ANY textbook of gynaecology which appears with the imprimatur of Dr. John G. Clark obtains thereby a good send-off, and is certain to receive more than passing attention from those to whom Dr. Clark's name stands for all that is soundest in American gynaecology. Dr. BROOKE M. ANSPACH is to be congratulated, therefore, not only upon having such a godparent for his new book,³ but also upon his having made the book worthy of its sponsor. Founding on an accurate, full, and lucid description of the anatomy and physiology of the reproductive organs in woman, the author follows the usual procedure of discussing the causes in general of pelvic disease and the methods of investigating it. The examination of the urinary system is particularly fully dealt with, and includes catheterization of the ureters, pyelography, and the estimation of the renal function. In his description of the diseases and abnormalities of the different organs Dr. Anspach follows the topographical classification, and while we may regret the sacrifice of strict scientific perspective which this arrangement entails we cannot but admit that on the whole it makes the subject simpler to the student or practitioner who has not given special study to the subject; together they form the public for whom the book is designed. An attempt to redeem the sacrifice is made by devoting separate chapters to the special peculiarities of certain forms of infection, notably gonorrhoea, tuberculosis, and syphilis.

The last sections of the book are occupied with the description of therapeutic measures, operative and medicinal. Special sections of considerable value are devoted to the discussion of radium and x-ray therapy, and to the use of vaccines in gynaecology. The book is sumptuously illustrated by 526 figures, most of which are well designed and likely to prove helpful. At the end of each section is a short but carefully selected bibliography of the more important papers on the subject, culled from both the more classic sources and the most recent work. Dr. Clark in his introduction makes particular reference to this, and we agree that the author has exhibited great discrimination in his choice of references.

The general impression that the book has made upon us is that, without being encyclopaedic, it is full and complete, accurate, lucid, practical, and throughout written with the restraint that is the hall-mark of a well-balanced judgement. We congratulate Dr. Anspach accordingly. Not for a long time have we seen an American textbook so well calculated to become popular with students on this side of the Atlantic as well as in the land of its birth.

A YEOMANRY MEDICAL OFFICER.

THE titanic struggle on the Western Front to a large extent overshadowed the campaigns elsewhere, at any rate in popular interest, and this probably applies to the medical service equally with other branches. Captain TEICHMAN, by publishing his *Diary of a Yeomanry M.O.*,⁴ has rendered a distinct service to the medical records of the war, and his daily record of the doings of a regimental medical officer cannot fail to interest many whose experience was largely confined to the trenches of France. So rarely, except in the last phase, did open fighting occur in France, that the account of the Egyptian and Sinai episodes seems to refer rather to war as understood before 1914, when troops moved in the open, cavalry patrols were constantly engaged, and the enemy showed an enterprise, and yet a regard for the common usages of warfare, which was far removed from the ruthless bitterness of the Germans as exhibited in France.

Captain Teichman does not profess to give any critical description of the operations in the various fields, but in homely fashion jots down the doings of his own regiment, the Worcester Yeomanry, adding such explanations of the general movements as a regimental officer could get to know. He is modest about his own deeds, but it is possible to read between the lines and to recognize that he must have been a most excellent regimental M.O., not sparing himself in work, nor thinking of personal risk. That he was twice wounded is sufficient proof of this,

apart from the decorations which indicate what others thought of his work. It is impossible to estimate what it means to a regiment to have a medical officer who is always "up" with them, and the R.A.M.C., with many fine achievements to be proud of, may regard as its finest the fact that there was a constant flow of such men, who by their cheery optimism as well as their medical and surgical skill did so much to sustain the spirits of all ranks. The value of a medical service depends as much on this as on its technical abilities. Regimental work was often a matter of personal self-sacrifice to a keen professional man, for his opportunities for more than elementary first aid or hasty symptomatic treatment were scanty, and it was only the recognition of the opportunities for the wider scope of service that reconciled the doctor to his very limited professional field.

Of special interest is the description of the difficulties of arranging transport for the wounded, and how they were overcome. Dhoolies, traverses, sand carts, and mule and camel litters were all employed, and the Ford ambulances were of great use in Sinai. Little reference is made, however, to the bugbear of all work in France—the ever-present sepsis—and it would seem that this was a problem of comparatively small importance. Tropical diseases, particularly malaria, gave rise to much more anxiety. It is tempting to follow the author over the various fronts, and to quote some of the incidents he records. The despatching of a venomous snake by D.R.L.S. to the A.D.M.S., who desired specimens for the preparation of antivenene, is a case in point, and the urgent "stop" wire from that officer, who was probably inundated with infuriated and highly venomous reptiles, recalls instances which occurred elsewhere of an order producing embarrassing results.

Until he was drafted to Italy, just before the end, Captain Teichman was fortunate, probably exceptionally so, in returning to his own unit each time after he was a casualty, and therefore the *Diary* is a regimental as well as a personal record; it will be perused by the Yeomanry with as much interest as by its medical readers, who should be numerous.

NOTES ON BOOKS.

PROFESSOR ARTHUR THOMSON'S well known *Outlines of Zoology*⁵ has now reached a seventh edition. It has undergone revision in order to bring it up to date, and by some additions the number of illustrations has been raised to 437. The book is perhaps of more use to the student of general zoology than to the medical student, since it contains much that is not required by the latter: yet every intelligent student will find interest in the chapters dealing with such subjects as geographical distribution and the doctrine of descent, which make the dry bones of morphology of more living interest. Moreover, it is just these very subjects in which Professor Thomson is a past master of the art of exposition. The new edition, which is the seventh, contains a bibliography of the more important textbooks and books on natural history, together with a number of representative test questions for students, which will be of considerable value to the "home student."

*The Canadian Mother's Book*⁶ is a sensible little book written in simple—and sometimes rather ecstatic—language, for the expectant and nursing mother; it is issued by the Child Welfare Division of the Canadian Department of Health. It emphasizes, more than most books of this nature do, the fact that practically every mother, if properly instructed, ought to be able to nurse her baby. "We are all responsible," it says, "for the folly of artificial feeding."

Colonel G. T. BIRDWOOD'S *Clinical Methods for Students in Tropical Medicine*,⁷ of which the third edition has recently been published, is a book which does not waste a word, but in a very practical and pointed manner carries out what it sets out to do. In the new edition Colonel Harvey has rewritten the chapter on the Wassermann

³ *Gynecology*. By Brooke M. Anspach, M.D., Associate in Gynecology, University of Pennsylvania. With an introduction by John G. Clark. London: J. B. Lippincott Company. 1921. (Med. 8vo, pp. 775; 526 figures. 42s. net.)

⁴ *Diary of a Yeomanry M.O. (Egypt, Gallipoli, Palestine, and Italy)*. By Captain O. Teichman, D.S.O., M.C., Croix de Guerre, Croce di Guerra; Royal Army Medical Corps (T.F.). London: T. Fisher Unwin, Ltd. 1921. (Med. 8vo, pp. 283, illustrated. 12s. 6d. net.)

⁵ *Outlines of Zoology*. By A. J. Thomson, M.A., LL.D. Seventh edition, revised. Edinburgh, Glasgow, and London: H. Frowde, and Hodder and Stoughton, 1921. (Cr. 8vo, pp. 810; 437 illustrations. 18s. net.)

⁶ *The Canadian Mother's Book*. Ottawa: The Deputy Minister, Department of Health. 1921.

⁷ *Clinical Methods for Students in Tropical Medicine*. By G. T. Birdwood, M.A., M.D., D.P.H., Lieut.-Colonel I.M.S.; with foreword by Sir J. Roberts, Kt., C.I.E. Calcutta and Simla: Thacker, Spink, and Co.; London: W. Thacker and Co. 1920. (Fcap. 8vo, pp. 391, Rs. 7.8.)

reaction, and Major Megan has written a chapter on the examination of faeces. Colonel Birdwood has contributed new chapters on the recent treatment of leprosy, the management of hookworm disease, and the identification of poisonous snakes. The book is very usefully interleaved, but the index might well have been improved. It is, however, certainly a volume which every student of tropical medicine should possess.

In *The Octocentenary of Reading Abbey* Dr. JAMIESON B. HURRY* has given an interesting sketch of the Noble and Royal Monastery of Reading, founded on June 18th, 1121, by Henry I, who was buried there after his death, on December 1st, 1135, from "a surfeit of lampreys," to which he appears to have been both partial and sensitive, for as this fish always made him dyspeptic it had been banned by his physicians. In 1164 Thomas à Becket dedicated the abbey church to the worship of God, and twenty-one years later Heraclius, Patriarch of Jerusalem, knelt here before Henry II and unsuccessfully implored him to save Jerusalem from capture by Saladin. It was in Reading that, about 1240, the unknown monk composed "Sumer is icuming in," one of the earliest examples of English secular music. King Henry VIII dissolved the abbey, and in 1539 the last abbot, Hugh Cook Faringdon, after a sham trial for treason, was executed before the gateway of his own stately abbey. Reading is, indeed, fortunate in its historian who has produced this attractively written and finely illustrated volume.

* *The Octocentenary of Reading Abbey (1121-1921)*. By Jameson B. Hurry, M.A., M.D. London: Elliot Stock, 1921. (Imp. 8vo, pp. 101; 10 plates. 10s. 6d. net.)

ROYAL MEDICAL BENEVOLENT FUND.

At the last meeting of the Committee, held on May 10th, twenty-one cases were considered, and £308 voted. The following is a summary of the cases relieved:

Daughter, aged 73, of M.R.C.S. Eng. who died in 1891. Owing to a limited income and having to help towards the expenses of a bed-ridden brother in a nursing home, applicant has asked the Fund to help her to supplement her £100 annuity of £40 and the £4 she was paid for making fancy bags and painting little water-colour sketches. Since the war she has had to pawn family things and pay a heavy rate of interest. Her sister applied to the Fund and the Committee made her a grant of £10. Voted £10.

Widow, aged 25, of M.R.C.S., who died of typhus while working on a Red Cross train in 1920. Applicant managed to escape from Russia with her little son and arrived in England without means and is at present being supported by friends. She is very anxious to be self-supporting and to this end has applied to the Fund for help and to advise in placing her son in a school. Voted £10.

Widow, aged 55, of L.F.P.S., who was acting as surgeon on board when torpedoed and all were lost. Applicant receives a pension from the War Risk Association of £5 6s. 8d. a month. Rent 11s. a week. Her youngest son, who is in the merchant service, is now out of work, and applicant finds it difficult to support two on her small pension. Voted £10 in two instalments.

Widow, aged 80, of L.R.C.S.I. and L.R.C.P. Edin. who died in 1918. Her sole income consists of £50 per annum derived from insurance. Applicant asks for help to supplement this amount as her rent is £10, and her board costs 15s. per week. Voted £18 in twelve instalments and also a special grant of £6.

Widow, aged 55, of L.S.A. who died in 1921. Owing to illness applicant's late husband was helped by the Fund. His widow asks for help as she has no settled income. She receives from friends about £25 per annum, and 7s. 6d. a week by letting rooms; her rent is 17s. 6d. a week. Voted £10 in two instalments.

Subscriptions may be sent to the Honorary Treasurer, Sir Charles J. Symonds, K.B.E., C.B., F.R.C.S., at 11, Chandos Street, Cavendish Square, London, W.1.

The Royal Medical Benevolent Fund Guild is overwhelmed, in these days of exorbitant prices for clothing and household necessities, with applications for coats and skirts for ladies and girls holding secretarial posts, and suits for working boys. The Guild appeals for second-hand clothes and household articles for the benefit of the widows and children who in happier times would not have needed assistance. The gifts should be sent to the Secretary of the Guild, 43, Bolsover Street, W.1.

MESSRS. BAILLIÈRE, TINDALL AND COX'S current catalogue gives a list of recently published new books and new editions, with descriptive notes. For the convenience of those who wish to order direct from the publishers, the weight of each book is given and the postal rates.

THE thirty-fifth annual meeting of the American Orthopaedic Association was held at Boston, Mass., from June 2nd to 6th. In addition to many contributions made by the leading American orthopaedic surgeons were papers on "The manipulation of stiff joints" and on "Surgical aspects of milk-borne tuberculosis," by Sir Robert Jones, and another on "Peripheral nerve injuries," by Mr. Harry Platt. Sir Robert Jones also gave clinical and operative demonstrations.

THE VOLUNTARY HOSPITALS COMMITTEE.

WE gave last week, at p. 870, a preliminary account of the report of the Voluntary Hospitals Committee, together with a summary of those recommendations which, if adopted, would require legislative or executive action. The Committee was appointed by the Minister of Health on January 25th, 1921, with Viscount Cave as chairman, "to consider the present financial position of voluntary hospitals and to make recommendations as to any action which should be taken to assist them." In an interim report, described in our issue of March 26th, p. 468, the Committee urged that contributions to voluntary hospitals might reasonably be made out of the available surplus funds of approved societies.

The final report, published on June 9th, is discussed elsewhere in a leading article. We propose to give here a more detailed account of certain matters of general interest, quoting from those sections which specially concern the medical profession.

In order to expedite its report, the Committee limited the evidence to witnesses representing groups of hospitals, or hospitals which might be taken as typical of a number of similar institutions in various parts of the country. Some of the Scottish evidence was heard on behalf of his colleagues by Lord Lighthgow in Edinburgh, and some of it by the Committee in London; the Irish hospitals were not included in the reference. The oral evidence was supplemented by a questionnaire issued to all hospitals outside the London area. The Committee also took evidence from representatives of the Royal Colleges of Physicians and Surgeons, the British Medical Association, the British Hospitals Association and its committees, King Edward's Hospital Fund for London, and from the superintendents of three Poor Law infirmaries.

The Present Financial Position.

In the area covered by King Edward's Fund there are 117 voluntary hospitals of different kinds, including cottage hospitals; in the rest of England and Wales there are 728 hospitals, including general, special and cottage hospitals; in Scotland there are 107 hospitals; making a total for Great Britain of 952. The number of beds available in these institutions at the end of 1920 was approximately 12,797 in London, 31,265 in the rest of England and Wales, and 8,132 in Scotland—a total of 52,194. Besides these there are Poor Law infirmaries with some 92,000 beds, and a number of convalescent homes.

The financial position is gravest in the London area; in the provinces the conditions, though in some cases serious, are in general more satisfactory; while in the Scottish hospitals the outlook is more hopeful still. Reviewing the financial position as a whole the Committee comes to the following conclusion:

"While in certain areas and at particular hospitals the governing bodies have been able to encounter the difficulties caused by the war without permanent injury to the institutions under their care, the position of a large number of hospitals is such as to make it improbable that they can be continued on a voluntary basis unless prompt and vigorous measures are taken to re-establish the position of 1914. The receipts have not fallen off—indeed, they have increased; but the cost of provisions, drugs, dressings, fuel, and labour has grown to such an extent that it far more than counterbalances the increase of income. . . . Under these conditions we estimate that unless some remedy is found there will be deficiencies in the present year in respect of the hospitals in the whole of Great Britain, including London amounting to not less than £1,000,000, and this without any provision being made for the necessary extensions and improvements. The position thus disclosed appears to us to involve danger to the whole of the existing hospital system."

The Committee's Proposals.

The Committee proposes, therefore, to consider the steps that should be taken to meet this serious contingency, and a reasoned statement is given of the losses which might be incurred if the voluntary system came to an end. Convinced that this system is worth saving, any proposals for continuous rate aid or State aid are ruled out.

* Cind. 1355. To be obtained from any bookseller or direct from H.M. Stationery Office. Price 3d. net.

Nevertheless, if the hospitals are to be saved from immediate disaster and restored to the position of security they occupied before the war, it is held that some assistance must forthwith be given from public funds. This, however, should be temporary only, and on the understanding that it is not to be continued beyond a limited period—say two years. Neither should any grant be made except to a hospital which can show that it is doing its best to re-establish its finances, and that it has a fair prospect of so doing before the end of the period of probation.

In regard to the machinery for administering the proposed grant, the Committee recommends the setting up of a central body for Great Britain whose first and principal duty would be to dispense the temporary grants.

"This central body should be formed on the lines of the University Grants Committee, and might bear the name of the 'Hospitals Commission.' It should be appointed by the Minister of Health and should consist of not more than twelve members, of whom the chairman and three others should be selected by the Minister of Health and one by the Secretary for Scotland, and of the remainder one should be nominated by each of the following bodies, namely: The Joint Committee of the Red Cross Society and the Order of St. John of Jerusalem; King Edward's Hospital Fund for London; the British Hospitals Association; the Royal College of Physicians; the Royal College of Surgeons; the British Medical Association; and the Scottish Committee of the British Medical Association. Service on the Hospitals Commission should be voluntary, but it should be advised by a technical expert and will require a small clerical staff. Its expenses should be borne on the votes for the Ministry of Health."

In order to deal with local questions of finance and policy it is recommended that the Commission should have the assistance of committees with local knowledge and influence set up in each area; to these all applications to share in the grant should in the first instance be made. King Edward's Fund would perform this function for London; elsewhere the normal unit should be the county or county borough.

The Committee is impressed with the view, put before it by many witnesses, that the present lack of organization and co-operation among the voluntary hospitals not only detracts from their efficiency, but is the cause of much avoidable expenditure. Subject to certain exceptions in the case of teaching and special hospitals, the Committee sees no reason why arrangements should not be made both for defining the functions of hospitals and promoting co-operation among them:

"If there were some body, such as a Voluntary Hospitals Committee, with authority to organize and grade the hospitals in a district and to act as a clearing house for patients requiring accommodation, a considerable saving might be effected."

Voluntary Hospitals Committees, being independent of the hospitals and able (by their control of grants or funds) to bring pressure upon hospitals

"would be in a position to collect information, to advise as to accounts and expenditure, to marshal appeals for funds, to act as a clearing house for patients, to promote the grading and the co-operation of the hospitals in their area, and to deal with the other matters referred to in the later paragraphs of this report."

Poor Law Infirmaries.

On the relations of the voluntary hospitals with the Poor Law infirmaries the Committee makes the following observations:

"We have been impressed with the volume and quality of the work carried out by the able infirmary officers whom we have seen, and it seems unfortunate that the abundant and varied clinical material in these institutions should be hardly used at all in the training of medical students. Further, we are informed that during the winter months there are, on an average, over 20,000 vacant beds for sick persons in Poor Law institutions, and that during the summer months the number increases to over 30,000; and it is very desirable that these vacant beds, many of which are suitable for general use, should, if possible, be used for reducing the long waiting lists at the voluntary hospitals. In a few instances the voluntary and Poor Law hospitals do to some extent work together. At Paddington arrangements have been made by which members of the staff of St. Mary's Hospital act as part-time officers of the Paddington Infirmary, and the laboratory work required by the infirmary is done at the hospital. At Lambeth the infirmary is visited by members of the staff of Guy's, and patients are sometimes transferred from one institution to the other. At Dudley Road, Birmingham, the guardians have expressed their willingness to allow students from the university to visit the wards. At

Wolverhampton it is proposed that the hospital should take over one of the pavilions of the infirmary (which is not required for Poor Law patients) and use it as an annexe to the hospital. But such instances are rare. It appears to us that it should be possible to make arrangements under which the staff and apparatus of voluntary hospitals should (so far as possible) be available for the treatment of infirmary patients, while the students at the hospital should be allowed to visit the infirmary wards, and the vacant beds at the infirmary should be at the disposal (on proper terms as to payment) of the hospital patients awaiting admission. Such arrangements could best be negotiated through the Voluntary Hospitals Committees when formed, or in London through the King's Fund; and, if statutory authority is required, it should be given."

Suggestions for Economy.

The Committee next suggests various steps which could be taken voluntarily by hospital managers to improve the financial position of the hospitals under their charge.

"With regard to the general expenditure in the hospitals, it has not been possible for us in the time at our disposal to make systematic inquiry. But the striking differences in expenditure between hospitals of like size and character appear to indicate that there is room in some cases for greater economy."

A series of paragraphs deal in turn with reduction of expenditure, uniform accounts, co-operative buying, removal of less serious cases to auxiliary hospitals, systematization of appeals for donations, collections from wage earners and contributions by employers, other contributory schemes—for example, those known as the Oxford and Sussex schemes—payments by patients, and the institution of staff funds.

Oxford and Sussex Schemes.

"The system of weekly contributions has been carried further by the Radcliffe Infirmary and County Hospital at Oxford, which affords an admirable instance both of the benefits of this system and of the advantages of hospital co-ordination. The Radcliffe, which is the only large hospital in the northern part of Oxfordshire and is connected with the medical school of the University, appears to perform the functions both of a 'secondary health centre' and of a 'teaching hospital' as defined in the interim Report of the Consultative Council on the Future Provision of Medical and Allied Services. It takes all the active cases for the Poor Law infirmaries in its district, and has succeeded in linking up with its work the primary and cottage hospitals and (to some extent) the district nursing service within its radius. And it has recently organized a scheme for obtaining weekly contributions, not only from workmen, but from the whole wage-earning population of the towns and villages in its area—and with conspicuous success. . . . We were informed that, although the scheme was only established in September last, there are already 35,000 supporters paying 2d. per week. . . . We are informed that the counties of Wilts and Hants are organizing schemes on somewhat similar lines."

"A method of voluntary insurance, called a Provident Scheme for Hospital Benefits and Additional Medical Services, has been inaugurated by the Sussex hospitals at Brighton, Hove, and Preston, and was described to us by its author, Dr. J. Gordon Dill, senior physician at the Royal Sussex County Hospital. The scheme is confined to persons whose income does not exceed £260 per annum for a single member, £400 per annum for a man and wife without children or a widow with one child, and £500 per annum for a married couple with a family. The subscription for an unmarried person or a widow or widower without children is £1 per annum; married people without children or a widow or widower with one child pay a joint subscription of £1 10s. per annum, and married people with a child or children under 16 or a widow or widower with children under 16 pay a family subscription of £2 per annum. In the case of persons employed at works or factories, the amount is collected as far as possible by weekly deductions from wages. Members are entitled to free consultation and treatment at any of the co-operating hospitals, or, in the case of members unable to leave their beds, at their homes, but subject in the case of country members to payment of half the usual mileage rate from Brighton. The treatment includes ordinary dental treatment, laboratory and x-ray examinations, massage and electrical treatment when required. Urgent cases are admitted to hospital at once and others in their turn, but a member has no precedence over more urgent cases. Of the proceeds of the scheme one-fortieth is reserved for the cost of laboratory work, one-fortieth for x-ray work, one-fortieth for secretarial work, thirty-five-fortieths are divided among the co-operating hospitals on a basis determined according to an estimate of work done, and the remaining two-fortieths are retained until the end of the year and are then distributed among those hospitals which have had the heaviest calls made upon them. Of the sums paid to the hospitals 25 per cent. is placed in a fund which is at the disposal of their medical staff. The scheme is not yet fully established; but Dr. Dill estimates that if 100,000 members can be obtained, the financial problem of the co-operating hospitals will disappear. The main objection taken to the scheme is that it implies a contract on the part of the hospitals to provide such institutional treatment as subscribers may require; and if a large number of

contributors are secured it may be impracticable to provide the necessary beds without largely increasing the hospital accommodation or excluding non-contributors. But the scheme is interesting and well worth careful consideration, and we understand that its adoption in London and elsewhere is being considered."

Payments by Patients.

In regard to payments by patients—a plan already adopted, in one form or another, at a number of voluntary hospitals—the Committee sees no reason why this practice should not be generally followed, provided care is taken that the poor are not excluded from benefits primarily intended for them.

"We were informed that the increase of the weekly collections at Newcastle has not materially interfered with voluntary payments by patients; but this experience may not be general, and it is obvious that if any system of insurance (such as the Sussex scheme) were generally adopted, this source of income would become less productive."

"As to paying wards—that is to say, private wards where patients are received on the terms of paying the whole cost of maintenance and treatment—we doubt whether hospitals can look for any substantial increase of income by the establishment of such wards. Nor is it desirable that they should do so, since wards of this character occupy considerable space, and the experience of other countries goes to show that a hospital which makes a profit on paying patients is tempted to extend its paying wards to the detriment of the poorer patients. But there may be instances in which vacant space may usefully be filled in this way."

Insured Persons.

The suggestion that the cost of maintenance and treatment of insured persons in a voluntary hospital should fall upon the insurance funds appeared to the Committee to rest upon a misconception of the purpose and effect of the Insurance Acts. Medical benefit as defined in the Acts clearly does not include the more advanced treatment normally given in a hospital or the maintenance of an insured person as an in-patient. But while holding that the approved societies are thus not under any obligation to provide the whole cost of maintenance and treatment of their members in hospital, the Committee feels strongly that they do owe the hospitals a large measure of support, and the hope is expressed that the generous example of the National Deposit Friendly Society, in allocating one-third of its available surplus for hospital and nursing services, will be widely followed.

Payments by Public Authorities.

Coming to proposals for aiding the hospitals which would require legislative or executive action, the Committee deals first with the payments now being made by public authorities for services rendered. These fall under the following heads: (1) Pensioners; (2) tuberculous patients; (3) venereal disease; (4) maternity and child welfare; (5) school medical services.

"It has been suggested to us that these payments should be increased in amount. So far as our inquiries have proceeded, we think that the payments made, except in the case of school medical services, are generally reasonable; but there may be exceptions in certain districts. As the cost of treating these cases differs in different localities, we think it best that any negotiations as to the increase in the amount of existing payments should be left to be undertaken by the hospitals or the Voluntary Hospitals Committees when formed; and we therefore make no recommendation as to those payments. . . ."

"A considerable volume of evidence was given in support of a proposal that grants should be made for the training of nurses, who not only receive a practical education in the wards, but at many hospitals are taught by lectures and classes. This proposal was supported by the witnesses called on behalf of the British Medical Association, who pointed out that nurses trained in the hospitals are regularly absorbed by the education authorities or by the general nursing service of the country. We think that grants for this purpose might be considered by the bodies having charge of the funds applicable for technical education."

A further point was made to the Committee by Mr. Bishop Harman in his evidence on behalf of the British Medical Association. He suggested, in effect, that the clinical notes of hospital patients should be collated, that there should be returns from every hospital, and that these should be collected and form part of the data for medical research: what the State is doing, so far as venereal disease is concerned, could and should be done generally. This suggestion is submitted by the Committee for the consideration of the Ministry of Health, and forms one of the recommendations.

Medical Staff Funds.

In connexion with the grants by public authorities the Committee refers to the practice which obtains in some hospitals of carrying a proportion (from 10 per cent. to 20 per cent.) of these grants to a staff fund which is placed at the absolute disposal of the honorary staff.

"In some of these hospitals, as at St. Bartholomew's, at the Royal Infirmary, Manchester, and at the Radcliffe Infirmary, Oxford, the fund has hitherto been applied by the staff to such purposes as the purchase of expensive apparatus or books, and the support of young practitioners taking up special branches of work; but in other cases the fund has been divided among the staff. The practice is supported by the British Medical Association on the ground that patients sent by a public authority are in the position of paying patients and that in the fees paid for such patients the medical practitioner is entitled to share. On the other hand, the honorary staffs of some hospitals are unwilling to share in such a fund; and two distinguished physicians expressed the view that if the medical staffs came to be subsidized to any substantial extent "the bottom would drop out of the voluntary system." It should be remembered also that, although the services of the staff are honorary, they obtain a valuable return in the form of medical and surgical experience and the enhanced reputation which accrues to a member of the visiting staff of a great hospital. If the system of carrying a percentage to a staff fund is confined to cases where the full cost of maintenance and treatment is paid by or on behalf of the patient, not much objection can (we think) be taken to it; but any extension of the practice beyond those limits appears to us endanger the future of the voluntary hospitals."

Further recommendations are that the contributions by employers to hospital funds should be allowed as deductions from profits for income tax purposes; that hospitals be authorized to claim repayment of income tax when payment of a legacy is delayed for more than a year; and that legacy and succession duty on testamentary gifts be remitted.

Temporary Grants.

The question is then asked whether the new sources of income now being opened and the relief recommended in previous paragraphs will enable the voluntary hospitals to attain a stable financial position.

"We think they will; but the process must take some little time, and unless some temporary financial help is provided without delay from public funds some of them are likely to collapse. After most carefully considering the amount required, we recommend that Parliament be asked to sanction an immediate grant of £1,000,000 to be expended in assistance to such voluntary hospitals as are in need of it. The administration of the grant would be entrusted to the Hospitals Commission on the terms set forth above. This grant, if sanctioned by Parliament, should be looked upon, not as a windfall to be divided among all the hospitals or to be distributed equally over the different parts of the country, but as an ambulance fund to be applied at the discretion of the Commission to the relief of actual and pressing needs. . . ."

"It is probable that the grant suggested for 1921 will not of itself be sufficient to enable the hospitals to tide over the crisis, and that a further grant (possibly of less amount) will be required in 1922. But we think that it should be made clear that Parliament will not consider itself under any obligation, express or implied, to continue the grant beyond the latter year, and that the responsibility for maintaining any voluntary hospital after that time will rest wholly upon those who have the charge of the institution. We have every confidence that if the assistance recommended is given by the Exchequer it will be within the power of those having control of our hospitals, by means of economy in management and energy in interesting the public in their work, to maintain that voluntary system of which we are justly proud."

Lastly, the Committee recommends that the Hospitals Commission be authorized during a period of two years from this time to recommend grants for the extension or improvement of hospital accommodation.

"Any such grant to be subject to a contribution of not less amount being hereafter made from other sources, and no such grant to be recommended by the Commission except after consultation with the Voluntary Hospitals Committee of the area, and on that Committee being satisfied that full provision has been made for meeting any increase in yearly expenditure which may be consequent upon the extension or improvement. We estimate that a sum of £250,000 may be required for this purpose in the financial year 1921-22."

The report is signed by the Chairman and the other five members of the Committee—Lord Linlithgow, Sir C. Hyde, Sir W. B. Peat, Mr. V. Hartshorn, and Mr. R. C. Norman. Besides Mr. Bishop Harman, Dr. H. G. Dain, Dr. J. R. Drever, Mr. W. McAdam Eccles, and Mr. A. E. Morison gave evidence on behalf of the British Medical Association.

British Medical Journal.

SATURDAY, JUNE 18TH, 1921.

THE VOLUNTARY HOSPITALS COMMITTEE.

THE Committee on Voluntary Hospitals, appointed by the Minister of Health last January, under the presidency of Viscount Cave, to consider the present financial position of the hospitals in Great Britain and "to make recommendations as to any action which should be taken to assist them," is to be congratulated upon the expedition with which it has performed the work of the inquiry committed to it. Speed has not entailed a loss of efficiency, for a better balanced report of a Government Committee it would be hard to find. There is evidence of a very thorough inquiry, and a complete grasp of the complex problem involved. Moreover, the recommendations made are of such a character as we feel assured will commend them to every section of national opinion, even though they involve public expenditure—a serious matter in these days of high taxation.

The report shows what a great work is done by the voluntary hospitals, and at what a singularly low cost. The contrast drawn between this economy of private effort in hospital management and the cost of State or municipal effort is most striking. To acknowledge the truth of this is not to disparage State effort; the difference is now known to arise from the very nature of things. People of every status in life—poor folk, workpeople, business men, people of leisure, and physicians and surgeons alike—will do for a voluntary concern what they would not dream of doing, and, indeed, what they could not be advised to do, for a State or municipal concern. This willingness to work freely for a voluntary institution is due to the fact that there is a sense of possession of a share in it, which cannot be felt for a huge State machine; and it is particularly true of a hospital, which makes a strong appeal to the best instincts of all who have any bowels of compassion. We have read no more striking commentary on the different feelings entertained for voluntary and State hospitals than the citation (on page 10 of the report) from the evidence of Sir Anthony Bowlby, who said "There is the active sympathy and co-operation of the whole of the populace of this country with hospitals and hospital treatment. The subscribers, and their friends, are in constant touch with the hospitals; ladies visit them; there are ladies' committees and visiting committees; all sorts of opportunities to help poor patients, whether it be as regards clothing, instruments, or convalescent homes. All that, of course, is entirely lacking in the hospitals on the Continent, where there is no such help at all. There is no inter-communication; the hospitals are practically closed places, into which nobody goes except the people who are authorized." Such a commentary as this coincides with the opinion of those acquainted with the facts; it is in itself sufficient to warrant the most strenuous efforts to retain a system which is so purely British and so rooted in the very genius of our people.

From the standpoint of economy, or from that of sentiment, in whichever way the problem be viewed, from the extreme of hard shell matter of fact to the other extreme of human sympathy, the voluntary

hospital system is easily first. As a system it may be called illogical, much less defensible on that ground than a complete and unified State provision; but even in its failure in logic it is logical, for it conforms to human nature—at least to British human nature. Faults there are in the system; these are frankly owned to in the report. Voluntary effort in its beginnings was sporadic. It burst out here and there with intense energy. Pity is moved, and expression is given thereto in the practical fashion of the good Samaritan. It chanced that pity is aroused on the road to Jericho, and there the effort is made, without reference to the road to Damascus. The time has come when sporadic and unequal efforts must be stabilized and correlated, and the recommendation of the Committee that there should be closer working between the hospitals is well timed, and will receive the support of the medical profession. The experience of such methods gained in London, through the action of King Edward's Hospital Fund, proves that there need be no drag on the wheels of progress or wet blanket on the flame of enthusiasm.

The first recommendation of the Committee is that there should be a central Hospitals Commission for Great Britain, formed on the lines of the University Grants Committee. This is in accordance with the plan advocated by the Representative Body of the British Medical Association. The first duty of this central Hospitals Commission would be the administration of the temporary grants recommended, but it would be available for other purposes. The constitution suggested for it would give suitable representation of the medical profession, but we should need to be assured that a like representation would be secured for the profession on the local or county committees. The Branches and Divisions of the British Medical Association would be able and willing to help these local committees, for they have the means of finding the most capable practitioners for the work, as was shown by the methods adopted to man the Local Medical War Committees.

On the several items of the financial recommendations the most pertinent comment is that most, if not all, the suggested reliefs are debts owing to the hospitals. During the war the Government departments responsible for sending sick and wounded into the voluntary hospitals proved most hard-fisted paymasters. They sublet their work to the hospitals on terms that left the London hospitals alone with a loss of over half a million sterling! The National Insurance scheme would have been a hopeless failure medically and financially had it not been for the voluntary hospitals; without these the weight of sickness benefit alone would have crushed it.

In an interim report published last March the Committee recommended as a pressing matter that the schemes to be approved for the distribution of the surplus disclosed at the quinquennial valuation of approved societies under the National Insurance Acts should provide for the application of a substantial part of that surplus in making contributions towards the cost of the maintenance of members of the societies in hospitals. So far as we are aware no society, with the honourable exception of the National Deposit Friendly Society, has at present acted upon this recommendation. The insurance companies have saved money in workmen's compensation, and made profits, on the work of the hospitals, but have not moved one finger to ease the heavy burdens of the hospitals. Municipal authorities have turned to the hospitals for help and got it. Education authorities have used the hospital machinery at inequitable rates. The voluntary hospitals have sown good seed in the

training of a succession of nurses of the sick, and the nation and its services have reaped the increase but forgotten to return a tithe to the diligent producer. These are debts to the hospitals. They should be paid. And they can be paid without endangering that essential feature of the voluntary system—free and independent management.

On the matter of relief to the hospitals on rates, income tax, death duties, and the like, we need not comment, save to remark that a wise liberality with regard to these claims has in other countries attracted money to voluntary effort, to the great saving in national expenditure. The Committee has examined the contribution schemes for hospital support: the workshop contributory schemes in industrial areas, and the Oxford and Sussex schemes come under favourable review. Some of these are well established, and may be expected to develop still greater ability; others, such as the modified Sussex scheme which is under consideration for London, are planned so as to be an insurance for hospital benefit, and raise far-reaching issues. So far, these schemes are in their infancy; the response of the people is yet to be seen.

The service of the medical staffs to the voluntary hospitals is commented upon in more than one part of the report; its value, its assiduity, and free character, are recognized, and the report contains what is, we believe, the first lay commentary on the "Medical Staff Fund Scheme"—the scheme of the British Medical Association for carrying a proportion of the grants for State and municipal patients to a staff fund which is placed at the absolute disposal of the honorary medical and surgical staff. The Committee's opinion is that "if the system of carrying a percentage of a staff fund is confined to cases where the full cost of maintenance and treatment is paid by or on behalf of the patient, not much objection can (we think) be taken to it; but any extension of the practice beyond those limits appears to us to endanger the future of the voluntary hospitals."

Of Poor Law infirmaries the Committee says that while it has been impressed with the volume and quality of the work carried out by infirmary officers, it is unfortunate that the abundant and varied clinical material in these institutions should hardly be used at all in the training of medical students. The estimates that during the winter months there are, on an average, over 20,000 vacant beds, and during the summer months over 30,000, are accepted, and the opinion is expressed that many of the vacant beds are suitable for general use and should be used for reducing the long waiting lists of the voluntary hospitals. The Committee goes on to suggest that one of the duties of a local Voluntary Hospital Committee should be to make arrangements under which the staff and apparatus of voluntary hospitals should be available for the treatment of infirmary patients, that students should be allowed to visit the infirmary wards, and that vacant beds at the infirmary should be at the disposal, on proper terms as to payment, of hospital patients awaiting admission.

We have summarized the report elsewhere in our columns this week. Nevertheless we would urge members of the profession to read the report in its entirety. It can be obtained through any bookseller for 4d. It is worth reading.

Finally, we would suggest to the powers that be, Parliament and the Cabinet, that what they would do they should do quickly: there is salvage to be made. The proposed temporary grant is not a dole but the payment of an overdue debt. Paid now, it will free the voluntary hospitals from a debt that is dragging

them down like a millstone about the neck and threatens to drown them. Freed from that, they, their executives, supporters and well-wishers will regain a buoyancy which will draw into their wake a new generation of supporters.

OPERATIONS FOR GENITAL PROLAPSE.

THE British Congress of Obstetrics and Gynaecology, held at Birmingham on June 3rd and 4th, a report of which is published in our present issue, was, from more than one point of view, an event of great importance to obstetricians and gynaecologists. The Congress was the first which embraced all the British obstetrical and gynaecological societies, and its success, viewed from every standpoint, was such that it is practically certain to be the first of an annual series.

The chief topic discussed—namely, "The end-results of plastic vaginal operations for genital prolapse"—is one of the greatest importance to all gynaecologists, as well as to the general practitioner who will sooner or later be called upon to advise patients with regard to operative treatment. It is therefore well to have an authoritative pronouncement from such a representative body of gynaecologists as those who took part in the discussion regarding the relative values of the vaginal and the abdominal methods of treatment. At the outset it may be said that a motion had been put down to the effect that "this meeting condemns the use of abdominal operations as unnecessary in the treatment of genital prolapse," but it was felt by a majority of the large assembly present that such a motion would, to a greater or less extent, interfere with freedom of debate, and consequently it was withdrawn before the discussion started. We cannot therefore record a definite pronouncement but only a general impression regarding the trend of opinion, and this will be referred to hereafter.

The three opening papers, by Dr. W. E. Fothergill, Dr. Lacey, and Professor Donald, were commendably brief and lucid. Professor Briggs of Liverpool was in the chair, and by his judicious enforcement of a rigid limit of ten minutes to the subsequent speeches it was possible to obtain within the short space of three hours a kaleidoscopic representation of the views of a large number of the leading gynaecologists of Great Britain. It is important to note, in the first place, that the results of the plastic operation given by Drs. Fothergill and Lacey pertained to cases operated upon during the years of war 1914-15-16, when it would naturally be expected that, owing to stress of work and to the fact that sometimes the actual operations had to be performed by relatively inexperienced surgeons, the after-results of operations would not be the best obtainable under more ideal conditions. In the second place, the patients were women of the working classes, employed in cotton mills or engaged in other laborious occupations, and therefore under the necessity of returning to work after the shortest possible period of convalescence. Taking these two facts into consideration, as well as the fact that no ease was included which merely required perineorrhaphy, Dr. Fothergill's 97½ per cent. of cures and the 87 per cent. of cures in the cases followed up by Dr. Lacey speak for themselves. Furthermore, when Dr. Lacey's results are examined more closely the 87 per cent. of cures becomes in reality much higher. Thus out of the 521 replies received, 455, or 87 per cent., answered the question, "Does the womb keep up well now?" with an

emphatic "Yes." Of the remaining 66, 29 were examined, and if 2 cases of hypertrophic elongation of the cervix are excluded, in both of which amputation should have been carried out at the time of operation, only 5 cases remain in which any anatomical abnormality could be discovered. Assuming that the same proportion of anatomical cures would have been found in the whole 66 had they attended for examination, we seem justified in concluding that only in 11 cases, or about 3 per cent., was the operation a failure. A study of the causes of failure in the 3 per cent. shows that, owing to the presence of such conditions as chronic bronchitis, certainly no better results could have been obtained had ventrofixation been done in addition to the vaginal plastic operation, and it goes without saying that ventrofixation *without* reconstruction of the damaged pelvic floor by the vaginal method must have resulted in a much smaller proportion of cures, whether symptomatic or anatomical.

A consideration of the views of those who took part in the subsequent discussion shows very definitely the almost unanimous opinion to be that in a very large proportion of cases, say 97 or 98 per cent., operation by the vaginal route was sufficient, and intervention by the abdominal route unnecessary and undesirable, increasing the risk and discomfort to which the patient was exposed. In a few cases—especially those in which complications existed, such as adhesions in a retroverted uterus, and perhaps also in cases of congenital prolapse in nulliparae, where all the supporting structures are loose and ill nourished—better results could perhaps be obtained by combining the abdominal and vaginal operations. It is, however, evident that such complications as adhesions and diseased ovaries and tubes are not prolapse at all, and may not even be complications of it; even Dr. Fothergill and his most ardent supporters admit the necessity for abdominal operation with a view to dealing with such conditions.

Professor Donald described the stages by which the present perfected plastic vaginal operations were evolved from the crude methods in use in Edinburgh in the early eighties, when all that was aimed at was so to repair the damaged tissues as to enable the patient to retain a pessary—an evolution in which Professor Donald himself has played a main and distinguished part. This is a record of which British gynaecologists in general, and those of the Manchester school in particular, have good reason to be proud.

PROFESSIONAL SECRECY IN COURTS OF LAW.

IN a case heard before Mr. Justice Horridge in the Divorce Court on June 9th the question of venereal disease arose, and counsel for the husband called Dr. John Elliott of Chester, who had treated the wife. Mr. Barrington Ward, K.C., raised the question whether Dr. Elliott was bound to give evidence. The judge asked whether any authority could be shown for counsel being heard merely on behalf of a witness. Mr. Ward replied in the negative, whereupon the judge declined to hear counsel. Dr. Elliott on entering the box asked the judge to exempt him from giving evidence with regard to venereal disease. Dr. Elliott said that he and other medical men had undertaken duties at the clinic on the distinct understanding that professional secrecy as to what happened there would be observed. The judge asked whether the witness could show any statute which upheld that contention. Dr. Elliott referred to Article II (2) of the Public Health Venereal Disease Regulations of the Ministry of Health, which provided that "all information obtained in regard to any person treated under a scheme approved in pursuance of this Article shall be regarded as confidential." The judge said the Ministry

had no power affecting the jurisdiction of the courts: doctors were subject to the orders of the court and must disclose what they knew. Dr. Elliott, while not contesting the ruling, observed that he was placed in a painful position. The Judge retorted: "I cannot see any painful position about it. You are bound to observe the regulations not to disclose voluntarily information you have obtained; but, so far as giving information which you are bound to give in assisting the administration of justice, it is your duty to give it." Dr. Elliott said: "We do not undertake not to disclose voluntarily, but not to disclose at all. It is one of the tenets of the medical profession that confidence must obtain between doctors and patients." The Judge: "But it is not an unfair obligation on doctors to assist in the administration of justice." Dr. Elliott said: "There is another point—that is, the effect of not keeping these proceedings secret." The Judge: "I have nothing to do with that." Dr. Elliott: "Very well, I have nothing further to say. I must bow to your ruling and give evidence." It would appear therefore that, unless Parliament interferes, the undertaking given by the Ministry of Health in the Public Health Venereal Disease Regulations, which have been approved by Parliament, has become of no effect. In the course of a letter on the subject Dr. J. S. Manson of Warrington writes: "The analogy between the doctor who knows, and the lawyer who knows, may be incomplete, yet it is sufficient to set up a certain feeling of injustice or inferiority in the medical profession as compared to the legal profession in the matter of professional secrets. This, however, is a minor point compared with the doctor's conception of his duty to his patient. The patient, anxious for his mental and physical welfare, unburdens his soul and submits his body to the examination of the doctor, and he is entitled, even as part of the treatment, that the information so obtained should be kept secret, and, except for the gravest of public reasons, such as the detection of serious crime or the spread of serious epidemic disease, the doctor should not be compelled to divulge. The decision of this conflict between the duty of a perplexed and conscientious doctor to his patient and his duty to the public should not be left in the hands of a single lawyer, however eminent, but should be referred to a small committee of the House of Lords, composed equally of eminent medical men and lawyers, for their decision. If some such scheme as this were adopted, it would soon be found that in actual practice much of the medical evidence now required in unimportant cases could be dispensed with, while the public welfare would be safeguarded by the necessary medical evidence in the serious and important cases."

ACQUIRED IMMUNITY AFTER EXPERIMENTAL MEASLES.

IN a previous communication, noted in the BRITISH MEDICAL JOURNAL (April 2nd, p. 500), Blake and Trask, of the Hospital of the Rockefeller Institute for Medical Research showed that a condition closely resembling measles in man could be induced in monkeys by the intratracheal injection of filtered or unfiltered nasopharyngeal washings from human patients in the prodromal or early eruptive stage of measles. In order to determine whether experimental measles protects, as human measles does, against a second attack, a series of reinoculation experiments¹ have been carried out on monkeys which had recovered from experimental measles. Monkeys were injected intratracheally with material containing the virus of measles, and other monkeys were intravenously injected with whole blood withdrawn from a monkey on the third day of experimental measles. None of these re-injected monkeys showed any evidence of infection with the virus of measles, and, as they were with one exception injected with a strain different from that originally employed, it seems to follow that the immunity conferred by experi-

¹ F. G. Blake, M.D., and J. D. Trask, jun., M.D., *Journ. Exper. Med.*, Baltimore, 1921, xxxiii, 621-626.

mental measles is, as in man, as efficient against a heterologous as against the homologous strain. Further, this would suggest the probability that all strains of the measles virus are of a homologous strain in as far as their property of stimulating immunity is concerned. As monkeys injected intravenously with the virus remained immune, it appears that the immunity is not solely, if at all, dependent upon a possible barrier offered by the respiratory mucous membrane of a monkey that has recovered from experimental measles.

CATARACT IN IRON WORKERS.

THE fact that cataract is peculiarly liable to develop in glass-workers is well known, and much information on the subject has been published from time to time in our columns. Evidence is now advanced that iron workers are also unduly liable to cataract. Three papers on the subject are published in the *British Journal of Ophthalmology* for May, 1921. Cridland, of Wolverhampton, deals with cataract in puddlers, among whom the cases are comparatively few. He points out that the number of puddlers is by no means large, and is likely to decrease in the future, as steel replaces puddled iron. His contribution adds a few details to the well-known paper which he published on this subject in 1915. St. Clair Roberts has collected notes on cases of cataract occurring in chain-makers at Dudley. In all he found a posterior polar and cortical opacity very similar to that described in glass-blowers. In describing the method of chainmaking by hand, he states that machines for making chains have not proved successful, and he tells us that it is a common belief among the workers that the sight should fail between the ages of 50 and 60. In uncomplicated cases there is no associated lesion of the fundus, and the results of operation are good. The most comprehensive of the three papers is that by Healy of Llanelly, who, having previously had experience of bottlemakers' cataract in Sunderland, has produced really valuable statistics of the number of cataract cases occurring in men of 35 years of age and over engaged in the tinplate industry at Llanelly. He also describes the nature of the work at length, and gives details of 209 cases. In his cases the posterior cortical type of opacity often existed in combination with cortical striae. His paper strongly confirms the supposition that it is the infra-red heat rays which are the important ones in the etiology of this condition, for in the tinplate mill the men are not exposed to ultra-violet rays. The atmosphere of the mills is dusty, and the men perspire freely; they are adverse to the wearing of protective goggles, but Healy believes that much might be done by suitable propaganda to overcome this prejudice. This series of papers offers weighty evidence in favour of the suggestion that cataract in iron-workers should be scheduled under the Workmen's Compensation Act, as well as glass-makers' cataract. The Glass-workers' Cataract Committee of the Royal Society has sent a deputation to Llanelly to inquire into Dr. Healy's cases, and there is reason to hope that the Home Office will shortly place these trades upon the schedule. These papers appear to us to be amongst the most important contributions to ophthalmology that have recently been published.

THE APOTHECARY POET.

ON October 29th, 1895, in celebration of the centenary of the birth of Keats, the late Sir William Osler read before the Johns Hopkins Historical Club one of his attractive biographical essays, that on *John Keats, the Apothecary Poet*, and it is appropriate that Sir George Newman, an honorary Freeman of the Apothecaries' Society, should now dedicate to the Master of that City Company a charming and critical study of *John Keats, Apothecary and*

Poet, on the centenary of his death. After his mother's death from tuberculosis, Keats, then 15 years old, was apprenticed for five years to a surgeon at Edmonton; but in 1814, more than a year before his time was up, he entered at Guy's Hospital, and in 1816 passed the examination for the Licence of the Apothecaries' Society with credit. After this he never attempted any further medical work, though on one or two occasions, when disheartened with the reception of his literary labours, he toyed with the idea of practice. What influence was exerted by medical training on the poet's mind is an interesting question; although his poems and letters do not reveal any obvious impress from the six years of professional study, it is difficult to believe that his sensitive and responsive mind was unaffected thereby. Thus, though a born lover of nature, he appears in his written remains as a trained and acute observer with a sense of thoroughness, a desire for system, knowledge, and philosophy, a wide sympathy with human suffering, and a fuller comprehension of the part played by health and disease in human affairs. The first of his printed poems, "The Imitation of Spenser," was written at the age of 17, and the last appeared in 1820—a period of eight years; nearly the whole of his output, however, was concentrated into a brilliant space of half that length. "Endymion" saw the light in 1818, and the immortal volume containing "Hyperion," "Lamia," "Isabella," "The Eve of St. Agnes," and the five famous Odes came out in July, 1820, when the author lay dying from tuberculosis, almost certainly contracted when nursing his brother, who had succumbed in 1818. As a boy his genius was awakened by Spenser's "Faerie Queen," and he became an inspired and imaginative interpreter of Nature for her own sake. In forsaking the apothecary's calling he adopted the yet nobler mission of repairing the sorrows and wounds of human lives by the healing power of beauty. Lastly, Keats was a philosopher—and, indeed, in one of his letters boldly describes himself as a philosopher first and a poet afterwards. Sir George Newman sums up Keats's philosophy as follows: "That beauty is truth; that such truth is power; that such power moulds the soul; and that the purpose of the soul is devotion to human service through personality."

THE FATE OF THE LYMPHOCYTES.

THE function and fate of the lymphocytes, which mainly enter the blood by the thoracic duct, are still unsettled. In dogs it has been estimated by P. Rous that the surprising number of 3,300,000 lymphocytes pass into the blood during the twenty-four hours, and that this exceeds the total ever present in the blood at one time. The interesting problem as to the fate of the lymphocytes has been investigated by Bunting and Huston,² of the University of Wisconsin. That the lymphocytes become transformed into other forms of leucocytes, as was once believed, is opposed to modern haematological teaching, and such an explanation of their disappearance need not be further considered. Bunting and Huston's experiments on rabbits showed that a billion or more lymphocytes enter the blood from the thoracic duct in the twenty-four hours, and that in six hours 443,000,000 lymphocytes disappear from the circulation. Stained films may present occasional disintegrating lymphocytes, but further experiments proved that there is not, in this way, the rapid destruction that would be necessary to explain the rate of their disappearance from the blood when their supply is cut off by ligation of the thoracic duct and splenectomy. The remaining possible explanation is that the lymphocytes leave the blood; there is not enough lymphocytic accumulation in the tissues to justify the view that they escape in

¹ *John Keats, Apothecary and Poet*. By Sir George Newman, K.C.B., M.D., D.C.L., Honorary Freeman of the Society of Apothecaries of London. Sholely'd: Printed by T. Bostin, 1921. (11p 3s. 1s.)
² C. H. Bunting and J. Huston, *Journ. Exper. Med.*, Baltimore, 1921, xxxix, 595-600.

this direction, and there is not any evidence of their destruction in the tissues. Microscopic examination of the organs led to the conclusion that the majority of the lymphocytes enter the mucous membrane of the gastro-intestinal tract and pass through into the lumen; this lymphocytic migration takes place not only from the blood but from the lymphoid nodules and patches, which are seen in sections to be delivering lymphocytes to the intestine on one side and to the afferent lymphatics and so *en route* for the thoracic duct on the other side. We therefore appear to be brought to the conclusion that in normal conditions the lymphocyte largely fulfils its function upon the surface of the intestinal mucosa; what this function may be is unknown, but the immunity of the gastro-intestinal mucosa to the countless bacteria and their toxins within its lumen suggests the possibility that the lymphocyte may affix toxins.

BRIGHT'S LESS KNOWN CONTRIBUTIONS TO MEDICINE.

IN an account of the observations other than those on renal disease made by Richard Bright, whose rare ability to observe was fortunately accompanied by admirable descriptive powers, Sir William Hale-White¹ remarks how much better it would have been if some modern authors had transcribed Bright's description of a disease instead of painting the picture themselves. A corresponding plan has often been advocated and adopted as regards sermons, and it is hard to believe that medical writers have not borrowed generously, though not quite verbatim, from such an authority as Bright. To this industrious observer, who sought out the secrets of morbid anatomy and avoided speculation, no trouble was too great to obtain an important necropsy, and for this purpose journeys into the country, in his day very tedious, were cheerfully undertaken. His original observations ranged over a wide field, and included the nervous system, the abdomen, heart-block, and the administration of oxygen. Thus he noted hemiopia in cerebral haemorrhage, described lateral sclerosis of the spinal cord in spastic paraplegia, discussed what was later known as Jacksonian epilepsy, and insisted on the association of chorea and rheumatism. In the Lumleian lectures on disorders of the brain delivered in 1837 he drew attention to the connexion between pericarditis and chorea; the lectures were never published, but, according to the late Sir Samuel Wilks, they contained the first description of a mitral murmur in chorea. Among his numerous contributions on abdominal disease, the most original is that on the occurrence of excessive fat in the faeces of patients with pancreatic carcinoma ulcerating into the duodenum; this was based on three cases, one in a woman aged 21 years only. In the first volume of the *Guy's Hospital Reports* he recorded three cases of acute yellow atrophy of the liver under the title of diffused inflammation of the organ, the present name being applied by Rokitansky in 1842; Bright's account, though not the first, as a reference to Dr. Wickham Legg's classic *Bile, Jaundice, and Biliary Diseases* will show, forms an important landmark in the history of this rare and still rather mysterious disease. It is interesting to learn that Bright anticipated his colleague, Thomas Addison, in so far that he described a case of bronzing of the skin, in which the chief morbid change was disease of the adrenals, but apparently he did not associate the symptoms and the lesion, and so Addison's claim to the discovery of the disease (1855) remains unchallenged. Sir W. Hale-White, who has done so much to throw light on the etiology and clinical picture of simple chronic peritonitis, considers that the first description of this condition was probably that given by Bright. Of a joint work on *The Elements of the Practice of Medicine* one volume only appeared (1839), and this is generally regarded as mainly

the work of Addison; but however this may be, it is remarkable for containing a descriptⁿ, which Howard Kelly seventy years later said "could not be surpassed to-day," of the now common disease which was named appendicitis by the late R. H. Fitz of Boston, U.S.A., in 1886.

MEATLESS DIETS.

THE Vegetarian Society of Manchester has published a pamphlet on vegetarian athletics,¹ written by Mr. Henry Light, who is described as captain for twenty years of the Vegetarian Cycling and Athletic Club. We are glad to see that he is no extremist, but one who recognizes the value of moderation both in opinions and in their expression. He presents first a formidable list of eminent athletes who have given up a meat dietary, and if we can trust the statements about their food intake (and non-scientific people are apt to take but scant account of accuracy without any intention to deceive) there is good testimony as to the value of their present system. But this does not mean that they were strict vegetarians. We believe it is usual to dub their dietary "Vem" (vegetables, eggs, milk, including milk products, for example, cheese). There is no physiological reason why such a diet should be inefficient if taken in properly balanced proportions. Towards the close of the pamphlet the question, What constitutes overfeeding and underfeeding? is raised. To answer such a poser we should have to explain the whole of the principles of nutrition, and that is beyond the scope of this note. Suffice it to say that the amount must depend on the age, size, and activities of each individual. The main factor that causes variation in an average adult is the amount of work he does. The energy-supplying food (fat and carbohydrate) must be proportioned to this. The supply of the protein food which builds tissues and repairs waste is a much more constant figure unless actual growth is in progress. There is no reason why all this should not be supplied by the vegetable world. The usefulness of meat in a dietary depends on what Rubner called the specific dynamic action of protein, and of all proteins those of animal flesh are most efficacious in this direction. But if meat has a specific action, the vegetarians can claim (what they have omitted to do in Mr. Light's article) that plants have also a specific usefulness in supplying to animals those accessory factors known as vitamins, which are indispensable to health and even to life itself.

CHILDREN'S DREAMS.

DREAMS are a source of perennial interest. To the foolish they are omens of profound import. To the wise they are a subject of curiosity and provide room for thought and memory searching in an effort to discover what brought them about. Both wise and simple are influenced by them, for a happy morning waking dream means a fair start for the day, and a nightmare a gloomy breakfast. The dreams of our childhood were as real a matter as the facts of our daily experience, and the meaning of these in the physiology of the child mind, has been studied by Dr. Kimmins, and his results have now been published in a small volume.² His investigations were made upon London elementary school children. His method was to secure their narration individually by the younger children to skilled observers, and to arrange that all dreams of children over 8 years of age were recorded by the dreamers themselves in response to the request, "Write a true and full account of the last dream you can remember. State your age, and also say about how long ago you had the dream you have described." Some 6,000 records were obtained from children aged from 8 to 14 years. He notes that in spite of fear dreams, children in normal health delight in dreaming, and it is an evident pleasure to them

to talk about and record their dreams. There is also a remarkable power of graphic description which exceeds their ability in ordinary essay writing and is so much in advance of their general standard of achievement that it would appear as though some fresh element had come into play. Dreams are far clearer and more vivid in the calm country than in the noise of London. Change of environment stimulates, and hard mental work increases the tendency to dreams; a stuffy bedroom diminishes their clearness. Persons of well-developed intelligence dream far more frequently than those of low culture. Dreams of motion, falling, flying, are rare under the age of 9 or 10 years; they then increase in frequency up to the age of 17 or 18. Regular institutional life tends to diminish this type of dream; the deaf scarcely ever experience it; febrile states accentuate the liability greatly. The fear dream is very common in quite young children: 25 per cent. were of this nature, and were chiefly of the dread of objectionable men; the fear of animals was more common amongst boys than girls. School activities appeared little in the dreams of children of any age. Air raids figured little, for the last of them occurred seven months before the investigation was made. Domestic occurrences and fairy dreams delight the girls, rarely the boys. The dream ghost has almost vanished. In dreams of adventure, common with boys, the dreamer is usually the hero or heroine. Amongst the blind and deaf dreams are lacking in variety; fear dreams are excessive—fear of animals particularly with the deaf, fear of fire with the blind; to the blind the air raid was a far greater terror than to the normal child, and the impression of it extended to a year after the last raid; for the deaf the raid had no terror. The dreams analysed afford no evidence that a child blind from birth ever sees as a dreamer, but abundant evidence that those who have recently become blind see clearly. It is suggested that a careful study of children's dreams may throw much light on the special interests and desires of the child at different ages, and (especially where dreams of unfulfilled wishes recur persistently) on those elements which are conspicuously lacking in the life of the child, and may seriously interfere with his natural development. Of these, the most obvious are dreams which indicate underfeeding and those which give evidence of stress and strain.

THE CENSUS.

THE Census, which was postponed from Sunday, April 24th, on account of industrial troubles, will be taken on Sunday next, June 19th. The schedule of inquiries contains several new features, the full intention of which cannot be gauged solely by the headings. The new Census paper is certainly more complicated than its predecessors, and many householders will find it troublesome to fill up. For the first time particulars of age are sought in years and months. The reason for this is that some people have filled in the space in round figures, such as twenty, thirty, and forty-five. The fresh demand is for precision. The question about divorce was not asked in previous censuses, but it is felt that statistics are important as touching the care of children, besides which the matter needs to be cleared up, for divorced persons have hitherto returned themselves haphazard as either single or married, and all the marriage figures are made unreliable to this extent. Another column is intended to bring out whether both parents are living, or whether either is dead, in order that accurate information may be obtained as to the number of orphans in the country. The section for details of birthplace and nationality contains alternative columns, the second requiring persons not born in the United Kingdom to state whether they are visitors or residents in this country, and of what nationality if born in a foreign country. Under the heading "Personal Occupation" a person in employment must make clear not only his occupation, but the kind of industry in which he is engaged; the name and address

of the employer are to be added, but they will not be published. In this way it will be ascertained that a carman, for example, is employed by a firm of woollen weavers, and is thus connected with the textile industry. The statistics of occupation will be of value from the standpoint of health by bringing out comparative knowledge of the working conditions of different portions of the community. The particulars as to the industries absorbing service will be more useful for economic purposes. In the alternative column persons out of work are to say so, and thus an aggregate total as to employment will be secured. "Place of Work" forms a new inquiry which has been suggested by the important problems of housing and transport. In the past the Census has shown how many persons dwell in different areas; in future it will show where they work. It is hoped thus to learn the daily tide of movement between people's homes and their places of work, its direction, range, and volume. It is believed that such knowledge will be of use in drawing conclusions as to where houses and continuation schools are most needed. Under the heading "Personal Occupation" information is sought in regard to the education of each child, whether part-time or whole-time. Another section, applying only to married men, widowers, or widows, gives a table for the number and ages of all living children and step-children under 16, whether already enumerated or not—that is to say, whether residing in the family or elsewhere. This is inserted with a view to ascertaining the amount of dependency upon various classes of men and women and various occupations or industries. Yet another provision will furnish an index to housing and therefore to health conditions; the enumerator is to note the number of living rooms occupied by each family. Householders in Wales and Monmouthshire will be asked how many persons in the family are able to speak both English and Welsh, or English only or Welsh only. For the present Census the number of districts is close upon 38,000 for England and Wales, or 2,000 more than at the last Census. In the official pamphlet of instructions an account is given of the process of Census-taking, and of the special machinery provided for punching cards, which, thus prepared, will be manipulated by sorting and counting machines for various purposes. The sorting machines are capable of distributing cards into ten receptacles at the rate of 15,000 to 20,000 an hour. Lastly, we may note that the object of the Census is thus defined: it is "to obtain reliable figures of the population of the country, showing how that population is made up, that is to say, of what sorts and conditions of people it is composed and how it is distributed through the local subdivisions."

COLONEL THOMAS SINCLAIR, C.B., Professor of Surgery in Queen's College, Belfast, is among the twenty-four members elected to the Senate of the Parliament of Northern Ireland; and Sir Thomas Joseph Stafford, Bt., C.B., F.R.C.S.I., Deputy Lieutenant and late Medical Commissioner, Local Government Board, Ireland, is elected to the Senate for the Southern Parliament.

REPRESENTATIVES of the Rockefeller Foundation are at present in this country to discuss the extension of the Foundation's activities in the investigation of tropical parasitic diseases. Hitherto the Foundation has been concerned chiefly with ankylostomiasis, but it is intended to take up other subjects, and the British Colonial Office has promised every facility. Meanwhile, Dr. Victor G. Heiser, one of the representatives, is proceeding at once to India with the view of studying the prevalence of ankylostomiasis there. The other representatives are Mr. George E. Vincent, President of the Foundation, and Dr. Wickliffe Rose, general director of the International Health Board.

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT.]

Naval Medical Vote.

IN Committee of Supply on Naval Estimates, on June 8th, a resolution was reported for a sum not exceeding £720,500, to defray the expense of medical services, including the cost of medical establishments at home and abroad, which will fall due before the end of March, 1922.

Commander Bellairs said he understood that the representatives of the army and navy were meeting together under the presidency of the Lord President of the Council. He desired, if possible, that Admiralty representatives should meet representatives of the War Office to see whether they could not effect economy by amalgamating the medical arrangements of the army and navy. He found, in the case of Hong Kong, that the military hospital there had accommodation for 166 patients, and the maximum number accommodated was 64, showing a surplus accommodation of 102. The minimum number of patients accommodated was 20, which gave a surplus of 146. Similar figures were shown in connexion with the naval hospital, which had accommodation for 135 patients, while the maximum number accommodated was 97 and the minimum 55. The Yokohama Naval Hospital, also on that station, was closed all through the war and right up to 1920, and it had now been reopened. He urged a thoroughgoing inquiry to prevent overlapping between the two services. There was no difference between the body of a sailor and the body of a soldier so far as medicine was concerned. He believed that the House would be shocked if it were to investigate the number of medical men, say, on the China station, and the number of men whom they had to treat. There were also convalescent barracks at Hong Kong for the military.

Sir Godfrey Collins supported the appeal made by the previous speaker, drawing attention to the case of Malak, where the naval and military had separate establishments side by side. He thought that if the army and navy had combined hospital accommodation it would be to the advantage of the services and the taxpayers. He asked, further, why the Admiralty had refused to adopt the recommendation of the Select Committee on National Expenditure to present their accounts to the House of Commons in the modern method. The War Office had accepted that recommendation, and their accounts revealed the cost of patients in every hospital under the War Office, whereas it was impossible to find, from the Naval Estimates, whether the medical establishments of the latter department were efficiently managed.

Mr. Amery, in reply, said the suggestion for amalgamating naval and military hospital work at certain stations abroad was one that naturally at first sight would appeal to the House. He would certainly look into it, but members would realize that the conditions of naval and military service and discipline and many of the aspects of their organization were so different as to make it not altogether an easy thing to carry out this amalgamation. He imagined, however, that there might be some stations where a military hospital could provide for a certain limited number of naval patients, and *vice versa*. With regard to the particular case of Yokohama, he had not only asked for a close investigation as to the cost of that establishment but also as to the possibility of getting some military establishment elsewhere to take up the patients who went to Yokohama. The War Office was at present the only department which had adopted the new method of accounting. The Admiralty was considering the whole question of their system and had before them a report by a Committee presided over by Colonel Gretton.

The vote was afterwards agreed to.

Coroners' Remuneration Bill.

This measure, which was introduced by Sir Thomas Bramsdon as past President of the Coroners' Society for England and Wales, went on second reading to Grand Committee, where Sir John Baird, on behalf of the Government, promised that if the bill was proceeded with, amendments should be made to secure a revision, and not merely an increase, of the salaries of coroners. On June 10th the bill came on report before the House of Commons, when a number of changes were proposed.

Sir Thomas Bramsdon explained that coroners for counties were paid by salary which was arranged by quinquennial valuation under the Act of 1860. Coroners for boroughs were paid by fees—£1 6s. 8d. for each inquest held; that was fixed by statute, the last increase having been made as far back as 1837. A borough coroner thus got nothing unless he actually held an inquest, whatever inquiries of a preliminary kind he might make; if an inquest lasted three or four days his fee was still limited to £1 6s. 8d. No alteration could be made while the law remained as at present. The legislation now proposed was intended to be temporary. A strong Departmental Committee, appointed in 1909, had recommended a revision in the pay of coroners. Sir Thomas Bramsdon added that borough coroners had no allowances; the sum of £1 6s. 8d. included clerk's fees, postages, and other incidental expenses.

Sir John Baird, in explaining the attitude of the Government,

said it was felt that coroners had a claim to consideration. As regards borough coroners, he agreed that what was adequate in 1837 could not be deemed so to-day. As regards county coroners, he pointed out that under the statute by which the quinquennial valuation takes place, the authorities have no power to consider higher cost of living, travelling, and other expenses, but had to revise solely in reference to the number of inquests held. It was now intended that all relevant matters should be taken into account.

The bill as it came down from Committee proposed that local authorities should proceed to revise the rates of salaries or fees payable to coroners, or, in other words, that an obligation should be imposed, and on this Sir Frederick Banbury moved an amendment to alter the words "shall" to "may," and this was carried by 74 votes to 49. Later he carried the deletion of a part of a subsection of the first clause, which provided that the Home Secretary should fix salary or fees if the authority and coroner failed to agree. Another provision in the bill that the fees should be revised so as to be increased by not less than 50 per cent. was consequently struck out, and the measure was afterwards given its third reading as a permissive bill, the real effect being that if it becomes a statute it will remove the provisions at present existing against the revision of fees or salaries by local authorities.

The Dentists Bill.

Through the unexpected lapse of other business, the Dentists Bill was taken on report in the House of Commons on June 13th.

Sir Alfred Mond (Minister of Health), meeting an objection by Colonel Wedgwood, pointed out that it was only on the understanding that this was a more or less agreed measure that the Government had adopted it; that there had been fairly full discussion in Grand Committee; and that if any member who had not put down notice of amendment on report (though there had been time) made a case for one, it could be put forward in another place.

Colonel Wedgwood, on the first clause, moved the adjournment. The report of the Departmental Committee upon which the bill was founded included, he said, a great deal more than a proposal to place dentists in the same category as doctors—that is, as a closed corporation. There were recommendations for a free dental service, and for some form of scholarship to enable children of the working class to become practitioners. Mr. Seddon, supporting the appeal of the Minister of Health, spoke of the excellent spirit manifested upstairs; contradicting Colonel Wedgwood's assertion that passing the examination would cost £1,000, he said there were thousands of dental mechanics who were making provision to meet the examination. The adjournment motion was negatived.

On Clause 3, on the subsection as to the right of persons who had attained the age of 23 before the commencement of the Act to pass "the prescribed examination within ten years from that date," Colonel Wedgwood proposed to alter "the prescribed" to "a modified," his object being to help the dental mechanics. Sir Alfred Mond replied that "a modified" meant nothing, whereas the word "prescribed" meant that the examination was going to be specially prepared to meet the needs of the occasion. It would be prepared by the Dental Board; all the different kinds of dentists would be represented on the Board, and there would be other members as well. The amendment was negatived. Lieut.-Commander Kenworthy moved to omit the subsection in Clause 16 to apply the bill to Ireland, holding that for Ireland this was a domestic matter and might be left to Irish parliaments or "whatever they might end by having in that country." Sir Alfred Mond said that if Ireland did not want the benefit of this bill, he had no doubt that its people could get rid of it at some future date. If Ireland were excluded, a dentist practising there would be unable to come over and practise in England or Scotland. Asked what would happen to the American dentist, the Minister said that any American dentist holding degrees similar to an English dentist could of course practise in this country. The amendment was withdrawn.

On the motion for the third reading of the bill Colonel Wedgwood moved its rejection, as a protest against the way the matter had been approached that night. Members seemed to look at the measure, he said, as one merely affecting dentists and dental practitioners. The question, he submitted, should be whether there would be a better dental service, and whether too much would be paid for getting it. He was not certain that giving any body of people a close monopoly was likely to improve the work they did. A higher standard might be got by a stiff examination, but the cost of training might exclude a certain amount of intelligence in the country which might otherwise come into the service. The bill might raise the practice of dentistry, but the other side to the question was that it would raise prices. Every dental practitioner who got on the register would have to fall in with a scale of fees given to dentists on the register. Nearly every colliery village he knew had its dental practitioner. They did not do their work very well, but they were cheap. The Departmental Committee had tried to balance the coming advance in fees by recommending the establishment of a Public Dental Service; but that idea had not been taken in the bill. He regretted also the dropping of the Committee's proposal for scholarships. The part of the report which would raise the cost to the public had been adopted; the other two parts which

would have kept down the price and enabled the sons of working-class people to become dentists had been rejected.

Sir A. Mond, in reply, urged that the bill was for the benefit of the public. There was nothing new in principle in it. By amending the defect in the Act of 1878 they were endeavouring to bring dentistry, which was an important branch of medical science, up to a higher standard. To do this they were including a large number of men who had not the academic but the practical experience, and liberal provision was made for them. There was nothing in the bill to enable prices to be put up. The law of supply and demand would apply, and the consideration of means. If the bill had been to exclude a large portion of the men practising now and create a scarcity of dentists, there would have been force in Colonel Wedgwood's argument. But practically the same number of dentists would practise.

Mr. Raffan supported the third reading. The proposals as to public dental service and scholarships could not properly be put in the bill as they were administrative matters.

Major Molson also declared himself in favour of the bill in the interests of the public, and remarked that the British Dental Association had behaved very generously in regard to the measure.

The bill was read a third time without division.

Bellahouston Hospital Inquiry.—Mr. Neil McLean, on June 9th, suggested to Mr. Macpherson that the inquiry into the administration of Bellahouston Hospital should be conducted in public. Mr. Macpherson said that, in response to a request for an impartial inquiry, he had appointed a Committee the members of which commanded the respect of all the people in Scotland. In the proceedings the medical sheets of the men might be asked for, and he could not be a party to the public disclosure of such information. Mr. McLean inquired whether the International Union of Ex-Service Men had been refused representation on the Advisory Committee. Mr. Macpherson said he had no information that this body was representative of ex-service men in Glasgow to any great extent. It had been requested to furnish a complete list of its members in Glasgow, but had not done so. He was satisfied that the interests of ex-service men were fully looked after by the twenty-six representatives already serving on the Advisory Committee. If, however, the International Union would satisfy the Regional Director in Scotland as to the strength of its membership, he would reconsider the matter. Mr. McLean submitted that the request for particulars was made on another occasion, and was also in the present instance out of all proportion to the purpose of the inquiry. Mr. Macpherson added that he thought he was entitled to ask the number of members of this union, as representation should be in proportion to membership. But he thought he had met Mr. McLean's point, as three of its members had been present throughout the inquiry.

National Insurance.—In reply to a question by Mr. Thomas Davies, on June 10th, as to an interpretation of a model rule defining the qualifying requirement for sickness or disablement benefit, Sir A. Mond said that under Section 14 (2) of the National Insurance Act, 1911, every approved society was required to have a rule as to the behaviour of members while incapable of work and in receipt of sickness or disablement benefit. The rule in question, which was drawn up with the concurrence of the Advisory Committee, composed of representatives of approved societies of all types, merely set out the restrictions which a society should impose on the activities of a member whom they had already decided to be incapable of work. The Ministry did not lay down any definition of light work, as it rested with each society to interpret its own rules in applying them to any case which might arise.

Discharged Soldiers and Insurance Benefit.—Mr. R. Young asked whether a discharged soldier temporarily unfit for work, and receiving while in hospital 100 per cent. allowance, was entitled to any benefit under the Insurance Act while in hospital. Mr. Parker, for the Ministry of Health, stated that sickness or disablement benefit was not payable to an insured person while he was an inmate of a hospital or similar institution, but the whole or part of the benefit was paid to his dependants, if any, or might be applied towards meeting any expenses for which the insured person might be liable, otherwise than to the hospital, or, with his consent, might be paid to the hospital if it was not maintained out of public funds. So far as the money was not used in any of these ways, it became payable to the insured person on leaving the hospital. Where the insured person was a discharged soldier in receipt of 100 per cent. allowance, the rate of sickness (or disablement) benefit was reduced by 7s. 6d. a week, unless he had been employed for 26 (or 104) weeks since discharge from the army.

London Hospital; the Closing of Wards.—Mr. Charles Edwards asked, on June 9th, whether the attention of the Minister of Health had been called to the closing of certain wards and curtailment of the out-patient department of the London Hospital, and whether he would take any steps to provide adequate facilities for medical treatment for the people of East London. Mr. Parker, for Sir A. Mond, said that no statement could be made until the Government had had the opportunity of considering the report of Lord Cave's committee which was then before them; accommodation for emergency cases was available in the Whitechapel and other infirmaries in East London.

Welsh Board of Health.—Sir A. Mond stated, on June 8th, in answer to Mr. A. T. Davies, that if a vacancy occurred he should be prepared to consider the appointment of a woman to the Welsh Board of Health. At present the Board, which consisted of salaried administrative officers, was sufficient in number for the work to be done.

Indian Army Officers' Pensions.—Colonel Sir C. Yate, on June 7th, asked whether a decision had been reached on the subject of the additional pensions of £100 and £200 a year which it was stated in the India Office Memorandum a year ago would be granted to Indian army officers on the supernumerary list who had held high civil appointments. Mr. Montagu said he hoped to reach a decision shortly, whereupon Sir C. Yate pointed out the long interval since the first announcement.

Hospital Accommodation for Disabled Men.—Viscount Curzon asked, on June 9th, whether the Ministry of Pensions could take up some of the vacant wards in hospitals and so release but accommodation, such as that at Ruskin Park. Mr. Macpherson replied that this hospital was transferred to the Ministry of Pensions by the War Office authorities. It had been fitted with special orthopaedic out-patient arrangements and special sections for the treatment of disabled officers and nurses. It had been found to provide the most convenient and incidentally the most economical centre for treating the large body of the disabled in that district.

NORTH EUROPEAN CONFERENCE ON VENEREAL DISEASES.

THE North European Red Cross Conference on Venereal Diseases, of which a preliminary note appeared in the JOURNAL of May 21st, 1921 (p. 749), was held from May 20th to 25th at Copenhagen. We have received from the National Council for Combating Venereal Diseases a copy of the following series of resolutions adopted by the Conference:

This Conference, having considered the general measures for the combating of venereal diseases which have been adopted by the participating countries, is unanimously of opinion, so far as the experience of the countries represented is concerned:

1. That the provision, by responsible health authorities, of adequate facilities for diagnosis and treatment on lines which ensure that the greatest possible number of infected persons is rendered non-infective, is a measure of prime importance to the reduction of venereal diseases. The urgent necessity of commencing treatment at the earliest possible moment should be emphasized. It is suggested that the above facilities should be provided free of cost to the patient where they are otherwise unlikely to be utilized to the fullest extent.
2. That the questions of compulsory notification and of compulsory treatment, being dependent on the experience, resources, and psychology of the people concerned in each country, must be decided by individual nations.
3. That instruction, theoretical and practical, in the recognition of venereal diseases, particularly in their earliest manifestations, and in their treatment, should form a part of the curriculum of every medical student, and that satisfaction of a test of proficiency in this subject should be a condition of every medical qualification.
4. That provision should be made at suitable treatment centres for such instruction of medical practitioners in the diagnosis and treatment of venereal diseases as will enable them to recognize these disabilities promptly and secure their adequate treatment.
5. That regulation and official toleration of professional prostitution has been found to be medically useless as a check on the spread of venereal diseases and may even prove positively harmful, tending as they do to give official sanction to a vicious traffic.
6. That the provision of "hostels" and rescue homes for the temporary care of girls suffering from venereal disease is a valuable means of preventing the spread of venereal diseases.
7. That the provision of opportunities for wholesome entertainment and recreation is an important factor in reducing the temptation to exposure to venereal infections.
8. That enlightenment of the general public on lines which are best calculated to minimize exposure to infection and emphasize the necessity of thorough treatment is an essential part of any scheme for the combating of venereal diseases. Instruction should particularly be addressed to parents and teachers in such a form as will enable them to give clear information on the reproduction of life and impress on adolescents the importance of individual responsibility to future generations. In the training of teachers special courses on these subjects should be provided.

England and Wales.

WELSH NATIONAL SCHOOL OF MEDICINE.

THE installation of H.R.H. The Prince of Wales as Chancellor of the University of Wales, at Cardiff, on June 8th, was an important event in the history of the Principality; later in the day the Chancellor laid the foundation stone of the department of Public Health and Preventive Medicine, to be erected at a cost of £60,000—the gift of Sir William James Thomas, to whose princely generosity the University already owed its Physiological Block, which was opened on the same occasion.

A number of honorary degrees were conferred by the Chancellor, amongst the distinguished recipients being Lord Haldane and Mr. Arthur James Balfour. The Prince delivered an admirable inaugural address as Chancellor, in the course of which he laid great emphasis upon the importance of laboratory accommodation and research work. There is a vast field for research in the important industrial area around Cardiff not only into the ordinary problems of disease, but into the health reactions of industrial life in the congested coal-mining districts of the Principality.

The Chair of Preventive Medicine at the Welsh National School of Medicine was endowed by the late Miss Emily Talbot of Margam Abbey, who transferred to the trustees of the college the sum of £37,000 in 4 per cent. Port Talbot Railway debenture stocks, the income of which is to be used for the salary of the Mansel Talbot Professor of Preventive Medicine. The University of Wales is fortunate in having secured the services of Professor Edgar L. Collis as the first occupant of this important department of its School of Medicine. The new Institute of Preventive Medicine as a component part of a complete medical school is remarkable as the first of its kind and far-reaching results are expected from this close association of the curative and preventive branches of medical research.

The new preventive medicine block will adjoin the recently erected physiological block as a part of the complete school of medicine, which is to be established on an island site which includes the old college—now used for the preliminary and intermediate stages of the medical curriculum. The buildings of the School of Medicine, when completed, will be an imposing series of structures in one of the main thoroughfares of the city, and close to the King Edward Hospital, which will provide the clinical facilities for the final studies.

A chair of tuberculosis has been endowed through the munificence of Major David Davies, M.P., and the Llandinam family, and by an arrangement with the Welsh National Memorial Association, Colonel S. Lyle Cummins, C.B., A.M.S., was recently appointed the first David Davies Professor of Tuberculosis.

The Dean of the Medical School, Professor David Hepburn, Professor Graham Brown—the Professor of Physiology—and Professors Collis and Cummins, were presented to the Prince, who afterwards inspected the physiological block with Professor Graham Brown, and showed a close interest in the equipment and research work of the department.

A great deal remains to be done before the scheme for a complete medical school is perfected, but, in the words of the address presented by the university authorities to the Chancellor, it is hoped that "the visit of the Prince will help the leaders of public opinion in South Wales to realize the significance of higher education in regard to national prosperity," and that the other captains of industry will follow the generous examples of the princely donors of the physiological and preventive medicine blocks, in the support of science as applied to the art of medicine and to industry.

A CRITICISM OF THE CHESHIRE TUBERCULOSIS SCHEME.

The tuberculosis scheme of the county of Cheshire has recently been the subject of criticism by the County Local Medical and Panel Committee.

The scheme is designed to provide facilities for treatment and prevention of all forms of tuberculosis affecting all classes of persons within the county, which, for administrative purposes, is divided into four dispensary districts, with one subdistrict. In each of these one or

more dispensaries or branch dispensaries is established; at present fourteen such institutions have been set up. The scheme also proposes to provide sanatorium accommodation for early curable cases and pulmonary hospitals for advanced cases. A sanatorium is now being established at Burntwood to provide seventy beds. It will serve the whole county of Cheshire, including the county boroughs, and also the county borough of Stoke-on-Trent, which is in Staffordshire, as is in fact Burntwood itself. There is also now approaching completion a training or employment colony at Wrenbury. The Cheshire branch of the British Red Cross Society and Order of St. John gave £30,000 to the County Council to help in establishing a colony for fifty cured or arrested male cases. Wrenbury Hall, with 162 acres, was purchased for the purpose. The doctor and matron are already installed, and it is hoped that the place may be opened in a few weeks.

Pulmonary hospitals for advanced cases requiring treatment or isolation are provided in tuberculosis pavilions attached to some of the ordinary isolation hospitals of different Cheshire districts. Arrangements have been made with the general hospitals, infirmaries, and cottage hospitals to provide beds for emergency cases and for surgical cases. Additional beds are retained at the Leasowe Children's Hospital for children affected with non-pulmonary tuberculosis, and the Royal Liverpool Country Hospital at Heswall is also used for the same class of disease. A central laboratory for the examination of sputum and pathological specimens has been equipped in connexion with the central office of the county tuberculosis officer. In addition to this officer the staff consists of four whole-time tuberculosis officers and eight tuberculosis nurses, two in each district working under the direction and supervision of the district tuberculosis officer. In the fifth, the Chester district, arrangements were made to share the services of the city tuberculosis officer, while in the part of the Chester area formed into a subdistrict the duties of the tuberculosis officer are carried out by a part-time officer, who is also Medical Officer of Health for the North-West Cheshire Combined Sanitary District. The chief tuberculosis officer was appointed to act as consultant to the district tuberculosis officers and to practitioners where necessary, and generally to supervise the residential treatment of all cases in institutions. As has already been stated, fourteen dispensaries and branch dispensaries have been established. The work done at a dispensary is defined as follows:

"The function of the dispensary is to act as a receiving centre for all classes of cases, and all kinds of information relative to and affecting tuberculosis in the district; a centre to which cases shall be sent for expert examination and diagnosis; a clearing house where all cases of tuberculosis shall be sorted out, classified, and suitable treatment or procedure determined in each instance; old cases re-examined from time to time as may be necessary, and home treatment supervised."

"Each dispensary district constitutes a complete unit of organization, and is under the control of the district tuberculosis officer, the nurses acting directly under his supervision. The tuberculosis officer examines patients at the dispensaries, makes such recommendations and reports as may be necessary in each case, and also acts as a consultant to the medical practitioners in regard to all cases of tuberculosis occurring within his area. . . ."

"One of the important functions of the dispensary is the examination of 'contacts' with a view to detection of incipient cases of disease at the earliest opportunity and before symptoms have become manifest."

The scheme, we understand, was promulgated in 1915, but for various reasons is only now coming into full working order. It has been watched by general practitioners in the county with interest from the first, and recent developments have induced the Cheshire Local Medical and Panel Committee to address a letter to the Cheshire County Council, suggesting that the tuberculosis dispensaries should be done away with and a simpler, more efficient, and less expensive system substituted.

The letter states that nine-tenths of the matters in question are within the day-to-day experience of general practitioners, who are naturally keen but far from unfriendly critics of the new official measures. The letter goes on to point out that the Committee regards the sanatorium at Burntwood as the central feature of the scheme. The sanatorium and the tuberculosis pavilions attached to certain of the isolation hospitals should have observation beds, to which a person, when his illness was first notified, would be admitted. The case could

there be investigated far more thoroughly than at a dispensary consultation; a temperature chart would, for example, be available, and after a few days, or in some cases weeks, no doubt would remain as to the condition of the patient and the tendency of the disease in his case.

With regard to the proposed consultative function of the dispensaries, the Committee expresses the view that consultations should be with consultants, and that in difficult cases the services of physicians, and in cases of surgical tuberculosis those of surgeons, of hospital standing should be available. The letter continues:

"The dispensaries can never provide a satisfactory consultant service. You cannot attract men of matured hospital experience and standing for the salary that can be offered. You cannot 'grow' such experience in an atmosphere in which the clinical element is too rarefied and the administrative too toxic. It is a product of the hospital. True, individuals may transcend their opportunities; but then the higher paid berths elsewhere soon attract them.

"On the other hand, my Committee holds that the senior medical staff at Burntwood, and also at Wrenbury, should be available for consultation, and that the assistant tuberculosis officers should be transferred to the sanatorium staff on the closure of the dispensaries. The Burntwood staff might possibly have to be increased by an extra doctor if the demand for consultants were to grow."

"The monotony of the life of an isolated institution, the tendency to stagnation, and the lack of stimulus from outside association would all be usefully modified by adding the duties of consultant to those of sanatorium medical officers. Alertness, efficiency, knowledge of the districts from which the patients come, their environment, and status will be gained on the one side; on the other, general practitioners will be brought into useful touch with the work at Burntwood."

The examination of contacts, it is considered, would be more likely to be acceptable if done by the family doctor.

"In the long run," it is said, "that system will prove to give more complete results than the vain attempt to carry out a family inquisition through the dispensary. If there were 500 families to be examined a year, at a guinea a family, the expense would be small compared with the saving of the rents of the dispensaries and of salaries."

On sanitary supervision and the enlistment of voluntary aid the letter makes the following observations:

"Since the inception of the scheme the district medical officer of health and sanitary inspector have regarded the matter of tuberculosis as very largely taken out of their hands; and there has been a tendency for the care of the sanitary environment of a tuberculosis patient to fall between two stools. The information that the Local Health Authority was once again to regard itself as fully responsible for the background in which the life of a consumptive is to be led would reawaken it to its opportunities, and bring into play all the forces of local knowledge and local enthusiasm."

The conclusion is that the dispensary system while it may work well in a city is inappropriate to a great scattered county, and the hope is expressed that the county council, with the advice of its chief tuberculosis officer, whose courtesy and desire to help is acknowledged, will accept the expression of the views of general practitioners contained in the letter. Their proposals, it is pointed out, have at least the merit of being far less expensive than the scheme that holds the field.

LIVERPOOL MEDICAL INSTITUTION: THREE JUBILEES.

A special general meeting of members was held on June 8th, to which ladies were invited, to tender the congratulations of the Institution to Drs. W. Macfie Campbell and John B. Edis and Mr. Rushton Parker on attaining the jubilee year of their membership. Dr. John E. Gemmell (President) was in the chair, and there was a good attendance of medical men and ladies. Owing to indisposition, neither Dr. Campbell nor Dr. Edis was able to be present. At the instance of the Chairman, the resolution that the congratulations of the Institution be tendered to each of the members was proposed and seconded formally by life-long friends of the recipients of the honour. In the case of Dr. W. Macfie Campbell, the resolution was proposed by Dr. T. R. Glynn, ex-President, who called to mind that Dr. Campbell was at one time resident house-surgeon at the Northern Hospital when Dr. Glynn was honorary physician. Afterwards he became leading obstetrician. Dr. Campbell had filled all the posts in the Medical Institution and was an ex-President. In spite of a large practice, his zeal in promoting the interests of the profession was remarkable, and Dr. Glynn expressed the hope

that Dr. Macfie Campbell would still enjoy good health, to which he was glad he was now returning, for many years to come. Mr. Charles H. B. Shears, in seconding the resolution, mentioned that he had been house surgeon at the Northern Hospital under Dr. W. Macfie Campbell, and bore testimony to the kindness and sterling character of his old and respected friend. The President read a letter from a member, who preferred to be anonymous, extolling the high professional standing Dr. Macfie Campbell always took in his relation to his fellow practitioners. A letter from Dr. Macfie Campbell was read by the President, in which he expressed his great regret at not being present to receive the congratulations of the members which he so highly appreciated and for which he tendered his sincere thanks. Dr. Macfie Campbell called to mind events in the history of the Liverpool Medical Institution, and mentioned the circumstances in which the first lady—the late Dr. Lucy Craddock—was admitted a member. The resolution was carried unanimously.

Dr. Charles B. Macalister proposed the resolution of congratulations to Dr. John B. Edis. He came to Liverpool to hold the post of medical missionary, and did much work during the epidemic of typhus raging at that time. Although not a robust man, he not only survived an attack of typhus and of typhoid fever, but built up for himself a large midwifery practice, and had brought into the world some ten thousand babies. He was one of the medical officers attached to the Hospital for Diseases of Women, and during a long and strenuous life continued to take a keen interest in the Liverpool Medical Mission. He was a great cyclist and expert with the camera, and to these recreations he ascribed his good health. Mr. Keith W. Monsarrat seconded the resolution, adding that Dr. Edis was a man held in affectionate regard by all with whom he was brought into contact. The Chairman put the resolution to the meeting, which carried it unanimously.

In proposing the resolution of congratulations to Mr. Rushton Parker, who was present, Mr. Paul gave an interesting account of his earliest recollections of Mr. Parker, whom he first met in 1875. Pathology, then comparatively a young science, was the bond of union between them. Mr. Parker was essentially a scientific surgeon, and this habit of mind was his leading characteristic. Mr. Parker recognized at the very outset the genius of the late Hugh Owen Thomas, and was one of the first in Liverpool to introduce the famous surgeon's methods into his own practice. Mr. Parker was ever sincere, frank and outspoken, witty, and possessed of a keen sense of the foibles of his professional brethren. Mr. Paul felt it an honour to be the proposer of these congratulations, and expressed the hope that Mr. Parker might celebrate his diamond jubilee membership. Dr. Glynn seconded the resolution, emphasizing the characteristic love of truth ever to be found in Mr. Rushton Parker, and incidentally alluded to the many acts of kindness he had shown to many of his professional brethren. Mr. Newbolt supported the resolution, adding an expression of his personal regard for Mr. Parker, not only as a surgeon but as a straightforward fearless man. The motion, on being put from the chair, was carried unanimously, and amid applause Mr. Rushton Parker rose to reply. He expressed his appreciation of the high compliment that the Institution had paid him, and went on to describe his earliest experiences, amusingly sketched incidents that happened to him as a young surgeon, and delighted his hearers with reminiscences of Mr. Stubbs, one of the honorary surgeons to the Royal Infirmary at that time. Mr. Parker alluded to the origin and the growth of the Liverpool Royal Infirmary School of Medicine, now the Medical Faculty of the University of Liverpool, and mentioned some of the characteristics of the lecturers of that time. In thanking the members for their congratulations, he felt he ought to propose a resolution of sympathy with Dr. Macfie Campbell and Dr. John B. Edis for their inability to be present on this occasion, and to express the hope that both would soon recover from their indisposition.

LIVERPOOL CHAIR OF OBSTETRICS.

At a meeting of the Council of the University of Liverpool, held on June 8th, Dr. W. Blair Bell, gynaecological and obstetrical surgeon to the Royal Infirmary, Liverpool, and lecturer in clinical gynaecology in the university, was appointed to the Chair of Obstetrics and Gynaecology, vacant through the resignation of Professor Henry Brigg.

THE LEEDS GENERAL INFIRMARY: RE-ALLOCATION OF BEDS.

The question of the re-allocation of beds throughout the hospital was recently referred to the Faculty for consideration and report, and, although this was by common consent regarded as a highly contentious matter, careful consideration in a spirit of mutual concession has resulted in the presentation to the board of a report which had the merit of coming from the Faculty without a dissident and which was adopted. It is true that effect cannot be given to the re-allocation until the modernization of certain of the wards, which was referred to in this column, has been completed. During the years of the war the division of the beds between the various departments has been modified and obscured by many circumstances. Thus, on the outbreak of the struggle a request came from the War Office for accommodation for 115 wounded soldiers, and this was afterwards increased to 135. A ward which is usually kept as an emergency ward was at once put in commission and the large out-patient waiting hall was converted and used for the accommodation of patients, much of the out-patient work being relegated to temporary centres near the infirmary. In passing, it may be mentioned that 4,918 soldiers from convoys were dealt with in the infirmary, and in this way the pressure on the Second Northern General Hospital was lessened. The admission of soldiers came to an end during 1919, but beginning in 1918 and still continuing there has been a yearly admission of discharged soldiers, who are being sent by some one or other of the authorities acting under the Ministry of Pensions. The figures for 1918, 1919, and 1920 were respectively 346, 353, and 283, and it is hoped that the numbers will dwindle and this call on the infirmary soon disappear, except possibly for a small number of special cases sent for investigation. The buildings of the Second Northern General Hospital are being used for pensioners, and this would appear to make further demands on the infirmary unnecessary, except, perhaps, for very special cases. During the war, also, it was found necessary to close two wards owing to a scarcity of nurses, so that when the new pavilion of the King Edward Memorial wing was opened the number of beds, as compared with pre-war years, was not materially increased. When the wards which it is determined are to be used in the not remote future can be occupied, there will be 432 beds for adults and 99 cots for children, with, in the case of the latter, the prospect of a substantial increase in the form of a semi-open-air ward on the terrace with accommodation for about 20 children. The arrangement of the wards has made it possible to allocate these beds and cots as follows:

	Beds.		Cots.	Total.
	Male.	Female.		
Medical	66	47	33	146
Surgical	135	71	52	258
Ophthalmic	27	17	8	52
Aural	14	12	6	32
Gynaecological	—	23	—	23
Isolation	8	8	—	16
Suspected alcoholism	2	—	—	2
Observation	2	—	—	2

Until such time as provision can be made for those patients who are at present accommodated in the isolation wards it will not be possible to transfer the isolation block to the venereal department, which is regarded as desirable, and which has been decided upon. This re-allocation of beds and cots, which has been the subject of much thought, does away with the mixture of medical and surgical cases in children which prevailed to a certain extent under the old arrangements; it brings the surgical cases nearer to the operating theatres, and leads generally to concentration of charges and convenience of teaching. It is hoped that the scheme will be in full operation by the beginning of next year.

PROVISION FOR TREATMENT OF CHILDREN IN LEEDS.

In the re-allocation of beds and cots above referred to, the need for improved and extended accommodation for children has been kept steadily in mind. It is indeed true that the number of children treated both in the in-patient and the out-patient department of the infirmary is greater than many members of the Leeds public grasp. This it is which leads from time to time to expressions of regret that "there is no children's hospital in Leeds." As a matter of fact no fewer than 1,500 were admitted to the children's wards during the year 1920, and the numbers dealt with in the out-patient department are very great. Until lately the accommodation especially reserved for children has been only 71 cots. In the near future, as has been mentioned above, the number of cots will be increased to 99 with the prospect of some 20 more in the semi-open-air ward, and such a segregation of the children's cots will be secured that the infirmary may be regarded as containing within its walls a fully equipped children's hospital. It is true that there is still in Leeds, appreciable by those who have eyes to see, ears to hear, and hearts to understand, an eloquent and urgent appeal for more accommodation for the treatment of children; but those who are best informed will cordially agree with Mr. Charles Lupton, the treasurer of the infirmary, when he says that the wisest way to meet this is not the provision of a new hospital, but a generous extension of the accommodation, some miles away from the centre of Leeds, for the treatment of those cases which are necessarily of long duration, such as articular and abdominal tuberculosis, and heart disease at that stage in its development when a few months of care may improve the prospect of a useful life and may lessen the likelihood of much suffering. An expensive and highly specialized institution is, indeed, in the first instance necessary for the treatment of such cases as may require difficult operations and careful investigation; when this time has been tided over the patients can be transferred to a place where they can get those things which are their later necessity—namely, good food, fresh air, and kindness. Leeds has been happy in the centralization of its medical charities; it is to be hoped that this will not be disturbed; decentralization would lead to extravagance in management, and it would be bad for the welfare of the patients and injurious to the teaching of the students. Those, therefore, who desire to further the treatment of children in Leeds can best do so by subscribing to the funds of the infirmary, and especially by the endowment of cots. In this respect the Leeds Caledonian Society has set a good example: at its annual dinner last January Dr. T. Wardrop Griffith, the president, was able to hand to Mr. Charles Lupton a cheque for £1,200, which he hoped might in time be increased to £1,500, to enable three cots to be endowed; it was, he said, the result of a collection made among the members of the society.

Scotland.

MEDICAL ADVISER TO PRISON COMMISSIONERS.

The Secretary for Scotland has appointed Harry Rainy, M.D., F.R.C.P.E., Vice-President of the Royal College of Physicians of Edinburgh, to be Medical Adviser to the Prison Commissioners for Scotland, in succession to the late Sir Thomas R. Fraser.

GLASGOW EAR, NOSE, AND THROAT HOSPITAL.

At the annual meeting of the Glasgow Hospital for Diseases of the Ear, Nose, and Throat, which was held on June 8th, Lord Provost Paxton presided and moved approval of the directors' report. In this it was stated that during the past year steps had been taken to organize a committee and to raise funds for the proposed new hospital, and that Lord Weir would act as chairman of this committee. It was hoped that the response to the appeal for funds which was now being made would enable the directors to build the new hospital within the next two years, as at present the accommodation available was greatly overtaxed. Last year 6,008 patients were treated at the hospital, and the number of attendances was 20,339. The building fund now amounts to £11,650.

Correspondence.

THE PURE CLINICIAN.

SIR,—I have read with interest but great uneasiness Sir James Mackenzie's address at St. Mary's Hospital; with uneasiness, for am I not right in assuming that Sir James is leading a new movement which appears to be increasing the distance between the patient and the laboratory, instead of striving for what everyone who has the interests of prevention, early diagnosis, and accurate specific treatment at heart desires—a decrease in the distance until there is a complete liaison?

He states that the diagnosis and prevention of typhoid fever, syphilis, and rabies is entirely the result of accurate clinical observation, while such diseases as malaria had to be handed over to the laboratory worker; yet everyone knows that the accurate diagnosis of all these diseases and their prevention cannot be achieved in the absence of the laboratory. The treatment of syphilis has to be controlled by laboratory tests, that of rabies is entirely dependent on the laboratory, while the treatment of the enterics, which can be aborted or very rapidly cured by laboratory products if the laboratory is properly used for early diagnosis, has, in the hands of the pure clinician, made no advance in specific treatment in the last fifty years.

I quite agree with Sir James as to the importance of prognosis. I always teach the importance of this and urge the perusal of the Registrar-General's returns, for it is from these and these alone that prognosis can properly be judged. Sir James takes measles as an instance for prognosis in cases of antigen (vaccine) therapy. Unfortunately the laboratory has so far failed to diagnose this disease, but measles, as Sir James points out, is of little importance; it has little effect on the general death rate. Let me take, however, two diseases, in one of which—tuberculosis—I am especially interested, and the other—heart disease—in which he is.

Now anyone reading such a book as Riviere's *Early Diagnosis of Tuberculosis of the Lungs* will realize to what very great refinement the interpretation of symptoms produced by the excitation of abnormal and interference with normal reflexes and that of physical signs has reached, and yet by these methods no certain diagnosis can be made, for the enlarged glands at the hilus of the lungs can be produced by many other microbes besides the tubercle bacillus. Only by subcutaneous tuberculin tests, a product of the laboratory, can an accurate diagnosis be made at this stage. Sir James Mackenzie's life work has been the accurate diagnosis of the lesions in hearts damaged by the depredations of microbes, but I have not gathered from his writings that he has been particularly interested in the accurate diagnosis of the microbial cause of the symptoms he has been treating; and yet the prevention of heart disease or of the constant flares-up of infection when it has occurred is entirely dependent on the isolation of the causative organism and the immunization of the patient with it.

The failure to control these and other causes of the highest death rates has been due to the seeking for and cure of the symptoms of the diseases instead of the seeking for and destruction of the microbial causes of them. For this there is no excuse, for the laboratory has made known the causes and furnished us with the means of treatment.—I am, etc.,

Dublin, June 4th.

W. M. CROFTON.

DEFECTS IN TUBERCULOSIS ADMINISTRATION.

SIR,—Efforts have been made in the county of Essex to remove the confusion and friction referred to by "Mixture" in your issue of June 4th (p. 839).

Conferences with the Ministry of Health and local sanitary authorities resulted in the unanimous adoption of the principle of a combined medical service for a specified area, whereby a whole-time medical officer was appointed to undertake the duties of local medical officer of health and assistant county medical officer (including tuberculosis officer, school medical inspector, and inspector of midwives). Salary and expenses are apportioned between the county council and the local sanitary authority on an agreed basis. As local medical officer of health he is directly responsible to the local sanitary authority, and

as assistant county medical officer he reports to the county council, through the county medical officer. There are already three such appointments, the first officer having actually taken up duty on April 1st, 1920.

Essex claims to be the pioneer of this fusion of local health duties, and it has succeeded beyond all expectations in removing hindrances to *progressivo preventivo* and remedial work. There is no overlapping or friction, one medical officer being responsible for safeguarding the health interests, personal as well as environmental, of the community. He receives his own notifications of cases of tuberculosis, keeps his own register, acts upon the cases as tuberculosis officer as well as local medical officer of health, and is further supported by a combined nursing and clinic service built up on the same lines. The same remarks apply to the school medical service.

Briefly, it may be said that unification has brought about a more economical service, increased the efficiency, zeal, and interest of the medical officer, and reduced the number of officials who visit homes by establishing a central health officer. The scheme is now about to be established on a somewhat similar basis in six more sanitary districts with an acreage of 203,934.

In other parts of the county we have endeavoured to overcome the difficulties in regard to the record-keeping and following up of notifications of cases of tuberculosis by asking the local authority to appoint the county council's tuberculosis officer as assistant medical officer of health, but this was secured in only three instances.

I am more than ever satisfied, after twelve months' experience, that the combined scheme outlined above is a foundation on which can be built an efficient and co-ordinated health service in county districts.—I am, etc.,

W. A. HULLOUGH,
County Medical Officer.

Chelmsford, June 11th.

A NEW STUDY OF APHASIA.

SIR,—One or two passages in your important discussion of this subject, no less than one or two passages in the lectures referred to therein, are perhaps a little difficult to some of us.

It is not quite clear what is meant by the "materialism" of the schoolmen which is said to have been swept away by Descartes, or how it is that, as a result of the teaching of Descartes, no one "presumed to correlate directly the activities of the Mind with the life of the brain."

For, in the fifth part of the *Discours*, Descartes himself discusses:

"Quels changements se doivent faire dans le cerveau pour causer la veille, et le sommeil et les songes; comment la lumière, les sons, les odeurs, les goûts, la chaleur et toutes les autres qualités des objets extérieurs y peuvent imprimer diverses idées par l'entremise des sens; comment le faim, la soif et les autres passions intérieures y peuvent aussi envoyer les leurs. . . ."

Descartes goes on clearly to indicate how, on the side of cerebral outgoings, movements of the limbs are produced. Even when he pictures animals as differing from human beings in the absence of controlling and directing faculties, he does not hesitate to correlate human reason with the life of the brain, in the famous passage which, though usually quoted as locating the "soul" in the pineal gland, really anticipates what we now express when we correlate so much of our emotional life with states of the chromaffin system.

Again, the view of language attributed by you to Locke is really that of Descartes. For the latter, speaking of animals as automata, says:

"Jamais elles ne pourraient user de paroles ni d'autres signes en les composant comme nous faisons pour déclarer aux autres nos pensées."

Here is the idea of language as expressive of propositions; and the famous sentence which Talleyrand inverted to form his wicked but obvious epigram.—I am, etc.,

London, W., June 10th.

F. G. CROOKSHANK.

THE PREPARATION OF SCIENTIFIC PAPERS.

SIR,—As Sir James Barr is so gracious as to express, in repeated phrases, his gratitude for my "instructive criticism," I may well be content to leave a decision on any disputed points to the judgement of your readers. Sir James states a limited defence with, if I may say so, excellent temper, and he attempts some amusing though

irrelevant counter-strokes; where, even to his ingenuity, defence is frankly impossible, he, as a prudent controversialist, practises a judicious silence. Had he cultivated the "pool" which he commends to me he might perchance have avoided his blunder relative to the "tower." But here again he shows his disposition to preach rather than to practise. His imagination and good nature credit me with a resolve not expressed in my letter, but if he, too, "intends to get rid of all superfluities," our combined examples will surely not be in vain. It is here that his collection of "a variety of paper fasteners" gives me some concern; so formidable an apparatus suggests a provision for the development of a "verbosity" from which Sir James fondly believes himself at present to be free. He offers me a specimen "fastener," but I would much rather hear he had "scrapped the lot." His opportunity just now would seem to lie in "works" rather than in "words," for after his recent enterprise it is to be feared he will, at least for some time, be ineffective in the pulpit.—I am, etc.,

London, W.1, June 13th.

C. O. HAWTHORNE.

REFRACTION WORK IN CHILDREN.

SIR.—When I was a house-surgeon in an eye hospital I was taught that retinoscopy was an exact science, that there should be no obstacle in determining objectively the actual error of refraction in the eye, and that the difficulty in prescribing glasses lay in deciding which glass was most suitable to the individual needs of the patient. In solving this difficulty in children one relied more on objective than subjective findings, entirely so in the case of illiterates.

Dr. A. E. Larking states that he considers three cases an hour a good average, but continues to the effect that six or more could be done were subjective tests dispensed with. It follows that at least half the time employed over the three cases an hour would be spent on subjective examination. What additional information would these subjective tests yield to aid in arriving at the desired glass? As accommodation has been paralysed, the glass giving the best vision would almost invariably be that which gives full correction. The refractionist by his retinoscopy is already aware of the strength of this lens, so that beyond the vision obtained he has learned nothing fresh. This glass, while giving the best vision, is not necessarily the one to be prescribed.

Again, in the very common error of hypermetropia with or without astigmatism, how is the examiner to estimate the presence or amount of latent hypermetropia, the ciliary muscle being paralysed, without knowledge of the manifest hypermetropia obtained only by a subjective examination made before atropine has been used? Is it wiser to lend a patient ear to the lisping assistance of childhood than to rely upon one's own observations and judgement backed by rules proved by experience to be sound, such as full correction in concomitant strabismus, in low and moderate degrees of astigmatism, in low and moderate degrees of myopia, and the use of Mr. Bishop Harman's chart giving the average necessary correction deduced from the total hypermetropia obtained by retinoscopy?

I have no desire to depreciate the importance of subjective examination, but feel convinced that if one is inclined to give it that prominence which Dr. A. E. Larking appears to regard as its due, it would be more helpful if deferred until the action of atropine had passed off.

Mr. J. Parkinson Higham raises the question of sweated labour, I think pertinently. It would be interesting to learn how many hours at six refractions an hour—that is, how many refractions a day—were expected of Dr. A. E. Larking by the Education Committee he mentions.—I am, etc.,

Barra, N.B., June 2nd.

J. N. M. SUTHERLAND.

SIR.—The emphasis laid on speed in refraction work in children will, I am afraid, tempt many men, especially beginners, to spend less time on their cases. This would be a great misfortune.

A case, without astigmatism, takes but a few minutes, but a beginner will find it very difficult to determine that no astigmatism is present, and should spend time on the point. In severe astigmatic cases, any time up to, say, three-quarters of an hour (beginners more) can often be

spent with advantage. It is wonderful what a small change, say, in the axis of a cylinder, will sometimes effect. Until all such possible changes have been tried, the best possible has not been done. Subjective tests are of great value not only in adults, but in children, and, within the above time limits, it would be true to say that the longer the time spent the better the result, and that more time had better be spent than other than the best possible result obtained.

Any number of cases can be done in an hour. The number actually done will depend on the degree of accuracy attained, the skill of the surgeon, the cases waiting, and most particularly on the proportion of severe cases. In our central eye clinic weeks sometimes pass without a case free from astigmatism, and, after having done some 7,000 refractions, I find time well spent at about three cases an hour.

To illustrate the importance of the best possible, perhaps I may be pardoned for giving this instance: A youth was brought to me privately, wearing glasses prescribed, possibly in a hurry, by a public institution. He stated that he had just been dismissed from work owing to his defective sight. A full hour spent on the case—one of severe myopic astigmatism—resulted in new glasses giving a considerable improvement, and a letter to his employer in a conditional reinstatement. He now, a year later, reports that he has retained his post.

Accuracy spells efficiency, comfort, first cost of glasses least cost; and, as bad spelling is now known to be often due to uncertain memory pictures the result of defective sight, accuracy spells spelling.—I am, etc.,

RALPH HOPTON, M.D. Lond.,

Consultant to the Leeds Education Authority;
Eye Surgeon to the Blind School.

Leeds, June 5th.

THE PREVENTION OF PUERPERAL INFECTION.

SIR.—For many years I have read with interest various articles on puerperal sepsis. All the authors advise the use of gloves, yet I have nowhere seen stated how long they should be boiled. Upon the details of the process employed rests the success or otherwise of this method. Unless the most scrupulous care be taken the chances of failure are considerable. For nearly ten years I have never made an examination without using a sterilized glove. The method I adopt is as follows:

On entering the house I ask for a saucepan with lid, a clean pocket-handkerchief, and boiling water, and that the gas stove be started. The glove or gloves (it is better to sterilize two or more at the same time) are each rolled up in a handkerchief beginning at the fingers, first having had at least an ounce of boiling water poured inside to wet all the fingers. They are placed in the pan and boiling water is poured over them, sufficient to boil for fifteen minutes without being dried up. A 4 oz. ear syringe is filled with hot water and also put in the pan. The lid is placed on, and I wait until I am sure all is at boiling point and boil for fifteen minutes. It is necessary to tell the people on no account to interfere with the boiling process.

In the meantime I commence cleansing my hands, continue this for five minutes, then go and see the patient, then resume cleansing the hands, telling the attendant with clean hands to give the patient a good wash with soap and water. It is no use in an ordinary case to suggest shaving the parts. Even the cutting off of extra long hair is resented.

At the end of fifteen minutes the lid is removed and the whole sufficiently cooled with ordinary tap water. The folded handkerchief and the syringe are removed to a basin of 1 in 1,000 biniodido. The vulva is separated by pulling on the neighbouring skin and washed by a stream of antiseptic by means of the syringe. The glove is now unrolled in the solution and the wrist picked up (allowing plenty of solution to float inside) and drawn on the hand to be used. It is assumed that the glove has been made right or left as the case may be, at the beginning. The examination is now made, using no lubricant. It is sometimes a little difficult, but a gentle rotary motion of the hand will overcome this. At the conclusion of the examination the glove is taken off and not used again.

I consider that two things are of the utmost importance. The glove must be sterilized on the spot, and it must be rejected after the examination, and a fresh one used if further interference is necessary. Of course, when forceps

are used, all are boiled together, but even then I roll up the glove.

Unless practitioners are prepared to take similar care in the use of gloves, it will be, in my opinion, much better to trust to the hands.—I am, etc.,

June 3rd.

OPOPONAX.

SIR,—In the articles and letters on puerperal infection two points of interest have received insufficient attention. In the first place, how far is puerperal septicaemia due to the fact that a small proportion of patients have not the ordinary immunity to the risks of infection. The absence of this immunity rather than the presence of any special form of infection may be responsible for a large proportion of the cases of septicaemia. We have all seen cases in ordinary practice in which a simple superficial infection by a common organism (such as the *Staphylococcus aureus*), in the form of a small boil, has proved fatal owing to the want of power to acquire immunity. I do not recollect any report of an investigation of the discharge from the anterior vagina taken day by day for the first week after a normal confinement, but in appearance and odour such discharge suggests organism infection in many patients who show no evidence of toxæmia.

Secondly, have we considered the point of view of the patient herself? In most women a confinement is one of the outstanding incidents of her life and largely a subject of conversation with her friends; the medical attendant who can give her a good hope of freedom from severe pain during that time, without unusual risk, is gratefully thought of. Delivery under anaesthesia is generally indefinitely delayed without instrumental help. To what extent is it proved that septicaemia is increased by such methods? It is of some value to the State for a patient to say that a confinement is "not so bad after all," and that she will not fear to run a similar risk again, as against instances where a woman says that her experience of her first confinement was sufficient to make her prevent a similar occurrence for many years. We cannot ignore altogether the patient's point of view, and an explanation of the risk of sepsis is poor consolation to a woman in a long second stage of a first labour.—I am, etc.,

June 6th.

H. S.

SIR,—When bits of placenta, membranes, blood clots, or other dead animal matter remain in the uterus for a little time after parturition they will usually become infected with dangerous bacteria, and puerperal fever will be likely to result. One of the first points therefore in preventing puerperal infection is to prevent, as far as possible, the retention of putrefiable material in the uterus. I have seen a case where death resulted from a tiny and hardly visible shred of dead tissue adherent to the interior of the uterus, a small abscess resulting opposite it on the exterior surface of the uterus. This abscess opened by a pin-hole opening into the peritoneal cavity, and death resulted. The presence of such shreds cannot readily be suspected or avoided without precautions not often adopted and not to be recommended as routine measures. If, however, a patient suddenly develops rigors and the temperature begins to rise, there is not a moment to be lost. The interior of the uterus should, in my opinion, at once be thoroughly swabbed or scrubbed out with a strong undiluted antiseptic by means of cotton-wool wrapped firmly on a strong uterine probe or sound. I have known this treatment stop at the commencement what seemed certain to be a virulent puerperal fever. In a few hours it will often be too late. The infective material must be removed or rendered harmless before the infection has spread beyond control.—I am, etc.,

June 3rd.

M. A. O.

THE ORGANIZATION OF SCHOOL OPHTHALMIC WORK.

SIR,—Mr. Bishop Harman states that "at present infants under the age of 7 years attending school do not have their eyes examined." Doubtless this is true of many educational areas, but I should like to point out that in the schools administered by the School Board of Glasgow the children in the infant departments have been regularly examined by the visiting oculist since 1905.

The examination is by retinoscopy and is rapidly done with the aid of a skiascope, which I described in the *Ophthalmic Review*, July, 1905. The children are brought into the dark room by classes, and are entirely under the control of their teachers, one of whom attracts the attention of each individual child while under examination. The co-operation of the teachers is essential, but in an experience extending over many years I rarely failed to obtain this, and I think the main reasons were that (a) the results of the examination were often of practical interest to them, and (b) they themselves realized that only with their help could the examination be carried out in a reasonable time.

Mr. Harman indicates the desirability of a routine examination of the eyes of infants, and the object of my letter is to show that such an examination is not only practicable but is an established custom here in Glasgow.

Further, I should like to add that the subjective testing of the older children is done entirely by the teachers.—I am, etc.,

Glasgow, May 28th.

H. WRIGHT THOMSON.

SIR,—Until the organization of school ophthalmic work is put on a better footing there is not likely to be more men seeking qualifications for doing this special work. For the majority it would be throwing time and money away. I know a man who has given four years to work in one of the London ophthalmic hospitals, and as clinical assistant in the eye department of one of the large general hospitals, ultimately becoming the senior clinical assistant. Nearly two years since he was appointed by a county council to do this special work, but during that time he has been favoured with one case only; there have been some 600 in all (it is not possible to find out the exact number); these have been examined and the fees taken by the assistant school inspector and his partner. I make no charge of unfairness or greed, I only mention the fact which speaks for itself, and I shall be pleased to communicate with Mr. Harman if he wishes to verify the statement. But whilst human nature remains what it is, I quite agree with him when he says, "there are advantages in separating the work of school medical inspector from the treatment of children found to be defective." At any rate, this kind of thing should be made impossible in a liberal profession, and until it is, it is no use asking medical men to give up time to acquire this special knowledge.—I am, etc.,

May 31st.

PAX.

COCYGEAL FISTULAE.

SIR,—Mr. Lockhart-Mummery, in your issue of June 4th, expresses the opinion that all fistulae met with in the neighbourhood of the tip of the coccyx, which do not communicate with the rectum, are congenital in origin. This is scarcely correct, because I have notes of a case of coccygeal fistula which was the result of necrosis of the coccyx. Also there is a type of fistula, having no communication with the rectum, which is the result of suppuration of the presacral lymphatic glands. The abscess thus formed, being bounded behind by the sacrum, and in front by the fascia propria of the rectum, has no alternative but to find an exit through the skin between the anus and the tip of the coccyx. Sometimes there is a single opening on one side of the middle line, but often there is a second opening on the opposite side, the result being a vertical horseshoe fistula. There is no doubt, however, that fistulae of congenital origin occur in this locality, but they are extremely rare. Although such a fistula may not make its appearance until comparatively late in life, in all cases it has been preceded either by a tumour or by a post-anal dimple.

Bland-Sutton, to whom, as Mr. Lockhart Mummery says, we owe our knowledge of the origin of this type of fistula, writes thus in his work on *Tumours* (fourth edition, page 432):

"Post-rectal dermoids sometimes open spontaneously in the perineum; the fistula is usually situated in the middle line of the perineum near the tip of the coccyx."

Again, on page 436, he says:

"Faulty coalescence of the cutaneous covering of the back often occurs over the sacral vertebrae, and gives rise to small congenital sinuses known as post-anal dimples and coccygeal sinuses."

The congenital coccygeal fistula should not be confounded with the condition known as sinus over the sacrum and coccyx, which, though rare, is infinitely more commonly met with. Apparently Mr. Lockhart-Mummery fails to discriminate between these two totally distinct conditions, because he says that several years ago the late Mr. Goodall (evidently a misprint for Goodsall) described a number of cases of fistulae over the coccyx, which were difficult to heal, but did not recognize their nature.

Goodsall and I, in our book *Diseases of the Anus and Rectum* (Part I, p. 187), devote a chapter to a lesion which we term "sinus over the sacrum and coccyx," and give notes of ten typical cases. In this disease there is always a clear history of antecedent traumatism, leading ultimately to an abscess, which usually is allowed to burst spontaneously. The resulting aperture is nearly always situated to the left of the middle line, at or about the level of the upper extremity of the internatal cleft and a long way from the tip of the coccyx. The site of the external opening is well shown in Fig. 69 of our book. That these sinuses are not congenital in origin appears from the following reasons:

1. Their appearance is never preceded either by a tumour or by a dimple.
2. The opening is never in the middle line.
3. The primary opening is never near the tip of the coccyx.
4. The sinus is never lined by skin.
5. The opening is usually surrounded by exuberant granulation tissue, similar to that met with in sinuses connected with carious bone.
6. The aperture often temporarily becomes closed—an impossibility if it were of congenital origin, owing to the epithelial lining.
7. Neither hair nor teeth are ever found in them.
8. The sinus can be effectually cured by simply laying it open freely, together with its lateral offshoots, and it is never necessary to excise any tissue whatever.

The mere fact that a sinus in the anal region is found to be lined by epithelium does not necessarily mean that it is of congenital origin. It is not an uncommon experience to find that the track of an anal fistula, if it has been in existence for a considerable time, and especially if it is short and wide in calibre, has become lined by epithelium from the external to the internal openings. This is not to be wondered at, because we know that many sinuses in connexion with long-standing bone disease become so lined, as does also the canal made through the lobule of the ear for the reception of an earring.—I am, etc.

London, W., June 7th.

W. ERNEST MILES.

INTERMISSIONS IN TRYPANOSOMIASIS.

SIR,—I see from the report of the meeting of the Royal Society of Tropical Medicine and Hygiene, on May 20th, in the *BRITISH MEDICAL JOURNAL* for May 28th, that both Dr. Manson-Bahr and Dr. Low were of opinion that cases of trypanosomiasis could not be regarded as cured until a period of at least three years had elapsed since the last appearance of the parasite in the blood.

In support of this view I may mention that, when in medical charge of the sleeping sickness area of Nyasaland in 1913, one of my patients, a child of 7, showed numerous trypanosomes (*T. rhodesiense*) in the blood on first examination, but none on many subsequent occasions until about a year later, when the trypanosomes reappeared, the symptoms, which had been in abeyance, returned, and death followed shortly afterwards. Owing to the opposition of the parents the child received no treatment of any kind, but was kept in his own village and away from the fly-infested bush.

The occurrence, in untreated cases, of such long intervals during which no trypanosomes are found in the peripheral circulation and the symptoms are stationary or absent, makes one hesitate before accepting Dr. Marshall's cases as permanent cures until a longer period has passed without relapse.—I am, etc.,

Duff House, Baff, May 31st.

PHILIP CONRAN.

ENUCLEATION OF THE TONSILS.

SIR, In the *JOURNAL* of June 11th, under the heading of the Laryngological Summer Meeting, I am reported to hold the view that enucleation of the tonsils for enlargement is unjustifiable.

The published title of the paper which I was to read was not my own wording, and, as I was subsequently

informed, it gave rise to a general misunderstanding as to my views. My contention is that enucleation as the routine method for dealing with all tonsils which are enlarged is unjustifiable, especially as all enlarged tonsils are not diseased. I am of opinion that enucleation should be reserved for diseased tonsils or conditions which necessitate the removal of the tonsils, such as chronic peritonsillar abscess, etc. The scarring which frequently results from enucleation may seriously impair and even cause loss of a singing voice in an adult, and may prevent the formation of a singing voice when the operation is performed in childhood. The operation, moreover, is not unattended with danger from severe haemorrhage. There have been many deaths from this cause (I referred to a throat specialist who, up to a year or more ago, had lost four patients from haemorrhage), and not only is the frequency of its occurrence shown by the numerous instruments which have been devised recently to deal with this condition, but to the subject being considered of sufficient importance to call for a discussion at the forthcoming meeting of the British Medical Association at Newcastle.

London, W., June 13th.

T. MARK HOVELL.

THE NOTIFICATION FEE AND THE END OF THE WAR.

SIR,—When I see a case of infectious disease I promptly notify it by telephone (cost 6d.), in order to ensure speedy removal. Postal facilities in this village are somewhat mediocre. Then, *pro forma*, I send on the usual certificate (cost 1d.). Subsequently I receive 1s. for my trouble; net profit 5d. I am informed that I am doing this because we are still at war with Turkey. How much longer are we to remain at war with Turkey? And what has Turkey to do with it, anyhow?—I am, etc.,

H. W. POOLER, M.B.,

Honorary Secretary, Chesterfield Division.

Alfreton, June 13th.

Obituary.

JOHN MATTHEW FORTESCUE-BRICKDALE,

M.A., M.D. OXON., M.R.C.P. LOND.,

Physician, Bristol Royal Infirmary.

The death of Dr. Fortescue-Brickdale at the early age of 51 has deprived the profession in Bristol of a physician who combined a scientific knowledge of medicine with a wide knowledge of literature and a love of the arts, especially music. He was the younger son of the late Matthew Inglett Fortescue-Brickdale, conveyancing counsel to the Court of Chancery. Educated at Dulwich College, Christ Church, Oxford, and Guy's Hospital, he settled in Bristol in 1903. Soon after his arrival he was appointed assistant physician to the Royal Hospital for Women and Children. He also held the appointment of lecturer in pharmacology in the University of Oxford. In 1908 he was elected assistant physician to the Bristol Royal Infirmary and physician in 1919. At the time of his death he was physician to Clifton College and director of the University Public Health Laboratory.

During the war Dr. Fortescue-Brickdale served for two years in France, and contracted there a severe illness, from which he seemed never to have recovered completely. Upon his return from France he was given charge of a special centre at the 2nd Southern General Hospital, Southmead, for cases of chest wounds, on which he published a report in the *Quarterly Journal of Medicine* in 1918. His other publications included a book written in collaboration with Professor Francis, *The Chemical Basis of Pharmacology, A Practical Guide to the Newer Remedies, A Textbook for Nurses* (with Mr. Hey Groves), and *A Textbook of Pharmacology and Medical Treatment for Nurses*. His literary accomplishments made him a valued member of the editorial staff of the *Bristol Medico-Chirurgical Journal*.

Apart from his exceptional intellectual endowments, Fortescue-Brickdale was possessed of a singular personal charm. Grave of aspect, he had nevertheless a deep fund of humour, and could talk entertainingly on any topic. An old Oxford friend writes of him, "He was never one to reply monosyllabically to any remark; he had something of the touchstone in his composition; full of wit himself, he was as often the cause of wit in others." He took part

in many local activities, and for some years before his death had been churchwarden at All Saints Church, Clifton; for he belonged in religious thought to the school of George Herbert and Nicholas Ferrar. By family connexions he had long associations with Bristol, and his death is deeply deplored, not only by his medical confrères and by the masters and boys of Clifton College, but by a wide circle of friends who knew his sterling worth. He leaves a widow and two sons.

We regret to record the death of Dr. HUGH DAVIES-JONES, which took place at Mountain Ash on June 6th, 1921, at the age of 66. He was a native of Menai Bridge, Anglesey, and was educated at Edinburgh and Glasgow, and took the diplomas of L.R.C.P. and S.Edin. in 1880. After acting as assistant to the late Dr. Benjamin Williams of Mountain Ash he went to Llangollen, North Wales, where he practised for about seventeen years. He returned to Mountain Ash in 1903 on the death of his brother, the late Dr. Daniel Davies-Jones, and became surgeon to Messrs. Nixon's Collieries and the Powell Duffryn Colliery. He was a very active member of the British Medical Association. He had been Chairman of the North Glamorgan and Brecknock Division, was a member of the Executive Committee, and represented the Division on the Branch Council; he had recently been appointed to represent the South Wales Branch on the Welsh National Memorial Association. He was very faithful in his attendance at the Division meetings and its committees, and only four days before his death was present at a Division meeting held at the General Hospital, Merthyr. He devoted a good deal of time to ambulance work; he was a lecturer and examiner in the St. John Ambulance Association, and had held very successful classes; recently he received a handsome presentation from one of his classes. Apart from his profession he took an active interest in the welfare of his town, and he and his family gave material and financial assistance to all good causes; during the war, though 60 years of age, he joined the V.T.C. and was a very active member; afterwards he received a commission. He was a kind and genial gentleman, very sympathetic to his patients, and greatly liked by them. He was skilled in his profession, but of a retiring disposition, and did not carry either his heart or his knowledge on the surface. He leaves a widow, two sons, and four daughters to mourn his loss. His two sons are members of the medical profession, the elder having been with his father, while the younger, recently qualified, is a resident at the King Edward VII Hospital, Cardiff. The local profession has lost a staunch friend who will be greatly missed in many spheres.

DR. JOHN GOODWIN SHEA, who died suddenly on March 21st, was born in Dublin in 1856. He took the diploma of L.R.C.S.I. in 1880, and that of L.R.C.P.I. in 1882, and settled in Chesterfield in 1885; after acting for some years as assistant to the late Dr. Jefferies, he succeeded him in practice. Dr. Shea became F.R.C.S.I. in 1894, and graduated M.D. Durham in 1902. He was a J.P. of the borough of Chesterfield for many years, and on the honorary staff of the Chesterfield Royal Hospital. In June of last year he retired from active practice to Ewell, in Surrey. He was a past president of the Midland Branch of the British Medical Association.

The Services.

OFFICERS' ALTERNATIVE PENSIONS.

THE Ministry of Pensions announce that officers and nurses disabled by service in the great war who intend to claim alternative retired pay or pension, based on pre-war earnings and present earning capacity, must make application before July 2nd, 1921, or before a year has elapsed since the first award of disability retired pay or pension, whichever is the later date. Applications for alternative pensions by widows of officers whose deaths were due to service in the great war must also be made before July 2nd, 1921, or within a year of the date of first award of the flat-rate pension. A widow who may not be eligible at present owing to the receipt of allowances for children, but who may become eligible when these allowances cease, must make application before July 2nd, 1921, in order to establish her future claim. The provision relating to the time

limit is contained in the Royal Warrant of July 2nd, 1920, and was necessitated by the difficulty experienced in obtaining proof of pre-war earnings. Under the terms of the Royal Warrant a disabled officer is not eligible for alternative retired pay if his pre-war earnings did not exceed £132 a year, nor is a disabled nurse eligible for alternative pension if her pre-war earnings did not exceed £95 a year. In the case of officers' widows there is no fixed limit.

As the substitution of alternative retired pay or pension for the ordinary flat-rate pension represents in some cases a substantial addition to the amount of the pension, disabled officers and nurses, and officers' widows who have not yet made application, should ascertain without loss of time whether they are entitled to the benefits of the alternative system. Applications and inquiries should be addressed to the Officers' Branch, Ministry of Pensions, Cromwell House Annexe, Millbank, S.W. 1.

HONOURS.

THE following awards are announced for services rendered during the operations in Waziristan:

C.S.I.—Colonel Charles W. Profeit, C.M.G., D.S.O., A.M.S.
C.I.E.—Colonel Thomas Stodart, I.M.S., Lieut.-Colonel (acting Colonel) Corrie Hudson, I.M.S.

O.B.E. (Military Division).—Captain (acting Lieut.-Colonel) Alexander G. Biggam, R.A.M.C., temporary Captain Nitya Nand Joshi, I.M.S., Major Thomas C. C. Leslie, R.A.M.C., Major (acting Lieut.-Colonel) Herbert B. Scott, I.M.S., Major (acting Lieut.-Colonel) Francis B. Shettle, I.M.S., Captain and Brevet Major (temporary Major) John A. Sutton, V.C., I.M.S., Major George S. Wallace, R.A.M.C., Major (temporary Lieut.-Colonel) Norman M. Wilson, I.M.S.

To be Brevet Lieutenant-Colonel. Major T. S. Dudding, O.B.E., R.A.M.C.

Bar to M.C.—Captain William J. S. Ingram, M.C., I.M.S.

M.C.—Temporary Captain Banwari Lal Gupta, I.M.S., temporary Lieutenant Mangalore Gopal Kini, I.M.S., temporary Captain Kishan Ganesh Mobile, I.M.S., Captain (acting Major) D. Reynolds, R.A.M.C., temporary Captain Sarevanamathar Thambiah, I.M.S.

The following are also mentioned for distinguished service: Major acting Lieut.-Colonel John Anderson, I.M.S., Major Duncan Coutts, I.M.S., Captain Radha Krishna Dewan, I.M.S., T.C., Major Charles H. Fielding, I.M.S., Captain (acting Major) Richard E. Flowerdew, I.M.S., Captain Cecil C. Harrison, R.A.M.C.(S.R.), Captain (acting Lieut.-Colonel) John Patrick Hubao, I.M.S., Captain Enathial John Koshi, I.M.S., T.C., Captain (temporary Major) Henry H. Mullholland, R.A.M.C., Captain (acting Lieut.-Colonel) Denis F. Murphy, I.M.S., Lieutenant Altamahomed Tajmahomed Shaikh, I.M.S., T.C., Captain (acting Lieut.-Colonel) Charles H. Smith, O.B.E., I.M.S., Captain Ralph R. Thompson, M.C., R.A.M.C., Captain (acting Major) Jagannath Balkrishna Vaidya, I.M.S., Mrs. Alice Penel, M.B., B.S., of the Afghan Mission Hospital, Bannu, together with twenty-three members of the Indian Medical Department.

Universities and Colleges.

UNIVERSITY OF OXFORD.

Litchfield Lecturer in Medicine. Ernest Mallam, D.M. Magdalen College, has been appointed Litchfield Lecturer in Medicine for two years as from October 5th, 1921.

Examiner in Animal Physiology.—Leonard Hill, M.B., F.R.S., has been reappointed Examiner in Animal Physiology in the Final Honour School of Natural Science.

Election of Members of the Board of the Faculty of Medicine.—The following have been re-elected members of the Board of the Faculty of Medicine: E. W. Ainley Walker, D.Sc., D.M., Fellow of University College, J. H. Thursfield, D.M., Trinity College and St. Bartholomew's Hospital, Claude G. Douglas, B.Sc., D.M., Fellow of St. John's College.

The following have been approved at the examination indicated:

D.P.H.—Part I: H. L. Conlthard, E. ff. Creed, S.-cl-D. A. E. Daab, A. Hunter, J. B. Kirk, N. B. Lushington, E. Newton, S. G. Overton, A. J. Partridge, E. G. Rawlinson, W. G. Southey, C. J. Todd, M. P. Wilson. Part II, and received the Diploma: H. L. Conlthard, T. J. Lloyd, G. W. Ronaldson, C. W. Sharpley.

William Brown, D.M., D.Sc. (Christchurch), Reader in Psychology in the University of London (King's College), has been elected Wilde Reader in Mental Philosophy.

UNIVERSITY OF CAMBRIDGE.

DR. HAMPTON HARTRIDGE, Fellow of King's College, has been reappointed Senior Demonstrator in Physiology.

At a congregation held on June 10th the following medical degrees were conferred:

M.D.—A. C. Roxburgh.
M.B., B.Ch.—J. C. Andrews, R. A. W. Procter, M. B. R. Swann, J. W. McK. Nicholl, F. R. Hobbs.
B.Ch.—A. J. Copland.

The Registry calls the attention of the tutors and praefectors of colleges and of the deans of medical schools to the report of the Special Board for Medicine of May 4th, 1921 (Report, page 9-5), recommending important alterations in the terms for the sending in of the names of candidates, and for the presenting of certificates for the Third Examination for Medical and Surgical Degree. All medical students should be instructed to substitute the words *thirty just* for *ten* or *thirty-one* for *ten*, and *thirty-one days* for *three weeks*, on pages 11, 17, 35, 36 of the Regulations and Schedules for Medical and Surgical Degrees. The additional fee for late entry is £2.

UNIVERSITY OF LONDON.

DR. E. G. GRAHAM LITTLE has been elected by the Graduates of Medicine and Surgery of the University of London to serve his fifth term of office as their representative on the Senate.

The following have been recognized as teachers of the University in the subjects and at the institutions indicated:

London (Royal Free Hospital) School of Medicine for Women: Mrs. Anne L. Gilliat (Anaesthetics).

St. Mary's Hospital Medical School: Mr. C. W. G. Bryan (Surgery). Mr. A. Fleming (Bacteriology).

Dr. Jobson Horne has been appointed Semon Lecturer. The lecture, entitled "The relationship of the larynx to pulmonary tuberculosis," will be delivered at the rooms of the Royal Society of Medicine on July 5th at 5 p.m.

The duration of the appointments of Professor A. D. Waller, F.R.S., and Dr. T. D. Lister, C.B.E., as director and treasurer respectively of the Physiological Laboratory has been extended to the end of 1921. Dr. John Fawcett has been appointed a governor of the Lister Institute of Preventive Medicine, and Dr. A. Thomas a governor of University College, Aberystwith.

The following have been appointed staff examiners in the subjects of examination for medical degrees 1921-22:

Anatomy: Professor G. Elliot Smith, F.R.S., and Dr. W. L. H. Duckworth. *Bacteriology:* Professor R. T. Hewlett. *Chemistry:* Dr. H. R. Le Sueur and Professor W. H. Lewis. *Forensic Medicine and Hygiene:* Drs. R. A. Lyster and W. G. Savage. *General Biology: A. Eastwood, B.Sc., and Miss P. C. Esdaile. Medicine:* Drs. J. Calvert, C.B.E., J. Fawcett, R. T. Williams, and C. R. Box. *Mental Diseases and Psychology:* Drs. R. H. Cole and W. H. B. Stoddart. *Obstetric Medicine:* Dr. Comyns Berkeley, Professor T. Wilson, Dr. J. S. Fairbairn, and Dr. T. G. Stevens. *Oto-Rhino-Laryngology:* Sir W. Milligan and Dr. Herbert Tilley. *Pathology:* Dr. C. Bolton, C.B.E., F.R.S., and Professor H. R. Dean. *Pharmacology:* Professor F. Ransom and Professor G. A. Gunn. *Physics:* A. Wood, M.A., and Professor S. Russ. *Physiology:* Professor J. S. Macdonald, F.R.S., and Professor M. S. Pembrey. *State Medicine:* Drs. W. G. Savage and A. G. R. Foulerton, O.B.E. *Surgery:* J. Sherren, C.B.E., C. H. Fagge, E. W. Hey Groves, and Professor G. E. Gask, C.M.G., D.S.O. *Tropical Medicine:* Dr. G. C. Low.

Mr. H. J. Waring, C.B.E., has been elected chairman of the Brown Animal Sanatory Institution Committee for the remainder of the year 1920-21. The annual report of the superintendent of the institution stated that during the year 6,040 animals, including 2,823 dogs, 2,660 cats, and 221 horses were treated there. The five lectures required to be given under the will of the late Mr. Brown were delivered by the superintendent during December at the Royal College of Surgeons, the subject chosen being influenza. The superintendent had continued in the laboratories his work on influenza for the Medical Research Council, and some interesting results are to be published shortly. He had also carried on researches on leprosy, and on the ultra-microscopic virus group in addition to examining a number of pathological specimens from the hospital. Mr. Twort's appointment as superintendent of the institution has been continued for one year as from June 1st, 1921.

Applications for the post of professor of medicine and director of the medical clinic at St. Mary's Hospital School, salary £2,000 a year, must be received by the Academic Registrar, University of London, not later than the first post on June 23rd.

The following candidates have been approved at the examination indicated:

DIPLOMA IN PSYCHOLOGICAL MEDICINE (with special knowledge of Psychiatry).—C. Farrar-Ridge, W. Moodie, A. A. W. Petrie.

UNIVERSITY OF MANCHESTER.

THE following appointments have been made: *Demonstrators in Pathology:* P. I. C. Gibson, M.B., B.S., and A. Haworth, M.Sc., M.R., Ch.B. *Demonstrators in Anatomy:* Georgina May Duthie, M.B., Ch.B., and R. C. Shaw, M.R.C.S.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

New Fellows.

At a meeting of the Council of the Royal College of Surgeons, held on June 9th, with Sir Anthony Bowlby, K.C.B., President, in the chair, diplomas of Fellow were conferred upon the following twenty-five candidates (including one woman) who have passed the requisite examinations and have complied with the by-laws—namely:

K. B. Bellwood, E. C. Fowden, G. N. Brandon, G. W. Carte, H. Corsi, R. Coyte, S. G. Dunn, J. A. W. Elden, Satapriya Ghosh, J. B. Payeraft, S. N. Hayes, O. S. Hillman, J. B. Hunter, C. M. Jones, O. R. M. Kelly, T. P. Kilber, C. Lamrinudi, H. M. Livingston, R. P. S. Mason, R. L. Newell, H. C. W. Nuttall, K. G. Pandalai, R. H. O. B. Robinson, F. W. Watkyn-Thomas, H. W. Wookey.

Mr. James Sherren and Mr. L. Bathie Rawling were elected members of the Board of Examiners in the vacancies occasioned by the retirement of two previous members of the Board.

The following were elected as examiners in anatomy and physiology for the Fellowship for the ensuing year:

Anatomy: A. R. Thompson, J. E. S. Frazer, G. Gordon-Taylor, W. F. Haslam. *Physiology:* H. Willoughby Lyle, F. A. Bainbridge, A. Rendle Short, J. Mellanby.

The following recommendations for examiners in other subjects were adopted by the Council:

Elementary Biology: T. W. Shore, J. P. Hill. *Anatomy:* F. G. Parsons, David Hepburn, Arthur Thomson. *Physiology:* G. A. Buckmaster, H. E. Roaf. *Midwifery:* G. F. Darwall Smith,

Cuthbert Lockyer, G. Drummond Robinson, C. Inbert Roberts, *Diploma in Public Health:* Sir F. W. Andrews, F. N. K. Menzies, *Diploma in Tropical Medicine and Hygiene:* H. B. G. Newham (*Bacteriology*); G. C. Low (*Diseases and Hygiene of Tropics*). *Diploma in Ophthalmic Medicine and Surgery:* J. H. Parsons, H. W. Lyle, E. Treacher Collins. *Diploma in Psychological Medicine:* Sir Frederick Mott.

The following professors and lecturers were appointed for the ensuing collegiate year:

Hunterian Professors.—Sir Arthur Keith: Six lectures on "The comparative osteology of human races," illustrated by collections in the Museum. Harold Burrows, C.B.E.: Two lectures on "The results and treatment of gunshot wounds of the blood vessels." Alfred G. T. Fisher: One lecture on "The pathology of chronic arthritis, with remarks on the basal principles of treatment of joint disease as indicated by anatomical and physiological observations." Charles A. Pannett: One lecture on "Hydronephrosis." Alan H. Todd: One lecture on "Orthopaedic aspects of rheumatoid arthritis." Kenneth M. Walker: One lecture on "Enlargement of the prostate."

Arris and Gale Lecturers.—V. Zachary Cope: One lecture on "The nerve supply of the parietal peritoneum and superperitoneal tissues." F. W. Edrige-Green, C.B.E.: One lecture on "New researches in colour vision." Swale Vincent: One lecture on "A critical examination of current views on internal secretion."

Erasmus Wilson Lecturer.—S. G. Shattock: Six demonstrations or pathological specimens in the Museum.

Arnott Demonstrator.—Sir Arthur Keith: Six demonstrations or the contents of the Museum.

Thomas Vicary Lecturer.—Sir Charles A. Pallance: Historical lecture.

A vote of congratulation was accorded to Sir Arthur Keith on the honour of knighthood conferred on him.

It was resolved that the examinations for the primary Fellowship should be held in June and December in 1922 and until further notice.

ROYAL FACULTY OF PHYSICIANS AND SURGEONS,
GLASGOW.

At the monthly meeting of the Royal Faculty of Physicians and Surgeons of Glasgow held on June 6th, the following were admitted (after examination) as Fellows: J. H. Fyfe, A. M. Laurie, T. T. Read, J. D. Wright.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND.

At the monthly business meeting of the President and Fellows held on June 3rd the Most Rev. and Right Hon. John H. Bernard, D.D., Provost of Trinity College, Dublin, was unanimously elected an Honorary Fellow of the College.

The following candidates, having passed the Membership Examination, were duly admitted Members of the College: L. Abrahamson, J. W. Bigger, C. Dickson, J. D. Sandes.

Medical News.

DR. MILES HARRIS PHILLIPS, surgeon to the Jessop Hospital for Women, Sheffield, has been appointed Professor of Obstetrics and Gynaecology in the University of Sheffield.

DR. E. F. HOARE, of the Middle Temple, and Dr. E. G. ANNIS, of Lincoln's Inn, have been called to the Bar.

A VACATION course of post-graduate instruction has been arranged at the Post-Graduate College, West London Hospital, Hammersmith, W., commencing on August 2nd and ending on August 27th. Further particulars can be obtained on application to the Secretary of the College.

DR. W. M. PALMER, of Linton, author of a number of works on the antiquities of Cambridgeshire, has been elected a Fellow of the Society of Antiquaries of London.

THE Council of the Royal Society of Medicine has awarded a Gibson Research Scholarship to Miss Gertrude M. A. Herzfeld, M.B., Ch.B., F.R.C.S. (Edin.), of Edinburgh. The scholarship will be held for two years, with a possibility of renewal for a third year.

WE are asked to state that Dr. Rollier has arranged to give a short post-graduate course of demonstrations on heliotherapy, at Leysin, from August 16th to August 20th.

THE new offices of the General Nursing Council for England and Wales at 12, York Gate, at the corner of Marylebone Road, were opened by Princess Christian on June 10th. The Council was called into existence by the Nurses' Registration Act, 1919, primarily to form and keep a register of nurses for the sick, in accordance with the provisions of the Act. It consists of two persons appointed by the Privy Council, two by the Board of Education, and five by the Ministry of Health, together with sixteen nurses selected by, among others, the Central Committee for the State Registration of Nurses, the College of Nursing, and the Royal British Nurses Association. Of the five members nominated by the Ministry of Health, two—Sir T. Jenner Verrall, LL.D., and Dr. E. W. Goodall, O.B.E.—were appointed at the suggestion of the British Medical Association.

THE fiftieth inter-hospital athletic sports will be held at Queen's Club, Barons Court, S.W., on Tuesday, June 28th, commencing at 2.30 p.m. The prizes will be presented by Viscountess Goschen. Further particulars can be obtained from Mr. L. G. Housden, Honorary Secretary U.H.A.C., Guy's Hospital, S.E.

DR. JAMES GRANT, who has practised at Rhynie, Aberdeenshire, for thirty-three years, has been presented by his patients and friends with an illuminated address and a cheque for £300, in appreciation of his valuable services to the community.

THE Ministry of Health has, at the request of the Metropolitan Water Board, issued a circular to metropolitan borough councils and sanitary authorities within the area of the Board inviting them to restrict the use of water for the watering of streets and the flushing of sewers. The shortage of the metropolitan supply of water is attributed to the prolonged drought.

A COURSE of twelve practical demonstrations on the management and feeding of infants and young children is being given on Tuesdays and Thursdays at the St. Marylebone General Dispensary, 77, Welbeck Street, W., by Dr. Eric Pritchard. Arrangements have been made to visit the Nursing Training School, 1, Wellgarth Road, Golders Green, N.W., to see the methods employed there in dealing with infants. The fee for the course, which commenced on June 14th, is £22s.

THE annual post-graduate class in oto-rhino-laryngology will be held in Professor Moure's clinic at Bordeaux from July 18th to July 30th.

THE Department of Medical Zoology in the School of Hygiene and Public Health, Johns Hopkins University, has arranged to send an expedition to Porto Rico this summer to study malaria and other problems arising out of disease-producing protozoa.

THE second International Congress for the Protection of Childhood will take place at Brussels from July 18th to 21st. The subscription for members is 25 francs, for associate members 10 francs. The organizing secretary is M. H. Velge, 27, rue de Turin, Brussels.

AT the last meeting of the Central Midwives Board for England and Wales, Sir Francis Champneys in the chair, it was reported that copies of the Central Midwives Board (Terms of Office) Order, 1921, had been forwarded from the Ministry of Health, the Order giving effect to the representation made by the Board on January 20th, 1921, that each of the members who, according to the Central Midwives Board (Constitution) Order, 1920, were to be appointed for a term of three years, should be appointed instead annually. It was announced that the Home Office had informed the Midwives Institute that, by virtue of the Regulations to be issued under the Dangerous Drugs Act, 1920, certified midwives who had notified their intention to practise would be authorized, under appropriate conditions, to purchase and be in possession of medicinal opium for use in the practice of midwifery.

THE German Congress of Internal Medicine will be held at Wiesbaden in 1922 under the presidency of Professor Wenckebach. The subsequent congress will be held in Vienna.

AN international congress of ophthalmology will be held at Washington from April 18th to 22nd, 1922, under the auspices of the American Ophthalmological Society, the Ophthalmological Section of the American Medical Association, and the Academy of Ophthalmology and Oto-rhino-laryngology.

THE twenty-sixth Dutch Congress of Public Health will be held in September at Arnhem, when the following subjects will be discussed: (1) Notification of infectious diseases; reporters, Kuiper (Amsterdam) and Kapsenberg (Groningen). (2) Destruction of vermin; reporters, Ringeling and Wolf (Amsterdam).

THE first stone of a Rockefeller tuberculosis dispensary has been laid at Bordeaux to commemorate the 284 American nurses who died during the war.

THE Municipal Council of Paris has decided to increase the fee payable to medical men summoned by the police to 20 francs.

AT a recent meeting of German scientists measures were agreed on as to the preservation of the most important features of scientific research under present social conditions. It was decided that subsidies should be secured for the 400 most important of the (roughly) 3,000 scientific journals published in German. To meet the lack of foreign publications a single large levy was voted to provide German readers with the most important foreign journals. Expedients were also found to combat the

shortage of research apparatus, drugs, experimental animals, and the like by centralizing the machinery for their purchase and distribution.

THE late Mr. Rutherford J. Pye-Smith, F.R.C.S., Emeritus Professor of Surgery in the University of Sheffield, has left estate of the gross value of £7,595, of which £3,603 is net personalty. He left the residue of his estate to his wife for life, and subject to her interest bequeathed £1,000 to the University of Sheffield for the chair in surgery, £100 to the Sheffield Royal Hospital, and £50 each to the Broompark Mission, Sheffield, the Edinburgh Medical Mission, and the Pye-Smith Scholarship Fund, Walthamstow Hall, Sevenoaks.

AT a meeting of the Society of Public Analysts on June 1st a paper on the composition of so-called egg powders was read by Beach, Needs, and Russell, comparing them with ordinary baking powders. A table of compositions was given, and it was suggested that a standard might be laid down for a minimum percentage of actual egg in such preparations.

DR. FRANCIS J. STUBBS has retired from the post of Medical Officer of Health to the Borough of Camberwell, after thirty years' service.

THE International Labour Bureau at Geneva has published figures showing that eleven nations (not including Russia, Turkey, Bulgaria, and Australia) have had 5,500,000 men disabled in the war. Of this number France has 1,500,000; Germany, 1,400,000; Great Britain, 1,170,000; Italy, 570,000; the United States, 200,000; Czechoslovakia, 175,000; Canada, 88,000; Rumania, 84,000; and Belgium, 40,000. Reports sent by the different Governments show that only a few of the disabled men now remain in military hospitals, and that the majority of the severely wounded who have been properly trained and provided with suitable appliances are capable of earning their livelihood, but there is difficulty in finding occupation for them all.

THE American Hospital Association will hold its annual conference at West Baden, Indiana, from September 12th to 17th.

A HOSPITAL ship to contain 500 patients is being built at Philadelphia.

Letters, Notes, and Answers.

As, owing to printing difficulties, the JOURNAL must be sent to press earlier than hitherto, it is essential that communications intended for the current issue should be received by the first post on Tuesday, and lengthy documents on Monday.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the BRITISH MEDICAL JOURNAL alone unless the contrary be stated.

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—of course not necessarily for publication.

AUTHORS desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Office, 429, Strand, W.C.2, on receipt of proof.

IN order to avoid delay, it is particularly requested that ALL letters on the editorial business of the JOURNAL be addressed to the Editor at the Office of the JOURNAL.

THE postal address of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is 429, Strand, London, W.C.2. The telegraphic addresses are:

1. EDITOR of the BRITISH MEDICAL JOURNAL, *Aitiology*, Westrand, London; telephone, 2630, Gerard.

2. FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate*, Westrand, London; telephone, 2630, Gerard.

3. MEDICAL SECRETARY, *Medisera*, Westrand, London; telephone, 763, Gerard. The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (Telegrams, London); Dublin; telephone, 4737, Dublin; and of the Scottish Office, 6, Rutland Square, Edinburgh (Telegrams, *Associate Edinburgh*; telephone, 4301, Central).

QUERIES AND ANSWERS.

DR. J. MOSELEY: I find in a mixed or mixed staphylococci abscesses has been seen in infantile eczema, which, when continuing at the time of eruption, may last for months.

T. M.: A few general medical officers of health to an urban district council from the clerk to the council the Sanitary Officers (London) Order, dated December 13th, 1919, Article 10 of which defines the duties of a medical officer of health. Textbooks he will find useful are *Higgins and Public Health*, by Whitelegge and Newman, published by Cassell and Co.; *Hygiene*, by Notter and Firth, published by Longmans and Co.; and *Sanitary Law and Practice*, by Robertson and Porter, published by the Sanitary Publishing Company, Ltd.

"OXYURIS VERMICULARIS."

DR. K. R. COLLIS HALLOWES (Peebles) writes in reply to "Worried": (a) Take care to prevent reinfection by prohibiting articles of diet that may be infected. (b) Internal administration of sulphur in increasing doses. (c) Wash round anus at bedtime, thoroughly dry, and apply a weak mercurial ointment.

"H. D. J." writes: If "Worried" tries aloes wine, about half an ounce, taken early in the morning on an empty stomach once or twice a week, he will find that *Oxyuris vermicularis* is destroyed; also the purgative mineral waters, as "Rubinat" or "Apenta," taken three times a week, will be beneficial. For many years I suffered from the same complaint and cured myself with the above treatment. Reinfection plays an important part and great personal cleanliness is necessary, specially washing the hands and fingers after going to the w.c. The use of lettuce, as in salads, and watercress should be avoided; my experience is that they are a fruitful source of entozoa.

INCOME TAX.

"A. M." and a friend have bought a practice for £2,000, which is to be discharged by the handing over of the first two years' receipts from panel practice.

* "A. M." and his colleague are in partnership and are therefore assessable in one sum—less, of course, the personal allowances applicable to each. The panel receipts will have to be regarded as (gross) income of the firm; the fact that they are paid away in discharge of the capital liability to the outgoing practitioner does not affect their taxability.

"M. G." inquires whether he can claim the average of three years in connexion with the assessment of his fixed salary as full-time public health officer. In the first two of the three years he was in the army.

* Legally the salary is assessable on the basis of the current year and cannot be averaged with previous earnings. We believe that concessions were made in some cases where the three years' average did apply—for example, that a locum-tenent might average his military earnings, though they were dissimilar in nature; but we have not heard of any concession that would cover our correspondent's case.

"A. K." asks for further information with regard to the allowances for interest paid to a bank.

* The primary claim is that repayment is due on that portion of the taxed income which goes in payment of the overdraft interest; there is sometimes a secondary claim—namely, that the income as reduced by the payment is sufficiently low to permit of some allowances being claimed from which the claimant would otherwise have been barred. For instance, if the total income for 1919-20 were £1,050, of which £100 was paid away as bank interest, then the claimant would be entitled (a) to repayment on £100 and (b) to an adjustment in view of the fact that his net income was below £1,000, and he was therefore entitled to pay on that amount at a lower rate than before. We understand from the correspondence that for 1919-20 "A. K." had repayment under both heads, but that for 1920-21 the secondary claim does not arise, seeing that the rate of tax payable on his net income is not affected by the reduction caused by payment of the bank interest.

LETTERS, NOTES, ETC.

NEED FOR POST-GRADUATE INSTRUCTION IN MOUTH SEPSIS.

DR. M. ASTON KEY (Southsea) writes: I confess to a considerable degree of sympathy with your dental correspondent, "A. B. C." (June 4th, p. 842), in his endeavour to secure adequate opportunities for dealing with the treatment of oral sepsis in a post-graduate course.

In the practice of general medicine every week brings us some fresh evidence of the varied results, early or late, arising from this trouble. We who are in the first attacking line know the value of close co-operation with the dental surgeon, not merely to the extent of sending our patients to him, but in discussing with him both the clinical symptoms which we attribute to the sepsis, and also the mode by which he intends to attack it from his standpoint.

The interpretation of skiagrams, the use of high-pressure sprays, of vaccines, and of the many other lesser methods of treatment are all subjects which well repay conferences between physician and dental surgeon; as much and more may be said of wholesale extractions and the period of time over which they are distributed. It is right that we should know the treatments other than extraction which are at the disposal of our dental brethren; if for no other reason, it is useful in dealing with cases in which extraction is difficult or undesirable. As Dr. Pye-Smith used to say, "Commonest things occur most often," and we see the evil results of oral sepsis many times daily. One cannot but feel that such a subject deserves thorough handling in any post-graduate course.

"M.R.C.S." writes to express the opinion that after the paper by Sir W. H. Willcox on infective arthritis (June 4th, p. 804), in which the writer laid stress on the fact that the commonest cause of infection was to be found in connexion with the teeth sockets, and Dr. William Hunter's paper on "The coming of age of oral sepsis" (June 11th, p. 859), there ought to be little need for "A. B. C." to ask whether any post-graduate course can be considered to be complete without some practical instruction in this disease, with its far-reaching effects. "M.R.C.S." is very glad to see there is a prospect of the dean of the medical school to which "A. B. C." is attached arranging for a demonstration.

TOXINS AND NERVE CENTRES.

MR. H. V. DREW, F.R.C.S. (London, W.), writes: In 1913 I was privileged to observe the experimental work then being conducted by Dr. Teale at University College Hospital laboratories, by which he demonstrated that antitetanus toxin would prevent tetanus in animals if given before tetanus inoculation, but had no effect afterwards, and saw this illustrated during the war, when the subjects of tetanus were being, so to speak, "flooded" with tetanus antitoxin, those cases only recovering, as was observed by Hippocrates, which were not acute or chronic. Dr. Teale also demonstrated the reason—namely, that the antitoxin only reached the spinal cord through the nerves themselves and not through the general circulation, the same as in tetanus poisoning. This he clearly showed by coloured injections, which were easily traceable. My object in referring to the above experiments is again to emphasize the necessity of recognizing the bed-rock principle that all diseases are controlled by the vital centres in the medulla, until these are put out of action by the toxin of the special disease of which the patient is suffering—by the direct influence it exerts on those centres by its toxin attacking through the intraspinal fluid, in which they are bathed, and through which only can they be reached. In 1916 I was greatly impressed by the marked resemblance in certain cases between acute pneumonia and cerebro-spinal meningitis and the immediate relief to both afforded by tapping the theca, and the possible differential diagnosis effected by the examination of the cerebro-spinal fluid. Ever since, on reflection, I am more and more convinced that as the vital centres in the medulla control all the vital processes in health, so they are the first affected in disease, and that it is only by attacking the poisonous toxin through the spinal fluid, and by prevention of direct injury to these vital centres, by tapping, pending the results of some form of antitoxin treatment, through the spinal fluid, that success can be attained.

Since you last published a letter from me on this subject, I am glad to see that on these lines sleeping sickness has been successfully attacked, and I only wonder how many thousands of lives have been unnecessarily sacrificed in other diseases since you first published my contribution on this subject in 1917—and several notes since.

"THE BUFF BOOK."

WE have received communications from Dr. W. B. Norcott (Wallington, Surrey) and Dr. Charles Wheen (London, W.), stating that their names have been inserted in the "Buff Book" without their knowledge or consent.

A CATCH.

A CORRESPONDENT invites our opinion upon the following extract from a description of the test match in the *Times*:

"It was a powerful stroke, and Mr. Hendry, after stopping the ball high above his head, finally got control of it as he lay prone on his back."

The anatomist to whom we have referred the matter suggests that the last four words are a misprint for "supine on his face."

VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 31, 32, 33, 36, 37, and 33 of our advertisement columns, and advertisements as to partnerships, assistantships, and locum tenencies at pages 34, 35, and 36.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

	£	s.	d.
Six lines and under	0	9	0
Each additional line... ..	0	1	6
Whole single column (three columns to page)	7	10	0
Half single column	3	15	0
Half page	10	0	0
Whole page	20	0	0

An average line contains six words.

All remittances by Post Office Orders must be made payable to the British Medical Association at the General Post Office, London. No responsibility will be accepted for any such remittance not so safeguarded.

Advertisements should be delivered, addressed to the Manager, 429, Strand, London, not later than the first post on Tuesday morning preceding publication, and, if not paid for at the time, should be accompanied by a reference.

NOTE.—It is against the rules of the Post Office to receive *postae restantae* letters addressed either in initials or numbers.

INTRINSIC CANCER OF THE LARYNX:

USUAL SITE OF ORIGIN, AS DEMONSTRATED AT 50 LARYNGO-FISSURES, AND ITS INFLUENCE ON DIAGNOSIS, PROGNOSIS, AND TREATMENT.*

BY

SIR STCLAIR THOMSON,

PROFESSOR OF LARYNGOLOGY AND SURGEON FOR DISEASES OF THE THROAT, KING'S COLLEGE HOSPITAL, LONDON.

It has been well said by McBride that in investigations on cancer of the larynx, the "pearl of great price is early diagnosis, for upon this depends the curability of the fell disease."¹ I think it is evident that many of the failures which overtook early efforts at cure by laryngo-fissure were due to delayed diagnosis. Just as early diagnosis and improved technique have advanced, so has this operation progressed until it has succeeded in securing more lasting cures than can be claimed for cancer in any other internal region of the body. Earlier diagnosis has also led to a steady diminution of the number of cases for which complete laryngectomy is the only possibility.

Last year I gave the results of an investigation into impaired mobility of a cord as an indication in diagnosis and prognosis in intrinsic cancer of the larynx, showing that it was neither a necessary nor a frequent symptom, that it was only met with in a minority of cases, and that, though it was a valuable symptom when present, other signs must be relied on for an early diagnosis.²

This summer I submit a research on another point which has not been settled and has threatened to mislead us. I refer to the current view that malignant disease of the endolarynx is most commonly met with in the posterior third of the glottis.

Historical.

Fortunately, in our speciality, and in this country, we need not go very far back to discover a source of error. If we turn to Morell Mackenzie's *Textbook*, published in 1880, we can detect one source and, at the same time, appreciate the progress made in the study of laryngeal cancer in forty years. On page 338 he begins his description by saying that "pain, dyspnoea and dysphagia are generally present," symptoms which, nowadays, we can only regard as indicative of a late and generally inoperable stage of the disease. It is true that he says, later on, that hoarseness may be a very early symptom, and sometimes precedes all other symptoms by months or even years; but the much greater prominence he gives to haemorrhage, fetor and cachexia would only mislead a present-day student. It is evident that he knew little of intrinsic cancer as we see and know it, possibly because forty years ago patients did not present themselves early for a persistent hoarseness, and even at the present day we know that medical men may fail to recognize the danger of delay in getting an expert opinion on a case of "mere huskiness." Mackenzie also misled a generation by stating (p. 336) that "the site of the tumour is in most cases one of the ventricular bands"; he even gives a table of 53 cases in which the cords only appear as the site of origin in 7 cases, and he points out that in 28 cases (or 56.7 per cent.) one of the ventricular bands was the first part affected.

By 1899 progress in diagnosis had been made, as shown by Lennox Browne's greater appreciation of the difference between extrinsic and intrinsic cancer, and his recognition of the fact that in the latter type "hoarseness is the earliest symptom of the disease and may have existed a very long time before advice will have been sought."³ But he also is mistaken when he writes that "enlarged experience convinces me that this form of cancer frequently commences in the ventricle." This teaching, in these two leading textbooks, was retarding progress.

Recent Views.

There can be little doubt that, as claimed by McBride,⁴ it was Semon who altered this view by showing from his experience that the intrinsic form of laryngeal cancer was more common than the extrinsic, and that the cords were "by far the most frequently affected parts." Semon recorded this as early as 1896⁵; it has been

confirmed by Schmiegelow, Chevalier Jackson and myself, and, doubtless, it is now admitted by all laryngologists. It was a great step forward. But, coming next to the consideration of which part of the cord is most frequently the site of origin, we see that Semon's independent observation was dimmed by the teaching of Virchow. He writes as follows: "Virchow has taught us that benign growths, if occurring on the vocal cords, have a tendency to localize themselves on their front parts, and very frequently on the anterior commissure of the vocal cords. If, on the other hand, you find a papillomatous-looking growth on the posterior parts of a vocal cord, particularly if the patient be well advanced in years, that is primarily suspicious, and still more so if such a growth be seated in the interarytenoid fold where benign growths practically never occur."

McBride, in summarizing Semon's teaching on this subject, gives as the first point of most importance, a "tumour which may be very minute, and, while it may be found in any part of the cord, is most commonly situated on the posterior third." I must confess that, like others, I accepted this teaching, and also McBride's statement, that Semon's observations "still remain the last important word which has been said on the diagnosis of early laryngeal cancer."⁶

Material and Methods.

The results of my own observations, which are now considerably larger than Semon's, will, I feel sure, demonstrate to your satisfaction that intrinsic cancer does not show a preference for the posterior part of the vocal cord, and that the interarytenoid region must be rarely affected—for I have never seen a case.

My conclusions are founded on 50 cases, in which the diagnosis was based not only on the appearances reflected in the laryngeal mirror, but also on the direct inspection of the disease when the larynx was opened by a laryngo-fissure. In addition, confirmation was sought in every instance by microscopic examination of the growth; the pathologist confirmed the clinical diagnosis in every case. I have never opened the larynx for epithelioma and found it to be anything else than cancer, although I have twice thought, at first, from clinical inspection that the disease was tuberculosis, but later on altered my diagnosis in time to secure a successful laryngo-fissure.

It will indicate the greater precision we are now able to arrive at in diagnosis if I recall that Grimwald, in 1907, recorded that out of 93 radical operations undertaken for the cure of what was supposed to be laryngeal cancer, the diagnosis turned out to have been mistaken in no less than 17—that is, in nearly 20 per cent. Jobson Horne, about the same date, formed the opinion that tuberculous disease was not infrequently mistaken for epithelioma, as he had learned from the examination of tissues sent him after removal by the mouth, by laryngo-fissure, or even with the entire larynx.⁷

Statistics.

These 50 cases have been tabulated according to the invasion by the neoplasm of (a) the anterior third of the cord only, (b) the middle third only, (c) the posterior third only; or combined invasion of (d) the anterior and middle thirds, (e) the middle and posterior thirds; or (f) the whole cord. I have also the numbers of the cases where (g) the anterior commissure or (h) the posterior commissure was attacked, and, finally, the statistics as regards (i) the subglottic area.

The results, so far as figures can express them, are as follows:

TABLE A.—Intrinsic Cancer.

Site of invasion in 50 cases.		
(a) Anterior third only of cord	...	3 cases
(b) Middle third only of cord	...	7 "
(c) Posterior third only of cord	...	0 "
(d) Anterior and middle thirds of cord	...	16 "
(e) Middle and posterior thirds of cord	...	3 "
(f) Whole cord	...	21 "
		50

TABLE B.—Intrinsic Cancer.

Extension in 50 cases to—		
(g) Anterior commissure	...	6 cases
(h) Posterior commissure (that is, the interarytenoid region)	...	0 "
(i) Subglottic region	...	13 "

* A paper read before the Summer Congress of the Section of Laryngology, Royal Society of Medicine, London, June 2nd, 1921.

Putting it, as regards the cords, in another way, I find that the portion of cord invaded by the cancerous growth is as follows:

TABLE C.—*Intrinsic Cancer.*
Third of cord invaded in 50 cases.

Anterior third in	39 cases
Middle third in	47 "
Posterior third in	24 "

In no single case was the growth at operation found to grow from any other area surrounding the glottis except the vocal cords and subglottic region.

Subglottic Cancer.

To have found the growth in the subglottic area in 13 out of 50 cases may come as a surprise. I was not prepared to find it, or, at least, to have found it so extensive, in several cases. Neither direct nor indirect laryngoscopy will always reveal it, but we may be prepared to meet it when the mobility of the cord is interfered with, and particularly when that mobility is impaired out of proportion to the visible extent of the lesion. Another discovery has been that a subglottic growth is more common in the anterior than in the posterior segment of the larynx. The subglottic invasion was found in one case where the anterior third only of the cord was affected; in 6 cases where only the anterior and middle thirds were attacked; and in 6 cases where the whole cord was invaded. But even in these last 6 cases, I hasten to say, the subglottic part of the growth was much more marked anteriorly, and, in some, was limited to the anterior half of the subglottic area. Indeed, as will be presently shown by illustrations, the cancer, in certain cases, undoubtedly originated below the anterior half of the cord, which it only invaded slowly and after it had made, relatively speaking, considerable progress before causing any symptoms. Want of tension in one cord was, in some cases, the first and only sign. Immobility of the cord is much more common in the subglottic cases; thus, in the 13 cases, the cord was fixed in no less than 6—that is, in nearly half the cases. Whereas, in the remaining 37 cases impaired mobility was only noted in 11—that is, in about 30 per cent. of them.

Author's View.

We now see that these 50 cases—controlled by indirect laryngoscopy, by direct inspection at a laryngo-fissure and by histological examination—yield a conclusion which is in direct opposition to that of Virchow and Semon. In other words, intrinsic cancer of the larynx is much more apt to take its origin in the centre or anterior portion of the vocal cord, or in the anterior half of the subglottic area, than in the posterior third of the larynx.

Pathology.

It is interesting to note that this conclusion appears to me to confirm the previsions which Jobson Horne based on his histological and pathological investigations of the larynx. In 1898, and again in 1907, he pointed out that tuberculosis attacks, by preference, that area of the larynx which is covered with columnar epithelium and is richest in glandular structure; whereas epithelioma shows a preference for that part of the larynx which is clad with squamous epithelium and is relatively free from glands. The posterior half of the larynx supplies the former conditions; the anterior half, which I have just shown to be the favourite site of intrinsic cancer, is lined with pavement epithelium, and is almost void of glands.⁹

As regards prognosis in reference to the site of an intrinsic cancer, it need hardly be pointed out that growths found on the upper surface of the cord, and those of a projecting or even semi-pedunculated character, are the most favourable. The more limited the growth the better is the prospect of completely removing it with a good margin of healthy tissue all round—that is in front and behind, above and below the cord, and also in the depth away from the glottis and toward the thyroid ala. These conditions are most likely to be met with in a growth of the middle of the cord, or of the anterior two-thirds; fortunately, as a reference to my statistics will show, these are the most usual sites.

If the anterior commissure is invaded the prognosis is not quite so good, though complete extirpation can still be effected, although with some sacrifice of the anterior part

of the opposite cord. As the growth approaches the arytenoid region the prognosis becomes less promising, and if the arytenoid itself is undoubtedly invaded it is probable that a hemi-laryngectomy or complete laryngectomy is the more promising operation.

When an epithelioma originates on the inner—that is, the glottic—surface of the cord the prognosis becomes less favourable, partly because there is lymphatic tissue in this area into which the cancer cells spread more rapidly than they do into the elastic tissue of the cord itself, and partly because the growth is already fairly extensive before it has appeared on the surface of the cord in sufficient amount to cause noticeable hoarseness and to be recognized clinically. Doubtless it is for these same two reasons that subglottic cancer is even more unpromising, and also because, as it dips down inside the crico-thyroid membrane, it is less circumscribed than when it lies entirely within the limiting barrier of the thyroid ala. In two cases I had to divide the cricoid cartilage to get below the downward extension of a subglottic epithelioma.

This darker prognosis with subglottic growths is confirmed by a reference to my 13 such cases: 7, or more than 50 per cent. of them, have died of recurrence. It is also striking to note that of these 13 cases the mobility of the cord was impaired or abolished in no less than 6, and that 4 out of the 6 are amongst the recurrences. This confirms the conclusion I enunciated in my paper of a year ago—namely, that impaired mobility of a cord is an unfavourable symptom.¹⁰

Treatment.

As the naked eye is not sufficiently trustworthy as a judge of the extent of an infiltrating growth, the entire cord should always be removed. Thus in one of my cases (No. 25) the pathologist reported that "the growth appears to be in the anterior part of the cord and to have burrowed backwards in the tissues beneath the surface epithelium, which is still intact over a considerable area of the growth." (The patient remains free from recurrence at the age of 77, five years after operation.) In a subglottic case (No. 24) the report of the pathologist was: "Specimen presented a deeply ulcerated new growth in subglottic region, immediately beneath the left vocal cord. A typical epithelioma. Though the growth arises beneath the cord, and the actual mucous membrane of the cord is still intact, the growth has invaded the substance of the cord beneath the mucosa." (The patient died of recurrence.)

CONCLUSIONS.

As Regards Usual Site of Origin.

1. Intrinsic cancer of the larynx originates on the vocal cords or in the subglottic area.
2. It has never been found in the posterior commissure (interarytenoid region), nor originating from the ventricular bands or the ventricle of Morgagni in 50 cases carefully examined both indirectly with the mirror and by direct inspection after splitting the larynx.
3. A malignant growth may originate on any part of a cord, but is more common in the central portion or anterior half than in the posterior area of the larynx.
4. As is now well known, an epithelioma originating in this region remains for a long time limited to the cord affected and the adjoining side of the larynx, but it may cross the anterior commissure, and, in later stages, it invades the arytenoid and the area to the outer side of it.
5. The inner surface of the cord may be affected primarily or by extension. The subglottic area may be invaded by a growth originating in a cord. But a cancer may also start below the level of the cords, in the subglottic area.
6. A subglottic cancer is much more common in the anterior than in the posterior half of the larynx.

As Regards Prognosis.

1. The superficial or projecting tumours of limited extent are the most favourable.
2. Those situated in the middle third or anterior half of the cord are more promising than those invading the anterior commissure in front or the arytenoid region behind.
3. Growths embedded in a cord, or extending into it below an intact mucosa are not so favourable.
4. An epithelioma extending along the inner margin of a cord is still less favourable.

5. Subglottic cancers are very unpromising as regards lasting cure by laryngo-fissure. They are frequently associated with impaired mobility or complete fixation of a cord.

As Regards Operation.

1. In every case, however limited the growth, the entire vocal cord should be excised from the anterior commissure up to and including the vocal process of the arytenoid.

2. The growth, with as wide a margin as possible of apparently healthy tissue all round it, should be removed in one mass; the excision should therefore go down to the lower edge of the subglottic area; above, it should pass through the healthy ventricular band; and externally it must include the perichondrium lining the thyroid ala.

3. To facilitate this the thyroid ala should be removed so that a laryngo-fissure is really a partial hemilaryngectomy.

HAEMATURIA AS SEEN BY THE SURGEON.

BY

ANDREW FULLERTON, C.B., C.M.G., F.R.C.S.I.,

SRGEON, ROYAL VICTORIA HOSPITAL, BELFAST, AND BELFAST HOSPITAL FOR SICK CHILDREN.

THERE are certain general rules laid down by clinicians to enable the practitioner to make a shrewd guess as to the cause and origin of haematuria in a given case. These rules are useful, but, as I shall show, they cannot always be relied upon for accurate diagnosis.

The cystoscope, combined in many cases with radiography, is indispensable for the examination of cases of haematuria from kidney, ureter, bladder, or prostate, and the urethroscope for doubtful cases of urethral haemorrhage. Indiscriminate enthusiasm, however, must be deprecated. A cystoscope or a urethroscope is not to be used in every patient who complains of urinary symptoms. The cystoscope may prove to be a dangerous weapon in certain cases of tubercle, malignant disease, enlarged prostate, sepsis, and incipient or established uraemia. It is well to proceed as far as possible along the ordinary lines towards diagnosis. The cystoscope or urethroscope may then be used to complete the examination.

General Considerations.

When blood is intimately mixed with the urine it is probable that the source of the haemorrhage is the kidney. This rule is not absolute. All we can say with certainty is that the blood is shed in small or moderate quantity, allowing intimate mixture with the urine before clotting has had time to take place. The cystoscope in a renal case may show a red efflux, the smoky or dark colour of the voided specimen being due to the change of oxyhaemoglobin into methaemoglobin by admixture with the acid urine. The following cases exemplify the difficulties of diagnosis:

A male, aged 56, presented himself with haematuria. The specimen passed was dark in colour. The only other symptom was frequency of micturition. Cystoscopy showed a malignant ulcer on the base of the bladder.

A man, aged 74, complained of difficulty and frequency of micturition, especially at night. The stream was small and the urine dark red; no clots were present. Instead of the expected enlarged prostate the cystoscope showed renal haematuria from the left side.

A clergyman, aged 56, stated that after a chill in 1919 he passed blood intimately mixed with the urine. He passed no clots, had no pain nor any dysuria. He had intervals of freedom with clear urine; later, tiny clots began to appear. The symptoms suggested haematuria of renal origin. Cystoscopy showed a papilloma on the right lateral wall of the bladder.

I could multiply cases to show the fallacy of depending for a diagnosis upon the character of the urine alone.

The presence of frequency of micturition is strongly suggestive that the site of the haematuria is the bladder or prostate; but the second case just mentioned, in which the haemorrhage came from the left kidney, shows how little dependence can be placed on this symptom. Frequency and bleeding in an old man will at once suggest enlarged prostate. The bleeding, as in the case just mentioned, may be from the kidney, or it may be from an unsuspected tumour, as in the case of a man, aged 70, who had symptoms of enlarged prostate. About a month before I saw him he had haematuria with clots and complete retention. Operation discovered not only an enlarged prostate but a papilloma as well. The haematuria was due to the papilloma and his other symptoms to the enlarged prostate.

If frequency of micturition and haematuria are combined with pain in the glans penis, scalding, and urgency, and if, in addition, pus and mucus are present, the diagnosis of cystitis is justified, but malignant growths and calculus must be excluded by direct observation.

Pain in the lumbar region, whether or not it culminates in renal colic, suggests an affection of the renal region of that side, but our expectations were belied in the case of a man, aged 49 years, who had haematuria with left lumbar pain. The cystoscope showed blood issuing from the right ureteral orifice.

If the haematuria is initial—that is, at the beginning of micturition—it comes, probably, from the prostatic urethra, or possibly from the anterior urethra. Blood issuing from the urethra, independently of micturition, comes from a source distal to the compressor urethrae. A small quantity may lie in the urethra and form a cast of the canal, which is swept out by the next act of micturition. Haematuria with massive clotting is often of bladder origin. During the late war, however, one of the most formidable complications of gunshot wounds of the kidney was secondary haemorrhage,¹ and in some of the cases blood was poured out in such quantity that the bladder was distended by large clots difficult to evacuate. In civil injuries of the kidney produced by crushes or strains, clots may form in the bladder. Again, in tumours of the kidney large clots may be passed, as in the case of a man aged 53, who complained that he passed numerous blood clots, about the thickness of the little finger. Cystoscopy showed blood issuing from the right ureteral orifice. Operation revealed a hypernephroma of the right kidney.

The size and shape of the clots may be of assistance in diagnosis. A long cast of the ureter is sometimes passed. Its length and thickness indicate its origin. More frequently shorter lengths are passed. Casts formed in the urethra are thicker and often show constrictions corresponding to those normally present in this canal.

Microscopical examination of the urine, especially if it can be carried out in the intervals between the attacks of bleeding, may be helpful. Mention need only be made of the presence of renal casts, cells from the bladder, ureter, or kidney, portions of tumour, pus cells, crystals, microorganisms, etc.

In the accompanying table I have grouped my cases according to the region affected; under each heading they are arranged in order of frequency. This has many disadvantages, but is convenient for my present purpose.

CASES OF HAEMATURIA.

Kidney.	Cases.
Tubercle of kidney (generally involving bladder secondarily)	100
Symptomless renal haematuria	47
Renal calculus	44
Pyelitis (including pyelitis and cystitis combined)	32
Renal tumours (including cysts)	21
Nephritis	19
Injury to kidney (excluding war injuries)	7
Renal colic (cause?)	5
Hydronephrosis	4
Pyonephrosis	4
Movable kidney	3
Horseshoe kidney	2
Oxaluria	2
Henoch's purpura	1
Accessory renal artery	1
<i>Ureter.</i>	
Ureteral calculus	9
Injury to ureter (excluding war injuries)	1

AFFECTIONS OF THE KIDNEY.

Tubercle of the Kidney.

Tuberculosis of the urinary tract is very common in the North of Ireland. Nearly 10 per cent. of all cases cystoscoped by me had urinary tuberculosis, and in 75 per cent. of these haematuria was present. In the overwhelming majority the primary focus, as far as the urinary tract was concerned, was the kidney. In my experience tuberculosis of the bladder, arising secondarily to deposits in the epididymis and testicle, is comparatively rare. If the ureteral catheter is used in all cases of tuberculosis of the epididymis the surgeon will be surprised to find how often the kidney is affected. I have seen tuberculosis of the epididymis make its appearance three months after the removal of a tuberculous kidney on the same side, and I have under my care at present a patient from whom I removed a tuberculous kidney, who has tuberculosis of the epididymis on both sides. While in France I saw, with Major Santos of the Portuguese army, a case in which the right kidney and ureter, the bladder, the prostate, the seminal vesicles and the urethra, including the meatus externus, were all infected with tubercle. Primary tuberculosis of the bladder, if it occurs at all, is so rare that such a diagnosis should not be made except after the most careful examination of all parts of the urinary tract.

The character of the haematuria in most cases of tuberculosis of the urinary tract resembles that found in bad cases of cystitis. The blood comes from the most part from ulcers on the bladder wall. Severe haematuria from the kidney is not, in my experience, frequent, but in the following case the blood was probably of renal origin:

A man, aged 27, first noticed blood ten years ago; it was not accompanied by any other symptoms and lasted for a week. He remained well for five years, when blood again appeared, accompanied this time by pain in the right lumbar region. Three years later he noticed a lump about the size of a pea behind the left testicle. Two years ago irritability of the bladder made its appearance. In January, 1920, I removed a tuberculous right kidney. The left epididymis was at this time hard and nodular, and the vas thickened. Both epididymides are now affected and there is a discharging sinus on both sides. This case has already been referred to.

Symptomless Renal Haematuria.

I have seen 47 cases of renal haematuria in which it was the only symptom of disease except for some renal colic in a few, due, no doubt, to the passage of small clots down the ureter. Some of these cases of symptomless renal haematuria have already perhaps proved, or may in the future declare themselves to be tumours, stones, tubercle, or other demonstrable affection of the kidney, but many will doubtless remain under the heading of what is known as renal epistaxis, renal haemophilia, essential renal haematuria, or symptomless renal haematuria. The haemorrhage in these cases is more or less severe, more or less persistent, and is seen to issue from one ureter. There are intervals of freedom in which the urine shows no departure from the normal. The patient may be otherwise in fair or even good condition, and the haematuria may persist for years without any serious impairment of the health. The bleeding is unilateral. No gross changes in the kidney can be found to account for it. Various hypotheses have been advanced to explain its occurrence. It

has been attributed to passive congestion, circumscribed or diffuse fibrous changes, disturbances of the vasomotor and sensory nerves, multiple microscopic calculi of the papillae, chronic papillitis, a varicose condition of the vessels of the papillae, adhesions, microbial infections, nephritis, etc. The following case will exemplify the difficulties of diagnosis:

A gentleman, aged 42, noticed, about ten days before I saw him, that his urine was bloodstained. There was no pain, except, perhaps, a slight uneasiness in the left side. The urine was dark in colour, and there were no clots, no pus, and no sugar. Both kidneys were easily palpable. Blood was seen to issue from the left ureter. The specimen obtained from the right side was normal in all respects. Shortly after this tubercle bacilli were found in the sputum, and the patient was sent to a sanatorium for some months. He remained free from bleeding for some years. In the summer of 1919 haematuria again appeared, and he passed occasional small clots. No enlargement of either kidney was found. The urine was free from tubercle bacilli, and casts were absent. X-ray examination was negative. The bleeding stopped, and he remained clear for nearly a year. It recurred in July, 1920, and continued till October. I then injected 10 c.cm. of 5 per cent. solution of nitrate of silver into the pelvis of the affected kidney, some of which immediately escaped into the bladder. The bleeding increased for a few days and then ceased. He remained well for a month, when another recurrence took place. The complication of tubercle bacilli in the sputum raised suspicions of tuberculosis of the kidney, but no sign of this has developed during the seven years I have had him under observation.

The following case is one of the most interesting I have seen:

A sailor, aged 30, two months after a fall on his right side on board ship, noticed that his urine was smoky. Professor Rovsing of Copenhagen found blood issuing from the right ureter. X-ray examination was negative. The right kidney was explored and nothing but adhesions to surrounding parts was found. The bleeding continued for three weeks and then cleared up for a few days to recur again for a week. Again it cleared up for three or four weeks and once again it recurred. On my examination the blood was seen to come from the left side. The specimen obtained from the side operated on by Professor Rovsing was absolutely normal. Three years later I again cystoscoped this patient, who had been bleeding off and on since my first examination. The blood was now coming from the right side.

Renal Calculus.

In 44 cases of renal calculus, out of 61 examined, the presence of blood was noted. The two cardinal signs of renal calculus are renal colic and haematuria, one or other or both of which may be entirely absent. Vomiting is also frequently present. In these days radiography will detect the smallest calculus, but in my earlier work, especially in the country, I had to depend on other methods for diagnosis. A history of renal colic with or without blood, the presence of pus, the presence of albumin, and a unilateral diuresis with a diminution of the specific gravity of the urine on the affected side afforded strong presumptive evidence upon which I often operated for stone. I should now be loath to operate without an X-ray examination. The symptoms of renal calculus are sometimes closely simulated by tuberculosis of the kidney, new growths, hydronephrosis, pyonephrosis, the presence of an accessory renal artery, hydatid cysts, and what I can only describe as ureteral spasm. I have often caused typical renal colic of a temporary character by the use of the ureteral catheter, and I have at least on one occasion relieved a patient by the mere passage of the same.

Pyelitis.

The essential feature of pyelitis is the presence of pus in the urine on one or both sides. The most usual cause is the *Bacillus coli communis*, but I have seen staphylococci, streptococci, and other organisms. Though severe haemorrhage may occur, the amount of blood present in my cases has been, as a rule, small, and not a dominant feature in the clinical picture. In acute cases the temperature is raised, and it is unwise to carry out any instrumental examination. After such an examination the temperature is likely to shoot up, and rigors may occur. Every case of pyelitis should be X-rayed. I have seen a patient treated by vaccines for months for persistent pyuria due to a stone in the pelvis of the kidney.

Renal Tumours and Cysts.

Under this heading there were 21 cases, including the following: Hypernephroma, by far the most numerous; malignant adenoma, sarcoma, malignant growths of the

abdomen involving the kidney by continuity, a case of hydatid cyst which I saw in France, congenital cystic kidney, a rare form of cystic kidney removed from a child aged 2 years, and one or two cases judged to be inoperable. In the space at my disposal I can only deal in a general way with this group. In the case of hydatid cysts and the cystic kidney removed from the child aged 2 years, the bleeding, though noticeable, was neither persistent nor serious. In a case of congenital cystic kidney the bleeding was so profuse as to threaten the life of the patient; as is well known, this type of tumour is nearly always bilateral, and it is therefore useless to remove one kidney.

In a case of sarcoma of the kidney the patient, a female child aged 3 years and 3 months, had severe haematuria, and screamed with pain on passing water, no doubt owing to the clots present in the bladder. Cystoscopy confirmed the diagnosis of haemorrhage from a tumour of the left kidney. A few days later I removed a sarcomatous kidney by the trans-peritoneal route. The patient died four months later from recurrence.

A man, aged 53, gave a history of having passed a stone after "terrible" renal colic. Twelve years later he presented himself with an indistinct swelling in the side previously affected with renal colic. In the previous illness he had had haematuria of slight degree. The urine was free from blood when I saw him for the swelling in the loin. I expected to find a stone in the pelvis of the kidney from the history, and also from the cystoscopic examination, which showed a diminished specific gravity in the specimen from the affected side. Operation revealed a malignant adenoma of the kidney.

In several of the cases of hypernephroma the bleeding was considerable and clots were passed. Some of them suffered from renal colic, and others had no other symptom but painless haematuria, at any rate in the early stages.

In cases of tumour of the kidney the earliest symptom may be a type of painless haematuria exactly similar to that described as "essential renal haematuria." I am not sure that every case of renal haematuria of doubtful origin should not be explored to avoid missing an early case of malignant disease. Many unnecessary operations would doubtless be performed, but some cases of tumour would be diagnosed in time to admit of successful removal with less chance of recurrence. The appearance of a tumour in the side shows that the disease is in an advanced stage. Radiography and pyelography may show earlier some alteration in the size or contour of the kidney, or in the pelvic shadow, and ought always to be resorted to in a doubtful case.

Nephritis.

I have examined 19 of these cases suffering from haematuria. In all, some other sign or symptom was present, such as casts in the urine, albumin when the bleeding was for the moment absent, cardio-vascular changes, albuminuric retinitis, oedema of the face and extremities, or some other indication of acute or chronic nephritis. These cases belong to the domain of the physician rather than that of the surgeon. Their chief feature, from a cystoscopic point of view, is the presence of blood on both sides. In 11 of my series this was the case. One of them was a case of trench nephritis, in another with severe renal colic and unilateral haematuria the late Dr. McQuitty made the diagnosis from the discovery of albuminuric retinitis. Some of these cases have cleared up completely.

Injury to the Kidney.

Besides the 56 cases of gunshot wounds of the kidney, fully reported elsewhere,¹ I have seen in civil practice 7 cases sufficiently mild to admit of cystoscopic examination. A comparatively slight strain is sometimes sufficient to injure the kidney and give rise to considerable haematuria. I have seen this occur in a patient who slipped on a plank and apparently bruised his kidney in the effort to right himself. With more severe injuries the presence of a perirenal haematoma, as in gunshot wounds of the kidney, is an outstanding feature and a help in diagnosis.

A young man, aged 18, was seen with Dr. Mann, of Dunnington. He fell across a drain, his shoulders resting on one bank and his feet on the other, so as to produce lateral flexion of the body, with the concavity to the right side. That the kidney on this side was injured was evident from haematuria with clots, a perirenal haematoma and pain. Cystoscopy showed blood issuing from the right ureteral orifice. Recovery without operation took place. In this case the kidney was probably crushed between the ribs and the ilium on the concave side.

It is important to know when to intervene in cases of renal injury. It is almost certainly fatal to operate on a bled patient. Blood transfusion, followed by immediate operation, saved lives during the late war.

Renal Colic without Obvious Cause.

In the 5 cases of this nature that I have seen the colic strongly suggested stone, but radiography failed to show any abnormal shadow. It may be, as Casper suggests, that spasm of the ureter occurs comparable to that of the oesophagus in hysterical people. In such cases the passage of the ureteral catheter might be tried, as in the case already mentioned.

Hydronephrosis.

Haematuria is not a cardinal sign of hydronephrosis, though it may be present. The chief signs and symptoms of this condition are pain, sometimes developing into renal colic with vomiting, and a tumour in the lumbar region which varies in size or even disappears altogether at times. The urine obtained from the affected side is of low specific gravity compared with that of the sound side. At times no fluid can be obtained owing to the block causing the hydronephrosis. In one case inspissated blood was seen by the cystoscope to be squeezed out from the ureter of the affected side like ointment from a tube. Bleeding had evidently taken place at some time into the sac of the distended kidney. By injecting opaque solutions like thorium nitrate or collargol into the pelvis of the kidney, and taking an X-ray photograph, the shape and the size of the pelvis of the kidney and its branches may be determined. If the cavity is large the opaque fluid may be so diluted that no definite shadow is seen.

Pyonephrosis.

The allied condition of pyonephrosis, of which I have had 4 cases giving a history of haematuria, is often diagnosed by the profuse discharge of pus which takes place at intervals from the distended kidney into the bladder.

In a case seen recently the urine had been clear and pronounced normal by our pathological department at the Royal Victoria Hospital. On cystoscopic examination I could detect no change in the ureter of the affected side, but on passing a ureteral catheter some way up clouds of pus were discharged by the side of the catheter into the bladder. The patient had suffered from severe attacks of renal colic. In the calyces of the distended kidney on removal a mixture of inspissated pus and blood was seen, and the colic may have been due to portions of this being passed along the ureter from time to time.

Movable Kidney.

It is well known that during Dietl's crises haematuria may occur, but I have only had 5 cases of movable kidney with haematuria sent to me for cystoscopic examination. In the first case, although the kidney was movable, pain was slight or absent. The specific gravity of the urine on the affected side was 1015, as against 1020 on the sound side. Blood was present in the jets from the affected side. Nephropexy cured the haematuria. In the second case the specific gravity was again lower on the affected side. The patient suffered from Dietl's crises. The late Dr. Hicks found the kidney surrounded by peritoneum which formed a mesentery for it. In the third case crises were present and there was considerable haematuria.

Horseshoe Kidney.

In 2 cases an exploration showed a horseshoe kidney. In the first there was a connecting band across the middle line between the lower poles of the kidneys. In the second case, which was under the care of Mr. Mitchell, I have no further note than that a horseshoe kidney was found. The symptoms in these cases resembled those of movable kidney, and were due, no doubt, to malposition of the organ with kinking of ureter or vessels.

Oxaluria.

Haematuria due to oxaluria is usually dealt with by the physician, but I have cystoscoped 2 cases in which the symptoms were attributed to the presence of numerous crystals of calcium oxalate in the urine. In one of these severe renal colic was complained of, but no stone was found on operation.

Henoch's Purpura.

I have cystoscoped one case of this affection. In addition to haematuria there were ecchymotic spots on the body, arms and legs, particularly about the joints. Haematemesis was present and moderate pyrexia. On cystoscopy blood-stained fluid was seen issuing from both ureters. The urine contained blood casts and granular casts.

Accessory Renal Artery.

I have published two cases of hydronephrosis due to this condition.³ In these no blood was found in the urine. I have, however, seen one other case in which haematuria was present, due, apparently, to the presence of an abnormal artery passing across the ureter to the lower pole of the kidney, "bow-stringing" the ureter, as Mr. Fenwick says, near its junction with the pelvis of the kidney.

AFFECTIONS OF THE URETER.

Ureteral Calculus.

In nine cases haematuria was due to ureteral calculus, which at the time of examination was arrested or actually impacted in the ureter. The symptoms resemble those of renal or vesical calculi, and are diagnosed by *x* ray with the opaque ureteral catheter in position. Stereoscopic radiograms should be taken, as shadows crossed by that of the opaque catheter may be in a different plane and altogether outside the region of the ureter. I adopt the method I suggested in France for locating foreign bodies in the neighbourhood of the kidney and ureter.⁴

Injury to Ureter.

In civil practice I have seen one case of injury to the ureter; it was caused by a fracture of the pelvis. I have published details of four cases seen during the war and caused by gunshot wounds. The haematuria is not, as a rule, serious. The most important diagnostic sign is urinary fistula in gunshot wounds and extravasation in the line of the ureter in civil wounds. I have used collargol injections with *x* ray to localize the lesions and assist in the diagnosis of these cases. The method has already been published in detail.¹

AFFECTIONS OF THE BLADDER.

Cystitis.

Haematuria was found in 113 cases of cystitis. In all it was moderate, and was often only discovered on microscopic examination. When visible it was generally of the terminal type, occurring at the end of micturition in the form of a few drops of blood with the last drops of urine. In some cases, and especially in those known as haemorrhagic cystitis, blood was mixed with the main part of the urine, although more pronounced in the last portion. During the war we became familiar with the haemorrhagic type of cystitis, with ecchymoses scattered over the mucous membrane.¹ In several of these cases streptococci were found. In ordinary circumstances, however, the most frequent organism was the *Bacillus coli communis*. Less frequent were staphylococci, *B. proteus*, gonococci, etc. In many cases, however, no bacteriological examination was made. I am not able to state definitely that in all of these cases the kidneys were free from infection. Cystitis is often due to a descending infection from the kidney. I have investigated a number of cases of cystitis which did not clear up with the ordinary methods of treatment, and in 17 pyelitis was present. These are included under the heading of pyelitis.

Tumours of the Bladder.

Some of the most severe cases of haematuria met with were due to tumours of the bladder. I have notes of 72 cases, and in most of them the haemorrhage is described as severe and associated with the formation of massive clots in the bladder. In some cases, however, the haemorrhage was trifling—at any rate, in the earlier stages.

A man, aged 38, complained of frequency of micturition and pain at the point of the penis. A little blood was passed on straining, and occasionally the act of micturition was suddenly arrested. These symptoms were strongly suggestive of stone. On passing the cystoscope, a pint of residual urine was drawn off. A small papilloma was seen to hang down over the vesical orifice of the urethra, suspended by a long pedicle. This acted as a ball valve, obstructing the flow of urine, and explained the patient's symptoms. The tumour was removed by suprapubic cystotomy.

A man, aged 54, noticed blood in his urine and slight pain in the left groin. He had some frequency of micturition during the day, but was not disturbed at night. There was also some pain at the point of the penis. The urine contained blood, but no pus. The cystoscope showed two small papillomata on the base of the bladder. These were removed by the high frequency current.

In other cases the bleeding was much more profuse, with much clotting, and in many there were multiple papillomata, extending all over the bladder. In the malignant cases sloughing of the free surface of the tumour and cystitis are more apt to occur, and the symptoms are correspondingly more severe.

The following case is so remarkable that I cannot refrain from mentioning it:

A woman, aged 51, had had the left breast removed for cancer about a year and a half before the present illness. She complained of blood in the urine; it was intimately mixed with the urine. There was a little frequency but no pain in the bladder region. There was some pain in the back, extending down the left leg. Cystoscopy showed at the apex of the bladder a sharply circumscribed circular ulcer about the size of a sixpenny-piece. The adjoining walls were drawn in folds towards the ulcerated area. Mr. Kirk operated and found an ulcer corresponding to the cystoscopic picture. The peritoneal aspect of the bladder was involved for an area rather smaller than the mucous membrane. Microscopically the ulcer proved to be scirrhus. In this case it is probable that cancer cells had dropped from the falciform ligament of the liver and taken root on the peritoneal aspect of the bladder.

The following case of fibromyoma is interesting owing to its extreme rarity:

A woman, aged 43, suffered from frequency with pain during micturition and haematuria with occasional clots. On cystoscopic examination I found a rounded projection on the right side about the size of a Tangerine orange; it was covered with normal mucous membrane, except at the inner edge where what looked like minute papillomata, or possibly mucous cysts, could be seen. I took the view that some growth in the pelvis was pushing the bladder wall inward, and referred the patient to a gynaecologist. Dr. Lowry found fibroids of the uterus, and a fibromyoma in the wall of the bladder quite free from the uterus.

The case of rhabdomyosarcoma is also interesting because very uncommon:

The patient had symptoms of cystitis for about a year. Cystoscopic examination showed on the base of the bladder, between the ureteral orifices, an ulcerated area covered with a whitish thick shreddy slough. The bladder was opened by the transvaginal route and a hardish ulcer, about half an inch in diameter, was excised. The excised area included the mouths of both ureters. Professor Symmers pronounced the ulcer to be malignant, a rhabdomyosarcoma showing muscle fibres with striation (foetal type). Also some cells round vessels (perithelioma). I examined the patient a year and a half later; the ureteric orifices were wide open, and the growth had not recurred.

Vesical Calculus.

Out of 46 cases of vesical calculus examined the presence of blood is mentioned in 34. This varied from a microscopic to a moderate degree of haemorrhage. The bleeding generally occurred at the end of micturition. The signs of stone in the bladder are sometimes obscure and the calculus is occasionally only accidentally discovered. Cases of severe cystitis are often labelled stone, and the symptoms are very similar. As a matter of fact, the symptoms of stone are due in a large measure to the cystitis which generally accompanies it. Sudden cessation of the stream is not diagnostic of stone. In cystitis spasm may occur at the neck of the bladder and the stream may be arrested, and in certain cases of stone this symptom may be entirely absent. Pain at the point of the penis is not confined to stone. It is present in cystitis. *X*-ray examination will detect a calculus, but I have seen a shadow in the pelvis diagnosed as stone which proved to be extravasical, and probably due to a deposit of tubercle in the ovary or broad ligament. Sir Almreth Wright asked me to see this case in France. The radiographer of the Harvard Unit had diagnosed a stone in the bladder. I could not find it on cystoscopic examination, but bimanually I could feel a hard mass in the pelvis. I subsequently removed a tuberculous kidney in this patient. The sound will detect most cases of stone, but the only satisfactory method is cystoscopy.

Ulceration of the Bladder.

Ulceration of the bladder is seen most frequently in tubercle of that organ and in malignant disease. Superficial ulceration is sometimes seen in cystitis. I have had

one case of extensive ulceration in which the mucous membrane of about a sixth part of the bladder sloughed, leaving the muscular coat exposed. This was attributed to mercury perchloride solution used to wash out the bladder, but it may have been due to an infection. Unfortunately a bacteriological examination was not made. The haematuria in the ten cases of ulceration of the bladder not due to tubercle or malignant disease, mentioned in the notes, was of a moderate character.

Rupture of Bladder Vessels.

The vessels of the mucous membrane of the healthy bladder very rarely rupture. In a few cases severe straining appears to be capable of causing this accident. I have had four cases in which such rupture had apparently taken place. One of these occurred in a case of retroverted uterus.

Bilharzia haematobia.

I have only cystoscoped two cases of bilharziasis of the bladder; both occurred in soldiers lately returned from the South African war. In the first case the symptoms came on nine months after the patient reached South Africa; he noticed a little blood at the end of micturition, but he had no other urinary symptoms. The urine was examined by Professor Symmers, who found the characteristic ova. The following appearances were seen with the cystoscope: The mucous membrane in places was dull red, thick and raised. Scattered over it were small raised white nodules, varying in size from that of a pin's head to that of a hemp seed. The little white bodies resembled pustular acne spots on the face. Small breaches of surface and haemorrhagic patches in the neighbourhood of these nodules were seen in some places. The appearances in the second case were somewhat similar.

Injury to the Bladder.

Injuries of the bladder are not infrequent in cases of fractured pelvis in civil life, but I have only cystoscoped one such case:

The patient was a railway porter who had been caught between a railway carriage and the platform. On admission to hospital he passed blood. The abdomen had been explored for ruptured bladder. There was some subperitoneal extravasation of blood on the left side of the bladder, but the peritoneum was not torn. Portions of the bowel and omentum were echymosed. The patient was cystoscoped a fortnight after his injury. There were a good many clots in the bladder. Several dark-coloured rents were seen in the left wall. The mucous membrane at the edges of these rents was pale, almost dead white. The rents gaped slightly. While I was examining the patient a gush of haemorrhage took place and obscured the view. This may have been from the right kidney, as I understand that Mr. Kirk later removed a ruptured right kidney.

AFFECTIONS OF THE PROSTATE AND URETHRA.

Enlarged Prostate: Prostatitis.

In some cases of enlarged prostate the haematuria is due to associated cystitis. The haematuria in these is similar to that described under the heading "cystitis." More important from the point of view of treatment is haemorrhage from the vessels of the prostate itself, or of the mucous membrane covering its projection into the bladder. This may be so severe as to fill the bladder with clots, which block the internal meatus and the eye of the catheter used for the relief of retention. The practitioner is in a difficulty when confronted with such a case. A specially constructed catheter, which can be opened at the tip, when the latter has entered the bladder and been pushed up to a region free of the clots, may be used, or it may be necessary to perform cystotomy, or even to remove the prostate as an emergency operation if the patient's condition is otherwise favourable.

The haemorrhage in the cases of prostatic abscess was not of great significance. In the prostatitis case the blood was seen in the seminal fluid after emission.

Papillomata of the Urethra.

I have notes of two cases of severe bleeding from papillomata of the urethra. In the first the bleeding was profuse and independent of micturition. Its source was detected by the urethroscope after the injection of adrenaline. Three or four small papillomata, each about

the size of a corker pin's head, were seen 2½ in. from the external meatus at a somewhat narrowed part of the urethra. Just behind this a large calibre stricture was seen. The papillomata were removed by a sharp curette, and the raw area was touched with a strong solution of nitrate of silver. The bladder, curiously enough, was full of blood, which had apparently passed back through a relaxed sphincter. On washing out, the bladder and ureteral orifices were seen to be healthy. The second case was almost exactly similar. The papillomata were removed by urethral forceps and the canal was packed for a few hours with strips of gauze.

Stone Impacted in the Urethra.

There were two cases of impacted stone in the present series. In the first the stone was situated just inside the meatus externus, and was easily removed. In the second the stone was detected in the prostatic urethra by the urethroscope. It was pushed back into the bladder and removed by litholapaxy. The bleeding in both these cases was trifling.

TREATMENT.

In cases of any severity the patient should be kept at rest, and morphine, if not contraindicated, should be administered. Calcium chloride or lactate should be given for a few days. Preparations of ergot and hazeline may be tried, and sterilized horse serum, or inhalations of CO₂, as recommended by Wright, may be of use in some cases. The underlying cause, if discoverable, will, of course, require attention. Tumours, calculi, tuberculous kidney, etc., demand surgical treatment in suitable cases. The bleeding in cystitis itself will be dealt with by urinary antiseptics and lavage of the bladder. Renal haematuria of the type known as "essential" may tax the resources of the surgeon to the utmost. Section of the kidney, decapsulation, fixation of a movable kidney, incision into the pelvis, with direct attack on the papillae, etc., and injection of silver nitrate solution or adrenaline, are among the methods used. Removal of the offending organ is a radical procedure, only justifiable if all other methods fail and the patient's life is in danger. To control haemorrhage of bladder origin, pending more radical measures, adrenaline may be employed. A slower but more lasting remedy is to irrigate with silver nitrate solution. Failing this, the bladder may have to be opened and the cause dealt with, or, if that is not feasible, a large tube may be inserted and irrigation with hot water carried out. In certain cases of haemorrhage into the bladder, with massive clotting, an evacuating catheter similar to that used for litholapaxy may be used to remove the clots. It may even be necessary to perform cystotomy to clear out the clots. Packing the bladder is an unsatisfactory proceeding. If resorted to, a way of escape must be provided for the urine, and the ureteral orifices must not be blocked. Raising the foot of the bed is helpful in some cases. Bleeding from the anterior urethra can be arrested by pressure. Bleeding from the bulbous or membranous urethra may be controlled by pressure applied to the perineum.

Finally, no patient ought to be allowed to die of haemorrhage without an attempt being made to restore him by transfusion of blood or intravenous injection of gum saline solution.

THE Union of International Associations of Brain Workers will hold a congress at Brussels from August 20th to August 22nd. The union was established in 1910. Before the war 250 associations of various kinds had joined it; of these 100 remained faithful, and took part in a congress held last year. Among the subjects to be discussed next August will be the steps which should be taken by brain workers to assert their rights in relation to both capital and labour, the difficulties encountered in the dissemination of periodical literature, and the steps which the League of Nations can take to carry out its avowed intention of helping brain workers. The subscription to the congress is 20 francs, and full particulars can be obtained on application to the Secrétariat du Congrès International du Travail Intellectuel, Palais Mondial, Parc du Cinquante-naire, Bruxelles.

THE SCHICK REACTION:

A CLINICAL TEST FOR THE DETERMINATION OF
SUSCEPTIBILITY TO DIPHTHERIA.

BY

GLADYS WARD, M.D., D.P.H. EDIN.,

ASSISTANT MEDICAL AND CHILD WELFARE OFFICER, DEPTFORD.

*Preparation of the Toxin and Technique of the
Injection.*

For purposes of the Schick test¹ a toxin which has been ripened for at least a year, and then carefully standardized by determining the minimal lethal dose for a 250-gram guinea-pig, should be used. The bulk toxin will keep its strength very well if a ripened toxin is used. A dilution of the toxin is then made, of such strength that 1 c.cm. contains one-tenth of a minimal lethal dose. The amount actually injected in the test is 0.2 c.cm. of this dilution—that is, one-fiftieth of a minimal lethal dose.

To make the injection it is essential to have a short, sharp-bevelled needle which fits accurately on the syringe. A 1 c.cm. Record syringe is found most convenient. The flexor aspect of the right forearm just below the bend of the elbow is the selected spot. The arm having been first cleaned with ether or spirit, the skin is made taut between the forefinger and thumb of the left hand, and 1.5 c.cm. of the diluted toxin is injected intracutaneously. The result is absolutely useless if the injection be made subcutaneously. When done correctly a raised white wheal with a definite edge, and on which the pores of the skin are visible, is produced. Finally, if the test has been successfully performed, it should be possible to express a small drop of blood-stained serum from the site of the injection.

A true positive reaction is clearly visible at the end of twenty-four hours as a clearly circumscribed red area, generally about $\frac{1}{2}$ inch in diameter, and accompanied by slight infiltration. This increases in intensity for the next three or four days, and then gradually fades, leaving a still distinct area of pigmentation and scaling. This pigmentation is generally faintly visible at the end of four or five weeks, and thereafter disappears. There is no general reaction. People who are using their arms a great deal may complain of some stiffness and local irritation.

A pseudo-reaction appears earlier, reaching its height in from twenty-four to thirty-six hours. It is not definitely circumscribed, and often shows a secondary areola, which fades off into the surrounding skin. The reaction begins to fade at the end of thirty-six hours, and has generally quite disappeared at the end of seventy-six hours, leaving no scaling; but, occasionally, a faint bluish mark persists on the skin for some days. The patient complains more frequently of stiffness and soreness of the arm, and in one or two cases a general reaction (headache, vomiting, etc.) has been noted.

A reaction is said to be negative when there is absolutely nothing to be seen at the site of the injection at any time.

The majority of the readings referred to in this paper were made at twenty-four hour, seventy-six hour, and seven-day intervals, the reasons for these intervals being as follows:

(a) At the end of twenty-four hours both the true and the pseudo-reaction, should it be present, are well marked.

(b) The pseudo-reaction has begun to fade at the end of forty-eight hours, and by the time seventy-six hours have elapsed has generally completely disappeared, thus rendering the second reading much simpler.

(c) The third reading was taken at the end of a week or ten days. I consider the latter quite reliable, and more convenient when dealing with patients in a general hospital.

The reading of the different reactions, after a short apprenticeship, presents little difficulty, except in cases complicated by a pseudo-element, and in these cases a "control" test may be done at a site on the left arm corresponding to the original test on the right. The control toxin is heated to 75° C. for ten minutes, whereby the specific toxin is destroyed, and the proteins, to which the pseudo-reaction is due, are left unchanged.

Careful records should be kept—these to include the name, age, and address of the patient, the date of injection, subsequent readings, and final remarks and results of each case.

It is, of course, essential that the toxin be reliable. I was fortunate in obtaining from Dr. Claude B. Ker one which had been prepared by Dr. R. A. O'Brien, and which had been proved to be entirely satisfactory.

The test depends on a local irritant action of minute quantities of diphtheria toxin given intracutaneously. A negative reaction indicates that the individual is possessed of a necessary number of antibodies to neutralize the

toxin, and is therefore immune to the disease at the time when the test is made. According to Schick himself a negative reaction indicates at least 1,30th of a unit of antitoxin per cubic centimetre of blood—that is, sufficient to protect against diphtheria. Von Behring maintains that 1 100th unit is sufficient. A positive reaction indicates that the individual tested does not contain sufficient antitoxin in his blood to render him immune. A pseudo-reaction is probably a local sensitization phenomenon of a protean character, since a similar reaction can be produced with toxin heated to 75° C. for five minutes, or with dilutions of the autolyzed substance of the diphtheria bacillus in which no toxin is present.

Influence of Age on the Schick Reaction.

The following table has been compiled from tests done in the Royal Hospital for Sick Children and in Craighlockhart Poorhouse Hospital, Edinburgh.

Age.	Number.	Negative.	Positive.	Percentage Positive.
0 to 6 months	25	23	2	8
6 months to 2 years ...	41	21	20	50
2 to 5 years	26	10	16	61
5 to 10 years	44	30	14	34
10 to 15 years	14	10	4	28
Total	150	94	56	37

Here we find that the greatest number of positive Schick reactions occurred in children between the ages of 6 months and 5 years. This we know to correspond with the age incidence of diphtheria.

The following is a table showing the number of deaths from diphtheria in this country in 1917.

All Ages.	— 1	1 —	5 —	10 —	15 —	25 —	35 —	45 —
648	42	404	145	33	6	7	3	8

From this we see that no less than 63 per cent. of the total number of deaths occurred between the ages of 1 and 5 years, and it is interesting to compare this figure with that quoted in the previous table of children between the ages of 2 and 5 years who give positive Schick reactions, the percentage of these being 61.

Influence of Concurrent Disease on the Reaction.

The following table gives the results in the scarlet fever wards:

Age.	Number.	Negative.	Positive.	Percentage Positive.
0 to 1 year	0	0	0	0
1 to 2 years	2	0	2	100
2 to 5	17	0	17	100
5 to 10	47	21	26	55.3
10 to 15	30	11	19	63
15 years and over ...	54	34	20	37
Total	150	66	84	55

These results, though comprising too small a number to be of great value, correspond fairly closely with those published by Dr. Leete² last year, his total percentage of positive results being 57.2.

Comparing the results between children tested in the scarlet fever wards and in the wards of a general hospital we find in the former 66 per cent. positive between the ages of 6 months and 15 years, in the latter only 37 per cent. For a long time, moreover, it has been a recognized fact that, in spite of all precautions, cases of diphtheria occur in the scarlet fever wards more readily than in others. Zingher³ suggests that there may be a destruction of the natural diphtheria antitoxin during an attack of

scarlet fever, while Von Behring has suggested that there is a temporary loss of natural immunity to diphtheria during the acute febrile stage of the disease.

Among the cases studied at the Sick Children's Hospital the actual disease from which the child was suffering at the time did not appear to have any definite bearing on the reaction, but the "acuteness" or "chronicity" of the case apparently bore a close relationship. The percentage of positive Schick reactions is given under the following headings:

Respiratory diseases (not tuberculous), 56.25 per cent. Alimentary diseases (not tuberculous) 50 per cent. Tuberculosis 45.5 per cent. Nervous disorders 33.5 per cent. Rheumatism 27 per cent. Rickets 16.6 per cent. Diseases of kidney and bladder 16.6 per cent. Congenital syphilis 14 per cent.

Another series of cases was then taken and divided into two groups—acute and chronic—care being taken to exclude entirely all such cases as could not be definitely classified.

The "chronic" cases included chronic tuberculous infections, long-standing empyemas, congenital syphilis, etc., while the "acute" were chiefly made up of pneumonia, acute bronchitis, acute gastro-enteritis, etc. The results were as follows:

Of chronic cases 28 per cent. were positive.
Of acute cases 60 per cent. were positive.

We see, therefore, that the number of positive Schick reactions found in the acute cases was as high as that found among scarlet fever patients. The figures obtained by Dr. Leete, in the 500 scarlet fever cases tested by him in the Edinburgh City Fever Hospital, show that between the ages of 1 and 15 years 60 per cent. were positive; my own figure is somewhat higher—namely, 67 per cent. "Acute general cases" in the same age group also gave 60 per cent. positive Schick reactions.

It was interesting to note, moreover, in several cases of *tabes mesenterica* tested, that most of those who came in almost in *extremis* and were "hopeless" from the first gave a strongly positive reaction, whilst those who were less severely infected and left hospital "improved" gave a negative reaction. Another interesting example was supplied by two sisters who were in the ward at the same time suffering from dysentery.

One was aged 7, the other 8, and neither of them had had diphtheria. The infection in both cases was by the *Shiga* bacillus. The younger, who was the more severely ill on admission and subsequently died, gave a strongly positive reaction, whilst the elder, who was only mildly infected and made a good recovery, gave a negative reaction.

It has been noted by various observers that immunity or non-immunity to diphtheria runs in families. Is not this case, then, very suggestive of the fact that any acute infection may cause a temporary loss of natural immunity, and that the high percentage of diphtheria cases occurring in scarlet fever wards may also be explained on these grounds?

It has been suggested that the Schick reaction might be due to a general reaction on the child's part to any toxic material. Dr. Ellsworth Moody⁴ successfully established this as a fallacy by testing 180 children in the St. Louis Children's Hospital with intradermic tuberculin and diphtheria toxin, and by finding similar reactions in only 34 cases.

Influence of Pregnancy on the Reaction.

Report on a series of 50 maternity cases. With the exception of three or four all the tests were made during the first week of the puerperium, the babies' ages varying from two to eight days.

Mother and baby negative	45
Mother and baby positive	1
Mother negative, baby positive	1*
Mother positive, baby negative	3

* Reaction doubtful (baby 4 months).

That is, 90 per cent. of the mothers, and 96 per cent. of the babies, gave a negative reaction. Controls were done at the same time with toxin which had been heated to 75 C. for ten minutes. We found that no less than 30 (that is, 60 per cent.) of the mothers gave pseudo-reactions, 27 of them occurring in the immune mothers and 3 in those who gave positive Schick reactions. Three of the 27 who showed a pseudo-reaction had had diphtheria in infancy.

The actual technique in newly-born infants presented some difficulty, but only those results have been used in which a quite satisfactory injection (showing the well marked white wheal, etc.) was made. The natural

erythema of a young infant's arm rendered one or two readings doubtful at first, but complete absence of pigmentation or scaling at the end of a week led one to the diagnosis of a negative reaction.

Finding 90 per cent. of negative reactions in puerperal women as compared with the 75 per cent. quoted by Schick in the records of the Willard Park Hospital, and the 67 per cent. found by myself in scarlet fever patients, raises once more the long-vexed question of the possibility of pregnancy conferring temporary immunity to disease. It is, however, quite impossible, in a short paper such as this, to enter into the controversial literature on that subject.

The large number of pseudo-reactions (90 per cent.) found among pregnant women. I think, endorses the view that the pseudo-reaction is of the nature of a local anaphylaxis, the woman in this instance being sensitized by the protein absorbed through the placenta.

Immunity in the New-born.

In the 50 odd cases tested only one baby gave a definitely positive reaction, and one in a 4 months baby was doubtful. Schick, however, found 7 per cent. of positive reactions in a series of nearly 300 tests made on new-born infants. According to Zingher,⁵ the antitoxin of the infant obtained from the immune mother lasts for about six to nine months after birth. Kazzowitz and Groer⁶ found that 84 per cent. of mothers and their new-born infants contain a body which has the property of neutralizing diphtheria toxin, and thus they identified with diphtheria antitoxin. This is present in mothers and infants, and, presumably, is transmitted through the placenta to the foetus, and because of its frequency is regarded as a physiological phenomenon. The fact that children of the same family give the same reaction also suggests an hereditary factor, which in the absence of infections by the *Klebs-Loeffler* bacillus gives rise to the presence of the so-called natural antitoxin. That nearly all infants are born with a sufficiency of antitoxin to render them immune to diphtheria is an established fact; why it should persist in some children and disappear in others is still unexplained. Zingher tells us that only a few infants retain their maternal immunity after the twelfth month, and probably all lose it before the eighteenth month of life.

Our next consideration is that of the establishment of an artificial immunity, which will replace or supplement the natural, and carry the child safely through those years when he is most susceptible to the disease.

Active Immunization of Infants.

As the immunity conferred by the mother varies in the length of time it persists—disappearing in most cases at the end of six months, yet persisting in some children till the end of the second year of life—it is obvious that a negative Schick reaction is not reliable until after the second year. Park and Zingher⁷ adopted the following procedure in institutions:

Inmates six months or more in age were Schick-tested. If positive they were immunized by injecting subcutaneously three doses of toxin-antitoxin mixture. Those giving a negative Schick reaction were retested every three months up to the third year because of the gradual loss of passive immunity in many. Those giving a positive test at any time were immunized. After the administration of the immunizing doses (work done by Dr. Blum) immunity developed in from three weeks to three months, and lasted more than two and a half years.

Speaking at the New York Academy of Medicine in 1918 Zingher said: "In children over 2 years of age a negative Schick test indicates a permanent immunity to diphtheria. Fully 99 per cent. of the children over 2 years of age who give a negative Schick reaction continue, when retested at a later period, to give a negative reaction."

He finds that those who gave a positive Schick reaction and were injected with toxin-antitoxin were slow in producing antitoxin. Only 30 per cent. were found to be immune at the end of three weeks, but the Schick test in the other children became fainter and fainter and eventually became negative in most instances.

Later Schick tests showed that 95 per cent. of these children had become immune. He has also immunized children by three doses of toxin-antitoxin and found that they gave negative Schick reactions when retested two and a half to three years later. He recommends that all positive reactors under 18 months be given three doses of toxin-antitoxin, each of 0.5 c.cm., one week apart; and that of the children over 18 months of age, and of adults, only those who give a positive reaction

should be immunized with toxin-antitoxin. They should have three doses of 1 c.cm. one week apart. Young children show no reaction.

In 1916 Park and Zingher⁶ presented a paper based on a series of over 1,000 cases that had been actively immunized with diphtheria toxin-antitoxin. These susceptible individuals were selected by means of the Schick test out of a total of about 10,000 children and adults in ten different institutions. The mixtures of toxin-antitoxin that were used for immunization were either neutral (66 to 70 per cent. L.+ to each unit of antitoxin), or slightly toxic (80 to 90 per cent. L.+ to each dose of antitoxin) to the guinea-pig. The dose was varied from 0.5 c.cm. to 1 c.cm. and the number of injections from one to three. The injections were made subcutaneously at intervals of seven days.

The retests with the Schick reaction showed that only 30 to 40 per cent. became immune three weeks after the first injection, about 50 per cent. at the end of four weeks, 70 to 80 per cent. at the end of six weeks, and 90 to 95 per cent. at the end of eight to twelve weeks.

The best results were obtained with the full immunization consisting of three injections of 1 c.cm. each, given at weekly intervals. The duration of the active immunity was studied in a group of children that was followed up for over one and a half years; these cases showed that the active immunity persisted for at least that length of time. It is possible that the immunity induced by the injections of toxin-antitoxin started a combined cellular production of antitoxin, which would have otherwise appeared much later in life. The L.+ dose of toxin is the amount which, when mixed with 1 unit of antitoxin and injected into a 250-gram guinea-pig, will cause its death at the end of four days.

Conclusions.

1. The Schick test has given us very definite data as to which years are the most dangerous with regard to diphtheria infection in a child's life. These are between 6 months and 6 years, while the periods of lowest susceptibility appear to be under 6 months and over 15 years. These results are endorsed by clinical experience.

2. It is of great value in deciding the difficult question of whether a patient is a carrier or is really suffering from diphtheria. For example, a case of streptococcal tonsillitis in a diphtheria carrier would by culture alone be thought to be one of diphtheria. If a Schick test were done on such a case no doubt would be left—in the case of the test being negative it would be treated as a carrier, and if the reaction were positive, as a case of diphtheria. Similarly in a case with a nasal purulent or sanious discharge the same difficulty would arise and a Schick reaction here too would indicate the line of treatment to be followed.

3. It has, perhaps, its greatest value in showing us to whom, among persons exposed to infection (for example, contacts, doctors and nurses), we may safely omit to give antitoxin—thus greatly minimizing the risk of anaphylaxis and also saving pain and expense. When possible, only those nurses who give a negative Schick reaction should be employed in diphtheria wards.

4. We are able by means of the Schick test to ascertain, in cases which have previously had the disease or have had antitoxin, to what extent their immunity persists, and whether they have sufficient antibodies to overcome a fresh infection.

5. Lastly, it has supplied us with a basis on which to build new immunizing methods, which have given such encouraging results in America that we feel justified in looking forward with confidence to the day when diphtheria will be a disease well under our control, and the infant and child life of this country robbed of one of its chief horrors.

I wish to express my thanks to Dr. Claude B. Ker for his guidance in doing this work, and for permission to publish the results. I also wish to thank Dr. Stewart Fowler, Dr. Lamond Lackie, and Dr. H. Gibson for giving me opportunities of carrying out the tests in their respective wards.

A MONUMENT was recently erected in one of the public parks of Madrid to Dr. C. M. Cortezo, the Spanish physician and politician, who is editor of the *Siglo Médico*, in recognition of his long philanthropic and public activities. At the inauguration ceremonies, in response to many speeches, Dr. Cortezo said that he accepted the tribute only as homage to the medical profession.

THE TREATMENT OF SYPHILIS IN MACEDONIA ON ACTIVE SERVICE.

BY

TREVOR HAYMAN FOWLER, M.R.C.S., L.R.C.P.LOND.,

CAPTAIN (LATE R.A.M.C.),

LATE SPECIALIST IN VENEREAL DISEASE, BRITISH SALONICA FORCE.

The experience of four and a half years in the army, the greater part of which time was spent in the diagnosis and treatment of venereal diseases, may justify a few remarks upon the methods employed in dealing with syphilis in Macedonia during the late war. I soon became impressed, first, with the importance of making a definite diagnosis as early as possible, and secondly, with the danger of the policy of applying local treatment to a venereal sore and awaiting results.

The hospital for venereal diseases contained some 300 beds, of which roughly a third were set apart for patients suffering from syphilis. Cases admitted to hospital with no other signs beyond a venereal sore were treated as follows: The sore was scraped and the exudate transferred to a microscope slide, a film made, stained by the Giemsa method, no other being at our disposal, and examined. If deemed advisable, the blood serum was tested by the Wassermann reaction, which was regarded as a help to diagnosis, but not relied upon alone, nor was it allowed to outweigh clinical evidence. Cases which left no room for doubt clinically were not necessarily subjected to the microscopic search for the *Spirochaeta pallida*, or to the Wassermann test. It is well perhaps to mention this fact, because in an article which appeared in the *Practitioner* for December, 1920, upon the Wassermann reaction, by Dr. C. Lundie, it was stated that in the army "a diagnosis of syphilis is not allowed, except when the *Spirochaeta pallida* is found or the Wassermann reaction is positive, and *per contra*, a cure is not admitted until both have become negative, a result in the case of the Wassermann sometimes impossible to attain."

The diagnosis having been made the patient was at once put under treatment, the usual course consisting of:

- (1) A weekly injection (intramuscular) of mercury.
- (2) Daily mercurial inunctions.
- (3) A weekly injection (intravenous) of "606" (salvarsan, kharsivan, diarsenol, galy), 0.3 gram, or a fortnightly injection 0.6 gram.
- (4) The urine was tested weekly, and treatment regulated thereby.
- (5) The patient was weighed at the commencement of treatment and at stated intervals throughout the course.

A rigid régime was insisted upon before and after the "606" injections; the reaction was usually slight, sometimes there was none. No cases of arsenical dermatitis occurred, and no suppurations ever followed the mercurial injections. Iodides were frequently given, but they did not form a part of the routine treatment. They were never used except in conjunction with mercury, not being regarded in themselves as a cure for syphilis.

Patients who had had repeated attacks of malaria, or who had suffered from dysentery or severe diarrhoea, and who had become debilitated thereby, did not make good subjects for this intensive treatment. As a rule mercury was withheld in these cases, at first altogether, and "606" administered in doses of 0.3 gram. If, as was usual, improvement took place, mercury was injected cautiously, a careful watch being kept for albuminuria or diarrhoea. A great many cases showed a mixed infection, due either to superimposed sepsis, or to the original sore containing pyogenic organisms. Suppurating inguinal glands were treated by simple surgical methods and were incised when "ripe"; at one time the plan of excising the glands before the skin had become involved was adopted; we found it tedious and without any appreciable advantages. The average stay of a patient in hospital was five to six weeks.

Each patient on leaving hospital was given a slip of paper which he was told to hand to his medical officer; whether this was always done is open to doubt. The advice given was to take one pill of hyd. c. cret. gr. ij each night for three months, to leave off for one month, and at the end of that month to have the blood tested by the

Wassermann reaction; he was told that if this was negative he should go on again exactly in the same way—that is, to take the pills for a further three months, to leave off for a month, and at the end of that month to have his blood tested again, and so on for at least twelve months. He was told that if the Wassermann reaction was at any time positive he should act according to further medical advice; the fact that the reaction was positive not being taken, in the absence of any signs of activity, as proof that a further course of intensive treatment was necessary or advisable.

Although we did not claim to "cure" after so short a course of treatment, we could claim that after a few weeks our patients were fit to carry on their duties in the trenches or elsewhere, which after all was an important matter in such a crisis.

RETROGRADE CATHETERIZATION FOR IMPERMEABLE STRICTURE OF THE URETHRA.

BY

W. J. FOSTER, F.R.C.S. (ENG.),

SURGEON, ROYAL BERKSHIRE HOSPITAL, READING.

THE operation here described is proposed as a substitute, in suitable cases, for Wheelhouse's operation, because it is easier to perform and gives better results from the patient's point of view.

Severe stricture of the urethra with retention of urine in the male is not as common in Reading as in London, but a few cases are admitted to the Royal Berkshire Hospital every year. Most of them can be treated by rapid dilatation under an anaesthetic, and quickly discharged from the wards to out-patients. Frequently before admission attempts have been made to pass a catheter, and the patient arrives with false passages and bleeding from the penis. In these cases I have the bladder aspirated above the pubes two or three times and try what rest, hot baths, and a free purge will do. Sometimes it is possible in a few days to pass a catheter and dilate the stricture. If this fails the patient is anaesthetized and a variety of catheters and sounds are tried. If I fail to get in even a filiform bougie the usual proceeding has been to do Wheelhouse's operation; but when there are false passages and a bleeding urethra this is often very difficult and tedious. Moreover, it leaves the patient with a urethra further damaged, the wound is in a bad place, and there is a chance of trouble with a urinary fistula and sometimes delay in healing. I have known several cases to do very well, and even with neglect after treatment on the patient's part to go very many years before they returned with acute retention of urine. Probably with reasonable care in passing a bougie the patient might have avoided further trouble. In many cases with false passages the difficulty of finding the tiny aperture of the stricture, together with the dirty position of the wound, and the sensitive area in which it is situated, condemns Wheelhouse's operation at the present day, although it was undoubtedly a good operation at the period when it was first performed. With modern experience in the treatment of suprapubic wounds, retrograde catheterization and dilatation of the stricture is preferable.

In such a case as I have described my method of late years has been, in the first place, to pass some sort of a catheter or bougie and perform rapid dilatation of the urethra. If this fails I select a time when the bladder is distended and make a suprapubic opening in the bladder; a No. 10 or 12 catheter (silver) is then taken in the right hand and easily passed into the bladder end of the urethra as far as the stricture. A No. 8 silver catheter is then passed into the penile urethra until it meets with the point of resistance of the stricture, avoiding the false passages if possible. The catheter in the bladder is then advanced with firm pressure, but without violence, until the stricture is stretched and pushed forwards as much as possible. With this catheter held firmly in position the No. 8 catheter is manipulated with the left hand and disentangled from any false passages; it is passed on carefully but firmly until metallic contact is made between the two catheters. Once certain of metallic contact some force and a little rubbing action may be used as long as the surgeon is certain the two catheters are touching at

their points. It is now easy to hold the points of the two catheters in contact, and to allow the penile catheter to push the bladder catheter gradually backwards until the former is in the bladder. A larger penile catheter is now passed in place of the No. 8. If the larger catheter gets trapped in the false passages it is very easy to slip in the bladder catheter again from the suprapubic wound and make contact with a penile catheter.

The urethra can now be rapidly dilated to No. 16 or 18, and a No. 12 silver or a large size hard rubber catheter tied in. The bladder is well washed out through the catheter and suprapubic wound and a drainage tube purse-stringed into the bladder wall. The wound is stitched up, or if too dirty the stitches are inserted and left untied for a few days. It is advisable to put a small drainage tube into the wound below the last stitch, if the wound is sutured at the time, in case of a leak by the side of the large tube. The suprapubic wound is treated as usual after a prostatectomy, and the catheter left in the urethra for a week. The bladder is washed out once or twice daily, according to the condition of the urine.

A case operated on recently by this method left the hospital in four weeks with the suprapubic wound healed, except a superficial granulation and a urethra that a No. 16 would drop through by its own weight. His recovery was delayed by a misunderstanding by which the catheter was removed in four days; the house-surgeon was unable to replace it. Under an anaesthetic a No. 18 sound passed quite easily, and I tied a fresh catheter in for a week. There was no further difficulty. If this had been done at first, as I directed, he would have been fit to go out some days or a week earlier.

I have been unable to find this operation described in any textbook on genito-urinary surgery. Thomson Walker mentions retrograde catheterization. He says: "Suprapubic cystotomy is performed, and retrograde catheterization with a metal sound. The point of this is cut down upon in the perineum. The operation has little to recommend it over the perineal dissection." This is only a method of doing Wheelhouse's operation. I have adopted it with advantage in a case in which I failed to find the aperture in the stricture after starting a Wheelhouse operation in the ordinary way. It certainly solved the difficulty. Should the operation I have described fail, it would be the quickest way of dealing with the difficulty. At present I have never found any necessity, as retrograde catheterization has invariably succeeded.

I think it is highly probable that other surgeons may be using this method of dealing with troublesome strictures, although I have failed to find any record. I am sure those who have not done so will find it a very easy and safe way of dealing with these cases, and the result very satisfactory to the patient. It is needless to say that the whole operation must be performed with strict surgical cleanliness.

In considering what damage is done to the urethra by retrograde catheterization, it is necessary to remember that the actual length of a stricture of the urethra may be considerable, perhaps from half an inch up to 1½ in. or more, but the part of the stricture that is really so small as to prevent the passage of urine or a fine bougie is short; in my opinion it rarely exceeds a quarter of an inch, and is often less. It is this portion that is nipped between the points of the two metal catheters. With a fixed point in the bladder end of the urethra, it is possible to force the penile catheter effectively through the constriction by steady pressure, or with a slight grinding movement. The exact size of the penile catheter may have to be varied, but the No. 6 to 8 is the usual size required to give the necessary rigidity. Once the catheters are in good metallic contact the whole difficulty is overcome.

The damage to the urethra is very slight, and the free drainage of the bladder tends to prevent any inflammatory reaction on the kidneys such as sometimes takes place after passing a catheter. The patient is far more comfortable afterwards, and is not so long in recovery on the average, in severe cases, as after Wheelhouse's operation. I can strongly recommend the operation in selected cases as easy, certain, and better for the patient.

A MONUMENT has been erected at Rome, Georgia, U.S.A., to the memory of Dr. Robert Battey, the originator of Battey's operation, oöphorectomy, first performed at Rome, U.S.A., in 1872. The chief address at the inauguration was made by Dr. Howard Kelly, of Baltimore.

SUGGESTED AUTOINOCULATION OF A RODENT ULCER.

BY

S. C. DYKE, M.B., D.P.H. OXON.,

PATHOLOGIST TO THE CLINICAL UNITS, ST. THOMAS'S HOSPITAL.

IN view of the interest attaching to the autoinoculation of malignant growths the following case may be worth recording:

F. L., a woman aged 71, was admitted to the wards of the Surgical Unit, St. Thomas's Hospital, under Sir Cuthbert Wallace, suffering from a large ulcer over the spine, in the sacro-iliac region. The ulcer, which on admission was about four inches in diameter, was preceded by a small itching papule about five years previously; it steadily increased in size and commenced to ulcerate about one year before the patient's admission to the hospital. As seen in the ward, the ulcer presented a hard, raised edge and was diagnosed clinically as an epithelioma.

The patient also showed a small ulcer on the left upper lip, clinically resembling a rodent ulcer. The history in regard to this was that the patient had been bitten at this spot by a dog about a year previous to admission. The wound healed to a certain extent, but then broke down, and had since remained as a small, slowly growing ulcer.

Both ulcers were excised by Mr. W. W. Wagstaffe, and on examination both proved to be rodent.

Up to a short time before admission the patient had been in the habit of herself dressing the ulcer on her back, and it is easy to understand how cells could have been carried from it on the patient's fingers to the fresh raw surface on her lip resulting from the bite. It is not suggested that there is any absolute proof that inoculation occurred in this way; cases of multiple rodent ulcer, where there is no question of autoinoculation, are common enough, and this may have been one of them. On the other hand, the coexistence of the original ulcerating growth and of a raw surface on an easily accessible place like the lip established a state of affairs very favourable to inoculation, and that such inoculation occurred may at least be regarded as highly probable.

The literature in regard to autoinoculation of malignant growths was very fully reviewed by Shattock and Dudgeon¹ in 1914. They record two cases, one reported by Butlin and one by Schimmelbusch, in which the evidence for autoinoculation by means of the fingers is so strong as to be almost conclusive. One of these cases was an epithelioma; the nature of the growth in Schimmelbusch's case is not mentioned. No instance of suggested autoinoculation of a rodent ulcer occurs among those collected in Shattock and Dudgeon's paper.

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL.

PERNICIOUS ANAEMIA: REPEATED DOSES OF CALOMEL: RECOVERY.

THREE years ago I attended a married lady, 37 years old, for anaemia. There was no haemorrhage to cause it. The complexion was lemon-coloured. The number of red corpuscles was about three-fifths of the normal, the colour index was above normal (1.25), and there was poikilocytosis. She got steadily worse in spite of arsenic and other tonics, until she was confined to bed. As she complained of the irritation caused by passing uric acid crystals, of which there was a considerable amount, the arsenic was stopped, and she was given 2-grain doses of calomel at first twice a week for six weeks, afterwards once a week for another six weeks, and finally once a month; she has kept on with the monthly dose until the present time.

The improvement after a few doses of calomel was marked. The uric acid crystals disappeared, and the anaemia steadily improved.

With the exception of some red bone marrow tabloids, after she had begun to improve, and some soda mixture for dyspepsia, she had no other drugs. At the present time she feels and looks quite well. Blood smears sent to the Clinical Research Association were reported on as follows:

"A differential count of the white blood corpuscles gives the following result:

Polymorphonuclear neutrophiles ...	32 per cent.
Small lymphocytes ...	62 "
Large lymphocytes ...	4 "
Eosinophiles ...	0.5 "
Mast cells ...	0.5 "
Myelocytes ...	1 "

"The red blood corpuscles seem to have a fairly high colour index. They vary considerably in size and very appreciably in shape.

"Megalocytes are very common. Microcytes and poikilocytes are also seen.

"Diffuse basophilia is seen fairly frequently, and nucleated forms are present in the proportion of one megaloblast per 100 leucocytes.

"No normoblasts were seen. The films gave an impression of a fairly well-marked leucopenia. These films are very suggestive of pernicious anaemia."

South Norwood.

JOHN C. FERRIER, M.D.

TARTAR EMETIC FOR VENEREAL GRANULOMA.

IN the *BRITISH MEDICAL JOURNAL* of November 30th, 1920, Dr. H. Lovett Cumming of Shanghai strongly advocates the use of intramuscular injections of tartar emetic in early cases of venereal granuloma. Might I venture a plea in favour of the intravenous route, both on account of simplicity and of the excellent immediate results both in early and late cases?

All my cases have been native Papuans. During the past eight months I have treated 84 cases (40 males and 44 females); in every instance the patients left the hospital apparently cured after a course of intravenous injections of tartar emetic. It has been impossible to trace the after-history of the majority, so that no statement can be made as to how permanent these results may be. However, four cases seen six months after finishing the treatment showed no sign of relapse. On the other hand, three cases definitely relapsed within two months of finishing the injections; these three cases received a second series of six injections. One of these cases four months after the second series shows no signs of relapse, and the smooth, healthy condition of the scars would lead one to believe that the cure is permanent.

Method.

A solution of 1 per cent. tartar emetic in distilled or rain water is filtered and boiled for two minutes. The injection is given on the same day with a 20 c.cm. Record syringe; 10 c.cm., containing 0.1 gram, is given twice weekly for ten injections; an interval of ten days is allowed to elapse, and then five more injections are given. In the case of men the dose can be increased up to 15 c.cm., containing 0.15 gram, without any very troublesome reactions, but 0.2 gram seems to be a dangerous dose to give as a routine. Acute antimonial poisoning developed in one case after such a dose.

The injections were given generally into the veins of the arm. Any extensive leakage into the subcutaneous tissues resulted in a most painful swelling with much oedema, which subsided in about two weeks without suppuration.

The beneficial effects of this treatment are apparent after two injections—that is, at the end of the first week. The rate at which new epithelium covers the raw ulcerated surfaces is remarkable. Islets of epithelium dotted here and there over the denuded area spring into existence. In the extensive cases of long standing new epithelium grows out from the anal margin and urethral orifice.

W. E. GIBLIN, M.C., M.B.

Samarai, Papua (British New Guinea).

THE PRIMARY ORGANISM IN CULTURES.

THE following may be of interest to some of your readers:

A short time ago I was asked to investigate a small epidemic of cases showing the following symptoms: (1) Pains in the limbs, (2) headache, (3) pyrexia, (4) slight sore throat. Cases in all stages, from the acute to the convalescent, were examined.

Stained smears from cultures of nasopharyngeal swabs of the early acute cases showed a pure culture of a Gram-negative coccus. Cultures of the rest showed a variety of organisms, among which was the Gram-negative coccus. On taking smears from the pure cultures two days later, I found that the Gram-negative coccus was dead and staining very faintly, and that what before appeared pure cultures

now showed a variety of organisms resembling smears of the convalescent cases.

Apparently, what had happened in the convalescent cases had now happened *in vitro*—namely, the primary organism had died, and when this happened the other organisms which had been present in the mucus of the swab began to grow. So that—and this is the point I wish to make—unless cases had been examined in the very early stages, one would have made the mistake of ascribing the epidemic to mixed infection.

I may add that my experience has led me to believe that this difficulty of getting the primary organism is responsible for a number of the failures of vaccine therapy.

C. B. DYSON.

Reports of Societies.

ORGANISM CULTIVATED FROM CARCINOMATA.

AT a meeting of the Edinburgh Obstetrical Society on June 8th, with Dr. WM. FORDYCE, President, in the chair, specimens of pathological and clinical interest were shown by the President, Drs. HAIG FERGUSON, H. S. DAVIDSON, G. R. LIVINGSTON, and ROBERTSON DOBIE.

Dr. JAMES YOUNG gave a preliminary communication on the life-cycle of an organism that he had obtained by cultivation from carcinomatous tumours. In culture the organism appeared ordinarily as oval or rounded bodies of different sizes and with a bipolar staining, and as bacillary forms of a length and thickness varying with the medium. The round forms were found to vary in size according to the stage in their development. All stages in their evolution were shown, and it was pointed out that in suitable media they proliferated actively. Under certain conditions they clumped together to form densely staining masses of a rounded or a lobulated character. Dr. Young said that he had succeeded in producing germination of these masses. In the process they at first became paler in areas, the remainder of the staining matter showing as masses of irregular size and shape. Eventually the whole spore mass became pale or finely granular, and minute rod-like structures were formed. These became free and developed into the bacillary forms, which Dr. Young believed were the vegetative phase of the organism. The filaments were long or short, and their thickness varied from very fine threads to comparatively thick elements. They usually stained deeply at each end, and they often had deeply staining granules along their course. Dr. Young believed that by cultivating pieces of carcinomatous tissue in a special medium, which he described, he had been able to recognize that the deeply staining masses, which are present commonly in the nucleus or in the intercellular spaces, are in reality spore masses. He had been able to watch them germinate into the rod-like or byphal forms. He had isolated the organism from 28 cases of human carcinoma, and he had also obtained a similar organism from breast carcinoma in the mouse. As controls he had used the medium without tissue and with non-carcinomatous normal or diseased tissue. He believed that the organism belonged to the fungi, but he had been unable so far to classify it. As far as he could say, he believed that the vegetative phase of the germ was passed in the nucleus.

THE fourth report of the Conjoint Board of Scientific Societies contains evidence that scientific investigation is being seriously hampered by the heavy cost of the publication of results. An exceptional number of papers are being communicated to the scientific societies, including many held up during the war, but the resources of the societies, which have not increased, are insufficient at present prices to publish even the normal pre-war number. The report contains an abstract of the third report of the Committee on the Water Power of the Empire, suggesting that a conference should be held with the various dominions and dependencies of the Empire with a view to the creation of an Imperial Water Power Board with powers to carry out a comprehensive policy for stimulating, co-ordinating, and where necessary assisting development throughout the Empire.

Reviews.

THE DAWN IN EUROPE.

BETWEEN the history of ancient Greece and Rome and the close of the glacial period lies the long series of centuries which marks the dawn for modern humanity in Europe. These centuries, numbering roughly one hundred, and known to the archaeologist as the Neolithic and Bronze ages, have been calling for a historian these years past, one who could weave into a consecutive whole the dry facts uncarved by generations of grave-searchers. The best historian we have discovered, the man who has succeeded in painting a vivid and living picture from the scanty material now available, is JOHN M. TYLER, Professor Emeritus of Biology, Amherst College, U.S.A. In his volume, *The New Stone Age in Northern Europe*,¹ he seeks to answer questions we are all interested in: Whence came the fair-haired Nordic peoples who live round the North and Baltic seas? How did they come by their Germanic or Saxon speech? How did they come by their robust manner of living? To be sure the answers he gives us are not final—are not even satisfying—but the manner in which he propounds his problems and frames his answers are those of a facile artist.

He is one of those writers who can have justice done to them only by quotation. The first excerpt we cite is chosen from the chapter in which he pictures the kind of life led by the lake-dwellers in central Europe some five or six thousand years ago:

"Could we have sat on one of these village platforms of a summer afternoon and looked out to the wheat fields on the shore, and seen the canoes come in with fish and game, and the cattle returning from the mainland pasture; could we have watched the men fashioning implements and all manner of woodwork, and the women grinding the grain or moulding the pottery, or spinning or weaving, we should have found a great deal to interest us. The fruit and berries, the smell of roasting fish and baking bread."

A clever picture which combines into a living whole the odds and ends gathered by generations of patient and learned archaeologists. Mr. Tyler's merits constitute even his defects, for to get his vivid results he has, time upon time, to convert probabilities into actualities.

Nevertheless, here is a writer who can waken the past and make it live with a verve. Another passage may be cited to show how he handles the "invention" of agriculture, the discovery which heralded the beginning of neolithic culture:

"When she turned homeward with her load of spoil, some berries, seeds, and small bulbs doubtless fell to the ground and escaped her notice. These grew and flourished in the richer soil around the hut or shelter, for all the garbage could not have accumulated in the hut. Some unusually observing woman noticed this and protected the plants, or even cultivated them a little with her digging stick . . . and gradually started a garden."

This passage is taken from p. 103, and when we come to p. 223 we find the author's gallant supposition has become a fact, for there we read:

"We have seen that women were the first great discoverers and inventors; discoverers and founders of all our household arts and crafts as well as of most of our science."

Our author has, as all good men should have, a "soft side" for women; but if we take as our guide to the past our experience of the present, then we fear it is difficult to allow the claims he here makes for the inventive faculty of early neolithic women.

In spite, however, of a too free use of his fancy and of his genius for painting homely pictures, he has written a book which is not only readable but deserves to be read, for it is founded on a very close and competent study of available literature. Indeed, the list of references to authorities given at the end of the book will prove useful to novice and expert alike. Above all, we wish he had broken away from the traditional story that the early history of man is that of a cradle-land in Asia from which wave upon wave of migrants have issued to give the world its present population. The true story will show many cradle-lands, and a world which was not always echoing the resounding tramp of migratory hordes.

A. KEITH.

¹ *The New Stone Age in Northern Europe*. By John M. Tyler. London: Bell and Sons, Ltd. 1921. (Demy 8vo, pp. 323; illustrated, 15s. net.)

THE NURSING OF EYE CASES.

THE nursing of ophthalmic patients is a special branch of the nurse's duties; in ELLIOT'S *The Care of Eye Cases*, she will find all that is necessary for her to know about the subject.² The book is divided into three parts: in the first are details on the anatomy of the eye, on aseptis and antisepsis in eye surgery, on drops and other remedial measures, bandages, shades and dressings, on the preparation for an eye operation and the care of the patient after operation. The second part deals with the more important diseases of the eye in a brief manner, but sufficiently for the purpose of the work; an appendix is devoted to instruments.

Every surgeon has his own ideas and his own technique, but we venture to think that few will cavil at the sound advice which is presented to the nurse on nearly every page of this book. Perhaps the author might with advantage have laid more stress on the necessity for a nurse who is looking after a case of blennorrhoea to wear a pair of protective goggles and rubber gloves for her own protection; and we should have welcomed a few paragraphs on the care of ophthalmic instruments. We note that the author considers that a Buller's shield is now little used; but we believe that many eye surgeons are old-fashioned enough to consider that a Buller's shield forms a most important part of the treatment of unilateral blennorrhoea and of diphtheria of the conjunctiva, both of them, it is true, conditions happily rare in this country.

The book is well brought out, the illustrations are numerous and very good, and the text remarkably free from typographical errors, though a few have crept into the appendix, such as Placido's disc, Liebrich's probes, the Moorfield's hook, while Streatfeild's name is misspelt. Junior ophthalmic surgeons, who have to deliver a short course of lectures to nurses on ophthalmic surgery, will find in this book an admirable foundation on which to build their lectures.

DISEASES OF CHILDREN.

The Diseases of Children,³ by the late Sir JAMES GOODHART, edited by Professor G. F. STILL, now appears in its eleventh edition, and so proclaims its still vigorous life. The book is well known, and its qualities are proved by the test of time. Its form and size remain the same, but the number of illustrations has increased to sixty. In its 900 pages it gives a sufficiently complete and an admirably practical account of the subject. Goodhart set out to write his book in 1885 from the standpoint of the clinician, and especially from that of his own clinical experience. Through successive editions, and since the accession of Dr. Still to joint authorship, these outstanding qualities have been retained. We find faithful and vivid clinical descriptions of disease and a constant appeal to clinical experience. It is not difficult to understand the success of a book conceived on this plan, and written by two men, each an acknowledged master of his subject in his own generation.

We have an impression that the student would find this an easier book to read if, in the accounts of the various diseases, a more prominent and systematic place were given to pathology, and if the accounts of symptoms in all their fullness and variety were more deliberately connected with the diseased processes underlying them. We would not have less said about symptoms; but it would assist the reader, especially the student reader, if pathology and morbid anatomy were given their paragraphs and subtitles as regularly as symptoms, diagnosis, and treatment. It is interesting to note Dr. Still's views on some matters of immediate interest and discussion. He is sympathetic but cautious towards the doctrine that rickets is due to the lack of a fat-soluble vitamin. He admits the therapeutic value of the newer arsenical preparations in the treatment of congenital syphilis, but on the whole prefers the older methods of treatment by mercury, which are simpler, less painful and dangerous, and probably, he thinks, as effective. He has not admitted the term *spasmodiphilia* into his account of tetany and laryngismus: the word is perhaps clumsy, but some term covering a variety

of clinical conditions that seem to belong to one group is useful. More might perhaps have been said about anaphylaxis, with reference to asthma and certain of the cases of urticaria and eczema in children.

We cordially welcome this new edition of a book that has now served the needs of students and practitioners of medicine for thirty-five years. Goodhart abhorred a compilation. He was not slow to acknowledge his debt to other writers and teachers, but in his book he aimed chiefly at communicating what he had learned and proved in his own wards and practice. Dr. Still carries on that good tradition, and so retains the great merit of the book, that it is written by those having authority, and not as the scribes.

THE CLACTON MILITARY HOSPITAL.

WHEN war broke out the Governors of the Middlesex Hospital offered their convalescent home at Clacton-on-Sea for the treatment of wounded and sick soldiers. The War Office accepted the offer, subject to the condition that a properly qualified medical officer could be found to reside in the hospital. The Board of Governors was faced with the difficulty that nearly all the hospital surgeons had been mobilized for various duties. There remained, however, the two gynaecologists, Dr. Comyns Berkeley and Dr. Victor Bonney, who, being over military age, accepted the post of resident medical officer to the hospital at Clacton between them. From August, 1914, to February, 1919, each of them took half-weekly turns of duty. Their work, surroundings, and experiences are recorded in *The Annals of the Middlesex Hospital at Clacton-on-Sea during the Great War*.⁴

The hospital was one of the "first-line" distributing hospitals in the Eastern Command, and during the four years and a half of its existence dealt with 9,242 patients suffering from all sorts of medical and surgical conditions, many of a serious nature. The solitary resident medical officer acted as physician, surgeon, specialist, x-ray expert, house-surgeon, house-physician, and registrar—just as if these two gynaecologists were officers in the R.A.M.C., ready to go anywhere and do anything, though neither, in fact, held a commission. The volume is not a record of scientific work; the description of the medical and surgical results is condensed into 14 of the 127 pages. The book is a chatty account of life in a soldier's hospital during the war at an exposed position on the East Coast. It is filled with many anecdotes of the medical officers, the matron, sisters and V.A.D.'s and other members of the staff, and of the patients; the hospital dog, donkey, and motor car are not forgotten. The illustrations are many, and consist of sketches, often comic in nature, by James Gibbon, Dr. T. Grimsdale, and Dr. Eric Fagan, and of photographs, some of which are somewhat spoiled by a curious speckling. At the end of the book is a complete list of the staff, the auxiliary hospitals to which patients were distributed, and the regiments to which patients belonged. There is also a list showing the extent to which the shower of honours connected with the war reached the Clacton Hospital; a list chiefly remarkable for its brevity. The Royal Red Cross reached the matron, the housekeeper, and a nurse. The strenuous labours, and sacrifice of time and money by the honorary surgeons appear to have passed quite unnoticed; there is no mention even of letters of thanks. No doubt the explanation is that Clacton, as one of the authors describes it, is really "off the map." It leads nowhere, and the only way out is the way you came in. The object in publishing the book is to advance the cause of the Middlesex Hospital by drawing attention to one part of its war services. There must be many to whom the story will appeal, and we wish the authors every success in their enterprise.

NOTES ON BOOKS.

THE second quarterly instalment of vol. lxxi of the *Guy's Hospital Reports*⁵ reflects credit on the energy of the editor, Dr. A. F. HURST, both for its punctuality and for the interest of its contents, which have not, as some-

² *The Care of Eye Cases*. A Manual for the Nurse, Practitioner and Student. By R. H. Elliot, M.D., Sc.D., F.R.C.S. London: Henry Frowde, and Hodder and Stoughton, 1921. (Demy 8vo, pp. 184; 51 figures. 12s. 6d. net.)

³ *The Diseases of Children*. By the late Sir James Frederic Goodhart, Bt. M.D., LL.D., Aberd., F.R.C.P. Edited by G. F. Still, M.A., M.D., F.R.C.P. Eleventh edition. London: J. and A. Churchill, 1921. (Demy 8vo, pp. 957; 60 figures. 32s. net.)

⁴ *The Annals of the Middlesex Hospital at Clacton-on-Sea during the Great War, 1914-1919*. London: W. J. Clark and Co. 1921. (Fcap. 4to, pp. 127. Illustrated.)

⁵ *Guy's Hospital Reports*, vol. lxxi (vol. i, Fourth Series), No. 2, April, 1921; pp. 137-251. Edited by A. F. Hurst, M.D. London: Henry Frowde, and Hodder and Stoughton, 1921. (12s. 6d. Subscription for volume of four numbers. £2 2s.)

times happens in hospital reports, been previously published. The first article is by Dr. Newton Pitt, *Le Moniteur* of the late Dr. P. H. Pye-Smith, who died in 1914; it quotes some of his numerous aphorisms, the last to the effect "Be sympathetic, and never give a minute diagnosis to the patient himself." Sir William Hale-White supplements his recent article on "Richard Bright and the discovery of the disease bearing his name" by another on his observations other than those on renal disease. The fourth of Dr. J. A. Ryle's studies in gastric secretion records experiments performed on himself to ascertain (1) the degree of discomfort entailed by swallowing and retaining the gastric tube, and (2) the secretory response to a standard test meal in a healthy subject; on no occasion was any real difficulty experienced in swallowing the tube, and after the first trial no unpleasant symptom of any kind was noted, talking and even mastication not being interfered with. Hour-glass contraction of the stomach is admirably described and illustrated in an article by the Editor and Mr. R. P. Rowlands. Mr. A. W. Ormond discusses the pathological effects of the visible and invisible spectrum on the eye, and points out the need for further information on the exact wave-lengths responsible for the morbid effects. Two cases of unilateral hysterical deafness cured by the monochord, an instrument consisting of a steel bar designed to produce high notes, are recorded by Mr. Mollison; and as Mr. T. B. Layton advocates local anaesthesia for the removal of tonsils in adults, and Mr. Zamora reports four cases of mastoiditis and complications without previous otorrhoea, the throat and ear department is well represented. Dr. G. W. Nicholson's studies on tumour formation show a philosophic outlook and much thought; and the volume closes with a case of impacted upper wisdom tooth recorded by Mr. Rowlands and Mr. M. F. Hopson.

The tenth edition of the *Elements of Practical Medicine* by the late Dr. A. H. CARTER, who died in 1918, appeared in 1912, and last year the eleventh was revised and brought out by Dr. A. G. GIBSON,⁶ Lecturer on Morbid Anatomy in the University of Oxford, and Physician to the Radcliffe Infirmary and County Hospital, Oxford. A happier choice of an editor it would have been difficult to find, for Dr. Gibson keeps an accurate watch on the pulse of current medical opinion and has performed his duties with a due sense of proportion. The war has considerably modified and added to our knowledge of some diseases, and care has been taken to incorporate as much of this as comes within the scope of this well known manual, which, as its title implies, is strictly elementary and more suited for the student when commencing clinical work than for the practitioner. In a short appreciation Dr. Carter is described as representing that type of English doctor of which Sydenham was the earliest example.

Professor O'DONOGHUE'S *Introduction to Zoology* for medical students supplies a definite want. The types selected are those which usually appear in the syllabus of elementary examinations in zoology, though the arrangement is somewhat different. The author has adopted Huxley's method of commencing with a vertebrate type, in this case the frog. He deals next with the protozoa, including the life-history of the malaria parasite, coelenterates, earthworm, dogfish, and rabbit. A chapter is devoted to histology and cytology, another to evolution, variation, and heredity, and two to embryology, the chick and the rabbit being selected as the examples in dealing with organogeny and later development. The book is clearly written and understandable. The illustrations are not too loaded with detail, so that they can be followed easily by the beginner. Physiology is dealt with more fully than is usual in a textbook of zoology, and there is a short account of such matters as toxins and antibodies generally. These are valuable additions for all students, more particularly students of medicine, for whom the book is primarily intended. It is a most useful textbook for the elementary student, and anyone who has mastered it has a good solid foundation on which to build.

Most medical men who were on active service during the war have an idea that if they cannot speak French fluently at least they can understand the language. When, however, the average man attempts to read a French medical work—and those who looked a few years ago to

Germany as the fount and origin of modern medical matters may well be surprised at the wealth of scientific information that French medicine has to offer—he is humbled by his ignorance of the precise meaning of many of the scientific terms. To his aid comes the *French-English Medical Dictionary* that Dr. ALFRED GORDON of Philadelphia, has edited. It is full, and appears, so far as we have tested it, to be accurate; it can be commended as a very useful little volume.

The *Empire Municipal Directory and Year Book*,⁷ which has now attained its thirty-ninth annual issue, is a useful directory of the British and Colonial municipal corporations and county, urban, and rural councils. It includes lists of the chief officials, with their addresses and telephone numbers. There are also special articles on such subjects as public health, public cleansing and waste utilization, housing and town planning, practical sanitation, and sewage disposal, containing reviews of recent progress on these problems and descriptions of all the approved methods. The volume may be commended to the attention particularly of public health officials.

⁷ *The Empire Municipal Directory of Local Authorities and Officials and Year Book of Municipal Engineering and the Sanitary Record* for 1921-22. London: The Sanitary Publishing Co. Ltd. 1921. (7 x 9½, pp. 271, 10s. 6d. net.)

APPLIANCES AND PREPARATIONS.

A Compact Warm Ether Inhaler.

DR. G. A. TICEHURST (Assistant Physician, East Sussex Hospital, Hastings) writes: The advantages of warm ether vapour for anaesthesia by the open method are generally admitted; they were described by Shipway in this country in 1916,¹ and considerable experience was afforded later by the use of his apparatus at many of our clearing stations and hospitals during the war. I have, however, felt the need of an inhaler of some kind which, being independent of an extraneous source of heat, and not needing continuous air pumping, would be sufficiently compact to be easily accommodated in the anaesthetist's bag, and would yet warm the inhaled vapour to a sufficient extent. A fairly obvious device is the utilization of the heat otherwise lost to the patient in his expired breath; this takes place in all closed forms of inhaler, and to a certain degree with open methods, using a mask. It is incidentally exactly comparable to the exhaust heating of a motor-car carburetter. The inhaler in which I have employed this device somewhat resembles the small Roth-Deaeger instrument, and consists (see illustration) of three parts: 1 a face-piece carrying the usual rubber cushion and provided with inspiratory and expiratory valves; 2 a radiating chamber containing nineteen thin metal tubes; and 3 a container for sponge or gauze upon which the ether is dropped. Ether is inspired from the container through the warmed "radiator" tubes, while the expired breath is directed by the expira-

tory valve through a short passage into the radiating chamber, where it passes between the tubes, to which it gives some of its heat, and escapes through holes in the opposite side. The radiator is locked to the face-piece by a small screw, and the container can be revolved into any convenient position for the dropping of ether. The inhaler is strictly of the semi-open type, but the airway has been kept everywhere as free as possible to prevent restriction of breathing and promote interchange of heat; a slight amount of rebreathing is allowed by the volume of the face-piece, the in- and out-going streams being otherwise separate. Without the radiating chamber in use the temperature of the inspired vapour above the face-piece is from 32 to 33 F. This is considerably lower than is shown by a thermometer under a Skinner's mask during "open" administration; but here the actual temperature is variable and uncertain owing to the fluctuation of the alternate warm and cold streams. On bringing the radiating chamber into use the temperature rises in the course of a few minutes to 65-70 F., occasionally higher, generally rather above room temperature, and remains fairly steady. This is again not so high as can be obtained with an extraneous source of heat, but is, I think, sufficient for the purpose. There is a considerable economy of ether over the use of a mask, and a welcome diminution in the amount of ether in the air surrounding operator and anaesthetist. Anaesthetic mixtures can be used equally well if desired. The instrument is made entirely of metal except for the rubber cushion and the valve-flaps; it can therefore be readily sterilized. Its length is approximately 7 in. and its weight 13 oz. It has been made for me by Messrs. Down Brothers, St. Thomas's Street, S.E.1. I have not been able to find any description of an inhaler on these lines; if such exists I must apologize to the designer for my unconscious plagiarism.

X-RAY AND RADIUM PROTECTION.

PRELIMINARY REPORT OF COMMITTEE.

THE X-Ray and Radium Protection Committee, representing the various radiological and other scientific bodies with their headquarters in the metropolis, after deliberating for some weeks, has issued its preliminary report, which is admittedly tentative in some of its recommendations. This report, which is a carefully thought out statement of present knowledge in regard to equipment, ventilation, and working conditions of *x*-ray and radium departments, was a matter of considerable urgency owing to the constant demand for guidance from individuals and institutions; it is printed in full below. After the completion of this, the preliminary part of its work, the Committee intends to proceed with its more extensive objects which may entail considerable research.

The chairman of the Committee is Sir Humphry Rolleston, K.C.B. The other members are: Sir Archibald Reid, K.B.E., C.M.G. (St. Thomas's Hospital), Dr. Robert Knox (King's College Hospital), Dr. G. Harrison Orton (St. Mary's Hospital), Dr. S. Gilbert Scott (London Hospital), Dr. J. C. Mottram (Pathologist, Radium Institute), Dr. G. W. C. Kaye, O.B.E. (National Physical Laboratory), and Mr. Cuthbert Andrews. The honorary secretaries are Dr. Stanley Melville (St. George's Hospital) and Professor S. Russ (the Middlesex Hospital).

Suggestions and offers of personal or other assistance are invited, and should be sent to the Honorary Secretaries of the Committee, care of Royal Society of Medicine, 1, Wimpole Street, W.1. Copies of the preliminary report may be had on application to the Honorary Secretaries.

Introduction.

The danger of over-exposure to *x* rays and radium can be avoided by the provision of efficient protection and suitable working conditions. The known effects on the operator to be guarded against are: (1) Visible injuries to the superficial tissues which may result in permanent damage. (2) Derangements of internal organs and changes in the blood. These are especially important, as their early manifestation is often unrecognized.

General Recommendations.

It is the duty of those in charge of *x*-ray and radium departments to ensure efficient protection and suitable working conditions for the personnel.

The following precautions are recommended:

1. Not more than seven working hours a day.
2. Sundays and two half-days off duty each week, to be spent as much as possible out of doors.
3. An annual holiday of one month, or two separate fortnights.

Sisters and nurses, employed as whole-time workers in *x*-ray and radium departments, should not be called upon for any other hospital service.

Protective Measures.

It cannot be insisted upon too strongly that a primary precaution in all *x*-ray work is to surround the *x*-ray bulb itself as completely as possible with adequate protective material, except for an aperture as small as possible for the work in hand.

The protective measures recommended are dealt with under the following sections:

- I. X rays for diagnostic purposes.
- II. X rays for superficial therapy.
- III. X rays for deep therapy.
- IV. X rays for industrial and research purposes.
- V. Electrical precautions in *x*-ray departments.
- VI. Ventilation of *x*-ray departments.
- VII. Radium therapy.

It must be clearly understood that the protective measures recommended for these various purposes are not necessarily interchangeable; for instance, to use for deep therapy the measures intended for superficial therapy would probably subject the worker to serious injury.

I.—X RAYS FOR DIAGNOSTIC PURPOSES.

(1) *Screen Examinations.*

(a) The *x*-ray bulb to be enclosed as completely as possible with protective material equivalent to not less than 2 mm. of lead. The material of the diaphragm to be equivalent to not less than 2 mm. of lead.

(b) The fluorescent screen to be fitted with lead-glass equivalent to not less than 1 mm. of lead, and to be large enough to cover the area irradiated when the diaphragm is opened to its widest. (Practical difficulties militate at present against the recommendation of a greater degree of protection.)

(c) A travelling protective screen, of material equivalent to not less than 2 mm. of lead, should be employed between the operator and the *x*-ray box.

(d) Protective gloves to be of lead-rubber (or the like) equivalent to not less than $\frac{1}{2}$ mm. of lead and to be lined with leather or other suitable material. (As practical difficulties militate at present against the recommendation of a greater degree of protection, all manipulations during screen examination should be reduced to a minimum.)

(e) A minimum output of radiation should be used with the bulb as far from the screen as is consistent with the efficiency of the work in hand. Screen work to be as expeditious as possible.

(2) *Radiographic Examinations ("Overhead" Equipment).*

(a) The *x*-ray bulb to be enclosed as completely as possible with protective material equivalent to not less than 2 mm. of lead.

(b) The operator to stand behind a protective screen of material equivalent to not less than 2 mm. of lead.

II.—X RAYS FOR SUPERFICIAL THERAPY.

It is difficult to define the line of demarcation between superficial and deep therapy. For this reason it is recommended that, in the reorganization of existing, or the equipment of new, *x*-ray departments small cubicles should not be adopted, but that the precautionary measures suggested for deep therapy should be followed. The definition of superficial therapy is considered to cover sets of apparatus giving a maximum of 100,000 volts (15 cm. spark-gap between points; 5 cm. spark-gap between spheres of diameter 5 cm.).

Cubicle System.

Where the cubicle system is already in existence it is recommended that:

1. The cubicle should be well lighted and ventilated, preferably provided with an exhaust electric fan in an outside wall or ventilation shaft. The controls of the *x*-ray apparatus to be outside the cubicle.

2. The walls of the cubicle to be of material equivalent to not less than 2 mm. of lead. Windows to be of lead-glass of equivalent thickness.

3. The *x*-ray bulb to be enclosed as completely as possible with protective material equivalent to not less than 2 mm. of lead.

III.—X RAYS FOR DEEP THERAPY.

This section refers to sets of apparatus giving voltages above 100,000.

1. Small cubicles are not recommended.

2. A large, lofty, well ventilated and lighted room to be provided.

3. The *x*-ray bulb to be enclosed as completely as possible with protective material equivalent to not less than 3 mm. of lead.

4. A separate enclosure to be provided for the operator, situated as far as possible from the *x*-ray bulb. All controls to be within this enclosure, the walls and windows of which to be of material equivalent to not less than 3 mm. of lead.

IV.—X RAYS FOR INDUSTRIAL AND RESEARCH PURPOSES.

The preceding recommendations for voltages above and below 100,000 will probably apply to the majority of conditions under which *x* rays are used for industrial and research purposes.

V.—ELECTRICAL PRECAUTIONS IN X-RAY DEPARTMENTS.

The following recommendations are made:

1. Wooden, cork, or rubber floors should be provided; existing concrete floors should be covered with one of the above materials.

2. Stout metal tubes or rods should, wherever possible, be used instead of wires for conductors. Thickly insulated wire is preferable to bare wire. Slack or looped wires are to be avoided.

3. All metal parts of the apparatus and room to be efficiently earthed.

4. All main and supply switches should be very distinctly indicated. Wherever possible double-pole switches should be used in preference to single-pole. Fuses no heavier than necessary for the purpose in hand should be used. Unemployed leads to the high-tension generator should not be permitted.

VI.—VENTILATION OF X-RAY DEPARTMENTS.

1. It is strongly recommended that the x-ray department should not be below the ground level.

2. The importance of adequate ventilation in both operating and dark rooms is supreme. Artificial ventilation is recommended in most cases. With very high potentials coronal discharges are difficult to avoid, and these produce ozone and nitrous fumes, both of which are prejudicial to the operator. Dark rooms should be capable of being readily opened up to sunshine and fresh air when not in use. The walls and ceilings of dark rooms are best painted some more cheerful hue than black.

VII.—RADIUM THERAPY.

The following protective measures are recommended for the handling of quantities of radium up to one gram:

1. In order to avoid injury to the fingers the radium, whether in the form of applicators of radium salt or of emanation tubes, should always be manipulated with forceps or similar instruments, and it should be carried from place to place in long-handled boxes lined on all sides with 1 cm. of lead.

2. In order to avoid the penetrating rays of radium all manipulations should be carried out as rapidly as possible, and the operator should not remain in the vicinity of radium for longer than is necessary. The radium, when not in use, should be stored in an enclosure, the wall thickness of which should be equivalent to not less than 8 cm. of lead.

3. In the handling of emanation all manipulations should, as far as possible, be carried out during its relatively inactive state. In manipulations where emanation is likely to come into direct contact with the fingers thin rubber gloves should be worn. The escape of emanation should be very carefully guarded against, and the room in which it is prepared should be provided with an exhaust electric fan.

Existing Facilities for Ensuring Safety of Operators.

The governing bodies of many institutions where radiological work is carried on may wish to have further guarantees of the general safety of the conditions under which their personnel work.

1. Although the Committee believe that an adequate degree of safety would result if the recommendations now put forward were acted upon, they would point out that this is entirely dependent upon the loyal co-operation of the personnel in following the precautionary measures outlined for their benefit.

2. The Committee would also point out that the National Physical Laboratory, Teddington, is prepared to carry out exact measurements upon x-ray protective materials and to arrange for periodic inspection of existing installations on the lines of the present recommendations.

3. Further, in view of the varying susceptibilities of workers to radiation, the Committee recommend that wherever possible, periodic tests—for example, every three months—be made upon the blood of the personnel, so that any changes which occur may be recognized at an early stage. In the present state of our knowledge it is difficult to decide when small variations from the normal blood count become significant.

NURSING associations in the United States of America have collected a sum of money to erect a memorial to the 284 American nurses who gave their lives in the war. It takes the form of a new building for the Florence Nightingale Training School for Nurses at Bordeaux, founded twenty years ago by Dr. Anna Hamilton.

THE third international post-graduate course in balneology and balneotherapy will be held at Carlsbad from September 11th to September 17th, when lectures will be delivered by members of the medical faculties of Berlin, Breslau, Budapesth, Erlangen, Göttingen, Halle, Prague, Rome, San Pablo (Brazil), Stockholm, and Vienna. The opening address will be given by Dr. Abderhalden of Halle.

THE PRIVATE CLINIC SYSTEM.

DISCUSSION AT THE ROYAL SOCIETY OF MEDICINE.

A GENERAL meeting of the Fellows of the Royal Society of Medicine was held on June 16th, under the presidency of Sir JOHN BLAND-SUTTON, to discuss the question of the private clinic system in Great Britain.

Sir THOMAS HORDER, who used the American term "group medicine," said that there was nothing new in this conception. The principle was in daily operation in most of the general hospitals, where patients were often transferred from one ward or department to another so as to secure for them the benefits of the service most nearly adapted to the nature of their disease. The facilities for group practice afforded by general hospital conditions had led to increased efficiency so far as the patient was concerned, and had also contributed to the advance of medical knowledge. It seemed natural, therefore, to consider some adaptation of the method to private practice; perhaps such a development was already overdue, and if the profession did not itself arrange for group medicine its hand might be forced by the public, and that would bring about many professional complications. The problem of the nursing home was bound up with this question of group diagnosis and treatment. The patient of moderate means wondered why little or nothing had been done to improve the present conditions in this respect, and if the development of group clinics hastened the arrival of institutions properly equipped and administered to replace the small private houses used as nursing homes, group medicine would at least have done something which would go far in its justification. Any clinic system must be planned so as to supplement the ordinary routine examination of the patient by facilities for expert investigation, and must also offer like facilities for more thorough and therefore more beneficent treatment than could be undertaken by any individual practitioner. It should also save time both for doctor and patient without sacrifice of efficiency. A practitioner working with a number of juniors, who were in effect his assistants and had no special knowledge or training, was a group indeed, but one which did not fulfil the requirements, and the same was true of a group consisting of a number of practitioners or consultants working together but not chosen so as to represent the various branches of medicine. A true group which did fulfil the requirements laid down consisted of a number of practitioners or consultants of equal professional status, chosen carefully—"hand-picked," as the Americans said—so as to be representative of various branches of medicine. Another system which fulfilled the requirements, although it was not a true group, was one in which a practitioner of great experience and balanced judgement first himself made a careful routine examination of the patients, and then referred them to particular specialists who were in association with him for expert investigation and report. The first of these units he called a group clinic, and the second a personal clinic. The group clinic had certain advantages: it could deal with patients having a large variety of diseases, and it would naturally have some arrangement by which its constituent members would be readily available for the expert examination of any patient. The chief of the personal clinic, on the other hand, must make his own special arrangements with his experts. In the group clinic meetings of all the members could take place at a settled time, whereas the chief of the personal clinic would rarely if ever meet all his experts together. Nevertheless, the personal clinic had advantages of its own. Its chief was brought into close touch with each patient, whereas in a group this personal relationship would tend to lapse, at least in respect to those patients whose trouble was found to concern more than one member of the group. The success of any form of group medicine depended upon a sound judgement at the outset in deciding what expert examinations were necessary, upon the subsequent co-ordination or integration of the various expert reports, and upon the decision as to a programme of treatment; and Sir Thomas Horder rather thought that in these respects the personal clinic would score. To send a patient round to a number of experts quite indiscriminately would bring the whole position of group medicine into disrepute. With regard to finance also, much greater difficulties faced the group clinic than the personal clinic. It was difficult to see how, under the group system, a flat-rate fee could

be arrived at without considering the members of the group as partners in a concern. On the other hand, the specialists attached to a personal clinic might be paid their customary consultation fees as extras. As a general financial principle, he thought it would be better to charge a smaller rate for the original survey, and then a surcharge for whatever special services were necessary, rather than to institute a larger flat-rate fee to cover all services. He left the problem of distribution among the members of the group to other speakers, and also the question of legal relationship, whether a deed of partnership or the setting up of an incorporated body was preferable. Certain precautions must be taken to prevent the growth of undesirable cliques, which would impair the cordial relationships existing at present among members of the profession. He feared also that the personal relationship between doctor and patient would tend to lapse in group medicine; it might be maintained by making the group no larger than was absolutely necessary to cover the main branches of practice, and by each member guarding the personal relationship of all patients who came originally to him. Up to now the private clinic supervised by one man who was fitted for this kind of work had been more easy to set going than the group clinic, yet it seemed highly probable that the group clinic would become a British institution. He believed that it had a better future than the personal clinic, although, of course, initial experiments must be regarded critically and its limitations must be faced—as, for instance, that it was less fitted for rural than for urban areas, and that some men were temperamentally less able than others to work in a team.

Sir HUMPHRY ROLLESTON said that the expression "team work" first became familiar in connexion with research into problems necessitating collaboration between experts in various branches of medicine. There its advantages were obvious, and its application to practice followed naturally. The question was how to place within the reach of the rest of the population the advantages which the necessitous poor got in the ordinary hospitals. To a certain extent practitioners in partnership had endeavoured to carry out the team idea. In choosing a junior partner, for instance, they would apply to the schools for one familiar with recent advances in surgery, and the older partners would give up their holiday for post-graduate instruction along some special line, so as to be authorities on a particular subject in their locality. He went on to refer to the great development of the Mayo Clinic at Rochester, Minnesota, and said that those who had had the opportunity of seeing the phenomenal success which had followed the organization of the Mayo brothers felt like the Queen of Sheba after her visit to Solomon. The Mayo Clinic had now become an educational and research institution as well, but originally it was an excellent example of a surgical clinic—the cases were mainly surgical—run on these group lines of medicine. There was room for a great deal of variation in the personnel and arrangements of team work; the team and its equipment might be made comprehensive, or it might be confined to a surgical or specialist function. The patients might be merely those belonging to members of the particular group, who had united their former practices so as to economize time and secure more satisfactory results, or they might be patients sent by outside practitioners for the purpose of diagnosis, to be returned with the report. In large cities there would be room for both these arrangements. In a small town the team might act injuriously to the interests of practitioners who were not members, and this must be prevented as far as possible. But in any case a team in an organized form was bound to come, if it had not already arrived. From the patient's point of view there was no doubt that a systematic examination by all available methods of the laboratory would be a great advantage. The procedure would be economical because the equipment would be concentrated in one establishment, so that the inclusive charge to the patient might be lower than would be the aggregate of fees under ordinary circumstances, while yet the return to the members might be higher. Medical men, with this combination of facilities and accessibility of advice, would get through their work in a more satisfactory manner and with less waste of time. A team of consultants and experts would be in the same position as a firm of general practitioners; as members of a team they might be regarded as a company, but he saw

no difficulty in securing any necessary statutory amendments to meet the position.

Dr. DRURY PENNINGTON spoke as a general practitioner who had had country experience. His attempts to get team work started had met with individual encouragement, but collectively there was a certain shyness among medical bodies, which hesitated to pronounce one way or the other. The most articulate objection was that the time was not ripe; but certainly the time was judged to be ripe for combination in all lines of trade and commerce. Was the medical profession alone to continue in the old-fashioned way? He maintained that the time was ripe, and for two reasons: (1) the rapidly decreasing power of the public to pay the old dues; (2) the formidable increase in the cost of diagnosis alone during the last fifteen years. When confronted with a chronic case having a multiplicity of symptoms probably arising from some fundamental cause or causes, he had found it necessary, in order to assure himself of the accuracy of his diagnosis, to apply to the bacteriologist and other experts for some of the links in the chain of evidence, but he had always to consider the patient's pocket, and this difficulty was often only surmounted by begging for gratuitous service from his colleagues—to which he greatly objected—or by converting his own fee into payment for such service. No one more highly appreciated the value of the advice of specialists than he did, but he thought that specialism sooner or later tended to produce a mental myopia, and the whole was sometimes lost in the part. He found himself often forced into being an arbiter between the conflicting opinions of rival specialists. He conceived it his duty to keep his eye on the individuality of his patient. He found himself less and less consulting with the man whose sole armamentarium was a stethoscope. Before many years were out he believed the general consulting physician would cease to exist, but he would find his regeneration in the rôle of assessor to a team. Dr. Pennington held that the time was ripe for an adaptation of medical practice to the evident requirements of modern science and economics alike. The formation of teams all over the country, each suited to the local requirements, must supersede the present system of individualism, and the faults which existed here and there in private practice would tend to disappear when the individual himself was no longer the only one to be considered.

Mr. BISHOP HARMAN said that he felt honoured in being asked to contribute to the discussion as Chairman of the Hospitals Committee of the British Medical Association, but he wished to make it clear that he had no authoritative information to give. There were certain points, however, which might throw light on professional feeling in the matter of these private clinics. During the war the Central Medical War Committee urged private practitioners to combine in order to foster subdivision of their work, thereby promoting economy and higher attainment in special branches, and to facilitate continuity during illness, holidays, and periods of study. The recommendation was well received and was acted upon with success. A combination for in-patient work in a private hospital in the provinces had been under review, and no exception had been taken to it. In general, he thought, the principle of combination, either for domiciliary treatment or clinic work, would be conceded. It was the necessary outcome of the growing complexity of medical work. It was the logical corollary of the established principle of hospital practice. It was a means of extending the known benefits, which patients in a charity foundation obtained as a matter of course, to private patients who were able to pay their way. In practice certain difficulties might arise: (1) The cost of establishing an efficient private clinic might be so high as to prevent a combination of capable doctors establishing their clinic on their own resources, and they might be tempted to accept lay association in finance, which might mean lay control or direction. The lay element would desire financial success, and the temptation to some form of advertising would be difficult to combat. Difficulties akin to this had arisen in connexion with establishments which were originally founded as quasi-medical institutions and now combined medical work with facilities for legitimate entertainment. A risk like this could be guarded against by a legal deed of constitution for each clinic before it was set up. (2) If powerful combinations became numerous they might exert an inhibitory influence on the younger members of the

profession who could not or would not seek admission to existing combinations. Possibly existing combinations might be powerful enough to prevent the establishment of new combinations, and thereby act detrimentally on the development of professional knowledge and skill. Possibilities such as these foreshadowed a risk of professional competition far more serious than anything now existing between individual practitioners or partnerships, and it was difficult to see how it could be guarded against. (3) Some might think there was a risk that the commercial aspect of a costly clinic would cause patients to be exploited for profit. That risk was present in any form of practice, individual or combined, and there was no safeguard against it other than a high standard of integrity in the profession. As long as the standard remained as high as it was to-day the risk was minimal, and there was no reason why it should not be maintained. In conclusion, Mr. Harman cited some actual expressions of intelligent patients in describing their experiences to him, which showed with what favour they viewed these arrangements.

Mr. W. H. CLAYTON-GREENE, speaking as a surgeon, declared that the existing system was most unsatisfactory to him. He believed that the phrase of a previous speaker, "mental myopia," excellently described the condition of some of the workers in laboratories who were not brought into contact with cases clinically. Specialism did narrow the view. At one end of Harley Street he thought there was a tendency to talk of ileum stasis, and at the other end a tendency to note duodenal irritation! If cases were consulted over, not only by the surgeon and physician, but by the radiographer and pathologist, many avoidable mistakes would not be made. The custom of sending a patient—or, rather, a piece of the patient—without any clinical report to the expert was utterly wrong. It resulted in what might be called the suggestion-error in diagnosis. These difficulties would be overcome if a clinical system were initiated whereby the specialists in different departments met and consulted and realized their own mistakes. On the operative side every one would agree that the smoothest operations were done in hospital, where real team work was available. How different was the condition obtaining in many of the nursing homes! It had to be remembered that no operation could be prophesied as a perfectly simple one. These reasons made him support most strongly the provision of private clinics. If a clinic system were introduced and did its job well, he had not the slightest doubt that the public would wear a path to its door.

Mr. W. S. DICKIE discussed in considerable detail the cost of setting up an institution for receiving private patients. In his view the ideal hospital for private patients might be constructed at a capital cost of not more than £500 a bed, and probably less. He discussed also the running costs, and his figures as he worked them out showed that a good private hospital might be run at seven guineas per bed per week.

Dr. A. F. HURST described the private clinic which he has set up twenty miles from London. In his view there was no question but that the patient needing elaborate examination gained considerably by the establishment of such a clinic. An inclusive fee made it possible to carry out many examinations, routine and otherwise, which they would be loath to make if each separate examination entailed an additional cost to the patient, and it had been remarkable what unexpected diagnoses they had reached as a result of these extra examinations. A clinic of this sort should be regarded as a place where there was a prolonged consultation. The saving of time to the medical man was very considerable because the work was all in one building, and there was no necessity to fit in various appointments at different places. Time was also saved from the patient's point of view, because within a week, even in the most complicated case, a definite diagnosis should be made if such diagnosis was possible at all. The presence of a resident medical officer was of enormous advantage because he took over a great deal of the routine work, and also was available to examine the patient and check the patient's description of his symptoms at any time, day or night. Dr. Hurst quite realized that the primary object of such an institution was diagnostic, but there were certain patients who ought to have their treatment under the same absolute control from day to day.

Dr. G. C. ANDERSON, who said that he spoke privately and not as an official of the British Medical Association, was quite sure that any movement on the lines of the private clinic system would be welcomed by the general practitioner. He urged the advantage it would be to a general practitioner to send a patient to a private clinic and there obtain a comprehensive report, with, most probably, an accurate diagnosis, owing to the ancillary aids to examination, combined with the ordinary clinical methods. Without such assistance the general practitioner might in the first instance direct the patient to a surgeon only to be told that the case was purely a medical one, or, again, that the surgeon must consult the radiographer. The fees charged at a clinic could be more moderate than the present fees charged by individual consultants because by combination the expenses would be lessened. Dr. Anderson sketched the possible constitution and working of a team. Each member might carry on his usual private practice at the clinic, where he would always have at hand a second opinion. Each member of the team might draw his own fees from the patients who consulted him at the clinic in a private capacity, but if any patient were sent by an outside practitioner to the clinic for general diagnosis the fee received for such diagnosis should go into the central pool, upon which would fall the burden of the upkeep of the establishment. The expenses necessary for the conduct of the clinic would be met out of this central fund, and the practitioners would thereby be enabled to carry on their private practice without any expense at all. Any surplus from the pool could be divided yearly among the members of the clinic. As for treatment, if a patient were treated in a nursing home attached to the clinic payment should be made in the usual way, the nursing home charges going towards the upkeep of the home, whilst the surgeon's or physician's fees would be paid direct to the individual who had undertaken the treatment. It would be an advantage to have a medical assessor attached to the clinic, to whom all patients other than those who wished to see a particular member of the team might be directed in the first instance. To be a success a private clinic should be conducted on such lines as would secure the hearty co-operation both of the general practitioner and of the consulting branch of the profession; the fact that such clinics existed should be communicated to the profession only in the usual way. Once the public was asked to aid in the financing of a nursing home the question of advertising was bound to arise, and he felt strongly that the control of private clinics, whether for diagnosis or treatment purposes, should be entirely in the hands of medical men.

Sir THOMAS HORDER then proposed a resolution:

That in the opinion of this meeting the time is ripe for the formation of group clinics in this country, and that sympathetic encouragement should be given to them by the profession and by its governing bodies.

Dr. C. O. HAWTHORNE suggested that it was inadvisable that such a resolution should be put to the meeting before the subject had been thrown open for general discussion; all the speakers had been those previously advertised to take part. He suggested that the discussion be adjourned to a convenient date.

Sir THOMAS HORDER fell in with this view, and it was agreed to hold a further meeting for fuller discussion, after which the resolution would be submitted.

THE USE AND ABUSE OF SCIENTIFIC MEDICAL LITERATURE.

A LECTURE which had its humorous touches was delivered at the Institute of Pathology and Research at St. Mary's Hospital on June 16th by Professor W. Bulloch, M.D., F.R.S., whose subject was the use and abuse of scientific medical literature. Professor Bulloch did not spare the frailties either of editors or contributors, and he appeared to think that medical journals still left a great deal to be wished for. His subject was suggested to him by a conversation he had with a house surgeon, who was proposing to write a paper on injuries of the upper extremity. Professor Bulloch remarked that this was an unusually comprehensive theme, and that if he confined himself to the last phalanx of the little finger he would probably

find sufficient material, but he discovered that the young man was almost childishly ignorant of medical literature, and had scarcely thought of referring to what might have been written before him.

Professor Bulloch began with a historical sketch, in which he touched slightly on ancient learning, the barrenness and decay of the centuries between the fifth and the eleventh, and the revival in Italy, gradually spreading from Salerno over Europe, until now there were in all the world 275 recognized universities, the largest in Paris, and the smallest at Reykjavik in Iceland with forty-five students. In the evolution of medical knowledge the era of dogma came first, with Hippocrates and Galen as its landmarks; then the era of empiricism, when medicine was based to a certain extent on experience, but was still dominated by preconceived notions, and was not capable of distinguishing between apparently similar phenomena; to this era belonged such terms as "rheumatism," "biliousness," and "congestion." Finally the concept arose that medicine was merely a branch of biology, and an age of specialism came in. Specialism had its bad side as well as its good, but it was mainly through specialism that modern knowledge had advanced. Books at first sufficed to keep pace with the growth of knowledge, but by degrees, with the rush of life, there arose a medical periodical literature. The first medical publications of this kind dated from the later years of the seventeenth century, and the growth had continued, slowly at first, but gathering momentum, until now there were between four and five thousand medical periodical publications of all sorts, including well over a thousand in the United States, over a hundred in Japan, and in China, with its splendid contempt for western civilization, only two, both of them in English. Some of the medical journals, particularly the American, were evanescent; but in our own more stable and conservative country the medical periodical literature shared these qualities, and was also immensely stodgy; the *Lancet* of to-day did not differ in substance and arrangement from the same journal of sixty years ago.

Professor Bulloch then gave some figures to prove how enormous was the output of the medical pen. Between 1893 and 1913, according to the *Catalogue of the Surgeon-General's Library* at Washington—the greatest medical library in the world—25,000 articles were written on tuberculosis alone, more than half of them dealing with the pulmonary form of the disease. At present there were 31 journals devoted exclusively to the subject of tuberculosis, 26 of them European and 5 American. Down to 1893 about 7,000 articles and books had been written on syphilis, but between 1893 and 1913 this output was doubled. In the same twenty years 7,000 articles were written on heart disease and 7,000 on pregnancy, including 870 on tubal pregnancy alone. What would be the result if this colossal production continued in the same ratio? At a time not very remote our libraries would have to be great cities, and all persons not engaged in writing would have to be engaged in editing or cataloguing. One of the good things which the war had done—perhaps its only virtue—was to bring about an increase in the cost of printing and paper, involving the cessation of many useless journals. Already, on any big subject, the task of the student, even if he dealt only with abstracts, was almost hopeless.

As for the British medical weekly journals, Professor Bulloch placed them on a plane of value rather below that of their Continental contemporaries. He gave a satirical summary of the contents—voluminous lectures by so-called leaders of the profession, whose contributions were out of date before they were written, some scrappy and badly reported clinical notes, a leader by an anonymous writer (the anonymity depriving the reader of any means of assessing its value); a record of the doughty deeds of the British Medical Association, what the Association did at its last picnic, and what it would do at its next; the Presidential Address, the Address in Medicine, and the Address in Surgery; various conflicting opinions on the Midwives' Registration Bill; announcements of births, deaths, and marriages, and a number of advertisements. The journals which the speaker selected for his unadulterated praise were various monthly or quarterly productions, like *Brain* and the *Journal of Physiology*. Professor Bulloch made merry over the titles of many journals in the States, where there was an organ called *Medical Chips*, and another, said to be devoted to furnishing materials for the use of busy

physicians, called *Medical Snapshots*. There was also a *Journal of Orificial Surgery*, while the number of dental papers, particularly on the Californian coast, was extraordinary.

Medical periodical literature was a necessity. Medical men could not be individualists. They must supplement their own work with the experience—including the contemporaneous experience—of others. From a study of the work of others they might get a clue to the knowledge still required to elucidate some disease. But, notwithstanding this great literature, there were vast lacunae in our knowledge whichever way we turned. Moreover, many affirmations were made in medical literature which had never been tested, and would not bear testing for a moment. He insisted that every quotation should be verified by reference to the original source, or if the original source was inaccessible the intermediate authority should be cited as well. An enormous number of errors occurred in transmission from one periodical to another, and details were added in an unaccountable fashion. The lecturer described his own efforts to trace the real authority for certain statements made in the literature of haemophilia. In instance after instance he found, on appealing to the person who was invoked as an authority for a statement, that that person had not actually seen the case in question, but had heard about it from someone else. Out of 949 papers on haemophilia he and a colleague found only 44 which were written in such a manner as to be useful for formulating some definite statement on the subject of heredity. Every article should have, for index purposes, a distinct title, as concise as possible; such titles as "A Strange Case," "A Clinical Record," "A Difficult Labour," "A Remarkable Tumour," should never appear in medical literature. On the other hand, the title was sometimes so lengthy as to make one wonder why the paper that followed need have been written at all. Then medical writers should always be explicit in their references. "Smith, B.M.J., 1904," was an instance of what to avoid: there were endless people of the name of Smith, and there were two volumes, each of 2,000 pages, of the *BRITISH MEDICAL JOURNAL* for 1904. He also urged that all articles should be signed; anonymous articles or articles with the initials only appended suggested that the writer had something to conceal. Editorial supervision and censorship needed to be very much more vigorous. The publication of the same paper in several journals—mostly for vanity and self-advertisement—was a thing which should be rigorously banned. In the library of the Royal College of Surgeons he had spread out before him not long ago six separate journals all containing the same paper which he checked in all of them paragraph by paragraph.

THE PART OF THE STATE IN THE PREVENTION OF DISEASE.

DR. ADDISON'S CAVENDISH LECTURE.

THE Cavendish Lecture was delivered before the West London Medico-Chirurgical Society on June 17th by Dr. CHRISTOPHER ADDISON, M.P., who took as his subject, "The part of the State in the prevention of disease." The chair was occupied by Dr. F. J. McCANN, President, who said, in introducing the lecturer, that there were few men who, like Dr. Addison, had risen to eminence in two professions. One of the few was Dr. Addison's late Cabinet colleague, Sir Auckland Geddes, now British Ambassador at Washington, and his earlier reputation, like Dr. Addison's, was achieved in anatomy. There was something in the study of anatomy which fitted men for public service. It taught them to grasp and appreciate detail, it fostered accuracy of statement, and, above all, it was a most excellent stimulus to memory. He was glad to think that, as Minister without portfolio, Dr. Addison would still be able to place his ripe experience and mature judgement at the disposal of the Prime Minister. (Applause.)

Dr. ADDISON, after a reference to his close association in boyhood with Mr. Keetley, the founder of the lectureship, went on to speak of the vast loss, not only in terms of money, but of physical and social wastage, which resulted from avoidable causes, and the need that as little as possible of that loss should be projected into the future. In these matters society must depend above all things upon the guidance of well balanced and carefully considered

professional advice of a practical kind, based upon the undoubted findings of experience, and as little cumbered as might be with the pedantry of high words. An opponent had to be reckoned with in the shape of a certain type of latter-day economist who would readily spend millions on armaments, even over and above the demands of the Services, and would urge the Government to shovel out other millions in all manner of doles and subsidies, but in meticulous and unfriendly detail would question every item spent on preventive services, and "will crucify you if you talk of research."

Individual Effort in Preventive Medicine.

By the nature of the case knowledge was always in advance of its application, but the character of the work of the average medical man placed its own difficulties in the way of his making the fullest use of his knowledge to aid in the prevention of sickness generally. As opportunities occurred, and as he was convinced that disabilities arose from faulty habits or conditions, the medical man gave such counsel as he thought would contribute to the prevention of their recurrence; but apart from the fact that these counsels were afterwards forgotten or not observed by his patients, he was often conscious that the causes were beyond either his control or theirs. The energies of the average medical man were devoted to healing the ill effects, and not so much to the removal of the cause, even when this was understood. At the same time the lecturer thought that there was a deficiency in the teaching of preventive medicine, and that this subject did not enter sufficiently into the medical curriculum. The next generation of medical men, he hoped, would have a better opportunity than the existing one for tracing the influence of domestic, social, and industrial habits and conditions upon physical disablement.

Do what they would as individuals, the fact remained that when an attempt was made to deal with the causes, either immediate or predisposing, in such a way as to affect in bulk the incidence of various avoidable disabilities, difficulties arose which were beyond the bounds of individual effort, and various agencies, central or local, had to be made use of. Some of this work could be most suitably done by voluntary effort. As Lord Cave's report had shown in the case of the voluntary hospitals, there was abundant room for an extension of the activities of such agencies. On the other hand, past history and present conditions showed also that there were many public necessities which could only be adequately dealt with by public measures with the authority of the State behind them.

The Question of a State Medical Service.

In connexion with this necessary intervention of the State for certain purposes much needless apprehension and suspicion had been aroused through the persuasions of some that the one panacea for the ills which had to be reckoned with was what was described as a State medical service. If some of those who entertained that idea were to examine the matter a little more closely they would speedily reject the notion that this was or could be a specific. Two things were certain: first, that much of the work to be undertaken in combating avoidable disease and disablement was best done, or perhaps could only be done, by civil or lay effort: secondly, that our countrymen would never consent to have their lives directed by doctors. The truth was that there were no short cuts on the long laborious road that society must follow, and it was more important to survey the country and make sure of the direction and see to the equipment than to arouse hopes—false hopes—of accomplishing the end in view by altered conditions of medical service which left the necessities of the case untouched.

The Cost of National Ill Health.

Dr. Addison proceeded to sketch the history and machinery of local government in its health aspects, enumerating the various public authorities and their functions and financial responsibilities. He mentioned incidentally that there were in the country 16,000 different rating and valuation authorities. He then presented an estimate of the cost of physical disability. Taking only the cost which was met out of money supplied from public sources—that is, from the Exchequer and from local rates

—in the year 1920 for England and Wales, he arrived at the following figures:

	£
Expenditure under Poor Law for medical services	11,000,000
Medical benefit including drugs under National Health Insurance	9,100,000
Infectious hospitals	3,000,000
Expenditure on asylums and for mental diseases generally	2,020,000
Tuberculosis services	1,900,000
Maternity and child welfare services	1,950,000
School medical services	600,000
Veneral diseases services	400,000
Port sanitary services	117,000

This amounted to a total of just over 30 millions. While ignoring the amounts spent privately on medical attendance, it was reasonable to add to this figure the contributions of the public towards the maintenance of the voluntary hospitals, whose expenditure for 1920 was seven millions; also the sums paid in sickness and disablement benefit by the approved societies, which, including costs of administration, amounted in 1919 to £8,700,000. Therefore it might roughly be said that the health services of the State and payments to the sick out of public and quasi-public funds in twelve months in England and Wales amounted to 46 millions. In passing he contrasted this figure with the grant from the State to the Medical Research Council, which last year was £125,000.

Incipient Disease.

An examination had been made for him at the Ministry of Health of the ailments for which insured persons in certain representative towns in 1916 sought medical advice. A very large proportion required medical attention because of colds, nasal and bronchial catarrh, and digestive disorders. His expert at the Ministry of Health came to these conclusions:

1. That the conditions which impair health and even lead to the disablement of men, women, and children, are not chiefly the conditions which kill them, though they may in many cases predispose to mortal disease.
2. That relatively little of the sickness is attributable directly to infectious disease.
3. That a substantial proportion of this disease is preventable.

Dr. Addison said that it had seemed to him for a long time past that in the medical schools more attention might be paid to instruction in the beginnings of disease with a view to the reduction of those so-called minor ailments which were among the most disabling. Any improvement in the facilities for early and mutual consultation among medical men and early access to improved methods of diagnosis and remedial treatment would go far to encourage people to seek help and advice at the beginning of their disorders, when timely treatment might prevent disabling effects from developing.

Lines of Preventive Effort.

The first line of preventive effort was to help and encourage medical research. He was glad to have been instrumental in increasing the grant to the Medical Research Council last year to £125,000, but he reminded the meeting how little this sum signified by pointing out that the 10 millions which was proposed as a grant in aid for miners' wages was equal to the contributions for medical research on the present basis for a period of eighty years. The reason why he had resisted the pressure put upon him in 1919 to bring the Medical Research Committee under the Ministry of Health was because he believed that research should be the handmaid of all, and not be subject to the embarrassments of any departmental or interdepartmental considerations. In the next place, preventive medicine should find a field in the improvement of home and domestic conditions and habits. Mr. S. P. Vivian, the Registrar-General, had undertaken for him a calculation of the money lost owing to tuberculosis. He found that, whilst the average period of sickness benefit for all persons coming on the sick funds of one of the chief approved societies was 4.9 weeks in the year, the average period of sickness benefit in the case of those with tuberculosis was 13.7 weeks. After making liberal allowances, Mr. Vivian could not bring the annual money cost of tuberculosis to a smaller figure than 14½ millions. Tuberculosis was largely a preventable disease, which would yield to the housing and town-planning provisions now available or in prospect.

After a reference to prevention associated with industrial conditions, and to the report of the Health of Munition Workers' Committee, Dr. Addison said that it could scarcely require argument that in a definite effort to improve and develop our preventive health services, not only the goodwill and sympathetic co-operation, but also the direct counsel and advice of those whose business it was to understand these questions was essential. What form this should take was a proper subject for discussion in detail, but the medical profession in the past, through its various associations and societies, had proved itself well able to arrange for such discussion, and he was sure it would do so in the future. He reiterated the need for well-considered effort in such directions as the spread of useful information and instruction, the provision of better housing conditions, the encouragement of research and inquiry, not only into the more strictly scientific aspects of medical problems, but in the field of employment and industrial conditions, and the improvement of facilities for early diagnosis and treatment, aided by better organization and direction of the agencies charged with responsibility in these matters.

In reply to a vote of thanks, which was accorded to him by acclamation, Dr. Addison said that some parts of his lecture were the result of experiences in public life not always gained in the easiest way. It might seem a far cry from the scientific application of medicine to the question of 16,000 different rating authorities, but all these factors were involved. The first step in the national prevention of disease—namely, the consolidation of the State departments—had been carried out, but the second step awaited the active co-operation of the medical profession in preventive directions. If society had had available in some practical form during the last fifty years the guidance of the medical profession in the prevention of disease a much larger advance towards national fitness would by now have been made.

SCHEME FOR A POST-GRADUATE MEDICAL SCHOOL IN LONDON.

REPORT OF THE MINISTRY OF HEALTH'S COMMITTEE.

The Report of the Post-Graduate Medical Committee, appointed by Dr. Addison, then Minister of Health, last January, to investigate the needs of medical practitioners and other graduates for further education in medicine in London, and to submit proposals for a practicable scheme for meeting these needs, was issued on June 18th. The Committee was constituted as follows:

The Earl of Athlone, G.C.B., *Chairman*.
Mr. H. J. Cardale, M.B.
Sir Wilmot Herringham, K.C.M.G., M.D.
Sir George Makins, G.C.M.G., F.R.C.S.
Sir George Newman, K.C.B., M.D.
Sir Robert Newman, M.P.
Sir Edward Penton, K.B.E.
Sir E. Cooper Perry, M.D.
Mr. J. Dill Russell, M.B., F.R.C.S.
Dr. T. W. Shore, O.B.E.

The Report begins by giving a short review of the provision hitherto made. After a reference to the special clinical or laboratory courses arranged from time to time at the undergraduate schools, and attended chiefly by old students each at his own school, a sketch is given of the story of the Medical Graduates' College and Polyclinic, and of the work of the Fellowship of Medicine and Post-Graduate Medical Association since 1918. The action of the Fellowship in arranging courses to meet a sudden and clamant demand which arose after the armistice is praised, and it is noted that the experiment showed the nature of the demand for post-graduate teaching and, by actual experiment, the difficulties by which the position is surrounded. A brief account is given of the work of the West London and the North-East London Post-Graduate Colleges, of the London School of Clinical Medicine, and of certain special hospitals.

Some comments on the ordinary medical curriculum lead up to the affirmation that "the undergraduate course of training alone does not at present equip men and women to practise their profession in a fully efficient way," so that provision is needed for post-graduate instruction to amplify and consolidate what has been learnt prior to

qualification. Additional training and the acquirement of a sense of responsibility immediately after actual qualification being recognized as essential, the opinion is expressed that the only effective way of bringing such opportunities within the reach of every recently qualified doctor competent and anxious to take advantage of them is to increase considerably the number of resident appointments and clinical assistantships. The number of students who qualified from the London medical schools in the year 1919-20 was 579, and it is thought that the number qualifying in any year in the immediate future may be estimated at 500. Though the teaching hospitals cannot provide resident appointments and clinical assistantships for anything approaching this number the Committee considers that the Poor Law infirmaries, the special hospitals, and the general hospitals without medical schools, can be utilized for the purpose.

THE NEED FOR POST-GRADUATE INSTRUCTION AND THE EXTENT OF THE DEMAND.

The Committee considers that the graduates requiring post-graduate instruction may be divided into seven categories:

(a) Graduates who have recently qualified; their needs have been briefly noted above.

(b) General practitioners of some years' standing who require general courses in medicine and surgery. The courses must be simple, practical, and so arranged as to minimize the calls upon the practitioner's time, opportunity and resources. He may wish to have in concise and concentrated form very much the same kind of instruction as the undergraduate is given at the bedside, but he does not wish to attend the same class as the undergraduate. "This," the Committee says, "is natural enough, and we are convinced that any post-graduate instructions, whether of this particular kind or any other, must be organized quite separately from undergraduate work. By this we mean that at the least it must be given at a different time, if not at a different place."

(c) General practitioners who seek instruction in special subjects; they want to keep abreast with latest advances in specialties in which they are interested, and are anxious to attend first-rate instruction at some special hospital or department. "To an increasing extent," it is said, "doctors are working in co-operation, partners take up different specialties in addition to their usual routine duties, so that collectively they can deal with cases . . . to the greater benefit of their patients, and without as much recourse to a consultant as has been the custom."

(d) Graduates from home and abroad who need instruction immediately after qualification, with a view to a higher degree or diploma, such as the M.D., or the M.S., or the F.R.C.S., or the diploma in public health, or that in tropical medicine. With regard to the latter the Committee points out that provision is already made, but it considers that instruction in public health should be better organized. In 1920, it is stated, 120 persons were preparing for the D.P.H. at five of the London schools, and all the other schools undertake to provide instruction if asked for. This is considered to be uneconomic, and it is suggested that an Institute of State Medicine should be formed in direct connexion with the University of London. In addition to providing courses necessary for the diploma in public health the institute might arrange for instruction in forensic medicine, in toxicology, and in industrial medicine, as well as in the relation of the practitioner to the State, his fellow practitioners, his patients, and the community at large. Such a course should be given by a general practitioner of experience. It would be of service to undergraduates who desire appointments or clinical assistantships and are about to be faced with the difficulties of private practice and the complexities of the insurance system.

(e) Officers in the naval, military, Indian and Colonial Medical Services would find civilian post-graduate instruction useful.

(f) Graduates who require facilities for extended medical research find at present little satisfactory provision made for them; the Committee is of opinion that further facilities should be afforded, but in the main at the undergraduate schools.

(g) Graduates from abroad falling into categories (b), (c), and (f) suffer from the lack of organization in London to meet their needs.

Assistance for General Practitioners.

It is pointed out that doctors in general practice, particularly those in category (b), might encounter difficulty in finding time to attend post-graduate courses; especially will this be true in the case of those working in rural areas, who will find it impossible to attend whole-time courses unless a locumtenent of a reliable and satisfactory kind can be obtained. It is suggested that the creation of a "Panel of Substitutes" among recently qualified practitioners would serve the double purpose of providing locumtenents and of encouraging newly qualified persons to seek resident appointments. The panel (or register) of substitutes would be kept by the central post-graduate office. At the same time it is recognized that the young graduate may have difficulty in meeting his expenses, and the suggestion is made that eventually State aid might be given to supplement the emoluments, if any, attached to resident posts or to clinical assistantships. On the other hand, the Committee has considered certain suggestions for offering inducements to general practitioners to attend post-graduate courses, by giving a certificate after successful attendance, by paying the fees of the courses, or even by raising the capitation fee of insurance practitioners on condition that they attended courses periodically. The Committee does not approve "these adventitious aids." It thinks that the man worth having will go to the post-graduate school "out of pride in his work and his profession, if only it is made practically possible for him to do so without encroaching on his meagre annual holiday, which is probably more essential to his efficiency than further instruction." It is, however, suggested that it would be reasonable to provide a locumtenent free to the practitioner attending a course at periodic intervals.

CENTRAL POST-GRADUATE HOSPITAL AND SCHOOL.

The Committee recommends the institution of a post-graduate medical school, attached to a large and well equipped hospital, for practitioners able to devote from one to three months to general instruction, for practitioners desiring further knowledge in special subjects, for officers in the services enjoying study leave, and for graduates from overseas. The school would be the centre of a great teaching organization, in which the special hospitals of London, the Poor Law infirmaries, and the medical schools with their clinical units and research departments, would all find their place. As an integral part of the organization there would be a bureau or central office, established under a committee of management, to co-ordinate the whole system, and with the central office would be included a library, a hostel, and all things necessary to afford full facilities for social intercourse.

The central institution for post-graduate instruction, with its hospital, should be situated in a central district easy of access. The hospital should be equipped in up-to-date fashion, and should have at least 300 beds devoted in the main to medicine and surgery, a comparatively small number being set aside for the chief specialties, so as to give completeness to the teaching in the out-patient departments, which should be very fully equipped. Midwifery and fevers should be studied in the special hospitals, and other special hospitals would be brought into the scheme for the benefit of post graduates anxious to qualify themselves to follow the several specialties. The general wards of the post-graduate hospital, comprising about one hundred beds for medical and surgical cases respectively, might, it is suggested, be divided into three services, the remaining 100 beds being allocated for special diseases in some such proportion as follows: Ophthalmology, 12; skin diseases, 12; gynaecology, 24; children's diseases, 12; venereal diseases, 6; neurology, 12; laryngology, otology, and rhinology, 12; for observation and septic cases, 12. It would be essential

to have a well-equipped pathological department to work in conjunction with the wards; it would be primarily concerned in giving full opportunity for studying the latest methods of examining blood, sputum, etc., and of applying the usual tests, but it might provide accommodation for a few graduates wishing to carry out research in some particular branch of pathology. The general features of the plan proposed are shown in the accompanying diagram.

The Conduct of the School.

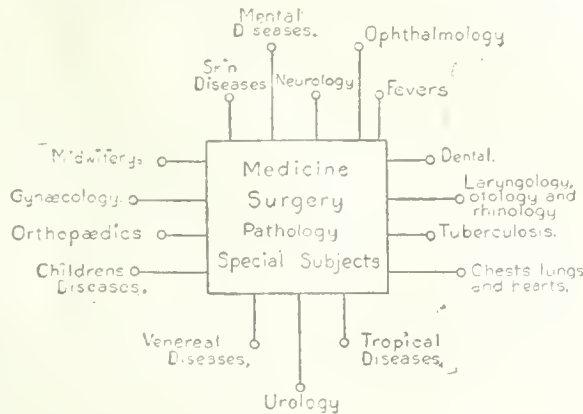

Medicine.—Instruction would be given daily in the mornings in the out-patient department by the assistant physicians; in the afternoons the physicians would take classes in the wards in the usual manner. On one day a week all the physicians might combine to give demonstrations and discuss selected cases in the wards for the benefit of all attending graduates. The resident house physicians, who would be of senior standing, would receive an honorarium for teaching, and would be responsible for some share in the training of the graduates in attendance.

Surgery.—A similar procedure would be followed.

The follow-up departments would be organized under the physicians and surgeons who to this extent at least should share in the out-patient work.

Special Demonstrations.—Late afternoon sessions (5 to 6.30 p.m.) should be arranged for special demonstrations by distinguished consultants not on the regular staff of the hospital. A consultant in medicine or surgery would give

one demonstration a week for ten weeks, but in some of the special subjects it might be unnecessary to provide for more than two or three demonstrations. These afternoon demonstrations would be given by the leaders in the subjects, and arrangements might be made during university vacations for eminent specialists from the provinces and Scotland, or from overseas and foreign countries, to share in the work. The beds at the central hospital allotted to special subjects might be used for these demonstrations, but it would also often be practicable for the specialist to bring with

him cases to illustrate his exposition or to hold demonstrations at his own hospital. General practitioners living at no great distance and able to attend only one or two afternoons a week might take advantage of these special demonstrations. Courses, with practical instruction, should be arranged in general and chemical pathology, bacteriology, and serology. Comparative pathology would be a proper subject for post-graduate study should the university be able to carry out the proposals put forward for the establishment of an institute of comparative pathology in conjunction with Brown's Animal Sanatory Institution and perhaps the Royal Veterinary College.

Therapeutics and Applied Anatomy and Physiology.—Courses in these subjects might be arranged at the central school, and pharmacology might be treated from a post-graduate point of view by means of special courses elsewhere under arrangements made by the central school.

Special Hospitals.—It is recommended that the great special hospitals should be closely associated with the central hospital and that the departments of the undergraduate schools should be regarded as special hospitals for the purposes of the scheme. Provision for dental training, would be made at the Royal Dental Hospital, and at existing dental departments attached to the general hospitals with teaching schools.

Staff of the Central Hospital.

The Committee recognizes that the staffing of the central hospital and school presents difficulties, especially if, as is considered desirable, an existing hospital and undergraduate school is converted into a post-graduate school. At the same time the difficulties are not considered

fundamental, and one at least would be diminished if the centre chosen for post-graduate instruction is already a school of the University of London, for the Senate is not likely to raise any objection to its continuance as such, even though its activities were limited to post-graduate work and to research. In this case it would continue to be managed as at present, but the general control of the system of post-graduate education would be assigned to the committee of management of the central office described below. The Committee is of opinion that the conversion of an existing hospital and undergraduate school is the best way of forming a post-graduate school, and points out that if the post-graduate centre achieves the success that is confidently hoped, it would be a unique institution with which it would be a high honour to be associated. If an existing school were converted the present staff would continue to serve it, strengthened as far as necessary by any suitable additions. It is, however, considered desirable that one of the three services in medicine and surgery respectively should be placed in charge of a physician or surgeon who is not a regular member of the hospital staff; he might be a distinguished past or present member of the staff of one of the undergraduate schools, and the duty might be taken in rotation for a period of three months by a series of physicians and surgeons.

Details of Staff and Finance.

On the assumption that the hospital service would be provided by the governors on the same scale as at undergraduate hospitals the following suggestions are made with regard to the constitution of the staff and the remuneration of its members.

Medicine and Surgery.—Three physicians or surgeons each receiving an annual honorarium of 100 guineas; three assistant physicians or surgeons with an annual honorarium of 200 guineas; three resident house officers with a salary of £200 a year with board and residence. The total for each service would be about £1,500 a year.

Pathology.—A full-time professor debarred from private practice and receiving a salary of £1,200 to £1,500, together with superannuation provision, would be required. As the subject would include bacteriology and serology, chemical pathology, morbid histology, and *post-mortem* examinations, full-time lecturers would be required to deal with branches of the subject other than that to which the head of the department devoted himself. The department would provide for instruction of post-graduates and for some research work; its total annual budget, including laboratory maintenance, would be about £4,000.

Special Departments.—A physician or surgeon would be required in each special department, and provision should be made also for teaching therapeutics and applied anatomy and physiology. The estimated cost of these departments and branches is £2,500.

Special demonstrations would be paid for at the rate of about ten guineas a demonstration; the cost it is estimated would be £2,000 a year.

Associated Hospitals.—Payment of the teachers at the special hospitals associated with the central hospital would be regulated by the extent of the demand, but it is estimated that an annual outlay of £1,500 would be required.

Superannuation.—The contribution of the school to the federated superannuation system of the universities on behalf of the full-time members of the staff of the post-graduate school would be £1,000 a year.

The total annual cost of the staff would thus be approximately £14,000.

Central Office.—The establishment of a central office easily accessible from the central hospital is recommended. It should be under the charge of a whole-time principal officer with a medical training, working under a committee of management. This committee should be appointed in the first place by the Privy Council, and should be fully representative of general practitioners and the principal educational bodies. The salary of the principal officer should be £1,500 a year, and he would be provided with an adequate clerical staff. In addition to providing accommodation for the principal officer and his staff the central office should be so arranged as to serve as a convenient meeting place for post-graduates; it would contain a library, a reading room, and a restaurant; it would be desirable to have a hostel also. It is estimated that the annual expenditure would be £4,000.

Financial Summary.

If the recommendations of the Committee were carried out a total annual revenue of £28,000 would be required—namely, for the teachers £14,000, for the central administration £4,000, for the Institute of State Medicine £10,000. There are only two sources from which this income can be derived—namely, the State or private endowment; local support from rates, the Committee points out, could not be expected for a series of institutions of a national character,

and "the course fees paid by post-graduates should, we suggest, be allocated for capital purposes." If the school and the institute were constituent parts of the University of London, as the Committee recommends, they would be eligible for inclusion on the list of grant-aided university institutions, and the Committee hopes that an annual grant of sufficient amount will be favourably considered by the University Grants Committee and the Treasury. If an undergraduate school were converted the grant at present given to that school would provide in part for the annual grant without additional cost to the State. In addition to the annual revenue considerable capital outlays for initial equipment and adaptation of premises for the school, the central office, and the institute, would be required. The Committee expresses the hope that the University Grants Committee might consider the possibility of making a capital grant for initial equipment and for social purposes on the basis of £ for £ contributed from other sources.

Provincial Areas.

The reference to the Committee did not instruct it to make recommendations with regard to provincial areas. While the Committee considers that the plan outlined will serve the purposes of a much wider area than London itself, there will remain a provincial demand to be met by the universities at the great centres, and they have already taken the matter into consideration.

ROYAL MEDICAL BENEVOLENT FUND.

At the meeting of the Committee held on June 14th twenty-seven cases were considered and £382 voted to twenty-three applicants. The following is a summary of some of the cases relieved:

Widow, aged 42, of M.B. Dublin who died in 1915. Applicant had nervous breakdown two years ago and sold her furniture to pay expenses, and only within the last few months has she been well enough to try to support herself and children. She receives £25 subscribed by medical men and invested with the Public Trustee, £30 from Devon and Exeter Medical Society, and £50 from a brother-in-law. Voted £18 in two instalments.

Daughter, aged 67, of M.R.C.S. Eng. who died in 1878. Three daughters were left to support themselves; one died recently who helped with the house. Their sole income is derived from letting apartments. Applicant and her sister, owing to indifferent health, find the work very trying. In 1910 and 1911 the Fund helped this case to the extent of £22. Voted £18 in twelve instalments and a special grant of £6.

Widow, aged 63, of L.R.F.P.S. Glasg. who, when the war broke out, went as a surgeon on transports engaged by different shipping companies, and not coming directly under the Admiralty was not entitled to a pension. Applicant is an invalid. Her son allows her £4 per month; the youngest daughter is out as a cook, but unable to help her mother financially. Voted £12 in twelve instalments.

Widow, aged 45, of L.S.A. Lond. who died in 1921. After paying funeral expenses and debts out of the insurance of £100 applicant had so little left that she applied to the Public Trustee for an advance of £20 pending the settlement of her father-in-law's estate, which is expected to realize about £60 per annum. The eldest girl earns 14s. per week and board; the youngest is undergoing three months' training as a shorthand-typist, the fees being paid by a neighbour. Voted £10.

Daughter, aged 36, of L.R.C.S. Edin. Applicant has supported herself by literary work, but owing to a nervous breakdown has been unable to carry on work, and was dependent on friends. She came under the notice of the Charity Organization Society, who applied to the Fund on her behalf. She was found to be very ill and near starvation. Another society sent her away for six weeks to regain strength, and ask for a grant towards the cost. Voted £15.

Subscriptions may be sent to the Honorary Treasurer, Sir Charters J. Symonds, C.B., F.R.C.S., at 11, Chandos Street, Cavendish Square, London, W.1.

The Royal Medical Benevolent Fund Guild is overwhelmed, in these days of exorbitant prices for clothing and household necessities, with applications for coats and skirts for ladies and girls holding secretarial posts, and suits for working boys. The Guild appeals for second-hand clothes and household articles for the benefit of the widows and children who in happier times would not have needed assistance. The gifts should be sent to the Secretary of the Guild, 43, Bolsover Street, W.1.

THE Labour Department of the United States has equipped a number of automobile dispensaries for child welfare work in country districts; each dispensary has a staff consisting of a woman doctor, nurse, driver, and conductor.

THE French Government announced recently that a premium would henceforward be paid for children born in France. In the provinces 300 francs will be paid for third infants, the scale being gradually increased to 650 francs for the tenth child; in Paris the premiums will be increased 50 per cent.

British Medical Journal.

SATURDAY, JUNE 25TH, 1921.

THE POST-GRADUATE SCHOOL REPORT.

As was to be expected from the constitution of the Post-Graduate Medical Committee, its report is a workmanlike document which makes certain definite proposals and is free from superfluities; we could, indeed, have wished that it had discussed one or two points more fully. It presents a scheme for meeting the wants of general practitioners and other post-graduates who are willing to devote a definite period to whole-time instruction of a general or specialist nature; it definitely recommends that for the proper provision of the necessary facilities a post-graduate medical school should be instituted in a central part of London and that a large and well-equipped hospital should be attached to it. In making this recommendation the Committee arrives at a conclusion which was reached by the Fellowship of Medicine more than a year ago: the Committee, indeed, pays a high compliment to the amalgamated Fellowship of Medicine and Post-Graduate Medical College when it says that one great service rendered by the courses instituted at the beginning of 1919 was to show the nature of the demand for post-graduate teaching, and the extent and variety, demonstrated by actual experiment, of the difficulties with which the position is surrounded. One of the difficulties, as has all along been realized, is that the possible attendants at a post-graduate school will not all want the same sort of instruction and opportunity. The Committee, indeed, as will be seen from the full account of the report given elsewhere (p. 942), makes out that there are seven different classes of post-graduates, although it must be admitted that the wants of some of the classes do not differ fundamentally from those of some others: as, for instance, (a) graduates who have recently qualified, and (b) graduates seeking a higher degree or diploma.

Another difficulty is that, to put the matter rather crudely, the staff of no one hospital can, under any conceivable conditions, be strong enough to be representative of all that is best in London. The Committee seeks to meet this objection by two suggestions, both ingenious and both, we believe, feasible. It will be observed that the Committee proposes that the hospital of the post-graduate school should have at least 300 beds, of which 100 would be for the medical service, 100 for the surgical service, and the remainder divided in certain proportions among various specialties. To bring in teachers not directly attached to the staff of the hospital it is proposed that the 100 medical and the 100 surgical beds should be divided each into three services, and that at the head of one of these services in each case should be a distinguished past or present member of the medical or surgical staff of an undergraduate school, who would take his turn in rotation for a period of three months. In the next place it is suggested that special demonstrations should be given by distinguished consultants not on the regular staff of the hospital; each would give one demonstration a week, for ten weeks as a maximum, the hour fixed being, for the convenience of general practitioners in the neighbourhood, late in the afternoon. The scheme presupposes proper medical

school buildings, with lecture rooms and laboratories. It is considered possible that the specialist giving the demonstrations might bring cases to illustrate his exposition to the Post-Graduate Hospital or might hold his demonstration at his own hospital—whether a special hospital or a general hospital with a medical school—the demonstrations in the latter case being so timed as not to clash with undergraduate instruction. Beds assigned at the Post-Graduate Hospital for special diseases might, however, be utilized, and the scheme contemplates the possibility of eminent specialists from the provinces and Scotland, or even from overseas dominions and foreign countries, taking their share in the work during university vacations. It is proposed to pay fees for the demonstrations, to give the physicians and surgeons of the post-graduate hospital an honorarium, to pay the residents salaries, and to engage whole-time professors and whole-time lecturers in the department of pathology. The cost of all this would, it is estimated, be £14,000 a year, and the central office would cost £4,000 a year. In addition some capital expenditure would be necessary, which might be considerable unless it were possible to take over an undergraduate school as a going concern. There is general agreement that there are too many undergraduate medical schools in London, though when it comes to selecting the particular school which is superfluous, agreement ceases; still, as the Committee points out, the post-graduate centre, if it achieves the success that is confidently anticipated, will be a unique institution with which it would be a high honour to be associated.

The report does not say what is to happen to the West London Post-Graduate College, or the North-East London Post-Graduate College, and we cannot suppose that they will allow themselves to be snuffed out. The Fellowship of Medicine might continue to do the social work, particularly among overseas or foreign visitors, for which it was instituted. The plan for "a panel of substitutes," to consist of recently qualified practitioners who would act as locumtenents for practitioners attending post-graduate classes, is interesting and ingenious. The Committee thinks it hardly possible, however, that it could be realized without a subsidy, direct or indirect, and were the rest of the scheme to be delayed on this account it would be regrettable.

When we ask ourselves what prospect there is of the recommendations of the Committee being carried out, we cannot but regret the introduction into the scheme of a plan for an Institute of State Medicine. We do not doubt that in the present temper of the country and of the House of Commons, objection to the scheme will be taken on the ground of expense. The proposal with regard to an Institute of State Medicine adds something like 50 per cent. to the total annual expenditure the recommendations of the Committee would involve, and we are decidedly of opinion that the establishment of such an institute, although theoretically advisable, is, as a matter of practical politics, not urgent. Excellent training for the examination for the diploma in public health can be obtained both in London and other centres, and we have not heard that candidates have ever experienced any difficulty in obtaining the facilities they needed.

It is a reproach to London, as everybody must be growing tired to be told, that it has not got a post-graduate medical school worthy of it. We may well be grateful to Dr. Addison for appointing the committee which, under the guidance of the Earl of Athlone, chairman of the Middlesex Hospital, has presented the Government, Parliament, and the public with a very clear statement of the situation and a

bold plan for remedying deficiencies which have long been the cause of anxiety to those jealous for the honour of British medicine. We earnestly hope that the recommendations of the report may early receive the attention of Dr. Addison's successor. The matter has two aspects, the national and the international, and in respect of the latter time is of great importance. Many teachers who themselves frequented Vienna and Berlin are sending foreign, and perhaps also overseas, post-graduates to these cities, whereas it is to the interests of this country from many points of view to attract them to London. Already there has been two years' delay: perhaps it was inevitable, but further delay is not inevitable. We hope also that the University of London will show itself alive to the necessities of the situation, and that the Senate will be disposed to encourage the conversion of an undergraduate school into a post-graduate school.

A NEW STUDY OF APHASIA.

II.

In a preceding article some account was given of the position to which the theory of aphasia had been advanced by the labours of Hughlings Jackson and Pierre Marie, and it was shown how Head's examination of Jackson's opinions brought us back to Locke's view that language is the use of articulate sounds as marks or signs of ideas within a man's own mind whereby they can be made known to others. We propose now to consider some of Dr. Head's own most recent observations.

During the war he examined many young and healthy patients who, from head wounds, had developed slighter and more specialized defects of speech than are met with in disease. They were for the most part intelligent and anxious to improve. Even had it not been clearly appreciated before, it would have been obvious from observation of this class of patient that there is no single psychological function or faculty corresponding to "speech." Dugald Stewart saw this when he remarked that "words only convey hints." Gradually societies of men agree amongst themselves to limit the scope of hints conveyed by particular words and phrases until a conventional dialect is arrived at. Words have no natural signification; the idea which each stands for must be learned and retained by those who would exchange thoughts. But words are not only the names of ideas in the mind: they are also the signs of the connexion that the mind gives to ideas one with another.

No lesion can affect speech and speech only. Cerebral injury only disturbs the complex act called "speech" by interfering with certain physiological processes which underlie the use of language. As Head shrewdly put it, "we should as soon expect a special centre for eating as for speech." This idea will come as rather a shock to those who have been brought up on the current teaching, with its terms "motor" and "sensory" aphasia, "alexia," "agraphia," and "amnesia verbalis." We had almost come to regard the faculty of speech as consisting of word-clusters pocketed away in definite centres in the brain which could be destroyed piecemeal and independently of other cerebral faculties. Head reminds us opportunely of Hughlings Jackson's division of language into emotional and intellectual. It is eminently helpful and practical; once grasped it is never forgotten and proves a key to unlock many doors. Emotional utterance is phylogenetically developed earlier and in the presence of injury or disease is retained longer. It enables man in common

with the lower animals to exhibit states of feeling. Intellectual language is developed later and consists in a power to convey ideas or propositions by gesture, vocal sounds, and by written signs. When the physiological processes which subserve the complex act of speech are disturbed, words, numbers, pictures, and every function which depends upon the use of symbols in constructive thought, may be affected. From what has gone before the reader will be prepared to learn that Head does not allow that language can be considered to be a function apart; it may suffer impairment in common with any mental process which demands for its performance exact comprehension, voluntary recall, and perfect expression. We cannot set definite limits to the processes involved, we do not know them. Head suggests that the whole group of allied processes might be spoken of as "symbolic thinking and expression," because it is mainly the use of words, numbers, and pictures which suffers in aphasia and kindred disorders. He warns us against regarding the term as in any way defining the group of processes affected and would have preferred some entirely indifferent term if one had been available. Hughlings Jackson had used the word "propositionize" to represent the mental processes which precede the intelligent use of language. Loss of language for both Hughlings Jackson and Head is, as we understand them, primarily a defect in formulating ideas, and secondarily a defect in correlating ideas to men's arbitrary signs, whether spoken or written words or gestures.

Locke discussed some of the difficulties to be encountered in analysing the nature of language. He pointed out that in the first place the ideas words stand for may be very complex, and made up of a great number of ideas put together; and that, in the second place, the ideas they stand for may have no certain connexion in nature, and no settled standard by which to rectify and adjust them. Thirdly, he observed that the signification of a word may be referred to a standard which is not generally or easily known, and finally he maintained that the signification of the word and the real essence of the thing may not be the same. Locke offers the definition we are looking for: "Words are the voluntary and unsteady signs of men's own ideas." Head's phrase "symbolic action" seems intended to cover all the possible uses of these unsteady signs.

The whole difficulty of adopting Head's views seems to lie in the acceptance of two particular terms: Jackson's "propositionizing" to represent the process of getting ready in the mind a concept or idea in such a shape that it may be communicated to others, and Head's "symbolic action" to represent the utterance of those signs or marks which, if employed according to the conventional dialect of a man's neighbours, will convey to them the idea or sequence of ideas which have been marshalled in his mind. In a concluding article the classification of conditions which Head proposes will be explained.

RESIGNATION OF PROFESSOR SIR HALLIDAY CROOM.

THE Court of the University of Edinburgh, at its meeting on June 13th, received with great regret the resignation of Professor Sir J. Halliday Croom from the Chair of Midwifery and accepted with grateful thanks a gift by the Professor of all the preparations, specimens, apparatus, and diagrams which he had collected during his tenure of the chair. It was known during the session that Sir Halliday Croom intended to resign before the beginning

of another winter, and at the close of his class in the university in March last he bade farewell to the men of the year in characteristically beautiful and thought-laden words. Some parts of this valedictory address were published in *The Student* for May, but it is to be hoped that in its fullness it may be made available for the reading of Sir Halliday's former pupils scattered all over the world. What a teacher has to say of his work after nearly fifty years' devotion to it cannot fail to be interesting; and when, in addition, large numbers of eager undergraduates attended that teaching all these years, interest deepens into absorbing, impressive, and rapt attention. Examples of the Professor's pithy, picturesque, sometimes pungent, and always arresting and memorable phrasing were not wanting in the farewell address. "Obstetrics can never be relegated to a second place in the curriculum. . . . As I have often said to you, in medicine and surgery you can fall back on the advice of your colleagues or on eminent specialists, but in the dramatic incidents of private obstetric practice you must work unaided and alone. . . . You are the lineal descendants of Goodsir, Simpson, Lister, Christison, Lylecock, Syme, and Bennett. . . . Can I make a stronger appeal than the old words, *Noblesse oblige*? . . . Let me assure you that to live is sometimes very difficult, but it is never meritorious in itself, and we must have a reason to allege to our own conscience why we should continue to exist on this crowded earth. . . . I am optimistic enough to re-echo Whittier's article of belief, and to make my last adieu to you all in his words, so full of good cheer and of eternal hope: 'Of course the world is growing better; the Lord reigns; our old planet is swinging slowly into full light. I despair of nothing good. All will come in due time that is really needed, and all you have to do is to work and wait.'" The class was not lacking in its recognition of Sir Halliday Croom's outstanding merits as a teacher, and in presenting the retiring Professor with a silver-mounted walking-stick and a silver cigar box from the present and from some of the former students, Mr. A. M. MacLachlaine said some true things in a felicitous way. "Coming to your department as to a somewhat dry and unromantic study, we have found you not, certainly, miscalling technicalities, but, so to speak, handing us a chair, and illustrating the minutiae of your art with aphorisms and modern instances ranging from the peerage to the byre." In speaking of the Professor's constant kindness shown to his pupils, Mr. MacLachlaine provoked a smile with his remark, "Sir, the medical student, like other wildfowl, responds to kindness." The undergraduate, with unerring instinct, laid emphasis, too, upon the outstanding attractiveness of Sir Halliday's lectures when he spoke of their aphoristic and vivid phraseology. Sentences minted in the midwifery class-room have over and over again become current coin in the University. Carlyle may have called man a tool-using animal, and the French have defined him as the cooking animal; but it needed Sir Halliday Croom to describe woman as a being with a Curve of Carus, throwing a sudden spotlight on this modest and retiring anatomical feature, and showing it up as a feature of generic import. Sir Halliday Croom's resignation of the Midwifery Chair has coincided with the completion of his term of office as Chairman of the Central Midwives Board for Scotland, and has involved his departure from the acting staff of the Royal Maternity Hospital; but he is still hale, hearty, full of life, keen of mind, and imbued with what he himself spoke of as the enthusiasm of humanity, and Edinburgh and his colleagues rejoice in his continued presence in their midst. If he finds time hanging heavily upon his hands a volume from his pen on Medical Edinburgh in the seventies of the past century would be a delightful book of remembrance as well as a joy to the lover of those less recent days when John Hatton Balfour spoke of "woody fibre," when Crum Brown (still alive and well at a great

age) set off explosive mixtures in the chemistry class-room, when Hughes Bennett and Lylecock saluted one another, when Sir William Turner ruled in the anatomy department and "vexed all very nervous pupils," when Sir Robert Christison tried the effect of swallowing calabar bean on an empty stomach, when Spence was said to be somewhat "dismal" in surgery, and Lister was brilliant in invention, when Sir Wyville Thomson described in prismatic eloquence the beauties of the jelly-fish of tropical seas, and when Sir Alexander Russell Simpson (Sir Halliday Croom's friend and predecessor in the chair) had, perhaps, his own brilliancy a little obscured by the exceeding brightness of his uncle's fame. It is understood that Sir Halliday Croom has expressed abhorrence for anything and everything of the nature of reminiscences; but will he not "take another thought" and give to his many friends the real gift of a sketch of the Edinburgh Medical School in the seventies?

PROTECTION OF RADIOLOGICAL WORKERS.

THE X Ray and Radium Protection Committee, the constitution of which was announced in the *JOURNAL* of May 28th, 1921, has now issued a preliminary report which we print in full this week at p. 936. The Committee was set up by a number of metropolitan organizations interested in radiology. The chairman is Sir Humphry Rolleston. In view of the constant demand for guidance from individuals and institutions it was thought desirable to issue an early statement on the means for the protection of the worker, and the present report accordingly gives an outline of existing knowledge with regard to equipment, ventilation, and working conditions of x-ray and radium departments. After the completion of this, the most pressing part of its work, the Committee will proceed further with the collection of data bearing on the effect of irradiation, with special reference to protection. Researches will be undertaken and further reports published from time to time. It will be observed that the preliminary report opens with the positive statement that the danger of over-exposure to x-rays and radium can be avoided by the provision of efficient protection and suitable working conditions; it is, therefore, the duty of those in charge of x-ray and radium departments to ensure that this provision is made for their workers. Although the Committee believes that an adequate degree of safety would result if the recommendations now put forward in some detail were acted upon, it insists that this protection depends entirely upon the loyal co-operation of the workers in following the precautionary measures advised. The Committee further recommends that periodic tests should be made of the blood of the personnel, so that any changes may be recognized at an early stage. This is necessary because susceptibility to radiation is not constant for all workers, and in the present state of knowledge it is difficult to decide when small variations from the normal blood count become significant.

THE IDEALS OF A BELOVED PHYSICIAN.

IN 1905 Dr. C. N. B. Camac of New York brought out, with the consent and guidance of his old teacher, a volume of *Counsels and Ideals*, selected from forty-seven of Sir William Osler's writings. This attractive collection of *obiter dicta*, representing Sir William's philosophy of life down to the time when he took up the duties of the Regius Professor of Medicine at Oxford, met such an immediate and well-deserved demand that within two years a fourth impression was required. In 1918 the book went out of print on account of the loss by enemy submarine action of a consignment for the American market. During his fatal illness Sir W. Osler had the possibility of a second edition in mind, and now, though with some hesitation from the consciousness that he had to act without the help of his former guide, Dr. Camac,

has most successfully accomplished this trust.' The additions, drawn from twenty-six addresses and papers published since 1904, form an appropriate summary of the Regius Professor's general teaching in Britain, and, as in the case of the first edition, leave the reader with the desire to possess, and pick out his own favourite passage from, the originals, some of which are, unhappily, not very easy of access. Comparison of the American with the Oxford period shows that the message of the later series is directed to the further evolution of methods and institutions outlined and advocated in the earlier addresses. The second edition contains an unfamiliar photograph of Sir W. Osler, which though at first sight disappointing grows on one, and a thoughtful and discriminating appreciation by Dr. Cainac, who points out that the reforming influence of the medical leader was greatly enhanced by a most exceptional personality, and that his great achievement—the establishment of a system of training in school and laboratory—was thus rendered possible. The secret of his great influence was human sympathy scattered through all his dealings with his fellows. His literary style is described as showing, in addition to the epigram, an element of surprise, climax and apt quotation constantly sustaining interest. In conclusion, *Counsels and Ideals* should most certainly be added to the Bedside Library list drawn up some years ago by Sir William Osler in order to render the medical student's education "if not of a scholar at least that of a gentleman."

THE FUTURE OF PHARMACY.

THE British Pharmaceutical Conference was held in Scarborough last week, under the presidency of Mr. E. Saville Peck, M.A., of Cambridge, who, in an address on British pharmacy and its possibilities, declared the present position of pharmacy to be unsatisfactory. He considered that a wider preliminary education for those entering the calling was necessary, and suggested that candidates for registration as apprentices and students of the Pharmaceutical Society should be required to pass one of the school-leaving certificate examinations. With a view to stimulating a professional spirit in the rank and file of pharmacists, he suggested that the local associations should discuss pharmaceutical professional matters and should send delegates to the annual conference, so that the considered opinions of members might be focussed for the information of the council of the society. He advocated the formation of an association of teachers from the various schools of pharmacy, which would meet annually for discussion. He advocated also the establishment of a university degree in science with pharmaceutics as one of the final subjects, and strongly urged the institution of a fellowship examination, to include biochemistry and bacteriology, and clinical microscopy, with a view to training students to carry out clinical analyses, and so assist in the diagnosis of disease. They were needed also by wholesale houses to undertake the preparation of vaccines and for research upon new drugs and remedies. Other suggestions contained in the address were as to the need for pharmaceutical research, the advisability of the separation of the prescribing and dispensing of medicines, and the institution of an Army Pharmaceutical Corps. It will be seen that Mr. Peck does not lack courage in the claims he makes for his calling. We agree as to the desirability of raising the standard of preliminary education, and agree also as to the need for pharmaceutical research, although it may be a little difficult to define the boundaries between it and pharmacological research. We are less clear about the advisability of training pharmacists in biochemistry, bacteriology, and microscopy, with a view to their taking charge of the clinical laboratories attached to the

primary and secondary centres described in the Dawson Report. This is what we think Mr. Peck means, and we are aware that the possibility of some such plan was recognized in the Report, but, unless we are very much mistaken, it was intended to apply to the primary centres only. We are by no means satisfied that the plan would work well even in the primary centres, and it would take a good deal to convince us that it is applicable to the secondary. We are inclined to think—and it is in this sense we read the Dawson Report—that the laboratories of the secondary centres must be in charge of a fully equipped medical director, who would have the help of a suitable laboratory assistant, for whom, we think, the training in pharmacy, biochemistry, and bacteriology suggested by Mr. Peck would be superfluous.

MENTAL THERAPEUTICS AND THE PUBLIC.

MORALISTS have always been concerned with the problem of the mental and moral weakling, but their attitude towards it has from age to age undergone profound changes. Thus, at one epoch the mentally and morally feeble were regarded with awe, at another with contempt, and at yet another with active intolerance; and in recent times with a sympathy so broad as to amount to an exoneration of all culpability. The same problem has always faced the medical man, who has endeavoured to solve it on the lines of common sense and experience; he has had a great measure of success, but it is only of late years that a serious attempt has been made to bring it within the field of the scientific method; it has been possible to do this only through the rapid growth of psychological knowledge. The prominence that has been given to mental analysis in the newspapers and monthly periodicals, as well as by writers of fiction, and the large number of irresponsible people practising it, call for the serious attention of the medical profession. Certain sections of the Churches have already defined their attitude. It should be emphasized that mental analysis is a grave operation on the mind, and should only be embarked upon in the same spirit as a serious surgical operation. It is an exploration, the operator having no knowledge beforehand of what he is going to find. Put in another way the whole process is a confession under duress, and the subject of it makes a present of his or her identity to the examiner. All the most intimate memories, desires, hopes, fears, tendencies, experiences, indeed the whole complex constituting the individual, have been surrendered to someone else. And it may be observed here that unless the analyst is convinced that his knowledge of the case before him is that of the true individual he will fail in his object. Thus the relationship between the patient and the examiner is a sacred one, since it involves the opening of the secret chambers of the personality. Once the sanctity of the process is admitted the need for discrimination becomes apparent. No one can lightly undertake to analyse another's mind; no one should lightly consent to be analysed. The necessity for analysis in this instance postulates the need for synthesis. The synthetic process involves considerations of environment, conditions of existence, relationship with other lives near and remote. The advice tendered in respect of the new life which the patient is to live must be tempered with a high conception of morality, or he or she cannot be reclaimed and made once more into a social being. The mere conversion of an inefficient mind into an efficient machine is a different question; it is not preceded by analysis, and can safely be left to competent teachers of mental training. But where analysis is a necessary preliminary the operator's responsibility is enormously increased, and the public should exercise the utmost discretion in its choice. The daily press recently furnished an instance of the practice of psychotherapy by an unqualified person, the end-result of which was an inquest. This may be an

¹ *Counsels and Ideals from the Writings of William Osler*. Selected and edited by C. N. B. Cainac. Second edition, with extracts from articles appearing since 1904. London and New York: Humphrey Mitford. 1921. (Cr. 8vo, pp. 379; 1 plate. 8s. 6d. net.)

extreme instance, but it serves to accentuate the point that (laying aside any question of the operator's analytical and reconstructive skill) the selection of cases for treatment is as difficult and delicate as it is important. Whatever the future may reveal, there is no doubt that in the present state of our knowledge the competent and proper person to make this selection is the medical practitioner, who alone is in the position to take full responsibility. Quackery, in the ordinary sense of the word, may not be actively harmful, but mental quackery is worse than witchcraft.

THE ROYAL SOCIETY OF MEDICINE.

A SPECIAL general meeting of the Fellows of the Royal Society of Medicine was held at the Society's house, 1, Wimpole Street, on June 10th, to consider three resolutions of the Council concerning the *Proceedings* of the Society and the subscription. At a previous meeting, on April 25th, the Council's resolution regarding the raising of the subscription was met by an amendment, proposed by Dr. H. H. Dale, that while the subscription should be raised, one guinea should be remitted from the subscription of Fellows who did not desire to receive the *Proceedings*. This amendment did not obtain a majority large enough to make it operative, but in face of the discussion to which it gave rise the Council underbroke to reconsider the matter, as it was evident that the majority of the Fellows of the Society agreed that too much of the revenue was being spent on the *Proceedings*. Before the meeting on June 10th a statement by the treasurers was circulated, showing that the large deficit of 1920 was due to the sudden increase in the cost of the *Proceedings*, amounting to about £4,000 over that for 1919, which in itself was well above the average of previous years. If the resolution before the meeting were passed £4,000 only would be allowed for *Proceedings*, while £1,500 would be allotted to the library, in accordance with the Council's resolution of October, 1920. The resolution, "That the By-laws be altered so as to provide that the *Proceedings* of the Society shall be published under the direction of the Council as regards arrangements for publication and the financial cost incurred, but this shall not interfere with the right of each Section to decide what shall appear as its own *Proceedings*, subject only to the financial limitations imposed by the Council of the Society," was proposed by Mr. Fagge and seconded by Dr. H. H. Dale; after a short discussion it was passed by 119 votes to 21. The second resolution, which concerned the copyright of papers accepted by the Society, was a merely formal rectification of an already existing By-law; it was adopted on a show of hands. The third resolution, "That the By-laws be altered so as to provide that the subscriptions of all Fellows in the London Postal Area be five guineas per annum, and that the subscriptions of all other Fellows in the United Kingdom be four guineas," provoked some discussion. The difference in the use made of the Society by Fellows residing close to the Society's house and by those living in the provinces or more distant parts of London was pointed out, and it was suggested that many of them might, on the raising of the subscription, resign the Fellowship, though some might wish to remain members of a Section. Since 1914 the number of Fellows and Members has increased from 2,842 to 3,369, but it was suggested that this total is really very small, and that if the work of the Society and the manner of election to it were better known, it might be greatly increased and the finances of the Society placed on a sounder footing. It seemed, however, to be more or less generally recognized that under present conditions the subscription had to be increased, and the resolution was passed by a majority of 107 to 35. At this meeting the freedom of debate was hampered by the fact that it was called for the alteration of by-laws, so that discussion was limited, no amendment being in order and only a direct vote, Yes or No, possible. The annual

meeting of the Society, which is to take place on Wednesday, July 6th, will afford greater latitude for discussing its future, and we venture to express the hope that means will be found to place its finances on a satisfactory basis. Sir Malcolm Morris has given notice that he will at this meeting move the appointment of a Committee of Fellows "to investigate the administration of the Society with a view to suggesting economy and improvements, and that it be authorized to obtain, if necessary, the aid of a chartered accountant." It was a great achievement to bring about the amalgamation of the numerous medical societies which exist in London, and Fellows may be reminded that in many instances the amalgamation enabled them to effect some economy in their list of subscriptions. The alteration in the by-laws by which the Council now has control over the expenditure Sections can incur in the production of the *Proceedings* will in itself tend materially to improve its position.

THE OXFORD OPHTHALMOLOGICAL CONGRESS.

THE twelfth Oxford Ophthalmological Congress will be opened on Thursday, July 7th, by the Master, Mr. Sydney Stephenson. A discussion on the causes of infection after extraction of senile cataract will be opened by Dr. Victor Morax, of Paris, who will maintain that by the improvement of surgical technique an operator is now able to avoid all the causes of infection due to himself, or the instruments or solutions he employs. One cause only remains of which he is not a complete master—namely, infection of the conjunctival sac, which may produce two kinds of infective complications: first, immediate infection, generally severe and often necessitating the enucleation of the eye; and secondly, late infection, which varies in severity, being sometimes slight, leading to iritis or iridocyclitis, after which complete recovery may take place, or more serious, going on to plastic iridocyclitis which may produce secondary glaucoma or sympathetic ophthalmia. The microbe most commonly responsible is, he maintains, the pneumococcus, although streptococci and staphylococci may occasionally be found. The infection, he thinks, reaches the conjunctival sac from the lacrimal duct. On the afternoon of the same day a series of papers will be read, and Dr. William Wallace will give an epidiascope demonstration of war injuries of the fundus. The Doyne Memorial Lecture will be given on the morning of July 8th by Mr. E. E. Maddox of Bournemouth, whose subject is heterophoria; afterwards papers will be read. In the afternoon demonstrations will be given and operations performed at the Eye Hospital. Papers will be read on the morning of Saturday, July 9th. The members will stay at Keble College from the evening of Wednesday, July 6th, and the annual dinner will take place in the hall of the College on the Thursday evening. A scientific museum will be open during the congress in which various specimens, instruments, and drawings will be shown. There will also be a commercial exhibition.

RECIPROCITY WITH SOUTH AFRICA.

THE President of the General Medical Council, in his address¹ at the opening of the summer session last month, said that the Union of South Africa was desirous that degrees in medicine and surgery granted by the universities in the Union should be recognized as registrable qualifications in this country. The Union, he said, admitted to its *Medical Register* practitioners registered in the United Kingdom. The Executive Committee, to which the Council had delegated its powers in this respect, in view of this fact and in view of the great progress made in the Union in developing its own system of medical education, had had no difficulty in advising the Lord President of the Privy Council that Part II of the Medical Act might be applied in South Africa. An Order in Council was issued last month carrying out this recommendation,

¹ SUPPLEMENT, May 28th, 1921, p. 193.

and the General Medical Council is therefore now free to recognize South African medical degrees which fulfil the prescribed conditions.

CONGRESS OF MEDICAL HISTORY.

THE Congress of Medical History, of which we have already published some particulars, will be opened at the Faculty of Medicine in Paris, by the Minister of Instruction, on the morning of Friday, July 1st. Discussions will take place on that afternoon, and on July 2nd, 4th, 5th, and 6th. The subjects for discussion include the history of hospitals; the diet scale of man, of animals, in antiquity, and in the Middle Ages; great historical epidemics; and the part played by drug dealers in the development of biology. On certain afternoons visits will be paid to various medical institutions and also to the principal libraries, galleries, and museums of Paris. On Friday evening Dr. Henry de Rothschild will give an entertainment at the Gymnase Theatre, when a piece by M. Pascal, entitled "Le Caducée," will be given. There will be other afternoon and evening entertainments, and a banquet at the Palais d'Orsay on the evening of July 6th, when the congress closes.

THE SERUM DIAGNOSIS OF SYPHILIS.

In the report in our issue of June 11th, 1921 (p. 859), of a lecture given by Professor Georges Dreyer, M.D., F.R.S., on June 2nd at St. Mary's Hospital, on a new method for the serum diagnosis of syphilis, the expression "Professor Dreyer's method" was used. We are asked by Professor Dreyer to make it quite clear that the lecture was mainly an account of the joint work of himself and Dr. H. K. Ward, M.C., and the method should therefore be referred to as the Dreyer-Ward method.

As already announced, the gold medal founded by a Fellow of the Royal Society of Medicine for a member of the medical profession who specially distinguished himself during the previous three years, was awarded to Sir Almoth Wright, who gave an address in acknowledgement last November (BRITISH MEDICAL JOURNAL, November 20th, 1920, p. 797). The medal, which was not ready at that date, will be presented to Sir Almoth Wright at the annual meeting of the Society at 5 p.m. on July 6th.

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT.]

Public Health Officers Bill.

THIS measure, which was introduced in the House of Commons by Sir Philip Magnus, and passed through all its stages there, is now awaiting second reading in the House of Lords. It had formal first reading on June 7th, and since then a petition against it has been presented by the City of Westminster.

Dentists Bill.

The Earl of Onslow, on behalf of the Ministry of Health, moved the second reading of the Dentists Bill in the House of Lords on June 16th. Having explained the provisions, he said that there was only one matter in regard to which there was any material difference of opinion, and that was as to the form of the *Register*. The admission of unqualified practitioners, even on the guarantee of experience required under the bill, had been opposed by Sir Frank Colyer, and a different form of register suggested. He had been answered by the chairman of the Departmental Committee (Mr. Acland) upon the report of which the bill was based. The reasons why the Government stood by the report could be explained in Committee. Lord Greville intimated that, as representing the Ivory Cross Society, he would have some criticism to make in Committee.

The Marquess of Salisbury said he believed all in that House were in favour of the bill, but there was an element which

needed careful scrutiny. In order to arrive at an agreement Mr. Acland's Committee seemed to have been led, as a *quid pro quo* to the unqualified practitioners, to admit the existing ones *en bloc* as fully qualified dentists. That might be good tactics from a parliamentary standpoint, but it was extremely bad for the people who suffered from toothache, and the peers would have to consider closely whether they were going to allow a number of practitioners, some of whom were little better than charlatans, to be admitted by a stroke of the pen to the full advantages, privileges, and dignities of dentists in order to facilitate the passage of the bill. That appeared to be the point. If there were a good answer they would bow to it, but he suggested that the Government should carefully consider whether a change in the bill in this respect ought not to be inserted.

Lord Knutsford said he was a member of the Departmental Committee, which sat for a long time and took a great deal of evidence. There was no suggestion that all unregistered men should be admitted *en bloc* to the *Register*. On the contrary, the Committee limited the admission to those men who had been in good practice for five years and could bring evidence as to good character in their practice. They also recommended that those men who had not been five years in practice, but who would submit themselves to a qualifying examination, should also be admitted. They had also received letters and circulars from a certain number of gentlemen, more noisy than wise, who wished to keep out all the unqualified men from the *Register*. He did not know whether it was realized that by far the greater part of the dental work in this country was done now by these unregistered men, and it would be monstrous to prevent them from carrying on their practice. Moreover, the dental work of the country could not be done unless these unqualified men were allowed to practise. Hence the clause. In those circulars and letters, which their Lordships might have read—or might not have read, but have put in the waste-paper basket for other people to read—there was a suggestion that a special list of these men might be made. A much better way would be that the *Register* should show the qualifications of every dentist opposite his name, and that those who were unregistered, or were on the *Register* without qualifications, should have this fact shown opposite their names in brackets. The Marquess of Salisbury spoke of the privileges of being on the *Register*. There was a good deal more than privilege in it. It meant that the way in which a dentist carried on his profession was controlled; that he was obliged to obey the ethics of the profession; that he could not do this and he could not do that; that he might not canvass and that he might not advertise for work. The *Register*, therefore, was a controlling influence. What they wanted to insist upon was that there should be no unregistered men operating in the country. Those were the huge advantages of the bill, and unless it passed good men would not go into the profession. If this bill passed it would increase the number of qualified men who would join and secure better treatment for everybody.

The bill was read a second time.

Ireland and the Dangerous Drugs Regulations.—Captain Charles Craig, on June 16th, brought before the House of Commons two alleged grievances in the proposed operation of the Dangerous Drugs Regulations as affecting Ireland, and for that purpose formally moved an address to His Majesty to annul the draft. His first point was as to the position of farmers. Hitherto they had been able to keep a small supply of laudanum for dosing horses and cattle for certain complaints, especially for colic. In future they would have to get a prescription from a veterinary surgeon before they could procure any laudanum. He understood that the Home Office was willing to modify the rule so that the drug could be obtained on some sort of certificate to be given by the police or some other body, but he asked for information. The second point concerned the chemists and druggists of Ireland. Under the law pharmaceutical chemists in that country had a monopoly of dealing with prescriptions, and ordinary chemists and druggists were able to sell poisons of any kind, though not to compound prescriptions. Under the Regulations the drugs specifically mentioned in the Act could be served out only on prescriptions, which meant that the chemists and druggists would lose their rights. It was hard that because of a certain amount of drug-taking in large cities these traders should lose a considerable part of their business. He put it that the same kind of certificate proposed for farmers should be available for them—for the sale of laudanum for instance—and that they should be at liberty similarly to sell patent medicines, such as chlorodyne and zinc ointment, which, he gathered, contained a prohibited drug, and other things which they received from manufacturers. Sir John Baird (Under Secretary for the Home Office) said it was certainly necessary to meet the case of the farmers. The Committee had suggested that this could be done in one of two ways—either by selling laudanum in a denatured form, or else, pending the discovery of some method of denaturing laudanum, by certificates issued to farmers by the local police. It was intended to provide for such issue. In the case of the chemists and druggists such legal opinion as the Home Office had been able to take held that, though the chemists and druggists were prohibited from compounding mixtures, they were entitled to dispense made-up prescriptions of something they had not made up themselves. Moreover, there was a considerable list of drugs which were exempted. Taking these two things together—the exempted drugs as contained in Schedule 2 and the belief that the druggist would be entitled to dispense mixtures containing poisons

which he had not himself compounded—*Le Doped* that the position was met. On a further question Sir John Parnall said, as regards the farmers, that the police authorities would not have to state whether a man was entitled to have land in. The certificate to be granted by the police authorities would be on a form supplied by the Home Office, and would be to the effect that the man was a bona fide farmer or stock owner. That was a matter of fact, not of opinion. Captain Craig afterwards withdrew his motion.

The Appointment of Medical Referees.—Mr. J. Guest asked the Minister of Pensions, on June 16th, (1) whether, since the original appointments of medical referees were made before the completion of medical demobilization, these appointments would now again be declared vacant and re-advertised, or whether the original appointments were fixed and permanent appointments of the present holders; (2) whether the appointments of medical referees were now reviewed every six months as originally decided; how many of these appointments have been considered vacant on review and changed, and whether the opinion of the local pensions committee is ever asked or considered in these appointments. Mr. Macpherson replied that in the latter part of 1919, when the demobilization of medical men was practically complete, the then existing appointments of medical referees to the number of 962 were declared and 1,553 new appointments were made, preference being given to those men who had served overseas during the war. All the present appointments were temporary, being subject to one month's notice on either side. While the paramount consideration in making these appointments must be medical, consideration was always given to representations made by local committees. In answer to Mr. Guest, Mr. Macpherson said that the Ministry utilized the services of 1,717 medical referees, whose appointments were part-time and subject to a month's notice. Payment was made at the rate of 5s. per case, except where the examination was in connexion with a claim to alternative pension, when the fee was 10s. 6d. The amount paid in fees to medical referees during the last financial year was approximately £2,500. He did not think there had been a transfer of duties formerly performed by war pensions committees to the medical referees. They dealt purely with the medical aspect of a case, and the local pensions committees dealt mainly with the facts.

Criminal Law Amendment Bill.—Viscountess Astor asked Mr. Chamberlain, on June 15th, whether he had received copies of two resolutions passed at a meeting held in the House of Commons in support of the Bishop of London's Criminal Law Amendment Bill, at which practically every organization interested was represented, promising to abstain from introducing controversial amendments, and whether, in the circumstances, he would give facilities for the passage of the bill this session. Mr. Chamberlain said he had received the resolutions, but could not make a pledge to find time at this stage, though he hoped it might be possible to do so later. Viscountess Astor again pleaded for a definite assurance, remarking that the measure would not involve any expenditure and was one of the bills that the Government could get through. Mr. Chamberlain said that he quite understood the importance attached to it by a very large section of public opinion, and he was anxious that it should be considered by the House this session. Major Claud Lowther asked whether Mr. Chamberlain was aware that the bill was likely to lead to considerable controversy. Viscountess Astor: Only by a certain section.

Scottish Universities.—Mr. Munro announced, at the instance of Mr. McCallum Scott, the decision that the annual financial and statistical reports relating to Scottish Universities for 1919-20 and future years, will be made available for members of the House of Commons in the form in which they appear in the returns from universities issued by the University Grants Committee.

National Health Insurance.—Mr. Jack Jones asked, on June 15th, if the Minister of Health would consider, in view of the large amount of unemployment and consequent distress, the advisability of making an allowance in contributions, under the National Health Insurance Act, so as to prevent a reduction in benefits to those who were drawing allowances under the Act. Sir A. Mond replied that the matter was being seriously considered, in the hope that it might be possible to do something in the direction suggested.

Medical Benefit.—Mr. Lyle, on June 20th, asked if there were statistics showing the number of insured under the National Insurance Act who were already in arrears with the maximum total of unpaid subscriptions, which, unless met before October, would debar them from medical benefit in 1922. Sir A. Mond replied that all insured persons remained entitled to medical benefit so long as they continued in insurance, and there was no suspension of benefit on account of arrears of contribution.

Holloway Prison.—Mr. Shortt, in reply to Lieut. Commander Kenworthy, on June 14th, said that no complaint as to the condition of the food served to prisoners in Holloway Prison had been made to the Visiting Committee. Members of the Committee frequently tested the quality of the food and were satisfied with it. Individual prisoners sometimes complained, but otherwise there was nothing to support the suggestion. No complaint had been made of the milk being sour. Mr. Shortt also answered in the negative the question as to the abolition of the hospital.

Medical Officers and Inspectors of Prisons.—Mr. Alfred T. Davies asked, on June 15th, what proportion of medical men whose services were used for examining ex-service men, had had experience overseas during the war, and whether the Minister of Pensions would consider the desirability of employing a larger number of such medical men in the interests of those so examined from time to time. Major Tremen said that approximately 60 per cent. of the medical officers employed in the department in examining ex-service men had served overseas during the great war. It was the practice of the Ministry, other things being equal, to give preference to medical men possessing the qualification named.

Income Tax Assessment.—In Committee on the Finance Bill, on June 14th, Mr. Hughes moved an amendment to Clause 18, under which Parliament is asked to say that Sections 43 and 44 of the Income Tax Act of 1918 were not continued in force for the year 1920-21, and are now expressly repealed. Under Section 43 of the Act of 1918, any person or company whose profits were reduced from war circumstances could claim to be charged on the average of three years ending the year of assessment instead of on the average of the previous three years. Under Section 44, any individual proving that his actual income from all sources was less by 10 per cent. than the income on which he had been assessed on the three years' average, was entitled to be charged upon his actual income and to obtain repayment of the difference. Last year Mr. Holmes moved specifically that these sections of the 1918 Act should remain in force. This was defeated at the instance of the Government by a large majority. But it seems to have been left obscure whether in the absence of a definite repealing provision the sections do not remain in force. Sir Robert Horne stated that there had been six decisions by Commissioners, three one way and three another, and none had gone to a court of law. Five hundred claims were pending. In the course of the debate there were protests, more especially against the retrospective part of Sir Robert Horne's proposal, but it was carried by 205 votes to 31.

Reassessment of Pensions.—Lieut.-Colonel the Hon. G. F. Stanley informed Mr. Frederick Thomson that, in the case of both officers and other ranks serving during the late war with a force under the British flag, service should count for reassessment of pension as if the service had been rendered with the British forces.

Deaths Associated with Vaccination.—In answer to Mr. J. Davison, Sir A. Mond stated that according to the Registrar-General's returns, the deaths registered in England and Wales in each of the last ten years as caused by or associated with vaccination are as follows:

	Registered on Certificate of a Registered Medical Practitioner.	Registered on Coroner's Certificate after Inquest.	Uncertified.	Total.
1911	11	4	—	15
1912	6	4	—	10
1913	6	—	1	7
1914	1	4	—	5
1915	9	1	—	10
1916	2	1	—	3
1917	6	2	—	8
1918	4	—	—	4
1919	5	2	—	7
1920	15	4	—	19

It cannot, however, be stated whether any of the cases in which no inquest was held were reported to a coroner or not.

Outbreaks of Rabies.—Major Barnston informed Captain Sir Hamilton Benn, on June 14th, that the most recent outbreak of rabies in England occurred at Southampton on June 6th and at Salisbury on June 7th. There had been no recent outbreak of rabies in Scotland. In Wales the last outbreak was on September 8th, 1920. As regards Wales the Muzzling Order was withdrawn on May 1st, 1921.

Wholesale and Retail Milk Prices.—Sir A. Boscawen said that the average prices at which contracts had been made for the summer months for milk delivered into London, producer paying carriage, were as follows: May and June, 1s. 2d. to 1s. 3d. per gallon; July, 1s. 4d. to 1s. 6d.; August, 1s. 6d. to 1s. 8d.; and September, 1s. 8d. to 1s. 10d. He understood that the price at which milk was being retailed in London was usually 8d. a quart. On another question, by Mr. Hurd, the Ministers said he was unaware that in some districts in Somerset farmers were receiving from wholesalers more than 10d., 8d., and in some exceptional cases, 6d. per gallon for their milk.

The River Lee.—Major Malone, on June 16th, asked the Minister of Health if he would exercise such pressure on the Lee Conservancy Board as to compel that authority to purify the river. He said that as late as last week the medical officer for Tottenham had reported to his Committee that objectionable matter, consisting of decomposing organic material and oil substances, had entered the river below the Tottenham Lock, causing, that reach to be highly polluted and offensive. Sir A. Mond replied that he had no information as to the complaints referred to, and he had no power to compel the Board to carry out the work indicated.

For-Save Men in Asylums.—Mr. F. Roberts asked, on June 16th, whether when an ex-service man had been committed to an asylum on account of mental injury attributable to the war, the man himself and his next of kin were informed that one of the privileges attached to his having been placed on a private patient footing was that, provided that he could not be proved to be dangerous and unfit to be at large, his next of kin had the right, in accordance with Section 72 to 74 of the Lunacy Act, to direct his discharge. Sir Alfred Mond said it was not desirable to furnish this information on admission, but when a service patient was sufficiently recovered to raise the question of his discharge, he was informed of the legal position and of the steps to be taken by his relatives.

England and Wales.

THE WEST MIDDLESEX HOSPITAL.

THE West Middlesex Hospital, situated at Isleworth, was formerly known as the Brentford Union Infirmary. It is built on an extensive site, which includes also the buildings of the workhouse, separate blocks for pulmonary tuberculosis, midwifery, and mentally defective boys. The wards of the hospital are of modern construction, well lighted and ventilated, and diverge from each side of a long central corridor. The wards on one side of this corridor contain 14 beds; on the other side are larger wards of 24 beds. There are three stories to each block. The total number of beds in the hospital is 420, but at present not all of these are available for patients. The number of beds in the workhouse is 880. Recently more of these have been made available for chronic patients and slight cases from the hospital; the total number of patients in the workhouse under the care of the medical staff of the hospital is now about 500.

Although it is now described as the West Middlesex Hospital the institution remains under the guardians of the poor of the Brentford Union. There is an arrangement by which the County Council sends its patients to the tuberculosis block, which has been raised off from the rest of the building. But this block, like the rest of the hospital, is under the governance of the guardians. The medical staff consists of a superintendent and two assistants. There is also a consultant staff, drawn mainly from London, whose services are honorary so far as the Poor Law patients are concerned: but they are paid the sum of one guinea as travelling expenses for each attendance.

The patients consist of Poor Law patients who are considered to be destitute and have to pass through the hands of the relieving officer. But the Ministry of Health allows considerable latitude in the estimation of medical destitution. Consequently many of the patients are by no means destitute, from the financial point of view. They are admitted because their means do not permit them to obtain suitable treatment; and those who can afford to pay are charged up to a maximum of £3 5s. a week for maintenance. Recently it has been decided to set apart two wards of eight beds each for a better class of paying patient. These patients will pay four guineas a week for their maintenance, with extra charges on a fixed scale for special services of a consultant or specialist nature, such as consultations, operations, x-ray work, and so on. The paying patients will only be admitted on the recommendation of an outside practitioner; they will be admitted through the clerk to the guardians, and not through the relieving officer; and it is intended that only serious cases, medical or surgical, shall be accepted for admission. Further, it is hoped to institute something of an out-patient nature, at all events for special cases. These paying patients will be treated by the medical superintendent and his assistants, but will have available the services of the consultant staff at the tariff which has been laid down.

In this brief description it will be seen that the arrangements at the West Middlesex Hospital differ in essential points from the ideals aimed at in Bradford; for example, the only attempt at disguising the nature of the institution has been the change of name. The guardians of the poor are the authority responsible for the institution. Except in case of emergency, the patients pass through the hands of the relieving officer. The hospital is not a municipal hospital open to all ratepayers. Inability to pay more than a certain rate for maintenance remains a safeguard against

misuse. With regard to the paying patients, however, the criterion for admission is not so much financial disability as the severity of the condition of sickness or disease. If the patient is sufficiently ill, or requires operation, he will be admitted, provided that his doctor recommends him and the clerk to the guardians is satisfied that he cannot afford to pay specialists' and nursing home fees. The decision as to admission rests with the authorities of the hospital; financial limitation being contemplated to a certain extent, inasmuch as the fees payable for consultant or specialist assistance are on quite a low scale.

The arrangements at this hospital do not seem to be in accord with the expressed opinions of the British Medical Association. The general practitioner is not used in any way except as a safeguard in the admission of patients to the paying wards. The treatment of the patient passes entirely into the hands of the hospital staff, and it is, we understand, considered impossible to make arrangements that patients admitted to the paying wards shall be treated by their own family practitioners. The hospital is not in any sense a primary centre such as is described in the Dawson Report.

There seems little doubt that the hospital, as at present conducted, meets some of the needs of the community. It provides hospital facilities for those who cannot afford to pay the ordinary fees of surgeons and of nursing homes. The facilities provided include nearly all those things which are said to be lacking in the treatment of pauper patients and the poorer classes of the community. Both with regard to Poor Law patients and those who will become paying patients in the hospital it imposes limits to prevent abuse by those who can afford to pay. It safeguards the general practitioner by refusing admission to the paying wards except on his recommendation. There are certain other points which should be carefully considered by the medical profession. In the first place the question arises whether the facilities provided at the public expense should be limited to certain sections of the community. At the present time the necessity of limiting expenditure probably renders such limitations obligatory. Should they be maintained when the financial position of the local authority improves? Much has been said about the abolition of the stigma of pauperism. But so long as a distinction of classes is made into those who can afford to pay for their treatment and those who cannot, so long there is bound to remain a stigma, at all events of poverty. The distinction involves the retention of an official of the nature of a relieving officer. He may be glorified by the name of almoner, but in essence his duties will in this respect be the same.

Secondly, so long as the distinction of classes is maintained, are the safeguards to the general practitioner sufficient? On the one hand, the relieving officer should be an efficient check in preventing abuse of the Poor Law side of the institution; on the other hand, the requirement of a doctor's recommendation should prevent the use of the paying wards by persons able to pay full fees and charges. The requirement that the clerk to the guardians shall approve the recommendation will tend to relieve the general practitioner of the risk of incurring odium by refusing to recommend unsuitable patients. The working of these safeguards is likely to be more satisfactory if the local profession is represented by a strong medical committee acting in harmony with the hospital authorities, and ready to judge any hospital scheme by the criterion whether it will work in the long run for the good of the community. This leads to a third question, which is, whether attendance by general practitioners will prove to be feasible in hospitals which serve large populous areas. So far as indication of their opinion has hitherto been given, the great majority of public medical officials regard such an arrangement as impossible. In cottage hospitals it can be made to work. In primary health centres, provided they serve a small area, it is possible that every local practitioner will be able to attend his patients in the hospital, though even here difficulties may arise. In large hospitals of the infirmary type it is not so easy to see how the difficulties would be overcome, and anything which helps us to understand how they may be surmounted is of value. The study of systems such as exist or are proposed in institutions of the nature of Bradford Municipal Hospital and the West Middlesex Hospital should help to elucidate these questions.

Scotland.

PARLIAMENTARY REPRESENTATION OF SCOTTISH UNIVERSITIES.

At meetings of the Unionist Associations of the Scottish Universities held recently a letter was received from Sir Watson Cheyne, Bt., K.C.M.G., one of the members for the Universities, stating that he might be compelled on account of his health to resign at any moment, and that even if he were able to remain in office till the end of the present Parliament he had definitely decided not to seek re-election. He suggested that a suitable prospective candidate should be selected without delay, so that he, Sir Watson Cheyne, might be in a position, if he felt unable to go on any longer, to resign without feeling that he was doing anything harmful to the constituency. It was unanimously agreed that in view of the complex problems of public health with which the House of Commons has now to deal, and of the value in relation thereto of highly trained professional opinion, the services of an eminent medical graduate of one of the Scottish Universities should if possible be obtained. Sir George Andreas Berry, LL.D., F.R.S.E., a former President of the Royal College of Surgeons, Edinburgh, and of the Ophthalmological Society of the United Kingdom, has been invited to become prospective Unionist candidate, and he has agreed to place his services at the disposal of the constituency. Sir George, who was educated at Marlborough and Edinburgh University, and also studied in London, Paris, Copenhagen, Vienna, and Giessen, was from 1882 to 1905 ophthalmic surgeon to the Edinburgh Royal Infirmary, later he acted as one of the managers; and for the past ten years he has been a member of the University Court of the University of Edinburgh. During the war, and for one year after the war, he served as Chief of the Ophthalmic Department of the 2nd General Hospital, in which capacity he had sometimes to deal with 100 new cases a day. He was knighted in 1916 in recognition of his scientific work. Lady Berry is a daughter of the late Sir William Muir, K.C.S.I., for many years Vice-Chancellor and Principal of the University of Edinburgh.

EDINBURGH UNIVERSITY COURT.

At a meeting of the Edinburgh University Court, on June 13th, Professor Sir Robert Philip and Professor Ritchie were appointed representatives of the University to the International Conference on Tuberculosis to be held in London in July. The Court resolved, consequent on the approval of the ordinance concerning matriculation and graduation fees, that on and after September 1st, 1921, the matriculation fee payable at the beginning of each academic year should be two guineas instead of one guinea; the fees for the degrees of Bachelor of Medicine and Bachelor of Surgery are to be £34 13s., for the degree of Master of Surgery £21, and for the degree of Doctor of Medicine £21. As recorded in another column, the resignation was intimated, and received by the Court with great regret, of Professor Sir John Halliday Croom from the chair of midwifery, and the gift by the professor of all the preparations, specimens, apparatus, and diagrams collected during his tenure of the chair, was accepted with thanks. The Court accepted also the offer of the Associated Societies of the University to present the records of the Hunterian Medical Society, formerly one of the Associated Societies, but now defunct for many years, and directed that the records should be deposited in the University library. It was reported to the Court that Lord Lytton and other members of the Committee on Indian Students appointed by the India Office would visit Edinburgh University on Monday, June 27th, and successive days. The Court resolved to invite all the Indian students and graduates of the University resident in Edinburgh to meet the committee in the Old College on June 27th. at 4 p.m.

CARE OF THE BLIND.

The Scottish Board of Health has issued a circular to local authorities with regard to the Blind Persons Act, 1920, drawing attention to the desirability of making proper use of the existing facilities and of assisting voluntary effort. At present, it is pointed out, grants are payable to approved voluntary agencies in accordance with the regulations made by the Board in respect of such services

as workshops and homes for the blind, hostels, home teaching, and book production. Application may, however, also be made by a voluntary agency for a grant in aid of any scheme of assistance other than those referred to in the regulations, which has for its object the betterment of the conditions of the blind or the prevention of blindness.

Ireland.

IRISH MEDICAL ASSOCIATION.

The annual general meeting of the Irish Medical Association was held in Dublin on June 15th, Dr. E. Magennis presiding. The statement of accounts showed a surplus of £854, and the membership at the end of the year was 684. The annual report and financial statement were adopted. Dr. Magennis was re-elected president, and in acknowledging the honour said that it had been suggested that the constitution of the Association should be altered, as the present system had not been a success; it was also proposed that the present subscription be increased. Dr. W. O'Sullivan was re-elected vice-president.

ROYAL MEDICAL BENEVOLENT FUND SOCIETY.

The annual meeting of the Royal Medical Benevolent Fund Society of Ireland was held in Dublin on June 15th at the Royal College of Physicians, with Sir James Craig in the chair. The annual report was read by Sir John Moore. The amount given in grants during the year was £1,201, and the revenue from all sources was £2,915. The President said that it was a serious reproach to the members of the medical profession that they did not realize the urgent need of supporting the Benevolent Fund Society.

ROYAL VICTORIA HOSPITAL, BELFAST.

At the meeting of the Board of Management of the Royal Victoria Hospital, Belfast, held on June 15th, S. B. Boyd Campbell, M.D., F.R.C.P. Edin., was appointed assistant physician, in the place of Dr. J. E. MacIlwaine, lately appointed physician.

Correspondence.

TREATMENT OF ACUTE TOXAEMIA.

SIR,—In his letter on this subject to the JOURNAL of June 4th Sir Archdall Reid states clearly a strong prima facie case for his belief that it is possible, by artificial means, to abstract toxin from sufferers under acute febrile diseases, and appeals to all ranks of the profession to make a trial of the treatment he has employed with a view to testing its value. Among the diseases mentioned by him as suitable for this trial are acute lobar pneumonia, diphtheria, measles, puerperal fever, sepsis, small-pox, etc., and the treatment he advocates is the giving, as early as possible, a dose of aspirin (10 grains), phenacetin (5 grains), and pulv. ipecac. co. (5 grains), to be repeated once or twice in twenty-four hours till the symptoms cease to recur. Unable as I am to make any such trial myself, but being sufficiently convinced of the importance of testing the results of Sir A. Reid's considerable experience in the matter, I ask for space for the following few remarks:

It seems essential (1) that the selected cases for testing should be in the earliest stage possible for observation, so as to lessen the likelihood of natural recovery at the recognized average periods; (2) that a careful diagnosis be made, and the symptoms, signs, and course of each case accurately recorded; (3) that every possible means be taken for careful examination of the sweat for the purpose of discovering the presence or absence of toxins.

Sir Archdall's hypothesis is based to some extent on the widespread belief that the sweating which occurs, whether in the so-called "critical" or continuous form, in many acute fevers is a natural method of cooling the healthy body; but this hypothesis also requires the assumption that elimination of toxins accompanies the sweating which so soon follows on the administration of each dose of the drug in febrile cases.

Lastly, though this point is perhaps not essential, I would remark that the exact nature of the drugs employed by Sir Archdall Reid may possibly escape the notice of

some who will make trial of this treatment. Some practitioners who object to phenacetin may prefer to give 15 grains of aspirin, and leave out the phenacetin; and some may question the importance of giving the compound ipecacuanha powder. Many may be inclined to attribute the rapid fall of temperature, abolition of headache, and sweating to the aspirin, and to give aspirin alone. I mention this as it seems desirable, in an extended trial of this great importance, that the medicine and doses used should be uniform throughout, and that, at least in the early trials for the purpose of testing the value of the treatment, Sir A. Reid's formula should be strictly followed. If the test corroborates his results, it would be of course open to anyone to modify the composition of the medicine employed.

There is an ample field for this testing in fever hospitals and especially in general practice.—I am, etc.,
London, W., June 19th. H. BRYAN DONKIN.

WHAT IS SCIENCE?

SIR,—In your issue of June 4th, in a very able and interesting leader on Medicine a Science, in which you do me the honour of mentioning my name, you have discussed various definitions of the word *science*. You quote specifically Sir William Osler's dictum that "the goal of science is the acquisition of new powers by new discoveries," and that of Clifford, recalled by Sir E. Ray Lankester, that "the subject of science is the human universe; that is to say, everything that is, or has been, or may be, related to man." You dismiss—rightly in my opinion—both these descriptions as not entirely satisfactory.

Now, I am far from being prepared to give a definition of science; still less am I in a position to correct or amend the definitions given by the very distinguished men whom you have quoted. Yet, without attempting to define science, may I suggest a provisional test for what is a science—a test that has been helpful to me, and, I think, may perhaps be of service to others? It is a test that I have ventured to apply tentatively in a chapter on "Science" contributed to a recent book on *Mediaeval Contributions to Modern Civilization*, edited by Professor F. J. C. Hearnshaw.

The test I apply is that *science is knowledge in the making*. We are all in danger of considering that science is a particular kind of knowledge, but reflection shows that it is not so. A Greek text, for example, may be scientifically treated and the scientist (called a philologist) may apply a perfectly scientific method in restoring or correcting it. Again, chemical knowledge can be quite unscientifically treated, as a glance at an advertisement of a quack remedy may rapidly convince us. The corrected text, however, can hardly be said to give "new powers" (to use Sir William Osler's phrase) in the ordinary sense of the word "power." Yet it is clearly knowledge in the making, and the text may be said to be scientifically edited.

Apply this test for a moment to medical studies, and let us take, as an example, the simplest and most fundamental of those studies. Descriptive human anatomy was, in the main, a creation of the sixteenth and seventeenth centuries. In the hands of Leonardo and Vesalius, of Fallopius, Fabricius ab Aquapendente and Eustachius, it was a progressive science. During the eighteenth and nineteenth centuries the limit of that type of knowledge was nearly reached. Descriptive anatomy is now a valuable and indispensable *discipline*, but it has almost as much ceased to be a science as has the equally indispensable knowledge of the multiplication table. Descriptive anatomy is hardly any longer knowledge in the making. Of course anatomists still retain their position as men of science—there are probably none with a better right to that title—but they do so mainly by virtue of the excursions they make into kindred and still progressive studies, such, for instance, as comparative anatomy, embryology, ethnology, physiological mechanics, and the like.

Apply the same test to the knowledge of a language. The grammar and construction of the classical and of the Western European languages are a fully explored field. The learning of them is a discipline; science has no part here. But there are still progressive sciences of phonetics and of comparative grammar. When the unwritten language of some wild tribe is from time to time explored, the process is or should be an application of scientific

method, and that method is still applicable to the imperfectly known languages of the monuments of the ancient East.

Science in this view is inextricably wrapped up with research; it is the growing edge between the unknown and the known, between the desert and the sown. In places this edge is sharp and clear, in places there is a wider and debatable area.

But there is a corollary arising out of this view of science as a process. To understand a process it is inevitably necessary to understand how it came to be what it is. A process is an organic thing—to understand it you must know and understand its history. Thus the teaching of science becomes, in its ultimate analysis, instruction in history; not, of course, what is usually termed "history" by the professed historians, nor even by the historians of science, but history, nevertheless. The "heuristic" method of teaching science—the only method that teaches science proper, the art of discovery, as distinct from the results of science—is in reality a method of recognizing this. You can only explain "scientific knowledge" by explaining *why* you hold that knowledge to be true knowledge. The answer to this question Why? must in its nature be a verification of past experience by present evidence, and this is, in fact, the method of history.

Thus we see the wheel turn full circle. The methods and the manner of teaching of the science of medicine that are so eloquently preached by Sir James Mackenzie are not far removed from the line of advance of what are too narrowly termed the "humanities." For the truth is that knowledge is one, and there is only one true and safe method of advancing it, and that is science. It is sometimes pathetic to see so-called "specialization" in scientific knowledge tending to separate men's thoughts and spheres of work rather than to unite them. This separation, however, mentally destructive though it be, can only be a passing phase, and is, perhaps, already declining. It is an evil against which the life work of the great men you have quoted—Osler and Clifford, Lankester and Mackenzie—stands out in lasting protest.—I am, etc.,

Oxford, June 15th.

CHARLES SINGER.

CAPILLARY PRESSURE.

SIR,—Dr. Gillespie (June 11th, p. 873) compares the capillaries to a soap bubble, and imagines the capillary wall as exerting a surface tension which raises the internal pressure. Now in the amputated leg of a frog the capillaries of the web of the foot are not emptied. Many remain full. It is evident, then, that the capillary wall does not exert a surface tension comparable to that of a soap bubble. The same thing holds good for the capillaries of the arm. Let the circulation be stopped by a tourniquet, after emptying the big veins by raising the arm for a second or two; the skin only slowly blanches, and the blanching that does take place seems to be brought about by gravity or bringing in the compressive action of the muscles. Again, in the case of the brain: when the skull is trephined and the dura incised the brain bulges in the trephine hole, but collapses when the heart stops beating and gravity comes into play. It does not collapse if the animal be so tilted that gravity keeps the vessels full. The surface tension energy imagined by Dr. Gillespie should certainly empty the capillaries against a very moderate opposing force of gravity.

If the brain ceases to bulge into the trephine hole when the heart stops beating, and the animal is in the horizontal position, it is just to infer that the expansion of the brain is due to that part of the force of the heart-beat which is left over after overcoming the resistance in the arteries and arterioles and maintaining the kinetic energy of flow, and the pressure that is required to reduce the bulging of the brain into the trephine hole is then the pressure that is required to overcome the expansion of the arteriole, capillary and venous network. That pressure is the same within the limits of measurement as the venous pressure measured directly in the torcular Herophili, and the same as that of the cerebro-spinal fluid measured by passing a hollow needle through the occipital atlantal membrane.

The method which I have used for measuring capillary pressure is one contrived by Roy and Graham Brown, and is one which has been used by many other physiologists. My findings are supported by Basle, who, after cutting

the finger and inserting it into a suitable vessel, measured the pressure to which the escaping blood raised the manometer—that is to say, he measured the internal pressure and found results which agree closely with those obtained by me using the Roy and Graham Brown apparatus.

In the amputated leg of the frog a very slight alteration of external pressure sends the corpuscles swirling along the capillary vessels. When the blood is flowing naturally a very small external pressure suffices to stop the flow in the outlying capillaries at the external edge of the web, the flow taking the pathway of less resistance through wider networks.

Physiological experiment has shown that an artery, big or small, when compressed by a surrounding fluid pressure, is shut up by a compressive force practically equal to that of the pressure which is maintaining the flow through the artery, and which is measured directly by a manometer connected with the lumen of the artery. The same holds good for a vein, big or small. It holds good also for the excised kidney when Ringer's fluid is circulated through it and the whole organ is submitted to external compression. It is known that a pressure of 10 to 15 mm. Hg suffices to maintain a circulation through the kidney. If the capillaries of the kidney were striving to contract like a soap bubble owing to surface tension, they ought to resist the flow of fluid at such low pressure.

The capillaries open into the veins, and measurement shows that venous pressure is very low, and in close agreement with the measurements of capillary pressure made by me. It seems highly improbable that there should be a high internal pressure produced by surface tension inside capillaries and a very low pressure in the veins with which they closely communicate. All these facts seem to show that we have the right to assume that the Roy and Graham Brown method holds good for the capillary sized vessels.

These statements are founded on physiological experiment, and if erroneous they can be overthrown by further experiment and more exact measurement. Physical theory unaccompanied by such experiment will do nothing to elucidate the principles of capillary circulation.—I am, etc.,

London, N.W.3, June 14th.

LEONARD HILL.

SIR,—The application of even elementary facts in physics to physiological data presents more difficulty than is apparent at first sight. It is apt to be forgotten that the physicist, especially in his mathematical treatment of experimental data, simplifies his data as far as possible. He introduces into his argument certain postulates, but prefers not to have too many postulates to deal with. The physiologist, on the other hand, can advance only slowly because he can neglect no data whatsoever pertaining to his problem.

To illustrate: Dr. Gillespie, in his interesting letter, sees an analogy between the mechanism which maintains a soap-bubble wall under tension and the mechanism by means of which a capillary wall, though thin and flaccid, could withstand high capillary pressure. Now, in the case of a soap bubble the pressure distending it is created by the tendency of the walls—surface tension—to contract into smallest compass, and, as elementary books on physics state, the pressure inside a soap bubble decreases as the bubble gets larger. Consequently, considering the very small radius of a capillary, it could withstand high internal pressure. After all, states Dr. Gillespie, the tension of the wall would be very small.

Now the physiologist may enter the field and ask whether the walls of a capillary actually behave like a soap-bubble film. If the pressure inside a soap bubble could be suddenly diminished below atmospheric the bubble walls would collapse. If, similarly, the pressure inside a capillary is reduced to zero we do not find that the walls of the capillary suddenly collapse. When the large veins are emptied by raising the arm for a few seconds and the brachial artery stopped by a tourniquet it takes quite a considerable time for the skin to become blanched, and even in this the blanching is aided by gravity. Evidently, then, there is no analogy between the tension of the wall of the soap bubble and the physical state of the wall of a capillary full of blood.

But I am quite willing to be aided by the simple formula used by Dr. Gillespie. I shall now proceed to apply it.

Let p_1 = represent inside pressure—for example, pressure inside capillary.
 p_2 = represent outside pressure—for example, pressure outside capillary.

Now, states Dr. Gillespie,

Let $p_1 - p_2 =$ the pressure caused by 50 mm. of Hg.

Here, again, the physiologist must interrupt the physicist. Where is that 50 mm. of Hg obtained? There is an airiness about that postulate of quite an engaging nature. The trouble is that no data whatever are available to the physiologist until he first measures p_1 plus p_2 —the pressure inside the capillary and the pressure outside the capillary.

Now the point arises whether the pressure outside the capillary can be compared with the pressure in a soap bubble. The skin is elastic and is distended by the inhibition of the tissues. Wounds we know gape. The skin then exerts a force inwards. It, like the soap bubble film, struggles to contract itself into smaller compass. According to the latter part of Dr. Gillespie's argument, we shall not need so much pressure to blanch capillaries, because the skin is compressing them. Now we find that $p_1 + p_2$ may amount to 33 mm. of Hg, where the measurement is made at heart level on the skin of the last digit of the thumb.

But p_2 can be measured—that is, the pressure required to collapse the flaccid capillary wall—when we have reduced the capillary blood pressure to zero and then found the pressure required to blanch them. According to Dr. Gillespie, that should not require much pressure, for the distended capillary wall under tension is striving to collapse and the outside skin is striving to contract. A small pressure, much less than the internal tissue pressure, is sufficient, according to Dr. Gillespie, to narrow the capillary walls and squeeze the blood out. We find that the pressure required to blanch the same last digit of the thumb at heart level is 23 mm. of Hg.

Now $p_1 + p_2 = 33$ mm. of Hg,
 $p_2 = 23$ mm. of Hg.

Accordingly $p_1 = 10$ mm. of Hg
 and $p_1 - p_2 = -10$ mm. of Hg approximately,

following Dr. Gillespie,

$T = \frac{1}{2} \times 15.6$ grams per sq. cm.
 $= 7.8$ grams per sq. cm.

Then $-15.6 = \frac{0.000005 \times T}{r}$
 and $T = 0.00005$ gram per cm. of length.

It will be noted that when physiology enters the field and supplies actual measurements in place of a gross assumption of 50 mm. of Hg, as the value of $p_1 - p_2$, Dr. Gillespie's application of simple physical law shows the tension per unit of length tending to split the tube longitudinally is actually a minus quantity. Is not this the result to be expected? No such tension exists.

The fact is, Dr. Hill is as nearly correct as any man of equal eminence who has devoted a large measure of his life to the study of these difficult problems can hope to be in the present state of our knowledge. The capillary wall is, to use Dr. Gillespie's phrase, "so thin and collapsible"; the venous wall is thicker but collapsible. The moment you compress and diminish the calibre of a vein by outside pressure, you measure the internal pressure. Similarly in a capillary, but with this fundamental physiological difficulty before you, in both cases—if you constrict the wall even slightly, the pressure you measure is no longer capillary but mounts automatically to the higher arteriole pressure of the entering blood stream.

There is no evidence whatever that the capillary wall is under strain like the film of a soap bubble. If you block by compression a capillary by stopping a red corpuscle, you have overtopped the internal capillary pressure without any assistance whatever from the flaccid capillary wall.

Finally, in the case of the measurement of arterial blood pressure it has been found that stoppage of the pulse wave accurately measures the systolic pressure and gives practically the same reading as a manometer connected directly with the artery. The blood flow stops at a pressure of at most a few millimetres of Hg higher.

Now the arterial wall is under distension, and to this extent may be compared to a soap-bubble film. It exerts

pressure tending to narrow the artery. But we have to exert a pressure equal to the internal pressure and no less to stop the pulse wave when the armet is used on the upper arm.—I am, etc.,

Halesowen, June 10th.

JAMES M. McQUEEN.

HEART-BLOCK.

SIR,—In your issue of June 11th Dr. G. Arbour Stephens makes some criticisms on my paper on heart-block which appeared in the *JOURNAL* of June 4th. Especially he calls in question my justification for the statement "it is clear that the systolic plateau is dimpled by the drag of the contracting auricle," and in connexion with this he asks "Is it the function of the auricle to 'dimple,' and if not, why in this particular case?"

I think it is generally recognized that when the auricle contracts at its usual time, that is to say, immediately before the ventricle, it will drive blood into that cavity, and cause its apex to rise against the chest wall to such an extent that in many cases, though not in all, this may be demonstrated in a tracing taken from the apex beat. It has been explained to us, and by no one better than by Sir Arthur Keith, that the auricles not only drive blood into the ventricles, but pull the bases of the ventricles upwards and backwards over the volume of blood in the auricles, and he happily likens this double action to that of a man pulling on a boot; for not only does he push his foot into the boot, but he pulls the boot up over his foot. Now, when the left auricle contracts, as it normally does at a time when the ventricle is at rest, its pull at the base in a direction away from the apex of the heart is more than neutralized in many instances by the projection of blood into the cavity of the ventricle, whose apex therefore is caused to rise, as may be shown in a tracing. When, however, the auricle contracts at the same time as the ventricle, there is probably no passage of blood into the lower chamber, and there will be no such wave as I have described. On the other hand, the auricle will, by its contraction, draw back the base of the ventricle in the manner described by Keith, and this will result in a dimpling of the systolic plateau.

It may be asked, "If the auricle cannot drive its blood onwards when it contracts at the same time as the ventricle, what becomes of that blood?" I suppose the answer to this is that it is driven back to some extent into the pulmonary veins, in the same way as we know from jugular tracings that the right auricle drives blood back into the veins of the neck when it finds itself contracting at the same time as the ventricle in some varieties of extrasystole, and in certain cases of spasmodic tachycardia. It is only therefore, I repeat, when the auricle and ventricle are contracting synchronously, and especially when the auricular systole falls near the middle of that of the ventricle, that we should expect to find this dimpling. It is seen in Figs. 4 and 5 of my paper that every fourth ventricular systole, and only every fourth, has an auricular systole associated with it in this manner. It is the plateaus of those systoles, and of those alone, therefore, which show the dimpling. The observation is not an original one on my part.

I am well aware how deceptive tracings taken from the region of the apex may be. As Mackenzie pointed out long ago, a systolic plateau may easily be represented by a systolic depression if care is not taken to place the receiver exactly over the apex beat. There may be no accessible apex beat, and that which has been so regarded may have its real character exposed by presenting a depression which is found to be systolic in time. During the systole of the ventricle there is often some lateral movement of the apex, and so the "apex tracing" may present mixed characters, and the movements of respiration may cause the tracing to present a rhythmical transition from plateaus to depressions. Now before I accept a tracing as being that of the apex beat, I try to eliminate these and other sources of fallacy. My receiver is $1\frac{1}{2}$ inch in diameter, and it might I think with advantage be less; a receiver three inches in diameter cannot give a tracing of the "apex beat" alone with accuracy, for this is a phenomenon limited to the apex of the heart. It may be the case that valuable information can be obtained by the use of a receiver of this size, but it would be the resultant of more than one movement and not the effect merely of the forward thrust, of the maintenance of this and of the

recession, and it was these alone with which I was concerned.

Dr. Stephens says I have given "no consideration . . . to the quantity and quality of the pericardial fluid present." That is true; but in none of the cases was there any evidence of fluid in the pericardial cavity. The absence of the ordinary signs of pericardial effusion is, of course, quite compatible with the presence in the sac of a considerable increase in the amount of the physiological secretion. My attention has not been directed to the influence of such small quantities of fluid on the characters of the apex beat.

Dr. Stephens claims more for my tracing (Fig. 5), and sees more in it than I do myself. To me, apart from the points discussed, it shows merely a condition of complete heart-block, and tells me nothing as to its causation; to Dr. Stephens it "suggests a toxic condition." The subsequent history does, I agree, lend support to such a view, with which, however, I was not concerned in my paper, but I cannot read into the tracing anything bearing upon the cause of the block.

I am quoted as having stated that my first case (the italics are my own) died "without any obvious (*sic*) cardiac symptoms." If I am right in supposing that the "*sic*" implies an incorrect use by me of the word "obvious" I do not agree. But the criticism may be on other grounds; and I may be in the position of Diogenes Tenfelsdrökh, who was asked to believe that the reason for the appalling epitaph he had written not being engraved was a "defect of Latinity." I do regret, however, that Dr. Stephens has, quite accidentally, I feel sure, quoted me as saying "the case died." I am glad to feel that I did not express myself in those words. What I wrote was "He"—that is to say the patient—"died."—I am, etc.,

Leeds, June 20th.

T. WARDROP GRIFFITH.

VOLUNTARY HOSPITALS COMMITTEE.

SIR,—In Section 39, with reference to the "contributors' certificates" issued at the Great Northern Central Hospital, the Committee says: "The scheme is in its infancy, and we are unable to express an opinion as to its value." The Committee must here be speaking of "value" in a financial sense only, since the contributor's certificate is merely the old "subscriber's line," which, from the medical standpoint, experience has shown to be an unmitigated evil. It is evil in two aspects. For many years, and as recently as this month, I have heard hospital officers allege that it is difficult to keep beds clear for cases medically urgent because cases not medically urgent are admitted in virtue of holding a line from a subscriber whom it will not do to offend. Thus, in practice, a non-medical condition takes precedence of medical urgency in the admission of patients. In the second place, I have known of the relatives of poor people sacrificing a whole working day in the search for a line which had been demanded after the patient was admitted. This was a means of impressing on them the importance of the hospital subscription in a factory or in a congregation.

No matter how generously the "voluntary" regulations are drawn, in practice constant supervision is needed to guard against an insidious entry of compulsion.—I am, etc.,

Dundee, June 19th.

R. C. BUIST.

CAMBRIDGE DIPLOMA IN HYGIENE.

SIR,—The University of Cambridge, in response to a communication from the League of Red Cross Societies at Geneva, has established a new Diploma in Hygiene.

In order that the scheme may assume an international aspect, it is hoped to bring together men representing the views of different countries; and that candidates from advanced countries, such as America and Scandinavia, as well as those from the more recently reorganized nations of Eastern Europe, may avail themselves of the facilities provided in these classes.

The training is primarily intended to benefit those who wish to familiarize themselves with English methods of sanitary science and practice, and to return to their own countries holding an official certificate that they are qualified to act as officers of health.

The diploma is open to candidates from all countries outside the British Dominions who possess a qualification to practise medicine or surgery which, though not registrable in Great Britain, is recognized by the authority of

the country in which the candidate practises. The diploma is not registrable by the General Medical Council of Great Britain and Ireland.

The full course must extend over a period of nine calendar months, and all candidates must have matriculated and resided in the University for not less than two terms, or for one term and during a long vacation course. The examination is divided into two parts, and the requirements for each part are similar to those demanded for the diploma in public health, with the exception that no detailed knowledge of English public health laws and statutes will be called for. It appears to be more important that candidates should become acquainted with the general principles of the English code of sanitary legislation than that they should possess a detailed knowledge of the legal duties and responsibilities of our sanitary authorities.

Arrangements are now being completed to ensure lodging accommodation not only for D.P.H. students but for the students who intend to take the diploma in hygiene.—I am, etc.,

J. E. PURVIS,
Secretary to the State Medicine Syndicate.
Public Health Laboratory, Cambridge.
June 18th.

COCCYGEAL FISTULAE.

SIR,—I have read Mr. Ernest Miles's comments on my paper on coccygeal fistulae in your issue of June 18th with much interest. There are one or two points which seem to me to call for a reply.

I did not mean to convey that all abscesses and fistulae over the coccyx are necessarily due to dermoids. Ordinary abscesses may, of course, occur in this as in any other situation due to caries of underlying bone, etc.; but the majority of such lesions in this situation will, I believe, prove to be due to the causes I have described.

The condition described by the late Mr. Goodsall as "sinuses over the sacrum and coccyx" is, I feel sure, the same as that which I have described as congenital coccygeal fistulae, in spite of Mr. Miles's arguments to the contrary. As no sections were made in Mr. Goodsall's cases it is not possible to prove this, but the descriptions given of his 10 cases bear such similarity to my own that I feel sure had a microscopical examination of sections of the fistulous tracks been made their congenital origin would have been apparent.

Mr. Miles seems to attach much importance to the opening of these sinuses being in the middle line, and to argue that when the opening is not in the middle line the sinuses cannot be congenital in origin. These congenital sinuses, however, may open in any direction, as the external openings are more often than not due to the secondary septic infection. Only this week I operated upon a patient in whom there was a large fistula with two long tracks running forward, one on each side of the anus, and opening on each side in front of the anus. Posteriorly these tracks communicated with a small cavity over the tip of the coccyx. This cavity proved to be a dermoid cyst of congenital origin, which had suppurated as the result of injury.

Most of the reasons given by Mr. Miles for considering that these sinuses are not congenital are quite unconvincing. Unless a case is seen before there is any sinus, it is not possible to know whether there had previously been a dimple or not. There may be quite a large amount of granulation tissue where suppuration has been going on for some time, and I see no reason why the aperture should not temporarily close, even where the sinus is congenital in origin, since it does not follow that the external opening, which is usually the result of secondary suppuration, is lined with skin. Teeth one would not expect to find in an inclusion dermoid.

With regard to their not being lined with skin, this can only be ascertained by a microscopical examination, as considerable modification of the lining membrane may have taken place as the result of suppuration. These cases are not so rare as Mr. Miles thinks. Since I have been on the look-out for them I have seen quite a number, and I feel sure that if Mr. Miles will have sections cut of such cases, he will be surprised by the number in which he finds evidence of congenital origin, in spite of the history

of injury, and the fact that there had been no previous history of any lump.—I am, etc.,

J. P. LOCKHART-MUMMERY, F.R.C.S.
London, June 18th.

NORTH EUROPEAN CONFERENCE ON VENEREAL DISEASES.

SIR,—In reference to your report of this conference, appearing in the JOURNAL of June 18th, permit me to inform you that the English delegates to the conference consisted of: Colonel L. W. Harrison, Dr. F. N. Kay Menzies, and Mrs. C. Neville Rolfe (Mrs. Gotto), who are well known opponents to immediate self-disinfection as a method of prevention.

Directly I heard that the conference had been arranged, I communicated with the Danish Red Cross at Copenhagen, requesting that my society should be represented at the conference, and the secretary sent me a most courteous reply, intimating that he would be pleased to welcome delegates from the Society for the Prevention of Venereal Disease, but that the selection of such delegates was entirely in the hands of the British Red Cross. I thereupon reiterated my request to the British Red Cross, and received a reply stating that the Society for the Prevention of Venereal Disease could not be represented at the conference, as the League of Red Cross Societies at Geneva had adopted the National Council for Combating Venereal Diseases as the recognized channel in this country, for communications on these subjects, and that they had already selected the delegates mentioned above.

The views of that very large section of the public in this country, who support the policy of immediate self-disinfection advocated by the Society for the Prevention of Venereal Disease, had no opportunity, therefore, of being represented at the conference, and this important aspect of venereal disease prevention was therefore largely neglected.—I am, etc.,

H. WANSEY BAYLY,
London, W., June 17th.
Hon. Sec. S.P.V.D.

THE PATHOLOGICAL MUSEUM AT THE ANNUAL MEETING.

SIR,—The Committee wish to call attention to the importance of the Pathological Museum, and the necessity of making it an adjunct to the work of the Sections.

It is requested that readers of papers in the various Sections, or others taking part in the discussions, should have specimens illustrating these to show, and should communicate at once with the Secretary of the Pathological Museum Committee. This also applies to anyone who wishes to exhibit specimens of general interest.—I am, etc.,

A. F. BERNARD SHAW, M.D.,
Honorary Secretary, Pathological Museum.
College of Medicine, Newcastle-upon-Tyne,
June 16th.

The Services.

INDIAN MEDICAL SERVICE.
ANNUAL DINNER IN LONDON.

The annual dinner in London of the Indian Medical Service took place on the evening of June 15th, when Major-General Sir R. Havelock Charles, G.C.V.O., M.D., Medical Adviser to the Secretary of State for India, was in the chair.

The officers present were:

- Major-Generals: E. E. Giffard, C.S.I., G. F. A. Harris, C.S.I., Sir P. Hehir, K.C.I.E., C.B., C.M.G.
- Colonels: J. K. Close, J. Crummin, V.C., C.B., C.I.E., Sir P. J. Freyer, K.C.B., J. L. Pratt, H. Austen Smith, C.I.E., C. N. C. Wimberley, C.M.G.
- Lieutenant-Colonels: A. Alcock, C.I.E., W. G. P. Alpin, O.B.E., J. Anderson, C.I.E., F. V. O. Beit, G. T. Birdwood, L. P. Brassey, A. W. T. Bust, W. H. Burke, S. H. Burnett, D. G. Crawford, C. D. Dawes, R. H. Elliot, S. C. Evans, A. A. Gibbs, L. Hirsch, C.I.E., C. T. Hudson, C.M.G., E. V. Hugo, C.M.G., J. G. Hulbert, S. P. James, J. G. Jordan, H. Kirkpatrick, W. Glen Liston, C.I.E., R. McCarrison, R. H. L. Meyer, A. Miller, R. A. Needham, C.I.E., D.S.O., J. W. F. Raitt, Sir L. Rogers, C.I.E., A. Spitteler, R. Steen, W. A. Sykes, D.S.O., W. H. Thornhill, W. Vost, J. N. Walker, H. J. Walton, J. H. Tull Walsh, H. R. Woolbert, J. C. S. Vaughan, A. C. Younan, A. W. Cook Young.
- Majors: H. C. Brown, C.I.E., H. P. Cook, W. T. Finlayson, D.S.O., C. A. Godson, M.C., I. Davenport Jones, H. C. Keates, W. D. Keyworth, H. H. King, A. A. McNeight, M. J. Quirke,

F. B. Shettle, E. C. Taylor, C. Thomson, W. P. G. Williams, N. M. Wilson, W. E. Rees Williams, O.B.E.

Captains: P. M. Antia, H. S. Cormack, M. L. C. Irvine, N. G. C. McVean, N. D. Puri.

The guests were the Editors of the BRITISH MEDICAL JOURNAL and the *Lancet*.

The toast to the Service was given by the Chairman: Colonel R. H. Elliot, who proposed the health of Sir Havelock Charles, eulogized his loyal defence of the interests of the Service. The toast was very warmly received and suitably acknowledged.

ROYAL NAVAL MEDICAL SERVICE.

APPROVAL has been given this year by His Majesty in Council for the following alterations in the regulations regarding promotion. They are applicable to medical officers of the Royal Naval Reserve and Royal Naval Volunteer Reserve serving on July 1st, 1919:

(a) Surgeon Lieutenants to be eligible for promotion after six years instead of eight as at present, the promotion of those on the list on July 1st, 1919, being antedated as necessary.

(b) Surgeon Lieutenant Commanders to be eligible for promotion to Surgeon Commander after six years instead of eight as at present, those on the list on July 1st, 1919, being given two years' seniority.

(c) Surgeon Commanders on the list on July 1st, 1919, to be given two years' seniority.

(d) The necessary promotions to the ranks of Surgeon Lieutenant Commander and Surgeon Commander to be made.

(e) The period of sea service required to qualify an officer for promotion to the ranks of Surgeon Lieutenant Commander and Surgeon Commander to be reduced from three to two years.

Officers who are promoted, or whose seniority is antedated under any of these rules, will not receive any advantage in respect thereof as regards pay from a date earlier than July 1st, 1919, but they will be granted such increments of pay as their new rank or seniority may entitle them to as from that date.

NAVAL, MILITARY, AND AIR FORCE HYGIENE.

A MEETING of the Naval, Military, and Air Force Hygiene Group of the Society of Medical Officers of Health will be held at the house of the Society, 1, Upper Montague Street, W.C., on Thursday, June 30th, at 4.30 p.m. Colonel H. W. Grattan, C.B.E., D.S.O., A.M.S., Deputy Director of Hygiene, War Office, will read a paper on "The co-operation between civil and military sanitary authorities during a grave national emergency."

HONOURS.

THE following appointments to the Order of the British Empire are announced:

To be Officers (Military Division).—Major (acting Lieut.-Colonel) John B. Dalzell-Hunter and Captain (acting Lieut.-Colonel) James Bennett Hance, of the Indian Medical Service, in recognition of services rendered in connexion with minor military operations within the Indian Empire or in territories adjacent thereto; Captain William Hunt, M.C., R.A.M.C., attached Egyptian Army, in recognition of valuable services rendered in connexion with military operations against the Garjak Nners, Sudan.

Universities and Colleges.

UNIVERSITY OF OXFORD.

At a congregation held on June 16th the degree of Doctor of Medicine was conferred on Herbert C. Squires.

UNIVERSITY OF CAMBRIDGE.

DR. G. H. F. NUTTALL'S reappointment for three years as Quick Professor of Biology expires in November, 1921, and a fresh election to the chair will be held on July 20th.

Dr. Louis Cobbett has been reappointed University Lecturer in Pathology.

At the congregation held on June 10th the degree of Doctor of Medicine was conferred on Mark Avent (Gonville and Caius College).

UNIVERSITY OF LONDON.

Semon Lecture, 1920-21.

DR. W. JOBSON HORNE, President of the Laryngological Section of the Royal Society of Medicine, will deliver the Semon lecture in the lecture hall of the Royal Society of Medicine, 1, Wimpole Street, W.1, on Tuesday, July 5th, at 5 p.m. The chair will be taken by Mr. Herbert Tilley, F.R.C.S. The subject of the lecture is "The relationship of the larynx to pulmonary tuberculosis" (with lantern illustrations).

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

AN extraordinary comitia of the Royal College of Physicians of London was held on June 15th, the President, Sir Norman Moore, Bt., occupying the chair. Communications were received 1) from the Secretary of the Royal College of Surgeons:

these were read and entered on the minutes; (2) from Jngalkisor Adhya, M.B., M.R.C.P., resigning the Membership of the College; this was accepted. Sir Humphry D. Rolleston was appointed a representative of the College on the Court of Governors of the University of Sheffield in place of Dr. T. D. Acland. A report from the representative of the College on the General Medical Council concerning the meeting of the Council held in May last was received and ordered to be entered in the minutes.

After some discussion the following resolution was passed and referred to the Committee of Management for report to the College:

That every candidate for the conjoint diploma of the Royal College of Physicians and the Royal College of Surgeons shall be required to produce evidence of adequate training in diseases of children, and that the final examination shall include examination in diseases of children.

The President then dissolved the comitia.

Obituary.

CHARLES JAMES MORTON, M.D., C.M. EDIN.

DR. CHARLES JAMES MORTON, who died at Territet, Switzerland, on May 28th, at the age of 57 years, received his medical education at Edinburgh, taking the degree of M.B., C.M., and the diplomas L.R.C.P., L.R.C.S. Edin., and L.R.F.P.S. Glasg. in 1886. After some time spent in study in London and Vienna, he took his M.D. degree in 1890, and in the same year settled at Walthamstow, where he practised for fifteen years and was much beloved by patients of all classes. He took great interest in the work of the British Medical Association, was secretary of the East London and Essex District of the Metropolitan Counties Branch in 1900-1, secretary of the Walthamstow Division during 1903-5, and Representative of the Walthamstow Division in the Representative Body for 1904-7. After leaving Walthamstow he migrated to Welbeck Street, where he practised as a radiologist. He was appointed radiologist at Guy's Hospital in 1907, doing much good work there till 1912, when failing health compelled him to resign.

On the outbreak of war Dr. Morton immediately offered his services, and received his commission in the Royal Army Medical Corps in 1914, being posted as radiologist to the Pavilion (Indian) Hospital, Brighton, and afterwards in a similar capacity to the Kitchener and 2nd Eastern Hospitals. He served until March, 1920, but his health having suffered severely from the labours of these strenuous years, he was obliged to give up active work and retire to Switzerland.

In addition to other offices Dr. Morton was consulting physician to the Walthamstow Dispensary and consulting radiologist to the Surrey County Hospital. Though not a prolific writer, he contributed a number of very practical articles on radiology to medical periodicals. His loss will be felt by a wide circle of friends, especially those of his profession whose interests he always had at heart. He leaves behind a widow and daughter.

Medical News.

IT has not been found possible to arrange for a meeting in July of the Dermatological Section of the Royal Society of Medicine.

MR. A. M. M. FORBES, coroner for East Middlesex, has been elected President of the Coroners' Society for England and Wales.

THE sixth annual meeting of the National Council for Combating Venereal Diseases will be held at the Morley Hall, George Street, Hanover Square, W., on Tuesday, June 28th, at 4.15 p.m., when Lord Gorell will preside.

DR. R. M. F. PICKEN, Assistant Medical Officer of Health, Glasgow, has been appointed Medical Officer of Health of the City of Cardiff and Port Sanitary Officer.

A CONFERENCE under the joint auspices of the Central Committee for the Care of Cripples, 19, Berkeley Street, London, W.1, and the Newcastle Invalid Children's Aid Association, 17, Ellison Place, Newcastle-upon-Tyne, will be held at Newcastle on July 19th, 1921. The subjects for discussion will be the treatment and education of physically defective children and the best methods of administration and co-ordination to procure the same. Programmes will be ready by the first week in July.

THE KING, on the occasion of the opening of the Northern Parliament of Ireland, conferred the honour of knighthood upon Dr. John Walton Browne, Deputy-Lieutenant for county Antrim, and surgeon to the Belfast Ophthalmic Hospital.

THE annual general meeting of the Medico-Legal Society will be held at 11, Chandos-street, W.1, at 8.15 p.m., on Thursday, July 7th (not Tuesday, June 28th, as previously announced). At 8.30 Dr. Louise Mellroy will read a paper on some factors in the control of the birth-rate, to be followed by a discussion.

THE National Housing and Town Planning Council has arranged for a number of conferences to be held in various localities during the next six weeks. The places selected are Manchester, Leeds, Llandrindod Wells (for Wales and Monmouthshire), Bristol, and Birmingham. The conference for the Home and Eastern Counties will be held at Caxton Hall, Westminster; for the Northern and Eastern Midland Counties at Newcastle-on-Tyne; and for other parts of the Midlands at Birmingham. The conference for Scotland has been arranged by the Scottish National Committee; it will sit on July 11th and 12th, under the presidency of Sir Henry Ballantyne, Chairman of the Royal Commission on Housing in Scotland, and will be addressed by Sir George MacRae, the Chairman of the Scottish Board of Health. The conferences, it is expected, will protest against proposals, attributed to the Ministry of Health, for cutting down the schemes of local authorities.

ON June 22nd a monument was unveiled at Utrecht to the celebrated ophthalmologist, Franciscus Cornelis Donders.

THE Research Defence Society will hold its annual general meeting on Wednesday next, June 29th, at 3.30, at the house of the Medical Society of London (11, Chandos Street, Cavendish Square). The chair will be taken by Lord Lamington, G.C.M.G., G.C.I.E. A short address will be given by Dr. H. H. Dale, C.B.E., F.R.S., on the work of the National Institute for Medical Research. The Society seeks to help the public to understand the aims and achievements of scientific medicine, and all interested are invited to attend the meeting and to bring friends. Specimens will be shown after the meeting, and tea and coffee will be served at 4.30.

THE seventeenth South African Medical Congress will be held in Cape Town from October 10th to 15th, with Dr. Hugh Smith, of Cape Town, as president. Every registered medical practitioner in South Africa is being invited to attend.

THE second English-speaking conference on infant welfare, organized by the National Association for the Prevention of Infant Mortality and National Baby Week Council, will be held at the Central Hall, Westminster, instead of at the Kingsway Hall, as previously announced, on July 5th, 6th, and 7th. Lord Astor, formerly Parliamentary Secretary to the Minister of Health, will preside and deliver the inaugural address. The subjects for discussion include "Residential provision for mothers and babies," "The physiological and economic aspects of the milk supply," "Uniformity of method and practice in the conduct of infant welfare centres," "Inheritance and environment as factors in racial health," and there will be special lectures in the evenings. In connexion with the conference a child welfare exhibition will be open from July 5th to July 9th, on the ground floor of the Central Hall, Westminster, and demonstrations will be given there on the care of the baby and on the work in day nurseries and Montessori schools. Throughout the week a large number of infant welfare centres and similar institutions will be open for inspection by delegates to the conference. For further particulars and for tickets and their prices, application should be made to Miss Halford, secretary, National Association for the Prevention of Infant Mortality, 4 and 5, Tavistock Square, W.C.1.

IN order to give effect to the decision of its governing body to appoint an advisory committee of experts in industrial hygiene, the International Labour Office has dispatched a letter to the Governments of Belgium, France, Germany, Great Britain, Italy, Japan, the Netherlands, Spain, Sweden, and Switzerland, requesting each of them to nominate as a member of this advisory committee one of its health inspectors or factory inspectors. The members of the committee in the various countries will keep in touch with the International Labour Office and its Industrial Hygiene Section by correspondence; the committee will meet when convened by the governing body, preferably on the occasion of the International Labour Conference.

THE sixth annual meeting of the National Council for Combating Venereal Diseases will be held in the Barnes Hall of the Royal Society of Medicine, 1, Wimpole Street, W., on Tuesday, June 28th, at 4.15 p.m., and not at the Morley Hall, George Street, Hanover Square, as previously arranged.

THE annual tournament of the Medical Golfing Society was held on June 16th at the Walton Heath golf course. The day passed very successfully and the pleasure of the competitors was largely due to the excellent condition of the course. The results of the various competitions were as follows: *Lancet Cup*, open to members of the medical profession, and given for the best scratch return under bogey—winner, H. D. Gillies, 3 up; *Henry Morris Challenge Cup*, under handicap: Class A: 1, C. E. Finney, 3 up; 2, J. A. Torrens, 2 up; last 9 holes, Murray Thompson, 2 up. Class B: 1, Eric Gandy, all square; 2, Sir Charles Ryall, 1 down; last 9 holes, E. H. Shaw, 1 up.

AT the St. Antoine Hospital, Paris, a special course on diseases of the digestive system, consisting of lectures in the mornings and afternoons, followed by practical work, will take place during the week July 11th to 18th. The fee is 100 francs; application should be made to Dr. Le Noir at the Hospital (Salle Arant).

THE Ministry of Health has issued a revised list of sanatoriums and other residential institutions approved by the Minister for the treatment of persons suffering from tuberculosis, and resident in England and Wales, with the names of the administrative counties and county boroughs in which the institutions are situate. The list is dated May 9th, 1921, and can be obtained through any bookseller or direct from H.M. Stationery Office, price 3d. net.

Letters, Notes, and Answers.

As, owing to printing difficulties, the JOURNAL must be sent to press earlier than hitherto, it is essential that communications intended for the current issue should be received by the first post on Tuesday, and lengthy documents on Monday.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the BRITISH MEDICAL JOURNAL alone unless the contrary be stated.

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—of course not necessarily for publication.

AUTHORS desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Office, 429, Strand, W.C.2, on receipt of proof.

IN order to avoid delay, it is particularly requested that ALL letters on the editorial business of the JOURNAL be addressed to the Editor at the Office of the JOURNAL.

THE postal address of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is 429, Strand, London, W.C.2. The telegraphic addresses are:

1. EDITOR of the BRITISH MEDICAL JOURNAL, *Aitology, Westrand, London*; telephone, 2630, Gerrard.
2. FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), *Articulate, Westrand, London*; telephone, 2630, Gerrard.
3. MEDICAL SECRETARY, *Medisera, Westrand, London*; telephone, 2630, Gerrard. The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams: *Bacillus, Dublin*; telephone, 4737, Dublin), and of the Scottish Office, 6, Rutland Square, Edinburgh (telegrams: *Associate, Edinburgh*; telephone, 4361, Central).

QUERIES AND ANSWERS.

MEMBER B.M.A. for twenty-five years wishes to hear the opinion of any colleague who has been using a kitchen stove made entirely for anthracite, with particular reference to cooking meals, hot water and cleanliness.

"SENEX," who has been asked to act as judge at a baby show, wishes to know how "points" should be given.

An article on Baby Shows and How to Judge Babies, by Dr. Eric Pritchard, appeared in *National Health*, June, 1917. The National Baby Week Council (5, Tavistock Square, London, W.C.1) has issued a leaflet (No. 6) on "Baby Shows and How to Judge Babies." Single copies can be obtained for 2d. post free, and score sheets for use by judges at baby shows for 6d. a dozen.

INCOME TAX.

"N." writes inquiring as to the position of practitioners who "spend a considerable part of the year abroad, engaging there in practice."

* * * Tax is chargeable under Schedule D "in respect of the annual profits or gains arising or accruing to any person residing in the United Kingdom from any trade, profession . . . whether the same be respectively carried on in the

United Kingdom or elsewhere." If our correspondent maintains a residence in this country and actually resides here personally during a portion of any financial year, we anticipate that he would be held liable on the whole of the net profits; if he was not in this country during the year we consider he could claim exemption on his foreign earnings. The question is not one of domicile, but of residence. "Domicile," as our correspondent is no doubt aware, has a technical legal meaning. A man might give up his residence here and with his family reside wholly abroad, while still retaining his English domicile.

"NESTOR" has for fifteen years returned and been assessed on the basis of three years' average receipts, "less expenses for the year in question." He is now asked to have his books audited and to supply a copy of the resulting profit and loss account.

We advise "Nestor" to point out that he has made his return on a cash basis for fifteen years, and that that method is established as the appropriate method of dealing with medical profits over the whole country. It has to be borne in mind that this system, however, breaks down when any special cause enters to increase or decrease the receipts; as, for instance, in the case of the purchase of an additional practice or the sale of a panel connexion, but we assume that there has been no such cause in this case. Our correspondent, however, is not quite correct on the question of expenses; these, like the receipts, should be taken on the basis of the three years.

"H." had to buy a second car in 1920 owing to the fact that his first car had broken down and was necessarily out of commission for some time. The car was bought for £350 and sold for £100 when the first car became available.

On the facts stated, and assuming that the two cars were not used together for any appreciable period, we are of opinion that the loss of £250 on the purchase and resale of the second car can properly be treated as an expense incurred in the overhaul of the first car.

LETTERS, NOTES, ETC.

DENTAL CARIES, APPENDICITIS, AND GASTRIC ULCER.

DR. W. E. NICKOLLS DUNN (London, W.) writes: In his letter from Mauritius in the JOURNAL of June 4th Dr. Andrew Balfour comments on the prevalence of ankylostomiasis. He continues, "Other worm infections are exceedingly common, and so, be it noted, is appendicitis." For several years I was in charge of the Luxor Hospital for natives in Upper Egypt, and much to my surprise I never saw a case of appendicitis. Ankylostomiasis was almost universal amongst the men. For many years I have pointed out that my patients had for the most part sound teeth, and that I never saw appendicitis, gastric ulcer, or cancer of breast or stomach. The town arab acquires dental caries, and the Egyptian surgeons inform me that they see appendicitis amongst the arab children in Cairo. In my opinion our diet, which causes dental caries, may also cause the appendicitis, ulcer, and cancer of the stomach. It is my expectation that with prevention of dental caries the above-named diseases will become infrequent.

NEED FOR POST-GRADUATE INSTRUCTION IN MOUTH SEPSIS.

"X. Y. Z." writes with reference to the difficulty "A. B. C."—a dental surgeon—is experiencing in arranging demonstrations, as part of a post-graduate course, at the hospital to which he is attached; in my opinion, no post-graduate course in medicine is complete without this subject being fully dealt with; indeed, so strongly do I feel about it that I would go farther and say that if time is a factor to be considered, then some of the less important classes should be cut out in order to give this subject a proper opportunity of being taught. The holding of such an opinion seems all the more justified after reading the article "The coming of age of oral sepsis," by Dr. William Hunter, which appears in the JOURNAL of June 11th, p. 859.

THE CHEMISTS' EXHIBITION.

THE Chemists' Exhibition, the twenty-second in a series organized by the *British and Colonial Pharmacist*, was held during five days of this week at the Central Hall, Westminster. The exhibits were confined to medicinal, dietary, and toilet preparations, but even with this restriction the contributions of nearly a hundred firms crowded two large floors. The general appearance of the stands said much, not only for skill and ingenuity in chemical manufacture, but for that decorative ability which makes the most of the product. The pharmaceutical craft is very old, receptive though it be of modern notions, and one firm (Allen and Hanburys, Ltd.), amid a tempting display of their gelatine capsules and other goods, summoned up some ghosts of former times by exhibiting their old prescription books and ledgers, dating

back to the eighteenth century, from which many quaint extracts might be made. Another old firm, with considerably more than a century behind it—Howards and Sons, Ltd.—made a feature of their standard ether and quinine salts and aspirin tablets; and then again, to show the stability of British firms, there was Pears' soap, which began its career in the reign of George III. Many exhibitors emphasized the wide range of their products, while others concentrated on a single article. Among the former were Parke, Davis and Co., with their lozenges and pills and soaps and peroxide solutions, making a very effective display, Genatosen, Limited, the British purchasers of the Sanatogen Company, and the Hoffmann-La Roche Works, from which came alkaloids, fine chemicals and pharmaceutical products. On the other hand, one large stall—that of William Browning Co., Ltd., a pioneer firm along this line—was devoted to purified petroleum and petroleum jellies. British Colloids, Ltd., placed in the forefront two of their colloidal preparations—one of metallic silver, and the other containing iron in colloidal form. Then there were on view such well known preparations as Glaxo products, Horlick's malted milk, and, on another range of application, were soaps and ointments at the stand of Newbery and Sons, Ltd., the Sanitas fluids and powders and embrocations, and the Milton disinfectant, a clear hypochlorite fluid. A little aside from the strict purpose of the exhibition, but none the less interesting, was a display of supports, pads, and cushions for the feet, shown by the Scholl Manufacturing Co., Ltd., and a range of natural mineral waters, brought together by Ingram and Royle, Ltd., the product of half a hundred springs, from Aix-les-Bains to Woodhall Spa. Elsewhere in the exhibition one noted many improvements in the way of syringes, atomizers, tubes, sprinklers, bottle-caps, and the like. The ingenuity shown in this direction seems to make an advance with each successive exhibition.

POST AND PROPTER.

"T. L. B." writes: A town medical society, taking its annual half holiday this week at a remote moorland village, where the only resident doctor had died a short time previously, was confronted by the following typewritten notice in the church signed by the two chairmen of parish meetings:

"A public meeting of the inhabitants of B— and H— will be held in the school at B— on Saturday, April 30th, 1921, at 7 p.m., to discuss the possibility of securing the services of a doctor for the district; and to consider the question of providing a hearse for the two parishes."

This apparent slur on the profession caused, at first, some consternation, but serene feelings were restored when it was recognized that the villagers had apparently never felt the need of a hearse until they were without a doctor.

VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 30, 31, 34, 35, 36, and 37 of our advertisement columns, and advertisements as to partnerships, assistantships, and locum tenencies at pages 32 and 33.

THE appointments of certifying factory surgeon at Ruabon (Denbigh) and West Drayton (Middlesex) are vacant.

THE post of one of the Medical Referees under the Workmen's Compensation Act, 1906, for the Falmouth and Truro, Helston, Newquay, Penzance, Redruth, and St. Austell County Courts, in Circuit No. 59, is vacant. Applications to the Private Secretary, Home Office, by July 13th.

Cultivation of Medicinal Plants in Scotland, by R. Glode Guyer, is the title of a little book which has been published at the price of 1s. 6d. by the well-known drug firm of Duncan, Flockhart and Co., Edinburgh and London. An interesting account of the romantic early history of the cultivation of medicinal plants in Scotland introduces the story, illustrated by photographs, of the establishment in 1915 by Messrs. Duncan and Flockhart of gardens at Edinburgh for the cultivation of medicinal plants under their laboratory control.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

	£	s.	d.
Six lines and under	0	9	0
Each additional line	0	1	6
Whole single column (three columns to page)	7	10	0
Half single column	3	15	0
Half page	10	0	0
Whole page	20	0	0

An average line contains six words.

All remittances by Post Office Orders must be made payable to the British Medical Association at the General Post Office, London. No responsibility will be accepted for any such remittance not so safeguarded.

Advertisements should be delivered, addressed to the Manager, 429, Strand, London, not later than the first post on Tuesday morning preceding publication, and, if not paid for at the time, should be accompanied by a reference.

NOTE.—It is against the rules of the Post Office to receive *postæ restantæ* letters addressed either in initials or numbers.

CONFERENCE OF REPRESENTATIVES OF MEDICAL STAFFS OF VOLUNTARY HOSPITALS.

London, Tuesday, December 21st, 1920.

A CONFERENCE of representatives of the medical staffs of voluntary hospitals of England and Wales, convened by the British Medical Association, was held in the Barnes Hall of the Royal Society of Medicine, 1, Wimpole Street, W., on December 21st, 1920. The purpose of the Conference was to discuss the situation created by the decision of the Minister of Health to appoint a small committee "to inquire into and report upon the financial position of the voluntary hospitals throughout the country, and to make recommendations."

The chair was taken by Sir JAMES GALLOWAY, K.B.E., senior physician, Charing Cross Hospital, and twenty-seven principal London hospitals and seventy-one provincial hospitals were represented, in almost every case by both a physician and a surgeon from their staffs. Members of the Hospitals Committee of the British Medical Association and the Chairman of Council (Dr. R. A. Bolam) were also present.

The CHAIRMAN, in opening the proceedings, said that many things which were happening affected the position of the medical staffs of voluntary hospitals, and on the initiative of the Chairman of Council of the British Medical Association it was thought desirable to bring representatives of such staffs together for the interchange of views and the passing of resolutions. Many hospital men in London were ignorant of the conditions of hospital practice in industrial areas, while the men in such areas were not as familiar as they were in London and other places with the conditions of hospitals serving large residential populations. Everything was to be gained by this, the first real interchange of hospital staff opinion. Many of the motions on the agenda which had been received from the staffs of various hospitals overlapped, and it had been a matter of some difficulty to select those most suitable for broad discussions; but he had endeavoured to make such a selection, and he hoped the representatives would support him in what was necessarily a somewhat arbitrary procedure. He thought also that it would be a great pity if the Conference were left without any sequel, and therefore he would at the proper time ask the representatives to nominate some body which might be responsible for continuing its work.

THE FINANCIAL POSITION OF VOLUNTARY HOSPITALS.

The Conference then, on the Chairman's motion, proceeded to consider what was the general opinion of hospital

staffs as to how the present financial difficulties of voluntary hospitals should be met.

The Conservation of the Voluntary Principle.

MR. BISHOP HARMAN (Chairman, Hospitals Committee, British Medical Association) moved:

That this Conference of the staffs of voluntary hospitals called by the British Medical Association desires to record its belief that the voluntary method of maintenance and staffing of the voluntary hospitals of the country is to the advantage of the public, of medical science, and of the medical profession, and that it should be maintained.

He wished the venerable President of the Association (Sir Clifford Allbutt) could have been present to move this resolution, because of his unique knowledge of the voluntary hospitals, and of the work he had done on their behalf. All those present had been bred and apprenticed in the service of the voluntary hospitals. They all knew the work done by those hospitals and believed in them. Times were changing, and there were many difficulties, but whatever modification the voluntary principle might undergo they were convinced that something like what they knew as the voluntary principle was necessary for the maintenance of this type of institution, and in the best interests both of the profession and the general public. When they lauded the voluntary hospitals they did not for a moment belittle the work done by the great State institutions. They recognized that work ungrudgingly. Yet they felt that there was something in the spirit of the voluntary hospitals which they could not afford to lose. Freedom was a necessary condition to the gathering of the best fruits of medical experience and practice. The voluntary hospitals had grown as time and place and circumstances directed, with nothing forced or artificial about them. This spontaneity which characterized them was of great advantage alike to the public and to medical science. He thought he spoke for most of those present when he said that they believed in the voluntary system so completely that they would like, if they could, to have the voluntary hospital of the old days, when all expenditure was paid by the charitable, when all the patients were necessitous and all the doctors gave their free service. That might not be possible now, but they wanted the nearest approximation to it that could be secured. This fine spirit of independence was of the greatest advantage to their professional life, and what advantaged medicine advantaged the public. There were other ways in which the public benefited. It would be a

positive loss to the public if there were no charities to which it could contribute of its surplus funds. Again, there were many most capable people in this country who exercised a useful influence in communal affairs, not by being elected to a public body, but by giving their services freely in the management of these hospitals. It would be a loss to the State if all the voluntary hospitals were gathered within the precise bounds of State activity and nothing was left to the voluntary action of these friendly semi-public agencies. Within recent years a member of the profession, Dr. Maudsley, had left a large sum for the founding of a voluntary hospital in that branch of medicine which was most completely covered by State service—the treatment of mental disease. Everyone knew how excellent were the State institutions for this purpose, yet Dr. Maudsley had felt that something was wanting, and the result was the great hospital now standing at Denmark Hill. That was one instance of the tenacious belief of the profession in this sense of freedom which could only be maintained within the voluntary system.

Sir HENRY DAVY (Royal Devon and Exeter Hospital) seconded the motion. The staff of his hospital was extremely anxious that the voluntary principle should be maintained as far as possible, and had asked its representatives to express its views strongly on the subject. Not only did the staff believe firmly in the voluntary principle, but also in its practicability, at least in a very large number of cases, in the existing situation. His was not a very large hospital (180 beds): it had a subscription list of about £5,000 and endowments yielding about £3,000 a year, but although there had been financial difficulties the way out was now being seen. A wage limit of £3 per week was instituted, and any person earning a wage above this limit could not be received into the hospital except by special leave of the Committee. The Hospital Committee elected once or twice a year a subcommittee of twelve to deal with admissions, and an inquiry officer was appointed to discover exactly the circumstances of each patient and to recommend what charge should be made. The maximum charge per week for an in-patient was 10s., but below this it varied according to what the responsible body thought the person could pay, and in necessitous cases no charge was made at all. During the last three or four months the hospital had had no difficulty in getting as much as from 250 to £60 a week from patients, and that, he believed, was going to save the position so far as finance was concerned. The hospital had also a method whereby persons above the wage limit could be received. If a doctor in the district had a case which required surgical operation or special medical treatment, he would write to one of the staff, and that member of the staff would place the matter before the special subcommittee. On admission this patient was charged whatever was thought advisable by the members of the staff under whose care he was going. The money received, which was paid into the hospital, was divided into two portions, half going to the hospital itself, and the other half to members of the staff. A number of State patients were also received, for whom the hospital was paid. In these ways the voluntary system, with all its freedom and helpfulness, was safeguarded, and the wishes of the profession also were being met. He believed that a very large number of hospitals which were now in great difficulty would be able to carry on if a similar plan were adopted. The out-patients were asked to contribute 1s. towards the cost of their medicine, and to pay the actual cost of their dressings according to the prices ruled by contract in the hospital, and 1s. also was charged for treatment in the electrical department. The alternative to carrying on a hospital in this manner was to let it be put on the rates.

Sir HAMILTON BALLANCE (Norfolk and Norwich Hospital) said that Sir Henry Davy had certainly told the Conference how a hospital could be kept going, but not on the voluntary system. Most hospitals at the present time were receiving contributions in respect of pensioners; many were receiving contributions from local authorities in respect of school children, and many were receiving money from workmen who contributed weekly to a fund organized for the purpose. The first two of these at least were not really voluntary contributions; they came either from the State or from the local municipal funds. Mr. Harman's motion would, if logically carried out, exclude these two classes of contributions, for they could not be accepted under a really voluntarily supported system. With regard to the staff, when pensioners were taken into a hospital the staff commonly received a proportion of the 9s. a day paid in respect of these pensioners. Some of the motions before the Conference put forward the view that the staff ought to have a portion of the workmen's contributory fund also. But this made it impossible to call

the staffs "honorary." If a local authority chose to pay three guineas a week for the maintenance of a patient, he did not see why, after the hospital had fully met its expenses in connexion with that patient, a sum should not be handed over to the staff, if the staff chose, for medical services, but in that case the staff must not regard itself as honorary. He did not like the idea of the staff taking a proportion of the funds paid to the hospital, whether for pensioners sent by the State, or for children sent by the local Education Committee, or for workmen sent through a workmen's contributory fund, unless the hospital had been fully reimbursed for its expenses in connexion with these cases.

Mr. F. W. COLLINSON (Preston Royal Infirmary) did not think personally that a charge made to local authorities affected their position as members of the staffs of voluntary hospitals. In the institution with which he was connected the method of charging patients had been in practice for some years, and had finally been regularized and defined, and had proved quite successful. The board felt that although the hospital was originally founded for the treatment of the necessitous, there was a large class of people who could not be called necessitous but yet were unable to meet the expenses of illness in their own homes or in private nursing homes. In these cases it was held to be perfectly justifiable to meet the people half way, and to use to a certain extent the funds of a voluntary hospital for helping them out of a very great difficulty. The people who felt the full force of such misfortunes were the middle classes. The professional man or shopkeeper in a small way could not afford to pay for an operation at home, and his domestic arrangements often precluded it; in helping such a person the infirmary board did not regard itself as departing from the voluntary principle. Apportioning a share of the funds for the members of the staff was satisfactory, in that it gave them the feeling that they were being compensated to a certain extent for the number of hours they spent in hospital, and, moreover, that they were not being "done" by persons able to pay for their services. Arrangements were now being made in Preston for using contributory methods, and an energetic secretary was trying to whip up the workpeople to give 2d. a week, which would yield £10,000 a year, and would largely help the hospital out of its difficulties. Thirty years ago a large proportion of operations were done outside the infirmary; to-day it was the smaller proportion which were done outside, and if the young surgeons could not remunerate themselves to some extent for the many hours they gave to the hospitals it would be very hard upon them. The institution still remained a voluntary hospital for those unable to pay, and thereby it maintained its original function, for it was for the benefit of those classes that the hospitals were first built. That should not prevent an institution charging when the persons in question could afford to pay. It might seem that the hospital was being turned into a cheap nursing home, but there was no claim upon the hospital for these people to be treated voluntarily.

Dr. ASTLEY CLARKE (Leicester Royal Infirmary) said that his hospital was in an industrial centre, and none of the 350 beds were paying beds; no payment was received for any patient who came in, and yet the hospital was thoroughly solvent. The income was obtained as a result of organization, forethought, and perseverance, and if other hospitals had followed the same policy the position of the voluntary hospitals at the present time would be greatly ameliorated. Roughly speaking, the finance of a hospital should be regarded as falling within two categories: capital expenditure and annual upkeep. The former should represent the gifts of employers, large philanthropic givers, and also legacies; the maintenance of the hospital, on the other hand, should be the primary concern of the people who stood to benefit. In Leicester certain special efforts were made which were only possible in such centres as county boroughs where, unlike London, local patriotism was strong. The treasurer went round to the great manufacturers and asked for a handsome annual subscription, and of that subscription he guaranteed to pay three-fourths to capital for future extensions, so that the employer would not again be approached for big sums when next the hospital developed. In the surrounding villages also special efforts were organized. In the speaker's view the primary meaning of a voluntary hospital system was a system free from bureaucracy.

Mr. W. S. DICKIE (North Riding Infirmary) said that the financial problem—which offered the only reason for departing from the voluntary system—did not arise in an acute form in the hospitals for which he spoke. The annual expenditure was fairly well met by subscriptions, but four-fifths of the funds came by way of workmen's contributions. For that reason those who had sent him to

the Conference were decidedly in favour of the continuance of the voluntary principle. Not that they believed it was necessarily the very best, but it was the one which for the time being answered to the conditions. They could fairly say in his part of Yorkshire that in the near future they would get sufficient to keep the hospitals going on the lines on which such institutions should be run. He was instructed to urge that the voluntary system as applied to the maintenance and staffing of hospitals should be supported.

The CHAIRMAN OF COUNCIL (Dr. Bolam), in order, he said, to clarify the situation, moved an amendment which substituted "administration" for "maintenance and staffing" in Mr. Harman's resolution. The one principle that the mover of the resolution contended for was the voluntary spirit, and that could be maintained by leaving the administration of the hospitals in the hands of the voluntary committees now administering them. This would at once put to the test the feeling of the Conference as to whether the great voluntary hospitals should be handed over to the municipalities or the State, or should remain under the control of those now supervising their work. He took it that the great majority of the representatives were out for the voluntary principle to that extent. (Hear, hear.) The hospitals represented in the Conference fell into several categories from the standpoint of their sources of financial support. Some could very well continue their work on purely voluntary lines, ministering to their patients through their endowments and voluntary subscriptions. Others, in a sense equally prosperous, were at the other extreme in that they ministered to their patients as a result of contributions which came practically from the patients themselves—a different kind of thing altogether, and one which bordered on the provident club or dispensary principle. Others, again, were in an intermediate position, wherein funds to a certain proportion were available for the benefit of the purely indigent, while the greater part came from people who, giving at first in a purely charitable spirit, gave now in the expectation that should illness overtake themselves or their families the hospital ministrations would be available for them. It would be well to have a resolution whose terms could be supported by the representatives of all these different classes of hospitals.

Sir HAMILTON BALLANCE seconded Dr. Bolam's amendment, and the amendment was accepted by Mr. Bishop Harman.

Dr. P. MACDONALD (York County Hospital) opposed the resolution. He did not believe that the voluntary method of maintenance or administration was to the advantage of the public, of the medical profession, or of medical science. Mr. Harman's introductory speech had made two alternating impressions on his mind. The first was that the mover had got hold of Wells's time machine and travelled back a century or so, and the next was that in the year 1920 that Conference had had Rip van Winkle coming from mid-Victorian times and addressing them before he was quite awake. These were not mid-Victorian times; they were neo-Georgian times. They were characterized by the insurgence of democracy, intolerance of caste and privilege, and the assertion of equality. What, in the light of these things, was going to be said for the voluntary system? The great mass of the people in this country were to get medical service—the most important thing after food and clothing and housing and the opportunity to work—from charitable sources, either wholly or partially! That was what the great voluntary system proposed. It would not do. The country had been through a war; most people believed that the war was waged to make the world safe for democracy. Much had been said about making a country fit for heroes to live in, and some of the heroes believed it. Did those present really think that these men, having been told what they were told, were going to have this important service given to them as a charity? Perhaps it was a sentimental objection, but the world was ruled by sentiment, and the English people were the most sentimental race on earth, with the possible exception of the Scottish. (Laughter.) But the ease against voluntarism was not all sentiment. There were hard, solid facts to be advanced in opposition. One fact was the number of hospital beds at the disposal of the community under this system. He himself had come to the conclusion that to be adequate the hospital beds must be increased by 200 per cent., and Sir Napier Burnett, in his preliminary survey of hospitals, had since stated that in his opinion the provision of hospital beds, which was now 1 per 1,000 of the population, should be 3 per 1,000 in industrial areas and 1.5 per 1,000 in rural areas. Take the case of Bradford. Bradford had three voluntary hospitals, with a total of 361 beds, serving a population which could not be less than half a million, and

the conditions were so intolerable that a municipal hospital had been established with (on paper) 1,148 beds. The voluntary system was inadequate, and never could be anything else. He believed he was correct in saying that the chairman of the Bradford Royal Infirmary had declared that its deficit was at the rate of £1,000 a month. He asked the Conference, was it going to demand anything less than adequacy? The tragedy was that valuable time was being wasted. The movement away from voluntarism and towards adequacy was at present a gentle stream, and if taken in time a barrage might be put across it, and it might be guided into sluices and made to send its energy through turbines. But if they tried to dam it they would fail; they would only give it a better head, an accelerated pace, so that shortly they would not be able to influence it at all, and it would become a cataract. The time to deal with the matter was now. It was for the Conference to give a lead, and that was why he hoped this resolution would be rejected altogether, and that they would declare that the voluntary system for the provision of hospitals was inadequate and wholly unsatisfactory.

Dr. FRANK RADCLIFFE (Oldham Royal Infirmary) pointed out certain great differences between the Poor Law infirmary and the voluntary hospital. It had to be remembered that in a publicly elected body like a board of guardians there might always be in the minds of some of the members a fear of the poll, and this did not apply in the case of the governors of a voluntary hospital. Those who had had experience of both the State-aided institution and the voluntary hospital knew how many advantages the latter possessed.

Mr. L. P. GAMGEE (Birmingham General Hospital) pointed out that large hospitals treated an enormous number of insured persons, and the Government had a very large fund in respect of insurance, amounting to millions, which was originally allocated for hospital treatment. If, by voting for this resolution, he excluded the present voluntary hospitals from participation in that fund he would regret it, firm believer in the voluntary system though he was.

Dr. T. SANSOME (West Bromwich and District Hospital) said that the point to be borne in mind was the large sum it was necessary to raise to keep the voluntary hospitals going. Probably the hospitals represented in that room were practically in debt to the extent of three millions. It was impossible to-day to run hospitals entirely on the voluntary system, especially as, being the best institutions for the purpose, they were called upon to do so much work for pensioners and others. The three millions of which he had spoken would never be secured from the people to-day, and it would be necessary to go to the Government for help. He would like the hospitals to remain as voluntary as possible, but they would drift hopelessly unless the Government did something for them.

Mr. BISHOP HARMAN, in reply, said that only two objections had been formulated against his resolution, one of them arising out of the interpretation of the word "voluntary," and the other the extreme logical opposition to voluntarism which Dr. Peter Macdonald had offered. The voluntary method as applied to maintenance or administration did not exclude from the hospitals a number of accessory pieces of work undertaken by them on a business basis. The State, for example, came to the voluntary hospitals when it was desired to establish venereal diseases clinics, and asked the hospitals to take over the work in return for State subsidy. Such work was an annex to the hospital, but not necessarily part and parcel of it. The flavour of voluntarism was retained, and, indeed, it was because of that flavour that the voluntary hospitals were sought out by the State or the municipality to perform these special services. (Children's and pensions clinics did not infringe the principle of a voluntary institution. Years ago "voluntary" and "gratis" were interchangeable words, but now they were miles apart. The word "voluntary" conveyed a principle hard to define, yet one which was understood by them all. In education the universities and medical and other schools were voluntary establishments, and yet were largely State aided. As for Dr. Macdonald, the speaker appreciated the logic of his argument. He would not defend voluntarism on logical grounds, but as with illogical people so with an illogical system, it was often very lovable.

Mr. Harman's resolution, with the word "administration" substituted for the words "maintenance and staffing," was then put, and in a meeting which numbered about 150, was carried with four dissentients.

Mr. A. E. MORISON (Durham County Hospital) moved: "That necessitous persons shall continue to be treated free," and this was immediately agreed to, with one dissentient.

Subsidies from Rates.

Mr. BISHOP HARMAN moved:

That it is undesirable that the voluntary hospitals should be subsidized by the local rating authorities, except in so far as payment is made for the examination and the care of patients for whom these authorities are responsible.

This, he said, was a bold challenge to the position taken up by the Government in Clause 11 of the recent Ministry of Health (Miscellaneous Provisions) Bill, which would enable county councils to subsidize local hospitals. The provision was hailed with the warmest enthusiasm in some quarters and met with equally determined opposition in others; ultimately the Minister withdrew part of that clause and agreed to remit the question to a special committee. The speaker did not wish to see the voluntary hospitals in the hands of local councils. When the great State hospitals already in existence were put upon a modern basis one of the conditions of the change would be that the control was taken from the many small authorities now governing them and put into the hands of the larger municipal authorities. With a number of State hospitals having very large accommodation governed by these authorities, were the authorities likely to look with a kindly eye upon voluntary institutions? Such a state of affairs must affect the voluntary hospitals, and almost certainly in some parts of the country would mean their disappearance or incorporation into a State hospital service.

The motion was agreed to, apparently without dissent.

Subsidies from the State.

Mr. BISHOP HARMAN then moved:

That in times of exceptional financial difficulty it is desirable that the central Government should subsidize voluntary hospitals, and that such subsidy in the case of any individual hospital should take the form of a contribution proportional to the income received by the hospital from voluntary and other contributions. The subsidies here proposed should be made through some central hospital fund, such as King Edward's Fund for London or the Red Cross.

He pointed to the parallel of the university grants which were made through and distributed by a committee appointed by the Government. The same method should be followed if the State was to help the hospitals. The principle was not democratic, but it appeared best to serve the purpose.

The CHAIRMAN OF COUNCIL moved an amendment which left out the reference to the ratio of Government contribution to income, and inserted words to the effect that the subsidy should take the form of grants in respect of the training of medical practitioners and nurses or of loans for extending the purposes of the hospital. Dr. Bolam thought that the principle whereby the grant was made proportional to the income of the hospital was very likely to lead to hardship in particular cases. It was a better principle, he contended, to allot a contribution in respect of work done which was capable of assessment. It must be recognized by them all as citizens that the Government was in no position at present to give any exceptional grants, and that it must look to the community in the various centres for the general support of the hospitals to the fullest extent. The grants that came from the Exchequer must necessarily be small, and could be properly given along the lines suggested in his amendment. He had expressly not laid it down by whom the money should be distributed. That was a matter of detail which it was not desirable to pursue at the present moment.

Mr. E. DEANESLY (Wolverhampton and Staffordshire General Hospital) seconded Dr. Bolam's amendment. He thought it highly desirable to include the reasons for which a Government grant was claimed.

Dr. P. MACDONALD hoped that both the mover of the original resolution and the mover of the amendment would content themselves with the mere statement that it was desirable that in times of financial difficulty the central Government should subsidize the voluntary hospitals.

Dr. HUGH BARBER (Derbyshire Royal Infirmary) urged the retention of the final clause of the motion, in which it was suggested that the subsidies should be made through some central hospital fund.

The CHAIRMAN OF COUNCIL pointed out that the grants which already came to hospitals from the State were usually sequestered for special purposes and were not applied to the maintenance and treatment of patients. He was convinced that his amendment was in proper sequence to the resolution already adopted by the Conference, affirming the desirability of maintaining the voluntary system. There was no more subtle drug in the pharmacopoeia than Government aid. If it was desired to maintain the

voluntary system, then Government aid must only be invoked in so far as the institutions were doing national work; that course would stave off the day when these institutions were taken under Government charge entirely.

The CHAIRMAN, in reply to a question, said that the Conference was only framing expressions of opinion for its own guidance and the guidance of whatever body the Conference might appoint to pursue the matter further.

Dr. Bolam's amendment, which Mr. Harman said he could not accept, was put to the Conference and lost by a large majority.

Mr. L. P. GANGE (Birmingham General Hospital) thought it well that the specific form of the Government contribution should be set down in the resolution. Unless this was done voluntary contributions would disappear. If the Government contribution was proportional to the income received from voluntary sources the voluntary subscriber would be encouraged and would continue, but if the Government paid the whole of the deficit then the voluntary subscription would cease.

Mr. MCADAM ECCLES (St. Bartholomew's Hospital) asked whether the Chairman of the Hospitals Committee really intended that the State should subsidize the voluntary hospitals indiscriminately. There were two classes of voluntary hospitals; those which were purely local to certain municipalities, and those which fulfilled a wider function in large centres of population and generally had medical and nursing schools attached to them. It would be better to ask the central Government to subsidize the large hospitals with medical and nursing schools attached, and leave it to the municipalities to subsidize local hospitals with local interests. ("No.")

Mr. HARMAN was not prepared to modify the original motion, nor to look at it in the way Mr. Eccles suggested. It was not desirable that any subsidy should be allocated to a particular hospital; it should only be given to a fund.

Dr. P. MACDONALD proposed, and Mr. L. P. GANGE seconded, that the middle clause of the motion, defining the form of Government contribution, should be left out, but this amendment was lost. A further amendment, proposed by Dr. HASLIP, which deleted the last phrase referring to specific organizations, was carried. The motion as finally agreed to was as follows:

That in times of financial difficulty it is desirable that the central Government should subsidize voluntary hospitals, and that such subsidy in the case of any individual hospital should take the form of a contribution proportional to the income received by the hospital from voluntary and other contributions. The subsidies here proposed should be made through some central hospital fund.

Employers' and Insurance Companies' Contributions.

Mr. BISHOP HARMAN moved:

That greatly extended support for voluntary hospitals should be sought from employers and insurance companies, seeing that they benefit largely, both directly and indirectly, by the services of the voluntary hospitals.

All those whose practice was in industrial areas knew that, despite the large number of working people coming to the hospitals, there was no proportionate recognition by the employers who undoubtedly benefited by the rapid treatment of their workpeople. The insurance companies now did an enormous business in connexion with the Employers' Liability Acts, and these companies also benefited very largely by the services of the voluntary hospitals. In the old days when insurance companies came into being to cover fire risk, they themselves furnished the first fire brigades. It became necessary at length for the communities to have their own fire brigades, but the London insurance companies still maintained their salvage corps which did valuable work in saving material. That principle might have been followed by the insurance companies in their business in connexion with the employers' liability; they had not done it in this country, though it had been done in America.

Mr. A. E. MORISON (Durham County Hospital and Sunderland Royal Infirmary) said that a very large amount of work was done both for insurance companies and employers without payment either to hospital or surgeon. The representative of a leading insurance company told him that if the insurance companies contributed, the employers would at once reduce their capitation grant for accidents. Before the war the speaker was looking after compensation work in his area, where there was a large colliery company, with three mines and employing ten thousand men. A cottage hospital, fully equipped, was looked after by the local practitioners, and in certain cases of accidents and operations he was called in. For three years he did every operation on every patient who came under the Workmen's Compensation

Act: for this he received a salary. The employers admitted that he saved them something like £4,000 a year in compensation by doing this. It was certainly incumbent upon employers to help the hospitals. At the same time, many of the large works in his area were now contributing at the rate of £1 for every £1,000 paid in wages, so that subscriptions, which in the case of one firm used to be about £20, rose to as much as £250 a year.

Mr. A. J. COUZENS (Queen Mary's Hospital for the East End) suggested that the discussion was waste of time. As medical men, had they anything to do with the methods by which funds were raised?

Dr. G. THOMSON (King Edward Memorial Hospital, Ealing) pointed out that it was comparatively easy to secure contributions in large industrial areas where there was a certain amount of local patriotism, but conditions were very different in London. So far as London was concerned, he thought that this could be only a pious resolution. It could only be put into effect through some central fund, which could allocate the money to hospitals scattered over a wide area.

Dr. A. J. H. ILES (Taunton and Somerset Hospital) suggested that the contributions from the insurance companies should be in the form of payment for work done. He did not think they could expect to get greatly extended funds from insurance companies in the ordinary way, but such companies should pay for work actually done on their behalf. He gave an instance of how this method had been applied successfully.

Dr. G. E. HASLIP (Hospitals Committee) urged that this was a pious resolution. The insurance companies would allow the voluntary hospitals to go on doing their work voluntarily for as long as they were willing to do so. This insurance question really involved a big principle affecting the whole situation. Directly a workman was receiving compensation for his accident he was no longer one of the necessitous poor for whom the voluntary hospitals were started.

Dr. E. T. COLLINS (King Edward VII's Hospital, Cardiff) disagreed with the last speaker. Many of those present at the Conference, he said, were members of boards of management and house committees, and if this resolution was carried it would enable the representatives who sat on such bodies to bring the matter to the notice of their colleagues as the expression of the opinion of a very large gathering of hospital physicians and surgeons. He agreed that as members of the medical staff it was no part of their duty to consider how money was to be raised, but as members of boards and committees it would be of very great value to have such a resolution.

Mr. W. S. DICKIE (North Riding Infirmary), while agreeing with the motion so far as it related to employers, thought that a will-o'-the-wisp was being pursued so far as it related to insurance companies. The insurance company was a business association, and was in the habit of claiming that hospital treatment was of no value to it, or might even in certain conceivable circumstances increase its expenditure instead of lessening it.

The resolution was carried.

Contributions from Patients.

Dr. J. R. ROBERTSON and Mr. F. G. RALPHS (both Ashton-under-Lyne Infirmary) respectively proposed and seconded:

That every patient of a voluntary hospital who is not a necessitous person should make a weekly contribution towards the cost of maintenance.

Dr. HASLIP did not think the supporters of the voluntary system quite appreciated what they were voting upon. How much did they think they were going to get out of the working man when he was in hospital and economically in a low state? Unless he was an insured person he could not usually contribute to the hospital at all. In that case he came into the category of necessitous persons. Very well. But if he was an insured person, from whom must the contribution come? From the Government? In that case the hospitals would be receiving Government contributions.

The CHAIRMAN OF COUNCIL, having elicited from the mover of the resolution that it was intended to propose that the patient should make a weekly contribution during the time he was in hospital, said that he thought the motion would secure a wider acceptance if the term "weekly" were deleted. It would then be possible to discuss whether the payment should be made while the patient was actually lying ill or whether a system of voluntary insurance should be encouraged.

Mr. E. DEANESLY (Wolverhampton and Staffordshire General Hospital) said that every hospital which had a

workmen's contribution fund would object to this principle. In some hospitals a weekly contribution might be a useful expedient, but to press it generally would be a mistake.

Dr. J. G. CLEGG (Manchester Royal Eye Infirmary) suggested that instead of "weekly contribution" the words "a contribution during treatment" should be used, and this would include both out-patients and in-patients.

Dr. ASTLEY (CLARKE Leicester) said that workmen who contributed to the hospitals by way of a workmen's fund would have nothing to do with paying beds in hospitals. They regarded admission as a right, and would not have almoners. He was sure that such men would withdraw their subscriptions absolutely if the principle of payment were insisted on.

Mr. J. L. JOYCE (Royal Berkshire Hospital, Reading) said that in his own hospital every patient had to pay 2s. a day for maintenance unless he could prove that he belonged to the necessitous poor, and 70 per cent. of the patients paid this contribution gladly. For a long time past it had been the custom, when patients left the hospital, to ask them to make a voluntary contribution, and when this system of payment for maintenance was started it was assumed that these voluntary contributions would diminish; on the contrary, they went up, and the workman's subscriptions to the hospital had increased also.

Dr. P. MACDONALD pleaded that if they were going to retain charity it should be retained completely and logically. He objected strongly to semi-charity and oblique charity.

Mr. E. H. E. STACK (Bristol Royal Infirmary) put it that the question was whether they were to get subscriptions from the well or the ill. That was the definite point to settle. It would certainly be wrong to mix the two. He suggested that a phrase might be inserted in the resolution: "Every patient who is not a regular subscriber," etc.

Dr. ROBERTSON, while willing to withdraw the word "weekly" in his motion, wanted to make it clear that the payment was for treatment, with or without maintenance.

The CHAIRMAN OF COUNCIL pointed out that in the case of certain hospitals this would mean that the funds forthcoming by weekly contributions from workmen, which now were in the hands of hospital governors, would be retained by representatives of workmen and paid out weekly for the individuals who happened to be in hospital. There were in industrial centres numbers of hospitals where 50 per cent. or more of the income—in some cases 90 per cent.—was in the form of weekly contributions from the workpeople, and now it was proposed to ask that the workmen as patients should pay during illness.

The CHAIRMAN thought it would be possible to make special provision to meet cases in which workmen's contributions were already forthcoming.

The resolution was carried in this form:

That every patient of a voluntary hospital who is not a necessitous person should make a contribution during treatment towards the cost of maintenance.

The Contributory Method of Subscription.

Mr. A. E. MORISON moved, on behalf of Durham County Hospital, a resolution affirming that the contributory method of subscription was the only one possible under the conditions obtaining in the North of England. In view, however, of the increased maintenance and other costs, the contributory rates paid by workmen should be materially increased. This, he said, was the feeling of hospital staffs in County Durham, a very populous industrial area. For something like twenty-five years it had been the custom among the workmen to contribute on the provident basis. At first, of course, the hospitals were regarded as charities; that view had now passed away, and the workmen resented any such suggestion, having regard to the payment by them of large donations. The staffs had been constantly pointing out to them that the only charitable part of the undertaking was the work of the medical and nursing staff. In most of the collieries and other works the workers were asked to contribute a certain sum per week, and all the workpeople not contributing in any other way were now being asked to set aside 3d. a week for the infirmary. Last year £10,000, or about one-third of the cost of upkeep, was received by way of the workmen's contributions. Before the war the men contributed about £8,000 a year—rather more than half the total contributions to the infirmary. The minimum of 3d. a week now asked for, which had already secured a good response, meant, in the case of seven works, an increase of subscription during the first eleven months of 1920 of £6,000, and it was expected that the workmen's contributions for the whole year would amount to something like £21,000. Another method was under consideration; this was for various collieries and other works to hold back the money

collected and send the hospital a capitation fee per week for every patient admitted from the area. Many collieries and works contributed exceedingly well, others very badly, only at the rate of 3d. per man per week, and it was desired to bring a little pressure of public opinion to bear upon these latter.

Dr. FRANK RADCLIFFE seconded the motion. Speaking of the Royal Infirmary, Oldham, he said that in 1910 the annual subscriptions amounted to £2,052, and in 1919 to £3,538, an increase of 75 per cent. There was still some charity left. The income from endowments in 1910 was £2,323, and in 1919 £4,831, an increase of more than 100 per cent. From the classes which might be called either capitalist or provident they had got an increased subscription of about 80 per cent. The figures for the Hospital Saturday Collection, a purely working-class affair, were in 1910 £2,492, and in 1919 £2,840. The workpeople of Oldham and their trade unions also had seen clearly that they ought to contribute more. A penny a head per week from the workmen in Oldham would put the Royal Infirmary in clover.

Mr. W. S. DICKIE and others supported the motion, and in answer to a question Mr. MORISON said that his motion, of course, aimed at voluntary contributions from the workpeople, but moral pressure should not be lost sight of.

Sir HAMILTON BALLANCE remarked that, of course, Mr. Morison under this scheme did not expect a working man to go to the hospital when he sprained his ankle, but only to go there for the treatment which the hospital was specially designed to give. Did he include the wives and families of the workmen?

Mr. MORISON replied in the affirmative.

Sir HAMILTON BALLANCE: Has the hospital any trouble with general practitioners in Mr. Morison's area?

Mr. MORISON: No. Most of our cases are sent by general practitioners.

Dr. HASLIP said that he calculated that if 3d. a week could be obtained from every insured person the hospitals would have a revenue of over eight millions a year.

After further discussion it was agreed that the Durham motion should be accepted as a rider to the Ashton-under-Lyne motion already carried, and that the motion should read as follows:

That every patient of a voluntary hospital who is not a necessitous person should make a contribution, during treatment, towards the cost of maintenance, unless the contributory method of subscription, regarded as essential in industrial areas, is adopted. In view, however, of the increased cost of maintenance this Conference considers that the contributory rates paid by workmen should be materially increased.

In this form it was adopted.

National Health Insurance Patients.

Dr. JOHN RUSSELL (North Staffordshire Infirmary) moved that in the case of persons insured under the National Insurance Acts payment should be made to the hospital for treatment which could not be obtained from the panel doctor in accordance with his agreement under the Acts. He wished to emphasize the feeling in North Staffordshire in favour of the voluntary system; but they considered that if the State made itself responsible for the treatment of any part of the community then a payment should be made by the State to the hospitals. How should this payment be made? At the outset of national insurance the people affected were promised that they should have opportunities of hospital consultation and treatment, but this had never been given under the Acts, simply because such facilities were already provided by the voluntary hospitals. In an area such as North Staffordshire 40 per cent. of the in-patients and 26 per cent. of the out-patients were insured persons. The latter percentage was very much higher until recently, when a system was adopted whereby insured people were examined by the surgeon or physician in charge of the out-patient department and in suitable cases were referred back to their own insurance practitioner for treatment, with a letter from the member of the honorary staff. This had materially diminished the number of out-patients on the books of the infirmary, and had been accomplished without any friction between the insurance practitioners and the infirmary staff.

Mr. E. DEANESLY, in supporting the motion, said that there was only one source from which it would be possible to look for a steady flow of funds for the hospital in future—namely, insurance. For years the hospitals had been doing the work for which national insurance was started, relieving the disabilities of the people who eventually came within national insurance, and keeping workmen in a fit state of health to do their work. It would be necessary

to add to the insurance fund a hospital benefit—say another 3d. a week—derived from both employer and insured person. This question was one of the most crucial they had to discuss.

Dr. F. RADCLIFFE questioned whether it was possible for them to get a penny from Insurance Acts funds without a new Act of Parliament. Moreover, immediately the Ministry of Health gave any money towards the treatment of insured persons in hospital, inspectors would be sent down, and there would be interference with the freedom of hospital practice.

Dr. A. J. CLEVELAND (Norfolk and Norwich Hospital) asked how, if the insurance funds were to be drawn upon for hospital treatment, the hospitals could expect to carry on the workmen's contribution schemes. The workmen could not be expected to continue their weekly pence for the support and maintenance of themselves or their fellows in hospital when the insurance authorities were asked to pay for them in hospital also.

Mr. W. S. DICKIE asked whether the payment to the hospital was to be for treatment which the insurance practitioner had neglected to give, or for treatment which presumably could not properly be undertaken, consistently with the best interests of the patient, by a general practitioner of ordinary competence and skill.

The CHAIRMAN OF COUNCIL wanted to know by whom this payment was to be made. The mover of the resolution had left that point vague. Was it to be made by the insured person during his term of sickness or, by means of a contributory system, during health? or was it to be from an insurance fund formed in part by the insured person and in part by the State, or by the State entirely? There was not much prospect of a subvention from the funds of the State for this purpose, nor was it likely that any Government at present would undertake to persuade the working classes that they must contribute some pence more a week towards the cost of hospital treatment.

Mr. R. J. FERGUSON (Kent and Canterbury Hospital) opposed the resolution on the ground of its effects upon insurance practice and the various complications it would introduce.

After some further discussion, Dr. RUSSELL agreed to withdraw the resolution. The CHAIRMAN said that the position of the insured person would doubtless be considered by the Hospitals Committee.

Patients of Various Classes.

Dr. MURRAY BLYTH (David Lewis Northern Hospital, Liverpool) moved:

That the voluntary hospitals should provide accommodation for patients of all classes who are able to pay for it, and that no fixed rate of payment for professional services rendered to such patients should be established; the fee so payable to remain, as at present, a matter of arrangement between patient, family physician, and consultant.

Dr. P. MACDONALD, in seconding, said that the hardest hit people in the community were the middle classes, and he believed that the easiest way of dealing with them in case of illness was by establishing accommodation for them in hospital.

Dr. BLYTH, in answer to questions, said that the staff of his hospital found it impossible to particularize the phrase "of all classes." Ultimately he agreed to leave out those words.

Mr. E. H. E. STACK (Bristol Royal Infirmary) said that this motion raised the whole question of the position of the general practitioner. He himself as consultant in a hospital thought it would be very unfair if a great number of the patients of general practitioners were allowed to come in under his care in hospital when they could be looked after by the general practitioners themselves. The best solution was to institute large nursing homes.

The CHAIRMAN OF COUNCIL moved to alter the opening phrase of the motion so that it should run:

That where voluntary hospitals provide accommodation for patients who are able to pay for it, no fixed rate of payment, etc.

Dr. T. SANSOME (West Bromwich and District Hospital) seconded, remarking that this principle had been applied at his hospital for a number of years. Sir HENRY DAVY also supported the amendment, which was accepted by Dr. Blyth, and with this modification the motion was agreed to.

ATTITUDE OF MEMBERS OF MEDICAL STAFFS OF HOSPITALS AS REGARDS PAYING PATIENTS.

The final hour of the Conference was devoted to this subject.

Dr. ASTLEY CLARKE (Leicester Royal Infirmary) moved :

That in the event of decisions being taken which would lead to patients paying, in part or in whole, the hospital maintenance fees, either individually or by some contributory method, or with the addition of rate aid or State aid, or by a combination of two or more of these methods, a percentage of all such payments should be passed into a fund which can be allocated in any manner which the honorary medical staff may determine.

The mover said that it was quite obvious that the old idea of an honorary staff had passed away. All of them had received money, for example, on account of pensioners. It was most important that the so-called honorary staffs of hospitals should define their position exactly. They were out for as much philanthropy as any other portion of the community. This resolution did not propose to touch any of the money subscribed voluntarily by the philanthropic person; but when money came to an institution from the State it was but logical to claim that a certain percentage, separately determinable in each area, should be allocated to the honorary medical staff. At Leicester they had no teaching school and no paid appointments of any kind, and it was extremely difficult for a young physician or surgeon who wanted to take up hospital work to make a living at all for some years. Other hospitals presented a different state of affairs, but what he had said was certainly true of many of the big hospitals in industrial areas. Much water had flowed under the bridges since a decision was taken on this matter at the Hospital Staffs Conference at Cambridge last June.

Mr. CECIL MARRIOTT (Leicester Royal Infirmary), in seconding, said that in the case of the necessitous poor, with the hospitals on an entirely voluntary basis, the medical staffs were all willing to remain as honorary physicians and surgeons doing gratuitous work; but when it came to a question of paying patients the position was changed, and a portion of the money so received should be allocated to a staff fund. That staff fund could be distributed in various ways, but some recognition of the services of the staff should certainly be made when payment was accepted by the hospital for the patients who were in its wards. The voluntary system with regard to these patients had gone by the board.

Mr. McADAM ECCLES (St. Bartholomew's Hospital) supported the resolution. If they determined, as members of staffs of voluntary hospitals, that a sum should be paid over to a fund to be entirely administered by the medical staff of the hospital, he did not think there was anyone who could gainsay them. Of course, if such money were paid directly into the pockets of particular members of the staff, and not into a common fund, objections might at once be raised.

Dr. F. RADCLIFFE wanted to omit the reference to patients for whom payment was made by a contributory method, for those words meant that in the hospitals in industrial areas, where the workmen contributed so much a week or a year, the staffs would receive payment for practically everybody who came into the institution. ("Why not?") He would be very sorry to see their honorary status disappear so completely.

Dr. J. A. NIXON (Bristol Royal Infirmary) thought it most important that the interests of the younger men in the profession should not be neglected. Conditions had altered so greatly that they could not expect to get a really free selection of competent young men on hospital staffs unless they quite boldly changed their attitude on this matter and told the public that such men must be paid. If this money were put into a staff fund it would have the advantage that those members of the staff who had done well in practice might perfectly well forego their share, which would mean that a larger amount could be allocated to the younger men. The time had come when they should drop this comparatively modern innovation of working entirely gratuitously for hospitals.

Sir HAMILTON BALLANCE asked if the mover would agree to delete the word "honorary." In future the vast majority of patients who came into hospital would be paid for; perhaps only 10 per cent. would come in free; the rest would be pensioners of the State, or participants in a contributory scheme of payment, or individually paying patients. If as honorary officers they were only going to look after a very small minimum of patients it seemed ridiculous to retain the title. Personally he liked his honorary position with its freedom, but if they were going to be paid let them frankly relinquish the adjective.

Dr. J. H. ABRAM (Liverpool Royal Infirmary) thought that there would be plenty of time for the discussion of titles. The Royal Infirmary staff did not want any percentage on contributions from insurance companies as far as the ordinary treatment of patients under the voluntary system was concerned, but when the State took a hand in

the business they thought a certain percentage ought to come to them.

Mr. R. J. FERGUSON said that at the Kent and Canterbury Hospital it had been decided to classify patients admitted thus: (1) Those earning less than £3 a week if without dependants or £3 10s. with dependants; (2) those earning between £3 and £6 a week; (3) those earning £6 a week and over. The first class was attended free by the staff, while the others contributed certain sums. Operations were classified according to their seriousness, but for patients not needing operation it was considered that a fee of 1s. 6d. a day should be charged for the staff fund.

The CHAIRMAN OF COUNCIL hoped that the Conference would pass the resolution unanimously. Although it had been suggested that by the acceptance of a percentage payment the staff ceased to be honorary, yet no one could contest the proposition that such a sum was not a payment but an honorarium. (Hear, hear.) He hoped also that the suggestion would be taken up that there should be payments from the contributing patients in such a way that these could be put as low or as high as might seem desirable. If a hospital accepted the responsibility for the maintenance and treatment of a certain class of patients in return for payment, either at the actual time of illness or during health, the profession would be right in staking out its claim to remuneration. The remuneration at present would only be an acknowledgement, but the time might come when the whole cost for these people would be paid by the State, and if the ground had been reserved by making it quite clear that there must be an acknowledgement for service—in the case of those near the necessitous line the acknowledgement might be very little—it would safeguard the claim of the medical staff for remuneration at a later date.

Sir HAMILTON BALLANCE again pressed his suggestion that the word "honorary" should be deleted, but the CHAIRMAN did not think there need be much hesitation over the acceptance of the word. He knew of one large hospital in which the staff, always accounted honorary, had been paid an honorarium for attendance ever since 1750.

The Leicester resolution was then put and carried unanimously.

FUTURE PROCEDURE.

The CHAIRMAN said that a resolution was down in his name asking the Conference to consider the question of submitting evidence before the Government Committee and the arrangement of witnesses therefor. In view of the length of the sitting, however, he would not enter upon this subject, but he thought it very desirable that the Conference should not leave off at a loose end, and that some body should be empowered to continue the consideration of the subjects which had occupied it that day, and if necessary to call another Conference for further debate. The alternatives were that the Hospitals Committee of the British Medical Association should have that power, and perhaps be asked to co-opt certain other members for this particular purpose, or that a small *ad hoc* committee should be appointed. The latter procedure, however, would be costly and would have to be undertaken right from the beginning, whereas machinery suitable for the purpose already existed in the shape of the Hospitals Committee.

Sir RICHARD LEECE (Derbyshire Royal Infirmary) proposed, and Sir HAMILTON BALLANCE seconded, and it was unanimously agreed—

That this Conference of staffs of voluntary hospitals of England and Wales convened by the British Medical Association considers that the questions discussed by the Conference are of great importance and by no means solved as yet. The Conference therefore believes it would be well to have a mechanism whereby a similar Conference could be called as and when necessary. To this end the Conference desires to ask the British Medical Association to authorize its Hospitals Committee to call the Conference when deemed desirable.

Votes of Thanks.

Sir HENRY DAVY moved a vote of thanks to the Royal Society of Medicine for lending the hall for the Conference, and this was seconded by the CHAIRMAN OF COUNCIL of the British Medical Association, who said that his Council was greatly indebted to the Royal Society of Medicine for its hearty co-operation in the matter of that most important meeting.

The resolution was carried with acclamation, and a vote of thanks to Sir James Galloway for the excellent way in which he had presided was carried in the same manner, at the instance of Sir HAMILTON BALLANCE.

British Medical Association.

CURRENT NOTES.

The I.M.S. and the New Scale of Pay.

OWING to the number of letters received by the British Medical Association from I.M.S. officers stating that the new scale of pay announced at the Annual Representative Meeting in June last has not yet become effective, representations have been made to the India Office. A reply has been received by the Association saying that the India Office presumes that by this time the pay has been adjusted at the new rates and that confirmation of this presumption has been asked for by telegram from the Government of India. I.M.S. officers need have no doubt whatever that they will receive the new rates of pay.

Deputation from the Panel Conference to the Ministry of Health.

The members of the Executive Subcommittee of the Insurance Acts Committee met representatives of the Ministry of Health on December 17th, 1920, and discussed with them the following questions arising out of the Annual Conference of Representatives of Local Medical and Panel Committees, 1920:

Inflation of index registers. Transfer of practices. Medical records. Election of Panel Committees. Dispensing. Emergency treatment. Branch surgeries. Postage on official communications. Amendment of model form for services outside the agreement. Procedure in connexion with statutory inquiries in regard to removal of practitioners' names from list. Ministry of Health Regional Medical Officers.

After a long discussion the Ministry's representatives agreed to send to the Insurance Acts Committee a considered communication embodying the decisions arrived at. A further report will be published as soon as this is received.

"Juveniles" and Contract Rates.

The Medico-Political Committee, in its consideration of the question of the fees which should be paid in respect of attendance on families at contract rates, was in some doubt as to the exact interpretation of the term "juvenile" in its relation to contract practice rates. It appears that in some cases the term "juvenile" includes persons from infancy to the age of 16, in others the age of entrance seems to be about 5. It is clear that the risks undertaken are much greater when infants are included than when entrance is at a later age, and therefore a contract rate which would be suitable for one category of "juveniles" would not do for the other. The Medical Secretary would be glad of any information from medical men engaged in contract practice which will assist the Committee in ascertaining what is understood by the term "juvenile" in their locality.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—A meeting of the Border Counties Branch will be held at Carlisle on Friday, January 14th, when Major Sinclair will give his Demonstration on the Treatment of Fractures, in the Lowther Hall, Lowther Street, at 3.30 p.m. The various methods of treatment will be shown, and a lantern demonstration given. There will be a dinner of the members in the evening.

MIDLAND BRANCH: NOTTINGHAM DIVISION.—Major Sinclair, C.M.G., R.A.M.C., will give a demonstration on "Fractures" in the General Hospital, Nottingham, on Wednesday, January 19th, starting at 2 p.m. At 4.30 an adjournment will be made to 64, St. James's Street, Nottingham, for tea, at the invitation of the Nottingham Medico-Chirurgical Society. At 5 p.m. Major Sinclair will give a lantern slide demonstration, illustrating his previous demonstration. All members of the Association are cordially invited to be present at this demonstration. Major Sinclair has kindly offered to repeat this demonstration the following day for the benefit of the nursing sisters of the Nottingham and neighbouring general hospitals.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following notifications are announced by the Admiralty; Surgeon Commanders. C. J. Baxter to the *President* additional for R.N. recruiting headquarters (temporary). H. A. Kellond-Knight to the *Assistance*. H. Hunt to the *Repulse* on recommissioning. W. W. Kerr to the *Raleigh*. C. A. G. Plumps for special service with R.M. battalion. J. G. Peebles to the Osea Naval Base; Surgeon Lieutenant Commanders H. E. J. White to the *Excellent*. F. C. Alton O.B.E., to the *Valiant* (temporary). R. S. W. W. Biddulph to the *Argus* on recommissioning. Surgeon Lieutenants: E. E. Kelley to the *Argus* on recommissioning. G. L. Stanley to the *Repulse* on recommissioning.

Surgeon Lieutenant E. S. Mellor has been promoted to the rank of Surgeon Lieutenant Commander.

DIARY OF SOCIETIES AND LECTURES.

LONDON DERMATOLOGICAL SOCIETY. 49, Leicester Square, W.C.—Thurs., 6 p.m., Cheshamfield Lecture by Dr. W. Griffith: Eczema.

ROYAL SOCIETY OF MEDICINE.—*Section of Surgery*: Wed., 4.30 p.m., Exhibits; 5.30 p.m., Mr. James Berry: A further series of 500 goitre operations, with special reference to after-results. Abstracts of notes with charts and specimens will be on view at 4.30 p.m. *Section of Obstetrics*: Thurs., 8 p.m., Dr. Louise Mellroy: Morphine in Labour. Mr Percival Cole: Inoperable Uterine Carcinoma Treated by the Cold Cautery Method.

POST-GRADUATE COURSES AND LECTURES.

SALFORD ROYAL HOSPITAL.—Thurs., 4.30 p.m., Mr. Macalpine: Urinary Disease.

WEST LONDON POST-GRADUATE COLLEGE. Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Mon., 2 p.m., Dr. Stewart: Out-patients; 2 p.m., Dr. Simson: Diseases of Women. Tues., 2 p.m., Mr. Gray: Out-patients; 2 p.m., Mr. Davis: Throat, Nose, and Ear. Wed., 10 a.m., Mr. MacDonald: Genito-Urinary; 2 p.m., Mr. Armour: Wards. Thurs., 2 p.m., Mr. Harman: Eyes; 2 p.m., Mr. Balowio: Orthopaedics. Fri., 10 a.m., Dr. McDougal: Electrical; 2 p.m., Dr. Burnford: Out-patients. Sat., 2 p.m., Dr. Owen and Mr. Sinclair: Out-patients.

British Medical Association.

OFFICES AND LIBRARY, 409, STRAND, LONDON, W.C.9.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager). Telegrams: Articulate, Westrand, London. MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London). Telephone number for all Departments: Gerrard 2650 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel: 4351 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel: 4737 Dublin.)

Diary of the Association.

JANUARY.

- 11 Tues. London: Contract Practice Subcommittee, 2.30 p.m.
14 Fri. Border Counties Branch, Lowther Hall, Lowther Street, Carlisle, 3.30 p.m. Demonstration by Major Sinclair on the Treatment of Fractures.
19 Wed. Nottingham Division: General Hospital, Nottingham. Demonstrations by Major Sinclair on Fractures at 2 p.m. and 5 p.m. Tea 4.30 p.m.
21 Fri. North of England Branch: Royal Victoria Infirmary, Newcastle-on-Tyne, 2.15 to 4.30 p.m. Clinical Demonstrations.

APPOINTMENTS.

BASDEN. Miss Margaret, M.B., B.S. Lond., F.R.C.S. Eng., Honorary Obstetric Surgeon to the London (Female) Lock Hospital, with charge of the beds in the maternity and labour wards and the mental defectives' unit.

FINGAN. P. O'Connell, L.D.S., R.C.S. Eng., D.D.S., Dental Surgeon to the Male and Female Lock Hospitals.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTH.

WIGHT.—At Swatow, China, on November 14th, 1920, to Dr. and Mrs. A. Wight, English Presbyterian Mission—a daughter.

MARRIAGE.

JOHNSTONE—DEMPSTER.—On December 21st, 1920, at St. Ninian's Cathedral, Perth, George Gordon Johnstone, M.C., M.D., D.P.H., to Constance Margaret, eldest daughter of Mr. and Mrs. T. Dempster of Perth.

British Medical Association.

PROCEEDINGS OF COUNCIL.

A MEETING of the Council was held at 429, Strand, London, W.C., on Wednesday, December 15th, 1920, with Dr. R. A. BOLAM in the chair. There were present:

Dr. T. W. H. GARSTANG (Chairman of Representative Meetings), Dr. G. E. HASLIP (Treasurer), Dr. T. RIDLEY BAILEY (Bilston), Dr. J. A. P. BARNES (London), Sir JAMES BARR (Liverpool), Dr. J. W. BONE (Luton), Dr. H. B. BRACKENBURY (Hornsey), Dr. H. C. BRISTOWE (Wrighton), Colonel Sir W. J. BUCHANAN, I.M.S. (ret.) (Dublin), Dr. C. BULTAR (London), Mr. RUSSELL COOMBE (Exeter), Dr. J. SINGLETON DARLING (Lurgan), The Right Hon. Lord DAWSON (London), Dr. JAMES DON (Newcastle), Mr. W. McADAM ECCLES (London), Dr. A. FORBES (Sheffield), Dr. E. R. FOTHERGILL (Hove), Dr. H. A. FRANCIS (London), Dr. JOHN GOFF (Windsorham), Mr. N. BISHOP HARMAN (London), Dr. I. W. JOHNSON (Bury), Dr. R. LANGDON-DOWN (Hampton Wick), Dr. W. F. LAW (Dublin), Dr. DAVID LAWSON (Banchory), Major-General Sir RICHARD H. LUCC (Derby), Major-General Sir WILLIAM MACPHERSON, A.M.S. (ret.) (London), Dr. S. MORTON MACKENZIE (Dorking), Dr. H. C. MACTIER (Wolverhampton), Surgeon-Captain E. H. MEADE, R.N. (ret.) (London), Dr. REGINALD C. PEACOCKE (Dublin), Dr. C. M. PEARSON (Edinburgh), Dr. FRANK RADCLIFFE (Oldham), Dr. C. E. ROBERTSON (Glasgow), Dr. D. ROSS (London), Dr. D. A. SHEAHAN (Portsmouth), Dr. W. JOHNSON SMYTH (Bournemouth), Dr. W. SNODGRASS (Glasgow), Dr. F. O. STEDMAN (Weybridge), Dr. JOHN STEVENS (Edinburgh), Dr. W. B. CRAWFORD (Treasure, Cardiff), Mr. E. B. TURNER (London), Dr. E. O. TURNER (Great Missenden), Sir JENNER VERRALL (Bath).

It was reported that Sir Richard H. Luce, K.C.M.G., C.B., Dr. J. W. Bone, and Dr. James Don had been elected to fill the vacancies on the Council caused respectively by the resignations of Dr. G. K. Smiley and Dr. A. Fulton and by the election of Dr. Bolam as chairman. It was resolved to submit the name of Major-General Sir William Macpherson, K.C.M.G., C.B., A.M.S. (ret.), to the Representative Body for election to represent the Army Medical Services on the Council in the place of the late Sir William Babbie, and in the meantime to invite Sir William Macpherson to attend the meetings of the Council and the Naval and Military Committee as representing the A.M.S.

The congratulations of the Council were offered to Professor C. S. Sherrington, who has frequently taken a distinguished part in the work of the Association, on his election to the Presidency of the Royal Society. The Chairman on behalf of the Council congratulated Mr. E. B. Turner on receiving the Medal of the Order of the British Empire for exceptional services during the war.

A communication was received from Mrs. Guy Illiston stating that the Association's memorial window to her husband's memory had been put up in St. John's Church, Felixstowe, and asking the Association to accept the deep appreciation of herself and family for the gift.

Finance.

The Council resolved to increase the salaries of the two Assistant Medical Secretaries, and to increase by 33½ per cent. the retiring allowance granted in 1918 to Dr. Guy Stephen, late sub-editor. It was resolved that the Association should effect for its officials, so long as they remain in its service, policies providing for an annuity of

£300, commencing at the age of 65, and that the Association should pay the whole premiums necessary in order to secure such policies.

In view of the growing popularity and demand for the British Medical Association Lectures, an additional sum of £200 was set apart for this purpose during 1921 out of the ordinary funds of the Association.

In pursuance of a communication addressed to the Prime Minister on July 20th, 1920, on the need of State Awards for Scientific Research, the following were appointed to co-operate with the British Science Guild: Sir T. Clifford Allbutt, Professor W. E. Dixon, Dr. J. S. Haldane, Dr. R. T. Leiper, Professor Benjamin Moore, and Mr. E. B. Turner.

The Council appointed Dr. R. Scott Stevenson to the vacant post of Sub-editor of the BRITISH MEDICAL JOURNAL.

Ministry of Health.

After a long discussion on the formation of a Central Medical Committee representative of the profession as a whole, to consult with the Minister of Health on questions of policy affecting the profession, it was resolved that the preliminary negotiations for the establishment of such a Representative Committee should be entrusted to an *ad hoc* committee consisting of the officers of the Association, together with Dr. J. A. Macdonald, Sir Jenner Verrall, and Dr. H. B. Brackenbury.

In view of the present political situation, no action was taken in the matter of calling a special Representative Meeting to consider the Medical Consultative Councils' Reports to the Minister of Health.

Annual Meetings.

The Annual Meeting for 1922 will be held at Glasgow. Upon intimation by the Chairman of the Scottish Committee that Sir William Macewen had been nominated by the Branch Council as President for 1922-23, and that Sir William Macewen was willing to accept the position, the Council resolved to recommend to the Representative Body:

That Sir William Macewen, C.B., LL.D., M.D., F.R.C.S., F.R.S., D.Sc., Regius Professor of Surgery, University of Glasgow, one of the Honorary Surgeons to H.M. the King in Scotland, be elected President of the Association for 1922-23.

The report of the Arrangements Committee for the Annual Meeting at Newcastle-on-Tyne in July, 1921, was received and approved. It was resolved that the three-day Scientific Sections should be limited to five—namely, Medicine, Surgery, Pathology and Bacteriology, Orthopaedics and Children's Diseases, Preventive Medicine and Industrial Diseases; that the two-day Sections be limited to six—namely, Oto-Rhino-Laryngology, Ophthalmology, Neurology and Psychiatry, Venereal Diseases, Obstetrics and Gynaecology, and Physiology Pharmacology Therapeutics and Dietetics; and that the following single-day Sections be held: Ambulance and Red Cross, Dermatology, Radiology and Electro-Therapeutics, Urology, Proctology,

and Medical Sociology. In connexion with the Newcastle Annual Meeting, Sir Thomas Oliver, M.D., will be invited to deliver a Special Address in Industrial Medicine on the evening of Wednesday, July 20th, and Professor Arthur Keith, F.R.S., to deliver a Popular Lecture on the evening of Friday, July 22nd. The President-elect, Professor David Drummond, C.B.E., M.D., D.C.L., will deliver his Presidential Address on Tuesday, July 19th, at 8.30 p.m. The Sections will meet as usual on the Wednesday, Thursday, and Friday. The Annual Representative Meeting will begin on the Friday of the preceding week—July 15th—at 10 a.m.

Professional Civil Servants in Ireland.

The Institution of Professional Civil Servants (Ireland) lately invited the Association to join in a deputation to the Government with respect to the Government of Ireland Bill. The object of the deputation is to press upon the Government various reasons for the amendment of the bill with a view to safeguarding, in any change that may come about as a result of the passing of the bill, the interests of present permanent established and unestablished professional and technical civil servants in Ireland. It was reported to the Council that the officers of the Association had nominated the Chairman of Representative Meetings to take part in the deputation.

Medico-Sociological Committee.

The Council, at its previous meeting on October 6th, 1920, resolved that a Medico-Sociological Committee be appointed experimentally, to consider social and economic questions affecting the public welfare as to which the medical profession has special knowledge, and to take such steps as may be found necessary in order to create or develop public opinion thereon. Having heard a report on this matter the Council on December 15th decided that the Medico-Sociological Committee should consist of the officers of the Association (*ex officio*), the Chairmen of the Medico-Political, Hospitals, Insurance Acts, and Public Health Committees, Drs. E. R. Fothergill, A. Forbes, A. C. Farquharson, M.P., and S. Morton Mackenzie, with power to add additional members, medical or lay, not exceeding six in all, for the consideration of the subject which the Association members of the Committee propose for the time being to consider.

CURRENT NOTES.

Insurance Medical Records.

In view of the controversy in the public press with regard to the new medical records which came into force on January 1st it may be advantageous to recapitulate the action which has been taken in this matter by the Insurance Acts Committee and by the Conference of Local Medical and Panel Committees.

The Insurance Acts Committee accepted the obligation to keep records in some form, and agreed that the prime purpose of the records should be clinical and not statistical or administrative, but it was not prepared to express any opinion as to the propriety of the present proposals until some experience had been gained of their working. Accordingly, the Insurance Acts Committee recommended to the Conference of Local Medical and Panel Committees that the new form of record must be tried before it could be either condemned or approved. This recommendation met with the approval of the annual Conference of Local Medical and Panel Committees held in October last, and an amendment urging non-acceptance of these records by practitioners was lost. In preparing the case for arbitration in connexion with the revised capitation rate it was recognized that some new system of medical records would be instituted, and insurance practitioners throughout the country were aware that it would be incumbent upon them to keep some form of record in the near future. When the question of medical records was discussed at the October conference no mention was made of the possible violation of professional secrecy as a result of keeping these records; in fact no objection at all was raised on ethical grounds, and if proper care is exercised by practitioners, and those persons who are appointed to scrutinize the records for statistical purposes have a proper sense of responsibility, there need be no violation of any secrets which insurance practitioners, in common with other practitioners throughout the country, are anxious to safeguard.

Present Position of R.A.M.C. Officers.

The Naval and Military Committee of the British Medical Association at its last meeting considered a letter drawing attention to several matters which are causing dissatisfaction among the officers of the Royal Army Medical Corps. Owing to the death of Sir William Babbie, who had proved himself invaluable from his wide experience and knowledge of army affairs, there was at that time no one on the Committee who directly represented the Army Medical Service. Since the Committee last met the Council of the Association has been fortunate in securing the help of Major General Sir William G. Macpherson, K.C.M.G., C.B., A.M.S. (ret.), as representative of the Army Medical Service, and in that capacity he will be a member *ex officio* of the Naval and Military Committee. In the meanwhile officers of the R.A.M.C. who are members of the Association may rest assured that a close watch on their interests is being maintained.

The Need of Early Application for Central Help.

It sometimes happens that medical practitioners fail to achieve success in local fights because they have not applied soon enough for assistance from the head office. The following is a case in point: An Education Committee decided to appoint an additional whole-time officer to do work which had previously been done by the local practitioners, and which they were ready and willing to continue to do. The local profession put up a very good fight in the committee for the continuation of the employment of general practitioners, and very nearly succeeded in carrying their point. The British Medical Association heard nothing of the case until it was too late to take effective action. Had central aid been applied for at an earlier date there might well have been a different result, for there is plenty of experience to show that a combination of local and central pressure often succeeds where either alone would have failed. It should be borne in mind that the Association through its central and local machinery can do a very great deal to help the profession in cases of this kind, but assistance must be applied for early.

Distribution Committee on Central and Mileage Pools.

For the information of rural insurance practitioners in particular, we publish the following complete list of the medical members of the Ministry of Health Distribution Committee on Central and Mileage Pools: Dr. H. G. Dain (Birmingham), Dr. H. J. Farman (London), Dr. E. Lewys-Lloyd (Merioneth), and Dr. J. P. Williams-Freeman (Andover); with the addition of Dr. T. Wood Locket (Melksham, Wilts) and Dr. Wm. Baigent (Northallerton, Yorks), when questions concerning the Central Mileage Fund are under consideration. All the above practitioners were nominated by the Insurance Acts Committee.

Association Notices.

A LEWISHAM DIVISION.

NOTICE is hereby given by the Council to all concerned that, as a result of a proposal made by the members of the Association resident in Lewisham, the Council has decided that as from January 8th, 1921, a Lewisham Division be formed of area co-terminous with the Borough of Lewisham, the new Division to form part of the Metropolitan Counties Branch, and the existing Woolwich and Lewisham Division to be modified accordingly.

PROPOSED ALTERATION OF AREA OF MIDLAND BRANCH, AND FORMATION OF A LINCOLNSHIRE BRANCH.

NOTICE is hereby given under Article 12 and By-law 77 to all concerned of a proposal made by the Midland Branch Council for subdivision of that Branch into two Branches, as follows:

Midland Branch: Area to be co-terminous with the combined areas of the existing Chesterfield, Derby, Leicester and Rutland, and Nottingham Divisions.

Lincolnshire Branch: Area to be co-terminous with the combined areas of Holland, Kesteven and Lincoln Divisions.

Written notice of the proposal has been given to all concerned, and the matter will be determined in due course.

by the Council. Any member affected by the proposed change, and objecting thereto, is requested to write, giving reason therefor, to the Medical Secretary, 429, Strand, W.C.2, not later than February 8th, 1921.

PROPOSED FORMATION OF A SHANGHAI BRANCH.

NOTICE is hereby given to all concerned of a proposal made by the members and non-members of the Association resident in Shanghai, for formation of a Shanghai Branch of the Association, of area such as may be agreed upon with the Hong Kong and China Branch. The matter will be determined in due course by the Council. Any member affected by the proposed change, and objecting thereto, is requested to write, giving reason therefor, to the Medical Secretary, 429, Strand, W.C.2, not later than April 30th, 1921.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A LIST of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—A meeting of the Border Counties Branch will be held at Carlisle on Friday, January 14th, when Major Sinclair will give his Demonstration on the Treatment of Fractures, in the Lowther Hall, Lowther Street, at 3.30 p.m. The various methods of treatment will be shown, and a lantern demonstration given. There will be a dinner of the members in the evening.

MIDLAND BRANCH: NOTTINGHAM DIVISION.—Major Sinclair, C.M.G., R.A.M.C., will give a demonstration on "Fractures" in the General Hospital, Nottingham, on Wednesday, January 19th, starting at 2 p.m. At 4.30 an adjournment will be made to 64, St. James's Street, Nottingham, for tea, at the invitation of the Nottingham Medico-Chirurgical Society. At 5 p.m. Major Sinclair will give a lantern slide demonstration, illustrating his previous demonstration. All members of the Association are cordially invited to be present at this demonstration. Major Sinclair has kindly offered to repeat this demonstration the following day for the benefit of the nursing sisters of the Nottingham and neighbouring general hospitals.

Meetings of Branches and Divisions.

ESSEX BRANCH: NORTH-EAST ESSEX DIVISION.

A CLINICAL meeting of the North East Essex Division was held at the Essex County Hospital on December 11th, 1920. Dr. S. W. CURT was in the chair. Dr. MILNER BURGESS (Frinton-on-Sea) read a paper on a case of glioma or gamma of the brain. Dr. HIRKINOTHAM (Colchester) showed a case of aortic incompetence with a curious murmur audible in the mouth. This case caused much discussion. Dr. FELL showed a case of myxoedema and a case of disseminated sclerosis simulating cerebellar tumour.

On December 17th a dinner was held in the Red Lion Hotel, Colchester. Dr. S. W. CURT was in the chair. Dr. ALFRED COX, the guest of the evening, spoke on the probable developments of medical service in this country and how the British Medical Association may mould them. Dr. Cox anticipated more State interference with general practice and the extension of the Insurance Act to dependants. He explained the course of negotiations between the Government and the British Medical Association with regard to various health measures in the past and showed how the Association had gained many points for the profession; the relative position of bargainers was one of give and take, and always must be so. Had the profession understood this during the negotiations over the Insurance Act it would have won a notable victory for the Association. In the future the Association could, by holding together and negotiating wisely, mould the various legislative measures proposed into practical and beneficial measures for all concerned. Increased membership was required, since the Ministry of Health was unwilling to negotiate with numerous bodies each claiming to represent the profession. At the close of his speech Dr. Cox answered many questions.

METROPOLITAN COUNTIES BRANCH: MARLBORNE DIVISION.

A MEETING of the Marlbone Division was held at 11, Chandos Street, on December 14th, 1920, when Sir JAMES GALLOWAY was in the chair. The following were elected representatives of the Branch Council: Sir James Galloway, Dr. B. Hartzkorne, Dr.

Halliday Sutherland, Mr. H. S. Souttar, Dr. Gouillet, and Dr. Blackhall-Morison.

A discussion on the question of "Multiple door-plates" was opened by Dr. ESTELLE COLL. She stated that in the neighbourhood there were houses sublet to doctors who were debarred from putting up plates; also that there were some houses in which doctors were not allowed to practise at all. Several members took part in the discussion. Much light was thrown on the matter by Mr. BISHOP HARMAN, who dealt with the legal position of the tenants and ground landlords. It was eventually decided that the Division was not in a position to take any action, and a resolution to this effect was carried.

The meeting passed a resolution sympathizing with Mr. Edward Wallis, the honorary secretary, in his severe illness, and expressing hope of his speedy recovery.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

A MEETING of the Willesden Division (to which non-members were invited) was held on December 22nd, 1920, at St. Andrew's Parish Hall, Willesden, with Dr. CRONE in the chair.

Rates for Contract Work.—The following resolution, of which due notice had been given, was agreed to without dissent, and the honorary Secretary was instructed to circulate a copy to every member and non-member in the Division:

That rates for contract work in Willesden be not less than the insurance rates—that is, 3d. per week per person over 15 years, and for those under 15 years 2d. per week.

Local Health Council.—The CHAIRMAN reported that the Division's three representatives (Drs. Paterson, Scott, and himself) on the Willesden Local Health Council had attended a preliminary meeting with representatives of the Urban District Council, the board of guardians, and the Cottage Hospital. Dr. Buehan, M.O.H., had briefly summarized the Medical Consultative Council's Report. The Chairman stated that the general impression he gathered as to the views of those present was that while approving the proposals of the Report they were of opinion that the time was not ripe for the inauguration of the scheme, and that the question of finance would militate against its early inception. He added that at the meeting he had pledged his word that if the scheme was inaugurated the Willesden profession would work it, and that eventually the Committee had appointed a small subcommittee (to which their honorary secretary, Dr. Paterson, was appointed) to draw up an agenda embodying the outlines of the Consultative Council's Report and indicating how far it could be carried into effect.

The Medical Officer of Health's Report. A discussion of the forty-fourth annual report of the medical officer of health for Willesden was opened by Drs. McEVoy and SKENE, who both regretted the absence of the medical officer of health, Dr. BUCHAN. They drew attention to the great increase in the medical activities of the Urban Council, chiefly carried out through the Health Committee; to the apparent ignorance of such activities on the part of the great body of over 100 medical practitioners in the locality; and to the necessity for the medical profession of the area to stir itself and take a hand in the formulation, guidance, and carrying out of those activities. They felt that the District Council should be asked to co-opt two or three of the local profession to its Health Committee, and that the profession itself should have its own small committee to consider these matters and advise both the local profession and the District Council. Reference was made to what appeared to be fallacious deductions from certain medical statistics, the speakers criticizing the undue magnification of inferences favourable to officials, and the slurring over of inferences creditable to the local profession; and to the fact that the general practitioners of the area were not utilized for the medical examination and treatment of school children at present carried out by the whole-time medical officers. Discussing the work and conduct of the baby clinics and isolation hospital, it was remarked that the latter had apparently during the war without any reference to members of the local profession and while a considerable number were serving with His Majesty's forces blossomed out into a municipal hospital staffed by whole-time medical officers. Dr. Skene added that as a reconvert to the British Medical Association he could not help pointing out that this report emphasized the great necessity for organization by the members of the medical profession, and that the Association, despite its faults and past mistakes, was the only medical organization capable of assisting them in organizing and fighting for the "family doctor."

Drs. STOCKER, SCOTT, LOCK, and others took part in the discussion, and the meeting agreed that efforts should be made to secure the election of two medical members to the District Council. The members present expressed their appreciation of the exceedingly able and thorough examination of the M.O.H.'s report placed before them by Drs. McEvoy and Skene.

Consideration of the question of a practitioner's mutual help scheme, which was to have been introduced by Dr. C. T. F. Scott, was postponed to the next meeting in view of the lateness of the hour.

On Tuesday, January 18th, Dr. Christine Murrell will open a discussion on "Maternity and child welfare clinics."

SOUTHERN BRANCH.

A MEETING of the Southern Branch was held at Portsmouth on December 9th, 1920, when Dr. A. A. MACKLITH (Southampton) was in the chair.

Dr. A. BOSWORTH WRIGHT, nominated by the Portsmouth

Division, was unanimously appointed as President elect. Seven new members were elected, bringing the membership up to 327.

Dr. D. SHEAHAN gave a full account of his stewardship as Representative at the Annual Representative Meeting for the past eleven years, during which time he had never missed a Division meeting.

The President (Dr. MACKETH) then invited a discussion on the Report of the Consultative Council. The matter having been very fully considered by the Divisions, the feeling of the meeting was that no useful purpose would be served by going over the ground again. The President then moved the following resolution:

While strongly supporting most of the provisions of the scheme outlined in the Report of the Consultative Council as an ideal to be kept in view, this meeting of the Southern Branch of the British Medical Association desires to point out that the matters calling for immediate attention are: (1) The greater provision of consultants and specialists. (2) The provision of the services of midwives and nurses. (3) The provision of the services of bacteriologists and pathologists. (4) The supply of vaccines and similar preparations. (5) The extension of medical attendance to the dependants of insured persons.

Mr. C. P. CHILDE moved the following amendment, which was seconded by Mr. LOCKHART STEPHENS:

In the opinion of the Southern Branch, the revolution in the practice of medicine outlined in the Report of the Consultative Council, whatever its advantages, is wholly inopportune in view of the obvious financial burden it will place on the shoulders of the taxpayer. The consideration therefore of any change of this sweeping character should be deferred until such time as the country has recovered from the crushing financial straits to which it has been reduced owing to the late war.

Dr. MEARNS FRASER and Mr. SCOTT RIDOUT spoke in favour of the amendment, and Dr. ALDERSON opposed it. On the vote being taken the amendment was carried with two dissentients.

SOUTH-WESTERN BRANCH: EAST CORNWALL DIVISION.

A MEETING of the East Cornwall Division was held at Liskeard on December 8th, 1920, when Dr. H. C. JONAS, President of the Branch, Mr. RUSSELL COOMBE, Chairman of the Organization Committee, and Dr. F. A. ROPER, Honorary Secretary of the Branch, were present. The following officers were elected:

Chairman: Dr. W. Nettle. *Vice-Chairman:* Dr. H. A. Burrowes. *Representative in Representative Body:* Dr. J. G. Morgan. *Honorary Secretary:* Dr. E. H. Hugo (Bodmin).

Dr. HUGO pointed out the impossibility, owing to the long distances, bad roads, and inconvenient and round-about railway service, of ever getting together a large meeting of the Division, and suggested that it might possibly be advisable to divide up the area into two Divisions.

Dr. JONAS expressed his pleasure at the revival of this Division after so long a period of inactivity, and Mr. RUSSELL COOMBE, in endorsing the President's remarks and congratulating the Division, gave a full and interesting summary of the work of the Association from its inception to the present day, for which account the meeting accorded him their thanks.

The meeting considered the interim report of the Consultative Council of Medical and Allied Subjects and recorded answers to the questions.

ULSTER BRANCH: BELFAST DIVISION.

THE opening meeting of the Belfast Division was held in the Medical Institute on December 9th, 1920. The following officers for 1920-21 were elected:

Chairman: Dr. R. Reid. *Treasurer and Secretary:* Dr. W. L. Storey. *Representatives in Representative Body:* Drs. R. W. Leslie and A. G. Robb.

The following resolution was adopted:

That this meeting take this the first opportunity of expressing its opinion that it is unjust of the authorities to ask medical practitioners to examine candidates for, or members of, the Special Constabulary without remuneration, and that those practitioners who have already made examinations *gratis* should be paid for their professional services.

The Honorary Secretary was instructed to send copies of the resolution to the local press and to the signatories of the notice that appeared in the newspapers regarding the enrolment of special constables.

FEES OF DOCTORS CALLED IN BY MIDWIVES.

THE Ministry of Health has issued to local supervising authorities under the Midwives Act a new scale of fees to be paid by the authorities to medical practitioners called in by midwives under Section 14 of the Midwives Act, 1918; this scale will take the place of that prescribed in December, 1918, by the Local Government Board, and comes into operation as from January 1st, 1921.

The chief alterations made by the new scale are: (1) The fee for attendance at confinements is 2 guineas in all cases, instead of 1 guinea in ordinary cases and 2 guineas in those necessitating operative issues; (2) a special fee of 1 guinea is prescribed for operative assistance given after the confinement, and also for attendance at abortions or miscarriages; (3) the fee for visits is increased to 5s. by day, and 10s. by night.

In a circular letter accompanying the new scale of fees local supervising authorities are asked to notify the terms of the new scale to the doctors practising in their districts; they are also reminded that they are empowered to recover the fee except in cases of poverty. The prescribed scale of fees is framed in the following terms:

	£	s.	d.
1. Fee for all attendances of a doctor at parturition—that is, from the commencement of labour until the child is born—whether operative assistance or not is involved, including all subsequent visits during the first ten days, inclusive of the day of birth	2	2	0
2. Fee for attendance of a second doctor to give an anaesthetic, whether on account of abortion or miscarriage, at parturition or subsequently	1	1	0
3. Fee for suturing the perineum, for the removal of adherent or retained placenta, for exploration of the uterus, for the treatment of post-partum haemorrhage, or for any operative emergency arising directly from parturition, including all subsequent necessary visits during the first ten days, inclusive of the day of birth	1	1	0
4. Fee for attendance at, or in connexion with, an abortion or miscarriage, including all subsequent visits during the ten days after and including the first visit	1	1	0
5. Fee for visits to mother or child not included under (1) to (4): Day (9 a.m. to 8 p.m.)	0	5	0
Night (8 p.m. to 9 a.m.)	0	10	0
6. The usual mileage fee of the district to be paid for all attendances under (1) to (5) of this scale.			
7. No fee shall be payable by the local supervising authority (a) where the doctor has agreed to attend the patient under arrangement made by or on behalf of the patient or by any club, medical institute, or other association of which the patient or her husband is a member; (b) where the doctor receives or agrees to receive a fee from the patient or her representative; (c) in respect of any services performed by the doctor after the expiry of four weeks from the day of birth.			

INSURANCE.

THE NEW MEDICAL RECORDS.

THE Interdepartmental Committee appointed by the Minister of Health to consider the form of medical record to be kept by insurance practitioners issued its report¹ last summer; a summary of this report was given in the SUPPLEMENT of July 31st, 1920, at p. 53. The obligation on insurance practitioners to keep records, which was in abeyance during the war period, is defined in the terms of service under the Medical Benefit Regulations; a practitioner is required "to keep records of the diseases of his patients and of his treatment of them in such form as the Minister may from time to time determine." The Committee recommended that such notes should be kept of every case treated as are likely to be of value to the practitioner himself, or to any other practitioner treating the same patient in subsequent illnesses. The form of record which would best meet this purpose, and would serve both as a medical record and as an index card, was described in the report and further illustrated in appendices. The Minister of Health accepted the Committee's recommendations relating to England and Wales, and the coming into force of the arrangements was fixed for January 1st, 1921.

Professional Secrecy under the System.

The new insurance records have been criticized in the public press on two grounds. The first objection is that insurance practitioners under paragraph 8 (13) (c) of the Terms of Service are required to afford to medical officers of the department, or such other persons as they may appoint for the purpose, access at all reasonable times to these records, and to furnish them with the records, or with any necessary information with regard to entries therein which they may require. There does not appear to be much substance in this criticism. The country has acquiesced in the insurance scheme, and it would probably often be impossible for medical officers of the Ministry of Health to utilize the records in the manner desired without employing confidential subordinates. The Ministry's concern with the information to be obtained from the cards will be mainly statistical.

The second criticism is to the effect that when an insurance patient changes his doctor the record card may pass into the hands of clerks employed in the offices of the Insurance Committees. With regard to this objection, it may be well to quote from paragraph 49 of the Committee's report:

"When the patient changes his insurance practitioner it will be necessary, in order to preserve the continuity of the record, to ensure that it is transferred from the old to the new doctor.

¹ Cmd. 835. H.M. Stationery Office. Price 3d. net.

The machinery of Insurance Committees will necessarily be utilized for this transmission, and provision could be made for avoiding disclosure of particulars of the illnesses from which patients have suffered to those engaged in the handling of the records in their transference by the use of special 'window' envelopes (in the form set out in Appendix IV). While thus avoiding disclosure that might be (or might at least be feared to be) prejudicial to the interests of insured persons, the use of these 'window' envelopes would enable the committees to make such entries on the front of the records as are rendered necessary in consequence of change of a doctor. The doctor previously responsible for the treatment of a patient who had been accepted by another doctor, on receiving intimation that the patient was removed from his list, would forward the record in one of these 'window' envelopes, enclosed in an outer envelope, to the Insurance Committee, who would arrange for its transfer to the new doctor if he resides in that area, or to another Insurance Committee if the new doctor resides in another area."

The "window" envelope is the method devised for "avoiding disclosure." These envelopes have an adhesive flap, and it appears to be intended, though it is nowhere so stated, that the old doctor, before sending the record on to his Insurance Committee, should close the flap. The "window" envelope ought to reach the new doctor closed and intact, for this is the means taken to preserve professional secrecy in the transmission of the card from the old doctor to the new. Short of improper action by the clerical staff of one or other of the Insurance Committees when two are concerned, the method would appear to ensure secrecy.

Instructions to Practitioners.

The Interdepartmental Committee advised that at the time when the new records were brought into operation practitioners should be furnished with a memorandum explanatory of the objects they are intended to serve and the mode in which they should be kept, and that a printed card giving concise directions as to the method of filling up and transmitting the records should be supplied for filing with the record cards. This suggestion has been carried into effect by the Ministry of Health, which has issued a Memorandum (274 I.C.) for the guidance of insurance practitioners, together with a card (274A I.C.) summarizing the instructions. The introduction states that the new form of record is based upon the recommendations of the Interdepartmental Committee. The objects the record is intended to fulfil are classified into (a) clinical, (b) administrative, and (c) statistical.

Clinical Purpose.

The clinical purpose, which is regarded as of paramount importance, is "to contribute to the efficient treatment of insured persons by preserving in a permanent and readily accessible form records of such clinical data as are likely to be of assistance to the practitioner making the record, or other practitioners under whose care the patient may subsequently come." To attain this object the record has been made continuous. It will be kept ordinarily in the possession of the practitioner who has, for the time being, the insured person under his care, "so that a connected history of illnesses may be obtained, and opportunity afforded for tracing the connexions and interactions of one illness with another." While it will be left, broadly, to the practitioner's judgement "to decide what notes are likely to be of value in a particular case, this discretion must clearly be exercised reasonably" and with due regard to the colleagues who will be dependent on him for useful notes concerning patients who, through removal or otherwise, may pass from his care to theirs. On the subject of trivial ailments a quotation is given from the Committee's report:

"The ultimate value, in a continuous history, of a note of disturbances to health, which at the moment may appear relatively unimportant, cannot be determined with confidence at that time, inasmuch as they may only manifest their true significance when they can be considered in their relation to subsequent occurrences."

The clinical part of the record is arranged in two columns headed respectively "Clinical Notes" and "Diagnosis." The second column is intended for definite diagnoses only, of which the practitioner feels reasonably certain. In order to economize time the use of certain symbols is permitted in making Clinical Notes in the first column. These symbols are:

"S.M. = minor surgery; Tr. = minor surgery (cases of injury); D. = digestive disturbance (undefined); Rh. = rheumatism and allied conditions; R.C. = catarrh of the respiratory tract; P.C.O. = pyrexia of unknown origin."

No other symbols are countenanced, nor any abbreviations that might not be readily intelligible to every medical man.

Administrative Purpose.

The most important data required under this head are a record of occasions (a) on which a patient is seen by the doctor, and (b) on which certificates of incapacity are given. Every visit or surgery attendance must be entered, but a special

arrangement has been made for reducing the labour of entry in cases in which another record (daybook or visiting list) is kept. This allows the practitioner, after entering the first three attendances or the first visit on the card, to insert weekly the total number of attendances, and weekly or monthly the total number of visits, giving the date of the first and last of these attendances or visits. As regards certificates, an entry is required on every occasion on which a first and on which a final certificate is given.

Method of Keeping Records.

The new form of record is thus described in the memorandum for the guidance of insurance practitioners:

"It takes the form of an envelope, which is itself the first record, and in which continuation cards will subsequently be placed. Each insurance practitioner will shortly receive from the Insurance Committee an envelope record in respect of each insured person on his list. These records will also take the place of the present Medical Index Cards. In order to relieve the doctor of clerical work the first portion of each envelope record will be completed, before issue, to show the insured person's name, address, society, an I number, the practitioner's name, the committee's cipher, and the date of issue. The records relating to men will be ruled in red, and those relating to women in blue. In addition to verifying the particulars already appearing on the envelope record the practitioner should, on the occasion of the insured person's first attendance for treatment, insert particulars as to occupation and age. Any subsequent alteration or addition should be made, when ascertained, in the appropriate space."

When the space on the back of an envelope is filled, further details are to be entered on a continuation card, which should be kept in the envelope record. On the death of an insured person the record is to be completed and forwarded to the Insurance Committee. When an insured person, by reason of removal or otherwise, transfers to the list of another practitioner, either in the same or another area, or goes out of insurance, the practitioner holding the record must forward it to the Insurance Committee when requested. When treatment is given to an insured person in respect of whom no envelope is held, a continuation card should be used by the practitioner pending arrival of the envelope. In the case of temporary residents and "travellers" a continuation card should be kept and forwarded to the Insurance Committee on the completion of treatment.

The memorandum refers as follows to the transmission of records through the post:

"These medical records are confidential documents. The Insurance Committees will supply practitioners with two kinds of envelopes: (1) A 'window' envelope, which is designed to conceal effectively the medical particulars inserted on the cards; and (2) a larger envelope, in which the 'window' envelopes and their contents can be transmitted through the post to the Insurance Committee. The covers sent through the post must bear postage stamps in the ordinary way, and practitioners will be informed by Insurance Committees of the arrangements for making payment to them of an allowance in respect of the additional expenditure incurred in connexion with the postage of these records."

STATEMENT BY THE MINISTRY.

The following statement by the Ministry of Health has been circulated to the press:

In view of the unfounded apprehension that may be created in the minds of insured persons and others by certain press criticisms of the new system of medical records to be kept by insurance practitioners, the Minister of Health thinks it desirable to issue a short statement on this subject.

In the original framing of the Regulations under the Insurance Act the importance was recognized of systematic recording of illnesses, both for the assistance of the doctor in treatment and for the collection of facts which would contribute to medical progress. At that time, however, it was thought desirable, in order to avoid any possible objections on the ground of professional secrecy, that particulars of illnesses should be entered by the doctor on one half of a folded card, and particulars identifying the patient on the other half, that these should be separated at the end of each year, and that thus when the two halves had been forwarded separately, one to the Insurance Committee for administrative purposes, containing no particulars of illnesses, and the other, containing the records of illnesses, to the Central Department, there would be no means of identifying the person who had suffered from these illnesses.

This feature of the system was much criticized by the medical profession on two grounds: first, that the doctor did not have in his possession a continuous record from year to year, and thereby obtain the assistance in the treatment of his patient that such a record would have afforded; second, that the history of illnesses in successive years could not be traced for statistical purposes, thus destroying much of the value the cards might otherwise have had in this way.

The Departmental Committee, presided over by Sir Humphry Rolleston, devoted, as their report shows, much thought to the

question of how a continuous record could be obtained without prejudicial disclosure of the patient's illnesses. This they considered they had attained by the system they proposed of "window envelopes," in which the cards could be transmitted from one doctor to another when a patient moved from one area to another. These envelopes are so devised that when sealed by the doctor no medical particulars are accessible to the officials of Insurance Committees through whose hands the envelopes pass; thus the procedure provides for medical particulars being conveyed from doctor to doctor without possibility of disclosure of medical particulars to any person in transit, unless he should, quite improperly, break the seal of the envelope. It is not to be believed that responsible officials will be so carried away by impertinent curiosity as to be guilty of an impropriety, particularly as the confidential nature of the records has been emphasized in the instructions to Insurance Committees.

The other possibility of leakage which is alleged is through the system of inspection of the records by medical officers of the Ministry, or "such other persons as they may appoint for the purpose." These words are inserted so that when required certain trustworthy clerks, who are established civil servants, may be employed to see that the more formal parts of the record are being properly kept, a purpose for which it is not necessary that the time of the medical officers themselves should be taken up. But the medical officers will themselves see the records from time to time for the purpose of assisting insurance practitioners in keeping the more distinctively medical part of the record and in connexion with consulting or referee duties.

For such inspection by persons other than medical officers there are a number of parallels. For example, full particulars of the cases of patients treated are kept in the registry of every important hospital, and are accessible for preservation and filing purposes to the clerical staff of the institution, but no one has thought it yet to say that hospitals must be prevented from keeping records of patients treated or preclude any but the medical staff from the handling of the records which is necessary in order that their full value may be obtained.

The Departmental Committee, composed mainly of medical men, devoted in their report a paragraph to the subject of the growing necessity, if the advance of medicine is to be properly maintained, of clerical work in connexion with medical practice, and pointed out that if the doctor is not to be diverted from his more strictly medical functions by work of this kind it is necessary that medically unskilled assistance should be employed for the purpose.

Summing the matter up, the system impugned has been carefully devised by an expert and mainly medical committee with the express object of meeting the desire of the profession for records that will be of real value in the treatment of disease and in the advancement of medical knowledge, and at the same time of preserving, in a way that the patients themselves are likely to desire, that secrecy as to medical particulars on which the medical profession itself has rightly always laid such stress.

CORRESPONDENCE.

Mutual Aid Schemes.

SIR,—In the SUPPLEMENT of the BRITISH MEDICAL JOURNAL for December 11th, page 153, Mr. Bishop Harman, speaking on what the work of a Division should be, said: "Secretaries might well study the Sheffield scheme for co-operative work during holidays or sickness of members." It may be of interest to the profession to know that in Leicester we have had in operation for two years a scheme of collective locum tenencies during holidays or sickness, which has been a conspicuous success.

The scheme is based on practitioners being invited to express their willingness to do some of the work of members absent on holiday or through illness, and on those members of the profession who desire to avail themselves of the facilities afforded by the scheme, contributing at certain rates to a pool. After payment of the necessary expenses for printing, etc., the sum remaining is divided amongst the members doing the work of absent doctors at so much per unit on the number of patients attended.

During the summer of 1919, £163 16s. was contributed to the pool. The expenses amounted to £5 16s. 3d., leaving £156 19s. 9d. to be distributed. During the summer of the current year £275 5s. was paid into the pool. The expenses amounted to £4 2s. 8d., and £271 2s. 4d. was distributed amongst those who did the work.

At the present time a scheme is in operation for sickness and short holidays during the winter months, and this has already proved very useful in a number of cases. —I am, etc.,

E. LEWIS LILLEY,

Honorary Secretary Leicester Panel Committee, and
Chairman Leicester Public Medical Service.

Leicester, Dec. 20th, 1920.

SIR,—The SUPPLEMENT of December 11th, 1920, contains a reference to the Sheffield scheme for mutual aid in holidays and in emergencies. The Sheffield Division do not

claim entire credit for the idea, as their scheme is built very largely on one which has been in force for some time in Middlesbrough. It is felt that this disclaimer is due to the Cleveland Division, who so readily gave valuable assistance while the scheme was being organized in Sheffield.—I am, etc.,

Sheffield, Jan. 3rd.

W. H. HELM.

The London Panel Committee.

SIR,—Dr. Brackenbry's very temperate and conciliatory letter in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of December 18th, 1920, under the above heading, makes clear the reason for the policy of the London Panel Committee which he criticizes. He says "the Committee's"—that is, the Insurance Acts Committee of the British Medical Association—"chief duty is to watch over the interests of the whole profession in its relation to the National Insurance Acts and their developments." With this statement we agree, but the fact that this is the Committee's chief duty naturally makes many doubtful as to its ideal fitness to have also as its chief duty the watching over of the interests of that part of the profession which has undertaken work in connexion with the Insurance Acts. It may be that those interests are identical, but they may not be, and in order to protect the interests of practitioners engaged in insurance work, the policy of the London Panel Committee is to establish in some form or other an independent executive committee of the Conference of Local Medical and Panel Committees. The object of such an executive would be to learn what are the views of the Conference as to the interests of their constituents, to support those views against all comers if so instructed, or to make, if so permitted, compromises on those views in the interests of the profession as a whole, but in all things to act as an instrument of the Conference and of the Conference alone.

As a constituent member of the Association of Panel Committees, the London Panel Committee believe that the aim they have in view would be secured by the development of that association.

Dr. Brackenbry's statement that the London Panel Committee are inconsistent in withdrawing their support from the Defence Fund will not bear examination. The London Panel Committee's contention is that this Fund, which is now almost entirely provided by Panel Committees, should be entirely so provided, and whilst bearing the cost of the Conference and other activities in connexion with safeguarding the interests of the Panel Committees' constituents, should not be used for any other purpose. In the London Panel Committee's opinion this position can only be satisfactorily secured by entrusting the Fund to a body directly elected by, and solely responsible to, the Conference of Panel Committees. Holding these views the Panel Committee for London could not consistently support the Defence Fund so long as it is entrusted to a body not so constituted.—We are, etc.,

H. J. CARDALE, E. A. GREGG,
W. COODE ADAMS, R. DUNSTAN,
LAURISTON E. SHAW, R. J. FARMAN.

Staple House, Chancery Lane, W.C.2.
Dec. 21st, 1920.

SIR,—At a recent meeting of this Committee, Circular Letter No. 191, from the County of London Panel Committee, came up for consideration. It was unanimously resolved that this Committee should reply that they were diametrically opposed to every point in the programme of the County of London Panel Committee in this connexion. —I am, etc.,

J. DUFF McCULLOCH,

Honorary Secretary, Bradford Local Medical
and Panel Committee.

December 27th, 1920.

Insurance Medical Records.

SIR,—With the introduction of the new medical records the question will be asked, How can the necessary work be simplified? I have two or three suggestions.

Besides the ordinary guide cards (consisting of the letters of the alphabet) there should be inserted among the records a sufficient number of guides containing the most frequent names on the doctor's list.

Let us consider the records under the name of "Smith," and suppose a doctor has twenty such records in his cabinet. When a patient of this name consults him the record will be removed from the cabinet, the necessary entry will be made, and before it is returned a wire clip will be slipped over the top of the record and the latter replaced. The clip should be kept on the record as long as the patient is under treatment.

A further aid is to insert a long paper knife, or similar object, in the place of the record as it is being withdrawn; the latter is then always put back in the same place. Let us further suppose that at a given time the doctor is treating four patients of the name of "Smith." Each of these records will have a clip on it, and search will only have to be made among four records instead of twenty, which will be a considerable saving of time. When the attendance is completed the clip is removed.—I am, etc.,

Builth Wells, Dec. 23rd, 1920.

W. BLACK JONES.

SIR, I enclose a copy of a letter which I am sending to the local press. I have experienced some hostility to the new medical records on the part of insured persons, on the grounds stated in my letter. It is bad enough to have to keep records one does not want to keep, without this added complication. If some such action were taken generally, it might remove the misapprehension which undoubtedly exists, and would take away one at any rate of the worries with which the Insurance Acts have saddled us.—I am, etc.,

York, Jan. 3rd.

J. C. LYTH.

* * * The letter referred to by Dr. Lyth is signed by him in his capacity as Honorary Secretary of the York Local Medical and Panel Committee; it runs as follows:

It is evident that considerable misapprehension, with resulting apprehension, exists in the minds of the public in regard to the new records required to be kept by insurance practitioners. This is, I believe, largely the result of a campaign engaged in by certain organs of the press, a campaign in which the matter has been dealt with in such a misleading way that it is difficult to avoid the conclusion that some of the misstatements are deliberate.

This would not greatly signify if it were not that medical practitioners are now placed in the unfortunate position of having to keep records, which they do not in many cases wish to keep, and to do so against the will of their patients. Briefly, the principal charge made against the new records is that they will make or may make public portions of a person's private history, which he has always rightly believed would be safe with his doctor.

Now, I do not for a moment desire to be taken as being in favour of the introduction of these records. I have always been against them, and have strenuously resisted their introduction. But the grounds of my resistance have been that I did not think the value of the records commensurate with the extra work involved for the medical practitioners. The value of the records is doubtful, and the extra clerical work considerable. I consider that the time spent on this work could be better employed in trying to cure the diseases which we are asked to tabulate.

But the idea that the records will or may become public in any sense of the term is simply nonsense. If it were so, no medical practitioner would lend himself to the work for an instant.

The record system has been devised with a most careful eye to prevent any such risk, and I think it most important that patients should know this. The records (which, as records, are probably as good as can be devised, if such are to be kept) are, in the first instance, kept by the medical attendant in his own possession. Only on the death or transfer of a patient are they given up to the Insurance Committee.

If this takes place, they are to be delivered in a sealed envelope showing only the name, address, and number of the person concerned. If this person has transferred to another district, or another doctor, the record is then forwarded to the doctor accepting the insured person, who opens the envelope for the first time. He thus has the advantage of seeing what has been the opinion of the original doctor on the case—an advantage which it must surely be obvious is shared equally by the patient. In no circumstances can the record be seen by even the clerical staff of an Insurance Committee; much less can it become public in any sense of the term. The only person other than a panel practitioner who may view the records is the Regional Medical Officer, who may, in his capacity of referee, have occasion to ask for their production. But he also is a medical man, who would require a full knowledge of the case in order to form a just estimate of the insured person's ability to work. To this also no reasonable person can take exception.

Should the keeping of these records prove so onerous as gravely to interfere with adequate time being spent on the more proper duties of panel practitioners, I have no doubt that they will not fail to say so, and it will be for the public then to support them in a refusal to perform such work. But it is worse than futile to deliberately confuse the issue and increase the difficulties of practitioners by creating misgivings in the minds of patients in regard to work which, granted the time to do it in, must necessarily be for their benefit.

SIR,—I have put the following notice in my waiting room and headed it: "Read this: a warning to the insured" —

The Ministry of Health now compels panel doctors to keep records of all the illnesses of the insured. These records will be

inspected, and the record card will be sent to the patient's new doctor when he moves or changes his doctor.

You cannot get away from your record; it will follow you as long as you are insured.

The good old rule that all that is told to the doctor is secret no longer applies to the insured. I think it only fair that insured patients should know of this most important change.

If the Ministry are too many for us, we can at least—and I think it is no less than our duty—warn our ignorant patients what they may expect. They have the votes and the political power not the profession. I hope other doctors will follow my example. I am, etc.,

England's Piece, Yattendon, Berks,
Dec. 19th, 1920.

F. A. BRODRIBB.

"COUNTRY PRACTITIONER" writes: I have just received a bundle of over 900 medical record envelopes tied up with string. After sorting these out I shall have to purchase a special cabinet with alphabetical guides. An enterprising firm has sent me an advertisement of one of these, which I find will cost me about £5. Surely this expense should be covered in some way, either by extra remuneration or else the Insurance Committee should provide receptacles for the cards.

INQUIRY INTO AN INSURANCE PRACTITIONER'S CONDUCT.

WE have received from the Ministry of Health a copy of a letter, dated December 22nd, 1920, addressed to the London Insurance Committee, conveying the Minister's decision in the matter of an inquiry, held on November 16th, 1920, in regard to a London medical practitioner, whose name and address we omit. The report mentioned in the letter has not been forwarded to us.

"I am directed by the Minister of Health to enclose a copy of the report made by the Inquiry Committee appointed by him to consider the representation made by the London Insurance Committee against Dr. A. of B., together with a formal document in which is embodied the decision of the Minister that Dr. A. should not be removed from the medical list, and his direction that the Insurance Committee's costs should be paid by Dr. A.

"With regard to the notice which was exhibited by Dr. A. in his waiting room, and which was of a character seriously to prejudice insurance administration, I am to state that the Minister notes that the practitioner has admitted the impropriety of, and has expressed his regret for, his action in this matter, and, further, that he was in failing health at the time. But for these considerations the Minister would have felt bound to regard the case as one for a severe penalty on the practitioner."

LOCAL MEDICAL AND PANEL COMMITTEES. DURHAM COUNTY.

THE Durham County Medical and Panel Committee, at a meeting held on December 16th, 1920, had under consideration a communication from the Panel Committee for the County of London urging the desirability of replacing the present Insurance Acts Committee by an organization composed entirely of representatives of Panel Committees, together with a communication from the Newcastle-on-Tyne Panel Committee expressing the opinion that such action would be short-sighted and an ill-advised policy. The Durham County Panel Committee expressed agreement with the opinion of the Newcastle-on-Tyne Panel Committee in this matter.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Commanders: W. E. Ormsby, O.B.E., to the *Ramillies*; C. J. O'Connell to the *Fred*, for R.N. Barracks; Surgeon Lieutenant L. S. Goss, O.B.E., to the *Pomona*, for R.N. College, Dartmouth.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Major G. W. Heron, D.S.O., O.B.E., relinquishes the acting rank of Colonel.

Major G. R. Panton to be acting Lieutenant-Colonel from July 20th to November 20th, 1920.

Captain Thomas J. E. Thompson, M.C., to be acting Major from January 8th to February 11th, 1919, and from March 20th to April 5th, 1919.

Captain S. Arnott is restored to the establishment.

Temporary Captain W. W. Forbes, O.B.E., relinquishes the acting rank of Major.

The following Lieutenants (Temporary Captains) to be Captains: D. J. H. Jones, T. H. Twigg, J. K. Holland, K. Masson, R. S. Strachan.

The following officers relinquish their commissions: Temporary Lieut. Colonel W. J. N. Vincent, O.B.E., on ceasing to be employed at the Wharfedale War Hospital, and retains the rank of Lieut.-Colonel; Temporary Major J. Dalrymple, C.M.G., O.B.E., and is granted the rank of Lieut.-Colonel; temporary Captain A. G. Welsford, and is granted the rank of Major, September 18th, 1920 (substituted for notification in the *London Gazette* of October 25th, 1920).

INDIAN MEDICAL SERVICE.

Lieut.-Colonel W. M. Anderson has been posted as Chief Medical Officer in the North-West Frontier Province.

Lieut.-Colonel de V. Coudon has been transferred to the temporary non-effective list, September 29th, 1920.

Lieut.-Colonel F. N. Windsor has been permitted to retire, August 15th, 1920.

Lieut.-Colonel L. J. M. Deas has been granted one year combined leave, October 20th, 1920.

Major R. H. Lee has been appointed to officiate as Civil Surgeon, Aimer, and Chief Medical Officer in Rajputana in addition to his own duties as Agency Surgeon, Kotah and Jhalawar, October 26th, 1920.

Major James Jackson Robb (since retired) has been promoted to the rank of Lieutenant-Colonel.

The promotion to present rank of Major Andrew Smith Leslie has been antedated from September 1st, 1918, to March 1st, 1918.

Colonel Percy Charles Hutchison Strickland has been permitted to retire from the service, August 19th, 1920.

Captain M. A. Nicholson was placed under the orders of the Civil Commissioner, Badliad (January 8th, 1919).

Major A. N. Dickson has been posted as Civil Surgeon, Kurram (October 26th, 1920).

Major H. B. Drake, Assay Master, Bombay, has been granted combined leave for twenty months (October 21st, 1920).

Major T. H. G. Oster, I.M.S., has been appointed temporarily as Director, Pasteur Institute, Ransoon.

The following officers have been granted permanent commissions as Lieutenants, with effect from November 1st, 1920, and have been promoted to be Captains from the same date: A. J. D'Souza, M.C., L. S. Modi, K. B. Bharucha, M. G. Bhandari, S. D. Billimoria, M. S. Joshi, R. C. Malhotra, H. A. Khia, S. L. Mitra, N. B. Mehta, M. A. Singh, S. C. Contractor, R. N. Khosla, K. N. Kapadia, M.C., H. S. Rajab, P. R. Vakil, M. L. Dhaswan, B. S. Dondy, A. M. Ghosh, S. Nas, M. T. Khandwala, M. L. Bhargava, T. R. Khandu, G. R. Oberai, J. Chaudra, G. A. Khan, J. E. Dharmibhoy, A. M. V. Hesterlow, M. Prasad, B. B. Gadgil, F. N. Basu, G. R. D. Rai, S. L. Patney, D. N. Bhaduri, R. D. Dani, G. Verghese, B. R. Chaudhari.

The following officers have been granted permanent commissions as Lieutenants, and will retain the temporary rank of Captain, with effect from November 1st, 1920: A. Ba Thaw, I. S. Nalwa, S. G. Mohamed, J. W. F. Albuquerque, G. Kumar, P. M. Antia, R. C. Watts.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Temporary Major W. A. Smith, T.D. (4th Battalion East Lancashire Regiment), relinquishes his temporary commission.

Captain C. E. K. Herapath, M.C., to be Major.

To be Captains: Captain A. C. Court, M.C. (late R.A.M.C.S.R.), Captain A. G. M. Middleton, M.C. (late R.A.M.C.), with precedence from December 17th, 1913, and May 23rd, 1918 respectively.

Captain Arthur E. Richmond, O.B.E., R.A.M.C., to be Adjutant of the R.A.M.C. School of Instruction, West Lancashire Division (T.F.).

Captain G. B. Gill to be Major.

Captain P. J. Watkin, M.C. (late R.A.M.C.), to be Captain, with precedence as from April 3rd, 1918.

H. M. Brown (late Devon Regiment), to be Lieutenant.

Super-numerary for Service with the Officers' Training Corps: London University Contingent.—Captain J. H. Ryffel resigns his commission and retains the rank of Captain. Lieutenant D. R. Wheeler (late R.A.M.C.) to be Lieutenant for service with Belfast University Contingent, Senior Division, Officers' Training Corps, with precedence as from May 7th, 1918.

DIARY OF SOCIETIES AND LECTURES.

HARVEIAN SOCIETY OF LONDON, 11, Chandos Street, W.1.—Thurs., 8.30 p.m., Annual General Meeting. Address by retiring President, Dr. W. Hill: The Great Advances in the Investigation and Treatment of Diseases of the Oesophagus during the Present Century (with lantern slides). Conversation.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 8.30 p.m., Pathological evening. Specimens and demonstrations by Dr. B. H. Spillsbury, Dr. E. H. Kettle, Dr. E. H. Shaw, Dr. Carnegie Dickson, Dr. A. Fleming, Dr. John Matthews, Dr. Robert Knox, Dr. Crofton Atkins, Dr. Harrison Croft, and Mr. C. A. Clark.

ROYAL SOCIETY OF MEDICINE.—Section of *Psychiatry*: Tues., 8.30 p.m., Dr. Morowoka: The Chord Plexus in Mental Disease. Section of *Neurology*: Thurs., 8.30 p.m., Internal meeting (tea, coffee, smoking). *Clinical Section*: Fri., 5 p.m., Cases. Section of *Ophthalmology*: Fri., 8 p.m., Cases; 8.30 p.m., Dr. Ransom Pridgen: The Size of the Physiological Cup in Relation to Glaucoma; Mr. B. T. Lang: Sclerometry.

SOCIETY FOR THE STUDY OF ISBERNITY, 11, Chandos Street, W.—Tues., 4 p.m., Discussion: Alcohol and Industrial Efficiency, to be opened by Dr. H. M. Vernon.

LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.—Thurs., 6 p.m., Chesterfield Lecture by Dr. J. L. Bunch: Drug Eruptions.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Western Infirmary.—Wed., 4.15 p.m., Professor Stockman and Mr. Edington: Medical and Surgical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Thurs., 4 p.m., Mr. Twistington Higgins: Significance of Lymph.

MANCHESTER: ANCOATS HOSPITAL.—Thurs., 4.30 p.m., Mr. Diggle: Carcinoma of the Larynx.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Sir William Thorburn: Surgical Treatment of Neuralgia.

MANCHESTER: ST. MARY'S HOSPITALS (Whitworth Street West Branch).—Fri., 4.30 p.m., Dr. Donald: Bladder Symptoms in Gynaecological Practice.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits: 2 p.m., In- and Out-patient Clinics and Operations. Mon., 12.15 p.m., Dr. Burnford: Pathological Demonstration; 5 p.m., Dr. Saunders: Investigation of Cases with Symptoms of Digestive Trouble. Tues., 12 noon, Mr. Gray: Fractures; 5 p.m., Mr. Davis: Lecture. Wed., 10 a.m., Mr. MacDonald: Genito-urinary; 5 p.m., Mr. Simson: Obstetric Emergencies. Thurs., 2 p.m., Mr. Armour: Operations; 5 p.m., Dr. Taylor: The Circulatory System. Fri., 10 a.m., Dr. McDougal: Electrical; 5 p.m., Mr. Baldwin: Appendicitis. Sat., 12 noon, Mr. Sinclair: Surgical Diseases of Abdomen; 2 p.m., Dr. Owen: Out-patients.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.9.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by Is. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager): Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London). Edition, *British Medical Journal* (Telegrams: Aillogis, Westrand, London). Telephone number for all Departments: Gerrard 2630 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 36, South Frederick Street, Dublin. (Telegrams: Baedilus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

JANUARY.

- 11 Tues. London: Contract Practice Subcommittee, 2.30 p.m.
12 Wed. London: Hospitals Committee, 2 p.m.
London: Propaganda Subcommittee, 2.15 p.m.
14 Fri. London: Ministry of Health Committee, 2.30 p.m.
Border Counties Branch: Lowther Hall, Lowther Street, Carlisle, 3.30 p.m. Demonstration by Major Sinclair on the Treatment of Fractures.
19 Wed. London: Medical Research and Laboratory Workers Subcommittee, 2.30 p.m.
London: University Teachers and Laboratory Workers' Salaries Subcommittee, 4 p.m.
Nottingham Division: General Hospital, Nottingham. Demonstrations by Major Sinclair on Fractures at 2 p.m. and 5 p.m. Tea 4.30 p.m.
20 Thurs. London: Territorial Force Subcommittee, 2.45 p.m.
21 Fri. North of England Branch: Royal Victoria Infirmary, Newcastle-on-Tyne, 2.15 to 4.30 p.m. Clinical Demonstrations.
25 Tues. London: Seruitary Subcommittee, 2 p.m. (Time provisional.)
23 Wed. London: Medico-Political Committee, 2.30 p.m.
28 Fri. London: Central Ethical Committee, 2 p.m.

FEBRUARY.

- 1 Tues. London: Organization Committee, 11 p.m. (Time provisional.)
16 Wed. London: Council, 10 a.m.

APPOINTMENTS.

EDMISTON, J. F., M.B., Ch.B. Liverp., Honorary Assistant Medical Officer, Southport Infirmary.

HARRER, T. H., M.D. Lond., Honorary Assistant Medical Officer, Southport Infirmary.

LITTLE, P. MacDonald, M.C., M.B., Ch.B. Edin., Resident House-Surgeon, Royal Devon and Exeter Hospital.

LOHMER, G. N., M.B., B.S. Melbourne, Medical Registrar, St. Mary's Hospital, Paddington.

STIDSTON, C. A., D.S.O., M.D., B.S. Lond., M.R.C.S., L.R.C.P., Honorary Surgeon to the Wolverhampton and Staffordshire General Hospital, Wolverhampton.

THWAITE, Harold, M.B., B.S. Lond., M.R.C.S., L.R.C.P., Physician to Out-patients to the Birmingham and Midland Free Hospital for Sick Children.

WILSON, A. Cyril, M.R.C.S., L.R.C.P., Senior Assistant Medical Officer to Peckham House and a member of the Special Neurological Clinic, Ministry of Pensions, Grosvenor Gardens.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTHS.

HODDER.—On December 29th, 1920, at Stafford, the wife of Dr. A. E. Hodder—a daughter.

SINCLAIR.—On the 24th December, 1920, at Heathdale, Harborne, Birmingham, to Mr. and Mrs. William Sinclair (née Stephanie P. L. H. T. Daniel, M.B., B.S., M.R.C.S.)—a son.

WOOD.—On December 27th, 1920, at 31, Ightenhill Park Lane, Burnley, the wife of Stanley Wood, M.R.C.S., of a daughter.

MARRIAGE.

DUNLOP—HYSLOP.—On December 28th, 1920, at St. Germain's Church, Edgbaston, Birmingham, by the Rev. R. W. Gibson, M.A., Vicar, James Kirkwood Dunlop, M.A., M.B., Ch.B., Sanghar, Dumfriesshire, to Chrissie Jane, elder daughter of Robert Hyslop, Creetown.

DEATHS.

DOWLING.—On 6th December, 1920, at 93, Bradford Street, Bolton, Rose Mary, the beloved wife of Francis Edward Dowling, L.R.C.S. and P.Ed., etc.

EMMS.—On Christmas Day, at The Cedars, Thurcaston, suddenly, Dr. Emms, late of Belgrave, age 70.

INSURANCE.

APPLICATION BY APPROVED MEDICAL AID INSTITUTION FOR EXTENSION OF AREA.

Those who have studied the various aspects of National Health Insurance will remember that Section 15 (4) of the National Insurance Act, 1911, allowed certain medical aid institutions "existing at the time of the passing of the Act" to receive the approval of the Commissioners, and, under conditions approved by them, to provide medical benefit for their members. This clause was the subject of great controversy at the time, and as first introduced was strongly opposed by the British Medical Association on the ground that not only did it give Government recognition to institutions already existing, but it allowed others to be set up. A compromise was arrived at in a conference between representatives of the Association and of the friendly societies, held in October, 1911, with Mr. Lloyd George in the chair. It was agreed that the "approval" of these societies should be limited to those then existing. This, like most compromises, pleased neither of the sides primarily interested. The almost universal opinion in the medical profession was then, and had been for years, that the medical aid institutions' method of providing medical attendance was bad in principle and had failed in practice. The Medical Alliance, the body representing these institutions, believed in the principle of having salaried doctors under the control of a lay committee, and it naturally fought for the vested interest which it represented.

The rules of the institutions had to receive the approval of the Commissioners, and they can only be changed now with the sanction of the Ministry of Health. The Middlesbrough and District Friendly Societies Medical Aid Association was approved in 1913, and its rules allowed it to operate within three miles of the Middlesbrough Town Hall. The governing body of the institution applied in November, 1919, to be allowed a radius of five miles. The British Medical Association, on hearing of this application, raised strong objection, and the Ministry refused it on the ground that the extension "would have the effect of so widening the scope of the association's activities as to change the character of the institution from that prevailing when it was originally approved." The institution then modified its application, asking to be allowed to take in only the areas of Normanby, Eston, and Grangetown, which are thickly populated industrial areas contiguous to Middlesbrough.

The Ministry decided to hold an inquiry on January 4th, 1921, at Middlesbrough.

Mr. R. W. Harris and Dr. J. Smith Whitaker represented the Ministry, and there were present a number of representatives of the Medical Aid Institution and of the workmen in the area which it was desired to include. These were introduced by Mr. Trevelyan Thompson, one of the members of Parliament for

Middlesbrough, and their views were stated by Mr. Robert Bell, Secretary of the Institute. Mr. Anderson represented the Medical Alliance, with which the Middlesbrough Institute is federated. Mr. Hutton and Mr. Peacock, Chairman and Secretary respectively of the North Riding Insurance Committee, represented that Committee. Mr. Plant, of Messrs. Steavenson and Plant, solicitors, represented the doctors in the area proposed to be included. Dr. G. H. Lowe, Honorary Secretary of the Middlesbrough Panel Committee and of the Cleveland Division of the British Medical Association, represented those bodies, and the Medical Secretary attended for the British Medical Association.

After a few opening remarks by Mr. Harris, who stated the objects of the inquiry, the Medical Secretary inquired whether the North Riding Pharmaceutical Committee had been asked to send representatives, as their interests were obviously involved. Mr. Harris said they had not been summoned, and promised that the point would be kept in mind by the Ministry.

The main argument for the extension, stated very persuasively by Mr. Bell, was that the areas proposed to be included were contiguous to the area already worked by the Institution, and that insured persons who wanted to join it ought not to be debarred by a boundary which was artificial, seeing that the work and interests of the workmen who were already members of the Institution were the same as those of the men just outside; also that it was unfair that they should have to provide for the dependants of insured persons residing in the new area, many of whom were now members, and should be debarred from accepting the insured persons, who were financially a better bargain from the Institution's point of view.

Mr. Plant dealt with the position of the doctors in the area now proposed to be absorbed. He pointed out that the idea of extension came from a body of workmen in that area who had resisted the efforts of the local doctors to obtain an increased weekly payment, and had brought in "doctors of their own" to prevent this increase; that these workmen had found themselves unable to provide medical attendance at a less figure than that suggested by the local doctors, and had had to raise their subscription to at least as high a rate; that the great majority of the workmen had stuck to their old doctors, but that those responsible for introducing the new men were looking to this absorption by the Middlesbrough Institution to stabilize their position by getting the machinery of the Insurance Act behind it. Mr. Plant showed that there was no ground for suggesting that the medical service in the district was not adequate, as there were eight doctors for a population of 30,000, without counting the two new doctors under the control of the workmen; that if the Middlesbrough Institution really believed that they were offering a better service than that given by the private practitioners of the district, there was nothing to hinder them allowing their doctors to go on the North Riding panel, and nothing then to prevent the insured persons in the area now in question choosing those doctors. This point evidently impressed the representatives of the

Ministry, who put searching questions to Mr. Bell and Mr. Anderson as to what difference there would be between the services of their doctors *quæ* medical aid doctors and of the same men *quæ* private insurance practitioners. The only reply seemed to be that the Institute would relieve the doctor of his clerical work, and thus enable him to give a better service than the doctor who had no such machinery at his back. Mr. Plant retorted that any advantage this might give would be far more than counterbalanced by the practical certainty of frequent change of personnel among the Institution doctors.

The Chairman of the North Riding Insurance Committee said that his Committee saw no advantage to the medical service of the district in the extension asked for. He was afraid it would be detrimental to the service, and unfair to the other doctors, inasmuch as the Committee would be unable to allocate to the Institution persons outside the approved radius of the Institution, while the other doctors would be obliged to accept allocations. He stated that there had never been a complaint about the medical service in the area under question during the whole seven years' existence of the service.

The Medical Secretary, after the detailed examination of the local position by Mr. Plant, confined himself mainly to the general aspect of the question, and reminded the representatives of the Ministry of the history of the clause in the 1911 Act which preserved the existence of the medical aid institutions. He said the Association held as strongly as ever that the principle underlying these institutes was bad, and the proof that the profession generally thought so was to be found in the inability of institutes to get doctors, or keep those they wanted to keep. He claimed that an extension of boundary should remove any institution from the category of institutions "existing at the time of the passing of the Act." In this case the part proposed to be included would be more important and richer from the Institution's point of view than the area covered by the parent body. Consent to the proposal would be to allow the less to swallow the greater. If consent were given to the proposal, the fight against these institutions—which had been patched up by the compromise, so far as the then existing bodies were concerned, and so long as they were content with the old position—would be reopened, and the consequences could not fail to be bad for the National Insurance medical service.

Mr. Bell replied, and the representatives of the Ministry stated that the decision of the Ministry would be announced shortly.

CORRESPONDENCE.

Insurance Medical Records.

SIR,—There is a great deal of nonsense written about the record cards and secrecy. As if we should dream of putting down anything on the cards that was really confidential! All we need put down is a clinical note, which not one man or woman in ten thousand, attended in private practice or otherwise, would object to.

There is less publicity in these records than in hospital records. As to the value patients set on keeping their complaints secret, it is instructive to listen for a few moments to the conversation in one's waiting-room. Symptoms and diseases—especially in medical terms, if they can get hold of them—are bandied about with the greatest gusto. And among private patients it is the same. They write to comparative strangers the most glowing description of their most intimate symptoms, and nothing pleases them better than the semi-public discussion of their own and other people's illnesses.

The complaints about the cards are got up, and kept up, by the press—not for the highest reasons. I have tested the trouble of keeping the records, and really it is very little extra work, and we are well paid for it.—I am, etc.,

Fairford, Glos., Jan. 8th.

H. BLOXSOME.

SIR,—It seems curious that neither the Interdepartmental Committee nor anyone at the Ministry of Health has foreseen the advantage which would have accrued if the new record envelopes had been made and printed so that a stiff edge would have been at the top. As at present designed the thin upper edges, which will be constantly fingered, will soon become dog-eared, and probably torn in course of time.

I suggest a better plan would have been to have the opening at the bottom. The record would then be placed in the drawer or cabinet with the open end downwards and the stout edge uppermost; this, as well as making the envelopes more durable, would have greatly facilitated the finding of any individual record. A possible objection

might be that the continuation cards would be in danger of falling out. I find, however, by trial, that this does not happen. An alternative would be to have the opening at the side, but the important point is that a stiff edge should be at the top.

With regard to secrecy: the Ministry have been caught napping in their instructions as to how we are to deal with temporary residents. For these cases we are told to fill in a continuation card and send it to the Local Insurance Committee; but no window envelopes have been issued suitable for this purpose, hence no secrecy.—I am, etc.,

Southport, Jan. 8th.

GEO. R. PENROSE.

SIR,—I have just sent a panel patient to a large city hospital as an "acute abdomen." Unless I worry the staff by post or make a long rail or motor journey to see the patient in hospital, all that I shall know as to the progress and outcome of the case will be the patient's unreliable version on the next occasion I happen to see him. In other words, at a time when the patient is necessarily under non-panel medical care and suffering from a complaint which may colour the whole of his subsequent medical history, no provision is made for maintaining the continuity of his records. The position is manifestly absurd, and when appreciated by the opponents of the record system will furnish them with a much more deadly weapon than the "secrecy stunt."—I am, etc.,

WM. J. AITKEN QUINE, M.B., B.S., D.P.H.

Chinley, Jan. 9th.

Medical Records in Courts of Law.

SIR.—It appears to have been overlooked by all concerned that various and far-reaching legal problems may arise by the demand of the courts of law for the production of these record cards in court. A late Master of the Rolls, Sir George Jessel, laid it down that the courts of law do not recognize professional secrecy between a doctor and his patient, and this view was upheld by the House of Lords, and therefore any judge can demand the production of these cards in court if he thinks fit. The cards will practically be a life-history of insured people, giving their age, changes of occupation and changes of address, in addition to the history of their diseases. Up to the present all citizens are supposed to stand equal before the law; now they will be divided into two classes in their relation to the law courts: one class of the community will be liable to have the records of their life-histories produced in open court and the other class will be immune from this publicity.—I am, etc.,

Stalybridge, Jan. 9th.

ADAM FOX, L.R.C.P., L.R.C.S.

British Medical Association.

THE MEDICAL SECRETARY'S VISIT TO LANCASHIRE DIVISIONS.

THE Honorary Secretary of the Lancashire and Cheshire Branch, Mr. F. Strong Heaney, has arranged the following series of Division meetings to be addressed by the Medical Secretary in the week beginning January 17th:

Monday, January 17th.—Evening: Ashton-under-Lyne.

Tuesday, January 18th.—Afternoon: Mid Cheshire, Evening: Stockport, Macclesfield and East Cheshire, and Hyde.

Wednesday, January 19th.—Afternoon: Liverpool and Birkenhead.

Thursday, January 20th.—Afternoon: Salford. Evening: Blackpool.

Friday, January 21st.—Afternoon: St. Helens. Evening: Wigan.

On Wednesday evening Dr. Cox will be the guest of the St. Helens Medical Society at its annual dinner. The Chairman of Representative Meetings, Dr. T.W. H. Garstang, hopes to accompany the Medical Secretary to most of the meetings.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—A meeting of the Willesden Division (open to non-members) will be held at St. Andrew's Parish Hall on Tuesday, January 18th, at 8.30 p.m. Dr. Christine Murrell will read a paper on maternity and child welfare clinics.

METROPOLITAN COUNTIES BRANCH: HARROW DIVISION.—A meeting of the Harrow Division will be held on January 25th at the Gayton Rooms, Harrow, when Dr. Crichton-Miller will read, at 9 p.m., a paper on toxins, endocrines, and emotives.

MIDLAND BRANCH: NOTTINGHAM DIVISION.—Major Sinclair, C.M.G., R.A.M.C., will give a demonstration on "Fractures" in the General Hospital, Nottingham, on Wednesday, January 19th, starting at 2 p.m. At 4.30 an adjournment will be made to 64, St. James's Street, Nottingham, for tea, at the invitation of the Nottingham Medico-Chirurgical Society. At 5 p.m. Major Sinclair will give a lantern slide demonstration, illustrating his previous demonstration. All members of the Association are cordially invited to be present at this demonstration. Major Sinclair has kindly offered to repeat this demonstration the following day for the benefit of the nursing sisters of the Nottingham and neighbouring general hospitals.

Meetings of Branches and Divisions.

VICTORIAN BRANCH.

At the close of the year the ballot papers were issued for the election of the new Branch Council. With the end of the Lodge dispute now in view, the incoming Council will be free from the heavy labours attaching to this question, and will be able to devote its energies in other directions. The situation at present is that nine large Orders, as well as certain smaller Friendly Societies, are working in harmony with the British Medical Association on the basis of the Wasley award. Three only have definitely refused to accept the terms of the British Medical Association.

Revision of Rules.

One of the many important subjects considered by the Council in 1920 was that of the revision of the rules. It had been recognized for some time that the time was ripe for such revision, but action in respect of the rule governing the annual subscription was rendered imperative by legislation passed at the Representative Meeting held at Cambridge last June, by which the annual contribution from Overseas Branches was raised to £22s. per member. The Council submitted to a special meeting of the Branch a proposal that the rates of subscription be four guineas for town members, three and a half guineas for country members, and two and a half guineas for junior members. Of these amounts, £2 2s., £1 11s. 6d., and 10s. 6d., respectively, were allotted to the Medical Society of Victoria. The Branch endorsed the suggestions of the Council regarding the increased subscription, though not without expressions of protest from various members who considered that the additional subscription asked of overseas members was scarcely warranted.

Another important change arising out of the revision of the rules is that the Council, elected by the members of the Branch, will in future select its own office-bearers. Hitherto the officers have been chosen by a general ballot of the members. There will be a Chairman of Committees, also selected by the Council, who, it is anticipated, will hold office for several consecutive years at least, and thus be conversant with the details of the activities of the retiring Council. There will also be representatives on the Council selected by the Divisions in town and country. This policy is designed to ensure greater strength to the Council, and to facilitate exchanges of views between the Council and the various Divisions; the change was suggested by experience in the recent Lodge dispute, when it was found that the presence of the local secretaries of Divisions on the Organization Committee was of the greatest assistance.

Parliamentary Representatives.

The election of Dr. J. R. Harris to the Legislative Council and of Dr. Stanley S. Argyle to the Legislative Assembly of the Victorian State Parliament are matters for congratulation. These gentlemen were entertained at dinner by the members of the Victorian Branch at the Grand Hotel, Melbourne, on November 25th, to mark their entry into Parliament. The medical profession in Victoria now feel that their views will be laid authoritatively before Parliament, and that misrepresentations of the opinions and attitude of the British Medical Association, some of which are matters of recent experience, will in future not go uncorrected.

Branch Honorary Secretary.

The Council has placed on record its very great appreciation of the services rendered the Association by Dr. J. W. Dunbar Hooper, during his four years' tenure of office as Honorary Secretary to the Victorian Branch. Dr. Hooper carried out the duties of honorary secretary during a particularly stressful term, which embraced almost the whole of the war period and that of the Lodge dispute. Only when the latter was fairly settled did he feel free to resign from the office which had absorbed such a large

amount of his time at a very great personal sacrifice. Dr. E. L. Davies was appointed as honorary secretary in succession to Dr. Hooper.

Post-graduate Classes.

The first series of post-graduate classes, arranged by the Permanent Committee for Post-graduate Work, established on the initiative of the Council of the British Medical Association, was held during the fortnight commencing November 8th, 1920. All the teaching hospitals, the Faculty of Medicine, the Walter and Eliza Hall Institute of Medical Research, and the Commonwealth Serum Laboratories co-operated, and the classes were well attended. The inaugural lecture on "Instruments of precision in diagnosis," was delivered at the University of Melbourne by Professor W. A. Osborne.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.

A DIVISIONAL dinner—the first since pre-war days—was held at the Abercorn Rooms, Great Eastern Hotel, on January 6th when Dr. CUTHBERT DIXON presided.

Dr. E. Goodall, President of the Branch, will deliver an address to the Division at the Metropolitan Hospital on Thursday, January 27th, at 9 p.m., on the nervous group of the acute infectious diseases.

A dinner dance has been arranged at the Abercorn Rooms on March 31st.

ULSTER BRANCH: BELFAST DIVISION.

At the opening meeting of the Belfast Division of the British Medical Association, a paper, perhaps most instructive from the point of view of diagnostic argument, was read by Dr. ROBERT REID, of Whiteabbey, Belfast, Chairman of the Division, on some interesting cases in general practice. A vote of thanks was accorded Dr. Reid, on the proposition of Colonel A. FULLERTON, seconded by Dr. R. W. LESLIE.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commanders: E. S. Miller to the *Warspite*, P. H. Boyden to the *Dryad*, W. L. Martin, O.B.E., to R.M. Depot, Deal, A. R. Thomas, O.B.E., and E. D. J. O'Malley, to the *Valiant*, R. H. Mornement, O.B.E., to R.M.A., Eastney, W. P. Walker to the *Indefatigable*, J. W. Craig to the *President* for R.N. College and Hospital School, Greenwich (temporary). Surgeon Lieut. Commander H. R. Bull to the *Raleigh* on commissioning. Surgeon Lieutenants: F. L. H. MacDowel to Special R.M. Battalion, J. R. Brennan to the *Cruace*.

ARMY MEDICAL SERVICE.

The following Major-Generals retire on retired pay: Louis E. Anderson, C.B., June 3rd, 1920 substituted for notification in the *London Gazette*, May 10th, 1920; Gerald Cree, C.B., C.M.G.

ROYAL ARMY MEDICAL CORPS.

The following are placed on the half-pay list on account of ill health: Lieut.-Colonel G. J. S. Archer, Major H. S. Dickson.

The following relinquish the acting rank of Major: Temporary Captain Robert B. Wallace, D.S.O., M.C., Captain and Brevet Major J. D. Bowie, D.S.O.

Captain W. Walker, M.C., to be acting Major.
To be temporary Captains, Temporary Lieutenant H. J. Brink, E. Tanton (late temporary Captain with seniority from September 29th, 1915).

J. A. B. Sim to be temporary Lieutenant.

The following officers relinquish their commissions: Temporary Major W. A. Brend, December 11th, 1917, and retains the rank of Major (substituted for the notification in the *London Gazette* of December 10th, 1917). Temporary Captains and retain the rank of Captain: O. V. Burrows, M.C., E. H. Cleveland, J. A. MacSweeney, S. Wigglesworth, W. Kingdon, G. Fildes, R. Stephens. Temporary Captains on appointment to the Indian Medical Service: P. A. Dargan, H. J. H. Symons, M.C. Temporary Lieutenant D. M. O'Dwyer, and retains the rank of Lieutenant.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Wing Commanders to be Group Captains: D. Munro, C.I.E., with effect from December 31st, 1920; N. J. Roche, O.B.E., R. V. Wells, C.B.E.

Squadron Leader to be Wing Commander: J. MacGregor, M.C.
Flight Lieutenants to be Squadron Leaders: T. J. Kelly, M.C., R. S. Overton.

INDIAN MEDICAL SERVICE.

Major J. A. Shorten, Professor of Physiology, Medical College, Calcutta, has been granted combined leave for seven months (December 1st, 1920).

Colonel J. B. Smith, C.B., K.H.P., has been promoted to the rank of Major-General (June 26th, 1920).

The following officers have been permitted to retire, with effect from the dates noted: Major-General H. H. Hendley, M.D., K.H.S. (June 26th, 1920). Lieut. Colonel F. N. Windsor, M.B. (August 15th, 1920). Major H. C. Brown, C.I.E. (October 23rd, 1920).

The promotion to present rank of Major H. Stout, O.B.E., M.D., has been antedated from August 1st, 1920, to February 1st, 1920.

The following Colonels have been appointed Honorary Surgeons to His Majesty the King: C. R. M. Green (June 15th, 1920), J. Garvie (June 20th, 1920).

The services of Captain J. H. Horne, M.B., have been placed temporarily at the disposal of the Chief Commissioner, Assam.

Major E. C. Taylor has been granted combined leave for one year (September 15th, 1920).

Major C. B. McConaghy has been appointed to hold charge of the current duties of the office of Political Agent, Bhopal, in addition to his own (November 19th 1920).

Captain (Brevet Major) T. A. Hughes, appointed to be Professor of Physiology, King Edward Medical College, Lahore (October 25th, 1920).

Major M. R. C. MacWatters, Professor of Surgery, King George's Medical College, Lucknow, has been granted combined leave for one year (November 3rd, 1920).

Major H. Halliday, Civil Surgeon, Simla West, has been granted privilege leave for six months (November 10th, 1920).

Major (Brevet Lieut.-Colonel) F. A. F. Burnardo, C.B.E., C.I.E., Civil Surgeon, Simla East, appointed to hold charge of the duties of the Civil Surgeon, Simla West.

Major R. F. D. MacGregor has been posted as Medical Officer, Sistan Consulate (December 12th, 1920).

Lieut.-Colonel H. Anstey Smith, C.I.E., M.B., has been promoted to the rank of Colonel (April 19th, 1920).

To be Lieutenants (April 24th, 1920): E. T. N. Taylor, M.B., A. S. Garewal, A. V. Lopes.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel J. H. P. Graham relinquishes his commission and retains the rank of Lieut.-Colonel.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major M. J. Mahoney, D.S.O., resigns his commission and retains the rank of Major.

Captain J. Ramsay, O.B.E., to be Major.

Captain G. R. E. G. Mackay, M.C., resigns his commission and is granted the rank of Major.

To be Captains: Captain J. Paton (late R.A.M.C.), with precedence as from April 1st, 1915 (October 14th, 1920—substituted for notification in the *London Gazette* of October 20th, 1920); Captain T. M. Jamieson from 4th Southern General Hospital, with precedence as from June 4th, 1915.

Captain L. R. G. de Granville to be Lieutenant, with precedence as from February 27th, 1915, and to relinquish the rank of Captain.

1st *London (C. of L.) Sauxitary Company*.—Major L. T. F. Bryett, T.D. resigns his commission and retains his rank, with permission to wear the prescribed uniform.

Supernumerary for Service with the O.T.C.—Temporary Captain V. G. L. Fielden, resigns his commission and retains the rank of Captain.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Captains W. C. Hodges and E. G. Annis resign their commissions, and are granted the rank of Major.

DIARY OF SOCIETIES AND LECTURES.

HUNTERIAN SOCIETY, Stion College, Embankment, E.C.—Wed., 9 p.m.: Lecture by Sir W. Arbuthnot Lane on Colectomy.

LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.2.—Tuesday, 4.30 p.m.: Pathological Specimens and Cases.

MEDICO-LEGAL SOCIETY, 11, Chandos Street, W.1.—Tuesday, 8.30 p.m., Dr. H. G. Sutherland; Medical Evidence in the Stanton Murder Trial.

ROYAL SOCIETY OF MEDICINE.—General Meeting of Fellows, Tues., 5 p.m. *Section of Therapeutics and Pharmacology*: Tues., 4.30 p.m., Laboratory Meeting at the National Institute for Medical Research, Hampstead. Presidential Address by Dr. H. H. Dale: Tendencies in Chemotherapy; Dr. J. H. Burn: Comparison of Digitalis Tinctures; Demonstrations. *Section of Pathology*: Tues., 8.30 p.m., Sir G. Lenthal Cheatle: Carcinoma of Breast; Dr. J. A. Murray: Early Carcinoma in the Mouse Mammary; Mr. A. H. Drew: Amitosis and Mitosis. *Section of History of Medicine*: Wed., 5 p.m., Dr. O. C. Gruner: The *De Viribus of Avicenna*; Dr. W. J. Turrell: Electro-therapists of the Eighteenth Century. *Section of Dermatology*: Thurs., 4.30 p.m., Cases. *Section of Otolaryngology*: Fri., 4.45 p.m., Cases; 5 p.m., Mr. T. Ritchie Rodger: Cavernous Sinus Thrombosis. *Section of Electro-Therapeutics*: Fri., 8.30 p.m., Dr. W. J. Turrell: Therapeutic Activity of Galvanic Current.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST GRADUATE MEDICAL ASSOCIATION, Royal Infirmary.—Wed., 4.15 p.m., Drs. Cowan and J. K. Reubie: Modern Treatment of Diabetes.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Dr. E. S. Reynolds: Apbasia.

MANCHESTER: ST. MARY'S HOSPITALS (WHITWORTH STREET WEST BRANCH).—Fri., 4.30 p.m., Dr. Lapage: Vomiting in New-born and Young Infants.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westminsterland Street, W.1.—Mon., 5.30 p.m., Dr. Parsons-Smith: Mitral Stenosis.

NORTH OF ENGLAND BRANCH, BRITISH MEDICAL ASSOCIATION, Royal Victoria Infirmary, Newcastle-on-Tyne.—Fri., 2.15 p.m., Mr. F. C. Pybus: Tuberculosis of the Spine; 2.45 p.m., Mr. J. Clay, O.B.E.: Urethral Obstruction; 3.15 p.m., Dr. A. Parkin: Clinical Cases; 3.45 p.m., Tea; 4 p.m., Dr. R. A. Bolam, O.B.E.: Dermatological Cases.

SALFORD ROYAL HOSPITAL.—Thurs., 4.30 p.m., Dr. Langley: Diagnosis of Diseases of the Liver.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Mon., 2 p.m., Dr. Stewart: Out-patients; 5 p.m., Dr. Saunders: Digestive Disturbances of Children. Tues., 10 a.m., Mr. Steadman: Dental; 5 p.m., Dr. Burnford: Physiology of Digestive Tract. Wed., 11 a.m., Mr. MacDonald: Cystoscopy; 5 p.m., Dr. Simson: Obstetric Emergencies. Thurs., 2 p.m., Mr. Bishop Harman: Eyes; 5 p.m., Professor H. Littlejohn: Medico-legal *Post-mortem* Examination of a Newly-born Infant. Fri., 2.30 p.m., Mr. Addison: Wards; 5 p.m., Mr. Baldwin: Appendicitis. Sat., 12 noon, Mr. Sinclair: Diseases of Abdomen; 2 p.m., Dr. Owen: Out-patients.

British Medical Association.

OFFICES AND LIBRARY, 49, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals and standard works can be consulted, is open to member from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books including current medical works; they will be forwarded if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London); MEDICAL SECRETARY (Telegrams: Medisecura, Westand, London); EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London).
Telephone number for all Departments: Gerrard 2630 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh (Telegrams: Associate, Edinburgh. Tel.: 4361 Central).

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin (Telegrams: Breillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

JANUARY.

- 14 Fri. London: Ministry of Health Committee, 2.30 p.m.
18 Tues. Willesden Division, St. Andrew's Parish Hall, High Road, Willesden Green, N.W., 8.30 p.m.

British Medical Association.

CURRENT NOTES.

Membership of the Association

BETWEEN January 1st and January 11th of the present year 444 new members have joined the British Medical Association.

Members of Long Standing or Retired from Practice.

The Council is recommending the Representative Body to reduce to two guineas the membership sub-scription in the case of members of forty years' standing, and also in the case of members of not less than ten years' standing retired from practice. If approved by the Annual Representative Meeting at Newcastle, these changes would in the ordinary way become effective as from January 1st, 1922, but the Council hopes to find means by which they can, if approved, be made retrospective for the current year.

Application by Approved Medical Aid Institution for Extension of Area

With reference to the report published in the SUPPLEMENT last week of an application for extension of area by the Middlesbrough and District Friendly Societies Medical Aid Association, we are informed by the Ministry of Health that the application has been refused. This news will be welcomed not only by the local members of the medical profession, who are principally concerned, but by all those practising in areas in which such institutions exist. As the Medical Secretary informed the representatives of the Ministry at the inquiry, the British Medical Association is willing to respect the compromise arrived at whereby those institutions which were approved at the beginning of the operation of the Insurance Act shall be tolerated so long as they are content to remain "as existing at the time of the passing of the Act." But, believing as it does that the principle on which these institutions are based is entirely wrong, the Association is bound to prevent by every means in its power any extension of their activities.

Unemployment Insurance Act and Doctors' Domestic Servants.

In November last the British Medical Association approached the Ministry of Labour upon the relation to the Unemployment Insurance Act of domestic servants employed by medical practitioners. A test case was put up by Dr. X. for a ruling as to whether or not L. N., a domestic servant, who also attends to the surgery door to admit and show out patients during consulting hours, is an employed person within the meaning of the Act. Dr. Courtenay Lord represented the Association, by invitation of the

Ministry of Labour, when the case was under consideration. The ruling of the Minister is to the effect that the said employment is not such as to make the said L. N. an employed person within the meaning of the said Act. In the covering letter the Ministry states "the decision will cover in principle all persons employed in the same occupation provided that the conditions are precisely similar." It is understood that a decision with regard to doctors' chauffeurs will be communicated to the Association without delay.

The Encephalitis Lethargica Schedule in London.

A member of the Association practising in London has forwarded copies of correspondence which has passed lately between the medical officer of health and himself regarding a schedule of inquiry on notified cases of encephalitis lethargica issued by the London County Council. This schedule includes a series of thirteen questions about the symptoms, etc., of the patient, with spaces for "results of blood tests or bacteriological examinations," "results of *post mortem* examination." One question has eight subheads on symptomatology—namely, "fever; lethargy; ptosis, squint, nystagmus; facial paralysis; paralysis or paresis of particular muscles of the trunk or limbs or sphincters; mental condition; delirium, tremors, or other nervous symptoms; speech changes." On receiving this schedule, the completion of which demands a good deal of time and the application of recent knowledge, the medical man asked what would be the fee for so doing. The answer was to the effect that no fee was payable, but that the medical officer of health would write (so far, we gather, with no result) to the London County Council on the matter. The medical officer of health added that these forms had been filled up by doctors all over London for some considerable time, and that this was the first occasion on which he had had difficulty in obtaining the information. That this should be so is a credit to the public spirit of London practitioners, but does not speak very well for their acumen. The delay in restoring, not to mention increasing, the notification fee for infectious diseases in general may, however, have accustomed the profession to exploitation at the hands of public bodies.

The Hospitals Committee.

The Hospitals Committee of the Association met on January 12th, and considered, amongst other matters, the following:

Payment of Members of Staffs of Voluntary Hospitals.—The Committee is collecting information as to the methods of payment of medical staffs of voluntary hospitals in respect of State- or rate-maintained and other "paying" patients in voluntary hospitals, and will be glad to receive details of any scheme in force of which it has not already been notified; the Committee has also appointed a sub-

committee to meet a subcommittee of the British Hospitals Association to discuss the question of obtaining increased payment from the Ministry of Pensions for hospitals, and any other relevant questions arising out of the Conference of Representatives of Voluntary Hospitals held on December 21st, 1920.

Conference of Representatives of Medical Staffs of Voluntary Hospitals.—Arising out of the Conference of Representatives of Medical Staffs of Voluntary Hospitals, held on December 21st, 1920, the Hospitals Committee has appointed a small subcommittee to prepare a statement of evidence for submission, on behalf of the British Medical Association, to the Committee appointed by the Minister of Health "to inquire into and report upon the financial position of the voluntary hospitals throughout the country and to make recommendations." This statement of evidence will be submitted to the Hospitals Committee for approval and will be finally decided upon at its next meeting.

Utilization of Poor Law Hospitals.—The Committee is also considering the question of the utilization of spare beds in Poor Law infirmaries for augmentation of voluntary hospitals. The Committee is well aware that suggestions to this effect have been made in several areas, and would be glad to be informed of the details of any scheme, other than those already notified, in order that the information may be utilized for a memorandum which is being prepared for consideration at its next meeting.

The Contract Practice Subcommittee.

The Contract Practice Subcommittee met on January 11th. A number of reports were received from areas which had recently adopted revised scales for attendance on uninsured persons at contract rates. The Subcommittee notes with regret that there is still a marked tendency to accept a much lower fee for persons up to the age of 16 than for adults. The question of mileage in connexion with coroners' inquests was considered, and it was decided to recommend the Medico-Political Committee to approach county councils with a view to inducing them to pay mileage, as is being done in the case of Montgomeryshire. The question of fees for certifying factory surgeons was under discussion, and it was decided to recommend the Medico-Political Committee to co-operate with the Association of Certifying Factory Surgeons in a renewed effort to get these fees placed on a more satisfactory basis. That Committee was asked also to consider the increased telephone rates as they affect medical men.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: HARROW DIVISION.—A meeting of the Harrow Division will be held on January 25th at the Gayton Rooms, Harrow, when Dr. Crichton-Miller will read, at 9 p.m., a paper on toxins, endocrines, and emotions.

INSURANCE.

EXPENDITURE AND INCOME STATISTICS.

As insurance practitioners are already aware, it is necessary to be in a position to justify any application that may be made to the proper authorities by the Insurance Acts Committee for increase in remuneration for work under the Insurance Act, on the grounds of increased practice expenses. The difficulty experienced by a medical practitioner in adopting a compound system of keeping his accounts has been a source of embarrassment to the British Medical Association in collecting statistics of expenditure and income at times when such information has been urgently required for furthering the interests of practitioners in their relations with Governmental and other bodies. A form for collection of statistics to be furnished by individual practitioners was sent in June, 1920, to Panel Committees, with a request that it should be distributed to those practitioners who could be relied upon to keep the figures and send them for the confidential use of the Insurance Acts Committee. These statistics, incidentally, are desired now, and should be forwarded to the Medical Secretary of the Association. As a result of the experience gained and the criticisms of that form, the Committee has drawn up a new form designed

by practitioners who understand and fully appreciate both the individual practitioner's and the Association's requirements. This is believed to be a considerable improvement on the old form, and should be found very useful to all practitioners who wish to keep particulars of their income and expenditure on a simple plan, irrespective of whether they place the schedule at the temporary disposal of the Committee or not. Practitioners are assured that the information supplied will be treated as strictly private and confidential, and will be used with great discretion; the names of individuals will not be disclosed even to the Insurance Acts Committee.

Description of the Form.

The form consists of a series of interleaves, with cash columns lettered to correspond with the various sections of expenditure and income, contained within a stiff cover. There are four divisions into which the columns of expenditure and income fall: wholly professional expenses, partly professional expenses, non-professional expenses, and professional income. It includes:

WHOLLY PROFESSIONAL EXPENSES.

(Note.—The whole of these expenses are deductible for income tax.)

Surgery Expenses.

Drugs, bottles, etc., carriage and delivery of medicines.
Salary of dispenser.
Branch surgery and establishment expenses applicable thereto.

Personal Expenses.

Professional books and journals.
Subscriptions to professional societies.
Instruments.
Laboratory and other fees.

Miscellaneous Expenses.

Professional stationery, postages, telegrams, etc., telephone.
Commissions on debt collecting, etc., sundries.

Salary of Assistant or Locumtenent.

Travelling.

Professional rail, cab fares, etc.
Motors, horses, etc.: (a) hire; (b) running expenses and repairs, including insurance; (c) wages and livery; (d) purchase and sale.

PARTLY PROFESSIONAL EXPENSES.

(Note.—A part of these expenses, usually one-third, but possibly up to two-thirds, is deductible for income tax.)

Establishment Expenses.

Rent or annual value of house; rates, house duty, etc.; repairs; fuel and light; fire insurance; servants' wages and insurance; household cleaning materials.

NON-PROFESSIONAL EXPENSES.

Household Expenses.

Provisions for whole household (in households where garden, dairy, pig, or poultry produce are self-supplied the value of these should be added); beverages, laundry, clothing (for whole household under each item); household replenishment; household sundries.

Personal.

Sundries (books, postage, stationery, etc.); private expenditure; life and other insurance premiums.
Education.
Holidays.
Income tax and other taxes not previously entered.

PROFESSIONAL INCOME.

Private fees (all descriptions).
Appointments.
National Insurance: (i) Capitation fees; (ii) drug fees; (iii) mileage.

A practitioner merely has to enter at the time of payment or receipt the amount expended or received in the appropriate column, at the same time entering the date and subsection number in the vacant space provided in the column. The sectional letters and the subsection numbers are omitted from the above summary of the schedule.

The new return and additional copies of the cash column interleaves will be supplied free to every practitioner who promises to send his return to the Medical Secretary when requested so to do. The form will be returned to the practitioner concerned as soon as the necessary particulars have been extracted. The information under each separate heading is essential, but any practitioner who is unable to state his non-professional expenses is asked to give what information he can under the other headings. Interleaves or, if desired, the complete book should be forwarded to the Medical Secretary, British Medical Association, 429, Strand, London, W.C.2.

Other practitioners who may wish to use the form to keep private particulars of their income and expenditure in a simple and easily accessible way can obtain it at a price of 1s., post free, and extra copies of the inside cash interleaves at 3d. each, from the Medical Secretary.

SANATORIUM BENEFIT IN SCOTLAND.

THE following communication has been sent to us by the Scottish Board of Health, 125, George Street, Edinburgh:

There appears to be some misunderstanding of the position of sanatorium benefit in Scotland. In England sanatorium benefit will not cease until May 1st to be included among the benefits conferred upon insured persons by Part I of the National Insurance Act, 1911; but in Scotland this termination has taken place, and as from January 1st, 1921, the Public Health Local Authorities have been required to make arrangements for the treatment of tuberculosis in insured persons. The issue of the National Health Insurance Termination of Sanatorium Benefit Regulations (Scotland), 1920, by the Scottish Board of Health completed the final transfer of this liability from Insurance Committees to local authorities.

Special arrangements have been made to ensure that there shall be no break in the continuity of treatment resulting from the transfer, and a special scheme under which treatment will be afforded by local authorities to ex-Service men suffering from tuberculosis has been devised. The local authorities are to receive, in respect of the treatment of insured persons suffering from tuberculosis, an Exchequer grant, which may be taken broadly as representing the amount that has been available to local Insurance Committees for institutional treatment; and in respect of the treatment of ex-Service men, the local authorities will obtain reimbursement of the entire cost of institutional treatment, and will also receive payment for the services of their tuberculosis officers.

CORRESPONDENCE.

Supply of Drugs in Rural Areas.

SIR,—I wish to call attention to the unreasonableness of Article 10 (2) of the Medical Benefit Regulations, 1920.

A certain rural practitioner does not wish to undertake any dispensing for insured persons, for there is a chemist residing practically opposite to him, and the latter has hitherto undertaken such work. An insured person, residing more than a mile away from the doctor, now claims to be supplied with drugs, etc., from the doctor, and the Insurance Committee has required that doctor to dispense such drugs, etc., much against the practitioner's wish.

Apparently the Insurance Committee cannot act otherwise under Article 10 (2). The doctor, of course, dispenses for his own private patients. It seems absurd that in this single isolated case, which inflicts no hardship upon the insured person, the doctor should be called upon to undertake a duty contrary to his usual practice.

In my opinion Article 10 (2) should be so amended that an Insurance Committee should have powers in refusing to allow an insured person this option of obtaining drugs from a practitioner, under special circumstances. The Article as it stands is entirely in favour of an insured person, and is unreasonable government.—I am, etc.,

SIDNEY CLARKE, M.D.,

Hon. Secretary, Hertfordshire Local Medical and Panel Committees.

St. Albans, Jan. 14th.

Insurance Medical Records.

SIR,—It is refreshing to read Dr. Bloxsome's letter in the SUPPLEMENT of January 15th after all the utter nonsense that has been inflicted upon us, both in the daily press and your previous issues, by men who, on the one hand, are using our profession as a pawn in a very apparent political game, and those who in the profession would like us to continue as little better than mountebanks.

I should think the majority of men would welcome the new system of keeping records of our cases as a definite step forward in a really scientific direction. Many of us have all through their careers kept records both of insured and private patients, and fully appreciate the fact that without these records they would have made little progress in their profession. The keeping of written records compels a man to read, because—unless he is a fool or a mountebank—he will not put in writing what he does not believe to be correct both in reasoning and fact. We have only to review the career of a man such as Sir James Mackenzie to realize the tremendous advantage to humanity which follows the keeping of records of cases, and, while it is given to few to possess the genius of such a man, and to be able to draw such far-reaching inferences as he has done, we can all gain tremendous benefits from the new system if we conscientiously carry it out.

The "professional secrecy" stunt is nothing but dust meant to delude the public, and an excuse for laziness. The records are not difficult to keep, if done daily; and even if they were they are worth it, and we are well paid for the work. Words fail me to realize the mentality of the man who puts up warning notices in his waiting-room about the keeping of records; he is certainly devoid of

any sense of humour, and my experience of the public, at least in these northern parts, is such that I know they are not to be taken in by such clap-trap.—I am, etc.,

Croft Mhairi, Tain, Jan. 16th.

ENEAS K. MACKENZIE.

SIR,—I have read with interest and some astonishment Dr. Bloxsome's letter under the above heading. It is ridiculous to say that the keeping of these records is very little extra work. With a moderately large panel I also have tested it. The amount of extra work, especially at this time of the year, is so much that I shall have to get clerical assistance.

I have thought the matter out, and think that the most expeditious way to get things done would be to have a clerk sitting in the waiting-room with the cabinets of envelopes; as the patient entered the room the clerk would find and hand him his envelope, which he would then bring in to me as his turn for admission arrived. Later, when surgery was over, the clerk would have to replace my pile of envelopes in their proper order in the cabinets. Whilst doing all this the whole idea of professional secrecy is done away with—it means that a third party possibly understands what is written, or otherwise that the doctor refrains from writing down essential details.

I am not interested in newspaper stunts; this is an innovation in our professional relations with patients, and I think a bad one. I quite agree with Dr. Fox's remarks about the production of record cards in law courts.

Dr. Bloxsome says we "are well paid for the work," and again I join issue with him. The bulk of practitioners doing panel work with whom I am acquainted agree that it is grievously underpaid.—I am, etc.,

Wednesfield, Jan. 10th. F. S. WILLIAMS, M.B., B.S. Lond.

SIR,—The suggestion made by Dr. Penrose in the SUPPLEMENT of January 15th is a most important one. In my own case the upper ends of the cards are already losing their elasticity to such an extent that I have had to add another box, and repack them more loosely. The stiffening of the upper portion means shortening the length of time it takes to hunt up a name. Perhaps a wire edge might be a still further improvement. I find the actual time taken for my panel, very slightly under 2,000, exceeds one hour daily, with the cards in their new state, in entering them up from one's day-book. There is no trouble in keeping a day-book. The time is taken up in entering from the day-book on to the cards, and the softer and more fingered these cards get the longer will be the time. I have tried several methods, and began keeping the cards from the moment they reached me, but I cannot reduce the time taken in entering up the record cards, working rapidly, to less than over one hour daily, so this softening of the cards is a very important matter.—I am, etc.,

Bristol, Jan. 15th.

E. J. BALL.

SIR,—The medical record scheme is decidedly a vexed question. The salient point is that it is unworkable. Even with a small panel it is at times impossible to make entries of all attendances, etc., and surely it is not necessary. Taken as a case-paper—giving essential points as to diagnoses and length of period of treatment—the record may be useful, both to the practitioner attending and to any successive medical attendant. That should be the use of the record, and it should be for medical use only. In the absence of records, I have made rough notes, alphabetically arranged, and I see no objection to the record if it is kept for a legitimate purpose of that nature; it will be beneficial both to doctor and patient. But to look out a card every time a patient is seen, with perhaps twenty or thirty people waiting for attendance, is practically impossible, and constitutes not a use but an abuse of the record system. This applies to a panel of hundreds, and with thousands the grievance is multiplied in corresponding ratio. It can only be done by employing clerical assistance, and then medical secrecy is altogether abolished.—I am, etc.,

Loughborough, Jan. 9th.

J. B. PIKE.

SIR,—Like a number of my friends, while complaining loudly at having so much extra work thrown on us by the Insurance Department of the Ministry of Health in the filling up of record envelopes and continuation cards, I am still anxious to fill them up as the Ministry would wish them done, but I find the directions are not explicit enough, and I am in doubt how to do them.

The directions say they are intended to last the whole of a man's working life, and at the same time every attendance is to be registered. If I were to follow this out with some of my patients the record envelope would be filled up and would also be filled with continuation cards in less than twelve months. It would help me and

no doubt a number of others if we might have a fac-simile of the back of an envelope for a supposed ease of pneumonia filled up and published in the next issue of your valuable JOURNAL. We should then see how it was intended we should fill them up.—I am, etc.,

Rotherham, Jan. 15th.

FREDK. J. BURMAN.

"J. S. D." writes: I have read with interest the various letters in the SUPPLEMENT regarding the new medical records, and it appears to me that the profession is being saddled needlessly with a great deal of cumbersome clerical work of very doubtful use, both from a statistical standpoint and the maintenance of professional secrecy. To my mind it seems belated and ludicrous to attempt to preserve professional secrecy by means of sealed windowed envelopes when one thinks of the immense number of incapacity certificates, issued daily by practitioners to insured persons, openly stating their names, and the diseases from which they are suffering; as every doctor knows, these are usually sent to the secretary in the case of small societies, or to the branch office of large societies, where they are probably open to the inspection of every member of the staff. The new arrangement looks very much like a case of "locking the stable door after the horse has bolted."

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following notifications are announced by the Admiralty: Surgeon Commanders R. B. Scribner to the *Victory* for hospital ship *Berberice*, G. S. Davidge to the *Crescent*, additional for duty at Leith and Granton, G. T. Verry to the *President*, additional for three months' hospital course, A. Woolcombe to the *Colossus*, T. E. Blunt to Haslar Hospital, Surgeon Lieut. Commanders H. E. R. Stephens, O.B.E., to the *Cleopatra* (temporary), L. R. Warburton, O.B.E., to R.N. Hospital, Catham, A. H. Joy to the *Bee*. Surgeon Lieutenant A. F. Grimby to the *Cyclamen*.

Surgeon Lieutenant G. L. Ritchie has been promoted to the rank of Surgeon Lieutenant Commander.

ARMY MEDICAL SERVICE.

Colonel E. M. Morphew, C.M.G., D.S.O., is placed on half pay. Colonel C. K. Morgan, C.B., C.M.G., retires on retired pay.

ROYAL ARMY MEDICAL CORPS.

Major F. T. Dowling relinquishes the acting rank of Lieutenant-Colonel.

Major J. Startin, M.C., is placed on the half-pay list on account of ill health.

The following retire on retired pay: Lieut.-Colonel A. F. Weston, Major F. A. Stephens, D.S.O. (November 14th, 1920, substituted for notification in the *London Gazette* of November 12th, 1920).

Captain D. T. M. Large to be temporary Major whilst specially employed.

Captain L. F. K. Way, D.S.O., retires, receiving a gratuity.

The following officers relinquish their commissions: Temporary Majors and retain the rank of Major: H. W. Wooley, J. M. Mathieson (on ceasing to be employed at the Wharfedale War Hospital). Temporary Captains and retain the rank of Captain: P. MacD. Little, M.C., T. Sheehan, H. Morell, L. Fraser, H. Bell, G. Cock, R. W. Harper, E. C. Lindsey, C. F. Maciachlan, M.C., O. Marshall, R. C. Phelps. Temporary Lieutenants and retain the rank of Lieutenant: J. S. F. J. Kerr, E. P. O'Dowd, J. A. A. P. Scott.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Captain J. Fanning is transferred to the unemployed list.

Captain A. E. McCulloch relinquishes his temporary R.A.F. commission (January 9th, 1919, substituted for notification in the *London Gazette* of January 21st, 1919).

GENERAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

A. L. Aymer, late Captain R.A.M.C. to be Major, April 24th, 1920, and the notifications in the *London Gazette* of April 28th and June 4th, 1920, are cancelled.

DIARY OF SOCIETIES AND LECTURES.

HARVEIAN SOCIETY OF LONDON, Paddington Town Hall, W.—Thursday, 8.30 p.m., adjourned debate on the Future of the Poor Law Infirmary.

LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.—Thursday, 6 p.m., Chesterton Lecture by Dr. W. K. Sibley: Acne.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 8.30 p.m., Dr. Anthony Feiling: Multiple Neuritis. Dr. F. G. Crookshank: Handprints in Mongolian and other Imbeciles.

ROYAL SOCIETY OF MEDICINE.—*Section of Odontology*: Monday, 8 p.m., Sir Frank Colyer: Old Dental Instruments. *Section of Medicine*: Tuesday, 5.30 p.m., Dr. P. J. Cammidge: Classification of Diabetes Mellitus. Dr. E. P. Poulton: Treatment of Peptic Ulcer by Gastric and Gastro-duodenal Tubes (to be preceded, at 5 p.m., by a demonstration of Cases). *Section of Bacteriology and Climatology*: Thursday, 5.30 p.m., Presidential Address, Dr. G. L. Pardington: Advancing Years and Palneotherapy. Members of Section, with guests, will dine at the Welbeck Palace Hotel, Welbeck Street, W., at 7 p.m. Those intending to be present are requested to notify Dr. C. F. Sonntag, 80A, Belsize Park Gardens, N.W.3, by January 26th. *Section of Urology*: Thursday, 3.30 p.m., at King's College Hospital, Operations by Mr. Thomson Walker: 8.30 p.m., at 1, Wimpole Street, W., Mr. Thomson Walker: Obstruction after Suprapubic Prostatectomy. *Section of Study of Disease in Children*: Friday, 4.30 p.m., Cases. *Section of Epidemiology and State Medicine*: Friday, 8.30 p.m., Dr. A. S. M. MacGregor: Current Small-pox in Glasgow.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Maternity and Women's Hospital.—Wednesday, 4.15 p.m., Dr. J. H. Martin: Obstetrical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thursday, 4 p.m., Mr. Barrington Ward: Hare lip and Left Palate.

MANCHESTER: ANCOATS HOSPITAL.—Thursday, 4.30 p.m., Dr. Reushaw: Specific Bactericidal Substances.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Dr. J. M. Brockbank: Pernicious Anaemia.

MANCHESTER: ST. MARY'S HOSPITALS (Whitworth Street West Branch).—Friday, 4.30 p.m., Dr. Clifford: Differential Diagnosis of Abdominal Swellings.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland Street, W.1.—Monday, 5.30 p.m., Dr. J. Parkinson: Tachycardia.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Daily (except Wednesday and Saturday), 2 p.m., Out-patient Clinics. Lectures, 3.30 p.m., Monday and Friday, Dr. Greenfield: Cerebro-spinal Fluid. Demonstrations of Cases, 3.30 p.m.; Tuesday, Dr. Russell; Thursday, Dr. Taylor.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Daily, In- and Out-patient Clinics, etc., 2.30 p.m., Operations. Lectures, 3 p.m.—Wednesday, Dr. Whiting: Cardiac Arrhythmia. Thursday, Dr. Hadfield: Spinal Anaesthesia. Friday, Dr. Sundell: Thoracic Tuberculosis in Children. Full particulars can be obtained from the Dean.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Lectures, 5 p.m.—Monday, Mr. Harman: Chronic Indigestion and Visual Acuity. Tuesday, Dr. Burnford: Investigation of Digestive Tract. Wednesday, Dr. Simson: Obstetric Emergencies. Thursday, Mr. Pinch: Radium Therapy. Friday, Mr. Baldwin: Appendicitis.

CURRENT NOTES.

Conference of Representatives of Voluntary Hospital Staffs in Scotland

The Hospitals Subcommittee of the Scottish Committee has convened a conference of staffs of voluntary hospitals to be held in the offices at 6, Rutland Square, Edinburgh, on Saturday, February 5th, at 2.30 p.m., to consider the present financial position of voluntary hospitals.

Proposed Central Professional Committee.

It will be remembered that when, on November 1st, 1920, a deputation of the British Medical Association waited upon the Minister of Health in regard to certain clauses in his Miscellaneous Provisions Bill and the Municipal Hospital at Bradford, he declared that he would not consult half a dozen different bodies each claiming to represent the profession, and invited the Association to take action to provide some body which he would be justified in considering representative of all sections. Dr. Addison followed this up by a letter, dated November 26th, to the Chairman of Council, in which he said:

"The difficulty is how to secure the appointment of a body which will be recognized not only by practitioners of all classes but by the various existing organizations as expressing the views of all sections of the profession. It is, of course, not for me to make any suggestions as to how such a body might be, or ought to be, constituted. But I am satisfied that it will be impossible to secure the constitution of a representative body without the good offices of the British Medical Association in bringing them together, and if your Council have not already done so, I would suggest that you should now initiate action to secure the appointment of a body whose credentials will be incontestable."

Since that time the Council has given very careful consideration to the matter, the details of which will probably be reported later; but it will interest members of the profession to know now that the Council at its last meeting resolved to invite those bodies with which the British Medical Association has been accustomed to work to assist it in establishing a joint representative committee, and it has asked the Society of Medical Officers of Health, the Medical Women's Federation, the Poor Law Medical Officers' Association of England and Wales, the Medico-Psychological Association, and the Association of Certifying Factory Surgeons if they are willing to co-operate with the Association in forming a body which could be suggested to the Minister of Health as providing him with the representative medical body which he has asked for. This is a preliminary step, and it must be understood that the above list is not necessarily final or complete. It is particularly hoped that the co-operation of the Royal Colleges may be secured when the project is a little more mature, and it is proposed that

such a joint representative medical committee, if established, should be empowered to confer, before making representations to the Ministry of Health on behalf of the profession on any matter, with any other medical society not represented on the committee.

Home Office Regulations as to Dangerous Drugs.

As stated in the JOURNAL of January 15th, page 96, the Home Office has issued draft Regulations of a very drastic nature in regard to the prescribing and dispensing of medicinal opium, morphine, cocaine, eegonine, and diamorphine. These regulations are issued under the Dangerous Drugs Act, and forty days must elapse between the issue of the draft regulations and their becoming operative. The Medico-Political Committee has already made a protest to the Home Office on general grounds, and is considering detailed representations with a view to modification of the regulations. These regulations, which will affect the daily life of every practising doctor, have been issued without any attempt to consult the British Medical Association as representing the organized profession. It is understood that the Pharmaceutical Society also was not consulted and is making strong representations as to the impracticability of the regulations.

Fees for Treatment of School Children in Scotland.

Attention was called to this matter in "Current Notes" on December 4th, 1920, and the situation which had arisen in Renfrewshire was explained. The local education authority had offered a fee of 15s. an hour for clinic work, and the practitioners in Port Glasgow had refused this and asked the support of the British Medical Association. The matter was taken up by the Division Secretary and the Scottish Medical Secretary, with the result that an offer of £1 1s. an hour has now been made.

Poor Law Hospitals and Civil Needs.

The Hospitals Committee has given very careful consideration to the question of the utilization of Poor Law hospitals for civil needs, and has passed the following resolutions, which will be submitted to the Council at its meeting on February 15th:

1. That in those infirmaries where there is spare accommodation and when the beds of the Poor Law patients have been met, it would be desirable that certain beds should be set aside for private patients paying a fee to be settled by the guardians, and that where a general practitioner wishes to continue to treat them patients of his own, he should be allowed to do so under the general administrative supervision of the medical superintendent, and that any of these patients should be allowed to call in a consultant from outside, the patient bearing the cost thereof.
2. That for "paying" patients admitted to infirmaries there should be an inclusive charge—to cover the cost of medical supervision, maintenance, nursing, food, and medicines within the ordinary tariff and pharmacopoeia

of the infirmary, the patient paying his medical attendant independently.

3. That any extra nursing and any food or medicine ordered over and above those allowed under the ordinary tariff and pharmacopoeia of the infirmaries should be charged as extras to the patient.
4. That all medical attendance by private practitioners on "paying" patients in infirmaries should be under the supervision of the medical superintendent of the infirmary.
5. That infirmaries, so far as practicable, should be utilized for medical education.

These resolutions were submitted by Dr. E. W. G. Masterman to a meeting of the Infirmary Medical Superintendents' Society, who passed the following resolutions in connexion therewith:

- (1) That when in any infirmary there are beds to spare, after the needs of the poor in the district are met, it is desirable that accommodation should be provided for private patients, who would pay a fixed sum covering their expenses.
- (2) That if, and only if, separate wards can be provided for their accommodation, such patients should, if they desire, continue under the treatment of their own medical attendants while in the infirmary, subject to the general administrative supervision of the medical superintendent, and also, if they so desire, call in other consultants' advice at their own expense.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH: HARROW DIVISION.

THE Division recently held three meetings to discuss the new record card for insured patients. These were held on January 4th, 14th, and 21st.

At the first meeting two resolutions were passed, after prolonged discussion. The first called attention to the objections to these records, outlined under five heads. The second had reference to the attitude of the Council in the matter, which was severely criticized, and to the correspondence of the Medical Secretary in the *Times*. The latter also was commented on very adversely.

On January 14th, as a result of these resolutions, the Division met again, to hear Dr. R. A. Bolam, Dr. Brackenbury, and Dr. Cox, who attended to put the case for the Association before the Division. The speeches of these visitors were of great assistance, and much information about the records and the press controversy regarding them was made available to the members. This meeting was adjourned to January 21st, as much remained for discussion, but before the adjournment a vote of confidence in the Medical Secretary was carried unanimously.

On January 21st another crowded meeting assembled, and many interesting speeches were made. A noticeable feature of several of these were the strong appeals for greater membership of the Association and for unanimity among the profession generally. As a result the following voting took place on these motions:

1. That the resolution embodying the Division's objections to the records be rescinded.
For, 8. Against, 7.

Many members refrained from voting, and it was agreed that the records should be discussed again in six months' time—after a trial of them had been made—the result to be reported to the Insurance Acts Committee.

2. That the resolution criticizing the action of the British Medical Association Council be rescinded.
For, 9. Against, 5.

Again a number of members did not vote.

The Division expressed its thanks to Drs. Bolam, Brackenbury, and Cox for having attended the meeting on January 14th.

METROPOLITAN COUNTIES BRANCH: WEST HERTFORDSHIRE DIVISION.

AT a meeting of the Watford Ward of the West Hertfordshire Division, held on January 7th, the following resolution was unanimously adopted:

That this meeting of panel practitioners protests—

1. That the new medical record cards were not submitted, previous to their issue, either to the Divisions of the British Medical Association or to the Panel Committees for an opinion from those who had to use them as to their feasibility and usefulness.
2. That this meeting is of opinion (a) that it is a waste of practitioners' time to verify and supply particulars of a clerical nature, and that generally the time required for this work will be more than can be given by panel practitioners, except to the prejudice of their real work; (b) that in the winter and times of stress it will be impossible to keep accurately the records as at present required, and therefore their value for statistical purposes will be destroyed; (c) that the record card should be kept by the insured person, the necessary particulars being entered by the doctor when giving attendance; (d) that panel practitioners should only be asked to supply the information required under Clinical Notes and Diagnosis.

LANCASHIRE AND CHESHIRE BRANCH: ST. HELENS DIVISION.

Visit of the Medical Secretary.

A MEETING of this Division was held on January 21st in the Board Room of the Providence Hospital, a large attendance of members and others being present to hear Dr. Cox, who was ably supported by Dr. Garstang, Chairman of Representative Meetings. Both were accorded a hearty welcome.

Dr. Cox gave a practical address on the history and working of the Association, pointing out that the interest of every class of practitioner was catered for by the Association. He showed the advantages to all classes—consultants, general practitioners, those in the public health and other institutional services, and to the men serving in the navy and army. The audience was much interested and the address not unprofitable; the Divisional Secretary being later in a position to report the acquisition of four new members, and the reclamation of other two former members who had resigned.

An animated discussion followed, during which many questions were asked and criticisms offered, to which Dr. Cox replied.

Dr. GARSTANG also spoke and gave a lucid and interesting account of the administrative machinery of the British Medical Association and its committees. He impressed upon his hearers how greatly the Association was dependent upon the Branches, Divisions, and especially the members, for the proper and efficient working of that body, and how deeply their individual and collective responsibility was concerned. The meeting was unanimous in its expression of appreciation of the work of the Association, and the visit of the Medical Secretary has aroused in the Division a keener interest in the British Medical Association and its work.

SOUTHERN BRANCH: PORTSMOUTH DIVISION.

A WELL attended meeting was held on January 11th at Portsmouth, to which all medical practitioners resident in Portsmouth were invited, to discuss the attitude of the profession to the new panel record cards. After considerable discussion the following resolution was, on the motion of Dr. J. G. BLACKMAN, seconded by Dr. A. V. MAYBURY, jun., carried unanimously:

This meeting is of opinion that the present record cards are for the most part valueless, that they occupy valuable time which would be better devoted to the treatment of the sick, and moreover they violate the confidence which should exist between doctor and patient. That this resolution be sent to the Ministry of Health, local members of Parliament, and the press, and to the Friendly Societies Council.

The following motion, proposed by Dr. MCASKIE and seconded by Dr. NEWTON, was, after discussion, carried by a large majority:

That the record cards be kept (according to regulation), and only handed over under protest until secrecy is assured.

The question of whether the record cards would be available for use in legal cases was also raised.

On the motion of Dr. SHEAHAN, seconded by Dr. BLACKMAN, it was unanimously resolved:

That the Insurance Acts Committee in not offering the most strenuous opposition to the new system of record keeping has forfeited the confidence of practitioners working under the National Health Insurance Acts.

Association Notices.

MEETING OF COUNCIL.

THE next meeting of Council will be held on Wednesday, February 16th, in the Council Room, 429, Strand, London, W.C.2, at 10 a.m.

CHANGE OF AREAS.

Areas of Edinburgh and Leith, and Lothians, Divisions.

NOTICE is hereby given by the Council to all concerned that, as the result of a proposal to that effect by the Edinburgh and Leith Division, the Council has decided that as from January 29th, 1921, the following places (having been merged by the Edinburgh Boundaries Extension Act, 1920, in the City of Edinburgh)—namely, Colinton, Corstorphine, Cramond, Juniper Green, and Liberton—be transferred from the area of the Lothians Division to that of the Edinburgh and Leith Division.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.—A meeting of the Camberwell Division will be held on Wednesday, March 2nd, when Dr. Hector Cameron, of Guy's Hospital, will give an address on Children.

METROPOLITAN COUNTIES BRANCH: EAST HERTFORDSHIRE DIVISION.—A meeting of this Division will be held at the Hertford County Hospital on Wednesday, February 2nd, at 2.30 p.m. A lecture will be delivered by Dr. John Freeman (London) on asthma from the immunological point of view, at 3 p.m. Each member is asked to invite one non-member.

INSURANCE. CORRESPONDENCE.

Record Cards.

SIR,—The flutter that the record cards have caused is somewhat amusing, but reveals a state of mind in our profession which is not logical.

As to the vast proportion of the insured, I do not think they can grumble at the details of their illnesses being recorded or becoming public property.

As to the profession, it is a pity that those of us who foresaw the probable developments were not listened to. Personally I have always hated the Act.

I must not omit to mention that the record cards have proved valuable to me in one particular. As I see each patient I refer to my batch of cards, and I am surprised to find what a number of patients I have been treating for whom no record card has been provided.

Plymouth, Jan. 22nd.

S. NOY SCOTT.

SIR,—A large medical fund that has several thousand insured members, attended by several medical men, has adopted a method of note-taking that might with advantage be used by private practitioners.

Bradford-on-Avon, Jan. 22nd.

CHAS. E. S. FLEMMING.

The following is a reproduction, reduced in size, of the leaf forwarded by Dr. Flemming:

Table with columns: Name, Address, Date, V, A, C, Clinical Notes, Diagnosis. Includes a signature line for the Doctor.

SIR,—In common with Dr. Mackenzie, I was very glad to read Dr. Bloxsome's letter in the SUPPLEMENT of January 15th.

With a panel of 900 I find the keeping of the records entails very little extra work. Undoubtedly during an epi-

demic the clerical work would assume greater proportions, but epidemics do not last for ever.

The "professional secrecy" question is, I think, much over-rated. Are we not, as a profession, making ourselves ridiculous over this subject?—I am, etc.,

J. PAULLY, M.B., B.S.Lond.

Pulham Market, Norfolk, Jan. 23rd.

SIR,—The medical record scheme is one that is admittedly not desired by the bulk of the panel practitioners or their insured patients.

I suggest that if we are to get this fresh inquisition rescinded we must once and for all pull together and endeavour to get every Panel Committee in the country to put a spoke in the wheel against this Ministerial tyranny.

Liskeard, Cornwall, Jan. 24th.

BRIAN B. METCALFE.

The Annual Conference of Local Medical and Panel Committees held on October 21st, 1920, after discussion passed a resolution to the following effect: While accepting the obligation to keep records in some form...

Medical Benefit.

SIR,—Enclosed is a copy of a letter I am sending to the Minister of Health. The subjects, to my mind, are so important that I think they deserve publication.

A. R. EATES, M.D.

To the Minister of Health.

SIR,—Re doctors' "lists," capitation fees, medical benefit, I beg to make a statement, and to ask if you will be so good as to order an inquiry to be made upon the cases I now bring to your notice.

I am on the panel for the County of London, and am supposed to have a "list" of between 1,400 and 1,500 insured persons; record cards supplied, so far, are woefully incomplete in number.

1. Mr. A., who was taken off, "ceased insurance," as from June 30th, 1919. Since that date A. applied for, and was really in need of, medical aid, which I could not give him as an insured person.

2. Miss B. removed, "ceased" June 30th, 1919; "reinstated" July 10th, 1919. Postcard and letter to Insurance Committee re date of reinstatement secured correction of date to July 1st, 1919.

3. Mr. C. Removed, "ceased" September 30th, 1920, whilst under treatment. After his removal from my list I charged a fee, in accordance with regulations, giving an official receipt.

4. Miss D. Removed, "ceased" September 30th, 1920. Has come up since for treatment, maintains that she has been wrongly deprived of benefit, declines to pay fees, and has been referred by me to the Insurance Committee.

5. Miss E. "Title to benefit not established." Removed September 30th, 1920. Maintains she is in full benefit. Cannot pay fees. Referred to Insurance Committee.

6. Miss F. "Out of benefit" March, 1919. Removed. Has since been attended by me—not charged fees. Maintains she is in full benefit.

to benefit. Am I to charge her fees, and so risk depriving her of treatment of which she is really in need?

7. Mrs. G. Removed, "ceased", December 31st, 1919. Recently came up for treatment as an insured person. Referred to Insurance Committee. Has since been "reinstated," and four quarters' capitation fees have been credited to me. No explanation of this blunder (?). May I here point out, Sir, that had this insured person not come up for treatment when she did, or had my own bookkeeping been as faulty as that of the Government, I should have lost one year's capitation fee? The same observation applies to the other cases mentioned, but who knows to how many others who have not come up for treatment it is applicable?

The last case I would bring under your notice is of a different nature:

8. Mr. E. This man applied to be placed upon my list in March, 1920. He brought his own card and that of his wife. These were signed by me and sent, together with some half a dozen others, to the Insurance Committee on March 24th, 1920. Some two months later the man applied to me for his card—his wife's had reached her. Referred to the Insurance Committee, who, after several applications by the insured person, furnished him with his medical card, placing the man on my list as from July 30th, 1920, thereby depriving me of two quarters' capitation fees.

Many representations by me have failed to get this matter adjusted by the Insurance Committee. Now, Sir, upon what grounds do the Committee justify their action in this case? I sent up the card in March, and it is for the Committee to prove that it was received only in July. And I mean to say that I see no reason why I should suffer for the errors of the Committee.

In conclusion, Sir, I would say that if doctors are prosecuted for alleged frauds upon Insurance Committees and approved societies, I now confidently expect to hear that by your action in the cases I place before you the Public Prosecutor will get busy.—I am, Sir, your humble fellow-servant of the State.

London, W., Jan. 13th.

A. R. EATES, M.B.

Central Insurance Defence Fund.

SIR,—As one who has applied for the return of the balance due to me, might I suggest to my fellow conspirators who are doing the same that the amounts they receive should be handed over to the Royal Medical Benevolent Fund to augment the *endowment*? If half the men ask for a refunding of their money and put it to such a use the endowment of this fine institution would benefit to the extent of about £6,000, and the donors would not feel that their pockets were any the lighter.—I am, etc.,

Bridport, Jan. 20th.

C. EDWARDS, M.D.

"AN OLD KINGSLEYITE" writes: The Secretary has sent a letter to the subscribers to the above fund, saying that it is to be wound up. In brief the chief points are as follows: About £30,000 subscribed; expended, £18,000, for compensation, etc.; balance £12,000. The subscribers are entitled to receive the balance, which may be 12s. 6d. in the £. The Insurance Acts Committee with the Council of the British Medical Association, after careful consideration decided that the balance be transferred to a new trust called the National Insurance Defence Trust. The objects are set forth and are worthy of support. Already I have consulted some of the subscribers, and it is suggested that one-half should be devoted to the Defence Trust and the other divided equally between the Royal Medical Benevolent Fund and Epsom College. Both have special claims on the medical profession; both are in need of special financial help. The British Medical Association for many years, through the active assistance of our late general manager, Mr. Elliston, raised large sums. Some of the subscribers have died; others have removed, and their addresses are lost. Few, if any, would wish to have their subscriptions returned if they knew that these very worthy charities would receive their share.

DIARY OF SOCIETIES AND LECTURES.

LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.—Thurs., 6 p.m., Chesterfield Lecture by Dr. W. Griffith: Parasitic Diseases of the Skin.

MIDDLESEX HOSPITAL MEDICAL SCHOOL.—Emeritus Lectures: Surgeon Rear Admiral Bassett-Smith, Tues., 3 p.m., Mediterranean Fever; Thurs., 3 p.m., Malaria.

ROYAL SOCIETY OF MEDICINE.—Occasional Lecture, Thurs., 5.30 p.m., Prof. F. Hobday: Diseases of Animals Contagious to Man. Section of Surgery: Subsection of Orthopaedics: Tues., 5 p.m., Cases; 6 p.m., Dr. G. Murray Leick: Reactions and Electrical Treatment of Intrinsic Muscles of Foot. Section of Pathology: Pathological Laboratory, University College Hospital Medical School, Tues., 8.30 p.m., Dr. Penfield: Golgi Apparatus in Nerve Cells; Mr. Barrington: Fungus Parasite in Kidney of Rabbit; Dr. Walshe: Encephalitis Lethargica; Dr. Lewis: Demonstrations; Mr. T. W. P. Lawrence: Specimen; Prof. Boycott: Hypertrophy of Haemoglobin. Section of Surgery: Wed., 5 p.m., Cases; 5.30 p.m., Mr. G. L. Edington: Meckel's Diverticulum as a Cause of Intestinal Obstruction. Section of Obstetrics and Gynaecology: Thurs., 8 p.m., Mr. F. C. Pybus: Tuberculous Peritubal Cyst; Dr. T. W. Eden and Mr. F. L. Provis: X-ray Treatment of Fibroids and Chronic Metritis. Section of Laryngology: Fri., 4 p.m., Epidiascope Demonstrations and Cases. Section of Anaesthetics: Fri., 8.30 p.m., Dr. Rowbotham and Dr. I. Magill: Anaesthesia in Plastic Surgery.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Victoria Infirmary, —Wed., 4.15 p.m., Mr. Parry: Surgical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thurs., 4 p.m., Dr. W. J. Pearson: The Premature Child.

LONDON LOCK HOSPITALS.—Clinical instruction daily. Lectures: (Male Hospital, Dean Street) Mon., 5 p.m., Mr. Gibbs: Complications of Prostatic Urethritis; Tues., 2.30 p.m., Mr. McDonagh: Nervous Syphilis; 5 p.m., Mr. Juler: Venereal Diseases of the Eye; Wed., 4.30 p.m., Mr. Joly: Acute Gonorrhoea in the Male; Fri., 4 p.m., Mr. Abraham: Gonorrhoeal Rheumatism.

MANCHESTER BABIES' HOSPITAL.—Sat., 3.30 p.m., Dr. Chisholm: Treatment of the Premature Child.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Mr. C. Roberts: Hernia.

MANCHESTER: ST. MARY'S HOSPITALS (Whitworth Street West Branch)—Fri., 4.30 p.m., Dr. Fothergill: Physical Signs in Abdomino-pelvic Surgery.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland Street, W.1.—Mon., 5.30 p.m., Dr. Goodall: Cardio-analysis.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Daily (except Wed. and Sat.), 2 p.m., Out-patient Clinics. Lectures—3.30 p.m., Mon., Dr. Greenfield: Cerebro-spinal Fluid; Tues., Dr. Collier: Headache; Thurs., Dr. Buzzard: Neuritic Affections. Demonstration of cases, Fri., 3.30 p.m.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Daily, 2 p.m., In- and Out-patient Clinics, Operations, etc. Lecture-demonstrations.—Mon., 4.30 p.m., Mr. Tanner: Surgical Cases; Tues., 3 p.m., Mr. Hayton: Vincent's Angina; Wed., 4.30 p.m., Dr. Alexander: Thyroid Insufficiency; Thurs., 3 p.m., Mr. Carson: Surgical Cases; Fri., 3 p.m., Mr. Gillespie: Cases of Surgical Interest.

SALFORD ROYAL HOSPITAL.—Thurs., 4.30 p.m., Mr. Jefferson: Gall Stones.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Lectures—5 p.m., Mon., Dr. Saunders: Digestive Disturbances of Adults; Tues., Dr. Burnford: Morbid Anatomy of Digestive Tract; Wed., Mr. Armour: Abdominal Tumours; Thurs., Dr. Strangeways: Rheumatoid Arthritis; Fri., Mr. Baldwin: Appendicitis.

OFFICES AND LIBRARY, 439, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London).

Telephone number for all Departments: Gerrard 2630 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

JANUARY.

28 Fri. London: Central Ethical Committee, 2 p.m.

FEBRUARY.

1 Tues. London: Grants Subcommittee, 9.30 a.m.
London: Propaganda Subcommittee, 10 a.m.
London: Organization Committee, 11 a.m.

2 Wed. London: Finance Committee, 2.30 p.m.
East Hertfordshire Division, Hertford County Hospital, 2.30 p.m. Lecture, 3 p.m.

4 Fri. London: Medico-Sociological Committee, 2.30 p.m.
London: Naval and Military Committee, 2.30 p.m.

16 Wed. London: Council, 10 a.m.

APPOINTMENTS.

DAVIDSON, Maurice, M.A., M.D. Oxon., M.R.C.P. Lond., Assistant Physician, Brompton Hospital for Consumption and Diseases of the Chest.

STRETTON, John Weston, F.R.C.S. Eng., B.Ch. Cantab., Honorary Surgeon, Kidderminster Infirmary and Children's Hospital.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning.

BIRTHS.

QUINLAN. On January 20th, at Stanley House, South Reddish, Stockport, the wife of W. T. Quinlan, M.R.C.S., L.R.C.P., of a son.

WATSON. On January 18th, at 33, High Street, Sheerness, the wife of F. H. Watson, M.B., B.Ch. Cantab., of a son.

IN MEMORIAM.

DYER.—In ever loving, proud, and grateful memory of Francis N. Y. Dyer, M.A., M.B., B.Ch. Cambridge, M.R.C.S., L.R.C.P. Lond., Captain R.A.F., late Surgeon R.N., who died of scarlet fever at the London Fever Hospital on January 24th, 1920, where he was Assistant Medical Officer, aged 26, the very dear and only child of Mr. and Mrs. Dyer, East Parade, Harrogate.

CURRENT NOTES.

Draft Regulations under the Dangerous Drugs Act.

FURTHER study of the draft Regulations made by the Home Office under the Dangerous Drugs Act of 1920 shows that the first impressions of the far-reaching effect they must have on the work of the medical practitioner, if put in force unmodified, were by no means exaggerated.¹ Four separate books will have to be kept at each surgery or branch surgery: one for cocaine and eegonine, one for morphine, one for heroin, and lastly, one for medicinal opium, and in each case for the substances containing them. In these books must be entered the details of all transactions in these drugs whether incoming or outgoing. Moreover, the entries must be made on the day on which any transaction in them takes place. The books must be open to inspection at any time. As the regulations now stand it would seem clear that entries must be made whenever a hypodermic injection of morphine is given or a morphine suppository is administered.

Apart from the great inconvenience and expense which these regulations will cause to bona fide patients who require medicines containing these drugs, serious objection will be raised by doctors who dispense their medicine to the requirement that the total amount of the drug in the package or bottle (and in case of solutions the amount and percentage of the drug in the solution) must be stated on the label of the bottle or package containing preparations of the drugs in question. The psychological effect of this requirement on many patients, like most other practical points connected with prescribing and dispensing, has been overlooked or ignored by the draftsman.

The British Medical Association obtained a copy of these draft regulations as soon as they were available, and no time was lost in sending a protest to the Home Office. Detailed criticism has been now sent in by the Medico-Political Committee, but individual practitioners can materially assist the campaign for modification of the regulations by writing to the Home Office urging that

the regulations should be held up until there has been consultation with representatives of those chiefly affected by them.

Fees for Cases of Miscarriage and Abortion.

The Association, when trying to assess what would be an adequate fee for attendance on cases of miscarriage and abortion for medical men called in on the advice of midwives, found some difficulty in arriving at a reasonable flat-rate fee in the absence of any data as to what proportion of such cases were really difficult. The fee fixed by the Ministry of Health is one guinea, with a further guinea if an anaesthetist is required. In order to obtain data in the event of future negotiations the Medical Secretary invites practitioners who keep a record of such cases to inform him of the number of cases of this kind to which they are called, and their character—stating whether they are difficult, taking up much time, and giving other particulars. If a sufficient number of examples could be collected it might be possible to determine what flat rate could be considered adequate.

Salaries of University Teachers and Professors.

A special subcommittee is at present engaged in considering the question of the salaries of members of the medical profession who are professors and teachers at university and teaching schools. This subcommittee has the advantage of the assistance of representatives of the Association of University Teachers, and hopes soon to be in a position to report, through the Medico-Political Committee, to the Council in order that a scale of salaries may be submitted to the Representative Meeting for its approval.

The Half-Yearly Indexes.

The usual half-yearly indexes to the JOURNAL and to the SUPPLEMENT and EPILOGUE have been prepared and printed. They will, however, not be issued with all copies of the JOURNAL, but only to those readers who ask for them. Any member or subscriber who desires to have one or all of the indexes can obtain what he wants, post free, by sending a post-card notifying his desire to the Financial Secretary and Business Manager, British Medical Association, 429, Strand, W.C.2. Those wishing to receive the indexes regularly as published should intimate this desire.

¹ See BRITISH MEDICAL JOURNAL, January 15th, 1921, p. 36; SUPPLEMENT, January 29th, 1921, p. 25.

Meetings of Branches and Divisions.

WILLESDEN DIVISION.

Maternity and Child Welfare Work.

At a meeting of the Willesden Division, which was held on January 18th, with Dr. J. S. CRONE, J.P., in the chair, an address was given on the subject of maternity and child welfare work, by Dr. CHRISTINE MURRELL. Two main points, she said, needed consideration:

- (1) What was done at clinics and did it need to be done?
- (2) If this was to be done, what was the best way?

The nature of the work was (i) preventive, (ii) curative, (iii) both combined, and the people dealt with were (a) infants, (b) children, (c) mothers.

In regard to the preventive work, often known as consultations, so far as (a) infants was concerned, this was new work. The Registrar-General's statistics, when first the mortality at various ages was worked out, showed variations between 30 and 130 per 1,000 births. The highest mortality was found in towns and the lowest in rural areas. So enormous a difference pointed to many preventable causes, such as housing and sanitation, both very important, and ignorance in mothercraft—due largely to compulsory education, which took the children out of the home during the ages when they would in the past have absorbed almost unconsciously the way in which to bring up healthy children. This pointed to a need for advisory work. Moreover, the whole range of medicine was permeated by the preventive spirit, a change much to be welcomed; all now recognized the value in health—as in other things—of a stitch taken in time. The value of the awakening of the spirit of competition and interest in the mothers at the consultations, whose life-work was otherwise done in almost complete isolation, was found to be of great value. In the past this work was not done by the general practitioner or obstetrician, and only occasionally by the children's specialist.

The result of the work that has been done was seen in a real lowering of the mortality rate, although undue claims were sometimes made. Increase of health in survivors was shown markedly in the lowered incidence of rickets. Opponents sometimes claimed that patent foods were too much pushed at consultations, but on the contrary, the value of breast feeding was strongly emphasized. The doctor had increased opportunity of observation of infant life and of gaining knowledge in infant feeding. Preventive work, so far as (b) children, was concerned, has already been almost universally adopted in the form of school medical inspection; while the preventive work for (c) mothers was gradually being introduced in the form of ante-natal clinics.

On the other hand, in regard to curative work, this was carried on in infant clinics, in school clinics, and in maternal clinics where both ante- and post-natal work was done. These ranked like the out-patient departments of hospitals and should be dealt with on the same lines. The question as to whether preventive and curative work could advantageously be combined at the same clinics had been much debated. There was no doubt that such a method was most convenient for the patients, saving considerable time; but the originators of the preventive work opposed the combination, as they feared under such a system the curative work would tend to dominate the situation and the preventive be allowed to slide. Dr. Murrell considered that this work was worth doing, but even those who did not agree would probably admit that it was almost certain that it was going to be done. On the point, therefore, of how it should be done it was useless for the profession to criticize schemes put forward unless they had a definite alternative to propose.

There were, she considered, three chief methods of carrying on the work: (1) The present basis, under which the initiative was left to voluntary philanthropic effort, as so frequently happened in British public life. Practically all the preventive work was started in this way, and for this the public was deeply indebted to the originators, but it was too cumbersome as a permanent method. (2) The work might be taken over completely by the local health authority. The disadvantages for the general public was that there was a tendency for the work undertaken in this way to become bureaucratic, and to suffer from a loss of elasticity which was so necessary in medical work. For the profession the disadvantage was that up to the present it had been taken for granted that when anything medical whatever was undertaken by the local health authority it must necessarily be placed under the M.O.H. This was unfair to him, and a retrograde step from the scientific point of view of medicine. Whereas the whole tendency of medicine as knowledge increased was to specialize more and more, here the reverse method was adopted when a medical officer, appointed chiefly for his executive and public health qualifications, was asked to take on the direction of clinical work. In actual practice, it generally drifted into the hands of a junior whole-time medical officer less experienced in the work under his control than the men who had to work under him. This objection might possibly be met by the appointment of a Clinical Medical Officer to the local health authority, who would not be under the M.O.H., but would work side by side with him. (3) The local profession should undertake the work, working in close collaboration with the local health authority.

This method from the administrative point of view was slightly more cumbersome, and in the initial stage would certainly be more difficult, but in Dr. Murrell's opinion it was the best.

The advantages for the general public were that they would get, she believed, what they wanted—namely, personal touch in their dealings with the doctor, and elasticity for meeting local conditions. For the profession the gain was that (1) the professional relationship between all the doctors of a district, which was always a matter needing delicate adjustment, would be much better arranged under such professional control; (2) the relation of the doctor and nurse, which under the local health authority's scheme was apt to be unsatisfactory, would be maintained on its usual professional lines; (3) the divorce between work at the clinic and home visiting could be much reduced, and the relationship of the clinic doctor and the usual medical attendant (when they were not actually the same) remain as close as that between the throat and ear or eye specialist and the general practitioner.

The difficulties, not disadvantages, would be found chiefly in organization and administration. A committee could be formed on the lines suggested in the Dawson Report—namely, a big local health committee with the public health committee of local health authority as its nucleus, and due representation of the local profession, with probably two subcommittees, one lay and the other professional, working in the same relation to each other as the medical and general committees of a general hospital. The clinics, either isolated or as branches of a larger health centre, would receive financial grants from the local health authority, a condition for such grants being that the work reached a required standard. The grants would need careful adjustment, but some such demarcation might possibly be adopted as (a) a grant covering the whole cost, in the case of patients of the insurance level, and (b) partial (for example, equipment expenses, etc.), for patients above the insurance level. In this way also the appointment of whole-time medical officers would be avoided. The appointment of such officers, in Dr. Murrell's opinion, was not fair either to the public or to the officers themselves. Advisory work could not be done well by people who had never had clinical experience, and who were unaware of the home conditions, and therefore suffered from loss of perspective in all their work. Also, for such officers there were very few posts for seniors in their branch of work, and the work itself unfitted them for any other branch of medicine, and those who did not get good promotion were in a few years' time in a sorry case. The most important point was that if the public was to get good clinical medical service the work should be under the control of a medical officer with clinical experience.

Discussion.

After an expression of thanks to Dr. Christine Murrell a discussion followed, in which Drs. SKENE, CORAM JAMES, RAWES, SCOTT, WILSON, and others took part. It was agreed that maternity and child welfare work was bound to progress, and that it was desirable to secure the right of every local practitioner to participate in the work of the clinic if he so chose. It was pointed out that the British Medical Association, and also the Ministry of Health, as instanced by the annual report of the Chief Medical Officer, Sir George Newman, were against a whole-time salaried State medical service. The fact was also referred to that the medical inspection and treatment of school children had originally been carried out by the local practitioners.

Dr. G. C. ANDERSON, Deputy Medical Secretary, British Medical Association, was present at the meeting, and, on being asked to speak, said that the maternity and child welfare question had come to the forefront at perhaps an unfortunate time from the professional point of view, namely, when most general practitioners were serving with His Majesty's Forces, and the general practitioner in many localities felt that they were now placed at a disadvantage in having to deal with what practically amounted to an accomplished fact. The views placed before the meeting by Dr. Murrell were practically the policy of the Association in the matter. It would appear that the only solution to the many problems connected with the medical services undertaken by local authorities was action along the lines of the Report of the Consultative Council. If the profession did not support that Report it might find itself faced with a whole-time salaried State medical service. Referring to the replies of some Divisions to the questions recently circulated by the Association on the Consultative Council's Report, to the effect that the whole idea was far too costly to have put into operation, Dr. Anderson said that the costliness of the complete scheme was admitted by everyone, but the proposals in the Report were intended to be a foundation upon which to build, and it was not necessary that the whole should be put into operation at once. He suggested that the local profession should adopt the proposals of the Report, with a view to securing that the local health services should follow upon the lines thereof, as he felt that the proposal of the Report constituted the great hope for the general practitioner, and it was upon the general practitioner that the health of the community rested.

LANCASHIRE AND CHESHIRE BRANCH: MID-CHESHIRE DIVISION.

THE annual meeting of the Mid-Cheshire Division was held at the Altrincham Hospital on January 18th. Dr. COX, O.B.E., the Medical Secretary, who was accompanied by Dr. Garstang, the Chairman of Representative Meetings, was present, and gave an address entitled: "The claims of the British Medical Association on every section of the medical profession." Dr. Cox developed the subject of his address under the various headings of "consultants," "whole-time medical officers," "the Services," and "the general practitioners," and made out a strong case for the claims of the Association on each of these sections of the profession. He subsequently dealt fully with a number of questions put to him by members.

BLACKPOOL DIVISION.

A MEETING of practitioners of the Blackpool Division, presided over by Dr. McCANDLISH, was held on January 20th when Dr. COX, Medical Secretary, and Dr. GARSTANG, Chairman of Representative Meetings, addressed the meeting.

Dr. COX spoke fully on the claims of the British Medical Association on every branch of the profession, and Dr. GARSTANG dealt with matters of organization and the method of electing the Council. In the discussion which followed, a severe criticism was passed on certain phases of the policy pursued by the Association.

On the motion of Dr. BARTON, seconded by Dr. STEWART, the following resolution was adopted with one dissentient:

That this meeting of medical practitioners of the Blackpool Division strongly condemns the British Medical Association for the feeble and ineffective action invariably taken when dealing with matters affecting the welfare of the profession.

A cordial vote of thanks, proposed by the CHAIRMAN and seconded by Dr. BARTON, was accorded to Drs. COX and Garstang for their attendance at the meeting.

There were twenty-one practitioners present at the meeting, ten of whom were members of the British Medical Association and eleven non-members. Dr. COX and Dr. GARSTANG expressed satisfaction with the interest that had been shown by the meeting, but regretted that members could vote for a resolution which condemned the Association for whose policy they were partly responsible. The hope was then expressed that these gentlemen would again visit the Division.

WARRINGTON DIVISION.

THE annual dinner of the Division was held at the Mirmarleigh Café, Warrington, on January 20th, when Dr. FERGUSON presided. There were twenty-two present, including members and non-members. The CHAIRMAN having proposed the Royal toasts, that of "The Army and Navy" was proposed by Dr. PEACOCKE and responded to by Dr. LEITH MURRAY (Liverpool) and Dr. TASSER, M.C. The toast of "The British Medical Association" was proposed by Mr. HEDLEY TAYLOR, and Dr. J. B. NADEN, J.P., responded. "The Visitors" was proposed by Dr. JOHNSTONE, and Dr. RATCLIFF-GAYLARD replied. Dr. FOX, J.P., proposed the toast of "The Ministry of Pensions," which was responded to by the HONORARY SECRETARY, and that of "The Chairman" was proposed by Dr. LEONARD. Amongst the guests were Dr. Ramsbottom, Mr. Roberts (Manchester), Dr. Leith Murray (Liverpool), Dr. Ratcliff-Gaylard (Birkenhead), Dr. S. E. Critchley, with Mr. Tasker (Carnarvon), Mr. Hedley Taylor and Mr. Forster. Mr. Thelwall Thomas (Liverpool), Professor J. W. Smith (Manchester) and others were unable to be present.

Association Notices.

MEETING OF COUNCIL.

THE next meeting of Council will be held on Wednesday February 16th, in the Council Room, 429, Strand, London, W.C.2, at 10 a.m.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, require to be published in the BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary not later than April 30th.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.—A meeting of members of the Division will be held to-day, Friday, February 4th, at 4 p.m., at 326, Brownhill Road, Catford, S.E.6.

CENTRAL MIDWIVES BOARD FOR SCOTLAND.

THE Scottish Board of Health has announced this week the constitution of the Central Midwives Board for Scotland as from February 1st, 1921, under the terms of the Midwives (Scotland) Act, 1915. The members appointed, with the bodies appointing them, are as follows:

Miss A. H. Turnbull; Miss I. L. Scrimgeour, Miss K. L. Scott. By the Scottish Board of Health.

Sir A. Buchan Hepburn, Bt. By the Association of County Councils for Scotland.

Sir Robert Cranston, K.C.V.O. By the Convention of Royal Burghs of Scotland.

Dr. James Haig Ferguson (Edinburgh). By the Queen Victoria Jubilee Institute for Nurses (Scottish Branch).

Dr. A. Campbell Munro. By the Society of Medical Officers of Health of Scotland.

Professor J. A. Kynoch, M.B. (St. Andrews). By the University Courts of the Universities of Edinburgh and St. Andrews.

Professor Robert Gordon McKerron, M.D. (Aberdeen). By the University Courts of the Universities of Glasgow and Aberdeen.

Dr. Robert Jardine (Glasgow). By the Royal College of Physicians of Edinburgh; Royal College of Surgeons of Edinburgh; Royal Faculty of Physicians and Surgeons of Glasgow.

Dr. Michael Dewar (Edinburgh); Dr. E. H. L. Oliphant (Glasgow). By the Scottish Committee of the British Medical Association.

* Midwives practising in Scotland.

GENERAL MEDICAL COUNCIL.

MEDICAL REGISTRATION.

ONE of the periodical revisions of a part of the *Medical Register* is being made, and practitioners are being circularized by the Registrar of the General Medical Council for purposes of inquiry as to whether they have ceased to practise or have changed their residences. It is of great importance that this inquiry should be answered without delay by the practitioners concerned, and if for any reason a permanent address cannot be given, some other should be supplied to which official communications can be directed. The responsibility of keeping his address correct rests with the practitioner, the *Medical Register* being the official book in which alone the entry of a name confers any legal privileges, and it must not be confused with any of the directories which issue circulars every year. Unless a practitioner's name continues to appear upon the *Medical Register* he is not entitled to recover charges in a court of law; he is not entitled to hold public appointments; nor is a certificate, as required by law, valid unless the practitioner's name be on the *Register*—points that are sometimes overlooked. With this circular from the Registrar, is enclosed a copy of certain important notices from the General Medical Council reiterating its resolutions upon forms of professional misconduct. The importance of a practitioner making certain of the exactitude of every certificate he may write is again emphasized, and as under the Midwives Act (Scotland) of 1915 the provisions of the Midwives Act of 1902 is extended since that date to Scotland (forbidding any woman "habitually for gain to attend women in childbirth otherwise than under the direction of a qualified medical practitioner, unless she be a certified midwife"), it is again pointed out by the Council that, in accordance with this recent enactment, medical practitioners must not knowingly enable uncertified women, under the pretence that such women are under their direction, to attend women in childbirth contrary to law.

REGISTRATION OF MEDICAL STUDENTS.

THE General Medical Council draws attention to the fact that on and after January 1st, 1923, all those who desire to be registered as medical or dental students will have to produce evidence that they have attained the age of 17 years, and the minimum standard of general education required will be that of university matriculation or entrance examination. Before registration as a medical student every applicant will be required to have passed, in addition to the examination in general education, an examination in elementary physics and elementary chemistry, conducted or recognized by one of the licensing bodies. A student who has attended an approved course of instruction in elementary biology at a secondary

school or other teaching institution recognized by a licensing body may be admitted to the professional examination in elementary biology immediately after his registration as a student.

INSURANCE.

DISTRIBUTION OF FUNDS.

A REPORT, dated December 30th, 1920, has been made by the Committee appointed by the Minister of Health to advise as to the basis on which, and the proportions in which, the funds available for remuneration of insurance practitioners for the treatment of insured persons and for mileage should be distributed amongst the Insurance Committee areas in England and Wales.

Central Practitioners' Fund.

The first part deals with the distribution of funds available for treatment. The revised apportionment recommended for 1920 is set out in an appendix. In the main this has been made on the basis outlined in the Committee's previous report dated November 26th, 1919, but the data available in respect of 1920 have been taken into consideration. The apportionment of the fund for 1921 has been considered on similar lines to those adopted for the provisional apportionment for 1920, and the basis on which, in the Committee's view, the respective shares of the several committees should be calculated is shown in a second appendix. In re-examining the 1920 distribution it became apparent that, though the final results were generally in close relation to the figures provisionally adopted, the situation had not yet reached a state of equilibrium after the serious disturbances during the war and during demobilization. Accordingly the Committee recommends that the distribution for 1921 set out in Appendix II should be regarded as provisional only, and should be reviewed towards the end of this year.

Central Mileage Fund.

In its former report the Committee proposed that this fund should be divided into two parts, namely:

(a) That portion required to meet the risks of a country practitioner which can properly be measured with reference merely to distance travelled; and

(b) The remainder to provide additional remuneration where the difficulties of the district are of an exceptional character, and therefore involve extra expense and/or loss of time not met by a grant on the ordinary basis of distance.

A grant of £300,000 having been made for 1920, its distribution was considered in detail. The first question was, What proportion of the total fund should be allotted under (b), in addition to any payments under (a), to districts presenting aspects of special difficulty, and such Insurance Committees as held themselves entitled to participate in this portion of the fund were invited to submit claims. These claims in England were examined by medical officers of the Ministry of Health, who consulted together as to a common standard. The areas were then visited by a medical officer. As a result of these investigations the Committee received reports as to the difficulties facing insurance practitioners in certain parts of the country. In the case of Wales reports were received from doctors in rural areas, and these were in the first place examined in detail by the Welsh Board of Health.

The claims received from the several areas showed much diversity. The main difficulties presented were the necessity of walking over rough country—such as mountain, marsh, or fen—severe gradients, and winter conditions. The Committee now concludes that a larger portion than 5 per cent. of the total fund should be reserved for these difficult areas, and it recommends that £34,900 should be allotted to committees for supplementary payments in respect of difficulties of an exceptional character. As regards the main portion of the Mileage Fund, the Committee recommends a distribution at the rate of 2s. 4d. a unit on the basis of the returns made. The resulting amounts so allotted to committees are set out in Appendix III.

As regards the Mileage Fund for 1921, the Committee recommends that 85 per cent. be provisionally taken as representing the main portion of the fund for the purpose of making quarterly advances to committees on the basis of their unit returns, and that provisional advances be made to the difficult areas, as set out in Appendix III. The closing paragraph of the Report is of special importance:

"It is desirable to draw attention to the difficulties under which your Committee have laboured, so far as the distribution of the Mileage Fund is concerned, owing to the inadequacy of the response on the part of insurance practitioners in England to the Ministry's request for returns. It cannot be too strongly pressed on the profession that it is solely in the interests of the practitioners themselves that the fund should be equitably distributed, and that unless the necessary particulars are furnished by the doctors individually, there is a possible risk of an unequal and anomalous distribution."

MEDICAL RECORDS IN SCOTLAND.

THE following letter has been received by the Scottish Insurance Acts Subcommittee from the Board of Health:

Scottish Board of Health,
83, Princes Street, Edinburgh.
January 7th, 1921.

SIR,

I am directed by the Scottish Board of Health to state that they have had before them the question raised at the recent conference with representatives of your Committee as to refunding to practitioners the cost of postages incurred in connexion with the new medical record procedure to be commenced as from January 1st, 1921. The Board understand from what passed at the conference that a similar question has been raised with the Ministry on behalf of English practitioners.

The Board have given the matter their careful consideration, and they desire to draw the attention of your Committee to the two following points of national difference, namely:

1. The obligation laid upon practitioners in Scotland in terms of the First Schedule to the Medical Benefit Regulations, 1920, is defined as follows, namely: "A practitioner is required to furnish records of the diseases of his patients and of his treatment of them in such form as the Board may from time to time determine." There is therefore a definite obligation on practitioners to send records to Insurance Committees without special remuneration therefor. The Board observe that the corresponding provision in the English Regulations requires the practitioner only to keep such records.

2. In Scotland the obligation of the practitioner to keep medical records is restricted to the recording of certificates of incapacity issued and furnishing an annual summary thereof. The record card adopted for use in England requires the recording by the practitioners of every attendance and visit on his insured patients. The Board are of opinion that the amount of clerical work devolving upon the Scottish practitioner is definitely less than that of the practitioner in England.

Apart from the foregoing considerations the Board desire to add that on the information before them they are unable to regard as reasonable the contention that the annual cost to practitioners is sufficient to justify any special payment. Practitioners should transmit these records to Insurance Committees along with their weekly consignments of medical cards, etc., and in the view of the Board such a method would not involve the practitioner in any appreciable additional expense. The Board are of opinion that no case has been made for any special payment to practitioners.

I am, Sir, your obedient servant,
(Sgd.) H. L. T. FRASER,
Assistant Secretary.

The Subcommittee, at its meeting on January 25th, decided that it could not accept the Board's interpretation of the regulation in this respect, and resolved to advise practitioners not to transmit records to Insurance Committees until arrangements are made for reimbursement of the expenses incurred.

CORRESPONDENCE.

The Medical Guild on the Interim Report of the Scottish Consultative Council.

SIR,—Its public utterances suggest that the Guild's chief end is to vilify the Act and enjoy it forever. Its misfortune is to rest oblivious of the fact that a public problem was put to the medical profession for solution in 1912 and that an analogous problem is put to it now. The problem in 1912 was to place at the service of the employed such medical aid as might be necessary in the prevention and cure of personal illness, and the problem now is to put the same aid at service for the wives and children in the same section of the population. The Consultative Council in their Report recommend as the function of the State "organizing" and "supplementing existing arrangements," and, as a first step, "unification of local authorities concerned with health." As the principle of organization, other than this, they recommend "the family as the normal unit and the family doctor as the normal medical attendant" and as the mediator of any auxiliary health agencies. The rest of their recommendations deal with individual deficiencies, and suggest modes in which they may be met when it is practicable to do so.

On this report the Medical Guild has issued a memorandum with the title "A State socialistic scheme of

medical service for Scotland." In this memorandum of twelve paragraphs the most important statements are either false in fact or false in suggestion. The third paragraph opens: "That the Insurance Act has been a failure from the public health point of view has not been seriously questioned." This is a very serious matter, and if the Medical Guild will face it and apply the methods of science to disentangle the influence of the Act among the conditions of public health since 1913, some discoveries await them. The only test, so far, which has the Act as the main factor in its results is the valuation of the funds for sickness benefit now in progress.

This assertion as history is followed by five paragraphs in which practically each statement is false in suggestion. "The family doctor is to be a State doctor," "The patient a name in a departmental directory," "The wishes of the patient and his family will have no place in a scheme of this kind," "The scheme assumes that the family practitioner is an ignorant and incompetent person, and that there is no second medical opinion or help available for cases in which it is required." This, which is almost more than suggestion, is followed by words that imply that in the days before the Insurance Act no one ever lacked a consultation or laboratory assistance. Happy Edinburgh! Were there no citizens whose economic defect was not covered by medical charity?

The ninth paragraph says "there is no attempt to estimate the cost of this scheme." This statement is quite true; but, as the recommendations of the report are not devised for this year or next, and may, indeed, be forwarded where and when practicable, the Advisory Council would have been even less wise than their critics had they attempted such an estimate, and we may leave its omission to balance the fact that the cost of the absence of the scheme is a no less real charge on the community than the cost of its fulfilment, and that the cost of its absence is collected in illness of those who cannot help themselves and in days of work lost from unfitness that might be prevented.—I am, etc.,

Dundee, Jan. 31st.

R. C. BUIST.

Mileage Records.

SIR,—A circular letter has been sent round from the Ministry of Health to doctors who were selected to keep these records, intimating that records are wanted for a complete year. As one of the doctors keeping a record of travelling in a typical rural area in North Northumberland, I would draw attention to a statement in this circular letter. It is this:

"It will be appreciated that the records already available, which have been kept for the most part under summer conditions only, might be misleading if not checked by further returns obtained in respect of winter months."

Apparently it is assumed that from looking at our mileage records, the difference between summer and winter travelling can be gauged, and I wish to show that it cannot be, for the number of miles will not do it.

It goes without saying that winter travelling is heavier upon both the man and his machine, but I question whether we country doctors travel on an average many more miles, if any more, in winter than in summer. We may have fewer patients in summer, but for all practical purposes we have to visit the same villages and outlying places with the same regularity all the year round. During winter we get more walking to do; we have to walk to places we motor to in summer. Lately, for instance, although we have not had snowstorms yet, we have had excessive rains and floods and gales. Four times this winter I have had to travel eight or nine miles round about to places four miles away owing either to flood water or fallen trees. A medical neighbour of mine recently, in order to reach his home nine miles away, tried three different roads, and was stopped on every one, and he took three hours and made a roundabout journey of fifteen miles to get there during a night of wind and rain. Now, Sir, I wish to point out that these, to us, very serious matters do not appear in our mileage records. We simply put down a certain number of miles day by day, the number of visits to insured and to uninsured persons, and nothing more.

Nothing is recorded of the difficulties, the nature of the roads here in winter, nor the time taken up. Frequently I am absent on a journey perhaps five hours distance, say, twenty miles—and visited not more than four or five people, and have spent two or more hours walking over fields, moors, or impassable roads. Reading our record figures for mileage must be like looking at a map of the district; they give no idea of the labour and time involved in making just a few visits. Now this is what we have to do almost daily through our long North Country winter,

even when we have no snow. When we get our snowstorms we may have to leave our cars behind and walk home—as I had to do last week, but because of flood water I left it at a farm and walked three miles home in the pouring rain. I am sure many country practitioners have a worse time than I have, but these (so-called, or mis-called) mileage returns show nothing of all this, and my claim is that they should. We country doctors do not grumble so much at the miles as such, but at the awful difficulties and the great length of time involved in getting through our country work.—I am, etc.,

Felton, Northumberland, Jan. 23rd.

ROBERT A. WELSH.

Overlapping Ministries.

SIR,—I desire to bring to the notice of the British Medical Association a condition of affairs in regard to a panel patient of mine which I consider calls for some explanation.

The patient presented himself to-day to me for medicine, which he alleged the Pensions Clinic for Dysentery, at Oxford, suggested he should do. He has been attending the clinic for five months. This is the first and only intimation I have had that the patient was attending such a clinic.

The point I desire to bring forward is, that if a department of State intervenes between patient and doctor in the rôle of consultant or what not, it is only right that some intimation should be given to the medical man whose patient he is, if only from the point of view of courtesy, whereas a helpful co-operation in elucidating the case and transmitting laboratory results or suggestions of treatment would be welcome.

I feel that there can be but little semblance between the established etiquette of private practice and that of insurance practice under a State department, in the instance I am quoting.—I am, etc.,

Baubury, Jan. 21st.

A. ALAN FORTY.

** The British Medical Association has on several occasions drawn the attention of the Ministry of Health to the overlapping of work as between that department and the Ministry of Pensions. A further representation upon this matter has now been made to the Ministry of Health.

Evening Surgery.

SIR,—On January 25th we received the following communication from the Insurance Committee for the County of Cambridge:

Dear Sirs,

I am directed by my Committee to inform you that they have had under consideration the surgery hours of doctors (Clause 8 (3) of the First Schedule to the Medical Benefit Regulations, 1920), and resolved that all panel doctors who have not hitherto arranged for evening surgery hours be asked to arrange for same forthwith.

My partner and I have been in practice here for some twenty-five years and have never had any evening surgery, although, of course, we have not refused to attend to any message that may have come in the evening.

Why should doctors be called upon to give up their evenings? The so-called working classes leave off work earlier than they ever did; then why should doctors work more hours? The working classes (if hard work is the qualification for inclusion in the term "working classes," surely doctors have a right to be included) have their half-day a week, their Sundays, and bank holidays—privileges which the doctors do not enjoy.

I was under the impression that panel patients were to be given a free choice of doctors. Panel patients know quite well what doctors have an evening surgery and what doctors have not, so surely they have no cause of complaint if they deliberately select a doctor who has no evening surgery.

If, then, there be no cause of complaint, why should the Insurance Committee order doctors to alter their arrangements forthwith? The question is, Have the Insurance Committees power to make such an order?—I am, etc.,

Royston, Jan. 31st.

C. F. WIGHTMAN.

A Curt Warning.

SIR,—The following extracts from an Insurance Committee circular may be of interest to insurance practitioners. It is in reference to "cases of apparently inadvertent breaches by doctors of the certification rules," and proceeds:

"It is considered that practitioners attending insured persons on behalf of the Committee should now be well acquainted with them, that infringements of them expose a doctor not only to

censure but to monetary penalty, and that such censure and penalty may be looked for in the case of any future irregularities."

It is not difficult to foresee the day when we shall receive similar circulars in reference to our weekly or monthly returns of sick and injured, including cases of P.U.O. and N.Y.D.—I am, etc.,

H. G. LANGDALE-SMITH,

Stechford, Jan. 31st.

The New Motor Taxation.

SIR,—Is the medical profession taking the new motor taxation without a protest? I for one—and there must be hundreds like me—feel the great injustice, and hope that something will be done to remedy a great wrong.

In 1914 I bought an Overland because I could not afford a better. It served my partner while I was with the B.E.F., and I am still using it, not being able to afford another. Now instead of a £5 3s. tax I have to pay £28.

My income is about £1,000 a year (can be verified by income-tax returns), and I have four children, all at school, the eldest 15. My bachelor doctor friends, who are, I dare say, making more money than I am, can afford to buy up-to-date cars with smaller cylinders and a supposed lesser horse-power and they get off with a lighter tax. Where in the name of conscience is the justice?

Can nothing be done for men in my position by our parliamentary representatives, or must we be utterly crushed? Were I not a doctor I would not be able to afford a car, and I can honestly say I do not use it a dozen times a year for pleasure only.

This tax is extortionate. Our cheap cars are going to be millstones round our necks. Why did we get a half-tax concession before and now have to pay the same as a millionaire and the man who simply keeps a car for pleasure?—I am, etc.,

Sandiacre, Notts, Jan. 21st.

CHARLES S. VARTAN.

* The British Medical Association has met the Minister of Transport on several occasions in an effort to obtain some remission of motor-car taxation for medical men. On the third occasion the Association pointed out at a deputation that in its opinion a flat-rate tax on petrol would be preferable to the £1 per horse-power tax. The Minister refused to make any concession and stated that as commercial cars were now being taxed no case could be made out for a concession to any section of the community. Details of action taken by the Association in this matter have appeared from time to time in "Current Notes," in the SUPPLEMENTS of May 1st, May 8th, May 29th, and July 19th, 1920, and also in the JOURNAL of May 15th, p. 685.

Central Insurance Defence Fund.

SIR,—Like many others I had filled up my reply, claiming the balance for myself. Dr. Edwards's suggestion in last week's SUPPLEMENT meets with my heartiest approval, and I hope others will write to Dr. Cox, the Secretary of the Fund. Dr. Cox has assured me that he will see that the subscribers' wishes are carried out, so it is not too late to act. Personally I wish Epsom College to share equally with the Royal Medical Benevolent Fund. Both are needy and deserving of all the support that can be given.—I am, etc.,

Blackpool, Jan. 31st.

JOHN BROWN.

Fees for Doctors called in by Midwives.

SIR,—Regarding the so-called new scale of fees of doctors called in by midwives (for the only real alterations are very slight and not worth the trouble of drawing up a new scale), are we to understand that this scale has been accepted as either reasonable or adequate by the British Medical Association? Personally, I wish to give every assistance to midwives when requiring help, but I cannot accept 2 guineas as a fee for forceps delivery or other difficult case—for instance, those in which turning is required. One almost always gives chloroform in these cases, without calling in another doctor.—I am, etc.,

Bridgwater, Jan. 14th.

R. COATES.

* The Annual Representative Meeting expressed the opinion that the fee of £2 2s. is too small to enable the Association to urge unwilling practitioners to accept it.

Insurance Record Cards.

"N.B.M.A." writes: As a member of the medical profession, which I entered as pupil fifty-four years ago. I must express my surprise at the attitude taken by many of the panel doctors of the present day in objecting to the use of the record cards. In nearly every business house in the country the card system is being adopted, and if we are professional men surely we are business men as well; if not we ought to be, in order to justify

our demands for any increase of pay. I have been on the panel since the commencement, and have kept a record card of every patient, every visit, and every attendance at my surgery, and find no difficulty in keeping them. System only is required, and plenty of time can be given for the examination of each case. My panel on January 1st, 1920, was 2,026. I have taken an extract for the month of March of that year, the busiest month of the year, and can give exact figures for each day of the month as I count up each night the visits paid and the attendances at my surgery of both insured patients, club patients, and private patients. I find the results for March as follows: The attendance of insured patients at surgery for the month numbered 1,037, or an average of 33.14 a day. Club patients, an average of 10 a day; private patients, an average of 27 a day, or a total average of 70 a day for the busiest month of the year. The visits numbered 757 for the whole month, an average of 24 a day, and on the visiting list 45 were insured patients. 16 club patients and 102 private patients. Every record card is marked up with every attendance at surgery, and visits and certificates as given, and attached to each is a copy of the prescription that he last had. Every complaint is noted, also the principal symptoms. This system gives an excellent record of a year's work, although it has never, so far, been used for statistical purposes. I fail to see why every methodical medical man of a business turn of mind cannot do likewise, and then we should have a good case to bring before the Ministry of Health for increased remuneration.

"A. B. C." asks where he can purchase the Dextro filing case for insurance records and envelopes.

LOCAL MEDICAL AND PANEL COMMITTEES.

COUNTY OF LONDON.

Record Cards.—At the meeting of the London Panel Committee on January 25th Dr. J. G. Duncanson, one of the regional medical officers for London, attended in order to explain the new record system. Dr. DUNCANSON said that the practitioner in the first instance had to verify the correctness of the entries on the card as he received it from the Insurance Committee, and to insert particulars of age, occupation, and marriage relation, which he would elicit from the patient when he came for treatment. With regard to the particulars of visits and attendances, certain medical men might prefer to put down on the card merely the date of the first visit and afterwards the total number of visits. If they did this, they should be prepared to furnish at the inspection the day-book or visiting list from which the figures were transferred. A great licence was left to the practitioner in the matter of clinical notes, but such notes would prove of great advantage alike to the practitioner and to any future practitioner under whose care the patient might go. On the question of secrecy he thought that the possibility of misdemeanour by the clerical staff was remote, especially when it was remembered that these were men with positions to lose and that such practices were subject to penalties.

In reply to questions, Dr. Duncanson said that there was no necessity to keep clinical notes of every visit. The clinical note was a note regarding the case, and presumably would be made at the first visit, and only altered later in exceptional circumstances. Asked whether the insured person had the right to refuse to have his diagnosis written on the card, Dr. Duncanson said that that was beyond him to answer. On the question of certificates, Dr. Duncanson said that a practitioner might give a vague certificate (1) when a certificate bearing the actual diagnosis would be prejudicial to the health of the patient, as in cancer or mental disease, and (2) in venereal disease when this was (a) congenital, or (b) acquired innocently, or (c) when the patient had been suffering for more than two years from the disease. On issuing vague certificates the practitioner must take care to communicate with his regional medical officer, stating his reasons for issuing such a certificate and giving the real diagnosis. As for the special intermediate certificate, this was not intended to be issued indiscriminately. If this certificate was not accepted by an approved society, the practitioner should communicate with the regional medical officer, who might then see the patient with or without consultation with the practitioner. In reply to a question, Dr. Duncanson said that a certificate should not be issued in uncomplicated pregnancy so long as the woman was capable of doing remunerative work, and the same criterion—the capacity for doing remunerative work—applied in the case of discharged soldiers undergoing training for another occupation.

A letter was read from the Cheshire Panel Committee urging that a request be sent to the Insurance Acts Committee to summon a conference to deal with the matter of record cards. Dr. E. A. GREGG said that as the London Committee did not recognize the Insurance Acts Committee it could not join in the request, but he urged that a

sympathetic reply be sent to Cheshire. Dr. H. J. CARDALE said that some of the statements in the memorandum circulated by Cheshire were inaccurate, and the London Committee must not give an unqualified endorsement. Ultimately it was agreed that no action be taken on the request of Cheshire, but that the consideration of the form of record card be remitted to a subcommittee.

Complaints against Practitioners.

The London Panel Committee Gazette for January draws the attention of insurance practitioners in London to the advisability of a doctor at once consulting the secretary of the Panel Committee on receipt of the notification of a complaint having been lodged against him by an insured person. "It is much to be desired that no action of any description should be taken without the advice of the secretary having been first obtained. The Panel Committee have secured the services of a firm of solicitors who have made the study of the National Health Insurance Acts and Regulations a speciality, and the secretary is empowered to seek their advice in all cases which raise questions of general interest to doctors on the panel."

WARWICKSHIRE.

THE Warwickshire Panel and Local Medical Committee held its first meeting of the new year at Coventry on January 20th, when Dr. H. TIBBITS (Chairman) presided over a good attendance.

With a view to obtaining close co-operation between the Committee and that of the neighbouring City of Coventry, Dr. W. H. Lowman, Chairman of the latter Panel Committee, was appointed a member to fill an existing vacancy. A letter was reported from the Ministry of Health in reply to one sent by the Committee raising the question of the degree of privilege attaching to confidential information imparted to the Regional Medical Officers of the Ministry under Article 10 of the Terms of Service. In this the Ministry stated that they were not aware that the fulfilment of the obligation referred to would involve the practitioner in any risk of proceedings being successfully taken against him.

Considerable discussion took place with regard to the new scheme of record keeping, opinion being fairly divided as to the degree of difficulty involved in this work. The Regional Medical Officer (Dr. T. M. Carter) attended by the Chairman's request, and the matter was discussed with him. Strong objection was taken by members to any contingent possibility of a routine examination of records by lay officials of the Ministry, and it was agreed that where this might become a necessity in the case of open negligence, the work should be done through the agency of part-time medical officials.

Matters of principle arose on consideration of accounts submitted by the Insurance Committee for review in respect of treatment rendered by practitioners under the local distribution scheme. Certain accounts submitted were for payment of anaesthetist's fees where the anaesthetic had been given in a local hospital. The Committee decided that these accounts being rendered in hospitals "where standard methods operated for rendering professional services" should not be recommended for payment from the local pool. An account for anaesthetic administered for certain dental extractions was not recommended on the ground that the service did not come within the category of those required to be given to the insured. On a review of certain services for which fees had been charged by an insurance practitioner to his insured patient, the Committee decided that surgical treatment in an incomplete abortion where a portion of the placenta was adherent to the posterior wall of the uterus, should not have been the subject of a charge; the service not being outside the ordinary competence of general practitioners in the district.

The dual notification required by the issue of "vague" certificates had been the subject of complaint, practitioners being required under Certification Rule 13 to send a note of clinical details to the regional medical officer and a statement as to the issue of the certificate to the Society. The Panel Committee considered that the procedure allowed by the rule was valuable, and adopted a draft form embodying both sets of notifications. It was decided to ask the Insurance Committee to adopt and print the form for issue to practitioners, this being performable in the middle; that portion appropriate to the Society to be sent under stamped cover to the Committee for forwarding where the Society's address was unknown to the doctor.

WOLVERHAMPTON.

A MEETING of the Borough of Wolverhampton Panel Committee, held on January 4th, the letter from the London Panel Committee suggesting that a separate body be set up to negotiate with the Government in all panel matters was received, and it was unanimously resolved:

That the Wolverhampton Panel Committee strongly opposes any change in the negotiating body and expresses its confidence in and appreciation of the Insurance Acts Committee of the British Medical Association.

NEWPORT, MON.

At a meeting of the Newport (Mon.) Local Medical and Panel Committee on January 12th, the following resolution was carried:

That in the opinion of this Committee the record cards are needless tax on the time of the panel practitioner, and of little use from a clinical or statistical point of view.

INSURANCE COMMITTEES.

COUNTY OF LONDON.

Remuneration of Medical Practitioners.—At the meeting of the London Insurance Committee, on January 27th, it was reported that the amount of the central practitioners' fund for 1920 had been finally determined at £6,675,000. The amount retained to meet claims for the first quarter of the year in respect to the treatment of invalided men was £60,350, leaving £6,614,650 available for distribution amongst insurance committees. The London share of this is 13.53 per cent., or £894,962, less £270 withheld from the Exchequer grant owing to the default of certain practitioners. The Insurance Committee has already paid £863,154 to practitioners for 1920, so that a balance of £31,528 remains to be distributed on the basis of the number of insured persons on practitioners' lists. The amount of the central practitioners' fund for 1921 has been provisionally determined at £6,450,000, and the London Committee's share at £873,330.

Limitation of Practitioners' Lists.—The Committee permitted three insurance practitioners to include up to 4,500 insured persons on their lists, these practitioners having already applied for and received permission to employ permanent assistants. With regard to two others who practised in partnership, and had been granted permission to employ an assistant jointly, the Committee decided to allow each of them to bring his individual list up to 3,750.

Surgery Accommodation.—The Committee decided on a previous occasion that the permission given to certain practitioners to include more than 3,000 insured persons on their lists should be subject to the Committee being satisfied as to the adequacy of the surgery and waiting-room accommodation. On this subject of accommodation the Committee at this meeting appointed the members of a deputation which is to wait upon the Ministry of Health, jointly with a deputation from the Panel Committee.

Prescriptions.—During nine months of last year London insurance practitioners issued 3,553,729 prescriptions. The average cost per prescription was 9.47d., the total cost, £140,201, and the average number of prescriptions per insured person was 0.71.

Medical Records.—Forms of record for 838,500 men and 814,500 women have been issued since January 1st to practitioners in the London area. A motion was on the agenda, supported by Dr. Ethel Bentham, that the Committee record its dissatisfaction with the scheme for the compilation of medical records on account of the expenditure involved, and also on the ground of its inexpediency as "calculated to lessen confidence in doctors and to deter patients from seeking advice." Just as the motion was reached, however, a member representing approved societies drew the Chairman's attention to the fact that a quorum was not present.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Captain R. A. Ross to the *Ganges* for Sick Quarters, Shotley; Surgeon Commanders T. W. Myles, C.B.E., A. C. W. Newport, M.V.O., and A. H. S. Richardson to the *President*, additional, for three months' hospital course; C. R. Rickard to the *Victory*, additional, for Haslar Hospital (temporary). Surgeon Lieutenant Commanders J. G. Dawson and F. J. D. Twigg to the *President*, additional, for three months' hospital course. Surgeon Lieutenant G. G. Newman to the *Cyclamen* on commissioning. Surgeon Lieutenant (temporary) T. L. P. Harries to the *Pembroke*, additional, for R.N. Barracks, (Chatham temporary). Surgeon Lieutenants promoted to the rank of Surgeon Lieutenant Commander: J. D. Bangay, L. F. Strugnell.

ARMY MEDICAL SERVICE.

Colonel J. McD. McCarthy retires on retired pay. Colonel J. R. McMunn, C.B., C.M.G., vacates the temporary appointment of Assistant Director-General. Colonel L. P. More is placed on half-pay, March 22nd, 1920 (Substituted for notification in the *London Gazette* of May 10th, 1920)

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel J. Hennessy, C.B., C.M.G., is placed on the half-pay list on account of ill health. Major and Brevet Lieut.-Colonel F. J. Brown, R. of O., relinquishes the temporary rank of Lieutenant-Colonel, November 25th, 1919. (Substituted for notification in the *London Gazette* of May 25th, 1920.)

Temporary Captain H. N. L. Webber relinquishes the acting rank of Major.

The following officers are, receiving a gratuity: Majors J. B. Meldin, R. B. Hole; Captain R. C. Robertson, M.C.

Temporary Captains J. N. Deacon, M.C., and P. Templeton relinquish their commissions and retain the rank of Captains.

The following officers relinquish their commissions:—Temporary Captains and retain the rank of Captain: J. N. Deacon, M.C., P. Templeton, W. S. T. Neville (December 24th, 1919), A. F. Wyatt. Temporary Lieutenant T. B. Pakenham, and retains the rank of Lieutenant.

The notification in the *London Gazette* of February 27th, 1919, regarding temporary Lieutenant C. Fletcher is cancelled. W. A. Lynn to be temporary Lieutenant.

INDIAN MEDICAL SERVICE.

Major-General W. R. Edwards, C.B., C.M.G., K.I.P., has been nominated to be a member of the Council of State.

The services of Captain C. Newcomb have been placed temporarily at the disposal of the Government of Madras (December 4th, 1920).

Captain H. K. Rowntree, M.C., has been appointed to officiate as Assistant Director-General, Indian Medical Service.

Captain E. S. Goss, M.C., has been appointed to officiate as Additional Assistant Director-General, Indian Medical Service.

Major (Temporary Lieut.-Colonel) H. Ross, O.B.E., has been appointed to the staff of the British Mission to Kabul as Medical Officer.

Lieutenants to be Captains: J. M. Shah (December 17th, 1918), J. G. Bird, M.B. (January 23rd, 1920), S. L. Bhatia, M.C. (April 8th, 1920), G. R. McRobert, M.B. (April 13th, 1920), A. C. Chatterji, M.B. (April 17th, 1920), D. Sanjay, M.B. (July 5th, 1920), S. M. A. Faruki, M.B. (July 6th, 1920), M. Fazzal-din, M.B. (July 13th, 1920), G. C. Maitra (July 14th, 1920), H. E. Magee (July 23rd, 1920), L. K. Ledger (August 1st, 1920), B. Basu (August 6th, 1920), P. F. A. Grant, M.B. (August 9th, 1920).

Lieut.-Colonel A. Street has been permitted to retire from the service (June 26th, 1920).

Captain H. H. King appointed sub *pro tempore* to the Bacteriological Department (March 15th, 1920).

The services of Lieut.-Colonel G. Mel C. Smith, C.M.G., have been replaced at the disposal of the Government of the Punjab (December 13th, 1920).

Lieut.-Colonel J. H. Hugo, D.S.O., has been posted as Residency Surgeon in Kashmir (December 13th, 1920).

Major to be Lieutenant-Colonels (December 27th, 1920): A. G. McKeudrick, O. St. J. Moses, F. W. Sumner, H. R. Nutt, W. D. Ritchie, N. E. H. Scott, C.I.E., J. K. S. Fleming, O.B.E., E. C. Hepper, C. E. Southon, O.B.E., G. Fowler, J. Husband, H. B. Foster, G. C. L. Kerans, D.S.O., C. B. McConaghy, H. W. Ihms, E. W. Browne, J. B. Christian, A. Murphy, O.B.E., L. P. Brassey, C. F. Marr, P. L. O'Neill, C.I.E.

The tenure of the appointment of Colonel C. N. C. Wimberley, C.M.G., will reckon from November 3rd, 1919.

Lieut.-Colonel C. M. Goodbody, C.I.E., D.S.O., has been transferred to the temporary non-effective list (November 14th, 1920).

Lieut.-Colonel L. G. Fischer has retired from the service (October 28th, 1920).

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Brevet Lieut.-Colonel W. H. G. H. Best is restored to the establishment.

The following Captains relinquish their commissions and retain the rank of Captain: D. C. Pinn, D.S.O., W. E. P. Briggs, E. R. W. Gilmore, S. F. Castell, K. McAlpine, J. L. Rowlands, J. Aitkin.

Captain C. H. Carlton, M.C., relinquishes his commission on appointment to the R.A.M.C.T.F.

TERRITORIAL FORCE.

ARMY MEDICAL SERVICE.

Lieut.-Colonel J. G. Martin, T.D., to be Colonel and Assistant Director of Medical Services, West Lancashire Division.

The announcements regarding Major C. H. Lindsay, C.M.G., D.S.O., R.A.M.C., and Colonel C. H. Lindsay, C.M.G., D.S.O., A.M.S., which appeared in the *London Gazette* of April 9th, 1920, are cancelled.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel P. Paget, T.D., to be Deputy Assistant Director of Medical Services, 42nd (East Lancashire) Division, with pay and allowances of a Major.

Lieut.-Colonel E. L. Gowlland, D.S.O. (late R.A.M.C.), to be Major, with precedence as from March 4th, 1911, and to relinquish the rank of Lieutenant-Colonel.

Major C. H. Lindsay, C.M.G., D.S.O., to be Deputy Assistant Director of Medical Services, West Lancashire Division (April 23rd, 1920).

Major J. B. Scott, M.C. (late R.A.M.C.S.R.), to be Captain, with precedence as from April 1st, 1915, and to relinquish the rank of Major Captains to be Majors: A. A. Hingston, L. Ball, M.C., L. D. Bailey, M.C., T. H. Kenworthy, M.C.

To be Captains: A. H. Crook (late Surgeon Lieutenant, R.N.V.R.), with precedence as from February 23rd, 1918. Captain F. R. Harris (late R.A.M.C.), with precedence from April 1st, 1920; Captain E. F. Skinner (late Captain R.A.M.C.T.F.), with precedence from October 10th, 1911; Captain R. F. Lintock, M.B. (late R.A.M.C.), with precedence as from February 18th, 1919. Captain D. S. Sutherland, from T.F. Res., with precedence as from September 30th, 1912. Major E. Walker (late R.A.M.C.), with precedence as from September 1st, 1913, and to relinquish the rank of Major. Captain C. H. Carlton, M.C. (late R.A.M.C.S.R.), with precedence from January 31st, 1915.

Captain J. E. Dunbar is restored to the establishment.

DIARY OF SOCIETIES AND LECTURES.

LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.—Thurs., 6 p.m., Chesterfield Lecture by Dr. Sibley: Alopecia.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 9 p.m., Mr. George E. Gask, C.M.G., D.S.O., F.R.C.S.: First Left-shoulder Lecture: Surgery of the Lung and Pleura.

MIDDLESEX HOSPITAL MEDICAL SCHOOL, W.—Emeritus Lecture, Tues., 3 p.m., Surgeon Rear Admiral Bassett-Smith: Trypanosomiasis.

ROYAL SOCIETY OF MEDICINE.—Section of *Psychiatry*: Tues., 8.30 p.m., Dr. W. A. Potts: Mental Tests. Section of *Surgery*, Subsection of *Proctology*: Wed., 5.30 p.m., Sir C. Gordon-Watson: Fistulae treated by Excision and Primary Suture; Mr. W. B. Gabriel: Results of Investigation of Rectal Fistulae; Mr. H. Greene Anderson: Abdomino-perineal Excision of Rectum. Section of *Neurology*: Thurs., National Hospital for the Paralysed and Epileptic, Queen Square, W.C.1., 8 p.m., Joint Meeting of *Clinical Medicine and Surgery Sections*, Fri., 5 p.m., Discussion: 'The Medical and Surgical Treatment of Graves's Disease, to be opened by Dr. Hector Mackenzie and Mr. James Berry. Section of *Ophthalmology*, 8 p.m., Cases, 8.30 p.m., Mr. B. T. Lang: Scotometry; Dr. T. Harrison Butler: Late Infection after Strabismic; Mr. M. L. Hepburn: Trephining.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Asylum, Gartnavel.—Wed., 4.15 p.m., Dr. Henderson: Mental Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Thurs., 4 p.m., Dr. Nabarro: Congenital Syphilis.

LONDON LOCK HOSPITALS.—Daily Clinics, Lectures (Male Hospital, Dean Street), Mon., 5 p.m., Mr. Gibbs: Complications in Treatment of Syphilis; Tues., 2.30 p.m., Mr. McDonagh: Metallic Intoxication; 5 p.m., Mr. Juler: Fundus, Orbit, and Neuro-

muscular Apparatus; Wed., 4.30 p.m., Mr. Joly: Chronic Gonorrhoea in the Male; Fri., 4 p.m., Mr. Abraham: Late Sequelae in Gonorrhoea in the Female.

MANCHESTER: ANCOATS HOSPITAL.—Thurs., 4.30 p.m., Dr. Morrison: Radiographical Demonstrations.

MANCHESTER BABIES' HOSPITAL, Onward Buildings, Deansgate.—Sat., 3.30 p.m., Dr. Dyson: Skin Diseases in the Infant.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Dr. H. R. Dean: Pneumococcus and the Serum Treatment of Pneumonia.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland Street, W.—Mon., 5.30 p.m., Dr. F. W. Price: Arterial Pulse.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Daily (except Wed. and Sat.), 2 p.m., Out-patient Clinics. Lectures.—3.30 p.m., Mon., Dr. K. Wilson: Old and New Afferent Systems; Tues., Dr. Collier: Cerebral Vascular Lesions; Thurs., Dr. Buzzard: Neuritic Affections; Fri., Mr. Sargent: Cerebral Abscess.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Daily, 2 p.m., In- and Out-patient Clinics, Operations, etc. Lecture-demonstrations.—Mon., 4.30 p.m., Mr. Banister: Heart Disease in Pregnancy; Tues., 3 p.m., Dr. Metcalfe: Electrolysis in Surface Diseases; Wed., 4.30 p.m., Mr. N. Fleming: Eye Disease; Thurs., 3 p.m., Dr. Hadfield: Anaesthesia; Fri., 3 p.m., Mr. Benians: Clinical Pathology.

ST. MARY'S HOSPITALS, Manchester, Whitworth Street West Branch, Fri., 4.30 p.m., Dr. Fletcher Shaw: Caesarean Section.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Lectures.—5 p.m., Mon., Dr. Saunders: Digestive Disturbances of Old Age; Tues. and Fri., Mr. Baldwin: Appendicitis; Wed., Mr. Armour: Abdominal Tumours; Thurs., Dr. Porter: Epidemic Diarrhoea.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westland, London), MEDICAL SECRETARY (Telegrams: Medisera, Westland, London), EDITOR, *British Medical Journal* (Telegrams: Atiology, Westrand, London). DANGEROUS DRUGS REGULATIONS.

PROTEST BY THE BRITISH MEDICAL ASSOCIATION.

The following letter and memorandum were addressed on February 3rd to the Home Secretary by the British Medical Association:

4.9, Strand, W.C.

Sir,

I have the honour to forward the enclosed memorandum concerning the draft Regulations made by the Secretary of State under Section 7 of the Dangerous Drugs Act of 1920.

The Association wishes to impress on you, Sir, that the medical profession is seriously alarmed at the prospect which the proposed operation of the Regulations opens up. The responsibilities and anxieties of medical practitioners—already great—seem likely to be seriously increased by clerical work and restrictions of a kind hitherto unknown in medical practice.

The Association trusts that you will withdraw the Regulations pending consideration of the question *de novo* in conference with representatives of the medical, dental, veterinary, and pharmaceutical professions; or, failing that, that you will allow this Association to state its objections to the Regulations by a small deputation.

Yours obediently,

ALFRED COX,
Medical Secretary.

The Secretary of State for Home Affairs,
Home Office, Whitehall.

MEMORANDUM

SUBMITTED BY THE BRITISH MEDICAL ASSOCIATION TO THE SECRETARY OF STATE FOR HOME AFFAIRS CONCERNING DRAFT REGULATIONS MADE BY THE SECRETARY OF STATE UNDER SECTION 7 OF THE DANGEROUS DRUGS ACT, 1920 (10 and 11 Geo. 5, Ch. 46).

1. The British Medical Association is well aware of the public danger arising from the improper use of the drugs whose manufacture, sale, possession and distribution it is proposed to control under these Regulations, and has on several occasions urged the necessity of such control. It further recognizes that in consequence medical practitioners must submit to the imposition of certain restraints in prescribing, compounding, dispensing and administering these drugs, and of certain clerical duties in recording their transactions in them.

2. But it appears to the Association that the Regulations as drafted will have effects far beyond those contemplated in Section 7 of the Dangerous Drugs Act of 1920, under which they are made and which states expressly that they

are to be "for the purpose of preventing the improper use of the drugs to which this part of the Act applies."

3. On the one hand, the medical profession will be hampered in its legitimate use of these drugs in treating the sick, and on the other hand the public will be inconvenienced by delay in obtaining medicines necessary for their treatment, and may even in some circumstances be deprived of remedies which, properly used, are invaluable in the relief of pain and in the saving of life. The cost of medicines containing these drugs must also be seriously increased if the restrictions contained in the Regulations are enforced.

4. As it is understood that it is necessary for the Regulations to be brought into force at an early date owing to the probable early lapse of the powers under the Defence of the Realm Regulation 40 B, some detailed criticisms of the draft Regulations in so far as they affect medical practitioners are herewith submitted. These criticisms must not, however, be regarded as complete.

5. The Association regrets that, so far as it is aware, no opportunity was afforded to any body representing the medical profession, or any other of the professions concerned, to give advice on the practical side of the question before the opinions of the Home Office were crystallized into draft Regulations. The Association knows by long experience how much easier it is to influence such regulations while they are in a fluid state and before they have been made public.

Regulation 5.

"Prescription must be in writing."

(a) Some medical men typewrite their prescriptions. It is difficult to see that this favours any improper use of the drugs, provided that the other provisions as to date, address, signature, and qualifications are carried out.

(b) Prescriptions, particularly in hospital work, may be printed—for example, where a stock mixture is ordered, and to this a scheduled drug may be added.

"And marked with the words 'Not to be repeated.'"

This appears to be totally unnecessary, as it is fully provided for by Regulation 6 (a) and (b).

"A prescription for the use of the drugs must be given by a duly qualified medical practitioner, and must comply," etc.

This appears to forbid every personal administration of the drugs by a duly qualified medical practitioner, or under his direct personal supervision, unless he writes a prescription in each case. In hospital practice particularly this would be impracticable. (See below.)

Regulation 6.

This Regulation should not apply to a medical practitioner dispensing his own medicines. It is customary to enter all prescriptions in a day-book, showing the name and address of the patient to whom supplied and the date on which supplied.

If this Regulation be enforced it appears that it will be necessary to keep four records of each transaction:

1. The customary record in the day-book of the service given to the patient and all medicines supplied, including, perhaps, things additional to the scheduled drug.
2. The prescription for the scheduled drug under Regulation 6 (b).
3. The record of the ingredients of the prescription, etc., in a special book under Regulation 6 (c).
4. The record in a special book for the special drug under Regulation 9 (b) and (c).

Regulation 8.

As drafted, the Regulation seems to demand that every mixture containing any of the scheduled drugs or preparations, even though the percentage may be below that laid down in Regulation 1, must have plainly marked on it the amount of the drug contained. This is probably not intended, as it would bring in such medicines as ordinary cough mixtures and the like, which appear to be expressly excluded from the operation of the Dangerous Drugs Act.

In any case the Regulation should not be applied to articles dispensed in pursuance of a prescription given by a duly qualified medical practitioner or to articles dispensed by a duly qualified medical practitioner for the personal use of his own patient, for two reasons:

1. Nervous and apprehensive patients would hesitate or even refuse to take or use medicines so labelled.
2. All patients taking or using these drugs on their doctor's prescription would become aware of the fact and also of the exact nature and dose of the drug prescribed. The objections to this are obvious and have been recognized in the nomenclature of the *British Pharmacopoeia*, which in the case of at least some preparations of opium disigns the fact that they contain this drug by giving them the name of some inert component—for example, opium pill is called *pilula saponis composita*, and opium suppositories are called *suppositoria plumbi composita*.

This Regulation will, in fact, not carry out the "purpose of preventing the improper use of the drugs to which this part of this Act applies," to quote Section 7 of the Dangerous Drugs Act, but will have exactly the contrary effect.

Regulation 9.

As applied to medical practitioners these records appear to be unnecessarily complicated.

- (1) Clause (a): One book might be substituted for four books.
- (2) Clause (c): The entry of the drugs purchased or obtained on the day on which the drug is received is not always feasible. Drug hampers are not always unpacked on the day of receipt.
- (3) Clause (d): Separate books at each set of premises. This would involve a set of books at every branch surgery and at every practitioner's private house, apart from his main surgery, as it is necessary to keep a small supply of such things as opium pill, chlorodyne, and hypodermic tablets of morphine always ready for personal administration in case of emergency.
- (4) Clause (g): Information as to purchases, stocks, and transactions. This would involve a complete record of every use of any of these drugs, and would be quite impracticable to a busy practitioner. By far the largest amounts would be used in compounding mixtures whose strength is below that laid down in Regulation 1. There is also a considerable waste—for example, in giving hypodermic injections, throwing away old stock, and the like.

Regulation 13.

This Regulation would appear to interfere with the delivery of the drugs to persons licensed or authorized to possess them without their signed authority in writing. This would be troublesome in the case of railway and other carriers; very awkward where a doctor wanted a supply in emergency and wished to telephone to his chemist to send some at once instead of giving a written authority to a messenger and sending it by hand; and quite impossible in the case of a patient with a sudden attack of, for example, gall-stone colic, or with severe haemoptysis needing immediate treatment.

6. *Matters requiring to be Adequately Provided for in Draft Regulations.*—Personal administration of the scheduled drugs by a medical practitioner—for example:

- Instillation of cocaine into the eye in testing refractions or examining the eye, or in eye operations;
- Spraying the throat or nose with cocaine for purposes of examination or operation;
- Injecting cocaine as a local anaesthetic;
- Hypodermic injection of morphine or heroin;
- Administration of morphine suppositories.

It is not clear how these procedures are to be carried out under the Regulations. Must a prescription be written out in each case? Must a record be kept for each case as laid down in Regulation 6? In how far will it be legal to depute personal administration to nurses and to hospital orderlies?

In small hospitals without resident house-surgeons, in nursing homes, and in private practice where a trained nurse is in attendance, it is a common occurrence to leave a hypodermic injection or a sedative draught which would contain one of the scheduled drugs, to be given if neces-

sary. Would this be in conformity with the Regulations, or would the nurse or orderly be a person not authorized to be in possession of the drug?

7. The Association would urge the Secretary of State to defer the operation of the Draft Regulations until the representatives of the medical, dental, veterinary, and pharmaceutical professions have been consulted. If this is not granted, the Association would press upon the Secretary of State to receive a deputation which could place more fully before him the reasons which have convinced the Association that the Regulations are so impracticable that they are bound to be ignored or evaded on a very extensive scale.

Association Notices.

MEETING OF COUNCIL.

THE next meeting of Council will be held on Wednesday, February 16th, in the Council Room, 429, Strand, London, W.C.2, at 10 a.m.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary not later than April 30th.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.—A meeting of the Camberwell Division will be held on Wednesday, March 2nd, when Dr. H. C. Cameron, of Guy's Hospital, will give an address on Children.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—A meeting of members and non-members will be held on Tuesday, February 15th, at 8.30 p.m., at St. Andrew's Parish Hall (Institute behind Church), High Road, Willesden Green, N.W. The meeting will consider proposals made by the Medical Officer of Health of Willesden, at the request of the Committee, for staffing the clinics with part-time medical practitioners. Dr. Anderson, Deputy Medical Secretary, has been instructed by the Council of the British Medical Association to advise and assist the Division in preparing a scheme for working clinics, and will be present.

SUSSEX BRANCH: CHICHESTER AND WORTHING DIVISION.—A meeting of the Division will be held at the Steyne Hotel, Worthing, on Wednesday, February 16th, at 6.30 p.m. At 6.45 p.m. Dr. A. F. Hurst, Physician and Neurologist to Guy's Hospital, will give an address on Asthma. Members wishing to stay for dinner (price 7s. 6d.) are requested to notify Dr. H. Milbank-Smith, Worthing Lodge, Worthing, by Monday, February 14th.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION. A MEETING of this Division was held on January 27th at the Metropolitan Hospital. Dr. E. W. GOODALL delivered an address on the "Nervous group of the acute infectious fevers." The members were very interested in the lecture, which was comprehensive and exceedingly useful from a practical point of view. A hearty vote of thanks was accorded to Dr. Goodall for his kindness in delivering the lecture.

SOUTHERN BRANCH: PORTSMOUTH DIVISION. *Dangerous Drugs Regulations.*

At a meeting of the Executive Committee, Portsmouth Division, held on February 3rd, the following resolution was unanimously adopted:

We, the members of the Executive of the Portsmouth Division of the British Medical Association, having read the proposed regulations for the sale of dangerous drugs, etc., emphatically protest against their application to medical men, as it is utterly impossible to carry them out: the result will be, either that the practitioner will be bound to ignore the regulations or his patients will be deprived of valuable and anodyne drugs, and thereby their sufferings will go unalleviated.

It was also resolved that copies of this resolution be sent to the Home Secretary, to local members of Parliament, and to the medical press.

INSURANCE.

CORRESPONDENCE.

The New System of Medical Records.

SIR,—The Insurance Acts Committee of the British Medical Association is issuing a memorandum on the character of the new system of medical records, which will be found to be more or less a defence in favour of their acceptance by the panel practitioner.

I believe the memorandum is divided into three parts, the first being a history of what has led up to the institution of the records, and the remaining parts will be mainly a critical defence of their favourable reception.

As to the first part, which concerns history, I have very little to say. It seems to me to be a correct and fair statement. As a matter of fact, this system was laid before the last Panel Conference held in London, and duly accepted by that conference for trial. I was not present at that conference, and do not feel justified in agreeing with the decisions of the conference. I am under the impression that the full nature of the new system was hardly comprehended by the delegates when they determined to give it a trial. Previous conferences have passed some very definite lines of liberty which should characterize any new form of records to be introduced. For instance, it was determined by a special conference in July, 1919, that the "Commissioners be requested to devise some simpler form in order to make work less onerous"; and again at the same conference, "that whilst not objecting to the principle of records in a simple form, the conference strongly opposed any complex system involving a multiplicity of forms with a consequent increase in clerical work."

I am under the impression that the last conference, which accepted the present record system, hardly comprehended the complexity of the system, accompanied as it is with multiplicity of forms and consequent increase in clerical work. However, they resolved that the new system should be given a trial, and the Insurance Acts Committee was perfectly justified in taking the view that it was their duty to smooth the way, so far as possible, for a fair trial to be given to the new system.

The trial is now in operation, and there are very varied accounts from different parts of the country as to their being received with favour or disfavour. I am told that in Lancashire there is an opinion favourable to the new system, a statement which surprises me considerably, for my own county entertains a very strong feeling of antagonism towards the system, which they consider alike complex, accompanied with an undue multiplicity of forms and burdensome pressure of increased clerical work. It seems to me, therefore, that it is opportune from the commencement to discuss the working of this system in its trial in the initial stages, and I think there should be ample opportunity given for the expression of the views of panel practitioners upon the bearing which this system has on their professional life. I am bound to admit that we have, more or less, deserved what we have got, but I do not think we should, any of us, be deterred from the expression of our opinions of the system now that it has come.

If the system is to remain, the wisdom of which I gravely doubt, it should, to my mind, be made less burdensome to the practitioner, and much less inquisitorial into the ailments of insured persons. If any records of ailments are to be made it seems to me they should only be those of a serious, acute, or preventable character, in which there may be shown to be some local circumstances, in the districts where insured persons dwell, which may require the more efficient oversight of sanitary authorities.

It is said that there is no obligation to enter notes in these records of every trivial illness or symptom. I do not so read the Regulations, for I think the intimation is quite clear that all ailments of every kind are to be entered in the records, and we must take the thing for what it is, and not what it ought to be, if we are to estimate its true value. An entry is certainly to be made in the column headed "Diagnosis" "when a definite and reasonably certain conclusion" has been arrived at. Thus if a married or unmarried woman has a miscarriage it must be entered as such. A spade must be called a spade, and not an excusable or inexcusable shovel.

The entry of all consultations and visits is required. If that means anything, it must imply what the word states, and every single consultation should find its place in the record. To my mind, also, it is necessary to enter every certificate that is given, though there seems a desire to prune down the record of the number of certificates. Whatever we may desire in this respect, I gather from the Regulations that all consultations and certificates must be

entered, and not simply the first and the final certificates. In other words, all intermediate certificates should, in my judgement, according to the said Regulations, find their due entry. If there is to be any alteration of detail, the sooner pronouncement is made on that matter the better, because there is a great diversity of opinion as to the extent of the obligation of the entries which will have to be made in the records.

I am unable, also, to sympathize with the protest against the comment in what is called the "Political Press." Doubtless every opportunity is taken for every act of a departmental official of the Government to be brought within the range of adverse criticism if the policy of the paper so dictates, but surely we have nothing to do with that. The protest of panel practitioners if they object to this system is not a political protest against the Government, but a professional and personal objection to the incidence of the burden which departmental officials are placing upon panel practitioners. Whether the Press approves or disapproves is a matter entirely for them, and we should be surely justified in making use of any portion of the public press which voices the sentiment of the profession for the time being. In this matter we have nothing to do with political quarrels. We are taking a purely business and not political view of this matter, and I hope we shall endeavour to keep outside the sphere of the party political game. Whatever it may be, we should have no part or lot in that sort of thing.

A good deal has been said in some papers by way of protest against the infringement of secrecy, which has hitherto prevailed between the medical practitioner and his patient in the matter of the privacy of the professional consultation which has taken place between them, and it has been said that too much has been made of this charge of violation of secrecy. To my mind, it is impossible to say too much about anything, whether it is legislative or departmental administration, which interferes with the privacy of a citizen's ailments. The State has no business to exercise an inquisitorial investigation into matters of private concern. If the individual is suffering from a preventable disease of an infectious or contagious character, then it becomes a matter not of private but of public interest, and legislation has very properly dealt with that matter: but the poor and the rich are all treated alike in that respect. The peer of the realm or the pauper in any parish are equally notifiable if they suffer from infectious diseases, but beyond that the general practitioner finds an alteration of the treatment of the individual, according to whether he may or may not be an insured person.

Departmental administration says that it will acknowledge no private right of the individual in this respect. There, it seems to me, a grave departure in the equality of the treatment of individuals has taken place. Why should certain people who are better off, so as to be outside the insurance scheme, be treated more favourably than those who are obliged, perforce by economic circumstances, to be numbered as insured persons, to be ticketed and labelled with all their ailments, in the same way as paupers have always been treated under the Poor Law system? It is the introduction of that antiquated system in a new form, and to my mind is highly objectionable. After all, illness is no respecter of persons. Kipling has put the solid truth in this matter when he said:

"For the Colonel's lady and Judy O'Grady
Are sisters under the skin."

Why should the colonel's lady be exempt from finding a place on the ailments schedules of Government departments while her poorer sister, Judy O'Grady, is duly labelled, ticketed, and docketed? That is exactly what has happened. One can readily see how this sentiment finds its reflection in a great deal of uneasiness which is being felt by insured persons, and, I think, not without reason. No Government department has any right to treat Mary Ann differently than it will treat her mistress the Lady Jane. The Lady Jane is exempt from interference, but her maid, Mary Ann, must go on the schedules. Lady Jane may be a far more dangerous person than Mary Ann, but Government authorities would not dare to bring her within the schedules of ordinary ailments.

There is another matter which I think to the panel practitioner is of grave moment. We have been frequently told, when discussions have taken place on the subject, that it was never intended that the panel practitioner should be subject to any regular inspection in his work. Panel conferences have protested against it, and we have always been assured that no system of inspection would ever take place, but now it appears that these district officers, regional or otherwise, "or such other persons as they may appoint for the purpose," forsooth, are to have access

at all reasonable times to these records, and we are to furnish them with any necessary information with regard to the entries therein which they may require. This is a gross betrayal, and, if we are to submit to it, will be a surrender of all the present liberty in the exercise of our professional duties which hitherto we have always enjoyed. We are to be inspected, forsooth, at every turn in all our panel work. To my mind this is State inspection with a vengeance, and the commencement of what will be infinitely worse in detail as time goes on, unless we can destroy the obnoxious innovation. We said we would not, we have always said we would not, and I hope we shall say we will not submit to this system of inspection.

This system was to have a trial. The trial is with us now. We have put the shoes on, and we have a right to say where they pinch.

I hope that some of the most objectionable features of this record system will soon be revised and altogether withdrawn. It is quite possible to devise a simple system which would be useful and helpful as between practitioner and practitioner in the interests of patients, but it would not be this system of medical records.—I am, etc.,

Crewe, Feb. 6th.

WILLIAM HODGSON.

Dr. G. YOUNG EALES (Torquay) writes: "In the SUPPLEMENT of February 5th, page 34, A. B. C. asks where he can purchase the Dextro filing case for insurance record envelopes. The address is Dextro, Ltd., 30, Arcade Chambers, St. Mary's Gate, Manchester. The case is cheap, handy, and convenient."

Several other correspondents have been good enough to send this information.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Commanders J. H. Lightfoot to the *Conqueror*, J. Boyan to the *Dolphin*, C. T. Baxter to the *President*, additional, for R.N. Recruiting Headquarters. Surgeon Lieut. Commander F. C. Wright to the *Birmingham*. Surgeon Lieutenants F. L. H. McPowel to Haulbowline Hospital and Dockyard, J. C. Brown to Special R.M. Battalion, H. B. Parker, D.Sc., to the *Undaunted* for voyage.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel A. E. Master retires on retired pay.
Lieut.-Colonel J. D. G. Macpherson is placed on retired pay on account of ill health contracted on active service.

DIARY OF SOCIETIES AND LECTURES.

HARVIAN SOCIETY, Town Hall, Harrow Road, Paddington—Thurs., 8.30 p.m., Dr. Wm. Brown: Psycho-analysis.

HENTERTIAN SOCIETY, Sion College, The Embankment, E.C.—Wed., 9 p.m., Oration by Dr. H. H. Bashford: The Ideal Element in Medicine.

MEDICO-LEGAL SOCIETY, 11, Chandos Street, W.1.—Thurs., 8.30 p.m., Dr. Halliday Sutherland: Medical Evidence in the Stanton Murder Trial.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 8.30 p.m., Discussion on Skin Disease: Its Relation to Internal Disorder, to be introduced by Sir James Gallova, followed by Dr. Arthur Hall, Dr. E. W. Goodall, Dr. A. Whitfield, Dr. E. Graham Little, Dr. H. W. Barber, Dr. H. G. Adamson, Dr. J. M. H. MacLeod, Dr. H. MacCormac, and Dr. K. Hutchison.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—Thurs., 5 p.m., Dr. Martin Flack: Nitroly Lecture—Respiratory Efficiency in Relation to Health and Disease.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C.—Mon., 4 p.m., Hunterian Oration by Sir Charters J. Symonds, K.B.E., C.B.; Wed., 5 p.m., Arris and Gale Lecture by Dr. F. W. Edridge-Green, C.B.E.: Cause and Prevention of Myopia.

ROYAL SOCIETY OF MEDICINE.—General meeting of Fellows, Tues., 5 p.m., *War Section*: Mon., 5 p.m., Exhibition and Demonstration of Splints etc., by Major M. Sinclair; 9 p.m., Paper with illustrative slides by Major Sinclair. *Section of Therapeutics and Pharmacology*: Tues., 4.30 p.m., Dr. J. H. Burn: Physiological Comparison of Digitalis Tinctures: Oral Administration of Pituitary Extract (Experimental). Dr. P. Hannill; (Clinical) Dr. M. Donaldson. *Section of Pathology*: Tues., 8.30 p.m., Drs. Gye and Kettle: Passive Immunity in Tetanus; Dr. Mackenzie Wallis: Estimation of Sugar in Blood; Dr. A. E. Gow: Pancreatic Infarct and Fat Necrosis; Dr. T. H. G. Shore: Influenzal Meningitis of Spinal Cord, etc.; Dr. E. H. Kettle: Congenital Sacral Teratoma, etc. *Section of History of Medicine*: Wed., 5 p.m., *Section of Dermatology*: Thurs., 4.20 p.m., Cases. *Section of Ology*: Fri., 4.45 p.m., Cases; 5 p.m., Dr. A. R. Friel: Zinc Ionization and Electrolysis in Chronic Otorrhoea. *Section of Electro-Therapeutics*: Fri., 8.30 p.m., Social evening, Informal discussion on questions of interest affecting the Section.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, W.1.—Fri., 7.45 p.m., Microscopical Specimens; 8.15 p.m., Papers:—Lieut.-Col. J. O. Kennedy, R.A.M.C.: Pathology of Relapsing Fever; Dr. A. M. Cole: Five Cases of Sarcosis Infection; Dr. A. Connall, W.A.M.S.: Examination of Chrysopeps for Filaria in West Africa.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Hospital for Sick Children.—Wed., 4.15 p.m., Mr. A. MacLennan and Mr. W. Rankin: Surgical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thurs., 4 p.m., Dr. Cockayne: Myopathy.

LONDON LOCK HOSPITALS.—Clinical Instruction daily. Lectures (Male Hospital, Dean Street, W.1.) Mon., 5 p.m., Mr. Gibbs: Ante-

natal and Post natal Treatment of Syphilis; Tues., 2.30 p.m., Mr. McDonagh: Laboratory Results and Clinical Experience; Wed., 4.30 p.m., Mr. Joly: Tests of Cure for Gonorrhoea; Fri., 4 p.m., Mr. Abraham: Early Syphilis Rashles.

MANCHESTER BARRIES' HOSPITAL.—Sat., 3.30 p.m., Dr. Renshaw: Congenital Syphilis.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Dr. F. E. Tylecote: Lumbar Puncture and its Value in Diagnosis.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westminster Street, W.1.—Mon., 5.30 p.m., Dr. Russell Wells: Irregular Heart Action.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Daily, excepting Wed. and Sat., 2 p.m., Out-patient Clinics. Lectures.—3.30 p.m., Mon., Dr. K. Wilson: Old and New Afferent Systems; Tues., 3.30 p.m., Dr. Collier: Acute Polyneuritis. Demonstrations of Cases.—3.30 p.m., Thurs., Dr. Taylor: Fri., Dr. Tooth.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Daily, 2 p.m., In- and Out-patient Clinics, Operations, etc. Lecture Demonstrations:—Mon., 4.30 p.m., Mr. Tanner: Surgical Cases; Tues., 4.20 p.m., Dr. A. J. Whiting: Innocent Irregularities of the Heart; Wed., 3 p.m., Dr. Oliver: Skin Cases; Thurs., 3 p.m., Mr. Carson: Surgical Cases; Fri., 3 p.m., Mr. Benians: Diagnostic Clinical Pathology.

NORTH OF ENGLAND BRANCH, British Medical Association, Royal Victoria Infirmary, Newcastle-upon-Tyne.—Fri., 2.15 p.m., Mr. Grey Turner: Cancer of the Colon; 2.45 p.m., Dr. D. W. Patterson, O.B.E.: Diseases of the Bronchi; 3.15 p.m., Professor H. B. Angus: Splint Treatment of Fractures of the Upper Extremity; 3.45 p.m., Tea; 4 p.m., Dr. A. F. B. Shaw: Arterial Degeneration; 4.30 p.m., Mr. N. Hodgson: Compound Fractures.

SALFORD ROYAL HOSPITAL.—Thurs., 4.30 p.m., Mr. Smalley: Nasal Sinusitis.

ST. MARY'S HOSPITALS, Manchester, Whitworth Street West Branch.—Fri., 4.30 p.m., Mr. Morley: Acute Intestinal Obstruction in Infants.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward visits; 2 p.m., In- and Out-patient Clinics and Operations. Lectures.—5 p.m., Mon., Mr. Harman: Intestinal Sepsis and Irido-cyclitis; Tues., Dr. Morton: X-ray Appearances of Stomach Diseases; Wed., Dr. Owen: Gastric Disorders; Thurs., Dr. Bruce: X-ray Diagnosis of Joint Disease; Fri., Mr. Baldwin: Appendicitis.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London).
MEDICAL SECRETARY (Telegram: Medisecra, Westrand, London).

CURRENT NOTES.

Memorandum on Insurance Medical Records.

A MEMORANDUM on Medical Records (Document M. 29) divided into three parts—the first historical, the second instructional, and the third ethical—has been issued by the Insurance Acts Committee to all Panel and Local Medical Committees. It has been considered advisable to issue to every insurance practitioner the second and third parts of this Memorandum in order, on the one hand, that the duties of insurance practitioners in connexion with the keeping of record cards may be fully understood, and on the other that the true position with regard to the preservation of professional secrecy under the new system may be made clear to all concerned. The first part of the Memorandum, tracing the history of record cards from the inception of the Insurance Acts to the present date, may, however, be obtained by any practitioner on application to the Medical Secretary, 429, Strand, W.C.2.

Dangerous Drugs Regulations.

Last week's SUPPLEMENT contained the full text of the Memorandum on the draft Regulations under Section 7 of the Dangerous Drugs Act, 1920, which was forwarded on February 3rd, 1921, by the British Medical Association to the Home Secretary. The Regulations are for the control of all dealings in morphine, cocaine, ecgonine, diamorphine (heroin), and their respective salts, as well as in medicinal opium and any preparations containing not less than 0.2 per cent. of morphine, or 0.1 per cent. of cocaine, ecgonine, or diamorphine. It was recorded in last week's JOURNAL, p. 241, that the Permanent Under-Secretary of State in the Home Office, Sir Edward Troup, in a statement in the public press, had said among other things that a doctor will not have to enter the fact in a book whenever he gives a hypodermic injection of morphine or otherwise administers any of these drugs. Sir Edward Troup has since replied to the British Medical Association in a letter dated February 12th, written on behalf of the Home Secretary. The Secretary of State, he says, has very

carefully considered the representations submitted on behalf of the British Medical Association, and he thinks that it should be possible to meet most, if not all, of the points taken in the Association's memorandum. The Home Secretary suggests that in the first instance the Medical Secretary of the Association should discuss the various points with the representatives of the Home Office, and if after such discussion a deputation from the Association appears to be desirable, the Secretary of State will be very willing to receive one. On February 14th Dr. Alfred Cox, the Medical Secretary, had a conversation with Sir Malcolm Delevingne, an Assistant Secretary in the Home Office, who agreed to send his proposals in time for consideration by the Council of the Association at its meeting on February 16th.

Unemployment Insurance Act.

Two further decisions have been received from the Ministry of Labour in connexion with doctors' servants and the Unemployment Insurance Act (see SUPPLEMENT, January 22nd, 1921, p. 21). It should be borne in mind that exemption from the scope of the Act as regards domestic servants is governed by the following statement: "employed in domestic service except when the employed person is employed in any trade or business carried on for the purpose of gain." The Ministry's decisions are as follows: Contributions are payable in respect of a medicine boy and messenger and a coachman employed by a doctor. A covering letter states that these decisions will apply to persons employed in the same occupation under similar conditions, and that the decision regarding a doctor's coachman will apply in principle to chauffeurs employed by medical practitioners to drive them on their rounds to visit patients.

Handbook of the Association.

The question of the *Handbook* of the Association for 1921-22 will be under consideration by the Propaganda Subcommittee on or about March 16th. The Subcommittee would be grateful for any suggestions on the subject from Honorary Secretaries or other members interested. Copies of the current *Handbook* will, so far as possible, be sent to members who apply for them.

Scottish Committee.

The following, among other matters, were dealt with at a meeting of the Scottish Committee held on February 10th, 1921:

Report of Scottish Consultative Council.—It was decided to hold a meeting of Scottish representatives in May to consider the Report. A questionnaire is to be issued to Divisions on the recommendations contained in the Report; replies to be sent in before April 15th.

Scale of Fees to Practitioners under the Midwives (Scotland) Act.—No reply having been yet received from the Board of Health to the proposals put forward by the Committee, it was resolved to advise practitioners not to undertake to respond to the call of midwives until a satisfactory reply has been given by the Board.

Mileage Grant to Insurance Practitioners.—The Rural Practitioners Subcommittee reported that the grant for 1920 has now been distributed on the basis of the scheme agreed to by the Subcommittee. The total sum is £55,000, with an additional sum of £10,000 for areas of special difficulty. The object of the "grading" of the units in the scheme is to secure that quasi-rural practitioners shall not benefit unduly at the expense of the strictly rural practitioner, and that object seems to the Subcommittee to have been attained. Panel Committees, however, are requested to examine carefully the local distribution with this in view. It was noted by the Committee that the value of the "unit" is 1s. 8d. in Scotland, which is apparently less than in England, and the Subcommittee was requested to consider the matter.

Highlands and Islands Subcommittee.—The Subcommittee recorded its satisfaction that the Board of Health had agreed to their representations for an increase in the guaranteed minimum income in single-practice areas, and for an increase in the scale of fees chargeable to patients under the Board's scheme. It was resolved that the Board be urged to fulfil their promise to review the Highlands grant in the light of the alterations in the Lowlands mileage grant, and to base the case for increase on: (a) The fact of the specially arduous conditions in the Highlands, which are comparable, not with average Lowland rural areas, but with the areas of special difficulty to which the additional grant of £10,000 is applicable; (b) the fact that the Lowlands grant has been increased two and a half times; (c) the fact that the cost of motor travelling is still increasing.

The Report of the Distribution Committee.

The importance of this matter justifies a further allusion to this report, which was dealt with in the SUPPLEMENT of February 5th, p. 32. The concluding paragraph on the difficulties of obtaining returns of mileage refers to a subject on which the Insurance Acts Committee has made repeated appeals to those concerned. If those insurance practitioners for whom the mileage fund is provided and who are directly concerned in getting their proper share of this fund neglect to send in their returns, they must not be surprised if the result of the distribution is unsatisfactory to them.

To deal with another aspect of the work of the Distribution Committee, some public acknowledgement is due to the Chairman, Sir Woodburn Kirby, for his services to insurance practitioners. The medical members of the Committee and the departmental members are of course interested, each in different ways, in the money to be distributed. But the chairman has no interest beyond that of performing a public service, and Sir Woodburn Kirby, a busy and eminent accountant, has performed a real service to the medical profession in accepting a position which entails no small demand on his time and skill. He is connected by birth and by marriage with our profession, and it is pleasant to suppose that this may have had something to do with his willingness to accept and continue in the chair of the Committee.

Lending Library.

The Librarian will be glad to assist members of the Association in the selection of works to be sent them by post, in accordance with the arrangements for borrowing books that are notified each week on the last page of the SUPPLEMENT.

**THE MEANS OF OBTAINING THE COLLECTIVE
OPINION OF THE MEDICAL PROFESSION
ON QUESTIONS OF POLICY.**

The Minister of Health made a request to a deputation from the British Medical Association on November 1st, 1920, that he should be provided with a body really representative of the whole profession, which he could consult on questions of policy, instead of being approached by half a dozen bodies each claiming to represent the profession. The matter has since then received the active attention of the Council, and certain sectional medical organizations have been invited to co-operate with the Association in forming such a body.

The Federation of Medical and Allied Societies called a conference on February 1st, 1921, with a view to discussing co-operation on the lines suggested by the Minister of Health. It issued a statement in which it laid down its ideas of the qualifications of such a body. The British Medical Association, amongst other bodies, was invited to the conference, but declined because it was itself engaged, at the suggestion of the Minister of Health, in trying to constitute a central medical committee representative of the profession as a whole.

The following memorandum, stating the views of the Association on the qualifications of a body professing to represent the medical profession as a whole, has been sent to the Federation, to the bodies whose representatives signed the invitation to the February 1st conference, to those other bodies invited to the conference, and to the Minister of Health:

**MEMORANDUM OF THE BRITISH MEDICAL
ASSOCIATION.**

1. The Minister of Health, addressing a deputation from the British Medical Association on November 1st, 1920, complained of the number of bodies that approached him claiming to be representative of the profession, and asked that some one body recognised as representing the whole profession should be provided, so that he could consult it on matters of policy affecting the medical profession. Further, in a letter to the Chairman of Council of the Association, dated November 26th, 1920, the Minister said he was "satisfied that it would be impossible to secure the constitution of a representative body without the good offices of the B.M.A. in bringing them together," and went on to suggest that the Council of the Association "should now initiate action to secure the appointment of a body whose credentials will be incontestable."

2. The Association has accepted the Minister's suggestion, and has invited certain medical bodies to co-operate with it in constituting a body which will satisfy his requirements. The Association desires to state its views as to the qualifications of such a body.

**Qualifications of a Body Representing the Medical
Profession as a Whole.**

3. In the first place the body must represent the views of the medical profession *and the medical profession alone*. The Minister has asked for such a body. When he wishes for the views of the Dental, Pharmaceutical or Nursing professions, he will naturally call on the organisations which represent those professions. They would not desire to have their views confused with those of the medical profession, and the medical profession would certainly not consider that representations from any body which attempted to fuse the interests and views of widely differing bodies ought to be taken by the Minister as the considered policy of the medical profession.

4. The body must be an immediately and directly *responsible* body—that is to say it must recognise the authority of its constituents and no other authority. It must be under the constitutional control of the whole of its constituents and without undue bias toward any one section of them. A body which the bulk of the profession felt they had no direct means of controlling would be worse than useless for the purpose of the Minister, and might do great damage to the interests of the profession itself.

5. The body must therefore be really *representative*. That is to say it must have modern constitutional methods of ascertaining the opinion of its constituents

and of securing their acceptance of agreements made on their behalf. The body as a whole, or the constituent parts of the body, must therefore have machinery, both central and local, for the purpose of eliciting opinions on policy.

6. The constituents of the body must be directly and intimately concerned in what is generally known as "medical politics," and they must be trained in expressing opinions on such matters. Bodies exclusively or mainly scientific have no concern with medical politics and have not the machinery for dealing with such matters.

7. The body must not profess to promote the interests of the community rather than those of doctors. Such a body would not be recognised by doctors as the body which primarily represents them and their views. Doctors are citizens as well as doctors, but what the Minister is understood to require is a body which will tell him what doctors *qua* doctors think, whether as to the interests of their own profession or as to general questions of public health.

How far does the British Medical Association meet these Requirements?

8. The British Medical Association acting alone would be justified in claiming that it possesses the qualifications enumerated above. It contains 52 per cent. of the whole profession on the Register, and this percentage applies approximately to every section of the profession. If those who are not practising their profession, and what may be called the "floating medical population" be eliminated, the Association could be shown to include about 60 per cent. of the active members of the profession.

9. It is really representative of its members and has well-tried machinery, both local and central for ascertaining their views. The control of its members over the Association is thoroughly democratic and complete. Its members are trained, both locally and centrally, in dealing with medical politics. It does not profess to represent the views of other professions, but it does claim to know with greater certainty than any other body the opinions of the majority of the medical profession.

10. Moreover, the Association is recognised informally by large numbers of practitioners who do not belong to it as the body which voices the wishes and sentiments of the profession as a whole. It is very frequently consulted by non-members individually in their troubles; also by bodies of non-members, or bodies of local practitioners, some members some not. It is recognised by the public as the body which bears the same relation to doctors generally as, for example, the National Union of Teachers does to elementary teachers, or the Miners' Federation to miners. The Government has frequently made use of it as the body which can more adequately than any other body represent the general profession. To name only the most recent and most conspicuous example—the machinery of the Association, both central and local, was used by the Government for the purpose of providing doctors for the services with due regard to the interests of the civil population. The Government recognised that there was no other existing body which had the machinery, and there was no question about the Association's ability to deal with and represent the views of practitioners, whether members of the Association or not.

11. The Association does not profess to include every member of the medical profession, and it knows of no organisation of any other calling which can make such a claim. The Association does claim to be by far the largest body of organised medical practitioners with a machinery capable of eliciting, by recognised constitutional methods, the views of the organised profession.

Co-operation of the British Medical Association with other Organized Medical Bodies.

12. In order to make itself as useful as possible to all sections of the profession the Association has always tried to work with organised bodies representing distinct sections of the profession. Representatives of the Society of Medical Officers of Health, the Medical Women's Federation, the Poor Law Medical Officers' Association of England and Wales, the Medico-Psychological Association, the Association of Certifying Factory Surgeons, and other bodies have frequently sat on Committees of the Association. All these Societies have on occasion attended on deputations to Ministers arranged by the Association. Most of them regularly and closely co-operate with the Association in its work for the pro-

fession. The three first-named societies have standing representation on some of the most important Committees of the Association.

13. The Insurance Acts Committee of the Association in a very special way represents the interests of the (approximately) 14,000 practitioners engaged in National Health Insurance work. A majority of the Committee consists of members elected directly by the Local Medical and Panel Committees of the country with no restriction as to whether their nominees are members of the Association or not. The Committee is directly authorised by a representative Conference, acting on behalf of the Local Medical and Panel Committees, to carry out all negotiations with the Ministry of Health on matters affecting practitioners engaged in National Health Insurance work.

14. Though the constitution of the Association and its traditional and regular co-operation with bodies representing special sections of the profession would justify it in claiming the qualifications required by a body representing the profession generally, it has invited these other bodies as independent organisations to join with it in attempting to form the body suggested by the Minister of Health.

15. The Association therefore feels that in accepting Dr. Addison's suggestion, if, as it expects, it secures the co-operation of the medical societies above named, it will be able to offer the Minister a body which (with the exception next to be mentioned) is *really* representative of all the organised medical profession, both generally and sectionally. The body when formed would, of course, consult with other medical bodies not directly represented on it when such consultation was thought desirable or necessary.

16. The exception referred to is that of the Royal College of Physicians of London and the Royal College of Surgeons of England. The Association recognises that the Councils of these bodies are able to speak for the consultant section of the profession in a way which is not open even to the British Medical Association which includes a large number of the Fellows of the Colleges. The Association has intimated to the Royal Colleges that their co-operation in the matter now under consideration would be greatly valued and that after the adhesion of the other bodies referred to has been obtained the Royal Colleges will be approached again more formally.

Meetings of Branches and Divisions.

ULSTER BRANCH.

Dangerous Drugs Regulations.

THE Ulster Branch has passed the following resolution:

That the Ulster Branch of the British Medical Association, at its meeting in Belfast on February 10th, 1921, protests strongly against the action of the Home Secretary in having issued Regulations under the Dangerous Drugs Act imposing severe and impracticable restrictions on doctors in connexion with such drugs as cocaine, egonine, heroin, and medicinal opium, without any consultation with the British Medical Association.

That while anxious to help to suppress the use of habit-forming drugs the profession is against action which is not based on a knowledge of the customs of the profession as ascertained by consultation with its organization.

That a copy of this resolution be sent to the Home Secretary, the Chief Secretary, and to each of the members of Parliament for the Ulster constituencies.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.

At a meeting of the Executive Committee of the Camberwell Division the Dangerous Drugs Act was considered, and it was resolved:

That the Executive Committee of the Division be applied to the Home Secretary, and be desired that they are impracticable that we must adhere to every clause of it.

A copy of the resolution was directed to be sent to the Home Secretary, the members of Parliament for the Division, the British Medical Association, and the medical press.

METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.

A MEETING of the Lewisham Division was held on February 4th, when the organization and ethical rules were adopted. The following officers were elected:

Chairman. Dr. G. W. Charsley. *Vice-Chairman.* Dr. Thomas E. White. *Representative on Branch Council.* Dr. James Gilchrist. *Honorary Secretary.* Dr. C. J. B. Buchan.

The Honorary Secretary reported that he had written to the Home Secretary about the draft Regulations under the Dangerous Drugs Act; it was decided that each member present should write also.

NORTH OF ENGLAND BRANCH: CLEVELAND DIVISION.

A BUSINESS meeting was held in the Zetland Hotel, Saltburn, on January 27th, when Dr. W. A. STEPHEN (Loftus) occupied the chair. The financial statement for 1920 was approved. It was resolved that the minimum fees to be charged to police authorities by members of the Division for professional attendance at the request of the police be half a guinea between the hours of 8 a.m. and 8 p.m., and one guinea between 8 p.m. and 8 a.m., and that such request be in writing. The Secretary was instructed to convey the resolution to the local authorities concerned. It was agreed to continue for 1921 the half-crown voluntary subscription for payment of Division expenses not defrayed by the head office.

The annual dinner was held in the Zetland Hotel, Saltburn, on February 3rd, when fifty-six members and friends were present, under the presidency of Dr. W. A. STEPHEN. A most enjoyable and successful evening was spent. Dr. T. M. BODY proposed the toast of "The Industries of Cleveland," which was suitably replied to by Sir ALFRED HUTCHINSON. The toast of "The Cleveland Division of the British Medical Association" was given by Mr. W. EDWARDS, M.A., in a humorous speech. The CHAIRMAN, in his reply, said that the Division was full of life and embraced in its ranks all the specialists in the area, as well as the vast majority of the general practitioners. He was particularly glad to see the close intercourse between the members of the country and Middlesbrough sections. "Sister Professions" was proposed by Dr. J. A. LONGLEY and responded to by Rev. H. HUBBARD, D.S.O., and by Mr. GEORGE BARNLEY, solicitor. "The Guests," proposed by Dr. A. BRYANS, was replied to by Mr. E. SPENCE, Deputy Mayor of Middlesbrough, and Mr. T. W. RIDLEY.

NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.

The annual meeting of the Sunderland Division was held on February 1st, when Dr. R. G. BELL was in the chair. The annual report and financial statement was presented.

The following officers were elected for the coming year:

Chairman: Dr. R. G. Bell. Vice-Chairman: Dr. Chalmers.
Honorary Secretary and Treasurer: Dr. H. Boyd Cunningham.

UGANDA BRANCH.

A MEETING of the Uganda Branch was held at Entebbe on November 24th, 1920, when the President, Dr. A. R. COOK, was in the chair.

A unanimous vote of thanks was accorded to Dr. J. H. REFOR for his services as honorary secretary of the Branch, on his resignation of the office, and his appointment as Representative in the Representative Body for 1921-22 was confirmed.

In view of the Colonial Office reference to private practice in its terms of appointment the whole question was discussed, and it was unanimously resolved:

That the Colonial Office be asked to inform all applicants for medical appointments in Uganda that at present in most stations in the Protectorate the income from private practice was practically nil.

It was unanimously agreed that the Secretary of State's ruling, that one-half of the M.O.H. allowance should be granted to medical officers and senior medical officers who enjoy the privilege of private practice, be accepted.

It was resolved to resume scientific discussions at the forthcoming general meetings, and Major Wiggins, P.M.O., promised to open a discussion on blackwater fever at the meeting in January.

The scheme of temporary medical officers' appointments was discussed. It was decided to forward recommendations to the Colonial Office through the Governor, and also to express regret that the medical staff of the Protectorate was not larger than it was in January last, and to suggest that the immediate introduction of the West Coast scheme of pay and allowances, present and prospective, was absolutely essential for the welfare of the Protectorate.

The P.M.O. reported that the Governor had agreed with the opinion that medical women and Sinhalese doctors were both unsuitable for filling vacancies on the staff on account of the conditions of the country.

Association Notices.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the

BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary not later than April 30th.

ELECTION OF MEMBERS OF COUNCIL FOR 1921-22 BY BRANCHES OUTSIDE THE UNITED KINGDOM.

THE following being the only nominations received for election to the Council for 1921-22 by Branches outside the United Kingdom (February 12th was the last day for receipt of nominations) are elected Members of Council for the periods stated:

No Nomination. South Australian, Tasmanian, Victorian, and Western Australian Branches.

Dr. H. A. FRANCIS (for two years 1921-23). New South Wales and Queensland Branches.

Dr. DAVID EWART (elected in 1920-21 for three years). New Zealand Branch.

No Nomination. Barbados, Bermuda, British Guiana, Grenada, Halifax (Nova Scotia), Jamaica, Leeward Islands, Montreal, St. John (New Brunswick), Saskatchewan, Toronto, Trinidad and Tobago Branches.

Lieut.-Colonel R. H. ELLIOT, I.M.S. (ret.). Assam, Baluchistan, Bombay, Burma, Ceylon, Hyderabad and Central Provinces, Punjab, South Indian and Madras Branches.

No Nomination. Hong Kong and China, Malaya Branches.

Dr. T. D. GREENLEES. Border (South Africa), Cape of Good Hope (Eastern), Cape of Good Hope (Western), East Africa, Egyptian, Gibraltar, Griqualand West, Malta, Natal Coastal, Natal Inland, Nyasaland, Orange Free State and Basutoland, Pretoria, Rhodesia, Uganda, Witwatersrand Branches.*

* Lieut.-Colonel Ward, C.B.E., D.S.O., was also nominated for this group, but has stated that he will be unable to give the time necessary, and so will not seek election.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—The winter clinical meeting of the Edinburgh Branch will be held in the Royal Infirmary on Friday, March 4th. All members of the profession are cordially invited. The museum will be open from 11 a.m. Arrangements will be made for holding special clinics during the forenoon. The clinical meeting will be held at 3.15 p.m. Those who have patients, specimens, etc., to show are requested to communicate with Dr. John Eason, 35, Melville Street, or Mr. J. W. Struthers, 15, Ainslie Place, not later than February 20th. At 5 p.m. Dr. J. S. Haldane, LL.D., F.R.S., Oxford, will deliver a lecture on "Some recent advances in the physiology of respiration, circulation, and renal excretion." There will be dinner at 6.30 p.m. in the Caledonian Station Hotel; morning dress; dinner ticket, price 10s. 6d. Members of the Branch are requested to notify the Honorary Secretaries not later than February 28th whether or not they intend to be present.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.—A meeting of the Camberwell Division will be held on Wednesday, March 2nd, when Dr. H. C. Cameron, of Guy's Hospital, will give an address on Children.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.—The spring meeting of this Branch will be held at Ledbury on Thursday, April 14th, when a British Medical Association Lecture will be given by Mr. P. L. Daniel, F.R.C.S., on "The differential diagnosis of acute abdominal conditions."

INSURANCE.

CORRESPONDENCE.

The New System of Medical Records.

SIR,—The letter from Sir William Hodgson on this subject, traversing the Memorandum issued by the Insurance Acts Committee, and condemning at some length and somewhat illogically, if I may say so, the whole system, demands a reply.

The Conference of Local Medical and Panel Committees held last October instructed its executive body—the Insurance Acts Committee—of which Sir William is a member, to hold its hand, neither condemning nor approving until sufficient time had elapsed to allow a considered judgement to be given, and a month seems hardly long enough for that purpose.

The first part of the Memorandum makes it quite clear that the keeping of records was part of the bargain made with the Government in 1912, and was and has been paid for as such ever since. That the obligations, but not the payment, was suspended for four years during great national stress does not affect the fact, but rather the reverse.

Granted that a record must be kept—and this was accepted by the conference—the only question that can arise is as to the form which it should take. It had to be "simple and not involving a multiplicity of forms." The great objection to the old form of record was that any

value to the practitioner or his patient was lost by its having to be surrendered at the end of each year, whereby the whole of his more or less valuable clinical notes was lost, and he had to begin all over again entering names and addresses, etc.

The new record card certainly has several advantages—it is a continuous record; the name, address, and other particulars are entered on it once and for all before it comes into the practitioner's possession; and it acts as an index register of his panel.

With a fairly extensive experience of recording illnesses, both privately and in the out-patient department of a large hospital, I have yet to see a more simple form of record card than the one recently evolved by the Inter-departmental Committee. If Sir William Hodgson (or anyone else) would bring his great talents to bear on evolving a more simple and at the same time useful card, no one, I venture to say, would more cordially welcome it than his colleagues of the Insurance Acts Committee.

Sir William Hodgson was scarcely happy in his quotation from Kipling and the deduction he drew from it. The "colonel's lady" without doubt has all her ailments duly "labelled, ticketed, and docketed" in the case-book of her family doctor, while it is the "Judy O'Grady—her sister under the skin"—who has not up to the present had that advantage. Now the Government steps in and says Judy shall be placed medically on a par with her more fortunate sister. Does any thinking man with the welfare of his profession and patients at heart deny the wisdom of this, or the right of the Ministry to see that it is done?

Similarly with the peer and the pauper, each has his health sheet kept either in the consulting-room of his doctor or in the archives of a board of guardians. The peer takes good care to consult a doctor who keeps records; he wants no haphazard physician with placebos. This leads up to the question of secrecy and how far this cry is genuine. It seems to me the question hardly comes in if the doctor keeps his own records. Does Sir William Hodgson or those who think with him refrain from sending cases of venereal disease and all its sequelae to the best general hospital, where all the details are noted and may be seen by both nurses and attendants? Did he in the old club days refuse to accept clubs which required certificates of sickness? If not, for ever let him hold his pen on this subject.

Much has been made of the time wasted in keeping records. Of course it takes a little time—very little when one is used to it—but in my experience the time is more than saved on some future occasion. The obligation is to keep only such notes of every case treated as in the opinion of the practitioner are likely to be of value to himself or any other practitioner treating the patient subsequently. The discretion is left to the practitioner's own judgement. Is it much trouble to enter the letter "D." in case of digestive disturbances or the letters "R.C." in minor respiratory troubles? These or similar symbols are all that need or are expected to be entered in "trivial" cases. But where does trivial end and serious begin? The "R.C." may become tuberculosis of the lung, the vague "D." may become carcinoma of the stomach, the septic mouth may infect the heart valves, or the neurasthenia may become the G.P.I. Let us then make some note, however brief, so that we may learn—those of us at any rate who do not know it all. Also let us keep an accurate summary of all attendances, otherwise when the economy campaign reaches the capitation fee, our negotiators may be "in the soup."

As regards inspection by the Regional Medical Officers, I can only say that I have been assured by the courteous gentleman who has charge of this region that his final instructions from the Ministry were something as follows: "You are a panel doctor going to help with your knowledge and experience other panel doctors, and by so much as you cease to be a panel doctor and become an official by that much will you have failed in your duty." If that is so, why should we call "Wolf" when there is no wolf but only a courteous colleague?

In conclusion I would say—and in this I feel sure Sir William Hodgson will agree—that a more earnest, zealous, or hard working body of men than the Insurance Acts Committee it would be difficult to find, and that any real criticisms of this system, or anything else connected with the working of the Acts, will always be welcomed with both hands.—I am, etc.,

Sheffield, Feb. 14th.

ALEX. FORBES.

Insurance Medical Records.

SIR,—We are pledged to make an honest attempt to keep the new record cards, but have reserved to ourselves the right of criticism in the light of experience. I believe

that many of our anticipated difficulties, whether they be realized or not, can be traced to the fundamental error of attempting to combine for our insured patients visiting lists, daybooks, and clinical life-histories all on one card—a combination never attempted for our private patients.

When the time comes to revise the present Regulations I would like panel practitioners and Panel Committees to consider seriously the following suggestions:

Let the present envelopes remain as index cards and clinical life-histories of our insured patients.

Let the only obligation on the part of the general practitioner, after verifying the correctness of certain particulars, be to enter on these envelopes such clinical notes as he may consider of value either to himself or to succeeding medical practitioners.

Let the law of averages be applied to assist us in obtaining the necessary statistics of attendances and visits, as is being done at the present time in the ease of the mileage returns.

Let it be the duty of Panel Committees to find a certain percentage (say 10 per cent.) of practitioners with average practices who would undertake to keep a simple form of loose-leaved daybook for their insured patients, providing either a fortnightly or monthly return of all attendances and visits, these returns, when completed, to be forwarded to the regional referee's office, there to be tabulated.

Let some suitable remuneration be granted from the local medical pool to these public-spirited gentlemen for their labours on behalf of the rest of the profession.

From these compact reliable returns the average number of attendances and visits per insured person for the area could easily be calculated.

Result.—(1) Relief to 90 per cent. of practitioners of much irksome and tiresome work. (2) Less wear and tear of envelopes. (3) Less continuation cards required, and so less bulk. (4) More efficient clinical records: attention directed solely to making them of real value. (5) A compact reliable and easily digested set of statistics in place of a mass of unreliable figures difficult to collect or tabulate. (6) Less local inspection: statistics of attendances and visits would be worked out in regional offices.

Arguments can be adduced both for and against this proposal, but I believe those in favour far outweigh those against, and I ask panel practitioners to give it their serious consideration; it would make for simplicity, efficiency, and reduction of labour.—I am, etc.,

Bratton, Wilts, Feb. 13th.

T. WOOD LOCKET.

Note.—The germ of this suggestion appeared in the second part of an amendment placed on the agenda of the last Panel Conference by Warrington.—T.W.L.

The New Record Cards.

SIR.—I am instructed to forward to you the following resolution which was passed at a meeting of the Kingston-upon-Hull Panel and Local Medical Committee held on February 4th, 1921:

This Committee, having carefully considered the question of the new medical Record Cards and the agitation which has been fomented against them in the public press, and having heard the views of their members who have had five weeks' experience of the working of the system, desires to record its opinion that:

1. The outcry which has taken place against the Records in some press organs is quite unwarranted, probably promoted for interested reasons, and not likely to conduce either to the safety and welfare of panel patients or to the smooth and efficient working of the National Health Insurance Acts.

2. While the system is doubtless capable of improvement in some of its details, it embodies a sound and necessary principle, and, if honestly and thoroughly administered, is calculated to be of great future benefit alike to patients, doctors, and the Ministry of Health.

3. As at the Conference of Local Medical and Panel Committees, held in London on October 21st, 1920, the scheme was discussed, and it was resolved that a fair trial should be given to the new Record Cards; that decision should be loyally accepted and adhered to for at least one year, during which time efforts could be made to collate the experiences of committees and doctors throughout the country with a view to improving some of the details of the present scheme and eliminating any features which may be found to interfere with its usefulness or efficiency.

—I am, etc.,

JOS. NELSON,

Honorary Secretary.

Hull, Feb. 14th.

SIR,—May I be allowed to state that my partners and I have found that the new medical record cards entail very little extra work and we entirely approve of them.

Between us we have a panel of over 2,500. We have placed all our record cards together in cabinets in the

surgery, and find that it is a matter of only a few seconds to ask a patient to produce his or her card, find it in the cabinets, and make the required entries. It is true that clerical errors are prominent in the cards as issued, and we have found that a number of cards are missing. These are easily replaced by continuation cards. The new cards are only a month old, but we, at any rate, have "got to work" with them.

Not one of our patients has raised any objection on seeing entries made on their cards. At first we were considerably puzzled as to how to proceed on receipt of the new cards, which all arrived together, but a month's trial of them has shown that we were hasty in raising objections.

The point as to whether it is necessary to record every attendance, visit, and certificate has still to be settled. I refuse to believe that such details are required just to show whether we are earning our money. The cards are on trial, and will no doubt be amended in some way. I consider that it is very necessary to keep records of all patients, and shall be just as pleased to receive records of those who are troublesome and worry one with nothing wrong as I shall be to receive records of interesting cases.

As far as I can in the rush of work I intend to keep the records to the best of my ability, and I hope others will do the same. I am, etc.,

Uxbridge, Feb. 3rd.

H. VICKERS, M.R.C.S., L.R.C.P.

Medical Records.

SIR,—A letter from Sir W. Hodgson in the SUPPLEMENT of February 12th seems to require some reply lest panel practitioners may be misled as to the duties imposed upon them in connexion with the new record cards.

The obligation of panel practitioners in the matter are clearly laid down in the report of the Records Committee and in the instructions issued by Insurance Committees with the cards. It is not correct to state that all certificates must be entered on the card. Only first and final certificates are required.

It is not correct to state that all ailments of every kind are to be entered on the records. With regard to clinical notes and diagnosis there is no obligation to make any entry on any particular case, but the doctor must make such entries as he considers will be of value to himself, or any doctor coming after, in the treatment of the patient. A series of symbols is suggested for the recording of minor ailments should the doctor consider it necessary to enter them.

It is required that all attendances and visits are to be entered, and arrangements are provided for summarizing visits each week or month, as well as attendances where these are very frequent.

The Records Committee considered the "professional secrecy" question, and were satisfied that the arrangements they suggested and which have been set up will provide efficiently against leakage of professional information during transit from doctor to doctor.

As Sir W. Hodgson says, the system is on trial, and if he or anyone else, will devise a more simple system which would be useful and helpful as between practitioner and practitioner in the interests of patients, or, after experience, offer constructive criticisms of this system, the Insurance Acts Committee will welcome them. At the same time I would suggest that those who squeal that the shoes pinch before they have had time to try them on, are never likely to find out where they really do pinch, or to get a comfortable working fit.—I am, etc.,

Birmingham, Feb. 15th.

H. GUY DAIN.

Medical Records in Scotland.

SIR,—The insurance practitioner of to-day is required in Scotland to "furnish" records, and, according to the Scottish Board of Health, in England merely to "keep" records. The Scottish Board have omitted from their Regulations two essential words "and deliver." To establish the contention of the Board—that there is a definite obligation on Scottish panel practitioners to send their records to Insurance Committees—the Regulation should read "furnish and deliver." No travesty of the English language can clothe the word "furnish" with a meaning it has not got. If I ask a firm to furnish me with suitable appliances for filing the record cards it will do so; the delivery of the goods is another matter. I shall have to pay carriage. It would, therefore, appear that the Scottish Board are not in any essential point in advance of the English Board, and it becomes a matter for arbitration as to whether the cards are to be delivered by the practitioner or, alternatively, collected by the Board: in addition I submit that if kept and available for inspection in my consulting room I have furnished records and complied with the spirit and letter of Clause 8 (11) Terms of Service

for Practitioners, etc. Obviously records "furnished" may be delivered by the practitioner, collected by the Board, or available for inspection.

Scottish practitioners would do well to note the letter of the Scottish Board as published in the SUPPLEMENT of February 5th, 1921. No doubt we will in time receive many official documents with a quasi-judicial tone, entirely cold and unsympathetic towards the rural practitioner, indicating that the Scottish Board are drifting towards a policy of trying to enforce the record card regulations according to their own interpretation, and riding rough-shod over the practitioner. It is essential that we should as one man follow the recommendations of the Scottish Insurance Acts Subcommittee, and not transmit records to Insurance Committees until arrangements are made for reimbursement of expenses incurred.

Record keeping should not have begun until all the essentials were in the hands of practitioners. We are temporizing in Scotland until the arrival of the envelope. The scheme of the Interdepartmental Committee has begun in chaos, and is apparently in danger of ending in confusion.

We are told that the records "are designed to afford a continuous record of illness and incapacity." What about age, occupation, and, in the case of women, whether married, single, or widow, with date of such marriage or widowhood? Surely secretaries of approved societies are in a better position than practitioners to supply the details, which do not seem to be connected with a "continuous record of illness and incapacity."

It is quite obvious from the correspondence in the SUPPLEMENT and notices in the lay press that there is a wide divergence of opinion on the question of medical records. As regards the value of purely clinical records there can be no doubt in the mind of any experienced practitioner. We must remember, however, that this is just the beginning: an enlightened Board of Health will at an early date consider the question of embodying the records of welfare and health visitors and records of medical inspectors of school children, so that the logical ideal will be attained, and the envelope of each insured person will contain a continuous record of health, illness, and incapacity from the cradle to the grave.—I am, etc.,

Dumfries, Feb. 12th.

GEORGE R. LIVINGSTON.

Dangerous Drugs Regulations.

SIR,—The Medical Benefit Subcommittee of the Brighton Insurance Committee have had before them, and have very carefully considered, the provisions of the draft Regulations proposed to be issued by the Secretary of State for Home Affairs under the Dangerous Drugs Act, 1920. As a result of this consideration the Subcommittee passed the following resolutions:

1. That the Secretary of State for Home Affairs be informed that the procedure which it is required, in compliance with the proposed Regulations, that insurance practitioners should adopt, will prove, under the unnecessary official interference with everyday practice, so irksome to practitioners that it will be detrimental to the interests of the injured person inasmuch as the consequence will be, in many cases, to deprive the insured person of the drug which may be necessary, and which would otherwise be given, and further if such drug is prescribed, its required advertisement on the bottle or package will have a harmful effect on the patient in many cases.
2. That the insurance practitioner should be allowed, as heretofore, every latitude in determining the drugs considered most desirable for his insurance patient without having to disclose to lay inspecting officials professional matters, and should be responsible to the Minister of Health alone for his actions in this direction.

In the discussion which took place the main points which were emphasized are as follows:

"Article 8 (8) of the terms of service for insurance practitioners stipulates: 'A practitioner is required to supply to a patient where requisite drugs and appliances, which are necessarily or ordinarily administered by a practitioner in person, or are needed for immediate administration or application or needed for use before a supply can conveniently be obtained otherwise under the Regulations.'"

It would appear from the rather vague terms of the draft Regulations, that on every occasion upon which an insurance practitioner is under the necessity of complying with the obligations undertaken as a consequence of the foregoing article, he must make, or cause to be made, in a book kept for the purpose, specific and detailed, and indeed somewhat laboured entries, if the particular drug comes within the scope of these proposed Regulations. It is strongly felt that this will be detrimental to the interests of insured persons, inasmuch as the practitioner rather than comply with the necessary clerical procedure may

refrain from giving the necessary drug. I am aware that Sir Edward Troup, Permanent Under-Secretary at the Home Office, in a letter which appeared in the *Times* of February 9th, stated as follows:

"In several important respects the Draft Regulations have been misunderstood. It has been suggested, for instance, that a doctor is required on each occasion on which he gives a hypodermic injection of morphia, or otherwise administers any of the drugs, to enter the fact in a book. This is not so. The Regulations require certain records to be kept in cases where drugs are supplied, and these apply to doctors who supply medicines to their patients, as well as to chemists who supply them on a doctor's prescription. But there is no requirement that a record has to be kept of a personal administration of the drugs by a doctor."

If Sir Edward Troup's interpretation on this point is the correct one, then it is respectfully submitted that the draft Regulations should be so amended as to make the matter quite clear.

Provided an insurance practitioner has occasion to prescribe medicines containing an amount beyond the statutory limit of any of the drugs set forth in the proposed Regulations, then the fact must be advertised on the bottle or package containing such drugs. Indeed, the article defining the "application" of the Regulations in connexion with morphine, cocaine, egonine, and diamorphine, when read in conjunction with Article (8) of the Regulations, is rather confusing. However, it is suggested that a bottle or package loudly proclaiming to the insured person the fact that it contains a certain percentage of a dangerous drug is not conducive to that serene frame of mind which, in the interests of the patient himself, his medical attendant would wish him to cultivate.

It is hoped that your influential journal will see its way to support the views above expressed and make every endeavour to get the proposed Regulations so amended as to entirely safeguard the interests of the country's insured population.—I am, etc.,

JNO. CAMPBELL,

Acting Clerk to the Insurance Committee for the
Borough of Brighton.

February 11th.

Medical Benefit.

SIR, I agree with everything in the letter you publish from Dr. Eates, of the London Panel, under date January 15th, sent to the Minister of Health. I believe every panel practitioner in the country could tell the same tale of insured persons being removed from his list through errors either of the Insurance Committees, the approved societies, or both. People are removed, and when the doctor tells them they can no longer be attended as panel patients they are surprised—they say they are stamping their cards, and produce them for us to see. They urge there is a mistake, and very often there is. I have been told officially that it is the doctor's duty to satisfy himself that a person is entitled to benefit. Why the doctor? To do this involves a weary correspondence with the Insurance Committee and the approved society, and very few men have the time to do it—they simply "let things go." It does not so much matter for a townsman with a large panel, but the country doctor, with a small panel and most of his patients many miles away, loses not only his capitation fees but his mileage.

Like Dr. Eates, I consider that our record cards supplied under the new Regulations are "wofully incomplete," and the reason given by the Northumberland Insurance Committee is that the supplies have run short at the Ministry of Health.

I hold that when an insured person is removed from a doctor's list, he should be told at the time in plain language which he can understand that until he is restored to that list he must pay for his medical attention. The term "ceased to be insured" is too vague, and it should be explained why he has "ceased to be insured." I often get such a removal notice, and I know the person is in regular insurable employment, but unless I give myself infinite trouble writing letters and making inquiries I never find out, and then I hear it was all a mistake, after losing possibly several quarters' fees. Why should we be penalized through the mistakes of others? I have long pointed out that all the penalizing falls on the doctor and never on the Insurance Committee, the approved society, nor the insured person. We not only have our own clerical work to do, but a vast deal that should belong to others.

I have definitely come to the conclusion that these matters are becoming worse. It would seem that with the increase of officials all round the work of the Insurance Act is less efficiently performed than it was in its early days.—I am, etc.,

Felton, Northumberland, Feb. 7th.

ROBERT A. WELSH.

Evening Surgery.

SIR,—I was very glad to see Dr. Wightman's letter, in the SUPPLEMENT of February 5th, about evening surgeries in the country. As regards my own practice, which is a very scattered one, there has never been an evening surgery and no grounds of complaint have arisen on that account. Any urgent case is seen at the surgery at any time, and it is much more convenient for the great bulk of my patients, who reside several miles away, to be seen at their own homes. I think we should hold out strongly against compulsory evening surgeries. Surely we should be allowed a short space of leisure in the evenings after a strenuous day's work. We have precious little time as it is that we can call our own, our days and nights being often taken up with work.—I am, etc.,

Caxton, nr. Cambridge, Feb. 8th.

P. HUGHES DUDLEY.

LOCAL MEDICAL AND PANEL COMMITTEES.

BIRMINGHAM.

A MEETING of the Birmingham Panel Committee was held on February 1st, with Dr. DAIN in the chair. The Birmingham Insurance Committee intimated that the "datum line" in connexion with the scrutiny of prescriptions was, as suggested by the Panel Committee, fixed at 75 per cent. above the average cost of prescriptions issued during the previous quarter. In reply to a letter from the Dewshury Panel Committee suggesting the giving up of the use of the telephone by practitioners as a protest against the new rates, it was decided to take no steps.

The Secretary was instructed to write, protesting against the proposed Regulations under the Dangerous Drugs Act, to the Home Secretary, the Ministry of Health, the General Medical Council, the Royal Colleges of Surgeons and Physicians, to local Members of Parliament, University representatives in Parliament, and Sir Gilbert Barling.

It was decided to refrain from asking for a special conference of Panel and Local Medical Committees to consider the record cards, as had been requested by the Cheshire Panel Committee.

DEVON COUNTY.

The following resolution was passed at a meeting held on February 11th, 1921:

That the Devon County Panel Committee recognizes that the keeping of some form of continuous medical record is not only desirable in the interests of patients, but constitutes one of the duties of panel practitioners; and that such duty was definitely considered as part of the service to be paid for when the case for increased remuneration was put before the Arbitration Board in 1920; and that while it does not approve the present form as best suited for its purpose, the Committee advises Devonshire practitioners loyally to carry out the decision of the Conference of Representatives of Panel Committees in 1920, and to give the new record forms a trial before passing a formal opinion thereon.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Commander R. Connell to the *Cleopatra*. Surgeon Lieut. Commanders H. E. R. Stephens, O.B.E., to the *Alacrity*, H. E. Scargill to the *Horvath*, W. J. Morris to the *Endeavour*. Surgeon Lieutenants J. H. B. Crosbie to the *Victory*, additional for Haslar Hospital, G. V. Hobbs to the *Iron Duke*, R. Biddle, O.B.E., to the *Hackbus*.

ARMY MEDICAL SERVICE.

Colonels T. V. Forrest, C.B., C.M.G., and S. L. Cummins, C.B., C.M.G., retire on retired pay.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel M. P. Corkery, O.B.E., is placed on the half-pay list on account of ill health.

Lieut.-Colonel J. Grech, D.S.O., retires on retired pay, November 23rd, 1920, and is granted the rank of Colonel (substituted for notification in the *London Gazette*, November 12th, 1920).

Major H. G. Pinches retires on retired pay, and is granted the rank of Lieutenant-Colonel.

Major J. A. Manifold, D.S.O., to be an assistant Professor, Royal Army Medical College.

The following relinquish the acting rank of Lieutenant-Colonel: Major H. T. Wilson, D.S.O., Captain and Brevet Major R. E. Barnsley, Major C. R. M. Morris, D.S.O.

The following Captains to be Majors: Brevet Major J. A. Manifold, D.S.O., S. S. Dykes, W. H. O'Riordan, M.C., C. T. V. Benson (acting Lieut.-Colonel) W. P. MacArthur, D.S.O., O.B.E., (acting Major) R. C. Priest, Brevet Major S. Tomlinson, D.S.O., (temporary Major) A. D. Stirling, D.S.O., G. P. Taylor, D.S.O., M.C., R. C. Paris, E. C. Lambkin, D.S.O., M.C., O. W. McSheehy, D.S.O., O.B.E., Brevet Major M. J. Williamson, M.C., C. L. Franklin, M.C., M. White, M.C., J. J. D. Roche, H. P. Joyn, A. S. M. Windsor, H. R. Edwards, J. R. Yonell, P. G. M. Elvery, D.S.O., M.C., J. J. H. Beekton, W. B. Rennie, M.C., W. Mathieson, O.B.E.

Captain L. F. K. Way, D.S.O., retires, receiving a gratuity, January 14th, 1921, and is granted the rank of Lieut.-Colonel. (Substituted for the notification in the *London Gazette*, January 13th, 1921.)

Temporary Captain W. L. Hay relinquishes the acting rank of Major.

The notification in the *London Gazette* of January 13th, 1921, regarding Major J. Startin, M.C., is cancelled.

The name of Captain Geoffrey Dowson Gripper is as now described, and not as in the *London Gazette* of May 9th, 1919.

To be Captains: Lieutenants (temporary Captains) P. A. Stewart, J. C. Collins, W. I. Fitzg., Powell, G. W. B. Shaw, W. C. Mackinnon. To be temporary Captains: F. W. Harlow, late temporary Captain, with seniority from December 19th, 1914; temporary Lieutenant O. T. J. C. de H. Clavre.

The following officers relinquish their commissions: Temporary Captains and retain the rank of Captain: R. Graut, J. Monroe, L. V. Gatt, C. F. Strange.

ROYAL AIR FORCE.

MEDICAL BRANCH.

The following are granted short service commissions as Flight Lieutenants, retaining their present seniority, with effect from February 4th: S. E. Duff, C. McC. Jones.

Flight Lieutenant R. Mugliston resigns his short service commission and is permitted to retain the rank of Captain.

F. R. Humphreys (Major R.A.M.C. T.F.) is granted a temporary commission as Flight Lieutenant and to be honorary Squadron Leader.

INDIAN MEDICAL SERVICE.

Major R. H. Bott, M.B., F.R.C.S., Professor of Operative Surgery, King Edward Medical College, Lahore, has been granted combined leave for eight months.

Lieut.-Colonel G. Tate, M.B., Officiating Professor of Midwifery, King Edward Medical College, Lahore, appointed to act as Professor of Operative Surgery in the College in addition to his own duties during the absence on leave of Major Bott.

Major W. S. Patton, M.B., has been placed on special duty under the Director-General, I.M.S.

Major J. McPherson appointed to hold charge of the current duties of the office of Political Agent, Eastern Rajputana States, in addition to his own duties (December 16th, 1920).

The following officers have been appointed to the service permanently, with effect from March 14th, 1920: B. Z. Shah, P. C. Banerjee, B. Sabai, D. B. Thapar.

The undermentioned officers have been permitted to retire from the service, with effect from the date specified:—Lieut.-Colonels: J. L. Macrae, October 21st, 1920; R. H. Castor, November 9th, 1920; J. Davidson, D.S.O., November 27th, 1920; C. A. Johnston, C.B., D.S.O., October 30th, 1920.

In the list of Majors promoted to be Lieutenant-Colonels, published in our issue of February 5th, p. 36, the name of G. Fowler was incorrectly printed.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major W. T. Rowe, M.C., to be Lieutenant-Colonel and command 3rd Northern Casualty Clearing Station.

Captains to be Majors: A. Robertson, O.B.E., R. G. Badenoch, G. T. Willan, D.S.O.

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 9 p.m., Second Lettsoman Lecture by Mr. George E. Gask, C.M.G., D.S.O.: The Surgery of the Lung and Pleura.

MIDDLESEX HOSPITAL MEDICAL SCHOOL, W.—Emeritus Lectures, 3 p.m.—Tues., Sir A. Pearce Gould: Surgery. Fri., Sir R. Douglas Powell: Phthisis.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—Tues. and Thurs., 5 p.m., Dr. M. Ruth Flack: Miroly Lectures—Respiratory Efficiency in Relation to Health and Disease.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C.—Mon., 5 p.m., Arris and Gale Lecture by Professor J. Howell Evans: The Azygos System of Veins in their Association with Surgical Affections.

ROYAL SOCIETY OF MEDICINE.—Section of Medicine: Guy's Hospital, Tues., 4-5.30 p.m., Tea, and Demonstrations by the Physicians and Assistant Physicians: 5.30 p.m., Dr. G. H. Hunt: Cardiac Efficiency; Mr. J. M. H. Campbell: Causation of Dyspnoea; Dr. J. A. Ryle: The Fractional Test Meal. Section of Tropical Medicine: Thurs., 5 p.m., Election of Officers and Council; Presidential Address by Sir Leonard Rogers; Paper by Dr. J. Gordon Thomson and Dr. A. Robertson: Laboratory Reports in the Diagnosis of Suspected Dysentery; Demonstrations by Professor Leiper and others. Section of Urology: Thurs., 8.30 p.m., Clinical and Pathological Evening; specimens will be shown. Section for the Study of Disease in Children: Fri., 4.30 p.m., Discussion on the Diagnosis and Treatment of Congenital Syphilis and its Effects, to be opened by Sir H. D. Rolleston and Mr. O. L. Addison. Section of Epidemiology and State Medicine: Fri., 8.30 p.m., Dr. R. M. F. Picken: Epidemiology of Measles in a Rural and Residential Area. Clinical, Medical, and Surgical Sections: Fri., 8.30 p.m., Adjourned Discussion on the Medical and Surgical Treatment of Graves's Disease; Mr. Donald Arnorn, Dr. J. M. H. Campbell, Mr. W. H. C. Romanis, Mr. A. J. Walton, Professor Earle, and others.

ST. JOHN'S HOSPITAL, 49, Leicester Square, W.C.2.—Thurs., 6 p.m., Dr. W. Griffith: Chesterfield Lecture—Diseases of the Skin Appendages.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Maternity and Women's Hospital.—Wed., 4.15 p.m., Dr. S. J. Cameron: Obstetrical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Thurs., 4 p.m., Dr. T. Thompson: Neuritis.

MANCHESTER: ANCOATS HOSPITAL.—Thurs., 4.30 p.m., Dr. Stirling: Treatment of Common Eye Diseases.

MANCHESTER BABIES' HOSPITAL, Slade Lane.—Sat., 3.30 p.m., Dr. Chisholm: The Non-thriving Infant.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Mr. P. R. Wrigley: Choleraeitis.

MANCHESTER: ST. MARY'S HOSPITAL (Whitworth Street West Branch)—Fri., 4.30 p.m., Dr. Lacey: Toxaemias of Pregnancy.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westminster Street, W.1.—Mon., 5.30 p.m., Dr. Hamill: Myocardial Disease.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Daily (except Wed. and Sat.) 2 p.m., Out-patient Clinics. Lectures, 3.30 p.m.—Mon., Dr. K. Wilson: Hysteria; Tues., Dr. Collier: Diseases of the Cranial Nerves; Thurs., Mr. Scott: Disturbances of the Vestibular System; Fri., Dr. G. Stewart: Affections of the Pituitary Gland.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Lectures, 5 p.m.—Mon., Dr. G. Stewart: Locomotor Ataxia; Tues., Dr. Burnford: Functions of the Digestive Tract; Wed., Mr. Armour: Abdominal Tumours; Thurs., Mr. S. Edwards: Rectal Surgery; Fri., Mr. Addison: Carcinoma of the Breast.

CURRENT NOTES.

Meeting of Council.

At the meeting of the Central Council held on February 16th congratulations were accorded to Sir Dawson Williams, Sir Squire Sprigge, Sir Charles Ryall, Sir William Hodgson, and Sir Alexander J. Hood of Sydney, on the knighthoods conferred on them at the New Year. Dr. J. A. Macdonald gave an extremely interesting account of his recent visit to the South African Branches, and the welcome he received everywhere throughout his tour. The Council expressed its pleasure at the conspicuous success with which Dr. Macdonald had acted as its representative in South Africa. Among the many important matters discussed was that of the steps to be taken whereby the Association may become in part a federation. The Council approved for publication in an early issue of the SUPPLEMENT an exhaustive report on this subject submitted in draft by the Organization Committee, and resolved to convene an extraordinary general meeting of the Association, to be held at Newcastle on July 19th, 1921, immediately after the statutory Annual General Meeting, for the purpose of adopting the amended articles and by-laws. An account of the complimentary luncheon given to Sir Dawson Williams, Editor of the BRITISH MEDICAL JOURNAL, by the Council, appears in the JOURNAL at p. 309. The usual report of the proceedings of Council will shortly be published in the SUPPLEMENT; but the position in regard to the draft Dangerous Drugs Regulations, as reported to the Council on February 16th, is described in a Current Note below.

Dangerous Drugs Regulations.

The Divisions of the Association and the Local Medical and Panel Committees are to be congratulated on the prompt way in which most of them have taken action in regard to the Regulations of the Home Office under the Dangerous Drugs Act. The Home Office has received many communications from individual doctors as well as from Divisions and Local Medical and Panel Committees, and many members of Parliament have been stimulated to action in regard to these unfortunate Regulations.

As reported in Current Notes last week, the Home Office has sent a statement of the modifications it is prepared to make in the Regulations; and this was considered by the Council on February 16th. The letter, summarized, states:

1. That there is no reason why prescriptions should not be either typewritten or printed.

2. That it is recognized that it will not be necessary to write the words "not to be repeated" on a prescription containing one of the drugs.

3. That the Regulations were not intended to try to get a record of drugs administered personally or under the direct supervision of a practitioner—that direct administration would not be held to be "supply" under the Regulations.

4. Suggestions are made for the simplification of the record demanded, and it is proposed now that one book instead of four shall be kept for the record so long as each of the four drugs is dealt with on separate pages, and that in the record, in addition to the date, name and address of the patient, it should only be necessary to make a cross reference to the prescription containing the drugs in the doctor's day book.

5. That Regulation 8 does not apply to preparations of the drugs which contain less than the percentages mentioned in Regulation 1, and that therefore the Association is in error in supposing that any package or bottle containing any preparation which contains one of the drugs, in whatever proportion, was intended to be marked with the name of the drug and the percentage thereof on the label. The Secretary of State is, moreover, prepared to drop the suggestion that the name and quantity of the drug shall be stated on the label of any medicine dispensed by a doctor or by a chemist on a doctor's prescription.

6. It will not be necessary to keep records at each separate branch surgery or house of call. All that will be required will be a record wherever the doctor keeps a separate day book.

7. There will be no difficulty about a doctor getting a supply of drugs by a telephone message, and alterations will be made in the Regulations to make it quite clear that the delivery by a chemist to his own messenger or to any common carrier for the purpose of delivery at a doctor's house is not intended to be covered by the Regulation.

The Council decided to express no opinion on the new proposals of the Home Office until the Regulations have been seen in their new form, and the Home Office has been so informed. In the meantime the Association, in conjunction with the British Dental Association, the Pharmaceutical Society of Great Britain, and other bodies concerned, is pressing the Home Secretary to receive a deputation, to urge on him (1) that Regulations of this kind should not have been issued, and shall not in future be issued, until the organizations concerned have been effectively consulted; (2) that the draft Regulations should be withdrawn pending the discussion of the subject by a small expert committee.

The attitude of the profession should continue to be one of great vigilance, as it may be necessary to call upon Parliament to object to the draft Regulations if the Home Office insists on placing them before the House without reference to an expert committee.

The Army Medical Service.

The attention of the Association has been called to an Army Order altering the dress distinctions on the cap and tunic of general officers and officers of the administrative staff, and it is understood that this is causing a considerable amount of irritation in the R.A.M.C. and amongst the officers concerned. It is unfortunate, from the point of

view of the medical profession, that such action should have been taken, as it appears to mean the restoration of class distinctions between medical and combatant officers. This element of class distinction created much discontent in the Medical Service of the Army in the years before it was constituted a Royal Corps, and it is a well-known fact that the professional efficiency of the R.A.M.C. made great advances as a result of its abolition, with corresponding advantage to the Army as a whole. The most bitter opponents of the changes which were then made in ranks and titles of medical officers now recognize their value. When the war broke out, the only rank which might be called a class distinction rank was that of surgeon-general, and this was altered to major-general early in 1918. Major-Generals, A.M.S., then wore the scarlet cap and gorget patches of the rank, while officers of the administrative medical staff of junior rank wore the blue cap band and gorget patches of other administrative staff officers. The new Army Order changes all this. Major-Generals, A.M.S., must now revert to the black velvet band and patches of surgeon-general, while administrative medical officers revert to bands and patches of dull cherry, the colour of the R.A.M.C. facings. The class distinction introduced by the new Order is made more significant by the fact that, although it affects the small number of senior officers of the Royal Army Ordnance, Veterinary, and Pay Corps, it does not affect those in the Royal Army Service Corps or the many officers of general rank who are, or were, employed on duties which were quite as far removed from combatant work as that of the A.M.S. It will be the duty of the Association to watch the effect of this Order, and to take any steps that may appear necessary to safeguard the interests of R.A.M.C. officers.

I.M.S. Pay—Civil Branch.

The Association has received a number of complaints from I.M.S. officers in civil employ owing to the fact that they have not yet received the increase of pay as promised last July. Very strong representations have been made to the India Office, and a letter has been received stating that a telegram has been sent to the Government of India asking that adjustment of arrears and pay due under the new scale shall be specially expedited. Representations have also been made privately, and the Chairman of the Committee has been given an unequivocal promise from a high quarter that the undertaking of the Secretary of State will be kept in full and that all back pay which is due will be given. The Naval and Military Committee is watching this matter very closely, and officers of the I.M.S. may confidently leave their interests in its hands.

Association Notices.

SUGGESTED CHANGES OF AREAS.

Proposed Ealing Division.

NOTICE is hereby given to all concerned of a proposal, made at a meeting of the members of the Association resident in the Ealing district, held on February 17th, 1921, that so much of the present South Middlesex Division as is contained within the Municipal Borough of Ealing, the Urban Districts of Hayes, Greenford, Southall-Norwood, Hanwell, Acton, Chiswick, and Brentford, be detached from that Division to form a separate Division, to be called the Ealing Division. Written notice of the proposal has been given to the Metropolitan Counties Branch and the South Middlesex Division, and the matter will be determined in due course by the Council. Any member affected by the proposed change, and objecting thereto, is requested to write, giving the reason therefor, to the Medical Secretary, 429, Strand, W.C., not later than March 26th, 1921.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—The winter clinical meeting of the Edinburgh Branch will be held in the Royal Infirmary on Friday, March 4th. All members of the profession are cordially invited. The museum will be open from 11 a.m. Arrangements will be made for holding special clinics during the forenoon. The clinical meeting will be held at 3.15 p.m. At 5 p.m. Dr. J. S. Haldane, LL.D., F.R.S., Oxford, will deliver a lecture on "Some recent advances in the physiology of respiration, circulation, and renal excretion." There will be dinner at 6.30 p.m. in the Caledonian Station Hotel; morning dress; dinner ticket, price 10s. 6d. Members of the Branch are requested to notify the Honorary Secretaries not later than February 28th whether or not they intend to be present.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.—A meeting of the Camberwell Division will be held on Wednesday, March 2nd, when Dr. H. C. Cameron, of Guy's Hospital, will give an address on Children.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.—A meeting of the City Division will be held at the Metropolitan Hospital on Wednesday, March 2nd, at 9.15 p.m., when Mr. McAdam Eccles will give a British Medical Association lecture on the Early Diagnosis of Acute Abdomens. A general meeting of the Division will be held on March 9th, and a dinner-dance will take place at the Abercorn Rooms, Great Eastern Hotel, on March 31st.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH: EALING DIVISION.

A MEETING of the members of the Association in Ealing and the neighbourhood, held at Ealing Broadway on February 17th, was well attended by practitioners from all parts of this area.

After some introductory remarks by Dr. GOODALL, President of the Metropolitan Counties Branch, Dr. J. W. BELL (North Ealing) was unanimously elected to the chair.

The following resolution was unanimously passed:

That the Council of the British Medical Association be requested to constitute a new Division of the Association, to be called the Ealing Division, which shall include all members resident in the borough of Ealing, the urban districts of Hayes, Greenford, Southall-Norwood, Hanwell, Acton, Chiswick, and Brentford.

The following officers were elected:

Chairman: Dr. J. W. Bell (Ealing). *Honorary Secretary:* Dr. J. A. Davidson (Golden Manor House, Hanwell). *Executive Committee:* Dr. Thomas Orr (Ealing), Dr. S. M. Banham (Ealing), Dr. Agnes Dunnell (Ealing), Dr. J. L. Timmins (Acton), Dr. G. Thomson (West Ealing), Dr. H. H. Tomkins (South Ealing), and Dr. A. H. Hart (Southall). *Representatives on Branch Council:* Dr. J. A. Davidson, and Dr. Agnes Dunnell.

Dr. ANDERSON, Deputy Medical Secretary of the Association, having spoken on the services rendered by the Association in the interests of its members, an animated debate followed. Questions were asked, and answered by Dr. ANDERSON and Mr. BISHOP HARMAN. Confidence in the power of the Association to help its members was freely expressed, and the proceedings terminated with a cordial vote of thanks to the Deputy Medical Secretary and members and officials of the Branch who visited Ealing for the occasion.

MALAYA BRANCH.

A Correction.

In the report of the proceedings of the Malaya Branch, published on December 18th, 1920, p. 166, it was incorrectly stated that the salaries paid to medical practitioners in the Government service were *inadequate*; it should have been stated that the meeting considered that the salaries were *adequate*.

CONFERENCE OF STAFFS OF VOLUNTARY HOSPITALS IN SCOTLAND.

A CONFERENCE of representatives of the honorary medical staffs of voluntary hospitals in Scotland, convened by the Hospitals Subcommittee of the Scottish Committee, was held in the offices of the Association, 6, Rutland Square, Edinburgh, on February 5th, to consider what is the general opinion of hospital staffs as to how the present financial difficulties of voluntary hospitals should be met. All the teaching hospitals were represented, as well as a large number of the smaller general and special hospitals throughout the country. Dr. R. C. BURST, Chairman of the Hospitals Subcommittee, presided.

It was moved on behalf of the Hospitals Subcommittee:

That the voluntary method of administration of the voluntary hospitals of the country should be maintained.

Dr. NORMAN WALKER moved an amendment:

That the present methods of administration of the voluntary hospitals should be continued.

He instanced the difficulty of defining "voluntary," and argued that where so many differences of opinion existed and when so many proposals were being considered, some of which might be thought to conflict with the voluntary principle, it was better to adopt a resolution in general terms which would cover everything that was at the present time regarded as voluntary.

The CHAIRMAN, on behalf of the Subcommittee, accepted the proposal, and called for a discussion on the general question.

Dr. STEPHEN (Banff) said he had been instructed to oppose the motion. He and his colleagues felt that it was no longer possible to carry on the smaller hospitals and to provide the necessary up-to-date equipment from voluntary sources alone, and that they must look for help from the State or elsewhere. Dr. McFARLAN (Stirling) said that the staff of his infirmary took the same attitude.

Dr. WALKER, in reply, pointed out that while changes might be required in connexion with some hospitals, they

would not be wanted everywhere. He, in common with the majority of people who considered this question, wished the voluntary principle to be maintained as far as possible.

The motion was agreed to.

The second motion standing in the name of the Subcommittee—

That necessitous persons shall continue to be treated free.— was withdrawn, the meeting being of opinion that the principle was sufficiently expressed in the previous motion.

Considerable discussion took place on the next motion, proposed by the Hospitals Subcommittee:

That it is undesirable that the voluntary hospitals should be subsidized by the local rating authorities, except in so far as payment is made for the examination and the care of patients for whom these authorities are responsible.

Dr. WALKER moved as an amendment:

That except under special circumstances it is not desirable that voluntary hospitals should be subsidized by the local rating authorities.

He preferred "not desirable" to "undesirable" as being less committal. The whole motion was too specific, and they would require a definition of the word "subsidized."

Dr. TROTTER (Perth), who seconded the amendment, said that Perth Royal Infirmary had approached the local authorities for relief of rates on the ground that they were a voluntary hospital.

Dr. BALLANTYNE (Glasgow) asked if the motion would preclude the acceptance of subscriptions from the local authority out of the "Common Good." He suggested that an addition should be made to show that it was taking money out of the rates that was objected to.

The CHAIRMAN pointed out that a corporation might make a contribution in its capacity as an employer or in return for beds being retained for a special purpose. Such a contribution would be in keeping with the voluntary principle, but a contribution given as a rating authority on behalf of the citizens raised a very different issue.

Dr. STEVENS (Edinburgh) supported the motion in that it supported the principle of payment for work done, and would not in any way compromise the hospital accepting payment. Professor MONRO (Glasgow) also supported the motion, objecting to the amendment as lacking in definiteness.

Dr. SNODGRASS (Chairman of the Scottish Committee), said that if they had a regular subsidy from the corporation they would have regularized control. "We want" (he said) "to avoid the hospitals being controlled by the State or municipality. We do not object to voluntary subscriptions from a corporation, but we object to a regularized system which would involve control."

The amendment was rejected, and the motion was carried with the substitution of "not desirable" for "undesirable."

The next motion was by the Hospitals Subcommittee:

That greatly extended support for voluntary hospitals should be sought from employers, employees, and insurance companies.

An amendment by Dundee Royal Infirmary to insert "and organized" between the words "extended" and "support" was accepted.

An amendment was proposed by Dr. NORMAN WALKER:

That the ever-increasing demand for the upkeep and extension of the existing and the provision of new hospitals necessitates an appeal to all sections of the community for increased support.

He wanted to broaden this motion for many reasons. Most hospitals had managed to carry on last year only by making a very special effort, and it was doubtful if this special effort could be made again. More hospital beds were required, and he could not see where the money was to come from to provide them. All classes of the community benefited, directly or indirectly, from the existence of the voluntary hospitals, and it ought to be brought home to the public how much they had benefited.

Professor MACKINTOSH supported the amendment, and felt that it would be a mistake to seem to pillory employers in this way. Mr. WADE thought it most desirable that the motion should not be altered since all present were prepared to defend the voluntary principle. If the voluntary principle did best for the country, then it must be maintained. Employers were beginning to realize more and more how much they benefited financially from the work done in hospitals.

After further discussion the motion was carried by a small majority, and the following rider was agreed to:

That the ever-increasing demand for the upkeep and extension of existing hospitals and for the provision of new hospitals necessitates greatly extended and adequately organized support by all sections of the community.

The Hospitals Subcommittee proposed:

That every patient of a voluntary hospital who is not a necessitous person should make a contribution, during treatment, towards the cost of maintenance, except where the contributory method of subscription is adopted as essential in industrial areas.

Professor MONRO (Glasgow Western Infirmary) opposed the motion. He objected to the principle, and believed it would be difficult to carry out in practice, with any degree of justice. Professor BOYD (Edinburgh Royal Infirmary) also opposed it, and said that the Royal Infirmary staff could not accept the motion.

Mr. PRINGLE (Glasgow Royal Infirmary) said the position in Glasgow was different from that in Edinburgh, because patients were not admitted to the Glasgow Royal Infirmary without a subscriber's line. The staff were unanimously of opinion that some steps should be taken to obtain contributions from patients who were able to pay. Dr. DIXON (Hawick) said that the principle had always obtained in their hospital and there had never been any difficulty. Dr. WALKER believed the contributory method promised the best results; the exacting of payment from patients would conflict with it, and would meet with opposition from the managerial side.

Professor MACKINTOSH (Aberdeen), though he agreed that patients did not give nearly as much as they ought to, could not agree to the proposal to make it a rule that persons under treatment should make a contribution.

The motion was rejected.

A motion that hospital almoners should be appointed was also lost.

The following was agreed to unanimously:

That where voluntary hospitals provide accommodation for patients who are able to pay for maintenance and treatment no fixed rate of payment for professional services rendered to such patients should be established, the fees so payable to remain as at present a matter of arrangement between patient, family physician, and consultant.

The motion by the Hospitals Subcommittee—

That in the event of decisions being taken which would lead to patients paying, in part or in whole, the hospital maintenance fees, either individually or by some contributory method, or with the addition of rate aid or State aid, or by a combination of two or more of these methods, a percentage of all such payments shall be passed into a fund which can be allocated in any manner which such honorary medical staff may determine.—

was rejected in favour of the resolution of the former Conference—namely:

That when a hospital receives payment from any public body for the treatment of individual cases a reasonable proportion of the amount received be put at the disposal of the medical staff.

The following motion by Glasgow Royal Infirmary was referred to the Hospitals Subcommittee for inquiry and action:

That in respect that the training and education of nurses is a branch of secondary education, voluntary hospitals, which are recognized training schools for nurses, should receive Government grants-in-aid as are given to schools for ordinary secondary education.

It was unanimously resolved:

That this Conference of Representatives of Medical Staffs of Voluntary Hospitals of Scotland, convened by the British Medical Association, considers that the questions discussed by the Conference are of great importance and by no means solved as yet. The Conference therefore believes it would be well to have the mechanism whereby a similar conference could be called as and when necessary. To this end the Conference desires to ask the Scottish Committee to authorize its Hospitals Subcommittee to call a Conference when deemed desirable.

The meeting concluded with a vote of thanks to the Chairman for his conduct of the business.

INSURANCE.

CONFERENCE OF REPRESENTATIVES OF PANEL COMMITTEES (GROUP F) AT BIRMINGHAM.

A MEETING of Representatives of Panel Committees comprising Group "F" was held at Birmingham on February 8th.

The SECRETARY (Birmingham Panel Committee) stated that no replies had been received to the invitations sent for the meeting from Burton on Trent, Worcester, Derbyshire, Derby and Leicestershire.

Dr. DAM (Chairman of the Birmingham Panel Committee) explained the objects of the conference, and said that he had been asked by his committee to arrange for a meeting of representatives of Panel Committees forming Group "F," to consider the formation of a Standing Joint Committee for that group, that in several groups such a committee had already been formed and found to be very useful. He stated that if it was decided to form one for Group "F," he thought the

Birmingham Panel Committee would be pleased to offer their room for the purpose of holding the meetings, and this offer was accepted.

Dr. Dain was then elected chairman for the meeting, and on a motion by him, it was decided to form a Standing Joint Committee. Several members considered that such a committee would be very useful and would strengthen the hands of their representatives on the Insurance Acts Committee.

The model scheme for the constitution of a Standing Joint Committee contained in M. 28 British Medical Association, was then considered, and the following scheme adopted:

1. There shall be a Standing Joint Committee for those Local Medical and Panel Committees comprised in Group "F," which jointly nominate two members for election on the Insurance Acts Committee.

2. The objects of the Standing Joint Committee shall be:

(i) To consider any matter affecting the welfare of insurance practitioners, and to take such action as may be deemed to be necessary in the interests of the insurance practitioners in the group.

(ii) To enter into any arrangements with neighbouring Local Medical and Panel Committees or group committees thereof, for similar purposes to those stated in Clause (i).

3. The Committee shall be called the "Group 'F' Standing Joint Committee of Local Medical and Panel Committees."

4. The following Local Medical and Panel Committees shall be deemed to be members of the group, but the list shall be corrected in accordance with any fresh grouping which may in future be adopted for the constitution of the Insurance Acts Committee:

Staffordshire	Burton-on-Trent	Stoke-on-Trent
Smethwick	Walsall	West Bromwich
Wolverhampton	Warwickshire	Birmingham
Coventry	Worcestershire	Dudley
Worcester	Herefordshire	Shropshire
Derbyshire	Derby	Leicestershire
Leicester		

5. Each of the Panel Committees comprised in the group under Article (4) hereof shall appoint one representative and a deputy to this Standing Joint Committee, and these shall be elected annually at the annual meetings of the respective committees comprised in the group, and shall be eligible for re-election. The representatives with any members of the Insurance Acts Committee who reside in the area of the group (who shall be *ex officio* members) shall constitute the Standing Joint Committee of the group.

6. The officers of the Standing Joint Committee shall be chairman, vice-chairman, secretary, and treasurer.

7. The Standing Joint Committee shall meet half-yearly in the months of April and September, also before any special conference of Local Medical and Panel Committees.

8. Special meetings shall be held at the discretion of the chairman (or, in his absence, the vice-chairman), or at the request of not less than six members of the Standing Joint Committee.

9. Two weeks' notice shall be given of the holding of all regular meetings; and for special meetings not less than three days' notice, and not more than seven days' notice, when called on demand.

10. An annual capitation, the amount of which shall be fixed annually in accordance with the requirements of the Joint Committee, but shall not exceed . . . per practitioner on the respective panel lists, shall be paid by each Panel Committee to the treasurer to meet the expenses of the Standing Joint Committee.

(A discussion here took place as to the amount to be fixed, and it was decided that this should be brought up again at the next meeting, after the representatives had reported to their committees.)

11. An annual financial statement shall be prepared by the treasurer and presented to the meeting held in the month of April in each year.

Dr. CROFTS (Leicester) suggested on behalf of his committee that Group "F" be divided into two single-member constituencies for the purpose of electing representatives on the Insurance Acts Committee. After some discussion, it was decided that the various Panel Committees should consider the proposal and their views be brought forward at the first meeting of the Standing Joint Committee.

On the motion of Dr. RIDLEY BAILEY (Insurance Acts Committee), the following resolution regarding the proposed Regulations in connexion with the Dangerous Drugs Act was carried unanimously:

That the representatives of the Panel Committees comprising Group "F" assembled in conference in Birmingham, strongly protest against the proposed Regulations of the Dangerous Drugs Act, and call upon the Government to withdraw the Regulations affecting the medical profession, as they are impracticable to carry out and likely to militate against the proper use of the drugs scheduled.

The Secretary was asked to forward a copy of the resolution, together with a list of the Panel Committees referred to, to the Prime Minister, the Chancellor of the Exchequer, the Chancellor of the University of Birmingham (Right Hon. Lord Robert Cecil, M.P.).

Drs. DAIN and RIDLEY BAILEY referred to several matters at present being discussed by the Insurance Acts Committee with the Government.

It was decided to hold the first meeting of the Standing Joint Committee on Thursday, April 14th, at 3.15 p.m., the business to be to elect officers; and the Secretary of the Birmingham Panel Committee was asked to send out the notices.

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 8.30 p.m., Discussion on the Chemical Estimation of Gastric Function, to be introduced by Dr. J. H. Ryffel, M.A., Dr. J. A. Kyle, Dr. T. I. Bennett, Dr. R. L. M. Wallis, Mr. E. C. Dodds, Dr. G. Graham, Dr. C. Bolton, Dr. R. Hutchison, Dr. W. H. Wilcox.

MIDDLESEX HOSPITAL MEDICAL SCHOOL, W.—Emeritus Lectures, 3 p.m.—Tues. and Thurs., Dr. W. McC. Wanklyn: Future of the Medical Profession.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—Tues. and Thurs., 5 p.m., Dr. George Graham: Goulstonian Lectures—Glycaemia and Glycosuria.

ROYAL SOCIETY OF MEDICINE.—Section of *Otolaryngology*: Mon., 8 p.m., Mr. W. W. James: Dental Infection; Mr. P. Cole: Pedicle Bone Grafts Two Years after Operation. Section of *Surgery, Subsection of Orthopaedics*: Tues., 5 p.m., Cases; 5.30 p.m., Discussion on Recurrent Dislocations (Shoulder, Patella, etc.) and their Treatment, opened by the President, Mr. Laming Evans (Shoulder); Mr. W. Rowley Bristow (Patella). Examples of the condition will be shown. Section of *Pathology*: Bacteriological Department, Guy's Hospital, S.E.1, Tues., 8.30 p.m., Demonstrations, Dr. E. P. Poulton: (1) Modification of Van Slyke's Method of Measuring Oxygen in Blood; (2) Method of Obtaining Alveolar Air Samples in Untrained Persons. Section of *Surgery*: Wed., 5.30 p.m., Demonstration, Mr. Edred M. Corner: The Fate of Silk Nerve Regeneration, and Internal Scars (Amputations); Pathological Specimens, Skiagraphic Plates, Prints, and Illustrations will be on view at 4.30 p.m. Section of *Obstetrics and Gynaecology*: Thurs., 8 p.m., Specimens, Dr. Russell Andrews: (1) Two Cases of Sarcoma of the Uterus; (2) Lipomatosis of Stroma of a Uterine Fibromyoma; Papers, Dr. Geoffrey Evans: The Arteries in a Uterus twenty-four days after Delivery; Dr. Alec Bourne: Puerperal Salpingo-peritonitis. Section of *Laryngology*: Fri., 4 p.m., Cases, Section of *Anaesthetics*: Fri., 8.30 p.m., Mr. R. Apperly: Importance of Examination by Anaesthetist of Patient.

ST. JOHN'S HOSPITAL, 49, Leicester Square, W.C.2.—Thurs., 6 p.m., Dr. W. Griffith: Chesterfield Lecture—Skin Eruptions of Syphilis.

TUBERCULOSIS SOCIETY OF GREAT BRITAIN AND IRELAND, Margaret Street Hospital, W.1.—Mon., 7.30 p.m., Dr. W. Gordon: Rain-bearing Winds and Tuberculosis.

SPECIAL NOTICE TO MEMBERS.

As the subject matter of the Report of the Council contained herein will require to be dealt with by early meetings of the Divisions, this "Supplement" should be carefully preserved and taken to the Division meeting.

British Medical Association.

CURRENT NOTES.

Question of the Association Becoming in Part a Federation.

As will be seen from the report by the Council printed in this SUPPLEMENT, an interesting stage has been reached in providing the powers whereby the British Medical Association could, if and so far as might be desired, become in part a federation. It will be remembered that this question has several times been raised in connexion with some of the Australian Branches since 1895 onwards, and also more recently in connexion with Ireland. It was first raised in the Representative Body, in connexion with sectional medical bodies at home, by the Brighton Division in 1914.

The present report marks a new epoch in the history of the Association. It provides machinery whereby the Association could, if and when so desired, admit into close and formal co-operation with itself, not only Oversea Branches or groups of such Branches which consider that this would be the best way of securing that full autonomy which several Oversea Branches have asked for, but also sectional medical societies at home with which the Association has been constantly working in co-operation. As regards the Oversea Branches, the Council naturally prefers, as closest and most intimate, the existing relationship of the Oversea Branches and Federal Committees to the parent body. Thus the Council would not at all, of its own accord, propose that any Branch or Federal Committee should take steps, even preliminary to federation with the Association, whereby the Branch or Committee would cease to be a Branch or Committee of the Association. None the less, the Council recognizes that in special circumstances a Branch or group might possibly find this a good plan, as perhaps best giving that full and free self-government which some of the Oversea Branches have intimated to the Council that the interests of their work might require. If the new Articles and By-laws are adopted by the Divisions and Representative Body, and any Oversea Branch should in fact decide to take advantage of the new facilities and therefore cease to be a Branch of the Association in the ordinary sense, the Association would of course extend to it a hearty welcome as an affiliating body, and loyally do its utmost to give it the fullest and most helpful co-operation. As regards the

home societies with which the Association has in the past co-operated, it is impossible to say how many of these would take the opportunity thus provided, but at any rate if the new Articles and By-laws go through, the Association will be able to offer to bodies with whom it wishes to work and who wish to work with it, a formal status and relationship which must materially change, and the Council believes strengthen, the position of the Association.

There is a special point to which attention was drawn in the February meeting of the Council which should receive the closest attention of those who are interested in the work of the Association. The Annual Representative Meeting, Cambridge, agreed that the Articles and By-laws to provide facilities for possible federation arrangements should be so worded as to make it possible for the Association to offer federation not only to medical bodies but to bodies allied in scope and work though not purely medical. It is very desirable that the Divisions should consider seriously, before these new Articles and By-laws are adopted, whether they wish the Association to place itself in a position to become a federation of medical bodies alone, or a mixed federation of medical bodies and bodies whose scope and work have an intimate medical bearing. This aspect is dealt with in paras. 1, 4 (b), 10, and 11 of the report, draft Articles 6 and 7, and By-law 10.

Committees of Inquiry.

Evidence was given by the British Medical Association at a meeting on February 23rd of the Committee appointed by the Minister of Health, under the chairmanship of Viscount Cave, to inquire into the financial position of voluntary hospitals.

The Association has arranged to give evidence also before the Departmental Committee—over which the Earl of Athlone, Chairman of the Middlesex Hospital, is presiding—which was appointed "to investigate the needs of medical practitioners and other graduates for further education in medicine in London, and to submit proposals for a practicable scheme for meeting them." Three representatives of the Association have been appointed to deal with the matter from three different aspects. The President, the Right Hon. Sir T. Clifford Allbutt, will give evidence from the standpoint of the teacher, Dr. C. O. Hawthorne will represent the point of view of practitioners who feel the need of post-graduate work, and Mr. R. J. Willan will speak from the standpoint of the organizer of post-graduate courses.

Scholarships and Grants in Aid of Scientific Research.

It has been the custom of the Council of the British Medical Association to award annually a number of Scholarships and Grants in aid of scientific research. The Scholarships include an Ernest Hart Memorial Scholarship of the value of £200 per annum, and three Research Scholarships each of the value of £150 per annum. The Science Grants amount, in the aggregate, to £350 per annum. The Council is now prepared to receive applications for the Association's Scholarships and Grants for 1921, the awards for which will be made in July next. Forms for the purpose can be obtained from the Medical Secretary, 429, Strand, W.C.2. Further particulars will appear in an early issue.

Dangerous Drugs Regulations.

In the Parliamentary Notes in this week's JOURNAL are printed the statements made in the House of Commons by the Home Secretary regarding the advice given to him by various medical bodies. It will be seen that Mr. Shortt stated that the draft had been submitted last November to the Royal Colleges of Physicians and Surgeons, and to the General Medical Council, and subject to certain minor suggestions had been approved by these bodies, whereas the Pharmaceutical Society of Great Britain had contended that the proposal to prohibit the sale of drugs to the public except on a medical prescription was *ultra vires*. We recorded in a Current Note last week that the British Medical Association, in conjunction with the British Dental Association, the Pharmaceutical Society of Great Britain, and other bodies concerned, was urging the Home Secretary to receive a deputation and appoint a small expert committee to advise him on the redrafting of the Dangerous Drugs Regulations. As will be seen from the letter printed in the SUPPLEMENT at p. 63, the Secretary of State has declined to take this course, but suggests that each of the bodies concerned should confer separately with representatives of the Home Office. The signatories of the joint letter are meeting on Thursday to consider parliamentary action.

Work of the Public Health Committee.

The Public Health Committee at its last meeting dealt with a difficulty which has arisen in connexion with the fees payable to tuberculosis officers acting as referees to the Ministry of Pensions in connexion with the filling up of form M.R.1, and received a report that in the near future the Ministry of Pensions, in conjunction with the Ministry of Health, proposed to pay public health authorities a lump sum in respect of this work, calculated on the average cost of the work done in the past, instead of paying by fee as formerly. The Committee has asked the Ministry of Pensions to take all possible steps to ensure that this sum of money should be paid to the tuberculosis officers in addition to their official salaries. The Committee at the same time considered a proposal by the Ministry of Pensions to pay tuberculosis officers from January 1st, 1921, until the new scheme of payment comes into force, the sum of 2s. 6d. for certifying to local Pensions Committees that a pensioner whom they have been called upon to examine is or is not able to work. The Committee has informed the Ministry that it will advise tuberculosis officers to accept this fee provided that the certificate is confined to a mere statement that the man is or is not able to work. Further consideration was given to the position as regards security of tenure of medical officers of health, as the Order designed to bring this about has not yet been made effective, and it was decided to recommend the Council to authorize the Committee to draft a bill for the purpose of obtaining security of tenure. Sir Philip Magnus, M.P., has been asked to inquire why the Order giving a modified security has not yet been issued by the Ministry of Health, and he has put down a question in the House. In connexion with mileage for public vaccinators the Committee is co-operating with the Association of Public Vaccinators in an effort to draw up a model scale of mileage for this service.

Compensation for Loss of Public Health Appointment.

The Council has approved the recommendation of the Public Health Committee in regard to the position of part-time medical officers of health who have been, or may be,

dispossessed of their appointments either by absorption of area or change of boundary. The Committee reported that in its opinion an effort should be made to obtain for such officers by way of compensation a sum calculated on the following basis:

For each year of service, 1/60th of the average salary for the last five years, plus:	
For 20 years' service and upwards	... 10/60ths additional
.. 15 years' service but under 20	... 7/60ths ..
.. 10 15	... 5/60ths ..
.. 5 10	... 3/60ths ..
Under 5 years' service 1/60th ..

The Association, when requested by any medical officer of health concerned, will bring this suggested scale to the notice of any local authority in which changes of the kind mentioned are proposed.

Earl Haig's Fund for Officers and ex-Service Men.

The Council at its meeting on February 16th considered a suggestion from the Oxford Division that it should "organize an attempt whereby every medical man in this country should be asked for a minimum donation or subscription of £1 ls. to this Fund." The Council came to the conclusion that as many medical men had already subscribed to this Fund individually, and had associated themselves with appeals in various parts of the country, it would not be advisable for the Council to take any action. But the Council warmly commends the example of the Oxford Division to the other Divisions and Branches of the Association. The Oxford Division took action in November, and reports that its resolution in favour of the Fund was taken up with great enthusiasm, and that since that time a cheque for £101 has been sent to Earl Haig's Fund.

Mileage for Coroners' Inquests.

In a Current Note published in the SUPPLEMENT of September 18th, 1920, p. 73, the question of travelling expenses in connexion with coroners' inquests was discussed, and it was stated that the Council of the County of Montgomery had agreed that travelling expenses on the approved county scale should be allowed to medical witnesses at coroners' inquests. The Medical Secretary has now addressed a letter to the clerks of county councils throughout England and Wales calling attention to the fact that under the Coroners Act a coroner has no power to pay travelling expenses to medical witnesses. The letter goes on to point out that even before the war the fees allowed by the Act for performing *post-mortem* examinations and attending at inquests were inadequate; they are now absurdly small, and the Association is pressing the Home Office to bring in an amending Act to meet this and other important points. In the meanwhile, however, the Association feels that those medical men who are so situated that they have to spend much time in travelling to do *post-mortem* examinations and attend inquests are at a special disadvantage which can and ought to be remedied at once. The letter concludes by expressing the hope that the council addressed will take the matter into consideration with a view to following the precedent set by the Montgomeryshire County Council.

Certification under the Workmen's Compensation Act.

From letters received by the Medical Department it appears that it is not at all uncommon for employers who require a certificate of disability from an injured workman in connexion with the Workmen's Compensation Act to send the man to the doctor hoping either that the doctor will not raise the question of a fee or that if he does he will get it out of the patient. For the benefit of members of the Association the Medico-Political Committee has directed that attention shall be called to Paragraph 14 of Schedule 1 of the Workmen's Compensation Act, 1906, which governs the position, and runs as follows:

Any workman receiving weekly payments under this Act shall, if so required by the employer, from time to time submit himself for examination by a duly qualified medical practitioner provided and paid by the employer.

Matters Referred to Divisions.

THE QUESTION OF STEPS TO BE TAKEN

WHEREBY

THE ASSOCIATION MAY BECOME IN
PART A FEDERATION.REPORT OF COUNCIL TO DIVISIONS AND
REPRESENTATIVE BODY.

INSTRUCTION OF A.R.M. 1920.

1. On consideration of the report and recommendations of the Council, 1919-20, (*B.M.J.* Supplement, April 24th, 1920), as to the possibility and desirability of taking further powers under the constitution of the Association whereby it might become in part a federation of medical bodies, the Annual Representative Meeting, Cambridge, 1920, passed the following resolution:—

"44. Resolved: That the Association take steps to obtain further powers under its constitution, on the lines indicated in the joint opinion of Counsel (Messrs. C. E. E. Jenkins, K.C., and T. R. Colquhoun Dill), dated March 6th, 1920 (see *B.M.J.* Supplement, April 24th, 1920, page 139), whereby the Association may, without abandoning its present position as an Association of individual members of the medical profession, become in addition a federation of medical bodies, provided that it be an instruction to the Council:—

(1) To arrange for there being held at an early date a conference of representatives of the Oversea Branches, especially the Branches in the Dominions, with representatives of the Association at home and with representatives of other bodies, if any, who in the opinion of the Council should be invited to such a conference, with a view to arriving, if possible, at a full agreement as to what should be the lines of the proposed new Articles and By-laws.

(2) To report further as soon as practicable to the Representative Body on the subject, with, if possible, such draft alterations of the Articles and By-laws as the Council may suggest with a view to taking further powers under the constitution of the Association in the way proposed.

(3) To arrange that the draft new Articles and By-laws shall *inter alia*:—

(a) Define the classes of organisations to be admissible, whether directly or by means of nominees, to membership of the Association. Such classes to include any portion of the Association which may incorporate itself separately, but also desire admission on the new basis; and to include also medical bodies outside the Association, and bodies representative of the allied professions, anywhere within the Empire.

(b) Assign to the Representative Body the settlement of the general conditions of such membership, including decision as to what shall be the minimum numerical backing within a body seeking to become such member of the Association, which shall render a request for such membership eligible for consideration.

(c) Assign to the Council the duty of submitting to the Representative Body, with a view to such membership, the name of any body proposing, or proposed by the Council, to become such member of the Association.

(d) Assign to the Representative Body the decision as to whether any individual body applying shall be admitted as such member of the Association, and if so, upon what special conditions, if any, in the individual case."

2. These instructions were referred at once by the Council to the Organisation Committee, and by the latter to the Scrutiny Sub-Committee which, under the chairmanship of Sir Jenner Verrall, LL.D., has been making a detailed scrutiny of the constitution and machinery of the Association (see *B.M.J.* Supplement, April 24th, 1920, page 111, para. 64).

3. In consultation with the legal advisers of the Association, the Scrutiny Sub-Committee went into the whole question of steps for federation facilities. Subsequently, on the report of the Organisation Committee, the Council has gone carefully into the matter.

CERTAIN BROAD PRINCIPLES.

4. As a result of several consultations with Counsel certain broad principles emerged:—

(a) That the status, objects and desires of bodies seeking affiliation might be expected to vary so widely as to make it undesirable to load the Articles and By-laws with the details necessary to meet every case that might arise. The proposed alterations in the Articles and By-laws should therefore place on the Representative Body, on receiving a report from the Council, the duty of deciding either to accept or refuse an application for affiliation, and of settling the terms upon which the application (if entertained) shall be granted, and the rights which shall be conceded.

(b) That the alterations made in the Articles and By-laws should be so general and wide in their scope as to give the Representative Body power to provide for the closest possible relation with purely medical bodies, designated in this report "Class (A)" bodies, such as the Oversea Branches, and on the other hand for a much looser or less intimate relationship with bodies not purely medical, designated in this report "Class (B)" bodies. It is believed the former object will be found to be fully provided for; the latter will depend entirely on the decisions of the Representative Body itself as to the terms and conditions it proposes in respect of any bodies applying.

(c) That from a legal point of view it is necessary to distinguish "corporate" bodies (*i.e.* bodies which have an existence in a legal sense) from "unincorporated" bodies (which have no such existence). The former can definitely become affiliated members of the Association; the latter can only nominate persons to act for them as affiliated members. Hence the separation into Corporate and Nominated members.

5. The Council has carefully considered the question whether Minute 44 of the Representative Meeting at Cambridge contemplated not only possible affiliation of outside bodies to the Association as a whole, but possible affiliation of local bodies outside the Association to Divisions or Branches of the Association. However this may be, the Council is legally advised that outside bodies could not be affiliated to, *i.e.*, be members of, a Division or Branch unless they were members of the Association, and that there would be great difficulty in giving an outside body actual membership of the Division or Branch, because neither a Division nor a Branch is in itself a "corporate" body, and not being such cannot legally take into affiliation another body. Provision is made, however, for Divisions and Branches to co-opt or appoint such persons as they desire to their Executive Committees and Branch Councils.

PROVISION MADE IN THE APPENDED ARTICLES AND BY-LAWS.

Possible Privileges of Affiliated Bodies.

6. The Council is legally advised that provision for representation of affiliated bodies at General Meetings of the Association is necessary under the Companies Acts. This has accordingly been provided for.

7. The draft amended Articles and By-laws proposed by the Council are appended. In detail it will be found that these give the Representative Body full discretion as to which (for example) of the following privileges it will grant to any bodies seeking one or other kind of affiliation:—

(i.) *As regards the Representative Body.*

Representation.
Right to bring forward motions.
Right to vote.
Right to attend merely, or be heard.

(ii.) *As regards the Council.*

Representation.
Right to bring forward motions.
Right to vote.

(iii.) *As regards Standing Committees.*

Representation.
Right to bring forward motions.
Right to vote.

(iv.) *As regards "British Medical Journal."*

Use of for notices and reports of meetings.
Refusal of advertisements.
Use of "Important Notices"
Supply of *British Medical Journal*

8. (a) One privilege not conceded is the right to vote in a Referendum. Since on a Referendum every individual

vote is reckoned in the total vote, it is the opinion of the Council that the possibility of an affiliated body with a large membership becoming possessed of what might be a casting vote is one not to be entertained.

(b) It is not proposed that the Association should pay the expenses of a representative sent by an affiliated body to an Association meeting.

9. It will be seen that in the draft Articles and By-Laws submitted, the possible privileges to be accorded to an affiliating body are referred to only in general terms. The Council on legal advice does not propose to attempt to define or enumerate in the Articles and By-laws the privileges which, or some of which, might be given by the Association. To make such an enumeration in the Articles and By-laws would make the Articles and By-laws unduly complicated and unwieldy, and would fetter the procedure of the Association.

Proposed Rules of Representative Body.

10. The Council proposes, in order to carry out the instruction of the Annual Representative Meeting at Cambridge, that under the provisions contained in draft Article 8 and By-law 10 (5), the Representative Body shall adopt rules, which it can modify from time to time, as to the possible privileges of a body affiliating with the Association, and as to the terms and conditions of admission to affiliation. The Council proposes that in the rules there shall be stated all the privileges which, or some of which, the Association might possibly give to a body affiliating to it and that the question of any reciprocal privileges be also dealt with therein. The Council further proposes that the Representative Body shall in the rules lay down, in general terms, for its own guidance and that of the Council, the privileges which may be accorded to a Class (A), and to a Class (B) body, respectively. Thus in the case of a Class (A), i.e., a wholly medical body, the relationship would or might be, according as mutually agreed in the individual case, of the closest possible nature consistent with the stability of the Association, and in the case of a Class (B), i.e., a non-medical body, probably much less close.

11. The rules will however, the Council proposes, leave to the Representative Body the fullest possible power to discriminate, and to decide in the individual case, what privileges shall or shall not be given, and on what terms. The rules will also regulate the procedure of the Council, and of the Representative Body itself, as regards possible applications for affiliations and as regards the actual arrangements effecting affiliation.

12. Pursuant to Minute 44 (1) of the Cambridge Representative Meeting, the Council is calling, to meet on July 5th, at the Head Office of the Association, a Conference of representatives of the Oversea bodies and of Ireland, including the Representatives and Members of Council for those areas, with representatives of the Council. The Council does not consider the time yet opportune for a Conference with other bodies such as are referred to in Minute 44 (1) of the A.R.M., 1920. The Council proposes to submit to the Divisions, to the Conference on July 5th, and to the Representative Meeting at Newcastle, draft rules of the Representative Body to govern affiliation.

Question of Financial or other Responsibility.

13. The Council is advised by Counsel that such affiliation as is proposed, of an outside body to the Association, would involve neither body in financial or other responsibility for actions of the other.

Application for Affiliation.

14. Any application will be dealt with, in the first instance, by the Council, and the Council will report to the Representative Body. The Representative Body will thus not deal with any such application except on report by the Council. These general provisions will, the Council intends, be supplemented by the rules of the Representative Body referred to in paragraph 10 above.

Termination of Affiliation.

15. Either body would be free to terminate the affiliation on notice duly given, and including, in the case of the Association, adoption of a resolution to that effect by the Representative Body by a majority of at least two-thirds of the votes thereon, after opportunity given to the body concerned to be heard on the subject at the Representative Meeting dealing with it.

GENERAL MEETINGS FOR ALTERATION OF ARTICLES.

16. If the representatives of the Oversea bodies and Ireland attending the Conference on July 5th, express their approval of the suggested alterations of the Articles and By-laws, the Council proposes that these be approved and adopted by the Annual Representative Meeting at Newcastle, and by General Meetings to be held on July 19th in Newcastle and August 3rd in London, and thus be made operative at once.

17. To be in time for consideration by the Conference and Annual Representative Meeting, any proposal by a Division, Branch or Federal Committee for amendment of the draft Articles and By-laws now submitted by the Council would require to be published in the *British Medical Journal* not later than May 14th, and should therefore be received at the Head Office not later than April 30th.

18. The Council recommends :

RECOMMENDATION.

That the Annual Representative Meeting, 1921, having considered the opinion of the representatives of the Oversea bodies and Ireland, approve and adopt the draft Articles and By-laws submitted by the Council (see Appendix), with a view to placing the Association in a position to become in part (if and as found desirable) a federation; and instruct the Council to submit those Articles to Extraordinary General Meetings of the Association on July 19th, and (if adopted by the Extraordinary General Meeting on July 19th) August 3rd, 1921, for final adoption as Articles of the Association.

APPENDIX.

(DRAFT) ARTICLES AND BY-LAWS SUBMITTED BY COUNCIL TO DIVISIONS AND REPRESENTATIVE BODY TO PLACE THE ASSOCIATION IN A POSITION TO BECOME IN PART A FEDERATION.

(NOTE.—Articles and By-laws not mentioned in this Appendix are intended to remain as at present, but to be re-numbered (including cross references) where necessary consequentially. References to lineage of existing Articles and By-laws are to those of the booklet print of the Memorandum, Articles and By-laws.)

New Articles 3-8 to take the place of existing Articles 3 and 4.

MEMBERSHIP.

3. The Association shall consist of members of the following classes, viz:—

- (1) Individual Members.
- (2) Corporate Members.
- (3) Nominated Members.

Individual Members.

(i.) *Ordinary.*

4. The following individuals shall be eligible as ordinary members of the Association, viz:—

(a) Any medical practitioner registered in the United Kingdom under the Medical Acts;

(b) Any medical practitioner who does not reside within the area of any Branch of the Association and who, though not so registered, is possessed of any of the qualifications described in Schedule (A) of the Medical Act, 1858; and

(c) Any medical practitioner residing within the area of any Branch of the Association situate in any part of the British Empire, other than the United Kingdom, who is so registered or possesses such medical qualification as shall, subject to the By-laws, be prescribed by the rules of the said Branch.

(ii.) *Honorary and Extraordinary.*

5. (1) The Association shall have power to elect as honorary members such individuals, and in such manner, as the By-laws may provide, and to admit members so elected to such privileges (other than that of voting as members of the Association) as may from time to time be conferred on them by or under the By-laws.

(2) Each Division or Branch shall have power to admit to certain of the privileges of membership of such

Division or Branch, other than that of voting: (a) individual members of the Association who are not entitled to be ordinary members of such Division or Branch; and (b) individuals being members of the medical profession, or distinguished in other sciences, who are not eligible as ordinary members of the Association.

Corporate Members.

6. The following corporate bodies shall be entitled to be corporate members of the Association, viz., any association or body of persons which:—

(a) Is incorporated under the laws of the United Kingdom or of any other part of the British Empire; and

(b) Has for one of its objects the promotion of medical or any allied science or of the welfare of the medical or any allied profession; and

(c) Is approved as a corporate member by the Representative Body hereinafter mentioned.

Nominated Members.

7. A nominated member of the Association shall be an individual nominated for that purpose by any unincorporate association or body of persons which—

(a) Has been formed within the United Kingdom or any other part of the British Empire; and

(b) Has for one of its objects the promotion of medical or any allied science or of the welfare of the medical or any allied profession; and

(c) Is approved by the Representative Body for the purpose of making such nomination. Any such association or body is hereinafter referred to as a "nominating body."

Members Generally.

8. Subject as hereinbefore provided, the conditions of membership shall be such as may from time to time be prescribed by the By-laws, and in particular the By-laws may prescribe modes of application for membership and the designations under which individuals shall be admitted to the privileges of extraordinary membership and the nature of such privileges and the conditions of admission thereto, and the conditions upon which any approval may be given by the Representative Body in the case of corporate members and nominating bodies.

[Existing Articles 3 and 4.

"Eligibility.

"3. Any medical practitioner registered in the United Kingdom under the Medical Acts, and any medical practitioner who does not reside within the area of any Branch of the Association and who, though not so registered, is possessed of any of the qualifications described in Schedule (A) of the Medical Act, 1858, and any medical practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualification as shall, subject to the By-laws, be prescribed by the rules of the said Branch, shall be eligible as an ordinary member of the Association. Subject as aforesaid the mode and conditions of election to membership shall from time to time be determined by or in accordance with the By-laws."

"Honorary and Extraordinary Members

"4. (1) The Association shall have power to elect as honorary members such persons, and in such manner as the By-laws may provide, and to admit members so elected to such privileges (other than that of voting as members of the Association) as may from time to time be conferred on them by or under the By-laws.

"(2) Each Division or Branch shall have power to admit to certain of the privileges of membership of such Division or Branch, other than that of voting: (a) members of the Association who are not entitled to be ordinary members of such Division or Branch; and (b) members of the medical profession, or persons distinguished in other sciences, who are not eligible as ordinary members of the Association. The By-laws may prescribe the designation under which persons shall be admitted to such privileges, the nature of the privileges to be conferred upon them and the conditions of admission thereto."

Article 9.

Existing Article 5 (to be Article 9) to be amended by insertion after "amount," in line 3, "or calculated in such manner."

[Existing Article 5.
"Subscriptions.

"5. Save as otherwise provided by the By-laws every member shall pay to the Association a subscription of such amount as may for the time being be prescribed by the By-laws. The said subscription shall be considered due in advance on the 1st of January of each year, or in the case of members elected during the year, at the time of election."

Article 10.

10. Each year's subscription shall, in the case of an individual member, entitle the member to all such privileges of membership as attach to the class of individual members to which he belongs, including that of receiving the Journal for the current year, and, in the case of an ordinary member, to the ordinary privileges of membership of that Division and of that Branch of which he is an ordinary member, and shall in the case of a corporate or nominated member entitle the member or the nominating body to all such privileges as may be prescribed by the conditions upon which such member is admitted to membership.

[Existing Article 6.

"Each year's subscription shall entitle the member to all privileges of membership of the Association, including that of receiving the Journal for the current year, and to the ordinary privileges of membership of that Division and of that Branch of which he is an ordinary member."

Article 11.

Re-Eligibility.

11. No person who shall have been a member of the Association and ceased to be such shall be eligible for re-election until all arrears of subscription (if any) due from such member to the Association at the date when the former membership ceased, shall have been paid, and no individual member whose former membership shall have been terminated by reason of his conviction or expulsion as hereinafter provided shall, without the previous sanction of the Council, be eligible for re-election by any Branch Council.

[Existing Article 7.

"Re-Eligibility.

"7. No person who shall have been a member of the Association and ceased to be such shall be eligible for re-election until he shall have paid all arrears of subscription (if any) due from him to the Association at the date when his former membership ceased, and no person whose former membership shall have been terminated by reason of his conviction or expulsion as hereinafter provided shall, without the previous sanction of the Council, be eligible for re-election by any Branch Council."

Article 12.

Existing Article 8 (to be Article 12) to be amended by substitution of "such" for "his," in line 1.

[Existing Article 8.

"Duration of Membership.

"8. Every member shall remain a member until his membership is terminated in accordance with the provisions hereinafter contained."

Article 13.

Termination of Membership.

13. Membership of the Association may be terminated in any of the following ways, namely:—

(a) In the case of any member, by resignation, subject to such notice as may be prescribed by the By-laws and subject to the provisions of the next succeeding Article

(b) In the case of any member, *ipso facto*, save as hereinafter provided, by default in the payment of subscriptions to the Association for such period as may be prescribed by the By-laws."

(c) In the case of an individual member, *ipso facto* (i.) upon sentence (after conviction in a Court of Justice of any crime) to imprisonment with hard labour without the option of a fine, or to any greater punishment; or (ii.) upon erasure from the Medical Register under Section 29 of the Medical Act of 1858; or (iii.) upon erasure from the Medical Register of any part of the British Empire on the ground of professional misconduct; or (iv.) upon forfeiture through misconduct of the medical qualification (if any) by virtue of which the member shall have been eligible for membership.

(d) In the case of an individual member, by expulsion (after the enquiry and in the manner prescribed in the next succeeding Article) on the ground that the conduct of the member is detrimental to the honour and interests of the medical profession or of the Association or calculated to bring the profession into disrepute, or on the ground that the member has wilfully and persistently refused to comply with the Regulations of the Association, or the rules of any Division or Branch of which he may be a member.

(e) In the case of a corporate member or a nominated member, *ipso facto* upon the passing by the Representative Body of a resolution that it is undesirable that such membership shall continue. Provided that no such resolution shall have effect unless (i.) the resolution is passed at a meeting of the Representative Body of which not less than six months' notice in writing has been given to the member concerned, stating that such resolution will be proposed at that meeting, and (ii.) opportunity has been given to the member concerned to be heard at such meeting, and (iii.) the resolution is carried by a majority of not less than two-thirds of the votes given thereon in the manner prescribed by the By-laws.

[Existing Article 9.

Termination of Membership.

"9. Membership of the Association may be terminated in any of the following ways, namely:—

"(a) By resignation, subject to such notice as may be prescribed by the By-laws and subject to the provisions of the next succeeding Article.

"(b) *Ipso facto*, save as hereinafter provided, by default in the payment of subscriptions to the Association for such period as may be prescribed by the By-laws.

"(c) *Ipso facto* (i.) upon sentence (after conviction in a Court of Justice of any crime) to imprisonment with hard labour without the option of a fine, or to any greater punishment; or (ii.) upon erasure from the Medical Register under Section 29 of the Medical Act of 1858; or (iii.) upon erasure from the Medical Register of any British Colony or Dependency on the ground of professional misconduct; or (iv.) upon forfeiture through misconduct of the medical qualification by virtue of which the member shall have been eligible for membership.

"(d) By expulsion (after the enquiry and in the manner prescribed in the next succeeding Article) on the ground that the conduct of the member is detrimental to the honour and interests of the medical profession or Association or calculated to bring the profession into disrepute, or on the ground that the member has wilfully and persistently refused to comply with the Regulations of the Association or the rules of any Division or Branch of which he may be a Member."]

Article 14.

Heading of existing Article 10 (to be Article 14) to be, instead of "Expulsion," "Expulsion of Individual Members."

Article 15.

Existing Article 11 (to be Article 15) to be amended by inserting, after "The," in line 1, "individual."

[Existing Article 11.

Formation of Divisions and Branches.

"11. The members of the Association shall be formed into separate local bodies styled Divisions and Branches."]

Article 16 (2).

Existing Article 12 (2) (to be Article 16 (2)) to be amended by inserting at the end of the last sentence but one, after the word "thereof," the words:—"The Council shall also have full power to dissolve any Division or Branch."; and by adding at the end of the Article, the words:—"or which it is proposed to dissolve."

[Existing Article 12 (2).

"12. (2) Subject in the case of Divisions and Branches not in the United Kingdom to the provisions of the By-laws, it shall rest with the Council from time to time to determine, recognise, and declare by resolution published in the Journal, what bodies of members shall be Divisions, and what Divisions and groups of Divisions shall be Branches of the Association, and what shall be the local area of each Division, and accordingly the Council shall have full power from time to time to amalgamate, subdivide and modify Divisions and Branches and the local areas thereof. Nevertheless, not less than one month's notice in all cases shall be given (in the manner prescribed by the By-laws) to any Division or Branch in whose boundaries or area any change is proposed."]

Article 18.

Existing Article 14 (to be Article 18) to be amended by inserting after "every," in the first line, "ordinary."

[Existing Article 14.

Membership

"14. Every member whose address as registered for the time being in the books of the Association is at a place situate within the area of any Division shall, *ipso facto*, be an ordinary member of that Division and of no other, and every ordinary member of a Division shall, *ipso facto*, be an ordinary member of the Branch which comprises that Division and of no other."]

Article 29.

Existing Article 25 (to be Article 29) to be amended by deleting the first four lines, and inserting in place thereof:—

Annual Scientific Meetings.

"29. The Council shall at least once a year arrange Meetings or Conferences of the Association either alone or in conjunction with other bodies (attendance at which shall be open to every individual member of the Association, and to such other persons or classes of persons as may from time to time be authorised in that behalf by the Representative Body), for the purpose of receiving" (etc., as at present).

[Existing Article 25.

Annual Scientific Meetings.

"25. The Council shall at least once a year arrange meetings or Conferences, alone or in conjunction with other bodies, which it shall be open to every member of the Association to attend, for the purpose of receiving addresses or other communications relating to the medical or allied sciences, and discussing such subjects pertaining thereto as the Council may think proper, and the Council may arrange to hold such meetings or Conferences in the United Kingdom or abroad. When held in the United Kingdom, one such meeting shall be convened at the same place as the Annual General Meeting of the Association, and in connection, but so as not to conflict therewith. For the more convenient consideration of the matters to be discussed, the Council may provide that they shall be considered in sectional meetings, and the Council shall appoint a President and other officers of such Section as well as readers of any addresses that may be given."]

Article 32.

General Powers (of Representative Body).

32. Subject to the provisions of any statute, the general control and direction of the policy and affairs of the Association shall be vested in a body of Representatives,

styled "the Representative Body," and composed (a) of individual members of the Association elected by the Divisions in the manner prescribed by the By-laws, and (b) of the members of the Council for the time being in office or elected to take office, and (c) of persons (if any) appointed by such corporate members and nominating bodies as may be empowered in that behalf by the conditions of membership affecting them respectively.

[Existing Article 28.

"General Powers.

"28. Subject to the provisions of any statute the general control and direction of the policy and affairs of the Association shall be vested in a body of Representatives styled "the Representative Body" and composed of members of the Association elected by the Divisions in the manner prescribed by the By-laws, and of the members of the Council for the time being in office or elected to take office."]

Article 33 (2).

33. (2.) Except as may be prescribed by the Representative Body, no person who is not a member of that Body shall be entitled to take part in any Representative Meeting.

[Existing Article 29 (2).

"29. (2). No member of the Association who is not a member of the Representative Body shall be entitled to take part in any Representative Meeting."]

Article 34 (2).

Existing Article 30 (2) (to be Article 34 (2)) to be amended by inserting, in the last line but 3, after "Division":—

"or by any corporate member of the Association or nominating body authorised in that behalf by the Representative Body, and shall have been published" (etc., as at present).

[Existing Article 30 (2)

"Resolutions (of Representative Body).

"30. (2). Provided that no resolution of the Representative Body to make any addition to or any amendment, alteration, or repeal of any Regulation or By-law or to make any new Regulation or By-law, shall have any operation unless a proposal to make the same shall have been previously approved and submitted to the Representative Body, either by the Council, or by a Branch, or by a Division, and shall have been published in the *Journal* not less than two months before the Annual Representative Meeting, or one month before the Special Representative Meeting at which such resolution is passed."]

Article 36.

Existing Article 32 (to be Article 36) to be amended by substituting, in line 5, for "members of the Association," "persons"; and by inserting, after "elected," in the same line, "or appointed."

[Existing Article 32.

"Composition (of Council).

32. The Council shall be composed of the President of the Association, the President-Elect, the Past-President, the Chairman of Representative Meetings, the Chairman of Council, the Past-Chairman of Council, and Treasurer *ex officio*, and of members of the Association elected by the bodies, and in the manner prescribed in that behalf by the By-laws."]

Article 42.

Existing Article 38 (to be Article 42) to be amended (1) by inserting, in the second line, after "Council":—" (other than such members, if any, thereof as may be appointed by a corporate member or by a nominating body)"; and (2) by substituting for the second sentence of second paragraph, the following:—

"The expenses, defined as aforesaid, within the United Kingdom, of all individual members attending meetings of Council or of Committees and of all persons invited by the Representative Body or by the Council to attend, and attending, any Conference or meeting, shall be defrayed in like manner."

[Existing Article 38.

"Expenses.

"38.—(1) The expenses, as defined in the By-laws, within the United Kingdom of members of Council and Representatives of Divisions attending any Representative Meeting shall be defrayed out of the general funds of the Association.

"Attendance of Representatives of Divisions for this purpose shall be construed to mean attendance at each session of the Representative Meeting, unless the Council shall be satisfied that good cause existed for absence from any particular session or sessions. The expenses, defined as aforesaid, within the United Kingdom of all members attending meetings of Council or of Committees and of all members authorised by the Representative Body or by the Council to attend, and attending, any Conference shall be defrayed in like manner.

"(2) The Council shall (subject as hereinbefore provided) determine what shall be considered an attendance for the purpose of this Article."]

Article 43.

Existing Article 39 (to be Article 43) to be amended by inserting, after "Division," in last line but one:—

"and of every corporate member and nominating body."

[Existing Article 39.

"Financial and other Reports and Audit.

"39. The Council shall annually prepare a Balance Sheet and Financial Statement of the Association for the past year, an Estimate of the probable income and expenditure of the Association for the coming year, and a Report of the general state and proceedings of the Association for the past year to be presented to the Annual Representative Meeting. Such Balance Sheet and Statement shall be audited by a professional accountant and a copy of the same as audited and also a copy of such Estimate and Report shall be sent to the Secretary of every Branch and Division, and published in the *Journal* not less than two months before the said meeting."]

Article 45.

Existing Article 41 (to be Article 45) to be amended by inserting, in line 4, after "separate," "class or."

[Existing Article 41.

"By-laws.

"41. Save so far as determined by statute or by the Regulations the constitution and mode of government of the Association, the rights and obligations of every member and separate body of members thereof, the appointment, duties, powers, and privileges of all Officers, and of all Councils, Committees, and governing and administrative bodies both of the Association and of every Division and Branch, shall be such as may from time to time be prescribed and determined by or in accordance with the By-laws, and the By-laws may from time to time be added to, amended, altered, or repealed by the Representative Body, subject to the provisions hereinbefore contained with respect to a resolution of that body for the purposes aforesaid."]

By-law 4.

Existing By-law 4 to be amended (i.) By inserting in the heading thereof, after "Membership":—(1) "Individual Members," (ii.) By inserting, in line 1, after "for," "ordinary."

[Existing By-law 4.

"MEMBERSHIP.

Application.

"4. Every candidate for membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and

By-laws, and the rules of the Division and Branch to which he may at any time belong, and to pay his subscription for the current year.”]

By-law 5 (1).

Existing By-law 5 (1) to be amended (i.) by inserting in line 2, after “election of,” “ordinary”; (ii.) by substituting, in line 9, for the words “a member,” the words “an ordinary member.”

Existing By-law 5 (1).

“*Election by Branches.*

“5. (1) In the case of a Branch in the United Kingdom, the mode of election of members shall be as follows:—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent by the Branch Secretary to the Association at the Head Office, and to every member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its rules prescribe) after the date of the said notice. A Branch may require that each candidate for election shall furnish a certificate signed by two members (either of the Association, or of the Branch, or of the Division in which he resides, as the rules of the Branch may prescribe) stating that from personal knowledge they consider him a suitable person for election.”]

By-law 6.

Existing By-law 6 to be amended (i.) by inserting, in line 4, after “three,” “individual”; (ii.) by inserting, in last line but 2, after “elected,” “an ordinary.”

[Existing By-law 6.

“*Election by the Council.*

“6. Every candidate who does not reside within the area of any Branch shall forward his application to the Association at the Head Office, together with a certificate signed by three members of the Association stating that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the Association from the Head Office to every member of the Council, and the candidate, if not disqualified by any of the Regulations or the By-laws, may be elected a member of the Association by the Council at any Meeting thereof held not less than one month after the date of the said notice.”]

New By-law 10, to follow existing By-law 9.

(2) *Corporate and Nominated Members.*

(1) Every application by an association or body of persons (in this By-law called “the applicant body”) desiring to become a corporate member or to be empowered to nominate a nominated member, shall be in writing signed by the Secretary or other responsible officer of the applicant body and transmitted to the Association at the Head Office.

(2) Every such application shall be considered by the Council at a meeting of which a notice, specifying that such consideration will form part of the business thereat, shall be sent to every member of the Council. Such consideration shall include a consideration of the Memorandum of Association or instrument of foundation and the regulations of the applicant body, and of the question whether the application appears to be within the powers of and to be made with the concurrence of a substantial number of the members of that body.

(3) The Council shall report to the Representative Body upon all applications considered by the Council, and no application shall be considered by the Representative Body except upon the report of the Council.

(4) The Representative Body may in each case reported on by the Council give or withhold the approval required by the Regulations, and shall not be bound to state any reasons for any such action.

(5) Where such approval is given, the Representative Body shall prescribe the conditions upon which the

membership applied for is to be permitted, and such conditions may include conditions fixing the amount of the subscription, and regulating, restricting, or negating rights of representation upon the Representative Body and upon the Council, and upon any Standing Committee, rights of attendance at meetings of the Representative Body and at scientific meetings of the Association, and such other conditions as the Representative Body may consider proper in each particular case.

By-law 11.

Annual List of Members.

11. In the month of May in each year a list of members of the Association shall be prepared and published, stating the names and addresses of such members as shown by the register (to be kept by the Association at the Head Office) of members of the Association on April 30th of that year. The persons named in the said list as ordinary members of any Division or Branch and no others (etc., as at present).

[Existing By-law 10.

“*Annual List of Members.*

“10. In the month of May in each year a list of members of the Association shall be prepared and published stating the names and addresses of the ordinary members of each Division and Branch as shown by the register (to be kept by the Association at the Head Office) of members of the Association on April 30th of that year, and those named in the said list as members of any Division or Branch and no others shall be deemed to be the ordinary members of such Division and Branch at the date of the publication of such list for all the purposes of the Regulations and the By-laws. Such list is hereinafter referred to as the ‘annual list.’”]

By-law 12.

Amount (of Subscriptions).

12. (1) On and after the 1st of January, 1922, and except as hereinafter provided, the annual subscription to the Association shall be:—

(a) For an ordinary member resident in any part of the United Kingdom—three guineas.

(b) For an ordinary member resident elsewhere—two guineas.

(c) For a corporate member or a nominated member—such sum whether by way of capitation or otherwise as the Representative Body may fix in each particular case.

Provided as follows:—

(i.) In the case of an ordinary member resident in the United Kingdom and admitted before the expiration of two years from the date of his registration under the Medical Acts, the annual subscription shall be one-and-a-half guineas until the 31st December next occurring after the expiration of the period of four years from the date of such registration.

(ii.) A member admitted on or after the 1st of July in any year shall pay half the current subscription for that year.

(2) For the purposes of this By-law an ordinary member shall be deemed to reside in that place in which his ordinary place of abode is situate at the time at which according to the Regulations his subscription is considered due.

[Existing By-law 11.

“*Subscriptions: Amount.*

“11. (1) On and after the 1st of January, 1921, and except as hereinafter provided, the Annual Subscription to the Association shall be:—

“(a) For a member resident in any part of the United Kingdom—three guineas.

“(b) For a member resident elsewhere—two guineas.

Provided as follows:—

“(c) In the case of a member resident in the United Kingdom and admitted before the expiration of two years from the date of his registration under the Medical Acts, the annual subscription shall be one-and-a-half guineas until the 31st of December next occurring after the expiration of the period of four years from the date of such registration.

“(d) A member admitted on or after the 1st of July in any year shall pay half his current subscription for that year.

"(2) For the purposes of this By-law a member shall be deemed to reside in that place in which his ordinary place of abode is situate at the time at which according to the Regulations his subscription is considered due."

By-law 14.

Arrears of Subscription, Cessation of Membership.

14. (1) If the subscription of a member for any year shall not have been paid on or before the 31st of December in that year, such member shall *ipso facto* (but save as otherwise provided by the Regulations and without prejudice to his liability to the Association) cease to be a member as from that day. Provided that upon payment before the 31st day of March in the succeeding year of all subscriptions due from such member he shall, if eligible, be restored to membership without re-election or new application.

(2) No member shall (except in case of a cesser of membership under the provisions of Clause (c), (d) or (e) of the 13th Article of Association or under the previous provision of this By-law) cease to be a member without having given three months' previous notice in writing of such member's intention in that behalf to the Association at the Head Office, and having paid all arrears of subscriptions (if any) due.

[Existing By-law 13.

Arrears of Subscription, Cessation of Membership.

" 13. (1) If the subscription of a member for any year shall not have been paid on or before the 31st of December in that year, he shall *ipso facto* (but save as otherwise provided by the Regulations and without prejudice to his liability to the Association) cease to be a member as from that day. Provided that upon payment before the 31st day of March in the succeeding year of all subscriptions due from him he shall, if eligible, be restored to membership without re-election.

(2) No member shall (except in case of his expulsion, or of his ceasing to be a member under the provisions of Clause (c) of the 9th Article of Association or under the previous provision of this By-law) cease to be a member without having given three months' previous notice in writing of his intention in that behalf to the Association at the Head Office, and having paid all arrears of subscriptions (if any) due from him."

By-law 17.

Existing By-law 16 (to be By-law 17) to be amended by substituting in line 3 and last but one, for "members" "persons."

[Existing By-law 16.

Local Management: Branches.

" 16. The management of the affairs of each Branch shall, save as otherwise provided in the By-laws, be vested in a Branch Council, composed of the following members:—

" (a) Those members of the Council who are elected (as hereinafter provided) by the Branch or by any group of Branches to which the Branch belongs or (wholly or in part) by Representatives of Constituencies comprised in the Branch.

" (b) The members elected to represent on the Representative Body the Divisions comprised in the Branch.

" (c) Such Officers of the Branch as the Branch shall by its rules declare to be members *ex officio* of the Branch Council.

" (d) Such members (if any) of any Local Medical Committee formed under the National Insurance Act, 1911, and such medical members (if any) of any Insurance Committee constituted under that Act, being (in either case) ordinary members of the Association resident within the area of the Branch as the Branch may appoint or the Branch Council may co-opt to be members of the Branch Council.

" (e) Such other members as the Branch may by its rules decide."

By-law 20.

Existing By-law 19 (to be By-law 20) to be amended by substituting in line 4 and last line but one, for "members", "persons."

[Existing By-law 19.

Local Management: Divisions.

" 19. The management of the affairs of each Division shall, save as otherwise provided in the By-laws, be vested in an Executive Committee composed of the following members:—

" (a) The member or members representing the Division on the Representative Body;

" (b) The member or members representing the Division on the Branch Council;

" (c) Such Officers of the Division as the Division shall by its rules declare to be members *ex officio* of the Executive Committee.

" (d) Such members (if any) of any Local Medical Committee formed under the National Insurance Act, 1911, and such medical members (if any) of any Insurance Committee constituted under that Act, being (in either case) ordinary members of the Association resident within the area of the Division as the Division may appoint or the Executive Committee may co-opt to be members of the Executive Committee.

" (e) Such other members elected by the Division as the Division may determine."

By-law 30.

Existing By-law 29 (to be By-law 30) to be amended by substituting, in line 4, for "members," "persons entitled to vote."

[Existing By-law 29.

Quorum (at General Meetings).

" 29. Except as hereinafter provided in this By-law no business shall be transacted in any General Meeting unless there be present a quorum of not less than 100 members. If within one hour from the time appointed for the meeting such quorum be not present, the Meeting, if convened upon the requisition of members, shall be dissolved. In any other case it shall stand adjourned to the same day in the following week, at the same time and place, and if at such adjourned meeting a quorum be not present those present shall be deemed to be a quorum."

New By-law 32. to follow existing By-law 30.

Persons entitled to Attend and Vote (at General Meetings).

32. (1) At every General Meeting of the Association the following persons shall be entitled to be present, namely:—

Every individual member of the Association.

Every nominated member of the Association.

One person to represent each corporate member of the Association, provided that such person shall be an official of such corporate member duly authorised by resolution of the corporation to act as such representative.

(2) Every such person (other than an honorary or extraordinary member) shall be entitled to vote at such Meeting.

By-law 33.

Voting at General Meetings.

33. At a General Meeting, unless a poll is demanded in writing by at least five persons present and entitled to vote, a declaration by the Chairman that a resolution has been carried, or carried by a particular majority, or lost or not carried by a particular majority, and an entry to that effect in the book of proceedings of the Association, shall be sufficient evidence of the fact without proof of the number or proportion of the votes recorded in favour of or against any such resolution. If a poll be demanded by five or more such persons, the same shall be taken, in such manner and either at once or after an interval or adjournment, as the Chairman directs, and the result of such poll shall be deemed to be the resolution of the Association in General Meeting. On a show of hands every such person shall have one vote, and upon a poll every such person shall have one vote. Votes must be given personally. In case of any equality of votes at any General Meeting, the Chairman shall have a second or

[Existing By-law 31.

"Voting at General Meetings.

"31. At a General Meeting, unless a poll is demanded in writing by at least five members, a declaration by the Chairman that a resolution has been carried, or carried by a particular majority, or lost or not carried by a particular majority, and an entry to that effect in the book of proceedings of the Association shall be sufficient evidence of the fact without proof of the number or proportion of the votes recorded in favour of or against any such resolution. If a poll be demanded by five members or more, the same shall be taken in such manner and either at once or after an interval or adjournment, as the Chairman directs, and the result of such poll shall be deemed to be the resolution of the Association in General Meeting. On a show of hands every member present in person shall have one vote, and upon a poll every member present in person shall have one vote. Votes must be given personally. In case of any equality of votes at any General Meeting, the Chairman shall have a second or casting vote."

By-law 44 (1).

Voting (in Representative Meetings).

44. (1) In any Representative Meeting, only Representatives of Constituencies and such representatives (if any) of corporate members and nominating bodies as may be empowered in that behalf by the Representative Body, and members of Council representing the Navy, Air Force, Army, and Indian Medical Services, shall be entitled to vote.

By-law 44 (2) and (3).

Existing By-law 42 (2) (to be By-law 44 (2)) to be amended by inserting, after "Representatives," in line 2, "of Constituencies."

Existing By-law 42 (3) (to be By-law 44 (3)) to be amended by inserting, after "Services," in last line but 1, "and representatives (if any) of corporate members and nominating bodies."

[Existing By-law 42.

"Voting.

"42. (1) In any Representative Meeting only Representatives of Constituencies and members of Council representing the Navy, Air Force, Army, and Indian Medical Services shall be entitled to vote.

"(2) Voting shall be by show of hands, unless before such vote is taken twenty Representatives present request that the vote be taken by card.

"(3) Where a vote is taken by card the Representative of each Constituency shall be entitled (or in the case of a Constituency electing two or more Representatives, such of those Representatives as are present shall together be entitled) to record a total number of votes equal to the number of members in that Constituency according to the annual list then in force; and where two or more Representatives of a Constituency are present the total number of votes of that Constituency shall be divided equally between those Representatives, fractions of votes being ignored. Members of Council representing the Navy, Air Force, Army, and Indian Medical Services shall not take part in a vote taken by card.

"(4) In speaking and voting upon any matter, the Representative or Representatives of any Constituency shall have regard and so far as may be conform to the preponderance of opinion of the members of that Constituency so far as such opinion is known to him or them.

"(5) The Chairman shall in the case of *æ* equality of votes have a casting vote, but shall not otherwise be entitled to vote."

By-law 48.

Existing By-law 46 (to be By-law 48) to be amended (1) by substituting "persons" for "members" in line 2; (2) by inserting "or appointed" after "elected" in line 3; (3) by inserting "members of the Association" after "Twenty-four," and deleting the existing words "of the Association," in sub-para. (a); (4) by inserting "members of the Association" after "Seven," and deleting the existing words "of the Association," in sub-para. (b); (5) by inserting "members of the

Association" after "Twelve," in sub-para. (c); (6) by inserting "members of the Association" after "Four," in sub-para. (d); and (7) by inserting a new sub-para. "(f)" as follows:—

"(f) Persons (if any) appointed by such corporate members and nominating bodies as may be empowered in that behalf by the Representative Body."

[Existing By-law 46.

"COUNCIL. Composition.

"46. The Council shall be composed of the members *ex officio* mentioned in the Regulations and of members elected in manner following, namely:—

"(a) Twenty-four by the Branches and Divisions of the Association in the United Kingdom which shall be grouped for that purpose as hereinafter mentioned.

"(b) Seven by the Branches of the Association not in the United Kingdom which shall be grouped for that purpose as hereinafter mentioned.

"(c) Twelve by the elected Representatives of the Constituencies comprised in the Branches and Divisions of the Association in the United Kingdom, which Branches and Divisions shall be formed for that purpose into twelve groups as hereinafter mentioned, the Representatives of all the Constituencies in each such group being entitled together to elect one member of Council.

"(d) Four by the Representative Meeting, which shall have power to elect such members at such time and in such manner as the Meeting may decide, provided that the term of office of each member so elected shall expire at the close of the Annual Representative Meeting next following the date of his election.

"(e) One medical officer on the active or retired list of each of the following Services, namely:—The Royal Navy Medical Service, the Royal Air Force Medical Service, the Army Medical Service, and the Indian Medical Service, to be elected by the Representative Body from officers nominated by Council, but so that no officer shall be elected who shall have retired from the active list more than five years before the election."

By-law 71.

Existing By-law 69 (to be By-law 71) to be amended, (1) by omitting, in line 4, the words "composed in the manner," and (2) by adding, at the end of the By-law:—

"The said Standing Committees shall be composed in the manner appearing in the said Schedule. Provided that the Council may add to any such Committee a person or persons to represent thereon any corporate member or nominating body which may be authorised by the Representative Body to require such representation."

[Existing By-law 69.

"69. Without prejudice to the foregoing By-laws there shall be Standing Committees, which may include persons who are not members of the Association, called by the names, composed in the manner, and having the powers and duties set forth in the Schedule to these By-laws."

By-law 79.

Existing By-law 77 (to be By-law 79) to be amended by inserting, after "or," in line 4, "in the case of a corporate member or nominated member, addressed to the Secretary of the corporation or nominating body at their last known address, or in the case of any member."

[Existing By-law 77.

"Notices.

77. (1) A notice may be served by the Association upon any member, either personally or by sending it through the post, in a prepaid letter addressed to such member at his last known address, or by publication of such notice in the *Journal*, and sending a copy of the *Journal* containing such notice to such member, prepaid and addressed as above mentioned.

(2) A notice may be served on any Division or Branch by serving the same as aforesaid on the Secretary of such Division or Branch, and if there be none, then on any two members of such Division or Branch.

(3) Any notice, if served by post, shall be deemed to have been served on the day following that on which the letter, or a copy of the *Journal* containing the same, is posted, and in proving such service it shall be sufficient to prove that the letter, or a copy of the *Journal* containing the notice, was properly addressed and put into the Post Office."]

DANGEROUS DRUGS REGULATIONS.

THE following communication has been forwarded to the Medical Secretary of the British Medical Association by Sir Edward Troup, Permanent Under-Secretary of State in the Home Office. Further references to this matter will be found in a Current Note in the SUPPLEMENT, and in Parliamentary Notes in the JOURNAL of this week.

Home Office, Whitehall,
February 25th, 1921.

Sir,

I am directed by the Secretary of State to say that he has had under consideration the letter of February 22nd, signed jointly by yourself and representatives of other bodies, on the subject of the draft Regulations issued under the Dangerous Drugs Act, 1920.

The letter repeats the request made in the previous letter of the Pharmaceutical Society that the Secretary of State will receive a joint deputation from the several bodies signing the joint letter, with a view to the appointment of a committee representative of the different interests to consider the draft Regulations and the objections which have been submitted. After full consideration the Secretary of State is of opinion that the appointment of such a committee is not necessary, would cause much delay, and would not be likely to lead to any useful result.

The interests concerned in the matters dealt with by the regulations are diverse, including the medical and dental professions, pharmaceutical chemists, the managements of hospitals and public institutions, manufacturers of the drugs, wholesale dealers, veterinary practitioners, registered and unregistered, users of the drugs for agricultural purposes, etc., etc.; and while the representatives of any particular interest would be able to speak with regard to his own case, he would not necessarily be able to judge on the application of the Regulations in other cases.

If it be true, as suggested in the joint letter, that the interests of the different bodies are more or less conflicting, the Secretary of State cannot agree that a solution of the difficulties caused by a conflict of interests—for example, as between the pharmaceutical chemist and the medical profession on the question of dispensing—is likely to be found by a joint committee, nor could he allow the Regulations, which are framed for the purpose of carrying out the objects of the International Opium Convention, to be the subject of bargaining between conflicting interests.

It appears to him that the right course is for each of the bodies concerned to confer with the representatives of the Department, who are anxious to remove the misapprehensions which have arisen and to agree to any modifications consistent with the public interest and our international obligations; and if any fear is entertained by some bodies that concessions may be made to other interests which will be injurious to themselves, the Secretary of State will be willing to communicate to the bodies concerned the terms of the modifications he proposes to make in the draft Regulations and to give them an opportunity of submitting further representations.

A letter on similar lines is being sent to the other bodies which signed the joint letter.

I am, Sir, your obedient servant,
(Signed) EDWARD TROUP.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A LIST of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

Association Notices.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary **not later than April 30th.**

ELECTION OF REPRESENTATIVE BODY OF ASSOCIATION, 1921-22.

Constituencies in Representative Body.

THE Council has finally grouped the **Home Divisions** for election of the Representative Body 1921-22 in the same manner as for 1920-21, except that the Caithness and Sutherland Division of the Northern Counties of Scotland Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch, have been made independent Constituencies.

As intimated to all the **Oversea Bodies**, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

THE REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body *must be elected not later than June 17th*, and their names notified to the Medical Secretary **not later than June 24th.** The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—The winter clinical meeting of the Edinburgh Branch will be held in the Royal Infirmary on Friday, March 4th. All members of the profession are cordially invited. The museum will be open from 11 a.m. Arrangements will be made for holding special clinics during the forenoon. The clinical meeting will be held at 3.15 p.m. At 5 p.m. Dr. J. S. Haldane, LL.D., F.R.S., Oxford, will deliver a lecture on "Some recent advances in the physiology of respiration, circulation, and renal excretion." There will be dinner at 6.30 p.m. in the Caledonian Station Hotel; morning dress; dinner ticket, price 10s. 6d.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.—The spring meeting of this Branch will be held at Ledbury on Thursday, April 14th, when a British Medical Association Lecture will be given by Mr. P. L. Daniel, F.R.C.S., on "The differential diagnosis of acute abdominal conditions."

Meetings of Branches and Divisions.

LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.
A MEETING of the Rochdale Division was held on February 2nd, when Dr. BATEMAN was in the chair. Dr. Bateman introduced the report of the Consultative Council on Medical and Allied Services, pointing out its chief points which would be to the benefit of the general practitioner, after which the different questions to Divisions were gone into separately and answered. On reaching the portion of the report regarding secondary health centres it was decided to postpone to a future meeting the consideration of the rest of the report.

On the motion of Dr. MILROE, seconded by Dr. BATEMAN, it was resolved to open a divisional list for the Dr. Macdonald testimonial; the sum of nine guineas was collected at the meeting.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

A MEETING of the Willesden Division, to which non-members resident in the area had been invited, was held on February 15th, with Dr. C. T. P. SCOTT in the chair.

The proposals drawn up by Dr. Buchan, Medical Officer of Health, at the request of the Executive Committee of the Division, for the staffing of the clinics of the school treatment and maternity and child welfare centres by part-time medical practitioners were considered, and an interesting discussion took place upon the three schemes prepared, and generally upon the question of the participation of the general

practitioners of the area in any scheme of the local authority for the medical inspection and treatment of school children and maternity and child welfare work, in the course of which the Deputy Medical Secretary of the Association gave details of a scheme in operation in Scotland, in the working of which there was complete co-operation between the authority and the local profession.

None of the schemes prepared by Dr. Buchan (for the utilization of the services of part-time practitioners) being considered satisfactory, it was agreed to consult the whole of the local profession individually upon the question. Instructions were given to a subcommittee, consisting of Drs. MacEvoy, Skene, Scott, Grainger Evans, with the Secretary, Dr. Paterson, to prepare a draft scheme for submission to a subsequent meeting of the Division. It was felt that prior to the preparation of the draft scheme it would be necessary to ascertain from each practitioner in the area whether he was prepared (1) to take part in the medical inspection of school children; (2) to participate in the treatment, and if so of what diseases, of the children who must be treated under the authority's scheme, and to participate in the work at the local authority's maternity and child welfare clinic. It was pointed out that in all cases the private practitioner would be adequately remunerated for any work, and that the schemes must be approved by the Council of the Association.

During the discussion the speakers all referred to the necessity for the utmost harmony in the relationship between the medical officials of the local authority and the local profession, and a letter was read from a former Secretary of the Division to one of the members present. This letter expressed the pleasure of the writer at seeing that the Willesden Division was still taking such a keen interest in medical politics, stating that he was a seceder from the ranks of general practitioners and had become a Government official, and from that point of view it was more than ever impressed upon him how much the officials were dependent upon the goodwill of the general practitioner; that much of the prejudice of the general practitioner against the official was undoubtedly due to a very great extent to the fact that the two sides did not come into personal contact, and that he was glad to see that the members of his old Division were going the right way to work in meeting the officials and securing an interchange of views, and were apparently anxious, not only for a share in the work, but for new opportunities that were likely to arise for increasing their experience and medical knowledge.

The conference on the Interim Report on the Future Provision of Medical and Allied Services, convened by the Chairman of the Willesden Urban District Council, was continued in the Council Chamber, Kilburn, on Thursday, February 17th. It was agreed to adopt the proposals set out in the Report of the Consultative Council on Medical and Allied Services, to the conditions obtaining in Willesden, and the question of how far the existing accommodation at the various institutions and hospitals in the parish could best be used was gone into, having regard to present statutory restrictions and regulations, in order that the present accommodation available could be fully used by the sick of Willesden.

A scheme was outlined whereby, in the event of further legislation, a systematized provision of all forms of medical and allied services in the parish could be made available for the inhabitants of Willesden, based on the lines of the report of the Consultative Council.

The pooling of the existing hospital accommodation and the allocation to them of work was considered—for instance, the Municipal Hospital was suggested for all infectious cases, the Willesden Infirmary for maternity cases, diseases of women, and other diseases of adults, the Willesden Hospital for diseases of children and adults, and St. Monica's Home, Brondesbury, for the same.

It was agreed:

- That the Willesden Infirmary or the Willesden Hospital should become the general hospital for Willesden, and should include provision for general and special services, laboratories, and other services, as set out in the "Dawson Report."
- That everything should be done to ensure the hearty co-operation of the general medical practitioner in the parish.
- That, as far as may be practicable, all public medical work in institutions or otherwise, should be carried out by part-time general medical practitioners.
- That primary health centres on the lines of the "Dawson Report" should be established.
- That, should it not be practicable to have beds attached to primary health centres, wards should be set apart at the various hospitals in Willesden where patients may be attended by their own medical practitioners.
- That a Local Medical Advisory Council should be formed on the lines of the "Dawson Report."

NORTH OF ENGLAND BRANCH: NORTH NORTHUMBERLAND DIVISION.

THE annual report shows that during 1920 six meetings of the Division were held, four being at Alnwick, one at Belford, and one—the annual summer meeting—at Bamburgh. It was decided at the second meeting in February that in future meetings the chief aim should be scientific. In pursuance of this course Dr. Hume was invited and attended the meeting at Belford in April, when he gave a most instructive and comprehensive address on "Disorders of the heart in pensioners"; whilst Dr. Bolam, with the help of Dr. Thompson, was present at the Infirmary at Alnwick in October to give an address and practical demonstration on the diagnosis and treatment of syphilis by modern methods. These two meetings were well

attended and thoroughly appreciated; the best thanks of the Division were accorded to the lecturers and demonstrator. The report notes with satisfaction that, with one exception, every medical man in active practice within the area of the Division is a member of the British Medical Association. On December 1st a very successful and well attended dinner was held at Alnwick for the purpose of meeting and hearing an address from Dr. Cox, the Medical Secretary.

NORTH OF ENGLAND BRANCH: STOCKTON DIVISION.

AT the last meeting of the Stockton Division the contemplated issue by the Home Office of an order under the Dangerous Drugs Act was discussed and the following resolution was unanimously adopted:

The Stockton Division of the British Medical Association considers that the order in question will serve no public interest and will impose unnecessary clerical work on medical practitioners.

A copy of the resolution has been sent to the Home Secretary, and the local member of Parliament has been personally interviewed in regard to the matter.

Contract rates for medical attendance on members of police force were also discussed. It was agreed that a fee of 26s. per head per annum for urban districts was reasonable, and that mileage should be extra in rural areas. The North of England Branch was asked to secure united action in the matter.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH: LANCASTER DIVISION.

THE following resolution was passed at a meeting of the profession held at the County Hotel, Lancaster, on February 20th:

Having carefully considered the draft Regulations under the Dangerous Drugs Act, as applied to medical men, we consider the conditions impossible to carry out.

SOUTHERN BRANCH: PORTSMOUTH DIVISION.

AT a recent meeting of the Portsmouth Division the proposed draft Regulations for the sale of morphine, heroin, and opium (medicinal) were discussed, and the following resolutions were adopted and forwarded to the Home Secretary:

- That this meeting of Portsmouth medical men protests against the action of the Home Secretary in formulating Regulations for the sale of dangerous drugs, etc., without consulting the largest organized body of medical men in the kingdom—the British Medical Association.
- That the medical men of the Portsmouth District, emphatically protest against the proposed Regulations under the Dangerous Drugs Act; that these regulations, if carried out, would have a most detrimental psychic effect on our patients; that they are unnecessary; and that the new clerical work and its concurrent inquisition are degrading and impossible of fulfilment for the medical profession—one of the hardest worked professions in the kingdom; and we further regard these draft Regulations as an intolerable and unwarrantable interference with our rights and privileges, and a slur on our honour and bona fides.

Mr. Atterbury was present at the meeting as representative of the local Pharmaceutical Society, and gave invaluable help and information.

SOUTH WALES AND MONMOUTHSHIRE BRANCH: NORTH GLAMORGAN DIVISION.

A MEETING of the North Glamorgan and Brecknock Division was held at Aberdare on February 17th, when Dr. F. J. JAYNE was in the chair. This was the first Division meeting to be held at the Aberdare Hospital, and every one testified that it had been thoroughly enjoyable. The SECRETARY gave extracts from the Medical Secretary's monthly report, observing that these reports of the Medical Secretary were very interesting and useful. The draft Regulations regarding dangerous drugs, a copy of which had been sent to most members present, was then considered, and the following resolution was carried:

That we, as medical men, having perused the draft circular of Regulations re dangerous drugs, are of opinion that the suggested regulations are utterly impracticable, and are futile to meet the real intention of same, whilst at the same time penalizing medical men, and imposing on them that which cannot be carried out. We therefore appeal to the authorities not to put them into operation in their present form, and without consulting the profession as to the best means of arriving at practical regulations, which will meet with the requirements and prevent illicit sale by unauthorized persons.

The resolution was directed to be forwarded to the Home Secretary, and in addition every one present promised to write a personal letter to the Home Office and to their respective Members of Parliament. At the invitation of the Division, Dr. T. R. LLEWELLYN, Regional Medical Officer to the Ministry of Health for the area, was present, and addressed the Division regarding his work and the relationship between himself and medical men and the Ministry of Health, emphasizing more particularly the new records which panel practitioners are asked to keep. Dr. Llewellyn pointed out that the profession were in honour and duty bound under an obligation to give the records a trial, and he explained what was really expected, and indicated that the records were of clinical and administrative importance. Several members asked questions and criticized the records from various points of view, and an interesting and useful discussion ensued. At the close, Dr. Llewellyn acknowledged his indebtedness to the Division for the opportunity of addressing them on this important if thorny subject of records, and a vote of thanks was accorded him for his presence and address.

British Medical Association.

EIGHTY-NINTH ANNUAL MEETING, NEWCASTLE-UPON-TYNE, JULY, 1921.

Patron: HIS MAJESTY THE KING.

President: The Right Hon. Sir T. CLIFFORD ALBUTT, P.C., K.C.B., F.R.S., Regius Professor of Physic, University of Cambridge.

President-Elect: DAVID DRUMMOND, C.B.E., M.A., M.D., D.C.L., Pro-Vice-Chancellor and Professor Principles and Practice of Medicine, University of Durham.

Chairman of Representative Meetings: T. W. H. GARSTANG, M.A., M.R.C.S., D.P.H.

Chairman of Council: R. A. BOLAM, O.B.E., M.D., M.R.C.P.

Treasurer: G. E. HASLIP, M.D.

PROGRAMME.

The President will give an Address on Tuesday, July 19th, at 8 p.m.

The REPRESENTATIVE MEETING will begin on Friday, July 15th, at 10 a.m., and be continued on the following days.

The statutory ANNUAL GENERAL MEETING will be held on July 19th, at 2 p.m., and the Adjourned General Meeting at 8 p.m.

The Annual Dinner of the Association will take place on Thursday, July 21st, at 7.30 p.m.

Religious services will be held on Tuesday, July 19th, at 5 p.m.

The Conference of Secretaries will be held at 2 p.m. on Wednesday, July 20th, and the Secretaries' Dinner will take place in the evening at 6.30.

A Special Address on Industrial Medicine will be given by Sir Thomas Oliver, M.D., on Wednesday, July 20th, at 8 p.m.

The Popular Lecture will be delivered by Professor Arthur Keith, F.R.S., on Friday, July 22nd, at 7.30 p.m.

DEMONSTRATIONS.

Laboratory and Clinical Demonstrations will be given on Wednesday, July 20th, Thursday, July 21st, and Friday, July 22nd, between 3 p.m. and 4.30 p.m.

THE SECTIONS.

The Sections will meet from 10 a.m. to 1 p.m.

The following Sections meet on three days Wednesday, Thursday, and Friday, July 20, 21, and 22.

MEDICINE.

President: Professor THOMAS BEATTIE, M.D., F.R.C.P.
Vice-Presidents: The Right Hon. LORD DAWSON OF PENN, G.C.V.O., M.D., F.R.C.P.; Professor A. J. HALL, M.D., F.R.C.P.; G. S. HAYNES, M.D.; J. WILKIE SMITH, M.D.
Honorary Secretaries: Professor W. E. HUME, C.M.G., M.D., F.R.C.P., (4, Ellison Place, Newcastle-on-Tyne); C. E. LAKIN, M.D., F.R.C.P., (105, Harley Street, London, W.1); W. T. RITCHIE, O.B.E., M.D., F.R.C.P.Ed. (14, Rothesay Place, Edinburgh).

SURGERY.

President: Professor J. RUTHERFORD MORISON, F.R.C.S.
Vice-Presidents: Professor H. BRUNTON ANGUS, F.R.C.S.; ARTHUR COOKE, F.R.C.S.; W. J. GREER, F.R.C.S.I.; A. M. MARTIN, M.B.
Honorary Secretaries: W. GIRLING BALL, F.R.C.S. (77, Wimpole Street, London, W.1); J. M. RENTON, F.R.C.S. (16, Sandyford Place, Glasgow, W.); G. GREY TURNER, M.S., F.R.C.S. (The Hawthorns, Osborne Road, Newcastle-on-Tyne).

PATHOLOGY AND BACTERIOLOGY.

President: Professor STUART McDONALD, M.D., F.R.C.P.Ed.
Vice-Presidents: J. F. GASKELL, M.D., F.R.C.P.; JAMES A. MURRAY, M.D.; Professor MATTHEW J. STEWART, M.B.
Honorary Secretaries: R. R. ELWORTHY, O.B.E., M.D. (West London Hospital, Hammersmith, London, W.6); A. F. BERNARD SHAW, M.D. (Pathological Department, College of Medicine, Newcastle-on-Tyne).

PREVENTIVE MEDICINE WITH INDUSTRIAL DISEASES.

President: Sir THOMAS OLIVER, M.D., F.R.C.P., LL.D.
Vice-Presidents: Sir JOSIAH COURT, M.R.C.S.; T. EUSTACE HILL, O.B.E., M.B.; I. G. MODLIN, O.B.E., M.D.
Honorary Secretaries: W. H. DICKINSON, O.B.E., M.B. (1, Ridley Villas, Newcastle-on-Tyne); C. M. WILSON, M.C., M.D. (64, South Audley Street, Grosvenor Square, W.1).

ORTHOPAEDICS AND DISEASES IN CHILDREN.

President: A. H. TUBBY, C.B., C.M.G., M.S., F.R.C.S.
Vice-Presidents: R. C. ELSMLIE, O.B.E., M.S., F.R.C.S.; H. MORLEY FLETCHER, M.D., F.R.C.P.; LACHLAN G. FRASER, M.D.; Sir HENRY M. W. GRAY, K.B.E., C.B., C.M.G., F.R.C.S.; A. E. MORISON, F.R.C.S. (Director of Demonstrations).
Honorary Secretaries: FRANK HAWTHORN, D.S.O., M.D. (10, Ellison Place, Newcastle-on-Tyne); C. MAX PAGE, D.S.O., F.R.C.S. (134, Harley Street, London, W.1); H. R. SOUPER, M.D. (Ministry of Pensions Hospital, Castle Leazes, Newcastle-on-Tyne).

The following Sections meet on two days.

NEUROLOGY AND PSYCHIATRY.

President: Professor A. W. MACKINTOSH, M.D., F.R.C.P.Ed.
Vice-Presidents: A. HELEN A. BOYLE, M.D.; E. FARQUHAR BUZZARD, M.D., F.R.C.P.; HARRY CAMPBELL, M.D., F.R.C.P.; HORSLEY DRUMMOND, M.D.
Honorary Secretaries: ANTHONY FEILING, M.D. (41, Devonshire Street, London, W.); GEORGE HALL, M.D., C.M.G. (1, Elington Road, Jesmond Road, Newcastle-on-Tyne).

OBSTETRICS AND GYNAECOLOGY.

President: Professor R. P. RANKEN LYLE, M.D.
Vice-Presidents: Lady BARRETT, M.D.; W. R. GROVE, M.D.; WILLIAM ROBINSON, F.R.C.S.
Honorary Secretaries: MABEL R. CAMPBELL, M.B. (49, Wimpole Road, Newcastle-on-Tyne); GORDON LEY, F.R.C.S. (5, Wimpole Street, London, W.1); E. FARQUHAR MURRAY, M.D., F.R.C.S. (52, Jesmond Road, Newcastle-on-Tyne).

OPHTHALMOLOGY.

President: Professor J. D. WARDALE, M.B., B.S.
Vice-Presidents: H. P. BENNETT, M.B.; Lieut.-Colonel R. H. ELLIOT, M.D., F.R.C.S., I.M.S. (ret.); HARRY M. TRAUQUAIR, M.D., F.R.C.S.Ed.
Honorary Secretaries: N. B. B. FLEMING, M.B., Ch.B. (9, Harley Street, London, W.1); STANLEY ROBSON, M.S., F.R.C.S.Ed. (Milton House, Rowlands Gill, co. Durham).

OTO-RHINO-LARYNGOLOGY.

Not yet completed.

PHYSIOLOGY, PHARMACOLOGY, THERAPEUTICS, AND DIETETICS.

President: H. H. DALE, C.B.E., M.D., F.R.S.
Vice-Presidents: Professor A. V. HILL, M.A., D.Sc., F.R.S.; Professor JOHN C. MEAKINS, M.D.; Professor J. A. MENZIES, M.D.; ALFRED PARKIN, F.R.C.S.
Honorary Secretaries: Miss MILDRED ATKINSON, B.Sc. (College of Medicine, Newcastle-on-Tyne); O. INCHLEY, M.D. (Babraham, Cambridge).

VENEREAL DISEASES.

President: Colonel L. W. HARRISON, D.S.O., R.A.M.C.
Vice-Presidents: JAMES CHARLES BUCKLEY, M.D.; CHARLES GIBBS, F.R.C.S.; MARY RAW, M.B.
Honorary Secretaries: KENNETH M. WALKER, O.B.E., F.R.C.S. (86, Harley Street, London, W.1); JAMES HUDSON, M.D. (42, Crossley Terrace, Newcastle-on-Tyne).

The following Sections meet on one day.

AMBULANCE AND RED CROSS.

President: Sir JAMES CANTLIE, K.B.E., F.R.C.S.
Vice-Presidents: ROBERT ANDERSON, M.D.; Sir G. T. BEATSON, K.C.B., K.B.E., M.D.; Major-General Sir G. J. H. EVATT, K.C.B., M.D.; Rev. C. F. TOWNLEY, M.A.

Honorary Secretaries: Lieut.-Colonel R. M. VICK, O.B.E. (The Warden's House, St. Bartholomew's Hospital, E.C.1); H. L. RUTTER, M.B.E., F.R.C.S., (31, West Parade, Newcastle-on-Tyne).

DERMATOLOGY.

President: JOHN FARQUHAR CHRISTIE, M.B.
Vice-Presidents: ERNEST DORE, M.D., F.R.C.P.; ARTHUR D. HEATH, M.D., M.R.C.P.; D. WELLS PATTERSON, O.B.E., M.B., M.R.C.P.

Honorary Secretaries: WILLIAM JENKINS OLIVER, M.B. (53, Queen Anne Street, London, W.1); SYDNEY THOMPSON, M.B., B.S. (19, Windsor Terrace, Newcastle-on-Tyne).

MEDICAL SOCIOLOGY.

President: Sir JENNER VERRALL, LL.D., M.R.C.S.
Vice-Presidents: CHARLES BUTTAR, M.D.; A. C. FARQUHARSON, M.D., M.P.; E. ROWLAND FOTHERGILL, M.B., B.S.

Honorary Secretaries: MABEL G. BRODIE, M.B. (Maternity and Child Welfare Offices, 42, Old Elvet, Durham); J. F. WALKER, M.B. (Rocklands, Clifton Terrace, Southend-on-Sea).

PROCTOLOGY.

President: J. P. LOCKHART-MUMMERY, F.R.C.S.
Vice-Presidents: HENRY B. DENSHAM, M.B.; W. ERNEST MILES, F.R.C.S.; D. P. D. WILKIE, O.B.E., F.R.C.S.

Honorary Secretaries: CECIL W. ROWNTREE, F.R.C.S. (9, Upper Brook Street, London, W.1); HAMILTON DRUMMOND, F.R.C.S. (6, Saville Place, Newcastle-on-Tyne).

RADIOLOGY AND ELECTRO-THERAPEUTICS

Not yet completed.

UROLOGY.

President: J. W. THOMSON WALKER, O.B.E., F.R.C.S.
Vice-Presidents: P. J. CAMMIDGE, M.D.; JOHN CLAY, C.B.E., F.R.C.S.; H. C. PEARSON, F.R.C.S. Ed.

Honorary Secretaries: SYDNEY G. MACDONALD, F.R.C.S. (51, Queen Anne Street, London, W.1); W. S. DICKIE, O.B.E., F.R.C.S. (Ardencape, Southfield Road, Middlesbrough).

The Honorary Local General Secretary of the meeting is R. J. Willan, O.B.E., M.V.O., F.R.C.S., 6, Keusington Terrace, Newcastle-on-Tyne.

INSURANCE.

CORRESPONDENCE.

The New System of Medical Records.

SIR,—The letter of Dr. T. Wood Locket in your issue of February 19th is worthy of the fullest consideration by all panel practitioners and Committees. He has been good enough to refer in his detailed scheme to the suggestion contained in the second part of the amendment placed on the agenda of the last Panel Conference by the Warrington Panel Committee. This Committee felt that the proper time to suggest amendments to the scheme of the Inter-departmental Committee on Medical Records was before the expense had been incurred in the manufacture and issue of the cards, but apparently those who swayed the last Panel Conference were also members of that Inter-departmental Committee, and the mover of the amendment—Dr. Ferguson—did not find a seconder. When passing this amendment the Warrington Committee had in memory the practical failure of the two previous methods of keeping records—the “floppy” book of 1913 and the stacks of parcelled cards which, dust-ridden, still encumber insurance offices, and it desired to limit the present experiment in the interests of economy and efficiency.

The mistake of the Interdepartmental Committee was its recommendation to issue cards to all insurance practitioners for all insurance patients, not recognizing that a very large proportion of these practitioners either by training, temperament, or by the arduous nature of their work are not fitted to keep such accurate records as to be reliable for statistical or other purposes. The argument that the scrappy notes on the back of an envelope are likely to benefit medical research is surely the height of fatuity, and even if some observation of purest ray serene were made by a genius for research, what chance would it have of being discovered “in its dark unfathomable cave” by the docketing clerks and the officers of the Ministry? Clinical records have some value, which, however, should not be exaggerated; the real question is whether they are worth the time, labour, and expense that are involved in keeping them.

There is another aspect on which I think all will agree—namely, that the Government is entitled to know what attendances are being given to the insured population. This information should be as accurate and reliable as possible, and Dr. T. Wood Locket's scheme of selecting a certain proportion of practitioners in each area working amongst a fair sample of the population seems to me to be the most likely to give accurate results. Panel practitioners would, of course, have to agree to accept inferences from these figures, and they would have to meet the expense, as Dr. Locket suggests, from the medical pool.

If some such limited scheme as this had been adopted from the first, there would have been none of the present outcry against records, and the panel-prying stunt of the *Daily Mail* would not even have had its present insubstantial basis.

Now that the cards have been issued, let us use them, as Dr. Locket suggests, for clinical notes in cases that suggest themselves to our clinical conscience, and leave the other details of attendances, certificates, etc., to medical recorders.—I am, etc.,

J. S. MANSON,

Warrington, Feb. 20th. Hon. Sec., Warrington Panel Committee

SIR,—The panel record card system puts the profession in the ambiguous position of the mythical preacher who taught us to act according to his preaching but not according to his deeds.

The profession has taught the lessons of industrial fatigue in relation to poor work, to accidents, and to disease and the longevity of the operatives. It has investigated this matter very carefully, and has arrived at some perfectly true, because scientific, conclusions. And having arrived at those conclusions, it has proceeded to violate its own idol by imposing on its members, already overworked, an additional and unnecessary imposition. To secure the problematical ideal of a clinical record of insured persons a nobler ideal—a demonstrated and dictated ideal—has been shattered. An imposition has been laid upon the shoulders of the overworked; by so doing we are degrading ourselves and eating our own words and impairing our efficiency.

Then how fatuous is the purpose of the records! Records for statistical scientific purposes we could understand even if we disapproved of the burden of keeping them. Records for disciplinary purposes we could understand. But records for clinical purposes! Have men become so altruistic that they have forgotten self to such an extent that all their past illnesses are forgotten? Or is there an epidemic of amnesia?—I am, etc.,

Pensilva, near Liskeard, Cornwall.

J. C. JONES, M.B.

SIR,—There is one aspect of the present system of records which is extremely irritating to a busy medical man, and which is quite unnecessary.

A patient walks in and says he is an insured patient, but has not got his medical card with him. The following process has then to be carried out:

1. A diagnosis has to be made and a prescription written. I am not sure whether this prescription ought to be on the usual insurance forms in triplicate or on private prescription forms.
2. Next a certificate has to be given that the patient is unfit for work.
3. Then an account for temporary residents has to be filled up and signed by the patient and endorsed by the doctor to the effect that the patient cannot produce his medical card and has paid a fee.
4. Next a continuation card has to be filled in with any necessary clinical details.
5. And an official receipt has to be given for the fee paid. It frequently happens that the patient then goes home, and the doctor sees him no more.
6. It is now the duty of the doctor—who supposes, from the non-appearance of the patient for, say a week, that the case is concluded—to send up the form of account and the continuation card to the clerk to the Insurance Committee.

Is not this an absurd amount of red tape? Its only object so far as I can see is to pander to careless patients. Would it not be much better and simpler to make patients who cannot produce their medical cards pay fees like private patients? This is a particular hardship in health resorts where there is a great influx of visitors.—I am, etc.,

Sandown, I.W., Feb. 28th.

H. B. BILLUPS,

INSURANCE COMMITTEES.

LONDON.

Scale of Fees under “Own Arrangements.”—The London Insurance Committee, at its meeting on February 24th, approved a revised scale of fees for the calculation of the sums expended by insured persons who are allowed to make their own arrangements. The scale hitherto in operation was adopted in 1913, and objections have been raised to its continuance in view of

the altered conditions now prevailing. The new scale is as follows:

	s.	d.
Attendance on patient at practitioner's residence, surgery, or dispensary	3	0
Visit to patient's residence	4	6
Special visit, such as visit made by patient's desire on same day as that on which a call is received after 10 a.m. or on Sunday	4	6
Night visit (between 8 p.m. and 8 a.m., in response to call received between those hours)	6	0
Surgical operation requiring local or general anaesthetic, or case of abortion or miscarriage	21	0
Administration of general anaesthetic	21	0
Setting of fracture (femur 2ls.) others	10	6
Reduction of dislocation (hip 2ls.), others	10	6
Fee for report	2	6
Fee for attendance for giving certificates	1	0

Subsequent attendances after the setting of a fracture or reduction of a dislocation are to be at "visit" rate.

Correction of Practitioners' Lists.—It was reported that corrected lists, representing nearly 200,000 persons, had been supplied to 237 practitioners in the London area, leaving over 1,200 practitioners' lists to be corrected in accordance with the requirements of the Distribution Fund. The correction, so far as it has gone, has shown that the number of medical index cards, which record the number of insured persons on each practitioner's list, differs to the extent of 9 or 10 per cent. from the figures of credit in the book ledgers: in the case of some practitioners the figures of credit are less than the number of cards, and in other cases more. It is upon the basis of these figures of credit that, for administrative convenience, the practitioners concerned have been paid, as it is impracticable to count on each quarter day the actual number of cards on the lists of 1,500 doctors, and these figures are adjusted by additions and corrections as they occur. Cases are given in which the figures of credit as a result of the correction have been reduced by several hundreds. In one case, when the figures before correction were 2,416, they have been reduced by 609, involving a monetary adjustment per annum of £334 19s. It is understood that the effect of correcting practitioners' lists now in progress will not vary the total amount available for distribution, but it will alter the incidence of payment of individual practitioners. Steps are being taken to ensure the maintenance of a correct list, both of figures of credit and medical index cards, and to secure that the adjustments in the two methods of record are carried out uniformly.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.
Record Cards.—At the meeting of the London Panel Committee on February 22nd, the question of record cards was again discussed, and the Committee accepted two recommendations of a subcommittee to the effect that some form of medical record was necessary, and that practitioners should not be required to enter matters on the record cards which in their opinion were likely to be detrimental to the interests of the insured persons concerned. A third recommendation, however, that the Committee should express no opinion with regard to the present form of record until it had been in use for a period of six months, was opposed by Dr. E. A. Gregg and others. Dr. Gregg agreed that a clinical record might be of great value, but he objected to the time-sheet, and pointed out various drawbacks, such as, for instance, that the period during which the practitioner was most busily engaged in attending to the patient was likely to be the very period during which he would omit to make the entries, and consequently would receive no credit for the work he was doing. The recommendation of the subcommittee was lost, and Dr. Gregg then moved:

"That in the opinion of the London Panel Committee the present medical records are neither advantageous to the medical service nor beneficial to the community, and that it is desirable that they be discontinued forthwith."

In spite of a remonstrance from the chairman of the Committee (Dr. Cardale), who said that the passing of this motion would be a futile proceeding and one not quite worthy of the reputation of the London Panel Committee, which had always stood for sanity in insurance policy, the motion was carried by about 22 to 12.

Services of a Second Practitioner.—A recommendation was before the Committee that an account for the services of a second practitioner in administering a general anaesthetic in a certain case be disallowed on the ground that a general anaesthetic was not necessary; the operation was for the evacuation of an abscess in quinsy. The practitioner attended before the Committee and said that in this case the patient, who was a young girl, could not or would not open her mouth without a general anaesthetic, and he produced other medical opinion to show that such an anaesthetic was necessary. After hearing the practitioner, who added to his evidence a protest against the waste of time involved in such an inquiry, the Committee unanimously rejected the subcommittee's recommendation and allowed the charge. In another case an account for emergency treatment was disallowed on the ground that although the patient's own doctor had been sent for, and was not available, his deputy had not been sent for and another practitioner was called in.

Dangerous Drugs Regulations.—The Committee agreed to make a protest against the draft regulations, issued by the Home Office, under the Dangerous Drugs Act, with regard to the prescribing and dispensing of certain drugs. An inquiry is to

be made of the Ministry of Health as to the obligations laid upon insurance practitioners, and the Ministry is to be asked to use its influence to obtain a postponement of the Regulations.

BRIGHTON.

The following resolutions have been unanimously adopted:

Medical Records.

That this meeting of insurance practitioners for Brighton, having considered the present record cards, is of opinion that they should be given a fair trial, but that in order to safeguard so far as possible the secrecy of the information given thereon, the Ministry of Health should claim privilege as being confidential documents, the contents of which ought not in the public interest to be disclosed; and, further, should take from time to time any other steps which would tend to secure most fully that secrecy which is essential for successful medical practice and is required for reliable statistical data.

Dangerous Drugs Regulations.

Having considered the Regulations proposed to be issued by the Home Office under the Dangerous Drugs Act, the Panel and Local Medical Committee for Brighton is of opinion that: (a) The procedure which it is required that the insurance practitioners should adopt will prove, under the unnecessary official interference with everyday practice, both irksome and detrimental to the interests of the insured person, seeing that the consequence will be in many cases to deprive such persons of the drugs which would otherwise be given, or, if they are given, their required advertisement on the bottle will have a harmful effect on the patient in many cases. (b) The insurance practitioner should be allowed, as heretofore, every latitude in determining the drugs considered most desirable for his insurance patient, without having to disclose to any inspecting officials professional matters, and should be responsible to the Minister of Health alone for his actions.

GLOUCESTERSHIRE.

At a joint meeting of the Gloucestershire Local Medical and Panel Committee and the corresponding Committee of the County Borough of Gloucester, held on February 1st, the following resolution was adopted:

That, in the opinion of this meeting, the record cards should take the place of the medical cards, and should be in the possession of the insured persons, who should be responsible for them and should produce them when required by the practitioners, and should surrender them for inspection from time to time in the same way as they surrender the stamped cards. Further, that the practitioners should only be responsible for such entries on the records as would afford a useful and continuous clinical record; all other particulars—for example, age, employment, etc.—being supplied by the approved societies.

A copy of the resolution has been forwarded to the Ministry of Health.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commanders F. H. Stephens, O.B.E., to the *Cambrian*, G. C. Cross to the *Cleopatra*, J. L. Barford to the *Pembroke*, for R.N. Barracks, Chatham (temporary), F. E. Bolton to the *Southampton*, Surgeon Lieutenant Commanders A. C. Paterson to the *Caroline*, A. S. Paterson to the *Crescent* (temporary), G. L. Ritchie, M.C., to the *Southampton*. Surgeon Lieutenant J. F. M. Campbell to the *Factory*, Surgeon Lieutenant (temporary) T. L. P. Harries to the *Indus*. To be Surgeon Lieutenant: J. W. Tighe.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Major H. M. J. Perry, O.B.E., to be a Professor at the Royal Army Medical College.

Major T. H. Gibbon, O.B.E., retains the temporary rank of Lieutenant-Colonel whilst specially employed.

Major P. J. Marett retires, receiving a gratuity, and is granted the rank of Lieutenant-Colonel.

Temporary Captain S. A. McClintock to be temporary Major whilst specially employed.

The notification in the *London Gazette* of July 1st, 1919, regarding Captain O. D. Jarvis is cancelled.

To be temporary Captains: C. B. Dyson, late Captain S.R. (seniority from November 7th, 1919), R. T. G. Aickin, late temporary Captain (seniority from February 3rd, 1917).

Temporary Captain F. W. H. Pilot relinquishes his commission.

INDIAN MEDICAL SERVICE.

Major Geoffrey Gratix Hirst to be an officer in charge, Medical Store Depot, vice Lieut.-Colonel William Davey Hayward, M.B., retired, August 5th, 1920.

The promotion to present rank of Major Robert Knowles is antedated from February 1st, 1920, to August 1st, 1919.

Lieut.-Colonel D. W. Sutherland, C.I.E., V.H.S., M.D., Principal and Professor of Medicine, King Edward Medical College, Lahore, is granted, with effect from January 15th, 1921, furlough on average salary for five months and in continuation vacation leave for three months.

Lieut.-Colonel E. V. Hugo, C.M.G., M.D., F.R.C.S., V.H.S., Professor of Surgery, King Edward Medical College, Lahore, is appointed to officiate as Principal of the College during the absence on leave of Lieut.-Colonel D. W. Sutherland until further orders.

Major J. J. Harper Nelson, O.B.E., M.C., M.D., F.R.C.S.E., Professor of Materia Medica, King Edward Medical College, Lahore, is appointed to officiate as Professor of Medicine in the College, with effect from date on which he assumes charge of his duties and until further orders.

Captain Amir Chand, M.B., is appointed to officiate as Professor of Materia Medica in the College, with effect from date on which he assumes charge of his duties and until further orders.

The services of Captain H. R. H. Robson, M.B., are placed temporarily at the disposal of the Government of Burma (December 13th, 1920).

Lieut.-Colonel F. H. G. Hutchinson, M.B., D.P.H., D.T.M., Sanitary Commissioner with the Government of India, is granted privilege

leave for six months and in continuation furlough on average salary for four months and ordinary furlough for two months, with effect from February 14th, 1921, or such subsequent date on which he may avail himself of the leave.

Lieut.-Colonel A. B. Fry, C.I.E., D.S.O., M.D., D.P.H., Special Deputy Sanitary Commissioner, Bengal, is placed on special duty under the Director-General Indian Medical Service, with effect from February 1st, 1921. He is appointed to officiate as Sanitary Commissioner with the Government of India, with effect from February 14th, 1921, or such subsequent date on which Lieut.-Colonel F. H. G. Hutchinson, M.B., D.P.H., D.T.M., proceeds on leave. Lodging allowance has been fixed at 12s. a day, irrespective of rank, for officers on study leave.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel P. R. Ash resigns his commission and retains the rank of Lieutenant-Colonel. Lieut.-Colonel J. B. Berry, T.D., relinquishes his commission on account of ill health, and retains the rank of Lieutenant-Colonel.

Captain D. G. Rice Oxley, M.C., to be Lieutenant-Colonel and command the 1st London (City of London) Field Ambulance.

Major N. Maclaren, T.D., to be Lieutenant-Colonel and command 1st Western Casualty Clearing Station.

To be Majors: Captain G. B. Gill, May 27th, 1920 (substituted for notification in the *London Gazette*, December 31st, 1920), W. Bowater, Surgeon-Major R. L. FitzGerald, from 5th Battalion East Lancashire Regiment, with precedence as from January 16th, 1916. Captain C. H. S. Redmond, Captain W. D. Carruthers, from 1st London (City of London) Sanitary Company, with precedence as from December 1st, 1915.

Captain (acting Lieut.-Colonel) J. R. Pooler, O.B.E., relinquishes his acting rank on ceasing to be employed.

Captain L. E. G. de Glanville (late R.A.M.C.) to be Lieutenant with precedence as from February 27th, 1915, and to relinquish the rank of Captain, July 21st, 1920 (substituted for notification published in the *London Gazette*, January 3rd, 1921, under the name L. R. G. de Glanville).

Captain (acting Major) W. C. Gunn relinquishes his acting rank on ceasing to be specially employed.

To be Captains:—Majors and to relinquish the rank of Major, J. L. Menzies, M.C. (late R.A.M.C.), with precedence as from May 10th 1918; P. J. Gaffikin, M.C. (late R.A.M.C.S.R.), with precedence as from April 1st, 1915; Captain H. W. Featherstone (late R.A.M.C.S.R.), with precedence from June 1st, 1913; Captain T. Carnwath, D.S.O., from T.F.Res. (August 3rd, 1920); Captain A. C. MacDonald, M.C. (late R.A.M.C.S.R.), with precedence as from February 10th, 1917; Captain H. L. Garson, O.B.E., M.C. (late R.A.M.C.S.R.), with precedence from May 13th, 1915.

Captain D. Buchanan is seconded under para. 114, T.F. Regulations. The following officers resign their commissions: Lieut.-Colonel C. S. Brebner, D.S.O., and retains the rank of Lieutenant Colonel. Major W. Macdonald, and retains the rank of Major. Captains J. Dale, O.B.E., and A. C. Mallace, M.C., and are granted the rank of Major. Captains and retain the rank of Captain: H. C. Gilmore, W. H. Dater, J. Morley, J. H. Barclay, L. T. Whelan, M.C.

To be Lieutenants: Captain T. D. Webster (late R.A.M.C.), with precedence as from May 7th, 1917, and to relinquish the rank of Captain. Lieutenant R. K. Nisbet (late R.A.M.C.), with precedence as from January 10th, 1915; Second Lieutenant R. J. Dyson, from T.F.Res. (West Yorkshire Regiment).

TERRITORIAL FORCE RESERVE.

ARMY MEDICAL SERVICE.

Major Sir Robert Jones, K.B.E., C.B., T.D., from 1st Western General Hospital, to be Colonel, and to be granted the honorary rank of Major-General.

DIARY OF SOCIETIES AND LECTURES.

HUNTERIAN SOCIETY, Stion College, The Embankment, E.C., Wed., 9 p.m.—Mr. H. Tyrrell Gray: Obscure Intestinal Colic. Dr. A. R. Friel: Continuous Electric Current in Treatment.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 9 p.m., Mr. G. E. Gask: Lentsomian Lecture on Surgery of the Chest and Pleura.

MIDDLESEX HOSPITAL MEDICAL SCHOOL, W.—Emeritus Lectures, 3 p.m.—Tues. Dr. W. McC. Wanklyn: Future of the Medical Profession. Fri., Sir J. Kingston-Fowler: Treatment of Tuberculosis.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—Tues., 5 p.m., Dr. George Graham: Goulstonian Lecture—Glycaemia and Glycosuria. Thurs., 5 p.m., Dr. A. Whitfield: Lumléian Lecture—Etiology of Skin Diseases.

ROYAL SOCIETY OF MEDICINE.—Section of *Psychiatry*: Tues., 5.30 p.m., Dr. Henry Devine: Study of Hallucinations in a Case of Schizophrenia. Section of *Balneology and Climatology*: Thurs., 5.30 p.m., Discussion on Baths and Health Resorts in Gynaecology. Members of the Section, with guests, will dine together at the Welbeck Palace Hotel, Welbeck Street, W., at 7 p.m. Those intending to be present are requested to notify Dr. C. F. Sonntag, 80A, Belsize Park Gardens, N.W.3. Section of *Neurology and Ophthalmology*: Thurs., 8 p.m., Cases. Thurs. and Fri., 8.30 p.m., Discussion: Ocular Palsies, to be opened by Dr. Gordon Holmes and Mr. Leslie Paton, and continued by Mr. J. B. Lawford, Mr. H. S. Mayon, Mr. N. Bishop Harman, Mr. Foster Moor, Mr. W. H. McMullen, Mr. M. L. Hine, Dr. S. A. K. Wilson, and others. *Clinical Section*: Fri., 5 p.m., Cases.

ST. JOHN'S HOSPITAL, 49, Leicester Square, W.C.2.—Thurs., 6 p.m., Dr. K. Sibley: Chesterfield Lecture—Electrical Treatments.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Western Infirmary.—Wed., 4.15 p.m., Professor Monro and Sir Kennedy Dalziel: Medical and Surgical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Thurs., 4 p.m., Dr. C. E. Heald: Muscular Defects in Poliomyelitis.

LONDON HOSPITAL MEDICAL COLLEGE.—Lecture Demonstrations on Gonorrhoea: Mr. Clarkson, Tues. and Thurs., 4.30 p.m., Men; Dr. Simpson, Wed. and Fri., 4.30 p.m., Women.

MANCHESTER BABIES' HOSPITAL, Slade Lane.—Sat., 3.30 p.m., Dr. Chisholm: Therapeutic Value of Food Preparations.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Mr. H. H. Bayler: Surgical Disorders of Infancy and Early Childhood.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland Street, W.1.—Mon., 5.30 p.m., Dr. J. Parkinson: Dropsy.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Daily (except Wed. and Sat.) 2 p.m., Out-patient Clinics. Lectures: 3.30 p.m.—Mon., Mr. Scott: Disturbances of the Vestibular System; Tues., Dr. R. Russell: Syphilis of the Nervous System; Thurs., Dr. G. Holmes: Muscular Atrophy; Fri., 3.30 p.m., Dr. E. J. Reynolds: X-Ray Demonstration of Cases.

ST. MARY'S HOSPITALS, Manchester (Whitworth Street West Branch).—Fri., 4.30 p.m., Dr. Ward: Dyspepsia in Infancy.

PROCEEDINGS OF COUNCIL.

A MEETING of the Council was held at 429, Strand, London, W.C., on Wednesday, February 16th, 1921, with Dr. R. A. BOLAM in the chair. There were present:

Sir Clifford Allbutt (President), Dr. T. W. H. Garstang (Chairman of Representative Meetings), Dr. G. E. Haslip (Treasurer), Dr. T. Ridley Bailey (Staffs), Dr. J. A. P. Barnes (London), Sir James Barr (Liverpool), Dr. J. W. Bone (Luton), Dr. H. B. Brackenbury (London), Dr. H. C. Bristowe (Wrighton), Dr. C. Buttar (London), Mr. Russell Coombe (Exeter), Dr. J. Singleton Darling (Lurgan), Dr. James Don (Newcastle), Dr. R. Langd in Down (Hampton Wick), Mr. W. McAdam Eccles (London), Lieut.-Col. R. H. Elliot, Dr. A. C. Farquharson, M.P. (London), Dr. A. Forbes (Sheffield), Dr. E. R. Fothergill (Hove), Dr. H. A. Francis (London), Dr. J. Goff (Windlesham), Mr. N. Bishop Harman (London), Dr. I. W. Johnson (Bury), Dr. D. Lawson (Banbury), Sir R. H. Luce (Derby), Dr. J. A. Macdonald (Tamnton), Dr. S. Morton Mackenzie (Dorling), Major-General Sir William Macpherson (London), Dr. H. C. Mactier (Wolverhampton), Surgeon Captain E. H. Meaden (London), Dr. R. Peacocke (Dublin), Dr. C. M. Pearson (Edinburgh), Dr. F. Radcliffe (Oldham), Dr. D. Ross (London), Dr. D. A. Sheahan (Portsmouth), Dr. W. Johnson Smyth (Bournemouth), Dr. W. Snodgrass (Glasgow), Dr. F. O. Stedman (Weybridge), Dr. J. Stevens (Edinburgh), Dr. W. B. Crawford (Treasure (Cardiff), Mr. E. B. Turner (London), Dr. E. O. Turner (Bucks), Sir Jenner Verrall (Bath).

The Council resolved to send a special letter to Sir Dawson Williams, Editor of the BRITISH MEDICAL JOURNAL, expressing its gratification that the Editor's services to the medical profession, medical journalism, and the community had been recognized by the King. Congratulations on their knighthoods was conveyed also to Sir Squire Sprigge, Sir Charles Ryall, Sir William Hodgson, and Sir Alexander Jarvie Hood.

Dr. Macdonald's Visit to South Africa.

The Chairman, on behalf of the Council, welcomed Dr. J. A. Macdonald after his recent visit to South Africa on behalf of the Association, and drew attention to resolutions by South African Branches expressing appreciation of Dr. Macdonald's work and personality. Dr. Macdonald, at the Chairman's invitation, then gave the Council some account of his travels (a report of this appears in the SUPPLEMENT at page 70). The Council placed on record its deep appreciation of the great service rendered to the Association by Dr. Macdonald during his tour of the South African Branches as the Council's representative.

The Question of Federation.

The Council approved for publication the report to Divisions and Representative Body (since published in the SUPPLEMENT of March 5th, 1921) upon the steps to be taken whereby the British Medical Association may become in part a federation. The Council resolved to convene an extraordinary general meeting of the Association, to be held at Newcastle on July 19th, 1921, for adoption of the amended articles and by-laws enabling the Association to become in part a federation. Should the amended articles and by-laws be adopted on July 19th, a further extraordinary general meeting will be held at 429, Strand, London, on August 3rd, 1921, to confirm the adoption. The Council decided also that a conference on this subject should be held at the Head Office on July 5th,

at 10 a.m., and invitations are being sent to the Oversea Branches, the Federal Committees, and the Joint Organization Committee for Ireland. This conference, after consideration of the report and recommendations published in last week's SUPPLEMENT will (by instruction of the Council) report direct to the Annual Representative Meeting, with particular reference to the views expressed by the Oversea and Irish representatives.

Professional Secrecy.

Arising out of a recommendation of the Central Ethical Committee the Council expressed the following opinion:

1. That when a medical practitioner refuses to divulge information which he has obtained in the exercise of his professional duties in such circumstances as the following:

- (a) In a court of law when the court has ruled that the information so obtained must be disclosed;
- (b) Where it is already provided by Act of Parliament that he must do so, for instance, as in notification of certain diseases,

such action must be taken entirely on his own responsibility, and the Association could not be expected to support him or protect him from consequences he may incur in so doing.

2. That if attempts be made to add additional exceptions to the general rule of the profession as regards professional secrecy, the Association recognizes that it will be necessary, after due consideration (i) to resist by all lawful means any such encroachment, and (ii) where such encroachment is attempted, to accord support by any means in the power of the Association to any individual practitioner who may be assailed through such new encroachment.

Municipal Hospitals and Clinics.

The Ministry of Health Committee, in its report to the Council, submitted a number of recommendations as to the policy of the Association on the question of municipal hospitals and clinics. It was decided to call a joint meeting of the Medico-Political, Public Health, Hospitals, and Ministry of Health Committees, to consider the whole question of municipal hospitals and clinics. The drawing up of an agenda for this meeting was placed in the hands of the four chairmen concerned, who were further empowered to invite to the conference representative medical officers of health or others particularly interested in the setting up or administration of municipal hospitals or clinics.

On the subject of Poor Law hospitals and civil needs a series of proposals put forward by the Hospitals Committee was approved for recommendation to the Representative Body, together with a number of the resolutions passed by the Conference of Representatives of Medical Staffs of Voluntary Hospitals held on December 21st, 1920, and reported in the SUPPLEMENT of January 1st, 1921.

The Collective Opinion of the Profession.

The report of the Special Committee appointed to consider the formation of a Central Medical Representative Committee was received and discussed, with particular reference to the memorandum on this subject published in the SUPPLEMENT of February 19th, 1921. The Chairman undertook that the Committee would take into consideration the series of questions formulated by Dr. Fothergill, and since embodied in a letter by him printed in the

JOURNAL of March 5th. The Special Committee considering this subject now consists of Dr. Bolam (chairman), Dr. Garstang, Dr. Haslip, Dr. Brackebury, Sir Jenner Verrall, and Dr. E. J. Maclean. The Chairman stated that the Certifying Factory Surgeons' Association and the Poor Law Medical Officers' Association of England and Wales had already accepted the invitation to co-operate with the British Medical Association in forming such a representative medical committee as the Minister of Health had asked for. (Since then the Society of Medical Officers of Health has also accepted.) The Chairman of the Scottish Committee stated that his committee was of opinion that there should be a Scottish representative on the English Central Committee when set up, and an English representative on the analogous Scottish Committee. This and other points Dr. Bolam undertook to bring to the notice of the Special Committee.

Medico-Political.

The report of the Medico-Political Committee included reference to medical certificates of inability to attend school, fees for medical practitioners called in on the advice of midwives, notification of infectious diseases, fees and travelling allowances for medical witnesses, the Tasmanian Medical Act, and the organization of the Post Office medical officers. Arising out of this Committee's report the Council resolved that the British Medical Association should endeavour to obtain the best terms and conditions for medically qualified laboratory and research workers and professors and teachers, so far as possible in co-operation with the Association of University Teachers. With regard to medical attendance on miners' and other workers' families, it was resolved that free choice of doctor by patient and of patient by doctor should be a recognized principle in all forms of contract practice. It was agreed that the British Medical Association should co-operate with the Association of Certifying Factory Surgeons in an endeavour to obtain increased fees for these practitioners. As recorded in the SUPPLEMENT, the position with regard to the draft Regulations under the Dangerous Drugs Act, 1920, was laid before the Council by the Chairman of the Medico-Political Committee and Dr. J. W. Bone. The Council was informed of the modifications which the Home Office was prepared to grant, but declined to give any opinion as to the practicability of the modified Regulations until the new draft had been seen.

Public Health.

The Public Health Committee was instructed to prepare and submit to a future meeting of the Council a draft Parliamentary Bill providing security of tenure for medical officers of health. On the recommendation of the Committee the Council expressed its approval of a resolution passed in July, 1920, by the National Veterinary Medical Association of Great Britain and Ireland, deprecating the use of tuberculin by persons other than members of the medical and veterinary professions, and calling for immediate steps to control the standardization of tuberculin used in the diagnosis of tuberculosis in cattle.

Emergency Medical Organization.

The report of the Naval and Military Committee introduced to the Council a scheme, drawn up in outline by the Territorial Force Subcommittee, for the expansion of the Army Medical Service in the event of a national emergency. The Council resolved to remit the scheme for consideration and report by an *ad hoc* committee consisting of those members of the late Central Medical War Committee who are members of the Council, together with four representatives of the Naval and Military Committee.

DR. MACDONALD'S MISSION TO SOUTH AFRICA.

At the meeting of the Council of the British Medical Association on February 26th Dr. Macdonald gave an account of the visit he paid last autumn, at the request of the Council, to the South African Branches. A proposal to establish a South African Medical Association has recently been mooted, and Dr. Macdonald's first objective was the Medical Congress in Durban, Natal, where it was anticipated that this proposal would be discussed. Dr. Macdonald, who was cordially received by the Council, began the account of his visit by stating that he left Southampton on September 11th, 1920, by the *Walmer Castle*, and after an uneventful voyage reached Capetown, where the boat stopped for

a day. There he had the advantage of talking with Dr. Jasper Anderson and Dr. Darley Hartley. After leaving Capetown, stops were made at Port Elizabeth and East London, but at neither place did he go ashore, as the landing facilities at both were bad—by tender at the former, and by basket to the tender at the latter. Medical men journeying to the congress at Durban came aboard at both places.

At Durban, which was reached on October 2nd, he was met by the president of the Natal Coastal Branch of the Association, Dr. Campbell, whose guest he was during his ten days' stay in Durban. The Congress, of which Dr. Campbell was president, was an unqualified success, especially so when it was realized that in the whole of South Africa there are only some 600 to 700 members of the Association, separated by hundreds of miles; over 100 attended the Congress, the largest number that had attended any medical congress ever held in South Africa.

The Congress was run on the same lines as the Annual Meeting at home, with the usual papers, discussions, exhibitions, and entertainments, the latter displaying the lavish and whole-hearted hospitality characteristic of colonial life. On the scientific side the Congress was, he thought, a distinct success, the papers, judging from those he heard, being excellent; the discussions were keen and critical, with a more independent and self-reliant tone than was often heard at home; this characteristic had been notable also at the meetings he had attended during the visit he had paid to Australia and New Zealand in 1914 on behalf of the Association. The exhibition of instruments, drugs, etc., was good, and must have been very useful to practitioners coming from outlying places who had little chance of seeing modern developments in appliances, instruments, and so on.

So far as he was concerned, however, the most interesting aspect of the Congress was the medico-political. The constitution of the Congress was curious in that while it was under the aegis and management of the British Medical Association any medical practitioner could on payment of one guinea attend the meetings, take part in the discussions, and vote on any matter not specially connected with Association work. Many points were raised at the meeting, but the main interest centred in a proposal which had been made to form a Medical Association of South Africa; while the movers in the matter wished to drop the term "British," they expressed the hope that their association would be affiliated or federated to the British Medical Association. The movement originated in the Witwatersrand Branch, and the main reasons assigned for making the proposal were that the new association would not be hampered by the constitution of the British Medical Association, and that an association with the name Medical Association of South Africa would attract men who would not join an association bearing the name "British." A keen discussion took place, during which it appeared that the movers in the scheme proposed to form the new association into a trade union and register it as such. It seemed that it was in this matter that they considered they would be hampered by the constitution of the British Medical Association, and that they were of opinion that the British Medical Association could not undertake collective bargaining. The opinion of their own legal advisers on this point, together with the letters of the Medical Secretary on the subject, proved the latter opinion to be wrong. Dr. Macdonald said that he had been asked to take part in the discussion, but declined on the ground that the matter was one of internal politics in which the central authorities of the British Medical Association had no desire to force the hands of members in South Africa. He had, however, expressed his willingness to give any information he could as to the powers of the British Medical Association or restrictions imposed by its constitution. The discussion on the question whether a separate medical trade union for South Africa should be formed ended by the adoption of a resolution postponing the question until the next Congress, to be held at Capetown this year, and directing that in the meantime the British Medical Association Branches should be consulted and a plebiscite taken.

He had a most kind and flattering reception from the Congress, and every one seemed to vie the one with the other in their determination to make his visit a pleasant one; in this he had no hesitation in saying they had succeeded.

He gathered that there was considerable slackness in organization, and practically no rules concerning ethical procedure, owing probably to the effect of the war. He advised that instead of the Branches acting independently the position of the South African Committee should be strengthened with a view to its being used to settle disputes and conduct negotiations. He recommended also the formation of Divisions in the very large Branches; the appointment of a travelling secretary who would visit the outlying districts from which men had difficulty in attending any congress; the appointment of a correspondent or correspondents to keep alive the intercourse between the Central Office and the South African Branches. He had promised also to try and induce the Central Council to send out a delegate periodically to South Africa on such a mission as his.

From Durban he proceeded to Pietermaritzburg, through some magnificent scenery, one of the finest views he had ever seen being the Valley of a Thousand Kopjes. At Pietermaritzburg, where he was a guest of Dr. and Mrs. Campbell Watt, who made his stay very happy by their kindness, he had an equally hospitable reception. He attended a dinner given by the Administrator of Natal at which all the doctors of the locality were invited to meet him. A well-attended meeting of the profession was held, at which there was an interesting discussion upon the question of the proposed new association. Here again everyone seemed to lay themselves out to make his stay pleasant, and he might at once say that this was true of every place he stopped at.

The next stage of his journey was to Johannesburg. On the way he stayed for a day at Ladysmith, whence he took a car to visit the battlefields. While in Ladysmith he was able to meet all the medical practitioners there; he then went on through Elandslaagte, Majuba, Sand Spruit, among other places, to Johannesburg—a most interesting journey.

Dr. R. Mackenzie, C.M.G., President of the Witwatersrand Branch, with Mrs. Mackenzie, made his stay at Johannesburg like being at home. He had expected that the meeting here would be large, and was not disappointed, something like eighty practitioners being present. When the question of the proposal for a new association came up for discussion he was asked to make a statement from the British Medical Association point of view; this he did, and had expected a keen discussion. In this expectation, however, he was disappointed, the discussion being practically confined to a speech by Dr. Napier in favour of the new association. He (Dr. Macdonald) had no difficulty in correcting the inaccuracies contained in this speech, and the discussion then ended. He understood that at a subsequent meeting of the South African Medical Association only seven practitioners were present. While at Johannesburg he paid a visit, under the guidance of Dr. Watkins-Pitchford and Sir Spencer Lister, to the South African Institute, which is devoted to medical research. The system of investigating and recording the incidence and progress of pulmonary silicosis among workers in the Rand mines was fully explained to him, as were the mode of preparation and results of the vaccine which had been used with success in the treatment of pneumonia complicated by influenza.

From Johannesburg he went to Pretoria, where there was a big meeting of the profession, at which some Dutch practitioners were present; it was held under the chairmanship of Dr. Gairdner, President of the Branch.

While at Johannesburg he had visited the gold mines, and at Pretoria one of the medical men drove him to the Premier Diamond Mine, where the Cullinan diamond was found. It was a curious mine, being merely a big hole in the ground, out of which some 93 million tons of gravel and clay had been excavated. He arrived just at the midday blasting, when in the course of two or three minutes there were some 2,500 explosions. During his stay in Pretoria he had an interview with General Smuts, the Premier, having received an introduction through the kindness of Dr. Peter Macdonald of York.

On the way back to Johannesburg he attended a meeting at Bloemfontein, where he met with the only rain of any consequence which fell during his visit to South Africa. The meeting there was not so well attended as others, owing probably to the short notice and the absence of the President, Dr. Manning. The discussion on the new association, however, was very keen, and there

appeared to be more support for the idea than at any place he visited.

The journey to East London took him through the veldt, which consisted of hundreds of miles of sandy plains—very poor ground and very poor cattle. He was told, however, that had he been a fortnight later he would have found the district covered with grass and flowers. East London, where he stayed with Dr. and Mrs. Bruce-Bays, was a charming seaside place. There was a good meeting of the local medical profession, at which very little sympathy was shown for a South African medical trade union.

Journeying from East London to Grahamstown he had his first experience of travelling by car over the veldt, and though the road was mostly such as an Englishman would scarcely trust his car on, the first eighty miles of the distance, to Breakfastlei, were covered at some twenty miles an hour. This journey, which was through Kaffirland proper, was very interesting, affording many varied glimpses of Kaffir life. At Breakfastlei he was met by two practitioners from Grahamstown, who took him the rest of the journey to that town through some wonderful scenery. Grahamstown, where he was entertained by Dr. Dru Drury, appeared to be the most English town of all those he visited in South Africa. It was a great educational centre and a cathedral city. The meeting of the profession there showed very little sympathy with the idea of a new association. He went with Dr. Dru Drury and Dr. Griffiths from there through fine scenery to Port Elizabeth, and was present at an excellent meeting, which was attended by every practitioner in Port Elizabeth. On his advice it was decided to form a Division at Port Elizabeth, since communication between it and Grahamstown is difficult.

From Port Elizabeth he went on to Capetown by the Garden Route through very beautiful scenery. There was an excellent meeting, at which no sympathy was shown with the idea of a South African medical trade union. During his week's stay in Capetown he enjoyed some very fine drives, and was entertained most hospitably.

From Capetown he went to Kimberley, where the kindness of the profession made his stay very pleasant. Dr. Symons, the President of the Branch, Dr. Lewis Jones, Dr. Wicks, and Mr. Grimmer, assistant manager of the de Beers Mines, doing everything possible for him. The meeting of the medical profession, which was well attended, showed very little sympathy with the idea of a new association. From Kimberley he travelled north into Rhodesia and reached Bulawayo, where Drs. Eaton and Forrester, the President and Secretary of the Rhodesian Branch, looked after his comfort very kindly, and he had the opportunity of meeting most of the doctors of the district. He visited Rhodes's grave on the Matoppoos, where also was the grave of Dr. Jameson and the memorial to Major Alan Wilson and the men who died at Shangani. From Bulawayo he went on to the Victoria Falls, a wonderful place, where he spent a few days. During a trip of some ten miles by motor boat on the Zambesi he saw five hippopotamuses and about a dozen crocodiles. Returning from Victoria Falls to Bulawayo, he went on to Salisbury, where Dr. and Mrs. Fleming were particularly kind to him, and the Deputy Administrator of Southern Rhodesia put a car at his disposal, and showed him great kindness generally. The meeting here was one of the best, considering the small number of medical men in the district. Some travelled about one hundred miles by car to attend the meeting.

For himself personally, the tragedy of the trip was that he had been disappointed in his hope of traversing the whole of the Cape to Cairo route by land, going through Tanganyika, Nairobi, Entebbe, to the Nile, and so to Khartoum and Cairo. Difficulties were raised about the journey, and he read in the newspapers that objections were made to a British subject penetrating the Belgian Congo at that time. He had therefore reluctantly abandoned the project, only to receive on his return home a letter from Dr. C. A. Wiggins of Entebbe, stating that the profession there was very disappointed, having made arrangements to convey him from Entebbe to the Nile, arrangements of which he did not know until he received Dr. Wiggins's letter. From Capetown he came home by the *Kenilworth Castle*.

The advice he had given as to the organization of the profession, during his visits to the various centres, had been

mainly on the lines of strengthening the position of the South African Committee, and making use of it for dealing with disputes, etc.—the establishment on both sides of more regular correspondence between the Central Office and South Africa, and the bringing into existence there of a set of ethical rules.

He was everywhere shown the greatest kindness, and the hope was expressed repeatedly that he would persuade the Council to arrange more such periodical visits. He felt that such a course was desirable, especially when it was realized that in two years the universities in South Africa would be beginning to confer their own degrees; students would then no longer have to come home for a degree or diploma, and the risk of the profession in South Africa becoming estranged from the profession at home would thereby be increased.

The CHAIRMAN called the attention of the Council to two communications received from South African Branches—the one from the Witwatersrand Branch, transmitting a resolution adopted on November 25th, 1920, thanking the British Medical Association in England for sending a man of Dr. Macdonald's outstanding ability, tact, and courtesy to visit the Branch; the other was from the Eastern Province Branch, enclosing a copy of two resolutions adopted on November 29th. The first thanked the Central Council for giving the Branch the advantage of meeting Dr. Macdonald and hearing his explanation of the relation of Overseas Branches to the parent Association; the second stated that the Branch could see no advantage in forming a Medical Association of South Africa, and was resolved in every way to maintain and strengthen the British Medical Association.

On the motion of Sir JENNER VERRALL, seconded by Dr. T. W. H. GARSTANG, Chairman of Representative Meetings, the Council unanimously adopted a resolution placing on record "its deep appreciation of the great service rendered to the Association by Dr. Macdonald in his recent visit to the South African Branches as the Council's representative."

British Medical Association.

CURRENT NOTES.

Work of the Medico-Political Committee.

AT the last meeting of the Medico-Political Committee a number of important matters were under discussion: (1) The question of payment for certificates for children who are unable to attend school was considered, and it was decided to recommend the Council to inform all local education authorities that, in the opinion of the Representative Body, such certificates should be paid for by the authority requiring them and that a form of certificate should be provided for the purpose. The Council has approved the recommendation, and the necessary action is being taken. (2) The question of motor car taxation was also considered, and it was decided, with the approval of the Council, to back up the effort of the Automobile Association and Motor Union to obtain the substitution of a flat rate tax on petrol for the present £1 per horse-power tax. (3) At its September meeting the Committee decided to ask the Civil Service Commissioners to raise to one guinea the fee now paid in respect of the examination of candidates for the Civil Service. The Civil Service Commissioners have refused to accede to the request, but the Committee is pressing them to reconsider the decision. (4) As a result of action taken at the September meeting, the Board of Customs and Excise has informed the Association that pensions officers who send applicants for pensions for blindness to obtain certificates of blindness from honorary officers of voluntary hospitals are not acting in accordance with the spirit of the instructions issued to them under the Act. (5) The Council has approved a recommendation by the Committee that the Association should endeavour to obtain the best possible terms and conditions for medically qualified laboratory and research workers and professors and teachers, in co-operation with the Association of University Teachers, and a subcommittee is now considering the matter. (6) Further consideration was given to

the fee for notification of infectious diseases, and it was decided to seek the assistance of the Committee of Medical Members of Parliament with a view to the early restoration of the pre-war fee. (7) The Council has approved the Committee's recommendation that the British Medical Association should co-operate with the Association of Certifying Factory Surgeons with a view to obtaining an increase in their fees. (8) The new rates for telephone service were considered, and the Committee, while regretting the increase, was of opinion that, assuming an increase to be necessary, this will not weigh more heavily on medical men than on other classes of telephone subscribers; the Committee, therefore, did not consider that there were sufficient grounds for making a special complaint.

Fees for Practitioners called in by Midwives (Scotland).

Some time ago the Scottish Committee, at the request of the Scottish Board of Health, submitted a revised scale of fees for practitioners called in by midwives. The scale proposed that (a) a flat rate of £2 2s. be paid for all emergencies arising during or immediately after parturition and should include responsibility for attendance during ten days after confinement; (b) £1 1s. for anaesthetist's fee; (c) £2 2s. for abortion or miscarriage, and (d) 5s. for a single day visit and 10s. 6d. for a night visit. At a conference between the Board and the Chairman's Subcommittee, held on February 25th, the Board intimated that under the Midwives (Scotland) Act, 1915, it was precluded from paying an inclusive fee to cover more than one subsequent visit, and it asked the Committee to reconsider the scale in the light of that, and to submit proposals on the lines of the English scale but including only one subsequent visit.

The Scottish Committee, at a meeting on March 4th, reconsidered the matter, and, having in view the prevailing fees charged for midwifery in private practice, and the decision of the Representative Body that a fee of £2 2s. is not sufficient in cases where operative interference is required, the Committee decided to submit the following scale to the Board, namely:

	£	s.	d.
(1) Fee for all attendances of a doctor during parturition (that is, from commencement of labour until the child is born), whether operative assistance or not is involved, including attendance during the third stage and including one subsequent visit	2	2	0
(2) Fee for attendance of a second doctor to give an anaesthetic	1	1	0
(3) Fee for suturing the perineum, for the removal of adherent or retained placenta, for exploration of the uterus, for the treatment of <i>post-partum</i> haemorrhage, or for any operative emergency arising directly from parturition, including one subsequent necessary visit	1	1	0
(4) Fee for attendance at, or in connexion with, an abortion or miscarriage, including one subsequent necessary visit	2	2	0
(5) Fee for visits to mother or child not included under (1) to (4):			
Day (9 a.m. to 8 p.m.)	0	5	0
Night (8 p.m. to 9 a.m.)	0	10	0
No fee to be paid for subsequent visits during the first ten days after parturition in a case where the doctor has already attended and been paid under (1), (3), and (4).			
(6) The usual mileage fee of the district to be paid for all attendances.			

It was agreed to suggest to the Board that practitioners called in in an emergency should give an honourable undertaking to give all necessary visits during the first ten days without additional charge.

Association Notices.

ELECTION OF COUNCIL OF ASSOCIATION, 1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and *Nomination Form*, are printed below. The *Nominations* must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

GROUPS OF HOME BRANCHES FOR ELECTION OF TWENTY-FOUR MEMBERS OF THE COUNCIL, 1921-22.

(Each Group elects One Member of Council unless otherwise stated.)

FORM FOR NOMINATION

BY A DIVISION, OR BY THREE MEMBERS OF A BRANCH, IN THE GROUP, OF A CANDIDATE FOR ELECTION AS ONE OF THE TWENTY-FOUR MEMBERS OF THE COUNCIL, 1921-22, TO BE ELECTED BY THE GROUPED HOME BRANCHES.

* By instruction of the Division I (* or We, the undersigned Members of the Branch) hereby nominate

..... of

as a Candidate for Election by the Branches in Group† as a Member of the Council of the Association.

.....Honorary Secretary.*
.....Division.*
(.....Member.*
.....Member.*
.....Member.*)

I hereby declare my willingness to serve, if elected, as a Member of the Council for the year 1921-22.

Candidate's Signature.....

N.B. — The Nominations must be in the hands of the Medical Secretary, 429, Strand, London, W.C.2., by **May 16th**. The above form may be used, or, if preferred, a separate form will be sent on application to the Medical Secretary.

* Please omit words not required. In the case of a nomination by members, the nomination, to be valid, must be signed by at least three members.

† The Group should be indicated by filling in the index letter (as above).

ELECTION OF REPRESENTATIVE BODY OF ASSOCIATION, 1921-22.

Constituencies in Representative Body.

THE Council has finally grouped the **Home Divisions** for election of the Representative Body, 1921-22, in the same manner as for 1920-21, except that the **Caithness and Sutherland Division** of the Northern Counties of Scotland Branch, and the **Rotherham and Sheffield**

Divisions of the Yorkshire Branch, have been made independent Constituencies.

As intimated to all the **Oversea Bodies**, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

The REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body must be elected not later than **June 17th**, and their names notified to the Medical Secretary **not later than June 24th**. The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the **BRITISH MEDICAL JOURNAL SUPPLEMENT** not later than **May 14th**, and for this purpose should be received by the Medical Secretary **not later than April 30th**.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A LIST of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: MARYLEBONE DIVISION.—A meeting of the Division will be held at 8.30 p.m. on Wednesday, March 16th, at 11, Chandos Street. Agenda: Election of two Representatives of the Division on the Branch Council any nominations for Representatives should reach the Honorary Secretaries by first post, March 15th). Address by Dr. T. Watts Eden, F.R.C.P., on "Some notes on the treatment of private patients in hospitals in the U.S.A. and Canada."

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—A meeting of members and non-members will be held on Tuesday, March 15th, at 8.30 p.m., at St. Andrew's Parish Hall, High Road, Willesden Green, N.W. (1) Report on conference with Willesden District Council, etc. (see **BRITISH MEDICAL JOURNAL SUPPLEMENT**, March 5th, 1921). (2) Consider formation of "Practitioners' Mutual Help Scheme" on lines of Sheffield Division. (3) Clinical meetings and medical club.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.—A meeting of the Branch will be held at the Feathers Hotel, Ledbury, on Thursday, April 7th, at 3.15 p.m., when a British Medical Association lecture will be given by Mr. P. Daniel, F.R.C.S., Surgeon to Charing Cross Hospital, on "Differential diagnosis of acute abdominal conditions from a clinical standpoint." A discussion will follow. The Branch Council will meet at 3 p.m.

Meetings of Branches and Divisions.

JOINT MEETING OF NOTTINGHAM DIVISION AND NOTTINGHAM MEDICO-CHIRURGICAL SOCIETY.

A JOINT meeting of the Nottingham Division of the British Medical Association and the Nottingham Medico-Chirurgical Society was held on March 2nd, with Dr. J. P. BLURTON, President of the Society, in the chair. The MEDICAL SECRETARY, by invitation of the two societies, addressed the meeting on "Some of the difficulties of a medical organizer." He detailed a considerable number of obstacles that he had met during the thirty years he had been interested in medical organization. The chief of these was the fact that nobody liked to be organized, least of all the medical man, for it meant some sacrifice of individuality. But the profession had for the

last twenty years been going through a process of intensive education, and was finding out that if it wanted to maintain its influence in public affairs and to preserve its status it must be organized for those purposes. He dealt with the atmosphere of suspicion of leaders which was a marked feature of all organizations; it was due not to any special dose of original sin in the medical profession, but to the imperfection of human nature. The average man did not understand democratic government; he did not realize that in selecting a man to represent him he necessarily must repose trust in him; on the contrary, he was inclined to resent action by his representatives because he did not, and could not, know all the factors which had influenced his representatives. This suspicion led to sensitive men declining to have anything to do with medical politics, and thereby the profession was deprived of the services of some of its best intellects. Dr. Cox also dwelt on the difficulty of reconciling the various interests inside the profession, and pointed out that no body other than the British Medical Association was capable of doing this, because no other body comprised and catered for all sections as the Association did. He said that up to the present time the consultant element of the profession had rather held aloof from medical politics, with a few brilliant exceptions, but that economic and other factors were forcing them to see that they also must have an organization which must be able to place the force of the whole organized profession at the back of any section which needed it at any particular time. The entry of the hospital physicians and surgeons and medical teachers into medical politics would be a great gain to all.

Dr. Cox urged members to take a proper pride in the Association; this, if properly developed, would make the Association a much greater force than it now was. If doctors could be induced to take the long view, both backwards and forwards, they would perceive that the Association had done great work for every section of the profession, was now more thoroughly equipped for that work than ever it had been, and that its future possibilities were unbounded. He was not at all pessimistic about the future of medical organization. The difficulties he had alluded to in his address were mainly due to the fact that the medical profession had only recently begun to realize the necessity for organization, as, up to twenty years ago, doctors had mainly had to deal as individuals with individuals, and did not need an organization for that purpose. The position was so changed nowadays, when all kinds of doctors were continually dealing with organized bodies of lay people, that the difficulties of a medical organizer were bound to get less as the necessity for, and the good results obtained from, organization became more apparent.

After several questions had been asked and answered, Dr. HOUFTON proposed and Dr. J. H. COX seconded a vote of thanks to Dr. Alfred Cox, which was carried very heartily.

LANCASHIRE AND CHESHIRE BRANCH: BURY DIVISION.

A MEETING of the Bury Division was held on February 2nd to consider the Consultative Council's interim report. Dr. TURNBULL was in the chair. The discussion, in which all took part, was introduced by Dr. I. W. JOHNSON. The advantages were felt to be: (1) Work would be in the hands of the general practitioner. (2) Every general practitioner would have the right to attend his own patients in an institution and have the advantages of institutional treatment, with the right to demand specialist treatment for such cases as needed it. The disadvantages were felt to be (1) the great cost, (2) opposition by present whole-time and part-time men adversely affected. A resolution approving the general principles of the scheme was unanimously adopted. A further resolution was passed appointing the Executive of the Division an Advisory Committee provisionally with power to co-opt members to safeguard the interests of the profession in any developments of the subject occurring within the area of the Division.

A MEETING of the Bury Division was held on February 24th, with Dr. TURNBULL in the chair. The HONORARY SECRETARY read the correspondence relating to the Dangerous Drugs Regulations, including the latest information available in the Assistant Medical Secretary's letter of February 21st. A general discussion ensued. On the motion of Dr. COOK, seconded by Dr. YOUNG, it was unanimously resolved:

The Bury Division of the British Medical Association, having read and discussed the proposed Regulations for the sale of dangerous drugs, emphatically protests against the application of these, or any similar regulations, to registered medical practitioners.

The Secretary was instructed to forward a copy of the resolution to the Home Office, the Ministry of Health, the British Medical Association, and the M.P. for Bury. Arrangements were also made with local secretaries and others to forward a copy to M.P.'s of other parliamentary divisions within the area of the Division, and the Secretary undertook to furnish copies of the resolution for this purpose to Drs. Lawrie, J. P. Stuart, and C. Crawshaw. The action of the Association in dealing with the Dangerous Drugs Regulations was criticized on the ground that, instead of devoting its time to getting details amended, the Council should make it plain that what the medical profession required was to be exempt and entirely outside the scope of any such regulations. Dr. NUTTALL proposed the following resolution, which was seconded by Dr. YOUNG, and unanimously carried:

That the Bury Division of the British Medical Association is of the opinion that the concessions mentioned in the Assistant Medical Secretary's letter of February 21st are utterly inadequate and do

not cover the objections to the draft Regulations, and requests the British Medical Association to call upon the Home Office to withdraw these draft Regulations unconditionally, in so far as they relate to registered medical practitioners.

A copy of the resolution was directed to be sent to the Medical Secretary of the British Medical Association.

Several members spoke on the subject of the new pink monthly certificates for insured persons, and described the difficulties they had experienced in obtaining from their respective Insurance Committees sufficient copies of them for their requirements. On Dr. J. HOLMES'S motion it was decided to bring the matter to the notice of the Insurance Acts Committee of the British Medical Association, in order that that Committee might use its influence to get a better supply for insurance practitioners.

MALAYA BRANCH.

At a meeting of the Malaya Branch of the British Medical Association at Kuala Lumpur, Selangor, Federated Malay States, in October, 1920, a paper was read by Dr. A. J. McCLOSKEY, S.M.O. Selangor, on the effect of the control and rationing of rice on beri-beri. He pointed out that control of rice came into force early in July, 1919, and rationing in January, 1920, in Perak, and in February, March, and April, 1920, in different parts of Selangor, and in 1920 he had found a marked reduction of the number of beri-beri cases admitted to hospital. The figures were: for Perak, in 1919, 504 cases of beri-beri treated, in 1920, 57 cases; or in 1919, 2.2 per cent. of the total of all diseases, in 1920 of 0.2 per cent. For Selangor, the corresponding figures were 673 cases in 1919, 173 in 1920, or 4.21 per cent. of all diseases treated, to 0.9 per cent. The rice consumed in Selangor and Negri Sembilan during 1919 and first two months of 1920 was Siam rice; since February, 1920, the rice consumed in Selangor has been all Rangoon and in Negri Sembilan mostly Rangoon. In Perak mostly Rangoon rice was consumed during the whole of 1919 and 1920, and in this State was found the lowest percentage of beri-beri during 1919, verifying the fact as stated by Fraser and Stanton that Siam rice was considerably more potent in its beri-beri-producing power than Rangoon rice. The control and rationing of rice had varied the rice used not only in quantity, but in kind and variety, and the reduced rice ration was supplemented by other articles of diet such as sweet potatoes and wheat flour, and in this way prevented the occurrence of beri-beri. The Siam rice consumed in 1919 was of a broken variety and not highly polished.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.

A MEETING of the City Division was held on March 2nd at the Metropolitan Hospital, Kingsland Road, N., when Dr. CUTHBERT DIXON was in the chair. There was a good attendance. Mr. W. MCADAM ECCLES delivered a comprehensive and helpful lecture on the early diagnosis of acute abdomen, which was greatly appreciated. An animated discussion followed, and the proceedings came to a close with a very hearty and unanimous vote of thanks to Mr. Eccles.

NORFOLK BRANCH: EAST NORFOLK DIVISION.

A MEETING of the East Norfolk Division was held at Norwich on March 1st. It was decided that as all the Poor Law authorities had increased the district medical officers' salaries by 12 to 33 per cent., no further increase should be asked for at present. Several of the members were of the opinion that the work was decreasing. It was reported that the fee for attendance upon pauper women in confinement was in many cases inadequate. A resolution was passed requesting the guardians to adopt a universal fee of £2.

The following protest was sent to the Home Office:

This Division of the British Medical Association protests against any Regulations which affect medical men being issued without the profession being previously consulted.

INSURANCE.

DISTRICT MEDICAL OFFICERS FOR SCOTLAND.

THE Scottish Board of Health announces that it has appointed the following medical men to be District Medical Officers:

Senior District Medical Officers.—Western District (Headquarters, Glasgow): R. Buchanan, M.B., C.M., D.P.H. South Eastern District (Headquarters, Edinburgh): A. M. McIntosh C.M.G., M.B., Ch.B., F.R.C.S.

Junior District Medical Officers.—South-Western District (Headquarters, Glasgow): John Gilmonr, M.B., C.M., F.R.C.S. D.P.H. Northern District (Headquarters, Aberdeen): John Jeffrey, M.B., Ch.B., F.R.C.S. Eastern District (Headquarters Dundee): J. Murray Young, M.B., C.M.

These officers will act as Medical Referees in case referred to them on questions of incapacity of insure persons for work and as consultants in giving second opinions on questions of diagnosis and treatment. They have also administrative duties in connexion with the Insurance Medical Service and other work of the Scottish Board of Health.

CORRESPONDENCE.

The New System of Medical Records.

SIR,—From reading the correspondence on the new system of medical records it is clear that there are two sides—a majority who view them with more or less disfavour and a minority who take the opposite view. I am inclined to think that the latter consist of those who have small panels and those who have very large ones. These last, no doubt, are fortunate to have dispensers who can relieve them of all the dispensing and book-keeping connected with their private practice, and so give them time to ferret out the record cards.

Speaking as a country practitioner who has to do all his own dispensing, both for private patients and insured patients in rural areas, I regard them as an unmitigated nuisance and from a clinical point of view quite useless. Holding as I do other appointments, I am appalled at the time nowadays which is taken up and wasted in what I term ink splashing.

We are provided with record envelopes often incorrectly addressed, and on the assumption that everybody brings his or her medical card with them, whereas it is the exception for them to do so and not the rule. In country districts it is not uncommon to have twenty or thirty patients with the same surname, and it is hardly to be expected that we can remember everybody's Christian name; and so if, say, out of twenty patients called Pike we enter the details of one of them on the envelope of another Pike in error, we are not provided with spare envelopes to replace the defaced one. What will happen when we take our holidays, and locums who are strange to the district replace us, Heaven only knows. When we visit a patient we spend our time finding out his age, occupation, married or single, which is annoying to both doctor and patient?

In the numerous letters that have been written on this subject I have not seen any reference to one most important point from the patient's point of view, and that is that the time taken up in taking out the record envelope from its file and filling up the details diverts the mind of the doctor from concentrating his attention on the diagnosis and treatment of his patient. You cannot have it both ways. One cannot imagine what would happen in a time of a bad influenza epidemic. This winter has been a comparatively healthy one, and even so many of us have to fill in our records after evening consulting hours when we should be resting.

If, however, some form of records is bound to stay, I agree with the letter of Dr. Manson in to-day's SUPPLEMENT that every insurance practitioner should carefully consider the alternative proposals of Dr. T. Wood Locket, as outlined in his letter of February 19th. It is certainly a most excellent and well-thought-out idea.—I am, etc.,
Gilligham, Dorset, March 5th. R. W. MORGAN, M.D.

DANGEROUS DRUGS REGULATIONS.

WE printed last week in the SUPPLEMENT the letter received by the Medical Secretary from Sir Edward Troup, Permanent Under-Secretary of State in the Home Office. The following joint reply was forwarded to the Home Secretary on March 3rd. It was signed by the Medical Secretary of the British Medical Association, the Secretary of the Pharmaceutical Society of Great Britain, the Vice-Chairman of the Scottish Pharmaceutical Federation, the President of the Pharmaceutical Society of Ireland, and the Secretary to the Parliamentary Committee of the Co-operative Congress.

March 3rd, 1921.

SIR,

Your letter of the 25th directed to the signatories of the letter of the 22nd February respecting the Regulations issued under the Dangerous Drugs Act, 1920, was considered to-day at a full meeting of the signatories, which passed the following resolution:

This meeting learns with grave concern the unwillingness of the Home Secretary to appoint an expert committee to advise him before he makes the Regulations under the Dangerous Drugs Act, and resolves to take every step to bring to the notice of Parliament the absolute necessity for the appointment of such a committee.

The meeting appointed a small subcommittee, consisting of the signatories to this letter, and instructed us to bring to your notice the following observations.

It is by no means the intention of any of the bodies which have approached you on this subject to dictate to you the form of the Regulations. On the contrary, we

unreservedly recognize your responsibility for carrying out the objects of the International Opium Convention, and we do not suggest that you should enter into any process of bargaining between the conflicting interests. What we do press for most earnestly is, that in making the Regulations which will govern the dealings of large numbers of people with very important drugs, you will be guided by people who know what the difficulties are, have considered the points of view of the various sections concerned in dealing in these drugs, and more especially have tried to combine these views in such a way as to convince you that no section has been overlooked, and that the public interest will be conserved.

We would most respectfully suggest that you should reconsider this question of the appointment of a committee. We do not ask that the committee shall be a committee representative of the different interests. We ask that it should be composed of persons who have sufficient knowledge of the technical points, including the legal points, to enable them to appreciate the representations of persons representing the various interests involved.

We feel sure that such a process would not lead to any waste of time but rather that it would be a much quicker process than the one suggested in the last paragraph of your letter of the 25th ult. Moreover, it would enable the various bodies concerned to place their views before the committee in the presence of each other and so give the committee which would advise you every opportunity for reconciling as far as possible the different points of view.

We believe, Sir, that you have no conception of the strong resentment which has been caused by the publication of the draft Regulations without previous effective consultation with bodies that are deeply and legitimately interested in dealings with dangerous drugs. We are anxious to assist you in arriving at Regulations which, while meeting the main object for which such Regulations have to be devised—namely, the control of illicit traffic in these drugs—will be as little onerous as possible.

We believe that our suggestion of a committee advising you after having heard what can be said by the bodies concerned will be the best and the quickest way of enabling practical Regulations to be made.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Captain D. W. Hewitt, C.B., C.M.G., to the *President*, for hospital ship *Panama*. Surgeon Commanders J. W. Craig to the *Orion*, as Squadron Medical Officer, L. Lindop to the *Hawkins*.

ARMY MEDICAL SERVICE.

Colonel Lancelot P. More is placed on half-pay April 1st, 1920 (substituted for notification in the *London Gazette*, January 27th, 1921).

ROYAL ARMY MEDICAL CORPS.

Major T. E. Harty, D.S.O., relinquishes the acting rank of Lieutenant-Colonel.

Major C. Kelly, M.C., is placed on the half-pay list on account of ill health.

Major J. B. Clarke retires on retired pay.

Temporary Major J. H. Spencer to be Captain, January 25th, 1912, but not to reckon for pay or allowances prior to June 1st, 1920, with precedence next below R. O. Kelly, and to retain the temporary rank of Major (substituted for notification in the *London Gazette*, July 23rd, 1920).

To be temporary Captains: E. G. S. Hall, late Captain S.R., with seniority March 3rd, 1918; R. Stephens, late temporary Captain, with seniority October 15th, 1915.

Lieutenant J. P. P. Gallagher resigns his commission. The following officers relinquish their commissions; Temporary Major G. W. Beresford, and retains the rank of Major. Temporary Captain (acting Major) J. B. Butler, and is granted the rank of Major. Temporary Captains and retain the rank of Captain: I. Ridge Jones, Z. A. Green, E. G. M. Gilchrist, W. Kirk, H. H. McClelland. Temporary honorary Captain M. Bronk, and retains the honorary rank of Captain. Temporary Lieutenant J. A. B. Sim.

INDIAN MEDICAL SERVICE.

Major J. A. Cruickshank appointed temporarily to the staff of the Bombay Bacteriological Laboratory.

Lieut.-Colonel C. Milne and Brevet Colonel W. H. Ogilvie have been promoted to the rank of Colonel (May 19th and 20th, 1920, respectively).

Major E. H. B. Stanley has been promoted to the rank of Lieut.-Colonel (July 29th, 1920).

Lieut.-Colonel J. Entrican appointed to hold the office of the Inspector-General of Civil Hospitals, Burma, substantively *pro tempore*, with effect from April 21st, 1920, until further orders.

Major H. W. Pierpoint has been posted as Agency Surgeon, Baghelkhand.

Lieut.-Colonel S. Hunt has been appointed Residency Surgeon, Gwalior.

The following officers have been promoted to the rank of Major with effect from the dates specified—January 30th, 1921: B. Gale, J. H. Horne, H. H. King, R. E. Flowerdew, J. G. B. Shand, and A. J. Lee. January 31st, 1921: C. H. Smith, T. J. C. Evans, A. C. Anderson, D. G. Cooper, W. L. Forsyth, and G. T. Burke.

The undermentioned officers have been permitted to retire from the service: Lieut.-Colonel G. T. Birdwood (November 2nd, 1920), Lieut.-Colonel G. H. Frost (January 1st, 1921), Colonel P. J. Lumsden (November 27th, 1920).

Lieut.-Colonel S. Hunt, an Agency Surgeon on reversion from military duty, is posted temporarily as Agency Surgeon, Baghelkhand (December 31st, 1920).

Lieut.-Colonel R. Steen, M.B., has been transferred to the temporary non-selective list (December 7th, 1920).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captains to be Majors: E. T. H. Lea, J. L. Menzies, M.C. The following officers resign their commissions: Captains B. J. Alcock and L. D. B. Cogan, D.S.O., and are granted the rank of Major. Captain W. G. Cook, and retains the rank of Captain. Lieutenant H. G. Kilner, from 5th Battalion Suffolk Regiment, to be Captain with precedence as from September 8th, 1915.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

The announcement regarding Captain L. A. Mackenzie, M.C., which appeared in the *London Gazette* of January 3rd, 1919, is cancelled.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain P. Walsh relinquishes the acting rank of Major. Captain E. T. H. Lea relinquishes his commission on appointment to the R.A.M.C.(T.F.). The following Captains relinquish their commissions and retain the rank of Captain: W. Buchan, V. D. Wyborn, D. Roger, E. S. Davies, A. J. Macartney, C. B. Dyson.

DIARY OF SOCIETIES AND LECTURES.

HARVEIAN SOCIETY OF LONDON, Town Hall, Paddington Green, W.—Thurs., 8.30 p.m., Dr. Leonard Williams: The Thyroid Gland in Everyday Life.

LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.2.—Tues., 4.30 p.m., Cases; 5 p.m., Dr. R. Craik: Ringworms.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 8.30 p.m., Discussion on Non-operative Treatment of Surgical Tuberculosis, by Sir Henry Gauvain, followed by Sir Anthony Bowlby, K.C.B., P.R.C.S., Mr. T. H. Kellock, Dr. W. T. Gordon Pugh, and Mr. W. H. Trethowan.

MEDICO-LEGAL SOCIETY, 11, Chandos Street, W.1.—Thurs., 8.30 p.m., Sir John Collie: The Plaintiff—a Psychological Study.

MIDDLESEX HOSPITAL MEDICAL SCHOOL, W.—Fri., 3 p.m., Emeritus Lecture by Sir J. Kingston Fowler: Treatment of Tuberculosis.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—Thurs. and Thurs., 5 p.m.—Dr. A. Whitfield: Linnæan Lectures, Etiology of Skin Diseases.

ROYAL SOCIETY OF MEDICINE.—General Meeting of Fellows, Mon., 5.30 p.m.: Discussion on the Eradication of Tuberculosis in Men and Animals, to be opened by Sir John McFadyean, followed by Sir Clifford Allbutt, Dr. Arthur Leatham, Professor Hobday, Dr. A. C. Imbau, Mr. Cyril Nichol, Sir G. Sims Woodhead, and others.

General Meeting of Fellows, Tues. 5 p.m.: Ballot for election to Fellowship. *War Section*: Mon., 5.30 p.m., Colonel H. E. R. James: Instruction for Medical Students in case of National Emergency. *Section of Therapeutics and Pharmacology*: Tues., 4.30 p.m., Mr. P. B. Roth: Uses of Heliotherapy. *Section of Pathology*: Tues., 8.30 p.m., Sir Lenthal Cheate: Parenchymatous Inflammation of the Breast; Dr. J. A. Murray and Dr. W. H. Woglom: Experimental Tar Cancer; Dr. A. J. Eagleton: Standardization of Antipneumococcal Serum; Dr. Nathan Raw: Attenuated Tubercle Bacilli. *Section of History of Medicine*: Wed., 5 p.m., Professor G. Elliot Smith: Ancient Egyptian Pathology and Medicine; Mr. Geoffrey Keynes: Unpublished Letters of Sir Thomas Browne; Mr. Marshall Montgomery: Identity of "cursed hebenon" in *Hamlet* with *ignum vitæ*. *Section of Study of Disease in Children*: Wed., 8.30 p.m., Adjourned Discussion on Congenital Syphilis, to be reopened by Dr. Morley Fletcher, and continued by Mr. John Adams, Dr. Jewesbury, Mr. McDonagh, Mr. Neame, Dr. Pitts, and others. *Section of Dermatology*: Thurs., 4.30 p.m., Cases; 5 p.m., Mr. T. C. Benliss: Catalytic Enzymes as an Aid to Diagnosis of Hair Infections. Cases. *Section of Otolaryngology*: Fri., 5 p.m., Demonstration of pathological specimens by Dr. Albert Gray; Mr. Jefferson Faulder and Mr. Colledge: Ears under Modern War Conditions. Cases. *Section of Electro-Therapeutics*: Fri., 8.30 p.m., Mackenzie-Davidson Memorial Lecture (Professor W. D. Halliburton): Physiological Advance—the Importance of the Infinitely Little.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE, Royal Army Medical College, Grosvenor Road, S.W.1.—Fri., 8.15 p.m., Demonstrations.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Maternity and Women's Hospital.—Wed., 4.15 p.m., Dr. S. J. Cameron: Obstetrical Cases.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thurs., 4 p.m., Dr. Hutchison: Diseases of the Liver.

LONDON HOSPITAL MEDICAL COLLEGE.—Lecture Demonstrations on Gonorrhoea, Tues. and Thurs., 4.30 p.m., Mr. Clarkson: Men, Wed. and Fri., 4.30 p.m., Dr. Simpson: Women.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Mr. H. H. Rayer: Surgical Disorders of Infancy and Early Childhood.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland Street, W.1.—Mon., 5.30 p.m., Dr. S. Oodall: Practical Points in Treatment.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Daily (except Wed. and Sat.), 2 p.m., Out-patient Clinics. Lectures, 3.30 p.m.—Mon., Dr. Saunders: Friedreich's

Ataxia; Tues., Dr. R. Russell: Syphilis of the Nervous System; Thurs., Dr. Saunders: Occupation Neuroses; Fri., Dr. Hinds-Howell: Disseminated Sclerosis.

NORTH OF ENGLAND BRANCH, BRITISH MEDICAL ASSOCIATION, Mental Hospital, Ryhope.—Fri., 3 p.m., Professor J. Middlemiss: Incipient Insanity.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Lectures, 5 p.m.—Mon., Dr. G. Stewart: Syringomyelia; Tues., Dr. Pernef: Acquired Syphilis in Infancy and Childhood; Wed., Mr. Gibb: Glaucoma; Thurs., Dr. B. Ball: Nasal Spurrage; Fri., Mr. Steadman: Dental Sepsis; Sat. (noon), Mr. Sinclair: Surgical Diseases of the Abdomen.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by ls. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London), MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London), EDITOR, *British Medical Journal* (Telegrams: Altiology, Westrand, London). CURRENT NOTES.

Inflation of Insurance Index Registers.

THE Insurance Acts Committee Executive and representatives of the Ministry of Health recently discussed the opinion which was expressed by the last Conference of Local Medical and Panel Committees—that inflation in the index registers is largely due to the dilatory methods of approved societies in returning the orange slips. The reply of the Ministry of Health has now been received, and is to the following effect:

It is recognized that it is of the utmost importance that approved societies should issue orange slips as soon as they are in possession of information as to persons ceasing to be entitled to medical benefit, and their attention has been called to this matter on several occasions. It will be remembered, however, that during the abnormal period of the war, and since the war, the difficulty which approved societies sometimes experience in getting information with regard to the position of their members has been seriously increased. It is hoped that the passing of this abnormal period and the coming into full operation of the new arrangements under which the medical benefit of persons going out of insurance is terminated at half-yearly periods, instead of, in all cases, at December 31st, will tend to eliminate the causes of former delays.

The Ministry will also be prepared to take action in regard to any particular cases which may be brought to their notice where there would appear to have been avoidable delay on the part of any society in issuing orange slips.

The Medical Secretary would be glad to hear of any particular instances of delay which have been brought to the notice of Panel Committees, in order that the matter may be taken up with the Ministry.

A Classified Directory.

In the JOURNAL of August 28th, 1920, p. 330, there appeared under the above heading a note drawing attention to a proposed publication, "The Buff Book," of which a circular had been issued by a firm styled the Business Telephone Directories Limited. The Central Ethical Committee of the British Medical Association considered that the insertion of a medical practitioner's name in this publication would be objectionable from the point of view that only selected names would be published therein to the exclusion of others. It seemed clear that no medical practitioner's name (with address and telephone number) would appear in "The Buff Book" unless he paid the minimum fee of one guinea. Further objection, moreover, arose in connexion with the specimens of type at varying prices shown in the circular. As will be seen from the report published in the SUPPLEMENT this week at p. 79, the Executive Committee of the General Medical Council has had this matter before it, and has passed a resolution which confirms, and indeed reinforces, the opinion expressed by the Central Ethical Committee of the British Medical Association. The grounds of objection, though stated in different words, are those put forward in the JOURNAL of August 28th last.

Fees of Admiralty Surgeons and Agents.

The British Medical Association has been endeavouring for the past twelve months to obtain a more reasonable

scale of fees for Admiralty surgeons and agents, but so far without any definite result. About June last a very satisfactory revised scale of fees was under the consideration of the Admiralty, but, unfortunately, it never received sanction. Frequent requests for an early settlement have always been met with the reply that the matter is under consideration by the Treasury. Feeling that the delay in this matter had been quite unreasonable, the Association requested Captain W. E. Elliot, M.P., to be good enough to ask a question in the House. Accordingly, Captain Elliot asked the Parliamentary Secretary to the Admiralty the following question:

When it is intended to revise the scale of fees paid by the Admiralty to surgeons and agents (Article 21, Clause 3), seeing that these fees are below those paid by other departments and have not been revised for thirty-five years, notwithstanding the enormous increase in the cost of living?

and received a reply as follows:

A revised scale of fees is now under consideration, and it is hoped that a decision may be reached and promulgated very shortly.

The reply is unsatisfactory, but it is hoped that the effect of the question will be to accelerate a decision.

DANGEROUS DRUGS DRAFT REGULATIONS.

MEETING AT THE HOUSE OF COMMONS.

ONE of the largest meetings of private members ever held at the House of Commons took place on Wednesday, March 9th, when some 200 members of Parliament gathered to hear the opinions of the medical and allied professions on the draft Regulations made by the Home Secretary under the Dangerous Drugs Act, 1920. Sir Henry Craik, K.C.B., M.P., was called upon to preside, and those immediately supporting him were: Mr. E. B. Turner, Chairman of the Medico-Political Committee of the British Medical Association, and Dr. Alfred Cox, Medical Secretary; Sir William Glyn-Jones, Secretary, Pharmaceutical Society of Great Britain; Mr. A. V. Alexander, Secretary, Parliamentary Committee of the Co-operative Congress; Mr. J. E. Connor, President, Pharmaceutical Society of Ireland; Mr. Walter McNab, Vice-Chairman, Scottish Pharmaceutical Federation; Mr. John Keall, President of the Retail Pharmacists' Union; Mr. Woolcock, M.P., and Mr. Kiley, M.P.

Sir HENRY CRAIK mentioned that there were some ten or twelve thousand members of the medical profession in the constituency (Scottish Universities) of which he was a representative, and he assumed that was why he was called to the chair. A large number of letters which members of Parliament had received indicated the immense amount of interest taken in this matter. He understood that they had met rather for inquiry than to protest against the proposed Regulations. Their object was to hear what well-known experts were able to tell them, in order that they might be prepared to criticize the Regulations when they came before the House of Commons. Since the meeting had been convened, Mr. Woolcock had received from Mr. Shortt, the Home Secretary, the following reply to a question:

"I have decided to appoint a small committee on the lines suggested by the hon. member, to consider and report to me in

cases in which we have not been able to come to an agreement with interested parties, what further modifications, if any, can safely and properly be made in the Draft Regulations, having regard to the main principles on which the Regulations are based, and which are essential in the public interest for safeguarding the use of drugs."

Sir WILLIAM GLYN-JONES expressed pleasure that so many members of the House of Commons were attending the meeting. The matter, he said, was of considerable importance, and it also involved a wider question, namely, what should be the procedure a department should take when the House delegated to it the working of legislation. This kind of thing was constantly arising. If as a result of the present difficulty, some procedure could be adopted whereby a Government department should take care to make such investigation as was necessary to put it in a fitting position to act for the House, still more good would result. Sir W. Glyn-Jones went on to present a statement of the position of affairs. He said that in January, 1912, Great Britain signed the Opium Convention which pledged the signatories to enact pharmacy laws or regulations to confine to medical or legitimate purposes the manufacture, sale, and use of morphine, cocaine, and their salts. The significant words were added: "unless laws or regulations on the subject are already in existence." Amongst the measures which the signatories were committed to take were: "To require that such persons shall enter in their books the quantities manufactured, imports, sales, and all other distribution, and exports of morphine, cocaine, and their respective salts." Again the following significant words are added: "This rule shall not necessarily apply to medical prescriptions, and to sales by duly authorized chemists." The Dangerous Drugs Act was passed last year to give the Home Office the power to make the required regulations. The Pharmaceutical Society being the statutory body to enforce the Pharmacy Acts in Great Britain, and to make regulations as to the keeping, dispensing, and selling of poisons, subject to the consent of the Privy Council, was also empowered by the Act to amend the schedule of poisons by adding thereto or removing therefrom any article, or by transferring an article from one part to another part of the schedule. The Council took the necessary steps to transfer from Part 2 of the schedule to Part 1 all the substances included in the provisions of the Dangerous Drugs Act, and the consent of the Privy Council to this change was notified in the *Gazette* on December 3rd, 1920.

On November 2nd the Home Office submitted for the confidential information of the Society and for the observations of its council a preliminary draft of the Regulations. On December 6th the Society wrote raising fundamental objections to the Regulations as drafted. The letter stated that the Society's council had appointed a subcommittee to place before the Home Office their suggestions, but wished to know at the first stage the opinion of the Home Secretary on the points raised in their communication. After a month's interval a reply was received from the Home Office disputing the preliminary objection, and saying that the Regulations were now formally issued in draft, and that any representations on details would be considered before the Regulations were finally made. The official notice had, in fact, been gazetted on January 7th and the draft Regulations published. They were ill-conceived and badly drafted, and bore on their face convincing evidence that the Home Office was without the knowledge of the conditions surrounding the supply of the substances dealt with, or that the Regulations were prepared with the deliberate disregard of those conditions. Nevertheless Sir Edward Troup wrote to the *Times* on February 10th a letter in which he said:

"The Regulations have not, as has been suggested, been issued without previous consultation with the interests most directly concerned. A preliminary draft was submitted to the Pharmaceutical Societies of Great Britain and Ireland, the General Medical Council, the Royal College of Physicians, and the Royal College of Surgeons."

To describe that statement as disingenuous would not be an extreme criticism. On February 3rd the Society submitted criticisms in detail, and asked that a joint deputation representing medical practitioners, pharmacists, dentists, veterinary surgeons, agriculturists, and other users of the drugs, should be received by the Home Secretary, with a view to urging the appointment by him of a joint committee to advise on the redrafting of the Regulations. The Home Office declined to receive the joint deputation, but offered to see one from the pharmacists. In the meantime officials of the Home Office were meeting various people separately and privately. On February 22nd a joint request, signed

by all the bodies represented and others, was sent asking for a re-consideration of the refusal to receive a joint deputation, with a view to the appointment of a small expert committee. On February 25th the Home Office replied maintaining its refusal.

Sir W. Glyn-Jones went on to say that the bodies concerned could not accept as a reasonable explanation of the alarmingly unsuitable character of the draft Regulations that they were put up to be shot at; but for the intervention of the societies referred to, the Regulations as drafted would have been made operative in due course. The societies realized that members of Parliament shared with their constituents a growing dislike of legislation by regulations and orders. Nothing but the most powerful reasons could justify the House of Commons deputing to a Government department the duty of legislating. It would have been inconvenient, if not impossible, for the House of Commons to have embodied such detailed provision in an Act of Parliament itself; if such an attempt had been made, the course would probably have been of appointing a Select Committee to take evidence, and upon its report the provisions would have been drafted. The duty, however, was delegated to the Home Office, in the belief that it would take adequate steps to see that the Regulations were properly made.

So much for the facts. He (Sir W. Glyn-Jones) was satisfied that the bulwark against the misuse of these drugs was the existence of people properly trained in responsibility. They could never by means of regulations prevent confirmed morphine takers from obtaining this drug. He hoped that the Select Committee to be set up would allow any person who had anything to tell them to come before them.

Dr. ALFRED COX said that that gathering was an inspiring sight for people who still believed in the power and the willingness of members of Parliament to protect the interests of the public. They were asking for the help of members to prevent the perpetration of a gross official blunder. When the body which he represented went to the Home Office, they received the greatest courtesy and consideration, and they were promised modifications which would go very far towards meeting the requirements of the profession. But they were not satisfied because they did not think that the method adopted was the proper one for dealing with these subjects. They had come to the House of Commons because they desired that this sort of thing should never happen again, and that next time a Government department was framing regulations to carry out an Act passed by the House of Commons, it should take care to consult people who knew what the business was. The Home Office said they did consult the people who knew. They went to the Royal College of Physicians, the Royal College of Surgeons, and the General Medical Council. To go to the Royal Colleges on matters of this kind was like going to the Lord Chancellor for advice on the habits of country solicitors. If they had come to the British Medical Association, which acted for the working members of the profession, that body would have advised them not to attempt to issue regulations which showed complete ignorance of ordinary practice and of human nature. Dr. Cox's second point was that the Committee which advised the Home Secretary should hear what each party had to say in the presence of the others. In this way the doctors would learn what the pharmacist considered were the objections to the Regulations; also what the wholesale men thought of them. To use a theatrical phrase, the Committee might be able to get the Home Secretary "to join the flats" and see that the Regulations were sensible and practical.

In the course of discussion, Sir William Glyn-Jones stated, with regard to the operation of the Regulations, that they had, after being framed, to be laid on the table of each House of Parliament for twenty-one days.

In reply to a question by Sir CLEMENT KINLOCH-COOKE as to the objection to the disclosure of certain drugs used in medicines prescribed, Dr. COX said that the Home Office intended to remedy this, but it had not been remedied yet.

Dr. MURRAY said that on a second reading of the bill he raised the question as to consultation by the Home Office with the Pharmaceutical Society and the British Medical Association, and understood that this was to be done.

Colonel RAW proposed:

That this meeting agrees to take all possible steps to secure the fullest consultation and consideration before the Dangerous Drugs Act Regulations are framed, and that a small committee take charge of the matter and report.

Mr. A. M. SAMUEL seconded the motion.

After further discussion the CHAIRMAN suggested that the following words should be added to the resolution:

In the opinion of this meeting any committee appointed by the Home Secretary should have wide terms of reference, and should be empowered to hear any evidence submitted to them on any matter affected by the Regulations, and should be sufficiently large to be fully representative.

The resolution thus developed was put to the meeting and carried unanimously.

The following were appointed members of the committee of representatives of the meeting:

Sir Henry Craik, Sir John Butcher, Sir Richard Winfrey, Lieut.-Colonel Raw, the Hon. W. Ormsby Gore, Mr. W. J. U. Woolcock, Dr. Murray, Mr. J. Hinds, Mr. Kiley, and Mr. A. E. Waterson.

On the motion of Mr. E. B. TURNER, seconded by Mr. E. T. NETHERCOAT, President of the Pharmaceutical Society, a hearty vote of thanks was passed to Sir Henry Craik for presiding.

Home Office Committee.

The Home Secretary has now appointed a Committee to consider the outstanding objections to the draft Regulations under the Dangerous Drugs Act, and to advise what modifications can safely and properly be made, having regard to the main principles on which the Regulations are based and which are essential in the public interest for safeguarding the use of the drugs.

The Committee is constituted as follows:

Mr. CHESTER JONES (Chairman),
Sir MALCOLM DELEVINGT, K.C.B.,
Captain W. E. ELLIOT, M.C., M.B., M.P.,
Major A. C. FARQUHARSON, M.D., M.P.,
Mr. GERALD A. FRANCIS, M.P.,
Mr. W. J. U. WOOLCOCK, C.B.E., M.P.

The secretary of the Committee is Mr. A. H. ANDERSON of the Home Office.

Association Notices.

A ZANZIBAR BRANCH.

THE following change has been made in accordance with the Articles and By-laws, and takes effect as from the date of publication of this notice:

That a Zanzibar Branch of the Association be formed, of area coterminous with the Protectorate of Zanzibar.

Representation in Representative Body. Under arrangements made by the Council, the Branch will be entitled to independent representation in the Representative Body, 1921-22, to return one Representative.

BRANCH AND DIVISION MEETINGS TO BE HELD.

SOUTH-WESTERN BRANCH.—An intermediate meeting of the Branch will be held at Newton Abbot on Thursday, April 7th. Members should notify the Honorary Secretary, Mr. F. A. Roper (12, Southernhay West, Exeter) not later than March 25th of any cases, notes, paper, specimens, or notices of motion they may wish to bring forward in order that they may be placed on the agenda paper.

GENERAL MEDICAL COUNCIL.

EXECUTIVE COMMITTEE.

A MEETING of the Executive Committee of the General Medical Council was held on February 21st, with Sir DONALD MACALISTER, President of the Council, in the chair.

Cessation of Reciprocity with Belgium.

A communication was received from the Privy Council, dated December 21st, 1920, stating that whereas the Kingdom of Belgium no longer afforded to the medical practitioners of the United Kingdom such privileges of practising in Belgium as were offered during the late war, the Order in Council of January 7th, 1915, should be revoked. The Executive Committee resolved, therefore, to instruct the Registrar that its resolution of January 22nd, 1915—that medical practitioners legally authorized to practise medicine, surgery, and midwifery in Belgium should be entitled to be registered in the Foreign List of the *Medical Register*—ceased to have effect as from December 21st, 1920, and that he should no longer register medical practitioners in the Foreign List in respect of Belgian qualifications.

Suggested Reciprocity with Spain.

A communication was received from the Privy Council including a translation of a Royal decree relating to the practice of medicine and dentistry in Spain with a view to

applying to Spain the provisions of Part II of the Medical Act of 1886. The decree stated that henceforth only doctors and dentists who had obtained their qualifications in countries with which Spain had reciprocal relations would be authorized to practise, and that temporary authorizations now in force would terminate as soon as the period expired for which they were granted. The Executive Committee represented that inquiries should be made by the Privy Council through the Foreign Office regarding: (1) the privileges of practising in Spain which would be afforded to registered medical practitioners of the United Kingdom in the event of reciprocity being established with that country, and also (2) the conditions and course of study and examinations prescribed for the attainment by Spanish practitioners of a medical diploma or degree entitling them to practise medicine, surgery, and midwifery in Spain, the recognition of which by the General Medical Council would be necessary in the event of reciprocity being established.

Ministry of Health and Post graduate Study.

THE REGISTRAR reported that a committee had been recently appointed by the Minister of Health to investigate the needs of medical practitioners and other graduates for further education in medicine in London, and to submit proposals for a practical scheme for meeting them. The Executive Committee expressed its gratification that the Ministry of Health had appointed such a committee, and desired that the scope of the investigations of the committee should be extended to the country as a whole. As, however, the statutory concern of the General Medical Council was not with post graduate instruction for registered practitioners but for the courses of study and examinations for primary qualifications, the Executive Committee felt itself unable to draw up any memorandum on the subject of post graduate instruction, but it was of opinion that many members of the Council would, if invited, be glad to submit their personal views for the information of the Ministry's committee.

Law Fellowship Book.

THE Executive Committee proceeded to deal with the question of the appearance of names in this book, which was informally under its consideration in November. The Bar Council had sent a communication stating that it considered that the book was issued for advertising purposes, and that it had resolved that it was not in accordance with the etiquette of the profession that barristers should insert their names in the book. The Law Society had so far felt a difficulty in expressing an opinion that it was contrary to the etiquette of the profession that solicitors should insert their names in the book. The view the Society had always expressed on the question of direct advertising was that so long as a directory was open to the whole profession without distinction, whether for payment or not, there was no objection to a solicitor allowing his name to appear in it; a further communication on the subject, however, might be sent. The Royal College of Veterinary Surgeons desired to be informed of any decision to which the General Medical Council might come on the subject. It was resolved:

That the Executive Committee is of opinion that the insertion of the name of a medical practitioner for payment, whether with or without typographical display, in a list issued to the public, and purporting to be a list of local medical practitioners, which is not open to the whole of the profession without such payment, is not in accordance with the professional standards in respect of advertising, and might be held to bring a practitioner so advertising himself within the terms of No. 5 of the Council's *Warning Notices*.

Correction of the Medical Register.

As a result of the issue of voting papers for the elections of direct representatives for the three divisions of the United Kingdom in November, 1919, 2,277 papers in all were returned through the Dead Letter Office. Although there is no obligation to do so, very great pains are always taken to prevent the unnecessary removal of names from the *Medical Register*, and in this case the usual care was taken. Not only were books of reference consulted, but information was obtained from the British Medical Association and other sources, and by the courtesy of the Editors a list of those who could not be traced was published in the *BRITISH MEDICAL JOURNAL* and *Lancet*. As a result only 484 names had to be erased from the *Register*, or in other words, 1,793 practitioners were saved from the serious consequences of their own neglect. In consequence of the close relationships which had been established between the Ministries of Health and Pensions, the Boards of Education and Trade, Insurance Committees,

chemists, and the General Medical Council, it is far more difficult now than it used to be for persons whose names do not appear upon the *Medical Register* to continue to practise as if registered.

INSURANCE.

CORRESPONDENCE.

Regional Medical Officers.

SIR.—A study of the Ministry of Health Memorandum N.M. 1 regarding regional medical staff will suggest the possibility of trouble in the working of the scheme. I would especially refer to the powers of the approved societies as detailed in paragraphs Nos. 11 and 24. In both, in the circumstances defined, the powers of the approved societies are absolute—that is, the desire or even the information of doctor or patient is ignored; the gravity of the matter is the more important in No. 24, where it is stated that the approved societies may draw the attention of the Regional Medical Staff when an insured member, admittedly incapable of work, has been in receipt of sickness or disablement benefit for at least four consecutive weeks, where they think it may be desirable that a second medical opinion should be obtained. The power of the societies to act is complete, and is in no way fettered or qualified by any feelings or wishes of patient or doctor.

This seems a new and unwarrantable interference between the patient and his medical attendant, and will surely constitute another obstructive snag to the easy progress of the National Insurance scheme. One can well imagine the possibility of onerous individuals in the societies doing irreparable damage between patient and doctor with such power in their hands, especially when prompted by personal grudges.

The Insurance Acts Committee might add to the many benefits which the practitioner and the community already owes to it by securing such amendment to this part of the scheme as will safeguard the legitimate interests of patient and doctor.—I am, etc.,

Llansantffraid, Mont., March 13th.

W. H. LEWIS.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commanders J. M. Hayes to the *Castor*, G. Nunn, O.B.E., to the *Briton*. Surgeon Lieutenant Commanders H. H. Ormsby to the *Victory* for R.M. Division, Forton, H. Wilks to the *Thistle*, C. M. R. Thatcher to H.M. Dockyard, Portsmouth, R. F. P. Cory to the *Pembroke* additional, J. A. O'Flynn to the *Fitzroy*, G. F. B. Page to the *Beaufort*. Surgeon Lieutenants J. F. M. Campbell to the *Flinders*, J. H. B. Crosbie to the *Kellett*, J. J. Carroll to the *Burslem*.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel M. P. Corkery, C.B.E., is placed on retired pay on account of ill health contracted on active service, February 5th, 1921 (substituted for the notification in the *London Gazette*, February 4th, 1921).

Major G. W. Heron, D.S.O., O.B.E., is seconded for service under the Foreign Office.

Captain and Brevet Major J. D. Kidd, O.B.E., M.C., relinquishes the acting rank of Major.

Temporary Captain J. H. Jones to be temporary Major whilst commanding troops on a hospital ship.

E. C. Lindsey, late temporary Captain, to be temporary Captain, with seniority from April 15th, 1916.

The notifications in the *London Gazette* of November 16th, 1916, and July 10th, 1919, regarding temporary Captain J. H. Jones are cancelled.

The following Lieutenants (temporary Captains) to be Captains: J. E. Measham, J. M. Savege, J. C. Burns, G. K. Fulton, R. B. Evans.

The following officers relinquish their commissions: Temporary Captain H. V. Lamb, and retains the rank of Captain; temporary Lieut. W. H. Steavenson, and retains the rank of Lieutenant.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain R. T. C. Robertson, D.S.O., to be Major.

The following officers relinquish their commissions: Captain, and is granted the rank of Major: H. D. Gardner. Captains, and retain the rank of Captain: F. M. Rorie, W. Andrew, H. Wands, F. Cameron, M.C.,

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major F. Loud, T.D., Sussex R.G.A. (temporary Major R.A.M.C., T.F.) relinquishes his temporary commission in the R.A.M.C., T.F.

Captain J. R. Pooler, O.B.E., to be Major.

Captain H. B. Porteous relinquishes his commission in the Territorial Force on appointment to a permanent commission in the Royal Air Force.

To be Captains: Captains B. E. A. Ratt (late R.A.M.C.), with precedence as from April 14th, 1919; John Taylor (late R.A.M.C., S.R.), with precedence from April 1st, 1915; F. A. E. Crew (from 6th Battalion Devon Regiment), with precedence as from June 1st, 1916, and to remain attached to the Edinburgh University Officers' Training Corps; V. Townrow (late R.A.M.C.), with precedence as from February 10th, 1918.

To be Lieutenants: Captain L. H. Taylor (late R.A.M.C.), with precedence as from September 7th, 1916, and to relinquish the rank of Captain; Lieut. O. G. Misquith (late 24th Battalion London Regiment).

4th Northern General Hospital.—Major E. C. Clements, O.B.E., relinquishes his commission in the Territorial Force, August 1st, 1919, on appointment to a permanent commission in the Royal Air Force.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Major G. L. L. Lawson resigns his commission, July 15th, 1920, and is granted the rank of Lieutenant-Colonel (substituted for notification in the *London Gazette*, July 14th, 1920).

Captain C. H. J. Fagan, O.B.E., from General List to be Lieutenant-Colonel.

VOLUNTEER FORCE.

Surgeon-Captain R. W. Branthwaite (Surgeon-Captain Territorial Force Reserve), 2nd Cadet Battalion, London Regiment, resigns his commission on ceasing to be employed with a cadet battalion.

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.—*Section of Odontology*: Mon., 8 p.m., Mr. J. G. Turner: Dental Sepsis in Relation to Rheumatism, etc. *Section of Medicine*: Tues., 5.30 p.m., Dr. Parkes Weber: Thrombosis of Inferior Vena Cava and both Renal Veins. Dr. Nathan Raw: Treatment of Tuberculosis with Attenuated Tubercle Vaccines.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Infirmary.—Wed., 4.15 p.m., Dr. D. Watson: Venereal Disease in the Male.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Dr. D. E. Core: Treatment of Neurasthenia.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westminster Street, W.1. Mon., 5.30 p.m., Dr. F. W. Price: Heart-block.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Medicisera, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London).

Telephone number for all Departments: Gerrard 2650 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

MARCH.

- 22 Tues. London: Public Health Committee, 3 p.m.
London: Science Committee, 2.30 p.m.
London: Scrutiny Subcommittee, 11.30 a.m.
23 Wed. London: Hospitals Committee, 2.30 p.m.
24 Thurs. London: Rural Practitioners Subcommittee, 2.30 p.m.
30 Wed. London: Medico-Political Committee (provisional).

APRIL.

- 7 Thurs. Worcestershire and Herefordshire Branch: British Medical Association Lecture by Mr. P. L. Dantel F.R.C.S., on the Differential Diagnosis of Acute Abdominal Conditions.
South-Western Branch, Newton Abbot.

APPOINTMENTS.

HIRSCH, Charles T. W., M.R.C.S., L.R.C.P., Anaesthetist to Hospital for Epilepsy and Paralysis, Maida Vale.

JOHNSTON, W. H., M.D., F.R.C.S. (Edin.), Medical Superintendent to the Highbury, Uffculme, and Sorrento Hospitals, of the Birmingham Orthopaedic Centre, vice Dr. J. A. Dickson, resigned.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s, which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

BIRTHS.

ABRAHAM.—On March 4th, at 59, Cambridge Terrace, W.2, Lilian Angela (*née* Francis), wife of J. Johnston Abraham, C.B.E., D.S.O., F.R.C.S., of a daughter (Joan Lilian).

BEVAN-JOHN.—On March 11th, at "Fairfield," Llanelly, to Dr. and Mrs. R. Bevan-John, a son.

LONDON: SATURDAY, MARCH 26TH, 1921.

CURRENT NOTES.

Pay of the R.A.M.C.

THE Naval and Military Committee of the British Medical Association has had under consideration the question of pay and retired pay in the Royal Army Medical Corps. The revised scale of pay, published on September 13th, 1919, was not entirely satisfactory. The most notable anomaly which it contained was that concerning the retired pay of majors, who under the new scale actually received less money than they did before. The Association at once called attention to this point, and it has been remedied. The Committee is of opinion that the amended scale of pay and retired pay which was issued on October 9th, 1920, and published in the BRITISH MEDICAL JOURNAL, October 16th, is a fair scale, and compares favourably with those of other services. There are, however, several points which need adjustment, such as the absence of any provision for an increase in the pay of majors between fifteen years' service and the date of their promotion to lieutenant-colonel. There is also the case of the Director-General, A.M.S., who receives considerably less emoluments than any other officer holding a lieutenant-general's appointment, and, being on consolidated pay, is at a further disadvantage by reason of income tax. These matters will receive the attention of the Naval and Military Committee.

Refusal of a Medical Certificate on Behalf of a Jurywoman.

Recently the Under Sheriff of Middlesex declined to accept a certificate which stated that a certain lady on account of a recent operation for appendicitis was unable to serve upon a jury at the Middlesex Assizes. A certificate was sent in accordance with a notice on the summons which stated that

"Application for exemption from attendances at jury ... must reach the Summoning Officer within three days of the receipt of this summons supported by medical certificate or otherwise that you are or will be unable to serve."

The Under Sheriff wrote stating that he was unable to excuse the patient, and must ask her to attend. Not having attended she was afterwards informed that she had been fined £2 2s. for non-attendance. The medical practitioner asked for the advice of the British Medical Association, and was told that if the patient was prepared to fight the case out she ought to write to the authorities and tell them that she did not intend to pay the fine and would be prepared to take the consequences, when the doctor would be able to attend the court and state his views on the injustice of the whole procedure. The practitioner was strongly advised to press this case as a test case, and was offered any help the Association could give him. He has since reported that the patient adopted the suggestion

made to her, and received, first, an apologetic explanation suggesting that someone had exceeded his authority, and, later, a notice that the fine had been remitted.

Wellhouse Hospital, Barnet.

The Wellhouse Hospital, Barnet, is a Poor Law infirmary with 204 beds, under the control of the board of guardians of the Barnet Union. The British Medical Association has had brought to its notice arrangements which have been made by the Barnet guardians whereby separate accommodation will be provided in the Wellhouse Hospital for persons who cannot secure admission to the voluntary hospitals, and are able to pay for medical care, treatment, and nursing. The local medical profession, which had not been consulted at all in the matter, held a meeting on January 19th, when a resolution was passed maintaining that the practitioners in the Barnet rural area should be allowed the right of entry into the Wellhouse Hospital to attend their own patients sent in by them. This was forwarded with a covering letter to the guardians, who, however, replied that they were unable at present to entertain any proposal to interfere with the existing arrangements, and indicating that the scheme in question had received the sanction of the Ministry of Health. The British Medical Association then approached the Ministry of Health in this matter, and the Deputy Medical Secretary, in the course of a letter, wrote as follows:

"Knowing how firmly the Minister believes in the advisability of consultation, both centrally and locally, in any new development of this kind, the Association is surprised at being informed that the new arrangements at the Wellhouse Hospital have received the sanction of the Minister of Health. Any new proposals for the medical service of the community are not likely to meet with much success if at the outset they are framed so as to excite hostility in the minds of the local medical profession, for, after all, the health services of this country cannot be satisfactory unless the hearty co-operation of the medical profession is assured. I should be glad to know, as soon as possible, whether or not the Minister has sanctioned the proposed arrangements at the Wellhouse Hospital, and whether or not he suggested that the local profession should be consulted before the scheme was finally settled. If the Minister has given his sanction I would most respectfully request that he suggests to the Barnet guardians the advisability of consulting the local profession before the schemes are actually put into operation."

The reply to this letter stated that the Ministry of Health had not been consulted in regard to the scheme of the board of guardians concerned. Inquiries have, however, been made, and the following letter has been addressed by the Ministry to the guardians of the Barnet Union:

"I am directed by the Minister of Health to state that he has been informed that the guardians of the Barnet Union have in contemplation a scheme for admitting persons other than sick poor to the Wellhouse Hospital. Such a scheme appears to the Minister to raise very important principles, medical and other, and he would be glad to receive as early as possible a full statement of the exact nature of the proposals, and what steps, if any, have been taken towards putting them into operation."

The matter is being considered by the Hospitals Committee of the Association at its meeting this week.

DANGEROUS DRUGS REGULATIONS.

THE following is a summary of the evidence given on March 22nd before the Home Office Committee on Dangerous Drugs Regulations, by Dr. J. W. Bone and Dr. Alfred Cox, on behalf of the British Medical Association:

1. The Association understands that the Committee is in possession of the correspondence which has passed between the Association and the Home Office in respect to the Draft Regulations. It is proposed, therefore, to take the detailed consideration of the Regulations up at the point where it was left by the letter from the Home Office of February 15th, on the assumption that the alterations in the Regulations promised by the Home Office will be made.

2. But before dealing with any details of the Regulations the Association desires to emphasize the statement made in the first paragraph of its Memorandum of February 3rd—namely, that it is "aware of the public danger arising from the improper use of the drugs . . . and recognizes that in consequence medical practitioners must submit to the imposition of certain restraints in prescribing, compounding, dispensing and administering these drugs, and of certain clerical duties in recording their transactions in them." The Association, speaking on behalf of a very considerable section of the medical profession, trusts that before placing on the profession such restraints and clerical duties the Committee will satisfy itself that they are necessary, will carry out the objects of the Opium Convention, and are not merely being imposed on doctors because it is felt that as regulations must be imposed on some distributors they must be imposed on all.

3. Clause 7 of the Dangerous Drugs Act, 1920, says that provision may be made for, *inter alia*, regulating the issue of prescriptions and the dispensing of the drugs by medical practitioners "for the purpose of preventing the improper use of the drugs." The Association earnestly hopes that the Committee will satisfy itself that improper use of the drugs can rightfully be laid to the charge of the medical profession. So far as the British Medical Association has been able to ascertain there is no evidence that the medical profession has had any part in the illicit traffic in these drugs. Unless the Committee is satisfied that there is such evidence, the Association would urge that it will not countenance the idea of placing restrictions on a body of professional men to whom the lives and health of the community are entrusted, and who, therefore, may be assumed to be trustworthy as regards handling powerful and dangerous drugs. Their time ought not to be taken up in keeping records of small dealings in drugs, unless it can be proved that these records are essential.

4. The Association has carefully examined the draft Regulations as amended in accordance with the Home Office letter of February 15th. It would appear that the idea originally underlying the draft Regulations was that every distributor of the drugs shall keep a balance sheet of his dealings in them; that is to say, that every doctor, for example, shall keep records which would enable anyone investigating them to ascertain how much of each of the drugs has come into the doctor's possession and what has become of them. The Association agrees that if this could be done the information thus obtained would enable a close check to be kept on the distribution of these drugs.

5. But this idea, which presumably underlay the original draft Regulations, has been abandoned. The striking of a balance was never a possibility, even under the original draft. If Clauses 4 and 5 (as explained in the Home Office letter of February 15th) were not meant to apply to personal administration, and seeing also that no record need be kept of those quantities of the drugs which are used in making preparations of less percentage strength than those mentioned in the Act. Under the Regulations as amended the check kept on the distribution of those of "the drugs" which get into the possession of a medical practitioner is worthless.

6. The following example is taken from the practice of one of the witnesses (Dr. Bone) who is a partner in a large practice in Luton which dispenses for all its private patients:

In 1919 there were 25 buying transactions in the scheduled drugs which, aggregated, would appear as follows:

Opium.				
Tinct. opii	2 lb. 8 oz.
Liq. opii sed.	8 oz.
Pulv. ipecac. co.	4 oz.
Pil. plumbi c. opio (gr. 5)	1 gross
Pil. opii (gr. 1/2)	1 gross
Morphine.				
Morph. sulph.	2 dr.
Liq. morph. hydrochlor.	9 oz.
Tinct. chlor. et morph.	6 oz.
Hypodermic tablets morph. sulph. (gr. 1/4)	2 tubes
(20 in each tube)				
Hypodermic tablets morph. sulph. (gr. 1/6)	2 tubes
(20 in each tube)				
Heroin.				
Tabellac heroin (gr. 1/25)	124
Cocaine.				
Tabell. cocain et pot. chlorat.	200
Ophthalmic tablets cocaine hydrochl. (gr. 1/50)	2 tubes
(12 in each tube)				

7. The *outgoings* that would require to be recorded under the Regulations (as amended by the Home Office letter of February

15th) would only be those relating to pulv. ipecac. co., pil. plumbi c. opio, pil. opii, and the tablets of heroin and cocaine, as these are the only transactions in which any of the drugs were dispensed at or above the scheduled percentage strength. In every other case the drugs were administered personally or were dispensed in mixtures below the scheduled strength. Such a record would, it appears to the Association, be useless as a check on illicit traffic.

8. The Association would again raise the question asked in its letter of February 3rd—namely: "In small hospitals without resident house-surgeons, in nursing homes and in private practice where a trained nurse is in attendance it is a common occurrence to leave a hypodermic injection or a sedative draught which would contain one of the scheduled drugs to be given if necessary. Would this be in conformity with the Regulations, or would the nurse or orderly be a person not authorized to be in possession of the drug?"

The class of cases above alluded to is a very common one, and unless the doctor can delegate his authority to administer the drugs personally there will be much totally unnecessary suffering. It cannot be expected, for example, that the honorary medical officers to hospitals should pay visits to those institutions merely to administer a sedative drug which up to the present has been administered, without any evidence of abuse, by trained nurses or other responsible persons.

9. The Association believes that Regulation 9 presents the following dilemma. Take the case of a person handing to a chemist, say in Brighton, a prescription purporting to be signed by a doctor in York. Either the chemist is a very careful person who declines to take the risk of deciding whether or not the prescription is really signed by a medical practitioner (he could only be sure if he were familiar with the writing), or he accepts the prescription at its face value and takes the risk of it being a forgery. In the first case the patient may be put to quite unnecessary inconvenience; in the second the Regulation is seriously impaired as a protection against unauthorized possession of the drugs.

10. Regulation 13. The Association is not satisfied with the answer given in the Home Office letter of February 15th. It is not yet clear whether Regulation 13 does or does not require that the messenger of an authorized person (either doctor, chemist, or patient) must be authorized in writing to receive the drugs. If it is meant that there is to be an authorization in writing in every case, the demand is an impossible one. If such authorization is not demanded, the uncertainties and difficulties of the pharmacist seem to be very great. Any undue difficulties placed in the way of the pharmacist will, of course, be reflected on the patient, and in due course on the doctor who gives the prescription.

11. The Association must in any case press for the exclusion of the substances mentioned in its letter of February 15th. Regulations may be necessary as regards some preparations of the drugs, but it is impossible for anyone to hold that any of the substances mentioned in that letter (with the possible exception of pulv. ipecac. co.) could be used by the illicit drug-taker. There seems no reason why they should not be excepted from any restrictions laid on prescriber, buyer or seller.

Association Notices.

ELECTION OF COUNCIL OF ASSOCIATION,
1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and **Nomination Form**, were published in the SUPPLEMENT of March 12th (p. 73). The **Nominations** must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

ELECTION OF REPRESENTATIVE BODY OF
ASSOCIATION, 1921-22.*Constituencies in Representative Body.*

THE Council has finally grouped the **Home Divisions** for election of the Representative Body, 1921-22, in the same manner as for 1920-21, except that the Caithness and Sutherland Division of the Northern Counties of Scotland Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch, have been made independent Constituencies.

As intimated to all the **Overseas Bodies**, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

THE REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body must be elected not later than **June 17th**, and their names notified to the Medical Secretary **not later than June 24th**. The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the *BRITISH MEDICAL JOURNAL SUPPLEMENT* not later than May 14th, and for this purpose should be received by the Medical Secretary **not later than April 30th.**

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A LIST of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

BRANCH AND DIVISION MEETINGS TO BE HELD.

SOUTH-WESTERN BRANCH.—An intermediate meeting of the Branch will be held at Newton Abbot on Thursday, April 7th. Members should notify the Honorary Secretary, Mr. F. A. Roper (12, Southernhay West, Exeter) not later than March 25th of any cases, notes, papers, specimens, or notices of motion they may wish to bring forward in order that they may be placed on the agenda paper.

Meetings of Branches and Divisions.

MALAYA BRANCH.

The Malaya Branch of the British Medical Association held a conference on January 20th, 1921, with the Commissioners of the National Council for Combating Venereal Diseases. Dr. MALCOLM WATSON, president of the Malayan Branch of the Association, presided, and in his opening address welcomed the advent of the Commissioners and dwelt on the importance of venereal disease to the community. Dr. HALLAM stated that the objects of the Commission were to confer with the local authorities in the Far Eastern ports with regard to the possible measures which might be undertaken to reduce the incidence of venereal disease, and spoke of the recommendations which had been approved by the National Council for the provision of free treatment, early treatment centres, and a campaign of education of the general public. He mentioned the fact that in Japan the public health department was in favour of suppressing brothels, and cited as an instance the improvement in one of the counties of Japan in which the measures had been already enforced.

Dr. D. J. GALLOWAY in his reply gave full approval to the establishment of free diagnosis and free treatment, and although approving of a campaign of education of the general public in principle, he was of opinion that little could be done on that score in Singapore. He proceeded to point out the great divergence which existed between the facts as existing there and the commonly accepted ideals which were held on this subject in civilized countries, and urged that the only way by which any useful measure could be evolved to deal with the evil was by a careful study of the local conditions. To that end he moved the following resolution:

That this Association memorialize the Government of the Straits Settlements and Federated Malay States to cause full enquiry to be made as to (a) the prevalence of venereal disease, (b) the cause of that prevalence, (c) means of treatment, (d) means of prevention, and (e) the subject of prostitution generally.

Dr. RATRAY, in seconding Dr. Galloway's proposal, stated that for the past year he had been making efforts to establish a kindred society in Malaya, giving greater prominence to the value of disinfectants in the prevention of venereal disease. Dr. HOOPS gave his experiences of the value of antiveneal clinics which he had established in Kedah. Dr. HACKER spoke of his experiences with the garrison in Singapore; he was in favour of early treatment.

In the subsequent discussion, Dr. CANDRIK, Dr. GLASS, Dr. DAWSON and Dr. VAN DORT joined. The proceedings were terminated by the unanimous adoption of Dr. Galloway's resolution, a copy of which has been forwarded to the Colonial Secretary. The Council and members of the Malaya Branch afterwards entertained the Commissioners to dinner at the Europe Hotel.

METROPOLITAN COUNTIES BRANCH: MARYLEBONE DIVISION.

A MEETING of the Marylebone Division was held on March 16th, when SIR JAMES GALLOWAY was in the chair. The senior honorary secretary, Mr. C. Edward Wallis, was welcomed back after his recent serious illness, and Messrs. E. E. Ware and Philip Figdor were elected to fill the vacancies on the Branch Council. Dr. T. WATTS EDIN gave a most interesting address on "Some notes on the treatment of private patients in hospitals in the United States of America and Canada," which was followed by a discussion.

MIDLAND BRANCH: NOTTINGHAM DIVISION.

THE report of the work done by the Division in 1920 shows that the membership increased from 161 to 177. During the year there were twelve Divisional meetings, four of which were combined meetings with the Nottingham Medico-Chirurgical Society, at which scientific and clinical matters only were discussed. The Executive Committee had nine meetings, while there were several smaller meetings, such as delegates meeting the Colliery Field Club Board four times and numerous smaller special meetings at various centres. In the early part of the year the Division agreed that all doctors should raise their private fees 50 per cent., and this was advertised to the public.

The Division, after a long and arduous fight with the Colliery Field Club, has just brought this dispute to a satisfactory ending. As a result of this the contract price for medical attendance on dependants of miners has been raised from 16s. 3d. to 21s. 8d. per annum per married man, in addition to the whole system being placed upon what the Executive hopes will prove to be a more satisfactory and businesslike footing. The result of these negotiations is that the salaries of the Notts colliery surgeons have been increased by £8,242 per annum, or an average of £114 10s. per colliery surgeon. Before 1916 the contract price for this was only 15s. 6d.

Again, owing to the action of the local Division, the salary for maternity and child welfare work in one district was raised from £20 to £80 for forty sessions. A scheme has already been started in some of the districts whereby neighbouring practitioners do one another's holiday work. It is hoped to develop this scheme further in the future. In addition to the above local work, the Executive Committee points out that during the year the increased capitation rates for attendance under the National Insurance Act came into force, and that the British Medical Association was largely responsible in obtaining that increase from the Government.

INSURANCE.

CHARGES OF FRAUD IN INSURANCE PRACTICE.

IN the JOURNAL of December 25th, 1920, at p. 932, we recorded that at the Manchester Assizes on November 29th Dr. J. T. Godfrey, of Royton, was convicted and sentenced to three months' imprisonment on an indictment charging him with fraudulent conversion of goods and attempting to obtain money by false pretences. The charges were preferred by the Lancashire Insurance Committee. We have now received from the Ministry of Health a communication relating to an inquiry held at Manchester on February 9th under Part VI of the Medical Benefit Regulations, 1920, in regard to Dr. J. T. Godfrey, together with the report of the Inquiry Committee, and a formal statement of the Minister's decision.

The Committee of Inquiry consisted of Mr. Hugh Gamon, barrister-at-law (chairman), Dr. A. Forbes, and Dr. T. A. Goodfellow. The Minister of Health was represented by Mr. L. G. Dawson, and Dr. Godfrey by Mr. John G. Mahaffy. The administrative officer and cashier of the Lancashire Insurance Committee gave evidence on oath as to the nature of the offences. It was admitted on the part of Dr. Godfrey that his conviction was on six charges, of which three related to attempts by him to obtain payment from the Lancashire Insurance Committee in respect of fictitious attendances upon insured persons, and the other three charges concerned the obtaining by Dr. Godfrey for his own benefit from a chemist of drugs and appliances by means of prescriptions written by him containing the names of insured persons from his list of patients. Dr. Godfrey, in the course of his evidence before the Committee, stated on oath that he had been unjustly convicted, contending that the evidence upon which his conviction had been obtained was to a large extent false, and suggesting that his conviction was the result of a conspiracy. He, however, brought before the Committee no evidence to support such contention, and the Committee was not able to accept his unsupported evidence of his innocence with regard to the transactions in question. They expressed themselves satisfied that all the offences, and particularly those of attempting to obtain money by false pretences, were deliberately committed.

The Minister of Health, having read and considered the Inquiry Committee's report, is satisfied that Dr. Godfrey's continuance on the Medical List would be prejudicial to the efficiency of the medical service of the insured, and accordingly decides that his name be removed as from April 1st, 1921, from the Medical Lists of the Insurance Committees for the County of Lancaster and for the County Boroughs of Oldham and Rochdale.

CORRESPONDENCE.

The New Medical Records.

SIR.—I am in practice in Scotland, in the County of Renfrew Insurance Area, and here is my experience with the new record cards and envelopes:

My record cards begin with the date January 7th, 1921, which was the date on which I received them.

On March 12th, 1921, my envelopes arrived and I proceeded to put the record cards inside. I found (1) I was duplicating on the envelope the date on the record card; (2) I must get hold of a paper cutter, or some such implement, in order to open up the inside of the "paper poke" and get the record card to reach the bottom; (3) I must double the size of my former cabinet to accommodate the envelopes and record cards, at what will no doubt be a substantial sum.

Meanwhile I have suspended operations pending an envelope opener and an enlarged cabinet.—I am, etc.,

THOS. CARRUTHERS, M.A., M.B., Ch.B.

Kilbarchan, Renfrewshire, March 17th.

The Dental Bill and Insurance Practice.

SIR.—Has any consideration been given as to how the new Dental Bill will affect panel practitioners? At the present time about nineteen-twentieths of insurance patients are treated by unqualified dentists.

I understand that under the present Regulations panel practitioners are liable to give anaesthetics for dental treatment. I presume that we shall now be compelled to attend at the surgeries of these formerly unqualified men which will cause a large increase of work. I hope I am wrong in my surmise. I shall be glad to know it.

It would be rather a Gilbertian situation if one week one is punished by the General Medical Council for giving an anaesthetic for a man, and the next week punished by the Insurance Commissioners for not doing so. Great is the power of parliamentary whitewash.—I am, etc.,

Worcester, March 20th.

W. G. BENNETT.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commander K. H. Jones to the *Fisgard*. Surgeon Lieutenant H. A. L. Guthrie to the *Robin*.

ARMY MEDICAL SERVICE.
ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel E. A. Bourke, D.S.O., is placed on retired pay on account of ill health contracted on active service.

The following temporary Captains relinquish their commissions and retain the rank of Captain: J. Anastasia, M.B.E., A. G. Wright.

ROYAL AIR FORCE.
MEDICAL BRANCH.

The following are granted permanent commissions as Flight Lieutenants, retaining their present seniority (subject to acceptance of final conditions of service): the notification in the *London Gazette* of July 13th appointing these officers to short-service commissions is cancelled; E. N. H. Gray, R. E. Bell, E. A. Lumley, M.C., D. G. Boddie, H. McW. Daniel, A. E. Barr-Simm (July 13th, 1920).

Flight Lieutenant D. McLaren is granted a permanent commission, retaining his present substantive rank and seniority (subject to acceptance of final conditions of service, March 31st, 1920). The notification in the *London Gazette* of September 14th, 1920, appointing this officer to a short-service commission is cancelled.

TERRITORIAL FORCE.
ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel A. B. Lyon, T.D., is appointed to command 1st London C.C.S.

Lieut.-Colonel J. H. Harris, T.D., resigns his commission and retains the rank of Lieutenant-Colonel, with permission to wear the prescribed uniform.

Captain and Brevet Major R. E. Barnsley, M.C., R.A.M.C., to be Adjutant of the R.A.M.C. School of Instruction, Northern Division (T.F.).

Captain P. J. Gaffikin, M.C., to be Major.

The following officers resign their commissions:—Major J. R. Lensen, and is granted the rank of Lieutenant-Colonel. Major A. W. French, T.D., and retains the rank of Major. Captain W. T. P. Meade-King, and is granted the rank of Major. Captains, and retain the rank of Captain: C. F. Backhouse, A. J. H. Isles, S. L. Brimblecombe, C. E. M. Jones, C. H. Maskew, A. V. Maybury.

5th Southern General Hospital.—The following officers resign their commissions and retain their rank: Lieut.-Colonel J. L. Square, Major (brevet Lieut.-Colonel) J. W. Gill, Major A. C. Roper, Captain (brevet Major) E. G. Smith, and Captains W. L. Pethybridge, G. F. Clion, G. C. F. Robinson, B. Dyball, R. V. Solly, R. Jaques, H. Andrew, and C. D. Lodsey.

5th Southern General Hospital.—The following officers resign their

commissions and retain their rank: Major N. E. Aldridge, Captains C. H. Sanders, M. H. Way, J. L. Wright, C. Lamplough, J. E. F. Falser, A. W. Power.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel C. A. Lees, C.B.E., from 2nd London (County of London) General Hospital, to be Lieutenant-Colonel.

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.—*Section of Laryngology*: Fri., 4 p.m., Cases. 4.15 p.m., Mr. A. Ryland: Epidiascope Demonstration of a Pharyngeal Pouch. *Section of Anaesthetics*: Fri., 8.30 p.m., Drs. R. L. Mackenzie Wallis and C. Langton Hewer: A New General Anaesthetic.

ST. JOHN'S HOSPITAL, 49, Leicester Square, W.C.—Thurs., 6 p.m., Chesterfield Lecture, Dr. W. Griffith: Bullous Eruptions.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Lock Hospital, 41, Tottenhamrow.—Wed., 4.15 p.m., Dr. Madeline Archibald: Venereal Disease in the Female.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m. (and 2.30 p.m. Fri.), Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by Is. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Mediseera, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Ailiology, Westrand, London). Telephone number for all Departments: Gerrard 2630 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rulland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

MARCH.

- 23 Tues. London: Grants Subcommittee, 10 a.m.
London: Organization Committee, 12 noon.
30 Wed. London: Medico-Political Committee, 2.30 p.m.

APRIL.

- 1 Fri. London: Central Ethical Committee, 2 p.m.
London: Medico-Sociological Committee, 2.30 p.m.
7 Thurs. Worcestershire and Herefordshire Branch: British Medical Association Lecture by Mr. P. L. Daniel, F.R.C.S., on the Differential Diagnosis of Acute Abdominal Conditions.
South-Western Branch, Newton Abbot.

APPOINTMENTS.

RICHARDS, H. A., M.A., B.Ch.Cantab., Junior Anaesthetist and Assistant Instructor in Anaesthetics to King's College Hospital.

ROBINSON, G. C. F., F.R.C.S. Eng., Honorary Consulting Surgeon to East Cornwall Hospital (Bodmin), Liskeard Cottage Hospital, Fowey Cottage Hospital, Kingsbridge Cottage Hospital, Totnes and District Hospital.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s, which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

MARRIAGES.

ANDERSON—HOOD.—On the 18th March, at St. Columba's (Church of Scotland), Pont Street, S.W., the marriage of Major H. Graeme Anderson, M.D., F.R.C.S., R.A.F., of 75, Harley Street, W., to Gladys, elder daughter of Charles Hood, of Hatch End, Middlesex.

JARVIS—COCKBURN.—At Duddingston Kirk, Midlothian, on March 17th, 1921, by the Rev. William Robertson, D.D., assisted by the Rev. William Serle, B.D., Captain Oswald D. Jarvis, O.B.E., Royal Army Medical Corps, to Alice, eldest daughter of the late Rev. George Cockburn, B.D., and of Mrs. Cockburn, 13, Elm Place, Aberdeen.

DEATHS.

FORT.—On March 13th, at Shorelea, Oldham, Lancs., Thomas Fort, M.R.C.S., L.R.C.P., L.M., in his 69th year.

KAY.—March 11th (suddenly), at The Grove, Starbeck, Harrogate, Elizabeth Mary, wife of Walter Smith-Kay, M.D., formerly Medical Superintendent of West Riding Asylum, Wadsley, Sheffield.

CURRENT NOTES.

Security of Tenure for Medical Officers of Health.

THE Public Health Committee of the Association at its meeting on March 22nd had under consideration the question of security of tenure of medical officers of health. Sanction had previously been obtained from the Council to proceed with the preparation of a bill with the object of obtaining security of tenure for medical officers of health and sanitary inspectors. This action had become necessary owing to Dr. Addison's statement in the House of Commons on March 2nd that legislation would be necessary to give security of tenure to existing health officers. The Committee has taken a bill called the Public Health Officers Bill, which was drawn up by the Association in 1910, and made such amendments to it as will give it the best possible chance of obtaining parliamentary sanction. Sir Philip Magnus, who has for many years been an enthusiastic supporter of the Association's efforts to obtain this object and who has given valuable assistance in the past, has again very kindly promised to undertake to introduce the bill, and it will now be pressed forward with all possible speed. He hopes it will be possible to gain for the bill the friendly interest of the Minister of Health. The Association has been advised that it would not only be futile but very inadvisable to make any effort at the present time to obtain superannuation for medical officers of health, and, in view of this advice and the statements on the subject which have recently been made in the House by Dr. Addison, has decided not to press this question for the present.

Post-Graduate Education.

The Science Committee of the British Medical Association has lately had under consideration the question of post graduate medical instruction in Great Britain, more particularly with a view to co-operation in the work of the Fellowship of Medicine and Post-Graduate Medical Association. In the meanwhile, as announced in the JOURNAL of January 29th, the Ministry of Health appointed a Committee, under the chairmanship of the Earl of Athlone, with the following terms of reference:

"To investigate the needs of medical practitioners and other graduates for further education in medicine in London, and to submit proposals for a practicable scheme for meeting them."

Upon the appointment of this Departmental Committee the British Medical Association requested to be allowed to submit evidence which it felt would prove of value to the Committee in its deliberations. The President of the Association, the Right Hon. Sir Clifford Allbutt, with Dr. C. O. Hawthorne and Mr. R. J. Willan, attended before the Committee on March 15th, and we hope to publish shortly a summary of their evidence.

I.M.S. Pay—Civil Side.

The British Medical Association has just been informed by the India Office that the revised rates of pay for the civil side of the Indian Medical Service which were promised in June, 1920, were announced in India on March 3rd, 1921. There has been a delay in issue of this pay which seems unreasonably long, and the Association has on several occasions lately informed the India Office that such delay was giving rise to very widespread dissatisfaction. The pay of administrative officers has not yet been decided upon, but it is understood that the proposals of the Government of India on this subject are now in the hands of the India Office, and the Association is pressing the India Office for an early decision on this matter.

Sections at the Annual Meeting.

In the SUPPLEMENT of March 5th, 1921, at p. 65, we printed the provisional programme of the Annual Meeting of the British Medical Association to be held at Newcastle-on-Tyne in July next. We are now able to give the dates on which the two-day sections and the one-day sections will meet.

Two-day Sections.

Neurology and Psychiatry ...	July 20th and 21st
Obstetrics and Gynaecology ...	July 21st and 22nd
Ophthalmology ...	July 21st and 22nd
Oto-Rhino-Laryngology ...	July 20th and 21st
Physiology, Pharmacology, Therapeutics and Dietetics ...	July 20th and 21st
Veneral Diseases ...	July 20th and 21st

One-day Sections.

Ambulance and Red Cross ...	July 20th
Dermatology ...	July 21st
Medical Sociology ...	July 22nd
Proctology ...	July 20th
Radiology and Electro-therapeutics ...	July 22nd
Urology ...	July 22nd

The following five sections will meet on each of the three days: Medicine, Surgery, Pathology and Bacteriology, Preventive Medicine with Industrial Diseases, Orthopaedics and Diseases in Children.

Medical Books for Serbia.

In a Current Note in the SUPPLEMENT of July 17th, 1920, a short account was given of the plight of the Serbian libraries after the war, and of the effort being made to reconstruct them. In this endeavour the Royal Society of Literature sought the help of the British Medical Association, and a letter from a subcommittee of the Society was considered by the Science Committee. In accordance with the instructions of the Committee the librarian prepared a list of surplus books which the Association could supply towards restoring the ruined libraries in Belgrade and other Serbian towns. This list was forwarded to the Serbian Library Section of the Royal Society of Literature. At the last meeting of the Science

Committee the librarian reported that some fifty volumes had been chosen, and would in due course be forwarded to the Serbian Library Section. By the gift of standard English works it is hoped to promote the study of our own literature and science where these have hitherto been too little known. A medical faculty of the University of Belgrade is being established, and an English medical library will be of special value to the students and staff.

MUNICIPAL CLINICS AND THE PRIVATE PRACTITIONER.

CONFERENCE OF COMMITTEES OF THE BRITISH MEDICAL ASSOCIATION.

A CONFERENCE of the Medico-Political, Public Health, Hospitals, and Ministry of Health Committees of the Association was held in the Council Room at 429, Strand, on March 16th, to consider the question of municipal clinics and hospitals, and the relations thereto of medical officers employed by municipal authorities and of private practitioners. There was a large attendance. Dr. R. A. BOLAM (Chairman of Council) presided, and, in opening the proceedings, mentioned that Dr. G. F. BUCHAN and Mr. H. S. SOUTTAR attended by invitation on account of their special interest in the subject under discussion.

A motion was proposed by Dr. E. J. MACLEAN affirming the desirability of finding a means of reconciling the differences between medical officers employed in municipal clinics and hospitals on the one hand and practitioners in related areas on the other.

Dr. H. B. BRACKENBURY said that in posing the problem before them he would start from the fundamental position—which he could not imagine the Representative Body ever going back upon—that it was the business of the private practitioner to treat the members of the public. The question was how far this general proposition might be limited or modified in special circumstances, and also how far it was possible to associate the private practitioner with the advance of preventive medicine in a wider aspect than its purely individual and domestic concerns. Unless they took it for granted that in general the private practitioner was to do the treatment and the whole-time officer attend to administration, he saw no possibility of harmony, though he could quite believe that each side of that proposition might need some modification.

Dr. G. F. BUCHAN began by dealing with certain matters relative to the municipal clinics and hospital in Willesden. The clinics were supported from the rates, and the feeling of all parties on the local council was that institutions supported from the rates should be available to all ratepayers. These clinics were not the crotchets of himself as medical officer: they were the outcome of the developments in public health legislation extending over the last forty years. In these clinics the clinic medical officer was the pivot of the whole organization. He dealt with a definite area and section of the population, had specified hours of work and salary, and had at his back the specialist and the hospital; the officer himself was a general, though not a private, practitioner. Dr. BUCHAN thought that if part-time service was introduced it must be thoroughly understood that the part-time officer was willing to accept responsibility, and to give a large amount of time—not much less than half his time—to the work. He must realize that the organization depended largely on him for maintenance and initiative. Furthermore, the part-time service must be on the same economic level as the whole-time service in the matter of cost to the ratepayers. He did not believe that administration could be separated from treatment, although the work of some men would be in its major part administrative, and the work of others in its major part clinical. He regarded it as peculiarly the business of the British Medical Association to try and make practical the ideals of Lord Dawson's report.

Mr. BISHOP HARMAN said that medical officers of health naturally stood for organization and private practitioners for freedom. The two positions were not incompatible with the public health ideal, but the attitude taken up by many on one side or the other was incompatible. An organization grew by accretion, swallowing up first one province and then another, until it might become unwieldy and embarrassed in action. He appealed to medical officers to recognize human nature, to preserve freedom as far as possible, and adapt existing circumstances rather than seek violent change.

Dr. Maclean's motion was agreed to unanimously, and a further motion was proposed by Dr. BRACKENBURY

urging that wherever possible a part-time service for municipal clinics should be provided.

Dr. BRACKENBURY said that those on his side did not differ from Dr. BUCHAN in his contention for the municipal clinic, but they thought that the means already to hand in the shape of the private practitioners of the locality ought to be utilized. Medical inspection might be left in the hands of administrative whole-time officers, but the treatment of the individual should remain, wherever possible, with the private practitioner. There was no difference as to the need for specialization. Nobody had stated that all medical practitioners were capable of doing all work, but when a man had done a thousand tonsils and adenoids cases he could do them as well as the man who had done five thousand. Given a certain degree of experience, relative efficiency ceased to matter. He agreed that a part-time man must do his agreed public work punctually and regularly, and allow no exigency of private practice to interfere.

Dr. ROCYN-JONES said that in his area part-time service had failed because the clinics had been secondary to his private practice in the practitioner's estimation. He did not believe that inspection and treatment could be divorced.

Dr. Brackenbury's motion was withdrawn, and the following was carried *nemine contradicente*, on the motion of Mr. BISHOP HARMAN:

That it is desirable in the interests of harmonious working, both from the public and professional standpoints, that clinical work done for the public health authority should, wherever possible, be carried out through the agency of private practitioners, subject to conditions to be agreed upon.

The CHAIRMAN suggested that the Conference should now consider the method to be adopted by the local authority in connexion with the treatment of a child found upon inspection to be defective. A memorandum was presented dealing with this subject, and special attention was directed to a suggested method:

The child should be given a note to hand to his parent stating the condition for which treatment is required, with the advice that the family doctor should be consulted thereon. A letter addressed to the family doctor should accompany the note to the parent, describing the condition found on inspection, and the doctor should at the same time be furnished with a post-card on which he should be asked to state his willingness or otherwise to treat the case. If the doctor agrees to treat the case it may be assumed that he is of opinion that the parents can pay, or at any rate that he is willing to take the risk. The responsibility of the education authority would then cease until such time as the child is again inspected. Should the school medical officer not be satisfied with the result of treatment the private practitioner should be offered an opportunity of consultation. If the family doctor prefers not to undertake treatment, or if there is no family doctor, the child should be treated at the clinic.

Dr. SNELL said that practically the same method had been tried in Coventry, but it was found that it did not work, chiefly because the private practitioner did not carry out the treatment of cases referred to him, as in many instances he did not consider it necessary. He (Dr. Snell) was of opinion that the amount of work taken out of the hands of private practitioners owing to the activities of the local authority was very small. Most of the work done by clinics never had been done by private practitioners, and the existence of the clinics, by raising the standard required as regards the health of children, had caused many children to be taken to private practitioners who would not otherwise have come under their treatment.

Dr. R. A. LYSTER regarded the method suggested as ideal, but from his own experience in Hampshire there were difficulties in carrying it out; a considerable number of practitioners resented the sending of a statement from the local authority to the parents giving the diagnosis, as it might suggest that private practitioners did not know their business. Any authority which tried to recover the cost of treatment wasted more money over the attempted recovery than the treatment actually cost. Medical inspection and treatment of school children by local authorities had increased the work of private practitioners. The employment of part-time officers was disliked by public authorities and was unpopular with the public. Such appointments had been tried and found to be unsatisfactory. Practitioners as a whole were, moreover, very suspicious of the part-time officer who was also in private practice.

Dr. A. LYNDON felt that the inspection of school children, which the profession ought to welcome, could only be done by whole-time officers. The practitioners in his area had no desire to carry out such inspection. Dr. BRACKENBURY agreed that inspection was better done by

whole-time than by part-time officers, but he was anxious about procedure immediately after inspection. A defective child should, in the first instance, be referred to a private practitioner if the parent was willing to engage one. Dr. C. SANDERS instanced the practice in his own area, where the parents nearly always attended at the inspection, and were advised immediately to consult a private practitioner when necessary.

Mr. BISHOP HARMAN suggested the following modification:

That a note should be sent to the parent stating that the child was suffering from certain defects, with a request that the family doctor be consulted, along with the statement that if the family doctor did not treat within a certain time treatment would be carried out at the school clinic.

He believed that clinics often resulted in children being taken to the private doctor in order to confirm the advice or suggestions given.

Dr. C. E. S. FLEMING thought that provision should be made in rural areas for consultations between private practitioners and the school medical officer. Dr. BUCHAN thought that only a small percentage of the letters sent from the school clinic would ever reach the practitioner, and in his experience very few parents attended the inspection of their children.

Ultimately the Conference unanimously resolved:

That in every case where defect is discovered on medical inspection a communication should be made to the parent, notifying him of the necessity of treatment and advising the calling in of a private practitioner.

On the motion of Dr. BRACKENBURY, seconded by Dr. DOMVILLE, it was also unanimously agreed that a form be prepared by the British Medical Association and the Society of Medical Officers of Health on which such communication could be made when necessary.

Certain resolutions were then passed with regard to the setting up and the staffing of the clinics:

- (1) That the giving of advice and treatment at school clinics should, wherever possible, be by the private practitioners of the area;
- (2) that the practitioners of the area should have the right themselves to refer cases to the school medical officer for treatment;
- (3) that home treatment undertaken by health visitors or nurses under the direction of medical officers who themselves are not in domiciliary attendance should be specifically limited by the directions of the medical officer.

With a view to carrying out the first of these resolutions the local authority, through the medical officer of health, should invite the medical practitioners to submit a scheme, and in the event of this scheme not being accepted by the local authority, or of a modification of it not being accepted by the practitioners, a conference should if possible be held for the adjustment of details.

Several matters were left over owing to the lateness of the hour, and it was left to the discretion of the Chairman to summon the Conference again if and when it seemed desirable.

Association Notices.

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.

2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each scholarship is tenable for one year, commencing on October 1st, 1921. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things

being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1921-22 must be made not later than Saturday, June 25th, 1921, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

ELECTION OF COUNCIL OF ASSOCIATION, 1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and *Nomination Form*, were published in the SUPPLEMENT of March 12th (p. 73). The *Nominations* must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

ELECTION OF REPRESENTATIVE BODY OF ASSOCIATION, 1921-22.

Constituencies in Representative Body.

THE Council has finally grouped the *Home Divisions* for election of the Representative Body, 1921-22, in the same manner as for 1920-21, except that the Caithness and Sutherland Division of the Northern Counties of Scotland Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch have been made independent Constituencies.

As intimated to all the *Oversea Bodies*, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

THE REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body must be elected not later than **June 17th**, and their names notified to the Medical Secretary **not later than June 24th**. The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary **not later than April 30th**.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A LIST of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

Meetings of Branches and Divisions.

GLASGOW AND WEST OF SCOTLAND BRANCH.

THE annual meeting of the Branch was held on March 16th, when Dr. LIVINGSTONE LOUDON, President, was in the chair. The following office-bearers were elected:

President: Dr. C. E. Robertson. *President-elect:* Dr. G. Douglas McKee. *Vice-Presidents:* Drs. Snodgrass and Livingstone London. *Honorary Secretary:* Dr. J. Russell. *Honorary Treasurer:* Dr. W. O. Taylor.

The retiring secretary, Dr. A. Kennedy Glen, was accorded a hearty vote of thanks for his services throughout the past two years, during which time the membership of the Branch has considerably increased.

Annual Meeting, Glasgow, 1922.—The retiring PRESIDENT, in demitting office, thanked the members for the honour they had done him and congratulated the Branch on its increasing strength. The ensuing year, he said, would be a busy one preparing for the Annual Meeting of the Association, but he was sure that members would take up the work enthusiastically and carry it through successfully. They had reason for congratulation in having obtained Sir William Macewen's consent to his nomination as President. Some discussion followed as to the method of appointing a general committee, and it was ultimately resolved that a preliminary committee be formed consisting of the members present, together with the Branch Council, with power to add to their number.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

A MEETING of the Division was held on March 15th, with Dr. J. S. CRONE in the chair.

The Honorary Secretary (Dr. W. PATERSON) read a letter of protest forwarded to the Home Secretary, pursuant to the instructions of the last meeting, with respect to the Dangerous Drugs Regulations, and a communication from Colonel Pinkham, M.P., regretting that illness prevented him taking any immediate action in the matter. The Secretary reported a very successful meeting of members of Parliament which had been arranged by the Association and the Pharmaceutical Society, with the result that the Government had appointed a committee to go into the whole question.

The Secretary reported that the questionnaire on medical inspection and treatment of school children, maternity and child welfare work, had been issued to 50 members and 55 non-members; that there were 52 replies, of which 36 expressed a positive opinion.

Of the 36 replies 24 were willing (12 were not) to undertake on a part-time basis the medical inspection of school children. In answer to Question 2—namely, whether they desired to undertake on a part-time basis the medical treatment of school children, and, if so, what branch of the work they were willing to undertake—22 were willing (14 were not) to undertake the treatment of minor ailments; 12 were willing (24 were not) to undertake operations for adenoids and tonsils; 13 were willing (23 were not) to administer anaesthetics for tonsils and adenoids; 24 were willing (12 were not) to administer anaesthetics for dental operations; none of the 36 were willing to undertake the treatment of ringworm by x-rays. In answer to Question 3, 13 were willing (23 were not) to undertake on a part-time basis the treatment necessary at maternity and child welfare clinics.

The meeting considered the question of the formation of a Practitioners' Mutual Help Scheme, and Dr. SCOTT explained what was being done in Middlesbrough, Sheffield, and other places in connexion with the provision of locumtenents for holidays, etc., and explained the scheme issued by the head office. The meeting expressed general approval of the formation of such a scheme, and appointed a subcommittee to consider and report upon the matter.

Dr. SKENE, in introducing a discussion on clinical meetings and a medical club, stated that, while it was necessary for the Division in looking after the interests of the local practitioners to hold many meetings the business of which must of necessity be of a medico-political character, he felt that the Division should take action in the matter of arranging clinical meetings and discussions and, if possible, a social club. He did not desire to suggest anything elaborate, but rather that the clinical meetings should be discussions by the local practitioners of any matter of interest which they might come across in their own practice, or which would be of interest to themselves or their colleagues in their everyday work. In order that the meetings should not be too dry, he suggested that something of a social character should be also arranged.

Dr. STURRIDGE was strongly in favour of the project and spoke as to the interesting and successful clinical meetings held by the medical officers of the divisions of the army to which he was attached at Malta and with the Rhine Army of Occupation. Dr. MACEVOY and others supported the suggestion, the former stating that the original Willesden Division arose out of the old Willesden Medical Society. He thought it only fair that the Honorary Secretary should be relieved from any work which might arise out of the clinical side of the Division's activities.

The CHAIRMAN stated that it was only the stress of medico-political work which had shelved the question of arranging the clinical work of the Division, and that the Division rules already provided for the holding of such meetings and the appointment of a clinical secretary. It was agreed that clinical meetings should be arranged for, and that Dr. Skene be appointed Clinical Secretary for one year.

It was unanimously resolved that the Division approve the candidature of the Secretary (Dr. Paterson) for election to the Central Council.

ESSEX BRANCH: SOUTH ESSEX DIVISION.

AT a meeting of the South Essex Division of the British Medical Association Dr. HERBERT FRENCH, of Guy's Hospital, read a paper on "Some clinical bits and pieces."

He advanced the emphatic opinion that acute nephritis did not occur without a cause, such as the chemical reaction to a foreign protein, as exemplified in puerperal eclampsia, or the presence of a focus of sepsis in some region of the body, as exemplified in scarlet fever and other exanthemata, and also further in a series of fourteen cases of tonsillitis which had recently come under his notice. These cases all showed the classical symptoms of acute nephritis—fever, albuminuria, oedema, and in one case haematuria and casts. They were all cured—the urine was free from albumin, and the patient quite well within at the most ten days—by enucleating the tonsils.

Dr. French then called attention to a condition often misdiagnosed as "calcareous rheumatism," but really due to a spicule of bone on the plantar surface of the os calcis, perhaps due to ossification of tendon or ligament. X rays would clear up the diagnosis and would sometimes show a tendency to shadow in the tendo Achillis as well. Treatment would be either surgical removal of the spicule or the formation of a groove inside the heel of the boot.

In regard to pyloric stenosis, non-malignant, produced by the fibrosis resulting from the scar of a healed gastric ulcer, he suggested that it did not give rise to vomiting until a late stage of the condition. He expressed the opinion that the development of contraction was such a slow process that in some cases the musculature of the stomach wall was able by hypertrophy to keep pace with the obstruction due to increasing narrowness of the pyloric orifice for years before giving up the struggle and resorting to ejection of the stomach contents instead. The condition could be definitely diagnosed only by serial x-ray examination after bismuth meal. Early gastroenterostomy was highly satisfactory before vomiting supervened, but not by any means so successful after the onset of vomiting.

He pleaded for a sane use of thyroid extract, which he strongly recommended as alleviative if not curative in tic douloureux, and the periodic sick headaches of women. He detailed illustrative cases, and incidentally drew attention to the nervous symptoms of myxoedema which would also be controlled by thyroid extract. As examples, he spoke of two patients who both presented a sign which he regarded as pathognomonic of myxoedema—the peculiar gelatinous appearance of the tissues between the eyelid and the eyebrow on the outer half of each eye. One case alternated melancholia with acute mania, and the other presented the symptoms of multiple peripheral neuritis. Both cases were able to resume their ordinary duties after three or four weeks' thyroid medication.

Discussions took place on each of the four points raised by Dr. French, who was heartily thanked for coming to speak.

INSURANCE.

CORRESPONDENCE.

Insurance Envelopes and Cards.

SIR,—The Minister of Health, acting on the advice of a special committee, has decided that both clinical and statistical records are necessary, and that the former are the most essential and important. To carry this out the envelopes and cards have been devised and sent to all insurance practitioners with instructions for filling in details.

Statistics have always been based on the returns of the year, and there is no indication that this basis will be altered. Is it intended that the envelopes and cards are to be sent every year to the Insurance Committee for statistic tables to be drawn up?

The clinical records are to be kept on the same envelopes and cards, and to be retained until the patient dies, or is transferred to some other medical man, in the hands of the medical attendant?

If they have to be sent each year for the purpose of statistics they will necessarily be kept a long time to tabulate, etc., and meanwhile the medical man will be without envelopes or cards to continue his entries. What is he to do in order to carry on the records?

It looks as if this had escaped the attention of the Committee and the Insurance Commissioners; at any rate they have not sent instructions for this dilemma, and unless they have some means of overcoming the chaos they will have to alter the single record arrangement and have separate cards for statistics and for clinical history and report of treatment, etc.

The old white cards in use till this year were well adapted for statistical purposes. The name, address, society, etc., and place for notes and treatment, on one side, and the space for each day of the year ruled on the other, with age, occupation, and nature of illness at the

lower half. But these cards were called in each Christmas, and then the medical men had a very heavy task to fill up new cards for the ensuing year. They also lost their records of illnesses, treatment, etc., of the past year and years.

The modern envelopes and cards are not suited for statistical purposes. Flimsy and difficult to handle, they will soon wear out and be a constant worry. The having to write on the back of the envelope is a mistake; and the ruling is most inconvenient—insufficient space for anything and no place for record of treatment.

What can be done to improve matters? The old white cards might be reissued for statistical purposes, and could be sent up every year. The new buff cards could be much improved, and then used only for clinical notes, records of treatment, and diagnosis, etc. In any case, the unfortunate medical man will have the trouble of much more writing, many more cards, and the expense of providing cabinets or boxes for the increased cards.—I am, etc.,

Twickenham, March 24th. H. HOWARD MURPHY, M.D.

LOCAL MEDICAL AND PANEL COMMITTEES.

COUNTY OF LONDON.

At a meeting on March 22nd, 1921, the London Panel Committee passed the following resolutions:

- That the Committee are of opinion that some form of medical record is necessary.
- That the Committee are of opinion that practitioners should not be required to enter matters on the record cards which in their opinion are likely to be detrimental to the interests of the insured persons concerned.
- That in the opinion of the London Panel Committee the present medical records are neither advantageous to the medical service nor beneficial to the community, and that it is desirable that they be discontinued forthwith.

THE FUTURE OF THE MEDICAL SERVICES IN CHESTER AND THE DISTRICT.

BY

JOHN ELLIOTT, O.B.E., M.D., F.R.C.P.,
HONORARY PHYSICIAN, CHESTER ROYAL INFIRMARY.

A LITTLE while ago I happened to be travelling with a colleague when we fell to talking of the prospects of medical practice. My estimate of the position was not exactly rosy, but the pessimism of my companion was unqualified. I hinted to him that I contemplated an incursion into the troubled waters of medical politics on the lines of the present discussion. He said, "Why should you or I move in the matter when the younger generation of practitioners, whom it more intimately concerns, will not even take the trouble to consider it?" He went on to tell me that out of some 600 medical men in his district 12 only attended a meeting called in their interest. This is a weighty indictment, but, I am pleased to say, cannot be urged against the profession in Chester and the neighbourhood, and the attendance here to-day is sufficient justification of the subject which I suggested for discussion.

The National Insurance Act.

The causes which have led up to the changed outlook for medical practice are so recent and so well known to all of you that I shall not waste your time by even mentioning them.

The National Insurance Act has come to stay, and yet we cannot part with the old system of club practice without a tinge of passing regret. It may be different in large industrial centres, but in country agricultural districts, such as ours, the old club practice offered advantages which no other system can surpass. As I have so frequently seen, the club patients in the surgeries of our country doctors were not merely individuals—they were friends. Under any State system I think they are more likely to be regarded as "cases," and it has been suggested that their doctor may be required to give damaging evidence against them in a court of law, either with or without the production of their record cards. The profession would welcome a definite pronouncement from Dr. Addison on this matter and any legislation that may be necessary to ensure the confidential character of the relation between doctor and patient. The Insurance Act has made no provision for hospital treatment of insured persons, but

it is sufficiently evident that the voluntary hospitals can no longer undertake such treatment without remuneration. The London Hospital has declined to do so unless the approved societies come to its aid. Let us hope that the surplus millions now in the hands of these societies may be utilized for such a purpose. It is evident from Dr. Addison's latest pronouncement that he has this matter under favourable consideration.

So much for the persons whose incomes entitle them to the benefits of National Insurance. They are adequately provided for. The crux of the situation centres round the provision of adequate medical treatment, both general and specialist (in the widest sense of the word), for the lower middle classes, whose incomes will not stand the strain of consultation and operation fees and nursing home charges.

The Poor Law Infirmaries.

The Poor Law infirmaries have now a large number of vacant beds. Strange to say, during the course of the war poverty has to a large extent vanished from our midst, and yet the everlasting truth, "the poor we have always with us," still holds good. The scene has shifted, and under very efficient and thorough taxation it is we ourselves who are the poor, and in my opinion we shall be poorer still before we are much older unless we are "up and doing." In Bradford the guardians have handed over their charge of the infirmary to the municipal authorities, the Poor Law infirmary thus becoming a municipal hospital with a whole-time medical service.

In other places they have opened them for the reception of paying patients, providing maintenance and treatment of every description at a very moderate cost—as, for example, in Manchester, where 200 beds have become available in Withington and Crumpsall Infirmaries, the contribution of three guineas per week entitling patients to maintenance and full medical service. Again, the guardians of the West Derby Union, Liverpool, at the request of the Chairman of the Middle Classes Union, Liverpool branch, have opened wards for the reception of paying patients on similar terms to those charged by the Manchester Poor Law infirmaries mentioned. It would be well to note carefully the conditions of service (BRITISH MEDICAL JOURNAL, February 5th, 1921, p. 209). The private medical attendant can consult with the medical staff of the infirmary, but no interference will be allowed either in the treatment or nursing of the patient. The staff consists of a medical superintendent, three resident medical officers, and a visiting staff of specialists. Patients will be admitted either on the recommendation of their own doctor, or on the personal application of the patient or his friends.

There can be no question that this constitutes a direct challenge to the position of the general practitioner, and if the practice is extended, as seems highly probable, it will very largely relieve him of the care and treatment of his own patients. I gather, however, that this procedure on the part of the Poor Law guardians has not yet received the sanction of the Ministry of Health.

Unless we take immediate steps to provide an efficient and complete medical service, including hospital accommodation for persons of moderate income, the prospects of the general practitioner are gloomy in the extreme.

Increasing numbers of students are flocking to our universities and medical schools, which are overcrowded already. At my old hospital (St. Bartholomew's) 150 full term students entered in 1920; in 1919 there were 161 entries; in previous years the entries numbered about 100. No doubt the previous shortage was due to war service, whilst its resulting post-war influx accounts in some measure for these figures, but the fact remains that our profession is attracting a very large number of students, both men and women. On inquiry of the General Medical Council I find that 1,457 students obtained a qualification to practise medicine in 1920. What is to become of the majority if, as seems probable, the medical care of the lower middle classes is to be largely taken out of our hands either by the Poor Law guardians' activities or by an extension of the principle of compulsory national insurance?

Before taking leave of the subject of the Poor Law infirmaries I would draw attention to a very able article on "Industrial Hospitals" by Dr. Bolam and Mr. Orde.† The authors advocate the use of the vacant Poor Law beds for (1) workers incapacitated by industry; (2) workers unable through curable disabilities to do full work: the costs of maintenance, etc., to be defrayed by contributions from both employers and the workers themselves, there being no burden on rates or taxes. This seems to me to be an altogether admirable suggestion.

* An address delivered at a meeting of practitioners under the auspices of the Chester and North Wales Medical Society, March 2nd, 1921.

Schemes for Providing Health Service.

I propose briefly to consider various schemes which have been either suggested or established with a view to the provision of an efficient health service by the general body of the medical profession itself.

Medical Consultative Council.—A diagram of the scheme propounded in the interim report of the Consultative Council on Medical and Allied Services was shown and explained, and Dr. Elliott went on to express the opinion that it would in many respects be an ideal scheme if unlimited financial support were forthcoming. Under present conditions he thought it out of the question.

The Gloucestershire Scheme was also illustrated by a diagram. I find the financial clauses of this scheme somewhat difficult to understand, and in any case I am sure we shall all agree that, like the scheme of the Consultative Council, it is much too ambitious for us to contemplate in this district. I hear from Dr. Middleton Martin, M.O.H. for Gloucestershire, to whose initiative the scheme is due, that it is not yet in operation, so that it is impossible for us to judge of its working.

Schemes for Medical Insurance.

The Sussex Provident Scheme is applicable to insured persons, and those whose income does not exceed £260 for single members, and £500 for a family. Benefits: Consultations, hospital treatment, dental treatment, laboratory, x-ray, massage, and electrical treatment. Subscriptions: £1 per annum for single members; for a married couple without children, 30s.; family rate, £2. Children over 16 years old counted as single members. For details of the scheme see BRITISH MEDICAL JOURNAL, January 22nd, 1921.

Leicester also has a provident scheme. Of the details of this I have no knowledge.

Co-operative Polyclinic for London, suggested by Mr. Parker, F.R.C.S. (*Lancet*, February 5th, 1921), with a maximum income limit of £2,000. Premium from £1 to £12 per year according to income. A private company to finance the scheme. I feel sure this scheme will not commend itself to you.

One great advantage of provident schemes is that the voluntary hospitals would benefit by them; in fact, if feasible and applicable to all areas, such a scheme would go far towards solving the financial problem of the voluntary hospitals. The Sussex scheme seems to me to be an ideal one for a limited community in a compact area. It can only be successful if the great majority of eligible persons become members.

The difficulties inseparable from the organization of a provident scheme in a district such as ours seem to me to be insurmountable.

It is not improbable that a considerable extension of the insurance principle may be in contemplation in the near future, either on voluntary or compulsory lines, so that it would be well to weigh carefully the very obvious advantages offered by a voluntary organization on the lines of the Sussex Provident Scheme.

I have now briefly described various schemes, either suggested or in operation, and have endeavoured to point out what in my opinion are their advantages and disadvantages; and have come to the conclusion that none of them are applicable to our immediate needs in this district. I have dealt with the matter from the point of view of the general practitioner. In my opinion the interests of the consultant and specialist are indissolubly linked with his, so that no special consideration from their point of view is necessary.

What can be Done in Cheshire and Flintshire?

In the first place, I am satisfied that in the event of any scheme being formulated the unit should be county council and county borough, but that if the Flintshire County Council and the Cheshire County Council agreed on a joint scheme the Ministry of Health would consider it favourably. It will be conceded that it is impossible at present to embark on any scheme which involves any great expenditure of public money. Our aim must be to forestall the kind intentions of the Poor Law guardians, and also any considerable extension of compulsory insurance, by providing for persons of moderate income a medical service which shall be equal in quality to that obtainable by anyone, whatever his income or advantages, and this with an eye to future contingencies in the way of linking up of various hospitals and other centres, and organizing the medical practitioners in the district for a complete health service, under which the general practitioner shall retain the care and treatment of his patients to the fullest possible extent.

Dr. Elliott showed a map of Cheshire on which the centres at present available for health service were marked and the accommodation they afforded and the uses to which they could be put indicated. After pointing out that the map showed that the district was in an exceptionally favourable position for the realization of a complete scheme, he made the following proposals:

1. The centralization of clinics as far as possible; such centralization not to interfere with existing centres for tuberculosis, maternity and child welfare, school clinics, etc. It must be obvious that the centralization of the various clinics must be an advantage both from the point of view of the local authorities, who will be saved much expenditure which would inevitably attend the acquisition of scattered sites and buildings, and from that of the medical practitioner, as being far more convenient for clinical study and teaching. It would also facilitate the formation of an extended scheme of health service in the future. The reconstruction of the Chester Royal Infirmary has provided much available space in wards not at present utilized, and is capable of almost indefinite extension in the way of separate huts or buildings on the site of the infirmary field.

2. The provision at cottage hospitals as well as at larger institutions of beds for paying patients, where they could be under the care of their own medical attendant, who could by arrangement with consultants or specialists procure any necessary special treatment. The provision of such beds would not involve serious outlay. In a small ward a few beds screened off with movable side screens would be all that is required. To do more than this in the present financial straits of the voluntary hospitals and the prevailing inflated prices in the building trade would be a costly mistake.

3. Similarly beds should be provided at all centres as far as possible for maternity cases; for cases in which difficulty is anticipated, or where operative interference is required; above all for cases whose home surroundings render the aseptic conduction of the labour impossible. The importance of this cannot be overestimated. I feel sure that the County Council would come to the financial aid of such a necessary procedure, and I hope the medical officer to the Council is prepared strongly to recommend such a course to his Council. It is a cause also which, I am convinced, would forcibly appeal to the benevolent. Since writing this I have read the leading article in the BRITISH MEDICAL JOURNAL of March 5th, p. 354, and would strongly recommend its careful perusal to those of you who have not already done so. I cannot refrain from quoting two paragraphs from that article: "Every general hospital should have a maternity ward or be associated with a lying-in hospital." Again, speaking of the "condition of the rooms where women are confined in poor and middle-class practices," it is said, "there is at present no possibility of getting all parturient women, or even all primigravidae, into a local cottage hospital or maternity ward."

4. Provision of a whole-time pathologist, whose headquarters should be at the Chester Royal Infirmary, but whose services should be available for any of the centres when required. The salary of such an officer could not be less than from £700 to £1,000 a year. If the authorities of the Chester Royal Infirmary agreed to such an appointment, his salary would have to be provided partly by the Royal Infirmary, partly by payment for public work done (Wassermann tests, etc.), and partly by contribution from the other centres which utilize part of his services. He should be at liberty also to undertake pathological work on the lines of private practice. I feel sure that Dr. Meredith Young would recommend his Council to help us financially with the salary of a pathologist. This matter would also, I believe, appeal to the city authorities.

5. An organized system of clinical lectures and demonstrations—to be held at any of the centres where interesting clinical material is available, and where any practitioner has matters of interest to communicate; the resources of special institutions, asylums, etc., to be available for this purpose, as also laboratory, x-ray, and electro-therapeutic departments. In this connexion I cannot do better than quote the weighty words of Sir George Newman ("The State and the Doctor," Cambridge meeting of the British Medical Association, July, 1920):

"In my view the State should never take out of the hands of the general practitioner—whether in contractual practice or otherwise—the patient whom he is willing and competent to handle on reasonable terms. The difficulty has been that the practitioner has not been in a position to render the medical service required by the State. It is evident that the solution is dependent partly on reform in the medical schools—a reform which, happily, is proceeding rapidly—and partly upon adequate arrangements for graduate education for the practitioner, and, may I add, willingness on his part to avail himself of the facilities which are provided? There is much remaining to be done in both directions; but before substantial progress can be achieved there is, first, considerable apathy to be overcome and a fuller appreciation of the needs of the situation; and, secondly, the further education of the practitioner must include an adequate professoriate, hospital and laboratory accommodation, and proper organization."

6. Organization of a system which would provide for special consultations or treatment at the wish of the general practitioner. This would present no difficulty, and needs no further notice.

7. The appointment of a representative committee to consider the best way of organizing a scheme on the lines suggested above when the circumstances are favourable, and when the co-operation of the local authorities can be obtained.

In conclusion, I wish to express my thanks to Dr. Meredith Young for his kind help, and for the hospital survey of the county which he undertook.

THE BRADFORD MUNICIPAL HOSPITAL.

THE following report of the Bradford Advisory Medical Committee, which had been considered in draft at a previous meeting held on February 10th, was adopted at a meeting of the medical profession of Bradford held on March 17th. The report, of which a copy has been forwarded to the Minister of Health and to the Bradford Health Committee, is signed by Dr. J. B. Dunlop, Chairman, Dr. J. Phillips, Vice-Chairman, and Drs. J. F. Allan, F. Beetham, R. A. Lankester, A. Manknell, G. H. Oliver, H. Shackleton, J. Wherry Wilson, W. Campbell, B. Hughes, J. V. S. Taylor, H. Vallow, and Dr. W. N. West Watson, Honorary Secretary.

Bradford Advisory Medical Committee's Report.

The Advisory Medical Committee, appointed by the medical profession of Bradford "to deal with the Health Committee on all matters relating to the public health of the city," has had under careful consideration the report of Dr. Buchan (medical officer of health) which was laid before the Health Committee, relating to the proposed establishment of a municipal hospital at St. Luke's. It has appeared to the Committee that the scheme before it is one which aims at establishing a municipal hospital of such magnitude that it will lead to the extinction of the existing voluntary institutions.

The discussion in Parliament and throughout the country of Clauses 10 and 11 of the now defunct Miscellaneous Provisions Bill showed that there was a very strong body of opinion averse from any steps being taken which would endanger the continued existence of voluntary hospitals.

Dr. Addison, Minister of Health, has several times stated that he is most anxious to do everything in his power to assist the voluntary hospitals to carry on, and it is also laid down in the Interim Report of Consultative Council on Medical and Allied Services that "We hope that the scheme that we have suggested will help these institutions, since these institutions are an essential part of the scheme." A non-medical committee has been appointed by Parliament with instructions to consider and report, at an early date, what measures can be taken to stabilize the position of the voluntary hospitals.

Conclusions.—The present would therefore appear to be a very inopportune time to launch an elaborate and costly scheme such as is proposed in Dr. Buchan's report, the carrying out of which would threaten the very existence of the voluntary hospitals in Bradford. The day when a tremendous struggle is required to ward off national bankruptcy hardly seems the best time to precipitate a crisis which must inevitably place a huge and permanent additional burden upon the rates.

Cost of Proposed Scheme.—In Dr. Buchan's report the number of beds available at St. Luke's Hospital is 1,148. The cost per bed per week at the Royal Infirmary is £3 12s. 6d. The cost to the Insurance Committee for a tuberculous patient at a sanatorium is £5 8s. 6d. per week. The Bradford Municipal Maternity Hospital costs very considerably more than either of the above. Calculating upon these data, the costs to the ratepayers of Bradford for the upkeep of St. Luke's Hospital would be at least £240,000 per annum. This sum means at least 16s. per head of the population of Bradford per annum. The inevitable result of a large addition to the rates, necessitated by this scheme, must be that many of the present supporters of the voluntary hospitals will not be able to continue their subscriptions, so that it will hardly be possible for these institutions to continue to exist.

Scope of the Scheme.—The present scheme also contemplates taking over work which is now being adequately performed by the existing voluntary hospitals and the medical practitioners of the city, thus producing an unnecessary and extravagant overlapping. This Committee, therefore, can only approve of the St. Luke's Hospital scheme in so far as it is necessary to complete the adequate provision for the institutional treatment of Bradford's sick.

Need for More Hospital Accommodation.—With regard to beds for in-patients, there is unquestionably a present deficiency, and this Committee would welcome the prospect of this being made up by the provision of a limited number of beds for general medical and surgical cases at St. Luke's Hospital.

Criticism of Proposed Accommodation.—The criticism of the number of beds set out in Dr. Buchan's scheme as being necessary at St. Luke's Hospital is based upon the following considerations:

(a) Sir Napier Burnett, who is the authority upon hospital matters, has estimated that three beds per 1,000 of population is the number required in an urban community: this would mean 900 beds for Bradford.

(b) Apart from St. Luke's Hospital, clinics and special hospitals, Bradford has in the three voluntary hospitals over 300 beds.

(c) Thus the number of beds required at St. Luke's Hospital is only 600, whereas the scheme provides for 1,148. Of the latter, 826 are allocated to medical and surgical cases, a number which closely approximates the total given in the above estimate as being necessary for the general requirements of the City.

(d) The number of beds allotted to the treatment of venereal disease is 108, which in the opinion of the Committee is unnecessary, inasmuch as very few venereal cases require in-patient treatment for more than a day or two, and the Ministry of Health has approved as adequate the accommodation and treatment now provided at the Royal Infirmary.

The question therefore comes to be whether the Health Committee intends to be content to supply only such accommodation and treatment as are at present not satisfactorily available; if so, by co-operating with the voluntary hospital boards, there will be no need for the full scheme as outlined in Dr. Buchan's report.

Special Departments. Turning to the question of special departments, the Committee considers that since there is abundant accommodation for the treatment of eye, ear, and throat cases at the Royal Eye and Ear Hospital, it is unnecessary to open a new department at St. Luke's Hospital, but rather that arrangements be made with the board of the Royal Eye and Ear Hospital for the treatment of St. Luke's cases. With regard to the suggested out-patient departments the Committee is of the opinion that no such departments are necessary, because, since the introduction of the National Health Insurance Act, with its provision for domiciliary treatment of ordinary illness, all voluntary hospitals have found that the work of their out-patient departments has been greatly reduced, and has assumed to a great extent a consultative character. The Committee considers that adequate provision for out-patient treatment is already made at the existing voluntary hospitals, and therefore it cannot see any justification for burdening the ratepayers with the cost of a new department of this kind at St. Luke's. As to casualties the Committee considers that as the casualty departments at the three voluntary hospitals are adequate and efficient for the City's needs, it is unnecessary to initiate a casualty department at St. Luke's Hospital. The Committee is also of the opinion that efficient x-ray and pathological departments should be established at St. Luke's, and also that experienced anaesthetists should be appointed. This would not preclude the general practitioner in the case from giving the anaesthetic if he and the surgeon so agree.

The Committee's Proposed Alternative Scheme.

Co-operation.—The Committee considers that the interests of the community will be best served by co-ordinating all the hospitals in the city—the three voluntary hospitals and St. Luke's Hospital—in such a way that each institution will become one branch of a conjoint hospital scheme. If this is to be accomplished it is essential that a joint board with executive powers shall be appointed, comprising representatives of each of the voluntary hospitals and of the Health Committee representing St. Luke's Hospital. While the internal affairs of each institution would continue to be administered by its own Board of Management, all matters which affected the hospitals as a conjoint institution would be dealt with by the joint board. This would include such matters as allocation of special work to a special hospital, and other methods and arrangements for avoiding overlapping; it would enable the Health Committee and its medical officer to receive first-hand information regarding the scope and accommodation of the voluntary hospitals, and the joint board would be a most important and useful body to discuss and determine such alterations as would be called for from time to time with regard to the provision for institutional treatment of Bradford's sick. The most urgently important function which such a board would be called upon to deal with would be the appointment of visiting staffs.

Staffing.—In the opinion of the Committee the best method of staffing would be a similar one to that which is satisfactorily working in the Paddington district of London. The Paddington district of London has an infirmary corresponding to St. Luke's, a general voluntary hospital and a children's hospital corresponding to our voluntary hospitals, and when the Poor Law infirmary was developed on lines somewhat similar to those proposed in Bradford, the visiting staff was appointed from the members of the staffs of the voluntary hospitals. At a discussion on the future of hospitals, held in London only a few weeks ago, the Medical Officer of Health for Paddington said of this arrangement: "The experiment of linking the local infirmary to St. Mary's Hospital has been so successful that there can be no doubt that such linking up will be general in the future." That some similar arrangement might be adopted with regard to the staffing of St. Luke's Hospital is the opinion of the Advisory Medical Committee. It would involve the enlargement of the staffs of the voluntary hospitals so that these would include all the men now doing consulting work in Bradford. The appointments would be open to all properly qualified medical practitioners. It could only be worked if a joint hospital board, such as the Committee has suggested, were set up with properly defined statutory powers, to include the nomination for election of applicants for any vacant posts on the staffs of any of the hospitals, selected after advertisement and after consultation with the Advisory Medical Committee. The actual appointments must, of course, be finally

made by the board of the hospital affected, or by the Health Committee in the case of St. Luke's, and in practice there is no likelihood of friction arising. When appointments are to be made to the staff of any hospital, it is customary for the lay members of the hospital board to be guided to their choice, to a considerable extent, by the opinion of their medical colleagues. With regard to appointments under this scheme, the joint hospital board would have the great advantage of the collective opinion of the medical profession, as voiced by the Advisory Medical Committee. This Committee has been democratically elected by the whole of the local medical profession, and it is felt that it is the body most capable of judging the relative merits of candidates for medical appointments.

Practitioners' Ward.—It is also considered desirable that beds should be set apart into which patients might be sent for treatment by their own medical attendants. The Committee suggests that the following conditions are necessary:

1. That the medical superintendent must have the right to decline to admit a case if he considers it to be unsuitable.
2. If a patient be in the ward over four weeks, a consultation must be held between one of the visiting staff and the practitioner in charge of the case.

Staff.—The Committee is of the opinion that in the first instance the following visiting staff would be necessary to carry out the work at St. Luke's Hospital efficiently: Four physicians, four surgeons, one obstetrician, one consulting ophthalmic surgeon, one consulting aural surgeon, one pathologist, one radiologist, two anaesthetists. This Committee is of the opinion that beds should be placed at the disposal of the tuberculosis officer of the city for cases requiring special observation. The Committee considers that for the best administration of the hospital it is not desirable that the medical superintendent of the institution should also act in the capacity of a member of the visiting staff, but that in consideration of the present circumstances this recommendation should not apply to the present administrator.

Admission.—The Committee believes that it will be the wish of the citizens of Bradford that only persons resident within the city boundaries shall be treated at the rate-maintained hospital, and that, as has been the custom with regard to Poor Law patients, contributions from patients or their relatives should be demanded according to their financial position. Patients from without the city should only be admitted if the total cost of their treatment and maintenance be met. Patients should be admitted to hospital only on the recommendation of a medical practitioner, except in cases of accident or emergency. Power to recommend patients to hospital should be expressly forbidden to all other parties.

Administration.—With regard to administration, the Committee is of the opinion that a hospital board should be constituted at St. Luke's Hospital to deal with the interior professional relations of the hospital and hospital arrangements, and that the hospital board should consist of the visiting staff, together with the superintendent of the hospital and at least four general practitioners appointed by the Advisory Medical Committee. Throughout its deliberations it has been the constant endeavour of the Advisory Medical Committee to produce a scheme which, while giving full consideration to the interests of the public health of the city by establishing an adequate hospital accommodation, shall, at the same time, be consistent with the economy so necessary at the present time. In this report the Committee has studiously avoided the mention of municipal clinics and health visitors, as it has not had time adequately to consider the evidence on which sound recommendations can be formulated. The Committee intends to embody in a further report its opinions and recommendations upon the general public health service of the city.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commanders E. R. Glazebrook to R.M. Division, Chatham; H. St. C. Colson to R.N. College, Greenwich (temporary); K. H. Jones to the *Fisgard*. Surgeon Lieutenant Commander R. A. Brown to the *Southampton*. Surgeon Lieutenants E. St. G. S. Goodwin to the *Ganges* for R.N. Sick Quarters, Shotley; J. W. Tighe to R.N. College, Greenwich.

ARMY MEDICAL SERVICE.

Major General O. R. A. Julian, C.B., C.M.G., C.B.E., retires on retired pay.

ROYAL ARMY MEDICAL CORPS.

Lieutenant (temporary Captain) H. G. P. Armitage to be Captain. H. W. Street, late Captain C.A.M.C., to be temporary Captain. The following Captains relinquish the acting rank of Major: C. M. Gozney, M.C., G. D. Harding, C. R. Dudgeon, M.C. The following officers relinquish their commissions: Temporary Major M. H. Allen, and retains the rank of Major. Temporary Captain J. D. Judson, and retains the rank of Captain.

ROYAL AIR FORCE.

MEDICAL BRANCH.

J. H. Peck is granted a short service commission as Squadron Leader for a period of two years on the active list, with effect from and with seniority of March 1st. J. C. Johnson is granted a temporary commission as Flight Lieutenant, with effect from and with seniority of March 4th. Flight Lieutenant L. G. Davies relinquishes his temporary commission upon termination of his appointment.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Captain E. Hulme resigns his commission, and retains the rank of Captain.

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE. *Section of Tropical Diseases and Parasitology*: Mon., 8.30 p.m., Dr. W. Broughton-Alcock: Laboratory Observations on Pansiclers with Malaria; Dr. H. C. Lucey: Large Mononuclear Leucocyte Count in Diagnosis of Malaria. *Section of Surgery—Subsection of Orthopaedics*: Tues., 5 p.m. Cases. *Section of Pathology*: Institute of Pathology, Charing Cross Hospital Medical School, Tues., 8.30 p.m., Mr. W. S. Cole and Dr. W. J. Adie: Quantitative Analysis of Gastric Contents; Mr. Cole and Miss J. Aynton: Post-operative Ketosis; Mr. J. E. Barnard: Demonstration of Structure of Bacteria; Dr. A. B. Rother: Agglutinins in Normal Serums for *B. enteritidis*, etc.; Dr. G. S. Wilson: Counting Viable Bacteria; Dr. H. B. Weir and Dr. Adie: (a) Infarct of Spleen; (b) Gumma of Heart; Dr. W. W. C. Topley, Mr. Barnard, and Dr. Wilson: Bacterial Cultures from a Single Cell; Drs. Topley and Weir: Lesions in Epidemic Diseases of Mice; Dr. Topley: *B. enteritidis* and *B. suis* group. *Clinical Section*: Fri., 5 p.m. Cases; 5.30 p.m., Dr. Ivor Davies: Hair Cast of Stomach and Gastro-intestinal Tract; Dr. M. Cassidy: Neoplasm of Lung.

ST. JOHN'S HOSPITAL, 49, Leicester Square, W.C.—Thurs., 6 p.m., Chesterfield Lecture by Dr. W. Knowles Sibley: Seborrhoea and Psoriasis.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Samaritan Hospital for Women.—Wed., 4.15 p.m., Dr. W. D. Macfarlane: Gynaecological Cases.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Mr. W. H. Hey: Diagnosis of the Chronic Abdomen.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m. (and 2.30 p.m. Tues.), Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Mediscera, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London).

Telephone number for all Departments: Gerrard 2630 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.) IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

APRIL.

- 7 Thurs. Worcestershire and Herefordshire Branch: British Medical Association Lecture by Mr. P. L. Daniel, F.R.C.S., on the Differential Diagnosis of Acute Abdominal Conditions. South-Western Branch, Newton Abbot.
- 8 Fri. London: Medico-Sociological Committee, 2.30 p.m.

APPOINTMENTS.

BROWNIE, W. Barrie, M.D., F.R.C.S. Edin., Ophthalmic Referee to County Court Circuit No. 4.

LEECH, E. Bosdin, M.D. Cantab., F.R.C.P., Physician to the Manchester Royal Infirmary.

WHITEHEAD, Henry, M.D. Vict. Manch., D.P.H., Medical Officer of Health for Wigan, vice Dr. F. E. Wynne.

WOOD, W. Q., M.D., F.R.C.S.E., Assistant Surgeon to the Chalmers Hospital, Edinburgh.

UNIVERSITY COLLEGE HOSPITAL.—The following appointments are announced:—*House-Physicians*: M. H. K. Kane, J. C. Blake. *House-Surgeon*: T. A. Butcher. *Obstetric Assistant*: C. A. Kirton. *Casualty Surgical Officer*: R. O. Eades. *Third Assistant in the Throat, Nose and Ear Department*: G. C. Scantlebury.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

MARRIAGE.

MOGG—THOMPSON.—On March 24th, at St. John's Church, Mansfield, by the Rev. W. Bathurst Soole, Gordon C. F. Moga, B.A., B.Sc., M.R.C.S., elder son of H. W. French Mogg, to Annie Gladys Thompson, M.B., Ch.B., elder daughter of Mr. and Mrs. Sidney Thompson, of Stone Cross, Mansfield.

DEATHS.

EWAN.—At 99, Philip Lane, Tottenham, London, N., on March 2nd, William John Strachan Ewan, M.B., C.M., eldest son of the late Rev. William Ewan, M.A., of Fyvie U. F. Church, and of 93, Bon Accord Street, Aberdeen.

KENNY.—On March 9th, 1921, at The Grange, Wickersley, near Rotherham, Yorks, John Drought Kenny, M.D., Ch.M., R.U.J., formerly of Treton, near Rotherham.

PYE-SMITH.—On March 23rd, at his house in Ampthill, Beds, after three days' illness, Rutherford John Pye-Smith, J.P., F.R.C.S., late of Sheffield, aged 73. Funeral 29th inst., 2.30 p.m., at Ampthill.

CURRENT NOTES.

The Indian Medical Service.

THE promise made in response to the representations of the British Medical Association that the pay of the officers of the Indian Medical Service should be increased by 50 per cent. was in part fulfilled soon afterwards by the issue of a new scale for officers in military employment. A resolution of the Government of India fixing scales for officers in civil employment was, we are informed, published in India on March 3rd. The new scales, it is stated, were, in consultation with the Secretary of State, settled as long ago as February, 1920, and payments will be made with retrospective effect from January 1st, 1920. When the official text is received it will be carefully examined; judging from the account published in the *Pioneer Mail* of March 11th, the provisions of the resolution are complicated.

Colonial Medical Services.

At its last meeting the Dominions Committee of the Association had again before it a large number of questions affecting the Colonial Medical Services. The Committee took strong exception to the delay on the part of the Colonial Office in dealing with the recommendations of the Departmental Committee, the report of which is dated as long ago as July 1st, 1920. In its reply to the Association of November 15th, 1920 printed in the SUPPLEMENT of November 27th, 1920, p. 141, the Colonial Office stated that the report of the Departmental Committee had been transmitted to the Colonial Governments and that it was expected that the observations of the latter would be received in a few weeks. In these circumstances the Dominions Committee, on March 21st, drew the attention of the Colonial Office to the great uneasiness and dissatisfaction felt by the British Medical Association at the delay in dealing effectively with the recommendations contained in the report, and intimated to the Colonial Office that unless the Association received very definite and early assurance that the grievances complained of were being remedied, it would be impossible for the Association to refrain from active dissuasion of medical men who might be thinking of entering the Colonial Service. In a reply dated March 29th, the Colonial Office expressed regret that the expectation that the Colonial Governments would reply at an early date to the circular dispatch sending out the report of the Departmental Committee had not been fulfilled; that several replies had been received, but that some of the larger colonies had not yet answered, and that a telegraphic reminder had been sent to all whose opinion was likely to be of importance. The Colonial Office further stated that in one case it had been ascertained that the delay was due to the desire of the Governor to obtain a full and complete expression of

opinion from the Medical Department, and to the wish of the head of the Medical Department, in his turn, to ascertain the views of his subordinates; that the officers in question are scattered over a very large tract of country, and would naturally take time to consider and formulate their views on the report; that as soon as the replies are forthcoming from the more important colonies which have not yet answered, the whole question will be carefully considered; and that "the Secretary of State trusts that he will be able to arrive at a definite conclusion, at any rate on the main suggestions of the Committee, without further delay." The Association is now on the point of making further detailed representations to the Colonial Office. These will be reported in this column as soon as possible.

Annual Meeting at Newcastle: Radiology Section

The Chairman of Council and the President-elect have invited Dr. Robert Knox to become President of the Section of Radiology and Electro-Therapeutics at the forthcoming Annual Meeting of the British Medical Association at Newcastle-on-Tyne, in place of the late Dr. W. Ironside Bruce, and Dr. Knox has accepted the post.

Mileage Fees for Pension Referees.

In February the Ministry of Pensions Subcommittee learned that the Ministry of Pensions was contemplating a reduction in the fees paid to medical referees in respect of mileage. A letter was sent to the Ministry pointing out that the proposed reduction was neither necessary nor reasonable, seeing that the cost of travelling was still very high. The Ministry of Pensions replied that the revised fees had been drawn up after due consideration of all the circumstances, and expressed regret that the suggestion made by the British Medical Association—that the old scale should be continued—could not be adopted. The chief reduction in the new scale of fees is that no fee is paid in respect of the first mile. It is understood that the new scale came into operation on March 1st, 1921. The Subcommittee has considered this reply and is of opinion that the matter cannot usefully be pressed further.

PAYING PATIENTS IN POOR LAW INFIRMARIES.

POLICY OF THE MINISTRY OF HEALTH.

THE following communication from the Ministry of Health has been received by the Medical Secretary of the British Medical Association:

Ministry of Health, Whitehall, S.W.1,
April 2nd, 1921.

Sir,

I am directed by the Minister of Health to refer to Dr. Anderson's letter of the 5th ult. and the previous correspondence respecting the schemes in contemplation by the guardians of the Manchester and West Derby Unions for the admission of persons other than the sick poor to their institutions, and to state that, following upon the inquiries which have been made on the subject, the Minister has addressed to

each board of guardians a letter in the terms of that to the West Derby guardians, a copy of which is enclosed for the information of the British Medical Association.

I am, Sir, your obedient servant,
(Signed) H. H. TURNER.

The letter referred to in the above communication is as follows:

Ministry of Health, March 29th, 1921.

Sir,

The Minister of Health has given further consideration to the scheme described in your letter of the 28th ultimo for admitting paying patients to vacant beds in the guardians' institutions, and he has directed me to request you to lay before the guardians the following observations in regard to this scheme.

1. The Minister deplors the conditions which have arisen in Liverpool and elsewhere as a result of the shortage of hospital accommodation, and in his opinion the only solution of the problem which is likely to command general approval is to make the institutions at present controlled by the guardians available for the use of the community as a whole, but free from the restrictions and disabilities that are inseparable from the use of these institutions so long as they remain under the control of the Poor Law authorities.

2. At the same time the Minister recognizes that the scheme of the guardians is a sincere attempt to meet a grave need, and pending the complete reorganization of the health services of the country which the Government have in view, he would be most reluctant to place any obstacles in the way of any practical proposals which the guardians can bring forward as a temporary measure for alleviating the suffering caused by the shortage of hospital accommodation, and which it is within their legal competence to carry into effect.

3. The Minister feels bound, however, to inform the guardians that he is advised that there is no legal authority under which they are empowered:

(a) To hold themselves out as prepared to receive patients, without investigation of their circumstances, in consideration of an undertaking to pay a fixed weekly sum;

(b) To recover from or in respect of a patient a sum in excess of the actual cost of the relief given, or, on the other hand, to compound for the recovery of a fixed sum less than the actual cost of relief where the patient's means are sufficient to enable him to repay the whole of that cost; or

(c) To differentiate between patients as regards the accommodation provided for them, or as regards their treatment, nursing, dietary, etc., merely on the ground that repayment is being obtained.

4. Apart from the legal issues above mentioned, the Minister considers that in order to secure the fullest benefit consistent with reasonable economy from the operation of the scheme, it is essential that it should be carefully co-ordinated with other agencies for the provision of medical treatment; and with this object the local medical committee, if appointed, or other appointed representatives of the medical profession and the managers of the voluntary hospitals in the locality should be called by the guardians into consultation with them.

Among matters which might usefully form the subject of such consultation would be the kinds of cases, medically, that would be most suitable for admission, and amongst these the kinds, if any, as to which it is considered that on medical grounds priority might advisedly be given, and the kind of recommendation—for example, from a medical practitioner already in attendance, or from a hospital or other medical institution—which should be regarded as affording *prima facie* ground for admission. Other questions meriting consideration might be whether, in order to avoid waste from overlapping, any kind of division of function could be arranged between large general hospitals on the one hand and the guardians' infirmary on the other, and whether arrangements could be made whereby the medical teaching staff of the university could have access to the guardians' infirmary for purposes of medical education.

I am, Sir, your obedient servant,
(Signed) H. W. S. FRANCIS,
Assistant Secretary.

Association Notices.

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.

2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each scholarship is tenable for one year, commencing on October 1st, 1921. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1921-22 must be made not later than Saturday, June 25th, 1921, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

ELECTION OF COUNCIL OF ASSOCIATION, 1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and **Nomination Form**, were published in the SUPPLEMENT of March 12th (p. 73). The **Nominations** must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

ELECTION OF REPRESENTATIVE BODY OF ASSOCIATION, 1921-22.

Constituencies in Representative Body.

THE Council has finally grouped the **Home Divisions** for election of the Representative Body, 1921-22, in the same manner as for 1920-21, except that the Caithness and Sutherland Division of the Northern Counties of Scotland Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch have been made independent Constituencies.

As intimated to all the **Oversea Bodies**, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

THE REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body *must be elected not later than June 17th*, and their names notified to the Medical Secretary **not later than June 24th**. The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary **not later than April 30th**.

BRANCH AND DIVISION MEETINGS TO BE HELD.

SUSSEX BRANCH: HASTINGS DIVISION.—A meeting of the Division, to which all medical practitioners in East Sussex are invited, will be held at the Albany Hotel, Hastings, on Friday, April 15th, at 4 p.m. Dr. Alfred Cox, Medical Secretary British Medical Association, will give an address entitled "How much more State medical service does the medical profession want?" The chair will be taken by Dr. J. D. Hessey. The address will be followed by questions and a discussion, to be opened by Dr. E. W. Skinner, J.P.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.

The City Division held a dinner-dance at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, on March 31st. Over fifty members and friends attended, and a most successful evening was spent. It is intended to hold another similar function in December.

INSURANCE.

CORRESPONDENCE.

Dental Anaesthetics: Insurance Records.

SIR,—It is evident that there are misapprehensions still to be removed in spite of all official communications and of memoranda from the Insurance Acts Committee sent to all Panel Committees and to every insurance practitioner. It is curious that some doctors prefer the greater trouble of writing to the lesser trouble of reading.

Dr. W. G. Bennett will be glad to know that he will not, as an insurance practitioner, be compelled to attend his patients at the surgeries of dentists who may be newly qualified under the Dental Bill if it becomes an Act. Indeed, as an insurance practitioner he is not in any way concerned with dental treatment by a dentist old or new. Such treatment is not within the insurance contract, and therefore fees for anaesthetics required for such treatment are a purely private matter, and are not allowed to be paid from the medical pool. If Dr. Bennett has been sending in claims for such anaesthetics his claims should have been disallowed by his Panel Committee.

Dr. Howard Murphy is concerned as to his course of action in order to keep his records when, as he imagines, the envelopes are "sent each year to the Insurance Committee for statistical tables to be drawn up." He will be relieved to know that they have not to be sent up each year or at any other time; and if he will read the official instructions he will see that the contingency of having to keep some notes with regard to a patient for whom he is not at the time in possession of an official envelope has not been overlooked, and that the course of action in this contingency is definitely laid down.

I do not think that Dr. Murphy's suggestion that two separate sets of records should be required will commend itself to insurance practitioners in general, but he does draw attention to several minor points which merit attention. May I emphasize the request of the Insurance Acts Committee that practitioners and Panel Committees will send up within the next six weeks any practical suggestions for the improvement of the present record forms or of the procedure to be adopted in connexion with them, so that all such suggestions may be codified and submitted to the next Panel Conference? This will be helpful, whereas such resolutions as those of the London Panel Committee—that records are necessary but that the present ones should be discontinued—are not helpful in the least. Perhaps they are not intended to be.—I am, etc.,

Stroud Green, N., April 2nd.

H. B. BRACKENBURY.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.

AT the last meeting of the London Panel Committee a report was presented by a deputation which waited recently on the Ministry of Health to discuss the question of surgery and waiting-room accommodation. The matter arose out of the action of the Insurance Committee in imposing a condition with respect to surgery accommodation upon practitioners who had applied for permission to include more than 3,000 insured persons on their lists. The representatives of the Ministry at the interview expressed the opinion that the question of surgery accommodation was a relevant circumstance in dealing with practitioners who had unusually large lists, and suggested that the Allocation Subcommittee, which is constituted partly of Insurance Committee representatives and Panel Committee representatives, was the proper body to deal in the first instance with all questions relating to surgery accommodation. This suggestion was agreed to, and the terms of reference of the

Allocation Subcommittee are to be widened accordingly. If a practitioner's accommodation appears to be inadequate for his practice, representations at first will be made to him, and in the event of his refusal to comply with a reasonable request, the matter will be brought to the notice of the Insurance Committee.

A scheme has been drafted for the reconstitution of the Panel Committee. The chief features of the proposals are that members of the committee should be elected for three years, one-third to retire annually; and that representation should be based on the number of electors in each area (one representative for each thirty or part of thirty in every borough). Under the present arrangements some boroughs are inadequately represented and others over-represented.

INSURANCE COMMITTEES.

LONDON.

THE London Insurance Committee, on March 31st, passed a resolution to the effect that unless steps were taken to keep the Committee notified of changes of address by insured persons, it would be unable to keep up to date the list of persons for whose treatment each insurance practitioner was responsible, as required by the Medical Benefit Regulations, and, further, that in view of the large number of inaccuracies in the registers, due to the non-notification of changes of address, it was impracticable properly to carry out the clause of the allocation scheme relating to the assignment of insured persons to practitioners. A deputation is to bring the subject before the Minister of Health.

Lock-up Surgeries.—It was reported that the Minister of Health's attention had been drawn recently to cases, particularly in the East End of London, in which insurance practitioners resided at a considerable distance from their surgeries, and inadequate arrangements were made for the attendance of a deputy in the absence of the principal practitioner. The Committee was requested to investigate the matter. Inquiries have already proceeded in three boroughs, and a full report is to be made when the investigations are completed. The Minister stated that while the considerations applied with special force when a practitioner was continuously absent from his practice and did not attend at the surgery, mere attendance during the restricted surgery hours was not in itself a complete fulfilment of the obligation to give personal service if during the remainder of the day and night the practitioner was not within reasonable call.

Range of Medical Service.—The Local Medical Committee having decided that an operation for the removal of haemorrhoids and an operation for the removal of cysts in the neighbourhood of the knee-joint were not such as could be properly undertaken by a general practitioner of ordinary professional competence and skill, the Medical Benefit Subcommittee of the Insurance Committee challenged this finding, and recommended to the Insurance Committee that it should intimate to the Ministry of Health its non-concurrence with this limitation upon the duties to be expected from an insurance practitioner. Mr. P. Rockliffe urged that if it was true that certain insurance practitioners were not capable of performing these operations their capitation fee should be forfeited and given to the hospitals where the operations were in fact performed. After some discussion, in which the medical members protested against lay judgement in a professional matter, the chairman of the subcommittee took back the recommendation in order to enable his subcommittee to present it later in a more reasoned form. The opinion of the Local Medical Committee was arrived at on the grounds that an operation for haemorrhoids involved risk of both primary and secondary haemorrhage, and that the removal of cysts from the neighbourhood of the knee-joint involved perforation of the joint and consequent risk of sepsis.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Commanders F. C. Wright to the *Lowestoft* for service on station as requisite; A. C. W. Newport, M.V.O., to the *President*, additional, for Cambridge University Naval School; D. G. Addison-Scott to the *Lowestoft* as Fleet Medical Officer on re-commissioning; C. H. L. Petch to the *Dragon*, W. H. Edgar to the *Wildfire*, A. R. Thomas, O.B.E., to the *Sandhurst*, G. Christie to the *Victory* additional for Haslar Hospital, J. H. Burdett to R.N. Hospital, Malta; Surgeon Lieutenant Commanders G. L. Ritchie, M.C., to the *Osea*, W. J. Gerrard to the *Surprise*; Surgeon Lieutenant G. Aubrey to the *Ajax*.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel T. E. Fielding, D.S.O., relinquishes the acting rank of Colonel.
Lieut.-Colonel A. R. O'Flaherty retires on retired pay.
Lieut.-Colonel N. Tyan-ke is placed on retired pay and is granted the rank of Colonel.
Major and Brevet Lieut.-Colonel F. W. Lamballe is placed on retired pay on account of ill health caused by military service.
Major W. Byam, O.B.E., relinquishes the temporary rank of Lieut.-Colonel on reduction of establishment.
Temporary Major E. H. Marshall (Major R.H. and R.F.A.T.F.) relinquishes his temporary commission.
Captain R. G. Shaw, M.C., to be acting Major from November 21st, 1919, to June 4th, 1920.

Captain A. B. H. Bridges, O.B.E., is restored to the establishment. To be Captains: Temporary Captain A. S. Plant, M.C., with seniority, February 4th, 1918, and precedence next below R. C. Atchinson; Captain S. O. Dolan from R.A.M.C.(T.F.), with seniority August 16th, 1918, and precedence next below C. F. Anthonisz; Captain F. McKibbin, from R.A.M.C.(S.I.), with seniority September 25th, 1918, and precedence next below P. A. L'Estrange.

F. J. Scrimgeour, O.B.E., relinquishes the local rank of Major, July 10th, 1919 (substituted for notification in the *London Gazette*, November 22nd, 1920).

Temporary Lieutenant H. P. Hodge to be temporary Captain.

The following relinquish their commissions: Temporary Lieutenant-Colonel and retain the rank of Lieutenant-Colonel: P. C. E. Tribe, O.B.E., Ernest W. White. Temporary Captains and retain the rank of Captain: C. L. de Zylva, on ceasing to serve with the Ceylon Sanitary Company; P. Kitchin, A. Cowes, Arthur G. Leitch.

ROYAL AIR FORCE. MEDICAL BRANCH.

The following are granted temporary commissions in the ranks stated, with effect from and with seniority of the dates indicated: Flight Lieutenants C. W. T. Baldwin (March 24th), D. Le Bas and W. R. Reith (April 1st), Flying Officers: F. T. Allen (March 29th), J. A. Perdrau (April 1st).

INDIAN MEDICAL SERVICE.

Lieut.-Colonel W. R. Battye, D.S.O., has been posted as Administrative Medical Officer in Central India and Agency Surgeon, Southern States of Central India.

Major G. D. Franklin, O.B.E., has been posted as Residency Surgeon, Madore.

Colonel T. Stodart, M.B., has been permitted to retire from the service (January 13th, 1921).

Major-General W. R. Edwards, C.R., C.M.G., K.H.P., Director-General, has been granted privilege leave for six months, March 15th, 1921.

Major-General W. H. B. Robinson, C.R., Surgeon-General with the Government of Bengal, has been appointed to officiate as Director-General, with effect from the date on which he assumes charge of that office.

Lieut.-Colonel W. H. Dickinson, Officiating Chemical Examiner, Bengal, and Professor of Chemistry, Medical College, Calcutta, has been granted, with effect from February 1st, combined leave for twelve months.

Colonel J. Garvie, K.H.S., Inspector-General of Civil Hospitals and Prisons, Assam, has been granted, with effect from March 20th, combined leave for eight months.

Lieut.-Colonel B. H. Deava, Principal and Professor of Medicine, Medical College, Calcutta, and First Physician to the College Hospitals, has been appointed to officiate as Inspector-General of Civil Hospitals and Prisons, Assam.

The services of Captain C. Newcombe, M.B., have been placed permanently at the disposal of the Government of Madras (December 4th, 1920).

Major R. T. D. MacGregor, Medical Officer, His Britannic Majesty's Consulate for Sistan and Kalin, is appointed to officiate as His Britannic Majesty's Consul for Sistan and Kalin in addition to his own duties (January 17th).

Lieut.-Colonel F. A. Smith has been posted as Residency Surgeon at Hyderabad (February 1st).

The undermentioned officers have been permitted to retire from the service, with effect from the dates specified: Colonel W. M. Molesworth, C.I.E., C.B.E., V.B.S. (January 22nd), Lieut.-Colonels C. Doochan and J. M. Crawford, O.B.E. (February 1st), Lieut.-Colonel W. B. Lane, C.I.E., C.B.E. (February 8th).

Major R. B. Seymour Sewell, Surgeon-Naturalist Marine Survey of India, has been granted, with effect from September 1st, 1920, thirteen months' combined leave.

Colonel C. R. M. Green, Inspector-General of Civil Hospitals, Central Provinces, has been granted privilege leave from February 25th.

Lieut.-Colonel P. F. Chapman, C.I.E., Civil Surgeon, Nagpur, has been appointed to officiate as Inspector-General of Civil Hospitals, Central Provinces, with effect from the date on which he assumes charge of his duties.

Lieut.-Colonel F. O'Kinealy, C.I.E., Surgeon-Superintendent General Hospital, Calcutta, has been appointed to officiate as Surgeon-General with the Government of Bengal (March 15th).

Major (Brevet Lieut.-Colonel) F. P. Connor, D.S.O., Professor of Clinical and Operative Surgery, Medical College, Calcutta, and Surgeon to the College Hospital, has been granted, with effect from February 21st, combined leave for eight months.

Major H. R. Steen, M.D., has been appointed to act as Professor of Clinical and Operative Surgery, Medical College, Calcutta, and Surgeon to the College Hospital (February 21st).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lieut. Colonel H. J. de Legh, T.D., resigns his commission and retains the rank of Lieutenant-Colonel, with permission to wear the prescribed uniform.

Captain H. J. G. Wells, R.A.M.C., to be Adjutant of the R.A.M.C. School of Instruction, West Riding Division.

Captain R. Ellis resigns his commission, and is granted the rank of Major.

Captain A. M. Daillie resigns his commission and retains the rank of Captain.

Captains to be Majors: S. F. St. J. Steadman, H. K. Griffith.

Captain J. G. Cooke resigns his commission, and is granted the rank of Major.

Captain D. R. E. Roberts (late R.A.M.C.) to be Captain, with precedence as from April 10th, 1918.

Lieutenant J. F. O'Grady to be Captain.

J. A. L. Loudon to be Lieutenant.

2nd London Sanitary Company.—Captain F. S. Carson, M.C., resigns his commission and retains the rank of Captain.

5th Southern General Hospital.—Captain C. H. Cowen resigns his commission and is granted the rank of Major.

Supernumery for Service with the O.T.C.—Captain H. Emerson, M.C., to be Major.

Sanitary Service.—Major R. A. Farrar is restored to the establishment on ceasing to be employed under the Colonial Office.

DIARY OF SOCIETIES AND LECTURES.

- HARVEIAN SOCIETY,** Town Hall, Paddington Green, W.—Thurs., 8.30 p.m., Mr. D. C. L. Fitzwilliams, C.M.G.: Naevi of Children and their Treatment.
- HUNTERIAN SOCIETY,** Sion College, Embankment, E.C.—Wed., 9 p.m., Discussion on the Treatment of Syphilis. To be opened by Mr. J. E. R. McDonagh.
- ROYAL COLLEGE OF PHYSICIANS OF LONDON,** Pall Mall East, S.W.—Tues. and Thurs., 5 p.m., Oliver Sharpey Lectures by Dr. Thomas Lewis, C.B.E., F.R.S.: Observations upon the Nature of Auricular Flutter and Fibrillation.
- ROYAL SOCIETY OF MEDICINE,**—Mon., 5 p.m., Demonstration of Lantern Slides in natural colours of dermatological and other medical subjects. Tues., 5 p.m., General Meeting of Fellows. *War Section:* Mon., 5.30 p.m., Surgeon-Commander S. F. Dudley, R.N.: Influenza Epidemic in the Royal Navy. *Section of Surgery, Subsection of Proctology:* Wed., 5 p.m., Discussion on Pruritus Ani, to be opened by Mr. Lockhart-Mummery and Sir Charles Gordon-Watson. *Section of Otolology:* Leicester Infirmary, Sat., 2.30 p.m., Mr. T. B. Layton and Mr. A. Ryland: Quantitative Estimation of Hearing; Unilateral Deafness. Mr. F. J. Clemenson: Sinusitis in Children. Cases will be shown by Dr. Macleod and Mr. Kece. Demonstration at the Aural Clinic of the Leicester Education Committee.
- ST. JOHN'S HOSPITAL,** 49, Leicester Square, W.C.—Thurs., 6 p.m., Chesterfield Lecture by Dr. W. Griffith: Treatment of Skin Diseases.
- SOCIETY FOR THE STUDY OF INEBRIETY,** 11, Chandos Street, W.1.—Thurs., 4 p.m., Discussion on the Use of Alcohol in Medicine. To be introduced by Dr. H. H. Dale, C.B.E., F.R.S.

British Medical Association.

CURRENT NOTES.

Membership of the Association.

In the period January 1st to March 31st, 962 new members joined the British Medical Association. The accession of new members to the Association thus continues to show a steady increase, a fact which is all the more gratifying having regard to the increased subscription.

Annual Reports of Divisions and Branches.

The number of annual reports received for 1920 by the Council from Divisions and Branches shows a marked increase on those received for several years past. There are still, however, some Divisions and Branches which have not reported. The reports are of great help to the Council, and it is hoped that those bodies which have not yet sent their reports will do so as soon as possible.

Emergency Treatment by Insurance Practitioners.

The last Conference of Panel Committees passed the following resolution:

That in the opinion of this Conference the ruling by which an insured person requiring emergency treatment outside the area in which his insurance practitioner resides is regarded as a temporary resident is inequitable in its operation and liable to grave abuse and should be amended.

The Insurance Acts Committee, after discussing the whole matter, proposed to the Ministry of Health that in all cases in which the emergency happens outside the district in which the patient's own doctor has undertaken to give attendance, it should be paid for on an attendance basis out of the area pool of the patient's home area. It was pointed out by the Ministry that this proposal would be, from an administrative point of view, practically unworkable, and therefore the Insurance Acts Committee agreed to accept the new arrangement which is contained in the circular letter to Insurance and Panel Committees printed in full at page 99 of this week's SUPPLEMENT.

Anaesthetists' Fees in Insurance Practice.

As considerable differences of opinion appeared to exist not only in the minds of insurance practitioners but in the decisions made from time to time by Panel Committees with regard to the payment of anaesthetists' fees, the Insurance Acts Committee reviewed the whole subject and

eventually discussed every aspect of it with representatives of the Ministry of Health. With the decisions which are now set out in the circular letter referred to above the Insurance Acts Committee is in entire agreement.

Dispensing in Rural Areas.

Representatives of the Rural Practitioners Subcommittee of the Insurance Acts Committee are at present discussing with the Ministry of Health amendments to the present Regulations as set out in Article 10 (2) in regard to dispensing in rural areas. The matter is one which concerns Insurance Committees, chemists and doctors, and a conference between representatives of these parties and the Ministry has already discussed the difficulties. It is hoped that before long a solution satisfactory to all will be found. An announcement may be expected shortly.

EIGHTY-NINTH ANNUAL MEETING

OF THE

British Medical Association.

NEWCASTLE-UPON-TYNE, 1921.

HOTEL ACCOMMODATION.

GREAT difficulty is being experienced in compiling a satisfactory list of hotel and lodging accommodation in Newcastle, owing to the small number of hotels in the town, and to the acute shortage of houses compelling large numbers of people to live in apartments.

A list of private addresses at which rooms may be engaged will be published early in May. In the meantime the Hotels and Lodgings Committee is issuing herewith particulars of hotels in and around Newcastle. As the hotel accommodation is very limited indeed, and is even now being taken up for as far ahead as July by their regular class of guests, members are strongly advised to make their bookings at once.

Many of the hotels included in the list given on page 98 are short distances out of Newcastle, and are specially suited for members who intend to make their visit coincide with their annual holiday. Details as to distance and train service are inserted, so that members may judge of their convenience in attending sectional meetings and evening functions. It is possible, of course, that the train services may be modified before the date of the meeting, and the hotel tariffs quoted are also liable to alteration. The prices quoted are for single persons per night.

ADVANCE LIST OF HOTELS.
NEWCASTLE-UPON-TYNE.

	Bed and Breakfast.	Lunch.	Dinner.
Central Station	11/6	4/-	7/6
Turk's Head	11/-	3/-	5/-
County	9/6	3/-	4/6
Douglas	12/6	3/6	6/-
Central Exchange	8/-	2/6	4/6
Tyne Temperance	9/-	—	—
Market	6/6	—	—
Clyde	8/-	—	—
Sun	8/-	3/-	—
Norfolk	8/-	3/-	—

Several of the above hotels, as indicated, do not give lunch or dinner. There are abundant restaurants in the town where such meals can be obtained, as also at the other hotels included in the list.

St. Margaret's	10/6	3/-	4/-
Imperial	10/6	3/-	5/-
Keensington	8/6	2/6	3/6
Osborne	10/6	3/6	5/-

These hotels are chiefly residential. They each expect to have a number of rooms available at the date of the meetings.

Teas can be had at all the hotels mentioned above, and some will quote terms which are inclusive for the day or week. Particulars could be obtained by application to the Manager. All these hotels are within a short distance of the Reception Room.

WHITLEY BAY.

Popular seaside resort; bathing, boating, etc. On coast, close to Tynemouth. Train service: journey, half an hour by electric train, every quarter or half hour. Late trains available till 11.45 p.m.

Waverley (10 double rooms available for dates of meeting)	9/-	3/-	4/-
Royal	12/6	4/-	5/-
Avenue	10/-	3/6	5/-
Esplanade (a number of rooms with twin beds. Only 2 single rooms, and 1 double room)	8/6	3/6	6/-

DURHAM.

Train service: 40 minutes slow; 20 minutes express. Morning trains convenient, and last train 10.50 p.m.

County: Bed and breakfast, 10/6; inclusive charge per day, £1 1s.
Three Tuns: Bed and breakfast, 9/-; inclusive charge per day, 17/6
Rose and Crown: Bed and breakfast, 8/-; inclusive charge per day, 16/-
Other meals can be obtained at the above hotels.

SOUTH SHIELDS.

Frequent train service. Journey, 34 minutes. Convenient trains. Last train, 11.45 p.m.

Golden Lion	8/6	3/6	4/6
Regent	8/6	2/6	5/-
Royal	10/6	4/-	5/-

SUNDERLAND.

Seaside resort. Golf, etc. Numerous and convenient trains. Journey, 22 minutes (express). Last train from Newcastle, 11.18 p.m.

Grand	8/6	3/-	4/-
Queen's	8/6	3/6	4/6
Roker	8/-	2/6	4/6
Park Hotel	8/6	4/6	4/6

HEXHAM.

Very beautiful old market town, abounding in natural and historical interest. Situated on the Tyne about twenty miles from Newcastle. Golf, etc. Convenient and frequent trains. Journey, 35 minutes express; 50 minutes slow. Last train 9.50 p.m.; 10.45 p.m. Thursdays only.

Hydropathic. Special terms for doctors attending the meetings, 12/- per day.

Royal	8/-	—	3/-
Abbey	8/6	(Inclusive charge per day, 14/-)	—

MORPETH.

Another fine old market town. Train service: Express 40 minutes. Convenient trains. Last train from Newcastle 8.55 p.m.; 10.52 p.m. Thursdays only.

George and Dragon }
Queen's Head } Terms on application.
New Phoenix }

CORBRIDGE.

A lovely residential spot in the beautiful Tyne valley, about five miles east of Hexham, and of great archaeological interest. Train service: Express 40 minutes. Convenient morning trains. Last train from Newcastle 9.50 p.m.; 10.45 p.m. Thursdays only.

Wheatshief } Tyuedale } Bed and breakfast, between 5/- and 7/5. Angel }

The hotels at Hexham, Morpeth, and Corbridge are on main roads to Newcastle, and would be very well suited for doctors bringing their cars with them. Many of the hotels quote reduced figures for double rooms when shared by two people. Inquiry should be made about this when engaging rooms.

The Chairman of the Hotels and Lodgings Committee is Dr. H. KERR, O.B.E., and the Honorary Secretary, Dr. E. F. MURRAY, 52, Jesmond Road, Newcastle-upon-Tyne. (Telephone: 916 Jesmond.)

Association Notices.

MEETING OF COUNCIL.

The next meeting of Council will be held on Wednesday, April 20th, in the Council Room, 429, Strand, London, W.C.2, at 10 a.m., and will adjourn at 5 p.m. till 10 a.m. on Thursday, April 21st.

AN EALING DIVISION.

THE following change has been made by the Council, and takes effect on April 16th:

That an Ealing Division be formed, of area co-terminous with the district comprised in the Municipal Borough of Ealing, the Urban Districts of Acton, Brentford, Chiswick, Greenford, Hanwell, Hayes, Sonthall-Norwood, the new Division to form part of the Metropolitan Counties Branch, and the area of the South Middlesex Division to be modified accordingly.

Representation in Representative Body.—As may be decided by the Council.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.—The annual meeting and dinner of the Division will be held on Thursday, May 19th.

SUSSEX BRANCH: HASTINGS DIVISION.—A meeting of the Division, to which all medical practitioners in East Sussex are invited, will be held at the Albany Hotel, Hastings, on Friday, April 15th, at 4 p.m. Dr. Alfred Cox, Medical Secretary British Medical Association, will give an address entitled "How much more State medical service does the medical profession want?" The chair will be taken by Dr. J. D. Hessey. The address will be followed by questions and a discussion, to be opened by Dr. E. W. Skinner, J.P.

Meetings of Branches and Divisions.

MIDLAND BRANCH: CHESTERFIELD DIVISION.

THE annual report for the year 1920 was presented to the annual meeting of the Division held on March 11th. The outstanding feature of the year was the negotiation with the colliery field clubs for increased remuneration and the establishment of a system of "free choice of doctor." Up to the middle of the summer the discussion with the Field Club representatives was proceeding satisfactorily; at that period the medical officers to two of the largest clubs were induced to make private arrangements with their respective committees, with the result that the collective negotiations were seriously embarrassed. In the long run, however, the Division executive was successful in obtaining a considerably higher rate of remuneration than had applied previously over the greater part of the area. A successful dinner was given by members of the Division to Dr. J. Court on the occasion of his knighthood, and to Dr. A. W. Shea on being awarded the Distinguished Service Order. The success of this dinner brought about a desire that one shall be held annually. During the year five Divisional meetings were held, with an average attendance of 10.5 out of a membership of 53, which the executive does not consider satisfactory. The executive met seven times, and there were fourteen special meetings, to most of which non-members were invited for the discussion of special business.

SOUTH MIDLAND BRANCH: BUCKINGHAMSHIRE DIVISION.

A MEETING of the Buckinghamshire Division was held on March 30th, at the Royal Bucks Hospital, Aylesbury, with Dr. KENNISH in the chair. After a discussion on motor car taxation, it was decided to send the following resolution to the Representative Meeting:

That in the case of a medical man having two cars, who uses only one at a time, the licence for the second car should be halved.

On the question of coroners' inquest fees it was unanimously resolved:

That an adequate travelling allowance be paid in connexion with attendance at a coroner's court, and that the fee for giving evidence should be two guineas, and for a post-mortem examination three guineas; also that these fees should apply to the staffs of hospitals.

It was also resolved:

That when medical men consider the salary paid by a public body is inadequate, statistics and full particulars of the work done should be submitted to the Division for their consideration with a view of obtaining the support of the whole profession.

SUFFOLK BRANCH: NORTH SUFFOLK DIVISION.

At a meeting of the North Suffolk Division, held on March 31st, the report of the Council on the question referred to Divisions as to the British Medical Association becoming in part a federation was considered. It was resolved by 8 votes to 2 that the Association should become a federation of medical bodies alone.

INSURANCE.

EMERGENCY TREATMENT AND ANAESTHETISTS' FEES.

THE following circular letter has been issued this week by the Ministry of Health to all Insurance and Panel Committees:

Emergency Treatment and Payment of Fees for the Provision of the Services of Anaesthetists.

Sir,

I am directed by the Minister of Health to state that he has been in communication with the representatives of insurance practitioners with regard to certain difficulties, which have arisen in connexion with these matters, as affecting the distribution of funds between insurance practitioners.

1. *Emergency Treatment.*

The Conference of Panel Committees, held in October of last year, passed the following resolution:

"That in the opinion of this Conference the ruling by which an insured person requiring emergency treatment outside the area in which his insurance practitioner resides is regarded as a temporary resident is inequitable in its operation and liable to grave abuse and should be amended."

It is understood that the difficulty contemplated by the resolution is mainly that which arises in the case of insured persons who, being on the list of a practitioner in their home area, leave their home daily to work in some other district and return to their place of residence in the evening.

Where in such cases a practitioner renders emergency treatment outside of the insured person's home area, the credit which he receives for such a person as a "temporary resident" creates, it is considered, an undue charge against the Practitioners' Fund, and the Department have accordingly prepared an additional model clause for inclusion in the Distribution schemes. The clause should be inserted as a proviso to paragraph 1 of Clause 4 of the Distribution Scheme (Form M.C.3) as follows:

"Provided that if an application for treatment is made by an insured person who is outside the radius of practice of the practitioner responsible for his treatment, and intends to remain outside the radius for less than twenty-four hours, the practitioner providing treatment will, instead of having the applicant placed on his list, be entitled to be paid as though the treatment had been given in an emergency under the last preceding clause, and the amount paid to the practitioner will be payable out of the Fund in the same manner and subject to the same conditions as payments made in respect of the administration of anaesthetics."

This will involve the insertion of the words "or under the proviso to Clause 4 of the Scheme" after the word "anaesthetics" in the second line of Clause 8 of the Scheme.

It will be seen that the effect of this amendment will be to make these payments a charge on the Practitioners' Fund for the area in which treatment is given. If, in any area, these charges on the Fund appear to the Committee to be unduly high compared with other areas, it will be open to the Committee to submit a case for consideration to the Distribution Committee appointed under Article 20 of the Regulations.

If the Committee, after consultation with the Panel Committee, desire to amend the Distribution scheme in this manner, the Department would be prepared to approve the amendment, and approval is hereby given to the adoption of the clause set out above. If it is decided to amend the Scheme, the Department should be informed, and the necessary notice sent to practitioners under agreement with the Committee.

2. *Anaesthetists' Fees.*

It has been found, as a result of recent correspondence with committees, that the power of Panel Committees under Clause 2 of the Distribution Scheme to scrutinize and disallow claims for the payment of anaesthetists' fees has resulted in a number of such claims being disallowed on the ground that the operation or service in connexion with which the anaesthetic was administered was outside the scope of medical benefit.

While it is open to the Panel Committee to raise such a question for determination in the manner prescribed by Article 35 of the Regulations, it is clearly undesirable that there should be any general action which should tend to an undue narrowing of the view taken by practitioners of their obligations under the terms of service.

It has been agreed that it would be of assistance if a model form were issued for use by practitioners claiming

fees for the services of anaesthetists, and the enclosed model form (G.P. 19) has accordingly been prepared for this purpose. It will be observed that the form contains a declaration to be signed by the practitioner claiming the fee to the effect that no charge was made by him for the operation or other service in connexion with which the anaesthetic was administered which he regarded as within his obligations as an insurance practitioner.

It is hoped that this declaration will obviate the necessity for the raising of any questions under Article 35 in connexion with cases in which an anaesthetist's fee is claimed.

It is desirable that this form should be generally adopted, and where this is done it will be necessary to make provision in paragraph 2 of the Distribution Scheme that the accounts for anaesthetists' fees should be furnished by practitioners on the form provided for the purpose, which should be appended to the scheme.

If any form is proposed to be appended to the Distribution Scheme other than the enclosed model, it will be necessary to obtain the approval of the Department, but the model form and the alteration to Article 2 of the Distribution Scheme is hereby formally approved.

Discussion has also taken place with representatives of insurance practitioners in regard to certain special cases where doubt has been expressed as to whether anaesthetists' fees were payable. In view of the different circumstances of particular cases, and having regard to the fact that an appeal may be made against the disallowance of such fees, it is not possible for the Department to give any rulings which would be of universal application, but the following notes of cases may be taken as generally representing the view of the Department arrived at after the discussions above referred to:

(a) *Operations in Cottage Hospitals and Similar Institutions.*—The question whether a fee should be allowed for the services of an anaesthetist where the operation is performed in hospital is a matter for the Panel Committee to determine. It is considered in general that if the staff of the hospital is a selected staff no anaesthetist's fee should be allowed, but if the hospital is one where any general practitioner can treat his own patient, the fact that the operation was performed in a hospital would not necessitate disallowance of the fee, provided that the service in connexion with which the anaesthetic was administered was within the scope of medical benefit.

(b) *Anaesthetics Administered by Assistants and Partners.*—It is considered that in general anaesthetists' fees should be payable in cases where an insurance practitioner performs the operation and the anaesthetic is administered by his assistant or partner. Similarly, the fee would be payable where the practitioner responsible for the case administers the anaesthetic and the assistant or partner performs the operation.

(c) *Arrangements under Article 10 (1) of the Terms of Service.*—If a practitioner arranges with another practitioner under Article 10 (1) of the Terms of Service to perform the operation, and the anaesthetic is administered by the practitioner himself or his assistant or by another practitioner, it is considered that the fee would be payable.

(d) *Anaesthetics Administered in Connexion with the Extraction of Teeth, or in Connexion with an Operation Performed by a Specialist.*—Where the extraction is performed by a dentist no fee would be payable. In the comparatively rare cases where teeth are extracted by an insurance practitioner as part of his agreement—for example, in rural areas where this service is customarily undertaken by doctors—a fee would be chargeable against the Practitioners' Fund.

No fee would be payable in respect of anaesthetics administered in connexion with an operation performed by a specialist, as the operation itself would be outside the scope of medical benefit. It is also clear that where an insurance practitioner performs the operation and also administers the anaesthetic no fee would be payable.

I am to add that Regulations are at present under consideration to amend Article 10 (2) of the present Regulations in regard to dispensing in rural areas, of which formal notice to all practitioners will be necessary, and if the Committee decide to adopt the amendments to the Distribution Scheme indicated above, they may find it convenient to defer giving notice of the alterations to practitioners until they are in a position to include in the same communication a notice of the proposed amendment of Article 10 (2).

A further communication will be addressed to Committees on this matter as soon as possible.

I am, Sir,

Your obedient servant,

R. W. HARRIS.

FORM G.P. 19.

Form for Use under Art. 2 of the Distribution Scheme M.C./3.

To the Insurance Committee for the County of
Borough of

I hereby give notice that on [date] I rendered to the patient named below, who is included in my list, the professional service, particulars of which are appended hereto, which required the services of a second practitioner for the purpose of administering an anaesthetic.

I hereby declare that the service was undertaken by me without charge to the patient, as being within my obligation under my terms of service.

And I hereby claim the payment of the fee provided for in the Distribution Scheme.

Name of insured person
Society and Branch
Membership No.
Address

Name of practitioner administering anaesthetic—
.....

Place where operation was performed—
.....

Particulars of service rendered. (Here describe shortly the nature of the operation or other service.)

Signature

Date

NOTE.—This form must be forwarded to the Insurance Committee within seven days after the date on which the service was rendered.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Commanders J. W. Craig to the *Conqueror* as Squadron Medical Officer; J. H. Lightfoot to the *Orion*; A. T. Rivers and G. D. Bateman to the *President*, additional (temporary), for service with the Medical Director; H. C. Whiteside to R.N. Sick Quarters, Dartmouth.

Surgeon Lieutenant Commander E. B. Fletcher, O.B.E., has been promoted to the rank of Surgeon Commander (D) and appointed to the *President*, additional, as Assistant to M.D.G. Surgeon Lieutenant J. B. Crawford has been promoted to the rank of Surgeon Lieutenant Commander.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Captain and Brevet Major J. D. Kidd, O.B.E., M.C., relinquishes the acting rank of Major, January 6th, 1921 (substituted for notice in the *London Gazette*, March 9th, 1921).

The following temporary Captains relinquish their commissions and retain the rank of Captain: L. J. Maxwell, J. A. Martin, R. H. Balfour-Barrow, P. G. Simpson, D. Evans, T. L. Davies, D. C. Snelzer, H. P. W. Lincoln, W. Pritchard-Airey, J. H. Whiteside.

ROYAL AIR FORCE.

MEDICAL BRANCH.

A. F. Wright is granted a temporary commission as Flight Lieutenant with effect from, and with seniority of, March 22nd.

The following relinquish their temporary commissions on return to naval duty: Wing Commander G. D. Bateman, O.B.E. (Surgeon Commander, R.N.), Squadron Leader A. R. Sharrod (Surgeon Lieutenant Commander, R.N.).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major W. A. Thompson to be Lieut.-Colonel and command 3rd Northern Field Ambulance.

Captain G. C. E. Simpson, O.B.E., to be Lieut.-Colonel and command 2nd West Lancashire Field Ambulance.

Captain L. T. Challinor vacates the appointment of D.A.D.M.S., 48th (South Midland) Division.

To be Majors:—Captains: L. A. Mackenzie, M.C., J. Turtle, S. J. Foulding, A. D. Kennedy, J. Taylor.

The following officers resign their commissions: Major (Brevet Lieut.-Colonel) B. M. H. Rogers, and is granted the rank of Lieut.-Colonel; Major W. R. N. Smithard, T.D., and is granted the rank of Lieut.-Colonel; Major L. T. Whelan, M.C. (February 25th, 1921), and retains the rank of Major (substituted for notification in the *London Gazette* of February 24th, 1921); Captain W. E. Kingdon, and retains the rank of Captain.

E. E. Pleasance (late Surgeon Sub-Lieutenant R.N.V.R.) to be Lieutenant.

CURRENT NOTES.

The Annual Meeting at Newcastle.

THE arrangements are gradually going forward for the eighty-ninth Annual Meeting of the British Medical Association to be held next July at Newcastle-on-Tyne. The Association has twice before met in Newcastle; the first occasion was in 1870, with Dr. Edward Charlton as president, and the second in 1893, under the presidency of Sir George Hare Philipson. The proceedings will open this year on Friday morning, July 15th, when the Representative Body will begin its annual meeting, the session being continued on the three following weekdays. Council meetings have been provisionally fixed for the mornings of Monday, July 18th, and Wednesday, July 20th. The statutory annual general meeting will be held at 2 p.m. on Tuesday, July 19th, on which day the social and scientific business of the annual meeting will commence with the delivery by Professor David Drummond of his Presidential Address to the Association at 8 p.m. The sectional meetings for scientific and clinical work will be held, as usual, on the Wednesday, Thursday, and Friday; the mornings from 10 a.m. to 1 p.m. being given up to discussions, and the afternoons from 3 to 4.30 o'clock to clinical and laboratory demonstrations, of which a special feature will be made, as was the case at Cambridge last year. The list of sections and their presidents is printed below. The first five sections will meet on July 20th, 21st, and 22nd; the six following sections on two days each; and the remaining six sections on one day each.

Medicine: Professor Thomas Beattie.
Surgery: Professor J. Rutherford Morison.
Pathology and Bacteriology: Professor Stuart McDonald.
Preventive Medicine with Industrial Diseases: Sir Thomas Oliver.

Orthopaedics and Diseases in Children: Mr. A. H. Tabby.

Neurology and Psychiatry (July 20th and 21st): Professor A. W. Mackintosh.

Obstetrics and Gynaecology (July 21st and 22nd): Professor R. P. Ranken Lyle.

Ophthalmology (July 21st and 22nd): Professor J. D. Wardale.

Oto-Rhino-Laryngology (July 20th and 21st): Dr. G. William Hill.

Physiology, Pharmacology, Therapeutics, and Dietetics (July 20th and 21st): Dr. H. H. Dale.

Veneral Diseases (July 20th and 21st): Colonel L. W. Harrison.

Ambulance and Red Cross (July 20th): Sir James Cantlie.
Dermatology (July 21st): Dr. J. Farquhar Christie.

Medical Sociology (July 22nd): Sir Jenner Verrall.
Proctology (July 20th): Mr. J. P. Lockhart-Mummery.

Radiology and Electro-Therapeutics (July 22nd): Dr. Robert Knox.

Urology (July 22nd): Mr. J. W. Thomson Walker.

There will be religious services on Tuesday, July 19th, at 5 p.m. On Wednesday evening at 8 o'clock Sir Thomas Oliver will give an address on Industrial Diseases, and on the same day the Secretaries will hold their annual conference and dinner. The Annual Dinner of the Association will be held on Thursday evening, July 21st, and on Friday Professor Arthur Keith will deliver the Popular Lecture at 7.30 p.m. Saturday, July 23rd, the last day of the meeting, has been set apart for excursions to places of interest in the neighbourhood. Articles on the history, institutions, and industries of Newcastle have appeared in the JOURNAL of December 11th, 1920, March 12th and April 16th, 1921, and information about hotel accommodation was given in last week's SUPPLEMENT. The Honorary Local General Secretary is Mr. R. J. Willan (6, Kensington Terrace, Newcastle-on-Tyne).

Motions for the Annual Representative Meeting.

As will be seen in another column, motions of which two months' notice are required by the By-laws must be in the hands of the Medical Secretary by April 30th. Motions which do not propose any alterations of Articles or By-laws, nor any material alteration in the policy of the Association, are in order any time before the Annual Representative Meeting (which opens on July 15th at Newcastle), but the earlier they are received the greater publicity they will get. So far the only motions received which would involve any alteration in policy are one which suggests the formation of a "student class" of members with a reduced subscription, one proposing that the collective opinion of the profession can only be expressed by a body directly elected by the profession, and one suggesting that the Association should appoint representatives to the Federation of Medical and Allied Societies. Full notice of these and of all other motions received will be given in the SUPPLEMENT on or before May 14th. Those Divisions which have ideas for the improvement of the constitution, policy, or working arrangements of the Association are invited to formulate them and send them to the Medical Secretary.

Tour of Yorkshire Divisions.

The Medical Secretary has made arrangements to visit the following Divisions of the Yorkshire Branch during the last week in April:

Wednesday, April 27th, Leeds Division at Leeds, 5.30 p.m.
Wednesday, April 27th, Halifax Division at Halifax; evening meeting.
Thursday, April 28th, Barnsley Division at Barnsley, 4 p.m.
Thursday, April 28th, Huddersfield Division at Huddersfield; evening meeting.
Friday, April 29th, Scarborough Division at Scarborough, 8 p.m.

Medical Cinematograph Exhibition.

A cinematograph exhibition of medical and surgical films was held on March 30th, at Exeter, under the auspices of the Exeter Division of the British Medical Association.

The following films were exhibited: Cholecystectomy, appendicectomy, gastro-enterostomy, hysterectomy, undescended testes, tibial bone graft, wound sterilization (Carrel). Over 100 members attended, many coming from distant towns, and the greatest interest was shown in the demonstration.

Association Notices.

ELECTION OF COUNCIL OF ASSOCIATION, 1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and **Nomination Form**, were published in the SUPPLEMENT of March 12th (p. 73). The **Nominations** must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

ELECTION OF REPRESENTATIVE BODY OF ASSOCIATION, 1921-22.

Constituencies in Representative Body.

THE Council has finally grouped the **Home Divisions** for election of the Representative Body, 1921-22, in the same manner as for 1920-21, except that the Calthness and Sutherland Division of the Northern Counties of Scotland Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch have been made independent Constituencies.

As intimated to all the **Oversea Bodies**, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

THE REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body *must be elected not later than June 17th*, and their names notified to the Medical Secretary **not later than June 24th**. The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

MOTIONS FOR ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, JULY, 1921.

NOTICES OF MOTION by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting of the Association, commencing Friday, July 15th, 1921, proposing to make any addition to, or any amendment, alteration, or repeal of, any Article or By-law, or to make any new Article or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the BRITISH MEDICAL JOURNAL SUPPLEMENT not later than May 14th, and for this purpose should be received by the Medical Secretary **not later than April 30th**.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.—A general meeting of the Division will be held at the Metropolitan Hospital to-day (Friday, April 22nd), at 9.15 p.m. Agenda: Election of officers for ensuing year. Representative for Annual Representative Meeting. Other matters.

METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.—A meeting of the Lewisham Division, to which all medical practitioners of Lewisham are invited, will be held at 45, Laurie Park Road, Sydenham, S.E.26, on April 26th, at 8.30 p.m., when the chair will be taken by Dr. G. W. Charsley. Agenda: Discussion of the Report of the Consultative Council (SUPPLEMENT, October 16th, 1920). Discussion re Municipal Clinics of Points in Letter from Honorary Secretary of Willesden Division in the BRITISH MEDICAL JOURNAL of January 29th, p. 171. Drs. Charsley and Gilchrist will report a case of pyaemia, and show specimens.

METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.—The annual meeting and dinner of the Division will be held on Thursday, May 19th.

Meetings of Branches and Divisions.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION. A MEETING of the Division was held at Newtown St. Boswells on April 6th, when Dr. A. D. FLEMING, Chairman of the Division, presided.

The annual report and financial statement were presented and approved.

The report of the Council to Divisions and the Representative Body regarding the steps to be taken whereby the Association may become in part a federation was submitted, together with a circular on that subject from Dr. E. R. Fothergill. Dr. A. J. CAMPBELL referred to the desire of the authorities that there should be some body to represent authoritatively the views of the medical profession, and expressed the opinion that the public did not fully appreciate the extent to which the British Medical Association represented the profession.

After discussion, the following resolution was adopted:

That while this Division does not object to a federation of any bodies composed exclusively of medical practitioners, it objects to federation with bodies not consisting exclusively of registered medical persons.

The Scottish Consultative Council's Report having been issued to members was taken as read. The HONORARY SECRETARY submitted a resolution that had been passed by the Edinburgh Branch. The discussion opened with some remarks as to the exact meaning of various parts of the scheme, and particularly as regards the persons who would be entitled to benefit under it. Drs. MUIR, BLAIR, MCLAGAN, CULLEN, HENDERSON, and others contributed to the discussion. It was soon apparent that members considered that the scheme would entail financial liabilities far beyond anything that was likely to be met in the present state of public finances, and that it was only possible to discuss the various proposals on the assumption that the scheme would be financed irrespective of its cost. The questions asked by the Scottish Committee were generally answered in the affirmative, it being deemed that the majority of the proposals made in the scheme were in themselves desirable if they could be paid for. The questions answered in the negative were Nos. 4 and 13.

LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.

THE annual meeting of the Rochdale Division was held at Rochdale on April 6th, when Dr. GEDDES was in the chair. The annual report showed that the membership had increased by three during the year; the average attendance at meetings was ten. The financial statement showed a small deficit.

The following officers were elected:

Chairman: Dr. Bateman. Vice-Chairman: Dr. Geddes. Secretary and Treasurer: Dr. James Melvin. Auditor: Dr. Harris. Representative in Representative Body and to Branch Council: Dr. S. T. Lord. Deputy Representative: Dr. James Melvin.

METROPOLITAN COUNTIES BRANCH (EAST HERTFORDSHIRE DIVISION).

A MEETING of the East Hertfordshire Division was held at the County Hospital, Hertford, on April 13th, when Dr. A. E. GILES (London) delivered a most instructive lecture on "Pessaries versus Operation in the Treatment of Displacements." Considerable discussion followed, in which most of those present took part.

SUFFOLK BRANCH.

THE spring meeting of the Suffolk Branch was held at Holesworth on April 13th, 1921. The following resolution was adopted:

That having in view the necessary financial difficulty of a small Division, the Branch Council asks the Organization Committee to consider some means of financing such Divisions providing the percentage of members is high.

Dr. CHARLES (Ipswich) showed an interesting series of pathological specimens. Dr. P. L. GIUSEPPI (Felixstowe) read a paper on some developments in the treatment of urethral strictures. Dr. WOOD (Woolpit) opened a discussion on thyroid therapy in private practice, and Dr. MITCHELL (Brookford) opened a discussion on the treatment of common colds and catarrhal conditions of the upper respiratory tracts.

UGANDA BRANCH.

THE annual meeting of the Uganda Branch was held at Mulago, Kampala, on January 15th, when Dr. Cook was in the chair.

The following officers were unanimously elected for 1921:

President: Major Wiggins, P.M.O. President-elect: Major Keane, D.S.O. Vice-President: Dr. Stanley Smith. Honorary Secretary and Treasurer: Captain Owen.

Dr. Peacock, who had been elected Honorary Treasurer and Secretary at a meeting held on July 22nd, 1920, was unable to act, as he had been transferred to an out-station. The Model Rules were accepted with slight modifications. It was agreed that no action should be taken with regard to modification of by-laws regarding adjudication of ethical cases (Articles of Association 10, b). It was noted with regret that Dr. J. A. Macdonald has been unable to visit Uganda. Major Wiggins, P.M.O., on behalf of the members, welcomed Dr. Cave, the only lady member in the country. Votes of thanks to the retiring President, Honorary Secretary, and other officers, and to Dr. Baker and Major Keane for entertaining the members at Mulago, were passed unanimously. A discussion on blackwater fever took place during the afternoon.

MEETINGS OF THE PROFESSION.

HASTINGS.

THE Medical Secretary addressed a meeting of the medical profession of Hastings and district at the Albany Hotel, Hastings, on Friday, April 15th. The meeting was called by Dr. A. M. Dady, Secretary of the Sussex Branch. There were fourteen present, Dr. J. D. HESSEY of St. Leonards being in the chair.

Dr. Cox said that his main object in attending the meeting was not so much to discuss the subject on which he had promised to address them but to find out whether the medical profession in Hastings and district was dead or only sleeping. There could be only two explanations of the prolonged disorganization of the medical profession in that district—either they were so well off that they had no grievances or they were unable to look far enough ahead to see that a local profession without proper organization was in a dangerous position.

He went on to deal with his subject, which was "How much more State medical service does the medical profession want?" He recounted the long list of appointments, part-time and whole-time, which involve the employment of the medical profession by the State, either centrally or locally. He said that there were about 1,000 more whole-time practitioners in the British islands in civil employ than there were in the Navy, the Army, the Air Force, and Indian Medical Service combined, and when it came to part-time employment a considerable majority of medical practitioners were doing some form of State medical service. Moreover, a great many of these services had been introduced at the distinct invitation of the profession itself, and the medical profession was divided, and always would be divided, as to how far other services now left to private practice ought to be organized by the State. For example, many practitioners believed that the average wage-earner could not be expected to provide himself with the services of specialists and institutional treatment, and that therefore the State ought to organize the provision of such services. Dr. Cox's experience led him to believe that the profession as a whole was convinced that a whole-time State medical service would be a bad thing for the profession and worse for the public, but he pointed out that if, as had been suggested by many practitioners themselves, the dependants of the insured were ever included in the National Insurance system there would be little difference between that position and a whole-time service. So long as the doctor had some work outside the State system and so long as the patient could choose his doctor there would be some difference, but it would not be great if the insured persons and their dependants were all medically provided for by the State. He did not believe such an extension was within measurable distance, mainly because the country could not afford it, but also because there were not sufficient doctors in the country to do the work properly if the dependants made the same demands on the doctors as the present insured persons did. If such an extension should come, the best hope of the profession would lie in the fact that all the developments of the National Insurance system had been in the direction of placing on the doctors themselves the responsibility for working the system properly. So long as that principle prevailed, the liberty of the doctor and his feeling of responsibility could not be seriously damaged.

Dr. Cox said that he threw out these reflections for discussion, not because he had any particular theory to advance, but because it was necessary that the profession should keep its eye on the tendencies which affected it and make up its mind which way it wanted those tendencies to move. His own personal opinion was that there was a great gain to the community in direct payment by the person who got a thing, whether it was medical attendance or boots. It encouraged self-reliance in the citizen and enabled him to speak his mind and act freely as regards the person who supplied the boots or the medical attendance in a way he could never do if the articles were supplied through a State store or a State system. Therefore he urged on the profession to stimulate every possible method of supplying what the public wanted in the medical line, other than State provision. As an instance of what the profession could do in this way, he pointed to Dr. Gordon Dill's scheme, which as an example of initiative and goodwill was worth any amount of mere grumbling at large about State encroachment on private practice, but much more difficult to do.

There were those who said it did not matter how much more or how much less State medical service the profession wanted because the question would not be settled by them. But this ignored the great social and political power of the profession. He entirely disagreed with those who belittled the political influence of the medical profession. His official experience had convinced him to the contrary, and there had never been a more striking proof of this than the recent discussion over the Dangerous Drugs Regulations. When the doctors really got busy and showed their Members of Parliament that they were seriously interested in this matter it was most striking to see how anxious the members were to meet the wishes of their medical constituents if they possibly could. They realized, if the doctors themselves did not, what an important factor the doctor could be in political life if and when he chose. Dr. Cox ended by urging those present to resuscitate the Hastings Division and to make it a useful unit in the machinery of the Association. If they were really contented (an unprecedented state of things), it was their duty to cast their ideas into the common pool. But he felt sure the time would come when they would have their own local difficulties and would be glad to know that they had behind them a national association.

The CHAIRMAN, Dr. E. W. SKINNER of Rye, Dr. G. LOCKE, Dr. F. B. LEWIS, Dr. W. MUIR-SMITH of Eastbourne, and others joined in the discussion. They all agreed on the necessity for unity and organization, and deplored the tendency to the employment of whole-time practitioners for work which private practitioners could do quite well. Dr. Muir-Smith pointed out that this tendency could be repressed if the doctors would only take the trouble. At Eastbourne, where they had a very active Division, they had got nearly all the work of the local authorities into the hands of private practitioners, and they were on the best terms with their local authorities. In fact, they had shown that the profession could by its unity, and having the national organization at its back, get almost anything in reason that it asked for.

A small committee was appointed to attempt to revive the Division, and Dr. HesseY consented to act as convener. The meeting closed with a hearty vote of thanks to Dr. Cox.

INSURANCE.

CORRESPONDENCE.

"Availability" in Emergency Cases.

SIR,—In the giving of "immediate" treatment in "emergency" cases to an insured person practitioners have variously interpreted the meaning to be given to the word "available" in the regulations. To be of avail a practitioner must be of value, use, service, or advantage to the person in such an emergency, and therefore it seems to me the term can be only in relation to the insured person and not to the practitioner, and that therefore it is of no moment or importance to contend that a practitioner was "available" because he was in the house and not sent for if the "emergency" exists. This is the only human and honourable view, and, I think I may add, its practicable exposition. A definite adoption of this view at the next conference might save much discussion at medical service subcommittees and correspondence with practitioners.—I am, etc.,

Harringay, April 17th.

A. G. NEWELL, M.D.

Dental Treatment by Insurance Practitioners.

SIR,—In reference to the circular letter issued by the Ministry of Health to Panel Committees the following words occur in Anaesthetists' Fees, paragraph (d): "where teeth are extracted by an insurance practitioner as part of his agreement," etc.

May I ask if it is part of a doctor's agreement in rural areas to extract teeth for insured patients? If so, then I take it that the capitation fee covers the dental treatment provided, and that no charge should be made. May I ask also if it is permissible to refuse to give the treatment conditionally or unconditionally?

Two issues arise: First, ought the capitation fee to include the patient's right to dental extraction by his panel doctor? Secondly, is this an unconditional right? If the answer to these two questions is in the affirmative, then the Ministry of Health is lending encouragement to dental treatment by persons unqualified in dental surgery.—I am, etc.,

Pensilva, nr. Liskeard, Cornwall, April 17th.

J. C. JONES.

LOCAL MEDICAL AND PANEL COMMITTEES.

LONDON.

Post-Graduate Courses.

THE London Panel Committee proposes to arrange for further courses of post-graduate lectures and teaching on similar lines to those followed in the courses held in previous years. The subjects proposed are at present clinical pathology and the diagnosis, treatment and prevention of venereal diseases. If a sufficient number express the desire, the Committee will endeavour to arrange for courses in general medicine and general surgery with opportunities for clinical teaching. The courses in clinical pathology, general medicine and general surgery will be held at Charing Cross Hospital; that in venereal disease at St. Thomas's Hospital. The fee for each course is £3 3s., which must be paid to the Secretary of the Panel Committee before a card of admission to the lectures is issued. In order that arrangements may be made for a start in the first week in May, applications must reach the Secretary, Staple House, 51, Chancery Lane, W.C.2, not later than April 18th. The Panel Committee is in negotiation also with the Metropolitan Asylums Board, with a view to the institution of post-graduate clinical demonstrations by the medical officers of the Board in the wards of the fever hospitals. The scheme provides that each course shall comprise a series of four or five clinical demonstrations in the wards of the hospitals, and that the fee for each course shall be one guinea, payable in advance to the Secretary of the Committee. Practitioners desirous of participating in these courses should make early application.

Chemists' Hours of Service.

Complaints have been made by practitioners in some districts that the insured persons on their lists have experienced difficulty in obtaining their medicines owing to the early

closing of chemists' shops. It is desired that concrete examples of such difficulties may be sent to the Secretary of the Panel Committee. The list of hours of service for chemists appears at the end of each *Borough Medical List*, a copy of which has been supplied by the London Insurance Committee to each practitioner on the panel.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commanders A. C. W. Newport, M.V.O., S. Roach, and G. D. Eateiman to the *Pembroke*, additional (temporary); W. T. Haydon to R.N. Barracks, Devonport; R. W. Stairstreet to the *Orion*. Surgeon Lieutenant Commanders H. St. C. Colson and G. A. S. Hamilton to the *Pembroke*, additional (temporary); J. D. Bangay, O.B.E., to the *Victory*, for R.M. Division Portsmouth. Surgeon Lieutenants H. L. Pridham and J. W. Tighe to the *Pembroke*, additional (temporary); C. N. Ratcliffe to the *Bryony*, A. G. Taylor to the *Sandhurst*, A. W. Gunn to the *Impregnable*.

ARMY MEDICAL SERVICE. ROYAL ARMY MEDICAL CORPS.

Temporary Captain M. Bates, O.B.E., relinquishes the acting rank of Major, October 15th, 1919 (substituted for notification in the *London Gazette*, April 22nd, 1920).

Captain C. B. Hogg is placed on the half-pay list on account of ill health.

The following temporary Captains relinquish their commissions, and retain the rank of Captain: C. H. Evans, W. B. Wilson, B. A. Cheadle, W. L. Young, R. S. Dollard, J. G. M. Sloane.

Lieutenant (temporary Captain) M. F. D. Graham resigns his commission, and is granted the rank of Captain.

ROYAL AIR FORCE. MEDICAL BRANCH.

The following are granted short service commissions as Flight Lieutenants, with effect from, and with seniority of, April 4th: M. J. Calahane, O. St. L. Campion, S. E. Elphick, A. E. Jenkins, W. B. Wilson.

INDIAN MEDICAL SERVICE.

The promotion of Major A. Cameron, O.B.E., M.B., to his present rank has been antedated from October 15th to September 1st, 1915.

The promotion of Major R. S. Townsend, M.C., M.B., to his present rank has been antedated from February 1st, 1920, to August 1st, 1919.

SPECIAL RESERVE OF OFFICERS. ROYAL ARMY MEDICAL CORPS.

The following Captains relinquish their commissions and retain the rank of Captain: H. Smith, G. Day.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major J. Oweo, T.D., resigns his commission and retains the rank of Major, with permission to wear the prescribed uniform.

Major (acting Lieut.-Colonel) L. C. V. Hardwicke relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed.

Captain H. W. Symons to be Major.
To be Captains: Major T. P. Cole (late R.A.M.C.), with precedence as from April 10th, 1918, and relinquishes the rank of Major; Captain H. V. Walsh (late R.A.M.C.), with precedence as from December 15th, 1918. Captain A. W. A. Davies (late R.A.M.C., S.R.), with precedence as from November 24th, 1917; Captain W. H. Kerr (late R.A.M.C., S.R.), with precedence as from May 1st, 1918; Captain A. E. Chisholm (late R.A.M.C.), with precedence as from March 11th, 1918; Lieut. C. G. Teall.

2nd London Sanitary Company.—Captain R. O. Sibley resigns his commission, and is granted the rank of Major.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

Major G. F. Whyte, T.D., from General List to be Lieutenant-Colonel.

DIARY OF SOCIETIES AND LECTURES.

HUNTERIAN SOCIETY, Sion College, the Embankment, E.C.—Wed., 8.45 p.m., Annual General Meeting.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C.—Museum Demonstrations: Mon., 5 p.m., Professor Shattock; Ostoma. Fri., 5 p.m., Professor Keith: Peritoneal Adhesions and Intestinal Stasis.

ROYAL SOCIETY OF MEDICINE.—Special General Meeting of Fellows, Mon., 5 p.m. *Section of Odontology*: Mon., 8 p.m., Mr. G. G. Campton and Mr. John Millard: Growth of the Face. *Section of Medicine*: Clinica. Meeting at St. Bartholomew's Hospital, Tues. Tea at 4 p.m. Dr. G. Graham: Treatment of Diabetes. Dr. A. E.

Gow: Intravenous Protein Therapy. Dr. Drysdale: Splenectomy in Acoholic Jaundice. Dr. F. R. Fraser: Digitalis Treatment by the Rapid Method. *Section of Urology*: Thurs. At St. Bartholomew's Hospital, 3.30. Operations by Mr. W. Girling Ball. At 1, Wimpole Street, 8.15 p.m., Specimens; 8.30 p.m., Mr. R. Thompson: Treatment of Epispadias and of Extroversion of Bladder.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Royal Infirmary, Wed., 4.15 p.m., Dr. Katharine Chapman: X Rays in Diagnosis and Treatment.

LONDON HOSPITAL MEDICAL COLLEGE, Mon., 5 p.m., Dr. W. M. Feldman: Ante-natal and Post-natal Child Physiology.

LONDON LOCK HOSPITALS.—Clinics daily. *Lectures*: (at 91, Dean Street, W.), Mon., 2.30 p.m., Mr. Thomson: Preparation of Deteriorated Vaccines for Gonorrhoea; 5 p.m., Mr. Gibbs: Complications in Treatment of Syphilis; Tues., 2.30 p.m., Mr. McDonagh: Metallic Toxication; 5 p.m., Mr. Juler: Syphilitic Diseases of Fundus, Orbit and Ocular Muscles; Wed., 4.30 p.m., Mr. Joly: Chronic Gonorrhoea in the Male; Fri., 2.30 p.m., Demonstration of Tests used in Syphilis; 4 p.m., Mr. Abraham: Late Sequelae of Gonorrhoea in the Female. (At 233, Harrow Road, W.) Wed., 3 p.m., Mr. Ernest Lane: Venereal Disease in Women and Children.

MANCHESTER ROYAL INFIRMARY, Tues., 4.30 p.m., Dr. J. G. Clegg: Iritis and Cyclitis.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—*Special Intensive Course*: Daily, 10.30 a.m. and 11.45 a.m. Demonstrations on Clinical and Laboratory Methods; 2 p.m. and 3 p.m., Groups of Illustrative Cases; 4.30 p.m., Clinical Lectures, free to medical practitioners. First Lecture, Monday, 4.30 p.m., Sir William Hale-White on Pleurisy. Full Syllabus of Course printed in *Bulletin of Fellowship of Medicine*.

ST. JOHN'S HOSPITAL, 49, Leicester Square, W.C.—Chesterfield Lecture, Thurs., 6 p.m., by Dr. W. K. Owsley Sibley: Lupus Vulgaris and Erythematosis.

WEST LONDON POST GRADUATE COLLEGE, HAMMERSMITH, W.—Daily, 10 a.m. (and Mod.), Tues. and Fri. at 2.30 p.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations.

APPOINTMENTS.

HAIRE, Norman, M.B., Ch.M. Syd., one of the Honorary Physicians of the Saffron Hill Maternity Centre (Holborn, Finsbury, and City Border).

PUNCH, A. L., M.B., B.S. Lond., M.R.C.P. (Physician in

charge of Out-patients), Great Northern Central Hospital, Holloway.

STORRS, C. S., M.D. Camb., Certifying Factory Surgeon for the Colne (Launce) district.

WALSHE, F. M. R., M.D., F.R.C.P., Assistant Physician to Out-patients, National Hospital for the Paralyzed and Epileptic, Queen Square, W.C.

EDINBURGH ROYAL INFIRMARY.—*Resident House-Physicians*: H. A. Macmillan, M.C., M.B., Ch.B., to Dr. Fleming; A. Y. Cochrane, M.B., Ch.B., to Dr. E. Bramwell. *Resident House-Surgeons*: R. M. Galloway, M.B., Ch.B., to Prof. Alexis Thomson; E. M. Byes, M.B., Ch.B., to Surgical Out-patient Department. *Clinical Assistants*: E. M. Carfoot, M.D., J. E. C. Henderson, M.D., and D. Watson, M.B., Ch.B., to Dr. Logan Turner.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

BIRTHS.

PINKERTON.—On April 19th, at a nursing home in Bolin-broke Grove, S.W., to Norah Dorothy Pinkerton, B.Sc., M.B., B.S., M.R.C.S., and John McLean Pinkerton, M.C., D.Sc., M.B., Ch.B., a daughter.

WOODWARK.—On April 11th, at 4, Harley Street, W., to Hilda (née Robinson), wife of A. S. Woodwark, C.M.G., C.B.E., M.D., F.R.C.P., a son.

MARRIAGE.

CAIRN-SARKIES.—On April 13th at Paddington, Myles Denton Cairn, M.D., B.Sc. Lond., of Hove, Sussex, to Mavis, younger daughter of Mr. J. Sarkies, late I.C.S. and Mrs. Sarkies.

DEATHS.

TYTLER.—On April 9th, at 23, Broadway, Withington, Manchester, Peter Tytler, M.D., aged 71, the beloved husband of Emily Tytler.
WRIGHT.—On April 2nd, suddenly, Joseph Farrall Wright, M.R.C.S., L.R.C.P., of 46, Derby Street, Bolton.

Preliminary.

THE ANNUAL MEETING AT CAMBRIDGE, 1920.

1. The Council, in accordance with the usual custom, has thanked the Cambridge Executive for their work, which culminated in the meeting at Cambridge in June last. But the Association generally will desire to have placed on record here its thanks to those who were responsible for the admirable arrangements made for the reception of the Association, and especially to the Honorary Local Secretaries, Dr. J. F. Gaskell and Dr. G. S. Haynes;

its opinion that the Cambridge Meeting was from every point of view one of the most enjoyable and successful in the long line of Annual Meetings; and the special debt of gratitude which the Association owes to its President, the Rt. Hon. Sir T. Clifford Allbutt. His position as President for five years has given him a unique place in the long and distinguished list of Presidents of the Association. His unique professional position, his strong and steady support of the Association in every possible way, and the devoted service given by him during the War to the nation, the profession and the Association, made the Privy Councillorship conferred upon him just after the Cambridge meeting seem peculiarly appropriate. His unflinching courtesy and geniality have endeared him to every member of the Association who knows him.

THE ANNUAL MEETING AT NEWCASTLE IN 1921.

2. Any place would have a difficult task to follow Cambridge in holding an Annual Meeting, but, remembering the successful Meeting that was held in Newcastle in 1893, the good work of the North of England Branch in the scientific, medico-political and social spheres and the high position it holds as an active unit of the Association, the Council feels sure that under the Presidency of Prof. David Drummond the Association may confidently look forward to a Meeting at Newcastle which in its own way will stand comparison even with Cambridge.

ANNUAL MEETING, 1922.

3. In connection with the Annual Meeting, 1922, to be held at Glasgow, the Glasgow and West of Scotland Branch has nominated Sir William Macewen, C.B., as President-Elect.

4. The Council recommends:—

Recommendation.—That Sir William Macewen, C.B., LL.D., M.D., F.R.C.S., F.R.S., D.Sc., Regius Professor of Surgery, University of Glasgow, one of the Hon. Surgeons to H.M. the King in Scotland, be elected President of the Association for 1922-23.

ANNUAL MEETING, 1923.

5. The Portsmouth Division has invited the Council to hold the Annual Meeting at Portsmouth in 1923.

6. The Council recommends:—

Recommendation. That the Annual Meeting, 1923, be held at Portsmouth.

HONOURS.

7. The Council has pleasure in announcing that during the present session honours have been conferred upon the following Members of the Association.

Privy Council.

Sir T. Clifford Allbutt, K.C.B. (President).

President of Royal Society.

Professor C. S. Sherrington (Oxford).

Knighthood.

Dr. Dawson Williams, C.B.E. (Editor, *B.M.J.*).

Dr. S. Squire Sprigge, M.A. (Editor, *Lancet*).

Mr. Chas. Ryall, C.B.E. (London).

Dr. William Hodgson, J.P. (Crewe).

Dr. Alexander Jarvie Hood (Sydney, N.S.W.).

OBITUARY.

8. The Association has to deplore the loss of the following Members:—

Name.	Offices held.
Dr. Phineas S. Abraham ...	President of Section of Dermatology, 1910.
Sir William Babbie, V.C., K.C.B., K.C.M.G.	Representative of the Army Medical Service on the Central Council, and a Member of the Naval and Military Committee; Vice-President of Section, Navy, Army and Ambulance, 1912.
Dr. Henry Barnes, LL.D. ...	President of the Association, Carlisle Meeting, 1896; Secretary, Section of Medicine, 1870; Vice-President of that Section, 1893; a former President of Border Counties Branch, a Member of the Branch Council, and a former Member of the Executive Committee of the English Division; Member of Association from 1864.
Dr. Henry Blake ...	A former Chairman and Representative of the old East Norfolk Division of the East Anglian Branch.
Dr. Wm. Ironside Bruce ...	Secretary of Section of Radiology and Medical Electricity, 1910; Vice-President of Section of Electro-Therapeutics, 1913, and nominated President of the Section of Radiology and Electro-Therapeutics at the forthcoming Annual Meeting at Newcastle-on-Tyne.
Dr. Ernest Hook Buckell ...	A former President of the Sussex Branch.
Sir John W. Byers ...	At one time a Member of the Central Council and Chairman of the Irish Committee; a former President of the North of Ireland Branch and President of the Section of Obstetric Medicine and Gynaecology, 1901.
Sir Charles Alexander Cameron	Past President of the Leinster Branch.
Mr. Robert Campbell...	A former President of the Ulster Branch; Vice-President of Section of Diseases of Children, 1909.
Dr. Arthur Desborough Clark	A Member of the Executive Committee of the Brighton Division of the Sussex Branch.
Dr. Frederick Herbert Dayus	A Member of the Executive Committee and a former Vice-Chairman of the Stratford Division of the Metropolitan Counties Branch.
Sir Alexander Dempsey ...	One of the Secretaries of the Annual Meeting at Belfast, 1884; a former Secretary and Treasurer and afterwards President of the North of Ireland Branch; Vice-President of Section of Ethics, 1895.
Deputy-Surgeon-General Wm. Gerard Don, A.M.S., (Ret.)	President of Section of Navy, Army and Ambulance, 1901.
Dr. John Henry Ewart ...	A former Representative of the Eastbourne Division of the Sussex Branch; a Member of the Central Ethical Committee and a former Member of Council.
Dr. Thomas Fort ...	A former Chairman and Representative of the Lancashire and Cheshire Branch and for some years a Member of the Council of that Branch.
Sir Kendal Matthew St. John Franks	A former President of the Transvaal Branch and for some years a Member of the Branch Council; Vice-President of the Sub-Section, Laryngology and Rhinology, 1894.
Dr. Charles Brooke Gratte...	A former Member of the Executive Committee of the Monmouthshire Division of the South Wales and Monmouthshire Branch and for some years a Member of the Council of that Branch.
Dr. Montagu Handfield-Jone	Secretary 1891, Vice-President 1895, of Section of Obstetric Medicine.
Dr. Robert Harris ...	A Member of the Lancashire and Cheshire Branch Council; a former President of the Branch, and for many years Secretary of the Southport Division.
Mr. Arthur Jackson ...	A former President of the Shropshire and Mid. Wales Branch.
Dr. Thomas Fair Johnston ...	A former Secretary of the Blyth Division of the North of England Branch.
Dr. Thomas Millhouse Livingstone	Vice-President, Section of Laryngology, Rhinology and Otology, 1914.
Dr. Donald Joseph Macaulay	A former Chairman of the Halifax Division of the Yorkshire Branch.
Dr. Thomas Fraser McFarlane	President of the Dundee Branch.
Dr. James Charles McWalter	Vice-Chairman of the Dublin Division of the Leinster Branch; Vice-President of the Section of Pharmacology and Therapeutics, 1914.
Dr. Frederick Charles Mears	A Member of the Executive Committee of the Tyneside Division of the North of England Branch.
Dr. Thomas George Miles ...	A former Member of the Insurance Acts Committee.
Surgeon-Major-General Henry Foljambe Paterson, A.M.S. (Ret.)	First President of the Hong Kong and China Branch.
Dr. David Lloyd Roberts ...	President of the Section of Obstetrics, 1902.
Dr. Wm. Latta Robertson, M.C.	Honorary Treasurer of the Dundee Branch.
Sir Felix Semon, K.C.V.O. ...	President of the Section of Laryngology, 1888 and 1895.
Dr. Frederick Charles Smyth	A former Member of the Executive Committee of the Belfast Division of the Ulster Branch.
Professor Sinclair White ...	President of the Association part of 1909. One of the Secretaries of the Annual Meeting at Sheffield, 1908; Secretary of the Section of Surgery, 1906, and President, 1908.
Dr. David Yellowlees ...	President of the Psychological Section, 1885.

Dr. Edward William Mahaffy Adair, Dr. John Wilson Adam, Dr. Evan Alban, Dr. Samuel Alfred Alcorn, Dr. W. H. Allan, Major Edward Randolph Armstrong, I.M.S., Dr. Walter Robert Awdry, Dr. C. Ayres, Dr. Annie Agnes Baird, Dr. Francis Joseph Batten, Dr. David Morgan Beddoe, Dr. P. M. Belhapa, Dr. Morry's Dewes Best, Dr. R. K. Bird, Dr. George H. S. Blackburne, Dr. A. O. Boer, Dr. William Bower, Dr. Lewis Dransfield Brown, Dr. Thomas William Brown, Dr. Henry Browne, Dr. Henry William Bryant, Dr. James Patrick Thomas Burke, Dr. Harry Burton, Dr. John Kerr Butter, Dr. Johannes Avetician Calantar, Lt. Col. R. H. Castor, I.M.S., Dr. Ebert Chambers, Mr. William L. Christie, Dr. J. Vivian Church, Dr. J. P. Clifford, Lt. Col. Robert Cobb, I.M.S., (Ret.), Dr. Victor Evelyn Collins, Dr. John Connell, Dr. John Joseph Connolly, Dr. Gladys Mary Cooksey, Dr. Archibald Gladstone Corbett, Lieut. Cecil Gerald Sedgely Corner, I.M.S., Dr. James Joseph Corr, Dr. Alexander Cosgrave, Dr. Michael James Bodkin Costello, Dr. James Luke Crisp, Dr. Charles Edward Dawson, Lt. Col. Thomas Henry Delany, I.M.S., (Ret.), Dr. Robert Denman, Dr. R. T. de Silva, Lt. Col. Henry Peers Dimmock, O.B.E., I.M.S., (Ret.), Capt. Subramanya Doraisamy, I.M.S., Dr. Augustus Charles Dove, Lt. Col. Ralph Evelyn Drake-Brockman, D.S.O., Dr. W. A. V. Dwyer, Dr. Edgar Duke, Dr. Robert Joseph Dwyer, Dr. Charles Edward Eadon-Clarke, Dr. Irene Cecil Davy Eaton, Dr. Alfred Wilson Emms, Dr. George Evans, Dr. William John Strachan Ewan, Dr. Harry Fayle, M.C., Dr. John Fotheringham, Senr., Lt. Col. Thomas Howard Foulkes, C.I.E., I.M.S., Dr. Michael John Fox, Dr. George Philip Francis, Dr. Alexander George Fraser, Dr. Jean Mary Frew, Dr. A. Fuller, Dr. William Kingston Fyffe, Dr. Charles Alexander Robert Gatley, Dr. George Gautby, Dr. Ernest Wm. Graham, Dr. Andrew Moir Gray, Dr. Wm. Frederick Liddon Green, Dr. James Greenwood, Dr. Neville Griffiths, Lt. Col. Percy de Ilaga Haig, I.M.S., (Ret.), Dr. James Arthur Harrahan, Dr. L. Herschell Harris, Dr. Walter Anstice Harvey, Dr. Clarence Haslewood, Dr. John Hassall, Dr. Richard Hatch, Dr. Edwin Hegan, Dr. Daniel D. Henegan, Lt. Col. Daniel Hennesey, R.A.M.C., (Ret.), Dr. Thomas Whiteside Hime, Mr. Wheeldon Hind, Dr. Harry Hollis, Dr. Albert Wm. Dunning Hunt, Major G. Gregory James, I.M.S., Dr. John Jamison, Dr. Claude Johnson, Dr. Henry Jones, Dr. Hugh Owen Jones, Dr. John Kenrick Jones, Dr. John Drought Kenny, Dr. Augustus Keppel Reade, Dr. Robert Kirk, Dr. James Kirkland, Dr. James Gowans Laing, Dr. Timothy Wood Lee, Dr. John Leslie, Dr. Robert Murray Leslie, Dr. John Lewtas, C.B.E., Dr. Osborne Ernest Barber Linnick, Dr. Alex. Mayne Love, Dr. Lionel Francis Lovell-Keays, Dr. William Houston Low, Dr. Donald Macaulay, O.B.E., Lt. Col. Benjamin Thomas McCreery, R.A.M.C., (Ret.), Dr. G. N. MacDairmid, Dr. Robert McElvie, Dr. William Andrew McKee, Dr. Archibald Andrew McKinnon, Dr. Ronald Nimian Mackenzie, Dr. Kenneth Norman Maclean, Dr. Robert Sater Mair, Dr. Edwin Allan Maling, Dr. Guy Eugene Manning, Dr. Robert Bruce Marjoriebanks, Dr. Walter Gibson Marsden, Dr. Alexander Wm. Mather, Dr. Francis Hollingsworth May, Dr. Frank Elliott Meade, Dr. John Gordon Smith Mennie, Dr. David Mitchell, Dr. Trafford Mitchell, Dr. M. M. Mody, Dr. Ethel Amy Mordaunt, Dr. William Morrison, Dr. Selby Woodhouse Morton, Dr. George Munro, Dr. George Bain Murdoch, Dr. James Murray, Dr. Edward Herbert Myddelton Gavey, Dr. A. Y. Narayanaiah, Dr. Joseph Nee tham, Dr. George Nisbet, Dr. Walter Blake Nisbet, Lt. Col. Thomas Edward Noding, R.A.M.C., (Ret.), Lt. Col. Arthur Hollbrook Nott, I.M.S., (Ret.), Dr. Henry Barton Owens, Dr. George Shepley Page, Dr. Gerald Crécy Parnell, Dr. Maurice Paterson, Dr. Alfred William Pearson, Capt. John Walter Pigeon, I.M.S., Dr. James Lind Porteous, Dr. Thomas Power, Dr. Zachariah Prentice, Dr. Robert Harding Rains, Dr. James Herbert Rhodes, Dr. Cyril Stephen Stokes Rigby, Dr. Richard Lumley Roberts, Dr. George James Robertson, Dr. John Roger, Dr. Dermid Maxwell Ross, Dr. Kenneth Mackinnon Ross, Dr. Charles E. R. Rutland, Dr. Ernest Noel Ryeart, Lieut. N. N. Saha, I.M.S., Dr. A. E. Salter, Dr. Samuel Radford Savage, Dr. Walter Joseph Schuller, Dr. John Robinson Scott, Dr. George Broadfoot Serle, Dr. Lionel Shingleton-Smith, Dr. Edmund James Simpson, Dr. Matilda Ann Sinclair, Dr. M. Sinnetamby, Dr. David Angus Smith, Dr. Charles Edward Southwell, Dr. E. J. S. Spark, Dr. F. G. Spittel, Dr. John Spring, Dr. Louis Edward Stamm, Dr. Benjamin Hosford Steede, Dr. James Stewart, Dr. James Stothard, Dr. Peter Sturrock Sturrock, Dr. Nusservanji F. Surveyor, Dr. Robert Russell Thomas, Dr. John Hilton Thompson, Dr. Thomas Thomson, Dr. Charles Augustus Thorne, M.B.E., Dr. John Thorney, Dr. Francis Henry Thornton, Dr. Arthur Joseph Henry Thornton, Dr. Harold Tipping, Dr. Claude J. Tozer, F.S.O., Major Wilfred Warwick Treves, O.B.E., R.A.M.C., Dr. John Tubb-Thomas, Dr. Edward Turner, Dr. Charles Tweedy, Dr. Alexander Veitch, Dr. Raymond Verel, O.B.E.,

Dr. Charles William Vickers, Dr. Robert Spence Walton, Dr. Thomas Warren, Dr. George Henry Watson, Dr. Ernest Webster, Dr. William Owen Williams, Dr. Stanislaus E. A. Z. Woinski, Dr. Edward Wright.

AWARD OF THE MEDAL OF THE ASSOCIATION.

MAJOR ARTHUR MARTIN-LEAKE, V.C., F.R.C.S., R.A.M.C.

9. It is hoped that Major Arthur Martin-Leake, V.C., F.R.C.S., R.A.M.C., who is now in India, may be able to be present at Newcastle to receive the Gold Medal awarded to him in 1915.—

"*Victoria Cross*.—For great devotion to duty and self-sacrifice at Vlakkfontein, February 8th, 1902, when he went out into the firing line to dress a wounded man under very heavy fire from about forty Boers only 100 yards off. When he had done all he could for him he went over to a badly wounded officer, and while trying to place him in a more comfortable position he was shot three times. He only gave up when thoroughly exhausted, and then he refused water until other wounded men had been served."—*London Gazette*, May 13th, 1902.)

"*Bar to Victoria Cross*.—For most conspicuous bravery and devotion to duty throughout the campaign, especially during the period October 29th to November 8th, 1914, near Zonnebeke, in rescuing, whilst exposed to constant fire, a large number of the wounded who were lying close to the enemy's trenches."—(*London Gazette*, February, 1915.)

SIR DAWSON WILLIAMS, C.B.E. (Editor, *British Medical Journal*).

10. The Council has decided to award the Gold Medal of the Association to Sir Dawson Williams, C.B.E., Editor of the *British Medical Journal* for his distinguished services to the Association and the medical profession as Editor of the *British Medical Journal* from 1898. The Medal will be presented on the occasion of the President's Address at Newcastle on July 19th, 1921.

ATTENDANCES AT COUNCIL AND COMMITTEE MEETINGS.

11. A list of attendances at Council, Committee and Subcommittee meetings, from the A.R.M. 1920, to April 8th, 1921, will be published in the *B.M.J.* Supplement of May 7th.

Finance.

12. The Revenue of the Association for the year ending December 31st, 1920, again shows a substantial increase on the previous year, but the expenditure has increased in greater proportion, so that the excess of expenditure over income is over £12,000 (£12,695 11s. 7d.). For Financial Statement see Appendix I. In 1919 the balance of income over expenditure was £5,204, but this was in large measure due to the receipt during that year of £5,000 from the Government as a contribution to the cost of the Central Medical War Committee, the expenses of which the Association had met from year to year during the period, nearly four years, for which it sat; this was credited to the receipts of 1919. Further, an opportunity having occurred the stock of paper was increased by an amount equivalent to £3,259.

13. The income in 1920 was £86,372; in 1919 it was £80,223. For a correct comparison of the two years, however, the sum of £5,000 credited to 1919 in respect of the Government Contribution for the Central Medical War Committee must be deducted from the receipts of that year, and when this is done it is seen that the ordinary income of 1920 exceeded the ordinary income of 1919 by £11,139; of this enhanced amount nearly the whole was due to increases in subscriptions (£3,920), and in receipts from advertisements (£6,345), making together £10,265. The true position when a comparison is made between 1919 and 1920 is, therefore, rather more favourable to the latter year than might appear from the crude figure given above. The increase under the head of subscriptions was due in part to an increase in the total number of Members, and in part to the receipt, too late for inclusion in the accounts for 1919, of certain remittances due during that year. The rest of the increase in income is due in the main to the receipt of a higher rental from the Cinema Company and the payment by it of arrears.

14. The total expenditure for 1920 was £97,171, to which is to be added £1,096 written off investments and £200 off the Library; when these amounts are added to the actual expenditure the total amounts to £98,467. In 1919 the comparable figure was £75,018. The increase in 1920

over 1919 was therefore £23,449. In 1920, however, the expenditure on general repairs, upkeep and alterations was £3,907 compared with £283 in 1919. This large increase was in the main due to the cost of repairing, cleaning, and redecorating the Association's house; very little had been done in the way of repairs since the house was taken into use in 1908, and during the war it was difficult to get even trifling defects attended to. The opportunity was taken to improve the lighting and ventilation of the Council Chamber, and to provide in the basement a luncheon room and kitchen for the clerical staff; this has been much appreciated by the staff and is managed by a Committee elected by it. The Council made a grant of £110 towards furnishing. The architects' fees for plans of the alteration amounted to £177 7s. In the accounts for the last six years a sum of £1,000 has been written off for each year for depreciation of premises; in view of the amount expended on repairs in 1920 no such deduction has been made in the present accounts.

GENERAL ASSOCIATION EXPENSES.

15. General Association Expenses rose from £1,539 in 1919 to £5,472 in 1920. It will be seen from Abstract A that more than half of this increase of £3,932 is accounted for by further payments (Plaintiffs' costs) in the Pratt case. Legal charges for advice in connection with the proposal that the Association should become in part a Federation amounted to £114. Disbursements through the Science Committee (Abstracts A and B), increased from £445 in 1919 to £1,119 in 1920 owing in the main to two causes—firstly, the return of peace made possible the resumption of laboratory work, and secondly, the institution of British Medical Association lectures. These lectures, which involved an expenditure of £268, are a new and successful feature in the Association's work.

16. The cost of Dr. Macdonald's mission to South Africa, undertaken by desire of the Council in response to a request from the South African Branches that a representative from home should attend the Medical Congress at Durban and visit each Branch, was £600.

GENERAL MEETINGS AND COMMITTEES.

17. The expenditure on the Representative Meeting, the Secretaries' Conference and the Sections of the Annual Meeting, and on the Meetings of Council, was (Abstract B) £3,830, or £894 more than in 1919, owing chiefly to increased cost of printing the agenda, etc., and to the expenses of the Sections at the Annual Meeting at Cambridge.

18. In the accounts for 1920 the cost of the Scottish Committee has been transferred from Abstract B (Central Committees) to the Profit and Loss Account, where it has been customary to show the cost of the Irish Committee. Allowance being made for this it will be seen that the expenditure, £9,396, of Central Committees in 1920 was £617 in excess of that for 1919; the Committees chiefly responsible are the Organisation, which spent £983 more and the Hospitals Committee which spent £110 more than in 1919, the Ministry of Health Committee which increased its expenditure from £140 to £467, and the Science Committee which disbursed £268 for lectures. The Office Committee, a new charge, cost £333. On the other hand several Committees reduced their expenditure; the Insurance Acts Committee showed the very substantial reduction of £1,404 the Central Ethical Committee spent £206 less, the Medico-Political £131 less, and the Naval and Military Committee £83 less.

CENTRAL STAFF EXPENSES.

19. The expenditure under this head (Abstract E) rose from £8,695 to £11,191, owing in the main to increases in the salaries of the staff rendered necessary by the altered value of money and increased cost of living. As from October 1st, 1920, the salary of the Medical Secretary was increased to £1,500, of the Deputy Medical Secretary to £1,050, and of the Scottish Medical Secretary to £1,000, rising by annual increments respectively to £1,800, £1,400 and £1,250.

FINANCIAL SECRETARY AND BUSINESS MANAGER.

20. Mr. W. E. Warne, the Financial Secretary and Business Manager, having reached the age of retirement, will shortly leave the service of the Association. A Selection Committee previously examined the applications for the post and recommended three applicants for consideration by the Council, which, at its meeting on April 20th, 1921, appointed Mr. L. Ferris Scott, C.A., to the position of Financial Secretary and Business Manager.

APPORTIONMENT OF MEMBER'S SUBSCRIPTION.

21. The following shows how the subscription of a member was apportioned towards defraying the expenses of the Association for the year ending December 31st, 1920:—

	£	s.	d.
General Association Expenses ...	5,472	4	0
Central Meeting Expenses ...	9,396	6	10
Central Premises Expenses ...	7,373	5	3
Central Printing, Stationery and Postage Account ...	2,402	1	9
Central Staff Account ...	11,191	8	0
Library Account Expenses ...	758		7
Journal Account Expenses ...	12,166	8	9
Grant to Irish Committee ...	1,183		9
Grant to Scottish Committee ...	1,633	1	1
Capitation Grants to Branches ...	3,251	2	3
Subscriptions written off for deaths ...	2,300	1	8
Written Off Investments, Depreciation, Advertisement Reserve etc. ...	1,546	1	1
		<u>£</u>	<u>2</u> <u>0</u>

ESTIMATE OF EXPENDITURE AND RECEIPTS FOR 1921.

22. The following figures represent an approximate forecast of the probable expenditure and revenue for the current year:—

	EXPENDITURE.		Estimate for 1921.
	1920	Estimate for 1921.	
	£	£	£
General Association Expenses	5,472	2,672 Decrease	2,800
Central Meeting Expenses ...	9,396	304 Increase	9,700
Central Premises Expenses ...	7,372	3,372 Decrease	4,000
Central Printing, Stationery and Postage Account ...	2,402	148 Increase	2,550
Central Staff Expenses ...	11,191	1,009 Increase	12,200
Library Account ...	758	22 Increase	780
Journal Account Expenses ...	51,958	592 Increase	52,550
Irish Committee ...	1,183	...	1,183
Scottish Committee ...	1,633	...	1,633
Capitation Grants ...	3,251	200 Increase	3,451
Arrears Written off ...	2,300	247 Decrease	2,053
Depreciation ...	1,296	1,096 Decrease	200
Estimated Total Expenditure	<u>£93,100</u>
	RECEIPTS.		
Subscriptions ...	42,393	10,000 Increase	52,393
Advertisements ...	31,916	5,000 Increase	36,916
Sundry Sales of Journals ...	7,876	...	7,876
Investments and Rents ...	3,561	200 Decrease	3,361
Estimated Total Revenue	<u>£100,546</u>
Estimated Total Revenue	£100,546
Estimated Total Expenditure	93,100
Estimated Surplus 1921	<u>£7,446</u>

WORK OF THE OFFICE COMMITTEE.

23. The Office Committee, which was instituted last year and consists of the Chairman of Representative Meetings, the Chairman of Council, the Treasurer, and the Editor, the Medical Secretary and the Financial Secretary, has met six times during the present Session and has done much useful work in co-ordinating the departments in the Office, in attending to various matters concerning the premises, and in keeping in touch with the requirements of the staff. Much of the work of the Committee consists of that adjustment as between departments which contributes greatly to easy working and is therefore very important, but it is difficult if not impossible to describe it in detail.

24. The Common Room, which was hardly ever used by members, has been turned into an office, and thus additional room, which was sorely needed, has been given to the clerical staff of the Medical Department. The basement, which was formerly used as a lumber room, has now been transformed partly into storage room, partly into rooms in which stencilling can be done, and partly into a Staff luncheon room and kitchen, as mentioned in paragraph 14. The provision of storage accommodation in the basement has released a room on the third floor which has been placed at the disposal of the Card Register Department, a department which has long required room for expansion.

THE WORK OF THE INTELLIGENCE DEPARTMENT.

25. The work of the Intelligence Department has developed along the lines laid down last year. Its function is so to deal with the mass of routine work as to ensure that no social or economic development, national or local, which may at a later stage touch the interests of the medical profession, passes unnoticed at the outset through the pressure of more urgent work. Its progress is marked by the increase in the number of calls made upon its services. The work involves close scrutiny of all public and private Bills on their introduction, parliamentary records, a considerable volume of official literature, a number of professional journals, and a daily average of from 30 to 40 cuttings from the London and Provincial press. Matters requiring immediate attention are brought to the notice of the appropriate department, and all information acquired in the course of the preliminary survey is recorded in the form found to be most readily available for future reference. Special enquiries have been carried out in one or two cases. Local newspaper cuttings of medical interest are always welcomed.

"British Medical Journal."

26. The gross cost of the production and distribution of the *British Medical Journal*, including all editorial and a proportion of the managerial expenses, was £51,958. The receipts from advertisements, sales to non-members, and a few small items amounted to £39,792, so that the net cost of the *Journal* to Members of the Association was £12,166, or 8s. 9d. a head for the year, including postage. This may be put in another way by stating that while the gross cost of producing a single copy of the *Journal* and supplying it to a Member was 9½d., the cost to him was 2½d. To a non-member the price of a single copy of the *Journal* including postage is 1s. 4d. The charges for postage of the *Journal* to Members amounted to £5,731 as against £4,082 in the previous year; this increase of £1,649 was for the main part due to the increase of the home postal rate from one half-penny to a penny, but in part also to the increase in the number of Members. The cost of address bands (material and labour) rose from £133 to £323; it is seen, therefore, that the distribution of the *Journal* to Members cost £1,839 more in 1920 than in 1919. The cost of production increased by £9,104. The Association pays Union rates; increases in the wages of compositors, machine hands, and generally of all printers' workmen were responsible for £4,835; increased expenditure on paper accounts for £2,118; these two items amount together £6,953. The remainder of the increased expenditure is for the most part due to increments of salary to members of the editorial and managerial staffs, but it may be noted that the new postage rate on correspondence has increased expenditure under this head by £219.

27. The average number of copies of the *British Medical Journal* printed weekly rose from 24,520 in 1919 to 26,195 in 1920. Owing to the enormously increased cost of printing and paper, the Council on December 17th, 1919, resolved (as recorded in last year's Report of Council) that, save on exceptional occasions, the maximum number of pages in any issue of the *Journal* should not exceed 104. This number was exceeded on ten occasions only. In order to effect economies in the cost of printing by abolishing night work it was decided that the *Journal* should be sent to press earlier than formerly. The change was made in April, 1920.

28. In September, 1920, new postal rates for newspapers came into force, and their effect was to double the cost of postage of the *Journal*. Until then it was possible, by reducing the number of pages of the *Journal*, including editorial matter, Supplement and advertisements, to 92, to keep within the ½d. postal rate. Since September the home postage on a copy of the *Journal* containing 92 pages or less has been 1d.; on those issues which contained more than 92 pages it has been 1½d. In view of this great increase of expenditure on postage an endeavour has been made to keep the *Journal* within 92 pages each week.

29. The publication of the Proceedings of the Annual Meeting at Cambridge, which had occupied nearly 236 pages of the *Journal*, was completed in the issue of December 25th, 1920. During the year the publication of the Proceedings of Council, which had been in abeyance during the war, was resumed. The Current Notes in the Supplement have been extended and developed in various directions with the object of keeping Members informed, week by week, of matters which are being dealt with by the standing committees of the Association. Space is

always held available in that column for brief notes on current matters of interest, setting out what the Association has done and is doing in various fields of activity.

30. The Journal Committee continues to exercise strict supervision over advertisements tendered for publication in the *Journal* and has found it necessary to exclude a considerable number which for one reason or another have not conformed to the policy and requirements of the Association.

31. During the year Mr. Albert Lucas, F.R.C.S., who had served on the Journal Committee since 1909 and was its Chairman for seven years, including the whole period of the war with its many and great difficulties, ceased to be Chairman, and the Council on June 8th accorded to him a warm vote of thanks for his services. On July 15th the Journal Committee elected Dr. J. A. Macdonald to be its Chairman for the ensuing year; during Dr. Macdonald's visit to South Africa, Dr. T. W. H. Garstang, Chairman of Representative Meetings, acted for him. Dr. R. Scott Stevenson has been appointed Sub-Editor of the *Journal* and took up his duties at the New Year.

Organisation.

QUESTION OF EFFICIENCY OF CONSTITUTION AND MACHINERY OF THE ASSOCIATION.

32. The Council has carefully considered the instruction contained in the following Minutes 155, 160 and 167 of the Annual Representative Meeting, 1919:—

Minute 155. Resolved: That this Meeting is of opinion that much closer touch and more personal interchange of views between Headquarters and Divisions, and also between individual Branches and Divisions, should be aimed at, and feels assured that by such means reconciling views would more readily be reached and concerted action made effective.

Minute 160 Resolved: That the following motion by Plymouth be referred to the Council for consideration and report:—

That amendments be made to the existing Regulations or By-laws, or if necessary the same be repealed and new ones adopted, whereby more prompt and active steps can be taken in matters of urgency and importance to secure quicker decisions and results, rather than by the present system of referring such matters to and from Divisional, Branch and Council Meetings, by which much valuable time is lost.

Minute 167. Resolved: That during the ensuing year the Council of the Association shall make a scrutiny of the existing local and central machinery of the Association and the By-laws controlling this, with a view to the discovery of possible defects or deficiencies and to the correction of the same, and report with recommendations.

33. A careful detailed scrutiny of the constitution and machinery of the Association has been made accordingly, the Organisation Committee having, with the approval of the Council, appointed a Special Sub-Committee to deal with the matter in the first instance. Sir Jenner Verrall, LL.D., who was a member of the Constitution Committee appointed by the Annual Meeting at Ipswich, 1900, has acted as Chairman of the Sub-Committee. The Sub-Committee dealt also with the question whether or no the Association should take power to become in part a federation of medical bodies. On that subject the Council has reported separately (see *B.M.J.* Supplement, March 5th (page 55) and this Supplement (page 119). The Sub-Committee held 23 meetings.

34. With certain exceptions, the present report of the Council deals only with matters in respect of which the Council proposes change or adjustment of the constitution or machinery of the Association. During or as a result of its scrutiny of the machinery, the Council has dealt with a large number of other matters. In respect of some of these, special action has been taken, e.g., a Medico-Sociological Committee has been provisionally set up, the Model Rules of Organisation of Divisions and Branches in the United Kingdom are being amended to provide that Executive Committees and Branch Councils shall have power to co-opt persons who are members of the Association, and the question of the use of bankers' orders in connection with the payment of the Association subscription has been dealt with.

35. The Council is glad to report its conclusion that the constitution and machinery of the Association have on

the whole proved well suited for carrying out the objects of the Association. The changes recommended in the following report are variations in the present constitution, or in present procedure, which experience seems to show would help the Association in keeping abreast of the times and make it still fitter than at present to fulfil its work for its members.

36. As in the case of all other voluntary bodies, medical and non-medical, the Association comprises members who realise the importance of effective organisation and members who do not. In every Division and in every Branch of the Association there are such members. The Council is glad to note evidence of increasing recognition by members of the need of that watchfulness and alertness on the part of the Divisions and Branches which are necessary elements of the life of a body representative of the medical profession. The percentage of members who take a keen interest in public questions affecting the profession is a steadily increasing one.

37. Recognising that the interests, professional and public, committed to the care of the Divisions and Branches, cannot afford to be compromised by neglect of duty on the part of the Officers of those bodies, the Council desires to remind the members of the Association of the duty incumbent upon them, of appointing or retaining on the Executive of the Division and Branch, only such members as can be depended upon to carry out the work for which they hold office.

ORDER FOLLOWED IN THIS REPORT.

38. Taking the order of the Articles and By-laws as the most convenient, the Council states its conclusions and recommendations under:—

(I.) Membership; (II.) Divisions and Branches; (III.) Representative Body; (IV.) Referendum; (V.) Council; (VI.) Committees; (VII.) Officers.

39. It must be clearly understood that the object of this report is to initiate in the Divisions, and then in the R.B., a discussion on the principles enunciated in the Recommendations. When the Divisions and Representative Body have decided as to the recommendations made, the Council will, at the A.R.M. 1922, so far as necessary, submit draft amended Articles or By-laws, so that while the general discussion will take place this year the changes in the constitution of the Association which are agreed upon will not come into force until after the A.R.M. 1922.

(I.) Membership.

ELIGIBILITY FOR MEMBERSHIP.

(Article 3.)

40. As regards the criterion for eligibility for membership in the case of practitioners not resident within the area of any Branch of the Association, there are now a number of medical qualifications additional to those "described in Schedule A of the Medical Act, 1858," which entitle to registration in the United Kingdom, and provision ought to be made for them.

Recommendation—That Article 3 be brought up to date so as to provide that any medical practitioner who does not reside within the area of any Branch, and who, though not registered in the United Kingdom, is possessed of a qualification registrable there, shall be eligible for membership of the Association.

ELECTION BY BRANCHES.

(By-law 5.)

41. Ever since the reorganisation of the Association in 1902, the By-laws have provided that applications for election by candidates resident within the area of a Branch in the United Kingdom shall be forwarded by the candidate to the Honorary Secretary of the Branch. In practice, the Council finds that it has long been the custom for the applications, which are frequently accompanied by a remittance, to be sent direct by the candidate to the Head Office, the latter forthwith registering them and forwarding them immediately to the Branch Secretary. For this existing practice there is obviously much to be said.

Recommendation—That it be an instruction to the Council to take steps for verbal amendment of By-law 5 (1) so as to provide that candidates for membership resident in the United Kingdom, shall forward their applications to the Head Office, and that thereupon the latter shall at once notify both the Division and Branch Secretaries concerned.

ELECTION BY COUNCIL (APPLICANTS OUTSIDE BRANCH AREA). (By-law 6.)

42. Candidates resident outside the area of the Branches of the Association often find it difficult to procure the 3 approving signatures at present required by By-law 6. The requirement has probably prevented many desirable candidates from applying.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 6 (4th and 5th lines) so as to provide that only 2 approving signatures shall be required in respect of a candidate not resident within any Branch area.

43. By-law 6 (last line but 1) provides that at least a month's notice be given to the members of the Council of the application for election of a member not resident in a Branch area. The idea was that members of the Council might in the interval make enquiries as to the desirability of any of the candidates. In practice this is not done, and there seems to be no advantage in the requirement. By far the greater number of candidates are members of the Services and thus require no approving signatures. The existing requirement means special circularisation of the members of the Council three weeks before the main Agenda of the Council meeting is issued, and the Council considers this expense unnecessary.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 6 (last line but one) so as to provide that in respect of the proposed election by the Council of a candidate not resident within a Branch area notice shall be sent to each member of the Council with the Agenda of the meeting at which the election is proposed to be held.

(II.) Divisions and Branches.

QUESTION OF NON-MEMBERS BEING ELIGIBLE ON OCCASION FOR MEMBERSHIP OF BRANCH COUNCILS AND DIVISION EXECUTIVE COMMITTEES.

(By-laws 16 and 19.)

44. The Council is legally advised that existing By-laws 16 and 19 do not make it clear whether persons not members of the Association could, if so desired, be placed on the Branch Council or Division Executive Committee. The Council considers that it should be made clear that non-members of the Association cannot be made members of the Branch or Division Executive.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-laws 16 and 19, as to local management of Branches and Divisions, so as to make it quite clear that a Branch Council or Division Executive Committee may not include persons not members of the Association.

MEMBERS OF COUNCIL AND MEMBERSHIP *ex officio* OF BRANCH COUNCIL.

(By-law 16.)

45. The Council considers that a member of the Council should not be, *ex officio*, a member of any Branch Council except that of the Branch in the area of which he or she resides. This will be all the more desirable if the R.B. approves the suggestion made later in this report that the members of Council elected by the R.B. shall be elected by groups representing respectively England, Wales, Scotland and Ireland. If this were passed, obviously it would, for example, be useless for 12 members of Council to be on the Branch Council of every English Branch.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 16 (a) so as to provide simply that the Branch Councils in the U.K. shall include, as member(s) *ex officio*, the member(s) of the Council, if any (other than representing the Services or the Oversea Branches), resident in the area of the Branch.

HONORARY SECRETARIES OF DIVISIONS, AND MEMBERSHIP *ex officio* OF BRANCH COUNCIL.

(By-law 16.)

46. The Council is convinced that it will tend to better co-ordination and efficiency of the machinery of the Association if the Honorary Secretary of each Division

is *ex officio* a member of the Branch Council. Some Branches already have Rules to this effect, and the arrangement works well.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 16 so as to provide that the *Honorary Secretaries of the Divisions* of a Branch (*i.e.* one from each Division) shall be members *ex officio* of the Branch Council.

QUESTION OF REPRESENTATION ON OCCASION OF LOCAL STATUTORY COMMITTEES AND OTHER LOCAL MEDICAL SOCIETIES ON BRANCH COUNCILS AND DIVISION EXECUTIVE COMMITTEES.

(By-laws 16 and 19.)

47. **Recommendation.**—That it be an instruction to the Council to take steps for amendment of By-laws 16 (d) and 19 (e) so as to give Branches and Divisions the power of placing upon their Councils and Executive Committees, not only members of Local Medical Committees and medical members of Insurance Committees under the National Insurance Act, 1911 (as at present), but *medical members of any local Council or Committee under any Act whatsoever, and representatives of any local medical societies* (being in either case members of the Association).

COMPOSITION OF EXECUTIVE COMMITTEE OF DIVISION.

(By-law 19.)

48. By-law 16 (e) provides that a Branch may appoint to serve on its Branch Council "such other members as the Branch may by its Rules decide," but By-law 19 (e) does not give specific similar power to a Division.

Recommendation.—That it be an instruction to the Council to take steps to bring By-law 19 (e) into line with By-law 16 (e).

POWERS OF COUNCIL IN CONNECTION WITH WORK OF BRANCHES.

49. The Council is of opinion that provision should be made in the By-laws specifically empowering the Council to deal with inactive Branches.

Recommendation.—That it be an instruction to the Council to take steps for insertion of a new By-law empowering the Council to organise any Branch which may have become unorganised or inactive, and to act for such Branch pending its re-organisation.

DUTIES AND POWERS OF BRANCH COUNCILS IN CONNECTION WITH WORK OF DIVISIONS.

(By-law 17.)

50. The Council has considered By-law 17 (co-ordination of policy of Divisions), and is of opinion that the duties of a Branch Council in relation to the work of a Division should be made more definite.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 17 to read as follows ((b) (c) and (d) are proposed additions to the present By-law):—

Branch Council and Work of Divisions.

" 17. It shall *inter alia* be the duty of every Branch Council:—

- (a) To advise the Divisions forming the Branch in matters of policy affecting the medical profession, with a view to promoting a common policy throughout those Divisions.
- (b) To suggest to the Divisions concerned, where considered necessary or desirable by the Branch Council, or in the case of inactivity of a Division, to the Council, such modification of Division areas as would, in the opinion of the Branch Council, contribute to the more effective working of such Division or Divisions, and to advise the Council thereon from time to time.
- (c) To call, when deemed necessary or desirable by the Branch Council, joint meetings of the members of two or more Divisions for the purpose of discussing matters in which those Divisions are jointly interested.

(d) To take, where considered necessary or desirable by the Branch Council, action to organise any Division which may have become unorganised or inactive, and pending such reorganisation to act for such Division.

(e) To report to the Council upon the questions dealt with by such advice or action in all cases in which such a report is considered by the Branch Council to be necessary or desirable, or is requested by the Council."

QUESTION OF SUB-DIVISIONS.

(By-law 21 (1).)

51. In the experience of the Council, By-law 21 (1) as to Sub-Divisions, made in 1914, is an unnecessary and undesirable complication of the machinery of the Association. Practically no Division has taken advantage of it. Areas which would appear to require special treatment of the kind suggested in the present By-law had better be made separate Divisions.

Recommendation.—That it be an instruction to the Council to take steps for deletion of By-law 21 (1), as to Sub-Divisions.

JOINT COMMITTEES OF DIVISIONS.

(By-law 21 (2) and (3).)

52. In connection with By-law 21 (3) as to Joint Committees of Divisions, the Council considers that it would be simpler and better if any joint committee the Divisions desired to appoint were appointed through Division Meetings convened by the Honorary Secretaries of the Divisions, instead of the existing arrangement (By-law 21 (3)) whereby the joint meetings can be convened only by the Branch Secretary or Secretaries.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 21 (3) to read somewhat as follows:—

"(3) Where the members of two or more Divisions desire to meet in combination for the purpose of discussing matters in which those Divisions are jointly interested, or for the appointment of Joint Committees as aforesaid, such meetings shall be convened by the *Honorary Secretaries of those Divisions*, or, by agreement, by one of such Secretaries, or, if necessary, by the Branch Council."

ORDINARY AND SUPPLEMENTARY GRANTS.

(By-laws 23-6.)

53. The Council is elsewhere recommending (*see para 135 of this Report*) that the A.R.M., 1921, amend By-law 23 so as to empower the Council to pay ordinary grants to Branches up to a maximum of 6s. a head (instead of the present 4s.).

54. Under such circumstances as have in some areas occurred, for example during the War, the Council finds that the work of a Division or Divisions may be interfered with by non-activity of the Branch Council, whereby the financial provision intended (By-laws 23 and 26) to meet the needs of the work of the Division does not reach the latter.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 23 (1) by addition of a provision to the effect that, in exceptional circumstances, and at the discretion of the Council, a portion of the ordinary annual grant to a Branch may be paid by the Treasurer of the Association *direct to a Division or Divisions of a Branch*, instead of to the Branch.

55. The question has arisen whether a second grant, or second instalment of grant, paid by a Branch Council to a Division in a given year is not really a supplementary grant within the meaning of By-laws 24-5, and, as such, payable by the Council and not the Branch Council. It is obvious to the Council that the supplementary grant provided for by By-laws 24-5 is a grant supplementary to the ordinary grant made by the Council to a Branch, and not at all necessarily to a sum paid by a Branch Council to a Division. The Council considers however that By-law 26 should be verbally amended so as to obviate any possible doubt. It would be a serious matter if the time of the Council, already heavily mortgaged, were to be taken up in dealing with ordinary applications by Divisions to their Branch Councils for further grants

which the Branch Council can make from funds in its hands.

Recommendation.—That it be an instruction to the Council to take steps for verbal amendment of By-law 26 ("Application of Grants") to read, in the last line but 2:—" . . . such sum or sums as the Branch Council may from time to time consider necessary to enable the Division to defray its expenses."

NEED FOR BETTER ORGANISATION OF WORK OF DIVISIONS AND BRANCHES: QUESTION OF RULES.

56. It is impossible for any Division or Branch to work effectively which is not in possession of up-to-date Rules. Rules which are obsolete are of little use, and sometimes an actual danger, to the body possessing them.

(A.) RULES OF DIVISIONS AND BRANCHES IN THE BRITISH ISLANDS.

(1) Rules of Organisation.

57. The Council finds that of the 213 Divisions and Division-Branches in the British Islands, there are 81 which are without Rules of Organisation. The Rules of 94 out of the 132 Divisions which have such Rules date back to before the war, and the Rules of 68 of them to before 1906. They are thus, in ways more or less numerous, out of date.

58. Similarly, of the 36 Branches in the British Islands of more than one Division, 5 are not in possession of Organisation Rules, and of the 31 which have such Rules, the Rules of 15 date back to before 1906.

(2) The Revised Ethical Rules.

59. The Annual Representative Meeting, 1919 (Min. 173) urged all Divisions and Branches in the British Islands to adopt the Rules governing Procedure in Ethical Matters, approved by that Meeting. There are still 73 Divisions and Division-Branches, and 6 Branches of more than one Division, which have not adopted the Rules. Till these Divisions and Branches have adopted the Rules, and notified the Council of their adoption, they have thus no means of making their decisions binding on their members or of dealing effectively with ethical matters. Such a Division or Branch is helpless as regards the points just mentioned, nor could it be allowed by the Council to avail itself of the Notices in the *British Medical Journal* as to appointments.

Adoption of Rules a Simple Matter.

60. On application to the Head Office the Council at once sends to any Division or Branch Secretary sufficient copies of the Model Rules of Organisation or of the Revised Ethical Rules for issue to all the members thereof with the Agenda of the meeting at which they are to be adopted. When adopted, all that is required is for the Division or Branch Secretary to notify the Medical Secretary, and when approved under the standing authority given by the Council, the Rules become operative forthwith.

61. It should further be borne in mind that the Rules of the Home Divisions and Branches, adopted and approved as above, are by special arrangement by the Council printed at the Head Office, at the cost of the central funds, in convenient booklet form, sufficient copies being then sent to the Division Executive Committee or Branch Council for issue to all the members of the Division or Branch, as well as copies to hand to new members on election.

Recommendation.—That the Annual Representative Meeting, 1921, strongly urges the Divisions and Branches in the British Islands not already in possession of Rules of Organisation of date subsequent to November, 1918, to adopt forthwith Rules of Organisation based upon the latest Model Rules of Organisation supplied by the Council.

Recommendation.—That the Annual Representative Meeting, 1921, strongly urges all Divisions and Branches in the British Islands which have not already adopted the Revised Rules governing Procedure in Ethical Matters, as approved by the Representative Body, 1919, to adopt those Rules forthwith.

Recommendation.—That it be a standing instruction to the Council to report to the Annual Representative Meeting the names of all Divisions and Branches in the British Islands which are without either Rules of Organisation or the Revised Ethical Rules approved by the Representative Body in 1919.

QUESTION OF RECOGNITION OF DIVISIONS AND BRANCHES WHICH HAVE NOT ADOPTED RULES.

62. The Council considers it of great and urgent importance that every Division and every Branch should be in possession of Organisation Rules and Rules as to Procedure in Ethical Matters, and is of opinion that no group of members should be permanently or finally recognised as a Division or a Branch unless they are in possession of Rules of Organisation and Rules as to Procedure in Ethical Matters (in the case of the British Islands, the Revised Ethical Rules urged by the A.R.M., 1919, for adoption). The Council is legally advised that effect can be given to this principle by amendment of existing Article 12, and that such amendment would not be inconsistent with Article 16 ("Autonomy of Divisions and Branches") or with any other Article or any By-law.

Recommendation.—That it be an instruction to the Council to take steps for amendment of Article 12 (2) to provide that no new group of members within the British Islands shall be finally recognised as a Division or as a Branch until such Division or Branch shall have adopted Rules of Organisation and the current Rules governing Procedure in Ethical Matters, and until such Rules shall have been approved by the Council.

(B.) OVERSEA DIVISIONS AND BRANCHES.

63. As is recognised explicitly in Article 16 and By-laws 15, 18 and 22, the conditions in the Oversea Divisions and Branches differ in many ways from those at home, and materially from one Division or Branch to another. For these reasons the Council and Representative Body have up to the present refrained from recommending any special Rules for adoption by those Divisions and Branches generally.

64. None the less, the Council recognises the importance of the Branches of the Association everywhere having at least Rules of Organisation. Of the 61 Oversea Divisions and Division-Branches, the Council is in possession of Rules of only 23. Of the 3 Oversea Branches of more than one Division, the Council is in possession of Rules of 2.

Recommendation.—That it be an instruction to the Council to draw the attention of those Oversea Divisions and Branches not in possession of such Rules, to the importance of every Division and Branch having up-to-date Rules of Organisation and Rules governing Procedure in Ethical Matters; and to draw the attention of all the Oversea bodies to the importance of keeping the Council duly supplied with copies.

POSTAL VOTING BY MEMBERS.

(NOTE—For question of postal voting by members on *Referendum*, see Section (IV.) of this Report.)

65. Considerable attention has been given to proposals that further facilities should be given for postal voting. In the opinion of the Council it is inadvisable to extend these powers of individual postal voting further than they at present exist. There are few, if any, similar bodies in which the individual member has greater power to influence the affairs, including the policy, of the organisation than is the case in the Association.

66. As matters stand, postal voting is already, or can be, adopted as regards election of members of Council, Division and Branch Officers, Representatives, Deputy-Representatives, etc., if the Division or Branch so chooses. But as regards voting on matters in general, including especially questions of policy, votes cast in meeting after discussion of a given subject are in the opinion of the Council of so much greater value than votes given through the post, that the Council is against anything that would tend to do away with the Divisional Meeting and the discussion thereat. These, in the opinion of the Council, are essential for the formation of instructed opinion.

(III.) Representative Body.

FORMATION OF CONSTITUENCIES.

(By-law 33 (3).)

67. At the present time the only reason for which the Council can grant separate representation to a Division which has less than 50 members is "special difficulties as to holding joint meetings with neighbouring Divisions." Experience goes to show that there are sometimes other reasons which should influence the Council in its decision, and the Council therefore asks to be given power to use its discretion in this matter.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 33 (3) so as to provide (simply) that the Council shall have power to give separate representation to any Division, though of fewer than 50 members, when it appears to the Council to be desirable.

TIME OF ELECTION OF REPRESENTATIVES.

(By-law 35 (1).)

68. At present Representatives can be elected not more than nine months nor less than four weeks before the A.R.M. at which they take office. In the opinion of the Council it is important that the Representatives should be appointed at least 2 months before the A.R.M., in order that, as prospective Representatives for the ensuing year, they may follow closely the work of their Constituencies and come to the A.R.M. fully instructed thereon.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 35 (1) so that the Representatives shall be elected not more than 9, nor less than 2 months before the A.R.M. at which they take office.

ELECTION OF REPRESENTATIVES BY GENERAL MEETING OF CONSTITUENCY OR BY VOTING PAPERS?

(By-law 35 (1).)

69. Indecision and difficulty have been caused by the fact that existing By-law 35 (1) leaves the decision whether the election of the Representative(s) is to be by General Meeting of the Constituency or by voting papers, to be "as the said Constituency may decide." In practice, to get such a decision may be rather difficult, as a Constituency frequently comprises two or more Divisions. The Council considers that there should be a ready means of settling the mode of election.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 35 (1) (last line but one), so as to provide that the *Executive Committee(s) of the Division(s) comprised in the Constituency shall decide* whether the election of the Representative(s) is to be by General Meeting of the Constituency or by postal vote.

ARRANGEMENTS FOR ELECTION OF REPRESENTATIVES.

(By-law 35 (2).)

70. Difficulty has frequently arisen owing to the provision in By-law 35 (2) that the meeting or voting papers for election of the Representative(s) shall be called or issued "by the Secretary of one of the Divisions" (in a compound Constituency).

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 35 (2) so as to provide that, in the case of a Constituency containing more than one Division, the meeting for election of the Representative(s) shall be called, or the voting papers issued, *by the Secretary of the largest Division*, or, failing action by him, by the Council.

NEED FOR MEETING OF CONSTITUENCY SHORTLY BEFORE A.R.M.

(By-law 35 (3) and (4).)

71. The Council considers it desirable that, in whatever manner the Representative(s) is elected (*i.e.* whether by meeting or postal vote), a meeting of the Constituency shall be held within the 28 days before the A.R.M., for consideration of the Agenda of the A.R.M. and instruction of the Representative(s).

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 35 (3) and (4) so as to provide that a *Meeting of the Constituency shall be held within the 28 days before the A.R.M.* to consider the Agenda of the A.R.M. and instruct the Representative(s) thereon.

NOTICE OF ELECTION OF REPRESENTATIVES.

(By-law 35 (4).)

72. There is, yearly, considerable irregularity in connection with the return of the Representatives. Some Constituencies fail to elect or to notify the Head Office of the result of the election within the four, or the three,

weeks at present prescribed (By-law 35 (1) and (4)). Such returns, made or received late, are under By-law 35 (4) invalid, but the Representative Body has made a practice of accepting them. The Council considers that the **Representative Body should discontinue acceptance of late returns**, giving all concerned due previous warning that the requirements of the By-laws as to election, and notice of election, of Representatives must be complied with.

73. The Council is also of opinion that notification of result of election not less than three weeks before the A.R.M. is much too short a time. In harmony with the Recommendation contained in paragraph 68 of this Report (to the effect that the Representatives shall be elected not less than two months before the A.R.M.), the Council recommends:

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 35 (4) so as to provide that notice of the names and addresses and mode of election of the Representatives be sent to the Head Office *not less than six weeks* before the A.R.M.

FILLING OF CASUAL VACANCY IN OFFICE OF REPRESENTATIVE.

(By-law 36 (4).)

74. By-law 36 (4), as to filling of casual vacancy in the post of Representative, is not sufficiently definite as regards notification of the result to the Head Office.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 36 (4), by insertion of provision that the name and address of the new Representative *shall be forwarded as soon as may be to the Head Office.*

DEPUTY-REPRESENTATIVES.

(By-law 37.)

75. The majority of the Constituencies, as a routine step, use the power given by By-law 37, adopted in 1917, to elect Deputy-Representatives for the year. The Council is glad of this, as the arrangement is more satisfactory in every way than the former plan, by which it was practically left to chance as to how, when, or if at all, a Deputy would be elected in the event of the Representative being unable or unwilling to attend a given Meeting. The Council considers that the new arrangement should be made the general and only one.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 37 so as to provide that, at the same time as it elects its Representative(s), each Constituency *shall elect its Deputy-Representative(s) for the year.*

CONVENING OF ANNUAL REPRESENTATIVE MEETINGS.

(By-law 38.)

76. Under the Articles and By-laws as they stand, the Council decides the place of the Annual General Meeting (Art. 17) and of the general Scientific Meetings (Art. 25), but the Annual Representative Meeting (By-law 38) decides the place of the next Annual Representative Meeting. In practice the Annual Representative Meeting and the Annual General Meeting are held at the same place, and it is desirable that this should be recognised in the By-laws. This will necessitate the Council submitting a recommendation to the Representative Body as to the place in which the Annual Representative Meeting is to be held, in view especially of the interdependence of the General, Scientific and Representative Meetings.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 38 ("Convening of Annual Representative Meetings"), whereby it will be the *duty of the Council to submit to the Annual Representative Meeting a recommendation as to where the next Annual Representative Meeting should be held.*

REQUISITION FOR SPECIAL REPRESENTATIVE MEETING.

(By-law 39 (1).)

77. The Council is of opinion that 7 is too small a number of Constituencies to make requisition for, and commit the Association to the expense of, a Special Representative Meeting.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 39 (1) so as to provide that Special Representative Meetings shall be convened at any time by the Chairman of Representative Meetings on the requisition of the Council (as at present), or on the requisition of not less than 20 Constituencies.

BUSINESS OF SPECIAL REPRESENTATIVE MEETINGS.

(By-law 39 (2).)

78. The Council considers it important that there should be the utmost liberty for discussion of any subject for which a Special Representative Meeting is convened. In the light of experience, it is possible that the existing words "indicate the object," in By-law 39 (2), would be apt to prevent such free and full discussion. The Council proposes to clear the matter up with Counsel.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 39 (2), so as to provide that free and full discussion shall be in order, if on reference to Counsel it is found that the present wording ("indicate the object for which such Meeting is convened") would tend to prevent such discussion at a Special Representative Meeting.

ELECTION OF MEMBERS OF COUNCIL BY A.R.M.

(By-law 40.)

79. Existing By-law 40 (fifth line) is incorrect in stating, as an item of the business of the A.R.M., the election of "12 members of the Council." In point of fact, the A.R.M. elects at present 16 members of the Council, viz., 12 by the grouped Representatives and 4 by the Representatives acting together. The Council considers that By-law 40 should leave the other By-laws to state the number of members of Council to be elected by the A.R.M.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 40 so as to read (fifth and sixth lines) as follows:—
"to elect such members of the Council, and such other Officers" (etc., as at present).

RESOLUTIONS BY DIVISIONS AND BRANCHES FOR CONSIDERATION OF A.R.M.

(By-law 40.)

80. The Council considers that the present wording of By-law 40 (last line but seven, etc.), viz., "to consider any resolution relating to the honour and interests of the medical profession or of the Association," is unduly restricted and not as wide as is permitted by paragraph 3 of the Memorandum of Association, nor as wide as the present practice of the Association in this connection.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 40 (last line but seven, etc.) so as to state as part of the business of the A.R.M.:—

"... to consider any resolution relating to the promotion of the medical or allied sciences or the maintenance of the honour or interests of the medical profession or of the Association which shall" (etc., as at present).

BUSINESS OF A.R.M.

(By-law 40.)

81. There is a verbal discrepancy between Article 30 (2), as to resolutions of the Representative Body, and By-law 40 (last line but two), as to the business of the A.R.M. The Council is legally advised that it will be well to amend the By-law to tally in this respect with the Article.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 40, as to business of A.R.M. (last line but two), so as to read "shall have been published in the Journal . . ."

ROLL CALL: CARD VOTE.

(By-law 42 (2).)

82. Though existing By-law 42 says nothing as to it, vote by roll call is now one of the recognised methods of voting in Representative Meetings. Under that method, the names of those voting for or against a motion

or amendment are taken, and recorded in the Minutes. The method is found extremely useful, being precise, and saving the time of the Meeting, as compared with the more cumbersome method of card vote, and the Council considers that voting by roll call should be regularised by By-law. Under the S.O.s. of the Representative Body a request by 10 Representatives secures (if a vote by card is not decided on) a vote by roll call. Under existing By-law 42 (2), a request by 20 Representatives secures a vote by card. In the opinion of the Council, the number of Representatives to secure a vote by roll call should be 15, and to secure a vote by card, a request to that effect by a majority of the Representatives present should be necessary.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 42 (2) so as to read somewhat as follows:—

"(2) Voting shall be by show of hands, unless before such vote is taken 15 Representatives present request that the vote be taken by roll call, in which event it shall, subject as below, be so taken. If however a vote by card is requested by a majority of the Representatives present, the vote shall be by card."

(IV.) Question of Referendum on Resolutions of R.B. or of General Meeting. (Art. 31.)

83. The Council has carefully considered the motion by Plymouth, referred to the Council in Minute 160 of the A.R.M., 1919 (see para. 32 of this report). In dealing with the motion, the Council has had the help of a memorandum by the Division on the subject. The Division raises two questions in connection with the procedure on a referendum as to a resolution of the Representative Body or General Meeting, viz., (1) whether the taking of a referendum could not be expedited in various ways which the Division suggests; and (2) whether Division Secretaries should not be empowered to obtain the decision of the Division either by general meeting or postal referendum of the members of the Division.

(1) QUESTION WHETHER REFERENDUM ON RESOLUTION OF R.B. OR GENERAL MEETING COULD NOT BE CARRIED OUT MORE EXPEDITIOUSLY.

84. Under present Article 31, the steps are:—

(1) Representative Body (or General Meeting) by resolution decides a question.

(2) Council holds, within 3 months (in practice immediately after the Meeting at which the resolution is passed), a meeting to consider the resolution, generally with others (Art. 31 (a)).

(3) Council at its meeting may approve the resolution, and is held to have approved it unless half or more of the members of the Council are present and it is determined by a majority of not less than two-thirds of the votes given, that the resolution does not properly represent the wishes of the Association and that a referendum is expedient (Art. 31 (b)).

(4) (If referendum being taken) Requisition for Division meetings must be sent by Council within 8 weeks of its meeting, together with any observations the Council may think fit to make as to the resolution (Art. 31 (c)).

(5) Meeting of Division to be held within 4 weeks of receipt of Council's requisition (Art. 31 (c)).

(6) Certificate of Division Secretary as to number of votes for and against resolution has to be in hands of Council within 4 months of meeting of Council (Art. 31 (e)).

(7) Resolution is deemed "approved on a referendum" if total of votes given at the Division meetings in its favour exceeds total of votes given against (Art. 31 (e)).

(8) If Council meeting prescribed by Article 31 (a) is not held, or if requisition prescribed by Art. 31 (a) is not sent, resolution comes into operation immediately on expiration of the 3 months or the 8 weeks, as the case may be (Art. 31 (f)).

(9) Approval of the resolution by Council or on referendum has to be published forthwith in Journal (Art. 31 (g)).

85. The Plymouth Division proposes that (a) the Council meeting be held within one month (instead of three); (b)

the referendum go to the Divisions within *one* week (instead of eight) of Council's decision to take it; and (c) the Divisions should arrive at their decisions within *one* week (instead of four).

(a) *Time of Meeting of Council.*

86. The Council considers that the proposal (a) of the Division is a good one. It seems desirable that the Council should arrive at its decision while the matter is fresh in the minds of its members. The month proposed by the Plymouth Division might on occasion save valuable time. The interval was in 1903 "7 days," being altered in 1910 to the present "3 months."

(b) *Time of Issue of Referendum to Divisions.*

87. It would be impossible for the Council to refer such a matter to the Divisions within one week of its meeting, it being not at all a straightforward task to draw up and settle, in terms fair and sufficiently informative, a referendum in such a case. It would rarely or never be possible, with due regard for efficient dispatch of business, for the Council simply to send to the Divisions a bare resolution of the R.B. or General Meeting and ask them to reply "yes" or "no." In practice it is found that, to give a clear issue, it is necessary to send, with the resolution, a statement of the main facts in connection with which the resolution was passed. The Council considers that Article 31 (c) properly directs that there should go to the Divisions, with the resolution, "such observations on the subject . . . as the Council may direct," and in order that this may be adequately done, the "8 weeks" stated by Article 31 (c) is, in the opinion of the Council, an appropriate time, especially in view of the fact that the A.R.M.s, at which most decisions of the Association are taken, are ordinarily held towards the end of July, and that in the following weeks a meeting of the Council, to settle the terms of the referendum, would be with difficulty arranged, nor could satisfactory meetings of Divisions in this period be secured.

(c) *Time of consideration of Referendum by the Divisions.*

88. The Plymouth Division raises the question whether it would not be possible for the Divisions to arrive at their decisions on a referendum within *one* week of its receipt (instead of the present four). The Council considers that the present period of four weeks, found to work well in practice, is a good one. Should there be any need for greater urgency, the Council considers that arrangements can readily be made to meet the special circumstances.

Recommendation—That it be an instruction to the Council to take steps for amendment of Article 31 (a) and (f) so as to provide that the meeting of the Council to consider a resolution of the R.B., or of a General Meeting, must be held *within one month* of the passing of the resolution.

(2) QUESTION OF DIVISION SECRETARIES HAVING AN OPTION TO OBTAIN DECISION OF DIVISION ON A REFERENDUM BY GENERAL MEETING OR INDIVIDUAL POSTAL VOTE.

89. From first to last the question of adopting the plan of individual postal vote, instead of or as part of a referendum to Division meetings, has received a large amount of consideration from the Association. Invariably, the decisions have been against introduction of individual postal vote as part of the referendum, on the ground that it would be subversive of the Divisional machinery of the Association. Obviously, the best decisions are those arrived at collectively after discussion, and the Division meeting (Article 31 (c) and (d)) ensures such discussion. This applies with special force to any matter which is considered of such importance as to necessitate an appeal to the Divisions from a decision of the R.B. The Council therefore regards as inadvisable the introduction of individual postal vote as part, or possible part, of a referendum.

(V.) Council.

COMPOSITION OF COUNCIL.
(By-law 46.)

90. In the scrutiny made of the machinery of the Association special consideration has been given by the Council to the question of the composition of the Council. At present, the Council consists of members appointed as follows:—

Category	No. of Members of Council
(a) Grouped Branches and Divisions in U.K. (By-law 46 (a))	24
(b) Grouped Branches outside U.K. (By-law 46 (b))	7
(c) 12 Groups of U.K. Representatives (By-law 46 (c))	12
(d) Representatives (By-law 46 (d))	4
(e) Representative Body (By-law 46 (e))	4 Service Members)
(f) Members <i>ex-officio</i> (Article 32)	7 (President, President-Elect, Past-President, Chairmen of R.B. and of Council, Past-Chairman of Council, Treasurer)
Total	58

Thus, of the total 40 members of the Council other than the Oversea, Service and *ex-officio* members, 24 are at present elected by the votes of the individual members of the Branches in the U.K., grouped in 24 groups for the purpose, 12 by the Representatives in the Representative Body grouped in 12 groups for that purpose, and 4 by the Representatives present at the A.R.M. acting together. There is no restriction as to what members of the Association shall be elected, except that to be eligible for election in the 24-election ((a) above) or the 12-election ((c) above), the candidate must be a member of a Branch in the group (By-law 51). In practice, those elected to the Council in the 12-election are nearly always Representatives, while on the other hand in the 24-election ((a) above) it often happens that some of those elected are neither Representatives nor members of the Representative Body.

91. As the 24-grouping and the 12-grouping (which are necessarily co-ordinated the one with the other) at present stand, there has advisedly been over-representation of Ireland and, to a less extent, of Scotland. On the combined 24 and 12-groupings, as matters stand, there is one member of Council—

- Ireland (741 B.M.A. members), for each 124 members.
- Scotland (2,122 B.M.A. members), for each 353 members.
- Wales (877 B.M.A. members), for each 584 members.
- English Provinces (9,501 B.M.A. members), for each 582 members.
- Metropolitan Counties Branch (3,000 B.M.A. members), for each 500 members.

92. In the opinion of the Council the election of 12 members of the Council by 12 groups of representatives is, on various grounds, especially the fact that the electorate is often a very small one, unsatisfactory. The Council considers that existing By-law 46 (c) and (d) should be deleted, and that the 16 members of Council in question should be elected by the grouped Representatives of England, Ireland, Scotland and Wales, acting together to elect, England 12, Ireland 1, Scotland 2, and Wales 1, members of Council.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 46 (and other By-laws consequentially) by substituting for existing By-law 46 (c) and (d), a paragraph somewhat as follows:—

"(c) 16 by the Representatives of Constituencies present at the Annual Representative Meeting, namely, 12 by the Representatives (acting together) of the Constituencies in England; 1 by the Representatives (acting together) of the Constituencies in Ireland; 2 by the Representatives (acting together) of the Constituencies in Scotland; and 1 by the Representatives (acting together) of the Constituencies in Wales;"

existing By-law 46 (e) to become 46 (d).

Recommendation That the R.B. direct that if and when the new system of election of the Council comes into operation, the Council reconsider the proportion of members of Council to be allotted to the various parts of the United Kingdom under By-law 46 (a), and the grouping within those parts.

MEMBERS OF COUNCIL REPRESENTING OVERSEA BRANCHES.
(By-law 46 (b).)

93. The Council has postponed consideration of the question of election of members of Council by the Oversea

Branches, pending settlement of the question of possible affiliation facilities. At present (1920-21 Council), the 5,708 members of the Oversea Branches are entitled to return seven members to the Council (By-law 46 (b)), i.e. on an average one member of Council for each 815 Oversea Branch members.

QUALIFICATION FOR ELECTION AS MEMBER OF COUNCIL TO REPRESENT A BRANCH OR GROUP IN THE UNITED KINGDOM.

94. While in the opinion of the Council the present arrangement whereby there is no stipulation to the effect that membership of the R.B. shall be a condition of eligibility for election as a member of the Council, is a good one, the Council is of the opinion that members of Council should have been members of the Association for at least the three years immediately preceding the election.

Recommendation—That it be an instruction to the Council to take steps for amendment of the By-laws so as to provide that no one shall be eligible for election as a member of Council to represent a Branch or Group in the United Kingdom, unless at the time of his (or her) election *he has been a member of the Association for at least the three years immediately preceding the election.*

MEMBERS OF COUNCIL *ex officio*.

(Article 32.)

(a) PAST-CHAIRMAN OF REPRESENTATIVE MEETINGS.

95. The Council considers it important that the Past-Chairman of Representative Meetings should be *ex-officio* a member of Council for one year after the expiration of his term of office.

Recommendation—That it be an instruction to the Council to take steps for amendment of Article 32 (and By-laws consequentially) so as to provide that the *Past-Chairman of Representative Meetings shall be a member of Council ex-officio for the year immediately following his period of office as Chairman.* (See also paragraph 122).

(b) DEPUTY-CHAIRMAN OF REPRESENTATIVE MEETINGS.

96. The Council considers that it would be helpful to the work of the Association if the Deputy-Chairman of Representative Meetings, in addition to the Chairman of Representative Meetings, were a member of the Council *ex officio*. It is important that the Deputy-Chairman should, by membership of the Council during the previous twelve months, have had the opportunity of making himself familiar with the central work of the Association.

Recommendation—That it be an instruction to the Council to take steps for amendment of Article 32 so as to provide that the *Deputy-Chairman of Representative Meetings shall be a member of the Council ex officio.*

VACANCIES IN COUNCIL.

97. By-law 55 provides for the filling of casual vacancies in the Council, i.e., vacancies occurring through the resignation, etc., of a member of Council. There is no explicit provision, however, in the By-laws for the filling of a vacancy caused by default of the electing body or group.

Recommendation—That it be an instruction to the Council to take steps for insertion of a new By-law somewhat as follows:—

“In the event of a vacancy (other than a casual vacancy under By-law 55) among the elected members of the Council, the Council shall in its discretion take steps to fill such vacancy, either by an election conducted in the usual way or by itself appointing a member to fill the vacancy.”

(VI.) Committees.

98. Apart from any modification which may arise from adoption of the proposals as regards affiliation facilities, the Council has specially considered the wish expressed by the Representative Body in 1915 to widen the basis of admission to Standing Committees. On consideration of existing By-law 69, the Council is of opinion that full provision is already made therein for the admission of practically any person, whether member or non-member of the Association, as a member of such a Committee, whose work or co-operation may be considered likely to be of assistance to the Committee.

SCOTTISH, IRISH, WELSH AND DOMINIONS COMMITTEES

99. Under By-law 70 each Standing Committee except the Scottish Committee must appoint from its own number a member of Council as Chairman. Under the By-law the Scottish Committee appoints both a Chairman and a Deputy-Chairman, and either the Chairman, Deputy-Chairman or Honorary Secretary of that Committee must be a member of the Council.

In the opinion of the Council this option should also be given to the Irish, Welsh and Dominions Committees.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 70 so as to read somewhat as follows:—

“70. Each Standing Committee, except the Scottish, Irish, Welsh, and Dominions Committees, shall appoint from its own number a member of Council as Chairman. Each Committee thus excepted shall appoint (etc. as at present).”

CASUAL VACANCIES IN COMMITTEES.

(By-law 71.)

100. The Council considers that *all* Committees (and not merely Standing Committees) should have power to fill any casual vacancy arising amongst their appointed members.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 71 so as to provide that *each* Committee (Standing or other) shall have power to fill any casual vacancy arising amongst its appointed members.

ABSENCE FROM COMMITTEE MEETINGS.

(By-law 72.)

101. The Council considers that a member of *any* Committee or Sub-Committee (whether Standing or other) absent without good reason from three consecutive meetings of the Committee should be deemed to have resigned his or her membership thereof.

Recommendation—That it be an instruction to the Council to take steps for amendment of By-law 72 so as to provide that if an appointed member of *any* Committee or Sub-Committee shall be absent from three successive meetings of that Committee or Sub-Committee, such member shall (except in case of illness or for some reason approved by the Chairman of the Committee or Sub-Committee) be deemed to have resigned his or her membership thereof, and a casual vacancy thereupon arise.

CONSULTATION BETWEEN COMMITTEES.

(Proposed new By-law.)

102. It is not provided in the present By-laws that Committees shall have full power to consult each other. Yet circumstances often arise in which it is important that a Committee should freely consult, or make suggestions to, another Committee or Committees.

Recommendation—That it be an instruction to the Council to take steps for insertion, after existing By-law 73 or elsewhere, of a new By-law somewhat as follows:—

“Consultation between Committees.

In respect of any matter with which it is dealing, it shall be competent for any Committee to consult, report to, or make suggestions to any other Committee of the Association. Similarly, it shall be competent for any Sub-Committee to consult, report to, or make a recommendation to any other Sub-Committee of the same parent Committee.”

CO-OPTION BY STANDING COMMITTEES.

103. Only the Organisation, Science, Insurance Acts, Scottish and Irish Committees have power of co-option of members. They have used that power both in the interest of the Association and with due regard to economy in respect of travelling expenses. The Council considers that it would be to the advantage of the work of the Association if each Standing Committee had the power of co-option.

Recommendation—That it be an instruction to the Council to take steps for insertion of a new By-law, after existing By-law 69 or elsewhere, somewhat as follows:—

“Each Standing Committee shall have power to call to its assistance for special purposes persons specially qualified to assist in any branch of its reference.”

STANDING COMMITTEES.

(See Schedule to By-laws.)

(1) FINANCE COMMITTEE.

(a) *Composition.*

104. The Council being adequately represented on the Finance Committee by the Chairman of the Organisation, Journal, Science, Medico-Political, Central Ethical and Insurance Acts Committees, there is, in the opinion of the Council, no need for the Council to appoint members specially to the Finance Committee.

105. Further, the Journal Committee being adequately represented in the Finance Committee by the Chairman of the former, there is, in the opinion of the Council, no need for the appointment of additional members of the Journal Committee to the Finance Committee.

106. In point of fact, the Council considers the existing Finance Committee (possible membership 20) too large. Under the proposal of the Council the Committee would have a membership of 14.

Recommendation.—That it be an instruction to the Council to take steps for amendment of the schedule to the By-laws, as to the composition of the Finance Committee, by omission (1) of appointment of members thereto by the Council; (2) of appointment of members thereto by the Journal Committee.

(b) *Reference to Finance Committee: Question of Premises Committee.*

107. The reference to the Finance Committee needs alteration, for (1) in the case of some of the funds held in trust by the Association it is the duty of other Committees to advise as to the administration thereof; (2) the supervision of the organisation and working of the Central Office is carried out by the Office Committee; (3) the Finance Committee (not the Premises Committee, which never meets) deals with questions affecting the land and house property of the Association.

Recommendation.—That it be an instruction to the Council to take steps for amendment of the reference to the Finance Committee so as to read somewhat as follows:—

“To certify the accounts prior to their presentation to the Council; to advise on (a) the administration of any funds held in trust by the Association not administered by any other Committee and of the Superannuation Fund; (b) as to the appointment of administrators for any such Funds; (c) as to the financial bearings of any proposals involving special expenditure; and (d) as to the financial position and real estate of the Association.”

Recommendation.—That it be an instruction to the Council to take steps for omission from the schedule to the By-laws of the provision for a Premises Committee.

(2) ORGANISATION COMMITTEE.

Reference.

108. The reference to the Organisation Committee also needs alteration, for the actual work of the Committee is wider than its reference. It will, the Council considers, be well that the Organisation Committee, and not as at present (nominally) the Science Committee, shall undertake the detail of the work of the central body as regards encouraging and assisting the scientific work of the Divisions and Branches.

109. Further, the *Journal* is one important means of propaganda by the Association, and it is necessary that the fact shall have the due attention of the Journal Committee. The Council is of opinion that it would therefore be helpful as regards co-ordination and effectiveness of work if the Organisation Committee appointed a member to the Journal Committee, such member to be, ordinarily or if possible, the Chairman of the Propaganda Subcommittee of the Organisation Committee. If the principle of election by the Organisation Committee of a member of the Journal Committee is approved by the Representative Body and the By-law altered accordingly, the actual method of making the nomination can be readily and simply provided for by standing order of the Organisation Committee.

Recommendation.—That it be an instruction to the Council to take steps for amendment of the reference to the Organisation Committee so as to read somewhat as follows:—

“(a) To organise systematic endeavours to maintain and increase the membership of the Association; to make reports to other Committees and the Council accordingly; and to advise and assist Divisions and Branches in the strengthening of their organisation, including the organisation of their work for the promotion of the medical and allied sciences;

(b) To advise as to the interpretation or alteration of the existing, or the adoption of new, Regulations and By-laws; as to questions of areas of existing, or formation of new, Divisions and Branches; as to grouping for electoral purposes; and as to the Rules (other than those relating to ethical matters) of Divisions and Branches and combinations thereof;

(c) To advise as to the ordinary and supplementary grants to Branches and Divisions.”

(3) JOURNAL COMMITTEE.

(a) *Composition.*

110. It has happened occasionally that the attendance at a meeting of the Journal Committee, the elected members of which at present number only 6, *viz.*, 3 appointed by the R.B. and 3 by the Council, has been too small to permit of full justice to its work.

Recommendation.—That it be an instruction to the Council to take steps to provide that the Representative Body and Council shall each appoint 4 members, and the Organisation Committee 1 member, to the Journal Committee.

(b) *Reference.*

111. The reference to the Journal Committee should be simplified, for (1) this Committee is not responsible for all the publications of the Association; (2) the Council considers (*see* para 105) that the Journal Committee is sufficiently represented in the Finance Committee by the Chairman of the Journal Committee.

Recommendation.—That it be an instruction to the Council to take steps for amendment of the reference to the Journal Committee so as to read somewhat as follows:—

“To consider matters connected with the *Journal* and any other publications of the Association which do not come within the scope of other Committees.”

(4) SCIENCE COMMITTEE.

(a) *Composition.*

112. At present the elected members of the Science Committee (8 in number) are appointed wholly by the Council. The Council is of opinion that it would add to the efficiency of the Committee if its membership were slightly larger, and appointed in part by the Representative Body.

Recommendation.—That it be an instruction to the Council to take steps to provide that the Representative Body shall appoint 4, and the Council 6, members of the Science Committee.

(b) *Reference.*

113. The reference to the Science Committee needs alteration, for (1) this Committee is not responsible, or not responsible in chief, for assisting the Officers of Sections; (2) it is now an important part of the work of the Science Committee to provide lecturers on scientific and clinical subjects for Division and Branch meetings; (3) the Council is proposing (paras. 108-9) that the Organisation Committee shall be made responsible in connection with the scientific work of the Divisions and Branches other than the provision of lecturers at meetings thereof.

Recommendation.—That it be an instruction to the Council to take steps for amendment of the reference to the Science Committee to read somewhat as follows:—

"To advise, and when so directed, act for the Council in all matters not specifically referred to other Committees which concern the work of the Association for the promotion of the medical and allied sciences, including the conditions of award of scholarships or grants given by the Association or under trusts undertaken by the Association; the arrangement of Committees for special scientific work; the provision of lecturers on scientific and clinical subjects to the Divisions and Branches or otherwise; and all matters connected with the library and its management."

(5) "PARLIAMENTARY AND MEDICO-POLITICAL" COMMITTEE.

(a) Name of Committee.

114. The Council finds that for various reasons it would be better, as indicating more helpfully the scope of the work of the Medico-Political Committee, to call it the "Parliamentary and Medico-Political Committee."

Recommendation.—That it be an instruction to the Council to take steps for alteration of the name of the Medico-Political Committee to "Parliamentary and Medico-Political Committee."

(b) Reference.

115. The Council proposes that, with but slight modification the existing reference to the Medico-Political Committee shall apply to the "Parliamentary and Medico-Political Committee." Other Committees of the Association, e.g., the Public Health, Insurance Acts, Hospitals and Naval and Military Committees, initiate on occasion Parliamentary action in connection with their work. This practice should not in any way be interfered with.

Recommendation.—That it be an instruction to the Council to take steps to provide that the reference to the Parliamentary and Medico-Political Committee shall be somewhat as follows:—

"To deal with Parliamentary and medico-political questions, and, generally, with all matters involving the public relations of the profession, not specially referred to other Committees."

(6) PUBLIC HEALTH, INSURANCE ACTS AND HOSPITALS COMMITTEES.

116. The Council has considered the question of the existing references to the present (Standing) Public Health, Insurance Acts and Hospitals Committees, the question whether the existing (*ad hoc*) Ministry of Health Committee should be made a Standing Committee, and if so, with what reference. The fact that there is now a Ministry of Health will, it is practically certain, necessitate considerable change as regards the work of some or all of these and possibly other Committees of the Association, but the Council does not consider the matter as yet ripe for solution.

(7) INSURANCE ACTS COMMITTEES.

117. The Council recommends:—

Recommendation.—That it be an instruction to the Council to take steps for amendment of the Schedule to the By-laws as to the composition of the Insurance Acts Committee, so as to define more clearly the method of election of the 22 practitioners referred to in the second paragraph thereof.

(8) NAVAL AND MILITARY, AND (9) DOMINIONS COMMITTEES.

117A. The Council has under consideration the question of the names and composition of, and the references to, the Naval and Military and Dominions Committees.

(10) IRISH COMMITTEE.

118. The Council has postponed consideration of the question of the Irish Committee, pending settlement of the question of possible affiliation facilities.

(11) ARRANGEMENTS COMMITTEE.

119. The Council considers it important that the existing (*ad hoc*) Arrangements Committee be made a Standing

Committee, formally entrusted with the duties carried out by the existing Committee.

Recommendation.—That it be an instruction to the Council to take steps to provide for a (standing) Arrangements Committee, somewhat as follows:—

The Arrangements Committee shall consist of the Officers of the Association, together with 6 members elected by the Council and 6 members elected by the Local Committee of Management of the Annual Meeting. The duty of the Arrangements Committee shall be to consider and advise the Council as to the appointment of Officers of Sections and Readers of Addresses at the Annual Meeting, and such other matters affecting the arrangements for the Annual Meeting as shall be referred to it.

MEDICO-SOCIOLOGICAL COMMITTEE.

(See also paragraph 266).

120. There are many matters intimately affecting the public health and welfare as to which the profession has special knowledge and which can best be dealt with by a partly lay and partly medical Committee. Considering that such a Committee would complete the Medico-Sociological machinery inaugurated by the appointment of the Medico-Sociological Section of the Annual Meeting, the Council has appointed as an experiment a Medico-Sociological Committee, with the following reference:—

"To consider social and economic questions affecting the public welfare as to which the medical profession may be thought to have special knowledge; and to take such steps as may be found necessary in order to create or develop public opinion thereon. The Committee shall add to its number for special purposes representative persons specially qualified to assist in any branch of its reference."

(VII.) Officers.

CHAIRMAN OF REPRESENTATIVE MEETINGS.

(Articles 32, 36, etc.)

121. The name of this Officer is still, technically, "Chairman of Representative Meetings," but in practice the designation "Chairman of the Representative Body" is frequently used as more definite, a consideration of importance as regards dealing with bodies and persons outside the Association. As the title stands it is apt to give, and has on occasion given, to persons ignorant of the constitution of the Association, the impression that the Chairman of Representative Meetings is Chairman only while the Meetings are in session. Similarly in the case of the Deputy-Chairman of Representative Meetings.

Recommendation.—That it be an instruction to the Council to take steps for verbal amendment of Article 32, etc., so as to provide that the Chairman of Representative Meetings shall be styled "Chairman of the Representative Body," and the Deputy-Chairman of Representative Meetings, "Deputy-Chairman of the Representative Body."

PAST-CHAIRMAN OF REPRESENTATIVE MEETINGS.

(By-law 61.)

(See also paragraph 95).

122. Under Article 32 and By-law 62, the Chairman of Council is for one year after his period of office a member of the Council *ex officio* for the space of one year. In the opinion of the Council it is important that the Chairman of Representative Meetings should similarly, for one year after his period of office, be a member of the Representative Body *ex officio*.

Recommendation.—That it be an instruction to the Council to take steps to provide that the Chairman of Representative Meetings shall, during his period of office *and for one year thereafter*, be a member of the Representative Body *ex officio*.

DEPUTY-CHAIRMAN OF REPRESENTATIVE MEETINGS.

(a) Status.

(Article 36.)

123. *Pari passu* with the increase of the work of the Association, the post of Deputy-Chairman of Representative Meetings becomes more and more important. In

paragraph 96 of this Report the Council is proposing that the Deputy-Chairman of Representative Meetings be a member of the Council *ex officio*. The Council considers that it is also necessary that he should have the status of an Officer of the Association.

Recommendation.—That it be an instruction to the Council to take steps for amendment of Article 36, etc., so as to provide that the Deputy-Chairman of Representative Meetings shall be an Officer of the Association.

(b) *Election.*

(By-laws 40 and 61.)

124. If the foregoing recommendation is approved by the Representative Body, the Council proposes that consequential adjustment be made in the By-laws.

Recommendation.—That it be an instruction to the Council to take steps for amendment of Section VIII. of the By-laws ("Officers") so as to include therein as requiring to be elected annually at the Annual Representative Meeting (in addition to the Chairman of Representative Meetings as at present), the Deputy-Chairman of Representative Meetings.

CHAIRMAN OF COUNCIL.

(By-law 62.)

125. The Chairman of Council is elected by that Council from its own number, and thus may have come on to the Council in any one of various ways, e.g., have been elected by grouped Representatives, by all the Representatives acting together, etc. By-law 62 requires verbal amendment to bring it into relation with the facts.

Recommendation.—That it be an instruction to the Council to take steps for amendment of By-law 62 (sixth line) so as to read for "group of Branches" "body or bodies."

Question of Steps to be taken whereby the Association may Become in Part a Federation.

Draft "Rules" or "Memoranda" of Representative Body as to Facilities for Federation or Affiliation accordingly.

126. In its report as to the question of the steps to be taken whereby the Association may become in part a federation (*B.M.J.* Supplement, March 5th, 1921, page 56, paras. 10-12), the Council stated that it proposed, in order to carry out the instructions of the Annual Representative Meeting at Cambridge, that the Representative Body should, under draft Article 8 and By-law 10 (5) (see same Supplement), adopt "Rules," which it could modify from time to time, as to the possible privileges of a body affiliating with the Association, and as to the terms and conditions of admission to affiliation.

127. The Council now submits accordingly, for the consideration of the Conference of Oversea Representatives on July 5th, the Divisions and the Representative Body, draft "Rules" or (as Counsel prefers to call them) "Memoranda," of the Representative Body on the subject (see Appendix II).

128. While thus carrying out the instructions contained in Minute 44 of the Annual Representative Meeting, 1920, the Council desires to add that, in its opinion, it would be inadvisable to affiliate to the Association at the present time any bodies whose ordinary membership is open to other than members of the medical profession. Any such step would not, in the opinion of the Council, as matters stand, add to the strength of the Association or of the medical profession as a whole.

129. The Council recommends:—

Recommendation.—That the A.R.M. 1921, adopt, as Memoranda of the Representative Body, the Memoranda, submitted in draft by the Council, in connection with the question of corporate members and nominating bodies.

SUBSCRIPTION.

(a) *Subscription of Oversea Members.*

130. The A.R.M., 1920, raised the subscription for members in the United Kingdom to 3, and for members

outside the United Kingdom to 2 guineas. The Council has since received representations as to the question of the subscription of Oversea members, from the Australian and New Zealand Branches. Having carefully considered the financial position of the Association and the special position of the Oversea Branches, the Council is of opinion that there is a case for reduction of the subscription payable to the Association by members resident overseas, other than members of the Royal Navy, Royal Air Force, Army and Indian Medical Services, from 2 to 1½ guineas. Much of the work done by the Council for the Branches at home and for the Services has to be done in the Dominions by the Branches themselves in combination, and this necessitates the levying of special local subscriptions.

(b) *Subscription of U.K. Members retired from Practice and U.K. Members of 40 years' standing.*

131. The Annual Representative Meeting at Cambridge instructed the Council to consider the question of reduction of the subscription of members retired from practice and of members of 40 years' standing.

132. The Council is of opinion that there should be a concession as regards the subscription payable by U.K. members of not less than 10 years' standing retired from practice, and by U.K. members of 40 years' standing whether retired from practice or not; and that the finances of the Association permit of a reduced subscription in respect of such members of 2 guineas.

(c) *Subscription of Husband and Wife resident in same House in U.K.*

133. The Council has also considered the question of a reduced subscription where husband and wife are both members and living in the same house in the U.K. The Council is of opinion that a reduction, from the ordinary joint subscription of 6, to one of 4½ guineas, is desirable in such cases.

(d) *(Alternative) Draft By-law Amendments accordingly.*

134. To meet the case (i.) where the R.B. desires to give effect to the above principles in existing By-law 11, or (ii.) in By-law 12 proposed by the Council as part of the plan for securing affiliation facilities (see *B.M.J.* Supplement, March 5th, 1921, page 60), the Council submits alternative Recommendations A and B.—

Recommendation A.—That the A.R.M., 1921, amend existing By-law 11 to read as follows:—

By-law 11. (1) On and after the 1st January, 1922, the annual subscription to the Association shall be as follows:—

A. *As to Members resident in any part of the United Kingdom—*

(i.) For a Member of not less than ten years' standing who has definitely and permanently retired from the active practice of the medical profession and has signed and transmitted to the Treasurer a declaration to that effect—Two Guineas.

(ii.) For any Member of not less than forty years' standing—Two Guineas.

(iii.) For a Member admitted to membership before the expiration of two years from the date of his registration under the Medical Acts—One Guinea and a Half until the 31st December next occurring after the expiration of four years from the date of such registration.

(iv.) For two Members being a husband and his wife residing together—Four Guineas and a Half.

(v.) Except as otherwise herein provided—Three Guineas.

B. *As to Members resident outside the United Kingdom—*

(i.) For any Officer of the Royal Navy Medical Service, the Royal Air Force Medical Service, the Army Medical Service, or the Indian Medical Service—Two Guineas.

(ii.) For any other Member—One Guinea and a Half.

Provided that any Member, wherever resident, who is admitted on or after the 1st July in any year, shall pay only half his current subscription for that year.

(2) For the purposes of this By-law a Member shall be deemed to reside in that place in which his ordinary place of abode is situate at the time at which according to the Regulations his subscription is considered due.

Recommendation B.—That the A.R.M. 1921 adopt, as a By-law of the Association, the following amended form of draft By-law 12 contained in the Appendix to the report of the Council as to the question of steps whereby the Association may become in part a federation (B.M.J. Supplement, March 5th, 1921, page 60):—

By-law 12. (1) On and after the 1st January, 1922, the annual subscription to the Association shall be as follows:—

A. As to ordinary Members resident in any part of the United Kingdom—

(i.) For a Member of not less than ten years' standing who has definitely and permanently retired from the active practice of the medical profession and has signed and transmitted to the Treasurer a declaration to that effect—Two Guineas.

(ii.) For any Member of not less than forty years' standing—Two Guineas.

(iii.) For a Member admitted to membership before the expiration of two years from the date of his registration under the Medical Acts—One Guinea and a Half, until the 31st December next occurring after the expiration of four years from the date of such registration.

(iv.) For two Members being a husband and his wife residing together—Four Guineas and a Half.

(v.) Except as otherwise herein provided—Three Guineas.

B. As to ordinary Members resident outside the United Kingdom—

(i.) For any Officer of the Royal Navy Medical Service, the Royal Air Force Medical Service, the Army Medical Service, or the Indian Medical Service—Two Guineas.

(ii.) For any other Member—One Guinea and a Half.

C. As to Corporate Members and Nominated Members—

Such sum whether by way of capitation or otherwise as the Representative Body may fix in each particular case.

Provided that any Member of any class (and in the case of an ordinary Member wherever resident) admitted on or after the 1st of July in any year shall pay only half the current subscription for that year.

(2) For the purposes of this By-law an ordinary Member shall be deemed to reside in that place in which his ordinary place of abode is situate at the time at which according to the Regulations his subscription is considered due.

AMOUNTS OF GRANTS TO BRANCHES.

135. The A.R.M., 1920 (Min. 51) instructed the Council to take steps for higher payments to the Divisions by the Branches. In view of the needs of the work of the Divisions and Branches, the Council finds that the existing By-law provision for ordinary grants to Branches, viz., up to a maximum of 4s. per Branch member, is insufficient

Recommendation.—That the A.R.M. 1921 amend By-law 23 (1) so as to read, in the 3rd and 4th lines, for "four shillings," "six shillings."

MEMBERSHIP.

136. The following is a statement of the changes in the membership during 1920 (the figures for 1919 are given for comparison):—

1919		1920		
New members ..	2,276	New members ..	2,627	
Arrears paid ..	111	Paid arrears ..	346	
Withdrawn		Withdrawn		
resignations ..	5	resignations ..	52	
	2,302		3,025	
Resignations ..	301	Resignations ..	716	
Deaths ..	834	Deaths ..	328	
Arrears ..	384	Arrears ..	741	
	1,019	Expelled ..	1	
	1,373		1,786	
Increase ..	1,373	Increase ..	1,239	

(Membership, December 31st, 1919 ... 21,355
Membership, December 31st, 1920 ... 22,594)

The Council is glad to report that in spite of the increase of subscription the net membership of the Association on March 4th showed an increase of 136.

NEW DIVISIONS AND BRANCHES.

137. During the year the Council has formed a number of new Divisions and Branches, including Ealing and Lewisham Divisions of the Metropolitan Counties Branch. For the new Branches formed overseas see para. 282 of this report.

HISTORY OF THE ASSOCIATION.

138. The Council considers it highly desirable that there should be a permanent record of the work of the Association and has asked Mr. S. D. Clippingdale, F.R.C.S., to prepare a short history for publication.

PROPAGANDA LITERATURE.

139. The following new leaflets have been prepared by the Propaganda Sub-Committee. They are now available and will be sent on application:—

"How does the B.M.A. spend its Money?"

"Science and the B.M.A."

"What the B.M.A. is doing now."

"Why all Poor Law Medical Officers should join the B.M.A."

"What the Association has done in connection with the Insurance Acts."

A "Services" leaflet is in preparation.

CONSTITUENCIES FOR ELECTION OF REPRESENTATIVE BODY, 1921-22.

(a) *Home Divisions.*

140. The Council has grouped the Home Divisions for election of Representatives, 1921-22, in the same way as for 1920-21, except that the Caithness and Sutherland Division of the Northern Counties of Scotland Branch, the Ealing Division of the Metropolitan Counties Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch, have each been made independent Constituencies.

(b) *Oversea Divisions.*

141. The Council has made each Oversea Division and Division-Branch an independent Constituency.

GROUPING OF BRANCHES FOR ELECTION OF THE COUNCIL, 1921-22.

(By-law 46 (a) and (b).)

142. Under the authority conferred upon it by the Representative Body, the Council has grouped the Branches and Constituencies for election of the Council, 1921-22, in the same manner as for 1920-21 (see B.M.J. Supplement, October 9th, 1920, page 90; and March 12th, 1921, page 72).

Science.

SCIENTIFIC WORK OF ANNUAL MEETING, 1921.

143. Guided by the experience of the very successful Meeting at Cambridge the three day sections have been limited to five, viz. Medicine, Surgery, Pathology and Bacteriology, Orthopaedics and Children's Diseases, Preventive Medicine and Industrial Diseases. It has been decided to hold six two-day sections in Oto-Rhino-Laryngology, Ophthalmology, Neurology, Venereal Diseases, Obstetrics and Gynaecology, and Physiology, Pharmacology, Therapeutics and Diabetics; whilst single day sections will be held in Ambulance and Red Cross, Dermatology, Radiology and Electro-Therapeutics, Urology, Proctology, and Medical Sociology.

B.M.A. LECTURES IN CLINICAL AND SCIENTIFIC SUBJECTS.

144. The increasing popularity of the scheme whereby the services of skilled lecturers are provided at the cost of the central funds is shown by the appended list of lectures which have been given since the A.R.M. of last year. In view of the growing demand for these lectures the Council has decided to set aside during 1921 an additional sum of £200, making a total of £400.

List of Lectures with Subjects since last A.R.M.

Lecturer's Name.	Title of Lecture.	Division or Branch.
Mr. Victor Bonney.	"Modern Methods in the Treatment of Difficult Labour."	Oxford and Reading Branch.
Dr. Robert Hutchison.	"The Diagnostic significance of Abdominal Pain in Childhood."	South Midland Branch.
Dr. W. Langdon Brown.	"The Internal Secretory Glands."	Suffolk Branch.
Dr. Henry McCormac, C.B.E.	"Some Observations on the Treatment of Syphilis."	Essex Branch.
Dr. H. Russell Andrews.	"Treatment of Uterine Fibroids."	Worcester and Hereford Branch.
Mr. A. Fleming.	"Vaccine Therapy in relation to General Practice."	Maidstone Division.
Prof. G. R. Murray.	"The Diagnosis and Treatment of the Diseases of the Endocrine Glands."	South Western Branch.
Mr. W. Sampson Handley.	"The Lines of Advance in the Surgery of the Breast."	Sheffield Division.
Major M. Sinclair, C.M.G., R.A.M.C. Do.	"Demonstration on the Treatment of Fractures." Do.	Border Counties Branch. Nottingham Division.
Mr. H. Wade, C.M.G., D.S.O.	"Modern Treatment of Fractures."	Fife Branch.
Dr. B. H. Spilbury.	"Criminal Abortion."	East York Division.
Dr. S. Alwyn Smith, O.B.E., D.S.O.	"Treatment of Fractures."	East Herts Division.
Sir Henry M. W. Gray, K.B.E., C.B., C.M.G.	"Application of the Professional Lessons of the War to Civil Work."	Northern Counties of Scotland Branch.
Sir Cuthbert S. Wallace, K.C.M.G., C.B.	"Shock."	Richmond Division.
Mr. Peter L. Daniel.	"The Differential Diagnosis of acute Abdominal conditions."	Worcester and Hereford Branch.
Mr. W. McAdam Eccles.	"The early Diagnosis of acute Abdominal affections."	City Division.
Dr. J. S. Haldane, F.R.S.	"Some recent Advances in the Physiology of Respiration, Circulation and Renal Excretion."	Edinburgh Branch.

STATE AWARD FOR SCIENTIFIC RESEARCH.

145. In 1914 the A.R.M. passed the following resolution:—

108. Resolved: That in the opinion of the Representative Body of the British Medical Association the petition of Sir Ronald Ross, K.C.B., F.R.S., to the House of Commons for remuneration for his services to the Empire in having discovered how malarial fever can be prevented, should be granted.

The Council decided subsequently that it would not press the Government to deal with the matter during the period of the war. With the return of peace conditions the Council approached the Chancellor of the Exchequer asking him to further a petition from Sir Ronald Ross to the House of Commons asking for compensation for losses in the emoluments of his profession owing to his work for the Empire in connection with malaria, citing the precedent of Jenner in support of the claim. The Chancellor of the Exchequer replied that, notwithstanding the precedent cited, it was not in accordance with modern usage for a petition of this class to be recommended to the House of Commons by the Crown on the advice of a Minister, and after reviewing the whole position he was unable to do anything. The Council thereupon addressed the Speaker of the House of Commons on the subject and asked him whether petitions could be received by him, and if not, whether he could indicate the route by which such petitions could be allowed to reach the House of Commons. The Speaker replied stating in accordance with the Standing Orders of the House that no application may be made for

a grant of public money except with the consent of the Crown. In the face of this opposition the Council came to the conclusion that no further action can usefully be taken by the Association in support of the petition of Sir Ronald Ross. The Council is co-operating with the Science Guild in efforts to find some way in which scientific inventors and discoverers may be encouraged by the State.

POST-GRADUATE MEDICAL INSTRUCTION.

146. In January the Minister of Health appointed a Committee, under the Chairmanship of the Earl of Athlone, to investigate the needs of medical practitioners and other graduates for further education in medicine in London, and to submit proposals for a practicable scheme for meeting them. The following gentlemen were asked by the Council to give evidence before this Committee:—

The President of the Association, The Rt. Hon. Sir T. Clifford Allbutt, K.C.B., LL.D., F.R.S.
Dr. C. O. Hawthorne, and
Mr. R. J. Willan, M.V.O., O.B.E.

The President's evidence was based on his wide general knowledge of, and long interest in, the subject. Dr. Hawthorne spoke as one who had much practical experience of Sir Jonathan Hutchison's Polyclinic, while Mr. Willan based his evidence on practical experience gained in connection with his successful efforts to promote post-graduate work on behalf of the Newcastle Division of the Association.

REMUNERATION OF LABORATORY AND RESEARCH WORKERS.

(a) *Whole-time.*

147. The Council has experienced difficulties in attempting to define for the purpose of advertisements submitted to the *Journal* the word "permanently" contained in the following Minute 65 of the A.R.M., 1920:—

Minute 65.—Resolved: That the minimum commencing salary of a whole-time medically qualified laboratory or research worker, who is permanently employed as such, should not be less than £500 per annum.

For instance, a laboratory worker may be permanently employed, but yet may be allowed to carry out in his employer's laboratory some private work which may be of pecuniary advantage to himself. The Council considers that Minute 65 of the A.R.M. should be so modified that the £500 minimum shall apply only to appointments which do not carry with them such advantages.

The Council recommends:—

Recommendation.—That Minute 65 of the A.R.M. 1920 be further defined as follows:—

That the minimum commencing salary of a whole-time medically qualified laboratory or research worker who is permanently and *exclusively* employed as such should not be less than £500 per annum.

(b) *Part-time.*

The Council recommends:—

Recommendation.—That those medically qualified laboratory or research workers holding part-time appointments should receive remuneration for the time engaged, at the rate of not less than £500 per annum.

THE LIBRARY.

148. The Council has considered a proposal that the Library should be made more accessible to members of the Association by making use of the Divisional machinery and has decided to try as an experiment in the South Essex Division, an arrangement whereby books from the Lending Library will be supplied to the members of the Division through the Division itself, the Division being responsible for the books. The details of the scheme are at present being worked out, and if the experiment proves a success these details will be communicated to other Divisions who may be anxious to adopt such a scheme.

149. The Council, last year, approved of a proposal whereby the Library was to remain open until 6.30 p.m. on week-days and 2.0 p.m. on Saturdays. This extension of hours has been responsible for 818 additional attendances and the Council proposes to continue the experiment for a further period of one year.

150. The catalogue of Periodical Publications in the Library is to be reprinted and brought up to date.

Medical Ethics.

PROFESSIONAL SECRECY.

151. The Council has given consideration to the following Minute 76 of the Annual Representative Meeting, 1920:—

That the Council be instructed to consider the extent to which, and the ways in which, the Association is prepared to support its members in maintaining professional secrecy.

The Council realises that there are times when public interest must prevail and over-ride the doctor's claim that information which he has obtained in a professional capacity shall not be disclosed, e.g., in a Court of Law when the Court has ruled that information of a confidential nature must be disclosed. Where a doctor refuses to obey the order of a Court in this respect the Council is of opinion that he must do so entirely on his own responsibility.

152. It appears to the Council, however, that the encroachments on professional secrecy are most likely to come from that side of Government which is concerned with the administration of the law. This tendency to encroachment has been partly in legislation and partly in judicial action. The Association had occasion not very long ago to resist with great difficulty a suggestion by the Lord Chief Justice and the Law Officers of the Crown that doctors should depart from their tradition of professional secrecy in order to aid the Law Officers in detecting the practice of abortion. The representations made by the Association were so effective that no further action has been taken in the matter, but at any time attempts may be renewed. The Council is of opinion that all such attempts should be resisted with all the means at the disposal of the Association.

153. The Council recommends:—

Recommendation.—(1) That when a medical practitioner refuses to divulge information which he has obtained in the exercise of his professional duties in such circumstances as the following:—

- (a) In a Court of Law when the Court has ruled that information so obtained must be disclosed;
- (b) where it is already provided by Act of Parliament that he must do so, for instance, in the notification of certain diseases;

such action must be taken entirely on his own responsibility and the Association cannot be expected to support him or protect him from consequences he may incur in so doing.

- (2) That if attempts be made to add additional exceptions to the general rule of the profession as regards professional secrecy, the Association recognises that it will be necessary, after consideration, (i.) to resist by all lawful means any such encroachment, and (ii.) where such encroachment is attempted, to accord support by any means in the power of the Association to any individual practitioner who may be assailed through such new encroachment.

SOUTH WALES COLLIERY MEDICAL AID SCHEMES.

154. The Council has sanctioned the insertion of eight Important Notices in respect of Workmen's Medical Schemes in the South Wales Colliery area. The Council views with great concern the extension of these Schemes and is desirous of supporting the local profession in its fight against them in every possible way. In order that the machinery of the Association may be placed promptly and fully at the disposal of the Divisions requiring it, the Council has adopted (with slight amendments) a Report of the Contract Practice Committee of the South Wales and Monmouthshire Branch, describing fully the objections, both public and professional, to Schemes formed under Section 15 (3) of the National Health Insurance Act.

IMPORTANT NOTICES.

155. During the year it has been necessary to insert several Important Notices in the *Journal* regarding Appointments the salaries attached to which did not conform to the scale laid down by the Representative Body. These Important Notices were only inserted at the request of the Divisions concerned, and in several

instances the Divisions also adopted resolutions under the Ethical Rules in relation to the appointments. The Council is glad to report that on several occasions such action had the desired result, the salary attached to the post being raised at least to the minimum recognised by the Association, and many practitioners are known to have refrained from applying for appointments after they had considered the objections to the appointments which were placed before them by the Association.

156. In order that the Important Notices may be utilised with no avoidable delay in cases where the salary of a whole-time or part-time appointment does not conform to a recognised minimum laid down by the Association, the Council has authorised the Chairman of the Central Ethical Committee to insert such Notices without waiting for the application of a Division or Branch under certain conditions. The conditions are (i.) that the salary or conditions of the appointment in question do not conform to a recognised minimum laid down by the Association, and (ii.) that the Division or Branch within whose area the appointment lies must have adopted the current rules of procedure in ethical matters. The adoption of this procedure will enable an Important Notice to be inserted promptly in cases where the delay consequent on following the present procedure, which is to wait for the initiative to be taken by the Division, might be dangerous.

Ministry of Health.

157. A Ministry of Health Committee was again appointed by the Council with a general reference to consider and report from time to time what should be represented to the Minister of Health as being the ideal system of Medical and Allied Services which would receive the support of the profession and towards which the Government should work. Representatives of the Medical Women's Federation, the Poor Law Medical Officers' Association, the Society of Medical Officers of Health and the British Dental Association were co-opted, as were all the members of the Association who are also members of the Consultative Councils in England and Wales.

REPORTS OF THE CONSULTATIVE COUNCILS OF THE MINISTRY OF HEALTH.

158. The Council in accordance with the instructions contained in Minutes 145 and 149 of the A.R.M. 1920, and after consideration of the opinion as to the Report of the Consultative Council expressed by the Meeting in Minutes 148, 149, 151-3, prepared and issued to the Divisions and Branches in October, 1920, the Memorandum (D. 4) (Appendix III. hereto) and Questions (D. 5) (Appendix IV. hereto) on the Report of the Consultative Council on Medical and Allied Services:—

Minute 145.—That the A.R.M. thanks the Ministry of Health Committee for work already undertaken and proceeds to consider the general principles contained in the Report of the English Consultative Council to the Ministry of Health; and that the whole question be submitted anew to the Divisions and thereafter considered at a Special Representative Meeting.

Minute 147.—Resolved: That the discussion on the question of the Report of the Consultative Council of the Ministry of Health be closed at 4 p.m. this afternoon; and that the matter be then referred to the Council to consider and to submit an exhaustive report to the Divisions, and to call, in due time, a Special Representative Meeting to consider this matter.

159. Division Secretaries were supplied with copies of the Reports of the English and Welsh Consultative Councils and of the summaries thereof, which had appeared in the *B.M.J.* May 29th and June 5th, 1920, and were asked to forward the replies of their Divisions to the Questions by November 15th, 1920, in view of the instruction of the A.R.M. 1920, as to the calling of a S.R.M., and the possibility of legislation early this year. Subsequently, however, the Council did not consider it necessary to incur the expenditure of calling a S.R.M. as it seemed very improbable that there would be any legislation before the A.R.M.

160. Up to January 14th, 1921, replies to the Questions were received from 127 Divisions and Branches, and a brief résumé thereof is given in Appendix V. hereto.

161. It was evident from the replies of a number of the Divisions that they had understood Question 1 as necessarily involving the establishment of a whole-time Salaried

State Medical Service, and that owing to this misapprehension some of their answers to subsequent questions had been prejudiced. It is necessary therefore to restate the question, and the Council hopes that the Divisions will give the following paragraph their careful consideration and instruct their Representatives, so that when the matter is discussed at the Representative Meeting the opinion of the Association on what is a fundamental point may be clearly elicited.

The original question was:—

“ Domiciliary Attendance.”

Should the State assume the responsibility for seeing that for every household in the land a family doctor is available? ”

162. What the Ministry of Health Committee was trying to bring out in the question was whether or not it is desirable that the State should undertake the responsibility for seeing that there is no district in the country without a practitioner who may be consulted when needed, payment for his services being made by one of the methods now in vogue:—

(1) As regards necessitous persons, by the public authority;

(2) As regards insured persons, under arrangements made by National Insurance Authorities; and

(3) As regards others, by payment of fees to the doctor himself, either by periodical contribution or on the basis of services rendered.

The question might in other words be restated as follows:—

Domiciliary Attendance.

Should the State assume responsibility for seeing that for every person requiring medical attention there should be available a general practitioner, who, however, would not necessarily be in the whole-time service of the State; whose services would only be available free of charge if the person were necessitous; and whose services should otherwise be available either on a contract or insurance arrangement, or on payment of fees?

MINISTRY OF HEALTH (MISCELLANEOUS PROVISIONS) BILL.

163. In the before-mentioned Memorandum the Council drew the attention of the Divisions to Clause 11 of the Ministry of Health (Miscellaneous Provisions) Bill, introduced into the House of Commons on August 16th last. That clause proposed to give the Councils of Counties and County Boroughs power (already possessed, but rarely exercised, by urban and rural sanitary authorities under the 1875 Public Health Act) to supply and maintain hospitals (including out-patient departments) of a general or special character; to contribute on terms and conditions to be approved by the Minister of Health to any voluntary hospital or similar institution in their area; and to maintain any poor law hospital or infirmary in their area.

164. The Council immediately made representations to the Minister of Health that there should be such amendments made to the Bill, and to the 1875 Public Health Act, as would require all local authorities to obtain the sanction of the Ministry of Health to their proposals before exercising any of their powers thereunder. It was felt that before such powers were conferred at all, it was essential that the conditions under which patients could be received into such aided or maintained hospitals, and the terms and conditions of the appointment of the staffs of such hospitals, should be made the subject of consultation with the profession. Dr. Addison was reminded that the Report of the Medical Consultative Council pointed out that “ many hospitals schemes are likely to be defective because their promoters fail to realise that a modern hospital should be part of a more comprehensive organisation.”

165. The Minister of Health thereupon invited a deputation to meet him and it did so on November 1st, 1920, the proceedings being fully reported in the *B.M.J.* Supplement of November 6th, 1920. It will be seen from that report that the Minister accepted the suggestions of the Association as regards the above Bill; agreed that on questions affecting the profession there should be consultation with it, and raised the question of a central committee representative of the medical profession which he could consult on questions of health legislation. The Bill was dropped, but as will be noted from references in the Hospitals section of this report the hospital problems which it was intended to deal with still remain and have caused much anxiety.

LOCAL MEDICAL ADVISORY COMMITTEE.

166. The possibility of general action by local health authorities on the lines of the suggestions in the Report of the Consultative Council, together with sporadic action such as has taken place at Bradford (*see* para. 255), has raised the question whether Local Medical Advisory Committees should be set up in anticipation of any legislation so as to be ready to be consulted by any Local Authority, or to press its views unasked on any such Authority as was taking steps likely to prejudice the interests of the profession locally. The necessity of such a Committee, representative of the whole profession, has been recognised by the Representative Body, which was, however, then contemplating that the Committee would be a statutory body. Pending the setting up of a Statutory Local Medical Advisory Committee it is a question whether the profession should elect such a Committee or should press for the recognition of the local Division or Branch of the B.M.A. when the area of that Division or Branch is approximately coterminous with that of the Local Authority. The matter is receiving the attention of the Council.

Proposed Central Medical Committee Representative of the Profession as a whole to consult with the Minister of Health on Questions of Policy affecting the Profession.

167. When, as mentioned in para. 165, a deputation from the Association waited upon the Minister of Health in regard to certain clauses in the Ministry of Health (Miscellaneous Provisions) Bill, after agreeing to accept, in the main, the suggestions brought forward by the deputation, Dr. Addison spoke at length in regard to a request made for consultation with the profession on the general policy of utilising the Poor Law Institutions for general hospital purposes. He said:—

“ On several occasions I have said in public ‘ If you want us to consult you, get busy and set up machinery whereby you can readily be consulted.’ I quite agree as to the reasonableness of consultation in the formative stages regarding regulations or conditions, or general principles, if some machinery for consultation were available, but I will not consult half a dozen different bodies, each claiming to represent the profession. No body of medical men is more competent than those before me to-day to state a case for the profession, and I should be very glad to see them in consultation. I am speaking now, of course, of consultation with an exterior body, in respect of the profession generally. I am leaving out of account for the moment the Consultative Council, which is now a part of the machinery of the Ministry. As soon as practicable, I, or an officer acting on my behalf, will be willing to discuss the general principles with some body representing the profession. I can imagine no organisation better qualified than the British Medical Association to get together a representative body, but I repeat that I am not going to make an agreement of this kind with a number of different bodies, each claiming to be representative.”

168. Subsequently the following correspondence took place between the Chairman of Council and Dr. Addison:—

“ Ministry of Health,

“ Whitehall, S.W.1.

“ November 26th, 1920.

“ Dear Professor Bolam,

“ You will remember that at the deputation from the British Medical Association which met me on the 1st instant, the question of consultations with the profession was discussed, and I stated that I was quite ready to agree to consult a representative body on questions of policy affecting practitioners, but that I could not undertake to consult all the various bodies which now claim a representative character. The difficulty is how to secure the appointment of a body which will be recognised not only by practitioners of all classes, but by the various existing organisations as expressing the views of all sections of the profession. It is, of course, not for me to make any suggestions as to how such a body might be, or ought to be, constituted. But I am satisfied that it will be impossible to secure the constitution of a representative body without the good offices of the British Medical Association in bringing them

together, and if your Council have not already done so, I would suggest that you should now initiate action to secure the appointment of a body whose credentials will be incontestable.

"Yours truly,
(Signed) CHRISTOPHER ADDISON."

"3, Queen's Square,
"Saville Row,
"Newcastle-on-Tyne.
"November 29th, 1920.

"Dear Dr. Addison.

"I am much obliged for your letter of the 26th instant.

"We took at once certain preliminary steps to secure a representative body, such as you kindly agreed to consult. The difficulties of satisfying all interests concerned are so great that one is bound to proceed cautiously in order to avoid jeopardising the successful result of negotiations. The matter was placed before our Ministry of Health Committee, and we have appointed a small Committee, consisting of the Officers of the Association, viz.: Sir T. Clifford Allbutt, Dr. T. W. H. Garstang, Dr. R. A. Bolam, Dr. G. E. Haslip, the Chairmen of the following standing Committees:—

"Ministry of Health Committee (Mr. E. B. Turner);

"Public Health Committee (Dr. T. Ridley Bailey);

"Insurance Acts Committee (Dr. H. B. Brackenbury);

"Hospitals Committee (Mr. N. Bishop Harman); together with Lord Dawson, Sir Malcolm Morris, K.C.V.O., and Dr. Ewen J. Maclean, Cardiff.

"The reference to this Committee was to consider and make a recommendation to the Council as to the suggested personnel of a representative body to consult yourself on questions of policy affecting practitioners. The meeting of this Committee is arranged for the 8th prox., in order to report to Council, which meets on 15th December.

"On behalf of the Council, I would wish to assure you that we are fully alive to the importance of obtaining, if possible, a body whose credentials, as you say, shall be incontestable in regard to its representative character. No effort will be spared on our part to reconcile conflicting interests, and attain that most desirable end.

"Yours sincerely,

(Signed) R. A. BOLAM."

(Note.—Sir Malcolm Morris declined to serve, and Dr. Gordon Dill was appointed in his stead.)

169. In December, 1920, the Council expressed the view that the B.M.A. itself adequately represents the views of the profession, by reason of the facts (1) that the Association contains a majority of the members of the profession, and, so far as is known, this is approximately true of every section of the profession; (2) that on the Committees of the Association dealing with Medico-Political matters there are representatives of other important medical societies officially nominated by them; (3) that the Insurance Acts Committee contains a majority of members directly elected by the Panel Committees of the country and so is representative of insurance practitioners, whether members of the B.M.A. or not.

170. The Council nevertheless was prepared to assist in establishing a Joint Representative Committee on which those Medical Corporations, Societies, or Committees with which the Association has been accustomed to work shall be invited to appoint representatives in due proportion, this Joint Representative Committee, if established, being empowered to confer with any other medical society not represented on the Joint Representative Committee before making representations to the Ministry of Health on behalf of the profession on any matter.

171. Preliminary negotiations for the establishment of such a Representative Committee were entrusted by the Council to an *ad hoc* Committee consisting of the Officers of the Association, together with Dr. J. A. Macdonald, Sir Jenner Verall, Dr. H. B. Brackenbury, and Dr. Ewen J. Maclean, to consider the position thus created, and to ascertain whether or not the Scottish Committee desired

that it should be represented on the proposed Committee. That Committee was of opinion that it should be represented.

172. The Council has communicated with the Society of Medical Officers of Health, the Medical Women's Federation, the Poor Law Medical Officers' Association of England and Wales, the Medico-Psychological Association, and the Association of Certifying Factory Surgeons, informing them of what had transpired, and asking them if they would be willing to co-operate with the Association in forming a body which could be suggested to the Minister of Health as providing him with the representative medical body which he had asked for.

173. It was left to the Chairman of Council to take action in communicating to the Royal Colleges the fact that the Association is in touch with certain medical bodies with which it has worked in the past, and that when relationship has been established with these bodies as regards the proposed new Committee, it is the intention of the Association to approach the Royal Colleges with a view of ascertaining under what conditions their co-operation could be secured.

174. Meanwhile the Council was called upon to deal with the proposal that another body should take the initiative in forming the body suggested by Dr. Addison. The communication and Memorandum enclosed therewith (Appendix VI.) were received from the Federation of Medical and Allied Societies inviting the Association, together with other bodies, to appoint three representatives to attend a private Conference upon the subject of a Central Representative Medical Committee on February 1st.

175. In view of the previous decisions of the Representative Body and Council upon the question of co-operation with the Federation, the Federation was informed that the Association regretted that it was unable to accept the invitation of the Federation to the Conference on February 1st, because the Minister of Health, in a letter dated November 26th, 1920, had asked the British Medical Association itself to "initiate action to secure the appointment of a body whose credentials will be incontestable," and the Association was engaged in trying to constitute such a body.

176. With a view of securing that the Association's point of view shall be known to all concerned the appended Memorandum (Appendix VII. hereto) was forwarded to (i.) the Minister of Health, (ii.) the various persons and bodies signing the above invitation of the Federation, (iii.) the Royal Colleges and other Societies invited to the Conference, and was published in the B.M.J. of 19th February.

177. The present position is that the Society of Medical Officers of Health, the Poor Law Medical Officers' Association, and the Association of Certifying Factory Surgeons have agreed to co-operate in the formation of the proposed Committee. The Medical Women's Federation is discussing the matter at its next Council meeting to be held in May. The Medico-Psychological Association has stated that it would be glad to co-operate with the British Medical Association through the Federation of Medical and Allied Societies in all matters and questions to be considered by the Ministry of Health.

Medico-Political.

FEE FOR NOTIFICATION OF INFECTIOUS DISEASES.

178. The Council, after careful consideration of Minute 160 of the A.R.M., 1920, which instructed the Council to press for the raising of the fee for notification of infectious diseases to 5s., came to the conclusion that it would be unwise to press the Government to increase this fee at the present time, and has concentrated its attention on trying to hasten the time when the old fee of 2s. 6d. shall be restored.

The A.R.M. 1920 also passed the following Minute 159:—

That the Representative Meeting instruct the Council to press for the immediate reversion to the 2s. 6d. fee for the notification of infectious diseases.

The 2s. 6d. fee for notification of infectious diseases was reduced to 1s. by Clauses 5 (2) and 24 (2) of the Local Government (Emergency Provisions) Act, 1916, and it cannot be restored except by (a) a special Act of Parliament, or (b) the official declaration of the end of the war. The Council has found no encouragement from any source for the suggestion that a special Act of Parliament should be demanded for the purpose of restoring the fee. Its efforts to hasten the official declara-

tion of the end of the war have been fruitless, because it is evident that many things of great national importance will be affected by that declaration. The matter has been pressed on the attention of the Ministry of Health by letters and on the notice of Parliament by questions and by an attempt to include a clause in the Ministry of Health (Miscellaneous Provisions) Bill, but all without effect. Judging by the latest statements by Ministers on this subject, the declaration of the end of the war cannot be long delayed, and we have the promise of the Ministry of Health stated in their circular to Local Authorities in December, 1919, that the fee will at once revert to 2s. 6d.

179. The Council urged the Minister of Health to take the necessary steps to give effect to the following Minute 162 of the A.R.M. 1920:—

That all necessary postage on notifications should be prepaid by the Authority responsible.

but the Ministry replied that it had no power to authorise or require local authorities to prepay postage on these forms, which by Statute are supplied free of charge to medical practitioners.

GAS LIGHT AND COKE COMPANY'S EMPLOYEES' BENEFIT SOCIETY.

180. The Council is pleased to report action which has resulted in a very substantial increase in the remuneration of the Medical Officers of the Gas Light and Coke Company's Employees' Benefit Society. When these negotiations were commenced, the Society was paying its Medical Officers 7s. 6d. per annum per family to include all the dependants. With very considerable difficulty the Council induced the Medical Officers to take combined action, and they are now receiving 21s. per family, together with several other concessions desired by them.

VICTORIA (AUSTRALIA) FRIENDLY SOCIETY APPOINTMENTS.

181. For many years the B.M.A. in Australia has been fighting the Friendly Societies for improved terms for medical contract work, and a uniform form of agreement between the Lodges and the doctors. An important Notice was first inserted on June 27th, 1914. The fight came to a climax on 21st May, 1919, when the Victorian Branch asked for the help of the Council in preventing the proposed importation of medical men from England. The "Important Notice" in the *B.M.J.* was continued, and advertisements were inserted in some of the most important newspapers in England, Scotland and Ireland, requesting doctors to apply for information before accepting any appointment connected with the Friendly Societies in Victoria, Australia. The Societies sent a representative to the United Kingdom to obtain medical practitioners, but their efforts were frustrated, for a report has since been received from the Secretary of the Victorian Branch stating that only four doctors were obtained from England, and that as a result of the action taken by the Association eleven of the fifteen Societies concerned have come into line with the policy of the B.M.A. The Victorian Branch has expressed its cordial thanks to the Council for the help thus given. The incident is very gratifying, not only because of the success of the action of the Association, but because it affords a concrete example of the advantages which our Oversea Branches may derive from their connection with the Association.

FEES FOR TRINITY HOUSE SURGEONS.

182. As a result of negotiations with Trinity House, the Elder Brethren have agreed to pay their M.O.s a 13s. capitation fee, as against a pre-war fee of 8s. for attendance on their employees, including the provision of medicines.

M.A.B. AND BONUSES FOR MEDICAL WOMEN.

183. As a result of negotiations by the Association and the Medical Women's Federation, the Metropolitan Asylums Board has granted the same war bonus to its women doctors as to the men, though previously they have made a difference between the two sexes. The Medical Women's Federation has thanked the Association for its help.

TAXATION OF MOTOR CARS.

184. The Council reports (i.) that the gist of Minute 178 of the A.R.M. 1920 (*i.e.*, that the fairest way to tax motor locomotion was by way of a tax on motor spirit)

was forwarded to the Minister of Transport on 16th July, 1920, and the attention of Sir William Joynson-Hicks, M.P., was also drawn to it; (ii.) that by invitation of Sir William Joynson-Hicks, the Chairman and Deputy Medical Secretary attended a deputation to the Minister of Transport on 18th June, 1920; (iii.) that representatives of the motor industry who were present were chiefly concerned in proving that the industry was in favour of a spirit tax of 1½d. per gallon as against the Government's proposed horse-power tax; and (iv.) that the Minister undertook to consider the facts and figures placed before him, and stated that it was a matter of indifference to him how the tax was levied so long as it produced the necessary 8½ to 8½ millions. The Government eventually decided to stand by its horse-power standard and definitely refused to make any rebates to any classes, whether commercial or professional. The Council has decided to co-operate with the Automobile Association and Motor Union in its efforts to obtain the substitution of a petrol tax for the present horse-power tax.

CENTRAL EMERGENCY FUND.

185. This voluntary fund was created by the Council in 1905 to assist members of the profession in maintaining their interests against organised bodies of the community. It is a Trust Fund and therefore not subject to any of the restrictions placed on the funds of the Association by Company Law. For some time no grants have been made from the fund, but past experience has shown how useful it can be in enabling individuals to face the financial difficulties which may be incurred by them when standing out for the policy recommended by the Association. The Council urges members to keep the fund well supported as need for it will certainly arise before long. An audited statement of the fund appears amongst the financial statements in this Report.

REPORT OF DEPARTMENTAL COMMITTEE ON WORKMEN'S COMPENSATION.

186. The Council has had before it (a) an analysis (as far as the recommendations affect the medical aspect of the Act) of the Report of the Departmental Committee appointed by the Home Office to inquire into the working of the present system of the payment of compensation to workmen for injuries sustained in the course of employment; and (b) a comparison of these recommendations with those of the Association as placed before the Departmental Committee. Further action is being reserved until legislation is introduced.

FEES FOR MEDICAL REFEREES UNDER WORKMEN'S COMPENSATION ACT.

187. The Council drew the attention of the Treasury to the fees which were fixed by the Treasury in 1907 for Referees under the Workmen's Compensation Act, and urged that they should be increased by 50 per cent.

To this the Home Secretary replied that he was not satisfied that any general revision of fees was necessary, and that the all-round increase proposed by the Association involving a substantial addition to public expenditure could not be entertained, especially in the present financial situation, unless the case for it were clearly established. The Council realises that the present time is probably as bad a time as could be selected for pressing such claims on the Treasury, and has decided not to press this matter further until a more suitable occasion.

FEES FOR MEDICAL EXAMINATION FOR LIFE INSURANCE.

188. The scale of fees set out in Minutes 119, 124, 128-30 of the A.R.M. 1920, has been accepted by the Insurance Companies represented by (a) the Life Offices' Association, and (b) the Association of Industrial Assurance Companies and collecting Friendly Societies. On the suggestion of the Life Offices' Association it has also been agreed that in the case of Industrial Offices which issue policies in their Ordinary Branches for £50 and under, if the 5s. form of examiner is used a fee of 5s. will be paid to the medical examiner; and if the 10s. 6d. form is used the fee will be 10s. 6d. The agreement has been loyally supported by both the Insurance Companies and the members of the Association, with exceedingly few exceptions.

MINIMUM SCALE OF FEES FOR PUBLIC DENTAL OFFICERS.

180. At the request of the British Dental Association for assistance in its efforts to carry into effect a scale of minimum salaries for Public Dental Officers, the Council has decided that advertisements offering a salary less than £500 per annum for whole-time single-handed Dental Officers, and advertisements offering less than £450 per annum for Assistant Dental Officers, shall not be inserted in the *B.M.J.*

VACCINATION.

190. The Council, acting on instructions contained in Minute 194 of the A.R.M. 1920, sent letters to the Ministry of Health of England and the Board of Health, Scotland, stating that in the opinion of the Association a session for vaccination should be limited to 2½ hours; that the fee for medical practitioners serving should be not less than £2 2s. per session; and that for whole-time service in performing vaccination the fee should be not less than £12 12s. per week. Only acknowledgments have been received.

POST OFFICE MEDICAL OFFICERS.

191. Continued efforts have been made by the Council to obtain recognition of the Association by the Postmaster-General as the mouthpiece of Post Office Medical Officers. This he has persistently refused to grant as he looks upon the Association of British Postal Medical Officers as the official body. As the Council knows that the number of Postal Medical Officers in the B.M.A. far exceeds those in the other Association it intends to pursue the matter if the Postal Medical Officer members of the B.M.A. will authorise it so to do. The Council has therefore issued a letter to all members who are Post Office Medical Officers asking them to state if they desire that pressure should be brought to bear on the P.M.G. with a view to obtaining his recognition of the B.M.A. as the body representative of Postal Medical Officers. Of the 1,411 members to whom this letter was issued, 814 have agreed to the proposed action of the B.M.A. and 18 have disagreed. A further letter is being sent to the 579 P.O.M.Os. who have not replied to the first letter.

FEES FOR MEDICAL PRACTITIONERS CALLED IN BY THE POLICE.

192. Pursuant to the following Minute 161 of the A.R.M. 1920:—

That fees for Police Calls should be:—Day Call, 7s. 6d.; Night Call, 10s. 6d.,

the Council considered the subject and, finding that these fees are settled locally and not by any central authority, issued a circular to all Divisions in the United Kingdom asking them to take steps locally to obtain the fees laid down in the Minute of the A.R.M., and failing that, to press for at least a 50 per cent. increase on the local pre-war fees. A number of Divisions have reported successful action in this matter.

GOVERNMENT COMMITTEE ON BLINDNESS.

193. Information having been received that evidence was to be taken by the Government Committee on Blindness, on the connection between industrial disease and blindness, the Council considered that this was a favourable opportunity to put forward witnesses who would speak *inter alia* as to the false economy of the Government in suppressing the reports of certifying factory surgeons on accidents. On 22nd March, 1921, Dr. W. F. Dearden (Honorary Secretary, Association of Certifying Factory Surgeons) and Dr. Percival J. Hay, Senior Ophthalmic Surgeon, Royal Hospital, Sheffield, gave evidence before the Committee.

FEES FOR MEDICAL PRACTITIONERS ATTENDING COURTS MARTIAL.

194. The Council, after consideration of the fees payable under Army Council Instruction 279 of 1920, to medical practitioners subpoenaed to attend Courts Martial: (viz. £2 2s. per diem for giving evidence and third class return railway fare, unless otherwise specially allowed by the Court), informed the War Office that it was of opinion (i) that Medical Officers should be placed in the same position as Army Officers when travelling, and allowed first class return railway fare; and (ii) that the fee for medical practitioners giving evidence at Courts Martial should be increased by 50 per cent. The Council is glad

to be able to report that these fees have, as from 4th May, 1920, been increased by 50 per cent. The Court now has authority to grant first class fares at its discretion.

UNEMPLOYMENT INSURANCE ACT, 1920.

195. The following rulings under the Unemployment Insurance Act, 1920, have been given by the Minister of Labour, to whom representations have been made by the Association with regard to persons employed by doctors:—

- (i.) That a domestic servant (in the employ of a medical practitioner), part of whose duties is to answer the door to patients "is not . . . an employed person within the meaning of the said Act;"
- (ii.) that doctors' coachmen and chauffeurs are employed persons within the meaning of the Act; and
- (iii.) that a medicine boy, who also acts as a messenger and cleaner of a surgery which is separate, but attached to the doctor's house, is an employed person within the meaning of the Act.

DEATH CERTIFICATION AND CORONERS' LAW.

196. On 3rd August, 1920, the Home Secretary and the Minister of Health received a deputation from the Association on the above matters. A full report of the deputation was published in the Supplement of 14th August, 1920 (p. 62), from which it will be seen that the main points raised were (a) dissatisfaction with the present form of death certificate, which made it possible for a doctor to certify death without having seen the dead body; (b) that it was objectionable that the paper certifying the cause of death should be handed to relatives of the deceased; (c) that there should be a dual certificate, one part stating the fact of death, to be given to the relatives, and the other part stating cause of death to be sent to the proper authorities; (d) that reform was needed with regard to the issue of burial orders, the registrar being entitled at present to issue such a certificate on information only, and could take a statement from any unqualified person, or relatives; (e) that there was need for legislation to govern the action of Coroners in investigating causes of death following accidents, and to prohibit riders by juries making remarks about people who were not present to defend themselves; (f) that reform was necessary with regard to identifying bodies; (g) that a fee should be provided for signing death certificates; (h) that a doctor should be entitled to a fee for giving evidence which might obviate the necessity for an inquest; (i) that a Resident M.O. of an institution who is called upon to give evidence at an inquest on a person who died in the institution should be paid for his attendance; and (j) that a fee of £1 1s. for a post-mortem examination was inadequate.

The Home Secretary and the Minister of Health both stated by letter that the points raised by the Association were receiving careful consideration, but no further information has been obtained. The questions are to be discussed with the Medical Parliamentary Committee at an early date, but it is understood that the probability of securing legislation this year is small.

SALARIES AND SUPERANNUATION OF PROFESSORS AND TEACHERS.

197. Pursuant to Minutes 65, 66 and 68 of the A.R.M. 1920, the Council has considered the question of the adoption of scales of salaries for members of the medical profession who are professors or teachers at Universities or Teaching Colleges, and makes the following recommendations in connection therewith:—

Relatively Higher Rate of Salaries of Medical, as Compared with Other Teachers.

Recommendation.—That in view of the longer period required for the education of a medical practitioner, as compared with other professions, the salaries of Medical Professors, Teachers, or Laboratory Workers should be at a higher rate than for other professions.

Non-Professorial Staff.

Recommendation.—That the essentially whole-time Non-Professorial Medical Teaching Staff should be divided into three grades as defined below, and with salaries as stated:—

Grade III.—Comprising those who are junior workers temporarily employed on probation; no person shall remain in Grade III. for more than two years.

That the minimum salaries for Grade III. be as follows:—

1st year	£300
2nd "	£350

Grade II.—Comprising Laboratory or Research Workers, or Teachers, who are permanently and exclusively employed as such.

That in accordance with Minute 65 of A.R.M. 1920, the minimum commencing salary for Grade II. shall be £500 per annum and that the full scale of this grade shall be as follows:—

1st year	£500
2nd "	£550
3rd "	£600
4th "	£650
5th "	£700
6th "	£750

and that this scale should not preclude a further increase in salary when circumstances render it desirable.

Grade I.—Comprising those of Grade II. whose qualifications or duties justify a position of seniority in status and a higher remuneration.

That the minimum salaries for Grade I. be as follows:—

1st year	£750
2nd "	£800
3rd "	£850
4th "	£900
5th "	£950
6th "	£1,000

and that this scale should not preclude a further increase in salary when circumstances render it desirable.

That after the probationary period (*i.e.*, Grade III.) has been completed, dismissal should only be possible on grounds of neglect of duty, improper conduct, or incapacity.

Professorial Staff.

Recommendation.—That the minimum salary for Professors who are permanently and exclusively employed as such should be £1,500 p.a.; the more important Chairs carrying considerably higher remuneration.

MEDICAL CERTIFICATES OF INABILITY TO ATTEND SCHOOL.

198. Pursuant to Minute 156 of A.R.M. 1920, the Education Authorities in England and Wales (326) have been informed that the Association is of opinion that where an elementary school authority requires a medical certificate of the inability of a child to attend school, the fee for such certificate should be paid by the Education Authority. The Education Authorities have also been informed that the Association is of opinion that a form of certificate should be provided for use in cases where the school attendance officer or other representative of the local education authority requires a certificate to be furnished. Up to 30th March, 1921, 53 replies had been received, of which (a) 21 stated that the matter should receive attention; (b) 9 stated that the onus for provision of certificates was on the parents; (c) 7 that they provide a certificate and pay for it, 1s. being the usual fee; (d) 2 were not in sympathy; (e) 8 were taking no action; (f) 2 asked what the fee should be; (g) 4 provide a School M.O. from whom certificates are obtained free of charge. The Scottish and Irish Medical Secretaries have been asked for their remarks on how this matter should be dealt with in Scotland and Ireland.

FEES AND TRAVELLING ALLOWANCES FOR MEDICAL WITNESSES.

199. Minutes 158 and 180 of the A.R.M. 1920, stated (i.) that the fees for medical witnesses should be 3 guineas for giving evidence at Assizes, County Courts,

and Petty Sessions, and 2 guineas in addition as a qualifying fee, and (ii.) that the Council should endeavour to obtain increased travelling allowances for medical witnesses, particularly where a journey by motor car is necessary. The Council reports that, after full consideration, whilst not considering the fees and travelling allowances to medical witnesses satisfactory, it is of opinion that the time is not opportune to apply for a further increase. As a result of representations made last session (as reported to the A.R.M. 1920) the allowances to medical witnesses in criminal cases were increased by 50 per cent. as from 25th March, 1920.

TRAVELLING ALLOWANCES OF PRACTITIONERS ATTENDING CORONERS' INQUESTS.

200. All County Councils in England and Wales (62) have been asked to grant travelling allowances to medical practitioners when attending coroners' inquests, and 27 replies have been received, of which 21 stated that the matter would receive attention; 4 gave details of travelling expenses which they are actually paying; and 2 asked for further information.

MEDICAL ATTENDANCE ON MINERS' AND OTHER WORKERS' FAMILIES.

201. Pursuant to Minutes 111 112 of the A.R.M. 1920, the question of the establishment of a minimum uniform contract practice rate for the dependants of miners and other workers throughout the United Kingdom has been considered, and the Council has come to the conclusions (i.) that it is impossible to establish a minimum uniform contract practice rate throughout the United Kingdom, and (ii.) that it is desirable, where possible, that minimum uniform rates should be established for areas in which conditions are approximately the same. The conditions both economic and social vary considerably from area to area, and so do the desire and capacity of the medical profession for organisation with a view to improvement of conditions. The Council believes that most good can be done by first trying to establish an ideal of what contract practice in the industrial areas should be, and secondly by pressing the better organised areas to try to get the model system adopted locally, in the hope that the more backward areas will gradually follow. Wales and Monmouthshire are not included in this scheme because many areas are paid by the poundage system and it is thought best, at first, to deal with the commoner capitation system, leaving Wales to be dealt with later.

202. The Council has accordingly instructed the Medico-Political Committee to draw up and submit to the Division for consideration, a model scheme embodying the conditions of service and the method and amount of remuneration for attendance on miners' and other workers' dependants in England (Monmouthshire for this purpose being excluded), as outlined below —

(i.) Free choice of doctor by patient and of patient by doctor;

It may be thought that as "free choice" is so essential a part of the creed of the Association as applied to contract work it is hardly necessary to emphasise it. As a matter of fact, however, there are still areas where doctors, by trying to preserve monopolies, are greatly hampering the struggle for better conditions. The Council is of opinion that it is impossible to organise a strong movement for improvement of remuneration and other conditions unless the workmen are promised free choice of all the doctors in the neighbourhood who are willing to do that kind of work.

(ii.) Weekly deductions to be made at the colliery or works office and disbursed direct to doctors without intervention of any Committee;

(iii.) That a Joint Committee should be set up to consider questions arising as to conditions of service;

(iv.) That as the conditions of service will be less onerous than conditions under the National Insurance Act, the remuneration should not be on the same scale, but should in no case be less than 4½d. per week if paid by all workers, married or unmarried, or 9d. per week, if paid by married men (including unmarried men with dependants) only; and

(v.) That as it is realised that the conditions in certain areas may not allow of the above terms being obtained, the approval of the Council may be given

provisionally to a scheme involving a less payment when the local Division can show that the conditions in the area demand it.

FEES FOR MEDICAL PRACTITIONERS CALLED IN ON THE ADVICE OF MIDWIVES.

203. After a very careful review of all the circumstances the Council reports to the A.R.M. that it considers it inadvisable to suggest any alteration of the definition of day and night visits in connection with the fees paid to medical practitioners called in on the advice of midwives, as suggested in the following Minute 173 of the A.R.M. 1920:

Minute 173—Resolved: That it be referred to the Council to consider whether the definition of day and night visits in connection with the question of the fees for medical practitioners called in on the advice of midwives should be amended to read as follows:—

Day (9 a.m. to 6 p.m.) 5s.

Night (6 p.m. to 9 a.m.) 10s.

Day visits are at present defined as from 9 a.m. to 8 p.m. and night visits as from 8 p.m. to 9 a.m., and as this adjustment is only of comparatively recent date (the periods formerly having been 12 hours for day and 12 for night), the Council does not advise any attempt at the present time to alter the arrangement.

TASMANIAN MEDICAL ACT.

204. Pursuant to Minute 221 of the A.R.M. 1920, a joint meeting of the Hospitals, Medico-Political and Dominions Committees, together with the Australasian Representatives, was held at Cambridge on July 1st, 1920, to consider what action, if any, could be taken with reference to the grave situation which had arisen in Tasmania owing to the passing into law of a Medical Act which (i.) made it an offence, with heavy penalties, for any registered medical practitioner to refuse or fail to meet in consultation any other registered medical practitioner; and (ii.) also made it an offence for any person or association to prevent, or attempt to prevent, directly or indirectly, any medical practitioner from accepting an appointment to a state-aided hospital. These provisions were the outcome of resignations of members of the Honorary Staffs of Hospitals in Tasmania, owing to the fact that the Tasmanian Government insisted upon their attending rich and poor alike gratuitously in hospitals. Certain suggestions were made at the Conference, and the Council has adopted such as seemed to be advisable.

205. The Council ascertained that the G.M.C. had been informed by the Colonial Office (a) that the Tasmanian Government was satisfied that this legislation had accomplished what it was intended to do, viz., that medical practitioners could, if they so desired, under the protection of the law, consult with any other medical practitioner; (b) that without this protection no member of the B.M.A. dared consult with practitioners outside that organisation; and (c) that, apart from this, there was the more important principle that in the case of life and death, and unless there was some valid reason, no medical practitioner should be permitted to refuse to consult with another who was attempting to save life, more so when that refusal might be due to fear of the consequences that might follow as a result of action on the part of the B.M.A. The solicitude for members of the B.M.A. shown in (b) above is quite touching but it need hardly be said that the Council does not accept this as in any way representing the real situation or the views of the Association either in Tasmania or elsewhere. But there are great difficulties in even seeming to interfere with the right of the Dominions to govern themselves. The Council is therefore of opinion that, whilst strongly protesting against this legislation as being class legislation of the worst kind, the Association can take no further steps which would be of help to the Tasmanian medical profession in this matter. The episode is a warning to the profession here and elsewhere of the kind of penal legislation as to which the medical profession needs to be continually on its guard.

FEES FOR CERTIFYING FACTORY SURGEONS.

206. The Council has offered to co-operate with the Association of Certifying Factory Surgeons in an endeavour to obtain an increase in the fees for these Surgeons.

PRISON MEDICAL OFFICERS.

207. After full consideration of the salaries and conditions of service of whole-time Prison Medical Officers, the Council informed the Home Secretary that it was considered that the commencing salaries and the annual increments of whole-time Prison Medical Officers were too low, and it was suggested that the increments should be raised from £20 to £50 for Senior, and from £15 to £25 for Junior Medical Officers. The Home Secretary was asked to take steps to secure that those Officers who had been in the Service prior to the institution of the improved scale of salaries should receive relatively higher salaries than those Officers who had joined the Service on the improved scale. He was also informed that the Association was of opinion that the maximum salary for whole-time Medical Officers should be increased to at least £800 per annum. The Home Secretary replied that in view of the present high rate of bonus to these Officers and the financial position of the country, he felt it impossible to ask the Treasury or Parliament for any further increase, and the Council, after due consideration of all the circumstances, has decided to take no further action at present.

208. Representations have also been made to the Home Secretary with regard to part-time Prison Medical Officers, and as a result thereof an increase of 30 per cent. in salary has been granted, as from 1st April, 1920, to those part-time Officers whose salaries had not been increased during the war. A fee of £2 2s. has also been sanctioned for each confinement attended by Medical Officers in prisons, and a fee of 10s. 6d. for each report required by a Court of Law, if the Medical Officer is not called as a witness and if he receives no fee as such from the Court.

CENTRAL COUNCIL FOR DISTRICT NURSING IN LONDON.

209. In response to a request from the Ministry of Health to nominate three representatives of the Association to serve on the Central Council for District Nursing in London (for the third triennial period of that Council), the Council has nominated the previous representatives of the Association, namely, Mr. E. B. Turner, Dr. T. W. H. Garstang, and Dr. M. G. Biggs.

DEVELOPMENT OF THE MEDICAL SERVICES OF WILLESDEN URBAN DISTRICT COUNCIL.

210. The rapid development of the Public Health Services of the Willesden U.D.C. has been considered by the Council, apart from the general question of the municipalisation of hospitals and clinics. The general outline of the Scheme is the establishment of a Municipal Hospital, with School and Maternity and Child Welfare Clinics staffed by whole-time salaried Medical Officers. The apparent intention of the Willesden U.D.C. to render the private practitioner superfluous to the great bulk of the ratepayers has caused serious alarm to the local practitioners. Every assistance is being given to the Division in the formulation of an alternative scheme, which while assisting the U.D.C. in all legitimate attempts to provide medical service to those who cannot provide it for themselves, shall preserve the right of the private practitioner to earn his living without unfair competition from the body spending the rates to which he is a contributor.

211. Arising out of the consideration of above matter by the Medico-Political Ministry of Health, Public Health and Hospitals Committees, the Council summoned a joint meeting of the four Committees. A Memorandum was prepared and placed before that meeting with the object of focussing the discussion upon the question of municipal hospitals and clinics and the relations thereto of medical officers employed by municipal authorities, and private practitioners. A further Conference of the four Committees is to be held for the purpose of completing the discussion.

212. The attention of members is drawn to the report of the proceedings which appeared in the *B.M.J.* Supplement of April 2nd, from which it will be seen that there was considerable agreement upon many general principles, with healthy differences as to details, in connection with the work of medical inspection and treatment of School Children. A further Conference is to be held to deal with the remaining subjects placed before the meeting, namely, Maternity and Child Welfare Work and Municipal Hospitals.

DANGEROUS DRUGS ACT, 1920: DRAFT REGULATIONS.

213. The Dangerous Drugs Act, 1920, was intended to control the sale and distribution of drugs—used by drug abusers—*i.e.*, opium, morphia, cocaine, heroin—and it gave the Home Secretary power to make Regulations. A set of Draft Regulations was issued by the Home Office on 7th January, 1921, and if no strong objection had been taken to them there is little doubt that at the end of the prescribed 10 days they would have become law, after which they could only have been withdrawn on the vote of one of the Houses of Parliament. This original draft required practitioners to keep in special books records of all purchases and supplies of “the drugs”—morphine, cocaine, ecgonine, heroin and medicinal opium, and these records were to be open at any time to inspection—presumably by the police. Apparently a separate set of books would be required at each branch surgery and call house. A prescription in writing was to be given whenever “the drugs” were ordered even apparently if they were used for personal administration. The name and amount of “the drugs” was to appear on any bottle or package containing “the drugs” and the draft apparently placed quite unnecessary difficulties in the way of “the drugs” being got by patients or used by doctors. The Draft Regulations showed an astonishing ignorance of the conditions of practice. The Home Office had not consulted the Association before issuing the Draft, but it afterwards explained that that document had been submitted to the Royal College of Physicians, London, the Royal College of Surgeons, England, and the General Medical Council, none of whom had taken objection to it. Immediately on receipt of the Draft the Home Secretary was informed that the Regulations were hopelessly impracticable and useless for the purpose of limiting the abuse of drugs. The Association took joint action with the Pharmaceutical Society of Great Britain (whose help, and especially that of Sir William Glyn-Jones, its Secretary, has been of the greatest value) and other bodies representing the manufacturers and wholesale and retail distributors of the drugs, and asked the Home Secretary to receive a joint deputation. This he refused, as also the suggestion that he should appoint a small expert Committee to advise him *de novo* on the Regulations. In company with the bodies above-mentioned a campaign in the Press and amongst Members of Parliament was at once instituted. The Parliamentary Medical Committee gave its assistance and so did many other members, amongst whom Mr. W. J. Uglow Woolcock, Mr. J. D. Kiley and Sir Henry Craik deserve special mention. The Divisions and Branches and the Panel Committees were urged to approach their Members, with the result that the meeting of Members of Parliament which took place on 9th March, 1921, has been described as the biggest meeting of its kind within the memory of the oldest Member. At that meeting it was evident that the pressure on the Home Secretary had had the desired effect, for he had on the same afternoon announced the setting up of a Committee to advise him on the Regulations. The Committee was composed as follows:—

Mr. Chester Jones (Chairman); Sir Malcolm Delevingne, K.C.B.; Capt. W. E. Elliott, M.C., M.P.; Major A. C. Farquharson, M.P.; Mr. Gerald A. France, M.P., and Mr. W. J. U. Woolcock, C.B.E., M.P.: to which Sir Beville Stanier, M.P., was afterwards added.

A *precis* of evidence was prepared by Dr. J. W. Bone and the Medical Secretary, who both gave evidence on 22nd March, 1921, and the Medical Secretary was recalled on April 4th. In their evidence they made it clear that while the Association did not wish to be merely obstructive and was willing to help any practicable efforts to check drug abuse, it considered most of the Draft Regulations and especially that part which required the doctor to keep a record of the ingoings and outgoings of “the drugs” to be quite useless and therefore irritating.

214. The Home Secretary had in a letter of 15th February announced many important modifications in the Draft as a result of the written representations of the Association, and at the meetings of the Departmental Committee still further concessions were announced. The numerous alterations which have been made in the Draft are the best justification for the action of the Association and the bodies co-operating with it. The Council will report further on receipt of the Regulations as revised by the Departmental Committee.

NEW RATES FOR TELEPHONE.

215. The Council has decided that, whilst regretting the increase in the rates for telephones, it is of opinion that the new rates will not weigh more heavily on medical men than on other classes of telephone subscribers, and that there are not sufficient grounds for asking for special concessions for the medical profession. The bulk of the calls through a doctor's

telephone are “in-calls” and therefore any flat rate devised to meet the large consumer would probably be dearer for the doctor than the new rate. That is always assuming that charges must be largely increased—a point on which the Government has been very emphatic. The Government inquiry into the whole telephone system which has just been set up will it is hoped provide some relief for medical subscribers.

NOTTINGHAMSHIRE COLLIERY APPOINTMENTS.

216. The Council is gratified to be able to report that after negotiations extending over several months, agreement has been arrived at between the Nottinghamshire practitioners and the colliery clubs in respect of an application by the practitioners for an increase of salary from 16s. 3d. to 26s. per annum per family. The agreement provides (i.) that payment be increased to 5d. per week per married man (*i.e.* 21s. 8d. per annum); (ii.) that medical attendance be provided for wives, and families under 16 years of age; (iii.) that unmarried members be allowed the same privilege, the 5d. per week providing for a widowed mother and family; (iv.) that certificates for clubs be supplied free of charge; and (v.) that boys aged 14 to 16 whose parents do not work at the colliery be entitled to medical attendance at half rate. The Nottingham Division is to be congratulated on the example it has given of the way in which the Association can confer great pecuniary benefits on its members—and also on non-members.

FEES FOR ADMIRALTY SURGEONS AND AGENTS.

217. The Council has been pursuing this subject with the Admiralty for 12 months, and at one time it looked as if the Admiralty had extracted reasonable terms from the Treasury, but some hitch occurred. For many months now the only satisfaction the Council has been able to get has been that the matter was “under consideration.” At the instance of the Association Captain W. E. Elliot, M.P. (Secretary, Medical Parliamentary Committee) asked a question on February 25th, 1921, to which the Parliamentary Secretary of the Admiralty replied that a revised scale of fees was under consideration and it was hoped that a decision would be reached and promulgated shortly. On April 13th, 1921, the revised scale not having been issued, Captain Elliot repeated the question and the Admiralty announced a revision of fees which is rather more than equal to 50 per cent. of the visiting fees and mileage.

THE MEDICAL PROFESSION AND WHITLEY COUNCILS.

218. The development of National Joint (Whitley) Councils is a matter of considerable importance to the profession and to the Association. If the remuneration and conditions of employment of doctors who are employed by the State or by Municipal Authorities, are to be settled by National Joint Councils, the doctors so concerned will probably to a large extent have to sacrifice their special position as technically trained and qualified persons and rank primarily as civil or municipal servants. So far, the results of these Councils as affecting the profession have not been satisfactory but, whatever the results, the doctors concerned are to a large extent cut off from their professional brethren and they may be obliged to sacrifice that support which the Association might be able to give them were they not concerned in any such Council. As the Council of the Association is desirous of testing the feelings of the various sections of the profession concerned, it has been decided to call together preliminary conferences, of the medical bodies concerned in the proposal to form National Joint Councils for the medical profession. In the first instance it is considered advisable that if medical practitioners are to be dealt with by these bodies arrangements should be made for two such Councils, one for the medical personnel of the Civil Service, and one for the medical personnel of the Local Government Service. The medical personnel of the following Government Departments (Ministry of Health, Ministry of Pensions, Home Office, Board of Education, Board of Control and Lunacy Board) are being invited to send not more than one representative each to a preliminary conference on the advisability of forming a National Joint Council for the medical personnel of the Civil Service. With a view to a preliminary conference on the formation of a National Joint Council for the medical personnel of the Local Government Service, the following societies are being invited to send not more than one representative each: Society of Medical Officers of Health, Association of County Medical Officers of Health, Association of School Medical Officers, Infirmary Superintendents Association, Poor Law Medical Officers Association, Association of Public Vaccinators, Assistant Asylum Medical Officers Association, Tuberculosis Society, Medico-Psychological Association and the Medical Women's Federation.

FEES FOR CERTIFICATION UNDER (A) LUNACY ACT, AND
(B) MENTAL DEFICIENCY ACT.

219. The attention of Divisions and Branches and Members of the Association generally has been drawn to the fact that the fees for certification under the Lunacy Act and the Mental Deficiency Act are fixed by Magistrates, and it has been suggested to the Divisions that local action should be taken to ensure that a fee of at least one guinea is paid for such certification. There are apparently a good many areas in which a less fee is paid.

MINIMUM SALARIES FOR PUBLIC APPOINTMENTS.

220. Pursuant to the following Minute of the A.R.M., 1920:—

Minute 106.—Resolved: That this Meeting is of opinion that a substantial addition is needed to all Public Health Salaries on the general lines of the scale indicated in Items 77-112 of the Agenda and that a Conjoint Committee of the B.M.A. and the Society of M.O.H. be formed to take charge of the case for improvement in the salaries of Medical Officers in the Public Health Services and to report to the Council of the B.M.A. and of the Society of M.O.H. as to any steps that may be necessary to this end,

a Conjoint Committee of the B.M.A. and Society of M.O.H. was formed and has held three meetings.

221. The position with regard to agreement on a scale of salaries for Public Appointments has been complicated by the affiliation of the Society of M.O.H. with the National Association of Local Government Officers. This latter Association, which comprises all grades of Local Government Officers, is a certified trade union. The representatives of the Society of M.O.H. informed the Council that they considered that as the N.A.L.G.O. had been authorised by the Government to prepare and submit to the National Joint Council for Local Authorities, Administrative, Technical and Clerical Services (otherwise known as the Whitley Council) scales of salaries for all Local Government Officers, representation of medical officers employed by local authorities on the N.A.L.G.O. was advisable, as, whether medical officers were represented or not, such scales would be prepared, including one for medical officers. They had, therefore, submitted the scale of salaries for Public Health Officers (with certain amendments), which was before the A.R.M. in 1920, to the arbitration of the Whitley Council through the N.A.L.G.O.

222. Prior to the meeting of the Conjoint Committee of 3rd December, 1920, the Council's representatives on the Conjoint Committee met and thoroughly discussed the whole position of medical men employed by Government Departments and Local Authorities, and the bearing of the Whitley Council idea upon them, and particularly the special case presented by the Society of M.O.H. At the meeting of the Conjoint Committee which followed, the following resolution of the B.M.A.'s representatives was placed before the representatives of the Society of M.O.H.:—

Resolved: That the representatives of the Society of Medical Officers of Health on the Joint Committee be informed at the meeting on the 3rd December:—

That the Association's representatives on the Joint Committee are prepared to recommend the Council:—

(a) to give any support within the power of the Association to the Society of Medical Officers of Health in putting forward their claim through the N.A.L.G.O., for the scale approved by the Council of the Society on the 24th September 1920;

(b) to give the full support of the Association to the Society in demanding from all Local Authorities the scale accepted by the Whitley Council, whatever it may be, for the time during which the Whitley Council award lasts;

(c) pending the negotiations with the Whitley Council (or in case the Whitley Council machinery should break down) to adopt and support by all means in its power a scale of minimum salaries not less than that stated in the June scale or more than that approved by the Council of the Society on the 24th September, 1920 (in each case omitting the bonuses);

(d) to use all the means in its power to obtain, in addition, bonuses for Medical Officers in all suitable cases approved by the Society and the Association;

This recommendation to be subject to an undertaking on behalf of the Society of Medical Officers of Health:—

(i.) To support the principle which is to be recommended to the Council of the Association, namely, that there should be a special Whitley Council (or Councils) established for the medical profession in the public services;

(ii.) To give all possible assistance in obtaining the formation of such Council or Councils;

(iii.) To abandon the project contained in paragraph 14 of the Report of its Special Salaries Committee of 29th October, 1920, namely, the formation of a Special Committee, composed on the one side of representatives of the State or Local Government, and on the other side by representatives of the Society of Medical Officers of Health, to deal with the special interests of Medical Officers of Health; and

(iv.) That in the event of a Whitley Council or Councils being set up for the medical profession, the Society will retire from the N.A.L.G.O. and place its case in the hands of the appropriate Medical Whitley Council.

223. The result was that the Society of M.O.H. expressed agreement with paragraphs (a) and (b) and (i.) and (ii.) of the resolution but felt that it would be inopportune to accept paragraph (c) whilst the question of remuneration was still under consideration by the National Joint Council for Local Authorities' Administrative, Technical and Clerical Services, and suggested that consideration of this, and paragraph (d) could with advantage be deferred pending the decision of the National Council. With regard to paragraphs (iii.) and (iv.), the Society felt that if a Special Whitley Council were set up for the medical profession employed in the Public Services it would be best for separate Committees of such a Council to be formed for each section of the profession represented. The Society is prepared to place its case in the hands of a National Whitley Council established for the medical profession, provided a satisfactory arrangement under paragraph (iii.) is come to.

224. The Council views the situation with great concern, at the Whitley Council idea is still in its infancy and if the Society of M.O.H. permanently throws in its lot with the N.A.L.G.O. serious injury might be done to the solidarity of the profession and to the influence of the Association. The Council felt that it would be justified in attempting to prevent this by promising the full support of the Association towards the scale of salaries of the Society of the M.O.H. on condition that this scale was accepted by the Whitley Council. The responsibility for the acceptance of the scale would then rest on a joint body composed of the employing interests on the one side and of the employed on the other side. Whatever doubts the Association might have as to the expediency of such a scale would matter little if the representatives of the Local Government Authorities on the Whitley Council had given their sanction to it. Until the Whitley Council has made a pronouncement on the scale of salaries submitted to it, the Council is of opinion that the Association cannot take any further steps, and the Society of M.O.H. agrees that such is the position.

MINISTRY OF PENSIONS MEDICAL OFFICERS.

225. The Council has been in active communication throughout the session with a body representing the whole-time medical officers of the Ministry of Pensions, both administrative and hospitals. The position of these officers is complicated by the fact that they are parties to a Departmental Whitley Council, the main influence of which seems to have been to delay quite unduly the examination of the special case of these officers. The Council has rendered all help possible and hopes shortly to report that a permanent working agreement has been arrived at by which the care and the interests of these officers will be entrusted solely to the Association.

PENSIONS MEDICAL REFEREES.

226. The attention of the Ministry of Pensions has been repeatedly drawn by letter and interview to the grievances of these ex-officers who believed that they were not getting their fair share of the Board work. The Council is glad to report that these representations were always received courteously and sympathetically and many individual hard-ships have been remedied.

National Health Insurance.

CONSTITUTION OF COMMITTEE.

227. The October, 1920, Conference of Representatives of Local Medical and Panel Committees expressed the opinion that each Annual Conference should appoint the Chairman of the next Annual Conference, and referred to the Insurance Acts Committee for consideration the suggestion that he should not be a member of that Committee. The Council is in entire agreement with the opinion that the Conference should elect its own Chairman to hold office from the end^{of} the Conference at which he is appointed to the end of the succeeding Annual Conference, as is the case with respect to the Chairmanship of the Representative Body. But the Council is strongly of opinion that whoever is appointed Chairman of the Conference should, during his year of office, be fully acquainted with the work of the Insurance Acts Committee, and that this experience can only be gained by membership of the Committee.

The Council therefore recommends:—

228. **Recommendation.**—That the following words be inserted in the second column (additional members *ex-officio*) of the Schedule to the By-laws referring to the Insurance Acts Committee:

"The Chairman for the time being of the Conference of Representatives of Local Medical and Panel Committees called by the Insurance Acts Committee of the British Medical Association."

CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

229. The Annual Conference of Representatives of Local Medical and Panel Committees was held on October 21st, 1920, under the Chairmanship of Dr. H. G. Dain (Birmingham), and was well attended and very representative. A full report of the proceedings was published in the *B.M.J.* Supplement for October 30th, 1920. The Conference decided to elect its own Chairman at each Annual Conference, to hold office for the succeeding twelve months. Dr. H. G. Dain was elected Chairman for 1920-21.

MEDICAL RECORDS.

230. As reported in the Annual Report of 1920 the Minister of Health and Scottish Board of Health appointed an Inter-departmental Committee "to consider and advise them as to the form of medical record to be prescribed under the conditions of service for medical practitioners contained in the new Medical Benefit Regulations, having due regard to the clinical purposes (including the remedial value to the patient of obtaining a suitable record of his case) as well as to the administrative and the statistical purposes which such records may be adapted to serve." Its report was issued in June, 1920. After consideration of the report, which fully described the nature of the new record, and which had been sent by the Ministry to every Panel Committee, the October 1920 Conference decided to express no opinion on it then, but to recommend insurance practitioners to give the new record card a fair trial before either condemning or approving it. The new record card came into operation on January 1st, 1921, and its introduction aroused a certain amount of criticism amongst insurance practitioners. Some of this was due to a want of appreciation that the form of record had been discussed by the Conference; some was due to a belief that the form was not satisfactory, and that some of the work entailed by it was unnecessary; but the criticism was in a large measure due to the efforts of a section of the lay press to prove, for their own purpose, that the card would violate the time-honoured custom of professional secrecy.

231. In view of the misconception which appeared to exist amongst a large number of practitioners as to what was required from them in connection with the cards, a circular was issued to all insurance practitioners (a) setting out their obligations in connection with the keeping of the cards, and (b) dealing with the question of the violation of professional secrecy. At the same time a Memorandum was issued to Local Medical and Panel Committees giving, in addition to (a) and (b) mentioned above, a short history of record cards from the inception of the Insurance Act. Panel Committees are being asked to forward by the end of June any observations they have to make as the result of experience of the new record cards, with a view to a report thereon being submitted to the Annual Conference in October. The whole question will thus be fully considered in the light of the experience gained. If

necessary, the Ministry will be asked to modify the existing form, or the methods of dealing with it, in such ways as the Conference may suggest.

MEDICAL AID INSTITUTES AS "APPROVED INSTITUTIONS."

232. The Middlesbrough Friendly Societies Medical Aid Institute desired to extend the area of its activities beyond the three miles radius prescribed in its "approval" by the Commissioners in 1913. The Ministry of Health held an inquiry into the matter on January 4th, 1921, which was fully reported in the *B.M.J.* Supplement of January 15th, 1921, and from which it will be seen that there were strong local reasons why the application should be resisted by the local medical profession, in addition to the objection felt by the profession in general to any extension of a system believed to be unsound. The Medical Secretary on behalf of the Association drew attention at the inquiry to the conference between representatives of the Friendly Societies and the Association, held in October, 1912, under the Chairmanship of Mr. Lloyd George, at which the Association agreed, on certain conditions, not to press its opposition to the "Harmsworth amendment" to the National Insurance Bill, under which certain Medical Aid Institutes would be recognised as part of the machinery of the National Insurance system. One of the conditions, as understood by the Association's representatives, was that those institutions would not seek to extend their operations outside the areas in which they operated at the time the Act was passed. The result of the inquiry was satisfactory, inasmuch as the Minister declined to allow the alteration of the rules asked for by the Institute.

TRANSFER OF PRACTICES.

233. The Annual Representative Meeting, 1920, instructed the Council to take active steps to further the just claims of insurance practitioners in the preservation of the capital value of their panel practices, and the Insurance Acts Committee has, as a result of the foregoing and somewhat similar instructions received from the October Conference, urged upon the Ministry of Health that a return be made to the position that obtained under the original Regulations, with certain modifications. Negotiations have been in progress for some time on this matter, and the Insurance Acts Committee hopes to be able to recommend certain proposals to the next Conference which it is believed may be acceptable to the Ministry, while securing the objects desired by the profession.

RANGE OF SERVICES—VACCINATION.

234. Pursuant to the instructions contained in Minute 188 of the A.R.M., 1920, the Solicitor's opinion was obtained as to whether the vaccination of insured persons came within the scope of the agreement with Insurance Committees under the old regulations. He was of opinion that if an insured person upon the list of an insurance practitioner asked the latter to vaccinate him and the practitioner considered it necessary or desirable that it should be done, the practitioner was, by virtue of his agreement, under an obligation to do it and could not charge or accept a fee for so doing. It is quite clear that vaccination comes within the practitioner's agreement under the 1920 Regulations, if such vaccination commends itself to the practitioner's judgment.

CENTRAL INSURANCE DEFENCE FUND.

235. The R.B. in 1918 passed the following resolution:—

Minute 88.—Resolved: That the balance in hand of the Central Insurance Defence Fund should either be transferred to the donors, or a scheme for its utilisation submitted to them for their approval,

and at the same time the Insurance Acts Committee was considering the question of the formation of a Defence Fund for practitioners working under the National Health Insurance Acts. The new fund—the National Insurance Defence Trust having been decided upon, the Council in October, 1918, decided after taking the advice of the Solicitor, that the Central Insurance Defence Fund be closed and that the subscribers to that Fund be informed by a circular (i.) that the Fund had been closed; (ii.) that a new Fund had been opened, with the reasons for taking that step, and (iii.) that the balance of their subscriptions (amount of balance to be stated) would be returned to them if they so desired, but that it was hoped that they would allow it to be transferred to the new fund, and that their consent to do so would be assumed unless they applied within three calendar months for its return.

236. As a large number of practitioners who subscribed to the Central Insurance Defence Fund were still on active service, the Council left it to the Insurance Acts Committee to decide when the appropriate time had arrived at which the attempt should be made to induce those subscribers to transfer their balances to the new fund. In December, 1920, upon it being decided that the time was ripe for action, the Association's Auditors, Messrs. Price, Waterhouse & Co., were instructed to commence the process of winding up the old fund, and in January, 1921, a circular was issued to all those subscribers who had balances, asking them if they desired their balance returned to them, but expressing the hope that they would allow such balance to be transferred to the new fund—the National Insurance Defence Trust. The work of winding up the old fund is entirely in the hands of Messrs. Price, Waterhouse, and is nearly completed. The Council hopes to be able to report the conclusion of the process in its Supplementary Report.

UNQUALIFIED PRACTITIONERS AND INSURED PERSONS.

237. Several insurance practitioners have applied for advice and assistance in connection with claims made on them that they should grant certificates to insured persons who were receiving attention from unqualified practitioners—principally bone-setters. Acting on the advice of the Solicitor of the Association they have been advised to cease attendance and the giving of certificates to such insured persons, and to request the Insurance Committee to remove the insured persons' names from their (the practitioners') lists, thus declining all responsibility for any further attendance or certificates. The practitioners were also advised that to continue to give certificates to such persons whilst under the treatment of an unqualified person might bring them under the censure of the General Medical Council, as it would probably be regarded as "covering."

238. The insurance practitioners and the Panel Committees concerned acted immediately upon the advice given, with the result that in every case the Insurance Acts Committee was informed that the difficulty had disappeared owing to the insured person ceasing to receive attention from the bone-setter. The Council felt that the principle involved was so important that it has promised that the full support of the Association shall be given to any practitioner against whom action is taken for refusing to give attendance or certificates to insured persons who have put themselves under the care of unqualified practitioners.

Public Health and Poor Law.

DANGER OF NEGLECT OF VACCINATION.

239. Pursuant to Minute 192 of the A.R.M., 1920, the Council has drawn the attention of the Ministry of Health and the Scottish Board of Health to the necessity of the more thorough vaccination of the community and the danger of the neglect of that precaution.

MILEAGE FEE FOR PUBLIC VACCINATORS.

240. The Council has considered the desirability of drawing up a model scale of mileage fees for Public Vaccinators, and has asked the Association of Public Vaccinators to co-operate.

ALLEGED SUPERSESSION OF POOR LAW DISTRICT MEDICAL OFFICERS.

241. In view of the threatened supersession of part-time District Medical Officers by whole-time Medical Officers attached to Poor Law Infirmarys, the Council informed the Ministry of Health that in its opinion the appointment of whole-time Officers to do the domiciliary work where it had previously been satisfactorily performed by District Medical Officers resident in the area was not desirable. A reply was received stating (i.) that no action was in contemplation by the Minister which would affect or interfere with the tenure of office of any medical officer employed by Guardians; and (ii.) that the Minister would not consider any such arrangement unless substantial grounds were adduced by Boards of Guardians in support of the proposal.

SUB-COMMITTEES.

242. For the past three or four years it has been the custom to appoint a M.O.H. Sub-Committee and a Poor Law Medical Officers' Sub-Committee of the Public Health Committee and to put on these

Sub-Committees nominees of the Society of M.O.H. and the P.L.M.O.'s Association respectively. The composition of this year's Committee was such that it was felt unnecessary to re-appoint these Sub-Committees, for it contains five whole-time Medical Officers of Health and one part time; while two of the members are P.L.M.O.'s. The Society of Medical Officers of Health, the Association of County Medical Officers, and the Poor Law Medical Officers' Association, on being informed of this fact, urged the reconsideration of this decision, but the Council, after carefully reviewing the position, decided to defer any further consideration thereof until next session.

ROYAL SANITARY INSTITUTE CONGRESS.

243. Drs. Herbert Jones and E. H. Snell attended the Congress of the Royal Sanitary Institute on 19th-24th July, 1920, as representatives of the B.M.A.

SUPERANNUATION OF MEDICAL OFFICERS OF HEALTH.

244. On the 8th June, 1920, the Minister of Health was asked to receive a deputation from the B.M.A. and the Society of Medical Officers of Health on the question of the Superannuation of Medical Officers of Health—a memorandum setting forth the views of the Association on the subject having been sent in previously at the request of the Ministry. The Minister intimated that the views of the two bodies on the recommendations of the Departmental Committee on the superannuation of persons employed by Local Authorities would receive his careful consideration, and that he had informed a deputation from the National Association of Local Government Officers that he would put forward proposals to the Government on the matter. On 27th October, 1920, the Minister announced in Parliament that a Bill would be introduced at an early date. On March 15th, 1921, in reply to a question in the House, Dr. Addison stated that in view of the heavy charges upon the rates which would be entailed by the introduction of a National Superannuation Scheme for Local Government Officers, the Government regretted that it could not proceed with this matter at the present time. The Council, after careful consideration of the position, decided regretfully to take no further action in the matter for the time being.

SECURITY OF TENURE OF HEALTH OFFICERS.

245. In June, 1920, Sir Philip Magnus, who has long taken a very active interest in the subject, reported that he had been informed officially that it was proposed to proceed with the issue of an Order giving security of tenure to Medical Officers of Health and Sanitary Inspectors. On November 2nd, 1920, a message was received from the Ministry that the Order was in proof and would be issued in a few days. As this Order was not published, the Council tried to get suitable clauses in the Ministry of Health (Miscellaneous Provisions) Bill. This Bill was, however, rejected by the House of Lords, and the Council then decided that it would be advisable to introduce a private Parliamentary Bill to give effect to this object. Accordingly the Public Health (Officers) Bill, as drafted by the Association and approved by the A.R.M., 1910, has been amended so as to provide for the security of tenure of M.O.H., Sanitary Inspectors, and Inspectors of Nuisances, and Sir Philip Magnus, with the support of the Medical Parliamentary Committee, introduced the Bill into Parliament, which passed Second Reading on 14th April and stands referred to a Committee. It is believed it will have the support of the Ministry of Health.

POSITION OF MEDICAL OFFICERS OF HEALTH WHO ARE DISPOSSESSED.

246. Several cases have arisen in which Medical Officers of Health have applied to the Association for advice as to compensation in connection with their loss of appointment, either by abolition of office or absorption of area. As it was considered that the absorption of areas might very probably become more general, the Council decided that, where desired, an effort should be made to obtain for such officers a sum of money for each year of service based on one-sixtieth of the average salary for the last five years' service, plus:—

For 20 years of service and upwards	...	10 60ths additional.
" 15 "	but under 20	7 60ths "
" 10 "	" "	5 60ths "
" 5 "	" "	3 60ths "
Under 5 "	" "	1 60th "

These terms are based on a recommendation in the Report of the Departmental Committee on the Superannuation of persons employed by Local Authorities in England and Wales.

FEES FOR REPORTS BY TUBERCULOSIS OFFICERS ACTING AS MEDICAL REFEREES FOR THE MINISTRY OF PENSIONS.

247. The question of the payment of Tuberculosis Officers acting as Medical Referees to the Ministry of Pensions for filling up Form M.R.1 has been considered by the Council, in view of complaints made by a group of Tuberculosis Officers that they had been informed in November, 1920, that they were no longer entitled to draw the fees which they had been drawing for this service for the past two years. The fee usually paid for this service was 5s. T.O.'s strictly speaking were supposed to do this work as part of their ordinary duties, but owing to the fact that some County Councils had allowed their T.O.'s to accept these fees, discriminations and consequent dissatisfaction had arisen. On representations being made to the Ministry of Pensions the Council was informed that the matter had been considered in conjunction with the Ministry of Health, and that it was proposed in future to substitute for the system of payment by fee a lump sum payment to Local Authorities in respect of certificates given by their T.O.'s acting as Medical Referees to the Ministry. In the meantime, however, the Ministry was prepared to pay a fee of 2s. 6d. to T.O.'s for each certificate issued by them as from 1st January, 1921, stating whether or not the man who had been recommended for treatment by them was able to work. The Council has advised applicants that the fee of 2s. 6d. offered by the Ministry of Pensions as an interim arrangement should be accepted, provided that the certificate is confined to a simple statement as to ability or inability to work; and has asked the Ministry to take all possible steps to insure that the lump sum payment which it proposes to make to the Authorities in respect of the completion of Form M.R.1 shall be paid to the T.O.'s in addition to their official salaries.

PUBLIC HEALTH AND POOR LAW APPOINTMENTS.

248. Successful action has been taken by the Association in connection with a number of Public Health and Poor Law Appointments in support of the policy of the Association in these matters. The Public Health cases comprised *inter alia* questions as to: (i.) Position of M.O.H. on abolition of office or absorption of area; (ii.) Salary of combined appointment of M.O.H. and School M.O.; (iii.) Requests for assistance to obtain increases of salary; (iv.) Compensation of M.O.H. called upon to resign on account of age; and (v.) Position of M.O.H. called upon by his Authority to examine applicants for posts under that Authority and to report on cases of alleged malingering amongst the Authority's employees.

249. The Poor Law cases dealt *inter alia* with:— (i.) Supersession of part-time P.L.M.O.'s and D.M.O.'s by whole-time officers; (ii.) Refusals by Boards of Guardians to grant increases of salary and to grant Civil Service bonus; (iii.) Question of increase of salaries of Parochial Medical Officers; (iv.) Appointment of D.M.O. who resided outside area; (v.) Appointment of non-service practitioner as P.L.M.O. whilst an ex-service practitioner had applied for the post; and (vi.) Salary of P.L.M.O. as affected by increases of work.

Hospitals.

CONFERENCE OF REPRESENTATIVES OF HONORARY STAFFS OF VOLUNTARY HOSPITALS.

250. Owing to the action of the Minister of Health in appointing a Committee "to enquire into and report upon the financial position of the Voluntary Hospitals throughout the country and to make recommendations" the Council called a Conference of Representatives of the honorary medical staffs of the Voluntary Hospitals containing 50 beds or more in England and Wales, for the purpose of discussing the situation thus created. The Conference took place in the Robert Barnes Hall, Royal Society of Medicine, by kind permission of the Society, on the 21st December, 1920, when 138 representatives attended. A report of the Conference appeared in the Supplement to the *Journal* of January 1st, 1921. It will be noted that the Conference requested the Council to instruct its Hospitals Committee to call the Conference together again when deemed desirable, and the Council will do so.

251. The resolutions of the Conference were thereafter considered and approved by the Council and are now submitted for the endorsement of the R.B. (Recommendations below)

Adoption of Voluntary Method of Administration of Voluntary Hospital

Recommendation.—That the R.B. desires to record its belief that the Voluntary method of administration of the Voluntary Hospitals of the country is to the advantage of the public, Medical Science and the Medical Profession, and that it should be maintained.

Necessitous Persons to be Treated Free.

Recommendation.—That necessitous persons shall continue to be treated free.

Subsidising of Voluntary Hospitals from Rates Undesirable.

Recommendation.—That it is undesirable that the Voluntary Hospitals should be subsidised by the local rating authorities, except in so far as payment is made for the examination and the care of patients for whom these authorities are responsible.

Subsidising by the Government of Hospitals in Financial Difficulties.

Recommendation.—That in times of financial difficulty it is desirable that the central Government should subsidise Voluntary Hospitals, and that such subsidy in the case of any individual hospital should take the form of a contribution proportional to the income received by the hospital from voluntary and other contributions. The subsidies here proposed should be made through some central hospital fund.

Support for Voluntary Hospitals by Employers and Insurance Companies.

Recommendation.—That greatly extended support for Voluntary Hospitals should be sought from Employers and Insurance Companies, seeing that they benefit largely both directly and indirectly by the services of the Voluntary Hospitals.

Contributions by Patients towards Maintenance.

Recommendation.—That every patient of a Voluntary Hospital who is not a necessitous person should make a contribution, during treatment, towards the cost of maintenance, unless the contributory method of subscription is adopted as essential in industrial areas. In view, however, of the increased cost of maintenance, etc., the R.B. considers that the contributory rates paid by workmen should be materially increased.

Payment of Practitioners for Services rendered to Paying Patients in Hospitals.

Recommendation.—That where Voluntary Hospitals provide accommodation for patients who are able to pay for it, no fixed rate of payment for professional services rendered to such patients should be established; the fees so payable to remain, as at present, a matter of arrangement between patient, family physician and consultant.

Formation of Medical Staff Fund.

Recommendation.—That in the event of decisions being taken which would lead to patients paying in part or in whole, the hospital maintenance fees, either individually or by some contributory method, or with the addition of rate aid or State aid, or by a combination of two or more of these methods, a percentage of all such payments should be passed into a fund which can be allocated in any manner which such honorary medical staff may determine.

EVIDENCE BEFORE GOVERNMENT COMMITTEE OF ENQUIRY INTO FINANCIAL POSITION OF VOLUNTARY HOSPITALS.

252. Evidence was given on behalf of the Association by Mr. Bishop Harman (Chairman of the Hospitals Committee), Dr. H. G. Dain, Dr. J. R. Drever (Scottish Medical Secretary), Mr. W. McAdam Eccles and Mr. A. E. Morrison before the Government Committee of Enquiry into the financial position of Voluntary Hospitals, and

followed the lines laid down by the resolutions of the Conference of members of Medical Staffs of Voluntary Hospitals Staffs.

PAYING PATIENTS IN POOR LAW HOSPITALS.

253. The attention of the Council has been drawn to schemes adopted in different parts of the country by Boards of Guardians so as to provide separate accommodation in their Poor Law Hospitals or Infirmarys for those persons who cannot secure early admission into the Voluntary Hospitals and who, whilst not being able to afford the expense involved by entering private nursing homes, are able to pay for less costly medical care treatment and nursing. There are some 13 or more schemes either contemplated or in operation, and as a rule no opportunity has been given to the profession to examine the scheme before its adoption by the Board of Guardians.

254. The Council has made representations to the Minister of Health in several instances and has thereby secured delay and an opportunity for local representation by the Divisions. Divisions have been advised whenever possible to insist upon two main principles, namely: (i.) that paying patients should be admitted into the Poor Law Hospitals only on the recommendation of their own private practitioners (if any); (ii.) that paying patients should be permitted to have in attendance upon them their own doctor whilst inmates of the Poor Law Hospital or Infirmary. The matter is one which, in the opinion of the Council, should not be dealt with piecemeal, as undesirable precedents are very likely to be set up in the absence of the recognition by the Ministry of Health of some general principles. The Minister has accordingly been asked to receive a deputation on the subject and has consented to do so.

The Council recommends:—

Recommendation—That the Report on the Future of Poor Law Infirmarys, with recommendations as to the utilisation of Poor Law Infirmarys for civil needs (see Appendix VIII.) be adopted.

BRADFORD SCHEME.

255. An account of what has happened at Bradford will be useful (a) to show the importance of the emphasis laid by the Association in its deputation to Dr. Addison on the necessity for consultation of the profession both locally and centrally before new schemes which affect the medical profession are floated; (b) as a record of a development which may have far-reaching effects and become an outstanding event in medico-political history; and (c) as an example of the ability and energy with which the profession can handle a difficult and dangerous local situation when thoroughly aroused and organised.

256. Bradford has for many years been famous as the home of municipal socialistic experiments. It has a large staff of whole-time medical officers whose activities are widespread and ever increasing. Therefore, when the Bradford Division heard of the proposal of the Bradford Health Committee to turn the recently acquired Poor Law Hospital into a Municipal General Hospital, without any reference to the local medical profession and apparently without any concern as to how the new hospital would affect the Voluntary Hospitals of the city, it was not surprised but felt that the time had come for decisive action. The whole profession was called together to consider the situation, and protests against the proposed developments were sent to the Health Committee and also to the Minister of Health. The Minister was reminded of his statement made to the Association's deputation that he was in favour of local consultation with the profession in such circumstances, and was informed that the Bradford profession was taking steps to form an Advisory Medical Committee which should be thoroughly representative of the whole local profession. The Minister replied by forwarding a letter he had sent to the Bradford City Council asking that body by what means it proposed to keep itself informed of the views of the profession as regards medical issues raised by its scheme.

257. The Bradford Division then, by means of meetings, circulars, etc., induced the local doctors to take a very active interest in the formation of the Advisory Medical Committee. The Committee when elected was composed as follows:—3 consultants, 9 general practitioners, 2 whole-time medical officers, and it is financed by a payment of 5s. a year from each of its constituents. As soon as it was appointed it set to work to draw up a report which should represent the views of the local profession for submission to the City Council. The Committee issued majority and minority reports, and the former, with some amendments,

was adopted at a largely attended meeting of the profession on March 17th and sent to the Health Committee, to the Ministry of Health, and to the Press, both medical and lay. (For report see Supplement, April 2nd, p. 91). As that report shows, the Bradford profession has not only criticised the proposals of the Health Committee as regards the Municipal Hospital, but has recognised the need for more hospital accommodation in the city and has put forward a constructive policy intended to assist the Health Committee in supplementing the resources of the Voluntary Hospitals by a scheme which would secure the support of the local profession.

FEES FOR X-RAY DIAGNOSIS AND TREATMENT OF TUBERCULOUS CASES REFERRED TO HOSPITALS BY LOCAL AUTHORITIES.

258. The Council has been asked to suggest the fees which should be paid to the members of the staff of a Voluntary Hospital for undertaking work in connection with X-ray diagnosis and treatment of cases which are referred to the hospital from the local Tuberculosis Dispensary.

The Council recommends:—

Recommendation.—That the fee to the practitioner conducting X-ray diagnosis and treatment of tuberculous cases referred to Hospitals by Local Authorities should be 21s. per case or £3 3s. 0d. per session not exceeding 2½ hours, in which not more than six cases should be seen.

FEES OF OPHTHALMOLOGIST TO POOR LAW INFIRMARY.

259. The Council's advice has been sought as to the fees which should be paid to ophthalmic specialists to Poor Law Infirmarys

The Council recommends:—

Recommendation.—That the remuneration of an ophthalmic specialist for attendance on Poor Law patients in Infirmarys should not be less than £2 2s. 0d. and mileage if outside London, and £3 3s. 0d. in London, as attendance fee, together with £5 5s. 0d. for each operation performed.

Naval and Military.

REPRESENTATIVE OF THE ARMY MEDICAL SERVICE ON THE COUNCIL.

260. The A.R.M. 1920 appointed Lieut.-Gen. Sir William Babbie, V.C., K.C.B., K.C.M.G., as the representative of the A.M.S. on the Council for the period 1920-23. A vacancy has, however, been caused by Sir William Babbie's death, and pending the appointment of his successor the Council has invited Major-General Sir William Macpherson to attend the meetings of Council and Naval and Military Committee.

Recommendation.—That Major-General Sir William Macpherson, K.C.M.G., C.B., A.M.S. (retired) be elected to represent the Army Medical Service on the Council for the period 1921-23.

SENIOR SURGEON COMMANDERS, R.N.

261. The Council in its last report stated that it had approached the Admiralty on the question of retired pay of those Senior Surgeon Commanders, R.N., who were adversely affected by the new Regulations governing retirement and retired pay which were introduced in January, 1920. The replies received to the Association's representations were of a most unsatisfactory character, and amounted to a complete refusal on the part of the Admiralty to make any concession. The Council felt that, in the interests of its Naval members, further action should be taken, and accordingly it has recently addressed a letter to the First Lord of the Admiralty personally, calling his attention to the injustice which has been done to those officers who have been retired compulsorily before reaching the age of 55, inasmuch as when they entered the service, they did so on the understanding that they would be eligible to serve to the age of 55. It was further pointed out that by their compulsory retirement before that age these officers have lost, or will lose, periods of from one to five years' service on full pay at a time when they would have been drawing the highest possible pay of their rank; and that whilst it was true that the retired pay of these officers has been increased by about 10 per cent., the new maximum of £600 is liable to a reduction of 20 per cent. in certain contingencies which, if it is enforced, will mean, that some officers will actually receive less than they would have got under the old scale. The Council informed the First Lord that the Association takes very serious exception to the treatment

which has been meted out to these officers, and I have asked that the whole question should receive his Lordship's serious attention as it is felt that the good faith of the Admiralty is involved. The Council awaits a detailed reply to its representations, and hopes to deal further with this matter in its Supplementary Report.

QUESTION OF INCREASE OF RETIRED PAY OF SENIOR SURGEON COMMANDERS WHO SERVED MORE THAN 20 YEARS.

262. The Council has also directed the attention of the First Lord of the Admiralty to the case of those Senior Surgeon Commanders who have served considerably more than 21 years and are now on the retired list with a rate of retired pay which can at the present time be earned by a Senior Surgeon Commander of 48 years of age with 21 years' service. The Council has pointed out that though it was undoubtedly the intention of the Government to give a substantial increase to all those who served in the war, and though practically all classes of officers, except Medical Officers, have received substantial increases, the retired pay of these Senior Surgeon Commanders has been increased by barely 10 per cent. The Council has urged that a concession should be made to these officers.

PAY AND RETIRED PAY OF THE R.A.M.C.

263. The Council has considered the question of the pay and retired pay of the R.A.M.C. The new scale of pay published in September, 1919, was not entirely satisfactory inasmuch as a Major of 20 years' service received less money under the new rates than he did under the old. The Council urged the reconsideration of this matter by the War Office, and it has now been rectified. In addition there was issued on October 9th, 1920, an amended scale of pay. The Council is of opinion that the new scale is a fair one, and that it compares favourably with those of other Services. There are, however, one or two points which still need consideration, such as the absence of any provision for an increase in the pay of Majors between 15 years' service and the date of their promotion to Lieut.-Colonel. The position of the D.G., A.M.S. as compared with the other Lieut.-Generals also needs attention.

INDIAN MEDICAL SERVICE.

264. The A.R.M. at Cambridge accepted the revised conditions of service for the Indian Medical Service, in satisfaction of the Association's demands, and the Council has accordingly through the columns of the *British Medical Journal*, etc., used its best endeavours to help recruiting for the I.M.S. The Council recognised that a reasonable time must be allowed to elapse before the new rates, etc., could be brought into operation, but owing to the very long delay which ensued in introducing the new rates for I.M.S. officers on the Civil side, the Council drew the attention of the India Office to the dissatisfaction which was being caused. It has since been learnt that the new rates were published in India on March 3rd and made operative as from January 1st, 1920. It was brought to the notice of the Council that the Administrative Officers of the Indian Medical Service feared they were to be excluded from the increase of pay granted to the other officers of the Service. The point was at once raised with the Secretary of State and an assurance has been received that the scales of pay for the Administrative Officers will be revised with effect from January 1st, 1920, although no promise is given that the scales of these highly placed officers will be raised to 50% above the pre-war figure. The Council has informed the India Office that it hopes that these officers will be dealt with generously, as their expenses have risen very considerably owing to the increased cost of living, and that it would be most unfortunate if these responsible officers were left with a feeling that in the general revision they had come out badly. The Council reports with satisfaction that since the new rates of pay for the I.M.S. were announced a number of officers have joined the Association. There are still, however, many members of the Service who are not members of the Association and the claims of the Association are being further pressed on these officers.

THE ASSOCIATION AND ITS SERVICE MEMBERS

265. The Council has dealt with many difficulties of a personal nature which have been brought to its notice by individual members, and in many cases has been able to take successful action with the authorities on behalf of the member concerned. The Council is fully cognisant of its responsibilities to its Service members, recognising that they are, by their conditions of service, debarred from standing up for themselves. It realises moreover that they are further handicapped by being scattered all over the world. Each Service has its own representative on the Council, and the

Naval and Military Committee deals solely with Service matters. The Council desires very specially to combat the erroneous impression which appears to prevail in some quarters that it gives preference in its interests or in its efforts to any one Service. It has taken up the cudgels for each and every Service in turn, and it will continue to do so whenever and wherever a good case can be found. As Service members are rarely able to have their interests looked after by a Branch or Division, they should not hesitate to avail themselves of the assistance and advice which can always be obtained by a personal call at the Head Office or by a letter addressed to the Medical Secretary. Such visits and communications are always regarded as strictly confidential.

Medico-Sociological.

266. The Council has appointed, experimentally, a Medico-Sociological Committee to consider social and economic questions affecting the public welfare as to which the medical profession has special knowledge, and to take such steps as may be found necessary in order to create or develop public opinion thereon. The Committee is at present discussing the question of the value of maternity and child welfare work in relation to the reduction of infant mortality, and for this purpose has co-opted various lay and medical members who have taken a prominent part in maternity and child welfare work, and has asked for the opinions of prominent workers in this field, both lay and medical.

Scotland.

DIRECT REPRESENTATIVES ON THE SCOTTISH COMMITTEE.

267. The first election of direct representatives under the new constitution was held in October last. A contest occurred in two out of the five groups, eight nominations being received for three vacancies in one group (Edinburgh Branch), and three for two vacancies in the other (Glasgow City). The election was conducted by postal vote, 60 per cent. of the electors voting.

FEEs TO PRACTITIONERS CALLED IN ON THE ADVICE OF MIDWIVES.

268. The Scottish Committee has been in negotiation with the Board of Health on the subject of the revision of the scale of fees, and proposed an inclusive fee of £2 2s. for all attendances at confinement, including immediate post-partum emergency, and including responsibility for any necessary attendances during ten days of the puerperium. This was not found practicable, as the Board held that under Section 22 (1) of the Act it was precluded from paying an inclusive fee to cover more than one subsequent visit, and they asked the Committee to submit new proposals on the lines of the revised English scale, allowing for the difference in after attendances. The Committee therefore substituted the following:—

1. Fee for all attendances during parturition and including one subsequent visit, £2 2s. 0d.
2. Fee for attendance of a second doctor to give anaesthetic, £1 1s. 0d.
3. Fee for suturing the perineum, for the removal of adherent or retained placenta, for the treatment of post-partum hæmorrhage or for any operative emergency arising directly from parturition, including one subsequent necessary visit, £1 1s. 0d.
4. Fee for attendance at or in connection with abortion or miscarriage, including one subsequent visit, £2 2s. 0d.
5. Fee for visits not included under (1) to (4):—
Day 5s.; Night 10s.
6. The usual mileage fees of the district to be charged.

and asked the Board to secure an amendment of the Act so as to permit of payment for attendances during ten days after parturition. Pending this alteration practitioners will be asked to give an honourable undertaking to give all necessary visits during the first ten days without additional charge. The Board has agreed to (2), (3), (5) and (6), and proposed under (1) a fee of £1 17s. 6d. (as compared with £2 2s. on the English scale and under (4) a fee of £1 1s. 0d. (the same as the English scale), which proposals are under consideration by the Committee.

SCHOOL CLINICS.

269. The Committee has asked from Secretaries of Divisions information as to schemes for attendance on school children, with a view to trying to secure the terms resolved upon at the last Representative Meeting. Action has been taken in several instances on the information received, notably in Renfrewshire, where the Education Authority offered a fee of 15s. per hour for attendance at clinics. On representations made by the Scottish Medical Secretary, acting in conjunction with the Division Secretary, the offer was amended to £1 1s. 0d. per hour.

CONFERENCE OF HOSPITALS STAFFS.

270. Two Conferences of Representatives of the Honorary Medical Staffs of Voluntary Hospitals have been held and have been well attended. At the first of these a resolution was unanimously adopted "That when a Hospital receives payment from any public body for the treatment of individual cases, a reasonable proportion of the amount received be put at the disposal of the medical staff." The Scottish Medical Secretary was instructed to send to the Governing Bodies of all hospitals in Scotland a Memorandum conveying the resolution and the reasons in support of it. At the second conference the present financial position of hospitals was considered and resolutions mainly but not entirely similar to those passed at the London Conference (*vide par.* 251), were passed affirming the voluntary principle. The Committee was asked to call further conferences when necessary.

REPORT OF THE SCOTTISH CONSULTATIVE COUNCIL.

271. The Committee has considered the Interim Report and has issued a Questionnaire to divisions. The replies have not been received in time for a report to be made in this document.

HIGHLANDS AND ISLANDS' MEDICAL SERVICE.

272. The Board of Health has replied to the representations of the Committee with regard to improvements in the terms of service, and has agreed to the proposals in respect of guaranteed minimum income in single practice areas, revision of scale of fees to be charged to patients, provision of locums, and provision of houses. It has not yet given its final reply on the question of increased mileage grant.

Wales.

STATUS OF WELSH COMMITTEE: REPRESENTATION OF WALES ON THE COUNCIL.

273. The alteration (agreed to last year by the Representative Body) to the By-laws, making the Welsh Committee more directly representative of the Welsh Divisions, has been greatly appreciated, although it has not been possible, so far this Session, to have more than one meeting of the Welsh Committee. The Committee feels that in comparison with Scotland and Ireland, Wales is under-represented on the Council, although its interests are just as special as either of those countries, and, in any alteration of the composition of the Council, will endeavour to see that the claim of Wales for two representatives thereon is not overlooked.

APPOINTMENT OF GENERAL PRACTITIONER TO THE WELSH BOARD OF HEALTH.

274. Representations were made to the Minister, the Welsh Board of Health and the Welsh Members of Parliament, as to the necessity for strengthening the Welsh Board of Health by the addition of a representative general practitioner. Many of the Welsh Members of Parliament received the representations quite sympathetically, but as no further appointments to the Board are contemplated, and in view of the present economic situation, it is not proposed to take any further action, notwithstanding the opinion of the Welsh Committee that the Board would be much stronger if it had upon it a member fully experienced in the special difficulties of the Welsh general practitioner.

CONTRACT PRACTICE IN SOUTH WALES.

275. The South Wales Branch has instituted a vigorous campaign against the contract practice "Schemes" in South Wales. A Contract Practice Sub-Committee composed of some of the most representative contract practice doctors in South Wales has met

frequently and has had before it reports from all the "disturbed areas." Dr. Ewen Maclean is chairman of the Sub-Committee. The Council at the request of the Welsh Committee has promised that the South Wales Branch shall have all the moral and pecuniary support in the power of the Association in fighting a battle which is considered to be not only the battle of Welsh colliery practitioners against debasing conditions of work, but a fight for the independence of the whole profession.

Ireland.

OFFICERS OF IRISH COMMITTEE.

276. Dr. Denis Walshe, Craigue, Co. Kilkenny, and Dr. John Mills, Ballinasloe, Co. Galway, were elected Chairman and Vice-Chairman respectively. The last meeting of the Irish Committee was held on October 20th, 1920. Owing to the very disturbed condition of the country and the great difficulties in travelling in several parts of Ireland, the Irish Committee has not yet held its usual Spring Meeting. As in previous years the greater part of Irish medico-political work has been done through a composite body called the Irish Medical Committee. The secretarial duties of this body are discharged in an honorary capacity jointly by the Irish Medical Secretary and the Secretary of the Irish Medical Association, thus reducing the expenses of administration to the cost of the stationery and postages.

IRISH PUBLIC HEALTH COUNCIL.

277. The outstanding event of the past year in Irish medical affairs was the publication of the Report of the Irish Public Health Council, a statutory body appointed under the Ministry of Health Act, 1919, to formulate proposals with a view to the submission to Parliament of an Irish Public Health Bill, which would, *inter alia*, place the public health services in Ireland on a wider and more comprehensive basis, and, where necessary, make mandatory on the local health authorities the various adoptive and permissive health enactments. The main recommendations in the Report of the Irish Public Health Council have been favourably received by the medical profession and have received very little adverse criticism from those interested. During the course of the deliberations of the Irish Public Health Council, deputations representing the Irish medical profession made many important representations on the subject of the reorganisation of the medical and health services in Ireland. The interests of the profession were well looked after both inside and outside the Council, and though this meant a great tax on the private time of those practitioners who acted as the representatives of the profession on the Council, as well as throwing an unusual amount of work upon the officials of the medical bodies, nothing was left undone to forward the best interests of the profession on every occasion. The Public Health Council in its Report recommended the co-ordination of central control of the medical and public health services in Ireland by the establishment of a Ministry of Health for Ireland and the formation within such a Ministry of a Health Council, composed of representatives of public and professional interests, to which should be entrusted the general direction of policy in regard to the administration of the medical and health services in Ireland. The proposal of such a Health Council is of far-reaching importance as it means the introduction of a new principle in administration, namely, the control by an elective body representative of the different interests concerned. The powers proposed for the Health Council are comprehensive and include the general policy and principles of administration of the public health and medical services. The proposed constitution of the Health Council is sixteen members, four of whom are to be representatives of the medical profession. The Chairman will be the Commissioner in charge of the Medical Department of the Ministry, and the Report recommends that he should have a casting vote in case of equality of voting. A meeting of Delegates, representative of the Irish medical profession, was held in the Royal College of Surgeons, Dublin, on October 20th, 1920. The chief business considered by the Delegates was the Report of the Irish Public Health Council, of which they approved generally, including the outlines of the proposed Irish Medical Service which, with the modifications suggested in the Report to meet local conditions, they considered should meet all the requirements of an

efficient health scheme for the Irish people. The Delegates were agreed that medical benefits, as administered in England, should be applied to the industrial areas in Ireland.

POOR LAW MEDICAL OFFICERS' SALARIES.

278. During the past two years the Irish Medical Secretary has attended meetings of Boards of Guardians in more than half the Poor Law Unions in Ireland for the purpose of stating the claims of the medical officials. In nearly all the Unions he visited scales of salaries have been adopted providing for increases varying from 80 to 120 per cent. The spirit in which the Boards of Guardians have met the claims of their doctors has, with few exceptions, been a very pleasant feature of the improved relations between these bodies and their medical officials. It is, however, very regrettable that recent legislation, in connection with the disturbed conditions in Ireland, should provide for the seizure of the hard-earned salaries of Poor Law and other medical officials and have them diverted to meet the awards for malicious injuries. In all Irish counties where the awards for malicious injuries are in excess of the local administrative funds, the result is that the Poor Law and other medical officials receive none of their salaries, notwithstanding that they have discharged their duties as heretofore.

AMALGAMATION OF MEDICAL ORGANISATIONS IN IRELAND.

279. The Irish Committee, at its meeting on October 20th, 1920, considered the position of the proposal for the amalgamation of Medical Organisations in Ireland, and whilst it was satisfied considerable progress had been made with regard to the question of amalgamation, it was however of opinion that much further progress could not be made until Irish Government had assumed a more definite and settled basis.

Oversea Branches.

WELCOME TO OVERSEA MEMBERS VISITING THE UNITED KINGDOM.

280. Oversea members intending to be present at the Annual Meeting at Newcastle in July are asked to notify the Honorary Secretary of the Newcastle Committee, Mr. R. J. Willan, M.V.O., F.R.C.S., 6, Kensington Terrace, Newcastle-on-Tyne, of the fact as early as possible. The Council wishes specially to remind members from overseas visiting the United Kingdom that the services of the Head Office staff are at their disposal for any advice or help in the power of the Council to give.

CONFERENCES OF OVERSEA REPRESENTATIVES AT ANNUAL REPRESENTATIVE MEETINGS.

281. In accordance with a wish expressed by Oversea Representatives, the Council has made arrangements for a Conference at each Annual Representative Meeting, of Oversea Representatives, Members of Council representing Oversea Branches, and visitors from overseas, being held prior to the discussion of matters specially affecting the Association overseas.

NEW OVERSEA BRANCHES.

282. Within the last two years Branches of the Association have been formed in East Africa, Nyasaland, Uganda and Zanzibar, and the Council hopes soon to form Mesopotamia, Sierra Leone and Tanganyika Branches. The question of formation of new Divisions or Branches in China is also being considered.

RELATIONSHIP BETWEEN THE OVERSEA DIVISIONS AND BRANCHES AND THE PARENT ASSOCIATION.

283. The Council published in the *B.M.J.* Supplement of March 5th 1921, (page 55), its report as to the question of steps whereby the Association may become in part a federation of medical bodies. It will be remembered that that question was first raised by some of the Australian Branches expressing a wish to be placed in possession of full power of managing their own affairs. The Council reports further on the general subject in paragraphs 63-64 of this report.

284. So far as specially affecting the Oversea Divisions and Branches, the Council desires to point out that the proposals provide machinery whereby the Association could, if and when this were desired, admit into close and formal co-operation with itself, bodies representing Oversea Branches or groups of Branches. But it must be carefully noted that a necessary preliminary of any such new arrangements would be that the Branch or group of Branches would cease to be a Branch or Branches of the Association. The Council naturally greatly prefers the retention of the existing relationship. The Council would not of its own accord propose that any Branch or Federal Committee should take steps, even preliminary to federation with the Association, whereby the Branch or Committee would cease to be a Branch or Committee of the Association. None the less, the Council recognises that in very special circumstances a Branch or group might come to the conclusion that this was the only means of securing that full and free self-government which some of the Oversea Branches have intimated to the Council that the interests of their work might require. If the new Articles and By-laws (*B.M.J.* Supplement, March 5th, 1921, pages 56-63) are adopted by the Divisions and Representative Body, and any Oversea Branch should in fact decide to take advantage of the new facilities and therefore cease to be a Branch of the Association in the ordinary sense, the Association would of course extend to it a hearty welcome as an affiliating body, and loyally do its utmost to give it the fullest and most helpful co-operation.

285. As mentioned in the March 5th Supplement, (page 56, paragraph 12), the Council has called, to meet on July 5th at the Head Office of the Association, for consideration of the whole matter, a Conference of representatives of the Oversea bodies and of Ireland, including the Representatives and Members of Council for those areas, with representatives of the Council. The Australian Federal Committee is being represented at the Conference by Dr. R. H. Todd, the Honorary Secretary of the Committee, and the New Zealand Branch by Dr. William Irving. The Conference will report to the Annual Representative Meeting at Newcastle.

AUSTRALASIAN MEDICAL CONGRESS.

286. Reports of the proceedings of the 11th Australasian Medical Congress, held in Brisbane in August, 1920, were published in the *B.M.J.* Supplement of November 13th and December 11th, 1920 (pages 163 and 194). The Council is gratified to learn that the Congresses will in future be held under the auspices of the Australian Federal Committee of the Association.

SOUTH AFRICAN MEDICAL CONGRESS, 1920: VISIT OF DR. J. A. MACDONALD (late Chairman of Council) TO SOUTH AFRICA.

287. The Council was pleased to receive from the South African Branches an invitation that a representative of the Home Association should visit that Country. At the request of the Council, Dr. J. A. Macdonald, late Chairman of Council, undertook to represent the parent body. He left England in September, 1920, and attended the South African Medical Congress in October, afterwards visiting the South African Branches. The cordial welcome and hospitality accorded to him have been a source of extreme gratification to the Council, and the visit has already had the result of increasing the interest taken by the Branches in South Africa in the work of the Association, and by the parent body in the work and welfare of the Association in South Africa. A full report of the visit was published in the Supplement of March 12th (page 70).

NEW SOUTH WALES BRANCH.

288. From the Annual Report for 1920 of the New South Wales Branch, the Council notes with much interest, not unmixed with envy, that the Branch held in the year no less than 23 meetings, viz., 9 ordinary, 6 extraordinary and 8 clinical, and that the Branch Council met 9 times in the year. Further, that the Standing Committees of the Branch Council (Executive and Finance, Ethics, Medical Politics, Organisation and Science) held between them a total of 49 meetings. The Council has long been of opinion that some of the Oversea Branches can give lessons to the Divisions and Branches at home as to effective

organisation and the above is a notable case in point. The splendid record of the Branch for 1920, for all these meetings were well attended, emphasises once again that most important factor in organisation, viz., the holding of regular meetings.

VICTORIA (AUSTRALIA) FRIENDLY SOCIETY APPOINTMENTS.

[For *ac ion* taken see paragraph 181.]

TASMANIAN MEDICAL ACT.

(See para. 204)

MEDICAL COMMISSIONS SENT OVERSEAS BY NATIONAL COUNCIL FOR COMBATING VENEREAL DISEASES.

289. At the request of the National Council for Combating Venereal Diseases, which was sending Medical Commissions to (1) Gibraltar and Malta; (2) Ceylon, Singapore, Colombo, Hong Kong, Borneo and Treaty Ports; and (3) Bahamas, Barbados, St. Vincent, Bermuda, British Guiana, Jamaica, and Antigua, the Branches of the Association in these areas were invited by the Council to co-operate by assisting the Commissions, the function of which is twofold, viz., to help the profession and educate the public. Practically all the Branches have given the desired assistance and the National Council has thanked the Association for the help thus given.

THE COLONIAL MEDICAL SERVICES.

290. In its Reports for 1920, the Council summarised the action taken in placing the views of the Association as to the terms and conditions of service in the Colonial Medical Services before the Departmental Committee appointed in November, 1919, by the Secretary of State, in the appointment of which the Association's previous representations had no doubt considerable influence. The Council in these Reports also stated that it had reason to believe that the report of the Departmental Committee might probably be published in June, 1920. The Association gave evidence before the Departmental Committee as long ago as February, 1920, and the memorandum of that evidence (*B.M.J.* Supplement, April 24th, 1920, page 141) was approved by the A.R.M. 1920 as the policy of the Association in respect of these Services. In spite of representations to the Colonial Office on the subject, and questions in Parliament, there was still no sign, in August, 1920, of the publication of the report of the Departmental Committee. Accordingly, there being still unredressed a very large number of grievances on the part of members of the Association both in the Colonial Services, and retired from those Services, it was decided, in August, 1920, to discontinue to accept for publication in the *British Medical Journal*, advertisements in respect of the Colonial Medical Services.

291. The report of the Departmental Committee was published on September 14th, 1920. A full summary of the report was published in the *B.M.J.* Supplement of September 18th, 1920, and the Council was gratified to find that the report and recommendations of the Departmental Committee endorsed, to a very large extent, the recommendations of the Association.

292. On October 15th, the Association sent to the Colonial Office the letter, dealing in detail with the whole position, published in the *B.M.J.* Supplement of November 27th, 1920. On October 28th also, a deputation consisting of the Chairman of the Dominions Committee, the Chairman of Council, Sir Anthony A. Bowlby (President, Royal College of Surgeons), Lt.-Col. R. H. Elliot, Dr. T. Duncan Greenlees and the Medical and Assistant Medical Secretaries, interviewed Sir Herbert Read and other officials at the Colonial Office. The deputation emphasised the policy of the Association as laid down by the Representative Body and contained in the Association's letter of October 15th, 1920. The deputation was on the whole favourably received, Sir Herbert Read giving an assurance that prompt action was being taken in connection with the recommendations of the Departmental Committee, and this was repeated in a letter received shortly afterwards (see *B.M.J.* Supplement, November 27th, 1920). On November 27th, 1920, the Colonial Office was informed that pending the receipt of their decisions, it had been decided

to resume publication in the *Journal*, if such publication was still desired by the Colonial Office, of advertisements of the Colonial Services. Lord Milner, replied on December 6th, 1920, expressing his gratification, and the advertisements of the Services were resumed in the *Journal*.

293. At its meeting in February, 1921, the Dominions Committee had before it a large number of representations from Oversea Branches and Medical Officers and ex-Medical Officers of various Colonial Services, especially the British Guiana, East African, Leeward Islands and Windward Islands Medical Services and the West African Medical Staff, expressing great dissatisfaction with the terms and conditions of service, and the delay on the part of the Colonial Office in dealing effectively with the recommendations of the Association and of the Departmental Committee. Further urgent representations were accordingly addressed to the Colonial Office emphasising in particular:—(a) the poor advances in the salaries of the middle-service and senior men; (b) the failure to supplement adequately the pensions of retired men; (c) the urgent need for a Medical Department of the Colonial Office; and (d) the lack of proper hospital provision. It was also intimated that unless the Association received a very definite and early assurance that the grievances complained of were being remedied, it would be impossible for the Association to refrain from active dissuasion of medical men who might be thinking of joining the Colonial Services.

294. In a reply dated March 29th, the Colonial Office expressed regret that its expectation of early replies from the Colonial Governments to the circular dispatch sending out the report of the Departmental Committee, had not been fulfilled, but that a telegraphic reminder had been sent to all which had not yet answered and whose opinion was of importance; that in one case the delay was due to the desire of the Governor to obtain a full and complete expression of opinion from the Medical Department, and to the wish of the Head of the Medical Department, in his turn, to ascertain the views of his subordinates who were scattered over a very large tract of country; that as soon as the replies were forthcoming, the question would be carefully considered; and that "the Secretary of State trusts that he will be able to arrive at a definite conclusion, at any rate on the main suggestions of the Committee, without further delay." The matter rests there for the moment, but if early satisfaction is not given by the Colonial Office, the Council feels that it must begin to persuade practitioners not to enter a Service so unsatisfactory.

PENSIONS OF MEDICAL OFFICERS RETIRED FROM THE COLONIAL SERVICES.

295. The Council considers that the whole position in connection with the increase of the pensions granted by various Colonial Governments to retired medical officers in view of the conditions resulting from the War is extremely unsatisfactory. Various increases stated to have been given, were summarised in the Supplementary Report of the Council, 1920. In addition to the fact that in some cases no increases whatever have been given, that statement of increases appears to be misleading, for some of the increases mentioned cannot be taken at their face value. The Council is again raising the whole matter with the Colonial Office.

BRITISH OFFICERS IN THE EGYPTIAN MEDICAL SERVICES.

296. British Members of the Association in the Egyptian Medical Services drew the attention of the Council to the position in which such Officers may find themselves if the present proposals for change of the Government of Egypt are carried into effect, and the matter was taken up by the Association with the Foreign Office. The Council has obtained an assurance that the representations made by the Association as regards the compensation of such Officers as might find their service compulsorily terminated will, if and when the proposals materialise, receive full consideration. The matter is being closely watched in the interests of the members of the Association in the Egyptian Services.

R. A. BOLAM,

Chairman of Council.

Having examined the Balance Sheet, dated 31st December, 1920, and Accounts with the books and vouchers of the Association, except as regards the Irish Committee Account, and having received all the information and explanations we have required, we report that the Balance Sheet is, in our opinion, properly drawn up so as to exhibit a true and correct view of the state of the affairs of the Association according to the best of our information and the explanations given to us and as shown by the books of the Association.

We have verified the Investments of the Association on General Account and on account of the Trust Funds shown and of the Office Staff Superannuation Fund, and we have verified the possession by the Bankers of the Association of the Deeds of the Freehold Property.

APPENDIX II.

(DRAFT) MEMORANDA FOR THE GUIDANCE OF THE REPRESENTATIVE BODY OF THE BRITISH MEDICAL ASSOCIATION IN CONNECTION WITH THE APPROVAL OF CORPORATE MEMBERS AND NOMINATING BODIES (*i.e.*, AFFILIATION OF OUTSIDE BODIES TO THE ASSOCIATION).*

See page 119 of Report of Council, para 126.

INTERPRETATIONS.

1. In these Memoranda—

A.B.=Applicant Body, *i.e.*, an association or body of persons desiring to become a corporate member of the British Medical Association or to be empowered to nominate a nominated member (By-law 10 (1)).

B.M.A.=British Medical Association.

C.M.=Corporate Member.

N.B.=Nominating Body.

N.M.=Nominated Member.

R.B.=Representative Body of British Medical Association.

PROCEDURE.

2. Each application by an association or body of persons desiring to become a C.M. or to be empowered to nominate a N.M. shall be in writing signed by the Secretary or other responsible officer of the A.B., and transmitted to the B.M.A. at the Head Office (By-law 10 (1)), and may be in the following form or in a form to the like effect:—

FORM OF APPLICATION BY AN ASSOCIATION OR BODY OF PERSONS DESIRING TO BECOME A CORPORATE MEMBER OR TO BE EMPOWERED TO NOMINATE A NOMINATED MEMBER OF THE B.M.A.

(Private and Confidential).

To the British Medical Association,
429, Strand,
London, W.C.2.

(1) I am instructed by the (a) of the (b) of (address) to inform you that the (b) desires to become a Corporate Member (*or*, to be empowered to nominate a Nominated Member) of the British Medical Association, as from 192

(2) There are enclosed herewith copies of the Memorandum of Association, Articles and By-laws (*or*, instrument of foundation, regulations, etc., as the case may be), and other necessary particulars in respect of the constitution and administration of the (b) and the conditions of membership thereof.

(3) The membership of the (b) on January 1st last was, made up as follows

(4) The (b) is duly registered under the of as a

(5) The present application is made as the result of a decision to that effect by the (a) of the (b) on 192 That decision was arrived at by votes in favour, as compared with votes against

(6) A statement (signed by me) of the mutual rights and privileges, terms and conditions, proposed, is enclosed herewith.

Signature

Office held

N.B.—The application requires to be signed by the Secretary or other responsible officer of the

*The Articles and By-laws referred to in these draft Memoranda are the draft Articles and By-laws appended to the report of the Council (*B.M.J.* Supplement, March 5th, 1921, page 56).

applicant body and transmitted to the Association at the Head Office (By-law 10 (1)).

(a) Insert name of Council or other governing or representative body of the A.B.

(b) Name of A.B.

3 Each application shall stand referred by the Council to the Organisation and Finance Committees, and these Committees shall, in joint meeting, consider the application and shall report thereon to the Council.

4. At any stage, if and when in the opinion of the Council such consultation is desirable, it shall be the duty of the Council to consult with the A.B. as to the question of the proposed rights and privileges, terms and conditions, with a view to the same being settled on mutually satisfactory lines.

5. Each application shall be considered by the Council, on the report of the Organisation and Finance Committees, at a meeting of which a notice, specifying that such consideration will form part of the business thereat, shall be sent to every member of the Council. Such consideration shall include a consideration of the Memorandum of Association or instrument of foundation and the regulations of the A.B., of the question whether the application appears to be within the powers of the A.B., and as to whether the application is made with the concurrence of a substantial number of the members of that body (By-law 10 (2)).

6. The Council shall report to the next Meeting of the R.B. upon each application considered by the Council, and no application shall be considered by the R.B. except upon the report of the Council (By-law 10 (3)). The report of the Council shall include a recommendation as to whether the R.B. should approve the A.B. as a C.M. (Art. 6) or as a N.B. (Art. 7), or withhold its approval, and whether conditionally or unconditionally, and may contain such observations relating to the application as the Council may think fit.

GENERAL CLASSIFICATION OF POSSIBLE APPLICANT BODIES.

7. In addition to the classification into "corporate bodies" and "unincorporated associations or bodies of persons," mentioned in Articles 6 and 7, there shall be recognised by the B.M.A. the following classification of possible applicant bodies:—

CLASS (A) BODIES: Outside bodies composed entirely of members of the medical profession, and admission to whose membership is open only to members of the medical profession.

CLASS (B) BODIES: Outside bodies whose membership is open to other than members of the medical profession, but which have for one or more of their objects the promotion of medical or any allied science or of the welfare of the medical or any allied profession.

8. It shall rest with the R.B. to decide in each individual case what privileges shall or shall not be given, and if given, upon what terms and conditions, to a body desiring to become a corporate member of the B.M.A., or to be empowered to nominate a nominated member thereof (Article 8 and By-law 10 (5)).

9. The R.B. may in each case give or withhold its approval, and shall not be bound to state any reasons for any such action (By-law 10 (4)).

10. In deciding the privileges, terms and conditions upon which an individual A.B. shall, if at all, be admitted (whether as a corporate member or a nominating body, as the case may be), the R.B. shall have regard to whether the body in question belongs to Class (A) or Class (B), and to the other circumstances of the individual case.

11. The following is the list of possible rights and privileges, and terms and conditions, in respect of a corporate member or nominating body. Which of those rights and privileges, and terms and conditions, shall apply in any individual case, shall be decided by the R.B. in respect of that case.

Privileges marked "MED" can be given by the R.B. in the case of a Class (A) body only.

POSSIBLE RIGHTS AND PRIVILEGES, AND TERMS AND CONDITIONS, IN RESPECT OF A CORPORATE MEMBER OR NOMINATING BODY ON THE ONE HAND, AND THE B.M.A. ON THE OTHER.

(1) AS REGARDS THE REPRESENTATIVE BODY OF THE BRITISH MEDICAL ASSOCIATION.

(MED) (a) Right of a C.M. or N.B. to Direct Representation.

Right to elect or appoint one Representative (and one or more Deputy-Representatives), with an additional Representative (and Deputy-Representative(s)) for each 500 members of the C.M. or N.B. after the first 500. The Representative(s) and Deputy-Representative(s) to be registered medical practitioners, and to be elected or appointed (so far as possible) so as to come into office at the time specified by the By-laws of the B.M.A. as regards Representatives of the B.M.A. Constituencies, but the mode of election or appointment to be in the discretion of the C.M. or N.B.

(MED) (b) Right of C.M. or N.B. to bring forward Motions.

The same terms and conditions to apply as are laid down by Article 34 and By-law 42 in respect of Divisions and Branches of the Association.

(MED) (c) Right of Representative of C.M. or N.B. to Vote.

Each Representative of the C.M. or N.B. to have one vote in a vote taken by show of hands, division or roll-call, but no vote in a vote taken by card (By-law 44).

(d) Right to be heard by Deputation.

(e) Right of Notice of Certain Proposals.

Right of C.M. or N.B. to receive a copy of every report, resolution or proposal on any subject affecting the honour or interests of those whom the C.M. or N.B. represents.

(2) AS REGARDS GENERAL MEETINGS OF THE B.M.A.

(a) Right of a C.M. or N.M. to share in requisition for General Meeting (Arts. 23-5).

(b) Receipt by a C.M. or N.M. of Notice of General Meeting (Art. 26).

(c) Right of C.M. or N.M. to attend or be represented at General Meeting.

Each N.M. shall have this right. Each C.M. shall be entitled to be represented by an official thereof duly authorised by resolution thereof to act as such representative (By-law 32 (1)).

(d) Right of C.M. or N. M. to Vote.

Each N.M. or authorised official of a C.M. (see foregoing), to be entitled to vote (By-law 32 (2)).

(3) AS REGARDS THE COUNCIL OF THE B.M.A.

(MED) (a) Right of C.M. or N.B. to Direct Representation.

Right of C.M. or N.B. to elect or appoint one member of Council. The member to be a registered medical practitioner, and to be elected or appointed (so far as possible) so as to come into office at the close of an A.R.M. (By-law 54 (3)). The mode of election or appointment to be in the discretion of the C.M. or N.B.

(MED) (b) Right of C.M. or N.B. to bring forward Motions.

The right to introduce motions. Such introduction to be according to the conditions laid down by the Standing Orders of the Council.

(MED) (c) Right to Vote.

A Member of Council elected or appointed by a C.M. or N.B. to have voting power.

(d) Right to be heard by Deputation.

(e) Right of Notice of Certain Proposals.

Right of C.M. or N.B. to receive a copy of every report, resolution or proposal on any subject affecting the honour or interests of those whom the C.M. or N.B. represents.

(4) AS REGARDS STANDING COMMITTEES OF THE B.M.A.

(a) Right of C.M. or N.B. to direct Representation.

Right of C.M. or N.B. to elect or appoint one or more members (whether or not members of the B.M.A.) to such Standing Committee or Committees of the B.M.A. as may be deemed appropriate in the particular case. Such Committee member or members to be elected or appointed (so far as possible) so as to come into office at the times specified by the By-laws of the B.M.A. as regards those members of the Standing Committees elected by the R.B. and Council of the B.M.A. The mode of election or appointment to be in the discretion of the C.M. or N.B.

(b) Right to Vote.

A member of a Standing Committee of the B.M.A. elected or appointed by a C.M. or N.B. to have voting power.

(c) Right of Notice of Certain Proposals.

Right of C.M. or N.B. to receive a copy of every report, resolution or proposal on any subject affecting the honour or interests of those whom the C.M. or N.B. represents.

(d) Right to be heard by Deputation.

(MED) (5) ANNUAL SCIENTIFIC MEETINGS OF THE B.M.A.

Right of members of the C.M. or N.B., who are members of the R.B., and also such other members of the C.M. or N.B., as are resident outside the United Kingdom, to attend the Annual Scientific Meetings of the B.M.A.

(6) BRITISH MEDICAL JOURNAL.

(a) "Important Notices."

Right of the C.M. or N.B. to apply for the use of the "Important Notices" column of the *British Medical Journal*, in respect of any appointment to which the C.M. or N.B. takes exception. The decision as to whether a Notice in any particular case shall be inserted shall rest with the Council of the B.M.A.

(b) Advertisements.

Right of the C.M. or N.B. as regards any advertisement offered to or appearing in the *British Medical Journal*, to which the C.M. or N.B. takes exception, to apply for its refusal or amendment. The decision as to the action to be taken as regards any individual advertisement to rest with the Council of the B.M.A.

(c) Notices and Reports of Meetings.

Right of the C.M. or N.B. to have published in the *British Medical Journal*, notices or reports of meetings thereof, subject to the discretion of the Editor of the *Journal* in respect of each individual notice or report.

(d) Supply of British Medical Journal.

In the case of a C.M. or N.B. outside the United Kingdom, supply in bulk weekly, carriage free, of a specified number of copies of the *British Medical Journal* (or of the *B.M.J. Supplement*).

Right of the Secretary of a C.M. or N.B. within the United Kingdom to receive weekly an official copy of the *British Medical Journal*.

(7) CENTRAL CONFERENCES AND DEPUTATIONS ORGANISED BY B.M.A.

Right of the C.M. or N.B. to representation in central conferences and deputations organised by the B.M.A. in respect of matters affecting the honour or interests of those whom the C.M. or N.B. represents, subject to approval by the Council in the case of each such conference or deputation.

(MED) (8) CENTRAL STAFF AND HEAD OFFICE OF B.M.A.

(a) *Right to Services of Staff.*

Right of the C.M. or N.B. to the use of the services of the staff of the Head Office of the B.M.A.

(b) *Right to use of Library.*(c) *Right to use of Council or Committee Room.*

Right of C.M. or N.B. to the use of the Council Room or of a Committee Room of the B.M.A., if vacant.

All these rights (a), (b), and (c) to be subject to the control of the Office Committee of the B.M.A. or other Committee concerned.

(MED) (9) INDIVIDUAL MEMBERSHIP OF C.M. OR N.B., AND OF B.M.A.

Individual member of C.M. or N.B., to be (if otherwise eligible) free to join as, or remain, an individual member of B.M.A., and *vice versa*.

(10) BRANCHES OF B.M.A.

(Subject in each case to the Rules of the Branch.)

Rights of a Local C.M. or N.B., i.e., one within the area of a Branch or neighbouring Branches of B.M.A.

(MED) (a) *Right to elect or appoint one Representative (being an ordinary Member of B.M.A.) as Member of the Branch Council.* The member to be elected or appointed (so far as possible) so as to come into office at the same time as the Branch Council. The mode of election or appointment to be in the discretion of the C.M. or N.B.

(MED) (b) *Right of C.M. or N.B. to bring forward Motions.*

Any such motion to be in the hands of the Honorary Secretary of the Branch in accordance with the Standing Orders of the Branch Council.

(MED) (c) *Right to Vote.*

A member of the Branch Council elected or appointed by a C.M. or N.B. to have voting power.

(d) *Right to be heard by Deputation.*

Any such deputation to be limited as the Branch Council may determine from time to time.

(e) *Agenda.*

Right to receive a copy of every report, resolution or proposal affecting the honour or interests of those whom the C.M. or N.B. represents.

(f) *Seats on Committees (Standing or ad hoc).*

Right of C.M. or N.B. to elect or appoint one or more members (whether or not members of B.M.A.) to such Standing Committee or Committees of the Branch Council, as may be agreed with the Branch Council. Such Committee member or members to be elected or appointed (so far as possible), so as to come into office at the times specified in the Rules of the Branch. The mode of election or appointment to be in the discretion of the C.M. or N.B.

(g) *Deputations and Conferences.*

Right of the C.M. or N.B. to representation at conferences and deputations organised by the Branch Council in respect of subjects affecting the honour or interests of those whom the C.M. or N.B. represents.

(h) *Right to use any Library or Club formed by Branch: Committee Rooms: Offices.*

Right of the members of the C.M. and N.B. to avail themselves of any such benefits, on such terms and conditions as may be agreed with the Branch Council.

(i) *Reciprocity.*

The Branch of the B.M.A. to obtain such privileges or rights as may be mutually agreed upon, including any or all of the above, on terms and conditions mutually determined from time to time.

(11) PRIVILEGES OR RIGHTS TO BE ACCORDED TO B.M.A.

Such privileges or rights for the B.M.A. as may be mutually agreed upon.

(12) GENERAL.

(a) *Advertising fact of Relationship to B.M.A.*

Right of C.M. or N.B. to announce publicly the fact of its relationship to B.M.A. and to use the style "Federated (or affiliated) to the B.M.A."

Notice of the relationship to be published by the B.M.A. Name of C.M. or N.B. (and N.M.) to be included in Annual List of Members of B.M.A. (By-law 11).

(b) *To be supplied by B.M.A.*

The B.M.A. to supply to the C.M. or N.B., post free, copies of all circular letters and other communications which concern the honour or interests of those whom the C.M. or N.B. represents and are referred to the Divisions of the B.M.A. (in so far as the same do not appear in the *British Medical Journal*).

(c) *Annual and Supplementary Reports of Council of B.M.A.*

The C.M. or N.B. to have the right of forwarding to the Council of the B.M.A., with a view to inclusion as an appendix in the Annual or Supplementary Report of that Council, draft paragraphs dealing with the work of the C.M. or N.B.

(13) SUBSCRIPTION BY C.M. OR N.B. TO B.M.A.

There shall be paid annually by the C.M. or N.B. to the B.M.A. such sum as may from time to time be mutually determined.

OPINION OF COUNSEL AS TO CERTAIN QUESTIONS
RAISED WITH HIM BY ORGANISATION COMMITTEE
IN CONNECTION WITH THE DRAFT
MEMORANDA.

I regard the proposed "Rules" as merely memoranda formulated by the Representative Body for their own guidance in carrying out the new duties which will be imposed upon that Body if and when the "Federation" Articles and By-laws are adopted. Those Articles and By-laws clearly involve material alterations of the constitution and policy of the Association, and fall within the provisions of existing Article 30 and By-law 40 as to a two months' publication. The "Rules" or "Memoranda" (as I should prefer to call them) do not themselves involve such alterations; they will be merely consequential on such alterations already made. In my opinion there is no obligation to publish them under the existing Regulations referred to, nor is there any such obligation as to any proposed amendments to them. It is probably most wise to publish the Rules (as is proposed); but if amendments to them are proposed in accordance with the usual practice of the Representative Body as to amendments to ordinary resolutions (as to which practice the Articles and By-laws are silent), I think that such amendments would be permissible and would be binding if carried.

I think that the Rules or Memoranda should be kept as elastic as possible and that the Representative Body ought not to tie their own hands more than is necessary. In settling them I have kept this in view, but I have hesitated to interfere with the considered opinions of the Organisation Committee on subjects with which they are so familiar.

T. R. COLQUHOUN DILL.

Lincoln's Inn.

7th April, 1921.

APPENDIX III.

MEMORANDUM ON THE REPORT OF THE CONSULTATIVE COUNCIL ON MEDICAL AND ALLIED SERVICES.

1. The establishment of a Ministry of Health (largely in accordance with the wishes and suggestions of the British Medical Association) justifies the assumption that the State proposes to undertake that there shall be available for the community a complete systematised provision for the preservation of the health of the public and for its medical treatment. This assumption underlies the Reports of the various Consultative Councils and the Report (A.R.M. 23) of the Ministry of Health Committee which was presented to the Representative Body.

2. It is recognised that the Report of the Consultative Council on Medical and Allied Services alluded to hereafter as "the Report" is an interim report only, and that there are many matters, particularly those relating to finance and administration, that are not dealt with therein, or are referred to in a very vague or tentative fashion. These matters are, however, in the opinion of the Council, of such importance that they ought not to be ignored in the consideration which the Association and the profession give to the subject matter of the Report, though they will have to be dealt with in detail at a later stage. A full synopsis of the Report (English and Welsh), reprinted from the *B.M.J.* of May 29th, 1920, will be found in Sub-Appendix B, and it is intended here only to draw attention particularly to some points of fundamental importance. These are grouped under the following headings:—

- A. Domiciliary Attendance.
- B. The Relation of Curative and Preventive Medicine.
- C. The Primary Health Centres.
- D. The Communal Services.
- E. The Secondary Health Centres.
- F. The Relation of Practitioners to Administration.
- G. The Composition and Powers of the Local Health Authority.

PRINCIPLES UNDERLYING THE REPORT.

3. But before dealing *seriatim* with these more fully it is considered advisable to enumerate the principles which appear to underlie the Reports of the Consultative Councils:—

(i.) That any scheme of services must be available for all classes of the community (par. 7 of the Report).

(ii.) That the general practitioner should participate in the three forms of service (a) Domiciliary, (b) Institutional, and (c) Communal (pars. 11, 48, 66).

(iii.) That preventive and curative medicine cannot be separated on any sound principle, and must be brought together in close co-operation (par. 6).

(iv.) That domiciliary service should under ordinary circumstances be carried out either at the home of the patient or at the doctor's surgery, as at present (par. 19).

(v.) That Primary Health Centres are essential to an efficient general practitioner Service, both urban and rural, and that general practitioner treatment should be centred on these (par. 45).

(vi.) That the general practitioner would attend at the Primary Centre such of his patients as require hospital treatment, irrespective of their status, though under varying terms and conditions of service (par. 47).

(vii.) That the three methods of payment of the general practitioners are: (1) by the patient, (2) through some method of insurance, or (3) by the Health Authority (par. 47).

(viii.) That the consultants attached to Secondary Centres should be part-time officers paid on a time basis, and should also visit the Primary Centres at fixed intervals; visits to patients' homes and special visits to the centres would be met by extra fees (pars. 62, 63).

(ix.) That a doctor would be able to arrange for his patient to be transferred to a Primary Health Centre under his care (par. 19). Secondary Centres would receive cases referred to them from Primary Centres (par. 1).

(x.) That the staffs of Secondary Hospitals should be elected by a Committee of Selection formed by representatives of (a) the Hospitals; (b) the Health Authority; (c) the University; and (d) the local doctors, on which the medical members would form a majority (pars. 67 and 68).

(xi.) That services should be administered by a Health Authority established in each area on which there should be an effective representation of the medical profession (par. 98).

These principles, as well as some others, are further dealt with in the appropriate paragraphs of this memorandum.

In these paragraphs there are set out the essential statements of the Report on the subjects dealt with, together with any opinion on the matter that has been expressed by the Council of the Association or Representative Body. This has been done for the information of the Divisions, but it should be understood that such opinions are not binding upon the Divisions in any way, nor are they intended to restrict the freedom of the Divisions in any answers they may give to the questions asked, or in any remark they may wish to make on the matters under consideration.

4. It is proposed both by the Report and by the Council that the whole country be divided into suitable administrative health areas, each having its Local Health Authority. Each Local Health Authority will be responsible for seeing that medical services, preventive and curative, are available for every person in its area. The services—preventive and curative in each case—are divided into: A. Domiciliary, B. Institutional, and C. Communal. In discussing each division regard must be had to the three groups into which the population falls:—(a) those for whom provision must be made without the requirement of any personal contribution; (b) those who may be expected to make some contribution by an insurance scheme or otherwise; and (c) those who are able to make provision for themselves. To which of these groups any individual should be assigned may well vary according to the particular service required. Finally, under each division it is necessary to bear in mind (1) the administration (2) the availability of the services to each group of the population, and (3) the methods of remuneration of the medical profession.

A. Domiciliary Attendance.

(Questions 1-3.)

5. The Report states that "domiciliary service is the first element in any scheme of systematised medical services," that this service "must be available for all classes of the community under conditions to be hereafter determined," and that availability "does not mean the services are to be free."

6. The Report does not propose any necessary or immediate change in the provision of domiciliary treatment. If and when such changes are proposed, resolutions which the Ministry of Health Committee has already passed with regard to the attitude of the Association towards such changes will come up for consideration.

7. The Welsh Consultative Council's Report states "that in some form or other for every household in the land a family doctor should be available" (par. 6).

8. In the English Report certain additional facilities are suggested to aid domiciliary service, such as the power to summon consultant or specialist assistance to the patient's house, and the provision of nurses for all illnesses and all persons when the doctor deems these to be necessary.

9. The Council and Representative Body have expressed the opinion that "general practitioner attendance and treatment is the only foundation on which any systematic provision of other kinds of treatment can properly be based; and that, generally speaking, it should be only on the recommendation of a general practitioner that additional services should be available." The Council is further of opinion that any other persons, while employed in the giving of domiciliary attendance (*e.g.* nurses, midwives, health visitors), should be under the supervision of the general practitioner connected with the case.

10. The Council is of opinion that domiciliary services should only be provided by the State, in whole or in part, for those who are considered, after due enquiry, to be unable to provide the same for themselves.

B. The Relation of Curative and Preventive Medicine.

(Question 4.)

11. The Report states that "preventive and curative medicine cannot be separated on any sound principle, and in any scheme of medical services must be brought together in close co-operation. They must be both brought within the sphere of the general practitioner."

12. The Representative Body has expressed the opinion that "in order to attain the objects of an ideal system of medical and allied services, it is necessary that the prevention of the occurrence of disease, as well as the provision for its treatment, should be based on the domiciliary medical service, and that general practitioners should be actively engaged in the practice of both." The Council is further of opinion that this should apply not only in the sphere of domiciliary service but as far as possible in the sphere of all additional services.

C. Primary Health Centres.

(Questions 5-9.)

13. The Report proposes the establishment of Primary Health Centres administered by or under the auspices of the Local Health Authority, and states that "in the Primary Health Centres there would be gathered together the health services and activities of the districts they served; the distinguishing features of those centres would be that they would be staffed by general practitioners; there would be wards of varying sizes for varying purposes, including provision for midwifery. The Primary Centre would provide the patient (on terms) with food, nursing, and all the equipment of efficient treatment but not with medical attendance, which would be paid for either by the patient, or through some method of insurance, or by the Health Authority." It is understood that the staffing by general practitioners means that it shall be open to any general practitioner of the district to treat any of his patients therein, under varying conditions of service.

14. The Representative Body has expressed the opinion "that in any scheme of medical reconstruction arrangements should be made for auxiliary hospitals in which general practitioners could treat their own patients," and has accepted the view "that the establishment of Primary Health Centres is the pivotal idea of the changes recommended in the Report."

15. The Report of the Welsh Consultative Council appears to suggest the establishment of fully-equipped out-patient departments at Primary Health Centres, but the functions of these departments are not strictly defined.

16. The Council is of opinion that the establishment of out-patient departments for purposes of general treatment would be entirely unnecessary and undesirable.

Common Surgeries.

(Questions 10 and 11.)

17. The Report agrees that the custom whereby each general practitioner has his consulting rooms at his own house, should under ordinary circumstances continue, but suggests that in certain congested areas where it is "impossible for a doctor to provide adequate accommodation at his own expense, it should be possible, if the public interest demands it, for the Health Authority to provide such accommodation at the Primary Health Centres or elsewhere on such terms as are reasonable and after previous consultation with a Local Medical Advisory Council. Where local conditions and medical opinion favoured the plan collective surgeries might with advantage be tried."

18. The Council and the Representative Body have expressed the opinion that Common Surgeries for general practitioners under the ægis of the State should not be approved.

D. Communal Services

(Questions 12 and 13.)

19. The Report states that "there would be accommodation for communal services such as those for pre-natal care, child welfare, medical inspection and treatment of school children, physical culture, examination of suspected cases of tuberculosis and occupational diseases, etc.; these services should, where possible, be aggregated at the Primary Centre; a dental clinic would be an important feature."

20. The Council is of opinion that for the correlation of treatment, for the convenience of the public, general practitioners and consultants, and for economy in administration, it is desirable that such communal services should be arranged at common centres; that if treatment of a non-specialist character at such a clinic is provided by a public authority, it should be carried out in all cases by, or under arrangements approved by, practitioners who are attending the patients or their families at their own homes, the ordinary treatment of tuberculosis, the ordinary work of a maternity and child welfare clinic, and the treatment of minor ailments at a school

clinic, being always regarded as being of a non-specialist character; and that in course of time these as well as other communal services (e.g., adenoids, refractions, venereal diseases) should be handed over to the general practitioner.

E. Secondary Health Centres.

(Questions 14 and 15.)

21. The Report states that "Secondary Health Centres would be mainly of a consultative type, receiving cases referred to them by the Primary Centres, either on account of difficulties of diagnosis or because a highly specialised equipment was needed"; that "cases referred for consultation or treatment would attend at Out-Patient Clinics or would occupy In-Patient Beds; the medical staff of the Secondary Centre being responsible for those cases while at the Centre, but every facility being afforded for general practitioners to keep in touch with their patients"; that "consultants would be appointed for these services, paid on a time basis, with extra fees for special visits; general practitioners should be eligible for these posts," certain tests of eligibility being taken into consideration. The members of the staff of the Secondary Centre would attend the Primary Centre for purpose of consultation at fixed intervals, and in urgent circumstances on special summons. The Report suggests that they should be appointed by a Committee of Selection on which the profession would have a majority of members, the Committee being composed of representatives of (a) the Hospitals; (b) the Health Authority; (c) the University; and (d) the local doctors. General practitioners would be eligible for election to the staff.

22. As part-time officers paid by the Health Authority (probably on a time basis), these consultants would be liable to be called into consultation on the case of any member of the community, whatever his status, who, being a patient in the Primary Centre, was willing to accept them as consultants, and to be seen by them at the time of their regular visits to the Centre. In this way their position would differ from that of the general practitioner attending the patient, as it is contemplated that the fees for attendance on patients other than those attended on some form of insurance or for State payment, shall be a matter of arrangement between the patient and the general practitioner.

23. The Council is of opinion that hospitals for cases of a special character should be established in larger areas which should be linked up with the Primary Hospitals, and that this provision would largely be made by utilising the present voluntary hospitals and poor-law infirmaries, though some additional provision might be required. The Representative Body has expressed the opinion that "the clinical medical staffs should be remunerated on a time basis or on a payment by attendance basis; that a medical committee should play an important part in their selection; and that in every case general practitioners, if possessed of the necessary special qualifications, should be eligible in the same way as consultants or specialists."

F. Practitioners and Administration.

(Question 16.)

24. Under the heading "Administration," the Report deals very tentatively with the composition of the Health Authority and the relation of the profession thereto. Upon the difficult question of the relation of the medical practitioner, as clinician, to the medical administrators it says very little, and that little is by no means clear. This, however, is a matter of immediate practical importance. The Report says that "the present trend of the public health service towards the inclusion of certain special branches of curative work is tending to deprive both the medical student and the practitioner of the experience they need," and this transference of departments of clinical work from private practitioners to whole-time salaried officers under the Medical Officers of Health is still going on. It is an urgent matter to agree on the respective spheres of the administrative officer and the private practitioner, general or consultant.

25. Within any given hospital or clinic there are matters of what may be called internal medical administration, involving such things as the relationship to one another of the practitioners attending the hospital or clinic, the number of beds or cases allotted to each of them, the time the beds are occupied, and possibly some measure of control over the methods of treatment adopted. Such matters may, for each institution or clinic, be in the hands of the ordinary clinical staff, one of them perhaps being in the position of "director" within these limits. The general provision and organisation

of the health services of an area, however, involving the relation of parts to the whole, and of every part and the whole to the Local Health Authority, must be in the hands of an Administrative Medical Officer and his subordinate officers. It is the respective spheres of such administrative medical officers and of the private practitioner that it is so important to determine.

26. The Council is of opinion that, while preventive work must be participated in by both clinicians and administrators in the fullest co-operation, it is, generally speaking, desirable:—

(a) That purely administrative work should be kept distinct from clinical attendance and should be in the hands of whole-time salaried medical officers;

(b) That the giving of advice and treatment to individuals should not be in the hands of such administrative officers, and that (unless in a few exceptional cases) such advice and treatment should be given by part-time medical practitioners;

(c) that the work of medical inspection (apart from advice and treatment) should according to circumstances, be undertaken either by administrative medical officers or by part-time practitioners.

G. Composition and Powers of the Local Health Authority.

(Questions 20 and 21.)

27. The Report states that "as regards the nature of the new Health Authority there are some who favour a Statutory Committee of an existing Local Health Authority, whereas there are others who favour the establishment of an *ad hoc* independent body for the purpose of administering health services alone: the question which of these courses is preferable is one upon which we would rather defer any final expression of opinion." No doubt this is not wholly, or even primarily, a professional question, but it is important to gather the opinion of the profession with regard to it. The Report and the Council and the Representative Body are, however, in agreement as to certain essential points, whatever the nature of the Local Health Authority may be.

28. The Council is of opinion that since a full medical and health provision for any area must be associated with institutions or machinery situated in a town of some considerable size, the most convenient area for health administration would be such a town together with so much of the surrounding district as can be properly and effectively associated with it, regardless of the present local government divisions of counties, county boroughs, municipal boroughs and urban districts; but that whether or no such complete rearrangement of area be regarded as possible, either for general local government purposes or for health purposes only, it is essential that all matters of health administration should stand referred preferably to a Local Health Council, or failing that to a Statutory Health Committee of the Local Government Authority.

29. The Representative Body and Council have expressed the opinion that on such Local Health Council or Statutory Health Committee there should be adequate representation of the medical profession of the area and of other persons or bodies engaged in public health work in the area; that for each area there should be established a Statutory Medical Committee to be directly elected by the medical practitioners resident in the area; that the duties of such Medical Committee should be to advise the Local Health Authority on all medical matters and to appoint the medical representatives on the Local Health Authority; that the administrative expenses of such Medical Committee should be a charge on the public funds; and that such Medical Committee should have the right, whenever it thought desirable, to present its views not only to the Local Health Authority but also to the Ministry of Health and to the public.

30. Questions as to all these points are set forth in Appendix IV.

MINISTRY OF HEALTH (MISCELLANEOUS PROVISIONS) BILL —MUNICIPAL HOSPITALS.

31. The Council desires to call attention to Clause 11 of the Ministry of Health (Miscellaneous Provisions) Bill, introduced into the House of Commons on August 16th last. This clause gives to the Councils of Counties and County Boroughs power (already possessed by urban and rural sanitary authorities under the 1875 Public Health Act, but, with one or two exceptions, not exercised by them) to supply and maintain hospitals (including outpatient departments) of a general or

special character; to contribute on terms and conditions to be approved by the Minister of Health to any voluntary hospital or similar institution in their area; and to maintain any poor-law hospital or infirmary in their area.

32. The Council is of opinion, and is making representations accordingly, that there should be such amendments made to the Bill, and to the 1875 Public Health Act, as will require all local authorities to obtain the sanction of the Ministry of Health to its proposals before exercising any of its powers thereunder. Before such powers are conferred at all it is essential that the conditions on which patients can be received into such aided or maintained hospitals and the terms and conditions of the appointment of the staffs of such hospitals should be made the subject of consultation with the profession. The Report of the Medical Consultative Council points out that "many hospital schemes are likely to be defective because their promoters fail to realise that a modern hospital should be part of a more comprehensive organisation."

APPENDIX IV.

QUESTIONS TO DIVISIONS ON THE REPORT OF THE CONSULTATIVE COUNCIL ON MEDICAL AND ALLIED SERVICES.

Domiciliary Attendance.

(Paras. 5-10.)

(1) Should the State assume responsibility for seeing that for every household in the land a family doctor is available?

(2) Should State provision of a domiciliary service on a free or contributory basis be limited to those who are considered to be unable to provide such service for themselves?

(3) In any further State provision of a domiciliary service upon a contributory basis, should the method of contributing be by an insurance scheme or otherwise? If otherwise, in what way?

The Relation of Curative and Preventive Medicine.

(Paras. 11 and 12.)

(4) Should practitioners associated with the State provision of a domiciliary service be required to undertake duties in relation to (a) personal and domestic, and (b) industrial hygiene and other spheres of preventive medicine?

Primary Health Centres.

(Paras. 13-16.)

(5) Are Primary Health Centres as described in the Report, or Centres similar thereto, an essential part of an efficient general practitioner service?

(6) Should all the general practitioners practising in the area have the right to use them?

(7) What variation, if any, as between the metropolitan, urban and rural areas should be adopted in their organisation?

(8) Under what conditions ought Primary Centres to be available for the different classes of the population?

(9) Is it desirable that out-patient departments for the purposes of general treatment should be established in connection with such centres?

Common Surgeries.

(Paras. 17 and 18.)

(10) Are Common Surgeries for general practitioners under the aegis of the State or a Local Authority desirable, and if so, under what conditions?

(11) Are Common Surgeries established and controlled by general practitioners themselves desirable, and if so, under what conditions?

Communal Services.

(Paras. 19 and 20.)

(12) Should the communal services (e.g. school clinics, tuberculosis clinics, venereal disease clinics, infant welfare clinics) be aggregated, whenever possible, at the Primary Health Centre?

(13) Is it essential that the work of these services, when it is not definitely of a specialist character, should be in the hands of the general practitioners of the locality? If so, in what way should the work be distributed and organised?

Secondary Health Centres.

(Paras. 21-23.)

(14) What is the most appropriate method of selecting the staff of a Secondary Health Centre or Hospital?

(15) Under what conditions should consultant and specialist facilities be made available under Health Authorities to the different classes of the population?

Practitioners and Administration.

(Paras. 24-26.)

(16) Have you any practical suggestions to make with regard to the line of differentiation of the administrative officer from the clinician?

Composition and Powers of the Local Health Authority.

(Paras. 27-29.)

(17) Do you regard the points set out as adequate representation of the profession on the Local Health Authority, and the establishment of a Statutory Medical Committee in each area, of the type and with the powers indicated, as absolutely essential?

(18) What do you regard as the most desirable form of constitution for the Local Health Authority, having regard to practical considerations, both of health administration and of local government?

Consultant and Specialist Services.

(19) Are there any objections to the scheme proposed with regard to consultant and specialist services from the point of view of:—

- (a) the General Public,
- (b) the General Practitioner,
- (c) the Consultant?

APPENDIX. V.

SUMMARY OF THE REPLIES OF DIVISIONS RECEIVED TO THE QUESTIONS UPON THE REPORT OF THE COUNCIL RESPECTING THE REPORTS OF THE CONSULTATIVE COUNCILS ON MEDICAL AND ALLIED SERVICES.

A.—ANALYSIS OF QUESTIONS.

DOMICILIARY ATTENDANCE.

(Paras. 5—10).

Question 1.—Should the State assume responsibility for seeing that for every household in the land a family doctor is available?

76 answer No. 41 answer Yes.

Question 2.—Should State provision of a domiciliary service on a free or contributory basis be limited to those who are considered to be unable to provide such services for themselves.

114 answer Yes. 6 answer No. 7 do not answer.

Question 3.—In any further State provision of a domiciliary service upon a contributory basis, should the method of contributing be by an insurance scheme or otherwise? If otherwise, in what way?

96 answer—By an insurance scheme. 7 answer No. 24 either do not answer the question or give answers which are neither Yes or No.

Question 4.—Should practitioners associated with the State provision of a domiciliary service be required to undertake duties in relation to (A) personal and domestic, and (B) industrial hygiene and other spheres of preventive medicine?

89 answer Yes. 14 answer No to both sections (A) and (B). 10 answer Yes to section (A) and No to section (B). 1 answers No to (A) and Yes to (B). 5 give other answers. 3 do not answer at all.

Question 5.—Are Primary Health Centres as described in the Report, or Centres similar thereto, an essential part of an efficient general practitioner service?

106 answer Yes. 13 answer No. 8 do not answer the question at all.

Question 6.—Should all the general practitioners practising in the area have the right to use them?

115 answer Yes. 1 answers No. 2 answer—Not applicable. 9 do not answer at all.

Question 7.—What variation, if any, as between the Metropolitan, Urban and Rural areas should be adopted in their organisation?

106 either do not answer the question or intimate they have no suggestion to submit; a few state they do not understand the question. 24 make suggestions.

Question 8.—Under what conditions ought Primary Centres to be available for the different classes of the population?

All but 16 answer this question. The general opinion is that Primary Centres ought to be available for all sections of the population; free to the necessitous and by a graduated system of payment to others; whilst all patients should be admitted only on the recommendation of a general practitioner, except in emergencies.

Question 9.—Is it desirable that out-patient departments for the purpose of general treatment should be established in connection with such centres?

101 answer No. 13 do not answer at all. 12 answer Yes.

Question 10.—Are Common Surgeries for general practitioners under the aegis of the State or a Local Authority desirable, and, if so, under what conditions?

108 answer No. 7 answer Yes. 11 do not answer at all.

Question 11.—Are Common Surgeries established and controlled by general practitioners themselves desirable, and, if so, under what conditions?

52 answer No. 9 do not answer at all. The remainder suggest either that it might be left to local option if controlled by general practitioners or that system might be established in congested areas.

Question 12.—Should the communal services (e.g., school clinics, tuberculosis clinics, venereal disease clinics, infant welfare clinics) be aggregated, whenever possible, at the Primary Health Centre?

108 answer Yes. 6 answer No. 9 do not answer at all.

Question 13.—Is it essential that the work of these services, when it is not definitely of a specialist character, should be in the hands of the general practitioners of the locality? If so in what way should the work be distributed and organised?

2 answer No. 8 do not answer at all. 116 answer Yes to first part of this question and make various suggestions.

Question 14. What is the most appropriate method of selecting the staff of a Secondary Health Centre or Hospital?

23 do not answer the question. 104 do answer it, of which 58 suggest the method mentioned in the Report of the Consultative Council. 9 suggest the method mentioned in the following paragraph 23 of Association's Report:—

23. The Council is of opinion that hospitals for cases of a special character should be established in larger areas which should be linked up with the Primary Hospitals, and that this provision would largely be made by utilising the present voluntary hospitals and poor law infirmaries, though some additional provision might be required. The Representative Body has expressed the opinion that "the clinical medical staffs should be remunerated on a time basis or on a payment by attendance basis; that a medical committee should play an important part in their selection; and that in every case general practitioners, if possessed of the necessary qualifications, should be eligible in the same way as consultants or specialists."

34 mention other ways.

Question 15.—Under what conditions should consultant and specialist facilities be made available under Health Authorities to the different classes of the population?

The consensus of opinion seems to be that specialist facilities should be available only on recommendation of general practitioners and that patients should pay according to their means, only the necessitous poor being paid for by the State or Local Authority. Some divisions consider that these facilities should be made available only to those who are unable to provide same for themselves.

Question 16.—Have you any practical suggestions to make with regard to the line of differentiation of the administrative officer from the clinician.

36 either do not answer or state that they have no suggestions to make. 52 intimate that they accept the relevant suggestions on the Association's report. 36 other answers do not give any practical suggestions beyond stating that the administrative and clinical work should be separated, and that the administrative officer should have nothing to do with clinical work.

Question 17.—Do you regard the points set out as to adequate representation of the profession on the Local Health Authority, and the establishment of a Statutory Medical Committee in each area, of the type and with the powers indicated, as absolutely essential?

11 do not answer at all. 105 answer Yes. 11 give other answers.

Question 18.—What do you regard as the most desirable form of constitution for the Local Health Authority, having regard to practical considerations, both of health administration and of local government?

32 do not answer the question. 21 state they agree with suggestions of the Association. 32 suggest an independent ad hoc body. 12 suggest a committee of existing Health Authority. 5 state they agree with the proposals in paragraph 98 of the Consultative Council's Report. 28 give other answers.

Question 19.—Are there any objections to the scheme proposed with regard to consultant and specialist services from the point of view of:—(A) the General Public; (B) the General Practitioner; (C) the Consultant?

24 give answers covering all 3 sub-sections. The chief objection mentioned is that of expense.

SUB-SECTION (A).

24 answer generally as stated above. 49 answer No. 36 do not answer. 10 answer Yes, the objection being chiefly expense.

SUB-SECTION (B).

24 answer generally as mentioned above. 43 answer No. 40 do not answer. 12 answer Yes, and state their objections, which may be summarised as fear of bureaucratic control and loss of individuality.

SUB-SECTION (C).

Many useful and detailed suggestions are made by certain Divisions. These are receiving the attention of the Committee.

APPENDIX VI.

COMMUNICATION AND MEMORANDUM RECEIVED FROM THE FEDERATION OF MEDICAL AND ALLIED SOCIETIES.

5, Vere Street,
Cavendish Square,
London, W.1.
January 19th, 1921.

The Medical Secretary,
British Medical Association.

Dear Sir,

We desire to draw the attention of your Council to the crisis that has arisen in regard to the organisation of the medical profession and enclose herewith copies of an explanatory Memorandum. It will be seen that Dr. Addison has made clear that he cannot receive any existing medical body as representing the views of the profession, and that he calls upon the various organisations to agree together.

The reasons preventing co-operation between certain important medical bodies appear to be based upon misunderstanding rather than irreconcilable divergence of views, and it is thought that a satisfactory solution to present difficulties would be found in open discussion.

On March 23rd, 1920, we invited the British Medical Association to reopen the Conferences it arranged in 1919 between five medical bodies, three of whom subsequently found the means of co-operation in the Federation. This invitation, we regret to say, was declined.

Before again approaching the Minister, we are anxious to find the greatest common measure of agreement possible, and therefore invite your Council to agree to nominate three representatives to attend a Private Conference on Tuesday, February 1st, at 5 p.m., at the Medical Society of London, 11, Chandos Street, W.1. Sir Humphry Davy Rolleston, K.C.B., M.D. (who is not connected with the Federation) has kindly agreed to act as Chairman.

The only matter the Conference will be asked to consider is the reference Dr. Addison has given the profession, namely, to agree together.

In addition to the Royal Colleges, whose assistance is sought, this invitation is being sent to the following bodies, whose co-operation with the societies forming this Federation would make collective representation possible:—

The British Medical Association; The Society of Medical Officers of Health; The Medico-Political Union; The National Medical Union and The Edinburgh Medical Guild. Three representatives of the Federation will also be nominated.

We are,

Yours very truly,

MALCOLM MORRIS (Chairman Executive Council).
ARTHUR LATHAM (Vice-Chairman Executive Council).
THOMAS HORDER (Hon. Treasurer).
WILLIAM PASTEUR } Royal Society of Medicine.
H. FARQUHAR BRIZZARD }
RONALD ROSS (British Science Guild).
R. H. COLE (Medico-Psychological Assoc. of Gt. Brit. & Ireland).
JOHN ROSE BRADFORD } London & Counties Med. Protec.
SIDNEY SPORTS } Sec.).
JANE WALKER (Medical Women's Federation).
H. J. CARDAL (Assoc. of Panel Committees).
C. F. RILEY (British Dental Assoc.).
PHILIP ROWSELL (Pharmaceutical Soc. of Gt. Britain).
COMYNS BERKELEY (College of Nursing).
N. HOWARD MUMFERY (Gen. Sec.).
Members of Executive Council.

MEMORANDUM

(CONTINUING)

THE URGENT NEED OF REPRESENTATIVE MEDICAL OPINION.

The collected and considered views of the medical profession are most urgently needed at the present time in connection with the reorganisation of the Health services, but are not available.

Of the numerous medical bodies, some aspire to represent the medical profession as a whole, and one—the British Medical Association—has claimed to do so. Neither it nor any other organisation of doctors is however recognised by the profession and by the Minister of

Health as individually representative of all sections and interests in medicine. This has been made sufficiently clear in Dr. Addison's recent public statements.

THE ATTITUDE OF THE MINISTER OF HEALTH.

On November 1st, 1920, in reply to a deputation of the British Medical Association, which asked that the medical profession might be consulted, Dr. Addison said:—

"He agreed as to the reasonableness of consultation, if the machinery for the purpose were available, but he would not consult a number of different bodies each claiming to represent the profession. If you want us to consult you, get busy and set up some machinery whereby you can readily be consulted." He added: "There is a local branch of the Association in each area but there are other local medical associations and societies as well."

On December 9th, 1920, Dr. Addison made the following statement to a deputation of the Medico-Political Union:—

"The voice of a united profession, speaking not of its own interests primarily but of the best way in which its services can be arranged for the public benefit, is most urgently required but has not yet been obtained. There is no lack of those who say they represent the profession as a whole, but there is no one body which even claims to represent all interested organisations, although some aspire to. It cannot be expected that a Minister should reconcile these interests or continue to consult a number of bodies. If you (Doctors) wish to procure attention for your views, you must agree together first. In no other way is it possible for your views to be represented in the Councils of those concerned with the reconstruction of the Health services."

THE PRESENT IMPASSE

This failure to find adequate collective expression cannot continue without grave detriment to both public and professional interests, and it appears urgently necessary to find the means of co-operation likely to qualify the profession to take its place on the councils of those concerned with the reorganisation of the Health services. Such co-operation need in no way affect direct Government consultation with certain bodies regarding principles or sectional interests.

REQUIREMENTS OF A REPRESENTATIVE BODY.

1. It should be able to represent the collective views of all sections of medical practice.

This cannot be effected by sounding every individual medical practitioner, except by referendum in the case of some clear-cut issue.

It can only be effected by sounding the collective opinion of sections of the profession.

2. It should leave to the existing bodies their respective and legitimate functions.

Therefore, it cannot concern itself with the domestic interests of the members of such bodies, or any matters not public concern.

3. It must be entirely independent, and free of bias towards either Government policy or sectional medical interests.

This can only be accomplished by a federation of bodies in which no one of them is dominant and whose office is distinct from those of the bodies co-operating.

4. It should be recognised by the public and the Government as existing to promote the best interests of the community rather than of the doctor.

5. It should link up with the medical profession those allied professions and occupations whose services are of an ancillary nature.

WHY NO EXISTING MEDICAL BODY IS SUITABLE.

No medical association or society includes the whole profession, the largest claiming but 52 per cent. of those on the register at home and abroad.

No one body is recognised by even a majority of the others as representing all sections.

The various separate bodies are unlikely ever to agree to sink their individuality in one of their number or subordinate their own, to its policy.

All existing medical bodies are viewed by the public as concerned with the advancement of professional interests alone and consequently as unable to express disinterested views.

THE MEANS AVAILABLE.

The present difficulty was foreseen in October, 1918, when a number of medical societies united to set up machinery such as now seems to be required. For two years this work has continued, and although The Federation of Medical and Allied Societies (which has been the outcome) cannot yet claim to provide the means of collective expression for all sections of the profession and its ancillary services, it does provide these means for 45 distinct societies, representing over 18,000 medical men and women and over 90,000 of those in the dental, pharmaceutical nursing and kindred callings.

As a partnership of free societies (rather than an addition to their number), the Federation has already accomplished much in uniting the medical profession. And, it seeks no leadership or control and confines itself to the public aspect of Health matters, it should tend to the increased prosperity of the various existing bodies who cannot but gain by mutual co-operation.

THE NECESSITY OF A CONFERENCE.

The reasons at present preventing co-operation between certain of the representative organisations, to whom this invitation has been issued, appear so incompatible with their avowed aims that the Council of the Federation feels that the difficulties would dissolve in open discussion. With this object a letter was addressed to the Council of the British Medical Association on March 23rd, 1920, asking it to call a conference of bodies to discuss co-operation. As this was declined my Executive Council considers that, before the Minister is again approached, an endeavour should be made to find the greatest possible common measure of agreement. In this endeavour the assistance of the Royal Colleges is particularly sought.

N. HOWARD MUMMERY, Lt.-Col.,

General Secretary,

The Federation of Medical and Allied Societies."

APPENDIX VII.

THE MEANS OF OBTAINING THE COLLECTIVE OPINION OF THE MEDICAL PROFESSION ON QUESTIONS OF POLICY.

1. The Minister of Health, addressing a deputation from the British Medical Association on November 1st, 1920, complained of the number of bodies that approached him claiming to be representative of the profession, and asked that some one body recognised as representing the whole profession should be provided, so that he could consult it on matters of policy affecting the medical profession. Further, in a letter to the Chairman of Council of the Association, dated November 26th, 1920, the Minister said he was "satisfied that it would be impossible to secure the constitution of a representative body without the good offices of the B.M.A. in bringing them together," and went on to suggest that the Council of the Association "should now initiate action to secure the appointment of a body whose credentials will be incontestable."

2. The Association has accepted the Minister's suggestion, and has invited certain medical bodies to co-operate with it in constituting a body which will satisfy his requirements. The Association desires to state its views as to the qualifications of such a body.

QUALIFICATIONS OF A BODY REPRESENTING THE MEDICAL PROFESSION AS A WHOLE.

3. In the first place the body must represent the views of the medical profession and the medical profession alone. The Minister has asked for such a body. When he wishes for the views of the Dental, Pharmaceutical or Nursing professions, he will naturally call on the organisations which represent those professions. They would not desire to have their views confused with those of the medical profession, and the medical profession would certainly not consider that representations from any body which attempted to fuse the interests and views of widely differing bodies ought to be taken by the Minister as the considered policy of the medical profession.

4. The body must be an immediately and directly responsible body—that is to say it must recognise the authority of its constituents and no other authority. It must be under the constitutional control of the whole of its constituents and without undue bias toward any one section of them. A body which the bulk of the profession felt they had no direct means of controlling would be worse than useless for the purpose of the Minister, and might do great damage to the interests of the profession itself.

5. The body must therefore be really representative. That is to say it must have modern constitutional methods of ascertaining the opinion of its constituents and of securing their acceptance of agreements made on their behalf. The body as a whole, or the constituent parts of the body, must therefore have machinery, both central and local, for the purpose of eliciting opinions on policy.

6. The constituents of the body must be directly and intimately concerned in what is generally known as "medical politics," and they must be trained in expressing opinions on such matters. Bodies exclusively or mainly scientific have no concern with medical politics and have not the machinery for dealing with such matters.

7. The body must not profess to promote the interests of the community rather than those of doctors. Such a body would not be recognised by doctors as the body which primarily represents them and their views. Doctors are citizens as well as doctors, but what the Minister is understood to require is a body which will tell him what doctors *qua* doctors think, whether as to the interests of their own profession or as to general questions of public health.

HOW FAR DOES THE B.M.A. MEET THESE REQUIREMENTS.

8. The British Medical Association acting alone would be justified in claiming that it possesses the qualifications enumerated above. It contains 52 per cent. of the whole profession on the Register, and this percentage applies approximately to every section of the profession. If those who are not practising their profession, and what may be called the "floating medical population" be eliminated, the Association could be shown to include about 60 per cent. of the active members of the profession.

9. It is really representative of its members and has well-tried machinery, both local and central for ascertaining their views. The control of its members over the Association is thoroughly democratic and complete. Its members are trained, both locally and centrally, in dealing with medical politics. It does not profess to represent the views of other professions, but it does claim to know with greater certainty than any other body the opinions of the majority of the medical profession.

10. Moreover, the Association is recognised informally by large numbers of practitioners who do not belong to it as the body which voices the wishes and sentiments of the profession as a whole. It is very frequently consulted by non-members individually in their troubles; also by bodies of non-members, or bodies of local practitioners, some members some not. It is recognised by the public as the body which bears the same relation to doctors generally as, for example, the National Union of Teachers does to elementary teachers, or the Miners' Federation to miners. The Government has frequently made use of it as the body which can more adequately than any other body represent the general profession. To name only the most recent and most conspicuous example—the machinery of the Association, both central and local, was used by the Government for the purpose of providing doctors for the Services with due regard to the interests of the civil population. The Government recognised that there was no other existing body which had the machinery, and there was no question about the Association's ability to deal with and represent the views of practitioners, whether members of the Association or not.

11. The Association does not profess to include every member of the medical profession, and it knows of no organisation of any other calling which can make such a claim. The Association does claim to be by far the largest body of organised medical practitioners with a machinery capable of eliciting, by recognised constitutional methods, the views of the organised profession.

CO-OPERATION OF B.M.A. WITH OTHER ORGANISED MEDICAL BODIES.

12. In order to make itself as useful as possible to all sections of the profession the Association has always tried to work with organised bodies representing distinct

sections of the profession. Representatives of the Society of Medical Officers of Health, the Medical Women's Federation, the Poor Law Medical Officers' Association of England and Wales, the Medico-Psychological Association, the Association of Certifying Factory Surgeons, and other bodies have frequently sat on Committees of the Association. All these Societies have on occasion attended on deputations to Ministers arranged by the Association. Most of them regularly and closely co-operate with the Association in its work for the profession. The three first-named societies have standing representation on some of the most important Committees of the Association.

13. The Insurance Acts Committee of the Association in a very special way represents the interests of the (approximately) 14,000 practitioners engaged in National Health Insurance work. A majority of the Committee consists of members elected directly by the Local Medical and Panel Committees of the country, with no restriction as to whether their nominees are members of the Association or not. The Committee is directly authorised by a representative Conference, acting on behalf of the Local Medical and Panel Committees, to carry out all negotiations with the Ministry of Health on matters affecting practitioners engaged in National Health Insurance work.

14. Though the constitution of the Association and its traditional and regular co-operation with bodies representing special sections of the profession would justify it in claiming the qualifications required by a body representing the profession generally, it has invited these other bodies as independent organisations to join with it in attempting to form the body suggested by the Minister of Health.

15. The Association therefore feels that in accepting Dr. Addison's suggestion, if, as it expects, it secures the co-operation of the medical societies above named, it will be able to offer the Minister a body which (with the exception next to be mentioned) is really representative of all the organised medical profession, both generally and sectionally. The body when formed would, of course, consult with other medical bodies not directly represented on it when such consultation was thought desirable or necessary.

16. The exception referred to is that of the Royal College of Physicians of London and the Royal College of Surgeons of England. The Association recognises that the Councils of these bodies are able to speak for the consultant section of the profession in a way which is not open even to the British Medical Association, which includes a large number of the Fellows of the Colleges. The Association has intimated to the Royal Colleges that their co-operation in the matter now under consideration would be greatly valued and that after the adhesion of the other bodies referred to has been obtained the Royal Colleges will be approached again more formally.

APPENDIX VIII.

REPORT ON THE FUTURE OF POOR LAW INFIRMARIES: WITH RECOMMENDATIONS AS TO THE UTILISATION OF POOR LAW INFIRMARIES FOR CIVIL NEEDS.

GENERAL MANAGEMENT.

1. Whether the body responsible for the Poor Law Infirmaries is to be the Guardians or some other body similar to the Metropolitan Asylums Board or the Municipal Council, it seems to be very important that the local medical profession should be represented on the Committee of Management.

There is no object in aiming at a very high percentage of representation. What is required is that a small number of local medical practitioners who are prepared to give time to the subject should be appointed.

2. A present difficulty with the Poor Law is the strict limitation of the patients in any given Infirmary to those who belong to a given "parish" or Union. This may have to be maintained under a municipal system in London, but it would be greatly to the advantage of the sick poor if some system could be adopted whereby people from other parishes or boroughs could attend any given Infirmary which can present them with special advantages, the cost of maintenance to be recovered from their Poor Law Union or Borough.

3. If "Poor Law" is done away with the Infirmaries will tap a type of patients at present very partially reached, such as those who are not in the strict sense entitled to Poor Law relief or object to be classed legally as paupers; and, far from there being any spare beds, very shortly there will be more applications than accommodation. Even now the amount of spare accommodation has been much exaggerated.

4. The only chance of meeting the needs of accommodation will be to utilise sick wards in the Workhouses to a much greater extent than hitherto for senile and unprogressive cases. Also it is very desirable that certain classes of cases should have accommodation elsewhere than in the best-equipped infirmaries. For example: cases of Tuberculosis might well be dealt with in special infirmaries set aside in various parts of London for such cases; also the infirmaries suitable for acute cases should not receive cases of Measles, Chicken Pox, Whooping Cough, &c., as, with the best efforts, these diseases are apt to spread.

5. It is to be hoped that the system of paying for hospital treatment will be maintained under any new system. Those unable to pay at all receiving benefit gratis (or possibly paid for by some authority, i.e., Guardians), and those able to pay a sum meeting the total cost of maintenance being, if thought desirable, treated as private patients with certain privileges. At the same time such patients should realise that they also are receiving benefit from public funds, as the "cost of maintenance" in no case meets the actual money expended on them.

6. With regard to the method of admission. It is desirable that the normal method of admission to the Infirmary should continue to be as at present, on the recommendation of a general practitioner. Cases of urgent illness and accident should be admitted, as at present, by the Medical Superintendent. It is not desirable to have an ordinary out-patient department attached to an Infirmary and run by the paid resident staff. If in any degree attached to the Infirmary such out-patient departments should be staffed by local practitioners, and the most that is desirable may be that the Medical Superintendent might have administrative control for the sake of unifying all the work.

METHOD OF STAFFING THE INFIRMARY.

7. There seem to be three rival suggestions:—

(a) Present system in large Infirmaries.

The present system which obtains in most large Poor Law Infirmaries provides that the work is done by a whole-time Medical Superintendent and his Assistants, who are all resident on the premises and devote their energy and attention exclusively to their patients.

This system forms an excellent foundation for the further building up of the professional side of the work.

8. This is not the place to enter into the duties and responsibility of the Medical Superintendent, but, for smooth working, the comfort of the patients, the satisfaction of the friends, and general efficiency, the system of making a senior Medical Officer responsible for the superintendence of everything is a sound one.

9. It is desirable that the Medical Superintendent should, in all cases, if possible, take a definite share of the professional work. It is impossible for him to attempt to treat any large proportion of the patients himself, but there should be a certain part, (for example, the "acute surgery" or some branch of medicine, "skin diseases," &c.) which he should take. It will be impossible to ensure the professional proficiency of the men to be chosen as Medical Superintendents unless the post offers to a keen medical man some medical interest. Besides this, in almost every case the Medical Superintendent must be responsible for much of the routine duties of a Medical Registrar.

10. The Assistant Medical Officers should be thoroughly efficient general practitioners; men who have done hospital appointments at the teaching hospitals and are of good professional standing. There is much routine work, but, on the other hand, considerably more professional responsibility than falls to the resident in the Voluntary Hospitals, and the appointments should be very valuable to practitioners who want to have two or three years experience of the kind of work they will have in general practice, before starting on their own account. The value of this work as experience for

general practitioners would be greatly increased if it could be provided that a proportion of these posts was tenable as part-time appointments by local practitioners of similar training, who were prepared to give the necessary regular service.

11. The Assistant Medical Superintendent should be, as far as possible, the complement to the Medical Superintendent. Where the latter is primarily a surgeon the assistant should be a thoroughly efficient junior physician, and where the Medical Superintendent is primarily a physician the Assistant Medical Superintendent should be primarily an operative surgeon.

12. Infirmary Superintendents are now realising that the increasing responsibility of their work and the great expansion of methods of diagnosis and treatment make it most desirable that consulting advice should be provided at the Infirmaries. For this a certain number of specialists should be attached to the Infirmaries and attend when necessary.

13. If these specialists belong to a teaching hospital and the teaching hospital can be brought into co-operation with the Infirmary, that will give great advantages, both for the teaching of students and because patients requiring specialised treatment can be transferred from the Infirmary to the Voluntary Hospital. Other Infirmaries may advantageously be used for Post-Graduate study.

(b) System of Voluntary Hospitals.

14. In mentioning this a distinction must be made between the teaching hospitals, where all the staff are by way of being specialists, and the non-teaching hospitals, especially in the Provinces, where the Medical Staff are in the main general practitioners.

15. If the staffing of Voluntary Hospitals by consultants and specialists were applied to Poor Law Infirmaries, the type of practitioners who would be attracted to the work would alter materially. The Medical Superintendent's duties would become mainly administrative as the consulting staff would undertake the clinical duties usually performed by him; the lessened responsibility would reduce the attractiveness of the Medical Superintendent's office and that of the offices of whole-time assistant medical officers who would be replaced by the junior resident staff usual in Voluntary Hospitals. These consequences would materially affect the opportunity for participation in the work by private practitioners employed on a part-time basis. It will probably be thought better to have a carefully selected staff of assistant medical officers, whether these be whole-time or part-time, who would be able to call in, through the Medical Superintendent, expert advice which the patient's condition calls for, rather than to graft the voluntary system of staffing on to the Poor Law Infirmaries.

(c) System whereby whole-time Staff is replaced by General Practitioners.

16. The third system which has been suggested is that the general practitioners of the area should replace in so far as it is possible the assistant whole-time resident staff.

17. There should be no great difficulty in securing that a private practitioner in the district who has specialised training should have the opportunity of coming on to the hospital staff as a consultant, or as an assistant medical officer as suggested at the end of para. 10. It appears, however, impossible to staff a large Infirmary with an indefinite number of general practitioners whose right to come in would be claimed on the ground that the cases were sent in by them and therefore should continue under their treatment inside. It is contended that private patients who are admitted to a Poor Law Infirmary should be allowed to avail themselves of the services of their own medical attendants, but it is considered impracticable to extend this principle to ordinary Poor Law patients.

RECOMMENDATIONS.

Admission of Private Patients employing their own Doctor.

1. That in those Poor Law Infirmaries where there is spare accommodation and when the needs of the Poor Law patients have been met, it would be desirable that certain beds should be set aside for private patients paying a fee to be settled by the Guardians; that where a general practitioner wishes to continue to treat therein patients

of his own, he should be allowed to do so under the general administrative supervision of the Medical Superintendent, and that any of these patients should be allowed to call in a consultant from outside, the patient bearing the cost thereof.

Inclusive Charge for Maintenance: Doctor paid by private arrangement.

2. That for "paying" patients admitted to Infirmaries there should be an inclusive charge to cover the cost of medical supervision, maintenance, nursing, food and medicines, within the ordinary tariff and pharmacopœia of the Infirmary, the patient paying his medical attendant independently.

Extra comforts to be available as "extras."

3. That any extra nursing and any food or medicine ordered over and above those allowed under the ordinary tariff and pharmacopœia of the Infirmaries should be charged as extras to the patient.

Administrative Supervision by Medical Superintendent.

4. That all medical attendance by private practitioners on "paying" patients in Infirmaries should be under the administrative supervision of the Medical Superintendent of the Infirmary.

Utilisation of Infirmaries for Medical Education.

5. That Infirmaries, so far as practicable, should be utilised for medical education.

Tendency towards "Primary Health Centre" type.

6. That in any hospital maintained by a local authority (including the Board of Guardians) for general cases, provision should be made for wards for the reception on the lines of the suggested primary health centre as outlined in the Consultative Council's report of private patients admitted on the recommendation of their own practitioner who should be able to attend these patients in such wards.

Representation of profession on Management Committee.

7. That Municipal Hospitals should be controlled by an *ad hoc* Committee on which there should be a small but definite representation of the medical profession.

Hospital benefits not to be confined to particular Parish or Union.

8. It is desirable in the interests of the patients that the Medical Superintendent should have power in special cases (including cases of urgency) to admit or retain patients from other parishes, the Guardians being empowered to recover the cost of maintenance thereof from the parish or borough in which the patient resides.

Use of Sick Wards in Workhouses for chronic cases.

9. That to meet the needs of accommodation, the sick wards in the Workhouses should be utilised to a much greater extent than hitherto for senile and chronic cases, and should be under the control of the Medical Superintendent of the Infirmary.

Exclusion of certain classes of cases.

10. That certain classes of cases, e.g., tuberculosis and certain infectious fevers not already provided for, should not be accommodated in general infirmaries, but in special hospitals arranged for this purpose.

Method of Admission to Hospital.

11. That the normal method of admission to an Infirmary should be on the recommendation of a general practitioner.

Eligibility of local profession for staff.

12. That District Medical Officers be selected from the private practitioners of the neighbourhood.

13. That, except for the treatment of private patients, the normal medical staff of an Infirmary should be a combination of the whole-time resident staff or a part-time selected staff with part-time specialists, the last being called in by the Medical Superintendent as and when necessary.

British Medical Association.

CURRENT NOTES.

Paying Patients in Poor Law Infirmaries.

A DEPUTATION from the British Medical Association attended at the Ministry of Health on April 26th to discuss with the Minister the conditions under which paying patients might be admitted to Poor Law infirmaries. Sir Alfred Mond was accompanied by the Earl of Onslow (Parliamentary Secretary) and by permanent officials of the Ministry. The deputation was headed by the Right Hon. Sir Clifford Allbutt (President of the Association), who made a graceful reference to Sir Alfred Mond's new appointment, and by Dr. R. A. Bolam (Chairman of Council), who briefly outlined the position and influence of the Association. Both Sir Clifford Allbutt and Dr. Bolam disclaimed, on behalf of the Association, any connexion with recent irresponsible criticism of the Ministry. Mr. Bishop Harman (Chairman of Hospitals Committee) then proceeded to lay before the Minister the suggestions of the Association with regard to the utilization of Poor Law infirmaries for civil needs. He emphasized three points which it was desirable to secure: (1) That the local medical profession of the districts concerned should be consulted with regard to any schemes which it was proposed to bring into operation; (2) that patients should only be accepted, as a general rule, on the recommendation of a private practitioner; and (3) that private practitioners should have the right of entry, so that patients might continue to be attended within the institution by the practitioner of their choice. Sir Alfred Mond made a brief but sympathetic reply. He said that he was well aware of the position and influence of the British Medical Association. To the points brought forward by Mr. Bishop Harman he could not give a very definite answer at that juncture. He saw certain advantages in the linking up of the private practitioner in the manner proposed; he also saw possible difficulties. He had not yet found time to study the whole problem, but he expressed himself as greatly obliged to the Association for bringing forward the proposals, which would have his careful consideration, and he invited further conferences on this and other difficulties concerning work in which the Ministry and the Association had a common interest. A full report of the proceedings will appear in the next issue of the SUPPLEMENT.

Health Certificates for Emigrants.

In a Current Note published in December last, attention was called to the serious inconvenience, or possible hardship, which may be inflicted on emigrants who have received from private practitioners certificates of good health which are not accepted by the medical officer at the port of embarkation or, as is more likely, at the port of disembarkation. The secretary of the Oversea Settlement Office has called the attention of the Association to two cases which illustrate what may happen to emigrants who are not physically sound but who have managed by some means or other to pass through the meshes of the net which is designed to catch them. In his letter the secretary says: "It is not clear how far the disabilities in question in these cases could have been detected in the first instance, but it is felt that such instances emphasize the need for caution on the part of medical practitioners who are asked to issue health certificates to intending settlers." In one case the emigrant suffered from epilepsy and in the other from arthritis in the feet. The epileptic, after being discharged from employment on several occasions on account of his fits, was eventually sent back to England. The man with arthritis is in hospital, and the Oversea Settlement Department has been asked to pay the cost of his passage back to England. It is quite possible that in both these cases there was nothing which the medical examiners could detect at the time of the examination. The difficulty might, however, be got over by pointing out to the intending emigrant what will almost certainly happen to him if any condition from which he has suffered, but which he has not disclosed to his doctor, incapacitates him after his arrival in the country to which he is going.

Anaesthetists' Fees in Insurance Practice.

A Current Note which appeared under this heading in the SUPPLEMENT of April 16th contained the following statement in connexion with the circular of the Ministry of Health, printed on page 99 of the same Supplement:

With the decisions which are now set out in the circular letter referred to above the Insurance Acts Committee is in entire agreement.

This statement requires modification, in view of the inclusion in the circular of the following decision (2) (d):

"In the comparatively rare cases where teeth are extracted by an insurance practitioner as part of his agreement—for example, in rural areas where this service is customarily undertaken by doctors—a fee would be chargeable against the Practitioners' Fund."

The attention of the Ministry has been drawn to the fact that the point was one which had never been referred to the Conference of Panel Committees, and that consequently the Insurance Acts Committee was not in a position to signify its assent to the decision on behalf of insurance practitioners.

Annual Meeting at Newcastle: Ophthalmological Section.

It has now been arranged that the Ophthalmological Section at the forthcoming Annual Meeting of the British Medical Association at Newcastle-upon-Tyne will meet on Wednesday, July 20th, and Thursday, July 21st, instead of, as was formerly announced, on the Thursday and Friday.

Association Notices.**NOTICES OF MOTION BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, NEWCASTLE, 1921.****By NEW SOUTH WALES DIVISION-BRANCH:**

That the annual subscription of members in Australia be £1 10s. instead of £2 2s. as at present; and that By-law 11 (1) (b) be amended accordingly.

By GATESHEAD DIVISION:

That the names of candidates for membership of the British Medical Association should be brought before the Division in which they reside.

That, in order to stimulate the interest of senior students of medicine in the work of the British Medical Association, and so tend to secure their adherence at the outset of their careers as practitioners, the British Medical Association institute a *student class* of members at a reduced fee, with the privilege of attending scientific meetings and receiving a free copy of the JOURNAL weekly.

By PORTSMOUTH DIVISION:

That the Representative Body is of opinion that medical men practising as whole-time officials of public authorities should be precluded from practice for private reward in the same district (i) while holding their appointments; and (ii) for a period of five years subsequently, except with the consent of the local medical profession.

That the Representative Body express the opinion that the collective opinion of the medical profession can be adequately and truly expressed to the Minister of Health only through a body elected directly by the profession for that purpose, such body to have the power, if thought advisable, to co-opt for any special purpose representatives of the medical profession not exceeding one third of the total number of the committee.

Rider: That this election should be organized and conducted by the British Medical Association.

By GUILDFORD DIVISION:

That the Representative Body is of the opinion that the present method of election of the members of the Ministry of Health Committee is unsatisfactory, in

view of the great importance to the profession of the work entrusted to that Committee, and accordingly instructs the Council to take immediate steps to convert the Ministry of Health Committee into a Standing Committee elected in the same manner as the Medico-Political Committee.

By BUCKINGHAMSHIRE DIVISION:

That in the event of a medical man having two cars, and who uses only one at a time, the licence for the second car should be halved.

That an adequate travelling allowance be paid in connexion with attendance at a coroner's court, and that the fee for giving evidence should be two guineas, and for a necropsy three guineas, also that these fees should apply to the staffs of hospitals.

By GLASGOW EASTERN DIVISION:

That the principle of federation be agreed to, but confined to bodies limiting their membership to medical men.

By GLOUCESTERSHIRE DIVISION-BRANCH:

That the Representative Body is of the opinion that the Association should agree to appoint accredited representatives to the Federation of Medical and Allied Societies.

By LEICESTERSHIRE AND RUTLAND DIVISION:

That the words "or any allied science," and "or any allied profession" in new Article 6 (b) be omitted.

That the words "or any allied science" and "or any allied profession" in new Article 7 (b) be omitted.

That Representation at the Annual Representative Meeting be based on the number of Members of the Division on December 31st preceding the Annual Representative Meeting.

By NORTH SUFFOLK DIVISION:

That the British Medical Association should become a federation of medical bodies alone.

By MID-CHEESHIRE DIVISION:

That the Representative Body disapproves of any attempt to procure federation or affiliation between the British Medical Association and any non-medical body.

That the Representative Body considers the insurance record cards are unnecessarily irksome and impracticable, and that the scheme by Dr. Locket as published in the BRITISH MEDICAL JOURNAL SUPPLEMENT of February 19th, 1921, be considered by the meeting.

That the Representative Body is of opinion that the lay press should be excluded from the Annual Representative Meeting, but that a *précis* of the proceedings should be supplied to them for publication.

ELECTION OF COUNCIL OF ASSOCIATION, 1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and **Nomination Form**, were published in the SUPPLEMENT of March 12th (p. 73). The **Nominations** must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

ELECTION OF REPRESENTATIVE BODY OF ASSOCIATION, 1921-22.*Constituencies in Representative Body.*

THE Council has finally grouped the **Home Divisions** for election of the Representative Body; 1921-22, in the same manner as for 1920-21, except that the Caithness

and Sutherland Division of the Northern Counties of Scotland Branch, and the Rotherham and Sheffield Divisions of the Yorkshire Branch have been made independent Constituencies.

As intimated to all the **Oversca Bodies**, the Council has made each Oversea Division and Division-Branch an independent Constituency.

Election of Representatives and Deputy-Representatives.

The REPRESENTATIVES AND DEPUTY-REPRESENTATIVES in the Representative Body must be elected not later than June 17th, and their names notified to the Medical Secretary not later than June 24th. The Annual Representative Meeting at Newcastle begins on July 15th.

Special attention is drawn to the fact that the election of Representative(s) and Deputy-Representative(s) may, at the discretion of the Constituency, be carried out by General Meeting of the Constituency, or by postal vote.

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each scholarship is tenable for one year, commencing on October 1st, 1921. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1921-22 must be made not later than Saturday, June 25th, 1921, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A LIST of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

BRANCH AND DIVISION MEETINGS TO BE HELD.

DORSET AND WEST HANTS BRANCH.—The annual meeting of the Dorset and West Hants Branch will be held at Yeovil on Wednesday, May 18th, at 3 o'clock, when the Presidential address, on "Experience of Two Recent Methods of Treatment,"

will be delivered by Dr. F. C. Bottomley, O.B.E. Luncheon will be served at 1.30 p.m. at the Three Coughs Hotel, the retiring President, Dr. Wetherall, in the chair. Dr. Norman Flower kindly invites members to tea after the meeting. A motor coach has been arranged to take members from the Bournemouth district, leaving The Square at 10.30 a.m. prompt. Applications for seats should be made early to Dr. Asten, Talbot Hill, Bournemouth.

METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.—The annual meeting and dinner of the Division will be held on Thursday, May 19th.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—A general meeting of the Westminster Division (which includes Holborn) will be held on May 6th at 4.30 p.m. at the St. James's Vestry Hall, Piccadilly (next St. James's Church). Dr. G. F. Buchan will give an address on "National Health and the Practitioners," to be followed by a discussion. Officers will be elected for the coming year, and the names of gentlemen desirous of serving on the Executive Committee should be sent to the Honorary Secretary, Dr. F. D. Bennett, 15, Savile Row, W.1.

A MEDICAL PROVIDENT SCHEME.

SUGGESTED ORGANIZATION FOR LONDON.

In the BRITISH MEDICAL JOURNAL of January 22nd, 1921, p. 129, an account was given of the Sussex Provident Scheme, which had been drawn up for the purpose of supplying its members with medical facilities of every kind. The scheme was approved by four meetings of the medical profession at Brighton, Hove, and Preston, called to consider it—namely, by meetings of the Executive Committee of the Brighton Division of the British Medical Association, of the Brighton Panel Committee, of the honorary medical and surgical staffs of the hospitals concerned, and of the medical and dental professions generally. The facilities arranged under the scheme were set out in the JOURNAL of January 22nd, and the rules for those participating in the scheme were printed in full.

SCHEME OF THE METROPOLITAN COUNTIES BRANCH COUNCIL.

An amended form of the Sussex scheme has now been drafted by the Council of the Metropolitan Counties Branch of the British Medical Association. It is headed: "National Provident Scheme for Hospital and Additional Medical Services: Draft of Suggested Organization for London." The scheme is described in the following memorandum, issued by the Branch Council from the Head Office of the Association, 429, Strand, and bearing date April 18th, 1921:

1. *The Problem.*

The great and increasing cost and complexity of medical services beyond the attendance of a general practitioner have made it impossible for a large majority of the population to obtain these benefits, although it is obvious that many cases cannot be properly dealt with unless the doctor in charge has them at his disposal. It therefore becomes a choice of either having to do without them or of accepting them wholly or in part as charity.

Further, many of the Voluntary Hospitals are already obliged to charge for their services, and have decided to ask all out-patients to bear part of the outgoing cost of their treatment, and in-patients to contribute, according to their means, to their maintenance in Hospital.

2. *Hospital Co-operation.*

But it can now be made possible, by the help and co-operation of the Hospitals, to meet these difficulties by the establishment of a provident scheme which will supply its members, free of cost, with practically all the resources of medicine which can be afforded.

All the General and Special Voluntary Hospitals in the City and Metropolitan Police Districts should be eligible to accept the Scheme; but the management of the Scheme should be in the hands of an independent Central Office.

There should be adequate Medical representation upon any Body concerned in starting or working the Scheme.

3. Scope of Scheme.

It should be clearly understood, however, that this Scheme

- (1) Has nothing whatever to do with the National Health Insurance or any other organisation for medical benefit; and
- (2) Does not provide its members with ordinary medical (*i.e.*, general practitioner) attendance, or other benefit to which they are entitled from the State or from local authorities; but
- (3) Is for the benefit of those who, irrespective of class or occupation, are in a financial position which makes them eligible for election as members.

4. Income Limit.

The maximum limit of income for all persons admitted to the Scheme in the Metropolitan Area should be, in the present value of money, £250 for single members, £400 for married people without children, or for a widow or widower with one child, and £500 for a family (but including only those children under 16 years of age).

The higher income limits should have reference to the combined earnings of the family, and should be reducible to the lower income limits in cases where there cease to be children under 16 years of age dependent.

If it is found impracticable to distinguish between the incomes of persons insured under the National Health Insurance Acts, the income limit should not apply to those persons.

5. Medical Examination.

No preliminary medical examination is considered necessary before the admission of an applicant.

6. Facilities.

The following facilities will be arranged:—

i. CONSULTATIONS.—The medical attendant of a member may arrange, by appointment, for consultations separate from other patients at any of the co-operating hospitals, and such treatment as he and the consultant may jointly think advisable will be undertaken, at the hospital if this should be necessary.

For those members who are unable to leave their beds, the services of visiting consultants (a list of whom will be kept at the offices) may be secured by appointment.

For members outside prescribed areas, unable to leave their beds, free consultations may be obtained by appointment, subject to the payment to the consultant at the time of consultation of a charge equal to one half of the usual mileage rates.

ii. NURSING.—The full range of services of the "Queen's" or other Provided Visiting Nurses will be available for members at the request of their medical attendants.

iii. DENTAL TREATMENT.—Members sent by their medical attendant will be supplied with all ordinary dental treatment which may be considered necessary by the Dental Surgeon, and with any dentures which may be required at Hospital rates.

iv. LABORATORY.—All the resources of the Pathological Laboratories of the Hospitals will be available for the benefit of members after consultation, including bacteriological and pathological investigations and examinations beyond the province of general practice, Wassermann and Widal tests, &c., blood examinations and counts, the preparation of autogenous vaccines, &c.

v. X-RAYS.—Examinations will be available at the request of the medical attendant of a member, and where found necessary will be made, and a report supplied to the doctor. Treatment by X-rays (including opaque meals with examinations) will be given when, after consultation, it has been considered advisable.

vi. MASSAGE will be provided by appointment for members in whose cases it is prescribed after consultation.

vii. ELECTRICAL TREATMENT—*i.e.*, galvanism, faradism, high-frequency, ionization, diathermy, &c.—will be administered by appointment, after consultation, in suitable cases.

viii. HOSPITAL TREATMENT.—Urgent cases will be admitted to hospitals as at present: other cases requiring operation or other hospital treatment will, after consultation, be admitted to hospital, or be placed upon the waiting list of the hospital until there is a vacant bed, but a member will not take precedence over more urgent cases, and the ordinary hospital

routine will not be disturbed. In all the co-operating hospitals in which private beds are reserved at present for paying patients, members will be admitted to these beds, if available, should they desire it, at a uniform reduction of one guinea a week from the usual price of the bed.

In the case of Out-Patients any member of the Scheme showing his card of membership and presenting an introduction from his Practitioner will not be subjected to any Almoner's enquiry.

ix. AMBULANCES.—Will be available at the request of the medical attendant for the transport of "Stretcher Cases."

7. Access to Facilities.

The facilities of the services should only be available on the application of the General Practitioner, with the approval, when applicable, of the member of the Hospital Staff concerned.

8. Rules.

1. No one will be accepted as a single member except an unmarried man or woman, or a widower or widow without children under the age of 16.

The subscription for a single member will be £1 per annum.

2. Married people without children, or a widower or widow with only one child under the age of 16 years, may only subscribe jointly at a rate of £1 10s per annum for the two, although each shall be accounted a member.

3. Married people with a child or children under the age of 16, or a widower or widow with children under the age of 16 years, may only subscribe at a family rate of £2 per annum, which shall include the whole family, however large, except children over the age of 16, who must be accepted as single members, although each individual in the family shall be accounted a member.

N.B. These rates are subject to revision after due notice.

4. All candidates for membership must be approved by the "Committee of Reference" formed by the co-operating hospitals, except in the case of those insured under the National Health Insurance Acts, who will produce their medical card.

In the event of the eligibility of any member being questioned the matter will be submitted to the "Committee of Reference," whose decision shall be final.

5. Cards of membership, bearing the date, will be issued on the first day of each month to those who have become members during the preceding month, and the benefits will begin on the date of the card, and continue for one calendar year. These cards must be produced as evidence of membership.

6. At the end of one year from the date of issue of the membership card the benefits will cease unless the subscription has been renewed. Fourteen days grace will be given for renewal (during which no benefit will be available), but, after this, renewed membership will only be possible from the beginning of the next quarter.

7. When the number of members has reached the limit of the capacity of the co-operative hospitals, the list will be closed.

9. Financial Aspect of the Scheme.

It is estimated that in the area under consideration the number of persons to whom the scheme is applicable could not be less than 5,000,000; and that if all these joined, as individuals, married persons, or families, as the case might be, the resulting income would be about £3,000,000 per annum. If as a basis for calculation it is assumed that sufficient persons join to produce an income of £1,200,000, this might be allotted as follows:—

	£
Hospitals 52/80	750,000
(including 25% to Staff Fund, £195,000)	
500 Nurses 6/80	90,000
30 Ambulances 2/80	30,000
Visiting Consultants 8/80	120,000
Administration 3/80	45,000
Reserve 9/80	135,000
	Total £1,200,000

THE ANNUAL MEETING AT NEWCASTLE.

THE following is a summary of the arrangements for the eighty-ninth Annual Meeting of the British Medical Association to be held next July at Newcastle-on-Tyne. The proceedings will open on Friday morning, July 15th, when the Representative Body will begin its annual meeting at 10 o'clock, the session being continued on the three following weekdays. Council meetings have been provisionally fixed for the mornings of Monday, July 18th, and Wednesday, July 20th. The statutory annual general meeting will be held at 2 p.m. on Tuesday, July 19th, on which day the social and scientific business of the annual meeting will commence with the delivery by Professor David Drummond of his Presidential Address to the Association at 8 p.m. The sectional meetings for scientific and clinical work will be held, as usual, on the Wednesday, Thursday, and Friday; the mornings from 10 a.m. to 1 p.m. being given up to discussions, and the afternoons from 3 to 4.30 o'clock to clinical and laboratory demonstrations, of which a special feature will be made, as was the case at Cambridge last year. The list of sections and their presidents is printed below. The first five sections will meet on July 20th, 21st, and 22nd; the six following sections on two days each; and the remaining six sections on one day each.

Medicine: Professor Thomas Beattie.
Surgery: Professor J. Rutherford Morison.
Pathology and Bacteriology: Professor Stuart McDonald.
Preventive Medicine with Industrial Diseases: Sir Thomas Oliver.
Orthopaedics and Diseases in Children: Mr. A. H. Tubby.

Neurology and Psychiatry (July 20th and 21st): Professor A. W. Mackintosh.
Obstetrics and Gynaecology (July 21st and 22nd): Professor R. P. Ranken Lyle.
Ophthalmology (July 20th and 21st): Professor J. D. Wardale.
Oto-Rhino-Laryngology (July 20th and 21st): Dr. G. William Hill.
Physiology, Pharmacology, Therapeutics, and Dietetics (July 20th and 21st): Dr. H. H. Dale.
Venereal Diseases (July 20th and 21st): Colonel L. W. Harrison.

Ambulance and Red Cross (July 20th): Sir James Cantlie.
Dermatology (July 21st): Dr. J. Farquhar Christie.
Medical Sociology (July 22nd): Sir Jenner Verrall.
Proctology (July 20th): Mr. J. P. Lockhart-Mummery.
Radiology and Electro-Therapeutics (July 22nd): Dr. Robert Knox.
Urology (July 22nd): Mr. J. W. Thomson Walker.

There will be religious services on Tuesday, July 19th, at 5 p.m. On Wednesday evening at 8 o'clock Sir Thomas Oliver will give an address on industrial diseases; on the same day the secretaries will hold their annual conference at 2 p.m., and their dinner at 6.30 p.m. The annual dinner of the Association will be held on Thursday evening, July 21st, at 7.30 p.m., and on Friday Professor Arthur Keith will deliver the Popular Lecture at 7.30 p.m. on "Evolutionary wounds, their healing and the part they play in the evolution of the human body." Saturday, July 23rd, the last day of the meeting, has been set apart for excursions to places of interest in the neighbourhood. Articles on the history, institutions, and industries of Newcastle have appeared in the *JOURNAL* of December 11th, 1920, March 12th and April 16th, 1921, and information about hotel accommodation was given in the *SUPPLEMENT* of April 16th. The Honorary Local General Secretary is Mr. R. J. Willan (6, Kensington Terrace, Newcastle-on-Tyne).

INSURANCE.

LONDON PANEL COMMITTEE.

Annual Dinner.

THE London Panel Committee held its first annual dinner on April 21st, at the Holborn Restaurant, when some 150 ladies and gentlemen were present, with Dr. H. F. CARDALE, chairman of the Local Medical and Panel Committee for London, in the chair. After the loyal toasts had been honoured, the toast of "The London Panel Committee" was proposed by Dr. R. E. CROSSE, of the Ministry of Health. He pointed out that unanimity in

the medical profession was necessary, and he thought that there was a growing disposition to choose leaders to make known the views of the profession and to trust those leaders. Panel Committees had more power than they realized, and if they were to put forward, in conjunction with other Panel Committees, well-considered proposals, they could consolidate the position of the panel doctor. In reply to the toast, Dr. CARDALE said that the London Panel Committee might have received abuse from both sides, but it steered a middle course. Dr. J. A. ANGUS, who also replied, took the opportunity of making a strong attack on the new medical record card system. The toast of "The Ladies" was proposed in a witty speech by Dr. LAURISTON E. SHAW, who considered that the husbands of the growing number of married medical women and of women in public life deserved much sympathy, and that they were assuming the status and position of the mid-Victorian wife. Dr. ETHEL BENTHAM did not agree with Dr. Shaw. She congratulated the Committee on having arranged a family reunion instead of a formal public dinner, and hoped it would have many annual successors.

During the dinner an excellent musical programme was carried out by Miss Olive Sturgess, Mr. Fred Curtis, and others, and by Mr. Tom Bacon's orchestra. After dinner a dance was held, in which most of the company took part. Dr. R. J. Farman, Dr. Hands, and the other members of the Committee who were responsible for the arrangements are to be congratulated on a successful and enjoyable evening.

HOSPITALS AND INSURED PATIENTS.

A MEETING between members of the executive of the British Hospitals Association and representatives of some of the largest approved societies in the United Kingdom was held on April 22nd at Grosvenor Place, under the chairmanship of Viscount Hambleden. The meeting was called for the purpose of considering the possibility of a working agreement between the hospitals and the approved societies, whereby institutional treatment would be provided for members of the societies in return for contributions from the societies in the form of an agreed percentage.

It was agreed that the executive of the British Hospitals Association should ascertain the views of hospitals throughout the country as to (1) whether they were prepared to accept from the societies an agreed percentage of the cost of treating their members, as in- or out-patients; (2) whether they were prepared to agree that a payment, direct or indirect, equivalent in value to such percentage should be required by the hospitals in respect of treatment afforded to members of societies not so contributing; and (3) whether, assuming equal urgency for in-patient treatment on the part of persons desiring the same, some measure of priority should be given to members of contributing societies.

If the hospitals generally are favourable to giving preferential treatment to members of approved societies in return for a percentage contribution, the parties will meet again to draft a scheme.

CORRESPONDENCE.

Mileage under the Insurance Acts.

SIR,—Country practitioners must feel grateful for the way in which the British Medical Association has pressed their case in respect of mileage. It must always be difficult to press the requirements, however just they may be, of a minority group in the profession. The Association has done this with two beneficial results. The system that has been adopted has been good, and the sum allocated has been considerable.

Progress has been made, to the gratification of those who have hoped for it, without having to resort to violent and dictatorial methods.—I am, etc.,

Cornwall, April 25th.

J. C. JONES.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty: Surgeon Commanders: L. C. Rowan-Robinson, J. P. H. Greenhalgh, J. McA. Holmes and C. H. L. Petch to the *Pembroke* additional (temporary); A. La. T. Darley, G. Nunn, A. H. H. Vizard, J. H. Lightfoot, and A. B. Marsh to the *Victory* additional (temporary); A. J. Hewitt, C. H. J. Robinson, and W. P. Walker to the *Tivid* additional (temporary); C. R. Rickard to the *Victory* additional; W. R. Harrison, O.B.E., to the *Thunderer* on commissioning. Surgeon Lieutenant Commanders: P. N. Burton and A. R. Shaerod to the *Pembroke* additional (temporary). R. A. W. Ford to the *Tivid* additional (temporary). Surgeon Lieutenant A. W. North to the *Thunderer* on commissioning.

ARMY MEDICAL SERVICE.

Colonel S. A. Archer, C.M.G., is placed on retired pay on account of ill health contracted on active service.

ROYAL ARMY MEDICAL CORPS.

Lieut. Colonel M. W. Falkner retires on retired pay on account of ill health contracted on active service.

Major M. J. Cromie is placed on the half-pay list on account of ill health.

Major J. Mackenzie to be temporary Lieutenant-Colonel whilst specially employed.

Captain R. Ellis, M.C., retires, receiving a gratuity, and is granted the rank of Major.

The following officers relinquish their commissions: Temporary Captains and retain the rank of Captain: W. F. Gardener, J. C. Ducaason.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Captain G. W. J. Bousfield is transferred to the unemployed list.

INDIAN MEDICAL SERVICE.

Lieut.-Colonel P. F. Chapman, C.I.E., M.B., appointed to officiate as Inspector-General of Civil Hospitals, Central Provinces, in addition to his own duties, March 1st.

Lieut.-Colonel J. C. H. Leicester, M.D., F.R.C.S., Professor of Midwifery, Medical College, Calcutta, has been granted, with effect from March 15th, combined leave for eight months.

Major V. B. Green-Armstrong, appointed to officiate as Professor of Midwifery, Medical College, Calcutta, during the absence on leave of Lieut.-Colonel J. C. H. Leicester.

Lieut.-Colonel W. V. Coppinger, D.S.O., M.D., F.R.C.S.I., Professor of Ophthalmic Surgery, Medical College, Calcutta, has been granted, with effect from February 15th, combined leave for eight months.

Captain P. K. Ghroy, M.B., appointed to officiate as Professor of Ophthalmic Surgery, Medical College, Calcutta, February 21st.

Colonel H. Austen Smith, C.I.E., M.B., Inspector-General of Civil Hospitals, Bihar and Orissa, has been granted, with effect from the date on which he may avail himself of it, combined leave for eight months.

Lieut.-Colonel R. H. Maddox, C.I.E., M.B., appointed to officiate as Inspector-General of Civil Hospitals, Bihar and Orissa, with effect from the date on which he assumes charge of that office.

Lieutenants to be Captains: F. R. Thornton, M.C., G. B. Mallya, F. M. Kirwan, V. N. Agate, S. R. Prall, J. C. Chukerbuti, S. A. Phatak, B. H. Kamakaka, M. A. Jafarey, S. N. Mukand (February 25th).

The undermentioned officers have been permitted to retire from the service, with effect from the dates specified: Lieut.-Colonels J. C. S. Vaughan (January 24th), H. Bennett, M.B. (January 29th), W. W. Clemesha, C.I.E. (February 1st), Sir Leonard Rogers, Kt., C.I.E. (March 1st), and Captain J. H. G. White (February 5th).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major J. Ward, C.M.G., D.S.O., vacates the appointment of D.A.D.M.S., 44th (Home Counties) Division.

Major M. White, M.C., R.A.M.C., to be Adjutant of the R.A.M.C. School of Instruction, Welsh Division (T.F.)

To be Majors: Captain (Brevet Major) A. Walker, D.S.O., Captains D. S. Sutherland, F. L. Rowse.

The following Captains resign their commissions and retain the rank of Captain: B. G. Goodwin, E. G. Anderson.

1st London (City of London) General Hospital.—Major (Brevet Lieut.-Colonel) W. McAdam Eccles is restored to the establishment.

1st London (City of London) Sanitary Company.—Captain H. Holroyd resigns his commission and retains the rank of Captain.

DEFENCE FORCE.

ARMY MEDICAL SERVICE: R.A.M.C.

To be temporary Captain: A. M. Johnson, M.C.

To be temporary Lieutenant: P. Lloyd-Williams.

DIARY OF SOCIETIES AND LECTURES.

ROYAL COLLEGE OF SURGEONS, Lincoln's Inn Fields, W.C.—Museum Demonstration, Mon., 5 p.m., Professor Shattock: Atrophy.

ROYAL SOCIETY OF MEDICINE.—Section of Tropical Diseases and Parasitology: Mon., 8.30 p.m., Dr. A. F. MacCallan: Ankylostomiasis Campaign in Egypt, 1913-1915; Sir Leonard Rogers: Mortality and Prognosis of Cholera treated by the author's Hypertonic Saline Method. Section of Surgery: Subsection of Orthopaedics: Tues., 5 p.m., Cases of Special Interest or demonstrating Special Methods of Bone Grafting will be shown by Mr. E. W. Hey Groves, Mr. O. L. Addison, and others. Section of Obstetrics and Gynaecology: Thurs., 8 p.m., Annual General Meeting; Mr. Henry Curtis: Angioma of Vagina Spontaneously Evacuated; Dr. Russell Andrews: Specimens of Carcinoma Originating in an Adenomyoma of the Uterus; Discussion: The Causes and Treatment of Sterility, to be opened by Dr. A. E. Giles. Section of Laryngology: Fri., 4 p.m., Cases; 4.45 p.m., Annual General Meeting.

POST-GRADUATE COURSES AND LECTURES.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Western Infirmary.—Wed., 4.15 p.m., Dr. B. Ness and Mr. A. Young: Medical Nervous Cases and Surgical Peripheral Nervous Cases.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Dr. W. Dyson: Tuberculosis of the Skin.

LONDON LOCK HOSPITALS.—Clinics daily. Lectures (at 91, Dean Street, W.1, Mon., 5 p.m., Mr. Gibbs: Ante-natal and Post-natal Treatment of Syphilis; Tues., 2.30 p.m., Mr. McDooagh: Clinical Demonstration; Wed., 4.30 p.m., Mr. Joly: Tests for Cure for Gonorrhoea in the Male; Thurs., 4 p.m., Dr. S. Phillips: Syphilitic Affections of the Kidney; Fri., 2.30 p.m., Mr. Thomson: Examinations of Chancres for *Spirillum pallidum*, etc.; 4 p.m., Mr. Abraham: Early Syphilitic Rash; (at 285, Harrow Road, W.), Wed., 3 p.m., Mr. Ernest Lane: Venereal Diseases in Women and Children.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Out-patient Clinics Daily, 2 p.m. (except Wed. and Sat.), Lectures—3.30 p.m., Mon., Dr. Saunders: Subacute Combined Degeneration of the Spinal Cord; Tues., Dr. James Taylor: Myasthenia Gravis; Fri., Dr. Collier: Hemiplegia; Thurs., Dr. Tooth: Demonstrations of Cases.

LONDON HOSPITAL MEDICAL COLLEGE, E.—Mon., 5 p.m., Dr. W. M. Feldman: Ante-natal and Post-natal Child Physiology; Tues. and Fri., 5.15 p.m., Dr. M. Culpin: Psychoneuroses.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m. (and Wed., 2 p.m.). Ward visits; 2 p.m., In- and Out-patient Clinics and Operations.

British Medical Association.

OFFICES AND LIBRARY, 49, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

MAY.

- 3 Tues. London: Standing Subcommittee, Central Ethical Committee, 3 p.m.
6 Fri. London: Westminster Division, St. James's Vestry Hall, Piccadilly, 4.30 p.m.
13 Fri. London: Medico-Sociological Committee, 2.30 p.m.
18 Wed. Dorset and West Hants Branch, Annual Meeting, Yeovil, 3 p.m.; Luncheon, 1.30 p.m.
19 Thurs. South-West Essex Division: Annual Meeting and Dinner.

APPOINTMENTS.

FITZMAURICE-KELLY, M., M.B., B.S.Lond., F.R.C.S., Assistant Surgeon to the Royal Alexandra Hospital for Sick Children, Brighton.

TELFORD, E. D., F.R.C.S., Lecturer in Practical Surgery, University of Manchester.

YELLOWLEES, Henry, O.B.E., M.D., F.R.F.P.S.Glas., Medical Superintendent of the Retreat, York.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

BIRTHS.

FELDMAN.—On the 18th of April, at Abbotsford, 875, Finchley Road, Golders Green, N.W., to Hilda, wife of W. M. Feldman, M.D., a daughter.

MARR.—On April 12th, at 7, Vickers Street, Nottingham, to the wife of D. J. Marr, M.B., L.D.S., a daughter.

PRATT.—On Wednesday, April 20th, the wife of Dr. G. Wyatt Pratt, the Vicarage, Patricroft, Manchester, of a daughter.

MARRIAGES.

COX-HARRIS.—On the 26th April, at Cholmeley Hall, Highgate, Hedley Chase Cox, M.B., B.S., M.R.C.S., only son of Mr. and Mrs. Cox, of Penrhyn, Hornsey Lane, Highgate, to Francis Maude Mary, younger daughter of Mr. and Mrs. Harris, of Red Gables, Whetstone.

HAYMAN-EDWARDS.—April 25th, at St. Paul's Church, Forest Hill, by the Rev. J. R. Melhuish, Frank Keith Hayman, M.B., B.S., F.R.C.S. Eng., son of Mr. and Mrs. F. Hayman, 32, Apsley Road, Clifton, Bristol, to Mary Coslett, youngest daughter of the late Mr. Tom Edwards, Cefn House, Pentypridd, and Mrs. Evan Llewellyn, Tan-y-Bryn, Pentre Rhondda.

DEATHS.

BLENEARNE.—On April 10th, 1921, William L'Heureux Blenearne, M.R.C.S., L.S.A., of Ladbroke Lodge, Windsor Road, Worthing, aged 74 years.

BURTON BROWN.—On April 21st, at 112, Tonbridge Road, Maidstone, Gerald Burton Burton-Brown, M.D., retired R.N., youngest son of the late T. E. Burton-Brown, M.D., C.I.E.

FARQUHARSON.—Died in a Nursing Home at Newcastle-on-Tyne, on 23rd inst., Dr. Robert, the beloved husband of Marjorie Farquharson, of Glebe House, Washington.

CURRENT NOTES.

Election of New Council.

MEMBERS of the Association are reminded that Monday, May 16th, is the last day for the receipt at the Head Office, 429, Strand, of nominations for election of 24 members to the Council by the grouped Branches.

Dr. J. A. Macdonald's Visit to South Africa.

The presidential address given to the Witwatersrand Branch by Dr. R. P. Mackenzie, C.M.G., on January 20th, 1921, contained the following passage:

"The visit of Dr. Macdonald to this country as representative of the Central Council of the British Medical Association was, I think, of inestimable value. Dr. Macdonald was able to point out to us how great was the sympathy existing between the Central Council of the British Medical Association and the Oversea Branches. In fact, so great is this sympathy that the Central Council is prepared to grant even fuller independence and autonomy to the British Medical Association in South Africa, even to the extent of considering affiliation under a new name. Dr. Macdonald clearly pointed out, however, that the Central Council would be very loath to take this step, as it appeared to the Council to be cutting the painter, and would practically mean the complete secession of the overseas Branches from the British Medical Association. We have been told by Dr. Macdonald that we can be certain of one thing, and that is that our desires will always receive cordial and sympathetic treatment at the hands of the Central Council. Dr. Macdonald also made it clear that our powers under the Memorandum and Articles of Association were much wider than many of us realize."

Again, in the Annual Report of the Branch, presented by Dr. J. J. Levin, the Honorary Secretary, the following remarks on the subject are made:

"*Dr. Macdonald's Visit.*—There is no doubt that the most important occurrence during the year for the Witwatersrand Branch of the British Medical Association was the visit of Dr. Macdonald. Dr. Macdonald attended one Council and one Branch meeting, at both of which the advice he gave us has been of immense value to us. We are the stronger for his visit. While here, in one way or another, he was able to meet a very large number of the members of the Association, and we have no doubt that, as a result of his visit, the position of the British Medical Association in South Africa, and more particularly the position of the Witwatersrand Branch, will be better understood and better appreciated by the Council in London, and therefore strengthen the position of the Association as a whole."

Fees for Admiralty Surgeons and Agents.

The action of the British Medical Association in the matter of raising the remuneration of Admiralty surgeons and agents has at last borne fruit. Dr. W. E. Elliot, M.P.,

asked a question on this matter in the House of Commons on February 24th and was told that the matter was under consideration. He repeated the question on April 13th and was told that a revised scale of fees had been promulgated, with the exception of those for medical examinations, which are still under discussion. The revised scale of fees has now been received. From this it appears that an increase of approximately 50 per cent. has been granted. The consultation fee at the surgery has gone up from 2s. 6d. to 3s. 6d.; the visiting fee at a coastguard station or house has gone up from 2s. 6d. to 5s. for the first patient and 3s. 6d. for each succeeding patient; for visiting patients on board the fee for proceeding on board has gone up from 2s. 6d. to 3s. 9d., and the visiting fee per patient from 2s. 6d. to 5s. for the first patient and 3s. 6d. for each succeeding patient; mileage has gone up from 1s. to 1s. 6d. and is paid for any distance over the first mile one way only.

Exemption of Women Jurors.

The Women Jurors (Criminal Cases) Rules, 1920, provide that the number of women summoned for Quarter Sessions Court must be the same in proportion as the number of women bears to the number of men on the book from which jurors are selected, and the Clerk of the Peace ought to have in court ready to serve if required at least fourteen women jurors, because a woman prisoner may apply, and the court may grant her request, to be tried by a jury composed of women only. The Rules provide that the Clerk of the Peace may in his discretion excuse women who are pregnant or suffering from some feminine condition or ailment, and are therefore unfit to serve, and he is to be satisfied as to this by medical certificate or otherwise. Mr. Sydney Jones, Clerk of the Peace at Scarborough, has approached the Scarborough Division of the British Medical Association, asking for its help to enable him to perform his duties adequately and with as little disagreeableness as possible. If he could have some guarantee from the Division that the greatest care would be taken in the giving of such certificates, he thought it would meet the case if the certificate took the following form:

I certify that..... will be unfit to serve as a Juror at the next Quarter Sessions.

This certificate is issued in accordance with the provisions of the Women Jurors (Criminal Cases) Rules, 1920.

He pointed out to the Division that his suggestion only referred to women jurors and to ailments particular to women, and that he relied on the local profession, if they accepted his suggestion, to make it possible for him to carry out his duties carefully and yet at the same time to obviate the disclosure of certain facts which some women might refuse to have disclosed even if it meant their

attendance at court with injury to themselves. The Scarborough Division has accepted Mr. Sydney Jones's suggestion, and is circularizing all the local members of the profession on the subject; it has forwarded this information to the Head Office in the hope that it may be of use in other areas.

Hours of Opening for the Library.

Last year arrangements were made to meet the general convenience of members, whereby the Central Library would remain open until 8.30 p.m. on ordinary week days and 2 p.m. on Saturdays. Very many members having availed themselves of the facilities thus afforded, the Council proposes to continue the experiment of the extra hours for an additional period of one year.

Regulations as to Research Scholarships.

The regulations as to the Association's Research Scholarships have hitherto provided, *inter alia*, that a scholarship of the British Medical Association may be held concurrently with another scholarship, but that the scholar shall not receive from the Association a sum greater than the amount required to bring the total sum received during one year to £250. Having regard to present economic conditions, the Council has increased the foregoing figure to £400.

PAYING PATIENTS IN POOR LAW INFIRMARIES.

DEPUTATION FROM THE BRITISH MEDICAL ASSOCIATION TO THE MINISTER OF HEALTH.

A DEPUTATION from the British Medical Association waited upon the Minister of Health (the Right Hon. Sir Alfred Mond, M.P.) on April 26th to discuss the development of the schemes, which are either contemplated or in operation, for the admission of paying patients to Poor Law infirmaries. The deputation consisted of the following:

The Right Hon. Sir Clifford Allbutt (President), Dr. R. A. Bolam (Chairman of Council), Mr. N. Bishop Harman (Chairman of Hospitals Committee), Dr. J. A. P. Barnes, Dr. A. C. Farquharson, M.P., Dr. T. W. H. Garstang, Dr. E. W. G. Masterman, Surg.-Captain Meaden, R.N. (retd.), and Mr. E. B. Turner, together with Dr. Alfred Cox (Medical Secretary), Dr. N. G. Horner (Assistant Editor, *British Medical Journal*), Dr. G. C. Anderson (Deputy Medical Secretary) and Dr. C. C. Lord (Assistant Medical Secretary).

The Minister was accompanied by:

The Earl of Onslow (Parliamentary Secretary), Sir Arthur Robinson (First Secretary), Sir Aubrey Symonds (Second Secretary), Sir George Newman (Chief Medical Officer), Dr. J. Smith Whitaker (Senior Medical Officer), Mr. L. G. Brock, C.B., and Mr. H. W. S. Francis (Assistant Secretaries), and Mr. Douglas Veale (Private Secretary).

SIR CLIFFORD ALLBUTT said that he hoped he might be permitted, at this their first meeting since the changes in the Cabinet, to congratulate Sir Alfred Mond upon his new office. He would like to say quite clearly whom the deputation represented. It represented—he thought he might fairly say—the medical profession. The claim that the British Medical Association included every practitioner in the country would not be true, but he thought that few practitioners would be found to deny that, speaking broadly, the Association represented the interests of them all. Sir Alfred Mond might not be aware that they had a meeting of an exceedingly strong body of representatives from every part of the country once a year or oftener. He might add that the Association was not a narrowly medical body. Those who guided its affairs were reasonable and sociable persons who were always open to consider—perhaps he ought to say, to consider in the first instance—the interests of the public in general, and not alone the interests of the profession. The relations of the Association with the Ministry of Health had been very amicable. The Association so far had worked in harmony with the Ministry, with the creation of which it had had a good deal to do, and he was quite sure that good feeling would continue. He did not wish it to be thought that the Association was in any way connected with the more or less irresponsible and often carping criticisms levelled against the Ministry. If by chance the Minister heard it stated—as he was afraid it had been stated—that the Association was in

antagonism, or partially so, to the Ministry, he hoped that Sir Alfred Mond would wait until he heard what the Chairman of Council had to say before he gave credence to such a report. Whatever might be said here and there in irresponsible places, he begged the Minister to believe that, speaking generally, they were in cordial sympathy with what the Ministry had so far done.

Dr. R. A. BOLAM said that, as Chairman of Council, the chief executive body of the Association, he might be allowed to amplify in one or two details what the President had stated. He wished to introduce the Association as an organized body of medical men with a history of ninety years behind it, but also as a modern organization which had its branches throughout the kingdom and the empire, and was equipped with modern machinery for ascertaining the opinion of its members. As the President had said, the Association not only took its part in medical organization and medico-politics, but it did not neglect the advancement of the science and art of medicine. It was the only body which held an annual medical congress, and it possessed the most influential medical journal in the empire. It was in constant touch with various Government departments—the War Office, India Office, Ministry of Pensions, and the like. Inquiry from these departments would show the activities of the Association in everything which affected every section of the medical profession. But it was only natural that the Association should have special interest in the Ministry of Health, not only because it was specially concerned with medical affairs, but because the Association had for many years been vitally interested in the constitution and formation of such a Ministry. Even so far back as 1868 the Association made what was perhaps the first suggestion for a Ministry, and it took a very active part in the campaign which finally led to the Ministry's formation. The great problem of health insurance and its medical benefits had naturally brought the side of the Ministry which dealt with these matters into close and continuous contact with the Insurance Acts Committee of the Association during recent years. They had, therefore, on all counts a very vital concern in the welfare of the Ministry. They might, perhaps, often disagree with its actions, and would not then scruple to tell the Minister of the day firmly—but, he trusted, always courteously—their ground for such disagreement. Nevertheless, they took this opportunity to dissociate themselves quite emphatically from certain recent attacks upon the Ministry and its chief medical and other officers; the attacks apparently sprang from quarters where it must be assumed that there was political animus or mistaken zeal for unwise retrenchment. They wished the Minister to understand that these attacks did not come from the medical profession as a whole, or, indeed, from anyone with whom they were in touch who carried any weight or authority with the profession. They realized that in the present state of the affairs of the nation it was incumbent upon any Minister that he should move slowly in matters of reform, but it was their duty as medical men to protest strongly against the curtailment of services which they had advocated as essential for the health of the community, and to urge progress where such could be economically undertaken. In the past (Dr. Bolam continued) they had not always agreed with the Chief Medical Officer of the Ministry and his staff. It was not to be expected that in the future agreement would always be possible, but they did know that these officers, from their dealings with them and from their writings, were honest and able public servants—(Hear, hear)—and they had confidence that the Minister would ensure that proper scope and opportunity were not denied them. In conclusion, he would like to say, in the words of one who in his day was a pioneer in sanitary medicine and a zealous servant of the State, that their one hope and aim was that the day had at last dawned when the personnel of the Ministry—of such a Ministry as that—and the members of the medical profession “shall work together, some in lines of scientific study and others in lines of political principle, so that statecraft and medical knowledge shall sincerely take counsel together for the health of the people.”

Mr. BISHOP HARMAN said that the points which the deputation had come to discuss with the Minister con-

cerned one branch of the hospital problem of the country. It was well known how difficult the hospital problem had been of recent years. To the problem of the voluntary hospitals, their accommodation, and maintenance, there was now added the problem of the Poor Law infirmaries, or, as some of them were called, municipal hospitals. During the war the buildings were largely used for military purposes, and since then these institutions had not reverted quite to their old position, but there had been a tendency to widen their scope. He was proud of the Poor Law infirmaries—at any rate those with which he was acquainted in London—and he was second to none in admiration of their buildings, staffs, equipment, and medical arrangements. But when he said that he always said it with a tone of regret, because these hospitals were not in the main stream of the medical practice of this country. Very few people in speaking of hospitals thought at all of the Poor Law infirmary, or, if they did, they considered it part and parcel of the hated Poor Law system. Technically these institutions were still part of the Poor Law, but their position in recent times had changed to a considerable extent. Patients could now be admitted who were not technically paupers. Not so long ago a body of medical men had interviewed some of the staff of the Ministry to urge upon them that accommodation might be provided in Poor Law institutions for infants suffering from ophthalmia neonatorum. He himself had also recently successfully pressed the claims of sick children who suffered from certain serious diseases, and admission to the Poor Law institution in this case, as in the other, did not make them paupers. Technically the institutions were still for the destitute poor, but everything depended on the interpretation of the word "destitute." In the old days "destitute" had been held to mean those without money, but it might relate specifically to medical necessities. If for any reason a man was not able to get himself attended to when sick, he was "destitute" within that definition. This had now become the view of certain boards of guardians in this country, and thirteen of these authorities had made it known that they were prepared to receive into their infirmaries persons who were not financially destitute but who were able to pay for what they received. Those present that day welcomed this development to a certain extent; it enlarged the field for dealing with the sick. But they wished to make some suggestions as to the arrangements which should be made before these schemes were officially acknowledged, if the Minister decided to acknowledge them at all. The first desirable thing was that in any arrangement the local medical profession, who would be most affected, and in whose hands the success or failure of the scheme must lie, should necessarily be consulted. He believed that the Ministry approved of that attitude in general, and he hoped that the Minister would be so impressed by its desirability in this instance as to give a general instruction or recommendation to all the authorities that they should follow it in practice. They would find the local profession keenly interested and thoroughly willing to help them in their endeavours. He would like all municipal hospitals to have attached to their administration an *ad hoc* committee, composed of representatives of the medical profession and of the municipal body, so that the wheels of the machinery might be greased by direct conference. The second point was that if these hospitals were thrown open to a wider *clientèle*, who did not come by way of the receiving officer, such patients should only be admitted on the recommendation of the practitioner who was attending them. He, of course, excluded accident and emergency cases, but the general rule should be that a case could only be admitted on the recommendation of a practitioner. Some of those for whom he was speaking wanted an income limit instituted, but if it was laid down that a doctor must recommend the case it would sufficiently prevent abuse and to some extent do away with the necessity for an income limit. The third point related to what would happen after the patient was admitted. At present the staffs of the infirmaries consisted of whole-time officers who, because they were whole-time, were to some extent cut off from their professional brethren in the district. It was desirable that that wall of separation should be broken down, and this object could best be attained by allowing a certain number of beds to be relegated to wards which might be recognized as wards where patients were attended

by the doctor of their choice. That arrangement, to borrow Board of Education phraseology, might be known as "right of entry."

Sir ALFRED MOND: That would really be establishing a claim for the doctor in the infirmary?

Mr. BISHOP HARMAN: It would be something like the provision of a private nursing home in the infirmary.

Sir ALFRED MOND: What about the nursing service, the provisioning and so forth?

Mr. BISHOP HARMAN said that if these separate wards were established certain special arrangements would have to be made, which were matters of detail; but the medical superintendent of the institution would be in sole administrative control, and his voice would be first and last in all administrative affairs. They wanted this to be fully understood. The visiting doctor would only be allowed to come and go at certain definite hours. It was very desirable that the medical superintendent should have a knowledge of the cases received in, so that in an emergency his help would be available for the patient. The proposed arrangement was almost paralleled by that which obtained in the big voluntary hospitals, where members of the staff submitted to the regulations of the resident medical officer as to the time at which they should attend and the procedure for dealing with patients. This "right of entry" would make the Poor Law infirmary approximate in some respects to the primary health centre of the Dawson Report. Mr. Bishop Harman referred in conclusion to the altered financial circumstances of a large section of the community, which made it extremely difficult for them to provide themselves with proper medical attention. The middle classes had rarely gone to the voluntary hospitals and had never dreamed of going to the Poor Law infirmary, and many people in those classes were now at their wits' end to get proper accommodation in sickness. They could not afford private nursing homes, the fees of which had gone beyond the capacity of, say, the poor parson or the clerk earning £500 or £600 a year. Some nursing homes were finding it more remunerative partly to close down and let off a part of their accommodation as flats. Another point was that the arrangement proposed would cost nothing to the State; indeed, the State might profit by it. It might be possible to capitalize the cost of the institution, and include in the fee for maintenance a portion of the overhead charges for running the institution. The Hospitals Committee of the Association had drawn up a series of recommendations which they had had the advantage of discussing with certain medical superintendents of Poor Law infirmaries, and some of the recommendations had been discussed by the Association of Medical Superintendents, and on the whole there was a fair basis of agreement. He hoped that a recent letter sent by the Ministry to the board of guardians at Barnet need not be taken to rule out the suggestions he had brought forward.

The Minister's Reply.

Sir ALFRED MOND thanked Sir Clifford Allbutt and the deputation generally for their courtesy in meeting him. He wished to say, in the first place, a few words on the more general question. The Chairman of Council had thought it necessary to inform him as to the importance of the British Medical Association. He could assure them that he and those associated with him at the Ministry were all well aware of the strong position and power of that body as representing the medical profession. He was very glad indeed to hear of their sympathetic feelings towards the Ministry, and to know that he might count upon the help of the Association. The burden of responsibility upon the Minister of Health was great, and he felt that his predecessor, being a medical man, was to that extent better qualified than a layman could possibly be to deal with these subjects. Still, he could assure them that he had the health side of the Ministry very much at heart, and he hoped to do something towards developing that health side, which, after all, was still only in the embryonic state, for he did not think that anybody would claim that it was as yet fully developed or even fully thought out. With regard to the questions specifically put to him that day, he had listened with great interest to what Mr. Bishop Harman had so lucidly put forward. The whole hospital situation was, as they knew, by no means satisfactory. Owing to the generosity of private individuals and

the generosity of the medical profession, our voluntary hospitals had been, he supposed, second to none, if not superior to any run on State or municipal lines in other countries. So much could be said for the continuation of voluntary effort in these matters that unless they were driven to it in the last resort, he did not think anyone would acquiesce in the disappearance of the voluntary system. No doubt the financial difficulties to-day were oppressive, but it was permissible to hope that the financial difficulties would not always be with them. A great many people found it impossible to enter nursing homes, and were looking for some institution which would enable them to get requisite medical and nursing attendance on terms within their means. Something, of course, had been done in this direction by the general hospitals. He believed that St Thomas's for a great many years had taken in paying patients, and he hoped that plan might be developed. In Continental countries such as France and Germany, and also in America, nobody would hesitate for a moment about going into the great municipal hospitals, where, they knew, the most scientific treatment and highly skilled nursing would be available. Probably the people in this country might make more use of the general hospitals.

The question of the Poor Law infirmary was a new one, and was coming to the front. The whole question of Poor Law administration had been in the melting-pot for many years—for more years than he cared to remember. Any fundamental change, of course, could not be effected by administration, but would require new legislation. So far as the Ministry could meet the ideas expressed by the deputation it was endeavouring to meet them. The principle of consultation with the local profession had been put into practice in cases like Bradford, and he thought it was a useful line to take. On the other hand, they could only advise boards of guardians, not compel them; they could only endeavour to bring them into what seemed a very good line to follow. With regard to the other points, the deputation would not expect a very definite reply from him on that occasion. He would very carefully consider these questions, but he saw that they raised difficulties. The admission of patients into a municipal hospital only on the recommendation of a general practitioner had certain practical advantages, but there might be considerable difficulties in individual cases. What if a patient wanted to go into a particular institution and his doctor refused to recommend him, whereupon he changed his doctor, and found another more amenable to his wishes? That would not be very satisfactory; it might create difficulty between doctors and patients, resulting in a raising of temperatures! At any rate, the idea would need to be very carefully considered. There might be objections also, if this plan were taken as an alternative to an income limit, to making the doctor the judge of a patient's financial position. Doctors were doubtless in a fairly good position for knowing whether or not a man could be a paying patient, but this might mean placing upon the doctor the responsibility for an examination more suitable to a chartered accountant than to a medical man. He was not rejecting the idea, but he did want to point out that it had its difficulties and to suggest that it was possible a certain friction might be created which later on they would be inclined to regret. He had been interested in Mr. Harman's third suggestion (allowing doctors to follow their patients into the infirmary), but he could give no opinion as to how far this could be put into practice. He had been engaged very closely on the Tuberculosis Bill, as well as upon non-health concerns of his department and of the Government—the industrial situation for one thing—and he had had no opportunity as yet to go into the technical side of these questions, but he would give them in due course his personal attention, with a view to being as helpful and sympathetic as the circumscribed powers of the Ministry would enable him to be. Perhaps at some future time they would have the opportunity of a fuller discussion. He was glad to have the assistance of so practical and representative a body as the British Medical Association, and he would be pleased to receive a deputation at any time when they had a proposal to make or when any difficulty arose in their common work upon which assistance and counsel might be offered. (Applause.)

Sir CLIFFORD ALBUTT thanked the Minister, and the deputation then withdrew.

EIGHTY-NINTH ANNUAL MEETING

OF THE

British Medical Association.

NEWCASTLE, JULY, 1921.

HOTEL AND HOSTEL ACCOMMODATION.

The Hotels, Lodgings, and Billeting Committee feel confident that they will be able to put up all those who are coming to the meeting in spite of the difficulty that has been experienced in getting accommodation. They would strongly emphasize, however, the necessity for making early application for rooms at the hotels. Already one or two hotels have ceased booking, and are not now published. The management of the County Hotel has been particularly generous in placing a large number of rooms at the disposal of doctors attending the conference. Some have twin-beds and some have double-beds, and the manager stipulates that such rooms must have two occupants. There are also single rooms. The hotels at Whitley Bay have been approached, and it is arranged that a number of rooms there are to be placed at the disposal of doctors. These are only to be reserved till June 1st, after which they will be let to their regular patrons. Whitley Bay is a most popular seaside resort, only a short train journey from Newcastle, and members are advised to make early application for these rooms. Applications for accommodation at any of the hotels outside Newcastle should be made to the representative of the Hotels, Lodgings, and Billeting Committee resident in that town. The names and addresses of these doctors are published in each case.

Many of the hotels included in the list given below are short distances out of Newcastle, and are specially suited for members who intend to make their visit coincide with their annual holiday. Details as to distance and train service are inserted, so that members may judge of their convenience in attending sectional meetings and evening functions. It is possible, of course, that the train services may be modified before the date of the meeting, and the hotel tariffs quoted are also liable to alteration. The prices quoted are for single persons per night. Members, when making application for rooms at hotels, should head their note-paper "Annual Meeting, British Medical Association."

ADVANCE LIST OF HOTELS.

NEWCASTLE-UPON-TYNE.

	Bed and Breakfast.	Lunch.	Dinner.
Turk's Head	11/-	3/-	5/-
County	9/6	3/-	4/6
Douglas (a few double rooms)	12/6	3/6	6/-
Central Exchange	8/-	2/6	4/6
Tyne Temperance (a few double rooms)	9/-	—	—
Market (a few rooms with two beds and some single rooms. Strictly commercial, not suitable for ladies)	6/6	—	—
Clyde (a few rooms with two beds)	8/-	—	—
Sun	8/-	3/-	—
Norfolk (a few double rooms)	8/-	3/-	—

Several of the above hotels, as indicated, do not give lunch or dinner. There are abundant restaurants in the town where such meals can be obtained, as also at the other hotels included in the list.

St. Margaret's	10/6	3/-	4/-
Imperial	10/6	3/-	5/-
Kensington	8/6	2/6	3/6
Osborne	10/6	3/6	5/-

These hotels are chiefly residential. They each expect to have a number of rooms available at the date of the meeting.

Teas can be had at all the hotels mentioned above, and some will quote terms which are inclusive for the day or week. Particulars could be obtained by application to the Manager. All these hotels are within a short distance of the Reception Room.

WHITLEY BAY.

Popular seaside resort; bathing, boating, etc. On coast, close to Tynewood. Train service: journey, half an hour by electric train, every quarter or half hour. Late trains available till 11.45 p.m.

Waverley	9/-	3/-	4/-
Royal	10/6	4/-	5/-
Avenue	10/-	3/6	5/-
Esplanade (a number of rooms with twin beds)	8/6	3/6	6/-

Local Representative: Dr. N. R. Rawson, Rydal House, Esplanade, Whitley Bay.

TYNEMOUTH.

Popular seaside resort. Attractions and train service are the same as for Whitley Bay. Journey 24 minutes.

	Bed and Breakfast.	Lunch.	Dinner.
Bath Hotel	8/-	3/-	7/6
Moria House (Barling House, Mrs.) St. n. Bury, Slyn street, Tynemouth	6	—	2/6

Local Representative: Dr. J. A. Hislop, Public Health Offices, Tynemouth.

DURHAM.

Train service: 40 minutes slow; 20 minutes express. Morning trains convenient, and last train 10.50 p.m.

County: Bed and breakfast, 10/6; inclusive charge per day, £1 1s.
 Three Inns: Bed and breakfast, 9/-; inclusive charge per day, 17 6.
 Rose and Crown: Bed and breakfast, 8/-; inclusive charge per day, 16/-
 Other meals can be obtained at the above hotels.
 Avenue Hotel (Temperance): Terms moderate.

Local Representative: Dr. F. V. T. Hare, The Avenue, Durham.

SOUTH SHIELDS.

Frequent train service: journey 34 minutes. Convenient trains. Last train 11.50 p.m.

Golden Lion	8/6	3/6	4/6
Regent	8/6	2/6	5/-
Royal	10/6	4/-	5/-

Local Representative: Dr. W. Campbell Lyons, 11, Ogle Terrace, South Shields.

SUNDERLAND.

Seaside resort. Golf, etc. Numerous and convenient trains; journey 22 minutes (express). Last train from Newcastle, 11.18 p.m.

Grand	8/6	3/-	4/-
Queen's	8/6	3/6	4/6
Royal	8/-	2/6	4/6
Park Hotel	8/6	4/6	4/6

Local Representative: Dr. H. Boyd Cunningham, 13, Ward Terrace, Sunderland.

HEXHAM.

Very beautiful old market town, abounding in natural and historical interest. Situated on the Tyne about twenty miles from Newcastle. Golf, etc. Convenient and frequent trains; journey, 55 minutes express; 50 minutes slow. Last train 9.50 p.m.; 10.45 p.m. Thursdays only.

Hydropathic. Special terms for doctors attending the meetings, 12/- per day.
 Royal 8/-
 Abbey 8/6 (Inclusive charge per day, 14/-)

Local Representative: Dr. J. A. Jackson, Carntyne, Hexham.

CORBRIDGE.

A lovely residential spot in the beautiful Tyne valley, about five miles east of Hexham, and of great archaeological interest. Train service: Express 40 minutes; convenient morning trains. Last train from Newcastle 9.50 p.m.; 10.45 p.m. Thursdays only.

Wheatsharf } Bed and breakfast, between 5/- and 7/5.
 Tynedale
 Angel

Local Representative: Dr. D. N. Jackson, Bridge House, Corbridge.

MORPETH.

Another fine old market town. Train service: Express 40 minutes; convenient trains. Last train from Newcastle 8.55 p.m.; 10.52 p.m. Thursdays only.

George and Dragon } Terms on application.
 Queen's Head
 New Phoenix

Local Representative: Dr. H. O. Dickie, Ward House, Morpeth.

CHOLLERFORD.

Quiet and picturesque village, near Roman wall and camp; 26 miles from Newcastle. Fishing, motoring.

The George: For terms apply to the Manager.

The hotels at Hexham, Morpeth, Corbridge, and Chollerford are on main roads to Newcastle, and would be very well suited for doctors bringing their cars with them. Many of the hotels quote reduced figures for double rooms when shared by two people. Inquiry should be made about this when engaging rooms.

EASTON HALL, ESKDALE TERRACE, JESMOND, NEWCASTLE.

This students' hostel has been very kindly put at the disposal of the Association. It is in the residential quarter of Newcastle and quite near the Reception Room. The rooms, though small, are very comfortable, and there are writing and reception rooms. Each room has a single bed and only men can be taken. There are several tennis courts in the grounds which would be available for the members. All the rooms will be available from Monday, July 18th, to

Saturday, the 23rd, but only ten will be at the disposal of the members from July 14th to the 18th.

Terms: Bed and breakfast, 8s. if member stays longer than two nights, 10s. if staying for one or two nights only. Tea (1s.) and dinner (3s. 6d.) will be provided if sufficient notice is given each day. Apply for rooms to Dr. E. F. Murray, 52, Jesmond Road, Newcastle-upon-Tyne.

A list of the hostels and colleges at Durham will be published in the near future.

Medical Women.

Those who propose to come to the meeting and have any difficulty in finding accommodation are requested to communicate with Dr. Ethel Williams, 3, Osborne Terrace, Newcastle-on-Tyne, who is Chairman of the Lady Doctors' Subcommittee.

The Chairman of the Hotels and Lodgings Committee is Dr. H. KERR, O.B.E., and the Honorary Secretary, Dr. E. F. MURRAY, 52, Jesmond Road, Newcastle-upon-Tyne. (Telephone: 916 Jesmond.)

THE PROPOSALS FOR FEDERATION.

DISCUSSION AT MEETING OF THE REIGATE DIVISION.

A MEETING of the local Division was held at the Redhill and Reigate Hospital on April 27th to consider the line of policy to be urged by its Representative at the Annual Representative Meeting on the question of federation of the British Medical Association with other medical and possibly also non-medical bodies (see SUPPLEMENT, March 5th, and leading article in the JOURNAL of April 30th, 1921). Dr. C. S. CRICHTON, the new Chairman, was in the chair, and Dr. E. R. Fothergill of Hove, who was present by invitation, and Dr. S. Morton Mackenzie, the retiring Chairman, were the openers of a debate in which they took opposing sides.

Dr. MORTON MACKENZIE held that the proposal to make the British Medical Association a federation of medical and allied bodies was unnecessary and dangerous. The history of the matter was that three or four years ago it was found desirable, purely for Association purposes, to give power to the Australian Branches to dissolve themselves as Branches and become separate incorporated bodies, but remaining federated with the Association. The reasons for this course were mainly legal; as Branches they could not hold property in Australia, and there were other anomalies and disadvantages. That the course was not taken out of antagonism to the parent Association was sufficiently evidenced by the fact that, although becoming legally separated, these former Branches desired to remain federated. The demand was acceded to on the recommendation of the Organization Committee, but a further resolution of the Representative Body, in the form of an instruction to the Council, opened up the wider question of the alteration of the By-laws of the Association so that societies in the United Kingdom, both medical and allied, might become federated with the Association. This project had been minutely discussed at headquarters, and would be the subject of a full discussion at the Representative Meeting in July. With the federation or affiliation of the Overseas Branches the speaker was cordially in sympathy, but to the wider idea of federation he was opposed. He did not believe that, so far as the federation of non-medical societies was concerned, more than a small section of the members of the Association favoured the proposal. It had been urged as a criticism by the Federation of Medical and Allied Societies that the British Medical Association embraced only 52 per cent. of the medical profession in its membership.

Lieut.-Colonel HOWARD MUMMERY interjected that the Federation had never put forward that figure of 52 per cent. on its own responsibility, but had quoted it from figures given by the Medical Secretary.

Dr. MACKENZIE said that while the figure was true of the Register as a whole, the proportion of medical men in actual practice who were members of the Association was much higher; he was not sure that it was greatly below 90 per cent. He did not believe that the Minister of Health dare do anything as regards medical men without consulting the Association, and he failed to see, as an out-and-out British Medical Association man, that the bringing in of outside societies would strengthen the Association in any particular, even though the societies thus brought in were confined to those consisting wholly of medical men. It was always possible by an

amicable arrangement to go to the Government on joint deputation with medical bodies specifically representing certain interests, and the effectiveness of this procedure would not be increased by actual federation. It was suggested that the federated societies should have representation on the Council and on the Representative Body. Was it desirable that the Association should transform its machinery into an omnibus collection of medical groups? The Association at present was in a very strong position. It could reply even to those who urged trade unionism that eminent publicists in Mr. and Mrs. Webb had held it up as a pattern for strength and efficiency. He strongly urged that, apart from this distinct matter of the Overseas Branches, federation should be definitely excluded from the programme.

Dr. E. R. FOTHERGILL said that no one could impugn his loyalty to the Association; it could be proved from the records of his work for the last nineteen years. Nor would he admit that he was fathering something quite alien from the original principles of the Association. A reference to its Articles and By-laws would show that its object when it was founded was "to promote the medical and allied sciences." He preferred the term "affiliation," which suggested a paternity attitude, to "federation," which suggested an equality attitude. Two considerations must be borne in mind. In the first place, in the course of years groups of men and women with common interests tended to crystallize into unions or leagues for mutual protection. After each group had been formed it was pulled this way and that by extremists—some on the right wing, who were reactionary, others on the left wing, who were progressive. A strained situation went on for some time, when it usually happened that the left wing split off and formed a new body. That had taken place inside the profession as well as outside. It was taking place now. The second point to remember was that the medical profession no longer occupied the isolated position of a generation or two ago. The profession itself no longer completely controlled the situation. To a greater and greater extent public opinion decided the lines upon which medical work should be done. As matters stood at present, if the Association represented 52 per cent. of the entire profession, and other bodies could say that they represented 10 or 20 per cent., the result of proceeding on quite separate lines would be confusion, and the Minister would probably decide to go his own way without further reference to a disunited profession. Was it not better to come to some terms with these bodies by a working agreement, so that when a question arose affecting one section of the profession the body directly interested could come into council with the Association, and thus, after joint and representative conferences, the authoritative opinion of the profession could be brought before the Government? It was proposed that a particular medical body might have a representative on the Council and at Representative Meetings, where resolutions could be brought forward and deputations received; also that certain seats might be allocated on standing committees which dealt with matters affecting this particular interest, and, further, that whatever the Association was doing which had reference to this side of medical work should be communicated, along with all documents, to the federating society, which would be expected to do the same in return. With regard to non-medical bodies, he knew that here he was on thinner ice, but what was proposed was not in this case representation on the Council or at the Representative Meetings; it was only some share in the work of appropriate committees, as well as common action and disclosure in any problem that might arise. It was absolutely untrue to suggest that the governing bodies of the Association would be swamped with dentists, nurses, and other outside people. He was aware that it had been said that this proposal was prompted by the formation a year or two ago of the Federation of Medical and Allied Societies, but as a matter of fact it was the subject of a resolution in 1914 at the Aberdeen meeting, and was only held up by the war. He concluded by saying that the Association was great, but it could not afford to ignore any group or section. If nothing was done, the outside bodies would be a source of confusion and uncertainty in any negotiations. The groups should be brought into living touch with the Association, both centrally in London, and locally in the Branches and Divisions.

Dr. S. A. CLARKE said that he was one of the original founders of the Medico-Political Union, which body he left on account of its extreme views and its chaos in finance; but many of the Union members all the time kept up their connexion with the Association, and the same was

doubtless true of other bodies. He supported the federation idea because it made for unity and coherence.

Dr. MORTON MACKENZIE said that two years ago efforts were made to arrive at some kind of working arrangement with the Medico-Political Union, and the only terms on which the Union would co-operate were that the Association should give up all its medico-political work and keep to its scientific activities.

Dr. CLARKE challenged Dr. Mackenzie's statement, which, he said, did not quite represent the case. Long before the more recent negotiations the Union had approached the Association over and over again to discover a working basis, and was repulsed. They had here a body which was at first anxious to co-operate, practically without conditions; was frustrated; and then, growing in strength, asserted itself and proved refractory.

Dr. W. McD. ELLIS asked what guarantee they had that other bodies would accept fellowship if it were offered. The idea of federation or affiliation went against the grain with him, but if it was going to bring in those members of the profession who at present stood aloof, he would waive his own feelings.

Dr. FOTHERGILL, before leaving to catch his train, pointed out that it did not follow because they had the resolutions proposed by the Council for federation, that they took immediate action. Each individual case would be dealt with on its merits and would be a matter of separate negotiation. He could imagine that the whole process, if the principle was adopted, might yet take some years to complete.

Dr. R. M. HUGO supported the policy of federation, and Dr. C. H. J. WATSON criticized it, and asked whether, if the Association represented 50 per cent. of the profession and another body 10 per cent., they were to have an equal force in formulating policy.

Lieut.-Colonel HOWARD MUMMERY, Secretary of the British Federation of Medical and Allied Societies, said that his position there was simply that of a member of the British Medical Association attending a meeting of the Division where he resided. He wanted the membership of the Association to increase, and that was also the wish of his Federation. The Association should become as strong numerically as possible, but he thought it was expecting too much to have the whole profession in one organization. Medicine was split up into many distinct branches and interests, as much differentiated from each other—save for the fact of a common portal—as the medical profession and the profession of nursing. He thought that if certain medical societies were going to be given representation on the Council of the Association, together with other benefits and privileges, the result would be to cause the members of those societies who were already members of the Association to relinquish their membership of the latter. The federation scheme would weaken the Association numerically. The Branches in the Dominions might become separate organizations if they wished, but why should the home position be weakened by taking in other medical bodies? The best plan would be for the British Medical Association to join the Federation already in existence, where it would retain its autonomy and its great privileges, and have every advantage which it now sought by reorganization from within. There were many organizations in the profession more representative than the Association so far as sectional interests were concerned.

Asked to define the position of his Federation in its relation to the British Medical Association, Lieut.-Colonel MUMMERY said that only those who chose to do so made out that it was in antagonism. The Association itself was one of the bodies which met a large number of others on October 1st, 1918. Sir Jenner Verrall, representing the Association, voted for setting up such a body as the Federation. Then the Association put forward a claim itself to form and control that body, and here there was a difference of opinion. The majority of the societies did not agree with that view, and themselves formed the Federation, hoping that the Association would see its way to come in. So far from being in opposition, the Federation maintained that it was supplementary to the present organization of the Association. The Federation at the moment represented, with very few exceptions, all the other interests in the profession, and a united profession was immediately available if the Association would take the hand of fellowship, which was still extended.

Dr. MACKENZIE said that he would like to have another opportunity of a discussion with Lieut.-Colonel Mummery on this matter. His answer to the whole discussion was that if the Association decided not to enter into any federation, it still remained so strong that no Minister of Health could

embark on any new policy which affected medical men without consulting it. Many of the advantages which Dr. Fothergill had instanced as attaching to federation were already available: only last year the Representative Body devoted an afternoon to hearing a deputation from the Society of Medical Officers of Health. If the societies were federated with it, the Association would lose members. What would be the use of a member of a federating society retaining his membership in the society and in the Association as well? There was no evidence that any society wished to federate, save the Overseas Branches, whose case was not on all fours with what was proposed under the wider scheme.

Two motions were then put to the meeting on the proposition of Dr. MacKENZIE, seconded by Dr. WALSON. The first was to the effect that, except for the Overseas Branches, all medical bodies should be excluded from federation. This was carried by 10 votes to 5. The second was that all non-medical bodies should be similarly excluded, and this was carried, with one dissentient.

Correspondence.

Proposed Opportunities for Affiliated Bodies connected with Allied Science.

SIR, The Council, acting on the instructions of the Cambridge Representative Meeting, has prepared draft Articles and By-laws (SUPPLEMENT, March 5th) and Rules (SUPPLEMENT, April 30th) under which it would be possible for any body formed for the advancement of an allied science to become affiliated to the British Medical Association, if mutually desired, after due consideration in each case by the Representative Body on the report of its Council.

It is to be noted that certain Divisions have already registered their objection to the principle of affiliating such bodies before they can have had any opportunity to consider the proposed rules to govern this, as these have been published only this past week. Evidently these Divisions, from lack of this information, and possibly being misled by the vague Current Note of March 5th, had come to the conclusion that the proposals were that such bodies would have the right, if affiliated, to ask for seats on the Representative Body and Council, and for the members to attend the annual scientific meetings, thus swamping the medical profession's parliament and executive committee, as also its scientific congresses.

This is not so. On reference to these rules now appearing for the first time in the SUPPLEMENT of April 30th, pp. 149-150, it can be seen that all that is proposed to offer to such bodies, in addition to a few detailed benefits, are the following:

1. Permission to be heard by deputation by the Representative Body and Council.
2. A seat on any committee, subcommittee, conference, or deputation formed to deal with any subject affecting the honour or interests of those whom the body represents.

These proposals now made are, in fact, putting on record what already is carried out under the Association's Memorandum (Section 3 (I)), in our central organization.

Such bodies, if affiliated, would not have seats on the Representative Body nor on the Council, nor could they claim them under the proposed Articles, By-laws, and Rules.

The question, therefore, which each Division should ask itself when considering these two Supplements is, Does it approve the continuation of the loose co-operation with allied science bodies now being carried on and its registration under the new Articles, By-laws, and Rules? If still in doubt about the possibilities of swamping the Representative Body, Council, or annual scientific meetings, the Division should adopt in addition a resolution, to be placed before the Representative Body, instructing the Council to have the Articles and By-laws strengthened in order to prevent this if counsel considers that there is any ambiguity in the matter.

Might one urge the Divisions to reply to the query in the affirmative, and to adopt, if considered necessary, a resolution on the lines as suggested?—I am, etc.,

Hove May 2nd.

E. ROWLAND FOTHERGILL.

Anaesthetists' Fees in Insurance Practice.

SIR,—I should be glad if I might have the use of a short space to call attention to the recent circular letter of the Ministry of Health on the subject of remuneration for

anaesthetics.* If I am correct in my contention this is a matter which should engage the immediate attention of all Panel Committees.

Paragraph (a) of this letter authorizes payments out of the medical pool in respect of anaesthetics given in hospitals and "similar institutions." It is obvious that no payments can be made for services which the Acts and Regulations do not provide, and the deduction is equally obvious that a particular hospital service—namely, the giving of anaesthetics—is now held by the Ministry to be provided by the Acts. So far as I am aware, all previous rulings of the Ministry have stated quite definitely that no sort of hospital service is provided. If this is an intentional reversal of previous rulings the position is very serious, if it is accidental and likely to be with drawn, no time should be lost in demanding its reconsideration.

You will note that no payment may be made in respect of the administration of an anaesthetic unless the service in connexion with which it is given is also within the terms of service. Therefore the legalizing of payment for hospital anaesthetics incidentally brings within the terms of service the operations themselves although performed in hospital. And if anaesthetic and operation are within the terms of service, it is evident that the ordinary attendance in hospital must be similarly included. Such attendance then becomes the duty of the practitioner, whether or no he is a member of the hospital staff, and where a patient is in hospital outside his own area the regulations dealing with temporary residents would appear to come into force. Again, if an anaesthetic may be given in hospital as part of the services to which a patient is entitled by virtue of his being insured, the necessary chloroform or ether can be ordered at the expense of insurance funds.

Once a Panel Committee authorizes payment for any service given in hospital, it allows by inference that we are under contract to give services in hospital, for only in such cases could payments out of the medical pool be legal. I do not for one moment believe that our present contract includes any such services, and I am very sure that our present rate of remuneration was not calculated to include such services. Nevertheless the circular letter referred to contains the significant clause: "it is clearly undesirable that there should be any general action which should tend to an undue narrowing of the view taken by practitioners of their obligations under the terms of service." There is further in the model form provided for claiming payments for anaesthetics a space left for stating where the operation was performed—that is, whether in hospital or otherwise.

May I venture to suggest to Panel Committees that they pass and forward to the Ministry resolutions in some such form as the following:

The Local Medical and Panel Committees for the of have had under consideration the circular letter of the Ministry of Health on emergency treatment and anaesthetist's fees. They decline to accept the inference to be drawn from paragraph (a) of this letter that services rendered in hospitals and similar institutions can be held to be within the terms of service and so can be remunerated out of insurance funds. They request that Form G.P. 19 may be amended by the deletion of the line "Place where operation was performed" and the substitution of "I hereby declare that the operation was not performed in any hospital or similar institution."

I have little doubt that if we accept this letter we shall find its terms included in the next revision of the Regulations, when we shall find that we have agreed to a very large extension of service and have forfeited our present legitimate claim for a share in any funds provided by approved societies or from other sources for the support of hospitals.—I am, etc.,

Sevenoaks, May 2nd.

GORDON WARD.

* SUPPLEMENT, April 16th, 1921, p. 99.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

A list of periodical publications, official reports, and Blue Books in the Library of the British Medical Association available for issue to members on loan has been printed, and copies can be obtained free on application to the Librarian at the house of the Association, 429, Strand, W.C. The regulations governing the loan of these publications are stated in the introduction to the list. The Library is open for consultation from 10 a.m. till 6.30 p.m. (on Saturdays 10 a.m. till 2 p.m.).

[Appendix to the Annual Report of Council, printed in the SUPPLEMENT of April 30th, 1921.]

RETURN OF ATTENDANCES

At Council, Committee, and Sub-Committee Meetings, from the Annual Representative Meeting, 1920, to April 8th, 1921.

(Prepared pursuant to Standing Orders.)

Association Notices.

ELECTION OF COUNCIL OF ASSOCIATION, 1921-22.

A LIST of the Groups of Branches in the United Kingdom for election of twenty-four Members of the Council, 1921-22, and **Nomination Form**, were published in the SUPPLEMENT of March 12th (p. 73). The **Nominations** must be in the hands of the Medical Secretary **by May 16th**.

The result of the election for Members of Council by the Groups of the Oversea Branches was published in the SUPPLEMENT of February 19th, 1921.

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.

2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each scholarship is tenable for one year, commencing on October 1st, 1921. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on

application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1921-22 must be made not later than Saturday, June 25th, 1921, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

SIERRA LEONE BRANCH.

THE following change has been made by the Council, and takes effect on May 7th, 1921:

That a Sierra Leone Branch of the Association be formed, of area coterminous with the Colony and Protectorate of Sierra Leone.

Representation in Representative Body.—Under arrangements made by the Council the Branch will be entitled to independent representation in the Representative Body, 1921-22, to return one Representative.

BRANCH AND DIVISION MEETINGS TO BE HELD.

DORSET AND WEST HANTS BRANCH.—The annual meeting of the Dorset and West Hants Branch will be held at Yeovil on Wednesday, May 18th, at 3 o'clock, when the Presidential address, on "Experience of Two Recent Methods of Treatment," will be delivered by Dr. F. C. Bottomley, O.B.E. Luncheon will be served at 1.30 p.m. at the Three Choughs Hotel, the retiring President, Dr. Wetherall, in the chair. Dr. Norman Flower kindly invites members to tea after the meeting. A motor coach has been arranged to take members from the Bournemouth district, leaving The Square at 10.30 a.m. prompt. Applications for seats should be made early to Dr. Asten, Talbot Hill, Bournemouth.

METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.—The annual meeting and dinner of the Division will be held on Thursday, May 19th.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—A general meeting of the Westminster Division (which includes Holborn) will be held on May 6th at 4.30 p.m. at the St. James's Vestry Hall, Piccadilly (next St. James's Church). Dr. G. E. Buchan will give an address on "National Health and the Practitioners," to be followed by a discussion. Officers will be elected for the coming year, and the names of gentlemen desirous of serving on the Executive Committee should be sent to the Honorary Secretary, Dr. F. D. Bennett, 18, Savile Row, W.1.

METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.—The annual general meeting of the Division will be held at the Camberwell Infirmary on Friday, May 13th, at 3.30 p.m.

SOUTH MIDLAND BRANCH: BUCKINGHAMSHIRE DIVISION.—A meeting of the Buckinghamshire Division will be held on Wednesday, May 11th, at the Red Lion Hotel, High Wycombe, at 2.30 p.m. It is hoped that one of the Medical Secretaries of the Association will be present to explain the proposed scheme of federation with other bodies. Every member residing in the south part of Buckinghamshire is asked to attend and to bring a friend. Lunch can be obtained at the hotel. After the transaction of business the Chairman (Dr. Kennish) will introduce a discussion on influenza.

Meetings of Branches and Divisions.

YORKSHIRE BRANCH: LEEDS DIVISION.

Address by the Medical Secretary.

A MEETING of the Leeds Division, to which all members of the medical profession resident in Leeds and district were invited, was held in the Medical School, Leeds, on April 27th. An address was given by Dr. ALFRED COX, the Medical Secretary, on "The present demand for economy, and its effect on the medical profession."

Dr. Cox said that the various sections and interests in the medical profession must show an underlying unity, they must sink individualistic tendencies and hang together. They had more objects in common than differences. This difficulty of getting people to take an interest in their own business was not peculiar to the medical profession; politicians, lawyers,

teachers, miners, etc., were similarly situated. In all cases the few worked while the many grumbled—and reaped the benefits. In anticipating a favourable issue to the present economic difficulties the ordinary good sense of the Englishman could be relied on. For some time past all kinds of working men had got wages which often had little relation to the value of their work. In 1919-20 bonuses were given, the amount of which depended on the cost of living. In the reaction that followed, when we found we were spending more than we were earning, economists had made violent attacks on bonuses, the new Education Act, and other legislation for the millennium had been damped down, and so forth. There was a tendency for wages and salaries to fall, but organized working men intended to insist on a higher standard of living than they had before the war. By all means let a workman have a decent day's pay, but let him see to it that he gave a decent day's work in return. This applied to our profession also. The public thought that medical men put their patient's interest above every other consideration, and so medical men occupied a privileged position in public esteem. If, however, the public had reason to think that medical men were concerned entirely with how much money they could get for the minimum of exertion, the influence of the medical profession with the public would lessen, and its most valuable asset—its privileged position—would be lost or endangered. The demand for economy would affect the medical profession in that it tended to stop or delay the introduction of legislation of medical interest which involved expense. The new Minister of Health had already said that he should not spend money now on such things as could fairly be postponed, and that no big scheme of medical reform was at present to be expected. The economy campaign was likely to react on insurance practitioners in a demand for reduction of capitation fee, and as all rates of medical payments and private fees had gone up in response to the stimulus given by the rate paid for the work done under the Insurance Act, there was bound to be a reaction if the fee was reduced, and the reaction would affect the whole profession. Doctors who thought that because they were in private practice the rates paid for contract work did not concern them were gravely mistaken. Medical men required organization to be able to cope with any such reaction. Reductions could not be resisted if they were brought about with even-handed justice, but the medical profession, which was one of the last to raise its fees, must see that they only fell as other prices fell. A merely local organization was quite helpless; a national organization was necessary. The profession had no organization with prestige and influence with the public and the Government except the British Medical Association. In that great Association the Yorkshire Branch, which should be one of the leading branches, did not occupy the position that its size, importance, and opportunities should command; and the Leeds Division did not compare favourably in work and numbers with some other Divisions of the Yorkshire Branch. The medical profession in Leeds should, without delay, take steps for the better organization of their Division, and Dr. Cox hoped that the consultants would interest themselves in the matter. The Association had in the past owed much to the work of consultants for their colleagues in other forms of practice, and it needed them now.

After some discussion, in which reasons were given for the backward condition of the Leeds Division, a cordial vote of thanks was accorded to Dr. Cox for his address.

YORKSHIRE BRANCH: HUDDERSFIELD DIVISION.

A MEETING of the Huddersfield Division was held at the Huddersfield Royal Infirmary, on April 28th, to which all practitioners in the Division were invited. Dr. Cox, Medical Secretary, gave an address entitled "How much more State medical service does the medical profession want?" A lively discussion ensued, in which Drs. LAIRD, E. TROTTER, MCVIE, ORR, ROWTHORNE, TANSLEY, and HIRST took part. Criticism of the British Medical Association policy in relation to the Insurance Act was the principal line of the debate. Dr. COX made a spirited reply. On the motion of Dr. E. WALKER, seconded by Dr. IRVING, a vote of thanks to Dr. Cox was carried with acclamation. The meeting lasted three hours. Twenty-nine medical men were present and two joined the Association at the end of the meeting. The meeting was preceded by a dinner, at which Dr. Cox was the guest of the Executive of the Division.

METROPOLITAN COUNTIES BRANCH: HARROW DIVISION.

At a meeting of the Harrow Division held on April 26th the question of the British Medical Association becoming a federation was discussed. The Division were unanimous in welcoming such a proceeding, and the Representative to the Representative Meeting was directed to support the view that admission to membership of the proposed federation be open to all societies representing the medical profession and the medical profession only.

The position of Dr. Fothergill was also discussed, but the general opinion was that the steps already taken by the Council were thoroughly to be approved.

The Division proposed to ask one of the authorities to attend the next meeting of the Division in May, to explain at length the national provident scheme for hospital and additional medical services.

METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.

THE third meeting of the Lewisham Division was held on April 26th, at 45, Lawrie Park Road, Sydenham, S.E.26, with Dr. G. W. CHARLESLEY in the chair. It was agreed to defer discussion of the provident scheme for London hospitals until next meeting. Dr. White was appointed the Representative for Lewisham at the Representative Meeting. The Consultative Council's report was then fully discussed and the queries answered. The letter on the subject of municipal clinics from the Honorary Secretary of the Willesden Division was discussed, and the meeting expressed its agreement with the points raised. Drs. CHARLESLEY and GILCHRIST reported an interesting case of pyaemia in a child in which it was difficult to discover the site of origin of the infection. Dr. RICHARDSON showed pathological specimens of the case.

SUFFOLK BRANCH: WEST SUFFOLK DIVISION.

A MEETING of the West Suffolk Division was held at Bury St. Edmunds on April 26th, when Dr. F. R. BARWELL was in the chair.

THE CHAIRMAN introduced a discussion on the Report of the Council on the question of federation, and explained briefly the chief objects aimed at and the alterations in the constitution of the British Medical Association necessary to attain them. He emphasized the importance of deciding whether members wished the Association to offer federation to semi-medical bodies. After discussion it was resolved *nem. con.*, on the motion of Colonel FREEMAN, seconded by Dr. DOBIN, that the Division support the following resolution passed by the Edinburgh Branch, South-Eastern Counties Division:

That while this Division does not object to a federation of any bodies composed exclusively of medical practitioners, it objects to federation with bodies not consisting exclusively of registered medical persons.

THE SECRETARY explained the memorandum on collective opinion of the profession by Dr. Rowland Fothergill. After discussion it was resolved, on the motion of the SECRETARY, seconded by Dr. BENNETT:

That the Division request that Council should give serious consideration to this memorandum; and that the Council be informed that this Division considers a referendum, as suggested, desirable.

Dr. A. HOPE GOSSE gave an address on "The clinical diagnosis of cardiac arrhythmias unaided by graphic methods." This was much appreciated, and numerous questions were asked. Dr. Gosse subsequently demonstrated in the hospital wards the use of the polygraph. On the motion of the CHAIRMAN a very hearty vote of thanks was accorded to Dr. Gosse for his paper. The meeting then adjourned for tea, which was kindly provided by the Matron. During tea the result of the draw for the golf competition instituted by the Executive Committee was announced.

CAPE OF GOOD HOPE (WESTERN) BRANCH.

AT the first meeting for 1921 of the Cape of Good Hope (Western) Branch of the British Medical Association, held on March 18th, a very interesting and instructive address was delivered by the President, Dr. D. P. MARAIS, on the early diagnosis of tuberculosis. The lecturer dealt fully with the various signs and symptoms, their explanation and relative importance in the formation of a correct diagnosis.

MALAYA BRANCH: SINGAPORE DIVISION.

A MEETING of the Singapore Division was held on March 17th, when the VICE-PRESIDENT was in the chair.

THE SECRETARY read a communication from the Principal of the School of Medicine, from which it appeared that an inspection of the examinations of the King Edward VII Medical School had been held by the General Medical Council, to whom the examination papers were also submitted. The Registrar of the General Medical Council had notified the Principal that the papers had been submitted to examination experts, members of the Council and others, with the result that the examinations were considered satisfactory and sufficient.

The question of the annual general meeting of the Branch, which falls to be held this year in Penang, was raised, and the Secretary was instructed to communicate with the Secretary in Penang as to their wish to hold it there.

Dr. GALLOWAY read a paper on "The febrile phases of syphilis," and in the discussion which followed Drs. CLARKE, DAWSON, and VAN DORT took part.

INSURANCE.

LONDON INSURANCE COMMITTEE.

Women Practitioners and Male Insured Persons.

THE London Insurance Committee, on April 28th, passed a resolution expressing the view that in the case of a woman medical practitioner who limited her acceptances of insured persons to women patients, and was not prepared to have male insured persons assigned to her, Section 5 of the Distribution Scheme came into operation; this provides that if any practitioner is relieved of the liability to have insured persons assigned to him, the units credited to him for the purposes of the distribution of the Practitioners' Fund shall be reduced by

10 per cent. in the case of medical officers of institutions and by 7½ per cent. in the case of other practitioners. It appears that four medical women in London have restricted their acceptances to female insured persons; each of these women practitioners, on being notified of the course intended, has protested against any reduction of credits, maintaining that it is not unreasonable that a woman should decline to undertake the treatment of male patients.

Range of Medical Service.—The Committee at its previous meeting referred back a recommendation that it should not concur in the opinion expressed by the Local Medical Committee that an operation for the removal of haemorrhoids and an operation for the removal of cysts from the neighbourhood of the knee-joint were services which could not, consistently with the best interests of the patient, be properly undertaken by a general practitioner of ordinary professional competence and skill. The subcommittee which originally brought forward the recommendation now reported that it had taken the advice of its medical members and had decided to recommend concurrence with the Local Medical Committee's opinion. The Committee also agreed with a resolution which had been passed by the Wigan Insurance Committee, complaining of the "unbearable and expensive procedure necessary to decide definitely whether or not an operation came within the scope of medical benefit, and suggesting that every kind of medical treatment should be made available to insured persons under the National Insurance Acts.

Forms of Medical Record.—The Committee considered certain resolutions which had been passed by the Panel Committee, complaining of the present form of medical records. The Insurance Committee expressed its own view in resolutions that some form of medical records in connexion with treatment was necessary; that provision should be made in the records for all matters that were likely to be of clinical value in connexion with the case; and that no opinion should be expressed at present as to the existing form of medical records.

Sanatorium Benefit.—The sanatorium benefit as administered by the Committee terminated on May 1st, and the Sanatorium Benefit Subcommittee took occasion to submit a report reviewing the measures which during the Committee's period of responsibility have been undertaken for the treatment of tuberculous persons among the insured population. From 1912 to 1921 over 36,000 applications for sanatorium benefit have been dealt with, and treatment has been afforded to 29,000 tuberculous persons. Institutional treatment, mostly in sanatoriums, has been given to 25,000 persons. The Minister of Health has expressed his appreciation of the Committee's work in connexion with the treatment of tuberculosis.

LONDON PANEL COMMITTEE.

Hours of Practitioners and Pharmacists.

AT the meeting of the London Panel Committee, on April 26th, a report was presented of a conference which has lately been held between representatives of the Panel, Pharmaceutical and Insurance Committees with regard chiefly to the adequacy of the pharmaceutical service for dealing with "urgent" prescriptions. The conference agreed, after a long discussion, that prescriptions marked "Urgent" should be dispensed up to the hour of 9 p.m.; that, in order to render "urgent" prescriptions authentic they should be marked "Urgent" and initialed by the doctor, who would also indicate the time of issue and endorse with the signature of the pharmacist, together with the time when dispensed. The position of the Pharmaceutical Committee was that the difficulty was caused or aggravated by the fact that the closing hour for pharmacists and the closing hour at the surgeries did not coincide, and that the situation would be relieved if those practitioners who sat until a late hour could be induced to bring their hours forward. The objection to earlier hours, particularly in industrial districts, was pointed out, but it was agreed that the Panel Committee should make inquiries of practitioners as to the practicability, consistently with the best interests of patients, of advancing the hours of consultation. Questions are also to be asked of the practitioners as to the adequacy of the pharmaceutical service in their districts, and these inquiries are now proceeding.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following notifications are announced by the Admiralty: Surgeon Commanders: H. Huskinson, W. S. H. Sequeira, S. F. Dudley, O.B.E., and S. Roach to the *President* additional for three months' hospital course. H. W. B. Shewell, O.B.E., to the *Revenge* as Squadron Medical Officer. W. W. Keir, C.M.G., to the *Teiud* additional for Plymouth Hospital (temporary). A. H. S. Richardson to R.N. Hospital, Haslar. Surgeon Lieut. Commanders: M. S. Moore to the *President* additional for three months' hospital course. H. R. B. Hull to the *Vivid* additional for Plymouth Hospital (temporary). Surgeon Lieutenants promoted to the rank of Surgeon Lieutenant Commander: J. C. Sinclair, H. L. P. Peregrino.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

To be Captains: Temporary Captain G. J. McGarty, M.C., with seniority April 19th, 1917, and precedence next below J. F. W. Moenan. Lieutenants (Temporary Captains) A. R. Bayliss, E. N. P. Martland. E. C. Pawcett, late temporary Captain, to be temporary Captain, with seniority, December 21st, 1916.

The following officers re-inquire their commissions: Temporary Major R. A. Beaver and retains the rank of Major. Temporary Captains and retain the rank of Captain: W. D. Perry (on account of ill health contracted on active service), J. Joule, W. Spilker, G. Fleming, E. Bryceon, H. R. McNair. Temporary Lieutenants and retain the rank of Lieutenant: S. E. Price, W. A. Byro (on account of ill health).

ROYAL AIR FORCE.

MEDICAL BRANCH.

The following are granted temporary commissions as Flight Lieutenants with effect from and with seniority of the dates indicated: R. J. Monahan (April 11th), J. Craig (April 25th).

OVERSEAS FORCES.

SOUTH AFRICAN MEDICAL CORPS.

Temporary Captain G. S. Coghlan, M.B.E., relinquishes his commission on completion of service, July 12th, 1920, and retains the rank of Captain.

Temporary Colonel P. G. Stock, C.B. (Colonel S.A.M.C.), relinquishes his temporary commission April 17th, 1919, and retains the rank of Colonel (substituted for notification in the *London Gazette*, May 27th, 1919).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel A. H. Vernon, T.D., to command 3rd Southern Casualty Clearing Station.

Captain (acting Major) E. Osborne relinquishes the acting rank of Major on ceasing to be specially employed.

To be Captains: Captain J. McKay, M.C. (late R.A.M.C., S.R.), with precedence as from January 24th, 1916; Captain F. D. Marsh, M.C., from 1st Southern General Hospital, with precedence as from August 25th, 1914.

D. J. Davies to be Lieutenant.

DEFENCE FORCE.

ARMY MEDICAL SERVICE.

R.A.M.C.—To be temporary Majors: J. A. Clark, L. R. Colledge, B. Addensbrooke, C. B. Baxler, O.B.E., T.D., S. J. C. Holden. To be temporary Captains: E. Coplans, T. P. Cole, C. H. Carlton, M.C., G. P. Hardy, M.C., E. Scott, D.S.O., F. J. Morris, J. Grant-Morrin, O. H. Mavor, J. A. Stephouse, H. L. Garson, O.B.E., M.C., A. Walker, D.S.O., H. K. Ward, A. Morris, C. H. Comerford, B. E. A. Batt, H. Wilson, M.C., W. Tresswain. To be temporary Lieutenants: O. G. Misquith, C. S. Atkin, A. Fisher.

1st East Anglian Field Ambulance.—To be temporary Lieutenant-Colonel: H. F. Everitt. To be temporary Captains: W. J. Rice, H. V. Walsh, C. S. Stadden, W. S. Forbes.

3rd (Home Counties) Field Ambulance (D.F.).—To be temporary Lieutenant-Colonel: H. G. G. Mackenzie, D.S.O.

4th London Field Ambulance (D.F.).—To be temporary Lieutenant: C. C. Coghlan.

5th London Field Ambulance (D.F.).—To be temporary Major: D. T. H. Lea.

6th London Field Ambulance (D.F.).—To be temporary Captains: J. Rowland, M.C., J. O. Thomas. To be temporary Lieutenant: J. Sannell.

1st South Midland Field Ambulance.—To be temporary Lieutenant-Colonel: W. Stobie, O.B.E.

2nd (Wessex) Field Ambulance (D.F.).—To be temporary Lieutenant-Colonel: C. M. Kennedy, M.B.E.

3rd (Wessex) Field Ambulance (D.F.).—To be temporary Lieutenant-Colonel: E. Alderson.

Sanitary Section.—To be temporary Captain: G. T. Stewart, West Riding Field Ambulance (D.F.).—To be temporary Lieut.-Colonels: J. Mackinnon, D.S.O., F. Whalley, D.S.O., W. Lister.

2nd (West Riding) Field Ambulance (D.F.).—To be temporary Major: T. R. Kenworthy. To be temporary Captain: D. F. Dobson.

3rd (West Riding) Field Ambulance (D.F.).—To be temporary Major: E. F. Skinner. To be temporary Captains: R. A. Stark, M.C., W. T. D. Mart, R. E. Pleasance.

3rd (West Lancashire) Field Ambulance (D.F.).—To be temporary Major: A. J. D. Riddett.

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.—War Section: Mon., 5.30 p.m., Annual General Meeting; Surgeon-Commander S. F. Dudley, R.N.; The Influenza Epidemic as it Affected the Royal Navy. Section of Psychiatry: Tues., 5.30 p.m., Annual General Meeting. Section of Surgery, Subsection of Proctology: Wed., 5.30 p.m., Annual General Meeting; Informal discussion, to be introduced by the President. Section of Neurology: Thurs., 8.30 p.m., Annual General Meeting; Professor Marinisco (Bukarest); Encephalitis Leborgia (communicated by Sir Frederick Mott). Clinical Section: Fri., 5.30 p.m., Annual General Meeting. Section of Ophthalmology: Fri., 8 p.m., Exhibits: 8.30 p.m., Dr. D. Leighton Davies; Lacrymal Obstruction, Results of Anatomical Method of Treatment (Toti); Mr. Ernest Clarke; Lessons from Forty Years of Refraction Work; Miss J. C. Mann; Aphakia in a Human Embryo of Five or Six Weeks.

HARVEIAN SOCIETY OF LONDON, Paddington Infirmary, Harrow Road, W.—Thurs., 4.30 p.m.: Clinical Meeting.

INSTITUTE OF PATHOLOGY AND RESEARCH, St. Mary's Hospital, Paddington, W.—Thurs., 4.30 p.m., Sir James Mackenzie, F.R.S.: The Opportunities of the General Practitioner as Essential for the Investigation of Disease and the Progress of Medicine.

POST-GRADUATE COURSES AND LECTURES.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In- and Out-patient Clinics and Operations. Demonstrations: Mon., 12.15 p.m., Dr. Burnford; Pathological, Tues., 12 noon, Mr. Gray; Fractures; Wed., 12 noon, Mr. Sinclair; Surgical Diseases of the Abdomen; Thurs., 10.30 a.m., Dr. Shinson; Gynaecological; Fri., 10 a.m., Dr. Stewart; Neurological; Sat., 10 a.m., Dr. Saunders; Medical Diseases of Children. Lectures: 5 p.m., Mr. Harman, Mon.: Education of

Children with Defective Vision; Tues.: Blind and Partly Blind Children; Wed., Dr. Owen; Nephritis; Thurs., Dr. E. S. Reynolds; Vascular Lesions of the Brain; Fri., Dr. Snowden: Psychological Analysis.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION, Eye Infirmary.—Wed., 4.15 p.m., Eye Cases.

LONDON HOSPITAL MEDICAL COLLEGE.—Mon., 5 p.m., Dr. W. M. Feldman: Ante-natal and Post-natal Child Physiology; Tues. and Fri., 5.15 p.m., Dr. M. Culpin: Psycho-neuroses.

LONDON LOCK HOSPITAL, Dean Street, W.—Tues., 2.30 p.m., Mr. McDonagh: Microscopic Demonstration of *Leucocytozoon sphyllidis*.

MANCHESTER ROYAL INFIRMARY.—Thurs., 4.30 p.m., Dr. G. R. Murray: Diseases of the Endocrine Glands.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Mon., Tues., Thurs., and Fri., 2 p.m.: Out-patient Clinics. Lectures: 3.30 p.m., Mon., Dr. Saunders; Pituitary Disorders; Tues., Dr. James Taylor; Epilepsy; Thurs., Dr. Tooth: Disseminated Sclerosis; Fri., Dr. Collier: Aphasia.

British Medical Association.

OFFICES AND LIBRARY, 49, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 1s. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate, Westrand, London). MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London). EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London). Telephone number for all Departments: Gerrard 2630 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4351 Central.) IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4757 Dublin.)
