plants.—Enough has been said of the mode of life of single-celled or few-celled plants. In larger plants, where there are masses of cells, the physiological processes are somewhat more complicated. Food is absorbed by the cells in contact with it. In aquatics, all (or nearly all) external cells absorb watery solutions. In terrestrial plants the external root-cells absorb the watery solutions in the soil. Cells in contact with the air may absorb gases. In all cases the active agent in absorption is the living protoplasm. Some food-matter is converted into cell-matter in the cell which absorbs it from without, but much more is absorbed by neighboring cells. Thus cell No. 1 may absorb food matter from the surrounding medium (water or air); cell No. 2 may absorb nearly all of it from No. 1; so cell No. 3 may take from No. 2, and so on. In this way food-matter may be transferred rapidly from the cells in contact with the food-supply to those a long distance from it, and in this way cells obtain much of the material which they need for their sustenance and growth. It is pretty certain that the nitrogenous constituents of cells are obtained by the protoplasm directly from various nitrates and the salts of ammonia dissolved in the water. In like manner, the lime, potash, sulphur, etc., are appropriated directly by the protoplasm of the cells.

There is one process, however, viz., the assimilation of carbon (starch-making), which can be performed only in those cells of the plant which contain chlorophyll. To such cells water and carbon dioxide must be transferred from the points where they are absorbed. In a common land plant, as a tree, for example, the chlorophyll-bearing cells are confined to the leaves and young branches; the water is absorbed by the roots, while the carbon dioxide is absorbed directly by the green cells of the leaves. When a molecule of starch is made, the water is taken from the supply at hand in the cell, and this loss is made up by absorption from the neighboring cells; these again absorb from others, until finally the root-supply is reached. This hydrocarbon (starch) is now a food-matter for the cells of the plant. It is transformed into a soluble substance (often sugar), and is absorbed from cell to cell until all parts of the plant are supplied. See Assimilation.

The total food-supply for the cells of a plant is thus: (1) water, (2) solutions which are used directly by the cells, (3) the hydrocarbon made by the green cells, to which may be added (4) oxygen, which is freely absorbed by the active cells. On this food-matter the cells live and grow as so many little organisms, each with its own wants and needs. When a cell has made a sufficient growth it may divide (see Cell), and when this takes place in a considerable number of the cells of a plant we say that it grows. The growth of

the plant is but the aggregate of the growth and division of its cells.

It is a common occurrence that cells do not themselves use the food-matter which they absorb, but store it for future use. Thus they often store starch, as in many seeds and tubers, but in all cases it is eventually used by growing cells (of the young plant, in the seed; of the new shoots, in the tuber).

It may be noted in passing that "sap" as commonly understood (i. e. as a kind of vegetable blood) has no existence except in imagination. Likewise the "circulation of sap" in plants, especially in trees, has no existence. It follows that the terms "crude sap" and "elaborated sap" are founded upon error. There is water in every living cell; when active it may contain from 75 to 95 per cent. of water, or even more in some cases. So a living plant is a watery thing, and this water contains food-matters in solution. These are absorbed from cell to cell as there may be demand. So there are movements of food-matters in plants, but they are not of the nature of currents streaming through particular tracts.

The evaporation of water from the exposed surfaces of plants gives rise to a movement (usually upward) of the water in the roots and stems. While the leaves and young stems are covered with an epidermis for checking evaporation, much water escapes through the stomata when they are open to allow an interchange of gases. This water-loss from the exposed cells is followed by absorption of water from deeper-lying cells, and these again draw from others, and so on. This movement of the water, which is purely a physical phenomenon, has doubtless been taken for a "sap circulation."

Reproduction.—The lowest plants merely divide themselves into two or more parts, each of which becomes a new individual. This is the non-sexual (asexual) method, and there are few (if any) plants which do not at some time give rise to new individuals in essentially this way. In many of the simpler plants single cells are spontaneously separated from the plant-body, which on germination produce new plants. These are the asexually formed spores, commonly called conidia, summer spores, tetraspores, etc. In higher plants single cells do not separate in this way, but masses of cells, buds, leaves, and shoots sometimes spontaneously fall away and give rise to new plants.

Sexual reproduction, in which the new individual is produced as a result of the union of two cells (male and female), is pretty general throughout the vegetable kingdom. The lowest plants, the water slimes, reproduce asexually only. In those a little higher, confervas, water flannels, etc., two similar cells (similar in size, shape, and activity at least) unite their protoplasms, the resulting mass forming a spore. From this sexually produced spore a new plant arises upon germination. In the green felts the two uniting cells are manifestly different, the larger being the female and the smaller the male. In red seaweeds the union of the male and female protoplasms no longer results in the production of one spore; here the female cell after fertilization sends out branches, each of which produces one or more spores. In the mosses the female cell is inclosed within a flask-shaped organ, the archegone; after fertilization it produces a many-celled growth, which eventually develops spores from some of its internal cells, thus constituting the spore capsules. Ferns have archegones similar to those in mosses; after fertilization these give rise to leafy shoots, which eventually produce spores. The germination of the spores gives rise again to the sexual plant, the so-called prothallium. The archegones of flowering plants are feebly developed, in most cases consisting of little more than the female cell. In pines and their allies, where they are best developed, they are produced in minute dependent plants (prothallia) in the interior of the ovule. Fertilization is followed by the growth (as in ferns) of a leafy shoot (the new plant) for a time inside of the ovule (seed state), and afterward in the earth and air. In the higher flowering plants the reduction of the archegones and prothallia is carried still further. See Reproduction (in plants).

The Classification of Plants.—There are so many kinds of plants in the world that it becomes necessary for us to classify them in order that we may be able to study them intelligently, and communicate our results to others. For this purpose alone any system will suffice which enumerates all plants and designates each kind with ease and certainty. Such a system was that devised by Linnæus a little more than one hundred and fifty years ago, and used for a century or more in Europe and America, although it brought together plants of very unlike characters. That it served the general purpose of classification referred to above is proved by the fact of its long use during a period in which the study of plants made great progress.

But it is not enough to arrange plants for our convenience; we wish to make our classification show also the natural relationships which exist between plants and groups of plants In such a classification the kinds of plants "are arranged according to the totality of their morphological resemblances" (Huxley), and not upon resemblances in single and relatively unimportant structures. Moreover, these resemblances are not confined to the adult plant, but include also those observed in its early (embryonic) life. To these we must bring such aid (all too little as yet) as we may obtain from a study of the ancestral vegetation of the globe. Such a natural system, when perfected, will not only show present resemblances, but it will indicate genetic relationships. It is perhaps needless to say that no system yet proposed approaches this ideal. It will be long before vegetable embryology will have supplied us with all the embryonic characters, and it will be still longer before phytopalæontology (fossil botany) will have traced for us the lines of descent for the vegetation of to-day. See Plants (Fossil).

Species.—In the examination of living things in any particular locality it is readily seen that there are different kinds, whose individuals resemble one another more than they do the individuals of other kinds. It is observed, moreover, that in reproduction the individuals of a particular kind always give rise to new ones of the same kind. Thus seeds of purslane always produce purslane plants, and while they may not be (and generally are not) exactly alike, they are unquestionably purslanes. By the observation of many such cases we arrive at the ordinary conception of kinds of plants, that is, of species. This appears to have been the conception of species held by Linnæus and many of his followers down to about the middle of the present century.

With the advent of the idea of evolution came a change in our conception of species. We no longer conceive species as a fixed group of essentially similar organisms running back in time unchanged to a definite beginning, and forward as unchanged to a definite end only in extinction. The history of the past shows us that species have come into existence and after a time have disappeared, but it suggests that they have arisen by modifications (variations) of pre-existing species, and that often they have disappeared, not by extinction, but by undergoing considerable modifications. There may have been, and probably was, much of actual extinction of species, but it is equally certain that in many a case the species disappeared in name only, and that the succession of organisms continued in unbroken lines. The modern conception of species is that it is composed of similar but not identical organisms, forming many adjacent or contiguous genetic lines, in which the individuals are the successive points. This living stream does not necessarily maintain a fixed position in the vegetable kingdom, but may drift more or less in this or that direction.

Genera.—There are few species which do not resemble other species. Observation has shown us that this resemblance is often so close as to make a natural group of species. Thus all the kinds of violets are readily recognized as violets, while they are also as readily recognized as different species. Such groupings of species are *genera*.

Families and Orders.—Related genera are grouped into *families*, and related families into *orders*. In most English and American works on systematic botany "family" and "order" have been made synonymous, or perhaps it may be better to say that families have been called orders, while the orders have been called *cohorts*. In zoölogy families and orders stand as separate groups, and no good reason has been assigned for a different practice in botany.

Classes.—Related orders are grouped into *classes*, which thus usually include great numbers of species. It is possible now to group all known plants into about fifteen classes, viz.: (1) *Schizophyceæ*, (2) *Chlorophyceæ*, (3) *Phæophyceæ*, (4) *Coleochæteæ*, (5) *Ascomycetes*, (6) *Basidiomycetes*, (7) *Florideæ* (or *Rhodophyceæ*), (8) *Charophyceæ*, (9) *Hepaticæ*, (10) *Musci*, (11) *Filicinæ*, (12) *Equisetinæ*, (13) *Lycopodinæ*, (14) *Gymnospermæ*, and (15) *Angiospermæ*. Two of these, viz., *Ascomycetes* and *Basidiomycetes*, are composed of degraded plants only, and are doubtfully entitled to class rank.

Branches or Divisions.—The foregoing classes may be grouped into branches or divisions in various ways, according to the views of the student. There is little question

nowadays as to the disposition of the higher classes (ninth to fifteenth inclusive), nor is there any doubt that the first class constitutes the lowest branch of the vegetable kingdom. There is, however, much doubt as to the proper disposal of the second to the eighth classes. See VEGETABLE KINGDOM.

The Distribution of Plants.—Ordinary observation shows us that the spores and seeds of plants are readily distributed over the earth's surface. They are blown by the winds and carried by the water, and often by animals of various kinds. Seeds are especially provided in many cases with structural devices for wind carriage, as in the milkweed and cottonwood, where a spreading tuft of long hairs enables the seed to be floated in the air for many miles. Many fruits are winged or provided with hair tufts, so that as they are carried away by winds their contained seeds are carried also. Again, many seeds serve as food for various animals, as squirrels, rats, mice, and some birds, which often make great stores of edible seeds for their winter food-supply. Still again many fleshy fruits are eaten by animals, the seeds often being rejected or passed through the alimentary canal uninjured. Some seeds and fruits attach themselves to passing animals by means of hooks or other devices, and are carried to considerable distances. On the Western plains the whole plant, in some cases, separates from the root, and is rolled and tumbled over the prairies for many miles, dropping here and there its burden of seeds. Similar "tumbleweeds" are to be found upon the plains of South America and Southeastern Europe.

These, in brief, are the ways in which the spores and seeds of plants become distributed over the face of the earth. They may spring up into plants which may become permanent residents in the new localities, or they may fail to find the proper conditions for growth and so disappear. The discussion of these conditions belongs to GEOGRAPHICAL BOTANY (*q. v.*).

HISTORY OF BOTANY.—The following summary by Mr. Roscoe Pound gives in one view the main facts in the history of botany. Theophrastus (B. C. 300), Dioscorides (*cir.* A. D. 64), and Pliny (a little later) were the principal writers on botany in ancient times. They enumerated and described medicinal and useful plants, and explained their supposed properties. Little or nothing more was done for over a thousand years. The first after the ancients is Otto Brunfels, a German monk (d. 1534). Fuchsius (1501–66) and Clusius (de l'Écluse—1526–1609) are some of the greater names in mediæval botany. These men and their contemporaries collected extensively, and published drawings and descriptions of plants, with notes of their properties. They did not classify, but some sort of conscious arrangement is to be seen in their works.

The first classification was made by Andrea Cesalpino (Cæsalpinus), an Italian physician (d. 1602). His system contains fifteen classes based on the fruit. Cesalpino was strongly imbued with scholasticism, and founded his system on predetermined marks obtained by reasoning from the supposed nature of plants. Classification down to Jussieu was based on single characters after Cesalpino. Of later botanists, Caspar Bauhin (1560–1624) and John Ray (1628–1705) deserve especial mention. Many terms in common use were first used by them or their contemporaries; e. g. monocotyledons, umbelliferæ, polypetalæ.

Marcello Malpighi, an Italian (1628–94), and Nehemiah Grew, an Englishman (1628–1711), founded vegetable anatomy. Marriotte, a Frenchman (d. 1684), and Stephen Hales, an Englishman (1677–1761), founded vegetable physiology. R. J. Camerarius, a German (1665–1721), demonstrated by experiment the sexuality of plants. Camerarius approached the subject in true scientific manner, as would be done today. His contemporaries and botanists long after him attempted to prove sexuality by abstract reasoning without experiment.

Joseph Pitton de Tournefort is the founder of genera. He was the last to classify plants as herbs, trees, and shrubs. Johann Jacob Dillenius, a German, afterward professor at Oxford (1684–1747), and Pietro Antonio Micheli, an Italian gardener (1679–1736), are the pioneers of cryptogamic botany.

Carl von Linne (Linnæus, 1707–78) invented the binomial nomenclature, reorganized nomenclature, revised the genera of flowering plants, and fixed species about in their present form. He was no experimenter, relied on abstract reasoning more than on observation, and fastened scholasticism on systematic botany. He was an admirer of Cesalpino, and founded a system based on the stamens. At the same time he made a provisional natural system. At the beginning of this century A. L. de Jussieu took it up and greatly developed it. He is called the founder of the natural system. A. P. De Candolle (1778–1841) put Jussieu's system on a permanent basis.

Robert Brown, between 1800 and 1830, discovered the nature of the gymnospermous flower, and called attention to the cell contents. C. H. Persoon (*Synopsis Fungorum*, 1801) put mycology on a lasting basis. Von Mohl and Naegeli, between 1820 and 1860, made vegetable anatomy what it now is. Hofmeister about the same time worked out the development and embryology of pteridophytes and gymnosperms. Tulasne and De Bary, before 1860, studied the development of fungi, and caused their classification to be remodeled. Schwendener discovered the true nature of the lichens about 1868.

About 1860 the Darwinian theory put the natural system on a sure foundation by explaining the relationships on which it was based. Systematic botany is, however, very conservative, and the full effect of this has not yet been felt.

In 1874 Sachs discarded fungi and algæ as definite groups, and co-ordinated the subdivisions of the cryptogams with the phanerogams. Henceforth cryptogam, like invertebrate, is a word of convenience only.

The Study of Botany.—Some knowledge of plants should be possessed by every one. Aside from its purely utilitarian importance in agriculture, horticulture, and medicine, botany when properly studied may become an important part of the general culture of the educated man. It should therefore occupy a proper place in the course of study pursued by pupils in the schools, and the teacher should be prepared to give instruction in accordance with the present state of the science. It is unfortunately true, however, that much of the study (and teaching) of botany is a full century behind the modern science, and the culture which it should give is wanting.

In beginning the study of botany it must be clearly understood that it is only by the study of *plants* that we can know plants. It is not a "book study," but rather a laboratory study, in which much of the laboratory is to be found in the fields and forests. The beginner should first of all make the acquaintance of a good number of representative plants. This he should accomplish by actual examination himself, with not too much in the way of suggestion from teacher or books. It is a good plan for the beginner to early set about the making of a collection of the plants in his neighborhood. In so doing he will learn much about their structure, habits, and reproduction. When he has acquired some familiarity with the general structure and physiology of plants in the principal groups of the vegetable kingdom, he may profitably spend a little time in learning the details of descriptive and systematic botany in some group, commonly the flowering plants. Should he have access to descriptive manuals of other groups, it will be well for him to use these enough to give him some familiarity with them.

This accomplished, he should take up the deeper study of structure, using a compound microscope capable of magnifying fully 600 diameters. He should become acquainted with protoplasm, and the various cells and tissues it builds in simple and complex plants. He is then prepared to take up the study of the particular structure of representative plants in the principal classes and orders of the vegetable kingdom. Should he desire to pursue the subject further, there open to him now many lines of work. Thus he may take up the structure and physiology of a single plant, or he may undertake some physiological investigation, or he may turn to some department of systematic botany, etc.

BIBLIOGRAPHY.—Only general works on botany will be noted here. See the bibliographies under the special topics. Baillon, *Dictionnaire de Botanique* (3 vols., 1876–92); Balfour, *Manual of Botany* (5th ed. 1875); Bentley, *Manual of Botany* (4th ed. 1882); Bessey, *Botany for High School sand Colleges* (7th ed. 1892); Duchartre, *Éléments de Botanique* (3d ed. 1885); Goebel, *Outlines of Classification and Special Morphology of Plants* (1887); Goodale, *Physiological Botany* (1885); Gray, *Structural Botany* (1879); Jackson, *Guide to the Literature of Botany* (1881); Le Maout and Decaisne, *General System of Botany* (1876); Luerssen, *Handbuch der Systematischen Botanik* (2 vols., 1879–82); Mohl, *The Vege-*

table Cell (1852); Pritzel, *Thesaurus Literaturæ Botanicæ* (1872); Sachs, *Text-book of Botany* (1882); Sachs, *Lectures on the Physiology of Plants* (1887); Vines, *Lectures on the Physiology of Plants* (1886). CHARLES E. BESSEY.

Botany Bay: a bay of Australia; in New South Wales. It was discovered by Capt. Cook in 1770, and received its name from Joseph Banks, the botanist of the expedition, in allusion to the great number of new plants found there. It is 5 miles S. of Sydney, in lat. 34° 2′ S. and lon. 151° 13′ E. A colony of British convicts was planted here in 1787, and was removed to Port Jackson in 1788, but the penal colony long continued to retain the name of Botany Bay. The transportation of criminals to New South Wales was discontinued in 1840, on account of the often-repeated protests of the colonists.

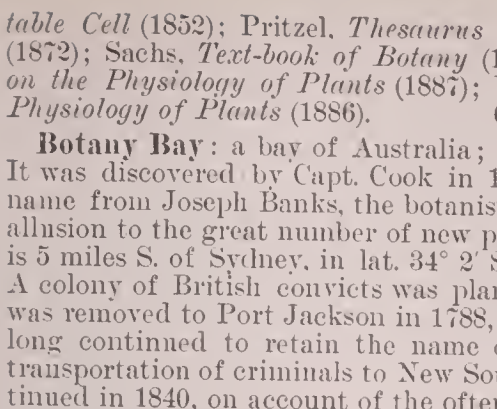
Botelho de Oliveira, bō-tāl′yō-dā-ō-lĕĕ′vā-ee′răă, MANOEL: Brazilian poet; b. at Bahia in 1636; d. Jan. 5, 1711. He was educated in Portugal, in the University of Coïmbra, and there became an enthusiastic admirer of the Spanish poet Góngora, whose works were the rage in both Spain and Portugal. He returned to Bahia and there followed the career of advocate. In 1705 his poems were published in Lisbon by the printer of the Inquisition, Manescal, under the title: *Musica do Parnasso, dividida em quatro côros de rimas portuguezas, castelhanas, italianas e latinas, com seu descante comico reduzido em duas comedias.*

A. R. MARSH.

Botero, bō-tā′rō, GIOVANNI, surnamed BENISIUS: Italian ecclesiastic and writer; b. at Bene, Piedmont, in 1540. He was secretary to St. Carlo Borromeo, and became in 1599 tutor to Charles Emmanuel's children. He wrote a noted political treatise, *Della Ragione di Stato*. D. in 1617.

Bot'etourt, NORBONNE BERKELEY, Lord: b. in England about 1734. He was appointed royal Governor of Virginia in 1768, and dissolved the Assembly of Burgesses in 1769 because they passed a remonstrance against some acts of the British Parliament. D. in Williamsburg, Va., Oct. 15, 1770.

Bot-fly: any dipterous insect of the family *Œstridæ*, but in the U. S. generally restricted to the horse bot-fly, *Gastrophilus equi*. The fly lays her eggs upon the hairs of the horse, and after laying her eggs almost immediately dies. The eggs, conveyed to the horse's stomach, are hatched, and the larvæ are provided with mouth-hooks, by which they hang on to the coats of the stomach. In about a year's time they are discharged with the excrement, and in one month they are changed into perfect flies. When very numerous there is reason to believe that bots are very injurious to the horse; but there is some dispute among horse-breeders as to the extent of the injury done by them.



Bot-fly.

Both'nia (in Swed. *Botten*): formerly a country of Northern Europe, which belonged to Sweden, and was situated on both sides of the Gulf of Bothnia. The eastern portion is now comprised in Finland, and the western forms the Swedish provinces of Piteå and Umeå.

Bothnia, Gulf of: the northern portion of the Baltic Sea; extends from Torneå southward to the island of Åland; is about 400 miles long and from 60 to 130 miles wide. It is bounded on the E. by Finland and on the W. by Sweden. Its greatest depth is about 50 fathoms. The navigation of it is rendered difficult by many small islands and sand-banks near the shores. The gulf is usually frozen in winter so that sledges can cross it.

Bothrioceph'alus [from Gr. *βοθρίον*, little trench + *κεφαλή*, head; in allusion to the depressions on each side of its head]: a genus of cestoid intestinal worms, formerly confounded with the *Tænia*, or common tapeworm. Two species occur in man, *Bothriocephalus latus* and *Bothriocephalus cordatus*. The former is common only in Switzerland, Russia, Sweden, Norway, Lapland, Finland, and Poland. It is from 6 to 20 feet in length; composed of numerous flat and wide segments, and an elongated, compressed, obtuse head, having an elongated slit-like sucker on each side. The eggs are oval, with a hood-shaped lid at one end, and are found numerously in the stools of infected persons. They develop in fresh water into an embryo having six hooklets and a ciliated covering. These enter certain fishes, especially the pike and eel-pout, where they become encysted in the tissue as cysticerci. Man is infected by eating the diseased fish. The symptoms produced are those of tapeworm in general, but occasionally a severe form of anæmia, "progressive pernicious anæmia," results. *Bothriocephalus cordatus* has been found to inhabit the human intestines only in North Greenland. In that country it is quite common in dogs. It is about a foot in length, and receives its name from the cordate or heart-shaped head. (Cobbold, *Proceedings of the Zoölogical Society*, London, 1862.) The means of destroying or expelling the "broad tapeworm," as this parasite is sometimes called, are the same as in the case of *Tænia*. See TAPEWORM.

Revised by WILLIAM PEPPER.

Both'well: a small village of Bothwell parish, Lanarkshire, Scotland; situated near the river Clyde; about 8½ miles S. E. of Glasgow (see map of Scotland, ref. 12–G). In the vicinity are the ruins of Bothwell Castle. The Covenanters were utterly routed by the troops of the Duke of Monmouth, June 22, 1679, at Bothwell Bridge. Pop. 2,600.

Bothwell: a post-town of Zone township, Bothwell electoral district, Ontario, Canada; on the Great Western Railway; 23 miles N. E. of Chatham (see map of Ontario, ref. 6–B). It has numerous petroleum-wells, and a trade in cattle, grain, and lumber, the latter being extensively manufactured here. Pop. 1,000.

Bothwell, JAMES HEPBURN, Earl of: b. about 1536; inherited the title and large estate of his father in 1556. In 1562 he was imprisoned for a conspiracy to seize the queen's person, but he escaped to France, after which he was outlawed. He returned in 1565, and became an enemy of Regent Murray and a favorite adviser of Queen Mary. The murder of Lord Darnley (1567) is generally imputed to him. He was indicted for this crime, but as he came to court with 4,000 followers he was acquitted. In Apr., 1567, many nobles signed a bond or document in which they commended Bothwell as a fit husband to the queen, whom he carried to Dunbar Castle. He married her in May of the same year. A strong party soon took arms against Bothwell, who fled to Denmark, where he was imprisoned. D. in the prison at Drangholm, Zeeland, Apr. 14, 1578. See Burton, *History of Scotland* (vol. iv.); Robertson, *History of Scotland*; and the dramas of Swinburne and Björnstjerne Björnson.

Botocu'dos, or **Aymo'res**: a native tribe of Brazil. They live in the forests on the Rio Doce, along the boundary of the provinces of Espirito Santo and Minas Geraes, and are said to resemble the Chinese. They are brave, but treacherous, and have caused the Government considerable trouble. They number about 4,000, and are rapidly dying out. They pierce the lower lip and insert a block of wood in the hole, from which comes their Portuguese name (*botoque*, a block of wood).

Botoshani, bō-tō-shaa′nĕĕ: a town in Roumania; on the Schiska; 60 miles N. W. of Jassy (see map of Austria-Hungary, ref. 6–M); carries on a considerable trade with Germany in cattle, wine, wool, tobacco, etc. Pop. 40,000.

Bo-tree, or **Pee'pul**: the *Ficus religiosa*, or sacred fig-tree of Hindustan and Ceylon; greatly venerated by the followers of Vishnu (who was born under this tree), and especially by the Bûddhists. It is a large tree, whose sap abounds in caoutchouc, and which yields a small edible fig, not much valued. Great amounts of lac are gathered from its branches, for it is one of the favorite abodes of the lac insect. The famous bo-tree of Anarajapura in Ceylon is believed, on apparently good grounds, to have been planted in 288 B. C.

Botrychium, bo-trik′i-um [Gr. *βότρυχος*, vine-stalk; *βότρυς*, cluster of grapes, in allusion to the appearance of the spore-bearing leaves]: a genus of adder-tongue ferns (*Ophioglossaceæ*) represented in the U. S. by seven species and several additional varieties. The most common species is *B. virginianum*, which occurs also in Europe and Asia. Other species—e. g. *B. lunaria* and *B. ternatum*—are widely distributed, occurring in North and South America, Europe, Asia, and Australia. See FERNWORTS and VEGETABLE KINGDOM.

CHARLES E. BESSEY.

Botry'tis: See Mildew.

Bots'ford, Amos Edwin: Canadian Senator; b. at St. John, N. B., Sept. 25, 1804, and educated at Sackville, N. B. He has been a member of the Executive Council of New Brunswick: a member of the Legislative Council of that province 1833–67; and in 1867 was called to the Canadian Senate and has been its speaker. He has been for fifty-nine consecutive years a member of the legislature of his country; has been prominent in military and judicial affairs; and, in addition to various other important missions assigned to him, was a delegate to Washington respecting a reciprocity treaty in 1852. He was appointed a privy councilor of Canada May 30, 1891. Neil Macdonald.

Botsrah: See Bostra.

Bot'ta, Anne Charlotte Lynch: poet; b. at Bennington, Vt., in 1820. She was married to Vincenzo Botta in 1855. She published a volume of poems (1848–84) and a *Handbook of Universal Literature* (1860–87). D. in New York city, Mar. 28, 1891.

Botta, Carlo Giuseppe Guglielmo, M. D.: an eminent Italian historian; b. at San Giorgio, in Piedmont, Nov. 6, 1766. He studied medicine, and served as surgeon in the French army in 1795–96. In 1803 he was elected to the French legislative body. He published in 1809 a *History of the American War of Independence*, and in 1825 a *History of the Nations of Italy from Constantine to Napoleon* (3 vols.). His most important works are a *History of Italy from 1789 to 1814* (Storia d'Italia dal 1789 al 1814, 4 vols., 1824) and his *Continuation of Guicciardini's History of Italy to 1789* (10 vols., 1832). He died in Paris, Aug. 10, 1837. See F. Becchi, *Elogia storico di C. Botta* (1839).

Botta, Paul Émile: archæologist and traveler; a son of the preceding; b. in Turin, Dec. 2, 1802; d. in Achères, near Poissy, Mar. 29, 1870. He entered the service of Mehemet Ali of Egypt as a physician about 1830, and became French consul at Alexandria. Having visited Arabia in 1837, he published in French a *Narrative of a Journey to Yemen, etc.* (1844). He was next sent as consul to Mosul, and in 1843 began to excavate the mound at Khorsabad near the Tigris for monuments of ancient Assyria, and there discovered the palace of Sargon (King of Assyria, 722–705 B. C.) with statues and cuneiform inscriptions. With the aid of the artist Flandin, he published in French a magnificent work entitled *Monuments of Nineveh, Discovered and Described by M. Botta, with Designs by Flandin* (5 vols. folio, 1847–50). Revised by D. G. Lyon.

Botta, Vincenzo, Ph. D.: b. near Turin, Italy, Nov. 11, 1818; became Professor of Philosophy at Cuneo, and afterward at Turin; a member of the parliament in 1849; in 1850 inspected the educational system of Germany, and in 1853 that of the U. S., and became Professor of Italian Literature in the University of the City of New York. Among his works are a *Life of Cavour* (New York, 1862); *Dante as Philosopher, Patriot, and Poet* (1865); and a history of modern philosophy in Italy. D. in New York, Oct. 5, 1894.

Bottesini, bot-tā-see'nĕe, Giovanni: musician; celebrated not only as a composer but also as the most remarkable performer on the double-bass ever known; b. at Crema, in Lombardy, Dec. 24, 1822; admitted to the Milan Conservatory when eleven years old, and took up the double-bass as a solo instrument; visited the U. S. with Arditi, and made a successful tour. His first opera, *Christophe Colombe*, was produced in Havana in 1846. Visited England in 1849, and conducted the Italian opera in Paris 1855–57, and afterward conductor at the Italian opera, Cairo, Egypt. His opera *L'Assedio di Firenze* was produced in Paris in 1856; *Ali Baba*, London, 1871; *Ero e Leandro*, Turin, 1879; and at the Norwich festival of 1887 his oratorio *The Garden of Olivet*, libretto by Joseph Bennett, was successfully sung. He died in 1889. D. E. Hervey.

Bött'ger, written also **Bött'cher**, or **Böt'tiger**, Johann Friedrich: a German alchemist; noted as the inventor of Meissen porcelain; b. at Schleiz, Feb. 4, 1682. He spent much time and money in the search for the philosopher's stone. D. in Dresden, Mar. 13, 1719.

Botticelli, Sandro: See Filipepi.

Böttticher, Paul: See Lagarde, Paul de.

Bottle Gourd, or **Cal'abash**: a plant of the genus *Lagenaria* and order *Cucurbitaceæ*: nearly allied to plants of the genus *Cucurbita*, in which it was formerly included. The *Lagenaria vulgaris*, or common bottle gourd, is a native of India, but is cultivated in many warm climates. It is a climbing annual, having white flowers, and a large bottle-shaped fruit with a hard rind, which is called a *calabash*, and is used for holding or dipping water. This fruit is sometimes several feet long. Some varieties of *Lagenaria* have an edible pulp, which is an important article of food.

Bottle-nose Whale, sometimes called **Bottlehead** (*Hyperoödon rostratus*): a cetaceous mammal of the family *Ziphiidæ*. It inhabits the North Atlantic and sometimes ascends rivers. It reaches a length of about 25 feet, and is remarkable for its bottle-shaped head. The name of Bottle-nose Dolphin is applied to another mammal, the *Tursiops tursio*, abundant in the North Atlantic.

Bottome, Margaret: See the Appendix.

Bottom Heat: a term applied in horticulture to the temperature communicated to certain soils, either by fermenting and decomposing substances placed underneath them, for which purpose leaves, fresh dung, and the refuse bark of the tanyard are often used, or by means of flues or hot-water apparatus. The system is applied to the cultivation of pineapples, grapes, melons, cucumbers, and other plants grown in hothouses, pits, or frames. It is one of the most important agents in the artificial cultivation of tender plants, whether flower or fruit bearing.

Bottomry [deriv. of *bottom*, lower part of hull, hull; imitation of Dutch *bodmerij*, so Germ. *Bodmerei*, Fr. *bomerie*]: the act of lending money on the pledge of a ship or on the bottom of a ship. It may be considered under the following divisions: 1, the nature of the contract; 2, its form; 3, by whom made; 4, the mode of its enforcement.

1. *The Nature of the Contract.*—It is a maritime contract, and in the nature of a wager. The substance of the contract is that if the ship returns, the loan is to be repaid with interest. If it is lost in the course of navigation, the debt is discharged, though the borrower may have abundant means for repayment. The principal of the loan being thus put at risk, the case does not come within the operation of the usury laws. Large interest is sometimes exacted—15 or 20 per cent., or even a larger rate. The proper court, however, has power, in extreme cases of excessive interest, to grant relief. Should the ship deviate from her voyage and be lost, the lender would not take that risk upon himself, but the borrower would still be liable. So if the ship be lost by the wrongful act of the borrower or the master, instead of the perils of the sea. It has been decided that the doctrine of constructive loss which applies in insurance law does not extend to a bottomry loan. This loan is not within the act of Congress, which requires mortgages and conveyances of vessels to be registered for the purpose of giving notice to subsequent grantors or to creditors. Should the ship return, the loan becomes due, and the principal and maritime interest together form a new principal, on which ordinary interest will be calculated until payment. A bottomry loan is strictly on the ship. A corresponding loan on the cargo is termed *respondentia*. It is governed by rules closely resembling those applicable to bottomry. A bottomry loan has this marked peculiarity, applicable, however, to other maritime liens: that where there are two or more in succession, the latest may have the preference, as it may be the price of the safety of the ship. In liens created regularly upon property on land it is a well-known general rule that the earliest has the preference.

2. *The Form of the Transaction.*—There is usually executed a bottomry bond. This is not, however, absolutely essential. The courts do not look so much at the technical forms as at the intent of the parties. Even if there were a sale intended as a security for a loan, evidence to show the true nature of the transaction could be adduced, and it would be enforced accordingly.

3. *By Whom Given.*—A bottomry bond may be executed either by the owner or the master of the ship in the owner's absence. The owner can execute it, in general, whenever he sees fit, so long as the transaction is in its nature maritime. A master of a ship, on the other hand, is governed by special rules. His leading duty is to navigate the ship, not to pledge nor to sell it. These latter powers are conferred upon him in extraordinary emergencies, where the exigencies require it. The lender must be prepared to show that the case is one which justifies the loan, such as stress of weather, necessity of repairs, and the like. Due measures must be taken to communicate with the owner where such communication is feasible. At the present time the

telegraph must be resorted to where it is accessible. The power of the master may in like manner in extraordinary cases extend to a pledge, or even a sale, of the cargo. The general test of his authority in all these cases is that he must exercise the diligence of a prudent owner, and that there must be an apparent necessity for the pledge or sale.

4. *Enforcement.*—A bottomry bond is enforceable in a court of admiralty—in this country in the district courts of the U. S. A proceeding is instituted against the ship, or, in technical language, *in rem*. If necessary, the ship may be sold, and the claim paid out of its proceeds. The borrower is also personally responsible. The lien of seamen for subsequent wages is superior to that of the bottomry lender. Should the latter, in order to preserve his own claim, discharge that of the seamen, he could have a lien upon the proceeds of the ship for his reimbursement, as well as a personal claim against the owners; or, in other words, he would be allowed to stand in the place of the seamen.

It may be added that if a ship, having incurred a bottomry loan, does not set out on her intended voyage, the property will not have incurred any maritime risk, and consequently the maritime interest can not be exacted, but only ordinary interest.

T. W. Dwight.

Botts, John Minor: statesman; b. at Dumfries, Prince William co., Va., Sept. 16, 1802; lost both parents by a theater fire in Richmond 1811. He was elected to Congress as a Whig in 1839, and re-elected several times, and denounced Mr. Tyler's breach with the party which had elected him Vice-President. In 1844 he supported Mr. Clay for the presidency. He opposed the repeal of the Missouri Compromise in 1854, was a firm adherent of the Union during the civil war, and afterward favored the Republican party, having suffered much inconvenience and a short imprisonment for his opinions at the hands of the Confederates. He wrote *The Great Rebellion* (1866). D. in Culpeper, Va., Jan. 8, 1869.

Bot'zen, or **Bozen** (It. *Bolsano*): a trading town of the Austrian Tyrol; at the junction of the river Talf with the Eisach; 33 miles by rail N. N. E. of Trent (see map of Austria-Hungary, ref. 7–B). It is situated in a hilly or mountainous district, is well built, and contains a gymnasium, a Gothic cathedral, and a castle; also manufactures of silk, linen, hosiery, etc. It has four annual fairs, and is an entrepôt of the trade between Italy, Germany, and Switzerland. Pop. (1890) 11,655.

Bouchard, boo'shaar', Henri Désire Abel: French physician; b. Dec. 18, 1833; M. D., University of Strassburg, 1856; appointed Professor of Anatomy in the Medical Faculty of Bordeaux 1878; author of *Essai sur les gaînes synoviales tendineuses du pied*; *Du tissu connectif*; *Nouveaux éléments d'anatomie descriptive et d'embryologie*; *Précis d'anatomie descriptive et d'embryologie.*

Boucher, bow'cher, Jonathan: philologist; b. in Blencow, Cumberland, England, Mar. 12, 1738. He removed to Virginia in 1756, when but sixteen years old. Nominated to the rectorship of Hanover parish before he was in orders, he was ordained in England March 26, 1762. In 1768 he was appointed by Gov. Eden to St. Anne's, Annapolis, and afterward to Queen Anne's, Prince George County. Sympathizing with the motherland at the breaking out of the Revolution, he returned to England in 1775, and compiled a *Glossary of Archaic and Provincial Words*. In 1797 he published *A View of the Causes and Consequences of the American Revolution*. This work was dedicated to Washington, with whom he had been personally acquainted. D. in Epsom, England, Apr. 27, 1804.

Revised by W. S. Perry.

Boucher de Crèvecœur de Perthes, boo'shay'de-krev'-kör'de-pert', Jacques: a French archæologist and naturalist; b. at Rethel, Sept. 10, 1788. His principal works are *The Creation* (5 vols., 1839–41), his principal publication; *Celtic and Antediluvian Antiquities* (1847); and *Antediluvian Man and his Works* (1860). He is regarded as the founder of the science of archæo-anthropology. D. in Abbeville, Aug. 9, 1868.

Bouches-du-Rhône, boosh'dü-rōn': a department in the southeast part of France; formerly included in Provence. Its area is 1,971 sq. miles. It is bounded N. by the Durance, which separates it from Vaucluse, E. by Var, S. by the Mediterranean, and W. by Gard. It is intersected by the Rhône, which enters the sea by several mouths, and forms a delta called the "Île de la Camargue." The surface in the east part is hilly, and is elsewhere diversified by plains, heaths, forests, and saline lakes. The grapevine and olive flourish here, and large numbers of silkworms and sheep are raised in this department. Among the public works are several canals, a railway connecting Marseilles with Lyons, and an aqueduct, 50 miles long, from the Durance to Marseilles, which is the capital. It has manufactures of cloth, hats, perfumes, wine, brandy, sugar, salt, soap, olive oil, and chemical products. It is divided into three arrondissements. Pop. (1896) 673,820.

Bouchette, Joseph: b. in Canada in 1774. In 1790 he entered the surveyor-general's office for British America, and afterward served in the volunteers and in the navy of the lakes. In 1804 he became surveyor-general. He served against the U. S. in the war of 1812. As surveyor-general he was afterward employed in establishing the southern boundary of Canada. He published (1816) a topographical and geographical description of Canada: *The British Dominions of North America* (1831); and a *Topographical Dictionary of Lower Canada* (1832). D. at Montreal, Apr. 9, 1841.

Boucicault, boo'sĕe-kō', Dion: playwright; b. in Dublin, Ireland, Dec. 26, 1822; educated by his guardian, Dr. Dionysius Lardner, and at the London University, as University College was then called. His first successful play was *London Assurance*, which he wrote in conjunction with John Brougham, and which was acted in 1841 at Covent Garden, London. He was married to Miss Agnes Robertson; removed to the U. S. in 1853, and remained till 1860, when he returned to London and brought out, at the Adelphi theater, his first, and still famous, Irish play, *The Colleen Bawn*. This is founded on Gerald Griffin's novel of *The Collegians*. In 1861 was produced at the same theater his play of *The Octoroon*, which vigorously illustrated, and by implication denounced, the evils of slavery in the Southern U. S. He remained in Great Britain till 1872, and furnished to the London stage a number of plays, among which were *The Relief of Lucknow* (1863); *The Streets of London* (1865); *Arrah-na-Pogue*; *Rip Van Winkle*; *The Flying Scud*; *The Long Strike* (1867); *How She Loves Him!*; *Foul Play* (written in collaboration with the novelist Charles Reade, 1868); *After Dark* (1869); *Formosa*; and *Kerry*. In the autumn of 1872 he appeared at Booth's theater, New York, as Shaun in *Arrah-na-Pogue*. In 1873 he produced, at Booth's theater, his beautiful Irish play of *Daddy O'Dowd*; at Wallack's theater, his *Mora* and his *Mimi*. On Dec. 25, 1873, he opened, in conjunction with Mr. William Stuart, the New Park theater, on Broadway, near Twenty-second Street, New York. *The Shaughraun*, produced at Wallack's theater in 1876, was one of his most successful dramas. He went on a professional tour to Australia, and married in 1889 Louisa Thorndyke, a young American actress. The question of the validity of the divorce proceedings with Agnes Robertson Boucicault was undetermined at the time of his death. Among his earlier works, prior to his first visit to America, were *Old Heads and Young Hearts*; *The Irish Heiress*; *The Willow Copse*; and *The Vampire*. The dramas of Boucicault are seldom, if ever, original in plot, but they are often original in action, treatment of incidents, and are bright in dialogue. He has been the means of great improvement and elevation to the Irish drama, having replaced the "ranting, roaring Irishman," with stuffed stick and black bottle, by genuine men of the Emerald Isle, such as Myles-na-Coppaleen, Shaun the Post, Kerry, and Daddy O'Dowd. As an actor, Mr. Boucicault's best successes were won in personating eccentric characters, such as Mantilini, and rustic old Irishmen, such as Daddy O'Dowd. He will also be remembered for having made dramatic authorship a remunerative profession to authors in Great Britain. This he did by asserting, maintaining, and finally establishing the principle that among theatrical attractions the play should be made predominant, and should be suitably recompensed. The change in practice that ensued may be inferred from the fact that whereas, in the earlier part of his career, Mr. Boucicault received but $300 for his *Corsican Brothers*, he obtained, in 1866, for his *Flying Scud*, $32,500. Boucicault was educated as an architect and civil engineer. As a manager he established a theater in Washington, D. C., in 1858; reconstructed the Metropolitan theater, New York, and converted it into the Winter Garden in 1859; remodeled Astley's circus and built the Westminster theater—both in London—in 1862.

He was the author of numerous newspaper essays and letters on dramatic subjects. D. in New York, Sept. 18, 1890.

Revised by B. B. Vallentine.

Boudinot, boo'di-not, Elias, LL. D.: philanthropist; b. in Philadelphia, May 2, 1740. He practiced law in New Jersey, and supported the popular cause in the Revolution. He was a member of the Continental (later U. S.) Congress in 1778–79, 1781–84; its president in 1782, in which capacity he signed the treaty of peace with Great Britain, and was director of the mint at Philadelphia from 1795 to 1805. In 1813 he was a founder of the American Board of Commissioners of Foreign Missions. In 1816 he became the first president of the American Bible Society, and so remained till his death. He wrote several works, and gave large sums of money for charitable purposes. His wife was a sister of Richard Stockton. D. in Burlington, N. J., Oct. 24, 1821.

Bouflers, boo'flār', Louis François, Duke de: French general; b. Jan. 10, 1644. He served under Turenne and Catinat; distinguished himself at Steenkerke in 1692, and became a marshal of France in 1693. He commanded at Namur when it was besieged by William III. of England in 1695, and defended Lille with success in 1708 against Prince Eugène. He commanded a wing at Malplaquet (1709), from which he made a masterly retreat. D. in Fontainebleau, Aug. 20, 1711. See *Vie du Maréchal de Bouflers* (Lille, 1852).

Bougainville, boo'găñ'veel', Louis Antoine, de: navigator; b. in Paris, Nov. 11, 1729. He was aide-de-camp to Montcalm in America in 1756; served with distinction in Germany in 1761; founded a colony in the Falkland islands, which was sold in 1766 to Spain; performed a voyage round the world in 1767–69, and discovered several islands in the South Sea, being the first Frenchman who had circumnavigated the globe. In 1771 he published a narrative of that voyage. During the American Revolution he had a high command in several naval battles between the French and British. D. Aug. 31, 1811.

Bough, bō, Samuel, R. S. A.: landscape-painter; b. at Carlisle, England, Jan. 8, 1822; at first a scene-painter; learned to work in oil and water-colors chiefly by self-instruction. Among his oil paintings are *Royal Volunteer Review* (1860); *Edinburgh from the Canal* (1862); *The Vale of Leith* (1866). Glasgow Institute possesses over 200 of his works. D. at Edinburgh, Nov. 19, 1878.

Bought Note: a memorandum given by a broker who effects a sale to the purchaser, in which the latter is notified that the property therein described has been bought for him of the seller, the price and terms being stated. A similar memorandum given to the seller is called the *sold note*. Both these memoranda and the broker's book entry should be signed, in order that they may not be excluded as evidence under the Statute of Frauds. In case of a discrepancy among them it becomes a question of fact what the real contract was. If the notes agree they will be taken to represent the contract; if they disagree, but one agrees with the entry, the contract will be presumed to be represented by the entry and the agreeing note.

Revised by F. Sturges Allen.

Boughton, baw'ton, George Henry: genre-painter; b. near Norwich, England, in 1834. When he was three years of age his parents went to Albany, N. Y.: he early took up the study of art without a master. In 1853 he made a sketching trip in Great Britain; returned to the U. S., and removed from Albany to New York in 1858. In 1860 he went to Paris, and thence to London in 1861, where he has since resided. National Academician 1871; associate Royal Academy, London, 1879; Royal Academy, 1896. His subjects are taken from the Puritan days in New England, "Knickerbocker" life in the early history of New York, and modern English scenes. His work is extremely popular both in the U. S. and in Great Britain. The *Edict of William the Testy* (1877) is in the Corcoran Art Gallery, Washington. Studio in London.

William A. Coffin.

Bougie, boo'zhee' [Fr., wax-candle: cf. Ital. *bugia*, Span. *bujia*, so named from *Bugia*, Arab. *Bijiyah*, an Algerian port from which wax was formerly exported in large quantities]: a slender surgical instrument designed to be introduced into the male urethra. It is usually made of gum-elastic or gutta-percha, but may be made of other flexible substances. Bougies are often medicated, but more commonly they are designed to act mechanically upon a contracted passage. They are sometimes made of a larger size for the rectum or for the œsophagus.

Bouguereau, boo'gă̆y-rō', Adolphe William: one of the most famous contemporary French painters; b. in La Rochelle, Nov. 30, 1825; pupil of Picot and winner of the Grand Prix de Rome in 1850. Member of the Institute; commander of the Legion of Honor 1885; medal of honor, Paris Exposition, 1878; medal of honor, Paris Salon, 1885. With the exception of Meissonier and Gérôme, his work is probably more widely known than that of any painter of the modern French school. Many of his pictures are owned in the U. S., and a number of them have become popular through engravings and other reproductive processes. He is chiefly celebrated as a painter of the nude figure, is a most skillful draughtsman, a delicate, but not forceful colorist. His *Youth of Bacchus* (1884) is one of the best of his compositions, and his *Madonna of Consolation* (1874) and his *Birth of Venus* (1879) are in the Luxembourg gallery. A picture called *Nymphs and Satyr*, painted in 1873, a fine example, is in the Hoffman House, New York. Most of the pictures by him in the U. S., however, are weakly sentimental figures of women and children, which detract from the reputation he achieved by his serious work. His abilities have been the subject of considerable difference of opinion among artists, the majority conceding him only powers of the second order. Studio in Paris.

William A. Coffin.

Bouillé, boo'lay', François Claude Amour, Marquis de: general; b. in Auvergne, France, Nov. 19, 1739; served in the Seven Years war; governor of Guadeloupe 1768; during American Revolution captured several British islands in the West Indies; member of Assembly of Notables 1787–88; commander-in-chief of the army of the Meuse, Saar, and Moselle 1790; aided Louis XVI. in his attempt to escape from Paris; served under Gustavus III. of Sweden 1791; later under Prince of Condé; d. in London, Nov. 14, 1800. Author of *Mémoires sur la Révolution Française*.

Bouillon, Godefroi de: See Godfrey of Bouillon.

Boulac: See Bulak.

Boulanger, -lăñ'zhay', Georges Ernest Jean Marie: French soldier and politician; b. at Rennes, April 29, 1837; appointed sub-lieutenant in First Regiment of Algerian Tirailleurs in 1856; received the decoration of the Legion of Honor in 1859; chief of battalion in the army of Paris during the Franco-Prussian war; appointed brigadier-general in 1880; sent to the U. S. as head of the mission to the Centennial Celebration in 1876; appointed French Minister of War Jan. 7, 1886. An energetic and capable organizer, he became the idol of the populace and the rising hope of the radicals, but eventually he brought forward measures for the reorganization of France which were accepted by Bonapartists, monarchists, clericals, and socialists. The movement known as Boulangism attracted all the malcontents, who elected him deputy for Nord by 100,000 majority, and for a time seriously disturbed political affairs in France. He fought a duel with Prime Minister Floquet, and was severely wounded, in 1888. Accused of violating his parole and conspiring to overturn the republic, he fled to Great Britain in order to avoid arrest. His trial proceeded in his absence, and he was sentenced to transportation for life. It was shown that the Duchess d'Uzès had supplied him with 3,000,000 francs for his political purposes. On Sept. 30, 1891, he shot himself on the grave of his mistress, Mme. de Bonnemain, who had followed him in exile and had supported him on her bounty during two years.

C. K. Adams.

Boulder: same as Bowlder (*q. v.*).

Boulder: a city and railroad center; capital of Boulder co., Col. (for location of county, see map of Colorado, ref. 2–E); situated at the east base of the Rocky Mountains, on both sides of Boulder creek, which flows through the famous Boulder Cañon. The State University is located here. Boulder has flouring-mills, smelting and sampling works, excellent public schools, and a complete system of water-works (the reservoir of which is fed by pure mountain-streams), and electric lights; is the center of both the agricultural and mining interests of the county, the great telluride belt of mines being only 6 to 8 miles distant, the free gold mines only 8 to 14 miles, and the famous silver mines of Caribou only 22 miles away. Coal and iron mines abound in the valley within 4 to 6 miles. This is a a favorite resort for tourists and invalids. Pop. (1880) 3,069; (1890) 3,330; (1900) 6,150.

Editor of "Herald."

Boulder-clay: same as BOWLDER-CLAY (*q. v.*).

Bou'le [Gr. βουλή, council]: the name of the ancient Athenian senate; instituted by Solon as a check on the *ecclesia* (ἐκκλησία), which was an assembly of the whole people. The boule was at first composed of 400 members, but Cleisthenes increased the number to 500 when he divided the Athenians into ten tribes. The number was subsequently raised to 600. All free-born Athenian citizens above thirty years of age were eligible to this council.

Boule, or **Boule-work**: See BUHL, or BUHL-WORK.

Boulevard' [Fr., loan-word from Germ. *Bollwerk*; Eng. *bulwark*, So. Russ. *bolverk*]: originally a kind of fortification introduced in France by the Normans after their conquest of Normandy. In France and Germany these defensive works have been generally leveled and turned into public promenades or avennes lined with trees. The Inner Boulevards of Paris form a magnificent central thoroughfare, lined on each side by a double row of trees, under which is a wide and elevated pathway, and bordered by elegant shops and mansions, the whole presenting a scene of gayety and splendor which no other capital can equal.

Boulogne, boo'lōñ', or **Boulogne-sur-Seine**, boo'lōñ'sür-sayn': a town of France; department of the Seine; on the right bank of the river Seine; 5 miles W. of Paris, from which it is separated by the BOIS DE BOULOGNE (*q. v.*). A fine stone bridge connects it with the ruined palace of St.-Cloud. It is surrounded by beautiful scenery. Pop. (1886) 30,084; (1896) 37,418.

Boulogne, or **Boulogne-sur-Mer**, -sür-mār': a seaport of France: department of Pas-de-Calais; on the English Channel; at the mouth of the Lianne; 158 miles by rail N. N. W. of Paris and 27 miles by rail S. W. of Calais; lat. 50° 44′ N., lon. 1° 37′ E. (see map of France, ref. 1–E). The railway which connects Calais with Amiens passes through it. It is divided into two parts—the upper and lower town, from the former of which the English coast is visible. The upper town has beautiful promenades, an old Gothic cathedral, an hôtel de ville, and an episcopal palace. The lower town is newer, more regular, and more populous. It contains a hospital, a theater, a museum, a public library, and an exchange. Boulogne derives much of its prosperity from English residents and visitors, who are very numerous. Steamers ply twice a day between this port and Folkestone. The harbor will admit large vessels during high water, and has been improved by the construction of vast moles at a cost of $5,000,000. Here are manufactures of linen and woolen goods, sailcloth, cordage, bottles, etc. It occupies the site of the ancient *Gesoriacum*, which after the time of Constantine the Great was called *Bononia Oceanensis*. Several centuries later the name was changed to *Bolonia*. At this place Napoleon assembled in 1804 an army of 180,000 men and a flotilla of 2,400 transports for the invasion of England. To commemorate this design, which, however, was never executed, a column 164 feet high was erected. Pop. (1891) 45,205; (1896) 46,807.

Boulogne, ÉTIENNE ANTOINE: French prelate: b. in Avignon, Dec. 26, 1747; edited during the Revolution the *Annales religieuses*, which was several times suppressed and revived with altered title. Under the empire he, as Bishop of Troyes, was imprisoned with two other bishops for declaring that the emperor had no authority to confine a bishop without the approval of the pope. He was made an archbishop in 1822. His works appeared in 1826–28, 8 vols. D. in Paris, May 13, 1825.

Boul'ton, MATTHEW: inventor; b. in Birmingham, England, Sept. 3, 1728. He was noted for his energy and enterprise as a manufacturer, and he became a friend and partner of James Watt. He established at Soho, near Birmingham, a manufactory of steam-engines in 1765. Boulton invented an improved apparatus for coining money and a new mode of inlaying steel. He was a man of generous disposition. D. in Soho, Aug. 18, 1809. See *Life of M. Boulton* (Birmingham, 1809), and S. Smiles, *Lives of Boulton and Watt* (1865).

Bou-Maza, surnamed SI MOHAMMED BEN ABDALLAH: an Arab chief; b. about 1820; followed for three years the austere life of a dervish; then, proclaiming that he was an emissary of heaven, he stirred up the Kabyles, the warlike inhabitants of Dahra in Algiers; preached the extermination of Christians, and waged war upon the allies of France, Hadj-Achmed and Sidi-Darribi. He surrendered after a protracted conflict with Gen. Herbillon, Jan. 13, 1847, and was conveyed to Paris. He afterward entered the service of the Porte, and attained the rank of colonel.

Bound, or **Bownde**, NICHOLAS, D. D.: a clergyman of the Church of England; educated at Cambridge; fellow of Peterhouse 1570; became rector of Norton, Suffolk, 1585; minister of Church of St. Andrew the Apostle, Norwich, and there he was buried Dec. 26, 1613. He published his famous work *The Doctrine of the Sabbath* (London, 1595); enlarged edition with partial Latin title, *Sabbathum Veteris et Novi Testamenti; or the True Doctrine of the Sabbath* (1606), in which the Puritan doctrine of the Lord's Day was for the first time broadly and prominently asserted. He also was an advocate of *The Holy Exercise of Fasting* (Cambridge, 1606).

Bound-bailiff: See BAILIFF.

Bound Brook: borough; in Bridgewater township, Somerset co., N. J. (for location of county, see map of New Jersey, ref. 3–C); 31 miles W. S. W. of New York. It is pleasantly situated on the Raritan river and the Delaware and Raritan Canal. It has seven churches and important woolen, engine, brass, and paint manufactures, and its trade in lumber is very extensive. Washington's army was encamped here for two winters. Pop. (1880) 934; (1890) 1,462; (1900) 2,622. EDITOR OF "CHRONICLE."

Bounty [from Fr. *bonté*, goodness, kindness; < Lat. *bo'nitas*]: a premium given by a government to foster some branch of industry, or to encourage enterprises which are believed to be of national importance and conducive to the public interests. The British Government formerly gave bounties to encourage the herring fisheries and the exportation of grain and Irish linen, and for other purposes. The modern political economists reject this factitious method of fostering commerce, agriculture, etc., and argue that it promotes a misdirection of capital, talent, and industry. The impolicy of giving bounties for such purposes appears to be now generally admitted, but they are still continued in France to promote ship-building and the production of sugar. They are often given, particularly in new countries, for the destruction of ferocious animals, as wolves, bears, etc. The general Government and some of the U. S. give bounties for tree-planting. Subsidies to sugar-planters, steamship companies, and land grants to railways are common in the U. S.

A bounty in money is also often given to induce men to enlist in the army and navy. The amount of this money varies according to the exigency and the difficulty of obtaining recruits. In 1812 the British Government offered a nominal bounty of £23 17*s.* 6*d.*, but this was subject to large deductions and drawbacks. The bounty given in Great Britain at present is about one pound sterling. In the American civil war the recruits of the Union army received in some cases a bounty of $500 or more. Many of these recruits deserted soon after they had received the bounty; these were called "bounty-jumpers."

Queen Anne's Bounty is a fund applied in England by a corporation of *ex-officio* governors to the augmentation of the incomes of the poorer clergy of the Church of England. Henry VIII. annexed to the crown the first fruits or the first year's income to a new incumbent of a benefice, and the tenths, which had previously gone to the pope. In 1703 Parliament, with the consent of Queen Anne, set aside the revenues from these sources for the increase of poor livings. In 1890 these amounted to $884,480, and the board of governors appropriate the revenue under a long series of statutes to promote private benefactions or endowments, or building of parsonages, by giving an equal sum not exceeding $1,000 to benefices having a yearly income of this amount or less.

Bounty, MUTINY OF THE: See BLIGH, WILLIAM, and PITCAIRN ISLAND.

Bouquet de la Grye, boo'kay' de-la-gree', JEAN JACQUES ANATOLE: hydrographical engineer; member of the Institute; commander of the Legion of Honor; b. in Thiers, Puy-de-Dôme, May 20, 1827; studied at the Polytechnic School, graduating in 1847 in the hydrographical engineers, of which he became engineer-in-chief in 1886. He is member of the bureau of longitudes; vice-president of the committee on hydrography; elected member of the Academy in 1884 in place of Yvon Villarceau. He is the ardent promoter of the project to make Paris a seaport by means of a ship-canal and the improvement of the Seine. Author of *Pilote des Côtes Ouest de la France*; *Notes sur la Sondage*

à la mer; *Étude hydrographique sur la baie de la Rochelle*; *Régime de la Loire maritime*; *Paris, Port de mer.*

W. R. H.

Bouquetin, boo'ke-tăñ', or **Ibex of the Alps** (in Germ. *Steinbock*): a species of wild goat (*Capra ibex*) formerly found on the Alps, and which ascends to the limit of perpetual snow. It is larger than the common goat, and has large horns which curve backward. The horns of the male are sometimes 20 inches long or more. It has no beard except a few hairs in winter. The color of the hair is mostly brown. This animal feeds on shrubs, lichens, and the scanty herbage which is found on the confines of vegetation. It has an extraordinary power of bounding from crag to crag, and of climbing precipices which are almost perpendicular. The bouquetin can be tamed if it is taken young, and it will breed with the common goat. The bouquetin is now extinct in the Alps, except possibly near Courmayeur. There are still probably forty or fifty on the mountains S. of the Dora Baltea. The bouquetin is preserved by law.

Bourbaki, boor'bă'kee', Charles Denis Sauter: French general; b. in Pau, Apr. 22, 1816: took part in the wars in the Crimea and in Italy: and in the German-French war of 1870 he commanded the imperial guards before Metz. After the deposition of Napoleon he organized the Army of the North under Gambetta; then tried with disastrous results to break the German line at Belfort. He attempted suicide, and gave up the command to Clinchant, who crossed the Swiss frontier with 84,000 men, Feb. 1, 1871. In 1873 he commanded an army-corps at Lyons; was retired from active duty in 1881. D. in Bayonne, Sept. 22, 1897.

Bourbon: a French island. See Réunion.

Bourbon: town; on railroad, Marshall co., Ind. (for location of county, see map of Indiana, ref. 2–E); 53 miles from Fort Wayne and 95 from Chicago. It has three churches, a graded school, including high-school department, wagon manufactories, a large roller flouring-mill, several boot and shoe manufactories, and various other mechanical enterprises. The surrounding country is very fertile, and some valuable timber, such as walnut, poplar, oak, maple, beech, etc., is yet standing. Large quantities of butter, eggs, poultry, wool, horses, cattle, hogs, sheep, wheat, oats, clover-seed, lumber, etc., are annually exported. Pop. (1880) 1,056; (1890) 1,064; (1900) 1,187. Editor of "Mirror."

Bourbon (Fr. pron. boor'bŏñ'): the name of a family which reigned over France from 1589 to 1792, and from 1815 to 1848. A prince of the Bourbon dynasty also obtained the throne of Spain in 1700, and another that of Naples and Sicily in 1735. The Bourbons derive their name from the castle of Bourbon, which was built in the thirteenth century, and was situated in the old province of Bourbonnais, 16 miles W. of Moulins. The heiress of the seigniory was married in 1272 to Robert, a younger son of King Louis IX. The seigniory was erected into a duchy, and Louis, a son of Robert, became about 1327 the first Duke of Bourbon. He died in 1341, and was succeeded by his son Pierre, who was killed at Poitiers in 1356. Louis, a son of Pierre, became the third Duke of Bourbon. He was one of the most powerful vassals of the crown of France, and made large additions to the duchy by his marriages. D. in 1410. His son Jean, b. in 1381, was the fourth duke. He was taken prisoner by the English at Agincourt, and detained until his death (1434). He was succeeded by his son Charles, b. in 1401. He died in 1456, leaving a son Jean, who became the sixth Duke of Bourbon and constable of France. See Bourbon, Charles de.

Among the collateral branches of the Bourbon family were those of Vendôme, Condé, Montpensier, Orléans, Conti, and Soissons. Antoine de Bourbon, Duke of Vendôme, became by marriage King of Navarre. His son, Henry of Navarre, was the first French king of the house of Bourbon, and began to reign as Henry IV. in 1589. He had two sons, Louis XIII. and Gaston, Duke of Orléans; a daughter, Elizabeth, who was married to Philip IV. of Spain, and Henrietta, who became the queen of Charles I. of England. Louis XIII., who died in 1643, left two sons, Louis XIV. and Philip, Duke of Orléans, who was the ancestor of King Louis Philippe. The dauphin, the eldest son of Louis XIV., d. in 1711, leaving three sons—1, Louis, Duke of Burgundy; 2, Philip, Duke of Anjou, who became King of Spain as Philip V.; 3, Charles, Duke of Berry. Louis of Burgundy, who died in 1712, was the father of Louis XV., who succeeded his great-grandfather, Louis XIV., in 1715. Louis XV. had one son, Louis, who died before his father, leaving three sons, who all reigned successively—namely, Louis XVI., Louis XVIII., and Charles X. Louis XVI. left one son, who by the royalists was recognized as Louis XVII., but perished as a child during the French Revolution. As the circumstances of his death remained unknown, many adventurers claimed to be Louis XVII. Louis XVIII. had no issue. Charles X. had two sons—Louis Antoine, who died without issue in 1844, and Charles Ferdinand, Duke of Berry. His only son, Henri, Duke of Bordeaux, styled Count de Chambord, was the heir to the throne, according to the Legitimists, who gave him the title of Henry V. See Chambord.

The House of Orléans is called the younger branch of the royal family of Bourbon, and is descended from Philip of Orléans, a younger brother of Louis XIV. His son Philip was regent of France during the minority of Louis XV., and left a son, Louis Philippe, Duke of Orléans. This last was the grandfather of the Duke of Orléans who figured in the Revolution as Citizen Egalité, and was father of Louis Philippe, who became King of the French in 1830. This king had five sons—the Duke of Orléans, the Duke of Nemours, the Prince de Joinville, the Duke of Aumale, and the Duke of Montpensier. The Count of Paris, the son of the eldest of these five, is regarded as the heir to the throne by the Orleanist party.

Philip, Duke of Anjou, who was placed on the throne of Spain in 1700, was the founder of a Spanish dynasty, which reigned in Spain until the dethronement of Queen Isabella in 1868, and regained the crown in 1875 through Alfonso XII. Philip of Anjou was also the ancestor of the Bourbon dynasties of Naples and Parma. Francis II., who was dethroned in Sept., 1860, was the last Bourbon monarch of Naples (or the Two Sicilies). The Bourbons have also ceased to reign in Parma, which was annexed to the kingdom of Italy in 1859. Louise of Bourbon, a daughter of the Duke of Berry and sister to the Count of Chambord, b. in 1819, d. in 1864, was married in 1845 at Frohsdorf to Charles III. of Parma, who descended from the Spanish line of the Bourbons. Charles III. was violently reactionary in his policy, and was assassinated Mar. 26, 1854. Louise immediately assumed the regency in the name of her minor son, Robert I., and she developed extraordinary energy and made great personal sacrifices in order to gain the confidence of the Italians and bring back order and peace. She was not altogether unsuccessful in her endeavors, but the tendency of the time pointed another way. See Achaintre, *Histoire Chronologique et Généalogique de la Maison Royale de Bourbon* (2 vols., 1825); Coxe, *Memoirs of the Kings of Spain of the House of Bourbon* (3 vols., 1813).

Bourbon, Charles, Duc de, usually styled Constable Bourbon (Connétable de Bourbon): French general; b. Feb. 17, 1489; son of Gilbert Bourbon, Count of Montpensier. He married the heiress of the Duke of Bourbon—Suzanne, a daughter of Pierre de Bourbon, who died in 1503—and became the owner of the vast estates of both branches of the Bourbons. But his brilliant military successes aroused the jealousy of Louis XII., who refused to make him commander-in-chief. Francis I., however, followed another policy. Charles was appointed constable of France in 1515, and was one of the generals who gained a victory at Marignano in that year. He was very popular with the soldiers and with the court, but his popularity caused his fall. The mother of Francis I. was enamored of him, but her overtures having been rejected, she became his enemy. At her instigation, the estates which he had acquired by marriage were seized by the king after the death of Suzanne. Other insults were heaped upon him. In the campaign against Charles V. the command of the vanguard was given to the Duc de Alençon. His official salaries and the sums he had borrowed for his war expenses were not paid, and he, the richest man in France, was actually reduced to beggary. Bourbon deeply resented this injury, renounced his allegiance to the King of France in 1523, and became the ally of the Emperor Charles V., for whose services he raised about 6,000 Germans. He contributed largely to the victory which the imperial army gained over the French at Pavia in 1525. It appears that he was distrusted by Charles V., who neglected to pay Bourbon's German mercenaries, and these consequently became mutinous. However, the emperor made him Duke of Milan and commander of his mercenaries in Northern Italy in 1526, and with them he conducted a daring enterprise against Rome, in which he displayed great military talent. His army

took Rome by assault May 5, 1527, but he was killed as he mounted the wall by a pistol-shot, fired, it is said, by Benvenuto Cellini. In German there is a biography by Schwartzenau (Berlin, 1852). The Constable Bourbon is a prominent character in Byron's drama *The Deformed Transformed*.

Bourdaloue, boor'dăă'loo', Louis: French pulpit orator; b. in Bourges, Aug. 20, 1632. He entered the order of Jesuits in 1648, and became professor of rhetoric and the humanities. In 1669 he removed to Paris, where he preached for many years before Louis XIV. and the court. His style of eloquence was less inflated and more direct than that which then prevailed in France. He was a general favorite with the common people, as well as the learned and higher classes. D. in Paris, May 13, 1704. His sermons were published in 16 vols., 1707–34. Perhaps the most famous among them are the sermon of the Passion; that on the Conception; and that on the Last Judgment. Eng. trans. of select sermons (n. e. London, 1884). See A. Feugère, *Bourdaloue, sa prédication et son temps* (Paris, 1874; 5th ed. 1889); M. Lauras, *Bourdaloue, sa vie et ses œuvres* (Paris, 1881).

Revised by A. R. Marsh.

Bourdon [Fr. pilgrim's staff]: in music, the humming sound produced by blowing through a long hollow staff. Hence the name given to the stop of low pitch found in all pipe-organs.

Bourg: a place of refuge or fortified place; the name of about forty villages and towns in France. The most important is **Bourg**, or **Bourg-en-Bresse**, boorg'ăăn-bres': a town of France; capital of the department of Ain; pleasantly situated on the Reyssouse; 57 miles by rail N. N. E. of Lyons (see map of France, ref. 6–H). Several railways connect it with Lyons, Mâcon, and Besançon. It is well built, has a college, a museum, a large hospital, and a public library of about 20,000 volumes. Here are manufactures of linen, cotton stuffs, hosiery, etc. Pop. (1896) 18,501.

Bourgeois, bŭr-jois': the name of a type used in printing. It is one size larger than brevier, and one size smaller than long primer. See Printing.

Bourgeois, boor'zhwăă': a French word signifying a citizen or resident of a city; a commoner, as distinguished from a nobleman; a civilian, as distinguished from a soldier. A citizen of the state or republic is called *citoyen*.

Bourgeoisie, boor'zhwăă'zee': a French term; is also much used in English, defined in dictionaries as "citizens," "citizenship," "commonalty." It is applied to the great middle class of French society, composed mostly of merchants, manufacturers, master mechanics, lawyers, etc., who live in towns and cities. They are inferior in rank to the aristocracy, and superior to the peasantry and to the *prolétaires* of the towns.

Bourges, boorzh' (anc. *Avaricum*, afterward *Bituriges*): a city of France; near its center; capital of the department of Cher; is situated in a fertile plain at the confluence of the Auron and the Eure, 146 miles by rail S. of Paris (see map of France, ref. 5–F). It is connected by railway with Paris, Orléans, Moulins, and other cities. It was inclosed by ramparts now converted into promenades or boulevards bordered with chestnut and walnut trees. The streets are crooked and the houses mostly antique. Bourges has a college, a normal school, a public library of about 25,000 volumes, a fine hôtel de ville, and a magnificent Gothic cathedral, which is considered one of the finest in Europe. It is the see of an archbishop. This town was formerly the seat of a celebrated university founded in 1463 and suppressed in 1789. It has manufactures of cutlery, woolen stuffs, etc. *Avaricum*, which occupied this site, was a very ancient town, and was the capital of Celtic Gaul about 500 B. C. It was the chief town of the Bituriges in the time of Julius Cæsar, who besieged and took it in 52 B. C., after which it became the capital of the Roman province of Aquitania. During the Middle Ages seven councils of the Church were held here, and in 1438 the Pragmatic Sanction of the Gallican Church was established here. Pop. (1886) 42,829; (1891) 45,432; (1896) 43,587.

Bourget, boor'zhay', Paul: French novelist and critic; b. at Amiens, Sept. 2, 1852; devoted himself early to journalism and literature. He has attracted much attention, on the one hand, by his work in criticism, *Études de Psychologie contemporaine* (2 series, 1883–85); *Études et Portraits* (1889); and, on the other hand, by his novels, in which the sad conclusions of so-called realist or naturalist psychology and the pessimism of the *fin du siècle* are embodied in delicate and subtle art. Among these novels the following have perhaps had most repute: *Cruelle Énigme* (1885); *Un Crime d'amour* (1886); *André Cornélis* (1887); *Mensonges* (1887); *Le Disciple* (1889); *Un cœur de femme* (1890); *La Terre Promise* (1892); *Cosmopolis* (1892); *La Duchesse Bleue* (1898); *Drames de Famille* (1900). He has published also several volumes of verse: *La vie inquiète* (1875); *Edel* (1878); *Les aveux* (1882); *Au bord de la mer*, etc. (1885).

Bourgoing, boor'gwăñ', Jean François, Baron de: French diplomatist: b. in Nevers, Nov. 20, 1748; was ambassador at different courts. During a nine years' residence in Spain he wrote, among others, a thorough book upon it, *Nouveau voyage en Espagne, etc.* D. in Carlsbad, July 20, 1811.

Bourignon, boo'rēēn'yōñ, Antoinette: a Flemish visionary; b. at Lille, Jan. 13, 1616; professed that she received special revelations; found asylum in a convent. Having left the convent and renounced Catholicism, she traveled in foreign countries; wrote several religious works; gained many converts to her sect; it especially prospered in Scotland. She was an eloquent speaker and writer. D. in Franeker, Friesland, Oct. 30, 1680. See a *Life of Antoinette Bourignon*, prefixed to her works (Amsterdam, 25 vols., 1676–84). Peter Poiret was the chief expounder of her mysticism. Some of her writings appeared in English within thirty years of her death. See Labadie, Jean, de.

Bou'rinot, John George, C. M. G., LL.D.: Canadian publicist; b. at Sydney, Nova Scotia, Oct. 24, 1838; educated at Trinity College, Toronto; engaged in journalism; established the *Halifax Reporter*, and was its editor for many years. After holding various appointments in the senate, he became clerk of the Dominion Parliament in 1880; created by the Queen a companion of the Order of St. Michael and St. George in 1890; and in 1892 was elected president of the Royal Society, Canada. He has contributed extensively to the magazines on both sides of the ocean. Among his works are: *Intellectual Development of Canadian People* (Toronto, 1880); *Parliamentary Practice and Procedure* (Montreal, 1884); *Constitutional History of Canada* (1887); and *Parliamentary Government in Canada* (1892).

Bourke, John Gregory: See the Appendix.

Bourmont, boor'mōñ', Louis Auguste Victor, de: Comte de Ghaisne; a French general; b. in Anjou, Sept. 2, 1773; was a royalist in the Revolution; fought against the republic in 1794–96; entered the service of Napoleon about 1809. Having served with distinction in Russia, he was raised to the rank of lieutenant-general in 1814. During the Hundred Days, 1815, he deserted Louis XVIII. and Napoleon by turns. He became Minister of War in 1829, and commander-in-chief of the army sent against Algiers in 1830. He conquered Algiers, and was rewarded in July, 1830, with the bâton of a marshal of France. Being devoted to Charles X., he was deprived of his command by the revolution of 1830, and went into exile, and fought for Dom Miguel in Portugal. Died in Anjou, Oct. 27, 1846. See De Lansac, *Notice sur le Comte de Bourmont* (1847).

Bourne: town (incorporated Apr. 2, 1884); Barnstable co., Mass. (for location of county, see map of Massachusetts, ref. 5–K); on Old Col. R. R. (Cape Cod Div.); 56 miles from Boston. The town has 6 churches and 11 schools, including a high school; its principal industries are freight-car manufactory, iron foundry, art-works, oystering, and line-fishing. Bourne was set off from Sandwich, and a large part of its territory borders on Buzzard's Bay. It is a popular summer-resort, and has many elegant summer residences. Pop. of township, including 8 villages (1890) 1,442; (1900) 1,657.

David D. Nye.

Bourne, Hugh: preacher; b. at Fordhays Farm, in the parish of Stoke-on-Trent, Staffordshire, England, Apr. 3, 1772; was one of the founders of the sect of Primitive Methodists. He was by trade a wheelwright; joined the Wesleyans 1799; started camp-meetings in imitation of the American practice 1807; was in consequence "cut off" from the Wesleyan connection in 1808. His new sect was organized in 1810. He visited the U. S. 1844–46. D. in Bemersley, Staffordshire, Oct. 11, 1852. He wrote a history of the Primitive Methodists (Bemersley, 1825). See his *Life*, by J. Walford (London, 1855), and Methodism.

Bourne, Vincent: English scholar and Latin poet; b. about 1695. He was an usher of Westminster School; graduated at Trinity College, Cambridge, and became a fellow in 1720; passed the rest of his life as a master in

Westminster School. He wrote several short original Latin poems, which are remarkably graceful, and produced Latin versions of English ballads, which are felicitous. These were published under the title *Poemata* (1734; another edition, with a memoir by Mitford, 1840). Cowper translated some of his original Latin poems. D. Dec. 2, 1747.
Revised by HENRY A. BEERS.

Bournemouth: a health-resort of Hampshire, England; on Poole Bay, English Channel. It is in the borough of Christchurch; 37 miles S. W. from Southampton (see map of England, ref. 14–G). The suburbs in Bourne Brook valley are laid out in pine groves and parks; there are here a national sanitarium, homes for consumptives and incurables, and other health establishments, a town-hall, and St. Peter's church, with a memorial to Keble. It was a coast-guard station until about 1840, when it began to grow rapidly on account of its benign climate. Pop. (1891) 37,650; (1901) 47,003.

Bour'nonite, or **Endel'lionite**: a triple sulphide of copper, antimony, and lead; composed of 41·8 per cent. of lead, 26 of antimony, 19·4 of sulphur, and 12·8 of copper. It occurs in crystals, and massive.

Bouro: See BURU.

Bourrienne, boor'ri-en', LOUIS ANTOINE FAUVELET, de: a French diplomatist; b. at Sens, July 9, 1769. He was a fellow-student and friend of Bonaparte at the school of Brienne. They met at Paris in 1792, and renewed their intimacy. In 1796 Bourrienne became private secretary to General Bonaparte, whom he followed to Egypt. In 1804 he was sent as minister to Hamburg, but he was accused of peculation, and was recalled in 1811 and forced to refund 1,000,000 francs. Having deserted Napoleon in 1814, he was appointed Minister of State by Louis XVIII. in 1815. He published an interesting work entitled *Memoirs upon Napoleon* (10 vols., 1829–31), which is an important contribution to the history of the times. Died in an asylum in Caen, Feb. 7, 1834. See Boulay de la Meurthe, *Bourrienne et ses Erreurs* (2 vols., 1830).

Bourse: See EXCHANGE.

Bousbecq, AUGIER GHISLEN: See BUSBECQ, AUGIER GHISLEN.

Boussingault, boos'săn'gō', JEAN BAPTISTE JOSEPH DIEUDONNÉ: chemist; b. in Paris, Feb. 2, 1802; educated at the mining school of St. Étienne; was an officer under Bolivar in South America in his youth. Returning to France, he was made Professor of Chemistry at Lyons, and in 1839 was elected a member of the Academy of Sciences and given the chair of Agriculture in the Paris Conservatory of Arts and Trades. He was made commander of the Legion of Honor in 1857, and promoted to the rank of grand officer of that order in 1876. In 1844 he published a valuable work, *Treatise on Rural Economy* (2 vols.). Among other works, he wrote *Annals of Physics and Chemistry*. He was a moderate republican member of the National Assembly in 1848. D. in Paris, May 12, 1887.

Bonstrophe'don [Gr. *βουστροφηδόν*, turning like oxen in plowing; *βοῦς*, ox + *στρέφειν*, turn]: a mode of writing practiced by the ancient Greeks until about 450 B. C.—namely, in alternate lines from right to left and from left to right, as fields are plowed in furrows, having an alternate direction.

Boutelle, CHARLES ADDISON: Congressman; b. at Damariscotta, Me., Feb. 9, 1839; educated at Yarmouth Academy; entered the shipping business; volunteered in the navy in 1862, and served with distinction to the close of the war; assumed the management of the Bangor *Whig and Courier* in 1870; unanimously nominated for Congress in 1880, and from that time served continuously till his death; represented Maine on the Republican national committee in 1884; chairman of the committee on naval affairs in the 51st, 54th, and 55th Congresses, and in this capacity drafted the bill providing for the first heavy battle-ships for the new navy. D. in Waverly, Mass., May 21, 1901. C. H. THURBER.

Bouterwek, boo'ter-vek, FRIEDRICH: philosopher and critic; b. near Goslar, in Hanover, Apr. 15, 1766. He wrote several poems and a romance called *Count Donamar* (3 vols., 1791). He became Extraordinary Professor of Philosophy at Göttingen in 1797 and ordinary professor in 1802. He published several works on philosophy and a *Treatise on Æsthetics* (1806). His reputation is founded on his excellent *History of Modern Poetry and Eloquence* (12 vols., 1801–19). D. in Göttingen, Aug. 9, 1828.

Boutmy, boot'mee', ÉMILE: publicist; b. at Paris, April 13, 1835; director of the École libre des Sciences politiques, and since 1880 member of the Academy of Moral and Political Sciences. M. Boutmy's chief works are: *Quelques observations sur la réforme de l'enseignement supérieur* (1877); *Études de droit constitutionel*; *France, Angleterre, États-Unis* (1885), an original and highly suggestive book, of which an English translation by E. M. Dicey was published at New York in 1891; and *Le développement de la constitution en Angleterre* (1886; English translation by J. M. Eaden, New York, 1891).
C. H. T.

Bou'ton, NATHANIEL, D. D.: b. in Norwalk, Conn., June 29, 1799; graduated from Yale College 1821, and from Andover Theological Seminary 1824; settled as pastor of the Congregational church in Concord, N. H., Mar. 23, 1825, and so remained till 1867; received the honorary appointment of State historian of New Hampshire; was corresponding secretary of New Hampshire Historical Society and one of its most prominent members. Among his principal works are *History of Concord, New Hampshire* (Concord, 1856), and 10 volumes of *Provincial Records* (of New Hampshire). D. in Concord, N. H., June 6, 1878.

Bont'well, GEORGE SEWALL, LL. D.: lawyer and cabinet officer; b. in Brookline, Mass., Jan. 28, 1818. His education was partly obtained in the public schools and by a course of prolonged private study. He taught school in his youth; was admitted to the bar at the age of twenty-eight; entered political life in 1840 as a disciple of Van Buren; was thrice defeated for Congress and twice for Governor of his native State; but in 1851 and 1852 was chosen chief executive of Massachusetts. He was long a member of the Massachusetts Board of Education, of which he was secretary for five years. He organized the internal revenue department of the U. S. Government, and in 1862 became its first commissioner. He was a member of Congress from Massachusetts 1863–69, and Secretary of the Treasury 1869–73 under President Grant. In 1873 he was chosen U. S. Senator from Massachusetts for the term ending 1877 in place of Hon. Henry Wilson, Vice-President of the U. S. Wrote treatises on education and taxation in a conservative spirit.

Bouvar'dia [named in honor of Bouvard, physician of Louis XIII.]: a genus of plants of the family *Rubiaceæ*; allied to the trees from which Peruvian bark is obtained. The corolla is tubular, four-lobed, and has four stamens included in it. The fruit is a capsule, two-celled. The species of this genus are natives of Mexico. Many species are cultivated in gardens for their beautiful flowers.

Bouvier, JOHN: jurist; b. in Codogno, province of Milan, Italy, in 1787; emigrated to the U. S. in 1802, and practiced law in Philadelphia. In 1838 he became a judge of the criminal court of that city. He published a *Law Dictionary* (1839), and *Institutes of American Law* (4 vols., 1851), which were long standard reference-books. D. in Philadelphia, Nov. 18, 1851.—His daughter HANNAH, b. in 1811, published *Familiar Astronomy* (1857).

Bovey, HENRY TAYLOR: See the Appendix.

Bovia'num: an ancient city of Italy; founded by the Samnites on or near the site of the modern Bojano; surrounded by high mountains. According to Livy it was a wealthy and powerful city. It was besieged and taken by the Romans in 311 B. C. In the second Punic war it was several times headquarters of the Roman army. During the Social war it was capital of the confederates.

Bo'vidæ [from Lat. *bos, bovis*, ox]: the ox family; an important family of ruminant mammals; rich in species, and including a large number of those most useful to man. They vary greatly in form, the average type, or that represented by the greatest number of species, being exemplified in the antelopes, while extremes are represented by the oxen, the sheep, and the goats. The head is narrowed forward, the nose generally naked, and the nostrils large and open. The teeth are of the typical ruminant type, no incisors being present in the upper jaw; and the upper canines also are usually lacking, though sometimes well developed. In the lower jaw are three incisors on each side, and in contact with them a canine shaped like an incisor and often mistaken for one. The horns are always developed in the males, and frequently in females. They are of the "hollow" type, each horn consisting of a solid process of the frontal bone, the "core," enveloped in a fibrous sheath of true horn; and they are not periodically shed as in the related deer family. The latter grows slowly, but continuously, from the base

and wears away at the tip. The family includes all the hollow-horned ruminants except the prong-horn of America and *Saïga* of the plains of Western Asia, each of which represents apparently a distinct family. The genera still embraced are quite numerous, and are susceptible of being grouped into several sections or sub-families. See CATTLE, and ADDAX, ANOA, ARNEE, BISON, BLAUW-BOC, BLES-BOC, BUFFALO, CHAMOIS, ELAND, GAYAL, GAZELLE, GNU, GOAT, IBEX, KOODOO, MUSK-OX, SHEEP, SPRING-BOK, STEIN-BOK, URUS, YAK, and ZEBU. Revised by DAVID S. JORDAN.

Bovino, bō-vee'nō (anc. *Vibinum*): a fortified town of Italy: province of Foggia; 14 miles S. S. W. of Foggia (see map of Italy, ref. 6-G). It has a cathedral and several churches. The imperialists defeated the Spaniards here in 1734. Pop. 8,000.

Bow and arrow: one of the oldest of missile weapons. Bows have been made of various materials and different sizes and powers from prehistoric times, and were the favorite and generally used projectile weapon until the introduction of small arms.

The English long-bow, which accomplished such remarkable results in the fourteenth and fifteenth centuries, was usually about 5½ feet long and was made of yew, although elm and wych-hazel were also used. The arrow was 3 feet long, feathered, and furnished with a steel head. In the hands of a good archer it was accurate, and had sufficient penetration to inflict fatal wounds up to 240 or 250 yards, with an extreme range of 300 to 400 yards, and a capacity of from eight to twelve shots per minute.

The cross-bow, which was a bow attached to a stock resembling a musket, was shorter and stiffer, and was sometimes drawn by a small windlass attached to the stock. It discharged a shorter and stouter arrow, called a "quarrel," and was of slower fire than the long-bow.

The shorter bows in different ages have been made of steel, horn, and other elastic materials, and the arrows have sometimes been poisoned, particularly by savages. See ARCHERS and ARCHERY. JAMES MERCUR.

Bow'dich, THOMAS EDWARD: an English linguist and traveler; b. in Bristol, June 20, 1791. Having visited Ashanti in 1816, he published a *Mission from Cape Coast Castle to Ashanti* (1819). He undertook an exploring expedition into the interior of Africa in 1822, but he died of fever on the river Gambia, near its mouth, Jan. 16, 1824. Of this exploration his wife edited his account (1825).

Bowditch, HENRY INGERSOLL: physician; son of Nathaniel, named below; b. in Salem, Mass., Aug. 9, 1808; d. in Boston, Jan. 14, 1892; graduated at Harvard 1838; studied medicine in Cambridge; Professor of Clinical Medicine in Harvard 1859-67; announced a law of soil-moisture as a cause of pulmonary disease; first practiced puncturing the chest cavity to remove pleural effusions; was an active abolitionist; translated from the French the treatises of Louis on *Typhoid* (Boston, 1836) and on *Phthisis* (1836), and of Maunoir on *Cataract* (1837); wrote papers for medical societies and journals.

Bowditch, HENRY PICKERING, M. D.: b. in Boston, Mass., Apr. 4, 1840; grandson of Nathaniel; graduated from Harvard College 1861; entered the army as second lieutenant in November of the same year; rose to the rank of captain; was discharged Feb., 1864; in March commissioned major, and served at the front through the rest of the war, entering Richmond at its evacuation; attended the Harvard Medical School 1865–66; M. D., Harvard, 1868; studied several years in Germany, and during the winter of 1868–69 in France; devoted himself especially to physiology under Prof. Ludwig at Leipzig; assistant Professor of Physiology, Harvard Medical School, 1871; full professor 1876; dean of the faculty, Harvard Medical School, 1883; author of numerous papers and reports on physiological subjects. See *Fifth Report, Harvard Class of 1861*. C. H. THURBER.

Bowditch, NATHANIEL, LL. D., F. R. S.: mathematician; b. in Salem, Mass., Mar. 26, 1773. He made several long voyages as an officer or supercargo of a merchant vessel, and learned Greek and Latin without a teacher. He published a valuable work called *The Practical Navigator*, which remained the standard among American seamen for eighty years. His greatest work was a translation of the celebrated *Mécanique Céleste* of Laplace, which he enriched with a commentary explaining the complicated mathematical operations of the work. He also published many papers on mathematical astronomy in the *Memoirs* of the American Academy and elsewhere. He was a fellow of the Royal Society of London, and a member of a large number of the learned societies of Europe and America. D. in Boston, Mar. 16, 1838. See a *Memoir of N. Bowditch*, by his son, N. I. Bowditch (1839).

Bowditch, NATHANIEL INGERSOLL: b. in Salem, Mass., Jan. 17, 1805; graduated at Harvard in 1822. He was called to the bar in Boston in 1825, but became a conveyancer, acquiring great reputation for accuracy and industry. He wrote much for periodicals, and published a *Memoir of N. Bowditch* (1840); a *History of the Massachusetts General Hospital* (1851); and *Suffolk Surnames*. Gave $70,000 to Harvard College for the endowment of scholarships. D. in Brookline, Apr. 16, 1861.

Bowd'ler, THOMAS: English expurgator; b. near Bath, July 11, 1754; educated at St. Andrews and at Edinburgh (M. D. 1776). He is chiefly noted for *The Family Shakespeare* (10 vols., 1818), in which he omitted from the original text "those words and expressions . . . . which can not with propriety be read aloud in a family." He also prepared an edition of Gibbon's *History* "with the careful omissions of all passages of an irreligious or immoral tendency," published by his nephew (6 vols., 1826). D. in Rhyddings, Feb. 24, 1825.

Bowdoin, bōd'n, JAMES, LL.D.: a Governor of Massachusetts; b. in Boston, Aug. 8, 1727; graduated at Harvard in 1745. He was president of the convention which in 1778 formed the constitution of Massachusetts; was chosen Governor of that State in 1785, and again in 1786. He suppressed Shay's rebellion in 1786. D. in Boston, Nov. 6, 1790.

Bowdoin, JAMES: son of the preceding; b. in Boston, Sept. 22, 1752. He graduated at Harvard in 1771; was sent in 1805 on a mission to Spain, to procure the cession of Florida to the U. S., and to obtain indemnity for injuries to commerce of the U. S. He was a benefactor of Bowdoin College, to which he gave 6,000 acres of land and £1,100, besides bequeathing to it his collections of books, minerals, and paintings, and the island of Naushon, in Buzzard's Bay, his summer residence, where he died Oct. 11, 1811.

Bowdoin College: the oldest college in Maine; chartered in 1794; opened in 1802 at Brunswick, Cumberland County. It was named in honor of Gov. James Bowdoin, of Massachusetts, whose son gave to the college, with gifts of land and money, his valuable library and collection of paintings. Connected with the college is the Medical School of Maine, founded in 1820. The college buildings, eleven in number, include a finely equipped gymnasium, and offer accommodation for various scientific collections and a library of 98,160 volumes. The faculty consists of 43 persons—35 professors, including the president, 6 instructors, a librarian, and a director of the gymnasium. The number of students in 1900 was 372. Rev. William De Witt Hyde, D. D., has been president since 1885. Its graduates, among whom may be mentioned Longfellow and Hawthorne, Chief Justice Fuller, and ex-Speaker Reed, number 4,763, of whom 2,756 are living.

Bow'ell, MACKENZIE: Canadian statesman; b. at Rickinghall, Suffolk, England, Dec. 27, 1823. He removed to Canada with his parents in 1833; engaged in journalism, and was editor and proprietor of the Belleville *Daily* and *Weekly Intelligencer* for a long period. He was elected to Parliament in 1867, and re-elected to every succeeding Parliament up to and including that following the general election of 1891. He became a member of the privy council and Minister of Customs Oct. 19, 1878, a portfolio which he held continuously till Jan. 25, 1892, when he was appointed Minister of Militia and Defense. He became Prime Minister in Dec., 1894, upon the death of Sir John Thompson, and retired Apr. 27, 1896.

Bowen, bō'en, Rt. Hon. Sir CHARLES SYNGE CHRISTOPHER, D. C. L., LL. D., F. R. S.: judge; b. in Wollaston, Gloucestershire, England, 1835; educated at Rugby and at Balliol College, Oxford, taking three of the great university prizes; called to the bar 1861; judge of the Queen's Bench Division of the High Court of Justice 1879; Lord Justice in the Court of Appeal and privy councilor 1882. D. Apr. 9, 1894.

Bowen, FRANCIS, LL. D.: writer; b. at Charlestown, Mass., Sept. 8, 1811; graduated at Harvard in 1833. He edited the *North American Review* about eleven years (1843–54); opposed Kossuth's mission in the U. S., which delayed his confirmation as professor for four years, and became in 1853 Professor of Natural Religion, Moral Phi-

losophy, etc., at Harvard University. Among his works are *Lives of Baron Steuben*, *James Otis*, and *Benjamin Lincoln*, which were published in Sparks's *American Biography*, and a treatise on *Political Economy*; assailed the speculative systems of Kant, Fichte, Comte, J. S. Mill; also published a *Treatise on Logic* (1864); *Modern Philosophy from Descartes to Schopenhauer and Hartmann* (1877); and *Gleanings from a Literary Life* (1880). D. in Cambridge, Jan. 21, 1890.

Bowen, Rt. Hon. Sir George Ferguson, D. C. L., LL. D.: English colonial statesman; b. 1821; educated at the Charterhouse and at Trinity College, Oxford; chief secretary to the Government of Ionian islands 1854–59; appointed governor of Queensland 1850; of New Zealand 1868; of Victoria 1873; of Mauritius 1875; of Hongkong 1883; royal commissioner to establish a new constitution for Malta 1888. Author of *Murray's Handbook for Travelers in Greece*; *Mount Athos, Thessaly, and Epirus* (1852); *Ithaca in 1850*; *Imperial Federation* (1886). In S. Lane-Poole's *Thirty Years of Colonial Government* (London, 1890) a biography of him may be found.

Bowen, Nathaniel, D. D.: b. in Boston, Mass., June 29, 1779; graduated at Charleston College, South Carolina, in 1794; held pastorates in Protestant Episcopal churches at Providence, R. I., Charleston, S.C., and New York city; Oct. 18, 1818, was consecrated Bishop of South Carolina. D. in Charleston, S. C., Aug. 25, 1839. He wrote *Christian Consolation* (Charleston, S. C., 1831); *Private Prayers* (1837); and two volumes of his sermons were published after his death.

Bow'er, Archibald: writer; of Roman Catholic parentage; b. at Dundee, Scotland, Jan. 17, 1685–86; educated at Douay; joined the Jesuits 1706; became counselor in the court of the Inquisition at Macerata; in alleged horror renounced in England the Roman Church 1726; rejoined the Jesuits 1745; and again became a Protestant 1747. His *History of the Popes*, in seven quarto volumes (1748–66; ed. S.H. Coxe, Philadelphia, 1844–45, 3 vols.), is characterized by great partisan bitterness. D. in London, Sept. 3, 1766.

Bower-bird: a name given by Gould to certain birds which construct bowers wherein the males disport themselves to attract the females. These structures have nothing to do with the nests, and are built by the males alone. The bowers or "runs" are made of small twigs or pieces of stiff grass, so arranged as to form a walk from 1 to 3 feet long and 7 or 8 inches wide. The spotted bower-bird (*Chlamydera maculata*) decorates both interior and exterior with pebbles, bits of bone, shell, etc.; the satin bower-bird (*Ptilorhynchus violaceus*) uses parrot feathers, and the regent bird (*Sericulus melinus*) confines itself almost entirely to snail shells. With two exceptions, the fourteen species of bower-birds are confined to Eastern Australia, and are partial to the thick woods. They are birds of moderate size, 8 to 10 inches long, and the males are usually much gayer in plumage than the females. F. A. Lucas.

Bow'ers, Theodore S.: soldier; b. in Pennsylvania, Oct. 10, 1832. A printer by trade, he subsequently edited a paper in Illinois; entered the service in Oct., 1861. He served continuously in the field and afterward at Washington, on the staff of Gen. Grant, from Apr., 1862, to Mar. 6, 1866, when he was accidentally killed by being thrown under a train at Garrison's station, New York. Brevet lieutenant-colonel, colonel, and brigadier-general U. S. army for gallant and meritorious services during the war.

Bowie: town (incorporated in 1884); Montague co., Tex. (for location of county, see map of Texas, ref. 2–H); on Fort Worth and Den. City, and Chi., R. I., and Tex. railways; 68 miles from Fort Worth; has 5 churches and 4 schools. Bowie is situated in the midst of the fruit-belt of Texas, and is the trading center for Montague and adjacent counties. Pop. of judicial district, including Bowie (1890) 1,486: (1900) 2,600. Editor of "Cross Timbers."

Bowie, James: soldier; b. in Burke co., Ga., about 1790; settled in Chatahoula parish, La., in 1802; in 1827 was involved in a *mêlée* which grew out of a duel opposite Natchez, and resulted in the death of six persons and the wounding of fifteen. Bowie, who had been shot early in the engagement, drew his knife, a rude one made from a blacksmith's rasp, and killed Major Norris Wright with it. This knife was remodeled by a Philadelphia cutler, and became the murderous bowie knife of frontier fame—"more trustworthy in the hands of a strong man than a pistol, for it will not snap." Bowie removed to Texas, and engaged in the revolt of that State from Mexico in 1835, attaining the rank of colonel. In Jan., 1836, he was ordered to Bexar, and three months later was at Alamo with Crockett and Travis, and perished Mar. 6, 1836, in the massacre which Santa Anna inflicted on the garrison.

Bowlder, bōl'der, or **Boulder**: a large, rounded mass or fragment of rock. Bowlders are usually rounded by attrition. In many cases they have been transported hundreds of miles by the action of icebergs or glaciers. Large masses of Scandinavian rocks are scattered over the plains of Denmark and Northern Germany. The pedestal of the statue of Peter the Great at St. Petersburg was hewn out of an erratic granite bowlder 42 feet long, 27 feet broad, and 21 feet high. In the Western States occur many granite bowlders which probably came from Canada. They abound along the coast of New England, where they often are so large as to form a prominent feature in the landscape. The famous Plymouth Rock is a bowlder of syenite. See Drift.

Bowlder-clay: See Drift and Geology.

Bowles, bōlz, Francis Tiffany: naval architect; b. in Springfield, Mass., Oct. 7, 1858; entered the navy as a cadet engineer in 1875; graduated at the Naval Academy of Annapolis with distinction; entered the school of naval architecture at the Royal Naval College at Greenwich, England; on his return from England, Nov. 1, 1881, was appointed assistant naval constructor in the U. S. navy, and assigned to duty as secretary to the naval advisory board at Washington 1882–86; in charge of construction and repair department of Navy-yard, Norfolk, Va., 1886–95; constructor 1888; naval constructor, Navy-yard, New York city, 1895–1901; chief constructor of the navy, with rank of rear-admiral, March 7, 1901.

Bowles, Samuel: journalist; b. in Springfield, Mass., Feb. 9, 1826. From 1844 to 1878 he was principal conductor of the *Springfield Republican*, one of the most successful newspapers in the U. S., and which he made a type of independent journalism. He published *Across the Continent* (1865); *The Switzerland of America* (1869); and other works. D. in Springfield, Mass., Jan. 16, 1878. See his *Life and Times*, by George S. Merriam (1885).

Bowles, William Lisle: English clergyman and poet; b. at King's Sutton, Northamptonshire, Sept. 24, 1762. He was educated at Winchester School and Trinity College, Oxford; was rector of several parishes and canon residentiary of Salisbury Cathedral (1828). D. in Salisbury, Apr. 7, 1850. He wrote much on antiquarian and ecclesiastical themes, but his most memorable publications were a volume of *Sonnets* (1789), which had great influence on Coleridge, and his edition of *Pope* (1806), that led to a controversy in which Byron, Campbell, and others took part. His sister, Caroline Bowles, was married to Robert Southey.
Henry A. Beers.

Bowling Green: capital of Warren co., Ky. (for location of county, see map of Kentucky, ref. 5–F); on L. and N. R. R., and on Barren river; 113 miles S. by W. of Louisville and 72 miles from Nashville. It is at the head of navigation, and has an active trade in pork, tobacco, lumber, etc. Here are Ogden College, Potter Female College, and several mills and factories. Steamboats navigate the river. Pop. (1880) 5,114; (1890) 7,803; (1900) 8,226.
Editor of "Park City Times."

Bowling Green: town; capital of Pike co., Mo. (for location of county, see map of Missouri, ref. 3–I); on C. and A. and St. L. and H. R. Rs.; 12 miles W. of Louisiana: has mining and agricultural industries. Pop. (1880) 1,067; (1890) 1,564; (1900) 1,902. Editor of "Times."

Bowling Green: town; capital of Wood co., O. (for location of county, see map of Ohio, ref. 2–D); on Western Division of the T. and O. C. R. R., and a branch of the C., H. and D. R. R.; 20 miles from Toledo; has 3 schools and 6 churches; principal industry of the county is agriculture and the production of oil and natural gas, the Wood County oil-field being one of the largest in the world. First settlement, at Perrysburg, about 1812. Pop. (1880) 1,539; (1890) 3,467; (1900) 5,067. Publishers of "Sentinel."

Bowls and **Bowling**: Two games are known as bowls, one an indoor game played on a long wooden alley, and the other an outdoor game played on a level grass-plat or bowling-green. The indoor game (called also *tenpins* and *skittles*) is played with lignum-vitæ balls rolled on a long alley floored with ash or maple boards 1 inch in thickness laid on

their edges. The regulation alley of the present time is required to measure not less than 75 feet in length (permitting a run of 15 feet for the bowler before he reaches the delivery-line) and not less than 41 nor more than 42 inches in width. In the best alleys the boards are bolted through and through at each 3 feet of their length, and are laid on crossties set in a bed of concrete, and the surface made by their exposed edges is smoothed with a plane. The object of the game is to knock down a number of wooden pins arranged at one end of the alley in a triangular form, the apex of which is toward the player, who stands at the other end of the alley. The game of bowling at pins was formerly played with nine pins, set in the shape of a diamond, and was called ninepins, but to evade a law prohibiting the playing at ninepins a tenth pin was added, and they were set in a triangular frame, and the game became known as tenpins.

At the sides of the alley are gutters, which at the corner pin must be 4 inches deep, into which unskillfully bowled balls drop when they leave the alley before reaching the pins. The balls are returned to the players' end from the pit into which they and the pins drop by an elevated run or trough directly above the gutter, sloping slightly downward. The score is recorded on a blackboard ruled off into squares. The pins now used in the regulation game as played in the U. S. are ten in number, are made of maplewood, are 15 inches in height, 15 inches in circumference at a point 4½ inches from their base, and 2¼ inches across at the base, and are placed 12 inches apart. Regulation balls do not exceed a circumference of 27 inches. This size weighs about 15¾ lb. The game as played in the U. S. consists of 10 frames of 10 pins each; 3 balls of any size within the regulation limits are allotted for each frame. Should the player bowl down all the pins with a single ball, the play is called a "ten strike," or double spare, meaning that the player is entitled to roll two spare balls at a new frame in order to complete the frame and his aggregate score for the inning when he secured the strike. Should the player continue to make "ten strikes" to the end of the game, he will secure the maximum score of 300 pins. Should the player bowl down all the pins with two balls, such play is called a "spare," which means that the player is entitled to roll one additional ball to complete the frame in which he secured the spare. Each pin bowled down counts one for the player. Each "strike" and "spare" counts ten, with the addition that to the "strike" is added all the pins which the player bowls down with *two* spare balls, and to the "spare" is added all the pins which he bowls down with *one* spare ball.

The games which gave origin to the modern bowling at pins have been traced back to the Middle Ages. The open-air game is the more ancient, and was early known under various names, such as "casting the stone," "bowles," French *boules*, *carreau*, etc. Stone bowls were used, and as these were not perfect spheres they described a curved line as they speeded down the "green" toward the mark bowled at, which was a cone. Two cones were used, one at each end of the rink, and bowled at alternately. The object of the player was to roll his bowl so that when it came to rest it would lie as near as possible to the cone. The object of the opposite side was to strike their opponents' bowls away from the cone and interpose their own bowls, or roll them nearer to the cone than the adversary. He whose bowl rested nearest the cone scored one point. Later stone bowls were supplanted by lignum-vitæ balls, the wood being cut from the outside of the tree; the heart, heavier than the outside, gave the desired bias to the bowl. Later the ball was loaded with lead to give it the required bias; or one side was cut a perfect half sphere, and the opposite side oval. The skill requisite in playing at bowls was that of the art of mastering the bias of each particular bowl. The cones were superseded by a stone or earthen ball about 3½ inches in diameter, called the "jack," this ball being rolled down the "green" at least a distance of 21 feet by the player who had won the toss, as a mark to bowl at. The bowling-green on which this game is played must be dead-level. It usually measures from 90 to 150 feet on a side, according to the limits of the ground, and is kept smooth by frequent rolling and the use of a scythe or lawn-mower.

Bowling on a "green" seems to have been in considerable vogue in New York and elsewhere in colonial days. In an old map of the city of New York, prepared about 1728, a "bowling-green" is shown on the north side of the public garden situated on "the King's Farm" (near the foot of Murray and Warren Streets). We also find that in 1732 the locality called "Bowling Green," at the foot of Broadway, was leased at a yearly rental of a pepper-corn, by John Chambers, Peter Bayard, and Peter Jay, and by them inclosed and laid out as a bowling-green.

Bowls as an indoor game had its origin in several games, variously styled club-kayles, cayles, kayle, keiles (French *quilles*), skittles, loggats, and skayles. In the kayle games and at loggats conical pins made of bone were used. These were set up in rows of six and eight, and were struck down by hurling clubs or "sheepes-joyntes" at them. Bowling down pins with a bowl or ball was the invention of a later period. In the French games of *carreau* the bowls were rolled at a fixed mark, while in the games called kayle, kayles, cayles, keiles (French *quilles*), closh, cloish, clossynge, kettles, kittles, skittles, Dutch-pins, four corners, half-bowl, rolly-polly, and ninepins, the bowls were rolled at pins. The earliest mention of bowls being played on an alley and under cover occurs in William Fitz-Stephen's *Survey of London*, about the twelfth century. The game was introduced into America by the English colonists. It is on record that a match was played on the "Knickerbocker Alley" in New York city, Jan. 1, 1840. Down to 1875, while clubs were numerous, there was great diversity as regards the length of the alley; the pins were of great size, and were set so close together that the falling of a single pin often caused the entire frame to collapse, and it was easy to run up a score of 300 in a very short time. In that year delegates representing nine clubs in New York and its vicinity formed a national bowling association, and framed laws for the regulation of the game. These related (1) to the size of the bowls, which were restricted in circumference to 27 inches; (2) to the distance from the pins at which the player was to halt and deliver his bowl (60 feet); and (3) to "dead-wood" or fallen pins, which were directed to be removed from the alley and gutters. Fifteen years later the American Amateur Bowling League was organized, afterward called "Union" instead of league. See *The American League Bowling Guide* (Brunswick-Balke-Collender Company, New York).

MORTIMER T. HUMPHREY.

Bowman, bō'man, ALEXANDER HAMILTON: soldier; b. in Wilkesbarre, Pa., May 15, 1803, graduated at West Point in 1825; lieutenant-colonel of engineers Mar. 3, 1863. He served as assistant professor at the Military Academy 1825–26; in building defenses and improving rivers and harbors on the Gulf of Mexico 1826–34; in constructing Memphis and St. Francis military road 1834–39; in the improvement of Cumberland and Tennessee rivers 1834–38; on the defenses of Charleston Harbor, S. C., 1838–53; as instructor of practical military engineering at the Military Academy 1851–52; in charge of improvement of Charleston harbor 1852–53; chief engineer U. S. treasury department and treasury building extension 1853–61; member of lighthouse board 1857–59; superintendent of Military Academy 1861–64; member of engineer boards 1847–65. D. at Wilkesbarre, Pa., Nov. 11, 1865.

Bowman, EDWARD MORRIS: musician; b. in Barnard, Vt., July 18, 1848, receiving his first musical instruction in the village where he went to school. In 1863 he went to Minneapolis, Minn., as a teacher and organist. In 1866 he studied under William Mason and the late John P. Morgan in New York; in 1872 went to Europe and studied in Berlin and Paris; on his return settled in St. Louis and began his career as a professional musician; again visited Europe in 1881, and while in London was made an associate of the College of Organists. In 1882 he was elected to the presidency of the Music Teachers' National Association, and again in 1892. He was the founder in 1884, and from the beginning has been the president, of the American College of Musicians; has been organist of churches in St. Louis, Mo., and in Newark, N. J., where he organized the Cacilian Choir of 100 voices; Professor of Music in Vassar College, succeeding the late Dr. F. L. Ritter, and from 1892 in Evelyn College, Princeton, N. J.

D. E. HERVEY.

Bowman, SAMUEL, D. D.: Protestant Episcopal bishop; b. in Wilkesbarre, Pa., May 21, 1800; studied law, but was ordained a deacon of the Protestant Episcopal Church in 1823, and a priest in 1824. He was long settled in Lancaster, Pa., 1827–58. In 1847 he was chosen Bishop of Indiana, but declined. In 1858 he was consecrated assistant Bishop of Pennsylvania. Died suddenly when on a visitation, near Butler, Pa., Aug 3, 1861.

Bowman, THOMAS, D. D., LL. D.: bishop in the M. E. Church; b. at Berwick, Pa., July, 15, 1817; graduated at

Dickinson College 1837; organized and was president of Dickinson Seminary, Williamsport, Pa., 1848–58; president of Indiana Asbury (now De Pauw) University 1858–72; chaplain U. S. Senate 1864–65; elected bishop of the M. E. Church 1872; retired 1896.

Bowman, Sir WILLIAM PAGET, M. D., LL. D., F. R. S.: ophthalmologist; b. at Nantwich, England, July 20, 1816; studied in Leyden, Amsterdam, Bonn, Heidelberg, Munich, Vienna, and Berlin; became Demonstrator of Anatomy and Curator of the Anatomical Museum in London 1838; honorary M. D., Dublin, 1867; LL. D., Cambridge, 1880, and Edinburgh, 1881; member of a large number of learned societies in various parts of Europe; author of *Lectures on the Parts Concerned in the Operations of the Eyes*; *Observations on Artificial Pupil*; *The Physiological Anatomy and Physiology of Man* (with Dr. Todd), etc. He was made a baronet in 1884. D. in London, Mar. 29, 1892.

Bowmanville: a port of entry; Darlington township, Durham co., Ontario, Canada; on the Grand Trunk Railway, 43 miles N. E. of Toronto (see map of Ontario, ref. 4–E). It has good water-power, and manufactures of furniture, pianos, organs, agricultural machinery, and flour. It has a good harbor, and is daily visited by steamers during the season of navigation. Pop. (1881) 3,504; (1891) 3,377.

Bowne, BORDEN PARKER, LL. D.: professor of philosophy; b. in Leonardville, N. J., Jan. 14, 1847; A. B., University of City of New York, 1871; studied at universities of Halle, Göttingen, and Paris 1873–75; religious editor New York *Independent* 1875–76; Professor of Philosophy, Boston University, since 1876; author of *The Philosophy of Herbert Spencer* (N. Y., 1874); *Studies in Theism* (1879); *Metaphysics* (1882); *Introduction to Psychological Theory* (1886); *Philosophy of Theism* (1887); *Principles of Ethics* (1892). C. H. THURBER.

Bow'ring, Sir JOHN: author and linguist; b. in Exeter, England, Oct. 17, 1792. He was an intimate friend of Jeremy Bentham, and was well versed in modern languages, especially the Slavonic. In 1825 he became editor of the *Westminster Review*. He collected and translated into verse the ancient and popular poems of almost all the countries of Europe. In 1835 he was elected to Parliament; in 1854 became governor of Hongkong, China; received the honor of knighthood in 1854; in 1856 ordered the bombardment of Canton in consequence of the Arrow affair. In 1859 he retired on a pension. Among his works is *The Kingdom and People of Siam* (2 vols., 1857). He wrote a description of his visit to the Philippine islands (1859). He also wrote some excellent hymns, including *In the cross of Christ I glory*. D. in Exeter, Nov. 23, 1872. See his *Autobiographical Reminiscences* (1877).

Bowsprit, bō'sprit, or bow'sprit: a large spar which projects over the stem or bow of a ship. It serves to support the foremast, which is fastened to it by large stays or ropes; also to carry sail forward, as a means of counteracting the effect of the after sails and keeping the sail power well balanced. In many cases the bowsprit rises at an angle of about 45 degrees. It supports the jib and flying-jibbooms.

Bowstring-hemp: the fiber of the *Sanseviera zeylanica*, a plant of the family *Hæmodoraceæ*; native of the East Indies. The Hindu name is *moorva*. This fiber, which is white, silky, and elastic, is used to make bowstrings. A similar fiber is obtained from the leaves of *Sanseviera roxburghiana*, a perennial Indian plant which has leaves about 3 feet long, and from other Asiatic and African species.

Box: an evergreen shrub or small tree of the genus *Buxus* and family *Euphorbiaceæ*, with opposite leaves entire at the margins. It has staminate and pistillate flowers growing on the same plant. The staminate flower is a perianth with four stamens, and the pistillate flower is a perianth with an ovary surmounted by three styles. The most important species is the *Buxus sempervirens* (common box), which is a native of Europe and Asia, has oval, shining, and deep-green leaves, and is remarkable for its compact habit of growth. In Southern Europe it grows 20 feet high or more. A variety called dwarf box, which is only 2 or 3 feet high, is extensively cultivated in gardens, and is used to form edgings of flower-beds and gravel-walks, being reduced by clipping to the height of a few inches. The wood of the box, which is very hard, heavy, compact, and fine-grained, is the best of all materials for wood-engraving, and is highly prized by turners. It is also commonly used to make flutes and other wind instruments. It is of a pale-yellow color, admits of a beautiful polish, and is not liable to be worm-eaten. Large quantities of boxwood are exported from Spain and Turkey. See SPURGEWORTS.

Revised by CHARLES E. BESSEY.

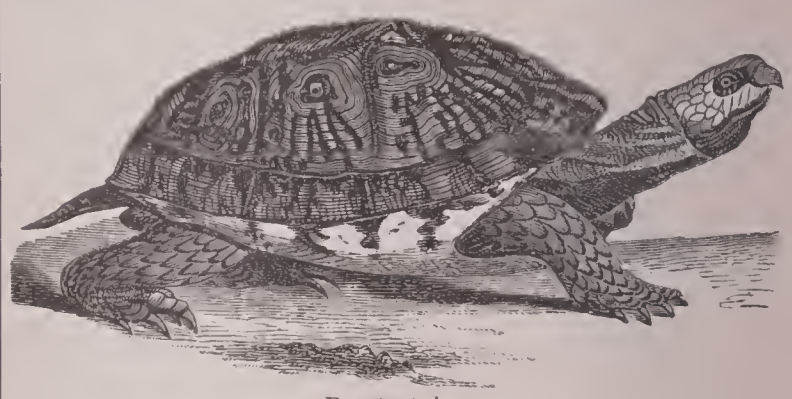
Box-elder, or **Ash-leaved Maple**: a small tree of the family *Sapindaceæ*, the *Acer negundo* or *Negundo aceroides*, which grows from Florida to Pennsylvania and westward, especially along the banks of streams. It is very beautiful, and is one of the characteristic trees of the far West. In Minnesota, Nebraska, etc., it is tapped like the sugar-maple, for its sap, which affords sugar of good quality.

Box-hauling: a method of working a ship from one tack to the other, characterized by the bracing of the head yards *abox*, or aback, either after luffing into the wind as in tacking, or at once without deadening the headway. The latter is sometimes called *wearing short round*. See TACKING AND WEARING.

Boxing the Compass: a nautical phrase, meaning an enumeration of the thirty-two points of the mariner's compass in their proper order, as *north*, *north by east*, *northnortheast*, and so on around till north is reached by way of the south and west quadrants. This enumeration may be considerably varied by beginning at any other point and going around both ways in turn. S. B. LUCE.

Box'tel: a village of Holland; in North Brabant; on the river Dommel; 6 miles S. of Bois-le-Duc (see map of Holland and Belgium, ref. 7–G). The river flows through the streets and affords passage for boats. Fine diaper is manufactured here. Pop. 5,700.

Box-tortoise, or **Box-turtle**: popular names of the *Cistudo carolina*; an American tortoise, characterized by the division of the plastron into two parts by a crosswise division, united, however, by a ligament which serves as a hinge on which the parts of the plastron turn, thus enabling the animal to shut himself entirely up in his shell. These tortoises are very timid and of gentle disposition. Their legs are longer and their speed greater than is usual among tortoises. Revised by D. S. JORDAN.



Box-tortoise.

Boyaca, bō-yăă-kaa': one of the states of Colombia; bounded N. E. and E. by Venezuela, S. and S. W. by Cundinamarca, and N. W. by Santander. Area, 33,351 sq. miles. While in the west the state is exceedingly mountainous, the east consists of a hot, dry plain. Copper and precious stones are found in the mountains. Capital, Tunja. Pop. 702,000.

Boyaca: a small village in the state of Boyaca, Colombia; about 20 miles S. of Tunja. It was the scene of a battle (Aug. 7, 1819) in which Bolivar, with about 2,000 patriots, defeated the superior Spanish force of Barreiro, took him prisoner, with most of his army, and forced the Spaniards to leave the country, then called New Grenada. H. H. S.

Boyar, boi'ăar, or bō-yaar' [from Russ. *boyarin*, lord]: a title given in ancient Russia to those who distinguished themselves in war. This afterward came to be the title of the nobility, who under the Grand Duke of Moscow formed an aristocracy with powers differing according to the character of the monarch, but which were so considerable that even Ivan the Terrible in his ukases added to the words "The czar has commanded," also "The boyars have approved." The last boyar died in 1750.

Boy-bishop: During the Middle Ages the custom grew up of allowing the choristers of cathedrals to choose yearly one of their number to act the part of the bishop. The election generally took place on Dec. 6, St. Nicholas's Day, after which the boy-bishop was vested in the episcopal attire, with

miter, ring, and pastoral staff. He held office till Dec. 28 (Holy Innocents' Day). The practice was permitted probably from the same motives which suffered the mummeries of the Abbot of Unreason (a graphic account of which may be found in Sir W. Scott's romance of *The Monastery*). If the boy-bishop died within his short period of office, he was buried in his episcopal robes. A tomb with the effigy of a boy so clothed may be seen in Salisbury Cathedral, England.

W. S. Perry.

Boyce, Hector: See Boece, Hector.

Boyce, James Petigru, D. D., LL. D.: b. in Charleston, S. C., Jan. 11, 1827: graduated at Brown University 1847, and at the Theological Seminary in Princeton, N. J., 1849–51: became pastor of a Baptist Church at Greenville, S. C., 1851; Professor of Theology in Furman University, Greenville, S. C., 1855; Professor of Theology in the Southern Baptist Theological Seminary (formerly Greenville, S. C., now Louisville, Ky.) 1859. He published several sermons, addresses, and articles, which have largely contributed to mold the opinions of the Southern Baptists, and held, as president of the Southern Baptist Convention, a position of commanding influence. D. in Pau, France, Dec. 28, 1888.

Boyce, William: English composer; b. in London, 1710; in 1736 appointed composer and in 1758 organist to the Chapel Royal; composed a number of anthems; the serenata *Solomon* (1743); and published *The Cathedral Music of the English Masters of the Last Two Centuries* (3 vols., 1760). D. in Kensington, London, Feb. 7, 1779.

Boy'cotting: a combining of persons or a concerted action to restrain from or prevent social or business intercourse with another. The term was coined from the name of a Capt. Boycott, an agent in Ireland of Lord Erne's Lough Mask estate, who in 1880 evicted a large number of tenants. These and their neighbors refused all intercourse with him and his family, and would not work for him or trade with him, or allow others to do so. He was aided in the harvesting of his crops by the Orangemen, and was obliged to work under military protection. When the combination amounts to a conspiracy to wrongfully prevent or restrain another from carrying on a legitimate business, or to accomplish any unlawful purpose, it is a criminal offense. See Conspiracy.

Revised by F. Sturges Allen.

Boyd, Andrew Kennedy Hutchison, D. D., LL. D. (whose pen-name was for some time *A. K. H. B.*): minister of the Church of Scotland; b. at Auchinlech, Ayrshire, Scotland, Nov. 3, 1825, where his father was parish minister. He was educated at King's College, London, and at Glasgow University; B. A. 1846. He was ordained in 1851; after having charge of several parishes, became minister of St. Andrews 1865. He published more than twenty volumes of contemplative essays and sermons, of which the *Recreations of a Country Parson* (1859–78, 3 series) has been especially popular. He published his reminiscences, *Twenty-five Years of St. Andrews, Sept., 1865, to Sept., 1890* (London, 1892, 2 vols.). D. in Bournemouth, England, Mar. 2, 1899.

Boyd, John Parker: general; b. in Newburyport, Mass., Dec. 21, 1764; entered the U. S. army as ensign in 1786. A spirit of adventure led him to India in 1789, where he commanded mercenaries, raised by himself and others, in the Mahratta service of native princes, and rose to the rank of commander. He returned to the U. S. in 1808, and was commissioned colonel of the Fourth U. S. Infantry. In the war with Great Britain he was a brigadier-general; distinguished himself at Tippecanoe, at the capture of Fort George, Canada, and Chrysler's Field. In 1830 President Jackson appointed him naval officer of the port of Boston, Mass. D. in Boston, Oct. 4, 1830.

Boyd, Linn: statesman; b. in Nashville, Tenn., Nov. 22, 1800; member of Congress from Kentucky for twenty years, being first elected in 1835. During his last term he served as Speaker of the House of Representatives. D. in Paducah, Ky., Dec. 18, 1859.

Boy'dell, John: engraver and patron of art; b. in Dorrington, Shropshire, England, Jan. 19, 1719; became a print-seller in London, and amassed a large fortune. He promoted the improvement of British art by his liberal patronage of native engravers and painters. He employed Opie, Reynolds, Northcote, West, and other painters to illustrate Shakspeare's works. The result was the *Shakspeare Gallery*, from which was engraved a volume of admirable plates (1803). He was lord mayor of London in 1790. D. there Dec. 11, 1804.

Boyer, bwäă'yā', Alexis, Baron de: surgeon; b. in Limousin, France, Mar. 1, 1757; son of a tailor; acquired his profession under great drawbacks. He was surgeon to Napoleon I. and Chirurgical Professor of the University of Paris. His main works are *Traité complet d'anatomie* (4 vols., 1797–99) and *Traité des maladies chirurgicales et des operations qui leur conviennent* (8 vols., 1814–22). D. Nov. 25, 1833.

Boyer, Jean Pierre: president of Hayti; b. at Port-au-Prince, Feb. 28, 1776; was a mulatto. He entered the French army in his youth, and as an officer in the army of Pétion fought against Dessalines and Christophe when he declared himself emperor. On the death of Pétion he was elected president of the republic in 1818. By partiality to the mulattoes and arbitrary measures he offended the Negroes, who revolted and expelled him from the island in 1843. D. in Paris, July 9, 1850.

Boy'ertown: borough (founded in 1800, incorporated as a borough in 1866): Berks co., Pa. (for location of county, see map of Pennsylvania, ref. 5–I): on branch of Phil. and Reading R. R.; 17 miles from Reading, 48 miles from Philadelphia. Cigar-making and iron-mining are the chief industries of Boyertown, over 500 persons being employed in the former industry. There are 6 graded schools and 6 churches. The population is largely American-born Germans. Pop. (1880) 1,099; (1890) 1,436; (1900) 1,709.

Editor of "Demokrat."

Boy'esen, Hjalmar Hjorth: Norse-American author and scholar; b. at Fredericksvaern, Norway, Sept. 23, 1848. He was educated at Leipzig and the university in Christiania; removed to the U. S. in 1868; edited *The Fremad*, a Norwegian paper, in Chicago; was Professor of German in Cornell University (1874–80) and in Columbia College, New York, from 1880 till his death, Oct. 4, 1895. He published, among other things, *Gunnar, a Norse Romance* (1874); *A Norseman's Pilgrimage* (1875); *Falconberg* (1878); *Goethe and Schiller, their Lives and Works* (1878); *Ilka on the Hill-top* (1881), which has been dramatized; *Queen Titania* (1882); *A Daughter of the Philistines* (Boston, 1883), which had great vogue in Europe and the U. S.; *Essays on German Literature* (1892); and *Boyhood in Norway* (1892). Several of his books have been translated into German and Norwegian. His fictions have usually a social or political bearing.

Henry A. Beers.

Boyl, Boil, or **Buell**, Antonio: Spanish Benedictine monk; b. in Catalonia about 1450. He was an inmate of the Convent of Montserrat when, in 1493, the pope appointed him apostolical vicar of the New World. With eleven other monks he accompanied Columbus to Hispaniola, where he acted as official councilor as well as religious leader. He showed a bigoted and unrelenting spirit toward the Indians, advising Columbus to put the chief Guacanagari to death; later he joined the malcontents against the admiral and his brothers, and in 1494 went to Spain to prefer charges against them: he was long one of the bitterest and most dangerous enemies of Columbus. He did not return to Hispaniola, but was made abbot of the Cuxa convent, where he died in 1520.

Herbert H. Smith.

Boyle, David: See the Appendix.

Boyle, Robert: celebrated experimental philosopher; b. in Lismore Castle, Ireland, Jan. 25, 1627; seventh son of Richard, the first Earl of Cork. He was educated at Eton and Geneva; took no part in political contests, but devoted himself to the cultivation of science, especially chemistry and natural philosophy. He became a resident of Oxford in 1654, and was one of the founders of the Royal Society. To qualify himself to defend the Christian religion, he learned the Hebrew and Greek languages. He improved the air-pump, and made important discoveries in pneumatics. Among his works are a *Disquisition on Final Causes*; a *Discourse of Things above Reason*; *Excellency of Theology*; and *Hydrostatical Paradoxes*. He declined a peerage which was repeatedly offered to him. He was remarkable for his benevolence and charity. It was through his Christian liberality that Eliot's Indian Bible was published; and it was by his exertions that the funds of the Society for the Propagation of the Gospel in New England, originally a Puritan organization, were preserved at the Restoration for their sacred uses. By his last will he endowed the Boyle Lectures (*q. v.*). D. in London, Dec. 30, 1691. His complete works, with a *Life*, in 5 vols. fol., were published by Thomas Birch (London, 1744).

Boyle Lectures: called from Robert Boyle, who bequeathed an annual salary to be paid to some clergyman for preaching eight sermons in a year in order "to prove the truth of the Christian religion against Atheists, Deists, Pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves." The first person selected to deliver the "Boyle Lectures" was the celebrated Richard Bentley (1691), who directed his arguments against atheism. In 1739 three volumes of the lectures were published, and nearly sixty volumes since then. The "Boyle Lectures" are still maintained.

Boyle's Law: a statement of the fact that "the volume of a gas is inversely as the pressure"; that is to say, if we double the pressure upon a gas we reduce its volume to one-half; if we make the pressure three times what it was at first, the bulk of the gas is reduced to one-third. More commonly called MARIOTTE'S LAW (*q. v.*).

Boyne: the most important river in the E. of Ireland; rises in the Bog of Allen; flows northeastward through Kildare, King's County, Meath, and Louth; enters the Irish Sea after a course of 65 miles. Many ruins of monasteries and castles are found on its banks. An obelisk 150 feet high, nearly 3 miles from Drogheda, commemorates the great battle of the Boyne, in which William III. defeated James II., July 1, 1690.

Boyn'ton, EDWARD CARLISLE: b. in Vermont about 1825; graduated at West Point in 1846. He entered the artillery; was severely wounded at Churubusco; breveted captain; assistant Professor of Chemistry, etc., at West Point (1848–55); Professor of Chemistry, etc., in the University of Mississippi (1856–61); and breveted major in 1865. He published a *History of West Point* (1863) and a *History of the United States Navy*. D. in Newburg, N. Y., May 13, 1893.

Boynton, JAMES STODDARD: b. in Henry co., Ga., May 7, 1833; practiced law; served as colonel in the civil war; resumed the practice of law; was elected to the Legislature and became president of the Senate, which office he held at the death of Gov. Alexander H. Stephens, Mar. 4, 1883; became acting Governor of Georgia Mar. 5, 1883. His successor, Henry D. McDaniel, was inaugurated May 9, 1883.

Boyton, PAUL: See the Appendix.

Boze'man: city; capital of Gallatin co., Mon. (for location of county, see map of Montana, ref. 7–F); on Northern Pacific R. R. and an affluent of Gallatin Fork of Missouri river; 98 miles S. S. E. of Helena and 65 miles N. of Yellowstone National Park. It has several banks, and its coal mines supply the Northern Pacific R. R. from Billings, Mon., to Portland, Or.—over 1,200 miles. It is the center of an agricultural community whose products are valued annually at more than $3,000,000; has grazing and stock interests yielding over $500,000 annually; and gold and silver mining interests, $300,000 annually. It has graded schools, an academy, a university school, flouring and planing mills, sash and door factory, numerous churches, etc. Pop. (1880) 894; (1890) 2,143; (1900) 3,419.

EDITOR OF "AVANT COURIER."

Bozen: See BOTZEN.

Boz'rah: an ancient city of Idumæa (Edom), often mentioned in the Bible. (See Genesis xxxvi.; Isaiah xxxiv. and liii.) It was situated to the S. E. of the Dead Sea, about halfway between the latter and Petra. Its site is probably occupied by the modern *Buseireh*, a poor village of about fifty wretched huts.

Bozzaris, bot'sa-ris, or **Botzaris**, MARCO: a Greek patriot; b. at Suli, in Albania, about 1788. He enlisted in the French army about 1808, and served several campaigns. When the Greeks took arms against the Turks in 1820, Bozzaris became the leader of a band of Suliotes, and gained several victories. He defended Missolonghi against the Turks in 1822. Aug. 20, 1823, he attacked and defeated a superior force at Carpenisi, near where the battle of Platæa was fought, but was killed in the action.

Bra: a town of Italy; province of Cuneo; on the river Stura; 38 miles S. S. E. of Turin (see map of Italy, ref. 3–B). It has manufactures of silk and metal-foundries; also a trade in grain, cattle, and wine. Pop. of commune, 15,000.

Brabançons, brăă'băăn'sōn': a class of mercenary soldiers chiefly from Brabant, whence they took their name. They served principally in the armies of England and France from the eleventh to the thirteenth centuries. They had little discipline, and were not much better than robbers.

Brabant, braa'bant, or brăă-bănt' (Fr. pron. brăă'băăn'): a former duchy of the Low Countries. In the sixth century it was conquered by the Franks. During the Middle Ages it changed masters very often, until in the fifteenth century it came to the House of Hapsburg. Charles V. left it to his son, Philip II., under whom the provinces revolted, but only the northern part succeeded in gaining its independence, and joined the Netherlands in 1648, while South Brabant remained with the Spanish-Austrian line until 1714, when it passed into the possession of the imperial line of Austria. It was conquered by the French in 1794, and divided into two provinces; in 1810 Napoleon also conquered the Dutch part of Brabant. In the treaty of Paris of 1814 Brabant became a part of the Netherlands, and was divided into the provinces of North Brabrant, Antwerp, and South Brabant. In consequence of the Belgian revolution of 1830, Antwerp and South Brabant passed to Belgium, while North Brabant remained with Holland. The inhabitants in the N. are Dutch, in the center Flemish, and in the S. Walloons. The boundary-line between the Germanic and French idioms runs S. of Brussels, past the villages of Braine l'Alleud, Waterloo, Wavre, and Sodoigne.

Brabant: a province of Belgium; bounded N. by Antwerp, E. by Limburg and Liège, S. by Namur and Hainant, and W. by East Flanders. Area, 1,268 sq. miles. Capital, Brussels. The principal rivers are the Dyle, Demer, and Senne. The surface is partly hilly and partly level; the soil is generally fertile and highly cultivated. This province contains extensive forests, mines of iron, and quarries of stone. It is intersected by several railways and canals. It has important manufactures of cotton and woolen fabrics, fine laces, hats, leather, jewelry, fine linens, ribbons, paper, machinery, etc. This is one of the most densely peopled districts in Europe. Pop. (1896) 1,212,686.

Brabant, North: a province of Holland; bounded N. by the river Meuse (or Maas), Holland, and Gelderland, E. by Limburg, S. by Belgium, and W. by Zeeland. Area, 1,980 sq. miles. Capital, Bois-le-Duc. It is drained by the Dommel, the Aa, and the Lintel. The surface is flat; the soil is generally fertile. The province is deficient in minerals and timber. Many cattle and sheep are raised here. It has manufactures of cotton, linen, and woolen goods. Pop. (1891) 574,075.

Brabourne, bray'bŭrn, EDWARD HUGESSEN KNATCHBULL-HUGESSEN, Lord: b. at Mersham Hatch, Kent, England, Apr. 29, 1829; educated at Eton, and at Magdalen College, Oxford; entered the House of Commons in 1857 as a Liberal; joined the Conservatives in 1885 through disaffection toward Gladstone's Irish and Transvaal policy; was a Lord of the Treasury 1859–66; Under Secretary of State for the Home Department 1868–71; for the colonies 1871–74; sworn of the privy council Mar. 24, 1873; elevated to the peerage in 1880; author of many tales for children, among which are *Stories for my Children* (1869); *Crackers for Christmas* (1870); *Uncle Joe's Stories* (1878); *The Truth about the Transvaal* (1881); *Friends and Foes from Fairyland* (1885), etc. He edited the *Letters of Jane Austen* (1885), his grand-aunt. D. Feb. 6, 1893. C. H. THURBER.

Brace, CHARLES LORING: philanthropist and writer; b. in Litchfield, Conn., June 19, 1826; graduated at Yale in 1846. Having traveled in Europe, he published *Hungary in 1851*; *Home Life in Germany* (1853); *Norse Folk*; *Races of the Old World* (1863); *Gesta Christi* (1882); *The Unknown God, or Inspiration among the Pre-Christian Races* (1890); and other works. He was the principal founder and first secretary of the Children's Aid Society of New York (1853), which has placed over 80,000 homeless children in rural Western homes and provided industrial schools, saving societies, and lodges for street children of the city. D. in Campfer, in the Engadin, Switzerland, Aug. 11, 1890.

Revised by HENRY A. BEERS.

Brachet, brăă'shay', AUGUSTE: French Romance philologist; b. in Tours, July 29, 1845; studied under Diez; became in 1870 Professor of Romance Philology in the École des Hautes Études at Paris; but since 1873 he has had no official position. Among his works are *Dictionnaire des doublets* (1867); *Grammaire historique de la langue française* (1867); *Dictionnaire étymologique de la langue française* (1870); a translation, with G. Paris and A. Morel

Fatio, of Fr. Diez's *Grammaire comparée des langues romanes* (1873–76). A. R. Marsh.

Bra'chial Ar'tery [*brachial* is from Lat. *bracchia'lis*, deriv. of *bracchium*, arm]: the main artery of the arm, a continuation of the axillary, as the latter is of the subclavian trunk. The brachial vessel lies upon the inside of the *humerus* or arm-bone, just back of the biceps muscle; near the elbow it passes forward and divides into the radial and ulnar arteries. Before this it gives off four smaller branches. The position of the brachial artery makes it quite practicable to compress it firmly against the bone in case of serious bleeding from a wound of the arm, forearm, or hand.

Brachiop'oda [from Gr. *βραχίων*, arm + *πούς, ποδός*, foot; in allusion to the ciliated arms]: a group of marine animals provided with bivalve shells, which in the fossil state form one of the most characteristic features of the Palæozoic rocks. They are represented by comparatively few living forms. The shells resemble somewhat those of the bivalve mollusks, with which these animals have usually been associated, but the two halves, or valves, of the shell are dorsal and ventral instead of lateral, and each valve is divisible into symmetrical halves. The ventral valve is usually the larger and more convex, and often serves directly for attachment of the animal to foreign bodies. In other cases attachment is brought about by means of a short stalk or peduncle, which passes either through a perforation in the ventral valve, or between the valves. Two long spirally coiled arms spring from the sides of the mouth, and are usually supported by a calcareous framework attached to the dorsal valve of the shell. These arms are grooved and ciliated, and serve to produce currents in the water, and thus bring food-particles to the mouth. Researches in the embryology of the Brachiopods have indicated their relationship with the *Bryozoa*, and have shown that their affinity is rather with the annulate worms than with the mollusks. David S. Jordan.

Brachis'tochrone [from Gr. *βράχιστος*, shortest + *χρόνος*, time]: the plane curve down which a material particle must slide without friction in order to pass in the shortest possible time from the upper to the lower of two given points not in the same vertical line. It is the common cycloid. The problem of the brachistochrone is celebrated in the history of mathematics. It was first proposed by John Bernoulli in 1696, and was solved by Sir Isaac Newton and James Bernoulli. It is often called "the curve of quickest descent." Revised by S. Newcomb.

Brachvogel, bra*kh*'fō-*gel*, Emil Albert: German novelist and dramatist; b. in Breslau, Apr. 29, 1824. Among his principal works are the novels entitled *A New Falstaff* (1862); *Beaumarchais* (1864); *The German Michael* (1868); and *Narcissus*, a drama. D. in Berlin, Nov. 27, 1878.

Brachycephal'ic: See Dolichocephalic.

Brachyu'ra [from Gr. *βραχύς*, short + *οὐρά*, tail]: the crabs; a tribe of decapod crustacea with the abdomen or tail short, without caudal fin, and folded beneath the thorax. See Crab.

Brack'enbury, Henry: soldier; b. at Bolingbroke, Lincolnshire, England, Sept. 1, 1837; served in the suppression of the Indian mutiny in 1857–58; in the Ashanti campaign in 1873–74; as chief of staff in the Zulu war; deputy adjutant-general of the Nile expeditionary force in 1884; succeeded Gen. Earle in command of the river column; made major-general June 15, 1885; lieutenant-general 1888. Author of *Fanti and Ashanti*; *Narrative of the Ashanti War*; *The River Column*; and of pamphlets. C. H. Thurber.

Brack'enridge, Henry Marie: judge and writer; b. in Pittsburg, Pa., May 11, 1786; son of Hugh Henry, named below. He held judgeships in Louisiana and Florida; was U. S. commissioner to the South American republics (1817–19). Among his numerous writings are *History of the Late War between the United States and Great Britain* (about 1816); a *Voyage to South America* (1820); and *Recollections of Persons and Places in the West* (1834). He was elected to Congress from Pennsylvania in 1840. D. in Pensacola, Fla., Jan. 18, 1871. Revised by Henry A. Beers.

Brackenridge, Hugh Henry: the father of Henry Marie; b. near Campbelton, Scotland, in 1748. He emigrated to the U. S. in childhood; graduated at Princeton in 1771; became a judge of the Supreme Court of Pennsylvania in 1799. He wrote a satirical work called *Modern Chivalry, or Adventures of Captain Farrago* (1796–1806). D. in Carlisle, Pa., June 25, 1816.

Bracket: a projecting arm of wood or metal employed to support a shelf or gallery. Also one of two marks [ ] used in printing to inclose a word, remark, explanation, etc. When a word in a classical work is included in brackets it implies that the word so inclosed does not properly belong to the original text, but has been either introduced by a mistake of the copyist, or has been inserted to supply an omission, correction, or explanation.

Brack'ett, Albert Gallatin: soldier; b. in Cherry Valley, N. Y., Feb. 14, 1829. He served during the Mexican war as first lieutenant Fourth Indiana Volunteers; appointed captain Second U. S. Cavalry Mar., 1855; engaged principally on frontier duty against hostile Indians in Texas prior to 1861, when, on Twiggs's surrender, he effected his escape, and was in command of cavalry at Blackburn's Ford, Va., July 18, 1861; commissioned colonel Ninth Illinois Volunteer Cavalry Aug., 1861; served during the civil war in the Western and Southwestern armies. He was promoted to be major First Cavalry, U. S. army, July 17, 1862; lieutenant-colonel Second Cavalry June 9, 1868; colonel Third Cavalry Mar. 20, 1879. After the war he commanded various departments and actively engaged in operations against the Indians. He was retired in Feb., 1891. He is author of *Lane's Brigade in Mexico* and *History of the United States Cavalry*.

Brackett, Anna C.: American educator; b. at Boston, 1836; educated at Framingham Normal School, Framingham, Mass.; taught with great success in large cities; translated the *Pädagogikals System* of Rosenkranz; author of *The Education of American Girls* (1874); *Poetry for Home and School* (1876).

Brackettville: capital of Kinney co., Tex. (for location of county, see map of Texas, ref. 5–F); in the southwest part of the State, about 30 miles from the Rio Grande. Pop. (1880) 1,126; (1890) 1,649; not returned separately in 1900.

Bract [from Lat. *brac'tea*, a thin leaf of metal]: a floral leaf, or an altered leaf, placed at the base of a flower on the outside of the calyx. It is a leaf from the axil of which a flower or floral axis is produced, instead of an ordinary leaf-bud or branch, and is regarded as the first attempt made by the leaves to change into floral organs. The bract is sometimes large and brightly colored. In several species of *Arum* it constitutes the large enveloping-leaf called a spathe. An involucre is a collection of bracts arranged in a whorl.

Brac'ton (properly **Bratton**), Henry, de: a distinguished English ecclesiastic and jurist, of whose life little is known. He was made archdeacon of Barnstaple in 1264, and later in the same year chancellor of the cathedral, which office he probably held till some time in 1268, when he is supposed to have died. For many years he was a justice in eyre and a justice of assize. His principal work, *De Legibus Angliæ et Consuetudinibus*, is a systematic treatise on jurisprudence and legislation, the plan or framework of which is borrowed from the Institutes of Justinian. The subject matter also in those branches of the law (e. g. the laws of personal property) which were still undeveloped in the common law were taken almost verbally from the Institutes or the Digest. Though this work is a landmark in the history of English law, no even tolerably reliable edition exists. In 1569 Richard Tottell edited an edition which is full of corruptions and mistranslations, and Sir Travers Twiss's edition is practically a reprint of this. The work was probably completed about the year 1258. See F. W. Maitland's *Bracton's Note-book* (London, 1887); and T. E. Scrutton's York prize essay of Cambridge University on the *Influence of the Roman Law on the Law of England* (Cambridge, 1885).
F. Sturges Allen.

Brad'bury, William Batchelder: musician and composer; b. in York, Me., Oct. 6, 1816; received musical instruction from Sumner Hill, of Boston, while still working at his trade as a shoemaker. In 1833 he attended Dr. Lowell Mason's singing-school and the Boston Academy of Music; was organist in several churches, and taught a singing-school in Machias, Me., for about a year and a half; traveled considerably, and in 1841 settled in the vicinity of New York city, teaching singing, organizing and conducting juvenile musical festivals, and composing and writing music for Sunday-schools. In 1847 he went to Leipzig, and studied there for two years. In 1849 he held his first musical con-

vention in Somerville, N. J., and in 1854 was associated in the Normal Musical Institute, North Reading, Pa.; in the same year became a partner in the piano manufacturing firm of Lighte, Newton & Bradbury. His principal books are *The Oriola* (1859); *The Golden Chain* (1861); *The Golden Shower* (1862); *The Golden Censer* (1864); *Fresh Laurels*; *The Shawm*; *The Jubilee*; and *The Keynote*. D. in Montclair, N. J., Jan. 7, 1868. D. E. Hervey.

Brad'dock: borough (founded in 1867); Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5–A); on B. and O., Pa. and Pittsburg and Lake Erie R. Rs., and on Monongahela river; 10 miles from Pittsburg; has 2 public schools, 4 parochial schools, steel-works, wire-mills, a furnace, and a forge. Pop. (1880) 3,310; (1890) 8,561; (1900) 15,654. Editor of "News."

Braddock, Edward: British general; b. in Perthshire, Scotland, about 1695. He commanded in a war against the French and Indians in North America. As he was marching to attack Fort Duquesne he was surprised by the Indians near Pittsburg, and was defeated and mortally wounded. D. at Great Meadows, 60 miles from the battle-field, July 13, 1755.

Braddon, Mary Elizabeth: See Maxwell.

Brad'ford: an important manufacturing town in the West Riding of Yorkshire, England; on a small branch of the Aire, and on the Leeds Railway; 9 miles by rail W. of Leeds (see map of England, ref. 6–H). It is situated at the meeting of three vales, and is built of stone. It returns three members to Parliament. Among the principal buildings are a handsome exchange, an elegant public hall, the parish church, erected in the reign of Henry VI., and a cloth-hall. The Saltaire alpaca and mohair mills, which are 3 miles from Bradford, were said to be the most splendid manufactories in England, but the industry has fallen away. Bradford is the chief seat in England of the manufacture of worsted fabrics, alpaca, mohair, etc. Broadcloths and cotton goods are also made. Mines of coal and iron are worked in this vicinity. Baptist, Independent, and Wesleyan colleges are near this city. Pop. (1891) 265,728; (1901) 279,809.

Bradford: town; Essex co., Mass.; on the south bank of the Merrimack river, 32 miles N. of Boston (see map of Massachusetts, ref. 1–I). A bridge and a railway viaduct connect it with Haverhill. It is the seat of Bradford Female Academy. Pop. (1890) 3,720; annexed to Haverhill since 1890.

Bradford: village (1861); in Darke and Miami counties, O. (for location, see map of Ohio, ref. 5–C); situated at terminus of three branches of Pa. R. R.; 83 miles W. of Columbus; has high school, railroad repair-shops, printing and shoe factories. The contiguous territory is settled with Dunkards. Pop. (1890) 1,338; (1900) 1,254. Editor of "Sentinel."

Bradford: city (settled 1823; incorporated 1879); McKean co., Pa.; on tributary of the Allegheny river, 11 miles distant; and on the Erie, Buffalo, Roch. and Pitts., Brad. Bord. and Kinzua, Allegheny and Kinz., West N. Y. and Penn., and other railways, and connected by electric railway (21 miles) with Olean, N. Y.; 79 miles S. of Buffalo (see map of Pennsylvania, ref. 2–D). It stands in the center of the most productive oil-field in the U. S. (1,550 to 2,550 feet above sea-level), and has large oil-refineries, oil-well supply shops, railroad shops, glass-works, extensive lumber interests and immense wood-working establishments, and vitrified, pressed, and enameled brick, and acid and wood alcohol works near the city; paved streets, electric lights, natural gas for light and fuel (domestic and manufacturing), fire department with 7 companies, gravity water system (springs, artesian wells, and watershed owned by the city); 19 churches, 8 large school buildings and a parochial school, and 3 daily, 3 Sunday, and 2 weekly newspapers. Pop. (1890) 10,514; (1900) 15,029. F. A. Churchill, ed. "Evening Star."

Bradford: village; Orange co., Vt.; on railroad and the Connecticut river; 29 miles S. E. of Montpelier (see map of Vermont, ref. 5–C). It has an academy and several factories. Pop. (1880) 619; (1890) 610; (1900) 614.
Editor of "United Opinion."

Bradford, Alden, LL. D.: b. in Duxbury, Mass., Nov. 19, 1765; graduated at Harvard in 1786, was a tutor there 1791–93; was successively a Congregational minister in Wiscasset (now in Maine), a clerk of the Massachusetts Supreme Court, a bookseller, secretary of State for Massachusetts (1812–24), and a journalist. Author of a *History of Massachusetts from 1764 till 1820* (Boston, 1822–29), and other works. D. in Boston, Oct. 26, 1843.

Bradford, Amory Howe, D. D.: Congregationalist; b. at Granby, Oswego co., N. Y., Apr. 14, 1846; graduated at Hamilton College 1867; studied at Auburn Theological Seminary, and finished his course at Andover Theological Seminary 1870; has been pastor at Montclair, N. J., since 1870. He is the author of *Spirit and Life* (1888); *Old Wine: New Bottles* (1892); and of numerous articles in various reviews. He is associate editor of *The Outlook*; also secretary of the American Institute of Christian Philosophy. He was Southworth lecturer on Congregationalism at Andover for 1892 and 1893.
George P. Fisher.

Bradford, Augustus W.: b. in Maryland about 1805; studied law; entered politics as a Whig; was a firm Unionist; a delegate to the peace congress 1861, and was chosen Governor of Maryland, holding the office until 1866. He was largely influential in securing the new constitution of Maryland (1864), by which slavery was abolished. In July, 1864, his house was burned by Confederate raiders. He was surveyor of Baltimore under President Johnson, and declined a position in the custom-house offered to him by President Grant. D. Mar. 1, 1881.

Bradford, Earls of, and Viscounts Newport (1815, in the United Kingdom): Barons Bradford (1794, in Great Britain), and baronets (1660); a prominent family of Great Britain.—Orlando George Charles Bridgman, the third earl, was born Apr. 24, 1819, and succeeded his father in 1865. He was member of Parliament for South Shropshire 1842–65.

Bradford, John: a distinguished preacher and martyr of the Church of England; b. in Manchester, England, about 1500; entered Catharine Hall, Cambridge, 1548; was ordained 1550. He became a chaplain to Edward VI., and after the accession of Mary was burned at the stake in Smithfield, London, July 1, 1555. He wrote many theological treatises which are published in the collections of the Parker Society. See William Stevens's *Life of John Bradford* (1832). W. S. Perry.

Bradford, Joseph M.: captain U. S. N.; b. in Sumner co., Tenn., Nov. 4, 1824; entered the navy as a midshipman Jan. 10, 1840. From Nov., 1863, to June, 1865, he served as fleet-captain of the South Atlantic blockading squadron, during which period he was frequently in battle, and was highly commended by Rear-Admiral Dahlgren, in his "general order" of June 16, 1865. D. at Norfolk, Va., Apr. 14, 1872.

Bradford, William: one of the Pilgrim Fathers; b. in Austerfield, Yorkshire, England, in 1589 (was baptized Mar. 19, 1589–90). He emigrated to New England in the Mayflower in 1620, and was elected governor of Plymouth Colony in 1621. Having been re-elected annually, he held the office till his death, except five years, when he declined the election. A patent or charter for the colony was granted in 1630 to William Bradford, his heirs and associates. D. in Plymouth, Mass., May 9, 1657. He left a *History of Plymouth Colony*, which was printed in 1856.

Bradford, William: the first printer in Pennsylvania; b. in Leicester, England, May 20, 1660; d. in New York, May 23, 1752. Being a Quaker he emigrated in 1682, and landed on the spot where Philadelphia was afterward built. In 1685 he began printing under the patronage of the Friends. His first work was the publication of an almanac in 1686, the *Kalendarium Pennsilvaniese*. In 1692 he incurred the displeasure of the dominant party in Philadelphia, through his sympathy with George Keith, and was imprisoned for libel. In 1693 he was induced by Gov. Benjamin Fletcher to remove to New York to become printer to their Majesties King William and Queen Mary. In that year he printed (1) *A Journal of the late actions of the French at Canada, with the manner of their being repulsed by His Excellency Benjamin Fletcher*; (2) the laws of the colony, commonly known as "Bradford's Laws." On Oct. 16, 1725, he began the publication of the *New York Gazette*, the first newspaper printed in New York city. In 1728 he established a paper-mill at Elizabethtown, N. J. He was printer to the government of New York for more than fifty years, and for more than thirty years the only one in the province. He was a warden of Trinity Church, in whose churchyard he lies buried. He had two sons, the younger of whom, Andrew, made a comfortable fortune as a printer and publisher in Philadelphia, where for a time he was a competitor of Benjamin Franklin. A. Growoll.

Bradford, William: marine-painter; b. in New Bedford, Mass., about 1830; d. in New York, Apr. 25, 1892. Began painting without instruction at Fairhaven and Lynn, and afterward on the coasts of Labrador and Nova Scotia. He accompanied Dr. Hayes, the Arctic explorer, on several of his voyages and painted pictures of the icy scenery of those regions. He exhibited a number of his works in London, and his *Steamer Panther in Melville Bay under the Light of the Midnight Sun* was exhibited at the Royal Academy in 1875 by order of the Queen, who purchased it. He disposed of other pictures at high prices, and soon became well known on both sides of the Atlantic. His works are interesting principally from the novelty of their subjects, and are not remarkable technically considered. He was elected an associate of the National Academy, New York, in 1874.

William A. Coffin.

Bradford, Great: a market-town of Wiltshire, England; on the river Avon; on the Kennet and Avon Canal; 10 miles by rail E. S. E. of Bath (see map of England, ref. 12–G). It has a fine old church, and manufactures of broadcloth, kerseymeres, and india-rubber goods. Pop. 5,000.

Brad'ke, Peter, von, Ph. D.: German philologist; b. in the Russian province of Livonia, June 27, 1853: studied at Dorpat and Tübingen; is Professor of Sanskrit and Comparative Philology in the University of Giessen, Hesse, Germany. Besides minor essays in periodicals, he has published *Studien und Versuche auf dem Gebiete alt-indo-germanischer Religionsgeschichte* (1885); *Beiträge zur Kenntniss der vorhistorischen Entwickelung unseres Sprachstammes* (1888); *Ueber die arische Alterthumswissenschaft und die Eigenart unseres Sprachstammes* (1888); *Ueber Methode und Ergebnisse der arischen Alterthumswissenschaft* (1890).

Brad'ish, Luther, LL. D.: b. in Cummington, Mass., Sept. 15, 1783; graduated at Williams College in 1804. He studied law; was employed as a Government agent in affairs relating to Levantine commerce; settled in Franklin co., N. Y.; became prominent in State politics; was Lieutenant-Governor (1829–43), and under Fillmore was assistant U. S. treasurer at New York. He was prominent in religious, educational, and other charitable and benevolent enterprises. D. in Newport, R. I., Aug. 30, 1863.

Brad'laugh, Charles: republican reformer and anti-socialist; b. in the East End of London, Sept. 26, 1833; educated at Bethnal Green and Hackney Road elementary schools until he was eleven; afterward successively errand-boy, coal-dealer, and free-thought lecturer; began to speak before street audiences at the age of fifteen; enlisted in 1850 in the army, and served for some time in Ireland; became clerk in a solicitor's office in 1853, and began to write under the pseudonym "Iconoclast"; edited successively the *Investigator* (1858–59), and the *National Reformer*; in 1868 began his efforts to enter Parliament, being then widely known throughout the country; contested Northampton three times in vain, but was finally returned for that borough in 1880, his colleague being Mr. Labouchere; his refusal to take the oath of allegiance, and his demand to be permitted to affirm instead, led to several exciting scenes in Parliament; thrice he lost his seat on this account, and was as many times re-elected, and in the new Parliament of 1885 he was allowed to take his seat. In 1888 he carried a bill through Parliament allowing all persons to affirm instead of taking the oath. He was also successful in moving to establish a labor bureau, and was recognized as one of the best informed men on East Indian affairs in Parliament. His personal influence grew in Parliament, where he became greatly respected by all parties for his good sense, eloquence, and kind disposition. In 1873 Mr. Bradlaugh lectured in the U. S., and was warmly received. In 1876 he joined with Annie Besant in republishing an old pamphlet on population, for which they were brought to trial and sentenced to a fine and imprisonment—a judgment overruled on appeal. In his *Impeachment of the House of Brunswick* he advocated the repeal of the Hanoverian settlement of the crown as soon as the Queen should cease to reign. D. in London, Jan. 29, 1891.

Brad'ley, Edward (better known as "Cuthbert Bede"): novelist and humorist; b. in Kidderminster, England, in 1827; was educated at Durham University; B. A. 1848: entered the Anglican ministry, and received a number of church preferments; at the time of his death had been rector of Lenton, near Grantham, since 1883. He was the author of many volumes of prose and verse, chiefly novels, of which his first venture, *Verdant Green*, a humorous story of Oxford life (London, 1853–57, 3 parts), is the best known. He contributed largely to periodical literature. D. in Lenton, Dec. 12, 1889.

Bradley, George Granville, D. D., LL. D.: Dean of Westminster; b. in High Wycombe, Dec. 11, 1821; educated under Dr. Arnold at Rugby, and at University College, Oxford, where he was a pupil of Dean Stanley; B. A. 1844; fellow of University College 1844–50; became assistant master of Rugby 1846; head-master of Marlborough College 1858; master of University College, Oxford, Dec., 1870; appointed to succeed Dean Stanley in the Deanery of Westminster Aug., 1881. Has published *Recollections of Arthur Penrhyn Stanley* (London, 1882), and lectures on *Ecclesiastes* (1885) and on *Job* (1887).

Bradley, James, D. D., F. R. S.: astronomer; b. in Sherbourn, Gloucestershire, England, Mar., 1693; excelled as an observer and as a theorist. He graduated at Oxford; B. A. 1714; was ordained as a priest, and obtained several livings, but resigned them when he became Savilian Professor of Astronomy at Oxford in 1721. In 1729 he announced the important discovery of the aberration of light, which serves to demonstrate the earth's motion around the sun. In 1742 he was appointed astronomer-royal, and began to make observations at Greenwich. His next discovery, announced 1748, was that the inclination of the earth's axis to the ecliptic is not constant, a fact which explained the precession of the equinoxes and the nutation of the earth's axis. This discovery forms an important epoch in astronomy. D. at Chalford, July 13, 1762, leaving in manuscript thirteen volumes of observations, which were published in 1798–1805. See his *Miscellaneous Works and Correspondence*, with memoir ed. by L. P. Rigaud (Oxford, 1832).

Bradley, Joseph P., LL. D.: associate justice of the U. S. Supreme Court; b. at Berne, Albany co., N. Y., Mar. 14, 1813; graduated at Rutgers College, New Brunswick, N. J., with honors, in 1836; admitted to the bar in 1839 at Newark, N. J. He married in 1844 a daughter of Chief Justice Hornblower. Besides his labors in every branch of his profession, he devoted much attention to mathematics and the study of law as a science, extending his researches to the civil law—researches which have been of great service in his judicial duties in Louisiana and Texas. Engaged in many important causes in the State and U. S. courts, he took but slight part in politics. He was formerly a Whig; warmly sustained the national cause in the civil war; headed the electoral ticket for Grant in 1868; ranked as a moderate Republican. He was appointed to the bench of the U. S. Supreme Court Mar. 21, 1870. He was a member of the electoral commission which seated Hayes in the presidential chair, and it was his vote that decided the issue. D. in Washington, D. C., Jan. 22, 1892.

Bradshaw, Henry: English scholar; b. in London, Feb. 2, 1831; entered King's College, Cambridge, 1850; fellow 1853; B. A. 1854; dean 1857–65; prælector 1868. Mar. 8, 1867, he was appointed librarian of the Cambridge University library, with which he had been connected in one or another capacity for over ten years, and he held this office at the time of his death, Feb. 10, 1886. His unsurpassed knowledge of manuscripts and early printed books and his stores of general and special information—literary, bibliographical, and antiquarian—were always at the service of students and investigators, in assisting whom he spent his time without stint. His studies in Chaucer, of whom he projected an edition, were of much importance; but only his *Skeleton of the Canterbury Tales* (printed 1868, issued in 1871 as No. 4 of his *Memoranda*) and two short notes were published. His most elaborate bibliographical work is a list of the editions of the Sarum Breviary, etc., in Procter and Wordsworth's *Breviarum secundum usum Sarum* (1886). He also issued a series of bibliographical *Memoranda* (1868–85) and contributed many short papers to the *Communications* of the Cambridge Antiquarian Society, etc.; but the amount of his publication bears no proportion to his learning and his influence on contemporary scholarship. His edition of the *Liber Niger* of Lincoln Cathedral, unfinished at his death, was completed by C. Wordsworth (*Statutes of Lincoln Cathedral*, part i., Cambridge, 1892). His services to liturgiology were commemorated in 1890 by the founding of the Henry Bradshaw Society "for the editing of rare liturgical texts." See G. W. Prothero, *A Memoir of Henry Bradshaw* (Cambridge, 1888); *Collected Papers of Henry Bradshaw* (Cambridge, 1889).

G. L. Kittredge.

Bradshaw, John: one of the English regicides; b. at Wibersley Hall, Cheshire, 1602 (baptized at Stockport church, Dec. 10, 1602); became in 1627 a barrister; chief justice of Chester in 1647; sergeant-at-law in 1648; and in 1649 president of the High Court which condemned Charles I. He conducted that cause with unfeeling sternness and severity, but with dignity, and probably with a conscientious desire to do justice to the king and the country. He afterward opposed Cromwell's ambitious designs, and the latter unsuccessfully tried to remove him from his chief justiceship. He later held various important positions. D. in London, Oct. 31, 1659, and was buried with great pomp. At the Restoration his body was exhumed from Westminster Abbey, along with those of Cromwell and Ireton, and the three bodies were hanged at Tyburn in their coffins (Jan. 30, 1660–61); the heads were then cut off and exposed in Westminster Hall, while their bodies were buried beneath the gallows.

Bradstreet, Anne: first American versifier; wife of Simon Bradstreet; daughter of Thomas Dudley; b. in Northampton, England, in 1612; removed to Massachusetts probably in 1630. Her father and her husband were both governors of the colony. She published a volume of poems in London in 1650 entitled *The Tenth Muse Lately Sprung Up in America*. These poems and her other writings have been several times reprinted (the last and best edition in 1867). D. Sept. 16, 1672. See her complete works edited by J. H. Ellis (Charlestown, Mass., 1868). Revised by Henry A. Beers.

Bradstreet, John: major-general; b. in Horbling, England, in 1711; d. in New York city, Sept. 25, 1774. When a young man he removed to America and entered the colonial army; in 1745, as lieutenant-colonel in Pepperell's (York, Me.) regiment, he figured prominently in the expedition against Louisburg. In the fall of the same year he was made a captain in the regular army, and on Sept. 16, 1746, was appointed lieutenant-governor of St. John's, Newfoundland. In the French and Indian war he fought at Ticonderoga, Fort Frontenac, and Crown Point; negotiated a treaty with the Western Indians at Detroit in 1764. Was commissioned a major-general in 1772.

Bradstreet, Simon: colonial Governor of Massachusetts: b. at Horbling, Lincolnshire, England, in Mar., 1603. He studied at Cambridge, and was for a time the steward of the Countess of Warwick; removed to Salem, Mass., in 1630, as an assistant judge; was one of the founders of Cambridge and Andover, and resided also at Ipswich and Boston. Besides holding other important positions, he was Governor (1679–86 and 1689–92). D. in Salem, Mass., Mar. 27, 1697.

Bradwardine, Thomas: English prelate and scholastic theologian; called The Profound Doctor; b. in Chichester in 1290; educated at Oxford, and attained high rank as a scholar. He became confessor to Edward III. 1338; was consecrated Archbishop of Canterbury at Avignon, July 19, 1349. His principal work, *De causa Dei contra Pelagium et de virtute causarum*, is a masterly argument for the doctrine of Augustine. He was an able mathematician of Oxford University. D. in London, Aug. 26, 1349, of the plague. See notice of his *Life* by Sir Henry Savile in his edition of Bradwardine's *De causa Dei*, etc. (London, 1618).

Brady, John Riker: jurist; b. in 1822 in New York city. In 1856 he was elected a justice of the New York court of common pleas, and in 1869 was made a justice of the Supreme Court of the State, and in 1877 was unanimously re-elected to the position. D. Mar. 16, 1891.

Henry Wade Rogers.

Brady, Nicholas, D. D.: b. at Bandon, Ireland, Oct. 28, 1659; educated at Oxford and Dublin; sided with King William against James II., and in consequence was made chaplain to the king. He received several English church preferments, but is best known for his share in the metrical version of the *Psalms* (London, 1695), which he made in conjunction with Nahum Tate (1652–1715), the poet laureate. *Tate and Brady's Psalms*, though justly ridiculed for their clumsiness, quaintness, and bombast, have some noble passages. Brady also published a *Translation of the Æneid* (4 vols. 8vo, 1726). D. in Richmond, Surrey, May 20, 1726.

Brady, William Maziere, D. D.: b. in Dublin, Ireland, in 1825, of a prominent family; graduated at Trinity College with honor. Entering the Irish State Church, he received lucrative appointments, which he hazarded, and in part lost, by his many bold and able attacks upon the Church establishment to which he himself belonged. He was one of the foremost leaders of the movement which resulted in the disestablishment of the Irish Church. In 1873 he entered the Roman Catholic Church. He is the author of several works, chiefly upon the ecclesiastical history and antiquities of Ireland and Great Britain, and has written a learned work on *The Episcopal Succession in England, Scotland, and Ireland. A. D. 1400 to 1875* (Rome, 1876–77, 3 vols.); also *Annals of the Catholic Hierarchy in England and Scotland* (London, 1883); *Anglo-Roman Papers* (1890).

Braga, braa'gă (anc. *Bracara Augusta*): a town of Portugal; capital of the province of Minho; on an eminence near the river Cavado; 39 miles N. N. E. of Oporto (see map of Spain, ref. 14–B). It is the seat of an archbishop. It has a fine Gothic cathedral and a college. Braga is inclosed by old walls and defended by a castle. Here are manufactures of linen, cutlery, firearms, jewelry, etc. It is a very ancient town, and has the ruins of a Roman temple and amphitheater. It was the capital of Lusitania after the latter had been conquered by the Suevi. Its archbishop is titular primate of Portugal. Church councils were held at Braga in 563, 572, and 672 A. D. Pop. 19,755.

Braga, Theophilo: Portuguese critic and philologist; b. in San Miguel (St. Michael), Azores, Feb. 24, 1843; educated at the University of Coimbra, and since 1872 Professor of Literature in the Curso Superior de Letras at Lisbon. He has been one of the most voluminous and at the same time influential (at least in his own country) of modern authors. A recent list of his productions embraces over ninety titles. In Portugal, Braga has been mainly influential as a democrat in politics and a positivist in philosophy. Among his works in the capacity of leader of the Portuguese Republicans are *Soluções positivas da Politica portugueza* (1879); *Dissolução do Systema constitucional* (1881). As positivist, Braga has published *Traços geraes de Philosophia positiva* (1877); *O Positivismo* (a review, 1878–79–80); *Historia universal, esboços de Sociologia descriptiva* (1879–82); besides great numbers of isolated articles and addresses. Outside of Portugal, however, Braga is chiefly known as philologist and historian of Portuguese literature. In this field his activity has been almost incredible; and, if his work suffers often from haste and impetuosity, yet, on the other hand, his contributions to our knowledge of the origins and development of the literature of the Spanish peninsula have been very important. Only a few of his works in this field can be mentioned here: *Historia da Poesia popular portugueza* (1867); *Historia da Poesia moderna em Portugal* (1869); *Historia do Theatro portuguez* (1870–71); *Historia dos Quinhentistas* (1871); *Theoria da Historia da Litteratura portugueza* (1872); *Trovadores Gallecio-portuguezes* (1871); *Manual da Historia da Litteratura portugueza* (1875); *Bocage, sua Vida e Epoca litteraria* (1877); *Cancioneiro da Vaticana* (1878); *Historia do Romantismo* (1880); *Retrato e Biographia de Camœs* (1880). Braga is also a poet, and several volumes of his verse have appeared. *Fothas verdes* (1858) and *Visão dos Tempos* (1864) are perhaps the most remarkable.

A. R. Marsh.

Bragança, brăă-gaan'săă: a seaport-town of Brazil; province of Pará; on the river Caite, near its mouth; 106 miles E. N. E. of Pará (see map of South America, ref. 3–G). It has a trade in sugar. Pop. 10,000.

Braganza, brăă-gaan'zăă: a fortified town of Portugal; province of Tras-os-Montes; on a small stream 35 miles N. W. of Mirandi (see map of Spain, ref. 13–C). It has a citadel, a college, and a castle partly ruined, which was the seat of the Dukes of Braganza. It is the seat of a Catholic bishop. The name of the reigning family of Portugal, the house of Braganza, is derived from this town, which has manufactures of velvet and other silk fabrics. Pop. 5,495.

Braganza, or **Bragança**: the name of the royal family of Portugal and the late imperial family of Brazil, which is descended from Affonso, Duke of Braganza, a natural son of John I., King of Portugal. He died in 1461. The first member of this family that became King of Portugal was the eighth duke, who began to reign as John IV. in 1640. The first Emperor of Brazil was Dom Pedro I., the eldest son of King John VI.

Brage, braa'ge [derivation uncertain, but cf. O. Eng. *bregn*, princeps]: in Scandinavian mythology a son of Odin. He is the god of poetry and eloquence, and is one of the twelve chief gods in Asgard. He is not only eminently skilled in poetry, but the art itself is from his name called

Brage, which epithet is also used to denote a great poet. He is represented as an old man with a long flowing beard, and persons with heavy beard are called after him beard-brage (skegg-bragi). His wife, Idun, keeps in a box the apples which the gods, when they feel old age approaching, have only to taste of to become young again. In this manner they preserve their youth until Ragnarok. The giant Thjasse once captured Idun with her apples and carried her to Jotunheim. This made the gods turn wrinkled and gray, but they compelled Loke to bring her back to Asgard. (See IDUN.) *Bragarœdur*, in the Younger Edda, gives a description of a banquet to Æger, the god of the sea, in Asgard, where Brage at the request of Æger tells how Idun was captured by Thjasse. At feasts given after the death of a king or jarl it was customary among the old Scandinavians for the heir of the deceased to occupy a lower bench in front of the high-seat until Brage's bowl was brought in. Then he arose, made a pledge, and drank the cup of Brage (*bragafull*).—BRAGE THE OLD is occasionally quoted in Old Norse literature as an ancient skald, but his existence is doubted. It is fair to assume that the god Brage has been changed into an historical person, and that poetry of which the authorship was unknown was ascribed to him. See Thorpe's *Northern Mythology*; Keyser's *Religion of the Northmen*; Anderson's *Norse Mythology*; and Bugge, *Der Gott Bragi*, in Paul and Braune's *Beiträge*, xiii. 187 ff. BRAGE is sometimes spelled BRAGI (*q. v.*).

RASMUS B. ANDERSON.

Bragg, BRAXTON: soldier; b. in Warren co., N. C., Mar. 22, 1817; graduated at West Point in 1837; became captain June 18, 1846, in the Third Artillery; and served with distinction at various posts until Jan. 3, 1856, when he resigned with the rank of brevet lieutenant-colonel. In the civil war he was in command of the forces of the Southern army at Pensacola operating against Fort Pickens 1861; of Second Corps at Shiloh 1862, being promoted to general on the death of Gen. A. S. Johnston; moved against Buell into Kentucky 1862, whence he was compelled to retire after defeat at Perrysville Oct. 8, 1862; defeated at Murfreesboro Jan. 2, 1863; after a brief arrest overthrew Rosecrans at Chickamauga Sept. 20, 1863; relieved from command Dec. 2, 1863, for loss of Mission Ridge in the battle of Chattanooga Nov. 25, 1863; led a small force from North Carolina to Georgia in 1864; became chief engineer to State of Alabama, and made improvements in Mobile harbor. D. in Galveston, Tex., Sept. 27, 1876.

Bragg, WALTER L.: lawyer; b. in Lowndes co., Ala., Feb. 25, 1838; graduated at Harvard in 1858. He was a captain in the Confederate army. At the close of the war he settled in Alabama and practiced law, and was the first president of its State bar association. He was president of the Alabama railroad commission and in 1877 was appointed a member of the Interstate Commerce Commission, being reappointed in 1889. D. at Spring Lake, N. J., Aug. 21, 1891.

HENRY WADE ROGERS.

Bra'gi: god of poetry in the northern mythology. See especially Bugge, *Der Gott Bragi* (in Paul and Braune's *Beiträge*, xiii. 187 ff.); and the article BRAGE.

Bragi the Old, or **Bragi Boddason**: Norwegian poet; celebrated as the most ancient skald whose name is known. He is commonly thought to have lived about 770–850, though some regard this date as too early. The meager fragments of his verse that have come down to us have been edited by H. Gering (Halle, 1886). See also Vigfússon, *Corpus Poeticum Boreale*, ii. 2 ff.

G. L. KITTREDGE.

Bra'he, TYCHO (Dan. pron. braa'*e*): astronomer; b. in Knudstrup, Scania, Sweden, Dec. 14, 1546, which at that time was a province of Denmark. He studied at Copenhagen, Leipzig, and Wittenberg, where his face was disfigured in a duel; was early fascinated with astronomy, and in 1563 began the correction of the *Alphonsine Tables*. The king, Frederic II., gave him the island of Hoëne, in the Sound, about 1575, where he built the finest observatory (Uranienborg) which ever had been erected in Europe. He enriched the science of astronomy very much, partly by his very numerous observations, partly by inventing new instruments. He formed a catalogue of 777 stars, increased by his pupil Kepler to 1,000 from the records which he left behind, and his recorded observations of the planet Mars furnished to the same distinguished successor the material from which he deduced his famous "Laws." An uncle who died in 1565 left him an estate. Having passed several years in Augsburg, he returned to his native country in 1570. He rejected the Copernican system, which in his time was not supported by the conclusive evidence we now have in its favor. In fact, Tycho's theory, which made the sun move round the earth, and all the other planets round the sun, explained all the phenomena then known equally well. After the death of his royal patron in 1588 he was first neglected, and then so persecuted by the court that he emigrated to Germany in 1597, and was induced by the Emperor Rudolph to settle at Prague, where he died Oct. 24 (N. S.), 1601. He published, besides other works, *Astronomiæ Instauratæ Progymnasmata* (1587–89). "As a practical astronomer," says Sir David Brewster, "Tycho has not been surpassed by any observer of ancient or modern times. The splendor and number of his instruments, the ingenuity which he exhibited in inventing new ones, and his skill and assiduity as an observer, have given a character to his labors and a value to his observations which will be appreciated to the latest posterity." See Brewster's *Martyrs of Science* (1841), and his *Life* by Frijs (Danish, 1871). Cf. J. L. E. Dreyer, *Tycho Brahe, Scientific Life and Work in the Sixteenth Century* (London, 1890).

Brahma [occurs in Hindi in two forms: (1) *Brahmă*, nom. sing. neut., and (2) *Brahmā*, nom. sing. masc. of a Sanskrit crude form *brahman*, meaning growth, increase, or expansion; probably from a root *bṛih*, or *vṛih*, to grow or increase. The form *Brahmā* is not found in the Vedas or Brāhmanas]: In philosophical Brahmanism the form Brahmă is used to designate the supreme, self-existent, and all-pervading soul of the universe, from which all things emanate, and to which they return. Brahmă is the Supreme Spirit, regarded as impersonal, and divested of all quality and action. It is described as absolute, eternal, without beginning or end, immaterial, invisible, and inappreciable by the senses until "the film of mental blindness has been removed." It receives no worship, but is an object of abstract meditation, the only means by which absorption into it can be attained. (See BRAHMANISM.) In Hindu mythology this impersonal Supreme Being, when dominated by Activity (one of the three eternal principles or binding qualities by the equipoise of which, according to the Sankhya philosophy, nature exists), becomes *Brahmā*, the Creator, the first member of the Hindu triad of gods (the others being Vishnu and Siva), and the lord and father of all creatures. (See VISHNU, SIVA, and TRIMURTI.) He is said to live for one hundred divine years of three hundred and sixty divine days and nights. A day and a night make a kalpa, which is equal to 4,320,000,000 mortal years. When created by Brahmā, the world remains unaltered for one of his days (2,160,000,000 mortal years). It is then consumed by fire, only the elements, the gods, and the sages surviving. When he wakes up at the beginning of the next kalpa, the process of creation is repeated, followed by a night of decay; and this takes place 36,000 times, when he expires and everything comes to an end. Brahmā is represented as of a red color, and with four heads and four arms. His vehicle is a swan. He is never worshiped by the people, and only one temple is known to have been erected in his honor. His consort is Saraswati, the goddess of learning, who is also known as *Brāhmi*.

R. LILLEY.

Brahman: a member of the sacerdotal caste among the Hindus. See BRAHMANISM and CASTE.

Brahmanism, braa'man-izm: the religion of the Hindus, established by the Brahman priests upon the basis of the *Vedas*.

All Brahmanical beliefs are founded upon the *Vedas*, the earliest literary productions of India. The literature of the *Vedas* consists of various strata. The lyric parts, the so-called *Mantras*, are prayers or hymns addressed to the personified forces of nature. Agni, the fire (*ignis*), the heavenly messenger, the heavenly guest, the carrier of the sacrifice to the gods; Indra, the Hercules, the demiurge, who is inspired by the intoxicating drink *soma* to give fight and slay the cloud-demons; Sūrya and Ushas (*sol* and *aurora*); Dyāus (Zeus) and Prithivi, the shining sky and the earth; Rudra and the Maruts, the storm-god and his companions; Varuna (Uranos), the encompassing, all-seeing sky, he who has his spies everywhere to ferret out the wrongs done by men, etc.

In connection with the worship of these divinities there grew up a vast system of sacrificial ritualism and theosophic speculation laid down in texts called *Brāhmanas*, *Sūtras*, and *Upanishads*. The *Upanishads* especially have remained the foundation of all the higher thought in Brah-

manism up to our day. They are the first exponents of Hindu pantheism. Nothing really exists, they affirm again and again, but the one Universal Spirit (called *ātman*, the self, or *brahma*, the spiritual essence), and whatever appears to exist independently is identical with that spirit. Even the earlier gods of the Vedic hymns are but manifestations of this all-power. No real self can exist separately from the one self-existent supreme self, and when by an act of that self the individualized spirits of men are allowed for a time an apparent separate existence, the ultimate end and aim of such spirits should be to attain complete reunion with the one eternal self in entire self-annihilation. Coupled with this is the doctrine of transmigration of souls (metempsychosis), which seems to rest upon a more popular foundation than pantheism, but which fused very readily with it. Metempsychosis implies the belief that every creature is born again and again in any of the countless possible forms which lie between the great self-existent and the most insignificant living atom in the universe. Every creature is again and again the prey of death until he accomplishes the union with Brahma. And the Hindus assign a reason for this distressing indestructibleness of individual existence. It is desire during life. Desire, they say, produces deeds or action, and action, whether good or bad, is by its very nature finite, and holds the actor within the chains of finite existence. Only he who knows this and acting upon this knowledge eradicates every desire by separation from the world attains to Brahma—that is, to release from the chain of finite existences.

Brahmanical pantheism is necessarily the special property of the spiritually enlightened, the Brahmans. Prior to the appearance of Bûddha these ideas remained the property of learned schools solely. To the people the Brahman philosophers gave nothing but a polytheistic worship, which kept on changing the attractive early Vedic beliefs into an idolatry growing more and more grotesque at every stage of its development. The Brahmanical priests, holding in their hands the knowledge of the sacrifice, grew into a hierarchy whose power has never been exceeded. They kept on strengthening the system of castes which even to-day is the most significant social factor in Hindu life. A disjointed mass of sacred writings full of heterogeneous doctrines has grown up, based in a large measure upon Vedic beliefs, but absorbing also at the same time much of the fetishism of the aborigines of India; it has stooped to appropriate and naturalize the adoration of the fish, the boar, the serpent, the monkey, rocks, stones, and trees. At present the essentials of Brahmanical belief may be summed up in two conditions: the admission of the spiritual supremacy of Brahmans, and obedience to the caste-rules concerning food, intermarriage, and professional pursuits. One may say that the practical religion of the 150,000,000 or more Brahmanical Hindus now living is the law of caste. The more general and abstract laws of religion and worship of the gods and idols are not ignored, but they take a distinctively secondary place. The highest law which concerns the Hindu is to eat correctly, to drink correctly, to marry correctly—that is, in accordance with the rules that obtain in his caste. See Barth, *The Religions of India* (Boston, 1882); Monier-Williams, *Brahmanism and Hinduism* (4th ed. New York, Macmillan & Co.). See also Sankhya and Caste.

Maurice Bloomfield.

Brahmapu'tra, also written **Burrampooter** (anc. *Dyardanes* or *Œdanes*): a great river of Asia. It rises in Tibet, where it first has a southerly course, and is known as the Kharta; then it has a long course eastward as the Sanpu, flowing in the valley between the Himalaya and Gangri Mountains. Opposite Eastern Bhutan it turns S. E., and is known as the Dihong river. In Northeast Assam it receives its largest tributary, the Burang river, when it becomes the Brahmaputra. Its general direction is then nearly W. S. W. until it passes through Assam and enters Bengal. It flows southward through Bengal, and enters the Bay of Bengal with the Ganges. It is connected with the Ganges not only by a common delta, but by a large branch or channel called the Jenna, which leaves the Brahmaputra about lat. 25° N. After receiving the tributary called the Meghna on the eastern side, it takes the name of that stream, and so remains to its mouth. It thus has five different names in its course. The identity of the Sanpu and Brahmaputra was long doubted by geographers, but is now settled. Its entire course is estimated at 1,800 miles. It inundates the level tracts of Bengal from April to September, and is said to discharge into the sea more water than the Ganges. The violence of its current and its *bore* (an upward wave caused by the sudden influence of the tide) render navigation difficult.

Brahmin: a member of the sacred or sacerdotal caste among the Hindus. See Caste.

Brah'mo So'maj [the Bengali form of Sanskr. *brahmasamāja*, meeting or society for worship]: a society of Theists in India. Founded in 1830 by Rammohun Roy, it increased in numbers and activity after 1842, under the leadership of Debendro Nath Tagore, who succeeded in emancipating it from Vedantism. In 1859 a new impulse was given to it by the ability and enthusiasm of Keshub Chunder Sen, who effected the separation of those who were willing to abolish caste in their communion, as the "Brahmo Somaj of India." The more conservative members remained in the Somaj or Church of Calcutta. Many of them are young Hindus educated at the English colleges. The first building for public worship of the progressive Brahmos was opened at Calcutta in 1869. The number of avowed Brahmos is probably not more than between 4,000 and 5,000, but large numbers of the educated natives sympathize with the movement. Keshub Chunder Sen, in his sermons and published tracts, avowed a belief in the unity of God, in immediate revelation, in the necessity of a new birth, in the immortality of the soul, and in the efficacy of prayer. His morality was pure, and he inculcated reverence for the character of Jesus Christ, but repudiated the doctrines of his divinity, mediation, and atonement as taught in the New Testament. This "Unitarian Theism" is said to resemble the theological rationalism of Theodore Parker. See *Six Months in India*, by Miss Mary Carpenter; *Hours of Work and Play*, by Miss F. P. Cobbe; an article in the *Contemporary Review* on *Indian Theism*, etc. (1869); Dr. Jardin's paper in *Proceedings of the Allahâbâd Conference* (1872); Mozoomdar's *Life and Teachings of Keshub Chunder Sen* (1888); the English work of Rammohun Roy (*q. v.*) (1888).

Revised by C. K. Adams.

Brahms, braams, Johannes: musician; b. in Hamburg, Germany, May 7, 1833; studied first under his father, and, being encouraged by Schumann in 1853, resolved to devote himself to a musical career. In 1861 he left Hamburg for Vienna, where he made his residence, and died there Apr. 3, 1897. His principal works are four symphonies for full orchestra, several overtures, and other orchestral works: *Rinaldo*, a cantata (for male voices); *Noenia*; *Song of Destiny*; *German Requiem*; *Song of the Fates* (for six-part chorus); *Rhapsodie* for alto solo and male chorus); *Song of Triumph*: *Ave Maria* (for female voices); *Funeral Hymn*: *Thirteenth Psalm* (for female voices). These choral works are all exceedingly difficult, but very effective when well sung. The admirers of Brahms consider him the true successor to Beethoven, and his first symphony was considered so fine by some critics as to rank after Beethoven's *Ninth*, and was called the *Tenth Symphony*. His orchestral works are much more frequently heard than his choral compositions, owing to the great difficulties in the latter. He also wrote many songs, ballads, and small choruses. D. E. Hervey.

Braidwood: city (founded in 1860); Will co., Ill. (for location of county, see map of Illinois, ref. 3–G); on Chicago and Alton R. R.; 58 miles from Chicago; has 5 churches, 5 public schools, coal-mining and agricultural industries. Pop. (1880) 5,524; (1890) 4,641; (1900) 3,279.

Editor of "Bulletin."

Braila, brăa-cc'la (Turk. *Ibraila*): a fortified town of Roumania; on the left bank of the Danube; about 100 miles from its mouth and 102 miles N. E. of Bucharest (see map of Austria-Hungary, ref. 8–N). Large quantities of grain and other produce are shipped at this place, which is the chief port of Roumania. Pop. 29,000.

Braille Alphabet: See Blind, Education of the.

Brain: the *encephalon* or contents of the cranium; the material instrument of thought, impulse, and perception in man and the higher animals. Only vertebrates have a true brain; in others ganglia or nerve-centers exist, but the "cephalic ganglia" of insects and other invertebrate animals are not strictly homologous with the brain.

The central nervous system of vertebrated animals consists of the *spinal cord* (see Medulla Spinalis), contained within the spinal canal of the vertebral column, and the expanded and highly differentiated *encephalon*, lying within its protecting bony case, the cranium. Disregarding the

exceptions presented by certain species and individuals, the development of the brain advances from the lowest class of vertebrates, the fishes, through amphibians, reptiles, birds, to mammals, reaching its culmination in man. On the one hand, the *amphioxus*—a peculiar fish, regarded as the lowest vertebrate, and remarkable for the rudimentary condition of its organs—possesses the least developed brain, this important organ being represented by an imperfectly differentiated cerebral vesicle in which the anterior end of the spinal cord ends; so immature is the brain in this animal that it was formerly regarded as entirely absent. In man, on the other hand, the brain attains its highest development, especially in those peculiarities indicative of intellectual power.

The ratio between the weight of the encephalon to that of the entire body increases as the zoölogical scale is ascended; thus in fishes the average ratio is (according to Leuret) about as 1 to 5,668; in reptiles, 1 to 1,321; birds, 1 to 212; mammals, 1 to 186; in man, 1 to 36. The elephant has the largest brain, in actual weight, of all animals, sometimes reaching 9 or 10 lb.; next is that of the whale, about 5 lb. The heaviest human brains have never weighed so much as this, yet the proportion of weight of the brain to the whole body of the elephant is but as 1 to 500. In some small animals and birds the ratio is relatively high; as in the marmoset, 1 to 22; field-mouse, 1 to 31; linnet and canary-bird, 1 to 20; and the blue-headed tit, 1 to 12. But it must be remembered that the *kind* of brain varies also; while the sensory-motor portions of the brain are of much greater relative size in the lower animals than in man, those parts associated with the highest intelligence, as the cerebral hemispheres, are especially conspicuous in the human brain. There is an obvious connection between the degree of cerebral development in the different groups of animals and their intelligence; the brain of man is greatly superior to any other in its development. As Huxley has pointed out, the difference in the *structure* of the brains of men and of the higher apes is not very marked, and the disparity in *size* is less than between the highest and the lowest of the quadrumana. But the gap is a wide one, since an average European child of four years old has a brain twice as large as an adult gorilla, whose weight is perhaps four times as great.

An appreciation of the plan upon which the primitive nervous system is formed is essential to a correct understanding of the adult brain. The earliest representative of the cerebro-spinal axis is the *neural tube*, formed by the folding in of the outer layer of the embryo along its dorsal surface. Later, the anterior end of the neural tube expands into three primary *cerebral vesicles*—anterior, middle, and posterior; the anterior and posterior of these subsequently subdivide, five partially constricted sacs, known as fore-brain, inter-brain, mid-brain, hind-brain and after-brain, now representing the future encephalon. These vesicles, together with the neural canal, constitute a single thin-walled tube, whose relatively large original lumen becomes proportionately reduced by the growth, thickening, and differentiation of its walls, being represented in later life by the ventricles of the brain and the central canal of the spinal cord.

In the typical vertebrate brain certain divisions are recognized, which correspond to its primitive condition; these are:

(1) *Prosencephalon*, comprising the structures of the cerebral hemispheres, together with the olfactory lobes;

(2) *Thalamencephalon*, including the thalami optici and the other parts about the third ventricle;

(3) *Mesencephalon*, embracing the structures around the Sylvian aqueduct, with the crura cerebri below and the optic lobes, or corpora quadrigemina, above;

(4) *Epencephalon*, corresponding to the cerebellum and pons Varolii;

(5) *Metencephalon*, consisting principally of the medulla oblongata.

In fishes, those parts which represent the cerebral hemispheres are generally no larger than the optic lobes; a condition to which, at a certain stage of development, the brain of the human embryo presents a near resemblance. In amphibia and reptiles there is not much advancement, but the cerebral hemispheres are larger and the cerebellum smaller. Birds have a considerable increase in the size of the hemispheres, which, in them, cover the olfactory ganglia in front and the optic lobes behind; the cerebellum in them is large. To each of these the embryonic human brain has, at certain stages, a resemblance.

Mammals present great diversity, from the smooth-brained (Lissencephala of Owen) Monotremata, Marsupialia, and Rodentia, up through the other groups to the highly convoluted (Gyrencephala) and otherwise complex brains of the anthropoid apes, as the gorilla and chimpanzee. In the higher apes the cerebral hemispheres roof over and partly conceal, when looked at from above, the cerebellum behind, as well as the olfactory bulbs in front; in the lemurs, however, the cerebellum is uncovered, and the surface of the cerebrum is almost devoid of convolutions.

In the human brain, the arrangement of its parts is so profoundly modified by the excessive development of the cerebral hemispheres that the correspondence between the typical vertebrate brain and the adult human organ becomes masked.

The average weight of the adult human brain in the male is about 49½ oz. (1,400 grammes), or slightly more than 3 lb. avoirdupois; in the female, about 44 oz. The usual difference of 4 to 6 oz. between the two is to be attributed to the lesser general body-weight in the female, and not to inferiority of cerebral development, since the ratio of the brain-weight to that of the entire body has been shown to be practically identical in both sexes. The proportionate weight of the brain to that of the body is greatest at birth, being then about as 1 : 6 (Tiedemann), diminishing gradually to the tenth year, when the ratio is 1 : 14; at the twentieth year, 1 : 30; after that period, 1 : 36·5. The brain attains its greatest weight at about the fortieth year; after that time a diminution is said to take place at the rate of about 1 oz. for each decade.

The relation between brain-weight and intelligence also must be admitted with reservations. While it may be accepted that in general heavy brains are associated with high intelligence, as in the comparison of nations and races, yet brain-weight can not be relied upon as the index of mental capacity in individuals, notwithstanding the conspicuous correspondence between intellectual endowment and high brain-weight in the well-known examples: Cuvier, 1,861 grammes (65·7 oz. avoir.); Byron, 1,807 grammes (63·8 oz.); Schiller, 1,580 grammes (55·8 oz.); Gauss, 1,492 grammes (52·7 oz.); Dante, 1,420 grammes (50·2 oz.), and others. On the other hand, the brains of men of acknowledged intellectual superiority have weighed less than the average, while some of the heaviest brains recorded have belonged to ignorant and illiterate individuals. Weight alone, therefore, may be regarded as suggestive, but by no means conclusive, evidence of intelligence; the development of the cerebral convolutions, the amount of cortical gray matter, and the number of ganglion nerve-cells are all factors to be considered in drawing accurate comparisons between brains.

The capacity of the cranium closely corresponds with the central development; the average capacity of the normal cranium is about 1,400 cubic cm. (85 cubic inches). Skulls have been divided into three classes: those belonging to a middle group, or *mesocephalic*, with a capacity of from 1,350 cubic cm. (82 cubic inches) to 1,450 cubic cm. (88 cubic inches); those below 1,350 cubic cm. capacity being *microcephalic*; those above 1,450 cubic cm., *megacephalic*. The Eskimo and European possess the largest cranial capacity; the Hindu the smallest. The cranium of idiots may be reduced to correspond to a brain-weight of only 23 oz.

It is usual to describe the human encephalon as composed of four chief divisions—*cerebrum*, *cerebellum*, *pons*, and *medulla oblongata*. These are enveloped within the skull by protecting membranes, which, from without inward, are the *dura*, *arachnoid*, and *pia*. The dura (mater) is the outer dense fibrous investment, closely adhering to the cranial bones in many places, and sending vertical partitions between the hemispheres of the cerebrum and cerebellum, and supporting and separating the hind part of the former from the latter by a horizontal septum. The arachnoid is an extremely delicate, web-like structure, usually so closely applied to the dura that it is frequently overlooked. The pia (mater) is the vascular tunic of the brain, supporting and conveying the blood-vessels supplying the nervous tissue, lying closely applied and following all the irregularities of its surface.

The cerebrum in the human brain greatly exceeds the other parts both in volume and weight, constituting about ·87 of the entire brain-weight. It consists of two *hemispheres* (Fig. 1, *a* and *b*) divided by a deep median cleft, the *longitudinal fissure* (*c*), in which the sickle-like fold of dura, *the falx*, projects; the separation of the hemispheres in front and behind is complete, the two halves, however, being connected by a transverse bridge, the *corpus callosum*, situated

at the bottom of the fissure, and occupying a little more than half its length.

The surfaces of the hemispheres in the adult human brain present a complicated arrangement of *convolutions* and in-

Fig. 1.—Brain viewed from above, showing some of the principal fissures and convolutions: *a*, *b*, cerebral hemispheres, separated by *c*, the longitudinal fissure; *d*, placed at the anterior border of the central fissure; *e*, part of parieto-occipital fissure; *F*, *P*, *O*, frontal, parietal, and occipital lobes.

tervening *fissures* (Fig. 1), resulting from the extensive folding of the cerebral surface taking place during the growth of the organ, greatly increased superficial area being thereby secured without undue augmentation of volume. While on cursory examination the convolutions seem disposed without order, comparison shows that they are grouped according to definite plans for each class of animal.

The under and outer surface of each hemisphere of the cerebrum of man presents a deep oblique incision, the *fissure*

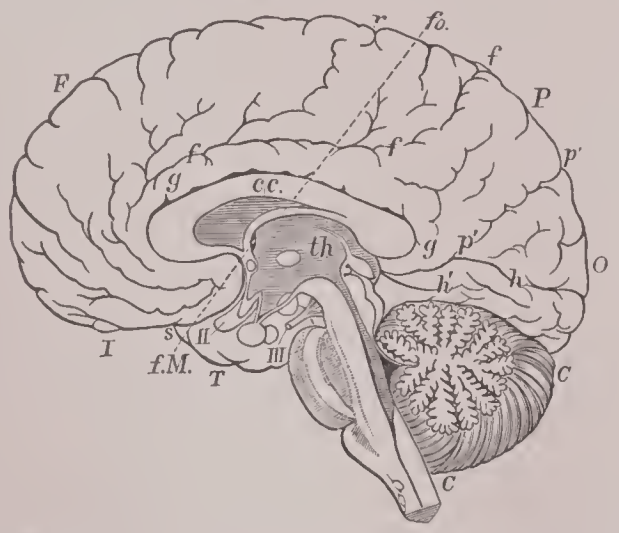


Fig. 2.—Median section through the brain, exposing mesial surfaces. *F*, *P*, *T*, and *O*, the frontal, parietal, temporal, and occipital lobes; *C*, cerebellum; *cc*, corpus callosum; *th*, thalmus (the letters are placed in third ventricle, seen in longitudinal section); the Sylvian aqueduct, shown leading from third to fourth ventricle; *f. M.* foramen of Monro, the communication between the lateral and third ventricles.

of Sylvius (Fig. 3, *a*), which begins on the base of the brain and passes outward, upward, and backward, to become a conspicuous landmark on the lateral aspect of the cerebrum. The less marked but important *central* or *Rolando's fissure* runs more nearly vertical, extending from close to the fissure of Sylvius almost to the superior margin of the hemisphere (Fig. 1, *d*). A third important incision, the *parieto-occipital* fissure (Fig. 1, *e*), is scarcely seen on the lateral or external surface, but appears on the inner or mesial as a cleft extending from the upper margin of the hemisphere, about midway between the central fissure and the posterior end of the brain, downward and forward for a variable distance.

These cardinal fissures divide each hemisphere into five principal divisions—the *frontal*, *parietal*, *occipital*, *temporo-sphenoidal*, and *central lobes*. The frontal lobe (Fig. 1, *F*; Fig. 3, *e*) includes the anterior part of the hemisphere, its posterior boundary being the fissure of Sylvius and the central fissure. The parietal lobe (Fig. 1, *P*) lies between the central fissure in front, the parieto-occipital fissure behind,

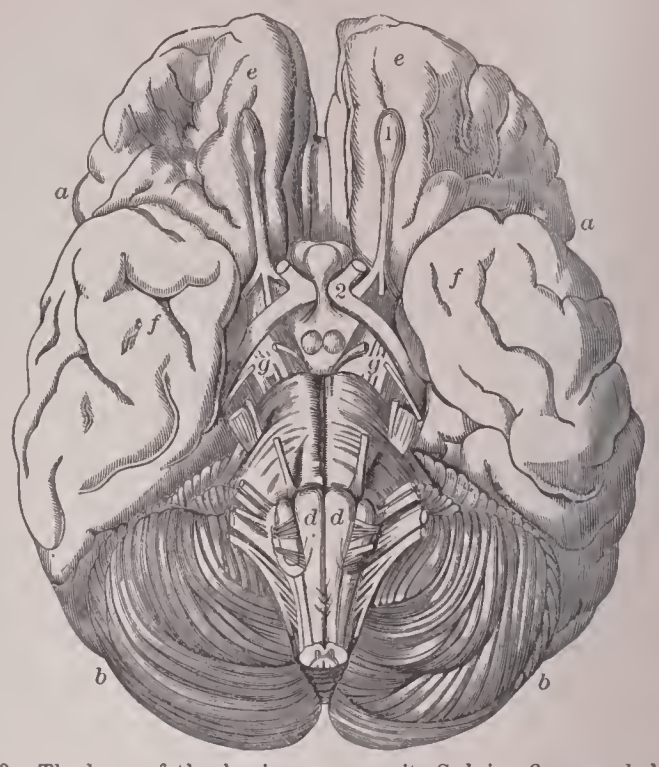

Fig. 3.—The base of the brain: *a*, opposite Sylvian fissure; *b*, hemispheres of cerebellum; *c*, pons; *d*, medulla (the latter is on the anterior pyramids); *e*, *f*, frontal and temporo-sphenoidal lobes; *g*, crura of cerebrum; 1, olfactory bulb; 2, optic chiasm. Cranial nerves seen emerging from sides of pons and medulla.

and the Sylvian fissure below. The occipital lobe (Fig. 1, *O*) includes the part of the hemisphere lying behind the parieto-occipital fissure, being separated by the latter from the parietal lobe above, but fusing with this and the temporo-sphenoidal lobe below and in front. The most dependent portion of the hemisphere, limited in front and above by the fissure of Sylvius and fusing behind with the parietal and occipital lobes, constitutes the temporo-sphenoidal lobe (Fig. 3, *f*). At the bottom of the Sylvian fissure, covered in and masked by the overhanging parts of the frontal and parietal lobes, lies the central lobe or island of Reil. Each of these lobes is subdivided by secondary fissures into a number of convolutions. The convolutions bordering the central fissure (Fig. 1, *d*)—ascending frontal (precentral) and ascending parietal (postcentral)—are of especial interest as being the areas presiding over the motion of certain important regions of the body, as will be presently described.

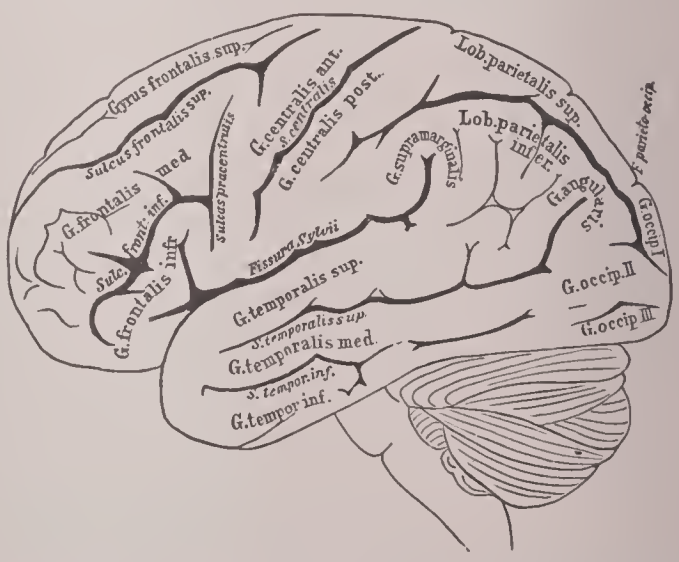

Fig. 4.—Lateral view of brain, showing the principal fissures and convolutions of the cerebral hemisphere, the cerebellum, pons, and oblongata in outline.

Without here considering the minute structure of the organ under consideration (for which see Histology), it must be remembered that the brain and spinal cord are composed of two kinds of nervous tissue—gray and white matter. The gray matter is the principal seat of the ganglionic nerve-

cells, hence its importance for the origination of impulses; the white matter, on the contrary, is chiefly composed of tracts of nerve fibers. In the cerebrum and cerebellum, the gray matter forms a continuous external or *cortical* layer, usually some 3 to 4 mm. thick, in which the nerve fibers, establishing communication with more or less remote parts of the body, end. In addition to the gray matter of the cortex, other large masses of this tissue, as the corpus striatum and optic thalamus, lie within in cerebrum, where they form the so-called "basal ganglia."

In order to examine the interior of the cerebrum, successive horizontal slices may be removed from the upper part of the hemispheres. Above the level of the transverse bridge, or *corpus callosum* (Fig. 5, *a*), the sections show large solid areas of white matter bordered by the gray cortical layer. On removing the corpus callosum, two large intracerebral cavities, the *lateral ventricles*, are exposed (Figs. 5 and 6), one in either hemisphere. These are irregular cavities, prolonged by their anterior, posterior, and lateral horns or *cornua*, respectively, into the frontal, occipital, and temporosphenoidal lobes. The ventricles, of which there are four true ones—the *two lateral*, the *third* and the *fourth*, together with the so-called *fifth* ventricle, which does not correspond with a true ventricle, being a space really without the neural tube—represent the remains of the cephalic divisions of the primitive neural canal.

Certain irregularities project into the sides and floor of the lateral ventricles. The most important and conspicuous are the *corpus striatum* (Fig. 6, *b*), occupying the sides and floor of the anterior portion of the cavity, and the *optic thalamus* (Fig. 6, *a*), situated behind and to the inner side of the former. The striatum comprises masses of white and gray matter; of the latter are the intra-ventricular portion, or *caudate nucleus*, appearing within the lateral ventricle, and the extra-ventricular part, or *lenticular nucleus*; these two are separated by a conspicuous tract of white matter, the *internal capsule*, composed of bundles of nerve fibers passing from the cerebral cortex to the deeper basal ganglia and to the tracts connecting the cerebrum with the subjacent divisions of the brain.

The *third ventricle* is a T-shaped cavity, the vertical arm being a narrow cleft (Fig. 6, *d*) between the mesial surfaces of the thalami (Fig. 6, *a*), while the horizontal limb extends over the upper surface of the latter, being roofed in by the delicate vascular membrane, the *velum interpositum*, an

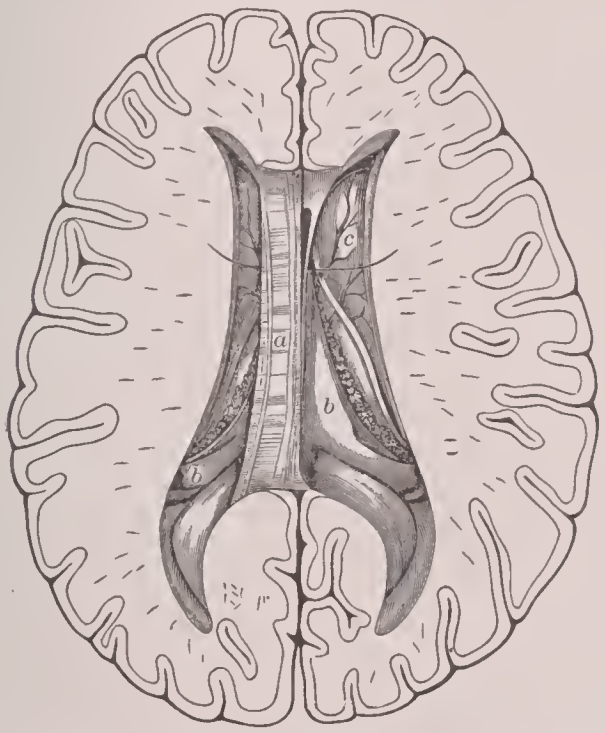

FIG. 5.—Horizontal section of the brain, about at the level of the corpus callosum (*a*), which has been partly removed to expose the underlying lateral ventricles, whose anterior and posterior horns extend into the frontal and occipital lobes.

extension of the pia. Three connecting bands—anterior, middle, and posterior *commissures*—bridge the cleft of the ventricle and connect the two thalami; the middle commissure is composed of gray matter, the other two of white. The thalami are composed largely of gray matter interspersed with bundles of fibers. At the extreme anterior end of the third ventricle a Y-shaped opening, the *foramen of Monro*, establishes communication between the lateral and third ventricles, while at its posterior extremity the narrow *aqueduct of Sylvius* leads from the third to the fourth ventricles. The so-called *fifth ventricle* (Fig. 6, *f*) is a narrow slit, included within the *septum lucidum*, separating the lateral ventricles and roofed in by the corpus callosum above; it does not correspond to a true ventricular cavity, having no communication and being really a cut off portion of the great longitudinal fissure.

Immediately behind the third ventricle and above the aqueduct of Sylvius four tuberosities are seen (Fig. 6, *g*), arranged as upper and lower pairs; these are the *corpora quadrigemina* of the human brain, and correspond to the singly paired optic lobes, which in other classes, especially in fishes and amphibia, constitute very conspicuous parts of the brain, sometimes even exceeding the cerebral hemispheres. Above the corpora quadrigemina is situated a peculiar cone-shaped organ, the *pineal body* (Fig. 6, *h*), whose significance was for centuries a riddle. Among other theories as to its function, Descartes regarded it as the seat of the soul. Recent comparative researches justify the belief that this body represents in man and the higher animals the degenerate remains of what, in past ages, in lower classes was a functionating third organ of sight—the *pineal eye*.

The *cerebellum*, or little brain, weighing about one-eighth as much as the cerebrum and contributing about one-tenth of the weight of the entire brain, occupies the posterior fossa of the cranium. In man it is completely covered in above by the highly developed cerebral mantle, being separated from the cerebrum by the *great transverse* (*Bichat's*) *fissure*, and the horizontal partition of dura, the *tentorium*.

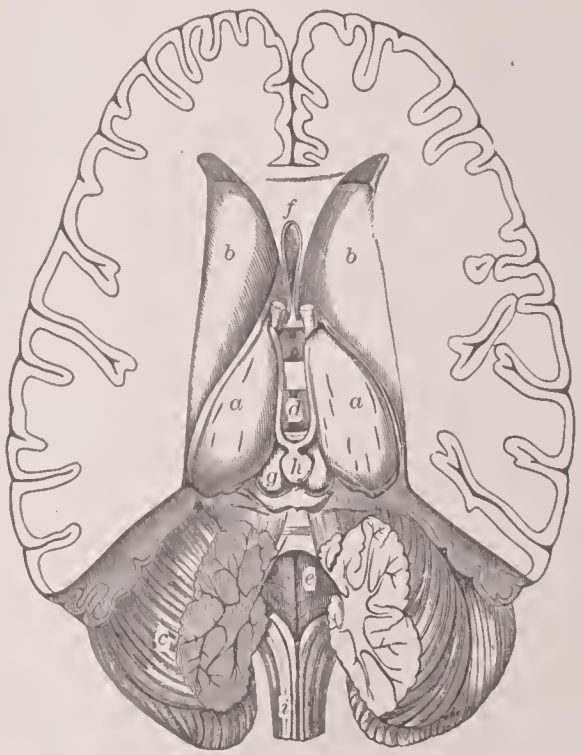

FIG. 6.—Horizontal section of the brain below the level of corpus callosum, exposing lateral (*b*, *b*), third (*d*), and fourth (*e*) ventricles; *f*, cleft within septum lucidum called fifth ventricle; *b*, *b*, interventricular surface of striatum, corresponding to nucleus caudatus; *a*, *a*, upper surface of thalamus; *g*, corpora quadrigemina; *h*, pineal body. Posterior parts of hemispheres have been removed to show cerebellum (*c*), the median portion of the latter cut away to expose fourth ventricle (*e*) and medulla (*i*).

The cerebellum consists of two hemispheres (Fig. 3, *b*, *b*), partially separated by a deep valley traversed by various commissural tracts. In addition to the separation into an upper and lower portion effected by the great *horizontal fissure*, each hemisphere is divided into a number of lobes by secondary fissures, on the upper surface there being two, on the lower five, such lobes. The exterior of the cerebellum presents numerous thin folds or laminæ, which, on transverse section, exhibit a characteristic foliated appearance—the *arbor vitæ* of the older anatomists—of the cortical layer of gray matter covering in the central white stems of nerve fibers. By means of a pair of anterior stalks, or *peduncles*, the cerebellum directly communicates with the anterior division of the encephalon, through the posterior peduncles, with the subjacent medulla, while the transverse fibers of the pons constitute the commissure uniting the hemispheres.

The remaining divisions of the brain—the pons and medulla—contain chiefly white matter, being made up largely of bundles of nerve fibers passing from the spinal

cord to higher portions of the nervous axis. The *pons* (*Varolii*) (Fig. 3, *c*) unites the various segments of the encephalon, connecting the cerebrum above, the cerebellum behind, and the medulla below. It appears as a quadrate body lying above the medulla, between the hemispheres of the cerebellum, and beneath those of the cerebrum. Alternate layers of transverse and longitudinal fibers, together with a limited amount of gray matter, constitute its mass; the transverse bundles connect the cerebellar hemispheres, while the longitudinal contain the fibers passing to and from the higher centers. At the upper border of the pons the longitudinal fibers are collected into two rounded stalks, the *cerebral crura* (Fig. 3, *g*), which diverge and enter the base of the hemispheres, forming the immediate bond of union between the cerebrum and pons, and constituting the great highway for the conveyance of nervous impressions to and from the cerebrum.

The *medulla oblongata* (Fig. 3, *d*), the most dependent division of the brain, extends from the lower border of the pons to become continuous with the spinal cord below. It is composed principally of the tracts of nerve fibers of the spinal cord (see MEDULLA SPINALIS), which are continued into the medulla to become rearranged as the *anterior pyramids*, *lateral tracts*, *restiform bodies*, and *posterior pyramids*. The most conspicuous of these are the anterior pyramids (*d*), which include the fibers derived from the anterior and lateral columns of the cord; at the lower end of these pyramids a crossing or *decussation* of part of the bundles takes place, by which arrangement fibers connected with one hemisphere pass to the opposite half of the cord and body, a fact of importance in explaining the phenomena of palsy. On the posterior surface of the medulla the *restiform* bodies are the largest tracts, collecting the fibers from the posterior and lateral columns of the cord, and becoming the posterior peduncles of the cerebellum. The *olivary bodies* are two prominent oval masses situated on the anterior surface of the medulla, near its upper part, between the anterior pyramids and the lateral tracts. The space included between the upper surface of the pons and medulla below, and the cerebellum and its attachments above, is the *fourth ventricle* (Fig. 6, *e*), continuous with the third through the Sylvian aqueduct in front, and with the central canal of the spinal cord behind. The floor of the fourth ventricle contains a layer of gray matter, derived practically as the continuation of that of the cord from below; this sheet of gray substance is of especial interest and importance on account of its relation to the deep origin of many important cranial nerves.

On examining the exterior of the base of the brain (Fig. 3), in addition to the lobes, convolutions, fissures, pituitary and mammillary bodies, and other details of its surface, there is seen the superficial origin of the twelve pairs of cranial nerves, named in the order, from before backward, in which they emerge from the surface of the encephalon. The *first* or *olfactory* nerves extend along the under surface of the frontal lobe, parallel with the median fissure, terminating in bulbous expansions (Fig. 3, 1), and represent the olfactory lobes of many animals. The *second* or *optic* nerves diverge outward and forward from the point of their junction and decussion, the *chiasm* (Fig. 3, 2), the widely expanded *optic tracts* winding backward across the crura to end in the thalami and corpora quadrigemina. The *third* or *motor oculi* nerves appear at the inner borders of the crura, while the *fourth* or *pathetic* wind round the crura from without in, usually lying close to the anterior border of the pons. The *fifth* or *trifacial* nerves, among the most important of those given off from the brain, are seen emerging on either side from the anterior part of the pons. The *sixth* or *abducent* nerves appear at the lower border of the pons in the depression between the pons and medulla. Beginning at the upper end of the latter, groups of fibers, composing the *seventh* (*facial*), *eighth* (*auditory*), *ninth* (*glossopharyngeal*), *tenth* (*pneumogastric*), and *eleventh* (*spinal accessory*) nerves, escape from the group between the restiform body behind and the olivary body and lateral tract in front. The *twelfth* or *hypoglossal* nerve arises superficially from the anterior surface of the oblongata between the pyramids and olivary bodies. For many other details of the complex structure of the brain, which must be here omitted, the reader is referred to special works on anatomy.

As has been stated already, the central masses of white matter, contributing so large a portion of the bulk of the brain, are composed of bundles of nerve fibers. The arrangement of these fibers is very complex, and the accurate determination of their course is a subject of great difficulty. Only a brief outline of the general plan of their distribution is here possible. The nerve fibers of the cerebrum are arranged in four principal groups: (1) those uniting the various parts of the same hemisphere; (2) those connecting identical areas of the two hemispheres, being the fibers composing the callosum and the anterior commissure; (3) fibers passing between dissimilar points of the two hemispheres; (4) those extending from the cortex directly or through the basal ganglia, into the crura, and *vice versa*, by their diverging course forming the *corona radiata*. Numerous fiber-tracts are found within the cerebellum, the principal ones affording connections with the adjacent parts, as well as uniting the various points of the cerebellum itself.

Regarding the *functions* of the structures constituting the encephalon, much uncertainty still exists; it may be assumed, however, that, in the present state of our knowledge, the cerebral hemispheres are the seat of all psychical activities involved in the processes of thinking, feeling, and willing. After destruction of these parts, the functions essential to the maintenance of life are carried on uninterruptedly, but without the accustomed guidance of intelligent volition. Both hemispheres participate in these psychical activities, so that impairment of one may be overcome by the other. From the anatomical peculiarities already described, it will be readily appreciated that the connection of the cerebral cortex with the other parts of the brain is essential for the exercise of will power and intelligence. It may be regarded as highly probable that every voluntary act influencing a given part of the body is under the control of some definite area of the cerebral cortex. Such areas have been determined with accuracy by experiment and disease for some few functions; among these, that the movements of the lower extremity, upper limb, and face are controlled respectively by the upper, middle, and lower thirds of the cortical substance bounding the central fissure—that is, of the ascending frontal and parietal convolutions. The area for speech is situated chiefly at the posterior part of the inferior frontal convolution of the *left* hemisphere, the central lobe, or the island of Reil, at the bottom of the Sylvian fissure, being also probably involved. Hearing is attributed to the upper temporal convolution, while sight is probably connected with a center situated within the occipital lobe (*cuneus*), embracing possibly the neighboring part of the parietal. Smell and taste seem to be associated in their areas, their joint center being ascribed a position on the inner and under side of the temporal lobe. Integrity of the paths conducting impulses from the cortical centers is, of course, essential for the performance of function; when the uniting tract of nerve fibers is damaged, as by an apoplectic clot, the stimulus is interrupted, and those parts beyond the obstruction, supplied by the affected fibers, remain unresponsive to volition, or paralyzed. Regarding the functions of the striatum and thalamus very little is known with certainty. The corpora quadrigemina are believed to be intimately concerned in maintaining co-ordination of movement and equilibrium, as well as connected with the deep origin of the nerves of sight. The cerebellum apparently exercises great control over exact co-ordination of movement; neither psychical activity, volition, nor consciousness is disturbed by injuries limited to this part of the brain. The medulla contains the areas presiding over many reflex acts, among these being the centers controlling respiration, coughing, sneezing, swallowing, vomiting, and others. In conclusion, it may be repeated that every part of the body influenced by will probably is supplied by nerves, which, in addition to the communication with ganglion-cells of the basal ganglia or spinal cord, are connected with some definite presiding cortical area, although our present knowledge of these intricate relations enables us to locate but few of the many controlling centers which undoubtedly exist. See LOCALIZATION, PHYSIOLOGY, and PSYCHOLOGY. G. A. PIERSOL.

Brain'ard, JOHN GARDINER CALKINS: poet; b. in New London, Conn., Oct. 21, 1796. He graduated at Yale in 1814. He published a volume of poems in 1825, and was for six years editor of the *Connecticut Mirror*. D. in New London, Sept. 26, 1828. See *Memoir of Brainard*, prefixed to his works, by J. G. Whittier, 1832.

Brain-coral: one of several species of massive actinoid coral in which the furrowed surface of the coral resembles the convolutions of the brain. "Over the curved surface of a live 'brain-stone' are stretched the soft organic parts of the coral, while in the superficial furrows lie the stomachs which

have a similar serpentine form to the convolutions in which they lie. Upon the surface of the brain-stone, arranged in lines, are found rows of mouths, each opening into that stomach or part of the stomach which lies just beneath them." (Fewkes, in *Standard Natural History.*)

DAVID S. JORDAN.

Braine, DANIEL LAURENCE: rear-admiral U. S. navy; b. in the city of New York, May 18, 1829; entered the navy as a midshipman May 30, 1846. In 1861–62 he commanded the steamer Monticello, taking part in the engagement with the battery at Sewell's Point, near Norfolk, Va., May 19, 1861, and in the capture of Forts Hatteras and Clark, N. C., Oct. 5 of the same year. Retired May 18, 1891.

Braine-le-Comte, brān'le-kōnt': a town of Belgium; province of Hainault; on the railway from Brussels to Valenciennes (see map of Holland and Belgium, ref. 11–D); has a church built about 1300, also cotton-mills and dye-works. Fine flax is raised in the vicinity. Pop. (1890) 776.

Brain'erd: city; capital of Crow Wing co., Minn. (for location of county, see map of Minnesota, ref. 6–D); on Northern Pacific R. R. and Brainerd and Northern, and on east bank of Mississippi river; 136 miles N. of St. Paul, 115 miles W. of Duluth; has 8 public-school buildings, 15 churches, mammoth shops of Northern Pacific R. R., water-works, electric lights, electric street railway, and immense saw-mills, now (1892) being constructed. The surrounding district is good farming land. Pop. (1880) 1,865; (1890) 5,703; (1900) 7,524.

EDITOR OF "TRIBUNE."

Brainerd, DAVID: missionary; b. in Haddam, Conn., Apr. 20, 1718. He entered Yale College in 1739, but was expelled in 1742 for an offense growing out of an excess of religious zeal. It is probable that his ardent evangelistic efforts were offensive to his college superiors. In 1743 he began his famous labors among the Indians in a village about halfway between Stockbridge, Mass., and Albany, N. Y. The year following he went among the Delawares in Pennsylvania, and afterward to Crossweeksung in New Jersey, where he had his most signal success. In the summer of 1747 he returned to Massachusetts in broken health, and died at Northampton, Oct. 9, 1747. Jonathan Edwards, to whose daughter he was engaged to be married, and at whose house he died, published a memoir of him in Boston, 1749; new edition, with his journals, by Sereno E. Dwight, in New Haven, 1822; best edition by Sherwood (New York, 1884).

Brainerd, JOHN: a younger brother of David Brainerd; b. at Haddam, Conn., Feb. 28, 1720; graduated at Yale College in 1746; and was for a time successor to his brother as missionary among the Indians in New Jersey. In 1757 he was settled at Newark, and in 1777 at Deerfield, N. J., where he died Mar. 18, 1781. See his *Life*, by Thomas Brainerd (Philadelphia, 1865).

Brainerd, THOMAS, D. D.: of the same stock as David and John Brainerd; b. at Leyden, N. Y., June 17, 1804; graduated at Andover Theological Seminary, Massachusetts, in 1831. From 1831 to 1833 he was pastor of the Fourth Presbyterian church in Cincinnati, O.; from 1833 to 1836 edited the *Cincinnati Journal* and *Youth's Magazine*; from 1837 till his death was pastor of the Pine Street church, Philadelphia. He was a leader of the New School party. He published in 1865 the *Life of John Brainerd*, etc. D. in Scranton, Pa., Aug. 21, 1866. See his *Life* by Mary Brainerd (Philadelphia, 1870).

Brain-fever: a popular name for CEREBRAL MENINGITIS (*q. v.*), a dangerous disease, characterized in its earlier stages by very high fever and intense headache, usually followed by delirium and death. Inflammation of the brain itself (encephalitis) is less common, but is even more fatal than the former. It is not easy to discriminate between the two during life. Cold applications to the head and mild but persistent derivative treatment are generally indicated.

Brain'tree: town; Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 3–I); on Old Colony R. R.; 10 miles S. of Boston. Here are manufactures of machinery, woolen goods, boots and shoes, paper, tacks, cordage, etc. Pop. (1880) 3,948; (1890) 4,848; (1900) 5,981.

Braize, or **Becker,** or **Porgy**: names applied in Great Britain to *Sparus pagrus*; a sea-fish allied to the American scup, and valued as food.

Brake: a thicket; a place overgrown with shrubs, brambles, or ferns. In the U. S. a thicket of canes is called a "canebrake." The name is also applied to *Pteris aquilina* and many other large ferns.

BRAKE: an instrument used to break flax or hemp; the hand or lever by which a pump is worked; a large harrow used in agriculture; a sharp bit or snaffle (of a bridle).

BRAKE: a machine attached to the wheels of heavy carriages and railroad cars, which, when pressed against the wheels, retards or stops their motion by friction. Patents have been obtained in the U. S. for numerous machines or inventions for this purpose. Among these are "steam car-brakes," in the use of which the friction is produced by steam-power, and the engineer of a locomotive applies the brakes by the turning of a cock; and the "Westinghouse air-brake," also controlled by the engineer, now extensively used. See RAILWAY EQUIPMENT under RAILWAYS.

Bra'ma: a genus of fishes of the family *Chætodontidæ* having the body very deep and compressed, a single elongated dorsal fin, and a forked tail, the points of which are widely divergent. The *Brama raii*, sometimes called *bream*, is common in the Mediterranean, and is highly esteemed for food.

Bramah, bray'ma, JOSEPH: machinist and inventor; b. in Stainborough, near Barnsley, Yorkshire, England, Apr. 13, 1749. He carried on business in London, and gained distinction by numerous and valuable inventions, among which are a safety lock, a hydrostatic press, and improvements in fire-engines and steam-engines. D. in Pimlico, London, Dec. 9, 1814.

Bramah's Press: See HYDROSTATIC PRESS.

Bramante: architect. See LAZZARI.

Brambling, Bramblefinch, or **Mountain Finch**: a small bird (*Fringilla montifringilla*); nearly allied to the chaffinch, than which it is rather larger. The predominant colors of the upper parts are black and brown, with white bands on the wings. The belly is white, and some of the wing-coverts are yellow. It breeds in the northern parts of Sweden and Norway, and visits England, Italy, and other countries as a winter bird of passage.

Bramhall, JOHN: Anglican prelate; b. at Bramhall Hall, Cheshire; baptized at Pontefract, Nov. 18, 1594; educated at Cambridge; B. A. 1612; became Bishop of Derry 1634; imitated Laud's policy of intolerance, which lost Ulster to the king and drove the bishop to take refuge in France; while in Paris engaged in a losing controversy with Hobbes on the question of freedom of the will; at the Restoration made Archbishop of Armagh 1661. D. at Armagh, June 25, 1663.

Brampton: town; capital of Peel co., Ontario, Canada (for location, see map of Ontario, ref. 4–D); situated at junction of Can. Pac. and Grand Trunk Railways; 21 miles W. of Toronto; has manufactures of flour, farming implements, gas-pipe, chandelier, pumps, etc., and a large trade. Pop. (1881) 2,920; (1891) 3,252.

EDITOR OF "CONSERVATOR."

Bram'well, Sir FREDERICK JOSEPH, Bart., D. C. L., F. R. S.: b. in London, Mar. 7, 1818. From his boyhood he evinced a great interest in mechanics. In 1834 he was apprenticed to John Hague, mechanical engineer, with whom he continued a few years as principal draftsman; in 1853 commenced business on his own account as a civil engineer; in 1856 was elected associate of the Institution of Civil Engineers, in 1862 to full membership; in 1867 was member of the council; in 1884–85 was president. From 1871 to 1875 he was president of the Society of Mechanical Engineers. In 1881 was knighted for his services in the promotion of technical education; in 1886 received the honorary degree of D. C. L. from Oxford; in 1889 he was created a baronet. Civilian member of Ordnance Committee since 1881. W. R. H.

Bran: the husk or outer covering of wheat, which in the process of flouring is separated from the fine flour. In 100 parts of bran there are of water, 13·1; albumen, 19·3; oil, 4·7; husk (with a little starch), 55·6; ash or saline matter, 7·3. Calico-printers use bran and warm water to remove coloring-matter from those parts of their goods which are not mordanted. Bran and the flour united—i. e. unbolted wheat flour—make a good bread, which is considered more digestible than that made of fine white flour. See FLOUR.

Branch (in botany): a part of any organ or member of the plant-body which has grown out from another similar organ or member. Thus we have root-branches and stem-branches, branches of leaves, branches of stamens, branches

of hairs, etc. Among the lower plants we find branching cells, branching threads, branching thallomes, etc. Popularly the term is often erroneously restricted to stem-branches.

In systematic botany *branch* is a great division of the vegetable kingdom; thus we speak of the branch of *Protophytes*, the branch of *Bryophytes*, etc. See VEGETABLE KINGDOM.

CHARLES E. BESSEY.

Branch, JOHN: b. at Halifax, N. C., Nov. 4, 1782; graduated at the University of North Carolina in 1801; became a lawyer; was made a judge of the superior court; Governor of North Carolina (1817–20); U. S. Senator (1823–29); Secretary of the Navy (1829–31); member of Congress (1831–33); Governor of Florida Territory (1844–45); besides holding other important offices. D. at Edgefield, N. C., Jan. 4, 1863.

Branch, LAWRENCE O'BRIEN: son of the preceding; b. in Halifax co., N. C., July 7, 1820; graduated at Princeton in 1838; was a Democratic representative in Congress from 1855 to 1861. He was made a brigadier-general in the Confederate army in 1861, and was killed at Antietam, Sept. 17, 1862.

Branchiop'oda [from Gr. *βράγχια*, gills + *πούς, ποδός*, foot]: a sub-order of entomostracous *Crustacea*, deriving their name from the peculiarity of having the gills, which are numerous, attached to the feet. They are small, many of them almost microscopic, and abound in stagnant fresh waters. A few are found in brine pools. They possess distinctly segmented bodies, and have numerous pairs of flattened swimming-feet. The carapace is flat and shield-shaped, or more frequently takes the form of a bivalve shell. They are enormously reproductive by parthenogenesis. Revised by D. S. JORDAN.

Branchios'toma [from Gr. *βράγχια*, gills + *στόμα*, mouth]: the lancelets; the only genus of the vertebrate class LEPTOCARDII (*q. v.*). The name *Branchiostoma* is prior to that of *Amphioxus*, and should be used rather than the latter.

Brand, Sir HENRY: See HAMPDEN, VISCOUNT.

Brande, WILLIAM THOMAS, F. R. S.: chemist; b. in London, England, Feb. 11, 1788. He lectured with success on chemistry at the Royal Institution, and filled for many years an important office in the mint. Among his works are a *Dictionary of Science, Literature, and Art* (1842, n. e. 1875) and a *Manual of Chemistry*. D. Feb. 11, 1866.

Brandeis, FREDERICK: See the Appendix.

Bran'denburg: the most important province of Prussia, and that which formed the nucleus of the Prussian kingdom. It corresponds nearly to the old *Mark* of Brandenburg, and has an area of 15,376 sq. miles. It is mostly a level plain which has but little elevation above the sea. It contains numerous lakes, is intersected by the Oder, and also drained by the Warthe, the Spree, the Havel, and the Elbe, which latter forms part of its W. boundary. The soil is sandy and moderately fertile. The province is traversed by several canals and railways. It has extensive manufactures of cotton, wool, linen, silk, paper, leather, sugar, etc. The chief towns are Potsdam, Königsberg, and Frankfort-on-the-Oder. The inhabitants are mostly Protestants. It is divided into two regencies (*Regierungsbegirke*) and thirty-three circles. This country was conquered by Charlemagne in 789 A. D. The first Margrave of Brandenburg was Albert the Bear, who is called the founder of the house of Brandenburg. He began to reign in 1134. Early in the fifteenth century the margrave became an elector of the German empire, and took the title of Elector of Brandenburg. Frederick William, who became elector in 1640, added the duchy of Prussia and part of Pomerania to his dominions, and his son took the title of King of Prussia in 1701. Pop. (1895) 2,821,695.

Brandenburg (anc. *Brennaborch* or *Brennabor*): a town of Prussia; in province of same name; on both sides of the river Havel, and on the Berlin and Magdeburg Railway; 38 miles by rail W. S. W. of Berlin (see map of German Empire, ref. 3–F). It is inclosed by walls, and divided by the river into the old and new town, between which, on an island, is a quarter called "Venice," containing a castle and a mediæval cathedral. The town has a riding academy, a gymnasium, a Realschule, and a public library; also manufactures of woolen and linen goods, hosiery, paper, leather, etc. Pop. (1880) 28,685; (1890) 37,823.

Brandenburg, New: a town of Mecklenburg-Strelitz; near the N. end of Tollensee; 18 miles N. N. E. of Strelitz and 53 miles W. N. W. of Stettin (see map of German Empire, ref. 2–G). It has wide and regular streets, and is said to be the most beautiful town in Mecklenburg-Strelitz. It has a grand-ducal palace, and manufactures of cotton and woolen goods, damasks, paper, and chemical products. Pop. (1890) 9,323.

Bran'des, CARL EDVARD COHEN: Danish journalist, politician, and dramatic writer; b. in Copenhagen, Oct. 21, 1847. In political and literary principles he is in full sympathy with his brother, GEORG BRANDES (*q. v.*). Of his plays may be mentioned *Et Besøg* (A Visit, 1882); *En Forlovelse* (A Betrothal, 1884); *Kærlighed* (Love, 1887); *En Politiker* (A Politician, 1889). He has published two works on the drama: *Dansk Skuespilkunst* (Danish Dramatic Art, 1880) and *Fremmed Skuespilkunst* (Foreign Dramatic Art, 1881).

G. L. KITTREDGE.

Brandes, GEORG MORRIS COHEN: Danish critic and literary historian; b. in Copenhagen, Feb. 4, 1842. Brandes is a radical in religion and politics, and the energy with which he proclaimed his views in his lectures and writings led to his withdrawing from Denmark and settling in Berlin (1877). In 1883 he was induced to return to Copenhagen by an association of private persons, who assured him a yearly salary of 4,000 crowns for ten years as public lecturer on belles-lettres. To his influence is ascribed in great part the "realistic" movement in recent Danish literature. His chief work, *Hovedstrømninger i det 19de Aarhundredes Literatur* (The Main Currents in the Literature of the Nineteenth Century), appeared in six volumes, 1872–90. Other works of importance are: *Kritiker og Portrætter* (Critiques and Portraits, 1870; 2d ed. 1885); *Danske Digter* (Danish Poets, 1877); *Moderne Geister* (1882; translated by R. B. Anderson as Eminent Authors of the Nineteenth Century); *Mennesker og Værker i nyere europæisk Literatur* (Men and Works in Modern European Literature, 1883); *Det moderne Gjennembruds Mænd* (Men of the Modern Awakening, 1883; 2d ed. 1891); *Berlin som tysk Rigshovedsted* (Berlin as Imperial Capital, 1884–85); *Ludvig Holberg* (1885); *Indtryk fra Polen* (Impressions of Poland, 1888); *Indtryk fra Rusland* (Impressions of Russia, 1888); *Essays* (2 vols., 1889).

G. L. KITTREDGE.

Branding: a mode of punishment formerly practiced in Greece and Rome upon slaves and convicts. Under Constantine the face was protected from such disfigurement. It was a mark of degradation provided for in the canon law, and in France galley-slaves could be branded down to 1832. In England vagabonds, gypsies, and brawlers might be burnt in the cheek or forehead from the days of Edward VI. to 1636. From the time of Henry VII. this penalty was inflicted in the case of all clergyable offenses (see BENEFIT OF CLERGY), but it was abolished by an act of Parliament in 1822. Branding had then become obsolete, except in the case of deserters from the army, who were marked with the letter D, not by a hot iron, but by ink or gunpowder. By the British Mutiny Act of 1858 it is enacted that the court martial, in addition to any other punishment, may order the offender to be marked on the left side, 2 inches below the armpit, with the letter D, such letter to be not less than 1 inch long, but the practice was abolished in 1879.

Bran'dis, CHRISTIAN AUGUST: professor at Bonn University; b. at Hildesheim, in Hanover, Feb. 15, 1790; son of Joachim Dietrich Brandis, a celebrated physician. He edited, with Emmanuel Bekker, a critical edition of *Aristotle*. He was the secretary of King Otho in Greece. His main work was a history of the Greek and Roman philosophies (2 vols., 1835–44; the third volume appeared in 1860–66), and a *History of the Development of Greek Philosophy* (2 vols., 1862–64). D. in Bonn, July 24, 1867. Cf. Bursian's *Geschichte der Classischen Philologie in Deutschland*, p. 917 ff. (Munich, 1883).

Brandis, Sir DIETRICH, Ph. D.: forester; b. in Bonn, Germany, Mar. 31, 1824; took his degree as doctor of philosophy at Bonn in 1848; appointed superintendent of forests in Pegu 1856; spent his life from that time to 1883, when he retired, in the care of the forests in the British possessions in India and Burma. He wrote numerous important monographs on the forests of India, and organized schools there for the instruction of the natives in their preservation. In 1887 he was made knight commander of the order of the Indian Empire.

Brandis, JOHANNES: metrologist; first decipherer of the Cypriote inscriptions; b. in Bonn, Germany, Dec. 14, 1830; d. in Linz, July 8, 1873. Author of *Das Münz-Mass- au. Gewichtswesen in Vorderasien bis auf Alexander d. Gr.* (Berlin, 1866). See E. Curtius, *Alterthum u. Gegenwart*.

Brandon: town; province of Manitoba, Canada (for location, see map of Canada, ref. 9–H); on Can. Pac. and N. P. and Man. Rys. It is surrounded by prairies, and the chief industries are stock-raising and farming. Pop. (1891) 3,778.

Brandon: township; Rutland co., Vt. (for location of county, see map of Vermont, ref. 7–B); on Cent. Vermont R. R.; near Otter Creek; 16 miles N. N. W. of Rutland. It has a graded academy, two parks, and manufactures of iron castings, carriages, flour, lime, lumber, paint, marble, etc. An elegant hotel was built in 1892. Pop. (1880) 3,280; (1890) 3,310; (1900) 2,759. EDITOR OF "UNION."

Brandt, HERMANN CARL GEORGE, M. A.: philologist; b. in Vilsen, Germany, Dec. 15, 1850; graduated at Hamilton College (1872); studied in Auburn Theological Seminary, and in Göttingen, Strassburg, and Freiburg, Germany. Instructor in Hamilton College (1874–76); associate professor in Johns Hopkins University; Professor of French, German, and Philology in Hamilton College (since 1882). Besides contributions to periodicals and to journals of societies, he has published an edition of Lessing's *Nathan der Weise* (1879); *German Grammar for High Schools and Colleges* (1884; 6th ed. 1892); *German Reader* (1889; 3d ed. 1892).

Brandy [abbreviation of *brandewine*, *brandy-wine*, from Dutch *brandewijn*, lit., burnt wine; so Germ. *Branntwein*]: the liquid obtained by distilling the fermented juice of the grape. It is generally manufactured from white and pale-red wines. White wine yields a richer brandy than red wine, as it contains more of the essential oil of grapes, to which the flavor of the brandy is due. The peculiarities of the wine pass to a certain extent to the brandy. Wines which taste of the soil communicate the same taste, the *goût de terre*, to the brandy distilled from them. Wines of Selleul in Dauphiny yield a brandy having the odor and taste of Florentine iris; those in St.-Pierre in Vivarais give a spirit which smells of violet. The stronger the wine the greater the yield. The wines of the south of Europe, being richest in alcohol, yield the most brandy. The usual yield is from 100 to 150 gal. from 1,000 gal. of wine. The best brandy, that distilled in the department of Charente, known as *cognac* and *armagnac* (names of towns), is made from very choice wines. Inferior brandies are distilled from dark-red wines of France, Spain, and Portugal; also from the fermented *marc* or refuse of the grape, and from the lees of wine and the scrapings of the casks. The catawba brandy, made from the lees of catawba wine in Ohio, is a very good brandy, though it has the peculiar flavor of this wine. The brandy distilled from catawba marc has an unpleasant taste, and contains much fusel oil. The wines of California yield brandy abundantly and of good quality. Various other liquors are known as brandies, such as "cider brandy" or "applejack," distilled from cider or from the "pomace" or refuse ground apples from the cider-press. This, when new, is a harsh, fiery liquor, but is much improved by age. "Peach brandy" is extensively made from the pulp of ripe peaches in some of the Southern States.

Fresh brandy is colorless, and remains so in glass vessels. The sherry-wine color which brandy generally exhibits is either derived from the cask or from burnt sugar purposely added. Brandy is almost pure alcohol and water, the percentage of alcohol varying from 48 to 56 per cent. It has an agreeable vinous, aromatic odor, and a peculiar well-known taste. Its specific gravity is from 0·902 to 0·941. Besides alcohol and water it contains the volatile oil of the wine; a little acetic acid, acetic ether, aldehyde, etc., together with the coloring-matter and tannic acid derived from the cask.

Brandy for medical use should be free from disagreeable odor and taste, and should be at least four years old. The advantage of keeping brandy a few years in the cask is due to the oxidation and removal of the ranker fusel oils, and to the precipitation of possible traces of copper or lead derived from the still by the tannic acid of the cask.

The greater part of the brandy and cognac of commerce is made from alcohol derived from Indian corn—rectified and deodorized whisky. This is diluted to proof, 50 per cent., and flavored with acetic ether, œnanthic ether, oil of grapes, argol, and tannin, and colored with burnt sugar. It is improved by the addition of a little real brandy, and by keeping it a few years in the cask. The following recipe for cognac brandy is taken from the circular of a New York firm, whose business it is to supply the necessary materials to the manufactures of wines and liquors: "To 40 gal. of spirit, double distilled and free from odor, and reduced to proof with distilled water, add $\frac{1}{6}$ oz. of our best cognac oil distilled from grapes, $1\frac{1}{2}$ pt. burnt-sugar coloring, and $\frac{1}{4}$ oz. of tannin." At the prices charged for the materials this choice brandy would cost the compounder $1.25 per gal., and would sell at from $10 to $25.

Brandy is an esteemed cordial and stomachic. It is frequently given in the sinking stages of low fevers and to convalescents, and to check diarrhœa. C. F. CHANDLER.

Brandy Station: on railroad; Culpeper co., Va. (for location, see map of Virginia, ref. 5–G); 56 miles S. W. of Alexandria; the scene of conflicts between the Federal and Confederate forces on Aug. 20, 1862, June 9, Sept. 13, and Oct. 11, 1863. Pop. (1880) 201.

Brandywine Creek: formed by East and West branches, which unite in Chester co., Pa. It flows southeastward into the State of Delaware, and enters the Christiana creek near Wilmington. It furnishes water-power for numerous mills. On its banks, in Chester County, the British general Howe defeated Washington, Sept. 11, 1777.

Branford: borough; New Haven co., Conn. (for location, see map of Connecticut, ref. 11–G); in Branford township; on N. Y. and N. H. R. R. (Shore Line Div.), and on Long Island Sound, 8 miles E. S. E. of New Haven. The harbor admits vessels of 300 tons. Its principal industries are agriculture, quarrying, and the manufacture of locks and malleable-iron fittings; is a place of summer resort. The Blackstone Memorial Library (cost, $300,000) was opened June, 1896. Pop. of township (1880) 3,047; (1890) 4,460; of borough (1900) 2,473.

Branks: an instrument formerly used in England and Scotland for the punishment of scolding women. It was of various forms, but consisted essentially of a bridle of iron or leather, to which was attached a piece of iron which held the tongue firmly. It is asserted that in some obscure places in England its use came down to quite recent times.

Bran'nan, JOHN MILTON: soldier; b. in the District of Columbia in 1819; graduated at West Point in 1841; colonel Fourth Artillery Mar. 15, 1881; Sept. 28, 1861, brigadier-general U. S. volunteers. He served in suppressing Canada border disturbances 1841–42; in the war with Mexico 1846–48; engaged at Vera Cruz, Cerro Gordo, La Hoya, Contreras, and Churubusco (brevet captain), and the city of Mexico (severely wounded at Belen Gate); adjutant First Artillery 1847–54; in Florida hostilities 1856–58. In the civil war he served in command of the department of Key West, Fla., 1862; in the department of the South 1862–63; on expedition to St. John's River, Fla. (brevet lieutenant-colonel); at Pocotaligo, S. C., and several minor actions; in Tennessee campaign 1863; engaged at Hoover's Gap, Tullahoma, Elk river, and Chickamauga (brevet colonel); as chief of artillery department of the Cumberland 1863–65; engaged at Missionary Ridge; in the various operations of the Atlanta campaign 1864 (brevet brigadier-general); in command of the district of Savannah, and temporarily of department of Georgia 1865–66. Brevet major-general Mar. 13, 1865, for meritorious services in the field. Retired Apr. 19, 1882. D. in New York city, Dec. 16, 1892.

Brant, JOSEPH THAYENDANEGA: a Mohawk Indian chief; b. in 1742; sent to the Indian school which grew into Dartmouth College; fought in the British army in the war of the Revolution; distinguished himself in Col. Leger's expedition against Fort Stanwix and at Oriskany in 1799. He prepared a version of the *Gospel of St. Mark* in Mohawk, which was published with the Mohawk *Book of Common Prayer* in 1787. D. Nov. 24, 1807. A colossal statue erected in memory of him was unveiled at Brantford, Ontario, Oct. 13, 1886. See W. L. Stone's *Life of Brant* (1838).

Brant, braant, SEBASTIAN: German poet; b. at Strassburg in 1458. He was appointed an imperial counselor by the Emperor Maximilian. He wrote a satirical poem entitled *Das Narrenschiff* (The Ship of Fools, 1494), a Latin translation of which (1497) made Brant famous throughout Europe. He held up to ridicule the vices and follies of his time, although without direct religious intention. Alexander Barclay made an English translation of it (London, 1509; best ed. by T. H. Jamieson, 1874, 2 vols.). Though not possessed of great poetical gifts he was one of the most influential authors of his time who may be classed among the forerunners of the literature of the Reformation. D. in Strassburg, May 10, 1521. See Zarncke's excellent edition of the *Narrenschiff* (Leipzig, 1854). Revised by JULIUS GOEBEL.

Brant'ford: a city of Ontario, Dominion of Canada; capital of Brant County; on Grand river and the Grand

Trunk and the Brantford, Waterloo and Lake Erie Rys.; 24 miles W. S. W. of Hamilton and 84 miles S. E. of Goderich (see map of Ontario, ref. 5–D). Here are large railway machine-shops and engine-houses, and manufactures of brass and iron castings, and farming implements; center of magnificent agricultural country. Pop. (1881) 9,616; (1891) 12,753. EDITOR OF "EXPOSITOR."

Brant Goose: See BARNACLE GOOSE.

Brantôme, brăñ'tōm', PIERRE DE BOURDEILLES, Abbé and Seigneur de: French historian; b. of a noble family at Périgord about 1540. He served in the army in several campaigns, and gained the favor of Charles IX., at whose court he passed some years. He wrote *Les Vies des Hommes Illustres et grands Capitaines*, etc., a work of high reputation. His style is charming, vivacious, *naïf*, sometimes descending to gossip, and sometimes rising to eloquence. Another work of his is *Vies des Dames galantes*. D. July 15, 1614.

Bra'shear City, now MORGAN CITY, La. (*q. v.*).

Bras'idas (in Gr. Βρασίδας): a Spartan general in the Peloponnesian war which began in 431 B.C. He relieved Megara in 424, and gained several victories over the Athenians. He was killed in 422 B.C. at Amphipolis, where he was opposed to the Athenian general Cleon. His memory was long honored by annual sacrifices.

Brass [O. Eng. *bræs*; origin obscure]: an important alloy of copper and zinc, extensively used for a great variety of purposes in the arts on account of the ease of working and its acceptable color. It is made (1) by fusing in crucibles copper and zinc, placing the latter below; considerable of the zinc is lost during the operation, owing to its volatility; (2) by heating copper in grains or sheets with oxide of zinc and charcoal; (3) the ancient method, by heating copper with calamine, a native ore of zinc, and charcoal. Different varieties of brass adapted to special uses are obtained by varying the proportions of the component metals. Common brass for ordinary purposes, which is cast in molds and finished by turning and filing, contains about 70 parts of copper and 30 of zinc. *Muntz* or *yellow metal*, which is rolled into sheets and used for sheathing ships, contains from 50 to 63 parts of copper and 37 to 50 of zinc. *Tombac*, *pinchbeck*, *prince's metal*, *Mannheim gold*, *mosaic gold*, *similör*, etc., contain 80 parts or more of copper to 20 or less of zinc. A little lead diminishes the ductility, while tin increases the hardness of brass. Articles of brass are cleaned by immersion in *aqua fortis* (nitric acid), and lacquered with shellac in alcohol. Brass is harder than copper, is malleable and ductile, and can be readily cast, rolled, stamped, and turned in the lathe. Next to iron in its different forms, it is the most important metal used in the arts.

Brasses, Monumental: sheets or plates of brass, upon which are engraved figures of men and women, in attempted portraiture of the dead, accompanied by heraldic devices, etc. Many still exist in England, which date from the latter part of the Middle Ages; some in their original position, let into the floor or wall, and others preserved in churches and museums. They are valuable for the study of mediæval art, of costume, arms, and heraldry. RUSSELL STURGIS.

Brasseur de Bourbourg, brăs'sẽr' de-boor' boor', CHARLES ÉTIENNE: a French abbé; b. in Bourbourg, Sept. 8, 1814; lived for a long time and traveled extensively in North and Central America; held various half-ecclesiastical positions in Mexico, and published *Histoire de Canada* (2 vols., 1851); *Histoire des nations civilisées du Mexique et de l'Amérique Centrale* (4 vols., 1857–59); *Gramatica de la lengua Quiche* (1862); and others relating to the Mayas civilization. D. in Nice, Jan. 8, 1874.

Brassey, THOMAS: railroad contractor; b. near Chester, England, Nov. 7, 1805; apprenticed to a land-surveyor; obtained in 1834 his first contract through George Stephenson to build a viaduct between Stafford and Wolverhampton; built the Great Northern Railway, the Grand Trunk in Canada, besides lines in Italy, the Crimea, Denmark, the Argentine Republic, France, Australia, and India. His operations were on an enormous scale, and he accumulated an estate valued at $35,000,000. D. at Hastings, Dec. 8, 1870. See his *Life*, by A. Helps (1872).—His son, Lord THOMAS: b. in Stafford in 1836; educated at Rugby and at University College, Oxford; sat in the House of Commons from 1865 to 1886; an admiralty lord; was made baron in the latter year. He greatly improved the naval administration, about which he published valuable treatises, and was an enthusiastic yachtsman, visiting all parts of the world in the Sunbeam. His wife, a granddaughter of the Earl of Essex, published several narratives of these voyages, and died Sept. 14, 1887, on her trip home from Australia, and was buried at sea.

Bras'sica: a genus of herbaceous plants of the family *Cruciferæ*; distinguished by a round and tapering two-valved pod (*silique*), globose seeds in one row in each valve, and conduplicate cotyledons. The species of this genus, which comprises the cabbage, cauliflower, broccoli, turnip, rape, etc., are natives of the temperate and cold regions of Europe and Asia. The species just named are extensively cultivated in gardens and fields. See CABBAGE and TURNIP.

Brathwaite, RICHARD (1588–1673): poet; educated at Oxford and Cambridge. Wrote *The Golden Fleece* (1611); *The Poet's Willow* (1614), pastorals; a collection of satirical verses; and *Barnabee's Journal* in doggerel and Latin rhymes, which came to its eleventh edition in 1876. His *Life* is prefixed to the ninth edition in 1818.

Brattleboro: town; Windham co., Vt. (for location of county, see map of Vermont, ref. 9–C); on Cent. Vermont and Vermont Val. R. Rs., and on Connecticut river; 60 miles N. of Springfield, Mass. It is the seat of the Vermont Asylum for the Insane, and the trade-center of Southeastern Vermont, and has the Brooks Library, bestowed by George J. Brooks in 1887. The Estey Organ Company is the leading manufacturing establishment. West Brattleboro has an academy. The town is noted for its beautiful natural scenery. Pop. of township (1880) 5,880, including 4,471 in village; (1890) 6,862; village, 5,467; (1900) 6,640; village, 5,297. EDITOR OF "PHŒNIX."

Brauns'berg: a town of Prussia; province of East Prussia; on the river Passarge; about 35 miles S. W. of Königsberg (see map of German Empire, ref. 2–J). It has manufactures of woolen and linen goods, and an active trade. Pop. (1890) 10,851.

Bravo-Murillo, braa'vō-moo-reel'yō, JUAN GONZALEZ: a Spanish statesman; b. in province of Badajoz, June, 1803; became in 1847 minister of justice; then of public instruction and of the finances. In 1851 he became the head of a new cabinet, in which position he followed a reactionary policy. In Apr., 1868, he again became president of the cabinet. On the expulsion of the queen in 1868 he followed her to Bayonne. D. in Madrid, Jan. 11, 1873.

Brawn: a preparation of food obtained from the flesh of the wild boar or of swine. After removing the bones and squeezing out much of the fat, the flesh is rolled and bound with a string. It is then successively stewed and baked with various preparations of herbs, wines, and spices, after which it is steeped in a solution of brine. Mock brawn is the flesh of the pig's head and feet cut into small pieces, boiled, pickled, and finally pressed into the shape of a collar. The term also denotes the muscular part of the human body.

Braxton, CARTER: planter; b. in Newington, Va., Sept. 10, 1736. He graduated at William and Mary College in 1756; was elected to the Continental Congress in 1775; signed the Declaration of Independence. D. in Richmond, Va., Oct. 10, 1797.

Bray (anc. *Bibracte*): a small parish in Berkshire, England; 22½ miles W. of London. Pop. 5,750. Famous for its vicar, who changed his religion three times during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, that he might "live and die the vicar of Bray."

Bray [in ancient Gaelic *Bray* meant marsh]: a fashionable watering-place of Ireland; at the mouth of the river Bray; 12 miles S. E. of Dublin; partly in the county of Dublin, but chiefly in the county of Wicklow (see map of Ireland, ref. 9–J); connected by 2 railways with Dublin; has 2 hotels, 6 churches and chapels, a bank, a court-house, a dispensary, a savings-bank, a newspaper, and some trade by sea. Pop. 6,600.

Brazen Sea: a great bowl of cast metal, probably of copper or bronze, which stood in the priests' court in Solomon's temple. (1 Kings vii. 23–26; 2 Chr. iv. 2–5; Josephus's *Antiquities*, viii. 3, 5). Its purpose was to hold water for the ablutions of the priests—e.g. their hands and feet (Ex. xxx. 18, *sqq.*). The brazen sea stood upon twelve oxen, the latter facing outward. The exact shape and size of the brazen sea are not known, but the best commentators think its contents exceeded 11,000 wine gal. It was broken up by the Chaldæans at the destruction of the temple, and the pieces taken to Babylon (2 Kings xxv. 13; Jer. lii. 17).

Brazen Serpent: the name of a copper or bronze figure of a serpent erected by Moses during the journey of the Israelites from Egypt to the land of promise, for the miraculous cure of those who had been bitten by venomous serpents (Num. xxi. 5, *sqq.*). This brazen serpent became an object of superstitious worship among the Israelites, and was consequently destroyed by Hezekiah (2 Kings xviii. 4). In accordance with John iii. 14, the brazen serpent is regarded as a type of Christ.

Brazil, United States of (Port. pron. braă-zeel'): the largest country of South America, occupying about two-fifths of the continent in the central and eastern parts; bounded E. by the Atlantic, and N. W. and S. by all the other South American countries except Chili. Length from N. to S. over 2,600 miles; greatest breadth, probably 2,700 miles. The extreme latitudes claimed are 5° 10′ N. and 33° 45′ S.; the extreme longitudes, 34° 40′ and about 74° W. Area by official figures (1892), 3,209,878 sq. miles; but this includes large tracts claimed by Venezuela, Colombia, and Bolivia. The northern and a part of the western boundaries are all uncertain and mostly in unexplored regions.

Topography.—Three main divisions are at once apparent: 1, the Brazilian plateau, with the coast and central mountains; 2, the great depressions of the Amazon and Paraguay, meeting in the center of the continent, and framing the first division on the northern and western sides; 3, a strip of land N. of the Amazon, forming a part of the Guiana plateau. This view of the surface will be clear if we imagine the continent to sink six or seven hundred feet; the ocean would then fill the Amazonian and Paraguayan depressions, leaving Central and Eastern Brazil as a great island, while Guiana would be another island to the N.

Mountains.—The Brazilian mountains border the southeastern edge of the first division, sending branches into the interior. Structurally the coast range begins in Uruguay, but it only takes a decidedly mountainous form from about lat. 29° 30′ S.; thence it follows the coast northeastward in a strip 50 miles wide, rapidly broadening from lat. 24° S., until, near Rio de Janeiro, it attains its extreme width of about 250 miles. Here there are two well-marked parallel chains: the Serra do Mar, ending on the coast near the mouth of the Parahyba, and the Serra da Mantiqueira; the latter range again divides N. of the Parahyba, and the branch nearest the coast dies out near Bahia; the other and higher one skirts the eastern side of the São Francisco valley to where that river turns eastward. Beyond the São Francisco there are isolated low ranges nearly to Cape São Roque. The average height of the coast range is perhaps 5,000 feet. Itatiaia, in the Mantiqueira sub-chain, attains 8,900 feet, and is probably the highest point in Brazil; the Organ Mountains in the Serra do Mar, at the head of Rio de Janeiro Bay, have peaks over 7,000 feet high. The scenery, especially on the coast from Cape Frio southward, is indescribably grand and beautiful.

The Serra dos Vertentes is a spur or ridge stretching westward from the Mantiqueira range and separating the head-waters of the Paraná from those of the São Francisco. Two mountain-chains extend northward from it, over the plateau: the Serra da Canastra between the São Francisco and Tocantins river systems, ending about lat. 10° S., and the Goyaz or Pyrineos Mountains, between the Tocantins and Araguaya. This latter range is of unknown northward extent; it contains peaks said to be over 7,000 feet high. The above enumeration includes all the true mountains in Brazil.

The Brazilian Plateau.—This extends from the mountains to the great river-depressions, and is separated from the northeastern coast only by a strip of low land 30 to 50 miles wide; it is partly divided by the Canastra, Goyaz, and Vertentes ranges. The average elevation is probably about 2,700 feet higher toward the mountains, falling gently northward to 700 or 800 feet as it approaches the Amazon. The surface is sometimes flat, oftener hilly or rolling. Nearly everywhere the outer edges are cut down abruptly, appearing from below like mountains, and the plateau itself is excavated by numerous deep river-valleys, the sides of which present similar escarpments. The bluffs are commonly but wrongly represented on our maps as mountain-ranges, seaming all Central and Eastern Brazil.

The Paraguayan Depression.—The Upper Paraguay flows through a vast swampy plain, the Brazilian portion of which is some 250 miles wide, and only 400 feet above the sea. (See PARAGUAY.) There are some isolated hills, the Serra dos Dourados, skirting the west shore of the river on the borders of Bolivia, and a similar chain crosses the river about lat. 21° S., passing into Paragnay.

The Amazonian Depression.—Along the lower Amazon this is a plain from 50 to 150 miles wide; above the Rio Negro and Madeira it spreads out so as to include, probably, all Northwestern Brazil. This upper portion, so far as we know, is a perfectly flat expanse, nowhere more than 200 or 300 feet above sea-level; the flood-plain itself is in parts 150 miles or more wide, narrowing below. The Brazilian plateau does not appear to be continued beyond the Madeira, and the Amazonian depression, following that river and the Madeira, is hardly separated from the Paraguayan swamps.

The Guiana Plateau.—The Brazilian portion stretches from the Rio Negro to the Atlantic, its southern edges appearing as the "table-topped hills" of Almeyrim and Velha Pobre, 20 miles N. of the Amazon. These are about 2,000 feet high, nearly flat above, and resemble the Brazilian plateau in structure and appearance.

Islands.—The only outlying islands are the volcanic rocks of Trindade and Fernando de Noronha, with the neighboring islets. Fernando de Noronha is used as a penal settlement; the others are desert. The Abrolhas and Rocas are dangerous reefs near the coast, the former with a few inhabitants. Santa Catharina, São Sebastião, and many smaller islands on the southeastern coast, and Maranhão on the northeast, are high islands separated from the mainland only by narrow channels. Marajó, at the month of the Amazon, is essentially an alluvial formation, and there are numerous low islands in the river estuary.

Harbors.—The southeastern coast has many excellent landlocked harbors, as well as the channels sheltered by São Sebastião and Santa Catharina islands. The whole northeastern coast is essentially without harbors, except the Bay of Maranhão and the Pará estuary.

Rivers.—The Amazon and its tributaries form the finest system of navigable rivers in the world. Ocean-steamers can ascend to Peru, and smaller ones far beyond. The Purús, Içá, and most of the upper Brazilian affluents are unobstructed almost to their sources; the Madeira and Negro have rapids in their middle courses, but are navigable above; the Tapajós, Xingú, and many smaller rivers and secondary branches admit steam-navigation in their lower courses. The Tocantins has an open channel for about 150 miles; above it is obstructed by rapids, but small steamers now ply on the upper Tocantins and Araguaya. The most important eastern river of Brazil is the São Francisco, about 1,800 miles long. Steamers ascend to the Paulo Affonso cataract, 148 miles; and above the falls a free course of 1,000 miles is now navigated. The Urugnay and upper Paraná, where they border on Brazil, are more or less obstructed; but the Paraná, with its Brazilian tributaries, promises to be of great importance in the future. Large steamers ascend the Paraguay to Corumbá (lat. 19° S.), and beyond that the river and its tributaries are navigated by smaller vessels. These channels form the principal outlet of Eastern Brazil.

Lakes.—Brazil has no large interior lakes. The Lagoa dos Patos and the Lagoa Merim of the S. are large, freshwater estuaries, with a narrow outlet, the Rio Grande do Sul. These lakes and the river Guahyba and its branches form an internal waterway of great value for this part of Brazil. The numerous lakes of the Amazonian and Paraguayan flood-lands are shallow but sometimes quite large. There are numerous lagoons along the coast.

Climate.—Generally speaking, Brazil has a moderately warm and very healthful climate. The heat is nowhere excessive, being modified by the regular winds and the elevation of the plateau. The warmest region is in the Paraguayan depression. On the Amazon the temperature rarely rises above 93° F. in the hottest hours, and the nights are cool. The mountain region is moderately warm on the coast, temperate at greater elevations, and the southern extremity of Brazil has a mild winter from May to September, with occasional slight snow. Rains are abundant nearly everywhere, but especially on the Amazon and in the coast range, where the dry season is only marked by less plentiful showers. The great plateau has perhaps the most delightful climate in the world. Here the months from May to October are cool, and nearly or quite rainless. A portion of Northeastern Brazil (Ceará, Rio Grande do Norte, Parahyba, and portions of Maranhão, Pernambuco, and Bahia) is less abundantly watered, and is subject to periodical droughts, sometimes lasting several years; that of 1877–80 depopu-

lated a large region, and caused the death of 500,000 persons.

Yellow fever appears in some of the coast cities almost every year during the warmer months; but severe epidemics of it are only occasional, principally at Santos and Rio de Janeiro. Malarial fevers are local and seldom severe.

Distribution of Plant Life.—The warm and damp Amazonian depression is covered with a thick tropical forest, with long extensions lining the affluents. Eastward the forest land is narrower and much broken by open lands. The coast range forms another forest region, the higher portions southward being composed of *Araucaria* pines. There is a third large forest region on the upper Paraná, and a coast strip from Pernambuco southward. The southern end of Brazil, from lat 30° S., is mostly open grassland. The Brazilian and Guiana plateaus are partly open, partly covered with a peculiar scattered growth of low trees, bushes, and grass called *cerrado*; but there are numberless small patches of forest on the hillsides, about streams and springs, and lining the ravines. The Paraguayan swamps are generally open, with a rank growth of grass.

Geology.—The coast range and interior mountains are formed of very ancient metamorphic rocks and granites. There are no recent volcanoes, but ancient volcanic rocks have been reported. The great plateau is composed of nearly horizontal strata, among which the Devonian, Carboniferous, and Cretaceous seem to be most widely spread. These reappear on the Amazon and in Southern Brazil. In the Amazonian depression these older rocks are covered with sandstones and clays, partly, at least, of later Tertiary age. Immense quantities of bones of quaternary animals have been found in caves in the southeastern portion of the plateau.

Minerals.—For more than a century Brazil was the principal gold and diamond producing country of the world. The most productive regions for both were Minas Geraes, Matto Grosso, Goyaz, and Bahia. The gold was obtained from surface washings, which are now nearly abandoned; but several quartz mines are worked productively in Minas Geraes and elsewhere. The lowering of the market price for diamonds, caused by the discovery of South African mines, made the Brazilian washings unlucrative. They are now worked only on a small scale. It is the opinion of experts that the riches of Brazil, in both gold and diamonds, are far from being exhausted. Silver, copper, and lead ores have been reported, but not in paying quantities; the immense and very rich deposits of iron are as yet nearly useless, owing to the lack of coal. Coal occurs in Southern Brazil, and is mined on a small scale, but the quality is inferior. Rock crystals, or "Brazilian pebbles," are exported from Goyaz and Bahia, and agate, carnelians, and petrified wood from Rio Grande do Sul.

Fauna and Flora.—These are both extremely rich, Brazil being the most characteristic portion of the great neo-tropical region. (See AMERICA, SOUTH.) Among the important forest products may be mentioned rubber (Amazon and Ceará), Brazil-nuts (Amazon and Maranhão), sarsaparilla, Tonka beans, various vegetable oils, and drugs. There are a vast number of beautiful cabinet woods, but almost the only one exported is rosewood, and this in small quantities. Among the larger Brazilian animals are tapirs, jaguars, stags, ostriches, alligators of several kinds, and large water-snakes. The fisheries of the Amazon and coast are very productive.

Agriculture.—Brazil has a large amount of fertile land, especially in the southeastern portion and on the Amazon; but a great portion of the plateau is probably only fitted for grazing. By far the most important product is coffee, in which Brazil stands first in the world. It constitutes more than half of her exports, the principal coffee region being in the coast range of São Paulo, Minas Geraes, Espirito Santo and Rio de Janeiro. Sugar is largely produced in Pernambuco, Bahia, Ceará, and elsewhere, and tobacco in Bahia. The cotton crop is now insignificant. Cacao is one of the principal products of the lower Amazon. Mandioca, maize, beans, rice, and tropical fruits and vegetables are largely raised for home consumption. The most important grazing districts are Rio Grande do Sul and Northeastern Brazil from Pernambuco to the Amazon; the herds of the interior are still small.

Manufactures.—Generally these are on a small scale, though collectively important. Cigars are largely manufactured at Bahia, and paper, furniture, saddles, hats, beer, rum, and many other articles in the southern cities.

Railroads and Transportation.—In 1898 there were 8,178 miles of railroads in operation, 4,989 miles building, 4,670 miles surveyed, and 8,440 miles projected, the most complete systems being in the coffee regions of São Paulo, Minas, and Rio; a large portion of these roads were constructed with a Government guarantee of interest on the outlay. All the large rivers have regular steam-navigation, with excellent vessels, and there are several Brazilian lines of coasting steamers. The country has 10,143 miles of telegraph lines; there is a submarine cable to Europe, and one is projected to the U. S. Good common roads are only found near the coast.

Education.—Primary education is general throughout Brazil, but the country schools are poor; in the cities and larger towns there are excellent schools (called *collegios*), and provisions for the study of law, medicine, and theology. Most of the cities have libraries, and some of them museums. Young Brazilians seeking higher education generally go to Portugal or France. See PORTUGUESE-BRAZILIAN LITERATURE.

Government.—It is a federal republic, very similar in form to that of the U. S. The president and vice-president are elected for four years, and can not be re-elected for the next succeeding term; senators are elected for nine years, and deputies, or members of the lower house, for three years. The states are completely independent in matters of their own internal administration. Freedom of religious worship is guaranteed by the Constitution. The president and congress are elected by practically universal suffrage. There are twenty states and a federal district (Rio de Janeiro).

Population.—This was estimated in 1896 at 16,300,000, and is probably too large. Over one-third are classed as white, but this includes a large number mixed with Indian and a smaller proportion with Negro blood. One-fifth are Negroes and as many more mulattoes; about 400,000 are civilized Indians; the remainder mixed races. The official estimate of 600,000 wild Indians is greatly exaggerated; the tribes are small, and altogether probably do not number 250,000. (For ethnology, see INDIAN TRIBES OF SOUTH AMERICA.) The great mass of the population is gathered in Southeastern Brazil. The interior and the Amazon valley are very thinly settled, and only partially explored. The largest cities are Rio de Janeiro, the capital, estimated, 350,000; Pernambuco, 190,000; Bahia, 80,000; Pará, about 50,000; São Paulo, Fortaleza, Maranhão, Parahyba, and Porto Alegre, all above 35,000. The whites are mainly of Portuguese descent, but in Southern Brazil there are several hundred thousand German colonists.

History.—Before Brazil was discovered, Spain and Portugal had regulated their claims of conquest by the treaty of Tordesillas. (See TORDESILLAS.) By this all new lands E. of about lon. 50° W. were assigned to Portugal. Accordingly, when the Spaniard Vicente Yanez Pinzon discovered the northeast coast of Brazil (Feb. and Mar., 1500), he did not take possession, and his voyage has little historical importance. The same year a Portuguese fleet was dispatched to India under Pedro Alvares Cabral. For some reason he stood far out in the Atlantic, and on Apr. 22 fell in with the Brazilian coast S. of Bahia. He took possession for Portugal, followed the coast for some distance, and then proceeded on his course to India, first sending back a ship with tidings of his discovery. Some other explorations were made, but Portugal was so much occupied with her Indian conquests that Brazil was long neglected. The first colony, São Vicente, S. of Rio, was formed by Martin Affonso de Sonza in 1532; and about this time the coast was divided into sections, which, as hereditary captaincies, were granted to distinguished Portuguese on the agreement that they should settle them. These correspond to the modern coast provinces, now states of Brazil. Bahia was founded in 1549, and became the capital. Spain did not dispute the rights of Portugal to Brazil, but other nations made attempts to colonize it. Such were the short-lived French colonies at Rio de Janeiro (1555–60) and Maranhão (1612–14). Attempts of the Dutch commenced in the Amazon early in the seventeenth century. They seized Bahia (1624) and held it for a year, and in 1631 they took Pernambuco and formed a powerful colony around it. Constantly at war with the Portuguese, they were finally driven out in 1654. After 1640 Brazil was governed by viceroys, and in 1762 the capital was changed from Bahia to Rio de Janeiro. During the eighteenth century the colonies developed rapidly, owing to the increasing importance of the sugar industry, and the discovery of rich gold and diamond mines in the interior. Armed expeditions in search of mines and of Indian slaves penetrated far into the interior,

founding towns in Goyaz, Matto Grosso, and even on the head-waters of the Madeira. Some of them attacked the Spanish missions of PARAGUAY (*q. v.*). The armies of Napoleon drove the prince regent, Dom John, out of Portugal, and he took refuge in Brazil (1808), making his capital at Rio de Janeiro. He succeeded to the Portuguese throne in Mar., 1816, and in Apr., 1821, returned to Portugal, leaving his son, Dom Pedro, as regent in Brazil. The prince placed himself at the head of the movement for independence, and on Sept. 7, 1822, definitely refused obedience to Portugal; a constituent assembly was convoked; Brazil was declared an independent empire, and on Dec. 1, 1822, Dom Pedro was crowned as Emperor Pedro I. of Brazil. There was some opposition and fighting, principally in the northern provinces, which did not entirely cease until 1837. For political reasons Pedro I. was compelled to abdicate Apr. 6, 1831, in favor of his son, Pedro II. The latter being a minor, the country was governed by a regency. His majority was proclaimed, and he assumed the crown in 1840.

Uruguay had formed a part of Brazil from 1821 to 1825, under the name of the Cis-Platine state. The dictator Rosas, of Buenos Ayres, having attempted to annex that country, Brazil made war on him, defeating him in 1852, and Uruguay remained independent. The war with Paraguay (1865–69) was brought on by the dictator Lopez of that country, and ended in his defeat and death. (See PARAGUAY.) Brazil was the last slave-holding state in America. A gradual emancipation law was passed in 1871, but the final extinction of slavery was due to a remarkable popular movement. Probably 200,000 slaves were freed by private means, and two provinces were emancipated before the abolishment of slavery was decreed (May 13, 1888) by an almost unanimous vote of parliament. In 1889 a sudden revolution forced the Emperor Pedro II. to abdicate; a provisional government under Fonseca succeeded; a federal constitution was adopted Feb. 24, 1891, Fonseca being first president. He was deposed in Nov., 1891, and succeeded by Floriana Peixoto, against whom several states and the navy rebelled in 1893–94, but this movement collapsed in Mar., 1894, when Prudente Moraes was elected president. The most notable events since that time have been the occupation of Trinidad by Great Britain in 1895, the great financial crisis of 1897, and the revolt in the Rio Grande in 1895, and that of the Fanatics of Canudos in 1897. Dr. Manoel Ferraz de Campos Salles was inaugurated president Nov. 15, 1898.

LITERATURE.—The *Catalogo da Exposição de Historia do Brazil* (Rio de Janeiro, 1881, 2 vols.) is a very complete bibliography of the country.

O Brazil Geographico e Historico (Rio de Janeiro, 1884, *et seq.*), founded on Wappaus' *Handbuch*, but with extensive additions by Brazilian scholars; Macedo, *Corographia do Brasil* (Rio de Janeiro, 1873); *Brazil* (Bulletin No. 7 of the Bureau of American Republics, 1891); *The Mappa Geral do Brazil*; the works of Denis, Carvalho, and Andrews.

History.—Porto Seguro, *Historia Geral do Brazil*; Southey, *History of Brazil.* The works of Pereira da Silva, Capistrano de Abreu, Macedo Teixeira de Mello, and Abreu e Lima.

Ethnology.—Martius, *Ethnographie Amerikas zumal Brasiliens* (Leipzig, 1867); Brinton, *The American Race* (New York, 1891).

Geology.—Hartt, *Geology and Physical Geography of Brazil* (Boston, 1870). The works of Derby, Gorceix, Lund, and Eschwege.

Zoölogy and Botany.—Wallace, *Geographical Distribution of Animals*; Martius, *Flora Brasiliensis.*

Travels.—Bates, *Naturalist on the Amazon*; Martius, *Reise in Brasilien*; Burton, *The Highlands of the Brazil*; Bigg-Wither, *Pioneering in South Brazil*; Wells, *Three Thousand Miles through Brazil*; Saint-Hilaire, Castelnau, Gardner, Koster, and Agassiz. HERBERT H. SMITH.

Brazil: railroad junction; city, and capital of Clay co., Ind. (for location of county, see map of Indiana, ref. 8–C); 16 miles E. N. E. of Terre Haute. It is an important center of the block coal and iron business. Pop. (1880) 3,441; (1890) 5,905; (1900) 7,786.

Brazil Cabbage: a Calla-like plant with large arrow-shaped leaves (*Xanthosoma sagittifolium*), of the family *Araceæ*, native of the West Indies, and now cultivated in Brazil for its thick, erect, nutritious rhizome, as well as for its foliage, which is cooked for food. This and other species of the genus are commonly grown in conservatories.

Brazilian Grass: popular name of a substance used in the manufacture of hats, sometimes called chip hats. It is not grass, but the leaves of a species of palm (*Chamærops argentea*) which are imported from Cuba.

Brazilian Literature: See PORTUGUESE LITERATURE IN BRAZIL.

Brazil-nuts: the seeds of the *Berthollelia excelsa*, a beautiful tree of the family *Myrtaceæ*. This tree, which

1 2 3

Brazil-nut: 1, represents the round woody pericarp, about one-fifth the natural diameter of an example of moderate size; 2, one of the nuts or seeds, half the natural length; 3, section of the same.

attains a height of 100 feet or more, abounds on the banks of the Orinoco and in the northern parts of Brazil, and bears a round woody pericarp nearly as large as a man's head. This pericarp contains about twenty-four seeds or nuts, which have the form of a triangular prism, and a hard shell inclosing a white kernel, which is very agreeable when fresh, but soon becomes rancid. They yield a large quantity of oil, which is valuable for burning in lamps. Many Brazil-nuts are exported from Pará to Europe and the U. S.

Brazil-wood: an important dyewood obtained from the *Cæsalpinia crispa*, a tree of the family *Leguminosæ*. There are several varieties, known as Pernambuco, Lima, Santa Martha, Sapan or Japan, etc. The wood contains a colorless principle. *brazilin* ($C_{16}H_{14}O_5H_2O$). This changes by oxidation to *brazilein* ($C_{16}H_{12}O_5$), the red coloring-matter which gives the wood its value. Pernambuco and Lima wood contain as high as 2·7 per cent. of brazilein, Sapan 1·5, and Santa Martha (also called Peach or Nicaragua) still less. Brazil-wood is very heavy and hard, is pale when freshly cut, but becomes red by exposure to the air. The coloring-matter is soluble in water, but more so in alcohol or ammonia. Brazil-wood has been largely supplanted by artificial dyes. It is used in calico-printing and in wood-dyeing, but it is not satisfactory.

Brazil-wood.

Bra'zos: one of the largest rivers of Texas; rises in the high table-land in the northwest part of the State; flows first nearly eastward to Baylor, then S. E. for about 200 miles, and subsequently S. S. E. till it enters the Gulf of Mexico. Its whole length is estimated at 900 miles. In the rainy season, from February to May inclusive, it is navigable for steamboats about 300 miles from its mouth.

Bra'zos Santia'go: an inlet and seaport of Texas; in Cameron County (for location of county, see map of Texas, ref. 8–H); between the north end of Brazos island and the south extremity of Padre island. It has some trade, but it has a bad and shifting bar. The settlement is on Brazos island, in lat. 26° 04′ N., lon. 97° 12′ W.

Brazza, Pierre Savorgnan, de: French explorer in Africa; b. on board ship off Rio de Janeiro, Jan. 26, 1852; entered the French navy 1870; explored the Ogowai 1876–78; continued his explorations in the country N. of the Congo, founding Franceville and many other stations 1878–85; appointed governor of the important dependency thus secured to France 1886.

Breach of the Peace: See Peace, Breach of the.

Breach of Promise: See Marriage.

Bread: the most common kind of prepared food; made from the flour or meal of some grain, moistened with water, and mixed or kneaded till of a uniform consistence. It may or may not be *raised* by the development of carbonic acid in the mass, or of other gas. It is formed into loaves or cakes, and finally baked before a fire or in an oven.

I. *Bread which is not raised* is often called *unleavened* bread. This may be made from the whole grain by soaking it in water, forming it in the hands, and either drying it in the sun or baking it before a fire. This is the simplest process of bread-making, and is still practiced to some extent among savages. Generally unleavened bread is made from grain which has been pounded or brayed in a mortar or between flat stones, reduced to meal in a mill, or even further reduced to flour. Coarse oat, barley, and pease meals are in Scotland made into bread by simply kneading with water, flavoring with salt, and baking before a fire. Wheat bread is made in a similar manner in many localities. The *passover cakes* of the Israelites were thus prepared. In the U. S., especially among the poorer classes in the South, Indian corn-meal is thus made into corn-bread. From wheat flour, sea-biscuit and the various kinds of crackers are prepared.

II. *Raised bread* is bread which is made porous and spongy by the aid of some gas, produced either before or during the baking. This gas may be carbonic acid, either generated by fermentation, produced by the decomposition in the bread of an alkaline bicarbonate, or mingled with the flour in solution in water under pressure. It may be air which is incorporated with the dough during the kneading and expanded during the baking, as in pastry, sponge cake, etc., or it may be carbonate of ammonia, which is vaporized during the baking.

The best bread is made of wheat flour, although the flour of rye, oats, and other grain is used. (See Flour.) Wheat flour owes its superiority to the large percentage of gluten which it contains. This body, when moistened with water, becomes adhesive, elastic, and tenacious, and holds the bubbles of gas formed during the process of raising the loaf, although it be distended to a spongy mass several times the original volume of the dough. The other cereals contain scarcely any gluten; hence it is difficult to make light-raised bread from them. (See Gluten.) The bread from wheat flour is whiter than that of other grains.

1. *Fermented bread* is prepared either with leaven or yeast. Leaven is dough—i. e. flour and water—in a state of incipient putrefaction. When flour is moistened with water and placed in a warm situation, spontaneous chemical action begins in the nitrogenous constituents, casein, fibrin, gluten, etc. This change extends later to the sugar, gum, and starch. At one stage of the decomposition the products of vinous fermentation may be detected, alcohol and carbonic acid; at a later stage an acid fermentation supervenes, producing lactic acid. The alcohol, carbonic acid, and lactic acid are formed from sugar, either the small quantity originally contained in the flour, or an additional quantity formed during the decomposition from the gum and starch. (See Fermentation.) The change of sugar in the vinous and lactic acid fermentations is shown in the following formulæ:

$$\underset{\text{Sugar.}}{C_6H_{12}O_6} = \underset{\text{Carbonic acid.}}{2CO_2} + \underset{\text{Alcohol.}}{2C_2H_6O.}$$

$$\underset{\text{Sugar}}{C_6H_{12}O_6} = \underset{\text{Lactic acid.}}{2C_3H_6O_3.}$$

Where leaven is used for making bread a portion of the dough is set aside at each baking to serve as leaven for the next. The process of making the bread is very simple. The proper quantity of flour is mixed with tepid water, the leaven, and a little salt, the whole being well incorporated by kneading. The mixture is placed in a warm situation and left over night to ferment. If the leaven is in the proper stage of decomposition, it will induce vinous fermentation, producing alcohol and carbonic acid gas; the latter, held by the elastic and tenacious gluten, will expand the mass into a light, porous sponge, which becomes in the oven a palatable loaf. If, however, the leaven be in a more advanced stage of decomposition, or if some other necessary condition fail, instead of alcohol and carbonic acid, lactic acid will be formed, and the dough will not be *raised* by gas, but will be heavy and sour. To avoid this latter result, saleratus, bicarbonate of potassa, or soda is added to the dough. This neutralizes the lactic acid as fast as it is formed, and by liberating carbonic acid gas at the same time inflates the sponge and makes it light and porous. Were there any certainty as to the quantity of lactic acid that would be generated, it might be possible to add the proper amount of saleratus to neutralize it, but in practice there is generally an excess or a deficiency. In the former case the bread is alkaline, yellow, and disagreeable; in the latter case, sour. Leaven is also liable to communicate a disagreeable taste and odor.

Notwithstanding the difficulty of making good bread with leaven, and the frequent failures in private families, in Paris, where bread-making has reached a high degree of perfection, the bread is raised chiefly by leaven, a little yeast only being added to facilitate the fermentation. According to Prof. Horsford, the following is the common method practiced in Paris: At eight o'clock in the evening a mass of paste (leaven or sour dough) is taken, composed of 8 kilog. of flour and 4 kilog. of water. This is left until six o'clock in the morning, and constitutes the main leaven; 8 kilog. more of flour and 4 kilog. of water are then added; this forms the first quality of leaven. At two o'clock in the afternoon 16 kilog. of flour and 8 of water are added; this is the second quality of leaven. At five o'clock the complete leaven is prepared by adding 100 lb. of flour and 52 kilog. of water, mixed with from 200 to 300 grammes of yeast. At seven o'clock 132 kilog. of flour and 68 kilog. of water, holding in solution 2 kilog. of salt, and mixed with from 300 to 600 grammes of yeast, are added to the leaven, and made into well-kneaded dough.

With this quantity of paste five or six batches of bread are made in the following manner: *1st Batch.*—This is composed of half the dough prepared as above, which is molded and left to rise, and then set in the oven. The bread of this first baking is sour, rather brown, and not particularly light. *2d Batch.*—The dough remaining of the first batch is mixed with 132 kilog. more of flour and 68 kilog. of water, mixed with the same proportion of salt and yeast as the preceding batch. Half of this dough forms the second baking, the bread of which is whiter and better than the first. *3d Batch.*—The same quantity of flour, water, and salt, with 300 grammes of yeast, is again added to the dough, of which half is baked as usual. *4th Batch.*—Same proceeding as for the third. *5th Batch.*—This is prepared like the foregoing, and produces what is called fancy bread, the finest quality of any.

The use of leaven is of great antiquity. The usual agent for raising bread in the public bakeries in the U. S. and in many families is yeast, either obtained from some brewery or specially prepared for the purpose. The following is a recipe in common use in New England: "Take eight good-sized potatoes, boil, mash fine, pass through a sieve, and work in a cup of flour. Thin to a cream with hot water, and add a teaspoonful of salt and a tablespoonful of sugar. When cooled to lukewarm, add a cupful of old yeast, and set aside in a warm place. In six hours the yeast will be ready to use. Bottled it will keep for a week. Use a cupful for two loaves of bread."

A very essential element of success in bread-making is thorough kneading. When the bread has risen sufficiently it is baked. There is a loss of about 25 per cent. in baking, chiefly water. In bread raised by fermentation some alcohol is evolved. Liebig estimated that 150,000 gal. of alcohol are thus lost annually in London alone, and 12,000,000 gal. in Germany. Efforts have been made to save it by condensation, but thus far without success.

The carbonic acid which gives lightness to fermented bread is derived chiefly from the small amount of sugar contained in the flour. If wheat is exposed to dampness after harvesting, or if the flour has been exposed to heat and moisture, the albumen which it contains is transformed into diastase (see Beer), which possesses the property of changing starch to dextrin (gum) and sugar. Bread made from such flour is sweet, sticky, heavy, and dark-colored. Several substances have been used to prevent these results. Alum

is said to have been extensively used in London; its use being now forbidden by law, lime-water was recommended by Liebig, and is largely used by the Glasgow bakers. Sulphate of copper is a poisonous salt, said to be used in Belgium, $\frac{1}{30000}$ to $\frac{1}{15000}$ being sufficient for the purpose. Mege-Mouriès announced some years ago (*Comptes Rendus*, xxxvii. 775; xxxviii. 351, 505; xlii. 1122; xliv. 40, 449; xlvi. 126; xlviii. 431; l. 467) the discovery of a body, "cerealine," found almost wholly in the bran, which possesses properties similar to those of diastase. He devised means for getting rid of this agent, or at least of its effects, and the following method of bread-making bears his name. It is assumed that 100 kilog. of wheaten meal have given

72 kil. 750 grammes finest white flour,
15 " 750 " dark groats,
11 " 500 " bran.

1. At six o'clock in the afternoon take 40 liters * of water at 18° R. (72½° F.), add 70 grammes of pure yeast, or 700 grammes common grocer's yeast, and 100 grammes of starch-sugar. (Instead of the yeast and sugar, take, if necessary, 26 grammes of tartaric acid.) The place where the mixture is set aside must be maintained nearly at the temperature of 18° R. 2. The next morning, at six o'clock, the fluid will be saturated with carbonic acid. Stir in the 15 kilog. 750 grammes of groats. Fermentation will commence immediately. 3. At two o'clock in the afternoon add 30 liters of water, and pass the whole through a very fine silk or silver-wire sieve, to separate the fine bran. 4. The 70 liters with which the groats have been treated, after passing through the sieve, will be reduced to about 55 liters, with which the 72 kilog. 750 grammes of white flour and 700 grammes of salt are to be kneaded into a dough. (The bran is again extracted with 30 liters of water, and the extract employed in the next batch.) 5. The dough is then placed in baking-pans to ferment. 6. When raised, it is placed in the oven.

The baking of bread can be effected at 212° F., but no crust will be formed; to secure the best result a temperature of 350° to 570° F. should be employed. A high heat should be avoided at first, lest a hard crust be formed, while the interior of the loaf remains unbaked. One hundred pounds of flour yield from 125 to 135 lb. of bread, the increase being due to the water added. The most common faults of wheat bread are due to its being (1) *sour*, from the flour having been partly spoiled, the yeast or leaven having been too old, or the dough having been allowed to stand too long before baking; (2) *bitter*, from excess of yeast or bad yeast; (3) *heavy*, from insufficient kneading, raising, or bad leaven; (4) *moldy*, from the flour having been kept too long in a damp place.

Graham bread is made from the unbolted meal of wheat, a mixture of bran and flour; it is used by dyspeptics. *Rye bread* is largely used in Northern Europe, and to some extent in the U. S. It is dark-colored, is harder than wheat bread, and has a peculiar taste.

2. *Substitutes for Fermentation.*—Carbonic acid may be developed in the dough by the decomposition of bicarbonate of potassa (saleratus) or of bicarbonate of soda by some acid. Sour milk, hydrochloric acid, tartaric acid, bitartrate of potassa (cream of tartar), and the acid phosphate of lime have been used for this purpose. They give rise respectively to lactate, chloride, tartrate, double tartrate (Rochelle salt) of potassium or sodium, or to (in the case of the last mentioned) a mixture of phosphate of lime and soda or potassa. As neither of these agents causes fermentation, none of the elements of the flour is lost, and a greater yield of bread is claimed. This saving is, however, very trifling, as the loss in fermentation is small. The use of the acid phosphate of lime, suggested by Prof. Horsford, is claimed to restore to the flour the phosphates of the wheat which were removed in the bran. The process has been commended by Liebig. One strong recommendation for these "baking-powders" is the fact that bread may be mixed and baked at once, without the delay of several hours which is necessary where fermentation is resorted to. As cream of tartar and acid phosphate of lime do not act on bicarbonate of soda in the absence of water, either of these acid salts may be mixed with the flour, together with the bicarbonate, thus producing what is now extensively sold in the U. S. under the name of "self-raising flour," which is already salted, and merely requires to be mixed with water and baked to produce a palatable loaf. Carbonate of ammonia (sal volatile) is sometimes used alone to raise bread; being very volatile, it is converted into vapor during the baking, and raises the loaf to a light sponge. Mr. Dauglish introduced *aërated bread*, which is prepared by kneading flour in a closed vessel with water supersaturated under pressure with carbonic acid gas. On bringing the dough into the air, the carbonic acid gas set free by the removal of the pressure expands it into a sponge. "Sponge cake" is raised by means of air which is incorporated with the flour by first beating eggs to a froth, stirring in the flour, and quickly baking. "Pastry" is made flaky, but not really spongy like bread, by mixing flour and water to a dough, rolling it out into sheets, applying butter liberally, doubling over the sheet, rolling it out again, and again applying butter. These operations are repeated till the dough becomes a sheet of innumerable layers of dough alternating with a thin coating of butter. On exposing this to the heat of the oven, the different layers of dough separate, either from the expansion of the imprisoned air or from steam, and the mass becomes light and flaky.

C. F. CHANDLER.

* A liter of water weighs 1,000 grammes = 1 kilog. = 2·2 lb. avoirdupois.

Breadal'bane, MARQUISES OF: Marquises of Breadalbane 1885, Earls of Holland, Viscounts of Tay and Paintland, Lords Glenorchy, Benederaloch, Ormelie, and Wreik (1677, in Scotland), and baronets (1625, in Scotland), a prominent family of Scotland.—GAVIN CAMPBELL, the seventh earl and first marquis, was born in 1851, and succeeded his father in 1871.

Breadfruit-tree: an important tree (*Artocarpus incisa*) of the family *Artocarpaceæ*; a native of Southern Asia, of the islands of the South Pacific, and of the Indian Archipelago, now naturalized in some of the West Indies. This tree

Breadfruit.

grows to the height of 40 or 50 feet, and has large, glossy, dark-green leaves, which are pinnatifid or deeply divided into pointed lobes. The leaves are sometimes 18 inches long. The fruit, which is a *sorosis*, is nearly spherical, and is covered with a rough rind, which is marked with small irregularly hexagonal divisions, having each a small prominence in the middle. The fruit sometimes weighs 4 lb. or more, contains a large portion of starch or feeula, and is a principal part of the food of the natives of the South Sea islands. The pulp is juicy and yellow when it is fully ripe, but it is in a better condition for eating before it arrives at that stage of maturity. When it is gathered before ripeness and baked, the pulp is white and mealy, very nutritious, and resembles wheat bread. The usual practice is to cut the fruit into three or four slices, and bake them in an oven. Sometimes the people of a village join to make a huge oven —a pit 20 or 30 feet in circumference—in which several hundred breadfruits are baked at once on heated stones. Baked in this mode, the bread will keep good for several weeks. The tree produces two or three crops in a year. It has been introduced into the West Indies with some success. The timber, which is light and of a rich yellow color, is used in building houses and for other purposes, but if exposed to the weather is not very durable. A sort of cloth is made of the fibrous inner bark. The tree abounds in a glutinous milky juice, which, when boiled with cocoanut oil, is used as a cement and as birdlime. Revised by CHARLES E. BESSEY.

Breadnut: the fruit of the *Brosimum alicastrum*, a tree of the family *Artocarpaceæ*; a native of Jamaica. It is allied to the breadfruit. The genus *Brosimum* has staminate and pistillate flowers on separate trees in globose catkins. Its fruit is a one-seeded drupe, which is edible, and is used instead of bread after it has been boiled or roasted. The tree has ovate, lanceolate, evergreen leaves, and abounds in a gummy milk.

Revised by CHARLES E. BESSEY.

Breakwater: a structure designed solely to tranquilize the surface of a body of water by preventing the entrance or formation of waves from the sea. It is intended primarily to provide shelter from storms, and must therefore be so placed as to bear the shock of the waves, winds, and currents tending to destroy it. Its function is therefore different from that of a mole, jetty, quay, or sea-wall, which has to fulfill other conditions, but often under more favorable exposures.

The fundamental purpose of a breakwater being protection, its location, plan, sections, dimensions, material, and mode of construction must be influenced to a great extent by the physical features and forces existing at the site of the proposed artificial harbor, advantage being taken of any natural formations which would reduce cost and increase stability.

This class of structure applies chiefly to artificial harbors, but the same general requirements exist with reference to the entrances to many natural harbors, especially where they are located inside of the general coast-line. It will therefore seem more appropriate to defer to their special headings the general consideration of the several forces involved in the problem, and to describe here only the various types and precedents found in our principal ports.

For this purpose breakwaters may be grouped into (*a*) those which project from a cape or headland, and are consequently *attached*; (*b*) those which are isolated, *insular* or detached; (*c*) those which are rigidly supported on the bed of the sea, *permanent*; (*d*) those which are upheld by the water, *floating*; (*e*) those which perform the double purpose of breaking the force of the waves by the outer slope, while they regulate the currents on the inner, *reaction*; (*f*) and those which require to be combined to produce a sufficiently tranquilizing effect, *composite*.

Instances of most of these types may be found in the various forms of sandy islands, spits, and hooks which bestud an alluvial coast, and a study of which will convey a good idea of the best forms and sections for similar materials and exposures, but as the engineer is required to apply wood, stone, or metal, the slopes and dimensions must be modified accordingly. To secure the desired protection, two methods are available. The first is to oppose the force of the waves by a resistance *en masse*; the second, by a neutralization of surface movements by disintegration and deflection. Both of these are in use, but the former is in general far more effective, as it is also more expensive.

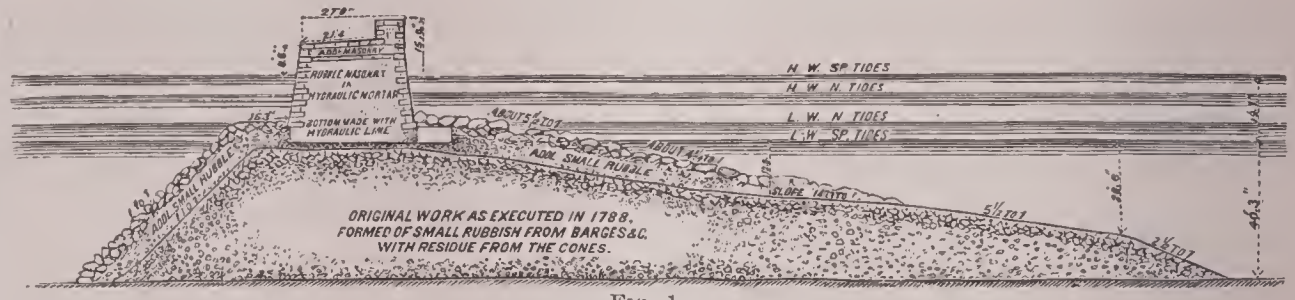

FIG. 1.

An instance of the application of both methods is found in the history of the breakwater of Cherbourg, on the north coast of Normandy, where the tide rises 18 feet. The crescent-shaped bay is embraced between Cape de la Hogue and Barfleur, and contains several rocky islands, which do not afford sufficient shelter. The French Government, after mature consideration and experiments made at Havre, decided to adopt the plans of M. Louis Alexander de Cessart, of building ninety large timber cones, having a diameter of 142 feet at base, 113 feet at top, 65 feet high, and weighing 1,000 tons net, to be floated by large casks from the ways to the site, sunk, and ballasted with rock. The depth from low water varied from 6 to 7 fathoms, hence the tops would project from 8 to 10 feet above high water. The first cone was placed in position June 23, 1786, and the last June 19, 1788, or two years later. Twenty-one cones were made, but only eighteen were used, the others being sold during the Revolution. The intervals between them were quite variable. The first space, between centers, was 513 feet; the second, 159; the third, 184, etc., some of the distances being as great as 1,845, 1,630, and 1,310 feet; so far apart, in fact, as to be inoperative, and to defeat the object of their existence; hence it happened that in a few years they were destroyed by the waves. The total length of this breakwater between the centers of the extreme cones was 12,470 feet (nearly 2½ miles). The gap between the first cone and the fort on Île Pelée was 3,269 feet, while that at the western end was 7,685 feet, making the total width of the bay 23,424 feet, or nearly 4½ miles.

These cones were ballasted by throwing into and around them 3,703,703 cubic yards of stone, at a cost of $3,100,000, which was subsequently utilized in the riprap breakwater of later date. The total cost of this original work was $4,512,200, or nearly $362 per lineal foot, proving it to be a very expensive experiment.*

The rubble mound which remained had been cut down by storms to 14 feet below low water, having an inner slope of one on one (45 degrees) and an outer or sea slope of one on ten. The National Assembly of 1791 authorized De Cessart to raise it to high water, but it was not done at that time. In 1804 a number of large blocks were placed on the center, and the battery replaced upon them.

Thereafter until 1830 little was done except to preserve the central battery, and to raise the remainder by means of rubble to low-water level; but finding it extremely difficult to maintain it in that position, and feeling that, in order to secure the desired tranquillity within the roadstead, it was necessary to raise the superstructure at least from 9 to 10 feet above high water of spring-tides, it was finally resolved, at the recommendation of several engineers, to construct a wall of solid masonry, with almost vertical sides, from low water upward, upon the top of the rubble base: this upright wall extends from thence up to the full height of 6 feet above the level of high water of spring tides; it is composed of rubble masonry faced with granite ashlar or dressed stone, in horizontal courses from 18 inches to 2 feet thick, and 3 to 4 feet wide, set in mortar. This part of the work is 36 ft. 3 in. wide at the base, and 29 ft. 3 in. wide at the top, the outer slope being 6 to 1, and the inner slope nearly the same: on the outside of this superstructure there is a solid parapet 8 ft. 3 in. thick, 6 feet high, and 8 ft. 6 in. wide at the top. The exterior base of this wall is founded on a bed of beton or concrete, set in wooden boxes or cases 10 feet long, 6 ft. 6 in. wide, and 3 ft. 3 in. deep, dove-tailed together, and well bedded in and covered with large blocks of rubble stone.

No sooner was this vertical wall raised above the level of high water than it presented such a sudden resistance to the waves, rolling upward along the rubble slope, that they broke against the face of the vertical wall with the greatest violence, and rising perpendicularly against it, fell down upon the rubble, undermining the base of the vertical wall and threatening to overwhelm it entirely. To obviate this, it became necessary to raise the rubble slope still higher, and to cover the surface with large heavy blocks, well wedged together: still this only partially remedied the evil, for, notwithstanding this casing, during heavy N. W. and N. E. gales at high water the waves beat with such violence against it that heavy masses of water wash over the top, so as to render it both difficult and dangerous to walk along it, although nearly 10 feet above high water of the highest tides; and it was proposed in 1850 to carry the rubble slope still higher in front of it; also to raise the wall 8 feet higher.

Sir John Rennie draws the following "conclusions" from the experience furnished by this structure:

"First. The plan of making the *digue* or breakwater isolated or detached from the shore is the best, and, if carried into effect with greater judgment, would have been more advantageous to the harbor.

* For a detailed account, see Cresy's *Enc. of Civil Eng.*

"Secondly. The cone system, although ingenious, was inapplicable and failed.

"Thirdly. The rubble system for the mass of the work is correct, and if blocks of greater size had been employed the result would have been more advantageous in economy of time, labor, and materials.

"Fourthly. The vertical wall system is inferior to the flat slope."

As this breakwater was designed to fulfill the double purpose of defense from the sea and from the enemy, it involved the combination of rubble mound and masonry superstructure with parapet and fortification, which increased the cost over that having to meet but a single condition.

The experience of the ancient Phœnicians and of the Sidonians, Egyptians, Romans, and Carthaginians, who built extensive moles of large masses of rock, has not been utilized in the modern structures which have been developed during the past century to meet the modified requirements of an extensive commerce operated by steam, and of the greater exposures to violent forces to which they are subjected.

These requirements have led to important modifications in the design and section of the breakwater, whereby the height of the rubble work is limited to from 15 to 25 feet below the surface of mean low water, that it may be kept below the disturbing action of storm-waves, and the capping thereof by a high wall of masonry extending above high water and sufficiently thick to resist the impact of the sea.

In plan it is important that there should be no re-entrant angle or convergent walls to compress the waves, and it is often necessary on exposed sea escarpments to deposit large concrete or natural blocks, weighing from 10 to 50 tons, to resist the force of the sea. These are known as *wave-breakers*.

Engineers at present have the benefit of an extended experienee, and in consequence can approximate their designs to those which have withstood the tests of time and the elements under similar conditions of material and exposures.

The result is that, in general, for a riprap breakwater the estimates are based upon a section of from 12 to 30 feet in width on top, rising to from 5 to 12 feet above high water, and having slopes of one on one on the harbor, and one on two or one on three on the sea side, capped by a revetment of rocks weighing from 2 to 10 tons each, laid as closely as possible above mean low water, and sometimes filled in with cement. The mean section of the breakwater at the mouth of Delaware Bay, resulting from an exposure to the easterly storms of the Atlantic for upward of fifty years, has the

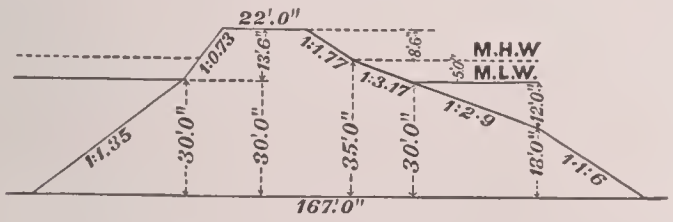

FIG. 2.—Mean section of present breakwater.

form shown in Fig. 2, where it will be seen that the bottom slope below the twelve-foot plane is 1 to 1·6 outside, and 1 to 1·3 inside. Within the wave-zone it is about 1 to 3, and above that level it increases again to 1 to 1·7. This section for a depth of 32 feet mean low water would contain 495·3 square yards, and require 165·1 cubic yards for each lineal foot of the work. At this site it was found that for this part of the work each cubic yard of volume, *in situ*, was equal to 1·5 gross tons of stone.

As the harbor formed by this breakwater is one of the oldest of its kind in the U. S., a brief reference to its plan will prove instructive. It was authorized by act of Congress passed May 24, 1828, and was designed upon the experience derived from Cherbourg and Plymouth. The first load of stone was delivered Apr. 18, 1829. It is located on the west bank of Delaware Bay in the lee of Cape Henlopen, lat. 38° 47′ N., lon. 75° 06′ W.

It is an artificial harbor formed by a breakwater of *pierre perdue*, 2,558 feet long on top, and extending in a straight line tangent to the cape at the time of its inception. The nearer extremity was 4,200 feet from the beach. There is an ice-breaker 1,359 feet long, making an interior angle of 146° 15′ with the axis of the breakwater, which latter would cut it at its middle point if produced. Thus between the ice-breaker and breakwater there was left a gap of nearly a quarter of a mile. Their tops were about 14 feet above mean low water. The stones vary in weight from ¼ to 7½ tons. By the year 1839 there were deposited 835,000 tons, at a cost of $1,880,000, giving a rate of $2.25 per ton in place, but the structure was not said to have been completed until 1869, when the total volume was estimated to be 892,528 tons and the cost $2,123,000.

The structure itself has withstood very well a number of severe storms, but its defective location, with reference to the currents, has caused injurious shoaling throughout the protected area, which will be more fully described under HARBORS. To provide additional shelter, as well as to improve the depths, the operation of closing the gap has been in progress for some years. A mattress-sill, 2 feet thick and 100 wide, has been laid as a foundation for a riprap mound which it was intended to raise to a height of 12 feet below the plane of mean low water, with a top width of 48 feet and slopes of ½. This was to have been capped by a concrete monolith, having the dimensions shown in Fig. 3.

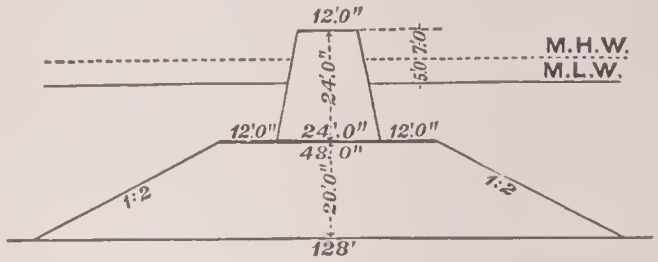

FIG. 3.—Section of the project of 1882.

This project was the result of a mature and careful digest of the more modern structures under similar exposures, made by Mr. Louis Y. Sehermerhorn, C. E., from whose condensed report the following extracts are taken:

Description of breakwaters consisting of a concrete superstructure founded upon a random stone substructure.

Such breakwaters have been built at the following localities:

LOCALITY.	Latitude north.	Longitude east.
Colombo, Ceylon, Indian Ocean	7°	80°
Madras, India, Indian Ocean	13°	80°
Mormugao, India, west coast	22°	69°
Manora, India, Arabian Sea	25°	67°
Kustendjie, Turkey, Black Sea	44°	29°
Odessa, Russia, Black Sea	46°	31°
Fiume, Austria, Adriatic Sea	45°	15½°
Ymuiden, Holland, North Sea	52½°	4½°

The following table gives the principal dimensions of these breakwaters:

LOCALITY.	Base of superstructure below M. L. W.	Top of superstructure above M. L. W.	Total height of superstructure.	Width of superstructure.	Range of tides.	Height above high water.	Depth of water over situ.
Colombo	*20	12	32	34	2·0	10	18–40
Madras	22	8	30	24	3·3	4·7	24–45
Mormugao	†18	‡20	38	30	6·0	14	20–28
Manora	15	9	24	24	8·7	0·3	18–30
Kustendjie	†16	12	28	12–18	....	12	12–20
Odessa	22	10	32	22–28	....	10	20–30
Fiume	22¾	....	24	23¾	1·5	1·5	20–70
Ymuiden	†25	18	43	28–38	5·5	12·5	10–30

* Rubble and 10-ton bags of concrete extend about 5 feet above the base.

† Sea-face and slope protected with large concrete blocks.

‡ Includes a parapet 7 feet high and 15 feet thick.

The exposure to which these breakwaters are subjected may be divided into two classes, the five subjected to ocean exposure falling into the first class, and the remaining three into the second class. In the first group the foundations of the concrete superstructure are placed from 15 to 25 feet below mean low water. This might have been adopted for two reasons, viz.: (1) economy of construction; (2) stability of the work.

In the case of Ymuiden breakwater, where the rubble base was only 3¼ feet in thickness, it seems highly probable from the known absence of stone within reasonable distance from the site of the work that the depth of 25 feet was chosen from grounds of economy. Excluding Ymuiden, for the remaining four works the depth of the concrete foundation varies from 15 feet at Manora to 22 feet at Madras.

The radical difference between the action of a vertical wall and flat slopes of random stone has resulted in material changes of opinion as to the limiting depth of wave disturbance, and where a depth of 12 feet was formerly considered

sufficient to place rubble-stone beyond the action of waves, depths of 18 and even 22 feet are now advocated and used.

At Alderney the rubble base was originally placed at 12 feet below mean low water, but before a condition of stability was attained the top of the rubble mound at the base of the superstructure had been reduced to a depth of between 15 and 18 feet, and even at this depth it was necessary to maintain the top of the rubble with added material to replace that which was swept away. There is most manifest economy in either placing the rubble so low at the first as to secure its stability, or else protecting it with stone too large to be removed. Otherwise the stability of the whole work is endangered, or else a large annual expense must be incurred to supply the waste and thereby insure the work.

At Tynemouth, where the superstructure is founded at a depth of 20 feet below mean low water, it has been necessary to protect the top of the rubble mound on the sea-face with a double row of large concrete blocks.

At Colombo the base of the superstructure at 2,000 feet from the shore, and in water 30 feet deep, is placed 16 feet below mean low water, but the sea-face of the work is protected by large rubble-stone raised to a height of 5 feet above the base, and such stone further protected with a close layer of 10-ton bags of concrete. At 3,000 feet from the shore, and in water 40 feet deep, the superstructure is carried to a depth of 20 feet below mean low water, and then protected by large rubble and concrete bags.

At Madras the base of the superstructure, founded 22 feet below mean low water, seems to have been sufficiently deep to protect the top of the rubble base from the effect of wave recoil. Nevertheless, in the amended project for the extension of the Madras breakwater, a wave-breaker is provided along the sea-face of the superstructure, consisting of large random blocks of concrete piled against the sea-face and extending to the plane of high water.

At Mormugao the base of the superstructure, founded 18 feet below mean low water, has been protected on its sea-face by a wave-breaker consisting of 20-ton concrete blocks extending above the plane of high water.

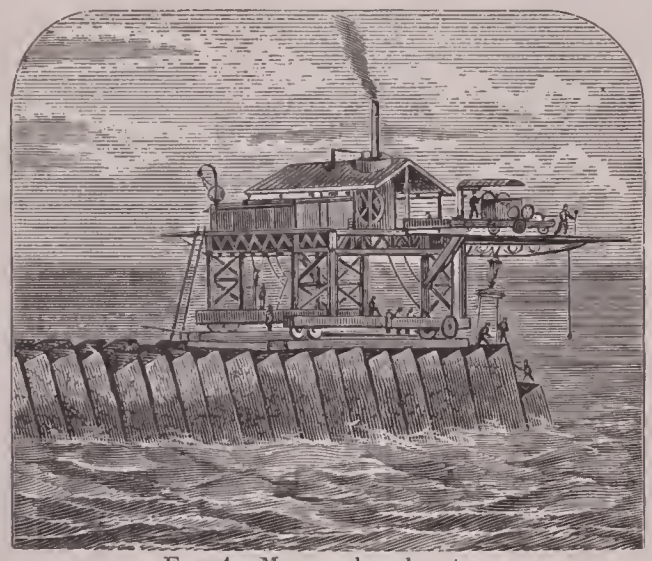

FIG. 4.—Manora breakwater.

At Manora the superstructure, founded at 15 feet below mean low water, has not suffered from any reduction of the rubble base. This is probably due to the reduced exposure of the locality, joined with the fact that the superstructure is so low, practically the plane of mean high water, that the seas easily pass over the work, and consequently greatly reduce the back draught or recoil of the waves.

At Kustendjie the superstructure, founded at 16 feet below mean low water, is protected on the sea-face with large random stone blocks, which extend about 8 feet above the base of the superstructure.

At Odessa, where the superstructure is founded 22 feet below mean low water, the rubble base has not required protection.

At Ymuiden, although the superstructure is founded at a depth of 25 feet below mean low water, the sea-face is provided with a wave-breaker of large concrete blocks extending above the plane of high water. This added precaution was probably made necessary for the reason that the rubble base was only 3¼ feet in thickness, and being founded on yielding sand, it became imperatively necessary to protect the sea-face from currents which would produce scour and the consequent settlement of the entire work.

With the exception of the Manora breakwater, the top of which is not above mean high water, we find that even when the base of the superstructure is placed at from 18 to 22 feet below mean low water it has been considered necessary to give increased assurance to the rubble base by special protection. While the formation of wave-breakers undoubtedly strengthens an otherwise weak superstructure, it is highly probable that the expenditure of a less amount of money applied toward placing the foundations at a lower level, or in giving increased thickness to the superstructure, would produce better results.

From the foregoing it may be inferred that, in localities subject to ocean exposure, the best modern practice would place the base of the superstructure at from 15 to 22 feet below mean low water, and even then give the top of the rubble mound additional security by the use of large stone or concrete blocks.

The novel feature of construction in the breakwaters at Colombo, Madras, Mormugao, Manora, and Kustendjie consists in the inclination of the blocks at various angles to the horizon, that they might settle independently without destroying the integrity of the structure. The original design

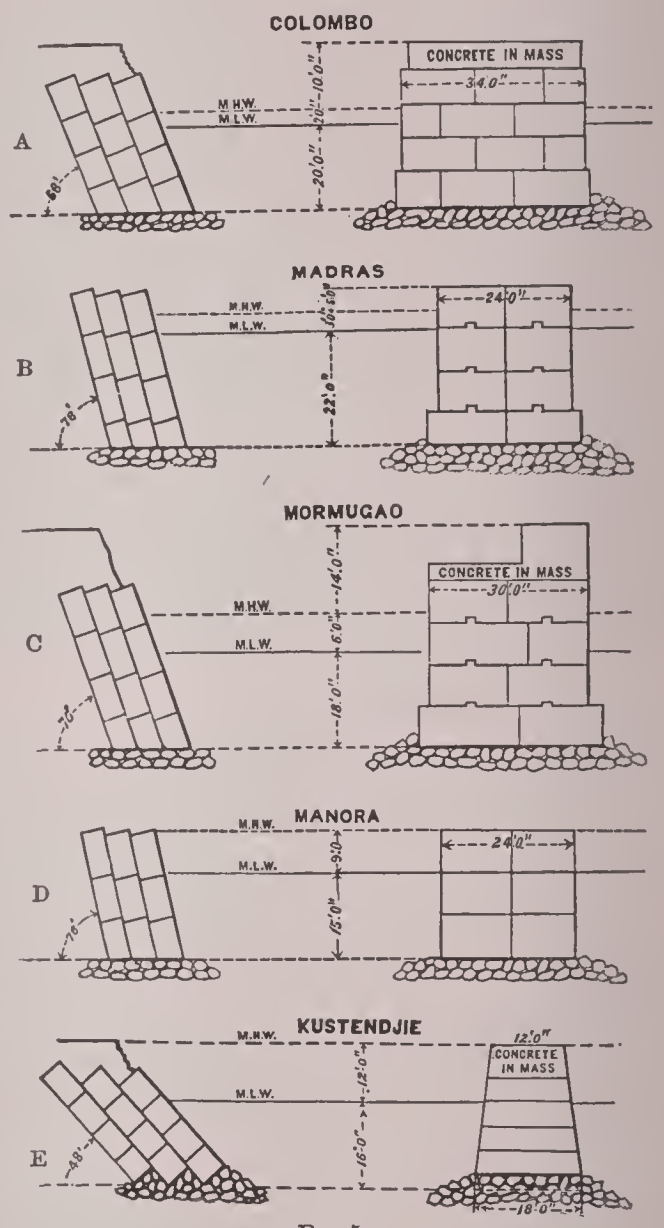

FIG. 5.

is attributed to Mr. Parkes, member of the Institute of Civil Engineers, London, and it has been successfully applied in the structures cited. The inclinations adopted are shown in the accompanying figures, as well as the depths, heights, and widths.

The cost of these several works was affected by a number of variable elements.

Thus at Colombo the ordinary labor was performed by prisoners, who received 37½ cents per day of eight hours. The cement, tools, and machinery, and skilled supervision were brought from England. Stone was carried 12 miles by rail, and the breakwater was connected with the shore and the quarries by a track. The cost, exclusive of dredging and reclamation, but including administration, was $2,430,000. The rubble mound was in part made by dumping from steam-barges, and was leveled by divers. The

total length was 4,212 feet for the western breakwater, and it was proposed to erect a rubble mound between its extremity and the shore 2,000 feet long, and having a harbor entrance at its western end of 800 feet in width to be capped by heavy blocks. The commerce of this port had increased from 446,100 tons in 1869 to 1,205,900 in 1879.

The Madras work cost $2,402,000; that at Manora $529,000; and that of Mormugao $420,000.

The average progress at Colombo was 150 linear feet per month of superstructure, 34 feet wide and from 24 to 28 feet high, or about 8,000 tons per working month. On one occasion 720 tons were set in twelve hours. At Madras the average rate was 7,000 tons per month; at Manora it was but 6,000 tons.

In considering the question of the proper dimensions to be given to a breakwater superstructure, more valuable indications are to be obtained from the cases of failures of works than in those which have proven successful.

The Madras breakwater failed entirely from an error in the details of construction, by which no bond was given to the blocks of the superstructure in a direction transverse to the axis of the breakwater. The Manora breakwater contained the same source of weakness, but its reduced height (the plane of high water) saved the superstructure from a fate similar to that of Madras.

Of the remaining breakwaters which have been considered Colombo furnishes the only case of partial failure which could be used as a valuable indication of the necessary section of a breakwater to withstand the action of an exposure similar to that of Colombo. As originally designed, the breakwater was rectangular in section, with the dimensions shown in A, Fig. 5.

The breakwater was given a width of 50 feet, so as to utilize the top as a quay. This width of 50 feet consisted of a sea-wall 24 feet thick, hearting-wall of rubble-stone 14 feet thick, and a harbor-wall 12 feet thick. In the construction of the work the sea-wall was kept about 700 feet in advance of the harbor-wall.

In July, 1878, when the breakwater had attained an extension of about 1,300 feet from the shore, and when the 24-foot thick sea-wall was 700 feet in advance of the harbor-wall, an unusually heavy southwest monsoon caused a horizontal displacement of the outer end of the advanced sea-wall "to the extent of 15 inches, pivoting on a point 150 feet landward, and lowering the outer end 12 inches, diminishing to nothing 450 feet inshore. . . . The signs of weakness which indicated the inadequacy of the sea-wall to sustain unaided the thrust of the sea" led to a modification of the hitherto adopted plan. The use of the breakwater as a quay was abolished, because it was found that the waves swept over the top of the work with too much force to permit its use for such a purpose. The failure of a superstructure 24 feet in thickness to withstand the shock of the seas had been demonstrated; consequently the further progress of the sea-wall was delayed until the harbor-wall could be brought up to its outer end. Then the dimensions of superstructure were modified by omitting the rubble-hearting between the sea and harbor walls, and uniting the two walls in one section 34 feet in thickness. This width was continued for the remaining 3,000 linear feet of the breakwater.

At the time of this failure of the sea-wall the top of the concrete blocks had not yet been covered with the monolith of concrete 4 feet in thickness, which, after all settlement had ceased, was finally placed so as to unite the tops of the blocks. Although an increased stability would have been given to the wall by this concrete capping, yet, on the other hand, the added height of 4 feet would have subjected the superstructure to an increased displacing force from the waves. This experience at Colombo was most valuable, and indicates that under a similar exposure the thickness of the superstructure to insure stability must be something greater than 24 feet. With the wall 34 feet in thickness, no difficulty has subsequently occurred, and of course it is not demonstrated that a less thickness than 34 feet would not have insured stability. The failure of the wall when 24 feet thick and the success of the wall when 34 feet thick simply indicates that somewhere between these limits assured stability was reached.

At Colombo five joggles are cut in the blocks to prevent transverse movement.

At Madras the blocks of each sloping section are connected by a mortise and tenon 4½ inches wide by 2½ deep, but there was at first no lateral connection between the blocks, so that the breakwater was broken in 1881.

At Mormugao, in addition to the mortise and tenon, there were vertical joggles 15 inches square extending through the two upper courses, and the top course was united by cramps of 2-inch square iron and by vertical dowels 7 feet long. At Kustendjie the blocks extended through the entire width, and were not connected by any binding materials.

In these four places, after settlement had ceased, a coping of concrete in mass was spread over the upper ends of the blocks to protect them from the recoil of the falling waves.

At Mormugao there was a slight tendency for the angle of the slope to flatten and become concave at the second or third courses above the base.

At Colombo, Madras, and Manora no such tendency toward the slipping of the lower blocks and consequently flattening of the slope is alluded to in the description of these works.

At Colombo the ultimate settlement of the tops of the blocks was from 8 to 18 inches. This was allowed for by keeping the outer end of the work slightly higher when first laid.

At Madras the settlement was from 6 inches to 4 feet, the latter being over a yielding bottom of sand and mud.

At Manora the settlement was excessive, and was from 3 to 4 feet. At this locality the deposition of the rubble mound but slightly preceded the construction of the superstructure, and its settlement was not complete before the superstructure was added. In addition to this the sand bottom yielded to the rubble to an unexpected degree.

At Mormugao the settlement of the superstructure was from 1½ to 2 feet, and quite even in extent.

The principle of using sloping blocks, arranged in more or less vertical sections independent of each other, was devised to overcome the difficulty adhering to settlement and the resulting dislocation of blocks bonded and arranged in horizontal planes. Again, in the system of ordinary horizontal bond the outer end of the work required to be left in an unfinished condition from the necessity of stepping back the successive courses of masonry on each other. With the system of sloping blocks the outer end of the work is at all times in a closer and more secure condition.

The sloping-block system was first adopted at Manora in 1870, and directly afterward at Kustendjie, then at Madras and Colombo, and lastly at Mormugao in 1880.

Vernon-Harcourt, in discussing the various forms of breakwaters, says: "The mixed system (an upright wall founded upon a rubble mound) will probably have the most extended application; and of all varieties of the type the best appears to be a superstructure founded some 20 feet below low water, upon a simple rubble base, formed of large concrete blocks laid with overhanging cranes upon the sloping-block principle, securely connected vertically and horizontally, and capped with concrete in mass after settlement has ceased."

In setting concrete blocks two methods have been used—viz., from staging and from cranes. The great advantage possessed by cranes over staging upon exposed sites is that, while the latter must be left exposed to storms, the former can always be run back into shelter. And although the first cost of suitable cranes for handling heavy blocks is quite large, their use dispenses with the great labor, ultimate cost, and delay incident to the use of staging.

The advantage seems so entirely in favor of cranes that they have practically taken the place of staging in modern works. At Kustendjie alone staging was used, but the total length of the breakwater was only 253 linear feet, and the work would not have economically carried any large expenditure for plant.

Notwithstanding the success of these several precedents and the determination to use this method of closing the gap at the Delaware breakwater, a change of executive officers, involving a review of the project, has resulted in a return to the riprap mound, based upon its simplicity and economy. It was found that in the more recent work 101,713 gross tons of stone have made 86,700 cubic yards of fill, giving only 1·17 gross ton required per yard, as contrasted with 1·5 in the older parts of the work. This was tested by stones weighed into barges, resulting in 1·15 tons per yard. The usual unit being 100 lb. per cubic foot for broken stone of average specific gravity, it would give 1·18 tons to the cubic yard, thus confirming the later estimate of material. On this basis to complete the closure of the gap there would be required 79,000 tons below low water at $3.00, and 27,000 tons above at $4.00, with contingencies, amounting to $400,000 as compared with a minimum of $500,000 for the mixed rubble and block system. The section of the present proj-

ect, as approved by the division engineer, Col. William P. Craighill, is illustrated in Fig. 6.

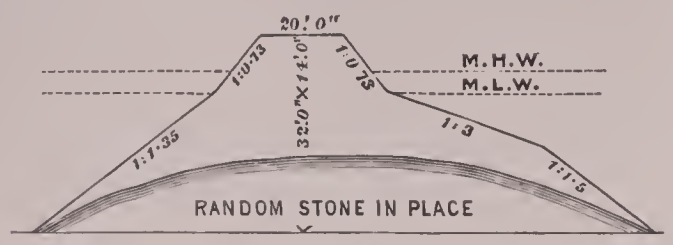

Fig. 6.

It is expected that the work will be completed in two years, and that the shoal, now stretching from the shore to the breakwater with depths of less than 15 feet, will be cut asunder by the currents aided by dredging.

Many other instances of riprap breakwaters might be cited, but they are mere modifications of those already alluded to. Probably one of the most important for its size and cost is that at Block island, at the eastern end of Long Island Sound, 14 miles from Montauk Point and 10 miles from Rhode Island mainland. The structure is only 1,000 feet long, having a gap 200 feet wide left between 300 and 500 feet from its outer end, which is to be closed. It was built between 1870 and 1879 at a cost of $354,125.59. This cost includes also the small inner harbor used by coasters and fishermen.

The Plymouth breakwater on the south coast of England was built in 30 feet of water at a cost of $1,470 per lineal foot. Between its commencement in 1812 and 1847, 3,600,000 tons of stone have been placed in the work, at a total cost, including the lighthouse, of $7,500,000. The breakwater is 5,100 feet long on top. The opening left on the western end is 4,300 feet and that on the eastern end is 2,200 feet wide, with depths of from 5 to 7 fathoms.

At Portland, England, the depth is twice as great (60 feet), but, the exposure being less, it has not been found necessary to cap the mound. The mean tide is 6¾ feet and the total height is 72 feet. The breakwater is massive, having a base of 340 feet, and containing 545 cubic yards per lineal foot. It was built under favorable circumstances, at a cost of $625 per foot, or $1.15 per cubic yard. The inner arm extends 1,700 feet to a gap of 400 feet, beyond which there is the outer mole, 6,400 feet in length, extending northward and inclosing an area of 2,130 acres, which constitutes the harbor. In this case one ton of the Portland stone was found to measure 20 cubic feet in the mound; hence one cubic yard would require 1·35 tons of stone.

Between 1849, when the work was commenced, and 1871, 5,731,000 tons were placed in the work. The mound was built from staging 18 feet above high water, supported on screw piles and carrying five lines of rails. The labor was furnished by convicts.

To reduce the quantity of material required for the mound, M. Poirel substituted concrete block at Algiers in 1834. Here a small island had been connected with the mainland in 1530 by a rubble mound 574 feet long and 118 feet wide on top. A rubble breakwater extended southward from the island 410 feet, inclosing a harbor of about 11 acres. But these structures required constant renewals. After the capture of Algiers by the French in 1830, concrete blocks, containing from 13 to 26 cubic yards, were used to protect the mole, and subsequently in reconstructing it a row of blocks in place was first laid in sizes varying from 80 to 260 cubic yards. Outside of this a row of heavy blocks was deposited, and the space between was filled with rubble. Behind this protecting mound a trench was excavated to 6½ feet below low water, which was filled with concrete in mass. It cost $400,000 for a length of 650 feet. The seaward extension of the northern breakwater was made by sinking blocks of 13 cubic yards directly in the sea. The outer slope was ¼, the inner ⅔. Since 1840 the harbor has been extended by curving the northern breakwater eastward 2,300 feet, and by building a southern wing out to meet it, leaving an opening of 1,115 feet in width for an entrance. The outer end of the breakwater is in 10 fathoms of water and the harbor covers 220 acres.

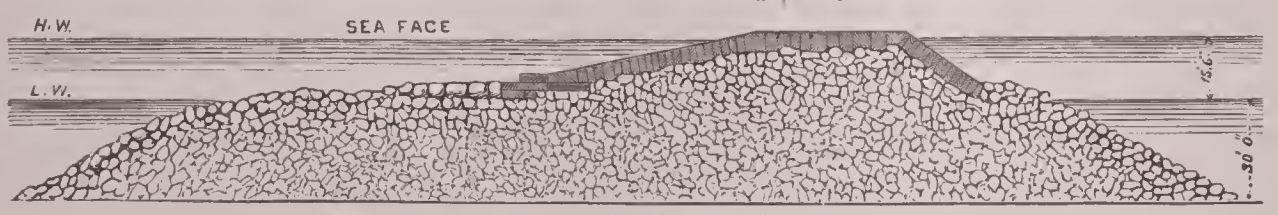

Fig. 7.—Section of the Plymouth breakwater.

In other situations destitute of suitable stone another form, the vertical-wall system, is adopted. In this mode the walls are built upright from the bottom, and as all the material below low water is put in place by diving apparatus, and is of an expensive nature, the cost of a work executed in this way is very great. The Dover breakwater is the most prominent example. It is built up solidly from the bottom of the sea, the exterior facing being of ashlar granite blocks, and the hearting of rectangular blocks of concrete, built in the same way as ashlar masonry up to the level of high water, above which it is filled in with concrete.

Concrete blocks are a costly substitute at best for rough quarry stone (when that is at hand), and with a system of construction which requires each block to be "laid" (under water) the expense must be very great. The Dover breakwater has cost over $2,000 per lineal foot.

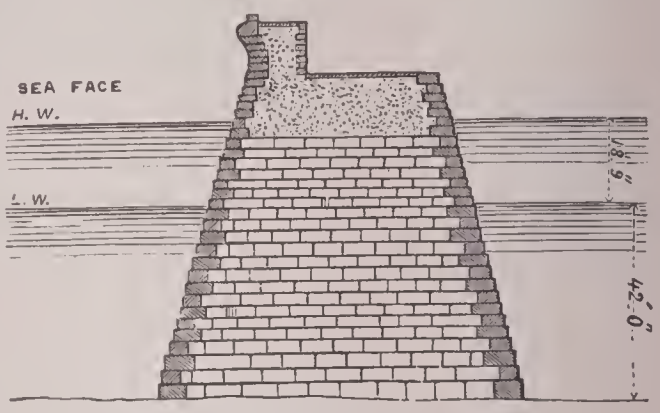

Fig. 8.—Dover (West) breakwater.

This method is only applicable where there is a good foundation sufficiently hard to resist the wave recoil and scour.

Floating Breakwaters.—Opinions differ greatly as to the utility of structures of this class, and the experience thus far is not very satisfactory, being based mainly upon wooden towers chained together and anchored. Many iron and steel forms have been patented, but not tried; among these may be mentioned that of the late Mr. Greenway Thomas, who designed floats in the form of a triangular prism with concave sides of 10 feet width and height, capped by a triangular pyramid. These buoys were anchored at three points and placed at intervals of 12 feet apart. Thus they were expected to decompose the waves and produce smooth water. An occasional expedient at sea is to lash spars and sails into a huge raft, in lee of which protection may be found. The use of oil is a well-known resort in severe storms, but these are temporary expedients belonging rather to the navigator than to the engineer.

In other cases floating iron caissons or cylinders have been suggested, revolving about horizontal axes, and having fins or flanges to check the rotation—but these only exist on paper. The estimated cost of these floating structures is about $100,000 per mile, so that if efficient they have much to commend them, as they can be placed in position rapidly, and may be shifted or removed without injury to channels or currents. The main objection urged to their use is the liability to break loose and injure shipping or other property.

Caissons or Cribs.—In fresh water, as on the Great Lakes, most of the breakwaters are composed of cribs framed on shore, and then towed to the site of the work and sunk. These are then filled with stone and covered with planks and caps, making piers as well as breakwaters. Where there are no teredo to eat up the timber, they form comparatively durable structures, but in sea water they will only last a few years, and hence are inapplicable. Here a temporary caisson may be used, filled with concrete or lined with walls, leaving cells to be filled with sand ballast. These large masses, weighing 400 to 500 tons, form a core, which may be prepared in a sheltered cove, and be towed in train to the work, and be scuttled, filled, and covered by riprap, making a rapid and cheap mode of construction, capable of be-

ing carried on continuously by day and night, and avoiding the scour incidental to the embankment method of building out. A breakwater constructed on this plan could be built for less than $1,000,000 per mile in 30 feet depth.

Foundations for breakwaters upon shifting or irregular bottoms have been constructed of concrete in bags, deposited from large hollow barges capable of handling masses weighing from 50 to 100 tons at a time, and upon these have been erected monoliths of concrete in mass, with parapet and covered way, as at Newhaven, Aberdeen, Fiume in Austria, etc.

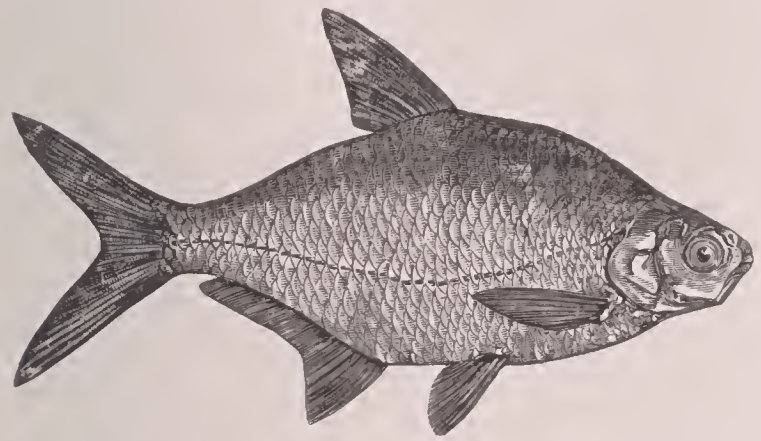
Bream [Fr. *brême* < O. Fr. *bresme*; of Germ. origin]: a name given to several species of fishes. One is a fresh-water fish of the family *Cyprinidæ*, the *Abramis brama*. It is



The bream.

found in many rivers and lakes of Europe. Related species (*Notemigonus*) occur in North America. The name sea-bream is given to various European fishes of the genera *Pagellus*, *Spondyliosoma*, *Brama*, etc. The name bream or brim is also often applied in the East and South to species of *Lepomis*, or sunfish (see Sunfish), fresh-water fishes of the U. S., remarkable for beautiful colors, and esteemed for food.

Revised by David S. Jordan.

Breast: See Mammary Glands.

Breast, Abscess of: chiefly due to infection through fissured nipple of a breast overfilled with milk. It is prevented by care and cleanliness, and best treated by a brisk purge, support to the breast, quinine, febrifuges and the unloading of the breast, thorough rubbing, and inunctions of warm camphorated oil. When abscess is formed, it must be poulticed or incised.

Revised by William Pepper.

Breast Wheel: in hydraulics, a water-wheel so placed as to be struck by the stream of water nearly on a level with the axle, the lower quadrant of the circumference on the side opposed to the stream being placed in a race or channel concentric with the wheel, through which the water is conducted in its descent. See Water-power.

Breastworks: See Fortifications.

Breath: See Respiration.

Brechin, brech'in: a town of Forfarshire, Scotland; on the left bank of the South Esk; 38 miles by rail S. S. W. of Aberdeen (see map of Scotland, ref. 9–I). It stands on an abrupt declivity, and some of the streets are very steep. It has a cathedral, part of which was built in the thirteenth century, now used as a parish church. Adjacent to this church is a remarkable round tower 85 feet high, and surmounted by a spire of 25 feet. Here are manufactures of linens and sailcloth, bleaching-works, etc. It is the seat of a bishop of the Scottish Episcopal Church. Pop. (1891) 8,955.

Breck, James Lloyd: Episcopal clergyman and pioneer educator; b. in Philadelphia, June 27, 1818; educated at Flushing, L. I., by Dr. Muhlenberg, and at the General Theological Seminary, New York; with two or three others formed an ascetic associate mission for frontier work; they founded Episcopal schools at Nashotah, maintained at first by receipts through the mail. In 1850 Dr. Breck moved to Minnesota, and founded at Crow Wing a mission to the Chippewas; eight years later he began the church schools at Faribault; in 1867 went to California, opened an associate mission at Benicia, and founded schools for youth of both sexes; here he died Mar. 30, 1876. He was an advanced High Churchman of monastic spirit and unusual zeal.

Breck'enridge: village and railroad junction; capital of Wilkin co., Minn. (for location of county, see map of Minnesota, ref. 6–A); on the Red River of the North; 217 miles W. N. W. of St. Paul. Steamers ply between this point and the Manitoba settlements. Pop. (1890) 655; (1900) 1,282.

Breckinridge, Gen. James: a soldier of the Revolution; b. near Fincastle, Botetourt co., Va., Mar. 7, 1763; graduated at William and Mary College in 1785; became an eminent Federalist lawyer in Virginia. He was a member of Congress (1809–17), and co-operated with Jefferson in establishing the University of Virginia. He was one of the originators of the Chesapeake and Ohio Canal. D. in Fincastle, Va., Aug. 9, 1846.—His brother John (1760–1806), a U. S. Senator from Kentucky, Attorney-General to President Jefferson, and a supporter of his measures, was the ancestor of the Kentucky Breckinridges named below.

Breckinridge, John, D. D.: Presbyterian divine and polemic; b. at Cabell's Dale, Ky., July 4, 1797; graduated at the College of New Jersey, Princeton, in 1818; studied at the Princeton Theological Seminary 1819–21; was tutor in the college 1820–21; chaplain to Congress 1822–23; pastor in Lexington, Ky., 1823–26; in Baltimore, Md., 1826–31; corresponding secretary of the board of education 1831–36; Professor of Pastoral Theology in Princeton Theological Seminary 1836–38; secretary of board of foreign missions 1838–40; president of the African Colonization Society; and at the time of his death president-elect of Oglethorpe University, Georgia. D. in Cabell's Dale, Ky., Aug. 4, 1841.

Breckinridge, John Cabell: statesman and general; grandson of John, noted above; b. near Lexington, Ky., Jan. 21, 1821. He studied law; practiced at Lexington, and was elected to Congress by the Democrats in 1851. He was chosen Vice-President of the U. S. in 1856, when James Buchanan was elected President. In 1860 he was nominated for the presidency by the Anti-Douglas Democrats who seceded from the convention that met at Charleston. His competitors were Abraham Lincoln, John Bell, and Stephen Douglas. Breckinridge received seventy-two electoral votes, being supported by all the Southern States except Virginia, Kentucky, Tennessee, and Missouri. Having been elected to the U. S. Senate, he took his seat in Mar., 1861; but he joined the Confederate army in the autumn of that year. He served as major-general at the battle of Stone river, which ended Jan. 2, 1863, and at Chickamauga, Sept. 19 and 20 of that year. In May, 1864, he defeated Gen. Sigel at Newmarket, in Virginia. He became secretary of war at Richmond in Jan., 1865; visited Europe about five months later; returned to the U. S. in 1868. D. in Lexington, Ky., May 17, 1875.

Breckinridge, Robert Jefferson, D. D., LL. D.: Presbyterian minister; b. at Cabell's Dale, Ky., Mar. 8, 1800; an uncle of the preceding. He graduated at Union College in 1819; practiced law in Kentucky eight years (1823–31); then turned to theology, and was pastor in Baltimore 1832–45; president of Jefferson College 1845–47; became pastor in Lexington, Ky., in 1847, Professor of Theology at Danville in 1853; resigned 1869. He published *Travels in Europe* (Philadelphia, 1839) and several works on theology. His principal work is in two volumes, *The Knowledge of God, Objectively Considered* (New York, 1857), and *The Knowledge of God, Subjectively Considered* (1859). He was a loyal friend of the Union in the civil war and presided over the convention in Baltimore which in 1864 renominated Mr. Lincoln. D. in Danville, Ky., Dec. 27, 1871.

Breckinridge, William Campbell Preston, LL. D.: Congressman; b. in Baltimore, Md., Aug. 28, 1837; studied at Centre College, Danville, Ky.; became a lawyer; served in the Confederate army as colonel of the Ninth Kentucky Cavalry; was afterward Professor of Equity Jnrisprudence in Cumberland University: represented Seventh District, Kentucky, from 1886 till 1895.

Brec'on, or **Breck'nockshire**: an inland county of South Wales; area, 719 sq. miles. It is bounded N. by Radnor, E. by Hereford, England; S. by Glamorgan, and W. by Caermarthen. The surface is occupied by several mountain-ranges and deep, beautiful, and fertile valleys. The highest point of this county is Brecknock Beacon, which has an altitude of 2,862 feet. Old red sandstone underlies the southern and middle parts of the county, and Silurian rocks are found in the N. The chief rivers are the Wye (which forms the N. E. boundary), the Usk, Elan, and Tawe. The staple products are oats, barley, wheat, and cattle. It has extensive iron-works. The climate is moist, but temperate and salubrious. Capital, Brecon. The other principal towns are Builth, Crickhowell, and Hay. The Welsh language is still that of the peasantry and of the middle class. Pop. (1891) 57,031.

Brecon, **Brecknock**, or **Aber-Honddu**: a town of Wales; capital of county of same name; finely situated in a valley on the river Usk; at the mouth of the Honddu; 38 miles by rail W. S. W. of Hereford (see map of England, ref. 11–E). It has beautiful promenades, an old castle, a collegiate church, and a college; also considerable manufactures. Pop. 6,500.

Breda': a town of Holland; in North Brabant; situated at the confluence of the navigable rivers Aa and Merk; 16 miles S. S. E. of Dordrecht (see map of Holland and Belgium, ref. 7–E). It is connected by railway with Antwerp and The Hague. It has a castle built in 1350, a Gothic cathedral, the spire of which is 362 feet high, and a magnetic observatory; also manufactures of linens, carpets, hats, soap, leather, etc. This town can be protected against an invading army by inundating the country around it. It is celebrated as the scene of the "Compromise of Breda," by which the patriots protested against the tyranny of Philip II. in 1566, and as the place from which Charles II. issued the "Declaration" which preceded his restoration in 1660. Pop. (1891) 22,536.

Bredahl, bray-daal', Christian Hviid: Danish poet; b. Oct. 30, 1784; d. Jan. 16, 1860. *Dramatic Scenes*, in six parts, appeared, the first in 1819 and the last in 1833. This is his chief work, and there are passages in it that by their glowing pathos and powerful diction remind us of Shakspeare. He wrote several dramas that were well received by the public. Rasmus B. Anderson.

Bredero, Gerbrand Adriaensz: Dutch poet and playwright; b. in Amsterdam, 1585: d. in Amsterdam, 1618. He belonged to the middle class, and his education was comparatively meager. Like Shakspeare, he knew "small Latin and less Greek." He was trained to be a painter, but his heart was in literature. The defects of his education were in a measure made good by association with the best spirits of his time—Grotius, Heinsius, Scriverius, Vondel, Coster; and his talents were such that he became the best writer of comedy Holland has produced. Still, his lack of the classics made him essentially mediæval and romantic in his sympathies, as is shown by the themes of his plays. These fall into two classes: tragi-comedies (essentialy *comedias de capa y espada*)—*Rodderijk ende Alphonsus* (1611); *Griane* (1612); *Lucette* (1616); *de Stomme Ridder* (1618)—and pure comedies: *de klucht van de Koe* (1612); *Symen sonder soeticheyt* (1612); *van de Meutenaer* (1613); *Het Moortje* (based on the *Eunuchus* of Terence, 1615); *de Spaensche Brabander Jerotimo* (based on a French trans. of Hurtado de Mendoza's *Lazarillo de Tormes*, 1617). The last piece is commonly regarded as Bredero's *chef d'œuvre*. Besides his plays, Bredero wrote poems in a singularly direct and imaginative style; and these were published in 1622 under the title *Boertigh amoureus ende aendachtigh groot liedtboeck*. His complete works were published in Amsterdam, 1638, and often since. See J. ten Brink, *G. A. Bredero, hist.-aesth. studie van het nt. blijspel der XVII. eeuw* (Utrecht, 1859). A. R. Marsh.

Bree, bray, Mathieu Ignace: Flemish historical painter; b. at Antwerp, Feb. 22, 1773. Among his works are *Rubens Dictating his Last Will* (in the Antwerp Museum); *Entrance of Napoleon into Antwerp*; and *Van der Werff Addressing the Famished Populace during the Siege of Leyden, 1574*. He was director of the Academy of Fine Arts in Antwerp, where he died Dec. 15, 1839.

Breeches Bible: See Bible (*Modern Versions*).

Breech-loading Firearms are those which are loaded by putting the cartridge directly in at the breech instead of ramming it in at the muzzle. It is said that breech-loading guns were used early in the reign of Henry VI. of England, and it is certain that they were used in Scotland about that time. There are several ancient specimens in the Tower of London. Many attempts to improve this kind of arms have been made, and of late with much success. Among the most celebrated weapons of this character are the Armstrong and Whitworth guns, the Krupp steel guns, the *mitrailleuse*, and among small-arms the needle-gun and the Chassepot, Enfield, Grecner, Lebel, Martini, Mauser, Sharps, Snider, Spencer, Ward-Burton, and Remington rifles.

Breed: a variety produced in any animal species in consequence of domestication, by changes somewhat analogous to those which occur in cultivated plants. The changes originated by breeding (artificial selection) are in some species, as in the dog and pigeon, very marked, producing external, and even structural, differences which, if they were permanent and originated by natural and unexplained causes, would confessedly be regarded as sufficient to establish difference of species or even genus. But the fact that thoroughbred animals, when neglected or allowed to go wild, tend to revert to the original type, and the not less important fact that animals of the most widely different varieties of the same species will (with a few possible exceptions) breed freely with each other, producing fertile young (which is rarely the case with those of different species), are by many held to show a radical difference between varieties or breeds and species. The study of the variations produced by artificial selection suggested to Darwin the name "natural selection" as applied to analogous processes in nature.

Some of the results of artificial selection on animals are truly marvelous. The numerous varieties of the dog and the pigeon have been, to a great extent, produced by design; animals being bred to develop certain desired peculiarities, the principle being that "like produces like," or that certain qualities possessed by the parent may be perpetuated and increased in the offspring. The milk-producing qualities of the Ayrshire cow, the butter-making excellence of the Jersey breed, the long-wooled Cotswold sheep, and the new breeds of easily fattened swine, afford illustrations of the industrial importanec of this remarkable plasticity or adaptability of the various domestic animals—an adaptability which has only of late been scientifically studied, and the limitations of which are as yet not well known. See Darwin, *Domesticated Animals and Cultivated Plants* (1867).
Revised by David S. Jordan.

Breed, David Riddle, D. D.: Presbyterian minister; b. in Pittsburg, Pa., June 10, 1848; graduated at Hamilton College (1867), and from Auburn Theological Seminary (1870); pastor in St. Paul, Minn. (1870–85), and in Chicago, Ill., from 1885; has published several little books, one of which, *More Light*, has a very wide circulation in a number of languages. He has also published *Abraham, the Typical Life of Faith* (Chicago, 1886); *A History of the Preparation of the World for Christ* (1891); and *Heresy and Heresy* (1891).

Breese, Kidder Randolph: captain U. S. navy; b. in Philadelphia, Apr. 14, 1831; entered the navy as a midshipman Nov. 6, 1846. At the close of 1861 he commanded the third division of Porter's mortar flotilla; took part in the bombardment of Forts Jackson and St. Philip; participated in the attacks on Vicksburg during June and July, 1862; took part in nearly all the severe engagements on the Mississippi and its tributaries during 1863 and 1864; was engaged as fleet-captain in the naval assault on Fort Fisher of Jan. 15, 1865, and commanded the storming party. D. at Newport, R. I., Sept. 13, 1881.

Breese, Samuel Livingston: rear-admiral U. S. navy; b. in New York in 1794; entered the navy in 1810; served against Great Britain and Mexico; became captain in 1841, and rear-admiral in 1862. D. at Mt. Airy, Pa., Dec. 17, 1870.

Breese, Sidney: b. at Whitesboro, Oneida co., N. Y., July 15, 1800; graduated at Union College in 1818. In 1821 he was called to the Illinois bar; attained distinction; an officer in the Black Hawk war, U. S.; State attorney 1822–27; appointed U. S. attorney for Illinois; U. S. Senator from Illinois (1843–49); speaker of the Illinois Legislature

in 1850. He was made circuit judge in 1835, and again in 1855, becoming chief judge of that bench. He was one of the originators of the Illinois Central R. R. D. at Pinckneyville, Ill., June 27, 1878.

Breeze: a soft wind, a gentle gale. *Land and Sea Breezes.*—In a fair day, near the seashore, an hour or two after sunrise, a gentle wind begins to blow from the sea toward the land, gradually increasing in force during the day. With the declining sun the sea-breeze loses its power, and dies out before sunset. A lull then ensues, after which a land-breeze sets in from the land toward the sea, and continues all night until before sunrise, when another calm occurs. The cause of these alternate winds is to be found in the fact that the land is more readily heated by the rays of the sun, and more quickly cooled in their absence, than the sea. In an island, for instance, in proportion as the sun rises above the horizon the land becomes warmer than the neighboring sea. Their respective atmospheres participate in these unequal temperatures; the fresh air of the sea rushes from all directions in the form of a *sea-breeze*, which makes itself felt along the whole coast, and the warmer and lighter air of the island will ascend into the atmosphere. During the night it is the reverse. The island loses heat by radiation, and cools quicker than the sea. Its atmosphere, having become heavier, flows into that of the sea in the form of a *land-breeze*; and this interchange lasts until the temperature, and consequently the density, of the two atmospheres has again become the same. This is the phenomenon observed almost daily on nearly all the seaboards.

Mountain-breezes.—Similar alternate breezes are observed to play between the great mountain-chains and the neighboring plains, as in the Alps. On a fair day strong breezes rush up the valley toward the overheated mountain-slopes, and descend with equal force during the night; for during the day the mountains absorb more heat than the neighboring free atmosphere, and radiate more during the night. See Winds.

Brehm, braym, Alfred Edmond: b. at Renthendorf, Saxe-Weimar, Feb. 2, 1829; studied natural history under his father, the famous ornithologist, Christian Ludwig Brehm; traveled in Egypt, Nubia, and the Sudan; visited Spain and Norway; went once more to Africa in 1862 in company with Duke Ernst of Saxe-Coburg-Gotha; was made director of the zoölogical garden in Hamburg 1863, and removed in 1867 to Berlin, where he founded the great aquarium. He published *Illustrirtes Thierleben* (6 vols., 1863), which was translated into French, and of which a new edition in 10 vols. appeared in 1868; *Das Leben der Vögel*, *Die Thiere des Waldes*, etc. D. in his native place, Nov. 15, 1884.

Brehon Law: the law by which Ireland was governed generally before the conquest, and to some extent as late as the eighteenth century. It was so called from the brehons who expounded it, and who were a class of jurists or law professors existing among the Irish according to a system common to the Gauls, Britons, and other Keltic nations. The office of brehon was often hereditary in families, and was of great importance, partly because the brehons preserved the laws in written form and not by tradition, as was the case with the bards, who also were clothed with a certain legal authority. The brehons were still in the full exercise of their functions as late as the reign of Elizabeth, as is shown by the Government records at Dublin, and traces of them are found in the early part of the eighteenth century. The largest body of these laws is preserved in a Gallic manuscript called *Shanchus Mór*, which was compiled in the first part of the fifth century. This manuscript, together with others, has been published in fac-simile and translated by a royal commission appointed in 1852, not, however, without numerous errors, owing to a lack of profound knowledge of old and modern Gaelic, and to the obscurity of the subject-matter. These show us that there existed in ancient Ireland a system of laws in which the property and personal rights of individuals were minutely regulated. There was a complicated system of land-tenure from monarch to slave through landlords and tenants, under which much of the land was held in common for tillage or pasturage. There were petty kingdoms, and divisions and sub-divisions of these, held together in a system not unlike the feudal system of England, but more loosely organized. The grades of rank were numerous, and the right to claim a certain rank depended upon the possession of a fixed amount of cattle, agricultural implements, and household goods. The laws governing marriage allowed great liberty to the husband in contracting irregular relations. They gave to the wife the right to alienate a portion of her separate estate, and to control to some extent her husband's right of alienation. The provisions governing the distribution of the estates of deceased persons were very minute, but obscure by reason of the technicality of the language employed. The putting out of children to be nursed and educated, which was practiced by the rich, was regulated with great particularity by laws which prescribed the fees to be paid, the instruction to be given to the children, the conditions upon which they could be returned before the end of pupilage, etc. In the law of torts all offenses, except murder, were condoned by fines or mulcts, and the amounts of these fines and the persons responsible for their payment were prescribed, in some cases the family being made liable therefor, and in other cases sureties somewhat after the manner of the old English institution of frank-pledge. The nature of the courts by which these laws were enforced was not clearly stated; the process, however, is more fully outlined, and included distress and other proceedings, in principle resembling the common law of England. This ancient body of laws is valuable for the light it throws upon the customs of the people and their household and public life, and upon the history of totemism, feudalism, the evolution of the clan, tribe, and state, and other kindred subjects. See Sir Henry S. Maine's *Lectures on the Early History of Institutions.*

F. Sturges Allen.

Brei'tenfeld: German village; 5 miles N. of Leipzig; the scene of two victories of the Swedes over the Imperialists, the first by Gustavus Adolphus over Tilly, Sept. 17, 1631, the second by Torstenson over Archduke Leopold and Piccolomini, Nov. 2, 1642. It also figured in the battle of Leipzig, Oct. 16, 1813.

Brei'tinger, Johann Jacob: German critic; b. in Zurich, Mar. 1, 1701. He was a friend and a collaborator of Bodmer. His chief work is the *Critische Dichtkunst* (Zurich, 1740), in which he expounds the æsthetic principles which helped to revolutionize German poetry. See Braitmaier, *Geschichte d. poet. Theorie*, etc., 1888. D. in Zurich, Dec. 15, 1774.

Julius Goebel.

Breitman, Hans: See Leland, C. G.

Brem'en: a state and free city of Germany; on both sides of the river Weser; about 45 miles from the sea and 60 miles S. W. of Hamburg; lat. 53° 4′ 36″ N., lon. 8° 48′ 54″ E. Area, 99 sq. miles (see map of German Empire, ref. 3–D). The city is divided into the old and the new town, the former of which is on the right bank of the river, and has narrow, crooked streets. The new town, which is connected with the old by two bridges, is more regular. The old ramparts have been leveled and converted into beautiful promenades and pleasure-grounds. The most remarkable edifices are the cathedral, built about 1,100; the fine old Gothic town-hall, with a famous wine-cellar; the exchange, the museum, and the observatory of Olbers. Bremen has a large public library, a normal school, a theater, and a hospital; also manufactures of woolen and cotton goods, beer, liquor, sugar, paper, starch, and cigars. As a commercial city this is one of the most important of Germany, having an extensive foreign trade, especially with the U. S., to which it ships about half of the total German emigration. It is connected by railway with Hanover, Bremerhaven, and other towns. Vessels drawing 7 feet of water can ascend to this point; large ships stop at Bremerhaven. The trade of Bremen has increased rapidly in the last fifteen years. The chief articles of export are woolen goods, linens, glass, hemp, hides, rags, wooden toys, and wool. The imports consist of cotton, coffee, sugar, rice, tobacco, wines, dyewoods, oil, tea, etc. Ship-building is carried on here extensively. The imports in 1890 amounted to 749,938,507 marks, and the exports to about 706,600,000 marks. The number of emigrants that embarked here in 1890 was 140,410. Pop. of city proper (1890) 124,887; (1895) 141,894.

Bremen was founded before 788 A. D., and was made a bishopric by Charlemagne. It was one of the chief towns of the Hanseatic League. In 1815 it was admitted into the Germanic confederation by the Congress of Vienna. In 1888 it joined the German Zollverein. The government of this city and the territory attached to it is a nominal republic, the total population of which in 1890 was 180,443. It is governed by a senate, forming the executive, and a house of burgesses, invested with the power of legislation.

Revised by C. K. Adams.

Bremen: town; Marshall co., Ind. (for location of county, see map of Indiana, ref. 2–E); on Balt. and Ohio R. R.; 13 miles N. E. of Plymouth, the capital of the county. It is a manufacturing town in an agricultural and lumbering district. Pop. (1880) 1,028; (1890) 1,076; (1900) 1,671.

Bremer, Fredrika: a popular Swedish novelist; b. in Åbo, Finland, Aug. 17, 1801. She was educated at Stockholm, and became in early youth familiar with German literature. Her first story, *Axel and Anna*, appeared in 1828 as No. 1 of *Sketches from Every-day Life* (*Teckningarutur hvardagslifort*), a general title under which she continued to publish stories until 1848. Some of the best known of these sketches are *The President's Daughters* (*Presidentens döttrar*, 1834); *Nina* (1835); *The Neighbors* (*Grannarne*, 1837); *Home* (*Hemmet*, 1839); *Brothers and Sisters* (*Syskonlif*, 1848). *The Bondmaid* (*Trälinnan*, 1840) is in another style. Miss Bremer visited the U. S. in 1849, and after her return to Sweden published *The Homes of the New World* (*Hemmen i den nya verlden*, 1853–54). *Hertha* appeared in 1856, and *Father and Daughter* (*Fader och Dotter*) in 1858. D. at Arsta, near Stockholm, Dec. 31, 1865. Most of Miss Bremer's stories have been translated into English, French, and German. See her *Life, Letters, and Posthumous Works*, edited by her sister Charlotte (New York, 1868).

Bremerha'ven: a town and port of Germany; on the right bank of the Weser, near its mouth; about 35 miles N. N. W. of Bremen (see map of German Empire, ref. 2–D). It is a part of the state of Bremen. It has an outer and an inner harbor, built by the citizens of Bremen (1827–30) for the accommodation of large ships which can not ascend the river. Pop. (1890) 16,335.

Brendan: See St. Brendan.

Brenham: city; capital of Washington co., Tex. (for location of county, see map of Texas, ref. 5–I); on Hous. and Tex. Cen. and Gulf, Col. and Santa Fé R. Rs.; 70 miles S. W. of Houston. It is in a fertile region adapted to the growth of cotton, corn, and small grain; has fine public school, large cotton-seed oil-mill, 2 cotton compresses, 2 foundries, electric-light system, and a number of small factories. Pop. (1880) 4,101; (1890) 5,209; (1900) 5,968.

Editor of "Banner."

Bren'ner Pass: lowest pass in the main chain of the Alps; on the route between Innspruck and Botzen; 4,775 feet above the level of the sea. The mountains on each side rise about 7,500 feet above the pass, which is open at all seasons of the year. In 1868 a railway was opened through this pass from Innspruck to Botzen, at which point it connects with the railways of Germany and Italy. At the summit of the pass is the small village of Brenner.

Bren'nus [Celt., king]: a famous chief of the Senones, a tribe of ancient Gauls who crossed the Apennines in 390 B. C., invaded the Roman state and defeated its army. Brennus then captured Rome, except the capitol, which he besieged for about six months. During this siege he attempted to surprise the garrison by night, but he was repulsed by Manlius, who was awakened by the cackling of some geese. The Romans purchased peace by the payment of 1,000 pounds of gold. To increase the price Brennus is said to have thrown his sword on the scale. See, on this subject, Arnold's *History of Rome*.

Brennus: a Gallic chief who invaded Greece with a large army about 280 B. C., and ravaged Macedonia and Thessaly. He was defeated at Delphi by the Greeks, who were said to have been aided by an earthquake.

Brenta'no, Clemens: German novelist and dramatist; b. in Frankfort-on-the-Main, Sept. 9, 1778. He was a brother of Goethe's friend, Bettina von Arnim; was a romanticist, and with unsettled mystic tendencies, so that for six years his dominant task was recording the revelations of the nun of Dülmen. He produced dramas entitled *Ponce de Leon* (1804) and *The Foundation of Prague* (1816). Among his admired novels is *The History of Caspar the Brave and the Fair Annerl*. In conjunction with Arnim he published the collection of ballads called *Des Knaben Wunderhorn* (1806–08; 2d ed. 1815). D. in Aschaffenburg, June 28, 1842.

Brentano, Lujo: economist; b. in Aschaffenburg, Bavaria, Dec. 18, 1844; educated at Dublin and at German universities; professor in Breslau 1872, in Strassburg 1882, in Vienna 1888, in Leipzig 1889, in Munich 1891. Author of work on *English Guilds* (1870); *Die Arbeitergilden der Gegenwart* (1871–72); *Das Arbeitsverhältnis gemäss dem heutigen Recht* (1876); *Die Arbeitsversicherung* (1879); and other works on English and German social questions.

Brentford: a market-town of England; capital of Middlesex; on the Thames; at the mouth of the Brent; 7 miles W. S. W. of London (see map of England, ref. 12–J). It is connected with Kew by a bridge across the Thames; has large gin-distilleries and the works of the West London Water Company. It consists mostly of one long street. The town is rich in historical interest, and has frequently been alluded to by Shakspeare and other dramatists. Pop. (1891) 13,736.

Brenton, William: colonial Governor; emigrated to Boston from Hammersmith, England; held important offices in Massachusetts and Rhode Island, where he was several times Lieutenant-Governor. He was President of Rhode Island (1660–61) and Governor (1666–69); acquired large estates as a surveyor; name perpetuated in Brenton's Reef. D. in Newport, 1674.

Brenz (in Lat. *Brentius*), Johann: German reformer; b. at Weil, in Swabia, June 24, 1499; was educated at Heidelberg, and became a Protestant under Luther's influence. He was a popular preacher at Halle, in Swabia, from 1522 to 1546, until, with the outbreak of the Smalcald war, he became an exile. Called by Duke Christopher to Stuttgart in 1553 as provost of the cathedral church, he thoroughly reorganized the Würtemberg Church, giving it its Church Orders, Confession, and Catechism. He participated in many theological conferences, and wrote extensive volumes of expository lectures. In his defense of Luther's doctrine of the Lord's Supper he is sometimes charged with being a Ubiquitarian. D. in Stuttgart, Sept. 17, 1570. See his *Life* by J. Hartmann (Elberfeld, 1862).

Revised by Henry E. Jacobs.

Bres'cia: a province of Lombardy, Italy; bounded N. by the Tyrol, E. by Lago di Garda and Verona, S. by Cremona, and W. by Bergamo. Area, 1,644 sq. miles. The soil is fertile. Silk and wool are among the staple productions. It has manufactures of woolen goods, firearms, and cutlery of superior quality. Capital, Brescia. Pop. (1890) 501,531.

Brescia (anc. *Brixia*): a handsome city of Lombardy, Italy; capital of province of same name; pleasantly situated on a wide plain and on the river Garza; 62 miles by rail E. N. E. of Milan (see map of Italy, ref. 2–C). It is on the railway which connects Milan with Venice. It has an old cathedral, a mediæval structure, and a new marble cathedral (Duomo Nuovo) commenced in 1604; also many churches richly adorned with works of art by celebrated masters, an episcopal palace, a college, a renowned public library (Biblioteca Quiriniana), a museum of antiquities, a botanic garden, and a theater. The Temple of Hercules, dating from the second century, was excavated in 1822, and is an archæological museum. Here are manufactures of cutlery, silk, linen, and woolen fabrics, paper, and wine. The streets and public squares are adorned with numerous fountains. Brixia was a very ancient town, and was the capital of the Cenomanni, a Gallic tribe. It was plundered by Attila, but soon recovered from this injury. The Emperor Otho I. declared it a free city about 936. It was bombarded and taken by the Austrian general Haynau in 1859. Pop. (1890) 43,354.

Bres'lau, or **Breslaw** (in Lat. *Bratislavia*; Polish *Wraclaw*): a large city of Prussia; capital of Silesia; on the river Oder; at the mouth of the Ohlau; and on the railway from Berlin to Vienna; 221 miles by rail S. E. of Berlin; lat. (of observatory) 51° 6′ 56·5″ N., long. 17° 2′ 18″ E. (see map of German Empire, ref. 5–I). It is, next to Berlin, the most populous city of Prussia. It is divided by the Oder into the old and new towns, which are connected by numerous bridges. The new town has wide and regular streets. It is the seat of a Roman Catholic bishop. The most remarkable edifices are a cathedral founded in the twelfth century, St. Elizabeth's church, the theater, the Rathhaus, exchange, mint, and university buildings. The university has a library of 350,000 volumes. Breslau contains other public libraries, an observatory, a botanic and zoölogical garden, four gymnasia, and numerous other schools of different kinds. It has an extensive trade, and is the greatest market for wool in Germany. It has manufactures of woolen, linen, cotton, and silk fabrics, broadcloths, lace, jewelry, soap, earthenware, starch, and ardent spirits. The number of distilleries in it is about 100. Railways extend to Dresden, Posen, Warsaw, and Vienna. Breslau is first mentioned by Dit-

mar, the chronicler, in 1000 A. D., and it seems to have been founded about that date. It became the seat of a bishop in 1052, and the capital of an independent duchy in 1163. Reduced to ashes by the Mongolians in 1241, it recovered, and in 1261 joined the Hanseatic League. In 1335 it came under Bohemia, and after the battle of Mohacz it passed to Austria. In 1741 it was taken by Prussia. Pop. (1890) 335,186; (1895) 373,163.

Brest (Lat. *Brestum*): a fortified city and seaport of France; department of Finistère; 314 miles W. of Paris (see map of France, ref. 3–A); said to be the strongest military port in France. It is on the north shore of the road of Brest, in lat. 48° 23′ N., lon. 4° 29′ W. Its outer harbor is one of the best and most capacious in Europe, having ample room for 500 ships of the line. The harbor or road communicates with the ocean by a single channel called the Goulet, which is 1,750 yards wide. In the middle of this channel are the Mignan rocks, which render the entrance of hostile ships very difficult and dangerous. The outer harbor or roadstead is about 6 miles long, and is defended by powerful batteries. The inner harbor is also secure and spacious. From its natural advantages and the strength of its defensive works, Brest is considered one of the first naval stations of Europe. Here are five large basins, extensive quays, an arsenal, vast magazines, large barracks, and a prison, the Bagne, which can accommodate 4,000 convicts. Brest is the western terminus of a railway which extends to Paris viâ Rennes and Le Mans. The city is built on the slopes of several hills, and is divided into two parts, which can communicate only by boats. It is encircled by ramparts, which, being planted with trees, form pleasant promenades. It has a naval school, a medical school, a communal college, besides numerous other schools, a public library, a botanic garden, an observatory, etc. This port has little trade except for the supply of the naval department, and its industry is confined to the equipment of the navy. This place was not of much importance until Cardinal Richelieu commenced in 1631 the fortifications, which were completed by Vauban. A submarine telegraph cable connects this harbor with Duxbury, Mass. Pop. (1881) 66,110; (1891) 75,854; (1896) 74,538.

Brest Litovsk′: a town of Russia; province of Grodno; 92 miles S. of Grodno (see map of Russia, ref. 8–B). It has several factories and considerable river trade, and is the seat of a United Armenian bishop. Pop. 39,901.

Bretagne (in Lat. *Britannia Minor*), usually called **Brit′tany** in English, or **Little Brittany**: a former province of France; extensive peninsula; bounded N. by the English Channel, and W. and S. W. by the Atlantic Ocean. It is now comprised in the departments of Finistère, Côtes-du-Nord, Morbihan, Ille-et-Vilaine, and Loire-Inférieure. It was divided into Haute-Bretagne (Upper Brittany), capital Rennes, and Basse-Bretagne (Lower Brittany), capital Vannes. Among the other towns are Brest, Quimper, and St.-Malo. The surface is partly mountainous, and the scenery wild and beautiful. This province, which in ancient times was called *Armorica*, was settled by the Cymri, a Celtic race to which the ancestors of the Welsh belonged. It contains large tracts of heath nearly uncultivated, and extensive forests. The outline is indented with numerous bays and inlets, which afford facilities for navigation and commerce. Brittany abounds in ancient monuments and cromlechs, which are ascribed to the Druids. The modern Bretons are tenacious of their ancient customs and peculiarities, and are generally Catholics. They are more loyal and devout than the majority of the French. Their language (the Armorican) is peculiar, and closely resembles the Welsh. This region and its people have a special interest for antiquarians. It became subject to the Franks in the time of Charlemagne. In 848 A. D. Nominoé, an Armorican chief, assumed the title of King of Bretagne, and defeated the army of King Charles the Bald. The Normans conquered it in the tenth century.

Geoffroi, Count of Rennes, became in 992 the first Duke of Bretagne, which continued to be an almost independent feudal duchy until it was annexed to France in 1531. Pop. (1891) 3,162,272. See Daru, *Histoire de Bretagne* (1826); Courson, *Histoire des Peuples Bretons, etc.* (1847).

Brethren: See Plymouth Brethren (so called); also Dunkers and United Brethren in Christ.

Brethren and Sisters of the Free Spirit: a sect of extremely pantheistic and immoral semi-monastic enthusiasts, which probably originated in the sect of Almericians, followers of Amalric of Bena, who died in 1209. Their principal doctrines were, according to the testimony of their Catholic prosecutors, our only source of knowledge: (1) God is all that is; (2) man is therefore God; (3) through sin (origin unexplained) there has come about a separation between man and God; (4) the reunion comes when man recognizes this union with God; (5) when he does, then he knows himself as God does, is perfect, and sin is impossible. The consequence was of course the grossest immorality. They suffered much from the severity of the authorities, but became very numerous in Germany, France, and Italy. The sect lasted till about 1450. They were otherwise known as *Homines Intelligentiæ* (men of understanding), also as Adamites, Turlupins, Schwestriones, Picards, etc.; and it is believed that the immoral "Adamites" now existing in Bohemia are their descendants.

Brethren of the Christian Schools: same as Brothers of the Christian Schools (*q. v.*).

Brethren of the Common Life (in Lat. *Fratres Vitæ Communis*): an association of pious men founded in Deventer, Holland, by Gerhard Groot about 1376. They had all possessions in common, wore a uniform dress, ate at the same table, and pursued the same tasks. They took the three monastic vows of obedience, poverty, and celibate chastity, but discipline was maintained, generally according to the rule of St. Augustine, without lifelong vows. Later, "Sisters of the Common Life" appeared. They lived in special houses, the sexes apart. The head of each band of brothers was called the rector; of sisters, the Martha; the head of all the brothers, the "father," who lived at Deventer; of the sisters, the "head Martha," who lived at Utrecht. The brothers supported themselves by teaching and copying manuscripts. They were forbidden to beg. For this reason the mendicant orders opposed them. In the popes they found, however, supporters, and the Council of Constance indorsed them. From Holland they spread to Northern Germany, Italy, and Portugal. In 1460 they numbered 130 houses. Their schools were famous. Thomas à Kempis belonged to them, and Wessel and Erasmus were educated by them. Luther and Melanchthon esteemed the brotherhood highly, and many of them became Protestants; others connected themselves with the Jesuits and other Roman Catholic orders, and before 1650 the fraternity was extinct. See S. Kettlewell, *Thomas à Kempis and the Brothers of the Common Life* (London, 1882, 2 vols.; 2d ed. 1884).

Revised by S. M. Jackson.

Breton, bre-tōṅ′, Émile Adelard: landscape-painter; brother and pupil of Jules Breton; b. at Courrières, Pas-de-Calais, France; first-class medals, Paris Expositions, 1878 and 1889; Legion of Honor 1878; medals at Centennial Exhibition, Philadelphia, 1876, and Vienna Exposition 1873. A fine winter landscape by him is in the Luxembourg Gallery, Paris.

W. A. C.

Breton, Jules Adolphe: painter of French peasant-life in village and field; b. at Courrières, May 1, 1827. He was a pupil of Félix de Vigne and of Drölling, and began exhibiting at the Salon about 1850. His first recompense was a third-class medal at the Paris Exposition of 1855, and in his artistic career since then he has been plentifully besprinkled with honors. He received the medal of honor at the Salon of 1872, and was made commander of the Legion of Honor in 1889; member of the Institute 1886. His pictures are excellent from the technical point of view, and his earlier work particularly evinces true poetic sentiment. In later pictures, however, the sentimental side of his art is sometimes too prominent, and the sturdy vigor of his earlier period is lacking. *Blessing the Harvest* (1857), *Calling Home the Reapers* (1859), *Evening* (1861), and *The Gleaner* (1877), all in the Luxembourg Gallery, are among his best works, *Blessing the Harvest* being one of the works with which he first attracted wide public notice. *Evening in a Hamlet of Finistère*, a picture of rare poetic quality, was sold in the Seney sale in New York in 1885 for $18,000, considered at that time a very high price for a picture by a modern artist, but it was surpassed by the price paid for his picture *The Communicants*, at the Morgan sale a few years later, which brought $45,000. His pictures are very popular in the U. S., and some important ones are owned by collectors in that country.

William A. Coffin.

Bretonic Language: The Bretonic or Armoric language is one of the few surviving remnants of the Celtic stock. The language of Basse-Bretagne, like its population, is an immi-

gration from England, and is therefore most closely related to the Welsh and the extinct Cornish; in fact, in the earliest records scarcely distinct from them. It is now divided into several dialects, of which the chief are those of Léon, of Tréguier, of Cornouailles, of Vannes. They are all more or less mixed with French loan-material, and are gradually yielding place entirely to the French. The orthography of Bretonic is essentially the French. The scanty earliest monuments of the language date from the eighth century, and consist almost entirely of glosses to Latin texts and proper names in mediæval documents. With the end of the fifteenth century begins the Bretonic literature proper, which is almost exclusively religious in content; hymns, lives of saints, etc., especially a series of religious dramas, or the so-called Mysteries. The nineteenth century presents also several secular poets. The most important element of the literature is constituted, however, by the tales and songs collected from popular tradition. The best survey of the development of language and literature is obtained from J. Loth's *Chrestomathie bretonne* (1890). See also Celtic Languages.

R. Thurneysen.

Breughel, brü'gel, Jan: Flemish painter; b. in Brussels in 1568; called Velvet Breughel, in reference to the material of his clothing. He painted landscapes, animals, flowers, and small figures, which are finely finished. Among his chief works are several pictures of *Adam and Eve in Paradise*, which are in the museums of the Louvre, Berlin, and The Hague. The figures of these were painted by Rubens. D. in Antwerp, Jan. 13, 1625.

Breughel, Pieter: Flemish painter; father of the preceding; b. at Breughel, near Breda, about 1520. He painted with success village festivals, comic subjects, and the amusements of rustic life. D. in Brussels in 1569.

Brevard', Ephraim, M. D.: b. in Mecklenburg co., N. C., about 1750; graduated at College of New Jersey in 1768; educated for a physician, and practiced at Charlotte, N. C.; became secretary of the noted Mecklenburg convention, which met in May, 1775, and was one of the committee to prepare resolutions. As such he participated in drafting its resolutions, which after 1819 were reputed to contain a famous declaration of independence, nearly fourteen months before Congress took a like step. He died in Charlotte, N. C., in 1783, but nothing was found in his papers corresponding to the declaration, although he was the secretary of the convention. He and six brothers entered the continental army; he was taken prisoner at Charleston, S. C., in 1780, and never recovered from the hardship of his imprisonment. See Mecklenburg Declaration of Independence.

Breve: in music, a note formed thus ▭, or ▭|, or ||▭||, and equivalent to two semibreves. The note for a whole bar in modern notation is called a semibreve. The breve is now used only in *alla capella* movements, psalm-tunes, and fugues, or at the close of a composition.

Brevet' [Fr. letters patent, license, commission; liter., a short writing, from Lat. *brevis*, short]: a military term applied to a class of commissions granted to officers of the U. S. army, and to the army and navy officers of Great Britain. Formerly in Great Britain a general brevet was issued upon special occasions, such as coronations, the end of a great war, the birth of an heir to the throne, etc., and when no occasion of this kind occurred they were issued at intervals of about six years, for the purpose of giving to officers a rank and pay commensurate with their length of service. From the time of James II. this general brevet formed a part of the military system of England, and was an implied condition upon an officer entering the service. The brevet advanced all officers of the army above the rank of lieutenant one grade in rank and pay, i. e. a captain became a major, a major became a lieutenant-colonel, etc. The officers of the navy received a similar advance. Brevets based upon some of the above-mentioned occurrences were issued in 1837, 1838, 1841, 1846, 1851, and 1854. Brevets were also conferred upon officers for acts of conspicuous gallantry in the field. In 1854 this system was changed and restricted. A brevet, without increase of pay, is now conferred upon an officer after five years' service as lieutenant-colonel, and, with a limited increase of pay and right to command, upon officers of lower rank for distinguished services in the field. In the U. S. brevets may be conferred for distinguished services upon officers of all ranks, by nomination by the President and confirmation by the Senate, in the same way that other appointments are made. Brevets, however, give no additional pay, and confer upon the officer the right to command according to his brevet rank only upon special assignment by the President. In the U. S. army a relation between pay and length of service is established by allowing to officers of the lower grades a certain increase of pay for each five years' continuous service.

James Mercur.

Bre'viary [from Lat. *brevia'rium*, abridgment, summary, deriv. of *brevis*, short]: an abridgment or epitome; also a book containing the daily service of the Church of Rome or of the Greek Church. It is so called, probably, because it was abridged from another service-book, called *Plenarium officium*, the "full service." The Roman Catholic Church has several breviaries, some being used in particular dioceses or in special monastic orders, but the *Breviarium Romanum* (Roman Breviary) is the most generally used, and is rapidly taking the place of the others throughout the Latin rite, and it has been translated into some of the Eastern rites. It is in four parts, the Psaltery, or psalms for canonical hours; the *Proprium de Tempore*, for festivals in honor of Christ; the *Proprium de Sanctis*, for festivals of special saints; and the *Commune Sanctorum*, for other days. The Greek Breviary (ὡρολόγιον) or "dial" is used in the Greek Church and the Roman Catholic churches of the Greek rite. (See Canonical Hours and Liturgy.) There is a translation of the *Roman Breviary* by John, Marquis of Bute (2 vols., Edinburgh and London, 1879).

Brevier': in typography, a type which is larger than minion and one size less than bourgeois. This cyclopædia is in brevier. See Printing.

Brevipen'nes [from Lat. *brevis*, short + *penna*, wing]: in the system of Cuvier, that tribe of birds which comprises the ostrich, cassowary, emeu, rhea, etc. They have wings so short that they are not fit for flight, but they serve to accelerate the speed with which the birds run on the ground. Their sternum (breast-bone) has no keel or ridge, a character now used to define the sub-class *Ratitæ*. The gigantic *Dinornis* and some other fossil birds exhibit the characters of the brevipennes. Birds of this tribe flourish only in solitudes and deserts, and are destined to extinction, as the progress of population is hostile to their increase or existence. See Cursores.

Revised by D. S. Jordan.

Brevoort', James Renwick: landscape-painter; b. in Westchester co., N. Y., July 20, 1832; pupil of Thomas Cummings; National Academician 1863. He lived for a long time in Florence, and painted Italian scenery; visited Holland and Switzerland also, and painted subjects which he found in those countries. Studio in New York.

W. A. C.

Brewer: city; Penobscot co., Me. (for location of county, see map of Maine, ref. 8–E); on Boston and Maine R. R., and on Penobscot river, opposite Bangor. Pop. (1880) 3,170; (1890) 4,193; (1900) 4,835.

Brew'er, David Josiah: jurist; b. in Smyrna, Asia Minor, June 20, 1837; graduated at Yale College in 1856, and at the Albany Law School in 1858; judge of the Supreme Court of Kansas 1870–81; and of the circuit court of the U. S. for the eighth circuit from 1884 until his appointment by President Harrison in 1889 as an associate justice of the Supreme Court of the U. S. Jan. 1, 1896, Mr. Cleveland made him a member of the Venezuela boundary commission, and he became its president.

Brewer, Ebenezer Cobham, LL. D.: Church of England clergyman and author; b. in London, May 2, 1810; educated at Trinity Hall, Cambridge; ordained in 1836. Author of *Guide to Science* (1850), translated by author into French; *Dictionary of Phrase and Fable* (21st ed. 1888); *Reader's Handbook* (12th ed. 1888); *Theology in Science* (1863); *History, Political and Literary, of France* (1863); *History of Germany* (1881); *Dictionary of Miracles* (1884); *Historic Note-book* (1891); about thirty educational works, and numerous pamphlets under various pseudonyms. D. Mar. 6, 1897.

Brewer, John Hyatt: See the Appendix.

Brewer, Leigh Richmond, D. D.: Missionary Bishop of Montana; b. in Berkshire, Vt., Jan. 20, 1839; graduated at Hobart College 1863 and at the General Theological Seminary 1866; ordained deacon July 1, 1866; was rector at Carthage and Watertown, Central New York; consecrated as missionary bishop Dec. 8, 1886.

Brewer, Thomas Mayo, A. M., M. D.: b. in Boston, Mass., Nov. 21, 1814. His grandfather, Col. James Brewer, was a well-known patriot of the Revolution and a leader in the "Boston tea-party" of 1773. Dr. Brewer graduated at

Harvard College in 1835, and at the Massachusetts Medical School in 1838. After two years of professional labor, in 1840 he became editor of the Boston *Atlas*, then a leading Whig paper; in 1857 became a partner in the publishing-house of Brewer & Tileson. Dr. Brewer was actively engaged for a lifetime in professional and business duties, but was best known as a thorough and enthusiastic ornithologist. In 1839 he edited a new edition of Wilson's *Ornithology*, for which he prepared a synopsis of all North American birds then known. He was a personal friend of Audubon. One volume of a fine work of his on the *Oölogy of North America* was published by the Smithsonian Institution, but the publication was suspended on account of its great cost. He also wrote most of the biographical portion of the *History of North American Birds*, of Baird, Brewer, and Ridgway (3 vols. of which were published by Little, Brown & Co. in 1874). D. in Boston, Mass., Jan. 23, 1880.

Brewer, William Henry: b. at Poughkeepsie, N. Y., Sept. 14, 1828; educated at the scientific school of Yale College and at the universities of Heidelberg and Munich; Professor of Chemistry and Geology in Washington College, Pa. (1858–60); first assistant in the geological survey of California (1860–64); Professor of Chemistry in the College of California; Professor of Agriculture in the Sheffield Scientific School, New Haven, Conn., since 1864. He prepared *Botany of California*, etc.

Brewerton, Henry, LL. D.: soldier; b. at Newburg, N. Y., Sept. 25, 1801; graduated at West Point 1819; colonel Corps of Engineers Apr. 22, 1864; served as assistant professor at the Military Academy 1819–21; in construction of fortifications 1821–32: Cumberland road 1832–36; improvement of Hudson river 1836–42; building Fort Montgomery, N. Y., 1841–45; superintendent of the Military Academy 1845–52; constructing defenses of Baltimore harbor 1852–64; of the Delaware 1862–64; of Point Lookout, Md., 1864–65; and of Hampton Roads 1864–70; improvements of harbors in Maryland 1852–64; and member of engineer and other boards 1839–67. Brevet brigadier-general Mar. 13, 1865, for long, faithful, and meritorious services, and retired from active service Mar. 7, 1867. D. at Wilmington, Del., Apr. 17, 1879.

Brewing: See Beer.

Brew'ster, Benjamin Harris, LL. D.: b. in New Jersey, Oct. 13, 1816; was seriously hurt by fire when a child; graduated at Princeton 1834; admitted to the Philadelphia bar 1838; soon appointed by President Polk to pass upon the claims of the Cherokee Indians against the U. S.; in 1867 appointed attorney-general of Pennsylvania; had a large practice, and was noted for the force and grace of his pleas. In Dec., 1881, he was appointed by President Arthur Attorney-General of the U. S., and held that office till Mar., 1885. D. in Philadelphia, Pa., Apr. 4, 1888.

Brewster, Sir David, LL. D., D. C. L., F. R. S.: natural philosopher; b. in Jedburgh, Scotland, Dec. 11, 1781. He was educated at the University of Edinburgh, and became in 1808 editor of the *Edinburgh Encyclopædia*, for which he wrote many articles. He received in 1815 the Copley medal of the Royal Society for an *Essay on the Polarization of Light by Reflection*. He invented the kaleidoscope in 1816. In conjunction with Prof. Jameson he founded the *Edinburgh Philosophical Journal* in 1819. As his relations as an editor brought him into frequent communications with the most eminent scientific men, and he was naturally one of the first to recognize the benefit which would accrue from regular intercourse among laborers in the same field, he, in articles in the *Quarterly Review*, threw out a suggestion which became the cause of the formation of the British Association for the Advancement of Science. It held its first meeting at York in 1831, and Brewster and Herschel had the chief part in shaping its constitution. About this date the Royal Society awarded to him the Rumford gold and silver medals for his discoveries in optics. He was knighted in 1832, and elected in 1849 one of the eight foreign associates of the French Institute. In 1850 he invented the stereoscope. Among his works are a *Treatise on Optics* (1831); *More Worlds than One* (1854); and *Memoirs of the Life and Writings of Sir Isaac Newton* (2 vols., 1855). In 1859 he was chosen principal of the University of Edinburgh. His wife was a daughter of Macpherson, the author of Ossian's poems. D. near Melrose, Feb. 10, 1868.

Brewster, William: one of the Pilgrims of Plymouth; b. at Scrooby, England, in 1560; was educated at Cambridge; entered the public service; became a Nonconformist, and in 1607 was imprisoned at Boston, Lincolnshire. He was liberated with great expense and difficulty, and went to Leyden, where he taught English. In 1620 he removed to America on the Mayflower's first voyage. He was ruling elder of the Church, preaching frequently, but never administering the sacraments. D. at Plymouth, Mass., greatly venerated, Apr. 10, 1644. See his *Life* by A. Steele (Philadelphia, 1857).

Brewton: town; capital of Escambia co., Ala. (for location of county, see map of Alabama, ref. 7–C); on L. and N. R. R.; 100 miles S. of Montgomery, near Conecuh river; has a collegiate institute, five churches, large lumber-mills, sash and door factory. In its vicinity are large vegetable farms, the produce of which is sent to Northern markets. Pop. (1890) 1,115; (1900) 1,382.

Editor of "Standard Gauge."

Brialmont, brē̆e'ăăl'mōn', Alexis Henri: engineer and military writer; b. in Venloo, province of Limburg, the Netherlands, May 25, 1821; entered the military school of Brussels in 1839; graduated as *sous-lieutenant du génie* (engineers) in 1843. Entered the staff corps (*l'état-major*) as captain 1855; became colonel 1868; chevalier of the order of Leopold 1846—officer 1859, commander 1870; major-general Mar. 25, 1874; member of the Belgian Academy of Sciences in 1865. He is now a lieutenant-general retired. As an officer of engineers he participated in the fortification of Antwerp and Diest, and when the present magnificent system of fortifications was decided upon he had the distinguished honor of planning works "unrivaled in Europe in the intelligent application of true principles of art to a great practical example." Col. Brialmont became an acknowledged authority on the modern art of fortification. His military publications are numerous; among the most important may be named: *Précis d'Art Militaire* (1850, 4 vols. 12mo); *Considérations Politiques et Militaires sur la Belgique* (1851–52, 3 vols. 8vo); *Histoire du Duc de Wellington* (1856–57, 3 vols. 8vo); *Études sur la Défense des États et sur la Fortification* (1863, 3 vols. 8vo, with atlas); *Études sur l'organisation des Armées* (1867, 1 vol. 8vo); *Traité de Fortification Polygonale* (1869, 3 vols. 8vo, with atlas); *La Fortification à Fossés Secs* (1872, 3vols. 8vo, with atlas); *Études sur la Fortification des Villes Capitales* (1873); *Les Régions Fortifiées*; *Tir plongeant et obus torpilles*; *La Fortification du Temps Présent* (1885). He is the author of the article on Intrenched Camps in the present work.

Brianchon's Theorem: in conic sections, the reciprocal of Pascal's theorem; first discovered by Brianchon. It was thus enunciated: "The three diagonals of every hexagon circumscribed to a conic meet in a point."

Briançon, brē̆e'ăăn'sōn (anc. *Brigantium*): a town of France: in the department of Hautes-Alpes; on the river Durance; 56 miles S. E. of Grenoble, and near the Italian frontier (see map of France, ref. 7–I). It is strongly fortified; is the principal French arsenal among the Alps, and is considered almost impregnable. Pop. (1891) 6,580.

Briansk'; a town of Russia; government of Orel; on the river Desna; 74 miles W. N. W. of Orel (see map of Russia, ref. 8–D). It has several churches, a cannon-foundry, an imperial building-yard, and a manufactory of small-arms. Pop. 15,000.

Bribery [from O. Fr. *bribe*, piece of bread, a gift to a beggar]: in criminal law, a taking or giving of a reward or consideration with the intent to corruptly influence a person in the performance of the duties of a public office or function, judicial or otherwise. The offense is completed by the corrupt taking or giving, whether the act contemplated be legal or illegal or be performed or not. An unaccepted offer to give or receive a consideration with such a corrupt intent constitutes an attempt to bribe. Both these acts were indictable offenses at the common law; but by statute in many cases acts have been made bribery which were not punishable as such at common law. A mere present after the performance of the act desired, without a previous corrupt understanding, does not constitute bribery. The giving or receiving of a consideration to corruptly influence a voter in a public election is bribery at common law as well as under the statutes, by which this subject is now generally regulated. The bribing of a juror is comprehended in the term Embracery (*q. v.*). Bribery is a serious offense against public probity, and the U. S. Constitution declares that the President and other civil officers are liable to im-

peachment for "treason, bribery, and other high crimes and misdemeanors." Revised by F. Sturges Allen.

Brice, Calvin Stewart: U. S. Senator; b. at Denmark, O., Sept. 17, 1845; A. B., Miami University, 1863; LL. D. 1892; served in the Union army 1862–65, after which he was admitted to the bar at Cincinnati 1866; on the Tilden electoral ticket in 1876 and the Cleveland electoral ticket in 1884; delegate-at-large from Ohio to the St. Louis Democratic national convention 1888; chairman of Democratic national committee 1889. In 1890 he was elected U. S. Senator from Ohio. D. in New York, Dec. 15, 1898.

Brick: a species of artificial stone made by molding plastic clay into blocks, and burning them. A very inferior quality of bricks is made by simply drying the blocks in the sun. The earths most employed in brickmaking are (1) the plastic clays, composed principally of silica and alumina in varying proportions; (2) the loams or sandy clays; and (3) the marls, which are either sandy, clayey, or calcareous, according as silica in the form of sand, alumina, or carbonate of lime preponderates in the mixture. These brick-clays almost always contain a small percentage of oxide of iron, carbonate of lime, soda, and carbonate of magnesia. The purer clays contain about 1 part of alumina to 2 of silica, with a percentage of water varying greatly among the different clays. They all mix up freely with water in either large or small proportions, and are characterized by a tenacious plasticity. If molded and baked, they shrink and warp greatly out of shape, and crack. Hence these rich clays all have to be tempered with sand, ashes, or cinders before they can be used for bricks. Some clays contain too much sand, and are weak and brittle after burning; these must be mixed with the richer clays. From the greatly varying character of the raw material, it results that the methods pursued in brickmaking must vary among different localities. Some clays require but very little change in the natural proportion of their ingredients, and but very little labor to prepare them for molding into bricks, it being merely necessary to add the requisite quantity of water to render the clay plastic; while others, such as the fire-clays and some of the marls, have to be pulverized by machinery before they can be reduced to a sufficiently plastic condition. The red color of burnt bricks is caused by the presence of a small percentage of oxide of iron, generally the protoxide. When there is more than 10 per cent. of iron oxide present the clay burns to a blue and almost a black color. A large percentage of iron, if lime also or an excess of silica be present, renders the clay fusible. Some clays contain lime and very little or no iron. These burn white, and require a less intense heat than any other clays to produce hard brick, the lime being a flux on the silica. When carbonate of lime, whether as chalk, marl, nodules of calcareous petrifactions, or in any other form, is present in the clay, it is converted into quicklime in burning, and only such portions of it will combine with the silica and alumina as come into actual contact with them. The balance remains quicklime, which will slake when the bricks become wet, and destroy them. Hence clay containing too much carbonate of lime is unfit for bricks. Other clays contain iron and lime with an excess of the latter, in which case the bricks burn to a light dun or a whitish color. Magnesia generally produces a brown color.

The presence of iron pyrites is objectionable, for the burning expels the sulphur, leaving oxide of iron or a basic sulphate, which occupies less volume than the original pyrites, and makes the bricks porous and weak. Vegetable remains, such as roots, grass, etc., should be excluded for a similar reason.

It is impossible to ascertain, by chemical analysis alone, whether or not a given clay or any mixture of two or more clays will make good bricks. The best chemical tests will furnish only a close approximation. The composition of four clays—two suitable for common bricks and two for fire-brick—is given below. Nos. 3 (from Stourbridge, England) and 4 are the fire-brick clays:

COMPONENTS.	No. 1.	No. 2.	No. 3.	No. 4.
Silica	50·40	49·44	51·80	58·40
Alumina	24·00	34·26	30·40	35·78
Oxide of iron		7·74	4·14	3·02
Carbonate of lime	2·70	1·48	.....	
Carbonate of magnesia	1·30	5·14	0·30	2·72
Water, etc.	21·60	1·94	13·11	
Totals	100	100	99·75	99·92

Some of the fire-clays contain as high as 65½ to 66 per cent. of silica, 27½ to 26½ per cent. of alumina, and 5½ to 6 per cent. of oxide of iron, the balance being the alkalies and water.

Fire-bricks are used for lining furnaces, kilns, ovens, etc., subjected to an intense heat that would destroy common bricks or stone. The Stourbridge fire-bricks are noted for their excellence. The clay is dug up and exposed from three to eighteen months, according to the weather, in "spoil heaps," spread over as large an area as practicable, until thoroughly disintegrated by weather and frost; in winter three months will suffice. The clay weighs 6 tons to 7 cubic yards, and some of the spoil heaps contain 10,000 tons. After weathering, the clay is ground in a circular pan under two cylindrical stone rollers, each weighing 2½ to 3¼ tons, and faced with iron. After grinding, the clay is carried on an endless band to a "riddle" of 4 or 6 meshes to the inch for fire-bricks, 6 to 10 meshes for fine cement clay, and 12 to 14 meshes for glass-house or pot clay. After passing the riddle the clay is tempered with water to a suitable degree of plasticity, and is then passed through a cylindrical cast-iron pug-mill, where it is cut and stirred by revolving helicoidal blades, which force it out through an opening at the bottom in the form of a bar, which is received and carried by an endless band to the molding-shed. The fire-bricks are molded by hand in the usual manner, dried in artificially heated sheds at a temperature of 60° to 70° F., or by the sun in clear weather. They are burned in circular domed kilns or cupolas called ovens, where they remain from eight to fourteen days, being subject to the intensity of flame or white heat for about four days and three nights. In burning, the heat is slowly increased and gradually lowered, and the burnt contents require seven days to cool. Most of the kilns contain 12,000 bricks—some, exceptionally, 30,000 to 35,000. The chimney-stack is on the outside, and the flame burns with a down draught, descending through holes in the floor. Coal is used for fuel.

Excellent fire-bricks are made in New Jersey at Perth Amboy, Woodbridge, South Amboy, Trenton, and other places in the vicinity. The process of manufacturing is essentially the same as for common bricks. The fire-clays of these localities contain generally more alumina and less silica than those of Stourbridge, England, and are therefore richer, the alumina reaching in some cases as high as $37\frac{1}{10}$ to $39\frac{7}{10}$ per cent., with only $43\frac{2}{10}$ to $45\frac{3}{10}$ per cent. of silica. The composition of the bricks consists of about $\frac{5}{8}$ raw clay, $\frac{1}{8}$ cement, $\frac{1}{8}$ kaolin, and $\frac{1}{8}$ fine sand. The cement is fire-clay that has been burnt; the kaolin is a clay consisting of very fine sand, mica, and fire-clay, found in the vicinity, and the fine sand is clean, coarse, angular-grained quartz, found remarkably pure near by.

The leading type of the machines used at Haverstraw, N. Y., and vicinity for the manufacture of common bricks, where about 2,000,000 per day are made during the working season, is shown in Fig. 1, and is known as the "Vervalen machine." The object of this machine is merely to fill the molds more rapidly than could be done by hand, and not to produce a pressed brick.

A is a wooden box or tub about 3 ft. 4 in. square inside, and from 4 ft. 6 in. to 5 feet high, into which the clay to be molded is cast. B is a vertical iron shaft about 5 inches in diameter, geared with the engine shaft C, which imparts to it a horizontal rotary motion. The lower end of B is provided with a heavy casting, shaped like the letter S, called the *wiper*, which sweeps the clay through a lateral opening in the front side of A into the cast-iron box D.

The shaft B is provided with a number of projecting arms, from fourteen to twenty-two, which clear the sides of the tub by about an inch, and serve to mix the ingredients before they are expelled by the wiper. When, however, the clay is previously mixed by a tempering wheel, these arms are removed, leaving only the wiper, and the tub then serves merely as a hopper. The bottom of the cast-iron box D is provided with six openings, through which the prepared clay is forced into corresponding openings in the mold E. A sort of rectangular piston works up and down in the box D by means of a connecting-rod, F, run by a drum, G. A crank at the end of the drum-shaft H communicates a stroke of about 7 inches to the piston, which stroke, however, can be diminished at pleasure by shifting the position of a pin at the lower extremity of F. The bottom of the piston does not come nearer than about 6 inches to the bottom of the box D.

The action of the machine will now be readily understood. The prepared clay is swept by the wiper out of A into D,

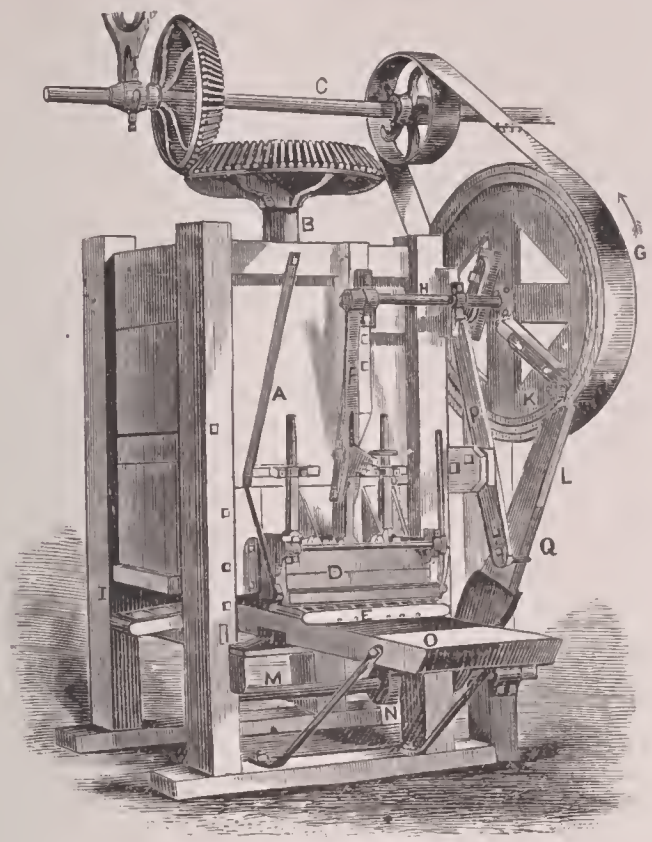


Fig. 1.—Vervalen machine.

whence it is expelled by a down stroke of the piston into a mold placed under it. While this mold is being filled an empty one is inserted behind it through the aperture I. The drum G continuing its revolution in the direction of the arrow, a cam, K, strikes the lever L, throwing it forward, as shown in the figure. It carries with it the shaft M, which by means of a horizontal rod attached to two cranks (one of which is shown partially in the figure at N) and passing behind the empty mold, forces it forward, thrusting out the full one upon the table O, and placing the empty mold in position to be filled. The drum G continuing its revolution, another cam, placed so as to clear the top of the lever L, strikes the upper arm of the lever P, causing it, by means of the projection Q, to return L to its primitive position. A chock prevents L from falling too far back. And so on.

Whenever the nature of the materials used admits, the mixture of the ingredients is made by the pug-mill working in the tub. In this case a rectangular pit is prepared directly behind the machine, capable of containing the amount of clay required for a day's work. The clay is placed overnight in this pit, and is wet down with a certain amount of water, varying according to the nature of the clay used. In the morning the other ingredients, consisting of sand and anthracite coal-dust, are carted to the pit and roughly mixed by two spaders, who afterward throw it up into the tub, where the pug-mill completes the mixing.

The proportion of sand used varies according to the quality of the clay and the relative proportions in which the two are found in the bank. It may be taken, on an average, at one-third sand to two-thirds clay. The Haverstraw sand is of excellent quality, and, more than the clay, gives the bricks of this locality their peculiar character. Coal-dust is used in the average proportion of 3 pecks to the 1,000 bricks. For burning properly in the kilns, a certain number of what are called *double-coal* bricks is required, in which the proportion is about 5 bush. of dust per 1,000 bricks. When mixed in a circular pit by means of a "tempering-wheel," the clay and coal-dust are disposed in alternate layers and cut up by the wheel. The sand is then added and incorporated by the wheel. The operation consumes the entire day.

When the molds, which are made mostly of cherry or locust wood, and contain six bricks each, are thrust from under the press upon the table, they are placed on trucks and wheeled under the drying-shed. The bricks are thrown out upon the flat. When sufficiently dry they are "edged up" by means of an instrument called an *edger*, then "spatted," or tapped with a flat board called a "spatter," to give them a clear edge, and then "hacked up," or placed in long and narrow rows on edge. When dry enough—that is, in one to three days, according to weather—they are built up in "arches," set on edge in the order called "three over one." The arches contain 28,000 to 35,000 bricks each, and are 6 bricks or 4 feet wide, about 44 bricks or 30 feet deep, and from 45 to 55 courses high. Each arch has an opening at the bottom—hence the name—in the center of its width, in which the wood used in baking is placed. On the outside are placed the "double-coal" bricks, to the number of about 3,000 per arch. Bricks containing only the usual proportion of coal would not burn properly at this distance from the fire.

A number of arches, five, ten, or more, are built up contiguously, so as to form a solid mass. The whole is then covered with a dry wall of baked bricks, the lower courses being one brick thick and the rest half a brick. At the bottom they leave a vacancy between the wall and the face of the arch, which gives a batter to the covering wall, and affords a better draught. Arch-irons or cast-iron frames having an opening of about 1 sq. foot are inserted in the openings, and the whole is smeared over with clay. The heap so prepared is called a kiln. This system of burning is pursued rather than that with permanent kilns, on account of the greater number of bricks which may be burned in a given space. At Haverstraw yards controlling only 200 feet frontage can thus make from 5,000,000 to 6,000,000 bricks per season of 150 working days.

About four cords of wood are used per arch, and the burning requires six days, fires being lit on Monday morning and drawn on Saturday evening. Molding is usually carried on during the forenoon of each day—about five to six hours—the rest of the day being spent in "hacking up," etc.

The machines above mentioned turn out, in ordinary working, ten molds or sixty bricks per minute, or 18,000 to 20,000 per forenoon. They require the following plant and help per machine: 25 molds, 4 trucks, and 8 men. If operated by steam, a machine turning out 18,000 per day requires 8 horse-power nominal, high pressure.

The standard of full work in this section is to turn out 1,000 bricks per day for every soul employed, from the time the clay is dug till the bricks are loaded in the vessels. Thus an establishment employing forty hands, all told, should turn out 40,000 bricks per day.

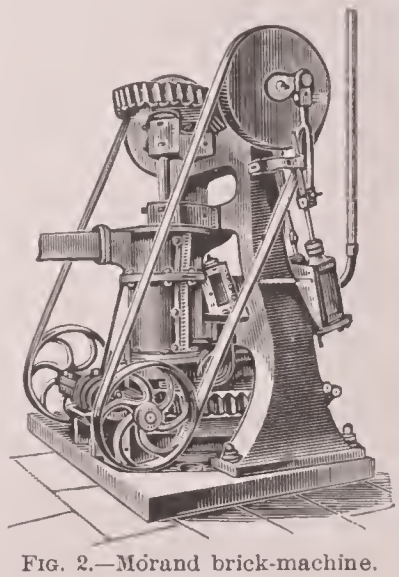

Fig. 2.—Mórand brick-machine.

The Morand brick-machine, Fig. 2, consists essentially of a pug-mill, under which revolves a horizontal iron table, in which there are eight openings or molds of the size of a brick. The mill mixes the clay, and forces it downward by its helicoidal arms through a slot in the bottom of the mill, thus filling the molds as they pass under the slot. Each mold then passes under a pressure-plate, which confines the clay on top, while a movable plate, which closes the mold at the bottom, is forced up by passing over a cam. This compresses the plastic brick, forcing out the air and excess of clay through a small hole in the pressure-plate. After passing the pressure-plate the bricks are thrust up to the top of the table, and then moved automatically to an endless band, which carries them away. From the band they are loaded upon cars, which convey them into drying-ovens. They go to the kiln the next day. See Kilns.

Three qualities of brick are taken from the kiln. Those forming the top and sides of the arches are called *arch brick*, those from the interior of the pile are *body brick*, and those from the exterior are *soft brick*. The arch bricks are hard and often brittle and weak from overburning; the soft bricks are underburned, and fit only for backing and filling. The body brick is of the best quality. Good bricks should be of regular shape, have parallel surfaces, plane faces, and sharp edges and angles. They should be of uniform texture, and should ring when struck a sharp blow with a hammer. The amount of water absorbed is an index of the durability of brick, and the best qualities should not absorb more than 10 per cent. of their weight of water after seven days' immersion. The higher the specific gravity the better is the quality of the brick, as a general rule.

The compressive strength of brick is extremely variable. A mean value may be stated at 2,500 lb. per square inch, but soft brick will scarcely bear more than one-tenth of this, while the best pressed brick will stand 7,000 lb. per square inch, or more. It is a general rule that the durability of brick increases with both its tensile and compressive strength. Compressive tests of brick are not easily made so as to give reliable results, owing to the difficulty of securing specimens with surfaces truly parallel. Tests for transverse or flexural strength are easier to make, and in general more satisfactory. These can well be executed by supporting the middle of the brick upon a fixed bar as a fulcrum, and hanging stirrups upon the ends to support a barrel for carrying the loads. Let l be the length of the brick from the center of one stirrup to that of the other, b the breadth and d the depth of the brick, and W the load which is placed in the barrel to cause rupture. Then if S be computed from the formula

$$S = \frac{3Pl}{bd^2},$$

this gives the quantity called the modulus of rupture. If b, d, and l be taken in inches, and P be in pounds, then S is in pounds per square inch, and the higher the value of this the better, other things being equal, is the brick.

The following are the average results of some of the tests made upon different qualities of brick used in the arch lining of the Vosburg tunnel on the Lehigh Valley R. R. The compressive strengths here given are comparative only as

MAKER AND NUMBER OF TESTS.	Class.	Per cent. of water absorbed to original weight.	Compressive strength, pounds per sq. inch.		Modulus of rupture, pounds per sq. inch.
			Cracked.	Crushed.	
C., 24 tests.	Very hard.	12·6	823	3,060	445
	Hard.....	13·6	1,408	2,541	530
	Medium...	17·2	795	1,274	290
E., 50 tests.	Very hard.	6·4	3,870	5,537	1,588
	Hard.....	15·4	1,960	3,063	893
	Medium...	18·9	2,695	4,287	641
	Soft.....	22·2	1,102	2,205	269

they were made in a wheel press which gave a shock to each brick as the stress was applied. It is interesting to note that the bricks began to crack under about one-half the stress which caused final rupture.

The paving-brick used in Western cities is made of fire-clay containing about 69 per cent. silica, 15 per cent. alumina, 5 per cent. of water chemically combined, 3 per cent. lime, 2·5 per cent. iron, and 2·5 per cent. magnesia. Such brick is semi-vitrified, has a specific gravity of over 2, is very tough, and often makes a good pavement for light traffic. The best qualities of such brick will absorb less than 5 per cent. of their weight of water after ten days' immersion. The following are mean results of a few tests of paving-brick for absorption, made by C. P. Chase in 1890, and also for com-

NAME.	Specific gravity.	PER CENT. OF ABSORPTION AFTER—		
		Three days.	Five days.	Ten days.
Ottawa, Ill.....	2·35	3·11	3·44	4·01
Burlington, Ia.....	2·28	1·62	1·79	1·84
Clinton, Ia.....	2·27	2·56	2·76	2·83
Galesburg, Ill.....	2·24	4·46	4·58	4·62
Bardolph, Ill.....	2·07	2·68	3·04	3·18
Common red.....	1·82	15·13	16·06	16·50

parison results for a common red brick. It is stated that the percentage of absorption varied almost directly with the degree of vitrification. The average compressive strength of paving-brick is about 7,000 lb. per square inch, but some varieties tested have given, for small specimens cut from the brick, results as high as 10,000 and 12,000 lb. per square inch. See the articles MASONRY and PAVEMENTS; also Baker's *Masonry Construction* (1891), and, on the manufacture of brick, several discussions in *Transactions* of the American Society of Civil Engineers for June, 1888.

Revised by MANSFIELD MERRIMAN.

Brick, Archæology of: The use of clay as a building material, in the form of bricks dried in the sun or kiln-burnt, dates from the earliest antiquity, not only in the Tigris-Euphrates valley, but in Egypt and other countries (Gen. xi. 3; Ex. i. 14; v. 7, 8). The great pyramid of Sakarah, supposed by Mariette to be the oldest in Egypt, and attributed by Maspéro to the fifth and sixth dynasties (more than 3,000 years B. C.), is of brick, as are many other lesser pyramids. Sun-dried brick was used by Osirtasen III. (twelfth dynasty) in his fortresses at Koummeh and Semneh, and by later monarchs for the circuit-walls of their temples, while burnt bricks served for the construction of dams, dikes, granaries, and other public works.

In the valley of the Tigris-Euphrates brick was practically the only building material, sun-dried brick forming the whole mass of the enormous terraces and thick walls of Assyrian and Chaldæan architecture. Scarcity of fuel in Assyria compelled an economy in the use of burnt brick, which was less pressing in Chaldæa, where some even of the most ancient terraces, as at Warkah and Mugheir, are faced with enameled or glazed bricks of brilliant colors. To preserve these enormous clay mounds from destruction by the infiltrations of rain-water, they were provided with elaborate drains, which offer us some of the earliest examples of arched construction. They were built without centerings by ingenious processes still in vogue in those regions, and their decay accounts for the ruin of the terraces and palaces above them. It was customary to stamp the bricks with the name of the reigning monarch, a fact of the greatest service in archæological investigations.

The Romans, however, deserve the credit of the greatest advances in the use of brick, which was by them very generally employed to face their concrete masonry, the facings being first built and the spaces between filled with concrete or beton. The Roman vaulting was of concrete, poured upon a skeleton of brick ribs, or over a thin shell of flat tiles laid edge to edge upon the centerings. Brick thus played a large part in the development of Roman architecture. The Byzantine architects also used brick as a material of construction, occasionally allowing it to appear externally in red bands alternating with bands of stone, a practice afterward copied by the Arab architects of Cairo. In the Middle Ages brick fell into general disuse, the settling of brick masonry and the massiveness it requires making it undesirable for the lofty vaulted structures of the Gothic architects, with their striving after slenderness and general lightness in the supporting masses. In Lombardy, however, and in Venice, it found more favor, and the use of terra-cotta in conjunction with brick supplied the element of grace and elegance otherwise lacking.

In New Mexico, Arizona, and Mexico, *adobe*, a species of unburnt brick, was used, not only by the Spaniards but by the Pueblos and other native races long before the advent of the Spaniards. Excellent bricks are found in Peru, and the Chinese and the people of India and Persia have also shown high skill both in the making and in the artistic use of plain and enameled or glazed bricks.

A. D. F. HAMLIN.

Bridge, JOHN FREDERICK: musician; b. in Oldbury, Worcestershire, England, Dec. 5, 1844; educated first by his father, and then by Mr. Hopkins, of Rochester cathedral; studied composition under Sir John Goss. His first appointment was, at the age of twenty-one, as organist of Trinity church, Windsor. In 1868 he took the degree of Mus. Bac. at Oxford; in 1869 was appointed organist of Manchester cathedral; in 1874 took the Mus. Doc. degree at Oxford, for which, as a degree exercise, he wrote the oratorio *Mount Moriah*. He was then appointed deputy organist of Westminster Abbey, and on the death of James Turle became full organist. His next work was the cantata *Boadicea*, followed by a setting of the *Hymn of St. Francis d'Assisi*. For the Birmingham festival of 1885 he set Gladstone's Latin version of *Rock of Ages*, as a motet for baritone solo and chorus. At the Queen's jubilee in 1886 he composed the jubilee anthem, by royal command. His oratorio *The Repentance of Nineveh* was composed for the Worcester festival of 1890, and the cantata *Callirhoe* for the Birmingham festival of 1888. For the Gloucester festival of 1892 he composed a short cantata on Dante's paraphrase of the Lord's Prayer, in the *Purgatorio*, canto xi. Dr. Bridge's church music is very much in favor, and he has also written some very fine songs, part-songs, and madrigals, both for male and mixed voices.

D. E. HERVEY.

Bridge, JOSEPH COX: musician; brother of Dr. John Frederick Bridge; b. in Rochester, England, Aug. 16, 1853; chorister and subsequently assistant organist at the cathedral; studied under his brother and John Hopkins, and took the degrees B. A. 1875, Mus. Bac. 1876, M. A. 1878, and Mus. Doc. 1879, from Oxford; appointed organist of Chester cathedral in 1879, where he still remains; revived

the Chester music festival in 1879, and at the festival of 1885 produced his oratorio *Daniel*. He is the conductor of several societies at Chester and Bradford. His compositions are chiefly for the church. D. E. Hervey.

Bridge, Magnetic: a device for the application of the principle of Wheatstone's bridge (see Bridge, Wheatstone's) to the measurement of magnetic resistances. See also Magnetism of Iron.

Bridge, Wheatstone's: See Wheatstone's Bridge.

Bridge of Allan: town of Stirlingshire, Scotland; so named from the bridge across the river Allan, which bounds it on the W.; situated at the southern base of the western termination of the Ochil Hills (see map of Scotland, ref. 11–G). Pop. 3,500. It has several elegant churches, fine hotels, and numerous lodging-houses. About 50,000 visitors frequent it annually on account of its mineral waters and mild and salubrious climate.

Bridgeport: a city, custom-house port, and important railroad and commercial center; one of the county-seats of Fairfield co., Conn. (for location, see map of Connecticut, ref. 12–E). The township was founded in 1821, and the city charter granted in 1836. It is situated on an inlet of Long Island Sound; at the mouth of Pequonnock river, which is bridged in many places; 58 miles N. E. of New York and 18 miles W. S. W. of New Haven; lat 41° 10′ 30″ N., lon. 73° 11′ 46″ W. It has lines of steamboats connecting it with New York, and a small steamer plying between it and Port Jefferson, L. I. It is on the N. Y., N. H. and H. R. R., and is a terminus of the Naugatuck and the Housatonic R. Rs. It now (1893) has an area of nearly 15 sq. miles, including East Bridgeport (or the part east of the Pequonnock river), and Black Rock at the other side of the city. Black Rock harbor is a favorite stopping-place for yachting squadrons, and will accommodate large vessels. Bridgeport has a fine school system; a large and well-managed public library (richly endowed by private bequest); a scientific society, having a fine collection of Indian relics; historical society, hospital, orphan asylum, energetic board of trade, and other public institutions and societies. There are many large and beautiful buildings, among which are U. S. post-office and custom-house, Y. M. C. A. building, the Barnum Memorial Institute (bequeathed to the Scientific and Historical Societies), and the Fairfield County court-house. It has three fine parks, of which Seaside park has a sea-wall and shore-drive 2 miles long. Here is a statue of Elias Howe, the inventor of the sewing-machine.

Industries.—Bridgeport is one of the chief manufacturing cities of the State, having, according to the census of 1890, 555 industrial establishments with a capital of $19,094,180, giving employment to 12,763 persons, and paying in wages annually $7,492,092. The cost of the materials employed is $10,173,212, and the value of the product $21,829,776. The industries which are especially noteworthy are the manufacture of carriages and wagons, corsets, sewing-machines, hardware, articles of aluminium and aluminium bronze, articles of brass, and forging. Here is a large grain elevator. The city has an ample water-supply, electric lights and gaslight system, and such other equipments as are necessary for an enterprising manufacturing and commercial city. Pop. (1870) before the annexation of Black Rock, a part of Fairfield, 18,969; (1880) 27,643; (1890) 48,866; (1900) 70,996.

Editor of "Evening Post."

Bridgeport: railroad junction; Belmont co., O. (for location of county, see map of Ohio, ref. 5–I); on the Ohio river, opposite Wheeling, with which it is connected by a bridge. Pop. (1880) 2,395; (1890) 3,369; (1900) 3,963.

Bridger's Pass: a defile in the Rocky Mountains; in the south part of the State of Wyoming. The overland mail route passed through it before the Pacific R. R. was opened. It is "a narrow gallery, walled by noble precipices of red granite and metamorphic sandstone, rising directly from the traveler's side to the almost perpendicular height of from 1,000 to 2,500 feet, and is several miles in length."

Bridges: A bridge is a structure spanning a valley, river, or other space, and intended to serve for the passage of men, animals, or vehicles. The most obvious and simple bridge is a tree thrown across the stream, and hence, says Rankine, "the first man who bridged a torrent with a fallen tree had in him something of the engineer." Another primitive method, practiced in some mountainous regions of South America, and also in China, is the suspension of a rope across a stream, to which a hammock is so hung that it can be drawn across from shore to shore; these are made of such stability that even mules are carried over in the hammocks. The fallen tree is the prototype of the modern girder, or truss bridge, and the rope is the germ from which the suspension bridge has been developed. Pontoons, or floating assemblages of boats, were constructed by the ancient Egyptians, and in modern times are of much use in military operations. See Bridges, Military.

A bridge consists of a substructure and a superstructure, the former being the abutments and piers, which are usually of masonry, and the latter being the timber or metal framework which is supported by them. There may be two abutments and one span of a superstructure, while for two spans an intermediate pier is required. The number of spans and piers will be determined in any given case by local conditions, the general problem being to devise such an arrangement that the total cost may be the least possible. As a rough rule it may be said that the greatest economy will be attained when the cost of the substructure is equal to the cost of the superstructure. The methods of constructing piers and abutments are described in the articles Foundation and Masonry, while here the superstructure, or bridge proper, receives chief attention.

Bridge structures are formed of arches springing from one abutment to another, or of trusses and girders resting upon the abutments, or of chains or cables suspended from towers. Thus arises the fundamental classification into arch bridges, truss bridges, and suspension bridges. But before considering the different forms under each of these classes an historical review of their development is perhaps best secured by dividing them into stone, timber, and iron structures. Truss bridges are far more numerous at the present day than any other form, and these may be built as fixed independent spans, as continuous over several spans, as drawbridges, and as cantilever structures. The articles Flexure, Moment, Stresses, and Strength of Materials deal with some of the mechanical principles employed in the computation and design of bridges.

The total length of a bridge is an index of its magnitude, but the length of its greatest span more often indicates the difficulty of its construction and its rank as an engineering work. The following is a list of the total lengths of several of the longest and most important bridges of the world:

	Feet.
New Tay bridge, Scotland	10,780
Ohio river bridge, Cairo, Ill.	10,560
Forth bridge, Scotland	8,295
Missouri river bridge, Kansas City, Mo.	7,633
Poughkeepsie bridge, N. Y.	6,770
Victoria bridge, Montreal, Canada	6,520
New Susquehanna bridge, Havre de Grace, Md.	6,315
East river bridge, New York	5,989
Cincinnati and Newport bridge, Ohio river	5,925
Cincinnati and Covington bridge, Ohio river	5,360
Rapperswyl bridge, Lake Zurich	5,333
Ohio river bridge, Louisville, Ky.	5,280

In general, these lengths include masonry or viaduct approaches as well as the main spans. In the following description of bridges of different classes those of longest span and of the greatest importance as engineering constructions at the time of their erection will, as a rule, receive principal attention.

Stone Bridges.—These were first constructed by the Romans, and eight over the river Tiber are described in history. Ruins of bridge structures are now found in different parts of the ancient Roman empire. The greater portion of the bridge of Aleántara upon the Tagus still remains as a fine example of masonry construction. It had six arches, the whole length being 670 Spanish feet, and the roadway being 205 feet above the bottom of the river. During the Middle Ages there existed a fraternity known as "Brothers of the Bridge," originally formed to secure the safe passage of travelers over rivers, which erected many stone bridges in France. The first stone bridge in London was begun in 1176 by Peter of Colechurch, a priest, and its construction occupied thirty-three years; it had nineteen arches of small span, with very wide piers. Few important structures were built, however, from the time of the Roman decadence until the middle of the eighteenth century. The Westminster bridge completed in 1750 had fifteen spans, the largest being an arch of 76 feet width. The finest of the earlier French bridges is that by Perronet, over the Seine at Neuilly, completed in 1774. It

consists of five arches, each 128 feet in span and 32 feet rise. The soffits of the arches are constructed of a conoidal form, perhaps to allow the easy passage of water in times of flood. Other stone bridges are mentioned in the article ARCH.

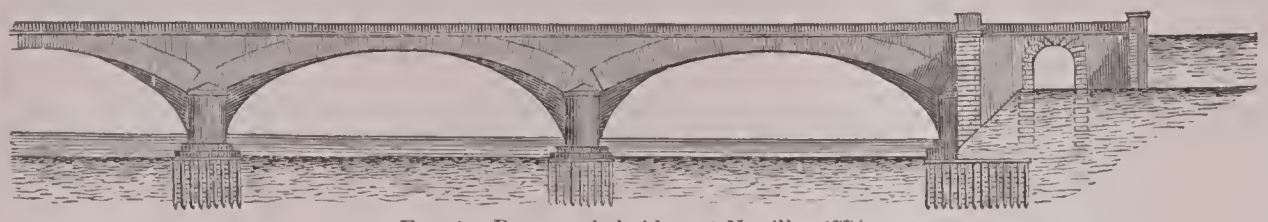

FIG. 1.—Perronet's bridge at Neuilly, 1774.

Culverts are small masonry bridges which allow the passage of streams through embankments. Excluding these, comparatively few stone bridges will be found on the railroads in the U. S. The Black Rock tunnel bridge, built in 1836 by Moncure Robinson, on the Philadelphia and Reading R. R., has five arches of 72 feet span and 16½ feet rise. The Pennsylvania R. R. has a number of stone bridges on its line between Harrisburg and Pittsburg, some of which have spans of nearly 100 feet. The cheapness of timber during the first half of the present century, and the great development of iron bridge construction since, have prevented the erection of the more costly stone structures. As it is found, however, that the life of iron bridges is much less than was at first supposed, stone bridges are now regarded with more favor on account both of durability and expense of maintenance.

Timber Bridges.—The oldest wooden bridge on record is the pons sublicius which was built at Rome across the Tiber, 621 B. C. It is celebrated for the combat of Horatius Cocles, a Roman knight, who saved the city by his noble defense of this bridge. The word *sublicius* is believed to imply wooden piers or piles. We have no satisfactory description of this structure, or of other ancient bridges, until 55 B. C., when Cæsar constructed a trestle or pile bridge across the Rhine near Bonn, the following account of which is given in his *Commentaries*:

"Timbers of a foot and a half thickness, sharpened at the foot, and of a length corresponding to the depth of the river, were assembled in couples, allowing an interval of 2 feet between them. Thus united by means of suitable apparatus, they were let down into the water, not vertically like ordinary piles, but inclined in the direction of the current, and thus driven. Another couple with opposite inclination was then fixed (or driven) 40 feet below the first. These double pieces, thus disposed, received at their extremity a beam of 2 feet thickness, which filled the interval between the pieces of each pair, and which was thus supported at each end by double ties. This framework composed of pieces inclined in opposing directions, strongly connected with each other, formed a very solid combination; for the property of such a disposition of materials is that the force of the current adds to its stability by exerting a strong pressure on the assemblage. After making a number of similar structures, placed at equal distances and extending from shore to shore, a continuous flooring was added composed of beams covered with fascines. Besides these arrangements inclined (brace) piles were driven on the lower side and connected with the rest of the work, forming a whole capable of resisting the greatest impetuosity of the current."

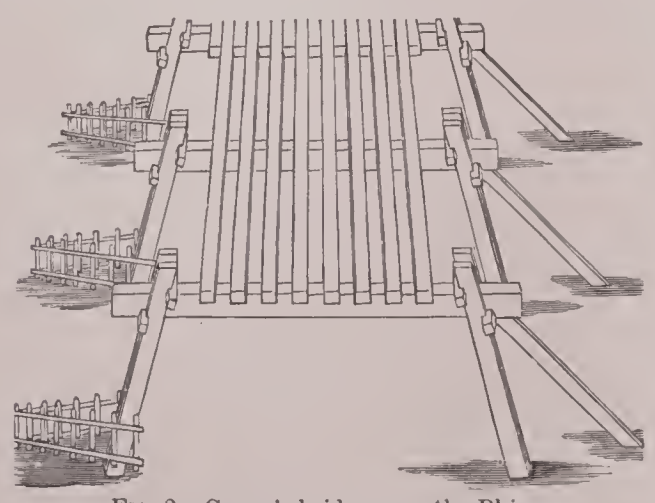

FIG. 2.—Cæsar's bridge over the Rhine.

This description clearly indicates a trestle bridge composed of bents protected by fenders. The cut is one of Rondelet's "restorations" of this interesting structure; its length was probably about 1,800 feet, and Cæsar says that ten days were occupied in its construction.

The longest timber span on record was built about 1760 by Ulric and John Grubenmann, over the Limmat river, near Baden. Its span was 366 feet, without intermediate support. This structure, like all other wooden bridges erected before the present century, was constructed with little regard to the principles of the economic disposition of materials, although it shows much skill in details of carpentry. It was destroyed by the French in the campaign of 1799. The cut shows one-half of the span only.

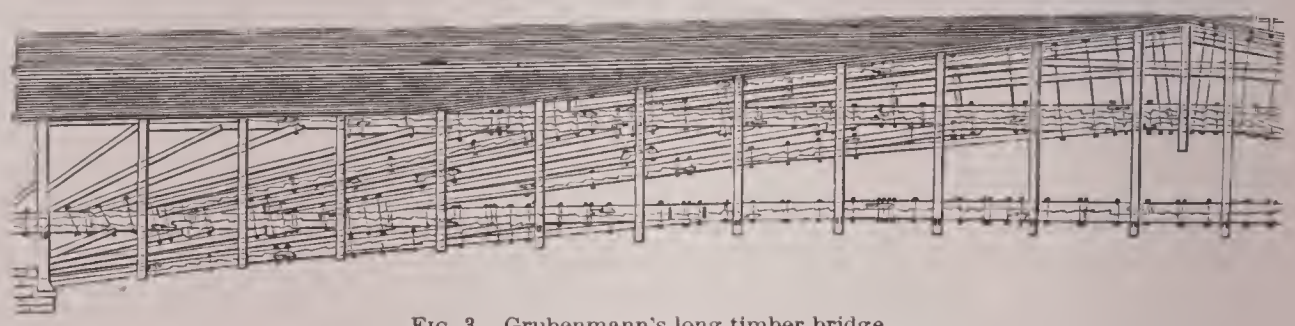

FIG. 3.—Grubenmann's long timber bridge.

The germs of the theory of trusses, and the definite division of a bridge into an upper chord, a lower chord, and inclined web members, are seen in bridges erected by Theodore Burr and by Timothy Palmer early in the present century. The oldest bridge now standing in the U. S. was built by Burr at Waterford, N. Y., in 1804, and consists of four spans of 154, 161, 176, and 180 feet in the clear; the timber is hewn yellow pine. In 1805 Palmer built the bridge over the Delaware river at Easton, Pa., which has three spans of 163 feet in the clear, or 195 feet between centers of piers; this bridge is also still in use, and only about one-sixth of the original timber has been renewed. Palmer also built in 1806 a bridge over the Schuylkill at Philadelphia, known as "the permanent bridge," which had two side spans of 150 feet and a central span of 195 feet. This bridge, like others of this period, was covered with boards to protect the framework from the weather. Palmer was a "self-taught architect," of Newburyport, Mass., but his structures display genius as well as practical knowledge. Burr's bridges are likewise noteworthy, particularly the one at Trenton, N. J., having five spans, the longest of 203 feet, and the one at Harrisburg, Pa., consisting of twelve spans of about 210 feet each; a portion of this last bridge is still in use. Previous to the year 1816 there were fourteen bridge patents issued by the U. S. patent office, but the nature of most of them is unknown, as the records were destroyed by fire.

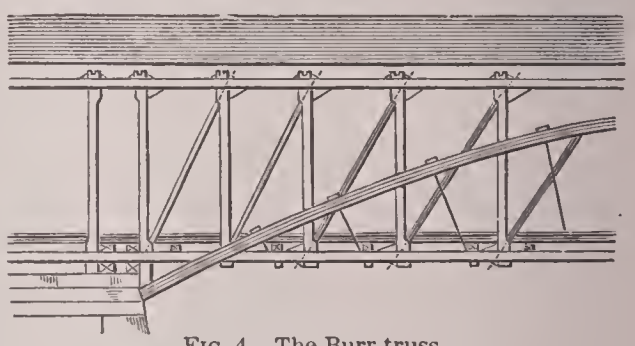

FIG. 4.—The Burr truss.

Thomas Pope, "architect and landscape gardener," published, in New York in 1811, the first American book on bridge construction, which, while giving descriptions of many European structures, is mainly devoted to advocating

a scheme of his own called "the flying pendant lever bridge," and which boldly sets forth a plan for a span of 1,800 feet

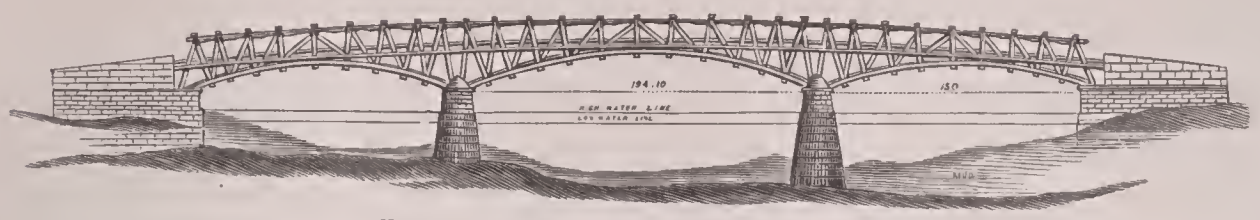

FIG. 5.—Palmer's bridge at Philadelphia, 1806.

over the Hudson river. The inventor gives his plan of construction in great detail, together with a view twice repeated of the entire bridge. But, as it was to be built out from its abutments without aid of false works, he has given a view (Fig. 6) of the half bridge thus projected, with the motto:

Like half a rainbow rising on yon shore
While its twin partner spans the semi o'er
And makes a perfect whole that need not part
Till time has furnished us a nobler art.

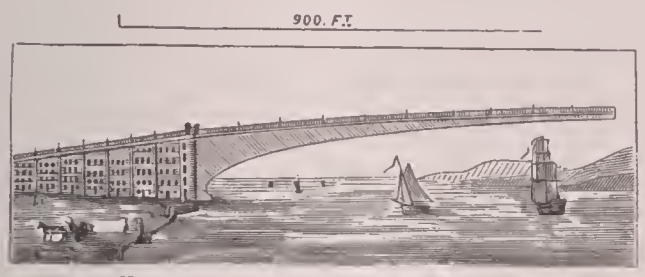

FIG. 6.—Thomas Pope's flying bridge.

The plan of building out arms from shore abutments and uniting them at the middle is a distinctive feature of the modern cantilever bridge. Pope had the idea, but built only a model of 50 feet span. It would not be possible, however, to erect a long span bridge with his details of construction.

In 1812 Lewis Wernwag built a bridge called "the Colossus" over the Schuylkill river at Fairmount, which had a clear span of 340 feet. As its rise was 38 feet, it acted like an arch as well as a truss, and, in fact, the upper part of one of the abutments is said to have moved 3 or 4 inches

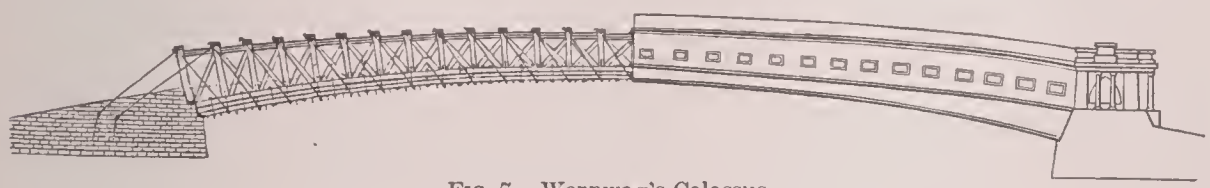

FIG. 7.—Wernwag's Colossus.

under the thrust. The double diagonal bracing connecting the upper and lower chords shows that its builder had considered the distorting action of moving loads. The lattice truss of Ithiel Town, introduced about 1820, was a form easy to construct for short spans, being made mostly of plank, but its use added little to the science of bridge construction.

In 1830 Col. S. H. Long, of the U. S. engineers, took out a patent for a truss, of which Fig. 8 shows one-half of the original drawing of the side elevation. In 1836 he published at Concord, N. H., a pamphlet of 75 pages, describing the features of his system. It had the great merit of providing

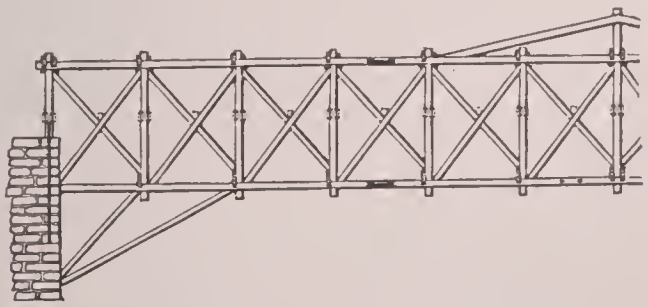

FIG. 8.—Long's truss, 1830.

diagonal counter braces to stiffen the truss under the action of the moving load, and these were fastened by wooden keys or wedges which were made adjustable, so that the structure could be stiffened at any time. The first bridge on this plan was on the Washington road, 2¼ miles from Baltimore, which had 109 feet span, and others were probably built on the Baltimore and Ohio R. R. Long's influence upon bridge building depends less upon bridges actually constructed by him than upon the clear recognition of the function of counter braces in stiffening the structure, "whether loaded or unloaded." Among other wooden bridge trusses devised after this time, should be mentioned those of Herman Haupt (1839) and D. C. McCallum (1851), the latter of which had a curved upper chord and the counter braces so arranged that the bridge could be stiffened by lengthening them when it was loaded. But about this time timber began to give way to iron. Details regarding early American timber bridges may be found in Duggan's *Stone, Iron, and*

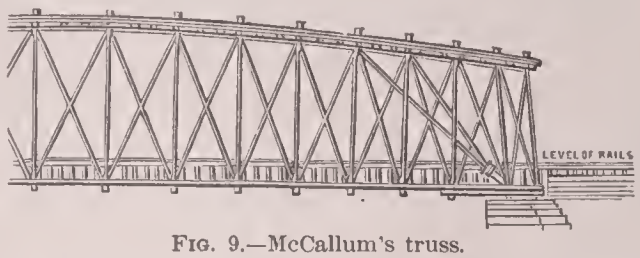

FIG. 9.—McCallum's truss.

Wood Bridges of United States Railroads (New York, 1850), and in Haupt's *General Theory of Bridge Construction* (New York, 1851).

Combination Bridges.—A combination truss is one which has some members made of timber and others of iron. William Howe in 1840 patented such a bridge, having its chords and diagonal braces of timber, and the vertical members of wrought iron. The braces butt at each end against cast-iron angle blocks, and the vertical ties have nuts at each end so that they can be firmly tightened. This bridge became very popular on account of facility of construction, satisfactory action under the passage of loads, and cheapness, and it was extensively built for highway and railway service. The cut shows one-half of a bridge whose span is about 140 feet. For railroad bridges greater in span than this the trusses were usually stiffened with arches, after the style of the Burr bridge. Many bridges were built on the Howe plan with spans of 200 feet or more. One of the most notable was the bridge on the Philadelphia, Baltimore and Wilmington R. R. over the Susquehanna river at Havre de Grace, which was completed in 1850. This had a total length of about 3,500 feet, there being thirteen spans of 250 feet each, and a draw span of 176 feet. The construction of this bridge occupied five years, and its cost was nearly $2,000,000. The figure shows an elevation of the drawbridge and of one of

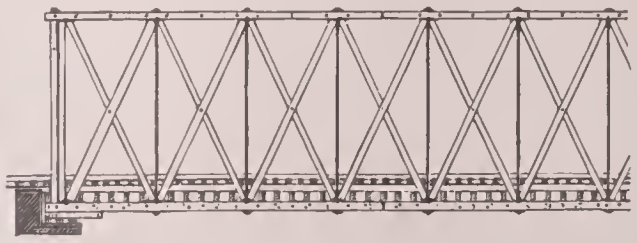

FIG. 10.—The Howe truss, 1840.

the fixed spans. Most of the Howe truss bridges in the Eastern and Middle States have been replaced by iron structures, but numbers of them are found in the Southern and

FIG. 11.—Havre de Grace bridge, 1850.

Western States, and they are still frequently built in localities where timber is cheap. For the greater part of the U. S., however, iron bridges are cheaper for spans of over 150 feet, and they are not only of longer life under natural wear, but are far less liable to decay and to destruction by fire.

In 1844 Thomas W. and Caleb Pratt patented a truss hav-

ing the upper and lower chords and the vertical posts of timber, while all the inclined members, except the two end ones, were made of adjustable iron rods. A skeleton diagram of the Pratt truss closely resembles one of the Howe truss, yet the principle of transmission of the stresses and the details of construction are quite different. As a combination bridge it never attained a popularity equal to that

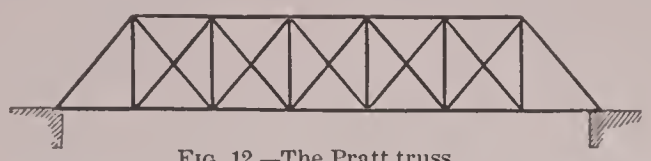

Fig. 12.—The Pratt truss.

of the Howe, as its methods of connecting the timber and iron members are quite complicated. Soon after 1850, however, it began to be constructed entirely in iron, and in this form has probably been more extensively built than any other one kind of truss. The Howe truss, on the other hand, is not well adapted for construction wholly in iron, and but few were ever built. The ill-fated Ashtabula bridge, which failed Dec. 29, 1876, causing the death of about ninety persons, was an iron Howe truss of 154 feet span.

Metallic Bridges.—Cast iron was employed during the latter part of the eighteenth century in the construction of several arched bridges in England (see Arch). Owing to the cheapness of timber in America, iron was little used prior to 1850, the first iron bridge erected being in 1840 over the Erie Canal. This had cast-iron girders, which were strengthened by wrought-iron suspension rods, and the span was about 77 feet. In the same year Squire Whipple built a truss with curved upper chord of cast iron and a straight lower chord of wrought iron, forming what is now called the bowstring truss. A number of these with spans of 100 feet and over were built in subsequent years. A truss invented by Wendell Bollman and another by Albert Fink were introduced soon after 1850, and extensively built in Maryland, Ohio, and westward; these had chords and posts of cast iron, and tension rods of wrought iron. Fig. 13 shows part of the old bridge between Louisville, Ky., and New Albany, Ind., where several Fink trusses are seen, the long channel span being a Warren truss with auxiliary verticals inserted. It will be noticed that the Fink truss has a pair of long tension rods running from the abutments to the

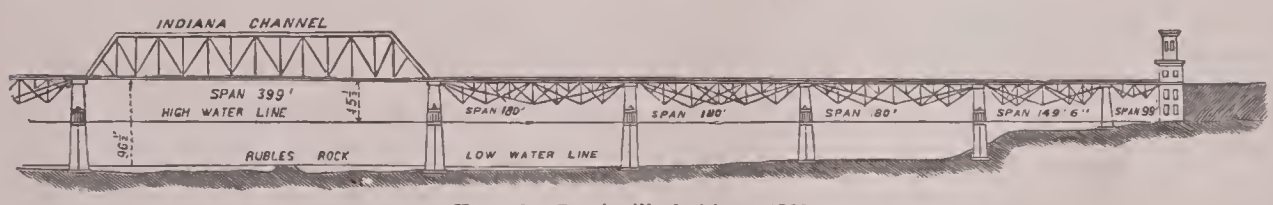

Fig. 13.—Louisville bridge, 1869.

foot of the central post, then each half span is subdivided by a post to whose foot a shorter pair of rods are connected, and so on with smaller divisions, thus forming a structure without a lower chord. It has not proved an economical truss, and could not be used for long spans, so that now it is rarely or never built.

In 1853 Squire Whipple built near Troy, N. Y., a railroad bridge of 146 feet clear span, the top chord and posts being of cast iron, and the lower chord and diagonal rods of wrought iron. This is the Pratt type, with a double system of posts and diagonals, usually called a double intersection truss, or more often a Whipple truss. This form has been extensively used in wrought iron, particularly for long spans, until about 1885, when it began to go out of use. Figs. 18 and 22 show the Whipple truss, and it will be observed that by its use the panel lengths can be made shorter than in the Pratt form of Fig. 12, with the same inclination of diagonals. This is advantageous in lessening the cost of the floor system, and the truss is only going out of use because other methods of securing the same results have been devised.

The forms of trusses which had been used for combination bridges, and for compound structures of cast and wrought iron, suffered more or less modification when wrought iron alone came to be employed, and some of these will receive mention below. The Howe truss, as an iron structure, proved an uneconomical and inconvenient arrangement, notwithstanding its great success as a combination bridge, while the Pratt truss, which was little built in wood and iron, proved admirably adapted for the use of wrought-iron connections. Under the sharp competition of bridge-builders every advantage that theory could indicate or that experience could suggest was seized upon to render structures both safe and economical.

Cast iron did not prove a satisfactory material for railroad bridges on account of its liability to failure under repeated stresses and sudden shocks. As we have seen, wrought iron was employed for tensile members in the first American bridges, but it was not until 1863 that a structure wholly of wrought iron was built. This was a bridge for the Lehigh Valley R. R. at Mauch Chunk, Pa., and even in this cast-iron joint details were employed. After this date the use of wrought iron increased with great rapidity, and at the present time cast iron would not be allowed except for highway bridges of short span and light traffic. Standard specifications for railroad bridges forbid the use of cast iron even for small joint blocks and bridge seats, although such are often allowed for highway structures.

Steel as a material for bridge construction began to be used about 1870, the first extensive application being in the great St. Louis arches in 1873, and later in the trusses of the suspension bridge over the East river between New York and Brooklyn. It is now extensively used in the form of plates for floor beams and of eye bars for the tensile members, and many entire bridges have been made of mild steel, the mechanical properties of which do not greatly differ from those of wrought iron. As steel is stronger than wrought iron, and qualities of suitable ductility and resilience can now be readily obtained at about the same cost per pound, its use is steadily increasing.

Classification.—In dealing with the subject from an historical point of view, and in tracing the development of different forms, a classification of bridges into stone, timber, and metallic, such as is given above, is very useful. But a comprehensive survey must include a division according to the principles employed in their construction. It is true that some structures exist in which the principles are so combined that their classification is quite difficult, but it has been found as a general rule that composite systems are not economically advantageous, and the tendency has long been toward simplicity of arrangement under forms which are capable of definite computation. For instance, Fig. 11 shows an arch combined with a truss, an old arrangement which is now universally abandoned except as a temporary expedient, for it is quite impossible to determine what proportions of the load are carried by the two different systems.

The three broad fundamental principles under which bridges may be classified are those of the beam, the arch, and the rope, which give rise respectively to the girder or truss bridge, the arched bridge, and the suspension bridge. The first of these exerts only vertical pressure upon its piers or points of support, while the second and third bring either outward thrusts or inward pulls upon the abutments or anchorages.

The words girder and truss are often used synonymously; but the first properly refers to a structure in one piece, or made of several pieces riveted together, so that it acts like a solid beam. For spans less than 30 feet bridges are often made by using solid iron or steel I beams, which are now rolled in sizes as high as 20 inches in depth. For spans between 30 and 90 feet plate girders are extensively used; these are made of iron plates and angles riveted together so as to form one solid structure. Lattice girders are also riveted, but instead of a plate connecting the flanges, diagonal pieces crossing each other are used. Box or tubular girders are formed by arranging iron plates, angles, and other shapes so as to inclose a hollow rectangular space, as seen in Fig. 20.

A truss consists of an upper chord, a lower chord, and of diagonal members connecting them, the whole forming an open framework so arranged that the principal members are subject only to tensile or compressive stresses. A truss having numerous diagonal members riveted to the chords is called a lattice girder. A truss having its members connected by pins at all principal joints is a pin bridge.

A girder or truss bridge is called simple, or independent, when supported only at each end, and it is continuous when it extends over more than two supports. A drawbridge is one that can be moved, usually by swinging around a cen-

tral pivot, so as to allow vessels to pass the structure. A cantilever was primitively any beam or truss projecting out from a wall, but a cantilever bridge now means a structure formed by two trusses extending from opposite abutments over two piers and united by another shorter simple truss.

In Europe the riveted system of construction now generally prevails. In this system the web members are connected to the chords by means of rivets, many plates being used at each joint to render this possible. In the U. S., however, the system of pin connections for these principal joints is universally used for bridges greater in span than 150 feet. Riveted trusses require much work in the field, while for pin trusses the erection is far simpler. It is claimed that riveted structures are less liable to failure than pin-connected ones: while, on the other hand, it is claimed that the stresses in the latter are more determinate, so that the material can be proportioned to give greater uniform security in all parts. Good bridges can be made upon either system, and considerations of economy will generally decide which is to be adopted in any given case.

Theory and Design of Trusses.—Bridge trusses erected prior to 1840 were rarely well arranged to carry the stresses that were brought upon them. The first publication in the U. S. dealing with the theory of the subject was that of Squire Whipple in 1847, and from that date computations and rational design became possible. It is not intended here to explain the theory of the computation of stresses, but a brief popular statement of a few fundamental principles will be useful before taking up the description of the great bridges of the world.

A Howe truss (Fig. 10) is formed by an upper chord which is always in compression, a lower chord always in tension, and certain web pieces which connect them. Of these web members the vertical ones are under tensile stress and the inclined ones under compressive stress. In the Pratt truss (Fig. 12) and in the Whipple truss (Fig. 18) the web members are arranged so that the vertical ones take the compression and the inclined ones the tension; this is a better arrangement than in the Howe truss, since a long bar or column is liable to bend under compressive stress, and must be stiffened to prevent this by the use of extra material. In the Howe truss one series of web braces provides for the action of the dead or permanent load, while the smaller ones, known as counter braces, prevent the distension under the live or rolling load. So in the Pratt and Whipple trusses there are main ties and counter ties which act in a similar manner. The stresses in the chords are greatest near the middle of the truss, as are also the stresses in the counters; the stresses in the main members of the webbing, however, are greatest near the ends of the truss. Now, to insure economy of material, the sizes of members must be proportional to the stresses that they are to carry; hence it is that the chords of a simple truss are smallest at the ends and greatest at the middle of a bridge, while the main bracing is greatest in size at the ends and least at the middle. The stresses in the chords under a given load vary with the height of the truss, the higher the truss the less being the stresses. Thus, as far as the chords are concerned, economy is secured by making a truss very high; but as the length of the web members increases with the height a limit exists, and this in practice results in making the height usually less than one-fifth of the span, or for long bridges one-tenth of the span.

The triangular truss, in which the webbing consists of members forming a series of equilateral triangles, each member being adapted for both tension and compression, was proposed in 1846 by Neville, a Belgian engineer, but was first built in England by Capt. Warren about 1850, and is hence called the Warren truss. In Fig. 14 is shown a skeleton diagram with spheres at the several apex points of the upper chord to represent the loads, the mark + denoting the compressive stress under a uniform load, while the mark — denotes tensile stress. In 1851 a railroad bridge on this system was built over the Trent, having a span of 240 feet, cast iron being used for compression members and wrought iron for tension members. In 1853 the Crumlin viaduct, formed of ten spans of 150 feet each, was erected on the same system, using wrought iron throughout. The piers of this structure were made of cast-iron posts with wrought-iron braces, the height of the highest pier being 170 feet, the whole forming a handsome structure.

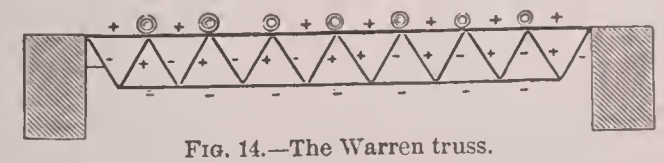

Fig. 14.—The Warren truss.

The bowstring truss, one form of which is shown by Fig. 15, originated in an attempt to economize material by making the chords of uniform section throughout. If this were done in a truss with parallel chords the end chord members

Fig. 15.—Inverted bowstring truss.

would have an excess of material, but by making one of the chords curved the stresses were rendered approximately uniform; for a parabolic curve the straight chord is strained alike throughout its entire length. The form in Fig. 15 is really an inverted bowstring truss, the name being originally applied to the case where the upper chord was curved and in compression and the lower one straight and in tension. Bridges with such trusses were first built by Laves in France about 1835 of timber and iron, and later they were erected of cast and wrought iron in England by Brunel, and in the U. S. by Whipple. This principle of construction has proved an economic one, and it is used to a greater or less extent in some of the longest truss bridges ever erected (see Fig. 23).

The lenticular truss has both upper and lower chords curved either in parabolic or circular lines. Such bridges were erected soon after 1840 in France, and were developed about 1850 in England and about 1860 in Germany into an important economic system of design. The horizontal line

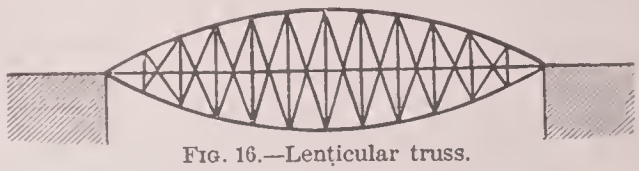

Fig. 16.—Lenticular truss.

in Fig. 16 indicates the position of the floor of the bridge, and does not represent a chord, the functions of these being fulfilled by the curved members alone. By properly proportioning the depths at the various panels the strains in the chord members can be made nearly equal, so that they can be of uniform section throughout; the web members are also found to vary less in size than in trusses where the chords are parallel. It is probable that this form of truss is the one which will ultimately be found to afford the greatest degree of economy as far as material alone is concerned. The longest one yet constructed is that designed by Brunel, and completed in 1859, to carry a railway across the Tamar river at Saltash, near Plymouth, England; this is 455 feet in span, and at that date was an engineering work of great magnitude. In this bridge the roadway was hung below the lower chord (see Fig. 21), but it is also sometimes placed above the upper chord.

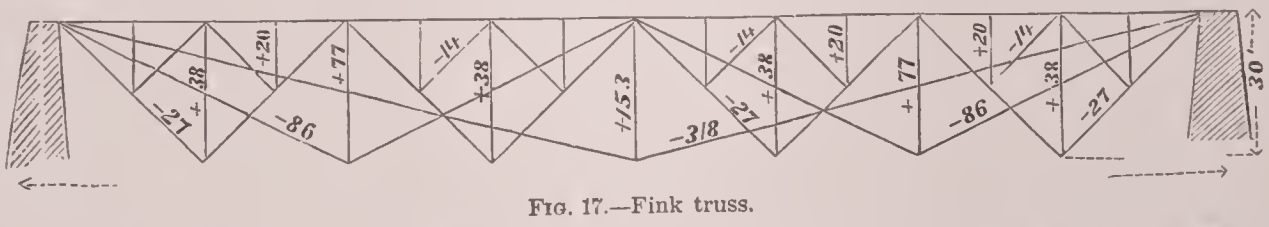

Fig. 17.—Fink truss.

The loads which the trusses are to carry are known in advance, and from these the stresses are computed by the principles of statics. (See Graphic Statics and Stresses.) The live load is that of a crowd of people on a highway bridge and of a train on a railroad bridge. The dead load is the weight of the bridge itself. It was formerly the practice to take the live load for a railroad bridge as a uniform rolling weight of about 2,000 lb. per linear foot per track, the exact figure being somewhat greater for short spans than for long ones on account of the greater shock due to the passage of trains, and most of the structures erected prior to 1875 were designed under such an assumption. From these loads the stresses are computed and written on a diagram called the

strain-sheet. In Fig. 17 is shown a strain-sheet of a Fink truss of 242 feet span and 30 feet depth, where are given the stresses due to a live load of 1·3 tons per foot and a dead load of 1·25 tons per foot, tensile stresses being marked with a minus sign and compressive stresses with a plus sign. The stress in the upper chord is compression, and is uniform throughout.

The Whipple truss, shown in the skeleton diagram of Fig. 18, consists of a double system of diagonals each of which

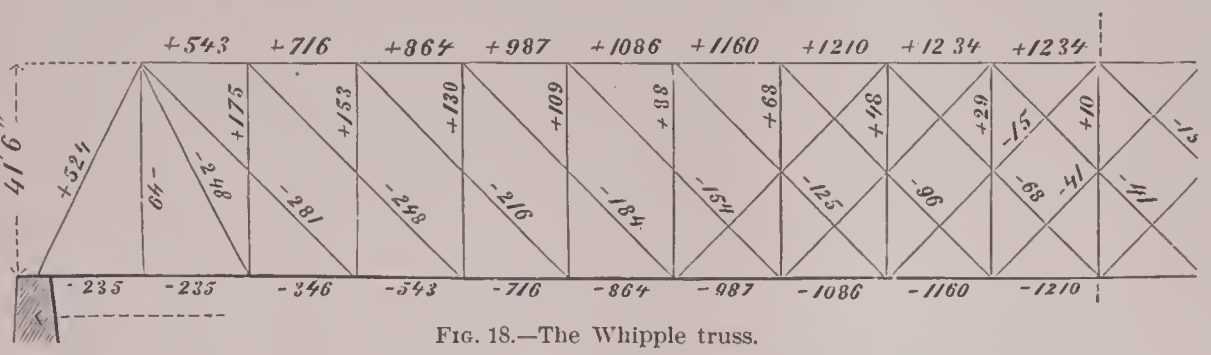

Fig. 18.—The Whipple truss.

is separately computed for the loads that come upon it. The cut gives the strain-sheet of the bridge built at Cincinnati in 1872, the span being 415 feet and the depth 41½ feet. This bridge carries a single track railroad on its lower chord, and outside of each truss is a highway track supported by projecting floor beams. The dead load was taken as 2½ tons per linear foot, and the live load at 1½ tons for the railroad and ¾ tons for the highway (see Fig. 22).

About 1875 the practice arose of taking a greater load per linear foot for the locomotive than for the train. For example, in the long span built over the Ohio at Cincinnati in 1877 it was required that the stresses should be computed for two locomotives coupled together, each of them weighing 36 tons on a 12-feet wheel base, or with tender 66 tons on a base of 50 feet, followed by cars weighing 0·9 ton per linear foot. About 1880 this method began to go out of use, and the practice was introduced of taking the actual wheel loads of a locomotive in their actual positions, the carload being, as before, considered as uniformly distributed. Theoretically the static stresses are more determinate under the assumption of exact concentrated loads than if they be regarded as distributed; but when the increased dynamic stresses due to the sudden application of the load are considered, which are indeterminate and can only be allowed for approximately, it is doubtful if these refinements of computation are either necessary or advantageous.

In Fig. 19 are shown the stresses on a drawbridge truss of 358 feet total length and 26 feet depth, caused by a dead load of 0·95 ton per linear foot and a live load of 1·25 tons

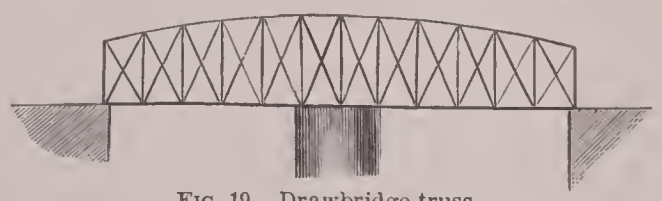

Fig. 19.—Drawbridge truss.

per linear foot. It is seen that the chords take both tension and compression, one kind of stress occurring when the draw is open and the other when it is closed and subjected to the live load. This truss is also of the Whipple type.

Tubular Bridges.—The Britannia bridge over the Menai Straits, in Wales, designed by Robert Stephenson, was completed in 1850. It has two spans of 460 feet and two of 230 feet, made of cast and wrought iron, forming a rectangular tube 1,380 feet long, 28 feet in depth, and 13 ft. 8 in. wide in the clear, through which a single track passes. Fig. 20 shows a section of the structure, but in reality there are two independent tubes side by side for the passage of trains in opposite directions. The shore spans of 230 feet were built in place on false works, but the long central spans were built on shore, floated out on pontoons, and lifted into place by hydraulic presses. The cost of the bridge, inclusive of substructure, was about $3,000,000.

The Victoria tubular bridge across the St. Lawrence river at Montreal, Canada, also designed by Robert Stephenson, was completed in 1860, having occupied six years in construction. It has twenty-five spans, the middle one being 330 feet, and each of the others 242 feet long, the whole, with abutments, being nearly 1¼ miles long. The tubing of this bridge is not cellular at top and bottom, as is the Britannia. The ironwork was made in England, even to the punching of the rivet-holes, and each span was built in place on false works. The cost was about $7,000,000.

Although these tubes form very strong and stiff bridges, yet it is now universally recognized that their erection was an error of judgment which retarded the development of economic bridge design. The train passes through the tube, as through a tunnel, in darkness and smoke, so that from the point of view of a traveler they are unfavorably regarded. Their great weight and the large amount of workmanship render them the most costly of all structures; indeed, both the Britannia and the Victoria bridges proved ruinous to the companies that built them. Simultaneously with the attempt to bridge large spans by the tubular plan in England and Canada the suspension principle was being applied for the same purpose in the U. S., although it had been rejected by the British engineers when considering the designs for the structure over the Menai Straits.

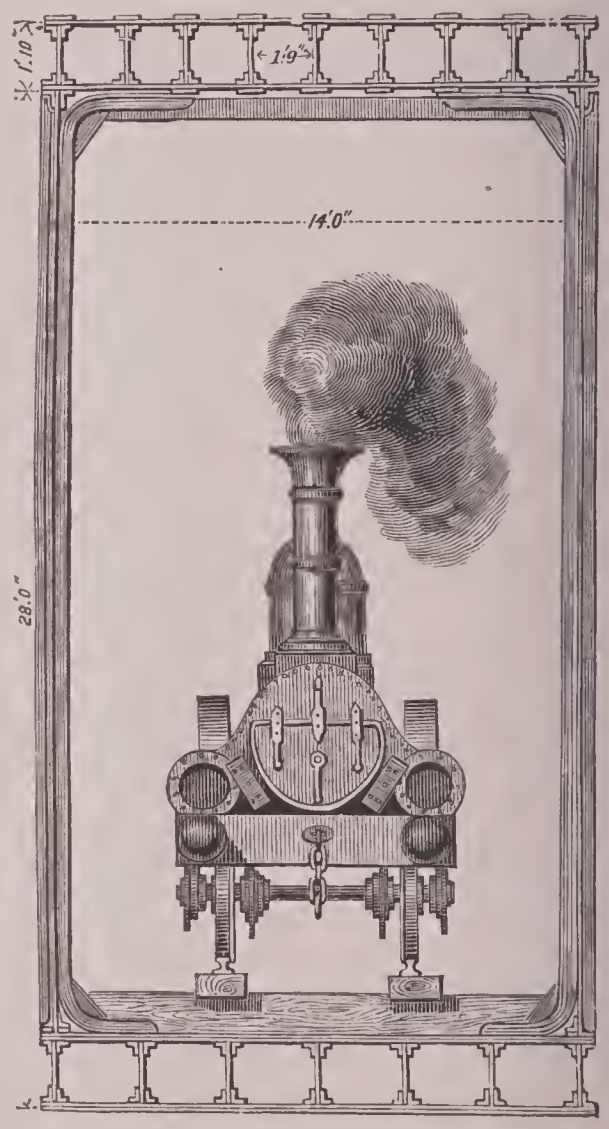

Fig. 20.—The Britannia tube, 1850.

Simple Truss Bridges of Long Span.—A bridge of more than 300 feet span is usually regarded as "long," but the number of these has become so great that a mere enumeration would occupy too much space. The following descriptions are, as a rule, limited to those spans which exceed 400 feet, and from these are selected such as are noteworthy on account of new principles of design, difficulties of construction, or special engineering features of interest.

The Saltash bridge has already been mentioned as an example of the application of the lenticular system to long spans. The whole structure has nineteen spans, two of 455 feet from center to center of piers and the others are 69½ feet each, making a total length of 2,240 feet. The main piers are 190 feet in height from the top to the foundation,

and they were sunk in open wrought-iron caissons. The upper chord, or arch as it is sometimes improperly called, is made of wrought-iron plates, forming a tube of an elliptical cross-section, its width being 16 ft. 9 in. and its depth 12 ft. 3 in. The lower chord is formed of suspension chains, and its horizontal pull counteracts the thrust of the upper chord, so that the resultant pressures on the supports are vertical. Each of the main trusses was constructed entire on shore, floated out on pontoons, and raised into place by hydraulic presses.

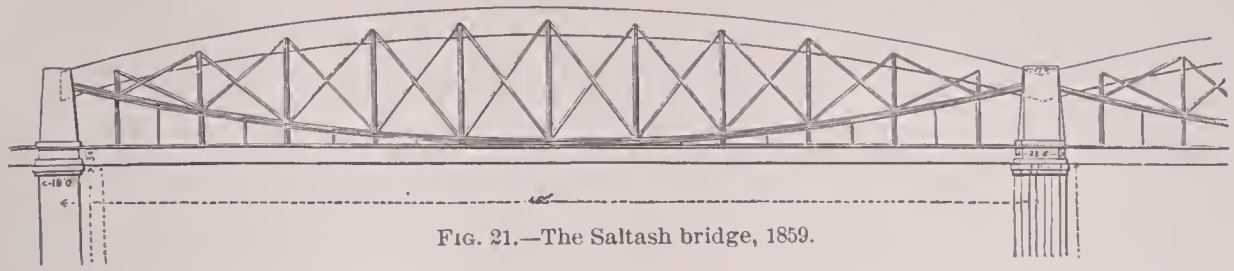

Fig. 21.—The Saltash bridge, 1859.

The Ohio river bridge at Louisville, Ky., designed by Albert Fink and completed in 1869, has a channel span of 400 feet, another fixed span of 370 feet, a draw span of 264 feet, and twenty-four other spans, the total length being 5,218 feet. A part of this bridge is shown in Fig. 13. At the time of its erection the channel span was the longest in America, and the whole bridge was regarded as an engineering work of great magnitude. The long channel spans were arranged with through trusses, while the others had deck trusses, the clear headway below the latter being 90 feet above low water. The extreme rise of the Ohio river is about 40 feet, and on this account the construction of foundations and the erection of false works are often attended with great danger.

The bridge over the Ohio river between Newport and Cincinnati, built in 1872 by the Keystone Bridge Company, J. H. Linville chief engineer, has a channel span of 420 feet, which is shown in Fig 22. The style of construction is that of the Whipple truss, which has also been extensively used for other long-span bridges. The entire structure ranks among the longest in the world, having twenty-three spans, aggregating 5,925 feet in length.

The Kuilenburg bridge, built by G. Van Diesen over the Leek, in Holland, in 1866, has one span of 515 feet between centers of piers. This is a lattice girder with a triple system of webbing, the upper chord being curved, and the truss resembling in general outline that shown in Fig. 9. For a number of years this span stood at the head as the longest of simple truss bridges.

In 1877 another bridge over the Ohio river at Cincinnati was completed by the Keystone Bridge Company, which had five spans aggregating 1,600 feet, the channel span being 519 feet between centers of piers, or 515 feet between centers of end pins. The general style and appearance of this span is like that shown in Fig. 22. The depth of this truss was 51½ feet and its width 20 feet, it being for a single-track railway. The lower chord was 106 feet above low-water mark. The weight of iron in one of the 300 feet spans was 657,400 lb., while that in the channel span of 515 feet was 2,634,400 lb., or nearly four times as much. In the progress of the design and construction of this bridge tests of materials and members were made upon an extensive scale, and knowledge thus obtained which proved of great value to the engineering profession.

In 1885 the bridge over the Ohio river at Henderson, Ky., was completed, which has a total length of 3,688 feet, and is composed of sixteen spans, the longest being 525 feet from center to center of piers. Since that date the development of the cantilever system has somewhat interfered with the design of simple trusses of long span, yet at least four over 500 feet in length have been erected. The bridge of the Baltimore and Ohio R. R. over the Susquehanna river at Havre de Grace, Md., includes two spans of 375 feet each, four spans of 475 feet each, and two spans of 515 feet each. The channel span of the Ohio Connecting Railway bridge at Pittsburg is 523 feet, and special interest attaches to this, as it was built on false works on shore and then the whole floated across the river on barges into its place on the piers. The bridge of the Norfolk and Western Railroad over the Ohio river at Ceredo, West Va., completed in 1892, has two spans of 301 feet each, two of 304 feet each, and one span of 521 feet, all being with bowstring trusses, and similar in general style to those in Fig. 23.

In 1886 occurred an interesting international competition for the erection of a bridge structure 2,900 feet long over the Hawkesbury river in New South Wales, Australia. Plans and proposals were submitted by fourteen bidders, two from Australia, one from France, eight from England and Scotland, and three from the U. S., the lowest bid being $1,364,690 and the highest $3,413,590 for both foundations and superstructure. The contract was awarded to the Union Bridge Company, of New York, and the work completed in

Fig. 22.—Cincinnati and Newport bridge, 1872.

1889. The piers are especially noteworthy on account of their great depth, and as having been sunk under very unfavorable conditions. (See Foundations.) The bridge has two spans of 408 feet each and five spans of 416 feet each, all being typical American trusses in the general features of design.

The longest simple truss span yet erected was built by the Phœnix Bridge Company in 1888 over the Ohio river at Cincinnati, its length being 550 feet between centers of piers, or 545 feet between centers of end pins. The bridge also has two other spans, each 490 feet in length. All the spans carry a double-track railroad, together with two roadways and sidewalks, so that they are the heaviest simple trusses ever constructed. Fig. 23 shows that the style of arrangement presents features radically different from the Whipple truss, not only in the curved outline of the upper chord, but in the arrangement of the webbing, whereby a double system is avoided and the long posts are strengthened by short horizontal struts. The truss of the central span is 84 feet in depth at the middle. The weight of iron and steel in the three spans is almost exactly 10,000,000 lb.; besides these there are approaches consisting of shorter spans which make the total length of the structure over one mile, so that in

all 20,360,000 lb. were used. The erection was accompanied with difficulties on account of unusual floods in the river, and the false works of one of the spans, together with about 700,000 lb. of iron and steel members, were swept away in a complete wreck. As an illustration of the perfection of American methods of construction and erection, it may be mentioned that the actual shop-work on the superstructure

The Lachine bridge, designed by C. Shaler Smith, and erected by the Dominion Bridge Company in 1887 over the St. Lawrence river at Montreal, is shown in Fig. 24. It consists of two central through spans of 408 feet each, and two side deck spans of 269 feet each, forming a continuous truss over five supports. The structure has great interest on account of the graceful and pleasing manner in which the

FIG. 23.—Cincinnati and Covington bridge, 1888.

began in Mar., 1888, and that the last of the three spans was coupled and traffic passed over on Dec. 25 of the same year.

The bridge over the Ohio river at Cairo, Ill., opened in 1889, includes two through spans of 518½ feet, seven of 400 feet, three deck spans of 249 feet, and thirty-eight spans of viaduct structure, making a total length of 10,560 feet. The cost of the substructure was $1,189,744 and of the superstructure $765,616.

Continuous Bridges.—A continuous truss extends over three or more supports, so that a load placed on one of the spans causes stresses in the other spans. Many such bridges have been erected in Europe, but the system has found little favor in the U. S. In a simple truss the stresses in the members are not affected by slight changes in level of the supports, but in a continuous truss they would be materially altered. A simple truss has the upper chord always in compression and the lower chord always in tension, but in a continuous truss the upper chord is in tension and the lower one in compression for some distance on each side of a pier (see FLEXURE), and a portion of each chord is liable to receive either kind of stress under the action of a passing load. Theory indicates that when several spans are to be bridged the continuous system requires less material than simple trusses, but this is apparently overbalanced by the uncertainties arising from the causes just mentioned.

Among the continuous bridges in England may be mentioned that over the Wye at Chepstow, having three spans of 100 feet each and one span of 305 feet. In Ireland the Boyne viaduct at Drogheda, built in 1855, has three spans of 141, 267, and 141 feet. In Germany is found the bridge over the Weichsel at Dirschau, having six continuous spans of 397 feet each. The Victoria tubular structure at Montreal, Canada, is continuous over one pier and disconnected at the next, thus making continuous bridges of two spans, each of 242 feet in length.

The bridge designed and built by C. Shaler Smith in 1877 over the Kentucky river is an interesting one, as it forms one of the connecting links between the continuous and the cantilever systems. The distance to be bridged was 1,125 feet at an elevation of 275 feet above the low-water level of the river, and it was divided into three spans of 375 feet each by two piers. As false works were impracticable, the structure was built out from each shore abutment, one panel after the other, until the piers were reached, and the process was then continued until the two halves met over the middle of the river, where they were united. Thus a continuous bridge of three spans was formed, but on account of the great height of the iron piers, and their alteration in length under changes of temperature, the chords were cut at a distance of 300 feet from each abutment, and the webbing was so arranged that horizontal stresses could not be transmitted. Thus the structure was converted into two simple trusses, each 300 feet in length, and a central truss 525 feet long. Each of the simple trusses was supported at one end by the shore abutment and at the other end by the projecting or cantilever part of the central truss. The disadvantages of permanent continuity were thus avoided, while all the advantages of this method of erection were secured.

transition from the deck to the through span is made, as well as for its low cost when compared with its neighbor, the Victoria tubular bridge. The following comparative details of these structures are valuable, as showing the prog-

FIG. 24.—Lachine bridge at Montreal, 1887.

ress made in the science and art of bridge design and erection during the short space of thirty years:

ITEMS.	Lachine.	Victoria.
Total length, in feet	3,535	6,520
Number of piers in water	12	24
Velocity of current, in miles	8 to 12	2 to 8
Depth of water, in feet	20 to 90	22
Time of building piers	1 year	6 years
Longest span, in feet	408	330
Minor spans, in feet	240	242
Masonry in piers, cubic yards	11,000	100,500
Iron and steel in bridge, tons	3,690	9,000
Total cost	$1,250,000	$7,000,000
Cost per linear foot	$354	$1,073

Drawbridges.—The usual type of drawbridge in the U. S. is that shown in Fig. 19. The truss is symmetrical, and rests on a turntable on the central or pivot pier. Two equal openings are provided when the draw is turned. When it is shut, the truss is a continuous one of two spans, and liable to be acted upon by the live load. When the draw is swung open the live load can not come on it, and it consists of two semi-girders or cantilevers, connected together over the pivot pier. In the first case the upper chord is under tension for a certain distance over the pivot pier, and under compression throughout the rest of its length, and the reverse holds for the lower chord. In the second case the top is in tension and the bottom is in compression. It is therefore necessary to make these chords so that they will resist both kinds of stress.

The practice among American bridge-builders is to consider the permanent load as at all times supported by the pivot pier, whether the draw be open or shut. The live load is provided for by considering the draw as a continuous girder on three supports. The depth of drawbridges is generally made greater over the pivot pier than at the ends. This gives an increase of depth where it is needed, while the truss is kept shallow at the ends, where any increase of weight

beyond what is absolutely needful is injurious, as increasing the stresses when the draw is open. Drawbridges are turned by gearing on the circumference of the pivot pier worked by hand or by steam.

The span of a drawbridge is usually estimated from end to end, and thus includes the space occupied by the center pier. A large number of such drawbridges with spans exceeding 300 feet have been built over the navigable rivers in the U. S. The Missouri river has several with openings of 160 feet in the clear. On the Mississippi river there is one of 362 feet span at Quincy, one of 380 feet span at Keokuk, and one at Louisiana, Mo., which has a span of 444 feet with two openings of 200 feet each in the clear.

The Arthur Kill drawbridge on the Baltimore and Ohio R. R., over the arm of the sea between Staten Island, N. Y., and the mainland of New Jersey, was built in 1888 by the Keystone Bridge Company. It is a single track draw of 496½ feet between centers of end piers, 54 feet deep at the middle, and 30 feet deep at the ends, and gives a clear waterway of 206 feet on one side and 214 feet on the other. The weight of the draw is supported by a rim-bearing turntable with 54 cast-steel rollers turning in a track 24 feet in diameter. When the draw is closed the ends are lifted by wedges, so that each half is independent of the other, and the structure becomes two simple trusses instead of being continuous. The ends can be lowered and the draw be swung open in three minutes.

The longest drawbridge yet constructed is that designed by Alfred P. Boller, and built in 1890 by the Union Bridge Company as a part of the railroad bridge over the Thames river at New London, Conn. In Fig. 25 are seen at the ends two deck spans of 150 feet each, then two through spans of 310 feet each, and in the middle the draw span of 503 feet, whose upper chord is reversed in curvature from the usual practice, the whole presenting a most graceful appearance. The draw is noteworthy not only on account of its length, but it carries two tracks, and each truss is proportioned for a moving load of two 86-ton locomotives followed by a train-load of 3,000 lb. per linear foot. The central height of the draw is 71 feet, the end height is 25 feet, the clear distance between tresses is 26 feet, and its weight is 1,300 tons.

FIG. 25.—Thames river bridge, New London, Conn., 1890.

Cantilever Bridges.—This type of truss bridge, which has been introduced and perfected since 1882, will be understood by a consideration of Fig. 26, which gives a skeleton diagram of the Niagara cantilever. $A\,C$ is a truss having a shore arm, $A\,B$, and a river arm, $B\,C$; it is supported by the anchorage A and the tower B. On the other side of the river is a similar truss, $F\,D$, supported at F and E. Connecting these two is a simple independent truss, $C\,D$. In the figure the chords appear continuous, but, in reality, these are arranged with sliding joints near C and D, so that no horizontal stresses can be transmitted. A load placed anywhere on $A\,B$ is supported at A and B; a load placed on $B\,C$ causes a downward pressure at B and an upward pull at A, and a load placed anywhere on $D\,F$ can produce no effect at either A or B. A load placed on the central span $C\,D$ is, however, carried to C and D in proper proportions, just as if C and D were the abutments of a simple truss, and then these proportions are transferred to the left and right respectively. The arm $B\,C$ is the cantilever part of the truss $A\,C$, and from this circumstance arose the term "cantilever bridge."

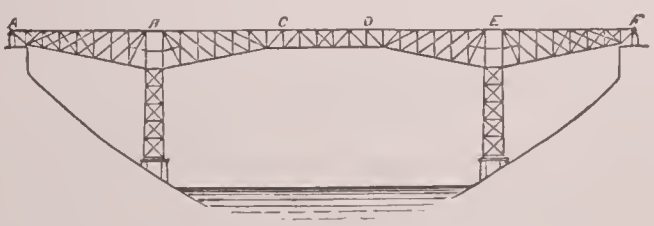

FIG. 26.—Niagara cantilever bridge, 1883.

Germs of the idea of a bridge with a projecting or cantilever arms are seen in the design made by Thomas Pope in 1811, and in a patent granted to A. Canfield in 1833. The Kentucky river bridge of 1875, often quoted as an application of the cantilever principle, can not be so regarded except in the method of its erection; it is rather a continuous bridge, modified by making permanent points of inflection according to principles which were well known. But the very great advantage of being able to erect a truss system over a deep chasm without the use of false works, which is a feature of both systems, has caused them to be sometimes confounded in principle. In 1870 Prof. W. P. Trowbridge proposed a design for a bridge across the East river at Blackwell's island, in which is seen a central truss supported by two cantilever arms, and in 1876 Charles Macdonald made plans for the same bridge showing similar features. In these designs the object appeared to be to modify the suspension system by avoiding the cables and the horizontal tensions caused by them.

A cantilever bridge was designed by Charles C. Schneider in 1882, and erected over the Niagara river during the following year, within 7½ months from the date of its commencement. Its total length is 910 feet, span of the shore arm 195 feet, length of the river arm 175 feet, length of the central truss 175 feet, and clear span between the towers 470 feet. The bridge is 245 feet high above the surface of the river, and the steel towers are 130 feet high. The erection was effected by constructing false works under the shore arms, and, when these were completed, building out the trusses, panel by panel, until they met over the middle of the river. The upper and lower chords were then disconnected near C and D, making $C\,D$ a simple truss, independent of the rest of the bridge. The cost of the bridge, exclusive of approaches, was about $600,000.

In 1885 a steel cantilever was erected over St. John river, New Brunswick, which has a total length of 813 feet, a clear central span of 477 feet, a shore arm of 191 feet, a river arm of 191 feet, and a central truss of 144 feet. The great advantage of the method of erection was here again demonstrated, so that since 1885 cantilever bridges have been built in such numbers as almost to escape record. For short spans they have not been able to displace simple trusses, but for spans between 400 and 800 feet, where false works are difficult of erection, they seem to be more economical than the simple truss, the arch, or the suspension system.

The bridge over the Hudson river at Poughkeepsie, completed in 1889, has a total length of 6,767 feet, the five spans over the river being 548, 525, 546, 525, and 548 feet between

centers of piers. Of these the first, third, and fifth are true cantilever spans, having a central truss connecting the arms which project in each direction from the second and fourth spans. Fig. 27 shows one of these fixed connecting spans, and also one of the cantilever spans. In this method of construction the fixed spans are erected upon false works, and their projecting arms are then built out in both directions. The economy of the cantilever system in erection is thus gained only for each alternate span, but for the fixed spans the advantage of the continuous system is gained without its disadvantages. This bridge is also noteworthy on account of the great depth of the foundations of the piers. See FOUNDATION.

FIG. 27.—Poughkeepsie cantilever bridge, 1889.

The bridge across the Colorado river at Red Rock, Cal., was built in 1890 by the Phœnix Bridge Company, and carries a single-track railroad. At that time it was the largest span of the cantilever type in the U. S. Its general arrangement is like that of the Niagara cantilever, except that it is a through bridge. The shore arms and the river arms are of the same length, 165 feet each, while the central truss is 330 feet long, thus making the distance between the piers 660 feet, and the total length 990 feet. The entire weight of iron and steel in the structure is 3,500,000 pounds, and it was erected in eighty working days, the total cost, exclusive of masonry work, being $230,160.

The bridge over the Mississippi river at Memphis, Tenn., designed by George S. Morison, and completed in 1892, contains two cantilever spans and one fixed span longer than any heretofore constructed in the U S., and next to the Forth bridge they are the longest truss spans in the world. The fixed span is 621 feet in length, and the cantilever spans are each 790 feet, consisting of two cantilever arms 169 feet long and a central truss of 452 feet. The bridge is a through railroad structure 78 feet high and 30 feet wide between centers of trusses, and the clear height of the lower chord above low water is 110 feet. The bridge proper is 2,600 feet long, and the iron viaduct approach is 2,300 feet in length. The material is mostly steel, and some of the pins used are 14 inches in diameter and nearly 5 feet long.

The Forth bridge, famous as having the longest spans in the world, remains to be noticed. In 1880 a design was made, having two suspension spans of 1,600 feet each, and the contract was awarded, but financial reasons necessitated its abandonment. In 1881 a design on the cantilever plan was made by the engineers, Benjamin Baker and John Fowler, having projecting arms 615 feet long, and a central truss 500 feet long. The general features of this plan were adopted, and under it, with some modifications, the structure was built. Work was begun in 1883, and the bridge was opened for traffic early in 1890. It consists of two shore arms, each 680 feet long, and two main spans, each 1,710 feet long. Fig. 28 shows one shore arm and one main span, with the middle pier, or a little more than one-half of the whole cantilever structure. Beginning at the end the successive distances are, in order, a shore arm of 680 feet, a tower of 155 feet, a cantilever arm of 680 feet, a central truss of 350 feet, a cantilever arm of 680 feet, and the middle tower of 270 feet length; then follows the other cantilever span of the same dimensions and its shore arm, the whole forming a structure symmetrical with respect to the center of the middle tower. Each of the towers has the great height of 343 feet, and they rest upon low masonry piers placed 120 feet apart transversely across the bridge. The width of the bridge at the central truss is, however, only sufficient for two railway tracks, so that the cantilever trusses are not parallel, but converge toward the ends; and as the tops of the towers are nearer together than the bases, the members of the truss do not lie in a plane, but in a warped surface. The compression members are, as a rule, tubular, the principal ones being 12 feet in diameter, while the tension members are mostly lattice girders. The whole structure is of steel, of which 51,000 tons were used on the main spans, and the cost, without the approaches, was about $13,000,000.

Arched Bridges.—The truss bridges above described form a distinct class intermediate between the arch and suspension systems. In a truss bridge one chord is in tension and the other in compression, while the points of support receive only vertical pressures. In a suspension bridge the main cables are in tension, and a horizontal pull is brought upon the abutments. In an arched bridge the main ribs are mostly subject to compressive stresses, while the abutments

FIG. 28.—The Forth cantilever bridge, 1890.

receive a horizontal thrust in addition to the vertical pressures. Some arched bridges have been described near the beginning of this article, and under ARCH those of widest span will be found mentioned. An arch is usually more graceful in appearance than a truss, and it seems to produce on the mind of the traveler a feeling of greater security. In the neighborhood of cities the question of æsthetics is an important one that can not be overlooked, and hence an arched bridge is sometimes preferred when a simple truss of equal strength could be erected for much less money.

The great arched bridge at St. Louis, of which an illustration is given in the article ARCH, has two spans of 497 feet and one of 515 feet in the clear, and a total length, including abutments, of 1,700 feet, and it carries two railroad tracks, together with a highway on the upper deck. Its cost was about $5,300,000, or $3,150 per linear foot, while that of the Poughkeepsie cantilever bridge, which has two railroad tracks only, was about $840 per linear foot. The steel for the St. Louis arches was, however, very costly, and at the present time a similar bridge could be erected at a much lower figure.

The Washington bridge over the Harlem river, shown in Fig. 29, is a highway structure of beautiful and imposing

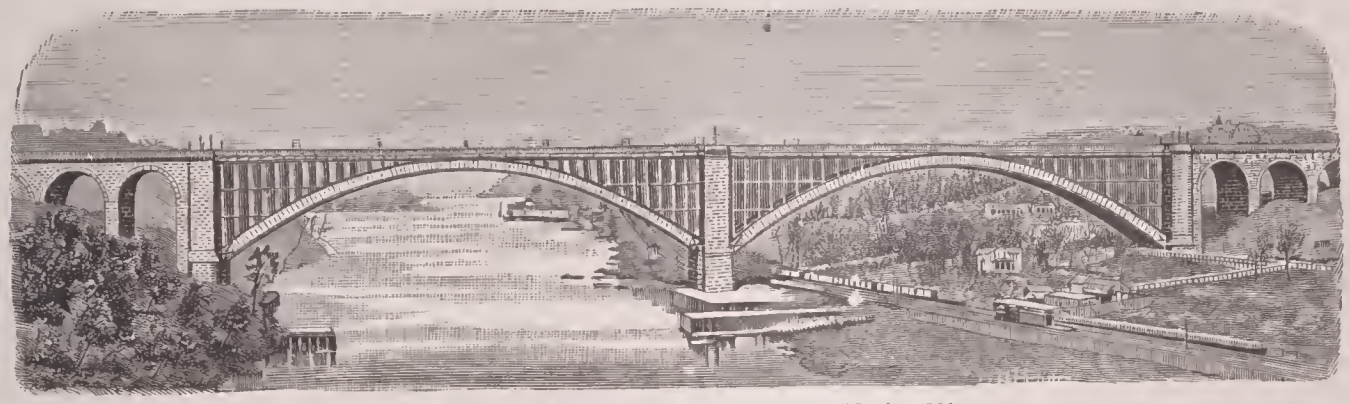

FIG. 29.—The Washington bridge at New York, 1889.

appearance. It has two metal arches, each 510 feet in clear span, and seven masonry arches each of 60 feet, the total length being 2,375 feet. The width of the roadway is 80 feet, and its height above mean high tide is 151 feet. Work was commenced in July, 1886, and the structure was completed in Feb., 1889, at a cost of $2,850,000, or $1,200 per linear foot. The webbing of the arches is formed by solid plates with radial stiffness at intervals, thus giving them an appearance as if made of masonry voussoirs. This structure was built by the city of New York, William R. Hutton being the engineer.

The word viaduct is applied to a bridge where the towers are high, crossing a valley or chasm. Some viaducts are also supported by one or more metallic arches. The great arch of the Garabit viaduct, 541 feet in span and 169 feet in rise, is shown in Fig. 30, which indicates also the method of erection, it having been built out from the abutment piece by piece and supported by cables fastened to the tops of the towers; the suspension rope shown above the span was used in transporting the materials from the completed roadway

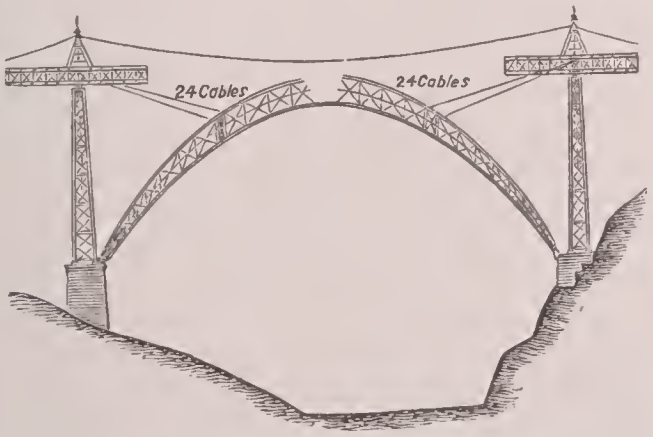

FIG. 30.—Arched viaduct at Garabit, France, 1885.

of the viaduct to their places in the arch. A method of erection somewhat similar was used in the St. Louis bridge, but the arches of the Washington bridge were built on timber false works. In general, it may be said that the erection of arched bridges is more difficult and costly than that of other kinds. In regard to the limiting spans possible under different systems, the arch and the simple truss stand at present on a close equality, the former having 541 feet and the latter 550 feet; but these distances are far surpassed by the suspension system with 1,695 feet, and by the cantilever system with 1,710 feet. See ARCH, AQUEDUCTS, and VIADUCT.

Suspension Bridges.—The modern suspension bridge consists of a platform hung from cables, which are stretched across a river, being supported by two towers and anchored at abutments. The platform is the roadway over which the traffic passes, and this is usually stiffened by a truss. Statements regarding ancient suspension bridges in China of several hundred feet in length are found in the writings of travelers, but definite descriptions are lacking, and probably, like the rope and chain bridges of the eighteenth century, most of them were arranged with the roadway platform laid directly on the chains. In 1741 such a chain bridge was erected in England over the Tees. It was a rude foot-walk of 70 feet span and 2 feet width only, and exercised no influence on the development of the present system. The main span of a modern suspension bridge is the distance between the towers, and there are usually two side or shore spans.

The first true suspension bridge having the roadway hung from cables was erected by Jacob Finlay in 1801 over Jacob's creek, near Greensburg, Pa. It had two chains, one on each side of the bridge, with links of the same length as the distance between the floor joists. These chains passed over towers, and each was bolted to four large anchor stones at the ends. The span between the towers was 70 feet, and the width of the roadway was 12½ feet. A patent was granted to Finlay in 1808, but before this date eight of these bridges had been erected, the longest being over the Schuylkill river, with 306 feet span, "aided by an intermediate pier." Others were built at Cumberland, Md., at Wilmington, Del., at Brownsville, Pa., and one over the Potomac above Washington, which is shown in Fig. 31. This

FIG. 31.—Potomac bridge, 1805.

had a span of 130 feet, a roadway 15 feet wide, and the chains were made of 1¼-inch wrought-iron bar. These bridges are mentioned in the book of Thomas Pope, published in 1811, and it has been thought by some writers that the knowledge of the system was thus introduced into Europe.

In 1809 John Templeman built a suspension bridge near Newburyport, Mass., having 240 feet span and two road-

ways each 15 feet in width. In 1815 one was constructed over the Lehigh river at Allentown, Pa., which had two spans of 230 feet each and a roadway 30 feet wide. This was badly damaged by fire in 1828, and soon after was carried away by a flood. All suspension bridges built up to this date had cables made of chains or links of bar iron. In 1816, however, White and Hazzard constructed a foot-bridge across the river at the falls of the Schuylkill, above Philadelphia, whose cables were made of six wires, $\frac{3}{8}$ of an inch in diameter, and thus a new epoch of development was instituted. The span of this structure was 408 feet, its cost was $125, a toll of one cent was charged for passage, and only eight persons were allowed upon it at one time.

The suspension system received no serious attention in Great Britain until 1814. In that year Telford instituted experiments on the tenacity of wrought iron, and concluded that it was possible to bridge spans of 1,000 feet on the suspension plan. In 1819 Samuel Brown built a bridge of 449 feet span across the Tweed, and in 1826 Telford completed the Menai chain bridge, which had a total length of 1,710 feet and a span of 580 feet. The Conway bridge, completed about the same time, had a span of 327 feet, and the Montrose bridge, finished in 1829, had a span of 432 feet. All of these structures had chains composed of straight bars several feet long, united by coupling bolts, the Menai bridge, for instance, having sixteen such chains, each of five wrought-iron bars, 9 feet long, $3\frac{1}{4}$ inches wide, and 1 inch thick. They were deficient in rigidity, and indeed the one over the Tweed was blown down six months after its erection, so that the system was gradually abandoned in England, and about 1850 the tubular girder was regarded as best adapted to long spans.

Suspension structures were built soon after 1820 in France, Belgium, and Germany, and a high degree of development was reached in 1834, when the long bridge at Freiburg in Switzerland was completed. This has a span of 870 feet, and is suspended at the height of 167 feet above the river. It is thus 319 feet longer than the Menai bridge, and 65 feet higher. It is supported on four cables of iron wire, each containing 1,056 wires, the united strength of which is capable of supporting three times the weight which the bridge will ever be likely to bear. It was subjected to several severe tests; for instance, 15 pieces of artillery, drawn by 50 horses, and accompanied by 300 people, passed over it at one time, and were collected in as close a body as possible, first on the center and then at the two extremities. A depression of $39\frac{1}{3}$ inches was thus produced, but no sensible oscillation was occasioned.

To resume the history of the development of the suspension system in the U. S., the name of Charles Ellet first claims notice. In 1842 he built a bridge of wire cables, 358 feet in span, over the Schuylkill river, to replace the wooden one erected thirty years before by Wernwag. In 1846 he built the Monongahela bridge at Pittsburg, which consisted of eight spans of 188 feet each, and at this date he expressed the conviction that "any span within 1,500 feet, with the usual deflection, can be made perfectly safe for the support of railroad trains as well as common travel." In 1847 he built a foot-bridge of about 800 feet span across the Niagara river 2 miles below the falls. In 1848 he constructed the Wheeling bridge over the Ohio, remarkable at the time as the longest span in the world, 1,010 feet; it was 24 feet wide, having both a roadway and a foot-walk, and had twelve cables containing a total of 6,600 wires. This bridge was blown down in 1854, nearly all the cables breaking at the anchorage.

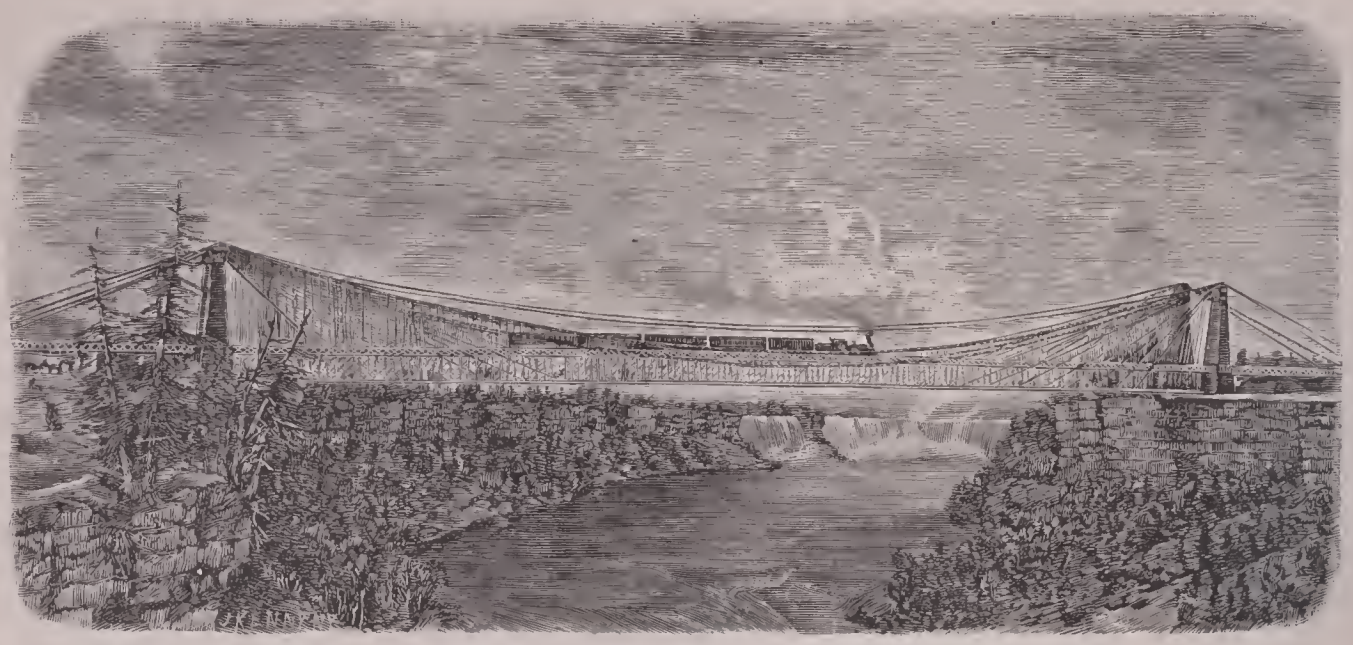

Fig. 32.—Niagara suspension bridge, 1854.

The perfection of the suspension system and its adaptation to railroad bridges of long span is due to John A. Roebling. The defect of the system was the lack of rigidity and the oscillations produced by wind. This he remedied by using deep stiffening trusses at each side of the roadway, aided by horizontal and vertical stays extending out from the towers. His first great work, the Niagara bridge, completed in 1854, has a span of 821 feet and a width of 15 feet, and carries two decks, the lower for highway and the upper for railway traffic. Each deck is supported by two cables $10\frac{1}{2}$ inches in diameter, composed of seven strands of 520 wires each. The trusses had wooden chords and posts, and wrought-iron diagonals, and the towers were of stone. In 1881 these trusses were replaced by new ones of steel and iron, and in 1887 the stone towers were taken out and wrought-iron ones erected. This bridge demonstrated the feasibility of the system for long spans under railroad traffic, but a few years after it had been rejected by the English engineers in favor of the tubular plan. Among the other bridges designed by Roebling space only permits a notice of two. The Cincinnati and Covington bridge, completed in 1867, has a span of 1,057 feet and a total length of 2,252 feet. This carries roadway traffic only, and is supported by two wire cables of $12\frac{1}{2}$ inches diameter. The greatest of all, however, is the East river bridge, connecting the cities of New York and Brooklyn, which has a main span of 1,595 feet and two side spans of 930 feet each, and carries two tracks of a cable railway, two roadways, and a foot-walk. The article Brooklyn gives a description and illustration of this grand structure, and the difficult work of sinking the piers is recorded in the article Foundation.

Methods of stiffening a suspension bridge by trussing the cables have also been employed, the most notable being the Point Street bridge at Pittsburg, Pa., designed by E. Hemberle, and built in 1878, which has a span of 800 feet and a deflection of 88 feet. In the common suspension system the cables pass over the towers on saddles which may have a slight horizontal motion, but in the stiffened system the plan of fastening them rigidly to the towers may be used. Two cables connected by bracing may be employed, thus forming an inverted rigid arch, as in the Grand Avenue bridge at St. Louis, built in 1891, which has a main span of 400 feet. A design for a bridge of this character over the Hudson river, between New York and Jersey City, has been made by Gustav Lindenthal. Its main span is to have the great length of 3,100 feet, which is nearly double that of the East river bridge, and the shore spans will be 1,800 feet each. The cables, four in number, are to be in pairs, and each will be about 50 inches in diameter. They will be

hinged to the towers by pins of hollow forged steel 25 feet long and 40 inches in diameter, and being braced together the calculation will be analogous to those of the elastic arch with hinged ends.

One of the first large suspension structures substituting steel for stone in the construction of the towers is the new East river bridge between Manhattan and Brooklyn boroughs, New York city.

Fig. 33 shows a view of the structure. In detail its dimensions are as follows: Length of entire bridge between terminals, 7,200 feet; length of main span, center to center of towers, 1,600 feet; extreme width of bridge, 118 feet; height of masonry in tower foundations above high water, 23 feet; minimum height of bridge above mean high water of spring tides for 200 feet on each side of center of main span, 135 feet; height of axis of cables at top of towers above high water, 332 ft. 8½ ins.; two stiffening trusses between towers, distance apart from center to center, 67 feet; width of carriage-ways, each, 20 feet; width of 2 footwalks, each, 12 feet; width of 4 trolley-car tracks, center to center, 9¾ feet; width of 2 elevated railroad tracks, center to center, 11 feet; grade of approaches, 3 per cent. The bridge will furnish accommodations for 4 surface railroad tracks, 2 tracks for elevated trains, 2 roadways for vehicles, 2 footways for pedestrians, and 2 cycle paths. The estimated cost is $8,000,000, exclusive of the right of way.

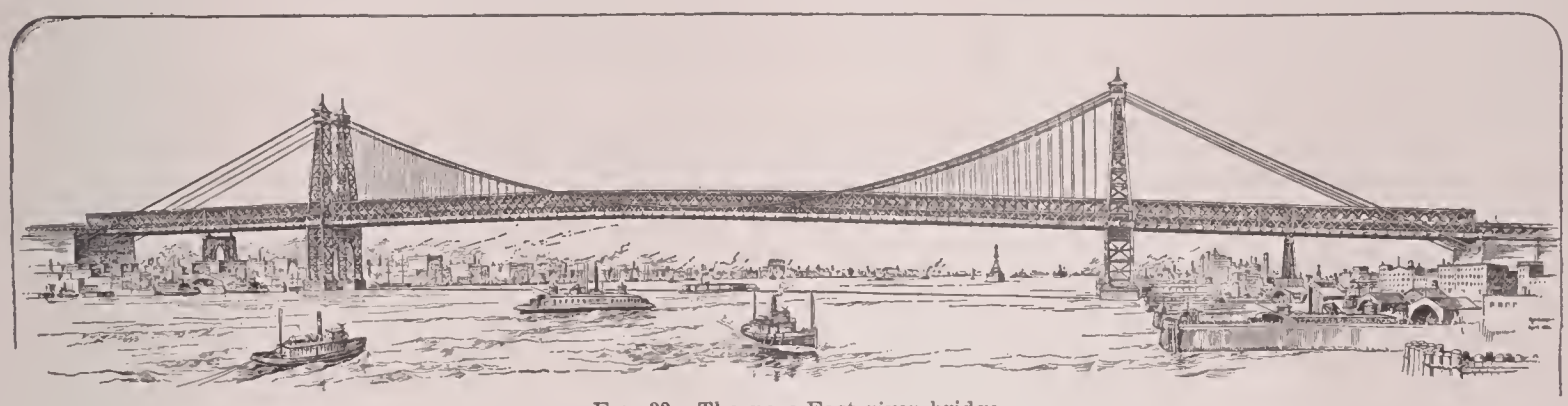

Fig. 33.—The new East river bridge.

A commission to carry on the work of construction was appointed, by authority of the Legislature, first by the mayors of New York and Brooklyn and afterward by Mayor Van Wyck, of Greater New York.

In 1901 the officials of the enterprise were: Mayor, Robert A. Van Wyck; chief engineer, Leffert L. Buck; commissioners—Borough of Manhattan, Lewis Nixon, Smith E. Lane, James W. Boyle; Borough of Brooklyn, Julian D. Fairchild, James D. Bell, John W. Weber.

The commission was authorized to construct a bridge from the foot of Broadway, Brooklyn, to the foot of Delancey slip, Manhattan. The original commission purchased all the rights of the East River Bridge Company, which was organized in 1892 to build a bridge between the same points, for $200,000 on Dec. 18, 1895.

The route agreed upon by the commission is from a point between South Fifth and South Sixth Streets to a point near the foot of Delancey Street, Manhattan.

There are about 1,500,000 feet of timber, 10,000 cubic yards of concrete, 45,000 cubic yards of stone masonry, and 1,600 tons of cable anchor steel in each anchorage. The Manhattan anchorage rests on 3,500 piles and the Brooklyn anchorage on the natural sand.

In the steel towers and the shore spans there was used 12,000 tons of steel. In making the steel cables there will be used 5,000 tons of steel wire and steel castings.

There will be about 12,000 tons of steel in the Manhattan approach, and about 6,000 tons of steel in the Brooklyn approach.

The towers were finished late in 1900, and the first wire in the process of constructing the cables was drawn across the river in March, 1901. At that time the engineers in charge of the work estimated that it would take them till 1904 to prepare the structure for traffic.

Failure of Bridges.—The subject of failures of bridges and of the causes of failure is one of great importance to a bridge engineer. Here it is only possible to briefly mention a few of those most important on account of the loss of life and of the lessons which they teach.

On Dec. 20, 1876, the Ashtabula bridge, in Ohio, on the Lake Shore R. R., fell while an express train was passing over it, and about eighty of the passengers and seven of the crew were killed out of a total of 158 persons on board. The bridge was a deck structure, 157 feet in span, of the Howe truss type, built all of iron. The report of a committee appointed by the Ohio Legislature to investigate the failure concluded that the bridge went down under an ordinary load by reason of defects in its original construction, and that these defects could have been discovered at any time after its erection by careful examination.

The Tariffville bridge, over the Farmington river, in Connecticut, went down on Jan. 15, 1878, while an excursion train was passing over it at slow speed, and thirteen persons were killed. It was a through Howe truss of the common pattern with two spans, each of 165 feet. The coroner's jury reported that the wrought-iron vertical rods were too small, and that the timber of the chords had become weakened by decay to such an extent as to render the bridge unfit for use.

The Tay bridge, in Scotland, was blown down on Dec. 28, 1879, while a train was passing over it in a violent storm of wind, and all on board—about seventy-five in number—perished. The bridge was the longest in the world, having eighty-five spans, with a total length of 10,321 feet, and thirteen spans and their piers were blown down. The piers were mostly made of cast-iron columns connected by horizontal braces. The board of inquiry reported that the failure was caused by the insufficiency of the cross-bracings and their fastenings to sustain the force of the wind, and that no understood rule and no requirements existed in Great Britain regarding computations for wind-pressures, although in France 55 lb. per square foot and in the U. S. 50 lb. was generally used. It is scarcely necessary to remark that careful computations of wind-stresses were made for the new Tay bridge.

On July 1, 1881, occurred at Morelos, Mexico, the most fatal bridge accident on record, whereby 247 soldiers were killed, 40 were injured, and only 20 escaped uninjured of all those on the train.

The necessity of careful inspection, as plainly emphasized by the disasters of Ashtabula and Tariffville, led to a thorough overhauling of old railroad bridges during the following years. Accidents, however, still occurred, but none involving great loss of life. In 1886 there were reported twenty-two failures of bridges in the U. S., by which thirty-five persons were killed. Of these twenty-one persons perished in the wreck of a bridge at Opelika, Ala., whose abutments are said to have been weakened by a freshet.

The Bussey bridge, at Roslindale, Mass., fell on Mar. 14, 1887, whereby 26 passengers were killed and 115 injured. The bridge was of 125 feet span, and of an unusual form of construction. The railroad commissioners reported that it was built practically without superintendence, and that the only inspection had been that made by a machinist who had regularly passed over vital parts of the bridge without realizing that they were important or defective. The lesson taught by this accident is that important constructions should be built and inspected by educated and trained engineers, if safety as well as economy is to be secured.

The accident at Chatsworth, Ill., on Aug. 10, 1887, may here be mentioned, although properly it was not caused by a bridge failure. A small wooden trestle, only 30 feet in length, had caught fire, and before an excursion train could be stopped it became wrecked, and 73 persons were killed and 374 injured.

In 1889 C. F. Stowell, bridge engineer of the New York State railroad commission, compiled a table showing the

bridge failures in the United States and Canada during the ten years 1879–88, which gives a total of 265 bridges. Of these, 27 were due to fire, 39 to freshet, 8 failed while undergoing repair, 60 were knocked down by derailed trains, and 34 fell with trains passing normally over them. This does not include trestles and culverts, or failures occurring without accident to a train. The most serious accident during 1889 was at St. George, Ontario, where a derailed train knocked down one span of a bridge, and 13 deaths and 29 injuries resulted. In 1890 a drawbridge was left open at Oakland, Cal., and a train plunged into the water, drowning thirteen persons; other serious disasters of this kind are also on record, but these are properly classed as due to negligence of operation.

On June 14, 1891, a small bridge of 134 feet span at Mönchenstein, Switzerland, failed while a passenger train was crossing it, by which 74 persons lost their lives and about 200 others were injured. The bridge had riveted lattice trusses, and had been in service for sixteen years. A commission of experts concluded that the bridge was faultily constructed and weak in some of its parts; that the iron was generally of poor quality; and that injury had occurred several years before by the sinking of one of the abutments during a freshet.

Statistics.—No statistics have ever been collected regarding the number of bridges of different kinds and lengths of spans. But figures obtained by Theodore Cooper in 1889 for 26,228 miles of railroad in the U. S. showed, excluding trestles and spans under 20 feet, 446,488 linear feet of bridges. Using this as a basis of estimate for the 160,000 miles of railroad in the U. S., he found the following distribution:

Spans from 20 to 50 feet	.121 miles	=	18,150	spans.
" " 50 " 100 "	.130 "	=	9,100	"
" " 100 " 150 "	.190 "	=	8,000	"
" " 150 " 200 "	.109 "	=	3,300	"
" over 200 feet	56 "	=	1,150	"
Total	.606 "	=	39,700	"

These include both wood and iron bridges, and for the iron bridges he gives the following estimates:

Spans under 20 feet	.17 miles	=	5,100	spans.
" from 20 to 50 feet	.86 "	=	12,900	"
" " 50 " 100 "	.66 "	=	4,600	"
" " 100 " 150 "	.93 "	=	3,600	"
" " 150 " 200 "	.69 "	=	2,100	"
" over 200 feet	.49 "	=	950	"
Total iron spans	.380 "	=	29,550	"

Literature.—The first book on bridge construction published in the U. S. was Thomas Pope's *Treatise on Bridge Architecture* (New York, 1811), which has already been alluded to as advocating the advantages of his "flying pendant lever bridge," but which devotes 196 pages to "an historical account and description of different bridges erected in various parts of the world." Mention has also been made of a pamphlet issued by Col. S. H. Long in 1836, but nothing further is known to have been published until 1847, when Squire Whipple issued at Utica, N. Y., a book entitled *A Work on Bridge-building*, consisting of two essays, the one elementary and general, the other giving original plans and practical details for iron and wooden bridges. This work gave methods for computing stresses in trusses, but its circulation was very small. In 1851 appeared *General Theory of Bridge Construction*, containing demonstrations of the principles of the art and their application to practice, by Herman Haupt, A. M., which gave an excellent discussion of the resistance of materials, the flexure of beams, and the theory of stresses, as well as examples of timber bridges for railroad service. Little literature appeared in this country between 1850 and 1870, but since 1870 a large number of books have been issued. The following are the titles of the several standard technical works, with the date of the first edition: Wood, *Treatise on the Theory of the Construction of Bridges and Roofs* (1873); Greene, *Trusses and Arches Analyzed by Graphic Methods* (1879); Burr, *Stresses in Bridge and Roof Trusses* (1880); Du Bois, *Strains in Framed Structures* (1883); Waddell, *Design of Highway Bridges* (1884); Bender, *Principles of Economy in Design of Metallic Bridges* (1885); Johnson and Bryan, *Modern Framed Structures* (1893). Monographs in book form have also appeared on the construction of the Niagara suspension bridge, the St. Louis and Illinois bridge, the Washington bridge in New York, and others, while the columns of engineering journals and of the *Transactions of the American Society of Civil Engineers* contain many valuable papers, both theoretical and descriptive. Almost the only books of an historical and descriptive nature published in the U. S. are Boller, *Iron Highway Bridges* (1876), and Cooper, *American Railroad Bridges* (1890).

Among foreign books the following may be noted as containing drawings and descriptions of bridge structures: Gauthey, *Traité de la construction des ponts* (Paris, 1809); Miller, *Die Brückenbaukunde* (Leipzig, 1860); Humber, *Cast and Wrought Iron Bridge Construction* (London, 1864); Maw and Dredge, *Road and Railway Bridges* (London, 1872); and Heinzerling, *Die Brücken in Eisen* (1874). Of the large number of foreign theoretical works, Fidler's *Practical Treatise on Bridge Construction* (London, 1887) may be mentioned as perhaps likely to be most serviceable to students.

Mansfield Merriman.

Bridges, Laws Governing the Erection of: In England at the common law no one can build a public bridge without a license. In the U. S. the building and maintaining of bridges upon the highways is a duty that is included in that usually imposed by statute upon the municipal corporations to maintain the highways in a condition reasonably safe and convenient for public travel. The right to erect a bridge over navigable waters may be conferred by State law, subject, however, to the exercise of the power conferred by the Constitution upon Congress to regulate navigation. In pursuance of this power Congress has passed a law (26 Stat. at large, 453) which provides that whenever the Secretary of War shall have good reason to believe that any bridge is an unreasonable obstruction to navigation he shall, after giving the parties opportunity to be heard, give notice to alter it, specifying the changes to be made. Failure to remove is a misdemeanor, and on conviction a fine not exceeding $5,000 may be imposed, each month of default being deemed a new offense. The custom is to obtain the consent both of Congress and of the State Legislature before bridging navigable waters.

F. Sturges Allen.

Bridges, Military: Wherever warfare has been so far reduced to a system and a science as to call into the field, for protracted campaigns, large and organized armies, the very necessities of the case call for some systematic method of passing streams, and, as belonging to it, special organizations of men (*personnel*) for making bridges, and a portable bridge *apparatus*.

The bridge of boats of Xerxes for passing the Hellespont, the timber-pile bridge of Cæsar (of which an account is given in the article Bridges), were not ordinary, but *extra*ordinary constructions necessitated by the magnitude of the obstacles; and they owe their record probably to that peculiarity. It is quite likely, however, that during ages when roads for wheeled vehicles scarcely existed, and, on the other hand, forest timber was abundant, the felled tree (elaborated into a rude bridge), or some such improvised expedient, could generally be resorted to, and that a regular "bridge equipage," in the modern sense of the term, did not exist. The Romans are known to have had a species of "ponton" (as we now call it) to carry with their armies. In fact the wooden boat has naturally offered the readiest means of support to portable bridges; but these, generally large and heavy, are with difficulty transported. Hence various expedients for creating a vessel of considerable flotation power, yet lighter and more portable than ordinary boats (such as framework, covered by skins, canvas, etc.) have been resorted to. The French, the systematizers of the modern art of war, were naturally the first to provide a regular organization and established type of construction for the military bridge, and to organize a *personnel* by which it should be operated.

Their first *ponton* was of copper. Their system has undergone successive modifications and improvements, and instead of metal, wood is used in their ponton. As fixed in 1853 the French ponton, as described by Gen. Cullum in his work on military bridges, is a flat-bottomed wooden boat, 31 feet long, the middle part or body of which, for a length of 16 feet, has a trapezoidal section of 5′ 7″ width at top and 4′ 4″ at bottom, and 2′ 7″ deep; the fore part, 8′ 9″ long, diminishes to 2′ 6″ in width at the bow, and has a sheer of 5½″; and the aft part, 6′ 3″ long, diminishes to 4′ 7″ in width at the stern, and has a sheer of 3″. Each bateau weighs 1,455 lb., is borne on the shoulders of 17 to 20 men, has a flotation of 18,600 lb., car-

ries 25 infantry soldiers, is convenient for disembarking troops, and can be easily navigated in a rapid current by five men.

The material for the French bateau bridge for an army consists of 8 abutments, 8 trestles, 32 bateaux, 4 mooring-boats, 339 balks (84 abutment, 24 claw, and 231 bateaux), 784 chesses, 32 anchors, and all the accessories for forming a bridge of 41 bays, 262 yards long, and 12′ 9½″ wide. This train may be divided into 4 divisions, each containing the material for a complete bridge.

The Russians have a somewhat lighter equipage; the ponton (of canvas) is a flat-bottomed bateau, having, except at the ends, a rectangular section. The length at top is 21 feet, and at bottom 18′ 4″; the width 5′ 4″; and the depth 2′ 4″. The skeleton consists of two side-frames, connected by movable transoms—all of 4-inch scantling. The canvas cover is 10′ 8″ wide, 30 feet long in the middle, and 23′ 3″ along the edges: both sides being tarred or painted black with a composition, applied hot, composed of hempseed oil, strong loam, india-rubber, soap, wax, and soot. The cover is brought over the ends of the frame, and lashed to the top transoms; it is secured, along the sides, to the top string-pieces of the side-frames by small nails passing through eyelet-holes along the edges of the cloth. A plank is laid on the bottom for the pontoniers to stand upon. The canvas ponton, frame and cover complete, weighs 718 lb., and has a flotation of 13,428 lb.

The complete bridge is composed of 32 canvas pontons, with bridge-flooring and accessories for 33 bays; and a section of the Birago equipage, consisting of 8 trestles and 15 wooden pontons (8 bow and 7 body pieces), with a bridge-flooring for 8 bays.

The Austrians, after satisfactory trials in the passage of the broad, deep, and rapid current of the Danube, adopted, in 1841, a system named from its inventor, Col. Birago, of the Austrian Imperial Engineers. This system was somewhat modified in 1859.

This equipage has fixed and floating bridge-supports, the former consisting of abutments and trestles, and the latter of pontons of two pieces assembled together according to the requirements of the bridge for the passage of infantry, cavalry, or artillery, and whether designed for one, two, or three distinct roadways.

The pontons are flat-bottomed bateaux of sheet iron, of one piece, or from two to six assembled together, end to end, by suitable bolts and fixtures. The Birago trestle is composed of a *cap* and two *legs*, to the lower ends of which *shoes* are attached to increase their bearing surface, and give greater stability to the trestle. The *cap* is *adjustable*, being partly supported at the proper height by *suspension* chains, at one end of which are large rings passed over the tops of the legs, the free ends being run through suspension rings on the upper side of the cap. After the chains are made taut, and the cap is at its proper height, the latter is held in place by the *toggles* inserted in the last link which has passed through the suspension rings.

Nothing like a "bridge equipage" had belonged to our military service until 1846. The Engineer Department had long foreseen the necessity of a corps of well-drilled pontoniers and a bridge equipage for our army, and year after year had urged their great importance upon the attention of Congress, but not until May 15, 1846, was its sanction given to the project of the department, and when too late to aid the passage of the Rio Grande by our forces then invading Mexico.

With the sanction of Congress finally obtained, a company of sappers, miners, and pontoniers was organized as part of the Corps of Engineers, and an india-rubber ponton bridge of 46 pontons was prepared by direction of the chief of engineers, but under the superintendence of the late Major-Gen. G. W. Cullum, then a captain in the Corps of Engineers. Another of 36 pontons was subsequently dispatched with the army under Gen. Scott. Owing to the lightness of these pontons only *thirty-five six-horse carriages* were necessary to transport, over the worst roads, a complete train for the formation of a bridge of 200 yards. For the French bateau bridge of nearly 240 meters *seventy-seven six-horse carriages* are used.

The rubber pontons in use for drill purposes at West Point having become unserviceable, and it having become evident that rubber was not adapted to their construction, experiments were undertaken by the then instructor of practical engineering, Capt. J. C. Duane, now brigadier-general and chief of engineers, U. S. army, retired.

The immense trains with which our armies are unavoidably encumbered, the long marches to be made, and the numerous wide and rapid rivers to be crossed, demand an equipage of the most substantial character. On the other hand, the extended expeditions of light columns, which necessarily attend our military operations, require a train light enough to keep pace with the most rapid cavalry movements.

Hence we require both a reserve and advance-guard train.

The experiments included the trial of the bridge equipages used by those European armies most experienced in the art of military bridge-building.

Pontons were constructed after the models of the French bateau, the Austrian sectional ponton, and the Russian canvas boat. Corrugated-iron boats were procured, corresponding as nearly in form and dimensions to the French and Austrian boats as the nature of the material would permit. A number of Birago trestles were also constructed. All of the above material, with the exception of the iron boats, was prepared by the enlisted men of the Engineer Company (A) then stationed at West Point.

The bridges formed of this material were exposed as much as possible to the action of heavy loads, storms, the tide, and floating ice. The material was also packed on carriages of various patterns in order to ascertain the best form, both of bridge material and of carriage, for transportation.

The selection of the French, Russian, and Austrian trains for these experiments was made after a careful study of the various equipages used by the armies of Europe. These three nations alone appeared to have definitely settled on their systems, and this after much experience and thorough research.

After experimenting for two years, the conclusion was arrived at that the French ponton should be adopted. Experiments followed to determine *the material* of which the ponton should be made. Life-boats having been successfully made of corrugated iron, it was presumed it might be, with equal advantage, applied to pontons. It was not only found that to get adequate strength the weight must be increased beyond that of the wooden ponton, but that iron failed in other respects. In fact, it would not bear land transportation, as, in traveling over a rough road, the joints open by the yielding of either the rivets or sheet iron. When in the bridge, if the boat grounds on an uneven or rocky bottom, a hole is frequently punched through it, and such injuries can not be repaired in the field. The wooden ponton is not only much less liable to such accidents, but can be readily repaired when they do occur.

See *Organization of the Bridge Equipage of the United States Army*.

Previous to the battle of Gettysburg a ponton bridge over the Potomac at Harper's Ferry was destroyed, the pontons being scuttled and set adrift above the rapids. About three weeks after, the water having fallen, the boats were recovered, repaired with pieces of hard-bread boxes obtained from the commissary, and used in constructing a bridge at Berlin, over which the entire army passed into Virginia.

With regard to the canvas boat, it soon became apparent that it was precisely what we required for our advance-guard train. It is light, simple, strong, easily repaired, and when packed can safely be transported with the superstructure of the bridge as rapidly as any column of troops can move. A strong argument in favor of its adoption was that it had been used successfully by the Russians for more than 100 years, under every variety of circumstances likely to occur in this country.

The French ponton wagon not being adapted to our rough roads, further experiments ensued to fix upon the selection of a proper carriage for transporting our bridge equipage.

Through the information gained by these experiments resulted the system of bridge equipage adopted at the commencement of the civil war.

"During the winter of 1861–62 five trains were constructed, each composed of 34 pontons and 8 trestles—the pontons being nearly of the same form and dimensions of the French bateau. The frame was somewhat different, the ribs being entire and strongly ironed, and the ironing stronger throughout. The stern was provided with a locker. There were also other alterations in the details of construction. The balks were stronger, and the Birago trestle was modified by substituting built beams, instead of solid timber, for the trestle caps and balks.

"At the same time several canvas trains were organized. In constructing the ponton frame the dimensions and form of the Russian boat were exactly retained. The scantling for the frame was considerably lighter, but, being strongly braced and ironed, the strength was about the same. One train was composed of canvas boats and trestles, being, in truth, a trestle train, with auxiliary pontons to be used only where the depth of water or muddy bottom prevented the use of trestles.

"In the month of Feb., 1862, a ponton bridge, composed of about sixty boats of the reserve train, was thrown across the Potomac at Harper's Ferry. The river was then a perfect torrent, the water being 15 feet above the summer level, and filled with driftwood and floating ice. The greatest difficulty was experienced in pulling the pontons into position, and it was necessary to make use of ship anchors and chain cables to hold them in place. Notwithstanding these unfavorable circumstances, the bridge was completed in about eight hours, and the corps commanded by Gen. Banks, with all its trains and artillery, passed over it without accident or delay.

"Several of these trains accompanied the army in the Peninsular campaign. The pontons were used in discharging quartermaster and commissary stores at Ship Point, in disembarking Gen. Franklin's command at West Point (York river), and in constructing bridges over Hampton creek, the streams in front of Yorktown, and the Upper Chickahominy. Finally a bridge was built over the Lower Chickahominy, about 2,000 feet long, over which nearly the whole Army of the Potomac, with its immense trains, artillery, and cavalry, passed with promptness and safety.

"After the army had passed, the bridge was dismantled and the balks, chesses, etc., packed into the pontons, which were formed into rafts and towed by steamers to Washington. The bridge trains were next transported to Harper's Ferry, where a bridge was constructed a second time, but under entirely different circumstances from that built during the previous winter. The water was now not deep enough; and, as it continued to subside shortly after the bridge was laid, many of the pontons grounded on a very uneven and rocky bottom. Some of them were completely out of water, yet the heavy trains continued to move over the bridge without seriously injuring them; and when the water rose, most of them floated as well as ever.

"Discovering in this way that the boats were much stronger than we had supposed, we were enabled to improve the method of bridging tidal streams.

"It had formerly been considered necessary to build out to low-water mark with trestles, so that the ponton should always be afloat. The bridge is now commenced at high-water mark, building with pontons alone. As the water subsides, the pontons nearest shore ground successively, forming a gentle ramp from the abutment to the floating portion of the bridge, instead of making the descent in 20 feet, as formerly. This method of course applies only to wooden pontons, and to cases where the bottom is favorable.

"During the Fredericksburg campaign it became necessary to force the passage of the Rappahannock. The enemy, having intrenched themselves on the bank, prevented for some time the construction of the bridge; until at length troops were embarked in the pontons and ferried across, where they stormed the rifle-pits, and held them until the bridge was completed.

"During the year 1863 the ponton trains accompanied the army in all its marches backward and forward through Virginia, frequently bridging the Potomac, Rapidan, and Rappahannock. In the latter stream the bridges remained in position all winter; and, notwithstanding the frequent floods and the quantity of ice formed, but few interruptions occurred on these thoroughfares.

"During the campaign of 1864 trains, composed of fourteen pontons and two trestles, accompanied each of the three army-corps of the Army of the Potomac. These trains attended their corps in the long march from Culpeper to the James river, and, although the roads were frequently very bad, in no instance did they delay the march of the troops or arrive late when a bridge was to be laid.

"The headquarters train was followed by a canvas train; which, when a crossing was to be made by surprise, was sent forward with the cavalry, who covered the construction of the bridge and held the position till the main body arrived.

"On reaching the James river, a bridge was laid opposite Charles City Court-house (at a point selected by the writer of this article), about 2,000 feet in length. The water was so deep and rapid that the pontons could not be held by their own anchors, and it was found necessary to attach their cables to schooners anchored above and below the bridge. . . . For the next 40 hours a continuous stream of wagons passed over the bridge, from 4,000 to 6,000 wagons, some said 50 miles of wagons, and nearly all the artillery of this army, and by far the larger portion of the infantry and all its cavalry present, and even to its heads of 3,000 or more of beef cattle—the most injurious of all—without an accident to man or beast." (*Report of Gen. Benham.*) The length of the bridge was made up of 200 feet in trestlework and 2,000 feet in pontons (101 in all); depth of the river, 85 feet.

"Thus the wooden ponton train through four years of war, during which the bridges constructed were without parallel in number and magnitude, amply fulfilled all the requisites of a good bridge equipage. The frequent crossing of the Potomac, Chickahominy and James rivers proved that, even under the most unfavorable circumstances it could furnish a bridge capable of passing a large army, with its heaviest trains over wide and rapid streams, with safety and dispatch.

"Its capabilities in ferrying troops were shown at Ship Point, West Point, and Fredericksburg; and of the mobility of the equipage there was abundant proof in the long marches during the last two years of the war.

"The canvas equipage, also, was perfectly successful as an advance-guard train. In the cavalry raids it was always able to keep pace with the columns; and, although they frequently marched hundreds of miles, it was invariably ready to furnish a prompt and secure means of crossing all the streams on their route. It also often furnished bridges for the heavy trains of the army over streams of moderate width and rapidity.

"The only part of the bridge equipage which did not realize all our expectations was the Birago trestle.

"As already stated, a train was organized early in the war on the Austrian principle, in which the trestle is the main dependence, the ponton being merely auxiliary. It was supposed that many streams would be encountered which would be bridged best with trestles alone, but none such were met with. In fact, when a stream is more than 2 feet deep, a ponton bridge may be laid; when less than that depth, if the bottom is hard, it may be forded, and no bridge is required; should the bottom be soft, the trestle legs will usually settle so as to render the bridge unsafe. As it was not deemed advisable to transport with the army a train which could only be used in exceptional cases, this description of equipage was abandoned. The trestle was, however, very useful as an auxiliary, especially with the canvas train; for, as these boats when in the bridge should never be allowed to touch the bottom, it is frequently necessary to build out several bays from the shore before sufficient depth of water can be obtained to float the ponton—and for this purpose nothing could be better than the Birago trestle, which is also equally useful for a similar purpose with the reserve train, when the river bottom is rough near the shore.

"The canvas train was extensively used by the Western army, and with such success that it was proposed to employ it exclusively. Experience, however, in the East has clearly proved that this train can not fulfill all that is required of the bridge equipage of a large army. The bridges of the Potomac and James rivers could not have been built with canvas boats, which will not resist ice and driftwood; neither are they suited to the disembarkation of troops or the passage of a river by force.

"Experience would therefore lead us to concur with Gen. Barnard in his remarks on this subject, viz.:

"'The numerous proposers of "flying" bridges forget that if a military bridge is intended to be *carried with* an army, it is also intended to *carry* an army. its columns of men, its cavalry, its countless heavy wagons, and its ponderous artillery. It must carry all these, and it must do it with certainty and safety, even though a demoralized corps should rush upon it in throngs. No makeshift expedient, no "ingenious" invention not tested by severe experiment, no light affair of which the chief merit alleged is that it is light, will be likely to do what is required, and what the French ponton has so often done.'"

The experienced engineer officers from whose *Introductory History* we quote constituted a board which, in 1870, established the present authorized organization. It was based upon the experience we have described in their language.

As now fixed the U. S. bridge equipage is composed of reserve and of advance-guard trains. The former are intended to accompany large bodies of troops in the field, and are provided with the material necessary for the construction of bridges of sufficient capacity to pass large armies with their heaviest trains over rivers of any size and rapidity.

The advance-guard equipage is intended for the use of light troops, such as advance guards, cavalry expeditions, etc. It is organized, both as regards material and carriages, with a view to rapidity of movement. At the same time it is capable of furnishing a bridge which will fulfill all the requirements of troops engaged on such service.

The basal elements of these distinct equipages—the French wooden bateau and the Russian canvas ponton—are of dimensions very nearly corresponding to those (already given) of their original prototypes; but with modifications in details of construction derived from our own experience.

The reserve equipage is divided into trains, each of which is composed of four ponton divisions and one supply division. Each division is accompanied by a tool wagon and traveling forge.

Each ponton division is complete in itself, containing all the material necessary for constructing a bridge of eleven bays, or 225 feet in length.

Each of these divisions is subdivided into four sections, two of which are ponton and two abutment sections; the former contains 3 ponton wagons and 1 chess wagon; the latter, 1 ponton, 1 chess, and 1 trestle wagon each.

The ponton section contains the material for three bays, and should never be subdivided. The division may be increased or diminished at pleasure by changing the number of its ponton sections.

The supply division is provided with articles necessary to replace material lost or worn out, such as balk, chess, spare parts of carriages, a few complete carriages, etc.

The carriages of this division consist of ponton, chess, and tool wagons, and of forges. Their number and proportion will be determined by the nature of the country in which the army is operating, and by the proximity of the main dépôt.

The trains of the advance-guard equipage are composed of 4 ponton divisions, each of which consists of 8 ponton, 2 chess, and 2 trestle wagons.

The ponton wagon carries all the material necessary for constructing a complete bay. The division may therefore be increased or diminished by one or more ponton wagons without disorganizing it. When a forced march is to be made, and it is desirable to lighten the loads, the chess may be removed from the ponton wagons, the rope from the trestle wagons, and the load of the chess wagons be reduced to 40 chess. The number of the latter wagons in this case must be increased to 5.

The ponton wagons of reserve train are drawn by 8 mules or 6 horses, those of the advance-guard train by 6 mules or 4 horses, the "loads" being about 3,000 and 2,000 lb. respectively. It would be out of place to enter more fully into this subject in this work; but these historical details concerning the development of the military-bridge system of the U. S.—a matter in which the country had no experience whatever—during the war can not fail to be interesting.

Railway Bridges.—Another interesting branch of the subject—the remarkable constructions applied to the improvisation of railroad bridges in place of destroyed ones, and the noteworthy system of repair and construction introduced into our military railway service, can only be alluded to. The military railroad construction and repair corps were a part of the quartermaster's department, which organized, hired, and paid all their members, and bought and paid for all the material, and possessed and operated the railroads at an expense which at one time amounted to about $2,000,000 per month. Under the chief of that department, and especially charged with this duty, the principal organizer and conductor of military railroad transportation and repairs was Brig.-Gen. D. C. McCallum (who has since made a valuable report on this subject), well known as an able civil engineer and inventor of the "inflexible arch truss"; but the credit of the military railroad operation, and repair and success, belong to no individual altogether, but to the quartermaster's department, and to the body of railroad engineers, superintendents, and operatives who came into its service to aid the country during the war.

In the occupation, for protracted periods, of the same ground (as in investments, sieges, etc.), military bridges assume frequently a semi-permanent character.

Thus while the Army of the Potomac occupied a position near Richmond (May and June, 1862) its wings were separated by the formidable barrier of the Chickahominy rivulet and swamp. One of the bridges is thus described in the report of the chief of engineers of the Army of the Potomac:

"The bridge was built over the stream upon frame trestles; through the swamp it was supported by cribs. The *approaches* to the bridge over the low bottom-lands were either raised corduroy or (on the north side) simply earth raised 2 or 3 feet (the soil being here sandy), with a layer of brush 1 foot below the upper surface, deep lateral ditches being made. The whole structure of the bridge and approaches was about 1,400 yards long. The trestlework and cribwork bridge was mostly done by troops of the engineer brigade under Gen. Woodbury; the approaches on the north by the 9th and 22d Massachusetts regiments (Cols. Cass and Gove, both of whom were killed in the battles following), and those on the south side by the 3d Vermont. The bridge was ready for the passage of teams on the 14th, covered with earth, and the approaches entirely completed on the 17th. The bridge proper was 1,080 feet long; roadway, 11 feet wide; number of cribs, 40; of framed trestles, 6." (Fig. 1.)

The combined armies under Gen. Grant occupied positions before Petersburg and Richmond from June, 1864, to Apr., 1865. The James river separated the Army of the James (in its final position) from the center and left. An assured communication was indispensable, and at the same time one which would not impede the navigation for Federal vessels, whether transports or armed.

Col. P. S. Michie, chief of engineers, Army of the James, designed and submitted for approval a timber-pile bridge with a floating draw (the floats being ordinary pontons), of which an elevation of a portion, including the "draw," of pontons is here given. (Fig. 2.)

FIG. 1.—Woodbury and Alexander's bridge.

The piles of trestles were guarded against ice (which in the winter forms freely in the upper James) by highly inclined guard-pieces, the feet of which were secured to piles in the bed of the river. Each trestle was made up of a cap-piece and six piles (in pairs) driven into the bed of the river.

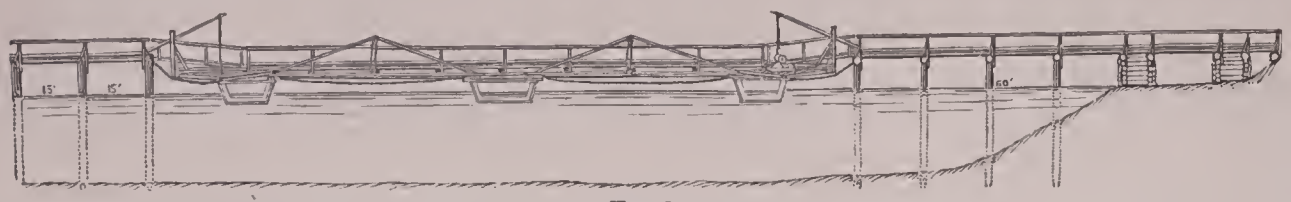

FIG. 2.

This bridge, which was constructed late in the year 1864, was in use down to the close of the civil war. During the period above indicated the gap in our lines made by the Rappahannock was occupied by one or more ordinary ponton bridges. See Haupt's *Military Bridges* (1867).

Revised by JAS. MERCUR.

Bridget (or **Brigit**), SAINT, or **Saint Bride**: one of the three patron saints of Ireland; b. at Fochart, now Faugher, 47 miles N. W. of Dublin, 453; early showed a character of great energy, courage, generosity, unselfishness, and holiness; became a devotee, and founded a monastery of the Columbian order at Kildare, 30 miles W. S. W. of Dublin; and there died Feb. 1, 523. The name Brigit means "the fiery arrow." Her day is Feb. 1.

Bridget, SAINT (of Sweden): See BIRGITTA, SAINT.

Bridgeton: city, railroad center, and port of entry, the capital of Cumberland co., N. J. (for location of county, see map of New Jersey, ref. 7–B); is situated on both sides of Cohansey river, a tide-water stream; 20 miles from Delaware Bay, 37 miles S. of Philadelphia, and 127 miles S. of New York. Its area is 15·39 sq. miles, or 9,849 acres. As a port of entry it is second in the State. The leading articles received are coal, pig iron and iron ore, lumber, lime and shells, fertilizers, and manufactured goods. The principal shipments are nails, gas and water pipe, canned fruits, woolen goods, window-glass, hollow-ware, and grain, potatoes, etc. It is the leading city of Southern New Jersey in the variety and value of its manufactured products. Educational facilities are fine. The South Jersey Institute for both sexes, opened in 1870 on a commanding site, has a handsome and well-appointed building which cost over $65,000. The West Jersey Academy occupies a fine building in a beautiful location. Ivy Hall, a select boarding-school for girls, has a high reputation. There are also public schools of a high order. It has a flourishing board of trade, building and loan associations, a large number of benevolent societies, and good county buildings. Pop. (1800) about 400; (1880) 8,722; (1890) 11,424; (1900) 13,913.

EDITOR OF "NEWS."

Bridgetown: the capital of the island of Barbados; on its west coast, and extends along the north side of Carlisle Bay, which forms its roadstead; lat. 13° 4′ N., lon. 59° 38′ W. (see map of West Indies, ref. 8–M). It is the residence of the Bishop of Barbados and the governor of the Windward islands, and has an arsenal and barracks in the vicinity. Pop. (1891) 21,000.

Bridgewater: a town and river-port of England; in Somersetshire; on both sides of the river Parret; 33 miles by rail S. W. of Bristol (see map of England, ref. 13–F). It is neatly built, and the houses are mostly of brick. Vessels of 200 tons can ascend the river to this town. Here is St. Mary's church, which has a remarkable and lofty spire. This is the native place of Admiral Blake. Bridgewater became a free borough in 1200. Pop. (1891) 12,429.

Bridgewater: a post-village of New Dublin township, Lunenburg County; 12 miles from Lunenburg, Nova Scotia (see map of Quebec and Nova Scotia, ref. 3–B); has manufactures of lumber, etc. Pop. 4,000.

Bridgewater: town; Plymouth co., Mass. (for location of county, see map of Massachusetts, ref. 4–I); on Old Col. R. R., 27 miles S. of Boston. It contains a State normal school, State almshouse, extensive iron-works, cotton-gin, and other manufacturing establishments, and is the seat of the county agricultural fair. Pop. of township (1880) 3,620; (1890) 4,249; (1900) 5,806. EDITOR OF "INDEPENDENT."

Bridgewater, FRANCIS HENRY EGERTON, eighth Earl of: b. in London, Nov. 11, 1756; son of John Egerton, Bishop of Durham. He inherited the earldom in 1823, and died unmarried in Paris, Feb. 11, 1829. By his last will he left £8,000 to be paid to the author of the best treatise *On the Power, Wisdom, and Goodness of God as Manifested in the Creation*. He was an Anglican priest, very eccentric. Thus he had his house in Paris filled with dogs and cats. Some, dressed up like human beings, were taken riding with him and fed at his table.

Bridgewater Treatises: a series of works named in honor of the Earl of Bridgewater. (See preceding article.) The trustees who had the control of his bequest of £8,000 placed it at the disposal of Gilbert Davies, president of the Royal Society, who appointed eight gentlemen to write separate treatises illustrative of the power, wisdom, and goodness of God. They are arranged as follows in the collected edition: Vol. i., by Sir Charles Bell, F. R. S., *The Hand as Evincing Design* (1832; 7th ed. 1860); ii., iii., by Rev. William Kirby, M. A., F. R. S., *Power, Wisdom, and Goodness of God in the Creation of Animals* (1835); iv., by John Kidd, M. D., F. R. S., *Adaptation of External Nature to the Physical Conditions of Man* (1833); v., by Rev. William Whewell, M. A., F. R. S., *Astronomy and General Physics with Reference to Natural Theology* (1833); vi., by Rev. Thomas Chalmers, D. D., *Adaptation of External Nature to the Moral and Intellectual Conditions of Man* (1833); vii., by William Prout, M. D., F. R. S., *Chemistry, Meteorology, and Digestion with Reference to Natural Theology* (1834; 4th ed. 1855); viii., ix., by Rev. William Buckland, D. D., F. R. S., *Geology and Mineralogy with Reference to Natural Theology* (1836); x., xi., by Peter Mark Roget, M. D., F. R. S., *Animal and Vegetable Physiology with Reference to Natural Theology* (4th ed. 1869).

Bridgman, FREDERICK ARTHUR: genre and portrait painter, principally of Oriental subjects; b. at Tuskegee, Ala., Nov. 10, 1847; pupil of Gérôme, Paris; National Academician 1881; member of the Society of American Artists 1880; medal at the Centennial Exhibition, Philadelphia, 1876; third-class medal, Salon, 1877; second-class medal and Legion of Honor, Paris Exposition, 1878; second class-medal, Paris Exposition, 1889; medal at Munich Exposition 1888. His picture *Procession of the Bull Apis* is in the Corcoran Art Gallery, Washington; his *Roumanian Lady*, in the Temple collection, Pennsylvania Academy, Philadelphia; and *Diligence in the Pyrenees*, in the Permanent Gallery, Liverpool, England. Many of his works are owned in the U. S. His pictures display very clever technique, and are generally brilliant in color. Studio in Paris.

WILLIAM A. COFFIN.

Bridgman, LAURA: a blind deaf-mute; afforded a remarkable instance of the development of intellectual and moral powers under the most adverse circumstances. She was born at Hanover, N. H., Dec. 21, 1829. When two years old she lost her sight, hearing, and smell through a severe illness, her sense of taste being at the same time greatly impaired. At the age of eight she was placed under the instruction of Dr. Howe, of Boston, principal of Perkins Institution. She soon learned to read and spell with a manual alphabet, and afterward learned to write and to sew, acquired very considerable information, and was an object of great interest to psychologists and to those interested in the education of persons of defective senses. She was a teacher in the Perkins Institute, and composed religious verse. D. May 24, 1889. See Mary S. Lamson's biography of her (Boston, 1878).

Bridgnorth (anc. *Bruges* or *Brugia*): a town of Shropshire, England; on both sides of the Severn; 19 miles S. E. of Shrewsbury, and 123 miles N. W. of London (see map of England, ref. 9–G). The upper part of the town is picturesquely built on a rock 60 feet higher than the river. It has an old castle, almshouses, a public library, a bluecoat or charity school, a handsome bridge, and manufactures of carpets, nails, tobacco-pipes, boats, and worsted stuffs. It has a heavy commerce upon the river, and is supposed to have been founded by a daughter of Alfred the Great. Pop. (1891) 5,723.

Bridgton: town; Cumberland co., Me. (for location of county, see map of Maine, ref. 10–B); on Bridgton and Saco

River R. R.; 38 miles from Portland. It has 5 churches, 5 graded schools, woolen mills, and other manufactories, and is accessible by steamboat from the foot of Sebago Lake. Pop. of township (1880) 2,863; (1890) 2,605; (1900) 2,868; village, 1,552. EDITOR OF "NEWS."

Bridlington, or **Burlington**: market-town in the East Riding of Yorkshire, England; on the North Sea; 54 miles by rail E. by N. of York (see map of England, ref. 6–J). Here are remains of a rich priory founded by a grand-nephew of William the Conqueror. Numerous ancient tumuli or barrows occur in this vicinity. Bridlington Quay, a seaport and bathing-place, is on the sea, 1 mile S. E. of the town. It has a chalybeate spring and several hotels; also an active trade in corn, which is exported from it. This place is noted for chalk-flint fossils. Pop. of Bridlington and Quay (1891) 6,611.

Bridport: a seaport-town of Dorsetshire, England; on the Brit or Bride river; 16 miles N. W. of Dorchester (see map of England, ref. 14–F). It is surrounded by hills, and consists chiefly of three spacious streets. It has a Gothic church, an almshouse, a town-hall; also manufactures of cordage, sail-cloth, shoe-thread, and fish-nets. The vicinity is celebrated for its butter and cheese. Pop. 7,500.

Brief [O. Fr. *bref*, *brief* < Lat. *breve*, a short list, note, dispatch, neut. of *brevis*, short]: in law, an abridged statement of the plaintiff's or defendant's case, prepared by his attorney for the use of the barrister or counsel. (See ATTORNEY.) It should contain a summary of the pleadings, a concise statement of the facts involved, the names of the witnesses, the substance of their testimony, and usually observations by the attorney in the nature of suggestions to counsel.

In the U. S., where the same person performs the functions of both attorney and counsel, the word "brief" is used to denote the sketch of the argument of counsel, with or without a statement of facts, which is either used by him or submitted to the court under its rules. "Brief" is also sometimes employed in the sense of *breve*, to denote one of the writs by which all suits in the higher courts were originally begun. Revised by F. STURGES ALLEN.

Brief, Papal: a letter addressed by the pope to temporal princes or communities on subjects of discipline or public affairs. It differs from the papal bull in several respects, giving decisions on matters of inferior importance, which do not require the deliberations and assent of a conclave of cardinals. It is not signed by the pope, but by the segretario de' brevi, an officer of the papal chancery. It is written on thin parchment, in current Latin characters, begins with the name of the pope, is dated after the modern and not, as in bulls, after the Roman fashion, and sealed in red wax with the pope's private seal, called the "Fisherman's Ring" (Annulus Piscatoris).

Brieg, breech: a town of Prussia; in Silesia; on the Oder, and on the railway from Breslau to Oppeln; 29 miles by rail N. of Neisse (see map of German Empire, ref. 5–I). It is well built, and has a gymnasium, a good library, and manufactures of hosiery, ribbons, linens, and woolens. Pop. (1890) 20,154.

Briel, or **The Brill**: a fortified seaport-town of Holland; province of South Holland; near the mouth of the river Meuse; 13 miles S. S. W. of The Hague; lat. of lighthouse 51° 54′ 11″ N., lon. 4° 9′ 51″ E. (see map of Holland and Belgium, ref. 6–D). It has a good harbor, is intersected by several canals, and contains several magazines. The capture of this town by William de la Marck in 1572 was the first important event in the long contest between the Dutch and Philip II. of Spain. Van Tromp and De Witt were born here. Pop. 4,600.

Brienne, or **Brienne-le-Château**, brē̆e′en′le-shă̆ă′tō′, called also **Brienne-Napoléon**, -nă̆ă′pō′lā′ōn′: a small town of France; department of Aube; on the river Aube; 23 miles E. N. E. of Troyes (see map of France, ref. 4–G). Here was a military school in which Napoleon I. was educated. The place derived its name from a château built by the last Count de Brienne. In Jan., 1814, a battle was fought here between Napoleon and the allies commanded by Blücher and Schwarzenberg, but was without important results. Pop. (1891) 1,732.

Brienz, bree′ens, **Lake of** (Germ. *Brienzer-See*): in Switzerland; is formed by the river Aar, at the foot of the Hasli valley. It is 8 miles long, 2 miles wide, and from 500 to 2,100 feet deep. The surface is 1,847 feet above the level of the sea. It is surrounded by high mountains, one of which, called the Rothhorn, commands a grand view of the Alps. The surplus water of this lake flows through the Aar into Lake Thun. A small steamer plies on the lake daily.

Brierre de Boismont, brē̆e′ār′de-bwă̆ă′mōn′, ALEXANDRE JACQUES FRANÇOIS: a French physician; b. in Rome, Oct. 18, 1797; published numerous treatises on medico-psychological subjects; among others, *De l'Ennui*; *Sur le Suicide et la Folie-suicide* (rev. ed. 1865); and *Des Maladies Mentales* (1866). D. in St.-Mandé, Dec. 25, 1881.

Brigade [Fr., from Ital. *brigata*, crew, company]: a group of regiments or battalions combined into one body. In the British army it denotes a body formed by the union of two or more regiments or battalions under one commander, called a brigadier. It is a temporary grouping which can be broken up whenever the commander of the army thinks proper. In the U. S. army two or more regiments of infantry or squadrons of cavalry may constitute a brigade. A brigade of cavalry is usually eight or ten squadrons. The term is often applied to uniformed bodies acting under authority in a semi-military way, as "fire brigade." The Royal Guard in Great Britain, consisting of three cavalry and three infantry regiments, is known as the Household Brigade.

Brigadier′, or **Brigadier-general**: the commander of a brigade; an officer who is one degree higher than a colonel, and one lower than a major-general. In the British army a brigadier is an officer (usually a colonel) who for a limited time and for a special service is appointed to the command of a brigade. When this is broken up he either falls back to his colonelcy or is raised to the rank of major-general.

Brig′andage: highway robbery by organized gangs, who make their home in secure places in the forests or among the mountains, from which they issue forth to seize and rob wayfarers or to hold them for ransom. In a period of barbarism, when might is the only right, brigandage has its rise. The heroes of Greece distinguished themselves by suppressing brigandage. Theseus, Perseus, and Hercules purged the country of these robbers who had taken refuge in caverns, and also of the princes who practiced the same trade. Cities pillaged each other. The Palatine Hill, the cradle of Rome, was originally a refuge for the brigands of the Campagna; during the whole period of the Roman republic the Italian peninsula was full of brigands. The fugitive slaves and the inhabitants of conquered cities who had escaped the Roman sword continually increased the number. The Ciminian forest was their headquarters, and this has remained until our time a most dangerous place for travelers from Florence to Rome. The civil wars increased the numbers of the brigands; Roman citizens were carried away almost under the eyes of the soldiers and held in prison until they paid a high ransom. Still the brigands, even at that period, were not without sentiment. Palæmon, the celebrated grammarian, having fallen into their hands, was sent away without harm as soon as they had heard his name. Fifteen centuries later Ariosto paid his ransom on almost the same spot by reading a few stanzas of his poem.

The vast forests that covered Gaul and Germany furnished a natural refuge for brigands; continual wars favored them, and the whole feudal system in many of its features was little better than respectable brigandage. In France the system survived longer than in Germany. The eighteenth century furnishes two famous names in the annals of brigandage in France, Cartouche and Mandrin. Napoleon having firmly established the security of the roads, since his day brigandage has practically been unknown in that country. Italy, always the classic home of brigands, and Spain, her rival in this respect, continued for many years to give a home to these romantic criminals. The outlaws were generally in league with the authorities, and were never betrayed except for vengeance; this was particularly the case in Southern Italy. The ordinary line of operations of the brigands extended from Vienna to Naples, covering the lofty mountains of Aquila and Aquino, E. of Rome. These are covered with dense forests, which support numerous goats, on which the brigands subsisted. Brigandage was entirely consistent with religion. A man took his gun and went upon the highway to collect money to pay his taxes or his church assessments. Napoleon waged a fierce war against this system in Italy, and during all his domination no assassination or theft was allowed to go unpunished. This was one great cause of the popular hatred against him. One of the most famous of the Italian brigands was Fra Diavolo, who played an important part in the revolution of Naples

in 1799, was received with great favor at the court, and given the title of colonel by Queen Caroline. Spain has had much the experience of Italy. No government has ever been strong enough to track the malefactors to their mountain fastnesses and exterminate them. Here, as in Italy, brigandage seemed rather chivalry. José Maria, the most celebrated of the Spanish contrabandists, is said never to have taken a ring from a lady's hand without saying "Madam, so fair a hand has no need of ornament." Other countries preserve tender recollections of these happy times. Schinderhannes is still popular along the Rhine; Chandor is as celebrated for his filibustering exploits as for his share in the revolution of 1848. In Albania this form of plunder still exists. A characteristic feature of brigandage everywhere is the holding of captives for a ransom. The brigand has furnished many heroes to literature and opera. Hernani, the hero of Victor Hugo's great drama, is one of the most celebrated. About's *Roi des Montagnes* is a well-known and delightful tale based upon brigandage in Greece. See Larousse, *Dictionnaire du XIX^e^ Siècle* (upon which this article is largely founded); Baedeker's *Guide to Southern Italy.* C. H. Thurber.

Brigan'tes: a powerful nation of ancient Britain, inhabited what is now the north of England, including the counties of Cumberland, Westmoreland, Durham, York, and Lancaster.

Briggs, Charles Augustus, D. D.: theologian and scholar; b. in New York city, Jan. 15, 1841; studied at the University of Virginia 1857–60, the Union Theological Seminary of New York 1861–63, and the University of Berlin 1866–69; was pastor of the Presbyterian church at Roselle, N. J., 1870–74; in 1875 was chosen Professor of Hebrew and the Cognate Languages in the Union Theological Seminary of New York; in 1891 was transferred to the newly endowed Edward Robinson chair of Biblical Theology. His inaugural address was the occasion of his trial for heresy by the Presbytery of New York, on the ground that it maintained the following errors: (1) that Reason is a fountain of divine authority which may and does savingly enlighten men; (2) that the Church is a fountain of divine authority which, apart from the Holy Scripture, may and does savingly enlighten men; (3) that errors may have existed in the original text of Holy Scripture, as it came from its authors; (4) that Moses is not the author of the Pentateuch; (5) that Isaiah is not the author of half the book that bears his name; (6) that Sanctification is not complete at death. The trial lasted for some six weeks (during November and December, 1892), and resulted in the acquittal of the accused on every count. It was shown to the satisfaction of the majority of the presbytery that he never maintained the error stated in the first two counts, and in regard to the others that it was allowable in a Presbyterian minister to hold the opinion sought to be condemned. He afterward left the Presbyterian Church and was ordained in the Episcopalian ministry. He was the editor of the *Presbyterian Review*, 1880–89, and author of *Biblical Study* (New York, 1883; 3d ed. 1888): *American Presbyterianism* (1885); *Messianic Prophecy* (1886); *Whither?* (1889); *The Bible, the Church, and the Reason* (1892). The University of Edinburgh gave him the degree of D. D. in 1884.

Briggs, Charles Frederick: journalist; b. at Nantucket, Mass., in 1804. He established the *Broadway Journal* in 1844, and was afterward associated editorially with *Putnam's Magazine*, the *Independent*, and the *New York Times*. He published, besides other works, *The Adventures of Harry Franco: a Tale of the Great Panic* (1839); *The Haunted Merchant* (1844); and *The Trippings of Tom Pepper* (1847). D. in Brooklyn, N. Y., June 20, 1877.

Briggs, George Nixon, LL. D.: lawyer and judge; b. in Adams, Mass., Apr. 13, 1796; became a lawyer in 1818 in Berkshire County; distinguished himself in defense of an Indian charged with murder in 1827; from 1831 was a member of Congress for twelve years, and Governor of Massachusetts from 1844 to 1851, during which time he refused to pardon Prof. Webster, the murderer of Dr. Parkman. He was a common pleas judge 1851–56; also a trustee of Williams College for sixteen years, and a distinguished philanthropist, and for many years president of the Baptist Missionary Union. D. in Pittsfield, Sept. 12, 1861. See his memoir under title *Great in Goodness* (Boston, 1866).

Briggs, Henry: mathematician; b. near Halifax, Yorkshire, in 1551; educated at St. John's College, Cambridge. He became in 1619 Savilian Professor of Astronomy at Oxford. He made important contributions to the theory of logarithms, in which the logarithm of ten was taken as unity, and published in 1624 a great work entitled *Arithmetica Logarithmica*, giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 100,000, calculated to 14 places. His *Trigonometria Britannica* (London, 1633) contained *Tables* of natural sines, tangents, and secants with logarithms to the hundredth part of a degree. D. in Oxford, Jan. 26, 1630.

Brigham, Amariah, M. D.: b. near New Marlborough, Mass., Dec. 26, 1798; practiced medicine in Hartford, Conn., where his opposition to revivals on hygienic grounds brought him obloquy. He became superintendent of the lunatic asylum at Utica, N. Y., in 1842. Among his works is *The Anatomy, Physiology, and Pathology of the Brain* (1840). D. in Utica, Sept. 8, 1849.

Brigham, Charles Henry: b. in Boston, Mass., July 27, 1820; graduated at Harvard; became in 1844 pastor of the First Congregational church in Taunton, Mass., and in 1865 pastor of the Unitarian church at Ann Arbor, Mich. After 1866 he was Professor of Biblical Archæology and Ecclesiastical History in the Meadville (Pa.) Theological School. He was a prominent member of the American Oriental Society, of the Philological Society, and of the American Association for the Advancement of Science, and was the author of many contributions to periodical literature. D. in Brooklyn, N. Y., Feb. 19, 1879. See his *Memoir* by E. B. Willson, Boston, 1881.

Brigham: city; capital of Box Elder co., Utah (for location of county, see map of Utah, ref. 2–L); on Cent. Pac. and on branch of Union Pac. R. Rs.; 60 miles N. of Salt Lake City, near the northern shore of Salt Lake. There are here churches of three denominations, and 4 district and 3 sectarian schools; farming and fruit, cattle, and sheep raising are the chief occupations of the people. Pop. (1880) 1,877; (1890) 2,139; (1900) 2,859.

Editor of "Bugler."

Bright, John: orator and statesman; b. near Rochdale, Lancashire, England, Nov. 16, 1811. He was a member of the Society of Friends. About 1840 he became a personal and political friend of Richard Cobden, and gained distinction as an orator of the Anti-Corn-Law League, in advocacy of which he addressed many public meetings. He was elected a member of Parliament for the city of Durham in 1843, and was returned for Manchester in the general election of 1847. Cobden and Bright became the principal leaders of the Manchester school or party, which was not identified with either of the great political parties, but advocated a pacific foreign policy and electoral reform. He was defeated in the election of 1857, because he had opposed the Crimean war against Russia and the Chinese war, but was elected in the same year by the Liberal voters of Birmingham, whom he continued to represent for many years. During the great civil war in the U. S. he expressed his sympathy with the Union cause in several eloquent speeches. After the Reform bill of Russell and Gladstone had been rejected by the House of Commons in 1866, Mr. Bright advocated the cause of electoral reform by vehement speeches at immense public meetings in London, Manchester, Birmingham, and other places. In 1867 the friends of reform triumphed, and procured the passage of a bill granting the right of suffrage to every householder in a borough. He entered the cabinet formed by Mr. Gladstone in Dec., 1868, as president of the Board of Trade, and resigned office on account of ill health about Mar., 1871; again a member of Mr. Gladstone's cabinet of Apr. 28, 1880; he resigned July 14, 1882, announcing in the House of Commons that he retired because he differed from his colleagues of the cabinet on their Irish home-rule and their Egyptian policy. He was elected lord rector of the University of Glasgow Nov. 15, 1880. A collection of his speeches was published in two volumes in 1868. D. in London, Mar. 27, 1889.

Bright, Marshal H.: b. at Hudson, N. Y., Aug. 18, 1834; educated at Lawrence Scientific School, Cambridge, 1852–53; reported in New York Senate 1854; associate editor *Albany Argus* same year; served in the civil war; appointed on the staff of Gen. Robert Anderson, Oct., 1861; served successively on staffs of Gens. W. T. Sherman, D. C. Buell, W. S. Rosecrans, and George H. Thomas 1861–65; participated in several engagements; breveted major for valuable and meritorious services; resigned his commission at close of the war 1865; engaged in silver mining in Nevada; became managing editor of *Christian at Work*, New York, 1873, and

editor-in-chief 1880. He has contributed to numerous periodicals on theological, scientific, and philosophical subjects, and delivered various addresses.

Bright, William, D. D.: Canon of Christ Church and Regius Professor of Ecclesiastical History, Oxford; b. in Doncaster, England, Dec. 14, 1824. Educated at Rugby and at University College, Oxford; graduated B. A. 1846; fellow of his college 1847; ordained 1848 and 1850; Canon Christ Church and regius professor 1868. Author of *Ancient Collects* (1857; 2d ed. 1861); *History of the Church from the Edict of Milan to Council of Chalcedon* (1860; 5th ed. 1888); *Sermons of St. Leo the Great on the Incarnation*, trans. with his *Tome* and *Notes* (2d ed. 1885); *Faith and Life* (1864; 2d ed. 1866); *Hymns and other Verses* (1866; 2d ed. 1874); *Chapters of Early English Church History* (1878; 3d ed. 1889); *Notes on the Canons of the First Four General Councils* (1882); *Iona and other Poems* (1886); *Addresses on the Seven Sayings from the Cross* (1887); *Sermons on the Incarnation* (1889); *Lessons from the Lives of Three Great Fathers* (1890); *The Roman Claims Tested by Antiquity* (1877). Editor of Eusebius's *Ecclesiastical History* (1872; 2d ed. 1882); St. Athanasius's *Orations against the Arians* (1873; 2d ed. 1883); *Socrates's Ecclesiastical History* (1878); select *Anti-Pelagian Treatises of St. Athanasius*, in The Library of the Fathers.

Brighton, formerly **Brighthelmstone**: a town and fashionable watering-place of England, in Sussex; on the English Channel; 50 miles S. of London (see map of England, ref. 14–J). It is the southern terminus of the London and Brighton Railway. Lat. of lighthouse, 50° 50′ N., lon. 0° 8′ W. It extends 3 miles along the coast, and is sheltered on the N. and N. E. by the South Downs. To resist the inroads of the sea, which formerly undermined the chalk-cliffs at Brighton, a sea-wall of great strength has been constructed. It is 60 feet high and forms an admirable promenade. In the middle of the town, in an open space called the Steyne, is the pavilion or Marine Palace, a fantastic structure of Oriental style built by the Prince of Wales (George IV.). It was finished in 1827, and is now owned by the corporation of Brighton. The town is well built, and consists mostly of new and elegant streets and terraces. It is a favorite resort for the aristocracy and the opulent classes, has numerous magnificent hotels, two theaters, assembly-rooms, and many boarding-schools. Among its institutions are Brighton College, founded in 1847 for the education of the sons of noblemen, a hospital, and the Sussex Literary and Scientific Institution. Brighton returns two members to Parliament. Steamers ply between this place and Dieppe. A fine terrace, called the Marine Parade, extends about a mile between the Steyne and Kempton, an eastern suburb of Brighton. It has little or no maritime trade, and owes its rapid increase to the salubrity of the air and its attractions to persons in pursuit of health and pleasure. It entertains annually about 80,000 visitors. Pop. (1881) 107,528; (1891) 115,873; (1901) 123,478.

Bright's Disease, or **Nephritis** (named after the famous English physician, Dr. Richard Bright, who studied this disease in the early part of the nineteenth century): essentially a degeneration of the kidney structure. In consequence of this, the normal excretory processes are not accomplished, and various poisonous substances meant for excretion are retained, to the impairment of the general health. The causes of this disease, or more properly group of diseases, for under the term Bright's disease are included various degenerations of the kidneys, are extremely varied. Infectious diseases, particularly scarlet fever, wet and cold, gout, syphilis, excessive use of alcohol, and many other causes, may bring about disease of the kidneys. Bright's disease may be acute or chronic. The former is the form commonly observed after infectious disease or exposure, and in a fair proportion of cases terminates happily. The latter is the result of more slowly acting causes, and may be accompanied by a great variety of symptoms. The first effect of degeneration of the kidney substance is alteration in the character of the urine. The presence of albumin in the urine, though by no means always indicative of Bright's disease, rarely fails to be a symptom of the disease. At the same time there may be seen by the microscope certain small "casts" or molds of the urinary tubules of the kidneys. The latter are considered absolutely indicative of the disease, whereas Albuminuria (*q. v.*) may occur in other conditions. Of the other symptoms derangement of the digestive system, headache, progressive weakness and anæmia, dimness of vision, and finally dropsy are important. In exacerbations these symptoms may become intensified, causing vomiting, diarrhœa, entire loss of vision, widespread dropsy (anasarca), and finally convulsions or coma. It is important to remember that Bright's disease as a rule is a wholly painless disease. The pains in the back and side so frequently attributed to this disease are usually muscular or rheumatic, sometimes they are expressions of disturbance or irritation of the intestines, but very rarely can they be attributed to Bright's disease. Stone in the kidney does cause such pains, but these are more acute than the dull ache spoken of, and are apt to be so severe as to lead to an early recognition of their true cause. The outlook in chronic Bright's disease is always gloomy, though many persons reach an old age totally unaware of the fact that they had the disease during many years, and others live long periods in comparative comfort after having discovered the disease. The best treatment is the hygienic, consisting of carefully regulated diet, avoiding meat and other albuminous foods as far as possible, the restriction of alcoholic drink to the minimum, moderate exercise, and careful avoidance of cold and wet. During the acute attacks medicinal treatment may be needed to compensate the improper excretion of urine. If dropsy is pronounced, active purgation or sweating may be required; if weakness and anæmia are great, iron will be found efficacious, or it may be necessary to administer other tonics. See Albuminuria.

William Pepper.

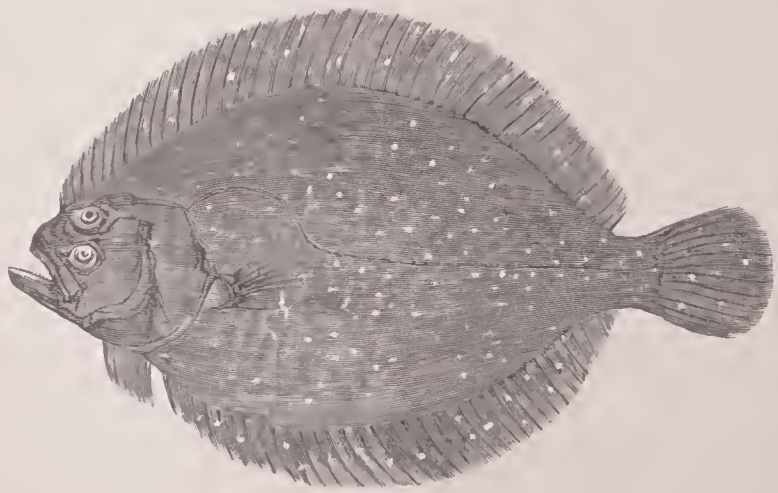
Brigitta: See Birgitta.

Brigittines, brij'it-inz, or **Order of the Saviour**: a monastic order affiliated with the Augustinians; founded by St. Bridget (or Birgitta) of Sweden in 1344. It originally included monks and nuns, who lived in the same house, but were forbidden to see each other. There are at present few if any Brigittine monks, and not many nuns. Sion House was the only English convent. Œcolampadius, the Reformer, was once a Brigittine monk.

Bri'gus: a port of entry and post-town; capital of Brigus district, Newfoundland; is about 35 miles N. W. of St. Johns. It has a small but good harbor, having over 820 cod-fishing boats and 30 trading vessels, and is visited by steamers from St. Johns. It has a convent of Sisters of Mercy and a jail. It has considerable agriculture. Pop. about 2,000.

Bril, Paul: landscape-painter; b. in Antwerp in 1556. He was a pupil of his brother Matthæus, and worked for many years in Rome, where he died Oct. 7, 1626.

Brill: a flounder (*Bothus rhombus*); found on the coasts of Europe, and esteemed as food, though inferior to the turbot which it much resembles, but from which it may be



The brill.

distinguished by its want of tubercles on the upper surface, and by the color, which is a reddish sandy brown on the upper side, varied with darker brown, and sprinkled with white pearly spots. It seldom weighs more than 8 lb.

Brimstone: a commercial and common name for Sulphur (*q. v.*).

Brindaban, brin-da-baan', or **Bindrabund** (anc. *Vrindavana*): a sacred town of British India; in Northwestern Provinces; on the river Jamna; about 40 miles N. N. W. of Agra and 7 miles from Muttra (see map of N. India, ref. 6–E). It has several temples of Krishna, one of which is a remarkably massive structure. This town is visited by multitudes of pilgrims from distant parts of India, and

their munificence is the chief support of the place. Pop. (1890) 21,467.

Brin'disi: a fortified seaport of Italy; province of Lecce; situated at the head of a bay of the Adriatic; 38 miles by rail N. N. W of Lecce; lat. of fort, 40° 39′ N., lon. 18° 1′ E. (see map of Italy, ref. 6–II). The ancient *Brundisium* was taken from the Sallentines by the Romans in 267 B. C., and was afterward the principal naval station of the Romans on the Adriatic. It had an excellent landlocked harbor, and was long one of the most important maritime cities of Italy. It was the port from which the Romans embarked on the voyage to Greece. Vergil died here in 19 B. C. The crusaders used it as their chief port of embarkation to the Holy Land. The harbor having become choked with sand, its importance greatly declined. Here is a mediæval cathedral and an ancient castle. The large steamers of the Peninsular and Oriental Company now enter this port, which has recently been improved. Since 1860 the government has dredged the harbor, so that a depth of nearly 6 fathoms has been obtained, and has constructed two breakwaters and about 3,000 feet of quay. The position of Brindisi has been rendered very advantageous for commerce by the opening of the Suez Canal. A railway extends from this town along the coast to Ancona, Milan, etc. Pop. 16,719.

Brine Shrimp. a small entomostracous crustacean of the order *Phyllopoda*; found in salt pools and salt lakes. The American species, *Artemia gracilis*, is common in many places and especially abundant in the Great Salt Lake, Lake Mono, and other salt or alkaline lakes of the Great Basin. The European species, *Artemia salina*, is of especial interest, from the fact that it is known to produce several broods parthenogenetically, and also that it has been known to vary very much in form with the degree of concentration of the brine in which it lives. DAVID S. JORDAN.

Brink, BERNHARD AEGIDIUS KONRAD TEN: philologist; b. at Amsterdam, Jan. 12, 1841. He was educated in Germany, and was Professor of Modern Languages in the University at Marburg 1870–73. In 1873 he was called to the University at Strassburg, then just reorganized, as Professor of English Philology, and he held that position till his death, Jan. 29, 1892. Ten Brink was not only a broad and accurate scholar, but a man of distinguished literary taste, and master of an attractive and elegant style. His principal work, *Geschichte der englischen Literatur* (pt. i., 1877, English translation, 1883; pt. ii., 1889–93, English translation, first half, 1893), comes down to the Reformation. Other important works are *Chaucer: Studien zur Geschichte seiner Entwicklung und zur Chronologie seiner Schriften* (1870); *Chaucers Sprache und Verkunst* (1884); *Béowulf* (1888), being No. 62 of *Quellen und Forschungen zur Sprach- und Culturgeschichte der germanischen Völker*, an important series of monographs begun in 1874, of which ten Brink was one of the founders and editors. G. L. KITTREDGE.

Brinkley: town (founded in 1874); Monroe co., Ark. (for location of county, see map of Arkansas, ref. 3–E); on Ark. Midland, Little Rock and Mem., St. Louis S. W., and Wh. and Bl. Riv. Val. R. Rs.; 68 miles from Memphis. Brinkley is situated in the fertile southern timber belt, and is the chief railroad center and manufacturing town of Eastern Arkansas; it has car-works, railroad machine and repair shops, oil-mill, two stave-factories and cooperage works, ice-factory, very large lumber-mill, water-works, electric lights, and two banks. There are seven churches and good public schools. The recent rapid growth of the town is due to the completion of the railroads centering here. Pop. (1880) 325; (1890) 1,510; (1900) 1,648. EDITOR OF "ARGUS."

Brinton, DANIEL GARRISON, M. D.: archæologist and ethnologist; b. at Thornbury, Chester co., Pa., May 13, 1837; A. B., Yale College, 1858; M. D., Jefferson Medical College, Philadelphia, 1860; studied in Paris and Heidelberg; entered the army as a surgeon, serving as medical director of the Eleventh Army-corps, and later as superintendent of hospitals at Quincy and Springfield, Ill.; edited the *Medical and Surgical Reporter* 1867–87; appointed Professor of Ethnology at the Academy of Natural Sciences in Philadelphia 1884; Professor of American Linguistics and Archæology in the University of Pennsylvania 1886; author of *The Floridian Peninsula* (1859); *The Myths of the New World* (1868); *American Hero Myths* (1882); *Essays of an Americanist* (1870); *Races and Peoples* (1890); *The American Race* (1892). *The Library of Aboriginal American Literature* (8 vols.), of which he was editor, is a reproduction of aboriginal legends, thought, and customs, as authentic material for linguistic study. He contributed largely to the study of American archæology, ethnology, and linguistics. D. in Atlantic City, N. J., July 31, 1899.

Brion, brē̆ē′ōṅ′, GUSTAVE: genre-painter, principally of Alsatian life; b. at Rothau, Alsace, Oct. 24, 1824; d. in Paris, Nov. 4, 1877. His *Pilgrims of St. Odile*, painted in 1863, is in the Louvre. He received the Legion of Honor and a first-class medal at the Salon of 1863, and the medal of honor in 1868. Knight of the Order of Leopold of Belgium. A good many of his works are in American collections. WILLIAM A. COFFIN.

Brisbane: city and seaport, and the capital of Queensland, Australia; on Brisbane river; about 20 miles from its entrance into Moreton Bay, and about 600 miles N. by E. of Sydney (see map of Australia, ref. 5–J). Wool and other products are exported from this place. It is connected by rail with Sydney, Melbourne, and Adelaide, and is in direct steamship communication with London and Liverpool. The Houses of Parliament meet in an expensive and handsome structure, and the public buildings are for the most part impressive. It is the seat of an Anglican and a Roman Catholic bishop. Settlement began here with a penal colony in 1825, which was broken up in 1839; was incorporated as a city in 1859 and made the capital of the Moreton Bay district, and subsequently of Queensland; was inundated and severely injured by a flood in the river early in Feb., 1893. Pop. (1881) 31,109; (1891) 55,959, including suburbs.

Brisbane, Sir THOMAS MACDOUGALL, G. C. B.: astronomer and general; b. in Largs, Ayrshire, Scotland, July 23, 1773; commanded a brigade in the Peninsula 1812–13; governor of New South Wales 1821–25, who improved the penal colonies and promoted the commerce of the colony. The river and town of Brisbane perpetuate his name. He catalogued 7,385 stars while in Australia, and on his return built an observatory on the Tweed; was made a baronet in 1836; succeeded Sir Walter Scott as president of the Royal Society of Edinburgh. D. in Largs, Jan. 27, 1860.

Brissot de Warville, brē̆ēs′sō′de-vaăr′vē̆ēl′, FÉLIX SATURNIN: painter of landscape and sheep (contemporary French school); b. at Sens, Yonne; d. in Paris, July, 1892. He was a pupil of Léon Cogniet, and obtained a second-class medal at the Salon of 1882. His work is notable for vigorous execution and excellent drawing of animals, especially sheep, which he particularly loved to paint.
WILLIAM A. COFFIN.

Brissot de Warville, JEAN PIERRE: French Girondist and political writer; b. near Chartres, Jan. 14, 1754. He published in 1780 a *Theory of Criminal Laws*. In 1785 he was unjustly imprisoned in the Bastile for about four months. With the aid of his friends he founded about 1788 the Society of the Friends of the Negroes, and visited the U. S. to promote the abolition of the slave-trade. After his return to France he founded and edited the *Patriote Français*, an able republican journal. In 1791 he was elected to the National Assembly by the voters of Paris. He was so prominent a leader of the Girondists that they were often called the Brissotins. Having been elected to the convention, he opposed the execution of the king. He was guillotined in Paris, Oct. 31, 1793. See Brissot's *Mémoires pour servir à l'Histoire de la Révolution*, published by his son (4 vols., 1830), and his own memoirs entitled *Legs à mes enfants* (1885).

Bris'ted, CHARLES ASTOR: son of the John mentioned below; b. in New York, Oct. 6, 1820; educated at Yale College, New Haven, and Trinity College, Cambridge; author of an edition of Catullus (1849); *Five Years in an English University* (1851; revised 1872); *The Upper Ten Thousand* (1852); *Pieces of a Broken-down Critic* (1858); *The Interference Theory of Government* (1867); *Anacreontics* (1872); and was a frequent contributor to leading periodicals. D. at Washington, D. C., Jan. 15, 1874.

Bristed, JOHN: an Episcopal clergyman; b. in Dorsetshire, England, in 1778; educated at Winchester School; removed to the U. S. in 1806; practiced law in New York; married a daughter of John Jacob Astor; studied divinity and was ordained in the Episcopal Church. He was author of *Critical and Philosophical Essays* (1804); *Resources of the United States* (1818), reprinted in London with the title *America and her Resources*, the same year; and *Anglo-American Churches* (1823). D. at Bristol, R. I., Feb. 23, 1855. Revised by W. S. PERRY.

Bristle-tail: an insect of the sub-order *Cinura*; an agile creature of low structure and without wings, found in damp rooms, and often feeding on tapestry or clothing. The long bristles at the tail suggest the name. A common species is *Lepisma saccharina*.

Bris'tol: maritime city of England; situated on the Avon at its confluence with the Frome; 8 miles from the sea; 11½ miles by rail N. W. of Bath, and 118 miles by rail W. of London: lat. 51° 27′ N., lon. 2° 35′ W. (see map of England, ref. 12–F). It is chiefly in the county of Gloucester, and partly in Somersetshire, and occupies several hills and valleys. It is the terminus of the Great Western, the Bristol and Exeter, and the Midland Railways. Bristol returns four members to Parliament. Among its remarkable buildings are the cathedral, which was founded about 1150; the fine church of St. Mary Redcliffe, which was completed in 1376; the Temple church, which has a leaning tower; the guildhall; the exchange, used as a corn-market; and the new general hospital. The modern portions of Bristol, including Clifton and other suburbs, consist of handsome residences in squares, terraces, crescents, and detached villas. This city has a public library, a bishop's college, a medical school, an infirmary, an asylum for the blind, an asylum for deaf-mutes, and other benevolent institutions. The Avon here, though narrow, is deep enough for large vessels. About £650,000 have been expended in turning this river into a new course, and its old channel now forms a harbor furnished with locks and quays 6,000 feet long. Bristol was the first British port between which and the U. S. a regular communication by steam was established. It has an extensive trade with Canada, the U. S., the West Indies, France, Russia, the shores of the Mediterranean, etc. The chief articles of export are copper, iron, brass, coal, salt, and manufactured goods. The manufactures of this city are chiefly cotton goods, refined sugar, glass, woolen goods, chemical products, machinery, and earthenware. Here are extensive ship-yards, which turn out excellent vessels. This place was called *Caer-oder* by the Britons, and *Bricstowe* or *Briestow* by the Anglo-Saxons. A fortified town existed here as early as 500 A. D. It was formerly the second commercial city in England. During the civil war it was taken alternately by Royalists and Roundheads. Pop. (1881) 206,503; (1891) 289,280; (1901) 328,836.

Bristol: town (incorporated 1785): Hartford co., Conn.; on N. E. R. R., 18 miles S. W. of Hartford (for location, see map of Connecticut, ref. 9–G); has 9 churches and 13 schools, including a high school, a free public library, a national and a savings bank, 2 stockinet factories, foundries, manufactories of brass goods, clocks, bells, hardware, steel fishing-rods, etc. The borough of Bristol (1893) has an estimated population (Jan. 1, 1896) of 6,127. It is connected with New Britain and Plainville by an electric tramway. Sewage is disposed of by irrigation system. Pop. of town (1890) 7,382; (1900) 9,643.

Bristol: town (incorporated in 1819); Grafton co., N. H. (for location of county, see map of New Hampshire, ref. 7–E); is terminus of Bristol branch of Concord Division of B. and M. R. R.; 32 miles from Concord, and is situated at the junction of Pemigewasset and Newfound rivers. Bristol has 6 schools, 3 churches, a public library, and manufactories of flannels, paper, wood-pulp, and wooden-wares. It is a place of summer resort. Pop. (1880) 1,352; (1890) 1,524; (1900) 1,600. EDITOR OF "ENTERPRISE."

Bristol: borough; Bucks co., Pa. (for location of county, see map of Pennsylvania, ref. 5–J); on railroad and on the Delaware river; 19 miles above Philadelphia, and nearly opposite Burlington, N. J. Its industries are iron-founding and manufactures of flour, machinery, worsted, and furniture. Here is a valuable mineral spring. Pop. (1880) 5,273; (1890) 6,553; (1900) 7,104.

Bristol: port of entry; capital of Bristol co., R. I. (for location of county, see map of Rhode Island, ref. 9–O); on P., W. and Bristol R. R., and on Narragansett Bay; 15 miles S. S. E. of Providence, and 7 miles S. W. of Fall River. It has a good harbor, which is easy of access, and will admit large vessels. It has two yacht-building establishments, and manufactures of cotton goods, rubber goods, worsted, etc. Bristol has 17 public schools, including a high school, 8 churches, a free library of about 12,000 volumes with brown-stone library building. The town's charter was granted in 1680. Pop. of township (1880) 6,028; (1890) 5,478; (1900) 6,901. EDITOR OF "PHŒNIX."

Bristol: city; Sullivan co., Tenn., and Washington co., Va. (for location of county, see map of Tennessee, ref. 5–K). The State division-line between Tennessee and Virginia runs E. and W. along the main street, and Bristol, Va., was formerly called Goodson. Bristol has King College for young men, Sullins College and Southwest Virginia Institute for young ladies, good public schools, 2 tobacco-factories and warehouses, 2 flouring-mills, an iron furnace, veneer-factory, cotton-factory, planing-mills, ice-factory, car-works, etc. Pop. (1880) 3,209; (1890) 3,324; (1900) 5,271. EDITOR OF "COURIER."

Bristol: town (founded in 1789); Addison co., Vt. (for location of county, see map of Vermont, ref. 5–B); is E. terminus of Bristol R. R., and 31 miles S. of Burlington; has a graded school and 7 district schools, and churches of 4 denominations. Its industries are principally farming (in which one-third of the population are engaged), and the manufacture of burial-caskets, beekeepers' supplies, and wooden mailing-boxes. Pop. (1880) 1,579; (1890) 1,828; (1900) 2,061. EDITOR OF "HERALD."

Bristol, GEORGE PRENTICE: scholar; b. at Clinton, N. Y., June 21, 1856; graduated at Hamilton College 1876; assistant Professor of Greek in Hamilton 1882–88; appointed associate Professor of Greek in Cornell University in 1888. Editor of *Selected Orations of Lysias* (1892). B. I. W.

Bristol, JOHN BUNYAN: landscape-painter; b. at Hillsdale, N. Y., Mar. 14, 1826. Studied at Hudson, N. Y., under Henry Ary, and first came into notice by the exhibition of landscapes which he had painted in Florida about 1860. National Academician 1875; honorable mention, Paris Exposition, 1889; medal of honor, Centennial Exhibition, Philadelphia, 1876, for his picture entitled *Mount Oxford*. Studio in New York. WILLIAM A. COFFIN.

Bristol, MARQUESSES OF (1826, in the United Kingdom), Earls of Bristol (1714, in Great Britain), Earls Jermyn (1826, in the United Kingdom), and Barons Hervey (1703, in England), a noble family of Great Britain.—FREDERICK WILLIAM JOHN HERVEY, the third marquess: b. June 28, 1834; succeeded his father in 1864. He was member of Parliament for West Suffolk 1859–64.

Bristol Brick, or **Bath Brick**: a variety of brick used for scouring steel table-cutlery and other polished steel surfaces. It is made at various places in England and the U. S., a peculiar fine sand being used in the manufacture.

Bristol Channel: an inlet of the Atlantic Ocean; in the southwest part of England; bounded on the N. by Wales and on the S. by Somerset and Devonshire. At the E. end it communicates with the estuary of the Severn. It is the largest inlet of Great Britain, and has a coast-line of 220 miles. The tides rise to an extraordinary height—at Bristol about 40 and at Chepstow sometimes 70 feet. The principal bays are Swansea Bay, Caermarthen Bay, Cardiff Roads, the Severn Estuary, and Barnstable Bay.

Bris'tow, BENJAMIN HELM: b. at Elkton, Todd co., Ky., in 1833; studied law, and practiced his profession successfully in Kentucky till 1861, when, on the outbreak of war, being of strong Union sentiments, he volunteered his services, and as major of the Twenty-fifth Kentucky Volunteers was engaged at Fort Donelson and as lieutenant-colonel at Shiloh, in command of the regiment, being wounded in the last-named battle. Afterward, as colonel of the Eighth Kentucky Cavalry, he served throughout the war with distinction. About the close of the war he received the appointment of U. S. district attorney for the Louisville district. The ability here exhibited led to his appointment as solicitor-general on the organization of the department of justice in 1870. After two years' service he resigned and became attorney of the Texas Pacific R. R., which position he held but a short time when he returned to the practice of his profession at Louisville, Ky.; was appointed attorney-general in 1873; and was Secretary of the Treasury in 1874–76. D. in New York, June 22, 1896.

Bristow, GEORGE FREDERICK: musician; b. in Brooklyn, N. Y., Dec. 19, 1825; studied principally under his father, an English musician and composer; became one of the earliest members of the New York Philharmonic Society; composed for this society his concert overture in E flat, op. 3, in 1846; his *Jullien* symphony, op. 24, in 1855; symphony in F sharp minor, op. 26, in 1858; overture *Columbus*, op. 34, in 1866; symphony *Arcadian*, op. 50, in 1873. His oratorio *Praise to God*, op. 32, was produced by the New York Harmonic Society in 1866. His opera *Rip Van Winkle*

was produced by the Pyne-Harrison company at Niblo's Garden, New York, in 1853, and had a long and successful run. This was rewritten to a new libretto in 1880. He was conductor of the Harmonic Society, the Mendelssohn Union, and the Centennial Choral Union; was for many years director of the music in the New York public schools. In addition to the works mentioned, he has composed an opera, *Columbus*, 1878; an oratorio, *Daniel*, 1867; a cantata, *The Great Republic*, 1862, besides much church music and many songs and piano pieces. He lives in New York city.

D. E. Hervey.

Bristow Station, now **Bristoe**: Prince William co., Va. (for location of county, see map of Virginia, ref. 4–H); on the Richmond and Danville R. R.; 4 miles W. S. W. of Manassas Junction. A severe engagement took place here the afternoon of Aug. 27, 1862, between the U. S. forces under Gen. Hooker and the Confederates under Gen. Ewell, darkness closing the conflict, with severe loss on both sides. On Oct. 14, 1863, the Confederate general A. P. Hill attacked the force under command of Gen. G. K. Warren, U. S. army, at this place; the attack was repulsed by Warren, who captured several pieces of artillery and many prisoners.

Brit: a name applied to young herrings.

Britan'nia: the ancient name of the island of Great Britain. It was inhabited by rude, uncivilized tribes of Britons (Lat. *Britanni*), who were perhaps, but not probably, the aborigines when Julius Cæsar invaded the island in 55 B. C. Their religion was a sanguinary Druidism. Many of the Britons were Cymric Celts, while those of the northern part were probably largely Gaelic. (See Briton.) They obstinately resisted the Roman invaders, but without success, and the southern half of the island was conquered by the armies of Vespasian. In the reign of Domitian, Agricola extended Roman power to Scotland, and erected a chain of forts between the friths of Clyde and Forth about 84 A. D. The northern part of the island was inhabited by the Caledonians and Picts, whom the Romans failed to subdue. These warlike barbarians made frequent inroads into the southern province, to obviate which the Romans built the wall of Antoninus about 140 A. D. Another rampart, called the Wall of Hadrian, extending from Solway Frith to the mouth of the Tyne, was completed by Severus about 210 A. D. The part of the island S. of this wall was for several centuries under the dominion of the Romans, who founded many towns (*municipia*), and diffused Roman culture, arts, and civilization in the country. They made numerous roads from London to the provinces, the remains of which are still visible. Many parts of England abound in Roman antiquities, including remains of camps, baths, mosaic pavements, weapons, ornaments, utensils, pottery, sculptures, and coins. It appears that the Romans intended to keep Britain as a permanent conquest, but in consequence of the internal disorders and external dangers that menaced the stability of the Roman empire the legions were withdrawn from the island about 420 A. D., soon after which it was invaded and conquered by the Saxons. It is said that Cæsar was the first who gave the name *Britannia* to this island, which before his time was called *Albion*. The name *Britannicæ Insulæ*, however, was applied to the British islands collectively before Cæsar invaded Albion. Britannia is usually personified in the fine arts as a woman seated on an insulated rock, leaning on a shield and holding in her hand a spear or trident. See Camden's *Britannia*.

Britannia Metal: an alloy of tin with a little antimony, zinc, and copper; largely used in the manufacture of coffee-pots, tea-pots, and other vessels. It is harder than pewter, and not so easily indented or bent. The proportions of the metals combined to make this alloy are various. The average composition in 100 parts is—tin, 85½; antimony, 10½; zinc, 3; and copper, 1. The present composition of the alloy used at Birmingham, England, is stated to be 90 of tin, 8 of antimony, 2 of copper.

Britannicus: a surname which, on account of some alleged victories in Britain, the Roman senate bestowed in 42 A. D. on the Emperor Claudius and his newly born son by Messalina, Claudius Tiberius Germanicus, and which afterward became the distinguishing appellation of the latter. In 48 Messalina was executed, and Agrippina, the second wife of Claudius, induced him to exclude Britannicus from the throne and appoint Nero, her son by her former husband, successor. After the accession of Nero, however, Agrippina used Britannicus as a means of intimidating him, and to get rid of his rival Nero poisoned him Dec. 15, 55.

British America: a name which in its widest sense comprises all British possessions in the western hemisphere. It is usually applied, however, to the territory embraced since 1873 in the Dominion of Canada and to Labrador and Newfoundland. See these headings respectively.

British Association for the Advancement of Science: a society for promoting the mutual acquaintance of scientific men, the interchange of scientific ideas, and the solidarity of the great body of scientific workers, founded in 1831 at a memorable meeting held in the city of York. With admirable prescience it was given so comprehensive an organization that only minor changes have been found necessary in subsequent years. Its annual meeting, held in the summer season, occupies a week. Each year a new meeting-place is chosen, and towns vie with one another for the privilege of entertaining the society. The proceedings consist chiefly of the announcement and discussion of results of scientific work, and for this purpose the association is divided into eight sections, meeting in separate halls. The field of Section A is mathematical and physical science; of B, chemical science; of C, geology; of D, biology; of E, geography; of F, economic science and statistics; of G, mechanical science; and of H, anthropology. The membership is about 4,600, the usual attendance about 2,000. A large income from dues yields a surplus which is devoted to the aid of special researches conducted by committees of the association. The grants for such purposes amount annually to about £1,000.

The example of Great Britain in founding this institution has been followed in Germany, France, and the U. S. See American Association for the Advancement of Science.

G. K. Gilbert.

British Columbia: a province of the Dominion of Canada; bounded S. by the U. S. (Washington, Idaho, and Montana), N. by Northwest Territory, E. by Athabasca and Alberta, and W. by the Pacific Ocean and Alaska. The northern boundary is the parallel of 60° N. It includes the important islands of Queen Charlotte (*q. v.*) and Vancouver (which last was, in 1849, made a crown colony, and in 1866 united to the present province, *q. v.*). British Columbia was united to Canada in 1871. The soil of portions of the province near the sea is good, and the climate mild, though rainy; but in the interior the surface is extremely rugged, and the climate is severe. The coast-line is characterized by remarkable fiords, called "canals," which are often walled in by mountains of moderate elevation known as the Cascade Range. The same feature is seen to an unusual degree in the lakes of the province. These are generally very long and narrow, lying between parallel ranges of mountains. The highest peaks in the Rocky Mountains of this province are Mt. Brown (about 16,000 feet) and Mt. Hooker (about 15,700 feet). Furs are largely exported. There is much valuable timber, and the fisheries have become important. Cod, haddock, herring, halibut, trout, sturgeon, anchovies, and especially salmon, abound. There is much fine grazing-land. Large amounts of gold have been obtained here, and silver, copper, zinc, mercury, coal, iron, and marble are found. Manufactures in 1891 embraced 755 establishments, $14,342,149 invested capital, 11,473 employees, and a production valued at $11,916,928. Education is compulsory. Religiously, the inhabitants in 1891 were divided into Anglicans 23,600, Roman Catholics 20,367, Presbyterians 15,281, Methodists 14,298, pagans (chiefly Indians and Chinese) 12,691, and of all other denominations 11,376. Area, 382,300 sq. miles. Capital, Victoria. The principal towns are Victoria and Nanaimo, on Vancouver Island, and Vancouver and New Westminster, on the mainland at the terminus of the C. P. R. R. Total pop. (1891) 97,612, of whom 42·4 per cent. were of foreign birth, though chiefly from Great Britain and the U. S., including about 25,000 Indians and 6,000 Chinese. The best harbor is at Esquimault. British Columbia has an Anglican bishop, whose seat is at New Westminster.

Certain islands in the Strait of Juan de Fuca, having been claimed by both the U. S. and Great Britain, were held under joint military occupation until Oct., 1872, when, by a decision of the Emperor William I. of Germany, to whom the dispute was referred, they became U. S. territory. These islands, of which San Juan is the most important,

are ten in number. Their entire population, now embraced in the county of San Juan, in 1880 was 948; (1890) 2,072; (1900) 2,928. Revised by M. W. Harrington.

British East Africa: See Ibea.

British Empire: See Great Britain and Ireland.

British Guiana: See Guiana.

British Gum: See Dextrin.

British Honduras: See Honduras, British.

British India: See India.

British Museum: in London; was established in 1753 by act of Parliament in pursuance of a bequest of Sir Hans Sloane to the nation of his cabinets of natural history and his library, numbering 50,000 volumes, in return for a sum of £20,000 to be paid to his heirs, and was opened in 1759. The palace of the Duke of Montague on Great Russell Street was purchased for the reception of the collection. In 1801 the Elgin marbles, in 1823 the library of George III., containing 80,000 volumes, were added to the museum, and it has been subsequently enriched by the Granville library, the Sir William Temple coin cabinets, the Layard and Loftus collection of Assyrian, and the Lady Webster collection of Mexican, antiquities, and other extensive accessions. The building in 1823–47 was enlarged and renovated at a cost of £150,000, and an additional wing was built in 1883 with the funds left by Mr. William White. The library numbers 1,600,000 volumes, besides many thousands of MSS., documents, and state papers. The collections of antiquities are altogether the completest in Europe. The museum contains also the finest collection of vases, among them the famous Portland vase, and the largest collections of Greek and Roman sculpture in the world, and the cabinets of natural objects embrace every province of science. A catalogue is now being printed, but will not be finished until 1900.

British New Guinea: See New Guinea.

British North Borneo: See Borneo.

Briton: a native or citizen of ancient Britain or Britannia (*q. v.*). When Cæsar invaded Albion in 55 B. C., he found in it two different peoples. The interior was occupied by the primitive or indigenous Celtic inhabitants, who had been driven back from the coasts by a people of probable Gothic descent. The latter had colonized the southeast part of the island, and were less numerous than the Celtic Britons. The language of the Southern Celtic Britons was very similar to the present Welsh. "The Gaels and Britons," says R. G. Latham, "are the fundamental populations of the British isles. The Picts were either aboriginal or intrusive. If aboriginal, they were like the Gaels and Britons, Keltic." (See Picts.) When Cæsar invaded the island, the Britons were divided into a number of petty kingdoms or states. Some of these were called *Silures*, *Brigantes*, *Ordovices*, *Trinobantes*, and *Cantii*. Their religion was Druidism. (See Druids.) The primitive Britons were brave and warlike, but, in consequence of their divisions, they were conquered by the Romans without much difficulty. They were rude barbarians, who painted their bodies blue. The term Briton is often applied to a modern inhabitant of Great Britain.

Brittany: See Bretagne.

Brittle-star: a starfish of the order *Ophiuroidea*, called also serpent-star. The brittle-stars possess a distinctly outlined central disk, in which is the stomach. The arms, usually five in number, spring abruptly from the disk. The ambulacral groove is covered by a series of plates, causing the ambulacral feet to extend from the sides of the arms. The arms are cylindrical and flexible, and do not contain any appendages of the stomach, as do those of true starfishes. The arms are unbranched in all but the family *Astrophytidæ*, to which the basket-fish and Gorgon's-head belong. There are about 500 species of brittle-stars, certain ones being very common on most coasts.

David S. Jordan.

Britton, Nathaniel Lord, E. M., Ph. D.: botanist; b. on Staten Island, N. Y., Jan. 15, 1859; graduated from Columbia College, in which he is now Professor of Botany. As botanist of the State geological survey he published a *Catalogue of the Plants Found in New Jersey* (1889). He is editor of the *Bulletin of the Torrey Botanical Club*. He has published technical papers on certain genera of sedges, *Cyperus*, *Scleria*, and *Eleocharis*, South American plants, Arizona plants, etc. Charles E. Bessey.

Brive, or **Brives-la-Gaillarde**, breev'laă-gă'yaard': a town of France; department of Corrèze; situated in a rich plain on the river Corrèze; 44 miles by rail E. of Périgueux (see map of France, ref. 7–E). It has manufactures of muslins, woolen stuffs, silk handkerchiefs, etc.; also a college and public library. Pop. (1896) 18,111.

Brix: See Brüx.

Broach (sometimes written *Baroa'ch*): a district and city in the North Division of Bombay, British India. The district is on the east side of the Gulf of Cambay, and S. of the river Mahi. Area, 1,453 sq. miles, consisting chiefly of the alluvial plain at the mouth of the river Nerbudda. The land is rich and highly cultivated, and though without forests is not destitute of trees. Agriculture is the almost exclusive industry. Pop. 327,000, about three-fourths Hindus. The chief town is Broach, situated on an elevated mound, supposed to be artificial, on the right-hand bank of the Nerbudda, 30 miles from its mouth. It has a considerable trade, and exports annually large quantities of raw cotton. It is probably the *Barygaza* of Ptolemy and Arrian. It first came into British possession in 1772. Pop. 38,000. It has two steam cotton-gins. It has also a Brahminical hospital for sick and disabled animals; even insects are received. On an island near Broach is the largest banyan-tree in India. It is said to have once sheltered an army of 7,000 men. M. W. Harrington.

Broad Arrow: a government mark used as a means of identification upon British Government stores of every description, and so called as being likened to the head of a broad arrow. It is a felony to obliterate or deface this mark; and the unlawful placing of it upon goods involves a penalty of £200 and the forfeiture of the goods. The mark is supposed to be of Celtic origin, and by some identified with a Druidical letter typical of superiority in rank, authority, or holiness, and also believed to have stood for king or prince. It was used as the cognizanee of Henry Viscount Sydney, Earl of Romney, Master-General of Ordnance from 1693 to 1702, and was first used as a government mark in his time.

Broad Mountain: a high ridge in the anthraeite-coal region of Pennsylvania, in Carbon and Schuylkill Counties. It has an altitude of about 2,000 feet above the sea, and is nearly 50 miles long. Its direction is nearly N. E. and S. W. The Mine Hill R. R. crosses this mountain.

Broad River: a river of the U. S., rising at the foot of the Blue Ridge, in the western part of North Carolina. Having entered South Carolina, it flows in a S. S. E. direction through fertile uplands, and unites with the Saluda at Columbia to form the Congaree river. Total length estimated at 150 miles.

Broad Top Mountain: a mountain of Pennsylvania; in the northeast part of Bedford County, and the south part of Huntingdon County. It rises about 2,500 feet above the level of the sea. Here are extensive beds of bituminous coal, for the transportation of which a railroad has been opened from this mountain to Huntingdon.

Broad'us, John Albert, D. D., LL. D.: Baptist educator and author; b. in Culpeper co., Va., Jan. 24, 1827; educated at the University of Virginia; assistant instructor at the University of Virginia; chaplain of the University of Virginia; pastor of churches in Charlottesville, South Carolina, and Kentucky. In 1859 he became professor in the Southern Baptist Theological Seminary, and upon the death of Dr. Boyce was chosen to be president of that institution. D. in Louisville, Ky., Mar. 16, 1895. He published *Preparation and Delivery of Sermons* (Philadelphia, 1870; 23d ed. 1898); *Lectures on Preaching* (New York, 1876); *Commentary on Matthew* (Philadelphia, 1886); *Sermons and Addresses* (1886); and *Jesus of Nazareth* (New York, 1890).

Broca, brō'kaa', Paul: French surgeon and anthropologist; b. at St. Foy-la-Grande, Gironde, June 28, 1824; Professor of Surgical Pathology at Paris; founded the Paris Anthropological Society; Legion of Honor 1868; president International Congress of Anthropology at Paris. 1878; since 1872 published the *Revue d'Anthropologie*. Among his voluminous works are *Sur l'Anesthésie Chirurgicale Hypnotique* (1859); *Études sur les Animaux Ressuscitants* (1860); *Traité des Tumeurs* (1865–69); *Mémoires sur les Caractères physiques de l'Homme Préhistorique* (1869); *L'Anatomie comparée de l'Homme et des Primates* (1869); *Mémoires d'Anthropologie* (1871–88); and *Correspondance* (1886). D. in Paris, July 9, 1880.

Brocade [Span. *brocado*: Ital. *broccata*, embossed material; deriv. of Ital. *brocca*, boss, stud; cf. Eng. *brooch*]: a silk fabric variegated with gold and silver threads, or a silk fabric on which figures of flowers, foliage, or other objects are formed by the threads of the warp and woof being raised by the Jacquard loom or other means. Brocade bears nearly the same relation to silk textures as damask to linen fabrics.

Broca's Convolution: See SPEECH.

Brock, Sir ISAAC: British soldier; b. in the island of Guernsey, Oct. 6, 1769; entered the army and rose by services in the West Indies, Holland, and Denmark to the command of a regiment, which was ordered to Canada in 1802. Here in 1803 he suppressed a threatening mutiny; in 1810 was made Lieutenant-Governor of Upper Canada; and in 1812 captured Detroit from Gen. Hull. He was killed in the battle of Queenstown, Oct. 13, 1812. He was then a major-general. Parliament pensioned his family, and monuments were erected to him in St. Paul's, London, and on Queenstown Heights, which are still standing. His name is perpetuated in that of Brockville, Ontario.

Brocken, The, or **Blocksberg** (anc. *Mons Bructerus*): a mountain of Prussia; province of Saxony; 20 miles W. S. W. of Halberstadt; the highest summit of the Hartz Mountains, and 3,740 feet above the level of the sea. It is cultivated nearly to the top, which commands a fine view in clear weather. The Brocken is the cradle of many popular superstitions. It is, according to an ancient belief, the scene of the annual dance of the witches on Walpurgis night (May 1). This superstition in all probability owes its origin to the phenomenon known as "The Specter of the Brocken," seen here and elsewhere, which is simply the shadow of a man or other object on the fog, best seen at sunrise. The apparent enlargement of the figure is an illusion, and the shadow can be seen only by the one who makes it or some one very close to him.

Brockes, brok'es, BARTHOLD HEINRICH: German poet; b. in Hamburg, Sept. 22, 1680. He was the first poet who turned away from the conventional classicism and dry learning of German poetry during the latter part of the seventeenth century, and who urged, especially in his *Irdisches Vergnügen in Gott* (Hamburg, 1721), a more thorough study and contemplation of nature. D. in Hamburg, Jan. 16, 1747. See Alois Brandl, *B. H. Brockes* (Innsbruck, 1878).

JULIUS GOEBEL.

Brock'ett, LINUS PIERPONT: historical and miscellaneous writer; b. at Canton, Conn., Oct. 16, 1820. He published among other works, a *History of Education* (1859); *History of the Civil War* (1866); *Men of Our Day* (1868); *The Year of Battles* (1871); and *Epidemic and Contagious Diseases* (1873). D. in Brooklyn, Jan. 13, 1893.

Brock'haus, FRIEDRICH ARNOLD: German publisher; b. at Dortmund, May 4, 1772. He was the founder of the firm of Brockhaus in Leipzig, and published six editions of the *Conversations-Lexikon*. He was distinguished for his literary culture, enterprise, and patriotism. He became a citizen of Leipzig in 1817. D. Aug. 20, 1823.—HEINRICH: son of the preceding; b. in Amsterdam, Feb. 4, 1804. He succeeded his father as proprietor of the publishing-house, and published new editions of the *Conversations-Lexikon*. D. in Leipzig, Nov. 15, 1874.—HERMANN: the brother of Heinrich; b. in Amsterdam, Jan. 28, 1806; was educated at Leipzig, Göttingen, and Bonn. He lived for a time in France and England; became professor at Jena in 1839, and at Leipzig in 1841, where in 1848 he was made Professor of Sanskrit Speech and Language, and there he died, Jan. 5, 1877. Among his publications are editions of the *Zendavesta* and the *Vendidâd Sâde*, in Latin (Leipzig, 1850); of the *Kathâ-Sarit-Sâgara*, or collection of fables of Somadeva Bhatta (2d ed. Leipzig, 1866); of the Persian compilation, *The Books of the Seven Wise Masters* (1845); and of a critical edition of the *Songs of Hafis* (1854–60).—HEINRICH EDUARD: b. in Leipzig, Aug. 7, 1829; son of Heinrich; educated at Leipzig, Heidelberg, and Berlin; a member of the Reichstag 1871–78; succeeded his father in 1874 at the head of the publishing-house.—His brother HEINRICH RUDOLF: b. in Leipzig, July 16, 1838; brought up to his father's business; became Eduard's partner. This firm has had in hand since its commencement in 1818 the publication of the enormous *German Encyclopædia of Learning and Art*, of Ersch and Gruber, which in 1888 had reached 168 volumes and was still incomplete.

Brockport: village; Monroe co., N. Y. (for location of county, see map of New York, ref. 4–D); on the N. Y. Cent. R. R., and on the Erie Canal; 17 miles W. of Rochester; is in the heart of a wealthy and populous farming country. Brockport has electric lights, water-works, eight churches, a State normal school, mower and reaper works, flour-mills, shoe-factory, and other manufactories. The manufacture of reapers began here in 1846, and subsequently the first reapers with circular platform and sweep-rake were constructed here. Pop. (1870) 2,817; (1880) 1,971; (1890) 3,742; (1900) 3,398.

EDITOR OF "REPUBLIC."

Brockton: city (formerly North Bridgewater, incorporated in 1874); Plymouth co., Mass.; on the N. Y., N. H. and Hart. Railroad; 20 miles S. of Boston (for location, see map of Massachusetts, ref. 4–J). It is one of the first cities in the county for wealth and population, and is an important trading-center. The manufacture of boots and shoes is the principal industry, there being invested in the various branches of this industry a capital of over $6,500,000, according to the U. S. census report for 1890; furniture, carriages, needles and shoe-tools, paper boxes, candy, etc., are also manufactured. It has a public library. Pop. (1880) 13,608; (1890), 27,294; (1900) 40,063.

EDITOR OF "ENTERPRISE."

Brock'ville: a port of entry of Ontario, Canada; capital of the county of Leeds; on the St. Lawrence river and the Grand Trunk Railway; 125 miles by railway S. W. of Montreal, and 75 miles by railway S. of Ottawa (see map of Ontario, ref. 3–H). Hardware, chemicals, white lead, gloves, farming tools, steam-engines, and machinery are manufactured here. It is the southern terminus of the Brockville and Ottawa Railway. Pop. of district, 13,000.

Brockway, HOWARD: See the Appendix.

Brockway, ZEBULON REED: penologist; b. in Lyme, New London co., Conn., Apr. 28, 1827; clerk Connecticut State-prison 1849–50; assistant superintendent, Albany, 1854–61, under Pillsbury; opened Detroit House of Correction and conducted it 1861–73; organized and since 1876 controlled Elmira penitentiary, New York; founder in the U. S. of indeterminate sentence and penal-reform methods; has written much for the magazines on penological questions, and is author of numerous papers in the *Proceedings* of the National Prison Association of the U. S.

Broderick, DAVID COLBRETH: U. S. Senator from California; b. in Washington, D. C., Feb. 4, 1820; educated in New York city; apprenticed to a stone-cutter; defeated as candidate for Congress in 1846; removed to California in 1849; served as U. S. Senator from California from 1857 to his death; fought a duel with Judge D. S. Terry, of the State Supreme Court, and was killed, near Lake Merced, Sept. 16, 1859.

Brod'head: Green co., Wis. (for location of county, see map of Wisconsin, ref. 7–D); beautifully situated on railroad and on Sugar river; 90 miles W. of Milwaukee; has a large graded school, a foundry, machine-shops, wagon and carriage factories, large flouring-mills, etc., and an extensive trade. The surrounding country is exceedingly fertile. Pop (1880) 1,254; (1890) 1,461; (1900) 1,584.

Brodhead, JOHN ROMEYN, LL. D.: historian; son of Rev. Dr. Jacob Brodhead; b. in Philadelphia, Jan. 2, 1814; graduated at Rutgers College in 1831, and was admitted to the bar in New York city in 1835. After two years he began to devote himself to the study of American history. In 1839 he went to Holland as secretary of the U. S. legation at The Hague. In 1841 he was appointed by Gov. Seward to search out and copy documents relating to the early history of New York. When he returned in 1844 he brought with him more than 5,000 separate documents, which led Mr. Bancroft to say that "the ship in which he returned was more richly freighted with new materials for American history than any that had ever crossed the Atlantic." These documents were afterward published in eleven quarto volumes. From 1846 to 1849 he was secretary of legation under Mr. Bancroft in London. From 1853 to 1857 he was naval officer of the port of New York. Years of patient labor were bestowed upon his *History of the State of New York*, the first volume of which appeared in 1853, and the second in 1871. D. in New York city, May 6, 1873.

Bro'die, Sir BENJAMIN COLLINS, D. C. L., F. R. S.: surgeon; b. in Wiltshire, England, June 9, 1783; became in 1832 surgeon to William IV.; was created a baronet in 1834. Among his works are *Lectures on Local Nervous Affections* (1837) and *Psychological Inquiries as to the Mental Faculties* (1854). He received the Copley medal of the Royal So-

ciety in 1811 for his contributions to physiology. D. near London, Oct. 21, 1862. See his *Autobiography* (1865).

Brod'rick, Hon. George Charles, D. C. L.: edncator; b. in Norfolk, England, May 5, 1831; educated at Eton, at Oxford, and at University of London; called to the bar 1859; member of school board for London 1877; member of governing body of Eton College; warden of Merton College 1881; has published *Political Studies* (1880); *English Land and English Landlords* (1881); *Memorials of Merton College*; and a *History of the University of Oxford*.

Brodsky, Adolph: See the Appendix.

Bro'dy (formerly called **Lubicz**): a trading-town of Austria, in Galicia; near the Russian frontier; 50 miles E. N. E. of Lemberg (see map of Austria-Hungary, ref. 3–L). It has an imperial chamber, a theater, and a castle; also manufactures of linen and leather. The majority of its inhabitants are Jews. Pop. (1890) 17,475.

Broglie, brō'yee', Achille Léonce Victor Charles, Duc de: statesman; b. in Paris, Nov. 28, 1785. He married in 1816 the daughter of Madame de Staël. He was a friend of Guizot, and co-operated with him as a leader of the party called Doctrinaires. He was Minister of Foreign Affairs from Oct., 1832, to Apr., 1834. In 1849 he was a conservative member of the Legislative Assembly. He was elected to the Academy in 1856. D. in Paris, Jan. 25, 1870.

Broglie, Jacques Victor Albert, Duc de: statesman and author; b. in Paris, June 13, 1821. Having kept aloof from public life during the second empire, he was appointed minister to London by M. Thiers in Feb., 1871; became Minister of Foreign Affairs in the MacMahon administration in 1873–74; Minister of Justice in 1877, but his exertions in behalf of the constitutional monarchy ended with the downfall of MacMahon. His principal works are *l'Église et l'Empire romain au quatrième Siècle* (1856, 6 vols.); *La Souveraineté Pontificale et la Liberté* (1861); *Frédéric II. et Marie Thérèse* (1882); *Frédéric II. et Louis XV.* (1885); *Marie Thérèse impératrice* (1887); *Maurice de Saxe et le Marquis d'Argenson* (2 vols., 1891).

Broiling: the process of cooking meat or fish by the direct action of heat over or in front of a clear fire. The food to be cooked is placed upon a gridiron. By this method the albumen on the outside of the food becomes coagulated at the outset, and forms a crust which prevents the juices flowing out.

Broken Bones: See Fracture.

Broken Bow: city; capital of Custer co., Neb. (for location of county, see map of Nebraska, ref. 10–F); is situated in a stock-raising and agricultural region. Pop. (1885) 212; (1890) 1,647; (1900) 1,375.

Broken Breast: a condition occurring in abscess of the breast. See Breast, Abscess of.

Broken Wind: a disease of the horse, the nature of which is not well understood, though it is characterized by difficulty in the act of expiration, the horse making a spasmodic effort to expel the air from the lungs. The symptoms are best observed when the horse is exercised, the breathing becoming labored, the nostrils dilated, the eyes bloodshot, showing imperfect purification of blood in the lungs. A broken-winded horse has a bad hollow cough. When the animal is oppressed by work, the pulse is exeessively rapid and the heart beats energetically. From this circumstance it is regarded by some as a disease of the heart. Low-bred horses are especially liable to broken wind if fed on innutritious and bulky food, and at the same time kept at hard work. The treatment is unsatisfactory, and we can only hope for palliation by keeping the alimentary canal in order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the best hay in spare quantities—10 to 12 lb. daily. The hay should be cut and wet. Fresh grass in its season is the proper food. Dusty hay and dry meal as food should especially be avoided.

Broker [from O. Fr. *brokeor*, *brocheor*, tapster, wine-retailer; deriv. of vb. *brochier*, tap, Eng. *broach*]: in general, a species of agent employed to act as a middleman or negotiator between distinct parties, such as buyer or seller, though this statement would not include a pawnbroker. He differs from a factor, since he does not have possession of the property with which he deals. He is in a certain sense the agent for both parties, though primarily of the party by whom he is employed. Accordingly, until he closes the negotiation he is the agent of the party who employs him. If he were employed to buy, he could not sell his own goods, but must buy of a third person, even though his engagement be gratuitous. Regularly, a broker discloses his agency on the face of the transaction; should he fail to do so, he would, by the general principles of the law of agency, make himself personally liable. When he has closed the negotiation, he usually gives to either party a memorandum of the transaction, and in the case of the sale of goods gives a "bought-and-sold note." For the purpose of complying with the rule of law requiring in certain sales a written memorandum, he is the agent of both parties. A broker is to be distinguished from an auctioneer; a broker may both sell and buy—an auctioneer only sells. A broker buys and sells at private sale—an auctioneer only sells at public sale. His compensation is usually derived from commissions upon the transaction, termed "brokerage." The commission is earned when the negotiation is completed. The real inquiry in such a case is, Did the broker's services result in bringing the buyer and seller together? If that be the case, he will be entitled to his commissions, though the contract, from subsequent causes, was not in fact carried out. On the other hand, if the negotiation failed at the time, and the parties were subsequently brought together by other means, his commissions would not be payable.

In the large cities brokers form a distinct class of persons, devoting themselves to special departments of agency, such as insurance-brokers, stock-brokers, real-estate brokers, produce-brokers, and the like. A person may, however, act as a broker in a single transaction without following the business, and will be governed in the main by the rules already stated. See Agent. T. W. Dwight.

Bro'mal: $C_2HBr_3O = C_2Br_3O.H$; a compound analogous to chloral, produced by the action of bromide on alcohol.

Bromberg, brom'bārch (Polish *Bydgoszcz*): a town of Prussia; province of Posen; on the river Brahe; about 6 miles from its junction with the Vistula, and 65 miles N. E. of Posen (see map of German Empire, ref. 3–I). It is on the railway from Berlin to Dantzig, and on the Bromberg Canal, which connects the Vistula with the Oder. It has a normal school and a gymnasium; also manufactures of linen and woolen fabrics, tobacco, Prussian blue, etc. Here are several distilleries, potteries, and breweries. Pop. (1885) 36,269; (1890) 41,451.

Brome, Richard: English dramatist; at first a servant of Ben Jonson; wrote twenty-four popular plays, fifteen being comedies. The best are *The Northern Lass* and *The Jovial Crew*. His dramatic works were reprinted in 1873. D. about 1652.

Brome-grass: a grass of the genus *Bromus*, which comprises numerous species, natives of both hemispheres. The *Bromus mollis* grows well on poor soils, and is readily eaten by cattle, but is not much esteemed by farmers. The tall brome grass (*Bromus giganteus*), a native of Europe, grows nearly 5 feet high, and affords a large bulk of foliage, not much relished by cattle. The *Bromus secalinus*, commonly called chess or cheat, is a troublesome weed which infests grain-fields both in Europe and the U. S. In the latter it is a naturalized exotic. It resembles rye (*secale*) when it is young, hence the specific name *secalinus*. The seeds retain their power of germinating for years. This weed is so common in wheat-fields that many farmers believe that wheat will turn into chess. *Bromus brizæformis* is grown in gardens for use in dry bouquets.

Brome'lia: a genus of plants of the family *Bromeliaceæ*; named after the Swedish botanist Bromel; natives of tropical America, though many have naturalized themselves in Asia and Africa. The fruit is succulent, and the leaves have spiny serratures on the margins. The genus comprises a number of species, the fibers of which are used for cordage, ropes, nets, etc. Among them are *Bromelia pigna*, which abounds in the Philippine islands, and is cultivated for its fiber by the Chinese; and the *Bromelia pinguis* of the West Indies, from the fruit of which a vinous liquor is prepared.

Bromelia Family (*Bromeliaceæ*): monocotyledonous plants, natives of tropical climates. They have six stamens and a single style, with a three-celled ovary. The leaves are hard, rigid, channeled, and often spiny. Some of the species have beautiful flowers. The order comprises more than 350 species, among which are the pineapple (*Ananas sativus*) and the *Tillandsia usneoides*, which is called Spanish moss

or old man's beard. It grows in the Southern U. S. on forest trees, from the branches of which it hangs down in long gray threads. The fiber of this is used to stuff mattresses. Many of the species are epiphytic, growing on trees, and are capable of vegetating for a long time without contact with the earth, and will flower if suspended in the air after being severed from their roots. The leaves of some are so formed as to retain near their base a quantity of water, and thus supply travelers with refreshment. Many plants of this order afford valuable fibers, which are used in making cordage, cloth, etc. The fiber of the leaves of *Ananas sativus* has been made into a fabric resembling white muslin.

Bromidrosis: See Skin Diseases.

Bro'mine, or **Bro'mium** [from Gr. *βρῶμος*, foul odor]: a chemical element discovered in 1826 by Balard. Its chemical symbol is Br, and atomic weight 80. It resembles chlorine in chemical habitudes, and exists in minute quantity in sea-water and the ashes of marine plants. It is also found in many mineral springs, especially those of Kissingen, Kreuznach, and Arnstadt (13·6 grains per imperial gallon), in Germany, Tenbury in Worcestershire (12½ grains), Saratoga and Ballston, N. Y., and in many brines, especially those of Pennsylvania and West Virginia, and in the waters of the Dead Sea (121 grains). Bromine also occurs as a bromide of silver in the mines of Chili and other countries. It is usually extracted from the mother-liquors or bitterns of brines, or from the purification of rock salt and chloride of potassium by the agency of chlorine or of binoxide of manganese and sulphuric acid. Formerly, most of the bromine was obtained at Schönebeck, Prussia; since the discovery of the Stassfurt deposits larger quantities (260 tons per annum) have been made there. In the U. S. much bromine is made at Tarentum, Sligo, and Natrona, Pa., at Pomeroy, O., Pittsburg, Pa., Syracuse, N. Y., and Kanawha, West Va.; also in Michigan. The total product of the U. S. was estimated at 388,000 lb. for 1890. To obviate the danger attending the transportation of bromine, much of the bromine of Stassfurt is shipped as ethyl bromide, from which it is easily set free.

Bromine is a dark reddish-brown liquid, having a powerful suffocating odor and emitting heavy red fumes. Its specific gravity is 2·976; it boils at 145·4° F., and freezes at 19·4°. It is very poisonous; is soluble in alcohol and ether, slightly so in water. It combines readily with metals; forms hydrobromic acid (HBr) with hydrogen, and with oxygen bromic acid ($HBrO_3$) and hypobromous acid (HBrO), all of which are analogous in their properties to the corresponding compounds of chlorine. Bromine possesses bleaching and disinfecting properties. It is used to a limited extent as a disinfectant, but its most important application is for the manufacture of bromide of potassium (KBr), which is used in medicine and in photography. Bromide of ammonium, cadmium, etc., are also prepared for the latter purpose. Bromine is also used extensively in the manufacture of aniline dyes.

Revised by Ira Remsen.

Bro'moform (or *tribrom-methane*, $CHBr_3$): a compound analogous to chloroform and iodoform. It is a heavy, volatile liquid.

Bromsgrove: a market-town of Worcestershire, England; 16 miles by rail S. W. of Birmingham; in a richly wooded valley; on the Birmingham and Bristol Railway (see map of England, ref. 10–G). It has a fine old church, and a grammar school founded by Edward VI.; also manufactures of buttons and nails. Pop. (1891) 7,934.

Bronchi, brong'kī [pl. of Lat. *bronchus*, from Gr. *βρόγχος*, windpipe]: the divisions of the trachea or windpipe through which the air is conveyed into the lungs. The trachea divides into a right and left bronchus similar in structure to itself. The right is the shorter of the two and is rather larger in caliber than the other. Within the lung the bronchi divide and subdivide, forming minute tubes. These are lined with epithelium of ciliated type, and their walls are composed of fibro-muscular tissue strengthened with rings or plates of cartilage. The terminal bronchi divide into bronchioles, which again open into the alveoli or respiratory part of the lungs.

W. P.

Bronchi'tis [from Gr. *βρόγχος*, trachea + suffix *-itis* (Gr. *-ῖτις*)]: a diseased condition characterized by inflammation or hyperæmia (congestion) of the mucous membrane lining the air-passages, and usually accompanied by a more or less excessive secretion of mucus from that membrane. Young children, old people, and those who are feeble or ill-nourished are especially liable to it. More or less bronchitis is usually associated with pulmonary consumption, with obstructive heart disease, and with asthma. It is often seen in patients with intermittent fever, typhoid, measles, and smallpox. Perhaps the most fruitful cause is exposure to sudden and extreme changes of the weather, leading primarily to that form of acute bronchitis which is known as a "cold on the lungs." Influenza is an epidemic bronchitis, the cause of which is undecided, but is probably some unknown influence existing in the air.

The symptoms of bronchitis are of various character, varying according as the disease is seated in the larger or the smaller bronchi; the disease is also much more formidable in young children and in aged persons than in others. There is especial danger in the case of infants that collapse of small portions of the lung may ensue. Bronchitis may be either chronic or acute. Uncomplicated chronic bronchitis may require the use of sedatives or tonics, with systematic exercise and careful attention to the other hygienic conditions, but the treatment of individual cases will vary with the circumstances and special condition of the patient. The inhalation of medicated vapors and atomized liquids is especially recommended in some cases. Acute bronchitis is in general to be treated by expectorants or emetics, to remove the secretion, and by diaphoretics and counter-irritants, such as mustard, on the extremities and the chest, to relieve the congested blood-vessels of the bronchi. When the case is extreme and suffocation threatened, an infant may be often relieved by a warm bath. There are other special remedial measures which may be resorted to under the advice of the physician.

The diagnosis of bronchitis may be somewhat obscure, but to the practitioner the stethoscope reveals the extent and character of the disease by signs which to the untrained observer might appear insignificant. It may be observed that, except in children and old persons, the great proportion of cases of acute bronchitis recover spontaneously.

Bronchocele, brong'kō-sēēl: See Goitre.

Bröndsted, brön'sted, Peter Oluf: b. at Fruering, Nov. 17, 1780; studied at the University of Copenhagen, then in Paris 1806–08; undertook extensive explorations in Greece and Asia Minor from 1810 to 1813. In the latter year he was made Professor of Philology in Copenhagen, but went in 1819 to Rome, and resided there till 1823, visiting Southern Italy, Sicily, the Ionian islands, and Malta. He spent some time in England and in Paris, 1828–32. Returning to Copenhagen in 1832 as director of the royal numismatical collections and Professor of Archæology, he died there June 26, 1842. His principal work is *Voyages dans la Grèce, accompagnés de recherches archéologiques et suivis d'un aperçu sur toutes les entreprises scientifiques qui ont eu lieu en Grèce depuis Pausanias jusqu'à nos jours* (Paris, 1826–30, 2 parts). He also wrote *Bidrag til den danske Historie af udenlandske Manuscriptsamlinger* (1817–18); *Description of Thirty-two Ancient Greek Painted Vases* (1832); *The Bronzes of Siris* (1836); and finally published a very fine Danish translation of Æschylus's *Agamemnon* (1842), leaving in MS. a version (published 1844) of the rest of the trilogy.

Revised by G. L. Kittredge.

Brongniart, brōñ'ñi-aar', Alexandre: savant: b. in Paris, Feb. 5, 1770. He became in 1800 director of the porcelain manufactory at Sèvres. In 1815 he was admitted into the Institute. He wrote, besides other works, an *Elementary Treatise on Mineralogy* (1807) and a *Treatise on the Art of Pottery* (1845). He classified reptiles, to the divisions of which he gave the names of Saurians, Batrachians, Chelonians, and Ophidians, and laid the foundations of a systematic study of Trilobites. D. in Paris, Oct. 7, 1847.

Bron'te: a town of Sicily; in the province of Catania; near the west base of Mt. Etna; 28 miles N. N. W. of Catania (see map of Italy, ref. 9–F). It has manufactures of paper and woolen goods. Pop. 17,395.

Bron'të, Anne: sister of Charlotte Brontë; b. at Haworth, Yorkshire, England, Mar. 25, 1820; wrote, under the pen-name *Acton Bell*, two novels, *Agnes Grey* (1847) and *The Tenant of Wildfell Hall* (1848), besides a number of poems. D. in Scarborough, May 28, 1849.

Henry A. Beers.

Brontë, Charlotte (*Currer Bell*): novelist; b. at Thornton, in Yorkshire, Apr. 21, 1816. Her eccentric father, Patrick Brontë, originally *Prunty*, became curate of Haworth,

Yorkshire, in 1820. She lost her mother in 1821, and was sent to a boarding-school, where her health was impaired by impure air and unwholesome food; and then taught until in 1842 she and her sister Emily went to Brussels to learn French. In 1846, Charlotte and her sisters, Emily and Anne, published a volume entitled *Poems by Currer, Ellis, and Acton Bell*. Her first successful work was *Jane Eyre, an Autobiography, edited by Currer Bell* (1847), which was very popular. Her other chief works are *Shirley* (1849) and *Villette* (1852). She was married in 1854 to the Rev. A. B. Nichols, her father's curate, and d. Mar. 31, 1855. See E. C. Gaskell's *Life of Charlotte Brontë* (2 vols., 1857), and another life of her by T. W. Reid, 1877.

Brontë, Emily Jane: sister of Charlotte; b. at Thornton, Yorkshire, England, Aug. 20, 1818. Her life was spent at her father's parsonage at Haworth, where she wrote, under the pen-name *Ellis Bell*, her strong but painful novel *Wuthering Heights* (1847), and a number of poems. She is the original of Shirley in Charlotte Brontë's novel of that name. D. in Haworth, Dec. 19, 1848. Henry A. Beers.

Brontotherium: See Titanotherium.

Bronze: an alloy of copper and tin in variable proportions; harder and more fusible than copper, but less malleable. Bell-metal is a variety of bronze, and the cannon commonly called brass are made of this alloy. Bronze was used by the ancients for weapons and utensils before the art of working iron had been invented. The metal which the Romans called *æs* was probably bronze. The brass mentioned in the Bible is supposed to have been either pure copper or an alloy of copper and tin. Bronze is extensively used in statues, machinery, and ordnance. The French and English have issued bronze coins for currency. Tempering produces on bronze an effect directly opposite to that on steel. To render bronze malleable it must be heated to redness and quenched in water. A mixture of 90 parts of copper with 10 of aluminium produces "aluminium bronze," a valuable alloy which is used as a substitute for bronze. "Manganese bronze" contains manganese in substitution for tin, up to 10 and even 20 per cent. Phosphor bronze is any standard bronze fluxed with phosphorus, and usually retains a small proportion of that element. All these alloys are usually stronger and sounder than the pure bronze. The varieties of bronze are composed of the following proportions: Bronze cannon, copper 9, tin 1; Chinese gongs, copper 5, tin 1; musical bells, copper 6, tin 1; house bells, copper 4, tin 1; large bells, copper 3, tin 1; bronze for wheels, copper 10, tin 1; telescope or speculum metal, copper 2, tin 1; mathematical instruments, copper 12, tin 1.

Bronze-brass alloys (*kalchoids*, as the writer has called them) are ternary alloys of copper, tin, and zinc. Their properties were investigated by the writer for the U. S. board appointed to test iron, steel, and other metals, 1875, by special processes devised for the purpose. (See *Report of United States Board*, R. H. Thurston, ed., Washington, 1878–80.) To represent with satisfactory precision, completeness, and intelligibility a series of researches on the character of triple alloys of all desired proportions appeared, at first, a most difficult, if not insolvable, problem. A very satisfactory method was, however, finally devised.

In any triangle, as at A, Fig. 1, let fall perpendiculars upon the three equal sides. The area of the whole triangle B, C, D, is measured by the product of the altitude, C E, by one-half the base, B D. Draw lines A B, A C, A D, to the vertices of the triangle, thus forming three smaller triangles, the sum of which equals, in area, the original triangle. We now have: C E × 1–2 B D = A F × 1–2 B D + A G × 1–2 B C + A H × 1–2 C D; or, the sides of the triangle being equal, C E × 1–2 B D = (A F + A G + A H) 1–2 B D. Hence A F + A G + A H = C E.

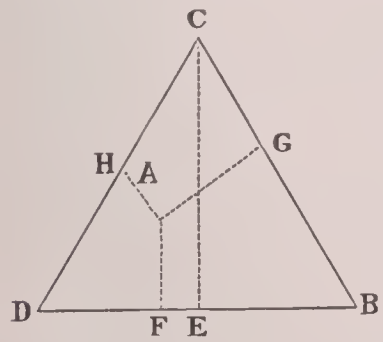


Fig. 1.

But the area of the whole triangle may be conceived to represent a ternary alloy composed of the three components in proportions represented by the areas of the three several small triangles which together make up its total area. But these smaller triangles have areas proportional, as has just been seen, to their altitudes, A F, A G, A H; the proportions in which the three metals are combined to form the given alloy may therefore be measured by the ratio of their representative triangles to the whole triangle in area and in altitude. Then, dividing the height of the large triangle into one hundred equal parts, the altitudes of the small triangles, measured in the same units, will represent the percentages of the three elements in the given alloy.

Every point in the triangle thus represents some certain triple alloy; there is no possible ternary alloy which has not its representative point in the triangle. We now have before us a field which exactly defines our research, and we may attempt its exploration with a clear understanding of what is to be done.

The result of an investigation such as has just been described may be very beautifully exhibited to the eye by making a *model* (Fig. 2) of the surface thus determined. In carrying out these researches the writer found the following plan perfectly satisfactory:

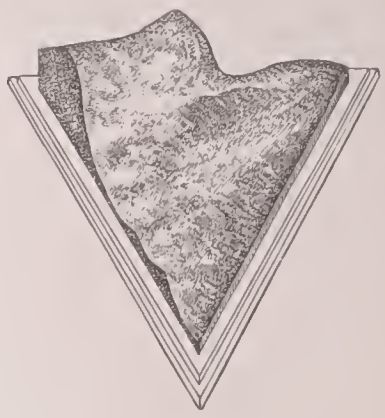

Fig. 2.

Lay out a triangle, as above described, upon a surface of sheet brass. At the points at which determinations have been made erect wires of which the lengths have been made carefully proportional to the ordinates of the representative surface at those points, screwing them firmly, or otherwise fixing them, in their places. When all the wires are in place and are found to be of the exact length required, place bits of board along the outside to form the boundaries of the triangle, and pour in plaster-of-Paris until the wires are all covered. When the plaster has set, remove the boards and carefully cut away the upper part of the plaster, working carefully down to the tops of the wires, just exposing their points. The surface thus produced is a model of the strength, or other quality represented, of all the alloys.

Similarly a model may be made to represent any other quality, as elasticity, ductility, malleability, resilience, or the total. (*New Plan of Representing Researches*, etc., R. H. Thurston, Proc. Am. Assoc. for Advancement of Science, 1887, vol. xxvi.)

The result of this investigation was the determination of the tenacities and other properties of all possible alloys of copper and zinc, copper and tin, and copper, zinc, and tin, and of the discovery of the existence and the location of a "maximum alloy," represented by the highest point on the model, of the highest tenacity attainable in this system of alloys; which alloy contains about 55 parts copper, 43 zinc, and 2 of tin, and has a tenacity of from 70,000 to 85,000 lb. per square inch (4,850 to 5,500 kilog. per square centimeter), according as it is well or badly fluxed. If t and z are the percentages of zinc and of tin, the alloys should have not less than the following tenacities in pounds on the square inch. (*Materials of Engineering*, R. H. Thurston, vol. iii., art. 255.)

For bronze, in British and metric measures, respectively:

$$T = 30{,}000 + 1{,}000\ t.$$
$$T_m = 2{,}100 + 70\ t, \text{ nearly.}$$

For brass:

$$T = 30{,}000 + 500\ z.$$
$$T_m = 2{,}100 + 35\ z, \text{ nearly.}$$

The best alloys in this respect have a composition—

$$Z + 3t = 55, \text{ nearly,}$$

and their tenacity is not far from

$$T = 40{,}000 + 500\ z.$$
$$T_m = 2{,}800 + 35\ z, \text{ nearly,}$$

when the proportion of tin exceeds about 1 per cent. The strongest alloys are deficient in ductility, however, as a rule, and lie on the margin of a field of *gray* alloys, in which all are too brittle for common use in the arts. With phosphorus used as a flux, the writer found it possible to secure tenacities, for alloys from copper 100, to $4t + z = 50$,

$$T = 60{,}000 + 1{,}000\ t + 500\ z.$$
$$T_m = 4{,}200 + 70\ t + 35\ z, \text{ nearly.}$$

Many exceptionally strong alloys are now known to fall into this class, or nearly so: as Farquharson's, copper 37, tin 1; British naval bronze, copper 87·65, tin 8·32, zinc 4·03; Tobin's alloys, used by the U. S. Navy Department, copper 58·22, tin 2·30, zinc 39·48, the atomic proportions of these elements. These alloys have tenacities ranging up to 70,000 lb. per

square inch, will work well either hot or cold, can be forged and rolled and make good castings. Cold-rolling increases tenacity greatly, while reducing their ductility and resilience, and this process was employed by Dean in the production of bronze ordnance, and also later by Uchatius for the Austrian army. R. H. Thurston.

Bronze, Age of: It is held by some archæologists that, when primeval man began to become civilized, the first weapons of war and utensils for industry were made of stone; that in the next stage of progress (in most nations before the beginning of history) there succeeded a time when copper and its alloys were used in the place of stone for many purposes, as is known to have been true among the Peruvians, and also among some of the ancient races of North America; and that in the third stage men learned how to smelt and work iron. Hence these three hypothetical stages are respectively termed the Age of Stone, the Age of Bronze, and the Age of Iron. These terms are convenient, though it is certain that the so-called ages interpenetrated and overlapped each other. In Denmark and Scandinavia especially there have been interesting and extensive collections made of the relics of the Age of Bronze, and it appears certain that a large part of these curious weapons and tools (which are in many cases finely wrought) were made in prehistoric times; nevertheless there are many able men who deny that the facts, so far as known, sustain the above-mentioned theory of the origin of civilization.

Bronzed Skin: See Addison's Disease.

Bronze-wing, or **Bronze-pigeon**: one of several species of pigeons; natives of Australia; mostly belonging to the genus *Phaps*. They have the wing coverts marked with lustrous bronze-colored spots. The common bronze-wing (*Phaps chalcoptera*) is distributed over all the Australian colonies. It weighs about 1 lb., and is esteemed as food.

Bronzing: the covering of articles made of clay, metal, wood, or other material with a substance which gives them the appearance of being made of bronze. Sometimes bronze or some other alloy of copper is actually spread upon the articles to be bronzed, which may be done by the electrotype process, or by applying the powdered alloy by means of *gold size*, which is a mixture of linseed-oil and gum animé. There are also certain chemical reagents which when applied to various metals will give them a bronzed appearance.

Brooke, Gustavus Vaughan: tragedian; b. in Dublin, Ireland, Apr. 25, 1818; was educated for the law; went upon the stage in 1833; attained eminence as a tragedian, playing with success in the principal cities of Great Britain and the U. S. He was lost on the steamer London while on a voyage to Australia, Jan. 11, 1866.

Brooke, Henry: dramatist and novelist; b. in the County of Cavan, Ireland, in 1703; educated at Trinity College, Dublin; was a friend of Pope. He wrote, besides other works, *Universal Beauty*, a poem; tragedies entitled the *Earl of Essex*; *Gustavus Vasa* (1739), which was produced in Ireland as *The Patriot*; and a novel called *The Fool of Quality*, of which an edition appeared in 1859, with encomiums from Charles Kingsley for its permanence of pure and elevating thought. D. in Dublin, Oct. 10, 1783.

Brooke, Sir James: Rajah of Sarawak; b. of English parents in Benares, India, Apr. 29, 1803; educated in Norwich. He served in the Burmese war of 1825, and was badly wounded; inherited from his father in 1835 an estate of $150,000; formed a project to suppress piracy in the Malay archipelago; went to Borneo in 1838. He rendered some service to the Sultan of Borneo, who in 1841 appointed him governor of Sarawak. He framed a code of laws for the natives of Sarawak, and displayed great energy in the extirpation of pirates. His coadjutors received £20,000 as head-money for the pirates whom they killed, but on parliamentary investigation he was exonerated from profiting by the bloody business. From 1848 to 1857 he was British governor and consul-general in the island of Labuan. In the latter year he repulsed a desperate attack of Chinese on his estates, and drove them from Borneo, and he lived to achieve the independence of Sarawak. In 1847 he was created a knight by Queen Victoria. D. at Burrator, Devonshire, England, June 11, 1868. See St. John's *Life of Sir James Brooke* (1879).

Brooke, John R.: See the Appendix.

Brooke, Stopford Augustus: clergyman and author; b. at Letterkenny, Ireland, Nov. 14, 1832; was educated at Trinity College, Dublin; held various London livings in the Church of England, becoming in 1872 a queen's chaplain; in 1880 he became a Unitarian because he had ceased to believe in a miraculous incarnation; officiates in Bedford chapel, Bloomsbury, London. He is the author of many volumes of sermons, mostly promulgating advanced Broad Church views, besides *Poems* (1888); *Theology in the English Poets* (1847); a very popular primer, *History of English Literature* (1876); *The Early Life of Jesus*; and the best edition yet extant of *The Life and Letters of Frederick W. Robertson* (1865). Henry A. Beers.

Brook Farm: a community established in West Roxbury, Mass., in 1841, as an experiment in "plain living and high thinking." The articles of association provided that the name and style of the community should be the "Brook Farm Institute of Agriculture and Education," and defined its object to be the establishment of an "agricultural, literary, and scientific school or college." The head of the community was George Ripley, formerly a Unitarian minister in Boston, who had been in 1836 one of the founders of the Transcendental Club, with Emerson, Hedge, Alcott, and others; and in 1840 had established the transcendentalist organ, *The Dial*, in connection with Emerson and Margaret Fuller. Associated with Ripley in the Brook Farm enterprise were Nathaniel Hawthorne, Charles A. Dana, John S. Dwight, and other well-known men. They bought a farm comprising some 200 acres, about 9 miles from the city of Boston. Several trades besides agriculture were carried on, and a number of children were received as pupils, instruction being furnished in ancient and modern languages, history, mathematics, moral philosophy, music, drawing, etc. It was designed to substitute co-operation for selfish competition, and to dignify bodily labor by uniting it with the intellectual and spiritual life. The community was at first organized as a joint-stock company, each subscriber being guaranteed 5 per cent. per annum on his shares. In 1844, mainly owing to the influence of Albert Brisbane, it was reorganized on a Fourieristic plan, as a "phalanstery," and incorporated in 1845 under the title of the "Brook Farm Phalanx." In the latter year the phalanstery building, an uncompleted wooden structure designed to lodge the entire community, was burned; and in 1847 the experiment, having proved a failure financially, was given up.

Life at Brook Farm, especially during the first years of enthusiasm, had idyllic and romantic aspects, of which Hawthorne availed himself in his *Blithedale Romance*. In its palmiest state the community, including school children and boarders, numbered about 150 souls. Kitchen and table were in common; very little help was hired, but philosophers, clergymen, and poets worked at the humblest tasks, milking cows, pitching manure, cleaning stables, etc., while cultivated women cooked, washed, ironed, and waited at table. All work, manual or intellectual, was credited to members at a uniform rate of ten cents an hour. Among many persons of note who took an interest in Brook Farm, and were frequent visitors though not residents there, were Emerson, Theodore Parker, Margaret Fuller, Bronson Alcott, Orestes A. Brownson, Rev. W. H. Channing, and Christopher P. Cranch. The *Harbinger*, a weekly journal devoted to the principle of association, was issued from Brook Farm from 1845 to 1847, and, after the break up of the community, transferred to New York. It numbered among its contributors, exclusive of Brook Farmers, writers like Lowell, Whittier, Greeley, Higginson, Story, and Curtis. See Hawthorne's *American Note-books*; O. B. Frothingham's *Life of George Ripley*; T. W. Higginson's *Life of Margaret Fuller*; the *Atlantic Monthly* for Oct., 1878; and *Old and New* for Feb., Apr., and Sept., 1871, and May, 1872.

Henry A. Beers.

Brookfield: town; on railroad; Linn co., Mo. (for location of county, see map of Missouri, ref. 2–F); is the central station and division headquarters of the Hannibal and St. Joseph R. R. Several of its offices, its round-house, and extensive shops are located here. There is a coal mine near the town. Pop. (1880) 2,264; (1890) 4,547; (1900) 5,484.

Brookhaven: city; capital of Lincoln co., Miss. (for location of county, see map of Mississippi, ref. 8–F); situated at junction of Ill. Cent. and Mer., Brookhaven and Natchez R. Rs., 54 miles S. by W. of Jackson. The city has 9 churches, a fine public school, and is the seat of Whitworth Female College, one of the most flourishing institutions of learning in the South; it has a foundry, machine-shops, and 2 planing-mills. The principal industries of the surround-

ing country are lumbering and agriculture, and Brookhaven is an important trading-center for the products, about 13,000 bales of cotton being marketed annually. Pop. (1880) 1,615; (1890) 2,142; (1893) with suburbs, about 3,000.

Brookings: city; capital of Brookings co., S. D. (for location of county, see map of South Dakota, ref. 6–G); on Chicago and N. W. R. R.; in the fertile Sioux valley. Here are South Dakota Agricultural College and U. S. Agricultural Experiment Station, large flouring-mill, large tow-mill, five churches, commodious school building, electric lights, and water-works. Pop. (1890) 1,518; (1900) 2,346.

Brookite: a mineral named in honor of Brooke, the crystallographer; pure native titanic anhydride. It occurs in reddish, yellowish, or hair-brown crystals, which are more or less translucent, and have a brilliant luster, inclining to metallic. It is found in Perthshire, Scotland, at Tavistock, in Savoy, and other places, A variety found in the Ozark Mountains, Arkansas, is called *arkansite*.

Brooklime (*Veronica beccabunga*): a perennial plant; native of Europe; grows in ditches and wet places. It has a procumbent stem and elliptical serrate leaves, which are succulent, and are used in England as an ingredient in spring salads. In the U. S. is found a similar plant, the *Veronica americana*, or American brooklime.

Brookline: a township in Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); on the Charles river, which separates it from Boston and Cambridge. It is connected with Boston by steam and street railways, and is almost wholly a place of residence. It has many fine villas and country seats, and, with its meandering and well-kept streets winding among lawns and terraced grounds, under fine old trees and amid ornamental shrubbery, presents the appearance of a park. A small part of this township has been annexed to Boston since the census of 1870. Brookline has a public library building costing $50,000, and a granite town-house costing $150,000. Pop. (1880) 8,057; (1890) 12,103; (1900) 19,935.

Brooklyn: city (formally laid out in 1855); Poweshiek co., Ia. (for location of county, see map of Iowa, ref. 5–I); on Ch., Rk. I. and Pac. R. R.; 72 miles E. of Des Moines, 104 miles W. of Davenport. It has graded schools, six churches, several grain elevators, and a flour-mill, and is a division station of the Ch., Rk. I. and Pac. R. R. The surrounding country is rich farming land. Pop. (1890) 1,202; (1900) 1,188.

Brooklyn: formerly a city, now a borough of New York city and the county-seat of Kings county; on the west end of Long Island; bounded by the East river (an estuary separating Long Island from Manhattan Island and connecting Long Island Sound with New York Bay), New York Bay, Buttermilk Channel, the Atlantic Ocean, Jamaica Bay, and the borough of Queens; lat. (at Navy-yard) 40° 51′ 30″ N., lon. 73° 59′ 30″ W. of Greenwich. Toward the East river and the ocean the ground is flat, but from New York Bay it rises with a steep grade to a ridge that extends eastward through the island. The highest altitude (202 feet) is reached at Prospect reservoir. The borough of Brooklyn, by surveys taken in 1899 and 1900, has an area of 77.62 sq. miles, which include the swamp lands in and about Jamaica Bay. In political divisions it has 32 wards, 21 assembly districts, 7 senatorial districts, and 6 congressional districts. It has 33 miles of water frontage, 713 miles of streets, of which 553 miles are paved. Brooklyn is an aggregation of villages that have gradually coalesced and therefore, as a whole, lack unity of design. The streets and avenues are broad and cross each other at right angles, except along the boundaries of the original villages. Fulton Street, the main business thoroughfare, was the old country road by which Long Island farmers made their way to the ferries of the East river to market their produce. The street was built up along the lines of the old road, which accounts for its many curves and turns. Miles of retail establishments, many unsurpassed in size and appointments by any in the country, line Fulton Street, Broadway, and Myrtle and Fifth Avenues.

The borough is supplied with water from ponds, streams, and driven wells on Long Island, the principal system covering a drainage area of 60¼ sq. miles. In the main system the water is pumped into the reservoir at Ridgewood, and thence distributed through mains, which, Jan. 1, 1901, aggregated 597 miles. In addition to the Ridgewood plant there are four other water plants: the Flatbush water works, owned by a private company, supplying the Twenty-ninth ward, and the New Lots, Gravesend, and New Utrecht plants, formerly private companies, but now owned by New York city. The average daily consumption of water in Brooklyn in 1900 was more than 104,400,000 gallons. The cost of the Ridgewood system was $18,386,662.

Parks.—The park system of Brooklyn consists of 36 parks, with a combined area of 1,566½ acres, and 22 parkways, 42½ miles in length. In addition there are 2 bicycle paths, each 5½ miles long, exclusively devoted to bicycle riders. The principal park is Prospect; area, 516½ acres; original cost of land (1866), $3,919,370; present value (1901), $27,735,000. It is on the highest ground in the city, and includes 110 acres of woodland, 77 acres of lakes and watercourses, 70 acres of meadows, 259⅙ acres of plantations, 8¾ miles of drives, 3 1/10 miles of bridle-roads, and 10¾ miles of walks. More than 25,000,000 visitors, it is estimated, visited the park in 1900. Fort Greene Park, 30 acres of beautiful grounds, is less than half a mile from the Borough Hall. Here 11,000 victims of the Revolutionary War prison ships are entombed. The last burial took place June 16, 1900, when the bones of the prison ship martyrs were removed from the Navy-yard to a specially constructed vault in Fort Greene. The largest park is Brooklyn Forest Park, a woodland at the boundary of Brooklyn and Queens boroughs; area, 536 acres; cost, $1,150,000. It is as yet undeveloped, with the exception of roadways. Public golf links are located at Sunset Park, Fifth Avenue and Forty-second Street. The administration of the park systems of Brooklyn and Queens is under a park commissioner appointed by the mayor of New York city.

Monuments.—The Soldiers and Sailors' Memorial Arch on Prospect Park Plaza, dedicated in 1892, is of white marble; the bas reliefs are by Maurice J. Power. In 1898 it was further adorned by a bronze group, called the Quadriga, designed by Frederick Macmonnies, and in 1900 by two more groups, one representing the Army and the other the Navy. In Prospect Park are the following bronze figures: J. S. T. Stranahan, busts of John Howard Payne, Thomas Moore, Washington Irving, Beethoven, and Mozart. A bronze statue of Major-Gen. Gouverneur Kemble Warren, in Prospect Park Plaza, was unveiled July 4, 1896. The bronze statue of Abraham Lincoln, dedicated Oct. 21, 1869, was removed from the Park Plaza in 1895, and placed in the flower garden overlooking Prospect Park lake. A statue of Gen. Grant is on Bedford Avenue near Dean Street, and one of Henry Ward Beecher stands in front of the Borough Hall.

Cemeteries.—Six cemeteries lie wholly or partly in Brooklyn, and others are just beyond the borough boundary in Queens. Greenwood, southwest of Prospect Park, has an area of 474 acres, and is widely known for the beauty of its ground and monuments. The burials, up to Oct. 1, 1900, numbered 309,000, and the yearly average is 4,784. Evergreens, in the northeast corner of the city, covers 375 acres, and on Oct. 1, 1900, contained the remains of 167,300 dead. Other cemeteries within Brooklyn's boundaries are Holy Cross, Twentieth ward, 60 acres with (Oct. 1, 1900) 246,190 interments; Kings County Farm (Potter's Field), 14 acres, contains the remains of 22,818 poor and unknown dead; Maimonides Cemetery, 7½ acres; Mount Hope, 12 acres; Washington Cemetery, on Ocean Parkway, contains 32,000 dead.

Transportation.—The borough is intersected with surface and elevated railroads. The first horse-car began to run July 4, 1854. The entire system is now controlled by two companies, and is operated by electricity. The total length of transportation lines, Feb. 1, 1901, was 549.7 miles, and the total number of passengers carried in the year ending June 30, 1900, was 324,898,232.

The first ferry between Manhattan and Long Island was established in 1642, about where Fulton Ferry now is. The first steam ferry was opened May 10, 1814. There are now (1901) fifteen ferries from different points in Brooklyn to Manhattan and Jersey City, and they are controlled by seven companies.

The New York and Brooklyn Bridge.—A suspension bridge over the East river, connecting Brooklyn and Manhattan boroughs. The plans and estimates were made by John A. Roebling, who was its chief engineer till his death in 1869. Washington A. Roebling, his son, succeeded him and completed the structure. Work was commenced Jan. 2, 1870. The first wire was run out May 29, 1877, and the bridge was opened to the public May 24, 1883. The bridge railroad was opened Sept. 24, 1883. Total length,

with extensions, is 6,537 feet. It has two granite towers, 278 feet high, one on either shore. The horizontal section of these towers at high water mark is 140 by 59 feet; at the top, 136 by 53 feet. The depth of the tower foundations below high water is, on the Manhattan side, 78 feet, and on the Brooklyn side 45 feet. The length of the river span is 1,595½ feet. The bridge is supported by four great cables, and by many stays extending from the towers. Each of the cables contains 5,296 parallel galvanized steel, oil-coated wires, closely bound up into a solid cable, 15¾ inches in diameter. Each wire is 3,578 feet long. The clear height of the bridge above high water is 135 feet in the middle of the river span, and at the towers 119¼ feet. The bridge is 85 feet wide, and contains 5 parallel avenues. The central avenue, 15½ feet wide, is for foot passengers, those on either side of the footway are for passenger cars; the motive power was formerly supplied by a cable 11,600 feet long, but the third-rail electric system has been placed on the bridge, and is now used almost exclusive of the cables. The outermost avenues, each 19 feet wide, are for vehicles. The permanent weight suspended from the cables is 14,680 tons. The original cost of construction was $15,000,000. In 1897 the Legislature empowered the trustees to enter into contracts with Brooklyn railroads to operate their lines over the bridge, and the first trolley car crossed it Dec. 31, 1897. The bridge railway was leased to the Elevated Railroads on July 1, 1898. The total number of passengers carried on the bridge railway up to July 1, 1898, was 500,147,723. Since the leasing of the railroad and the operation of trolley cars across the bridge, no record has been kept of the number of passengers crossing. The total receipts of the bridge, from May 23, 1883, to Dec. 1, 1900, were $18,532,169.50, and the expenditures for the same period were $18,688,639.68. For the new EAST RIVER BRIDGE, see BRIDGE.

Buildings.—Among the principal buildings are the Borough Hall, Court-house, Municipal Building, Hall of Records, Federal Building, Academy of Music, Academy of Design, Brooklyn Library, Eagle Building, Long Island Historical Library, Brooklyn and Dime Savings Bank, Mechanisc Bank, Temple Bar Building, Polytechnic, Packer, Pratt, and Berkeley Institutes, and many large commercial buildings.

Churches.—On Jan. 1, 1901, Brooklyn had 382 Protestant and Jewish churches, with a membership of 131,178, and 145,473 Sunday-school children. In 1900 these churches raised for all purposes $2,362,210. They have a total indebtedness of $1,863,700, and own property valued at $169,923,681. The total number of sittings in Protestant churches and chapels is 294,648. There are 84 Roman Catholic churches, with 307,975 parishioners, 47,426 Sunday-school children, and 31,087 parochial-school children. This denomination owns property to the value of $10,086,000, indebted to the extent of $1,342,859. The total seating capacity in Catholic churches is 37,284. There are 75 religious societies and Young Men's Christian Associations, besides church societies, 100 city missionaries, 31 missions, 10 Chinese missions, 41 church sewing and industrial schools, 19 church kindergartens, and 19 free church reading-rooms.

Education.—The public schools consist of 6 high schools, a training-school for teachers, 122 day and 16 evening schools, 10 industrial and asylum schools, and a truant school. There are 5 private institutions of high order, viz., the Polytechnic, Packer, Pratt, and Berkeley Institutes, and the Adelphi Academy and College. There are also 2 Roman Catholic colleges, a college of pharmacy, 2 medical colleges, 7 business colleges, and 48 private schools and academies. There are 23 libraries, having an aggregate of more than 480,000 volumes, of which 208,445 volumes are also in free circulation. There is a Museum of Natural History, Antiquities, and Mechanical Arts; a Museum of Arts and Sciences, 10 local and 2 post-graduate Chautauqua societies, and 14 art associations and societies.

Clubs and Societies.—There are 82 social clubs, maintaining club-houses or club-rooms: 306 miscellaneous societies, and 145 political clubs, besides hundreds of lodges, posts, etc., of the various fraternal societies.

Newspapers.—Brooklyn has 5 dailies, 1 semi-weekly, 2 semi-monthlies, 13 monthlies, and 3 quarterlies.

Charitable Institutions.—Brooklyn has 4 hospitals, supported entirely by the State and city, and a U. S. Naval Hospital, supported by the Government. There are also 27 hospitals, supported mainly by private subscription, 23 dispensaries, 5 training-schools for nurses, 9 societies organized to aid in hospital work, 2 private hospitals, 13 homes for the aged, 36 homes and societies for the relief of children, 5 truant homes, 32 homes and societies for special relief, and 18 organizations for extending temporary relief. The Bureau of Charities maintains 16 industrial agencies throughout the borough. In addition, there are 18 societies offering miscellaneous relief. About $1,000,000 was appropriated by the city in 1900 toward defraying expenses of charitable organizations in Brooklyn.

Finances, Banks, etc.—The amount of the debt of Brooklyn, as contracted before consolidation with New York and outstanding on December 1, 1900, was $63,126,274.10; and the county debt amounted to $13,767,392.83. The assessed valuation of real estate in 1900 was $651,408,500, of personal property $43,937,440. The assessment of Brooklyn banks in 1900 was $3,657,191. In addition to the amount for general administration of New York city government, there was appropriated for running Brooklyn departments in 1900, $2,613,663.46, and for county and State purposes $2,665,936.72. The tax rate in Brooklyn was $2.32 per $100 in 1900. There are 15 State, 5 national, and 16 savings banks, 10 trust companies, 5 title guarantee, 8 safe deposit, 5 fire insurance, and 7 illuminating companies, also 36 building and loan associations, with assets amounting to $8,844,768, and loans on bonds and mortgages amounting to $7,565,928.

Courts.—U. S. circuit and district courts, and circuit court of appeals; special, trial, and appellate division of Supreme Court of New York State; county and surrogate courts; court of special sessions of the second division of the city of New York; 5 municipal courts, and 8 city magistrate courts, fulfill the duties of the police courts that prevailed before consolidation.

Manufactures.—According to the 14th annual report of the State Factory Inspector, for the year ending Nov. 30, 1899, 1,070 firms were engaged in the manufacture of clothing and garments, and 2,112 in the manufacture of other products. Nearly every industry is represented.

Commerce.—Though pre-eminently a city of homes for men doing business in New York, Brooklyn has developed an extensive commerce. The wharves and docks of the city have a water frontage of more than 25 miles, lined with great storehouses and elevators, and represent an investment of hundreds of millions of dollars. Ninety per cent of the coffee and sugar imported into the U. S. is received there. Thirty-three regular lines of steamships, and a great number of "tramp" steamers and sailing vessels, dock in Brooklyn. Along the water front are also extensive basins, one covering 40 acres and accommodating 500 vessels at one time, shipyards, dry docks, and marine railways. Here also is the Brooklyn Navy-yard, the most important station in the U. S., where four-fifths of the stores for the entire navy are handled, and war-ships repaired and fitted for sea service.

The United States census taken in 1900 shows the population of Brooklyn to be 1,166,582. The annexation of Gravesend brought into Brooklyn's limits all the beach hotels and the shore resorts on Coney Island, and the race-courses of the Coney Island and the Brooklyn Jockey Clubs and of the Brighton Beach Racing Association. The government of the city was vested in a board of aldermen, called the common council, the majority of whose members were elected in aldermanic districts and the remainder from the city at large; terms of all members were two years. The administrative power was vested in the mayor and heads of departments, all of whom (except those of the department of finance, audit, and public instruction) were appointed by the mayor. For the new borough government, see NEW YORK, in the Appendix. Over the ground now occupied by the borough of Brooklyn, on Aug. 7, 1776, was fought the first great battle of the Revolution after the Declaration of Independence, the battle of Long Island.

Revised by BENJAMIN T. BUTTERWORTH, JR.

Brooks, CHARLES WILLIAM SHIRLEY: journalist, lecturer, dramatist, and novelist; b. in London, England, Apr. 29, 1816; became a newspaper reporter and writer; was sent by the *Morning Chronicle* to the East to report on the condition of labor, and produced the *Russians of the South* (1856). He produced the dramas *The Creole*, *Our New Governess*, etc. Among his novels are *Aspen Court* (1857); *Gordian Knot* (1860); *The Silver Cord* (1861); and *Sooner or Later* (1868). He became connected with *Punch* in 1851, and on the death of Mark Lemon in 1870 succeeded him as editor. D. in London, Feb. 23, 1874.

The Approach to the East River Bridge—(New York side).

Brooks, Charles Timothy: Unitarian minister and poet; b. at Salem, Mass., June 20, 1813; graduated at Harvard in 1832, and was pastor at Newport, R. I., from 1837 to 1873. He translated *Faust*, *Hesperus*, *Titan*, and many small poems from the German. His *Poems*, *Original and Translated*, were published with a memoir by Charles W. Wendte (Boston, 1885). D. in Newport, R. I., June 14, 1883.

Brooks, Elbridge Gerry, D. D.: b. at Dover, N. H., July 29, 1816; studied law (1833–35) with Chief Justice Tenney of Maine; began preaching in 1836; became Universalist pastor in West Amesbury, Mass., 1837, East Cambridge 1838, Lowell 1845, and Lynn, Mass., 1850, New York city 1859, resigned 1867. Philadelphia, Pa., 1868. He was general secretary of the Universalist general convention 1867–68. D. in Philadelphia, Pa., April 8, 1878. See his *Life* by E. S. Brooks (Boston, 1888).

Brooks, Erastus: journalist; b. at Portland, Me., Jan. 31, 1815; educated at Brown University; was the coadjutor and partner of his brother James (*q. v.*) on the *New York Express*, and its proprietor until 1877; State Senator 1853–57, becoming involved in a controversy with Archbishop Hughes on account of his efforts to divest Roman Catholic bishops of the power to hold real estate in trust for the Church; Assemblyman and Democratic leader 1878–79 and 1881. D. Nov. 25, 1886.

Brooks, James: editor and politician; b. in Portland, Me., Nov. 10, 1810; graduated at Waterville in 1831. He was educated by his own industry. He studied law with John Neal the novelist; taught school, and at the same time engaged in political journalism. When twenty-one years of age he was elected to the State Legislature, and in the following year became a newspaper correspondent at Washington. He afterward traveled in the South and in Europe. In 1836 he established the *New York Express*. He was a member of Congress 1849–53, 1865–67, his seat being at last successfully contested by Hon. W. E. Dodge, and 1869–73. He was one of the leaders of the Knownothing party, and during the war a peace Democrat; was censured in Congress for participation in the Crédit Mobilier corrupt practices. D. in Washington, Apr. 30, 1873.

Brooks, John, M. D., LL. D.: b. in Medford, Mass., May 31, 1752; practiced medicine at Reading; fought with the greatest honor as an officer at Lexington, White Plains, Saratoga, Monmouth, etc., becoming a colonel and adjutant-general. He practiced medicine at Medford, Mass., after the war, and was a member of the State convention which adopted the Federal Constitution. He was Governor of Massachusetts (1816–23), and president of the Massachusetts Medical Society (1817–25). D. Mar. 1, 1825.

Brooks, Kendall, D. D.: b. in Roxbury, Mass., Sept. 3, 1821; graduated at Brown University 1841; Newton Theological Institute 1845; tutor in Columbian College 1841–43; pastor of the Baptist church at Eastport, Me., 1845–52; Professor of Mathematics and Natural Philosophy in Waterville College 1852–55; pastor at Fitchburg, Mass., 1855–65; editor of the *National Baptist*, Philadelphia, 1865–68; and president of Kalamazoo College, Michigan, 1868–87.

Brooks, Maria Gowen: poet; b. in Medford, Mass., about 1795. She was married young to a Mr. Brooks, a merchant of Boston. Her chief work is *Zophiel, or the Bride of Seven*, the first canto of which was published in 1825, and the complete poem in London in 1833, under the supervision of Robert Southey, who gave the author the sobriquet Maria del Occidente (Maria of the West). D. at Matanzas, Cuba, Nov. 11, 1845.

Brooks, Noah: journalist and author; b. at Castine, Me., Oct. 30, 1830. He has been engaged in newspaper work since 1850, first in Boston, afterward in California, Washington, and New York, where he was one of the editorial staff of the *Tribune* and the *Times*. In 1884–1893 he edited the *Daily Advertiser* of Newark, N. J. He has published a *Life of Abraham Lincoln* (1888) and a number of books for boys, such as *The Boy Emigrants* (1876) and *The Fairport Nine* (1881).

Henry A. Beers.

Brooks, Phillips, D. D., Oxon.: author, preacher, and Bishop of Massachusetts; b. in Boston, Dec. 13, 1835; graduated at Harvard in 1855. He studied in the Episcopal Theological Seminary at Alexandria, Va.; was ordained in 1859; became the same year rector of the Church of the Advent in Philadelphia, and in 1862 of the Church of the Holy Trinity, where he remained until 1869, when he accepted the rectorship of Trinity church in Boston. In 1886 he was elected in Philadelphia assistant bishop in Pennsylvania, but declined the office. Elected Bishop of Massachusetts on Apr. 30, 1891, he accepted the appointment, and was consecrated in his own church Oct. 14 of the same year. He published five volumes of sermons; *Lectures on Preaching*, delivered before the Divinity School of Yale College; several orations, short poems, carols, etc., all of which have been issued in repeated editions. He was a Broad Churchman, and was regarded in England and the U. S. as the greatest preacher of his Church. He was a man of noble stature, rapid in utterance, averse to polemics, but a great spiritual leader. D. in Boston, Mass., Jan. 23, 1893. A statue of Bishop Brooks is to be erected in Copley Square, Boston, overlooking the scenes of his rectorate at Trinity church. Three of Bishop Brooks's brothers entered the Episcopal Church ministry.—Frederick: b. in Boston, Mass., Aug. 5, 1842; graduated at Harvard 1863; studied theology at the Episcopal Divinity School, Philadelphia; ordained in 1866; was rector of churches in Des Moines, Ia., and Cleveland, O.; drowned by stepping through an open draw at night in the bridge over Charles river, Boston, Sept. 15, 1874. Posthumous volume of sermons (1875), with introduction by Phillips Brooks.—Arthur: b. in Boston, June 11, 1845; graduated at Harvard 1867; studied theology in Andover and Philadelphia; took orders in 1870; rector in Williamsport, Pa., of St. James's church, Chicago, and of the Church of the Incarnation, New York, 1875. D. at sea July 10, 1895. He published *Sermons* (1886; English ed. *Christ for To-day*).—John Cotton: b. in Boston, Aug. 29, 1849; graduated at Harvard 1872; studied theology at Andover and Philadelphia; ordained 1875; rector in Bristol, Pa., 1876; Providence, R. I., and of Christ church, Springfield, Mass., 1878.

Brooks, William Keith, Ph. D.: b. in Cleveland, O., Mar. 25, 1848; graduated from Williams College 1870; took the degree Ph. D. at Harvard University 1874; was assistant in the Boston Society of Natural History 1874–75; became associate of Johns Hopkins University 1876; and in 1883 Professor of Morphology there. Dr. Brooks is a member of the National Academy of Sciences and of several foreign scientific societies. In 1878 he organized the Johns Hopkins summer marine laboratory, which has won a reputation for itself by the class of students who study there, and the publications which are the result of their work. His most important works are *Handbook of Invertebrate Zoölogy* (1881. 400 pp., 300 cuts); *Heredity* (1883, 300 pp.); and *The Development and Protection of the Oyster in Maryland* (192 pp. quarto, 13 plates, 3 charts, 1884). Besides these, he has published *Leucifer, a Study in Morphology* (1881), and a monograph on *Stomatopoda* (1886) in *Transactions* of the London Royal Society, and other papers on marine forms.

Brooks, William Thomas Harbaugh: soldier; b. in New Lisbon, O., Jan. 28, 1821; graduated at West Point in 1841; major Eighteenth Infantry Mar. 12, 1862; and Sept. 28, 1861, brigadier-general U. S. volunteers. He served in the Florida war 1841–42; on frontier duty 1843–45; in the military occupation of Texas 1845–46; in the war with Mexico 1846–48; was engaged at Palo Alto, Resaca de la Palma, Monterey (brevet captain), Vera Cruz, Cerro Gordo, Contreras, Churubusco (brevet major), and the city of Mexico, as aide-de-camp to Brevet Maj.-Gen. Twiggs 1848–51; in active operations in New Mexico in 1868, and engaged in several skirmishes against the Navajos. In the civil war he served in the Virginia Peninsula campaign 1862; engaged at Yorktown, Golden's Farm, Savage Station (wounded), and Glendale; in the Maryland campaign, 1862, engaged at Crampton Pass and Antietam (wounded); commanded division in the Rappahannock campaign 1862–63; in command of the department of the Monongahela 1863–64, when Pittsburg was threatened by a raid: in command of the Tenth Corps before Richmond 1864; engaged at Swift's Creek, Drury's Bluff, Bermuda Hundred, Cold Harbor, and the siege of Petersburg. Failing health from exposure and wounds caused him to resign from the army, July 14, 1864, and in 1866 he retired to a farm in Huntsville, Ala., where he resided till his death, July 19, 1870.

Brookville: town; on railroad; capital of Franklin co., Ind. (for location of county, see map of Indiana, ref. 8–G). It has great water-power, paper-mills, flouring-mills, etc., and contains Brookville College. Pop. (1880) 1,813; (1890) 2,028; (1900) 2,037.

Brookville: borough and capital of Jefferson co., Pa.; on railroad and on Red Bank creek (for location of county, see

map of Pennsylvania, ref. 3–C). Pop. (1880) 2,136; (1890) 2,478; (1900) 2,472.

Broom: any one of several shrubs of the family *Leguminosæ*. They belong to the allied genera of *Spartium*, *Genista*, and *Cytisus*. The common broom of Europe (*Cytisus scoparius*) grows on dry and sandy soils and heaths, and bears handsome yellow flowers. The branches, which are very tough and angular, are used for making brooms. The young tops and seeds, being strongly diuretic, are used in medicine, and are beneficial in dropsy. All kinds of broom have long, slender branches. The Spanish broom (*Spartium junceum*) grows wild in the south of Europe, and possesses medical properties like the common broom. The fiber of its branchlets is used in Italy and Spain for making cloths and ropes. The *Cytisus albus*, or white broom, also a native of Europe, is cultivated in England as an ornamental shrub, and bears white flowers which are much admired. It sometimes attains a height of 15 feet or more. The broom (Fr. *genêt*) gave name to the royal family of Plantagenet, one of its ancestors having the broom for his crest.

Broom-corn: a plant of the order *Graminæ*; native of the East Indies; cultivated in the U. S. It is a variety of the same species which produces sugar-cane, durra-corn, and other plants (*Sor'ghum sacchara'tum* or *Sacchar'um officinar'um*). It has a jointed stem, which grows to the height of 8 or 10 feet, and bears spikelets, two and three together, on the ramifications of an open panicle. Only the middle or terminal one of these is fertile; stamens three. The panicle is extensively used in the manufacture of brooms. It is stated that this plant was first introduced into the U. S. by Dr. Franklin, who, finding a seed on a whisk that had been imported, planted it and propagated it. It succeeds best in alluvial soils, but will generally produce a fair crop on any land that is adapted to maize. Broom-corn is largely cultivated in the Mohawk Valley of New York, in Nebraska and Kansas, and other regions. It is planted in rows about 3 feet apart, and in hills about 18 inches apart. The average produce of an acre is about 500 lb. of the brush or material for brooms. The brush, or stems of the panicle, grow straighter if the panicle stands in a horizontal or drooping position. The stalks are therefore broken over when the panicle is nearly full grown, at a point a foot or a foot and a half below the head. Two rows are ordinarily broken toward each other. This operation is called "tabling." The seed of broom-corn is often fed to chickens, but it has comparatively little value. The brush is not harvested until the seed is nearly ripe, and by this time the herbage is so hard that it has little value for fodder. Revised by L. H. Bailey.

Broome, Sir Frederick Napier, K. C. M. G.: British colonial statesman and author; b. in Canada, 1842; educated at Whitchurch Grammar School, Shropshire, England; emigrated to New Zealand 1857; returning to England, was on the staff of *The Times* 1869–73; colonial secretary of Natal 1875; of Mauritius 1877; lieutenant-governor of Mauritius 1880. As governor of Western Australia, 1882–90, he did much to promote the interests of the colony. Besides contributions to magazines, he was author of *Poems from New Zealand* (1868) and *The Stranger of Seriphos* (1869). D. in England, Nov. 26, 1896.

Broome, John L.: b. Mar. 8, 1824, in New York city; appointed 2d lieutenant in the marine corps Jan. 12, 1848; 1st lieutenant, 1857; captain, 1861. He served in the Mexican war; was in command of the marine guard of the Hartford (1862–63). Brevetted major 1864, lieutenant-colonel 1879. Retired Mar. 8, 1888.

Brosböll, bros'böl, Johan Carl Christian: Danish novelist; b. in Fridericia, Aug. 7, 1820. Under the pseudonym *Carit Etlar* he published many novels and tales, and some poems and dramas. His best stories are scenes from Danish history and peasant-life in Jutland. His works were collected in twenty-four volumes (*Skrifter*, 1859–68); an additional collection (*Ny Samling*) appeared 1873–79 (five volumes), and a new edition was published in 1887, ff.

Brotherhood of Andrew and Philip: See the Appendix.

Brotherhood of the Kingdom: See the Appendix.

Brotherhood of St. Andrew: See the Appendix.

Brother Jonathan: See Trumbull, Jonathan.

Brothers of the Christian Schools: an order in the Roman Catholic Church; founded in 1679 at Rheims by the Abbé La Salle, and confirmed in 1725 by Benedict XIII. Its members are not allowed to enter the priesthood. They devote themselves to teaching, and especially to the instruction of the poor, mostly in rudimentary branches, but sometimes in more advanced studies. They are numerous in France, Ireland, Italy, the U. S., and most other countries.

Brough, John: b. in Marietta, O., Sept. 17, 1811; was a printer in his youth; studied at Ohio University. He edited several political journals; became a powerful Democratic orator; held important public offices. In 1846 he became a lawyer. In 1848 he left political life for a time to preside over a railroad. In 1864 he became Governor of Ohio, receiving the joint vote of all parties who were in favor of prosecuting the war against the insurgent States. D. in Cleveland, Aug. 29, 1865.

Brougham, brōō'am, Henry, Lord: orator, lawyer, and writer; b. in Edinburgh, Scotland, Sept. 19, 1779. His mother was a niece of Dr. Robertson, the historian. He graduated in the University of Edinburgh, studied law, and was admitted to the Scottish bar in 1800. He was intimate with Francis Jeffrey and Sydney Smith, whom he aided in founding the *Edinburgh Review* in 1802, and he continued to contribute to that review for many years. In 1808 he removed to London, and was called to the English bar. He became a Whig member of Parliament in 1810, and soon acquired a high reputation as a debater as well as a forensic pleader. As a parliamentary orator he was distinguished for vehemence and energy, and the rather free use of sarcasm and invective. He represented Winchelsea from 1816 to 1830. Among his famous performances as an advocate was his defense of Queen Caroline (1821), by which he gained great popularity. He distinguished himself as a promoter of popular education, as a reformer of laws, and a friend of political reform and progress. In 1825 he published *Practical Observations on the Education of the People*. He took a prominent part in founding the Society for the Diffusion of Useful Knowledge, of which he became in 1827 the first chairman. He made a powerful speech against slavery in 1830, soon after which he was returned to Parliament by the great popular constituency of Yorkshire. In the same year he was appointed Lord Chancellor in the new Whig ministry, and was raised to the peerage as Baron Brougham and Vaux. He retired from office with his colleagues in Nov., 1834, after which he ceased to act with the Whigs, without joining any other party, but pursued an independent political course.

Among his writings are a *Treatise on the Objects, Advantages, and Pleasures of Science*; *Sketches of Statesmen of the Time of George III.* (3 vols., 1839–43); *Political Philosophy* (3 vols., 1840–44). He died at Cannes, in France, May 9, 1868. He had published an edition of his collected works in 10 vols., 1857. See Lord Campbell's *Life of Lord Brougham*.

Brougham, John: actor and playwright; b. in Dublin, Ireland, May 9, 1810; educated to be a surgeon, but reverses led to a change of plan, and he entered the stage at the Tottenham theater, London, in 1830. Afterward he was engaged by Madame Vestris to act in her stock company at the London Olympic theater. His first dramatic composition was a burlesque, written for William E. Burton. It succeeded, and he wrote many similar pieces of a light description. It was at this period that he wrote, in conjunction with Dion Boucicault, the comedy of *London Assurance*. A little later he undertook the management of the London Lyceum, and for this stage he wrote several plays.

In 1842 Brougham removed to the U. S.; acted at the Park theater, and made a professional tour of the theatrical cities of the U. S. He then settled down as a member of the stock company of Burton's theater, New York. Here he wrote *Vanity Fair*; *The Irish Yankee*; *Benjamin Franklin*; *The Irish Emigrant*; a dramatization of *Dombey and Son*; and other dramas. He then undertook the management of Niblo's Garden. On Dec. 23, 1850, he opened Brougham's Lyceum, which afterward became Wallack's theater. Brougham did not keep it long, but while there he wrote, among other pieces, a dramatization of *David Copperfield*, and a new version of *The Actress of Padua*. His next venture was made at the Old Bowery theater (1856–57), where he produced *The Pirates of the Mississippi*; *The Red Mask*; *Tom and Jerry in America*; *The Miller of New Jersey*, all dramas of a common sort, but profitable. Then he accepted an engagement at Wallack's theater, and while there he wrote a version of *Bleak House*; *Pocahontas*; *The Ruling Passion*; and *Playing with Fire*. A little later he left Wallack's and rejoined Burton at the Metro-

politan theater, and here he produced his burlesque of *Columbus*.

In 1861–62 Brougham went to London, where he remained upward of four years. During this time he wrote *The Duke's Motto* and *Bel Demonio*, and dramatic versions of two novels by Miss M. E. Braddon called *Lady Audley's Secret* and *Only a Clod*.

In 1869 he opened Brougham's theater, in Twenty-fourth Street, New York. His management in this house was of short duration. His last appearance on the stage occurred on Oct. 25, 1879, at Booth's theater, New York. He was one of the founders of the Lotos Club, of New York, and for some time its president.

Brougham started in New York a comic paper called *The Lantern*, and he was author of two volumes of miscellaneous writings entitled *A Basket of Chips* and *The Bunsby Papers*. He was separated from his first wife in 1845. His second wife, Miss Nelson, whom he wedded in 1847, died in 1870. D. at New York, June 7, 1880.

Revised by B. B. Vallentine.

Broughton, Rhoda: novelist; b. at Segrwyd Hall, Denbighshire, Wales, Nov. 29, 1840. Among her novels are *Not Wisely, but Too Well* (1867); *Cometh up as a Flower* (1867); *Red as a Rose is She* (1870); *Good-bye, Sweetheart* (1872). Miss Broughton has lived much at Oxford, the scene of her novels *Belinda* (1883) and *Doctor Cupid* (1886).

Brounoff, Platon: See the Appendix.

Brous'sa, or **Brussa** (anc. *Prusa ad Olympum*): a city of Asia Minor; in Anatolia; pleasantly situated at the north base of Mt. Olympus; about 60 miles S. by E. from Constantinople (see map of Turkey, ref. 4–E). It is on a beautiful and fertile plain, and presents a magnificent external appearance, having more than 200 mosques and minarets, some of which are very handsome. The streets are narrow, but are kept clean by running water. Here are many colleges and schools, several Armenian churches, and large bazaars supplied with European goods. Broussa is one of the most commercial cities in Asiatic Turkey, and raw silk is the chief article of export. It has manufactures of silk, satin, gauze, cotton cloths, and tapestry. The silks of Broussa are highly esteemed in the European markets. A superior article of China was formerly manufactured here, but the art is now lost. Here are warm mineral springs which were celebrated in ancient times. *Prusa* was the capital of ancient Bithynia. It was taken by the Turkish Sultan Orkhân in 1326, after which it was the capital of the Turkish empire until 1453. Feb. 28, 1855, the town was nearly destroyed by an earthquake. Pop. reported 37,500 in 1885, but since the Russo-Turkish war it has grown rapidly, and was (1891) estimated at 100,000.

Broussais, broo'say', François Joseph Victor: physician; b. in Saint-Malo, department of Ille-et-Vilaine, France, Dec. 17, 1772; educated in the public school of Dinan and under the supervision of his father, who was a country physician. On the outbreak of the Revolution he joined the army as a volunteer, but was discharged on account of sickness; studied medicine; obtained a commission as surgeon, first on a ship of war, afterward at Brest, and went in 1799 to Paris to pursue a regular course of medicine. In 1804 he was appointed military surgeon to the camp of Boulogne, and accompanied this division of the French army till 1808. After the publication in that year of his *Histoire des Phlegmasies chroniques*, he was made chief physician to one of the divisions of the French army in Spain, and remained there till 1814. After the end of the war he was made assistant professor at the military hospital of the Val de Grâce in Paris; published in 1816 *Examen de doctrine médicale généralement adoptée*; in 1824 *Traité de la physiologie appliquée à la pathologie*; in 1829 *Commentaires des propositions de pathologie consignés dans l'examen*; in 1832 *Le cholera morbus épidémique*, and was in the same year appointed Professor of General Pathology in the Academy of Medicine, which office he held till his death, Nov. 17, 1838. He was the founder of the physiological system of medicine.

Brousson, broo'sõn', Claude: b. in Nîmes, France, in 1647; studied law, and was a celebrated advocate in Toulouse when the persecutions began against the Huguenots, to whose sect he belonged. After the Revocation of the Edict of Nantes in 1685, when the churches of the Huguenots were interdicted, their ministers exiled, and their books burnt, Brousson assembled from time to time his co-religionists in his house, and endeavored to uphold their courage and strengthen their power of resistance. These reunions caused finally a popular outbreak in Toulouse, and Brousson was compelled to flee to Switzerland. Here he was consecrated to the ministry, and although the governor of the province of Languedoc put a price of 10,000 livres on his head, he returned to France, and lived up to 1693 as an itinerant priest in the Cévennes, where he preached in the caves and crags to those who gathered around him, forming the famous *assemblées du désert*. After a short residence in the Netherlands, he re-entered France by the way of the Jura Mountains, and began once more to preach in the Cévennes, but was caught, brought to Montpellier, tried on a charge of co-operating with Count Schomberg in a scheme of invading France, and broken on the wheel Nov. 4, 1698. His influence, both as a preacher and a writer, was very great, and he is considered one of the martyrs of the French Reformed Church. He wrote *L'état des réformés de France* (3 vols., The Hague, 1684); *Lettres au clergé de France* (1685); *Lettres des Protestants de France à toutes les autres Protestants de l'Europe* (Berlin, 1688); *Lettres aux Catholiques romains* (1689); *Relation sommaire des merveilles que Dieu fait en France dans les Cévennes* (1694); *La manne mystique du désert* (published in 1695 by the synod of Haarlem), etc.

Broussone'tia: a genus of trees allied to the mulberry. It comprises the paper mulberry (*Broussonetia papyrifera*), the fibrous bark of which is used by the Chinese and Japanese in the manufacture of paper. It is a small tree with deciduous leaves of variable shape. It is planted as a shade tree in some American cities.

Brown (in Fr. *brun*): in painting, a dark dusky color, inclined to red, of various degrees of depth. It belongs to the tertiary colors known as russets and olives, in which the hue is modified by an admixture of black or a dark pigment. Among the brown pigments are bister, umber, raw and burnt sienna, and brown madder.

Brown, Aaron Venable: statesman; b. in Brunswick co., Va., Aug. 15, 1795; graduated at Chapel Hill in 1814; removed to Tennessee in 1815; partner of James K. Polk; member of Congress 1839–45; and was elected Governor of the State in 1845. He became Postmaster-General of the U. S. in 1857 under Buchanan. D. in Washington, D. C., Mar. 8, 1859.

Brown, Benjamin Gratz: b. in Lexington, Ky., May 28, 1826; graduated at Yale in 1847. He began the practice of law at St. Louis, Mo.; was a member of the State Legislature (1852–58); edited the Missouri *Democrat* (1854–59). On the breaking out of the war in 1861 he raised a regiment and fought on the side of the Union; afterward commanded a brigade of militia. He was among the most active and influential in procuring the adoption of the ordinance of freedom in 1864 by the State of Missouri. He was U. S. Senator in 1863–67, and was made Governor of Missouri in 1871. He was nominated at the Cincinnati convention, May, 1872, for the office of Vice-President of the U. S., Horace Greeley being the nominee for President. D. in St. Louis, Dec. 13, 1885.

Brown, Charles Brockden: novelist, and the first professional man of letters in the U. S.; b. in Philadelphia, Jan. 17, 1771. His life was spent in New York and Philadelphia, where he edited *The Literary Magazine and American Register* (1803–08). His romances, *Wieland* (1798), *Ormund* (1799), *Edgar Huntley* (1799), *Arthur Mervyn* (1800), *Jane Talbot* (1801), and *Clara Howard* (1801), are weird and mysterious, dealing with the phenomena of sleep-walking, ventriloquism, etc. D. Feb. 22, 1810. See Prescott's *Life of C. B. Brown*, in Sparks's *American Biography*, vol. i.; W. Dunlap's *Life of Charles B. Brown*, prefixed to an edition of his works (1827); E. I. Stevenson's *Life*, announced (1897).

Brown, Ford Madox: decorative and genre painter; b. of English parents at Calais, France, Apr. 16, 1821; pupil of the academies of Bruges and Antwerp. Notable among his works is a series of frescoes in the town-hall of Manchester, illustrating the history of the city. He generally held aloof from public exhibitions. D. in London, Oct. 6, 1893.

William A. Coffin.

Brown, Francis, D. D.: b. in Chester, N. H., Jan. 11, 1784; graduated at Dartmouth College in 1805; tutor from 1806 to 1809; settled over the Congregational church in North Yarmouth, Me., in 1810; chosen president of his alma mater in 1815. It was during his presidency that the famous Dartmouth College case was carried up to the U. S.

Supreme Court. Jeremiah Mason and Daniel Webster admired the ability with which he served them in their management of the case, which was won for him, and he was reinstated as college president in 1819. D. July 17, 1820.

Brown, Francis, Ph. D., D. D.: grandson of Francis Brown; b. in Hanover, N. H., Dec. 26, 1849; graduated at Dartmouth College in 1870; tutor there 1872 to 1874; graduated at the Union Theological Seminary in 1877; spent two years in Germany; in 1879 was appointed instructor, in 1881 Associate Professor, in Biblical Philology in the Union Theological Seminary, New York; in 1890 was transferred to the chair of Hebrew and the Cognate Languages. He edited Lenormant's *The Beginnings of History* and (with Dr. R. D. Hitchcock) the *Teaching of the Twelve Apostles*. He wrote *Assyriology, its Use and Abuse in Old Testament Study* (1885). Revised by George P. Fisher.

Brown, George: naval officer; b. in Indiana, June 19, 1835; entered the navy as a midshipman Feb. 5, 1849. He was in command of Admiral Porter's flag-ship, the Octorora, at the attack on Vicksburg, June 28, 1862. On the night of Feb. 24, 1863, Brown, in the steamer Indianola, defended his vessel for an hour and twenty-seven minutes against the rams Queen of the West and William H. Webb, and two large "cotton-clads," surrendering the Indianola only when she was fast filling with water. He commanded the steamer Itasca at the battle of Mobile Bay, Aug. 5, 1864, and during the subsequent operations against the defenses of Mobile. On Jan. 25, 1890, he was assigned to the command of the Pacific station; became a rear-admiral Sept. 27, 1893; retired in 1898.

Brown, George: Canadian statesman; b. in Edinburgh, Scotland, Nov. 29, 1818. He was educated in his native city, and in early manhood removed with his parents to New York. In 1843 he proceeded to Toronto, and in 1844 established the *Globe* newspaper, which has been ever since the leading Liberal paper of Canada. He entered Parliament in 1852; formed the Brown-Dorian administration Aug. 2, 1858, but resigned with his colleagues after holding office for a few days in consequence of adverse vote passed by the Assembly. He was leader of the Reform section of the coalition government from 1864 till 1865, when he resigned owing to the policy of the Government relative to a reciprocity treaty with the U. S. He was a delegate to the Charlottetown conference in 1864; to that at Quebec the same year; went to London on public business in 1865; and to Washington in 1874 as joint plenipotentiary with Sir Edward Thornton to negotiate a commercial treaty with the U. S. On Mar. 25, 1880, he was shot in the leg by a discharged employee, and died in consequence May 9 following. See Hon. Alexander Mackenzie's *Life and Speeches of the Hon. George Brown* (Toronto, 1882).

Neil Macdonald.

Brown, George Loring: landscape-painter; b. in Boston, Mass., Feb. 2, 1814; pupil of Washington Allston, and Isabey, Paris. Most of his works are owned in Boston and vicinity. His *Crown of New England* was purchased by the Prince of Wales when he visited the U. S. in 1860, and his *Bay of New York* was presented to the Prince of Wales in the same year by a number of New York merchants. D. in Malden, Mass., June 12, 1889. W. A. C.

Brown, George William: jurist; b. in Baltimore, Md., Oct. 13, 1812; graduated at Rutgers College in 1831. In 1867 he was a member of the Maryland constitutional convention, and from 1873 until 1888 was chief justice of that State. He was one of three compilers of the first *Digest of the Decisions of the Maryland Court of Appeals*. He was mayor of Baltimore at the time the mob of that city attacked the Sixth Massachusetts Regiment on its way to the defense of Washington, Apr. 19, 1861. D. at Lake Mohonk, N. Y., Sept. 6, 1890. Henry Wade Rogers.

Brown, Goold: grammarian and teacher: b. in Providence, R. I., Mar. 7, 1791; taught an academy in New York for twenty years. He published *Institutes of English Grammar* (1823) and *Grammar of English Grammars* (1850). D. in Lynn, Mass., Mar. 31, 1857.

Brown, Harvey: soldier; b. in Rahway, N. J., in 1795; graduated at West Point in 1818; colonel Fifth Artillery May 5, 1861. He served chiefly at seaboard posts 1818–61; as aide-de-camp to Maj.-Gen. Brown 1824–25; on quartermaster duty 1826–29; in the Black Hawk expedition 1832; in the Florida war 1836–38; engaged at Wahoo Swamp; suppressing Canada border disturbances 1839–41; in the war with Mexico 1846–48; engaged at Monterey, Vera Cruz, Cerro Gordo, Contreras (brevet lieutenant-colonel), Molino del Rey, and the city of Mexico (brevet colonel); on recruiting service 1848–52; superintendent 1851–52; in Florida hostilities 1852–53; in command of the artillery school for practice 1857–58; inspector of artillery 1859–60. In the civil war he was engaged in the defense of Fort Pickens, Fla., 1861–62 (brevet brigadier-general); and as military commander of the city of New York, Jan. 15–July 16, 1863, suppressed the draft riots (brevet major-general). Retired from active service Aug. 1, 1863. D. at Clifton, Staten Island, N. Y., Mar. 31, 1874.

Brown, Henry Billings, LL. D.: jurist; b. in Lee, Mass., Mar. 2, 1836; graduated at Yale in 1856; studied law; removed to Michigan; became U. S. district judge in 1875; appointed associate justice of the Supreme Court of the U. S. in 1890, succeeding Samuel F. Miller.

Henry Wade Rogers.

Brown, Henry Kirke: sculptor and painter; b. in Leyden, Mass., Feb. 24, 1814. Among his best works are the equestrian statue of Washington in Union Square, New York; a colossal bronze statue of Gov. Clinton at Greenwood Cemetery; the *Angel of the Resurrection*, also at Greenwood; and a colossal equestrian statue of Gen. Winfield Scott. His statue of Gov. Clinton at Washington is perhaps the finest. He was the first American to use bronze in sculpture, made much portrait statuary, and was also a painter of no mean ability. D. in Newburg, N. Y., July 10, 1886.

Brown, Jacob: b. in Bucks co., Pa., May 9, 1775; removed to New York in 1798. He joined the army in 1812, and defended Sackett's Harbor in 1813. Having been raised to the rank of major-general, he invaded Canada in the spring of 1814, and commanded with success at Chippewa and Niagara Falls in July of that year. He became commander-in-chief of the U. S. army in 1821. D. in Washington, D. C., Feb. 24, 1828.

Brown, James: merchant; b. in Providence, R. I., Mar. 22, 1698. He was in the third generation of descent from Chad Brown, who immigrated to New England in 1638; became pastor in succession to Roger Williams of the First Baptist church in Providence; was known as the "Peacemaker" of the colony, and died about 1665. James was the father of four sons who were benefactors of Brown University (*q. v.*), founders of the prosperity of Providence, and of a very wealthy family in Rhode Island. D. Apr. 27, 1739.—His son Nicholas; b. in Providence, July 28, 1729; d. there May 29, 1791. He was a zealous Baptist, and greatly increased his fortune by commerce.—The second son, Joseph; b. in Providence, Dec. 3, 1733; on acquiring a fortune, gave much time to mechanics and astronomy. He made observations of the transit of Venus in 1769, and published his observations; was Professor of Natural Philosophy in Rhode Island College from 1784; alone of the brothers became a communicant in the Baptist church; d. Dec. 3, 1785.—John; b. in Providence, Jan. 23, 1736; was the more enterprising of the house; opened trade with China and the East Indies; led the raid upon the British sloop of war Gaspee, 1772; imported and supplied ammunition to the army under Washington while at Cambridge; representative in the Sixth Congress; laid the corner-stone of Rhode Island College when it was removed to Providence; was its benefactor and treasurer from 1783; d. in Providence, Sept. 20, 1803.—Moses, youngest of the brothers; b. in Providence, Apr. 4, 1738; had mercantile experience in the family business; withdrew in 1773; became a Quaker, a patron of Friends' schools, and an abolitionist; d. in Providence, Sept. 6, 1836.—Nicholas, who bore his father's name (as above); b. in Providence, Apr. 4, 1769; is the member of the family for whom Rhode Island College in 1804 changed its name to Brown University. Inheriting wealth and a trading business, he took his brother-in-law into partnership, and thus formed the powerful house of Brown & Ives, now engaged in textile manufactures. He took some representative part in Whig politics, gave about $100,000 to the college, endowed the Providence Athenæum and an insane asylum; d. in Providence, Sept. 27, 1841.—His son was John Carter Brown; bibliophile; b. in Providence, Aug. 28, 1797; graduated at Brown University 1816; partner in his father's business; gathered a library of Americana prior to 1800, rich in Canadian, New England, Spanish, and Portuguese documents and books; celebrated among scholars for its completeness; catalogued by J. R. Bartlett (4 vols., 1871). Mr.

Brown gave $160,000 to Brown University, chiefly for library equipment. D. in Providence, June 10, 1874.

Brown, James Allen, D. D., LL. D.: Lutheran divine; b. of Quaker parentage, in Lancaster co., Pa., Feb. 19, 1821; graduated at Pennsylvania College, Gettysburg, 1842; pastor in Baltimore, Md., and Reading, Pa.; Professor of Systematic Theology, Newberry, S. C., 1859–61, and at Gettysburg, Pa., 1864–79; author of *The New Theology* (1857), and editor of *Quarterly Review of Lutheran Church* (1870–79). D. in Lancaster, Pa., June 19, 1883.

Henry E. Jacobs.

Brown, J. Appleton: landscape-painter: b. at Newburyport, Mass., July 24, 1844; pupil of Benjamin C. Porter, Boston, and of Lambinet in France; member of the Society of American Artists 1892. His pictures of springtime are sympathetically treated, and his landscape work in general is noteworthy on account of its delicate and tender color. Most of his artistic career has been passed in Boston, but he removed to New York in 1891. W. A. C.

Brown, James Baldwin: Congregationalist; b. in London, England, Aug. 19, 1820; d. in London, June 23, 1884. He graduated at University College, London, 1839. He first studied law and afterward theology. He became a minister at Derby (1843), and then was pastor in London, in the Clapham Road (1846). From there he removed with his congregation to Brixton (1870). He had great influence in the Christian communion to which he belonged. He was a prolific author on a variety of theological and ecclesiastical topics. One of his principal works is *The Doctrine of Annihilation in the Light of the Gospel of Love* (London, 1875; 2d ed. 1878). George P. Fisher.

Brown, John: a religious writer; b. at Carpow, in Perthshire, Scotland, in 1722. He studied theology under Ebenezer Erskine, of Stirling, in connection with the Associate Burgher Synod, and in 1751 became pastor of the Associate congregation at Haddington, and so remained till his death. He had a high reputation for piety and learning. It is stated that he knew nine languages. Among his works are a *Dictionary of the Bible* (Edinburgh, 1769) and a *Self-interpreting Bible* (1778, 2 vols.). D. in Haddington, June 19, 1787.

Brown, John, M. D.: a physician; author of the Brunonian system of medicine; was born in Bunkle parish, Berwickshire, Scotland, in 1735. He published in 1780 *Elementa Medicinæ*, in which he propounded his new system, in which diseases were classified as the consequence of an excess or deficiency of excitement, or as sthenic and asthenic. This was received with favor by many physicians. His favorite medicines were alcohol and opium. D. in London, Oct. 17, 1788.

Brown, John: patriot; b. in Sandisfield, Mass., Oct. 19, 1744; graduated at Yale in 1761; became king's attorney in the New York colony; afterward practiced law at Pittsfield, Mass. In 1774 and 1775 he operated for the cause of freedom in Canada; aided in the capture of Ticonderoga; took Fort Chambly; fought at Quebec; became a lieutenant-colonel; and in 1777 surprised the outposts at Ticonderoga, and made important captures. He was killed by the Indians in the Mohawk Valley campaign, Oct. 19, 1780.

Brown, John, M. D.: physician; a son of Rev. Dr. John Brown, of Haddington (1784–1858); b. in Biggar, Scotland, Sept. 22, 1810. He practiced in Edinburgh, and published *Horæ Subsecivæ* (1858), containing the well-known *Our Dogs, Rab and his Friends*, and *John Leech and Other Papers* (1882). He wrote but little, and only of animals and things he loved. Pathos and humor are his characteristics. He suffered much from periods of depression. D. in Edinburgh, May 11, 1882.

Brown, John, **of Ossawatomie**: a zealous opponent of slavery; b. in Torrington, Conn., May 9, 1800. He removed to Ohio in early youth, married, and worked at the trade of a tanner. His life was always unsettled and adventurous, but as upright and resolute as an old Covenanter's. He was twice married and had twenty children, and the whole family made sacrifices to sustain his enterprises. In 1855 he emigrated to Kansas, where he fought against the pro-slavery party, and lived at Ossawatomie. His house was burned and a son killed in the border wars of Kansas, and he made bloody reprisals. He was the master-spirit of the convention which met at Chatham, Canada, in May, 1859, and organized an invasion of Virginia in order to liberate the slaves. In July of that year he rented a farmhouse about 6 miles from Harper's Ferry. On Oct. 16, aided by twenty-two associates, of whom six were Negroes, he surprised Harper's Ferry, and captured the arsenal and armory. He and his party were overcome the next day by a detachment of U. S. troops, and Brown and his surviving followers were given up to the State authorities for trial. He was hanged at Charlestown, Va., Dec. 2, 1859, exhibiting great serenity and elevation of mind. His adventure was influential in disclosing and intensifying the feeling between the North and the South, and a popular song concerning him was an inspiring tune in all the Union camps during the civil war. See Redpath, *Life of Captain John Brown* (1860), and the fuller work of F. B. Sanborn, *Life and Letters of John Brown* (1885).

Brown, John G.: genre-painter; b. at Durham, England, Nov. 11, 1831; pupil of the Academy at Edinburgh, Scotland, and afterward, when he removed to the U. S., studied in the schools of the National Academy, New York, in 1853; National Academician 1863; honorable mention, Paris Exposition, 1889. The subjects of his works are scenes of country life and single figures. His portrayals of the New York bootblacks and street urchins are widely known and very popular. He is president of the American Water-color Society, and paints skillfully in oil and in water-color. Studio in New York. William A. Coffin.

Brown, John Henry Hobart, D. D.: first Protestant Episcopal bishop in Fond du Lac, Wis.; b. in New York city, Dec. 1, 1831; graduated at the General Theological Seminary 1854; took orders 1855; served parishes in New York State; consecrated bishop Dec. 15, 1875; d. at his see May 2, 1888.

Brown, John Lewis: French painter of genre and outdoor life, principally hunting scenes; b. at Bordeaux, Aug. 16, 1829. He became identified with the impressionists, and his pictures give evidence of careful and artistic observation and talent in the representation of atmospheric effects. Pupil of Roqueplan and of Belloc; first-class medal, Paris Exposition, 1889; Legion of Honor 1870. Studio in Paris. D. in 1892. W. A. C.

Brown, Joseph Emerson, LL. D.: statesman; b. in Pickens co., S. C., Apr. 15, 1821; educated at Calhoun Academy, S. C., and in law at Yale College 1846; settled in Canton, Ga.; engaged in politics and served in the Legislature; superior court judge of Blue Ridge circuit 1855; elected Governor in 1857 and for three succeeding terms; as war Governor of Georgia seized the Savannah forts before his State seceded; disputed with Mr. Davis the Confederate conscription laws; opposed Sherman's march through Georgia with 10,000 recruits gathered from exempt classes, but refused to send them out of the State; prisoner of war in 1864; acquiesced in reconstruction laws, and supported Grant for the presidency at the cost of popularity at home; chief justice of Georgia 1868; president of Western and Atlantic R. R. from 1870; U. S. Senator in 1880 to fill vacancy caused by resignation of Gen. Gordon; retained in the Senate by the Legislature until 1890, when he declined a re-election; gave $50,000 to Southern Baptist Theological Seminary, and as much more to the Georgia State University. D. in Atlanta, Ga., Nov. 30, 1894. See his *Life and Times*, by H. Fielder (Springfield, Mass., 1883).

Brown, Robert: founder of the Brownist sect, or Independents (*q. v.*); b. in Tolethorpe, Rutlandshire, England, about 1550; probably graduated at Corpus Christi College, Cambridge, 1574; taught school in Southwark, and preached in the fields; went to Norwich and organized a Congregational church in 1581, publishing his views of church polity; took refuge in Holland and distributed tracts in England, for which two men were hanged; tried for heresy in Scotland 1583; preached in Northampton; got into jail for it; was excommunicated by the Bishop of Peterborough, having never separated entirely from the establishment; conformed in 1591, and for forty years was rector of Achurch-cum-Thorpe, diocese of Peterborough; left treatises, of which three are extant, teaching Congregationalism as practiced in the U. S.; said he had been "in thirty-two dungeons"; d. in 1633, and, it is reported, in Northampton jail.

Brown, Robert, M. A., Ph. D.: traveler and scientist; b. in Campster, Caithness, Scotland, Mar. 23, 1842; studied at Edinburgh, Leyden, Copenhagen, and Rostock; visited Jan Mayen, Spitzbergen, Greenland, and western shore of Baffin's Bay (1861); the Pacific islands, Alaska, Venezuela, and Bering seacoast and Vancouver (1863–66); Greenland

a second time and North Africa since 1867; removed to London, 1876 in order to devote himself to literary work; member of numerous learned societies; author of twenty-six volumes, including *Peoples of the World* (6 vols.); *Countries of the World* (6 vols.); *Manual of Botany; Our Earth* (3 vols.); and *Science for All* (5 vols.); a large number of scientific memoirs, and some 3,000 articles and reviews in various languages. D. Oct. 26, 1895.

Brown, Robert, F. R. S., D. C. L.: botanist; b. at Montrose, Scotland, Dec. 21, 1773. He studied medicine in the University of Edinburgh, and was naturalist to the expedition which Capt. Flinders conducted to Australia in 1801. In 1805 he returned with a collection of 4,000 species of Australian plants, and in 1810 he published a *Prodromus Floræ Novæ Hollandiæ*. He also wrote *General Remarks, Geographical and Systematical, on the Botany of Terra Australis* (1814). His discovery of the gymnospermy of the conifers was published in 1825. In 1827 he became keeper of the botanical department of the British Museum. D. in London, June 10, 1858.

Brown, Sir Samuel: naval officer and civil engineer; b. in London, England, in 1776. He served on the sea in the Napoleonic wars; invented a method of manufacturing chain cables which led to their introduction into the navy; in 1819 built the first suspension bridge in England. Made a Hanoverian knight in 1838. D. in Blackheath, Mar. 15, 1852.

Brown, Samuel Gilman, D. D., LL. D.: son of President Francis Brown; b. in North Yarmouth, Me., Jan. 4, 1813; graduated at Dartmouth College in 1831, and at Andover Theological Seminary in 1837; traveled in Europe from 1838 to 1840; was professor in Dartmouth College, first of oratory and belles-lettres, from 1840 to 1863, then of intellectual philosophy from 1863 to 1867, and was president of Hamilton College from 1867 to 1881. Besides numerous addresses and articles in reviews, he published a *Biography of Self-taught Men* (1847) and *The Life of Hon. Rufus Choate* (1862). He also lectured on *British Orators*. D. in Utica, N. Y., Nov. 4, 1885.

Brown, Thomas, M. D.: metaphysician; b. in Kirkcudbrightshire, Scotland, Jan. 9, 1778. He was a pupil of Dugald Stewart in Edinburgh. In 1798 he published a refutation of Darwin's *Zoönomia*. Having studied medicine, he graduated in 1803, and practiced medicine about seven years. In 1810 he was appointed colleague of Dugald Stewart as Professor of Moral Philosophy in the University of Edinburgh. He was very popular as a lecturer, and published *Lectures on the Philosophy of the Human Mind* (4 vols., 1820). His other chief work is *Observations on the Relation of Cause and Effect* (1805; 3d ed. enlarged, 1818). His chief contribution to psychology is an explication of the sixth or *muscular* sense. Died while on a visit in London, Apr. 2, 1820. See Dr. Welsh, *Account of the Life and Writings of Thomas Brown* (1825).

Brown, Thomas: English humorist; b. at Shifnal, in Shropshire, in 1663; educated at Christ Church, Oxford. His writings consist largely of satires, epigrams, lampoons, farces, and sketches of low life in London, such as *Amusements, Serious and Comical* (1700); *A Wall Round London and Westminster*. D. June 16, 1704. Henry A. Beers.

Brown, Thomas Edward: See the Appendix.

Browne, Charles Farrar (known as *Artemus Ward*): humorous writer; b. at Waterford, Me., Apr. 26, 1834. He learned the business of a printer; removed to Ohio, and about 1858 began contributing to the *Cleveland Plaindealer* a series of humorous *Letters from Artemus Ward, Showman*. In 1860 he went to New York and joined the editorial staff of *Vanity Fair*. He became a popular lecturer; visited California in 1863 and London in 1866. D. at Southampton, England, Mar. 6, 1867. He published *Artemus Ward, his Book* (1862), and other works. See his *Complete Writings*, with biography, by M. D. Landon (New York, 1875).

Browne, Edward Harold, D. D., D. C. L.: Bishop of Winchester, England; b. at Aylesbury, Buckinghamshire, Mar. 6, 1811; educated at Emmanuel College, Cambridge, 1832; took orders in 1836; consecrated Bishop of Ely 1864; translated to Winchester 1873; resigned 1891. Bishop Browne took a great interest in the Old Catholic movement, and attended the Old Catholic congress at Cologne in 1872. He was a member of the O. T. Company of Revision of King James's Version. He was the author of *An Exposition of the XXXIX. Articles* (2 vols., 1850–53; 13th ed. in 1 vol., 1887); *Sermons on the Atonement and other Subjects* (1859); *Messiah Foretold and Expected* (1862); *The Pentateuch and the Elohistic Psalms in reply to Bishop Colenso* (1863); *The Strife, the Victory, the Kingdom* (1872); *Position and Parties of the English Church* (1875); *Commentary on Genesis* in the *Speaker's Commentary*, together with numerous charges, addresses, etc. D. Dec. 19, 1891.

William Stevens Perry.

Browne, Sir J. C.: See Crichton-Browne.

Browne, John Ross: Irish-American writer and traveler; b. in Ireland in 1817. Among his works are *Etchings of a Whaling Cruise* (1846) and *Yusef, or the Journey of the Fragi* (1853). He was minister to China in 1868–70. D. in Oakland, Cal., Dec. 9, 1875.

Browne, Samuel J.: b. in England, Mar. 19, 1788; became in 1798 a resident of Cincinnati, O., where he grew rich by investments in land. He was long a minister of the United Brethren, and afterward of the Presbyterians. D. in Harrison Junction, O., Sept. 10, 1872, leaving a large amount of money to found a church, a university, and a free school.

Browne, Sir Thomas, M. D.: English philosopher and writer; b. in London, Nov. 19, 1605. He practiced medicine at Norwich for many years; published, besides other works, *Religio Medici* (1642); *Inquiries into Vulgar and Common Errors* (1646); and *Urn Burial* (1658), all written in a quaint, highly latinized style, and displaying a most peculiar imagination. He was knighted by Charles II. in 1671. D. Nov. 19, 1682.

Browne, William: pastoral poet; b. at Tavistock, Devonshire, England, in 1591. He was educated at Exeter College, Oxford; afterward entered himself at the Inner Temple. His best-known works are *Britannia's Pastorals* (1613–16) and *The Shepherd's Pipe* (1614). D. about 1643.

Henry A. Beers.

Brownell, Henry Howard: b. in Providence, R. I., Feb. 6, 1820; graduated at Trinity College, Hartford, Conn., in 1841; wrote a number of popular histories; a volume of *Poems* (1847); *Lyrics of a Day* (1864); *War Lyrics* (1866). In the civil war he was a volunteer naval officer, serving on Farragut's staff. He lived mainly at East Hartford, where he died Oct. 31, 1872.

Brownell, Thomas Church, D. D., LL. D.: Bishop of Connecticut; b. at Westport, Mass., Oct. 19, 1779; graduated at Union College in 1804. He held various professorships in the college until 1816, when he took orders in the Protestant Episcopal Church. In 1819 he was consecrated Bishop of Connecticut, and was the first president of Trinity College, Hartford (1824–31). He was largely instrumental in providing liberal endowments for its professorships, and in securing important additions to its general fund. In 1852 he became presiding Bishop of the Protestant Episcopal Church in the U. S. He published an *Expositor* of the New Testament; a *Commentary on the Book of Common Prayer*; *Religion of the Heart and Life* (5 vols., 1839–40); *Consolation for the Afflicted*; *Christian's Walk and Consolation*; and several other works. D. in Hartford, Conn., Jan. 13, 1865. A bronze statue of the bishop stands on the campus of Trinity College, Hartford, the gift of his son-in-law, Gordon W. Burnham, of New York.

Brownian Movements (*Pedesis*): those movements seen with the microscope among minute particles (not living) in a liquid. Robert Brown, the botanist, first described them in 1827. These movements have often been mistaken for *vital* motions. When bacteria or other minute organisms in a solution are observed through a microscope they are found to be in motion. After the liquid has been sterilized by heat or otherwise, motion still goes on, but in a manner obviously different from that due to living organisms. The same phenomena can be exhibited by rubbing fine powder of gamboge, carmine, lampblack, or pumice-stone in water. Indeed, as Jevons has shown, all solid matter when very finely divided, and in suitable liquid, shows this motion. Beale considers of the same nature the motions of very minute bubbles ($\frac{1}{20000}$ of an inch in diameter) within certain crystals. These movements have not been satisfactorily explained. Beale suggests their possible connection with heat. See Jevons, *Quarterly Journal of Microscopy*, viii. (1878), p. 172; also Carpenter, *The Microscope*, 7th ed., p. 373.

E. L. Nichols.

Brownie: a spirit of the fairy order in the old superstitions of Scotland. The tradition is that he was a good-humored goblin, who attached himself to farmhouses, and occupied himself when the family were in bed in performing any work, such as churning, threshing, etc.—a spirit not seen or spoken to, and only known by the performance of voluntary labors. In Cornwall a goblin known as Browny is called to assist at the swarming of bees.

Browning, Elizabeth Barrett: the greatest English poetess; b. in Carlton Hall, Durham, Mar. 6, 1806. Her father, Edward Moulton, took the name Barrett on the inheritance of some estates in Jamaica. She was liberally educated, and studied the Greek and Latin languages with success. She published in 1826 a volume entitled an *Essay on Mind, and other Poems*, and in 1833 translated from the Greek of Æschylus *Prometheus Bound*. Her health having been impaired by the rupture of a blood-vessel in 1837, she passed several years in seclusion. In 1846 she was married clandestinely to the poet Robert Browning, and went with him to reside in Italy. Among her poems are *The Seraphim and other Poems* (1838); *The Romaunt of the Page* (1839); *A Drama of Exile* (1844); *Aurora Leigh* (1856); *Poems before Congress* (1860); and *Last Poems* (1861). Many of Mrs. Browning's poems, such as *Casa Guidi Windows* (1851), relate to Italy and the Italian aspirations for liberty and unity. *Aurora Leigh* (1856), in which she embodies her philosophy of life and art, is a novel in verse, dealing with contemporary thought in 12,000 lines of blank verse. *Sonnets from the Portuguese* (1850) contains some of the finest love poetry in the language, and is not, in fact, a translation, as the title implies, but original with Mrs. Browning. She died in Florence, June 30, 1861.

Revised by Henry A. Beers.

Browning, Orville Hickman: statesman; b. in Harrison co., Ky., 1810; educated at Augusta College; studied law; called to the bar in 1831; removed to Quincy, Ill. He served in the Black Hawk war; became a prominent State politician; was U. S. Senator (1861–63); Secretary of the Interior (1866–68); acting Attorney-General of the U. S. under President Johnson (1868–69). D. in Quincy, Aug. 10, 1881.

Browning, Robert: the foremost of psychological poets; b. at Camberwell, a suburb of London, May 7, 1812. His early education, up to the age of fourteen, was got in private schools and at home; subsequently a private tutor was employed for some years. His father, a clerk in the Bank of England and a scholar of the old-fashioned classical type, was an enthusiastic collector of scarce and curious books, and his house was filled with them. These the young Browning voraciously devoured, and from them, and the inspiration of his book-loving father and of a mother of whom Carlyle spoke as "the true type of a Scottish gentlewoman," and the poet himself as "a divine woman," he derived an education of a kind which, no doubt, better fitted him for his future work than any he could have derived from either of the great universities at the time. In a private letter he says: "I could never have done much by either process," meaning that of public school or university.

In his eighteenth year he attended for only a term or two the London University, now University College, where he studied Greek chiefly, an ardent love of which he had imbibed from his father. The winter of 1833–34 he spent in Russia, and was much impressed with Russian life and Russian winter scenery. It does not seem that, up to this time, he had pursued any strictly scientific studies, though his knowledge of various sciences appears, from his poetry, to have become later quite extensive. Throughout his works there are many evidences of a deep insight into the phenomena of nature. But the human soul was ever his ultimate interest; in his own words, "little else is worth study" than what bears upon its development. His early work, *Paracelsus* (1835), showed the transcendental character of his genius, and struck the key-note of his subsequent poetry—namely, that "truth is within ourselves," meaning spiritual and absolute truth, the greatest agency for the awakening of which being great personalities.

He married in 1846 the poet Elizabeth Barrett. Their married life of fifteen years (she died in 1861) was spent in Italy, and chiefly in Florence, golden records of which are his *One Word More* and *O Lyric Love, Half Angel and Half Bird*. A son, Robert Wiedemann Barrett Browning, who has attained to considerable distinction as an artist, was born Mar. 9, 1849.

Italy was ever Browning's "land of lands," and his poetry is informed throughout with its spirit, and exhibits a subtle knowledge of the Italian character in all its phases. "Open my heart and you will see graved inside of it 'Italy.'" After the death of Mrs. Browning he took up his abode in London, making annual summer visits to the Continent till the end of his life, especially to his beloved Venice.

Of his voluminous poetry space allows mention of only the more important works, or collections published under general titles: *Strafford: an Historical Tragedy* (1837); *Sordello* (1840); *Bells and Pomegranates*, in 8 nos. (1841–46), containing many of his most popular compositions; *Christmas Eve and Easter Day* (1850) give the poet's attitude toward Christianity; *Men and Women* (1855); *Dramatis Personæ* (1864); the last two collections will continue perhaps to be most read; *The Ring and the Book* (1868–69), his masterpiece, and the greatest poetical achievement of the century; *Balaustion's Adventure, including a Transcript* from *Euripides* (1871); the *Transcript* is a paraphrase of the *Alkestis*, informed with the idea of the regenerating power of personality; *Fifine at the Fair* (1872); *Red Cotton Nightcap Country* (1873); *Aristophanes's Apology* (1875); *La Saisiaz* (1878), "the poet's musings on death, God, the soul, and the future state"; *Dramatic Idylls* (1879; 2d series 1880), etc. His last volume, *Asolando*, was published in London on the day of his death, which took place in Venice, in the Palazzo Rezzonico, Dec. 12, 1889. His body rests in Poets' Corner, in Westminster Abbey.

By far the largest portion of his voluminous poetry is dramatic monologue—a difficult art-form which he made peculiarly his own, in bringing it into the service of that "worthier stage, the soul itself, its shifting fancies and celestial lights."

After nearly fifty years of noble poetic productiveness, which was unattended by any conspicuous recognition, the poet at last received a portion of the payment in the public estimation which had been so long due him. The Browning Society of London was founded in 1881 by Dr. F. J. Furnivall for the study and discussion of his works, the publication of papers on them, etc. A large body of valuable criticism has been since published by the society, and an interest has been awakened which has resulted in the publication of many works of various kinds on his poetry, and in the establishment of Browning clubs all over the English-speaking world—an interest which, by reason of its solid basis, will be perpetuated and increased.

Hiram Corson.

Brownists: See Baptists.

Brownlow, William Gannaway: Methodist divine and politician; b. in Wythe co., Va., Aug. 29, 1805; removed to Tennessee, where he edited the *Knoxville Whig*, in which his caustic writing earned him the sobriquet of "the fighting parson." In 1856 he published *The Iron Wheel Examined and its False Spokes Extracted*, in reply to an assault on Methodism. After the breaking out of the war in 1861 he was a firm adherent of the Union party, in consequence of which he suffered arrest and imprisonment, when the Confederate government in 1862 sent him within the Union lines. He then lectured in Northern cities to large audiences, but in 1864 returned to Knoxville, and in 1865 was elected Governor of Tennessee by the Republicans; re-elected in 1867. He was a member of the U. S. Senate from 1869 to 1875. D. in Knoxville, Tenn., Apr. 29, 1877.

Brownlow: Earls, and Viscounts Alford (1815, in the United Kingdom), Barons Brownlow (1776, in Great Britain), and Baronets (1677), a prominent family of Great Britain.—Adelbert Wellington Brownlow, the third earl, born Aug. 19, 1844, succeeded his brother in 1867. He was member of Parliament for North Shropshire 1866–67.

Brown-Séquard, brown'se-kaar', C. Édouard, M. D.: physiologist and neurologist; b. in the island of Mauritius in 1818. He was the son of Edward Brown, a Philadelphian, and a French lady *née* Séquard. He studied in Paris, where he graduated as M. D. in 1840. He gained distinction by experiments on blood, animal heat, and the spinal cord. These highly important researches are believed to have thrown as much light as those of any other observer upon the physiology and diseases of the nervous system. In 1869 he was appointed professor in the School of Medicine in Paris. His researches have done much to elucidate the relations of the sensor to the motor nerves and the gray matter of the brain. He was a lecturer in Harvard University 1864–68; a practitioner in New York 1873–78; the founder of several medical journals in Paris; Professor, from

1878, of Experimental Medicine in the Collège de France. Late in life he announced the discovery of an *elixir vitæ* prepared from the genitals of sheep for inoculation, but to the detriment of his reputation. He resided chiefly in Paris. His principal works are *Physiology and Pathology of the Nervous System* (1860); *Paralysis of the Lower Extremities* (1860); *Lectures on Nervous Affections* (1873); articles in medical journals. D. in Paris, Apr. 1, 1894.

Brownson, Nathan: a physician and statesman of Georgia; graduated at Yale in 1761; member of the Provincial Congress (1775); surgeon of the Revolutionary army; member of the Continental Congress (1776 and 1778); Governor of Georgia in 1781. D. in Liberty co., Ga., in 1796.

Brownson, Orestes Augustus, LL. D.: journalist and theologian; b. in Stockbridge, Vt., Sept. 16, 1803. He founded in 1838 *The Boston Quarterly Review*, known later as *Brownson's Quarterly Review* (New York), and nearly all written by him; discontinued in 1873; was a frequent contributor to the *Democratic Review*. He became a Roman Catholic in 1844, having previously been a Presbyterian, Universalist, and Unitarian. He published a novel, *Charles Elwood, or the Infidel Converted* (Boston, 1840), and other works. D. in Detroit, Mich., Apr. 17, 1876. See his *Works* (New York, 1883–85, 19 vols.).

Brown's Valley: village; Traverse co., Minn. (for location of county, see map of Minnesota, ref. 8–A); is terminus of Brown's Valley branch of Great Northern R. R.; has four churches, a good school, a grain elevator, and a flouring-mill. Its water-supply is mostly derived from an artesian well. It is situated in a fine agricultural district between the sources of Big Stone and Traverse Lakes, which form the boundary between Minnesota and South Dakota for over 70 miles. Pop. (1880) 64; (1890) 498; (1900) 721.

Editor of "Interlake Tribune."

Brownsville: Lonoke co., Ark. (for location of county, see map of Arkansas, ref. 3–D); 27 miles E. of Little Rock. Here an engagement took place, Aug. 25, 1863, between a division of U. S. cavalry and the Confederates, who were quickly driven from the town.

Brownsville: borough; Fayette co., Pa.: on railroad and the Monongahela river; 35 miles S. of Pittsburg (for location of county, see map of Pennsylvania, ref. 6–B); has large glass-factories, coal mines, iron-foundries, machine-shops, planing-mills, etc. Pop. (1880) 1,489; (1890) 1,417; (1900) 1,552.

Editor of "Clipper."

Brownsville: city; capital of Haywood co., Tenn. (for location of county, see map of Tennessee, ref. 7–B). The city is in the midst of a rich cotton-growing district, and its principal industries are connected with the shipping and manufacture of cotton. Pop. (1890) 2,516; (1900) 2,645.

Brownsville: a river-port and city; on railroad; capital of Cameron co., Tex. (for location of county, see map of Texas, ref. 8–H); on the left bank of the Rio Grande, opposite Matamoras, Mexico. It has steam-navigation on the Rio Grande and an extensive trade with Mexico. Here are a custom-house, 6 churches, 9 schools, and a Roman Catholic college. Brownsville was taken from the Confederates by Gen. Banks in Nov., 1863. Pop. (1880) 4,938; (1890) 6,134; (1900) 6,305.

Editor of "Cosmopolitan."

Brown University: an institution of learning founded in 1764 at Warren, R. I., and removed to Providence, its present seat, in 1770. Its first name was Rhode Island College, but in 1804 it received its present name, in honor of Nicholas Brown, one of its chief benefactors. Its presidents have been James Manning, 1765–90; Jonathan Maxey, 1792–1802; Asa Messer, 1802–27; Francis Wayland, 1827–55; Barnes Sears, 1855–67; Alexis Caswell, 1868–72; Ezekiel G. Robinson, 1872–89; E. Benjamin Andrews, 1889–98; William Herbert Perry Faunce since May, 1899. The corporation consists of 12 fellows and 36 trustees, of whom a slight majority, including the president, must be Baptists, while the rest *can not* be, except that 4 fellows may be members of any denomination, though these places have never been filled by Baptists. The administration is most liberal and catholic. The statistics for 1900 show 75 members of the faculty and 886 students, of whom 88 are graduate students. The library has 100,000 volumes. The 13 university buildings are all substantial and in good order, and several of them new and of superior architecture. The gymnasium is exceptionally beautiful and well equipped. The observatory contains one of the finest telescopes in America. The university's invested funds amount to about $1,300,000. The buildings and grounds have an assessed valuation of half a million more. Courses of study are provided for the degrees of A. B., B. P., B. S., C. E., and M. E. The studies for the first year are usually prescribed, the rest nearly all elective. Of the graduate students ten are candidates for the degree of Ph. D. About half the students are from Rhode Island, about a fourth from Massachusetts and Connecticut. In the remainder nearly all the States are represented, as well as Canada. Revised by E. B. Andrews.

Brownwood: city; capital of Brown co., Tex. (for location of county, see map of Texas, ref. 3–G); on Gulf, Col. and Santa Fé and Fort Worth and Rio Gr. R. Rs.; 370 miles from Galveston and 140 miles from Austin; has 6 churches, 2 public schools, Daniel Baker College (Presbyterian), and Howard Payne College (Baptist). Its principal industrial establishments are a cottonseed-oil mill, roller flouring-mills, ice-factory, wire-fence, iron-cornice, and saddle and harness manufactories, and coal mines. The city has a thriving trade in wheat, cotton, hay, pecans, cattle, and hides. Pop. (1880) 725; (1890) 2,176; (1900) 3,965.

Proprietor of "Banner."

Brozik, Vaczlav: painter of historical subjects and genre; b. at Tzemoschna, near Pilsen, Bohemia, in 1852; pupil of Piloty and of Munkacsy; second-class medal, Salon, 1878; officer Legion of Honor 1890. His best work is the *The Imperial Counselors Martinitz and Slawata thrown out of the windows of the Château of Hradschine at Prague by Count Thurn, in 1618*, which is dramatically composed, and fairly good in color and drawing. The large picture of *Columbus before Ferdinand and Isabella*, in the Metropolitan Museum, New York, is much inferior to it. Studio in Paris.

William A. Coffin.

Bruce: the name of a noble family of Scotland; descended from Robert de Bruis (or de Brus), a Norman knight who followed William the Conqueror to England in 1066. He derived his lineage from Brusi, a Northman, a son of the famous Sigurd. His younger son, Adam, who acquired a large estate in Yorkshire, left a son, Robert, who received from David I. of Scotland a grant of the lordship of Annandale, held by the tenure of military service. He died in 1141, and left a son Robert, who was the second Lord of Annandale. This second lord had a grandson, Robert, who was the fourth Lord of Annandale. He married Isabel, a daughter of David, Earl of Huntingdon, younger brother of King William the Lion, and thus laid the foundation for the royal house of Bruce. He died in 1245. Robert de Bruce, a son of the preceding, and the fifth Lord of Annandale, was born in 1210. When the Scottish throne became vacant by the death of Queen Margaret in 1290, this Robert de Bruce and Baliol claimed the throne. The dispute was referred to Edward I. of England, who decided in favor of Baliol. Robert died in 1295, leaving a son, Robert, who by his marriage with the Countess of Carrick obtained the title of Earl of Carrick (1271). He fought in the English army against Baliol at the battle of Dunbar. D. in 1304, and left a son, Robert, who became King of Scotland.

Bruce, Alexander Balmain, D. D.: theologian; b. in the parish of Aberdalgie, Perthshire, Scotland, Jan. 30, 1831; studied in Edinburgh; was settled in Cardross, Dumbartonshire, in 1859; was translated to Broughty Ferry, Forfarshire, in 1868; and in 1875 was made Professor of Apologetics and New Testament Exegesis in Free Church College of Glasgow. Has published *The Training of the Twelve Apostles* (Edinburgh, 1871; 3d ed. 1883); *The Humiliation of Christ* (1876; 2d ed. 1881); *The Chief End of Revelation* (London, 1881); *The Parabolic Teaching of Christ* (1882; 3d ed. 1887); *The Galilean Gospel* (Edinburgh, 1882); *The Miraculous Element in the Gospels* (London, 1887); *The Kingdom of God* (Edinburgh, 1889); *Apologetics* (1892); and some minor works.

S. M. Jackson.

Bruce, David: See David II.

Bruce, Edward: King of Ireland; younger brother of Robert, King of Scotland; fought for Scottish independence; landing in Ireland with 6,000 men in 1315, wrested Ulster from the English, and was crowned King of Ireland 1316; defeated and slain in battle of Dundalk, Oct. 5, 1318.

Bruce, Sir Frederick William Adolphus: a British diplomatist; b. in Broomhall, Fifeshire, Scotland, Apr. 14, 1814; brother of Lord Elgin; graduated at Oxford 1834. He was consul-general in Egypt in 1849; minister to China 1861; and in 1865 succeeded Lord Lyons as ambassador at Washington. D. in Boston, Mass., Sept. 19, 1867.

Bruce, George: b. in Edinburgh, Scotland, June 26, 1781; removed in 1795 to the U. S., and learned to be a printer in Philadelphia. In 1803 he became publisher and printer of the New York *Daily Advertiser*; in 1806, with his brother David, he began printing books; in 1812 they introduced stereotyping into the U. S., and soon after established an extensive type and stereotype founding business. George, with his nephew David, invented a successful type-casting machine. D. in New York, July 6, 1866.

Bruce, Sir George Barclay: b. in Newcastle-on-Tyne in 1821. He was trained for the profession of a civil engineer as a pupil of Robert Stephenson, on whose recommendation he obtained appointments on the Newcastle and Darlington, the Northampton and Peterborough, and the York, Newcastle and Berwick Railways, and became resident engineer of the Royal Border bridge, a work nearly half a mile long, carrying the last-named railway over the Tweed at Berwick. This bridge was opened by the Queen with considerable state in 1850. Shortly afterward Mr. Bruce went to India, and in 1853 became chief engineer of the Madras Railway. He laid out and constructed the original line, 500 miles long, on the departmental system, i. e. dispensing with a contractor, a proceeding which was reckoned a bold experiment in those days. He became consulting engineer to what is now the South Indian Railway, of 600 miles, which was carried out on the same system as the Madras line. In addition, he was engineer also to some East Prussian railways, and to the Government of New Zealand for its lines, as well as to those constructed in Spain and the Spanish-speaking republics, among the most notable being the Rio Tinto and the East Argentine lines. On June 6, 1887, he was elected president of the Institution of Civil Engineers, and again on May 29, 1888. Shortly afterward he received the honor of knighthood, as having been president at the time of the jubilee of the Queen. Sir George has been moderator of the English Presbyterian Synod. Wm. R. Hutton.

Bruce, James: traveler; b. in the county of Stirling, Dec. 14, 1730. He was appointed consul-general at Algiers in 1763, after which he studied several Oriental languages, and explored the antiquities of Barbary. In 1768 he departed from Cairo on a journey to Abyssinia, in order to discover the source of the Nile. Passing through Syene, Cosseir, and Jidda, he reached Gondar in Feb., 1770. He discovered the source of the Blue Nile in November of that year, and remained about two years in Abyssinia, the king of which treated him kindly. He passed through great dangers and hardships in his return, and arrived in England in 1774. In 1790 he published *Travels to Discover the Source of the Nile* (5 vols.). His veracity was at first doubted by many, but his statements have been confirmed by Salt, Belzoni, and others. D. at Kinnard, Apr. 27, 1794. See A. Murray, *Life of Bruce*.

Bruce, Michael: Scottish poet, whose productions (mostly hymns) are characterized by singular pathos and beauty; b. at Kinneswood, in the county of Kinross, Mar. 27, 1746. He died of consumption July 5, 1767. In 1770 his "friend," the Rev. John Logan (1748–88), published what purported to be his literary remains. In 1781 this same Logan published another volume of poems, which he called his own. The best of these, it is now almost absolutely certain, came from the pen of Michael Bruce. A baser act of literary piracy was never perpetrated. See *The Works of Michael Bruce*, edited by Rev. Alexander B. Grosart, Edinburgh, 1865.

Bruce, Robert: an heroic King of Scotland; b. Mar. 21, 1274; son of Robert de Bruce, Earl of Carrick. In 1296, as Earl of Carrick, he swore fealty to Edward I. of England, but he soon joined the Scottish leaders who were fighting for the independence of Scotland. Having made peace with Edward I., he became in 1299 one of the four regents who ruled the kingdom. In 1305 he was involved in a quarrel with the Red Comyn, who was a nephew of Baliol, and was a claimant of the throne. Bruce killed Comyn, and then assembled his vassals, and was crowned at Scone in the spring of 1306. His small army was soon defeated by the English, and he was compelled to take refuge in the island of Rathlin, on the coast of Ireland, where he remained all winter. Renewing the contest in the spring, he defeated the English at Loudon Hill in May, 1307. In less than two years he made himself master of nearly all Scotland, and in 1309 he drove back an invading army of Edward II. The latter invaded Scotland again in 1314 with an army of about 100,000 men. Bruce, who had less than half as many, gained a complete victory at Bannockburn, June 24, 1314. In 1318 the Scots invaded England, and after several other campaigns the war was suspended in 1323 by a truce. By a treaty of peace concluded at Northampton in 1328 the English king recognized the independence of Scotland. Bruce died June 7, 1329, and was succeeded by his son David.

Bru'cea: a genus of shrubs of the family *Rutaceæ*. One species of this genus, a native of Abyssinia, is called *Brucea anti-dysenterica* because its leaves have astringent properties of great value in diarrhœa and dysentery. In Sumatra and China another species, the *Brucea sumatrana*, is used for the same purpose as the species just named. H. A. H.

Bruce Mines: a port of entry of the Algoma district, Ontario, Canada; near the north end of Lake Huron; 35 miles below Sault Ste. Marie (see map of Canada, ref. 10–K). It has productive copper mines, and exports large quantities of fish. Pop. 1,500.

Bruch, brookh, Max: musician; b. in Cologne, on the Rhine, Jan. 6, 1838; early showed musical talent, in which he was directed by his mother. By the time he was fourteen years old he had already written nearly seventy compositions, among them being a symphony, which was performed in Cologne in 1852. He then studied, first under Ferdinand Hiller, and later at Leipzig. In 1859 he returned to his native city, and began his professional career. Among his early compositions is his *Jubilate, Amen*, which has been sung with great success by choral societies. His first great work was the opera *Loreley*, composed to the text which Geibel wrote for Mendelssohn. This was produced in Mannheim in 1863, and is a standard work in the German operatic repertory. In 1864 he produced his cantata for male voices, *Frithjof*, at Aix-la-Chapelle. In 1873 his opera *Hermione*, based on Shakspeare's *Winter's Tale*, was produced at Berlin and Dresden. Other important compositions are *Salamis*; *Norman Expedition*; *Roman Song of Triumph* (a particularly fine work); *Fair Ellen*, on the story of the siege of Lucknow: *Odysseus*; *Lay of the Bell*; *Achilleus* and *Arminius*. This last is a special favorite in the U. S., having been sung twice at the Worcester festivals, and also in Philadelphia. Bruch also composed symphonies and overtures, and a few violin concertos, but is better known by his vocal music. D. E. Hervey.

Bruch'sal: a town of Germany; in Baden; on the river Salzbach; and on the railway from Heidelberg to Carlsruhe; 14 miles by rail N. E. of the latter (see map of German Empire, ref. 6–D). It is the northwestern terminus of a railway which extends to Friedrichshafen on Lake Constance. It has an old castle of the twelfth century, a fine palace, a gymnasium, and a paper-mill. Pop. (1885) 11,657; (1890) 11,902.

Bru'cia, or **Brucine**: a bitter and poisonous vegetable alkaloid found in *Strychnos nux vomica*. It is characterized by giving a blood-red color with concentrated nitric acid. It was discovered in bark incorrectly supposed to be that of *Brucea antidysenterica*, whence its name. Its toxicological effects are like those of strychnia, but it is far less active.

Brucite: the native magnesic hydrate, MgH_2O_2. It is found in serpentine at Hoboken, N. J. The finest specimens occur in the chrome mines of Texas, Pa.

Brück'e, Ernst Wilhelm: physiologist; b. at Berlin, Germany, June 6, 1819; became in 1846 teacher of anatomy at the Berlin Art Academy; in 1849 Professor of Physiology in Vienna. He is the author of *Anatomische Beschreibung des Augapfels* (1847); *Grundzüge der Physiologie und Systematik der Sprachlaute* (1856; 2d ed. 1876); *Neue Methode der phonetischen Transcription* (1863); *Physiologie der Farben für die Zwecke der Kunstgewerbe* (1866); *Die physiologischen Grundlagen der neuhochdeutschen Verskunst* (1871); and *Vorlesungen über Physiologie* (1885). D. in Vienna, Jan. 7, 1892.

Brucker, broo'ker, Johann Jakob: a German historian and Protestant minister; b. in Augsburg, Jan. 22, 1696; studied at Jena; became pastor in Augsburg 1744. Among his works is a *Critical History of Philosophy* (in Latin, 5 vols., Leipzig, 1741–44), which has a high reputation. It contains valuable biographical materials, but is deficient in critical analysis. D. in Augsburg, Nov. 26, 1770.

Bruck-Lajos, Louis: genre-painter; b. at Papa, Hungary, Nov. 3, 1846; pupil of the Vienna Academy and of Munkacsy; formerly a frequent exhibitor in the Paris

Salons, but has resided of late years in London, and his work is more often seen there. Well known to American collectors. W. A. C.

Bruckner, brook'ner, ANTON: musician; b. at Ausfelden, Austria, Sept. 4, 1824; was a chorister and subsequently organist of the Institute of St. Florian; in 1855 became organist of Linz cathedral; continued his studies under Sechter and Kitzler; succeeded Sechter as organist of the Hof Kapelle, Vienna, at the death of the latter in 1867. He was a famous organist, and in late life became a composer, and produced three grand masses, seven symphonies, and many other works, all of which are marked by profound learning. His romantic symphony in E flat (No. 4) was performed in New York by the Philharmonic Society, Mar. 16, 1888; his symphony in D minor by the Symphony Society in 1885; and his symphony in E major (No. 7) by the Philharmonic Society in 1886. D. Oct. 11, 1896. D. E. HERVEY.

Bruges, broo'jez (Dutch *Brugge*, or *Bruggen*, i. e. bridges, Lat. *Brugæ*): a fortified city of Belgium; capital of the province of West Flanders; situated on a fertile plain about 8 miles from the ocean, and 64 miles by rail N. W. of Brussels; lat. 51° 12′ N., lon. 3° 14′ E. (see map of Holland and Belgium, ref. 9–B). The railway from Ostend to Brussels passes through Bruges, which is connected with the ocean by several canals. It derives its name from the numerous bridges (about fifty-four) which here cross the canals. It contains many fine Gothic edifices, some of which were built in the fourteenth century, and are richly adorned with works of art. Among these are the Church of Notre Dame, which has a spire 450 feet high, and contains a splendid monument of Charles the Bold; the town-hall, with a lofty tower and a celebrated chime of forty-eight bells; and the Cathedral of St.-Sauveur, furnished with paintings of eminent artists. Memling's *Shrine of St. Ursula* and his other works at Bruges are of great importance in the history of mediæval painting. Bruges has an academy of painting, a public library, a museum, an episcopal college, a hospital, a school of surgery, and an institution for the blind. Here are manufactures of cotton, linen, and woolen fabrics, lace, leather, cordage, tobacco, and soap. Several thousand women are employed in the manufacture of lace of fine quality. Bruges was an important commercial town before the Norman conquest (1066), after which it continued to increase in riches and population. In the thirteenth century it was the great central mart of the Hanseatic League. Its manufactures were also very extensive. The tapestry and cloths of Bruges were celebrated for their excellence. The population once exceeded 200,000. Its prosperity was injured by a popular revolt in 1488, and by persecutions and vexations under Philip II. of Spain. Pop. (1896) 50,338.

Brugmann, brookh'măn, FRIEDRICH KARL: philologist; b. at Wiesbaden, Germany, Mar. 16, 1849; studied at Halle and Leipzig 1867–71; taught in the gymnasium at Wiesbaden 1872–73, at Leipzig 1873–77. In 1877 he became a privat-docent in the University of Leipzig; in 1882 assistant professor; in 1884 was called to the professorship of Comparative Philology at Freiburg; in 1887, after the death of Georg Curtius, was called as his successor to Leipzig. Brugmann is distinguished not only for his scientific attainments, but for his skill as a teacher, and his clearness and force as a lecturer and writer. His investigations in the field of Indo-European vocalism have done much to bring about the great changes of theory and method which characterize the history of the science in the last fifteen years. Especially rich in its results was his article on *Nasalis sonans*, published in vol. ix. of *Curtius's Studien*, of which Brugmann was at the time joint-editor. Though the position taken in this article was so radical as to call forth a disclaimer and rebuke (see note at end of *Studien*, ix.) from his co-editor, Prof. Curtius, and led ultimately to a personal rupture between the two men, it proved itself to be nothing less than a turning-point in the history of the science. Its essential results are to-day universally accepted. The association of Brugmann with Hermann Osthoff in the publication of the *Morphologische Untersuchungen* (vols. i.–iv., 1878–81, vol. v., 1890) was especially significant, these writings characterizing the period of transition. The chief work of Brugmann is that in which he brings together and classifies with a masterly control of the difficult material involved the whole body of results in the field of Indo-European grammar from the sides of phonology and inflection, *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (3 parts appeared, 1886–90; English translation). Among his other works are: *Ein Problem der homerischen Textkritik* (1876); *Litauische Volkslieder und Märchen*, with A. Leskien (1882); *Griechische Grammatik*, in vol. ii. of *Müller's Handbuch der Albertinus Wissenschaft* (2d ed. 1890); *Zum heutigen Stand der Sprachwissenschaft* (1885). He is also, in company with W. Streitberg, editor of the *Indogermanische Forschungen*. BENJ. IDE WHEELER.

Brugsch, brookhsh, HEINRICH KARL: Egyptologist; b. at Berlin, Feb. 18, 1827; studied at Berlin; made his first scientific journey to Egypt in 1853; became privat-docent in Egyptology in Berlin 1854; accompanied the Prussian embassy into Persia 1860; returned 1861; he was appointed Prussian consul to Cairo in 1864; in 1868 the khedive made him director of the museum of Boulak; became Professor of Egyptology at Göttingen 1869. In 1885 and 1886 he was again in Persia for a stay, but from 1886 he lived in Berlin, where he lectured in the university. In 1891 he took 3,000 papyrus rolls with him from Egypt. Among his numerous writings, all of which are of the first rank, may be mentioned: *Grammaire démotique* (Berlin, 1855); *Hieroglyphisch-demotische Wörterbuch* (Leipzig, 1867–82, 7 vols.); *Geschichte Ægyptens unter den Pharaonen* (1877; Eng. trans. *History of Egypt under the Pharaohs*, 1879; 2d ed. by Mary Brodrick, 1891); *Religion und Mythologie der alten Ægypter* (1884); *Thesaurus inscriptionum ægypticarum* (1883–91, 6 parts); *Steininschrift u. Bibelwort* (Berlin, 1st and 2d ed. 1891). D. in Berlin, Sept. 10, 1894.

Brühl, HEINRICH, Count von: German statesman; b. in Weissenfels, Aug. 13, 1700; prime minister to Augustus III. of Saxony and Poland 1746; impoverished the country in slavishly supplying his master's and his own extravagance; gained wealth and titles. The Royal Library in Dresden contains his collection of 62,000 volumes. D. in Dresden, Oct. 28, 1763.

Brule Indians: See SIOUAN INDIANS.

Brumaire, brü'mãr': second month in the calendar of the French republic; derived from *brume*, a mist, a fog, Lat. *bruma*, winter. It comprised the time from Oct. 23 to Nov. 21. See CALENDAR.

Brum'mell, GEORGE BRYAN: "Beau Brummell," a famous fop; b. in London, June 7, 1778; schooled at Eton and for a while at Oxford. He had elegant taste in dress, became intimate with the Prince of Wales, lived in sumptuous style, and associated with the nobility on equal terms; was recognized as an oracle in questions of etiquette and dress; squandered a fortune; went into exile in 1815; and died at Caen in a pauper lunatic asylum, Mar. 29, 1840. See his *Life* by Jesse (new ed. 1886).

Brunck, RICHARD FRANÇOIS PHILIPPE: classical scholar; b. at Strassburg, Alsace, Dec. 30, 1729. He was liberally educated in Paris, and became an ingenious critic and bold emendator of the classics. He edited Anacreon, Aristophanes, Sophocles, and Terence, and published *Analecta Veterum Poetarum Græcorum* (1772–76). In the French Revolution he warmly supported the popular cause. D. June 12, 1803.

Brundisium: See BRINDISI.

Brunehaut, brün'hō, or **Brunehilde**, brün'hĕld': a famous queen; daughter of Athanagildus, King of the Visigoths. She was married in 568 A. D. to Sigebert, King of Austrasia. She was beautiful, ambitious, and high-spirited. Her husband was assassinated in 575 by the order of Fredegonda, Queen of Neustria. She afterward governed the kingdom with ability, and obtained an ascendency over her son Childebert, who was the nominal king. Having been defeated in battle and captured by Clotaire II., she was murdered in 613 A. D.

Brunei, or **Borneo**: a seaport-town on the northwest coast of Borneo; capital of the sultanate of Brunei (see map of East Indies, ref. 5–F), a territory of 3,000 sq. miles and 50,000 inhabitants which came under British protection in 1888. The houses are built on posts, and canals pass through all the streets. Pop. about 25,000.

Brunel', ISAMBARD KINGDOM, D. C. L., F. R. S.: engineer; b. in Portsmouth, England, Apr. 9, 1806. He was employed under his father as assistant engineer of the Thames tunnel, in the construction of which he displayed great energy and ability. In 1833 he was appointed chief engineer of the Great Western Railway. He was the designer and engineer of the Great Western steamship and of the Great Eastern, said to be the largest vessel ever built,

and of the Royal Albert bridge, Saltash. (See BRIDGE.) D. Sept. 14, 1859. See *Life* (1870) by his son.

Brunel, Sir MARK ISAMBARD, F. R. S.: engineer; b. near Rouen, in France, Apr. 25, 1769; father of the preceding. Driven from France by the Reign of Terror, he removed to New York in 1793, and designed the Bowery theater of that city. In 1799 he went to England, and married a Miss Kingdom. He was distinguished for his mechanical ingenuity, and invented a machine for making block pulleys, for which the Government gave him $85,000, and other useful machines. His most important work is the Thames tunnel, which was commenced in 1825 and opened in 1843. D. Dec. 12, 1849. See R. Beamish, *Life of M. I. Brunel.*

Brunelleschi, broo-nel-les'kĕe, FILIPPO: architect and sculptor; b. in Florence in 1377. He promoted the restoration of the ancient style of architecture as a substitute for the Gothic, which in his youth prevailed in Italy. The first church built in Europe in the revived classical style was the Church of San Lorenzo in Florence, designed by him. About 1418 he was appointed architect of the Cathedral of Florence (Santa Maria del Fiore), which had been commenced about 1296, and was unfinished. He raised over it a grand and beautiful dome, which is one of the largest in the world. Among his other works is the Pitti Palace of Florence. D. in Florence, Apr. 16, 1446. See Baldinucci, *Vita di F. di Ser Brunellesco* (1812).

Brunet, brü'nay', JACQUES CHARLES: bibliographer; b. in Paris, Nov. 2, 1780; d. there, Nov. 14, 1867. He was the son of a bookseller, and was brought up among books. He prepared numerous catalogues, and contributed largely to the science of bibliography. His great work was the *Manuel du Libraire et de l'Amateur de Livres* (first published in 1810; 5th ed., Paris, 1860–65, 6 vols., 3 supplements, 1870–80).

Brunetière, brü'ne'ti-ār', FERDINAND: French critic; b. in Toulon, July 19, 1849; became in 1886 Lecturer on the French Language and Literature in the École Normale Supérieure at Paris, and a member of the Academy June 8, 1893. As a contributor to the *Revue des Deux Mondes* he has distinguished himself for his defense of the classic French tradition in literature, and for his sharp criticism of realism, naturalism, determinism, and similar literary and ethical doctrines in great vogue. Among his works are *Études critiques sur l'histoire de la littérature française* (3 series, 1880–82–87); *Le Roman naturaliste* (1883); *Histoire et Littérature* (1884–86); *l'Évolution des Genres dans l'Histoire de la Littérature* (vol. i., 1890). A. R. MARSH.

Brunhilda, or **Brunehild** of Norse mythology: See BRYNHILD.

Bruni: See ARETINUS.

Brunlees, Sir JAMES, F. R. S.: past president of the Institution of Civil Engineers; b. at Kelso, Roxburghshire, Scotland, in 1816; educated there and at the University of Edinburgh. He practiced as a surveyor, and in 1838 became assistant engineer on the Bolton and Preston Railway, one of the first lines constructed in England. From 1844 to 1850 he carried out the extensive works of the Lancashire and Yorkshire Railway system, with Sir John Hawkshaw as chief engineer. In 1850 he constructed the Londonderry and Coleraine Railway, in 1852 undertook the difficult Ulverston and Lancaster Railway across Morecambe Bay; was engaged in other engineering work in England and abroad, and as arbitrator in the settlement of disputed contracts. Among his works are the Solway Junction Railway, Clifton Extension Railway, Mersey Tunnel Railway, the Avonmouth, King's Lynn, and Whitehaven docks. He was associated with Sir John Hawkshaw as engineer of the proposed Channel tunnel. He constructed in Brazil the São Paulo, the Minas and Rio, and the Porto Alegre railways, and received the decoration of the Brazilian order of the Rose. He also built the Central Uruguay and the Bolivar railways. He was knighted by the Queen at Windsor in 1886. He became a member of the Institution of Civil Engineers in 1853, and its president in 1883. He wrote upon piles, railways, sea embankments, land reclamation, iron viaducts, etc. D. June 2, 1892.
WM. R. HUTTON.

Brünn (Slavic *Brno*, the ford): a fortified city of Austria; the capital of Moravia; beautifully situated at the confluence of the Schwarza and the Zwittawa; 94 miles by rail N. N. E. of Vienna, and 159 miles by rail S. E. of Prague; lat. 49° 11′ 39″ N., lon. 16° 36′ 39″ E. (see map of Austria-Hungary, ref. 4–F). Here is the castle of Spielberg, used as a state prison. Among the remarkable public buildings are the cathedral, the Gothic Church of St. James, the *Landhaus*, formerly a rich Augustine convent, several palaces of the nobility, and a theater. Brünn also contains a museum, a public library, and a botanic garden. It has important manufactures of woolen, cotton, and silk fabrics, ribbons, glass, soap, and tobacco. It is the seat of the highest civil and military authorities of Moravia and Austrian Silesia, and of a Roman Catholic bishop. Its manufactures of woolens are said to be the most extensive in the Austrian empire. Over 15,000 persons are employed in the factories. Napoleon used Brünn as his headquarters before the battle of Austerlitz. Pop. (1880) 82,660; (1891) 95,342.

Brunn, HEINRICH, von: archæologist; b. in Wörlitz, Jan. 23, 1822; pupil of Welcker and Ritschl; Professor of Archæology in the University of Munich; author, among other works, of *Geschichte der griech. Künstler* (2 vols., Stuttgart, 1853–59; 2d ed. 1888–89). D. July 23, 1894.

Bru'no (in Lat. *Brunus*), GIORDANO: philosopher; b. at Nola, in the kingdom of Naples, in 1548, and entered the Dominican order in 1563. He was a man of independent and speculative spirit, and rejected the orthodox doctrines of the Church. On account of his opinions he was obliged to leave his monastery in 1576, and afterward led a wandering life. He fled first to Geneva; a few years after he removed to Paris; passed some time in England. His principal works are *Spaccio della Bestia trionfante* (1584); *Della Causa Principio e Uno*; *Del Infinito Universo e Mondi.* About 1592 he returned to Italy and became a resident of Venice. Having been accused of heresy, he was imprisoned at Rome for seven years, and was burned there as a heretic Feb. 17, 1600. On June 9, 1889, a monument to him was unveiled on the same spot where he died. He was an advocate of the Copernican system on speculative and not scientific grounds. He declared the universe to be everlasting, complete, and to be God. Nature is the self-evolution of God. Fr. H. Jacobi and Schelling first called the attention of the modern world to his views. His Italian works were edited by P. Lagarde (Göttingen, 1888, 2 vols.) and his Latin works by Tocco (Florence, 1889, 1891). His *Della Causa Principio e Uno* was translated into German in J. H. Kirchmann's *Philosophische Bibliothek* (Leipzig, part 184, 1873), and his *Reformation des Himmels* (1889).
Revised by S. M. JACKSON.

Bruno, SAINT: founder of the Carthusians; b. in Cologne about 1030. His parents were prominent persons, and his education was the best the times afforded. In 1057 he became master of the cathedral school in Rheims. In 1082 he retired from the world, and with a few friends began to live in solitude at Saisse-Fontaines; in 1084 he withdrew to La Grande Chartreuse, and founded there the order of Carthusians, who adopted the rule of St. Benedict. The monastery of La Grande Chartreuse was afterward built at the same place. In 1090 he obeyed the papal summons and went to Rome as papal adviser, but finding court life distasteful he sought and obtained means to build another monastery at Della Torre (1094); subsequently another was built (1097). D. at Della Torre, Italy, Oct. 6, 1101. He was canonized 1628. (See CARTHUSIANS.) See his *Life* by D. M. Tappert (Luxemburg, 1872).

Bruno the Great: Archbishop of Cologne; b. 925; a younger brother of the Emperor Otho I. He was a man of great talents, virtue, and learning, and had a powerful influence in the Church and state. He became lord high chancellor of the empire 940; Archbishop of Cologne 953. D. in Rheims, Oct. 11, 965.

Bruns, PAUL VICTOR, von: b. in Brunswick, Aug. 9, 1812; studied at Brunswick, Tübingen, and Berlin. He was the author of several surgical treatises and handbooks, and made a special study of diseases of the larynx, for the treatment of which he invented a new and effective throat-mirror. He was one of the highest surgical authorities in Germany. His work on laryngoscopic surgery gained for him the grand prize of 20,000 marks, offered by the Academy of Turin. D. in Tübingen, Mar. 19, 1883.

Brunswick: a duchy of the German empire; consists of three larger parts and several enclaves. Area, 1,424 sq. miles. The larger part, containing the capital, is entirely surrounded by Prussia. The chief mountain-range is a part of the Hartz Mountains in the S., the highest point of which in the duchy is the Wormberg, 3,245 feet high. It is traversed by the Ocker in the N., and the Leine, Aller, and

Bode. The chief products are grain, flax, and hops. Among the mineral products are silver, lead, iron, copper, coal, alabaster, alum, salt, etc. It has extensive manufactures of linen, wooden wares, glass, sugar, tobacco, paper, cloths, etc., also large beer-breweries. It has 5 gymnasia, 1 polytechnic school, a theological seminary, 2 normal, and numerous other schools. The government is a constitutional monarchy, and the supreme power is vested in a duke and a legislative body of 46 members. The receipts and expenses for 1891–92 were each estimated at 12,400,000 marks. The public debt in 1891 amounted to 28,371,588 marks. Brunswick is represented by 2 members in the Bundesrath of the empire, and 3 deputies in the imperial Reichstag. Its contingent to the German army forms part of the Tenth Army-corps. Pop. in 1890, 403,029.

History.—Brunswick formed originally a part of the duchy of Saxony, and was given in 1194 to Henry the Lion. His grandson Otto became first Duke of Brunswick in 1235. After having been divided and reunited by the descendants of Otto, they were again united under Ernest the Confessor (d. 1546). His two sons, Henry and William, again divided the country, and formed the two branches Brunswick-Oels and Brunswick-Lüneburg, the latter of which reigned as electors of Hanover, and in the person of George I. succeeded to the British throne. Brunswick was annexed to the kingdom of Westphalia in consequence of the treaty of Tilsit, but in 1813 it again became an independent state under Frederick William, who was killed in the battle of Quatre Bras in 1815. He was succeeded by his son Karl, who was expelled from the country in 1830, and was succeeded by his brother Wilhelm, who died Oct. 18, 1884. Brunswick joined the German customs-union in 1844, assisted Prussia in the war of 1866, joined the North German Confederation in the same year, and became a member of the German empire upon its revival in 1870. With the death of Duke Wilhelm the ducal line of Brunswick became extinct, Duke Charles having died in Aug., 1873, without issue. Prince Albrecht, b. May 8, 1837, son of the late Prince Albrecht of Prussia, was unanimously elected regent of the duchy by the Diet, Oct. 21, 1885; accession Nov. 2, 1885. The heir to Brunswick is the Duke of Cumberland, excluded owing to his refusal to give up his claim to the throne of Hanover.

Revised by C. K. Adams.

Brunswick (Germ. *Braunschweig*; anc. *Brunonis Vicus*): a city of Germany; capital of the duchy of the same name; on the river Oker; and in a level district; 47 miles by rail E. S. E. of Hanover; lat. 52° 16′ 11″ N., lon. 10° 32′ 09″ E. (see map of German Empire, ref. 4–E). The old fortifications have been demolished and converted into pleasant promenades. It contains a magnificent ducal palace, an ancient cathedral, the Church of St. Andrew with a steeple 316 feet high, a mint, an opera-house, a town-hall, and a museum which contains paintings by Albert Dürer, Rembrandt, Holbein, and other great masters. Railways extend from this town to Hanover, Magdeburg, and other places. Here are manufactures of linen and woolen goods, lacquered wares, papier-maché, tobacco, hardware, etc. A great annual fair is held here. Among its institutions are a college, a gymnasium, a Realschule, and an asylum for deaf-mutes. This is a very old town. It was enlarged and beautified by Henry the Lion in the twelfth century. It formerly belonged to the Hanse League. Pop. (1885) 85,174; (1890) 101,047.

Brunswick: city; railroad junction, and port of entry; capital of Glynn co., Ga. (for location of county, see map of Georgia, ref. 7–K): on St. Simon's Sound; 8 miles from the Atlantic Ocean, and 80 miles S. S. W. of Savannah. It has a first-class system of public schools. There are here a safe and spacious harbor, a large manufacture and export of yellow-pine lumber, and a large export trade in cotton. At the south end of St. Simon's island, and on the north side of the entrance to the sound, is St. Simon's lighthouse. It is of brick, and is 108 feet high. Pop. (1880) 2,891; (1890) 8,459; (1900) 9,081.

Editor of "Times."

Brunswick: town; Cumberland co., Me. (for location of county, see map of Maine, ref. 10–B); on railroads connecting it with Portland, Augusta, and Bath; on Androscoggin river at head of navigation; 29 miles N. E. of Portland; connected by bridge with Topsham. Falls in the river furnish ample water-power. The town is the seat of Bowdoin College (*q. v.*); its industries are flour, cotton and paper mills, tannery, shipping, etc. Pop. (1880) 5,384; (1890) 6,012; (1900) 6,806.

Brunswick: town; Chariton co., Mo. (for location of county, see map of Missouri, ref. 3–F); on Wabash R. R., and on the north bank of the Missouri river; 90 miles E. by N. by railroad from Kansas City; has excellent public school, saw and planing mill, cigar-factory; is good wheat and corn shipping-point. Pop. (1880) 1,801; (1890) 1,748; (1900) 1,403.

Editor of "Brunswicker."

Brunswick-Bevern, August Wilhelm, Duke of: a Prussian general; b. Oct. 15, 1715; took part in the wars of Frederick the Great against Austria. He distinguished himself in the battles of Lowasitz, Reichenberg, Prague, and Kollin. He was defeated and taken prisoner at Breslau in 1757, and was released in 1758. D. Aug. 1, 1781. He was the tallest soldier of his time in the Prussian army.

Brunswick Black: a varnish used for the purpose of giving a bright polished appearance to coarse iron-work, such as grates and fenders. It is chiefly composed of bitumen, lampblack, and turpentine, and is applied with a brush.

Brunswick Green: an oxychloride of copper, used as a pigment in the arts. It is obtained by exposing metallic copper to the action of ammonium chloride, or by mixing sulphate of copper and common salt into a paste with water. It is also generated by the action of sea-water on copper, and occurs native in Atacama in the form of green sand, hence called atacamite.

Bruns'wick-Lü'neburg, Karl Wilhelm Ferdinand, Duke of: a German general; b. Oct. 9, 1735; nephew of Frederick the Great; eldest son of Duke Karl. He fought for his uncle in the Seven Years war, and succeeded to the dukedom in 1780. He became in 1792 commander-in-chief of the allied armies of Austria and Prussia, which invaded France and were repulsed by Dumouriez. In 1793 he resigned the command. He took command of the Prussian army in 1806, and was defeated by the French at Jena in October of that year. In this battle he was mortally wounded. D. Nov. 10, 1806.

Bruschius, broo'shi-ŭs, or **Brusch**, broosh, Gaspard: German historian; b. at Schlakenwald, Bohemia, Aug. 19, 1518; in 1552 made a count palatine and poet laureate by Ferdinand, King of the Romans. He favored Luther and Melanchthon, and in 1559 was murdered in a forest by some gentlemen who thought themselves satirized by him. His chief historical works are *De Germaniæ episcopatibus epitome* (1549) and *Monasteriorum Germaniæ præcipuorum Chronologia* (1551).

Brush: name of instruments for removing dirt from various surfaces by friction, for adjusting the hair, for polishing, for applying paints, whitewashes, and the like. Hog's bristles furnish a large part of the material for the friction surface of the best brushes; but for delicate work camel's, badger's, sable's, and rabbit's hair is used. Wire brushes are used in various departments of manufacturing industry. Split whalebone is sometimes employed as a substitute for bristles. Broom-corn and twigs of trees are often employed for stiff brushes, and the coarse instruments used in cleaning streets are partly made from bass or piassaba and other imported palm fibers. Most brushes are made by joining some of the above materials to a stock of wood, leather, bone, or metal, by various methods—a business which gives employment to many thousands in Europe and the U. S. Ingenious machines have been invented for the performance of various parts of the work of making brushes; and these machines have greatly reduced the labor and expense of manufacture.

Brush (in dynamo-electricity): a device for making electric contact with the moving parts of a generator or motor. Brushes consist of strips of copper or brass, or of bundles of wire held with suitable pressure by means of a spring in contact with the commutator or other moving part with which connection is sought. Carbon plates or pencils are largely used instead of metallic brushes. In static electricity a brush is the name given to certain forms of silent discharge through the air, the illumination from which is so faint as to be clearly visible only in a darkened room. See Dynamo Electric Machines and Electric Discharge.

Brush, Charles Francis: best known as the inventor of the Brush dynamo for arc lighting, and of a lamp that worked uniformly on a large circuit supplying many lights; b. in Euclid, O., Mar. 17, 1849, and graduated at the University of Michigan in 1869. He is also the inventor of a great number of devices which have been of practical value in the development of the electric light. In 1881 he was

made chevalier of the Legion of Honor in France. Resides in Cleveland.

Brush, George De Forest: painter of figure-subjects; b. at Shelbyville, Tenn., in 1855; pupil of Gérôme, Paris; member of the Society of American Artists 1880; associate National Academy of Design; first Hallgarten prize, National Academy, 1888. His pictures of Indian life in the West attracted notice in the New York exhibitions about 1883, and some of his most successful works are among those of that class of subjects. Latterly he has spent some years in Paris again, and at the Society of American Artists in 1892 exhibited two remarkable works, *The Portrait* and *Ossian the Bard*. His work is especially good in drawing, and presents some points of similarity in technical method to that of Gérôme, but is entirely individual in character. *Mourning her Brave* and *An Aztec Sculptor*, two of his best pictures, are in the collection of Thomas B. Clarke, New York. Studio in New York. William A. Coffin.

Brush, George Jarvis: mineralogist; b. in Brooklyn, N. Y., Dec. 15, 1831; educated at Yale College, at the University of Munich, the Mining Academy of Freiberg, Saxony, and the School of Mines in London. He became in 1855 Professor of Metallurgy in Yale, to which the professorship of mineralogy was added in 1864. He is executive officer of the Sheffield Scientific School, has published numerous papers in the *American Journal of Science*, and is author of parts of the fifth edition of Dana's *Mineralogy*. See *Popular Science Monthly* for Nov., 1881.

Brush-turkey, sometimes called **New Holland Vulture**: a bird (*Talegalla lathami*) of Australia, remarkable for the peculiar manner in which its eggs are hatched. Several pairs of these birds, having united to build a nest, collect leaves, grass, etc., into a heap, sometimes to the amount of several cart-loads. In this mass the several females deposit their eggs, where they remain till hatched by

Brush-turkey.

the artificial heat of the mound. The bird is about the size of the common turkey, and has wattles on its head and neck. When pursued, it endeavors to makes its escape by running through the tangled brush or by flying into the low branches of a neighboring tree.

Besides the above, there are several other species and genera, all Australian, and nearly all closely resembling the above bird in its peculiar habits. These now constitute the family *Megapodidæ* (*q. v.*). The birds are edible, and are much sought as game.

Bruso'ni, Girolamo: Italian historian and poet; b. in Legnano, Dec. 10, 1610. He wrote many Latin and Italian poems; was for a time confined in prison at Venice for assuming improperly the dress of a Carthusian monk. He wrote many historical and other works, of which the best known is *Istoria d'Italia* (1656–80). D. after 1679.

Brussa: a city of Asia Minor. See Broussa.

Brus'sels (in Dutch, *Brussel*; Fr. *Bruxelles*): capital of Belgium; in the province of Brabant; on the river Senne; 27 miles by rail S. of Antwerp, and 227 miles by rail N. N. E. of Paris; lat. 50° 51′ 10″ N., lon. 4° 22′ 13″ E. (see map of Holland and Belgium, ref. 10–D). It is built partly on the slope of a hill which rises 220 feet above the level of the sea, and partly on a fertile plain. The upper town on the hill is the most modern and fashionable, and contains the royal palace, public offices, and the finest hotels. Brussels is the most important and populous city of Belgium, is remarkable for the number and richness of its antique buildings, and ranks among the finest cities of Europe. The walls which formerly surrounded this city have been converted into broad promenades lined with double rows of shade trees. The Allée Verte is a fashionable promenade along the Scheldt Canal, and extends to the royal palace of Laeken, about 3 miles N. of the city. The principal public squares are the Place Royale, the Grande Place, in which stands the hôtel de ville, and the Place de la Monnaie, which contains the mint, the theater, and the exchange. Among the remarkable edifices of the city are the hôtel de ville, a fine Gothic structure with a spire 364 feet high, in the grand hall of which the Emperor Charles V. abdicated in 1555; the Gothic Cathedral of St. Gudule, which was built about 1270 and is celebrated for its painted windows, numerous statues, and carved pulpit; the Church of Notre Dame de la Chapelle commenced in 1134; the royal palace; the modern Church of Notre Dame de Bon Secours; the former palace of the Prince of Orange; and the Palace of the Fine Arts, which contains a large collection of paintings of the Flemish school; the Palais de Justice, built in 1866–83 at a cost of nearly $10,000,000, situated in the upper part of the city on a commanding eminence, and one of the most strikingly handsome buildings in Europe. Brussels has a public library (Royal) of 350,000 volumes; a botanic garden; an astronomical observatory, one of the finest in Europe; a magnetic observatory; a free university, founded in 1834, with four faculties—viz., law, medicine, mathematical, and physical sciences, and belles-lettres; a normal school, a polytechnic school, and institutions for the blind and for deaf-mutes. The only mint of the kingdom is situated here. In 1888 a world's exhibition was held in this city. Brussels is one of the great centers of Belgian industry, and is celebrated for the manufacture of lace which is considered the finest in the world. The other chief products of its manufactories are fine linens, damasks, ribbons, gold and silver embroidery, glass mirrors, jewelry, paper, porcelain, hats, mathematical and musical instruments, carriages, and chemical products. Its trade is facilitated by a canal which connects it with Antwerp, and by railways which radiate in many directions. About one-third of the people of this city speak French, and the others Flemish or Dutch. Brussels was the seat of the International Monetary Conference, called by the U. S. to discuss the position of silver, which met in Dec., 1892. Pop. (with suburbs) (1880) 394,940; (1885) 438,843; (1891) 482,268: of the city proper (1891) 182,305; (with suburbs) (1896) 531,011.

Brussels Conference: a conference of delegates from the principal military powers, called by the Emperor of Russia in 1874, to prepare the way for an agreement upon a code of rules to govern civilized warfare. It met in Brussels July 27 of that year. Delegates from Russia, Germany, France, Austria, Great Britain, the Netherlands, Belgium, Italy, Spain, Denmark, Norway and Sweden, the Swiss Confederation, and Greece were present. The single English delegate attended under express stipulations that the rules of naval warfare should not be discussed. The U. S. were not represented, alleging the lateness of the invitation.

The draft of a code had been submitted before this to the governments invited, and many of its rules, embodying the best modern usage, were acceptable to all the delegates. Thus there was a substantial agreement on the subjects of lawful weapons, care of the wounded, pillage, sieges, armistices, prisoners of war, spies, treatment of public and private property, capitulations, duties of neutral states in case troops are driven across their frontiers, and flags of truce.

The chief points of difference related to the topics of "occupation of territory" and the "*levée en masse*." Here the interests of the great and of the smaller military powers proved irreconcilable. On the one side it was argued that a portion of the enemy's territory once occupied by an invader, its defenders having been arrested or driven out, remains lawfully in the hands of that invader as occupied territory, even though his forces may have advanced and left it vacant. In the opinion of the smaller states, occupation was held a question of fact, not of construction; it must be substantiated by the constant presence of an invading force strong enough to keep its people from rising.

In like manner the *levée en masse*, or popular rising against an invader in unoccupied territory, was held by one set of delegates to be lawful only when these irregular forces were properly officered, bore arms openly, and wore such a badge or uniform as to be recognizable at a distance. Such conditions were believed by the other set to be inconsistent with a popular rising for defense, a measure upon which states with no compulsory military service must rely in case

of invasion. The subject of what could be lawfully exacted from conquered territory under the head of requisitions and contributions was also in dispute.

Although thus failing of adoption, the Brussels conference was not without value. It brought out clearly the points at issue, and the necessity for compromise in regard to them. It was a promising step in a right direction. A later attempt to codify the laws of war was made in 1880 by a committee of the Institute of International Law, with the Brussels code as a basis. It legalizes the *levée en masse* on the sole condition that the rules of war be adhered to, and defines occupied territory as a region where the former sovereign has ceased to exercise authority and the invading power alone finds itself able to maintain order. This Oxford code is reasonable, and worthy of a recognition which it has not yet received from any government.

THEODORE S. WOOLSEY.

Brussels Sprouts: like the CABBAGE (*q. v.*), a form of *Brassica oleracea*. It takes its name from Brussels, Belgium, and from the term "sprouts," which is used for kale-like plants. It differs from the cabbage in forming little heads (or buds) in the axils of the leaves nearly the whole length of the stem. As these buds develop the leaves are cut away until only a crown is left at the top of the stem. These little heads attain a diameter of an inch or two. Brussels sprouts is grown for a fall crop, the seeds being started out of doors. L. H. BAILEY.

Bru'tus, LUCIUS JUNIUS: Roman patriot; son of Tarquinia and nephew of Tarquin the Proud. According to tradition, that tyrant was about to put him to death, but he saved his life by feigning idiocy, which was the origin of his surname *Brutus*. When the tragic fate of Lucretia had prepared the people to revolt, Brutus led them, expelled the Tarquins from Rome, and founded a republic (509 B. C.). He was then elected one of the consuls. He ordered the execution of his own sons, Titus and Tiberius, who were convicted of treason. About 507 he was killed in a battle against the Tarquins.

Brutus, MARCUS JUNIUS: a Roman republican: descendant of the preceding; b. in 85 B. C. He married Portia, the daughter of Cato Uticensis, who was his maternal uncle. In the civil war he fought under Pompey against Cæsar, but after the battle of Pharsalia he was kindly treated by the dictator with whom he entered into friendly relations; he was appointed Governor of Cisalpine Gaul. His zeal for republican liberty and the influence of his friend Cassius induced him to join the conspiracy against Cæsar; both took part in his murder; became prominent leaders of the republican party; led an army against that of Antony and Octavius at Philippi (42 B. C.), and after the reverse of Cassius Brutus killed himself on the field.

Bry'an: village and capital of Williams co., O. (see map of Ohio, ref. 1–C); on Lake Shore and M. S. R. R.; 53 miles W. S. W. of Toledo. Has machine-shop, graded schools, and churches. Pop. (1880) 2,952; (1890) 3,068; (1900) 3,131.

Bryan: village and capital of Brazos co., Tex. (for location of county, see map of Texas, ref. 4–I); on Houston and Texas Cent. R. R.; 100 miles N. W. of Houston. Industries are saw and grist mill, carriage and wagon shop, chair-factory, etc. Near by is the Agricultural and Mechanical College of Texas. Pop. (1890) 2,979; (1900) 3,589.

Bryan, WILLIAM JENNINGS: lawyer, politician, and journalist; b. at Salem, Ill., Mar. 19, 1860; educated at Whipple Academy and Illinois College, Jacksonville, Ill., where he graduated with honor in 1881; studied law at Chicago for two years; returned to Jacksonville, where he began practice; married a year later, and in 1887 removed to Lincoln, Neb.; was a delegate to the Democratic State convention at Omaha 1888; declined the nomination for lieutenant-governor 1889; in 1890 elected as a Democrat to Congress; became a member of the ways and means committee; advocated "tariff for revenue only" and attracted attention as a speaker, being frequently spoken of as the "boy orator of the Platte"; re-elected to Congress in 1892 and became a champion of "free silver." At the end of his second term he returned to Nebraska and became editor of the Omaha *World-Herald*. In 1896 he received the Democratic and People's Party nomination for President on a free-silver platform, but was not elected. In 1898 he became colonel of a Nebraska volunteer regiment, and resigned in December. He was nominated again, in 1900, by the Democratic and People's (Fusion) Parties, and indorsed by the Silver Republicans and the Anti-Imperialist League, and again defeated. In Jan., 1901, he established *The Commoner*, a newspaper devoted to the interests of the laboring man and to the advocacy of "free silver."

Bryanites: followers of William O'Bryan, who separated from the Wesleyans in 1815. See BIBLE CHRISTIANS.

Bryant, WILLIAM CULLEN: poet and journalist; b. in Cummington, Hampshire co., Mass., Nov. 3, 1794; educated at Williams College, which he entered in 1810. He studied law, and in 1815 was admitted to the bar, but after practicing successfully for ten years, first at Plainfield and then at Great Barrington, removed in 1825 to New York, and became an editor. In 1826 he became connected with the *Evening Post*, of which he was the editor-in-chief from 1828 till his death. Mr. Bryant visited Europe several times and presented the literary fruit of his travel in a series of *Letters of a Traveler* (1852 and 1859), *Letters from Spain and other Countries*, and *Letters from the East* (1869), which rank high in literature of their class. Bryant's career as a poet began very early. He contributed verses to the county gazette before he was ten years old; in his fourteenth year he published a political satire, *The Embargo*, together with another long poem, *The Spanish Revolution*, which in a twelvemonth reached a second edition. *Thanatopsis*, perhaps the most impressive and most widely known of his pieces, was produced in his nineteenth year. He published the first volume of poems, *The Ages*, in 1821 at Cambridge, and the first complete collection in 1832 at New York. His translations of the *Iliad* and *Odyssey* into blank verse were published in 1870 and 1871. He responded to frequent invitations to make ceremonial addresses—a duty that he discharged with rare felicity. His efforts in this kind have been collected in a volume of *Orations and Addresses* (1873). An edition of his works complete in four volumes was published in 1883–84, edited by his son-in-law, Parke Godwin. D. at New York city, June 12, 1878. See his *Life* by Parke Godwin (New York, 1883, 2 vols.).

Revised by HENRY A. BEERS.

Bryce, GEORGE, LL. D.: Canadian clergyman; b. at Mt. Pleasant, Brant co., Ont., April 22, 1844. He graduated at Toronto University in 1869, at Knox College in 1871, and the latter year was elected as assistant and successor in Chalmers's church, Quebec. The same year he was authorized by the Presbyterian General Assembly to establish a college among Selkirk settlers on Red river, and also to organize a Presbyterian church in Winnipeg, Manitoba, all of which he successfully accomplished. The college was incorporated in 1883, and in 1884 was removed to Winnipeg. He was one of the principal founders of Manitoba University in 1871; appointed inspector of Winnipeg schools in 1877; examiner in natural science in Manitoba University in 1878; and moderator of first Presbyterian synod of Manitoba and Northwest Territories in 1884. Among his works are *Manitoba, its Infancy, Growth and Present Condition* (London, 1882); *Canada and the Northwest* (1887); and *A Short History of the Canadian People* (1886).

NEIL MACDONALD.

Bryce, JAMES, M. P.: statesman and author; b. in Belfast, Ireland, May 10, 1838; educated at the High School and University of Glasgow, and at Trinity College, Oxford, graduating at the latter in 1862 with a double first; appointed Regius Professor of Civil Law in Oxford University 1870; elected to Parliament in 1880; Under Secretary of State for Foreign Affairs in Mr. Gladstone's government in 1885. Author of *The Holy Roman Empire* (9th ed. 1888); *Transcaucasia and Ararat* (1877; new ed. 1897); and edited *Two Centuries of Irish History* (1888). *The American Commonwealth* (1888) is the best known of his works in the U. S., and is regarded by some as the best description of the political and social institutions of the U. S. ever written. In 1892 he was appointed Chancellor of the Duchy of Lancaster, with a seat in the cabinet of Mr. Gladstone.

C. K. ADAMS.

Brydges, Sir SAMUEL EGERTON: English writer and bibliographer; b. in Kent, Nov. 30, 1762; published, besides many novels, letters, poems, etc., *Censura Literaria, Containing Titles and Opinions of Old English Books* (10 vols., 1805–09); *The British Bibliographer* (4 vols. 8vo, 1810–14); and *Res Literariæ* (3 vols., 1821). He claimed that he was the lawful heir to the barony of Chandos, but his title was not recognized. D. at Geneva, Sept. 8, 1837. See his *Autobiography* (2 vols., 1834).

Bryen'nios, Philotheos: Greek Catholic bishop; b. in Constantinople, Mar. 26, 1833; educated at Chalce and in Germany; became Professor of Theology at Chalce 1861; metropolitan of Serrae, in Macedonia, 1875; of Nicomedia 1877. In 1873 he discovered the famous *Teaching of the Twelve Apostles* in the Jerusalem monastery in Constantinople, and published it first in 1883. See Dr. Schaff's edition (3d ed. 1888).

Bryen'nius, Nicephorus: Byzantine historian and general; a minister of Alexis Comnenus, whose daughter, Anna Comnena, he married. D. about 1137. His *History of Constantinople* was edited by Meineke (1836).

Bryn'hild, or **Brynhil'da**: a beautiful maiden, celebrated in the Norse mythology. Though called a valkyria, she is evidently the same person as the Princess Brunhild of the *Nibelungen Lied*. See Thorp's *Northern Mythology*, vol. i.; also Nibelungen Lied, in this work.

Bryn Mawr College (at Bryn Mawr, on the Pennsylvania R. R., 10 miles W. of Philadelphia): founded by Joseph W. Taylor, M. D., a member of the Society of Friends, who died in 1880, having bought the land, about 42 acres, and begun the erection of the college buildings during his lifetime. The college is intended to give to women of intelligence and refinement the best opportunities for culture, combined with Christian influences and social amenities. Its distinctive features are a high standard of preparation for admission; a system of studies which combines required courses for general culture with varied elective groups of two chief studies in fixed combinations and other free electives; graduate courses in all subjects offered to undergraduates; fellowships of $525 each, nine in number, open to graduates who have already distinguished themselves in particular branches of study, namely, Greek, Latin, English, German, Romance languages, history, mathematics, biology, and chemistry. A fellowship is also offered yearly to a graduate of the college to enable her to pursue studies at some European university. M. Carey Thomas, LL. D., is president (1900).

Bry'ony: a tendril-bearing, climbing, herbaceous plant of the genus *Bryonia*, of the *Cucurbitaceæ* or Gourd Family (*q. v.*). The genus contains about twenty species. They are natives of temperate and tropical regions. Two species (*B. dioica* and *B. alba*) occur in Europe, and from the roots of these is obtained the drug "Bryonia," a drastic hydragogue cathartic, now much less used than formerly. Some of the species are quite ornamental, and are desirable climbers since their tuberous roots are perennial, the stems and leaves only dying at the end of the year. The cut-leaved bryony of Ceylon is now assigned to the genus *Bryonopsis*.

Bryony, Black: a pretty, twining, tuberous-rooted plant (*Tamus communis*) belonging to the Yam family, and native of Europe, North Africa, and temperate Asia. It is somewhat cultivated for its beautiful foliage of heart-shaped, bright green leaves and bright red (but inedible) berries. A second species occurs in the Canary islands.

Bry'ophytes [from Gr. *βρύον*, moss + *φυτόν*, plant]: the mossworts (*Bryophyta*); one of the branches of the vegetable kingdom, characterized by the production of antherids and *archegones*, the latter after fertilization developing a more or less stalked, leafless *spore-fruit*. They are readily separated into two classes, viz.: (1) the liverworts (*Hepaticæ*), which are mostly thalloid plants, with splitting spore-fruits, containing elaters; (2) the mosses (*Musci*), leafy-stemmed plants, with spore-fruits mostly opening by a lid, and containing no elaters. See Plants (Fossil). C. E. Bessey.

Bryozo'a [from Gr. *βρύον*, moss + *ζῷον*, animal]: group of animals of doubtful affinities, being placed by some zoölogists as one of the classes of the *Molluscoidea*, the *Brachiopoda* being the other class; by others as one of the orders of the class *Prosopygia*, of the branch *Vermes*. (See Worms.) They are very small, and moss-like or polyp-like in appearance, usually united together in colonies, mostly marine, but some species live in fresh water. They are also known as Polyzoa (*q. v.*). J. S. K.

Bry'son, Andrew: rear-admiral U. S. navy: b. in New York, July 25, 1823; entered the navy 1837; commanded the ironclad Lehigh in 1863 and 1864 at the reduction of Fort Macon, and was in all the important fights with the defenses of Charleston harbor; became commander 1873; rear-admiral 1880; retired 1881. D. in Washington, D. C., Feb. 7, 1892.

Bu'balus [Gr. *βούβαλος*, a species of antelope]: a genus of *Bovidæ*, the species of which constitute the buffaloes of India and Africa. See Buffalo.

Bubas'tis (the *Pi-beseth* of Scripture and modern *Telbasia*): a ruined city of Lower Egypt; in the delta of the Nile; about 75 miles a little E. of N. from Cairo; lat 30° 36′ N., lon. 31° 33′ E. The site is now occupied by extensive mounds containing the remains of brick houses and broken pottery. See *Herodotus* ii., 137, 156.

Bubastis: a goddess of ancient Egypt; a deification of the moon corresponding to the Greek Artemis; said to signify literally "she who multiplies her aspects"; so called in allusion to the changes of the moon. According to other authorities, Bubastis was the deification of the cat, which animal, as is well known, was an object of worship in ancient Egypt. Her name, according to modern Egyptologists, was *Pecht* or *Pasht*.

Bubble: a globular film or vesicle of water or other liquid inflated with air, vapor, or gas. The study of bubbles has added much to our knowledge of capillarity and of molecular action in liquids. The thickness of the soap-bubble film, determined by means of the interference of light, to which the bubble owes its transcendent coloring, has furnished physicists with a means of estimating the probable size of the molecule. Soap films have been observed the thickness of which was certainly less than $\frac{1}{2000000}$ of an inch. It is certain that a molecule of water can not exceed such a film in thickness, and there are reasons, on the other hand, for thinking that its diameter can not be less than $\frac{1}{50000000}$ of an inch. E. L. N.

Bubou'ic Plague: See Plague.

Bucaramau'ga: the capital of the department of Santander, republic of Colombia; lon. 73° 10′ W., lat. 7° N.; on the east side of the main mountain-range (see map of South America, ref. 2–C). There are extensive gold, copper, and iron mines in the vicinity. Pop. 16,000.

Buccaneer' [from Fr. *boucanier*, deriv. of *boucaner*, to smoke meat on a *boucan*, a native So. Amer. name for a wooden grate or framework used in drying meat]: a name originally applied to French hunters in Hayti who brought their meat to market cured; then to the famous adventurers or filibusters who in the sixteenth and seventeenth centuries infested the West Indies and the Spanish colonies of South America. They were mostly English and French, and were united by a common hostility to the Spaniards, to plunder whom was their principal object and business. For mutual protection against the cruelty of the Spaniards, they organized themselves into an association or community bound by a simple code of laws. The island of Tortuga was at one time occupied by them, and was their chief base of operations. They took immense booty from the Spanish galleons which conveyed precious metals to Spain, and often attacked towns on the coasts. Among the famous and able leaders of the buccaneers were the French Montbar, surnamed The Exterminator, and Henry Morgan, a Welshman, who was born about 1637. The latter organized fleets and armaments, took fortresses, and displayed remarkable military talents. He was knighted by Charles II., and made governor of Jamaica, already in possession of his confederates. The navigator Dampier also took part with the buccaneers in some expeditions against the Spaniards. The wars of William III. with France dissolved the confederation, and in 1701, treaty of Ryswick, the buccaneers lost their political character, and were replaced by a set of marine thieves or vulgar pirates. See James Burney, *History of the Buccaneers* (1816); Thornbury, *Monarchs of the Main* (1855); and *Les Flibustiers au XVII^e Siècle* (1884).

Buccina'tor [Lat. deriv. of *buccina're*, to blow the trumpet, Lat. *bu'cina*]: a muscle situated in the substance of the cheeks; so called because, when the cheeks are distended with air, the contraction of the buccinator muscle forces it out. Its principal use is to hold the food between the teeth during mastication.

Buc'cinum [Lat., trumpet]: a genus of gasteropod mollusks known as the whelks; characterized by a shell with a smooth nonplicated columella, and with a fissure or short respiratory canal inflected toward the left. The shape of some species of this genus resembles that of a trumpet. *Buccinum undatum* is one of the most common of the species, and is a typical representative of the genus. Most of the living species are found in the cold zones; many are fossil.

Buc'cleuch, Dukes of (1663): Dukes of Queensberry, Marquesses of Dumfriesshire, Earls of Drumlanrig and Sanquhar (1684), Earls of Buccleuch (1619), Earls of Dalkeith (1663), Viscounts of Nith, Torthorwold, and Ross, and Barons Douglass (1684), Barons Scott of Buccleuch (1606), Barons Scott of Eskdale (1619), Lords Scott of Winchester (1663, in Scotland), Earls of Doncaster, and Barons Tynedale (1662, in England): a noble family of Scotland, descended from Sir Walter Scott of Branxholm and Buccleuch, a brave and powerful chieftain who lived in the reign of James V. He fought at the battle of Pinkie in 1547, and died in 1552. Some incidents of his life formed the subject of Scott's poem, the *Lay of the Last Minstrel*. His great-grandson, also named Sir Walter, was raised to the peerage as Lord Scott of Buccleuch in 1606. The first duke was beheaded in 1685, but the duchess retained the title and estates. Henry, the third duke, born in 1746, was a pupil and friend of Adam Smith. He distinguished himself by his efforts to improve his extensive estates by planting trees, enriching the soil, making roads, and improving the breed of sheep. D. in 1812. —His grandson, Walter Francis, b. Nov. 25, 1806, the fifth Duke of Buccleuch and the seventh of Queensberry, is said to have spent £320,000 in improving the harbor of Granton, about 2 miles from Edinburgh, the greatest public work ever executed in Scotland by an individual at his own expense. He succeeded his father in 1819; was Lord Privy Seal 1842–46; and president of the council in 1846. D. in 1884. —The sixth duke, William Henry Walter, b. in 1831, was M. P. for Midlothian 1853–68 and 1874–80.

Bucen'taur (It. *Bucentoro*): name of a celebrated Venetian galley which was gilded and sumptuously furnished, and was used only once a year in a splendid aquatic procession, when the doge performed the ceremony of espousing the Adriatic on Ascension Day by dropping a ring into the water. It was about 100 feet long, and in the annual procession was followed by many gondolas and feluccas. It was burned in 1797, having been kept for this service since 1177.

Buceph'alus [Gr. *βουκέφαλος*, ox-head, probably applied to a horse branded with the mark of an ox-head]: the favorite horse of Alexander the Great, who rode on him in all his campaigns. He was purchased in Thessaly by King Philip, and cost, according to Pliny, 16 talents, equal to nearly $20,000 of our money. The royal grooms were unable to manage him, but Alexander, then very young, tried and succeeded; and Bucephalus would never permit any one but Alexander to ride him. Bucephalus died in India from the effects of wounds received in battle about 326 B. C., and Alexander built in his honor the city Bucephala on the Hydaspes.

Bu'cer [from Gr. *βούς*, cow + *κέρας*, horn; being a literal translation of his German name, *Kuhhorn*], Martin: German Reformer; b. in Schlettstadt, near Strassburg, in 1491; was for a time a Dominican friar; became a Protestant in 1521; a friend of Luther; studied Greek and Hebrew at Heidelberg. He introduced the Reformed doctrines at Strassburg 1523, and was for many years Professor of Theology at that city. When dissensions arose between Luther and Zwingli, Bucer acted the part of mediator. At first he openly repudiated Luther's doctrine. He composed the Tetrapolitan Confession, which was offered at Augsburg alongside of that of the Lutherans. In 1536 he went to Wittenberg to effect a reconciliation. The result was *The Wittenberg Concord*, in which he indorsed Luther's doctrine of the Real Presence, but denied that unbelieving communicants received Christ's body. This appears to have remained his position to the end. In 1543 he co-operated with Melanchthon in the preparation of the Formula for the Reformation of Cologne by Archbishop Hermann, a document whose chief significance is the important part which it bore in the preparation of the English *Book of Common Prayer*. At the invitation of Archbishop Cranmer he went to England in 1549, and became Professor of Theology at Cambridge, prominently participating in the reforms made by Cranmer, especially in the liturgical sphere. Of this activity his *Censura* on the *Prayer-book* (1550), and the other writings contained in his *Scripta Anglicana* (Basel, 1577) are memorials. D. in Cambridge, England, Feb. 28, 1551. See his biography by J. W. Baum (Elberfeld, 1860) and in Stephen's *Dictionary of National Biography*.

Henry E. Jacobs.

Bucerot'idæ [from Gr. *βούκερως*, ox-horned], or **Hornbills**: a family of the *Picariæ*, remarkable for the excessive size of the mandibles, of which the upper usually supports a large horn-like protuberance. The feet are strong and short, the wings short; size large.

Buch, bookh, Leopold, von: geologist; b. at Stolpe-on-the-Oder, Prussia, Apr. 25, 1774; studied mineralogy under Werner at Freiberg; explored the geology of many countries of Europe, generally traveling on foot. In 1805 he witnessed an eruption of Mt. Vesuvius, which converted him to the Plutonic theory. Among his principal works are *Geognostic Observations during Travels in Germany and Italy* (2 vols., 1802–09); *Travels in Norway and Lapland* (1810); and *On the Mountain Systems of Russia* (1840). He published an excellent geological map of Germany (1824); was author of the doctrine of the slow upheaval of continents. D. in Berlin, Mar. 4, 1853. See the English translation of Flourens's *Eulogy on L. von Buch*, in the Smithsonian Report for 1862, p. 358.

Buchan, bŭkh'an: a district of Scotland; in the northeastern part of Aberdeenshire; consists of about one-fourth of the county lying between the Doveran and the Ytham.

Buchan'an: village (incorporated in 1858): Berrien co., Mich. (for location of county, see map of Michigan, ref. 8–G); on the St. Joseph river, and on railroad; 87 miles E. of Chicago and 197 miles W. of Detroit. Buchanan has a graded school and six churches; it is situated in the midst of a rich agricultural and fruit region, has a large trade, and a variety of manufactures. Pop. (1880) 1,894; (1890) 1,994; (1900) 1,708.

Editor of "Record."

Buchanan, byŭ-kan'an, Claudius, D. D.: clergyman of the Church of England; b. at Cambuslang, near Glasgow, Scotland, Mar. 12, 1766; educated at Queen's College, Cambridge, England. He was professor in the College of Fort William in Bengal (1799–1807); returned to England 1808; wrote *Christian Researches in Asia* (1811), a work that contributed largely to awaken the missionary spirit of the present time. D. in Broxbourne, Hertfordshire, Feb. 9, 1815. See *Memoirs*, by Dr. Hugh Pearson (London, 1819; 5th ed. 1846).

Buchanan, Franklin: b. in Baltimore, Md., Sept. 18, 1800; became a midshipman of the U. S. navy in 1815; passed through the various grades of the service, becoming a captain in 1855. In 1861 he resigned, intending to enter the Confederate service, but subsequently he asked to be restored. His request was refused, and he then joined the Southern navy. He commanded the Merrimack frigate after she was fitted up as an ironclad, and with her engaged and sunk the wooden frigates Congress and Cumberland. Being wounded in this affair, the command of the Merrimack in the encounter with the Monitor devolved upon Lieut. Catesby Jones. For this service Buchanan was made a Confederate admiral; was defeated and made prisoner by Farragut in Mobile Bay Aug. 5, 1864, having fought on board the ironclad Tennessee, and lost a leg. President of the Maryland Agricultural College after the war. D. in Talbot co., Md., May 11, 1874.

Buchanan, George: Scottish poet and historian; b. at Killearn, Stirlingshire, Feb., 1506. He was well educated in Paris, and became a professor in a college of that city. Having adopted the Reformed doctrines, he returned to Scotland in 1537, and wrote *Somnium*, a satire against the monks, for which he was persecuted. He took refuge in England, and passed over to France about 1540. He was employed as a teacher in Bordeaux and Paris for several years, during which he wrote some Latin tragedies; also taught three years in the Portuguese university in Coimbra, where he was driven by persecutions for suspected heresy. After several changes of residence and adventures, he returned to Scotland in 1560. In 1562 he was appointed classical tutor to Mary Queen of Scots. His religious and political principles rendered him in the civil war that ensued a supporter of Regent Murray, who made him principal of St. Leonard's College, St. Andrews. Lennox made him preceptor to the young king, James VI., in 1570, and Keeper of the Privy Seal in the same year. D. in Edinburgh, Sept. 28, 1582. As a scholar he was almost unrivaled by any of his contemporaries. He wrote Latin verse with great purity, and was humorous, sarcastic, and profound. His chief works are a *History of Scotland* (Rerum Scoticarum Historia, 1582); a metrical Latin version of the Psalms (1570); *Franciscanus*, a poetical satire; and a posthumous tract, *De Jure Regni*, affirming that kings exist by will of the people, which had great influence in the politics of the next century. See his *Autobiography*, 1608; David Irving, *Memoirs of the Life of George Buchanan* (1817).

Buchanan, Isaac: Canadian politician; b. in Glasgow, Scotland, July 21, 1810; became a leading merchant and president of the board of trade in Hamilton, Ontario. He was active in putting down the rebellion of 1837, and was for many years prominently engaged in public affairs. He published *The Relations of the Industry of Canada with the Mother Country and the United States.* Elected to the Canadian Parliament in 1841 for the city of Toronto, he helped to secure responsible government for the people and to procure the reduction of the duty on Canadian wheat. In 1843 he supported Lord Metcalf's administration at the head of the Constitutional or order party. For many years he held a seat in the executive council of the province. D. Oct. 1, 1883.

Buchanan, James: fifteenth President of the U. S.; b. near Mercersburg, Franklin co., Pa., Apr. 23, 1791; graduated at Dickinson College, Carlisle, in 1809; admitted to the bar in 1812. He was a Federalist in his youth, but supported the war of 1812–15, which he thought glorious to the people but disgraceful in the extreme to the administration. The death of his betrothed led him into politics as a distraction from his grief, and in 1820 he went to Congress, where he served ten years, turning Democrat on questions of internal improvement. Here he was especially conspicuous on bills reorganizing the judiciary and fixing its appellate jurisdiction. In 1828 he supported Gen. Jackson for the presidency, who sent him in 1831 as minister to Russia, where he concluded a favorable commercial treaty; was U. S. Senator 1834–45, when he took an influential position, defending the executive prerogatives of veto and of removing civil-service officials at will, urging spoliation claims against France, and also the expunging from the record of the senatorial censure of Jackson. While defending the right of petition, he declared against the power of the Government to interfere with slavery in the States. At this time his separation from Whig doctrines became complete, and he refused to be a candidate for the presidency, after having been a conspicuous supporter of Van Buren, that the nomination might go to James K. Polk, who appointed him his Secretary of State. The questions he confronted then were the northwest boundary-line of Oregon, the Mexican war, and the application of the Monroe doctrine to California and Central America, with a view to prevent British acquisitions there. Mr. Buchanan formulated the policy of the administration on these points. During the Taylor-Fillmore government he established himself at Wheatlands, near Lancaster, and received his niece, Harriet Lane, and a nephew in their orphanage into his family. Here he opposed the Wilmot proviso, and supported the compromises of 1850. After four years of private life he was sent by President Pierce, with whom he had contested the nomination for presidency, as minister to England in 1853. He then joined in the Ostend manifesto, proposing the acquisition of Cuba by treaty or otherwise. It was his bid for the Democratic nomination, and it won. He was nominated by the Democrats, and elected President of the U. S. in 1856. The other candidates were John C. Fremont, Republican, and Millard Fillmore, "American." Mr. Buchanan received 174 electoral votes. His cabinet contained Howell Cobb, J. B. Floyd, Jacob Thompson, and Isaac Toucey, who proved to be secessionists and labored to weaken the Government, but Mr. Buchanan perceived this reluctantly and tardily. He blamed the North for its abolitionism as a cause of sectional hatred, supported the Lecompton Constitution for Kansas, and directed a government controlled by the Southern Democracy, even to the extent of using his influence against the nomination of Douglas. The problem of his administration was to prevent the division of the Democratic party, and in this he utterly failed, becoming a partisan of the Southern wing. When secession came on he was tortured between his subserviency to the conspirators in his cabinet and among his counselors and his desire to postpone the collapse of the Union under his administration. His final position was announced in a feeble message of Dec., 1860, in which he blamed the Northern people for the disruption of the Union, and affirmed that the executive had no power or right to prevent the secession of a State. He published in 1866 *Mr. Buchanan's Administration*, a work in defense of his policy as President. Events forced the disunionists to leave the cabinet, and they were replaced by loyal men who passed the possession of the Government over to Mr. Lincoln with only seven States in secession. In his retirement Mr. Buchanan supported the war for the Union. D. near Lancaster, Pa., June 1, 1868. See his *Life* by G. T. Curtis (New York, 1883).

Buchanan, Robert Christie: soldier; b. in Maryland about 1811; graduated at West Point in 1830; Feb. 8, 1864, colonel Tenth Infantry. He served in Black Hawk war 1832; in command of gunboats in the battle of Bad Axe river; as adjutant Fourth Infantry 1835–38; in Florida war 1836–38—1841–42; in the military occupation of Texas 1845–46; in the war with Mexico 1846–48 under both Taylor and Scott; in command of district of Oregon and Northern California 1856; against Rogue river Indians; superintendent of Western recruiting 1857–59. In the civil war he served in the Virginia Peninsula 1862; Gaines's Mill (brevet colonel), Malvern Hill (brevet brigadier-general); in Northern Virginia campaign 1862; engaged at Antietam and at Fredericksburg (brevet major-general); assistant provost-marshal, etc., for New York 1864, and member of commissions 1865–68. Retired from active service Dec. 31, 1870. D. in Washington, D. C., Nov. 29, 1878.

Buchanan, Robert Williams: poet and romancer; b. at Glasgow, Aug. 18, 1841; educated at Glasgow University; went to London in 1860. He published some forty volumes in prose and verse, consisting of novels, plays, poems, and critical essays. Among these are *Idyls and Legends of Inverburn* (1865); *David Gray and Other Essays* (1868); *The Drama of Kings* (1871); *The New Abelard, a Romance* (1884). He attacked Rossetti, Swinburne, and others in an article in the *Contemporary Review* entitled *The Fleshly School of Poetry* (1872). He visited the U. S. in 1884–85. D. June 10, 1901. Henry A. Beers.

Buchanan, Thomas McKean: lieutenant-commander U. S. navy; b. at Bellefonte, Pa., Sept. 10, 1837; graduated at the Naval Academy in 1855. He was in many engagements on the lower Mississippi in co-operation with the Union army, and on Jan. 15, 1862, fell, shot through the head, while "encouraging in his own person his officers and men to fight courageously" in the sharp action at Bayou Tèche.

Buchanites, bŭk'an-īts: a Scotch fanatical sect, now extinct; derived its existence (in 1783) and its name from a Mrs. Buchan, whose maiden name was Elspeth Simpson; b. at Fatmacken, between Banff and Portsoy, in 1738; married Robert Buchan, but separated from him; in 1781 removed to Glasgow, and in 1783 to Irvine, where she, with Rev. Hugh White, founded the sect, which ultimately numbered forty-six. White claimed that Mrs. Buchan was the woman mentioned in Rev. xii., and she that he was the manchild. The sect was expelled for immoral practices in 1784, and established the farm of New Cample, in the parish of Closeburn, Dumfriesshire. Mrs. Buchan professed to give the Holy Ghost by breathing. She died May, 1791—a disproof of their claim that they would be living on the earth when Christ came. The last of the sect died in 1848. See Train, *The Buchanites from First to Last*, Edinburgh, 1846.

Bucharest' (i. e. City of Joy): the capital of Roumania; situated in a fertile plain on the river Dimbovetza, about 140 miles N. W. of Varna; lat. 44° 25′ 30″ N., lon. 26° 5′ 24″ E. (see map of Austria-Hungary, ref. 9–M). The houses are mostly mean, and the streets dirty and not well paved. It contain over 100 churches, a college, a public library, several hospitals, and an excessive number of gaming-houses. This city has the reputation of being the most dissolute capital in Europe. It is the entrepôt for the trade between Austria and Turkey, the chief articles of which are grain, wool, salt, building-timber, cattle, and wax. The treaty of peace by which the sultan ceded Bessarabia and part of Moldavia to Russia was concluded here in May, 1812. Pop. (1876) 221,000; (1892) probably 250,000.

Büch'eler, Franz: classical philologist, eminent authority in the domain of early Latin; b. in Rheinberg, June 3, 1837; professor in Bonn since 1870. Among his works are *Grundriss der lateinischen Declination* (1879); *Frontinus, de aquis urbis*; *Pervigilium Veneris*; *Petronius* (ed. mai. 1862; together with *Liber Priapeorum*, Varro's *Saturæ Menippeæ*, and the *Apocolocyntesis* of Seneca, 1882); *Quinti Ciceronis reliquiæ* (1869); *Herodas* (1892); and numerous articles on early Latin in the Rheinische Museum and elsewhere. A. Gudeman.

Buchez, bü'shay', Philippe Joseph Benjamin: philosophical writer and republican; b. in Mortagne, Ardennes, France, Mar. 31, 1796. He studied medicine, and took part in several plots against the Bourbons. He wrote, besides

other works, *The Science of the Development of Humanity* (1833), and a *Complete Treatise on Philosophy from the Catholic and Progressive Point of View* (3 vols., 1840). Buchez and Roux Lavergne published *The Parliamentary History of the French Revolution* (40 vols., 1833–38). He was president of the National Assembly in May, 1848. D. in Rhodes, France, Aug. 12, 1865.

Büch'ner, Friedrich Karl Christian Ludwig: b. in Darmstadt, Germany, Mar. 29, 1824; a leading advocate of "humanitarian," materialistic, and atheistic opinions. His best-known work is entitled *Kraft und Stoff* (Force and Matter, 1854). He wrote also two volumes with the title *Physiological Pictures* (1861): one on *Natural Philosophy*; *Six Lectures on Darwin* (1868); and a work on *Man in the Past, Present, and Future* (1869–70). The last has been translated (1872) into English by W. S. Dallas, F. L. S. With considerable acquaintance with recent science, an easy style, and some ingenuity of argument, the principal attraction of Büchner's works to most readers is, probably, his audacity. In 1872–73 Büchner made a lecturing tour in the U. S., under the auspices of the German Turnverein. D. in Darmstadt, May 1, 1899.

Buchtel College (Akron, O.): Its corner-stone was laid July 4, 1871, and it was opened for the reception of students Sept. 11, 1872. It was founded by the Ohio Convention of Universalists, and named Buchtel College in honor of John R. Buchtel (1820–1892), whose benefactions to the college are estimated at $500,000. It is open to men and women on equal terms, and offers three courses of study—the classical, the philosophical, and the scientific—leading respectively to the degrees of A. B., Ph. B., and B. S. Besides the main college building it has an astronomical observatory and a gymnasium.

Buchu, byu'kyu [a South African word]: the leaves of *Barosma crenata*, *crenulata*, and *serratifolia*, and of other strong-smelling South African plants used in medicine for their diuretic properties. They belong to the family *Rutaceæ*, and are used by the Hottentots for many diseases. The natives also prize them for their fragrance, and use them in perfuming their bodies. In commerce the various kinds of buchu are known as "round" and "long" buchu, etc. They all contain a volatile oil.

Buck: the male of the fallow deer and of other species of deer; also the male of sheep, goats, antelopes, and rabbits. The term is not properly applied to the male of red-deer or American deer, which is called a stag. The term doe is applied to the females of those species of deer the males of which are called bucks.

Buck, Dudley: organist and composer; b. in Hartford, Conn., Mar. 10, 1839; studied first at home and later in Leipzig. On his return was appointed organist of Park church, Hartford, and a few years later went to St. James's church, Chicago. The great fire of 1871 having destroyed his home there, he returned East, and was for a short time organist of the great organ in Music Hall, Boston; soon went to New York, and acted as substitute conductor of Thomas's Central Park Garden concerts; was appointed organist of St. Ann's church, Brooklyn, and later of the Church of the Holy Trinity, Brooklyn, where he still remains. Buck is one of the finest organists in the U. S., and as a composer is also very eminent. In 1876 he was selected to compose the cantata for the opening of the Centennial Exhibition in Philadelphia. His cantata *Scenes from Longfellow's Golden Legend* took the $1,000 prize at the Cincinnati festival of 1880. He has also composed the following cantatas: *Forty-sixth Psalm*; *The Legend of Don Munio*; *Voyage of Columbus* (for male voices); *The Light of Asia* (text by Edwin Arnold); *Hymn to Music*; *The Nun of Nidaros* (for male voices); *King Olaf's Christmas* (for male voices); *Chorus of Spirits and Hours*, from Shelley's *Prometheus*, besides an opera, *Deserel*, and another in manuscript and unproduced, together with numerous songs and part songs, for both male and mixed voices, and very many pieces for the organ, and almost numberless pieces of church music. He is the conductor of the Apollo Club of Brooklyn, a society of male voices, and has frequently officiated as judge in musical competitions. His music is very popular, being full of beautiful melody. He has also composed several works for full orchestra, including several symphonies, a concert overture, *Marmion*, and some smaller works. His cantata *The Story of the Cross* was published in 1891. D. E. Hervey.

Buck Bean, or **Marsh Trefoil** (*Menyanthes trifoliata*): a plant of the family *Gentianaceæ*. It is indigenous in Europe and the U. S., and is widely distributed in the colder parts of the northern hemisphere. It grows in bogs and marshes, hence also called *bog-bean*. The leaves are ternate, the corolla funnel-shaped and five-parted, and the fruit is a pod or two-valved capsule. A bitter extract obtained from the leaves is a valuable remedy for dyspepsia and disorders of the bowels. The whole plant is tonic, and is used in Germany as a substitute for hops.

Buckeye: the popular name of certain American exogenous trees and shrubs of the genus *Æsculus* and the family *Sapindaceæ*. The Ohio buckeye (*Æsculus glabra*), growing in the valley of the Mississippi, is a large tree with a strong-smelling bark, small obscure flowers, and prickly fruit containing the seed, a large nut resembling that of the horse-chestnut tree, which is a near relative of this buckeye. The sweet buckeye (*Æ. octandra*), a tree, sometimes a shrub, of a range rather more to the south than that of the preceding, has yellow or sometimes dull purple flowers. The red buckeye (*Æ. pavia*) has a still more southern habitat. It is generally small, and has bright-red flowers. The California buckeye (*Æ. californica*) is a tree 30 to 40 feet in height, growing on the Coast Range Mountains and the western slopes of the Sierra Nevada. There are various other species in Asia. Revised by Charles E. Bessey.

Buckhan'non: town; capital of Upshur co., West Va. (for location of county, see map of West Virginia, ref. 7–H); on W. Va. and Pitts. R. R., and on Buckhannon river; 41 miles from Clarksburg. Here are flouring, saw, and woolen mills, tannery, a furniture-factory, and two colleges. Pop. (1880) 761; (1890) 1,403; (1900) 1,589.

Buckingham, George Villiers, Duke of: favorite of James I. of England; b. in Leicestershire, Aug. 20, 1592. He became in 1617 a gentleman of the bedchamber, and obtained in the space of two years the titles of baron, viscount, and earl. In 1616 he was appointed lord admiral of England. He accompanied Charles, Prince of Wales, when he went to Madrid in 1623 to obtain in marriage the infanta of Spain. The failure of this suit was ascribed to the arrogance of Villiers, who in his absence was created Duke of Buckingham. He negotiated the marriage of the prince with Henrietta of France; contrived a disastrous expedition against Cadiz and an impotent one against Rochelle, from which he returned in disgrace. After the death of James I. he became the favorite and prime minister of Charles I., but he made himself odious to the nation. He was assassinated in Portsmouth while embarking for a second raid on Rochelle by John Felton, Aug. 23, 1628.

Buckingham, George Villiers, Duke of: b. in Westminster, Jan. 30, 1627. He was an adroit courtier, but profligate and unprincipled. On the defeat of the royalist party in 1651 he went into exile. At the Restoration (1660) he became a member of the privy council and an enemy of Lord Clarendon, after whose fall (1667) he was a confidential minister of Charles II. He was the president of the ministry called the "Cabal." He wrote the *Rehearsal*, a burlesque on the heroic plays of Dryden and other Restoration dramatists, produced at the King's theater in 1671, with immense success, and other plays. D. in Kirby Moorside, Yorkshire, Apr. 16, 1688.

Buckingham, Joseph Tinker: writer; b. at Windham, Conn., Dec. 21, 1779; published *Specimens of Newspaper Literature* (1850) and *Personal Memoirs* (1852); became successively editor of the *New England Galaxy*, the *Boston Courier*, and the *New England Magazine*. D. in Cambridge, Mass., Apr. 11, 1861.

Buckingham, William Alfred: war Governor of Connecticut: b. in Lebanon, Conn., May 28, 1804; brought up on a farm; became a manufacturer in Norwich, of which city he was mayor for four terms; was nine times successively elected Governor of his native State (1858–66); sent 55,000 troops to the Union army without drafting, an excess of the quota of the State by 6,000; U. S. senator 1869 to his death; eminent in temperance and missionary projects, and in Congregational councils; gave $25,000 to Yale Theological Seminary; d. in Norwich, Conn., Feb. 3, 1875. A statue of him is in the State-house at Hartford.

Buckinghamshire (England): See Bucks.

Buckingham and Chandos, Dukes of: Marquesses of Chandos and Earls Temple of Stowe (1822, in the United Kingdom), Marquesses of Buckingham (1784), Earls Tem-

ple (1749), Viscounts and Barons Cobham (1718, in Great Britain), Earls Nugent (1776, in Ireland), Barons Kinloss (1601, in Scotland), a noble family of Great Britain.—Richard Plantagenet Campbell Temple Nugent-Brydges Chandos Grenville, the third duke of this family, b. in 1823, sueeeeded his father in 1861. He was lord president of the council 1866–67, Secretary of State for the Colonies 1867–68, and beeame Lord-Lieutenant of Bucks; governor of Madras 1875–80; chairman of committees of House of Lords. D. Mar. 27, 1889, and the dukedom was extinguished with him.

Buckinghamshire, Earls of (1746, in England): Barons Hobart (1728, in Great Britain), and baronets (1611, in England), a noble family of Great Britain.—Augustus Edward Hobart, the sixth earl, b. Nov. 1, 1793, suceeeded his brother in 1849, and d. in 1885. Present earl is Sidney Carr Hobart-Hampden, b. in 1860.

Buckland, Cyrus: inventor; b. in Manchester, Conn., Aug. 10, 1799; beeame a machinist, and found employment in the Springfield armory. He invented a machine for turning gun-stocks finished from the rough block; also perfeeted the interehangeability of the parts of a musket, reducing the eost one-half. Received $70,000 from Congress for his inventions; retired in broken health in 1859; d. Feb. 26, 1891.

Buckland, William, D. D., F. R. S.: geologist; b. in Tiverton, England, in 1784; edueated at Corpus Christi College, Oxford; reader on geology on royal foundation at Oxford in 1819; author of a distinguished work in geology, *Reliquiæ Diluvianæ* (1 vol., 1823). His principal work is the Bridgewater Treatise entitled *Geology and Mineralogy, Considered with Reference to Natural Theology* (2 vols., 1836). In 1825 he beeame a eanon of Christ ehureh, Oxford; Dean of Westminster in 1845. D. Aug. 14, 1856.—Francis Trevelyan, his son: b. in Oxford, Dee. 17, 1826; a pisciculturist: beeame inspector of British salmon and herring fisheries; wrote treatises on his favorite pursuits; d. Dee. 19, 1880. See his *Life* by J. C. Bompas (London, 1885).

Bucklan'dia: a large and beautiful evergreen tree of the family *Hamamelaceæ*: native of the Himalaya Mountains. The trunk is sometimes 7 feet in diameter at 5 feet from the ground, and grows to the height of 40 feet before it braneh es. The foliage is thick and glossy, but the timber is not very valuable.

Buckle, George Earle: English journalist; b. June 10, 1854; edueated at Oxford; was called to the bar at Lineoln's Inn, 1880; entered the offiee of *The Times* in 1880, and beeame its editor in 1884. Married in 1885 a daughter of James Payn.

Buckle, Henry Thomas: philosophieal historian; b. at Lee, in Kent, Nov. 24, 1822. His father was a merehant, at whose death he eame into the possession of an ample fortune, and was enabled to gratify his fondness for books, forming, it is said, one of the finest private libraries to be found in all Europe. He published in 1857 the first volume of the *History of Civilization in England*, a work displaying great boldness as well as affluence of thought, and eharaeterized by an easy and vigorous style. It proposed to introduee a new method of studying and writing history which should raise history to the rank of a real science. The second volume appeared in 1861. He taught that skepticism was the souree of progress and eredulity retarded it, working out his conclusions often in a one-sided way and with boldness offensive to conservative minds. Mr. Buekle set out on an Eastern tour in 1861, and died at Damaseus, May 29, 1862. The three volumes of *Miscellaneous and Posthumous Writings* were edited by Miss Taylor (1872). See his *Life* by A. H. Huth (1880).

Buckley, James Monroe, D. D., LL. D.: editor and minister of the Methodist Episeopal Church; b. at Rahway, N. J., Dee. 16, 1836; educated at Pennington Seminary and Wesleyan University; entered the ministry 1858: editor of *The Christian Advocate* (New York sinee 1880); author of *Two Weeks in the Yosemite and Vicinity* (New York, 1873); *Christians and the Theater* (1875); *Supposed Miracles* (Boston, 1875); *Midnight Sun, the Czar and the Nihilists* (Boston, 1886); *Oats or Wild Oats* (New York, 1885); *Faith Healing* (New York, 1892).

Buckley, Samuel Botsford, Ph. D.: b. in Torrey, Yates co., N. Y., May 9, 1809; graduated at Wesleyan University in 1836; traveled extensively, chiefly in the Southern States, as a student of botany, malaeology, geology, geodesy, etc.; was assistant naturalist and geologist in the State survey of Texas 1860–61; was connected with the U. S. sanitary commission 1862–65; State geologist of Texas 1866–67; was 1871–72 editorially connected with the *State Gazette*, Austin, Tex.; was author of many scientific and other papers, and prepared a work on the trees and shrubs of the U. S. He discovered the flowers and fruit of the shrub or small tree *Buckleya distichophylla*, named in his honor by Dr. Torrey. D. in Austin, Tex., Feb. 18, 1884.

Buck'minster, Joseph, D. D.: an orthodox divine; b. at Rutland, Mass., Oct. 14, 1751; graduated at Yale in 1770; beeame pastor of a ehureh at Portsmouth, N. H., in 1779; and was an eloquent and popular preaeher. D. in Readsboro, Vt., June 10, 1812. See his *Memoirs* (Boston, 1851), by his daughter, Eliza B. Lee.

Buckminster, Joseph Stevens, D. D.: b. at Portsmouth, N. H., May 26, 1784; son of Joseph mentioned above; graduated at Harvard in 1800, and in 1804 beeame pastor of the Brattle Street ehureh in Boston. He had great oratorical ability, and as a member of the Anthology Club and contributor to the *Monthly Anthology* he was one of the founders of Boston's literary reputation, and especially one of those who first gave the preaching of his time a literary form where it had been merely expository and hortatory, strewn thiek with Scripture texts with which chapter and verse were given. He was of the Liberal Christian party of his day, whieh beeame distinetly Unitarian shortly after his death. In the pulpit he was Channing's rival, and no less on this account his valued friend. His literary tastes were likely to draw him from the pulpit to seeular scholarship, when his brilliant career was eut short by epilepsy. D. June 9, 1812. See his *Memoirs* (Boston, 1851), by his sister.

John W. Chadwick.

Buckner, Simon Bolivar: Confederate general; b. 1823 in Kentucky: graduated at West Point in 1844; in infantry 1844–52; subsequently commissary of subsistenee: served at frontier posts 1844–52; assistant professor at the Military Aeademy 1846; in the war with Mexieo 1846–48 under both Taylor and Seott; quartermaster Sixth Infantry; assistant instructor at the Military Aeademy 1848–50; on eommissary duty at New York eity 1852–55; resigned Mar. 26, 1855. He was superintendent of eonstruetion of Chieago custom-house 1855; adjutant-general, rank of colonel, of Illinois 1857; farmer near Louisville, and inspeetor-general commanding Kentucky home guards 1860–61; joined the Southern army in the eivil war; was in eommand of Bowling Green, which he evaeuated on the eapture of Fort Henry, falling back on Fort Donelson (surrendered Feb. 16, 1862, to Gen. Grant, with 16,000 troops and vast stores); prisoner of war at Fort Warren till Aug., 1862; in command of a division of Hardee's eorps in Bragg's army in Tennessee; as major-general assigned to third division; ineluded, May 26, 1865, in Kirby Smith's surrender to Gen. Canby. He was eleeted Governor of Kentucky Aug. 1, 1887. Nominated for Viee-President by the Sound-money Demoerats Sept. 3, 1896.

Buckuill, Sir John Charles: See the Appendix.

Bucks, or **Buckinghamshire**: an inland eounty of England; bounded N. by Northampton, E. by Bedford and Hertford, S. by Berks, and W. by Berks and Oxford. It has an area of 746 sq. miles. The surface is diversified by valleys and hills of moderate height. The Chiltern range of chalk-hills, about 900 feet high, extends across the county in a N. E. and S. W. direction. Near the middle of the county is the fertile Vale of Aylesbury, whieh is farther N. than the Chiltern Hills; the soil is generally fertile, and eontains a large portion of elay. It is drained by the Ouse, the Thames, and other smaller rivers. The staple products are wheat, beans, butter, eattle, and mutton. The sheep of the Vale of Aylesbury are noted for their fine and heavy fleeces. Bucks County is intersected by the Great Western and Northwestern Railways. The chief towns are Aylesbury, Buckingham, and Marlow. Pop. (1891) 186,680; (1901) 196,843.

Bucksport: township; terminus of Bucksport braneh of Maine Central R. R.; Haneoek eo., Me. (for loeation of county, see map of Maine, ref. 8–E); on left (east) bank of Penobseot river; 18 miles S. of Bangor. It derives its support prineipally from ship-building, fisheries, tanneries, sawmills, and ice business. Just out of the village are U. S. salmon-breeding houses and pond. It has daily stage eonnection with outlying towns. Bueksport has three ehurehes, and is the seat of the East Maine Conferenee Seminary.

Pop. of township (1880) 3,047 : (1890) 2,921 ; (1900) 2,339.
EDITOR OF "CLIPPER."

Buckthorn : a shrub or small tree of the genus *Rhamnus* and family *Rhamnaceæ* ; distinguished by a bell-shaped calyx which is four or five cleft, and petals which are small and sometimes wanting. The fruit is a berry-like drupe, containing two to four separate seed-like nutlets. The species are numerous, and natives of many temperate and tropical regions. The common buckthorn (*Rhamnus catharticus*) is a deciduous shrub, a native of Europe, and naturalized in the U. S. It has spiny branches, ovate leaves, and small black berries (or drupes) which are nauseous and purgative, and which yield the pigment called sap-green (or bladder-green). This shrub is planted for hedges in the U. S. The Atlantic States have two native species. The alder buckthorn (*Rhamnus frangula*) is a European shrub which is not armed with spines, and has ovate, entire leaves. The berries are violently cathartic. The bark has been employed in medicine, and is used for dyeing yellow. The unripe fruit of dyer's buckthorn (*Rhamnus infectorius*), a shrub which grows in Southern Europe, yields a bright yellow dye. The so-called French or Avignon berries used by dyers are the fruit of the last and other species.

Buckwheat [*buck-* has same root as *beech* : Germ. *Buche*, without umlaut ; cf. Germ. *Buchweize*] : an annual plant (*Fagopy'rum esculentum*, or *Polygo'num fagopyrum*) ; of the order *Polygonaceæ* ; said to be a native of Central Asia and Manchuria. It is cultivated for food in Europe and the U. S. It grows to the height of 2 feet or more. It has triangular, heart-shaped or halberd-shaped leaves. The seeds are triangular, and resemble a beech-nut in form. Cakes of buckwheat eaten warm are a favorite article of food, and very nutritious. Buckwheat meal contains about 10 per cent. of gluten and 50 per cent. of starch. Bees are partial to the flowers of this plant, which secrete a large portion of honey, not of the first quality. Buckwheat comes to maturity in a shorter time than most other grains, and may be sown late. In the U. S. the seeds are usually sown broadcast. The quantity of seed required for one acre is a bushel or one bushel and a half. It requires little nitrogenous or coarse, heavy manure. A good crop of this grain yields about 30 bush. on an acre, and a bushel of it weighs from 45 to 48 lb. Formerly buckwheat was grown mostly as a late-season and "catch" crop, but it now receives more systematic treatment in many parts of the country. Another species, called Tartarian buckwheat (*Fagopyrum tartar'icum*), is a hardy native of Siberia, and is adapted to cold climates. It is distinguished from the common buckwheat by the toothed edges of its seeds, and is inferior in quality.
Revised by L. H. BAILEY.

Buckwheat Family (*Polygonaceæ*) : apetalous, dicotyledonous herbs, shrubs, or even trees ; with a superior one-celled ovary, containing an erect, straight ovule. They are related to the amaranths, chenopods, and pinkworts. There are about 600 species, widely distributed throughout the world. The most important genera are : *Eriogonum*, containing about 100 species, all American ; *Polygonum*, with 150 species ; *Rumex*, with 130 species ; and *Coccoloba*, with 80 species. *Fagopyrum esculentum* of Asia is the well-known buckwheat ; *Rheum rhaponticum*, *R. undulatum*, and *R. officinale* are known as rhubarb, and supply the drug bearing that name, while the petioles of the first and second are used for pies, tarts, sauces, etc. CHARLES E. BESSEY.

Buckwheat-tree : a small tree or shrub of Georgia and the Gulf States (the *Cliftonia ligustrina*) ; a smooth, elegant evergreen of the family *Cyrillaceæ*. It has clusters of white, fragrant blossoms in March, April, and May. It grows around swamps, ponds, and streams, and is often called *titi*. Its pendulous-winged fruit is sometimes shaped like a kernel of buckwheat ; whence the name.

Bucol'ic [from Gr. βουκολικός, deriv. of βουκόλος, herdsman] : pastoral or pertaining to herdsmen. This term is applied to a kind of pastoral poetry written in hexameter verse. The poems of Theocritus and the *Eclogues* of Vergil are the most perfect models of bucolic poetry.

Bucy'rus : city ; capital of Crawford co., O. (for location of county, see map of Ohio, ref. 3–F) ; on Pa. and Ohio Central R. Rs., and on Sandusky river ; 62 miles N. of Columbus. It is the seat of a large farming and manufacturing community ; has large union school-house, gas and electric lights, good sewerage system, and pavements of vitrified brick in many of its streets. There are mineral springs in the town and neighborhood. The skeleton of a mastodon was found in the vicinity in 1838. Pop. (1880) 3,835 ; (1890) 5,974 ; (1900) 6,560. EDITOR OF "FORUM."

Bud (in plants) : In the growth of a shoot it frequently happens that the elongation of the stem is checked for a time, while the leaves continue their growth for a while longer. The result is a collection of leaves, mostly closely packed together into a pretty solid mass, and this we call a *bud*. Usually the leaves are considerably modified, the outer ones soon becoming hard and scale-like, constituting the so-called "bud scales." When the elongation of the stem is resumed the leaves are separated, and the bud disappears. A bud is thus a quiescent state of a shoot. In popular botany buds are distinguished as "leaf-buds" and "flower-buds," the former developing leafy shoots and the latter one or more flowers. Inasmuch as flowers are themselves transformed shoots, all buds are, strictly speaking, essentially alike.

Sometimes the word *bud* is applied to particular outgrowths in the lower plants, especially when these have to do with the production of new plants. Thus we speak of the buds on the yeast plant, the buds of liverworts, etc. This use of the word should be abandoned, as it tends to confusion. CHARLES E. BESSEY.

Buda, boo'da : city of the Austrian empire ; formerly a capital of Hungary. From its hot springs Buda derives its German name of *Ofen*—i. e. oven. Buda is on the right bank of the Danube opposite to Pest, with which it is now incorporated as one city, styled BUDAPEST (*q. v.*). Pop. (1880) of Buda alone, about 60,000.

Budæus (*Budé*), GUILLAUME : philologian ; b. in Paris, 1467 ; d. there Aug. 23, 1540 ; employed by Louis XII. and Francis I. in Roman embassies and other public business ; instigated the founding of the Collège de France ; obtained license for printing in opposition to the Sorbonne ; was royal librarian when he died. His best-known works were *Annotationes in xxiv. libros Pandectorum* (1508) ; *De Asse et partibus ejus* (1514) ; and *Commentarii Linguæ Græcæ* (1519) ; suspected of secret predilections for Lutheranism. See his *Life* by E. de Budé (Paris, 1884), and his *Lettres inédites* (Paris, 1887). D. in Paris, Aug. 22, 1540.

Buda, Old (in Ger. *Alt Ofen* ; Hun. *O' Buda*) : a municipal town of Hungary, in the county of Pest, on the Danube, almost adjoining the suburbs of Buda (see map of Austria-Hungary, ref. 6–H). It is supposed to be the ancient *Sicambria*. Pop. 16,000.

Budapest, boo'da-pest : capital of the kingdom of Hungary ; is composed of Buda, on the right bank of the Danube, and Pest, on the left bank, the two being connected by several handsome bridges, one a suspension bridge 1,200 feet in length (see map of Austria-Hungary, ref. 6–H). Buda and Pest were independent of each other up to 1873. The population of the two cities in 1848 was scarcely 100,000. Their growth was not marked until the formation of the new constitution of the Austro-Hungarian empire in 1868. Hungary then became practically an independent kingdom, and Budapest, as co-ordinate capital with Vienna of the empire, and the center of the growing national life, entered upon a new and magnificent era. Its growth in the two decades from 1870 to 1890 rivals, and in some respects surpasses, that of the great Western cities of the U. S. Buda, formerly the more important, has been outstripped by Pest in this advance. Buda is strikingly picturesque. A rock, springing abruptly from the river, and rising to a height of nearly 1,000 feet, is crowned by the now useless citadel ; a neighboring but lower eminence affords a striking site for the imposing royal palace ; and the city forms itself in an amphitheater about the base. Pest is situated on a sandy plain, but its location gives it marked commercial advantages. Budapest is the greatest grain-market of the empire. Vast fleets of grain-boats ply upon the Danube, and the milling industry is of great extent. Many of the improvements in flour-milling, including the roller-process, originated here. The city council numbers 400, doubtless the largest body of the kind in the world ; but the government is efficiently carried on by a small number of municipal officials. Sanitary improvements have reduced the death-rate from 50 per 1,000 to 29. The old streets have been straightened so far as possible. Andrássy Strasse is the finest street of the city, and by reason of its length (2 miles), its width, paving, and the uniformly handsome buildings that line it, has a claim

to be considered among the great streets of the world. The quays that confine the Danube for a distance of 3 miles, lined with fine buildings, are a striking part of the city. Radiating thoroughfares, intersected by the so-called *Ringstrassen*, have been introduced. Near the Blocksberg on the Buda side, on which is the observatory, are three celebrated sulphur springs, much resorted to for certain diseases, and contributing not a little to the natural advantages of the city. Budapest has a flourishing university, an academy of sciences, a polytechnic school, and is well provided with other educational institutions. Besides the buildings already mentioned, the cathedral, city-hall, national theater, and university church are among the most important. The Margaretta island in the Danube has been transformed into a park. Wine of a superior quality is produced in the vicinity (the Ofner). The Imperial Parliament meets in alternate years at Budapest and Vienna, and the emperor and court spend much time in the Hungarian capital. The history of the city is most interesting; it was once the site of a Roman colony; was long regarded as the citadel of Christendom against the Turks; belonged to the Turks, 1529–1686; in 300 years the citadel was besieged twenty times. The election of the Hungarian kings formerly took place on the Rakós, a neighboring plain, and here as many as 100,000 men often encamped for months. The new Budapest is the center of the political, commercial, literary, and artistic life of a progressive and ambitious people numbering 17,000,000, and as such is reasonably sure of maintaining and improving its position among the great cities of the world. Pop. (1890) 506,384. See *Budapest, the Rise of a New Metropolis*, by Albert Shaw, *The Century*, June, 1892. C. H. Thurber.

Budd, Joseph Lancaster: Professor of Horticulture and Forestry in the Iowa Agricultural College; b. in Peekskill, N. Y., July 5, 1835; known for his efforts to secure hardy fruits for the Northwest, particularly through his travels in Russia with Charles Gibb (*q. v.*), and the introduction of many Russian fruits and ornamental trees. The papers and library of the late Charles Downing were bequeathed to him.

Budde'us, Johann Franz: Lutheran theologian and philosopher; b. in Anclam, in Pomerania, June 25, 1667. He was elected in 1692 Professor of the Greek Language at Coburg; in 1693 was invited to take the chair of Moral Philosophy at Halle; in 1705 became Professor of Theology at Jena. His position was one which harmonized orthodoxy and pietism. His erudition was enormous (he was the most universal scholar among the theologians of his time), yet accurate, and his judgment was of the most solid kind. He wrote more than a hundred books, most of which are still sought by scholars, and several of which are acknowledged standards. His more important books were: *Institutiones Theologiæ Moralis* (Leipzig, 1171); *Institutiones Theologiæ Dogmaticæ* (Leipzig, 1728); *Historia Theologiæ Dogmaticæ et Moralis* (Frankfort, 1725). In philosophy he was an eclectic. D. in Gotha, Nov. 19, 1729.

Revised by Henry E. Jacobs.

Buddha or **Booddha**: a Sanskrit word meaning "awakened, enlightened, illuminated." It is applied to a man who has attained to perfect knowledge of the truth; who by good works through countless existences has at length become released from the bonds of existence; and who, before entering into Nirvana (*q. v.*) preaches the truth to mankind for its redemption. Innumerable Buddhas have already appeared. The Buddha of the present dispensation—the historical Buddha—was born of the Kshatriya tribe of Çākyas (Sakyas), and called in his youth Siddhattha. After attaining enlightenment, he was called Gotama (or Gautama) Buddha; also Samana Gotama, "the Gotamid ascetic." Çākya-muni (Sakyamuni), "Çākya-sage," and Çākya-singha, "Lion of the tribe of Çākyas," are mere epithets, like "Prophet of Nazareth." See Gautama. C. R. Lanman.

Buddhism: a complex, many-sided religious system which originated in India, probably about 500 B. C., and flourished there for sixteen centuries alongside of Brahmanism (*q. v.*), from which it may be said to have been evolved, and with which it had many things in common. By the thirteenth century of our era it had practically disappeared there, losing itself in that development of Brahmanism which is known as Hinduism, and to which it had itself contributed. From India the system was carried southward to Ceylon about 250 B. C.; thence to Burma in the fifth century of our era, and to Siam in the seventh. As it now exists in these countries it adheres more closely to the primitive system than does that which prevails elsewhere, and is known among scholars as southern Buddhism. About 245 B. C. it was carried northward by missionaries to Kashmir, whence it spread to Nepál, Tibet, China, Korea, and Japan. In these countries it received so many new developments that in some important respects it bears little resemblance to the original. Northern Bûddhism adheres in the main to the expanded form of doctrine promulgated by Nagarjuna, the fourteenth Indian patriarch, called the *Mahāyāna*, or "Great Vehicle or Conveyance," as distinguished from the more primitive doctrines of the southern school, called *Hīnāyana*, the "Little (or Inferior) Vehicle or Conveyance." The form of Buddhism which prevails in Tibet and Mongolia is called Lamaism. See all these titles and the countries named.

Its Founder.—Buddhism originated in the ethical and philosophical teachings of an ascetic and reformer known among southern Buddhists as Gautama, or Gotama (the sacerdotal name of the family to which he belonged), among northern Buddhists as Sakyamuni (the "Sakya Sage"), and generally among Europeans as the Buddha, or simply Buddha, the "enlightened" one, referring to the perfect insight which came to him as he sat under the Bo-tree (*q. v.*) pondering in rapt meditation on the problem of life and its attendant miseries. Son of a wealthy Sakya chieftain (whose seat was at Kapilavastu, near the foot of the Himalayas), reared in luxury and surrounded with all the pleasures and seductions of an Eastern court, he seems to have reached the age of twenty-nine before making acquaintance with human suffering, or realizing its universality, depth, and intensity. The story is that on four different occasions, while driving through the city, this was presented to him in four "visions." One of the devas appeared to his gaze first as a decrepit and wrinkled old man, tottering along with the help of a staff; next as a loathsome leper, writhing by the wayside in the agonies of disease; on the third occasion as a putrid corpse being carried to the grave. Profoundly saddened and impressed by these sights, and by the knowledge which inquiry brought him, that these were no uncommon occurrences but the lot of all without reference to sex, caste, or condition, he was prepared for the fourth vision, a Brahmanical recluse, who had abandoned the world and its fleeting pleasures in order that by meditation and mendicancy he might find a way of escape from the ills of life. This seemed to Gautama to point to a way of deliverance, so forsaking his home, his wife, and the boy born to him that very day, he assumed the garb of a mendicant, and set out to find salvation for himself and all mankind. Disappointed with the Brahmanical teaching which he first tried, he plunged into the forest, and for six years unavailingly sought by increasingly vigorous austerities and self-mortification to find the peace and deliverance he desired. At last almost in despair he flung himself down beneath a bo-tree, and there, after forty days and nights of fixed contemplation, enlightenment came to him, and the problem was solved.

Doctrinal Basis.—His solution of the problem is expressed in the Four Verities or Noble Truths, regarded as fundamental by all Buddhists of whatever school. They are: 1. Suffering exists wherever sentient being exists. 2. The cause of suffering is desire, a craving for pleasure or for existence. This leads to rebirth, and rebirth is suffering. 3. Deliverance from suffering can be effected only by the extinction or "blowing out" of desire. This is Nirvana (*q. v.*). 4. This cessation of suffering and entrance into Nirvana can be attained only by walking in the Path of Buddha, or the Noble Eightfold Path. This comprises right views (as to the nature and cause of suffering); right thoughts; right words; right actions; right means of livelihood—that is, as a mendicant monk, living in celibacy and on offered alms; right application of the spirit to the study of the law; right memory, or freedom from error in recollecting the law; and right meditation. The last four of these apply particularly to the community of monks which he founded; the first four to both monks and laymen.

In this Eightfold Path there are four distinct stages. He who has arrived at a just perception of the four verities and enters upon "the stream of holy conduct," successively becomes free from the first three of the ten fetters which bind us to life with its sorrows, viz., from delusion in regard to self, from doubt as to Buddha and his law, and from dependence on works, or a belief in the efficacy of rites and ceremonies. By perseverance throughout the second stage lust, hatred, and delusion are reduced to a minimum, and the disciple attains to the degree of saintship, which in-

volves only one more return to this world. By perseverance in the third stage sensuality and ill-will are entirely destroyed, and he is freed from all necessity of ever returning to this world. When the fourth stage is completed he is set free from all error; he has burst the remaining five fetters, viz., love of life on the earth, desire of life in heaven, pride, self-righteousness, and ignorance—the first link in the twelve-linked chain of cause and effect. See NIDANA.

Upon the Four Noble Truths and this Eightfold Path has been reared the whole elaborate superstructure of Buddhist doctrine and practice, with its TRANSMIGRATION; its six GÂTI, or conditions of sentient existence; its twelve NIDANAS, or links in the chain of causation; its five Skandhas, or bundles of material and abstract qualities, by the union of which personality is produced; its PARAMITAS, or cardinal virtues, by means of which one may pass across the great sea of life and death to the shores of NIRVANA; its DHYÂNA, or fixed contemplation; its Brahmalokas and its Devalokas; its heavens of TUSHITA and SWARGA; its SUKHĀVATĪ, or PARADISE OF THE WEST; its hot and cold hells (see NARAKA); its SANGHA, or order of monks; its VIHARAS, or monasteries; and its numerous sects and developments, some account of all of which is necessary to any adequate presentation of Buddhism, but which can not be dwelt on within the limits of a single page. See all the above titles in the order here given. See also TSING-TU (or JODO) and SHINSHIU.

In its primitive form Buddhism was essentially atheistic. The gods, equally with men and animals and all the other forms of sentient existence, were subject to change—to decay, death, and rebirth. Hence sacrifice and all forms of worship were useless, and a priesthood unnecessary. Later, however, the worship of various deities was introduced, and Buddha himself, as well as MAITREYA (*q. v.*), the coming Buddha; Adibuddha, the origin of all things; the DHYANI-BUDDHAS, or impersonations of abstract thought; Amitabha, the Buddha of "Boundless Light" who presides over the Paradise of the West; Avalokiteshvara, the god (or goddess) of mercy (see KWAN-YIN); and many others, are objects of worship throughout some section of the northern school. It also denied the existence of the soul, and, indeed, of everything except body, mind, and sensation, of heaven, earth, and hell, all of which, however, are described as characterized by impermanency, and subject to continual disintegration and reintegration. Man is conceived of as a combination of five skandhas, or bundles of material qualities, sensations, abstract ideas, tendencies of mind, and mental powers. The breaking up of these is death. A force, however, is left behind, and under the influence of this there is a tendency in these five elements to recombine and form a new personality or individual. This force is called Karma, the consequence of the acts, words, and thoughts of the individual during the continuance of the combination of qualities which has come to an end. It is this accumulation of merit or demerit which determines the nature and condition of the new personality, but it can not be said to be a soul. See KARMA.

The Brotherhood or Sangha.—A very important feature of the system of Buddha was the community or brotherhood of converts which grew up around him. At first it consisted of himself and his first five converts, the ascetics, with whom he had lived in the forests before he discovered that austerities were useless in bringing deliverance from the ills of life. As converts increased they joined this band of disciples called Bikshus and Bikshunis (male and female mendicants), and bound themselves to chastity and a life of self-denial. Conduct was regulated by a simple code of ten prohibitions. Not to kill (or even injure *any* living thing, no matter how lowly); not to steal, or commit adultery, or lie (and this included abstention from all manner of improper speech); not to use strong drink, or take repasts at improper times; not to look at dances and plays, or have costly raiment, perfumes, or ornaments; not to have a large bed or quilt; and not to receive gold or silver. In addition to these, twelve observances were enjoined on recluses, who were required to use clothes made of rags picked up in burying-grounds or on the road; to have only three such coats, all made by the wearer's own hands; to have a cloak of yellow wool to cover all, and made in the same way; to live exclusively on food given in charity and without asking; never to eat or drink after midday; to live in the forests or jungles; to have no roof but the foliage of the trees; to sit with the back supported by the trunk of a tree; to sleep sitting and not lying; never to change the position of the mat or quilt when once it had been spread; and lastly to go once a month to the cremation or burying grounds to meditate on the vanity of life. As his doctrines spread, and it was found impracticable for all to join this brotherhood, the first five injunctions (as the first four of the eight noble paths) were made obligatory on the masses. The one great redeeming and commendable feature of Buddhism is its charity, its kindliness toward and its care for the welfare of all living things, and its sympathy with sorrowing humanity; and its spread is perhaps more due to this than to any other feature. As it now exists its many votaries in its temples and monasteries are perhaps the only real *Buddhists*, but its moral teachings exercise considerable influence over a very large proportion of the inhabitants of Asia, from Ceylon to Japan. For Esoteric Buddhism, see THEOSOPHY; for Buddhist Cosmogony, see JAMBUDVIPA and SUMERU; and for an account of its scriptures (which are voluminous), see TRIPITAKA.

The following works on Buddhism may be consulted with profit: *Introduction à l'histoire du Bouddhisme Indien*, by Eugene Burnouf (1844–76); *Le Lotus de la Bonne loi*, by the same author (1852); *A Manual of Buddhism*, by R. Spence Hardy (2d ed. 1880); *Eastern Monachism* (1860) and *Legends and Theories of the Buddhists* (1866), both by the same author; *Religion des Buddha*, by Koeppen (vol. i. deals with *Southern Buddhism* (1857) and vol. ii. with *Lamaism*, 1859); *Buddhism in Tibet*, by Schlagintweit (1863); *The Wheel of the Law*, by Alabaster (1871); *Legend of the Burmese Buddha*, by Bishop Bigandet (1858); *Buddagosha's Parables* (from the Burmese), by Capt. Rogers, with Introduction by Max Müller (1870); *Der Buddhismus, seine Dogmen und Literatur*, by Wassilief (1869); *A Catena of Buddhist Scriptures*, by Beal (1871); *Texts from the Buddhist Canon, commonly known as Dhammapada*, translated from the Chinese by the same author; *Chinese Buddhism*, by Edkins (1880); *Buddhism* (1880), and the *Hibbert Lectures* (1881), by T. W. Rhys Davids; *Buddhism in its Connection with Hinduism*, by Monier-Williams (1889); and *Buddhism, Primitive and Present, in Magadha and Ceylon*, by Bishop Copleston (1892). R. LILLEY.

Budding, or **Inoculation**, is a mode of propagating improved and choice varieties of fruit which can not be reproduced by seeds. It is the best mode of propagating peaches, and is convenient in the case of plums, cherries, apples, pears, roses, etc. The best time for budding is the last half of summer. The operation is performed by opening the bark of the stock with a vertical and transverse cut, nearly like a letter T, and inserting into it a leaf-bud of another variety. The length of the bark and wood cut off with the bud is about an inch. These buds are taken from a branch formed in the present or preceding year. They should be cut squarely at the top, so as to fit the transverse section of the bark of the stock. The leaf growing close to the bud should be cut off. The process is finished by tying the bud with bass matting, soft cotton twine, or woolen yarn. The operation just described is called "shield-budding," and is more rapidly performed than grafting.

Bude-light: a brilliant light invented by a Mr. Gurney, of Bude, in Cornwall, England. He introduced a stream of oxygen into a flaming jet of oil or gas. The expense of this system has prevented its general use. The same name is sometimes inappropriately given in Great Britain to other similar inventions.

Budissin: See BAUTZEN.

Buel, SAMUEL, D. D.: theological writer and professor; b. in Troy, N. Y., June 11, 1815; graduated at Williams College 1833; rector of parishes in Michigan, Pennsylvania, Maryland, and New York; Professor of Ecclesiastical History and subsequently of Divinity in the Seabury Divinity School, Faribault, Minn., 1886; of Systematic Divinity and Dogmatic Theology in the General Seminary, New York city, 1871. He translated the *Report of the Union Conferences held August 10–16, 1875, at Bonn* (New York, 1876). He wrote *The Apostolical System of the Church Defended* (Philadelphia, 1844); *Eucharistic Presence, Sacrifice, and Adoration* (New York, 1874); and *A Treatise of Dogmatic Theology* (1890, 2 vols.). Died in New York city, Dec. 30, 1892.

Buell, DON CARLOS: soldier; b. near Marietta, O., Mar. 23, 1818; graduated at West Point in 1841; after serving in the infantry till 1848, became, July 17, 1862, assistant adjutant-general U. S. A., rank of colonel, and Mar. 21, 1862, major-general U. S. volunteers. He served in the

Florida war 1841–42; on frontier duty 1843–45; in the military occupation of Texas 1845–46; in the war with Mexico 1846–48, and was wounded at Churubusco; adjutant of the Third Infantry 1847–48; assistant adjutant-general at Washington, D. C., 1848–49; at headquarters of various departments 1849–61. In the civil war he was in command of the department and army of the Ohio 1862; engaged at the battle of Shiloh, siege of Corinth, operations in Northern Alabama, and the retreat to Louisville to cut off the army of Bragg, which he drove from Kentucky; was before a commission to investigate his operations 1862–63. He resigned from the army June 1, 1864, and in 1865 became president of the Green River (Kentucky) Iron-works. D. in Louisville, Ky., Nov. 19, 1898.

Buena Vista (Sp. pron. bwā'nāă-vees'tāă): a hamlet in Mexico; about 90 miles S. W. of Monterey and 7 miles S. of Saltillo; famous for the battle fought in its vicinity between the U. S. forces under Gen. Zachary Taylor and the Mexican army under Santa Anna, Feb. 22–23, 1847. Gen. Taylor, having become assured, from reconnoissances on Feb. 20, that the enemy was in heavy force at Encarnación, 30 miles in front of Agua Nueva, with the evident intention of attacking his position, withdrew his army on the 21st from the camp at Agua Nueva, which could be turned on either flank, and took up a strong line a little in front of Buena Vista. A cavalry force left at Agua Nueva to cover the removal of supplies was driven in during the night, and on the morning of the 22d the Mexican army appeared immediately in front of Buena Vista, and at 11 A. M. (Feb. 23) a flag was sent from Santa Anna with a summons of unconditional surrender, to which Gen. Taylor laconically replied that he "declined to accede to the request."

The line occupied by the U. S. troops was one of remarkable strength. The road at this point becomes a narrow defile, the valley on its right being rendered impracticable for artillery by a system of deep and impassable gullies, while on the left a succession of rugged ridges and precipitous ravines extends back toward the mountain which bounds the valley. The features of the ground were such as nearly to paralyze the artillery and cavalry of the enemy, while his infantry could not derive all the advantage of his numerical superiority. The action was commenced about three o'clock in the afternoon of the 22d, between the light troops on the left, and skirmishing continued till dark, but no serious attack was made until the morning of the 23d. During the night of the 22d the Mexicans had occupied the mountain-side by light troops, with the intention of forcing the left flank of the U. S. army, and it was here that the action commenced on the 23d, and an obstinate and sanguinary conflict was maintained, with short intervals and varying success, throughout the day, resulting in the repulse of the enemy from Taylor's lines, which, however, had been much contracted since morning. An attack of cavalry upon Buena Vista and a demonstration upon Saltillo were also repelled, and during the night Santa Anna abandoned his position and fell back upon Agua Nueva. A reconnoissance made on the 26th disclosed the fact that the retreat had been continued in the direction of San Luis Potosi, and Gen. Taylor resumed his former camp at Agua Nueva on the 27th.

The U. S. force engaged was about 5,200, while the Mexican army was stated by Santa Anna in his summons to be 20,000 strong. The loss in U. S. troops was 746, of which 267 were killed; the Mexican loss in killed and wounded was about 2,000.

Buen Ayre: See BONAIRE.

Buendia, bwen-dee'ăă, JUAN: Peruvian general; b. at Lima, 1814. He early entered the army as an artillery cadet, ascending by regular grades to the rank of general; in 1874 he commanded the force which crushed the insurrection of Pierola. When the Chilian war broke out in 1879 he was put in command of the army of the south at Tarapaca. With 7,000 Bolivians and Peruvians, very badly equipped, he attacked 10,000 Chilians on the heights of San Francisco, near Pisagua (Nov. 8, 1879); he was defeated with terrible loss, and retreated to Tarapaca, where the Chilians attacked him, but were repulsed (Nov. 27), losing most of their artillery. Buendia then continued his retreat to Arica. He was court martialed, but exonerated, and served in the defense of Lima. After the war he retired to private life.

HERBERT H. SMITH.

Bue'nos Ay'res: a province of the Argentine Republic; bounded N. E. by the Rio de la Plata, E. and S. E. by the Atlantic Ocean, and S. W. by the Rio Negro, which separates it from Patagonia. The area is estimated at 63,000 sq. miles. The surface is an alluvial plain, in which timber and stones are scarce; the soil is mostly fertile. Here are vast treeless, grassy plains, called *pampas*, which afford pasture to immense herds of cattle and horses. These constitute the principal riches of the inhabitants. This province is not liberally supplied with rivers or running streams, but contains a great number of salt lakes. The principal river besides the Paraná (La Plata) is the Rio Colorado, which traverses the S. W. part of the province. The climate in the N. part is mild, and has a mean summer temperature of 90° F. It became independent of Spain in 1810, seceded from the Argentine Republic in 1853, and was reunited to it in June, 1860. A large number of Europeans have emigrated to this province. Pop. (1895) 921,222. Capital, La Plata (founded in 1884), and situated about 40 miles S. E. of the city of Buenos Ayres.

Buenos Ayres: a seaport of South America; capital and largest city of the Argentine Republic; on the right bank of the La Plata; lat. 34° 36′ S., lon. 58° 22′ W. (see map of South America, ref. 8–F). It is nearly opposite to Montevideo, which is 100 miles distant. The streets cross each other at right angles, are paved with granite, and bordered by low brick houses, which usually have each a garden adjoining. The principal public buildings are a large cathedral, numerous churches, the House of Representatives, and a college, with which are connected a large library, an observatory, and a normal school. The adjacent country is alluvial, and nearly destitute of timber. The climate is dry and healthy. Many fine public buildings have lately been completed, and others are in progress. Its trade and prosperity are impeded by the want of a safe and commodious harbor. The chief exports are hides, beef, grain, wool, tallow, horns, and skins. It is rapidly growing in importance. Pop. (1882) 295,000; (1892), 549,307; (1895) 665,243.

Bufarik, or **Boofarik**, boo-fāă-reek': a village of Algeria; 18 miles S. S. W. of Algiers; on the road from Algiers to Blidah and Oran; an important military station. It has a trade in cotton, grain, olives, oranges, and an important weekly market. Pop. (1891) 8,064.

Buffalo: either of two species of ruminant animals of the family *Bovidæ*, the *Bubalus buffelus* and *Bubalus caffer*. The former is a native of India, where it has been long domesticated, and is an important and useful animal. It is generally used as a beast of burden in India and also in Italy, where it was introduced about 600 A. D. It is larger and more powerful than an ox, and has a larger head in proportion to the size of the body; the dorsal line rises into a considerable elevation above the shoulders. It has large crooked horns, which are curved first outward and downward, and next backward and upward. The buffalo is partial to marshy places, and is addicted to wallowing in the mud and shallow water. Its flesh is inferior to that of the ox, but the milk of the female is said to be excellent in quality. The tame buffaloes of India are easily managed and guided by a mere rope, and the driver often rides on their backs. The jungles of India are also infested by wild buffaloes of the same species, sometimes called arna or arnee, a fierce and dangerous animal, which is more than a match for a tiger. The Cape buffalo (*Bubalus caffer*) is a native of South Africa, and has not been domesticated. It has large horns, the bases of which are close together. The horns spread or diverge laterally, are next bent downward, and have the point curved upward and inward. The animal measures about 8 feet from the base of its horns to its tail, and is about 5½ feet in height. It is a dangerous animal, and will attack men without provocation, but it is sometimes mastered by the lion. Its hide is so thick and tough that the Caffers make shields of it. Vast herds were formerly found in South Africa. For the American buffalo, see BISON.

Cape buffalo.

Revised by D. S. JORDAN.

Buffalo: a city; port of entry, and important railroad and commercial center; capital of Erie co., N. Y. (for location of county, see map of New York, ref. 5–C); in lat. 42° 53′ N., lon. 78° 55′ W.; at the foot of Lake Erie and head of

Niagara river. It is also the western terminus of the Erie Canal. In population and wealth it is the second city in the State. The city is delightfully situated, having a navigable water-front of about 7 miles, with numerous substantial and extensive piers, breakwaters, basins, and canals, constructed at an expense of several millions of dollars, partly by the Federal Government and partly by the State and municipal authorities. It has one of the finest harbors on the lakes, formed by the Buffalo river, navigable for about 2 miles from its mouth. The entrance is protected by extensive breakwaters. The city extends down the Niagara river and Lake Erie about 9 miles, and at right angles with it the same distance. The Niagara is here crossed with a fine iron truss railroad bridge, completed in 1873 at a cost of $1,500,000.

Buffalo is noted for its wide and beautiful streets, and the profusion of trees and shrubbery with which they are decorated. The report of the State assessors for 1900 puts the valuation for the purpose of taxation at $245,873,587, an increase of $9,000,000 for the year; exempt from taxation, $32,148,030. The bonded debt of the city Jan. 1, 1901, was $16,561,644.94, as compared to $15,986,339.08 for Jan. 1, 1900, an increase during the year of $32,663.37. The city treasurer received from all sources in 1900, $9,187,673.19.

The extensive water-works are the property of the city. There are several gas companies, three electrical lighting companies, natural gas, a magnificent park and boulevards almost surrounding the city, a State normal school and school of practice, 3 high schools, and 60 district schools, besides many other educational establishments. The City and County Hall, built of granite, was completed in 1876 at a cost of $1,400,000. The State has erected an insane asylum, which accommodates 1,500 patients; it cost over two million dollars. The city has a music hall and a merchants' exchange. There are 4 large markets, 40 grain elevators, and a new $3,000,000 post-office building. There are 2 State armories and an arsenal. There are 187 church edifices. Of the latter, two (one Roman Catholic and the other Episcopalian) are imposing cathedrals. With literary, benevolent, and educational institutions Buffalo is well supplied. Among them are the Women's Union; the Buffalo Public Library, with a library of 100,000 volumes, and real estate and buildings worth $350,000; the Society of Natural Sciences, with an extensive collection, and a large museum of casts of fossil remains; the Albright Art Gallery, an historical society, law library, Grosvenor Library (free), 26 hospitals, 2 orphan asylums, 2 medical colleges, a female seminary, and several Catholic colleges. Buffalo has over twenty cemeteries, and a crematory. It has 80 newspapers and periodicals, 11 of them dailies. There are 15 banks of discount, with an aggregate capital of $5,050,000; and 4 savings-banks, with deposits amounting to about $45,850,016. The building and loan association movement has been extensively developed.

Commerce.—Buffalo is the great E. terminus of the lake traffic, especially of the grain, ore, and lumber trade. In 1900 grain receipts by lake were 214,971,364 bush. (including flour estimated as wheat). The lumber trade is very extensive. Imports of all kinds of coal in 1900 were 6,767,217 tons; exports by lake, 1,826,091 tons; and imports of ore, 1,392,559 tons. The receipts of live stock in 1900 were 28,539 cars cattle, 26,492 cars hogs, 3,656 cars sheep. In 1900 the arrivals and departures of vessels were 9,973, with nearly 10,701,222 tonnage.

Manufactures.—In 1901 Buffalo had 4,000 manufacturing establishments, with a capital of $67,867,154, employing 150,000 persons, who received $24,617,408 in wages, the total value of the product being $96,448,654.

On Dec. 29, 1814, a force of British and Indians crossed the Niagara, landed at a point between Buffalo and Black Rock, and in an engagement on the 30th defeated the American militia under Gen. Hall. They then sacked and burned both villages, and murdered all the inhabitants that were not able to get away. Only the jail and one house were left. This was done in revenge for the burning of Newark, Canada. After the war Buffalo grew rapidly, and in 1828 contained about 7,000 inhabitants, the completion of the canal in 1825 giving a strong impetus to its growth. It became a city in 1832, and then had 15,000 inhabitants. Pop. (1835) 15,700; (1880) 155,134; (1890) 255,664; (1892) 278,796; (1895) 335,709; (1900) 352,387.

Buffalo: city; capital of Johnson co., Wy. (for location of county, see map of Wyoming, ref. 8–J); has electric lights and water-works. Farming, stock-raising, and mining are its principal industries. Pop. (1890) 1,087; (1900) 710.

Buffalo-berry (*Shepherdia argentea*): a large shrub of the family *Oleaster* or *Elæagnaceæ*; dicœcious flowers and silvery-scurfy opposite leaves; introduced to cultivation as a fruit-plant in 1890. It bears small, ovoid, scarlet, acid berries in clusters. It is native to the interior region E. of the Sierra Nevadas and W. of the Mississippi, extending from Saskatchewan to the mountains of New Mexico.

Buffalo-fish: any one of the large suckers (*Ictiobus* and *Sclerognathus*); of the family *Catostomidæ*; found in the Mississippi valley. They reach a weight of 10 or 12 lb., but are not much valued as food, being flavorless and full of bones.

Buffet, Louis Joseph: politician; b. in Mirecourt, Vosges, France, Oct. 26, 1818; elected to the Chamber of Deputies from the Vosges in 1848; Minister of Commerce and Agriculture under Louis Napoleon; Finance Minister in the Ollivier cabinet 1870; elected president of the National Assembly, to succeed M. Jules Grévy, Apr. 4, 1873; vice-president of the council and Minister of the Interior 1875; elected life senator June 16, 1876.

Buffon, büf'fōn, Georges Louis Leclerc, Comte de: naturalist and philosopher; b. in Montbar, in Burgundy, Sept. 7, 1707. He was liberally educated, and traveled in his youth in Italy and England. In 1739 he was elected to the Academy of Sciences and appointed intendant of the royal garden in Paris. He published in 1749 the first three volumes of his *Natural History*, in which he was assisted by Daubenton. Twelve other volumes of it appeared between 1749 and 1767. This work, which made an epoch in the study of the natural sciences, displays a brilliant imagination and presents many ingenious ideas. He was admitted into the French Academy in 1753. Among his most admired works is the *Epochs of Nature* (Époques de la Nature), which appeared in a supplement to his *Natural History*. He received from the king the title of Count de Buffon in 1776. D. in Paris, Apr. 16, 1788. See Condorcet, *Éloge de Buffon*; Cuvier, *Éloge de Buffon*, prefixed to an edition of the *Natural History* (36 vols., 1826); Flourens, *Buffon: Histoire de sa Vie, etc.* (1844).

Bufon'idæ: See Toad.

Bu'ford, John: soldier; b. in Kentucky in 1826; graduated at West Point in 1848; served on frontier duty 1848–61; quartermaster of the Second Dragoons 1855–58; in the Sioux expedition 1855; engaged at Blue Water in quelling the Kansas disturbances 1856–57; on the Utah expedition 1857–58. In the civil war he served as assistant inspector-general (major), making inspections 1861–62; in command of cavalry brigade in Northern Virginia campaign 1862; engaged at Madison Court-house, Kelley's Ford, Thoroughfare Gap, and Manassas (wounded); chief of cavalry of the Army of the Potomac in Maryland campaign; engaged at South Mountain and Antietam; in Rappahannock campaign, commanding cavalry brigade 1862–63; engaged at Fredericksburg, Stoneman's raid, and Beverly Ford; in command of a division of cavalry in the Pennsylvania campaign 1863; engaged at Gettysburg and numerous skirmishes in Central Virginia 1863; engaged at Culpeper, Bristow Station, and numerous movements and skirmishes. He was an admirable cavalry officer; rose to be major-general of volunteers, died from the effects of exposure and wounds, Dec. 16, 1863, at Washington, D. C.

Buford, Napoleon Bonaparte: soldier and engineer; b. in Woodford co., Ky., Jan. 13, 1807; graduated at West Point in 1827; and Apr. 15, 1862, brigadier-general U. S. volunteers. He served on garrison and topographical duty; as assistant professor at the Military Academy till Dec. 31, 1835, when he resigned, and entered upon railroad and banking business chiefly at Rock Island, Ill. In the civil war he was colonel of the Twenty-seventh Illinois Volunteers till promoted brigadier-general; engaged in the battle of Belmont; attack of Island No. 10; capture of Union City, Ky.; siege and battle of Corinth, Miss.; siege of Vicksburg; in command of Helena, Ark. Brevet major-general U. S. volunteers Mar. 13, 1865, and Aug. 24, 1865, mustered out of volunteer service. He was superintendent of a mining company in Colorado; special U. S. Indian commissioner 1867–68; Union Pacific Railway commissioner 1868–69. D. Mar. 28, 1883.

northward and northwestward; after a course of about 450 miles enters the Vistula at the fortress of Modlin, about 18 miles N. W. of Warsaw.

Bug, or **Bog** (anc. *Hypanis*): a river of Russia; the northern of this name rises in Podolia; flows nearly southeastward, and enters the estuary of the Dnieper 30 miles W. of Kherson. Its whole length is estimated at 500 miles. It is navigable for small vessels from its mouth to Vosnesensk, upward of 100 miles.

Bug Bible: See BIBLE.

Bugeaud, bü'zhō', THOMAS ROBERT, Duc d'Isly: general; b. in Limoges, France, Oct. 15, 1784; rose in the Napoleonic wars to a colonelcy. Soon after the revolution of 1830 he was created a marshal of France. Having won several victories in Algeria, he was appointed governor-general of the same in 1840. He defeated the army of the Emperor of Morocco at Isly in 1844. During the revolution of Feb., 1848, he commanded the army at Paris. D. from cholera in Paris, June 10, 1849. See his *Memoirs* by Comte d'Ideville (Eng. trans. 1882).

Bugenhagen, boo'gen-hää-gen, JOHANN, surnamed POMERANUS, or Dr. Pommer: learned German Protestant Reformer; b. at Wollin, Pomerania, June 24, 1485. He was converted to the doctrines of Luther in 1520, and became pastor at Wittenberg in 1522. He was a devoted friend of Luther, whom he assisted in the translation of the Bible. His chief works are a *Commentary on the Psalms* (Basel, 1524), and an arrangement of the *Passion History*. He organized the Lutheran Church in Pomerania, Hamburg, Brunswick, and Denmark. D. in Wittenberg, Apr. 20, 1558. See his *Life* by J. B. Vogt (Elberfeld, 1867) and by H. Hering (Halle, 1888). His correspondence, edited by J. B. Vogt, appeared in Stettin in 1888.

Bug-fish: the menhaden (*Brevoortia tyrannus*); a herring-like fish of the Atlantic coasts of the U. S.; so called from the fact that a small crustacean (*Oniscus prægustator*) is often to be found living in the fore part of its mouth.

Bugge, bŏŏg'ge, ELSEUS SOPHUS: philologist; b. in Laurvik, Norway, Jan. 5, 1833; appointed lector in the university at Christiania in 1864, and professor in 1866. Bugge's contributions to almost all branches of philology have been important. He is an eminent runologist and Béowulf scholar. His great edition of the *Poetic Edda* appeared in 1867 (Norrœn Fornkvæði). His *Studies Concerning the Origin of the Northern Mythology*, etc. (Studien over de nordiske Gude- og Heltesagns Oprindelse, 1881–89; Germ. tran., Studien, etc., by O. Brenner, 1881–89), are revolutionary in tendency and have provoked violent opposition. (See NORTHERN MYTHOLOGY.) Of his other works may be mentioned his collection of Norse ballads (*Gamle Norske Folkeviser*, 1858), and his edition of the *Volsunga* and other sagas, *Norrøne Skrifter of Sagnhistorisk Indhold* (1864–73). Much of his most important work has appeared in learned periodicals.

G. L. KITTREDGE.

Bu'gis: a people of the Malay Archipelago; chiefly inhabiting Celebes and Macassar. They are noted for their commercial enterprise, and own many vessels employed in the navigation of the East Indian seas. They are muscular, middle-sized, and of a light-brown color, and have made considerable progress in civilization. They manufacture cotton cloth, build durable sailing-vessels, and are said to be skillful workers in copper and iron.

Bugle: a brass musical wind instrument; has been improved by keys so as to be capable of all the inflections of the scale. In its original form the bugle is the signal horn for the English infantry, as the trumpet for the cavalry. Five sounds only are required for the various calls. This instrument is never used in the orchestra.

Bugle: a plant of the genus *Ajuga* which contains about fifty annual or perennial herbaceous plants of the *Labiatæ* or MINT FAMILY (*q. v.*), bearing whorls of very irregular flowers. None are natives of North America. Half a dozen species have been introduced into flower-gardens, where they are quite ornamental and easily grown. C. E. B.

Bu'gloss [via Fr. and Lat. from Gr. *βούγλωσσος*, ox-tongued; *βοῦς*, ox + *γλῶσσα*, tongue, perhaps from the shape and roughness of its leaves]: a common name given to several species of plants of the family *Boraginaceæ* and of the genera *Anchusa* and *Lycopsis*. The *Lycopsis arvensis* is a common weed in the grain-fields of Great Britain. The *Lycopsis* has a funnel-shaped corolla with a curiously curved tube. The *Echium vulgare*, called viper's bugloss, is a native of Europe and naturalized in the U. S.

Bühler, GEORG: Indologist; b. at Berstel, in Hanover, July 19, 1837; studied at Göttingen, Paris, and London, and became professor in Elphinstone College, Bombay, in 1863. He made many expeditions in search of Sanskrit manuscripts, exploring the libraries of Gujerat, Rajputana, etc., and even Kashmir; made valuable reports to Government upon his work; and purchased many old manuscripts, which are now in the Dekkan College, Puna, accessible to scholars. He also purchased for the libraries of Oxford, Cambridge, and Berlin. With Kielhorn he founded in 1868 the Bombay Sanskrit Series, a very useful collection (to date, 40 vols.). In 1880 he was called to the University of Vienna, where, with his colleagues of the Oriental Institute, he established in 1887 the *Wiener Zeitschrift für die Kunde des Morgenlandes* (to date, 6 vols.). His studies in Hindu law appeared in the *Digest*, in translations of Manu and other law-books, vols. xxv., ii., and xiv. of Max Müller's *Sacred Books of the East*, and elsewhere. His achievements in Indian epigraphy and chronology (in the *Indian Antiquary* and *Epigraphia Indica*), literary and religious history, are of great importance.

Buhl-work: a Germanized form of Boule or Boulle work; a form of decorative inlaying for cabinet work, brought to perfection by André Charles Boule (1642–1732), a French cabinet-maker, whose name was given to this form of art. He used brass, tortoise-shell, ivory, and gold, working out designs of flowers, landscapes, and even hunting scenes, and invented a process of multiplying copies of his designs and obtaining figures and matrices by one operation. The work is done with veneers.

Buhrstone: See BURRSTONE.

Building and Loan Associations: societies established for the purpose of enabling persons of moderate means to become the owners of homes by a succession of small payments; called also *Building Societies* (in Great Britain and Pennsylvania); *Co-operative Banks* (Massachusetts); *Co-operative Savings and Loan Associations* (New York).

The first of these associations was established at Birmingham, England, in 1781. In 1836 they had become so numerous and important that a Building Societies act (now superseded by that of 1874) was passed in that year. The first American society seems to have been organized at Frankford (now a part of Philadelphia) in 1831. The system has flourished most in Pennsylvania, but is widely popular, as will be seen from the following table, reported to the U. S. League of Building and Loan Associations at their annual meeting in Indianapolis in July, 1900:

STATES.	Number of associations.	Total membership.	Total assets.
Pennsylvania	1,174	281,456	$112,120,436
Ohio	773	287,477	102,409,699
Illinois	599	100,000	54,104,602
New Jersey	335	99,160	46,100,000
New York	299	89,409	37,253,725
Indiana	424	109,043	31,425,587
Massachusetts	125	68,349	26,744,647
California	151	37,780	20,285,454
Missouri	191	38,000	13,835,817
Michigan	72	32,775	10,159,562
Iowa	79	23,000	5,723,799
Connecticut	15	12,773	3,774,526
Wisconsin	52	13,450	3,582,922
Kansas	46	12,000	2,880,764
Nebraska	60	13,813	3,3 2,781
Maine	32	8,155	2,975,716
Tennessee	26	4,795	2,874,097
Minnesota	46	7,500	2,848,179
New Hampshire	17	4,950	1,921,927
North Dakota	7	1,000	364,130
	4,523	1,244,885	$484,728,370
Other States	962	267,800	97,137,800
Totals	5,485	1,512,685	$581,866,170

Reports for 1894 show 2,767 associations in the United Kingdom, with 587,856 members, and funds of £51,546,007. Similar associations exist in the British colonies.

The capital of a building association is provided by the issue of shares ordinarily worth $200 each. These are not sold outright, but are paid for in installments at the rate of $1.00 a month. If there were no such thing as interest it would of course take 200 months, or nearly seventeen years, to pay for a share: but the money thus paid in is loaned out and the subscribers are credited with the interest, so that the time is much shortened. If the money is so invested as to earn 6 per cent. above expenses, the shares will *mature* in

126 months or about ten and a half years; that is, 126 monthly payments of $1.00 each will entitle the holder, at the end of that time, to $200 in the treasury of the society.

But how is this money invested? It is loaned to members in sums not exceeding the maturity value of their shares to assist them in owning their homes. If a man is making payments on one share he is entitled to become a borrower to the extent of $200; if he is making payments on five shares he may borrow $1,000, and so on—provided, of course, that he can show that the money is to be safely invested. Only it will generally happen, in the early stages of a society's life, that there are more men who want to borrow than there are funds available. In this case, who shall have the preference? Sometimes this is decided by order of subscription to the shares; sometimes by lot; but in most societies the loan is awarded to the man who will bid the highest premium for the privilege of having it, and these premiums form an important part of the society's profits. Sometimes this premium is paid in the form of a gross sum deducted from the principal of the loan; more commonly it takes the form of a small monthly payment in addition to the interest itself. Thus a man who had subscribed to five shares, and secured a loan of $1,000 at a premium of 40 cents a share per month, would have to pay each month as follows:

Subscription to five shares	$5 00
One month's interest on $1,000 at 6 per cent.	5 00
Premium on loan of $1,000 (five shares)	2 00
Total	$12 00

This sum of $12.00 per month he would continue to pay until his shares matured, that is, until they were worth $200 each. At that time, probably some twelve and a half years from the date of the original organization, he would own five full-paid shares of $200 each, which would stand to his credit on the books of the association, and which would, without further transactions, cancel the principal of his debt. At this same time those who had been subscribers and not borrowers would find that they had credits without corresponding debts, and the treasurer of the association would pay them in full from the funds which the financial operations just described would have enabled him to accumulate. When this was done the affairs of the association would be said to be wound up.

In the older building societies affairs were actually managed in this way. All the payments were begun at the same date; all the shares matured at the same date, and at this time the affairs of the association were absolutely closed. This was not without its advantages. The complete winding up insured a certain plainness and straightforwardness of accounts which it was harder to secure as certainly in any other fashion. But the advantage was rather dearly purchased. In the first place, the system made it hard for new members to enter the association after it was once established. They could only do so by paying in a lump sum the amount which they would have contributed month by month, with the addition of the profits which such contributions would have earned during the time which had elapsed since the association was organized. In the second place—and this was much more serious—it was necessary to accumulate a good deal of cash for the purpose of winding up any such association all at once. The non-borrowing shares had to be paid in full, and these were often very numerous. To accumulate this cash it was necessary to keep much money comparatively idle for months before the winding up of the association, for it was impossible to find borrowers for short-time loans as freely as for long-time loans in the early period of the society's life. Of course, any such failure to realize profits told upon the gains of the investors as a whole. To meet these difficulties, inherent in the "terminating" plan just described, the system of series of shares was invented. Under this system the society is not arranged for winding up at a definite time, nor do all the shares mature at the same date. If a number of men want to come in a year after the society is started they are encouraged to do so; and instead of being compelled to pay back dues in a lump sum they are allowed to subscribe to new shares which will mature a year later than the old ones. We thus have successive series of shares, usually, though not always, bearing dates one year apart, and maturing at similar intervals one after another, whose accounts and profits are kept separately. If a non-borrowing member in an older series wishes to become a borrower, he is encouraged to draw out the amount due to his credit on the older series and let his shares in that series be canceled; and then he subscribes to shares in a new series as a basis for whatever further money he needs in the way of loans. As the shares of the older series approach maturity, opportunities are given for voluntary withdrawal on the basis of the profits already earned, and in some societies authority is given for the compulsory retirement, at proper valuation, of non-matured shares. The object of all these provisions is to avoid the necessity of accumulating large sums of idle cash for the exigencies of any single moment, which would be a source of loss and of danger. In England this difficulty is sometimes obviated by providing that certain shares are to be reinvested instead of being paid up, and in the German *Baugenossenschaften* this principle appears to have been carried yet further. Such methods tend to create a separate body of non-borrowers, who furnish no small part of the capital, and deprive the scheme of some of its essentially co-operative character. The extreme of this deprivation is seen in the building societies of France, which are generally managed by representatives of the lenders alone. The workman pays for his home by installments, as in Great Britain or the U. S., but he does not furnish the bulk of the capital by such payments, nor does he control its management and disposition. Under such circumstances much of the educational value of these institutions is lost.

In case the subscriber to a non-borrowing share is unable to keep up his payments he is generally allowed to withdraw and receive back the money that he has paid in, provided the society has funds available for that purpose. Whether he should be allowed the full share of profits already earned, or only a part of them, is a disputed question. As the shares approach maturity it is generally well to encourage voluntary withdrawal for reasons just given, and in that case full profits should be allowed. At earlier periods in the life of the shares it is thought better to hold back a part of the profits, as penalty for too early withdrawal.

The mechanism of these societies is simple. Their affairs are controlled by a president and board of directors; but the most active officials are the secretary and treasurer. At the monthly meetings, which are held regularly, the secretary takes the names of applicants, receives the fees of members and hands them over to the treasurer. At each of these meetings the amount available for loaning is announced, and public bids are made for the award. The loan is granted to the highest bidder, subject to the approval of the "property committee" of the board of directors, whose duty it is to see that the borrower does not invest the money in an unsafe manner. If he wishes the loan to buy a house already built, they have to see that the price is not in excess of the permanent value of the property; if he wishes to build, they may examine into the character of the real estate, house-plans, etc. In cases of the latter class the money is not generally paid to the borrower in a lump sum, but given by the treasurer to the contractor from time to time, as the building progresses. If the committee reports unfavorably on the security, the loan is of course awarded to some one else. The treasurer, who may have large amounts of money to handle, is, in all well-managed societies, an official under bonds. He is assisted in his duties by a "finance committee" of the board of directors, distinct from the property committee just described. Further details and suggestions as to organization and management are given in Judge Seymour Dexter's excellent little book *Co-operative Savings and Loan Associations* (New York), also in the *Report of the Pennsylvania Bureau of Industrial Statistics* for 1888. So economical is the administration of these societies that the more recent Pennsylvania reports show current expenses of about 1 per cent. of the moneys handled.

The advantages of societies of this kind are very great; but they are not to be sought in the most obvious lines, or in the ways which are ordinarily assumed. To begin with, these societies do not always or generally furnish a means by which an intelligent workman can get his home *cheaper* than by dealing with reputable savings-banks. The financial statements purporting to show comparative cost by different methods of payment are often misleading. So well informed a writer as Mr. Linn, whose articles in *Scribner's Magazine* have been a most useful means of disseminating information on this subject, presents an illustration of economy which starts from an absolutely false assumption as to the possible relations between interest-rate, premium, and time of maturity. A man who puts his money in a savings-bank at 4 per cent. until he accumulates a fund large enough to enable him to borrow the balance of what he needs at 6

per cent., with the right to make partial payments on the principal, gets his house cheaper than he can through the agency of any ordinary building society. For the neighborhood of Philadelphia, where the system is so well established that a great deal of capital stands constantly at the disposal of these societies, this statement should perhaps be modified; but for the country as a whole, it is a safe one to make; at any rate, wherever the interest which a man pays on savings-bank loans is only about 2 per cent. greater than that which he can receive on savings-bank deposits.

The shorter the time in which the shares mature the worse is the economy for the borrowers as a class. If the shares mature in less than eleven years, it shows as a mere matter of arithmetic that the non-borrowers are making *ten* per cent. on the money advanced, a rate of profit which in these days is quite excessive. The borrowers as a class must pay this. But the answer is made that the borrowers gain, along with the rest, by the fact that the period of payment is shortened by the more rapid maturity of the shares. The speciousness of this argument constitutes one of the dangers of this form of association. The borrowers apparently share in all the profits: they do not see that if the non-borrowers furnish two-thirds of the capital, the borrowers pay the whole extra profit by excessively high premiums and only get one-third of it back. The temptation to make premiums too high is one that is very difficult to avoid; and few members of a building society have the financial knowledge to resist it. If the shares of a society mature in less than twelve years, with the rates of interest prevailing in some U. S. cities, it may be confidently stated that the borrowers have sacrificed their own commercial advantage.

Another claim urged in behalf of these associations is that they stimulate the habit of saving by making it compulsory. It is said that a man will save more when he is compelled to put it in a building society than when he simply has the option of putting it in a savings-bank. This is doubtless true, but the gain is attended with certain serious losses. In case of sickness this compulsory saving, instead of being a help to a man, may be the worst possible burden. If he has been attracted into paying a high premium, he may find that this burden becomes enormously heavy, and unless the administration of the society is unusually intelligent the danger from this source is very great indeed. If a man's earnings and expenses are perfectly regular, regular saving furnishes the best possible check against extravagance; but if he is brought face to face with unexpectedly increased expenses and unexpectedly diminished earnings, it adds to a load which is heavy enough at best.

A more unmixed gain to the community as well as to the members lies in the fact that these societies enable workmen to become owners of real estate sooner than any other means which has yet been devised. The combination of payments in the share with security for the loan makes it possible for these societies to advance up to 70 or 80 per cent. of the value of the property, while the savings-banks are restricted to 50 per cent. However the account may stand in the matter of dollars and cents, the workman is a great gainer in happiness and self-respect in becoming a real-estate owner as soon as possible. The "magic of property" will enable him to work harder and feel the load less. Even when he is paying an unduly high premium, he is paying it under conditions which make him feel its burdens least and its benefits most. And besides the gain to the individual house-owners and their families, there is a tremendous gain to the community in having the ownership of real estate widely distributed. It puts every owner more completely on the side of law and order than he ever was before. He feels himself an integral part of the state more fully, and is the more ready to take the full share of his responsibilities as a citizen.

The association also has a strong educational effect on its members in teaching them practical lessons concerning the conduct of business. They learn to provide for a future debt by constant investment of their savings in an attractive form. They find out about the handling of money; about interest and the laws which govern it; about the relation between values in the present and future; and a thousand other things which lay the foundation for business success. They also learn about the conditions and methods of building; they learn to buy and build with better judgment than their unaided knowledge would have taught them. So great have been the gains of this sort that there are not a few such societies in which rich men take part as means of both learning and teaching—an interchange of suggestions as to the better ways of utilizing money in building houses. This educational influence is not the result of any machinery; it comes from the contact of man with man. It is not found in the "national" loan associations, which simply provide a means of investment and borrowing—too often under disadvantageous conditions. Even at their best the national associations are subject to most of the special dangers of the local ones, with few of their distinctive advantages. The co-operative character and the educational influence which this involves are either absent from the national associations or present only in name. The expense of advertising connected with such associations is large; the effective control by investors or any one else is small. In fact, the moment a building association goes outside of certain narrowly defined lines of business, there are great opportunities for abuse of power. The recent history of building societies in England has furnished a conspicuous example of this. Many of them entered upon banking transactions for which they had neither the proper organization, the proper oversight, nor the proper cash reserve. In some cases their methods of business were legitimate enough, and the public suspicion of their characters proved to be unjustified; but not a few were unsound from beginning to end. In his report for 1892 the registrar of friendly societies wisely insists upon constant inspection of the accounts by the investors themselves as the only effective safeguard against abuse of power by the building society officials.

ARTHUR T. HADLEY.

Building-stone: stone suitable for building purposes. The varieties of stone most commonly employed for building purposes may be grouped under the general names of granite, marble, limestone, and sandstone, though other rocks, such as the serpentines, traps, porphyries, and recent volcanics, are not infrequently utilized when their colors are suitable, or where, on account of locality or means of transportation, they are to be had at a less cost than other stone.

It may be well, before proceeding to describe in detail the various stones used in architectural application, to call attention briefly to the essential qualities which such stone should possess. These qualities, named in the order of their importance, are as follows, regard being had to their use in ordinary building:

(1) Durability. (2) Permanency of color. (3) Crushing strength and elasticity. (4) Cheapness.

Durability.—Not all stones are equally durable, and this is due to a variety of causes. Taken from its quarry-bed and placed in the wall of a building a stone becomes exposed to the constant variations of temperatures, to the chemical action of acid rains and atmospheres, to the combined chemical and physical action of growing organisms, to the compressive weight of the overlying material, and perhaps to the mechanical action of wind-blown sand or the wear of passing feet. To these must be added the destructive action of artificial heat, as when a building is injured by fire. The constant expansion and contraction produced by variations in temperature are perhaps more trying than is ordinarily supposed. Stones, as a rule, possess but a low conducting power. They are aggregates of minerals, more or less closely cohering, each of which possesses its own degree of expansion and contraction. As temperatures rise, each constituent expands, crowding with resistless force against its neighbor; as temperatures fall a corresponding contraction takes place. A slow and gradual weakening and disintegration is the inevitable result. Artificial heat, as produced by a burning building, is necessarily more injurious in proportion as the temperature is higher. Sufficient data are not at hand for estimating accurately the comparative fireproof properties of various stones, but it is an assured fact that granite in this respect ranks extremely low, while the fact that certain siliceous sandstones are used for furnace backings would seem to show that they are at least very nearly if not quite fireproof. Up to the temperature at which it is converted into quicklime, ordinary limestone has been found more durable than granite. The durability of color of any stone depends mainly upon the presence or absence of ferruginous and carbonaceous matter. Stone containing iron in the form of sulphide or protoxide carbonate compounds is liable to change from a white or blue-gray to a buff, yellow, or brown-red color. Where this change takes place uniformly throughout a stone it is often beneficial, changing a cold gray to a warm buff tint. Such a change is spoken of as "mellowing"; frequently, however, the ox-

idation takes place in spots or streaks, and the result is unsightly. Carbonaceous material, which imparts a dark color to the stone, may in time bleach out to a dirty whiteness.

When a stone becomes saturated with water from rain or other causes, and is then subjected to freezing temperatures, an energetic agent for disintegration is brought into play. Water passing from a liquid to a solid state exerts a pressure of 138 tons to the square foot of surface. It is therefore not surprising that a small amount of water confined within the pores of a stone produces in time very disastrous results.

The water from rainfalls passing through the atmosphere takes up a small amount of carbonic acid. This when brought in contact with stone in the walls of a building is productive of a slight solvent action, particularly in marbles and limestones, or in sandstones with calcareous cements.

In certain cases the crushing strength and elasticity of stone are matters of importance. It must, however, be admitted that these qualities have in times past been greatly overestimated. It is a rule among builders never so to place a stone that it shall be subjected to more than one-tenth or even one-twentieth the pressure it is known to be capable of sustaining. Under such circumstances there are few kinds of stone that are not strong enough for all ordinary purposes of construction, and the test of ratio of absorption, resistance to freezing, and permanency of color, are of vastly greater importance than that of compression. The relative cheapness of materials and their color are still, and perhaps must always be, the controlling factors in deciding what materials shall be used in the greater number of cases. Cheapness is necessarily dependent upon abundance, proximity of quarries to market, and ready means of transportation, together with the ease with which a stone may be quarried and worked. The last quality, unfortunately, not infrequently leads to the selection of a soft, porous, and inferior article.

Testing.—The tests which thus far have been made upon stone to ascertain their fitness for any particular form of architectural application were made mainly with a view of ascertaining their crushing strength and resistance to action of frost. The crushing strength is tested by means of machines, in which small cubes are submitted to a measured force until they are crushed. Such machines are manufactured by Fairbanks & Co., of New York, and the Riehle Bros., of Philadelphia. There is also a remarkable testing-machine, invented by A. H. Emery, in use at the Watertown arsenal in Massachusetts. A large number of such tests have been made under the direction of Gen. Q. A. Gillmore at Staten Island, N. Y., by Gen. Franklin at the Navy-yard in Washington, by engineers at the Watertown arsenal, and others. The results obtained by these investigators do not afford very satisfactory data for a comparison of the relative strength of the different materials, owing presumably to a lack of uniformity in the methods employed and in preparing the cubes to be experimented upon. Enough, however, has been done to warrant the assertion that in other than very exceptional circumstances no further tests of this nature are needed, since under the conditions ordinarily existing a very weak stone will prove sufficiently strong for all practical purposes.

The question, indeed, is no longer what will a carefully prepared cube of the stone bear to-day, but rather how will it endure the vicissitudes of a trying climate, and what will it bear after years of exposure to the action of heat and frost. To these questions the ordinary tests give us no clew. The following figures indicate the range in compressive strength and weight per cubic foot among various rocks so far as they have been ascertained:

DESCRIPTION.	Strength in lbs. per cubic inch.	Weight in lbs. per cubic foot.
Granite	15,000 to 25,000	165 to 170
Trap (diabase)	20,000 " 30,000	175 " 185
Marble (crystalline limestone)	6,000 " 12,000	165 " 170
Marble (crystalline dolomite)	8,000 " 13,000	168 " 175
Limestone	5,000 " 14,000	145 " 170
Sandstone	5,000 " 17,000	130 " 160

For a single test, the best that can be applied to stone is one to ascertain its power to resist the action of frost. This can best be done by actually freezing prepared cubes when saturated with moisture. Chemical methods, as saturating with a solution of sulphate of soda, which is then allowed to crystallize, have proved unsatisfactory and unreliable. The power of stone to resist the action of an acid atmosphere was tested by Prof. N. H. Winchell at Minneapolis, Minn., by placing prepared cubes in a dish of water through which carbonic acid was kept constantly bubbling. The resistance to heat was tested by placing the specimen in a muffler, raising to a white heat, and noting the change in color and disintegration, if any. While still hot the cubes were dropped into cold water and the effect noted.

None of the tests that can be made in the laboratory are equal for practical results to an examination of the old exposures in a quarry or of stone as it appears in the walls of a building of long standing. Any serious disintegration or discoloration will here have made itself apparent.

"A good building-stone, whatever its kind, should possess a moderately fine and even texture, with the grains well compacted; should give out a clear ringing sound when struck with a hammer; and show always a clear, fresh fracture. It should also be capable of absorbing only a proportionately small amount of water."

Granite has ranked from time immemorial as one of the strongest and most desirable of building materials. Unfortunately, its great hardness has until recently proved a serious drawback to its use in other than the most massive structures. The invention of machines for cutting, grinding, and polishing, has, however, very largely done away with this difficulty, and the stone is now in very general use, not merely for house walls and massive masonry, but in turned and polished columns, pilasters, balustrades, monuments, and tombstones. Commercially, the name granite is made to include a variety of siliceous rocks having only a massive and granular crystalline structure in common; the diabases and gabbros are thus included under the name of *black granite*. Properly the name is restricted to eruptive rocks consisting essentially of the minerals quartz, potash feldspar, and one or more minerals of the mica, hornblende, or pyroxene group. The prevailing color of granite is some shade of gray, though pink and red colors are common. The gray hues are due to the prevalence of mica or hornblende; the pink and red to the prevailing pink and red feldspars. The ordinary grays are used mainly for general building, curbings, and pavements, while the darker colors, as those of Quincy (Mass.), and the pink and red varieties, are utilized in ornamental work and for the bases of statues. Granites occur in all the States bordering upon the Appalachian Mountain system, but are more extensively quarried in Maine and Massachusetts than elsewhere, a fact due to the excellent facilities for shipping as much as to the quality of the material. The most noted granites of the U. S. are those of Hallowell, Red Beach, Vinalhaven, Dix's and Hurricane islands, and adjacent localities on the coast of Maine, Concord, N. H., Quincy and Cape Ann, Mass., Westerly, R. I., Richmond, Va., Iron County, Mo., and East St. Cloud, Minn. Good granites abound in the Rocky Mountain region, but are as yet undeveloped, excepting to a slight extent in Colorado and California. Among other noted stones belonging to this class are the red granites from the Bay of Fundy, Nova Scotia, and from near Peterhead, Scotland. A gray granite with pink crystals of porphyritic feldspar is obtained in Shap, Westmoreland co., England, and a coarse, dark red-brown variety in Sweden.

Marble.—The term "marble" as ordinarily used includes any stone composed essentially of carbonate of lime alone, or the carbonate of lime and magnesia in varying proportions, and which, owing to its color and texture, is sufficiently beautiful for a high grade of building material, or for monumental or decorative work. In color marbles vary from pure white, through all shades of gray, to black; yellow, pink, brown, and red are by no means uncommon, the gray and black hues being, as a rule, due to carbonaceous matter, and the others to iron oxides. In texture they vary from finely and coarsely granular to compact and apparently amorphous, at times highly fossiliferous. A high grade of marble for polished interior decorative work should be so compact as to yield under the hands of the workman a close, enamel-like surface with little if any granulation. For building and statuary purposes, on the other hand, a granular stone is the most desirable, giving in tool-dressed or rock-faced work an effect much more pleasing to the eye than do the compact varieties.

The principal sources of American marbles are at present the beds of Silurian limestone and dolomite which border the Appalachian Mountain system. Vermont produces some 60 per cent. of the entire output. Coarse dolomite marbles eminently suited for constructive purposes occur in

Western Connecticut and Massachusetts, and in Southeastern New York; a coarse building-marble is also quarried in Northern Georgia. Pink and chocolate variegated marbles suitable for furniture and interior decorative work occur abundantly in Eastern Tennessee, and have been quarried for many years. This is now the chief source in the U. S. for colored decorative marble. Good marbles are known to occur in the Rocky Mountain region, but as yet they have come into but little use, owing to their inaccessibility. Recent developments in Colorado and California are, however, very promising.

The principal foreign sources of marble are Northern Italy, the French Pyrenees, Belgium, Germany, and Algeria: Spain and Portugal are also productive. The most noted of these are the white statuary marble of Carrara, the black and gold and Sienna marbles of Italy; the so-called Numidian marbles of Algeria; the *griotte* or French red from the Pyrenees; the St. Anne and Sarracolin from Belgium; the Formosa and Bougard from Germany; and the yellow from Portugal.

The so-called "onyx marble" is in reality a compact and very beautiful variety of travertine. This is by far the most beautiful and highly prized of all marbles. The principal sources of supply in times past have been Egypt and Algeria, more recently Mexico, and still more recently high-grade material of this nature has been found in Arizona and California in the U. S. Extensive deposits are also reported in the desert region of Lower California. The verd antique marbles, so called, are mentioned under the head of SERPENTINE (*q. v.*).

LIMESTONES.—Limestones vary in color and texture, as well as in durability for constructive purposes, as do the marbles. They may be compact and amorphous, finely or coarsely crystalline, or fossiliferous. Some, like the Florida coquina, are mere aggregates of more or less comminuted shells. The limestones as a rule are less desirable for constructive purposes than are the granites, marbles, or sandstone; this on account of their colors and poor working qualities. There are, however, important exceptions. The most important of the limestones used for constructive purposes are the oölites or oölitic limestones from the subcarboniferous beds of Southern Indiana and adjacent portions of Kentucky; these are of a white or cream color, fine grained and readily wrought. They are eminently suited for finely carved and ornate styles of architecture. In color and texture they correspond closely with the Jurassic oölites of England, which have been in use in that country since early in the twelfth century. The dolomitic Silurian limestone underlying the city of Chicago, and adjacent portions of Will and Cook Counties, is another important source of material for both building and flagging purposes. In many instances the stone contains sufficient bituminous matter to discolor and impart to it a peculiar antique look which is much esteemed by some. Important beds of limestone for structural purposes also occur in Iowa, Kansas, and Missouri. Ohio also has many quarries of local importance, but few of them are known beyond the limits of the State.

SANDSTONES are among the most variable of natural building materials. As the name denotes, they are composed essentially of consolidated sand, but the composition, texture, and color of this sand may vary almost indefinitely. As a rule, the predominating constituent in a sandstone is the mineral quartz, in rounded or more or less angular grains. Feldspar and minerals of the hornblende, pyroxene, or mica group are, however, common. The usual cementing or binding constituent in sandstone is silica, carbonate of lime, iron oxide, or clayey matter. The durability of the stone, as well as its working qualities, is dependent more upon the character of this cement than upon that of the grains composing the stone itself. Of all cementing materials the siliceous is the most durable, and the clayey the least so, since the first is less susceptible to the solvent action of water from rainfalls. Both ferruginous and calcareous cements are slightly soluble and liable to slow removal, whereby the stone becomes friable and slowly disintegrates. The clayey cement is a source of weakness on account of its tendency to absorb water, whereby the stone is rendered liable to injury by freezing. In color sandstones are as variable as in texture. The prevailing hues are some shades of gray, buff, drab, red, or brown, the coloring-matter being mainly iron in some of its forms. A white color denotes the absence of iron. The red is due to anhydrous iron sesquioxide; brown to a hydrous sesquioxide; the gray color may be due to iron in the form of a protoxide carbonate. Such stones are liable to turn yellowish on exposure. In certain of the Ohio quarries the stone is brown in color as exposed in the surface outcrops, but dark blue-gray below the water level, the change being due to the oxidation in the upper layers of the protoxide carbonate. In many sandstones the cementing silica has so orientated itself around the original quartz granules as to convert the stone into a granular aggregate of imperfect crystals. Such stones are properly quartzites, and rank among the most indestructible of building-stones, though unfortunately they are extremely hard to work. The well-known Potsdam sandstone of St. Lawrence co., N. Y., is one of the best examples of this phenomenon.

All stone are softer and most readily worked when first quarried than after seasoning, but this characteristic is most strongly marked in sandstone. This is due to the fact that the stone as it lies in the ground contains a small amount of sap, or quarry water, as it is called, and this carries the cementing material in solution, to be deposited on evaporation. So abundant is this quarry water in many sandstones that the rock is liable to serious injury if frozen without previous seasoning. On this account many quarries in northern latitudes can be worked only during the warmer seasons of the year.

The favorite sandstones for constructive purposes in the U. S. are the Ohio freestones, or Berea grits, from the Waverly division of the sub-carboniferous formations in Ohio, and the brown and red freestones from the Triassic formations of the Atlantic States and eastern slopes of the Rocky Mountain range. The first is a fine light drab, gray, or buff siliceous sandstone, very readily wrought, and, when properly laid, very durable. The best-developed quarries are in the towns of Berea, Amherst, East Cleveland, Illyria, and Independence, in Lorain and Cuyahoga Counties. The Triassic stone is of a prevailing brown or red-brown color, and has been used frequently in New York and other Eastern cities in the form of ashlar blocks for house fronts. Unfortunately, little judgment was exercised in either the selection of the material or its preparation and laying in the wall. Serious disintegration has not infrequently resulted and the stone been brought thereby into undeserved disrepute. The principal quarries in the East are along the Connecticut valley in Massachusetts and Connecticut, particularly at Portland in the last-named State, and in various towns in Passaic, Essex, Hunterdon, and Mercer Counties in New Jersey, and at the mouth of Seneca creek in Maryland. Extensive quarries are also operated at Hummelstown, in Dauphin co., Pa. Within a few years operations have begun in Triassic beds forming the eastern foothills of the Rocky Mountains near Golden, Col., and Flagstaff, Arizona. Beds of Medina sandstone of a red-brown and gray color in Western New York furnish also a high-grade building and paving stone. Thin bedded blue-gray aluminous sandstones belonging to the Hamilton group are admirably suited for pavements, steps, sills, and lintels, and are extensively quarried in Albany, Green, and Ulster Counties in this same State, and in Luzerne, Wyoming, and other counties in Pennsylvania. The stone is popularly known as "bluestone" or "flagstone," on account of its color or the prevailing use to which it is put. Silurian sandstones, also of a brown or red color, are found in the northern part of the upper peninsula of Michigan, and are being worked at various points in Marquette, Baraga, and Houghton Counties to furnish materials to cities along the lakes. A dense quartzite of Potsdam age occurring near Sioux Falls, in South Dakota, has been worked for building and paving materials, and to a slight extent for ornamental work, such as turned columns and polished tiling. A beautiful light-buff stone from sub-carboniferous beds near St. Genevieve, Mo., has been utilized to some extent. The sandstones of the Pacific coast have been as yet but little developed, as there has been until recently but small demand for such materials. Large quantities occur around the Bay of San Francisco, in California; in Douglas co., Ore., and on Chuckaunt Bay, in Washington.

The most noted of foreign sandstones which are brought into the U. S. are the pale olive green Coal Measure stones from the vicinity of Dorchester, New Brunswick, and the bright-red "Corsehill stone" from near Annan, in Dumfriesshire, Scotland. A brown-red Potsdam stone is also imported to some extent from Verde island, Nipigon Bay, Lake Superior.

PORPHYRY, as the name is ordinarily used, includes any rock with a porphyritic structure. The quartz porphyries

of Eastern Massachusetts are of exceptional beauty when polished, but their intense hardness prohibits their extensive use. The green antique porphyry, or *Marmor Lacedæmonium viride* of the ancients, is a porphyritic diabase, while the red Egyptian porphyry, or *Rosso antico*, is, according to Delesse, a porphyrite.

Alabaster, a fine translucent variety of gypsum, is little used for other work than that of making small stands, vases, and statuettes. It is too soft for use where exposed to wear. No alabaster of importance is produced in the U. S., the chief source of supply being Northern Italy, whence it is exported in the manufactured form under the name of "Florentine marble."

Serpentinous rocks are abundant in numerous localities along the Appalachian and Coast Range belts of mountains, but are at present in little demand owing to the fact that the colors are cold and do not readily harmonize with their surroundings. The rock is as a rule, moreover, badly jointed, and this renders the procuring of large slabs or blocks a matter of great difficulty. Serpentines of compact texture and susceptible of a light lustrous polish occur at Deer island, Maine; near Roxbury, in Vermont; Lynnfield, Mass.; Milford, Conn.; Essex co., N. Y.; in Harford co., Md.; on the Gila river, Grant co., New Mexico; and near Victor, in San Bernardino co., Cal. A coarse, porous, light-green serpentinous rock is quarried in Chester co., Pa., and furnishes a cheap and durable building material for the many cities and towns in the vicinity.

The most noted of foreign serpentines, or verd antiques, are those of the Lizard district, in Cornwall, England; the "Connemara green" from County Galway, in Ireland; and the serpentinous *breccia* from near Genoa, Italy.

Trap is a term used to include a number of igneous rocks which may be more accurately described under the names of diabase, dolorite, basalt, melaphyr, diorite, and gabbro. These rocks are little used for building or decorative purposes, owing to their somber hue and poor working qualities. They are, however, exceedingly strong and often very durable. The Mesozoic traps of the Atlantic border are extensively used for road ballast and street pavements, and more rarely for bridge work and general constructive purposes. Gabbros from the coast of Maine, and near Duluth, Minn., are also in great favor for monumental work, acquiring a high polish, and being dark gray or nearly black in color; such are commercially known as "black granites."

The total value of the building-stone production of the U. S. for 1899, as given by the Geological Survey, was as follows: Granite (including trap rock, valued at $1,275,041), $11,618,339; sandstone (including bluestone, valued at $815,284), $6,362,944; slate, $3,962,733; marble, $4,011,681; limestone, $18,757,963; total, $44,713,660.

Buildings, Warming and Ventilation of: See Warming and Ventilation of Buildings.

Buisson, Ferdinand E.: See the Appendix.

Bujalance, boo-*kh*ăă-laan'thăy: a town of Spain; province of Cordova; about 25 miles E. of Cordova (see map of Spain, ref. 18–E). Its wall is flanked with old towers; it has an old Arabian castle and a college. Here are manufactures of woolen goods, glass, and pottery. Pop. 10,500.

Bukovina, boo-kō-vee'na: a province of Austria; bounded N. by Galicia, E. and S. by Roumania, and W. by Hungary, and Galicia (see map of Austria-Hungary, ref. 5–L). Area, 4,035 sq. miles. With the exception of both banks of the Pruth, its chief river, the country is mountainous throughout. The climate is severe, but healthful. It has very little commerce and industry. The chief occupations of the inhabitants are agriculture and cattle-raising. Iron, copper, and rock-salt are mined in large quantities. Bukovina was originally a part of Transylvania, with which country it passed under Turkish rule in 1529; ceded to Austria in 1777; united with Galicia in 1786; organized as a separate crownland in 1849. Pop. (1891) 646,591.

Bulak, or **Boulac**, boo-laak': a town of Egypt; on the right bank of the Nile; about a mile from Cairo; at the branching of the Pelusiac arm of the Nile. It formerly stood on an island. The vessels navigating the Nile discharge their cargoes at Bulak, which is the port of Cairo, and contains a custom-house. It has manufactures of cotton and silk, a Government printing-office, and a very valuable museum of Egyptian antiquities. Pop. about 13,000.

Bulb [from Lat. *bulbus*, from Gr. *βολβός*, onion]: in botany, a generally rounded or ovoid structure consisting of a short stem, upon which are attached many thickened bases of leaves, usually in the form of concentric layers. For the most part bulbs are subterranean, or partly so, and from the lower part of the short stem roots grow out and downward into the soil. The onion is a good example of a bulb, and in it the little stem may be easily seen by making a vertical section, while the arrangement of the layers may be best seen in a cross-section. By a close comparison of bulbs and buds it is readily seen that their structure is similar. Each is but the quiescent state of a shoot, in which by the checked growth of the axis the leaves are developed in close proximity. Thickened stems are sometimes erroneously called bulbs, as in the crocus, gladiolus, etc., where they are more properly called *corms*. Thickened roots of particular shapes are often termed *bulbous roots* in allusion to their resemblance to bulbs in form, although there is otherwise no similarity.

C. E. B.

Bul'bul: the Persian name of the nightingale; sometimes used by English poets. The same name is given by the people of India to a different species of bird, the *Pycnonotus hæmorrhous*. It is a small bird of brilliant plumage, and remarkable for its pugnacity and its lively manners. It likes to build near houses. Its constant singing is described as pleasant, but hardly musical, at least not to be compared with that of the true nightingale.

Bulga'ria (anc. *Mœsia Inferior*): a principality of Europe; bounded N. by the Danube, E. by the Black Sea, S. by the Balkan Mountain range, and W. by Servia (see map of Turkey, 3–D). Area, 24,360 sq. miles. The surface is level in the N. and mountainous in the S., and is generally well wooded. The soil in some parts is fertile. It is drained by numerous small tributaries of the Danube. The chief articles of export are horned cattle, grain, wine, iron, wood, hides, wax, and attar of roses. The principal towns are Rustchuk (Russe), Plevna, Razgrad, Sevliovo, Rahova, Vratya, Varna, Widin, Sofia, and Schumla. The Bulgarians belong to the Greek Church, but for many years endeavored to become independent of the patriarchate of Constantinople, and to have all the Bulgarian dioceses of Turkey united under one Bulgarian exarch. The demand was granted by the Turkish Government in Apr., 1870. The people are of the Finnish-Ugrian race, but adopted very early the Slavonian language. This country was conquered by the Turks in 1396. By the treaty of Berlin in 1878 (see Berlin Congress), it was made an autonomous and tributary principality under the Sultan of Turkey. Pop. (1888) 2,193,934. Capital, Sofia. In Oct., 1885, Eastern Roumelia (area about 13,500

sq. miles, with 960,441 pop. in 1888) was annexed to Bulgaria. Prince Alexander of Bulgaria abdicated Sept. 7, 1886. Ferdinand, Duke of Saxony, was elected Prince of Bulgaria by the National Assembly July 7, 1887, and assumed the government Aug. 14, 1887. His election and the union of Eastern Roumelia to Bulgaria have not yet (1896) been confirmed by the great powers. See ARMY, and Jirecek, *Das Fürstenthum Bulgarien* (1891).

Bulgarian Language: See SLAVIC LANGUAGES.

Bulgarian Literature: The literature of Bulgaria falls into two distinct and widely separated periods. The first of these extends from the ninth to the fourteenth century, the date of the conquest of the Bulgarians by the Turks; the second comes wholly within our own century. The literary language of the two periods is different, and the very alphabet has changed. In the early period the so-called Cyrillic alphabet obtained, being the alphabet given to the Slavic race by Cyril and Methodius, the apostles to the Slavs, who were themselves Bulgarians from Salonica and began the spreading of the Orthodox Greek faith among the Slavs from Bulgaria. There, too, they designed the Slavic alphabet, and translated the Scriptures and various Church books; and the ancient Bulgarian dialect and style of writing are both called Cyrillic. Being then of all the Slavs nearest to and most in contact with the Byzantine Greeks, the Bulgarians advanced in literature more rapidly than any other Slavic nation. Most of the literary production of that time, however, was theological in its character. The Gospel of Ostromir' is taken as the purest standard, for style and also for orthography, of the Cyrillic or Old Bulgarian literature. The language compares favorably with Latin and Greek for richness and pliability, and translations were freely made from these tongues. Many manuscripts containing such translations are preserved in the great libraries of Europe, though unfortunately few have as yet been published. Scholars have, however, derived important aid from them for the study of the originals. Old Bulgarian literature reached its zenith during the reign of the Tzar Simeon (latter part of the tenth century). Though consisting, as has been indicated, largely of translations, it well deserves study for the light it throws upon the general literary relations of mediæval Europe.

After the conquest of Bulgaria by the Turks (1396), the Greek subjects of the Turkish Government succeeded in prejudicing their rulers against the unruly Bulgarians, and in obtaining the right themselves to invade the country with their churches, schools, and language. Speedily the Greek tongue replaced the Bulgarian in religion and education. The Greek bishops, with intent to Hellenize the Bulgarians, destroyed the public, and even private, libraries in which were Bulgarian books, so that only scattered manuscripts were preserved.

The gap in Bulgarian literature from the fourteenth to the nineteenth century is bridged by a single class of literary productions, popular ballads, tales, and proverbs; and these are rarely other than modern in the form we have. Still they are in substance traditional, and give us much information as to the life of Bulgaria during these centuries. The ballads often make use of Bulgarian history under the tzars, especially the last, Tzar Shishman; but for the most part they describe the wrongs suffered from the Turks and Greeks, and the deeds of the heroic avengers of these wrongs. There are love ballads also. All are sung to melancholy, long-drawn airs, said to have been adopted after the Turkish conquest. In the heroic ballads, the chief figures, represented as banner-bearers of bands of Haiducs, are the leaders of bodies of insurgents; and the Bulgarian heroes are often confused with the ballad heroes of Servia and Montenegro. There are many collections of these ballads, of which the following may be named, those of Bezsonoff, the brothers Miladinoff, Kachanofski, Verkovich, Hieff, and Shapkareff. See BALLAD POETRY.

Modern Period.—The first Bulgarian book of the new epoch was published in 1806. Certain Bulgarians educated in Russia formed a club in Odessa for the purpose of reviving Bulgarian literature, and also with the intent to make Bulgaria an independent exarchate. The last point was not gained until Apr., 1870, after many and severe trials. But long before this, local revolts against the Greek patriarchate had banished the Greek bishops, with their books and language, from most of the Bulgarian churches and schools. About the middle of the century, a gymnasium was established at Bolgrad, in Bessarabia; and the brothers Apriloff, of Odessa, had endowed another in their native town in Bulgaria, Gabrova. Text-books and periodicals began to be published in Bulgarian. At first an attempt was made to preserve the Old Bulgarian alphabet and language—or at least, as Rakóvski advocated, to adopt an intermediate dialect, which should serve as a medium for all Slavs, as Old Bulgarian had formerly done. It was found, however, that the language had undergone such modifications that the modern form of it was related to the old form much as modern to ancient Greek, or Italian to Latin. Accordingly, the old idiom, with the Russisms it had acquired from the printing of the Church books in Russia, was consigned to the use of the Church, while the living language was adopted for the schools and for literary purposes. The old accentuation and abbreviations and from eleven to sixteen letters of the old alphabet have been abandoned: and the calligraphic handwriting and the smooth Russian type are employed. These changes, however, have not been thoroughly or systematically carried out; and the tendency to adopt the phonetic system of writing, advocated especially by Prof. Drinoff, causes great confusion in Bulgarian orthography.

The following writers of the new epoch deserve to be mentioned: P. R. Slavéicoff, I. Grúeff, Neófit Rílski, Lúben Karavéloff, and S. Rakóvski. Though not writers of cosmopolitan training or European reputation, these men have done much for the literary future of their race. Slavéicoff, especially, the most productive of all, has proved himself a born poet and a sharp satirist. His *Sméshen Kalendár*, *Nova-moda Kalendár*, and his periodical *Gáida* have been the principal factors in the overthrow of the Greek hierarchy and the awakening of independent Bulgarian life. Slavéicoff has also translated many novels and poems into Bulgarian, and has edited several periodicals. Grúeff has worked mainly as a teacher through the schools. He has composed and translated many text-books. Rílski, first a teacher and then hegumenos of the monastery of Rila, has translated the New Testament, and composed the first Bulgarian dictionary and grammar, but only the grammar was published in 1835. Karavéloff is a noted novelist and journalist.

Education is making greater progress in Bulgaria than in any other Slavic country. Missionaries from the U. S. have contributed much to this, and, indeed, to the development of Bulgarian literature. Dr. Riggs published in 1844 a Bulgarian grammar, and Mr. Morse in 1859 the first vocabulary. Bulgaria has now a university at Sofia, 7 gymnasia for boys and 6 for girls, 2 normal schools, 1 commercial, 2 agricultural and 1 technical, all under the care of the Government, and very prosperous. The exarchate supports also a gymnasium in Salonica and many grammar schools in Macedonia. For professional training, Bulgarians must still go to foreign countries.

In the way of periodicals, Bulgaria has eleven magazines or reviews, of which the *Sbornic*, edited by the Ministry of Education, *Periodichesko Spisanie*, and *Trud* are very good; and twenty-eight newspapers, of which two are dailies.

E. S. YOVTCHEFF.

Bulgarin, FADDÉÏ VENEDIKTOVITCH: Russian writer; b. in the department of Minsk, in Lithuania, 1789; d. near Dorpat, Sept. 13, 1859. In his youth he served in the Russian army against Napoleon, and in Finland; but in 1810, having withdrawn from the Russian service, he joined the famous Polish legion at Warsaw, and served under Napoleon in Italy, Spain, and Germany (1810–14). After the conclusion of peace he entered the Russian administration, and at the same time began to write. In 1825 he founded with Gretch the journal *Sseviernaja Ptchelá* (*Northern Bee*), for which he wrote many years. He was an able writer, but unjust, servile, and venal. In politics and literature both he was a fierce absolutist and reactionary; and as such he enjoyed the special favor of the Russian Government. His feud with the Russian romanticists, especially Pushkin, was of the bitterest. He is now chiefly remembered for his novels, which have undeniable power, and which have been translated into most of the languages of Europe. The chief of these are *Ivan Vuishigin, or the Russian Gil Blas* (1829); *Demetrius* (1830); *Mazeppa* (1832); *Peter Ivanovitch Vuishigin, sequel to the Russian Gil Blas* (1834). Besides these novels, Bulgarin wrote a great work, *Russia, Geographical, Statistical, and Literary* (6 vols., St. Petersburg, 1836), and *Memoirs* (*Wospominania*, 6 vols., St. Petersburg, 1844–49; Germ. trans. by Reinthal and Clemenz, 6 vols., Jena, 1858–61).

A. R. MARSH.

Bulkeley, Morgan Gardner, A. M.: Governor of Connecticut; b. in East Haddam, Conn., Dec. 26, 1837; educated in Hartford High School; mayor of Hartford 1880–88; elected Governor of Connecticut in 1889; and in 1891 held over with the aid of the House of Representatives, owing to alleged defects of election returns, although he had not been a candidate for the office.

Bulkhead: on board ship, a partition separating the cabins and staterooms on the same deck, as *cabin bulkhead*, *wardroom bulkhead*, etc. Water-tight bulkheads are transverse partitions of iron dividing the holds of the modern steamship into compartments. Transverse and longitudinal bulkheads increase the structural strength of a ship, and, by confining a fire or a leak to one compartment, add to her safety.

A *collision bulkhead* is a transverse partition in the fore body of a ship. Should the bow be stove in by a collision, it confines the water to the forward compartment. The name is also applied to a structure of wood or stone, to hold back earth, as on a water front, in a mine, etc. S. B. Luce.

Bull (in Lat. *taurus*, Fr. *taureau*): the male of animals belonging to the family *Bovidæ* and genus *Bos*. The name is also applied to the males of some other animals, such as the elk, sea-lion, seal, whale. (See Bovidæ.) Also the name of one of the twelve signs of the Zodiac, and of a constellation which does not coincide with the sign. (See Taurus.) In conversation, a ridiculous speech defined by Sydney Smith as "an apparent congruity and a real incongruity of ideas suddenly discovered." The use of the term was known as early as the fourteenth century.

Bull, or **Papal Bull** [from Lat. *bulla*, knob, seal]: an ordinance or decree of the pope, equivalent to the edicts, proclamations, or letters-patent of secular sovereigns, some of which were formerly called bulls. (See Bull, Golden, below.) All bulls are written in Latin, except those addressed to the United Greek churches. They are generally designated by the first words of the text; thus the bull issued in 1536 against heretics was called the bull "In Cœna Domini," and that directed against the Jansenists in 1713 was the bull "Unigenitus." The publication of a bull is termed fulmination (from the Lat. *fulmino*, *fulminatum*, to "hurl a thunderbolt," *fulmen*). Bulls are written on parchment, and a leaden seal is appended to every bull by means of a silken cord if the object of the bull be the granting of a favor; but if it be a matter of justice, the cord is of hemp.

Revised by John J. Keane.

Bull, Golden: a term applied to a decree or enactment of Charles IV., Emperor of Germany, published in 1356, in two diets held in succession at Nuremberg and Metz, in order to fix the laws in the election of emperor and to regulate the number and privileges of electors. It is preserved at Frankfort-on-the-Main. Another "golden bull," of Andrew II. of Hungary, in 1222, fixed the privileges of the nobles, and was regarded as a national constitution.

Bull, John: See the Appendix.

Bull, Ole Bornemann: Norwegian violinist; b. at Bergen, Feb. 5, 1810. He visited Paris in his youth, and afterward performed in Italy and England with great success. In 1845 he purchased a large tract of land in Pennsylvania, and founded the colony of Oleana. This failed, and he returned to Europe, but subsequently visited the U. S. several times. D. at Bergen, Norway, Aug. 18, 1880.

Bul'la: a genus of molluscs belonging to the order of *Opisthobranchs* (see Gasteropoda) and family *Bullidæ*, which receives its name from the swollen globular shell with which all the species are provided. The whorls of the shell are few in number, the outer ones greatly swollen, and the spire is frequently covered by the outer whorl. The animal has a broad, flat head, which is united to the fleshy tentacles to form a frontal disk. Gills occur only on the right side. The species, of which over fifty are known, are all marine, and are mostly inhabitants of warmer seas, especially those with sandy bottoms. Fossil species occur in Cretaceous rocks.

Bulla velum.

Bull-baiting: a sport formerly common in England, but illegal since 1835. The bull was baited by inciting dogs to attack him, and in order that the bull's temper might be excited his nose was blown full of pepper. Sometimes the bull was fastened by a rope, and bulldogs were set at him, one at a time, to fasten themselves on his nose, which operation was called pinning the bull. The sport, however, chiefly consisted in seeing the dogs tossed.

Bulldog [so called from the practice of Bull-baiting (*q. v.*)]: a variety of dog especially bred in Great Britain. It is remarkable for its courage, faithfulness, persistency, and strength. It is now much less frequently bred than in past times. The size of the neck and fore quarters of this dog is quite in excess of the development of the other parts. The bulldog is one of the most fierce, and even dangerous, of his species. Its chief value at present is for crossing with other breeds. The greyhound, the terrier, and the pointer, each have their courage and persistency much improved by this cross, if judiciously made.

Bulldozing, Bulldoser, or **Bulldozer**: a slang term of Louisiana origin, having as yet a variable significance. Its first use was in the parishes of Feliciana and Baton Rouge, in 1876, to describe the doings of a band of a dozen Regulators styled the "Union Stop," who undertook, in the absence of law, to check the stealing and killing of stock, which were destroying the cattle and hogs of that region. The punishment of offenders was with the well-known bull-whip—a hickory handle of 12 or 15 inches and a plaited thong of 3 to 5 feet. A dozen lashes (or the dozen composing the band) gave the name to the process or dose of strapping, and it was called "bulldosing" or "bulldozing." It soon was applied to all summary punishment not authorized by law. More recently it became a political term, particularly as applied to the influencing of negro voters by those of their own color; but bulldozing has become a term used to describe all the various kinds of intimidation, real or imaginary, used at elections.

Buller, Gen. Sir Redvers Henry: English soldier; b. in Devonshire in 1839; entered the army in 1858; served with distinction in China, the Ashanti war, the Zulu war, the Boer war, the Egyptian war of 1882, and the Sudan campaigns of 1884–85; quartermaster-general 1887; under-secretary for Ireland 1887; adjutant-general 1890–97; in command at Aldershot 1898–99. Commanded the British forces in South Africa in 1899. He relieved Ladysmith, March 1, 1900.

Bullet (in Fr. *balle*; Germ. *Kugel*): a projectile of lead to be discharged from various kinds of small-arms. For smooth-bore arms bullets are usually spherical, but for rifled musketry various forms of the elongated bullet are used. Most of these bullets have an expansive base, either hollow or plugged with wood, the design being to force the soft lead outward, so as to cause it to fit the grooves of the rifle, and thus give the bullet a rotation around its long axis during the motion forward. This rotation increases the range and precision. Bullets were formerly always cast, but now they are more frequently stamped in steel dies.

Bulletin [Fr.]: in diplomatics, a term equivalent to schedule, and variously applied to different public acts. In recent times the word is often used to denote an official report, a dispatch of a military commander, and in a wider sense any public notice or announcement, especially of recent events. In France the ticket or slip of paper which each elector uses in voting at elections is called a bulletin.

Bull-fighting (in Sp. *corrida de toros* or *fiesta de toros*): a contest between men and bulls carried out as a show for the public entertainment. Bull-fights were introduced at Rome by Julius Cæsar, and were popular during the reigns of the emperors. They were introduced into Spain by the Moors in the eighth century. They were abolished there by Philip V., but were revived early in the nineteenth century. They are now a popular sport in Spain as well as in Spanish America. Lately efforts have been made to introduce them into the south of France, but have met with some opposition. At the present time bull-fights are carried out by private individuals or for the benefit of hospitals or other public institutions. In Madrid the fights take place in the Plaza de Toros, an arena round which the seats are ranged as in an amphitheater, with rows of boxes at the top. It is said there is room for 10,000 spectators. The actors in the bull-fight are generally professionals, but amateurs are sometimes permitted to take part. The fight is divided into three acts. In the first act the *picadors* take part, in the second the *chulos*, and the third act is reserved for the *matador*. The picadors, who are dressed like the knights of ancient times, are mounted and armed with lances (hence

the name, from Spanish *pica*, a pike or lance. They take their place at the center of the arena. The chulos, who are on foot, are dressed in colored cloaks. The matador is on foot, and carries a sword and a *muleta*—a stick with a piece of red silk fastened to it. When the magistrate gives the signal a bull is let out into the arena. If the bull is a brave one, the picadors assume a defensive attitude; but if he is sluggish, they attack him vigorously. If they fail in irritating him, the animal is stabbed in the back of the neck. Whenever a picador's horse is wounded or he himself is thrown, the chulos advance and distract the bull's attention with their cloaks. The bull generally kills some of the horses, and on rare occasions one or two men. When the bull becomes exhausted, the picadors are succeeded by the chulos with banderillas—small barbed darts—to which firecrackers are sometimes attached. These the chulos discharge at the bull to stimulate his flagging energies. In the last act the matador enters alone. The bull being enraged by the sight of the muleta makes a dash for it, and the matador standing aside drives his sword in front of the left shoulder. A team of mules then enters, and the dead body of the bull is quickly carried away. The matador is greeted with cheers, but the populace is equally well satisfied should the bull be the victor, when another matador enters the arena.

Bullfinch (*Pyrrhula europæa*): a European bird of the family of *Fringillidæ*; about the size of the common sparrow; often kept as a cage-bird, especially by the Germans.

Bullfinch.

It is easily trained. The plumage is bluish gray above, the breast is of a bright tile red, and the crown of the head and the greater wing-coverts are black. It builds on bushes or trees near the ground, and feeds chiefly on seeds, berries, and buds. Its song is not naturally very agreeable, but it can be improved by education, and trained bullfinches are sold for high prices. The pine bullfinch (*Pinicola enucleator*) is a beautiful northern bird of both hemispheres. The male is of a splendid red, the female an orange green.

Bullfrog (*Rana catesbiana*): a frog found in the U. S.; of olive-green color; generally 8 to 12 inches long, though in some cases it attains the length of 19 to 21 inches. It derives its name from the remarkable loudness of its voice, which is of a deep bass, and resembles the bellowing of a bull. It is almost wholly aquatic. The hind legs of this frog are often used as food.

Bullhead: the popular name of small fishes of the genus *Cottus*, of which there are several species in Europe and America. Another name commonly given them is Miller's-thumb (*q. v.*). *Ameiurus nebulosus* and occasionally other species of catfish are locally known as bullheads in the Northeastern States.

Bullinger, bŏŏl'ling-*er*, Heinrich: Swiss reformer; b. in Bremgarten, in the canton of Aargau, near Zurich, July 18, 1504; d. in Zurich, Sept. 17, 1575; studied theology in Cologne, and became a teacher in the convent at Kappel 1523; by the writings of Luther, Melanchthon, and Zwingli led to embrace the Reformation. In 1529 he was chosen pastor of his native city, and married, and in 1531 he succeeded Zwingli as pastor of Zurich. He wrote with great dignity against Luther in the controversy concerning the Lord's Supper, but he finally came to an agreement with Calvin; and he drew up the Second Helvetic Confession 1566, the most elaborate Reformed creed. Of his numerous writings—commentaries, sermons, dogmatical expositions, polemical treatises against the Lutherans, the Anabaptists, etc.—there is no collected edition; but they enjoyed great authority in their time. His *Reformationsgeschichte*, edited by Hottinger and Vögeli, appeared first in 3 vols. (Frauenfeld, 1838–40); his sermons, the so-called *Decades*, were early translated (London, 1577; new ed. Cambridge, 1849–52, 4 vols.) and their reading was enjoined by convocation on the inferior ministers. See his *Life*, by C. Pestalozzi (Elberfeld, 1858) and by Roget Christoffel (Zurich, 1875); also G. R. Zimmermann, *Die Zuricher Kirche und ihre Antistes* (Zurich, 1877).

Bullion: gold or silver in mass, and hence gold or silver without reference to shape or form. The term is ordinarily used of uncoined gold and silver, but is sometimes applied to coined metal when sold by the bulk instead of according to its face value, especially when worn, or depreciated by alloy. Gold and silver are called bullion when smelted from the ore and not perfectly refined, or when perfectly refined but in ingots or bars, or in any uncoined form.

Bullions, Peter: See the Appendix.

Bullock, Charles: Anglican clergyman; b. in 1829; educated in St. Bee's College, Cumberland; was appointed rector of St. Nicholas, Worcester, 1860; removed to Blackheath in 1874; founded and edited several popular religious periodicals—*The Fireside*, *Home Words*, *The Day of Days*, and *Hand and Heart*, afterward called *The Church Standard*; he also published *England's Royal Home*, *The Home Life of the Prince Consort*, etc.

Bullock, Rufus Brown: first Governor of Georgia under the new constitution adopted in pursuance of the reconstruction measures of Congress; b. in Bethlehem, Albany co., N. Y., Mar. 28, 1834; educated at Albion Academy; sent to organize a Southern express business at Augusta, Ga.; was a member of the State constitutional convention which was called in 1867. In the ensuing election in 1868 the constitution formed by this convention was ratified; and he was declared to be duly elected Governor of the State. This office he held until the fall of 1870, maintaining in the face of great obloquy the rights of Negro representatives in the Legislature, and appealing to Congress for support. When a new Legislature strongly opposed to his policy was elected, he resigned office and retired to Atlanta. The courts vindicated him from every allegation of corrupt practices. He greatly extended the railroad and traffic systems of Georgia.

Bullock, William A.: inventor; b. in Greenville, Greene co., N. Y., in 1813; became a machinist; founded the *Banner of the Union* (Philadelphia, 1849); removed to Catskill, and invented a press to print his paper; constructed a "planetary press" for Frank Leslie, which worked with unmatched speed; improved his invention until he had produced the self-feeding, automatic-adjusting, and printed sheet delivering web-press, capable of turning out 30,000 newspapers, cut apart and folded, in an hour; injured while setting up one of his own presses in Philadelphia, and d. there Apr. 14, 1867.

Bull Run, Battle of: a battle which has been classed as one of the decisive battles of the civil war in the U. S. As the *first* pitched battle—the first trial of strength between the North and South—its inception and issue were pregnant with grave consequences to the future of a struggle in which the two combatants were yet hesitating to engage. In its purely *military* results it has been well said that "the cannon of Bull Run echoed henceforth on every battle-field of the war." The bombardment of Fort Sumter found the Government completely destitute of an organized force—the army scattered on distant frontiers (a large portion indeed captured through the agency of its commander), and the navy dispersed to remote quarters of the earth. For no inconsiderable period the possession of the national capital seemed to be due rather to the hesitation or irresolution of the Confederates than to its capability of vigorous defense. But the President's call for 75,000 volunteers for "three months" (his power to call out the militia to "suppress insurrection" being thus legally limited) had assembled in Washington and elsewhere a large militia force which, strengthened by such portions of the regular force as could be made available, had been diligently trained under direction of army officers.

Simultaneously with the occupation of the Virginia shore

of the Potomac by the Union army, the Confederates had established themselves at Manassas Junction, a point on the railroad 25 miles W. from Alexandria, and the junction of the great Southern railroad route (connecting Washington with Richmond and the South) and the Manassas Gap R. R., leading to the valley of the Shenandoah, where another Confederate force under Johnston confronted Patterson, who had recently crossed the Potomac at Harper's Ferry.

Map of the battle of Bull Run, July 21, 1861.

The occupation of Manassas was recommended to the Confederates by the fact that it controlled the railroad routes, and was itself a strong position. An elevated plateau in the crotch formed by the Occoquan and its principal tributary from the north, Bull Run, of which the beds are canal-like cuts in horizontal strata of red sandstone, it was of difficult approach to an attacking army, while the general character of the country, broken, wooded, with few roads fit for the movement of troops, was favorable to the defense.

Leading almost directly W. from Alexandria, diverging slightly to the north from the railroad, a macadamized road passed through Centreville, 22 miles distant.

From Centreville, a little W. of S. and 6 or 7 miles distant, lay Manassas Junction. About midway between these two points flowed the rivulet of Bull Run (the real defensive line of the Confederates) in a general direction from N. W. to S. E.

A road led from Centreville almost directly to the Junction, crossing Bull Run 3 miles from Centreville at E. Mitchell's Ford, a short distance below which is Blackburn's Ford. The turnpike before mentioned continued its westerly course toward Warrenton, in a nearly straight line beyond Centreville, crossing Bull Run at the Stone Bridge, 4 miles distant. Somewhat eastwardly of S., a country road from Centreville crossed Bull Run and the railroad at Union Mills.

The Confederate force was distributed along Bull Run from Union Mills to the Stone Bridge (nearly 8 miles), with reserves and a fortified position at or near the Junction.

The line was a strong one, for the stream, though containing but little water at that season, was, owing to the character of the bed and to the abrupt and wooded slopes of its right bank, a formidable obstacle.

The army of Gen. McDowell, which marched to the attack of this position, numbered about 30,000 men. Save perhaps 700 or 800 regular troops (fragments of regiments) of the old army, it was composed wholly of raw volunteers, none of whom had been in a soldier's garb more than two or three months, and at least half of whom were enlisted only for a term of three months, then just about expiring. Such an army as this was certainly not the best suited for an offensive campaign. Troops *utterly* raw; brigades and divisions, the component parts of which had never been brought in contact before, commanded by officers who, though generally of ability, were for the first time exercising these extensive commands, and who had hardly even seen the troops they commanded.

Such was the army which marched from the banks of the Potomac on the afternoon of July 16. It moved in four columns, one by the turnpike, one by the lateral country roads on the right, one on the left of the railroad, and another between the turnpike and railroad, following what is known as the "Braddock" road, from its having been made by that general on his memorable march to Fort Duquesne in 1754, which terminated in his disastrous defeat and death.

The "plan" of the campaign organized by Gen. McDowell had been carefully studied by him in conjunction with his staff officers for a week or two before the movement commenced. It was a feature of it, after reaching Fairfax Court-house, to make a sudden movement to the left, crossing the Occoquan just below the junction of that stream with Bull Run, aiming at the enemy's railroad communications. His personal reconnoissances in that direction, made on the 18th, led him to consider the country impracticable for the operations of his army.

However imperative it was (for many reasons) to lose no time (a regiment, the term of which expired on the eve of the battle, actually marched "to the rear," as Gen. McDowell expressed it, "to the sound of the enemy's cannon") it was out of the question to attack until some plan could be devised which would promise success. A day was accordingly spent in reconnoissances.

The Stone Bridge, already mentioned as forming the left of the enemy's defensive position, was a single-arched structure over the narrow stream. The passage was found to be guarded by field-guns, and the road and adjacent ground beyond obstructed by formidable abattis. Several roads were ascertained to lead to fords between Blackburn's and the Stone Bridge, but they were mere by-paths, the opposite banks of the stream generally steep and tangled, and probably obstructed.

It was found that a couple of miles above the Stone Bridge there was a good ford at Sudley Springs, which was but slightly guarded, and that above that point the stream was, almost everywhere, easily passable. No continuous road communicated from the turnpike with the Sudley ford, but reconnoissances showed that the intervening country was almost everywhere practicable to all arms.

The writer finds in his note-book the following memorandum of a "plan of battle" or attack, which, founded upon the above results of reconnoissance, was submitted to Gen. McDowell.

1st.—One division to advance on Warrenton Turnpike at 3 o'clock to-morrow morning. The leading brigade to threaten the bridge over Bull Run—throwing skirmishers

into the woods on both flanks. No serious effort will be made on the bridge, but artillery may be opened upon it, as if to open the way for an assault, and the operation to be conducted *as if* an assault were intended.

The 2d, 3d, and 4th brigades to turn to the right at the road ½ to ¾ of a mile beyond Cub Run. On reaching the forks to the two fords a brigade will turn off on the *left* fork, advancing on it *just enough* to clear the route for the passage of the two following brigades, which take the *right* fork toward Sudley Springs. The ford at Sudley Springs will be turned by a march around and some 200 yards above it. The leading brigade will be followed by the one in rear, and the whole force advance rapidly by the road from Sudley Springs southward to reach the Warrenton Pike by the shortest ronte. The brigade left on the road to the lower ford will then pass over. Detachments from the advanced brigades should be sent to take in rear the defenders of the lower ford and Warrenton Pike bridge. The brigade left at the Stone Bridge will cross over and join the other two.

2d.—Another division should follow to take position behind Bull Run, to be ready to pass over if necessary—bnt, unless ordered from headquarters, to remain on the east side.

3d.—Another division should, simultaneously with the commencement of the first operation, commence the semblance of an attack on Blackburn's Ford. Every appearance of a formidable assault should be made, but *no attempt to force the passage*, unless the enemy shows unmistakable signs of retiring.

4th.—Another division should remain in reserve at Centreville.

This plan was adopted by the general, modifying the composition only of the different columns thus:

One division under Col. Miles to remain in reserve at Centreville, and to make, with one of its brigades, a false attack on Blackburn's Ford; another division (Tyler's) to move by the turnpike up to the Stone Bridge and threaten that point, and, at the proper time, to carry it and unite with the principal column, which, consisting of the two divisions of Hunter and Heintzelman (about 12,000 men), was to diverge from the turnpike, and, by a flank movement, reach the Sudley Ford, and descending the right bank of the stream, take the defenses of the Stone Bridge in the rear. The united force would then give battle, strike at the enemy's railroad communication, or act otherwise, as circumstances might dictate.

This plan was carried out in its main features, but it failed in one important particular. It was calculated that the marching column should diverge from the turnpike by early daylight (the route being so wooded that a night march was deemed imprudent) and reach Sudley Ford by 6 or 7 A. M. The Stone Bridge division did not clear the road over which both, for a certain distance, had to pass, so that the column could take up its march until near 6 o'clock. The route through fields and woods to Sudley proved to be far longer and more difficult than was believed. The column did not reach the Sudley Ford till near half-past nine, three or four hours "behind time." When it reached the ford the heads of the enemy's columns were visible, on the march to meet the attack.

This loss of time caused the loss of the battle. It might have been unwarrantable to have *counted* on punctuality with an army so utterly inexperienced in tactical manœuvers and in marching; nevertheless the immediate end aimed at was gained—the passage of Bull Run was accomplished and the Confederate left turned, while the appearance of Tyler's column in the front of the Stone Bridge had disconcerted their plan of attacking *our* left by crossing at the lower fords. Hunter, having crossed at Sudley Springs, led his column down to take in reverse the Stone Bridge position. Evans, who held the Confederate left at that point, had had his attention occupied through the morning hours by Tyler in his front; but the march of Hunter's column became evident long before the ford was reached, and ere it reached the bridge Evans, sending for re-enforcements, had formed *en potence* across Hunter's line of march. A sharp combat ensued, which resulted in forcing the Confederate position and in opening the Stone Bridge to Tyler's division; two of the brigades (W. T. Sherman's and Keyes's) immediately passed and joined their force with Hunter's. Thus had been gained the *immediate* end of the tactical plan of the operation. The Confederate left had been turned, the Warrenton Turnpike taken from them (opening to us the Stone Bridge); and their line had been driven back a mile and a half. Gen. McDowell had thus brought nearly all his three divisions into position on the enemy's left flank, and was advancing nearly 18,000 strong. The Confederate left (all his troops that had been engaged) had been thrown into confusion. Gens. Johnston and Beauregard hastened to the scene, ordering up to their routed left all the brigades which could be spared from the center and left of their line. "We came," says Johnston, "not a moment too soon," for "the long contest had greatly discouraged the troops of Bee and Evans." He found "that the aspect of affairs was critical," but by great efforts "and some example" the "battle was re-established," and, after a time, "many of the broken troops, fragments of companies, and individual stragglers, were reformed and brought into action."

The position on which a stand was now made was a tableland in which the slopes from Young's creek (crossing the Union line of march at right angles and emptying into Bull Run near the Stone Bridge) terminate in the general level of the country. To carry the position, McDowell advanced the brigades of Wilcox and Howard on the right, supported by part of Porter's brigade and the cavalry under Palmer; the brigades of Franklin and Sherman in the center and up the road, and Keyes's brigade on the left. Schenck's brigade (of Tyler's division) was still at Centreville; but the positions of these troops, coupled with the demonstrations made, still detained several Confederate brigades confronting them.

A severe contest ensued for this position, with varying success, the result of which was, at 3 P. M., the possession of the hill, the fighting having commenced at 10.30 A. M. of a July day. The men, who had been up since 2 o'clock in the morning, were exhausted by fatigue, want of food and water, and somewhat demoralized by the vigorous resistance they had encountered.
