Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

Seminary of Quebec
Library

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Séminaire de Québec
Bibliothèque

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

GUTHRIE'S UNIVERSAL GEOGRAPHY IMPROVED:

BEING A NEW
SYSTEM
OF
MODERN GEOGRAPHY:
OR A
Geographical, Historical, and Commercial Grammar;
AND
PRESENT STATE
OF ALL THE SEVERAL
KINGDOMS OF THE WORLD

CONTAINING

- I. An Account of the Figures, Motions, and Distances, of the Planets, according to the Newtonian System, and the latest Observations.
- II. A New General View of the Earth, considered as a Planet; with many useful Geographical Definitions and Problems.
- III. A Display of the Grand Divisions of the Globe into Land and Water, Continents and Islands.
- IV. The Situation, Extent, &c. &c. of Empires, Kingdoms, States, Provinces, and Colonies.
- V. Their Climates, Air, Soil, Vegetable Productions, Metals, Minerals, Natural Curiosities, Seas, Rivers, Bays, Capes, Promontories, and Lakes.
- VI. The Birds and Beasts peculiar to each Country.
- VII. Observations and Remarks on the Changes that have been any where observed upon the Face of Nature, since the most early Periods of History.
- VIII. The History and Origin of Nations; their various Forms of Government, Religion, Laws, Revenues, Taxes, Naval and Military Strength.
- IX. The Genius, Manners, Customs, and Habits of the People in various Parts of the Globe.
- X. Their Language, Learning, Arts, Sciences, Manufactures, and Commerce.
- XI. The Chief Cities, Structures, Ruins, and Artificial Curiosities throughout the World.
- XII. The Longitude, Latitude, Bearings, and Distances of Principal Places from London.

TO WHICH ARE ADDED,

- I. A New and Copious GEOGRAPHICAL INDEX, with the Names and Places alphabetically arranged.
- II. A New GENEALOGICAL TABLE and ACCOUNT of all the Sovereigns in the World.
- III. A CHRONOLOGICAL TABLE of Remarkable Events, from the Creation to the present Time.

A NEW EDITION,

ENLARGED, CORRECTED AND IMPROVED, WITH GREAT ADDITIONS;

Being enriched with the most recent DISCOVERIES of the latest VOYAGERS and TRAVELLERS.

The Historical Part comprising the latest and most important Occurrences and Events, particularly the Revolutions in France, Sweden, Poland, &c.

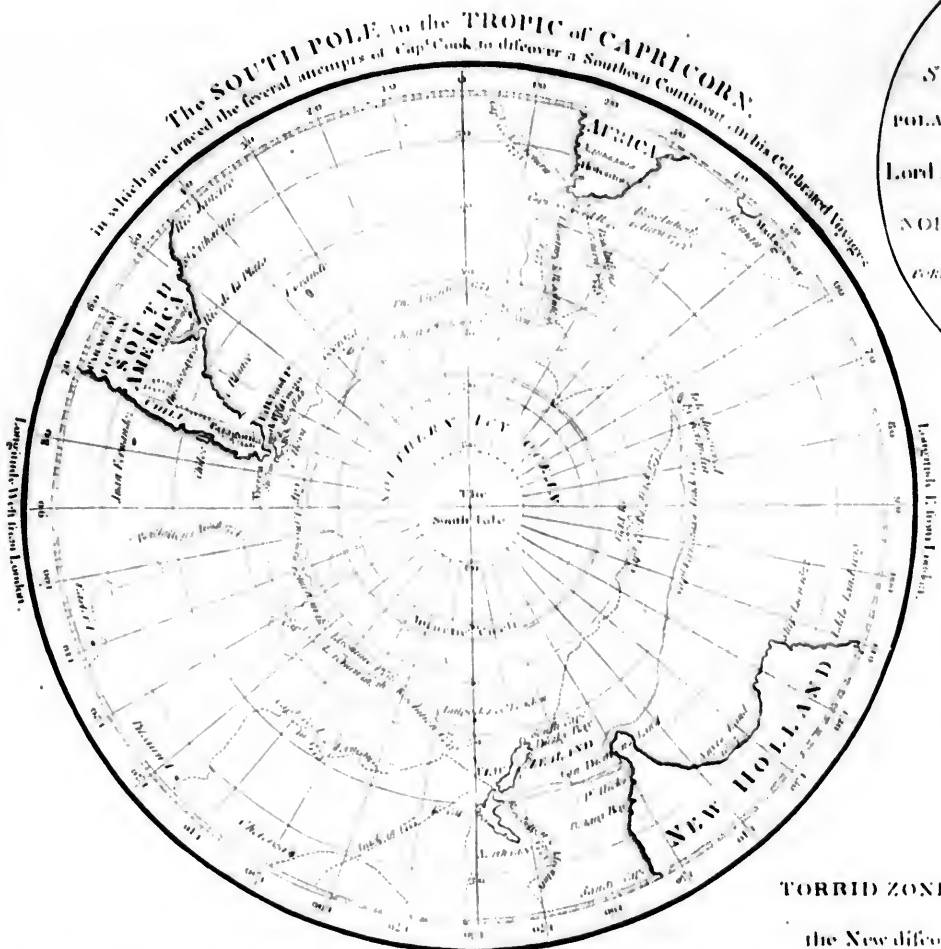

The Astronomical Part, including the latest Discoveries of JAMES FERGUSON, F. R. S. Dr. HERSCHELL, and other Eminent Astronomers.

ILLUSTRATED WITH A SET OF LARGE AND ACCURATE MAPS.

P R E F A C E.

THE great popularity and excellence of this work render it totally unnecessary to pass any encomium upon it here. So universally known are the merits of Guthrie's System of Geography, that to expatiate upon them now would be both needless and superfluous: we shall therefore only remark those undeniable advantages which must result from a New Edition, and in consideration of which, we were prompted to exert our utmost abilities to accommodate the Public with one, which we presume, for accuracy and improvement, will receive their general approbation.

A work of this nature, notwithstanding it redounds much to the credit and genius of its original Author, certainly admits in the course of time of being continually enriched by the discoveries which are continually made; it is natural to expect from a geographical composition, a faithful account of all those important articles which have recently occurred, during the late Expeditions and Voyages of our eminent Navigators and Travellers, who have lately explored many distant lands, and happily effected such discoveries as are really useful and interesting:—indeed without those relations, no System of Geography can be accounted complete; at least it cannot be so satisfactory as one which unites therewith History and Commerce, and contains the most recent information. When therefore we consider the continual revolution of human affairs and states, we must allow that many alterations and additions are absolutely necessary to enhance the value of such an esteemed undertaking.

In respect to the alterations, they are such as were unavoidably required to admit of the additions, which were so highly essential. In uniting several particulars, and introducing such accession of matter, as must certainly be expected from a New Edition, we were not only obliged to expunge the overflowing superfluities of former ones, but likewise to make such transpositions as were absolutely necessary for the sake of connection. The additions, which consist of all the recent discoveries, in this Edition, precede those parts with which former editions have commenced. Our motive for this was not only to pay due honor to our eminent navigators, who have lately explored such dangerous and immense tracts, and brought home information, that both redounds to their own credit, and the advantage of the Public; but likewise on account of their being in a great measure a clue to the succeeding matter, whereby our Readers may with greater facility become acquainted with our New Geographical, Historical, and Commercial System. These additions will not only be found considerable, but exceedingly interesting, as they comprise every remarkable circumstance that is related in the accounts of Captain Cook, and all the late Journals of the Voyages of Captains Phillips, King, Ball, Hunter, White, Dixon, Portlock, &c. &c. &c. They are succeeded by the important Histories and Descriptions of ASIA, AFRICA, AMERICA, and EUROPE; here also are incorporated, several particulars relative to these four principal parts of the World, which have been hitherto unknown, and for which we are indebted to the communications and labours of several ingenious travellers, particularly Brissot, Hodges, Blythe, &c. &c.

In our survey of Asia, we owe no inconsiderable improvements to the Travels of Mr. Franklin, in Persia; the Abbè Grosier's History of China; Dr. Robertson's Critical Survey of India, &c. &c. We have likewise endeavoured to be as copious as possible in our discussion of Africa, of which so little hitherto has been certainly known: We have therefore been the more diligent in our inquiries, and abstracted all the most valuable information that could be found in the Travels, Memoirs, &c. of

Mr.

Mr. Vaillant, Major Rennell, and others. Our relation of America we presume will be found both satisfactory and complete, seeing we have not only carefully examined the works of the celebrated Morfe, but likewise applied to several other authentic sources, which have amply assisted our endeavours, and enabled us to give the best information in the most full and explanatory manner. We have been carefully attentive to, and remarkably full in our account of, Europe, which occupies no inconsiderable part of our volume, and strictly accurate in all our other descriptions. To complete the whole, a copious Treatise upon Astronomy is added, chiefly extracted from the labours of the celebrated Ferguson, Dr. Herschell, and other famous astronomers; to this is subjoined, a New Chronological List of remarkable Events, Discoveries, and Inventions, from the earliest period to the present time; as also a Genealogical Table of all the Sovereigns in the World.

Considerable as our additions may seem, yet our Readers may be assured, that the omissions, in order to make room for them, are such as the nicest critic must allow to be immaterial: the parts expunged were generally such as were not founded on authenticity, and did not tally with our recent accounts; others were mere tautologies, and therefore could be well spared; upon the whole, however, the present edition is in every department more copious than any other, and the Public are now presented with a New Historical and Commercial System of Geography, which contains every interesting particular in the most explicit manner, without making too voluminous a size, or being reduced to an insignificant abstract.

To the original Author, the ingenious Guthrie, is certainly due not only the plan, but the groundwork of this great undertaking; from our improvements, however, we hope to derive some credit, having, with unremitting attention, applied ourselves to the arduous task, and by the most laborious researches, endeavoured to complete the great object in view. The extremes of prolixity and brevity are equally avoided, and all the errors of former editions removed, and their deficiencies supplied. To enter into any specious preamble for introducing a new Edition of this useful and popular undertaking, would be in our opinion both arrogant and presumptive. An age so enlightened and refined as the present, becomes soon sensible of what is rational and worthy of attention—for us, therefore, to prescribe, would be the height of presumption, and to expatiate upon our merits, an insult to the understanding of our Readers, who are undoubtedly the most capable of judging, and therefore the most proper to decide. To their candid inspection, we shall of course submit the fruits of our perseverance and labour, which, if accounted ripe and salutary, will be an ample compensation for the pains we have taken: and we doubt not, since in these polite days, the study of Geography is now become both universal and fashionable, and which, doubtless, has tended in a great measure to assist and promote the refinement of the present age, that this work will receive not only the approbation, but the patronage, of a discerning Public; and as it includes all the most recent observations and discoveries, which have been made by our late eminent Navigators and Geographical Travellers, which are in any degree interesting and worthy of insertion, that consequently THIS Edition, being the LAST, will have the preference of ALL OTHERS, and be entitled to a candid examination. Those who have consulted the former editions, will be most capable of seeing the superiority of the present, and relying on our own assiduity, improvements, and accuracy (so far we must presume), we are convinced that every impartial Reader will, on a fair and unbiassed scrutiny, perceive the several advantages of this New Edition: resting on this hope, and assured of public favour, we shall wave any further preface discourse, and leave the work, now in maturity, to speak for itself, doubting not, but it will receive that encouragement and popularity which so distinguished it in its infant state.

A NEW
COMPLETE AND AUTHENTIC
SYSTEM
OF
UNIVERSAL GEOGRAPHY.

BOOK I.
NEW DISCOVERIES.

INTRODUCTION.

IN the Disposition of a Plan of GEOGRAPHY, as there will always be a wide Field open before the Writer, it is a nice Part of his Business to determine, from what Part he shall begin his Literary Journey. However, as is already hinted in the Preface, the Curiosity of People in general, the Importance of the Subject, and other Circumstances, have induced us to begin with the NEW DISCOVERIES, though in Date more modern than any other Articles. The Expedition planned by the ENGLISH GOVERNMENT for the Transportation of CONVICTS, and the planting a COLONY in a Part of that immense Tract in the *Southern Clime*, called NEW HOLLAND; in particular, having excited the CURIOSITY of the PUBLIC, and given rise to many Speculations respecting its Consequences, will be sufficient Authority for our beginning this Work with a particular Description of NEW HOLLAND, comprehending PORT-JACKSON, where the Operations for forming the Colony commenced; BOTANY-BAY, the Spot first destined for the Establishment of the Colony; NORFOLK-ISLAND, another Settlement, and all the Places in that Quarter which have been visited by the late NAVIGATORS. These Accounts will comprise, in the whole, a general VIEW of the COUNTRY, its Productions, Inhabitants, &c. as displayed in the NARRATIVES not only of the celebrated Captain COOK, but the Accounts of Captains KING, BALL, HUNTER, and all those who have lately explored this immense Tract.

CHAP. I.

NEW HOLLAND.

General Description of it, and its Discovery by Captain COOK. Particular Account of BOTANY-BAY, PORT-JACKSON, NORFOLK-ISLAND, &c. including the latest Discoveries, by Captains KING, BALL, and HUNTER.

THIS immense tract in the southern clime, called New Holland, from its having been chiefly explored by Dutch navigators, was never ascertained as an island or continent, till Captain Cook, with an ardour and perseverance peculiar to himself, and which distinguished him from predecessors of every

country, explored it on the easternmost coast in 1770, and discovered it to be an island of vast extent, reaching from 10 to 44 degrees south, and between 110 and 154 degrees east of London.

The respective parts on this coast being discovered by different navigators at different periods of time, they had names given them by those who discovered them. Thus, the first land discovered in these parts was called Eendragt (or Concord) Land, from the name of the vessel in which the discovery was made in 1616, in 24 deg. 25 min. south. The next situated in 15 deg. south, was called Arnheim and Diemen, by Zeehen, who discovered it in 1618, though not the same part with that afterwards called Diemen's Land, by Tasman, which is the southern extremity of the island, in latitude 43 degrees,

groes, and was discovered in 1642. Jan Van Edels gave his name to a southern part discovered by him in 1619. A coast that communicates to Leawen's land towards the westward, and a part of the western coast, near the tropic of Capricorn, was called De Witts, from Peter Van Nuits, who discovered them in 1627, as was the great gulph of Carpentaria, between 10 and 20 degrees south, from Peter Carpenter, a Dutchman, who discovered it in 1628. Dampier, an Englishman, sailed from Timor in 1687, and coasted the western parts of New Holland. In 1699, as the Dutch suppressed their discoveries, he left England in order to explore this country, and sailing along the western coast, from 28 to 15 degrees, saw the land of Eendragt and of De Witt. Returning to Timor, he set out from thence to prosecute his design, explored the isles of Papua, sailed round New Guinea, discovered the passage that bears his name, afterwards gave the appellation of New Britain to a considerable island that forms this passage, and then returned to Timor by the way of New Guinea. Captain Cook, in consequence of his discovery, gave it the name of.

NEW SOUTH-WALES.

This country is in general low and level, and, upon the whole, rather barren than fruitful, yet the rising ground is chequered with woods and lawns, and the vallies and plains are, in many places, covered with herbage. The face of the country is by far most pleasing to the southward, the trees in that quarter being taller, and the herbage more verdant, than towards the northward; the grass in general is high but thin, and the trees, where largest, are seldom less than forty feet asunder. The whole eastern coast is well watered by small brooks and springs. Though there are no great rivers, these brooks might probably be increased in rainy weather; it being the height of the dry season when visited by Captain Cook.

Of timber-trees, there are but two sorts; the largest is the gum-tree, which grows all over the island; it produces a gum of a deep red; the wood is heavy, hard, and dark-coloured, resembling the lignum vitæ, with narrow leaves, like those of the willow. The other is a sort of pine, something like the live oak of America. Of palm-trees there are three sorts. There is also a kind of cherry-tree and trees with a red apple, as also trees with a soft bark, which is easily peeled off, and is the same with that used for caulking ships in the East-Indies. Though there are but few esculent plants in these parts, they afford a variety of such as are adapted to gratify the curiosity of the naturalist.

In this country there were not many animals seen: the only tame ones were dogs. Of the wild species of quadrupeds, was a kind of opossum, about the size of a large rat, a creature with a membranous bag near the stomach, in which it conceals and carries its young when apprehensive of danger. There is a remarkable animal, called by the natives kangaroo, which, when

full grown, is as large as a sheep, some weighing upwards of eighty pounds. It goes in an erect posture, and its motion is by successive leaps or hops of a great length. The skin is covered with a short fur of a dark mouse or grey colour, except the head and ears, which are somewhat like those of a hare, which it also resembles in taste, but is deemed better flavoured. They have likewise an animal resembling a pole-cat, which the natives call *quoll*; the back is brown spotted with white, and the belly is unmixed white. It was also affirmed by some of Captain Cook's people, that they had seen some animals of the wolf and weazel kind; but as they were not caught, they cannot be described.

There are gulls, shaggs, solan-geese, or gannets, of two sorts, boobies, noddies, curleues, ducks, and pelicans of an enormous size. The principal land birds are brown hawks or eagles, crows, large pigeons, parrots, paroquets, cockatoos or doves, quails, bustards, herons, cranes, and many others. Here are serpents, of which some are venomous, others harmless, scorpions, centipedes, and lizards.

The most remarkable insect found in this country is the ant, of which there are several sorts; one is green, and builds its nest upon trees, by bending down several leaves, each of which is as broad as a man's hand, and gluing the points of them together, so as to form a purse. Thousands of these busy insects were seen uniting all their strength to hold the leaves in due position, while other busy multitudes were employed within, in applying the gluten, which is an animal juice, to prevent their returning back. Another kind burrows in the root of a plant which grows on the bark of trees, in the manner of mistletoe, and is about the size of a large turnip. When cut, it appears intersected by innumerable winding passages, all filled with these insects; yet the vegetation of the plant does not appear to suffer any injury. Another sort are black; their habitations are the inside of the branches of trees, which they render hollow by working out the pith, almost to the extremity of the twigs, yet the tree flourishes at the same time, as if it had no such inmates. These three species of ants are all furnished with stings, which cause a kind of pungent titillation; but it soon ceases. There is still another sort possessing no power of tormenting; they resemble the white ants of the East-Indies, and the construction of their habitations is still more curious than that of the former. They have two sorts, one suspended on the branches of trees, and the other built on the ground. The materials of the first seem to be formed of small parts of vegetables knaded together with a glutinous matter, with which nature has probably supplied them. Upon breaking the outside of this dwelling, innumerable cells, swarming with inhabitants, appear in a great variety of winding directions, all communicating with each other, and with several apertures that lead to other nests upon the same tree. Their habitations upon the ground are generally at the root of a tree. They are of different sizes, formed like an irregular sided cone, and

and sometimes more than six feet high. The outside is of well tempered clay, about two inches thick; and within are the cells, which have no opening outward. These structures are proof against any wet that can fall, which those on the trees are not, from the nature and thinness of their crust or wall.

Here are abundance of fish, and of various kinds, but unknown in Europe, except the muller and some of the shell-fish. Upon the shoals and reefs are great quantities of the finest green turtle in the world, and oysters of various kinds, particularly the rock and pearl oyster. In the rivers and salt creeks are alligators.

This extensive country appears to be very thinly inhabited; as the natives along the coast seldom appear in larger companies together than thirty. The inland parts are, most probably, quite uninhabited, as no part of the coast that was visited had any appearance of cultivation; and the wretched natives drew their whole subsistence from the sea. The whole tribe, with which any intercourse was established, consisted of twenty-one persons, twelve men, seven women, a boy, and a girl.

The men are of middle stature; their complexion is nearly of a chocolate colour, their features tolerable, their eyes pretty good, and their teeth rather even and regular. Their hair, which naturally grows long and black, they crop short; their beards grow bushy and thick, but they keep them short by singeing them. In general, they are clean limbed, and remarkably vigorous, active, and nimble. Their countenances are not without expression; but their voices are remarkably soft and effeminate.

Though both sexes go stark naked, as described by Captain Cook, yet they are not without their ornaments, the principal of which is a bone, which they thrust through the cartilage that divides the nostrils from each other, and reaching quite across the face, causes the wearer to snuffle, so as scarcely to be understood, and obliges him to keep his mouth constantly open in order to breathe freely. Besides this nose-ornament, they wear necklaces made of shells, bracelets of small cords wound two or three times about the upper part of the arm, and a string of human hair plaited, about as thick as a thread of yarn, tied round the waist. Some had large gorgets of shells hanging on the breast, and a few women had feathers on their heads stuck on with gum.

The natives paint their bodies both white and red, and draw a circle of white round each eye; they have holes in their ears; but were not seen to wear any thing in them. On their bodies were several large scars in irregular lines, apparently made by some blunt instruments, probably as memorials of grief for the dead.

Neither town nor village appeared in the whole country, nor did either art or industry appear in the construction of their houses, if they can be so called. They are built with pliable rods, not thicker than a finger, in the form of an oven, by bending them and sticking the two ends to the ground. The covering is of

palm leaves and pieces of bark, and the entrance by a large hole at one end, opposite to which the fire is made. Some of them are just high enough to sit upright in, but not large enough for a man to extend himself in any direction; so that the tenants of these hovels are under the necessity of coiling themselves up with their heels to their heads, in order to make room for three or four of them to sleep together. The warmer the weather, the slihter the sheds are constructed; one side is entirely open, and none of them are more than four feet deep. They are put up occasionally as exigence may require, and left behind them when they remove to another spot. When they take up their residence only for a night in a place, they put up no shed, but repose on the bushes and grass, which grows here to a great height.

Their utensils are a vessel made of bark to hold the water they fetch from springs, and a bag about the size of a moderate cabbage-net, which the men carry upon their backs with a string which passes over their heads. It contains paint, fish-hooks, darts, and bracelets, which compose the whole property of the richest men amongst them. Their fish-hooks, of which many are extremely small, are made with great nicety, and their mode of striking turtle is curious. For this purpose they have a wooden peg, about a foot in length, and well bearded. This fits into a socket at the end of a staff of light wood, in length about seven or eight feet, and about the thickness of a man's wrist. One end of a loose line, about three or four fathoms long, is tied to the staff, and the other end fastened to the peg. In order to strike the turtle, the peg is fixed into the socket, so that when it has entered the body, and is there retained by the barbs, the staff flies off, and serves for a float to trace their victim in the water.

Fish indeed is their chief food, though they sometimes contrive to kill the kangaroo, and birds of various kinds. They either broil or bake their provisions by the help of hot stones, like the inhabitants of the South-sea islands, for there is no appearance of their eating any animal-food raw. The only vegetable that can be considered as an article of food is the yam, though they may probably eat of those very few fruits the country produces.

To produce fire, they take two pieces of soft dry wood, one a round stick about eight or nine inches long, the other piece is flat. One end of the round piece they shape into a bluntish point, and make a hole in the flat piece. In this hole they twist the end of the stick, in the manner that we do a chocolate-mill, pressing it down in the hole as much as possible. By this method they get fire in less than two minutes, and from the smallest spark increase it with astonishing speed and dexterity. They will wrap up a spark in a little dry grass, which by moving will be fanned into a blaze. Thus a man will run on for miles, and without any fire visible in his hands, will, at a hundred yards or less, stoop down and leave fire behind him. The principal means of annoying their European visitors, was by setting fire to the high grass in the neighbourhood of the place where

where the tents were fixed, which being very dry, burnt with great rapidity, and did much damage.

Spears or lances of different kinds, some with four prongs, pointed with bone and barbed, are their weapons. The points are smeared with hard resin, which gives them a polish, and makes them enter deeper into what they strike. To the northward, the lance has but one point, the shaft is made of cane very straight and light, and from eight to fourteen feet long. These weapons are thrown with great force and dexterity; if intended to wound at a short distance, as from ten to twenty yards, simply with the hand, but if at the distance of forty or fifty yards, with a throwing stick, and that with so good an aim, that the natives are as sure of their mark as the most expert sportsman with a fowling-piece. These lances cannot be drawn out of a wound without tearing away the flesh, or leaving the sharp ragged splinters of the bone or shell which forms the barb behind them.

The canoes of this country make as wretched an appearance as their dwellings. Those on the southern part of the coast are made of one piece of bark, tied together at the ends, and kept open in the middle by small bows of wood. In shallow water, they push them on by a pole; in deeper, by paddles about eighteen inches long, two of which they use at a time. To the northward, they are made of the trunk of a tree hollowed out by fire. They are about fourteen feet in length, very narrow, and fitted with an out-rigger to prevent their over-setting. None of these boats will carry more than four people.

The only tools seen among them were an adze clumsily made of stone, some small pieces of the same substance in form of a wedge, a wooden mallet, and some shells and fragments of coral.

The New-Hollanders have no idea of traffic, for though they received the things that were given them, they appeared wholly insensible to all the signs that were made them that something was expected in return. Many of the trinkets that were given them were afterwards found negligently thrown away in the woods, like toys, the charms of which ceased with their novelty.

The cause of the small number of the human species which are to be met with throughout this country cannot be ascertained; but from their total ignorance of agriculture, commerce, and the means of procuring the comforts and conveniences of life, they appear such as Europeans would rank among the most miserable of the human species.

B O T A N Y - B A Y .

Its several Productions; also the Genius and Customs of the Inhabitants.

GOVERNMENT having formed a design to remove the great inconvenience which this country suffered, from the goals being so exceedingly crowded

with criminals, who had by the laws been sentenced to transportation, determined, for this necessary purpose, to establish a settlement on the east coast of New Holland; and as Botany-Bay was the only place entered by Captain Cook's ship, which could be called a harbour, it was fixed on as the most convenient place for the intended purpose.

This place was called Botany-Bay, from the great quantity of plants collected there; and the spot where our new settlement is made, lies in latitude 34 south, and in longitude from Greenwich 151 degrees 23 minutes. Captain Cook describes it as capacious, safe, and convenient; to be known by the land on the sea coast, which is nearly level and of a moderate height, with steep rocky cliffs next the sea, which have the appearance of a long island lying close under the shore. About the middle of this land lies the harbour, which, on approaching it from the southward, is discovered before the vessel comes abreast of it, but is not discovered so soon from the northward: the entrance is little more than a quarter of a mile, and lies to the W. N. W.

There are but two kinds of timber-wood here. The trees are as large, or larger than the English oak, and one of them has some resemblance of it. It is that which yields the reddish gum like dragons blood, and the wood is heavy, hard, and dark-coloured like *lignum vite*. The other, which grows tall and straight, is something like the pine; and the wood of it, which bears some similitude to the live oak of America, is likewise hard and heavy. There are a few shrubs and several kinds of palm: mangroves abound towards the head of the bay.

The country in general, as far as it was observed, is level, low, and woody. In the woods are great numbers of birds of exquisite beauty, particularly of the parrot kind; there were found also crows exactly similar to those in England. There is great plenty of water fowl towards the head of the harbour, where are large flats of sand and mud, but their species is chiefly unknown. One of the most remarkable was black and white, much larger than a swan, and in shape somewhat resembling a pelican. The banks of sand and mud produced great quantities of oysters, muscles, cockles, and other shell fish, which seem to be the chief subsistence of the inhabitants, who go in shoal water with their little canoes, and gather them up. Besides these, they catch other fish, some of which they strike with gigs, and some they take with hook and line.

Of their precise manner of life little can be known, as no connection was formed with them, for they never afforded an European navigator an opportunity for a party, nor would they touch any one article that was left in their huts (or any places they frequented) on purpose for them to take away.

From the place where the ship anchored in April 1770, which was abreast of a small village consisting of six or eight houses, as the men were preparing to hoist out the boat, they observed an old woman and three children

dr-n come out of the wood, where they had been to fetch materials for firing. She frequently cast an eye towards the vessel, but expressed neither in look or gesture the smallest degree of fear or surprisè. Having kindled a fire, some men landed from four canoes that came in from fishing, and having hauled up their boats began to prepare their food, wholly unconcerned about the strangers, though within only half a mile of them. They had not yet seen one of them but what was stark naked, the old woman herself being destitute of the least covering.

A company set out from the ship (with Tupia, one of the natives of that clime, of the party) with a design of landing on the spot where they saw the people, hoping to meet no interruption, as they so little regarded their coming into the bay. But they found themselves disappointed, for as soon as they approached the rock, two of the natives came down, each armed with a lance about ten feet long, and a short stick which appeared to be used as a machine to assist them in throwing it. They seemed determined to defend their coast, though the party that landed were forty in number.

Tupia, above-mentioned, was a native of Otaheite, visited by Captain Cook previous to his arrival here. This man was so firmly attached to our people, from being almost constantly with them during their stay in his own country, that he often expressed a desire of going with them. To have such a person on board was certainly desirable, for many reasons. He was a man of the first rank in his country, and had great experience in navigation. By learning his language, and teaching him theirs, our people might derive much useful information; and as there was reason to apprehend there was great similarity (as appeared in the instance of New Zealand) between the languages of the natives of these southern climes, he might occasionally serve as an interpreter. In fine, as he was evidently a man of genius and science, Captain Cook gladly admitted him and his servant on board, on the ship's departure from Otaheite. But to return:

The Captain, with his wonted humanity, being desirous of preventing hostilities with such inequality of force, ordered the boat's crew to lie upon their oars, when they parlied by signs, and to procure their good will he caused nails, beads, and other trifles to be thrown to them, which they took up with apparent satisfaction. Signs were then made by the Europeans, that they wanted water, and every means used that could be devised to prevail with them to believe the innocence of their design. The natives waving to them being interpreted as an invitation, they put on the boat, but the men on shore resumed their posture of defence. One appeared to be a youth about nineteen or twenty, and the other a man of middle age. Captain Cook, now urged by necessity, fired a musket between them, upon the report of which, the younger dropped a bundle of lances, but, upon instantaneous recollection, snatched them up in great haste. Two discharges of

small-shot from the musket on the one party, and a discharge of a stone and a lance from the other ensued, in consequence of which the eldest of the natives was slightly wounded in the legs, but the Europeans received no hurt; when on the suggestion of Mr. Banks (now Sir Joseph) that the lances might be poisoned, it was deemed imprudent to venture into the woods. They then visited the huts, in one of which were some children hid behind a shield, and some bark. They were left in their retreat without knowing they had been discovered, and the visitors on their departure threw in some beads, ribbons, pieces of cloth, and other presents, in order to conciliate the inhabitants on their return. They took away with them all the lances they found lying about, to the number of fifty. They were in length from six to fifteen feet, had four prongs like a fish-gig, each pointed with a fish bone, and very sharp. They were smeared with a viscous substance, of a green colour, which favoured the opinion of their being poisoned; though it proved after to be a mistake, for it was discovered from the sea weed that adhered to them, that they had been used for the purpose of striking fish.

The canoes on the beach seemed to be the worst that had been seen. They were between twelve and fourteen feet long, and made of the bark of a tree in one piece, which had been drawn together and tied up at each end, the middle being kept open by sticks, which were placed from gunwale to gunwale as thwarts. It was now remarked that this boldness of the natives dwindled into a general trepidation; not only from the small-shot which had been discharged at the two champions who first defended the coast, but likewise the havock made by the small arms amongst the birds.

The Europeans having re-embarked in their boat, deposited their lances on board, and proceeded to the north point of the bay, but the inhabitants they had seen on their entrance, had by this time totally deserted it. Upon going on shore the following day in quest of water, a small stream was found fully answerable to their purpose. It was observed by some of the officers, upon revisiting the huts, that the beads, ribbons, &c. which had been left there the preceding night, remained in the very same place untouched, nor was there an Indian to be seen. Those also whom they saw upon a future excursion, fled at their approach, as they did upon every like occasion.

In process of time, Captain Cook, accompanied by Mr. Banks, Dr. Solander, and seven others, determined to make an excursion into the country, and having properly accoutred themselves for the expedition, set out and first visited the huts, near the watering place, where some of the natives daily resorted; and though they found the presents still remained untouched, they left other articles of more value, and then went up into the country. The soil was found to be either swamp or light sand, and the face of the country to be pleasingly

variegated by woods and lawns. The trees are tall, straight, and stand at such a distance from each other, that the whole country, or that part at least where the swamps do not interpose, might be cultivated without felling one of them. The ground between the trees is covered with grass, of which there is great abundance growing in tufts as large as can be grasped in the hand, which stand very close to each other. Many sheds of the natives, and places where they had slept on the grass, without any shelter, were seen; but only one of the people, who fled the moment he was discovered. Presents were left at all these places, with the same view as before, of producing confidence.

With respect to discoveries on this first excursion, it is noticed, that they had a transient and imperfect view of a quadruped about the size of a rabbit. An English greyhound, which was with them, got sight of it, and would probably have caught it, had he not been lamed by a stump that lay concealed in the grass. They afterwards saw the dung of an animal that fed upon grass, and which they judged could not be less than a deer; and the footsteps of another, which was clawed like a dog, and seemed about the size of a wolf. They also traced a small animal, whose foot resembled that of a pole-cat or weazle. Birds of various kinds were seen in their trees, some of them of exquisite beauty, particularly loriquets and cockatoos, which flew in numerous flocks. The trees were not of many sorts, but it appeared that steps had been cut in some of them at certain distances for the convenience of climbing.

The same party made another excursion along the sea coast to the southward, and the next day gathered many plants, besides which they saw nothing worthy of notice. But Captain Cook, with his wonted perseverance, went with two ingenious gentlemen to the head of the bay, in order to explore that part of the country, and make further attempts to form some connection with the natives. Proceeding up the country to some distance, they found the face of it nearly the same with that which has been already described; but the soil was much richer, for instead of sand, there was discovered a deep black mould, which appeared very fit for the production of grain of any kind. In the woods was found a tree which bore fruit that in colour and shape resembled a cherry, the juice was agreeably tart, though it had but little flavour. Interspersed were some very fine meadows; some places were rocky, but those were comparatively few; the stone is sandy and fit for building.

A petty officer, having straggled a long way from his companions, met with a very old man and woman and some little children sitting under a tree by the water side, and though neither party saw the other till they were close together, the Indians shewed signs of fear, but did not attempt to run away. The man and woman were both grey headed with age, the hair on the man's head was bushy, and his beard long and rough, the woman's hair was cropped, and both of them were stark

naked. Another party afterwards went over to the north shore, and made an excursion a few miles into the country, proceeding afterwards in the direction of the coast. This part was found without wood, and somewhat resembling the marshes in England. The surface of the ground was covered with a thin brush of plants about as high as the knees: the hills near the coast are low, but others rise behind them, increasing by a gradual ascent to a considerable distance, with marshes and morasses between.

To the northward is Hervey's-Bay, in which was found a real mangrove, such as grows in the West-Indies, and the first of the kind met with in these seas. In the branches of this mangrove were many nests of a remarkable kind of ant as green as grass. There were also seen upon them great numbers of small green caterpillars, their foreheads were thick set with hairs, and they were ranged upon the leaves side by side like a file of soldiers to the number of twenty or thirty together. The hair of their bodies on touching them was found to have the quality of a nettle, and gave a much more acute though less durable pain.

A species of the bustard was found further to the northward, as large as a turkey, one of which weighed seventeen pounds and an half. Those who partook of it allowed it to be the best bird they had tasted since they left England; and in honour of it they called the inlet Bustard-Bay. It lies in latitude 24 degrees 4 minutes, and 151 degrees 42 minutes east. Here are oysters in great plenty; amongst others, the hammer oyster, and abundance of small pearl oysters, from whence Captain Cook took occasion to remark, "that if in deeper water there was equal plenty of such oysters at their full growth, a pearl fishery might be established here to very great advantage.

During the stay of the English in the harbour, they caused the British colours to be displayed on shore every day, and the ship's name and the date of the year to be inscribed on one of the trees near the watering place, to perpetuate the memory of their transactions; and on the 6th of May they set sail from New Holland.

Along the coast of New South-Wales the sea in all parts conceals shoals that suddenly project from the shore, and rocks that abruptly rise like a pyramid from the bottom for an extent of 22 degrees latitude, more than 1300 miles. Off Cape Tribulation our bold and hitherto fortunate adventurers very nearly escaped the miseries of shipwreck; for on the 10th of June 1770, at eleven o'clock at night, the ship suddenly struck against a coral rock and became immovable, except by the heaving of the surge, which beat her against the crags of the rock upon which she lay, and caused so violent a concussion, that it was with the utmost difficulty the ablest man on board could stand upon his legs. At length, after a series of hardships, fatigue, and danger, they were happily delivered, and the river which afforded them relief in this emergency was named *Endeavour River*.

Captain

Captain Cook, being resolved to determine whether this country did or did not join to New Guinea, in effecting his design braved such dangers as would have appalled the resolution of any man whose spirit for discovery had not absorbed all regard to personal safety. After much investigation he found the two countries to be divided by a narrow sea, which he therefore called *Endeavour Straights*.

The most northern promontory of the country is York Cape, in 142 degrees east longitude; 10 degrees 37 minutes south latitude. On a small island our countryman took possession of the whole eastern coast in right of his Majesty King George the Third, by the name of New South-Wales, on which account the island received the name of Possession-Island. Here the few inhabitants that were seen, both men and women, were also stark naked. Endeavour Straights are ten leagues long from north-east to south-west, and about five leagues broad. The north-east entrance of this passage is formed by New Holland, and the south-east by an assemblage of islands, which have been called the Prince of Wales's Islands, and probably extend near to New Guinea. Monsieur de Bougainville, the celebrated French navigator, who came just at the entrance of these Straights to the most south-east parts of New Guinea, called that sea, "The Gulph of the Louisiade," the Straights since navigated by Captain Cook being not known to exist.

Before we leave Botany-Bay, we presume the following short account of the proceedings in trying offenders in the criminal courts there (as related by Captain Hunter, in his Historical Journal) will be acceptable to our readers: "The judge-advocate issues his precept for the three senior naval officers, and their military officers, to assemble at the time appointed, dressed in their uniforms and their side-arms. When they are met, the judge-advocate administers an oath to the members, similar to that which is used at military courts-martial; afterwards, one of the members administers the same oath to the judge-advocate who presides at the court, and the rest take their seats according to their rank. The prisoner is then asked, whether he is guilty or not, and, as the general answer is, Not Guilty, the accusations against him are read, and witnesses are examined on oath to support or prove the charge; after which the prisoner enters on his defence, and brings evidence to prove his innocence: the court is then cleared, and the members consider what sentence to pronounce; if it be death, five out of the seven must concur in opinion. The governor can respite a criminal condemned to die, and the legislature has fully empowered him to execute the sentence of the law, or to temper it with mercy. Actions for debt, to a certain amount, are cognizable by this court, as are all other actions of common law, when they are decided according to the law of England, as nearly as the situation will allow.

PORT - JACKSON.

Description of the Country, and its Produce. Some Account of the Natives; their Disposition, Weapons, Ornaments, &c.

AS nothing was found in Botany-Bay to recommend it as a place on which to form an infant settlement; the governor, accompanied by Captain Hunter, and two other officers, soon discovered a large opening, or bay, about three leagues and a half to the northward of Cape Banks; and such was their account of the harbour, and the advantages attending the place, upon their return, that a resolution was formed of evacuating Botany-Bay, and fixing their residence here.

At day-break a general alarm was given, by the appearance of two ships, of considerable size, standing in for the mouth of the bay, it being the prevailing opinion that they were Dutchmen, sent to assert a claim to the country. The two strangers proved to be the *Buffalo* and *Astrolabe*, which sailed from Brest in June 1785, upon discoveries, and were commanded by Monsieur de la Peyrouse; M. de L'Angle, who commanded one of the ships when they left France, had been lately, when the ships were at the Islands of Navigators, murdered, with several other officers and seamen, by the natives, who had, before that unfortunate day, always appeared to be upon the most friendly and familiar terms with them. This accident, it seems, happened when their launches were on shore filling water, on the last day they intended remaining on those islands. While they were employed in filling their water-casks, having the most perfect confidence in the friendly disposition of the natives, the sailors had been attentive to the keeping the boats afloat. Some misunderstanding having also happened between some of the seamen and the natives, an insult had been offered by one or other, which was resented by the opposite party: a quarrel ensued, and the impossibility of moving the boats exposed the officers and crew to the rage of the multitude, who attacked them with clubs and showers of stones; and would inevitably have massacred the whole, if there had not been a small boat at hand, which picked up those who, depending on their swimming, had quitted the shore. Many of the natives were killed upon this occasion; and the loss of the ships was said to be fourteen persons killed, including Captain de L'Angle, and some other officers; several were much wounded, and the boats were entirely destroyed.

The passage from Botany-Bay to Port-Jackson was both speedy and pleasant. Having passed between the Capes which form its entrance, the fleet arrived at Port-Jackson, one of the finest and most extensive harbours in the universe, and at the same time the most secure, being safe from all the winds that blow. It is divided into a great number of coves, to which the governor has given different names. That on which the town is to be built is called Sydney-Cove. It is one of the

smallest

smallest in the harbour, but the most convenient, as ships of the greatest burden can with ease go into it, and heave out close to the shore. Tricomaléc, acknowledged to be one of the best harbours in the world, is by no means to be compared to it. In a word, Port-Jackson would afford sufficient and safe anchorage for all the navies of Europe. During a run up the harbour of about four miles, in a westerly direction, a luxuriant prospect presented itself on the shores, covered with trees to the water's edge, among which many of the Indians were frequently seen, till the fleet arrived at a small snug cove to the southward, on the banks of which the plan of operations were destined to commence. On their arrival, the natives appeared tolerably numerous, from whence they had reason to conclude the country more populous than Captain Cook thought it, as they were assembled on the beach, to the south shore, to the number of not less than forty persons, shouting, and making many uncouth signs and gestures. As the boat, in which were the governor, some officers, and attendants, rowed up the harbour close to the land, for some distance, the Indians kept pace with her on the beach. When signs were made of a want of water, the natives directly comprehended the meaning, and pointed to a spot where it could be procured; on which the boat was immediately pushed in, and a landing took place. The Indians, though timorous, shewed no signs of resentment at our people's going on shore; and when an interview commenced, seemed highly entertained with their new acquaintance, from whom they accepted of a looking-glass, some beads, and other toys.

In the late expedition, the adventurers had several more interviews with the natives, which ended in so friendly a manner, that hopes were entertained of bringing about a connection with them. The first object of our people was to win their affection, and the next to convince them of our superiority. To this purpose an officer one day prevailed on one of them to place a target, made of bark, against a tree, which he fired at with a pistol, at the distance of some paces. The Indians, though terrified at the report, did not run away; but their astonishment exceeded their alarm, on looking at the shield which the ball had perforated. As this produced a little shyness, the officer, to dissipate their fears, and remove their jealousy, whistled the air of *Marlbrouk*, with which they appeared highly charmed, and imitated him with equal pleasure and readiness.

Upon this occasion an officer remarked, that he was afterwards told by Monsieur de Peyroust, the French commandant before mentioned, that the natives of California, and throughout all the islands of the Pacific Ocean, and, in short, wherever he had been, seemed equally touched and delighted with this little plaintive air.

Some of the officers one day met a native, an old man, in the woods. He had a beard of considerable length, which his new acquaintance gave him to understand, by signals, they would rid him of, if he pleased;

stroking their chins, and shewing him the smoothness of them at the same time. At length the old Indian consented; and one of the officers, taking a penknife from his pocket, and making use of the best substitute for lather he could find, performed the operation with great success, and, as it proved, much to the liking of the old man, who, in a few days after, reposed a confidence in our people, of which they had hitherto known no example, by paddling along-side one of the ships in his canoe, and pointing to his beard. Various arts were ineffectually tried to induce him to enter the ship; but as he continued to decline the invitation, a barber was sent down into the boat along-side the canoe, from whence leaning over the gunwale, he complied with the wish of the old man, to his infinite satisfaction. In addition to the consequences expected from this dawning of cordiality, it afforded proof, that the beard is considered by these people more as an incumbrance than a mark of dignity.

After transacting the necessary previous business, the commissions were upon an appointed day read, and possession was taken of the settlement in form. The marine battalion being drawn up, and the convicts assembled on the occasion, his Majesty's commission was read, appointing his Excellency Arthur Phillip, Esq. Governor and Captain-General in and over the territory of New South-Wales, and its dependencies; together with the acts of parliament for establishing trials by law within the same; and the patents, under the great seal of Great-Britain, for holding civil and criminal courts of judicature, by which all cases of life and death, as well as matters of property were to be decided.

The extent of this authority is defined, in the governor's commission, to reach from the latitude of 43 deg. 49 min. south, to the latitude of 10 deg. 37 min. south, being the northern and southern extremities of New Holland. It commences again at the 135th degree of longitude east, and proceeding in an easterly direction, comprehends all islands within the limits of the above specified latitudes in the Pacific Ocean. As the discoveries of English navigators alone are comprised in this territory, it is presumed, this partition will obviate all cause of future litigation between us and the Dutch. It appears from the commission, considered in the whole, that government have been no less attentive in arming Mr. Phillip with plenitude of power, than extent of dominion.

In order to enforce the rigour of the law, it was found necessary to restrain the violation of public security. A set of desperate and hardened miscreants leagued themselves for the purposes of depredation; and, as is generally the case, had insinuation enough to entice others, less versed in iniquity, to become instrumental in carrying it on.

About the middle of March, the French departed from this place, on the prosecution of their voyage; and that during their stay in that part, the officers of the two nations had frequent opportunities of testifying their mutual

mutual regard, by visits, and every token of friendship and zeal. The gentleman to whom we are indebted for this account, mentions Monsieur de Peyrouse with the highest respect, as an officer of eminent qualifications, and a man of exemplary humanity, of which he gave proof, in a striking, as well as laudable, instance of conduct, when ordered to destroy our settlement at Honduras in the last war. He always mentioned the name and talents of Captain Cook in the most feeling manner, and declared, with the utmost frankness and candour, that "our illustrious circumnavigator had left nothing to those who might follow in his track to describe or fill up." Being asked what reception he had met with when he touched at the Sandwich-Islands, his answer is highly worthy of notice: "During the whole of our voyage in the South-Seas, said he, the people of the Sandwich-Islands were the only Indians who never gave us cause of complaint. They furnished us liberally with provisions, and administered cheerfully to all our wants." It is remarked, upon this occasion, with equal candour, that Owhyhee was not one of the islands visited by that navigator.

Captain Hunter observes, "That with a small company he was one day on shore in another part of the harbour, making friendship with a party of the natives, when in a short time their numbers increased to eighty or ninety men, all armed with a lance and throwing-stick, and many with the addition of a shield made of the bark of a tree: some were in shape an oblong square, and others of these shields were oval; these were the first shields we had seen in the country; it has been since found that they are in general made of wood. The natives were much surprised at one of our gentlemen, who, pulling a pistol out of his pocket, that was loaded with ball, and standing at some distance, fired the ball through the thickest part of the shield; which they examined with astonishment, and seemed to wonder that an instrument so small should be capable of wounding so deep.

"The natives were noisy, but did not appear disposed to quarrel; we gave them such little presents as we had with us, with which they seemed well pleased; although we had much reason afterwards to believe that such trifles only pleased them as baubles do children, for a moment; for at other times we had frequently found our presents lying dispersed on the beach, though caught at by these people with apparent avidity at the time they were offered.

"While we were employed with this party, we observed at a distance a number of women, who were peeping from their concealments, but durst not gratify their natural curiosity, by appearing openly and conversing with us; as the men appeared here to be very absolute. I signified to the men, that we had observed the women, and that I wished to make them some presents, if they might be permitted to come forward and receive them. The men seemed unwilling to suffer them to advance; for we had frequently observed, that they took

particular care upon every occasion to keep the women at a distance, and I believe wholly from an idea of danger. They desired to have the presents for the women, and they would carry and deliver them; but to this proposal I positively refused to agree, and made them understand, that unless they were allowed to come forward, they should not have any.

"Finding I was determined, an old man, who seemed to have the principal authority, directed the women to advance, which they did immediately, with much good humour; and, during the whole time that we were decorating them with beads, rags of white linen, and some other trifles, they laughed immoderately, although trembling at the same time through an idea of danger. Most of those we saw at this time were young women, who I judged were from eighteen to twenty-five years of age: they were all perfectly naked, as when first born; are in general well made, not quite so thin as the men, but rather smaller limbed."

The account further observes, that the men, being armed, scarified, and painted, drew themselves up in a line on the beach, and each man had a green bough in his hand, as a sign of friendship; their disposition was as regular as any well disciplined troops could have been; and this party, it was apprehended, they designed entirely for the defence of the women, if any insult had been offered them. At this interview, two very stout men were also placed upon a rock, near to where the boats lay, as sentinels, for they never moved from the spot till the boats left the beach; so that it is probable they were ordered there to watch the motions of their visitors.

As the governor was exploring Broken-Bay, which is contiguous to Port-Jackson, he saw a great number of the natives. One of the females had formed an attachment to his great coat; and to obtain it she used a variety of means. First, she danced and played a number of antic tricks; but finding this mode ineffectual, she had recourse to tears, which she shed plentifully. This expedient not answering, she ceased from weeping, and appeared as cheerful as any of the party around her. We have introduced this incident, to shew that they are not a people devoid of art and finesse, in order to obtain their ends; for though their women appeared with such few decorations, yet it was evident they had no aversion to finery.

The surgeon observed, at a repast, wherein he grouped with the natives, one of the women who sat next to him, observing that he had a white handkerchief in his hand, exhibited a number of lascivious airs, in order to obtain it. He therefore tore it into ribbons, being desirous of multiplying one present into many, with which he decorated her head and neck. On her admiring the buttons of his coat, as he had nothing else left, he cut them away, and tied them round her waist. Thus ornamented, and charmed with her acquirements, she turned away with a look of inexpressible archness and joy, which seemed to shew that, like the women in the South-Seas in general, they are fond of new ornaments.

He also observed, that there is no hospitality nor harmony among them; as appeared from their eating so greedily without regarding the accommodation of any about them; devouring the fish voraciously, which had been thrown on the fire and scarcely warm.

These people are very ravenous in their appetites, as appears from the following instance. One of the officers shot a bird, which fell at an old man's feet. The explosion at first greatly alarmed him; but perceiving no ill was intended, he soon got over his fears. The bird was then given to him, which, having barely plucked, and not more than half broiled, he devoured, entrails, bones and all.

A convict, who had been gathering what they call sweet tea, about a mile from the camp, met a party of the natives, consisting of fourteen, by whom he was beaten and wounded with the stick used in throwing their spears. They then made him strip, and would have taken from him his clothes, and probably his life, had it not been for the report of some muskets, which they no sooner heard than they ran away.

The following circumstances will convince us of the destructive nature of their weapons, and their skill and adroitness in the use of them. A convict, being in a state of convalescence, had obtained permission from the governor to go a little way up the country, to gather herbs, for the purpose of making tea. This man, after night set in, was brought to the hospital, with one of the spears used by the natives sticking in his loins. It had been darted at him as he was stooping, and while his back was turned to the assailant. The weapon was barbed, and stuck so very fast, that it would admit of no motion. The surgeon, after dilating the wound to a considerable length and depth, with some difficulty extracted the spear, which had penetrated the flesh nearly three inches. After the operation, the convict gave information, that he had received his wound from three of the natives, who came behind him at a time when he expected no person to be near him, except another convict, whom he had met a little before, employed on the same business as himself. He added, that after they wounded him, they beat him in a cruel manner; and stripping the clothes from his back, carried them off, making signs to him (as he interpreted them) to return to the camp. He further related, that after they had left him, he saw his fellow convict in the possession of another party of the natives, who were dragging him along, with his head bleeding, and seemingly in great distress; while he himself was so exhausted with the loss of blood, that instead of being able to assist his companion, he was happy to escape with his life.

They afterwards continued to avail themselves of every opportunity of exercising their cruelty on our people. An officer of the marines, who had been up the harbour to procure some rushes for thatch, brought to the hospital the bodies of two men employed as ruff-cutters, whom he found murdered by the natives in a shocking manner. One of them was transixed through

the breast with one of their spears, which was extracted with great difficulty and force. He had two other spears sticking in him to a depth which must have proved mortal. His skull was divided and comminuted so much, that his brains easily found a passage through. His eyes were out. The other was a youth, and had only some trifling marks of violence about him. This lad could not have been many hours dead; for when the officer found him among some mangrove trees, and at a considerable distance from where the other man lay, he was not stiff, nor very cold; nor was he perfectly so when brought to the hospital. The natives, whenever an opportunity offers, never fail to steal or destroy any of the live stock they can possibly get possession of. Nor are they less cowardly than cruel; for they always behave with an apparent civility when they fall in with men that are armed; but when they meet persons unarmed, they seldom fail to take every advantage of them; in consequence of which, many of the convicts have fallen sacrifices to these savages: but the soldiers they never assail, being always terrified at the sight of a red coat.

These people are very happy at grimace and mimicry; as an instance of which, it is remarked by the surgeon of the settlement, that, going upon an excursion, they observed a party of the natives sitting, and sat down near the bank, to watch their motions. To pass away time, one of the gentlemen sung several songs; and when he had done, the females in the canoes either sung one of their own songs, or imitated him, in which they succeeded beyond conception. Any thing spoken by our people they most accurately recited, and this in a manner in which the Europeans fell greatly short in their attempts to repeat the language after them, which shews the strength of their organical powers. Nor are they without ingenuity, as appeared from various figures observed by a party of our people on their excursion to the westward. These figures were cut on the smooth surface of some large stones, and consisted chiefly of representations of themselves in different attitudes, of their canoes, of several sorts of fish, and animals: and considering the rudeness of the instruments with which the figures must have been executed, they seemed to exhibit tolerable likenesses.

The natives are generally of the common stature; but their limbs are remarkably small. Their skin is of the colour of wood foot, or what would be called a dark chocolate colour. Their hair is black, but not woolly; it is short, but not cropt; in some lank, in others curled. Some parts of their bodies are painted red; and the upper lip and breasts of some of them are painted with streaks of white. Their features are far from disagreeable; and their teeth even and white. Their voices are soft and tuneable. It is remarked, that the deficiency of one of the fore teeth of the upper jaw, mentioned by Dampier, was seen in almost the whole of the men; but their organs of sight, so far from being defective, as that author mentions those of the inhabitants of the western side of the continent to be, are remarkably

remarkably quick and piercing. They have bracelets upon the upper part of their arms, made of plaited hair. They are fond of ornament, though absolutely without apparel: and one of them, to whom was given an old shirt, instead of throwing it over any part of the body, tied it as a fillet round his head.

Both men and women go stark naked, and seem to have no more sense of indecency in discovering their whole body, than the inhabitants of England have in discovering their hands and face. Their principal ornament is the bone which they thrust through the cartilage that divides the nostrils from each other. What perversion of taste could induce them to think this a decoration, or what could prompt them, before they had worn it, or seen it worn, to suffer the pain and inconvenience that must of necessity attend it, is perhaps beyond the power of human sagacity to determine. As this bone is as thick as a man's finger, and between five and six inches long, it reaches quite across the face, and so effectually stops up both the nostrils, that they are forced to keep their mouths wide open for breath, and stifle so when they attempt to speak, that they are scarcely intelligible even to each other. The seamen, with some humour, called it the spritsail-yard; and, indeed, it had so ludicrous an appearance, that, till our people were used to it, they found it difficult to refrain from laughter. Besides the nose-jewel, they have necklaces made of shells, very neatly cut and strung together; bracelets of small cord, wound two or three times about the upper part of their arm; and a string of plaited human hair, about as thick as a thread of yarn, tied round the waist. Some of them have also gorgets of shells hanging round the neck, so as to reach across the breast.

Though these people wear no clothes, their bodies have a covering besides the dirt; for they paint them both white and red. The red is commonly laid on in broad patches upon the shoulders and breast; and the white stripes, some narrow and some broad: the narrow are drawn over the limbs, and the broad over the body, not without some degree of taste. The white is also laid on in small patches upon the face, and drawn in a circle round each eye. The red seemed to be ochre, but what the white was could not be discovered: it was close grained, saponaceous to the touch, and heavy. Besides the paint with which they besmear their bodies, they also use grease, or some stinking oily substance, for the same purpose. Some of them ornament their hair with the teeth of fish, fastened on by gum and the skin of the kangaroo.

No marks of disease or sores were found upon their bodies, but large scars, in irregular lines, which appeared to be the remains of wounds they had inflicted upon themselves with some blunt instrument, and which our people understood, by signs, to have been memorials of grief for their dead relations or friends.

They seemed to set so great a value upon such ornaments as they had, that they would never part with the

least article for any thing that could be offered; which was the more extraordinary, as the European beads and ribbons were ornaments of the same kind, but of better form, and more showy materials.

Though, as before observed, both sexes, and those of all ages, are invariably found naked, it must not be inferred from this, that custom so inures them to the change of the elements, as to make them bear, with indifference, the extremes of heat and cold; for they give visible and repeated proofs, that the latter affects them severely, when they are seen shivering and huddling themselves up in heaps in their huts, or the caverns of the rocks, until a fire can be kindled.

These people have no fixed habitations, for nothing can be seen like a town or village in the whole country. Their houses, if so they may be called, are constructed without art or industry. They are built with pliable rods, not thicker than a finger, in the form of an oven, by bending them, and sticking the two ends to the ground. The covering is of plain leaves, and pieces of bark; and the entrance by a large hole at one end, opposite to which the fire is made. Some of them are just high enough to sit upright in, but not large enough for a man to extend himself in any direction; so that the tenants of these hovels are under the necessity of coiling themselves with their heels to their heads, in order to make room for three or four of them to sleep together. The warmer the weather, the slihter the sheds are constructed. One side is entirely open, and none of them are more than four feet deep. They are put up occasionally, as exigence may require, by those people, who may be considered as a wandering herd, in quest of any place that would furnish them with a temporary subsistence, and therefore leave them behind them when they remove to another spot. When they take up their residence only for a night in a place, they put up no shed, but repose on the grass, which grows to a great height in this country.

A kind of oblong vessel was the only furniture belonging to these houses, that fell under observation; it was made of bark, by the simple contrivance of tying up the two ends with a withy, which, not being cut off, serves for a handle. Their chief utensil is a small bag, about the size of a moderate cabbage-net, which is made by laying threads loop within loop, somewhat in the manner used by ladies to make purses. This bag the man carries loose upon his back with a small string, which passes over his head. It generally contains a lump or two of paint or resin, some fish-hooks and lines, a few points of darts, and their usual ornaments, which include all the worldly treasure of the richest man among them.

They are utterly strangers to that useful branch of knowledge, the cultivation of the ground, and wholly depend for food on the few fruits they gather; the roots they dig up in the swamps; and the fish they pick up along shore, or contrive to strike from their canoes with spears. Fishing, indeed, seems to engross nearly the whole

whole of their time, probably from its forming the chief part of their subsistence, which, observation has proved, cannot be procured without the most painful labour, and unwearied assiduity. They sometimes indeed contrive to kill the kangaroo, and some birds; but these are so shy, that our people find it difficult to get within reach of them with a fowling-piece. The only vegetable that can be considered as an article of food is the yam.

Many of their fish-hooks are extremely small, but made with great nicety; and their mode of striking turtle is curious. For this purpose they have a peg of wood, about a foot in length, and well bearded. This fits into a socket, at the end of a staff of light wood, in length about seven or eight feet, and about the thickness of a man's wrist. One end of a loose line, about three or four fathoms long, is tied to the staff, and the other end fastened to the peg. In order to strike the turtle, the peg is fixed into the socket, so that, when it has entered the body, and is there retained by the barb, the staff flies off, and serves for a float to trace their object in the water.

In general they do not eat animal-food raw; but having no vessel in which water can be boiled, they either broil it upon the coals, or bake it in a hole by the help of hot stones.

No signs of any religion has been observed among them, yet they are not entirely ignorant of a future state, as they say the bones of the dead are in the grave, and the body (probably they mean the soul) is in the clouds: Wolarre-warré once asked the judge-advocate, if the white men went to the clouds also?

They put their dead for some time in a fire; after which they are laid at length in a grave, dug very clean out, the bottom being first very carefully covered with long grass, or fern; the body is then put in, and covered over with long grass, and the grave is then filled with earth, the mould rising above it as in England.

Wolarre-warré affirms, that there are apparitions in the country, which he calls *mané*. He describes them as coming up with a strange noise, and catching hold of any one by the throat. He made use of many words on this occasion, and pointed up to the sky. He also related, that these apparitions singe the beards and the hair: this he describes as a very painful operation, rubbing his face after every operation of the brand.

The sun, moon, and stars, they call *woré*, bad. A native girl among our people, once went into very violent convulsions on seeing a falling star, and said, that every body would be destroyed, though some who were about her observed, that she particularly alluded to the *Murray nevée*, the Sirius.

To give some idea of their language: the emu (*mar-vang*), the patagorang, and the menagine, a small animal, are all named *go-along*, which term is supposed to mean an animal, as Wolarre-warré uses it in contradistinction to a bird or a fish. On being asked if the emu was a bird (*binyan*) he shook his head, and said, *go-along*.

He calls Governor Phillip, *beanga*, father, and names himself *dooroo*, son. The judge and commissary he calls *babunna*, brother. Wolarre-warré sings a great deal, and with much variety. The following are some words which were caught: "E eye at wange-wandeliah chiango wandeago mangenny wakey angoul barre boalah barrema." In counting the numerals, he cannot reckon beyond four; which he does in this manner: One, wogul or ya-ole; two, bulla and yablowxe; three, booroo, or brewé; four, cal-una-long. On laying down a fifth object, he named it with the rest, marry-diola. He calls the four principal winds by the following names: The north, boo-roo-way; the south, bain-mar-ree; the west, bow-wan; the east, gonie-mah. He throws the spear ninety yards with great force and exactness.

The following is the description of a family in New South-Wales: The natives sing an hymn, or song of joy, from day-break until sun-rise. They procure fire with infinite labour, by fixing the pointed end of a round piece of stick into a hole, made in a flat piece of wood, and twirling it round swiftly betwixt both hands, sliding them at the same time upwards and downwards, until the operator is fatigued, when he is relieved by some of his companions, who are all seated in a circle for that purpose, and each takes his turn in the operation, until fire is procured. This being a tedious process, it is no wonder that they are never seen without a piece of lighted wood in their hand.

When equipped for any exploit, the natives are armed with a shield, made of the bark of a tree, with which they very dexterously ward off any thing thrown at them. They have also a bludgeon, or club, about twenty inches long, with a large and pointed end; and sometimes a stone hatchet. These make up the catalogue of their military implements. But the principal means of annoying their European visitors was by setting fire to the high grass, which, being very dry, burnt with great rapidity, and did much damage.

The kangaroo is one of the most valuable animals produced in this island, it grows to a very considerable size; some of them weigh not less than 150 pounds. A male of 130 pounds weight has been killed, whose dimensions were as follow: Extreme length, seven feet three inches; length of the tail, three feet four inches and a half; length of the hinder legs, three feet two inches; length of the fore paws, one foot seven inches and a half; circumference of the tail at the root, one foot five inches. Notwithstanding this, the kangaroo, on being brought forth, is not larger than a rat. In running, this animal confines himself entirely to his hinder legs, which are possessed with an extraordinary muscular power. Their speed is very great, though not in general quite equal to that of a greyhound: but when the greyhounds are so fortunate as to seize them, they are incapable of retaining their hold, from the amazing struggles of the animal. The bound of the kangaroo, when not hard pressed, has been measured, and found to

exceed

exceed twenty feet. At what time of the year they copulate, and in what manner, is not known. The testicles of the male are placed contrary to the usual order of nature.

When young, the kangaroo eats tender and well flavoured, tasting like veal; but the old ones are more tough and stringy than bull-beef. They are not carnivorous, but subsist altogether on particular flowers and grass. Their bleat is mournful, and very different from that of any other animal: it is, however, seldom heard but in the young ones. The female opossum has a pouch, or pocket, in which she carries her young. Some have been shot with a young one, not larger than a walnut, sticking to a teat in this pocket. Others with young ones no bigger than a rat; one of which was most perfectly formed, with every mark and distinguishing characteristic of the kangaroo. Of its natural history at present little is known: from which the author of the latest narratives of the transactions, discoveries, and remarks on this part of the globe, very pertinently infers, that, as so very little knowledge is as yet obtained of its habits, haunts, and customs, to attempt particular and accurate descriptions of it, might beget error, which time, or a fuller knowledge of its properties, would directly contradict. It is further added, that, with respect to mere conjectures (and such too often are imposed on the public for incontestable facts) it cannot be improper to suppress them.

The native dog of this country is much fiercer than the kangaroo. The chase, if in an open field (which is the place most frequented by that animal) is seldom more than eight or ten minutes; and if there are more dogs than one, seldom so long. As soon as the hound seizes him, he turns, and catching hold with the nails of his fore-paws, springs upon and strikes at the dog with the claws of his hind-feet, which are wonderfully strong, and tears him to such a degree, that it has frequently happened, that we have been under the necessity of carrying the dog home, from the severity of his wounds. Few of these animals have ever effected their escape after being seized by the dog, for they have generally caught them by the throat, and there held them until they were assisted, although many of them have very near lost their lives in the struggle. Some of the male kangaroos are of a very large size, and, when sitting on their haunches, were five feet eight inches high. Such an animal is too strong for a single dog, and, though he might be much wounded, would, except the dog had assistance at hand, certainly kill him. These dogs may be more fierce, but they do not appear to be so strong as our large greyhound. There was one seen in pursuit of a kangaroo by a person who was employed in shooting, who, mistaking the two animals, as they passed him to be of the kind he was looking for, he fired at the hindmost and brought him down; but when he came up, it proved to be a native dog. Of those dogs we have had many which were taken when young, but never could cure them of their natural ferocity.

Although well fed, they would at all times, but particularly in the dark, fly at young pigs, chickens, or any small animal which they might be able to conquer, and immediately kill, and generally eat them. The writer of this account tells us, he had one which was a little puppy when caught, but notwithstanding he took much pains to correct and cure it of its savageness, perceived it took every opportunity it met with, to snap off the head of a fowl, or worry a pig, and would do it in defiance of correction. They are a very good-natured animal when domesticated, but it is thought impossible to cure that savageness which all of them seem to possess.

The animals here partake, in a great measure, of the nature of the kangaroo. There is the kangaroo opossum, the kangaroo rat, &c. the formation of the four legs and feet of which bear no proportion to the length of the hind legs. There is a quadruped, which the natives call *quoll*. It resembles a pole-cat. The back is brown, spotted with white; and the belly white, unmixed. To beasts of prey our people were utter strangers; nor have they yet any cause to believe that they exist in the country. And happy it is for them that they do not, as their presence would deprive them of the only fresh meals the settlement affords, the flesh of the kangaroo. The only domestic animal they have is the dog, which, in their language, is called *dingo*, and much resembles the fox dog of England. These animals are equally shy of strangers, and attached to the natives.

There are many different kinds of bats, particularly one, which is larger than a partridge. Our people were not fortunate enough to take one, either alive or dead.

As most of the large trees are hollow, by being rotten in the heart, the opossum, kangaroo rat, squirrel, and various other animals which inhabit the woods, when they are pursued, commonly run into the hollow of a tree: in order therefore to make sure of them (which the natives seldom fail in) when they find them in the tree, one man climbs even the tallest tree with much ease, by means of notches at convenient distances, that are made with a stone hatchet: when he is arrived at the top, or where there may be an outlet for the animal, he fits there with a club or stick in his hand, while another person below applies a fire to the lower opening, and fills the hollow of the tree with smoke: this obliges the animal to attempt to make its escape, either upwards or downwards; but which ever way it goes, it is almost certain of death, for they very seldom escape. They also, when in considerable numbers, set the country on fire for several miles extent, which, it is generally understood, is for the purpose of disturbing such animals as may be within reach of the conflagration, whereby they have an opportunity of killing many.

Birds of various kinds are very numerous here, amongst which are many of exquisite beauty, particularly loriquets and cockatoos. The water fowl are, gulls, shags; solan geese, or gannets, of two sorts; boobies, noddies, curlicus, ducks, pelicans of an

F

enormous

enormous size, and many others. One of the most remarkable was black and white, much larger than a swan, and in shape somewhat resembling a pelican. The land birds are, crows, parrots, pigeons, doves, quails, bustards, herons, cranes, hawks, and eagles. But the bird which principally claims attention is the cassowary, a species of ostrich, approaching nearer to the emu of South-America than any other known. One of them was shot, at a considerable distance, with a single ball, by a convict employed for that purpose by the governor. Its weight, when complete, was seventy pounds; and its length, from the end of the toe to the tip of the beak, seven feet two inches; though there was reason to believe it had not attained its full growth.

On dissection, many anatomical singularities were observed: the gall-bladder was remarkably large, the liver not bigger than that of a barn-door fowl; and, after the strictest search, no gizzard could be found. The legs, which were of a vast length, were covered with thick, strong scales, plainly indicating the animal to be formed for living amidst deserts; and the foot differed from an ostrich's by forming a triangle, instead of being cloven. Goldsmith, whose account of the emu is the only one we can refer to, says, "that it is covered, from the back and rump, with long feathers, which fall backward, and cover the anus; these feathers are grey on the back, and white on the belly." The wings are so small as hardly to deserve the name, and are unfurnished with those beautiful ornaments which adorn the wings of the ostrich. All the feathers are extremely coarse; but the construction of them deserves notice: they grow in pairs from a single shaft, a singularity which the author we have quoted has omitted to remark. It may be presumed, that these birds are not very scarce, as several have been seen, some of them immensely large; but they are so wild as to make shooting them a matter of great difficulty. Though incapable of flying, they run with such swiftness, that our fleetest greyhounds are left far behind in every attempt to catch them. The flesh was eaten, and tasted like beef.

Here are in general excellent fish; but several of them partake of the properties of the shark, like the animals in some degree resembling the kangaroo. The land, the grass, the trees, the animals, the birds and the fish, in their different species, approach by strong shades of similitude to each other. A certain likeness runs through the whole. They are in general palatable, and some of them are very delicious. Upon the shoals and reefs are incredible numbers of the finest green turtle in the world, and oysters of various kinds, particularly the rock-oyster, and the pearl-oyster. The cockles are of such an enormous size, that one of them is more than one person can eat. There are also large muscels, and stingrays, which weigh no less than 336 pounds after the entrails are taken out. In the rivers and salt creeks are alligators. A shark of an enormous

size was found here, which measured, at the shoulders, six feet and a half in circumference. His liver yielded twenty-four gallons of oil; and in his stomach was found the head of a fish of the like species. The Indians, probably from having felt the effects of their voracious fury, testify the utmost horror on seeing these terrible fish.

Among the insects here, is a very peculiar kind of ant, as green as a leaf. They live upon trees, where they build their nests. These nests are of a very curious structure: they are formed by bending down several of the leaves, each of which is as broad as a man's hand: they glue the points of them together, so as to form a purse. The viscus used for this purpose is an animal juice, which nature has enabled them to evacuate. Their method of first bending down the leaves, our naturalists had not an opportunity to observe; but they saw thousands uniting all their strength to hold them in this position, while other busy multitudes were employed within, in applying the gluten that was to prevent their returning back. To satisfy themselves that the leaves were bent and held down by the efforts of these diminutive artificers, our people disturbed them in their work; and, as soon as they were driven from their station, the leaves, on which they were employed, sprang up with a force much greater than they could have thought them able to conquer by any combination of their strength. But though our people gratified their curiosity at the expense of these insects, the injury did not go unrevengeed, for thousands immediately threw themselves upon them, and gave them intolerable pain with their stings, especially those which took possession of the neck and hair, from whence they were not easily driven.

There are upon the leaves of the mangrove, great numbers of small green caterpillars; their foreheads are thick set with hairs, and they range upon the leaves, side by side, like a file of soldiers, to the number of twenty or thirty together; the hair of their bodies, on touching them, have the quality of a nettle, and give a more acute, though less durable pain.

With respect to the climate, it is undoubtedly very desirable to live in. In summer the heats are usually moderated by the sea breeze, which sets in early; and in winter the degree of cold is so slight, as to occasion but little inconvenience. It is remarked, as a circumstance peculiar to this country, that every part of it, even the most inaccessible and rocky, appears as if, at certain times of the year, it was all on fire. Indeed, in many parts, large trees are seen, the trunks and branches of which are evidently rent and demolished by lightning. The ground was so very dry and parched, that poles or pegs could not be driven into it without considerable difficulty and labour.

As the governor was invariably intent on exploring the country, he for that end formed a party, with unwearied industry, and great toil, traversing an extensive tract

tract of ground, which appeared, from such observations as could be made, capable of producing every thing which a happy soil and genial climate can bring forth. The face of the country was such as to promise success, whenever it should be cultivated; for the soil was found to be much richer than it was described by Captain Cook; as, instead of sand, they found a deep black mould, which seemed very fit for the production of grain of any kind. But such were the labour and difficulty attending the clearing of the ground, that, incredible as it may appear, it is a known fact, that ten or twelve men have been employed for five whole days in grubbing up a tree; and when this has been effected, the timber has only been fit for firewood; so that, in consequence of the great labour in clearing the ground, and the weak state of the people, to which may be added the scarcity of tools, most of those brought from England being lost in the woods among the grass, through the carelessness of the convicts, the prospect of future success is not the most promising, till they can so far clear the ground, as to produce a sufficient support for the new settlement; but, nevertheless, the richness of the soil will amply repay them, when this difficulty is happily surmounted.

The timber was found to be very unfit for building; the only purpose for which it will answer is firewood, and for that it is excellent: but in other respects, it is the worst wood that any country or climate can produce; although some of the trees, when standing, appear fit for any use whatever, masts for shipping not excepted. Strange as it may be imagined, most of the wood in this country, though dried ever so well, will not float. Repeated trials have only served to prove, that, immediately on immersion, it sinks to the bottom like a stone. The trees were not of many species. Among others, there was a large one, which yielded a gum not unlike that called dragon's blood. In the woods was found a tree, which bore fruit that, in colour and shape, resembled a cherry: the juice had an agreeable tartness, though but little flavour.

Between the trees the ground is covered with grass, of which there is great abundance, growing in tufts as large as can well be grasped in the hand, which stand very close to each other. In those places where trees are scarce, a variety of flowering shrubs abound, most of them entirely new to an European, and surpassing in beauty, fragrance, and number, all ever seen in an uncultivated state. Among these a tall shrub, bearing an elegant white flower, which smells like English May, is particularly delightful, and perfumes the air around to a great distance.

A kind of vine grows here, which runs to a great extent along the ground; the stalk is not so thick as the smallest honey-suckle, nor is the leaf so large as the common bay-leaf, though somewhat similar to it; and the taste is sweet, exactly like the liquorice root of the shops. Of this the convicts and soldiers make

an infusion, which is tolerably pleasant, and serves as no bad succedaneum for tea. The surgeon found it to be a good pectoral, and not at all unpleasant.

This country abounds with free-stone of an excellent quality, which was considered as an happy circumstance, as it tended so materially to forward the intended plan of forming the town. The greatest impediment to building was a want of lime-stone, of which no signs had hitherto appeared. Clay, for making bricks, abounding, a considerable quantity of them were burned, and ready for that necessary purpose.

With respect to the present state of the colony, we must observe, that when the plan of the settlement was first projected, it was apprehended that the stores sent from England, together with the produce of the country, would be sufficient for the support of the people, till they should receive a further supply, but the eatable vegetable productions being so scarce, the animal productions not abounding in that degree as was imagined, and the fisheries proving unsuccessful, they were, in consequence, reduced to an allowance of two ounces of meat a day; and fresh provisions became scarcer than in a blockaded town. The little live stock which, at so much expence, and with so many difficulties, had been brought on shore, prudence forbade the use of; and fish, which, for a short time, had been tolerably plenty, was become very scarce; so that had it not been for a stray kangaroo, which fortune now-and-then threw in the way, the people would, in general, have been strangers to the taste of fresh food.

In consequence of this scarcity of wholesome provisions, the scurvy began its usual ravages, and extended its baneful influence through all descriptions of persons, particularly as the eatable vegetable productions of the country neither abound, nor are efficacious in the removal of this disease. Many other calamitous circumstances combined to aggravate their distress; and, amongst others, the whole stock of black cattle, consisting of five cows and a bull, had strayed into the woods, and, notwithstanding the most diligent search, could not be found. But at length they were happily relieved by the arrival of the fleet from England with ample supplies; and from the last accounts transmitted since that time, it appears, that the produce of the country being more abundant in consequence of a better knowledge being obtained of its resources, and the fisheries proving more successful, they are now in a more comfortable situation; and their future prospects are very promising, as is evident from some late accounts which were conveyed by Governor Philip to Lord Sydney, who caused them to be laid before the House of Commons.

Captain Hunter, before he left Port-Jackson, gives an entertaining description of a dance, with which the natives diverted the governor and his people, before he left the place.

“The

"The natives, he observes, were become very familiar and intimate with every person in the settlement. Many of them now took up their rest every night in some of the gentlemen's houses; their very unprovoked attack on the governor and his party, being now passed over, and almost forgot.

"We have frequently observed, since this familiar intercourse took place, that they often had a dance amongst themselves at night, on the lower part of Sydney-Cove, where a small house had been built by the governor's order for their accommodation. It had been signified to some of the principal amongst them, that we should be glad to have an opportunity of seeing them dance, which they readily agreed to; and the following night was appointed, when the governor and a considerable number attended, every one being provided with arms of some kind; a caution, which, notwithstanding friendly appearances, was generally allowed to be necessary; for experience had convinced us, that these people have a good deal of treachery in their disposition.

"Preparatory to this exhibition, much attention was paid to the decorating themselves: they were all Adams and Eves, without even a single fig-leaf, and also without their dignity. The young women were employed with all their art in painting the young men, who were chiefly ornamented with streaks of white, done with pipe-clay, and in different forms, according to the taste of the man himself, or to that of the lady who adorned him: no soap preparing for an assembly was ever more desirous of making his person irresistibly beautiful. This paint, so much in use among them, could not be applied without a little moisture; and the lady, in drawing these marks on the face, which were so essential a part of the decoration, I observed frequently to spit in the face of her friend, whom she was employed in adorning, in order to make the white clay mark the stronger.

"When they were all prepared, we walked down to the place appointed after dark (for they prefer taking their amusement by fire-light) we found several fires lighted, and a considerable number of people assembled. We walked round, to see that there were no armed lurkers among the bushes.

"The dancers being ready, we were placed in a semicircle by Ba-na-lang and Co-al-by, who seemed to have the chief authority and direction. The dance was begun by a few young boys, and was increased by men and women, chiefly by the former, until their number amounted from twenty to twenty-six. Their dance was truly wild and savage, yet in many parts there appeared order and regularity. One man would frequently single himself out from the dance, and, running round the whole of the performers, sing out in a loud voice, using some expressions in one particular tone of voice which we could not understand; he would then join the dance, in which it was observed, that certain parties alternately led forward to the front,

and there exhibited, with their utmost skill and agility, all the various motions, which, with them, seemed to constitute the principal beauties of dancing. One of the most striking was, that of placing their feet very wide apart, and, by an extraordinary exertion of the muscles of the thighs and legs, moving the knees in a trembling and very surprising manner, such as none of us could imitate, which seemed to shew, that it required much practice to arrive at any degree of perfection in this singular motion.

"There appeared a great deal of variety in their different dances; in one of which they paired themselves, and frequently danced back to back; they then changed suddenly, and faced each other. Sometimes all the performers sat down on the ground, with their feet under them; and at a particular word or order, they raised themselves up. This motion they performed without any assistance from the hands. Now they ran back in direct rows, then advanced in the same order; again they would form a circle, with some distinguished person in the centre, and sometimes the whole of the performers would appear with a green bough in their hands, which they held up in a conspicuous manner. In all the different figures which they performed, they generally finished by certain numbers of their principal dancers advancing to the front, and going through that favourite part of the dance, the quivering motion of the knees. Whenever this was done, the whole company faced to the front, and went through the same motions; but it was noticed, that some were more frequently in the front than others, and those we supposed were such as had great confidence in their own skill in the execution of this very difficult part of the performance; and no doubt were vain enough to outshine in their ability the rest of the company. On the whole, this exhibition was well worth seeing; and this was the first opportunity that had offered for us to see any thing of the kind since we had been in the country.

"Their music consisted of two sticks of very hard wood, one of which the musician held upon his breast in the manner of a violin, and struck it with the other, in good order and regular time. The performer, who was a stout, strong-voiced man, sung the whole time, and frequently applied those graces in music, the piano and forte. He was assisted by several young boys and girls, who sat at his feet, and, by the manner of crossing the thighs, made a hollow between them and their belly, upon which they beat time with the flat of their hand, so as to make a kind of sound, which will be better understood from the manner of its being produced, than from any verbal description. These children also sung with the chief musical performer, who stood up the whole time, and seemed to have the most laborious part of the performance. They very frequently, at the conclusion of the dance, would apply to us for our opinions, or rather for marks of our approbation of their performance, which we never failed to give, by often repeating

repeating the word *boojery*, which signifies good; or *boojery caribberie*, a good dance. These signs of pleasure in us, seemed to give them great satisfaction, and generally produced more than ordinary exertions from the whole company of performers in the next dance."

Late Accounts respecting the Colony at PORT-JACKSON, as far as Dec. 16, 1791.

"IT appears, that the great number of spermaceti whales which had been seen on the coast of New South-Wales, induced the masters of those vessels which were fitted out for that fishery (and intended, after landing the convicts, to proceed to the north-west coast of America) to try for a corgo here.

"The *Matilda*, and the *Mary-Ann* transports, returned from their fishing-cruise on the 10th of November 1791. These vessels had run to the southward in search of seals, and met with very bad weather, but saw no fish. The *Matilda* had put into *Jervis-Bay*, which, according to the master's account, is a very fine harbour, capable of receiving the largest ships, and the anchorage very good. These two vessels, after re-fitting, sailed again to try for fish on this coast.

"Our colony began to reap barley on the 22d of November, and the wheat was getting ripe.

"The *Supply* armed tender, after having been under repair from the time she returned from *Norfolk-Island*, was found, on a survey, to be in so bad a state, that the best repair which could be given her in this country, would only render her serviceable for six months longer; Governor Phillip, therefore, ordered her to England, and she sailed on the 26th of November.

"From the debilitated state in which many of the convicts were landed from the last ships, the number of sick were greatly increased: the surgeon's returns on the 27th, being upwards of 400 sick at *Parramatta*; and the same day medicines were distributed to 192 at *Sydney*. To the number of sick at *Parramatta*, upwards of 100 may be added, who were so weak, that they could not be put to any kind of labour, not even to that of pulling grafs for thatching the huts. Forty-two convicts died in the month of November, and in these people nature seemed to be fairly worn out: many of them were so thoroughly exhausted, that they expired without a groan, and apparently without any kind of pain.

"Showers of rain had been more frequent lately than for many months past, but not in the abundance which the ground required; and from the extreme dryness of the weather, and from the ground not being sufficiently worked before the maize was put into it, a great number of acres was likely to be destroyed. This was one of the many inconveniences the settlement laboured under, from the want of people to employ in agriculture, who would feel themselves interested in the

labour of those that were under their direction, and who had some knowledge as farmers.

"The following parcels of land were in cultivation at *Parramatta* in November 1791.

Acres.	Roods.	Perches.	
351	2	5	in Maize.
41	1	8	Wheat.
6	1	30	Barley.
1	0	0	Oats.
2	0	3	Potatoes.
4	2	0	Not cultivated, but cleared.
4	2	15	Mostly planted with vines.
6	0	0	The governor's garden partly sown with maize and wheat.
80	0	0	Garden-ground belonging to individuals.
17	0	0	Land in cultivation by the New South-Wales corps.
150	0	0	Cleared, and to be sowed with turnips.
91	3	2	Ground in cultivation by settlers.
28	0	0	Ground in cultivation by officers of the civil and military.
134	0	0	Enclosed, and the timber thinned for feeding cattle.
Making in the whole upwards of 918 acres.			

"The above grounds were measured by *David Burton*, the public gardener, who observes, that the soil in most places is remarkably good, and only wants cultivation to be fit for any use, for the ground that has been the longest in cultivation bears the best crops.

"Of the convicts who were received by the last ships, there were great numbers of the worst of characters, particularly amongst those who came from *Ireland*, and whose great ignorance led them into schemes more destructive to themselves, than they were likely to be to the settlement. Some of these people had formed an idea, that they could go along the coast, and subsist on oysters and other shell-fish, till they reached some of the Chinese settlements: others had heard, that there were a copper-coloured people only 150 miles to the northward, where they would be free. Full of these notions, three parties set off; but after straggling about for many days, several of them were taken, and others returned to the settlement. Governor Phillip was less inclined to inflict any punishment on these people, than he was to punish those who had deceived them by the information of "not being far from some of the Chinese settlements, and near people who would receive them, and where they would have every thing they wanted, and live very happy." These reasons most of them assigned for going into the woods, and where some of them still remained, dreading a severe punishment if they returned. A general pardon was therefore promised to all those who came back within a certain time, as several were supposed to be lurking in the woods near the settlement: however, some of these wretches were so prepossessed

with an idea of being able to live in the woods, and on the sea coast, until they could reach a settlement, or find a people who would maintain them without labour, that several who were brought in when almost famished, and carried to the hospital, went away again as soon as they were judged able to return to their labour: and although what would be called a day's work in England, is very seldom done by any convict in the settlement, yet some of them declared, that they would sooner perish in the woods, than be obliged to work; and forty were now absent. In order to give those who might be still lurking near the settlement, an opportunity of returning, all the convicts were assembled, and a pardon was promised to all who returned within five days: at the same time they were assured, that very severe punishment would be inflicted on any who were taken after the expiration of that time, or who should in future attempt to leave the settlement. Several appeared sensible of the lenity shewn them when their irons were taken off; but some of them appeared capable of the most daring attempts, and even talked of seizing on the soldiers arms; they were however informed, that no mercy would be shewn to any who were even seen near those that might make an attempt of the kind.

"All the whalers who came into the harbour to refit, failed again by the 11th of December; and the Albemarle and the Active transports failed on the 2d for Bombay, where they were to load with cotton for England.

"A new store was now covered in at Sydney, which was the best that had been built in the colony, and was intended for the convicts clothing and the implements of husbandry: it has a second floor, and is eighty feet in length, by twenty-four in breadth. A building of twenty-six feet by twenty-four, was likewise covered in at Parramatta, and was intended for a place of worship, until a church could be built.

"The idea of finding a Chinese settlement at no great distance to the northward, still prevailed amongst the Irish convicts; and on the 4th of December two of them stole the surgeon's boat, but they only got a few miles to the northward of the harbour, when they were obliged to run her on shore. Some officers who were out a shooting, saw this boat on the beach, and stove a plank in her, that she might not be carried away; they also saw two men, who ran into the woods: however, a convict, who had been six weeks in the woods, and was scarcely able to walk, gave himself up to the officers, and, with their assistance, was able to return to Sydney.

"Many of those convicts who left the settlement, as has already been related, came back; some were still missing, and several were said to be killed by the natives. The miserable situation of those who returned to the settlement would, it was believed, most effectually prevent any more excursions of the like nature.

"On the 5th of December, the Queen transport returned from Norfolk-Island, with the lieutenant-governor

of the territory, who was relieved by Lieutenant-Governor King; a detachment of marines, who had been doing duty on the island, a party of the New South-Wales corps, who were relieved by Captain Paterson, and some convicts, whose times for which they had been sentenced were expired. By the 7th, the Gorgon was nearly ready for sea, and the detachment of marines who came from England in the first ships, was ordered to hold themselves ready to embark, except one captain, three lieutenants, eight non-commissioned officers, and fifty privates, who were to stay at Port-Jackson, until the remainder of the New South-Wales corps should arrive. Those marines who were desirous of becoming settlers, remained likewise, to the number of thirty-one.

"Of those convicts who were received from the last ships, 114 males, and two females, died before the 15th of December. The number of sick had considerably decreased lately, the surgeon's list being now reduced from 602 to 403.

"The Matilda and the Mary-Ann transports came into harbour on the 16th; these ships had been out but nine days. The Matilda had been into Jervis-Bay, but had not seen any spermaceti whales. The Mary-Ann fell in with one shoal; it was in the evening, when all the boats were absent from the ship. The master was in hopes they should have the fish about them the next morning, but he had the mortification to find, that a current had driven the ships fifty miles to the southward."

NORFOLK-ISLAND,

As described by Lieutenant Governor KING, in a Paper delivered by him, and dated Jan. 10, 1790.

THIS island is situated in the latitude of 29 degrees, 0 min. south; and in the longitude of 168 degrees, 0 min. east. Its form is nearly oblong, and it contains from twelve to fourteen thousand acres.

The face of the country is hilly, and some of the valleys are tolerably large for the size of the island; many of the hills are very steep, and some few very perpendicular, that they cannot be cultivated; but where such situations are, they will do very well for fuel: on the tops of the hills are some very extensive flats.

Mount-Pitt is the only remarkable high hill in the island, and is about one hundred and fifty fathoms high. The cliffs which surround the island are about forty fathoms high, and perpendicular: the basis of the island is a hard firm clay. The whole island is covered with a thick wood, choked up with a thick underwood; but it is well supplied with many streams of very fine water, many of which are sufficient to turn any number of mills. These springs are full of very large eels.

From the coast to the summit of Mount-Pitt, is a continuation of the richest and deepest soil in the world, which varies from a rich black mould, to a fat red earth.

earth. We have dug down forty feet, and found the same soil.

The air is very wholesome, and the climate may be called a very healthy one; there has been no sickness since I first landed on the island.

Five kinds of trees grow on the island, which are good timber, viz. The pine, live oak, a yellow wood, a hard black wood, and a kind of beech. The pine trees are of a large size, many of which are from one hundred and eighty to two hundred and twenty feet in height, and from six to nine feet in diameter. Those trees which are from one hundred to one hundred and eighty feet in height, are, in general, found: from the root to the lower branches, there are from eighty to ninety feet of sound timber: the rest is too hard and knotty for use. It sometimes happens, that, after cutting off twenty feet from the butt, it becomes rotten or stinky; for which reason no dependence can be put in it for large masts or yards. The timber of the pine is very useful in buildings, and is plentiful along the coasts. Its dispersed situation in the interior parts of the island, is well calculated for erecting such buildings as may be necessary. From what I have seen of this wood, I think it is very durable; two boats have been built of it, and have answered the purpose fully. The live oak, yellow wood, black wood, and beech, are all of a close grain, and are a durable wood.

The flax plant of New Zealand grows spontaneously in many parts of the island, but mostly abounds on the sea-coast, where there is a great quantity of it. The leaves of the flax, when fully grown, are six feet long, and six inches wide. Each plant contains seven of those leaves. A strong, woody stalk arises from the centre, which bears the flowers. It seeds annually; and the old leaves are forced out by the young ones every year. Every method has been tried to work it; but I much fear, that, until a native of New Zealand can be carried to Norfolk-Island, the method of dressing that valuable commodity will not be known; and could that be obtained, I have no doubt but Norfolk-Island would very soon clothe the inhabitants of New South-Wales.

This island abounds with pigeons, parrots, hawks, and other smaller birds, which are now in a wild state. The ground is much infested with different kinds of the grub worms, which are very destructive to the growth of vegetables. They are mostly troublesome about the spring. It is to be hoped, that when more ground is cleared away, this evil will cease.

There are great quantities of very fine fish on the coasts of this island, which are principally the snapper, and weigh from four to eight pounds each. A few fish are at times caught from the shore: this however happens but seldom; so that a supply of fish must depend on the weather, and the surf permitting boats to go out. In moderate weather, boats might land in Collins's-Bay, on Phillip's-Island, where a great quantity of fish might be cured, from March to September, after which time

the fly prevents it. No opportunities were ever lost of sending the boat out, which enabled us to make a saving of two pounds of meat each man a week.

Sydney-Bay lies in latitude 29 degrees 95 minutes south, longitude 168 degrees 2 minutes east, and variation 11 degrees east. The tide flows fast, and changes at three quarters past seven, and rises from five to seven feet. The flood runs to the S. W. by S. and the ebb to the N. E. by N. On the south side of the island, is where the settlement is made. Landing at this place entirely depends on the wind and the weather. I have seen as good landing as in the Thames for a fortnight or three weeks together; and I have often seen it impracticable to land for ten or twelve days successively; but it is much oftener good landing than bad. Anson's-Bay is a small bay, with a sandy beach, where landing is in general good, with an off-shore wind, and moderate weather. Ball-Bay is on the south-east side of the island; the beach is of large loose stones. When landing is bad in Sydney-Bay, it is very good here; as it also is in Cascade-Bay, on the north side of the island.

In general the tides are equal each way; the ebbs and the flows regular along the shore six each tide. The eastern tide is stronger than the western tide. Sometimes the eastern tide runs several hours beyond its usual course, and sometimes the western tide thus irregularly; which irregularities, though they seldom happen, make it necessary to bring to, and try the tide, before you come within the outer part of the Nepean-Island; and beware of an indraught, which sometimes sets into the bight, on the west side of the bay, on both sides, while you are baffled by the south-east and southerly winds, as you come in with Sydney-Bay. All within Nepean-Island is foul ground, and very irregular soundings, and no safe passage between it and Port-Hunter; but if a ship should be pressed by necessity, it is recommended to keep within half a cable's length of Nepean-Island, after having passed the bed of rocks to the westward of the little bay.

At Norfolk-Island, the spring is very visible in August; but the trees in many parts of the island are in a constant succession of flowering and seeding all the year round. Every kind of garden vegetable thrives well, and comes to great perfection. The summer is very hot: Governor King observes, that he had no thermometer to determine the degree of heat; but it is excessive. From the 23d of September, to the 22d of February, 1790, not one drop of rain fell, excepting on two days in December; but it should be remarked, that there was no drought in the former year. All the grain and the European plants seeded in December. From February to August, may be called the rainy season; not that we may suppose there is any regular time of rains during these months, as the weather is sometimes very fine for a fortnight together; but when the rain does fall, it pours in torrents. The governor adds, that he does not recollect more than three claps of thunder,

or lightning, during the time he remained on the island. The winter, which may be said to commence in April and in July, is very pleasant. There is never any frost; but when the south-west winds blow, which are very frequent and violent in these months, the air is raw and cold. It is very remarkable, that during some days in December and January, the weather has been much colder than in the winter months. The south-east and east winds are very parching and dry, as no dew falls when those winds prevail.

During the winter months, the wind is mostly from south to west, blowing with great violence for a week together; afterwards it veers round to the southward and south-east, which brings fine weather for a few days; then it veers to east, north-east, and north-west, blowing in heavy gales, and generally accompanied with violent torrents of rain; after which it shifts to south-west; but not a single instance was observed of the wind coming to the north-east round by west. The south-east wind blows during the summer with very little variation, and sometimes very strong.

The coasts of the island are in general steep, and excepting Sydney, Anson, Ball, and Cascade-Bays, are inaccessible, being surrounded by steep cliffs, which rise perpendicularly from the sea. A number of large rocks lie scattered about close to the shore, or which a continued surf breaks with great force.

The following are Lieutenant-Governor King's latest Dispatches respecting Norfolk-Island: they are dated Dec. 29, 1791, and received Nov. 30, 1792.

"The wheat harvest at Norfolk-Island was finished by the 10th of December 1791, when about one thousand bushels of wheat were got in, and well thatched in stacks. The Indian corn had suffered by a series of dry hot weather, ever since the preceding July.

"Lieutenant-Governor King, finding great inconvenience from the size and construction of the frame of a store-house, which was eighty feet long by twenty-four feet wide, as well as from its situation, it being near the shore, determined to build one, forty feet by twenty-four, on the terrace at Mount-George. He had also found it necessary to build a gaol opposite the barrack-yard, and another at Queensborough.

"A good road has been made to the landing rock in Cascade-Bay, so that now any thing may be landed with the greatest safety.

"Eighteen copper bolts, six copper sheets, two sixteen-inch cables, two hundred weight of lead, one fish-tackle fall, twenty pounds of chalk, three rudder-chains, two top-chains, and iron work of various sorts, had been saved from the wreck of the Sirius. The greatest part of these articles, Lieutenant-Governor King proposed sending to Port-Jackson.

"Ten settlers, who lately belonged to the Sirius, were doing exceedingly well; but there was reason to fear, that great part of the marine settlers, when the novelty of their situation was gone off, would have nei-

ther ability nor inclination to improve the portions of ground allotted them. They had already been extremely troublesome, and the lieutenant-governor had been under the necessity of imposing heavy fines on two; the first, for beating the watch, and using inflammatory language; and the second, for cruelly beating a convict woman.

"The convict settlers were all doing very well, and were quiet, attentive, and orderly: they were increased to the number of forty. The whole number of settlers on the island were eighty; and it will be difficult to fix more, until the ground is further cleared.

"A quantity of coral and other testaceous substances, with different kinds of stones, were burnt forty-eight hours, and produced a very fine white lime, much superior to any lime made of chalk, and it proved a very tough cement.

"Eighteen convicts, under the direction of an overseer, who is a settler, were employed in making bricks. A bricklayer was much wanted, as one who was sent in the Queen, died in his passage.

"Lieutenant-Governor King, finding it necessary to discharge Mr. Doridge, the superintendent of convicts at Queensborough, has appointed Mr. Darcy Wentworth to succeed him. Mr. Wentworth had behaved with the greatest attention and propriety as assistant-surgeon, which duty he still continued to discharge. Mr. W. N. Chapman was appointed store-keeper at Phillipburgh.

"A corporal and six privates were stationed in a house with a good garden to it, on an eminence commanding Queensborough; and a serjeant and ten men were fixed in a similar situation at Phillipburgh; and they were kept as separate from the convicts as possible.

"The lieutenant-governor had been under the necessity of appointing a town-adjutant and inspector of outposts, and he named Lieutenant Abbott for these duties. He also established rules and regulations for the observance of every person on the island, and for keeping a night patrol; a deputy provost-marshal was also appointed.

"The wreck of the Sirius went to pieces on the 1st of January 1792, and every thing possible was saved out of her. The same day, every person on the island went to a reduced allowance of provisions; but the fish daily caught, was sufficient to serve all the inhabitants three times over.

"Some of the settlers were permitted to employ the convicts as their servants, on condition of maintaining them without the aid of the public stores; and some of the convicts were allowed to work for themselves, on the same condition.

"It will be absolutely necessary to establish a court of justice, as corporal punishments have but little effect, although robberies were confined to a particular class of convicts, and were by no means general.

"By the 15th of January, 260 bushels of Indian corn were

were gathered in; a number of acres were then in different states of growth, which were likely to yield about 300 bushels more. The wheat threshed well, and yielded plentifully. The granary was finished, and every endeavour used to keep the weevil out of it."

For the above conclusive accounts, as likewise for several interesting particulars relating to our other settlement in this quarter, we acknowledge ourselves indebted to that valuable work, lately published, entitled, "An Historical Journal of the Transactions at Port-Jackson and Norfolk-Island; with the Discoveries which have been made in New South-Wales, and in the Southern Ocean, since the Publication of Phillip's Voyage, &c. by John Hunter, Esq. Post-Captain in his Majesty's Navy."

GENERAL OBSERVATIONS.

IT has been remarked, by an observer on the spot, of eminent discernment and penetration, that if the colony is intended only as a receptacle for convicts, this place stands unequalled, from the situation, extent, and nature of the country: but that, if taken in a commercial view, its importance will not appear striking, as the New Zealand hemp, of which sanguine expectations were formed, is not a native of the soil: and an adjacent island, where an assurance was entertained of finding it, is without it; consequently, the scheme of being able to assist the East-Indies with naval stores, in case of a war, must be rendered abortive, both from the deficiency and quality of the timber growing in this country. It is also given as an opinion, formed on due observation, that, through sufficient numbers, and industry in cultivation, the country would, in the course of a few years, produce grain enough for the support of its new possessors; but to effect this, the present limits must be greatly extended.

To men of small property, contracted desires, and a disposition for retirement, the continent of New South-Wales may have its inducements. One of this description, with letters of recommendation, and a sufficient capital to furnish an assortment of tools for agricultural and domestic purposes, possessed also of a few household utensils, a cow, a few sheep, and breeding sows, with proper protection and encouragement, might obtain a comfortable subsistence, and a moderate independence in a course of time. But they who are induced to emigrate hither, are recommended, before they quit England, to provide all their wearing-apparel for themselves, family, and servants; their furniture, tools of every kind, and implements of husbandry (among which a plough need not be included, the hoe being used) as they will touch at no place where these articles can be purchased to advantage.

If the sheep and hogs are English, it will be the better. With respect to wines, spirits, tobacco, sugar, coffee, tea, rice, and many other articles, they may venture to rely on Teneriffe or Madeira, the Brazils, and

Cape of Good-Hope. It will not be their interest to draw bills on their voyage out, as the exchange of money will be found invariably against them, and a large discount is also deducted. Drafts on the places they are to touch at, or cash (dollars if possible) will best answer their purpose. Men of desperate fortunes, and the lower classes, can propose to themselves no kind of advantage, unless they can procure a passage as indented servants, similar to the custom of emigrating to America; for it is absurd to imagine that government will be disposed to maintain them here until they can be settled, and without such support they must eventually perish for want of subsistence.

CHAP. II.

VAN DIEMAN'S LAND.

Description of Van Dieman's Land, the Southern Extremity of New Holland, with Remarks on the Persons, Manners, Customs, Language, and Character of the Natives, and the several Productions of the Country.

IN the year 1766, Captain Cook having embarked in his third voyage, again visited the Coast of New Holland, which he approached from the southward. On the 24th of January 1777, he fell in with Van Dieman's Land, and on the 26th anchored in Adventure-Bay, in latitude 43 degrees 21 minutes south, being about five degrees more to the southward than that part of the land which he first saw in his course from New Zealand in the year 1770. Before we proceed to relate the particular transactions of our modern navigators, we deem it proper to set forth the first account of the country now under consideration upon its discovery.

Captain Abel Jansen Tasman having been sent from Batavia for the express purpose of making a perfect survey of this country, in August 1642, found himself, on the 6th of November following, in latitude 49 degrees 4 min. south, longitude 114 deg. 56 min. east. Struck by weather then determining him to stand towards the north east, on the 24th of the same month, being in the latitude of 42 deg. 25 min. south, longitude 163 deg. 50 min. he discovered land lying east south-east, which he called Van Dieman's Land.

On the 1st of December he anchored in a bay, which he called the Bay of Frederic Henry; and heard, or at least fancied he heard, the sound of people upon the shore, but saw no person. The most remarkable and worthy of observation, were two trees, of two fathoms, or two fathoms and a half in girth, and 60 or 65 feet high, from the root to the branch. They had cut with a flint a kind of steps in the bark, in order to climb up to the birds nests. The steps were at the distance of five feet from each other, from whence it was concluded, either that those people were of prodigious size,

or that they have some way of climbing trees unknown to Europeans. In one of the trees the slips were so fresh, that it was judged they could not have been cut above four days: A noise heard resembled that of some sort of a trumpet; it seemed to be at no great distance, but no living creature was seen notwithstanding. The marks of wild beasts were perceived in the sand; they resembled those of a tyger, or some such creature. Some gum, and likewise some lark, were gathered from the trees. Smoke was observed in several places; nothing more was done, however, than setting up a post, on which eve y one present cut his name and his mark, and upon which a flag was hoisted by Tasman the commander.

The natives, who first presented themselves to the view of the English here at the wooding-place, were eight men and a boy. They approached with great confidence, none of them having any weapons but one, who had a short stick pointed at one end. Our countrymen describe them as of middling stature, and somewhat slender, their hair black and woolly, and their skin also black. They were entirely naked, with large punctures or ridges, some in curved and others in straight lines, on different parts of their bodies. They were not distinguished by lips remarkably thick, nor their noses so flat as the natives of Guinea; on the contrary, their features were far from being disagreeable. They had pretty good eyes, and their teeth were tolerably even and regular, though very dirty. Most of them had their hair and beards smeared with a red ointment, and some had their faces also painted with the same composition. They received the presents that were made them without the least appearance of satisfaction. When some bread was given them, and they were made to understand, that it was to be eaten, they either returned or threw it away without ever tasting it. They all refused some elephant fish; but accepted some birds that were presented, and in such a manner as indicated they were fond of such food.

A dead calm prevented the ship from sailing; the commander sent parties on shore to cut wood and grass, and accompanied the wooding party himself. As several of the natives had been observed sauntering on the shore, and thereby indicated they had no apprehension of injury, but, on the contrary, were desirous of maintaining an intercourse, he wished to be present on the occasion. The party had not been long landed, before about twenty of them, men and boys, joined them, without expressing the least fear or distrust. One of this company was distinguished not only by his deformity, but the drollery of his gestures, and the seeming humour of his speeches, which, however, could not be understood by those for whose entertainment they were supposed to be exhibited. Their language appeared to be different from that spoken by the inhabitants of the more northern parts of this country explored in a former voyage, which is not extraordinary, since these our navigators saw now, and those they then visited, differed in many

other respects. Some of the present groupe wore round their necks three or four folds of small cord, made of the fur of some animal; others had narrow slips of the kangaroo skin round their ancles. They were each of them presented with a string of beads and a medal, and seemed to receive them with some satisfaction. They did not appear to set any value on iron, or even to know the use of fish-hooks, though it is more than probable they were acquainted with some method of catching fish. Several deserted habitations were observed near the head of the bay. There were little sheds or hovels, built of sticks, and covered with the bark of trees. There appeared evident signs of their abode in the trunks of large trees, which had been hollowed by fire, most probably for this very purpose. In or near all these habitations, and wherever there was an heap of shells, there remained the marks of fire, an indubitable proof that they do not eat their food raw.

After the commander left the shore, several women and children made their appearance, and were introduced by the men to Lieutenant King. These females wore a kangaroo skin, in the same shape as it came from the animal, over their shoulders, the only use of which seemed to be to support their children on their backs; for it left those parts uncovered which modesty directs to conceal. In all other respects they were as naked as the men, and as black, and their bodies marked with scars in the same manner. They differed, however, in having their heads shaved, leaving a very narrow circle of hair all round, somewhat resembling the tonsure of the Romish ecclesiastics. Many of the children had pleasing features; but of the persons of the women, especially those advanced in years, a less favourable report was made. Some of the gentlemen paid their addresses to them, and made liberal offers; but they were rejected with great disdain; whether from a sense of virtue, or fear of displeasing their men, cannot be determined. That this gallantry was not very agreeable to the latter is evident; for an elderly man, as soon as he observed it, ordered all the women and children to retire, which they obeyed, though some shewed a degree of reluctance. It is here to be observed, that the people now seen differed, particularly in the texture of their hair, from the natives of the more northern parts of this country.

Van Dieman's Land had been twice visited before. In the beginning of our account, it is set forth to have been so named by Tasman, who discovered it in November 1642. From that time it had escaped all further notice by European navigators, till Captain Furneaux touched at it in March 1773. Captain Cook observes, that if the whole of the country now described does not deserve the name of a continent, it is, by far, the largest island in the universe.

For the most part the land is of a good height, agreeably diversified with hills and valleys, and exhibits, upon the whole, a verdant appearance. It abounds with wood, and, from what was met with in Adventure-Bay, seems not ill supplied with water; for plenty was found in three

or four places in this bay. The best, or what is most convenient for ships that touch here, is a rivulet, which is one of several that fall into a pond that lies behind a beach at the head of the bay. It there mixes with the sea water; so that it must be taken up above this pond, which may be done without any great trouble. In several places fire-wood is to be procured with great ease.

As Mr. Anderson, surgeon of the Resolution, a person of general knowledge, spent the small time the ships remained in Adventure-Bay, in examining the island; the following are his remarks on the inhabitants and their language, and his account of the natural productions of the country.

At the bottom of Adventure-Bay, there is a beautiful sandy beach, about two miles long, formed, to all appearance, by the particles washed by the sea from a very fine white sand-stone. This beach is well adapted for hauling a seine: behind it is a plain, with a blackish lake, out of which were caught, by angling, some bream and trout. The other parts of the country are mostly hilly, and are an entire forest of tall trees, rendered almost impassable by shrubs, breaks of fern, and fallen trees.

The soil on the flat land, and on the lower part of the hills, is sandy, or consists of a yellowish mould, and, in some parts, of a reddish clay; but further up the hills it is of a grey tough cast. The country, upon the whole, bears many marks of being very dry, and the heat appears to be great.

No mineral bodies, or stones of any other sort than the white sand stone, already mentioned, were observed, nor were there any vegetables found that afforded subsistence for man.

The forest trees are all of one kind, and, in general, quite straight; they bear clusters of small white flowers. The principal plants are a species of gladiolus, rush, bell-flower, samphire, wood-forrel, milk-wort, and Job's tears, with a few others peculiar to the place.

The only animal of the quadruped kind seen distinctly, was a species of opossum, about twice the size of a large rat. The kangaroo, another animal, found further northward in New Holland, must certainly inhabit here, as some of the natives had pieces of their skins. And there are several flocks of birds; but, as in other neighbouring parts, all so scarce and shy, that it is plain they are harassed by the natives, who chiefly subsist upon them. In the woods, the principal sorts are large brown hawks or eagles; crows nearly the same as ours in England; yellowish paroquets, and another small one, which has part of the head and neck of a most beautiful azure colour, and was thence named *motacilla cyanea*. On the shore were several gulls, black oyster-catchers or sea-pies, and plovers of a stone colour, with a black hood. About the pond or lake behind the beach, a few wild ducks were seen, and some snags were observed to perch upon the high leafless trees near the shore.

Some pretty large blackish snakes were seen in the

woods, and a lizard was killed that was fifteen inches long and six round, beautifully clouded with black and yellow.

Great variety of fish are found in the sea, as the elephant-fish, rays, nurfes, leather-jackets, white bream, soles, flounders, gurnards, besides a sort not recollected to have been seen before, and which partakes of the nature both of a round and of a flat fish. Upon the rocks are plenty of muscles and other small shell-fish; and some Medusa's heads were found upon the beach.

There is a variety of insects here, though they are not numerous. The most troublesome are the musquitoes, and a large black ant, whose bite is very painful.

In this country the natives had little of that ferocious aspect common to savages; but, on the contrary, seemed mild and cheerful, without reserve, or jealousy of strangers. They are almost devoid of personal activity and genius, and, in those particulars, nearly upon a par with the inanimate inhabitants of Terra del Fuego, who are so deficient in point of invention, as not to be capable of making clothing for defending themselves from the extreme rigour of their climate, though furnished with the materials. They display indeed some ingenuity in their method of cutting their arms and bodies in lines of different directions, raised above the surface of their skins. However, their want of curiosity, indifference for presents made them, and general inattention, plainly testified they were not possessed of any acuteness of understanding. Their colour is a dull black, sometimes heightened by smutting their bodies, as was supposed from their leaving a mark behind on touching any clean substance. Their hair is perfectly woolly, and clotted with grease like that of the Hottentots. Their noses, though flat, are broad and full, and the lower part of the face projects considerably. Their eyes are of a moderate size, and though not remarkably quick and piercing, give the countenance a frank, cheerful, and pleasing cast. Their teeth are not very white, nor well set, their mouths are rather wide; they wear their beards long and clotted with paint. In other respects they are well-proportioned, though the belly projects rather too much. Their most favourite attitude is to stand with one side forward, and one hand grasping across the back the opposite arm, which, on this occasion, hangs down by the projecting side.

In the bay, near the shore, were observed some wretched contrivances of sticks, covered with bark, which scarcely deserve the name of huts. They seemed, indeed, to have been merely temporary, as many of their largest trees appeared to have been converted into more comfortable and commodious habitations. The trunks of these were hollowed out by fire to the height of six or seven feet. That they sometimes dwell in them was evident from the hearths in the middle, made of clay, round which four or five persons might sit. These places of shelter are rendered durable by their leaving one side of the tree sound, so that it continues growing as luxuriantly as those which remain untouched.

Voyagers

Voyagers have generally concluded, that the people here are of the same stock with those of New Zealand, and other southern islands, though they differ in point of language.

C H A P. III. NEW ZEALAND.

Discovery and Description of the Country; its Situation, Extent, Soil, Climate, Mountains, &c.

THIS island was first discovered by Tasman, a Dutchman, in the year 1642, who meeting with a very hostile reception from the natives, as soon as he came to anchor, he thought it prudent to weigh without so much as attempting to land; but gave the appellation of Murderers'-Bay to the road in which he dropped anchor, and the general name of New Zealand to the whole country, at that period supposed to be part of a southern continent.

Captain Cook often visited New Zealand, first in 1769, in the close of which and the beginning of the ensuing year, he coasted the country during a space of six months, and found it to consist of two large islands divided by a passage (now called Cook's Straights) about four or five leagues broad, and lying nearly north and south of each other, between the latitudes of 34 degrees 22 minutes and 47 degrees 25 minutes south, and between the longitude of 166 and 180 degrees east. The same navigator visited it again in 1773, and for the third time in 1774. These two islands are nearly of the same extent, and taken together as large as Great-Britain, having many small islands about them. The northernmost is called by the natives Eahei-Nomarve, and the southernmost Tivy or Tovai-Poenamoo. The latter is mostly hilly, and, to appearance, barren and thinly inhabited; but the former, though very mountainous, is tolerably fertile, and can boast of a rivulet running through every valley. Though these valleys do not abound with wood, yet, from the apparent nature of the soil, it was the opinion of some ingenious persons, that every kind of European grain would flourish here, and that through the exertion of industry in cultivation, not only the necessaries but luxuries of life might be obtained in rich variety. The climate, upon the whole, is said to be more temperate than that of England, from the vegetables that were found growing there in the winter season.

During six months circuit, in which Captain Cook fully explored the coasts of both islands, he gave names to several bays, rivers, and other parts of those coasts, from remarkable characters and various occurring circumstances. He called the first place where he anchored Poverty-Bay, because no necessaries were found there but wood. The next port he made was named Mercury-

Bay, because an observation was there made of the Transit of Mercury over the Sun; it is situated in latitude 36 degrees 57 minutes. The river that empties itself at the head of Mercury-Bay was called The River Thames; from its apparent resemblance to our river of that name; and its banks are pointed out as the most advantageous spot in these islands for planting a colony. The bay of islands, lying more to the northward, derives its appellation from the great number of islands contiguous, and from its several harbours, which are equally safe and commodious.

North-Cape, or Cape-North, so called from its situation, is the northern extremity of land on the island Eahei-Nomarve. The coast along the western shore was called, The Desert Coast, and a peak remarkably high, of most majestic appearance, and from the space which the snow occupies on it, supposed to be not much inferior to the Peak of Teneriffe, named Mount Egmont; and the shore under it, forming a large cape, received the appellation of Cape Egmont.

The southern island was as accurately surveyed as the northern. Here likewise, from the causes above-mentioned, names were given to several parts, as Banks's-Island, Cape-Saunders, The Traps, Dusky-Bay, Admiralty-Bay, &c. &c.

In Queen Charlotte's Sound (in which is situated Murderers'-Bay, so called by Tasman) was discovered a fine stream of excellent water, and wood in abundance. The inhabitants, who scarcely exceeded four hundred in number, were dispersed along the shore; they are poorer than the inhabitants of other parts of the country, their ground is uncultivated, their chief food is fish and fern-roots, and their canoes are without ornament. The climate here is much milder than that of Dusky-Bay, and as no frost was seen at the beginning of June, almost the depth of winter, it is probable that it seldom freezes here. There were some curiosities found on the hills and beaches, and, from many different appearances, the former existence of a volcano in New Zealand was more than conjectured. Queen Charlotte's-Sound is particularly eligible as a port and place of refreshment; from the number of antiscorbutic plants which grow upon every beach, many of which contribute both to health and aliment.

From the hills in general towards the sea, are one continued forest of lofty trees, which flourish with uncommon vigour; and it was remarked that no country abounded upon the whole so much with trees and plants, that were entirely unknown to the naturalists of Europe, as New Zealand. The size, growth, and durability of the timber render it fit for any kind of building. The large trees on the hills are chiefly of two sorts, one of them is of the size of our largest firs, and grows nearly in the same manner. A decoction of its leaves fermented with sugar or treacle, supplies the place of spruce in making beer, and our countrymen acknowledged it to be little inferior to American spruce beer; the other sort of tree is like a maple, and often grows very large, but

the sea, are one ourish with un-that no country trees and plants, alists of Europe, and durability of building. The wo sorts, one of nd grows nearly leaves ferment-ace of spruce in nowledged it to ; the other fort very large, but is

is only fit for fuel, the wood being too heavy for masts and yards, though it was the general opinion, that if some means could be devised to lighten them, they would produce masts superior to those of any country in Europe. In Dusky-Bay a beautiful tree was found in flower, of the myrtle kind, of which an infusion was drank instead of tea. Its leaves are aromatic, astringent, and have a very pleasant flavour at the first infusion, which is changed to a strong bitter on pouring water on the leaves a second time.

Trees of various sorts grow on the flats behind the beaches: two or three bear a kind of plum of the size of prunes; the one which is yellow is called karraca, and the other, which is black, maitao, though neither of them afforded a pleasant taste. The woods in many parts were so over-run with supple-jacks, that it was scarcely possible to force a way through them; several of these were fifty or sixty feet long.

This country produces wild celery and a kind of cresses, which grow in abundance on all parts of the sea coasts; these are sometimes used as salad or dressed as greens; in all those ways they are excellent, and, together with the fish, form a desirable refreshment. Here is the proper mulberry-tree, but extremely rare; also a berry which serves the natives instead of flax and hemp, and exceeds all that are made use of for such purposes in other countries. There are two sorts of this plant, in one kind the flowers are yellow, and in the other, a deep red. Of the leaves of these plants, with very little preparation, the natives make all their common apparel; of these also they make all their lines and cordage for every purpose. These are much stronger than any thing we can make with hemp. This plant grows in all places near the sea, and sometimes a considerable way up the hills, in bunches or tufts; being perennial it may be cut down to the root every year, and requires little care and attendance in the cultivation. It is remarked that our botanists were greatly tantalized here by the appearance of numerous trees and shrubs, which had lost their flowers and fruits, and only served to give them an idea of the great profusion of vegetables in this country.

There are not many insects in this country. There is a sort of little crane fly, particularly troublesome in the southern parts during bad weather. The sand fly, the only noxious one, is very numerous here, and is almost as disagreeable as the musquito. Their bite causes a swelling and intolerable itching. There are some butterflies, two sorts of dragon-flies, some small grasshoppers, several sorts of spiders, some black ants, and scorpion-flies, with whose chirping the woods resound. There are snakes and lizards of an enormous size.

In the woods are a great number and variety of birds, some are very beautiful, and most of them peculiar to the place. The only bird here which resembles any in Europe is the gannet; here are ducks and shaggs, but very different from any among us: their hawks, owls, and quails differ but little. There is a small green

bird, almost the only musical one to be found here. His melody is so sweet, and his notes so varied, that the listener would imagine himself surrounded by a variety of birds, when he exerts his vocal powers. From this circumstance he was called the mocking bird. Here are water hens of a large species; rails are scarce in all parts of New Zealand, except at Dusky-Bay, where they were seen in great numbers; also cormorants, oyster-catchers or seapies, albatrosses, ducks, penguins, and other sorts of the aquatic kind. Five species of ducks were found in Dusky-Bay, differing from each other in size and plumage. Among the small birds, are the wattle-bird, the poy-bird, and the fantail. Of the fantail there are different sorts; but the body of the most remarkable one is scarcely larger than a good filbert, yet it spreads a tail of most beautiful plumage, surpassing in extent considering its size. Our late travellers remark, that though it would be difficult and fatiguing to follow the birds of sport on account of the quantity of under-wood and the climbing plants, yet by continuing in one place, a fowler may shoot as many in a day as would serve seven or eight persons. The reason assigned for this observation is, that these birds were so little acquainted with mankind, that they familiarly perched on the nearest branches and hopped even on the ends of the fowling pieces, looking at every one that came near them with the greatest curiosity.

In this extensive country, the only quadrupeds which are known are dogs and rats. The dogs are of the rough, long-haired sort, with pricked ears, and much resembling the shepherd's cur; they are of different colours, and though kept by the natives as a domestic animal, pampered and indulged with fish as food in common with their masters, their bodies are afterwards eaten by them, and their skins applied to various uses of dress and ornament. The custom of eating dog's flesh is partly general among the inhabitants of these southern climes, and was at length adopted by our European navigators as a relief from the loathsome taste of salt provisions. The leg of a dog, killed on board one of the ships, was roasted and served up at the captain's table, which the company through disuse could not distinguish from mutton.

Many sorts of fish were caught here by the seine, and amongst the rest a species unknown in Europe, but very delicious. Every creek swarms with them. Mackerel of various kinds were caught in immense shoals; but the highest luxury which the sea affords here, is the lobster, or sea cray-fish, which differs from those in Europe in several particulars. They have a great number of prickles on their backs, and are red when first taken out of the water. There are elephant-fish, mullets, soles, flounders, bream, conger-eels, and a fish of five or six pounds weight, called by the natives a moggie. With the hook and line was caught a blackish fish called cole-fish by the seamen, but differing greatly from that of the same name in Europe. There is also a sort of small salmon, skate, gurnards, and nurfs; these

in general are well-flavoured, but the small salmon, colefish, and mogge are superior to the others. There are vast quantities of muscles among the rocks, many cockles in the sand of the small beaches, and in some places oysters, which, though small, have an agreeable taste, together with other shell fish of various kinds. There is not here any mineral deserving notice, except a green jasper stone of which the tools and ornaments of the inhabitants are made. This is held in high estimation among them, and they entertain some superstitious notions about the mode of its generation, but the particulars our countrymen could not comprehend.

In New Zealand the number of inhabitants bears no proportion to the extent of country. The southern part is very thinly inhabited, consisting chiefly of wanderers; but the northern is better peopled, though the western side of the island is quite a desert, and the interior parts are so mountainous that scarce any place is inhabited but the sea coasts.

The stature of the islanders in general is equal to the Europeans, but they are not so well formed, especially about the limbs, which are distorted by sitting so much on their hams, and being deprived, by the mountainous nature of the country, from using that kind of exercise which would render the body straight and well proportioned. Some, however, are well made, vigorous and active, and have a good share of adroitness and manual dexterity.

Their complexion is mostly brown, though not deeper than that of a Spaniard who has been exposed to the heat of the sun. They are rather darker in the southern island. Their faces are commonly round, their lips rather full, and their noses (though not flat) large towards the point. Their eyes are large, their teeth broad and irregular, their hair in general black, strong and straight, commonly cut short on the hinder part, and the rest tied on the crown of the head. The countenance of the young is generally free and open, but in many of the men it has a serious or sullen cast. The men are larger than the women, who are not remarkable for any peculiar graces either of form or feature; but their voices are very soft and harmonious, by which they are chiefly distinguished, the dress of both sexes being nearly the same. Like the women of most other countries, they have a cheerfulness superior to the men, and a greater flow of animal spirits.

They have a garment made of silky flax, about five feet in length and four in breadth. This appears to be their principal manufacture, which is performed by knotting. Two corners of this garment pass over the shoulders, and they fasten it on the breast with that which covers the body; it is again fastened about the belly with a girdle made of mat. It is sometimes covered with dog skin or large feathers. Many of them wear coats over this garment, extending from the shoulders to the heels. The most common covering, however, is a quantity of the sedgy plant badly manufactured, fastened to a string and thrown over the shoulders, whence

it falls down on all sides to the middle of the thighs. They adorn their heads with feathers, combs of bone or wood, pearl shells, and the inner skin of leaves. Both sexes have their ears slit, in which are hung beads, pieces of jasper, or bits of cloth. Some have the septum of the nose bored in the lower part, but no ornament was seen in it. Their tattowing is done very curiously, in spiral and other figures, and in many places indented with their skin, so as to look like carving; but, at a distance, it appears as if it had been only smeared with black paint. This tattowing and staining the face is peculiar to the principal men among them; those of inferior rank, as well as women, content themselves with besmearing their faces with red paint or ochre. The women wear necklaces of shark's teeth, or bunches of long beads, and some of them have small triangular aprons, adorned with feathers or pieces of pearl-shells fastened about the waist with a double or treble set of cords. Their winter dress is a shaggy cloak, called boghee boghee, which hangs round their necks like a thatch of straw. Their cloth is white and as glossy as silk, worked by hands, and wrought as even as if it had been wrought in a loom, and is chiefly worn by the men, though it is made by women, who also carry burdens and do all the arduous.

They erect their huts with great facility. They have been seen to erect above twenty of them on a spot of ground which was covered with plants and shrubs not an hour before. The savages had no sooner leaped from the canoes, than they tore up the shrubs and plants from the ground they had fixed on, and put up some part of the framing of a hut. These huts are sufficiently calculated for affording shelter from the rain and wind, and are built contiguous to each other. The best seen was built in the manner of one of our country barns, and was about six feet in height, fifteen in breadth, and thirty-three in length. The inside was strong and regular, well fastened by means of withes, &c. and painted red and black. At one end it had a hole serving as a door to creep out at, near which was a square hole, which served both for window and chimney.

Their hippahs, or fortified villages, consist of strong holds, erected on rocks, and secured on the land side by a bank, a ditch, and an high paling within the ditch. Some have out-works curiously constructed. These places seem only to be the occasional abodes of the natives, in case of danger from their enemies; for as soon as their state of tranquillity returns, they quit these heights for the level country.

They feed mostly on fish, which they catch with different kinds of nets, or wooden fish-hooks, pointed with bone, but made in so extraordinary a manner, that it appears astonishing how they can answer such a purpose. They shewed themselves more expert fishermen than any of their European visitants, nor were any of the methods practised by our people equal to theirs. They dress their fish by roasting, or rather baking them, being entirely ignorant of the art of boiling. It is thus they

le of the thighs. combs of bone or of leaves. they catch with dif- hooks, pointed with y a manner, that it answer such a purpose. expert fishermen than or were any of the equal to theirs. They er baking them, be- boiling. It is thus they

they also dress the root of the large fern-tree, in a hole prepared for that purpose: when dressed, they split it, and find a glutinous substance within, not unlike sago powder. The smaller fern-root seems to be their substitute for bread; being dried and carried about with them, together with great quantities of dried fish, when they go far from their habitations.

Water is their only drink, and they constantly refused to touch either wine or brandy, when on board the European vessels, and drank pure water, or sweetened with sugar, though they partook very freely of the provisions that were put on the table. They are as filthy in their feeding as in their persons, which often emit a very offensive effluvia, from the quantity of grease about them, and from their never washing their garments.

For an uncivilized people, their ingenuity claims notice; as, without the assistance of metal tools, they make every thing by which they procure their subsistence, clothing, and warlike weapons, with neatness, strength, and convenience. Their chief mechanical tools are the adze and axe, made of hard black stone, chisels of human bone, or fragments of jasper. They esteem their axes the most valuable of their possessions, nor will part with one of them upon any consideration. They have baskets of various kinds and sizes, made of wicker-work. The making of nets seem to be the staple manufacture of those parts of the country which were visited. These nets are of a circular form, extended by two hoops, and about seven or eight feet in diameter; the top is open, and they fasten sea-ears to the bottom as a bait. They let down this net, so as to lie upon the ground; and when they imagine fish enough are collected over it, they draw up by a gentle motion, so that the fish rise with it, scarcely sensible that they are lifted, till they come near the surface of the water, and then a sudden jerk brings them with the net into the boat.

They have a singular taste for carving, which must be admitted as their master-piece. This appears on the most trifling things: the ornaments on the heads of some of their canoes, not only display much design, but execution, though their tools in general are very awkward. A shell, a piece of flint or jasper, is their substitute for a knife, and a shark's tooth, fixed on the end of a piece of wood, is their auger.

Their chief weapons are spears or lances, darts, battle-axes, and the patoo-patoo. The spear is fourteen or fifteen feet long, pointed at both ends, and sometimes headed with bone. It is grasped by the middle, so that the part behind balancing that before, makes a push more difficult to be parried, than that of a weapon which is held by the end. The patoo-patoo is formed like a pointed battle-axe, with a short handle, and sharp edges, and designed for close fighting: through the handle there is a string to twist round the hand when the weapon is used. This patoo-patoo is worn in the girdle, as a considerable military ornament.

The chiefs carry about them a staff of distinction, generally the rib of a whale, ornamented round the top with carving, dog-skin, and feathers, like our halberts. Sometimes this staff is merely a stick about six feet long, adorned in the same manner, and inlaid with a shell resembling mother-of-pearl.

Their canoes are of different sizes, and much resemble the New-England whale-boat. Some of the largest fort seem to be built for war, being near seventy feet long, five feet broad, and three feet and an half deep. They have a sharp bottom, consisting of three trunks of trees hollowed, of which that in the middle is the longest. The side-planks are sixty-two feet long, in one piece, and carved in bas-relief; the head is still more richly adorned with carving. The gunwale boards are likewise frequently ornamented with tufts of white feathers placed upon a black ground. Their boats are worked by paddles, about six feet long, neatly made, the blade being oval, pointed at the bottom, and gradually losing its oval form in the handle. They make their strokes with those paddles with incredible quickness, and keep time so exactly, that all the rowers seem actuated by one common impulse. Sails of matting fixed upright, between two poles, are sometimes used; but they can make no way with these, unless it be right before the wind. The smaller canoes were no other than trunks of trees, intended wholly for fishing, without either convenience or ornament. The New Zealanders are by no means expert in navigation.

The natives of this country live under continual apprehensions of being destroyed by each other; most of their tribes having, as they think, sustained injuries from some other tribe, which they are over-eager to revenge. They generally steal upon the adverse party in the night; and if they chance to find them unguarded, which however seldom happens, they put every one to death without distinction, not sparing even women or children. When they have completed the inhuman massacre, they either gorge themselves on the spot, or carry off as many bodies as they can, and feast on them at home with the most horrid acts of brutality. If they are discovered before they have time to execute their sanguinary purpose, they usually steal off again, and sometimes they are pursued and attacked by the adverse party in their turn. They never give quarter, so that the vanquished must trust to flight alone for safety. From this state of perpetual hostility, and this destructive mode of carrying it on, a New Zealander acquires such habitual vigilance and circumspection, that he is seldom off his guard; indeed, they have the most powerful motives to be vigilant.

The inhabitants of the southern isle, in particular, lead a wandering kind of life, and seem to be under no regular kind of government, yet the head of each tribe is respected, and, on some occasions, commands obedience. Those of the northern isle acknowledge a sovereign, to whom great respect is paid, and by whom justice is prob-

ably

bably administered. The European visitants were given to understand, that they possessed their authority by inheritance.

It appears that the men here till the ground, make nets, catch birds, and fish with nets and lines, and the women dig up fern-roots, collect lobsters, and other shell-fish, in the shallow waters near the beach, dress the food, and weave cloth. Respect is paid to old men among them, who may be supposed to owe their consequence to the long experience they have gained; but their chiefs are strong, active young men, in the prime and flower of their life.

Their excessive cruelty towards some of our countrymen, in the year 1773, will appear by the following relation:

The two ships commanded by the Captains Cook and Furneaux having parted company, and not happening to join again, some time after the departure of Captain Cook, Captain Furneaux arrived in the month of December in Queen Charlotte's-Sound.—While he lay there, a cutter, with two petty officers and eight seamen, being sent up a creek to procure wood and water, not returning the next day, a boat was sent with an officer in quest of them. They were soon alarmed by the sight of some parts of the cutter, and some shoes, one of which was known to belong to a midshipman who was one of the party: presently a piece of meat was found, which at first was supposed to be some of the salted meat belonging to the cutter's crew; but on closer examination, it was found to be fresh. Several baskets lay on the beach tied up, which they eagerly cut open, and found to contain roasted flesh and fern-roots, which served them for bread. On further search many shoes were found, and a hand, which was immediately known to belong to a fore-castleman, it being marked with the initial letters of his name with an instrument, by a native of Otaheite. Many other articles were found, till having searched in vain in every part of the beach for the cutter, a shocking spectacle suddenly opened to their view. Here were scattered the heads, hearts, and lungs of several of the unhappy men, who had been massacred by the natives, and dogs were seen devouring their entrails. The sailors stood aghast, struck with horror at the sight, and with imprecations vowed revenge, which was soon executed, by firing and killing many of the savages, and destroying all the canoes that lay on the beach.

Yet notwithstanding their ferocity in the above, and divers other instances in their disposition, our countrymen had an opportunity of remarking, not only their personal subordination, but some proofs of their hospitality. Going on shore in search of the natural productions of the country, two very ingenious gentlemen accidentally fell in with an agreeable Indian family. The principal were a widow, and a darling son about ten years old. The widow was mourning for her husband, according to their custom, with tears of blood, and the child, by the death of the father, was become proprietor

of a district of land. The widow and her son were sitting upon mats, and the rest of the family, to the number of sixteen or seventeen of both sexes, sat round them in the open air; for they did not appear to have any home, or other shelter from the weather, the inclemencies of which custom had enabled them to endure without any lasting inconvenience. It was remarked, that their whole behaviour was obliging, affable, and unselfish. They presented their visitants with a fish, and a brand of fire to dress it, and importuned them to stay till morning, which they would have done, had they not expected the vessel to sail.

When our British navigators first explored these parts, the first inhabitants they saw were a man and two women. The man stood with a battle-axe and club in his hand, on the rocky point of an island, and called to the commander and others who were passing near him in a boat. The women were behind him, each with a long spear in her hand. His salutation was answered in the language of Otaheite, "Tayo barre mai;" Friend, come hither. He did not, however, stir from his post; but held a long speech, frequently swinging round his club, on which he leaned at other times. The commander landed on the rock alone. The poor native gave evident tokens of fear, but stood however firm on the same spot. The commander went up to him and embraced him, according to the custom of the country, by joining noses. This token of amity dispelled all apprehensions on the part of the natives. The man received the presents that were made him, and the two women joined company. One of them had a prodigious excrescence on the upper lip, and was in every respect remarkably ugly. But on a renewal of the visit the next day, the natives received all the articles that were offered them with great indifference, except hatchets and spike nails; in return for which, they parted with several of their ornaments and weapons, but did not seem inclined to part with their spears. A good understanding being now established, the next time our countrymen visited them, they found them dressed out in the highest taste of the country. Their hair was combed, tied to the crown of the head, and anointed with oil or grease; white feathers were stuck at the top; some had fillets of white feathers all round the head, and others wore pieces of an albatross skin, with the fine down in their ears. A cloak of red baize was presented to the chief, in return for which, he gave the commander a patoo-patoo, which he drew from his side.

A man and young woman being prevailed on to come on board, the former, before he left the shore, broke off a small green branch from a bush, walked on with it in his hand, and having struck the ship's side with it several times, began to recite a kind of speech or prayer, which seemed to have regular cadences, and to be arranged in metre as a poem. It lasted two or three minutes, and when over, he threw the branch into the main chain, and went on board. His manner of delivering solemn orations, and making peace, is practised

by

by all nations in the South-Seas, as appears from the testimonies of various voyagers. All they saw excited the curiosity both of the girl and the man; they were particularly pleased to find the use of chairs, and that they might be removed from place to place; but it was not possible to fix their attention to any one thing for a single moment.

Of all the various presents that were made the man, hatchets and spike nails still continued to be most valuable in his eyes; these he never would suffer to go out of his hands after he had once laid hold of them, whereas he would lay many other articles carelessly down, and often at last leave them behind him. They could not be prevailed upon to eat any thing; but passed some compliments on our countrymen, according to their own forms and customs.

In a short time an acquaintance was cultivated with a few more of the natives, who seemed to be the only inhabitants in this part of the country. These coveted the possession of every thing they saw, or could lay their hands on, except muskets, which they would not touch, having learnt to dread them as instruments of death, from the destruction they had seen them make among the wild-fowl.

The disposition of these people is however very open, for if they had not discovered themselves, and thereby made the first advances, they might with great ease have kept themselves concealed; but a certain openness and honesty appeared strongly to mark their character; for had they been inclined to treachery, they would have endeavoured to have cut off small parties that were frequently dispersed in different parts of the woods, in which they might have been but too successful.

The following little anecdotes may tend further to a display of the disposition of these islanders.

A New Zealander came on board an European vessel when she lay in Queen Charlotte's-Sound, accompanied by his son and daughter. Being introduced into the cabin, the son was presented by the captain with divers trinkets, and dressed out in one of his own white shirts. Unable to withstand the impulse of puerile vanity, he ran upon deck in order to shew his finery to his countrymen. An old he-goat, conceiving a kind of capricious dislike to the ludicrous figure of poor Khoaa (for that was the boy's name) assailed him, and raising himself on his hind legs, with one butt of his head, laid him prostrate on the deck. The father, amazed to see the incipient present begrimed with filth, bestowed many blows on the unfortunate sufferer, in token of his resentment. The shirt, however, by washing, was soon brought to its former state of purity; and what was more, the boy was washed all over; most probably for the first time in his life; but the provident father, dreading another mischance to the precious vestment, carefully rolled it up, and taking off his own dress, made a bundle of it, in which he placed all the presents that he and his son had received.

A disposition to steal and secrete every thing they

could lay their hands on, was discoverable in all that came on board the vessel in Queen Charlotte's-Sound; and those that were detected, were treated with merited disgrace and ignominy. They appeared to feel the whole weight of shame which their behaviour brought on them; nay, one of them uttered threats, and made violent gestures in his canoe. Upon another occasion of the like nature, a young New Zealander discovered his resentment by striking a sailor, merely for recovering his property that had been stolen; but the tar, according to the law of retaliation, imprinted the marks of his fit on the face of the aggressor.

A boy, about fourteen years of age, was prevailed on to drink a glass of Madeira wine, which caused him to make wry faces; but a glass of sweet Cape wine being filled out to him, he relished it so well as to lick his lips, and desired to have another, which he likewise drank off. This soon began to elevate his spirits, as appeared from the volubility of his tongue and his antic gestures, as well as his expression of indignation at being refused divers articles, for which he had conceived a predilection. In a word, his behaviour was such, as exhibited a very just sample of the impatient temper of those people.

Several of the natives here had very expressive countenances; particularly some old men with grey and white beards, and some young men with great quantities of bushy hair, which hung wildly over their faces, and increased the ferocity of their looks. As proofs of the force of superior genius, their inquiries after Tupia, and the concern they shewed for his death, were singularly emphatical. It was shrewdly observed by one of our countrymen present, that this man, with the capacity with which he was endowed, and which had been cultivated no further than the simplicity of his native manners extended, was probably better qualified for civilizing the New Zealanders, than any of the more enlightened Europeans.

Their various methods of attack and defence, as exhibited before the Europeans, were as follow: One of their young men mounted a fighting stage, which they call porava, and another went into a ditch. Both he who was to defend the place, and he who was to assault it, sung the evar-song, and danced with frightful gesticulations. These were practised as means of working themselves up into that mechanical fury, which among all uncivilized nations is the necessary prelude to a battle. Their engagements, whether in boats or on shore, are generally hand to hand, and the slaughter must consequently be great, as a second blow with any of their weapons is unnecessary, if the first takes place. Their trust, however, seems to be principally placed in the patoo-patoo, already described. They gloried in their cruelties, and shewed their visitors the manner in which they dispatched their prisoners, which was to knock them down with their patoo-patoos, and then to rip them up. They made no scruple of declaring their practice of eating their enemies. The bones of a man were

K seen

seen with the flesh off; and every circumstance concurred to render it evident that these people were cannibals, for there was found in one of their provision baskets, the remaining flesh, which appeared to have been dressed by fire, and in the gristles at the end were the marks of teeth which had gnawed them. To ascertain the fact, Tupia was directed to ask what bones they were; the Indians without hesitation replied, the bones of a man: when asked what was become of the flesh, they replied, they had eaten it. One being afterwards asked why they did not eat the body of a woman that was seen floating upon the water? The woman, they said, died of a disease; and added, that she was their relation, and they eat only the bodies of their enemies.

The people of New Zealand are more passionate than the other South-Sea islanders in general, yet they are more modest; and if the women are not invincible, the terms and manner of their compliance are as decent as those in marriage amongst the Europeans. When an overture is made to any young woman, the party is given to understand, that the consent of friends is necessary; that a suitable present must be made; that the consenting female must be treated with good manners; that no unbecoming liberties must be taken, and that day-light must not be witness to what passes between them.

The lower garment worn by the women, is bound fast round them, except when they go into the water to catch lobsters, and then they take care not to be seen by the men. But, in course of time, the morals of the natives, both male and female, appeared not to be at all mended by their intercourse with Europeans. It was observed by our countrymen, on their second visit, that instead of behaving with the same reserve that had marked their conduct before, both sexes had abandoned their native principles, and the men promoted a shameful traffic of their daughters and sisters. It did not appear, however, that the married women were suffered to have any intercourse of this kind. The ideas of female chastity, which prevail here, are quite different from ours; for here a girl may grant her favours to a plurality of lovers, without any stain on her character; but conjugal fidelity is rigorously expected if she marries. Polygamy is allowed; and it is not uncommon for a man to have two or three wives. The females are marriageable at a very early age; and it should seem that one who is unmarried is but in a forlorn state: she can with difficulty get a subsistence, at least she is in a great measure without a protector, though in constant want of a powerful one.

In some places to the northward, there were considerable traces of cultivation, and the ground appeared as well broken and tilled as amongst us. The plantations were of different extent from one or two acres to ten, and in the whole of Poverty-Bay there appeared from 150 to 200 acres in cultivation, though an hundred people were not seen all the time the Europeans continued there.

As Tupia was perfectly understood in his own language by the natives of this country, and there seemed to be a similarity of dialect in all the islands visited by our European navigators, it was deemed a strong argument for the inhabitants being all descended from one common stock. Exceptions are however found to the universality of the language, among the inhabitants of New Caledonia and the New Hebrides.

The war-song of New Zealand is extraordinary. In it the women join the men with horrid distortions of countenance and hideous cries, which they utter in extreme good time. Their musical instruments consist of a trumpet, or tube of wood, about four feet long, and pretty straight. It makes a strange and uncouth noise, and it was observed they always sounded the same note. Another trumpet was made of a large whelk, mounted with wood, curiously carved, and pierced at the point where the mouth was applied. An hideous bellowing was all the sound that could be produced from this instrument. The natives were frequently heard singing on shore, as well as in their canoes, and sometimes they sang on board the European vessels.

Some of the New Zealanders, inhabitants of Queen Charlotte's-Sound, exhibited an *heiva*, or dance, on the quarter-deck. They placed themselves in a row, and parted with their shaggy upper garments; one of them sang some words in a rude manner, and all the rest accompanied the gestures he made, alternately extending their arms, and stamping with their feet in a violent and most frantic manner. The last words, which might be supposed to be the chorus, they all repeated together, and some sort of metre was distinguishable, but whether it was calculated to make rhyme, could not be discovered.

The ease with which their wounds heal, is adduced as a strong proof of the health which these people enjoy. One of them had a shot with a musket ball through the fleshy part of the arm, which, without any application, soon appeared well adjusted, and in a fair way of being perfectly healed. The venereal disease is now, indeed, too common among them. This dreadful disorder is said to have been introduced among the natives by the crew of a vessel unknown, that put into an harbour on the north-west coast of Teerawite, a few years before our countrymen arrived in the Sound in the Endeavour. The only method they practise as a remedy, is to give the patient the use of a kind of hot bath, produced by the steam of certain green plants placed over hot stones.

The New Zealanders acknowledge a Supreme Being; they believe in many inferior divinities; yet there was not a single ceremony observed in any part of New Zealand, that could be supposed to have a religious tendency, nor did they appear to have any priests. Here were no places of public worship, like the *Morais* in other parts; but in a plantation of sweet potatoes was seen a small area of a square figure, surrounded with

with stones, in the middle of which a sharp stake, (which they use as a spade) was set up. The natives being questioned about it, said, it was an offering to the gods, by which the owner hoped to render them propitious, and to reap a plentiful harvest.

The manner of burying their dead could not be ascertained. From the minutest inquiry, it seemed, that in the northern parts they buried them in the ground, and in the southern, that they threw them into the sea; the only process which they use being to tie a stone to the body to cause it to sink. They affect, however, to conceal every thing relating to the dead with a kind of mysterious secrecy. Whatever may be their forms and modes of funeral, they lament the loss of their friends in a manner the most tender and affectionate.

Both men and women, upon the death of a relation or friend, bewail them with the most miserable cries, at the same time cutting large gashes in their foreheads, cheeks, arms, or breasts, with shells, or pieces of flint, till the blood flows copiously, and mixes with their tears. They also carve the resemblance of a human figure, and hang it about their necks as a memorial of those who were dear to them. They likewise perform the ceremony of lamenting and cutting for joy, at the return of a friend who has been some time absent.

Captain Cook, on his last visit to this country, in 1777, anchored in his old station in Queen Charlotte's-Sound, soon after which several canoes filled with natives came along side the vessels; but very few of them would venture on board, which appeared the more extraordinary, as the commander was well known to them all. There was one man in particular amongst them whom he had treated with remarkable kindness during his whole stay; yet now, neither professions of friendship, nor presents, could prevail upon him to come into the ship. This shyness was to be accounted for only upon this supposition, that they were apprehensive of a revisit to revenge the deaths of our countrymen on a former voyage. The commander, therefore, deemed it expedient to use every endeavour to assure them of the continuance of his friendship, and that he should not disturb them on that account. It should seem that this had the desired effect; for they soon laid aside all manner of restraint and distrust. As a proof of this, great numbers of families came from different parts of the coast, and took up their residence close to the Europeans, from which they derived very considerable advantages, and, in particular, an ample supply of fish and vegetables.

It was remarked, upon an excursion up the island, that though upon the former voyage several spots were planted with English garden seeds, not the least vestige of these ever remained; and it was there supposed, that they had been all rooted out to make room for buildings when these spots were re-inhabited; for at all the

other gardens then planted by Captain Furneaux, although now wholly over-run with the weeds of the country, were found cabbages, onions, leeks, purslain, radishes, mustard, together with a few potatoes.

When the commander, accompanied by several officers, Omai (who was then on his return to his own country) and two of the natives, proceeded about three leagues up the sound, in order to cut grass, &c. They visited, on their return, Grays-Cove, the memorable scene of the massacre of their countrymen. Here the commander met with a friendly chief, called Pedro, who had attended him on a former occasion, and therefore availing himself of the opportunity of inquiring into the circumstances attending their melancholy fate, used Omai as interpreter: the natives answered all the questions that were put to them on the subject without reserve, and like men who are under no dread of a punishment for a crime of which they are not guilty: for it was already known, that none of these had been concerned in the unhappy transaction.

Though the narration was in some degree intricate, it appeared upon the whole, that the quarrel first took its rise from some thefts, in the commission of which the natives were detected. The Europeans chastised them with blows for the offence, in resentment of which the quarrel opened, and two New Zealanders were shot dead by the only two muskets that were fired; for before our people had time to discharge a third, or to load again those that had been fired, the natives rushed in upon them, overpowered them with their number, and put them all to death. Those who escaped, besides relating the story of the massacre, made the party acquainted with the very spot that was the scene of it. They pointed to the place of the sun to mark to them at what hour of the day it happened, according to which it must have been late in the afternoon. They also shewed the place where their boat lay, and it appeared to be about two hundred yards distant from that where the crew were seated at dinner at the time of the commission of the theft of some bread and fish. They all agreed, that there was no premeditated plan of bloodshed, and that if the theft had not been unfortunately too hastily resented, no mischief would have happened. Amongst occasional visitors was a chief, named Kaheora, who stood charged as the head of the party that committed the massacre: but his greatest enemies, at the same time that they solicited his destruction, excupulated him from any intention to quarrel, much less to kill, till the fray had actually commenced.

It appeared also, that the unhappy victims were under no apprehension of their fate, otherwife they would not have ventured to sit down to a repast at so considerable a distance from their boat, amongst people who were the next moment to be their murderers. What became of the boat could not be learnt. Some said the was pulled to pieces and burnt, others said she was carried they knew not whither by a party of strangers.

The

The party continued here till the evening; when having loaded the rest of the boats with grass, celery, scurvy-grass, &c. they embarked to return to the ships. The day following, Pedro and all his family came and took up his abode near their European visitors. The proper name of this chief is Matahouah, the other being given him by some of the people during the last voyage, which till now was unknown to the commander. He was, however, equally well known amongst his countrymen by both names.

At one time our people were visited by a tribe or family, consisting of about thirty persons, men, women, and children. The name of their chief was Tomaton-Geauoaramec, a man of about forty-five years of age, with a cheerful, open countenance. It was remarked, indeed, that the rest of his tribe were the handsomest of the New Zealand race ever met with.

By this time, great numbers of them daily frequented the ships and the encampment on the shore; but the latter became by far the most favourite place of resort, while our people there were melting some seal-blubber. It appeared from observation, that no Greenlander was ever fonder of train-oil than the New Zealanders; for they relished the very skimings of the kettle and dregs of the casks; and a little of the most stinking oil, was a delicious repast.

The ships weighing anchor, and standing out of the cove, were seen from streaks of weather under a necessity of coming to again, a little without the island of Moheara, to wait for a more favourable opportunity of putting into the freight. Here three or four canoes, filled with natives, came off to the crews, and a brisk trade was carried on for the curiosities of this place. In one canoe was Kahoorā, already mentioned as the leader of the party who cut off the crew of the Adventurer's boat. He was pointed out to the commander by Omai, who solicited him to shoot him. Not satisfied with this, he addressed himself to Kahoorā, threatening to be his executioner, if he ever presumed to face our people again. The New Zealander, however, paid so little regard to his threats, that the very next morning he returned with his whole family, men, women, and children, to the number of twenty and upwards.

Omai then renewed his solicitations to the commander to kill him; and though he used several specious arguments, they had no weight. He desired him, however, to ask the chief, why he had killed Captain Furneaux's people? At this question, Kahoorā folded his arms, hung down his head, and there was every reason, from his appearance, to think, he expected instant death: but no sooner was he assured of his safety, than he became cheerful. He did not, however, seem willing to answer the questions put to him, till repeatedly promised he should not be hurt. He then ventured to give information, that one of his countrymen having brought a stone hatchet to barter, the man to whom it was offered, took it, and would neither return, or give any thing for it; on which the owner snatched

up the bread as an equivalent, and then the quarrel began.

The rest of the story differed very little from what had been before related by his countrymen.

Most of the natives well knew that the British commander was acquainted with the history of the massacre, and expected it to be avenged in the death of Kahoorā. Many of them indeed seemed not only to wish it, but expressed a surprise at what they deemed so undeserved a forbearance. The commander professes this admiration of the man's courage, in putting himself in his power, and of the proofs he gave of placing his whole safety in the declarations he had uniformly made to those who solicited his death, "that he (the captain) had been a friend to them all, and would continue so, unless they gave him cause to act otherwise; that as to their inhuman treatment of his countrymen, he should think no more of it, the transaction having happened long ago, and when he was not present; but that if ever they made a second attempt of this kind, they might rest assured of feeling the weight of his resentment."

Some time before the arrival of our ships at New Zealand, Omai had expressed a desire of taking one of the natives with him to his own country, and soon had an opportunity of being gratified in the same; for a youth about seventeen or eighteen years of age, named Taweihooa, offered to accompany him, and took up his residence on board. The commander paid little attention to this at first, imagining that he would go off when the ship was about to depart. At length, finding that he was fixed in his resolution, and having learnt that he was the only son of a deceased chief, and that his mother, still living, was a woman much respected there, he was apprehensive that Omai had deceived him and his friend, by giving them hopes and assurances of his being sent back. He therefore caused it to be made known to them all, that if the young man went away with the ships, he would never return. But this declaration seemed to make no sort of impression. The afternoon before the ship left the Cove, his mother came on board to receive her last present from Omai. The same evening, she and Taweihooa parted, with all the marks of tender affection that might be expected between a parent and a child, who were never to meet again. But she said she would cry no more, and indeed she kept her word; for when she returned the next morning to take her last farewell of him, all the time she was on board, she remained cheerful, and went away apparently unconcerned.

Another youth was to have gone with Taweihooa as his servant, and with this view, as was supposed, he remained on board till the ship was about to sail, when his friends took him on shore. His place, however, was supplied next morning by another boy, of about nine or ten years of age, named Kokoa. He was presented to the commander by his own father, who, it was believed, would have parted with his dog with far less indifference. He stripped the boy of the very little clothing

clothing he had, and left him as naked as he was born. It was totally in vain to endeavour to persuade these people of the impossibility of these youths ever returning home. Not one, not even their nearest relations, seemed to trouble themselves about their future fate; and as this was the case, the commander was well satisfied that the boys would be no losers by exchange of place; and he the more readily gave consent to their going on that account.

CHAP. IV.

NEW CALEDONIA, AND ISLANDS CONTIGUOUS.

Their Situation, Vegetables, Animals, Dress, Dwellings, Disposition, Musical Instruments, and various Customs of the Natives.

CAPTAIN COOK discovered this island in 1774, and called it New Caledonia, after he had in vain endeavoured to discover the Indian name. Indeed, it is probable, that it was not known by one general name, as it has been represented as the largest island that has been discovered in the southern Pacific Ocean, New Zealand and New Holland excepted, extending from 19 deg. 37 min. to 22 deg. 30 min. south latitude, and from 163 deg. 37 min. to 167 deg. 14 min. east long. In length it is computed to be 87 leagues, in the direction of north-west and south-east, but its breadth no where exceeds 10. It is situated about 12 deg. distant from New Holland.

This country is diversified by hills and vallies of various extent. From the hills issue many fine streams, which render the vallies both fertile and pleasant, and but for which the whole spot might be called a dreary waste, nature having been less bountiful to New Caledonia, than to the other tropical islands in the South-Seas. The mountains, and other high parts, are, for the general, incapable of cultivation, consisting chiefly of barren rocks. The island bears, upon the whole, a resemblance to those parts of New South-Wales that are under the same parallel of latitude; several of its natural productions being the same, and the woods without underwood, as in that country.

The whole coast appeared surrounded by reefs or shoals, which render the access to it very dangerous; though, at the same time, they guard it from the attacks of wind and sea, cause it to abound with fish, and secure an easy and safe navigation along it for canoes. The coast in general seems to be inhabited; the plantations in the plains appear to be laid out with judgment, and cultivated with industry. Some of them were lying fallow, some seemed to be lately laid down, and others of longer date, parts of which they were again

beginning to dig up, having previously set fire to the grass, &c. that had over-run the surface. Yet though recruiting the land by letting it continue fallow for a series of time, was observed by all the different nations in this sea, none appeared to have any notion of manuring it. On the beach was found a large irregular mass of rock, not less than a cube of ten feet, which consisted of a close-grained stone, speckled, full of granites, rather larger than pins heads; from whence it was conjectured, that some rich and useful mineral might be deposited in this island.

There is no great variety in the vegetable system in this country; however, several of a new species were found here, and a few young bread-fruit trees; but they seem to have come up without culture. There are a few plantations and sugar-canes, and some cocoa-nut trees small and thinly planted. A new kind of passion-flower was also met with, which was never before known to grow wild any where but in America. Several trees called *caputi* trees, were found in flower. They had a loose bark, which in many places burst off from the wood, and concealed within it beetles, ants, spiders, lizards, and scorpions. This bark is said to be used in the East-Indies, for calking ships. The wood of the tree is very hard, the leaves are long and narrow, of a pale, dead colour, and a fine aromatic.

A great variety of the feathered tribe, and for the most part entirely new, were found here, particularly a beautiful species of parrots, unknown to naturalists. There were also ducks, large tame fowls, with bright plumage, a kind of small crow, tinged with blue, turtle-doves, fly-catchers, hawks, boobies, tropic birds, and others.

Turtles and fish are here in plenty, particularly a species of a poisonous quality, as appeared from its effects upon some of our countrymen, who ate a small part of the liver for supper. A few hours after they had retired to rest, they were awakened by very alarming symptoms, being seized with extreme giddiness; their hands and feet were numbed, so as scarcely to be able to crawl, and a dreadful languor took possession of their whole frame. Emetics were administered with some success; but sudorifics proved most effectual. It seemed that the natives had not the least notion of goats, swine, dogs, or cats, as they had not even a name for any one of them. The chief insects are musketoes, which abound here.

In general the natives of New Caledonia are stout, and well proportioned. They have good features, black hair, strong and frizzled. Their principal colour is swarthy, or what we call mahogany. Some wear their hair long, and tie it up to the crown of their heads. Others suffer only a large lock to grow on each side, which they tie up in clubs; many of the men, as well as all the women, wear it cropped short. They use a kind of comb made of sticks of hard wood, from seven to ten inches long, and about the thickness of knitting-needles. A number of these, amounting to

about twenty, are fastened together at one end, parallel to each other, and near one-tenth of an inch asunder: the other ends, which are a little pointed, will spread out or open like the sticks of a fan. These combs they wear constantly in their hair, on one side of their head. Some had a kind of stiff black cap, like that of an hussar, which appeared to be a great ornament among them, and was supposed to be worn only by chiefs and warriors. The men go naked, except tying a wrapper round the middle, and another round the neck. A piece of brown cloth, which is sometimes tucked up to the belt, and sometimes hangs down, scarcely deserves the name of a covering, and in the eyes of Europeans would appear rather obscene than decent. This piece of cloth is sometimes of such a length, that the extremity is fastened to a string round the neck. To this string they hang small round beads of a pale green nephritic stone. Coarse garments were seen among them, made of a sort of matting; but they seemed never to wear them except when in their canoes, and unemployed. They stretch the flaps of their ears to a great length, cut out the whole cartilage or gristle, and hang a number of tortoise-shell rings in them.

In New Caledonia, the women are kept at a distance by the men, and seem fearful to offend them, either by look or gesture. They were the only persons in the family who seemed to have any employment, several of them bringing bundles of sticks and fuel on their backs. Their indolent husbands scarcely deigned to regard them, though they exhibited that social cheerfulness which is the distinguishing ornament of the sex. They carried their infants on their backs in a kind of satchel, and were seen to dig up the earth in order to plant it. Their stature is of the middle size, and their whole form rather clumsy. Their dress is very disfiguring, and indeed gives them a thick, squat shape. It is a short petticoat, resembling fringe, consisting of filaments or little cords about eight inches long, just dropping below the waist. These filaments were sometimes dyed black; but frequently those on the outside only were of that colour, while the rest were of a dirty grey. They wore shells, ear-rings, and pieces of nephritic stones, like the men, and tattooed or besmeared themselves in three black straight lines, from the under lip downwards to the chin. Their features expressed much good-nature.

Some of the women were shy, and seemed by their motions to indicate an apprehension of being slain, if observed alone with a stranger; while others expressed no dread of the jealousy of the men. They came among the crowd, and sometimes amused themselves in encouraging the proposals of the sailors, though they constantly eluded their pursuit, and heartily derided their disappointment. It was remarkable, that during the vessel's stay in the island, there was not a single instance of the women permitting an indecent familiarity from an European.

The houses or huts here are of a circular form, somewhat like a bee-hive, and full as close and warm: the

entrance is by a small door, or long hole, just big enough to admit a man bent double: the roof is lofty, and brought to a point at the top; the framing is of small reeds, &c. and both sides and roof are thick and close covered with thatch, made of coarse long grass. In the inside of the habitation are set up posts, to which coarse spars are fastened, and platforms made for the convenience of laying any thing on. In most of these huts were no fire-places, and there was no passage for the smoke but through the door; they were insupportable to those unaccustomed to them. The smoke was supposed to be designed to drive out the musketoes that swarm here: they commonly erect two or three of these huts near each other, under a cluster of lofty fig-trees, whose foliage is so thick as to keep off the rays of the sun. These trees are described by voyagers, as shooting forth roots from the upper part of the stem, perfectly round, as if made by a turner: the bark seems to be the substance of which they prepare the small pieces of cloth so remarkable in their dress.

Their canoes are heavy and clumsy, and made out of two large trees hollowed out, the gunnel raised about two inches high, and closed at each end with a kind of bulk head of the same height. Two canoes thus constructed, are secured to each other about three feet asunder, by means of cross spars, which project about a foot over each side; over which is laid a deck, or heavy platform, made of plank, on which they have a fire-heap, and generally a fire burning: they are navigated by one or two sails, extended on a small yard, the end of which is fixed in a notch or hole in the deck. Their working tools are made of the same materials, and nearly in the manner as those of the islands contiguous. They have no great variety of household utensils; the principal is a jar made of red clay, in which they bake their roots, and probably their fish.

The natives are well provided with offensive weapons, such as clubs, spears, darts, and slings for casting stones: their clubs are about two feet and a half long, and of various forms; some like a scythe, others like a pick-axe; some have a head like a hawk, and others have knobs at the ends; but they are all neatly made, and well polished. Many of their darts and spears are ornamented with carved work: their slings are as simple as possible, being no other than a slender round cord, no thicker than packthread, with a tassel at one end, a loop at the other, and in the middle. They take some pains to form the stones they use into a proper shape, which is something like an egg: these, exactly fit the loop in the middle of the sling, and are kept in a pocket of matting, tied round the waist for that purpose. They cast the dart by the assistance of short cords, knobbed at one end, and looped at the other, which the seamen call Becketts, and were dexterous in the use of them. Their spears are fifteen or twenty feet long, blackened over, and have a prominence near the middle, carved so as to bear some resemblance to an human face.

The

The language of the inhabitants of New Caledonia bears little affinity to any of the various dialects spoken in the other islands in the South-Seas, the word *areetee*, and one or two more excepted: this is the more extraordinary, as different dialects of one language were spoken, not only in the eastern islands, but at New Zealand: their pronunciation is indistinct.

These people are remarkably courteous and friendly, and not in the least addicted to pilfering, in which last respectable quality they stand alone. They are good swimmers, and fond of singing and dancing. The only musical instrument observed among them was a kind of whistle made of a polished piece of brown wood, about two inches long, shaped like a bell, though apparently solid, with a rope fixed at the small end: two holes were made in it near the base, and another near the insertion of the rope, all which communicated with each other, and, by blowing in the uppermost, a shrill sound like whistling was produced.

Many inhabitants in New Caledonia were seen with very thick legs and arms, which seemed to be affected with a kind of leprosy. The swelling was found to be extremely hard, but the skin was not alike harsh and scaly in all the sick persons. The preternatural expansion of the leg and arm did not appear to be a great inconvenience to those who suffered it, and they indicated, by tokens, that they felt pain in it very rarely; but in some the disorder began to form blotches, which were marks of a great degree of virulence.

The method used by the people of New Caledonia to deposit their dead in the ground, is more judicious and decent than that of some others in the South-Seas, where they expose them above ground, till the flesh is putrefied; as the last-mentioned custom must be attended with the most pernicious consequences, and produce dreadful epidemical distempers. The grave of a chief who had been slain in battle here, bore resemblance to a large mole-hill, and was decorated with spears, darts, &c. all stuck upright in the ground round about it. It appears a custom universally prevalent with mankind, to erect a monument on the spot where their dead are buried.

One of the English officers was shewed a chief whom they called Tea-Booma, and styled their *areetee*, or king; but little is known of their mode of government, and less of their religion. They gave the Europeans a very welcome and peaceable reception, addressing the commander first in a short speech, and then inviting him on shore; but they are indolent, and destitute of curiosity: the greater part of them did not remove from their seats when the strangers passed them for the first time: they are also remarkably grave, speak always in a serious tone, and laughter is hardly ever observed among them.

When Captain Cook first landed in this part, he was accompanied by a native who appeared to be a man of some weight, and who had come on board the vessel before she came to an anchor. The natives assembled in

great numbers on the beach, induced merely by curiosity; for many had not so much as a stick in their hands: the party were received on landing with the greatest courtesy, and with the surprise natural for people to express at seeing men and things so wonderful. The commander made presents to all whom his companion pointed out; but on his going to give a few beads and medals to some woman who stood behind the crowd, the chief held his arm, and would not suffer him to do it. As they proceeded up the creek one of the party shot a duck, which was the first use the natives had seen of fire-arms: the friendly chief requested to have it, and when he had landed, he told his countrymen in what manner it was killed. From this excursion, the party learned that they were to expect nothing from these people, but the privilege of visiting their country undisturbed, for they had little else than good nature to bestow. In this particular, they are said to have exceeded all the nations our voyagers had met with; and they observed, that although it did not satisfy the demands of nature, it at once pleased, and left all their minds in tranquillity.

A hatchet here was not quite so valuable as a spike nail; small nails were of little or no value to them; nor did they admire beads, looking-glasses, &c. Many of the natives came on board the ship with perfect confidence, and one of them exchanged a yam for a piece of red cloth. They admired every thing that had a red colour, particularly red cloth or baize, but did not choose to give any thing in exchange. Captain Cook sent the King Tea-Booma a dog and a bitch, both young, but nearly full grown, which may be the means of stocking the country with that species of animals; and to Hebai, the friendly chief before spoken of, he gave a sow and boar pig, in order to provide, if possible, a stock of domestic animals, for a nation whose inoffensive character seemed highly deserving of such a present. To enhance their value with the Indians, and thereby induce them to be more careful of their stock of hogs, it was explained to them how many young ones the females would have at one time, and how soon this would multiply to some hundreds. Not one of the natives attempted to take the least trifle by stealth, but all behaved with the strictest honesty. Some of them spoke of a great land to the northward, which they called Mingha, the inhabitants of which were their enemies, and very warlike. They likewise pointed out a sepulchral mound, where one of their chiefs lay buried, who had been killed, fighting in the defence of his country, by a native of this Mingha. The appearance of a large beef bone, which an officer began to pick towards the conclusion of the supper, interrupted this conversation.

The natives talked loudly and earnestly to each other, looked with great surprise and some marks of disgust at the strangers, and at last went away all together, expressing by signs, that they supposed it to be the limb of a man. The officer was very desirous of freeing himself and his countrymen from this suspicion, but was prevented

vented by two insurmountable obstacles, want of language, and the natives having never seen a quadruped. At another time the Europeans were given to understand, by very significant gestures, that the natives had enemies who feasted upon flesh, which, doubtless, had caused them to impute the same practice to their new visitors. This island remains entirely unexplored on the south side: its minerals and vegetables have not been touched upon; animals, it should seem to have none, from the ignorance which the natives to the northward discovered of such as they saw. The commander caused the following inscription to be cut in a remarkable large and shady tree on the beach close to a rivulet: "His Britannic Majesty's Ship, Resolution, September 1774," to perpetuate the memory of the expedition.

The ISLE OF PINES, to the S. W. of New Caledonia, lies in latitude 22 deg. 40 min. south, longitude 167 deg. 43 min. east. This island, so far from being an inconsiderable spot, as some have believed, is not less than fourteen or fifteen miles over in a south-east and north-west direction: it is high, and remarkable in the middle, being quite a pointed hill, sloping towards the extremities, which are very low; the low land had many tall pine trees upon it; these trees seemed exceedingly to surpass in length those of Norfolk-Island, but their branches did not appear to extend so far from the body of the tree.

BOTANY-ISLAND is about two miles in circuit, entirely flat and sandy, six leagues distant from the south end of New Caledonia. This island was so called by Captain Cook, from its containing in so small a space a flora of near thirty species, among which were several new ones. It is a small island wholly covered with cypress trees; but in the interior part it is mixed with vegetable earth, from the trees and plants which continually decay on it, without being cleared away by human industry.

NORFOLK-ISLAND likewise received its name from Captain Cook, who discovered it in the year 1774. It is situated in latitude 29 deg. 0 min. south, longitude 163 deg. 0 min. east. It abounds, like the former, with cypress trees. There were foundings at a great distance in about twenty fathom, and eight leagues from the south-east end bottom was found at thirty and forty fathom. The rocks of this island consist of a common yellowish clayey stone and small bits of reddish lava which seemed to be decaying, and indicated that this island had been a volcano. It is but a few miles long, very steep, and uninhabited, and is supposed never to have had a human footstep upon it till that time. Vegetables here thrive with great luxuriance in a rich black mould, accumulated during ages past from decay-

ed trees and plants. The cypress and cabbage-palm flourish here in great perfection: the former yields timber, and the latter a most palatable refreshment. The central floot, or heart of this fruit, more resembles an almond than a cabbage in taste. Here were parrots, paroquets, pigeons, and a number of small birds peculiar to the spot, some of which were very beautiful. The fish caught, together with the birds and vegetables, enabled the whole ship's company to fare sumptuously for a day or two. Here is likewise the flax-plant, and rather more luxuriant than any where in New Zealand. It was the opinion of two eminent naturalists, that if this island was of greater extent, it would serve every purpose of establishing an European settlement. For a further and more ample account, see before, p. 26.

C H A P. V.

THE NEW HEBRIDES.

Discovery, Soil, Climate, Customs, and Manners of the Inhabitants.

DE QUIROS, in the year 1606, discovered the northernmost of these islands; they were then considered as a part of the southern continent, which till very lately was supposed to exist. In 1768 they were visited by Mont. de Bougainville, who, besides landing on the island of Lepers, did no more than discover that the land was not connected, but composed of islands, which he called *The Great Cyclades*.

In the year 1774, Captain Cook, besides ascertaining the extent and situation of these islands, added the knowledge of several in this groupe that were before unknown. He explored the whole cluster, and thence claiming a right to affix to them a general appellation, named them THE NEW HEBRIDES. They are situated between the latitudes of 14 deg. 21 min. and 20 deg. 4 min. south, and 170 deg. 21 min. east longitude. They extend 125 leagues in the direction of N. N. W. and S. S. E. The whole cluster consists of the following islands, some of which have received names from the different European navigators; others retain the names they bore among the natives. They are as follow: Tierra del Espiritu Santo, Mallicollo, St. Bartholomew, Isle of Lepers, Aurora, Whitfuntide, Ambrym, Apee, Three Hills, Sandwich, Montague, Hinchinbroke, Erromango, Immer, Annatom, and Tanna.

TIERRA DEL ESPIRITU is the most western and largest of all the Hebrides, being twenty-two leagues long, twelve broad, and six in circuit. It lies in 15 deg. 20 min. south latitude, and 166 deg. 50 min. east longitude. The land, especially to the west side, is very mountainous, and in many places the hills rise directly from the sea. Every part of it, except the cliffs and

tations, and every valley watered with a stream. On
the north side is a very fine bay, called by De Quiros,
St. Philip and St. Jago. The two points which form its
entrance, lie at ten leagues distance from each other.
Here De Quiros is supposed to have anchored, and
to have given the name of Vera Cruz to the
port in which his ships lay. He describes it as capa-
cious enough to contain 1000 ships with clear soundings.
The country seemed fertile and populous. Two canoes
with triangular sails, came off towards the ship: the
men were tall and stout, of a dark colour, and had
woolly hair; they were naked; some of them had a
bunch of feathers on the top of the head, and others
wore a white shell tied on the forehead. On their arms
they wore bracelets of shell work, and round their middle
a narrow belt, from whence two long slips of matting
hung down before and behind.

On the first day of the arrival of our navigators, no
tokens of friendship could prevail with the natives to
come near enough to hold any intercourse; but the
next morning, they ventured to close as to receive
a present of nails, medals, and red baize; but the nails
were most valued. They fastened a branch of the pep-
per plant to the same rope by which the nails had been
lowered to them from the ship; and this was the only
return they made for what had been given them. The
diffidence with which they approached the vessel, may
well be accounted for, from the traditional knowledge
which doubtless subsists among them concerning the vi-
sits made them by De Quiros; for on his coming to an
anchor, and sending a boat from the ship, a chief (as
he is called in the narrative) the king, attended by some
Indians, came to the strand, and endeavoured to ex-
cite their departure by presents of fruit, but the Spani-
ards leaping on the shore, made signs of peace: the na-
tives, still anxious for the departure of the strangers,
and the latter persisting in their endeavours to force
their way, hostilities commenced between the parties;
but the arrows of the one flew without effect, whilst the
fire-arms of the other laid the king and many of his fol-
lowers breathless on the beach. This island, from ap-
pearance, as to vegetable productions, would have af-
forded the botanist an ample harvest of new plants.

MALLICOLLO is the most considerable island next to
Espiritu Santo: it is eight leagues long, and situated in
16 deg. 25 min. south latitude, and 167 deg. 57 min.
east longitude. On inquiry of the natives concerning
the name of this island, answer was made, that it was
Mallicollo, which has the closest resemblance possible to
Manicollo, the name which De Quiros received for it
168 years before. He did not visit the island, but had
his intelligence from the natives.

When our countrymen touched at Mallicollo, they
attentively examined the south coast, and found it luxu-
riantly clothed with wood, and other productions of na-

ture. They picked up an orange, which the natives call
abbi-mora. This was the first orange that was met with
in this sea, and the only one that was seen here; being
decayed, it cannot certainly be known whether it was fit
to be eaten. The country is described as mountainous
and woody, but the soil is rich and fertile, producing
sugar-canes, yams, cocoa-nuts, bread-fruit, bananas,
and turmeric. There are hogs here, and various kinds
of birds; and as the frequent squeaking of pigs was heard
in the woods, it was concluded that there were abun-
dance of the former.

A shark, which measured nine feet in length, was
caught, and afforded the crew a very palatable refresh-
ment. This shark, when cut open, was found to have
the bony point of an arrow sticking in its head, having
been shot quite through the skull. The wound was
healed so perfectly, that not the smallest vestige of it
appeared on the outside. A piece of the wood still re-
mained sticking to the bony point, as well as a few fibres
with which it had been tied on; but both the wood and
the fibres were so rotted, as to crumble into dust at the
touch. A large reddish fish, of the sea-bream kind, was
likewise caught, but it proved of very noxious quality,
for all who ate of it were seized with violent pains in the
head and bones, attended with scorching heat all over
the skin, and numbness in the joints. It affected the
dogs and hogs, who had eaten the garbage, in the high-
est degree. The opinion of naturalists upon the whole,
was, that these fish may not always be poisonous, but that,
like many species in the East and West-Indies, they may
acquire that quality by feeding on poisonous vegetables.

The people here are described as remarkably ugly,
dark, ill-proportioned, diminutive in size, and in every
respect different from the other islanders in the South-
Seas. They have flat noses and foreheads, woolly hair,
and short beards. To add to their natural deformity,
they have a custom of tying a belt or cord, uncom-
monly tight, round the waist, so that the belly seems in
a manner divided, one part being above and the other
below the rope. They wear bracelets of shells on the
arm, a piece of white curved stone in the nostrils, and
on their breast hangs a shell suspended by a string
round their necks: some wear tortoiseshell ear-rings
and other rings of shells.

The first natives that were seen upon the island had
clubs in their hands, and waded into the water, carry-
ing green boughs, the universal sign of peace. In a
day's time they ventured to come within a few yards of
the ship's boat, which was sent out, when they dipped
their hands into the sea and gathering some water in the
palms, poured it on their heads. The officers in the
boat, in compliance with their example, did the same,
with which the Indians appeared to be much pleased,
repeating the word Tomari, or Tomarro, continually.
The greater part being now armed with bows and ar-
rows, they ventured near the ship, and received and ex-
changed a few presents. They continued about the
ship talking very loudly, but in such a manner as was

M

very

very entertaining. Some continued about the ship till midnight; finding, however, at length they were but little noticed, they returned on shore, where the sound of singing and drums was heard all night. These people seemed to covet whatever they saw, but never repined at a refusal. They were highly delighted with the looking-glasses that were given them; and notwithstanding their remarkable deformity, were enraptured at viewing themselves.

Next morning the natives came off to the vessel in their canoes, and four or five of them went on board without any arms. They soon became familiar, and with the greatest ease climbed up the shrouds to the mast head. When they came down, the commander took them all into the cabin, and gave them presents of various articles. They appeared the most intelligent of any nation that had been seen in the South-Seas; readily understood meanings conveyed by signs and gestures, and soon taught the officers words in their language, which appeared peculiar to themselves. When some of the most respectable of our countrymen went on shore, the natives with great good-will sat down on the stump of a tree to teach them their language. They were surprised at the readiness of their guests in remembering, and seemed to spend some time in pondering how it was possible to preserve the sound by such means as pencils and paper. Nor were they less apt in catching the sounds of the European languages; from whence it was justly remarked, that what they wanted in personal beauty was compensated in acuteness of understanding.—But they expressed their admiration by hissing like a goose. There appeared but few women amongst them; those few, however, were no less ugly than the men. They were of small stature, and their heads, faces, and shoulders, were painted red. Some wore a kind of petticoat, others a bag made of a kind of cloth in which they carry their children. The younger females went stark naked, like the males of the same age.

The women in general were not observed to have any finery in their ears, or round their necks and arms, it being fashionable in this island for the men only to adorn themselves; and as, wherever this custom prevails, the other sex is commonly oppressed, despised, and in a state of servility, so the men here seemed to have no kind of regard for them; none of them came off to the ship, and they generally kept at a distance when any party landed from the boat.

The houses, or rather huts, here, are low and thatched with palm leaves. Some few are enclosed with boards, and the entrance is by a square hole at one end.

Their chief weapons are bows and arrows, and a club about two feet and a half in length, made of hard wood, commonly knobbed at one end and well polished. This weapon they hang on their right shoulder from a thick rope made of a kind of grass. Their arrows are composed of a kind of reed made of hard wood or bone, supposed to be poisoned. They are very care-

ful of them, and keep them in a sort of quiver made of leaves.

As these people apply themselves to husbandry, their food seems to be principally vegetables; though as fowls and hogs are bred, these may constitute a part of their subsistence, as well as that derived from the ocean. Their canoes were small, not exceeding two feet in width, of indifferent workmanship, and without ornament, but provided with an out-rigger.

One of the latest navigators gave the following relation, which we cite as an indication of the genius and disposition of these people. "When the natives saw us under sail for our departure from the island, they came off in canoes, making exchanges with more confidence than before, and giving such extraordinary proofs of their honesty as surprised us. As the vessel at first had fresh way through the water, several of the canoes dropped astern after they received goods, and before they had time to deliver theirs in return. Instead of taking advantage of this, they used their utmost efforts to get up with us and deliver what they had already been paid for. One man in particular followed us a considerable time, and did not reach us till it was calm, and the thing was forgotten. As soon as he came along side he held up the article, which several on board were ready to buy; but he refused to part with it, till he saw the person to whom he had before sold it, and to whom he gave it. The person, not knowing the man again, offered him something in return, which he refused; and shewing him what had been given before, made us sensible of the nice sense of honour which had actuated this Indian."

ST. BARTHOLOMEW-ISLAND was so called by Captain Cook, from its having been discovered on St. Bartholomew's day. It is between six and seven leagues in circumference, and situated in latitude 15 deg. 23 min. south.

The **ISLE** of **LEPERS** received its denomination from the number of people afflicted with the leprosy that were seen upon it. This Isle lies between **Espritu Santo** and **Aurora-Island**, eight leagues from the former and three from the latter, in latitude 15 deg. 22 min. south. It is of an oval figure, very high, and 18 or 20 leagues in circuit. Many beautiful cascades of water were seen pouring down from the hills. Here the palms grow on the hills. The natives are of two colours; their lips are thick, their hair woolly, and sometimes of a yellowish cast. They are short, ugly, and ill proportioned, and most of them infected with the leprosy. The women are no less disgusting than the men; they go almost naked; they have bandages to carry their children on their backs. In the cloth of which these bandages are made, are very pretty drawings of a fine crimson colour.

None of these men have beads: they pierce the nose in order to fix some ornament to it; they likewise wear on the arm, in form of a bracelet, a tooth, of a substance like ivory; on the neck they have pieces of tortoiseshell. Their arms are bows and arrows, clubs of hard wood and stones, which they use without slings. The arrows are reeds armed with a long and very sharp point made of bone. Some of these points are formed in such a manner as to prevent the arrows being drawn out of a wound.

The natives appeared to be very friendly to M. de Bougainville, when he touched here in 1768, until all the men were embarked; but then they sent a flight of arrows after them; which assault, although it was attended with no bad consequences, was revenged by discharging a volley of musketry, which killed several of the natives. It is not, therefore, to be wondered at, that when Captain Cook appeared off their coast, the natives should be so shy of any intercourse with strangers. Two or three natives put off in a canoe; but no tokens of friendship could induce them to come near the ship.

In AURORA-ISLAND inhabitants were discovered and some canoes; but none came off to the ship. A fine beach and most luxuriant vegetation presented themselves. The whole country was woody, and a beautiful cascade poured through a forest. The island is about twelve leagues long, but not above five miles broad in any part, lying nearly north and south. A channel divides this island from

WHIT-SUNDAY-ISLE, which lies, as was computed, about four miles to the south, runs in the same direction, and is of the same length, having more sloping exposures than Aurora; it appears to be better inhabited, and to contain more plantations.

AMBRYM is about 17 leagues in circuit, and two leagues and a half from the south end of Whit-Sunday-Isle. Its shores are rather low, but the land rises with an unequal ascent to an high mountain in the middle of the island, which gave occasion to suppose that a volcano was seated there.

APEE, distant from Ambrym about five leagues, is not less than twenty leagues in circuit. Its longest direction is about eight leagues north west and south east. It is of considerable height, and richly diversified with woods and lawns.

SANDWICH-ISLE, which, in compliment to Lord Sandwich, is so called, is 10 leagues long and 25 in circuit. It exhibits a delightful view, the hills gently sloping to the sea. Several small islands lay disposed

about here, to which Captain Cook gave the names of the Shepherd's-Islands, Three Hills, Two Hills, The Monument, Montagu, and Hinchinbrook.

ERROMANGO lies 18 leagues from Sandwich-Island, and is between 24 and 25 leagues in circuit. The middle of it lies in 18 deg. 54 min south latitude. The natives of this island seem to be of a different race from those of Mallicollo, and speak a different language. They are of the middle size, have a good shape and tolerable features. Their colour is very dark, and they paint their faces, some with black, and others with red pigment; their hair is very curly and crisp, and in some degree woolly. But few women were seen, and those very ugly; they wore a petticoat made of the leaves of some plant. The men were in a manner naked, having only the belt about the waist, and a piece of cloth or leaf used for a wrapper. No canoes were seen in any part of the island. They live in houses covered with thatch, and their plantations are laid out by line, and fenced round.

Captain Cook went on shore here with two boats. He presented some of the natives with medals and cloth, and received every token of amity in return. Making signs that he wanted water, one of them ran to a hovel at a small distance, and presently returned with a little in a bamboo. On asking for something to eat, he was as readily presented with a yam and some cocoa nuts. During this time the whole groupe were armed with clubs, spears, darts, bows, and arrows, which excited some suspicion, and led Captain Cook to cut short his visit, telling the chief, by signs, that he should soon return. Seeing their guests about to depart, they endeavoured to haul that boat on shore, which had the commander on board, whilst others snatched the oars out of the people's hands. At the head of this party was the chief. Those who could not come at the boat, stood behind, armed with weapons, ready to support those that were most forward. Signs and threats having no effect on these people, personal safety became the only consideration; but in this emergency the British commander was unwilling to fire among the crowd, and resolved to make the chief alone fall a victim to his own treachery. His musket, at that critical moment, missed fire, which could not fail of giving the natives a very mean opinion of the weapons that were opposed to them. They determined, therefore, to show how much more effectual theirs were, by throwing stones and darts, and shooting arrows. This being the case, a general discharge of fire-arms could no longer be avoided. It threw them into confusion; but a second was hardly sufficient to drive them off the beach. Four lay to all appearance dead on the shore; but two of them afterwards crawled into the bushes. Not half of the muskets would go off, which saved the lives of many

of these poor mistaken wretches. One of the men in the boat was wounded in the cheek with a dart; an arrow struck the master on the breast, but as its force was spent it hardly penetrated the skin. The report of the muskets on shore alarmed those in the ship, and another boat was immediately sent off, and a swivel, that fired to the port where a number of the natives were assembled, and a great gun fired towards the hills, which struck them with a panic, and they all hastened to screen themselves in the bushes. With this unhappy skirmish all intercourse ended.

INMER is the most eastern island of all the Hebrides. It appeared to be about five leagues in circuit, of a considerable height, and flatish top.

ANNATOM is the southernmost island, situated in latitude 20 deg. 3 min. south; longitude 170 deg. 4 min. east.

Six leagues on the south side of Erromango is **TANNA**. It is about eight leagues long, three or four broad, and twenty-four in circuit. Its latitude is 19 deg. 30 min. south, and longitude 169 deg. 38 min. Its name signifies *earth* in the Malay language. The soil in some places was found to be a rich black mould; in other parts it seemed to be composed of decayed vegetables and the ashes of a volcano, which was seen about eleven miles to the westward of the vessel burning with great fury. The country is in general so covered with trees, shrubs, and plants, as to choke up the bread fruit and cocoa nuts; but it is not populous, nor the houses consequently numerous.

The volcano emitted at different times vast quantities of fire and smoke for sixteen days, accompanied with an explosion about once in five minutes. Some of these explosions resembled violent claps of thunder: the whole air was filled with smoky particles and ashes, which occasioned much pain when they fell into the eye: at one time great stones were seen thrown up into the air, some of which were at least as large as the hull of a ship's long boat. It first presented a most magnificent sight. The smoke, which rolled up from time to time, in thick and heavy volumes, was coloured with all the various hues of yellow, orange, crimson, and purple, which died away into a reddish grey and brown. As often as a new explosion happened, the whole country, with its shaggy forests, were tinged with the same orange and purple, according to its distance, or particular exposure to volcanic light. It sometimes continued quite silent for five or six days together. It was remarked, that the explosions of the volcanos recommenced after a shower of rain, so that it should seem that rain excites them, by promoting or increasing the fermentation of various mineral substances in the

mountain. The black ashes with which the whole country was strewed, were found to be long, needle-like, and semi-transparent, and to contribute greatly to that luxuriance of vegetation which is remarkable on this island; many plants here attaining twice the height which they reach in other countries; their leaves are broader, their flowers larger and more richly scented.

Some new plants were collected here, and a variety of odoriferous shrubs, and some others were cultivated only for their elegant appearance. The plantations on this island consist for the most part of yams, bananas, eddoes, and sugar-canes, all which being very low, permit the eye to take in a great extent of country. Here are great numbers of fig-trees, which the natives cultivate for the sake of the fruit and leaves. They are of two or three different kinds, and one sort in particular bears figs of the common size, which are wholly like peaches on the outside, and have a beautiful crimson pulp like pomegranates; they are sweetish and juicy, but rather insipid.

Several small birds were observed here with a very beautiful plumage, and of a kind that had not been seen before. The natives were seen to have no methods of catching fish, but by striking; it is probable that they draw but little of their subsistence from the water. Upwards of three hundred pounds weight of mullet, and other fish, were caught by three hauls with the seine.

A young native was shewn every part of the ship, but nothing fixed his attention a moment, or caused in him the least surprise. He had no knowledge of goats, dogs, or cats, calling them all hogs. (booga). The commander made him a present of a dog and a bitch, as he shewed a liking to that kind of animal. They appear to have plenty of hogs, but very few domestic fowls. Some rats of the same kind as is common on the other islands in the Pacific Ocean, frequent the fields of sugar-cane, in which they make great depredations; the natives, therefore, dig several holes all round these plantations, in which they catch these animals.

The natives of this island are of a middle size, and tolerably proportioned. Their colour is a dark chestnut brown, with a very swarthy mixture. They go naked, having only a string round the belly, which did not, however, cut the body in so shocking a manner as that in the island of Mallicollo. Their hair is generally black or brown, growing to a tolerable length, and very crisp and curly. Their beards, which are strong and bushy, are generally short. The women wear their hair cropped, as do the boys till they approach manhood. They make use of a cylindrical piece of alabaster two inches long, which they wear in the cartilaginous part between the nostrils, as a nose-jewel. Not one single corpulent man was seen here; all are active and full of spirits. Their features are large, the noses broad; but the eyes full, and in general agreeable. They make incisions chiefly on the upper arm and belly, which are instead of punctures; they cut the flesh

with a bamboo or sharp shell, and apply a particular plant, which forms an elevated scar on the surface of the skin after it is healed. These scars are formed to represent flowers and other fancied figures, which are deemed a great beauty by the natives. Most of them have an open, manly, and good-natured air, though some were seen as in other nations, whose countenances indicated malevolence.

Though, like all the tropical nations, the people are active and nimble, they were not fond of labour, nor would ever assist in any work that the ship's company was carrying on, which the Indians of the other islands used to delight in. They throw all the laborious drudgery on the women; from which occasion was taken to remark, that though they were not beauties, they were handsome enough for the men, and too handsome for the use that was made of them. Their ears are hung full of tortoise-shell rings, and necklaces of shells fall on their bosoms. Some of the elderly women had caps made of a green plantain leaf, or of matted work; but this head-dress was rather uncommon. The number of ornaments considerably increased with age, the oldest and ugliest being loaded with necklaces, ear-rings, nose-jewels, and bracelets. The women here are expert cooks: they roast and boil the yams and bananas, they stew the green leaves of a kind of fig, they bake puddings made of a paste of bananas and eddoes, containing a mixture of cocoa-nut kernel and leaves.

The people of Tanna, with respect to their domestic life, are rather of a serious turn, yet are not wholly destitute of amusements, and their music is in greater perfection than any in the South-Seas. Their European visitants gave them a variety of airs, in return for which, the natives sang several times very harmoniously. They likewise produced a musical instrument, which consisted of eight reeds, regularly decreasing in size, and comprehending an octave, though the single reeds were not perfectly in tune.

Their houses are like the roof of a thatched house in England, taken off the walls, and placed on the ground. Some were open at both ends, others closed with reeds, and all were covered with a palm thatch. A few of them were thirty or forty feet long, and fourteen or sixteen broad. Besides these, they have other mean hovels, which were supposed to be designed only to sleep in.

In point of neatness, their weapons come far short of some that were seen in other islands. They are clubs, spears or darts, bows and arrows, and stones. The clubs are of three or four kinds, and from three to five feet long. They seem to place most dependence on the darts, with which they kill both birds and fish, and are sure of hitting a mark within the compass of the crown of a hat, at the distance of eighteen yards; but at double that distance, it is a chance if they hit a mark the size of a man's body, though they will throw the weapon sixty or seventy yards. The arrows are made of reeds pointed with hard wood; some are bearded, and some are not, and those for shooting birds have

two, three, and sometimes four points. The stones they use in general are the branches of coral rocks, from eight to fourteen inches long, and from an inch to an inch and a half diameter. Those who use stones keep them generally in their belts.

Their canoes can boast neither art or ornament; all of them have out-riggers, and some may contain twenty people. Their sails are low triangular mats, of which the broadest part is uppermost, and the sharp angle below. A long piece of timber, hollowed out in the middle, forms the bottom of the canoe, and upon this one or two planks are fixed, forming the two sides, by means of ropes of the cocoa-nut fibres. Their oars are ill-shaped, and very clumsily made.

Added to the common language of the land, and a dialect of the neighbouring islands, some words were collected of a third language, which was chiefly current among the inhabitants of the western hills. Some of our intelligent voyagers, on comparing their vocabularies, to discover that two different words were used to signify the sky, applied to one of the natives to know which of the expressions was right. He immediately held out one hand, and applied it to one of the words; then moving the other hand under it, he pronounced the second word, intimating, that the upper was properly the sky, and the lower, clouds that moved under it.

No other liquor was seen here than water and the cocoa-nut juice. They signified, in the most pointed manner, to our countrymen, that they eat human flesh, and that circumcision was practised among them. Nay, they introduced the subject of eating human flesh, by asking our people, if it was a practice among them. They appeared to have some nominal chief, with very little authority. One old chief was said to be the king of the island. His name was Geogy, and they gave him the title of Areekee. Notwithstanding his advanced years, he had a merry, open countenance.

No information could be derived respecting the religion of these people, only every morning at day-break was heard a slow solemn song or dirge, sung on the eastern side of the harbour, which lasted more than a quarter of an hour. As this was supposed to be a religious act, the curiosity of our navigators was excited to inquire further concerning it. But when they attempted to pass that way, the natives crowded about them, and entreated them with the greatest earnestness to return. As they still seemed to persist, they were at length given to understand, that if they remained obstinate in their attempt, they would be killed and eaten. They now turned off towards a hut about fifty yards distant, where the ground began to rise, on which several of the Indians took up arms out of the hut, apparently meaning to force them to return back. Unwilling, therefore, to give offence, our people checked their curiosity, and were content to leave this point undetermined. Nothing however was seen in the general behaviour of these people, that bore any resemblance to a

N

religious

religious act, nor any thing that could be construed into superstition.

When the boat first went on shore, the natives were drawn up in great numbers on the beach, armed with clubs, darts, spears, slings, and stones. From this hostile appearance, the British commander was induced to re-embark speedily to prevent disagreeable consequences. In order to terrify without hurting them, he ordered a musket to be fired over their heads, but the alarm was only momentary, as the natives instantly recovered themselves, and began to display their weapons. A few great guns, however, being fired from the ship, they all dispersed, leaving the beach free for a second debarkation. The commander having marked out boundaries on the shore with a line, the natives came gradually forward, some unarmed.

An old man, named Powang, shewed a very friendly disposition in forwarding an intercourse between the commander and the natives. Such was the honesty of this old man, that he brought an axe which had been left by the ship's company upon the beach. They were extremely jealous of any one going up the country, or even along the shore of the harbour, a disposition that greatly obstructed the naturalists in their attempts to explore.

As the carrying of bundles is the office of the women in this country, the natives imagined that those from the ship who carried loads were females. A man who carried a bag which contained the plants selected by the naturalists, was followed by some of them, who, by their conversation, which was overheard, considered him as a woman, until by some means they discovered their mistake, on which they cried out, *Errorange!* *errorange!* It is a man! it is a man!

A tillar to the rudder being wanted, the carpenter was sent on shore to look at a tree for the purpose, and with him an officer with a party of men to cut it down, provided leave could be obtained of the natives. The officer understanding that there was no objection, the people accordingly went to work; but as the tree was large, the felling of it was a work of time, and before it was down, word was brought that *Paowang* was not pleased: orders were therefore sent from on board to desist. The commander soon after went on shore, and sending for *Paowang*, presented him with a dog and a piece of cloth, and then explained to him the purpose for which the tree was wanted. All the natives present discovered great satisfaction at the means that were used to obtain the grant of the tree, and unanimously consented to its being felled.

But many were afraid to touch the presents that were offered them, nor did they seem to have any notion of exchanging one thing for another. But few refreshments were obtained on this island; some fruit or roots were daily procured from the natives, though

greatly inadequate to the demands of the ship's company.

As the natives had no knowledge of iron, nails, iron tools, beads, &c. which were so current in other parts, they were of no value here, nor was cloth of any use in a country where the inhabitants went mostly naked. The only commodity they seemed desirous of obtaining was tortoiseshell; but as no demand was expected for such an article, there were only a few small pieces remaining in the ship, which had been purchased at another island. The sailors, however, notwithstanding the loathsomeness of salt provisions of long standing, had not a single provident thought for the future, but exchanged their tortoiseshell for bows and arrows, instead of furnishing themselves with a stock of yams.

A party from the ship passing through a shrubbery, observed a man at work cutting sticks, and seeing him make a very slow progress with his hatchet, which was only a bit of shell in lieu of a blade, they set about helping him with an iron hatchet, and in a few minutes cut a much greater heap than he had done the whole day. Several Indians, who were witnesses to this dispatch, expressed the greatest astonishment at the utility of this tool, and some were very desirous of possessing it, by offering their bows and arrows for it. This was considered as a favourable opportunity for procuring hogs; but they were deaf to every proposal of that kind, and never exchanged a single hog; one pig only was obtained as a present to the commander from *Paowang*.

There being great reason to suppose that the inhabitants of Tanna are harassed by frequent wars; the distrust which they expressed on the first debarkation from the ships is not surprising. But as soon as they were assured of the pacific disposition of their new visitants, all suspicions entirely subsided. They did not trade, indeed, because they had not the means in proportion to the other islanders; but they were as assiduous in offering their services, and from less interested motives. If any of the botanists had procured a plant, of which he was desirous of having other specimens, he had only to signify it to some natives, who would immediately hasten to the spot where it was to be found, and bring it with the most engaging alacrity. The civility of the natives was conspicuous in this particular instance. If they met any officer or gentleman of the ship in a narrow path, they always stepped aside, in order to make way. If they happened to know their names, they pronounced them with a smile, which could be extremely well understood as a salutation. If they had not seen them before, they commonly inquired their names, in order to know them again. They have the same engaging manner of expressing their friendship by a mutual exchange of names, as is common in the most eastern islands of this sea.

C H A P. VI.

THE FRIENDLY ISLANDS.

Discovery, Number, Situation, Soil, Productions, Extent, Manners, and Customs of the Inhabitants.

THESE islands form a cluster extending about three deg. of latitude and two of longitude. The principal are Middleburg, Rotterdam, or Anamooka, Hapace, Amsterdam, or Tongataboo, and Pylstart, so denominated by Tasman; there are also others which have been seen and visited by more modern navigators. We shall attend to them severally in their respective order.

MIDDLEBURG, called by the Natives EOOA.

This island forms a very beautiful landscape. Its skirts are in general laid out in plantations, especially those on the north-west and south-west sides. The interior parts are not, indeed, so well cultivated as they might be, but this heightens the prospect; for while the other isles of this cluster are level, the eye can discover nothing but the trees that cover them; here the land rising gradually upwards presents an extensive view, where groves of trees are only interspersed at irregular distances, in a kind of beautiful disorder. It is shaded near the shore with various trees, amongst which are the habitations of the natives, laid out in such order as convenience requires, and they may boast a most delightful situation. About half way up the island is a deep valley, the bottom and sides of which, though composed of hardly any thing but coral rock, are clothed with trees. The soil in general is reddish clay, which in many places seems to be very deep.

On the most elevated part of the island is a round platform or mount of earth, supported by a wall of coral stones, to bring which to such an height must have cost much labour. This mount, called by the natives *Etchee*, is said to have been erected by order of one of their chiefs. Not many paces from this, though on a former voyage, complaint was made of a dearth of water; on the last was found an excellent spring, and about a mile lower down a running stream, which, it is said, found its way to the sea when the rains were copious. It appeared from information, that all or most of the land in this island belonged to the great chiefs of Amsterdam or Tongataboo, and that the inhabitants were only tenants or vassals to them. This, indeed, is represented to be the case at all the other neighbouring isles, except Rotterdam or Anamooka, where there are some chiefs who seem to act with a degree of independence.

Yams, with other roots, bananas, and bread-fruit, are the principal articles of food here; but the latter appeared to be scarce. The pepper tree, or *ava ava*, of

which they make a favourite intoxicating liquor, also grows here. There are many odoriferous trees and shrubs, and one in particular of the lemon species; naturalists likewise met with divers new kinds of plants. The *casuarina*, or club-wood, as in some neighbouring islands, points out also to the repositories of their dead. The shaddock, and several other trees are found upon the island.

The common complexion of the natives is mahogany or chefnut brown, with black hair. Some are of an olive colour, and some of the women much fairer, which may be the effect of being more or less exposed to the sun. The men in general are of the middle stature; though some measured six feet. Their bodies are well proportioned, though muscular, which seems a consequence of much exercise. Their features are various, nor are they characterised by any general likeness, unless it be a fullness at the point of the nose, which is very common. The women in general are not so tall as the men; their bodies and limbs are well proportioned, and what peculiarly distinguishes them is the uncommon smallness and delicacy of their fingers, which may be put in competition with the finest in any part of the world.

Puncturing or tattooing the skin is in full fashion amongst the men here; on the tenderest part of the body are marked configurated scars, which must be very painful as well as dangerous. The chiefs are exempted from this custom. The dress of both men and women is much the same, and consists of a piece of cloth or matting (though mostly the former) about two yards wide, and two and an half long, so as to wrap in great abundance round the waist, to which it is confined by a girdle or cord. Before it is double, and hangs down like a petticoat as low as the middle of the leg. This, as to form, is the general dress; but large pieces of cloth and fine matting are worn only by those of superior rank. The inferior class are satisfied with small pieces, and often wear nothing but a covering made of leaves of plants, or the *maro*, which is a narrow piece of cloth or matting like a sash. This they pass between the thighs and wrap round the waist, but the use of it is chiefly confined to the men. They have various dresses made for the purpose of their haivas or grand entertainments; but the form is always the same; the richest are adorned more or less with red feathers. Both sexes sometimes screen their faces from the sun with little bonnets made of divers materials.

The sexes differ as little in their ornaments as their clothing. Of these the most common are necklaces made of various sweet scented flowers, which go under the general name of *Kabulla*. Others consist of several strings of small shells, sharks teeth, and other things, which hang loose upon the breast. In the same manner they likewise wear a mother of pearl shell, neatly polished, and a ring of the same substance carved, on the upper part of the arm, as also rings of tortoiseshell on the fingers, and a number of these joined together

as bracelets on the wrists. The lobes of the ears are perforated with two holes, in which they wear cylindrical pieces of ivory, stuck through both sides the holes. Some use reeds filled with a yellow pigment. This seems to be a fine powder of turmeric, with which the women rub themselves all over in the same manner as the European females use dry rouge upon their cheeks.

What particularly characterizes these people, and was remarked by Tasman, is, that most of them want the little finger on one, and sometimes on both hands; nor did the difference of age or sex exempt from this amputation, for the very children were observed to have suffered that loss. They had also a round spot on each cheek bone, which appeared to have been burned or blistered, on some it seemed to have been recently made, on others it was covered with scurf, and the mark was slight; but the purport of it could not be discovered. The women in general here are represented as modest and reserved in their behaviour, though, as in all other islands, there were some exceptions.

The natives of these islands are much commended by voyagers for their cleanliness, to produce which they are said to bathe frequently in ponds which seem to serve no other purpose. Though the water in most of them is nauseous to a degree, they prefer them to that of the sea, imagining, that salt water hurts their skins. When necessity obliges them to bathe in the sea, they commonly have some cocoa-nut shells filled with fresh water poured over them, to wash it off. The cocoa-nut oil has an admirable effect on the skin in rendering it smooth; for which these people hold it in such estimation, that they not only pour a great quantity of it upon their heads and shoulders, but rub the body all over briskly with a smaller quantity. The language here is soft and not unpleasing, and whatever they say is spoken in a kind of singing tone.

In building their houses, they do not discover much taste or ingenuity; though the defect is rather in the design than the execution. Those of the lower people are poor huts, those of the better are larger and more comfortable. Their houses, properly speaking, are thatched roofs or sheds supported by posts and rafters disposed in a tolerably judicious manner. The floor is a little raised, covered with strong thick matting, and kept very clean. They are mostly closed on the weather side with the same sort of matting, the other being open. A thick strong mat, of two or three feet broad, bent into the form of a semicircle and set upon its edge, with the ends touching the side of the house, in shape resembling the fender of a fire hearth, encloses a space for the master and mistress of the family to sleep in. The latter indeed spends most of her time during the day within it. The rest of the family sleep upon the floor wherever they please to lie down, the unmarried men and women apart from each other. If the family be large, there are small nuis adjoining, to which the servants retire in the night, so that privacy is as much observed here as can be expected. They have mats

made on purpose for sleeping on, and the clothes they wear in the day serve for their covering in the night. Their household furniture consists of some bowls and platters, cocoa-nut shells, some small wooden stools which serve them for pillows, and perhaps a large stool for the master of the family to sit on.

Clubs, spears, bows, and arrows, are their weapons. The former are of a great variety of shapes, and many of them so heavy as not to be managed with one hand, but with difficulty. The most common form is quadrangular. The far greater part were carved all over in many chequered patterns, which seem to have required great patience and a long time to work up, as a sharp stone or piece of coral are the only tools made use of. The whole surface of the plain clubs was as highly polished, as if furnished by an European artist with the best instruments. Their spears are sometimes plain sharp-pointed sticks, and sometimes barbed. Their bows and arrows are of a peculiar construction. The former, which is about six feet long, is about the size of a little finger, and when slack forms a slight curve: the convex part is channelled with a single deep groove in which the bow-string is lodged. The arrow is made of reed near six feet long, and pointed with hard wood. When the bow is to be bent, instead of drawing it so as to increase the natural curve, they draw it the contrary way, make it perfectly straight, and then form the curve on the other side.

There is much ingenuity displayed in the construction of their canoes. They have out-riggers made of poles, and their workmanship is admirable. Two of these are joined together with surprising exactness, and the surface is polished in a very curious manner. Their paddles have short blades, and are very neatly wrought.

A circumstance occurred in this place which afforded an opportunity of observing how these people treat conjugal infidelity. Some of our people, on their return from an excursion, being informed that a party of the natives had struck one of their own countrymen with a club, which laid bare, or, as others said, fractured his skull, and then broke his thigh with the same, inquired the reason of such treatment, and were given to understand that he had been discovered in a situation rather indelicate with a woman that was *taboo'd*, that is, forbidden. But the female delinquent had by far the smaller share of punishment; as our people were told, she would only receive a slight beating for her misdemeanour.

When our navigators first visited this island, they observed, that several of both sexes were affected with leprous disorders in the most virulent degree, in various parts of their bodies. The face of one woman was corroded by the acrid humours, so as to exhibit a most horrid spectacle. Many others were likewise so disfigured by the disorder, that they could not be beheld without a mixture of disgust and pity.

met with who have visited them. When Captain Cook first anchored on the W. N. W. side of this island, two canoes with several men in each came along-side the ship; one of them on board, without the least hesitation, presented a root of the pepper tree, touched the noses of the officers with his own, in token of friendship, and then sat down on the deck without speaking a word. The native was presented with a nail, which, on receiving, according to the general custom of the island, he held over his head, pronouncing the word *fagafetai* or *fagafatie*. This was most probably meant as an expression of his thankfulness.

No people could give greater proof of liberality of disposition, for they came in great numbers about our vessels, threw bales of cloth into them, and retired without so much as waiting for a return. As an instance of their hospitality, Captain Cook, with several officers and gentlemen, were conducted, on their landing, by a chief, named Tioony, to his mansion, delightfully situated about three hundred yards from the sea, at the head of a fine lawn, and under the shade of some shaddock trees, and there elegantly entertained. The very same chief, on the commander's last visit, visited him on board immediately as he came to an anchor, and with the utmost cordiality rendered him every friendly service within his power. The European strangers indeed were caressed by old and young, men and women, who embraced them, kissed their hands, and laid them on their breasts with the most expressive looks of affection. It was very remarkable that the discharge of guns neither excited their admiration, nor their fear, which plainly proved that their civility arose from the bent of natural disposition, and not from a motive of conciliating the favour of their guests, because they knew they were able to do them an injury.

The only glaring defect that sullies their character is, a propensity to theft, which is said to be confined to nails, on which they set so high a value, that they would endeavour to possess them at any rate; but we are sorry to say, that truth and candour obliges us to confess, that from later experience, in many instances, the propensity in some appeared to be so universal as to admit of no limitation.

The inhabitants of the Friendly Islands are so agreeably circumstanced, as neither to be subject to excessive labour on the one hand, or supine indolence on the other. Their occupations are agreeably diversified, and their recreations and amusements follow in pleasing succession, so that they neither disgust or tire. To the women is committed the care of making the cloth, and to them is also consigned the manufacture of their mats.

Architecture, boat-building, agriculture, and fishing, are the principal objects of the men's attention. As cultivated roots and fruits form their chief subsistence, they find it necessary to practise husbandry, which they have brought by their diligence to some degree of perfection. In planting yams and plantains, they dig small holes for their reception, and afterwards root up

the surrounding grass. The instruments used by them for this purpose are called *hooa*; and are nothing more than stakes of various lengths, flattened and sharpened to an edge at one end; and the largest ones have a short piece fixed transversely, by means of which they press the implement into the ground with the foot. When they plant the two above-mentioned vegetables, they observe such particular exactness, that, whichever way you turn your eyes, the rows present themselves complete and regular. Some of their vegetable productions, and in particular the bread-fruit and cocoa-nut trees, are scattered without order, and reared without pains. The same may be said of another large tree, which produces a roundish compressed nut, called *ceffee*; and of a smaller tree bearing an oval nut, with two or three triangular kernels. The *kappe* is, in general, planted regularly, and in large spots; but the *maubaba* is interspersed among other things, as is also the *jeeje*. Sugar-cane is usually in small spots, closely crowded. The tree, of which the cloth is made, is kept very clean, and has a good space allowed for it. The *pandanus* is commonly planted in a row, close together, at the sides of the fields.

The dwellings of the lower class of people are wretched huts, scarcely sufficient to shelter them from the weather. Those of the better sort are larger, as well as more commodious and comfortable. An house of a middling size is about, twelve feet in height, twenty in breadth, and thirty in length. Their houses are, properly speaking, thatched roofs or sheds, supported by rafters and posts. The floor is raised with earth smoothed, and covered with thick matting. Some of their habitations are open all round; but the major part of them are inclosed on the weather side with strong mats, or with branches of the cocoa-nut tree, plated or interwoven with each other. A thick mat, about three feet broad, bent into a semicircular form, and placed edgewise, with the ends touching the side of the house, encloses a sufficient space for the master and mistress to sleep in. The rest of the family sleep upon any part of the floor, the unmarried men and women lying apart from each other. If the family is large, there are little huts adjoining, in which the servants sleep. Their whole furniture consists of some wooden stools, which serve them for pillows; baskets of different sizes, in which they put their combs, fish-hooks, and tools; two or three wooden bowls, in which they make *kava*; some cocoa-nut shells, a few gourds, and a bundle or two of cloth.

However, the deficiency so apparent in the building of their houses is amply compensated in the construction of their canoes, which display much taste and ingenuity. The double ones are made sufficiently large to carry about fifty persons, and sail at a great rate. Upon them they generally fix a hut or shed, for the reception of the master and his family. They are made of the bread-fruit tree, and the workmanship is extremely neat. They appear on the outside as if they were composed

of one solid piece; but, upon closer inspection, they are found to consist of a great number of pieces, which fit each other exactly, and by means of a ledge on the inside are secured together with cocoa-nut line. The single canoes are furnished with an out-rigger. The only tools which they make use of in the construction of these boats, are hatchets, or adzes, of a smooth black stone; augers made of shark's teeth; and rasps, composed of the rough skin of a fish, fastened on flat pieces of wood. The same tools are all they have for other works, except shells, which serve them for knives. Their cordage is made of the fibres of the cocoa-nut husk, which, though not above ten inches long, they plait about the size of a quill, to whatever length is required, and roll it up in balls; from which the ropes of a larger size are made by twisting several of those together. Their fishing-lines are as strong and even as our best cord. Their small hooks consist entirely of pearl-shells; but the large ones are only covered with it on the back; and the points of both are, in general, of tortoiseshell. With the large hooks they catch albigores, and bonnetos, by putting them to a bamboo-end, about twelve feet long, with a line of the same length. They have also numbers of small seines, some of which are of the most delicate texture.

Their pipes or musical reeds, which resemble the *fyrix* of the ancients, have eight or ten pieces placed parallel to each other, most of which are of unequal lengths. Their flutes are made of a joint of bamboo, about eighteen inches long, and are closed at both ends, having a hole near each end, and four others; two of which, and only one of the first, are used by them in playing. They close the left nostril with the thumb of the left-hand, and blow into the hole at one end with the other nostril. The fore-finger of the right-hand is applied to the lowest hole on the right, and the middle finger of the left to the first hole on that side. In this manner, with only three notes, they produce a pleasing, though simple music.

Clubs curiously ornamented, spears, and darts, are their warlike weapons. They also make bows and arrows; but these are intended for amusement, such as shooting at birds, &c. and not for the purpose of war. Their stools, or rather pillows, are about two feet long, but only four or five inches in height, and near four in breadth, inclining downwards towards the middle, with four strong legs and circular feet; the whole composed of brown or black wood, neatly polished, and sometimes inlaid with ivory. They likewise inlay with ivory the handles of fly-flaps; and, with a shark's tooth, shape bones into figures of men, birds, &c.

Cocoa-nuts, plantains, bread-fruit, and yams, compose the greater part of their vegetable food. Their chief articles of animal food are hogs, fish, and fowls; but the common people frequently eat rats. Their hogs, fowls, and turtle, seem to be only occasional dainties served for people of rank. Their food is, in general, dressed by baking; and they make, from different sorts

of fruit, several dishes, which are very good. They sometimes boil their fish in the green leaves of the plantain-tree, which serve as a bag to hold both fish and water: having tied them up, they wrap them again in three or four other leaves, and place them upon stones heated for the purpose: when they are sufficiently done, they not only eat the fish, but drink the liquor or soup. They are not very cleanly either in their cookery, or their manner of eating. Their usual drink at their meals is water, or cocoa-nut milk, the *kava* being only their morning beverage. The food that is served up to the chiefs is generally laid upon plantain-leaves. The king, at his meals, is commonly attended upon by three or four of the natives, one of whom cuts large pieces of the fish, or of the joint, another afterwards divides it into mouthfuls, and the rest stand by with cocoa-nuts, and whatever else he may happen to want. The women are not excluded from taking their meals with the men; but there are certain ranks that are not allowed either to eat or drink together. This distinction begins with his majesty.

They rise at day-break, and retire to rest as soon as it becomes dark. They, for the most part, sleep also in the day time, when the weather is very hot. They are fond of associating together, in consequence of which, it is not uncommon to find several houses empty, and the possessors of them assembled in some other house, or upon some convenient spot in the neighbourhood, where they relax themselves by conversation and other amusements. Their private diversions chiefly consist of dancing, singing, and music. When two or three women snap their fingers, and sing in concert, it is called *oobai*; but when there are more, they form several parties, each of which sings in a different key, which constitutes an agreeable melody, and is termed *beeava*, or *baiva*. The songs are generally accompanied with the music of their flutes. The dances both of the men and women are performed with an ease and grace which are difficult to be described.

The nature of their marriages could not be ascertained, either in point of form, or obligation; it is certain, however, that the major part of the men content themselves with one wife. The chiefs, indeed, commonly have several women, but only one is considered in the light of mistress of the family.

These people display a striking instance of humanity in the manner in which they are affected by the loss of their friends and relations. Besides the *tooge*, and burnt circles and scars, they strike a shark's tooth into their heads till the blood flows considerably, beat their teeth with stones, and thrust spears not only through their cheeks into their mouths, but also into the inner parts of their thighs, and into their sides. The more painful operations, however, are only practised when they mourn for the deaths of those who were most nearly connected with them.

When one of them dies, he is wrapped up in mats and cloth, and then interred. The *fiavokas* seem to be

wrapped up in mats he *fiatookas* seem to be appro-

appropriated to the chiefs and other persons of distinction, as their burial places; but the inferior people have no particular spot set apart for their interment. It is uncertain what part of the mourning ceremony follows immediately afterwards; but there is something besides the general one, which is continued for a considerable time. They seem to consider death as a great evil, to avert which they practise a very singular custom.

When Captain Cook, during his second voyage, first visited these islands, he observed, that many of the natives had one or both of their little fingers cut off; of the reason of which mutilation, he could not then obtain a satisfactory account; but he was now informed, that they perform this operation when they are afflicted with some dangerous disorder, which they imagine may bring them to the grave. They suppose, that the little finger will be accepted of by the Deity, as a kind of propitiatory sacrifice sufficiently efficacious to procure their recovery. In cutting it off, they make use of a stone hatchet. There is scarcely one person in ten who is not thus mutilated; and they sometimes cut so close, as to encroach upon that bone of the hand which joins the amputated finger. It is also common for the lower class of people to cut off a joint of their little finger, on account of the sickness of the chiefs to whom they respectively belong.

They have apparently little conception of future punishment for sins committed in the present life. They believe, however, that they meet with just punishment upon earth; and, therefore, put every method in practice to render their divinities propitious. They admit a plurality of deities, all of them inferior to *Kallafootonga*, who they say is a female, and the supreme author of most things, residing in the heavens, and directing the wind, rain, thunder, &c. They are of opinion, that when she is much displeas'd with them, the productions of the earth are blasted, many things consumed by lightning, and themselves afflicted with sickness and death; but that when her anger abates, every thing is immediately restored to its former state. Among their subordinate deities, they mention *Futtasaihe*, or *Footasooa*, who has the administration of the sea, and its productions; *Toosooa-boolootoo*, god of the clouds and fog; *Talletoboo*, *Mattaba*, *Tarceava*, and others. The same system of religion does not extend all over the Friendly Islands; the supreme deity of Hapaec, for instance, being called *Alo Alo*. They entertain very absurd opinions relative to the power and various attributes of these beings, who they suppose have no further concern with them after death.

They have juster sentiments of the immortality and immateriality of the soul, which they call *life*, the living principle, or an *Otooa*, that is a divinity. They imagine, that, immediately after death, the souls of their chiefs are separated from their bodies, and go to a delightful region called *Boolootoo*, the god of which is named *Goolebo*. By this *Goolebo*, they probably personify death. His country, according to their mythology,

is the general repository of the dead; and those who are once conveyed thither, are no more subject to death, but feast on all the favourite productions of their native soil, with which this blissful abode is plentifully furnished. As for the souls of people of an inferior class, they are supposed by them to suffer a kind of transmigration; or are eaten up, they say, by a bird called *loata*, which walks on the graves with that intent. They do not worship any visible part of the creation, or any things made by their own hands. They make no offerings of dogs, hogs, or fruit, unless emblematically. But there seems to be no reason to doabt of their offering up human sacrifices. Their *fiatookas* are, in general, burying-grounds and places of worship: some of them, however, appear to be appropriated only to the former purpose: but these are small, and greatly inferior to the rest.

The English could derive but little information as to their mode and form of government. A subordination, resembling the feudal system of our ancestors in Europe, is established among them; but of its subdivisions, and the constituent parts, we are ignorant. Though some of them asserted, that the king's power is unbounded, and that he has the absolute disposal of the lives and properties of his subjects; yet the few circumstances that offered themselves to our observation, contradicted, rather than confirmed, the idea of despotic sway. Mareewagee, Feenou, and Old Toobou, acted each the part of a petty sovereign, and sometimes even counteracted the measures of the king. Nor was his court superior in splendor to those of Old Toobou and Mareewagee, who, next to his majesty, were the most potent chiefs in these islands; and next after them, Feenou appeared to stand highest in rank and authority. But, how independent soever of the king the principal men may be, the inferior people are totally subject to the will of the chiefs to whom they severally belong.

Tongataboo is divided into a great number of districts, each of which has its peculiar chiefs, who distributes justice, and decides disputes, within his own territory. Most of these chieftains have estates in other islands, whence they procure supplies. The king, at stated times, receives the product of his distant domains at Tongataboo, which is not only the usual place of his residence, but the abode of most persons of distinction among these islands. Its inhabitants frequently call it the Land of Chiefs, and stigmatize the subordinate isles with the appellation of Lands of Servants.

Their chiefs are styled Lords of the earth, and also of the sun and sky; and great deference, not to say worship, is paid to them. The royal family assume the name of *Futtasaihe*, from the god distinguished by that appellation, who is probably considered by them as their titular patron. The king's peculiar title is simply *Tooe Tonga*. The order and decorum observed in his presence, and likewise in that of the other chiefs, are admirable. Whenever he sits down, all the attendants:

tendants seat themselves before him, forming a semicircle, and leaving a sufficient space between them and him, into which no one, unless he has particular business, presumes to come. Nor is any one suffered to sit or pass behind him, or even near him, without his permission. When a person wishes to speak to his majesty, he comes forward, and having seated himself before him, delivers in a few words what he has to say; then, after being favoured with an answer, retires. If the king speaks to any one, the latter gives an answer from his seat, unless he has to receive an order; in which case he rises from his place, and seats himself cross-legged before his majesty. To speak to the king standing, would have been considered as a great mark of impolite behaviour.

None of the civilized nations have excelled them in implicit obedience to the commands of their chiefs, in decorum and order of behaviour, as well as in harmony and unanimity. Such a behaviour manifests itself in a remarkable manner, whenever their chiefs harangue a body of them assembled together, which frequently happens. The greatest attention, and most profound silence are observed during the harangue; nor is there ever seen a single instance of any one present shewing signs of being displeased, or seeming in the least inclined to dispute the declared will of the speaker. It is a peculiar privilege annexed to the person of the king, not to be punctured, or circumcised, or rather supercised, as his subjects are. Whenever he walks out, all who meet him must sit down till he has passed. No person is suffered to be over his head; but, on the contrary, all must come under his feet.

The method of doing homage to their sovereign, and the other chiefs, is as follows: the person who is to pay obedience, squats down before the great personage, and bows the head down to the sole of his foot, which he taps or touches with the under and upper side of the fingers of each hand; then rising up, he retires. His majesty cannot refuse any one who is desirous of paying him this homage, which is called by the natives *moe moea*; for the people frequently think proper to shew him these marks of submission when he is walking; and he is on these occasions obliged to stop, and hold up one of his feet behind him, till they have performed this respectable ceremony. The hands, after having been thus applied, become, in some cases, useless for a little time; for, till they are washed, they must not touch food of any sort. This prohibition, in a country where water is far from being plentiful, would be attended with inconvenience, if a piece of any juicy plant, which they can immediately procure, being rubbed over the hands, did not serve for the purpose of purification. When the hands are in this situation, they term it *taboo rema*; the former word generally signifying forbidden, and the latter implying hand. When the *taboo* is incurred, by doing homage to a person of rank, it may thus easily be washed off; but in several other cases, it must continue for a certain period. Women, who

have been *taboo rema*, are not fed by themselves, but by others. The interdicted person, after the limited time has elapsed, washes herself in one of their baths, which are in general dirty ponds of brackish water. She then waits upon the sovereign, and having paid the customary obeisance, takes hold of his foot, which she applies to her shoulders, breast, and other parts; he then embraces her on both shoulders, and she immediately retires, purified from her uncleanness. If it be always necessary to have recourse to his majesty for this purpose, it may be one reason of travelling from one island to another.

It may here be proper to observe, that divers significations seem to be annexed to the word *taboo*. They call human sacrifices *tangata taboo*; and when any particular thing is prohibited to be eaten, or made use of, they say it is *taboo*. If the king goes into a house belonging to one of his subjects, that will, in consequence, become *taboo*, and can never be again inhabited by the owner of it; so that, wherever his majesty travels, there are houses peculiarly assigned for his accommodation. A certain person is appointed as an inspector of all the produce of the island, who takes care that each individual shall cultivate and plant his quota, at the same time directing what shall, and what shall not, be eaten. By so prudent a regulation, they take effectual precautions against a famine; sufficient ground is employed in raising provisions; and every article is secured from unnecessary consumption. By another good regulation, an officer is appointed to superintend the police, whose business it is to punish all delinquents: he is also generalissimo, or commander in chief of the forces of the islands. If this commander should act inconsistent with the duties of his office, or govern in such a manner as may be injurious to the public welfare, he would, by the collective body of the people, be deposed from his sovereignty, and put to death. A monarch thus subject to control and punishment for abuse of power, cannot justly be deemed a despotic prince.

We might be led to suppose, on a review of these islands, and the remote distance at which some of them are situated from the seat of government, that many efforts would have been made to throw off the yoke of subjection; but such a circumstance never happens. One reason of their not being thus embroiled in domestic commotions may be this; that all the principal chiefs take up their residence at Tongataboo. They also secure the dependence of the other isles, by the decisive celerity of their operations; for if a seditious and popular man should start up in any of them, the commander is immediately dispatched thither to put him to death, by which means they prevent any considerable insurrection.

The different classes of their chiefs seem to be nearly as numerous as among us; but there are few, comparatively speaking, that are lords of extensive districts of territory. It is said, that when a person of property

dies;

themselves, but after the limited time of their baths, brackish water. Having paid the boat, which the other parts; he and the immediate channels. If it be is majesty for this avelling from one

dies, all his possessions devolve on the sovereign; but that it is customary to give them to the eldest son of the deceased, with this condition annexed, that he should provide out of the estate for the other children. The crown is hereditary; and it is known, from a particular circumstance, that the Futtafaïhe have reigned, in a direct line, for the space of at least one hundred and thirty-five years, which have elapsed between our countrymen visiting these islands, and Tasman's discovery of them.

Upon inquiring of them, whether any traditional account of the arrival of Tasman's ships had been preserved among them till this time, it was found, that this history had been delivered down to them, from their ancestors, with great accuracy: for they said, that his two ships resembled ours, and also mentioned the place where they had lain at anchor, their having continued but a few days, and their quitting that station to go to Annamooka; and, for the purpose of informing us how long ago this affair had happened, they communicated to us the name of the Futtafaïhe who reigned at that time, and those who had succeeded him in the sovereignty, down to Poulaho, who is the fifth monarch since that period.

Their rank of precedence ever appeared a matter of great difficulty to ascertain. It was generally supposed that the present sovereign of the Friendly Islands held the highest rank of any person in his dominions. But it was found to be otherwise; for Latoolibooloo and three women are superior, in some respects, to Poulaho himself. These great personages are distinguished by the title of *Tammaha*, which implies a chief. The late king, father of Poulaho, left behind him a sister of equal rank, and older than himself; she, by a native of Feejee, had a son and two daughters; and these three persons, as well as their mother, are of higher rank than the king. Endeavours were made to discover the reason of this pre-eminence of the *Tammahas*, but without effect. The mother, and one of her daughters, named Toocela-Kaiapa, resided at Vavaoo. The other daughter, called Mounoulakaiapa, and Latoolibooloo, the son, dwelt at Tongataboo. Latoolibooloo was supposed, by his countrymen, to be disordered in his senses.

The more speculative part of our countrymen say, that the language of the natives of the Friendly Islands bears a striking resemblance to those of New Zealand, of Otaheite, and the Society Isles. The pronunciation of these people differs, indeed, in many instances, from that both of Otaheite and New Zealand; but, notwithstanding that, a great number of words are either very little changed, or exactly the same. The language, as spoken by the Friendly Islanders, is sufficiently copious to express all their ideas; and besides being tolerably harmonious in common conversation, is easily adapted to the purposes of music. They have terms to signify numbers as far as an hundred thousand, beyond which they either would not, or could not reckon.

The tides are more considerable at the Friendly

Islands, than at any other of Captain Cook's discoveries in this ocean, that are situate within either of the tropics. At Annamooka, the tide rises and falls about six feet upon a perpendicular. At Tongataboo it rises and falls four feet and three quarters on the full and change days, and three feet and an half at the quadratures.

The latitude of that part of Tongataboo, where our countrymen erected an observatory, and which was near the middle of the north side of the island, is, according to the most accurate observations, 21 deg. 8 min. 19 sec. south; and its longitude 184 deg. 55 min. 18 sec. east.

ROTTERDAM, called by the Natives ANNAMOOKA.

Disposition, Customs, and Manners peculiar to the Inhabitants.

TASMAN discovered this island in the same year with the former; it was also named by him. It lies in latitude 20 deg. 15 min. south, and longitude 174 deg. 31 min. west. The shore consists of a steep, rugged coral rock, about nine or ten feet high; but there are two sandy beaches, which are defended from the sea by a reef of the same kind of rock. In the centre of the island is a salt water lake, in breadth about a mile and a half. On the rising parts, and especially towards the sea, the soil is either of a blackish mould or reddish clay, though not a stream of water was to be found upon the island but what was brackish.

The persons, dispositions, dress, manners, customs, language, &c. of the inhabitants here, are almost the same as those of the natives of Middleburgh, and indeed of the Friendly Islands in general, as before described. Upon the whole, the land appears to be well cultivated, and if some parts lie waste, the design is evidently that they might recover that strength which had been exhausted by too frequent culture. The chief plantations were yams and plantains. Bread fruit and cocoa-trees are also interspersed without regular order, but are chiefly found near the habitations of the natives. The island is in general covered with luxuriant trees and bushes, but particularly those parts towards the sea and round the lake.

These islanders gave proof of that courteous disposition from which their country is denominated, to all the strangers they met from our vessels, bowing their heads, and using the expression, *lehi waa*, good friend, or some word to that import. They readily undertook to conduct into the recesses of their country such as applied to them, climbed the highest trees to procure them flowers, and took to the water, like spaniels, after birds that were shot: they pointed out the finest plants; and gave them their proper names; and whenever any intimation was given, that specimens of a certain kind of plant were wanted, they would go to any distance to procure them.

They manage their canoes with the greatest agility, and swim with surprising ease. Their common trailing canoes are neatly made, and curiously polished. Their consist of two, fastened to a transverse platform of planks, in the middle of which they erect an hut, where they place their goods, their arms, and utensils, and where they pass great part of their time. They have also holes which give into the body of each canoe: their masts are straight poles, which can be struck at pleasure; and their sails are very large and triangular, but not very proper to make way before the wind. Their cordage, in general, is excellent, and they have also contrived a very good ground tackle, consisting of a strong rope, with large stones at the end, by means of which they come to an anchor.

From the inquiry of a great number of the natives, on the arrival of the vessel in the island, it appeared, that the same of these voyagers had already reached this spot. They supplied their European visitors with plenty of fruit and roots. A few fowls, and one or two small pigs, were all the animal food procured here.

No king, on the first visit, was distinguished amongst these people, and their method of government was entirely unknown. A young dog and a bitch were left here, as they had no such animal among them, and were the first of those they saw. The people here are more afflicted with the leprosy, or some scrophulous disorder, than at any of the other islands.

Captain Cook, revisiting these islands in 1777, resumed the same station for anchorage as he had before occupied, and, as he thought, most probably in the same place where the first discoverer of this and some of the neighbouring islands anchored in 1643. The officers sometimes amused themselves in walking up the country, and shooting wild ducks, resembling our widgeon, which are very numerous on the salt lake, as well as on the pool where water was procured. They found, in these excursions, that the inhabitants frequently deserted their houses to repair to the trading place, without entertaining the least suspicion that strangers would take away or destroy any property that belonged to them. From this circumstance, it might be supposed, that most of the natives were sometimes collected on the beach, and that there would be no great difficulty in forming an accurate computation of their number; but the continual resort of visitors from other islands rendered it impossible. However, as they never saw more than a thousand persons collected at one time, it may be reasonably supposed, that there are about twice that number upon the island.

The natives, as upon a former occasion, shewed their European visitors every mark of civility. In the course of a few days they were visited by a great chief from Tongataboo, or Amsterdani, whose name was Feenou, and whom the commander was introduced as king of all the Friendly Isles. He was also given to understand, that on his arrival, a canoe had been dispatched to Tongataboo with the news; in consequence of

which, this chief immediately passed over to Annamooka. When the British commander went to pay this great man a visit, having first received a present of two fish from him, brought on board by one of his servants, he came up to him immediately on his landing. He appeared to be about thirty years of age, tall, but thin, and had more of the European features than had been seen before. Captain Cook, after the first salutation, asked if he was the king; for notwithstanding the information he had received, finding he was not the man he had remembered to have seen under that character during a former voyage, he began to entertain doubts. Taipa, a friendly chief, who had accompanied him since his last arrival, officiously answered for him, and mentioned many islands of which he said Feenou was the sovereign. The monarch, and five or six of his attendants, having done the European visitor the honour of accompanying him on board, he gave suitable presents to them all, and having entertained them in such a manner as he thought would be most agreeable, attended them on shore in the evening, and received a return for the presents he had made.

A matter now fell out, the recital of which will convey some idea of the extent of the authority exercised here over the common people, very little of which was known before. While Feenou was on board the ship, an inferior chief, for what reason our people on shore did not know, ordered all the natives to retire from the post they occupied. Some of them having ventured to return, he took up a large stick and beat them most unmercifully. He struck one man on the side of the face with so much violence, that the blood gushed out of his mouth and nostrils, and after laying some time motionless, he was removed from the place in convulsions. The person who had inflicted the blow, being told that he had killed the man, only laughed at it, and it was evident that he was not in the least sorry for what had happened. It was heard afterwards, however, that the poor sufferer had been so fortunate as to recover. One of the natives having stolen a large junk axe out of the ship on the first day of arrival, opportunity was taken of an invitation to apply to Feenou to exert his authority to get it restored; and such was the effect of his mandate, that it was brought on board before the captain's departure.

On this second visit, the islanders gave frequent proof of their expertness in theft. And it is remarked from experience, that even some of their chiefs did not think this profession beneath them; for one of them was detected carrying out of the ship, concealed under his clothes, the bolt belonging to the spun-yarn winch, for which he was sentenced by the commander to receive a dozen lashes, and kept in confinement till he paid for his liberty. Their servants, or slaves, however, were still employed in this dirty work, and it seems at the instigation of their masters, who, nevertheless, when any of them happened to be caught in the act, so far from interceding for them, would advise the Europeans

to kill them. As this was a punishment they did not choose to inflict, and flogging seemed to make no greater impression on them, than it would have done on the main-mast, a mode of treatment was devised which was thought to have had some effect. The delinquents were put under the hands of the barber, who completely shaved their heads, thus pointing them as objects of ridicule to their countrymen, and enabling our people to deprive them of future opportunities for a repetition of their rogueries by keeping them at a distance.

Fenou was so fond of associating with his European friends, that he visited them daily, and gave the strongest proofs of his esteem and respect. But the commander, finding that the island was exhausted of almost every article of food that it afforded, determined to proceed directly to Tongataboo. Fenou, understanding his resolution, importuned him strongly to alter his plan, to which he expressed as much an aversion as if he had some particular interest to answer by diverting him from it. In preference to it, he warmly recommended an island, or rather a group of islands, called Hapace, lying to the north-east, where he assured him he might obtain a plentiful supply of every refreshment in the easiest manner; and to add weight to his advice, he engaged to attend his new friends thither in person. Arguments so founded could not fail of having full weight, and Hapace was accordingly made choice of for the next station. Indeed, as it had never been visited by any European ships, the examination of it became an object of importance.

ISLES OF HAPAE.

Various Forms, Ceremonies, and Entertainments.

TO the north and north-east of Annamooka, and in the direct track to Hapace, whither our voyagers were now bound, the sea is sprinkled with a great number of very small isles. As from the shoals and rocks adjoining to this group there was no assurance that there was a free or safe passage for large vessels, though the natives sailed through the intervals in their canoes, it was deemed expedient to go to the westward of the above islands; the course was framed N. N. W. towards Kao and Toofa, the two most westerly islands in sight, and remarkable for their great height. These isles lie scattered at unequal distances, and are in general nearly as high as Annamooka. Most of them are entirely clothed with trees; amongst which are many cocoa-palms, and each forms a prospect like a beautiful garden placed in the sea.

When Hapace was in sight, our navigators could judge it to be low land, from the trees only appearing above the water. On a nearer view, they could see it plainly forming three islands, almost of an equal size, and soon after a fourth to the southward as large as the

others. Each seemed to be about six or seven miles long, and of a similar height and appearance. The northernmost of them is called Haanno; the next Foa, the third Lefooga, and the southernmost Hoolaiva; but all four are included under the general name of Hapace.

As soon as the European vessels came to an anchor at Hapace, they were visited by the natives, and surrounded by a multitude of their canoes, filled also with them. They brought from the shore hogs, fowls, fruit, and roots. Fenou and Omai having come on board after it was light, in order to introduce the commander to the people of the island, he accompanied them on shore for that purpose, landing at the north part of Lefooga, a little to the right of the ship's station. Being asked how long he intended to stay, and replying five days, Taipa was ordered to proclaim to the people, as by Omai, his interpreter, he was given to understand, that they were all, both old and young, to look upon the visitor before them as a friend, who intended to remain with them a few days; that, during his stay, they must not steal any thing, nor molest him any other way, and that it was expected they should bring hogs, fowls, fruit, &c. to the ships, where they would receive in exchange for them a great variety of articles, which he enumerated. Taipa then took occasion to signify to the commander that it was necessary he should make a present to the chief of the island, whose name was Earoupa, in consequence of which such articles were presented him as far exceeded his expectation. Fenou then ordered Earoupa to sit by him, and to harangue the people as Taipa had done before him, and to the same purpose.

At this place the supply of provisions was copious, for in the course of one day our people got by barter along side the ships about twenty small hogs, besides a large quantity of fruit and roots. The commander was informed, that on his first landing in the morning a man came off to the ships, and ordered every one of the natives to go on shore. Probably this was done with a view to have the whole body of the inhabitants present at the ceremony of his reception; for when that was over, multitudes of them returned again to the ship.

Fenou, attended by Omai, came soon after on board to require the presence of the commander upon the island. In landing, he was conducted to the same place where he had been seated the day before, and where, seeing a large concourse of people already assembled, he conjectured that something more than ordinary was in agitation, but could obtain no information as to particulars. He had not been long seated before near an hundred of the natives appeared in sight, and advanced laden with yams, bread-fruit, cocoa-nuts, and sugar-canes. They deposited their burdens in two heaps or piles upon the left-hand. Soon after arrived a number of others bearing the same kind of articles, which were collected into two piles on the right; to these were tied two pigs and six fowls, and so those upon the left-hand,

hand, six pigs and two turtles. Earoupa seated himself before the several articles to the left, and another chief before those on the right; they being, as was judged, the two chiefs who had collected them, by order of Fenou, who seemed to be as implicitly obeyed here as he had been at Annamooka; and, in consequence of his commanding superiority over the chiefs of Hapae, had laid this tax upon them for the present occasion.

When this munificent collection of provision was laid down in order, and disposed to the best advantage, the bearers of it joined the multitude, who formed a large circle round the whole. Presently a number of men entered the circle, armed with clubs made of green branches of the cocoa-nut tree. These paraded about for a few minutes, and then retired, the one half to the one side, and the other half to the other side, seating themselves before the spectators. Soon after they successively entered the lists, and entertained them with single combats. One champion rising up, and stepping forward from one side, challenged those on the other side, by expressive gestures more than by words, to send one of their body to oppose him. If the challenge was accepted, the two combatants put themselves in proper attitudes, and then began the engagement, which continued till one or other owned himself conquered, or till their weapons were broken. As soon as each combat was over, the victor squatted himself down opposite to the chief, then rose up and retired. At the same time some old men, who seemed to sit as judges, gave their plaudits in a few words; and the multitude, especially those on the side to which the victor belonged, celebrated the glory he had acquired in two or three loud huzzas. During the intervals of suspension from this entertainment, there were both wrestling and boxing matches; the latter differed very little from the method practised in England.

But what most surprised our people was, to see two lusty wenches step forth, and begin boxing without ceremony, and with as much art as the men. This contest, however, did not last above half a minute before one of them gave it up. The conquering heroine received the same applause from the spectators, which they bestowed upon the successful combatants of the other sex. The Europeans expressed some dislike at this entertainment, which, however, did not prevent two other females from entering the lists. They seemed to be girls of spirit, and would certainly have given each other a good drubbing, if two old women had not interposed to part them. All the combats were exhibited in the midst of at least three thousand people, and were conducted with the greatest good-humour on all sides; though some of the champions, women as well as men, received blows which they must have felt for some time after.

As soon as the diversions were ended, the chief gave the commander to understand, that the heaps of provision on the right-hand were a present to Omai, and those on the left-hand, being about two thirds of the whole

quantity, were given to himself. He assured him, that a guard was needless, as not the smallest article would be taken away by the natives. So, indeed, it proved; for when the provisions were removed on board, not a cocoa nut was missing. It was remarked, that this present of Fenou exceeded any that had been made the commander by any of the sovereigns of the various islands he had visited in the Pacific Ocean. His liberality was compensated by the bestowal of such commodities as were supposed to be most valuable in his estimation. This chief having expressed a desire to see the marines go through their military exercise, they were accordingly ordered on shore from both ships.

After they had performed various evolutions, and fired several volleys to the gratification of the spectators, the chief entertained his visitors, in his turn, with an exhibition, which, as acknowledged by all, was performed with dexterity and exactness, far surpassing the specimen the Europeans had given of their military manœuvres. This was a dance performed by men, and in which no less than one hundred and five persons bore their parts. Each of them had in his hand an instrument neatly made, in shape resembling a paddle, of two feet and an half in length, with a small handle and a thin blade, so that they were very light. With this instrument, they made many and various flourishes, each of which was accompanied with a different attitude of the body, or a different movement. At first, the performers ranged themselves in three lines, and by various evolutions, each man changed his station in such a manner, that those who had been in the rear came into the front. Nor did they remain long in the same position, but these changes were made by pretty quick transitions. At one time they extended themselves in one line; they then formed into a semicircle; and, lastly, into two square columns. While this last movement was executing, one of them advanced, and performed an antic dance before the commander, with which the whole ended. It was the general opinion of the party present, that such a performance would have met with universal applause upon an European stage; and it so far exceeded any attempt our people had made to entertain them, that they seem to plume themselves upon their superiority in this particular. They held none of our musical instruments in the least esteem, except the drum. The French-horns in particular seemed to be held in great contempt, for neither here, or at any other of the islands, would they pay the least attention to them.

To give the natives a more favourable opinion of English amusements, and to have their minds fully impressed with a sense of our superior attainments, the commander directed some fire-works to be prepared, and after dark caused them to be played off in the presence of Fenou, the other chief, and a vast concourse of their people. They succeeded in general so well as to answer the end proposed. The water and sky-rockets, in particular, pleased and astonished them exceedingly.

As a prelude to another entertainment of dances which Fenou had prepared for his guests, a band of music, or chorus of eighteen men, seated themselves before them in the centre of the circle composed by the numerous spectators, the area of which was to be the scene of the exhibitions. Four or five of this band had pieces of large bamboo, from three to five or six feet long, each managed by one man, who held it nearly in a vertical position, the upper end open, but the other closed by one of the joints. With this close end, the performers kept constantly striking to the ground, though slowly, thus producing different notes, according to the different lengths of the instruments, but all of them of the hollow or bafe sort; to counteract which, a person kept striking, quickly and with two sticks, a piece of the same substance, split and laid along the ground, and by that producing a tone as acute as those proceeding from the others were grave. The rest of the band, as well as those who performed on the bamboo, sung a slow and soft air, which so tempered the harsher notes of the above instruments, that no bystander, however accustomed to hear the most perfect modulations of sweet sounds, could avoid confessing the vast power and pleasing effect of this simple harmony. After this concert had continued about a quarter of an hour, twenty women entered the circle. Most of them had upon their heads garlands of crimson flowers of China rose, or others; and many of them had ornamented their persons with leaves of trees, cut with great nicety about the edges. They formed a circle round the chorus, turning their faces towards it, and began by singing a soft air, to which responses were made by the chorus in the same tone, and these were repeated alternately. All this while the women accompanied their song with several very graceful motions of their hands towards their faces, and in other directions, at the same time making constantly a step forward, and then back again with one foot, while the other was fixed. They then turned their faces to the assembly, sung some time, and retreated slowly in a body, to that part of the circle which was opposite to the spot where the principal spectators sat. After this, one of them advanced from each side, meeting and passing each other in the front, and continuing their progress round till they came to the rest. On which two advanced from each side, two of whom also passed each other, and returned as the former; but the other two remained, and to these came one from each side by intervals, till the whole number had again formed a circle about the chorus.

They now changed their manner of dancing to a quicker measure, in which they made a kind of half turn by leaping, and clapped their hands, and snapped their fingers, repeating some words in conjunction with the chorus. Towards the end, as the quickness of the music increased, their gestures and attitudes were varied with wonderful vigour and dexterity, and some of their motions by our countrymen might be deemed in-

decent: though probably this part of the performance was not meant to convey any wanton ideas, but merely to display the astonishing variety of their movements. Another exhibition followed, performed by fifteen men; and though some of them were old, time seemed to have robbed them of but little of their agility. They were disposed in a kind of circle, divided at the front. Sometimes they sung slowly, in concert with the chorus, making several graceful motions with their hands, but differing from those of the women; at the same time inclining the body alternately to either side, by raising one leg outward, and resting on the other; the arm of the same side being also stretched upwards. They then recited sentences, which were answered by the chorus; and occasionally increased the measure of the dance, by clapping the hands, and quickening the motions of the feet. Towards the conclusion, the rapidity of the music and dancing so much increased, that the different movements were hard to be distinguished.

Twelve other men advanced after the conclusion of the dance, placing themselves in double rows, fronting each other. On one side was stationed a kind of prompter, who repeated several sentences, to which responses were made by the performers and the chorus. They sung and danced slowly; and gradually grew quicker, like those whom they had succeeded.

The next that exhibited themselves were nine women, who sat down opposite the hut where the chief had placed himself. A man immediately rose, and gave the first of these women a blow on the back with both his fists joined. He treated the second and third in the same manner; but when he came to the fourth, he struck her upon the breast. Upon seeing this, a person instantly rising from among the crowd, knocked him down with a blow on the head, and he was quietly carried away. But this did not excuse the other five women from so extraordinary a discipline; for they were treated in the same manner by a person who succeeded him. When these nine women danced, their performance was twice disapproved of, and they were obliged to repeat it again. There was no great difference between this dance and that of the first women, except that these sometimes raised the body upon one leg, and then upon the other, alternately, by a sort of double motion. Soon after a person entered, making some ludicrous remarks on what had been exhibited, which extorted a burst of laughter from the crowd. The company had then a dance by the attendants of Fenou; they formed a double circle of twenty-four each round the chorus, and joined in a gentle soothing song, accompanied with motions of the head and hands. They also began with slow movements, which gradually became more and more rapid, and finally closed with several very ingenious transportations of the two circles.

The entertainments of this remarkable night concluded with a dance in which the principal people present

present exhibited, and which was performed with so much spirit, and so great exactness, that they met with universal approbation. The native spectators, who, no doubt, were perfect judges whether the several performances were properly executed, could not withhold their applauses of some particular parts, and even a stranger who never saw the diversion before, felt at this time similar satisfaction.

The place where these dances were performed, was an open space amongst the trees, just by the sea, with lights at small intervals placed round the inside of the circle. The concourse of people was pretty large, though not equal to the number assembled when the marines went through their exercise. Some guessed there might be about five thousand persons present on this occasion.

The commander next day took a tour into the island of Lefooga, of which he was desirous to obtain some knowledge, and found it to be in several respects superior to Annamooka. The plantations were more numerous and more extensive. In many places, indeed, towards the sea, especially on the east side, the country is still waste, which is owing probably to the sandy soil, as it is much lower than Annamooka and its surrounding isles. But towards the middle of the island the soil was better, and the marks of considerable population and of improved cultivation were every where seen. The party which went on the excursion observed large spots covered with the paper mulberry-trees, and the plantations in general were well stocked with such roots and fruits as are the natural produce of the island. To these some addition was made by our countrymen, in sowing the seeds of Indian corn, melons, pumpkins, &c.

The island is not above seven miles long, and in some places not above two or three broad. The east side of it, which is exposed to the trade-wind, has a reef running to a considerable breadth from it, on which the sea breaks with great violence. It is a continuation of this reef that joins Lefooga to Foa, which is not above half a mile distant, and at low water the natives can walk upon this reef, which is then partly dry, from one island to another. The shore itself is either a coral rock, six or seven feet high, or a sandy beach; but higher than the west side, which in general is not more than three or four feet from the level of the sea, with a sandy beach its whole length.

A party in a walk happened to step into a house where a woman was dressing the eyes of a young child who seemed blind, the eyes being much inflamed, and a film spread over them. The instruments she used were two slender wooden probes, with which she had brushed the eyes so as to make them bleed. It seems worth mentioning, that the natives of those islands should attempt an operation of this sort, though our countrymen entered the house too late to describe exactly how this female oculist applied the wretched tools she had to work with. However, they saw a different operation go on in the same house, of which they were able to give a tolerable account. They there

found another woman shaving a child's head with a shark's tooth, stuck into the end of a piece of stick. It was observed, that she first wetted the hair with a rag dipped in water, applying her instrument to that part which had been previously soaked. The operation seemed to give no pain to the child, although the hair was taken off as close as if one of our razors had been employed. A person of curiosity amongst the party, encouraged by what he saw, soon after tried one of these singular instruments upon himself, and found it to be an excellent shift. The men of these islands, however, have recourse to another contrivance when they shave their beards. They perform the operation, as before mentioned, with two shells, and some amongst them seem to profess this trade. It was as common, according to the account of our voyagers, to see the sailors go on shore to have their beards scraped off, after the fashion of Hapae, as it was to see their chiefs come on board to be shaved by our barbers.

An artificial mount was near the south end of the island Lefooga. From the size of some trees that were growing upon it, and from other appearances, it was supposed to have been raised in remote times. At the bottom of this mount stood a stone, which must have been hewn out of coral rock; it was four feet broad, two and a half thick, and fourteen high, and our people were told by the natives present, that not above half its length appeared above ground. They called it *tangata areke* (tangata in their language is man, areke, king) and said that it had been set up, and the mount raised by some of their forefathers, in memory of one of their kings; but how long since, they could not give information.

The party that landed at Hoolaiwa did not find the least mark of cultivation or habitation upon it, except a single hut, the residence of a man employed to catch fish and turtle. Uninhabited as Hoolaiwa is, an artificial mount, like that at the adjoining island, has been raised upon it as high as the surrounding trees. A large sailing canoe here came under the commander's stern, in which was a person named Tuttafaihe, or Poulaho, or both, who, as the natives then on board informed our people, was king of Tongataboo, and was king of all the neighbouring islands that we had seen or heard of. The commander was surprised at having a stranger introduced to him under that dignified character, which he had been before assured belonged to another; but the natives persisted in their declaration, and for the first time confessed that Fenou was not the king, but only a subordinate chief, though of great power, as he was often sent from Tongataboo to the other islands on warlike expeditions, or to decide differences. However, as it was the interest as well as inclination of the commander to pay court to all the great men, without inquiring into the validity of their assumed titles, Poulaho was invited on board; nor was he an unwelcome guest, for he brought with him as a present two good fat hogs, though not so fat as himself. If weight of

body could give weight in rank or power, he was certainly the most eminent man in that respect who had been seen; for, though not very tall, he was very un- wieldy, and almost shapeless with corpulence. He ap- peared to be a sedate, sensible man, viewed the ship and the several new objects with uncommon attention, and asked many pertinent questions.

Poulaho soon became as solicitous himself as his peo- ple were, to convince his new friends that he was king, and not Fenou, who had passed with them as such: for he soon perceived they had some doubts about it, which Omai, from his attachment to Fenou, was not very de- sirus of removing. Poulaho sat down to table, ate lit- tle, drank less, and, on rising, desired the commander to accompany him on shore. This was accordingly com- plied with, after presenting him with such articles as he was observed to value most, and were even beyond his expectation to receive. This munificence was however amply compensated both by presents and honours, as soon as they reached the shore. The commander was placed at his side, while he received the several articles his people had got by trading on board the ships. At length he ordered every thing to be restored to the respective owners, except a glass bowl, with which he was so much pleased, that he reserved it to himself.

The persons who brought these things to him first squatted themselves down before him, then deposited their several purchases, and immediately rose up and retired. The same respectful ceremony was observed in taking them away, and not one of them presumed to speak to him standing. The commander staid till several of his attendants left him, first paying him obedience, by bow- ing the head down to the soles of his feet, and touching or tapping the same with the upper and under side of the fingers of both hands. The commander was charmed with the decorum that was observed, and declared that he had no-where seen the like, even amongst more civi- lized nations.

The king continued to heap favours on his new friend, and, in particular, presented the commander with one of their caps, which were known to be valued at Otaheite, one of the places of their future destination. These caps, or rather bonnets, are composed of the tail feathers of the tropic bird, with the red feathers of the parroquets wrought upon them, or jointly with them. After various courses, hazards, and difficulties, they arrived and landed at Kotoo, in order to examine that island.

It is scarcely accessible by boats on account of the cor- al reefs that surround it. It is not more than a mile and a half, or two miles long, and not so broad. The north-west end of it is low, like the islands of Hapae, but it rises suddenly in the middle, and terminates in reddish clayey cliffs at the south-east end about thirty feet high. The soil in that quarter is of the same sort as in the cliffs; but in the other parts, it is a loose black mould. It produces the same fruits and roots which were

found at the other islands, and is tolerably cultivated, but thinly inhabited.

C H A P. VII.

ISLANDS BETWEEN THE EQUATOR AND THE SOUTHERN TROPIC.

Their Situation, Productions, Manners of the Natives, and other Particulars.

AS some of these are comprehended under the list of the Friendly Islands, as such they will be pointed out and first attended to.

From the best accounts, we may include not only the groupe at Hapae, visited by our late navigators, but those discovered nearly under the same meridian to the north, as well as some others under the dominion of Tongataboo, which, though not the largest, is the capital seat of government.

This archipelago must be very extensive, for the natives reckoned a great number of islands; fifteen of them were said to be very lofty.

The principal of those seen on the last voyage have been described, viz. Eooa, Annamooka, Hapae, and Tongataboo.

PLYSTART-ISLAND was so called by Tasman who first saw it. The name signifies arrow-tail. This island lies in latitude 22 deg. 26 min. south, and longi- tude 170 deg. 59 min. west; it is mountainous, barren, and about two or three miles in circumference.

AMMATAFOA. From the appearance of a thick smoke arising from this island, and a fire issuing from it in the night, it was concluded that there was a volcano upon it, and this opinion was confirmed by infor- mation received from the natives that the appearances are constant. Near to this island is a high peak called Oghoa. They are both inhabited, seem barren, and are about twelve leagues distant from Annamooka.

It is supposed by Captain Cook, that Prince William's Islands, discovered and so named by Tasman, are in- cluded in this list; and assigns as a reason, that while he lay at Hapae, he received information from one of the natives, that at the distance of three or four days sail from thence to the north-west, there was a cluster of small islands, and this account corresponds with that given in Tasman's voyage. From the best information our late navigators could obtain, the most considerable in this neighbourhood are Hamoi, Vavaoo, and Feejee. Each of these was represented to them as larger than Tongataboo: our cou- rymen in their late voyages did not visit them.

HAMOÀ lies two days sail north-west from Vavaoò. It is said to be the largest of all their islands; affords harbours and good water, and produces in abundance all the articles of refreshment that are found at the places our people visited. Poulaho frequently resides upon this island; and the people here are in high estimation at Tongataboo.

FEJEE lies in the direction of north-west by west, about three days sail from Tongataboo. It abounds with hogs, dogs, fowls, and such fruits and roots as are to be found in any of the others, and is much larger than Tongataboo; but not subject to its dominion, as the other islands of this archipelago are. Feejee and Tongataboo frequently engage in war against each other; and the inhabitants of the latter are often so much afraid of this enemy, that they bend the body forward, and cover the face with their hands, to express the sense of their own inferiority to the Feejee men. This is, indeed, no matter of surprize, for those of Feejee have rendered themselves formidable, by their dexterity in the use of bows and slings; but more so, by their savage practice of eating such of their enemies as they kill in battle. Extreme hunger, some say, first occasioned men to feed on human flesh; but where could be the inducement for the Feejee people to continue it in the midst of plenty? It is held in detestation by the inhabitants of Tongataboo, who seem to cultivate the friendship of their savage neighbours of Feejee through fear; though they, occasionally, venture to skirmish with them on their own territory, and carry off large quantities of red feathers as trophies. When a profound peace reigns between the two islands, they have frequent intercourse together; though, it is probable, they have not long been known to each other; or, it might be supposed that Tongataboo, and its neighbouring islands, would, before this time, have been supplied with a breed of dogs, which are numerous at Feejee, and were not introduced at Tongataboo, when first visited by our countrymen in 1773.

The colour of the natives of Feejee, met with here, was a shade darker than any of the inhabitants of the other Friendly Islands. One of the natives was seen, who had his left ear slit, and the lobe so stretched, that it almost extended to his shoulder; which singularity had been observed at other islands in the South-Seas during a former voyage. The Feejee men were much revered here; not only on account of their power and cruelty in war, but also for their ingenuity; for they greatly excelled the inhabitants of Tongataboo in workmanship. Specimens were shewn of their clubs and spears, which were ingeniously carved. Some of their beautifully chequered cloth, variegated mats, earthen pots, and other articles, also displayed a superiority in the execution.

Feejee, as before observed, is three days sail from Tongataboo; these people having no other method of

expressing the distance from island to island, but by mentioning the time required for the voyage in one of their canoes. That this might be ascertained with some precision, Captain Cook failed in one of their canoes, and by repeated trials with the log, found that she went close hauled, in a gentle gale, seven miles in an hour. He judged from this, they could sail, with such breezes as in general blow in their seas, seven or eight miles an hour on an average. Each day, however, is not to be reckoned at twenty-four hours; for when they talk of one day's sail, they mean no more than from the morning to the evening, or ten or twelve hours at the most. From the morning of the first day till the evening of the second, is, with them, two days sail. In the day, they are guided by the sun; and, in the night, by stars. When these are obscured, they can only have recourse to the points from whence the winds and waves come upon the vessel. If, at that time, the winds and waves should shift, they are quite bewildered, often missing their intended port, and sometimes are never heard of more.

TRAITORS, or KEPPEL'S ISLAND, lying in 15 deg. 55 min. latitude; 175 deg. 3 min. longitude west, is three miles and a half in extent and two in breadth. It was seen by Le Mair in 1716, and by him named, The Island of Traitors. When Captain Wallis arrived here, in the Dolphin, in 1765, he found a good landing place. The natives appear to be of a disposition similar to that of those of the Friendly Islands in general, and resemble them in the clothing and the amputation of the little fingers. At that time no hogs were seen upon this island, and the refreshments procured were trifling.

The reason that Captain Cook comprehends both this, and the following, called Boscawen's Island, in the list, arises from the following circumstances. Inquiring one day of Poulaho, the king, in what manner the inhabitants of Tongataboo had acquired the knowledge of iron, and from what quarter they had procured a small iron tool, which he had seen amongst them when he first visited their island; he was informed they had received it from an island, which he called Necootaboo. On a more minute inquiry, the king said, that one of those islanders sold a club for five nails to some of the crew of a ship that had touched there, and that these five nails were afterwards sent to Tongataboo. He added, that this was the first iron known amongst them, so that what Tasman left of that metal must have been worn out and forgotten long ago. On inquiring further, the principal facts appeared to be fresh in his memory; he said there was but one ship, that she did not come to anchor, but left the island after her boat had been on shore. From several particulars which he mentioned, it could not be many years since this had happened. It appeared, further, from his account, that there were two islands

near each other, at which he had been himself. The one he described as high and peaked, like Kao, and he called it Kootahce; the other, where the people of the ship landed, called Necootabootaboo, he represented as much lower. He added, that the natives of both were the same sort of people with those of Tongataboo; and built their canoes in the same manner; that their island had hogs and fowls, and in general the same vegetable productions. Upon the whole, it appeared evident to Captain Cook, that the ships so pointedly referred to, in this conversation, could be no other than the Dolphin, the only ship from Europe, as far as could be learned, that had touched, of late years, at any island in this part of the Pacific Ocean, prior to his former visit of the Friendly Islands.

COCOS, OR BOSCAWEN'S-ISLAND. This island received the former name from Le Mair and Schouten, who first visited it in 1716, and the latter from Captain Wallis, who saw it the same voyage as he did the foregoing. It lies in latitude 15 deg. 50 min. south, and longitude 175 deg. west. The natives of this, as well as Traitors-Island, are of a savage disposition. Their clothing consists of rushes or mats; they have their hair in different forms, and are robust and well proportioned. The flaps of their ears are slit, and hang down almost to their shoulders. They wear whiflers and a short tuft under the chin, and their bodies are punctured or tattooed.

When the first Europeans arrived at this spot, one of the chiefs put off from the shore, in a canoe covered with a mat in the form of a tent, and accompanied by a number of people in thirty canoes. As they approached Schouten's ship, the chief cried out three times with a loud voice, and at the fourth all the attendants joined him. He presented the commander with a paper dress and a fine mat, for which he received due compensation. These people soon gave proofs of an irresistible propensity to theft, attempting to pilfer every thing they saw; they even tried to draw out the nails from the ship's side with their teeth; nay, some swam under the very keel and strove to draw the nails from thence, till being fired at they desisted. A vast number of them, however, next day put off from shore with some hogs, bananas, fowls, and cocoa nuts, of which they have plenty. When the chief, or Latow, as he is there called, gave the signal from his double canoe, there was a general shout, followed by a volley of stones thrown on board the ship. The chief, indeed, was so absurd as to suppose that he could run down the ship with his canoe, and made the ridiculous attempt, in which he struck the head of it to pieces. This exasperated the savages, and they renewed the attack, but they were soon put to flight, by the discharge of small arms and a few great guns.

HERVEY-ISLAND, so called by Captain Cook, in

honour of the Earl of Bristol, was discovered by him in 1773. It is situated low, in latitude 19 deg. 8 min. south, longitude 158 deg. 4 min. west. On his last voyage, our people observed, on their approach, several canoes coming from the shore towards the ships, a circumstance which occasioned much surprize, as no traces or signs of inhabitants were seen when the island was first discovered. It might, indeed, be owing to a brisk gale that then blew, and prevented their canoes from coming out. Those that came off stopped at a short distance from the vessel: it was with difficulty they were prevailed on to come along side, but could not be induced, by any means, to come on board. They soon, however, began to evince their propensity to theft, so prevalent in this part of the globe, in stealing oars, cutting away a net, containing meat, that hung over the stern of one of the ships, and other acts of a like nature. But it appeared that they had a knowledge of bartering, for they exchanged some fish for some of our small nails, of which they were extravagantly fond, and called them *goore*. Pieces of paper, or any trifling article that was thrown to them, they caught with the greatest avidity; and if what was thrown fell into the sea, they immediately plunged in to swim after it.

The colour of the natives of Hervey-Island, is of a deep cast, and several of them had a fierce savage aspect, like the natives of New Zealand, though some were fairer. Their hair was long and black, either hanging loose about their shoulders, or tied in a bunch on the top of the head. Some few, indeed, had it cropped short, and in two or three of them, it was of a red or brownish colour. Their clothing was a narrow piece of mat, bound several times round the lower part of the body, and passing between the thighs. A fine cap of red feathers was seen lying in one of the canoes, and some amongst them were ornamented with the shell of a pearl-oyster, polished and hung about the neck.

The boats that were sent to reconnoitre the coast, could advance no further than the other edge of the reef, which was computed almost a quarter of a mile from the dry land. A number of the natives came upon the reef, armed with clubs and long pikes, meaning, as was supposed, to oppose the people's landing; though, at the same time, they threw cocoa-nuts to them, and requested them to come on shore. Notwithstanding this seeming friendly treatment, the women were very active in bringing down a fresh supply of darts and spears.

Captain Cook discovered PALMERSTON'S-ISLAND in 1774. It lies in latitude 18 deg. 4 min south, and longitude 163 deg. 10 min. west. This island consists of a group of small islets, about nine or ten in number, connected by a reef of coral rocks, and lying in a circular direction. It appeared from observation made by

near

some of our people in going on shore upon the last voyage, that the island does not exceed a mile in circumference, and is not elevated above three feet beyond the level of the sea. It consists almost entirely of a coral sand, with a small mixture of blackish mould, which appeared to be produced from rotten vegetables.

The soil, poor as it is, however, is covered with shrubs and bushes; a great number of man of war birds, tropic birds, and also two sorts of boobies were perceived, which were then laying their eggs, and so exceedingly tame as to suffer themselves to be taken off their nests, which consisted only of a few sticks loosely put together. These tropic birds differ essentially from the common sort, being of a beautiful white, slightly tinged with red, and having two long tail-feathers of a deepish crimson. Our people killed a considerable number of each sort, which, though not the most delicate kind of food, were highly acceptable to such as had been a long time confined to a salt diet. There were plenty of red crabs creeping among the trees; and several fish caught, which, when the sea retreated, had been left in holes upon the reef.

At one part of the reef, which bounds the lake within, almost even with the surface, there appeared a large bed of coral, which afforded a most enchanting prospect. Its base, which was fixed to the shore, extended so far that it could not be seen, so that it appeared to be suspended in the water. The sea was then unruffled, and the refulgence of the sun exposed the various sorts of coral, in the most beautiful order; some parts luxuriantly branching into the water; others appearing in vast variety of figures; and the whole greatly heightened by spangles of the richest colours, glowing from a number of large clams interspersed in every part. Even this delightful scene was greatly improved by the multitude of fishes, whose colours were the most beautiful that can be imagined; blue, yellow, red, &c. far exceeding any thing that can be produced by art. The richness of this view was greatly increased by their various forms; and the whole could not possibly be surveyed without a most pleasing transport.

No traces could be discovered of inhabitants having been here, except a piece of a canoe that was found upon the beach; and probably that might have been drifted from some other island. Some small brown rats were found on this island; a circumstance, perhaps, not easily accounted for, unless the possibility of their being imported in the canoe, of which the remains were seen, be admitted.

An ample supply was found here for the subsistence of the cattle, consisting principally of tender branches of the whana-tree, palm-tree, palm-cabbage, and young cocoa-nut trees. Amongst the great number of fish found upon the reefs, were some beautiful large spotted eels, which would raise themselves out of the water, and endeavour to bite their pursuers. There were also frappers, parrot-fish, and a brown spotted rock-fish, not larger than a haddock, so tame that it would remain

fixed, and gaze at the people. If they had been really in want, a sufficient supply might easily have been had. There were also some shell-fish; and when the tide flowed, several sharks came with it, some of which were killed by our people; but their presence rendered it, at that time, unsafe to walk in the water. Mufquetoes abound here.

The islets, comprehended under the name of Palmerston's-Island, may be said to be the summits of a reef of coral-rock, covered only with a thin coat of sand; though clothed with trees and plants, like the low grounds of the high islands of this ocean.

In their course to Annamooka, our late navigators passed the following places.

SAVAGE-ISLAND, discovered by Captain Cook in 1774. It lies in latitude 19 deg. 1 min. south, and longitude 169 deg. 37 min. west. On his first landing the inhabitants discovered a most savage ferocity, and withstood every possible intimation of good-will. They gave such evident tokens of hostile designs in darting a spear, which grazed the commander's shoulder, and other instances, that a party posted on a rock, to secure a retreat in case of an attack, found it necessary to fire on the natives to rescue him, and those who were with him, from impending destruction. From the general aspect and conduct of these islanders, Captain Cook was induced to call this spot Savage-Island. It is in extent about seven leagues, of a round form, good height, and has deep water close to its shores. As no soil was to be seen towards the coasts, and the trees alone supplied the trees with moisture, the interior parts are supposed to be barren.

EIMEO, or WALLIS'S DUKE OF YORK'S ISLAND, was first discovered by Captain Wallis in 1767. It was visited by Captain Cook in 1777. The harbour, which is called Taloo, is situated on the north side of the island. It runs between the hills about two miles south, or south by east. For safety and soundness of bottom it is pronounced by our navigators equal to any harbour met with in this ocean, to which is added this peculiar convenience, that a vessel can sail both in and out with the reigning trade wind. A rivulet falls into it sufficiently capacious to admit boats a quarter of a mile up, where the water was found perfectly fresh. The banks of the rivulet are covered with what the natives call the Pooroo tree, which is in no estimation, and solely used for firing. From these two causes wood and water abound here. There is another harbour called Parowroah, about two miles to the eastward on the same side of the island. Though much larger within than Taloo, the opening in the reef lies to leeward of it, and is in no degree so wide. From these two defects the harbour of Taloo is evidently superior. On the south side of the island are one or two more

harbours, but they are inconsiderable compared with those above described.

The natives of the Duke of York's Island are a stout, robust, well-made people, of a light copper colour; none of them could be called black; they go entirely naked. The hair is woolly; but it is so managed by some sort of grease or ointment, and a white or red powder with which they dress it, that it hangs on some like so many candle-wicks, or rather like the thrums of a new mop reversed, or turned upside down: they are generally as fully powdered as a beau dressed for an assembly; some have their hair of a yellow, sun-burnt colour; others quite red, as if powdered wholly with the true marechall; none are seen with the hair of its natural colour. This yellow or red appearance, we believe, may be occasioned by an universal method of powdering, for the powder seems to be made from burnt shells or coral, and is really a kind of lime: they generally carry a small gourd or box filled with it about them; and when they are hostilely disposed, they frequently take a quantity of this powder into the hollow of the hand, from which, with a strong blast from the mouth, they blow it before them; and at a small distance it has exactly the appearance of firing gunpowder, and no doubt so meant as a token of defiance.

Their chief, upon hostile occasions, powdered his body all over, so that it was no difficult matter to discover him; they also upon such occasions painted their faces red; some had marks upon their arms and shoulders, caused by scarifying those parts in long stripes, and letting the sore rise above the surface of the skin. They frequently wore a bone or reed thrust through the septum of the nose, and, like the natives of Lord Howe's Group, had also holes cut through the wings of the nose, into which were fixed short pieces of hollow reed, as ladies wear wires to keep the ears open when newly bored; into these hollows or rings they occasionally stuck long pieces of reed, which are no doubt considered by them as ornamental. The men in general were well-looking people; but the women are remarkable for being of a dark hue, low of stature, and disagreeable features.

Numbers of the natives came on board the European vessels as soon as they had anchored, from mere curiosity, as appeared by their bringing out commodities for the purpose of traffic. Several canoes, however, arrived the next day from more remote quarters with an abundant supply of bread-fruit, cocoa nuts, and a few hogs, which were exchanged for beads, nails, and hatchets.

Maheme, the chief of the island, accompanied by his wife, visited the commander on board; but through extreme caution and deliberation, betrayed much distrust. They were presented with such articles as appeared mostly to engage their attention, which they took with them on shore, and returned with a hog in compensation; but received an additional present to its full value. This chief was between forty and fifty years of age, and bald headed, which in these islands was rather un-

gular at that time of life. He seemed desirous of concealing this baldness, as he wore a turban, from whence it was inferred, that it was held disgraceful; a very probable supposition, as one of the natives had his head shaved, as a punishment for theft. This propensity to pilfering prevailed here in common with the islanders in general, and the loss of a goat on the part of the Europeans had nearly been attended with the most serious consequences. The natives were guilty of great duplicity of conduct upon this occasion. The chief retired to a remote part of the island; their replies were equivocal on demanding restoration of the animal, inasmuch that it was deemed expedient to send on shore an armed party which drove the natives before them. However, as assurance was given them of their safety, it put a stop to their flight. Persisting in their denial of any knowledge of the animal, six or eight of their houses were set on fire, two or three canoes were consumed, and a messenger was dispatched to Mahem with a peremptory declaration, that on his refusing immediate restoration of the goat, a single canoe should not be left on the island, nor should hostilities cease while the stolen animal continued in his possession. These means had the desired effect; the goat was returned; and, it appeared from good intelligence, that it was brought from the very place where the inhabitants, but the day before, declared their total ignorance of the matter.

This island, in its produce, is nearly the same with that of those adjoining. The country is hilly, has little low land except some valleys, and the flat border that almost surrounds the sea. These hills, though rocky, are generally covered almost to their tops with trees. At the bottom of Taloo harbour the ground gradually rises to the foot of the hills, but the flat border on each side becomes quite steep at a very small distance from the sea. This gives it a romantic cast, pleasing to the view. In the low grounds the soil is of a yellowish stiff mould; on the lower hills it is blacker and looser, and the stone that composes the hills is of a bluish colour, with some particles of glimmer interspersed. Near where the vessels lay were two large stones, or rather rocks, concerning which the natives entertain some superstitious notions, considering them as brother and sister, and holding them to be *Eutooa's*, or Divinities brought thither by supernatural agency.

The island called O-HETEROA is thirteen miles in circumference, situated in latitude 22 deg. 27. min. south, and longitude 150 deg. 47 min. west. Though more even and uniform, it is neither so populous or fertile as the adjacent islands. The inhabitants are not hospitable, nor have they an harbour for the accommodation of shipping. There is a bay on the western side of the island; the bottom is foul and rocky; but the water is so clear that the bottom can be seen at the depth of 25 fathom, or 150 feet. The natives are of

an hostile disposition, and generally armed with lances near twenty feet long, made of a very hard wood, polished and sharpened at one end. They differ much in the form of their drefs from the other islanders, though the materials are the same. Some of them wear caps made of the large feathers of the tropic bird, and cover their bodies with stripes of different coloured cloth, as yellow, red, and brown. Their habit is a kind of short jacket of cloth, which reaches to the knee. It is of one piece, and having a hole in the middle, with long stitches round it, is thereby rendered different from the drefs of all the other islanders. Through this hole the head is put, and the whole being bound round the body by a piece of yellow cloth or sash, that passes round the neck behind, is crossed upon the breast, and collected round the waist like a belt, which passes over another belt of red cloth, so that they are represented as making a very gay and warlike appearance. They take singular pains in adorning their canoes, by the embellishments of carvings, and some rows of white feathers hanging down from head to stern.

The ISLANDS of DANGER, were so called by Commodore Byron, from the hazard to which a vessel is exposed from the rocks and broken ground between them, which being so low a ship may be close in with them before they are seen. They are three in number, and their situation is differently laid down by Commodore Byron and Captain Cook, the former placing them in latitude 12 deg. 33 min. south, longitude 167 deg. 47 min. west. The length of the most extensive of these islands is about three leagues. From the extreme points runs out a reef upon which the sea breaks to a tremendous height. Innumerable rocks and shoals stretch near two leagues into the sea, on the north-west and west sides, and are extremely dangerous. These islands are populous, and appear fertile and beautiful; but they are secluded from investigation by their very dangerous situation.

BYRON'S DUKE of YORK'S ISLAND, was thus named by Commodore Byron, who discovered it in 1765. It lies in latitude 8 deg. 41 min. south, and longitude 173 deg. 3 min. west. It is a dreary spot, uninhabited; a dreadful sea breaks upon almost every part of the coast, nor could soundings be any-where found. The boats landed with great difficulty, and procured some cocoa-nuts, which greatly refreshed the crew, amidst a dearth of wholesome food. The island appeared as if it never had been trodden by a human being before. Innumerable sea-fowls were seen sitting upon their nests, built upon high trees; but so tame that they suffered themselves to be knocked down without leaving their nests. No other animal was seen but land-crabs, with which the ground was covered.

TURTLE-ISLAND, so denominated by Captain Cook, who first visited it, from the number of turtles with which it abounded, lies in latitude 19 deg. 48 min. south, and longitude 178 deg. 2 min. west.

When QUEEN CHARLOTTE'S ISLANDS were first discovered by Captain Carteret, seven of them were counted; but there was reason to suppose there were more dispersed within the cluster. The water here is excellent; but there is a dearth of wholesome vegetables. The colour of the natives is black, their hair is woolly, and they go stark naked. A party sent on shore upon this island by Captain Wallis to procure provisions, by their insolent behaviour, brought upon themselves the resentment of the natives, and thereupon ensued a skirmish, in which the master of the ship, and several seamen were wounded by arrows, and afterwards died, while the Dolphin lay here. To protect the English on shore from the fury of the natives, grape shot was fired from the ship's guns, which so intimidated them, that they abandoned that part of the island, and left the people to fill water without annoyance. The commander was not necessary to the carnage, as the insult given to the natives was contrary to his express orders, and he was under an indispensable necessity of procuring water by any means. The inhabitants are very nimble and vigorous, and of an amphibious compound, as they were in and out of their canoes every minute. These islands lie in latitude 11 deg. longitude 164 deg. east.

BYRON'S-ISLAND, was so called from Commodore Byron, who discovered it in 1765; it lies in 1 deg. 18 min. south latitude, and 170 deg. 50 min. east longitude. There being no part favourable for anchorage, the people could not go on shore, nor procure any refreshments. It was supposed to be about four leagues in extent, and was evidently very populous, for as soon as the vessels came in sight, the natives assembled on the beach, to the number of above a thousand, and more than sixty canoes put off from the shore, made towards it, and ranged themselves in a circle round it. Having gazed for some time, one of the people jumped out, swam to the ship, and ran up the side like a cat. Having stepped over the gunwale he sat down upon it, burst into a fit of excessive laughter, and starting up suddenly, ran up and down the ship, seemingly desirous of stealing whatever he could lay his hands on, but could not effect his design, as being stark naked it was impossible to conceal his booty. Much merriment was produced on the sailors dressing him in a jacket and trowsers, as he then displayed all the droll gesticulations of an ape. He was ready enough to eat, with a most voracious appetite, some bread which was given him; and having played a number of antic tricks, leaped over in his new garb, and swam to his canoe.

The

The natives of this island are of good stature, proportion, and features. Their complexion is of a bright copper, and the mixture of cheerfulness and intrepidity, discoverable in their countenances, strikes the beholder. They have long black hair; some had long beards, others only whiskers, and others nothing more than a small tuft at the point of the chin. They were all stark naked except some ornaments, which consisted of shells fancifully disposed and strung together, which they wore round their necks, wrists, and waists. Their ears were perforated, but they had no ornaments in them, though it seemed as if they had worn very heavy ones, for their ears hung down almost to their shoulders, and some were split quite through. A person amongst them of apparent importance, had a string of human teeth tied about his waist, which was supposed to be a badge of his valour, as he would not part with it upon any consideration. Some were armed with a kind of spear very broad at the end, and stuck full of shark's teeth, which were as sharp as a lancet. They were of a savage disposition; for when our people shewed them some cocoa-nuts, and indicated, by signs, that they wanted more, instead of supplying them, they discovered a desire of depriving them of those few they had remaining; so that we could expect no friendship to be established with them.

CHAP. VIII.

OF THE ISLANDS OF MANGEEA, WATEOO, AND OTAKOOTAI.

The Soil, Manners, Disposition, Dress, and Customs of the Natives.

MANGEEA, or MANGYA, is situated in 21 deg. 59 min. south latitude, and 201 deg. 53 min. east longitude, and was discovered by Captain Cook in March 1777. As an attempt to land from boats appeared impracticable, on account of the surf, and no bottom could be found for anchorage, till they came within a cable's length of the breakers, our late navigators were obliged to leave this island unvisited. However, those parts of the coast that fell under observation are guarded by a reef of coral rock, against which a heavy surf is continually breaking.

This island is about five leagues in circumference; and though of a moderate and pretty equal height, may be seen in clear weather at the distance of ten leagues. In the interior parts it rises into small hills, whence there is an easy descent to the shore, which, in the south-west part, is steep, though not very high, and has several excavations made by the dashing of the waves against a brownish sand stone, of which it consists. The descent here abounds with trees of a deep green, which seem to be all of one sort, except nearest the shore, where was observed a number of that species, found in the woods of New Zealand. The shore on the north-west part terminates in a sandy beach, beyond which the

land is broken into small clafms, and has a broad border of trees, which resemble tall willows. Further upon the ascent, the trees were of the deep green before mentioned. Some trees of the higher forts were thinly scattered on the hills, the other parts of which were either covered with something like fern, or were bare, and of a reddish colour.

This island, upon the whole, has a pleasing appearance, and might, by proper cultivation, be made a beautiful spot. From the numbers and aspect of the natives, it is highly probable, that such articles of provision as the island produces, are found in great abundance. Our countrymen were informed, that they had no hogs or dogs, though they had heard of both those animals; but that they had plantains, taro, and bread-fruit. The only birds observed were some terns, noddies, white egg-birds, and one white heron.

As our people approached the shore, they saw many of the natives running along the beach, and, by the assistance of glasses, could perceive that they were armed with long spears and clubs, which they brandished in the air with signs of threatening, but, as some supposed, with invitations to land. Most of them were naked, except having a kind of girdle, which was brought up between the thighs; but some of them wore about their shoulders pieces of cloth of various colours, white, striped, or chequered; and almost all of them had about their heads a white wrapper, in some degree resembling a turban. They were of a tawny complexion, robust, and about the middle size.

A man getting into a small canoe, at a distant part of the beach, put off, as with a view of reaching the ship; but his courage failing, he quickly returned towards the shore. Another man soon after joined him in the canoe; and then both of them paddled towards it. They seemed, however, afraid to approach, till their apprehensions were partly removed by Omai, who addressed them in a language they understood. Thus encouraged, they came near enough to receive nails and beads, which, being tied to some wood, were thrown into the canoe. They, however, put the wood aside without untying the things from it, which might perhaps have proceeded from superstition; for Omai told our people, that when they observed them offering presents, they requested something for their *Eatooa*. On being asked by Omai, whether they ever eat human flesh, they replied in the negative, with equal abhorrence and indignation. One of them, named Mourooa, being questioned with regard to a scar on his forehead, said, it was the consequence of a wound he had received in fighting with the natives of an island lying towards the north-east, the people of which sometimes invaded them. They afterwards laid hands on a rope, but would not venture on board, telling Omai, that their countrymen on shore had suggested to them this caution; and had likewise directed them to inquire when our ship came, and to learn the name of the captain. Their chief, they said, was called Orooeeeka, the name of the

S

island

island *Mangya* or *Mangœa*, to which they sometimes added *noœ*, *nai*, *naiwa*.

We perceived one of the natives to be rather corpulent; and, though not tall, well proportioned. As his person was agreeable, so was his disposition; this appeared from some droll gesticulations, which indicated humour and good-nature. He also made others of a ferocious kind, and repeated some words with an air of devotion, before he would venture to take hold of the rope at the stern of the ship. His complexion was nearly of the same cast with that of the natives of the most southern parts of Europe. His companion was not so handsome. They both had strong, straight, black hair, tied together on the top of their heads with a piece of white cloth. They had long beards; and the inside of their arms, from the elbow to the shoulder, and some other parts, were tattooed or punctured. The lobes of their ears were slit to such a length, that one of them stuck a knife and some beads that were given him in them. The same person had hung about his neck, by way of ornament, two polished pearl shells, and a bunch of human hair, loosely twisted together. They wore a kind of girdle, of a substance manufactured from the *marus papyrifera*, and glazed like those used in the Friendly Islands. They had on their feet a sort of sandals, made of a grassy substance interwoven, which were observed to be all worn by those seen on the beach.

The canoe in which they came, was the only one of the natives seen; it was very narrow, and not above ten feet long, but strong and neatly made. The lower part was of white wood, but the upper part black; and their paddles were made of wood of the same colour; these were broad at one end, and blunted, and about three feet long. The fore part had a flat board fastened over it, which projected out, to prevent the water from getting in. It had an upright stern, five feet high, which terminated at top in a kind of fork. They paddled indifferently either end of the canoe forward.

While the English officers were employed in reconnoitring the coast in two boats, the natives thronged down upon the reef all armed. Mourooa, who was in the boat with Captain Cook, thinking, perhaps, that this warlike appearance deterred them from landing, commanded his own people to retire. As many of them complied, it was imagined that he was a person of some consequence. Several of them, instigated by curiosity, swam from the shore to the boats, and came on board them without reserve. It was difficult to keep them out, and prevent their pilfering whatever they could lay hands upon. At length, when they observed our people returning to the ships, they all departed except Mourooa, who, though not without manifest indication of fear, accompanied the commodore on board the *Resolution*. The cattle and other new objects that he saw there, did not strike him with much surprise; his mind, perhaps, being too much occupied about his own safety, to allow him to attend to other things. He seemed very uneasy, gave but little new

intelligence; and therefore, after he had continued a short time on board, Captain Cook ordered a boat to carry him towards the land. In his way out of the cabin, happening to stumble over one of the goats, he stopped, looked at the animal, and asked Omai what bird it was; but not receiving an immediate answer from him, he put the same question to some of the people who were upon deck. The boat having conveyed him near the surf, he leaped into the water, and swam ashore. His countrymen, eager to learn what he had seen, flocked round him as soon as he had landed; in which situation they remained till our people lost sight of them.

These islanders speak a language resembling that spoken at Otaheite, but their pronunciation is more guttural, and they have some words peculiar to themselves. It was remarked, that they seemed to resemble the natives of Otaheite in their persons more than any other nation seen in these seas, having a smooth skin, and not being muscular. Their general disposition and method of living, as far as there were opportunities of judging, were supposed to be similar. One house was observed near the beach. It was pleasantly situated in a grove of trees, and appeared to be about thirty feet long, and seven or eight feet high, with an open end. Their mode of salutation is that of joining noses, with the additional ceremony of taking the hand of the person whom they salute, and rubbing it with a degree of warmth upon their nose and mouth.

WATEOOO was discovered also by Captain Cook in 1777, is situated in latitude 20 deg. 1 min. south, and longitude 201 deg. 45 min. east. It is a beautiful spot, about six leagues in circuit, with a surface covered with verdure, and composed of hills and plains. The soil in some parts is light and sandy, but on the rising ground of a reddish cast.

Soon after the arrival of the European vessels, several of the natives put off from the shore in several canoes, and came alongside of them. Their canoes are long and narrow, and supported with out-riggers; the head is flat above, but prow-like below, and the stern about four feet high. They seemed to have no idea of barter or traffic; as after having received some presents of knives, beads, and other trifles, they gave our people some cocoa-nuts, in consequence of having asked for them, but not by way of exchange. One of them with a little persuasion came on board, and others soon followed his example. They appeared to be perfectly free from all apprehension of danger. When introduced into the cabin, and conducted to other parts of the ship, though some objects seemed to surprise them, nothing could fix their attention. They were afraid to venture near the cows and horses, of whose nature they could form no conception. As for the sheep and goats, they gave the seamen to understand, that they knew them to be birds, a most astonishing proof of their ignorance.

and total want of conception. Though the commodore bestowed on his new friends what he supposed would be most acceptable, yet they seemed rather disappointed.

Such of the natives as were seen in these canoes, were in general of the middle stature, and not unlike those of Manceea. Their hair either flowed loose over their shoulders, or was tied on the crown of the head; and though in some it was frized, yet that, as well as the straight sort, was long. Some of the young men were handsome. Like the inhabitants of Manceea, they wore girdles of glazed cloth, or fine matting, the ends of which were brought between their thighs. Their ears were bored, and they wore about their necks, by way of ornament, a sort of broad grass, stained with red, and strung with berries of the night-shade. They were punctured or tattooed from the middle downwards, particularly upon their legs, which made them appear as if they wore boots. Their beards were long, and they had a kind of sandals on their feet. They were frank and cheerful in their deportment, and very friendly and good-natured.

Some cocoa-nuts and plantains, and a hog, were brought in some canoes, for which the natives demanded a dog in return, refusing every other thing offered by way of exchange. Though one of the sailors had a dog and a bitch, which were great nuisances in the ship, and which might have served to propagate a race of so useful an animal in this island, yet he could not be prevailed upon to part with them. However, to gratify them, Omai gave them a favourite dog he had brought from Great-Britain; with which acquisition they were highly satisfied. Now-and-then some of them brought a few cocoa-nuts to the ships, and exchanged them for whatever was offered.

The following account of transactions, which is very circumstantial, and includes some observations on the island and its inhabitants, is presented as a general display.

“ Some of our people rowed towards a sandy beach, where a great number of the natives had assembled, and came to anchor at the distance of an hundred yards from the reef. Several of the islanders swam off, bringing cocoa-nuts with them; and Omai gave them to understand, that our people were desirous of landing. Soon after two canoes came off; and to inspire the natives with greater confidence, they resolved to go unarmed. The conductors of the canoes, watching with great attention the motion of the surf, landed them safely on the reef. A native took hold of each of them, with a view of supporting them in walking over the rugged rocks to the beach, where several others, holding in their hands the green boughs of a species of *mi-misa*, met them, and saluted them by the junction of noses. They were conducted from the beach amidst a vast multitude, who flocked round them with the most eager curiosity; and being led up an avenue of cocoa-palms, soon came to a number of men, arranged in two rows, and armed with clubs.

“ Proceeding onward among these, they found a person who appeared to be a chief, sitting cross-legged on the ground, and cooling himself with a kind of triangular fan, made from the leaf of the cocoa-palm, with a polished handle of black wood. He wore in his ears large bunches of beautiful feathers of a red colour; but had no other mark to distinguish him from the rest of the people. Our countrymen having saluted him as he sat, marched on among the men armed with clubs, and came to a second chief, adorned like the former, and occupied like him in fanning himself. He was remarkable for his size and corpulence, though he did not appear to be above thirty years of age. They were conducted in the same manner to a third chief, who seemed older than the two former; he was also sitting, and was ornamented with red feathers. After they had saluted him as they had done the others, he desired them to sit down; which they willingly consented to, being greatly fatigued with walking, and with the extreme heat they felt amidst the surrounding multitude. The people being ordered to separate, they saw, at a small distance, about twenty young women, adorned like the chiefs, with red feathers, engaged in a dance, which they performed to a slow and solemn air, sung by them all. They rose up, and walked forward to see these dancers, who, without paying them the smallest attention, still continued their dance. They seemed to be directed by a man, who mentioned the several motions they were to make. They never changed the spot, as Europeans do in dancing, though their feet were not entirely at rest: this exercise consisted chiefly in moving their fingers very nimbly, holding their hands at the same time near the face, and occasionally clapping them together. Their dancing and singing were performed in the exactest concert. They were in general very stout, and of an olive complexion, with black hair flowing with ringlets down their necks. Their shape and limbs were elegantly formed; their dress consisted only of a piece of glazed cloth, tied round the waist, which scarcely reached so low as the knees. Their features were rather too full to constitute a perfect beauty. Their eyes were of a deep black, and their countenances expressed a great degree of modesty and complacency.

“ While the dance continued, a noise was heard by our countrymen, as if some horses had been galloping towards them; and, on turning their eyes aside, they saw the people armed with clubs, who had been desired to entertain them, as they supposed, with an exhibition of their mode of fighting; which they now did, one party pursuing another which ran away.

“ One of our people found that the natives pilfered several trifling things which were in his pocket; and on his complaining of this treatment to the chief, he justified their behaviour. From these circumstances it was apprehended, that they designed to detain the party among them. In this situation he asked for something to eat; upon which they brought him some

cocoa-nuts, bread-fruit, and a sort of four pudding; and when he complained of the heat, occasioned by the multitude of people, the chief himself condescended to fan him. To try whether their suspicions were well founded or not, they attempted to get to the beach; but were soon stopped by some of the natives, who said they must return to the place which they had left. On their coming up, they found Omai under the same apprehensions; but he had, as he imagined, an additional motive of terror; for, having observed that they had dug a hole in the ground for an oven, which they were now heating, he could assign no other reason for it, than that they intended to roast and devour our party: he even went so far as to ask them whether that was their intention, at which they were much surprised, asking, in return, whether that custom prevailed among us. Our party were continually in a crowd, who frequently desired them to uncover parts of their skin, the sight of which struck the islanders with admiration. They at the same time rifled their pockets; and one of them snatched from an officer a bayonet which hung by his side. This being represented to one of the chiefs, he pretended to send a person in search of it, but probably countenanced the theft; for Omai, soon after, had a dagger stolen from his side in the same manner.

“They now brought some green boughs as emblems of friendship, and, sticking the ends of them in the ground, desired that our party would hold them as they sat, giving them to understand, that they must stay and eat with them. The sight of a pig lying near the oven which they had prepared and heated, removed Omai's apprehensions of being put into it himself, and made him think that it might be intended for the repast of him and his friends. The chief also sent some of his people to provide food for the cattle, and they returned with a few plantain trees, which they conveyed to the boats. In the mean time our party made a second attempt to get to the beach; but, on their arrival, they found themselves watched by people who seemed to have been stationed there for that purpose; for, when one of them endeavoured to wade it upon the reef, a native dragged him back by his clothes. They also insisted upon his throwing down some pieces of coral that he had picked up, and, on his refusal to comply, took them from him by force. Nor would they suffer him to retain some small plants which he had gathered. They likewise took a fan from an officer, which, on his coming ashore, he had received as a present.

“Finding that obedience to their will was the only method of procuring better treatment, our people returned to the place they had quitted; and the natives now promised, that, after they had partaken of a repast which had been prepared for them, they should be furnished with a canoe to carry them off to their boats. Accordingly, the second chief to whom they had been presented, having seated himself on a low stool, and directed the multitude to form a large ring, made them

sit down by him. A number of cocoa-nuts were now brought, with a quantity of baked plantains, and a piece of the pig that had been dressed was placed before each of them. Their fatigue, however, had taken away their appetites; but they ate a little to please their entertainers. It being now near sun-set, the islanders sent down to the beach the remainder of the provisions that had been dressed, to be carried to the ships. Our people found a canoe prepared to put them off to their boats, which the natives did with great caution; but as they were pushing the canoe into the surf, one of them snatched a bag out of her, which contained a pocket pistol, but the owner calling out to the thief with marks of the highest displeasure, he swam back to the canoe with the bag. The islanders then put them on board the boats, with the cocoa-nuts, plantains, and other provisions; and they immediately rowed back to the ships.

“The restrained situation of the party gave them very little opportunity of observing the country: for they were seldom an hundred yards from the place where they had been introduced to the chiefs, and consequently were confined to the surrounding objects. The first thing that attracted their notice was the number of people, which must have been at least two thousand. Except a few, those who had come on board the ships were all of an inferior class; for a great number of those seen on shore had a superior dignity of demeanor, and their complexion was much whiter. In general, they had their hair, which was long and black, tied on the crown of the head. Many of the young men were perfect models in shape, and of a delicate complexion. The old men were, many of them, corpulent; and they, as well as the young, had a remarkable smoothness of skin. Their general dress consisted of a piece of cloth wrapped about the waist, but some had pieces of mats most curiously variegated with black and white, formed into a kind of jacket without sleeves; while others wore conical caps made of the core of a cocoa nut, interwoven with beads. In their ears, which were pierced, they hung pieces of the membranous part of some plant, or stuck there some odoriferous flower. The chiefs, and other persons of rank, had two little balls, with a common base, made of bone, which they hung round their necks with small cord. Red feathers are here considered as a particular mark of distinction; for none but the chiefs, and the young women who danced, assumed them. Some of the men were punctured all over the sides and back, and some of the women had the same ornament (if it deserves that name) on their legs.

“The elderly women had their hair cropped short, and many of them were cut all over the fore part of the body in oblique lines. The wife of a chief appeared with her child laid in a piece of red cloth, which had been presented to her husband; she suckled the infant much after the manner of our women. Another chief introduced his daughter, who was young, beautiful,

and modest. No personal deformities were observed in either sex, except in a few individuals, who had scars of broad ulcers remaining on the face, and other parts. Their weapons were spears and clubs, the latter of which were generally about six feet long, made of a hard black wood neatly polished. The spears were formed of the same wood simply pointed, and were in general twelve feet long; but some were so short as to seem intended for darts.

“Our party continued all the day under the shade of various trees, where they preserved their canoes from the sun. They had eight or ten of them, all double ones; that is, two single ones fastened together by rafters lashed across.

“Most of the trees observed were cocoa-palms, some species of *bibiscus*, a sort of *sapborbia*, and many of the same kind as had been seen at Mangeea. The latter are tall and slender, resembling a cypress, and are called by the natives *iva*. Here was seen a species of *convolvulus*, and some treacle-mustard. The soil, towards the sea, is nothing more than a bank of coral, generally steep and rugged, which, though it has been for many centuries exposed to the weather, has suffered no further change than becoming black on its surface.

“The party which landed upon this occasion were gratified in no particular except that of curiosity in speculation; for they did not procure any article that could be ranked among the grand objects in view. Omai was questioned by the natives concerning us, our country, our ships, and arms: in answer to which he told them, among many other particulars, that our country had ships as large as their island, on board of which were implements of war (describing our guns) of such dimensions as to contain several people within them; one of which could demolish the island at one shot. As for the guns in our two ships, he acknowledged they were but small in comparison with the former; yet even these he said could with great ease, at a considerable distance, destroy the island and all its inhabitants. On their inquiring by what means this could be done, Omai produced some cartridges from his pocket, and having submitted to inspection the balls, and the gunpowder by which they were to be set in motion, he disposed the latter upon the ground, and, by means of a piece of lighted wood, set it on fire. The sudden blast, the mingled flame and smoke, that instantaneously succeeded, filled the natives with such astonishment, that they no longer doubted the formidable power of our weapons. Had it not been for the terrible ideas they entertained of the guns of our ships, from this specimen of their mode of operation, it was imagined they would have detained the party on shore the whole night; for Omai assured them, that if he and his friends did not return on board the same day, they might expect that the Commodore would fire upon the island.

“But the Europeans were not the only strangers

upon this island, as was discovered by Omai's accompanying our countrymen on shore. He had scarcely landed on the beach, when he found among the crowd three of his own countrymen, natives of the Society Isles. The mutual surprise and pleasure in which they engaged in conversation may be easily imagined. Their story is a very affecting one. About twenty persons, male and female, had embarked in a canoe at Oraheite, with an intention of crossing over to Ulietea; but were prevented by contrary winds from reaching the latter, or returning to the former island. Their stock of provision being soon exhausted, they suffered inconceivable hardships. They passed many days without sustenance, in consequence of which their number gradually diminished, worn out by famine and fatigue. Only four men survived, when their canoe was overfet. The destruction of this small remnant now seemed inevitable; however, they continued hanging by the side of the vessel, during some of the last days, till they providentially came in sight of the inhabitants of this island, who sent out canoes and brought them on shore. One of these four died. The other three were so well satisfied with the generous treatment they met with here, that they refused the offer made them by our party, at the request of Omai, of taking them on board our ships, and restoring them to their native islands. They had arrived upon this coast at least twelve years before. Their names were Tavee, Otirrerora, Orououte: the former was born at Huaheine, the second at Ulietea, and the latter at Otaheite. This circumstance will serve to explain, in a more satisfactory manner, than the conjectures of some speculative reasoners, how the detached parts of the world, and, in particular, the islands of the Pacific Ocean, may have been first peopled; those especially that lie at a considerable distance from each other, or from any inhabited continent.

“Several of the houses of the natives were observed to be long and spacious. The produce of this island is nearly the same with that of Mangeea.

“According to Omai's report of what he learned from his three countrymen in the course of conversation, the manners of the people of Wateoo, their general habits of life, and their method of treating strangers, greatly resemble those at Otaheite, and its neighbouring islands. There is also a great similarity between their religious opinions and ceremonies. From every circumstance, indeed, it may be considered as indubitable, that the inhabitants of Wateoo derive their descent from the same stock, which has so remarkably diffused itself over the immense extent of the Southern Ocean. Omai assured our people, that they dignified their island with the pompous appellation of *Wenooa no te Eatooa*, implying a *land of Gods*; esteeming themselves a kind of divinities, possessed with the spirit of the *Eatooa*. Their language was equally well understood by Omai, and by the two New Zealanders who were on board.

From divers particulars already mentioned, it appears
 T
 that

that Watercoo can be of little service to any ship that wants refreshment, unless in a case of the most absolute necessity.

The natives being ignorant of the value of some of our commodities, might be induced to bring off fruits and hogs to ship standing off and on, or to boats lying off the reef, as the boats of our latest circumnavigators did. It is doubtful, however, if any fresh water could be procured; for though some was brought in cocoonut shells to the party who went on shore, they were told, that it was at a considerable distance; and probably it is not to be met with but in some stagnate pools, as no running stream was any where seen.

OTAKOOTAIA lies in latitude 19 deg. 15 min. south, and longitude 201 deg. 37 min. east. It was discovered by Captain Cook in 1777. It is about three or four leagues distant from Watercoo, and supposed not to exceed three miles in circuit.

The natives labour under a dearth of water. The only common trees found here were the cocoa palms, of which there were several clusters, and great quantities of the *waharra* or *pandanus*. There were also the *calliphylum*, *juriana*, with a few other shrubs, also a sort of *bind-weed*, *treacle-mustard*, a species of *spurge*, and the *matinda citri-folia*.

The only bird seen among the trees was a beautiful cuckoo, of a chestnut brown, variegated with black; but upon the shore was a small sort of curlew, blue and white herons, some egg-birds, and a great number of noddies. A lizard was caught running up a tree, and though small, had a forbidding aspect. Many of another kind were likewise seen. Infinite numbers of a kind of moth elegantly speckled with black, white, and red, swarmed on the bushes towards the sea. Other sorts of moths and pretty butterflies were seen.

Though our countrymen saw no fixed inhabitants upon this island, they discovered a few empty huts, which proved that it had been at least occasionally visited. Monuments, consisting of several large stones, were also erected under the shade of some trees: there were also some smaller ones, with which several places were enclosed, where it was thence inferred their dead had been buried. As many cockle shells were found very large, and of a particular kind, it was supposed that the island must have been visited by people who sometimes fed on shell-fish.

CHAP. IX.

NEW DISCOVERIES

By English Navigators, and not yet settled by the Europeans.

INTRODUCTION.

THOUGH we are greatly indebted to the moderns, for the amazing progress they have made in Geography, yet we are still far from knowing

all the parts of our terraqueous globe, or of being made acquainted with the prodigious variety of the human species inhabiting the different countries of the earth. Terra del Fuego was believed to be the extremity of South America, till Magellan, in 1519, discovered the straits which bear his name. It was then considered as an island; but succeeding navigators found that this also was a mistake; and that, instead of being one, it consists of several islands; but with regard to the nature of the country, or the dispositions of the inhabitants, we had but very imperfect notions, till the Endeavour, a ship fitted out by the government in pursuit of natural knowledge, visited Terra del Fuego in 1769. Put before we give a particular account of that and other voyages, it will be necessary to give a compendious narrative of the several voyages and expeditions projected and accomplished by British navigators in the reign of King George III. for the discovery of a southern continent.

In August 1766, the Dolphin was sent out under the command of Captain Wallis, with the Swallow, commanded by Captain Carteret, at the expence of the British government, in order to make discoveries in the southern hemisphere. These vessels proceeded together, till they came within sight of the South-Sea, at the western entrance of the Strait of Magellan, and returned from thence by different routes to England: Captain Wallis, on the 6th of June 1767, discovered an island, about four miles long and three wide, to which he gave the name of Whitsun-Island, it being discovered on Whitsun-Eve. Its latitude is 19 deg. 26 min. S. and its longitude 137 deg. 56 min. W. The next day he discovered another island, to which he gave the appellation of Queen Charlotte's-Island; it is about six miles long, and one mile wide, and lies in latitude 19 deg. 18 min. S. and 138 deg. 1 min. W. He tells us, that the inhabitants of this island were of a middle stature, and dark complexion, with long black hair, which hung loose over their shoulders. The men were well made, and the women handsome. Their clothing was a kind of coarse cloth or matting, which was fastened about their middle, and seemed capable of being brought up round their shoulders. A few days afterwards he also discovered several other small islands, to which he gave the names of Egmont-Island, Gloucester-Island, Cumberland-Island, Osnaburgh-Island, and Prince William Henry's-Island. On the 19th of the same month, he discovered the island of Otahite; and after quitting that, he discovered, on the 28th of July 1767, another island, about six miles long, which he called Sir Charles Saunders's-Island; and on the 30th of the same month, another about ten miles long, and four broad, which he called Lord Howe's-Island. After having seen several other small islands, he arrived at Batavia on the 30th of November, at the Cape of Good-Hope on the 4th of February 1768, and on the

10th of May following his ship anchored safely in the
Doth.

After Captain Carteret, in the Swallow, had parted
from Captain Wallis, in the Dolphin, having passed
through the Straight of Magellan, and made some stay
at the island of Masafuero, on the 2d of July 1767,
he saw an island about five miles in circumference, to
which he gave the name of Pitcairn's-Island; it is situ-
ated in lat. 25 deg. 2 min. south, and in 133 deg.
21 min. west long. about 1000 leagues to the eastward
of the continent of America. On the 11th of the
same month he observed another small island, to which
he gave the name of the Bishop of Osnaburgh's-Island.
The next day he discovered two other small islands, to
which he gave the name of Queen Charlotte's-Islands;
and also three others, which he named Gower's-Island,
Simpson's-Island, and Carteret-Island. On the 27th
of the same month they discovered Sir Charles Hardy's-
Island; which lies in lat. 4 deg. 50 min. south, and the
next day Winchelsea's-Island, distant about 10 leagues
in the direction of south by east. He afterwards dis-
covered several other islands, and then proceeding
homewards round the Cape of Good-Hope, he arrived,
March 1769, in England.

The Royal Society, about the latter end of the year
1767, came to a resolution, that it would be proper to
send persons into some part of the South-Sea, to observe
a transit of the planet Venus over the sun's disk, which,
according to astronomical calculation, would happen in
the year 1769; and that the islands named Marguefas
de Mendoza, or those of Rotterdam or Amsterdams,
were the properest places then known for making such
observations. In consequence of these resolutions, it
was recommended to his majesty, in a memorial from
the society, dated February 1768, that he would be
pleased to order such an observation to be made; where-
upon his majesty signified by the Lord's Commissioners
of the Admiralty, his pleasure that a ship should be
provided to carry such observers as the society should
think fit to the South-Seas; and accordingly a bark of
370 tons was prepared for that purpose. It was called
the Endeavour, and commanded by Captain James
Cook, who was soon after, by the Royal Society, ap-
pointed with Mr. Charles Green, a gentleman who
had long been assistant to Dr. Bradley, at the Royal
Observatory at Greenwich, to observe the transit. But
while this vessel was getting ready for her expedition,
Captain Wallis returned; and it having been recom-
mended to him by Lord Martin, when he went out,
to fix on a proper place for this astronomical observation,
he by letter dated on board the Dolphin, May 18,
1768, the day before he landed at Hastings, mentioned
Port-Royal harbour, in the island of Otaheite; the
Royal Society, therefore, by letter dated the beginning
of June, in answer to an application from the admir-
rally, to be informed whether they would have their
observers sent, mentioned that place.

Captain Cook set out from Plymouth, in the En-

deavour, on the 26th of August 1768. He was
accompanied in his voyage by Joseph Banks, Esq. and
Dr. Solander. They made no discovery till they got
within the tropic, where they fell in with Lagoin-
Island, Two Groups, Bird-Island, and Chain-Island;
and they arrived at Otaheite on the 13th of April 1769.
During their stay at that island, they had an opportunity
of making very accurate inquiries relative to its produce
and inhabitants; and on the 4th of June the whole
passage of the planet Venus over the sun's disk was
observed by them with great advantage: the philosophi-
cal transactions contain an ample account of the result
of their observations. After Captain Cook departed
from Otaheite, he discovered and visited the Society-
Islands and Ohetsoa, and thence proceeded to the south
till he arrived in the latitude of 40 deg. 22 min. and
147 deg. 29 min. west long. and afterwards made an
accurate survey of the coast of New Zealand. In
November he discovered a chain of islands, which lie
called Barrier-Islands. He afterwards proceeded to
New Holland, and from thence to New Guernsey;
and in September 1770 arrived at the island of Savus,
from whence he sailed to Batavia, and from thence
proceeding round the Cape of Good Hope, he arrived
on the 19th of June 1771, in England.

In a short time after Captain Cook's return home in
the Endeavour, it was resolved to equip two ships, in
order to make further discoveries in the southern hemi-
sphere. Accordingly, the Resolution, commanded by
Captain Cook, and the Adventure, by Captain Tobias
Furneaux, were appointed for that purpose; and, exclu-
sive of excellent officers, and able seamen, several
learned and ingenious gentlemen were engaged to assist
in the undertaking. The two vessels sailed from Ply-
mouth Sound on July 13, 1772, and on the 29th of the
same month arrived at the island of Madeira. From
thence they proceeded to the Cape of Good-Hope,
which they came to on the 10th of October following;
and in February 1773, arrived at New Zealand, having
sought in vain for a southern continent. In that month
the Resolution and Adventure separated, in consequence
of a thick fog, but joined company again in Queen
Charlotte's Sound, on the 18th of May following. In
August, they arrived at Otaheite, and in December
they discovered Hervey's-Island. On the 2d of Octo-
ber, they came to Middleburgh, one of the Friendly
Islands; and about the close of the month, the two ships
separated, and did not join company any more. Cap-
tain Cook, however, proceeded in the Resolution, in
order to make discoveries in the Southern polar regions,
but was stopped in his progress by the ice, in the lati-
tude of 71 deg. 10 min. south, and 106 deg. 54 min.
west long. He then proceeded to Easter-Island, where
he arrived in March 1774, as he did also in the same
month at the Marquesas. He afterwards discovered four
islands, which he named Palliser's-Islands; and again
steered for Otaheite, where he arrived on the 22d of
April, and made some stay; and also visited the neigh-
bouring;

bouring isles. In August he came to the New Hebrides, some of which were first discovered by him. After quitting these islands, he steered to the southward a few days, and discovered New Caledonia. Having surveyed the south-west coast of this island, Captain Cook again stood for New Zealand, in order to refresh his crew, and put his ship into a condition to encounter the dangers attending the navigation in the high southern latitudes. Directing his course to the south and east, after leaving New Zealand, till he arrived in the latitude of 35 deg. 6 min. south, 138 deg. 56 min. west long. without meeting with any continent. This able navigator gave up all hopes of discovering any in that ocean; and therefore came to a resolution to steer directly to the west entrance of the Straights of Magellan, with a view of coasting and surveying the uttermost, or south side of Terra del Fuego. Keeping accordingly in about the latitude of 53 or 35, and steering nearly east, he arrived off the western mouth of these straits, without meeting with any thing remarkable in this new route. In January 1775, he discovered a large and dreary island, to which he gave the name of South Georgia. He afterwards perceived various capes, and elevated snow-clad coasts, to the most extreme part of which he gave the name of the Southern Thule, as being the nearest land to that pole which has been yet discovered. In February, he perceived Sandwich-land, and several islands covered with snow. He then proceeded round the Cape of Good-Hope to England, where he arrived on the 30th of July 1775. Captain Furneaux had returned in the Adventure a year before, having sailed round the Cape of Good-Hope without making any remarkable discovery. Ten of his men, a boat's crew, had been murdered and eaten by some of the savages of New Zealand; so that this voyage afforded a melancholy proof, that cannibals really exist. Indeed, in the course of these voyages of discovery, other evidence of this disputed matter too plainly appeared.

Another voyage was performed by Captain Cook and Captain Clarke, in the Resolution and Discovery, in the years 1776, 1777, 1778, and 1779, in search of a north-west passage between the continents of Asia and America. After they had arrived at the Cape of Good-Hope, they proceeded from thence to New Holland; and in their course, they discovered two islands, which Captain Cook called Prince Edward's Isles. The largest, about fifteen leagues in circuit, is in lat. 46 deg. 53 min. south, and 27 deg. 46 min. long. The other, about nine leagues in circuit, lat. 46 deg. 40 min. and long. 38 deg. 8 min. east, both barren, and almost covered with snow. From thence they proceeded to New Zealand, and afterwards they visited the Friendly and the Society-Isles. In January 1777, they arrived at the Sandwich-Isles, which are twelve in num-

ber, and are situate between 22 deg. 15 min. and 28 deg. 53 min. north lat. Captain Cook afterwards discovered King George's-Sound, which is on the north-west coast of America, and is extensive. That part of it where the ships under his command anchored, is in lat. 42 deg. 36 min. north, and long. 232 deg. 28 min. east. On the 12th of May, they discovered Sandwich-Sound, in lat. 59 deg. 54 min. north. The harbour in which the ships anchored, appeared to be almost surrounded with high land, which was covered with snow; and here they were visited by some of the natives in their canoes. They afterwards proceeded to the Island of Unalatchka, and after their departure from thence still continued to trace the coast. They arrived on the 20th of August 1778, in lat. 70 deg. 54 min. and 194 deg. 55 min. long. where they found themselves almost surrounded with ice, and the further they proceeded to the eastward, the closer the ice, became compacted. This voyage afforded sufficient evidence, that no practicable passage exists between the Atlantic and Pacific Oceans towards the north; and it also ascertained the western boundaries of the great continent of America. On their return, it unfortunately happened, that the celebrated and able navigator, Captain Cook, was killed in an affray with the natives, of which event, a full detail will be given in its proper place. In his last voyage, he had explored the coast of America, from 42 deg. 27 min. to 70 deg. 40 min. 57 sec. north. After his death, the command devolved on Captain Clarke, who died at sea on his return to the southward, on the 22d day of August 1779. The two ships returned home by the Cape of Good-Hope, and anchored at the Nore, on the 5th of October 1780.

Captain Cook, in the course of his voyage in the Resolution, begun in 1772, had made the circuit of the southern ocean, in a high latitude, and had traversed it in such a manner, as to leave little room for indulging an idea of a southern continent, except so near the pole, as to be out of the reach of navigation. It deserved also to be remembered, in honour of that experienced commander, that, with a company of 418 men, he performed this voyage of three years and eighteen days, throughout all the climates, from 52 deg. north, to 71 deg. south, with the loss of only one man by sickness; and this appears in a great measure to have arisen from the great humanity of the commander, and his uncommon care and attention to adopt every method for preserving the health of his men, and devising all proper means for removing those diseases which long voyages and different climates had subjected them to.

Having presented the readers with this summary introduction we shall treat of the Isles discovered in the course of these voyages, beginning with Otaheite, in the description of which our readers may find both instruction and amusement.

C H A P. X.

OTAHEITE, OR, ST. GEORGE'S-ISLAND.

Its Situation and Extent. Captain Wallis anchors there. Endeavours to traffic with the Inhabitants. Natives assault and attack the Vessel. Various Affrays and Reconcilements. The Captain takes Possession of the Place in the Name of the King of England. Peace perfectly restored, and Traffic established. Oberoa, a Princess, comes on board. Her Friendship for Captain Wallis, and Sorrow at his Departure.

THE first discovery of this island is not perfectly known; it has however been visited by several navigators, particularly by Commodore Byron, and, lastly, by Captain Wallis, in the *Dolphin*, on the 19th of June 1767. It is situated in 17 deg. 30 min. south lat. and 149 deg. 5 min. west long. It consists of two peninsulas, joined by an isthmus, and is surrounded by a reef of coral rocks, which form several excellent bays and harbours, where there is room and depth of water for almost any number of the largest ships. The length of the island is thirty miles. A border of low-land almost surrounds each peninsula, and behind this border the land rises in ridges that run up into the middle of the divisions, and these form mountains that may be seen at sixty leagues distance. But we shall now proceed to a detail of events in circumstantial order.

After Captain Wallis had passed several small islands, he discovered a high spot of land in hazy weather, near which having anchored, when the fog cleared up, he took a view of the land, and conceived it to be worthy of his notice.

About this time, a number of canoes surrounded the vessel, who seemed amazed at her construction. Many invitations were given to the natives in the canoes to come on board, which they did, but not till after several branches of plantain had been thrown on the ship's deck, in token of peace and friendship. On their first essay, one of the strangers being struck down by a he-goat, leaped into the sea, and his companions immediately followed. These circumstances impressed the English sailors with a strong idea of their timidity.

When this alarm was over, many of them came on board again; but could not be prevailed on to traffic, though they shewed great inclination to steal some articles; and one of them snatching a laced hat from an officer's head, jumped into the sea, and swam clear off with it.

When the boats were afterwards sent out in search of anchorage, the islanders surrounding our people, a gun was fired over their heads to intimidate them, when exhibiting signs of a hostile intention, a musket was discharged, whereby an offender was wounded; and the

consequence was, that his party dispersed in consternation.

The vessel now sailing along the coast, and coming to an anchor occasionally, the natives began to resort on board, bringing fruit, fowl, and hogs, in exchange for nails, toys, &c. And with the men also came some women, whose behaviour was not the most modest, but very friendly, so that there was reason to conclude a commerce and amicable connexion established, after having repelled some acts of hostility. But at this juncture, several canoes surrounded the ship, loaded with pebbles, which the islanders had been found very dextrous in slinging. The people in these canoes played on a sort of flute, and blowed their shells, and in this manner they advanced to the found of music.

One of these canoes came forward, with a chief sitting under an awning, who, being encouraged to come alongside, gave an English sailor a bunch of red and yellow feathers, as a present for the captain. This was accepted, and some things were preparing to be given him in return, when the canoe suddenly put off, and a branch of the cocoa-nut tree was thrown up in the air, as a signal for the commencement of hostilities, whereon volleys of stones were poured by the canoes from all quarters into the vessel. The unwelcome salute was returned by a discharge of musketry and two of the ship's guns, which at first disordered the islanders; but they rallied, and there were numbers seen ready to embark to support the assailants. Notwithstanding the cannon were brought to bear, they returned to the attack, and several of the seamen were wounded by their missiles. However, at length, a shot striking a canoe that seemed to have a chief on board, the canoes rowed off with precipitation, and the people fled behind the hills for shelter.

Soon after this Lieutenant Furneaux was sent on shore with the boats well armed, and a party of marines, with orders to land his men under cover of the ship; the intent being to procure water from a place where they had received intelligence by a reconnoitring party, that some of the purest was to be obtained.

This officer having executed that part of his orders, proceeded to take possession of the island in the name of the King of Great-Britain, and displayed a broad pendant on a staff set up on the occasion. They now perceived an old man on the opposite side of the river, who was apparently terrified, and in a supplicating posture. When signs were made for him to advance, he crossed, and crawled on his hands and knees towards the lieutenant, who gave him signs of encouragement, but could not forbear likewise pointing at the stones which the Indians used to annoy the ship. Several hatchets were then produced, and two water casks filled, in order to renew the idea of bartering with the natives. Some trinkets were also presented to this man, who danced round the flag-staff to express his joy; and this ceremony, returning again after the lieutenant embarked, he and several of the natives who came with him re-

peated,

U

peated, though at first they appeared to be frightened by the pendants shaking in the wind.

The consequence of this reconciliation was, that two large hogs having been laid before the flag-staff, and danced round, were put into a canoe, which the old man brought as a present aloft side the vessel. He would not accept of any thing, but pronounced a speech, between the different parts of which he delivered, one by one, a number of plantain leaves, which seemed calculated to answer the same end as the belts of wampum delivered at their *talks* by the natives of North-America.

Notwithstanding all this, hostilities were renewed, and the flag-staff was taken away; but when the offenders were fired at, they retired in confusion. Therefore, finally to convince them of the power of those whom they seemed to rashly disposed to contend with, cannon were pointed, and fired first into the woods, and afterwards towards the hills, where numbers of the Otaheiteans were assembled, to their great terror and astonishment; besides which, fifty of their canoes were destroyed. These proceedings, together with the incident of some of them having seen the surgeon, when on shore, shoot three ducks flying, gave them such an idea of the extent to which fire-arms would reach, and the execution done by them, that levelling a cannon, or only pointing a musket, served to disperse whole bodies of warriors.

Thus by degrees, partly by force, and partly by kindness, was friendship established between our people and a set of men, who had displayed more courage in war than could have been rationally expected, from the fears shewn by individuals among them upon trifling occasions. But such paradoxes will ever appear among nations destitute of refinement, and such are to be traced and solved only by those who have read the book of human nature, and, combining the knowledge gained by books with that resulting from experience, can thereby in some measure form a judgment of the motives that actuate communities, too often termed *savage*, because they possess not our modern cultivation, which perhaps they might ignorantly deem a corruption of manners.

It should appear from the sequel, that the natives of Otaheite fought, not against the English in anger or malice, but from a supposition that they came with a design to invade or injure them; as nothing could be more friendly than their behaviour, when they were fully convinced to the contrary. The frequent overtures to barter commodities might not at first perhaps seem to them a sufficient token of intended amity, but as a snare laid, which they rather wished to avoid.

Soon after these transactions, a tall female, of a majestic deportment, and placid countenance, who seemed to have come from some distance, came on board his ship, where she was well entertained, presented with several trinkets, a looking-glass, and a blue mantle, which latter the captain himself tied on, and with these

she seemed greatly delighted; but in all her gestures, still retained her dignity.

It was afterwards asserted, that she was no less than she appeared. Her name was Oberca, and it was said she was queen at least of that part of the island where Captain Wallis landed.

She was visited the next day by the captain, who was not yet entirely recovered from a late indisposition that had confined him to his vessel, and rendered him very weak; and on which account, he was carried by her attendants to her own dwelling, as she was prepared for the visit. Numbers of persons assembled on the occasion were dispersed, on a sign from the queen; and when the guests entered her house, which was spaciouly built, according to the manner of the country, the captain's coat, stockings, and shoes being taken off, in which she herself assisted, some young girls were introduced, who smoothed his skin, and chafed it softly with their hands; the same was done by Lieutenant Furneaux and the purser, who attended him, and who had likewise been indisposed; and they all found benefit from this gentle operation, which however was interrupted for a time, by the surgeon's taking off his wig, in order to cool himself. This appeared to the natives as a most extraordinary circumstance, and excited their astonishment accordingly; but the girls soon returned to their employment.

The queen was so tender of her principal guest, that when she walked out with him, she laid hold of his arm, and lifted him like an infant over any dirt or water that happened to be in the way.

It appeared, that the Otaheiteans had no utensils for boiling their food, and were entirely ignorant of the possibility of such an operation, and of the effects of hot water. This was evident enough from a whimsical circumstance that happened on board the ship, where the queen was one morning at breakfast with the captain. One of her attendants (apparently a person of no mean rank) observing that the tea-pot was filled by turning the cock of an urn that stood on the table, took it into his head to turn it also, and received the boiling water on his hand. In consequence, being scalded, he roared out, and danced about the cabin with the most extravagant gestures, and his companions stood staring in astonishment, till the surgeon applied a lenient remedy to the part affected.

However, a person who was serviceable in bringing in provisions, and had curiously observed the gunner boiling his pork when on shore, was put in possession of an iron pot, and after that he always boiled his meat for himself and his associates.

The queen was equally surpris'd and pleas'd at looking through a telescope, which Captain Wallis brought with him to her house, directing her view to various objects which were very familiar to her, but not perceptible to the naked eye, which, when the glass was removed, to her amazement she strove to trace in vain. She had at first admir'd the structure, little guessing, as

might well be conceived, the use of such an instrument. Captain Wallis gave his royal hostess two turkies, two geese, three guinea-hens, and a cat big with kitten; some looking-glasses, china, linen, needles, thread, and ribbands, together with cutlery-ware, and other articles (among which various vegetables and garden seeds were not forgotten) in memorial of the presents received from her, and her friendly behaviour.

When the time for his departure drew near, it was not without reluctance that the captain intimated this circumstance to the queen, who received the tidings with real concern, an intercourse of good offices having endeared them to each other. Trying the force of persuasion in vain to detain her guest, she came on board the Dolphin, where she remained till the anchor was weighed, and the vessel under sail; she then received the last presents he made her in solemn silence, when he bid farewell to Oherea, and the island of Otahaité.

C H A P. XI.

Captain Cook on his first Voyage visits Otahaité. His Reception by the Natives. Alterations there. Tootahab found to be a Man in Power. A Fort erected. Various Thefts. Oherea again brought forward. Strange Adventure with her. A Wrestling Match. A Chief's Honesty not Proof against a Basket of Nails. Observation of the Transit of Venus in those Parts.

IT was on the 13th of April 1769, as we have already observed, that Captain Cook, on his first voyage, fell in with Otahaité, and came to an anchor in Port-Royal harbour. The canoes of the natives immediately swarmed round the Endeavour, bringing with them fruits and other provisions to exchange for various commodities. At the same time an old man came on board, who was known to many of the officers, who had been here before with Captain Wallis. This man, who was called Owahaw, had a respectable appearance.

When Captain Cook, Mr. Banks, and Dr. Solander went on shore, accompanied by the above-named Indian, together with a party of men, they were received with the greatest joy and respect, by a vast number of the natives, who very thankfully accepted their presents; and promising to conduct them to a more agreeable spot, led them for some miles through pleasant groves of trees, intermixed with the huts of the natives; yet they saw no fowls and few hogs in their road. Things seemed to wear somewhat of a different appearance from what the officers who were with Captain Wallis had before observed; and, according to their opinion, the queen's house had been removed.

They were now informed, that such as they had seen before, were not any of the principal people of the island; but early the next morning some canoes ap-

peared alongside the ship, which contained persons whose dress seemed to denote their being of distinction; and two of them who came on board, having fixed on Mr. Banks and Captain Cook respectively as friends, invited them on shore to their dwellings; whither those gentlemen went accordingly, accompanied by Dr. Solander and others. Soon after landing, they were conducted to a large house, and introduced to a middle-aged man, whose name they found to be Tootahah. He presented Mr. Banks with a cock, a hen, and a piece of perfumed cloth, and received a suitable present in return. They afterwards visited several other large houses, where they were introduced to many females, who pressed them to sit down and stay, and behaved in a manner agreeably free and engaging. On their return, they were met by Tuborai Tamaidé, another chief, with whom they dined, and proceeded to settle a treaty of peace and mutual intercourse.

Nevertheless, the circumstance of most of the hogs, and all the poultry seeming to have vanished, caused the captain to suspect, that these had been driven up the country: it was therefore resolved to explore the woods, whilst an officer was left with a party of marines to guard the tent.

It is to be observed, that as soon as the Endeavour reached Otahaité, Captain Cook established several very judicious rules and ordinances among his people, all tending to facilitate barter for provisions, and preserve peace and harmony between them and the natives, which those who broke through were to be severely punished; and these, with other precautions that had been taken, were deemed sufficient, with a people so friendly, to secure tranquillity. But where the customs and manners of nations are so different as those of England and Otahaité, it must needs be that disputes will frequently arise, and sometimes on mere trifling occasions.

While this party were pursuing their design, they heard two pieces fired, which they knew must be discharged by the guard left at the tent, a circumstance not at all pleasing at such a juncture. However, Owahaw dispersed all the Indians, three excepted, who gave every possible token of fidelity.

It is natural to suppose, that the captain and his companions were anxious to know what had passed at the tent during the time of their absence; and on the strictest inquiry, they found the following circumstance had occasioned the alarm. One of the natives, whose propensity to theft was unconquerable, had snatched a sentinel's musquet out of his hand, in consequence of which, by order of a young midshipman who commanded the guard, they fired, but none were slain or wounded except the aggressor, who was pursued and killed as soon as overtaken. As it was apprehended that the matter would excite some resentment in the islanders, but few of whom appeared the next morning, and none of those few were inclined to come on board the ship, she was brought closer in shore, and so moored, that her broadside was brought to bear on a spot which had been pitched

on for the erection of a little temporary fortification, equally calculated for defence and convenience. Mr. Buchan, who was Mr. Banks's landscape painter, died the next day, universally regretted.

The anger of the natives seemed soon to have subsided, and our people remained quiet enough on shore, except their being annoyed by flies, which, to the working parties there, seemed the most troublesome of enemies.

Tuborai Tamaide, resolving to build a house near the English fort, brought the materials with him, and invited Mr. Banks to a place in the woods where he sometimes resided, entertained him with a dish of somewhat that had the appearance of wheat flour, but when stirred about with cocoa-nut milk, formed a jelly of an agreeable flavour, not unlike what is called *Blanc-Mange* in Europe. He also gave this gentleman two garments, one made of scarlet cloth, the other of fine matting. It was not long afterwards that the same chief, who was a frequent guest to Mr. Banks on board, preferred a complaint against the ship's butcher for having brutally threatened to cut his wife's throat, because she would not let him have one of the stone axes, or adzes, which they substitute for iron in this island, in return only for a single nail; a flagrant violation of justice and good order, and a breach of those rules which the captain had resolved should be attended to while the vessel staid at Otaheite. The consequence was, that the offender was flogged in sight of the Indians, and he went through the whole of the punishment notwithstanding they themselves interceded for him, and that even with tears and exclamations of sorrow, after they had seen the first lash given. This strictness of discipline being certainly as well timed as necessary, did honour to the justice and policy of the commander.

It was remarkable, that Captain Cook having produced an iron adze, made in imitation of one of those stone instruments just mentioned, Tootahah, to whom it was only shewed as a curiosity, laid hold of it, and could not be satisfied till he was permitted to take it away, though an offer was made him to select any article in its stead out of numbers contained in all the chests that could be conveniently opened before him.

On several of the natives bringing their axes to be ground, all of which, it was scarcely doubted, had been left there by Captain Wallis or some of his people; a French one was discovered among the rest. It appeared that the Otaheiteans were indebted for this to M. de Bougainville, who had visited the island in 1768.

About this time some coldness was occasioned by the following incident. Mr. Banks's gun was suddenly taken out of his hand by Tuborai Tamaide, one day when he seemed employed only in curiously observing it. The Indian also pulled the trigger, though the piece only flashed in the pan. This was an offence not so heinous in itself as it might tend to prove inconve-

nient in its consequences. It is unnecessary to observe, that in our expeditions to these places, the knowledge of fire arms furnishes almost the whole of the security of the few against the many; and experience has continually evinced how soon a sudden mistake, and fatal resentment may be kindled in the bosoms of those who seem most friendly among the uncultivated nations. Considerations of this nature appear to have influenced Mr. Banks, in giving a most severe reprimand for this presumption to one favourite Indian acquaintance, who was not insensible either of the rebuke, or the cause of its sharpness, as he demonstrated by his behaviour; but that of one of his female attendants was truly extraordinary on this occasion. She broke forth into tears, wounded herself with a shark's tooth, and exhibited before the offended party a number of extravagant gestures, refusing to answer such questions as were asked; and yet after all this, she carefully took up the certain pieces of cloth, which she had placed to receive her blood, and having thrown them into the sea, bathed herself in the river, and returned with a cheerful countenance.

The same chief's wife came one morning to solicit Mr. Banks's attendance on her husband, whom she represented as being in a most deplorable state, occasioned by having swallowed something very deadly, that was given him by one of the Endeavour's people. Mr. Banks went accordingly, found the person in question extremely sick indeed. On his arrival, he perceived that the Indian had already been vomiting, which saved the trouble of prescribing an emetic. It appeared likewise that he had thrown up a leaf which those around him affirmed to contain the poison; and indeed this, which was only a leaf of tobacco, proved to be all the poison that the sick chief had swallowed. The cause of the disorder being thus explained, the patient, who, while Mr. Banks examined the leaf, seemed in doubt whether he should live or die, was now only ordered to drink plentifully of cocoa-nut milk, in consequence of which simple and agreeable remedy he soon became as well and cheerful as ever.

In the mean time, Oberea, who seemed to have been lost, was luckily discovered at Mr. Banks's tent by the gunner, who recognized in her the same person that had been so friendly to Captain Wallis (with whom this officer sailed in the Dolphin) and was set down as queen of the Island. She was tall and majestic, as has been already observed, her eyes had great expression in them, her skin was white, and she appeared to have been what might properly be termed handsome; but being now past forty, she was rather on the decline. She was conducted on board the ship, where she was presented, amongst other matters, with a doll, which greatly delighted her. But this circumstance being observed by Tootahah, who, though not king, seemed to be invested with the authority of a regent, he would not be satisfied without a present of the same sort. And dolls now grew so much in fashion, that for

a while they were preferred even to axes, till time and just reflexion caused the islanders once again to set a due value on the latter, as being so useful and necessary. Temporary fashions, however, were found to prevail in many more instances, even among these children of simple nature.

There was a circumstance relative to Oberea, which at first greatly surpris'd Mr. Banks; namely, that one morning being informed she was asleep under the awning of her canoe, when going to awake her, he found she was in bed with a young man, whose name was Obadec; but it was soon understood that a commerce of this kind was frequent with the ladies of Otahcite, and so familiarized were they to it, that no secrecy was observed in the matter.

About this time the natives exercising some of their usual dexterity, the astronomical quadrant was missing, though for the whole night a centinel had been placed within a few yards of the place where it was lodged.—But a proper application being made to Tubourai Tamaide, he found out the thief, and the instrument, which luckily had received no damage, was with some trouble recovered.

In Captain Cook's absence, who had gone to support Mr. Banks and Mr. Green, while they were travelling up the country, in search of the quadrant, an embargo having been laid on the canoes in the bay, by that commander's order, occasioned a disturbance: for one of these attempting to depart, a boat was sent out to detain her, on which the Indians, among whom was Tootahah, leaped into the sea. When this chief was taken up swimming, the lieutenant confined him in the port, which was now quite finished and fortified, and the captain found it surrounded by a number of the natives when he returned from his excursion.

He caused the prisoner, who had expected nothing but death, to be released; yet the affair raised great murmurings among his countrymen, who pretended that he had been beaten and ill used, but no proofs appeared of such treatment. Yet the markets were but ill supplied, which was doubtless owing to the circumstance just mentioned.

These were matters however, which, from the friendly disposition of the natives, their guests conceived might be well settled; and, in particular, they endeavoured to conciliate the affections of the chief whose confinement had occasioned the dispute. And in fact, little was done in the principal matter, which regarded provisions, till that was accomplished; nor was this brought about without some difficulty. Tootahah had left some hogs behind him which he demanded; but it was thought most proper not to send them, because his presence was deemed necessary for the desired reconciliation. This was at last happily effected, Messrs. Banks and Solander making a journey to the chief's residence, which was at seventy miles distance. From what had passed, they had some ideas of finding disgustful treatment from the people; but in this they were agreeably disappointed:

for they heard nothing but shouts, which in their language expressed that Tootahah was a friend to the English.

As this chief, not receiving the hogs he left, had demanded an axe and a shirt in return for them, these articles were brought and given to him, together with a garment of broad cloth; and he seemed well pleased with the additional present. He was found sitting under a tree, with many old men standing about him, who afterwards were conducted to the court-yard of his house, where a spectacle was prepared for their entertainment. It was a wrestling match, which was conducted in the following order.

Several combatants, to the number of ten or twelve, entering on an area which was left void for that purpose, after having challenged, engaged each other, the principal object of each being to overthrow his adversary by dint of strength. For this purpose they closed, and seized each other by the hand or any part of the body, as opportunity offered; thus grappling till he who had the best hold, or was the most powerful man, threw his antagonist. If this could be done by either party, in about the space of a minute, the conqueror received the plaudits of the old men, and three huzzas; if not, they generally parted, either by the intervention of their friends or by mutual consent, and in this manner one engagement succeeded another. A man who was provided with a stick, and who had first made way for the English by exercising it pretty smartly, kept the rings, and preserved order among the populace.

While this was going forward others performed a dance, but neither of these parties seemed at all disposed to take notice of what was going forward elsewhere; their own sport and the wished applauses of the audience, being all that engrossed their attention. When it was known that this reconciliation had been brought to bear, and that Tubourai Tamaide was gone on board the Endeavour, provisions, which had hitherto been with-held, were brought in great plenty.

But some more extraordinary spectacles than that of the wrestling match were soon after exhibited before Mr. Banks and others, of which we have the following account.

"As that gentleman was sitting in his chair, some ladies of the island, who were strangers, advanced in procession, the rest of the Indians forming a lane to let them pass in order. Coming up to Mr. Banks, they presented him with some plants and parrots' feathers. Tupia, who officiated as master of the ceremonies, received several branches, brought at six different times, and laid them down in the boat. Nine bundles of cloth were also afterwards brought and divided into three parcels.—What followed, appeared the most extraordinary part of the ceremony, which was, that one of the women called Ooratoo, who seemed to be the principal actress in the ceremony, stepped on one of the parcels, and pulled her clothes up as high as her waist, turning round three times

with an air of unaffected simplicity. This she repeated with the two other parcels; and then these females advancing, saluted Mr. Banks, who made them suitable presents. And on the Sunday following, (after divine service had been performed) the day was concluded with an act of open lewdness between a young fellow and a girl about twelve years of age, of which Oberea and some females of the first rank thought fit not only to be spectators, but also to give it their countenance and applause.

It was somewhat extraordinary that an inclination to theft prevailed so strongly among the natives of Otaheite, as to taint their chiefs and persons supposed to be of the greatest integrity among them. Tubourai Tamaide, of whom Mr. Banks had entertained a high opinion, could not resist the temptation offered by a basket of nails being left in the corner of his tent. On being taxed, he confessed that he had stolen four of them, but he was much more inclined to frame excuses, than to make restitution. He said, the things stolen were at Eparre; however he produced one of the nails, and, on restoring the rest, was to be forgiven; but, instead of doing this, he withdrew, and when he was seen about ten days afterwards, it was in vain that all persuasions were used to induce him to return this apparently trifling portion of property; and perceiving himself treated with reserve, he again withdrew in his usual manner.

A visit was determined on by Captain Cook, Mr. Banks, and Dr. Solander, to Tootahah, who had lately twice changed his place of residence, and now lived about six miles distant from his former dwelling. He was found sitting under a tree, with a number of people round him, as was his usual custom; and when the guests had made their presents, they were invited to pass the night there. But there was a prospect of some inconvenience, as more people were assembled than the houses and canoe could contain. Oberea, however, being there with her train of attendants, Mr. Banks accepted of a place in her canoe, where he retired to rest accordingly. But, though Oberea herself had the charge of that gentleman's clothes, yet he lost them together with his pistols, his powder horn, and other articles. She got up, indeed, and Tootahah being roused, who lay in the next canoe, they went in search of the thief; but their endeavours proved fruitless. Mr. Banks being a second time roused by some music, as he afterwards observed lights at a small distance, rose, and went to seek for his companions. Accordingly he found where Captain Cook and the rest of the gentlemen lay, to whom he related his misfortune; but they had a story in some measure to match his: for they informed him that they had lost their stockings and jackets, and it appeared that Dr. Solander was the only one who was not robbed among them. Mr. Banks, who had at first been left in his waistcoat and breeches, had made a temporary shift with some garments which he

borrowed of Oberea, in which he cut an odd figure; but the clothes, and other matters that had been stolen from him, were never afterwards heard of.

Preparations having been made for viewing the transit of Venus, two parties were sent out to make observations from different spots. The parties sent out had good success in the pursuit of their undertaking, though they differed as to the time of the contact. The following was Mr. Green's account of that phenomenon.

	Morning.
The first external contact	9 25 4
The first internal contact, or total immersion	9 44 4
	Afternoon.
The second internal contact, or beginning of the emersion	3 14 8
The second external contact, or total immersion	3 32 10

The latitude of the observatory, was 170 deg. 29 min. 13 sec. south, long. 149 deg. 32 min. 30 sec. west from Greenwich.

We have already observed, that there were two parties. Those who went towards the Island of Emayo, after rowing the greater part of the night previous to the transit, hailed a canoe, and were informed by the Indians of a place that they judged proper for an observatory.

Mr. Banks left them as soon as it was light, and saw the sun emerge from an unclouded horizon, whence he drew favourable prognostics for the business of the day. He went to obtain fresh provisions on the island; and the following is an account of this short expedition:

"As he was trading with the natives, Tarrao, who was the king of the place, came to visit him, bringing his sister Nuna with him. As it was customary for the people of those places, at their conferences, to be seated, Mr. Banks spread his turban of Indian cloth, on which they all sat down. Then some bread-fruit and coconuts, together with a hog and a dog were brought as the king's present; and his guest, in return, sent for a shirt, an adze, and some beads, which the sovereign of Emayo received with apparent satisfaction. Tubourai Tamaide, and Tonio (said to be related to Tarrao) also gave him a long nail, and left a shirt as a present for Nuna. The king, his sister, and three beautiful young women, their attendants, afterwards went with Mr. Banks to the observatory, where he shewed them the planet Venus passing over the sun's disk; at the same time acquainting them, that to view it in this situation, was the cause of his undertaking a voyage to those remoter parts."

The people at Emayo seemed to resemble those of Otaheite, and appeared to be acquainted with the nature of trading articles.

Some

Some of the ship's company having broke into the store-room while the officers and gentlemen were employed in viewing the transit, a number of spike-nails were stolen from thence. The person who was found out in this theft, had but few in possession; however, he was ordered to receive two dozen of lashes. Some examples of this kind were necessary, because the seamen knowing what value was put on such commodities on shore, where the property of men, and the favours of women were alike to be purchased with them; if these thoughtless beings had not been restrained, it is probable, and indeed partly appeared from their conduct, that they would have left but few nails, and little iron-work that they could possibly remove in or about the vessel.

C H A P. XII.

Celebration of King George's Birth-Day at Otaheite. Mr. Banks acts a Part in an extraordinary Funeral Solemnity. Various disputes amicably settled. Journey to a different Part of the Island. Tupia, an Indian, resolves to embark with Captain Cook. Two Mariners are brought back. The Vessels depart from the Island.

THE two parties that went out to observe the transit of Venus on the 3d of June, being still absent on the 4th, it was resolved to defer the celebration of his Majesty's birth-day till the 5th of June. It was then kept, many of the Indian chiefs being invited to the entertainment provided, and drinking the King of Great-Britain's health by the name of *Kibiargo* (their best imitation of *King George*) upon the occasion.

An old female of some distinction dying about this time, gave the English an opportunity of observing the manner in which the islanders dispose of a corpse, which they do not bury directly, but place on a bier, till it is corrupted, and then the ceremony of interment is used with the bones. The morais were also found at length to serve as places of religious worship; but of these we shall treat at large hereafter. We shall here only give an account of the funeral rites, as performed after the decease of the person above-mentioned, in which Mr. Banks bore a principal part, because he was informed that he could not be admitted as a spectator on any other condition. The ceremony was thus conducted.

"This gentleman went in the evening where the body was deposited, and was there met by the relations of the deceased, and joined by several other persons. Tubourai Tamaide was the principal mourner, dressed in a whimsical, though, as some thought, not an ungraceful manner. To conform to the Indian custom, he was obliged for the time to quit his usual dress, and wear nothing but a small piece of cloth tied round his middle,

and suffer his flesh to be blacked over with charcoal and water, as were the bodies of several others, among whom were some females that were not any more covered than himself. The procession having begun, the chief mourner repeated something that was supposed to be a prayer, when he came up to the body, and repeated the same when he came to his own house. They afterwards went on by permission towards the fort. It is usual for the rest of the Indians, as much as possible, to shun these processions. Passing on from the fort along the shore, they crossed the river, passing several houses which, for the time, were deserted; and, during the rest of the procession, which lasted for half an hour, not an Indian was to be seen. The office which Mr. Banks filled was called *Niniveb*, and there were two others in the same character. These approached the chief mourners, when none of the rest of the natives were to be seen, exclaiming "Imatata!" Then those who had assisted at the ceremony resumed their former dress, after having first performed ablution in the river."

Mr. Banks, who certainly underwent no small inconvenience in adapting himself for these rites, received great applause from Tubourai Tamaide, for the propriety wherewith, it seems, he supported his part in a ceremony of which he must be supposed to entertain but an imperfect conception.

Tubourai Tamaide and Mr. Gore having challenged each other to a shooting match, the Indian brought his bow and arrows to decide the matter; but, before they were prepared for the contest, it was discovered that each had mistaken his antagonist's meaning; for the Indian meant only to try who could shoot furthest, but Mr. Gore designed to level at a mark. As soon as this was found out, the challenge consequently came to nothing. Nevertheless, for the honour of Otaheite, and to shew how skilful he was, Tubourai kneeled down and shot an unfeathered arrow (dropping the bow as soon as it was discharged) which held its course for near the sixth part of a mile.

As many things had still continued to be conveyed away by some of the light-fingered islanders, an iron coal-rake for the oven being stolen in the night of the 14th of June; and as the centinels had received orders not to fire on the natives, even if they should be detected in theft, Captain Cook resolved in his mind what expedient it would be best to adopt, in order, if possible, entirely to suppress these practices; and, in consequence, he tried the following expedient. Twenty of their double canoes containing cargoes of fish, being just arrived, he seized them, and caused notice to be given, that unless, not only the coal-rake, but also all the other articles that had been taken away, were returned, these vessels, so valuable to them, should certainly be burnt.

All the effect produced by this menace, was the restitution.

restitution of the coal-rake; but the other things were kept by those who stole them; and as Captain Cook's humanity would not permit him to let the innocent suffer for the guilty, in the end he gave up the cargoes of the vessels.

But there was another circumstance which was near raising a most serious dispute between the English and the islanders, as originating from a matter of which the former were most tenacious. A boat being sent out to procure ballast, as the officer could not immediately find what he wanted, he began to pull down one of the sepulchral monuments. This action was looked upon as such a piece of sacrilege, that the people, enraged, rose in opposition. But happily Mr. Banks, receiving intelligence of the circumstance, repaired to the spot, and brought about a reconciliation, and settled the matter in dispute, by sending the boats to the river side, where there were plenty of stones to be had without any hazard of offending.

Captain Cook and Mr. Banks having formed a design of sailing round the island, set out on the morning of the 16th of June for this purpose. When they came to a large bay, their design of crossing it was mentioned to this Indian guide, whose name was Tilubaola: he at first refused to cross it, and likewise endeavoured to persuade the English gentlemen to lay aside their intention, saying, "That country was inhabited by people that were not subjects to Tootahah, and who would destroy them all." Nevertheless, when he found them resolved to proceed, he at last ventured to accompany them.

After spending the night at the house of Oratora, a friendly lady, they departed, and landed the next day in the district of a chief, named Mairatata, and whose father was called Pahuirede. There was something which might be thought not very promising in those appellations, the former signifying, "The burying-place of men," and the latter, "The stealer of boats," in the language of the islanders.

It may not be amiss here to observe, that the inhabitants of that part of the country which had become familiar to the English, though very backward in learning to pronounce the names of their guests, were yet ready enough in giving them others. They called Captain Cook, Toote; Mr. Hicks, Hate; and the Master, Bobo; Mr. Gore they named Toarro; Dr. Solander, Torano; Mr. Banks, Tassane; Mr. Green, Eterrec; Mr. Parkinson, Patani; Mr. Sporing, Polini, &c. Now three or four at most of these names may be allowed imitations of the English ones, but the others seem so different, that they may be set down as appellations of significance, and occasioned by something relative to the person, situation, or actions of the party. What seems to support this conjecture, is its having been particularly remarked, that they called Mr. Monkhouse, who commanded the guard that shot the man for taking the musket, as before related, by a name which signifies *dead* or *deadly*, in their language,

as having caused the death of one of their countrymen.

Amongst a crowd of the natives that came round them, the English gentlemen recognized only two persons; the rest being absolute strangers to them. However, they proceeded (the whole party consisting of four only) till they came to a part of the country governed by one Waheatua; and met that chief, together with an agreeable woman, about twenty-two, called Toudidde, who appeared to fill the same rank here as Oberea did in another quarter of the island. Their journey here lay chiefly through a country fertile enough, as it appeared, in every thing but bread-fruit, and where there were numbers of morais, or burying-places, neat, and adorned with various carvings. Being fatigued, they went on board their boat, and in the evening of this day they landed on an island which was called Ootareite, and got some refreshment at the only house they could then discover. But they found a good harbour in the southern part of the island, and, after landing again in different places, were met by Mathiabo, the chief, of whom they purchased a hog, for a glass bottle. Here they remarked several human jaw-bones, seemingly fresh (and which had not lost any of the teeth) fastened on a board of a semicircular figure, but could not obtain any satisfactory account concerning them.

Having been piloted over certain shoals, and turning to the N. W. side of Otaheite, where a bay answering to that on the S. E. forms the isthmus, they were invited on shore by several beautiful women, and, accepting the invitation, supped at the house of a chief, named Wiverou, in company with Mathiabo, which latter, on retiring to rest, borrowed Mr. Banks's cloak, to serve as a coverlet, and made no scruple of taking it away with him the next morning. But this mean action being discovered, when he heard that the injured party was coming in search of him, he sent a person back with the property. However, the gentlemen at their return, finding the house deserted, and their boat missing, which it appeared had been driven away by the tide, considering the smallness of their party, and that they had not a spare ball, or charge of powder, they were not without apprehensions lest the Indians might take some undue advantage of their situation; but were agreeably disappointed to find themselves treated in the most civil and friendly manner.

A chief named Omae was building a house at Tiarrabou, the last district in which the travellers landed, and would have given a hog in exchange for a hatchet, but as they had not one left, he would not trade for nails; however, at last, both a hatchet and a nail were promised on his sending the beast to the port. At this place they saw one of the Indian Eutuas, a figure resembling a man, made of wicker work, near seven feet high, covered with black and white feathers, and which had protuberances that they called Tata Eie, or little men, on his head.

Being

Being come to the district call porra, where Oberea governed, they landed then. Finding that she was gone with intent to visit them at the fort, they slept at her house, where they were entertained by her father. In this neighbourhood, Mr. Banks saw a vast pyramid of stone work, with a slight of steps on each side. It appeared to be near fifty feet high, was about 270 feet in length, and about one third as wide, and they found it was intended for the morai of Oamo and Oberea. The foundation was of rock stones, the steps were of coral, and the upper part consisted of round pebbles, all of the same size, and squared with the greatest exactness, which must have been an almost immense labour for the builders, who were destitute of the proper implements, when this fabric was raised. At the top, in the centre, was a bird carved in wood, and near it a fish in stone. Part of one side of a court or square was constituted by this pyramid, the sides of which were almost equal. The whole was enclosed with a wall, and paved with flat stones, and exhibited the appearance of a firm and compact building. Another paved square was seen at a little distance, in which were several ewattas or altars, on which it appeared that they placed their offerings, when ceremony or inclination led them to acts of devotion. Returning to Port-Royal harbour, after an accurate survey, they determined the circumference of Otaheite to be about 100 miles, both peninsulas included.

While Captain Cook was preparing for his departure, two young marines thought proper to depart from the fort, and were not to be found the next morning; and notice was then given, that the vessel would sail on that or the ensuing day. However, the captain, rather than he would come to a rupture with the Indians just on quitting them, was willing to stay a little longer. But having waited in vain, when an inquiry was made, he was plainly given to understand, that these men had fled to the mountains, and did not intend ever to come back again, as they had chosen wives for themselves on the island. But as it was not reasonable to suppose the commander would lose his men in such a manner, he intimated to those chiefs who were then in the fort with the women (among which latter were Oberea and Fornia) that they must all be considered as prisoners, till the fugitives, whom it had been represented as impossible to take, should be returned. An officer being sent for Tootahah, brought him without any alarm on board the ship, whether when night came on, those who had been confined in the fort were also conveyed; a circumstance that excited some disagreeable apprehensions among them, especially the women, whom Captain Cook escorted with others to the vessel.

When one of the deserters was brought back, he related, that the partner of his flight, and two of those that had been sent to recover them, would be detained till Tootahah was set at liberty; who was immediately informed of this, and told, that it was expected he should

send proper orders, and some of his people, to assist a party dispatched in the long boat to effect a rescue. To this the Indian chief made no objections.

The design succeeded, and the men returned, though at first without the arms they had with them when they set out; but these also being afterwards restored, the captain set his hostages at liberty.

Tupia, an Indian, who was frequent in his intercourse with the English, had often expressed a strong desire of going with them whenever they should leave the island. He still persisted in his resolution; and as he was a priest, had some ideas of navigation, and was once a sort of minister to Oberea, it was thought proper to admit him on board, as also his servant Taiijota, at his earnest request.

When the time for departure approached, Captain Cook going to obtain a drawing of the morai which Tootahah had at Eparre, was met there by Oberea and others, and all in good humour. Tupia, who had taken leave of his friends, and given them some tokens of remembrance, came back with the captain and his train; the principal persons came likewise on board, the vessel was surrounded with canoes full of the common people, and all animosities being forgotten, the good-natured people of Otaheite shed tears at the departure of their guests. Tupia was much moved; but he used every effort to suppress the feelings natural to such an one on leaving his country. He went with Mr. Banks to the mast-head, from whence, waving his hand, he took his last farewell, and departed with Captain Cook, who had staid three months at this island.

C H A P. XIII.

State of Otaheite on Captain Cook's second Visit. Revolution there. Otoo, a timid Prince, King of the whole Island. Friendly Conference with Wabatoov. The King visited on Shore, and entertained on Board. Stratagem of one of the Natives defeated. Ships depart. Omai, a native of Bolobala, sails with Captain Furneaux for England.

AFTER having narrowly escaped the danger of a shipwreck on a tremendous rock, Captain Cook, in his second voyage of discovery, in the Resolution, having also with him the Adventure, Captain Furneaux, came to Otaheite, and anchored in Onitipha-Bay on the 18th of August 1773. Several of the natives were about, and even on board the ships, while they were in the utmost peril of destruction, yet they appeared quite insensible of the situation of the voyagers, and came and went without any seeming concern, a circumstance which was thought not a little singular. It was evening before they asked after Tupia, and they were satisfied when they heard the cause of his death.

There was now some difficulty in obtaining hogs, though these animals were seen on shore in great num-

Y

bers,

bers, it being asserted, that they belonged to the chief Waheatow.

At this time a man, supposed to be a principal person, came on board with many of his friends, and received some presents; but both he and they being detected in several thefts, they were all turned out of the ship, and the captain ordered two muskets to be fired over his canoe after he had embarked, which affrighted the pretended chief so much, that he quitted it and jumped into the water. A boat being dispatched for the canoe, the crew were pelted with stones from the shore. A cannon, loaded with ball, was therefore fired along the coast; and the captain going off in another boat, they soon obtained the object in question. However, the English and the Indians becoming friends again, the captured vessel was soon restored.

Mr. Banks and several people were now asked for, who had been at Otaheite on Captain Cook's first voyage; and the natives also informed their guests, that there had been a battle since the Endeavour's departure, in which both Tubourai Tamaide, and Tootahah, the regent, were slain. That a prince, named Otoo, now governed in his stead, and peace was fully established on the island.

When Waheatow came into the neighbourhood, being desirous to see Captain Cook, the latter went accordingly, accompanied by Captain Furneaux, some gentlemen, and several of the natives, and met him advancing, with a numerous train, at the distance of about a mile from the landing-place, who halted, when he perceived the company. He well recollected the captain, whom he placed on the same seat with himself, and inquired after some of the English that he had seen at Otaheite in 1769, at which time this chief was called Terace, he having assumed his father's name after his decease. He received many presents from the captain, seemed concerned when he was told the vessel would sail the next day, and promised that the English should be supplied with plenty of hogs, if they would stay longer. He could not be gratified in this particular, but his guests remained with him all the morning. This chief gave them two hogs at parting, and more were got at the trading places; so that fresh pork was served up to the crews of both the ships; besides that a lieutenant who was left on shore for the purpose, followed and brought eight pigs on board the vessels, after they had departed (being plentifully supplied by the canoes attending them with fruits, which relieved the sick) for Matavai Bay in the same island.

Arriving there on the 25th of the month, the deck was presently crowded with natives (most of whom knew Captain Cook) before the ships could come to an anchor; and the new king, Otoo, waited with a great crowd on shore; but when the captain was going to pay him a visit, he understood that this timid prince had suddenly retired to Oparree in a sort of panic. It was not possible to assign or guess at any rational grounds for such a behaviour, since the people in general were

happy in seeing this gallant officer; and as they well knew he never attempted to exert his force against them without sufficient provocation. Notwithstanding this, the captain set out for Oparree, accompanied by Captain Furneaux, Marituta, his wife, and other persons; and they were all conducted to the king, who sat, attended by numbers, in the old patriarchal fashion common here, under the spreading branches of a tree. Several presents being made him and his attendants, some pieces of cloth were offered on their part; but they were given to understand, that as all they had received was intended only in token of friendship, nothing would be accepted in return. Otoo was well made, of an agreeable person, six feet high, and about thirty years of age. All his subjects were uncovered before him. He promised to send some hogs, but seemed backward in engaging himself to come on board one of the ships, because, as he acknowledged, he was afraid of what he would have had more reason to fear at a distance, the great guns; but in uncultivated minds there is no accounting for prejudices.

However, he got the better of his fears so far as to pay the English a visit, after much persuasion, coming on board, accompanied by his younger brother, his sisters, and attendants, all of whom received presents, which they carried back to Oparree, after they had breakfasted. When Captain Cook landed with his company, the mother of Tootahah laid hold of his hand, and burst into a flood of tears, exclaiming, that her son, his friend Tootahah, was no more; and this humane man must have melted in sympathetic sorrow, had not the king separated them; and it was not without difficulty he was prevailed on to give his consent that they should meet again.

This prince, to whom Captain Furneaux gave a he and she-goat, having found that the great guns were not likely to do him any harm, took courage, and honoured the English a second time with his presence, bringing a hog, some fruits, and cloth to Captain Cook; and then going on board the Adventure, complimented Captain Furneaux with similar presents, for all which he received a suitable return; and his sister was dressed out by Captain Cook in a very agreeable manner. When he thought proper to depart, he was entertained with bagpipes and dancing, which latter was pretty closely imitated by some of his own attendants. His majesty of Otaheite promised also to pay his English friends a third visit; but as this was only on condition that they should first wait on him, both the captains made an excursion to Oparree, and presented him with some articles which he had never seen before. One of the gifts was a broad sword, which so much affrighted him, that at first he had desired it might be taken away. With much persuasion, however, he was prevailed on for a little time to wear it by his side. After this, they repaired to the theatre, where they were entertained with a piece, consisting of comedy and dance. The subject they could not well find out; though they heard frequent

When this diversion was over, the king desired his guests to depart, and loaded them with fruit and fish. He sent more fruit and fish the next morning. Captain Cook presented him with three Cape sheep, as it was his last visit. With this present he was well pleased, though he had not much reason to be so, as they were all weathers; this he was made acquainted with. Tootahah's mother again presented herself to Captain Cook; but could not look upon him without shedding many tears. Having determined to leave the island, the king seemed much affected when Captain Cook told him of his resolution. They embraced each other several times, and departed. The lieutenant returning, who had been sent for the hogs promised, there came with him Pottatou (the chief of the district of Attahounou) with his wife, to pay Captain Cook a visit, and made him a present of two hogs and some fish. The lieutenant got likewise two more hogs. As the wind was westerly, they were obliged to dismiss their friends sooner than they wished; but they were well satisfied with their reception.

Captain Wallis had planted several sorts of garden-seed and divers kinds of fruits, of which there were no remains when Captain Cook left the island on the former voyage. On his arrival in 1773, he found none of the various seeds, that had been sown by Europeans, had succeeded except pumpkins, and for these the natives had not, as may be well supposed, the least esteem. While the ships staid at Otaheite, Tervah, a sensible old chief, invited two of the gentlemen into his canoe, in which they accompanied him and his wife to the place of their residence. In their passage the old man asked a variety of questions relative to the nature and constitution of the country, from whence these wonderful strangers came. He concluded that Mr. Banks, whom he had seen a few years before, could be no less than the king's brother, and that Captain Cook was high admiral. The information that was given him, was received with the greatest marks of surprise and attention; but when he was told, that in England there were neither bread-fruit nor cocoa-nut trees, he seemed to think meanly of it, notwithstanding all its other advantages.

A short time before the ships got under sail, a young man, whose name was Pores, came on board the Resolution, and requested the commander to take him with him, which, as it was apprehended he might be of occasional service, was complied with. Many others offered themselves, but were refused. The only terms proposed by this youth were an axe and a spike-nail for his father, who was then on board. He had them accordingly, and they parted just as the vessel was getting under sail, without the least apparent natural affection. This raised a doubt as to their consanguinity; which was confirmed by a canoe conducted by two more

coming alongside, as they were standing out of the bay, and demanding the young man in the name of Otoo, who was not then in that neighbourhood.

As the person in question seemed at first undetermined in his own choice, whether he should go or stay, an offer was made to send him back, if the axe and spike-nail were returned; but the man who demanded him, declared they were not on shore, and, waving their claim, departed.

In the year 1767 and 1768, the island of Otaheite, as it were, swarmed with hogs and fowls; but at this time it was so ill supplied with these animals, that hardly any thing would tempt the owners to part with them; and the little stock they had, seemed to be at the disposal of their kings. When the vessels lay at Oaitipihā-Bay, in the kingdom of Tiarrabou, or lesser Peninsula, our people were given to understand, as we have observed, that every hog and fowl belonged to Waheatow; and that all the kingdom of Opoureonu, or the greater Peninsula, belonged to Otoo.

While at this island, they got only twenty-four hogs in seventeen days, half of which came from the kings themselves, and the other half they were inclined to think were sold by their permission: They attributed the scarcity of hogs to two causes; first, to the great number of these animals which had been consumed, and carried away for stock, by the ships that had touched here of late years; secondly, to the frequent wars between the two kingdoms. Two, they knew, had commenced since the year 1767; but now peace reigned among them, though they did not seem to entertain a cordial friendship for each other. Our people could not learn the occasion of the late war, nor who were victorious in the conflict; but they learnt, that in the last battle, which terminated the dispute, numbers were killed on both sides. On the part of Opoureonu, Tootahah, their very good friend, was killed, and several other chiefs.

Captain Furneaux, in September 1773, agreed to receive on board his ship a young man named Omai, a native of Ulietea, one of the Society Islands, where he had some property, of which he was dispossessed by the people of Bolabola. The two ships separating in a storm a few months afterwards, the voyage of the Adventure was brought to a much earlier conclusion than that of the Resolution; for she arrived at Spithead in July following.

Captain Cook did not at first think Omai a proper person to bring to England; but, upon his arrival, he changed his opinion, and declared, that he much doubted whether any others of the natives would have given more general satisfaction by his behaviour amongst our people; being of opinion, that the qualities of his head and heart did honour to human nature; and he was described, perhaps rather too partially, as being endued with a great share of understanding, quick parts, and honest principles, which rendered him acceptable to the best company, and a proper degree of pride, which induced

duced him to avoid the company of persons of inferior rank; and it was said, that though, doubtless, he had passions in common with others of the same age, he had judgment enough not to indulge them to an excess. His principal patrons whilst in England were the Earl of Sandwich, Mr. Banks, and Dr. Solander. His noble patron, then first lord of the admiralty, introduced him to his majesty at Kew, and during his stay in England he received many favours; and his taste for pleasure, whatever share he possessed of it, was certainly amply gratified; though perhaps more care was taken to satisfy him, and also render him pleasing to others, than to cultivate more solid talents, and thoroughly enlighten his mind. Some of this kind appears likely, at least, from the sequel of his adventures, as far as they have come to our knowledge.

C H A P. XIV.

Captain Cook on his third and last Voyage, arrives with Omai at Otaheite. Visited by the Natives. Account of the Spaniards having landed on the Island. Great Joy there on the Captain's Arrival, who introduces Omai to the King. A Banquet and dramatic Entertainment. Manner of embalming the Bodies of Persons of Distinction. Description of the House built by the Spaniards. Departure of the Vessels. Observations on Omai's Conduct at Otaheite.

CAPTAIN COOK, sailing on his third and last voyage, for discoveries in the Pacific-Ocean, &c. with Omai on board, came to Otaheite, and steered for Oaitipha-Bay, on the 12th of August 1777.

On approaching the land, the vessels were attended by several canoes, but as these did not appear to contain any persons of distinction, no notice was taken of them; nor did those on board seem to know that Omai was their countryman: but at length a chief, called Ootee, whom the captain had known before, with some others, recognised Omai; among these was his brother-in-law. There was nothing striking, however, in the meeting of these two persons, till Omai, conducting his relation into the cabin, made him a present of some red feathers. As soon as this was known, Ootee, who before scarcely thought it worth while to speak to him, now desired they might exchange names, and become friends (which was confirmed by a present) according to the custom of the country. This might serve as a specimen of what was to be expected; and it was a pity that the traveller, thus happily returned, who wanted not for proper advice, did not conduct himself accordingly.

The Resolution and Discovery standing for the bay, where they did not come to an anchor till the 13th, at nine in the morning, were surrounded by a number of canoes, the news of Omai's being on board, and of the red feathers, having been sufficiently circulated; but as numbers on board were possessed of this article, it ap-

peared, that so precarious and fluctuating was the state of traffic and barter, that a quantity of feathers, which might be taken from the body of a tom-tit, would, early in the morning, have purchased a hog of forty or fifty pounds weight; they decreased above five hundred per cent. in value in a few hours: however, the balance, even then, was considerably in favour of our people, and red feathers still preserved a superiority over every other commodity.

The officers were now informed by the natives who came off to them, that since Captain Cook had been at this island in 1774, two ships had been twice in this bay, and had left animals there resembling those they had on board; but on a minute inquiry into particulars, they were found to consist only of hogs, dogs, goats, a bull, and the male of another animal; which the natives so imperfectly described, that they could not conjecture what it was. These ships, they said, had come from a place called Keema, which was supposed to be Lima, the capital of Peru, and that these late visitors were consequently Spaniards. They added, that the first time they arrived, they built a house, and left behind them two priests, a boy or servant, and a fourth person whom they called Mateena, much spoken of at this time, taking away with them, when they sailed, four of the natives: that about ten months after, the same ships returned, bringing back only two of the natives, the other two having died at Lima; and that, after a short stay, they took away the people they had left, but that the house they had erected was then standing.

Not long after the ships had anchored in the bay, Omai's sister came on board, in order to congratulate him on his return. It was pleasing to observe, that their meeting was marked with expressions of the tenderest affection, more easily conceived than described.

Captain Cook having received a message from Wahaiadoo, Prince of Tiarraboo, notifying his arrival, and requesting he would come ashore to meet him, Omai and the captain prepared to make him a visit in form. Omai, on this occasion, took some pains to dress himself, not after the manner of the English, nor that of Otaheite, or Tongatattoo, or in the dress of any other country; but in a strange medley of all the habiliments and ornaments of which he was possessed. Thus equipped, on landing, they first paid a visit to Etary, an old chief, who being carried on an hand-barrow, accompanied them to a large building, where he was set down. Omai seated himself on one side, and the captain on the other. The young chief soon after arrived, attended by his mother and several principal men, who all seated themselves opposite to their visitors. One who sat near the captain made a short speech, consisting of separate sentences, part of which was dictated by those about him. Another, on the opposite side, near the chief, spoke next; Etary after him, and then Omai. The subjects of these orations were, Captain

 orations were, Captain
 Cook's

Cook's arrival. The Resolution took her old station in
 Matavai-Bay.

The most extravagant signs of joy were displayed by
 the natives of Otaheite on the arrival of the English,
 some of the ceremonies attending which, namely, women's
 beating their breasts, and people's wounding
 themselves with shark's teeth, could not but appear
 strange, and even disgusting to Europeans. In the
 mean time, there was scarcely a child that could list the
 word Tooté (Captain Cook's appellation among them)
 who was silent, or did not give some tokens of sharing
 in the general satisfaction; yet in their subsequent deal-
 ings, they shewed sufficiently, as usual, that a merce-
 nary disposition prevailed among them.

Otoo, the king of the island, accompanied by a great
 number of the natives, in their canoes, came from Opa-
 ree soon after the arrival of the English; and having
 landed on Matavai-Point, sent a messenger on board, in-
 timating his desire to see Captain Cook there. The cap-
 tain accordingly went on shore, attended by Omai, and
 some of the officers. They found a vast multitude of
 people assembled on this occasion, in the midst of whom
 was the king, with his father, his two brothers, and
 three sisters. The captain saluted Otoo, and was fol-
 lowed by Omai, who kneeled and embraced his legs.
 Though Omai had prepared himself for this ceremony,
 by dressing himself in his best apparel, and behaved
 with great respect and modesty, yet very little notice
 was taken of him. He made the king a present of
 two yards of gold cloth, and a large tassel of red fea-
 thers; and the captain gave him a gold-laced hat, a
 suit of fine linen, some tools, a quantity of red feathers,
 and one of the bonnets worn at the Friendly Islands.

Afterwards the king and all the royal family accom-
 panied Captain Cook on board, followed by several ca-
 noes plentifully laden with all kinds of provisions. Each
 family owned a part, so that the captain had a present
 from every one of them; and each received from him a
 separate present in return. Not long after the king's
 mother came on board, bringing with her some provisi-
 ons and cloth, which she divided between the captain
 and Omai. Though the latter was but little noticed at
 first by his countrymen, they no sooner gained informa-
 tion of his wealth, than they began to court his friend-
 ship. Captain Cook encouraged this as far as lay in his
 power, being desirous of fixing him with Otoo, and in-
 tended to leave all the European animals at this island,
 as he thought Omai would be able to give the natives
 some instructions with regard to their use and manage-
 ment.

Soon after the ships were moored, Captain Cook, with
 Omai, took an airing on horseback, to the great aston-
 ishment of the inhabitants, many hundreds of whom
 followed him with loud acclamations. Omai, to excite
 their admiration the more, was dressed cap-a-pee in a
 suit of armour, and was mounted and caparisoned with
 his sword and pike, like St. George going to kill the
 dragon, whom he very nearly represented; only that

Omai had pistols in his holsters, of which the bold saint
 knew not the use. Omai, however, made good use of
 his arms; for when the crowd became clamorous and
 troublesome, he every now and then pulled out a pis-
 tol, and fired it over them, which never failed to disperse
 them.

While the vessels lay in Matavai-Harbour, the com-
 manders, with the principal officers and gentlemen, em-
 barked on board the pinraces, which, on this occasion,
 were decked in all the magnificence that silken stream-
 ers, embroidered ensigns, and other gorgeous decorati-
 ons could display, to pay a visit to the king at Oparree.
 Omai, to surprise them the more, was clothed in a cap-
 tain's uniform, and could hardly be distinguished from a
 British officer.

From Matavai to Oparree, is about six miles. When
 the party arrived at the landing-place, they were re-
 ceived by the marines then under arms. As soon as the
 company were disembarked, the whole band of music
 struck up a military march, and the procession began.
 The road from the beach to the entrance of the pal-
 lace (about half a mile) was lined on both sides with
 natives from all parts, expecting to see Omai on horse-
 back, as the account of his appearance on the other
 side of the island had already reached the inhabitants on
 this. The whole court were likewise assembled, and
 the king, with his sisters, on the approach of Captain
 Cook, came forth to meet him. As he was perfectly
 known by them, their first salutations were friendly,
 according to their known customs; and when these were
 over, proper attention was paid to every gentleman
 in company, and that too with a politeness quite
 unexpected by those who had never before been on this
 island.

As soon as the company had entered the palace, and
 were seated, some discourse passed between the king
 and Captain Cook; after which Omai was presented
 to his majesty, and paid him the usual homage of a
 subject to a sovereign of that country, which consists
 of little more than being uncovered before him, and
 then entered into a familiar conversation on the subject
 of his travels.

Otoo, impatient to hear his story, asked him many
 questions before he gave him time to answer one. He
 inquired about the King of England, his place of resi-
 dence, his court, his attendants, his warriors, his ships
 of war, his morai, the extent of his possessions, &c. &c.
 Omai did not fail to magnify the grandeur of the great
 king. He represented the splendor of his court, by the
 brilliancy of the stars in the firmament; the extent of
 his dominions, by the vast expanse of heaven; the great-
 ness of his power, by the thunder that shakes the earth.
 He said, this monarch had three hundred thousand war-
 riors every day at his command, and more than double
 that number of sailors. That his ships of war exceeded
 those at Matavai in magnitude, in the same proportion
 as those exceeded the small canoes at Oparree.

The king, astonished, interrupted him: he asked,
 Z where

where people could be had to navigate so many ships? and if there were, how could provisions be got for such a multitude? Omai assured him, that in one city only there were more people than were contained in the whole group of islands; that the country was full of large populous cities; notwithstanding which, provisions were so plentiful, that for a few pieces of yellow metal, like those of which he had seen many (meaning the medals given by Captain Cook to the chiefs) the Great King could purchase a quantity of provisions sufficient for the maintenance of a sailor for a whole year. That in the country of the Great King, there were more than an hundred different kinds of four-footed animals, from the size of a rat, to that of a stage erected on an ordinary canoe; and that all these propagated very fast.

He added, that the ships of war, in Pretanne, were furnished with poo-pooos (guns) each of which would receive the largest poo-poo his majesty had yet seen, within it; that some carried a hundred and more of those poo-pooos, with suitable accommodations for a thousand fighting men, and stowage for all kinds of cordage and warlike stores, besides provisions and water for a thousand days; that they were sometimes abroad as long, fighting with the enemies of the Great King; that they carried with them frequently, in these expeditions, poo-pooos that would hold a small hog, and which threw hollow globes of iron, of vast bigness, filled with fire and all manner of combustibles, and implements of destruction, to a great distance; a few of which, were they to be thrown among the fleet of Otaheite, would set them on fire, and destroy the whole navy, were they ever so numerous.

The king seemed more astonished than delighted at this narration, and suddenly left Omai, to join the company that were in conversation with Captain Cook. By this time dinner was nearly ready, and, as soon as the company were properly seated, was brought in by as many tow-tows as there were persons to dine; besides these, the king, the two commanders, and Omai, had each of them several persons of superior rank to attend them. The dinner consisted of fish and fowl of various kinds, dressed after their manner; barbecued pigs, stewed yams, and fruit of the most delicious flavour; all served with ease and regularity.

The guests were conducted to the theatre, where a company of players were in readiness to perform a dramatical entertainment.

The drama was regularly divided into three acts: the first consisted of dancing and dumb-show; the second of comedy, which, to those who understood the language, was very laughable; for Omai, and the natives, appeared highly diverted the whole time; the last was a musical piece, in which the young princesses were the sole performers. Between the acts, some feats of arms were exhibited, by combatants with lances and clubs. One made the attack, the other stood upon the defensive. He who made the attack, bran-

dished his lance, and either threw, pushed, or used it instead of his club. He who was upon the defensive, stuck the point of his lance in the ground, in an oblique direction, so that the upper part rose above his head; and by observing the eye of his enemy, parried his blows, or his strokes, by the motion of his lance, and it was rare that he was hurt by the club. If his antagonist struck at his legs, he shewed his agility by jumping over the club; and if at his head, he was no less nimble in crouching under it. Their dexterity consisted chiefly in the defence, otherwise the combat might have been fatal, which always ended in good-humour.

These entertainments, which generally lasted about four hours, were really diverting. In the hornpipe, they excelled the Europeans, for they added contortions of the face and muscles to the nimbleness of the foot, that were inimitable. Their comedy seemed to consist of some simple story, made laughable by the manner of delivery, somewhat in the style of the merry-andrews formerly at the fairs in England.

As night came on, the commanders took their leave, after inviting the king and his attendants to dine on board the Resolution. They were conducted to the water-side, in the same manner as they approached the palace, and were attended by the king and royal family. The next morning Omai's mother, and several of his relations arrived; but their interview was not like that between him and his sister, for the old lady wounded herself with shark's teeth, which appeared but an odd idea of joy to the voyagers.

Our people had brought from the other islands several shaddock-trees, which they planted here, and there appeared to them a probability of their succeeding, unless their growth should be checked by the same idle curiosity which destroyed a vine planted at Oaitipha by the Spaniards. Many of the natives assembled to taste the first fruits it produced; but being still sour, they considered it little better than poison, and trod it under foot.

The captain attending Otoo to his father's, he saw several people employed in dressing two girls with fine cloth, after a very singular fashion. There were several pieces, one end of each was held over the heads of the girls, while the remainder was wrapped round their bodies under the arm-pits. The upper ends were then let fall, and hung in folds to the ground, over the other, so as to bear some resemblance to a circular hoop-petticoat: lastly, round the sides of all were wrapped several pieces of cloth, of various colours, which considerably increased the size, it being five or six yards in circuit; and the weight of this singular attire was as much as the poor girls could support. To each were hung two taames, or breast-plates; in order to establish the whole, and give it a picturesque appearance. Thus equipped, they were taken on board, together with several hogs, and a quantity of fruit, the whole being a present to the English commander from Otoo's father.

Those who are dressed in this manner, are called *atee*; but this ceremony is never performed, except when large presents of cloth are to be made. It never was seen practised upon any other occasion; but both Captain Cook and Captain Clerke, who sailed under his command, had cloth presented to them afterwards wrapped round the bearers in the same manner.

Captain Cook, going to see an embalmed corpse, near the residence of Otoo; on inquiry, it was found to be the remains of Tee, a chief well known to him, when he last visited this island. It was lying in an elegant *toopapao*, in all respects similar to that at Oaiti-piha, in which the remains of Waheiatow, the elder, were deposited. The body was found uncovered within the *toopapao*, and wrapped up in cloth. At the captain's desire, the person who had the care of it, brought it out and placed it upon a kind of bier, so as to exhibit a perfect view of it. The attendants then ornamented the place with mats and cloth, disposed in such a manner as to produce a pleasing effect. The body was entire in every part; putrefaction seemed hardly to be begun, and not the least disagreeable smell proceeded from it, though this was one of the hottest climates, and Tee had been dead above four months. There was, indeed, a shrinking of the muscular parts and eyes, but the hair and nails were in their original state, and the several joints were pliable. The deceased was thus preserved, by drawing out the intestines, and other viscera, after which the whole cavity is stuffed with cloth; that when any moisture appeared, it was immediately dried up, and the body rubbed all over with perfumed cocoa-nut oil, which, frequently repeated, preserved them several months; after which they mouldered away gradually. Omai told them, that the bodies of all their great men, who die a natural death, are thus preserved, and exposed to public inspection.

We must not omit to mention here, that Captain Cook having heard so much of the strangers who visited Otaheite, and the house they had erected, was resolved to survey this edifice, of which the reader will take the following description:

"It stood near the beach, and was comprised of wooden materials, such as seemed to have been brought thither ready prepared, the planks being all numbered; and it consisted of two small rooms, in the innermost of which were a bedstead, a table, and a bench: some old hats and other trifles were also left there; and of these the natives appeared particularly careful, as well as of the building itself, which was preserved from the injuries of the weather by a sort of shed they had erected over it. Around it were a number of scuttles, as if intended for air-holes, though there might be a design of rendering them serviceable for firing muskets from, if occasion required it; and the whole structure seemed to Captain Cook to indicate a deeper plan than the natives were aware of. At a little distance stood a wooden cross, on the transverse part of which was inscribed, *Cbristus vincit*, and on the perpendicular, *Carulus III.*

imperat. 1774. This latter circumstance being noticed by the captain, he preserved the memory of the visits of the English, by inscribing *Georgius Tertius, rex, annis* 1767, 1769, 1773, 1774, & 1777. Near the foot of the cross, was the Spanish commodore's grave, who died on the island."

As it appeared, that whatever might be the views of the Spaniards, they had spared no pains in endeavouring to gain the friendship of the islanders, who spoke of them with the greatest respect; so Captain Cook thought proper to caution them how they trusted their new friends, if ever they should pay them another visit. And he afterwards heard, in the course of a conference with the natives, that the Spaniards had desired, the English should never more be admitted into Oaiti-piha-Harbour, as they asserted, that all was *their* property. But the islanders added, in a soothing manner, "that they were so far from entertaining a thought of complying with this injunction, that they came to surrender to the English the province of Tiaraboo, and every thing in it."

Many of the sailors being very desirous to stay at Otaheite, Otoo interested himself in their behalf, and endeavoured to prevail on Captain Cook to grant their request; but he rejected peremptorily every application of that kind, though often repeated; nor would he suffer any of the natives to enter on board, though many would have gladly accompanied the Europeans wherever they intended to sail, and that too after they were assured, that they never intended to visit their country any more. Some of the women also would have followed their Ehoonoas, or British husbands, could they have been permitted; but the commander was equally averse to the taking any of the natives away, as to the leaving his own people behind.

When the king found he could not obtain his wishes in this respect, he applied to Captain Cook for another favour, which was, to allow our carpenters to make him a chest, or press, to secure the treasures he had accumulated in presents: he even begged that a bed might be placed in it, where he intended to sleep. This request the captain readily granted; and while the workmen were employed in making this uncommon piece of furniture, they were plentifully supplied with barbecued hog, and such dainties as the country afforded, so that they thought themselves amply compensated for their pains. Captain Cook accompanied Otoo to Oparree; and before he left it took a survey of the cattle and poultry which he had consigned to his friend's care. Every thing was in a promising way, and properly attended to. Two of the geese, and two of the ducks, were sitting; but the pea-hen and turkey-hen had neither of them begun to lay. He took four goats from Otoo, two of which he intended to leave at Ulietea, and to reserve two for the use of any other islands he might touch at in his passage to the north. The captain was informed by Otoo, that he had a canoe, which he desired he would take with him as a present from the Earee of Otaheite,

Otaheite, to the Eareerahie of Pretanne. The captain was highly pleased with Otoo for this mark of his gratitude. At first, he supposed it to be a model of one of their vessels of war, but it proved to be a small iwahah, about sixteen feet long. It was double, and probably had been built for the purpose, and was decorated with carved work, like their canoes in general. It being inconvenient to take it on board, the captain could only thank him for his good intention; but the king would have been much better pleased if his present could have been accepted.

By the following manœuvre of this prince, it will appear, that the people of this island do not want for address in bringing about their purposes. Among other things which the captain had at different times given Otoo, was a spying-glass: having been two or three days possessed of this glass, he, perhaps, grew tired of it, or discovered that it could not be of any use to him; he therefore, carried it privately to Captain Clerke, telling him, that he had got a present for him, in return for his friendship, which he supposed would be agreeable: "But, says Otoo, Toote must not be informed of this, because he wanted it, and I refused to let him have it." Accordingly he put the glass into Captain Clerke's hands, assuring him, at the same time, that he came honestly by it. Captain Clerke, at first, wished to be excused from accepting it; but Otoo insisted that he should, and left it with him. A few days after, he reminded Captain Clerke of the glass; who, though he did not wish to have it, was yet desirous of obliging Otoo; and thinking a few axes would be more acceptable, produced four, and offered them in exchange. Otoo immediately exclaimed, "Toote offered me five for it." Well, says Captain Clerke, if that be the case, you shall not be a loser by your friendship for me; there are six axes for you. He readily accepted them, but again artfully desired that Captain Cook might not be made acquainted with the transaction, which he knew could not redound to his own honour.

The English were detained here some time longer than they expected, during which the ships were crowded with friends, and surrounded with canoes, for none of them would quit the place till they departed. At length, the wind came round to the east, and they weighed anchor. When the Resolution and Discovery were under sail, to oblige Otoo, and to gratify the curiosity of his people, several guns were fired, after which all friends, except his majesty, and two or three more, took leave of their visitors with such lively marks of sorrow and affection, as sufficiently testified how much they regretted their departure. Otoo being desirous of seeing the Resolution sail, she made a stretch out to sea, and then in again immediately, when the king took his last farewell, and went ashore in his canoe. It was strictly enjoined the captain by Otoo, to request, in his name, the Eareerahie of Pretanne (meaning the King of England) to send him by the next ship some red

feathers, and the birds which produced them; also axes, half a dozen muskets, powder and shot, and by no means to forget horses. Before the English left the island, Captain Cook was much pressed to join Otoo's forces in an expedition against Emayo, where some years since, they said, a chief had been murdered, whom the inhabitants of the last-mentioned place had desired those of Otaheite to send them for a king. A fleet indeed had sailed before against these people, but had returned without achieving any thing; and therefore another attack was resolved on. The captain answered, that he could not think of engaging in hostilities against those who had not given him any offence, and predicted the miscarriage of the expedition, on account of their offering a human sacrifice to insure its success.

Otoo left the most valuable presents he had received, in the captain's possession, till the day before they sailed, the king declaring that they could be no where so safe. From the acquisition of new riches, the inducements to pilfering must certainly have increased, and the chiefs were sensible of this, from their being so exceedingly desirous of having chests. The few that the Spaniards had left among them were highly prized, and they were continually asking for others from our people. Locks and bolts were not considered as a sufficient security, so that a chest must be large enough for two people to sleep upon, and consequently guard it in the night. Yet, in the midst of all this insecurity of property, it is no less strange than true, that no laws were made, or even suggested, to suppress such a growing evil; no reason for which can be assigned, but the weak one, that custom had appeared to authorise these shameful depredations.

On account of the incapacity of these people to calculate the time of past events, it could never be learned, to a certainty, when the Spaniards landed on the island. The live stock they left here, consisted of one bull, some goats, hogs, and dogs, and the male of another animal, which, according to information, was a ram, at that time at Bolabola. The hogs being large, had already much improved the breed originally found upon the island. Goats were also plentiful, there being hardly a chief without them.

The dogs that the Spaniards put ashore, were of two or three sorts: had they all been hanged, instead of being left upon the island, it would have been better for the natives. A young ram fell a victim to one of these animals.

Four Spaniards remained on shore when their ship left the island, two of whom were priests, one a servant, and the other was much caressed among the natives, who distinguished him by the name of Mateema. He seemed to have so far studied their language, as to have been able to speak it, and to have been indefatigable in impressing on the minds of the Otaheiteans exalted ideas of the greatness of the Spaniards nation, and inducing them to think meanly of the English.

It is hard to conceive, what were the views of the priests; they could not relate to religion; for the natives said, they never conversed with them, either on this or any other subject. The priests resided the whole time at Oaitipaha; but Mateema roved about continually, visiting many parts of the island. After he and his companions had staid ten months, two ships arriving at Otaheite, took them on board, and sailed in five days. Whatever designs the Spaniards might have on this island, their hasty departure shewed they had now laid them aside. However, they endeavoured to make the natives believe, that they intended to return, and would bring them all kinds of animals, and men and women, who were to settle on the island.

As Captain Cook had received a visit from one of the two natives of this island who had been taken to Lima by the Spaniards, it is somewhat remarkable that he never saw him afterwards, especially as the captain received him with uncommon civility. It was imagined that Omai, from motives of jealousy, had kept him from the captain, he being a traveller, who, in some degree, might vie with himself. Captain Clerke, who had seen the other man, spoke of him as an inconsiderable character; and his own countrymen entertained the same opinion of him. In short, those two adventurers seemed to be held in little or no esteem.

In the mean time, Omai himself, who had been fortunate enough to return with so many more advantages, was far from improving them, as might have been expected. He exhibited little indeed of dignity, but much of a puerile vanity: slighting the advice of his best friends, he, like many Europeans, seemed to delight only in that sort of society where he expected to be deemed the head of the company. By such means, he lost the friendship of all the principal persons in the country, who presently found, that they could not get from any person in either of the ships such gifts as Omai bestowed on the lower orders of the people. This conduct naturally lost him the favour of Otoo, and of those with whom he should have been careful to cultivate an acquaintance. His sister and his brother-in-law likewise very unkindly joined a select body, that seemed to have laid a scheme for plundering him, which they would have done completely, but for the interference of Captain Cook, who took the most useful articles this traveller had under his care, and forbade these greedy relations to appear at Huaheine all the time he continued at the Society-Islands, whither he intended directing his course after leaving Otaheite, according to the plan of his voyage.

But before we pursue the captain's track any further, we shall here present the reader with a summary view of the most remarkable customs and manners of the natives of Otaheite, and such other particulars as we could not have introduced so properly before, without breaking in upon the thread of our narrative.

3

C H A P. XV.

Soil, Persons, Dwellings, Habits, Disposition, and various Customs of the Inhabitants of Otaheite. Their Food and Manner of Eating. Birds and Beasts peculiar to the Island.

THE inhabitants of Otaheite have the happiness to be situate on an island, which, though within the tropics, may be reckoned as one of the most healthy in the world. M. Bougainville, who visited this place, as we have already mentioned, takes notice, that the greatest part of his sailors who were sent on shore for the cure of disorders occasioned by heat, salt provisions, and other causes incidental to long voyages, here regained their strength, finding the land fertile, and the warmth of the sea tempered with the purest air.

The soil, which is of a blackish colour, is watered by a number of rivulets. On the borders of the valley through which the river flows, there are several houses with walled gardens, and plenty of fowls and hogs. Channels are cut in many places to conduct the water from the hills to the plantations. Streams meander through various windings, and stupendous mountains overhang the vallies. Towards the sea, the view is delightful, the sides of the hills being covered with trees, and the vallies with grass. No under-wood was found beneath the trees, neither on the sides or bottoms of the hills, but there was plenty of good grass. Many fine springs gush from the borders of the mountains, all of which are covered with wood on the sides, and fern on the summits. Sugar-cane grows without cultivation on the high land, as also turmeric and ginger.

This island, known by the general name of O T A H E I T E, forms two distinct kingdoms, which are united by a narrow neck of land. The largest of these is called by the natives *Tiarrabou*, or *Otaheite-Nue*; the smaller *Oporouu*, or *Otaheite-Ete*.

It is surrounded by a reef of coral rocks, forming several bays, among which the principal is Port-Royal, called by the natives *Matavai*. The country affords a beautiful prospect. It rises in ridges, forming mountains in the middle of the island, that may be seen at the distance of sixty miles. Towards the sea, it is level, and covered with fruit-trees of divers kinds, but particularly the cocoa-nut. In this part are the houses of the inhabitants, which do not form villages, being ranged along the whole border, at about fifty yards distance from each other.

The vegetable productions of this island are as various as numerous in their respective species. There are bread-fruit, cocoa-nuts, bananas of many sorts, sweet potatoes, plantains, yams, a delicious fruit known here by the name of *jambu*, sugar-cane, the paper-mulberry, ginger, turmeric, and several sorts of figs, all of which the soil produces spontaneously, or with very little culture. They have the *ava-ava*, from which they extract

A a

tract.

tract the intoxicating liquor already described in the other islands. A most extraordinary tree here received the name of *Barringtonia*. The leaves are of a most beautiful white, tipped with a bright crimson. It is called *buddoo* by the natives, who affirm, that its fruit, which is a large nut, being bruised, mixed with shell-fish, and strewed in the sea, has an effect so intoxicating upon the fish, that they will come to the surface of the water, and suffer themselves to be taken with hands. There are other plants of a similar quality in these climates, particularly one called *tubbe*, which grows on another island, and intoxicates fish in the same manner as the *barringtonia* or *buddoo*. It is remarked from observation, that the fish caught by means of these intoxicating plants, were neither nauseous or unwholesome. There are also the *wharra*, *pandanus*, and a sort of shady trees, covered with a dark green foliage, bearing what they call golden apples, which resemble, in flavour and juiciness, the anana, or pine.

The people of Otaheite are robust, well proportioned, comely, and alert. With respect to stature, the men in general are from five feet seven to five feet ten inches. The tallest man seen by Captain Wallis, measured six feet three inches and an half; and Otoo, King of Otaheite, is described by Captain Cook as reaching that stature. Monsieur de Bougainville says, they would, in point of form, be most excellent models for painting an Hercules or a Mars. The standard of the women in general is near three inches shorter. Their noses are generally rather flat, though in other respects they are handsome and agreeable, having delicate skins, eyes fully expressive, and teeth beautifully white and even. Their hair is for the most part black, though some, in contradistinction from the natives of Asia, Africa, and America, in general, have it brown, red, or flaxen; the children of both sexes in particular have that of the latter colour. The complexion of the men is tawny, though that of those who go upon the water is reddish. The women are of a fine clear olive colour, or what we call a brunette. The men wear their beards in various forms, plucking out a great part. Contrary to the custom of most other nations, the women of this country cut their hair short, whereas the men wear it long, sometimes hanging loose upon their shoulders, and at other times, tied in a knot on the crown of the head, in which they stick the feathers of birds of various colours. Like the Chinese, the principal men of the island suffer the nails of their fingers to grow very long as a badge of honour, and as an indication of their not being subject to any servile employment. The nail of the middle-finger on the right-hand, was observed to be short; but the reason of that peculiarity could not be learned. Their mien and deportment are perfectly graceful.

Tattooing or puncturing is in general practised here with both sexes, and performed in the same manner as at the other islands in these seas already described. They

usually undergo this operation at the age of about ten or twelve years, and in different parts of the body; but those which suffer most severely, are the breech and the loins, which are marked with arches, carried one above another a considerable way up the back.

Mr. Banks, who accompanied Captain Cook, was present at the operation of tattooing performed on the posteriors of a girl between twelve and thirteen years of age. The instrument used had twenty teeth, and at each stroke, which was repeated every moment, issued an ichor or serum tinged with blood. The girl bore the pain with great resolution for some minutes, till at length it became so intolerable, that she burst out into violent exclamations; but the operator, notwithstanding the most earnest entreaties to desist, was inexorable, whilst two women who attended upon the occasion, both chid and beat her for struggling. The operator had continued for the space of a quarter of an hour, in which only one side was tattooed, the other having undergone the same ceremony some time before, and the arches upon the loins, which they deem the most ornamental, was yet to be made.

Their dress consists of cloth and matting of various kinds; the first they wear in fine, the latter in foul weather. Two pieces of this cloth or matting compose the dress; one of them having a hole in the middle to put the head through, the long ends hang before and behind; the other pieces, which are between four and five yards long, and about one broad, they wrap round the body in an easy manner. The men's dress differs from the women's in this instance, that in one part of the garment, instead of falling below the knees, it is brought between the legs. This dress is worn by all ranks of people; but that of the better sort of women consists of a great quantity of materials. In the heat of the day, both sexes wear only a piece of cloth tied round the waist. They have small bonnets made of cocoa-nut leaves or matting, constructed, in a few minutes, to shade their faces from the sun. The ornaments of both sexes consist of feathers, flowers, shells, and pearls, but the latter are more worn by the women. Boys and girls go naked, the former till they are seven or eight years old, and the latter till they are five or six. Their clothes are in general strongly perfumed. They have a custom in many hot countries of anointing their hair with cocoa-nut oil, the smell of which is very agreeable.

The chief uses for which the houses of the inhabitants of Otaheite are designed, are to sleep in, or to avoid rain; as in fair weather, they eat in the open air, under the shade of trees. They are at best but sheds, and in general without division or apartments. The roof resembles our thatched houses, and consists of two flat sides, inclining to each other. The floor is covered with hay, over which they spread mats. The size of the houses is proportioned to the number of the family, and the several departments adapted for the convenience of the different ranks. The master and his wife

repose in the middle; round them the married peo-
ple; next the unmarried females; then, at some dis-
tance, the unmarried men; then the servants at the ex-
tremity of the shed, but, in fair weather, in the open
air. The houses of the chiefs differ in some particu-
lars, having more convenient apartments constructed for
privacy. Some are so formed as to be carried in can-
oes; they are very small, and enclosed with leaves of
the cocoa-nut, but the air nevertheless penetrates; these
are designed only for the accommodation of the great.

With respect to the disposition and temper of these
islanders, it has been remarked, that their passions are
violent, and subject to frequent transitions from one ex-
treme to another, especially after the succession of grief
and rapture. As they seem absorbed in luxury, it is nat-
ural to suppose them unable to endure pain in an
acute degree; but it will appear otherwise, when ob-
served, that the women undergo the most excruciating
tortures from their own hands on the death of rela-
tions, as will hereafter be described. They point
out particular friends, by taking off a part of their
clothing and putting it on them. Their treatment
of our countrymen, after prejudices arising from
novelty had subsided, was generous and courteous.
If an engaging look from a native was returned by a
smile from any of our countrymen, they would avail
themselves of the opportunity to prefer the request of
a bead, or some other bauble; but maintained an even-
ness of temper whether granted or denied. When the
frequency and importunity of their solicitations
became subjects for the display of sarcasm amongst our
people, they would only carry it off with an hearty
laugh. Novelty was the leading topic of their conver-
sation; their intercourse with strangers, and the infor-
mation they derived, and observations they made, were
subjects reserved for the entertainment and diversion of
each other. Though they always expressed emotions at
the explosion of gunpowder, they overcame, by degrees,
their former dread and apprehension.

Their mode of paying obeisance to strangers or supe-
riors, at a first meeting, is by uncovering themselves to
the middle; and they have a common phrase when
any one sneezes, implying, "May the Good Ge-
nius awake you!" or, "May not the Evil Genius lull
you asleep!"

Though they possess many good qualities, they par-
take, as we have seen, of the propensity to theft, that
characterises the inhabitants of the South-Sea islands in
general. The terrible apprehensions of the effects of fire-
arms, as upon every occasion, seldom failed of producing
restitution.

One of the natives having the dexterity to cross the
river unperceived, and steal a hatchet, the gunner of
the Dolphin, who was commanding officer of a watering
party on shore, signified by signs to an old man who
was appointed to superintend commerce on the part of
the Indians, the offence committed, and drew out some

of his people, as if he would have gone into the woods
in quest of the delinquent. The old man, intimidated
by this specious preparation, gave the officer to under-
stand he would prevent the execution of his design,
by restoring the article missed; and setting off immedi-
ately, returned in a very short time with the article stolen.
The gunner insisting on the thief being produced, it
was complied with, though with apparent reluctance;
and being known to be an old offender, he was sent
prisoner on board. The captain, however, only punish-
ed him with apprehension, and then dismissed and sent
him on shore. He was received on his return by his
countrymen with loudest acclamations, and carried off
in triumph by them into the woods. Conscious, how-
ever, of the lenity of the gunner, he expressed his grati-
tude by presenting him with a roasted hog, and some
bread-fruit.

Another trait of the disposition of these people is,
that they have not an idea of any thing being indecent,
and transgress the rules of modesty, without the least
sense of shame, or notion of impropriety. Notwith-
standing this disposition, the wives here owe their hus-
bands a blind submission, nor does the passion of jealousy
prevail amongst them in the least degree.

The sagacity of these people in foretelling the
weather, particularly the quarter from whence the wind
will blow, is very extraordinary. In their long voy-
ages, they steer by the sun in the day, and in the night
by the stars, all of which they distinguish separately by
names, and know in what part of the heavens they will
appear in any of the months during which they are vi-
sible in their horizon. They can also determine with
precision the times of their annual appearing or disap-
pearing.

Vegetables compose the chief part of the diet of the
common people of this island, whilst those of exalted
rank feed on the flesh of hogs, dogs, and fowls, and
gormandize to an excess. Amongst the articles of ve-
getable food, are the bread-fruit, bananas, plantains,
yams, apples, and a four fruit, which, though not plea-
sant in itself, affords an agreeable relish to roasted
bread-fruit, with which it is frequently beaten up.
The bread-fruit, which is the chief support of these peo-
ple, is attended with no other trouble after the tree is
planted, than that of climbing to gather its produce.
When the fruit is not in season, its deficiency is supplied
with cocoa-nuts, bananas, and plantains.

A very common dish, is a pudding composed of
bread-fruit, plantains, taro, and pandanus-nuts, each
rasped, scraped, or beat up very fine, and baked by
itself. A quantity of the juice of cocoa-nut kernels is
put into a large tray or wooden vessel, in which the
other articles from the oven are put, together with
some hot stones, in order to make the contents firmer.
Three or four persons are employed in stirring
up the several ingredients, till they are perfectly incor-
porated, and the juice of the cocoa-nut turns to oil;
and, at last, the whole mass is nearly of the consistency

of a hasty-pudding. Some of these puddings are excellent, and few that we make in England equal to them.

They substitute, instead of the bread-fruit, a kind of paste made of cocoa-nuts, bananas, and plantains, which they gather before the bread-fruit is perfectly ripe, and lay in heaps, covering it closely with leaves. It then ferments, after which the core is extracted, and the fruit put into a hole dug in the earth, which is lined with grafs. This is also covered with leaves, and pressed down with a weight of stones. This occasions a great fermentation; when the fruit becomes sour, it is then baked and eaten. It will keep a considerable time before it is baked, and afterwards. The paste so made, is called Malinc. Different dishes are made of the bread-fruit itself.

Their method of killing such animals as are intended for food, is by suffocation; stopping the mouth and nose with their hands. This done, they singe off the hair, by holding the animal over a fire, and scraping him with a shell. They then cut him up with the same instrument, take out, wash the entrails, and put them into cocoa-nut shells, together with the blood. Such dogs as are designed for food, are fed wholly upon vegetables; and some of our countrymen who have tasted the flesh of that animal thus fed, have declared it to be little inferior to lamb.

In dressing their food, they observe the following process. First, the fire is kindled by rubbing one piece of dry wood upon the side of another. Then digging a pit about half a foot deep, and two or three yards in circumference, they pave the bottom with large pebble-stones, which they lay down very smooth and even, and kindle a fire in it with dry wood, leaves, and the huks of cocoa-nuts. They take out the embers when the stones are sufficiently heated, and, after raking up the ashes on every side, cover the stones with a layer of cocoa-nut leaves, and wrap up the animal that is to be dressed in the leaves of the plantain. If it is a large hog, they split it; but if a small one, they wrap it up whole. Having placed it in the pit, and covered it with hot embers, they lay upon them bread-fruit and yams, which are also wrapped in the leaves of the plantain. Over these they frequently spread the remainder of the embers, mixing among them some of the hot stones, with more cocoa-nuts among them, and then close up all with earth, so that the heat is kept in. The oven is kept thus closed a longer or shorter time, according to the size of the meat that is dressing.

The usual sauce to their food is salt-water: those who live near the sea, have it furnished as it is wanted; those at a distance keep it in large bamboos. The kernels of the cocoa-nut furnish them with another sauce, which, made into paste, something of the consistence of butter, are beaten up with salt water, that has a very strong flavour, and, at first, seems nauseous, but after being used some time, is much relished. Till visited by

the English, they were quite unacquainted with the method of boiling, having no vessels that will bear fire.

The females here are totally excluded from men's society whilst at their meals. Such indeed was their prejudice in favour of this custom, that they expressed their disgust even at their visitants eating in the society of women, and of the same food. And the women were so accustomed to this mode of separation, that the Europeans could never prevail with them to partake with them at their table when they were dining in company. When any of them has been occasionally alone with a woman, she has sometimes eaten; but not only expressed the greatest reluctance, but exerted the strongest promises of secrecy. Even brothers and sisters among them have their separate baskets of provisions, and separate apparatus for their meals. The women have their food separately prepared by boys for this purpose.

They usually eat under the shade of a spreading tree; their table-cloth is composed of broad canvas, spread in great abundance. If a person of rank, he is attended by a number of servants, who seat themselves round him. Before he begins his meal, he washes his mouth and hands very clean, and repeats this practice several times while he is eating. He peels off the rind of the bread-fruit with his fingers and nails. He never eats apples before they are pared, to do which, a small shell, of a kind that is to be picked up every where, is tossed to him by one of the attendants. Whilst he is eating, he frequently drinks a small quantity of salt-water, either out of a cocoa-nut shell which is placed by him, or out of the hand. If he eats fish, it is dressed and wrapped up in canvas; the fish being broken into a cocoa-nut of salt-water, he feeds himself by taking up a piece with the fingers of one hand, and bringing with it as much of the salt-water as he can retain in the hollow of his palm. When he dines on flesh, a piece of bamboo is tossed to him to serve as a knife; having split it transversely with his nail, it becomes fit for use, and with this he divides the flesh. He crams a great quantity into his mouth at a time, and ends his repast by sipping some bread-fruit pounded and mixed with water, till it is brought to the consistency of an unbaked custard. He then washes his mouth and hands; at the same time, the attendants close the cocoa-nut shells that have been used, and place every thing that is left in a kind of basket.

Such is their aversion to feeding themselves, that one of the chiefs, on a visit on board an European vessel, would have gone without his dinner, if one of the servants had not fed him. Some of the English had an opportunity of observing a singular instance of gluttony. Arriving, upon an excursion, at a neat house, they saw a very corpulent man, who seemed to be a chief of the district, lolling at his ease, while two servants were preparing his desert, by beating up with water some bread-fruit and bananas in a large wooden bowl, and mixing

unacquainted with vessels that will bear

cluded from men's society, indeed was their preference that they expressed their sitting in the society of. And the women were so partial, that the Europeans were to partake with them dining in company. Occasionally alone with a man, but not only expressed the strongest prejudices among them provisions, and separate women have their food is purpose.

shade of a spreading tree, instead of broad canvas, a person of rank, he is attended, who seat themselves at his meal, he washes his hands, and repeats this ceremony is eating. He peals the nuts with his fingers and before they are pared, he takes a kind that is to be used to him by one of the attendants, he frequently washes with water, either out of a shell, or by him, or out of the hollow and wrapped up in a piece of bread, and the hollow of his palatine. The shell of bamboo is tossed and split it transversely for use, and with this he takes a great quantity into his stomach by sipping some of it with water, till it is as unbacked custard. He eats of it at the same time, but shells that have been used is left in a kind of

ing themselves, that one day a European vessel, a frigate, if one of the vessels of the English had an opportunity of instance of gluttony. At a neat house, they saw a man who was to be a chief of the two servants were present with water some bread in a wooden bowl, and mixing with

with them a quantity of fermented four paste; while this was doing, a woman who sat near him, crammed into his throat, by handfuls, the remains of a large baked fish and some bread-fruit, which he swallowed most voraciously. He had a heavy phlegmatic countenance, which seemed to indicate, that all his enjoyment centered in the gratification of his appetite, or, in other words, that he wished to live merely to gourmandize.

The people of Otaheite appear to have an aversion to strong liquors, their chief drink being water, or milk of the cocoa-nut. If any of them had drunk too freely with the seamen, they ever after refused the liquor which had produced that effect. They have the intoxicating plant called *ava-ava*, but they use the liquor from it with great moderation. Sometimes they chew the root, and sometimes eat it wholly.

One of our people made particular inquiry concerning the nature of the perfume-root, with which the natives perfume their clothes and oils. An Indian, more communicative than the rest, pointed out to him several plants, which are sometimes used as substitutes; but he would not, or could not point out the real plants. According to the accounts received afterwards, there are no less than fourteen different plants used in the preparation of perfume, from which it appears, that these people were particularly fond of a compound of smells.

Diseases in general do not prevail so much in this island as in many others. The natives, however, are subject to leprous complaints, which appear in cutaneous eruptions. Some had ulcers in different parts of their bodies, but they were so little regarded, that no application was made to cure them. They are sometimes afflicted with cholics and coughs, and those who live luxuriously are liable to the attack of a disorder similar to the gout. It is affirmed by Monsieur de Bougainville's surgeon, that many had evident marks of the small-pox.

The crew of the French ship that visited this island a short time after Captain Wallis had left it, are said to have entailed the venereal disease upon the natives. Above half of Captain Cook's people, in 1769, had contracted it during a stay of three months. The natives distinguished it by a name implying rottenness, but of a more extensive signification. They described the sufferings which the first victims to its rage endured in the most moving terms; and assured our people, that it caused the hair and nails to rot off, and the flesh to rot from the bones; that it excited such dread and horror among the inhabitants, that, fearing infection, the afflicted were abandoned by their nearest relations, and suffered to perish in extreme misery. But they seem since to have found out a specific remedy for it, as none were seen labouring under the dreadful symptoms before mentioned upon future visits.

The management of the sick belongs to the priests, whose method of cure generally consists in pronouncing a set form of words, after which the leaves of the

cocoa-tree plant are applied to the fingers and toes of the sick; so that nature is left to conflict with the disease without the assistance of art. Without medical knowledge, they appear to possess considerable skill in surgery, which they displayed while the Dolphin lay in Port-Royal harbour. One of the crew, who, on shore, happened to run a large splinter into his foot, and the surgeon not being at hand, one of his comrades endeavoured to take it out with a pen-knife; but, after giving the man great pain, he was obliged to desist. An old native, of a friendly, social disposition, happening to be present, called a man of his country from the other side of the river, who, having examined the lacerated foot, fetched a shell from the beach, which he broke to a point with his teeth, and with this instrument laid open the wound, and extracted the splinter. While this operation was performing, the old man went a little way into a wood, and returned with some gum, which he applied to the wound with a piece of clean cloth that was wrapped round him, and in the space of two days it was perfectly healed. The surgeon of the ship procured some of this gum, which was produced by the apple tree, and used it as a vulnerary balsam with great success. Captain Cook saw many of the natives with dreadful scars, and amongst the rest, one man, whose face was almost entirely destroyed, his nose-bone included was quite flat, and one cheek and one eye were so beaten in, that the hollow would almost receive a man's fist, yet no ulcer remained.

Among the birds found on this island, are small paroquets, very remarkable on account of the mixture of blue and red on their feathers. There is another sort of a greenish colour, with a few red spots; these were frequently seen tame in the houses of the natives, who valued them for their red feathers. Here is a king-fisher, of a dark green, with a collar of the same hue round his white throat; a large cuckoo, and a blue heron. There are small birds of various kinds, which harbour in the shade of the bread-fruit, and other trees. Contrary to the commonly-received notion, that birds in warm climates are not remarkable for their song, these have a very agreeable note.

The domestic poultry here are cocks and hens, exactly like those in Europe. There are besides wild-ducks, also turtle-doves, and large pigeons, of a dark blue plumage, and excellent taste.

The only quadrupeds in the island are hogs, dogs, and rats. The natives are said to have a scrupulous regard for the latter, and that they will by no means kill them. But Captain Cook, in 1773, turned a number of cats on the island, from which, it is reasonable to suppose, the number of these favoured vermin must be reduced.

On comparing various accounts, it appears, that musquitos and flies infest the island; but this seems to be only at certain seasons, and in particular places. Here were found neither frogs, toads, scorpions, centipedes, or any kind of serpent. The

most troublesome insect was the ant, of which there were but few.

They have fish in great variety, and of excellent flavour. Their principal employment is to catch, and their principal luxury to eat, them.

They make ropes and lines, and thereby provide themselves with fishing-nets, of the bark of a tree, which supplies the want of hemp: of the fibres of the cocconut they make thread, with which they fasten the different parts of their canvas, and subserve other purposes. Their fishing-lines are made from the bark of a nettle which grows on the mountains, and is called *crava*; they are capable of holding any kind of fish. Their hooks are made of mother-of-pearl, to which they fix a tuft of hair made to resemble a fish. Instead of being bearded, the point turns inwards. They have a kind of seine, made of a coarse broad grass, the blades of which are like flags. These they twist and tie together in a loose manner, till the neck, which is about as wide as a large sack, is from sixty to eighty fathoms long. This seine they haul in shoal, smooth water, and its own weight keeps it so close to the ground, that scarcely a single fish can escape. They have harpoons made of cane, and pointed with hard wood, with which they can strike fish more effectually than an European can with one loaded with iron. They have no method, however, of securing a fish when they have only pierced it with their harpoon, as the instrument is not fastened to a line. Pieces of coral are used as files to form mother-of-pearl and other hard shells into the shape required.

CHAP. XVI.

Language, Manufactures, Succession, Manner of embalming the Dead, Dances, Musical Instruments, Government, Customs, Human Sacrifices, and Manner of treating the Bodies of the Chiefs that fall in Battle at Otaheite.

WITH regard to the language of these islanders, we are not sufficiently acquainted with it to speak of its extent; however, by such specimens as have been seen, it appears to be rather expressive than copious; few words commonly producing few words amongst all the children of Adam; dialects of this language, however, are found to be used at most of the southern islands.

The principal manufacture of Otaheite is cloth; of this there are three sorts, all which are made out of the bark of different trees, namely, the mulberry, the bread-fruit, and a tree which bears some resemblance to the West-Indian wild fig-tree. The first of these produces the finest, which is seldom worn but by those of the first rank. The next sort is made of the bread-fruit tree; and the last, of that which resembles the wild fig-tree. But this last sort, though the coarsest,

is scarcer than either of the other two, which are manufactured only in small quantities, as the same manner is used in manufacturing all these cloths in general.

They soak the bark of the tree for two or three days in water; then take it out, and separate the inner from the external coat, by scraping it with a shell, after which it is spread out on plantain-leaves, placing two or three layers over one another, care being taken to make it of an equal thickness in every part. In this state it continues till it is almost dry, when it adheres so firmly, that it may be taken from the ground without breaking. After this process, it is laid on a smooth board, and beaten with an instrument made for the purpose, of the compact heavy wood called *Etoa*. The instrument is about fourteen inches long, and about seven in circumference; it is of a quadrangular shape, and each of the four sides is marked with longitudinal grooves or furrows, differing in this instance, that there is a regular gradation in the width and depth of the grooves on each of the sides; the coarser side not containing more than ten of these furrows, while the finest is furnished with above fifty. It is with that side of the mallet, where the grooves are deepest and widest, that they begin to beat their cloth, and, proceeding regularly, finish with that which has the greatest number. By this beating, the cloth is extended in a manner similar to the gold that is formed into leaves by the hammer; and it is also marked with small channels, resembling those which are visible on paper, but rather deeper; 't is in general beat very thin, but when they want it thicker than common, they take two or three pieces, and paste them together with a kind of glue, prepared from the root called *Pea*. This cloth becomes exceeding white by bleaching, and is dyed of a red, yellow, brown, or black colour; the first is exceeding beautiful, and equal, if not superior, to any in Europe. They make the red colour from the mixture of the juices of two vegetables, neither of which used separately has this effect.

The whole process of making cloth is performed by women, who are dressed in old dirty rags of this cloth, and have very hard hands. They prepare a red dye, which is made by mixing the yellow juice of a small species of fig, called by the natives *mattee*, with the greenish juice of a sort of fern, or of several plants which produce a bright crimson, and this the women rub with their hands if the whole piece is to be uniformly of the same colour; or they make use of a bamboo-reed, if it is to be marked or sprinkled with different patterns. This colour fades very soon, and becomes of a dirty red, besides being liable to be spoiled by rain, or other accidents. The cloth, however, which is dyed, or rather stained with it, is highly valued by the natives, and worn only by persons of rank among them. Their matting manufacture is also very considerable: it constitutes a great part of their employment, and may be said, in its produce, to excel any in Europe. The materials they work up for this purpose are rushes,

this purpose are rushes,

grass,

grass, the bark of trees, and the leaves of a plant they
call *wharraw*. The uses to which they apply their
matting are various: on that of the canvas kind, they
sleep in the night, and sit in the day. The fine sort they
convert into upper garments in rainy weather, as their
cloth is soon wetted through.

They are very dextrous at basket and wicker-work;
both men and women are employed at it, and they make
them of many different patterns.

A dramatic haiva, or play, consists of dancing,
and a kind of comedy, or rather farce. The per-
formers are of both sexes. The music on this occa-
sion consists of drums only: it lasts about two hours,
sometimes longer, and upon the whole is generally well
conducted.

One of their dances is called *Timoredet*, which is
performed by eight or ten young girls, and consists of
loose attitudes and gestures, in which they are trained
from their infancy. Their motions are so very regu-
lar, as scarcely to be excelled by the best performers upon
any of the stages of Europe.

Their principal musical instruments are the flute and
the drum. Their flutes have only two stops, and there-
fore sound no more than four notes by half-tones.
They are sounded like our German-flute, only the per-
former, instead of applying it to the mouth, blows it
with one nostril, stopping the other with his thumb.
They are made of a hollow bamboo, about a foot long.
To the stops they apply the fore-finger of the left-hand,
and the middle-finger of the right. While these in-
struments are sounding, others sing and keep time to
them. The drum is made of a hollow block of wood,
of a cylindrical form, solid at one end, and covered at
the other with a shark's skin. They are beaten with
their hands instead of sticks. Their skill extends to
turning of two drums of different notes into concord:
they can likewise bring their flutes into unison. Their
songs are generally extemporary, and in rhyme.

They have the exercise of throwing the lance, not
at a mark, but for distance. The weapon is about nine
feet long; the mark is the bowl of the plantain, and
the distance about twenty yards.

The form of government in Otaheite, though rather
unsettled, and in some degree apparently uncertain,
bears a resemblance, in point of subordination,
to the early state of all the nations in Europe when
under the feudal system. The people are divided into
four ranks or classes, viz. *Earee Rabie*, signifying king,
or superior governor; *Earee*, answering to the title of
baron; *Manabouni*, to that of vassal; and *Toutou*, to that
of villain, according to the old law term amongst
us. Under the latter is included the lowest order of
the people.

The island is divided into what our countrymen
term the Greater and Lesser Peninsula, generally go-

verned by two independent kings: but Captain Cook,
however, left Otoo in the situation of monarch of the
whole island; yet there was a dependent prince of the
smaller Peninsula. *Earierabie*, great king, or em-
peror, is their highest title. *Earie*, is applied to a
petty king, or a considerable chief, though sometimes
the monarch is content with that title.

As children in this country succeed to the title and
authority of their fathers as soon as they are born,
the sovereignty of the king of course ceases as soon
as he has a son born. It is so likewise with the *Earee*,
or baron, as the son succeeds to the titles and hon-
ours of his father as soon as he is born. He is indeed
reduced to the rank of a private man, all marks of
respect being transferred to the son. But here it is pro-
per to observe, with respect to the former, that a regent
is chosen, and the father generally retains his power
under that title, till the son becomes of age; and as
to the latter, that the estates remain in his possession,
and under the management of the father, to the same
period.

The subordination of the *Toutous*, or lower class,
deserves attention. Though employed in feeding the
animals for their luxurious chiefs, they are not suffered
to taste a morsel of their food. They undergo, with-
out daring to repine, the severest chastisements, if
through the unavoidable means of a concourse, they
press upon or incommode the king, or any chief, in
his progress; and this subordination is preserved with-
out any formal power vested in the king to enforce it.
He does not appear to have any military force, either to
awe his subjects into obedience, or suppress a species
of rebellion. He has no body or life-guard; the bar-
ons who attend his person do not go armed; so that
the distinction of rank that is maintained here, must be
attributed to the placid and complacent disposition of
the people in general.

Notwithstanding this distinction of rank, and its
consequent subordination, the necessities of life are
within the reach of every individual, at the expence of
very moderate labour; and if the higher class possess
exclusively some articles of luxury, as pork, fish,
fowls, and cloth, there are no objects here so
extremely destitute and wretched, as those which
too often shock the humane beholder in more civili-
zied states.

The conduct of these people does not appear to be
under the restriction of any stated form of government.
From divers causes, very few actions among them are
deemed criminal. They have no idea of the use of
money; though adultery is held criminal, yet as con-
cubinage with unmarried women is exempt from that
imputation, it takes off from the temptation to it. Be-
sides, in a country where there is very little, or none
at all of that delicacy prevalent in more enlightened or
civilized parts of the world, a predilection for any one
woman is not liable to be attended with any serious
consequences.

Adultery,

Adultery, however, is sometimes punished with death from the hands of the injured party, when under the influence of a passion naturally excited by such a cause; though in general the women, if detected, only undergo a severe beating, and the gallant passes unnoticed.

The chief defect here, is trusting executive justice to the lawless bounds of the injured party, who inflicts punishment as judge and executioner on the delinquent at his own will, without any restriction. The chiefs, however, in acts of flagrant violation of justice and humanity, sometimes interpose.

A sort of liveries distinguish the servants of the higher class. They wear their sashes higher or lower in proportion to the rank of their masters. The servants of the chiefs are distinguished by the sash being fastened close under the arm; those of the inferior rank of nobility by its going round the loins. One circumstance which does honour to their system of government is, the obtaining immediate information of any design that is formed. As a proof of this it is observed, that one of the water casks being stolen from an European vessel in the night; the transaction next morning was universally known among the Indians, though, it was evident, the theft was committed in a distant part of the island. By the same means the Europeans were apprised of a similar intent the following night; so that in consequence of placing a centinel over the casks, the thief who came accordingly was disappointed of his booty.

Several parts of the island were private property, descending to the heir of the possessor at his death, and that descent appeared to fall indiscriminately to man or woman.

The number of the inhabitants of one district of the island was estimated at 2,400, women and children included.

Captain Cook, on a certain occasion, receiving information from Otoo the king, that the war canoes of several of his districts were about to undergo a general review, went in his boat to take a survey of it. Their war canoes, which are with stages whereon they fight, amount to about 60 in number; and there are nearly as many more of a smaller size. The captain was ready to have attended them to Oparree; but the chiefs resolved that they would not move till the next day. This happened to be a fortunate delay; as it afforded him an opportunity of getting some fight into their manner of fighting. He therefore desired Otoo to give orders, that some of them should go through the necessary manoeuvres. Two of them were accordingly ordered into the bay; in one of which were the king, Capt. Cook, and an officer, and one of the islanders went on board another.

As soon as they had got sufficient sea room, they faced and advanced, and retreated by turns as quick as their rowers could paddle. In the mean time, the warriors on the stages flourished their weapons, and played

a variety of antic tricks, which could answer no other purpose than that of rousing their passions, to prepare them for the onset. The king stood by the side of the stages, giving the necessary orders when to advance, and when to retreat. Great judgment and a quick eye seems to be necessary in this department, to seize every advantage, and to avoid every disadvantage. At length the two canoes closed stage to stage; and after a severe though short conflict, all the troops on Otoo's stage were supposed to be killed, and the opposite party boarded them; when instantly Otoo and the paddler in the canoe, leaped into the sea, as if reduced to the necessity of preserving their lives by swimming. But they sometimes lash the two vessels together head to head, and fight till all the warriors on one side or the other are killed; yet this close combat is never practised, except when the contending parties are determined to conquer or die. Indeed, in this instance, one or the other must infallibly happen; for they never give quarter unless it be to reserve their prisoners for a more cruel death the following day. All the power and strength of these islands lie in their navies.

A general encounter on land was never heard of; and all their decisive actions are on the water. When the time and place of battle are fixed by both parties, the preceding day and night are spent in feasting and diversions. When the day dawns, they launch the canoes, make every necessary preparation, and with the day begin the battle; the fate of which, in general, decides the dispute. The vanquished endeavour to save themselves by a precipitate flight; and those who reach the shore fly with their friends to the mountains; for the victors, before their fury abates, spare neither the aged, women, or children. They assemble the next day at the morai, to return thanks to the Eatooa for the victory, and offer there the slain and the prisoners as sacrifices. A treaty is then set on foot; and the conquerors obtain usually their own terms; whereby large districts of land, and even whole islands, sometimes change their proprietors and masters.

One of our most celebrated navigators acknowledged, that their naval armaments exceeded every idea he had formed of the power of this small island. The same remark was made of their dock yards, in which were large canoes, some lately built, and others building; two of which were the largest ever seen in that sea, or any where else under that name; and it must be confessed, that the power and consequence of the island never appeared to such advantage as when, upon another occasion, the fleet of war canoes was assembled. The amount of those collected was 159 of the largest, besides 70 smaller ones. The concourse of people was more surprising than the number of canoes; for, upon a moderate computation, they could not contain less than fifteen hundred warriors, and four thousand rowers or paddlers. Our countrymen were given to understand, that this formidable fleet was only the naval force of a single district, and that all the

others could furnish a naval armament in proportion to their number and size. The officers were dressed in their war habits, which consisted of a great quantity of cloth, turbans, breast-plates, and helmets; some of the latter were of such a size as greatly to encumber the wearer. Their whole dress appeared rather calculated for show than use, and not adapted to the purpose designed. The vessels being decorated with flags, streamers, &c. made upon the whole a noble appearance.

Two kinds of canoes are here in use, one they call Ivahahs, the other Pahies; the former serve for short voyages at sea, and the latter for long ones. These boats do not differ either in shape or size, but they are in no degree proportionate, being from sixty to seventy feet in length, and not more than the thirtieth part in breadth. Some are employed in going from one island to another, and others used for fishing. There is also the Ivahah, which serves for war; these are by far the longest, and the head and stern are considerably above the body. These Ivahahs are fastened together side by side when they go to sea, at the distance of a few feet, by strong wooden poles, which are laid across them and joined to each side. A stage or platform is raised on the fore part, about ten or twelve feet long, upon which stand the fighting men, whose missile weapons are slings and spears. Beneath these stages the rowers sit, who supply the place of those who are wounded. The fighting Ivahahs are from thirty or forty to ten feet in length, and those for travelling have a small house fixed on board, which is fastened upon the fore part, for the better accommodation of persons of rank, who occupy them both day and night. The Pahies differ also in size, being from sixty to seventy feet long, they are also very narrow, and are sometimes used for fighting, but chiefly for long voyages. In going from one island to another they are out sometimes a month, and often at sea a fortnight or twenty days; and if they had convenience to stow more provisions, they could stay out much longer. These vessels are very useful in landing, and putting off from the shore in a surf, for by their great length and high stern they landed dry, when the English boats could scarcely land at all.

The chief parts or pieces of these vessels are formed separately without either saw, chissel, or any other iron tool, which renders their fabrication more surprising and worthy observation. These parts being prepared, the keel is fixed upon blocks, and the planks are supported with props, till they are sewed or joined together with strong plaited thongs, which are passed several times through holes bored with a chissel of bone, such as they commonly make use of, and when finished they are sufficiently tight without calking.

Their instruments of war are clubs, spears, and stones. They use their slings with great dexterity. They have likewise bows and arrows; but the arrows are of no other use than merely to bring down a bird, being headed only with a stone, and none of them

pointed. Their targets are of a semicircular form, made of wicker work and plaited strings of the cocoonut fibres, covered with glossy bluish green feathers, and ornamented with sharke's teeth curiously displayed.

The tools which these people make use of for building houses, constructing canoes, hewing stones, and for cleaving, carving, and polishing timber, consist of nothing more than an adze of stone, and a chissel of bone, most commonly that of a man's arm; and for a file or polisher, they make use of a rasp of coral and coral sand. The blades of their adzes are extremely rough, but not very hard; they make them of various sizes, those for felling wood weigh six or seven pounds, and others which are used for carving, only a few ounces; they are obliged every minute to sharpen them on a stone, which is always kept near them for that purpose. The most difficult task they meet with in the use of these tools, is the felling of a tree, which employs a great number of hands for several days together. The tree which is in general use is called Aoi, the stem of which is straight and tall. Some of the smaller boats are made of the bread-fruit tree, which is wrought without much difficulty, being of a light spongy nature. Instead of planes they use their adzes with great dexterity. Their canoes are all shaped with the hand, the Indians not being acquainted with the method of warping a plank.

They are remarkable swimmers. It is related that on a part of the shore where a tremendously high surf broke, inasmuch that no European boat could live, and the best swimmer in Europe could not preserve himself from drowning, if by any accident he had been exposed to its fury, ten or eleven Indians were swimming here for their amusement. If a surf broke near them, they dived under it and rose again on the other side. They availed themselves greatly of the stern of an old canoe, which they took before them and swam out with it as far as the outermost beach, when two or three getting into it and turning the square end to the breaking wave, were driven towards the shore with incredible rapidity, sometimes almost to the beach; but generally the wave broke over them before they got half way, in which case they dived and rose on the other side with the canoe in their hands, and swimming out with it again, were again driven back. During this arduous effort, none of the swimmers attempted to come on shore, but seemed to enjoy the sport in the highest degree. A bead intended to have been dropped into a canoe, having accidentally fallen into the sea, a little boy about six years old jumped immediately overboard, and, diving after it, recovered his jewel. Our officers, to encourage the child, dropped more beads, which excited the desire of a number of both sexes of the natives to amuse the strangers with their feats in the water; they dived, and not only brought up several beads scattered at once, but likewise large nails, which from their weight descended quickly to a considerable depth. Swimming

seems to be familiar to both sexes from the earliest childhood, and the pliancy of their limbs and easy positions in the water were most amazing, and seemed to indicate that they were a kind of amphibious creatures.

Among many articles of traffic, feathers became of the highest value with the women, and of course objects which attracted their particular attention. They filed them *Ossa*, and they seem to have been prized equal to jewels in Europe.

The most attractive were those called *coravine*, which grow on the head of the green parroquet, and the natives soon became judges competent to distinguish the superior from the inferior sorts. Our people endeavoured to impose dyed feathers upon them for those of a genuine colour; but all their arts of deception were abortive. The rage for the possession of feathers became boundless, and they were the wages of the females favours in general; nor did even husbands seem to discountenance them in throwing out allurements to our countrymen to obtain possession of them. To such a degree of phrenzy did their desire for this article prevail, that a single little feather was preferred to a bead or a nail, and a very small piece of cloth closely covered with them was received with a rapture of delight equal to any that could be excited in the mind of an European on the presentation of a diamond of the first magnitude. Their warriors exchanged their very helmets for red feathers, and the sailors purchased targets innumerable with them.

Their curious and singular mourning dresses, which formerly had been prized so highly, were disposed of when feathers became the objects of barter. Captain Cook presented one of these mourning dresses to the British Museum.

The islanders also at this time discovered great inclination for baskets, clubs, and painted cloth, and were excessively taken with the mats of Tongataboo, though, in general, they resemble those of their own manufacture. Our people, however, availed themselves of this disposition, and imposed on them, under another name, the very mats they had formerly purchased at Otaheite, and they had more success in this deception, than in the imposition of dyed feathers.

The natives here live to an advanced age, without being much incommoded by infirmities, retain their intellectual powers, and preserve their teeth to the last. Mons. de Bougainville, the French navigator often referred to, describes an old man, who had no other trait of age than that venerable one which is imprinted on a fine figure. Silver locks and a white beard adorned his head. His body was nervous and his flesh solid. He had neither wrinkles or any other tokens of decrepitude. This man, however, so respectable in appearance, seemed averse to the society of strangers: he was totally regardless of their caresses, and gave no indications of fear, astonishment, or curiosity. Those objects that excited the rapture of the multitude had

no charms for him; he accounted them batibles: from which consideration it appeared that his mind was as found and unimpaired as his body.

The same navigator relates, that his people found upon this island five or six men of most singular appearance. Their skins were of a dead white like the nose of a white horse, scurfy, covered with a kind of down, and of a hue that could not admit of being termed complexion. The hair on their heads, eyebrows, and beards, were of the same dead white: they had eyes resembling those of a ferret, and were remarkably near sighted. They were, upon the whole, considered as being of no particular race of mankind, nor did they appear to propagate beings similar to themselves.

In this island marriages do not come under the cognizance or sanction of the priests, being merely secular contracts, abstracted from any solemn tie, or formal ceremony. But if the priests are deprived of the benefits that might result from marriages, if under the list of their functions, they are amply compensated by an exclusive right to perform the ceremony of tattooing, which being universally adopted must be very lucrative, and furnish them with all the luxuries of life. The males in general undergo a kind of circumcision, which they intimate as done from a principle of cleanliness: however, it is deemed a foul disgrace not to submit to it. The performance of this ceremony is likewise the exclusive right of the priests.

As to their religion, it is very mysterious; and as the language adapted to it was different from that which was spoken on other occasions, our voyagers were not able to gain much knowledge of it. All the information they could obtain in regard to this particular was, that the natives imagined every thing in the creation to proceed from the conjunction of two persons. One of these (which they consider as the first) they call *Taroaitheetoomo*, and the other *Tapapa*; and the year which they call *Tettowmatatayo*, they suppose to be the daughter of these two. They also imagine an inferior sort of deities, known by the name of *Eatooas*, two of whom, they say, formerly inhabited the earth, and they suppose that the first man and woman descended from them. The Supreme Being they style, "The Cauler of Earthquakes;" but more frequently address their prayers to *Tane*, whom they conceive to be a son of the first progenitors of nature. They believe in the existence of the soul in a separate state, and suppose that there are two situations differing in the degrees of happiness, which they consider as receptacles for different ranks, but not as places of rewards and punishments. Their notion is, that the chiefs and principal people will have the preference to those of lower ranks; for as to their actions they cannot conceive them to influence their future state, as they believe the deity takes no cognizance of them.

firmly asserted, on the he took with him to France,

France, that human sacrifices constitute a part of the religious ceremonies of the people of Otaheite; therefore, Captain Cook, desirous of having further information concerning so interesting a matter, went to a morai, or place of worship (which we shall describe in course) accompanied by captain Furneaux of the Adventure, having with them a seaman who spoke the language tolerably well, and several of the natives. Observing in the morai a kind of bier with a shed erected over it, on which lay a corpse and some provisions, inquiry was made if the plantains were for the Eatooa or Divinity, and if they sacrificed to him hogs, dogs, fowls, &c. To all this a native replied in the affirmative. On inquiry being made whether they sacrificed men to the Eatooa, the answer was *taato eno*, “bad man,” first *tipariby*, beating them till they were dead. When the question was put, If good men were put to death in this manner? the reply was in the negative. Being asked whether Towtows, that is, men of the lowest class, were ever thus sacrificed, if good men? a native replied in the negative, repeating the words *taato eno*, or bad men. It appeared, from what could be gathered upon this occasion, that men, for certain crimes, were condemned to be sacrificed to the Deity, provided they did not possess any property to purchase their redemption.

The following is a circumstantial account of the sacrifice at which Captain Cook was present. Having asked permission to be a spectator, which was readily granted, he repaired to Attahooroo, where the ceremony was to be performed. Being arrived there with many others, Otoo desired that the sailors might be ordered to continue in the boat; and that the persons present would take off their hats as soon as they should come to the morai. To this they immediately proceeded, followed by numbers of men and some boys; but not one woman was present. They found four priests with their assistants waiting for them, and on their arrival the ceremonies commenced. The dead body or sacrifice was in a small canoe that lay on the beach fronting the morai. Two of the priests, with several of their attendants, were sitting by the canoe that lay on the beach; the others at the morai. The company stopped at the distance of 20 or 30 paces from the priests. Here Otoo placed himself; the European visitors and a few others standing by him, while the bulk of the people were removed to a greater distance. The ceremonies now commenced. One of the assistants of the priests brought a young plantain tree, and laid it down before the king. Another approached, bearing a small tuft of red feathers, twitted on some fibres of the cocoa-nut husk, with which he touched one of Otoo's feet, and afterwards retired with it to his companions. One of the priests who were seated at the morai then began a long prayer, and at particular times sent down young plantain trees, which were placed upon the sacrifice. During this prayer, one of the natives who stood by the officiating priest, held in his hands two bundles, in one of which, as was afterwards found, was the royal

maro; and the other, if it may be allowed the expression, the ark of the Eatooa. The prayer being finished, the priests at the morai, with their assistants, went and sat down by those who were upon the beach, carrying the two bundles with them. They here renewed their prayers; during which the plantain-trees were taken, one by one, at various times, from off the dead body, which, being wrapped up in cocoa-leaves and small branches, was now taken out of the canoe and laid upon the beach. The priests placed themselves round it, some standing, and others sitting; and one or more of them repeated sentences for about ten minutes. The body was now stripped of the leaves and branches, and placed parallel with the sea-shore. Then one of the priests standing at the feet of the corpse, pronounced a long prayer, in which he was joined occasionally by others, each of them holding a tuft of red feathers in his hand. While this prayer was repeating, some hair was pulled off the head of the intended sacrifice, and the left eye was taken out; both which being wrapped in a green leaf, were presented to the king, who, however, did not touch them, but gave to the man who brought them to him the tuft of red feathers which he had received from Towha who was related to the king and chief of the district of Tettaha. This, with the eye and hair, were taken to the priests. Not long after this the king sent them another bunch of feathers.

In the course of this last ceremony, a king-fisher making a noise, Omai said to Captain Cook, “That is the Eatooa;” and he seemed to consider it as a favourable prognostic. The corpse was then carried a little way, and laid under a tree, near which were fixed three thin pieces of wood neatly carved in various figures. The bundles of cloth were placed on a part of the morai; and the tufts of red feathers were laid at the feet of the dead body, round which the priests stationed themselves; and our people were at this time permitted to go as near as they pleased. He who seemed to be the chief priest spoke for about a quarter of an hour, with different tones and gestures; sometimes appearing to expostulate with the deceased, at other times asking several questions; then making various demands, as if the dead body had power himself, or interest with the deity, to engage him to grant such request; among which, he desired him particularly to deliver Eimeo, Maheine its chief, the women, hogs, and other things of the island into their hands; which was, indeed, the express object of the sacrifice. He then prayed near half an hour, in a whining tone, and two other priests joined in the prayer, in the course of which one of them plucked some more hair from the head of the corpse, and put it upon one of the bundles. The high priest now prayed alone, holding in his hand the feathers received from Towha. Having finished, he gave them to another priest, who prayed in like manner; then all the tufts of feathers were placed upon the bundles of cloth, which concluded

the ceremony at this place. The dead body was now carried to the most conspicuous part of the morai, with the feathers, and the two bundles of cloth, while the drums beat slowly. The feathers and bundles were laid against a pile of stones, and the body at the foot of them. The priests having again seated themselves round the corpse, renewed their prayers, while some of their assistants dug a hole about the depth of two feet, into which they threw the victim, and covered it over with stones and earth. While they were depositing the body in the grave, a boy squeaked aloud, upon which Omai told the captain, it was the Eatooa. In the mean time, a fire having been made, a lean dog, half starved, was produced, and killed by twisting the neck. The hair was then singed off, and the entrails being taken out, they were thrown into the fire, and left there to be consumed; but the kidney, heart, and liver, were baked on heated stones. The carcase, after having been rubbed over with the blood of the animal, was, with the liver, &c. laid down before the priests, who were seated round the grave praying. They, for some time, uttered ejaculations over the dog, while two men, at intervals, beat very loud on two drums; and a boy screamed in a loud shrill voice three times. This, they said, was to invite the Eatooa to feast on the banquet, that they had prepared for him. When the priests had finished their prayers, the body, heart, liver, &c. of the dog, were placed on a whatta, or scaffold, about six feet in height, on which lay the remains of two other dogs, and of two pigs, that had been lately sacrificed. The priests and their attendants now gave a shout, and this proclaimed the ceremonies ended for the present.

As it grew towards evening, the English were conducted to a house belonging to Patatou, where they were entertained and lodged for the night. Having been informed, that the religious rites were to be renewed the next day, they could not quit the place while any thing remained to be seen.

Early in the morning they repaired to the scene of action; and soon afterwards a pig was sacrificed, and laid upon the same scaffold with the others. About eight o'clock Otoo took our party to the morai, where the priest and a great multitude of people were by this time assembled. The two bundles occupied the place where they had been deposited the preceding evening; the two drums were in the front of the morai, and the priests were stationed beyond them. The king placed himself between the drums, and desired Captain Cook to stand by him. The ceremony commenced with bringing a young plantain tree, and laying it at the king's feet. A prayer was then repeated by the priests, holding in their hands several tufts of red, and a plume of ostrich feathers; which the commodore had presented to Otoo on his first arrival.

When the priests had ended the prayer, they changed their station, and placed themselves between our party and the morai. One of them, the same who had performed the principal part the preceding day,

began another prayer, which continued near half an hour. During the prayer, the tufts of red feathers were put, one by one, upon the ark of the Eatooa. Not long after, four pigs were produced, one of which was killed immediately, and the three others were taken to a neighbouring sty.

The maro with which the natives invest their kings, was contained in one of the bundles. When taken out of the cloth, it was spread on the ground at full length before the priests. It is a girdle about fifteen feet in length, and one foot and a quarter in breadth, and is probably put on in the same manner as the common maro, or piece of cloth, used by these islanders to wrap round the waist. It was ornamented with yellow and red feathers; but principally with the former. One end of it was bordered with eight pieces, about the size and figure of a horse-shoe, whose edges were fringed with black feathers; the other end was forked, having the points of various lengths. The feathers were ranged in two rows, in square compartments, and produced a pleasing effect. They had been first fixed upon some of the cloth of the island, and then sewed to the upper part of the pendant, which Captain Wallis had left flying on shore, the first time of his arrival at Matavai. The priests pronounced a long prayer, relative to this part of the ceremony; and after it was ended, the badge of royalty was folded up with great care, and put into the cloth. The other bundle, already mentioned under the name of the ark, was next opened at one end; but our party were not permitted to approach near enough to examine its mysterious contents. The intelligence they obtained respecting its contents was, that the Eatooa (or rather, what is supposed to represent him) was concealed therein.

The twisted fibres of the husk of the cocoa-nut compose the sacred repository, and its figure is nearly circular, with one end considerably thicker than the other. The pig that had been killed, was by this time cleaned, and its entrails taken out. These happened to have many of those convulsive motions which frequently appear, in different parts, when an animal is killed; and this was considered as a very favourable omen. After having been exposed for some time, the entrails were carried and laid down before the priests, one of whom closely inspected them, turning them for this purpose gently with a stick. Having been sufficiently examined, they were thrown into the fire. The sacrificed pig, and its liver, heart, &c. were now put upon the scaffold where the dog had been deposited; and then all the feathers, except the ostrich-plume, being enclosed in the ark, an end was put to the whole solemnity.

Four double canoes remained upon the beach all the time, before the place of sacrifice. A small platform, covered with palm leaves, fastened in mysterious knots, was fixed on the fore-part of each of those canoes; and this also is called a morai. Some plantains, cocoa-nuts, bread-fruit, fish, and other articles, lay upon each

each of these naval morais. The natives said, that they belonged to the Eatooa, and that they were to attend the fleet sent out against Eumaio.

The unfortunate victim offered on this occasion was, to appearance, a middle-aged man, and one of the lowest class of the people; but it did not appear that they had fixed upon him on account of his having committed any particular crime that deserved death. It is certain, however, that they usually select such guilty persons for sacrifices, or else vagabonds, who have no visible way of procuring an honest livelihood. Having examined the body of the unhappy sufferer, now offered up as the object of these people's adoration, our party observed, that it was bloody about the head, and much bruised upon the right temple, which denoted the manner in which he had been killed; and they were informed, that he had been knocked on the head with a stone. The wretches who are devoted on these occasions, are never previously apprised of their fate. Whenever any one of the principal chiefs conceives a human sacrifice necessary, on any great emergency, he fixes upon the victim, and then dispatches some of his trusty servants, who fall upon him suddenly, and either stone him to death, or beat out his brains with a club. The king is then acquainted with it, whose presence is said to be absolutely necessary at the solemn rites that follow; and, indeed, in the late performance, Otoo bore a capital part. The solemnity itself is called Poore Eree, or the prayer of the chief: and the victim is termed Taata-taboo, or consecrated man. The morai, where the late sacrifice was offered, is always appropriated for the burial of the king of the whole island, and likewise of his family, and some other persons of distinguished rank. It differs little, except in extent, from the common morais. Its principal part is a large oblong pile of stones, about thirteen feet in height, and contracted towards the top, with a quadrangular area on each side, loosely paved with pebbles, under which the bones of the chiefs are deposited. Towards the end nearest the sea, is the place of sacrifice, where is a very large whatta, or scaffold, on which the offerings of fruits and other vegetables are placed; but the animals are laid on a smaller one, and the human sacrifices are interred under the pavement. There are several reliques scattered about this place; such as small stones raised in several parts of the pavement; some with bits of cloth fastened round them, others entirely covered with it; and upon the side of the large pile fronting the area, are a great number of pieces of carved wood, in which their gods are supposed to reside occasionally.

There is an heap of stones at one end of the large scaffold, with a sort of platform on one side. On this are deposited all the skulls of the human sacrifices, which are taken up after they have remained under ground for some months. Just above them many of the carved pieces of wood are placed; and here the Maro, and the other bundle, supposed to contain the god Ooro, were laid during the celebration of the late solemn rites.

This barbarous custom of offering human sacrifices most probably prevails in all or most of the islands of the Pacific Ocean, however distant from each other some of them may be. And though it may be supposed, that not more than one person is offered at one time, either at Otaheite, or other islands, yet these occasions, in all probability, occur so frequently, as to make a terrible havoc of the human species; for no less than forty-nine skulls of former victims, were counted lying before the morai at Attahooroo; and as none of those skulls appeared to have suffered any considerable change or decay from the weather, it may be inferred, that only a short time had elapsed since the victims to whom they belonged had been offered.

Yet this horrible solemnity appeared not to impress any awe for their deity, such as they supposed him, nor any veneration for religion, upon the minds of the spectators; as this was far from being the case on the late occasion; for though a vast multitude had assembled at the morai, they shewed very little reverence for what was transacting; and Omai happening to arrive after the ceremonies had begun, many of the islanders thronged round him, and were engaged for the remaining part of the time in making him recount some of his adventures; to which they listened with great eagerness of attention, regardless of the solemn offices which their priests were then performing. Indeed, the priests themselves, except the one who sustained the principal part, either from their being familiarized to such objects, or from their reposing no great degree of confidence in the efficacy of their religious institutions, maintained very little of that solemnity, so necessary to give, even to acts of real devotion, their proper effect.

Their habit was but an ordinary one; they conversed together with great familiarity; and the only attempt they made to preserve decorum, was by exerting their authority, to prevent the populace from encroaching on the spot, and to suffer our party, as strangers, to come forward. They were, however, very candid in the answers which they gave to any interrogatories that were put to them, with regard to this inhuman institution. Being asked, what was the design of it? they replied, that it was an ancient custom, and highly pleasing to their god, who came and fed upon the sacrifices; in consequence of which, he granted their petitions. It was then objected, that he certainly did not feed on these, as he was neither seen to do it, nor were the bodies of the sacrificed animals soon consumed; and that as to the corpse of a human victim, they prevented his feeding on that by interring it. In answer to these objections, they observed, that he came in the night, invisibly, and fed only on the soul, or immaterial part, which (as these people say) remains about the place of sacrifice, till the carcase of the victim is wholly waited by putrefaction.

Besides this, among other savage customs, they adopt that of cutting out the jaw-bones of their enemies slain

in battle, which they carry about with them as trophies; and they, in some measure, offer up their bodies to the Eatooa: for after an engagement, in which they have come off victorious, they collect all the dead, and bring them to the morai, where, with great form and ceremony, they dig a large hole, and bury them all in it, as so many offerings to their divinities. But they treat in a different manner their own chiefs that fall in battle. A late king, Tootaha, Tubourai Tamaide, and another chief, who were slain in an engagement with those of Tiaraboo, were brought to the morai at Attahooroo; at which place the priests cut out their bowels before the great altar; and their dead bodies were afterwards interred in three different places near the great pile of stones above mentioned; and the common men who lost their lives in the battle, were all buried in one hole, at the foot of the same pile. This was performed the day after the battle, with much pomp and formality, amidst a numerous concourse of people, as a thanksgiving offered to the deity, for the victory they had obtained the preceding day. The vanquished, in the mean time, had taken refuge in the mountains, where they remained upwards of a week, till the fury of the victors began to abate. A treaty was then set on foot, by which it was agreed, that Otoo should be proclaimed king of the whole island; and the solemnity of investing him with the maro, or badge of royalty, was performed at the same morai, with great magnificence.

As the natives call their places of interment Morais, so likewise they do their places of worship. They approach these morais with awe and reverence; not, as it should seem, because they esteem any thing there sacred, but because they there worship an invisible being, for whom they entertain the profoundest respect, although not excited by the hope of reward, or the dread of punishment. They hold these cemeteries, or places of worship, so venerable, that the chiefs themselves, and their wives, on passing them, take their upper garments from their shoulders. The manner in which they bury their dead, and express their sorrow for the loss of relatives and friends departed, is thus described by the latest and most intelligent observers.

The corpse was placed in the open air, till the bones became quite dry. A shed was erected near the residence of the deceased; one end was left quite open; the other end and the two sides were partly enclosed with a sort of wicker-work. The bier was a frame of wood, like that on which the seamen's beds, called cots, are placed, with a matted bottom, and supported by four posts, at the height of above four feet from the ground. The body was covered first with a mat, and then with white cloth. By the side of it lay a wooden mace, one of the implements of war, and near the head of it cocoa-nut shells; at the other end a bunch of green leaves with some dried twigs, all tied together, were stuck in the ground, by which lay a stone as big as a cocoa-nut. Near these lay one of

the young plantain leaves that are used for emblems of peace, and close by it a stone axe. At the open end of the shed also hung a great number of palm nuts, in several strings; and without the shed was stuck up in the ground a stem of a plantain tree, about six feet high, upon the top of which was placed a cocoa-nut shell full of fresh water: against the side of one of these pots hung a small bag containing some bread-fruit ready roasted. The food thus placed by the corpse was designed as an offering to their deities.

Round about the spot where the body is placed they strew small pieces of cloth, on which the tears and blood of the mourners have been shed; for in their paroxysms of grief, it is an universal custom to wound themselves with a shark's tooth.

The mourning that is worn here is a head-dress of feathers, the colour of which is consecrated to death, and a veil over the face. The dress is called *Eeva*. The whole country is said to appear thus on the death of their king. The mourning for fathers is very long. The women mourn for their husbands; but not the husbands for their wives.

The island producing no commodities that can be converted to the purpose of foreign traffic, the main benefit that can accrue from a knowledge of it is the supplying of ships with refreshments in passing through the South-Seas: and certainly it might be rendered competently subservient to that desirable purpose, as such European productions, both animal and vegetable, as are conducive to the same, might be abundantly cultivated in so favourable a climate which must alike benefit the voyagers and the inhabitants of Otaheite.

CHAP. XVII.

SOCIETY-ISLANDS.

Situation, Number, and Extent. Their Soil and Productions. Various Incidents. Omai settled at Huahaine. Ship's Departure.

THE SOCIETY-ISLANDS, so called in honour of the Royal-Society, form a group of six in number, called Huahaine, Ulitea, Bolabola, Otaha, Tubai, and Morona. They are situate between 16 deg. 10 min. north, and 16 deg. 55 min. south latitude, and between 150 deg. 57 min. and 152 deg. of west longitude; and were discovered by Captain Cook, in the year 1769.

After the commander left Otaheite, in the Endeavour, having Tupia on board, he came in sight of Huahaine, lying in latitude 160 deg. 43 min. south, and 150 deg. 52 min. west longitude. It is divided into two peninsulas connected by an isthmus, which however is overflowed at high water. The appearance of the country is somewhat like that of Otaheite; but it seems to have suffered some shocks from volcanoes.

Though

Though several canoes made up towards the Endeavour, as she approached, yet none of the Indians would come along-side, till they received encouragement from Tupia, in whom they placed so much confidence, and who so far removed their fear, that the king and queen came on board. Almost every thing these people saw in the vessel, excited their astonishment; but it was remarked, that they made no inquiries after any other objects, than such as immediately presented themselves to their view, appearing to be entirely satisfied with what was shewn them, though they might reasonably have supposed that a building of such utility and extent as the ship, must have afforded many curiosities. The ceremony of exchanging names, generally considered as a mark of friendship in these islands, passed between the king, whose name was Oree, and Captain Cook.

Anchoring in a small but fine harbour, Captain Cook went on shore, accompanied by Mr. Banks and some other gentlemen, with Tupia and the king. Various ceremonies then passed between the king and our people, which were considered as a kind of ratification of a treaty between the English and the king of Huahine.

The level part of this island is very fertile, and abounds with bread-fruit and cocoa-nut trees; and its productions are more forward than those at Otaheite. The mountains here, and in the Society-Islands in general, continually attract the vapours from the atmosphere, and many rivulets descend from the broken rocks into the plain, so that they are supplied with plenty of water.

The islanders take great pains with the cultivation of their cloth-tree, having drains made through beds of earth to draw off the water, and the sides neatly built up with stones; and in the drains they plant the *arum*, which yields the yam they call *tatoe*.

When the commander left this island, he presented the king with a small plate of pewter, on which was inscribed, "His Britannic Majesty's ship Endeavour, Lieutenant Cook, Commander, 16th July 1769."

Many of the younger men of the natives, during the stay of the ship at this island, voluntarily offered to take their passage with the commander for England. From the whole he singled out one, called by some, Oedidee, by others, Mahine. This youth was a native of Bolabola, and a near relation of O-Poony, the king of that island, and conqueror of several adjacent ones. He is described as possessing mental and personal accomplishments, which endeared him to the people in general on board the ship.

Arriving in 62 degrees south latitude, Mahine expressed his surprise at several little snow and hail showers on the preceding days, such phenomena being utterly unknown in his country. The appearance of white stones, which melted in his hand, was altogether miraculous in his eyes; and though pains were taken to explain to him that cold was the cause of their for-

mation, his ideas on that subject did not seem to be very clear. A very heavy fall of snow surprised him more than ever; and after long consideration of its singular qualities, he said he would call it white rain when he got back to his own country. In fine, it was with difficulty he was persuaded to believe that snow and ice were only fresh water, till he was shewn some congealed in a cask on the deck. He still, however, declared that he would call this 'the white land,' by way of distinguishing it from all the rest.

He had collected a number of little slender twigs, which he carefully tied in a bundle, and made use of instead of a journal: for every island he had seen and visited after his departure from the Society-Islands, he had selected a little twig, so that his collection, by this time, amounted to about nine or ten, of which he remembered the names perfectly well, in the same order as he had seen them; and the white land, or *whennua teatea*, was the last. He inquired frequently how many other countries they should meet with in their way to England, and formed a separate bundle of them, which he studied with equal care.

Having crossed the antarctic circle, where the sun scarce sunk below the horizon, Mahine was struck with the greatest astonishment at this appearance, and could scarcely believe his senses; all the endeavours used to explain it to him miscarried, and he assured the gentlemen, that he despaired of finding belief among his countrymen, when he should go back to recount the wonders of congealed rain, and of perpetual day.

The approach of winter led Captain Cook once more to seek the refreshments of milder climes, and therefore determining on a visit to these islands, he made Otaheite in his passage, where Mahine met with several of his relations, and married the daughter of a chief of the district of Matavia. The ceremony performed on this occasion was not observed by any of the ship's company, who could convey any kind of idea of it: only a petty officer, who was present, reported, that a number of ceremonies were performed which were extremely curious, but could not relate any one of them, so that this interesting particular, respecting the manners of these people, remains entirely unknown. Mahine embarked with Captain Cook, leaving, as supposed, his new-married wife behind him.

He would willingly have proceeded for England, had he had the least hopes given him of ever returning to his native home; but, as Captain Cook could not promise, or even suppose, that more English ships would be sent to these islands, Mahine chose to remain in his native country; but he left the ship with regret, fully demonstrative of the esteem he bore to the English.

The greatest anguish appeared in this young man's breast when he went away. He looked up at the ship, burst into tears, and then sunk down into the canoe. Just as he was going out of the ship, he made a request

to.

to Captain Cook, with which he complied, and then gave him a certificate of the time he had been on board, and recommended him to the notice of those who might touch there after him.

When Captain Cook visited this island on his second voyage with the *Resolution* and *Adventure* under his command, the former anchored in twenty-four fathoms water, but the latter got on shore on the north side of the channel, though she was happily got off again without receiving any damage. The natives received our people with the utmost cordiality.

Captain Cook was informed that Oree was still alive, and waited to see him. The commanders, with others, went to the place appointed for the interview. The chief had carefully preserved the piece of pewter, with an inscription on it, which Captain Cook had presented him with in 1769, together with a piece of counterfeit English coin, which, with a few beads, were all in the same bag the captain made for them; these the chief sent on board. This part of the ceremony being over, our party were desired by their guide to decorate three young plantain trees with nails, looking-glasses, beads, medals, &c. With these in their hands they landed, and were conducted through the multitude. They were directed to sit down a few paces before the chief, and the plantains were laid one by one before him. They were told that one was for the Deity, another for the king, and a third for friendship. This being done, the king came to Captain Cook, fell on his neck, and kissed him. A great effusion of tears fell down the venerable cheeks of this old man, which appeared such as spoke the language of the heart. Presents were made to all his attendants and friends. Captain Cook regarded him as a father, and therefore presented him with the most valuable articles he had.

Going on shore after breakfast, the commander heard that one of the inhabitants had been very insolent and troublesome. The man was shewn to him, equipped in his war habit, with a club in each hand. The captain took these from him, as he perceived him bent on mischief, broke them before his face, and obliged him to retire. Being informed that this man was a chief, he became a little suspicious of him, and sent for a guard. About this time a gentleman had gone out to collect plants alone; two men assaulted him, and stripped him of every thing but his trowers; luckily they did him no harm, though they struck him several times with his own hanger. They made off when they had done this, and another of the natives brought a piece of cloth to cover him. This gentleman presently appeared at the trading-place, where a number of the natives were assembled, who fled at seeing him. Captain Cook persuaded some of them to return, assuring them that none should suffer who were innocent. When the king heard this complaint, he and his companions wept bitterly; and as soon as his grief was alluaged, he made a long harangue to the

people that had returned, telling them the baseness of such actions, when the captain and his crew had always behaved so well to them. He then took a very particular account of all the things the gentleman had lost, and pronounced they should be returned, if it was in his power to find them. After this, he desired Captain Cook to follow him to the boat, but the people being apprehensive of his safety, used every argument to dissuade him from it. It is impossible to describe the grief they expressed in the entreaties they used; every face was bedewed with tears, and every mouth was filled with the most dissuasive arguments. Oree was deaf to them all, and insisted on going with the captain; when they both were in the boat, he desired it might be put off. The only person who did not oppose his going, was his sister, and she shewed a magnanimity of spirit equal to her brother.

Peace was now perfectly re-established, provisions poured in from all quarters, the gentleman's coat and hanger were returned, and thus ended these troublesome transactions.

The Captains Cook and Furneaux went to pay their farewell to Oree, and presented him with things both valuable and useful. They also left him a copper-plate with this inscription, "Anchored here his Britannic Majesty's ships *Resolution* and *Adventure*, September 1773." Having traded for such things as were wanted, they took their leave, which was very affectionate. On returning to the ships, they were crowded, with canoes filled with hogs, fowls, &c. Soon after they were on board, the king came and informed them that the robbers were taken, and desired them to go on shore in order to behold their exemplary punishment. This they would have done, but were prevented by the *Adventure's* being out of the harbour, and the *Resolution* under sail. Oree staid with them till they were near two miles out at sea, and then, after taking another affectionate leave, parted. During their short stay at the small but fertile island of Huaheine, they procured upwards of 300 hogs, besides fowls and fruit in great abundance.

The *Resolution* and *Discovery*, on Captain Cook's third voyage, anchored on the 12th of October 1777, at the northern entrance of Owhere harbour, situated on the west side of this island. Omai, in his canoe, entered the harbour just before them, but did not land; and though many of his countrymen crowded to see him, he did not take much notice of them. Great numbers also came off to the ships, insomuch that they were greatly incommoded by them.

The next morning, all the principal people of the island repaired to the European ships, agreeable to the wishes of the commodore, as it was now time to settle Omai, and he supposed that the presence of these chiefs would enable him to effect it in a satisfactory manner. But Omai now seemed inclined to establish himself at Ulitea; and if he and Captain Cook could have agreed with respect to the mode of accomplishing that

design, the latter would have consented to adopt it. His father had been deprived by the inhabitants of Bolabola, when they subdued Ulitea, of some land in that island; and the captain hoped he should be able to get it restored to the son without difficulty. For this purpose, it was necessary that Omai should be upon friendly terms with those who had become masters of the island; but he would not listen to any such proposal, and imagined that the captain would make use of force to reinstate him in his forfeited lands.

This prepossession preventing his being fixed at Ulitea, the captain began to consider Huaheine as the more proper place, and therefore determined to avail himself of the presence of the chief men of that island, and propose the affair to them.

The ships were no less crowded with hogs, than with chiefs, the former being poured in faster than the butchers and salters could dispatch them. Indeed, for several days after arrival, some hundreds, great and small, were brought on board; and, if any were refused, they were thrown into the boats and left behind.

The captain prepared to make a visit in form to Taireetareea, the Earee rahie, or then reigning king of the island. Omai, who was to accompany him, dressed himself very properly on the occasion, and provided a handsome present for the chief himself, and another for his Eatooa. Their landing drew most of the visitors from the ships, so that the concourse of people became very great.

When the king appeared, his presence might have been dispensed with, as his age did not exceed ten years. Omai, who stood at a little distance from the circle of great men, began with making his offerings to the gods, which consisted of cloth, red feathers, &c. Another offering succeeded, which was to be given to the gods by the young chief; and after that, several other tufts of red feathers were presented. The different articles were laid before the priest, being each of them delivered with a kind of prayer, which was spoken by one of Omai's friends, though in a great measure dictated by himself. In these prayers he did not forget his friends in England, nor those who had conducted him safe back to his native country. The Earee rahie of Pretanne (king of Great-Britain), the Earl of Sandwich, Toote (Captain Cook), Tatee (Captain Clerke), were mentioned in every one of them. These offerings and prayers being ended, the priest took each of the articles in order, and, after repeating a concluding prayer, sent every one of them to the morai.

After the performance of these religious rites, Omai seated himself by the captain, who bestowed a present on the young prince, and received another in return. Some arrangements were then agreed upon, relative to the mode of carrying on the intercourse between our people and the natives. The establishment of Omai was then proposed to this assembly of chiefs. They

were informed, that the English had conveyed him into their country, where he was well received by the great king of Pretanne, and his Earees; and had been treated, during his whole stay, with all the marks of regard and affection; that he had been brought back again, enriched with a variety of articles, which, it was hoped, would be highly beneficial to his countrymen; and that, besides the two horses which were to continue with him, many other new and useful animals had been left at Otaheite, which would speedily multiply, and furnish a sufficient number for the use of all the neighbouring islands. They were then given to understand, it was the commodore's earnest request, that they would give his friend Omai, a piece of land, upon which he might build a house, and raise provisions for himself and family; adding, that if he could not obtain this at Huaheine, either by donation or purchase, he was resolved to carry him to Ulitea, and settle him there.

This conclusion seemed most to gain the approbation of all the chiefs; and the reason was obvious. Omai had flattered himself, that the captain would use force in restoring him to his father's possessions in Ulitea; and he had vaunted himself on this subject among some chiefs, at this meeting, who now expected that they should be assisted by our people in an invasion of Ulitea, and driving the Bolabolans out of that island.

But as it was proper that they should be undeceived in this particular, the captain, with this view, signified to them, in the most decisive manner, that he would neither give them any assistance in such an enterprize, nor even suffer it to be put in execution, while he remained in their seas; and that, if Omai established himself in Ulitea, he should be introduced as a friend, and not forced upon the people of Bolabola as their conqueror. This declaration gave a new turn to the sentiments of the council; one of whom expressed himself to this effect: that the whole island of Huaheine, and whatever it contained, were Captain Cook's, and therefore he might dispose of what portion he pleased to his friend: but, though Omai seemed much pleased at hearing this, he desired them to mark out the spot, and likewise the exact quantity of land, which they intended to grant for the settlement. Upon this, some chiefs, who had retired from the assembly, were sent for, and after a short consultation the commodore's request was unanimously complied with, and the ground immediately fixed upon, adjoining to the house where the present meeting was held. It extended along the shore of the harbour near two hundred yards; its depth, to the bottom of the hill, was somewhat more; and a proportionate part of the hill was comprehended in the grant.

Captain Cook rode with Omai on horseback, to give him an air of consequence, followed by the natives, who, attracted by the novelty of the sight, flocked from the most remote parts of the island to be spectators.

The affair being settled between the commodore and the chief, the carpenters and calkers were ordered on shore to erect a house for Omai, wherein he might secure the various European commodities that he had in his possession: at the same time others of our people were employed in making a garden for his use, planting vines, shaddocks, melons, pine-apples, and the seeds of various kinds of vegetables; all which were in a flourishing state before their departure from the island.

Omai began now to pay a serious attention to his own affairs, and heartily repented of his ill-judged prodigality at Otaheite. He was now the only rich man in the kingdom; and master of an accumulated quantity of a species of treasure, which his countrymen could not create by any art or industry of their own. It was natural, therefore, to imagine, that while all were desirous of sharing this envied wealth, all would be ready to join in attempts to strip its sole proprietor. As the most likely means of preventing this, Captain Cook advised him to distribute some of his moveables among two or three of the principal chiefs; who, on being thus gratified, might be induced to favour him with their patronage, and shield him from the injuries of others. Omai promised to follow this advice, and before our people sailed, this prudent step was taken. The captain, however, not confiding wholly in the operations of gratitude, had recourse to the more forcible and effectual motive of intimidation, taking every opportunity of notifying to the inhabitants that it was his intention to make another visit to their island, after having been absent the usual time; and that if he did not find his friend in the same state of security in which he should leave him at present, all those who had been his enemies might expect to become the objects of his resentment.

The intercourse of trade and friendly offices between the English and the inhabitants of Huaheine was interrupted; for, in the evening, one of them found means to get into Mr. Bayley's observatory, and carry off a sextant unobserved. Captain Cook was no sooner informed of this theft, than he went ashore, and desired Omai to apply to the chiefs to procure restitution. He accordingly made application to them, but they took no steps towards recovering the instrument, being more attentive to a beeva that was then exhibiting, till the captain ordered the performers to desist. Being now convinced he was in earnest, they began to make some inquiry after the delinquent, who was sitting in the midst of them, with such marks of unconcern, that the captain was in great doubt of his being guilty, particularly as he denied it. Omai assuring him this was the person, he was sent on board the *Resolution*, and put in irons. This raised a great disturbance among the islanders, and the whole body fled with precipitation. The prisoner being examined by Omai, was with some difficulty brought to confess where he had concealed the sextant, and it was brought back unhurt the

next morning. After this, the natives recovered from their consternation, and began to gather about the English as usual.

As the thief appeared to be a shameless villain, the commodore punished him with greater severity than he had ever done any former culprit; for, besides having his head and beard shaved, he ordered both his ears to be cut off, and his eye-brows to be stayed, than which no punishment could have subjected him to greater disgrace. In this bleeding condition he was sent on shore, and exposed as a spectacle to intimidate the people from meddling with what was not their own. The natives looked with horror upon the man, and it was easy to perceive that this act gave them general disgust: even Omai was affected, though he endeavoured to justify it, by telling his friends, that if such a crime had been committed in the country where he had been, the thief would have been sentenced to lose his life. But, how well soever he might carry off the matter, he dreaded the consequences to himself, which, in part, appeared a few days afterwards.

A report being spread that one of our goats had been stolen by the before-mentioned thief; and though, upon examination, every thing was found safe in that quarter, yet it appeared that he had destroyed and carried off from the grounds of Omai several vines and cabbage plants; that he had publicly threatened to put him to death, and to set fire to his house as soon as his European friends should quit this place. To prevent his doing any further mischief, the captain ordered him to be seized, and confined again on board the ship, with a view of carrying him off the island; and this intention seemed to give general satisfaction to all the chiefs. He was a native of Bolabola; but there were too many of the people here ready to cooperate with him in all his designs.

Their Earee rahie was but a child; and it was not observed that there was an individual; or any set of men, who held the reins of government for him; so that whenever any misunderstanding occurred between the English and the natives, they never knew properly to whom it was necessary to apply, in order to effect an accommodation, or procure redress. Early in the morning, five days after his imprisonment, the Bolabola-man found means to escape from his confinement, and out of the ship, carrying with him the shackle of the bilboe-bolt that had been put about his leg, which was taken from him as soon as he arrived on shore, by one of the chiefs, and given to Omai, who went with all expedition on board the ship, to inform the captain, that his mortal enemy was again let loose upon him.

Indeed our people were pleased at hearing that the delinquent who escaped had gone over to Ulitea; but it was thought by some he only intended to conceal himself till their departure, when he would revenge the supposed indignity by open or secret attacks upon

Omai,

Omai, whose house being nearly finished, many of his moveables were carried on shore. Among other articles was a box of toys, which greatly pleased the gazing multitude; but as to his plates, dishes, drinking mugs, glasses, &c. scarce one of his countrymen would even look at them. Omai himself began to think, that they would be of no service to him; that a baked hog was more savory than a boiled one; that a plantain leaf made as good a dish or plate as pewter; that a cocoa-nut shell was as convenient a goblet as one of our mugs. He therefore disposed of most of those articles of English furniture among the crew of the ships; and received from them in return, hatchets, and other implements, which had a more intrinsic value in this part of the world. Among the numerous presents bestowed upon him in England, fireworks had not been omitted; some of which were now exhibited, before a great number of people, who beheld them with a mixture of pleasure and fear. Those that remained were put in order, and left with Omai, on the island.

Preparations were now made for departure from Huahine, and every thing taken off from the shore except a goat big with kid, a horse and a mare, which were left in the possession of Omai, who was now to be finally separated from his English friends. They gave him also a boar and two sows, of the English breed; and he had two sows of his own. The horse had covered the mare at Otaheite; so that the introduction of a breed of horses into these islands has probably succeeded by this valuable present.

Omai's European weapons consisted of a fowling-piece, two pair of pistols, several swords, cutlasses, a musket, bayonet, and a cartouch box. After he had got on shore whatever belonged to him, he frequently invited the two captains, and most of the officers of both ships, to dine with him; on which occasions his table was plentifully spread with the best provisions that the island could afford. He went through the fatigues of the day better than could have been expected from the dependancy that appeared in his countenance, when first the company began to assemble. Perhaps his awkward situation, between half Indian and half European preparations, might contribute not a little to embarrass him; for having never before made an entertainment himself, though he had been a partaker at many, both in England and in the islands, he was yet at a loss to conduct himself properly to so many guests, all of them superior to himself in point of rank, though he might be said to be superior, in point of fortune, to most of the chiefs at his table.

Nothing, however, was wanting to impress the inhabitants with an opinion of his consequence. The drums, trumpets, bagpipes, hautboys, flutes, violins, in short, the whole band of music attended, and took by turns to play while dinner was getting ready; and when the company were seated, the whole band joined in full concert, to the admiration of crowds of

the inhabitants, who were assembled round the house on this occasion.

The dinner consisted, as usual, of the various productions of the island, barbecued hogs, fowls dressed, some after the manner of the country, and some after the English fashion, with plenty of wine and other liquors, with which two or three of the chiefs made very free. When the dinner was over, heivas and fireworks succeeded; and when night approached, the multitudes that attended as spectators, dispersed without the least disorder.

Before they set sail, the commodore caused the following inscription to be cut in the front of Omai's house:

Georgius tertius, Rex, 2 Novembris, 1777.

*Navis { Resolutiun, Jac. Cook, Pr.
Discovery, Car. Clerke, Pr.*

Having thus executed his main design, he took advantage of an easterly breeze, and sailed out of Owharre harbour. Our people had procured more than 400 hogs on this island.

It was agreed upon, that immediately after the departure of the ships, Omai should erect a spacious house, after the fashion of his own country; and the chiefs of the island promised to contribute their assistance. Many of the natives continued on board till the vessels were under sail; when the captain, to gratify their curiosity, ordered five of the great guns to be fired. They then all departed except Omai, who remained till the ships went out to sea.

He then went on shore in a boat, and took a very affectionate and final leave of the captain, never to see him more. On this occasion he gave him his last instructions how to act, directing him to send his boat to Ulitea, to acquaint him with the behaviour of the chiefs in the absence of the ships, which he was to signify by particular and private tokens. He had endeavoured to prevail on Captain Cook to let him return to England, which made his parting with him and our officers the more affecting. If tears could have prevailed on the commander to let him return, Omai's eyes were never dry; and if the tenderest supplications of a dutiful son to an obdurate father could have made any impressions, Omai hung round his neck in all the seeming agony of a child trying to melt the heart of a reluctant parent. He twined his arms round him with the ardour of inviolable friendship, till Captain Cook, unable any longer to contain himself, broke from and retired to his cabin, to indulge that natural sympathy which he could not resist, leaving Omai to dry up his tears, and compose himself on the quarter deck.

Having then bid farewell, he was accompanied by Lieutenant King in the boat, who informed Captain Cook he had wept all the time he was going on shore. It was hoped that he would exert his endeavours to bring to perfection the various fruits and vegetables that were planted by his English friends. Indeed the principal

principal advantage these islands are likely to receive from the travels of Omai, will probably arise from the animals that have been left upon them; which, perhaps, they never would have obtained, if he had not come over to England. When these multiply, Otaheite, and the Society-Isles, will equal any places in the known world, with respect to provisions. Omai's return, and the substantial proofs he had displayed of British liberality, encouraged many to offer themselves as volunteers on an expedition to England.

ULIETEÀ, which we come next to treat of, is about 20 leagues in circumference. When Captain Cook, Mr. Banks, and others went on shore, accompanied by Tupia, they were received by the natives in the most courteous manner; reports concerning them having been transmitted from Otaheite. After some ceremonies had passed, Captain Cook took possession of this and the adjacent islands, in the name of the king of Great-Britain.

The country has extensive plains and high hills, the soil on the top of which was found to be a kind of stone marle. On the sides were some scattered flints, and a few pieces of a spongy stone *lava*, of a whitish colour, which seemed to contain some remains of iron; it was conjectured that great quantities of that metal might be lodged in the mountainous parts of the island. Its vegetable productions are chiefly plantains, coconuts, and yams: those of the animal kind, hogs and fowls; but the latter articles do not abound.

There is great similarity in person, manners, and customs between the natives of this and the islands adjacent. Ulietea, however, was distinguished from the rest, by a remarkable morai, which the natives called Tapodelotea. The walls which were about eight feet, were raised of coral stones, some extremely large. The whole enclosed an area, of about 25 yards square, which was filled up with smaller stones. Upon an altar, at a small distance from this enclosure, was deposited as a sacrifice, a hog, very nicely washed, weighing about fourscore pounds.

Several structures dedicated to the deities were placed about here. These structures are a kind of chest or ark, the lid of which is fixed on with art, and neatly thatched with palm-nut leaves. Each of them was fixed on two poles, the use of which seemed to be to remove it from place to place.

On the first arrival of Captain Cook here, he received a present of considerable value from Opooney, the king of Bolabola, who was then at the island of Otaha. In return for the compliment, the commander, principal officers, &c. determined to pay him a visit; when, behold, to their astonishment, this triumphant conqueror appeared to be nothing more than a man, tottering with the decrepitude of age, incapable of the common functions of life, and in a word a mere lumpish mass.

Three extraordinary persons were seen at this island; two of them were as brother and sister: the former measured six feet four inches, and the sister younger than him five feet ten inches and an half. The third was a chief named Herca, a native of Bolabola. He was the most corpulent man in any of the South-Sea islands. He measured round the waist no less than 54 inches; one of his thighs was 31 inches and 3-quarters in girth. His hair was likewise remarkable; for it hung down in long black wavy tresses to the small of his back, and in such quantities, that it increased the apparent bulk of his head considerably.

When Captain Cook anchored here, on his second voyage, he was visited by Oreo, the chief, who brought with him a handsome present. A party of them went on shore to make him a return, and as they entered the house, were met by five old women, who were lamenting on some incident, and had cut their faces in a shocking manner. This was not the worst part of the story, for they were obliged to submit to their embraces, and got themselves covered with blood. After the ceremony was over, they washed themselves, and appeared as cheerful as any other person.

Soon after, intelligence was received, that two of the Discovery's people, a midshipman and a gunner's mate, had made their escape in a canoe, and landed on an adjoining island, with a view to continue their course to Otaheite, as soon as they had furnished themselves with provisions for the voyage. They were no sooner missed, and report made to Captain Cook, than he ordered all the boats to be manned, and a pursuit to commence with all possible expedition; at the same time confining the king, his two sons, and two of the principal chiefs of the island, on board the Discovery, till the fugitives should be taken and restored.

This he did, no doubt, to interest the people of the island in the pursuit, and to prevent their assisting the deserters in making their escape. He also promised a reward of large axes, looking-glasses, and other articles of considerable value, to any of the natives, who should be instrumental in apprehending and bringing them back. To enforce his orders he caused all the vessels to be seized, and threatened destruction to the country if his men should be with-held. He even menaced the king and the young princes with death, if they were not brought back within a certain time. This might seem hard usage, yet it had its effect; as without this steady resolute proceeding, the deserters would never have been recovered.

The ship's boats went day after day to all the adjoining islands, without being able to learn the least trace of them; and this they continued, till having searched every island within the distance of two days' sail, they were at length obliged to give over any further search as fruitless.

At length, after fourteen days absence, some Indians came on board, and acquainted Captain Cook that the fugitives were found, and that in a few days they

they would be brought back; desiring, at the same time, the release of the prisoners, as a condition without which they would again be set at large. But Captain Cook paid no regard to this information. On the contrary, he renewed his threatenings, which he said he would instantly order to be carried into execution, if the men were not delivered up.

The very day following, about five in the evening, a number of canoes were seen at a distance, making towards the ships, and as they approached nearer they were heard to sing and rejoice as if they had succeeded in finding what they went in search of. About six they came so nigh, that they could discern, with glasses, the deserters fastened together. They were no sooner brought on board, than the royal prisoners were released, to the unspeakable joy of all but the two fugitives, who were under great apprehensions for their lives; their punishment, however, was not so severe as might have been expected.

When Captain Cook, on his third voyage, entered the harbour of Ulietea, in the Resolution, having the Discovery, Captain Clerke, under his command, the natives surrounded the ships in their canoes, for the purpose of exchanging their commodities for those of our people.

A few days after their arrival, a centinel on shore, named John Harrison, deserted, taking with him his musket and accoutrements. As soon as intelligence was gained which way he was gone, a party was detached in search of him; but they returned in the evening without success. The next day the captain applied to the chief concerning this affair, who promised to send a party of the islanders after the fugitive, and gave hopes that he should be brought back in the course of that day. This, however, did not happen; and there was reason to imagine, that Oreo the chief had taken no steps to find him.

A considerable number of the natives were at this time about the ships, and several thefts committed, the consequences of which being apprehended by them, very few came on board the next morning. Oreo himself caught the alarm, and fled with his whole family. Captain Cook considered this as a good opportunity to insist upon their delivering up the deserter; and having heard he was at a place called Hamoa, situate on the other side of the island, he repaired thither with two armed boats, attended by a native. In their way, they met with the chief, who embarked with them. The captain, with a few of his men, landing about a mile from the spot, marched up to it with great expedition, lest the sight of the boats should give the alarm, and allow the offender sufficient time to escape to the mountains. This precaution was found unnecessary; for the natives of that part of the island having obtained information of the captain's approach, were prepared to deliver the deserter. He was found with

his musket lying before him, seated between two women, who, the instant that the captain entered the house, rose up to plead in his vindication.

As such proceedings deserved to be discouraged, the captain, with a stern look, bid them be gone; upon which they burst into tears, and retired. Paha, the chief of the district, now came with a sucking pig, and a plantain-tree, which he was on the point of presenting to Captain Cook, as a peace-offering, who rejected it; and having ordered the chief to quit his presence, embarked with the deserter in one of the boats, and returned to the ships. After this, harmony was speedily restored. The delinquent made no other excuse for his conduct, than that the natives had enticed him away; which, perhaps, was in a great measure true, as Paha, and the two women above mentioned, had been at the ship the day before his desertion. As he had remained on his post till within a few minutes of the time in which he was to have been relieved by another, the punishment he received was not very severe.

About a fortnight after they arrived at Ulietea, Omal, according to instruction given him by Captain Cook, dispatched two of his people in a canoe, with intelligence, that he continued undisturbed at Huaheine, and that every thing succeeded with him, except that his goat had died in kidding. This information was accompanied with a request, that the captain would send him another, and also two axes. Pleased with this additional opportunity of serving him, the captain sent back the messengers to Huaheine, with the two axes, and a male and female kid to his friend.

The circumstance attending the desertion of these people, and particularly the confinement of the chiefs, induced the natives to meditate an attempt for their relief, which had it not been prevented, might have involved our people in still greater distress. Captain Cook being on shore, abreast of the ship, observed all their canoes, in and about the harbour, began to move off. He inquired, in vain, for the cause of this; till information was received from the Discovery, that a body of the islanders had seized Captain Clerke and Lieutenant Gore, as they were walking at a small distance from the ships.

The commodore, struck with the boldness of this scheme of retaliation, which seemed to counteract him in his own way, instantly commanded his people to arm; and in a few minutes, a strong party, under the conduct of Mr. King, was sent to the rescue of the two gentlemen. At the same time, two armed boats were dispatched to intercept the flying canoes in their retreat to the shore. These detachments had scarcely gone out of sight, when intelligence arrived, which proved the information erroneous, so that they were immediately, in consequence of this, called in. However, it appeared from several corroborating particulars, that the natives had actually formed the design of seizing Captain Clerke; and the following day it became no secret.

But the principal part, at first, of the plan of their operations was, to have secured the person of Captain Cook. He was accustomed to bathe every morning in the fresh water; on which occasions he frequently went alone, unarmed. Expecting him to go this evening, as usual, they had resolved upon seizing him, and Captain Clerke likewise, if he had accompanied him. But the commander, after confining the chief's family, had taken care not to put himself in their power; and had cautioned Captain Clerke and the officers not to go any considerable distance from the ships.

In the course of the afternoon, Oreo asked the commodore, three or four times, if he would not go to the bathing place; till at length finding that he could not be prevailed upon, he retired, with his people, notwithstanding many entreaties to the contrary. Having no suspicion at this time of their design, Captain Cook imagined that a sudden panic had seized them, which would be soon over. Being disappointed with respect to him, they fixed upon those whom they thought more in their power.

It was a fortunate circumstance that they did not succeed in their design, and that no mischief was done on the occasion; no muskets being fired except two or three to stop the canoes; to which firing, perhaps, Captain Clerke and Mr. Gore owed their safety; but Mr. King ascribed this to the captain's walking with a pistol in his hand, which, he says, he once fired; at which time a party of the islanders, armed with clubs, were marching towards them, but dispersed on hearing the report of the muskets. This conspiracy was first discovered by a girl, who had been brought from Huahine by one of our officers. Happening to overhear some of the Uliteans say, they would seize Captain Clerke and Mr. Gore, she immediately ran to acquaint the first of our people that she met with of the design. Those who had been trusted with the execution of the plan threatened to put her to death, as soon as the ships should quit Ulitea, for disappointing them. Being aware of this, it was so contrived, that the girl's friends should come a day or two afterwards, and take her out of the ship, to convey her to a place where she might remain concealed till an opportunity should offer for her escaping to Huaheine.

This island of Ulitea differs essentially from the rest of the Society-Islands in one particular instance, which is, that the women have more liberty here, and are not restrained from eating in company with the men.

BOLABOLA is situated about four leagues distant from Otaha; surrounded by a reef of coral rocks, and several small islands, in compass together about eight leagues, and made up of one forked peak, with seven low islands round it.

The harbour of Bolabola, called Oteevanooa, on the west side of the island, is very capacious, and though

our countrymen did not enter it, they had the satisfaction of being informed, by persons employed for that purpose, that it was a very proper place for the reception of ships. There are many islets or small islands that surround it, which add to the number of its inhabitants, and the amount of its vegetable productions.

The principal reason that induced Captain Cook to touch at this island on his voyage was, to procure one of the anchors which had been lost at Otahaite by Monsieur de Bougainville, which, he was informed, had been afterwards found by the natives there, and sent by them to Opoony, the chief of Bolabola. It was not on account of the want of anchors that he was anxious to get possession of it; but the people having parted with all the hatchets and other iron tools and implements, in purchasing refreshments, they were now obliged to create a fresh assortment of trading articles, by making them out of the spare iron they could find on board, and even the greatest part of that had been already expended. Captain Cook, therefore, supposed Monsieur de Bougainville's anchor would, in a great measure, supply the want of that useful material, and he did not entertain a doubt but Opoony might be induced to part with it.

Oreo, accompanied by six or eight others from Ulitea, attended the commodore to Bolabola; and, indeed, most of the natives, except the chief, would gladly have taken their passage to England.

On his landing, the commodore was introduced to Opoony, surrounded by a vast concourse of people. The necessary formality of compliments being over, he requested the chief to give him the anchor; and by way of inducement produced the present he intended for him. It consisted of a linen night-gown, some gauze handkerchiefs, a shirt, a looking-glass, some beads and toys, and six axes. Opoony, however, refused to accept the present till the commodore had received the anchor; and ordered three persons to go and deliver it to him, with directions to receive from him what he thought proper in return. With these messengers persons deputed set out in boats for a neighbouring island, where the anchor had been deposited; but it was neither so large or so perfect as was expected. By the mark that was upon it, it appeared to have originally weighed 700 pounds; but it now wanted the two palms, the ring, and part of the shank. The reason of Opoony's refusing Captain Cook's present was now apparent; he, doubtless, supposed that the anchor, in its then state, was so much inferior to its former value, that, when he saw it he would be displeased. The commodore, notwithstanding, took the anchor as he found it, and sent the whole of the present which he at first intended.

It might at first seem surprising that Bolabola should become so responsible. The reason will be seen by the following short narrative.

Ulitea and Otaha had long been friendly; or, as the natives emphatically express it, they were considered

they had the satisfactions employed for proper place for the fillets or small islands, number of its inhabitants productions.

On the 10th of October, Captain Cook to procure one of the islands at Otaheite by Monsieur de Bougainville, and sent by them

It was not on account that he was anxious to have parted with his arms and implements, in case he were now obliged to give up articles, by making a search could find on board, but he had been already examined, supposed Monsieur de Bougainville a great measure, supposed, and he did not think he would be induced to part

With eight others from the island of Bolabola; and, in the event of the chief, would return to England.

On the 11th of October, a French vessel was introduced to the assistance of people, and the French vessels being overboard, he went to the anchor; and by the presence of the French vessel he intended to spend the night-gown, some looking-glasses, some powder, and some Opoony, however, the commodore had received three persons to go and receive from him the vessel. With these men in boats from a neighbouring island had been deposited; and the vessel appeared as was expected.

It appeared to have originated in what he now wanted the vessel to be the shank. The reason of the vessel's present was supposed that the anchor, inferior to its former, would be displeased. The vessel, took the anchor as the present which he

It appeared that Bolabola should be seen by the

When friendly; or, as they were considered

as two brothers, whose views and interests were the same. The island of Huaheine was also admitted as a friend, but not in so eminent a degree. Like a traitor, Otaheite leagued with Bolabola, jointly to attack Ulietea, whose people required the assistance of their friends in Huaheine against these united powers. The inhabitants of Bolabola were encouraged by a pretended prophetess, who predicted their success. The canoes of Bolabola attacked those of Ulietea and Huaheine: the encounter lasted long, they being lashed strongly together with ropes; and, notwithstanding the prediction, the Bolabola fleet would have been vanquished, had not that of Otaheite arrived at the critical moment. The fortune of the day was now turned; victory declared in favour of the Bolabolans; and their enemies were totally defeated. Two days after the conquerors invaded Huaheine, which they subdued, it being weakly defended, as most of its warriors were then absent. Many of its fugitives, however, having got to Otaheite, there related their melancholy tale. This so affected those of their own country, and of Ulietea, whom they found in that island, that they obtained their assistance. They were furnished with only ten fighting canoes; with which inconsiderable force they effected a landing at Huaheine in the night; and, taking the Bolabola men by surprize, killed many of them, and dispersed the rest. Thus were they again, by one bold effort, possessed of their own island, which at this day remains independent, and is governed by its own chiefs. When the combined fleets of Ulietea and Huaheine were defeated, the men of Bolabola were applied to by their new allies of Otaheite to be allowed an equal share of the conquests. This being refused, the alliance broke; and, during the subsequent war, Otaheite was conquered as well as Ulietea, both of which remain subject to Bolabola; the chiefs by whom they are governed being only deputies to Opoony the king of the island. In the reduction of the two islands five battles were fought at different places, and great numbers fell in the contest.

Since the conquest of Ulietea and Otaheite, the Bolabola men are considered as invincible; and their fame is so far extended, that, even at Otaheite, it is not dreaded, they are respected for their valour. If it is asserted, they never fly from an enemy, and that they are victorious against an equal number of the other islanders. Indeed, the estimation in which the people of Bolabola are held at Otaheite may be gathered from M. de Bougainville's anchor having been sent to their sovereign. The intention of transporting the Spanish bull to their island must be ascribed to the same cause. They also had a third European curiosity brought to Otaheite by the Spaniards. This animal had been so imperfectly described by the natives, that our voyagers had been much puzzled to conjecture what it could be. When Captain Clerke's deserters, however, were brought back from Bolabola, they said the animal had been shewn to them, and that it was a ram. In consequence of this intelligence, Captain Cook, when he landed to

meet Opoony, took an ewe with him in the boat, of the Cape of Good-Hope breed, whereby a foundation might be laid for a breed of sheep at Bolabola. He also left with Otaheite, at Ulietea, two goats, and an English boar and sow; so that the race of hogs will be considerably improved, in a few years, not only at Otaheite, but also at all the neighbouring islands; and they will, perhaps, be stocked with many valuable European animals. When this is really the case, these islands will be unrivalled in abundance and variety of refreshments for the supply of future navigators. Even in their present state they are hardly to be excelled. When the inhabitants are not disturbed by intestine broils, which had been the case for several years past, their productions are numerous and plentiful.

The following is the mode of salting pork, used by Captain Cook in his voyages.

In the evening the hogs were killed, and, when cleaned, were cut up, after which the bones were taken out. The meat was salted while hot, and laid in such a manner as to permit the juices to drain from it, till the next morning: it was then salted again, put into a cask, and covered with pickle. It remained in this situation four or five days, when it was taken out, and carefully examined; and if any of it appeared to be in the least tainted, which sometimes happened, it was separated from the rest, which was repacked, headed up, and filled with good pickle. It was again examined in about eight or ten days time, but there appeared no necessity for it, as it was generally found to be all thoroughly cured. Bay and white salt mixed together answers the best, though either of them will do alone. Great care was taken that none of the large blood-vessels remained in the meat; and that not too much should be packed together at the first salting, lest those pieces which are in the middle should heat, and hinder the salt from penetrating them. In tropical climates, meat ought not to be salted in many and sultry weather.

OTAHAE bears a strong resemblance to those islands adjacent. It is not populous. The harbour on the east side was found safe and convenient, with good anchorage. This island is situated within about two miles of Ulietea; but as both are enclosed in one reef of coral rocks, there is no passage for shipping between them.

Like the inhabitants of every part of this spot, they received our countrymen who landed from the boat on their coast with all tokens of courtesy, and used the same honorary compliments to them as they did to their kings, to Mr. Banks, and Dr. Solander.

The island of TUBAI produces nothing but coconuts, and is said to be inhabited only by three families. But as the coast abounds with fish, the shore is frequently visited by the people of the adjacent islands.

MOROUA,

MOROUA, or MAWRUA, is a small island surrounded by a reef of rocks, and has no harbour for shipping. It has some few inhabitants, and produces the same articles with those adjacent. In the midst of it is an high round hill, which may be seen at the distance of ten leagues, for which only it is remarkable.

THE people of the Society-Islands are in general stout and well made, and many of them tall. They are not of so dark a complexion as those of Otaheite, and the women are in general as handsome, and nearly of the same colour as Europeans.

They are exceeding indolent, and have very little curiosity. Dogs, in spite of their stupidity, are in great favour with all the women. Here was seen a middle aged woman, whose breasts were full of milk, offering them to a little puppy that had been trained up to suck them: the sight disgusted those who saw it to such a degree that they could not forbear expressing their dislike of it; but the woman only smiled at them, and said, that she suffered little pigs to do the same: it appeared afterwards that this woman had lost her child.

The veneration of the inhabitants for certain kinds of birds is evident from the following circumstance. On a shooting party our people happened to kill several king-fishers; and just as they had brought down one of those birds, they met Oreo and his family walking with Captain Cook; the chief just then took no notice of the bird, but his fair daughter lamented the death of her Eatoo; her mother, and most of the women, seemed also grieved at its fate; and on stepping into the boat, Oreo himself desired them, with a very serious air, not to kill the king-fishers and the herons, allowing them, at the same time, the liberty of killing any other sorts of birds. It is to be remembered that Omai, at the sacrifice, called the king-fisher an *Eatoo*; so that bird appears to be thought sacred.

Great quantities of the root called *ava ava* are cultivated in these islands, with which the natives make their intoxicating liquor. This is no other than the pepper plant. It seems, however, that drunkenness here is punished, like all other excesses, with diseases; the old men who make a practice of hard-drinking are lean, and covered with a scaly or scabby skin, have red eyes, and red blotches on all parts of their bodies: they acknowledge these evils to arise from intemperance, and perhaps those leprous disorders that some were seen to be afflicted with at Otaheite are produced by taking large potions of this liquor.

Their entertainments of a public nature consist of dancing, and a kind of dramatic exhibition; which dramatic exhibitions, as well as festive entertainments, from their singularity, are worthy of attention.

A party of our people were present at Ulitea, where a performance was exhibited, called by the natives *Middij Murrany*; which signifies, "the child is coming." It concluded with a representation of a woman

in labour, acted by a set of great brawny fellows, one of whom seemed to bring forth a great strapping boy about six feet high, who ran about the stage, dragging after him a large whisp of straw, which hung by a string from his middle. Captain Cook observed, that the moment they got hold of the fellow, they flattened or pressed his nose, from whence he concludes, that their new born infants are so treated, which accounts for the natives in general having flat noses.

The only actress at Oreo's theatre was his daughter Poyadua, a pretty brown girl, at whose shrine many offerings were made by her numerous votaries on these occasions.

Another dramatic exhibition was presented to our people at Huahine: the piece represented a girl running away from her parents, and seemed to be levelled at a female passenger whom they had brought from Otaheite, who happened to be present at the representation. It had such an impression upon the girl, that she could scarcely be persuaded to see the piece out, or to refrain from tears while acting. It concluded with the reception she was supposed to meet with from her friends at her return, which was made out to be unfavourable. Thus it appears that these people introduce extempore pieces on occasion, and it is most probable, that this was meant as a satire upon the girl, and to discourage others from acting in the same manner.

Oreo likewise gave a public dinner to the Captains Cook and Furneaux, several of the officers of both ships, and the passengers. On this occasion a great part of the spacious house was spread with large quantities of leaves, which served for a table cloth, round which the visitants seated themselves, together with the principal people of the island. Soon after, one of the servants, or tow-tows, brought a hog smoking on his shoulders, which was roasted whole, and wrapped in a large bundle of plantain leaves; this he threw upon the floor, round which the company was seated. Another smaller hog was carried in the same manner, and both so hot as hardly to be touched: the table, or rather floor, was garnished about with hot bread-fruit and plantains, with a quantity of cocoa-nuts for drink. Each man being ready with his knife in his hand, the hogs were presently cut to pieces, and the European part of the company agreed, that they tasted better than an English barbecue: the equal degree of heat with which it steeps under ground, had preserved and concentrated all its juices; the fat was not luscious and surfeiting, and the skin, instead of being very hard, which is the case of roasted pork with us, was as tender as any other part. One of these hogs weighed between 50 and 60 pounds, and the other about half as much, yet all the parts were equally done. The chief, his son, and some others of his male friends, partook of this repast with their guests: the men ate with great liking; but all the women were stationed behind, and were not admitted as sharers in the feast.

It is the custom in these islands for the chiefs to have

have burial places erected while they are yet alive, which doubtless occasioned Oreo's inquiring of Captain Cook (when he could not obtain his promise to return in departing from Ulitea in his second voyage) the name of his morai, or burying-place. Hence it appears that these people could not give a greater proof of their affection to their English friends, than in expressing a desire to remember them even beyond the period of their lives.

The religion of the inhabitants of the Society-Islands appeared to consist in having a diversity of gods peculiar to each island. But they believe, in general, every man to have a separate being within himself, named *Tee*, which acts in consequence of the impression of the senses, and combines ideas into thoughts, which they call *parou no te oboo*, which literally signifies "words in the belly." This mind they suppose to have an existence after the dissolution of the body, and that the man in that state feasts on bread-fruit and pork, which need no preparation from the fire.

Besides their greater divinities, they have a number of inferior ones, some of whom they suppose to be inimical to mankind. The high priest of the island is called Tahowarahai; to him the Eatooa, or god, is supposed to descend, and hold converse with him, whilst he remains invisible to the people that surround him. Offerings are made to the greater deities, of hogs and poultry roasted, and of all kinds of eatables; but the inferior, and particularly the malevolent spirits, are only revered by a kind of hissing.

In these islands the priests continue in office for life, and the dignity is hereditary. The high priest is always an Earee, who has the highest rank next to the king. They are consulted upon many important occasions; partake largely of the good things of the country, and, in short, have found means to make themselves necessary. Besides the priests, there are in every district teachers, or *tata-o-rerors*, who instruct the people in astronomy and the navigation of those seas, which however is very imperfect.

C H A P. XVIII.

THE MARQUESAS.

General Description of them.

ALVARA MENDANA, a Spaniard, is accounted the first discoverer of the Marquesas; and they were so denominated in honour of the Marquis of Cannette, in 1595, then Viceroy of Peru. Their particular names are, La Magdalena, S. Pedro, La Dominica, Santa Christina, and Hood's-Island. Mendana had only seen the four first; and the last was discovered by Captain Cook, in 1774. It lies to the north-west of the rest, in 9 deg. 26 min. south; and 138 deg. of W. longitude, and five

leagues and a half distant from the Eastern point of S. Magdalena. The five Marquesas Isles take up about one degree of latitude, and near half a degree of longitude. The people here are ruled by a chief, whose dignity seems principally to consist in a superiority of dress.

Captain Cook relates, that the inhabitants of these islands excel, in general, all the nations of the South-Seas, in symmetry of form, and regularity of features. He mentions, in particular, that not one disproportioned person was seen upon the island of Christina; but that all were robust, well made, and active. Their countenances were open and lively. The men are about five feet six inches in stature; their hair is of divers colours, but none red. It is mostly worn short, unless it be a bunch tied in a knot on each side of the crown. Their complexion, naturally tawny, is rendered almost black by punctures over the whole body. Their only covering was a small piece of cloth round the waist and loins.

The women were inferior to the men in stature, but well proportioned. Their general complexion was brown. They were some of them punctured, and their body dress was a single piece of cloth made of the mulberry bark, which covered them from the shoulders to the knees. They use a head-dress, a kind of broad fillet, curiously made of the fibres of the husks of cocoa-nuts. This fillet is interspersed with mother-of-pearl and tortoise-shells, wrought into curious figures, and displayed in divers forms. To the fillet is fixed the tail feathers of tropic birds, which, standing upright when it is tied on, the whole together makes a very brilliant appearance. They wear a kind of ruff, or necklace, made of light wood; the outer and upper sides covered with small peas, fixed on with gum. They have also some bunches of human hair fastened to a string, and tied round the legs and arms; but no one person is ever decorated with all these ornaments. They were none of them held in estimation like the human hair, the bunches of which, it is probable, were worn in remembrance of their deceased relations, and therefore looked upon with a degree of veneration; or, they might have been the spoils of their enemies, worn as badges of conquest. They had a kind of fan to cool themselves in hot weather, formed of a tough bark or grass, very firmly and curiously plaited, and frequently whitened with shell lime. Some had large feathered leaves of a kind of palm, which answered the purpose of an umbrella.

When the king visited Captain Cook, he was completely decorated with all these ornaments, and the only one ever seen so dressed. He complimented the captain with some presents, and gave him to understand the superiority of his rank. Their extraordinary ornaments are necklaces and amulets made of shells. They had all their ears pierced, though none were seen with ear-rings.

G g

Their

Their habitations, which are in the valleys and on the sides of the hills near the plantations, resemble, in form, those of Otaheite, but are much meaner, and covered with leaves of the bread-fruit tree. They are built, in general, on a square or oblong pavement of stone, raised some height above the level of the ground. They have also a pavement near their houses for the purpose of sitting to eat, regale, and amuse themselves. Our people, by the help of glasses, could discern, along the uppermost edge of a mountain, a row of flakes or palisades closely connected together, like a fortification, which seemed to resemble the Hippahs of New Zealand.

The only quadrupeds seen here were hogs and rats. But there were fowls, and many small birds in the woods, that warbled most melodiously. Notwithstanding these islands produce fowls, hogs, and the waters, at certain times, fish in abundance, the inhabitants subsist chiefly on vegetable food. As cocoa-nuts do not abound, pure water is their drink in ordinary.

In the articles of eating and cookery, they are not cleanly. Pork and fowls are dressed in an oven of hot stones: but fruit and roots they roast on the fire; and after taking off the rind and skin, put them into a platter or trough, with water, out of which Captain Cook affirms, he saw both men and hogs eat at the same time.

It appears that these islands are similar in their origin, and the nature of their minerals, to the Society-Islands, the greater part of which seem to have been the burning mountains.

The Marquesans discovered the same timidity on the approach of strangers, in common with the natives of the southern climes; nor could be induced for some time, to come on board the ships, by any signs of friendship that could be made them. They ventured indeed to come along-side, and offered some pepper-roots, which were fixed on the shrouds, as tokens of reciprocal friendship. The exchange of nails for fish and bread-fruit, in great perfection, was highly salutary, as well as gratifying to the whole ship's company, who, for the course of nineteen weeks, had subsisted on salt provisions, which having then been two years on board, were neither agreeable in flavour, nor of a nutritive quality. The canoes retired a little after sun-set, according to the general custom of the natives of the South-Sea islands, who cannot be prevailed on to keep awake a single night, by the most attracting novelty.

Those parts of these islands which are capable of cultivation are very populous; but as they are in general mountainous, and have many inaccessible rocks, it is doubted whether the whole group contain fifty thousand inhabitants.

Intercourse had not been long held between our people and the natives, before it was evident they were more disposed to receive than to give; for having taken a nail in exchange for some bread-fruit, they

with-held the article so purchased, till Captain Cook had recourse to the ordinary means of firing a musket over their heads, and thus terrified them into fair dealing. Nor were these islanders exempt from that propensity to theft, which characterizes the nations of the South-Seas. Soon after they had courage enough to venture on board, one of them stole an iron stanchion from the gangway, with which he sprang into the sea, and notwithstanding its weight, swam with it to his canoe, and was making to the shore with all speed. A musket was fired over his head to frighten him back, but to no effect; he still continued to make off with his booty. The whistling of another ball over his head was as ineffectual. An officer, less patient of such an injury than reason and humanity should have taught him to be, levelled at him, and shot him through the head. Captain Cook had given orders to fire over the canoe, but not to kill any one. He was in a boat, and came up with the canoe soon after. There were two men in her; one fat bailing out the blood and water, in a kind of hysteric laugh; the other, a youth of about fourteen or fifteen years of age, who afterwards proved to be the son of the deceased, fixed his eyes on the dead body, with a serious and dejected countenance. This act of severity, however, did not estrange the islanders from the ship, and a traffic was carried on to the satisfaction of both parties. Bread-fruit, bananas, plantains, and some hogs, were given in exchange for small nails, knives, and pieces of Amsterdams cloth. Red feathers of the Amsterdams island were greatly esteemed here.

Captain Cook, accompanied with the gentlemen of the ship, in their walks about the country, came accidentally to the house which had been the habitation of the man who had been shot; there they found his son, who fled at their approach: they inquired for his female relations, and were told that they remained at the top of the mountain, to weep and mourn for the dead. But though they were then among the relations of a man who had been killed by them, not the least tokens of animosity or revenge were discernible among the natives.

On seeing a sailor corrected by the boatswain's mate, they exclaimed, "He beats his brother;" which arises from their idea of all one country being in effect of one and the same family.

C H A P . XIX.

Description of the ISLANDS termed, "The Low ISLANDS in the SOUTH-WEST."

THESE islands, which form a group, connected by a reef of coral rocks, and lie scattered, in general, between the latitude of 14 deg. 28 min. south, and the longitude of 138 deg. and 56 min. west, are the following;

rm a group, connected by
d lie scattered, in general,
deg. 28 min. south, and
and 56 min. west, are the
following;

following: King George's, Disappointment, Palliser, Dog, Queen Charlotte's, Lagoon, Thumb-Cap, Bow, The Groups, Bird, Chain, Osnaburg, and Pitcairn Islands. Of these we shall treat in their respective order.

KING GEORGE'S ISLANDS are two in number; they were first discovered by Commodore Byron, in 1765. When the English first went on shore, they found many huts deserted by the natives, the dogs being the only tenants; and those animals, terrified by the appearance of strangers, kept a continual howling all the time they continued on shore. The hovels, though very mean and low, were situated in a charming spot, amidst a grove of lofty trees, some of which were the cocoa, and others of a species unknown. The natives seemed to derive the necessaries of life, in general, from the cocoa-nut tree, as it supplied them not only with food, but sails, cordage, and timber.

The cocoa-palm may well be deemed the staple of life, as it produces every essential requisite for the support of many nations on the globe. Every part of it is converted to some useful purpose: as for instance; the nuts, whilst green, contain a liquor pleasant to the palate, and of a quality so singularly cooling, that it allays thirst, and affords refreshment in a hot climate, beyond any other production. When in due progress the kernel forms, it is at first of the substance of a rich cream; and afterwards growing firm and oily, like an almond, becomes equally balsamic and nourishing. The oil extracted from it is adapted to divers purposes, and particularly that of anointing the hair, and frequently the whole body. Cups are made of the hard shell; and a variety of cordage, elastic and durable, from the fibrous coating around it. Several articles of Indian household furniture, and divers kinds of ornaments, are fabricated of these materials. The long-feathered leaves or branches, which spread from the top of the stem, are convenient coverings for their houses; and those, when plaited, make excellent baskets for provisions. A cloth sufficient for covering the body in a hot climate is made of the inner bark: and the very stem itself, when grown too old to bear, may be used in the construction of a hut, or the mast of a canoe. All these very essential benefits are derived from this one production. The shore of this island was covered with coral, and the shells of very large pearl oysters.

Commodore Byron has given the following account of the natives, their customs, &c. "The women wear a piece of cloth hanging from the waist down to the knee; and the men were naked. Near their houses were buildings of a different kind, which were supposed to be burying-places. These were situated under lofty trees; the sides and tops were of stone; and, in their figure, they sometimes resembled the

square tombs with a flat top, which are in our country church-yards. Near these buildings were found many neat boxes, full of human bones: and upon the branches of the trees which shaded them hung a great number of the heads and bones of turtle, and a variety of fish, enclosed in a kind of basket-work of reeds; on examining which, nothing appeared to remain but the skin and the teeth: the bones and entrails seemed to have been extracted, and the muscular flesh dried away."

Captain Cook, who gives a more ample and satisfactory account of them, sailed between these two islands in April 1774: he says they lie nearly east and west. The island to the eastward is called by the natives *Tiookea*; it is something of an oval shape, and about ten leagues in circuit. The inhabitants of this island, and probably of all the low ones, are of a much darker colour than those of the higher islands, and of an hostile disposition. Their origin is doubtless one and the same; but being dependent on the sea for a subsistence, and from their way of life exposed to the sun and weather, their colour is darker, and their bodies become more hardy and robust. The figure of a fish is punctured or marked on their bodies. A lieutenant, with two boats well armed, were sent on shore; two gentlemen were of the party; they landed without any opposition from the natives. As soon as they came on shore, the islanders embraced them by touching noses, a mode of civility used in New Zealand, which is some hundred leagues distance, and the chief place besides this where the custom has been observed to prevail.

The naturalists found here various plants, and particularly a scurvy-grass. The natives shewed them that they bruised this plant, mixed it with shell-fish, and threw it into the sea, whenever they perceived a shoal of fish, which, intoxicated by it, were caught on the surface of the water without trouble. The soil is but barren, the foundation consisting of coral, very little elevated above the surface of the water. The officer of the boats perceiving the Indians collecting into a body, having distributed presents to those who surrounded him, soon prepared to go, desirous of avoiding any affray. The collected body crowded about the boats, and seemed doubtful whether they should detain our people, or suffer them to depart. At length, however, they assisted them in pushing off the boats. Some of the most turbulent threw stones into the water, and seemed to glory as if they had driven them off. Captain Cook, from this circumstance, found it expedient to give orders for firing four or five cannon shot into the sea, close by the shore, and over the heads of the Indians, as they were seated along the beach, to shew them that they were entirely at the mercy of their visitors. Notwithstanding all this, the party brought off to the ship five dogs, with which the island seemed to be plentifully supplied. These they purchased with small

nails.

nails, and some ripe bananas, which latter they brought from the Marquesas. The dogs had fine long hair, and were of a white colour.

The other island, which is inconsiderable, is situated two leagues to the westward of Tiookea, is four leagues in length, and from five to three miles in breadth.

The ISLANDS OF DISAPPOINTMENT, were first discovered by Commodore Byron in 1765, and so named from the shores affording no anchorage for his ships, on which account he was obliged to quit them, without landing or procuring any refreshments for his crew, who were then languishing with sickness. They are a cluster of small islands, and lie in latitude 14 deg. 10 min. south; longitude 141 deg. 6 min. west. They are inhabited by Indians, who appeared on the beach with spears in their hands, that were at least sixteen feet long. They every where discovered hostile intentions and seemed by signs to threaten the people in the boat with death, if they came on shore. There are cocoa trees in great abundance, and the shore abounds with turtle.

PALLISER-ISLANDS were discovered by Captain Cook in April 1774; they lie in 15 deg. 26 min. south; and 14 deg. 20 min. west, and are four in number: the largest is seven miles long, and not above two broad. The greatest distance of one from the other is not above six leagues. People, huts, canoes, and places erected for drying fish, were seen here. The natives were armed with long spikes.

DOG-ISLAND, 15 deg. 13 min. south, was discovered by Le Mair and Schouten, April 16:5, who gave it that name from having seen three Spanish dogs on the island.

QUEEN CHARLOTTE'S ISLAND, 19 deg. 18 min. south; 138 deg. 4 min. west; was first discovered by Captain Wallis, in the Dolphin, in 1767, who took possession of it in the name of King George the Third. Here is good water, and plenty of cocoa-nuts, palm-nuts, and scurvy-grass. The inhabitants are of a middle stature, and dark complexion, with long hair hanging loose over their shoulders: the men well made, and the women handsome. Their clothing is a kind of coarse cloth, or matting, which they fasten about their middle.

LAGOON-ISLAND, 19 deg. 47 min. south; 139 deg. 28 min. west; is of an oval form, with a lake in the middle, which occupies much the greatest part

of it. The whole island is covered with trees of different verdure. It is inhabited by a race of Indians, tall, of a copper colour, with long black hair. Their weapons are poles, or spikes, which reach twice as high as themselves. Their habitations were seen under some clumps of palm trees, which formed very beautiful groves. This island was discovered by Captain Cook, April 1769.

THUMB-CAP lies about seven leagues north-west of Lagoon-Island: it is a low, woody island, of a circular form, and not much above a mile in compass. There was no appearance of inhabitants: the land was covered with verdure.

BOW-ISLAND, so called by Captain Cook, in 1769, on account of its singular figure, being shaped exactly like a bow; the arch and curve of which is land, and the space between them water. The curve is a flat beach, without any signs of vegetation, having nothing upon it but heaps of sea-weed. It appeared to be narrow, and about three or four leagues in length. The horns, or extremities of the bow, were two large tufts of cocoa-nut trees, of different height and figure. From the smoke seen in different parts the island appeared to be inhabited.

THE GROUPS are long, narrow strips of land, ranging in all directions; some of them ten miles or upwards in length, but none more than a quarter of a mile in breadth. Trees of various kinds, particularly the cocoa-nut, abound here. The people appeared to be well made, of a brown complexion; most of them carried in their hands a slender pole, about fourteen feet long, pointed like a spear: they had likewise something shaped like a paddle, about four feet long. Their canoes were of different sizes; some so small, as to carry no more than three men; others had six or seven; and some of their boats hoisted a sail.

BIRD-ISLAND, so called by Captain Cook, from the great number of birds that were seen on it, is supposed to be about four miles in circumference. It is low, with a piece of water in the middle. No inhabitants appeared.

CHAIN-ISLAND seemed about five leagues long, in the direction of north-west and south-east, and about five miles broad. It appeared to be a double range of woody islands, joined together by reefs, so as to compose one island in the form of an ellipsis, or oval, with a lake in the middle. The trees are large, and from the smoke that issued from the woods it seemed to be inhabited.

OSNABURGH.

OSNABURGH-ISLAND, called by the natives Maitea, was first discovered by Captain Wallis in 1767. It is an high round island, not above a league in circuit; in some parts covered with trees, in others a naked rock, and is 44 leagues distant from Chain-Island, west by south.

PITCAIRN-ISLAND was discovered by Captain Carteret. Captain Cook was very near it in August 1773; but could not fall in with it.

Besides these, which we have described from the most authentic accounts, Captain Wallis also saw five other islands, which he named *Whitsunday, Egmont, Gloucester, Cumberland, and Prince William-Henry*; and in August 1773, Captain Cook fell in with five others, which he named *Resolution, Doubtful, Furneaux, Adventure, and Chane*. Some of the most westwardly of these scattered islands were seen by M. de Bougainville, and called *Les quatre Facardins, and Isles des Lanciers*. That navigator very properly calls this cluster of low, over-looked islands, *The dangerous Archipelago*.

TOOBOUAI-ISLAND, discovered by Captain Cook in 1777, is to the southward of this group. It is situated in latitude 23 deg. 25 min. south, longitude 218 deg. 37 min. east. The spot, at first view, appeared like several distinct islands, but on nearer approach it was found to be connected, and to form but one island. It is guarded by a reef of coral rock, extending in some places a mile from the land, with an high surf breaking upon it. Our people observed from the ships the natives walking or running along shore, and then saw two canoes launched, in which were about a dozen men making towards them. Stopping suddenly when they came near the ships, Omai, according to custom, was desired to use his endeavours to prevail on them to come nearer, but all his efforts proved ineffectual. Those in the canoes, however, indicated by signs a strong desire for our people to go on shore, and those on the beach displayed something white, which was considered as an intimation to the same purport; and the landing might have been effected with ease and safety, as there was good anchorage without the reef, and an opening in it free from surf. But as no refreshments were wanting, and Captain Cook was desirous of availing himself of a fair wind for the prosecution of his voyage, after divers ineffectual attempts to prevail on the natives to come near the vessel, and hold intercourse, he left them, and stood to the northward.

The greatest extent of this island, in any direction, is not above five or six miles. There are hills in it of considerable height. At the foot of these is a narrow border of flat land, extending almost round it, with a white-sand beach. The hills, except a few rocky cliffs, were covered with herbage. According to the informa-

tion our people derived from the men in the canoes, the island abounds with the same animal and vegetable productions as were found in its vicinity.

Such of the natives who were seen in the canoes were copper-coloured: some wearing their hair (which was straight and black) flowing about the shoulders, and others having it tied in a bunch on the crown of the head. Their faces were rather round and full, and expressed a ferocity of disposition. All the covering of those in the canoes was a piece of narrow stuff wrapped round the waist, and passing between the thighs; but some upon the beach were observed to be completely dressed in white. Several in the canoes wore ornaments of pearl shells about their necks: one in particular continued a considerable time blowing a large conch-shell in a long tone without any variation; but what it portended, our people could not determine. The men in the canoes, finding the captain's resolution to depart, stood up, and repeated something aloud, though it was not known whether it expressed hostile or friendly designs. They had, however, no weapons with them; nor could it be discovered by the glasses, that they on shore were armed, as might have been reasonably supposed.

CHAP. XX.

EASTER-ISLAND.

Soil, Situation, Inhabitants, Animal and Vegetable Productions.

CAPTAIN COOK observes, that the view of this island from the east answered the geographical description given of it: Davis's Land. Admiral Roggewein touched at it in 1722, and gave it the name of Easter-Island: but the accounts given of it by the writers of his voyage, appear rather fabulous than authentic; at least they by no means agree with the state in which it was found by those British navigators who last visited it.

This island was called by the natives by a variety of names, as *Wachu, Tamarahi, Whyhu, and Teapy*. It seems that the Spaniards had visited it in 1769, and given it the appellation of the Island of St. Carlos. Some signs of this visit were seen among the natives, and, in particular, several articles of wearing-apparel, which were of European manufacture. It is situated in latitude 27 deg. 30 min. south; and longitude 109 deg. 46 min. west; and is about ten or twelve leagues in circuit.

Soon after the *Resolution*, Captain Cook, made the island, the master being sent out in a boat to sound the coast, one of the natives swam off to her, and insisted on coming aboard the ship. The first thing he did was, to measure the length of the ship, by fathoming her

H h front

from the taffarel to the stem; and as he counted the fathoms, it was observed by our people, that he called the numbers by the same names that they do at Otaheite; nevertheless, his language was nearly unintelligible to all of them.

When Captain Cook went on shore, accompanied by a party, to see what the island was likely to afford, they landed at the beach, where some hundreds of the natives were assembled; and who were so impatient to see them, that many of them swam off to meet the boats.

Not one of them had so much as a stick, or weapon of any sort in his hand. After distributing a few trinkets among them, our people made signs for something to eat, on which they brought down a few potatoes, plantains, and sugar-canes, and exchanged them for nails, looking-glasses, and pieces of cloth.

Near the place where they landed were some tall statues. The country appeared quite barren, and without wood. There were, nevertheless, several plantations of potatoes, plantains, and sugar-canes. They also saw some fowls, and found a well of brackish water.

The captain was obliged to content himself with remaining at the landing-place among the natives, as he was not yet quite recovered from a bilious cholick, which had been so violent as to confine him to his bed. It was several days before the most dangerous symptoms of his disorder were removed; during which time, the surgeon was to him not only a skilful physician, but an affectionate adviser. When he began to recover, a favourite dog fell a sacrifice to his disordered stomach. They had no other fresh meat whatever on board; and the captain could eat of this flesh, and of broth made of it, when he could taste nothing else. Thus he received nourishment and strength from food, which would have made most people in Europe sick. So true it is, that necessity is governed by no law.

The soil of this island is in general a dry, hard clay; but towards the highest part of the south end it is a fine red earth, seemed much better, bore a longer grass, and was not covered with stones, as in the other parts. The most remarkable curiosity here, is a number of gigantic statues, of which, however, very few remain entire. These statues are placed on the east coast. On the east side of the island were seen the remains of three platforms of stonework, on each of which had stood four of these large statues; but they were all fallen down from two of them, and one from the third: they were broken or defaced by the fall. One which had fallen, being measured, was fifteen feet in length, and six broad over the shoulders. Each statue had on its head a large cylindric stone, of a red colour, wrought perfectly round. Others were found that measured near twenty-seven feet, and upwards of eight feet over the shoulders: and still a larger one was seen standing, the shade of which was sufficient to shelter all the party, consisting of near thirty persons, from the rays of the sun. The workmanship was rude, but not bad, nor were the features of the face ill formed; the ears were long, according to the distortion practised

in the country; and the bodies had hardly any thing of a human figure about them. Yet as these islanders, wholly unacquainted with any mechanical power, could raise such stupendous figures, and afterwards place the cylindric stones upon their head, it must be allowed to be considered as admirable!

The party, on their further progress, came to a more fertile part of the island, interspersed with plantations, and not so much encumbered with stones as those they had seen before; but they could find no water, except what the natives twice or thrice brought them, which, though brackish and stinking, was rendered acceptable, by the extremity of their thirst. They also passed some huts, the owners of which met them with roasted potatoes and sugar-canes, and placing themselves ahead of the party (for they marched in a line, in order to have the benefit of the path) gave one to each man as he passed by. But at the very time some were relieving the thirsty and hungry, there were others who endeavoured to steal from them the very things which had been given them. At last, to prevent worse consequences, they were obliged to fire a load of small shot at one, who was so audacious as to snatch the bag which contained every thing they carried with them. The shot hit him on the back, on which he dropped the bag, ran a little way, and then fell: but he afterwards got up and walked, and what became of him they knew not, nor whether he was much wounded. This affair occasioned some delay, and drew the natives together. They presently saw the man who had hitherto led the way, and one or two more, coming running towards them; but instead of stopping when they came up, they continued to run round them, repeating, in a kind manner, a few words, until they set forwards again. Then their old guide hoisted his flag, leading the way as before; and none ever attempted to steal from them the whole day afterwards.

They met with a well at the east end of the island, the water of which was perfectly fresh, being considerably above the level of the sea; but it was dirty, owing to a custom of the natives; who never go to drink without washing themselves, all over as soon as they have done: and if ever so many of them are together, the first leaps right into the middle of the hole, drinks, and washes himself without the least ceremony; after which another takes his place, and does the same.

No quadrupeds were seen upon this island, except black rats, which are common to all the islands of the South-Seas. It appeared that the islanders eat these rats; for our people saw a man with some dead ones in his hand, and seemed unwilling to part with them, giving them to understand they were for food. There were a few domestic fowls, small, but well tasted: and two or three noddies were seen, which were so tame as to settle on the shoulders of the natives.

The coast did not appear to abound with fish, at least our people could catch none with hook and line; and they saw but very little among the natives.

This

This country produces only a few shrubs, the leaf and
seeds of one of which (called by the natives *Torremeds*)
was not much unlike that of the common *Vetch*: the
seeds had a disagreeable bitter taste, and are considered
by the natives as poisonous: the wood is of a reddish
colour, hard and heavy, but crooked, and exceeding
six or seven feet in height: and not a tree was seen on
the whole island that exceeded the height of ten feet.
Another small shrub was seen here, whose wood is white
and brittle, and, as well as its leaf, to the eye somewhat
resembles the ash. There are also some of the Ota-
heitean cloth plant, but dwarfish and weak, being from
two to four feet high. They are planted in rows among
very large rocks, where the rains have washed a little
soil together. Here are sugar-canes, bananas, and
yams, which thrive to admiration, considering the stony
quality of the ground. The sugar-canes were about
nine or ten feet high, and contained a very sweet juice,
which the inhabitants very hospitably presented to their
guests, whenever they asked for something to drink.
These are said to be sweeter than those at Otaheite.
The whole number of plants growing on this island
does not exceed twenty species.

Here are potatoes of a gold-yellow colour, as sweet as
carrots: these were found nourishing, and antiscorbutic.
Here is likewise a species of nightshade, which is made
use of at Otaheite, and the other islands, as a vulnerary
medicine, and is probably cultivated here for the same
purpose. As a proof of the industry of the natives, the
grass, which commonly springs up among the stones,
on the uncultivated soil, is carefully plucked up, and
spread over their plantations as a manure, or to preserve
them in some measure from the parching beams of the
sun.

The natives of this island are in general slender,
brisk and active, have good features, and countenances
not disagreeable. Their colour is of a chestnut brown;
their hair black, curling, and remarkably strong; that
on the head, as well as on the face, is cut short. The
men for the most part are in a manner naked, wearing
nothing but a slip of cloth betwixt their legs, each end
of which is fastened to a cord or belt they wear round
the waist. The cloth from Otaheite, as indeed any
sort, was much valued by these people. The men
have punctures on their bodies, which is common, as
to all the South-Sea islands. The greatest singularity
is the size of their ears, the lobe or extremity of which
is so stretched out, as almost to rest on the shoulder,
and is pierced by a very large hole, through which
three or four fingers might be thrust with ease. The
chief ornaments for their ears are the white down of
feathers, and rings, which they wear in the inside of
the hole, made of the leaf of the sugar-cane, which is
very elastic, and rolled up like a watch-spring. Some
were seen covered with a kind of bright cloth, of an
orange colour, and these were supposed to be chiefs.

One of the natives who came on board the ship had
a belt round his middle, from whence a kind of net-

work descended before, but too thin to answer the pur-
pose of a concealment. A string was tied about his
neck, and a flat bone, something shaped like a tongue,
and about five inches long, was fastened to it, and hung
down on the breast, which he gave our people to un-
derstand was the bone of a porpoise. He was presented
with nails, medals, and strings of beads, all of which
he desired to have tied round his head.

At first he shewed signs of fear and diffidence, asking
in a dialect of the language generally used in the South-
Sea, and which was somewhat understood by many on
board, whether they would kill him as an enemy? On
being assured of good treatment, he became perfectly
unconcerned, and at ease, and talked of nothing but
dancing.

The women of this island are small, slender limbed,
and have punctures on the face, resembling the patches
sometimes in fashion among European ladies. They
paint their whole face with a reddish brown ruddle,
over which they lay a bright orange colour, extracted from
the turmeric root; or they variegate their faces with
strokes of white-shell lime; which led an observer to
remark, that the art of painting is not confined to those
ladies who have an opportunity of imitating French
fashions. All the women were clad in scanty pieces of
cloth; one piece wrapped round their loins, and ano-
ther over their shoulders, made a complete dress. Both
sexes have thin, but not savage features. The women
wear their hair long, and sometimes tied on the crown
of their head.

The violent action of the sun upon their heads, has
led them to contrive various coverings for that part.
Their head-dress is a round fillet adorned with feathers,
and a straw bonnet, something like a Scotch one; the
former worn by the men, the latter by the women.
Many of the men wore a ring about two inches thick,
of grass, strong and curiously plaited, and fitted close
round the head. This was covered with the long fea-
thers of the man-of-war bird. Others had huge bushy
caps of brown gull's feathers, which were almost as
large as the full-bottomed wigs of European lawyers;
besides which, some wear a single hoop of wood, round
which the long white feathers of the gannet hung nod-
ding. In colour, features, and language, the inhabi-
tants of Easter-Island bear such affinity to the people of
the more western islands, that there can be no doubt of
their having had the same origin.

According to the best calculation that could be made,
the number of inhabitants in this island were not above
seven hundred, and of these the females bore no propor-
tion in number to the males. The females were either
few in number, or else most of them abstained, or were
restrained from appearing while the vessel lay here; yet
the men shewed no signs of a jealous disposition, nor the
women any scruples of appearing in public: in fact,
they seemed to be neither reserved or chaste. But as
all the women who were seen were liberal of their fa-
vours, it is more than probable that all the married
and

and modest had concealed themselves from their impetuous visitants, in some distant parts of the island; and what further strengthens this supposition is, that heaps of stones were seen piled up in little hillocks, which had one steep perpendicular side, where a hole went under ground. These islanders, in common with those of the South-Seas, soon gave proofs of their propensity to theft, as before observed. It was with difficulty the ship's crew could keep their hats on their heads, and hardly possible to keep any thing in their pockets. One thief was fired at with small shot, which wounded him so that he fell soon after he had thrown down the fatal acquisition.

Such mildness and good-nature appear in the disposition of these people, as prevent them to behave as kindly and hospitably as their barren country will permit them. A party who had rambled up the island, and were returning to the ship, passed a native who was digging potatoes in a field; they no sooner complained to him of great thirst, than he ran immediately to a large plantation of sugar-canes, and brought out a load of the best and juiciest on his back, for their refreshment. Their disposition is far from being warlike, although they have weapons of defence.

Potatoes, bananas, yams, sugar-canes, and about fifty fowls, were the only provisions obtained here; in exchange for which, the natives received, with great pleasure, empty cocoa-shells, which had been procured upon other South-Sea islands. The cloth made at Otaheite, and European cloth, bore the next degree of esteem, and iron-ware held the lowest place. Most of the natives, on receiving a cocoa-nut, a piece of cloth, or a nail, in the way of barter, ran away immediately, as if apprehensive lest the other should repent his bargain, and insist on a re-exchange. Their eagerness for cloth led them to part with their caps, head-dresses, necklaces, ornaments for the ears, and several human figures, made out of narrow pieces of wood, about eighteen inches or two feet long, and wrought in a much neater and more proportionate manner, than could have been expected from such a forlorn race. They represented men and women. The features were not pleasing, and the whole figure was much too long to be natural; but, notwithstanding, there was something characteristic in them, which bespoke a taste for the arts. The wood of which they were made was finely polished, close grained, and of a dark brown: nor can it be explained how such toys could come into their possession, as nothing could be found on the island, after the nicest scrutiny, which produced this kind of wood, it being the perfume wood of Otaheite. A very singular figure thus carved, with long nails, and fingers bent downwards, was brought to England, and presented to the British Museum.

Their houses are low, miserable huts, constructed by setting sticks upright in the ground, at six or eight feet distance, then bending them towards each other, and tying them together at the top, forming thereby a kind of Gothic arch. The longest sticks are placed in the middle, and shorter ones each way, and at less distance asunder; by which means the building is highest and broadest in the middle, and lower and narrower towards each end. To these are tied others horizontally, and the whole is thatched over with leaves of sugar-cane. The door-way is in the middle of one side, formed like a porch, and so low and narrow as just to admit a man to enter upon all fours.

The weapons of these islanders are short wooden clubs, and spears about six feet long, crooked, and armed at one end with pieces of flint. They have likewise a weapon made of wood, like the patoo-patoo of New-Zealand.

Not more than three or four canoes were seen belonging to the whole island, and these very mean, and badly constructed. From the small number and lightness of their boats, it may be supposed, that they procure very little of their subsistence from fishing, and particularly as no mention is made of any fishing implements seen here.

During the short time that the Resolution lay at Easter-Island, a circumstance occurred which plainly proved that the natives had no idea of private property. A field of sweet potatoes furnished a desirable article of traffic to the ship's company. Several of the natives dug up these roots, and exchanged them with the officers for what they most valued. After they had employed themselves in this manner for some hours, another native arrived, who with great fury drove the intruders away, and himself alone dug up the roots, and sold them in the manner that the others had done; from which circumstance it was inferred very naturally, that this man was the owner of the field, whom the others had robbed of the fruits of his labour, being tempted to commit the trespass, by the ready market to which they brought their plunder.

They have a king, whom they stile *aree*, or *bareeke*: he is described as a middle-aged man, rather tall, his face and whole body strongly punctured. He wore a piece of cloth made of the mulberry bark, quilted with threads of grass, and stained yellow with turmeric. On his head he had a cap of long shining black feathers, which might be called a diadem. No great degree of homage was observed to be paid to him by the people; and from the poverty of the country, his subjects can afford to shew but few distinctions to their monarch.

Of the religion of these people, our navigators declare themselves entirely ignorant.

C H A P. XXI.

NEW GUINEA, NEW BRITAIN,
NEW IRELAND, NEW HANOVER,
AND OTHER SMALL ISLANDS.*Account of their Situation, Inhabitants, Produce, &c.*

NEW GUINEA.

THIS island was first visited by a European ship in 1529. It was called by Saavedra, a Portuguese, who discovered the north-west part of it, Terra de Papuas, or Papos, as was the south-west part of it New Guinea, by Van Schouten, a Dutch discoverer. The eastern part of it was styled by a French navigator, Louisiade. Dampier touched here; and after Lim Admiral Roggewein. Captain Cook made the coast of this island in September 1770, in latitude 6 deg. 15 min. south; longitude 130 deg. east. But his survey of the island could be but transient; for perceiving when he landed with a party of our people, that the Indians were resolutely bent on hostilities, it was generally agreed upon, to prevent the destruction of those people, as they had no intention to invade their country, to return to the boat. They are said by Captain Cook to make the same personal appearance as the New Hollanders; and the country in general is by him described, as resembling the South-Sea islands, New Zealand, and New Holland, in its vegetable productions. Indeed, New Guinea was supposed to be connected with New Holland, until Captain Cook discovered the strait which separates them. The following is the only particular circumstance relative to the people of this island, mentioned in Captain Cook's account.

"When our people got on board the boat, they rowed along the shore, and the number of Indians assembled seemed to be between sixty and an hundred. All the while they were shouting defiance, and throwing something out of their hands, which burnt exactly like gunpowder, but made no report. What these fires were, or for what purpose intended, could not be guessed at. Those who discharged them, had in their hand a short piece of stick, possibly a hollow cane, which they swung sideways from them, and immediately fire and smoke issued, exactly resembling the discharge of a musket, and of no longer duration. This wonderful phenomenon was observed from the ship, and the deception was so great, that the people on board thought they had fire-arms; and even in the boat, if they had not been so near as that they must have heard the report, if there had been any, they should have thought they had been firing volleys. After looking at them attentively some time, without taking any notice of their flashing and vociferation, the sailors fired some muskets over their heads. Upon hearing the balls rattle among the trees, they walked leisurely away, and the boat returned to the ship. Upon examining some weapons which the

natives had thrown, they were found to be light darts, about four feet long, very ill made, of a reed or bamboo-cane, and pointed with hard wood, in which there were many barbs. They were discharged with great force; for at sixty yards distance they went beyond the party; but in what manner they were thrown could not be exactly seen. But the general opinion was, that they were thrown with a flick, in the manner practised by the New Hollanders."

Captain Forest visited it in 1775. As the Tartar galley, belonging to the East-India Company, then under his command, stood on towards Dory harbour, two of the natives of Papua came on board, and appeared perfectly complacent. Their hair was bushed out to an incredible extent. To render it as bulky as possible, it was combed in a direction straight from the head, which is sometimes ornamented with feathers. The left ears of the women were perforated, and adorned with small brass rings.

Coming to an anchor, our countrymen had an opportunity of taking a view of one of the capital mansions of these people, situated on the bank. These were erected on posts, fixed several yards below low-water mark, for the convenience of the tenants, who occupied divers distinct parts of the mansion, that contained many families. In this country, the married people, unmarried women, and children, live in the larger tenements; and the bachelors by themselves in the smaller.

The men wore a thin stuff, produced from the cocconut tree, tied about the middle, and taken up behind between the thighs. That of the women was a coarse blue stuff, worn round the middle, and tucked up behind like the men's. The boys and girls went naked. Laborious offices here seemed to fall to the lot of the women, while the men idly fauntered about. The natives follow the diversion of hunting the wild hog, which they called Ben, with a kind of fox-looking dogs they called Naf. Among small islands, the wild hogs often swim in a string from one island to another; the hog behind, leaning his snout on those before; so that the sportsmen kill them with ease.

The coast of the promontory of Dory is described as extending about thirteen or fourteen leagues; the height not extreme, and the rise gradual. The country abounds with lofty trees, whose branches afford the traveller an agreeable shade. There are many rivulets of fresh water; and, scattered in particular tracks, good herbage.

The country abounds with hogs; and there are abacoons, and other kinds of fish.

The birds of paradise, which so much excite the curiosity of speculatists, are said to have been first found by the Portuguese on the Island of Gilolo, the Papuas Islands, and on New Guinea. They were denominated *passaros de sol*, i. e. "birds of the sun." By some they were called *manuco Deivata*, "the bird of God." Captain Forest was informed at an island called Linty, on this coast (the small islands on which are numberless)

that the birds of paradise come thither at certain seasons in flocks, and that settling on trees, they are caught with bird-lime, after which their bodies are dried with the feathers on, as they are seen in Europe. It appeared further, that the account of these birds having no legs, being constantly on the wing, and living on the air, which gave rise to the custom of cutting off their legs when offered to sale, was without foundation. The natives kill them as soon as taken. They have formidable bills, and defend themselves with great resolution. But what they subsist on has not been yet discovered. There are six distinct species of these birds; and they have afforded great scope for the speculation of naturalists.

Neither goats nor fowls were found in Dory. All the refreshment that could be procured on shore was the flesh of the wild hog, some species of fish and vegetables excepted. The quadrupeds seen were hogs, dogs, and wild cats.

The nutmeg-tree was found at different islands on this coast, but when cut down, it appeared that the fruit was not ripe. Our people were informed by the natives, that there were many such trees about the country; but they did not discover any knowledge of their worth and importance, though they seemed to set a due value upon other productions. They acknowledged that quantities of nutmegs were collected at certain places, but for what use could not be learnt. The natives, indeed, did not seem inclined to gratify the curiosity of our people, as to this and other particulars.

The Dutch derive such a source of wealth from the nutmeg-tree, that they are jealous lest any foreign power should deprive them of so profitable a monopoly; and being apprehensive that the Chinese, from being so near, should establish a trade with the natives for this useful commodity, they have prevented them by an agreement from coming to this place, though a trade might be so advantageously carried on between the parties. They even send out people yearly to destroy all the nutmeg-trees, wherever they can find them: but it being the natural produce of this part of the country, it will grow, in spite of their utmost efforts to prevent it.

The value of iron amongst these people is such, that for the consideration of receiving an axe or a chopping-knife, the receiver subjects his lands or his labour to a continual tax of some article or other for its use.

The natives, and especially the females, seemed to be of a musical turn. Some of them being asked by one of our people to sing, she gave proofs of a good voice and ear; as did others upon future occasions. Their mode of courting is rather extraordinary. The lover comes freely to the mansion of the favourite female, and without ceremony places himself by her. The old folks at a distance are then said often to call out, "Well, have you agreed?" If the parties agree before witnesses, a cock, procured with great difficulty, is killed, and thus ends the ceremony.

The tenements in which they dwell are poorly furnished; and as they cook in each separate apartment, and have no chimney, the smoke issues out at every part of the roof; so that at a distance the whole roof seems to smoke. They are very expert with the bow. Some of their arrows are six feet long. The former is made of bamboo, and the string of split ratan. They carry on a considerable traffic with the Chinese, of whom they purchase their iron tools, beads, plates, basons, &c. They trade also in slaves, ambergris, tortoiseshell, small pearls, and divers kinds of birds, and particularly the bird of paradise.

The inhabitants here are in general represented as numerous, fierce, and hostile, as appeared from their behaviour when visited by Captain Cook. The people of New Guinea are frequently invaded and carried into slavery by the Mahometans of the Molucca islands adjacent.

NEW BRITAIN was once supposed to be connected with New Guinea, until Dampier discovered it to be divided by a strait. Its most northern point is in 4 deg. south latitude, and it extends to 6 deg. 30 min. south. Dampier gave its most eastern point the name of Cape Orford: it lies in 151 deg. 34 min. east longitude: the western limits had not then been accurately surveyed. Dampier likewise gave names to several small islands which he saw in passing between New Guinea and New Britain. From four of these, volcanoes were observed emitting smoke and fire. The country appeared to be high land, mixed with vallies, every where abounding with large and stately trees, and well inhabited by a strong race of people of a very dark complexion. M. Bougainville represents the natives of this island as entirely black, with frizzled woolly hair, which some of them powdered white, having pretty long beards and white ornaments round their arms in form of bracelets; their nudities but indifferently covered with leaves of trees; in their persons they are tall, active, and robust. He observes, that they kept at some distance from the ships, and discovered a disposition alternately inclined to war and traffic. No European has ever yet had any friendly intercourse with the inhabitants of this island.

Dampier sailed round the north coast of NEW IRELAND, and supposed it to be a part of New Britain. That navigator called the most southern point of it Cape St. George, which, together with Cape Orford in New Britain, were thought to be the two points that formed a deep bay, which he called St. George's Bay. But Captain Carteret, who sailed round it in 1767, found it to terminate in a narrow channel, to which he gave the name of St. George's Channel. This island is a long narrow slip of land lying north-west and south-east, in extent about eighty leagues.

well are poorly furnished separate apartment, the issues out at every distance the whole roof expert with the bow long. The former is of split ratan. They with the Chinese, of tools, beads, plates, in slaves, ambergris, ers kinds of birds, and

north coast of New ve a part of New Britain. ost southern point of it ether with Cape Orford ut to be the two points he called St. George's who sailed round it in n a narrow channel, to St. George's Channel. slip of land lying north- it about eighty leagues. The

The harbour, called by Captain Carteret English Cove, lies in lat. 5 deg. south, long. 157 deg. 19 min. east. There is another harbour about four leagues to westward, which he named Carteret-Harbour.

The crew of the Swallow, who at that time were in general perishing with sickness, obtained relief from some cocoa-nuts found upon this island, as they did also from some rock oysters and cockles they procured from the rocks at low water. The upper part of the tree which bears the cocoa-nut is called the cabbage. This is a white, crisp, juicy substance: it tastes somewhat like a chestnut, but when boiled is superior to the best parsnip, and is, perhaps, the most powerful antiscorbutic in the world. For every one of these cabbages that were obtained, they were forced to cut down a tree, which was done with great regret; but this depredation on the parent stock was unavoidable. These almost-expiring navigators likewise received great refreshment from the fruit of a tall tree that resembles a plum, and particularly that which in the West-Indies is called the Jamaica Plum.

The shore about this place is rocky, and the country high and mountainous, but covered with trees of various kinds, some of which are of an enormous growth. Among others, the nutmeg-tree was found in great plenty. Captain Carteret gathered a few of the nuts, but they were not ripe. They did not appear to be the best sort, but he imputes that to their growing wild, and being too much in the shade of taller trees. The woods abound with pigeons, doves, rooks, parrots, and a large bird with a black plumage, which makes a noise somewhat like the barking of a dog.

The only quadrupeds seen in this island by the crew of the Swallow were two of a small size, which were supposed to be dogs; they were very wild, and ran with great swiftness: here were seen centipedes, scorpions, and a few serpents of different kinds, but no people. They fell in, however, with several deserted habitations, and by the shells that were scattered about them, and seemed not to have been long taken out of the water, and some sticks half burnt, the natives were supposed to have just left the place when they arrived. Captain Carteret was in so enfeebled a state of body as to be prevented from attending circumstantially to a description of the country. However, in English Cove he took possession of it for his Britannic majesty, and nailed upon a high tree a piece of board faced with lead, on which was engraved an English union, with the name of the ship and her commander, the name of the cove, and the time of their coming in and going out of it. M. de Bourgainville touched here about a year after, and gave it the name of Port Praslin. He found part of Captain Carteret's inscription, which seemed to have been taken down and defaced by the natives.

In this island there were some wild boars, large pigeons of beautiful plumage, turtle doves, parrots, and crown birds. Ants swarmed about the thatch-palm and cabbage-trees. The country appeared mountainous;

the soil light, yet producing several kinds of fine timber trees; the pepper-tree is said to be common. Here was found a very extraordinary insect about three inches long; almost every part of its body was of such a texture as to appear like a leaf, even when closely viewed. Each of its wings forms one half of a leaf, and when the two are closed together, it appears like an entire leaf. The under side of its body resembles a leaf of a more dead colour than the upper one. It has six legs, of which the upper joints are likewise similar to parts of leaves. Several flocks of an earthquake were felt here, which lasted about two minutes, and were very distinctly noticed on board, as well as on shore. Here was a prodigious cascade precipitated through vast rocks, which diversified the fall of water.

SANDWICH-ISLAND lies in the western part of St. George's Channel, on which coast the Swallow anchored. Soon after ten canoes put off from New Ireland, with about one hundred and fifty men on board; they exchanged some trifles, but none of them would venture up the side of the ship. They preferred iron to every thing else, although none of it was manufactured except nails; there being no cutlery ware on board. One of their canoes was not less than ninety feet long, being very little shorter than the ship, notwithstanding which, it was formed of a single tree. It had some carved ornaments about it, and was rowed or paddled by thirty-three men. There was no appearance of sails. The Indians were black and woolly-headed like negroes, without their flat noses and thick lips. They were all stark naked, except ornaments of shells about their legs and arms. Their hair, as well as their beards, was profusely covered with a white powder. They were armed with spears, and long sticks or poles, like the quarter staff. As they kept a watchful eye upon the ship's guns, it is probable they were not wholly unacquainted with the effect of fire-arms. They had fishing nets with them, which, as well as their cordage, seemed to be very well made. After they had continued this intercourse for some time, a breeze sprung up, and they returned to the shore.

The Swallow having reached the western point of New Ireland, a fine large island presented itself, to which Captain Carteret gave the name of

NEW HANOVER, to the westward of New Ireland; it was so called by Captain Carteret. The land is high, and finely covered with trees, among which are many plantations, and the whole has a beautiful appearance. About eight leagues to the westward, appeared six or seven small islands, which received the name of the Duke of Portland's Islands.

ADMIRALTY-ISLANDS lie in about 2 deg. 18 min. south latitude; and 146 deg. 44 min. east longitude. There

There are between twenty and thirty islands said to be scattered about here, one of which is very extensive. Captain Carteret, who first discovered them, was prevented touching at them, although their appearance was very inviting, on account of the condition of his ship; and as he was entirely unprovided with such articles of barter as suited the Indian trade.

These islands abound with vegetable productions of various kinds; and the natives seemed to be very numerous. Captain Carteret was of opinion that they produced spices, as he found the nutmeg-tree upon a soil comparatively rocky and barren, upon the coast of New Ireland.

CHRISTMAS-ISLAND was discovered by Capt. Cook, on the 24th of December 1777, and called by him Christmas-Island, from the ship's companies having kept that festival there. It lies in latitude 1 deg. 58 min. north; longitude 202 deg. 28 min. east. Its form is semicircular, and, like most other isles in this ocean, it is surrounded by a reef of coral rocks, extending but a little distance from the shore: and further out than this reef, on the western side, is a bank of sand, which extends a mile into the sea. There is good anchorage on this bank, between eighteen and thirty fathoms. The soil of this island is in some places light and blackish, composed of sand, the dung of birds, and rotten vegetables. In other parts, it is formed of broken coral stones, decayed shells, and other marine productions. These are deposited in long narrow ridges, parallel with the sea coast, and must have been thrown up by the waves. This seems to prove that the island has been produced by different accessions from the sea; and is in a state of augmentation; the broken pieces of coral, and likewise many of the shells, being too large and heavy, to have been brought from the heath by any birds, to the places where our navigators found them lying.

No fresh water could be found in the whole island, though our people frequently dug for it. They met with several ponds of salt water, which having no visible communication with the sea, were supposed to have been filled by the water filtrating through the sand, during the time of high tides. Not the smallest trace of any human footstep could be discerned by our people, who went on shore for the purpose of observing an eclipse of the sun, which happened on the 30th of December; and also for the catching of turtle. Indeed, should any human being be accidentally driven upon the island, or left there, they could scarcely be able to prolong their existence; for though there are birds and fish in abundance, there are no visible means of allaying thirst, nor any vegetable that would serve as a substitute for bread, or correct the bad effects of salt diet. Very little fruit was found on the few cocoa-nut trees upon the island, and that little, not good.

In some parts were observed a few low trees, besides several small shrubs and plants, which grew in a very languid manner. There was a kind of purslain, a spe-

cies of sida, or Indian mallow, with two sorts of grafs. Under these trees fat vast numbers of a new species of egg-bird, black above, and white below, having a white arch on the forehead. These birds are somewhat larger than the common noddy: their eggs are bluish, and speckled with black. There were likewise many common boobies, a sort resembling a gannet, and a chocolate coloured species with a white belly. Man-of-war birds, curlews, plovers, tropic birds, petrels, &c. were also seen here. There were small rats, numbers of land crabs, and lizards.

On this island there was so much fish that some of the crew brought on board as many as weighed upwards of two hundred pounds; from a grappling near the shore. A great quantity were also taken with the hook and line, principally consisting of cavallias, snappers, and a few rock-fish of two species, one with whitish streaks scattered about, and the other with numerous blue spots.

There was procured for both ships, about three hundred turtles, which weighed one with another about ninety pounds: they were all of the green sort, and perhaps not inferior in goodness to any in the world.

When the party that was employed in catching turtle returned on board, a sailor that belonged to the Discovery had been missing two days. At first there were two men who had lost their way; but happening to disagree with respect to the track that was most likely to bring them to their companions, they had separated, and one of them found means to rejoin the party, after an absence of twenty-four hours, during which he had experienced great distress. There being, as before observed, no fresh water upon the island, and not one cocoa-nut tree in that part of it where he was straggling, in order to allay his thirst, he had recourse to the extraordinary expedient of drinking the blood of a turtle, which he had killed for that purpose. His method of refreshing himself, when fatigued, was equally singular, though he said he felt the good effects of it. He undressed himself and lay down in the shallow water on the beach for some time. It was matter of astonishment how these two men lost their way: the land over which their journey lay, from the sea coast to the place where the boats were stationed, did not exceed three miles across; nor was there any thing that could obstruct their view, for the country was level, with a few shrubs dispersed about it; and from many parts, the masts of the vessels could be easily discerned. This, however, seemed to be a rule of direction which they did not think of; nor did they recollect in what part of the island the ships lay at anchor; and they were totally at a loss how to get back to them, or the party from which they had so carelessly strayed. A party was detached in search of the other man, and they soon had the good fortune to find their lost companion. The distress of this man must have been much greater than that of the other straggler, not only as he had been lost a longer time, but he was too delicate to drink turtle's blood.

with two sorts of grafs. There were also several birds of a new species of the below, having a white and red are somewhat larger than the others. There

There being some yams and cocoa-nuts on board, in a state of vegetation, they were planted, by Captain Cook's order, on the small island where the astronomers had observed the late eclipse; and some seeds of melons were sown in another place. The captain also left on that little isle a bottle, containing the following inscription:

Georgius Tertius, Rex, 31 Decembris, 1777.

Discovery, Car. Clerke, Pr.*

CHAP. XXII.

THE SANDWICH ISLANDS.

A General Description. Account of Atooi. Reception of the English there. A remarkable Morai there. Various Observances.

CAPTAIN COOK discovered these islands on his last voyage to the Pacific Ocean in 1778, they were by him distinguished by the name of the Sandwich Islands, in honour of the Earl of Sandwich.

The first five which he saw were called by the natives Woahoo, Atooi, Oneehew, Oreehoua, and Tahoor. He received some intelligence with respect to the existence of a low uninhabited island in the neighbourhood, named Tammata-pappa, which was never visited. Besides, he was further informed, that there were other islands both to the eastward and westward. Owwhyee, the spot where our celebrated navigator fell a victim to the fury of the natives, with some others, was not discovered till some time after those just mentioned, and will therefore be introduced, with every transaction relative to that memorable event, in its proper place. All these islands, he observed, were situated between the latitude of 21 deg. 30 min. and 22 deg. 15 min. north; and between the longitude of 199 deg. 20 min. and 201 deg. 30 min. east. All the information that could be derived respecting Woahoo, the most easterly of the islands discovered, was, that it is high land, and inhabited.

The Captain touched at Oneehew, and was paid a degree of homage by the natives that came on board, as they crouched down upon the deck, nor would quit that humble posture till they were requested to rise. When he went on shore, he took with him three goats, a young boar and sow of the English breed, and also the seeds of onions, pumpkins, and melons. These he disposed of in such a manner, as he thought would best tend to promote the propagation of the respective species. This island is chiefly low land, except one part, which rises immediately from the sea to a considerable height; as does also its south-east point, which terminates in a round hill. Its chief

vegetable productions are yams, and the sweet root called *tee*. Our people procured some salt here, called by the natives *patai*, which is produced in salt ponds. With it they cure both fish and pork; and some of the fish being purchased, proved good, and kept well. The anchoring place at this island was in latitude 21 deg. 50 min. north; and longitude 199 deg. 45 min. east. Oreehoua and Tahoor, are two little islands in the vicinity of the former. Tahoor is uninhabited.

As the ships approached Atooi, many of the inhabitants put off in their canoes, and very readily came along-side. Our people were agreeably surprised to find that they spoke a dialect of the Otaheitean language. They could not at first be prevailed upon by any entreaties to come on board. Captain Cook tied some brass medals to a rope, which he gave to those who were in one of the canoes; and they fastened some mackerel to the rope, by way of equivalent. This was repeated, and some small nails, or pieces of iron, were given them; for which they gave in exchange some more fish, and a sweet potato; a sure indication of having some notion of bartering. One of them even offered for sale the piece of stuff which he wore about his waist.

The natives of this island were of the middling stature, and of a robust form. Their complexion was brown; and though there appeared to be little difference in the casts of their colour, there was a considerable variation in their features. Most of them had their hair cropped rather short; a few had it tied in a bunch at the top of the head; and others suffered it to flow loose. It seemed to be naturally black; but, the generality of them had stained it with some stuff, which changed it to a brownish colour. Most of them had pretty long beards. They had no ornaments about their persons; nor was it observed that they had their ears perforated. Some of them were tattooed on the hands, or near the hips: and the pieces of cloth which were worn by them round their middle were curiously coloured with white, black, and red. They seemed to be mild and good-natured; and were furnished with no arms of any kind, except some small stones, which they had manifestly brought for their own defence; and these they threw into the sea when they found there was no occasion for them.

As the ships sailed along the coast, in quest of a convenient spot for anchorage, some of the natives ventured to come on board; and none of the inhabitants they ever met with before, in any other island or country, were so astonished as these people were, upon entering a ship. Their eyes were incessantly roving from one object to another, while the wildness of their looks and gestures fully indicated their perfect ignorance with respect to every thing they saw; and strongly pointed out, that they had never, till the present time, been visited by Europeans, nor been acquainted with any of their commodities,

K k

except

except iron. This metal, however, they had in all probability only heard of, or at most known it in some inconsiderable quantity, brought to them at a remote period. They asked for it by the appellation of *kamaité*, referring probably to some instrument, in making which iron could be serviceably employed: for they applied that name to the blade of a knife, though they had no idea of that particular instrument, which they could not even handle properly. They also frequently called iron by the name of *toe*, which signifies a hatchet or adze. On being shewn some beads, they first asked what they were, and then whether they were to be eaten? But on their being informed, that they were to be hung in their ears they rejected them as useless. They were equally indifferent with regard to a looking-glass that was offered them, and returned it for a similar reason. China cups, plates of earthen ware, and other things of that kind, were so new to them, that they asked whether they were made of wood? They were, in many respects, naturally polite; or, at least, cautious of giving offence. Some of them, just before their venturing on board, repeated a long prayer; and others afterwards sung, and made various motions with their hands.

When the boats, with a proper officer, were dispatched to look out for a convenient landing-place, the commodore gave peremptory orders, that none of the crew should go on shore, to prevent, if possible, the importation of a dangerous disease into this island, which he knew some of them now laboured under, and which they unfortunately communicated to other islands in this ocean. From the same motive, he commanded that all female visitants should be excluded from both the ships. Many persons of this sex had come off in the canoes. Their complexion and stature were not very different from those of the men: and though their countenances were extremely open and agreeable, few traces of delicacy were visible, either in their faces or other proportions. The only difference in their dress, was their having a piece of cloth about their bodies, reaching from near the middle, almost down to the knees, instead of the *mara* worn by the male sex.

The ships being brought to anchor, the captain went on shore, and was received in the most submissive manner by the islanders, who fell prostrate upon their faces, and continued in that posture of humiliation till, by signs, he prevailed on them to rise. They then presented to him many small pigs, with plantain-trees, making use of nearly the same ceremonies, which had been practised on similar occasions at the Society and other isles; and a long oration, or prayer, being pronounced by an individual, in which others of the assembly occasionally joined. Captain Cook signified his acceptance of their proffered friendship, by bestowing on them in return such presents as he had brought on shore. Having determined on an

excursion into the country, he was accompanied by two gentlemen, and followed by a numerous train of natives, one of whom, who had been very active in keeping the others in order, the captain made choice of as a guide. This man, from time to time, proclaiming the approach of the strangers, every person who met them fell prostrate on the ground, and remained in that humble position till they had passed. This they were afterwards informed is their method of shewing respect to their own great chiefs.

On their excursion they saw a morai, which bore a striking resemblance, in several respects, to those they had seen at Otaheite, and other islands in this ocean. It was an oblong space, of considerable extent, environed by a stone-wall, four or five feet high. The enclosed space was loosely paved; and at one end of it was placed the obelisk or pyramid, called by the natives *hemanao*, which was an exact model of the larger one that they had discerned from the ships. It was about twenty feet in height, and four feet square at the base. Its four sides were formed of small poles, interwoven with twigs and branches, thus composing an indifferent wicker-work, hollow within, from the top to the bottom. It appeared to be in a ruinous state, and had been originally covered with a thin greyish cloth. On each side of it were long pieces of wicker-work, termed *heraene*, in a condition equally ruinous; with two poles inclining towards each other at one corner, where some plantains were placed on a board, fixed at the height of about half a dozen feet. This was called by the islanders *herairemy*; and they said, that the fruit was an offering to their deity. Before the *hemanao* were several pieces of wood, carved into some resemblance of human figures. There was also a stone near two feet in height, covered with cloth. Adjoining to this, on the outside of the morai, was a small shed, which they denominated *harepahoo*; and before it there was a grave, where the remains of a woman had been deposited. On the further side of the area of the morai, there was a house or shed, called *hemanaa*; it was about forty feet in length, ten or eleven feet in height, and ten in breadth in the middle, but narrower at each end; though considerably longer, it was lower than their common habitations. Opposite the entrance into this house stood two images, near three feet high, cut out of one piece of wood, with pedestals. They were said to be *Eatoa no Vahaina*, or representations of goddesses, and were not very indifferent, either in point of execution or design. On the head of one of them was a cylindrical cap, not unlike the head-dress at Otaheite, called *tomou*; and on that of the other, a carved helmet, somewhat resembling those of the ancient warriors; and both of them had pieces of cloth fastened about the loins, and hanging down a considerable way. There was also, at the side of each, a piece of carved wood, with cloth hung on it. Before the pedestals lay a quantity of fern, which had been placed there at different times. In the middle of the

They were said smentations of goddesses, either in point of head of one of them like the head-dress at n that of the other, s embling those of the of them had pieces of, and hanging down a, at the side of each, oth hung on it. Before fern, which had been In the middle of the house,

house, and before the images just described, was an oblong space, enclosed by an edging of stone, and covered with the shreds of cloth. This was the grave of seven chiefs, and was called *heneene*.

From the similarity between this morai, and those of the islands they had lately quitted, little doubt was entertained, that a similarity existed also in the rites here solemnized, and particularly in the horrid oblation of human victims. The conception was soon confirmed: for on one side of the entrance into the *hemanaa*, they observed a small square place, and another still smaller; and on asking what these were, they were informed by their conductor, that in one of them was interred a man who had been sacrificed; and in the other a hog, which had also been offered up to the deity. At no great distance from these were three other square enclosed places, with two pieces of carved wood at each of them, and an heap of fern upon them. These were the graves of three chiefs; and before them was an enclosed space, of an oblong figure, called *iangataboo*, by the guide, who declared to them, that three human sacrifices, one at the funeral of each chief, had been there buried. Indeed, there was not room to doubt of the universal prevalence of this practice in the island under description.

Of all the various articles which the natives brought to exchange with the English, nothing so much attracted their notice, and, it might be added, their admiration, as a sort of cloak and cap, which, even in more polished countries, might be esteemed elegant. These cloaks are nearly of the shape and size of the short ones worn by the men in Spain, and by the women in England, tied loosely before, and reaching to the middle of the back. The ground of them is a net work, with the most beautiful red and yellow feathers so closely fixed upon it, that the surface, both in point of smoothness and glossiness, resembles the richest velvet. The method of varying the mixture is very different; some of them having triangular spaces of red and yellow alternately; others, a sort of crescent; while some were entirely red, except that they had a broad yellow border. The brilliant colours of the feathers, in those cloaks that were new; had a very fine effect. The natives, at first, refused to part with one of these cloaks for any thing that was offered in exchange, demanding no less a price than one of the mullets. They afterwards, however, received as the purchase of them some very large nails. Those of the best sort were scarce; and it is probable, that they are used only on particular occasions. The caps are made in the form of an helmet, with the middle part, or crest, frequently of an hand's breadth. They fit very close upon the head, and have notches to admit the ears. They consist of twigs and osiers, covered with a network, into which feathers are wrought, as upon the cloaks, but somewhat closer, and less diversified; the major part being red, with some yellow, green, or black stripes on the sides. These caps, in all probabi-

lity, complete the dress with the cloaks; for the islanders appeared sometimes in both together.

At first it was not easy to conjecture by what means they procured such a quantity of these beautiful feathers, but were soon made acquainted with that particular from the great number of skins of a small red species of bird they brought for sale. Those that were first purchased consisted only of the skin from behind the shoulder of the wings; but they afterwards got many with the hind part, including the feet and tail. The reason assigned by the inhabitants of Atooi, for the custom of cutting off the feet of these birds is, that by this practice they can preserve them the more easily, without losing any part which they consider as valuable. The red bird of this island was a species of merops, about as large as a sparrow: its colour was a beautiful scarlet, with the tail and wings black; and it had an arched bill, twice as long as the head, which, with the feet, was of a reddish hue. The contents of the head were taken out, as in the birds of paradise. But it was not observed, that they practised any other mode of preserving them, than simple drying; for the skins, though they were moist, had neither smell or taste.

It appears that the inhabitants of this island feed upon human flesh. One of them that came out in a canoe, bringing articles by way of barter, and amongst the rest some fish-hooks, was observed to have a very small parcel fastened to the string of one of them, which he carefully separated, and reserved for himself, when he disposed of the hook. Upon inquiry what it was, he pointed to his belly, and intimated something of its being dead; saying, at the same time, that it was bad. He was requested to open the parcel, which he did with great reluctance, and it was found that it contained a small thin piece of flesh; which had, to all appearance, been dried, but was then wet with salt water. Our people imagining it might be human flesh, put the question to the producer of it; who answered, that the flesh was part of a man. Another of the islanders, who stood near him, was then asked, whether it was a custom among them to eat their enemies who had been slain in battle, on which he replied in the affirmative. Yet further inquiries on this subject were made. A small instrument of wood, beset with shark's teeth, had been purchased, which, as it resembled the saw or knife made use of by the savages of New Zealand, to dissect the bodies of their enemies, was suspected to be employed here for the same purpose. One of the islanders being questioned on this point, acknowledged that the instrument before mentioned served the purpose of cutting out the fleshy part of the belly, when any person was slain. This explained and confirmed the circumstance before related, of the man's pointing to his belly: The native, however, from whom this intelligence was received, being asked, whether his countrymen ever fed on the part thus cut out, strongly denied it; but, when the question was repeated, he shewed some degree of apprehension, and swam off to his canoe.

canoe. An elderly man, who sat foremost in the canoe, was then asked whether they eat the flesh, and he answered in the affirmative. The question being put a second time, he again affirmed the fact, adding, that it was savory food. The inquiry, whether these islanders were cannibals, was renewed when the ships were off Oneehow. The subject did not arise from any questions put by their visitors, but from a circumstance that seemed to remove all doubt. One of the natives, who wished to get in at the gun-room port, was refused; and he then asked, whether they would kill and eat him, if he should come in; accompanying this question with signs so expressive, that a doubt could not be entertained with respect to his meaning. Our people had now an opportunity of retorting the question as to this practice; when a man behind the other in the canoe, instantly replied, that if they were killed on shore, they would not scruple to eat them: not that he meant the natives would destroy them for that purpose, but that their devouring them would be the consequence of creating enmity.

The following are some additional observations made by Captain Cook on the island of which we are here treating.

Further Particulars relative to Atooi. Soil, Climate, Animal, and Vegetable Productions. Dress, Habitations, Music, Weapons, Agriculture, and Manners of the Inhabitants.

THE island of Atooi is at least ten leagues from east to west, from whence its circumference may be nearly guessed.

The land does not in the least resemble, in its general appearance, any of the islands which our late navigators had visited within the tropic of Capricorn, except in its hills near the centre, which are high, but slope gradually towards the sea, or lower lands. Though it presents not to the view the delightful borders of Otaheite, nor the luxuriant plains of Tongataboo, covered with trees, which at once afford a shelter from the scorching rays of the sun, a beautiful prospect to the eye, and food for the natives, yet its possessing a greater portion of gently rising land renders it, in some degree, superior to the above-mentioned favourite islands, as being more capable of improvement. The height of the land within, and the number of clouds hanging over it, seemed to indicate that there was a sufficient supply of water, and that there were some running streams, though our people had not an opportunity of seeing them. The ground, from the woody part to the sea, was covered with an excellent kind of grass, about two feet in height, which sometimes grew in tufts, and appeared capable of being converted into abundant crops of fine hay. But on this extensive space not even a shrub grew naturally. In the narrow valley leading to the morai the soil is of a dark brown colour, rather

loose; but on the high ground it is of a reddish brown, more stiff and clayey. Its quality may be better estimated from its productions, than from its appearance. For the vale, or moist ground, produces taro, much larger than any seen before; and the more elevated ground sweet potatoes, that seldom weigh less than two or three pounds, frequently ten, and sometimes a dozen or fourteen.

The temperature of the climate may be easily guessed from the situation of the island. It was remarked, however, by those who were most capable of judging, that, from what they experienced, it might be said to be very variable; for, according to the general opinion, it was, at this time, the season of the year when the weather is supposed to be the most settled, the sun being at its greatest annual distance. The heat was now very moderate; and few of those inconveniences to which many countries lying within the tropics are subject, either from heat or moisture, seemed to be experienced here. Nor were there any dews of consequence; a circumstance which may partly be accounted for by the lower part of the country being destitute of trees. The rock that constitutes the sides of the valley is a dark grey ponderous stone, but honey-combed, with some spots of a rusty colour, and some very minute shining particles interperfed. It is of an immense depth, and seems to be divided into strata, though nothing is interposed; for the large pieces always broke off to a determined thickness, and did not appear to have adhered to those that were below them. Other stones are, in all probability, much more various than in the southern islands. For during the short time the ships remained here, besides the *lapis hydius*, was found a species of cream-coloured whetstone, sometimes variegated with whiter or blacker veins, like marble; and also common writing slate.

The only tame or domestic animals found here were hogs, dogs, and fowls, which were all of the same kind as those met with in the South-Sea islands in general. There were some small lizards and some rats, resembling those of the other islands.

The voyagers did not meet with scarlet birds alive that were brought for sale; but saw one small one, about the size of a canary bird, of a deep crimson colour. They also saw a large owl, two brown hawks or kites, and a wild duck; and heard from the natives the names of some other birds, among which were the *otoo*, or bluish bird, and the *tarata*, a sort of whimbrel. It is probable that the species of birds are numerous, if a judgment may be formed from the quantity of fine yellow, green, and small, velvet-like, blackish feathers used upon the cloaks, and other ornaments, worn by these people. The island did not appear to produce fish either in quantity or variety, as the only fish seen by our people, besides the small mackerel, were common mullets; a species of a chalky colour; a small brownish rock fish, adorned with blue spots; a turtle, which was penned up in a pond; and three or four

four

forts of fish salted. The few shell-fish seen were converted into ornaments, though they were destitute of the recommendation either of beauty or novelty.

There are six different kinds of plantains; bread-fruit, a few cocoa-palms, some yams, the kappee of the Friendly-Islands, or Virginian arum; the etooa tree, and odoriferous gardenia, or cape jesmine. There were several trees of the dooe dooe, that bear the oily nuts, which are stuck upon a kind of skewer, and made use of as candles. The islanders wear these nuts, hung on strings, round their necks. There is a species of sida, or Indian mallow; also the *morinda citrifolia*, which is here called *none*; a species of convolvulus, the *ava*, or intoxicating pepper, besides a great quantity of gourds. These last grow to a very large size, and are of a remarkable variety of shapes, which are, perhaps, the effect of art. Upon the dry sand, about the village, grew a plant, that had never been seen by our people in this ocean, of the size of a common thistle and prickly, but bearing a fine flower, greatly resembling a white poppy.

The natives of Atooi appear to be of a frank, cheerful disposition; equally free from the sickle levity that characterizes the inhabitants of Otaheite, and the sedate cast which is observable among many of those of Tongataboo. They seem to cultivate a social intercourse with each other, and, except the propensity to thieving, which is, as it were, innate in most of the people of these seas, they were exceeding friendly. When they saw the different articles of European manufacture, they could not refrain from expressing their astonishment, by a mixture of joy and concern, that seemed to apply the case as a lesson of humility to themselves; and, on every occasion, appeared to have a proper consciousness of their own inferiority. It was pleasing to observe with what affection the women managed their infants, and with what alacrity the men contributed their assistance in such a tender office. They are active, vigorous, and expert swimmers; leaving their canoes upon the most frivolous occasion, diving under them, and swimming to others, though at a considerable distance. Women were frequently seen with infants at their breasts, when the surf was so high as to prevent their landing in their canoes, to leap overboard, and swim on shore.

If judgment might be formed from the number seen by our people as they ranged along the coast, the inhabitants of this island are pretty numerous. Including the straggling houses, there might, perhaps, be in the whole island sixty such villages as that near which the ships anchored; and, if allowance is made of five persons to each house, there would be, in every village, five hundred; or thirty thousand upon the island. This number is by no means exaggerated, for there were sometimes three thousand people, at least, collected on the beach, when it could not be supposed that above a tenth part of the natives were present.

Having already described the ordinary dresses of the

natives of both sexes; we shall now attend to particulars. The women have often much larger pieces of cloth wrapped about them, extending from just below the breasts to the hams, and sometimes lower; and several were observed with pieces thrown loosely over their shoulders, which covered the greatest part of the body; but the children, when very young, go entirely naked. They do not wear any thing on the head; but the hair, both of men and women, is cut in various forms, and the general fashion, particularly among the latter, is to have it short behind and long before. The men frequently had it cut on each side in such a manner, that the remaining part somewhat resembled the crest of their caps or helmets. Both sexes, however, seemed to be very careless about their hair, and had no combs, or any thing of the kind, to dress it. The men sometimes twist it into a number of separate parcels, like the tails of a wig, each about as thick as a finger; though most of these, which are so long as to reach far down the back, are artificially fixed upon the head, over their own hair. The people of the Sandwich-Isles have not their ears perforated, nor do they wear any ornaments in them. Both men and women, however, adorn themselves with necklaces composed of bunches of small black cord, like our hat-string, often above an hundred-fold. They have also necklaces of many strings of very small shells, or of the dried flowers of the Indian mallow; and they sometimes hang round their necks a small human figure of bone, about the length of three inches. The women likewise wear bracelets of a single shell, pieces of black wood, with bits of ivory interspersed, and neatly polished, fastened together by a string drawn closely through them; or others of hogs' teeth placed parallel to each other, with the concave part outward, and the points cut off; some of which, formed only of large boars' tusks, appeared very elegant. The men sometimes fix on their heads plumes of feathers of the tropic bird, or those of cocks, fastened round neat polished sticks two feet in length; and, for the same purpose, they sew the skin of a white dog's tail over a stick, with its tuft at the end. They also frequently wear on the head a kind of ornament about the thickness of a finger, covered with yellow and red feathers, curiously varied, and tied behind; and, on that part of the arm which is above the elbow, a sort of broad shell-work grounded upon net-work. The men sometimes puncture themselves upon the hands or arms, but frequently no marks at all were seen; though a few individuals had more of this species of ornament than had been usually noticed at other places, and curiously executed in a great variety of lines and figures, on the arms and fore-part of the body.

Their habitations are scattered about without the least order; some are large and commodious, from 40 to 50 feet in length, and 20 or 30 in breadth; while others are the most contemptible hovels. Their figure resembles that of hay-stacks; or, perhaps, a better idea may be conceived of them, by supposing the roof of a

barn placed on the ground in such a manner as to form an high sharp ridge with two low sides. The gable at each end, corresponding to the sides, makes these dwelling-places close all round; and they are well covered with long grass, which is laid on slender poles. The entrance is made either in the end or side, and is an oblong hole extremely low: it is often shut up by a board of planks fastened together, which serves as a door; but, as it has no hinges, may be removed occasionally. No light enters the house except by this opening; and though such close habitations may be comfortable places of retreat in bad weather, they seem but ill adapted to the warm climate of this country.

They are kept remarkably clean, however, and the floors are strewn with dried grass, over which mats are spread to sit, or to sleep on. At one end stands a bench about three feet high, on which the domestic utensils are placed. These consist of gourd-shells, which the natives convert into vessels that serve as bottles to hold water, and as baskets to contain their food and other things; they have also a few wooden bowls and trenchers of various sizes. Sweet potatoes and plantains constitute the principal part of their vegetable diet; so that yams and bread-fruit are rather to be considered as rarities. Of animal food they appear to be in no want, as they have great numbers of hogs, which run without restraint about the houses; and, if they eat dogs, which is not altogether improbable, their stock of these seemed very considerable. The quantities of fishing-hooks found among them indicated that they procure some supply of food from the sea. They have a custom of salting fish, and likewise pork, which they preserve in gourd-shells. The salt which they use for this purpose is of a reddish colour, but not very coarse.

Their vegetable articles of food they bake with heated stones; and from the great quantity which was seen dressed at one time, it was supposed that all the inhabitants of a village, or at least a considerable number of people, joined in the use of a common oven. They eat out of a sort of wooden trenchers, and, as far as our people could judge from one instance, the women, if restrained from feeding at the same dish, as is the custom at Otaheite, are at least allowed to eat at the same place near them.

The diversions of these islanders are various. The English did not see the dances in which they use the feathered cloaks and caps; but, from the motions which they made with their hands, on other occasions, when they sung, they judged that they were somewhat similar to those they had met with at the southern islands, tho' not so skilfully performed. They had not among them either flutes or reeds, and the only two musical instruments seen were of a very rude kind. One of them does not produce a sound superior to that of a child's rattle. It consists of what may be denominated a conic cap inverted, but very little hollowed at the base, made of a sedge-like plant, the upper part of which, and likewise the edges, are embellish'd with beautiful red

feathers, and to the point, or lower part, is fixed a gourd-shell. Into this they put something to rattle, which is done by holding the instrument by the small part, and shaking it briskly before the face, at the same time striking the breast with the other hand. The other instrument was a hollow vessel of wood not unlike a platter, combined with the use of two sticks, on which one of the natives was observed performing. He held one of the sticks, about two feet in length, with one hand, in the same manner as the Europeans hold a violin, and struck it with the other, which was smaller, and resembled a drum-stick, in a quicker or slower measure; beating with his foot at the same time upon the hollow vessel that lay upon the ground inverted, and thus producing a tune that was not disagreeable. This music was accompanied by the vocal performance of some women, whose song had a pleasing effect.

Much ingenuity is displayed in their different manufactures. Their cloth is made from the *morus papyrifera*, and, doubtless, in the same manner as at Tongataboo and Otaheite; as some of the grooved sticks were bought with which they beat it. Its texture, however, though thicker, is inferior to that of the cloth of either of the places just mentioned; but in colouring or staining it, the inhabitants of Atooi display a superiority of taste, by the infinite variety of figures which they execute. Their colours, indeed, are not very bright, except the red; but the regularity of the figures and stripes is amazing; for, as far as was known, they have nothing like stamps or prints, to make the impressions. Besides the variegated sorts, they have some pieces of plain white cloth, and others of a single colour, particularly light blue, and dark brown. In general, the pieces brought for exchange, were about the breadth of two feet, and four or five yards in length, being the form and quantity made use of by them for their common dress, or *maro*; and even some of these were composed of pieces sewed together. They have also a particular sort that is thin, and greatly resembles oil-cloth; and which is either oiled or soaked in some kind of varnish. They fabricate numbers of white mats, which are strong, with many red stripes, quadrangular and other figures interwoven on one side. These, in all probability, make a part of their dress; for when they offered them to sale, they put them on their backs. They manufacture others of a coarser sort, plain and strong, which they spread over their floors to sleep upon.

Their gourd-shells they stain neatly with undulated lines, triangles, and other figures of a black colour. They also seem to be acquainted with the art of varnishing; for some of their stained gourd-shells are covered with a sort of lacker; and, on other occasions, they make use of a strong size, or glutinous substance, to fasten things together. Their wooden dishes and bowls, out of which they drink their *ava*, are of the *ctoa* tree, or *cordia*, extremely neat, and well polished. They likewise make small square fans of mat or wicker work

with handles of the same, or of wood, tapering from
them, which are curiously wrought with small cords of
hair and cocoa-nut fibres intermixed. Their fishing-
hooks are ingeniously made; some of bone, many of
pearl-shell, and others of wood, pointed with bone.
The bones are for the most part small, and consist of
two pieces; and the various sorts have a barb, either on
the inside, or the outside: but others have both, the
exterior one being furthest from the point. Of the lat-
ter sort, one was procured, nine inches in length, made
of a single piece of bone; the elegant form and polish
of which could not be exceeded by any European arti-
st. They polish their stones by constant friction, with
pumice-stone in water; and such of the tools as were
seen resembled those of the southern islanders. Their
hatchets, or rather adzes, were exactly of the same pat-
tern, and were either formed of a blackish stone, or of
a clay-coloured one. They have also small instruments,
composed of a single shark's tooth, some of which are
fixed to the fore part of the jaw-bone of a dog, and
others to a thin wooden handle of a similar shape; and
at the other end there is a bit of string fastened through
a little hole. They serve occasionally as knives, and
are probably used in carving. The only iron tools seen
among them, and which they possessed before the arrival
of our ships, were a piece of iron hoop, about the
length of two inches, fitted into a wooden handle; and
another edge-tool, which was supposed to have been
made of the point of a broad sword. Their having the
actual possession of these, and their being acquainted
with the use of this metal, inclined some of our people
to imagine, that they were not the first European visi-
tors of these islands. But the very great surprise which
they testified on seeing the ships, and their perfect igno-
rance of the use of fire-arms, cannot be reconciled with
such an opinion. However, some have thought that the
natives of Atooi might have received this metal from
intermediate islands, situated between them and the La-
drones, which the Spaniards have frequented almost
ever since the period of Magellan's voyage in 1719.

Besides their spears, formed of a fine brownish wood,
beautifully polished, some of which are barbed at one
end, and flattened to a point at the other, they have a
kind of weapon which the voyagers had never met with
before: it somewhat resembles a dagger, and is, in gen-
eral, about eighteen inches in length, sharpened at one
or both ends, and secured to the hand by a string. Its
use is to stab in close combat, and seems well adapted for
that purpose. Some of these may be denominated double
daggers, having a handle in the middle, by which they
are the better calculated to strike different ways.
They have likewise bows and arrows; but, both from
their slender construction, and their apparent scarcity, it
is probable that they never make use of them in battle.
The knife or saw, with which they dissect the dead
bodies of their enemies, may also be ranked among their
weapons, as they both strike and cut with it when en-
gaged in close fight. It is a small flat wooden instru-

ment, about a foot in length, of an oval shape,
rounded at the corners: its edges are surrounded with
sharks' teeth, strongly fixed to it, and pointing out-
wards; and it has generally a hole in the handle, through
which passes a long string, which they wrap several
times round the wrist.

Their canoes are commonly about four and twenty
feet in length, and have the bottom, in general, formed
of a single piece of wood, hollowed out to the thickness
of an inch, or more, and brought to a point at each end.
The sides are composed of three boards, each about an
inch thick, neatly fitted, and lashed to the bottom. The
extremities, both at the head and stern, are a little
elevated, and both are made sharp, somewhat resembling
a wedge, but they flatten more abruptly, so that the two
side-boards join each other, side by side, for upwards of
a foot. As they seldom exceed a foot and a half in
breadth, those that go single (for they sometimes join
them) have out-riggers, which are shaped and fitted with
more judgment than any before seen. They are rowed
by paddles, such as had been generally observed at other
islands: and some of them have a light triangular sail,
extended to a mast or boom. The ropes which they use
for their boats, and the smaller cords for their fishing-
tackle, are strong, and neatly made.

The natives seem to possess a knowledge of agricul-
ture. The vale-ground is one continued plantation of
taro, and some other articles, which have all the appear-
ance of being carefully attended to. The potato-fields,
and spots of sugar-cane, or plantains, on the higher
grounds, are planted with great regularity; but neither
these, or the others, are enclosed with any fence, unless
the ditches in the low grounds may be considered as
such: which, it is more probable, are designed to con-
vey water to the taro. The great quantity and excel-
lence of these articles may, perhaps, be as much owing
to skilful culture, as natural fertility of soil, which seems
better adapted to them, than to bread-fruit and cocoa-
nut trees; the few of these latter which were seen, not
being in a thriving state. Notwithstanding this skill in
agriculture, the island, from its general appearance,
seemed to be capable of more extensive improvement,
and of maintaining thrice as many inhabitants as are
now upon it; for the greater part of it, that now lies
waste, was apparently as good a soil as those parts that
were cultivated. It must therefore be inferred, that
these people do increase in that proportion, which would
render it necessary for them to take advantage of the
extent of their island, towards raising a greater quantity
of its vegetable productions for their maintenance.

There was not an opportunity of forming an accu-
rate judgment of the mode of government established
amongst these people; but, from our general observa-
tion, it seemed reasonable to imagine, that it is of the
same nature with that which prevails in all the islands
they had hitherto visited; and, in all probability, their
wars among themselves are equally frequent. This in-
deed might be inferred from the number of weapons
which

which were found in their possession, and from the excellent order in which they kept them. But they had proofs of the fact from their own confession; being informed, these wars are carried on between the different districts of their own island, as well as between it and the inhabitants of the neighbouring islands. No other cause than this need be assigned, to account for the appearance before mentioned, or their population not being proportioned to the extent of their ground that is capable of cultivation.

Besides observing in general that there is an affinity between the manners of these people, and the natives of the Friendly and Society-Islands, here follow a few particulars, that will serve to place this in a striking point of view.

As to religious institutions, and the manner of disposing of the dead, the inhabitants of Tongataboo bury the dead with great decency, and they also inter their human sacrifices; but they do not offer any other animal, or even a vegetable to their deities. The Otaheiteans do not inter their dead, but expose them to waste by time and putrefaction, though they afterwards bury the bones; and this being the case, it is remarkable that they should inter the entire bodies of their human sacrifices. They also offer up to their gods other animals and vegetables; but are far from being attentive to the condition of the places where they celebrate those solemn rites; most of their morais being in a ruinous state, and shewing manifest tokens of neglect. The people of Atooi, again, bury both their common dead, and their human sacrifices, as at Tongataboo; but they resemble those of Otaheite, in offering vegetables and animals to their gods, and in the neglected state of their religious places. It may be observed, also, that the taboo also prevails in Atooi, in its full extent, and apparently with greater strictness than even at Tongataboo: for the natives here always asked with great eagerness, and with indications of a fear of offending, whether any particular thing which they desired to see, or their visitors were willing to shew, was taboo, or (as they pronounced the word) tafoo? meaning, forbidden. The language used in both places may be said to be almost entirely the same.

Discovery of Mowee and Owhyhee. Character of the Natives of the latter. Karakakoo-Bay described. Ceremonies and Customs of the Natives. Captain Cook's Reception there.

BEFORE our navigators had sufficient refreshments, they were obliged to quit these islands. The anchor of the Resolution having started, she drove off the bank a considerable way to the leeward of the ship's last station; so that the commodore foreseeing it would require more time to regain it than he chose to employ, he made the signal for the Discovery to weigh anchor,

and both ships directed their course to the northward, in prosecution of discoveries; which was in February 1778.

Captain Cook, after having explored the dreary regions of the north, for the course of several succeeding months, determined to revisit the Sandwich-Islands, in order to pass a few of the winter months, provided he should meet with the necessary refreshments.

From a more extensive view of the spot on the second visit, which was November 26, 1771, it appeared that the former discovery made by these, of the group of islands, had been imperfect; those which they had visited in their progress northward, all lying to the leeward of their present station.

An elevated hill appeared in the country, whose summit rose above the clouds. The land, from this hill, fell in a gradual slope, terminating in a steep rocky coast; the sea breaking against it in a most dreadful manner. Unable to weather the island, they bore up, and ranged to the westward. They now perceived people on many parts of the shore, and several houses and plantations. The country appeared to be well supplied with wood and water, and streams were seen, in various places, falling into the sea.

The chief design of revisiting these islands, being to procure a competent supply of provisions, must have been frustrated, if a free trade with the natives was permitted; Captain Cook therefore published an order, prohibiting all persons on board the ship from trading, except those appointed by himself and Captain Clerke; and these were under limitations of trading only for provisions and refreshments. Injunctions were also laid against the admittance of women into the ships, but under certain restrictions: but the evil which was intended to have been prevented by this regulation had already got amongst them. While the ships were ranging along the coast, some canoes came off, and, when they got along-side, many of the conductors of them came on board without hesitation. It was perceived that they were of the same nation as those islanders more to the leeward, which they had already visited; and, as they understood, were no strangers to their having been there. These visitors supplied them with a quantity of cuttle fish, in exchange for nails and iron. They brought but little fruit or roots, but said they had plenty of them on their island, as well as hogs and fowls. Many of them afterwards brought divers commodities, which were bartered for such articles as our people had to dispose of. This island was called by the natives Mowee. The chief, who is named Terreeoboo, visited the commodore on board, and made him a present in the usual form.

Another island was soon after seen to the windward, called by the natives Owhyhee. Standing on and off during the night, the English were greatly surprised in the morning, at seeing the summits of the mountain covered with snow. Though they were not of an extraordinary height, the snow, in some places, ap-

peared to be of a considerable depth, and to have re-
mained there some time. Drawing near the shore, the
natives approached, and appeared a little shy at first;
but some were prevailed on to come on board, and, at
length, induced to return to the island, to bring a
supply of what was wanted. Numbers followed, and
brought a tolerable supply of pigs, fruit, and roots.

The commodore having procured a great quantity
of sugar-cane, and, upon trial, discovering that a de-
coction of it made very palatable beer, he ordered some
of it to be brewed for general use; but, on broaching
the casks, not one of the crew would even taste the
liquor. Having no other motive in preparing this be-
verage, than that of preserving the spirits for a colder
climate, he neither exerted his authority, nor had re-
course to persuasion, to induce them to drink it; well
knowing, that so long as they could be plentifully sup-
plied with vegetables, there was no danger of the
scurvy; but, that he might not be disappointed in his
views, he ordered that no grog should be served in
either of the ships. The officers continued to drink
this sugar-cane beer, whenever materials could be pro-
cured for brewing it. Some hops, which were on
board, improved it much; and it was, doubtless, ex-
tremely wholesome; though the inconsiderate crew
thought it injurious to their health.

The voyagers met with less reserve and suspicion,
in their intercourse with the people of this island, than
they had ever experienced among any tribe of savages.
They frequently sent up into the ship, the articles they
meant to barter, and afterwards came in themselves to
traffic on the quarter-deck. The inhabitants of Ota-
heite, whom they had often visited, had not that con-
fidence in their integrity; whence it may be inferred,
that those of Owhyhee are more faithful in their deal-
ings with each other, than those of Otaheite.

At first, they never attempted to over-reach in ex-
changes, or to commit a single theft. They perfectly
understood trading, and clearly comprehended the rea-
son of the ships plying upon the coast. For though
they brought off plenty of pigs, and other provisions,
they were particular in keeping up their price; and,
rather than dispose of them at an undervalue, would
carry them ashore again. Canoes, however, coming
off from all quarters, there were at least a thousand
about the two ships, crowded with people, and laden
with hogs and other provisions. Our people were
perfectly convinced of their having no hostile inten-
tions; not a single person having a weapon with him
of any sort. Trade and curiosity were their only in-
ducements to make the visit. From the numbers
frequently on board, it might be expected that some
of them would betray a thievish disposition. One of
them took a boat's rudder from the ship, and was not
detected, till it was too late to recover it. Captain
Cook imagined this to be a proper opportunity to shew
these islanders the use of fire-arms. Two or three
muskets, and as many four-pounders, were, by his

orders, fired over the canoe which went away with the
rudder: but as the shot was not intended to take the
effect, the surrounding multitude were only surprised
and frightened.

The ships anchoring in the bay, called by the na-
tives Karakahooa-Bay, they continued much crowded
with the natives, and surrounded by a vast multitude of
canoes. In the course of their voyage, such vast
numbers of people had not been seen assembled at one
place. Besides those who came in canoes, all the shore
was covered with spectators; and hundreds were
swimming about the ships, like shoals of fish. They
were struck with the singularity of this scene; and few
on board lamented their having sailed in their late en-
deavours, to find a northern passage homeward the last
summer; since to this disappointment they were in-
debted for revisiting the Sandwich-Islands, and for en-
riching their voyage with a discovery, in many respects,
the most important that has been made by Europeans,
in the Pacific-Ocean.

This bay is situated in the district of Akona, on the
west side of the island of Owhyhee. It extends about
a mile in depth, and is bounded by two points of land,
bearing south-east and north-west from each other, at
the distance of half a league. The north point is flat
and barren, on which is situated the village of Kow-
rowa. A more considerable village, called Kakooa,
stands in the bottom of the bay, near a grove of stately
cocoa-trees. An high rocky cliff, inaccessible from the
sea-shore, runs between them. Near the coast, on the
south-side, the land has a rugged appearance; beyond
which the country gradually rises, and abounds with
cultivated enclosures, and groves of cocoa-trees. The
habitations of the people are scattered about in great
numbers. Round the bay the shore is covered with a
black coral rock, except at Kakooa, where there is an
excellent sandy beach, with a morai at one extremity,
and a spring of fresh water at the other.

As soon as the ships were brought to anchor, the
natives came off in astonishing numbers, expressing
their joy by singing, shouting, and the most extrava-
gant gestures. The decks, sides, and rigging, of the
ships, were covered with them. Women and boys,
who were unable to procure canoes, came swimming
round in great multitudes; some of whom, not finding
room to get on board, amused themselves the whole
day by playing in the water.

A chief called Pareea was amongst those of the na-
tives who came on board the Resolution. Though a
young man, he was soon discovered to be a person of
great authority. He told Captain Cook that he was
Jakane to the sovereign of the island, who was then on
a military expedition at Mowhee, from whence he
was expected to return in a few days. It was not
known whether the word *Jakane* was a name of office,
or expressive of affinity. Some presents from the
commodore attached him to their interests, and they
found him exceedingly useful. Before they had been

M m

long

long at anchor, the Discovery had so many people hanging on one side, that she was observed to heel considerably; and it appeared impossible to prevent the crowds from pressing into her. Captain Cook, apprehensive that she might receive some injury, communicated his apprehensions to Pareea, who instantly cleared the ship of its incumbrances, and dispersed the canoes that surrounded her. From this circumstance, it is plain that the chiefs have a most despotic authority over the inferior people. An instance similar to this happened on board the Resolution, where the crowd so far impeded the ordinary business of the ship, that it was found necessary to apply to Kaneena, another chief, who had also attached himself particularly to Captain Cook. The inconvenience suffered was no sooner mentioned, than he ordered the natives immediately to quit the vessel, when, without a moment's hesitation, they all jumped overboard, except one person, who loitering behind, and, by his manner, expressing some degree of unwillingness to obey, Kaneena took hold of him immediately, and threw him into the sea. These two chiefs were exceedingly well proportioned, and had countenances remarkably pleasing. Kaneena was a fine figure. His height was about six feet; his features were regular and expressive; his deportment was easy, firm, and graceful; and he had dark lively eyes.

The two chiefs, Pareea and Kaneena, afterwards introduced a third on board, whose name was Koah. He was represented as a priest, and one who, in his early days, had distinguished himself as a warrior. He was a little, old, emaciated figure, having sore red eyes, and his body covered with a leprous scurf, occasioned by the immoderate use of the ava. Being conducted to the cabin, he approached the commodore with the greatest deference, threw a piece of red cloth over his shoulders, and retreating a few paces, made an offering of a small pig, at the same time pronouncing a discourse of a considerable length.

During their continuance at Owhyhee, this ceremony was repeated often, and, from a variety of circumstances, it seemed to be a kind of religious adoration. Red cloth is an article with which their idols are arrayed; and a pig is a common offering to the Eatooas. Their speeches were delivered with a volubility that indicated them to be conformable to some ritual.

At the conclusion of this ceremony, Koah dined with the commodore, and ate plentifully of the viands before him; but, like most of the islanders in those seas, he could hardly be induced to taste wine or spirits a second time. In the evening, the commodore went on shore. As soon as they landed on the beach, they were preceded by four men, bearing each a wand tipped with dog's hair, and pronouncing, with a loud voice, a short sentence, in which the word Orono was very distinguishable. The crowd assembled on the shore, retired at their approach; and not an individual was to

be seen, except a few who had prostrated themselves on the ground, near the habitations of the adjacent village. Here it may be proper to observe, that Orono, which was Captain Cook's general appellation among the natives of Owhyhee, was sometimes applied by them to an invisible being inhabiting heaven. It was also a title of great rank in the island.

Though we have already mentioned several morai appertaining to different islands of the South-Seas, that of Owhyhee is so singular in its construction, and so peculiar in its ceremonies, that we shall here describe it.

This morai consisted of a square solid pile of stones, of the length of forty yards, the breadth of twenty, and the height of fourteen. The top of it was flat, and a wooden rail surrounded it, on which were displayed the skulls of those natives who had been sacrificed on the deaths of their chiefs. A ruinous wooden building was situated in the centre of the area, connected with the rail by a stone wall, dividing the whole space into two parts. Five poles, of about twenty feet in height, supported an irregular kind of scaffold, on the side next the country; and, on the side towards the sea, were two small houses, with a covered communication.

Captain Cook, accompanied by a party of gentlemen, was conducted to the summit of this pile by Koah, one of the chiefs before-mentioned. They beheld, at their entrance, two large wooden images, with most distorted features, having a long piece of wood proceeding from the top of their heads, of a conical form inverted: the other parts were covered with red cloth. Here Captain Cook was received by a tall young man, having a long beard, who presented him to the images, and chanted a kind of hymn, in which he was assisted by Koah. The party were then led to that side of the morai where the poles were erected, at the foot of which twelve images were ranged in the form of a semicircle; the middle figure having a high table before it, on which was a putrid hog, and under it some cocoa-nuts, plantains, potatoes, bread-fruit, and pieces of sugar-cane. The commodore was conducted under this stand by Koah, who, taking down the hog, held it towards him, when, having again addressed him in a long and vehement speech, he suffered it to fall upon the ground, and ascended the scaffolding with him, though at the peril of their falling. Ten men now advanced in solemn procession, and entered the top of the morai, bearing a live hog, and a piece of large red cloth of considerable dimensions. Advancing a few paces, they stopped, and prostrated themselves; and a young man approaching them, received the cloth, and carried it to Koah, who wrapped it round Captain Cook, and made him an offering of the hog. The situation of their visitor was truly whimsical. He was aloft, swathed in red cloth, and hardly able to keep his hold in the rotten scaffolding. He was entertained, however, with the chanting of

Koah and Kaireekēea, sometimes in concert, and some-
times alternately.

After this office was performed, which was of
considerable duration, Koah let the hog drop, and he
and his guest immediately descended. He then con-
ducted him to the images, to each of which he expressed
himself in a sneering tone, snapping his fingers at them
as he passed. He then presented him to that in the cen-
tre, which, from its being habited in red cloth, ap-
peared to be in the highest estimation. He fell prostrate
before this figure, and kissed it, requesting Captain
Cook would do the same; which he readily submitted to,
being determined to follow Koah's directions through-
out the whole of this ceremony. The party were
now conveyed into the other division of the morai,
where a space, of about twelve feet square, was sunk
three feet below the level of the area. They descended
into this, and Captain Cook was immediately seated be-
tween two idols, one of his arms being supported by
Koah, and an officer was requested to support the other.
A second procession of natives at this time arrived
with a baked hog, a pudding, some cocoa-nuts, bread-
fruit, and other vegetables. As they drew near, Kai-
reekea placed himself before them, and presented the
hog to the commodore, in the usual manner, chanting
as before, and his companions making regular responses.
Their speeches and responses grew gradually shorter and
shorter; and, towards the conclusion, Kaireekēea's did
not exceed three or four words, which was answered by
the word Orono.

The natives, having concluded this offering, seated
themselves fronting our people, and began to cut up the
baked hog, to break the cocoa-nuts, and to peel the
vegetables. Others were employed in brewing the ava,
by chewing it in the same manner as at the Friendly-
Islands. Kaireekēea then chewed part of the kernel of
a cocoa-nut, and wrapped it in a piece of cloth, with
which he rubbed the captain's head, face, hands, arms,
and shoulders. The ava was afterwards handed round,
and when they had all tasted it, Koah and Pareea pulled
the flesh of the hog in pieces, and proceeded to put
some of it into the mouths of the English. An officer
had no particular objection to being fed by Pareea, who
was remarkably cleanly in his person; but Capt. Cook,
to whom a piece was presented by Koah, could not swal-
low a morsel, the putrid hog being strong in his recol-
lection; and the old man having, from motives of civi-
lity, chewed it for him, his reluctance was much in-
creased by that circumstance.

When the ceremony was finished, the party quitted
the morai, after distributing among the populace some
pieces of iron, and other articles, with which they were
much delighted. They were then conducted in pro-
cession to the boats, the men attending with wands, and
pronouncing sentences as before. Most of the natives
again retired, and the remaining few prostrated them-
selves as they passed along the shore.

Some curiosity being excited by the regular attend-

ance of the priests at the morai, the party determined to
visit the habitations of a society of them which they had
lately discovered. Their huts were erected round a
pond enclosed with a grove of cocoa-trees, by which
they were separated from the beach and the village, and
which gave the situation an air of religious retirement.
When Captain Cook arrived at the beach, he was
conducted to Harre-no-Orono, or the house of Orono.
On his approaching this sacred place, he was seated at
the foot of a wooden idol, resembling those which he
had seen at the morai. Here an officer again support-
ed one of his arms. He was then arrayed in red cloth,
and Kaireekēea, assisted by twelve priests, presented a
pig with the usual solemnities. After this ceremony,
the pig was strangled, and thrown into the embers of a
fire prepared for that purpose. When the hair was
singd off, a second offering was made, and the chant-
ing repeated as before; after which the dead pig was
held, for some time, under the Captain's nose, and then
laid, with a cocoa-nut, at his feet. This part of the
ceremony being concluded, the performers sat down,
and the ava was brewed and handed about; a baked hog
was brought in, and the party were fed as in the former
ceremony. Whenever he went on shore, during
the continuance of the ships in the bay, he was preced-
ed by one of these priests, who proclaimed the landing
of the Orono, and ordered the inhabitants to prostrate
themselves. He was constantly attended by the same
person on the water, where he was stationed in the bow
of the boat, having a wand in his hand to give notice
of his approach to the natives, who were in canoes; on
which they instantly ceased paddling, and fell on their
faces till he had passed.

That the astronomical gentlemen might not be incom-
moded at the observatory on shore, by the intrusion of
the natives, the place was consecrated by the priests,
by placing their wands round the wall by which it was
enclosed.

This interdiction was the *taboo* already mentioned.
No canoes attempted to land near the spot; the natives
only sat on the wall, not daring to come within the ta-
bood space without obtaining permission. The men,
indeed, would bring provisions into the field, but all en-
deavours were ineffectual to induce the women to ap-
proach. Presents were tried, but without success. At-
tempts were made to prevail on Pareea and Koah to
bring them, but to no purpose: the Eatooa and Terre-
oboo, they said, would kill them if they did.

This circumstance afforded great amusement to the
people on board, whither multitudes (particularly wo-
men) continually flocked; inasmuch that they were fre-
quently obliged to clear the vessel, in order to have room
to perform their necessary duties. Two or three hun-
dred women were sometimes obliged to jump at once
into the water, where they continued to swim and play
till they could come on board again.

Not confining themselves to such civilities, the peo-
ple of Owhyhee supplied their visitors with hogs and
other

other provisions, more than sufficient for subsistence; and canoes, laden with provisions, were as regularly sent off to the ships. Nothing was demanded in return, nor was the most distant hint ever given that any compensation was expected. Their manner of conferring favours appeared more like the discharge of a religious duty than the result of mere liberality. All this munificence was at the expence of Kaoo, the chief priest, and grandfather to Kaiteekoa, who was then in the suit of the sovereign of the island.

Some time after the commander's reception at the habitations of the priests, the king in a large canoe, with some attendants in two others, was seen paddling from the village, in great state, towards the ships. Their appearance was noble. Terreeboob and his chiefs were in the first canoe, arrayed in feathered cloaks and helmets, and armed with spears and daggers. In the second came Kaoo, the chief priest, together with his brethren, having their idols displayed on red cloth. These idols were figures of an enormous size, made of wicker work, and curiously ornamented with small feathers of a variety of colours. Their eyes were large pearl-oysters, with a black nut placed in the centre; a double row of the fangs of dogs was fixed in each of their mouths, which, as well as the rest of their features, appeared distorted. The third canoe was laden with hogs and vegetables. As they advanced, the priests, in the second canoe, chanted their hymns with great solemnity. After paddling round the vessels, they did not come on board as was expected, but made immediately towards the shore at the beach, where an English party was stationed.

On their approach, the officers of the party ordered the guard to be drawn up in form to receive the king; and Captain Cook, seeing that he intended to go on shore, went thither also, and landed almost at the same instant. They were ushered into the tent, and the king was hardly seated, when he rose up, and gracefully threw over the captain's shoulders the rich feathered cloak himself had wore, placed an helmet on his head, and presented him with a curious fan. Five or six other cloaks, of great beauty and value, were spread at his feet.

Then four hogs were brought forward by the king's attendants, together with bread-fruit, cocoa-nuts, and sugar-canes. Afterwards followed the ceremony of Terreeboob's changing names with Captain Cook, the strongest pledge of friendship among all the islanders of the Pacific-Ocean. A solemn procession now advanced, consisting of priests, preceded by a venerable personage, followed by a train of people leading large hogs; others being laden with potatoes, plantains, &c. It was easily perceived, by the countenance and gestures of Kaiteekoa, that the old man who headed the procession was the chief priest, on whose bounty the English had so long subsisted. He wrapped a piece of red cloth round the shoulders of Captain Cook, as a mark of peculiar respect. The officers were not a little surprised to recognize,

in the person of the king, an emaciated old man, who had come on board the Resolution, from the north-east side of the island of Mowee; and perceived that several of his attendants were the same persons as before accompanied him.

When the usual ceremonies of interview had passed, Captain Cook conducted Terreeboob, and several of his chiefs, on board the Resolution. They were received with every possible attention and respect; and the commodore put a linen shirt upon the sovereign, and girt his own hanger round him. Kaoo, and about half a dozen other ancient chiefs, remained on shore.

During all this time, not a canoe was permitted to appear in the bay, and those natives who did not confine themselves to their huts, lay prostrate on the ground. Before the king quitted the Resolution, he granted leave for the natives to trade with the ships as usual, except the women, who were prohibited from this privilege.

CHAP. XXIII.

Friendly Behaviour of the People of Owhyhee. Their Priests and Ceremonies. Their Opinion of their Visitors. Presents from their King Terreeboob. Ships depart, but are obliged to return.

SUCH confidence was placed in the natives here by our people, that the officers, &c. frequently made excursions up the country, either singly, or in small parties, and even ventured to continue out the whole night. Indeed, it would be endless to relate all the instances of generosity they received upon these occasions.

The people flocked about them every where, anxious to afford every assistance in their power, and appeared highly gratified, if they condescended to accept of their services. Variety of innocent arts were practised to attract their notice, or to delay their departure. The boys and girls ran through their villages before them, stopping at every opening, where there was a commodious place to form a group for dancing. They were at one time solicited to take a draught of the milk of cocoa-nuts, or accept of such other refreshment as their huts afforded: at another, they were encircled by a company of young women, who exerted their skill and agility in amuling them with songs and dances. The more agreeable the natives rendered themselves to our people, by their instances of hospitality, the greater was their disgust and concern, at finding them prone to theft, the general vice of the islanders of these seas. This was a distressing circumstance, and sometimes obliged them to exercise severity, which they would have been happy to have avoided, if it had not been essentially necessary. Some expert swimmers were one day detected under the ship, drawing out the nails from the sheathing, which they ingeniously performed

with a flint stone, fastened to the end of a short stick. This practice was so injurious to the vessels, that our people fired small shot at the offenders: but that they easily evaded, by diving to the bottoms of the ships. It therefore became highly necessary to make an example of one of them, by flogging him on board the ship.

At this time an excursion into the country, by a large party from both ships, afforded Kaoo a fresh opportunity of exercising his civility and generosity. No sooner was he informed of their departure, than he sent after them a large quantity of provisions, with orders, that every attention and assistance should be granted them by the inhabitants of those districts through which they were to pass. His conduct, on this occasion, was so delicate and disinterested, that even the people he employed were not permitted to accept of the smallest present. At the end of six days the party returned, without having penetrated more than twenty miles into the island.

The natives presented their visitors with the exhibition of a boxing-match. Though these games were inferior, in every respect, to those they had seen exhibited at the Friendly-Islands, yet, as they were somewhat different, we shall here give a short account of them.

A vast concourse of people assembled on an even spot of ground, not far distant from the tents. A long vacant space was left in the centre of them, at the upper end of which the judges presided, under three standards. Slips of cloth, of various colours, were pendent from them; as were the skins of two wild geese, some small birds, and a few bunches of feathers.

The necessary preparations being made, the judges gave the signal, and two combatants appeared in view. They advanced slowly, drawing up their feet very high behind, and, rubbing their hands upon the soles. As they came forward, they frequently surveyed each other from head to foot, with an air of contempt, looking archly at the spectators, distorting their features, and practising a variety of unnatural gestures. When they were advanced within the reach of each other, they held both arms straight out before their faces, at which part they always aimed their blows. They struck with a full swing of the arm; did not attempt to parry, but endeavoured to elude their adversary's attack, by stooping or retreating. The battle was expeditiously decided; for if either of them fell, whether by accident, or a blow, he was deemed vanquished; and the victor expressed his triumph by a variety of strange gestures, which usually excited a loud laugh among the spectators, for which purpose it seemed to be calculated. The successful combatant waited for a second antagonist; and, if again victorious, for a third; and so on, till he was at last defeated.

When any two of these champions were preparing to attack each other, a third might advance, and make choice of either of them for his antagonist, when the other was

under the necessity of withdrawing. If the combat proved long and tedious, or appeared unequal, a chief generally interfered, and concluded it by putting a stick between the combatants. As this exhibition was at the desire of our people, it was expected that some of them would have engaged with the natives; but though they received pressing invitations to bear a part, they did not hearken to the challenges, not having forgot some blows they received at the Friendly-Islands.

At this time, the death of William Whatman, a seaman of the gunner's crew, is particularly mentioned. He was a man in years, and much respected for his attachment to Captain Cook. He had served twenty-one years as a marine, and then entered as a seaman in 1772, on board the Resolution, and served with the commodore in his voyage towards the south pole. On their return, he got admittance into Greenwich-Hospital, through the interest of Captain Cook, at the same time with himself; and, anxious to follow the fortunes of his benefactor, he also quitted it with him, on his appointment to the command of the present expedition. He had been often subject to slight fevers in the course of the voyage, and was infirm when the ships arrived in the bay; where having been sent a few days on shore, he thought himself perfectly restored, and requested to return on board. His request was complied with; but the day following he had a stroke of the palsy, which, in two days afterwards, put a period to his life.

As an additional instance of respect to his visitors, Terreeboo caused the remains of this honest seaman to be buried in the morai, with great solemnity. Kaoo and his brethren were present at the funeral; they behaved with great decorum, and paid due attention while the service was performing. On our people beginning to fill up the grave, they approached it with great awe, and threw in a dead pig, together with some cocoa-nuts and plantains. For three successive nights they surrounded it, sacrificing hogs, and reciting hymns and prayers till morning. A post was erected at the head of the grave, and a piece of board nailed thereon, on which was inscribed the name and age of the deceased, and the day of his departure from this life. These the natives assured them they would not remove; and they will probably be permitted to remain, so long as such frail materials can endure.

The ships being in want of fuel, Captain Cook desired Lieutenant King to treat with the priests for the purchase of the rail on the morai. Mr. King had his doubts about the decency of this overture, and apprehended that the bare mention of it might be deemed impious; but in this he was exceedingly mistaken. They expressed no kind of surprise at the application, and the wood was delivered without the least stipulation. They were indeed so little affected by the circumstance, that they even assisted in the removal. When the particulars were mentioned to Kaoo, he seemed indifferent about the matter, desiring only the restoration of the centre

image, which being immediately complied with, it was conveyed to one of the priest's houses.

As the chiefs of the island had frequently expressed an importunate desire to know the precise time fixed for the departure of the English, a curiosity was excited in the minds of the speculative part of them, to learn the opinion entertained by the islanders, relative to them and the objects of their visit. The only information that could be obtained was, that they supposed our people had left their native country on account of the scantiness of provisions, and had visited them for the sole purpose of filling their bellies. This conclusion was natural enough, considering the meagre appearance of some of the crew, the voracity with which they devoured their fresh provisions, and their anxiety to purchase as much of it as possible. One circumstance may be added to these, which puzzled them exceedingly, namely, that of our people having no women with them. The natives would often pat the bellies of the sailors (who were much improved in sleekness after their arrival at the bay) and telling them, in the best manner they could, that it was time for them to depart; but if they would return the next bread-fruit season, they should be better able to supply them. They had now continued sixteen days in the bay, during which time the consumption of hogs and vegetables had been so enormous, that our people could not be surpris'd at their wishing to see them take their leave. However, it appeared that Terreeooboo had no other view in his inquiries, than a desire of having sufficient notice, to prepare suitable presents for them at their departure: for when he was informed of their intention to quit the island in two days, a kind of proclamation was immediately made, requiring the natives to bring in their hogs and vegetables, for the king to present to the Orono.

A droll genius among them exhibited a variety of tricks for the entertainment of our people on shore. In his hand he held an instrument of music; bits of seaweed were fastened round his neck; and, round each leg, some strong netting; on which were fixed some rows of dogs teeth, hanging loose. His dancing was accompanied with strange grimaces, and unnatural distortions of the features, which, though sometimes highly ridiculous, were, upon the whole, without meaning or expression. This diversion was closed with wrestling and boxing matches: and our people, in return, exhibited the few fire-works they had remaining. Nothing could more effectually excite the admiration of these islanders, or strike them with more exalted ideas of the superiority of their visitors, than such a representation. Though this was, in every respect, much inferior to that at Hapae, yet the astonishment of the people was equally great.

Before the departure of the ships from the island, the time of which was now fixed on, Terreeooboo invited the commodore, principal officers, &c. to attend him to Kao's residence. On their arrival there, they

saw large quantities of cloth lie scattered on the ground; abundance of red and yellow feathers fastened to the fibres of cocoa-nut husks; and plenty of hatchets and iron ware, which had been received in barter. Not far from these was deposited an immense quantity of various kinds of vegetables; and, at a little distance, a large herd of hogs. It was supposed, at first, that the whole was intended as a present for them, till they were informed by Kaireekoa, that it was a tribute to the king, from the inhabitants of that district. The guests were no sooner seated, than the bundles were brought, and laid severally at Terreeooboo's feet; and the cloth, feathers, and iron, were displayed before him.

The king expressed the highest degree of satisfaction at this mark of duty and affection from his subjects; and having caused about a third of the iron utensils, and some pieces of cloth to be selected, ordered these to be set aside by themselves; and the remainder of the cloth, hogs, vegetables, &c. were afterwards presented to Captain Cook. The whole of this welcome present was immediately conveyed on board. The large hogs were selected, in order to be salted for sea store; but the smaller pigs, and the vegetables, were divided between the crews, Lieutenant King being the last on shore, and waiting for the return of the boat, the inhabitants crowded about him, and having prevailed on him to sit down among them, expressed their regret at his separation from them. It was even with difficulty that they would suffer him to depart. He was, indeed, highly esteemed among them, as will appear from the following relation. Having had, while the ships were in the bay, the command of the party on shore, he became more acquainted with the natives, and they with him, than those who were required to be on board. He experienced great kindness and civility from the inhabitants in general; but the friendship shewn by the priests was constant and unbounded.

Being anxious to conciliate their esteem, he so happily succeeded, that, when they were acquainted with the time of his departure, he was urged to remain behind, and received overtures of the most flattering kind. When he endeavoured to excuse himself, by alleging that Captain Cook would not permit it, they proposed to conduct him to the mountains, and there conceal him, till the departure of the ships. On further assurance that the captain would not sail without him, the king and Kao repaired to Captain Cook (whom they supposed to be his father) formally requesting that he might be suffered to remain behind. The commodore, unwilling to give an absolute refusal to a proposal so generously intended, he assured them, that he could not then part with him; but he should return thither the next year, when he would endeavour to oblige them. The ships at length unmoored and sailed out of the bay, attended by a vast number of canoes. It was Captain Cook's intention to furnish the

survey of Owhyhee, before he went to the other islands, hoping to meet with a road more sheltered than Karakakooa-Bay; and if he should not succeed here, he meant to examine the south-east part of Mowee, where, he had been informed, there was an excellent harbour.

The people on board, in their progress to the northward, observed two men in a canoe paddling towards them. They naturally conjectured that they had been driven off the shore by stress of weather, and stopped the ship's way, in order to take them in. They were so exhausted with fatigue, that had not one of the natives on board jumped into the canoe to their assistance, they would hardly have been able to fix it to the rope thrown out for that purpose. With difficulty, however, they were got up the ship's side, together with a child about four years of age, which had been lashed under the thwarts of the canoe, with only its head above the water. They informed their deliverers, that they had quitted the land the morning before, since which time they had no food or water. Provision was given them with proper precautions, and the child intrusted to the care of one of the women on board; and the next morning they were all perfectly recovered.

The Resolution having received very essential damage in a gale of wind; inasmuch as totally to obstruct her further progress, Captain Cook for some time hesitated whether he should return to Karakakooa, or take the chance of finding a harbour in the islands to leeward. The bay was not so commodious, but that a better might probably be met with, either for repairing the masts, or procuring refreshments; the latter of which, it was imagined, the neighbourhood of Karakakooa had lately been pretty well drained of. It was, on the other hand, considered as an imprudent step, to leave a tolerable good harbour, which, once lost, could not be regained, for the mere possibility of meeting with a better; especially as the failure of such a contingency might have deprived them of any resource. Therefore concluding as to length to return, the ships stood in for the bay, and, upon arrival, came to anchor in their former station.

Alteration in the Behaviour of the Islanders. A Theft and its Consequences. The English attacked. Fresh Jealousies and Animosity. Attempt to secure the Person of the King. Failure. An insolent Chief shot by Captain Cook. General Attack, which ends with the Death of that gallant Commander.

THE English were beyond measure astonished at their reception, on coming to anchor in Karakakooa-Bay a second time. No shouts, bustle, or confusion, but a solitary bay, with hardly a canoe stirring was observed. The curiosity of the natives, indeed, might be supposed to be diminished by this time: but the

hospitable treatment the English had continually been favoured with, and the friendly footing on which they parted, induced them to expect that, on their return, they would have received them with the greatest demonstrations of joy.

The cause of this strange appearance was thus explained by the return of a boat, which had been sent on shore. That Terreeoboo was absent, and that the bay was *tabooed*. This account appeared very satisfactory to many; but others were of opinion that there was, at this time, something very dubious in the behaviour of the natives; and that the *taboo*, or interdiction, on pretence of Terreeoboo's absence, was artfully contrived, to give him time to consult his chiefs in what manner they should be treated. They never could ascertain whether these suspicions were well founded, or whether the natives had given a true account. A cause of suspicion might also arise from the following circumstance. A native having sold a hog on board the Resolution, and received the price agreed on, Pareea, who saw the transaction, advised the seller not to part with his hog, without an advanced price. For his interference in this business, he was harshly spoken to, and pushed away: and as the *taboo* was soon laid on the bay, it was at first supposed to be in consequence of the affront offered to the chief. These two causes considered, it was extremely difficult to draw any certain conclusions. Lieutenant King also received information that several chiefs were assembled near the beach, and were driving away the natives, who assisted the sailors in rolling the casks to the shore; that their behaviour seemed exceedingly suspicious, and liable to raise further disturbance. The lieutenant sent a marine with the officer who brought the intelligence, agreeable to his request, but permitted him to take only his side-arms. The officer in a short time returned; and informed Mr. King that the inhabitants had armed themselves with stones, and were become tumultuous. He therefore went himself to the spot, attended by a marine with his musket. At their approach the islanders threw away their stones; and on Mr. King's application to some of the chiefs, the mob was dispersed. Every thing being now quiet, Mr. King went to meet Captain Cook, who was then coming on shore in the pinnace. He related to him what had recently happened; and received orders to fire a ball at the offenders, if they again behaved insolently, and began to throw stones. In consequence of these directions, Mr. King gave orders to the corporal, that the centinels' pieces should be loaded with ball, instead of shot. A continued fire of muskets being heard from the Discovery, and perceived to be directed at a canoe which was hastening towards the shore, with one of the small boats in pursuit of it, this firing, it was concluded, was in consequence of a theft. Captain Cook, therefore, ordered Mr. King to follow him with a marine armed, and to endeavour

to seize the people as they landed. They accordingly ran to the place where the canoe was expected to come ashore, but did not arrive in time; the people having quitted it, and fled into the country before they came up. Being wholly ignorant, at this time, that the goods had been already restored, and thinking it probable, from what they had observed, that they might be of importance, they did not choose to relinquish their endeavours to recover them; and having inquired of the natives what course the people had taken, they pursued them till it was almost dark, when they supposed themselves to be about three miles from the tents; and thinking the islanders amused them with false information in their pursuit, gave up the search, and returned. An incident occurred during their absence, that occasioned a difference of a very serious nature. The officer who had been dispatched in the small boat after the thieves, and who was returning on board with the booty that had been restored, seeing Captain Cook and Mr. King engaged in the pursuit of the offenders, seized a canoe which was drawn up on the shore. This canoe unfortunately belonged to Pareea, who, at that instant arriving from on board the Discovery, claimed his property, and protested his innocence. The officer persisted in detaining it, in which he was encouraged by the crew of the pinnace, then waiting for Captain Cook; in consequence of which a scuffle ensued, and Pareea was knocked down by a violent blow on the head with an oar. Several of the natives, who had hitherto been peaceable spectators, began now to attack our people with a shower of stones, so that they were forced to a precipitate retreat, and swam off to a rock at a considerable distance from the shore. The pinnace was plundered immediately by the natives, and would have been entirely demolished, if Pareea had not interposed.

On hearing these circumstances, Captain Cook expressed the greatest concern, and discovered some apprehensions, that the islanders would oblige him to pursue violent measures; adding, they must not be permitted to suppose that they had gained an advantage. It was, however, too late to take any steps that evening: he therefore only gave orders that every islander should be immediately turned out of the ship. This order being executed, Lieutenant King returned on shore; and the events of the day having much abated former confidence in the natives, a double guard was posted on the morai, with orders to let Mr. King know, if any men were lurking about the beach. At eleven o'clock, five of the natives were seen creeping round the bottom of the morai: they approached with great caution, and, at last, perceiving they were discovered, immediately retired out of sight. About midnight one of them ventured himself near the observatory, when a sentinel fired over him, on which they all fled; and there was no further disturbance during

the remainder of the night. Next morning Mr. King received information that the Discovery's cutter had, some time in the night, been stolen from the buoy where it had been moored.

Going on board the Resolution, he found the marines were arming themselves, and Captain Cook busied in loading his double-barrelled gun. Whilst he was acquainting him with what had happened in the night at the morai, he eagerly interrupted him, informing him that he had received intelligence of the loss, and was making preparations to recover it.

It was his usual practice, in all the islands of this ocean, when any thing of consequence had been stolen from him, by some stratagem, to get the king, or some of the principal Erees, on board, where he detained them as hostages, till the property was restored. This method having hitherto proved successful, he meant to adopt it on the present occasion; and gave orders to stop every canoe that should attempt to leave the bay; resolving to seize and destroy them, if the cutter could not be recovered by peaceable means. Pursuant to this order, the boats of the ships, properly manned and armed, were stationed across the bay; and, before Mr. King quitted the ship, some great guns were fired at two canoes, that were attempting to escape.

Captain Cook and Mr. King quitted the ship together: the former in the pinnace, with Mr. Phillips, lieutenant of marines, and nine privates; and the latter in the small boat. The last orders Mr. King received from Captain Cook were, to quiet the minds of the natives on that side the bay where our people were stationed, by the strongest assurances that they should not be injured; to keep his people together, and to be continually on his guard. Captain Cook and Mr. King then separated; the captain going towards Kowrowa, where Terreeboob resided, while Mr. King proceeded to the beach. His first business, when he arrived on shore, was, to issue strict orders to the marines to continue within the tent, to charge their muskets with ball, and not, on any consideration, to quit their arms. He then attended old Kaoo and the priests at their respective huts, and explained to them, as well as he was able, the reason of the hostile preparations which had so exceedingly alarmed them. He found they were no strangers to the circumstance of the cutter's being stolen, and assured them, that though the commodore was not only resolved to recover it, but also to punish, in the most exemplary manner, the authors of the theft, yet that they, and all the inhabitants of the village, on that side, had not the least occasion to be alarmed, or to apprehend the least danger. He importuned the priests to communicate this to the people, and entreat them not to entertain an idea of fear, but to continue peaceable and quiet. Kaoo demanded of Mr. King, with great emotion, if any harm was to happen to Terreeboob? He assured him there was not; and both he and

his brethren appeared much satisfied with this as-
surance.

Captain Cook, having landed at Kowrowa, with the lieutenant and nine marines, he proceeded immediately into the village, where he was respectfully received; the people, as usual, prostrating themselves before him, and making their accustomed offerings of small hogs. Perceiving that his design was not suspected, his next step was to inquire for the king and the two boys, his sons, who had been almost continually his guests on board the Resolution. The boys presently returned with the natives, who had been searching for them, and immediately conducted Capt. Cook to the habitation where Terreeoboo had slept. The old man had just awoke; and after some conversation respecting the loss of the cutter, from which the commodore was convinced that he was not in any wise privy to it, he invited him to accompany him, and spent the day on board the Resolution. The king accepted the invitation, and arose immediately to accompany him. The two boys were already in the pinnace, and the rest of the party approaching the water-side, when a woman, named Kanee-Karabeea, the mother of the boys, and one of Terreeoboo's favourite wives, followed him, beseeching him, with tears and entreaties, not to go on board. Two chiefs, who came with her, took hold of him, and, insisting he should proceed no further, obliged him to sit down. The islanders, now collecting in vast numbers along the shore, who had probably been alarmed by the discharging of the great guns, and the hostile appearances in the bay, gathered together round Captain Cook and Terreeoboo. Thus situated, the lieutenant of marines, perceiving that his men were huddled together in the crowd, and consequently unable to use their arms, if there should appear to be a necessity for it, proposed to Captain Cook, to draw them up along the rocks, close to the edge of the water. The populace making way for them to pass, the lieutenant drew them up in a line, within about thirty yards of the place where Terreeoboo was sitting.

The old king continued, all this time, on the ground, bearing the most visible marks of terror and dejection in his countenance. Captain Cook, unwilling to abandon the object which occasioned him to come on shore, urged him most earnestly to proceed; whilst, on the other hand, whenever the king expressed any inclination to follow him, the chiefs who surrounded him interposed: at first they had recourse to prayers and entreaties, but afterwards to force and violence, and even insisted on his remaining on shore. Captain Cook, at length, perceiving the alarm had spread too generally, and that there was not a probability of getting him off without bloodshed, gave up the point, observing, that to compel him to go on board would probably occasion the loss of many of the lives of the inhabitants.

Though this enterprize had now failed, and was

abandoned by Captain Cook, yet it did not appear that his person was in the least degree of danger, till an accident happened, which occasioned a fatal turn to the affair. The boats, stationed across the bay, having fired at some canoes for attempting to get out, unfortunately had killed one of their principal chiefs. Intelligence of his death arrived at the village where Captain Cook then was, just as he had parted from the king, and was proceeding with great deliberation towards the shore. The ferment it immediately occasioned was but too conspicuous; the women and children were instantly sent away, and the men were soon clad in their war-mats, and armed with spears and stones.

One of the natives having provided himself with a stone, and a long iron spike (called by the natives a *pahoo*) advanced towards the captain, flourishing his weapon in defiance, and threatening to throw the stone. The captain requested him to desist; but the islander repeating his menaces, he was highly provoked, and fired a load of small shot at him. The man was defended by his war-mat, which the shot could not penetrate; his firing, therefore, served only to irritate and encourage them. Volleys of stones were thrown at the marines; and one of the natives attempted the life of one of our people with his *pahoo*, but not succeeding in the attempt, he received from him a blow with the butt-end of his piece. Captain Cook immediately discharged his second barrel loaded with ball, and killed one of the assailants. A general attack with stones succeeded, which was followed on the part of our people by a discharge of musquetry, not only from the marines, but those in the boats. The natives received the fire with great firmness; and without giving time for the marines to charge again, they rushed in upon them with dreadful shouts and yells. What followed was a scene of horror and confusion.

Four of the marines retreated among the rocks, and fell a sacrifice to the fury of the enemy; three others were dangerously wounded; and the lieutenant stabbed between the shoulders, but having reserved his fire, he shot the man from whom he had received the wound at the instant he was preparing to repeat the blow. The last time the unfortunate commander was distinctly seen, he was standing at the water's edge, ordering the boats to cease firing and pull in. Such as were present supposed that the marines, and those who were in the boats, fired without Captain Cook's orders, and that he was anxious to prevent the further effusion of blood: it is therefore probable, that on this occasion his humanity proved fatal to him; for it was observed, that while he faced the natives he was not endangered, but when he turned about to give directions to the boats, he was stabbed in the back, and fell with his face into the water. A general shout was set up by the islanders on seeing him fall, and his body was dragged inhumanly on shore, where he was surrounded by the enemy,

enemy, who, snatching the dagger from each others hands, displayed a savage eagerness to join in his destruction.

Thus ended the life of the greatest navigator that this or any other nation ever could boast, after having successfully led his crews of gallant British seamen thrice round the world; reduced to a certainty the non-existence of a Southern Continent, concerning which the learned of all nations were in doubt, settled the boundaries of the earth and sea, and shewn the impracticability of a north-west passage from the Atlantic to the Great Southern-Ocean, for which our ablest navigators had contended, and in pursuit of which vast sums had been expended in vain, and many valuable mariners had unfortunately perished.

Captain Cook raised himself solely by his merit from a very obscure birth to the rank of Post-Captain in the Royal-Navy. He possessed, in an eminent degree, all the qualifications requisite for his profession and great undertakings. Deliberate in judging; sagacious in determining; active in executing; unflinching by labour, difficulties, and disappointments; fertile in expedients, never wanting presence of mind, but ever possessing the full use of a sound understanding. In discipline, though mild and just, he was exact: he was a father to his people, who were attached to him from affection, and obedient from confidence. By his benevolent and unabated attention to the welfare of his ship's company, he discovered and introduced a system for the preservation of the healths of seamen, which has proved wonderfully efficacious. With a company of 118 persons he performed his second voyage, and but one of these died of a disease. That spirit of humanity and justice with which he treated the savages wherever he found them, when opposed to the ferocious and inhuman conduct of the first conquerors in the New World, does honour to his age and country, and will hand him down with reverence to posterity. Nor was his humanity less conspicuous in his endeavours to civilize the natives of those remote regions, and to introduce some of our most useful animals, vegetables, and grain among them.

CHAP. XXIV.

Further Transactions after Captain Cook's Death. Peace restored. His Remains interred. The Ships depart from Owhyhee. Supplementary Observations on the Country, &c.

FOUR of the marines, as we have already mentioned, being killed on the spot, the rest, with the lieutenant, threw themselves into the water, and made their escape under cover of a smart fire from the boats. On this occasion a striking instance of gallant behaviour, and of affection for his men, was displayed by

the lieutenant; for he had scarcely got into the boat, when, seeing one of the marines, who was a bad swimmer, struggling in the water, and in danger of being taken by the islanders, he instantly leaped into the sea to his assistance, though considerably wounded himself, and after receiving a blow on his head from a stone, which had almost sent him to the bottom, he caught the man by the hair, and brought him off in safety.

For some time the English kept up a constant fire from the boats (which, during the whole transaction, were at no greater distance from the land than twenty yards) in order to afford their unfortunate companions, if any of them should still remain alive, an opportunity of effecting their escape. These continued efforts, seconded by a few guns, that were at the same time fired from the Resolution, having at length compelled the enemy to retire, a small boat, manned by five midshipmen, pulled towards the shore, where they perceived the bodies lying on the ground without any signs of life. However, they judged it dangerous to attempt to bring them off with so inconsiderable a force, and therefore returned to the ships, leaving the bodies together with ten stands of arms in the natives possession.

When the general consternation consequent on the news of the late melancholy event had, in some degree, subsided, the grand object of attention was the party of our people at the morai, whose situation was highly critical and important. Besides the lives of the men, the issue of the expedition, and the return of at least one of the ships, were involved in the same common danger, as the mast of the Resolution, and the principal part of the sails, were on shore guarded by only six marines.

Lieutenant King stationed the whole body of marines on the top of the morai, which formed a strong and advantageous post; and having intrusted it to the command of an officer, he went on board the Discovery, in order to confer with Captain Clerke on the critical situation of affairs. The natives at first attacked the English with stones from behind the walls of their enclosures, and meeting with no resistance, they soon became more daring. A few courageous fellows, having crept along the beach, under cover of the rocks, suddenly presented themselves at the foot of the morai, with an intention of storming it on the side next the sea, which was its only accessible part, and they were not dislodged before they had stowed a considerable quantity of shot, and had seen one of their number fall. The courage of one of these assailants deserves to be recorded. Having retired with a view of carrying off his companion, amidst the fire of our whole party, he received a wound, which obliged him to quit the body, and retire; but a few minutes after he again made his appearance, and receiving another wound was under the necessity of retreating a second time. At that moment Mr. King arrived at the morai, and saw this man return a third time, faint with the loss of blood and fatigue. Being informed of what had happened, he set

the whole body of man which formed a strong having intrusted it to the sent on board the Discovery, Captain Clerke on the natives at first attacked behind the walls of their no resistance, they soon courageous fellows, harder cover of the rocks, at the foot of the morai, it on the side next the side part; and they were stored a considerable quantity of their number fall. assailants deserves to be with a view of carrying off the of our whole party, he aged him to quit the body, as after he again made his another wound was under cond time. At that morai, and saw this man the loss of blood and fatigue had happened, he forbad

bad the soldiers to fire, and the islander was suffered to carry off his friend, which he was just able to accomplish, and then fell down himself, and died by his side. A strong reinforcement having landed from both ships, the natives retreated behind the wall, which afforded Lieutenant King an opportunity of obtaining a truce, and thereby bringing off with his party the very essential articles that were left on shore.

A consultation having been held on board respecting future measures, the recovery of Captain Cook's body, and the restitution of the boat; were objects universally insisted on, but different opinions were given as to the mode of effecting the same, some being for rigorous and others for lenient measures; the latter, however, were at length agreed upon to be adopted.

The chief command of the expedition now devolving on Captain Clerke, he went on board the Resolution, and Mr. Gore took the command of the Discovery.

According to measures agreed upon at the late consultation, Lieutenant King proceeded towards the shore with the boats of both ships, well manned and armed, with a view of bringing the islanders to a parley, and of obtaining, if possible, a conference with some of the Eracs. If he should succeed in this attempt, he was to demand the dead bodies, and particularly that of Capt. Cook; to threaten them, in case of a refusal, with resentment; but by no means to fire, unless attacked; and not to go on shore on any account whatever.

He left the ships with his detachment about four o'clock in the afternoon; and, as they approached the shore, they perceived every indication of a hostile reception. The natives were all in motion; the women and children retiring; the men arming themselves with long spears and daggers, and putting on their war mats. It also appeared, that since the morning they had thrown up breast-works of stone along the beach, where Capt. Cook had landed, in expectation, perhaps, of an attack at that place.

As soon as the party came within reach, the islanders began to throw stones at them with slings, though without doing any mischief. Mr. King concluded, from these appearances, that all attempts to bring them to a parley would be ineffectual, unless he gave them some ground for mutual confidence. He therefore ordered the armed boats to stop, and advanced alone in the small boat, holding in his hand a white flag; the meaning of which, from an universal shout of joy from the natives; he had the satisfaction to find was immediately understood. The women instantly returned from the side of the hill, whither they had retired; the men threw off their mats, and all seated themselves together by the sea-side, extending their arms, and inviting him to land.

Though such behaviour seemed expressive of a friendly disposition, he could not avoid entertaining suspicions of its sincerity. But when he saw Koah, with extraordinary boldness and assurance swimming off towards the boat, with a white flag in his hand, he

thought proper to return this mark of confidence, and accordingly received him into the boat, though he was armed; a circumstance which did not contribute to lessen Mr. King's suspicions. He had, indeed, long harboured an unfavourable opinion of Koah; and therefore without ceremony informed him, that he had come to demand the body of Captain Cook, and to declare war against the natives, unless it was restored without delay. Koah assured him that this should be done as soon as possible, and that he would go himself for that purpose; and after requesting a piece of iron of Mr. King, with marks of great assurance, he leaped into the water, and swam ashore, calling out to his countrymen, that all were friends again. Mr. King waited with great anxiety near an hour for his return. During this interval, the other boats had approached so near the shore, that the men who were in them entered into a conversation with a party of the islanders, at a little distance, by whom they were informed, that the captain's body had been cut to pieces and carried up the country.

For some time after, there appeared a degree of ambiguity in the conduct of the natives, which raised doubts in the minds of our people, as to the event of their present operations; till at length one night, it being exceedingly dark, a canoe was heard paddling towards the ship, and it was no sooner perceived, than both the centinels on deck fired into it. There were two of the natives in this canoe, who immediately roared out "Tinnee" (which was their method of pronouncing Mr. King's name) said they were friends, and had something with them which belonged to Capt. Cook. When they came on board, they threw themselves at the feet of the officers, and seemed to be extremely terrified. It fortunately happened, that neither of them were hurt, notwithstanding the balls of both pieces had gone through the canoe.

One of them was the person who constantly attended Captain Cook, with the particular ceremonies before described. After bewailing, with many tears, the loss of the Orono, as he called him, he informed the officers that he had brought a part of his body. He then produced a small bundle, which he brought under his arm; and it is impossible to describe the horror with which our people were seized, upon finding in it a piece of human flesh, of the weight of about nine or ten pounds. This, he said, was all that now remained of the body; that the rest had been cut in pieces and burnt; but that the head, and all the bones, except those which belonged to the trunk, were in the possession of Terreeoboo, and the other chiefs; that what they had brought had been allotted to Kaoo, the chief of the priests, for the purpose of being used in some religious ceremony; and that he had sent it as a testimony of his innocence, and of his attachment to them. Though these two friendly visitants were pressed by the officers to continue on board till the next morning, they could not be prevailed upon; declaring, that if this transaction should come

to the knowledge of the king, or any of the Erees, it might be attended with the most fatal consequences to their whole society; to prevent which, they had been under the necessity of coming in the dark; and the same precaution, they said, would be requisite in returning on shore. They added, that the chiefs were eager to take revenge for the death of their countrymen; and particularly cautioned our people against trusting Koah, who, he assured them, was their implacable enemy, and ardently longed for an opportunity of fighting. The two natives then took their leave, it being about eleven o'clock at night.

The situation of the English was now extremely unpromising; none of the purposes for which this pacific plan of proceedings had been adopted, having hitherto been, in any respect, promoted by it. No satisfactory answer had been given to their demands. They did not seem to have made any progress towards a reconciliation with the natives, who still remained on the shore in hostile postures, as if determined to oppose any endeavours that might be made to land; and yet it was become absolutely necessary to attempt landing, as the completing the stock of water would not admit of any longer delay. The islanders behaved in a manner the most daring and presumptuous. One of them had the insolence to come within musket-shot ahead of the Resolution, and, after throwing several stones, waved over his head the hat which had belonged to Captain Cook, while his countrymen on shore were exulting and encouraging his audacity.

The seamen were highly enraged at this insult, and coming in a body on the quarter deck, begged they might no longer be obliged to put up with such reiterated provocations, and requested Mr. King to endeavour to obtain permission for them, from Captain Clerke, to take advantage of the first fair occasion of avenging the death of their much-lamented commander. On Mr. King's acquainting the captain with what was passing, he ordered some great guns to be fired at the islanders on shore; and promised the crew, that, if they should be molested at the watering-place, the next day, they should then be permitted to chastise them.

Before they could bring the guns to bear, the natives suspecting their intentions, from the bustle and agitation they observed in the ship, had retired behind their houses and walls. They were consequently obliged to fire, in some degree, at random; notwithstanding which the shot produced all the effects that could be desired. For, in a short time afterwards, they perceived Koah paddling towards them with the greatest haste; and when he arrived, they learned, that some people had lost their lives, and, among the rest, a principal Eree, nearly related to Terreeboob.

Soon after Koah's arrival, two boys swam off from the morai towards the vessel, each armed with a long spear; and after they had approached pretty near, they began, in a very solemn manner, to chant a song; the subject of which, from their frequently mentioning the

word Orono, and pointing to the village where Captain Cook had been slain, was concluded to be the late calamitous occurrence. Having sung for near a quarter of an hour in a plaintive strain, during all which time they continued in the water, they repaired on board the Discovery, and delivered up their spears; and, after remaining there a short time, returned on shore. It could not be learned who sent them, or what was the object of this ceremony. The two natives who had visited them before, came off again in the night, and assured them, that, though the effects of the great guns had much alarmed the chiefs, they had by no means relinquished their hostile intentions, and advised them to be on their guard.

When the boats of both ships were dispatched ashore to procure water, the Discovery was warped close to the beach, in order to protect the persons employed in that service. It was soon found, that the intelligence sent by the priests was not destitute of foundation, and that the islanders were determined to neglect no opportunity of annoying them, when it could be done without much hazard. It was now deemed absolutely necessary to burn down some straggling huts, near the wall behind which they had sheltered themselves. In executing the orders that were given for that purpose, some were hurried into acts of devastation and cruelty.

In escaping from the flames, several of the inhabitants were shot; and the party cut off the heads of two of them, and brought them on board. The fate of one unhappy native was much lamented by them all. As he was repairing to the well for water, he was shot at by one of the marines. The ball happened to strike his calabash, which he instantly threw from him, and ran off. He was pursued into one of the caves, and no lion could have defended his den with greater bravery and fierceness; till, at length, after he had found means to keep two of his pursuers at bay for a considerable time, he expired, covered with wounds. This accident first brought the English acquainted with the use to which these caverns were applied.

A man, much advanced in years, was taken prisoner, bound, and conveyed on board the Resolution, in the same boat with the heads of his two countrymen. Horror could not be more strongly portrayed than in the face of this person; nor so violent a transition to immoderate joy, as when he was untied, and given to understand, that he might depart in safety. He shewed that he was not deficient in gratitude, as he returned afterwards with a present of provisions.

Yet, amidst all these disturbances, the female natives who were on board did not offer to depart, or discover any apprehensions, either for themselves, or their friends on shore. They appeared, indeed, so perfectly unconcerned for the latter, that some of them who were on deck when the village was in flames, seemed to admire the spectacle, and frequently exclaimed, that it was *meitai*, or very fine.

At length a chief, named Eappo, a man of the first distinction,

distinction, came with presents from Terreeboob, to sue
for peace. These presents were accepted; and the chief
was dismissed with the following answer: That no peace
would be granted, till the remains of Capt. Cook should
be restored.

Information was received from Eappo, that the flesh
of all the bones of our people who had been slain, as
well as the bones of the trunks, had been burnt; that the
limb-bones of the marines had been distributed among
the inferior chiefs; and that the remains of Capt. Cook
had been disposed of as follows: the head to a great Eree,
called Kahoopou; the hair to Maiha-Maiha; and the
arms, legs, and thighs, to Terreeboob. Eappo was very
urgent that one of our officers should go on shore, and
offer to remain on board, in the mean time, as an
hostage. This request, however, was not complied with;
and he departed with a promise of bringing the bones the
following day.

A numerous body of the natives was seen in the
morning descending the hill, which is over the beach, in
a sort of procession, each man carrying on his shoulders
two or three sugar-canes, and some bread-fruit, plan-
tains, and taro, in his hand. They were preceded by
two drummers, who, when they reached the water-side,
seated themselves by a white flag, and began beating
their drums, while those who had followed them ad-
vanced, one by one, and deposited the presents they had
brought with them; after which they retired in the same
order. Soon afterwards, Eappo appeared in his long
feathered cloak, bearing something with great so-
lemnity in his hands; and having stationed himself on a
rock, he made signs that a boat should be sent him.

Captain Clerke went himself in the pinnace to receive
them, and ordered Mr. King to attend him in the cut-
ter. When they arrived at the beach, Eappo, entering
the pinnace, delivered the bones to Captain Clerke,
wrapped up in a great quantity of fine new cloth, and
covered with a spotted cloak of black and white feathers.
In this bundle were found both the hands of Captain
Cook entire, which were well known from a scar on one
of them, that divided the fore-finger from the thumb,
the whole length of the metacarpal-bone; the skull, but
with the scalp separated from it, and the bones of the
face wanting; the scalp, with the ears adhering to it,
and the hair upon it cut short: the bones of both the
arms, with the skin of the fore-arms hanging to them;
the bones of the thighs and legs joined together, but
without the feet. The ligaments of the joints were ob-
served to be entire: and the whole shewed sufficient
marks of having been in the fire, except the hands,
which had the flesh remaining upon them, and were cut
in several places, and crammed with salt, most probably
with a view of preserving them. The skull was free
from any fracture, but the scalp had a cut in the back
part of it. The lower jaw and feet, which were want-
ing, had been seized, as Eappo said, by different Erees;
and he added, that Terreeboob was using every means
to recover them.

Eappo, and the king's son, came afterwards on board,
and brought with them not only the remaining bones of
Captain Cook, but likewise the barrels of his gun, his
shoes, and some other trifles which had belonged to him.
Eappo declared that Terreeboob, Maiha-Maiha, and him-
self, were extremely desirous of peace; that they had
given the most convincing proofs of it; and that they had
been prevented from giving it sooner by the other
chiefs, many of whom were still disaffected. He la-
mented, with the most lively sorrow, the deaths of six
chiefs, who had been killed by our people, some of
whom, he said, were among their best friends. He said
that the cutter had been taken away by Pareca's people,
probably in revenge for the blow that he had received,
and that it had been broken up the following day. The
arms of the marines, which were now demanded, had
been carried off by the populace, and were irre-
coverable.

It now only remained, on the part of our people, to
perform the last solemn offices to their excellent com-
mander. Eappo was dismissed with orders to *taboo* all
the bay; and in the afternoon, the bones having been
deposited in a coffin, the funeral service was read over
them, and they were committed to the deep with the
usual military honours.

Matters being now amicably settled, Captain Clerke
gave orders for the ship to unmoor, and for all the na-
tives to be dismissed. The chiefs took a friendly leave
of their visitors; and the anchor being weighed, they
stood out of Karakakooa-Bay; but not without many
sighs from the crews, for the loss of their great com-
mander.

On leaving Karakakooa-Bay, in the island of Owhy-
hee, the ships passed Tahoorā, and touched at Woahoo;
and, in consequence of disappointment in attempting to
water, proceeded to Atooi, and came to anchor in their
former station. Our people immediately observed, on
the natives coming on board, that there was not that
complacency in their countenances, or cordiality in their
manner, as when they first visited them. Indeed, they
gave evident tokens of a disposition totally reverse from
that which they had discovered before, and seemed much
inclined to hostility. The main design, in touching at
this island, was to procure water, in which the people
were much annoyed, and obstructed by the natives. At
length, however, after great difficulty, and some encoun-
ters, it was completed.

When the officers, whose presence was required on
shore, returned to the ships, they were informed, that
several chiefs had been on board, and apologized for the
conduct of their countrymen. Presents were afterwards
exchanged between Captain Clerke and Tonceo, who
held the supreme power, and apparent amity subsisted
till the ships left the island, and proceeded to Oneehow,
from which they sailed, in prosecution of their voyage to
the northward, in March 1779.

The group of islands called by the general appellation
of the Sandwich-Islands, were found, at length, to be

eleven in number; and as our navigators could never learn that the natives had knowledge of any other islands, it is most probable that there are no others in their vicinity. Of these we have mentioned six, viz. Woahoo, Atooi, Onechew, Oreehoua, Tahoorā, and Owhyhee, the grand and principal scene of action. The others are called Morotoi, Morotinnee, Ranai, Kahowrowhee, and Moodoo-Papapa. These agree, in general, with the description given of the former: and Morotinnee, as well as Tahoorā, is uninhabited.

There are two mountains in the island of Owhyhee deserving of notice. The first, called Mouna-Kaah (or the mountain Kaah) rises in three peaks, continually covered with snow, and may be discerned at the distance of forty leagues. The coast to the northward of this mountain is composed of high and abrupt cliffs, from which fall many beautiful cascades of water. The mountain is very steep, and its lower part abounds with wood.

On the ships doubling the east part of the island, they had sight of another snowy mountain, called by the natives Mouna-Roa (or the extensive mountain) which, during the whole time they were sailing along the south-eastern side, continued to be a very conspicuous object. It was flat at the summit, which was perpetually involved in snow; and they once observed its sides also slightly covered with it for a considerable way down. This mountain is supposed to be at least 16,020 feet; and therefore exceeds the height of the peak of Teneriffe by 3680 feet. The peaks of Mouna-Kaah seemed to be of the height of about half a mile; and, as they are wholly covered with snow, the altitude of their summits must at least be 18,400 feet.

One of the English who set out on an expedition up the country, principally with an intention of reaching the snowy mountains, under the guidance of two natives, stopped, for the night, at a hut they observed among the plantations, where they supposed themselves to be six or seven miles distant from the ships. The prospect from this spot was very delightful. They had a view of the vessels in the bay before them. To the left, they saw a continued range of villages, interspersed with groves of cocoa-nut trees spreading along the shore; a thick wood extending itself behind them: and to the right, a very considerable extent of ground, laid out with great regularity in well-cultivated plantations, displayed itself to their view. Near this spot, the natives pointed out to them, at a distance from every other dwelling, the residence of a hermit, who, they said, had, in the former part of his life, been a great chief and warrior, but had long ago retired from the sea coast of the island, and now never quitted the environs of his cottage. As they approached him, they prostrated themselves, and afterwards presented him with some provisions. His behaviour was easy, frank, and cheerful. He testified little astonishment at the sight of the English; but though pressed to accept some European curiosities, he thought proper to decline the offer, and

soon withdrew to his cottage. The party represented him as by far the most aged person they had ever seen, judging him to be, at a moderate computation, upwards of an hundred years of age.

As they had supposed that the mountain was not more than ten or a dozen miles distant from the bay, and consequently expected to reach it with ease early the following morning, they were now greatly surprised to find the distance scarce perceptibly diminished. This circumstance, with the uninhabited state of the country, which they were on the point of entering, rendering it necessary to provide a supply of provisions, they dispatched one of their conductors back to the village for that purpose. Whilst they waited his return, they were attended by several of Kaoo's servants, whom that general old man had sent after them, loaded with refreshments, and fully authorized, as their route lay through his grounds, to demand, and take away with them, whatever they might want.

Their surprise was great, to find the cold here so intense; but as they had no thermometer with them, they could only form their judgment of it from their feelings, which, from the warm atmosphere they had quitted, must have been a very fallacious method of judging. They found it, however, so cold, that they could hardly get any sleep; and the islanders could not sleep at all; both parties being disturbed, during the whole night, by continual coughing. As they, at this time, could not be at any very great height, their distance from the sea being no more than six or seven miles, and part of the road on a very moderate ascent, this uncommon degree of cold must be attributed to the easterly wind blowing fresh over the snowy mountains. They proceeded on their journey early the next morning, and filled their calabashes at a well of excellent water, situate about half a mile from their hut. After they had passed the plantations, they arrived at a thick wood, which they entered by a path that had been made for the convenience of the islanders, who frequently repaired thither for the purpose of catching birds, as well as procuring the wild-or horse-plantain. Their progress now became extremely slow, and was attended with great labour; for the ground was either swampy, or covered with large stones; the path narrow, and often interrupted by trees lying across it, which they were obliged to climb over, as the thickness of the underwood on each side rendered it impracticable to pass round them. They saw, in these woods, pieces of white cloth fixed on poles, at small distances, which they imagined were land-marks for the division of property, as they only observed them where the wild plantains grew. The trees were of the same kind with the spice-tree of New Holland; they were straight and lofty, and their circumference was, on an average one with another, from two to four feet.

Many other disagreeable circumstances, besides the cold, and particularly the aversion their conductors discovered to going on, induced this party to come to a

ed this party to come to a
determination

determination of returning to the ships, after taking a survey of the country from the highest trees they could find. They were surprised at seeing several fields of hay; and upon their inquiry to what particular use it was applied, we were informed, that it was intended to cover the grounds where the young taro grew, in order to preserve them from being scorched by the rays of the sun. They observed among the plantations a few huts scattered about, which afforded occasional shelter to the labourers; but they did not see any villages at a greater distance from the sea than four or five miles. Near one of them, which was situated about four miles from the bay, they discovered a cave, forty fathoms long, three broad, and of the same height. It was open at each end; its sides were fluted, as if wrought with a chissel; and the surface was glazed over, perhaps by the action of fire. The birds of these islands are numerous, though the variety is not great. Some of them may vie with those of any country in point of beauty. Their vegetable productions are not very different from those of the other islands of the Pacific-Ocean. The coasts abound with variety of fish.

The natives of the Sandwich-Islands are, doubtless, of the same extraction with the inhabitants of the Society and Friendly-Islands. This is not only evinced by the general resemblance of their persons, and the great similarity of their manners and customs, but seems to be established, beyond all controversy, by the identity of their language. It may not, perhaps, be very difficult to conjecture from what continent they originally emigrated, and by what steps they have diffused themselves over so immense a space. They bear strong marks of affinity to some of the Indian tribes, who inhabit the Ladrões and Caroline-Isles; and the same affinity and resemblance may also be traced among the Malays and the Battas. At what particular time these migrations happened, is less easy to ascertain. They are indeed very populous, and have no tradition respecting their own origin, but what is wholly fabulous; though, on the other hand, the simplicity which is still prevalent in their manners and habits of life, and the unadulterated state of their general language, seem to demonstrate, that it could not have been at any very remote period.

The superiority generally observed at other islands in the persons of the Erees, is likewise found here. Those that were seen were perfectly well formed; whereas the lower class of people, besides their general inferiority, are subject to all the variety of figure and make that is met with in the populace of other parts of the world. There were more frequent instances of deformity observed here than in any of the other islands visited. While the ships were cruising off Owwhyee, two dwarfs came on board, one of whom was an old man of the height of four feet two inches, but very well proportioned; and the other was a woman nearly of the same stature. Our people afterwards saw among the natives three who were hump-backed, and a young man who

had been destitute of hands and feet, from the very moment of his birth. Squinting is common among them, and a man who had been born blind, was brought on board for the purpose of being cured. Besides these particular defects, they are, in general, exceeding subject to biles and ulcers, which was ascribed to the great quantity of salt they usually ate with their fish and flesh. Though the Erees are free from these complaints, many of them experience still more dreadful effects from the too frequent use of the ava. Those who were the most affected by it had their eyes red and inflamed, their limbs emaciated, their bodies covered with a whitish scurf, and their whole frame trembling and paralytic, attended with a disability of raising their heads.

The excellence of their manufactures, and their improvements in agriculture, are, doubtless, adequate to their situation and natural advantages. The eagerness of curiosity with which they used to attend the armourer's forge, and the various expedients which they had invented, even before our departure from their islands, for working the iron obtained from us into such weapons as were best calculated for their purposes, were strong indications of docility and ingenuity.

Tattooing or puncturing the body prevails among these people; and of all the islands in the ocean, it is only at New Zealand, and the Sandwich-Isles, that the face is tattooed. There is this difference between the two nations, that the New Zealanders perform this operation in elegant spiral volutes, and the Sandwich-Islanders in straight lines, that intersect each other at right angles. Some of the natives have half their bodies, from head to foot, tattooed, which gives them a most striking appearance. It is generally done with great neatness and regularity; but several of them have only an arm thus marked, others a leg; some, again, tattoo both an arm and a leg; and others only the hand. The hands and arms of the women are punctured in a very neat manner; and they have a remarkable custom of tattooing the tip of the tongues of some of the females. There was some reason to imagine, that the practice of puncturing was often intended as a sign of mourning, on the decease of a chief, or any other calamitous occurrence; for they were frequently informed, that such a mark was in memory of such a chief, and so of the others. The people of the lowest order are tattooed with a particular mark, which distinguishes them as the property of the chiefs to whom they are respectively subject.

The natives live together in small towns or villages, which contain from about one hundred to two hundred houses, built pretty close to each other, without order or regularity, and having a winding path that leads through them. They are frequently flanked, towards the sea-side, with loose detached walls, which appear to be intended for shelter and defence. They are of various dimensions, from forty-five feet by twenty-four, to eighteen by twelve. Some are of a larger size, being fifty feet

feet in length, and thirty in breadth, and entirely open at one end. They are very cleanly at their meals, and their method of dressing both their vegetable and animal food was universally acknowledged to be superior to ours. The Erees constantly begin their meals with a dose of the extract of pepper-root, or ava, prepared in the usual mode. The women eat apart from the other sex, and are prohibited from feeding on pork, turtle, and some particular species of plantains.

They generally rise with the sun; and, after having enjoyed the cool of the evening, retire to their repose a few hours after sun-set. The Erees are occupied in making canoes and mats: the Towtows are chiefly employed in the plantations, and also in fishing; and the women are engaged in the manufactory of cloth. They amuse themselves at their leisure hours with various diversions. Their young persons, of both sexes, are fond of dancing; and, on more solemn occasions, they entertain themselves with wrestling, and boxing-matches, as has been observed, performed after the same manner of the natives of the Friendly-Islands; to whom, however, they are greatly inferior in all these respects.

The music of these people is of a rude kind; for the only musical instruments that was observed among them, were drums of various sizes. Their songs, however, which they are said to sing in parts, and which they accompany with a gentle motion of their arms, like the inhabitants of the Friendly-Islands, have a very pleasing effect.

They are generally addicted to gambling. One of their games resembles our game of draughts; but, from the number of squares, it seems to be much more intricate. The board is of the length of about two feet, and is divided into two hundred and thirty-eight squares, fourteen in a row. In this game they use black and white pebbles, which they move from one square to another. Another of their games consists in concealing a stone under some cloth, which is spread out by one of the parties, and rumpled in such a manner, that it is difficult to distinguish where the stone lies. The antagonist then strikes with a stick, that part of the cloth where he supposes it to be; and the chances being, upon the whole, against his hitting it, odds of all degrees are laid, varying with the opinion of the dexterity of the antagonist. They often entertain themselves with races between boys and girls, on which occasions they lay wagers with great spirit. Our people saw a man bearing his breast, and tearing his hair, in the violence of rage, for having lost three hatchets at one of these races, which he had purchased from them with near half his property a very little time before. Among the various diversions of the children, was one frequently played at, and which shewed a considerable share of dexterity. They take a short stick, through one extremity of which runs a peg sharpened at both ends, extending about an inch on each side; then throwing up a ball formed of green leaves moulded together, and fastened with twine, they catch it on one of the points of the peg; imme-

diately after which, they throw it up again from the peg, then turn the stick round, and catch the ball on the other point of the peg. Thus, for some time, they continue catching it on each point of the peg alternately, without missing it. They are equally expert at another diversion of a similar nature, throwing up in the air, and catching, in their turns, many of these balls: and our people have often seen little children thus keep five balls in motion at once.

Their method of agriculture resembles that of the other islands of the Pacific-Ocean.

The inhabitants of the Sandwich-Islands are divided into three classes. The Erees, or chiefs of each district, are the first; and one of these is superior to the rest, who was called, at Owhyhee, *Eree-Taboo*, and *Eree-Mose*; the first name expressing his authority, and the latter signifying that, in his presence, all must prostrate themselves. Those of the second class appear to enjoy a right of property, but have no authority. Those who compose the third class, are called *Towtows*, or servants, and have neither rank or property.

The Erees appear to have unlimited power over the inferior classes of people; many instances of which occurred daily, whilst our people continued among them, and the people are implicitly obedient. It is remarkable, however, that the chiefs were never seen to exercise any acts of cruelty, injustice, or insolence towards them; though they put in practice their power over each other, in a most tyrannical degree, as appears from the following instances. One of the lower order of chiefs having shewn great civility to the master of the ship, on his examination of Karakakooa-Bay, Mr. King, some time afterwards, took him on board the *Resolution*, and introduced him to Captain Cook, who engaged him to dine. While the company remained at table, Pareea entered, whose countenance manifested the highest indignation at seeing their guest so honourably entertained. He seized him by the hair of his head, and would have dragged him out of the cabin, if the captain had not interfered. After much altercation, no other indulgence could be obtained (without quarrelling with Pareea) than that the guest should be permitted to remain in the cabin, on condition that he seated himself on the floor, while Pareea occupied his place at the table. An instance, somewhat similar, happened when Terreebooo came first on board the *Resolution*, when Maiba-Maiba, who attended him, seeing Pareea upon deck, turned him most ignominiously out of the ship; even though the officers knew Pareea to be a man of the first consequence.

Little information could be obtained respecting their administering of justice. If a quarrel arose among the lower class of people, the matter was referred to the decision of some chief. If an inferior chief had offended one of superior rank, his punishment was dictated by the feelings of the superior at that moment. If he should fortunately escape the first transports of his rage, he perhaps found means, through the mediation of others,

others, to compound for his offence, by all or part of his effects.

As to their religion, it resembles that of the Society and Friendly-Isles. In common with each other, they have all their morais, their whattas, their sacred songs, and their sacrifices. The ceremonies here, are, indeed, longer and more numerous than in the islands above mentioned.

The Society and Friendly islanders pay adoration to particular birds; and it seems to be a custom extremely prevalent in these islands. Ravens are, perhaps, the chief objects of it here; for Mr. King saw two of these birds perfectly tame, at the village of Kakooa, and was told they were Eatooas. He offered several articles for them, which were all refused; and he was particularly cautioned not to hurt or offend them. The prayers and offerings made by the priests before their meals, may be classed among their religious ceremonies. We have already observed, that human sacrifices are common here. They have one most extraordinary religious custom, which is that of knocking out their fore teeth. Most of the common people, and many of the chiefs, had lost one or more of them; and this, it seems, was considered as a propitiatory sacrifice to the Eatooa, to avert his anger on particular occasions.

The English could derive but very imperfect information of their opinions respecting a future state. On inquiring of them whether the dead were gone, they were told that the breath, which they seemed to consider as the immortal part, was fled to the Eatooa. They seemed also to give a description of some place, which they suppose to be the abode of the dead; but they could not learn that they had any idea of rewards or punishments.

Of their marriages it can only be said, that such a compact seems to exist among them. Whether polygamy is allowed, or whether it is mixed with concubinage, could not be ascertained.

From the following instance, it appears, that among married women of rank, not only fidelity, but even a degree of reserve is required.

Omeah, a chief of the highest dignity, rose two or three times from his place, at one of their boxing matches, and approached his wife with strong marks of displeasure, commanding her, as was supposed, to withdraw. Whether he thought her beauty engaged too much of the attention of his visitors, or whatever might be his motives, there certainly existed no real cause of jealousy. She, however, continued in her place, and at the conclusion of the entertainment joined the party of officers, and even solicited some trifling presents. She was informed that they had not any about them; but that if she would accompany them to the tent, she should be welcome to make choice of what she liked. She accordingly proceeded with them, which being observed by Omeah, he followed in a great rage, seized her by the hair, and, with his fists, began to inflict severe corporal punishment. Having been the innocent

cause of this treatment, the officers were exceedingly concerned at it; though they understood it would be highly improper for them to interfere between husband and wife of such superior rank. The natives, however, at length interposed; and the next day they had the satisfaction of meeting them together, perfectly satisfied with each other: and, what was extremely singular, the wife would not permit them to rally the husband on his behaviour, which they had an inclination to do; plainly telling them, that he acted very properly.

The English had twice an opportunity, while the ships lay at Karakakooa-Bay, of seeing a part of their funeral rites. Hearing of the death of an old chief, not far from the observatories, some of them repaired to the place, where they beheld a number of people assembled. They were seated round an area, fronting the house where the deceased lay; and a man, having on a red feathered cap, came to the door, constantly putting out his head, and making a most lamentable howl, accompanied with horrid grimaces, and violent distortions of the face. A large mat was afterwards spread upon the area, and thirteen women and two men, who came out of the house, sat down upon it in three equal rows; three of the women, and the two men, being in front. The women had feathered ruffs on their necks and hands; and their shoulders were decorated with broad green leaves, curiously scolloped. Near a small hut, at one corner of this area, half a dozen boys were placed, waving small white banners, and taboo sticks, who would not suffer our people to approach them. Hence they imagined that the dead body was deposited in the hut; but were afterwards informed, that it remained in the house where the tricks were playing at the door by the man in the red cap. The company seated on the mat sung a melancholy strain, accompanied with a gentle motion of the arms and body. This having continued for some time, they threw themselves in a posture between kneeling and sitting, and put their arms and bodies into a most rapid motion, keeping pace, at the same time, with the music. These last exertions being too violent to continue, at intervals they had slower motions. An hour having passed in these ceremonies, more mats were spread upon the area, when the dead chief's widow, and three or four other elderly women, came out of the house with slow and solemn pace, and, seating themselves before the company, began to wail most bitterly, in which they were joined by the three rows of women behind them; the two men appearing melancholy and pensive. They continued thus, with little variation, till late in the evening, and, at day-light in the morning, the people dispersed, and every thing was quiet. It was said the body was removed, but it was not known how it was disposed of. As they were making inquiry of some of the natives, they were approached by three women of rank, who signified to them, that their presence interrupted the performance of some necessary rites. Soon after they had left them, they heard their cries and lamentations; and when they

met them a few hours after, the lower parts of their faces were painted perfectly black, in token of mourning. They had likewise an opportunity of observing the ceremonies at the funeral of one of the ordinary class. Hearing some mournful cries issuing from a miserable hut, they entered it, and discovered two women, whom they supposed to be the mother and daughter, weeping over the body of a man, who had that moment expired. They first covered the body with a cloth, then lying down by it, they spread the cloth over themselves, beginning a melancholy kind of song, often repeating *Aweh me draah! Aweh tanee!* "Oh, my father! Oh, my husband!" In one corner a younger daughter lay prostrate on the ground, having some black cloth spread over her, and repeating the same expressions. On inquiry afterwards, how the body had been disposed of, they pointed towards the sea, perhaps indicating thereby, that it had been deposited in the deep, or that it had been conveyed to some place of burial beyond the bay, which was all the information that could be got on the occasion.

C H A P. XXV.

THE PALOS OR PELEW ISLANDS.

Situation and Description of these Islands. Various Particulars respecting the friendly Intercourse between the English and the Natives. Great Hospitality of the King, who presents the Captain with an Island.

THAT chain of islands called the PALOS, or PELEW-ISLANDS, were probably first noticed by some of the Spaniards of the Philippines, and by them named the Palos-Islands; the tall palm trees, which grow there in great abundance, having at a distance the appearance of (*palos*, i. e.) masts of ships. That this was the origin of their name, is rendered still more probable, as the Spaniards gave the same appellation to all the numerous islands of this archipelago, most of which are now known by the name of the New Carolines. The Pelew-Islands are situated in the west part of the Pacific-Ocean, between the 5th and 9th degrees of north latitude, and between 130 and 136 degrees of east longitude; and, though heretofore imperfectly noticed by some ships making the eastern passage from China, were never visited by any Europeans, till the crew of the Antelope, Captain Wilson, a packet belonging to the East-India Company, which was wrecked in August 1783, landed there, and were the means of discovering to us a new world, or set of human beings, who, though of an uncultivated nature, appeared to be greatly different from those commonly termed savages, and evince principles of humanity and generosity that would reflect the highest honour on the most exalted of our race. These islands are long but narrow, of a moderate

height, well covered with wood, at least such of the islands as Captain Wilson's people had an opportunity of seeing. They are circled on the west side by a reef of coral, of which no end could be seen from any eminences they were on; this reef in some places extends five or six leagues from the shore, and not less than two or three in any parts that were visited.

As the Antelope, which sailed from Macao the 20th of June 1783, was proceeding on her voyage from China, she unfortunately struck on a rock in the night of the 9th of the following August.

The crew, waiting with anxious suspense the approach of morning, in order to discover whether any land was near, descried, at the dawn of day, a small island to the southward, about three or four leagues distant; and soon after some other islands were seen to the eastward, which proved to be those under consideration.

As the island (properly called Cooroora, of which Pelew is the capital) came in sight, the jolly-boat hoisted English colours, and fired three musquets; which were answered, as they apprehended, nearer the shore, by a white flag stuck on a pole; this was conceived to have been suggested by the Malay on the island (whom we shall have occasion hereafter to mention) and proved to be some of the white cloth that had been given to the king. Raa Kook, the king's brother, and commander in chief of his forces, having quitted his canoe, came into the jolly-boat; and our people, on landing, fired three musquets more, after having hoisted their colours, and fixed them in the ground opposite a house close to the water-side, at the end of the causeway where they came on shore; to which house the English were conducted by Raa Kook to wait the king's coming, he having dispatched a messenger to notify the captain's arrival. Before the king appeared, some of the natives were sent down with refreshments: they first brought a large tureen made of wood, in the shape of a bird, and inlaid with shell, this was full of sweet drink; they also brought a painted stand, about two feet in height, inlaid in the same manner as the tureen, upon which were sweetmeats garnished with Seville oranges; next came a basket of boiled yams, followed by another of young cocoa-nuts; these were all placed in a kind of order, preparatory to the king's coming.

Apprehensions were naturally felt on account of the natives. Boats, however, were manned, loaded with such articles as were deemed most necessary, and dispatched from the ship under the direction of a principal officer, whose design was to obtain, if possible, a friendly intercourse with the inhabitants, in case they should find any. As the ship was expected every moment to go to pieces, those who remained went immediately to work to make a raft, on which, when completed, with the assistance of two boats, they all, except one man, who fell overboard before they set out, reached the shore, after encountering many difficulties.

l, at least such of the people had an opportunity in the west side by a reef could be seen from any reef in some places at the shore, and not less what were visited.

In the course of two days from their landing, the crew observed some natives approaching, in canoes, from the points of the bay. This spread to great a conglomeration, that all ran to their arms; but as there were only two canoes, the captain ordered the people out of sight till further notice.

A very singular circumstance much facilitated the intercourse between our countrymen and the natives. A Malay, who some time before was cast away upon this island, had acquired the language; and it happened that one of the Antelope's men was a native of Bengal, and spoke the Malay tongue, by which means a ready communication was maintained on both sides, and all those impediments were removed at once, which would have arisen among people who had no means of conveying their thoughts to one another by language, but must have trusted to signs and gestures, which might have given rise to a thousand misconceptions.

When the canoes, which advanced slowly towards the shore, got within hearing, the native of Bengal spoke to them in the Malay tongue; on which, though they did not seem to understand him, they stopped their canoes. Soon after, however, one of them spoke in the above language, asking our people "Who they were? whether they were friends or enemies?" The native of Bengal, by the captain's direction, replied, "That they were distressed Englishmen, who had lost their ship on the reef, and that they were friends." On this they seemed to commune together; and soon after came out of their canoes, which Captain Wilson observing, he waded into the water to meet them; and after embracing them in a friendly manner, conducted them to his officers, and the others who had retired.

These people were entirely naked. They were of a deep copper colour, and their skins soft and glossy, owing to the external use of cocoa-nut oil. Each chief had a basket of beetle nut, and a bamboo, finely polished, and inlaid at each end, in which they carried a kind of coral, burnt to a lime, called *chinam*. It was observed that all their teeth were black, and that the beetle nut, of which they had always a quid in their mouths, rendered the saliva red, which, together with their black teeth, gave their mouths a very disgusting appearance. They were of a middling stature, straight, and muscular, their limbs well formed, and they had a majestic gait. Their hair was black, long, and rolled up behind close to their heads, which appeared neat and becoming. They tattooed their legs a little above the ancles to the middle of their thighs, which gave them a deeper colour than the other parts of their bodies. None of them had any beards, except the youngest of the king's brothers; and it was, in course of time, observed, that they plucked out the hairs by the roots, and that very few only, who had strong thick beards, cherished and let them grow.

Whatever surprize the singularity of these natives might excite in the minds of our people, the natives

were no less wrapt in admiration at their appearances. The whiteness of colour attracted them so much, that it was evident they had never before seen any Europeans. They were continually exclaiming, *Wool!* *wool!* and *wool-a-treee!* words which implied that they were perfectly pleased with their visitors. They stroked their bodies and arms outside the garments, seeming to doubt whether their coverings were not a part of their real body, being totally ignorant of the use of clothes. However, the Malay informed them, that the English living in a much colder climate than theirs were obliged to have recourse to artificial warmth, to shield them from the inclemency of the weather, and that, from custom, they could not dispense with it, in a degree, even in the warmest regions.

The hands of the Europeans next engaged their attention, and particularly the black veins of the wrists. They probably imagined the whiteness of the hands and face to be artificial; and the blackness of the veins caused them to think, that it was a mode of tattooing; for they desired to look at the top parts of the arms, to see if the whiteness was continued. After this they requested a further view of the body, when some of the crew opened their bosoms, and told them that the other parts were nearly the same as that. The hair on the breasts of the Europeans excited their astonishment, as they consider such incumbrance highly indelicate, and pluck it out wherever it is found. The natives having in some degree satisfied their curiosity, began to express apprehensions that they had intruded too much; but the captain convinced them, by means of the Malay, that their fears were groundless.

As the natives expressed a desire that Captain Wilson would send one of his people to Pelew, that the king might see what kind of beings white men were, the captain complied, and appointed his brother for that purpose, giving him a small remnant of blue cloth, a canister of tea, another of sugar-candy, and a jar of preserved fruit, as a present for the king, of whom we shall here introduce the following account.

ABBA THULLE, as king, was the first person in the government at Pelew, and in him the chief authority was lodged. He appeared to be considered as the father of his people; and, though divested of all external decorations of royalty, had every mark of distinction paid to his person.

His rupacks or chiefs approached him with the greatest respect, and his common subjects, whenever they passed near him, or had occasion to address him, put their hands behind them, and crouched towards the ground: even if they were passing any house or place where the king was supposed to be, they humiliated themselves in the same manner, till they had got beyond his probable presence, when they resumed their usual mode of walking. On all occasions, however, the behaviour of Abba Thulle appeared gentle and gracious, yet always full of dignity; he heard what-

ever

ever his subjects had to say to him, and, by his affability and condescension, never suffered them to go away dissatisfied.

This personage, how great soever he was held at Pelew, was not understood by the English, when there, to possess a sovereignty over all the islands which came within their knowledge. The rupacks of Eonungs, Emillegue, and Artingall, and the rupack Meath, were independent in their own territories: yet Abba Thulle had several islands over which he ruled.

Upon all occurrences of moment, he convened the rupacks and officers of state; their councils were always held in the open air, upon square pavements; where the king first stated the business upon which he had assembled them, and submitted it to their consideration. Each rupack present delivered his opinion, but without rising from his seat: when the matter before them was settled, the king, standing up, put an end to the council.—After which they often entered into familiar conversation, and sometimes chatted together for an hour after their business was dispatched.

When any message was brought to the king, whether in council or elsewhere, if it came by one of the common people, it was delivered at some distance, in a low voice, to one of the inferior rupacks; who, bending in an humble manner at the king's side, delivered the message in a low tone of voice, with his face turned aside. His commands appeared to be absolute, though he acted in no important business without the advice of his chiefs. In council there was a particular stone on which the king sat; the other rupacks did not always take the same place, seating themselves sometimes on his right-hand, and sometimes on his left.

Every day in the afternoon, the king, whether he was at Pelew, or with the English at Oroolong (the island he had given them) went to sit in public, for the purpose of hearing any requests, or of adjusting any difference or dispute which might have arisen among his subjects.

Captain Wilson observes, with respect to the character and disposition of "this excellent man, who ruled over these sons of nature, that he certainly, in every part of his conduct, showed himself firm, noble, gracious, and benevolent; there was a dignity in all his deportment, a gentleness in all his manners, and a warmth and sensibility about his heart that won the love of all who approached him. Nature had bestowed on him a contemplative mind, which he had himself improved by those reflections that good sense dictated, and observation confirmed."

Raa Kook, the king's brother, and general of all his forces, was the next in power. It was his duty to summon the rupacks to attend the king, on whatever expedition or purpose they were called upon; but though Raa Kook acted as commander in chief, yet all the executive orders came from the king, whenever he attended in person. The general, as the king's

next brother, was his presumptive heir; the succession of Pelew not going to the king's children, till it had passed through the king's brothers: so that after the demise of Abba Thulle, the sovereignty would have descended to Raa Kook; on his demise, to Arra Kooker; and, at the death of this last brother, it would have reverted to the eldest son of Abba Thulle; on which contingency, Qui Bill, being the presumptive heir, would, during the reign of his last surviving uncle, have become of course the hereditary general; as Lee Boo would when the sovereignty had fallen to his elder brother.

A particular chief, or rupack, always attended the king, and, being always near his person, was first consulted: but whether his office was religious or civil, or both, could not be learned with any certainty. He was not considered as a warrior, nor ever bore arms; and has only one wife, whereas the other rupacks had two. But, to resume our narrative:

The natives behaved in the most friendly manner to the English; and their monarch soon after paid them a visit, with his son and brother. His majesty was perfectly naked, and had no kind of ornament or mark of distinction, like his principal officers, who wore a bracelet of bone at their wrists. He bore a hatchet on his shoulder, the head of which was made of iron, a circumstance which surprised our people much, as all the other hatchets they had seen were of shell. The handle of it, which formed a sharp angle, stuck close to his shoulder, lying before and behind, and wanting no tying to keep it steady in walking.

His majesty would not go into the tents. A fall was therefore spread for him, on which he sat down, with his chief minister opposite, and his two brothers on each side; and the whole was encompassed by his attendants, who were numerous. He drank a cup of tea, but did not approve of the taste. Captain Wilson availed himself of this opportunity to obtain permission from the king to build a vessel, in order to convey the crew to some European settlement; and highly gratified him by causing a party of men to be drawn up, and fire three volleys. This occasioned such shouting and chattering, as equalled in noise the report of the pieces.

Captain Wilson dressed the king's son in a silk coat and blue trowsers. He was a young man extremely well made, but had lost his nose, whether in battle, or from a scrophulous disease, which is prevalent there, was not known.

Arra Kooker, one of the king's brothers, requested a white shirt, and as soon as it was given him, he put it on, in transports of joy, which he indicated by dancing and jumping, and in forming a humorous contrast between his shirt and his skin. This prince had a great propensity to mimicry, and often amused our people by taking off their manners, but with so much good nature, that no one could feel the least offence. He entertained a great partiality for their Newfoundland

dog, with a partial jump, the Kooker saluted with a fall of a seeming but for he was

a partiality for him; and, at his appearance, would
jump, bark, leap, and play a variety of tricks. Arra
Kooker would often imitate him in the same mode of
salutation, by barking, jumping, &c. which could not
fail of exciting the risible faculties. This prince was
seemingly about forty years of age, short in stature,
but so plump and fat, that he was almost as broad as
he was long.

After various ceremonies had passed, the captain
presented his majesty with a scarlet coat; who then
making signs to go on shore, jumped into the water,
and swam to land.

When the captain, and several officers, reached Pe-
lew, on a visit to the king, they came into a large
square pavement, round which were several houses,
and was conducted into one that stood in the centre of
one of the sides. Out of this house issued a number
of women, who were waiting to see those new beings
the English. Those our people were given to under-
stand were the wives of some of the rupacks, or great
officers of state. They were rather fairer than the rest of
the women, had some little ornaments about them, and
their faces and breasts were rubbed over with turmeric.

The king, and one of his brothers, led his guests
into this house; the women then returned, and receiv-
ed them with much joy, presenting their company
with cocoa-nuts and sweet drink, which all sat down
and partook of. The ladies also seated themselves, and
taking a parcel of leaves, began to make nets, an em-
ployment in which they pass great part of their time.
The king informed his guests that his house was to
be their abode as long as they remained at Pelew, and
that there they were to sleep. After this he rose up,
previously apologizing to the captain for retiring, saying
he was going to bathe.

Soon after a message came to Raa Hook from the
queen, requesting that she might see the English at her
dwelling. They attended him thither, and observed
immediately before it a rail, on which were some tame
pigeons tied by the leg. This is a bird held in such
estimation in those islands, that none but rupacks and
their families are allowed to eat them.

As they approached, the queen opened her window,
and spoke to Raa Hook, to desire the English would
sit down on the pavement before her, which being
complied with, a number of attendants brought out
yams, cocoa-nuts, and sweet drink. While they were
partaking of these, the queen asked Raa Hook many
questions about our people, of whom she took very great
notice, and wished some of them would come close to the
window, and draw up their coat sleeves, that she might
see the colour of their skins. After she had viewed
them attentively, and asked, through Raa Hook, as
many circumstances respecting them as she thought she
could with propriety obtrude, she signified that she
would not longer trespass on their time, by detaining
them; so they rose and took their leave.

Raa Hook now took them to his own house, where
they were welcomed without any parade. His wife,
among other things, gave them a broiled pigeon, a de-
licacy that, as before observed, only falls to the share
of the dignified.

There the character of the prince appeared in a new
and interesting light: his children encompassed him,
and climbing to his knees, fondly caressed their father,
while his supreme pleasure appeared to be in rolling
and tossing them about. This domestic scene, how-
ever, so much occupied the minds of the captain and
officers, that it was dark before they thought of reti-
ring. Raa Hook begged they would dispense with his
attendance, and ordered the Malay to conduct them to
their destined habitation, where they found some fish for
supper, sent by the king. Though the night proved
tempestuous, their house was so well thatched that the
rain could not penetrate.

The king having signified to Captain Wilson his
pleasure of tendering to him the island where the
English resided, as a present, and informed him that
they distinguished it by the name of Oroolong, in order
to announce possession of it, the British pendant was
hoisted, and three volleys of small arms fired. On the
east-side is the bay and harbour, which lies east and
west: it was judged the whole circumference of the
island did not exceed three miles. To this island the
captain would have returned the day following (the
night he passed with the officers under the roof of the
hospitable Prince Raa Hook) if the weather had not
turned unfavourable. They therefore took a ramble
further into the country, where the lands appeared to
be pretty well cultivated, and the villages full of inha-
bitants. They observed that the lower orders of the
women were busied in looking after the yam planta-
tions, which were mostly in swampy ground. Others
they found employed in making baskets and mats, and
in nursing their children. Among the women whom
Raa Hook conducted about the cove, there was one
who struck all our countrymen, as being superior in
elegance and beauty, as well as in her graceful manner
of walking, to any female they had noticed at Pelew;
she was very young, and they could not help making
some inquiries about her of the general; who informed
them, that she was one of the king's wives, and was
called LUDEE. This lady, as well as all her female
companions, testified that degree of surprise which the
first sight of our different works had excited in all the
other natives.

The employment of the men seemed to be that of
gathering cocoa-nuts, felling trees, and making spears
and darts, the chief warlike instruments of the Pelew-
ans. In the use of these they were remarkably expert,
as they afforded abundant proof in divers engagements
with the subjects of a neighbouring prince; in which
they were aided by a select party of the English at the
request of Abba Thulle, and obtained a complete victo-
ry by dint of the superior force of our fire-arms.

As the English had been useful in their assistance against the enemy, the king was deliberating what present or compensation he should make to the English leader. After a while he sent him, as a particular mark of his gratitude and esteem, two lovely young women. Captain Wilson, who was a grave sober man, and had his son with him, a youth about seventeen, was particularly embarrassed. He, however, thought proper to send them back again. The king of Pelew was exceedingly unhappy that his present was not accepted, and concluded, in his own mind, that their being rejected was owing to their not being sufficiently young. To obviate this objection, after some strong parental struggles, he actually sent Captain Wilson his own daughter, a sweet little girl, who was no more than twelve years old. She was of course returned also: but it was extremely difficult to satisfy the king that in this rejection of his presents no insult was intended.

The death of Raa Hook's valiant son afforded our people an opportunity of being acquainted with their funeral ceremonies. Having been invited to an entertainment by one of the rupaaks, they were surprised, when the repast was ended, at hearing the doleful lamentations of women at some distance; and going to the place from whence the sound proceeded, they observed a concourse of females following a dead body, held up in a mat, and laid on a sort of bier, made of bamboos, carried by four men on their shoulders. These were the only males in company. Our people followed to the place of interment, where the body was deposited without any religious ceremony, the bearers filling up the grave with their hands and feet, while the women knelt down, and again vented the most piercing cries, at times indicating as if their phrenzy would lead them to tear up the corpse.

The marriages of these people are simply a mutual contract between the sexes, which is held inviolate. A plurality of wives is allowed; but they have seldom more than two. They had no established religion, but seemed to possess an innate confidence of the efficacy of virtue, and the temporal advantages arising from moral rectitude.

C H A P. XXVI.

General Remarks on the Disposition, Character, and Religion of the Natives. The Order of the Bone described. Interesting Account of Lee Boo, one of the King's Sons, intrusted by his Father to the Care of Captain Wilson, who sails with him first to China, and afterwards arrives with him in England. Becoming Behaviour of the young Prince there; and affecting Particulars of his Death by the Small-Pox.

THE conduct of these people to the English was, from the first to the last, uniformly courteous and attentive, accompanied with a politeness that surprised

those on whom it was bestowed. At all times they seemed so cautious of intruding, that on many occasions they sacrificed their natural curiosity to that respect which decent good-manners appeared to them to exact. Their liberality to the English, at their departure, when individuals poured in all the best they had to give, and that of articles too, of which they had far from plenty themselves, strongly demonstrated, that these testimonies of friendship were the effusion of hearts that glowed with the flame of philanthropy; and when our countrymen, from want of stowage, were compelled to refuse the further marks of kindness which were offered them, the entreating eyes, and supplicating gestures with which they solicited their acceptance of what they had brought, most forcibly expressed how much their minds were wounded, to think they had not arrived early enough, to have their little tributes of affection received. Nor was this conduct of theirs an ostentatious civility exercised towards strangers; separated as they were from the rest of the world, the character of a stranger had never entered their imagination. They felt our people were distressed, and in consequence wished they should share what they had to give. It was not that worldly munificence, which bestows and spreads its favours with a distant eye to retribution; their bosoms had never harboured so contaminating a thought; no; it was the pure emotions of native benevolence! it was the love of man! it was a scene that pictured human nature in triumphant colouring; and whilst their liberality gratified the sense, their virtue struck the heart!

Having given a sketch of the character of these people, it may not be amiss to inquire concerning their religion; which we shall do in the words of Mr. Keate.

"There are few people, I believe, among the race of men, whom navigation hath brought to our knowledge, who have not shewn, in some instance or other, a sense of something like religion, how much soever it might be mixed with idolatry or superstition; and yet our people, during their continuance with the natives of Pelew, never saw any particular ceremonies, or observed any thing that had the appearance of public worship. Indeed, circumstanced as the English were, they had not enough of the language to enter on topics of this nature; and it would also have been indifferet to have done it, as such inquiries might have been misconceived, or misconstrued by the natives: added to this, their thoughts were naturally bent on getting away, and preserving, while they remained here, the happy intercourse which subsisted between them and the inhabitants.

"Though there was not found, on any of the islands they visited, any place appropriated for religious rites, it would perhaps be going too far to declare, that the people of Pelew had absolutely no idea of religion. Independent of external ceremony, there may be such a thing as the religion of the heart, by which the mind

found, on any of the islands opriated for religious rites, too far to declare, that they ly no idea of religion. In omony, there may be such a heart, by which the mind may

may, in awful silence, be turned to contemplate the God of nature; and though unblest with those lights, which have pointed to the Christian world an unerring path to happiness and peace, yet they might, from the light of reason only, have discovered the efficacy of virtue, and the temporal advantages arising from moral rectitude.

"The reader will, by this time, have met with sufficient occurrences to convince him, that the inhabitants of these new-discovered regions had a fixed and rooted sense of the great moral duties: this appeared to govern their conduct, glow in all their actions, and grace their lives. Actuated by such principles, we see them laborious, industrious, and benevolent: in moments of danger firm, and prodigal of life; in misfortunes patient, in death resigned. And if, under all these circumstances, he can conceive, that the natives of Pelew passed their lives without some degree of confidence, some degree of hope, I have only to say, his idea of mankind must widely differ from my own.

"Superstition is a word of great latitude, and vaguely defined; though it hath, in enlightened eyes, been called the offspring of ignorance; yet in no times hath it existed without having some connection with religion. Now that the people of Pelew had, beyond all doubt, some portion of it, appears from the wish expressed by the king, when he saw the ship (Oroolong) building, 'That the English would take out of it some particular wood, which he perceived they had made use of, and which, he observed to them, was deemed to be of ill omen, or unpropitious.'

"They had also an idea of an evil spirit, that often counteracted human affairs; a very particular instance of this was seen, when Mr. Barker (a most valuable member in the English Society) fell backward from the side of the vessel, then on the stocks; Raa Hook, who happened to be present, observed thereupon, that it was owing to the *unlucky wood* our people had suffered to remain in the vessel, that the evil spirit had occasioned this mischief to Mr. Barker.

"In the passage from Pelew to China, somewhat was discovered in Prince Le Boo, pretty similar to what is called *second-sight*. At the time he was very sea-sick, he said, how much he was concerned at the distress his father and friends were feeling, who *knew* what he was then suffering. [His expression at the time was, *that he was sensible his father and family had been very unhappy from knowing that he had been sick.*] The same anxiety operated on him on their account, when he perceived his dissolution drawing near.

"They certainly entertained so strong an idea of divination, that whenever any matter of moment was going to be undertaken, they conceived they could, by splitting the leaves of a particular plant, that was not unlike our bulrush, and measuring the strips of this long narrow leaf on the back of their middle-finger, form a judgment whether it would or would not turn out prosperous. This was observed by Mr. M. Wilson,

in his first visit to the king at Pelew; and, on inquiry, was afterwards explained to the English by the linguist, as being done to discover if their arrival foreboded good or ill-fortune. It was noticed by several of our people, that the king recurred to this supposed oracle on different occasions, particularly at the time when they went on the second expedition against Artingall, a neighbouring island, when he appeared to be very unwilling to go aboard his canoe, and kept all his attendants waiting, till he had tumbled and twisted his leaves into a form that satisfied his mind, and predicted success. Our people never observed any person but the king apply to this divination.

"It is hardly possible but the fond anxiety of a parent, on giving up a son into the hands of strangers, who were to convey him to remote regions, of which he could form to himself but very imperfect notions, would, on so interesting a point, induce him to examine his oracle with uncommon attention; and it is as little to be doubted, but that every thing wore, to his imagination, a prosperous appearance: yet, to evince the fallacy of his prophetic leaves, they certainly augured not the truth, nor presented to the father's mind even a suspicion, that the son he parted with, he should see no more!

"On this subject, I would further wish to bring back to the reader's recollection a few occurrences:—As Raa Hook, and others of the natives, were two or three times present, when Captain Wilson, on a Sunday evening, assembled his people to read prayers to them, they expressed no surprise at what was doing, but appeared clearly to understand, that it was the mode in which the English addressed the invisible God, whom they looked up to for protection; and how different forever their own notions might be, they attended the English on these occasions with great respect, seeming desirous to join it, and constantly preserving the most profound silence, the general never allowing the natives to speak a single word, and refusing even to receive a message from the king, which arrived at the tents during divine service.

"The ceremony used by Raa Hook, after the funeral of his son, when he repeated something to himself whilst he was marking the cocoa-nuts, and the bundle of beetle-leaves which the old woman was to place on the young man's grave, had every appearance of a pious office; and when he planted the cocoa-nuts, and some other fruit trees on the island of Oroolong, what he uttered in a low voice, as each seed was deposited in the earth, impressed those present as the giving a benediction to the future tree that was to spring from it. The king also, when he took leave of his son, said a few words, which, by the solemnity they were delivered with, and the respectful manner in which Lee Boo received them, induced all our countrymen to conceive it was a kind of blessing.

"I must, in this place, add a circumstance that passed in conversation with Captain Wilson and Lee Boo.

Boo, after he had been some time in England: the former telling him, that saying prayers at church was to make men good, that when they died, and were buried, they might live again above (pointing to the sky); Lee Boo, with great earnestness, replied, *All same Pelew; bad men stay on earth; good men go into sky, become very beautiful*—holding his hand in the air, and giving a fluttering motion to his fingers. This surely conveyed a strong idea, that they believed the spirit existed, when the body was no more.

“After combining all these facts, and uniting them with the moral characters of the people, the reader is left in a situation to judge for himself; independent of Lee Boo’s declaration, whether it is probable that their lives could be conducted with that decency we have seen, and their minds trained to so strong a sense of justice, propriety, and decency, without having some guiding principle of religion; thus much, at least, I think, we may be authorised to assert—If all this was effected without it, it proves, that the natives of Pelew had been happy enough, not only to discover, but to be perfectly convinced, that VIRTUE IS ITS OWN REWARD.”

After three months stay on the island, our countrymen were enabled, by the most persevering toil, but still more by the beneficence and integrity of the natives, to build a vessel out of the fragments of their wreck. In this, after leaving one of the crew, named Madan Blanchard, who requested permission to remain on the island, they departed on the 12th of November, and arrived at Macao on the 30th of the same month, whence they afterwards proceeded to England.

The king, finding the English were preparing for their departure in their new vessel, the Oroolong, sent in the morning a message to Captain Wilson, desiring him to come to him at the watering-place; and on his arrival, acquainted him, that it was his intention to invest him with the Order of the BONE, and make him in form a rupack of the first rank. The captain expressed his acknowledgment for the honour his majesty purposed to confer on him, and the pleasure he felt at being admitted a Chief of Pelew.

The king and all the rupacks then went and sat down under the shade of some large trees, and Captain Wilson was desired to sit at a little distance; when Raa Kook receiving the bone, presented it as from his brother, Abba Thulle, and wanted to know which hand he used in common. This the general wished to ascertain, by putting a stone in his hand, which he desired him to throw at a distance from him. Finding it was the right-hand he naturally used, he was again requested to sit down, and the bone applied to his left-hand, to see if it was large enough for his hand to slip through: being not found sufficiently so, it was rasped away, till judged to be wide enough: when Raa Kook, the chief minister, and all the rupacks, proceeded to the investment, in the following manner:

The general made a string fast to each of the fingers

of the captain’s left-hand, and then lubricating the hand with oil, the chief minister placed himself behind the captain, holding him fast by the shoulders: Raa Kook then passed the different strings through the bone, and giving them to another rupack, they endeavoured to draw his hand through; Raa Kook, at the same time, with his own hand, compressing that of the captain into the smallest compass he possibly could, so that the bone might pass over the joints. During this, the most profound silence was preserved, both by the rupacks who assisted, and the people who attended as spectators, except by the king, who occasionally suggested in what manner they might facilitate the operation. The point being at last obtained, and the hand fairly passed through, the whole assembly expressed great joy. Abba Thulle then addressing the captain, told him, *That the bone should be rubbed bright every day, and preserved as a testimony of the rank he held amongst them; that this mark of dignity must, on every occasion, be defended valiantly, nor suffered to be torn from his arm, but with the loss of life.*

The ceremony ended, all the rupacks congratulated Captain Wilson on his being one of their order; and the inferior natives flocked round to look at the bone, and appeared highly pleased to see his arm adorned with it, calling him English Rupack.

This mark of distinction is given and received in those regions, as a reward of valour and fidelity, and held out as the prize of merit. The decoration indeed derives all its splendor from the combined ideas of the mind whilst viewing it; and the imagination is equally impressed with the same sentiment, whether the badge of honour be a strip of velvet tied round the knee, a tail of ribbon and cross dangling at the button hole, a star embroidered on the coat, or a bone upon the arm.

ANECDOTES OF LE BOO, SECOND SON OF ABBA THULLE.

The king, his father, from a predilection to our people, resolved to intrust his second son to the care of Captain Wilson, that he might have the advantage of improving himself, by accompanying the English, and of learning many things, that might, at his return, greatly benefit his own country. He added, that one of the Malays, from Pelelew, a neighbouring island, should also go to attend on him. He described his son as a young man of an amiable and gentle disposition; that he was sensible, and of a mild temper, and spoke much in his commendation.

Captain Wilson expressed himself exceedingly obliged and honoured by this singular mark of the king’s confidence and esteem; and assured him, that he should endeavour to merit the high trust reposed in him, by treating the young prince with the same tenderness and affection as his own son.

Lee Boo, we are told, gave our people an early opportunity of seeing the natural benevolence of his mind; for when at Canton, seeing some of the Chinese boats that are rowed by poor Tartar women, with their little

children tied to their backs (and who live in families on
the water) surround the vessel, to petition for frag-
ments of victuals; the young prince, on noticing their
supplications, gave them oranges, and such other things
as he had, being particularly attentive to offer them those
things which he liked best himself.

Amongst several other things which solicited his no-
tice, when at the house of Mr. McIntyre, at Macao,
there was a large mirror at the upper end of the hall,
which reflected almost his whole person. Here Lee Boo
stood in perfect amazement at seeing himself;—he
laughed—he drew back—and returned to look again,
quite absorbed in wonder—he made an effort to look
behind, as if conceiving somebody was there, but found
the glass fixed close to the wall. Mr. McIntyre observ-
ing the idea that had crossed him, ordered a small glass
to be brought into the room, wherein having viewed
his face, he looked behind, to discover the person who
looked at him, totally unable to make out how all this
was produced.

As he drew near the British Channel, the number of
vessels that he observed pursuing their different courses,
increasing so much, he was obliged to give up the keep-
ing of his journal. When the Morse got to the Isle of
France, Captain Wilson, his brother, the prince, with
several other passengers, quitted her, and coming in a
boat between the Needles, arrived safe at Portsmouth the
14th day of July 1784. On landing, the number and
size of the men of war, then in harbour, the variety of
houses, and the ramparts, were all objects of attraction:
he seemed so totally absorbed in silent surprise, that he
had no leisure to ask any questions.

Mr. Keate, the writer of Captain Wilson's account
of the Pelew-Islands, observes, that going to Rother-
hithe to see the captain, Lee Boo was reading at a win-
dow; that he recollected him instantly, and flew with
eagerness to the door to meet him, looked on him as a
friend, ever after attached himself to him, appearing to
be happy whenever they met together. That he seemed
to be pleased with every thing about him, and said,
*All fine country, fine street, fine coach, and house upon
high up to sky*, putting alternately one hand above
another, by which it was found (their own habitations
being all on the ground) that every separate story of our
buildings, he, at that time, considered as a distinct
house.

He was introduced to several of the directors of the
India-Company, taken to visit many of the captain's
friends, and gradually shewn most of the public build-
ings in the different quarters of the town; but his pru-
dent conductor had the caution to avoid taking him to
any places of public entertainment, lest he might, in
those licensed resorts, catch the small-pox, a disease which
he purposed to inoculate the young prince with, as soon
as he had acquired enough of our language, to be rea-
soned into the necessity of submitting to the operation;
judging, and surely not without good reason, that by giv-
ing him so offensive and troublesome a distemper, without

first explaining its nature, and preparing his mind to
yield to it, might weaken that unbounded confidence
which this youth placed in his adopted father.

After he had been a while settled, and a little habitu-
ated to the manners of this country, he was sent every
day to an academy at Rotherhithe, to be instructed in
reading and writing, which he himself was eager to at-
tain, and most assiduous in learning. His whole ce-
portment, while there, was so engaging, that it not only
gained him the esteem of the gentleman under whose
tuition he was placed, but also the affection of his young
companions. In the hours of recess, when he returned
to the captain's house, he amused the whole family by
his vivacity, noticing every particularity he saw in any
of his schoolfellows, with great good-humour mimic-
ing their different manners, sometimes saying he would
have a school of his own when he returned to Pelew,
and should be thought very wise, when he taught the
great people their letters.

Captain Wilson, and the young prince, dining with
Mr. Keate early after his arrival, the latter was asking
how he was affected by painting: on mentioning the
subject, Dr. Carmichael Smyth, whom Dr. Keate had
requested to meet this stranger, wished the last-mentio-
ned person to bring a miniature of himself, that thereby
all might observe if it struck him. He took it in his
hand, and instantly darting his eyes towards Mr. Keate,
called out, *Miss Keate, very nice, very good.* The
captain then asking him, if he understood what it signi-
fied, he replied, *Lee Boo understand well, that Miss
Keate die—this Miss Keate live.* The writer re-
marks, that a treatise on the utility and intent of por-
trait-painting, could not have better defined the art than
this little sentence. Mrs. Wilson desiring Lee Boo,
who was on the opposite side of the table, to send her
some cherries, perceiving that he was going to take them
up with his fingers, jocosely noticed it to him; when he
instantly resorted to a spoon; but sensible that he had
discovered a little unpoliteness, his countenance was in
a moment covered with a blush, that visibly forced it-
self through his dark complexion.

Whenever he had opportunities of seeing gardens, he
was an attentive observer of the plants and fruit-trees,
would ask many questions about them, and say, when
he returned home, he would take seeds of such as would
live and flourish in Pelew; talked frequently of the
things he should then persuade the king to alter, or adopt;
and appeared, in viewing most objects, to consider how
far they might be rendered useful to his own country.

He was now proceeding with hasty strides in gaining
the English language, and advancing so rapidly with his
pen, that he would, probably, in a very short time,
have written a very fine hand, when he was overtaken
by that very disease, which with so much caution had
been guarded against. On the 16th of December 1784,
he felt himself much indisposed, and in a day or two
after an eruption appeared all over him. Dr. Smyth
told the family, that there was not a doubt with respect

to the disease; and was sorry to add (what he thought it right to prepare them for) that the appearances were such as almost totally precluded the hope of a favourable termination.

Mrs. Wilson happening to have some indisposition: at this time, which confined her to her bed, Lee Boo, on hearing of it, became impatient, saying, *What, mother ill! Lee Boo get up to see her*; which he did, and would go to her apartment, to be satisfied how she really was.

On the Thursday before his death, walking across the room, he looked at himself in the glass (his face being then much swelled and disfigured) he shook his head, and turned away, as if disgusted at his own appearance, and told Mr. Sharp, *that his father and mother much grieve, for they knew he was very sick*; this he repeated several times. At night, growing worse, he began to think himself in danger: he took Mr. Sharp by the hand, and fixing his eyes stedfastly on him, with earnestness said, *Good friend, when you go to Pelew, tell Abba Thulle, that Lee Boo take much drink, to make small-pox go away, but he die: that the captain and mother (meaning Mrs. Wilson) very kind;—all English very good men—was much sorry he could not speak to the king the number of fine things the English had got.* Then he reckoned what had been given him as presents, which he wished Mr. Sharp would distribute, when he went back, among the chiefs; and requested that very particular care might be taken of the blue glass barrels, or pedicels, which he directed should be given to the king. Poor Tom Rose, who stood at the foot of his young master's bed, was shedding tears at hearing all this, which Lee Boo observing, rebuked him for his weakness, saying, *Why should he be crying so because Lee Boo die?*

Whatever he felt, his spirit was above complaining; and Mrs. Wilson's chamber being adjoining to his own, he often called out to inquire if she was better, always adding (lest she might suffer any inquietude on his account) *Lee Boo do well, mother.* The small-pox, which had been out eight or nine days, not rising, he began to feel himself sink; and told Mr. Sharp, *he was going away.* His mind, however, remained perfectly clear and calm to the last, though what he suffered in the latter part of his existence, was severe, indeed! The strength of his constitution struggled long and hard against the venom of his distemper, till exhausted nature yielded in the contest.

Mr. Keate proceeds with his affecting narrative, as follows:

“Dr. Smyth had the goodness, every day, on his return from Rotherhithe, to inform me (Captain Wilson) of the state of his patient, but never gave me any hope of his recovery. Being under an engagement with my family to pass a week at the house of my friend, Mr. Brock Watson, at Sheen, who was equally anxious and alarmed as ourselves for this amiable young man, I requested the doctor would have

the goodness to continue to me his information. The second day after I left town, I received the intelligence of his death, which deeply affected us all. I cannot give an account of this melancholy event so well as by transcribing Dr. Smyth's letter, by which it was conveyed to me.

“Monday, Dec. 27, 1784.

“MY DEAR SIR,

“It is an unpleasant task for me to be the herald of bad news; yet, according to my promise, I must inform you of the fate of poor Lee Boo, who died this morning without a groan, the vigour of his mind and body resisting to the very last. Yesterday, the secondary fever coming on, he was seized with a shivering fit, (succeeded by a head-ach, violent perturbation of the heart, anxiety, and difficult breathing; again used the warm bath, which, as formerly, afforded him a temporary relief. He had a blister put on his back, which was as ineffectual as those applied to his legs. He expressed all his feelings to me, in the most forcible and pathetic manner, put my hand upon his heart, leaned his head on my arm, and explained his uneasiness in breathing; but when I was gone, he complained no more, shewing that he complained with a view to be relieved, not to be pitied.—In short, living or dying, he has given me a lesson which I shall never forget; and surely, for patience and fortitude, he was an example worthy of the imitation of a stoic! I did not see Captain Wilson when I called this morning, but the maid-servant was in tears, and every person in the family wore the face of grief: poor Lee Boo's affectionate temper made every one look upon him as a brother or a child. Compliments to the ladies, and to Mr. Watson, who, I make no doubt, will all join in regretting the untimely end of our poor prince; from you my friend, something more will be expected; and though you cannot bring him back to life, you are called upon (particularly considering his great attachment to you) not to let the memory of so much virtue pass away unrecorded. But I am interrupted in these melancholy reflections, and have only time to assure you of (what will never pass away but with myself) the sincere friendship of

“Your affectionate, &c.

“JAMES CARMICHAEL SMYTH.”

Captain Wilson notified to the India-House the unfortunate death of this young man: and received orders to conduct every thing with proper decency respecting his funeral. He was interred in Rotherhithe church-yard, the captain and his brother attending. All the young people of the academy joined in this testimony of regard; and the concourse of people at the church was so great, that it appeared as if the whole parish had assembled, to join in seeing the last ceremonies paid to one

The India-Company, soon after, ordered a tomb
to be erected over his grave, with the following in-
scription:

TO THE MEMORY

Of Prince LEE BOO,

A Native of the Pelew, or Palos-Islands,
And Son to ABBA THULLE, Rupack, or King
Of the Island COOROOAA;

Who departed this Life on the 17th of December 1784,

Aged 20 Years,

This Stone is inscribed

By the Honourable United East-India-Company,
As a Testimony of Esteem for the humane and
Kind Treatment

Afforded by his Father to the Crew of their Ship,

The Antelope, Captain Wilfor,

Which was wrecked off that Island,

On the Night of the 9th of August, 1783.

Stop, Reader, stop!—let NATURE claim a tear;

A Prince of mine—LEE BOO lies bury'd here.

From the above recited anecdotes of this amiable
youth, cut off in the moment that his character began
to blossom, what hopes might not have been entertained
of the future fruit such a plant would have produced!
He had both ardour and talents for improvement, and
every gentle quality of the heart to make himself be-
loved; so that, as far as the dim sight of mortals is per-
mitted to penetrate, he might, had his days been length-
ened, have carried back to his own country, not the
vices of a new world, but those solid advantages which
his own good sense would have suggested, as likely to
become most useful to it.

The evening before the Oroolong sailed, the king
asked Captain Wilfor, how long it might be before
his return to Pelew? And being told, that it would
probably be about thirty moons, or might chance to
extend to six more, Abba Thulle drew from his basket
a piece of line, and, after making thirty knots on it,
a little distance from each other, left a long space, and
then adding six others, carefully put it by.

As the slow but sure steps of time have been moving
onward, the reader's imagination will figure the anx-
ious parent resorting to this cherished remembrancer,

and with joy untying the earlier records of each elap-
sing period:—as he sees him advancing on his line, he
will conceive that joy redoubled; and when nearly ap-
proaching to the thirtieth knot, almost accusing the
planet of the night for passing so tardily away.

When verging towards the termination of his latest
reckoning, he will then picture the mind of the good
old king, glowing with parental affection, occasionally
alarmed by doubt, yet still buoyed up by hope; he will
then fancy him pacing inquisitively the sea-shore, and
often commanding his people to ascend every rocky
height, and glance their eyes along the level line of the
horizon which bounds the surrounding ocean, to see if
haply it might not in some part be broken by the distant
appearance of a returning sail.

Lastly, he will view the good Abba Thulle, wearied
out by that expectation which so many returning
moons, since his reckoning ceased, have by this time
taught him he had nourished in vain. But the reader
will bring him back to his remembrance, as armed
with that unshaken fortitude, which was equal to the
trials of varying life. He will not in him, as in less
manly spirits, see the passions rushing into opposite ex-
tremes:—hope turned into despair—affection con-
verted to hatred. No—after some allowance for their
natural fermentation, he will suppose them
all placidly subsiding into the calm of resigna-
tion. In proof of the truth of these remarks,
we doubt not, it will afford peculiar satisfaction to
our readers, to be informed, that in the beginning of
September 1791, advices were received by the Lord
Thurlow East-Indiaman, that the Panther, of 200 tons,
commanded by Lieutenant McCluer, with the Endea-
vour of sixty tons, had sailed from Bombay on the
23d of August 1790, and arrived safely at the Pelew-
Islands.

On their arrival, they observed two canoes, which
made towards the shore, instead of coming to the ships,
as had been expected. These, they supposed, were go-
ing to give an account to Abba Thulle of their arrival;
and in this conjecture they were not mistaken; for soon
after, they saw a number of canoes coming after them,
in one of which was the good old king.

Immediately on his coming on board, he went up to
the captain, taking him, by his dress, to be his former
friend, Captain Wilfor, and immediately felt on his arm
for the *bone* (a mark of honour he had conferred on the
captain, as described in p. 160.) and inquired what was
become of it. Finding his mistake in the person, and
being told that Captain Wilfor was alive and well in
England, he expressed great satisfaction.

Captain McCluer then communicated to him the
death of Lee Boo, and the disorder of which he died;
for which event, the good old man said, that he had
prepared his mind; that he had counted up to some
score moons, but the time being passed, he had despaired
of ever seeing the English more, judging that they had
either perished in their voyage to China, or did not in-
tend

tend to return again to visit his islands: he was, however, perfectly confident in the goodness of the English, and that Captain Wilson would take care of his son.

In relating the death of Blanchard (the seaman who had been left there by his desire) he was full of grief, and could hardly express himself, so much did he feel his loss. Blanchard was mortally wounded, in an engagement with the people of Pelelew, and died soon after; as did the great and good friends of Captain Wilson and his crew, Raa Kook, and Arra Kooker. During the time of Captain McCluer's stay at the islands, which was near a month, the utmost harmony and friendship prevailed; the good old king liberally supplied them with fish and yams, when the canoes came in, as he used to do to his former friends.

We have now given a circumstantial review of regions first explored in the vast Pacific-Ocean, by the latest most ingenious and enterprising navigators; in which the inquisitive mind has been presented with a display of human nature, in its rude and uncultivated state, and have therein pictured scenes tending to excite equal horror and amazement; but are happy to observe, that we have been enabled to close this part of the New Discoveries, with a copious description of the Pelelew-Islands, the character and virtues of whose inha-

bitants appear in the most amiable light, and cannot fail to affect the intelligent and philanthropic reader with the most pleasing sensations in the perusal.

We now pass on to Asia, being that quarter of the globe which is allowed, by geographers in general, to claim pre-eminence from the serenity of its air, the fertility of its soil, the richness of its mines, and on various other accounts. Here new prospects open to the view, and here much more important, as well as entertaining discoveries, both on the coasts, as well as in the distant islands, have been recently made by our late navigators, all of which will be described in their proper places.

In this part of our undertaking, we shall survey amazingly extensive and opulent empires, trace the progress of arts and sciences, perceive the effects of different dispositions and propensities in a different race of men, and likewise give a detail of the customs, manners, and ceremonies of people totally opposite to those already described. As these subjects are happily adapted to blend instruction with entertainment, at the same time that they tend to expand the ideas of the readers, we presume they will not repent of devoting some part of their time to the contemplation of them. To the continental part, we shall also add a description at large of the Asiatic islands, classed under one general head.

A SPECIMEN OF THE PELEW LANGUAGE.

<i>Arracat</i>A man.	<i>Tair</i>A spoon.	<i>Arrell</i>Fresh water.

UNIVERSAL GEOGRAPHY.

BOOK II.

A S I A.

CHAP. I.

General Description of this Quarter of the World.

THOUGH for the reasons we have enumerated in the Preface, this quarter claims a superiority over the rest; it must nevertheless be owned, that a considerable part of Asia, particularly that called Turkey, has lost much of its ancient splendor and fertility, and from the most populous and best cultivated spot in the whole territory, is now become a wild and uncultivated desert. The other parts, however, are still in a flourishing condition, which is rather to be attributed to the richness of the soil, than to the industry of the inhabitants, who are remarkable for their indolence, luxury, and effeminacy. This effeminacy is chiefly owing to the warmth of the climate, though in some measure heightened by custom and education; and the symptoms of it are more or less visible, as the several nations are seated nearer or further from the north. Hence the people of Tartary, and the Asiatic parts of Russia, are as brave, hardy, strong, and vigorous, as those who inhabit the same latitudes in Europe. What

is wanting in the robust frame of their bodies among the Chinese, Mogul Indians, and all the inhabitants of the more southern regions, is in a great measure made up to them by the vivacity of their minds, and the ingenuity they possess in various kinds of workmanship, which our most skilful mechanics have long endeavoured to imitate, but without success.

Asia claims the first planting of cities, institution of laws and government, civilization of manners, origin of arts and sciences, and cultivation of human literature in general. To these distinguished blessings of a spiritual or mental kind, may be added the bounties of Providence, which are here dispensed in vast variety, as well as superabundance. In fine, if we advert to the serenity of its air, the fertility of its soil, the deliciousness of its fruits, the salubrity of its drugs, the fragrance and balsamic qualities of its plants, gums, and spices; the quantity, beauty, and value of its gems, the fineness of its silks and cottons, and many other natural endowments, we cannot but admit of its decided superiority, nor can we wonder at its ancient splendor, power, and opulence. The following are the principal regions into which Asia is divided:

ASIA is situated between 25 and 180 deg. of east long. and between the equator and 80 deg. of north lat. It is about 4740 English miles in length, from the Dardanelles on the west, to the eastern shore of Tartary, and about 4380 miles in breadth, from the most southern part of Malacca, to the most northern cape of Nova-Zembla. It is bounded by the Frozen-Ocean on the north; on the west, it is separated from Africa by the Red-Sea; and from Europe by the Levant or Mediterranean, the Archipelago, the Hellespont, the Sea of Marmora, the Bosphorus, the Black-Sea, the river Don, and a line drawn from it to the river Tobol, and

from thence to the river Oby, which falls into the Frozen-Ocean; on the east, it is bounded by the Pacific-Ocean, or South-Sea, which separates it from America, and on the south, by the Indian-Ocean; so that it is almost surrounded by the sea.

In ancient times, great part of this vast country was successively governed by the Assyrians, Medes, Persians, and Greeks; but the immense regions of India and China were little known to Alexander, or to any of the conquerors of the ancient world. Secluded by an almost impenetrable range of mountains and deserts, they were free from the swords of European warriors, and enjoyed their

their delicious climate, and the decline of the empire of Asia submitted to the middle of the world, they are usually, Africa, and Europe, of Cyrus, Alexander, the height of power, the death of T, the victorious, the middle regions of the countries of the Chinese, the the lesser kingdom.

The prevailing religion of the globe, is about the most abject, they enjoy some share, as the Tartars are very, on account of their independent themselves, with unconcern, they remain uncorrupted; their laws, their customs are their whole property and arms. They are content to the choice, and are for subsistence, do slaves.

The Tartar, they never equally free, ruled in the country, periods, where the spotism over the man, chief against, no longer a pure occupation of all. altitudes of Tartar, seller moves with enemy in every be the land, he crosses, and robbery acquired.

Among the inhabitants of Persia from Ir, they have formed a valley contains a c, spotism is temporary, people, that he is, their sovereign. they derive credit, they attend him in

which falls into the gulf, bounded by the Persian Gulf, separates it from the Indian-Ocean; so

a vast country was formed by the Medes, Persians, and Scythians, or to any of the nations of India and Persia, or to any of the nations of the deserts, they were the most powerful, and enjoyed their

their delicious climates unenvied and unmolested. Upon the decline of the above-mentioned empires, great part of Asia submitted to the Roman arms; and afterwards, in the middle ages, the successors of Mahomet, or, as they are usually called, Saracens, founded in Asia, Africa, and Europe, a more extensive empire than that of Cyrus, Alexander, or even the Romans, when in its height of power. The Saracen greatness ended with the death of Tamerlane; and the Turks, on every side victorious, soon after possessed themselves of the middle regions of Asia, which they still enjoy. Besides the countries under the dominion of the Turks and Russians, Asia contains at present three large empires: the Chinese, the Mogul, and the Persian, upon which the lesser kingdoms and sovereignties generally depend.

The prevailing form of government in this division of the globe, is absolute monarchy; and here the people are the most abject slaves. If any of them can be said to enjoy some share of liberty, it is the wandering tribes, as the Tartars and Arabs. The latter alone possess liberty, on account of the sterility of their soil; independent themselves of revolution and change, they see, with unconcern, empires falling and rising around them. They remain unconquered by arms, by luxury, by corruption; their language is permanent; they adhere to their customs and manners, and retain their dress. Their whole property consists of flocks and herds, tents and arms. They annually make a small and voluntary present to the chief of their race. They revolt from oppression, and are free from necessity, which they mistake for choice. When men are obliged to wander for subsistence, despotism knows not where to find its slaves.

The Tartar, though a wanderer like the Arab, was never equally free. A violent aristocracy always prevailed in the country of the former, except in a few short periods, where the fortune of one established a transient despotism over the whole. There man is armed against man, chief against chief, and tribe against tribe. War is no longer a particular profession, but the constant occupation of all. Men are more afraid of men, in the solitudes of Tartary, than of beasts of prey. The traveller moves with great circumspection, and fears an enemy in every blast. When he perceives a track in the sand, he crosses it, and begins to draw his sword. The assassin is dignified with the name of conqueror, and robbery acquires the more honourable name of conquest.

Among the inhabitants of the mountains which separate Persia from India, the nature and face of the country have formed a different species of society. Every valley contains a community subject to a prince, whose despotism is tempered by an idea established among his people, that he is the chief of their blood, as well as their sovereign. They obey him without reluctance, as they derive credit to their family from his greatness. They attend him in his wars, with the attachment which

children have for a parent; and his government, though severe, partakes more of the rigid discipline of the general, than of the caprice of an arbitrary sovereign.

With regard to the great empires of Turkey, Persia, Hindostan, and China, they are despotic in the strictest sense of the word; and many of the Asiatic nations, when the Dutch first came among them, could not conceive how there should exist any other form of government than that of a despotic monarchy.

Turkey, Arabia, Persia, part of Tartary, and part of India, profess Mahometanism. The Persian and Indian Mahometans are of the sect of Hali, and the others of that of Omar; but both own Mahomet for their law-giver, and the Koran for their rule of faith and life. In the other parts of Tartary, India, China, Japan, and the Asiatic islands, they are generally heathens and idolaters. Christianity, though planted here with amazing rapidity by the apostles and primitive fathers, suffered an almost total eclipse by the conquests of the Saracens, and afterwards by the Turks. Incredible indeed have been the hazards, perils, and sufferings of popish missionaries, to propagate their doctrines in the most distant regions, and among the grossest idolaters; but their labours have hitherto failed of success, owing in a great measure to their own avarice, and the rapacity and profligate disposition of the Europeans, who resort thither chiefly in search of wealth and dominion. Jews are to be found every where in Asia.

This fine and extensive country being inhabited by a great variety of people, it is no wonder that the languages are also different. It would be a task at once both difficult and useless to enumerate them all: it will be sufficient to observe, that the principal spoken in Asia, are the modern Greek, the Turkish, the Russian, the Tartarian, the Persian, the Arabic, the Malayan, the Chinese, and the Japanese. On the coasts of India and China, most of the European languages are spoken.

CHAPTER II.

TURKEY IN ASIA.

Turkey in general. Its Situation, Extent, Divisions, Mountains, Rivers, Animals, &c.

THE eastern provinces of Turkey are, 1. Eyraca, Arabic, or Chaldea, whose chief towns are Bassora and Bagdad. 2. Diarbec, or Mesopotamia; chief towns, Diarbec, Orfa, and Mossul. 3. Curdistan, or Assyria; chief towns, Nineveh and Belbis. 4. Turcomania, or Armenia; chief towns, Erzerum and Van. 5. Georgia, including Mingrelia and Imaretta, and part of Circassia; chief towns, Teflis, Amarchia, and Gonie.

NATOLIA, or the Lesser Asia, on the west, contains, 1. Natolia Proper, whose chief towns are Bursa, Nice, Smyrna,

Smyrna, and Ephesus. 2. Amasia; chief towns, Amasia, Trapezond, and Tocat. 3. Aladuliâ; chief towns, Ajazzo and Marat. 4. Caramania; chief towns, Satalia and Terraffo.

East of the Levant, are Syria, with Palestine, or the Holy-Land; the chief towns in which are Aleppo, Antioch, Damascus, Tyre, Sidon, Tripoli, Scanderoon, and Jerusalem.

The mountains, which are many, have been the most celebrated, in sacred and profane history, of any in the universe. The principal, which are situated in Lesser Asia, are Olympus, Ida, Tauris, Anti-Tauris, and the Carmanian Mountains. Besides these, are Mount Caucasus, or the Daghistan Mountains; Ararat, where the ark rested, and the other Armenian Mountains; Curdistan and Palestine, Hermon and Lebanon.

Asia is perhaps the best situated for navigation of any country in the universe; but the natives do not know how to make use of the uncommon natural advantages with which Providence has blessed them. The seas which border on it are the Euxine, or Black-Sea; the Bosphorus, or Sea of Constantinople; the Propontis, or Sea of Marmora; the Hellespont, and Ægean-Sea, or Archipelago, which divide Asia from Europe; the Levant, or White-Sea, and the Persian-Gulf. The Red-Sea likewise divides it from Africa, which occasions the Grand Seigneur, among his other titles, to style himself "Lord of the Black, White, and Red-Seas."

The most remarkable rivers are the Euphrates, Tigris, Meander, Orontes, Sarabat, Jordan, Haly, and Kara; which will be particularly described as they occur.

With respect to the air and climate, both are most delightful, and naturally salubrious to the human constitution: yet such is the equality with which the Author of nature has dispensed his benefits, that Turkey, both in Europe and Asia, is often visited by the plague, a dreadful scourge of mankind wherever it takes place, but here doubly destructive, from the native indolence of the Turks, and their superstitious belief in that kind of predestination which prevents them from using the proper precautions to defend themselves against this calamity, and its fatal effects.

We need scarcely inform the reader, that this country, which contains the most fertile provinces of Asia, produces all the luxuries of life in the utmost abundance, notwithstanding the indolence of its owners. Raw silk, corn, wine, oil, honey, fruit of every species, coffee, myrrh, frankincense, and odoriferous plants and drugs, are natives found here almost without culture, which is practised chiefly by Greek and Armenian Christians. Nature has here brought all her productions to the highest perfection. The olives, citrons, lemons, oranges, figs, and dates produced in these provinces, are highly delicious, and in such plenty, that they cost the inhabitants very little, and it is said, in

some places, nothing. Their asparagus is often as large as a man's leg, and their grapes far exceed in size those of other countries.

Their animal productions by sea and land, are equally excellent and plentiful. The breed of Turkish and Arabian horses (the latter especially) are beyond any in the world, and have considerably improved that of the English. Camels are generally made use of for travelling and carrying burdens; that animal, besides the advantage of strength, being formed by nature to travel a considerable time without either provender or water. Their manufacture, known by the name of camblets, was originally made by a mixture of camels-hair with silk, though it is now often made with wool and silk. Oxen are generally used in tillage. Buffaloes are found in several parts of Turkey, the flesh of which may be purchased at an easy rate; but it is very bad, nor is the beef much better. Vast flocks of sheep, however, are fed all over the country, but particularly in the province of Lycæonia, where they are mostly of the Syrian kind. The flesh of these sheep have an exquisite taste, and their tails are exceedingly long and thick, some of them having been known to weigh thirty pounds. Innumerable herds of goats are likewise kept here, especially in Pamphylia, the hair of this animal being also of infinite use in the manufacture of their fine camblets, and great quantities of it are exported to Europe. Their kids are esteemed delicate eating, and said to surpass, in flavour and taste, those of Europe.

In Turkey, some of the birds are of an extraordinary size, particularly the ostrich, but these are not very common. There is great plenty of wild-fowl, and the island of Cyprus produces a bird, about the size of a lark; many thousands of them, when pickled down in barrels, are sent annually to Venice, where they fetch a very good price. Great numbers of them are caught in the months of September and October.

Great quantities of fish are found in most of the rivers, particularly salmon and carp of an amazing size; but the fish on their sea-coasts are esteemed far more delicate in their kind, viz. turbot, roes, soles, roach, pilchers, tunnies, oysters, herrings, &c.

This country contains all the metals that are to be found in the richest kingdoms and provinces of Europe; and its medicinal springs and baths exceed those of any in the known world. Some of these are remarkable for their salubrity, and others for their costly decorations. Near the gulf of Nicomedia is a fountain much esteemed by the Turks and Greeks for its medicinal virtues; as are several springs and rivulets in the neighbourhood of Coos. Therma, in Bithynia, is famous for its hot-baths. Near Bursa, is a large bath, the waters of which flow through mines of triol: near it is a warm bath; and at about a league distance is another, where the water is hot enough to boil an egg.

CHAP. III.

TURKEY.

Population, Inhabitants, Manners, Customs, Diversions, Dress, Marriages, Funerals, Religion, Ecclesiastical Institutions of Christians, Learning and Learned Men, Antiquities, Curiosities, &c.

THE limits of this great country not being accurately fixed, geographers have not been able to ascertain its population, which is by no means equal either to its extent or fertility. It certainly is not so great as it was before the Christian æra, or even under the Roman emperors, owing to various causes; and above all, to the tyranny under which the natives live, and their polygamy, which appears to be an enemy to population, if we may conclude from the state of the Greeks and Armenians, among whom it is not practised, as they are more prolific than the Turks, notwithstanding the rigid subjection in which they are kept by the latter; but the plague is the greatest cause of depopulation. The Turkish monarch, however, has more subjects than any two princes of Europe.

With respect to the inhabitants, the men, in general, are well made and robust: when young, their complexions are fair, and their faces handsome: their hair and eyes are black, or dark brown. The women, when young, have delicate complexions, and regular features, but they generally look old at thirty. They are said to be exceeding amorous, lively, and witty. The Turks are rather hypocondriac, grave, sedate, and passive; yet, when agitated by passion, become furious, raging, ungovernable; sometimes are big with dissimulation, jealous, suspicious, and vindictive beyond conception. In matters of religion, they are tenacious, superstitious, and morose. Though the greater part of them seem hardly capable of much benevolence, or even humanity, with regard to Jews, Christians, or any who differ from them in point of opinion; yet they are far from being devoid of social affections for those of their own religion. But interest is their supreme good; and when that comes in competition, all ties of religion, consanguinity, or friendship, are with the generality speedily dissolved.

The morals of the Asiatic Turks are, however, in many respects, preferable to those of the Europeans: they are hospitable to strangers, and the vices of avarice and inhumanity reign chiefly among the great: they are likewise said to be charitable to one another, and punctual in their dealings. Their benevolence and public spirit is most conspicuous in their building caravanseras, or places of entertainment, on roads that are destitute of accommodations, for the refreshment of poor pilgrims or travellers. With the same laudable view, they search out the best springs, and dig wells, which in those countries are a luxury to weary travellers.

The Turks sit cross-legged upon mats, not only at their meals, but in company. Their ideas, except what they acquire from others, are simple and confined, seldom reaching without the walls of their own houses: where they sit conversing with their women, drinking coffee, smoking tobacco, or chewing opium.

They have little curiosity to be informed of the state of their own, or any other country. If a vizier, bashaw, or other officer, is turned out, or strangled, they say no more on the occasion, than that there will be a new vizier or governor, seldom inquiring into the reason of the disgrace of the former minister. They are perfect strangers to wit and agreeable conversation. They have few printed books; and the Koran, with the comments upon it, form the chief part of their study. Nothing is negotiated in Turkey without presents; and even justice may be purchased by a well-timed bribe.

About eleven o'clock in the forenoon, they dine; but supper is their principal meal, which they eat at five in the winter, and six in the summer. Among the great people, their dishes are served up one by one; but they have neither knife nor fork, and are not permitted by their religion to use gold or silver spoons. Their victuals are always high-seasoned. Rice is the common food of the lower sort, and sometimes it is boiled up with gravy; but their chief dish is pilau, which is mutton and fowl boiled to rags, and the rice being boiled quite dry, the soup is high-seasoned, and poured upon it. They drink water, sherbet, and coffee; and the greatest indulgence they are addicted to, is the chewing vast quantities of opium, which gives them sensations resembling those of intoxication. Guests of higher rank sometimes have their beards perfumed by a female slave of the family. They are temperate, and sober, from a principle of their religion, which forbids them the use of wine; though many of them, notwithstanding this injunction, indulge themselves in strong liquors to excess. Their common salutation is by bowing the head a little, and laying the right-hand on the breast; but to persons of rank, they stoop so low as to kiss the border of their veil. They sleep in linen waistcoats and drawers, upon mattresses, and cover themselves with a quilt. Few or none of the considerable inhabitants of this vast empire have any notion of walking, or riding, either for health or diversion: the most religious among them find, however, sufficient exercise, when they conform themselves to the frequent ablutions, prayers, and rites prescribed them by Mahomet. They are falsely accused of cruelty towards their slaves or servants; for they frequently behave with more lenity to them than the Christians; especially if they are acquainted with any art or trade that may be useful to the community.

Their usual amusements within doors are the chess, or draught-board; and if they play at chance-games, they never bet money, that being prohibited by the

Koran. Their active diversions consist in shooting at a mark, or tilting with darts, at which they are very expert. Some of their great men are fond of hunting, and take the field with numerous equipages, which are joined by their inferiors; but this is often done for political purposes, that they may know the strength of their dependents.

As to their dress, the men shave their heads, leaving a lock on the crown, and wear their beards long, except the military, and those in the seraglio, who wear only whiskers: they cover their heads with a turban, which they never put off but when they sleep: they suffer no Christians, or other people, to wear white turbans. Their shirts are without collar or wristband, and over them they throw a long vest, which they tie with a sash, and over the vest they wear a loose gown somewhat shorter. Their breeches or drawers are of a piece with their stockings; and, instead of shoes, they wear slippers, which they put off when they enter a temple or house. The dress of the women differs little from that of the men, only they wear stiffened caps upon their heads, with horns resembling a mitre, and wear their hair down. When they appear abroad, which is but seldom, they are so muffled up as not to be known to their nearest relations. Such of the women as are virtuous, make no use of paint to heighten their beauty, or to disguise their complexions; but they often tinge their hands and feet with kenna, which gives them a deep yellow. The men, in colouring their beards, make use of the same expedient.

In Turkey, marriages are chiefly negotiated by the ladies; and when the preliminaries are adjusted, and terms agreed upon, the bridegroom elect pays down a sum of money, which is generally employed in furnishing the house of the young couple; a licence is obtained from the *cadi*, or proper magistrate, and the parties are married. The wedding is celebrated, as in other nations, with mirth and jollity. They are not allowed by their law more than four wives, but they may have as many concubines as they can maintain: in consequence of this permission, the wealthy Turks, besides their wives, keep a kind of seraglio of women; but all these indulgences are sometimes not sufficient to gratify their unnatural desires. The women are kept under a rigorous confinement. Divorces are allowed; but no man is allowed to take back again the woman he has once repudiated, till she has been married to another, and divorced by him also; which is sometimes done as a mere form, where the parties agree to live together again.

Their funerals are exceedingly decent. The corpse is attended by the relations, chanting passages from the Koran; and after being deposited in a mosque (as they call their temples) they are buried in a field by the *iman* or priest, who pronounces a funeral oration at the time of the interment. The male relations express their sorrow by alms and prayers; the women, by deck-

ing the tomb on certain days with flowers and green leaves. A widow leaves off all finery for twelve months, and in mourning for her husband, wears a particular head-dress.

The established religion of the Turks is the Mahometan, so called from Mahomet, the author of it; some account of which the reader will find in the following history of Arabia, the native country of that impostor. The Mahometans are divided into two great sects, those of Ali and Omar: the Persians being of the former, and the Turks of the latter; but these are again subdivided into many others. There is no ordination among their clergy; any person may be a priest that pleases to take the habit, and perform the functions of his order: he may also lay down his office when he thinks proper. That the Mahometans believe women possess no souls, is a vulgar error, since many passages in the Koran prove the contrary opinion.

With respect to the ecclesiastical institutions of Christians, the Turkish government has formed these into part of its finances, and tolerated them where they are most profitable; but the hardships imposed upon the Greek church are such, as must always dispose that people to favour any revolution of government. Constantinople, Jerusalem, Alexandria, and Antioch, are patriarchates; and their heads are indulged, according as they pay for their privilege, with a civil as well as an ecclesiastical authority over their votaries. The same may be said of the Nestorian and Armenian patriarchs; and every great city that can pay for the privilege, has its archbishop or bishop. All male Christians, according to their stations, pay also a capitation-tax, from seventeen years old to sixty.

In this empire, the radical languages are the Sclavonian, which seems to have been the mother tongue of the ancient Turks; the Greek modernized, but still bearing a relation to the old language; the Arabic, and the Syriac, a dialect of which is still spoken. Their pater-noster is expressed in the following specimen:

“Pater hemas, opios iso ees tos ouranous; hagia

Till of late, the Turks professed a sovereign contempt for our learning. Greece, which was the native country of genius, arts, and sciences, produces at present, besides Turks, numerous bands of Christian bishops, priests, and monks, who, in general, are as ignorant as the Turks themselves, and are divided into various absurd sects of what they call Christianity. The education of the Turks seldom extends further than reading the Turkish language, and the Koran, and writing a common letter. Some of them understand

astronomy, so far as to calculate the time of an eclipse; but the number of these being very small, they are looked upon as extraordinary persons. There are, however, some schools, colleges, and academies to be met with in Turkey, but they are on a very different footing from those among us; and some years ago, a printing-house was opened at Constantinople, where books of all kinds, except on matters of religion, were allowed to be printed.

Their natural and artificial antiquities and curiosities are so various, that they have furnished matter for many voluminous publications, and others are appearing every day. These countries contained all that was rich and magnificent in architecture and sculpture; and neither the barbarity of the Turks, nor the depredations they have suffered from the Europeans, seem to have diminished their number. They are more or less perfect, according to the air, soil, or climate in which they stand, and all of them bear deplorable marks of neglect. Many of the finest temples are converted into Turkish mosques, or Greek churches, and are more disfigured than those which remain in ruins. Amidst such a group of curiosities, all that can be done here, is, to select some of the most striking; and as Palmyra and Balbec form the pride of all antiquity, we shall therefore begin with them:

"Palmyra, in the deserts of Arabia, or, as by the scripture styled, Tadmor in the wilderness, is situated in the wilds of Arabia Petræa, about 33 deg. north lat. and 200 miles to the south of Aleppo. Its present appearance affords a most awful spectacle. As you approach, the first object which presents itself is a ruined castle, on the north side of the city. From it you descry Tadmor, enclosed on three sides by long ridges of mountains; southward of it is a vast plain, extending far beyond the sight. The city must have been of large extent, from the space now taken up by its ruins; among which live about thirty or forty miserable families, and huts of dirt, within a spacious court, which once enclosed a magnificent temple. This court hath a stately high wall, of large square stone, adorned by pilasters both within and without; there are about sixty on each side. The beautiful cornices have been beaten down by the Turks. Towards the centre, are the remains of a castle, shrouding the fragments of a temple of exquisite beauty, as appears by what is still standing of its entrance, viz. two stones thirty-five feet long, carved with vines, and clusters of grapes. In the great court are the remains of two rows of very noble marble pillars, thirty-seven feet high, with capitals finely carved, and the cornices must have been of equal elegance; fifty-eight of these pillars are entire: there must have been many more, as it appears they went quite round the court, supporting a most spacious double piazza. The walks on the west side of this piazza, which face the front of the temple, seem to have been grand and spacious; and at each end are two niches for statues at length, with pedestals, borders, supporters, canopies, &c. carved with inimitable art. The space within this once

beautiful enclosure, is (or rather was) encompassed by another row of pillars of a different order, fifty feet high; sixteen of which are yet standing. The temple was about ninety feet long, and forty broad: its grand entrance on the west appears, by what remains of it, to have been the most magnificent in the world. Over a door-way in the remaining walls, you trace a spread-eagle, as at Balbec; and here are the fragments of cupids, as well as of eagles, most finely imitating nature, on large stones mouldering on the earth. Nothing of the temple stands but the walls, the window-places of which are narrow at top, but richly adorned with sculpture. In the middle is a cupola, all one solid piece. Leaving this court and temple, your eyes are saluted with a great number of pillars of marble, scattered for near a mile. To the north, you have a stately obelisk before you, consisting of seven large stones, besides its capital, grandly sculptured: it is more than fifty feet high, and is twelve feet and a half in circumference just above the pedestal; and it is imagined a statue once stood upon it. To the east and west of this, at the distance of about a quarter of a mile, is another obelisk, that seems to have corresponded with the first-mentioned; and, according to the fragment of a third, it should seem that there was a continued range of them. On one of them, which is about forty feet high, there is a Gothic inscription, commemorating two patriots; and about an hundred paces from it, is a large and lofty entrance, leading to a grand piazza, adorned with marble pillars, on most of which there are inscriptions. A little further onward, to the left, are the remains of a stately pile of remarkably fine marble, twenty-two feet long. On the west side of the piazza, are several openings for gates; two of them appear to have been the most superb that ever captivated the human eye, both in point of grandeur of work in general, and the beautiful porphyry pillars with which they were adorned. Eastward of the piazza, are a great number of scattered marble pillars, most of which have been deprived of their elegant capitals. A little ruined temple lies mouldering at a short distance, which appears to have been a very curious structure. But of all the venerable remains, none more attract the admiration, than the magnificent sepulchres towards the north of the city, extending a mile and more, and which, at a distance, have the appearance of tops of decayed churches, or bastions of ruined fortifications."

Nothing but ocular proof could convince any man, that so superb a city, formerly ten miles in circumference, could exist in the midst of what now are tracts of barren, uninhabitable sand. Nothing, however, is more certain, than that Palmyra was formerly the capital of a great kingdom; that it was the pride as well as the emporium of the eastern world; and that its merchants dealt with the Romans, and the western nations, for the merchandises and luxuries of India and Arabia. Its present altered state, therefore, can be only accounted for by natural causes, which have turned the more fertile tracts

tracts into barren deserts. The Asiatics think that Palmyra, as well as Balbec, owes its original to Solomon; and in this they receive some countenance from sacred history. In profane history, it is not mentioned before the time of Marc Antony; and its most superb buildings are thought to be of the lower empire, about the time of Gallienus. Odenathus, the last king of Palmyra, was highly caressed by that emperor, and even declared Augustus. His widow Zenobia reigned in great glory for some time; and Longinus, the celebrated critic, was her secretary. Not being able to brook the Roman tyranny, she declared war against the emperor Aurelian, who took her prisoner, led her in triumph to Rome, and put to death her principal nobility, and among others, the excellent Longinus. He afterwards destroyed her city, and massacred its inhabitants, but expended large sums out of Zenobia's treasures, in repairing the temple of the Sun, the majestic ruins of which are hereunder mentioned. Travellers give but an imperfect account of that celebrated city; nor do any of the Palmyrene inscriptions reach above the Christian era, though there can be no doubt that the city itself is of much higher antiquity. The emperor Justinian made some efforts to restore it to its ancient splendor, but without effect, for it dwindled by degrees to its present wretched state. It has been very justly observed, that its architecture, and the proportions of its columns, are by no means equal to those of Balbec; which we shall now give an account of.

The venerable ruins of Balbec (called by the Greeks Heliopolis, or The City of the Sun) evince, that it was one of the most magnificent cities in the universe; at present it is not above a mile and a half in circumference, and the poor inhabitants, who are about 5000 in number, chiefly Greeks, live in or near the circular temple, in mean houses, built out of the ancient ruins. The Hon. Van Egmont says,

“Balbec, now called Baalbec, is probably the ancient Heliopolis, or City of the Sun; and its new name seems to correspond with the ancient Baal, in the Phœnician language, signifying an idol, particularly that of the sun. And what seems to confirm me in my opinion, that Balbec is the ancient Heliopolis, or City of the Sun, was a medal of Philippus Cæsar, which I found here. He is on one side represented as a youth without beard, or crown; and on the reverse are two eagles, with the ends of their beaks joined; and between them is inscribed, COL. HEL. whence it is plain, that this city was at that time a Roman colony.” It is situated in one of the most delightful plains in the world, at the foot of Mount Antilibanus towards the westward: it is about 30 miles north of Damascus, and the same east from the sea-coast, in 33 deg. north lat. and 37 deg. 30 min. east long. This place was by the Arabians called the Wonder of Syria; and the magnificent ruins are certainly the admiration of all travellers who behold them. A superb palace, a noble temple, and some other ruins, stand at the south-west of the town; and having

been patched and pieced in later times, are converted into a castle, as it is called. In approaching these venerable edifices, a rotunda or round pile attracts the view, encircled with pillars of the Corinthian order, which support a cornice that runs all round the structure. The whole, though greatly decayed, exhibits marks of astonishing elegance and grandeur, being built of marble, circular without, and octangular within. The Greeks, by whom it hath been converted into a church, have taken infinite pains to spoil its beauty, by daubing it with plaster. There is a superb, lofty building contiguous to the rotunda, which leads to a noble arched portico, of 150 paces in length, that conducts you to a temple of astonishing magnificence, which is a miracle hath withstood the injuries of time. It is an oblong square, of 192 feet in length on the outside, and 120 within. The breadth on the outside is ninety-six feet, and within sixty. The whole is surrounded by a noble portico, supported by pillars of the Corinthian order, each of which consists only of three stones, though the height is fifty-four feet, and the diameter six feet three inches; they are nine feet distant from each other, and from the wall of the temple: their number on each side of the temple is fourteen, and at each end eight; the architrave and cornice are exquisitely carved and embellished. Round the temple, between the wall and pillars, is an arcade of large stones, hollowed out archwise, in the centre of each of which is a god, goddess, or hero, executed with such animation as is scarce conceivable. Round the foot of the temple wall is a double border of marble, whose lower parts are filled with basso relievo miniatures, expressive of heathen ceremonials and mysteries. The entrance to the temple is the most august imaginable, the ascent being by thirty steps, bounded by a wall on each side that leads to a pedestal, on which a statue formerly stood. The front is composed of eight Corinthian pillars, fluted like those that go round the temple, and a nobly-proportioned triangular pediment; in the midst of these pillars, at six feet distance, are four others, resembling the former, and two more, with three faces each: all these form a portico sixty feet broad, and twenty-four deep, before the door of the temple. Under the vault of the portico, the entrance of the temple appears through these pillars in admirable proportion. The portal is square, and of marble, forty feet high, and twenty-eight wide, the aperture being about twenty; from this portal the bottom of the lintel is seen, embellished by a piece of sculpture not to be paralleled in the universe: it represents a prodigious large eagle in basso relievo, his wings are expanded, and he carries a caduceus in his pounces; on either side a cupid appears, holding the one end of a festoon by a ribbon, as the eagle himself holds the other in his beak, in a manner inimitably fine.

The temple is divided into three aisles, two narrow on the sides, and one broad in the middle, by three rows of fluted Corinthian pillars, of near four feet in diameter, and about thirty-six feet in height, including the

pedestal: the pillars are 12 in number, six of a side, at 18 feet distance from each other, and 12 from the walls. The walls themselves are decorated by two rows of pilasters, one above the other, and between each two of the innermost is a niche 15 feet high; the bottoms of the niches are upon a level with the bases of the pillars, and the wall to that height is wrought in the proportion of a Corinthian pedestal: the niches themselves are Corinthian, and executed with inimitable delicacy. Over the round niches are a row of square ones between the pilasters of the upper order: the ornaments are marble, and the pediment triangular. At the west end of the middle aisle, you ascend to a choir by 12 steps: the choir is distinguished from the rest of the fabric by two large square columns adorned with pilasters, which form a superb entrance. The profusion of admirable sculpture here is astonishing; but the architecture is the same as in the body of the temple, except that the niches stand upon the pavement, and the pillars are without pedestals. The principal deity formerly worshipped here stood in a vast niche at the bottom of the choir. The choir is open towards the middle. The whole pile stands upon vaults of such excellent architecture, and so bold in their construction, that it is imagined they were designed for something more than merely to support the superincumbent building. This temple anciently was accompanied by some other magnificent buildings, as is evident from four ascents to it, one upon each angle, with marble steps long enough for ten people to go up abreast.

The palace, which is in what the Turks call the Castle, must have been one of the most superb structures that imagination can conceive, but it is much more decayed than the temple. It ought to be observed, that the old wall which encloses both these structures is composed of such prodigious blocks of stone as almost transcends belief; three in particular that lie close to each other in a line extend 183 feet, one being 63 feet in length, and the other two 60 feet each. A dark arched vault, containing many busts, leads to an hexagonal building which forms a spacious theatre; the end opens to a terrace which is ascended by marble steps; you then enter a square court surrounded by magnificent buildings: on each hand are double rows of pillars, which form galleries of 66 fathoms in length and eight in breadth. The bottom of this court is occupied by a building amazingly sumptuous, which appears to have been the body of the palace; the columns are as large as those of the Hippodrome at Constantinople, nine of them are standing, and a good piece of the entablature. But it is surprising that each of these large columns is made of one entire block only. All the buildings in this castle front the east, and the Corinthian order prevails throughout the whole; there is no place where such precious remains of architecture and sculpture are to be found; as the fine taste of Greece, and the magnificence of Rome, seem to be blended; the ornaments are at once innumerable and

exquisite. Beneath the whole are vaults, in which vast flights of marble stairs, of 200 steps in a flight, are frequently found. The turn and elevation of these vaults are bold and surprising; they contain many noble halls and superb apartments, admirably decorated. Some of these vaults are dark, others receive light from large windows which stand on the level of the ground above; but the most singular circumstance is, that all these astonishing edifices are built with such enormous stones as those before-mentioned, without any visible sign of mortar, or any kind of cement whatever. The present city is surrounded with a wall of square stones, and some towers in good condition; the gardens in the environs are pleasant, fruitful, and well watered. Many houses which contain various apartments, are cut out of the solid rocks. Conjectures of a very different nature have been formed concerning the founders of these immense buildings. The inhabitants of Asia ascribe them to Solomon, but some make them so modern as the time of Antoninus Pius. Perhaps they are of different æras; and though that prince and his successors may have rebuilt some part of them, yet the boldness of their architecture, the beauty of their ornaments, and the stupendous execution of the whole, seem to fix their foundation to a period before the christian æra, but without going back to the ancient times of the Jews or Phœnicians, who probably knew little of the Greek style in building and ornamenting. Balbec is at present a little city, encompassed with a wall. A free-stone quarry in the neighbourhood furnished the stones for the body of the temple; and one of the stones, not quite detached from the bottom of the quarry, is 70 feet long, 14 broad, and 14 feet five inches deep, which, reduced to our measure, is 135 tons. The ornamental parts were furnished from a coarse white marble quarry, at a greater distance.

The cities of Mecca and Medina are curiosities only through the superstition of the Mahometans. Their buildings are mean, when compared to European houses or churches; and even the temple of Mecca, in point of architecture, makes but a sorry appearance, though erected upon the spot where the great prophet is said to have been born. The same may be said of the mosque at Medina, where that impostor was buried; so that the vast sums spent yearly by Mahometan pilgrims, in visiting those places, are undoubtedly converted to temporal uses. We shall not amuse the reader with any accounts of the spot which is said to have formed Paradise, and to have been situated between the river Euphrates and the Tigris, where there are some tracts which undoubtedly deserve that name. The different ruins, some of them inexpressibly magnificent, that are to be found in those immense regions, cannot be appropriated with any certainty to their original founders; so great is the ignorance in which they have been buried for these thousand years past. It is indeed easy to pronounce whether the style of their buildings be Greek, Roman, or Saracen; but their inscriptions

tions will give the best information concerning particulars.

The seat of Old Troy cannot be distinguished by the smallest vestige, and is known only by its being opposite to the isle of Tenedos, and the name of a rock, which the poets magnified into a river. A temple of marble built in honour of Augustus Cæsar, at Milisso in Caria, and a few structures of the same kind, in the neighbourhood, are among the antiquities that are still entire. Three theatres of white marble, and a noble circus near Laodicea, now Latichea, have suffered very little from time or barbarism; and some travellers think that the ruins of the celebrated temple of Diana, near Ephesus, may be discerned.

CH A P. IV.

The Provinces and chief Towns of TURKEY.

THE province of Eyraca-Arabia, Yerack, or Irack-Arabi, hath been anciently termed Shinaar, Babylonica, and Chaldea. It lies between 30 and 40 deg. north latitude; and is bounded on the north by Diarbec; on the west, by the deserts of Sham; on the south, partly by the same deserts, as those of Arabia; and by the Median and Assyrian mountains, on the east.

The air of this country is in general very serene and temperate, but at certain times is so extremely dangerous, and the heats so excessive, that formerly many of the inhabitants used to sleep in cisterns of water; and this pernicious practice is at present not entirely discontinued. The inhabitants are sometimes visited by a pestilential wind, which has greatly excited the attention of travellers and philosophers. As they have no rains for eight months in the year, and sometimes much longer, the land is watered from the Euphrates, and other rivers, by means of a great number of engines admirably constructed for that purpose.

The country, in general, yields grain two hundred fold, and frequently three hundred; and its fertility is such, that it would astonish a traveller who had seen all the rest of the known world. The palms, particularly those of the date kind, afford the inhabitants meat, wine, and honey. The millet and sesame shoot up to the size of trees, and the barley and wheat have leaves of four fingers in breadth. They have neither olives nor grapes; but the sesame is an excellent substitute to furnish oil where olives are wanting, and, in lieu of grapes, the palm supplies them with wine.

The Tigris and Euphrates used formerly to overflow in the months of June, July, and August, and cover the whole country with water; and the inundations were generally increased by torrents of melted snow, which poured down from the Armenian mountains; but those floods proving very detrimental in various cases, the inhabitants guarded against them by

cutting a great number of artificial canals, rivers, and canals, which they effected with infinite assiduity and labour. Thus the waters were properly distributed, an easy communication made betwixt every part of the country, and the people universally benefited. The pasture being exceedingly rich, great numbers of cattle are fed, which not only plentifully supply the inhabitants with meat, but with milk, butter, and other useful necessaries.

This country is famous for the great plain of Shinaar, or Sennaar, where the whole race of mankind were collected together after the flood, and from thence dispersed over the face of the whole earth; which was the place where the tower of Babel was built, and the renowned city of Babylon, of which the vestiges, or what are shewn for such, are very inconsiderable.

Bagdad, the capital of the ancient Chaldea, was the metropolis of the caliphate under the Saracens in the 12th century. This city is built upon the Tigris, not far, it is supposed, from the site of the ancient Babylon: few marks of its ancient grandeur are now remaining. It is in the form of an irregular square, and rudely fortified; but the conveniency of its situation renders it one of the seats of the Turkish government, and it has still a considerable trade, being annually visited by the Smyrna, Aleppo, and western caravans. The houses of Bagdad are generally large, built of brick and cement, and arched over to admit the free circulation of the air: many of their windows are made of elegant Venetian glass, and the ceiling ornamented with chequered work. Most of the houses have also a court-yard before them, in the middle of which is a small plantation of orange-trees. The number of houses is computed at 80,000, each of which pays an annual tribute to the bashaw, which is calculated to produce 300,000l. sterling. Their bazars, in which the tradesmen have their shops, are tolerably handsome, large, and extensive, filled with shops of all kinds of merchandize, to the number of 12,000. These were erected by the Persians, when they were in possession of the place, as were also their bagnios, and almost every thing here worthy the notice of a traveller. In this city are five mosques, two of which are well built, and have handsome domes, covered with varnished tiles of different colours. Two chapels are permitted for those of the Romish and Greek persuasions. On the north-west corner of the city stands the castle, which is of white stone, and commands the river, consisting of curtains and bastions, on which some large cannon are mounted, with two mortars in each bastion; but in the year 1779 they were so honey-combed and bad, as to be supposed not able to support a siege. Below the castle, by the water-side, is the palace of the Turkish governor; and there are several summer-houses on the river, which make a fine appearance. and elegance of their dialect. The pilgrims, who visit Mecca by land, pass thro' Bagdad, and pay four piastres by way of tribute, which brings a considerable revenue to the grand seignior.

Bassora, or Basrah, on the frontiers of Dusia, lies in 30 deg. 17 min. north lat. and 9 deg. 10 min. east longitude, being about 250 miles south-east from Bagdad, and 240 south-west from Ispahan; it was built A. D. 636, by Omar the second caliph, in order to cut off the communication between Persia and India. This city is 19 miles in circumference, opulent and populous, but the buildings have nothing extraordinary in them, the houses being only two stories high, built with bricks dried in the sun, and flat on the tops. The circumjacent country is exceedingly fertile and delightful. It is subject to an Arabian prince, who is tributary to the grand seignior.

The Province of DIARBEC, or MESOPOTAMIA.

THIS country extends about 600 miles along the banks of the Euphrates and Tigris, from Mount Taurus, on the north, to the Persian gulph on the south. The breadth is in some places 300, and in others 150 miles. The air is exceedingly temperate and serene. The country produces silk; and is fertile with very little cultivation, being rich in grain, fruits, and pasturage. Numerous flocks and abundance of cattle feed on the latter; yet there are considerable uninhabited deserts in some parts. The celebrated rivers Euphrates and Tigris flow through this country, and not only supply it with excellent fish, but contribute exceedingly to its beauty and fertility.

The Tigris rises in the Armenian mountains; and acquired its name from its rapidity, the word, in the Median language, signifying a dart or arrow. It passes through the lake Arethusa, and afterwards sinking into the earth, rises again on the other side of Mount Taurus. It proceeds from thence to the lake Thespiates, but, in the way, hides itself for the space of 25 miles, and afterwards proceeds with great rapidity. Between Assyria and Mesopotamia, it receives several rivers; and below Bagdad branches into two channels, both which disembrace themselves into the Euphrates, and form an island by that means.

But the most considerable river in Asia is the Euphrates, which takes its source in Mount Taurus; proceeding westerly, it crosses Turcomania, then turning southward, it divides Syria from Diarbec. Afterwards running along the western limits of Arabia Deserta, it waters a great number of towns, and then flows smoothly to the city of Asia, where the reflux, or tides of the Persian gulph, disturb its stream, and discolour its waters, though ninety miles distance from it. At about 60 miles from the Persian gulph it unites with the Tigris. In general it flows gently,

and waters a great number of fertile and delightful plains; its banks are embellished with perpetual verdure, and adorned by many trees, particularly palms; it is neither deep nor wide, except when the melting of the snows on the Armenian mountains occasions it to swell; but the waters are deemed very salubrious.

Diarbec is the chief city of this province: it is situated in 37 deg. 35 min. north lat. and 40 deg. 50 min. east longitude, and encompassed by two walls, the outermost of which is defended by 72 towers; there are but three gates, over that towards the west some Latin and Greek inscriptions are seen, though many of the letters are almost obliterated. The name, however, of Constantine is still visible, and frequently repeated, which gives occasion to surmise that it was either originally built, or greatly repaired and improved by that emperor. The Tigris forms a half moon about it, and from its wall to the water side there is a steep precipice. It contains about 20,000 inhabitants, and upon the whole is one of the most commercial, strong, opulent, and populous cities of all Asiatic Turkey. It is supplied with water from the Tigris by means of an artificial canal, and embellished with many noble piazzas or market places, and other elegant buildings, particularly a spacious grand mosque, which was once a christian church. On the sides of the river are several caravanferas or inns; and near the town is a chapel, in which the Turks affirm that Job lies buried: about a league from the city the Tigris is fordable, nevertheless there is a stone bridge over this very part, on account of the floods, which are occasioned by the excessive rains and melted snows, and which often render the ford impassable. The neighbouring country is pleasant and fertile. The pigeons are larger and more delicate than any in Europe. The meat, bread, and wine, are admirable, and the fruits excellent.

The men are more affable here, and the women are treated with much more politeness, and have greater indulgence granted them, than in any other part of the Turkish empire. The chief manufactures carried on here are dyeing, dressing, and tanning, particularly goats skin, which is commonly known by the name of Turkey leather, of which immense quantities are vended in all parts of Asia and Europe: they likewise dye linen and cotton to great perfection. The waters of the Tigris are said to be admirably adapted to dyeing, and give the leather a finer grain, and leather, linen, and cotton, a livelier colour than any other waters.

The governor of this city, who is a bassa, is exceedingly powerful, and usually has a body of 20,000 cavalry under his command, that he may be the better enabled to repel the incursions of the Cordes and Tartars, who in great companies of horse attack and rob the caravans.

Orfa, or Orpha, lies in 37 deg. 16 min. north latitude, and 39 deg. 15 min. east longitude; and is situated

situated at the head of the river Scirtas, on the east side of the Euphrates, and about 65 miles from it. The inhabitants affirm, that it was the place where the city of Edesse stood, and where Abraham dwelt. The city is surrounded by a good stone wall, and is about two leagues in compass, but the houses in general are deserted, and in a ruinous condition, and those that are inhabited are but low and ill built; upon the whole the place resembles more a wilderness than a metropolis, though Tavernier is inclined to deem it the capital of Mesopotamia; the inhabitants carry on a great trade in some excellent tapestries and yellow leather.

The neighbouring country is exceedingly rich in corn, wine, fruits, &c. the city is governed by a beglerberg, who has 150 janissaries, and 600 spahis under his command, to awe the Arabian free-booters. Several pleasant gardens surround the walls of the city, and are watered by small artificial canals, which flow through cuts from one that is pretty large; in the time of our Saviour, this city and territory had a prince of its own named Agbarus.

Mosul, or Mossul, stands on the banks of the Tigris, and is situated in 36 deg. 59 min. north latitude, and 43 deg. east longitude, opposite to the ruins of the ancient city of Nineveh. It is surrounded by handsome stone walls, and is very spacious, being about a league in circumference, but the number of inhabitants are not proportionable to the extent. The people have great commercial connections with the inhabitants of Bagdad, and the merchants of Curdistan. Caravans likewise pass through it to and from Persia. The basha, whose residence is in the castle, has always 9000 men under his command. It is singular, that the soil on the city side of the river is exceedingly barren, but on the opposite it is very fertile. The heat is so excessive in summer, that none go out of doors from two hours after sun rise till an hour after sun set. There is likewise a malignant and dangerous wind called Samiel, which reigns from hence to Surat, and is supposed to be the same east wind mentioned by Job. It is impregnated with little streaks of fire as small as hairs, which immediately kill those who breathe or inhale them, and turn them as black as a coal. When the people perceive them coming, they fall flat on their faces, and sometimes escape. This wind is felt chiefly on the banks of the river, but not on the water, and is deemed to proceed from sulphurous vapours, which are kindled by agitation. Independent of this wind the hot air is often dangerous, and injures the lungs, inflames the blood, and parches the skin, or raises it into blisters, and occasions it to peel off. On this account travellers wear a kind of mask made of a soft black crape to preserve their eyes. But if after all their precaution they become inflamed, the afflicted person anoints them with a mixture of sugar and long pepper sifted very fine, and made into a salve.

In Diarbec are a few other less considerable cities and towns; namely,

Bir, or Beer, in 37 deg. 15 min. north latitude, and 38 deg. 15 min. east longitude. It is situated on the side of a hill to the east of the Euphrates, and defended by two large old castles, the one on the land side, and the other on the banks of the river. The garrison consists of about 200 janissaries, and 400 spahis, commanded by a sangiac. The neighbouring territory is pleasant, fertile, and well cultivated, except to the eastward, where it is rough, hilly, and rather sterile.

Gezira, in 37 deg. 30 min. north lat. and 39 deg. 10 min. east long. It is situated in an island in the Tigris; and is a small, but rich commercial city, governed by a bey.

Amadia, or Amad, is about 72 miles east from Gezira, and the same west from Mosul.

Zibin, in the midway between Orfa and Mosul, is a tolerable town, situated on an ascent. It is surrounded with good walls and ditches, well supplied with springs and fountains, and is furnished with provisions in great plenty.

Nisbin, or Nafbin, about 35 miles from the Tigris, is divided into two wards, each on an eminence, with a large tract of ploughed land between. Several arches, gates, and the remains of a noble church are still visible.

The Province of CURDISTAN, or ASSYRIA.

THIS division lies on the east side of the Tigris, towards Persia, which bounds it on the east; it hath the Tigris on the west, Eyraca-Arabia on the south, and Turcomania on the north. It is not above 90 miles broad towards the south, but to the northward it extends near 200 miles from east to west. From north to south it reaches from 53 deg. 30 min. to 27 deg. 20 min. north latitude.

Nineveh, a magnificent city, celebrated in sacred and profane history, once stood here. It was built upon the Tigris, opposite to where Mosul at present stands. The walls were 60 miles in circumference, the same as those of Babylon, and sufficiently broad to admit of three chariots going abreast upon them; they were flanked with 1150 turrets, each of which rose 200 feet above the walls.

Betlis is situated in 37 deg. 55 min. north, and 43 deg. 30 min. east long. It is the residence of a powerful prince of the Curdes, who is independent both of Turks and Persians. The Curdes are continually upon the watch for caravans; and when they meet with one, if they are strong enough, they usually rob and murder the whole company. They dwell in tents while the weather permits, and do not retire to the villages till the snow compels them. The city of Betlis is built between two high mountains; the castle is situated

situated upon there is no rock, which cult to ascend the castle.

min. north, and 39 residence of a powerful independent both of are continually upon when they meet with they usually rob and they dwell in tents do not retire to the . The city of Ercis is a strong garrison; the castle is situated

situated upon a hill that resembles a sugar-loaf; and there is no coming at it but by a winding path cut in a rock, which is exceedingly steep, rugged, and difficult to ascend. There are three draw-bridges before the castle.

Cherofsoul, called by some the capital of Curdistan, is in 36 deg. north lat. and 45 deg. east long. and situated about 150 miles north of Bagdad. The houses are all hewn out of a rock on the side of a hill, which extends a mile in length, and there is an ascent to them of about 20 steps. The bafsa, or governor of the province, who hath several sangiacs under him, resides here.

Abela (celebrated in history for the decisive battle fought, in a plain near it, between Alexander the Great and Darius) is in 35 deg. north lat. and 77 deg. 20 min. east longitude, and situated between the Caprus and Lycus, or the two Zabs, as some writers term those rivers.

To these we may add, Harpel, a large town, and the residence of a sangiac: it is situated on the river Caprus, and surrounded by a mud-wall. The houses are miserably built. In this province is likewise the town of Holwan, in 35 deg. north lat. and 47 deg. 10 min. east longitude: it is situated between the mountains that divide the Persian Irak, Curdistan, and Chaldea.

TURCOMANIA, OR ARMENIA.

THIS province is bounded on the north by Georgia; on the south, by Mesopotamia; on the east, by Persia; on the west, by Cappadocia and the Lesser Armenia, from which it is separated by the Euphrates. It extends from 38 deg. 20 min. to 42 deg. north latitude, and from 39 to almost 42 deg. north longitude, and from 39 to almost 42 deg. east longitude. It is about 300 miles in length, and 200 in breadth.

The country, which, in general, is exceedingly mountainous, produces nothing without the most indefatigable industry; every kind of grain is but indifferent: the wine is likewise bad. The cold being very intense, occasions the fruit to be extremely backward. There are, however, some fine dales and pleasant vallies interspersed among the hills.

Ararat, the Paryadræ, Marusius, Antitauris, Abus, Niphates, Mofchick, and Gordyæan, are the principal mountains. The rivers which water this country are the Cyrus, Lycus, Phasis, Araxes, Tygris, and Euphrates.

Arzenim, or Erzeron, is the capital city of Turcomania. It is a place of great trade, and situated on the northern extremity of the province, about ten days journey from the frontiers of Persia, and five from the Black Sea: it is defended by a good castle, and has a strong garrison of janissaries commanded by an aga; about 18,000 Turks, 8000 Armenians, and 500 Greeks

reside here. The Armenians are allowed to have a bishop; and they have two churches, and several monasteries.

The city Van, or Wan, is situated on a lake of the same name, one of the largest in Asia, in 38 deg. 12 min. north latitude, and 44 deg. 55 min. east long. It is large, and stands at the foot of a high craggy mountain, in which there is a fortress deemed impregnable, that commands the town and country, and has a strong Turkish garrison. The lake is 150 miles in circumference, receives many rivers into its bosom, and contains several islands; two of these, viz. Limdali and Adafeton, are considerable, each having little villages and a monastery of Armenian monks on it. Here are a great variety of fine fish, particularly one of the pilchard kind, large quantities of which are exported to many distant places, as well as consumed at home, being used in sauces, and eaten in the same manner as anchovies.

Cars, or Kars, called by the Turks, Azem, is in 40 deg. north latitude, and 43 deg. 20 min. east longitude, about 150 miles north of Arzerum. The city is defended by a strong castle built upon a steep rock: the houses are mean, and in a ruinous condition. The country about it, though naturally fertile, is but very little cultivated. The bathaw of Cars is subject to the governor of Arzerum.

Irvan, Erivan, or Chirvan, is situated in 40 deg. 10 min. north lat. and 45 deg. 30 min. east long. It is about 180 miles east of Arzerum, and has been alternately possessed by the Turks and Persians. It is a spacious place, but ill built, and very dirty. The town is watered by two rivers, and the neighbouring country is extremely fertile in corn, wine, rice, cotton, &c. Here provisions are exceedingly cheap, particularly game, and the fruits and wine are admirable. The public square, or piazza, is handsome; and the bazar, or market, capacious. The baths and caravanferas, as well as the governor's palace, are elegant and roomy buildings. The river Zangeric issues from the lake of Erivan, which is about 25 miles in circumference, and contains an island with an Armenian monastery, the monks of which lead a life uncommonly austere, never speaking to each other but four times a year.

Nackfivan stands about 63 miles south of Erivan, and about seven leagues from the Araxes, in 39 deg. north lat. and 75 deg. east long. It contains many bazars, caravanferas, public baths, coffee-houses, handsome streets, &c. The celebrated battle between Lucullus and Mithridates was fought near it.

Zulpha (or Old Zulpha, to distinguish it from New Zulpha, near Ispahan, in Persia) stands on the Araxes, which begins to be navigable about six miles below the town. Near it are several Armenian monasteries, the monks of which are Roman Catholics of the Dominican order. The district contains about 6000 souls, who are all Roman Catholics, whose mode

Y y of

of worship is the same with those of Europe, except that mass is celebrated in the Armenian instead of the Latin tongue. Their archbishop is chosen by themselves; but he is obliged to go to Rome to be confirmed by the pope before he can officiate. At the foot of a high mountain near Zulpha are some medicinal springs, particularly celebrated (among their other virtues) for curing persons bit by any venomous animal.

GEORGIA, including MINGRELIA and IMARETTA.

GEORGIA, or Gurgistan, is bounded on the north by Circassia; on the south, by Armenia; on the east, by Daghestan; and on the west by the Euxine or Black Sea. It is partly subject to the Turks, and partly to the Persians; abounds with mountains and woods, which are interspersed with a variety of beautiful vales and fertile plains.

The air of this country is dry, cold in winter, and hot in summer. It produces all kinds of fruits, which are excellent, and the bread is hardly to be paralleled. There is plenty of fine cattle; the pork is admirable; the wild and tame fowl incomparable; and the fish, both of sea and river, equal to any in the universe. Here are likewise produced great quantities of excellent silk.

The Georgians in general are by some travellers said to be the handsomest people in the world; and some think that they early received the practice of inoculation for the small-pox. They make no scruple of selling and drinking wine: in their capital and other towns; and their valour has procured them many distinguishing liberties and privileges. Lately they formed an alliance with Russia, whose protection they claimed. They are, however, represented as great liars; implacable in their hatred; addicted to drunkenness, luxury, and libertinism. The clergy in general are worse than the laity, and the women are as vicious as either. They hurt their beauty with paint, and their minds by the most licentious behaviour. They are all usurers, and affect a grave deportment. All religions are tolerated in Georgia, every one being at liberty to think, pray, and speak as he pleases. The Armenians are the richest people here, occupy the principal places of trust and power, and are more numerous than the Georgians themselves.

The principal rivers are the Kur or Cyrus, and the Aragus: the first rises in the Moschian mountains, and discharges itself into the Caspian sea; the latter springs from the mountains which separate Iberia from Colchis, and falls into the Cyrus.

Teflis, the capital, is a handsome city, and makes a fine appearance, its inhabitants being about 30,000. It is situated at the foot of a mountain, by the side of the river Kur, and is surrounded by strong walls, except on the side of the river. It has a large fortress

on the declivity of the mountain, which is a place of refuge for criminals and debtors, and the garrison consists of native Persians. There are fourteen churches in Teflis, six of which belong to the Georgians, and the rest to the Armenians: the Malometans, who are here, have no mosques. In the neighbourhood of this city are many pleasant houses and fine gardens.

The western parts of Iberia or Georgia, which the moderns call Mingrelia, but which was known to the ancients by the appellation of Colchis, is bounded on the east by Georgia, properly so called; on the west, by the Euxine sea; on the north, by Mount Caucasus; and, on the south, by Armenia and part of Pontus.

The following rivers run through Mingrelia, viz. the Corax, Hippus, Cyancus, Chanitus, Abarus, Cissa, Ophis, and Phasis, where the Argonauts landed. All the above rivers empty themselves into the Euxine sea; but none of them are considerable, except the Phasis, which rises in Mount Caucasus. The inhabitants of this celebrated mountain are said to have little besides speech, which can entitle them to humanity; they are tall and well made, their looks are fierce, and indicate the savage disposition of their minds.

MINGRELIA is in general extremely woody, full of hills, and but little cultivated; the soil is bad and sterile, the fruits are all ill tasted and unwholesome, except the grapes, which might be converted into some of the best wine in the universe, if the natives did but know how to make it. The country, however, abounds in beeves, hogs, wild boars, and good venison; likewise in partridges, pheasants, quails, &c. falcons, eagles, pelicans, tigers, leopards, wolves, and jackals, breed on Mount Caucasus.

They make their bread of a small grain called gomen: it is agreeable to the taste, salubrious, cooling, and laxative. Their principal food is beef and pork. They have a great number of excellent horses, which are never shod, nor fed with corn.

Here are no towns, except two little ones by the sea-side, but the country is every where interspersed with houses. Their castles are built of stone, to the height of about fifty feet, in the midst of a wood; these are about ten in number, in the principal of which, named Rues, the prince keeps his court. They have many huts made of branches of trees, canes, and reeds, and are so secure in these retreats, that none can come at them, but by one winding narrow passage, which, when they apprehend an attack, is always stopped up. They have neither windows nor chimnies, but are furnished with beds and couches; and the whole family, together with the cattle, all lie in one room at night.

As to the natives, the men are well-proportioned, and the women pretty, but they paint their faces and eye-brows; they wear their hair in curled ringlets, are witty and polite, but vain, luxurious, treacherous, and ferocious; dexterous thieves, and glory in the practice

practice. They to have many children, whom for necessities quick, they do likewise murder do it with the of their misery when a man wife, he obligately dressed, very loving man.

They profess exceedingly ignorant few of the clergy greatly impose vination. The cestors to St. A.

IMARETTA breadth; it complains produce the whole morning. They have a great deal of copical towns in ziki. Georgia, which the world was known to the world, is bounded on the north, called; on the west, by Mount Caucasus, and part of Pontus; on the south, by the high Mingrelia, viz. Chantlus, Abfatus, and Argonauts landed. The Euxine gives into the Caucasus considerable, except the Caucasus. The inhabitants are said to have a title them to humane, their looks are of a disposition of their

is very woody, full of the soil is bad and unwholesome, and is converted into a verve, if the natives. The country, however, is full of wild boars, and good sea-fants, quails, &c. leopards, wolves, &c.

A small grain called wheat, salubrious, and good food is beef and mutton of excellent horses, and corn.

There are a few little ones by the sea where interspersed with a small part of stone, to the middle of a wood; in the principal of these keeps his court. The branches of trees are in these retreats, and they apprehend an enemy have neither weapons, nor are they furnished with beds and arms, together with the

are well-proportioned, and paint their faces and hair in curled rings, and are very luxurious, treacherous, and glory in the practice

practice. They think it prudent, as well as lawful, to have many wives, because they bring them many children, whom they can sell for money, or barter for necessaries; when children, however, come too quick, they do not hesitate to murder them. They likewise murder the sick and aged, and pretend they do it with the benevolent design of putting them out of their misery. Adultery is thought but a trifle: when a man catches another in familiarity with his wife, he obliges him to pay a hog, which is immediately dressed, and all three partake of the feast in a very loving manner.

They profess the christian religion; but are exceedingly ignorant of all its duties and precepts; few of the clergy can either write or read; but they greatly impose upon the laity, by pretending to divination. They attribute the conversion of their ancestors to St. Andrew.

IMARETTA is about 120 miles in length, and 60 in breadth; it contains many hills and woods, but the plains produce corn, cattle, pulse, &c. It is upon the whole more fertile and plentiful than Mingrelia. They have some excellent iron mines, carry on a great deal of commerce, and coin money. The principal towns in this principality are Cotatis and Akalziki. Cotatis is situated at the foot of a mountain, on the top of which there is a strong castle to command and defend it. It is watered by the Phasis; the town has no walls, and contains only about 200 houses: it lies in 42 deg. 23 min. north latitude, and 43 deg. 54 min. east longitude. Akalziki is situated in a hole, surrounded by about 20 hills, in 41 deg. 55 min. north latitude, and 44 deg. 55 min. east longitude; the river Kur flows very near it. The town contains about 400 houses, which are built of wood, and the walls and fortifications are old and ruinous; the inhabitants are a mixture of Georgians, Armenians, Jews, Turks, Greeks, &c. who have several churches and a synagogue.

The northernmost of these countries is Abcassia, having the Euxine sea to the south, Circassia on the west, and Mount Caucasus on the north and east. The principal traffick is in slaves; the inhabitants, however, deal in the skins of tigers, deer, &c. box-wood, honey, wax, and thread, which they exchange with the merchants who come upon the coast, for many things which they have occasion for. They go almost naked, and live in little mean low huts. They were once Christians, but are at present exceedingly ignorant, and little better than savages.

With respect to the Mameluks, who were once so celebrated in Asia and Egypt, these people were no other originally than Georgian children, who being brought up to a military life, became so powerful as to revolt against their masters, and usurp the throne of Egypt.

This country has lately claimed independence, and put itself under the dominion of Russia.

C H A P. V.

NATOLIA, or the LESSER ASIA, in the WEST.

Chief Towns, Inhabitants, Buildings, Rivers, &c.

NATOLIA, or Anatolia Proper, is the nearest to Europe, and the largest of the four provinces into which Asia Minor is divided. It extends almost from 26 to 35 deg. of east longitude, and from 37 to 41 deg. of north latitude; being bounded on the west by the Archipelago and Propontis; on the north, by the Euxine sea; on the south, by Caramania; and, on the east, by Amasia and Aladulia; and contains the provinces of Bithynia, Mysia, the Lesser Phrygia, Æolis, Ionia, Caria, Doris, Lydia, Phrygia, Paphlagonia, and Galatia.

The chief towns in Natolia, which merit our notice, are, Bursa, Nice, Smyrna, and Ephesus.

Bursa is the capital of Bithynia, and was the metropolis of the whole Ottoman empire before the Turks possessed themselves of Constantinople. It lies in 40 deg. 16 min. north lat. and 29 deg. 35 min. east long. and is situated at the foot of Mount Olympus, 20 miles from the sea of Marmora, and 58 south of Constantinople: it is exceeding well built, and deemed one of the best paved cities in all the Turkish empire; the streets are spacious, the caravanseras noble and convenient, and the mosques magnificent. This city still preserves a share of its ancient grandeur, beauty, and opulence; it is likewise a place of considerable traffick. In the bezeltine all kinds of commodities of home manufactory, and others from the Levant, are exposed to sale. The workmen here manufacture the best silks, hangings, carpets, tapestries, &c. in Turkey.

The city is about three miles in circumference, but the walls are falling to decay. It is computed to contain 40,000 Turks. The suburbs, which are more spacious and handsome than the city itself, are inhabited by 4000 Jews, 500 Armenians, and 900 Greek families, independent of many foreigners who are settled here. The fine orchards, gardens, plantations of mulberry, plantain, and other trees, &c. afford some of the most delightful, pleasant, and shady walks that imagination can conceive. All the necessaries, and even luxuries of life, are excellent in their kinds, very plentiful, and quite reasonable: the wine in particular is exquisite, and the fish of an excellent taste and flavour.

There is a castle in the middle of the city: it was once the palace, but is now running to decay. The seraglio, built by Mahomet IV. is a noble edifice. There are some excellent hot baths in the city; and in the suburbs the Greeks have three handsome churches, the Armenians one, and the Jews four synagogues.

Nice, called by the Turks Nickor, stands about 30 miles from Constantinople, in 40 deg. 32 min. north lat. and 29 deg. 40 min. east long. being situated near a gulph of the sea of Marmora, called Alicanio or Afcu; though

though its ancient splendor is much diminished, it is still a considerable place, and contains about 10,000 inhabitants, Turks, Greeks, Armenians, and Jews, whose commerce is very great in corn, fruit, tapestries, fine cloths, and other merchandize brought from the Levant. The streets are large and well built: there is a seraglio in the highest part of the town.

Smyrna, which the Turks call *İsmir*, lies in 38 deg. 15 min. north lat. and 27 deg. 10 min. east long. It is the best sea-port town in the Levant, and the most populous and opulent city of Asia Minor; being about eight days journey by land from Constantinople, and about 133 leagues by water. In the time of the Romans, it was looked upon as the most beautiful of the Tenian cities, and was called, *The Ornament of Asia*.

The commodious harbour and advantageous situation of Smyrna has rendered it one of the most opulent cities in Turkey. The haven is defended by a strong castle, and sheltered from all winds, except the westerly, by high mountains. There is an astonishing conflux of people in Smyrna, of several nations, who differ in manners, dress, language, religion, &c. The Turks occupy the greatest part of the town; the Protestants and Roman Catholics have their chapels, and the Jews a synagogue or two. The Armenians have a large handsome church, with a contiguous burying-ground.

The principal buildings are the mosques, baths, market, and khans, and some of these are very noble; the streets in general are narrow, inconvenient, and intricate; but the most disagreeable circumstance to those who live here is the great heats, which commence in June, and continue till September: this city is likewise annually visited by the plague.

Provisions are extremely plenty in Smyrna: the tails of some of the sheep weigh ten pounds, and are deemed a great dainty. The fish taken in the bay are excellent; wild hogs, hares, and all other kinds of game, fowls, &c. may be had in abundance; the wine, olives, fruits, &c. are all admirable. The musketoes, as well as a much smaller fly, of which the name is unknown, are extremely troublesome, but more so to strangers than natives; lemon juice is the best remedy for the fiery tumours which ensue.

In the harbour are always ships of almost all nations, and all burthens. The European merchants bring hither a great variety of goods from Europe, the East and West-Indies, &c. export fine and coarse wool, silk, cotton, mohair, wax, rhubarb, gall-nuts, opium, aloes, scammony, tully, galbanum, tacamahac, gum-tragacanth, ammoniac, and arabic, myrrh, frankincense, zedoar, &c. The town is supposed to contain about 15,000 Turks, 10,000 Greeks, and 2000 Jews, besides Armenians, Franks, &c. The whole country is exceedingly rich and fertile. In the neighbourhood a kind of earth is found, which being boiled with oil makes excellent soap.

Ephesus is in 38 deg. 16 min. north lat. and 27 deg. 3 min. east long. It lies about 50 miles south of

Smyrna, 23 from Miletus, and 63 from Laodicea and was anciently the metropolis of all Asia; Ephesus and Smyrna having been termed the eyes of Asia Minor; but of this once splendid, opulent, and magnificent city, nothing remains but about 30 houses inhabited by Greek families, who are miserably poor, and so exceedingly ignorant, that none of them are able to read the admirable epistle with which St. Paul honoured them. The Greeks call this city *Elefo*, and the Turks have given it the name of *Ajalalouch*. There are many noble ruins, particularly of an aqueduct, a theatre, and a circus.

Ancyri, or, as the Turks call it, *Angouri*, or *Angora*, is in 40 deg. north lat. and 32 deg. 58 min. east long. 250 miles east of Smyrna. It is a very populous and trading place. The inhabitants are estimated at 40,000 Turks, 5000 Armenians, and 1000 Greeks. The chief manufacture was camlets; the evidences of its primitive grandeur are innumerable; the streets, piazzas, &c. being full of stately remains, columns, &c. of the finest marble, porphyry, red jasper, and other beautiful stones, elegantly wrought; the modern buildings, however, are mean, low, and formed only of mud and turf. The sheep bred here are some of the finest, and the goats the most beautiful in the universe; the hair of the latter is of a dazzling whiteness, as fine as silk.

Natolia is excellently well watered; the principal rivers are the Zanthus, Cydnus, Meander, Granicus, Scamander, Cayster, Herminus, Paëtolus, and Cæicus, which discharge themselves into the Mediterranean and Euxine seas, the Archipelago, and the Euphrates. The principal lake is *Gool-Bug-Shaw*, 50 miles long, and 20 broad.

A M A S I A.

THIS province is bounded on the north by the Euxine sea; on the south, by Caramania and Adulia; on the east, by Armenia; and on the west, by Nartolia Proper.

The capital city, called also *Amasia*, and by the Turks *Amnafan*, is about 60 miles from the Euxine sea, and 40 east of *Tocat*, situated on the river *Iris*, or *Casalmach*, as it is now called. Though the place is large, the commerce is inconsiderable; the river, however, is navigable for ships of great burthen up to the town itself. On a mountain to the east there is a strong castle, and a wooden bridge over the river. There are only two caravanferas at present in the city. This was formerly a place of great beauty and importance.

Trapezonde, or *Trebizonde*, called by the Turks *Tarabozan*, is situated in the ancient *Pontus Cappadocia*, on the eastern parts of *Amasia*, at the foot of a hill. It is a kind of peninsula, running into the Euxine sea. It lies in 41 deg. 5 min. north lat. and

39 deg.

ASTA.]

39 deg. 22 min. north lat. and 39 deg. 22 min. east long. It is a very strong, defend- ed city, and the most opulent of the neighbourhood. It is situated on the banks of various trees, and is the seat of an aston- ishing quantity of country farms, gardens and gro- ves. The suburbs, v- isited by the Armenians, are the most beautiful city itself. A- djoining parts, and render the eating of the water. *Tocat*, or *Tocat*, is in 38 deg. 15 min. north lat. and 27 deg. 10 min. east long. It is a considerable thoro- ughfare, and stands partly at the foot of very high hills, and is extremely well watered, and the most fertile and opulent of the province. The garrison consists of 12,000 men. Here are twelve churches, without; several monasteries, and a chapel. The population is 20,000 Turkish families.

ALAM

THIS country is called *Amasia Minor*, is called for the purpose of the purpose, but abounds in abundance of excellent horses and sheep; venisilver, copper, Ajazzo, or Caramania) w- in a gulph of the name. It is said was anciently a city. *Marat*, Marat, is situated on the south-east, situated on a strait about 180 miles from a place of some importance. *Caissa*, the banks of the Nile, is situated 100 miles west of *Syene*, with towers. The bazar is a place of some importance, are built either of stone or they referent

39 from Laodicea of all Asia; Ephesus the eyes of Asia opulent, and magnat about 30 houses are miserably poor, none of them are with which St. Paul all this city Elefo, name of Ajafalouch, particularly of an aque-

called by the Turks cient Pontus Cappamafia, at the foot of la, running into the min. north lat. and 39 deg.

39 deg. 22 min. east long. at about 18 miles distance from Tocat. The walls of this city are high and strong, defended by towers, battlements, &c. The environs, though little cultivated, are very fertile; the neighbouring mountains are covered with stately woods of various trees, such as oaks, elms, beech, &c. which are of an astonishing height, and the whole face of the country forms an agreeable landscape. In the city, the gardens and groves are as numerous as the houses; but the suburbs, which are inhabited by Greeks and Armenians, are more extensive and populous than the city itself. A great deal of rock-honey is found in the adjacent parts, which is so exceedingly luscious as to render the eating much of it dangerous.

Tocat, or New Cæsarea, lies in 38 deg. 48 min. north lat. and 30 deg. 58 min. east long. and is a considerable thoroughfare for the caravans to Smyrna. It stands partly at the foot, and partly on the sides of two very high hills, on the river Toslanlu. The environs are extremely fertile, some excellent plants are produced, and curious fossils found, particularly many subterraneous vegetations of admirable beauty. The garrison consists of about 1000 janissaries and spahis. Here are twelve mosques with minarets, and many without; seven Armenian churches, and one Greek chapel. The city and suburbs are supposed to contain 20,000 Turkish, 4000 Armenian, and about 500 Greek families.

ALADULIA, OR ANADULIA.

THIS country, which is the third division of Asia Minor, is called, by the Turks, Dulgadir. It is unfit for the purposes of agriculture, being rough and hilly; but abounds in excellent pasture, and produces abundance of excellent fruit, wines, and cattle, particularly horses and camels, besides vast herds of goats and sheep; venison, all kinds of game, &c. There is silver, copper, iron, alum, &c. in the mountains.

Ajazzo, or Lajazzo (placed by some geographers in Caramania) was formerly called Issus, and is situated in a gulph of the Mediterranean, to which it gives its name. It is a neat, strong, opulent, sea-port town, and was anciently a place of very great importance.

Marat, Mars, or Maraph, is a large well-built city, in the south-east boundaries of the province. It is situated on a small river, which falls into the Euphrates about 180 miles to the southward of Trebizonde: it is a place of some commerce, and a bashaw resides here.

Caisa, the ancient Cæsarea, is a large town on the banks of the Millas, near mount Argæus, and about 70 miles west of Scisais. The walls are strong, and flanked with towers. The castle is in the centre of the city. The bazar is handsome; and well furnished with all sorts of merchandize, the houses in its neighbourhood are built either in the form of a tower with a cupola; or they resemble a sugar-loaf. Their principal trade is

in cotton. The city is well supplied with water from the river.

CARAMANIA.

THE province of Caramania extends itself along the Mediterranean coast from north to south, comprising the ancient Pamphylia, Pisidia, Lycaonia, and Cilicia, with part of Isauria, Phrygia, Pataiana, Cappadocia, &c. It reaches from the neighbourhood of Alexandretta to the gulph of Macri, at the mouth of which lies the island of Rhodes. The Turks call this country Caraman-ili: it is divided into the Greater and Lesser; the latter lying along the sea-coast, and the former to the north of Mount Taurus. The principal town is

Satalia, anciently called Attalia, and by the Turks Sataliah. It was formerly an important city in Pamphylia, at the bottom of the gulph of its name, in 36 deg. 45 min. north lat. and 31 deg. 20 min. east long. It is the strongest place the Turks have upon this coast. The harbour would be commodious, if the entrance was not difficult and dangerous. This is one of the most singular places in the universe, being divided into three distinct towns, each of which is divided from the others by its own strong walls, and the gates are shut up precisely at noon every Friday till one o'clock, from a pretended prophecy, that on such an hour the Christians are to surprise it. The whole is about six miles in circumference; the buildings are good, the place populous, and the trade considerable. The castle, which commands the town, is a very good one. The neighbouring country is very fertile and delightful, being covered with citron and orange-trees, which afford an exquisite fragraney. The summers are so hot, that they who can afford it retire towards the mountains, where there is more air and shade.

Teraſſo, Tarſon, or Horn, the ancient Tarsus, is situated upon the Cydnus, about six miles from its mouth. If we may venture to judge by the ruins of the old wall, it appears to have been near 12 miles in circumference. At the mouth of the river there is a commodious harbour. The lake Rhegium is about a mile below the town, through which the Cydnus runs; but, this place is at present quite decayed.

The Xanthus, Lamus, Cestrus, Eurymedon, Cydnus, Sarus or Smarus, Pyramus, Smyras, Latamao, &c. are the principal rivers. Caramania contains also many celebrated mountains, viz. Olympus (of which name there are many in Asia) Cragus, and Antigragus, all in Lycia; Amanus in Cilicia; the great chain called Mount Taurus; and the celebrated Lycian volcano mountain, called by the ancients Chimæra.

SYRIA, WITH PALESTINE, Or the HOLY LAND, East of the LEVANT SEA.

THIS division of Turkish Asia, called by the Turks Souric and Souristan, was originally so named from its

capital Tzor or Tzur, which the Greeks softened into Sur and Tyre. This country includes Syria, properly so called, Phœnicia or Phenice, and Judea or Palestine. It extends from north to south about 400 miles, and about 200 from east to west, being bounded on the north by Mount Amanus and a branch of Mount Taurus, which separates it from Armenia Minor and Cilicia; on the west, by Arabia the Desert: and on the east by the Euphrates, which divides it from Mesopotamia or Diarbec.

Libanus, Anti-Libanus, Gilcad, Tabor, Carmel, Cassius, Amanus, and Alladaurus, with some smaller in Judea, viz. Sion, Hermon, Ebal, Olivet, Calvary, Gerizim, and Moriah, are the principal mountains.

The chief rivers are the Euphrates, Jordan, Cassimeer, Licomes, Chryssorroas, Orontes, Odonis, Cherfeus, and Colk.

The air of Syria is the most serene, temperate, and healthful imaginable; during the hot months of June, July, and August, it is agreeably refreshed by cooling breezes from the Mediterranean. The face of the country is delightful and level, the soil rich and fertile. It abounds not only with all the necessaries of life, but with all the delicacies that can gratify the most luxurious appetite; and is superior, in point of climate and produce, to all other countries that even lie under the same parallel of latitude. In short, though Syria contains some rocky mountains, it would be the finest and most desirable country in the universe, were it not under such a despotic government as that of the Turks.

In this part of Turkey, we meet with the following principal cities and towns:

Aleppo, the finest and most opulent city in all Syria, lies in 36 deg. 30 min. north lat. and 37 deg. 50 min. east long. It stands on four hills, about 60 miles to the eastward of Scanderoon, is about three (including the suburbs, seven) miles in circuit, has twelve gates, and the walls, which are tolerably strong, are flanked with towers. Most of the streets are well paved, and the houses in general better built than they commonly are in other towns in Turkey. On a hill, in the centre of the city, stands a large castle, well mounted with cannon, and has a large garrison. Here are about 120 mosques, some of them very magnificent, several Turkish monasteries, colleges, khans or inns, bazars, divans, and other public edifices, which, in general, make a better figure within than without. The town is well supplied with provisions of all sorts; and water is brought to it by aqueducts, from a river near two days' journey from the city. The whole number of the inhabitants, Jews, Turks, and Christians, in the city and suburbs, is about 250,000. In the serene months of May and September, the people lie all night on the tops of their houses, without danger.

A bashaw governs this city, and commands the whole country from Scanderoon to the Euphrates; under him are three agas or governors of the city and

castle, together with the sub-bashaw, whose office is to go the rounds every night, as captain of the watch, and to execute the sentence of the bashaw on criminals and delinquents. The cadi is the sole judge in all civil matters, he makes and dissolves all marriage contracts, confirms acts of sale and purchase, and, in order to prevent frauds and abuses, creates masters of every trade.

Here is a very considerable traffick carried on, for hither are brought all the commodities of Europe and Asia; and from hence they are again exported, the former into Asia, and the latter to Europe. In Aleppo are several manufactures, particularly those of fine Turkey leather, silk, camblet, and soap. The principal commodities brought from hence to Europe are raw silk, cotton, program, yarn, galls, and a great variety of drugs. The English, French, Dutch, Italians, Arabians, Persians, Indians, &c. have their respective consuls residing here.

What remains of the ancient city of Antioch, is situate about 22 miles from Scanderoon, in a fine plain of 18 miles in extent, on the river Hasi or Orante: the Turks call it Antackia. It has a castle which commands the town and river, and some considerable remains of ancient temples, walls, churches, &c. together with an extensive canal. The vast number of plantains, poplars, sycamores, fruit-trees, &c. in the gardens of the town, make it at a distance look like a forest.

Damascus, now called Sham, is situated on the river Barada, and was formerly a very celebrated city, having eight gates, with strong walls. It is of an oblong figure, about two miles in length, and was long the residence of the Syrian kings, and afterwards of the caliphs of the Saracens. Most of the private houses here are low, and make a very mean appearance, being built with nothing but sun-burnt bricks, or mud; but the public buildings, in general, are very handsome. In the centre of the city is a castle, of an oval form, the walls of which are fourteen feet thick, flanked with square towers, mounted with cannon, and well furnished with arms and water: in this place is kept a constant garrison of fifteen thousand janissaries. In the neighbourhood of the city is an hospital for pilgrims and strangers of all religions, who are maintained at the grand seignior's expence. The great mosque, formerly a christian church, is a very magnificent edifice, into which it is death for any but Mussulmen to enter. The bagnios here are generally noble buildings, and most of the streets are arched, to keep off the sun and rain.

The chief trade of this city consists in scymitars, sword-blades, knives, bridle-bits, and all kinds of iron and steel wares, in which it is supposed above twenty thousand of the inhabitants are employed. They likewise manufacture those beautiful silks, which from this city obtained the appellation of damasks; and carry on a considerable traffick in raw and worked silk, otto of

roses, which is one of the most fragrant scents in na-
ture, fruits and wine. The merchandizes of Turkey,
Arabia, and India, are brought hither by caravans,
which are continually going and coming from Egypt,
Aleppo, Bagdad, Mecca, &c. The country round
this place is very pleasant and fertile; it is remark-
able for fine grapes, some of the bunches weighing
between thirty and forty pounds. There is a species of
alabaster found near the city, and a red earth, both in
great esteem; the latter is said to be good against the
bite of venomous creatures. Some of the sheep here
are surprisingly large. The inhabitants of this place
do not thresh their corn, as in most other countries,
but cut the straw off with iron pincers, fastened to
wooden rollers, drawn over the corn by a horse. All
sorts of Christians in this city are allowed their churches
and particular worship, and the Jews have some noble
synagogues.

Tyre and Sidon, formerly so distinguished by their
grandeur and opulence, are almost entirely decayed;
the latter, indeed, has a good harbour, and still carries
on a trifling trade. The houses are built chiefly of
stone, and are two stories high. The inhabitants are
about 16,000, chiefly Greeks: it has two public baths,
and two mosques.

But Tyre, which is now called Sur, is only inha-
bited by a few miserable fishermen, who live in the
ruins of its primitive state. On the land side there
are strong walls of stone eighteen feet high, and seven
broad. The circumference is about a mile and a half;
here are 500 Christians and Mahometans. Some of the
ruins of ancient Tyre are still to be seen.

Tripoli stands in the Levant sea, in 34 deg. 30 min.
north lat. and 36 deg. 15 min. east long. at the foot
of Mount Libanus. It is extensive, strong, populous,
and opulent, adorned with fine gardens and orchards,
plantations of mulberry-trees, &c. The walls are
strong, and fortified with seven towers. The castle is
the residence of the beglerbeg, and garrisoned by 200
Janizaries. It is a strong fortress, situated on an emi-
nence, and well stored with cannon. This city is
commodious, and watered by a little river: on ac-
count of its importance, they deem it the capital of
Phœnicia. The harbour is very open, but it is in
some measure defended by two small islands at about
two leagues from it. There are six square towers or
castles along the shore, well fortified with artillery.
The town contains about 8000 houses, and 60,000
inhabitants, who consist of Jews, Turks, or Christians.
There is a large handsome mosque, which was once a
Christian church. The Jesuits have a handsome col-
lege, and the Christians in general some monasteries
and chapels.

The air is clear and healthy, the country rich and
fertile, and the town plentifully supplied with all kinds
of provisions. The gardens have all cascades and
fountains, and even the chambers have water con-
veyed to them. In the gardens the people spend most

of their summer, being buried in their silk-worm
manufactory.

Scanderoon (anciently called Alexandretta, or Little
Alexandria, to distinguish it from Alexandria in Egypt)
lies in 36 deg. 34 min. north lat. and 36 deg. 40 min.
east long. about 60 miles from Aleppo, to which it is
the port town: it stands near the sea on the gulph of
Ajazzo; but its marshy situation renders the town so
unhealthy, that it only contains at present a confused
and straggling heap of mean wretched houses built of
wood, or huts formed of the boughs of trees inter-
woven and covered with mud, inhabited principally by
Greeks. It is defended only by an old decayed castle,
and a few soldiers, under the command of the go-
vernor. The adjacent country is in general rich,
level, and fruitful.

PALESTINE, or Judea, is situated between 31 deg. 30
min. and 32 deg. 30 min. north lat. and from 34 deg.
50 min. to 37 deg. 15 min. east long. being bounded by
the Mediterranean sea on the west, Syria and Phœni-
cia on the north, Arabia Deserta on the east, and
Arabia Petraea on the south. It is therefore near 200
miles in length, and about 80 in breadth towards the
middle, but increases or diminishes 12 or 15 miles in
other places; the longest day is about 14 hours 15
minutes.

The air of Judea is the most salubrious and pleasant
imaginable; neither heat nor cold are felt in the ex-
treme, but an agreeable serenity diffuses itself through-
out the year, which puts the stranger in mind of the
golden age.

The city of Jerusalem is at present about three miles
in circumference, and lies in 31 deg. 50 min. north
lat. and 36 deg. east long. being situated on a rocky
mountain. Dr. Shaw says, "The hills which stand
about Jerusalem make it appear to be situated, as it
were, in an amphitheatre, whose arena inclineth to
the eastward. We have now where, as I know of, any
distinct view of it: that from the Mount of Olives,
which is the least, and perhaps the furthest, is not-
withstanding at so small a distance, that when our
Saviour was there, he might be said, almost in a literal
sense, "to have wept over it." There are very few
remains of the city, either as it was in our Saviour's
time, or as it was afterwards rebuilt by Hadrian,
scarce one stone being left upon another; even the
very situation is altered; for Mount Sion, the most
eminent part of the Old Jerusalem, is now excluded,
and its ditches filled up; while the places adjoining to
Mount Calvary, where Christ is said to have suffered
without the gate, are now almost in the centre of the
city."

With respect to its present state, the Turks call it
Cudsembaric: it is thinly inhabited; the walls are
weak, and without bastions; the ditch inconsiderable;
the gates are six in number, viz. Damascus, St. Ste-
phen's, Herod's, Sterquilina, Bethlehem, and Mount
Sion Gate; beside the Golden Gate, which is shut up,

on account of a prophecy which the Turks have among them, that by that gate the Christians are to take Jerusalem. The streets are narrow, and the houses mean. Pilgrims and travellers; who flock from all parts, either through devotion or out of curiosity, are the principal support of the city. A Turkish bassa resides here, to keep good order, collect the grand seignior's revenues, and protect the pilgrims from the insults of the Arabs.

No European Christian is permitted to enter the city till the requisite duties are discharged; nor can a stranger safely stay here, without being upon good terms with the Latin fathers; these ecclesiastics subsisting by their forgeries, and pretending to guide travellers to every spot mentioned in the Old and New Testament.

The principal object of the pilgrims is the church of the Holy Sepulchre, situated upon Mount Calvary. It is 100 paces in length, and 60 in breadth: the workmen were obliged to reduce the hill to a plain area, in order to lay the foundation; but great precaution was used not to alter any part of it, where our Saviour's Passion was concerned. The scene of the Crucifixion is left entire, being about 12 yards square, and stands at this day so much higher than the floor of the church, that it is ascended to by 21 steps. The Holy Sepulchre, which was originally a cave hewn out in the bottom of the rock, may be now compared to a grotto standing above ground, and having the rock cut away, and levelled all round. The walls of the church of the Holy Sepulchre are of stone, and the roof of cedar; the east end encloses Mount Calvary, and the west the Holy Sepulchre; the former is covered with a superb cupola, supported by 16 large columns, and open at top. Over the altar there is another fine dome; the nave constitutes the choir, and the isles of the church contain the most remarkable places where the circumstances of our Saviour's Passion were transacted, together with the tombs of Godfrey and Baldwin, the two first Christian kings of Jerusalem. In the church of the Crucifixion, the hole is shewn in which it is said the cross was fixed. The altar has three crosses richly adorned on it, particularly with four lamps of immense value, which are kept constantly burning. The cloister round the sepulchre is divided into sundry chapels. The Latins, who take care of the church, have apartments on the north-west side, but they are never suffered to go out; the Turks keeping the keys, and furnishing them with provisions through a wicket. Some grand ceremonies are performed at Easter, representing Christ's passion, crucifixion, death, and resurrection.

Bethlehem is distant between six and seven miles from Jerusalem, to the south west in the way to Hebron: it lies in north lat. 31 deg. 35 min. and in 65 deg. 50 min. long. Anciently it was called the City of David, having been the birth-place of the royal psalmist. It was otherwise called Ephrath or Ephrath: see Genesis xxxv. 19. It was originally built by the Jebusites, and both Jerom and Eusebius assure us, that the monument of Jesse, the father of David, was here shewn in their

time. It is seated on a pleasant hill, in a fine fertile plain, and enjoys a most excellent air. It contains a convent of the Latins, another of the Greeks, and another of the Armenians, and is annually resorted to by a great number of pilgrims and travellers. All the convents have doors which open into the chapel of the holy manger: for the place where the blessed Redeemer was born, and the manger in which he was laid, are shewn to this day.

The most judicious travellers, upon an attentive survey of many of the countries contained in Asia Minor, and which are celebrated in the Greek and Roman history, fully vindicate all that has been said by sacred and profane writers, of their beauty, strength, fertility, and population; though it must be confessed, that at present, through the Turkish indolence and tyranny, they are either totally forsaken, or a theatre of ruin. The sites of ancient cities are still discernible, and so luxurious is nature in those countries, that in many places she triumphs over her forlorn condition. Even Palestine and Judea, the most despicable at present of all those countries, lie buried within the luxuries of their own soil.

The Turks seem particularly fond of representing Judea in the most despicable colours, and have formed a thousand falsehoods concerning it, which, being artfully propagated among ourselves, have imposed upon weak Christians. The late Rev. Dr. Shaw, professor of Greek, at Oxford, who seems to have examined that country with an uncommon degree of accuracy, and was qualified by the soundest philosophy to make the most just observations, says, that were the Holy Land as well cultivated as in former times, it would be more fertile than the very best parts of Syria and Phoenicia, because the soil is generally much richer, and, every thing considered, yields larger crops. Therefore the barrenness, he further remarks, of which some authors complain, does not proceed from the natural unfruitfulness of the country, but from the want of inhabitants, the indolence which prevails among the few who possess it, and the perpetual discords and depredations of the petty princes who share this fine country. Indeed the inhabitants can have but little inclination to cultivate the earth. "In Palestine, says Mr. Wood, we have often seen the husbandman sowing, accompanied by an armed party, to prevent his being robbed of the seed!" And, after all, whoever sows, is uncertain whether he shall ever reap the harvest.

Some part of Palestine revived under the government of Sheik Daher, the ally of the famous Ali Bey. He enlarged the buildings and walls of St. John de Acre, formerly Ptolemais, and shewed great indulgence to the Christians. Its inhabitants were lately computed at 40,000. Caifa, which stands on the declivity of Mount Carmel, distant about twenty miles from Acre, was also new built and enlarged by Daher.

small vessels, and its circumference is about two miles. The number of inhabitants is 7000. The western part of the town is inhabited by Christians.

The present state of Ramah is deplorable, its walls being in decay, and most of the houses empty, though the number of inhabitants is still between 3 and 4000.

Not a house is standing of the once magnificent city of Casarea, but the remains of the walls testify its former grandeur.

Azotus is about two miles in circumference; the inhabitants are near 3000, and mostly Mahometans. An old structure is shewn here, with fine marble pillars, which is said to be the house that Sampson pulled down, when insulted by the Philistines.

Gaza is still respectable; it extends from east to west three miles, and is a mile in breadth, divided into the old and new town. The last is inhabited by the inferior Turks and Arabs: the number of the inhabitants is reckoned to be 26,000. It is about five miles from the sea, and outside the town is a market for the country people to dispose of their commodities to the inhabitants; for they are not permitted to enter the town. The country around is very fertile; but corn, oil, wine, honey, bees-wax, flax, and cotton, are its chief produce.

It may be a question with some, whether those countries of Asia could ever be restored to their ancient grandeur, trade, and population; but I apprehend that it would now be impossible, let the Turkish government be ever so beneficent, to divert commerce (without which all attempts of that kind must be feeble) from its European channels. There can, however, be no question, that a government less brutal and bigoted than that of the Turks might make the natives a powerful, as well as a happy people within themselves: the misfortune is, that the Greeks, Armenians, and other sects of Christians there, partake but too much of the Turkish stupidity. Though they are not suffered to wear white turbans, or to ride on horseback, and are subjected to a thousand indignities and miseries, and are even, in many places, far more numerous than their oppressors; yet so abject is their spirit, that they make no efforts for their own deliverance, and are contented under all their mortifications. If they are less indolent than their oppressors, it is because they must otherwise starve; and they dare not enjoy even the property they acquire, lest it should be discovered to their tyrants, who would convert it to their own use, as though they were lawfully entitled to it.

With respect to their commerce and manufactures, there are no people in the world, who, from advantage of situation, and vast extent of empire, seem more calculated for monopolizing the trade of the whole east, than the Turks. They possess the navigation of the Black-Sea, the Levant, and the Red-Sea, which undoubtedly affords them greater opportunities of importing the rich merchandizes of the east, and distributing them all over Europe, than any other power. But such is the indolence of this people, that those great objects

are little attended to. The cities of Tyre, Sidon, and Alexandria, formerly the chief emporiums for trade in the universe, are now of no consequence, but are entirely overlooked.

The Turks have but few merchant-ships, and never attempt distant voyages; so that the English, French, Dutch, and other European nations, resort thither with the commodities of their respective countries, and return laden with those of Turkey: even the inland trade of the empire, which is exceeding trifling, is carried on by Jews and Armenians.

Their articles for export are coffee, rhubarb, turpentine, storax, gums, opium, galls, mastic, emery, Lemnian-bole, pomegranate-shells, sponges, dates; wine, oil, figs, raisins, mother of pearl, box-wood, saffron, and some other articles; to which may be added, the produce of their manufactures, consisting of silks, burdets, cottons, dimities, waxed-linen, shagreen-skins, blue, red, and yellow Morocco-leather, carpets, and soap.

The traffic of the human species, though shocking to human nature, is carried on in a very extraordinary degree in Turkey; for they not only sell their slaves of both sexes, but also beautiful young girls, who are purchased, particularly by the Jews in Circassia, Georgia, and other parts, and again sold to supply the seraglies of the grand seignior, and other great men.

By the constitution and government established in Turkey, the grand seignior is one of the most despotic princes upon earth, having an absolute power of life and death over all his subjects; of the justice of which they are so entirely persuaded, that they never make any resistance, but submit with mildness to the first order he issues for taking away their goods, and even their lives. This excess of obedience is taught them by their religion; and, labouring under the force of this prejudice, even the chief officers of the empire conclude it to be their highest good-fortune and glory to end their days by the hand or command of their sovereign. The whole extent of the Turkish empire, lands, and houses, are his property, and at his sole disposal, except lands annexed to the church; which is a law that the Jews and Christians avail themselves of, to secure the enjoyment of their estates to posterity: and so sacred and inviolable has it been held, that there is no instance recorded in history of a sultan's having even attempted to violate it.

The Asiatic Turks hold their lands by a kind of military tenure, being obliged to maintain horses and men always in readiness, against the grand seignior shall call them forth to serve in the wars. At his inauguration, this prince obliges himself to govern within the compass of the Mahometan law; which is in fact no restriction at all, for this very law styles him the mouth and interpreter of it, and endows him with a power to alter and annul the most fixed and settled rules, or at least to dispense with them when they prove an obstacle to his government. But notwithstanding this despotic power, if he acts contrary to the humours of the people, parti-

cularly the janissaries, he is in danger of being deposed, and also put to death; therefore upon the least suggestion of the disaffection or misconduct of his ministers, he causes them to be murdered, or at least disgraced; and frequently saves himself from the general fury, by throwing the whole blame of any mal-administration upon the grand vizier, and sacrificing him to the public resentment.

There is a gradation of the great officers of state in Turkey; of whom are the grand vizier, or prime minister; the captain-bashaw, or admiral; the musti, or high-priest; the viziers of the bench, or of three bashaws tails, so denominated from three horses tails being carried before them when they march; these sit in the divan, or courts of justice, with the musti; the kadilafquiers, or chief justices of provinces; the beglerbegs, or viceroys; the bashaws, or governors of towns and districts under the beglerbegs; the kaimacan, or governor of Constantinople; the grand vizier has a deputy, who is likewise styled kaimacan: the reis-effendi, or lord-chancellor and secretary of state; and the teterdar, or lord-treasurer. There are likewise the aga of the Janissaries, the aga of the Spahis, the aga of the Siluds, and some others. The chief officers of the seraglio are, the kishar aga, who is superintendent of the women, and has the command of all the black eunuchs; the capi-aga, who has the command of all the white eunuchs, and to whom all petitions intended for the sultan are first delivered.

The officers, both civil and military, with the best part of their forces, are seldom composed of Turks, but consist chiefly of the children of Tartar or Christian slaves taken in war, or renegadoes. The most beautiful, well-made, and sprightly of these, while exceeding young, are presented to the grand seignior; and such as he approves of, are admitted into the seraglios of Constantinople, Adrianople, and Pera, where they are educated under the appellation of Ichogians. Being circumcised, they are first taught silence, and a modest, humble behaviour; and as they advance in years, they are instructed in the Mahometan religion, the Turkish language, and afterwards the Persian and Arabic. When fit for many exercises, they are taught the use of arms, and such other sciences as may render them serviceable to the state, and are advanced, and their salaries augmented, according to their proficiency. When any post becomes vacant, it is filled by one of these; but none are preferred out of the seraglio before they have attained the age of forty. These men, however, being tutored in the school of adversity, and arriving at pre-eminence, are generally as distinguished for abilities, as deficient in virtue. They possess all the dissimulation, intrigue, and corruption, which often accompanies ambition in an humble rank; and they have a further reason for plundering the people, because they are uncertain how long they may possess the dignities to which they are arrived. The administration of justice, therefore, is

extremely corrupt over the whole empire, which is owing, not to the laws of the kingdom, which are very equitable, but to the iniquitous conduct and manners of the judges. Besides these Ichogians, there are children in these seraglios called Azamogians, who are trained up for inferior employments. Among the sultan's attendants, are a number of mutes and dwarfs, the former of which converse by signs with great readiness, and the latter divert the court by their buffoonery.

The revenues of the grand seignior are immense, but it is impossible to ascertain the exact sum. According to Baron de Tott, they are estimated on the records to amount to 25,400,000*l.* but produce effectively only 3,200,000*l.* to the public. They arise from the customs, the produce of the demesne lands, the capitation or poll-tax, imposed on every subject of the empire who is not a Mahometan; towards which the rich pay thirty shillings a year, tradesmen fifteen shillings, and common labourers six shillings and tenpence halfpenny. Besides this, are the annual tributes paid by the Cham of the Crim Tartars, the Princes of Moldavia, Walachia, the little republic of Ragusa, and part of Mingrelia, together with half a million annually from Egypt. All these, however, are inconsiderable, when compared to the vast sums extorted by the sultan from his viceroys and great officers of state, under the plausible appellation of presents. He also raises vast sums by the confiscations of the estates and effects of his ministers, whom, if they happen to be immoderately rich, he frequently puts to death, under pretence of misconduct. He is likewise heir to all his officers and ministers; who, after distressing the people they are appointed to govern, in order to amass prodigious wealth, are obliged to leave it at his disposal when they die; and it is seldom that generosity prompts him to bestow any considerable part on the relations of the deceased.

In Turkey, the current coin consists of gold and silver, there being no copper or brass money. The gold coins are the altines or ducats, and the zehinos. The former are worth about seven shillings and sixpence, and the latter about nine shillings. The silver coins are, the asper, worth three halfpence; the para, worth four-pence halfpenny; the grosh, about three-pence; the krip, about eleven-pence, and the solga, about two shillings and two-pence farthing. The gold and silver of all countries go for their full value.—A kize is a bag of fifteen thousand ducats; a purse is worth five hundred thousand crowns, and of these the sultan makes his common presents; but those he presents to his sultanas or favourites, are called golden purses, and contain thirty thousand crowns.

As to the Turkish military and marine strength, their armies, even in time of peace, are very numerous; and the chief part of them consist of a kind of militia, amounting to several hundred thousand men, whom their leaders are obliged to conduct into the

field,

field, whenever they are termed light-horse; these men; but there is his, who are all grand feignior's of the empire, however, who are else armies, and on engagement: they are quartered in frequently grow much so far as to deposit from the treasury strained up from There are not less over every province selves to be register the privileges of being subject to no chief commander

field, whenever the government requires their service; they are termed the Tinar-spahis, and are in fact light-horse; these amount to about 268,000 effective men: but there is another body of cavalry, called Spahis, who are about 12,000 in number, and form the grand seignior's horse-guard. The chief dependence of the empire, however, is upon the janissaries, or infantry, who are esteemed the best soldiers in the Turkish armies, and on whom they principally depend in an engagement: their number is about 25,000 men, who are quartered in and near Constantinople. These frequently grow mutinous, and have sometimes proceeded so far as to depose the sultan. They receive their pay from the treasury, are educated in the seraglio, and trained up from their infancy to the use of arms. There are not less than 100,000 foot soldiers, scattered over every province of the empire, who procure themselves to be registered in this body, in order to enjoy the privileges of janissaries, which are very great, being subject to no jurisdiction but that of the aga, or chief commander of their corps.

The titles of the emperor are swelled with all the pomp of eastern magnificence. He is styled by his subjects, "The Shadow of God, a God on Earth, Brother to the Sun and Moon, Disposer of all Earthly Crowns," &c. The grand seignior's arms are, Vert, a crescent argent, crested with a turban, charged with three black plumes of heron's-quills, with this motto, *DONEC TOTUM IMPLEAT ORBEM*, i. e. *Until he shall fill the whole world.*

The grand seignior's seraglio consists of a collection of beautiful young women, chiefly sent as presents from the provinces and Greek islands, most of them being the children of Christian parents. The brave Prince Heraclius hath for some years past abolished the infamous tribute of children of both sexes, formerly paid every year by Georgia to the Porte. The number of women in the harem depends on the taste of the reigning monarch, or sultan: Selim had 2000, Achmet had but 300, and the present sultan hath nearly 1600. On their admission, they are committed to the care of old ladies, taught to sew and embroider, music, dancing, and other accomplishments, and furnished with the richest clothes and ornaments. They all sleep in separate beds, and between every fifth there is a preceptress. Their chief governess is called Katon Kiaga, or governess of the noble young ladies. There is not one servant among them, for they are obliged to wait on one another by rotation: the last that is entered, serves her who preceded her and herself. These ladies are scarcely ever suffered to go abroad, except when the grand seignior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are enclosed with lattices and linen curtains; and when they go by land, they are put into close chariots, and signals are made at certain distances, to give notice, that none approach the roads through which they march. The boats of the harem, which

carry the grand seignior's wives, are manned with twenty-four rowers, and have white covered tilts, shut alternately by Venetian blinds.

Whenever the ladies are permitted to walk in the gardens of the seraglio, all people are ordered to retire, and on every side there is a guard of black eunuchs, with sabres in their hands, while others go their rounds, in order to hinder any person from seeing them. If unfortunately any one is found in the garden, either through ignorance or inadvertence, he is undoubtedly killed, and his head brought to the feet of the grand seignior, who gives a reward to the guard for their vigilance. Sometimes the sultan goes into the gardens to amuse himself when the women are there; and it is then that they make use of their utmost efforts, by dancing, singing, seducing gestures, and amorous blandishments, to ensnare the affections of the monarch. He is not allowed to take a virgin to his bed, except during the solemn festivals, and on occasion of some extraordinary rejoicings, or the arrival of some good news. Upon such occasions, if the sultan chooses a new companion to his bed, he enters into the apartment of the women, who are ranged in files by the governesses, to whom he speaks, and intimates the person he likes best; but does not throw the handkerchief to her, as is generally asserted and believed.

As soon as the grand seignior has chosen the girl that he has declined to be the partner of his bed, all the others follow her to the bath, washing and perfuming her, and dressing her superbly, conducting her, singing, dancing, and rejoicing, to the bed-chamber of the sultan, who is generally, on such an occasion, already in bed. Scarcely has the new-elected favourite entered the chamber, introduced by the grand eunuch who is upon guard, than she kneels down; and when the sultan calls her, she creeps into bed to him at the foot of the bed, if he does not order her, by special grace, to approach by the side: after a certain time, upon a signal given by the sultan, the governess of the girls, with all her suite, enter the apartment, and take her back again, conducting her with the same ceremony, to the women's apartments; and if by good-fortune she becomes pregnant, and is delivered of a boy, she is called *afaki-sultanehs*, that is to say, *sultanehs-mother*. For the first son, she has the honour to be crowned, and she has the liberty of forming her court, by way of distinction. Eunuchs are also assigned for her guard, and for her particular service. No other ladies, though delivered of boys, are either crowned or maintained in such a costly manner as the first; however, they have their service apart, and handsome appointments.

After the death of the sultan, the mothers of the male children are shut up in the old seraglio, from whence they can never come out any more, unless any of their sons ascend the throne. A writer of credit informs us, that the female slave who becomes the mother

ther of a sultan, and lives long enough to see her son mount the throne, is the only woman who, at that period alone, acquires the distinction of sultana-mother: she is till then in the interior of her prison with her son. The title of *Bache-Kadun*, principal woman, is the first dignity of the grand seignior's harem; and she hath a larger allowance than those who have the title of second, third, and fourth woman, which is the number of free women allowed by the Koran.

A COMPENDIOUS HISTORY of the ORIGIN, PROGRESS, and ESTABLISHMENT of the TURKS.

THE southern and more fertile parts of Asia have, at different periods, been conquered by that warlike and hardy race of men who inhabit the vast country known to the ancients by the name of Scythia, and among the moderns by that of Tartary. One tribe of these people, called Turks, or Turcomans (which name signifies wanderers) extended its conquests under various leaders, and during several centuries, from the shore of the Caspian-Sea, to the Straights of the Dardanelles. Having been long resident in the capacity of body guards about the courts of the Saracens, they embraced the doctrine of Mahomet, and acted for a considerable time as mercenaries in the armies of contending princes. Their chief residence was in the neighbourhood of Mount Caucasus, from whence they removed to Armenia-Major, and after being employed as mercenaries by the sultans of Persia, they seized that kingdom about the year 1037, and spread their ravages over all the neighbouring countries. Bound by their religion to make converts to Mahometanism, they never were without a pretence for invading and plundering the dominions of the Greek emperors, and were sometimes commanded by very able generals. On the declension of the caliphate, or empire of the Saracens, they made themselves masters of Palestine; and the visiting the holy city of Jerusalem being then part of the Christian exercises, in which they had been tolerated by the Saracens, the Turks laid the European pilgrims under such heavy contributions, and exercised such horrible cruelties upon the Christian inhabitants of the country, as gave rise to the famous crusades, of which an ample account is given in another part of this work.

The Greek emperors were unfortunately more jealous of the Christians than of the Turks; and though after oceans of blood were spilt, a Christian kingdom was erected at Jerusalem, under Godfrey of Boulogne, neither he nor his successors were able to maintain it, by any real power they possessed. About the year 1299, the Turks had extended their dominions on every side, and possessed themselves, under Othman, of some of the finest provinces in Asia, of Nice, and Prusa, in Bithynia, which Othman made his capital, and, as it were, first embodied them into a nation; hence they

took the name of Othmans from that leader, the appellation of Turks, as it signifies in the original wanderers, or banished men, being considered by them as a term of reproach.

Othman may with propriety be styled the founder of the Turkish empire, and was succeeded by a race of the most warlike princes that are mentioned in history. About the year 1357 they passed the Hellespont, and got a footing in Europe, and Amurath settled the seat of his empire at Adrianople, which he took in the year 1360: under him the order of janissaries was established. Such were their conquests, that Bajazet I. after conquering Bulgaria, and defeating the Greek Emperor Sigismund, laid siege to Constantinople, in hopes of subjecting all the Greek empire to his obedience. His greatness and insolence provoked Tamerlane, a Tartarian prince, who was just then returned from his eastern conquests, to declare war against him. A decisive battle was fought between those rival conquerors, in Natolia, in the plain where Pompey defeated Mithridates, when Bajazet's forces were cut to pieces, and he himself taken prisoner, and shut up in an iron cage, where he ended his days.

This was a dreadful blow to the Othmans; but the successors of Tamerlane, by declaring war against one another, gave the Turks an opportunity of recovering the prodigious loss they had sustained, and of becoming more powerful than ever; and though their career was in some measure checked by the valour of the Venetians, Hungarians, and the famous Scanderbeg, a prince of Epirus, nevertheless they gradually reduced the dominions of the Greek emperors; and, after a long siege, Mahomet II. took Constantinople in 1453. Thus, after an existence of ten centuries, from its first commencement under Constantine the Great, ended the eastern empire; an event which had been long foreseen, and was owing to many causes; the chief was, the total degeneracy and luxury of the Greek emperors themselves, their courts and families; the dislike their subjects had to the popes, and the western church, one of their patriarchs having declared publicly to a Romish legate, "That he would rather see a turban than the pope's tiara upon the great altar of Constantinople." But as the Turks, when they extended their conquests, did not exterminate the conquered nations, but reduced them to subjection, the remains of the ancient Greeks still exist, as we have already observed, particularly in Constantinople, and the neighbouring islands, where, though grievously oppressed, they profess Christianity under their own patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem; and the Armenians have three patriarchs, more wealthy than those of the Greek church, on account of their people being richer, and more conversant in trade. It is said that the modern Greeks, though pining under the tyrannical yoke of the Turkish government, still preserve somewhat of the exterior appearance, though nothing of the internal principles,

principles, by which so eminently distinguished. The conquest submission of a Turk have been and as having accu- tical balance of In 1481, Mahomet was succeeded by That prince carried and Venetians, Egyptians; but feeble, was harassed, and by order of a Jew persuaded Selim, persuaded to throne in peace, man race subsisted, and caused strangled, with race. principles, by which their ancestors were so long and so eminently distinguished.

The conquest of the capital was followed by the submission of all Greece; and from this time the Turks have been looked upon as an European power, and as having acquired a considerable weight in the political balance of affairs.

In 1481, Mahomet paid the debt of nature, and was succeeded on the Othman throne by Bajazet II. That prince carried on a war against the Hungarians and Venetians, as well as against the Persians and Egyptians; but falling ill of the gout, he became indolent, was harassed with family differences, and at length, by order of his second son, Selim, he was poisoned by a Jew physician.

Selim, persuaded that he could never possess the throne in peace, while any other prince of the Othman race subsisted, pursued the barbarous policy of the east, and caused his eldest brother, Achmet, to be strangled, with many other princes of the Othman race. He continued the war against the Sophis of Persia, and the Prince of Mount Taurus, and defeated their forces; but finding himself unable to penetrate into the Persian dominions, he turned his arms against Egypt, which, after many bloody battles, he subdued, in the year 1517. He was also successful in the Lesser Asia, where he made himself master of Aleppo, Antioch, Tripoli, Damascus, Gaza, and several other places. He was succeeded, in 1520, by his son

Soliman the Magnificent, the greatest prince that ever filled the throne of Othman. Availing himself of the fatal differences which prevailed among the Christian powers, he besieged and took Rhodes, driving the knights from that island to Malta, which was given them by the Emperor Charles V. The reign of Soliman, after this, was a continual war with the Christian powers, and generally successful, both by sea and land. He took Buda, the metropolis of Hungary at that time, and Belgrade, and carried off near 200,000 captives. This happened A. D. 1526; and two years afterwards, he advanced into Austria, and besieged Vienna, but retired on the approach of Charles V. he miscarried also in an attempt he made to take the Isle of Malta. Dying in 1566, he was succeeded by

Selim, the son and successor of Soliman, who continued the wars begun by his father against the Christians, but without his good fortune. The Turkish fleet, which was now very powerful, was totally defeated by the Christians, in the battle of Lepanto. This blow almost annihilated the Turkish navy, and had the victory been properly pursued by the Christians, especially the Spaniards, Selim had tottered on his throne. But differences and jealousies prevailing among them, the panic of the Turks subsided, they soon recovered their spirits, and their army again became formidable; but their marine has never since been able to face that

of the Christians. Selim died in 1575, and was succeeded by his son,

Amurath III. who carried on a successful war against the Persians, and obliged them to cede Tauris, Teflis, and many other cities to the Turks. He was also fortunate in his wars against the Hungarians, and made himself master of the fortress of Raab. His whole reign was indeed a continual war, the operations of which were various; sometimes fortune attended the Othman standards, and sometimes those of the enemy. After a reign of eighteen years, Amurath paid the debt of nature, and his son,

Mahomet III. ascended the Turkish throne. The most memorable transactions of the reign of this prince are his cruelties. At his accession to the throne, he caused nineteen of his brothers to be strangled: and as ten of his father's concubines were supposed to be pregnant, he caused these unhappy victims of his jealousy to be thrown into the sea. But though he waded to the throne through a sea of blood, he did not long enjoy it. He died of the plague in the year 1604.

Achmet succeeded to the Turkish throne on the death of his brother, and carried on an unsuccessful war against the Persians: but though his army was defeated in Asia, and several towns taken from him, yet his forces in Hungary were victorious, and obliged the Austrians to sign a peace in 1606, by which Achmet was allowed to retain all the conquests he had made. Soon after this peace, Achmet died, and

Osman, his son, then only sixteen years of age, succeeded him. He was a prince of great hopes, and seemed formed for governing a turbulent people; but being unsuccessful in his wars against Poland, he was put to death by the Janissaries, whose power he intended to have reduced. He was succeeded by

Morad IV. who, after a long contest with the Persians, made himself master of the city of Bagdad.

Ibrahim, his brother, succeeded him in the Othman throne, in 1640, but being a worthless, inactive prince, he was strangled in the seraglio by the Janissaries, in 1648.

Mahomet IV. succeeded Ibrahim, and carried on a long war against the Venetians. During his reign, Candy was taken by the Turks, after a siege of thirty years, and the loss of 180,000 men. A bloody war succeeded between the Turks and Imperialists, in which the former were so successful, that they laid siege to Vienna; but were forced to raise it with great loss, by John Sobieski, King of Poland. This misfortune caused a ferment in Constantinople, Mahomet was shut up in prison, and

Soliman II. Mahomet's brother, was placed upon the throne. The standards of this prince were equally unfortunate, nor was his brother, Achmet II. more successful: the Turks were beaten in almost every action, and victory seemed to have totally deserted the Othman forces. Persuaded that many of the late misfor-
tures

tunes were owing to the want of abilities in the Turkish generals.

Mustapha II. who mounted the throne in 1696, headed his armies in person. But he was soon convinced that his opinion was too precipitately formed; the celebrated Prince Eugene, who then commanded the Imperial armies, totally defeated him, and a peace was concluded between the Imperialists and Turks, in the year 1699. This defeat terminated the reign of Mustapha; he was deposed, his musti beheaded, and his brother,

Achmet III. was placed upon the throne. This prince was more successful; he gave shelter at Bender to Charles XII. and terminated a successful war against the Russians, by a peace concluded at Pruth. He also declared war against the Venetians; but the numerous armies he levied for attacking the territories of that republic alarmed all Europe, so that the scene of action was translated to Hungary. Eugene then commanded the Imperial army, and gave the Turks so many repeated defeats, that Achmet was forced to conclude an inglorious peace at Passarowitz, in 1718. Nor were the Turkish armies more successful in Asia; they were defeated by Kouli Khan, who had seized the throne of Persia. Enraged at these repeated misfortunes, and alarmed at the progress of the Persians, the populace demanded the heads of the vizier, the chief admiral, and the secretary. These were accordingly struck off; but even this sacrifice was not sufficient to appease the clamours of the people; Achmet himself was deposed, and

Mahomet V. advanced to the throne. This total change in the government did not however recall victory to the standards of Othman. Mahomet was as unsuccessful as his predecessor, and at last obliged to acknowledge the usurper Koutli Khan as Sophi of Persia.

The war being thus terminated in Asia, Mahomet turned his arms against the Imperialists and Russians: he was victorious in several actions with the former; Eugene was dead, and there was no other general of equal talents to supply his place: but his forces were not a match for the latter. Defeat succeeded defeat, and the progress of the Russians was so rapid, that Constantinople itself was threatened with a siege. Reduced to this extremity, a hasty peace was concluded with the emperor, and soon after another with the Russians, both disadvantageous to the Turks. Mahomet died in 1754, and was succeeded by his brother

Osman III. who after a short reign of three years, paid the debt of nature, and the crown was placed upon the head of Mustapha III. This prince was born in 1723, and died on the 21st of January 1774, whilst engaged in an unsuccessful war against the Russians, of which some account will be given in our history of Russia.

Abdul Hamed, or Achmet IV. grand seignior, was born in 1710, and succeeded to the throne of Turkey

on the death of Mustapha, his brother: he had three sons and three daughters.

In the course of the war between Mustapha and the Empress of Russia, a considerable Russian fleet was fitted out, which set sail from the Baltic, with a view of shaking the remote parts of the Archipelago. This fleet first sailed to Minorca, and departing from thence in the beginning of February 1770, shaped its course for the Morea. Count Orlov, the Russian admiral, having debarked such land forces as he had with him at Maina, which lies a little to the westward of Metapan, and about fifty miles to the south-west of Mistra, the ancient Sparta, the Marriotes, the descendants of the Lacedaemonians, and who still possessed the country of their ancestors, under subjection to the grand seignior, immediately flew to their arms in every quarter, and joined the Russians by thousands, from their aversion to the tyranny of the Turks. The other Greeks followed their example, or rather only wanted to hear the arrival of the Russians, to do what they had long intended; and the whole Morea seemed every where in motion. The open country was quickly over-run, and Mistra, Arcadia, and several other places as speedily taken, while the Russian ships that had been separated, or that put into Italy, arrived successively, and landed their men in different quarters, where every small detachment soon swelled to a little army, and the Turks were every-where attacked or intercepted. In the mean time the Greeks gave the utmost loose to their revenge, and every-where slaughtered the Turks without mercy; and the rage and fury with which the inhabitants of the continent were seized, extended itself to the islands, where also the Turks were massacred in great numbers.* They were, indeed, unable to make head against the Russians and Greeks in the field; their only protection was found within their fortresses. The mal-contented had so much increased since the first debarkation of the Russians, that they invested Napoli di Romania, Corinth, and the castle of Patras, with several other places of less note.

Whilst they were employed in these enterprizes, an army of 30,000 men, composed chiefly of Albanians and Epirotes, entered the Morea, commanded by Serckier, Bathaw of Bosnia. This Turkish general recovered all the northern part of the peninsula, as soon as he appeared in it; and all the Greeks that were found in arms, or out of their villages, were instantly put to death. The Russians were now driven back to their ships; but about the same time another Russian squadron, commanded by Admiral Elphinston, arrived from England, to reinforce Count Orlov's armament. The Turkish fleet also appeared, and an obstinate engagement was fought in the channel of Scio, which divides that island from Natolia, or the Lesser Asia.

The Turkish fleet was considerably superior in force, consisting of fifteen ships of the line, from sixty to ninety guns, besides a number of chebques and gal-

lies, amounting to thirty. The Russians had only some of the ships, on both sides, approaching sufficient to grapple with the admiral, encountered, of ninety galleys, both fought with great spirit, and the Russians, after the Turkish fleet was disentangled, were in flames. The possibility of success was a most terrible encouragement to the principal officers on the Russian side.

The dreadful fate of those that were on both sides; and the continued till night, either side. The Russians cut their cables, and the Russian ships, and in the morning conveyed among the Russian service, himself directed the destruction. The five hours the war, a few galleys that were totally destroyed, and bombarded, that protected it, blown up the port, reduced to a heap of ruins, and a fine appearance at once.

As we intend to give some of the military operations between the Turks and the Russians, a few months after the death of Achmet IV. the only young prince, in a situation to manage his brother to the prize, he intrusted the strongest to the grand seignior. The great importance of the empire

er: he had three

Mustapha and the Russian fleet was sailing, with a view to the Archipelago. This, starting from thence, shaped its course to the Russian admiral, who he had with him westward of Malacca, the descendant of the Sultan. Still possessed the submission to the Turkish arms in every part of thousands, from the Turks. The other admiral only wanted to do what they had done before. The country was quickly taken, and several other places were taken. The ships that had been taken, arrived successfully, in different quarters, swelled to a little more, were attacked or injured. The wrecks gave the utility where slaughter, the rage and fury of the continent were increased, where also the officers. They were, at the Russians and the destruction was found. The contents had so much of the Russians, in Asia, Corinth, and other places of less

these enterprizes, an chiefly of Albanians commanded by Seraskier, general recommendation, as soon as the ships that were found were instantly put to be given back to their other Russian squadron, arrived from the emperor's armament. The obstinate engagement, which divides the continent of Asia,

superior in force, and from sixty to a hundred and gal- lies,

lies, amounting in the whole to near thirty sail; the Russians had only ten ships of the line, and five frigates. Some of the ships engaged with great resolution, whilst others, on both sides, found various causes for not approaching sufficiently near. But Spirtoff, a Russian admiral, encountered the captain-pacha, in the Sultane, of ninety guns, yard-arm and yard-arm. They both fought with the greatest fury, and at length ran so close, that they locked themselves together with grappling-irons, and other tackling. In this situation, the Russians, by throwing hand-granades from the tops, set the Turkish ship on fire, and as they could not now be disentangled, both ships were in a little time equally in flames. Thus dreadfully circumstanced, without a possibility of succour, they both at length blew up with a most terrible explosion. The commanders and principal officers on each side were mostly saved, but the greatest part of the crews were lost.

The dreadful fate of those ships, as well as the danger to those that were near them, produced a kind of pause on both sides; after which the action was renewed, and continued till night, without any material advantage on either side. When it became dark, the Turkish fleet cut their cables, and ran into a bay on the coast of Natalia: the Russians surrounded them thus closely pent up, and in the night some fire-ships were successfully conveyed among the Turkish fleet, by the intrepid behaviour of Lieutenant Dugdale, an Englishman in the Russian service, who, though abandoned by his crew, himself directed the operations of these vessels of destruction. The fire took place so effectually, that in five hours the whole fleet, except one man of war, and a few gallees that were towed off by the Russians, was totally destroyed; after which, they entered the harbour, and bombarded and cannonaded the town, and a castle that protected it, with such success, that a shot having blown up the powder-magazine in the latter, both were reduced to a heap of rubbish. Thus of a town, a castle, and a fine fleet, which had made a formidable appearance at one o'clock, there was scarcely left a vestige at nine the same morning.

As we intend, in our account of Russia, to notice some of the military transactions by land, in the war between that empire and Turkey, we shall only add here, that after a most unfortunate war on the side of the Turks, peace was at length concluded between them and the Russians, on the 21st of July 1774, a few months after the accession of the late grand seignior, Achmet IV. The emperor, Mustapha III. left a son, then only in his 13th year; but as he was too young to manage the reins of government, in the then critical situation of the Turkish affairs, Mustapha appointed his brother to succeed him in the throne; and to this prize he intrusted the care of his infant son, under the strongest terms of recommendation. The present grand seignior is Salem III. born in 1761.

The great springs of those successes which have rendered the empire of the Turks so formidable, have been

ascribed to their perseverance, their numerous Asiatic armies, and an implicit submission to their officers, rather than to any excellency in military discipline, or courage in war. The extension, as well as duration of their empire, may indeed, in some measure, be owing to the military institution of the Janissaries, a corps originally composed of the children of such Christian parents as could not pay their taxes. These being collected together, were formed to the exercise of arms under the eyes of their officers in the seraglio: they were generally in number about 40,000, and so excellent was their discipline, that they were deemed to be invincible, and they still continue to be the flower of the Turkish armies. But the Ottoman power is in a declining state: the political situation of Europe, and the jealousies that subsist among its princes, are now the surest basis of this empire, and the principal reason why these once haughty infidels are suffered to remain any longer in possession of the finest provinces in the world.

CHAP. VI.

EASTERN TARTARY.

Extent, Boundaries, Divisions, Mountains, Rivers, Produce, Animals, Inhabitants, &c.

THESE vast regions are 4000 miles in length, and 2,400 in breadth; being situated between 50 and 150 deg. east long. and 30 and 72 deg. north lat.

Taken in its fullest extent, Tartary is bounded by the Frozen-Ocean on the north; by the Pacific-Ocean on the east; by China, India, Persia, and the Caspian-Sea, on the south; and by Muscovy on the west. But the accounts given us by geographers, respecting the extent, limits, and situation of this country, are not to be depended upon entirely, since the Empress of Russia and her ministry are ignorant of her precise limits with the Chinese, Persians, and other nations.

One part of this extensive territory is subject to the Chinese empire, another is under the dominion of Russia; and the third is independent.

Its grand divisions, subdivisions, and chief towns, are as follow:

The north-east division contains the Kamtschatka Tartars, whose chief town is Kamtschatka; and the Jakutskoi-Tartars, whose chief town is Jakutskoi.

The south-east division includes the Thibet and Mogul-Tartars, whose chief towns are Bratski, Thibet, Polog, Kudak, containing 985,380 square miles.

The north-west division comprises Samoieda and Ostiack: their chief towns are Mangasia and Kortskoi.

The south-west division contains Circassian and Astrachan-Tartary, whose chief towns are Terki and Astrachan.

The middle division includes Siberia, with its chief town,

town, Tobolsk; Kalmuck-Tartary, and its chief town, Bokhariz; and Usbeck-Tartary, whose chief town is Samercand; Kalmuck-Tartary contains 850,000 square miles, and Usbeck-Tartary 339,840.

The chief mountains of Tartary are Caucasus in Circassia, and the mountains of Taurus and Ararat, so contiguous to it, that they appear like a continuation of the same mountain, which crosses all Asia from Mingrelia to the Indies; and the mountains of Stolp, in the north.

Its seas are, the Frozen-Ocean, the Pacific-Ocean, and the Caspian.

There are several lakes in Tartary, the most considerable of which are the Baikal, the Kifan, and the Kologal.

The most remarkable rivers are, the Wolga, which runs a course of 2000 miles; the Obey, which divides Asia from Europe, the Tabol, Irtis, Genesá or Jenka; the Argun, which divides the Russian and Chinese empires; the Burrumpooter, and the Lena.

As this country is of a vast extent from north to south, consequently the air, climate, soil, and produce, must be very different; the southern parts being in the same latitudes with Spain, France, Italy, and part of Turkey; and the northern reaching beyond the arctic polar circle.

The most uncomfortable regions are Nova Zembla and Russian Lapland; the earth, which is covered with snow nine months in the year, being extremely barren, and every where incumbered with unwholesome marshes, uninhabited mountains, and impenetrable thickets.

Mr. Bell, who travelled with the Russian ambassador to China, represents some parts of Tartary as fertile and desirable countries, which, when cultivated, yield excellent fruits, particularly very large grapes; and the grass grows spontaneously to an amazing height, but the Tartars have no idea of making it into hay. The common productions are, some wheat, rice, barley; several kinds of roots, and pulse, coffee, aloes, and various other drugs. Their method of procuring early grass for their cattle, particularly in Mongalia, is very extraordinary: during the high winds which blow here in spring, they set fire to the rank grass; this runs in a most amazing manner, and the flames frequently spread till their progress is stopped by some river or barren hill. The following year the ashes of this consumed grass, washed into the earth by the snow as it melts, prove such excellent manure, that the young grass springs thicker than wheat, on the land thus prepared.

Besides other land and amphibious animals common in the north parts of Europe, such as bears, wolves, &c. there are, in some parts of Tartary, camels, dromedaries, goats with yellow hair, squirrels, foxes, an animal called hautchan, resembling an elk; another called chulon or chalsion, which seems to be a sort of lynx, a little creature called tael-pe, and marmots. The last of these animals are chiefly found on the hills in Mongalia, where they burrow under the broad spread-

ing leaves of the rhubarb plants; to the growth of which it is said their dung, and their casting up the earth about the roots, greatly contribute. Their horses are of a good size for the saddle, and very hardy; as they run wild till they are five or six years old, they are generally headstrong.

Near Astrachan, there is a bird (by travellers taken to be the pelican) called by the Russians Baba, of a grey colour, and something larger than a swan; he has a broad bill, under which hangs a bag that may contain a quart or more; he wades near the edge of a river, and, on seeing a shoal or fry of small fishes, spreads his wings, and drives them to a shallow, where he gobbles as many of them as he can into his bag, and then going ashore, eats them, or carries them to the young.

The population of Tartary can never be ascertained; but from some circumstances we must conclude, that the number of inhabitants are by no means proportioned to the extent of their country. These people, originally descended from the Scythians, are now generally divided into three distinct powers; the first are those known by the name of Tartars, the second are the Calmucks, and the third the Monguls. The Tartars, properly so called, live to the west of the Caspian sea. The most considerable of them are the Usbecks, subject to Persia; the Kara Kallpacks, the Nogais, and the Baskirs, the two last being subject to Russia; and the Daghestans, who depend on no power, and are more savage and untractable than any of the rest.

In their persons they are generally short and stout, with broad faces, flat noses, and small but quick black eyes. They continually thin their beards by plucking the hairs out by the roots, so that they are scarcely visible. The women bear a strong resemblance to the men, except in Circassia, where they are esteemed as remarkable beauties, and are admired for their wit and address. Many of them are found in the seraglios of the grand seignior, and other great personages, both in Turkey and Persia; being purchased of their parents, while exceeding young, by merchants, who cause them to be instructed in such accomplishments as may tend to enhance their value when offered to sale. The Tartarian women are famed for being honest, sincere, and in general very modest. Adultery is a crime scarce ever heard of among them.

In their dispositions the Tartars are naturally easy and cheerful, always disposed to laughter, and scarce ever experience either care or melancholy. They are extremely hospitable to each other, and likewise to strangers, who put themselves under their protection. Their ideas of filial duty cannot be exceeded, and scarcely equalled, by more polished nations; but they sometimes carry them to what we must term, a cruel height, for if any of them are rendered infirm by age, or seized with an incurable distemper, they build a small hut near some river, into which they put the patient with a quantity of provisions, and then quitting him, seldom or never return to know his fate. The reason they

assign for this is that it prevents a good offer for them; believe leads to happiness tempted by an usually, if well-verb: "Though own handle."

are naturally easy and tender, and scarce ever holy. They are and likewise to their protection. Their proceeded, and scarce; but they sometimes, a cruel height, by age, or seized build a small hut, but the patient with quitting him, seldom. The reason they assign

assign for this strange conduct is, that they do their parents a good office in sending them to a better world; for they believe in a future state, and that virtue leads to happiness, and vice to misery: therefore, when tempted by another to commit a bad action, they usually, if well-disposed, reply in the following proverb: "Though a knife be sharp, it cannot cut its own handle." Their only employment is tending their flocks, hunting, and managing their horses; for, being inured to horsemanship from their infancy, they seldom appear on foot; their dexterity in shooting at a mark is inconceivable, and frequently while in full gallop, they will cleave a pole, at a considerable distance from them, with an arrow. They avoid all kind of labour, and have few mechanics among them, except those who make arms. In general, they lead a wandering life, setting out in the spring, frequently ten thousand in a body, preceded by their flocks and herds; and when they come to an inviting spot, they pitch their tents, and stay there till all the grass is consumed, when they again set forward in search of another fertile plain. Some of them live in huts half sunk under ground, the fire being in the centre, with a hole just over it in the roof to let out the smoke, and round it are benches to sit or lie upon. This seems to be the common method of living among all the northern nations, from Lapland eastward, to the Japanese ocean. In the northern provinces, as soon as the winter sets in, every family burrows itself under ground, nor do they emerge again till the succeeding spring.

Their favourite food is horse-flesh, which they broil and roast, and sometimes large pieces of it are smoked or dried in the sun; but they never eat it raw, as is commonly believed, unless compelled to it by necessity. On long marches, all their provisions consist of cheese, or rather dried curd, made up into little balls, which they poult, and, mixing the powder with water, drink it.

Some of the tribes are far more filthy than others, but in this particular none exceed the Kamtschatkans, who are said never to wash their hands or face, nor cut their nails: they eat out of the same dish with the dogs, without ever being washed, every thing about them stinks of fish, and they never comb their heads. Both men and women plait their hair in two locks, binding the ends with small cords. If any hair happens to start out, they sew it down with thread, to make it lie close, by which means their heads swarm with vermin, which they scrape off with their hands.

The Tartars have very little money except what they get from the Russians, and their other neighbours, in exchange for cattle: and with this they sometimes buy meal, but it is more frequently expended in cloths, silks, stuffs, and other apparel for their women, whom they likewise purchase with a cattle.

They are not very nice in their marriages, not being uncommon, in some of the more barbarous tribes, for a father to marry his own daughter; and there is very little difference made between the child of a concubine

or slave, and that of a wife, except that, among the heads of tribes, the wife's son is always preferred in the succession. But what is still a greater hardship, every wife, when turned of forty, is degraded to the menial offices of a servant, and, as such, must wait on the young wife who succeeds to her place.

The Tartarian dress is very simple; that of the men consists of a short jacket, with narrow sleeves, made of deer-skins, with the fur outward, and trowsers and hose all of one piece. Most of the tribes shave their heads, except a lock behind, which is plaited, and hangs down their backs. They wear a cap turned up with fur, adorned on the top with a tassel of red silk. The women are dressed in loose gowns, ornamented and bordered with different colours; they all wear ear-rings, and their hair plaited in several locks. Those of most consequence among them, wear silk garments in the summer.

The inhabitants of Siberia are, like their ancestors, most of them idolaters. They consist of many nations, entirely differing from each other in their manner of living, religion, language, and countenances. But in this they agree, that none of them follow agriculture, which is carried on by some Tartars, and such as are converted to Christianity. A few of them breed cattle, and others follow hunting. The population of Siberia has been much increased since it became a Russian province, for the Russians have built therein a number of towns, fortresses, and villages. Notwithstanding which, it presents but a void and desert appearance; since, by its extent, it is capable of supporting several millions more than it at present contains.

The religion of the Circassians is Paganism; for, notwithstanding they use circumcision among them, they have neither priest, koran, or mosque, like other Mahometans. Every body here offers his own sacrifice at pleasure, for which, however, they have certain days, established more by custom than any positive command. Their most solemn sacrifice is offered at the death of their nearest friends, upon which occasion both men and women meet in the field to be present at the offering, which is a he-goat: this having killed, they flay it, and stretch the skin, with the head and horns on, upon a cross at the top of a long pole, placed commonly in a quickset hedge (to keep the cattle from it) and the sacrifice is offered near the place, by boiling and roasting the flesh, which they afterwards eat. When the feast is over, the men rise, and having paid their adoration to the skin, and muttered over some certain prayers, the women withdraw, and the men conclude the ceremony with drinking a great quantity of aqua vitæ, and this generally ends in a quarrel before they break up the meeting.

We shall now proceed to give an account of the religion and government of the kingdom of Thibet, and Lassa, a large tract of Tartary bordering upon China, which is considered as the most remarkable, and most

worthy of attention. The Thibetians are governed by the Grand Lama, or Delai Lama, who is not only submitted to, and adored by them, but is also the great object of adoration for the various tribes of heathen Tartars, who roam through the vast tract of continent which stretches from the banks of the Wolga, to Korea on the sea of Japan. He is not only the sovereign pontiff, the vicegerent of the deity on earth; but, as superstition is ever the strongest, where it is most removed from its object, the more remote Tartars absolutely regard him as the Deity himself. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come up from different parts, to worship and make rich offerings at his shrine: even the emperor of China, who is a Manchon Tartar, does not fail in acknowledgments to him in his religious capacity, though the Lama is tributary to him, and actually entertains, at a great expence, in the palace of Peking, an inferior Lama, deputed as his nuncio from Thibet. The opinion of those who are reputed the most orthodox among the Thibetians, is, that when the Grand Lama seems to die, either of old age or infirmity, his soul in fact only quits a crazy habitation, to look for another younger or better, and it is discovered again in the body of some child, by certain tokens known only to the Lamas or priests, in which order he always appears.

In 1774 the Grand Lama was an infant, which had been discovered some time before by the Taysloo Lama, who in authority and sanctity of character is next to the Grand Lama, and during his minority acts as chief. The Lamas, who form the most numerous as well as the most powerful body in the state, have the priesthood entirely in their hands; and, besides, fill up many monastic orders, which are held in great veneration among them. The residence of the Grand Lama is at Patoli, a vast palace on a mountain near the banks of the Barampooter, about seven miles from Lassa. The English East-India company made a treaty with the Lama in 1774, in consequence of the fort of Dellameotta, the principal pass through the ridge of the Bootan mountains, being taken by storm by Capt. Jones in 1773, which made the Thibetians sue for peace. The people at Thibet have a great veneration for the cow, and also highly respect the waters of the Ganges, the source of which they believe to be in heaven. The Sunniasses, or Indian pilgrims, often visit Thibet as an holy place, and the Lama always entertains a body of two or three hundred in his pay. Besides his religious influence and authority, the Grand Lama is possessed of unlimited power throughout his very extensive dominions.

The religion of Schamanism is also very prevalent among the Tartars. The professors of this religion believe in one supreme God, the creator of all things. They believe that he loves his creation, and all his creatures; that he knows every thing, and is all powerful; but that he pays no attention to the particular actions of men, being too great for them to be able to offend

him, or to do any thing that can be meritorious in his sight. But they also maintain, that the Supreme Being has divided the government of the world, and the destiny of men, among a number of inferior divinities, under his command and control, but who nevertheless generally act according to their own fancies; and therefore it is incumbent on mankind to use all the means in their power for obtaining their favour. They likewise suppose, that, for the most part, these subordinate deities abominate and punish premeditated villany, fraud, and cruelty. They are all firmly persuaded of a future existence; but they have many superstitious notions and practices. Among all the Schamanes, women are considered as beings vastly inferior to men, and are thought to have been created only for their sensual pleasure, to people the world, and to superintend and manage household affairs: in consequence of these principles, it is no wonder they are treated with that contempt and severity they commonly meet with.

Among a nation of Tartars, the reader cannot expect to find a very satisfactory account on the article of learning; it is, however, very certain, that under Jenghis Khan and Tamerlane, and their early descendants, Astrachan and the neighbouring countries were the seats of learning and politeness, as well as empire and magnificence. Modern luxury, be it ever so splendid, falls short of that of those princes; and there are still extant some remains of their taste in architecture, but these are only to be found in desolate and almost inaccessible places. The cultivation of learning was the first care of the prince, and generally committed to the care of his own relations. They wrote in the Persian or Arabic tongues; and their histories carry with them the strongest marks of authenticity: many of these are still extant in manuscript.

Their curiosities are comprehended in the remains of the buildings left by the above-mentioned great conquerors, and their successors. Here are remains of ditches and ramparts, which heretofore either surrounded small towns, now quite demolished, or were designed for the defence of camps, forts, or castles, the vestiges of which are often to be discovered upon the spot, as well as other traces of buildings, &c. which strongly indicate their pristine importance. Many of them are in tolerable preservation, and make some figure even at present.

The Slabode, or Tartarian suburb of Kaimof, on the Oha, seems to have been the residence of some khan. In the midst of the ruins of that city is a round and elevated tower, called in their language Misiqui, a sort of temple, or building dedicated to devotion. Here are also the remains of the walls of a palace; and in one of the maselets, or burial-places, is a very considerable mausoleum; all which edifices are built of hewn stone and bricks. From an Arabic inscription we learn, that the khan of Schagali was buried there in the nine hundred and sixty-second year of the hegira, or the one thousand five hundred and twentieth of the christian era. Near Mount Caucasus are still very considerable

remains of Madfchar, a celebrated city of former times. Near Derbent are numerous tombs covered with cylindrical stones, exceeding the usual stature of men, with Arabic inscriptions.

In the environs of Astrachan, the ruins of ancient Astrachan are very visible, and the rubbish and ramparts of another respectable town still exist near Tzantzin, on the left shore of the Wolga. A little below the mouth of the Kama, which empties itself into the above-mentioned river, are many superb monuments of the ancient city Bulgaria, consisting of towers, mosques, houses, and sepulchres, all built of stone or brick. The oldest epitaohs have been there more than eleven centuries, and the most modern at least 400 years. Not far from hence, on the Tcheremscham, a little river that runs into the Wolga, are found ruins somewhat more injured by the depredations of time: they are those of Boulymer, an ancient and very considerable city of the Bulgarians. The small town of Bilyairk has been erected by the Tartars upon its ruins.

There is a monument, in the fortress of Kafan, of the ancient Tartarian kingdom of that name. Its lofty walls are so broad, that they serve at present for ramparts: the turrets of which, as well as the old palace of the khan, are built of hewn stone. In going up the river Kafanha, we meet with epitaphs, and the strong ramparts of the old Kafan. Near the Oufa are ceteries full of innumerable inscriptions, and several sepulchral vaults. The ramparts of Sibir, the ancient capital of Tartary, are still seen about Tobolsk upon the Irtych. The lofty walls of Tontoura appear yet in the Baraba, a little gulph in the river Om; and near the mouth of the Oural are the ditches of the city Saratchik. Not to mention a great number of other cities and ruins in Siberia; and especially all those that are to be met with in the desert of Kirgius, which abounds in the relics of opulent cities. Some gold and silver coins have likewise been found, with several manuscripts neatly written, which have been carried to Petersburg.

About eighty miles from Lassa is the lake Palte, or Janglo; of that extent, the natives say it requires eighteen days to walk round it. In the middle of it are islands, one of which is the seat of the Lamissa Turecpama, or the great regenerate, in whom the Tibetians think a divine spirit resides, as in the Great Lama. M. Voltaire, in his History of Peter the Great, informs us, that there were found in Kalmuc Tartary a subterraneous house of stone, some urns, lamps, and ear-rings, an equestrian statue, an oriental prince with a diadem on his head, two women seated on thrones, and a roll of manuscript, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be in the language of Thibet. Hair, fine wool, coarse cloths, rock salt, musk, and gold, are their staple commodities.

CHAP. VII.

DESCRIPTION OF VARIOUS ISLANDS
DISCOVERED BY THE RUSSIANS.

THOUGH the voyages of Columbus and Vasquez de Gama had discovered a new world in the west, and proved the cause of exploring many countries little known, but by hearsay, in the oriental quarter of the world; yet it was still supposed, by many who curiously contemplated the figure of the globe, that there were many islands in the eastern ocean; and much land to the southward yet remaining undiscovered; and some for a long time entertained the idea of a vast southern continent, or first division of the world, which they contended was necessary to keep up the due balance of the terraqueous globe.

While these things were yet in contemplation, the Russians discovered the northern Archipelago, a vast number of islands situate between the eastern coast of Kamtschatka and the western part of the continent of America; the first project for making which discoveries was actually conceived and set on foot by the Czar Peter the Great. The first group of these islands called Salignan, comprehends (partly under the name of Aleutian Isles) 1. Beerings-Island. 2. Copper-Island. 3. Orma. 4. Samyra. 5. Anakta. The second group, called Khao, contains eight islands. 1. Imnaak. 2. Kiska. 3. Ichetchia. 4. Ava. 5. Kavia. 6. Ichangulak. 7. Ulagama. 8. Amtchikidga. The third, under the general name of Negho, comprehends a number of islands, sixteen of which are thus denominated. 1. Amatinak. 2. Ulak. 3. Unalga. 4. Navoltscha. 5. Uliga. 6. Anagin. 7. Kagulak. 8. Illak. 9. Takavanga. 10. Kanaga; on both which are volcanos. 11. Leg. 12. Sketskuná. 13. Tugaloon. 14. Goreloi. 15. Ochtu. 16. Amla. The fourth group, which is called Kavalang, and by the Russians the Fox-Islands, contains: 1. Amuchta. 2. Tschigama. 3. Ichegula. 4. Uniftra. 5. Ulaga. 6. Tauagulana. 7. Kagamin. 8. Kigalga. 9. Skelmaga. 10. Umnaak. 11. Agun-Alashka. 12. Unimga. 13. Uligu. 14. Anturo-Leifume. 15. Semidit. 16. Senagak.

The natives of these islands (some of which are only occasionally inhabited) are, in general, strong and robust, but short in stature. They have little beards, lank black hair, and flat faces, with a fair complexion. The inhabitants of the Aleutian Isles generally live upon wild animals and roots which grow spontaneously, little troubling themselves to catch the fine fish which the rivers abound.

Copper-Island takes its name from the quantity of copper which the sea throws upon its coasts. The Fox-Islands receive their appellation from the number of black, grey, and red foxes which are found there.

The

The inhabitants are the most numerous and warlike of all these Tartars, they generally wear a cap, and a coat that reaches to the knee. Some of them adopt caps of a party-coloured bird-skin, on which they suffer part of the wings and tail to remain. They often ornament these on the fore part with a board set with the jaw-bones of sea-bears, and ornamented with beads. They generally eat their flesh and fish raw, and so they feed their children with it; but when they think proper to dress their food, they choose a hollow stone in which they put the viands, closing the interstices with clay or lime; then laying that horizontally on two other stones, kindle a fire beneath. What they intend for keeping, they do not salt, but dry it fresh in the open air.

They use bows and arrows, darts, and wooden targets in war. They live together either in families, or societies of several families united, which they call a race; and these are in a state of alliance, though without any settled form of government. Nor does it appear that they have either established laws or punishments, but property in each island is held in common among every society, and so enjoyed without disturbance. The consequence is a perfect equality, that child of the simplicity of nature, never to be expected in mighty states or in great republics, and so often considered as a mere Utopian scheme and idle dream by European politicians.

These people are described as possessing, with but little acuteness, a good portion of natural sense; in general, slow and phlegmatic, but capable of being roused by injuries to a most implacable fury, and susceptible of apprehensions of evil, which will often drive them to the commission of suicide, which they perpetrate with great apparent indifference. They seem much averse to the visits of their powerful neighbours the Russians.

As a race of Tartars, delicacy is not to be expected among these islanders; and they may well be concluded strangers to what is termed the refinement of manners. They seldom heat their dwellings, but when they are necessitated to warm themselves, they either fire train oil, and pour it into a hollow stone, or stand over a bundle of burning hay, and this they think sufficient. They endure the cold the more easily because they are inured to it from early youth: a mother will carry her infant when it cries to the sea-side, though in winter, and hold it in the water till it is quiet; by which means the child, as it grows up, can walk barefooted at all seasons, and never experiences any sensible inconvenience from the severity of the weather. Trees are not found on these islands, but drift wood is brought on shore in great quantities.

Being of an hospitable disposition, the natives of the northern Archipelago make frequent feasts, at the celebration of which they put on their most shewy caps, and advance in procession to meet their guests with drums beating, proceeded by singing and dancing women, especially if the people of one island are visited

by those of another; and these feasts form the principal part of their recreation.

Such are the manners of the inhabitants of a cluster of islands which were discovered at various times; and as we have already observed, on a plan conceived by Peter the First, that famous reformer and enlightener of his people. But great projects, do not always meet with immediate success.

It was in the year 1728 that Beerling and Tichrichoff, two Moscovite navigators, failed first on a voyage of discovery, which, however, produced nothing worthy of notice. A second expedition succeeded no better; and in a third voyage, in 1741, Beerling's ship was cast away, and he died on an island not far from Kamtschatka; and so little did the Russians possess of nautical knowledge, that notwithstanding all encouragements given by their government, and though these islands were in their own neighbourhood, no perfect idea of them was obtained till so late as the year 1750. The account which we have here given, is from the authority of Mr. Muller, who consulted many journals of voyages, by the direction of the present Empress of Russia, to which he added the substance of further information received from a native and chief of one of the islands, who was brought to Peterburgh in the year 1751.

CHAP. VIII.

KAMTSCHATKA.

Extent, Boundaries, Inhabitants, &c.

THIS is a great peninsula, extending from north to south about 7 deg. 30 min. It is divided into four districts, Bolcheresk, Tigilskai Krepost, Verchnei, or Upper Kamtschatkoi Ostrog, and Nishnei, or Lower Kamtschatkoi Ostrog. The eastern ocean separates it from America; on the west, it has Penshinska for its boundary, commencing near the southern point of the Cape of Kamtschatka, and extending northerly between Ochotkoy and the western coast of Kamtschatka. The southern part is in 51 deg. north lat. and 143 deg. long. east of London.

The inhabitants have no one fixed general name for this country, though the Russians call the whole of it Kamtschatka: it has the several names of Kurilski, Bolshcheretki, Awatcha Koreki, Ukoj, and Tegil, some from the names of the natives, and others from some particular or memorable circumstance. The three divided nations have different languages.

The Kamtschadales are short in stature, have dark hair, hollow eyes, sharp noses, and tawny complexions. Their dress consists of deer-skins, with the fur outwards; also of dog-skins, and those of other animals. They often wear two coats, the sleeves of the outer coat reaching down to the knees; they have a hood to it, which in bad weather serves to cover the head; and they

...ey ornament the back part with shreds of skins, and
...ometimes with silk of different colours.

The men wear a leather belt round them, and their
...egs are covered with different coloured skins; they
...wear seal-skin caps or hats, and sometimes a hat or cap
...of birch bark: some have caps of grass plaited.

The women wear the same sorts of garments as the
...men; though their coats, or rather waistcoats, fit closer
...to their bodies, and are decorated with slips of red, blue,
...and yellow cloth, and sometimes ribband, or woollen
...silk. They have fur caps, that are white within, and
...black without: they let their hair grow much longer
...than the men, plait it, and hang brass trinkets to it.

There are three volcanoes in Kamtschatka. The
...first is that of Awatcha, to the northward of the bay of
...that name. The second issues from some mountains
...situated between the river of Kamtschatka and that of
...Tabolski. The third volcano issues from the highest
...mountain in Kamtschatka on the banks of the river of
...that name.

The Kamtschadales live some of them in huts, others
...in the woods, and on the banks of rivers. The men,
...when not employed in hunting or fishing, weave nets,
...and construct sledges or boats: in the spring and summer
...winter they procure the necessaries of life, and lay up a
...store for the succeeding winter, which is not very in
...clement, though their spring and summer do not con
...tinue more than four months.

THE PROVINCE OF JAKUTSKOI.

IN this country, and in the northern parts of Si
...beria, the cold sometimes increases so considerably in a
...few hours as to strike men and cattle dead, who hap
...pen to be at too great a distance from any habitation to
...shelter themselves from it: but when some parts of the
...body are only frozen, they rub them with snow, by
...which the circulation is immediately restored. This
...severe weather is succeeded by so hot a summer, that
...the inhabitants are obliged to go partly naked.

In the northern parts, beyond the sixtieth degree of
...latitude, the earth produces neither corn nor fruit; they
...are, however, supplied with those necessaries from the
...southern parts; and they are in want of neither fish
...nor animal food; for they have a great diversity of the
...former, and a plenty of tame and wild animals; and as
...to fuel, they have also a sufficiency of that necessary
...article.

There is some corn in the country of the Jakutskoi,
...but they pay little regard to it, as their chief attention,
...like that of their neighbours, is employed in hunting
...animals.

The town of Jakutskoi, on the river Lena, is the
...capital of the province, and is about 400 miles from the
...Frozen-Ocean.

These people form one of the most considerable and
...numerous Pagan nations in this vast country: they are

divided into ten tribes, making in the whole not less
...than 30 or 40,000 persons, all under the dominion and
...taxation of Russia.

The Jakuti believe in a Supreme Being, and have
...attempted to give an image of him; the image, how
...ever, hath a very hideous aspect, with a big head, and
...large eyes of coral. They place it in a tree, and cover
...it with furs: once a year they assemble together, and
...sacrifice horses, &c. to this image, sticking up the horses
...heads all round the tree. Then sitting down in a cir
...cle, they drink of a liquor which they call cumose, and
...get intoxicated with it. They also throw some of the
...liquor into the air, and into a fire which they light on
...the occasion.

When Captain Cook first made the land of the
...Jakutskoi, in August 1778, it was supposed by some,
...on board the Resolution, to be a part of the Island of
...Alaschka, laid down in Mr. Stæhlin's map; but, from
...the appearance of the coast, and other circumstances,
...it was soon conjectured to be rather the country of the
...Jakutskoi, or the eastern extremity of Asia, explored
...by Beerling in 1728. In admitting this, however,
...without farther examination, we must have pronounced
...Mr. Stæhlin's map, and his account of the New
...Northern Archipelago, to be either remarkably erro
...neous, even in latitude, or else to be a mere fiction;
...a judgment which we would not presume to pass upon a
...publication to respectfully vouched, without producing
...the most decisive proofs.

This country, lying on the eastern coast of Asia, is
...bounded on the south by the river Anadir, and ex
...tends along the shore, to the north and north-east, to
...74 deg. of latitude.

Upon Captain Cook's landing, with a party of our
...people, at this place, thirty or forty men, each of
...whom was armed with a spontoon, a bow, and arrows,
...stood drawn up on an eminence near the houses. Three
...of them came down towards the shore, on the approach
...of our people, and were so polite as to pull off their
...caps, and make them low bows. Though this civility
...was returned, it did not inspire them with sufficient
...confidence to wait for their landing; for, the instant
...the boats put ashore, the natives retired. Captain Cook
...followed them alone, without any thing in his hand, and,
...by signs and gestures, prevailed on them to stop, and
...accept some trifling presents. In return for these, they
...gave him two fox-skins, and a couple of sea-horse teeth.
...The captain was of opinion, that they had brought these
...articles down with them, for the purpose of presenting
...them to him, and that they would have given them,
...even if they had expected no return.

They discovered manifest tokens of apprehension and
...fear, intimating their desire, by signs, that no more of
...our people should be suffered to come up. On the cap
...tain's laying his hand on the shoulder of one of them,
...he started back several paces. In proportion as he ad
...vanced, they retreated, always in the attitude of being
...ready to make use of their spears; while those on the

eminence were ready to support them with their arrows. Insensibly, however, the captain, and two or three of his companions, introduced themselves among them. The distribution of a few beads among some of them soon created a degree of confidence; so that they were not alarmed, when the party was joined by a few more; and, in a short time, a kind of traffic was entered into. In exchange for tobacco, knives, beads, and other articles, they gave a few arrows, and some of their clothing: but nothing that our people had to offer, could induce them to part with a spear or a bow. These they held in continual readiness, never quitting them, except at one time, when four or five persons laid theirs down, while they favoured our people with a song and a dance; and even then, they placed them in such a manner, that they could lay hold of them in a moment.

Their arrows were pointed either with stone or bone, but very few of them had barbs; and some of them had a round blunt point. What use these are applied to could not be determined, unless it be to kill small animals without damaging the skin.

Their spontoons, or spears, were of iron or steel, and of European or Asiatic workmanship; and considerable pains had been taken to embellish them with carving, and inlayings of brass, and of a white metal. Those who stood with bows and arrows in their hands, had the spear slung by a leathern strap over their right shoulder. A leathern quiver, slung over their left shoulder, served to contain arrows; and some of these quivers were exceedingly beautiful, being made of red leather, on which was very neat embroidery, and other ornaments. In this, and some instances of their clothing, they gave proofs of a degree of ingenuity, not to be expected among the inhabitants of so northern a region. The natives were robust and well proportioned. No women or children, of either sex, were observed, nor any aged persons, except one man, whose head was bald, and he was the only one who bore no arms: the others seemed to be select men, and rather under than above the middle age. The elderly man had a black mark across his face, which was not perceived in any others. All of them had their ears perforated, and some had glass beads hanging to them. These were the only fixed ornaments seen about them, for they wore none to their lips.

The drefs of these people consisted of a frock, a pair of breeches, a pair of boots, and a pair of gloves, all made of the skins of deer, dogs, seals, and other animals, extremely well dressed, some with the hair or fur on, and others without it. Their hair was apparently black; but their heads were either shaved, or their hair cut close off; and none of them wore beads.

They have their winter and summer habitations: the former are like a vault, the floor of which is sunk below the surface of the earth. One of them, examined by Captain Cook's people, was of an oval figure, about twenty feet in length, and twelve or more in height; the framing consisting of wood and the ribs of whales, judiciously disposed, and bound together with smaller

materials of the same kind. Over this framing, a covering of strong coarse grass was laid, and that again was covered with earth; so that on the outside the houses had the appearance of a little hillock, supported by a wall of stone, of the height of three or four feet, which was built round the two sides, and one end. At the other end of the habitation the earth was raised sloping, to walk up to the entrance, which was by a hole in the top of the roof, over that end. The floor was boarded, and under it was a sort of cellar, in which was seen nothing but water. At the end of each house was a vaulted room, which was supposed to be a store-room.

Their summer huts were of a tolerable size, and brought to a kind of point at the top. Slight poles and bones, covered with the skins of sea-animals, composed the framing. The inside of one being examined, there was a fire-place just within the door, where a few wooden vessels were deposited, all very dirty. Their bed-places were close to the side, and occupied about one half of the circuit: some degree of privacy seemed to be observed; for there were several partitions made with skins. The bed and bedding consisted of deer skins, and most of them were clean and dry.

When a visiter comes to see them, he is always presented with the master of the hut's wife or daughter, who hands to him a basin of her own urine, with which the visiter (if among their own people) walters his mouth; and this he is obliged to do, or he is not looked upon as a friend.

About the houses were erected several stages ten or twelve feet in height. They were composed entirely of bones, and were apparently intended for drying their fish and skins, which were thus placed out of the reach of their dogs, of which they had great numbers.

These dogs are of the fox kind, rather large, and of different colours, with long soft hair resembling wool. They are, in all probability, used for the purpose of drawing their sledges in winter; for it appears that they have sledges, as many of them were seen laid up in one of their winter huts. It is likewise not improbable that dogs constitute a part of their food, for several lay dead, which had been recently killed.

The canoes of these people resemble those of the northern parts, the form being simple, but calculated for every useful purpose.

From the large bones of fish, and other sea animals, it appeared, that the sea furnished them with the greater part of their subsistence. The country seemed exceedingly barren, as our people saw not a tree or shrub. At some distance towards the west they observed a ridge of mountains covered with snow, that had fallen not long before.

Such of these people as live to the northward of the Anadir not being under the dominion of the Russians, are inimical to those who are. The Russians, indeed, have made many strenuous but unsuccessful efforts to bring them under a general subjection.

ward, in order to make a nearer approach to the
merican coast; and arriving in their passage at the
titude of 70 deg. 6 min. north, saw an amazing num-
er of sea-horses on the ice, and as they were in want
of fresh provisions, the boats were dispatched from each
ship to procure some. Nine of these animals were
brought on board the Resolution, and which, till this
time, were supposed to have been sea cows; nor would the
difference have been known, had not two or three men
on board, who had been in Greenland, declared what
animals these were, and that no person ever eat of them.
Notwithstanding this, they served for provisions, and
there were few of our people who did not prefer them
to salt meat.

The fat of these animals, at first, is as sweet as
butter; but, in a few days, it becomes rancid, un-
less it is salted, in which state it will keep much longer.
The lean flesh is coarse and blackish, and has a strong
taste; but the heart is almost as well tasted as that of a
bullcock. The fat, when melted, affords a great quan-
tity of oil, which burns very well in lamps; and their
sides, which are of great thickness, were very useful
about the rigging. The teeth, or tusks, of most of
them were, at this time, of a very small size; even
some of the largest and oldest of these animals had them
not exceeding six inches in length. Hence it was con-
cluded that they had lately shed their old teeth.

They lie upon the ice in herds of many hundreds,
huddling, like swine, one over the other; and they roar
very loud; so that in the night, or when the weather
was very foggy, they gave our people notice of the
vicinity of the ice, before they could discern it. It was
never found that the whole herd were asleep at the same
time, some of them being constantly on the watch.
These, on the approach of the boat, would awake those
that were next to them; and the alarm being thus gra-
dually communicated, the whole herd would presently
be awake. However, they were seldom in a hurry to
get away, before they had been once fired at. Then
they would fall into the sea, one over the other in the
utmost confusion; and, if our people did not happen,
at the first discharge, to kill those they fired at, they
generally lost them, though mortally wounded.

They did not appear to be so dangerous as some au-
thors have represented them; even when they were
attacked. They are, indeed, more so in appearance,
than in reality. Vast multitudes of them would follow,
and come close up to the boats; but the flash of a
musket in the pan, or even the mere pointing one at
them, would send them down in a moment. The fe-
male, however, will defend her young ones to the very
last, and at the expence of her own life, whether upon
the ice or in the water.

There appeared some striking instances of parental
affection in these animals. All of them, on the ap-
proach of the boats towards the ice, took their young
ones under their fins, and attempted to escape with
them into the sea. Some, whose cubs were killed or

wounded, and left floating upon the surface of the wa-
ter, rose again, and carried them down, sometimes just
as the men were on the point of taking them into the
boat; and could be traced bearing them to a consider-
able distance through the water, which was stained with
their blood. They were afterwards observed bringing
them, at intervals, above the surface, as if for air, and
again plunging under it, with a horrid bellowing. The
female, in particular, whose young one had been killed,
and taken into the boat, became so furious, that she
even struck her two tusks through the bottom of the
cutter. Nor will the young one quit the dam though
she has been killed; so that if you destroy one, you are
sure of the other. The dam, when in the water, holds
her young one between her fore fins.

Why this animal should be called a sea-horse is dif-
ficult to determine, unless the word be a corruption of
the Russian name *Morse*; for they do not in the least
resemble a horse. It is, doubtless, the same animal that
is found in the Gulf of St. Lawrence, and there
called a sea-cow. It is certainly more like a cow than
a horse; but this resemblance consists in nothing but
the snout. In short, it is an animal not unlike a seal,
but incomparably larger. The length of one of them,
which was none of the largest, was nine feet four
inches from the snout to the tail; the circumference of
its body at the shoulder was seven feet ten inches; its
circumference near the hinder fins was five feet six
inches; and the weight of the carcase, without the
head, skin, or entrails, was eight hundred and
fifty-four pounds. The head weighed forty-one
pounds and an half, and the skin two hundred and
five pounds.

Captain Cook's people, in a short time, began to
relish these animals, so that the whole stock they had
procured was soon expended.

THE PROVINCE OF THIBET.

THIS division of Tartary is situated in an excellent
climate, between 30 and 40 deg. of north lat. but it
is surrounded with very extensive mountains, and is
bounded, on the East, by China; on the west, by
Indostan; on the north, by the country of the Mon-
gols; and on the south by Ava. The whole country
extends in length, from east to west, upwards of 1700
miles, and the broadest part of it, from north to south,
is about 1780. It is divided into three principal parts,
namely, Great Thibet, Little Thibet, and Lassa. This
last division, being the most rich, as well as the most
plentiful province, and the residence of the grand lama,
frequently givese name to the whole country.

In general, the climate of this country is very tem-
perate and healthful; but in the western parts it is cold,
especially on the tops of the mountains. The soil is
for the most part fertile, and produces great plenty of
rice and pulse. It is particularly famous for the produce
of

of rhubarb and mulk, the latter of which is esteemed the best of any to be met with in India.

There are many rivers in Thibet, some of which produce great quantities of gold, particularly the Kin-chayang, which enters the Chinese province of Yun-nan, whose name signifies the river with golden-sand: here is also the Nukyang, a very principal one; the Lantfan-kyang, which also enters Yun-nan, and flows into the kingdom of Tonquin; and the great river called Yotutian-pu, or Dian-pu.

The towns in this province are for the most part exceeding small, and very poorly inhabited; nor is even Lassa, the principal place in the country, in the least fortified. There is indeed but little occasion for fortifications here, the Tartars, in their wars, choosing rather to fight in the open fields, than to undertake sieges.

The natives of Thibet are in general a very robust and healthy people. They have an olive or tawney complexion, their noses are flat, and their faces very broad; but the women are much handsomer in their features than the men. They are naturally very indolent, and the common people in particular are exceeding filthy. The garments of both sexes are alike, consisting of a large piece of coarse cloth, fastened round the body with a girdle, and on their heads they wear a kind of bonnet, which is decorated with pieces of tortoise-shell, and other trifling baubles; but the better sort adorn them with coral, and beads of amber. Both sexes wear bracelets on their left arms, fastened with beads.

The poor people live principally on rice and pulse, though they have various kinds of flesh: they are in general very temperate in their diet; but, as they are extremely fond of spirituous liquors, will often drink to excess.

The houses of the better sort are tolerably handsome, and chiefly built of wood; but those of the common people are low, mean huts, made of stones rudely piled together.

The country of the Mogul Tartars, or Mongols, is bounded on the east by the territories of the Mantchews, the Kalkas on the west, China on the south, and by Eastern Tartary and the Kalka Tartars on the north.

Here the climate is exceedingly severe, and ice lies on the ground eight or nine months together. It is a country not very well known, except that part of it which the caravans pass in travelling from Muscovy to China.

The Bratski Tartars dwell near the Lake Baikal, many of whom are good mechanics, and others well skilled in husbandry. Some of these Bratski are people of considerable property: it is not uncommon for a man to be proprietor of five or six hundred horses, as well as of numbers of other cattle. The food of these people is venison and horse-flesh, the latter of which they prefer.

SAMOIEDA, OR, SAMOEDIA.

THIS country is situated north-west of Siberia: it is divided into Obdora on the west, and Mariano and Loppo east of the river Oby: the Riphæan mountains surrounding the river Potzor, are its western limits.

Their dwelling-places are caves, in which they live nine months in the year, and make subterraneous passages for the purpose of visiting each other. They burn lamps fed with a stinking fish-oil.

The Ostiocs live along the rivers Oby, Jenisay, &c. These people dry their fish in the summer, which serves them in the winter: they have no rice, but subsist on roots, fish, wild-fowl, &c. Their winter-huts are low in the ground, with a roof of bark or rushes; in summer, they build on the banks of the rivers, and employ themselves in fishing. Their sledges are drawn by dogs, four of which will draw a sledge with 300 pounds weight upon it, fifteen leagues in a day. What is remarkable, they have posts in this country for sledges, as regular as the posts of Europe, with relays of dogs for travellers to change on their journey at set distances: they increase the number of dogs, in proportion to the hurry a passenger is in. These people worship and offer sacrifices to small brazen idols, placed in groves, or on the tops of houses.

WESTERN TARTARY. CIRCASSIA AND ASTRACHAN.

CIRCASSIA is that country lying between the Caspian-Sea on the east; Asoph, and the Palus-Mæotis on the west; the high mountains of Caucasus on the south; and Astrachan on the north. The southern division is claimed by the Persians, the western is under the dominion of the Turks, and the eastern pays obedience to Russia.

Kizlaar is the capital of Circassia. This town being only in 44 deg. north lat. the air is consequently serene and wholesome. It was built by the Russians: the citadel is only formed of earth, but the garrison consists of about 500 regulars, and 3000 Cossacks; the latter of whom are permitted by the Russian government to erect habitations on the banks of the Terek, which flows from east to west, and affords a great variety of fish, as sturgeon, salmon, &c.

The Circassians are lovely in their features, majestic in their persons, and agreeable in their deportment. In their stature they are large, and the men make excellent soldiers.

The country abounds in wild swine, wolves, and foxes; produces vines, whose grapes are excellent, and here is a great variety of game.

Terki, the capital of Circassian Tartary, is seated in a spacious plain, on an island formed by the rivers Terki and Bustrow, and is garrisoned by 2000 regulars, and 1000 Cossacks.

swine, wolves, and dogs are excellent, and

Tartary, is seated in the valley by the rivers Terek, 2000 regulars, and 1000 Cossacks.

300 Cossacks. It is well fortified with ramparts and bastions in the modern style, well stored with cannon, and has always a considerable garrison in it, under the command of a governor. The Circassian prince, who resides here, is allowed 500 Russians for his guard, but one of his own subjects are permitted to dwell within the city, for the fortifications. Ever since the reduction of these parts to the obedience of Russia, they have put all places of strength, not only Russian garrisons and governors, but magistrates, and priests for the exercise of the Christian religion: yet the Circassian Tartars are governed by their own princes, lords, and judges; but these administer justice in the name of the emperor, and in matters of importance, not without the presence of the Russian governors, being all obliged to take the oath of allegiance to his imperial majesty.

This city has a great number of serpents about it, which make holes in the ground that are extremely dangerous. These serpents are about six or seven feet in length, and about the thickness of a man's arm. There are likewise mice as large as squirrels, which are called Jeruhah. Their ears are long, and their fore-feet shorter than those behind, which prevents their running swiftly; they, however, can leap to a considerable height or distance, by laying their tail over their backs.

The kingdom of ASTRACHAN lies between 44 deg. 30 min. and 52 deg. north latitude; the longitude east is 44 deg. 30 min. being bounded on the east by the country of the Cossacks; on the north, by the kingdom of Kazan, and part of Siberia; and towards the South, by Circassia. The eastern boundaries being deserts very little known and uninhabited, cannot be ascertained.

The habitations and manner of living of the Tartar citizens and villages of Astrachan, are perfectly similar with those of the Tartars of Kafon. In the city of Astrachan, they have a large magazine for goods, built of brick, and several shops upon arches. They carry on an important commerce with the Armenians, Persians, Indians, and Bukharians; and manufacture Morocco-leather, cottons, camblets, and silks.

The metropolis, called also Astrachan, is built upon an island in the Volga, known by the name of the Isle of Hares. It is in 46 deg. 13 min. north latitude, and 48 deg. east longitude. This city is commonly supposed to contain 100,000 inhabitants. It abounds in well-stocked magazines, and hath a citadel surrounded by a thick brick wall, of about thirty feet in height; though this citadel, which lies towards the west of the city, is regularly built, the bastions are strong, and the cannons numerous. Here is a palace for the governor, and another for the archbishop. In the court of chancery, all civil and military affairs are heard and adjusted, and the records are kept. The citadel hath three gates, one opens to the city, another to the Volga, and the third to the Tartar suburbs. It contains likewise a guard-house, a metropolitan-church, and a monastery.

This city is surrounded by a wall, between which and the houses is a large intermediate space, upon which none are permitted to build. It consists principally of three long streets from east to west, which are intersected by many others, and is upon the whole about a mile in length. The houses are built of timber, the suburbs are extensive, and more populous than the city. There are four churches and a monastery belonging to those of the Greek persuasion. The reformers have a church built of wood; the Roman Catholics have a monastery, and the Armenians a church of stone. Without the suburbs, are a naval and military-hospital, and a large monastery.

No Tartar is permitted to stay all night in the city. Armenian and Russian merchants inhabit the eastern suburbs, and the Indians are permitted to live in guarded Caravan-seras.

Astrachan is garrisoned by five regiments of infantry, and one of dragoons; many field-regiments and Cossacks, exclusive of the Tartar militia, winter here, besides the garrison itself.

The use of the regulars is to march against the wild Tartars whenever they attempt to make any incursions into this kingdom, and the irregulars are employed to scour the deserts, in order to trace out the lurking-places of the banditti.

The commerce of Astrachan consists chiefly in silks, brocades, velvets, satins, drugs, copper, cotton, Persian fruits, wines, sweetmeats, &c. which they import; and in return, export meal, fish, salt, woollen, &c. All naval and military stores are prohibited from being exported to Persia.

The Russians, who compose a principal part of the inhabitants, are in the chief offices of state. The Georgians, who profess the Greek religion, are fond of serving in the army; and the Armenians, who, in person, disposition, and features, very much resemble the Jews, have no other object but scraping money together by means of traffic. As for the Persian and Tartar inhabitants, they are too fond of indolence and roving to think of any thing else, unless compelled to it by absolute necessity. Their huts, which are about twelve feet in diameter, are formed of canes or bulrushes, at the top of which a hole is made to let out the smoke: their fuel is turf, or cow-dung.

The soil is light and sandy, but so much impregnated with salt, as greatly adds to its sterility. The earth produces no grain, unless it has been overflowed during the winter season. Its natural productions are reeds, liquorice, kal, guristar-aculeata, the herb astrachania-nitratia, &c. The inhabitants likewise raise melons and pumpions, which they eat with bread. The wine made of their grapes is too sharp, which proceeds from the salt of the earth, though their grapes are fine, and delicious to the taste. The mulberries are unwholesome, but the garden vegetables tolerably good.

C H A P. IX.

SIBERIA, INCLUDING KALMUCK AND
USBECK-TARTARY.

SIBERIA extends from 50 to 68 deg. north lat. and is bounded on the west by Russia, from which it is separated by the mountains of Werkhotauria, which extend from Mount Caucasus, and divide Asia from Europe quite to the Frozen-Ocean, which bounds it on the north; on the east it is bounded by the Japanese-Ocean; and part of Tartary; and on the south, by the same. It is upwards of 3000 miles in length, from east to west, and about 760 in breadth. The southern is the only part fit for human beings to live in: here the climate is mild, and the soil appears as if it would be fertile, if cultivated. The northern part exhibits nothing but impenetrable woods, snow-topt mountains, fens, lakes, marshes, &c. and is withal so much exposed to the bleak winds, that it is quite barren and desolate. To these dreary regions, the czars of Muscovy banish their courtiers and other great persons who incur their displeasure.

The climate of Siberia is cold, but the air pure and wholesome; and Mr. Tooke observes, that its inhabitants, in all probability, would live to an extreme old age, if they were not so much addicted to an immoderate use of intoxicating liquors.

Siberia contains mines of gold, silver, copper, iron, jasper, lapis-lazuli, and loadstones. Naturalists have long disputed, whether a substance found there, resembling elephants-teeth, are really such, or whether they are a marine production: when polished with art and skill, their appearance is certainly whimsical and curious.

A great variety of animals range the forests of Siberia, some of which are not to be found in other countries. These supply the inhabitants with food and clothes, and at the same time furnish them with commodities for an advantageous trade. This territory may also be considered as the native country of black foxes, sables, and ermines, the skins of which are superior to those of any other part of the world. Horses and cattle are in great plenty, and may be had cheap.

Tobolski, the capital, is situated in 58 deg. north lat. and 67 deg. east long. from London, and contains about 15,000 inhabitants, almost all Russians, or naturalized. The city is divided into two parts; the larger being situated on the banks of the river Irtyz, and the other upon a hill. This part is fortified, both east and north, by a rampart, ballions, and a ditch six feet broad, bordered with palisadoes.

This city has a governor, whose prerogative reaches almost all over Siberia: here too is a court of equity, composed of fifteen counsellors, who conduct both civil and military affairs. In the lower town are seven churches, and a convent built of stone; and there are

three different communications from the upper to the lower town. It has a garrison, consisting of two regiments of infantry. A considerable traffic was once carried on between this place and the Chinese, by means of caravans; but the reciprocal knavery of the Chinese and Russian merchants reduced it in a short time to a very languishing state.

The KALMUCKS are the inhabitants of a prodigious desert, which lies between the rivers Don and Volga. These people are continually roving about; in the winter, they usually reside on the borders of Circassia; they proceed northerly in the spring, and return back again at the latter end of autumn. They never cultivate any land, their only riches being their flocks and cattle, on whose account they principally roam about in search of fresh pasture. Their temporary habitations are huts, covered with reeds, rushes, or felt.

These people are divided into different hordes, each of which hath its chief, but all are subject to one foreign, called khan, who has an agent or envoy at Atrachan.

USBECK-TARTARY is situated between the Great Mogul's dominions, which bound it on the south, and the Caspian-Sea, which, with Persia, are the western confines. It has the country of the Kalmucks on the north, and Thibet towards the east.

The country of Usbeck-Tartary was once the seat of a more powerful empire than that of Rome or Greece. It was not only the native country, but the favourite residence of Zingis or Jenghis Khan, and Tamerlane, who enriched it with the spoils of India and the eastern world.

The Usbecks are generally esteemed the most civilized of all the Mahometan Tartars; not but they can pillage and rob their neighbours as well as any other Tartarian tribe. They nearly resemble the Persians in their dress, their boots, which are uncommonly large, excepted: the chiefs wear a plume of feathers on their turban, and as well as their khan, pride themselves much on being the descendants of the renowned Tamerlane.

Their common food is pilau, or boiled rice, but their greatest delicacy is horse-flesh. They drink a kind of arrack, or fermented liquor, made of mare's-milk: Their language is a mixture of the Turkish, Persian, and Mongol; but they are well acquainted with the Persian language in its purity.

The capital of this country is called Bukharia, and lies in 39 deg. 15 min. north latitude, at the distance of thirteen miles from the once famous city of Samarcand. It is surrounded by a mud wall; the houses are built of wood, but the mosque and caravanferas are of brick. It is tolerably populous, but not equal to what it was formerly. The khan is permitted to seize upon the property of whom he pleases, which damps the spirit of cultivation, and greatly injures commerce.

Lassa is a small city, but the houses, which are of stone, are spacious and lofty.

The city of Derbent, situated on the Caspian shore, is called the frontier of Persia. It is said to have been the first built by Alexander the Great, and that he here received the visit from the Amazonian queen Thalestris. It is now enclosed with a strong broad wall, built with large square stones, hard as marble, from the quarries in Caucasus.

Tarku is the capital of Dagestan, and contains three thousand horses, two stories high, platformed at top for walking. The Tartars of this province are numerous and Mahometans, governed by a shekhal, whose office is elective.

With respect to commerce and manufactures, we must confess that this head makes but an inconsiderable figure in the description of Tartary, their chief traffic consisting in cattle, skins, beavers, rhubarb, mink, and fish. The Atrachais, notwithstanding their interruptions by the wild Tartars, carry on a considerable traffic into Persia, to which they export red leather, woollen, and linen cloth, and some of the manufactures of Europe.

We shall conclude our account of this country with some few particulars concerning its inhabitants, who are generally allowed to be the descendants of Japhet.

Though it is certain that Tartary, formerly known by the name of Scythia, peopled the northern parts of Europe, and furnished those amazing numbers who, under various names, destroyed the Roman empire, yet it is now but very thinly inhabited; and those fine provinces, where learning and the arts once resided, are now scenes of horror and barbarity. This must have been owing to the dreadful massacres made among the nations by the victorious Jenghis Khan, and Tamerlane, and their descendants; for nothing is more common in their histories, than their putting to the sword three or four hundred thousand people in a few days. Some authors indeed have absurdly questioned the veracity of the historians of these great conquerors, though it be better established than that of the Greek and Roman writers. The former, about the year 1200, made himself master of those regions which form at this day the Asiatic part of the Russian empire; and his son, Batou Sagin, made himself master of the southern Russia, and peopled it with Tartar colonies, which are now confounded or blended with the Russians. Long and heavily did the Tartar yoke gall the neck of Russia, till alleviated by the divisions amongst themselves: but they were not delivered from these warlike invaders till the time of Ivan III. who ascended the Russian throne in 1462. He repeatedly defeated them, subdued the kingdom of Kasan and other provinces, and made his name respected in all that quarter. Tamerlane's memory hath been more permanent than that of Zingis Khan: his defeat of the Turkish emperor, Bajazet, hath been before noticed in the history of that nation, and great were his conquests, and his name far beyond the limits of his proper dominions. His de-

scendant is claimed not only by all the khans and petty princes of Tartary, but by the Emperor of Indostan himself.

It may not be amiss to mention, that, among the Tartars, the standard or colours of the respective tribes form a distinct mark, whereby each Tartar knows the tribe to which he belongs. These marks of distinction consist of a piece of Chinese linen, or other coloured stuff, suspended on a lance twelve feet in length, among the Pagan Tartars. The Mahometan Tartars write upon their standards the name of God, in the Arabic language. The Kalmucks and the Mogul Tartars, distinguish theirs by the name of some animal; and as the branches or divisions of a tribe preserve always the figure drawn upon the standard of that tribe, adding only the particular denomination of each branch, those standards answer the purpose of a genealogical table or tree, by which the origin and descent of each individual may be ascertained.

The khans pay a tribute, or acknowledgment of their dependence upon one or other of their powerful neighbours, who treat them with caution and lenity; as the friendship of these barbarians is of the utmost consequence to the powers with whom they are allied. Some tribes, however, affect independence; and, when united, they form a powerful body, and of late have been very formidable to their neighbours, particularly to the Chinese, of which we shall give some account in the description of that empire.

The method of carrying on war, by wasting the country, is very ancient among the Tartars, and practised by all of them, from the Danube eastward. This circumstance renders them a dreadful enemy to regular troops, who must thereby be deprived of all subsistence, while the Tartars are at no loss for provisions, having always many spare horses to kill and eat.

CHAP. X.

C H I N A.

Extent, Boundaries, Divisions, Climate, Soil, Produce, Rivers, Inhabitants, &c.

THIS vast and opulent empire, is 1450 miles in length, and 1260 in breadth, and is situated between 20 and 42 deg. north lat. and between 98 and 123 east long: it contains 1,110,000 square miles, to which if we add Chinese Tartary, containing 644,000, the whole will amount to 1,754,000.

China is bounded by the Chinese Tartary, and an amazing stone wall, on the north; by the Pacific-Ocean, which divides it from North-America, on the east; by Tonquin, and the Tartarian countries and mountains of Thibet and Russia, on the west; and by the Chinesian Sea, on the south.

According to the authors of the Universal History,

the great division of this empire is into fifteen provinces, exclusive of that of Lyau-tong, which is situated without the great wall, though under the same dominion; each of which might, for their largeness, fertility, populousness, and opulence, pass for so many distinct kingdoms. But it is necessary to acquaint the reader, that the informations contained in Du Halde's voluminous account of China, are drawn from the papers of jesuits, and other religious sent thither by the pope, but whose missions have been at an end for above half a century. Some of those fathers were men of penetration and judgment, and had great opportunities of procuring information about a century ago; but even their accounts of this empire are justly to be suspected. They had powerful enemies at the court of Rome, where they maintained their footing only by magnifying their own labours and successes, as well as the importance of the Chinese empire, so that their exaggerated accounts ought to be read with great caution.

The name of this empire is probably derived from a Chinese word, signifying central or middle; for the natives, till they were convinced to the contrary by the European mathematicians, fancied that the world was flat; and that their country not only occupied the best part, but lay exactly in the middle.

China is a plain country, and contains no remarkable mountains except to the north, where those which separate it from Tartary are craggy, steep, and almost inaccessible; but many hills are scattered throughout the whole empire, which in general are cultivated by the admirable contrivances and indefatigable industry of the natives. Numbers of these are, with infinite labour, cut into the most whimsical figures, so as to resemble, at a distance, elephants, camels, leopards, bears, tigers, &c.

The principal rivers are, 1. the Hoambo, or Yellow-River, so called from being tinged with a yellow colour, owing to the peculiar quality of the soil through which it flows. It rises towards the frontiers of Indostan, in the intermediate mountains between Tartary and the province of Szechan, and after pursuing a winding-course of near 1900 miles, it falls into the eastern ocean: this river is exceedingly rapid. 2. The Ky-am, or Blue-River, rises in Thibet, flows from east to west, and disembogues itself into the Eastern Ocean: it is remarkably broad and deep. 3. The Bloody-River, so called from the redness of its sand. 4. The Pearl-River, so denominated, on account of the number of precious stones found among its gravel. 5. A river near Somin, which in harvest-time turns blue, when its waters give an admirable tinge of that colour. 6. A river near Pengau, whose waters are so thin, that even timber will sink in them. 7. A seventh, in the neighbourhood of Ching-tien, the waters of which are odoriferous. 8. The Kin-xa, which contains gold-sand. 9. The Xo, of a medicinal quality, on which account many flock to its banks for the cure of

various disorders. 10. The river, near the city Hang-chen, which annually, on a certain day, rises to an astonishing height; a phenomenon not yet accounted for either by Asiatic or European philosophers. By these rivers, and the canals, the people are plentifully supplied with excellent fish in the greatest variety.

The chief bays of this country, are those of Nankin and Canton.

The canals of this mighty empire are perhaps the most useful and stupendous works that ever the imagination of man conceived, or the exertion of human industry executed, and are sufficient to entitle the ancient Chinese to the character of being the wisest and most industrious people in the world. The commodiousness and length of them is incredible. The chief of them are lined with hewn-stone on the sides; and they are so deep, that they carry large vessels, and sometimes extend above 1000 miles in length. Those vessels are fitted up for all the conveniences of life; and it has been thought by some, that in China the water contains as many inhabitants as the land. They are furnished with stone quays, and sometimes with bridges of an amazing construction. The navigation is slow, and the vessels sometimes drawn by men. No precautions are wanting, that could be obtained by art or perseverance, for the safety of the passengers, in case a canal is crossed by a rapid river, or exposed to torrents from the mountains. These canals, and the variety that is seen upon their borders, render China the most delightful to the eye of any country in the world, as well as fertile, in places that are not so by nature. Innumerable bridges pass over these canals, the centre arches of which are sufficiently high to admit of a vessel passing without lowering the mast.

Though no country is better fitted than China for producing timber of all kinds, yet such is the industry of the inhabitants, that they are not incumbered with forests or woods. They suffer no timber to grow, but for ornament and use, or on the side of mountains, from whence the trees, when cut down, can be conveyed by water to any place.

The air of China differs according to the situation of the places. Towards the north, it is sharp; in the middle, mild; and in the south, hot. The soil is, either by nature or art, fruitful in every thing that can administer either to the necessities, conveniences, or luxuries of life. The culture of the cotton and the rice fields, from which the bulk of the inhabitants are clothed and fed, is ingenious almost beyond description. The rare trees and aromatic productions, either ornamental or medicinal, that abound in other parts of the world, are to be found in China, and some are peculiar to itself.

Gardening is placed in China at the head of the sciences: the profession is honourable; the professors men of the greatest abilities; and a kind of degree is taken, ere they can be admitted to practise this most ancient and most useful art. But, for all their skill,

they are unacquainted with the art of meliorating the soil, which accretions of sand, gravel, and leas of principal trees are a kind of date-fruit that resembles the pea of Europe yields excellent is, half cypress berries of which overcomes those which is of two chiu; the former is so much admired latter bears a nut which furnishes a varnish size-tree, yields admirable use in much admired by of all their carpenter's ponds in their gleaning of any, peculiar respect tree has red leaves, contrast, and green the kernels; which candles are made and the light rarely periodically covered its branches thin yew-trees yield fruit and the produce sweetmeat.

They are unacquainted with the nature of grafting trees, or of meliorating the earth where they are planted; on which account the fruit in general is of an inferior flavour, and less delicious than the European fruit. The principal trees are orange, lemon, and citron; the li-tchi, a kind of date-tree; the pea-tree, which produces a fruit that resembles, and is as delicate to the taste, as the pea of Europe; the meal-tree, the pulp of which yields excellent flour; the hermaphrodite-tree, which is half cypress and half juniper; the pepper-tree, the berries of which are so strong, that the smell frequently overcomes those that pluck them; the varnish-tree, which is of two species, viz. the tsi-chu, and the tong-chu; the former produces that admirable varnish, which is so much admired in most parts of the universe; the latter bears a nut, from which an oil is extracted, that furnishes a varnish of an inferior kind: the kou-chu, or size-tree, yields a matter resembling milk, which is of admirable use in gilding: the weeping willow-tree is much admired by the Chinese, who plant it on the sides of all their canals and rivers, and near most of the ponds in their gardens. They deem its shade the most pleasing of any, and their pastoral poets mention it with peculiar respect in all their compositions. The tallow-tree has red leaves and white fruit, which form a lively contrast, and greatly please the eye of the beholder: of the kernels, which have all the properties of tallow, candles are made; the flame is yellow, the smell strong, and the light rather dim. The white wax-tree is periodically covered with swarms of insects, who leave on its branches thin threads of wax. The mango and long-yea-trees yield fine fruits, that serve as delicate pickles, and the produce of the tse-tse-tree is an admirable sweetmeat.

The polomic-tree, which is not peculiar to China alone, bears the largest fruit in the world, the kernel of which is delicious when roasted, and makes an admired dish when dressed in cocoa-nut milk; but the most singular particular of this tree is, that the fruit grows from the trunk of the tree, and not from the branches, which, indeed, would not be able to sustain it.

The wood of the iron-tree is so hard, that whatever is made of it is exceedingly durable; of this, anchors are formed, and the Chinese affirm, that they are more lasting than those that are made of the metal from which the tree receives its name.

The tset-ham is admired for the beauty of its wood, which is of an admirable red, beautifully variegated with fine veins, which produce such an effect, that it seems to the eye to be elegantly painted.

The bamboo, or cane-tree, is pretty high and thick, the bud has an excellent flavour, and the pith is fine eating; it grows in marshy grounds, is used in buildings, and the tubes are often converted into water-pipes; baskets are fabricated of its splinters, and when it grows old and rotten, the Chinese reduce it to a paste, of which paper is made. Here is likewise a reed, of which not only baskets and mats are made, but ropes, pack-

thread, &c. The nan-mu-tree, however, furnishes the principal wood for the purposes of building; nevertheless, they have oak, pine, sanders-wood, ebony, camphire, &c.

But one of the most remarkable and profitable productions of this country, is the tea-tree; and this being almost as generally used at present in many parts of Europe as in China, we shall be the more particular in our description of it. All the various kinds of tea are produced by the same sort of shrub, only the leaves are gathered at different periods; indeed the soil where the tea-tree grows, makes some little difference in the flavour of the leaves: its taste is bitter, and its qualities astringent; the little oil it contains is resinous, and its salt fixed; it purifies, dilutes, invigorates the brain and stomach, promotes digestion, perspiration, &c. The Chinese use it in fevers, cholics, and other acute disorders, chronic diseases, scorbutic habits, &c. Its virtues are not local, though they are perhaps more efficacious in China than other places.

The general division of teas is into two sorts, viz. green and bohea; but these are again distinguished by other appellations, according to the time of gathering, province where produced, or method of curing: as congo, fouchong, singlo, bloom, imperial, hyson, &c. &c. the singlo is deemed the most delicate, and the bohea the most wholesome: the bohea is gathered in March, the imperial in April, the singlo in May, and the green in June. After the leaves are first plucked, persons are employed to infuse them for a certain time in water, by which the resinous particles are dissipated, and they are rendered palatable; for without such a preparatory prelude, they would be so exceedingly bitter, that scarce any quantity of sugar would prove sufficient to correct the taste, or render them agreeable to the palate; after infusion, the bohea, which is made of the leaves when in maturity, is dried by the fire, or in the sun; but the green, after being exposed for a short space to the rays of the sun, and assiduously turned and stirred about the whole time, is strewn upon sheets of copper (which are gently warmed by embers beneath them) and rolled up and down by proper persons, whose hands are defended by thick leather gloves from the effluvia, which would, without such precaution, prove of the most pernicious consequence.

The tea receives the principal part of its green tincture, and fine flavour, from the baleful vapours that exhale from the heated copper; yet these very circumstances, that should render it obnoxious, are its principal recommendations, not only with the Europeans, but the Asiatics; who are so infatuated, as to please the eye and gratify the palate at the expence of their constitutions; and to prefer the unwholesome green to the more salubrious bohea. Green is considerably dearer than bohea, on account of the greater trouble in preparing it, which is already mentioned, and because when the young leaves are plucked, the tree receives so much injury, that it is allowed two

or three years to regain its strength and vigour, during which time, the leaves that accidentally fall, are gathered up and converted into bohea. Mr. Bell, however, the latest traveller who hath given us any authentic account of China, affirms, that the bohea, in curing, is mixed with another herb; this is probably only an adulteration, of which the Chinese, who are exceedingly avaricious, and practised in every artifice to defraud, may be justly suspected.

Dr. Quincy calls tea the most salubrious of all vegetables that were ever introduced into food or medicine; and Dr. Cheyne recommends green-tea as a fine diluter; while Dr. James, on the contrary, says, "Whatever virtues are ascribed to tea, or however useful it may be in China, it is very certain that either the tea, or the water, or both, are extremely prejudicial, as an habitual drink in England;" but, with submission to these great physicians, we rather think they have carried their respective opinions too much into extremes. Tea hath, doubtless, many of the virtues which the Chinese ascribe to it, without being an universal medicine, as Doctor Quincy would have us believe; it may likewise have its bad qualities, without being so exceedingly pernicious as Doctor James would persuade us. Besides, if we consider the probable adulterations of the Chinese merchants, and our own domestic dealers, with the virtues it may lose in the voyage, and by the length of time it lays by previous to consumption, it is natural to conclude, that the latter gentleman drew his inferences, not from the effects of the genuine, but of a spurious and adulterated kind of tea.

The Chinese drink their tea without sugar, though the latter, as well as the former, is a produce of their country, and exceedingly cheap. The very best green tea is sold at Peking at the rate of two shillings English per pound; and it is observable, that the tea-tree degenerates when transplanted, even in countries under the same parallel of latitude. The Dutch dry and prepare sage as tea is in China; of which the Chinese are so fond, that they give four pounds of the latter for one of the former.

The culture of this plant seems to be very simple; and it is certain that some kinds are of a much higher and more delicious flavour than others. It is thought that the finest, which is the flower of the tea, is imported over-land to Russia; but we know of little difference in their effects on the human body.

The Portuguese, it is supposed, had the use of tea long before the English; but it was introduced among the latter before the restoration, as mention of it is made in the first act of parliament, that settled the exercise on the king for life in 1660. Catharine of Lisbon, wife to Charles II. rendered the use of it common at court.

The ginseng (a native of Chinese Tartary) so famous among the Chinese as the universal remedy, and monopolized even by their emperors, is now found to be but a common root, and is plentiful in British Ame-

rica. When brought to Europe, it is little distinguished for its healing qualities; and this instance alone ought to teach us with what caution the former accounts of China, penned by the jesuits, are to be read. It grows in moist grounds, is many years maturing, has small leaves, pointing upwards, a bluish flower, and, when dried, is of a greyish cast. Several other vegetables of a medicinal nature are also found in China, particularly rhubarb, ton-ling, or China-root; the tihohang, a restorative; the fant-li, a purifier; and tobacco.

Naturalists affirm, that China produces all metals and minerals that are known in the world. They procure gold, which is the natural produce of the country, by gathering the larger particles which are washed down the rivers, catching the smaller by means of sieves, or searching for what accidentally sticks in the banks. They have also gold mines; but as one of the fundamental maxims of the Chinese government, is, that of not introducing a superabundance of gold and silver, for fear of hurting industry, these are therefore but slightly worked, and the currency of that metal is supplied by the grains the people pick up in the sands of rivers and mountains. The silver specie is furnished from the mines of Honan. The mountains are stored with iron, copper, quicksilver, lead, white copper, or tutanage, which the natives call pe-tong, loadstones, pit-coal, salts of various kinds, and quarries of stone, particularly marble, many veins of which are finely variegated with landscapes; and some of the other stones, when burnt, produce a metal of which they make excellent swords, and other weapons.

The meadows and pastures are fat and rich, and feed prodigious quantities of cattle.

No country is better furnished with horses, the breed of which, though small, hath been greatly improved by the introduction of the Tartarian, Arabian, and Persian.

Here are likewise great numbers of oxen, buffaloes, swine, game, &c. Their tygers are exceedingly fierce and dangerous, for they search for their prey in droves, and when pressed by hunger, will enter villages, and attack the inhabitants with great fury.

The bears in China naturally walk upon their hind-legs, have faces resembling those of monkeys, long beards, and great sagacity: they are taught a variety of tricks, and are rendered very entertaining by the address of their tutors. The Chinese camel is about the bigness of a middle-sized horse, of a dun or ash colour; it is well made, and has two bunches upon its back. Here are no lions, and but few elephants, but many rhinoceroses and wild boars: stags also, and hares are in great plenty. The dwarf stag is a great curiosity, being in form exactly like a stag, and in size no bigger than a dog: this is accounted a domestic animal, as few persons of any consideration are without them in their houses or gardens. The musk-cat is likewise found here, from a bag under the navel of which is taken that noble perfume called musk, which

wild mules can never be so far broken as to become
serviceable; they are therefore only caught to be killed,
as their flesh is a delicacy.

With respect to the population of China, some ac-
counts inform us, that there are in this vast empire
fifty-eight millions of inhabitants; and all between
twenty and sixty years of age pay an annual tax; but in
a work published at Berlin in 1786, by Professor Herr-
mann, the population of China (including Chinese
Tartary) is settled at 104,096,254 souls, allowing 946
inhabitants to every square mile. Of this amazing
number, one-fourth part, he says, contributes to the
public taxes; and the army is computed at one-seven-
tieth. Notwithstanding the industry of the people,
their amazing increase frequently occasions a scarcity
of provisions. As next to being barren, they count it
the greatest scandal to bring females into the world;
therefore if a woman of a poor family happens to have
three or four girls successively, it not unfrequently hap-
pens that she will expose them on the high roads, or
cast them into a river, which they are allowed to do;
but then they fasten a gourd to the child, that it may
float on the water; and there are often compassionate
people of fortune, who are moved by the cries of the
children, to save them from death.

The Chinese, in their persons, are middle-sized,
their faces broad, their eyes black and small, their
noses rather short. The Chinese have particular ideas
of beauty: they pluck up the hairs of the lower part
of their faces by the roots with tweezers, leaving a few
straggling ones by way of beard. Their Tartar princes
compel them to cut off the hair of their heads, and,
like Mahometans, to wear only a lock on the crown.
Their complexion towards the north, is fair; towards
the south, swarthy; and the fatter a man is, they think
him the handsomer. Men of quality and learning,
who are not much exposed to the sun, are delicately
complexioned; and they who are bred to letters, let
the nails of their fingers grow to an enormous
length, to shew that they are not employed in manual
labour.

As to the Chinese women, they have little eyes,
plump rosy lips, black hair, regular features, and a
delicate though florid complexion. The smallness of
their feet is reckoned a principal part of their beauty,
and so swathing is omitted, from their earliest age, to
give them that unnatural accomplishment; so that
when they grow up, they may be said to totter rather
than to walk. This absurd custom is said by some to
have been invented by the ancient Chinese to palliate
their jealousy, by restraining women from visiting, and
rambling abroad too much.

It would give little information, and less amusement
to the reader, were we to enter into all the ridiculous
formalities of the Chinese, especially of their men of
quality, when paying or receiving visits; and this very
probably would come too late, as the manners of the

Chinese, since they fell under the power of the Tar-
tars, are greatly altered, and daily vary. It is suffi-
cient to observe, that the legislators of China, looking
upon submission and subordination as the corner-stones
of all society, devised those outward marks of respect,
ridiculous as they appear to us, as the test of duty and
respect from inferiors to superiors; and their capital
maxim was, that the man who was deficient in civility,
was void of good sense.

From the general mode of behaviour, and the com-
pliments used by the Chinese on every occasion, they
seem to be a polite and affable people: but view them;
independent of the ceremonials prescribed by law, and
they will appear to be the most dishonest, low, thieving
set in the world, employing their natural quickness
only to improve the arts of cheating the European na-
tions they deal with, especially the English: but it has
been remarked, that none but a Chinese can over-reach
a Chinese. They are fond of law-disputes beyond any
people in the world. Their hypocrisy is without
bounds; and the men of property among them prac-
tise the most avowed bribery, and the lowest meannesses,
to obtain preferment. It should however be remem-
bered, that some of the late accounts of China have
been drawn up by those who were little acquainted
with any part of that empire, but the sea-port towns,
in which they probably met with many knavish and
designing people. Some of the jesuit missionaries seem
to have too much extolled the Chinese, who are, on
the other hand, too much degraded by later writers.
Upon the whole, it seems not just to attempt to char-
acterise a great nation by a few unfavourable in-
stances, though well attested; and we appear not to be
sufficiently acquainted with the interior parts of China,
to form an accurate judgment of the manners and char-
acters of the inhabitants.

The dress of the Chinese varies according to the de-
grees among them. The men wear caps on their
heads, of the fashion of a bell; those of quality are
ornamented with jewels: the rest of their dress is easy
and loose, consisting of a vest and sash, a coat or gown
thrown over them, silk boots, quilted with cotton, and
a pair of drawers. The ladies towards the south wear
nothing on their head; sometimes their hair is drawn
up in a net, and sometimes it is dishevelled: their dress
differs but little from that of the men, only their gown
or upper garment has very large open sleeves. The
dress, both of men and women, varies, however, ac-
cording to the temperature of the climate. On paying
a visit, they envelope themselves entirely with a blue
silk loose habit, which they cover with a black or pur-
ple cloak, that reaches to the mid-leg, they usually
wear a scymetar by their side, and carry a fan in their
hand, but never forget the silk buskins which cover
their pink stockings. Elderly women generally dress
in black or purple, but the youthful in whatever col-
ours they please, except yellow, which none but the
royal family are permitted to wear.

Marriages in China are concluded on by the parents, and that is generally when the parties are perfect children, who never see each other till the day of their nuptials; and though in other countries it is the custom for women to bring portions to their husbands, here husbands pay a sum of money to the parents of the bride, which is generally laid out in clothes, &c. for her: then follow certain ceremonies, the chief of which consist in the relations on both sides sending to demand the name of the intended bridegroom and bride, and in making them presents. The relations of the bride, who fix the day of the nuptials, frequently consult the calendar for a fortunate day; mean-while the man sends his intended bride some jewels, pendants, and the like; at least this is the custom among the rich. When the nuptials are ratified, the bride goes among the ladies, and spends the day with them, while the bridegroom treats his friends in a separate apartment, and at night the couple repair to bed.

No man, except the emperor, can marry more than one wife; he however has the privilege of taking as many concubines into his house as he pleases, but these must be obedient to the wife, and treat her as their mistress, though the children are not deemed bastards, but share the father's estate in common with those of the lawful wife, who permits them to style her mother, and treats them as the does her own children. The emperor has three wives, and about 3000 concubines.

As to the funerals of these people, a great personage is always buried with a peculiar solemnity and pomp: they first wash the corpse, and after embalming it, dress it in the richest robes, and then expose it to view in a raised alcove, before which the wives, children, relations, and friends prostrate themselves: near the coffin, stands an image of the deceased, or else some carved work, with his name in large characters, and with flowers, perfumes, and flambeaux. The coffin is made of precious wood, varnished and gilt. People of note, and even some of the poorer sort, will have their coffins made in their life-time. Before the corpse is put into the coffin, a quantity of lime is strewed at the bottom of it. Every Chinese keeps in his house a table or altar, upon which are written the names of his father, grandfather, and great-grandfather, before which they frequently burn incense, and prostrate themselves; and when the father of a family dies, the name of the great-grandfather is taken away, and that of the deceased is substituted.

The mourning of the Chinese is white, which is worn three years for a parent; wives mourn three years for their husbands, but husbands only one year for their wives. Children, mourning for their parents, wear coarse white cloth the first year, a better sort the second year, and the third year white silk if they please. The first hundred days are spent in solitude, lamentation, and abstinence; and during the whole period of their mourning, they are forced to refrain from holding

any public employment; even a mandarin quits all business on such an occasion.

The two principal public festivals or rejoicings in China, are celebrated, one in the beginning, and the other about the middle of January. The former is kept in visiting, sealing, making presents, &c. that of the middle of the month, is called the Feast of the Lanterns.

The Chinese language contains only 336 words, all of one syllable; but then each word is pronounced with such various modulations, and each with a different meaning, that it becomes more copious than could easily be imagined, and enables them to express themselves very well on the common occasions of life. The missionaries, who adapt the European characters, as well as they can, to the expression of Chinese words, have devised eleven different, and some of them very compounded, marks and aspirations, to signify the various modulations, elevations, and depressions of the voice, which distinguish the several meanings of the same monosyllable. The Chinese oral language, being thus barren and contracted, is unfit for literature, and therefore their literature is all comprised in arbitrary characters, which are amazingly complicated and numerous: according to some of their writers, they amount to 25,000, to 50 or 40,000 according to others; but the later writers say, they amount to 80,000; though he is reckoned a very learned man who is master of 15 or 20,000. This language being wholly addressed to the eye, and having no affinity with their tongue, as spoken, the latter hath still continued in its original, rude, uncultivated state, while the former has received all possible improvements.

As a specimen of the Chinese language, we shall gratify the curiosity of our readers with a copy of an original poem, in praise of tea, composed by the reigning emperor of China, Kien-long, and published by authority.

THE CHINESE EMPEROR'S POEM.

their original hieroglyphic nature, that they do not com-
 bine into words like letters or marks for sounds; but
 we find one mark for a man, another for a horse, a third
 for a dog, and in short a separate and distinct mark for
 each thing which hath a corporeal form. The Chinese
 do use a great number of marks entirely of a symbolic
 nature, to impress on the eye the conceptions of the
 mind, which have no corporeal forms, though they do
 not combine these last marks into words, like marks for
 sounds or letters; but a separate mark is made to repre-
 sent or stand for each idea, and they use them in the
 same manner as they do their abridged picture-charac-
 ters, which were originally imitative or hieroglyphic.

The Chinese do not write with a reed like the Ara-
 bians, or with a crayon like the Siamese, or with a
 pen like the Europeans; but with an hair-pencil. They
 make use of a piece of polished marble, hollowed at one
 end to hold water, wherein they dip their slick of ink,
 and then gently rubbing it, there is in a few moments
 produced a fluid ink. They do not hold their pencils
 obliquely as we do our pens, but perpendicular to the
 paper: they write from top to bottom in columns, and
 begin their books where ours end; that is, they begin
 at the right-hand side of the paper, and proceed to the
 left, like the Hebrews: but their paper being very thin,
 it will not bear writing on both sides of it. Sometimes
 the title is placed horizontally, and this is likewise read
 from the right-hand.

They lay claim to the invention of printing at least
 four hundred years before it was practised by the Euro-
 peans; but that can only be applied to block-printing;
 and their method is not at all like ours.

The genius and learning of the Chinese is peculiar
 to themselves. They have no conception of what is
 beautiful in writing, regular in architecture, or natural
 in painting; and yet in their gardening, and planning
 their grounds, they hit upon the true sublime and beau-
 tiful. They perform all the operations of arithmetic
 with prodigious quickness, but differently from the Euro-
 peans. Till the latter came among them, they were
 ignorant of mathematical learning, and all its depend-
 ing arts. They had no proper apparatus for astron-
 omical observations; and the metaphysical learning,
 which existed among them, was confined to their phi-
 losophers; but even the arts introduced by the Jesuits
 were of very short duration among them, and lasted
 very little longer than the reign of Cang-hi, who was
 contemporary with our Charles II. nor is it very prob-
 able they ever will be revived.

The progress of the Chinese erudition is greatly re-
 tard by the difficulty of mastering and retaining such
 a number of arbitrary marks and characters as there are
 in what may be called their written language. But
 there is no part of the globe where learning is attended
 with such honours and rewards, and where there are
 more powerful inducements to cultivate and pursue it.
 The literati are revered as men of another species,
 and are the only nobility known in China. If their

birth be ever so mean and low, they become mandarins
 of the highest rank, in proportion to the extent of their
 learning. On the other hand, how exalted soever their
 birth may be, they quickly sink into poverty and obs-
 curity, if they neglect those studies which raised their
 fathers; since there is no nation in the world where the
 first honours of the state lie so open to the lowest of the
 people, and where there is less of hereditary greatness.

The Chinese range all their works of literature in
 four classes. The first is the class of Kings, or the sac-
 red books, which contains the principles of the Chi-
 nese religion, morality, and government, and several
 curious and obscure records, relative to these important
 subjects. History forms a class apart; yet, in the first
 class, there are placed some historical monuments on
 account of their relation to religion and government,
 and among others the Tekun-theou, a work of Con-
 fucius, which contains the annals of twelve kings of
 Low, the native country of that illustrious sage. The
 second class is that of the Su, or Che, that is, of history
 and the historians. The third class, called the Tsi, or
 Tse, comprehends philosophy and the philosophers, and
 contains the works of the Chinese literati, the produc-
 tions also of foreign sects and religions, which the Chi-
 nese consider only in the light of philosophical opinions,
 and all books relative to mathematics, astronomy, phy-
 sic, military science, the art of divination, agriculture,
 and the arts and sciences in general. The fourth class
 is called Tcie, or Miscellanies, and contains all the
 poetical books of the Chinese, their pieces of eloquence,
 their songs, romances, tragedies, and comedies.

The Chinese literati, in all the periods of their mo-
 narchy, have applied themselves less to the study of
 nature, and to the researches of natural philosophy,
 than to moral inquiries, the practical science of life,
 and internal polity and manners. It is said, that it
 was not before the dynasty of the Long, in the tenth
 and eleventh centuries after Christ, that the Chinese
 philosophers formed hypotheses concerning the natural
 system of the universe, and entered into discussions of
 a scholastic kind; and this was perhaps in consequence
 of the intercourse they had long maintained with the
 learned among the Arabians, who, studied assiduously
 the works of Aristotle; and the progress of the Chi-
 nese in natural philosophy has been much inferior to
 that of the Europeans, since they have begun to pay
 some attention to that science.

The Chinese have justly claimed the invention of
 gunpowder, which they made use of against Zinghis
 Khan and Tamerlane. They seem to have known
 nothing of small fire-arms, and to have been only
 acquainted with the cannon, which they call the
 fire-pan.

Their industry and ingenuity in the manufactures of
 porcelain, silks, stuffs, japanning, and the like fed-
 erary trades, is amazing, and can be equalled only by
 their labours in the field, in making canals, levelling
 mountains, raising gardens, &c.

The Chinese porcelain, which they call Tse-ki, is made of the Pe-tun-tse and Kao-lin, the former of which is a fine white earth, and the latter an earthy kind of stone with bright particles like those of silver. After they have washed and purged the stone from its stony and fossil matter, they break it into pieces with hammers in mortars, and with stone pestles reduce it to a fine powder. These pestles, which are capped with iron, are worked perpetually, either by man's labour, or by means of water, in the same manner as the hammers of paper-mills. The powder is put into a vessel, and briskly stirred about; when, after it has rested a few minutes, a thick cream rises on the surface, which they take off, and pour it into a second vessel of water; this cream is not less than four or five inches thick. The gross part of the powder that remains in the first vessel they take out and pound afresh. With regard to what is put into the second vessel, they wait till it has formed a kind of paste at the bottom; and when the water is clear, they pour it gently off, and call the paste into large moulds, in which it is dried. It is remarkable that neither the Pe-tun-tse nor Kao-lin are to be got in the neighbourhood of King-te-tching; they are obliged to fetch them from the province of Chan-si, twenty or thirty leagues off, where the inhabitants know not how to use them: of these are made cups and vases of various kinds, sizes, and colours; some red, some yellow, some grey, some blue, and others white, but none of a perfectly black ground: red and sky-blue are the most common colours.

The whole process of painting the porcelain is long and laborious, and employs a great number of hands; it is the business of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third; a fourth is employed in the formation of birds and other animals; a fifth forms rivers, rocks, &c. and a sixth is engaged in the figures of men and women.

They use all colours in painting their china ware; some quite red with small spots, others entirely blue, others streaked or chequed with squares, like mosaic work, which is reckoned among the most beautiful. Some of their china is mixed with various colours, like jasper; and some is adorned with flowers, landscapes, dragons, and frequently human figures. These figures are often rilievo, which is thus effected: they first delineate the figure with a pencil, and then pare down the contiguous ground, so that it appears raised or embossed on the superficies. They make every kind of representation in this sort of ware, as idols, animals, &c. Many of these figures known in Europe by the name of Chinese baboons are images of the gods they worship.

The silks most esteemed either for richness or beauty, are the Nan-king damasks of various colours, satins, taffeties, brocades, gauzes, &c. These, when quite new, have a very fine and handsome ap-

pearance; but their beauty soon fades. A strong durable satin called Touan-tse is much esteemed: it is sometimes plain, and sometimes figured with representations of birds, trees, flowers, and particularly dragons; for the figure of a dragon is a very favourite representation with the Chinese, on account of the peculiar veneration they have for the memory of a celebrated dragon, which, agreeable to their fabulous antiquity, inspired their great legislator Fo-hi. These figures are not raised upon the silk after the European manner; the texture is even throughout, the figures being distinguishable by difference of colour, and not by their projecting from the ground of the silk; after the manner of basso-relievo, these colours consist of the juices of herbs and flowers, which so effectually penetrate the silk, that the stain always remains in it, and so admirable is the deception, that the figures appear as if actually projecting from the ground of the silk.

The Chinese, however, are ignorant of the art of wire-drawing, and consequently have no gold and silver thread; to supply this defect, they roll their silk in thin wire plates, to give it the tinge; and sometimes, instead of gilding the thread, they apply the leaf gold to the silk in the piece. This splendid finery soon tarnishes, and is worn only by mandarins of the first consequence, and their ladies. Having thus far treated of the silks, we shall now say something of the silk-worm.

The worm, when it leaves its egg, is no bigger than the head of a common pin; it feeds upon the mulberry leaf, and grows to the size of a caterpillar, after which it no longer eats, but prepares for its dissolution: it wraps itself in a kind of silken ball spun from its own bowels, and its head separating from its body, the insect now no way resembles its original form: it hath apparently neither life nor motion; however, after remaining in this state some time, it awakes to a new being, and appears a different kind of insect. It resembles a large moth or butterfly; and in this last stage the female propagates the species by laying a prodigious number of eggs, after which she dies. This valuable worm is composed of several elastic springs from one extremity to the other it has a kind of little nerve, which we will call the spine; this spine, placed in the centre of its body, and continued through its whole length, sustains two other nerves or strings; one of these is the heart, which is composed of many oval vessels; the other, which is the lungs, is double, and appears to be an assemblage of several rings extending towards the two sides of the insect, and between which are certain orifices that correspond with those distributed along the exterior sides. It is, through these apertures that the air flows to the lungs, and by its spring and expansion promotes the circulation of the chyle or humour which nourishes the insect.

It is necessary to add, that the worm is perfectly black when it first comes out of the egg. In a few days

begins to assume a whitish hue; or ash grey; after this its coat silies, and becomes ragged; at which time the insect casts it off, and appears in a new habit. It increases in bulk, and becomes more white, though a little inclining to a bluish cast; then divesting itself of its skin, it appears in its third habit; when its colour, head, and whole form are so metamorphos'd, that it appears quite another insect. In a few days it becomes changed to a bright yellow; so that, from the time of its leaving the egg, it hath divested itself of three different coverings. It continues feeding a short time longer, and then renouncing all society, wraps itself in its little silken ball as already mentioned.

With respect to the natural curiosities in China, several of these have been already mentioned under the preceding articles; to which we shall add, under this head, the volcano of Linfung, which is said sometimes to make so furious a discharge of fire and ashes, as to occasion a tempest in the air; and some of their tales are said to petrify fishes when put into them. Their curiosities, effected by art and labour, are stupendous.

The great wall, separating China from Tartary, to prevent the incursions of the Tartars, is supposed to extend from 1200 to 1500 miles. It was built by the emperor Xi-Hoam-ti, about 214 years before the Christian era; is carried over mountains and vallies, and reaches from the province of Xen-si to the Kang-si, between the provinces of Peking and Ly-an-tong. In most places it is built of brick and mortar, both so well tempered and excellent in their kind, that though it has stood for 1800 years, it is but little decayed. The beginning of this wall is a large bulwark of stone piled in the sea, in the province of Pe-chei, to the east of Peking, and almost in the same latitude: it is built like the walls of the capital city of the empire, but much wider, being terraced and cas'd with bricks, and is from twenty to twenty-five feet high, and paved wide enough for five or six horsemen to travel abreast with ease. The gates of this wall are fortified with towers, and large square towers are erected at proper distances through its whole extent. There are 3000 of these towers, which, before the Tartars became masters of China, used to be garrisoned with a million of soldiers.

Their triumphal arches are amongst the most famous buildings of the Chinese: they are called by the natives Pay-leou, and are in every city or large town in the empire. Though they are not built in the Greek or Roman style of architecture, yet they are superb and beautiful, and erected to the memories of their great men, with vast labour and expence. They have commonly three gates, formed by columns, the bases of which are without moulding or embellishment; either have they capitals or cornices: the frieze is high and to an absurdity; to admit space for inscriptions, as well as borders of ornaments, consisting of birds, flowers, human figures, &c. They are usual in the

whole to be 100, two hundred of which are particularly magnificent.

The Chinese bridges cannot be sufficiently admired. They are built sometimes upon barges strongly chained together, yet so as to be parted, and to let vessels pass that sail up and down the river. Some of them run from mountain to mountain, and consist only of one arch; that over the river Saffrany is 400 cubits long, and 500 high; though a single arch, and joins two mountains; and some in the interior parts of the empire are said to be still more stupendous.

Their towers, the models of which are now so common in Europe under the name of Pagodas, are vast embellishments to the face of this country. They seem to be constructed by a regular order, and all of them are finished with exquisite carvings and gildings, and other ornaments. The most remarkable of these is that at Nan-king, called the Porcelain Tower, from its being covered from top to bottom with porcelain tiles, finely painted: it is of an octangular figure, contains nine stories, is about 200 feet high, and 40 in diameter. It is raised on a very solid base of brick-work, the wall at the bottom being at least twelve feet thick. The structure lessens all the way to the top, which is terminated by a sort of spire or pyramid, having a large golden ball or pine-apple on its summit. Between every story there is a kind of penthouse or shed on the outside of the tower; at each corner whereof are hung little bells, which, being moved by the wind, make a pleasant jingling. The ceilings of the rooms are adorned with paintings, and the light is admitted through windows of lattice-work. There are also abundance of niches in the wall, filled with images of their deities; and the amazing variety of ornaments that embellish the whole, render it one of the most beautiful structures in the kingdom.

The Chinese are remarkably fond of bells, which has given name to one of their principal festivals. A bell of Peking weighs 120,000lb. but its sound is said to be disagreeable.

Their temples are chiefly remarkable for the disagreeable taste in which they are built, and the ugliness of the idols they contain. Their sepulchral monuments have a pompous appearance.

The last curiosity we shall mention, is the fireworks of the Chinese, which exceed those of all other nations, both in beauty and variety.

It would take a volume to describe all the buildings and other objects deserving attention in this empire, where every province is a scene of curiosities. Their structures, except those above-mentioned, are confined to no order; and being susceptible of all kind of ornaments, exhibit a wild variety of pleasing elegance, very agreeable to the eye and imagination, by presenting a diversity of objects not to be found in European architecture; though none of these structures, singly considered, has the least claim to true beauty and just proportion.

re established in the
most

most exact and uniform method, for the administration of justice, and the due performance of all the offices of a well-regulated government. The emperor is assisted, in the management of the great affairs of the kingdom, by two sovereign councils, which assemble at Peking. Besides these, six superior tribunals are held in the same city for civil and military affairs; and their authority extends to every part of the empire.

Every mandarin or governor is obliged to transmit to court annually a particular account of his government, and is severely punished if he endeavours to palliate any miscarriage; but as corruption prevails to a shameful degree in China, he that offers the highest bribe is sure of gaining his cause. Except the princes of the blood, and tributary kings, there are at present no hereditary nobility among the Chinese, nor is there any distinction but what flows from their offices, or their superior wealth or learning.

As to religion, the Chinese are, in fact, idolaters, but they are said to worship one supreme God, and several inferior deities, who appear to have been men eminent in their several ages, particularly the inventors of arts and sciences. They also worship things inanimate, as mountains, woods, and rivers; but never sacrifice to vice, as is customary with most Pagans. There are, at present, three sects in China: first, the followers of Li-Laokun, who, according to their account, lived above five hundred years before Christ, and taught that God was corporeal. They profess the study of magic, and pretend to make a drink which gives immortality. Secondly, the disciples of the celebrated Confucius, who taught that God was a most pure and perfect principle, and the fountain and essence of all beings. Thirdly, the worshippers of the idol Fo, or Fohi, the founder of the Chinese nation; and this sect is much more numerous than the other two. The emperor, being of the Tartar race, follows the idolatry of that nation, and worships the Dalay Lama.

In the accounts of China, transmitted to us by the Jesuits, we are told, that the doctrine of Confucius approximates nearly to Christianity, but very little dependence can be placed on their relations. About 100 years ago great numbers of these fathers resorted to China, and, being men of great abilities, soon made a prodigious number of converts; for, if they may be depended on, they had no less than two hundred churches and chapels; but the emperor finding that these restless ecclesiastics, under pretence of religion, were aspiring to the civil direction of the government, immediately banished them, levelled their churches with the ground, and forbade the exercise of the Christian religion, which since that time has made no figure in China. History informs us, that Christianity was planted in China by St. Thomas, or one of his disciples, and many of the Chinese records tend to confirm this opinion; but the Jesuits affirm that they did not perceive the least remains of it on their arrival in the country.

The revenues of this extensive empire are said by some to amount to twenty millions sterling a year; but this cannot be meant in money, which does not at all abound in China. The taxes collected for the use of government in rice, and other commodities, may very possibly amount to that sum: these are certainly very great, and may be easily imposed, as an account of every man's family and substance is annually enrolled.

With regard to their military and marine strength, China is at this time a far more powerful empire than it was before its conquest by the Eastern Tartars in 1644. This is owing to the consummate policy of Chou-tchi, the first Tartarian emperor of China, who obliged his hereditary subjects to conform themselves to the Chinese manners and policy, and the Chinese to wear the Tartar dress and arms. The two nations were thereby incorporated. The Chinese were appointed to all the civil offices of the empire. The emperor made Peking the seat of his government, and the Tartars quietly submitted to a change of their country and condition which was so much in their favour. But this security of the Chinese from the Tartars, takes from them all military objects; the Tartar power alone being formidable to that empire. The only danger that threatens it at present, is the dilute of arms.

The Chinese land army is said to consist of five millions of men; but in these are comprehended all who are employed in collecting the revenue, preserving the canals, the great roads, and the public peace. The imperial guards amount to about 30,000. The marine force is composed chiefly of junks (vessels much in use here) and other small ships, that trade coast-ways, or to the neighbouring countries, or to prevent sudden descents. In 1772, there was published at Paris a treatise on the military art, translated from the Chinese into the French language, from which it appears that the Chinese are well versed in the theory of the art of war; but caution, care, and circumspection, are much recommended to their generals: and one of their maxims is, never to fight with enemies either more numerous or better armed than themselves.

For the better conducting all matters relative to the war department, the Chinese have placed the military government of the country under the direction of an order of mandarins, called the mandarins of war, of whom there are five classes, viz. the mandarins of the rear-guard, the mandarins of the left wing, those of the right wing, those of the main body, and those of the van-guard. These five classes are under the jurisdiction of so many courts or tribunals, which are all subject to a sixth, viz. the fourth sovereign court at Peking, which is intrusted with the care of the military of the empire. The president of the sixth tribunal of war is always a grandee of the realm; his authority extends to all military persons; to him belongs the supreme command of the army: but, should there be a war, the Chinese law prescribes, there shall in such case be joined with him in commission a mandarin of letters, bearing

the title of superintendent of arms; and there must be likewise appointed out of the same order two inspectors of his conduct. The generalissimo undertakes no enterprise without the consent of these three officers, who send a particular account of his operations to the fourth supreme court at Peking, that awful tribunal, to which even the general himself is accountable. These mandarins, or officers at war, are computed at no less than eighteen thousand.

PROVINCES and CHIEF CITIES in CHINA.

THE sixteen provinces, into which China is divided, are as follow: viz. Pe-ke-li, Kyang-nan, Kiang-si, Pö-kyen, Che-ky-ang, Hu-quang, Ho-nan, Shang-tong, Shan-si, Shen-si, Se-chuen, Quan-tong, Quang-li, Yun-nan, Quew-chew, Ly-au-tong (without the great wall.)

The empire is said to contain 4400 walled cities; the chief of which are Peking, Nanking, and Canton.

Peking, the capital of the Chinese empire, and the ordinary residence of the emperors, is situated in a very fertile plain, in the province of Pe-tche-li, and twenty leagues distant from the great wall. It is an oblong square, and is divided into two cities; that which contains the emperor's palace is called the Tartar city, because the houses were given to the Tartars when the present family came to the throne, and they refusing to suffer the Chinese to inhabit it, forced them to live without the walls, where they in a short time built a new city; which, by being joined to the other, renders the whole of an irregular form, six leagues in compass. The walls and gates of Peking are of the surprising height of fifty cubits, so that they hide the whole city; and are so broad, that centinels are placed upon them on horseback; for there are slopes within the city, of considerable length, by which horsemen may ascend the walls; and in several places there are houses built for the guard. The gates, which are nine in number, are neither embellished with statues nor other carving, all their beauty consisting in their prodigious height, which at a distance gives them a noble appearance. The arches of the gates are built of marble, and the rest with large bricks, cemented with excellent mortar. Most of the streets are built in a direct line; the largest are about 120 feet broad, and a league in length; but, from their not being paved, are remarkably dirty in the winter, and dusty in the summer. The houses are poorly built in front, and very low, most of them having only a ground-floor, and none exceeding one story above it.

The shops where they sell silks and china-ware generally take up the whole street, and afford a very agreeable prospect. Each shop-keeper places before his shop, on a small kind of pedestal, a board about twenty feet high, painted, varnished, and often gilt, on which are written, in large characters, the names of the several commodities he sells. These being placed on each side

of the street, at nearly an equal distance from each other, have a very pretty appearance.

Of all the buildings in this great city, the most remarkable is the imperial palace, the grandeur of which does not consist so much in the nobleness and elegance of the architecture, as in the multitude of its buildings, courts, and gardens, all regularly disposed: for within the walls are not only the emperor's house, but a little town, inhabited by the officers of the court, and a multitude of artificers employed and kept by the emperor; but the houses of the courtiers and artificers are low and ill-contrived. F. Altiret, a French Jesuit, who was indulged with a sight of the palace and gardens, says, that the palace is more than three miles in circumference, and that the front of the buildings shines with gilding, paint, and varnish, while the inside is set off and furnished with every thing that is most beautiful and precious in China, the Indies, and Europe.

The gardens of this palace are large tracts of ground, in which are raised, at proper distances, artificial mountains, from twenty to sixty feet high, which form a number of small vallies, plentifully watered by canals, which, uniting, form lakes and meers. Beautiful and magnificent barks sail on these pieces of water; and the banks are ornamented with ranges of buildings, not any two of which are said to have any resemblance to each other, which diversity produces a very pleasing effect.

Every valley has its house of pleasure, large enough to lodge one of our greatest lords in Europe with all his retinue: many of these houses are built with cedar, brought at a vast expence the distance of 500 leagues. Of these palaces, or villa's, there are more than 200 in this vast enclosure.

In the middle of a lake, which is near half a league in diameter every way, is a rocky island, on which is built a palace, containing more than a hundred apartments. It has four fronts, and is a very elegant and magnificent structure. The mountains and hills are covered with trees, particularly such as produce beautiful and aromatic flowers; and the canals are edged with rustic pieces of rock, disposed with such art, as exactly to resemble the wildness of nature, which gives them a very pleasing appearance. The city of Peking is computed to contain two millions of inhabitants, though Nanking is said to exceed it both in extent and population.

Canton, the capital of the province of Quang-tong, is about as large as Paris: it is the greatest port in China, and the only one that has been much frequented by the Europeans. The city wall is about five miles in circumference, with very pleasant walks around it. From the top of some adjacent hills, on which forts are built, you have a fine prospect of the country. It is beautifully interspersed with mountains, little hills, and vallies, all green; and these again pleasantly diversified with small towns, villages, high towers, temples, the seats of mandarins, and other great men, which are

watered with delightful lakes, canals, and small branches
 from the river Pa; on which are numberless boats and
 junks, sailing different ways through the most fertile
 parts of the country: the city is entered by seven iron
 gates, and within side of each there is a guard-house.
 There are many pretty buildings in this city, great
 numbers of triumphal arches, and temples well stocked
 with images.

The streets of Canton are very straight, but gener-
 ally narrow, and paved with flag-stones: they are so
 crowded, that it is difficult to walk in them; yet a
 woman of any fashion is seldom to be seen, unless by
 chance when coming out of their chairs. There are
 great numbers of market-places for fish, flesh, poultry,
 vegetables, and all kinds of provisions, which are sold
 very cheap. There are many private walks about the
 skirts of the town, where those of the better sort have
 their houses, which are little frequented by Europeans,
 whose business lies chiefly in the trading parts of the
 city, where there are only shops and warehouses. The
 shops of those who deal in silk are very neat, make a
 fine shew, and are all in one place; for tradesmen, or
 dealers in one kind of goods, herd together in the same
 street. Few of the Chinese traders of any substance
 keep their families in the house where they do business,
 nor do any of their windows look towards those of their
 neighbours. It is computed that there are in this city,
 and its suburbs, 1,200,000 people; and there are often
 5000 junks or trading vessels lying before it.

Nanking (a name signifying the court of the south,
 as Peking does the court of the north) is the capital of
 the province of Kiang-nan. This once splendid and
 extensive city was for many ages the metropolis of the
 Chinese empire, as well as the residence of the em-
 perors; whence it took its name. It is the largest city
 in China, and was originally surrounded with a triple
 wall, measuring about sixteen leagues in circumference:
 but the palace, once famous for its splendor and mag-
 nificence, hath been destroyed, as well as many grand
 monuments. The streets of this city are narrow, but
 well paved; the houses low, but handsome; the shops
 spacious, and most richly furnished with goods.

Nanking is celebrated for its great number of libra-
 ries: it excels likewise in printing, and in artificers of
 most kinds: here too reside the most eminent doctors
 of the empire, as well as the greater part of such man-
 darins as have been discharged from their governments.
 The number of people resident in this ancient city is
 estimated at about four millions, including those who
 live in barks upon the water; and, indeed whenever a
 city is situated on the banks of a canal or river; there is
 seen another large floating city of barks. If we except
 a few temples, the city gates, and a tower about 200
 feet high, the present public buildings of Nanking
 have rather a mean appearance.

Sou-tcheou, the second city of the province of Kiang-
 nan, is celebrated for its commerce and beautiful ap-
 pearance. In point of situation, it may be compared to

Venice, though far superior in extent and populousness.
 It is four leagues in circumference, exclusive of the
 suburbs, which are very extensive: it abounds with
 canals of pure water, capable of bearing ships of heavy
 burthen; and here people are conveyed to almost any
 part of the city in gondolas elegantly painted. The
 trade and riches of this city, the beauty of its situation,
 the fruitfulness of the circumjacent country, the contin-
 ued appearance of the gondolas, the concourse of
 visitants, and the natural politeness of the inhabitants,
 render it the paradise of China, in the fullest sense of
 the term.

HISTORY OF THE EMPIRE OF CHINA.

THE antiquity of the Chinese is universally ad-
 mitted; but it is difficult to ascertain the first period of
 their true chronology. A French writer allows the
 Chinese nation to be near as old as the deluge; nor
 does Maigret, in his remarks on the obscurity of the
 reign of Fo-hi, deny the reality of it; others of the
 learned give it as their opinion, that the Chinese have
 been a nation near four thousand years. Even such as
 have treated with ridicule the pretensions of these peo-
 ple to antiquity, allow their monarchy to be at least as
 ancient as that of the Egyptians, Assyrians, or any
 other country recorded in history.

The first inhabitants of China settled in the province
 of Chen-si, from whence they spread themselves over
 the adjacent countries, Honan, Pe-tche-li, and Chan-
 tong, which four provinces together formed a consider-
 able kingdom, containing that large tract of country
 lying north of the river Yang-tse-kiang. The fame of
 the first princes of this infant monarchy brought to-
 gether great numbers of foreigners; therefore, to ex-
 tend the bounds of their kingdom, they drained a large
 tract of low country that lay under water, fencing the
 land against the encroachments of the sea with high
 banks, and by the same means confining the course of
 the rivers within deep and narrow channels: thus two
 fine provinces, Tche-kiang and Kiang-nan, were added
 to the kingdom.

We are told, "that under the reign of the em-
 peror Yu, which they place above two thousand years
 before Christ, they discovered a large tract of territory
 to the south, partly destitute of inhabitants: this large
 extent of country, Yu and his successors peopled with
 colonies, at different periods, under the control of
 princes of the blood, to whom they portioned out this
 new country, reserving to themselves only some acknow-
 ledgment. Thus were formed several little tributary
 kingdoms, which being afterwards united to the empire,
 rendered it very considerable. During the reign of Yu,
 the monarchy was divided into nine provinces, a par-
 ticular delineation of which this emperor caused to be
 engraved on nine brazen vessels. In the year 2037
 before Christ, several nations sent ambassadors to China,
 and

and submitted voluntarily to a yearly tribute. Towards the end of the second dynasty, about 1,200 years before Christ, certain Chinese colonies extended themselves to the eastern coast, and also took possession of several islands.

Under the fifth race, or dynasty, which commenced about the year 200 before Christ, the Chinese not only enlarged their borders to the north, after many signal victories obtained over the Tartars, but pushed their conquests even to the confines of India, viz. to Pegu, Siam, Camboya, and Bengal.

About 600 years after Christ, Kao-tsou-venti, founder of the twelfth race, added to the empire several of the northern provinces, situated beyond the river Yang-tso-kiang, and which at that time composed a particular kingdom subject to the Tartars: this went by the name of the northern empire for several ages.

The revolution which happened in 1644, when China was conquered by the Tartars, only served to increase the power and extent of this great empire, by joining to its former possessions a considerable part of Great Tartary. Thus this vast monarchy attained to the summit of its greatness, by a gradual progress, not so much in the way of conquest like other empires, as by the wisdom of its laws, the reputation of its government, and at last by its disgrace.

The family of Yu ended with the reign of Kié, a wretch of infamous memory, who is said to have drowned, in the space of one day, three thousand of his subjects, in a pit which he caused to be filled with wine. This and other enormities occasioned a revolt of his subjects, who placed upon the throne Tchou-tang, a tributary prince of China.

Tcheou rendered himself abhorred by his subjects on account of his wicked and debauched life: his people therefore applied to Vou-vang, a prince of a small neighbouring state, and placed him on the throne. Vou-vang, however, in the beginning of his reign, committed a very capital fault, which in time was productive of great revolutions. In order to gratify certain families, and the princes of the blood royal in particular, he erected for them several petty kingdoms, which were at first feudatory to the empire, but soon after declared for independence.

Under the thirteenth emperor of this family, all these petty princes were engaged in intestine wars, and distracted the whole empire. China became a scene of rapine for many ages; its authority was held in contempt, and the tributary princes controlled the emperors, enthroning and deposing them, as their inclination or caprice dictated.

Tcheou-kiun, the thirty-fifth and last emperor of this race, found a very powerful rival in Tchao-siang, his vassal, the King of Tsin, to whom he was forced to give up his crown; this rebel, however, happened to die suddenly, and his son, who succeeded him, also died soon after; so that his grandson was the first who

enjoyed the advantages of this usurpation. This grandson was named Tchuang-siang-vang, and was the founder of the fourth succession, which gave four emperors to China, and lasted forty-three years only.

The fifth dynasty began with the reign of Lieou-pan, who was first a common soldier, and at the head of a gang of robbers: he obtained the imperial throne by dint of violence, and yet proved himself capable of governing with a becoming dignity, judgment, penetration, and justice. This race lasted 426 years, and produced a great many very respectable characters; but the last monarchs of this race suffering themselves to be ruled by the court eunuchs, fell into disgrace, and became as odious as the eunuchs themselves. The people took up arms, and wars ensued, which terminated in a division of the empire into four parts, under four distinct sovereigns; these however were reunited by Tchao-lie-vang, founder of the sixth dynasty. This monarch, after the short reign of three years, died, and left Heou-ti, his son, who filled the throne forty-one years, and then most shamefully abdicated it in favour of the usurper, Chi-tsou-youti, founder of the seventh dynasty.

The seventh race subsisted 155 years, giving fifteen emperors to China, most of whom, through their want of capacity to govern, discredited the elevated station of life in which fate had placed them. The last of these monarchs was put to death in the second year of his reign, by one Lieo-you, who, quitting the trade of a shoe-maker, commenced soldier, rose to the rank of general, and afterwards ascended the throne of the empire.

This eighth race, with the ninth, tenth, and two following, only comprehend 198 years; in which space of time there were no less than twenty-four reigns. The Chinese annals of this period present us with scarce any thing but revolution, rapine, and destruction; weak, spiritless, and superstitious princes, controlled by their ministers, and some of them betrayed, and even murdered by the very men in whom they had confided.

Under the first emperor of the thirteenth family, the people enjoyed the blessings of peace, the happy effects of the prudent and constitutional administration of those emperors. The tranquillity which was in a more particular manner enjoyed during the reign of Tai-siong, the second emperor of this race, is recorded to the immortal honour of that sovereign. Under Hiven, the sixth emperor, the tranquil state of the nation was disturbed with new commotions and seditions, which lasted in continual succession from his reign down to that of Tchao-suen, the twentieth and last emperor of this race. These disturbances were occasioned by the arbitrary and oppressive conduct of the eunuchs, to whom the monarchs of this dynasty committed an unlimited exercise of regal jurisdiction. Tchou-ven, the captain of a gang of banditti, taking advantage of their unhappy broils, deposed Tchao-suen, murdered him, and founded him-

of the fourteenth family, which, with the four follow
ing, subsisted about fifty years; in which short inter
val, no less than thirteen monarchs swayed the
imperial sceptre, most of whom suffered a violent
death.
During their last reigns; the Tartars, who in
habited Leao-tong, one of the most northern pro
vinces of China, began to render themselves powerful.
This province was bedded to them by the last emperors of
the thirteenth race; and Kao-tsou, head of the sixteenth,
who was indebted to them for his advancement to the
throne; gave up to them sixteen more towns in the pro
vince of Pe-tche-li, exclusive of a tribute of 300,000
pieces of silk. These shameful compliances increased
their power and pride; and were productive of
misery for 400 years, which nearly desolated the
empire.
The Chinese, at length, called to their assistance the
Niu-tche, or Eastern Tartars, in conjunction with
whom they drove the Northern Tartars from a country
in which they had possessed upwards of two centuries: the
Chinese, however, were obliged to pay dearly for the
aid of their allies, who not only constrained them to
cede Leao-tong by way of compensation, but also took
possession of Pe-tche-li, Chen-li, and Ho-nan; and
they some years afterwards invaded the very heart of
the empire, took Peking, the capital, burned the
royal palace to the ground, and forced the Chi
nese to accept of the most dishonourable terms of pa
cification.
Under this family, another race of Tartars, called
the Tan-yu Tartars, settled westward of China, en
tered into an alliance with the Chinese against their con
querors, the Niu-tche Tartars, and after several engage
ments, the Niu-tche victors were themselves conquered
and driven from their possessions in Leao-tong and the
other provinces, after an usurpation of 117 years. The
Tan-yu heroes, however, in requital of their services,
demanded a settlement in those provinces from whence
they had exterminated the Niu-tche barbarians; these
were accordingly ceded to them; but not contented
with such cession, they took possession of Yun-nan, Se
tchuen, and Hou-gang; and in less than half a cen
tury were masters of the whole empire.
The twentieth race took the name of Yven,
and had for its founder Chi-tsou, fourth son of
Tai-tsou, in whom commenced the third Tartarian
usurpation. The Yven family gave to China nine
emperors, the former of whom, by their prudent ad
ministration, won the hearts of their subjects; but the
succeeding monarchs, indulging in a life of indolence,
luxury, and dissipation, perceived themselves excelled in
the use of arms and natural courage by the very people
whom they had conquered, who, possessing the liveliest
sentiments of freedom, and despising their dissipated
victors, wrested conquest from their hands, and drove
them back to their native country. This family, which
lasted only eighty-nine years, became extinct in the

person of Chun-ti, a very worthless monarch, who was
addicted to a variety of vices; which made way for the
twenty-first race; of which Tai-tsou was founder; and
subsisted 276 years. The commotions that happened
under this family, produced gradually that grand revo
lution; which a second time placed a Tartarian family
on the throne of China. The progress of which was
as follows:
The Niu-tche or Eastern Tartars, being expelled
from Leao-tong and the empire, retreated into the
ancient country bordering upon Leao-tong, separating
themselves into seven distinct cantons, and fighting
against each other, till at length they were united in
subjection to one sovereign. It happened that their
merchants, trading in Leao-tong, having received some
indignity from the merchants of China, exhibited a
complaint to the mandarins, who, instead of attending
to their complaint, augmented considerably the griev
ance, by craftily drawing their prince into an ambu
cade, and severing his head from his shoulders.
The Tartars, enraged at this cruel and iniquitous act,
marched a numerous army into the very heart of Leao
tong, commanded by Tien-ming, son of their murdered
prince, who subdued Leao-tong and Pe-tche-li, but was
soon obliged to abandon those provinces, which were,
however, with the rest of the Chinese empire, reserved
for his grandson T'iong-te, but who was cut off by
sudden death, in the moment of his great view of sove
reignty. He had been brought up and educated in
China; was master of the Chinese tongue, and per
fectly acquainted with the disposition and genius of the
people.
At this period the empire was very critically situated:
the war with the Niu-tche Tartars continued, and as
an addition to this national calamity, there was a great
famine in the land. The then reigning monarch,
too, Hoai-tsong, was a man of mean abilities, suffer
ing himself to be directed in every thing by his ministers
and eunuchs, who greatly oppressed the people. A re
volt was the consequence, and in a short space of time
there were eight different factions under the same num
ber of chiefs; these were, however, reduced afterwards
to two, and at length to one, headed by a commander
named Li, who invading and possessing himself of the
provinces of Ho-nan and Chen-si, styled himself emper
or of China. In Ho-nan he committed the most dread
ful ravages; in his attack of Cuif-ong, its capital, that
town was laid under water by a sudden breaking down
of the dykes of the Yellow-River, and 300,000 persons
perished in the inundation. He afterwards marched to
Peking, at the head of 300,000 troops, and entered
the city without the least opposition; for he had pri
vately conveyed into the city a number of his people in
disguise, who threw open the gates to him; and such
was the supineness of Hoai-tsong, the emperor, that
he knew nothing of this circumstance, till the usurper
had laid the whole city under his subjection.
As soon as the emperor heard the news, he marched

from his palace at the head of 600 of his guards, who treacherously abandoned him. Thus situated, he flew into the gardens of his palace with his daughter, whose head he cut off, and then hung himself upon a tree: his wives, his prime-minister, and some of his eunuchs, also destroyed themselves. The news of this melancholy event soon reached the army, then making war in Tartary, under the command of a general named Ou-fang-guey, who refused to acknowledge Li as his sovereign; whereupon the latter put himself at the head of his numerous army, for the purpose of giving him battle.

Ou-fang-guey shut himself up in a strong fortified town; thither Li marched his troops, and having taken captive the father of Ou-fang-guey, ordered him to be loaded with irons, and placed at the foot of the town wall, sending word to his son at the same time, that if he did not immediately surrender, his father's throat should be cut from ear to ear. The father found means to send a message to the son, begging him not to surrender; the son sacrificed his filial esteem to the interests of his country, and the old man was most cruelly put to death. The patriotic soul of Ou-fang-guey, now inflamed with rage, concluded a peace with the Niu-tche Tartars, and engaged them to enter into an alliance with him against Li, whose superior force it was impossible for him to resist.

Tsong-te, the Tartarian king, came to his assistance at the head of 80,000 warriors, forced the tyrant to raise the siege, pursued him even to Peking, and so totally routed his army, that he was forced to fly into the province of Chen-si, where he spent the remainder of his days in obscurity. Tsong-te being thus successful, the people idolized him as their deliverer, and he bestowed several distinguished honours upon the faithful Ou-fang-guey: the latter, however, soon had cause to repent his having leagued himself with so great and powerful a prince, for Tsong-te was no sooner arrived at Peking, than he began to think of improving the success of his arms, and the favourable disposition of the people (with whom, history informs us, he had been brought up and educated) into the means of his advancement to the throne of China; but being seized with an illness that speedily brought on his dissolution, all that he could do was to declare his son emperor, who was only about six years of age. This election was confirmed by the grandees and people, who in consideration of the signal services done by the father, connived at the tender age of the child, who took the name of Chun-si, and is considered as the founder of the twenty-second dynasty, which now fills the imperial throne of China.

By this revolution, which happened in the year 1644, a considerable part of Great Tartary was united to the Chinese empire; and since the union, the Tartars seem rather to have submitted to the laws of the Chinese, than to have imposed any upon them; in fact, the latter may be said to be as great gainers by it, as the Tar-

tars themselves. China still holds the seat of empire, and has the supreme courts of justice: thither flows all the opulence of the united kingdoms, and all honours are conferred there. Both nations, so opposite in genius and character, have each been considerably advantaged by the incorporation; the fierce spirit of the Tartar has given a spark of martial fire to the peaceful temper of the Chinese, while the arts and commerce of the latter have humanized and softened the savage roughness of the former.

China having acquired great additional strength by her union with Tartary, has now no enemy to dread; nor were ever the opulence, power, grandeur, and glory of the Chinese empire greater than at present: at home it hath all the blessings of peace, and abroad it is respected: it hath enjoyed a perfect tranquillity for upwards of eighty years, and is unrivalled by all other nations for its public works of art; having thirty-two royal palaces, 272 grand libraries, 709 halls, 1,159 triumphal arches, 331 beautiful bridges, and 680 curious tombs.

A CHRONOLOGICAL TABLE of the Twenty-Two DYNASTIES of CHINA.

Dynasties, or Families.	Years before and after Christ.	Duration of each Dynasty.	Emperors
I Hia	2207	458	17
II Chang	1766	644	28
III Tchcou	1122	874	35
IV Tsin	248	42	4

CHAP. XI.

INDIA, OR INDOSTAN.

General Description, with a particular Account of its Boundaries, Situation, Extent, Divisions, Inhabitants, Government, Religion, Produce, &c.

INDIA is bounded by Ubeck-Tartary and Thibet on the north; by Acham, Ava, and the Bay of Bengal, on the east; by the Indian-Ocean, on the south; and by the same sea, and Persia, on the west. It is situated between the equator and the parallel of 40 deg. north latitude, and between the 66th and 109th deg. of east longitude; being 2048 miles long, from north to south, and upward of 1400 broad from east to west.

This vast country at large may be divided into three great parts: first, the peninsula of India beyond the Ganges, called the Further Peninsula; secondly, the main land, or the Mogul's empire; thirdly, the peninsula within, or on this side the Ganges; all of them vast, populous, and extensive empires. But before they are considered separately, it will be necessary to premise some particulars which are common to them all, as this method will at once save many repetitions, and convey a more adequate idea to the reader of every material circumstance relative to this large country.

We shall begin with an account of their population; inhabitants, religion, and government.

The two latter divisions are comprehended, by an excellent and authentic historian, under the title of Indostan. This writer says, the Mahometans (who are called Moors) of Indostan, are computed to be about ten millions. Above half of the empire is subject to rajahs, or kings, who derive their descent from the old princes of India, and exercise all right of sovereignty, only paying a tribute to the great mogul, and observing the treaties by which their ancestors recognized his superiority. In other respects, the government of Indostan is full of wise checks upon the overgrowing greatness of any subject; but as precautions of that kind depend upon the administration; the indolence and barbarity of the moguls and emperors, and their great viceroys, have rendered them fruitless.

The Indians, or original inhabitants of the country, are called Gentoos; or, as others style them, Hindoos; and the country Hindooostan, or Hindostan. They pretend that Bramma, their legislator both in politics and religion, was inferior only to God, and that he existed many thousand years before our account of the creation. This Bramma probably was some great and good genius, whose beneficence, like that of the pagan legislators, led his people and their posterity to pay him divine

honours. The Bramins (for so the Gento priests are called) pretend that he bequeathed to them a book called the Vidam, containing his doctrines and institutions; and that though the original is lost, they are still possessed of a sacred commentary upon it, called the Shahitah, which is written in the Shan'scrita, now a dead language, understood only by the Bramins, who study it, even as our sacred scriptures, written in the Greek and Hebrew, are. But it is not well known, whether that language was originally different from that of the country, or whether it has only now become unintelligible to the people, through that change to which all living languages are incident.

The foundation of Bramma's doctrine, uncorrupted by the arts and glosses of the Bramins, consisted in the belief of a Supreme Being, who originally created a regular gradation of beings, some superior, and some inferior to man; in the immortality of the soul, and a future state of rewards and punishments, which is to consist of a transmigration into different bodies, according to the lives they have led in their pre-existent state. From this it appears more than probable, that the Pythagorean metempsychosis took its rise in India. But in order to accommodate this sublime, but otherwise complicated doctrine, to the capacities of the lower ranks of people, the Bramins have had recourse to sensible representations of the Deity and his attributes; by which means, the original doctrines of Bramma have degenerated into rank, ridiculous idolatry, in the worship of the most hideous figures, either delineated or carved; and the belief of an Omnipotent Being is now almost confined to the Gentoos. Wooden images are placed in all their temples, and on certain festivals are exhibited in the high roads, and in the streets of towns. The human figures with elephants' heads, which are the objects of their devotion, have many hands, and are enormously corpulent. Yet amidst all their errors, they agree in those truths which form the harmony of the universe, that "there is one supreme God, and that he is best pleased by charity and good works."

From time immemorial, the Hindoos have been divided into four great tribes.

1. The first and most noble are the Bramins, who alone can officiate in the priesthood, like the Jewish tribe of Levi. They are not, however, excluded from government, trade, or agriculture, though they are strictly prohibited from all menial offices by their laws.

2. The second in order is the Sittri tribe, who, according to their original institution, ought to be all military men; but they frequently follow other professions.

3. The third is the tribe of Beise, who are chiefly merchants, bankers, and banjas, or shopkeepers.

4. The fourth tribe is that of Sudder, who ought to be menial servants, and they are incapable of raising themselves to any superior rank.

If any one of them should be excommunicated from any

any of the four tribes, he and his posterity are for ever shut out from the society of every body in the nation, excepting that of the Harri cast, who are held in utter detestation by all the other tribes, and are employed only in the meanest and vilest offices. This circumstance renders communication so dreadful, that an Hindoo, rather than deviate from one article of his faith, will suffer the torture, and even death itself.

The Gentoos are also subdivided into casts, or smaller classes and tribes; and it has been computed, that there are eighty-four of these casts, though some have supposed there was a greater number. The order of pre-eminence of all the casts, in a particular city or province, is generally indisputably decided. The Indian of an inferior would think himself honoured by adopting the customs of a superior cast; but this last would give battle, sooner than not vindicate its prerogatives: the inferior receives with respect the victuals prepared by a superior cast, but the superior will not partake of a meal which has been prepared by the hands of an inferior cast.

There are some casts remarkable for their beauty, and others as remarkable for their ugliness. The most striking features in the character of the Hindoos, are their superstition, and veneration for the institutions and tenets of their forefathers. Their marriages are circumscribed by the same barriers as the rest of their intercourse; and hence, besides the national physiognomy, the members of each cast preserve an air of still greater resemblance to one another.

The division of the Gentoos into tribes or classes, discovers a striking peculiarity in their government and religion. The tribes are headed by a chief, who is in some degree responsible for the conduct of those under him; and individuals, on proper occasions, are sometimes summoned to assemble together, in conformity to the requisitions of government.

Among the Gentoos, the principal deity or divinity itself is represented as having an infinite number of heads, hands, and eyes, which are emblematical of his knowledge, power, and penetration; and the inferior attributes are figured by almost every animal or visible object in the creation: in particular, wisdom is represented by a snake. But the ignorant, not content with one deity, have split their principal divinity into many thousand parts, and changed each attribute into a separate god.

There are upwards of eighty sects who support the religious tenets of Bramma; in some fundamental points they concur, and never dispute upon any. They live in friendship with persons of all persuasions, and admit of no proselytes; they say heaven has many gates, and every one may enter at which he pleases.

In this country, the dominion of religion extends to a thousand particulars, which in others are governed either by the civil laws, or by taste, custom, or fashion. Dress, food, the common intercourses of life, marriages, professions, are all under the jurisdiction of religion.

There is scarcely any thing which is not regulated by superstition. It prescribes rules of conduct in all circumstances and situations; nor is there any thing so most trifling or minute, as to be considered a matter of indifference.

As to the religion of the Mahomedans here, it is the same as in Persia, and is the religion of the court; the Mahomedan fanaticism, however, having subsided to a degree of rationality and candour, all professions or religions here, through this means, are practised with freedom and tranquillity.

The original government of the Hindoos was in reality an hierarchy; for among that religious people, the highest authority was possessed by the priesthood, or the Bramin cast.

The governments of both nations were not only hierarchical, but there was in both a vast variety of religious observances and ceremonies, extending to many particulars, which in other countries are matters of choice or indifference; and both entertained the most profound respect and veneration for their ancestors. All the casts acknowledge the Bramins for their priests, and from them derive their belief of the transmigration, which leads many of them to afflict themselves even at the death of a fly, although occasioned by inadvertence. But the greater number of casts are less scrupulous, and eat, though very sparingly, both of fish and flesh; but like the Jews, not of all kinds indifferently. To beef they have a particular objection.

The food of the Hindoos is simple, consisting chiefly of rice, ghee, which is a kind of imperfect butter, milk, vegetables, and oriental spices of different kinds, but chiefly what is called in the east, chilly; and in the west, green or Cayen pepper. The warrior cast partake of the flesh of goats, mutton, and poultry. Other superior casts may eat poultry and fish; but the inferior casts are prohibited from eating flesh or fish of any kind. Their greatest luxury consists in the use of the richest spices and perfumes, of which the great people are very lavish, and which grow almost spontaneously in their gardens. They esteem milk the purest of foods, because they think it partakes of some of the properties of the nectar of their gods, and because they almost ascribe divinity to the cow itself.

Penal laws are scarce known among the Gentoos, as their motives to bad actions are few. Temperance in their living, and delicate in their constitutions, their passions are calm, and their manners gentle: they have no object but that of living with comfort and ease, their happiness principally consisting in the solaces of a domestic life; and they are taught by their religion, that marriage is an indispensable duty in every man, who does not entirely separate himself from the world thro' a principle of devotion. Their religion also permits them to have several wives; but they seldom have more than one; and it has been observed, that their wives are distinguished by a decency of demeanour, a solicitude in their families, and a fidelity to their vows,

which might do honour to human nature in the most civilized countries.

The amusements of the Hindoos consist in going to their pagodas, in assisting at religious shows, and in fulfilling a variety of ceremonies prescribed to them by the Bramins. Their religion seems to forbid them to quit their own shores, nor do they want any thing from abroad. If others therefore had looked on them with the same indifference with which they regard the rest of the world, they might have continued to live in much tranquillity and happiness.

The Gentoos soldiers are called rajah-poots, or persons descended from the rajahs. They reside chiefly in the northern provinces, and are generally more fair-complexioned than the people of the southern provinces, who are quite black. These rajah-poots are a robust, brave, faithful people, and enter into the service of those who will pay them; but when their leader falls in battle, they think that their engagements to him are finished, and they run off the field without incurring the charge of cowardice.

The abominable custom of women burning themselves upon the death of their husbands, still continues to be practised in India among some of high cast and condition; though since the Moguls have become masters of Indostan, these shocking spectacles have been much less frequent than formerly, nor do the Bramins encourage them.

The following recent instance we have been lately favoured with, will sufficiently prove, that the custom above alluded to is still observed; and may serve to invalidate the modern opinion, that the Bramin women have discontinued it: "Signor Nicola Fontana de Cremona, a doctor of physic, at Calcutta, was witness, on Nov. 24, 1784, to the shocking sight of a woman, the wife of a Bramin, burning herself on the same pile with her husband. The sight was more affecting, as the wife was both young and handsome. The ceremony commenced about sun-set. During the preparation of the funeral pile, the females were employed in preparing the widow for the voluntary sacrifice: they administered opium to her with a view to annihilate those feelings which so painful a death must naturally excite. After taking the opium, she was stripped and plunged into the river, in order to purify her for that state which they were taught to believe the most enjoy, viz. that she would live happy with her husband 3500 years in the Elysian-Fields. Having been washed, and for her clothes thrown about her, she resolutely walked towards the wood, and boldly placed herself at the feet of her deceased husband: there the undressed herself, and distributed her clothes to those around her: she said a few words, was set fast to the dead body, and the pile was instantly set on fire. As the flames reached her, she began to scream; the whole company instantly struck up a doleful kind of hymn; and the more her screams increased, the louder they raised their voices. When the wood

and bodies were reduced to ashes, each departed home; and thus ended the process of this horrid, superstitious, and most unnatural ceremony."

It may not be amiss to remark, that the institution of the above horrible sacrifice is not to be ascribed to Bramma, but seems rather to be the invention of some Bramin, who carried his jealousy beyond the grave. It is a piece of refinement dictated by a barbarous and over-strained affection, and suitable to the character of those superstitious beings who think there is a particular merit in rigid morality, or what they style a transcendent purity of manners, how incompatible soever their general conduct is to the principles of right reason and true religion.

The famous dancing-girls are a particular class of women, who are allowed to be openly prostituted. By the continuation of wanton attitudes, they acquire, as they grow warm in the dance, a frantic lasciviousness themselves, and communicate, by a natural contagion, the most voluptuous desires to the beholders. Their attitudes and movements are very easy, and not ungraceful. Their persons are delicately formed, gaudily decorated, and highly perfumed.

The Gentoos apply themselves to the cultivation of their lands, and to public and necessary works, with the same assiduity as the Chinese; and are also remarkably honest and humane. There is scarcely an instance of a robbery in all Indostan, though the diamond-merchants travel without defensive weapons. A late writer observes, that the Hindoos, as well as the Persians, Tartars, and adjoining nations, who have inhabited Indostan since it was invaded by Tamerlane, though of different nations, religions, laws, and customs, possess, nevertheless, in equal degrees, hospitality, politeness, and address. In refinement and ease, they are superior to any people to the westward of them. In politeness and address, in gracefulness of deportment, and speech, an Indian is as much superior to a Frenchman of fashion, as a French courtier is to a Dutch burgomaster of Dort. The Hindoos, especially those of the higher casts, are in their demeanour easy and unconstrained, still more than even a French courtier, and their ease and freedom is reserved, modest, and respectful; whereas, on the contrary, a Frenchman's ease is mixed with forward familiarity, confidence, and self-conceit.

The Indians are of a middle stature, their persons straight and elegant, their limbs finely proportioned, their fingers long and tapering, their countenances open and pleasant, and their features exhibit the most delicate lines of beauty in the females, and in the males a kind of manly softness. Their walk and gait, as well as their whole deportment, is in the highest degree graceful. The inhabitants of the northern part are of a deep olive colour; and those of the south, black. The natives, who dwell on the mountains in the centre of the peninsula, are exceedingly black: all have black eyes, and long black hair.

The dress of the men is a kind of close-bodied gown, and wide trowsers, resembling petticoats; reaching down to their slippers. Such of the women as appear in public, have shawls over their heads and shoulders, short close jackets, and tight drawers, which come down to their ancles. Hence the dress of the men gives them, in the eyes of Europeans, the appearance of effeminacy; whereas that of the women will appear rather masculine: but these ideas are chiefly owing to the influence of habit and custom on human sentiments. The men tie their hair up in a roll, over which they have a small turban. The women's hair is also tied up in a roll, like the men's, and is adorned with jewels, or toys in imitation of them; they have pendants in their ears and noses, and several strings of beads round their necks; they wear bracelets on their wrists and ancles, and rings on their fingers and toes: they put their bare feet into slippers, as the men do; though indeed, in the southern parts, some of the women wear no slippers or shoes at all.

The Moors, or Mahometans, appear in a very handsome and becoming dress: they have grand turbans of rich muslin, and their garments reach down to their feet. Their fashes are embroidered in great taste, the ends being decorated with gold and silver tinsel, and in their fashes they stick their daggers; they wear embroidered slippers, which they take off, and leave at the foot of a *sopha* when on a visit. They are remarkably fond of smoking tobacco, and use the callaan.

In manners, the inhabitants of Indostan resemble the other natives of southern Asia: they are effeminate and luxurious, and are by education taught to affect a grave deportment, which initiates them early in the arts of dissimulation, and they are very apt to gratify a private revenge without having had any public quarrel.

Their houses are of two kinds, those built by the Moguls, and those by the original Indians. The houses of the Moguls are all in the Persian taste; in short, they seem to imitate the Persians in every thing. The Indian houses cover much ground, and have spacious galleries and accommodations of various kinds. The apartments are small, and the furniture not very elegant, if we except the rich Persian carpets. The grandeur of their palaces consists in baths, perfumes, temples, gods, and harems. The harems, or zenanas, that is, the residences of the women, are removed from the front of the house, and lighted only from a square space in the centre of the whole building. The apartments in the houses of the wealthy are ornamented chiefly with looking-glasses, which are purchased of the Europeans, and many of their ceilings are inlaid with mother-of-pearl and ivory.

The Bramins superintend and have the immediate direction of all the temples and pagodas erected in every capital, which are stupendous, but disgusting stone buildings. If these Indian priests are masters of any uncommon art or science, they frequently turn it to the purposes of profit from their ignorant votaries. They know how to calculate eclipses; and judicial astrology

is so prevalent among them, that half the year is taken up with unlucky days; the head astrologer being always consulted in their councils. The Mahometans likewise encourage those superstitious, and appropriate to themselves the fruits of the Gentoo industry.

Though the Gentoos are entirely passive under all their oppressions, and, by their state of existence, the practice of their religion, and the scantiness of their food, have nothing of those disagreeable qualities in their nature that animates the generality of mankind; yet they are susceptible of avarice, and sometimes bury their money; many of them, rather than discover it, have put themselves to death by poison, or otherwise. The vast scarcity of silver, that till of late prevailed in Indostan, has been ascribed to this practice.

The Indians are supposed, for the reasons above-mentioned, to be less under the influence of their passions than the inhabitants of other countries. The perpetual use of rice, their chief food, gives them but little nourishment; and their marrying early, the male before fourteen, and their women at ten or eleven years of age, keeps them low and feeble in their persons. A man is in the decline of life at thirty, and their beauty is on the decay at eighteen: at twenty-five, they have all the marks of old age. We are not therefore to wonder at their being soon strangers to all personal exertion and vigour of mind; and whatever may be the cause, a person who has lately travelled into this country observes, that death is regarded with less horror in India than in any other country in the world. "The origin and the end of all things, says the Indian philosopher of the present times, is a vacuum. A state of repose is the state of greatest perfection; and this is the state after which a wise man aspires." "It is better, say the Hindoos, to sit than to walk, and to sleep than to wake; but death is the best of all."

At certain times, a court of justice is held for determining disputes relative to property, and other controversies among the people. Law-suits are here very quickly adjusted, as the whole power of deciding is vested in the judge, whose principle is avarice, and whose soul is consequently a stranger to tender or equitable sentiments.

In every town and village, courts are likewise held for the administration of justice: the principal person of the place acts as judge, and determines all disputes within his district; the determination, however, is generally made in favour of him who displays the greatest liberality, and can give the highest bribe.

The emperor himself decides in all capital cases, and his viceroys do in their different governments. Though there are no written laws, particular punishments are inflicted for particular offences. Murder and robbery are punished with death; but the mode of executing is entirely in the will of the mogul or his viceroy. Some offenders are beheaded, some hanged, some impaled upon sharp-pointed stakes, and others trampled to death by

elephants. The excessive torture, broken by the elephant with his heavy fapire. They have torn to pieces his According to the death are not to but to be cut off effusion of blood, all their sins upon it is thought their

elephants. The poor criminal who is doomed to suffer excessive torture, has the bones of his legs and arms broken by the elephant, who kicks him in those parts with his heavy foot, and then leaves the victim to expire. There have been instances of delinquents being torn to pieces by dogs, in the empire of Indostan. According to the Gentoo laws, criminals sentenced to death are not to be strangled, suffocated, or poisoned, but to be cut off by the sword; because, without an effusion of blood, malefactors are supposed to die with all their sins upon them; but by the shedding of blood, it is thought their crimes against the Deity are expiated.

In India, the Mahometans are called Moors, and are of Persian, Turkish, Arabic, and other extractions. They invaded Indostan soon after the caliphs of Bagdad began to reign. Afterwards penetrating to Dehli, they made that city their capital. They settled colonies in several places, whose descendants are called Pytans; but their empire was overthrown by Tamerlane, who founded the Mogul government, which still subsists. Their princes, being strict Mahometans, received under their protection all that professed the same religion, and who, being a brave, enterprising people, counterbalanced the numbers of the natives. The vast resort of Persian and Tartar tribes has likewise strengthened the Mahometan government; but it is observable, that in two or three generations the progeny of all those adventurers, who brought nothing with them but their horses and swords, degenerated into all the indolence and sensuality of the east.

The Moors are said to have introduced the division of provinces, over which they appointed soubahs; and those provinces, each of which might be styled an empire, were subdivided into nabobships; each nabob being immediately accountable to his soubah, who in process of time became almost independent on the emperor, or, as he is called, the Great Mogul, upon their paying him an annual tribute.

The Marattas at present make the greatest figure of all the Tartar tribes: Malwa, Berar, Orissa, Candesh, and Visipour, the principal part of Amednagur or Dowatabad, half of Guzarat, and a small part of Agimere, Agra, and Allahabad, are comprised within their extensive empire, which reaches from sea to sea across the widest part of the peninsula, and from the confines of Agra northward to the Kistna southward, forming a tract of about 1000 miles long, and 700 wide. This extensive country is divided among a number of chiefs, whose obedience to the Paiswah, or head, is merely nominal, and they are often at war among themselves, and with their head. For the last twenty years, their power has been on the decline. They are now a kind of mercenaries, who live on the mountains between Indostan and Persia. They commonly serve on horseback, and, when well commanded, have been known to prevail even to the court of Dehli. Though they are originally Gentooes, yet they are of bold active spirits, and pay no great respect to the principles of their religion.

A modern writer says, that the Mahometans or Moor are of so detestable a character, that he never knew above two or three exceptions, and those were among the Tartar and Persian officers of the army. We are indeed told, that they are void of every principle even of their own religion; and if they have any virtue, it is an appearance of hospitality, but it is an appearance only; for while they are drinking with, and embracing a friend, they will stab him to the heart. But, according to others, the Marattas, who have been unjustly represented as barbarians, are a great and rising people, subject to a regular government, the principles of which are founded in virtue. These people are at this time in friendship with the English; but a rupture taking place between them and Tippoo Saib, a formidable neighbouring potentate, the country of the latter was conquered by the English, their allies, in 1792.

The Gentooes have a remarkable manner of drinking. They religiously avoid touching with their lips the vessel that contains the liquor, and pour it into their mouths, holding the bottle, or other vessel, at least at a foot distance. They will drink from a pump, or any running stream, but not out of a standing pool; for their idea is, that stagnated water has a polluting quality.

The empire is hereditary, and the emperor is heir only to his own officers. The imperial demesne lands are those of the great rajah families, which fell to Tamerlane and his successors. Certain portions of them are called jaghire lands; and are bestowed by the crown on the great lords or omrahs, and upon their death revert to the emperor; but the rights of the sub-tenants, even of those lands, are indefeasible. All other lands go in the hereditary line, and continue in that state even down to the sub-tenants, while the lord can pay his taxes, and the latter their rent, both which are immutably fixed in the public books of each district. The Mahometan institutes prevail only in their great towns and their neighbourhood.

According to the Gentoo constitution, land is not private property, but belongs to the community in the several villages, but this does not extend to houses and gardens: these villages are supplied with their respective public officers, as the head-man, to execute justice; the conicopoly, to keep the accounts of the village; the corn-meter, smith, barber, doctor, astrologer, &c. The grounds are cultivated by the community, and the produce shared out in certain proportions to all. One is allotted to the Pagodas and Bramins, one to the government, another to the public officers, one to the repair of tanks or reservoirs of water, and the rest is distributed among the community: but the Mahometan government, and the intrusion of Europeans, have introduced some innovations in this ancient constitution, among which the farming the circar, or government shares, are particularly instanced.

The government of this great empire, the outlines of which we have now given, long subsisted without almost the semblance of virtue or probity among its great officers,

officers, either civil or military; till it was shaken after the overthrow of Mahomet Shah, by Kouli Khan, which was attended by so great a diminution of the imperial authority, that the soubahs and nabobs became absolute in their own governments. Though they could not alter the fundamental laws of property, yet they framed new taxes, which beggared the people, to pay their armies and support their power: so that many of the people, within these few years past, after being unmercifully plundered by collectors and tax-masters, were left to perish through want. To sum up the misery of the inhabitants, those soubahs and nabobs, and other Mahometan governors, employ the Gentoos themselves, and some even of the Bramins, as the ministers of their rapaciousness and cruelties.

Upon the whole, ever since the invasion of Kouli Khan, Indostan, from being a well regulated government, is become a scene of mere anarchy or aristocracy; every great man protects himself in his tyranny by his soldiers, whose pay far exceeds the natural riches of his government. As private assassinations and other murders are now committed here with impunity, the people, who know they can be in no worse state, concern themselves very little in the revolutions of government. To the above causes are owing the late successes of the English in Indostan. The reader, from this representation, may perceive, that all the English have acquired in point of territory, has been gained from usurpers and robbers; and their possession of it being guaranteed by the present lawful emperor, is said to be founded upon the laws and constitutions of that country. But notwithstanding this, we are sorry to be obliged to remark, that the conduct of many of the servants of the East-India company towards the natives, not being properly checked or punished, either by the directors, or the British legislature, has in too many instances been highly dishonourable to the English name, and totally inconsistent with that humanity which was formerly our national characteristic. But we hope the wisdom and justice of the British parliament will prompt them to punish the delinquents for past offences, find expedients for removing the present evils, and for preventing the like in future.

CHAP. XII.

INDIA BEYOND THE GANGES, CALLED THE FURTHER PENINSULA.

Situation, Extent, Mountains, Rivers, Soil, Produce, Trade, &c.

THIS peninsula is situated between the 9th and 10th deg. of east longitude, and between the 1st and 20th of north latitude; being about 2000 miles in length, and 1000 in breadth. It is bounded by Thibet and China, on the north; by China and the Chinese

sea, on the east; by the same sea and the Straights of Malacca, on the south; and by the bay of Bengal, and the Hindur India, on the west. The province of Meckler, and other districts, are subject to the king of Ava or Burmah, and lie between Bengal and China.

On the north-west, are the kingdoms of Acham, Ava, and Arracan, whose chief towns are Camdara, Ava, Arracan; containing 180,000 square miles.

On the south-west, are the kingdoms of Pegu, Mataban, Siam, Malacca. Their chief towns are, Pegu, east long. 97 deg. north lat. 17 deg. 30 min. containing 50,000 square miles. Mataban; Siam, east long. 100 deg. 55 min. north lat. 14 deg. 18 min. containing 170,000 sq. miles. Malacca, east long. 101 deg. north lat. 2 deg. 12 min. containing 48,000 square miles.

On the north-east are the kingdoms of Tonquin and Laos. Their chief towns are, Cachao, or Keccio, east long. 105 deg. north lat. 21 deg. 30 min. containing 122,000 square miles; Lanchang, containing 59,400 square miles.

On the south-east, lie Cochin-China, Cambodia, and Chiampa; whose chief towns are Thoanoa, containing 61,900 square miles; Cambodia and Padram, containing 60,200 square miles.

The whole of this peninsula was unknown to the ancients, and is partly so to the moderns. The name of India is taken from the river Indus, which of all others was best known to the Persians.

The air of this peninsula is very dry and healthy in the northern parts, but the southern provinces are very hot and moist, especially in the vallies, and low-lands near the sea and rivers, and therefore not so healthy notwithstanding which, the natives build most of their towns in these parts. They are obliged to erect their houses upon high pillars to secure them from the floods during the rainy season, at which time they have no communication with each other but by boats; and such storms of wind, thunder, and lightning happen, about the equinoxes on the shifting of the monsoons, as are seldom seen in Europe. The year is not divided into winter and summer, as with us, but into the dry and wet seasons, or into the easterly and westerly monsoons; a term sometimes applied to those periodical winds, and sometimes to the wet and dry weather. When the storms cease, there are sea and land breezes near the coast, which shift every twelve hours.

The mountains of this part of India run from north to south almost the whole length of the country. The mines of it yield gold, diamonds, rubies, topazes, amethysts, beryls, asterias or cat's-eyes, and other precious stones, in which the natives drive a great trade.

The principal rivers are, 1. The Domca, in Tonquin, which runs from north to south, and, passing by Cachao the capital, falls into the Chinese sea. 2. The Mecon, which running from north to south, through Laos and Cambodia, falls by two channels into the same sea. 3. The Menan, which runs from north to south through Siam, and falls into the bay of Siam. 4. The

The Domes, in Tenasserim, south, and, passing by the Chinese sea. 2. The channels into the bay of Siam. 4. The

or the great river Nou Kian, which joining the river Pegu, they both fall through one mouth into the bay of Bengal. 5. The Sanpoo, or Burrumpooter. Adjoining to this country are the promontories of Siam, Ronana, and Branfac; the bays of Bengal, Siam, and Cochinchina; and the Straights of Malacca and Singapore.

The soil is in general fertile, but more so in some places than others. Those are remarkably so which are watered by the torrents from the mountains, and the mud and slime left on the surface when the floods retire. There are produced all the delicious fruits found in other countries contiguous to the Ganges, as well as roots and vegetables. Areca and betle claim particular mention, from the unbounded use made of them by the Indians. The areca-tree nearly resembles the cocoa in its height and shape; but the trunk is smaller, and the leaves shorter. Under the leaves grows a long mass, which forms a bunch or cluster of fruit, resembling nuts or apricots, intermixed with flowers. About two months after the flowers are gone, the husk which covers the fruit begins to open and fall off, when an oblong fruit appears of the size of a middling plum, and of a whitish and shining colour; its shell becomes firm, compact, and reddish; the pulp contained in it is of a brown cast, bordering on red, and soft and astringent to the taste.

The betle is a plant which creeps along the ground like peas or hops, so that its stalk must be supported by props, or planted near the areca-tree, to which it fixes itself like ivy. Its leaf resembles that of the citron-tree, and becomes reddish when dried. When it is planted in watery places it produces a fruit shaped like a rat's tail, but bears none in climates which are too hot or too cold; in which places the inhabitants make use of the leaves prepared with lime of oyster-shells, instead of it.

An Indian is seldom seen without betle in his mouth, which they say strengthens the gums, preserves the breath, makes the breath sweet, is good for the stomach, promotes digestion, prevents wind and vomiting, to which they are very subject, and is an antidote against the scurvy. When they chew the areca, they mix the husk with the leaves of the betle, dividing a nut into eight or ten parts.

Their other productions are corn, rice, pepper, and a variety of garden-stuff and drugs. The principal fruit-trees are the palm, cocoa-nut, tamarind, quava, mango, plantains, orange, lemon, and pomegranate. Fine-apples and melons are likewise found here in the greatest plenty and perfection.

The trade and manufactures of this peninsula vary in the different kingdoms of it; but they principally consist in muslins, chints, dimities, calicoes, and silks. The natives are very ingenious in weaving, embroidering, and damming, especially the last; so that if a piece of muslin is torn, they join it with such neatness, as not to be discovered by the most curious inspection. Their

painting, though they are ignorant of drawing, is amazingly vivid in its colours. No nation exceeds them for inlaying in ivory; nor can they be equalled for cabinets, ecrutoires, and other curious works in wood, very finely lacquered. The fineness of their linen, and their fillagree work in gold and silver, far exceed those in any other part of the world. They have a method of covering canes with cases of beautiful tortoiseshell; and of making beads, little idols, bracelets, necklaces, and various toys, of a very transparent crystal, found in the mountains. In short, the commerce of India is courted by all trading nations in the world, and probably has been so from the earliest ages: it was not unknown even in Solomon's time; and the Greeks and Romans drew from thence their highest materials of luxury. The English, Dutch, French, Danish, and Swedish vessels resort thither annually. The greatest part of it, however, now centres in England, though that of the Dutch is very considerable. The French trade thither has been long on the decline, and that of the Swedes and Danes is very inconsiderable. The natives have some merchant ships of their own, in which they traffic with the countries bordering upon India; but their principal trade is with the Europeans.

Of the different Kingdoms on this Peninsula, and the Religion, Customs, Government, Constitution, &c. of their respective Inhabitants.

THE kingdom of Acham, or Azem, has China to the east, Indostan to the west, Tipra to the south, and Boutan, with part of Independent Tartary, to the north. It is one of the most fertile kingdoms in Asia, producing every thing necessary for the support of human life. It contains mines of gold, silver, steel, iron, and lead, the property of which the king has reserved to himself, on condition of not levying any taxes on the people. Great quantities of coarse silk are also produced here, especially a particular sort spun by a little insect resembling a silk-worm, which, when manufactured, bears a prodigious fine gloss, but it is not lasting. Two sorts of gum-lack are found in this kingdom, the best is of a red colour, and used by the natives in painting their linen; the other is made use of to varnish cabinets and make sealing-wax. Their gold is current in ingots, but they have pieces of silver coin of two shillings each in value.

The inhabitants towards the north have good complexions and indifferent features, but are subject to prodigious wens or swellings in their throats, owing to the bad quality of the water. Those in the southern extremity are swarthy and flat-nosed, but have no disagreeable swellings in their throats. The only covering they wear is a piece of cloth girt round their middle, and on their heads a cap or bonnet, hung round with bears' teeth. They bore very large holes in their ears, in

3 L which

which they hang pieces of gold and silver. The legs and arms of the most affluent among them are adorned with bracelets of coral and amber, while the poorer sort make use of tortoise and other large shells, formed into rings for this purpose. There is scarce a man in Azem but has a horse for himself, and an elephant to carry his wives, which are usually four; to every one of whom he assigns her particular domestic offices. They pay no taxes, they do not even work in the mines, slaves being purchased for that purpose. The favourite food of this people is dog's flesh, though all kinds of game, and other provisions, abound here. They have prodigious quantities of fine large grapes, from which they extract brandy instead of wine. The Azemites dispute the invention of gunpowder with the Chinese; and many circumstances conspire to decide this contested point in their favour.

These Indians, as well as the Chinese, had unquestionably the use of gunpowder before it was known in Europe; and the invention is generally ascribed to the Azemites.

The metropolis of this kingdom, and the residence of the king, which lies in 25 deg. 33 min. north latitude, is named Camdaras, Kemmeroofs, or Guergen: and the city of Azoo is the royal burial place. When any king is buried in the grand temple, his favourite idol is buried; this always being either of gold or silver, the vaults are filled with immense treasures. The people imagine that the righteous have, in the other world, plenty of what they desire, but that the wicked suffer all the miseries of hunger and thirst. Full of this notion, and not entertaining any very high idea of the morality or piety of their monarchs, they bury with them all kinds of edibles, great riches, several of their wives, officers, elephants, slaves, &c. lest they should fare worse in the other world than they did in this.

AVA; according to some accounts, is about 765 English miles in length, and 575 in breadth; but, according to others, it is about 800 miles long, and 250 broad. It is situated between 15 and 28 deg. north latitude: and is bounded, on the east, by Laos and Siam; on the west, by Bengal; on the south, by the Indian sea; and on the north by Thibet. It is said to be larger than the whole empire of Germany. It is in general a flat country and very fertile, yielding rice, fruits, garden-stuff, and a variety of wild and tame animals. It also contains mines of silver, lead, and copper.

The king assumes next to divine honours: his subjects approach him with the most abject reverence; and the highest title they aspire to, is that of his first slave. When they speak or write to him, they term him their kiak, or God; and in his letters to foreign princes, he arrogates to himself the title of King of kings, to whom all other kings ought to be subject. He is accounted near kinsman to all the gods in heaven and on earth; allied to all the planets; having the sun for his brother, and the moon and stars for his cousins.

Ava, the capital, carries on a great trade in musk and jewels; the latter are principally rubies and sapphires. Every town in the dominions of the king of Ava has a kind of aristocratical government. The subjects trade chiefly in musk and jewels, and in most particulars resemble those of Pegu.

ARRACAN, which is called by some the empire of Mogo, is bounded, on the east, by Ava; on the west, by the bay and country of Bengal; and, on the north, by Tipra: it extends about 400 miles in length; and contains a great number of places, many of which are uninhabited, from the numerous wild beasts that infest the whole country.

This kingdom enjoys a very salutary air, and is prodigiously fertile and pleasant; but, though situated in a warm latitude, it freezes very intensely when the winds blow from the north-east.

The inhabitants are in general very robust, and have broad flat foreheads, which is esteemed a beauty among them, large open nostrils, small quick eyes, and ears which hang down to their shoulders; the women are tolerably fair. Men of rank wear a vest, or shirt, of fine white calico, which fits close to the body and arms. Over it they have a long gown of the same species of linen, which buttons round the arms, and is tied close upon the breast with ribbons. They wear an apron which covers the belly and thighs before, with another piece of white calico, resembling a bag, which, being gathered in several folds, is fastened over the middle and falls down behind, so that they look as if they carried a large bundle of cloth about them. Their hair, which they suffer to grow to a prodigious length, is tied in tresses behind the head.

The women wear a kind of transparent flowered gauze, which, covering the bosom, passes over the shoulders. About their waists they fasten a quantity of very fine calico, which goes three or four times round them, and reaches down to their feet. Those who can afford it wear a silk scarf over one of their arms, and their hair is curled in a very becoming manner. They put rings of glass, silver, &c. in their ears; and sometimes they wear bracelets all the way up their arms to the elbows, and from the ancles to the calves of their legs; but the genteeler sort content themselves with a few, curiously japanned. They are, however, in general, very ostentatious, and usually make an appearance beyond their abilities.

A man may marry several wives, besides which, he is allowed as many concubines as he can maintain; but they are very indelicate in their amours, always preferring such women as have been openly connected with the Dutch and other foreigners; and, it is said, that those who marry a virgin even hire these people to consummate the nuptials.

Their conduct towards their sick is equally ridiculous, being always attended by a number of superstitious ceremonies, performed by the priests and the relations of the patient: but when a person is seized with

a disease, judges the banks of a river favoured by birds.

These idolaters which they bake and, it is said, built in form of thousand of them have their domes which they wear shoulders. Their heads shag called Pungrim, a yellow nitre. There are very little of them. There are several Lapins, who are themselves, and are by the people.

The navigation of Bengal and Pegu is little by sea. Foreign commerce is conducted by the great numbers. They send to Ormuz and Persia, which species. They live in unions of the dead, tin, stick-lead other precious

Arracan, are well fortified: it is miles in circumference stone walls, and mountains, so an almost impracticable within strongly in a fine river that and at length falls into the hands of the inhabitants in this of foreigners.

sick is equally afflicted with a number of superstitious priests and the rest of the people. A person is seized with a disease,

a disease, judged to be incurable, he is exposed on the banks of a river, where he is either drowned, or devoured by birds or beasts of prey.

These idolatrous people make their images of clay, which they bake in the sun, and then worship them; and, it is said, that some of their temples, which are built in form of a pyramid, contain no less than twenty thousand of these idols. Besides the temple idols, they have their domestic, or household gods, the marks of which they wear branded on their arms, sides, and shoulders. The priests are clothed in yellow, have their heads shaved, and all go uncovered, except those called Pungriui, who, being superior to the rest, wear a yellow mitre. They are all obliged to live single, and have very little communication with the rest of the world. There are a number of hermits among them, called Talapoins, who inflict very rigorous penances on themselves, and are for that reason held in very high esteem by the people.

The navigation of Arracan extends no further than Bengal and Pegu, so that the inhabitants trade very little by sea. Few of the natives attend at all to the foreign commerce which is carried on, it being chiefly conducted by the Mahometans, who are settled there in great numbers. Of these some trade in elephants, which they send to Orixá, the coast of Coromandel, Golconda, and Persia, which they barter for calicoes, silks, and spices. They likewise carry on a traffic with the dominions of the Great Mogul, in timber for building, lead, tin, stick-lack, elephants teeth, diamonds, rubies, and other precious stones.

Arracan, the capital of this kingdom, is large and well fortified: it is situated in a valley, and is fifteen miles in circumference. It is enclosed by very high stone walls, and surrounded by a ridge of steep craggy mountains, so artificially formed as to render a penetration almost impracticable; besides which, there is a castle within strongly fortified. The city is well watered by a fine river that passes through it in different streams, and at length forms two channels, which empty themselves into the bay of Bengal. The number of inhabitants in this city are estimated at 160,000, exclusive of foreigners. The houses in general are small, and built of bamboos; but those of the better sort are spacious and handsome: in it are upwards of 600 idol temples, most of which are spacious buildings, elegantly ornamented. The palace is exceeding magnificent, being decorated with the most costly ornaments. The apartments are lined with various kinds of wood that discharge the most agreeable fragrance; and the roofs of those belonging to the king are covered with plates of gold. In the centre of the palace is the grand hall, which contains a canopy ornamented with wedges of solid gold, resembling sugar-loaves.

The province of Pegu is situated between the 110th and 116th degrees of longitude, and between the 17th and 20th degrees of north latitude, being about 350 English miles in length, and almost the same in breadth.

This kingdom is very salutary and fertile, the soil being enriched by the inundations of the river Ava; and it also abounds in elephants, buffaloes, goats; hogs, all sorts of game, particularly stags, and exceeding fine poultry.

The inhabitants are of a tawny complexion; and the women, according to the character given of them by all travellers, strangers to modesty. This, however, renders them the more agreeable to their own countrymen, for, it is asserted, that no Peguan, from the king to the peasant, will marry a woman who has not previously lived with an European. Fathers offer their daughters to strangers for a certain term, and most of the foreigners who trade with them, marry a wife for the time of their stay. Their common drink is water, or a liquor distilled from the milk of the cocoa-nut; and rice, made into cakes, serves them instead of bread.

The priests of this country are called talapoins, who recommend charity and humanity as the greatest of all virtues; and indeed these men do honour to human nature, if the accounts given of them be literally authentic. When the master of a vessel happens to be shipwrecked on the coast, and he, by this calamity, becomes the slave of the sovereign, the talapoins humanely intercede for him, and get him into their pious care and protection. In their temples these good men supply a distressed stranger with every thing he wants; and as they are physicians as well as priests, they tenderly take care of sick persons; and, after their recovery, give them letters of recommendation to some other convent on the road they travel.

The riches of the king, when an independent state, were almost incredible; some of his idols, as big as life, being of massy gold and silver. His revenues arose from the rents of lands, of which he was sole proprietor, and from duties on merchandize; so that some thought him to be the richest monarch in the world, except the Chinese emperor. He was said to be able to bring a million, and, on occasion, a million and a half of soldiers, to the field, well clothed and armed; and to be master of 800 trained elephants, each with a castle on his back holding four soldiers.

The constitution of this empire is of the feudal kind, for the king assigns lands and towns to his nobles upon military tenures. In the year 1754, Pegu was reduced to the state of a dependent province by the king of Ava. Macao is the great mart of trade here.

MARTABAN, or Martavan, in the bay of Bengal, was once a kingdom, but is now only a Siamese province. It is 300 miles long, 115 broad; and is so fertile as to have annually three harvests, and is blessed with such a pure air, that the inhabitants never are afflicted with the head-ach. It produces, besides corn, oranges, lemons, figs, pears, chestnuts, medicinal plants, oil of jessamy, gold, silver, steel, iron, lead, copper, rubies, lacque, benzoin, &c. The people make a kind of black porcelain, with which they trade to Malacca.

The

The kingdom of SIAM is about 834 English miles in length, and 400 in breadth where widest, but in some places it is not above half so much. It is surrounded by high mountains, which on the east side separate it from the kingdoms of Cambaja and Laos; on the west, from Pegu; and on the north from Ava, or, more properly, from Jangoma; on the south it is washed by the river Siam, and has the peninsula of Malacca, the north-west part whereof is under its dominion.

By the overflowing of the river Menan, in the month of March, annually, the country is entirely under water for 120 miles round. These inundations leave a mud and slime behind them, which, together with the earth washed down from the mountains, render the land very fertile. The vegetable and animal productions, together with the minerals in this kingdom, are the same with those already mentioned in Azem or Pegu, &c.

The inhabitants of both sexes are more modest than any found in the rest of this peninsula. They are of a good stature, seldom corpulent, and have tawny complexions. The faces of both men and women are broad, with high cheek bones, but their fore-heads and chins suddenly contract and terminate in a point. They have dark small eyes, hollow jaws, large mouths, thick pale lips, short noses, large ears, and thick lank hair, which both men and women cut so short, that it reaches no lower than their ears. The dress of the better sort is much the same as that of the other kingdoms in this peninsula; but as to the common people, they go almost naked. The king wears a cap in the form of a sugar-loaf, ending in a circle of precious stones; and those of his officers have circles of gold, silver, or vermilion gilt, to distinguish their quality, which entirely depends upon the possession of places, for there is no such thing as nobility among them. The Siamese, in their manners, are civil, courteous, and timorous; they have a ready and clear conception, and soon attain any art that is taught them; their rural sports are fishing and hunting; they also act comedies by torch light, from evening till morning, and observe a great number of festivals.

As to religion, every Siamese temple has its convent of friars annexed to it, and they are said to have a proportionable number of nunneries. Besides the images in their temples, whereof the elephant and the horse are the chief, they worship almost every thing animate and inanimate; beasts, birds, fishes, woods, mountains, rivers, &c. and like all the inhabitants of this peninsula, and many other parts of Asia, &c. believe in the doctrine of transmigration. They have two languages, one termed Balli, which is the learned or sacred language; the other which is spoke in common, is, in some respects, similar to the Chinese, but in others very different.

The king is the most haughty and despotic monarch upon earth, and the respect he demands from his subjects borders upon adoration. Even in council, which lasts sometimes four hours, the ministers of

state, and the mandarins, are continually prostrated before him; they never speak to him but on their knees, with their hands raised to their heads, making every moment profound reverences, and accompanying their discourse with pompous phrases, celebrating his power and his goodness. When he goes abroad, all are obliged to keep within doors: in short, all his subjects are his slaves, who possess nothing but what belongs to him, and he commands their service both in peace and war. His revenues arise from the lands of the crown, and a rent paid him in kind out of all the lands in his dominions, also by monopolies of almost every branch of trade; but he does not receive above six hundred thousand pounds per annum in money.

They have a silver coin in Siam called a tyeal, worth about three shillings and three halfpence, but they have neither gold nor copper money. Those shells, called cowries, serve to buy trifles: they are current in all those countries; and differ in value according to the plenty or scarcity of them: in Siam, 800 of them are equal to one penny.

The city of Siam is ten miles in circumference; and many navigable canals, whose sources are in the river Menan, pass through it. The walls are thick and high; built of stone and bricks, of both which materials some of the bridges are erected, though most are built of wood. The only public structures worth notice are the palaces; and the temples, which are gilded on the outside that the effulgence of the sunbeams reflect from them, and dazzle the eyes of the beholders. One of the latter, which is a square building, contains 100 idols, placed in niches four feet from the ground: they are as big as life, sit cross-legged and are all gilt.

The streets are narrow, but regular; the houses are built on raised ground, by reason of the frequent inundations; and the inhabitants in the rainy seasons go about their business in boats. All the houses are built of timber or cane, except one street, which contains 200 brick dwellings of only one story.

The river will contain vessels of 400 tons burthen, and divides the city into eight parts. The markets here are well stocked with cattle, wild and tame; rice, fruits, pulse, roots, &c. and the trade consists of the admirable gems of Pegu, silver bullion, manufactured iron, broad flannel cloth, looking-glasses, &c. China-wares are cheaper than at Bantam.

Bankok, which stands about eighteen leagues to the south of Siam, is the only place towards the coast that is fortified with walls, batteries, and brass cannon.

MALACCA is a large country, and contains several kingdoms or provinces: but the Dutch are said to be real masters and sovereigns of the whole peninsula, being in possession of the capital city. The inhabitants differ but little from brutes in their manner of living; and yet the Malayan language is reckoned the purest of any spoken in all the Indies. We are told by the latest travellers, that its chief produce is tin, pepper, elephants

elephants teeth, and pretend it is the most ancient, and their riches by an excellent situation in China; so that the Portuguese, who Dutch, Malacca, Goa and Orissa, Moluccas, &c. The city of Malacca, surrounded by the streets are full of trees on both sides, and some of them are handsome and cultivated by 2000 the best and safest vessels from most of the Portuguese being a grand market before the Dutch commerce, it has a command, Siam, respect its commerce as well as the degenerate formerly an industry the tyranny of they should never slavery and ignorance. Here is a kind of English in their command, and the commerce is conducted by a council, who little provided they caniling by it. The Malays are in manner of beasts, desirous of having, that, as soon as they offer them their means they shall be content, that there is a country, who in the European manner, which reach towards, and they are always sleep. The inland people much in mischief by ground but will burn it. Rice is cultivated; but chiefly on the articles of servants-teeth, rose

and contains several Dutch are said to be the whole peninsula. The inhabitants their manner of living; reckoned the puzul

We are told by the produce is tin, pepper, elephants

elephants teeth, canes, and gums. Some missionaries pretend it is the Golden Chersonesus, or peninsula of the ancients, and that the inhabitants used to measure their riches by bars of gold. The truth is, that the excellent situation of this country admits of a trade with China; so that when it was first discovered by the Portuguese, who were afterwards expelled by the Dutch, Malacca was the richest city in the east, next to Goa and Ormur, being the key of the China, Japan, Moluccas, and Sunda trade.

The city of Malacca is an extensive and populous place, surrounded with a stone wall and bastions: many of the streets are spacious and handsome, and are shaded with trees on both sides: the houses stand pretty close to each other, and are built chiefly of bamboos, though some of them are of stone. The governor's house is handsome and commodious, and is situated in the fort, surrounded by 200 Europeans. The harbour is one of the best and safest in that part of the globe, and receives vessels from most parts of the Indies. When possessed by the Portuguese, the city was remarkably opulent, being a grand mart for precious stones and gold; and before the Dutch made Batavia the chief place of their commerce, it had all the rich commodities of Pegu, Coromandel, Siam, Banda, and other countries: but at present its commerce is not very considerable, which, as well as the degeneracy of the Malaysans, who were formerly an industrious people, is easily accounted for by the tyranny of the Dutch, whose interest it is that they should never recover from their present state of slavery and ignorance.

Here is a kind of smuggling trade carried on by the English in their country ships, from the coast of Coromandel, and the bay of Bengal, to Malacca. This commerce is connived at by the Dutch governor and council, who little regard the orders of their superiors, provided they can enrich themselves from the profits arising by it.

The Malays are in general savages, and live after the manner of beasts. They are extremely swarthy, and so desirous of having children as white as the Europeans, that, as soon as they arrive on their coast, they offer them their wives and daughters, thinking by that means they shall obtain their wishes. It is however asserted, that there are another sort of people in this country, who in shape, as well as complexion, resemble the Europeans, having grey eyes, and yellowish hair, which reach to the women's hips; their feet turn upwards, and they can see only in the night, and therefore always sleep till sun-set.

The inland people, called Morakabos, delight so much in mischief, that if the Malaysans sow grain in any ground but what is well fenced, they come down and burn it. Rice, or any other kind of grain, is very little cultivated; and in some of these parts the people subsist chiefly on sago.

The articles for trade are gold, tin, pepper, elephants-teeth, rose-wood, cinnamon, eagle and kalam-

bak-woods, sapan-wood, diamonds, gum-benjamin, rattans, and canes.

TONQUIN.

THE kingdom of TONQUIN is bounded on the east and north by the empire of China; on the west, by the two small kingdoms of Laos and Bowes, bordering on Siam; and on the south and south-east by Cochinchina. It is about 400 miles in length, and 300 in the broadest part.

As to the climate of Tonquin, this country being situated under the tropic, the weather is extremely variable; however, their two chief distinctions with respect to this, are those of the dry and rainy seasons; the former of which is the more agreeable, and continues from September to March; during which time, the north-wind blows without intermission, and the air is healthful, except in January and February, when the weather is frequently very severe. The rainy season begins in April, and ends in August, the south-wind blowing all the time; the three first months of this season are very unhealthy. During the months of June, July, and August, the heat is very intense; nevertheless, the country, at this time, has a most pleasing and beautiful appearance; the trees are loaded with fruit, and the plains covered with a rich harvest. However, as the land mostly lies low, particularly near the sea, it is subject to frequent inundations; and when these are greater than usual, the natives are considerable sufferers.

The inhabitants are of a tawny colour, though not so deep as most other Indians. Their faces are oval, and generally flattish, notwithstanding which they have a graceful appearance. Their hair is black, long, and lank, and both sexes affect to have their teeth as black as ebony, white ones being esteemed a great defect. The men are of a strong, hardy constitution; and the higher class of women very modest and reserved. They are dressed much in the same manner, wearing a straight, long robe, close at the neck, and reaching down to the heels, which is kept close to the waist by a girdle of silk, or gold and silver tissue. The ladies cover their heads with a sort of very broad hat, made of the leaves of a tree, and adorned with a net-work of thread curiously wrought: it is the custom of the country to go barefooted all the year.

The Tonquinese are indefatigable in whatever business they apply themselves to: their judgment is just, their memory retentive, and they are capable of long application; but on the other hand, they are said to possess a most unbounded love for gaming, and that the lower class are insufferably indolent. They are, however, excellent mechanics, and fair traders; but greatly oppressed by their king and great lords. His majesty engrosses the trade, and his factors sell by retail to the Dutch and other nations. The Tonquinese

are fond of lacker-houses, which are unwholesome and poisonous. The people in the south are a savage race, and go almost naked, with large silver and gold earrings, and coral, amber, or shell bracelets.

Silks, cottons, and lackered ware, are the principal manufactures of Tonquin. The trade of it is carried on almost entirely in foreign bottoms, and the articles exported from thence are aloes, turpentine, musk, rhubarb, and several other drugs, saltpetre, sulphur, spices, &c.

In Cachao, the capital of this kingdom, the English have a very flourishing house, conveniently fitted up, with storehouses, offices, and noble apartments for the merchants, factors, and other officers belonging to the company. The chonah, or chief governor, generally resides in this city, which is situated in the centre of the country. The bua's palace is a vast structure, and has a fine arsenal.

The natives are all Pagans, and, among other animals, worship the elephant and horse. They are exceedingly superstitious, great pretenders to astrology and the black-art, and strict observers of times and seasons.

Tonquin was originally under the Chinese government; but having revolted, a civil war ensued, which continued some centuries: at last a compromise was effected between the contending parties, wherein it was agreed, that the representative of Din, the first revolter, should enjoy all the executive powers of the government, under the appellation of Chouah; and that the heir of the ancient kings should retain the royal titles, with some other inconsiderable prerogatives, exercised within the limits of his own palace, from whence neither he, nor any of his family, stir but four times in a year, when they are allowed to stay out six days each time, being always attended by officers, or spies, appointed by the chonah. In the mean time, this bua, or real monarch, reigns with the utmost despotism: every subject is obliged to pay him a land-tax, according to his circumstances, and the fertility of his lands; besides which, they are bound to pay him a personal service of six months in every year, for which he only allows them a bare subsistence, and even that is in his power to refuse.

THE KINGDOM OF LAOS.

Boundaries, Produce, Inhabitants, &c.

THIS is a rich plentiful country, but is little visited by Europeans. It is bounded on the east by Cochinchina and Tonquin; on the west, by Brama; on the north, by the lake Chamay; and on the south, by Cambodia and Siam. Its extent cannot with certainty be ascertained; but the general opinion is, that it reaches from the 15th to the 25th degree of north latitude.

The most valuable article produced in this country is gum benjamin, which is esteemed the best in quality of any throughout the Indies; it grows in great abundance, and brings so considerable a revenue to the king, that the exportation of it is severely prohibited. The gardens abound with a great variety of fruit, and they have rice in abundance, which, though different in taste from that of any other country, is esteemed the best in the east. They have a great plenty of honey, wax, cotton, amber, and musk; and ivory is so highly valued, from the great number of elephants with which the country abounds, that the teeth are used for fences to their fields and gardens. They have prodigious herds of beeves and buffaloes, and the rivers abound with all kinds of fish, some of which are of an immense size. In these rivers are found gold and silver dust; and in several parts of the country are mines of iron, lead, and tin. Salt is also produced here in great abundance, and prodigious quantities of it are exported to foreign parts. It is formed by a white froth left on the rice-fields after harvest, which afterwards becomes condensed by the heat of the sun.

The inhabitants of Laos, called Langians, are naturally very affable in their disposition; and though they envy such as are in a more eligible situation than themselves, yet they are strictly honest, and appear to be unstrangers to avaricious sentiments. They are in general well-shaped, and though their complexion is of an olive cast, yet they are much fairer than their neighbours: the women are very modest in their carriage, and in other respects little inferior to the women of Portugal.

Their food principally consists of rice, the flesh of the buffalo, and several kinds of pulse: they eat four meals a day, and have very great appetites, notwithstanding which, they are seldom afflicted with any distempers. They sometimes eat fowls, which they dress without plucking off the feathers; and they kill them by striking them on the head with a stick, the shedding of blood being considered as one of the greatest crimes.

Their employment principally consists in husbandry and fishing; but they are naturally of an indolent disposition, nor will they attend business till they are reduced to it from absolute necessity.

A robbery is here seldom heard of, but when such circumstances do happen, if the criminal cannot be found, the neighbours must make restitution to the parties injured.

Their marriage ceremonies consist only in the parties promising before two who have been some years joined in wedlock, that they will be true to each other so long as they shall live; but they often part from the most trifling circumstances, and this may be attributed to the insignificance of the mode by which they are joined together.

If a woman is found guilty of adultery, she is deprived of her liberty, and for the rest of her life is con-

sidered as an abject slave, and undergoes a severe treatment.

Fornication is severely punished in the talapoins, and under severe penalties.

The talapoins are a religious order, who from their childhood are devoted to a life of poverty, when they are admitted into the order, they are obliged to be very industrious, and to perform the most humble and laborious offices, and to be perfectly free from all manner of pride and arrogance.

The Langians are a people who deny the truth of the Christian religion, after the good assurance given them by the sun, and that the heavens were created by them, they return to the same error, and confirmate their

The king presides in all the civil or military employments, and the property of individual subjects is sacred to their purposes as he can be said to owe the least homage to any foreign, who count themselves monarchs. This is his superiority of years, which are reckoned by his shoulders.

In order to show respect for him, and his subjects testify their gratitude by their rejoicings. Several of them are obliged to pay the king, and they acknowledge their presents.

The metropolis is Lanhang, and the interior part of the kingdom is defended on the other by a palace is very lofty, and is surrounded by high walls and other fortifications. In circumference, and the apartments are so richly garnished with carpets instead of mats.

...sidered as an absolute slave, and must be subject to such
...severe treatment as her husband shall think proper to
...inflict.

...Fornication is permitted among the laity, but
...the talapoins, or priests, are prohibited from it
...under severe punishments. Polygamy is also al
...lowed.

...The talapoins, or priests, are under tuition from
...their childhood till they are twenty-three years of
...age, when they undergo an examination, and, if ap
...proved of, are immediately appointed to the order of
...priesthood. In the exercise of their office, they are in
...general very indolent; and though they originate from
...the most humble stations, they afterwards assume an in
...sufferable arrogance.

...The Langians profess the pagan religion. Those
...who deny the transmigration of souls, affirm, that the
...wicked, after death, are irredeemably lost; but that
...the good assume a body of air, as light and pure as the
...sun, and that after insensibly passing through sixteen
...heavens, where they enjoy the most perfect felicity,
...they return to their natural shape, and enjoy a state of
...consummate felicity.

...The king preserves an unlimited power in all cases,
...whether civil or ecclesiastical; and all honours and em
...ployments are solely at his disposal: the private prop
...erty of individuals is liable to be converted to such
...purposes as he shall think proper; so that no family
...can be said to enjoy their own possessions. The great
...est homage is paid by all ranks of people to the sove
...reign, who considers himself as superior to all other
...monarchs. The characteristic by which he denotes
...his superiority over them, is from the length of his
...ears, which are so distended by weights as to hang upon
...his shoulders.

...In order to impress his people with a due sense of
...respect for him, he appears in public twice every year;
...and his subjects are so elated on this occasion, that they
...testify their gladness by the most distinguished re
...joicings. Several tributary kings come to court, in or
...der to pay their homage to the king of Laos, and
...they acknowledge their submission to him by magnifi
...cent presents.

...The metropolis of this kingdom is by some called
...Lanchang, and by others Lanjeng. It is situated in
...the interior part of the kingdom, in 18 deg. north lat.
...it is defended on one side by the great river Lao, and
...on the other by high walls, and broad ditches. The
...palace is very lofty and magnificent, and, with the of
...fices and other buildings, extends more than two miles
...in circumference. The architecture is exceeding grand,
...and the apartments within are furnished in the most
...sumptuous manner; the basso-relievo's in particular
...are so richly gilt, that they appear as if covered with
...panes instead of leaves of gold.

...The houses of the better sort are built of wood, are
...very lofty and handsome, and elegantly furnished; but
...those of the common sort are very low and mean. The

...talapoins or priests only have liberty to build their houses
...of brick or stone.

COCHIN, OR WESTERN CHINA.

Extent, Boundaries, Inhabitants, &c.

...THIS country is about 500 miles in length, but
...much less extensive in its breadth from east to west. It
...is situated under the torrid zone, and extends, accord
...ing to some, from the 8th to the 17th, and, according
...to others, from the 12th to the 18th deg. of north lat.
...being bounded on the east by the Chinese Sea; on the
...west, by Laos and Cambodia; and on the north, by
...Tonquin. It was originally a province of Tonquin,
...but has for upwards of 300 years formed a distinct
...kingdom, and is, like Tonquin, tributary to the Chi
...nese emperor.

...The houses are built of canes entwined together, so
...that the walls resemble the sides of a wicker basket,
...and these they plaster over with a kind of mortar made
...of dirt or lime.

...The inhabitants of this kingdom resemble the Sia
...mese in their stature and complexion, and the sexes are
...scarce distinguishable by their dress, which consists of
...a long gown, bound round them with a sash: people of
...distinction usually wear silk, but they prefer English
...broad-cloth, when it is to be purchased: the inferior
...sort wear cotton cloth, dyed of a dark colour. They
...are excellent mechanics, and very fair dealers. Their
...chief food is rice, pulse, and fish variously dressed and
...seasoned. Their common drink is tea, and they
...have also some strong liquors, brewed or distilled
...from rice. Their government is nearly the same as
...that of China.

...The king has an absolute power over the lives and
...fortunes of his subjects, and conducts all the affairs of
...his dominions in the most despotic manner, without
...consulting his ministers. His revenues, which are im
...mense, arise from the sale of odoriferous woods, gold
...dust, and elephants teeth. One third of all the rice
...produced in the kingdom is his, and he receives yearly
...tributes of considerable value from all the provinces
...subject to him, besides other prodigious taxes and ad
...vantages.

...The religion, marriages, funeral ceremonies, &c. of
...the Cochinchinese, are the same as those of the Ton
...quinefe.

...CAMBODIA, OR CAMBOYA, is situated on the east
...side of the Gulf of Siam. Its greatest length, from
...north to south, is about 520 English miles; and its
...greatest breadth, from west to east, about 398 miles;
...being bounded, on the west, by Cochinchina; by the
...Indian-Ocean, on the south; and by the kingdom of
...Laos, and the Keinois mountains, on the north. The
...river

river Mecon, which is very spacious, runs through it, the banks of which are the only habitable parts of the nation, on account of its sultry air, and the pestiferous gnats, serpents, and other noxious animals bred in the woods.

The soil, commodities, trade, animals, and products by sea and land, are much the same with those of the other kingdoms of this vast peninsula.

The betle (already noticed in the general account of this peninsula) is a plant of a particular flavour, and, as they say, an excellent remedy for all those diseases that are common to the inhabitants of the East-Indies, is the highest luxury of the Cambodians, from the king to the peasant; but it is very unpalatable and disagreeable to the Europeans.

The same barbarous magnificence, despotism, ignorance, and idolatry, prevail here as throughout the rest of the peninsula.

Their capital, Cambodia, which is the only city here worth notice, is situated on the river Mecon, about 100 miles from the bar. It is built on a rising ground, in order to avoid the annual overflowings of the river, and principally consists of one large street. About the centre of it is a palace for the residence of the prince; it is a very insignificant edifice, surrounded by a kind of wall, with ramparts, on which are several pieces of artillery.

Between Cambodia and Cochlin-China lies the little kingdom of Chiampa, the inhabitants of which trade with the Chinese, and seem therefore to be somewhat more civilized than their neighbours.

We shall close our description of this peninsula, with some account of the kingdom of Tipra, or Tipoura, which is bounded by the empire of Ava, and part of China, to the south and east; by Independent Tartary, to the north; by Arracan, to the south-west; and by Indostan, to the west. Lying under the tropic of Cancer, it is exceedingly hot, the air is nevertheless pure and salubrious; but the water is so bad, that it occasions the throats of the inhabitants to swell to a prodigious size.

The sovereign of this country is tributary to the king of Arracan: he exports gold and silver to China in ingots, and in return receives silver, which is coined into two species of currency, at 20d. and 22d. value each: gold is coined into aspers, which are worth about 5s. apiece.

CHAP. XIII.

INDIA WITHIN THE GANGES.

Extent, Boundaries, Climate, Seas, Bays, Inhabitants, Produce, &c.

THIS extensive empire (including the peninsula west of the Ganges) is 2000 miles in length, and 1500 in breadth; situated between 7 and 40 deg. north lat.

and 66 and 92 deg. east long. and occupies a space of 870,910 square miles. Its boundaries are Utbeck Tartary, and Thibet, on the north; Thibet and the Bay of Bengal on the east; the Indian Ocean, on the south; and the same sea, with Persia, on the west: the Mogul empire, or Indostan, properly so called, being the main land.

The north-east division of India contains the provinces of Bengal Proper, Naugracut, Jessuat, Patna, Necbal, Gore, Rotas; whose chief towns and places are Calcutta, Fort William, Hugly, Decca, belonging to the English; Malda, English and Dutch; Chaugan, Cassumbazar, Naugracut, Rajapour, Patna, Necbal, Gore, Rotas.

The north-west division on the frontiers of Persia, and on the river Indus, contains the provinces of Saret, Jesselmere, Tata, or Sinda, Bucknor, Moultan, Haican, Cabul; the chief towns of which are Jagual, Jesselmere, Tata, Buc. nor, Moultan, Haican, Cabul.

The middle division contains the provinces of Candish, Berar, Chitor, Ratipor, Navar, Gualcor, Jaugapour, Asmer, or Bando; their chief towns are Madipour, Berar, Chitor, Ratipor, Navar, Gualcor, Agra, Delhi, Lahor, Hendowns, Cassimere, Jaugapour, Asmer.

In this climate, the winds generally blow from the south months from the south, and six from the north. In April, May, and the beginning of June, the weather is excessively hot, but there are refreshing sea-breezes; and in some dry seasons, the hurricanes, which tear up the sands, and let them fall in dry showers, are excessively disagreeable. The English, and the Europeans in general, who arrive at Indostan, are commonly seized with some illness, such as flux or fever, in their different appearances; but when properly treated, they recover, and afterwards prove healthy, especially if the patients are abstemious.

Indostan is surrounded on three sides by mountains. The most remarkable are those of Caucasus and Naugracut, which divide India from Persia, Utbeck Tartary, and Thibet, and are inhabited by Marattas, Afghans, or Patans, and other people more warlike than the Gentoos. The mountains of Balegaut, which run almost the whole length of India from north to south, and cut the peninsula of India in two, are so high, that they stop the western monsoon, the rains beginning sooner on the Malabar coast, than on the coast of Coromandel. These mountains are only passable in certain places, through which roads have been made for the sake of commerce.

The most remarkable rivers are the Indus and the Ganges. The Indus is by the natives called Sindh, or Sindh, and is formed of about ten principal streams, which descend from the Persian and Tartarian mountains on the north-east and north-west.

commonly

commonly styled the River Attock; below Moultan, it is often named the Soor, until it divides itself into many channels near Tatta, where the principal branch takes the name of Mehran. Besides these famous rivers, many others water this country, as the Behat, or Helium, the Hydaspes of Alexander, the Jenau, or the ancient Acelines, or Beah, Batege, Jumna, and the Rauvee, formerly the Hydaspes, on the south bank of which stands the city of Lahore.

The Gentoos are persuaded, that the waters of the three great rivers, Ganges, Kistna, and Indus, have the sacred virtue of purifying from all pollutions and sins, those who bathe in them. This religious idea seems to be founded on a principle of policy, and intended to restrain the natives from emigrating into distant countries; for it is remarkable, that the sacred rivers are so situated, that there is not any part of India where the inhabitants may not have an opportunity of washing away their sins, as they suppose.

The Ganges, which rises in the mountains of Thibet, with its different branches, runs through the kingdoms of Bengal, Bahar, and Orixia, and the upper provinces of Oude, Rohilcund, Agra, Delhi, and Lachore, being a course of about 3000 miles. The Kistna divides the Carnatic from Golconda, and runs through the Villapore into the interior parts of the Deccan. And the Indus, bounding the Guzarat provinces, separates Indostan from the Persian dominions.

The seas, bays, and capes, are as follow: the Indian-Ocean, the Bay of Bengal, Capes Comorin and Diu, the Gulf of Cambaya, the Streights of Ramana-kael.

With respect to the inhabitants, as we have already made a general review of this great empire, it is therefore necessary only to add, to what was said of their religion and sects, that the fakirs are a kind of Mahometan mendicants or beggars, who travel about, practising the greatest austerities; but many of them are impostors. Their number is said to be 800,000. Another set of mendicants are the joghis, who are idolaters, and are supposed to be twelve millions in number, but all of them vagabonds, and have been impostors, who live by amusing the credulous Gentoos with foolish fictions. The Banians profess the Gentoos religion, or somewhat like it: they serve as brokers, and take their name from their affected innocence of life.

There are likewise the Persees, or Parses, of Indostan, who are originally the Gauris: they are a most industrious people, particularly in weaving, and architecture of every kind. They pretend to be possessed of the works of Zoroaster, whom they call by various names, and which some of the Europeans suppose contain many particulars that would throw some light upon ancient history, both sacred and profane. Though this opinion may be countenanced by the few parcels of those books that have appeared in the world; nevertheless, some think, that the whole is an imposture,

founded upon sacred, traditional, and profane histories, aided by religion. They are styled worshippers of fire, and are known as paying divine adoration to it; but, we are told, only as an emblem of the Divinity, and as his chief agent in the system of the universe. They never, indeed, extinguish fire, but will stand for hours by their lamps, putting up their prayers to God, with folded hands, and their eyes turned towards heaven with great marks of devotion. They utter ejaculatory prayers all day long, and constantly mix business, and even common conversation, with devotion.

The Persees have a superstitious veneration for cocks and dogs. They breed great numbers of dogs at their own houses, and feed them regularly twice every day with rice and ghee. To all dogs, whether their own, or not, they are very hospitable. Whenever they see a dog, they presently call him, and offer him food. If you walk abroad with a dog in any of their villages, you presently hear the cry of Jo! Jo! at every turn, each striving to be the first to entertain your dogs. These animals are also sacred in all the Turkish dominions.

The dogs on the island of Bombay, a few years ago, were many of them mad; whereupon an order was given by the governor, for killing all dogs without exception. When this order was known, the Persees were greatly alarmed, met together, and entered into a solemn league and covenant in defence of their dogs, threatening to protect their lives at the risque of their own. It was therefore thought prudent not to insist on the execution of the decree that had been issued against those faithful and affectionate domestics, but to suffer them to live.

Hunting with the bow, as well as the gun, is a common diversion among the nobility and people of rank, who often train up leopards to the sports of the field. Like other people in hot countries, they affect shady walks and cool fountains. They are fond of tumblers, mountebanks, and jugglers; of barbarous music, both from wind and stringed instruments, and play at cards in their private parties.

Their houses make no appearance, and those of the commonalty are poor and mean, and generally thatched, which renders them subject to fire; but the manufacturers choose to work in the open air; and the insides of houses belonging to principal persons are many of them magnificent, and in general neat, commodious, and pleasant.

With respect to trade and manufactures, it appears, from the most authentic accounts, that the empire of Indostan, particularly the kingdom or province of Bengal, from the mildness of its climate, the fertility of its soil, and the natural industry of the Hindoos, has been always remarkable for its commerce. Every village has its canal, every town its river, and the whole kingdom the Ganges, which falling by various mouths into the Bay of Bengal, opens a noble communication with the ocean, for exporting the produce and manufactures of this famous country.

While the house of Tamerlane filled the throne of Indostan, the balance of trade was greatly in favour of Bengal. Sensible of the advantages they themselves derived from a free commercial intercourse between their subjects, they were invariably the protectors of merchants. The military ideas which they brought from Tartary, prevented the military servants of the crown from engaging in trade; and therefore monopolies of every kind were discouraged, and almost unknown. No government in Europe was ever more severe against forestalling and regrating, than that of the moguls in India. A small duty was paid to the crown, but this was amply repaid by the noble security given to the merchant.

The commerce of the English, Dutch, French, Danes, and Portuguese, was principally carried on with bullion: and it appears from a very moderate computation, that no less than 917,500*l.* sterling, in bullion, were thrown annually into that kingdom by the Europeans only. The exports of Bengal to the gulphs of Persia and Arabia were very great, and brought home annually in gold into her coffers 375,000*l.* Her trade in opium and piece-goods to the peninsula beyond the Ganges, to the Malayan and Philippine-Islands, brought yearly a balance in her favour of 150,000*l.* The inland trade of Bengal, with the upper provinces of Indostan and Assam 250,000*l.* And the coasting trade with the coasts of Coromandel and Malabar, 100,000*l.* So that the annual balance of trade in favour of Bengal, was 1,852,500*l.* sterling. Out of which take 1,250,000*l.* remitted annually to Delhi, and there remains 602,500*l.* yearly acquisition. Bengal was at that period one of the richest, most populous, and best cultivated kingdoms in the world; but the troubles and civil wars which succeeded, have been attended with the most tragical events. The country has been depopulated, distresses of every kind have succeeded to plenty and ease. Many of the principal cities have been rendered desolate, the most fertile fields laid waste, and near five millions of harmless and industrious people either expelled or destroyed. These dreadful disasters have greatly impoverished this once flourishing country, now become so highly interesting to the subjects of Great-Britain.

The Mahometan merchants in India carry on a great trade with Mecca, in Arabia, from the western parts of this empire, up the Red-Sea. This trade is carried on in a particular species of vessels, called junks, the largest of which, we are told, besides the cargoes, will carry 1700 Mahometan pilgrims to visit the tomb of their prophet. At Mecca, they meet with Abyssinian, Egyptian, and other traders, to whom they dispose of their cargoes for gold and silver: so that a Mahometan junk is often worth 200,000*l.* on his return from his voyage.

Before we enter upon a description of the provinces and cities of Indostan, it may be proper to observe, that the British nation possesses in full sovereignty, the

the whole foubah of Bengal, and the greatest part of Bahar. In Orissa, or Orissa, only the districts of Midnapour. The whole possessions contain about 150,000 square miles, and ten millions of inhabitants. With their allies and tributaries, they now occupy the whole navigable course of the Ganges, from its entry on the plains to the sea, which is more than 1350 miles.

The only places worth mentioning, in the middle provinces of Indostan, are Agra and Delhi.

Agra is the capital of the province of that name; it was founded in the year 1566, by Eckbar, who called it Eckbarabat, and made it the metropolis of his empire. It is situated in 26 degrees north latitude, and in 79 degrees east longitude from London: it lies on the river Gemma, about 700 miles north-east of Surat, a journey which the caravans generally perform in nine weeks, and about 500 leagues north of Pondicherry on the Coromandel coast. This is the greatest city in all the Indies, containing 40 large towns, and 340 villages. It stands in the middle of a sandy plain, which greatly adds to the heat of the climate; it is about eight miles long, but not near so broad; and no part is fortified but the palace; there are, however, generally a great number of soldiers here.

The houses are so situated, as to command an agreeable prospect of the river, and, according to Tavernier, are at some distance from each other encompassed by lofty walls. The buildings of the omrahs and other great men are of stone, and elegantly constructed. The great numbers of mosques, caravanseras, squares, baths, and reservoirs, intermixed with gardens, trees, and flowers, render this place extremely pleasant; and the royal palace is a magnificent structure, situated in the form of a crescent on the banks of the river, defended by a lofty stone wall mounted with cannon, and encompassed by a broad moat, across which are draw-bridges; and there is a terrace garden cut through, with canals of running water, mixed with verdant plats and summer-houses, forming a most pleasing scene. The palace is divided from the city by a large noble square, where the rajahs alternately mount guard at the two outer gates, facing the principal streets of the city. On entering the first gate of the palace, a fine stone walk presents itself, with canals on each side of it; and further on is seen a spacious square, in which the omrahs assemble, and the Mahometan guards are mustered. Still further on, the eye is presented with another grand square or court, which leads to the Durbar (another spacious court) originally the place of resort for persons who had audience of the emperor; during which interval a band of music always played, while the imperial monarch sat on a throne of jewels.

In 1638, this city had no less than 70 mosques. There are 800 purifying baths in it; and near it stands that grand piece of architecture the mausoleum, which 20,000 men were 22 years in building. The Dutch have a factory here, but not the English.

The Dutch have a

the province of Delhi, situated

situated in the heart of the empire, is in 78 degrees east longitude from London, and in 26 degrees north latitude: it stands in the form of a crescent on the river Gemma, which divides it; and it is distinguished into three towns, lying within about 120 miles north of Agra, in a fine plentiful country, where the air is more cool and salubrious than at Agra. The first town that was built, is said to have had nine castles and fifty-two gates. At some distance is a stone bridge, and a delightful plantation of trees, leading to the second town, which was taken from the Indians by the first Mogul conqueror, who afterwards demolished it.

The city of Delhi is entered by a long street, with arches on each side of it, under which are the shops of the tradesmen. This street leads directly to the palace, the entrance of which are a couple of elephant figures, on whose backs ride two famous rajahs, representatives of two brothers, who lost their lives in bravely defending certain towns laid siege to by Eckbar. The palace wall, which is of hewn stone, with battlements, and every tenth battlement having a tower, is not much less than two miles in circumference. The ditches encompassing the wall are full of water, and are likewise lined with hewn stone.

The houses of the great, which are on the banks of the river, or in the suburbs, are spacious and airy, having large courts, cellars, gardens, groves, ponds, fountains, and enormous fans on each side, for cooling the air. The poorer sort live in houses built with clay; and wretched, which have convenient courts and gardens.

Here is a market for all sorts of green and dry fruits, which are brought from Persia and other countries; but they are in general exceeding dear; melons, in particular, have been sold from 6s. to 8s. each.

In this city there are scarce any mechanics, not from want of skill in the people, but from the ill treatment of the omrabs, who, if they can meet with them, oblige them to work, and reward them according to their own discretion.

Tatta, the capital of the province of Sinda, is situated on a fine plain: it is about three miles in length, and about one and a half in breadth. Here is a palace for the nabob, and also a citadel. This city is famous for the manufacture of palanquins, which are a kind of canopied couches, on which the great men all over India, Europeans as well as natives, repose when they appear abroad. They are carried by four men, who will trot along, morning and evening, forty miles a day; ten being generally hired, who usually carry the palanquin by turns, four at a time. Though a palanquin is dear at first cost, yet the porters may be hired for nine or ten shillings a month each, out of which they maintain themselves.

The citadel in Tatta, which stands at the west end of the town, has barracks and stables, capable of accommodating between 20 and 30,000 men and horse. The road at Tatta is about a mile broad, and famous for its fine carp.

Moultan is not a very fruitful province, yet it yields excellent iron and canes. Its capital is not very large, nor does it carry on any considerable trade, but is famous for the excellent bows made there, and its nimble dancers. It is, by the course of the river, about 800 miles from the sea. The inhabitants, by their situation, are enabled to deal with the Persians and Tartars yearly for above 60,000 horses.

The province of Cassimere is entirely surrounded by mountains, excepting two or three narrow passages, which conduct the traveller into its delightful plains. It is said to contain an hundred thousand villages stored with cattle and game, without any beasts of prey; and the capital, which is called by some Cassimere, and by others Sirenaker, is a very large city. It is situated near a fine lake, and so delightfully diversified with canals and gardens, that the moguls give it the appellation of the Paradise of the Indies. The inhabitants, particularly the women, are as fair as the Europeans. They are celebrated for their wit and dexterity, and are exceeding ingenious in making curious toys, which they sell in every part of the Indies. They likewise carry on a curious manufacture of shawls, which are made either of the wool of the country, being finer than that of Spain, or of hair, finer than beaver, taken from a wild goat, in Great Thibet. They are very light and warm, for which reason the Indians wear them round their heads in the winter.

Lahor is one of the largest and most fruitful provinces in the Indies, being well watered, and abounding in rice, corn, fruits, good wine, and the best sugars in all Indostan. The capital also, called Lahor, was once no less than three leagues in length, but is now greatly decayed. The inhabitants carry on several manufactures, and all those of India flourish in the different towns of this province.

The province of Afmer, which lies south-west of Delhi, and west of Agra, is divided into three lesser provinces or districts, called Bando, Jesselmere, and Soret. The capital city is Afmer, which is tolerably large, and carries on a great trade in salt-petre. Pilgrims from all parts of India resort to this city, in order to pay their devotions at the tomb of Khoja Mondi, a Mahometan saint.

The province of Kabul, or Kabulestan, is remarkable only for its productions of drugs, canes, and iron. In the two last articles a considerable trade is carried on with the Persians and Tartars, who barter their horses for them. This province, besides Kabul, its capital, which is very large, contains a number of small cities, towns, and villages.

Patna, situated in the Upper Ganges, is thought the most famous province in the universe for the cultivation of opium, but it is far inferior in strength to that made in Syria and Persia. The capital, of the same name, is one of the largest cities in India. The English and Dutch have factories here.

The province or soubahship of Malva, lying to the west

west of Bengal, we know little of; Sindia and Halkar divide the largest part of it. The capital of the former is Ongein; and of Halkar, the city of Indoor. It is as fertile as the other provinces.

Candish includes the province of Berar and part of Orixa: its capital is Brampur, or Burhanpoor, a flourishing city, and it carries on a vast trade in chintzes, calicoes, and embroidered stuffs. Cattack is the capital of Orixa, and lies in the only road between Bengal and the northern circars, and belongs to the Berar, Rajah, Moodajee Boola, whose dominions are very extensive. Of the five northern circars, Cicacole, Rajamundry, Ellore, Condapilly, and Gunton, the latter is in the hands of the Nizam, the rest are in possession of the English.

The province of Bengal gives name to the most considerable gulf in Asia, divides the two peninsulas of the Indies; and is perhaps, of all the Indian provinces, the most interesting to an English reader. It is upwards of 240 leagues from east to west; and its natural situation (as described by Major Rennels, late surveyor-general in Bengal) is singularly happy with respect to security from the attack of foreign enemies. On the north and east, it hath no warlike neighbours, and hath moreover a formidable barrier of mountains, rivers, or extensive wastes, towards those quarters, should an enemy start up. On the south is a sea-coast guarded by shallows and impenetrable woods, and with only one port, which is difficult of access in an extent of 300 miles. An enemy can only be apprehended on the west; but there the natural barrier is strong, and with its population and resources, and the usual proportion of British troops, Bengal might bid defiance to any part of Indostan which was inclined to become its enemy. It is estimated to be the store-house of the East-Indies. Its fertility exceeds that of Egypt after being overflowed by the Nile; and the produce of its soil consists of rice, sugar-canes, corn, sesamum, small mulberry, and other trees: here is likewise an herb, from which very beautiful stuffs and tapetries are made. Its calicoes, silks, salt-petre, lakka, opium, wax, and civet, go all over the world; and provisions here are in vast plenty, and incredibly cheap, especially pullets, ducks, and geese. The country is intersected by canals cut out of the Ganges for the benefit of commerce, and extends near 100 leagues on both sides the river, being full of cities, towns, villages, and castles. The English company's forces established in Bengal are very considerable. The power is invested in Europeans, though the bulk of the army consists of natives.

The worship of the Gentoos, in its greatest purity, is practised in Bengal; and their sacred river (Ganges) is in a manner lined with their magnificent pagodas or temples. The women are said to be lascivious and enticing, notwithstanding their religion.

Calcutta is the principal English factory in Bengal: it is called Fort-William, and situated on the river Hugly, the most westerly branch of the Ganges. The

fort itself is said to be irregular, and untenable against disciplined troops; but the servants of the company have provided themselves with an excellent house, and most convenient apartments for their accommodation. As the town itself has been in fact for some time in possession of the company, an English civil government, by a mayor and aldermen, was introduced into it. This was immediately under the authority of the company.

Afterwards, in 1773, an act of parliament was passed, to regulate the affairs of the East-India Company, as well in India as in Europe. By this act, the governor-general and four counsellors were appointed, and chosen by the parliament, with whom was vested the whole military and civil government of the presidency of Fort-William; and the ordering, management, and government of all the terrestrial acquisitions and revenues in the kingdom of Bengal, Bahar, and Orissa, so long as the company should be in possession of them.

The governor-general and council, so appointed, are invested with the power of superintending and controlling the government and management of the presidencies of Madras, Bombay, and Bencoolen: they are likewise to pay obedience to the orders of the court of directors, and to correspond with them: and are empowered to establish a court of judicature at Fort-William, to consist of a chief justice, and three other judges, to be named from time to time by his majesty: these are to exercise all criminal, admiralty, and ecclesiastical jurisdiction; to be a court of record, and a court of oyer and terminer for the town of Calcutta, and factory of Fort-William, and its limits; and the factories subordinate thereto.

But the establishment of this supreme court does not appear to have promoted either the interests of the East-India Company, or the felicity of the people of the country. No proper attention has been paid to the manners and customs of the people; acts of great oppression and injustice have been committed, and the supreme court has been a source of great dissatisfaction, disorder, and confusion. We must refer the reader to our account in the History of England, for the subsequent regulations respecting the East-India territories and company.

In 1757, the soubah of Bengal, whose indignation had been raised by some procedures of the company, invested Calcutta, which was then in a defenceless state. The governor, and some of the principal persons of the places, alarmed at the appearance of a very numerous army, threw themselves, with their chief effects on board the ships in the river; they who remained, for some hours, defended the fort; but their ammunition being expended, they surrendered upon terms. The soubah, a capricious unfeeling tyrant, instead of observing the capitulation, forced Mr. Holwell, the governor's chief servant, and 145 British subjects, into a little but secure prison, called the Black-Hole, &

the Black-Hole, a place

about eighteen feet square, and shut up from all com-
munication of free air. Their miseries, during the
night, were inexpressible, and before morning no more
than twenty-three were found alive, the rest dying of
asphyxiation, which was generally attended with a hor-
rible frenzy, in consequence of fevers, and an excessive
thirst occasioned by the violent heat of the place.
Among those who survived was Mr. Holwell himself,
who transmitted to the company a most affecting ac-
count of the catastrophe.

The insensible Nabob returned to his capital, after
slundering the place, imagining he had rooted the
English out of his dominions; but the seasonable ar-
rival of Admiral Watson, and Colonel (afterwards
Lord) Clive, put them once more, with some difficulty,
in possession of the place; and the war was soon con-
cluded by the battle of Plassey, gained by the colonel,
and the death of the Nabob Suraj Dowlaja, in whose
place Mhir Jaffer, one of his generals, and who had
previously signed a secret treaty with Clive to desert
his master and amply reward the English, was ad-
vanced to the Gubahship. After the unfortunate Mr.
Holwell and his friends had obtained their discharge,
they took boat, and arrived at Corcomadad, a Dutch
settlement, whence they embarked and sailed for
England.

The Nabob of Bengal keeps his court at Muxadabad,
or Moorshedabad: Benares lying in the same province,
the Gentoos university, and celebrated for its sanctity.
This zemindary, which includes also the circars of
Jazayer and Chunar, constituted a part of the do-
minions of Oude till 1744, when its tribute or quit-rent
of twenty-four lacs, was transferred to the English.

The principal place possessed by the French in Bengal
is Chandernagore, which lies higher up the river than
Calcutta: but though strongly fortified, furnished with
a garrison of 500 Europeans, and 1200 Indians, and
defended by 123 pieces of cannon and three mortars,
it was taken by the English admirals Watson and
Pococke, and Colonel Clive; and the same place was
also obliged to surrender in the last war, but restored
by the peace.

Hugly, which is fifty miles to the north of Cal-
cutta, upon the Ganges, is a place of prodigious
trade for the richest of all Indian commodities. The
Dutch have here a well-fortified factory, erected in
an open place, at a small distance from the river.
The search for diamonds is carried on by about
20,000 people from Saumelpour, which lies thirty
leagues to the north of Hugly, for about fifty miles
further.

Dacca is said to be the largest city of Bengal, and
the tide comes up to its walls. It contains an English
and a Dutch factory. The town is situated in 24 deg.
north lat. the soil is fertile, the situation fine, and the
cheat commodities of India and Europe are brought
to its market. It receives considerable advantages from
its cottons, from which are produced striped and

worked muslins, more valuable in their texture than
those made in any other parts of India. The best and
finest embroideries in gold, silver, or silk, are manu-
factured here.

The other chief towns are Cassumbazar, Chinchura,
Barnagua, and Maldo; besides a number of other
places of less note, but all of them abounding in the
manufactures of India.

The provinces described above, are those which be-
long to the mogul's empire to the north of the penin-
sula within the Ganges. In our account of the penin-
sula itself, we shall take notice of the provinces that
lie to the southward.

THE HISTORY OF INDIA.

THE famous Alexander of Macedon was the first
invader, worthy to be noticed, of this extensive and
fruitful country. Where the fortrefs of Rötus now
stands, on the banks of the Behar, he is supposed to
have put in execution his stratagem for crossing the
river, whilst the opposite shore was possessed by Porus,
whom Alexander defeated, but afterwards restored to
him his dominions, as a reward for his bravery in
defending them. Zinghis Khan also directed his force
there in 1221, and obliged the emperor to forsake his
capital. The seat of government was indeed often
changed, either by necessity or choice, as from Gaza
to Delhi, to Lahor, Agra, and Canase. This last
place was in the reign of Porus, and for ages, the
capital of Indostan, but is now reduced to a
middling town, though the ruins are of great extent:
it is supposed to be the Palibrotha of the ancients.
In the sixth century it contained 30,000 shops in
which beetle-nut was sold, and there were also 60,000
bands of musicians, and singers, who paid a tax to
government.

Tamerlane the Great was the next conqueror of
India: he crossed the Indus nearly at the same place
with Alexander. But Mahometan princes had entered,
made conquests, and established themselves in this
country, long before Tamerlane. Valid the sixth
of the Caliphs, named Omniades, who ascended the
throne in the 708th year of the Christian æra, and in
the 90th of the Hegira, made conquests in India;
by which means the Koran was introduced here very
early. Mahmoud, son of Sebegetchia, prince of Gazra,
the capital of a province separated by mountains from
the north-west parts of India, and situated near Kan-
dahar, carried the Koran with the sword into Indostan
in the year 1000 or 1002 of the Christian æra. He
treated the Indians with all the rigor of a conqueror,
and all the fury of a zealot, plundering treasures,
demolishing temples, and murdering idolaters through-
out his route. The wealth found by him in Indostan
is represented to be immense.

The successors of Mahmoud are called the dynasty of the Gaznavides, and maintained themselves in a great part of the countries which he had conquered in India, till the year 1155, or 1157, when Cofron Schah, the thirteenth and last prince of the Garnavide race, was deposed by Kuffain Gauri, who founded the dynasty of the Gaurides, which furnished five princes, who possessed nearly the same countries as the Gaznavides their predecessors.

Scheabbedin, the fourth of the Gauride emperors, during the life of his brother and predecessor Gaiâ-theddin, conquered the kingdoms of Moultan and Delhi, and drew from thence prodigious treasures. But an Indian, who had been rendered desperate by the pollutions and insults to which he saw his gods and temples exposed, made a vow to assassinate Scheabbedin, and executed it. The race of Gaurides finished in the year 1212, in the person of Mahmoud, successor and nephew to Scheabbedin, who was also cut off by the swords of assassins.

Several revolutions followed till the time of Tamerlane, who made his appearance in India at the end of the year 1398, descending more terrible than all its former inundations, from the centre of the northern part of the Indian Caucasus. This invincible barbarian, securing the northern provinces to himself, met with no resistance sufficient to justify, even by the military maxims of Tartars, the cruelties with which he marked his way. But after an immense slaughter of human victims, he at length rendered himself master, on uniting his conquests of the vast tract of territory from the coast of Smyrna to the borders of the Ganges. The history of Tamerlane's successors, who reigned over Indostan with little interruption more than 350 years, has been variously represented; but all agree in the main, that they were powerful and despotic princes, reigned very magnificently, and committed their provinces to rapacious governors, or to their own sons, whereby their empire was often miserably torn in pieces.

It is highly worthy of remark, that the provinces of Indostan have seldom continued under one head during a period of twenty years, from the earliest history down to the reign of Akbar, who died in the year 1605, amidst the tears of his subjects, who loved him as their father, admired him as their leader, and revered him as their prince. Bold, manly, and enterprising, he was an enemy to oppression; and he hated cruelty, as he was a stranger to fear. This great prince took from his officers the power of oppressing the people. Severe in his justice, he never forgave extortion. He encouraged trade by the invariable protection given to merchants of all nations; regarding neither the religious opinions, nor the countries of men; all who entered his dominions were his subjects, and they had a right to his justice.

In process of time, Bengal, Guzarat, and other provinces, became independent, and sometimes the

empire of Indostan was confined within the proper limits of the province itself: so that the history of it furnishes an excellent lesson to princes, not to grasp at too much dominion; and to mankind, to circumscribe the ambitious designs and undertakings of their rulers. These observations will appear the more just, if we consider, that some parts of the empire were 1000 miles distant from the seat of government: the English conquests in India met those of Tamerlane in a point equidistant from the mouths of the Ganges and Indus, in the year 1744, for they closed their campaign that year at Saldong, 1100 miles from Calcutta.

The famous Aurengzebe, in the year 1667, though the youngest among many sons of the reigning emperor, after defeating or murdering his father, brothers, and nephews, mounted the throne of Indostan, and may be considered as the real founder and legislator of the Mogul empire. He was a great and politic prince, and the first who extended his dominion, though it was little better than nominal, over the Peninsula within the Ganges, at present so well known to the English. He lived so late as the year 1707, and died in the 49th year of his reign, and 90th of his age. It is said that some of his great officers of state were alive in the year 1750.

From what has been already said of this empire, Aurengzebe seems to have left too much power to the governors of his distant provinces, and to have been at no pains in preventing the effects of that dreadful despotism, which, while in his hands, preserved the tranquillity of his empire; but when it devolved to his weak, indolent successors, occasioned its overthrow. Four of his grandsons, in 1713, disputed the empire, which, after a bloody struggle, fell to the eldest,

Mauzoldin, who took the name of Jehander Shah. This prince was a slave to his pleasures, and was governed by his mistress so absolutely, that his great omrahs conspired against him, and raised to the throne one of his nephews, who struck off his uncle's head.

Furrukhîr, the new emperor, was governed and at last enslaved by two brothers of the name of Leyl, who abused his power so grossly, that being afraid to punish them publicly, he ordered them both to be privately assassinated. They discovered his intention, and dethroned the emperor, whom they also imprisoned, and afterwards strangled.

The two brothers, after the death of Furrukhîr, raised to the throne a grandson of Aurengzebe, by his daughter. The young emperor, who was only seventeen years of age, proving disagreeable to them, they invested with the sovereignty his elder brother, who took the title of

Shah Jehan. On his accession, the rajahs of Indostan, whose ancestors had entered into stipulations, or what may be called "pacta conventa," when they admitted the Mogul family, took the field against the two brothers; but the latter were victorious, and

Shah Jehan was put in peaceable possession of the em-
 pire, but died in 1719: He was succeeded by another
 prince of the Mogul race, who took the name of
 Mohammed Shah. This monarch entered into pri-
 vate measures with his great rajahs for destroying the
 rebels, who were declared enemies to Nizamul Muluck,
 one of Aurengzebe's favourite generals. Nizam, it is
 said, was privately encouraged by the emperor to de-
 feat himself, against the brothers, and to proclaim
 himself soubah of Decan, which belonged to one of the
 rajahs, who was assassinated by the emperor's order,
 and who immediately advanced to Delhi, to destroy
 the other brother; but he no sooner understood what
 had happened, than he proclaimed the Sultan Ibrahim,
 another of the Mogul princes, emperor. A battle
 ensued in 1720, in which the emperor was victorious,
 and is said to have used his conquest with great
 moderation, for he commended Ibrahim to the prison
 from whence he had been taken; and Seyd, being
 likewise a prisoner, was condemned to perpetual con-
 finement, but the emperor took possession of his vast
 riches. Seyd did not long survive his confinement;
 and, upon his death, the emperor abandoned him-
 self to the same course of pleasures that had been so
 fatal to his predecessors.

As to Nizam, he became now the great imperial
 general, and was often employed against the Marattas,
 whom he defeated, when they had almost made them-
 selves masters of Agra and Delhi. He was confirmed
 in his soubahship, and was considered as the first
 subject in the empire. Authors, however, are not
 agreed as to his motives for inviting Nadir Shah,
 otherwise Kouli Khan, the Persian monarch, to invade
 Indolstan. It is thought that he had intelligence
 of a strong party formed against him at court; but
 the truth perhaps is, that Nizam did not think that
 Nadir Shah could have success, and at first wanted to
 make himself useful by opposing him. The success
 of Nadir Shah is well known, and the immense
 treasure which he carried from Indolstan in 1739. Be-
 sides these treasures, he obliged the mogul to surrender
 to him all the lands to the west of the rivers Attoch and
 Hind, comprehending the provinces of Peyshor, Cabul,
 and Gagna, with many other rich and populous prin-
 cipalities, the whole of them almost equal in value
 to the crown of Persia itself. This invasion cost the
 Moguls 200,000 lives.

The plunder made by Nadir Shah is by some ac-
 counts, and those strongly authenticated, made to
 amount to the incredible sum of two hundred and
 thirty-one millions sterling, as mentioned by the
 London Gazette of those times. The most moderate
 say, that Nadir's own share amounted to considerably
 above seventy millions. Be that as it will, the in-
 vasion of Nadir Shah may be considered as putting a
 period to the greatness of the Mogul empire in the
 house of Tamerlane.

When Nadir Shah had raised all the money he could

in Delhi, he reinstated the mogul, Mohampaed Shah,
 in the sovereignty, and returned into his own country.
 A general defection of the provinces soon after ensued;
 none being willing to yield obedience to a prince
 deprived of the power to enforce it. The provinces
 to the north-west of the Indus had been ceded to
 Nadir Shah, who being assassinated in 1747, Achmet
 Abdalla, his treasurer, an unprincipled man, but pos-
 sessed of great intrepidity, found means, in the general
 confusion occasioned by the tyrant's death, to carry
 off three hundred camels loaded with wealth, whereby
 he was enabled to put himself at the head of an army,
 and march against Delhi with 50,000 horse. Thus
 was the wealth drawn from Delhi made the means
 of continuing those miseries of war which it had at
 first subjected them to. In this extremity, Prince
 Ahmed Shah, the mogul's eldest son, and the vizier,
 with other leading men, took the field, with 80,000
 horse, to oppose the invader. The war was carried
 on with various success, and Mohammed Shah died
 before its termination. His son, Ahmed Shah then
 mounted the imperial throne at Delhi; but the em-
 pire fell every day more into decay. Abdallah erected
 an independent kingdom, of which Kandahar is the
 capital, and the Indus is the general boundary to
 the east.

Before the invasion of Nadir Shah, the Marattas, a
 warlike nation, possessing the south-western peninsula
 of India, had exacted a chart or tribute from the em-
 pire, arising out of the revenues of the province of
 Bengal, which being withheld, in consequence of the
 enfeebled state of the empire, the Marattas became cla-
 morous. The kingdom began to totter to its founda-
 tion; every petty chief, by counterfeiting grants from
 Delhi, laying claim to jaghires and to districts. The
 country was distracted by civil wars, and groaned under
 every species of domestic confusion.

Ahmed Shah reigned only seven years, after which
 much greater dissensions and disturbances prevailed in
 this country; whereby the people were involved in great
 calamities. After this, the imperial dignity of Indolstan
 was vested in Shah Allum, or Zadah, who is universally
 acknowledged to be a real descendant from the Tamer-
 lane race. A perpetual commission, for the office of
 receiver-general of the revenues of Bengal, Bahar, and
 Orixia, was obtained from him for the company. In
 consideration of this imperial mandate, which conferred
 the government of Bengal for ever on the company, Shah
 Allum was to receive an annual pension of 325,000l.
 The annuity was moderate to the lineal successor of
 Tamerlane. He was at the same time guaranteed in
 the possession of the province of Allahabad; and thus a
 kind of provision was made for a prince who retained
 nothing of what belonged to his illustrious ancestors,
 but the empty title of emperor of Indolstan, since he de-
 pends upon the protection of the English, whose interest
 it is to sup, out him

We have no doubt but many of our readers will be
 entertained

entertained with the perusal of the petition of a mock monarch, who styles himself "Great Mogul; Emperor of Indostan; the Invincible Conqueror of the Universe; King of the world," &c. &c. &c. to a company of merchants.

"The Humble Petition of the Grand Mogul, to the President and Council at Bengal."

"If this country is to be kept, put me in possession of it, and leave a small detachment of troops with me, to shew that I am protected by the English, and they shall be at my expence; that if any enemy comes at any time against me, I will make such connections in the country, that with my own troops, and the aforementioned small detachment, I will defend the country without any further assistance from the English; and "I will pay them, out of the revenues of the country, what sum they shall demand yearly." If the English will, contrary to their interest, make peace with the vizier, I will go to Dehli; for I cannot think of returning again into the hands of a man who has used me so ill. I have no friends I depend upon more than the English; their former behaviour to me will make me ever respect and regard them. Now is their time to be in possession of a country abounding with riches and treasure: "I shall be satisfied with whatever share they please of it." The Rohillas were always enemies to the imperious vizier: they are all my friends."

This singular petition, which was dated from the camp at Banares, 22 Nov. 1764, was transmitted to the council by Major Heëtor Monro.

To conclude, notwithstanding the pleasing prospects wherewith the minds of ambitious and avaricious individuals may be blinded, while they flatter themselves with the gratification of their sordid and dishonourable wishes by plundering and distressing their innocent neighbours; it is certainly the interest of the East-India company, that their governments in India should interfere as little as possible in the domestic or national quarrels of the powers in India, and that they should always endeavour to be in a state of peace and amity with them. But it has unfortunately happened that they have not adhered to these maxims of sound policy; inasmuch as the governors and servants of the East-India company have unnecessarily, and sometimes very wrongfully, interfered with the disputes between the Indian princes, whereby they have embroiled themselves, and taken an active part in wars of a very pernicious and unjustifiable nature. Those in which they have been engaged with the Marattas, and with that enterprising prince Hyder Ally, lately deceased, but who is succeeded by a warlike son, Tippoo Saib, have been attended with an enormous expence, and been extremely prejudicial to the interests of the company, and the British nation at large. By exciting the indignation of the country princes against them, they have greatly lessened the security of the possessions of the company; and by temporary plaus-

of violence and injustice, and sometimes by an infringement of their own treaties, they have forfeited the opinion of the natives, whose good will and friendship it had been their wisdom to cultivate and preserve. But we hope the time is not far distant, when the Supreme Council of the nation will make suitable provision for establishing our East-India affairs upon a more equitable and solid basis.

C H A P. XIV.

THE PENINSULA WITHIN THE GANGES.

European Settlements, Rivers, Mountains, &c.

THE south-east coast of India, situate on the bay of Bengal, usually called the Coast of Coromandel, comprises the provinces of Madura, Tanjore, east-side of Bishnagar, or Carnatic, Golconda, and Orixia. The chief towns in these provinces are, Madura, containing 16,400 square miles; Tanjore, Tranquebar (Dutch), Negapatam (English), Bishnagar, Porta Nova (Dutch), Fort St. David (English), Pondicherry, Comynore (French), Coblou, Sadraspatan (Dutch), St. Thomas (Portuguese), Fort St. George or Madras (English), Pullicate (Dutch), containing 33,550 square miles; Golconda, containing 62,100 square miles; Ganj, or Coulou, diamond mines; Masulipatam (English and Dutch), Visagapatam (English), Bimlipatan (Dutch), Orixia, Ballasore, (English).

The south-west coast of India, usually called the coast of Malabar, comprises the west side of Bishnagar, or Carnatic; the provinces of Deccan or Vissapour; Cambray, or Guzarat. The chief towns are, Tegapatam (Dutch), Anjengo (English), Cochin (Dutch), Callicut, Tellicherry (English), Canannore (Dutch); Mangalore, Barcelore (Dutch and Portuguese), Radconda (diamond mines), Cawar (English), Goa (Portuguese), Rajapoor (French), Dabul (English), Dundee, Shouia (Portuguese), Bombay (isle and town, English), Bassien (Portuguese), Salfette (English), Damon (Portuguese), Surat, Swalley, Barak (English and Dutch), Amedabad, Cambaya, Dicu (Portuguese).

The rivers in this peninsula are, the famous Kistna, a principal branch of which passes within 30 miles east of Poonah, where it is named Beurah, and is esteemed a sacred river; the Puddar and Godaven, which last is also esteemed as a sacred river; the Cattack, or Mahanada, the mouths of which have never been traced; the Soane and Nerbudda.

A chain of mountains, which we have already taken notice of, run from north to south of this part of India, and render it winter on one side of the Peninsula, while it is summer on the other. Towards the latter end of June, a south-west wind begins to blow from the sea, on the coast of Malabar, attended by prodigious and constant rains, which continue four months; during which time the weather is serene on the eastern hills,

of this part of India,
the Peninsula, while
rds the latter end of
to blow from the sea,
ed by prodigious and
our months; during
ne on the eastern side,
known

known by the appellation of the coast of Coromandel. About the end of October, the rainy season, and the change of the monsoon, begin on the Coromandel coast, which being entirely unprovided with good harbours, renders it extremely dangerous for ships to remain there, during that time; and to this are owing the periodical returns of the English shipping to Bombay, upon the Malabar coast.

The AIR of this peninsula is naturally hot, but is refreshed by breezes, the wind altering every twelve hours; that is, from midnight to noon it blows off the land, when it is intolerably hot, and during the other twelve hours from the sea, which last proves a great refreshment to the inhabitants of the coast.

The SOIL is in general fruitful, and its productions are the same with those already mentioned in the other parts of the East-Indies. The like may be said of their quadrupeds, fish, fowl, noxious creatures, and insects.

There is great reason to suppose that the INHABITANTS of this part are the descendants of a colony which have migrated hither from Ethiopia, as their complexions are blacker than those of the other peninsula of India. The great part of them have but a faint notion of any allegiance they owe to the emperor of Indollan, whose tribute from hence has been, ever since the invasion of Nadir Shah, intercepted by their soubahs and nabobs, who now exercise an independent power in the government; but besides these soubahs, and other imperial viceroys, many estates in this peninsula belong to rajahs or lords, who are the descendants of their old princes, and look upon themselves as independent on the mogul and his authority.

As one soubah often engrosses several provinces, and fixes the seat of his government according to his own conveniency; it would on these accounts be more conformable to the present state of this peninsula to divide it into soubahships than into provinces; but the ancient division into provinces is still continued, and the whole country considered as composed of two principal parts, called the coast of Coromandel, and the coast of Malabar. These are subdivided into provinces, and in these the greater part of the European factories in India are established.

The province of Madura, which begins at Cape Comorin, the southernmost part of the peninsula, is about as extensive as the kingdom of Portugal, and is said to be governed by a monarch, who has seventy tributary princes under him, each being independent in his own principality, only paying him a tax. This province produces nothing valuable, except a pearl fishery, which is on its coast. The capital is also called Madura, and the other principal towns in it are Trilhirapalli, Manapar, where the Dutch have a factory, and Tutukurin, a large sea-port, which, together with several smaller, belong to the Dutch.

To the east of Madura lies the small kingdom of Tanjore, the soil of which is exceedingly fertile, and

its prince rich, till plundered by the nabob of Arcor, and some British subjects connected with him; the chief places in it are Tanjore, the capital, which is governed by a rajah under the English protection.

Negapatan, a Dutch colony and fortress, was taken from them during the last war, and confirmed to the English by the last treaty of peace; and Tranquebar, belonging to the Danes. The king's revenues are said to be very considerable.

North of Tanjore lies the kingdom of Karnata, better known to us by the appellation of the Carnatic. It is bounded on the east by the bay of Bengal, on the north by the river Kistna, which divides it from Golconda, on the west by Vissipour, and, on the south, by the kingdoms of Messaur and Tanjore. It is about 345 miles in length, from south to north, and 276 in breadth, from east to west. This country is in general fertile, and contains a considerable number of cities and towns. The whole kingdom is divided into small principalities, whose princes are all independent in their respective territories, but at the same time subordinate to the Great Mogul.

The most remarkable places on the sea-coast, commonly called the Coromandel coast, are the following, viz. Porto Nova, where the Portuguese are very numerous, and the English and Dutch have also some houses.

Fort St. David's, which, with the district round it, belongs to the English, who purchased it in 1686, from a Maratta prince, for ninety thousand pagodas. The fort is tolerably strong, and the country, which extends eight miles every way, fertile and pleasant.

Pondicherry, which lies about five leagues to the north of Fort St. David's, and was formerly the principal place belonging to the French in the East-Indies. It has been repeatedly taken by the English, and as often restored by treaties of peace.

Madras, or Fort St. George, the capital of the English East-India settlements, is divided into two parts, called the White and Black Towns. It stands fronting the sea, and has a salt-water river on the land side, which prevents all fresh springs from being brought within a mile of the town, and, in the rainy season, causes inundations on one side, while the sea often threatens destruction on the other: so that its situation is far from being either safe or commodious, though it is both healthy and delightful.

The White Town, which is inhabited by Europeans, is walled quite round, and has several bastions and bulwarks to defend it; besides which it is secured by the sea on one side, and a salt river on the other. It is about 400 paces long, and 150 broad. The streets are in general regular, and in the centre of the town stands Fort St. George. The houses are of brick, well built, with flat roofs, and spacious rooms. Here are two elegant churches, one for the Protestants, the other for the Roman Catholics, a good hospital, a mint for coining rupees and pagodas, and a town-hall, under-

noath which is a prison for debtors. The town is a corporation, consisting of a mayor and aldermen, formerly chosen by the burghers, but at present by the governor and his council; in consequence of which every thing is carried on as the governor's will directs, who can annul all decisions in case of debt, or otherwise, made by the court, which is properly a court of conscience. Nothing has been omitted to mend the natural badness of the situation of this town, which seems originally owing to the neighbourhood of the diamond mines, that are but a week's journey distant. These mines are under the direction of a Mogul officer, who lets them out by admeasurement, enclosing the contents by palisadoes; all diamonds above a certain weight originally belonged to the emperor. Religions of every kind are tolerated at Madras, every sect having its respective place of worship.

Eighty thousand inhabitants of various nations are said to be dependent upon Madras; but its safety consists in the superiority of the English by sea. It carries on a considerable trade with China, Persia, and Mocha. The district belonging to Madras does not extend much more than forty miles round, and is of little value for its product.

Immense fortunes have been acquired by the English upon this coast within these forty years, but some of these fortunes appear to have been obtained by the most illicit practices. Some fundamental errors must therefore have crept into the constitution of the East-India Company. The directors considered the riches acquired by their governors and other servants, as being plundered from the company, and accordingly sent out superintendants to control their governors and over-govern servants, and have from time to time changed their governors and members of the council there.

Through the distractions of the Mogul empire, the support of our government, and the undaunted but fortunate efforts of their military officers, the English East-India Company have acquired so amazing a property in this peninsula, and in Indostan, that it is superior to the revenues of many crowned heads; and some of their own servants affirm, that, when all their expences are paid, their clear revenue amounts to near two millions sterling; out of which they were to pay 400,000l. annually to the government, while suffered to enjoy their revenues. How that revenue is collected, or from whence it arises, is best known to the company; part of it, however, has been granted in property, and part of it is secured on mortgages, for discharging their expences in supporting the interests of their friends, the emperor, and the respective soubahs and nabobs, to whom they have afforded their assistance.

Many rights peculiar to sovereignty, have been exercised by this company; such as those of holding forts, coining money, &c. Those powers were thought incompatible with the principles of a commercial limited company, and therefore the English ministry and parliament have repeatedly interfered; in order to regulate

the affairs of the company; a board of control at home being at length established.

The Moguls are for the most part entirely passive in all the revolutions of their government. The Moors or Mahometans ignorant and treacherous as they appear to have no violent attachment to any religious principles, and are so abject enough to live under any form of government. These considerations manifest the wisdom of not driving them into desperate measures, and thereby affecting an union of their forces which must prove fatal to the British interest there.

It is indeed much to be regretted, that as the government has thought proper to interfere in the affairs of the East-India-Company, it has not also taken some measures to punish those many and infamous instances of oppression, injustice, and cruelty, of which the servants of the company have been guilty, and which have been so loudly complained of both at home and in the Indies. The supreme court lately established at Calcutta, has not answered the purposes for which it was appointed; it has been equally complained of by the servants of the company, and by the natives: many of the latter have been grievously harassed by it, who were not amenable to its jurisdiction; nor has that regard been paid to their manners and customs, which both justice and policy required. These reflections, founded on indubitable facts, we hope will have their due weight with those who have ability and inclination to rectify these enormous abuses of delegated authority.

The Black Town is inhabited by Gentoos, Mahometans, Armenians, Portuguese, and by the merchants of every nation in Asia, together with negroes. It is about a mile and a half in circuit, almost encompassed by a river and the sea; and has of late years been surrounded by a stone wall, with bastions cannon proof. Here is an Armenian church, and several pagods, or Indian temples; but the houses in general are nothing more than thatched cottages. To the north of Madras lies Pullicate, belonging to the Dutch, who have a small fort there, in which they keep a garrison.

The kingdom of Golconda extends 260 miles along the bay of Bengal, in form of a crescent, and is as broad from east to west. The soil, which is fertile, yields annually two crops of rice, and several kinds of grain. Of the grapes, which are remarkably fine, and ripe in January, the inhabitants make a very good white-wine. The country also yields iron, bezoar, mines of iron, steel, and salt, and several of diamonds (of which Raelconda is a very famous one) with other precious stones. Provisions of all kinds are extraordinary cheap; a sheep being bought for a shilling, a fowl for two-pence, and so in proportion. Golconda is subject to a prince called the Nizam, or soubah of the Deccan, who is tributary to the great mogul, has vast revenues arising from lands, customs of merchandise, and provisions, but principally from the diamond-mines and salt. His army is said to be very numerous, consisting generally of 300,000 horse and foot; besides 200 elephants.

lephants. The inhabitants are many of them ex-
 tremely rich, and the artificers are very skilful in the
 cotton manufactures, which they make so fine, and of
 such lively colours, that many prefer them to silk.
 This kingdom contains several large cities, among
 which are Bagnagar, or Hyderabad, the capital; but
 the kingdom takes its name from the city of Golconda,
 and comprises the eastern part of Dowletabad.
 East-fourth-east of Golconda lies Masulipatam, where
 the English and Dutch have factories. The English
 have also factories at Ganjam and Visagapatam, on this
 coast; and the Dutch at Nasripore.
 The province of Orixá, from whence the English
 company draw some part of their revenues, lies to the
 north of Golconda, extending in length from east to
 west about 550 miles, and in breadth about 240. It is
 governed chiefly by Moodajee Bouslah, and his brother
 Sembajee, allies to the Marattas. In this province
 stands the idolatrous temple of Jagaryunt, which they
 say is attended by 500 priests. The idol is an irregular
 pyramidal black stone, of about 4 or 500 pounds
 weight, with two rich diamonds near the top, to re-
 present eyes, and the nose and mouth painted with ver-
 million.
 The Deccan is a very extensive country, compre-
 ending several large provinces, and some kingdoms;
 particularly those of Basraim, Balagate, Telenga, and
 the kingdom of Visapour. The names, dependencies,
 and governments of those provinces are extremely un-
 settled, and have been subject to almost annual revolu-
 tions and alterations since their reduction by Aureng-
 zee, or his father; so that modern geographers are
 not agreed upon their exact situation and extent. The
 principal towns are Aurungabad, and Doltabad, or
 Dowlatabad; the latter is the strongest place in all In-
 dia. In a plain of about two leagues square, stand
 the famous pagods of Elora. The tombs, chapels,
 temples, pillars, and many thousand figures that sur-
 round it, are said to be cut out of the natural rock, and
 to surpass all the other efforts of human art.
 Telenga is situated on the east of Golconda. Beder,
 its capital, is a very large city, surrounded by brick
 walls, and garrisoned with 3000 horse and foot.
 The inhabitants speak a language peculiar to them-
 selves.
 Guzerat is a maritime province on the gulf of Cam-
 baya, and one of the finest in India, but inhabited by
 a fierce, rapacious people. It is said to contain thirty-
 five cities. Amedabad is the capital of the province,
 where there is an English factory, and is said to vie in
 wealth with the richest towns in Europe.
 Surat, where the English have a factory, lies at the
 distance of about forty-three French leagues from
 Guzerat.
 The kingdom of Visapour is very extensive: the
 western part of it is called Konkan, and is intermin-
 ed with the Portuguese possessions. The rajah of
 Visapour is said to have had a yearly revenue of six

millions sterling, and to bring into the field 150,000
 horse and foot. The capital is of the same name, and
 the country very fruitful. The principal places on this
 coast are Daman, Bassaim-Trapor, or Tarapor, Chawl,
 Dandi-Rajah-pur, Dabul-Rajah-pur, Gheriah, and
 Vingorla. The Portuguese have lost several valuable
 possessions on this coast, and those which remain are
 on the decline.
 There are also many islands on this coast, among
 which is that of Bombay, belonging to the English
 East-India Company. It is about seven miles in
 length, and twenty in circumference. It originally
 belonged to the Portuguese, and was given to
 Charles II. as part of the portion he received with the
 infant of Portugal, who gave it to the East-India
 Company; and the island is still divided into three
 Roman-Catholic parishes, inhabited by Portuguese,
 and what are called Popish-mestizo, and Canarins; the
 former being a mixed breed of the natives and Portu-
 guese, and the other the aborigines of the country.
 The Portuguese gave it the appellation of Boonbay,
 from the excellency of its harbour, which, it is said,
 will conveniently hold a thousand sail of ships. The
 chief town is near a mile long, but filled with very
 mean houses, except a few belonging to the Portuguese.
 At a small distance from it stands the fort, but not in
 the most advantageous situation. The soil of the island
 is in general sterile, the principal produce of it being
 fine groves of cocoa-nut trees; and in the gardens are
 found several sorts of Indian fruits. The air and cli-
 mate are rather unhealthy, particularly to strangers;
 and the best water to be had, is what the people catch
 in cisterns during the great rains, for that contained in
 the wells has a brackish disagreeable taste. The inha-
 bitants, who are a mixture of several nations, amount
 in all to near 60,000, and every one enjoys the practice
 of his religion unmolested. The posts of the governor
 and council of Bombay, as well as those of the officers
 under them, are lucrative; and the troops on the island
 are commanded by English officers. The natives,
 when formed into companies, and disciplined, are here,
 and in every part of India, distinguished by the appel-
 lation of Seapoys.
 The Turks that resort to this place on account of
 trade, are, like the rest of their countrymen, sately,
 grave, and reserved, and honest in their dealings, though
 merchants. The Persians are more gay, lively; and
 conversible, but less honest in matters of trade than the
 faturnine Turks. The Arabians are all life and fire,
 and when they come with you on any subject, will
 make you a fine show in flowing numbers, and a
 musical cadence, but they are the most dishonest of all.
 The Armenians are generally handsome in their fea-
 tures, mild in their tempers, and in their nature kind
 and beneficent: they are a kind of Christians, and an
 honour to that religion, beyond numbers that go from
 England.
 Contiguous to Bombay are several other islands, one
 of

of which called Elephanta, contains one of the greatest and most inexplicable antiquities in the world. A figure of an elephant, about seven feet high, rudely carved out of a black stone, is placed on the landing-place, near the bottom of a mountain, from whence an easy ascent leads to a stupendous temple, hewn out of the solid rock, eighty or ninety feet long, and forty broad. The roof, which is flat, is supported by regular rows of pillars, about ten feet high, with capitals, resembling round cushions, as if pressed by the weight of the incumbent mountain. At the further end of the temple are three gigantic figures, and round it are various others, and groups cut in stone, one of which bears a rude resemblance to the judgment of Solomon. There is also a colonade, and a door of regular architecture: but when, or by whom this prodigious edifice was erected, still is, and in all probability ever will remain a secret. It is certain that it was not built by the Hindoos, the aborigines of this country, as it has not the least appearance of their manner.

South of Bombay lies the island and city of Goa, the chief settlements of the Portuguese in the East-Indies. The island is about twenty-seven miles in compass, and has one of the finest and strongest ports of this part of the world. Formerly it was a most superb settlement, but is now greatly gone to decay. The Jesuits, before they were suppressed, had five houses here, and it is said their revenues were equal to those of the crown of Portugal. The number of inhabitants are supposed to be about 27,000, of which the native Portuguese form a very small proportion. The natives are as black as jet, having long black hair, and many of them very fine features. The men are, in general, proud, jealous, revengeful, indolent, and indigent; and the women lazy and lascivious. Goa, and all the Portuguese settlements on this coast, are under a viceroy, who still keeps up the remains of the ancient grandeur of the government, though the power and credit of it are in a manner lost. The Peninsula of Salzete, with some other places, are dependent on Goa, but they are of very little consequence, otherwise than as they supply that city with provisions.

South of the Portuguese territories lies Sunda, which is governed by a rajah, subject to the great mogul. The mountains in this country are said to yield the finest pepper in the world. The only place worthy notice in it is Corwar, where the English have a factory, and it is the most pleasant and healthy settlement belonging to the company on the Malabar coast. Their government here is under the direction of a chief and council, and the garrison consists of thirty Seapoys, besides English.

About forty miles to the south of Goa lies Canoree, which reaches as far as Calicut. It is a pleasant country, and prodigiously fertile in rice, large quantities of which are imported into Europe, besides supplying several parts of India. The Canorees are generally excellent sojourners and miners, and very attentive to com-

merce. Their language, which is termed Kanoor, is spoken, with some variation of dialect, from the borders of Malabar to Surat. The principal places in it are Bedmur, Onar, Batakolo, Barfeloar, Baktal, Molkey, and Mangalore, which is the greatest market trade in all the Canoree dominions.

The celebrated Hyder Ally, with whom the company formerly made a peace, but with whom the servants soon after embroiled them, and who in the late war made a violent irruption into the Carnatic, took many of its chief places, obtained great advantages over the company's troops, and brought his forces to the gates of Madras, but died before the conclusion of the war. He is said to be a native of Mysore, which lies to the south-west of the Carnatic. The Christians of the apostle St. Thomas live at the foot of the Gatti mountains.

The dominions of Tippoo Saib, son of Hyder Ally, comprehend generally the provinces of Mysore, Canore, Zaimbalore, Zanaree, and Dindigal, besides his acquisitions to the northward from the Marattas: they are at least 400 miles in length, and in breadth from 80 to 130, so that he hath the largest share in the peninsula.

Malabar, which gives its name to the whole south-west coast of the peninsula, taken in its most extensive sense, contains not only the country under that name to the west of Cape Comorin, but also those to the east, as far as Negapatan. But in the more contracted and modern sense of the word, Malabar is now confined only to the country so called, lying on the west of Cape Comorin, and known by the appellation of the dominion of the Samorin. This country is about 200 miles in length, and from eighty to twenty in breadth. The air is exceeding good, and the soil as fertile as any in Asia; usually yielding two crops annually. Formerly Malabar was united under one emperor, called the Samorin; but it is now divided into a number of small principalities, most of which are independent.

The most remarkable places in this country, are Cannanore, which contains a Dutch factory and fort; Tillicherry, where the English have a small settlement, and keep a constant garrison of thirty or forty soldiers. The chief trade consists in pepper and cardamoms. Burgara, Kota, Tikorey, Calicut, where the French and Portuguese have small factories; Tanmore, Pranancy, Chitiva, where the Dutch have a factory; Kranganor, where there is also a factory belonging to the Dutch; and Cochin. Among the inhabitants of the last, are several thousand Jews, who have a synagogue about two miles from the city, in which are preserved their records engraven on copper-plates, in Hebrew characters. They call themselves a remnant of the tribe of Manassih, a part whereof was, by order of Nebuchadnezzar, carried to the most eastern province of his extensive empire, which it seems reached as far as Cape Comorin. The Dutch have a settlement, and a garrison of 300 men at Cochin, the king

being in fact only their vassal. In Porkey, Hoilkoi- man, and Koyloan, the Dutch have also factories; to which we may add Erwa, where the Danes have a small factory; Anjengo, where the English have a fort and settlement, being the most southerly position they have on the Malabar coast; Tegapatan, where the Dutch have a factory, and Holicha. All these towns are situated along the coast, but there are several within land, some of which are very considerable.

Cape Comorin, which is about three leagues in extent, forms the most southern part of this peninsula. In this small space one has often the pleasure of seeing summer and winter united; for the trees will be loaded with blossoms and fruit on one side of a garden, while on the other they are stripped of all their leaves. This phenomenon is owing to the mountains of Gatti, mentioned before, which traverse the whole peninsula from south to north. On the opposite sides of the Cape, the winds are continually at variance; blowing from the west on the western side, and from the east on the eastern.

CHAP. XV.
P E R S I A .

Extent, Boundaries, Divisions, Name, Climate, Soil, Rivers, Chief Cities, Islands, &c.

MODERN Persia is situated between the 44th and 70th deg. of east longitude, and between the 25th and 44th deg. of north latitude. It is about 2300 miles in length, and 1100 in breadth; and contains 800,000 square miles. It is bounded by the mountains of Ararat, or Daghistan, which separate it from Circassian Tartary, on the north-west; by the Caspian Sea, which divides it from Russia, on the north; by the river Oxus, which divides it from Ubeck Tartary, on the north-east; by India, on the east; by Arabia and Turkey, on the west; and by the Indian-Ocean, and the gulfs of Persia and Ormus, on the south.

Geographers in general divide this extensive empire into the following provinces, viz. On the frontiers of India are Chorasan, part of the ancient Hyrcania, including Herat and Esterabad; Sablestan, including the ancient Bactriana and Candahor; and Sigistan, the ancient Drangianna. The southern division contains Makran, Kerman, the ancient Gedrosia, and Farsistan, the ancient Persia. The south-west division, on the frontiers of Persia, contains the provinces of Churistan, the ancient Susiana, and Iac-Agem, the ancient Parthia. The north-west division, lying between the Caspian Sea and the frontiers of Turkey in Asia, contains the provinces of Aderbeitzen, the ancient Media; Gangea, Daghistan, part of the ancient

Iberia and Colchis; Ghilan, part of the ancient Hyrcania; Shirvan, and Mazanderan.

With respect to its name, it is probable that the word Persia is only a corruption of the word Parthia, and that the modern Persians derive their name from their progenitors the Parthians, the ancient inhabitants of the country. The word itself implies a houseman; the Persians and Parthians having always been famed for their skill in horsemanship. The ancient poets derived its name from Persius, the son of Jupiter and Danae, which appears too fabulous to deserve a preference.

The air of this vast kingdom varies prodigiously, according to the different situation of places. In the midland provinces of Persia, it is serene, pure, and exhilarating, but in the southern provinces it is hot, and sometimes communicates to the midland parts noxious blasts, which are often so fatal, that the inhabitants fortify their heads with very thick turbans. Those provinces which are in the neighbourhood of Caucasus and Daghistan, and the mountains near the Caspian Sea, are piercing cold, which may be attributed to the snow with which the summits of these mountains are perpetually covered.

The soil and productions vary like the air. Towards Tartary and the Caspian Sea, the soil is far from being luxuriant, but with cultivation it might produce abundance of corn and fruits. South of Mount Taurus, the fertility of the country in corn, fruits, wine, and other luxuries of life, is equalled by few others. It produces wine and oil in plenty, fenna, rhubarb, and the finest of drugs. The fruits are delicious, especially their dates, oranges, pistachio-nuts, melons, cucumbers, and garden-stuff; not to mention vast quantities of excellent silk; and the gulf of Bassora formerly furnished great part of Europe and Asia with very fine pearls. Some parts, near Ispahan especially, produce almost all the flowers that are valued in Europe; and from some of them, the roses especially, they extract waters of a salubrious and odorific quality, which form a gainful commodity in trade. In short, the fruits, vegetables, and flowers of Persia, are of a most exalted flavour; and had the natives the art of horticulture to as great perfection as some nations in Europe, by transplanting, engrafting, and other meliorations, they would add greatly to the natural riches of the country. The Persian assafoetida flows from a plant called hiltot, and turns into a gum: some of it is white, and some black; but the former is so much valued, that the natives make very rich sauces of it, and sometimes eat it as a rarity. Tobacco grows all over Persia, and saffron is cultivated in many parts of it.

There is no country in the world which contains more mountains than India, some of the chief of which form natural bulwarks to this extensive empire. Among these are Caucasus and Ararat, sometimes called the mountains of Daghistan, which fill all the isthmus

 The Persian marriages are usually founded upon
 mercenary motives, the legal wife being considered as
 superintendant of the other women. They are in-
 deed allowed by law to have four wives, and as many
 concubines as they please; but they seldom marry any
 more than one. If a man wants to part from his wife
 through mere whim, and wants to be divorced from
 her, though she hath not committed any fault, he is
 obliged to pay the dowry contracted for at the mar-
 riage. We are told, that men may marry for life, or
 for any determined time, in Persia, as well as through
 the Tartary; and that travellers or merchants, who in-
 tend to stay some time in any city, commonly apply to
 the cadec, or judge, for a wife during the time he pro-
 poses to stay. The cadec, for a stated gratuity, pro-
 vides a number of girls, whom he declares to be hon-
 est, and free from diseases; and he becomes surety for
 them. A gentleman who lately attended the Russian
 embassy to Persia, declares, that, amongst thousands,
 there has not been one instance of their dishonesty during
 the time agreed upon.
 The Persians in general bury their dead; but the
 Gours expose them to be devoured by beasts of prey, or
 other voracious creatures.
 When a person is on the point of expiring, the Per-
 sians kindle fires at the tops of their houses, which
 serve as signals to their neighbours and travelling stran-
 gers to offer up their prayers for the patient. The
 mollah or priest being sent for, he exhorts the sick per-
 son to repentance, who usually says, *taube*, or I do re-
 pent. The breath is no sooner out of the body, than
 the surviving relations and friends set up a terrible
 screaming, and, like the Irish, make use of many af-
 fectionate expressions to the dead corpse, bewailing his
 fate, and declaring their affliction to be past remedy.
 The coffin is wrapped in a kind of winding-sheet, on
 which many passages of the Koran are stamped or
 written. The face of the dead person is laid towards
 Mecca, and an arch is built on that side near the grave.
 The religion at present established in Persia, is that
 of Mahomet, but they differ from the Turks by follow-
 ing the sect of Ali; for which reason, the Turks, who
 adhere to the succession of Omar and Abu Bekr, call
 them heretics. Their religious notions are, if possible,
 in some respects, more sanctifical and sensual than those
 of the Turks; but in many points it is mingled with
 some Bramin superstitions. When they are taxed by
 the Christians with drinking strong liquors, as many of
 them do, they retort upon them very justly, "You
 Christians whore and get drunk, though you know you
 are committing sins, which is the very case with us."
 Respecting the Bramins, the comparison between them
 and the Persian Guebres, or Gours, who pretend to be
 the disciples and successors of the ancient Magi, the
 followers of Zoroaster, may well deserve a learned dis-
 quisation: it may be easily proved, that both of them

held originally pure and simple ideas of a Supreme Be-
 ing; but the Indian Bramins and Parrees accute the
 Gours, who still worship the fire, of having sensualized
 those ideas, and of introducing an evil principle into
 the government of the world. A combustible ground,
 about ten miles distant from Baku, is the scene of the
 Guebres devotions. It must be admitted, that the
 ground is impregnated with very surprising inflamma-
 tory qualities, and contains several old little temples, in
 one of which the Guebres pretend to preserve the sa-
 cred flame of the universal fire which rises from the
 end, and a large hollow cane stuck in the ground, re-
 sembling a lamp burning with very pure spirits. Their
 sect is said to be numerous, though tolerated in very
 few places. The Mahometans are the declared ene-
 mies of the Gours, who were banished out of Persia by
 Shah Abbas. The present race of Persians are said to
 be very cool in the doctrines of Mahomet, owing chiefly
 to their late wars with the Turks.
 The ancient Christians seem to have been early
 driven into Persia and the neighbouring countries, by
 the long wars between the Romans and Persians: even
 to this day, many sects are found that evidently have
 Christianity for the ground-work of their religion.
 Some of them, called Souffees, who are a kind of qui-
 etists, sacrifice their passions to God, and profess the
 moral duties. The Sabeen Christians have, in their re-
 ligion, a mixture of Judaism and Mahometanism: they
 are numerous towards the Persian Gulf. The Arme-
 nian and Georgian Christians are also very numerous in
 Persia.
 The Persian language is spoken in common through-
 out the whole empire, but more correctly in some pro-
 vinces than others. The Turkish, however, is the polite
 or court language. Many of the learned Persians have
 written in the Arabic, and the higher class have adopt-
 ed it as the modish language, as we do the French.
 The common people towards the southern coasts of the
 Caspian Sea speak Turkish; and the Arabic probably
 was introduced into Persia under the caliphates, when
 learning flourished in those countries. The pure Per-
 sic is said to be spoken in the southern parts, on the coast
 of the Persian gulf, and in Isfahan; but in many of the
 provinces they speak a barbarous mixture of the Turk-
 ish, Russian, and other languages. Their pater-noster
 is of the following tenor: "Ei padre ma kih der of-
 " moni; pac bafched mām tu; bayayed padefchahi tu;
 " sehwad chwāste tu henjunāaukih der ofmon nūz
 " derzemīn; bēh māra jmrouz nān kefāf rouz mara;
 " wadargudfar mara konāhan ma zjunankitima niz mig
 " farim ormān mara; wador ozmajfeh mīnedāzzmara;
 " likin chalās kun mara ez efcherir." Amen.
 The Persian alphabet consists of twenty-eight let-
 ters, none of which are vowels; their accent serves in
 lieu thereof, and points out how the voice is to be mo-
 dulated, and the consonants pronounced; they have no
 stops, but begin every sentence with a capital letter;
 but in whatever language they write, always make use

of Arabic characters; and, instead of quills, use reeds to make pens of.

In ancient times, the Persians were famed for learning and learned men; and their poets were renowned all over the east. A manuscript at Oxford contains the lives of 125 of the finest Persian poets: Ferdusi and Sadi were among the most celebrated. The former comprised the history of Persia in a series of epic poems, which employed him for near thirty years, and which are said to be a glorious monument of eastern genius and learning. Sadi was a native of Schiras, flourished in the thirteenth century, and wrote many fine pieces both in prose and verse. Shemseddin was one of the most eminent Lyric poets that Asia has produced; and Nakhtheb wrote in Persian a book called "The Tales of a Parrot," not unlike the Decameron of Boccaccio. Jami, who flourished in the middle of the sixteenth century, was a most animated and elegant poet: his beautiful compositions, on a great variety of subjects, are preserved at Oxford, in twenty-two volumes. Hariri composed in a rich, elegant, and flowery style, a moral work, in fifty dissertations, on the changes of fortune, and the various conditions of human life, interspersed with a number of agreeable adventures, and several fine pieces of poetry.

Learning is now at a very low ebb among the Persians. Their boasted skill in astronomy is reduced to a mere smattering in that science, and terminates in judicial astrology; so that no people in the world are more superstitious than the Persians: they place an implicit confidence in their astrologers, who are all natives of Chorassan, and pretend to be descended from the ancient Magi. Their almanacks are an absurd mixture of astronomy and judicial astrology, morality and predictions; and they understand nothing more of arithmetic than the four fundamental rules. In short, their genius is but little cultivated by education, and less by experience, as they never travel into foreign countries; and the sameness of customs and manners in their own, does not afford a sufficient variety for observation and improvement.

The learned profession in greatest esteem among them is that of medicine; which is at perpetual variance with astrology, because every dose must be in the lucky hour fixed by the astrologer, which often defeats the ends of the prescription. It is said, however, that the Persian physicians are acute and sagacious. Their drugs are excellent, and they are no strangers to the practices of Galen and Avicenna. Add to this, that the plague is but little known in this country; many diseases also are equally rare here, that are fatal in other places; such as the gout, the stone, the small-pox, consumptions, and apoplexies. The Persian practice of physic is therefore pretty much circumscribed; and they are very ignorant in surgery, which is exercised by barbers, whose chief knowledge of it is in letting blood; for they trust the healing of green wounds to the excellency of the air, and the good habit of the patient's body. They are also totally unacquainted with anatomy.

The Persians salute by an inclination of the head, and putting the right hand to the breast upon the heart. Before the sovereign and great men, they bow with their faces three times towards the ground; but in their relations and familiar companions salute thus: he who pays the compliment, presses one of the other person's hands between both his own, and then gently raises it up to his forehead, which is expressive of the highest and most cordial esteem.

The most magnificent remains of antiquity in Persia are the ruins of Persepolis, the ancient metropolis of that kingdom, consisting of superb columns, spacious stair-cases, grand portals, and beautiful pilasters adorned with figures in basso relievo. Accurate descriptions of these superb remains of antiquity may be found in Sir John Chardin's and M. le Brun's Travels, and in the sixth volume of the ancient part of the Universal History. About a league distance from these ruins is a famous mountain, situated between two fine plains, to which the natives give the several appellations of Kabraston Gauron, Nachs-Kulstan, and Tak-Kulstan. It is an entire rock, harder and capable of a better polish than marble. Having been levelled by art, its sides are quite perpendicular, so that it has the appearance of a large wall; and upon it are a variety of figures, represented in bass relief with great skill and beauty. At a small distance from these figures are several tombs cut out of the rock, with two small edifices, and several inscriptions. These are supposed to have been the burial-places of the ancient kings of Persia, and many of the inscriptions and figures are yet perfect; but others, through the brutal zeal of the Mahometans, who think it meritorious to destroy all kinds of images, and the injuries of time, are almost defaced. At Ispahan is a pillar, erected by Shah Abbas, sixty feet high, consisting of the skulls of beasts. It is said that some of his subjects having rebelled against him, he made a vow, that, on subduing them, he would erect such a pillar of their skulls; but, upon their submission, he relented, and substituted those of brutes, obliging each of the rebels to find one.

The river Mahmoudker, or the deafening river, is a very surprising natural curiosity. At some distance from Ispahan there is a range of rocks, plain and even for a considerable space, except that here and there they have openings, like the embrasures of battlements; through these the winds pass with amazing velocity. The river falls from these rocks into a noble basin, partly wrought by the water itself, and partly by art. In ascending the mountain the water is seen at the bottom of it like a sleeping lake, interspersed with rocks. It is supposed to be unfathomable, and, when stones are thrown into it, they cause a most amazing noise, which almost deafens the hearer, from which circumstance it, in all probability, derives its name. Many are of opinion that this river does not derive its water from springs, but from the snow on the

Near Gombroon are some baths, which, for the
innumerable cures performed by them, justly merit a place
among the natural curiosities of Persia. The everlast-
ing fire at Baku has been already mentioned under the
article of religion.

The Persian mosques are buildings set apart for pub-
lic worship: they are of a square form, and generally
of stone; before the chief gate there is a square court,
paved with white marble, and low galleries round it,
whose roof is supported by marble pillars. Those gal-
leries serve for places of ablution, before the Maho-
metans go into the mosque. About every mosque there
are six towers, called minarets, each of which has three
little open galleries, one above another. These towers,
as well as the mosques, are covered with lead, and
adorned with gilding and other embellishments; and
from thence, instead of a bell, the people are called
to prayer by certain officers appointed for that purpose.
At Sultania, once a noble city, but now greatly de-
cayed, there is a prodigious large mosque, that con-
tains the sepulchre of Sultan Mahomet Chabadende,
the founder of the city. This mosque hath three gates
of fine polished steel, which equal in bigness the gates
of any church in Europe; the roof is of blue and
white stones. At the entrance of it there is a beautiful
fountain; the tower, which is of an octagonal form,
is surrounded by eight other towers. Upon the whole,
it is a structure which astonishes the imagination, and
justifies the curiosity.

No woman is allowed to enter the mosque; nor can
a man with his shoes or stockings on. Near most
mosques is a place of entertainment for strangers
during three days; and the tomb of the founder, with
conveniences for reading the Koran, and praying.
Near the mosque founded by Shah Ismael, are the
ruins of a triumphal arch built of free-stone.

The Persian bagnios are usually round, though some
few are square. The roofs are covered with painted
tiles, the walls are of a beautiful kind of white stone;
each is covered with a dome. In the centre of the
building is a large hall, floored with marble, and a
capacious basin to bathe, round which are the apart-
ments to dress and undress in. Each bagnio contains
three rooms; the first for dressing and undressing; the
second contains the water, and the third the bath.

When the baths are ready in the morning, a servant
goes to the terrace on the top of the building, and
blows a horn, to give public notice of the same. The
men bathe in the morning, and the women in the after-
noon about four o'clock. When the men have done
bathing, the male attendants all withdraw, and are suc-
ceeded by the females, who are appointed to attend the
women. No people of any very great consideration,
however, go to the public baths, as they generally
have baths in their own houses.

Bathing is not only enjoined to the Persians by their
religion, but it is particularly conducive to their health,
on account of their never entirely undressing themselves
when they go to rest. Add to this, they reckon it
among their principal pleasures.

Besides being well rubbed by the attendants at the
bagnios, the barbers shave them with incredible dif-
patch and ease, and there cut the nails both of their
hands and feet, chafe the flesh, and give them a very
rough pull of both the arms, in order to stretch the
nerves.

The Persian harams, or seraglio's, which are appro-
priated for the women, are, from the most credible
accounts of them, contrived according to the taste and
conveniency of the owner, and divided into a certain
number of apartments; and as there is no country in
the world where women are so strictly guarded and con-
fined as among the great men in Persia, these rooms
therefore are seldom or never entered by strangers.

With respect to manufactures and commerce, it has
been justly remarked, that the Persians equal, if not
exceed all the manufacturers in the world in silk,
woollen, mohair, carpets, and leather. Their works
in these join fancy, taste, and elegance, to richness,
neatness, and shew; and yet they are ignorant of
painting, and their drawings are very rude. Their
dyeing excels that of Europe. Their silver and gold
laces, and threads, are admirable for preserving their
lustre. Their embroideries and horse-furniture are
unequaled; nor are they ignorant of the pottery and
window-glass manufactures. On the other hand, their
carpenters are very indifferent artists, which is said to
be owing to the scarcity of timber all over Persia.
Their jewellers and goldsmiths are clumsy workmen,
and they are ignorant of lock-making and the manu-
facture of looking-glasses. Upon the whole, they lie
under inexpressible hardships from the form of their
government, which renders them slaves to their kings,
who often engross either their labour or profits, as the
exigencies of the state, or other lucrative motives, may
prompt them.

As the Persians have little or no shipping, their trade
is chiefly carried on in foreign bottoms. That between
the English and other nations, by the gulph of Ormus,
at Gombroon, was the most gainful they had; but the
perpetual wars they have been engaged in have ruined
their commerce. The great scheme of the English, in
trading with the Persians through Russia, promised vast
advantages to both nations, but it has hitherto answered
the expectations of neither. Perhaps the court of Pe-
tersburgh is not fond of suffering the English to establish
themselves upon the Caspian Sea, the navigation of
which is now possessed by the Russians; but till the go-
vernment of Persia is in a more settled state than at pre-
sent, we can say nothing with certainty on that head.

THE CONSTITUTION AND GOVERNMENT OF PERSIA
are extremely precarious, as resting in the breast of a
despotic and often capricious monarch. The Persians,
however,

however, had some fundamental rules of government. They excluded from their throne females, but not their male progeny. Blindness likewise was a disqualification for the royal succession. In other respects, the king's will was a law for the people. The favourites of the prince, female as well as male, are his only counsellors, and the smallest disobedience to their will is attended with immediate death. The Persians have no degrees of nobility, so that the respect due to every man, on account of his high station, expires with himself. The king has been known to prefer a younger son to his throne, by putting out the eyes of the elder brother. The instances that have been given of the cruelties and inhumanities practised by the Mahometan kings of Persia, are almost incredible, especially during the two last centuries. The reason given to the christian ambassadors, by Shah Abbas, one of their most celebrated princes, was, that the Persians were such brutes, and so insensible by nature, that they could not be governed without the exercise of exemplary cruelties. But this was only a wretched and ill-grounded apology for his own barbarity.

No rank or condition of Persians is exempted from severe taxations and services. The crown claims one-third of the cattle, corn, and fruits of his subjects, and likewise a third of silk and cotton. Even the water, that is let into fields and gardens, is subject to a tax; and foreigners, who are not Mahometans, pay each a ducat per head. The governors of the provinces have particular lands assigned to them for maintaining their retinues and troops, and the crown lands defray the expences of the court, king's household, and great officers of state. From the above statement, the reader cannot doubt that the revenues of the Persian kings were prodigious; but, in the present distracted state of that country, nothing can be said with any certainty.

The military strength of Persia consisted formerly of cavalry, and it is now thought to exceed that of the Turks. Since the beginning of this century, however, their kings have raised bodies of infantry. The troops are distinguished into two bodies called Kortkies and Goulans: these are cavalry, and upon a peace-establishment, the former amount to about 22,000, and the latter to about 8,000 men; they are generally well kept, and regularly paid. The kortkies are the descendants of foreigners, and the goulans are made up of Georgian renegades and slaves of all nations. The tangchies or infantry are composed of the most hardy peasants, and amount to about 50,000 men. The regular troops of horse and foot brought to the field, even under Kouli Khan, did not exceed 60,000; and according to the modern histories of Persia, they are easily recruited in case of a defeat.

The fortified towns and places in Persia, are in general despicable, and they had no great naval power till the time of Kouli Khan, who built a royal fleet, in which was a man of war of eighty guns; but it is imagined that they are laid up in the ports, and rot-

ten, as nothing hath been heard of them since the death of that usurper. The arms of Persia are a lion couchant looking at the sun as he rises over his head. The emperor's title of Shah signifies Disposer of kingdoms. The Persian monarch does not subscribe his name to public instruments, but the deed runs in this style, viz. "This edict or act is given by him whom the universe obeys."

From the distracted state of Persia for many successive years, the political division of the provinces cannot be ascertained; but the most remarkable places in the empire have been visited of late years by several merchants and others, who went upon embassies; the most authentic and interesting of whose accounts we shall borrow for the information of our readers, by describing some of their cities and principal towns.

Ispahan, the capital of Persia, is situated in a delightful and extensive plain, surrounded by mountains on the banks of the river Zenderoud, over which there are three fine bridges. The fertility of the soil, the mildness of the seasons, and the fine temperature of the air, all conspire to render this city one of the most inviting and desirable in the world. The mountains with which it is surrounded, defend it equally from the sultry heats of the summer, and the piercing winds of the winter seasons; and the plain on which it stands is watered by several rivers, which contribute both to its ornament and use; the water of these streams being sweet, pleasant, and wholesome, almost beyond comparison.

The extent of Ispahan is very great, not less, perhaps, than twenty miles within the walls, which are of earth, poorly built, and so covered with houses and shaded with gardens, that in many places it is difficult to discover them. The number of inhabitants were formerly computed at 650,000; but since the reign of Kouli Khan, who almost depopulated the city, the number is vastly decreased, not one third of the houses being inhabited, and many of them levelled with the ground.

The streets are in general long, narrow, crooked, and unpaved; but some of them are broad and handsome, adorned with canals and fountains, and, on each side a row of lofty trees planted. As it seldom rains here, the city is rendered extremely disagreeable in summer by the dust; though the citizens, to remove this inconvenience as much as possible, frequently cause the streets to be watered, during the intense heat.

Most of the public buildings are rather neat than magnificent, though here are some sumptuous palaces, and handsome houses. The royal palace is very spacious, being near a league and a half in compass, and contains some very grand apartments. The royal mosque, the Kayserich, where all sorts of foreign commodities are exposed to sale, and the mint, called Serrah Khoneh, where the current money of the kingdom is coined, are all noble structures; and the royal square, or Meidan Shah, is one of the finest in the

world. The

is one of the finest in
the

world. There are in Ispahan 160 mosques, 1800 ca
raneras, 160 public baths, and a prodigious number
of fine squares.

This city has eight, or, as some say, ten gates, be
sides posterns; the suburbs are very large, and, besides
atives, Ispahan formerly contained above 10,000 In
dians, all supported by trade, 20,000 Georgians, Cir
cassians, and Tartars; with a considerable number of
English, Dutch, and Portuguese, and a few French.

The bridge at Zulpha, one of the suburbs of Ispa
han, is esteemed the finest structure in Persia. It is
built of brick, with edgings of free-stone, and is almost
level, the middle of it being not much higher than the
sides. It is above 300 paces in length, and 20 in
breadth, and supported by a great number of low
stone arches. On each side is a gallery eight or nine
feet broad, extending from one end to the other, raised
several steps above the level of the bridge, with a num
ber of apertures to let in the air and light, and give a
prospect of the river. These galleries or covered walks
are not entirely appropriated to foot passengers; they
are frequently used by horsemen in winter, when the
river overflows, and fills the middle passage of the
bridge, which is properly designed for horses. Over
the galleries is a platform, but so much exposed to the
sun that it is seldom frequented. The most remark
able part of this bridge is a passage along the bed of
the river, when the water is low in summer, for the
convenience of foot passengers in that hot season; for
the stones are so placed, that a person may step from
one to the other without wetting his shoes; and proper
openings are made through the piers, from one end of
the bridge to the other.

Gombroon, or, as the natives call it, Bander-Abassii,
owes its present wealth and grandeur to the demolition
of Ormus, and the destruction of the Portuguese em
pire in the East-Indies. It was built by the great Shah
Abbas, and is now very justly esteemed one of the chief
ports in the East.

This city is large, and, from the extensive commerce
carried on in it, by the English and Dutch factories,
as well as the natives, is extremely populous; but its
situation is remarkably bad. It is defended on the
land-side by a single wall only; but towards the sea
are erected several small forts, with a platform, two
castles, and two stone bastions, mounted with cannon,
to secure it and the road from the attempts of an
enemy.

The streets are narrow, and the houses in most of
them so out of repair, some half ruined, and others
entirely so, that a stranger would suppose the town had
been sacked and ravaged by an enemy, not a vestige of
the wealth really contained in the place appearing in
view. The Banians, or shop-keepers, have most of
them tolerable houses; they are in general built of
earth and lime, but the better sort are of stone; most
of them have ventilators on the top, which contributes
greatly to the health of the inhabitants.

Gombroon is an unhealthy place; the most sickly
months are from April to October, during which time
the genteel part of the inhabitants retire into the coun
try, winter being the only time for commerce.

There are great plenty of sheep, goats, hares, pigeons,
partridges, &c. and wheat in such abundance, that the
poor subsist chiefly on bread and dates. Rice is im
ported from India; and the adjacent country affords
apricots, peaches, pomegranates, and other delicious
fruits in great abundance. But amidst all these advan
tages there is the greatest scarcity of fresh water, not a
spring or well is found in the town, or nearer to it than
Athen, from which place all the inhabitants of this city
are supplied with water, though at the distance of seven
miles; and persons of condition keep a camel constantly
employed in fetching fresh and wholesome water.

About the year 1631 the English began to settle here,
when, in consideration of their services against the Por
tuguese, Shah Abbas granted them half the customs of
that port. They enjoyed this lucrative donation, till
they began to neglect the services they had stipulated,
when it was taken from them. They have still a fac
tory here, and at Athen they have a country-house with
noble gardens, to which the factors repair for their
amusement. As the natives have no ships of their own,
and are entirely ignorant of navigation, they send their
goods to Surat, and other Indian marts, in English and
Dutch bottoms, at an exorbitant price, so that great
part of the company's profit arises from freights.

The commodities of the Gombroon market are, fine
wines of different kinds; raisins, almonds, prunellas,
dates, pistachio nuts, ginger, silks, carpets, leather,
galbanum, ammoniac, assaetida, tragacanth, with
other gums, and a variety of drugs.

In 33 deg. 51 min. of north lat. lies the city of
Katschan, in the midst of a fine fertile plain; this is
one of the finest cities in Persia, the houses in general
being handsome, and the public structures superior to
those of any other city; the country about it is so
fruitful, that the very poorest inhabitants live luxuri
ously. The city is exceeding populous, not only from
the great number of natives, but from the vast influx of
foreigners, who flock thither from all parts, particu
larly from India, to carry on trade; the walls and for
tifications are made of a kind of potter's clay. The
Sophi hath a grand garden here, in the midst of which
is a summer palace, reputed to have a thousand doors
and windows. The greatest inconvenience in Kats
chan is the want of water, as they have not any but
what is ill-tasted, thick, and muddy.

Resched, which is in 31 deg. north lat. and in 50 deg.
long. from London, is the capital of the province of
Ghilan, which is one of the most fertile, rich, and
pleasant provinces in all Persia. It is large and popu
lous, but hath not the least fortification. The streets
are agreeable and planted with trees; but the houses in
general are meaner than those of any other city in the
empire; they are all covered with tiles, or slates.

The

The market-place is capacious, and contains many good shops; and all the necessaries of life are exceedingly cheap.

Derbent is situated in 41 deg. 15 min. north lat. and in 51 deg. east long. it is about three miles in length, and near five hundred paces in breadth; the castle and wall are five feet thick, and it is supposed they were built by Alexander the Great. They appear to be built with free-stone, but in reality are a composition of pounded muske-shells, and pieces of free-stone beaten to powder, which being moulded into the form of bricks, are so excellently cemented together, that the whole composition becomes harder than any marble; a garrison of five hundred soldiers is kept here.

Schiras, which lies about two hundred miles to the southward of Ispahan, is a place of considerable trade. The wines made here are the best in Persia; the fruits and flowers are incomparable, and the surrounding country is a perfect paradise; but only about four thousand of the houses are at present inhabited; it is the capital of Pars, the ancient Persia; and its college for the study of oriental literature, is one of the best in Persia. Though the streets are narrow, the buildings in general are superb and elegant, and the mosques are innumerable.

A NEW HISTORY OF PERSIA.

PERSIA has been inhabited from the most early times: it was peopled by Elam the son of Shem, soon after the confusion at Babel. It constituted part of the first monarchy called the Assyrian empire, founded by Nimrod, Belus, or Baal, about 200 years after the Flood. But the foundation of the empire of Persia, singly considered, was laid by Cyrus about the year before Christ 556. This prince, in the first year of his reign, published the famous edict, by which the Jews were permitted to return to Jerusalem; restoring at the same time all the vessels of the temple, which Nebuchadnezzar had brought from Judea, and placed in the temple of Belus, his god. The empire continued in its lustre about 227 years, when it terminated in the person of Darius, who was conquered by Alexander the Great.

On the death of that monarch, whose dominions were divided among his principal officers, Persia, together with Babylonia and Syria, fell to the share of Seleucus, the son of Antiochus. The Romans afterwards subdued all the territories possessed by the successors of Alexander's generals, except Persia, which still continued to have princes of its own, who more than once defeated the Roman legions.

The Saracens, about the year 630, made a conquest of Persia, and kept possession of the throne during an interval of 70 years, when they were driven out by the Turks. About the year 1260, the Tartars and Scythians, under the conduct of two of the Sons of Zingis

Khan, defeated the Turks, and took possession of the empire. Tamerlane, after defeating Bajazet, reduced both Persia and Turkey in Asia. On his return to Samarcand, the capital of his dominions, with a great number of Persian captives, Cheik Aider, a doctor of the Mahomedan law, highly esteemed in that country, obtained the release of most of these prisoners. This act of kindness greatly increased his reputation with his countrymen; and Tamerlane having appointed no governor of the western provinces, the Cheik assumed the office; and, pretending that he was lineally descended from Ali, the son-in-law and genuine successor of Mahomet, took upon himself the title of Caliph, which includes both the spiritual and civil jurisdiction. This event happened in the year 1400. Ismael Saphi succeeded his father; and being a brave successful prince, was confirmed in his possession of the throne by the unanimous voice of the people. At his death Shah Tahmas obtained the sceptre of Persia; but being a very cruel prince, he was deposed by his subjects, and his brother Codabundi placed on the throne.

Codabundi deceased in 1585; and was succeeded by his son Shah Abbas, a virtuous and warlike prince. He recovered the province of Candahor from the emperor of Indostan, reduced the kingdoms of Lar and Ormus, and expelled the Turks from great part of Armenia and Georgia. He reigned forty years; and was by far the greatest prince of the Sophi dynasty. He was succeeded by his grandson Shah Sophi, a cruel and tyrannical prince, an enemy to virtue, and a scandal to humanity. His successors followed his steps, till the people, roused at last by their sufferings, exerted the rights of human nature, and in the year 1701 deposed Husein, a prince of the Sophi race, and put him to death; together with all his family, except Shah Tahmas, who escaped from the rebels, and took refuge in the northern parts of Persia. Mahmud, who headed the rebels, took possession of the throne. He did not, however, long enjoy the imperial sceptre, which he had purchased by the blood of his master; he was soon after murdered by Efref, one of his general officers, who usurped the throne. In the mean time prince Tahmas raised a powerful army, and was joined by a great number of royalists, and among the rest, by Kouli Khan, a famous partizan on the frontiers of Usbec Tartary. Efref, whose cruelty and injustice had rendered him obnoxious to the people, was defeated, taken prisoner, and put to death. Tahmas ascended the throne of his ancestors, and sent Kouli Khan, at the head of a numerous army, against the Turks. The Persians were victorious, and Kouli Khan recovered all the places the Othmans had taken on the frontiers of Persia during the late troubles. Haughty by nature, and insolent from success, Kouli Khan beheld the honours conferred on him by the Sophi with contempt. He complained that his services were neglected; but nursed in silence the bloody design he had formed against his master. He courted popularity, and when his scheme was ripe for execution, he drop-

ped the mask. He assumed Nadir Shah, prisoner, and All opposed mounted the throne, and had the usurper princes. His being treasure been already Usbec Tart Khan; he courts arms invincible Tartan; but standards, now which all his treacheries arm victorious arm the defiles of the force the enemy of one campaign. ped the mask that had hitherto concealed his intentions. He assumed the names of Tahmas Kouli Khan and Nadir Shah, rebelled against his sovereign, took him prisoner, and put him secretly to death. All opposition being thus removed, Shah Nadir mounted the Persian throne. Cruel and fierce by nature, and happy only in the midst of war and tumult, the usurper turned his arms against the neighbouring princes. His expedition into Indostan, and the amazing treasure he collected in that famous empire, have been already mentioned in the history of the Indies. Usbeck Tartary next excited the ambition of Kouli Khan; he conquered that country, and thinking his arms invincible, attempted to reduce the Daghestan Tartars; but fortune, that had hitherto attended his standards, now forsook him. He found difficulties which all his ferocious abilities could not remove. The precipices of Daghestan opposed his march, and his victorious army was cut off by Tartar detachments in the defiles of the mountains, without his being able to force the enemy to an engagement. The misfortunes of one campaign were not however sufficient to intimidate Nadir; he led his forces against the Turks, and defeated them in several battles. He laid siege to Bagdat, but could not succeed, and was obliged, after many efforts, to abandon the enterprize. His next attempt for his restless soul could never be idle) was against the religion of his country; he was determined to introduce the tenets of Omar, instead of those of Ali, embraced by the Persians; but soon found that it is much easier to conquer force than bigotry; the great principle of his government was terror, which was ever exerted in vain. Exasperated at an opposition he could not subdue, he became one of the most cruel tyrants that ever disgraced mankind. He put his own sons to death, and formed the detestable design of exterminating all his family and relations. Self-preservation now opposed the diabolical purpose; his actions were those of a madman, and his relations and chief officers assassinated him in his tent. This event happened in the year 1747. The cruelty of Nadir had destroyed all the immediate branches of the royal family, and the throne became the sport of fortune. One pretender after another started up and fell, either by open force, or the secret machinations of treachery. Anarchy and destruction overspread the whole empire; the fields were laid waste, the cities were plundered, the inhabitants murdered, and every district exhibited a scene of horror and of blood. Famine at last reached the sword of destruction, and Kerim Khan was crowned at Tauris in the year 1763. Since that period the Persians have enjoyed the happiness of peace; but it is very probable that the miseries and distress which have been introduced by rebellion, will not for a long time be removed; trade is still in a languishing condition, great part of the country remains uncultivated, and poverty and toil have usurped the place of affluence and ease.

CHAP. XVI.

A R A B I A.

Situation, Boundaries, Divisions, Climate, Soil, Produce, Inhabitants, Language, Religion, &c.

ARABIA is situated between the 35th and 60th deg. of east longitude, and between the 12th and 30th of north latitude; extending about 300 miles in length, and 1200 in breadth, and contains 700,000 square miles. It is bounded by Turkey on the north; by Persia and the gulphs of Bassora and Ormus, on the east; by the Red Sea, which divides it from Africa, on the west; and by the Indian Ocean, on the south.

This country is divided into, 1. Arabia Petraea, N. W. 2. Arabia Deserta, in the middle. 3. Arabia Felix, S. E. Arabia Petraea has for its chief town, Suez, east long. 33 deg. 27 min. north lat. 29 deg. 50 min.

Arabia Deserta is subdivided into Haggiaz or Mecca, and Tehama; whose chief towns are, Mecca, east long. 43 deg. 30 min. lat. 21 deg. 20 min. Siden, Medina, and Dhafar.

Arabia Felix is subdivided into Mocha, Hadramut, Casheen, Segur, Oman or Muscat, Jamama, and Bahara. The town of Sibt belongs to Mocha, and that of Elcaif to Bahara; the rest are the same as the provinces.

This country has always preserved its ancient name. The word *Arab*, it is generally said, signifies a robber or free-booter. The word *Saracen*, by which one tribe is called, is said to signify both a thief, and an inhabitant of the desert. These names justly belong to the Arabians, for they seldom let any merchandize pass through the country without extorting something from it, if not robbing, the owners. Thus concerning the Arabians, who are the posterity of Ithmael, is the prediction in scripture, Gen. xvi. 12. fulfilled, where it is said, "He will be a wild man; his hand will be against every man, and every man's hand against him; and he shall dwell in the presence of all his brethren."

The principal mountains in Arabia are those called Gebel el Ared, in Arabia Felix, and the mountains of Sinai and Horeb, in Arabia Petraea, east of the Red Sea. The latter are situated on the north side of the desert of Sinai, and very steep and high, but not proportionably broad; and though a road is cut all the way up to their summits, the ascent is very difficult and fatiguing.

The principal rivers are the Euphrates, which washes the north-east limits, and the Tigris; both which have been already mentioned in the description of Turkey in Asia. Besides these, there are few rivers, fountains, or springs in this country, which is almost surrounded with seas; namely, the Indian Ocean, the Red Sea, the gulfs of Persia and Ormus. Rosalgate and Mussledon are the chief capes or promontories.

Arabia being situated between the 2d, 3d, 4th, and 5th climates, the longest day in the south is about four

teen hours and an half, and in the north eighteen hours and an half. A considerable part of this country lies under the torrid zone, and the tropic of Cancer passes over Arabia Felix; so that the air is excessively dry and hot, and, in many places, very unsalutary, particularly near the coast.

The air is said to be the most sultry and dry in the northern parts; and the hot poisonous winds, which blow there as well as in Persia, often prove fatal to those who breathe them. Towards the south, the heat is somewhat alleviated by the prodigious dews which generally fall in the night, and refresh the earth.

The heat of the climate is greatly increased by the nature of the soil, which, in a great measure, consists of barren rocky mountains, or sandy deserts of prodigious extent, over which there is no beaten path; so that the caravans, obliged by the excessive heat to travel in the night, and having no tracks, are guided, as at sea, by a compass, or by the stars. "Here," says Dr. Shaw, "are no pastures stored with flocks, nor valleys standing thick with corn; here are no vineyards or oliveyards; but the whole is a lonesome desolate wilderness, no otherwise diversified than by plains covered with sands, and mountains that are made up of naked rocks and precipices. Neither is this country ever, unless sometimes at the equinoxes, refreshed with rain; and the intenseness of the cold in the night is almost equal to that of the heat in the day." This, however, is not to be understood of the southern parts of Arabia, where the soil, refreshed by the dews already mentioned, is in general exceeding fertile.

The cultivated lands in the southern parts of Arabia Felix, which are chiefly about the towns near the sea-coast, yield exceeding fine coffee, manna, myrrh, cassia, aloes, balm of Gilead, frankincense, spikenard, and other valuable gums; cinnamon, pepper, and cardamoms; oranges, lemons, pomegranates, figs, dates, and other fruits, with a small quantity of corn and wine. At Betesfagui the coffee tree is cultivated.

The Arabian horses are held in the highest esteem all over Europe for their swiftness and beauty, and preferred to those of any other country for stallions; the breed of English horses, particularly, have been much improved by them. The finest sort is in the kingdom of Supnaa, where Mocha is situated. But the most useful animals to the Arabs are their camels and dromedaries, which are fitted by nature for travelling in parched and sandy deserts, their stomachs being formed in such a manner, that they can from thence throw the water up into their throats. This peculiarity enables them to travel seven or eight days without drinking. It is said, that these animals can distinguish the scent of water at a considerable distance, and the instant they smell it set out on a swift trot, and never stop till they reach the spot where it is found. They usually carry eight hundred weight upon their backs, which is never taken off during the longest journeys, for they naturally kneel down to rest, and rise again with their load.

Though the Arabs in general are a wandering people, and consequently very little acquainted with commerce;

there is, however, a considerable trade carried on from Mocha, by the English and Dutch companies sent there, in coffee, alibanum, myrrh, aloes, liquid storax, white and yellow arsenic, gum Arabic, balm of Gilead and other drugs.

As to the inhabitants, they are, in common with most of the Asiatics, of a swarthy complexion, middle stature, and thin, with black hair and eyes. They are said to be a brave people, excellent horsemen, very swift of foot, expert at the bow and lance, and, since they became acquainted with fire-arms, good marksmen. Some of them reside in cities and towns upon the sea-coast, and apply themselves to trade, and cultivate the sciences; but the far greater part have no settled habitation, roving with their flocks and herds, from place to place, for the conveniency of water and pasture; and carrying their abode in any particular spot, they live in tents. Among themselves, and towards such strangers as they receive as friends, they are honest, civil, and humane; but their general character is that of freebooters or robbers, which the word Arab is said to imply. Their food is chiefly rice, fish, herbs, venison, fowl, and most kinds of flesh; but they prefer that of camels. Like the Jews, they always drain the blood from every thing they eat, and abstain from such fish as have no scales. Their drink is chiefly water and thersbet, for they have no strong liquors.

The habit of the roving Arabs is a kind of blue shirt, girt about them with a white sash or girdle; and some of them have a vest of fur or sheep skins over it. They likewise wear drawers, and sometimes slippers, but no stockings; and they have a cap or turban on their heads. Many of them, however, go naked; but the women are so wrapped up, that no part of them can be seen but their eyes.

We shall now give some account of the caravans, and manner of travelling through the deserts.—A caravan implies a company of merchants, travellers, or pilgrims, who, for their greater security, form a troop, in order to assist each other in travelling through the deserts, which are infested by wild Arabs and other banditti. But no caravan can be formed without procuring the permission in writing of the prince in whose dominions the caravan is formed, as well as that of those through whose territories it is to pass. These permissions always express the number of persons and carriages, and the quantity of merchandize, which are to compose the caravan, as well as the merchants to whom the goods belong. They also regulate every thing relating to its police and government, during the whole journey.

Caravans are generally distinguished into four kinds: the heavy caravans, which are composed of elephants, camels, dromedaries, and horses; the light caravans, in which there are but few elephants; the common caravans, in which there are none of those unwieldy animals; and the horse caravans, in which horses only are used.

The heavy caravans are regulated by the following portions: when there are five hundred elephants, they

 ated by the following
 ndred elephants, they

and a thousand camels, a thousand dromedaries, and
 thousand horses. The escort consists of four thou
 and cavalry. Two men are necessary for leading one
 dromedary, seven men for eleven camels, and five men
 for three dromedaries. This multitude of servants, to
 gether with the officers and passengers, whose number
 is not limited, serve to support the escort, in case of an
 attack; and therefore render the caravan at once more
 formidable and more secure.

The Arabian princes subsist principally in robbing;
 they traverse the deserts in troops, so that the caravans
 always travel with the greatest precaution, being drawn
 up in a very regular manner. None stray from the ca
 van, nor deviate from the position assigned them at their
 first setting out. The wandering Arabs, as soon as
 they have intelligence of a caravan having entered the
 deserts, send out spies to make the necessary observations
 on the number and force of the escort. If they find
 they are not able to attack the caravan in form, they
 never round it, in order to pilfer from the merchants

during the night; but, if they think themselves able to
 defeat the escort, they approach boldly, and begin the
 attack with the utmost fury. If the escort stand firm,
 the Arabs generally fly with the greatest precipitation;
 but, being strangers to military discipline, they hardly
 rally after being once repulsed; but, if the escort
 give way, the whole is thrown into confusion, the cara
 van is plundered, and the whole convoy, except the
 foreign merchants, sold for slaves. It is therefore no
 wonder if travellers of all kinds, and even pilgrims
 themselves, who cross these barren tracks from motives
 of devotion, are struck with terror on entering the de
 serts. Nor is even the most powerful caravan always
 secure, for they have more than once been attacked and
 plundered. In the year 1750, a body of 50,000 Ara
 bians, under the command of one of their princes, at
 tacked a caravan of merchants and pilgrims returning
 from Mecca, killed about 60,000 persons, and plun
 dered it of every thing valuable, though escorted by a
 Turkish army. On the sea-coast they are mere pirates,
 and make prizes of every vessel they can master, with
 out distinction.

The whole commerce of the Indies was formerly
 carried on by caravans; but, since the discovery of a
 passage by the Cape of Good Hope, the caravan trade
 has been upon a decline. The dreadful wars carried on
 in the Lesser Asia and Egypt, whereby these rich coun
 tries were stripped of their wealth and inhabitants, in
 creased the evil; and the exactions of the Turks, added
 to the late dreadful troubles in Persia, have almost anni
 hilated the whole. Few caravans now cross the de
 serts, except those that pass annually to Mecca on ac
 count of religion; and even these begin to decline, be
 cause the merchants are no longer able to carry on their
 former trade with India. The roving Arabs raise a
 contribution on the caravans; those which travel from
 Damas to Mecca procure an uninterrupted journey for
 the consideration of 150,000 livres, to which the grand
 signior is subjected.

Many of the wild Arabs are still Pagans, but the
 people in general profess Mahometanism. Of this re
 ligion we shall give an account in the History of Ma
 homet, their countryman.

Arabia was, in former ages, famous for learning and
 learned men, who were skilled in all the liberal arts; and
 many of the Arabian performances in physic, astronomy,
 and mathematics, shew the authors have been persons of
 great genius and application; but there is scarcely a coun
 try at present where the people are so universally ignorant.
 The vulgar language used in the three Arabias is the Ara
 bek, or corrupt Arabian, which is likewise spoken, with
 some variation of dialect, over great part of the East,
 from Egypt to the court of the great mogul.

The pure old grammatical Arabic, which is said to
 be a dialect of the Hebrew, and, by the people of the
 east, accounted the richest, most energetic, and copious
 language in the world, is taught in their schools as
 Greek and Latin is among Europeans, and used by Ma
 hometans in their worship. The books which treat of
 it, say, they have no less than a thousand terms to ex
 press the word camel, and five hundred for that of a lion.
 In this language the Koran was written, and they will
 not suffer it to be read in any other: they look upon it to
 have been the language of Paradise, and think no man
 can be master of it without a miracle, as consisting of
 several millions of words.

Sir William Jones has lately translated into English
 seven Arabian poems, called the Moalakat, which are
 preserved in the temple of Mecca, or suspended on its
 walls or gates, and afford a fine specimen of oriental
 poetry, as to the dramatic pastoral. As a specimen of
 these poems may serve to gratify the curiosity of our
 readers, and also display a lively and entertaining view
 of the Arabian customs and modes of living, we have
 therefore transcribed from one of them the following
 stanzas:

1. " Desolate are the mansions of the fair, the sta
 tions in Minia, where they rested, and those where they
 fixed their abodes! Wild are the hills of Goul, and de
 serted is the summit of Rijam."
2. " The canabs of Rayaan are destroyed: the re
 mains of them are laid bare, and smoothed by the floods,
 like characters engraved on the solid rocks."
3. " Dear ruins! many a year has been closed,
 many a month, holy and unhallowed, has elapsed, since
 I exchanged tender vows with the fair inhabitants."
4. " The rainy constellations of spring have made
 their hills green and luxuriant: the drops from the
 thunder clouds have drenched them with profuse as well
 as with gentle showers."
5. " Showers from every nightly cloud, from every
 cloud vesting the horizon at day-break, and from every
 evening-cloud, responsive with hoarse murmurs." (&c.)
6. " Here the wild eringo-plants raise their heads:
 here the antelopes bring forth their young by the sides
 of the valley, and here the ostriches drop their eggs."
7. " The large eyed wild cows lie suckling their
 young

young a few days old; their young, who will soon become a herd on the plain."

8. "The torrents have cleared the rubbish, and disclosed the traces of habitations, as the reeds of a writer restore effaced letters in a book;"

9. "Or as the black dust, sprinkled over the varied marks on a fair hand, brings to view, with a brighter tint, the blue stains of woad."

10. "I stood asking news of the ruins concerning their lovely habitants; but what avail my questions to dreary rocks, who answer them only by their echo?"

11. "In the plains, which now are naked, a populous city once dwelled: but they decamped at early dawn, and nothing now remains but the canals, which encircled their tents; and the Thumaam plants, with which they were repaired."

12. "How were thy tender affections raised, when the damsels of the tribe departed; when they hid themselves in carriages of cotton, like antelopes in their lair; and the tents, as they were struck, gave a piercing sound!"

13. "They were concealed in vehicles, whose sides were well covered with awnings and carpets, with fine spun curtains and pictured vests."

14. "A company of maidens were seated in them, with black eyes and graceful motions, like the wild heifers of Tudah, or the roes of Wegera, tenderly gazing on their young."

15. "They hastened their camels till the sultry vapour gradually stole them from thy sight, and they seemed to pass through a vale, wild with terrors, and rough with large stones; like the valley of Sina."

The Arabic pater-noster is as follows: "Abinna ell-adhi si-ssamwat; jetkaddas es-sac; rati malacutac; taouri machhiatic, cama si-ssama; kedhalec ala-lardh aating chobzena ketatna iaum beiaum; wagfor lena donubena, wachataina, cama nogfor-nachna lemen aca doina; walâ tadechehalna shajarib; laken mejjina me nnescherir." Amen.

In these countries, time is measured by hour-glasses; and, in some parts of Arabia Petraea, they have calendars that were left them by their ancestors, which are rather curious, and in which the sun's place, the semi-diurnal and nocturnal arch, the length of the twilight, and the hours of prayer, are inserted in their proper columns, and calculated to a moment.

They know nothing of algebra, or numerical arithmetic, though their ancestors furnished us with the characters of the one, and with the name at least of the other; yet they have a way of reckoning by putting their hands into each other's sleeves, and touching one another with a certain joint or finger so expressively that, without even moving their lips, they can conclude bargains or agreements. They have, however, if you believe them, some wise men among them, who are so skilled in figures as to be able, by certain combinations of numbers, to form the most wonderful calculations. But Arabia is the boasted seat of wonders!

The principal places and cities in Arabia come next under our consideration.

The desert of Sinai is a beautiful plain, near nine miles long, and above three in breadth; it lies open to the north-east, but, to the southward, is closed by the lower eminences of Mount Sinai; and other parts of that mountain make such encroachments upon the plain as to divide it into two, each so capacious as to be sufficient to receive the whole Israelitish camp.

Mount Horeb, where Moses kept the flocks of Jethro, his father-in-law, when he saw the burning bush, may be seen from Mount Sinai. On these mountains are many chapels and cells, possessed by the Greek and Latin monks, who, like the religious at Jerusalem, pretend to shew the very spot where every miracle or remarkable transaction recorded in Scripture was performed. But these pious frauds gain no credit with sensible people.

There are few places worthy notice in Arabia. The principal cities are Mecca, Medina, Mocha, Aden, Muscat, and Suez; and those only will be described. The two former are the centre of the devotion of all Mahometans; and the four latter the principal places of trade.

Mecca, the capital of all Arabia, and celebrated for being the birth-place of Mahomet, is situated forty-two miles to the east of the Red Sea, in so barren a spot, that the country round it affords no sustenance either for man or beast; so that the city is supplied with corn, &c. by two caravans, which arrive there, one in the summer, and the other in the winter, annually. All the water from the springs in the town is bitter and unfit to drink, which obliges the inhabitants to prefer the rain water in cisterns. There is indeed a well in the neighbourhood, called by the Arabs Zemzem, to which they hold in the highest veneration, believing it to be the same which the angel pointed out to Hagar when her son Ishmael was perishing with thirst. The pilgrims, who resort to this city, always drink of the water of this well, to which they ascribe a number of fabulous virtues. It is of a brackish taste, and causes eruptions on the bodies of those who drink it in any great quantity.

Hammam Farau is the name of a hot spring, which rises by two apertures out of a rock, at the foot of a high mountain. It is used in baths by the neighbouring sick, who commonly stay forty days for cure, during which their only food is a fruit called Lalfaf, which grows here. The tradition that the Jews passed this way, and that Pharaoh's army was drowned here, has occasioned this place to receive the name of Birket-el-Faraun. The Arabs imagine that Pharaoh is doing penance at the bottom of this well, and vomits up the sulphurous vapour with which the water is impregnated.

The mosque in this city is esteemed the most magnificent of any temple in the world. Its lofty roof, raised in form of a dome, and covered with gold, and the two beautiful towers, of extraordinary height and architecture, make a most superb appearance, and are conspicuous

ous at a very great distance. This temple has an
undred gates, with a window over each; is three hun-
red and seventy cubits long, three hundred and fifteen
road, and supported by four hundred and thirty-four
pillars. The Mahometans pretend that this mosque is
ected on the very spot where Abraham built his dwell-
ing-house, which has been preserved ever since, and
stands in the centre of the temple. They call it Al-
Masabah, the Holy House, or chapel, and say, that it
was first erected by Adam; but, being destroyed by the
deluge, was, by the command of God, rebuilt by Abra-
ham and Ishmael. It is about fifteen feet long, twelve
feet broad, and thirty high. The door is of silver; the
walls are constantly covered with hangings of fine silk,
beautifully wrought, and girt round with two belts of
gold, one near the bottom, and the other near the top.
In this house the Mahometans also affirm that their
great prophet was born, and every Mussulman is obliged,
by his religion, to visit it once in his life, or to send a
contribution; so that the number of pilgrims who annually
resort thither is incredible.

Medina is situated about 250 miles north of Mecca,
and fifty from the Red Sea. It is famous for being the
place which Mahomet chose for his residence when he
was driven out of Mecca, and likewise that of his in-
terment. The mosque, which contains his sepulchre,
is a structure of vast magnificence, and styled the Most
Holy. It is supported by 400 stately columns, and em-
bellished with 300 silver lamps, continually burning.
The cupola, which is but small, is covered with plates
of silver, and under it is raised the prophet's tomb of
white marble, enclosed in such a manner that it can
only be viewed through windows, made for that pur-
pose, and latticed with silver. The inside is enriched
with stones of immense value, particularly that part
which is over the head of the prophet. At the foot of
the coffin is a golden crescent, the workmanship of
which is greatly admired, being curiously wrought, and
adorned with precious stones. The coffin is covered
with cloth of gold, and over it is a rich canopy of silver
tissue, both which are renewed annually by the bashaw
of Egypt, according to the orders he receives, for this
purpose, from the grand seignior. The camel which car-
ries it derives a sort of sanctity from it, and is never to
be used in any drudgery afterwards. The old pall and
canopy are always cut to pieces, and sold to the super-
stitious Mahometans as sacred relics. The place where
the coffin lies, is supported by black marble pillars, and
is encompassed by a balustrade of silver, hung with a num-
ber of lamps of the same metal, kept continually burn-
ing. Vast numbers of pilgrims resort to this city, but
not in such multitudes as to Mecca; for this journey is
not enjoined expressly by their religion, though such as
perform it are entitled to great privileges, and esteemed
saints ever after. Christians are forbid approaching
either Mecca or Medina within a limited distance, on
pain of being burnt alive.

Mocha is a port town, situated on the Red Sea, and

gives name to a kingdom of considerable extent along
the southern coast of Arabia. It has four gates and as
many towers; the buildings are lofty, and tolerably regu-
lar: they are covered with a chinam or stucco, that
gives a dazzling whiteness to them. The harbour is
semicircular, the circumference of the wall is two miles,
and there are several handsome mosques here. This
city is now the emporium for the trade of all India to
the Red Sea, and the coffee exported from thence is
esteemed superior to that of any other place. It has al-
ready been observed, that the English and Dutch com-
panies have houses there, and carry on a considerable
commerce. The only inconvenience they sustain is
from the violence and exactions of the Arabian princes;
for the king's customs are easy, being fixed at three per
cent. to all Europeans.

Aden is likewise a considerable place for trade, on the
Indian Ocean, being situated in the kingdom, about
120 miles south-east of that city, and not far from the
Streights of Babelmandel. It stands at the foot of several
high mountains, on the summits of which the Arabians
have erected five or six forts, with several fortifications,
to guard the passes. This town is well supplied with
good water, and contains about 6000 inhabitants.

Muschat, or Moscat, and Suez, were formerly places
of considerable strength; but they are now only re-
markable for the trade carried on with the latter by
the Turks, and with the former by the Portuguese.

The city of Suez stands upon the western side, but
not just upon the western extremity of the Arabian gulf.
It is not surrounded with walls; but the houses are
built so closely together that there are only two passages
into the city, of which that nearest the sea is open, the
other shut by a very insufficient gate. The houses are
very sorry structures; the kans being the only solid build-
ings in the city. Hardly any part now remains of the
castle which the Turks built upon the ruins of the an-
cient Kolfum. Suez is very thinly inhabited: among
its inhabitants are some Greeks, and a few families of
Copts; but, about the time of the departure of the fleet,
it is crowded with strangers.

The ground lying around it is all one bed of rock,
slightly covered with sand; scarce a plant is to be seen
any where in the neighbourhood; trees, gardens, mea-
dows, and fields, are entirely unknown at Suez. Fish
is the only article of provisions plentiful here. All
other necessaries of life, for both men and the domestic
animals, are brought from afar, from Cairo, which
is three days journey from Suez; Mount Sinai, at the
distance of six days journey; or Ghasso, at the distance
of seven. There is not a single spring of water.

Ship-building is the chief employment of the inhabi-
tants; although wood and iron, and all the other ma-
terials, are to be brought from Cairo upon camels, and
are consequently very dear. The ships built at Suez
have a very awkward rudder, made of a large beam,
the use of which is dangerous and inconvenient. The
governor of Suez was a bey from Cairo; and he kept a

very numerous household. He was a Mahometan by birth, and the son of a sugar-merchant. This account of Suez is extracted from Mr. Niebuhr's Travels through Arabia, published in 1792.

Mr. Niebuhr, in his travels through Arabia, has given the following description of the city of Loheia in that country. He tells us it has stood only for three centuries: that its founder and patron was a Mahometan saint, called Schiech Saled, who built a hut on the shore where Loheia now stands, and spent there the rest of his days as a hermit. After his death, a kabbet, or house of prayer, was raised over his tomb; and it was afterwards, by degrees, embellished and endowed. Some devout persons, imagining that it would be a great happiness to them to live near the remains of so holy a person, built huts for themselves about his tomb. Nearly at the same time, the harbour of Marabea, a neighbouring city, in which a governor resided, was filled up. The inhabitants, upon this, deserted their city, and settled at Loheia, whither the seat of government was also transferred.

The territory of Loheia is arid and barren. The harbour is so indifferent, that even the smallest vessels are obliged to anchor at a great distance from the city; and when the tide is at ebb, laden boats cannot approach near it. Notwithstanding this disadvantage, a considerable trade in coffee is carried on from Loheia; the coffee is brought from the neighbouring hills, and exposed in one large heap for sale. This coffee is not reputed to be so good as that which comes from Beit el Fakih, and is shipped at Mocha and Hodeida: but coffee is to be purchased here upon more reasonable terms, and the carriage to Jidda costs less.

Loheia, although without walls, is not entirely defenceless. Twelve towers, guarded by soldiers, stand at equal distances round it. These towers resemble those in some of the imperial cities of Germany: the height of its gates renders it necessary to climb up to them upon ladders. Only one of those towers, and that newly built by Emir Farhan, is such as to admit of being defended by cannons: the rest are so ill built, that the Arabs of Hafehid, some time since, made their way through them, and set fire to the city.

Several of the houses in Loheia are built of stone; but the greater part are huts constructed in that fashion which is common among the Arabs. The walls are of mud, mixed with dung, and the roof is thatched with a sort of grass, which is very common there. Around the walls within, are a range of beds made of straw, on which, notwithstanding their simplicity, a person may either sit or lie commodiously enough. Such a house is not large enough to be divided into separate apartments; it has seldom windows, and its door is only a straw mat. When an Arab has a family and cattle, he builds for their accommodation several such huts, and encloses the whole with a strong wooden fence. The population of the cities of Arabia, therefore, cannot be proportionate to

their extent. The water of Loheia is very bad, and is brought from a distance: the best comes two leagues and a half from the city. The common people drink from a well, which is a league from the city. Within two leagues of Loheia, is a small hill, which affords considerable quantities of mineral salt.

The city of Mocha, built about four centuries since, stands in a very dry and barren situation. Its fortifications are the walls that surround it, some towers on the way to Mufa, which are dignified with the name of castles, and two other castles of the same sort upon the two arms of the harbour. The greatest of these castles is called Kalla Tojar, and the smallest Kalla Abdurrah, from the names of two saints, buried in these two places. They are provided with some few pieces of cannon.

The houses in the city are built of stone, and some are handsome: however, there are others, both within and without the walls, no better than the huts common through all the Tehama. In the environs of the city are an abundance of date trees, and many agreeable gardens.

The northern parts of Arabia being subject to the Turks, are governed by bashas, of their appointment. The inland country is under the jurisdiction of several petty princes, denominated Xerifs and Imans, who, in spiritual as well as temporal affairs, seem to be absolute, guiding themselves by no other laws than those found in the Koran, and the comments upon it. The wandering Arabs are governed by sheikhs and emirs. A sheikh superintends a particular collection of tents, which are called dow-wars; but an emir rules over a whole tribe, and, consequently, their authority extends to many of these dow-wars. There is one distinguished by the title of grand-emir, who is in some respects superior to the rest, tho' his authority is often disputed.

The Arabs have no standing regular militia, but their chief commands both the persons and purties of the subjects, as the necessity of affairs requires. The people are distributed into several clans; and the whole number of inhabitants are supposed to amount to about two millions.

THE HISTORY OF THE ARABS, AND OF MAHOMET, THEIR PROPHET.

THE Arabs, even from the earliest times, have been a free and independent people. It was foretold of their great ancestor Ishmael, that his hand should be against every man, and every man's hand against him. This prediction has been remarkably fulfilled. The Arabs are still wanderers in their native country; they owe no subjection to any but their emirs, the princes or chiefs of each itinerant tribe. Robbers by profession, they consider the property of every stranger as their own; and their ferocity, added to the inhospitable nature of their extensive deserts, has much tended to less

phia is very bad, and the best comes from the common people. The common people league from the city is a small hill, which is a mineral salt.

For four centuries since they have ever since continued under a kind of patriarchal government. Neither the Persians under Cyrus, the Greeks under Alexander, the Romans under their fortunate generals, the Tartars under Tamerlane, the Turks in their greatest height of power, could make an entire conquest of Arabia. Part of that country was indeed subdued; but the greater number of these wandering tribes still preserved their independency, and bid defiance to all the force that could be sent against them.

In the sixth century, about the year 596, the great prophet Mahomet appeared, and changed for a time the greater part of the Arabian system of government. He was born at Mecca, and descended from the tribe of the Coreischites, esteemed the most ancient and illustrious in Arabia; but his parents were very poor.

In the early part of his life, he was employed as a shepherd by his uncle, Abuteleb, and in that capacity travelled into Syria, Palestine, and Egypt. Subtle by nature, though destitute of learning, he made many observations on the different religions professed in those countries, and the various sects into which they were divided. He perceived that most of the fundamental principles of these different sects were the same, and that the contested tenets which had given rise to such dreadful animosities, were trifling in themselves, and hence imagined that it would be easy to form a religion which would unite them all, and remove those animosities which had produced so many disorders among mankind. But his poverty and want of learning were obstacles which he was at first in no capacity to surmount.

In the mean time his uncle died, and Mahomet became a servant to a rich Syrian merchant, and for some years travelled with his caravans into different parts of Asia-Minor. Cadija, the wife of Mahomet's master, soon received her servant with pleasure, and at his death, took him to her bed. This fortunate incident removed one of the obstacles to Mahomet's scheme; he was now possessed of wealth sufficient for his purposes, but learning was not to be purchased with money; time and assiduity alone could procure that valuable acquisition; and those were incompatible with the nature of his design. Enterprising by nature, and possessed of a species of ambition peculiar to himself, he considered every moment he delayed the execution of his scheme, as a loss to the world as well as to himself.

ARABS, AND OF THE PROPHET.

In his state of perturbation he discovered, that a person among his own servants was possessed of the learning he so greatly wanted, and which had hitherto prevented him from attempting the work he was so desirous to perform. This person's name was Sergius, a

Nestorian monk, a person of great parts and learning; but such a libertine in his conduct, that he had been expelled the convent, and taken shelter among the Arabs. It has been disputed whether Mahomet's scheme, for establishing a new religion, was the effect of enthusiasm or ambition; the latter is generally believed; perhaps both had a share.

However that be, the monk cordially embraced the offers of Mahomet; but, at the same time, rightly observed, that it would be very difficult, perhaps impossible, to establish a new religion, without pretending to a divine sanction. Mahomet perceived the justness of the remark, and, ever fruitful in resources, determined to turn a natural calamity to his own advantage. He had long been afflicted with epileptic fits, and pretended that these were only trances, into which he was thrown at the sight of the angel Gabriel, who was often sent from heaven to reveal the will of the Almighty, and which he was commanded to publish to the world. But lest the truth of this story should be suspected, he lived a very austere and abstemious life, which soon procured him a character for sanctity, far superior to that of any of his neighbours. This gave a sanction to his pretensions; his followers increased daily both in number and enthusiasm, and Mahomet now thought proper to make an open declaration of his mission. He asserted, that he was a prophet sent from God into the world to teach his law, and compel mankind to observe it. Alarmed at the pretensions of this enthusiastic impostor, and dreading the fatal consequences generally attending popular insurrections, the magistrates of Mecca determined to put a final period to the growing evil, by taking off the bigotted leader. But the requisite secrecy was not observed: Mahomet was apprised of their intentions, and fled, with a few of his faithful followers, to Medina. This flight, which happened in the tenth year of his ministry, the Mahometans use as an epocha in the computation of time, calling it by the Arabic word, Hegira, i. e. the flight.

The same of Mahomet had reached Medina some years before he was obliged to take refuge in that city; so that the inhabitants received him with open arms. Assisted by his faithful companion the monk, Mahomet now applied himself to form a system of religion that should extend to all the neighbouring nations, and be conformable to their different professions. At the same time, he was very careful to render it agreeable to the prejudices of mankind. He knew that sensual enjoyments were much better adapted to the generality of the people, than spiritual; and therefore promised them every delight that human nature is capable of enjoying.

The fundamental principle on which Mahomet erected the superstructure of his religion was, that there has been from the beginning of the world but one true orthodox belief, which consists in acknowledging one true God only, and obeying the precepts of such ministers and prophets as he shall, from time to time, send:

send:

send:

send:

send into the world, to reveal his will to mankind. Upon this foundation, he pretended to be a prophet sent into the world to reform the abuses crept into religion, and to reduce it to its original simplicity. He added, that as the endeavours of Moses and Christ were rendered abortive, God had sent him, as his last and greatest prophet, with a more ample commission than either Moses or Christ were intrusted with. They were confined to persuasion only, but his extended to force. The sword was to effect what preaching and miracles had endeavoured in vain: the divine law was to be propagated by force, and the throne of the faithful founded on the blood of unbelievers. The bounds of this kingdom were to be the same with those of the world, and all the nations of the world were to be governed by the sceptre of Mahomet. But as these conquests could not be made without danger, Mahomet promised, that those who ventured their lives in establishing his kingdom, should enjoy the spoils and possessions of their enemies, as a reward in this life, and, after death, a paradise of all sensual enjoyments, especially those of love. He added, that those who died in propagating the faith, would enjoy a distinguished place in paradise, experience pleasures peculiarly intense, and vastly superior to the rest of mankind. These particulars, together with the doctrine of predestination, and a prohibition of drinking spirituous liquors, formed the principal articles of Mahomet's creed; and were written by the monk already mentioned, in a book called the Koran, or Alkoran, by way of eminence above all other writings.

The Koran was no sooner published, than Mahomet's followers increased in a very astonishing manner. His doctrine was soon propagated in distant countries. Arians, Jews, and Pagans abandoned their former religion, and became Mahometans. The contagion spread in a very rapid manner over Arabia, Syria, Egypt, and Persia; and Mahomet, from a deceitful, impotent impostor, became one of the most powerful monarchs of his age. He died three years after his conquest of Mecca, in the sixty-third year of his age, and in the year 629. His successors pursued the plan of their prophet, and exerted themselves in propagating his religion by the sword.

It may not be improper in this place to present the reader with a chronological account of the caliphs, from Mahomet, founder of the Arabian empire.

The caliphs of Egypt and Arabia, under the names of Saracens and Moors, extended their conquests into various parts of Europe. They reduced great part of Spain, France, Italy, and the islands in the Mediter-

anean. The caliphs of Persia turned their arms to the east, and conquered several countries; the Tartars, under Tamerlane, carried their conquests into China and the Indies; and the Turks reduced the Greek empire, and made Constantinople the seat of their government.

In this rapid manner was the Mahometan religion propagated in various parts of the world; it is still professed by a considerable part of mankind, and established in various countries.

THE EMPIRE OF JAPAN.

THE islands of which this extensive and opulent empire is composed, are called Japan, or Nippon, Bongo, Tonsa, and Dezima. They are situated about 150 miles east of China, and extend from the 30th to the 41st deg. of north lat. and from the 130th to the 147th deg. of east long.

The inhabitants call this empire Nippon, the name of the chief island; the Chinese term it Siphon; and the Europeans give it the general appellation of Japan. It was first discovered between the years 1535

and 1548, by the Portuguese, who were afterwards expelled from this gainful trade by the Dutch.

Japan being situated between the fourth and seventh climates, the sun rises with them about eight hours before it does with us. The sea breezes greatly mitigate the heat in summer, but they add to the excessive coldness in winter, and render the seasons in general exceedingly unsettled. The rains in summer are very violent, and forms of thunder and lightning, and dreadful hurricanes, frequently happen, to the great detriment of the country: earthquakes are also very common here.

The soil, and likewise the animal and vegetable productions of Japan, are much the same with those in China. The earth yields Indian and other corn, fine rice, millet, and various other grain, besides several kinds of fruits: likewise flowers and herbs, particularly excellent tea. The mountains, woods, and forests are well stocked with horses, sheep, oxen, hogs, elephants, wild beasts, buffaloes, deer, &c.

The rivers, which afford plenty of fish, are generally exceeding rapid, and many dreadful cataracts fall from the mountains. The principal rivers are the Ujingava, whose waters are so furious, that no bridge can be built over it; the Corric, that takes its name from the province in which it rises; and the Akagava, remarkable for its depth and perpetual fluctuation.

The chief lake, called Citz, is 100 miles in length, and twenty in breadth. It is formed by the conflux of several rivers, and disembogues itself into the sea on the south-west side of the island.

The mountains in this empire are very numerous, most of the islands of which it is composed being surrounded by them; one in particular, in Nippon, is of such a prodigious height, that though its distance from the shore is fifty-four miles, it may be discerned twice that distance by vessels at sea; and some authors are of opinion that it is higher than the famous peak at Teneriffe. Indeed, this may with more propriety be called a cluster of mountains, and among them are eight dreadful volcanoes, which burn with such prodigious fury, that the country is often destroyed for several miles round. Some of the mountains yield mines of gold, silver, copper, tin, lead, iron, and various other metals; while others abound with several sorts of marble and precious stones. The mountains in the island of Nippon also afford great variety of medicinal waters of different degrees of heat; one of which is said to be as hot as burning-oil. Several rivers and brooks have their sources among them, some of which fall in gentle cascades, whilst others form dreadful cataracts. The seas surrounding these islands produce great quantities of red and white coral, and pearls of great value, with a profusion of sea-plants and beautiful shells. Many dangerous whirlpools are formed in these seas, which make a great noise, and, at low water, swallow up the largest vessels, if they attempt to cross them.

The complexion of the Japanese are in general yellowish, although some few, chiefly women, are almost white. Their narrow eyes, and high eyebrows, are like those of the Chinese and Tartars, and their noses are short and thick. Their hair is universally black.

They are very ingenious mechanics, and greatly excel the Chinese in such works as are common in both empires; particularly in the beauty, goodness, and variety of their silks, cottons, and other stuffs, and in the porcelain and lacquered wares. Both the temper and workmanship of their scimitars, swords, muskets, &c. are superior to any other made in these eastern parts.

Their architecture is in the same style as that of China, but they affect rather usefulness than grandeur in their houses, which are built with upright posts, crossed and wattled with bamboo, plattered both without and within, and whitewashed; they generally have two stories; but the uppermost is low, and seldom inhabited. The roofs are covered with pantiles, large and heavy, but neatly made. The floors are elevated two feet from the ground, and covered with planks, on which mats are laid. They have no furniture in their rooms, not even beds. They sit down on their heels upon mats. Their victuals are served up on a low board, near the floor, one dish at a time. Their mirrors are not fixed up as ornamental furniture.

Their dress is similar to that of the Chinese, but more neat and elegant, and generally of silk or cotton. The women of fashion, especially the young ones, adorn themselves with flowers, feathers, pearls, &c. but are seldom seen abroad, or even at home, by any except their own people, without a veil. Fans are used by both sexes equally.

They are naturally cleanly; in their manners, civil and polite; obedient to parents, respectful to superiors, and honest in their dealings; so that, though their penal laws are severe, punishments are seldom inflicted. Commerce, manufactures, and agriculture flourish here.

The forces of Japan, in time of war, amount to 400,000 foot, and 40,000 horse; and the annual revenues have been computed at thirty-six millions sterling. The government, like that of all the eastern nations, is despotic; but the power of the emperor is generally exercised with clemency.

The principal commodities exported from Japan, are rice, silk, and cotton; fine porcelain and lacquered wares; gold, silver, copper wrought and in bars, iron, steel, and other metals; rich furs, tea of all sorts, much finer and better cured than that of China; a great variety of drugs, which as well as their tea are sold genuine, well dried, and carefully preserved; diamonds and other precious stones, pearls of exquisite beauty, coral, ambergris, &c.

All trade with the Europeans, except the Dutch, is prohibited; and even the Hollanders are allowed to have only one factory, which is at Nagasaki, in the island of Dezima, where there is an excellent harbour. Nor are they permitted to converse with any of the inhabitants, but such as are appointed by the governor, except the six weeks of open trade, when the Japanese resort from all parts of the empire to Dezima, where they open booths furnished with the finest merchandise of their country.

In the city of Meaco, in 45 deg. 38 min. north lat. and 138 deg. 15 min. east long. which was formerly the capital of Japan, is a colossus of gilt copper, of prodigious dimensions. It is seated in a chair eighty feet in breadth, and seventy in height. The thumb of this enormous statue is fourteen inches in circumference.

the other parts in proportion; fifteen men can
 and on its head. It is one of the principal idols of
 the empire.
 Jeddo, Jedo, or Yeddo, is now the metropolis of the
 empire, and the most considerable city in Japan. It is
 large and populous, and contains the palace of the em
 peror, ten or twelve miles in circumference. This
 city is in 35 deg. 48 min. north lat. and 144 deg. 10
 min. east long.
 Next to the above two, the most considerable city
 in Japan is Ofacco, which is situated at the mouth of
 the river Jedogawa, about fifteen leagues from Meaco,
 and in 35 deg. 15 min. north lat. and 137 deg. 20 min.
 east long. It is deemed the principal sea-port in the
 empire, and is filled with an incredible number of mer
 chants, tradesmen, mechanics, ecclesiastics, &c. It is
 but fifteen miles in circuit, contains many elegant
 houses, some palaces belonging to the nobility, and is
 strongly fortified.
 The principal commodities of Japan have been al
 ready mentioned: and it may not be improper to add,
 that no people in the world equal the Japanese in the
 honesty of their dealings; no fraud of any kind is prac
 tised; their commodities are genuine, not the least
 adulteration is used. Cautions and faithful themselves,
 they expect the same treatment from others. All com
 modities are exported and imported duty free. But if
 contraband goods are found on board any trading ves
 sel, if the wares are either adulterated or damaged, and
 the injury concealed, or any fraud be discovered in the
 voice, the offenders are always punished in the severest
 manner.
 At the season when the Dutch fleet is expected, cen
 tinals are placed on the hills to give timely notice of
 the approach of any ships; and boats are immediately
 sent off with proper officers, who take care that no
 trade of any kind be carried on with the natives, till
 the permission to trade arrives from the emperor: even
 when the greatest regularity is observed, six only of the
 galleons are permitted to go on shore at one time; and
 in this manner they succeed each other during the time
 the mart is open. By this wise conduct, all disorders
 are unknown; trade is carried on in a fair and open
 manner; all frauds and deceptions, which generally re
 sult from hurry and confusion, are prevented; and the
 whole is conducted in a manner that gives entire satis
 faction to both parties.
 Besides the sugars, spices, and manufactured goods
 which the Dutch send to Japan, they carry thither an
 nually upwards of 200,000 doe-skins, and more than
 200,000 hides, the greatest part of which they get
 from Siam, where they pay for them in money. The
 merchandise they export from these islands, both for
 Bengal and Europe, consists in 900 chests of copper,
 each weighing 120 pounds, and from 25 to 30,000
 pounds weight of camphire. Their profits on imports
 and exports are valued at forty or forty-five per cent.
 As the Dutch company do not pay duty in Japan, ei

ther on their exports or imports, they send an annual
 present to the emperor, consisting of cloths, chintz,
 succotas, cottons, stuffs, and trinkets.
 The Japanese are the grossest of all idolaters; nor
 does it appear that they ever had any notion of a Su
 preme Being; they believe the world to have existed
 from all eternity; and that the gods they worship were
 once men, who lived upon earth several thousand
 years, and were at last, as a reward for their piety,
 mortification, and voluntary death, raised to that height
 of power and dignity they now possess. They are so
 irreconcilable to Christianity, that it is commonly said,
 the Dutch, who are the only Europeans with whom
 they now trade, pretend themselves to be no Christians,
 and humour the people in the most absurd superstitions;
 inasmuch as it is said, that a stranger is not suffered to
 land in any part of the empire, unless he first publicly
 renounces the Christian religion. But notwithstanding
 this shameful compliance of the Dutch, the natives are
 very shy and rigorous in all their dealings with them.
 The Japanese are not remarkable for useful learning,
 astrology being the art in general studied among them.
 There are, however, a vast number of universities, in
 which the priests preside, dispersed all over the empire:
 they are finely situated, richly endowed, accommodated
 with all the conveniences of life, and furnished with
 large libraries. These people are much addicted to po
 etry, music, and painting; and are said to excel in the
 first, both with regard to the style, imagery, and har
 mony of the cadence. They are better painters than
 the Chinese, but greatly inferior to the European artists.
 Their language has some affinity to that of China, but
 appears, from its various dialects, to have been origi
 nally compounded of that and other languages, used by
 the various nations that first peopled these islands.
 With respect to their history, the Japanese annals of
 early times are filled with such inconsistent absurdities,
 and ridiculous fables, that no dependence can be placed
 on them, till about 660 years before Christ, which is
 their common æra; and, according to which, our pre
 sent year 1793 is with them the year 2453; it is like
 wise to be observed, that the Japanese year begins the
 nearest new moon, which either precedes or follows the
 5th day of February.
 The histories of Japan, written by the natives, take
 very little notice of the policy, virtues, vices, or trans
 actions of their monarchs, but are filled with an ac
 count of their descent, names, birth, succession, length
 of reign, &c.
 The following chronicle of the more recent princes
 of Japan, is taken from their own historians.
 1. Taycho. This monarch was of a very mean ex
 traction, but in his youth raised himself to be butler to
 a tributary prince, and by dint of valour and merit
 was at length exalted to the cuboship. He was the first
 monarch who obliged the petty kings and great lords
 to attend upon him personally, and suffer their wives
 and kindred to reside in his palace, as hostages for their
 fidelity;

1. fidelity; by which prudent policy he struck at the very root of that rebellious spirit so common in Japan, and put an end to the possibility of raising insurrections. He expelled the Portuguese from Japan, prohibited their ever after trading with his subjects, and began the first persecution against the Christians. He died on the 6th of December, A. D. 1598. After his decease he was deified, and called the *Second Mars of Japan*.

2. Quanbacundoño, the nephew of Taycho, is accounted the thirtieth Cubo, as he reigned for some time in conjunction with his uncle; but having disobliged that monarch, he was ordered to rip up his own bowels, the most honourable method of suffering death in Japan.

3. Fide-Jori, the son of Taycho, began his reign at six years of age; during his minority, the affairs of government were conducted by his father-in-law, Ijejas; for Fide-Jori had been contracted in his infancy to a daughter of that nobleman, who traitorously deprived him of his crown and life, after a reign of fourteen years.

4. Ijejas-Samma, having usurped the throne, made the following articles the principal objects of his reign. 1. The total extirpation of the Portuguese from Japan, 2. The prohibition of any of his subjects from leaving the empire, and recalling those who were in foreign parts. 3. The publication of severe edicts against gaming, luxury, and duelling. 4. The granting a Dutch factory to be established in Japan.

It may be proper to observe here, that the persecution against the Christians in Japan, both natives and foreigners, was carried on with such horrid cruelty, that in the space of the four first years of the reign of this monarch, 20,570 persons were massacred. Notwithstanding which, in the two succeeding years, after the churches had been shut, and the public professing of Christianity prohibited, the Jesuits, by their private endeavours, made 12,000 profelytes; and when any of these were detected, they not only absolutely refused to abjure the Christian faith, but readily submitted to death, and suffered martyrdom with astonishing constancy. And indeed the persecution continued forty years, reckoning from its commencement, in the reign of Taycho, with unremitting cruelty, before Christianity could be totally exterminated. Ijejas reigned about five years after the death of Fide-Jori, and died at about seventy years of age.

5. Fide-Tada, the grandson of the above monarch, as we have already intimated, continued the persecution, till at length the Christians, driven to the utmost despair, retired to the number of 37,000, to the castle of Simabara, in the island of Ximo, where they determined to defend themselves to the last extremity. The Japanese army laid siege to the place, which held out for three months; but at length was compelled to surrender on the 12th of April 1638, when the Christians were all put to the sword.

This monarch reigned eighteen years, and was succeeded by his son,

6. Ijemitz. This emperor reigned twenty years, and was succeeded by,

7. Ijetznako. This monarch, who was the son of the former, reigned thirty years, and left the crown to his son,

8. Tsinajos. This prince was the last Japanese monarch that we have any authentic account of, and upon the throne when the Dutch ambassador was in Japan, in the year 1692, being then forty-three years of age, and having reigned thirteen years; he was a great philosopher, a strict observer of the laws, exceedingly humane and benevolent, and, in the sense of the word, the father of his people.

CHAP. XVIII.

THE LADRONE ISLANDS.

THESE islands, which are about twenty in number, belong to the Spaniards, and were first discovered in 1521. They obtained the name of Ladrone Islands, from Mary, Queen of Spain, who reigned at the time of their being first inhabited by her subjects. They are also known by the name of Thieves-Islands, which epithet was given to them by Ferdinand Magellan, the first person who discovered them, on account of the continual robberies for some time committed by the natives.

The Ladrone Islands lie about 600 leagues to the east of Canton in China; 700 leagues east from the Philippines, and 7900 west from Cape Corientes in America. The principal part of them have been for many years uninhabited; notwithstanding they are all pleasantly situated, and the soil in general is very fertile. The only one that can properly be said to be now inhabited by the Spaniards is Guam, where a governor resides, and where there is kept a very strong garrison. It is at this island that the Manila register-ship generally takes in fresh provisions and waters, in her passage from Acapulco to the Philippines.

The islands of Tinian and Rota were once very populous; but the former is now quite uninhabited, and the latter contains only a few Indians, who are employed in cultivating rice for the inhabitants of Guam.

Guam is about forty miles in length, and ninety miles in circumference, and the number of inhabitants are estimated at 4000; out of which it is supposed 2000 live in the city of San Ignatio de Agona, where the governor usually resides. It is pleasantly situated, and affords a fine landscape when viewed from the sea. The soil being rather dry, it produces little rice; but they have several kinds of excellent fruit, particularly pine-apples, melons, and oranges. They have likewise plenty of cocoas, yams, and a fruit about the size of an apple, which, when baked, is exceeding good, and is used instead of bread.

The natives of this island are strong and well-shaped,

of an olive complexion, and a black hair, anoint their bodies with oil, and paint their faces, and the tops of their heads, with a red ochre, and chiefly consist of a large park; the latter is the hog, which grows in the other island. The other island is very commodious, and the island of Tinian himself and his

THE ISLANDS

SOME parts of them from the natives live independent of any government. FORMOSA, which is a very fertile island, together a very beautiful. It is situated in the north of Fo-ken in China, and is about 100 leagues in length from north to south, and 20 miles in breadth. The soil is almost everywhere fertile, and this is far from the heat of the island, which is not agreeable to the sea. That part of the island particularly fertile, and is of several kinds of grain, and is greatly accelerated by the sea breeze. This island is particularly famous as it is particularly famous for its oranges, papayas, &c. and is a very fertile island, as peaches, and they have like other fruits, and they consist of a large quantity of orange juice, which is used for sugar and tobacco, and is used for other purposes, and they are very much valued. The wild bees seldom seen, as

GRAPHY.

[11A.]

of an olive complexion: they have thick lips, a black hair, and a stern countenance: they wear long hair, and paint their teeth with red and black colours. Their houses are chiefly built of stone and timber, and the tops of them are covered with tiles. Their food chiefly consists of cocoa-nuts, bananas, fowls, fish, and pork; the latter of which is peculiarly sweet in taste, the hogs being principally fed with cocoa-nuts, which grow here in the greatest abundance. The other islands here, though uninhabited, afford a great plenty of provisions; but neither of them have any commodious harbour. Lord Anson landed upon the island of Tinian, where he found great refreshment for himself and his crew.

THE ISLANDS OF FORMOSA AND HAINAN.

SOME parts of these islands belong to the Chinese, to whom the natives are subject; but in the other parts they live independent, and are only subject to their own laws and government.

FORMOSA, which is the most fertile of these islands, altogether a very fine country; and for that reason it retained its name, the word Formosa signifying *fair* or *beautiful*. It is situated nearly opposite to the province Fo-kien in China, and is computed to be 216 miles in length from north to south, and about 70 miles in the broadest part. Its longitude from Pekin is from 3 deg. 20 min. to 5 deg. 40 min. east; so that when the sun is almost vertical over it, the climate is rather hot; but this is far from being disagreeable, as the violence of the heat is greatly mitigated by the situation of the island, which is so elevated, as to receive the most agreeable advantages from the cooling breezes of the sea.

That part of the island possessed by the Chinese is particularly fertile, and produces great quantities of different kinds of grain, especially rice; and its fertility is greatly accelerated by the numerous rivers, whose streams glide conveniently through it.

This island likewise produces as great a variety of fruits as are to be found in any other parts of the Indies; particularly oranges, cocoas, bananas, ananas, guayavas, papayas, &c. also several kinds of those produced in Europe, as peaches, apricots, figs, grapes, and chestnuts. They have likewise a sort of melon, which is of an oblong form, and much larger than those in Europe: they consist of a white or red pulp, and are full of a fine juice, which is exceeding grateful to the taste. Sugar and tobacco also grow here to the greatest perfection; and the trees that produce these are so agreeably arranged, that they appear as if calculated to embellish the most beautiful garden.

The wild beasts of this island are but few, and those seldom seen, as they chiefly inhabit the distant parts of

it, which are exceeding mountainous, and seldom resorted to by the inhabitants. They have some horses, sheep, oxen, goats, and hogs. They have but few birds, the principal of which is the pheasant; but the rivers produce great plenty of various kinds of fish.

The coasts about this island are very high and rocky, and have neither havens or sea-ports, so that it is almost impossible to effect an invasion. Teovang, or Tyowang, is the only bay in the whole island, where ships of any bulk can approach; and this is situated at the mouth of a river so narrow, and defended by such high rocks and forts on each side, that no enemy could possibly enter it, without being repulsed.

The inhabitants of those parts of the island belonging to the Chinese, have the same manners and customs, and are under the same government as those of China; so that a repetition of them would be here unnecessary; we shall therefore only describe the persons, manners, and customs of the natives.

The natives of this island, who are subject to the Chinese, are divided into forty-five boroughs, or towns, thirty-six of which are in the northern part, and nine in the southern. They are in general of a low stature, have a large mouth, and are very swarthy in complexion: they have a very high forehead, and are altogether greatly disproportioned, for the body is very short, the neck small, and the arms and legs remarkably long.

Their weapons are bows and arrows, which they use with such dexterity, that they will kill a pheasant flying at the distance of 400 yards. They have little ceremony in their marriages; nor do they purchase their wives as in China.

Some writers have described the Formosans as being mere infidels, which we can assign no other reason for, but from their being considered so by the Chinese. This, however, is a false assertion: they believe in one Supreme Being, and seem to entertain wiser notions than the inhabitants of many eastern countries. The Chinese acknowledge that they are not subject to cheat, thief, or quarrel; but, on the contrary, that they practise all the duties of equity and mutual benevolence. They worship idols as in China, to whom they offer sacrifices of hogs, rice, &c.

Their manner of treating the dead before interment is very singular. When a person dies, they lay him on a kind of scaffold made of bamboo, which they place over a slow fire for nine days; after which they wrap the corpse in a mat, and lay it on a higher scaffold, covered with a pavilion, made of shreds of silk, cloth, &c. Here it remains for two years, at the expiration of which, they dig a large hole in the ground, and bury it. Each of these ceremonies is accompanied with feasting, music, dancing, &c.

One custom is almost universal among them, namely, if a person is exceeding ill, or afflicted with any painful disorder, which is not likely to be removed, they think it a kindness to dispatch him.

The government of each town or borough is confined

fixed to itself. Three or four of the most ancient, who are known to be men of integrity, are appointed as judges over the rest, who determine all differences; and he who refuses to submit to the decision, is banished the town, nor can he either return, or be admitted into any of the others, so that he is obliged to finish his days, without ever again participating of the natural enjoyments of society.

An annual tribute is paid by the inhabitants to the Chinese, which consists of certain quantities of grain, the tails and skins of stags, and other productions of the country. In order to gather this tribute, a person is appointed to each town, who learns the language of the natives, and discharges the office of interpreter between them and the mandarins of China. There were formerly twelve boroughs in the southern part of the island that paid tribute to the Chinese; but, from the tyrannic conduct of their interpreter, or gatherer of the tax, they revolted, drove the interpreter out of the town, and no longer continued to pay tribute to China.

The capital city of Formosa is called Tai-ouan-fou. It is large and populous, and carries on so extensive a trade, that it is little inferior to some of the most opulent in China. It is plentifully supplied with all kinds of provisions, either of its own product, or commodities brought from other countries, as rice, cotton, sugar, wine, tobacco, and dried venison, the latter of which is greatly admired by the Chinese, and considered as the most delicious food. They have likewise all kinds of fruits, medicinal herbs, roots, gems, &c. with plenty of linen, silk, and cotton of various sorts.

The streets are long and spacious, the houses very small, built of clay, and covered with thatch; the buildings have awnings on each side, that join in such a manner as to cover the street; but these are only used during the hot months, to keep off the excessive heat of the sun. Some of the streets are near three miles in length, and between thirty and forty feet broad: these streets are chiefly occupied by dealers, whose shops are furnished with all kinds of goods, ranged and displayed to the greatest advantage. These shops appear very brilliant, and many people walk in the streets merely to gratify themselves with the sight of so great a variety of the richest commodities.

Though this city is not defended either by walls or fortifications, it has a good garrison of horse and foot, consisting of 10,000 men, who are principally Tartars. These are commanded by a lieutenant-general, two major-generals, and a number of inferior officers, who are at liberty to relinquish their situation after having served three years, or sooner, if occasion should require. The harbour is tolerably good, and sheltered from the winds; but the entrance to it is dangerous for ships of burthen, the bottom of it being rocky, and the water not above ten feet deep at the highest tides.

The most authentic historians inform us, that the island of Formosa was first inhabited by the Japanese

about the beginning of the last century. These people were so pleased with the appearance of the country, that they built several small towns, and soon settled a colony: however, they were but a short time on the island before they were interrupted by the Dutch, a ship belonging to whom being accidentally forced into the harbour, the people landed on the island, in order to obtain refreshments, and repair the damage the vessel had sustained by the storm. Pleased with the apparent fertility of the country, and the wholesomeness of the climate, they formed a plan of circumventing the Japanese, by taking the island into their own possession. Fearful, however, of offending them, lest it might be injurious to their trade, they were very cautious in what manner they proceeded; and though they were the most powerful, yet they were rather desirous of obtaining their wishes by artful than violent measures. To effect this, they earnestly entreated the Japanese, that they would permit them to build a house near the sea side, which, they alleged, would be of the greatest utility to them in their passage to and from Japan. This request was refused, which produced a second solicitation that met with no better success. Unwilling, however, to give up any endeavours they could project, they again renewed their solicitations, and pressed them to give consent, assuring them that they desired no more ground than what might be encompassed by the hide of an ox. The modesty, as well as oddity, of this request, had the wished-for effect, and the Japanese at length gave their consent.

Having now made an opening into their future intentions, the Dutch immediately discovered a piece of cunning little thought of by the Japanese. They got a large hide, which they cut into a number of slips, and, fastening the whole together, covered a very extensive piece of ground, on which, instead of a single building, they erected several spacious habitations. The Japanese were at first greatly vexed at this stratagem, but, from the singularity of it, they were at length pacified; and were so far from either envying the Dutch, or being in any way apprehensive of danger from them, that they permitted them to do whatever they thought proper; and of this indulgence the Dutch were not deficient in taking the greatest advantages, for they soon erected several strong buildings, particularly a castle, which they called Zealand, situated on so advantageous a spot, that it was impossible for any ship to enter it, of whatever force, without being repulsed. But in process of time, the Japanese, being either offended at the great progress the Dutch had made, or not finding the advantages they expected, soon quitted the island, and left the Dutch in sole possession of it; after which the latter erected other fortifications opposite to their new fort, and raised such other defences, as made them complete masters of the island, which however continued but a few years in their possession. One of the Chinese generals (a man of an enterprising genius) being defeated by the Tartars, who were then at war with the Chi-

 One of the Chinese ge-
 enius) being defeated
 at war with the Chi-
 nese,

fixed his views on Formosa, forming a resolution
 ousting the Dutch, and establishing a new kingdom
 the island. Accordingly he sailed from China with
 very considerable fleet, and arriving near the mouth
 the harbour, he landed some of his men, and began
 attack the fort of Zealand. The Dutch, not being
 apprehensive of any danger, were ill provided to attack
 powerful an enemy: they had only four ships in the
 harbour, and not above twenty men in the fort, exclu-
 of the natives; notwithstanding which they made
 forcible an opposition, that the siege lasted upwards
 three months. The Chinese general was so enraged
 being thus disappointed, that he at length had re-
 urre to a very desperate effort, which had the desired
 ct. He converted several of his vessels, into fire-
 ps, and the wind happening to be high and favour-
 le, drove them into the harbour, when three of the
 utch ships were entirely destroyed. Thus situated,
 e Dutch could not make any further resistance, and
 e Chinese general offering them liberty to depart with
 ir effects in case they would surrender, they readily
 cepted the offer; and putting all their valuables on
 ard the ship that was left, they departed, and left the
 hinese general sole possessor of the island. The ge-
 ral immediately acknowledged submission to the em-
 or, and several other towns were soon built on dif-
 erent parts of the island, the inhabitants of which have
 r since been subject to the government of China,
 ll, as hath been before observed, testify their submis-
 ion by an annual tribute.

HAINAN, the other island (the principal part
 of which also belongs to the Chinese) is of consider-
 able extent, and some of the towns are very populous.
 It is situated between 107 and 110 deg. east long. and
 between 18 and 20 deg. north lat. It is bounded on
 the east by the Chinese sea; on the west by the coast of
 Cochinchina; on the north by part of the province of
 Kiang-tong, to which it belongs; and on the south
 by the channel of Paracel, which joins the eastern coast
 of Cochinchina. It is about 200 miles in length
 from east to west, near 150 in breadth, and about 400
 in circumference.

Kian-tcheou is the principal city; and is so situated,
 that ships lie at anchor close to its walls with the
 greatest security. The streets are very uniform, and
 most of them at least a mile in length, but the houses
 in general are low mean buildings. But, besides the
 capital, there are several other considerable cities on
 the island, all of which are situated near the sea-side,
 and subject to the jurisdiction of Kian-tcheou, which
 is governed by mandarins of two orders, namely, those
 of learning, and those of arms.

On the southern part of the island there is a fine
 bay, the bay of which is near twenty feet deep. There
 is also another very convenient port on the northern
 part, the entrance to which is defended by two small
 islands, though the depth of water does not exceed twelve
 fathoms. Here the barks frequently come from Canton

with various commodities, in exchange for which they
 take several kinds of minerals, the natural produce of
 the country; for in some parts of the island there are
 gold and silver mines, as also mines that produce the
 lapis-lazuli, which the natives of Canton use in paint-
 ing the blue porcelain. Between the two forts that
 defend the entrance of the northern port, is a large
 plain, on which are several handsome Chinese se-
 pulchres.

The climate of this island is in general very un-
 healthy, particularly the northern part, though the soil
 is tolerably fertile. The southern and eastern parts are
 exceeding mountainous; but the vallies beneath are
 rich, and produce great plenty of rice. Here are like-
 wise several sorts of very valuable trees, particularly
 the rose, or violet-tree, which is so fragrant in its
 scent, that it is purchased at a very high price for the
 sole use of the emperor. There is also another tree
 little inferior to this; it produces a kind of liquid,
 which by the natives is called dragon's blood, and, if
 thrown into the fire, diffuses a scent of the most agree-
 able nature. Indigo grows very plentifully on this
 island, as also sugar, tobacco, and cotton; and they
 have a great variety of the most delicious fruits.

Horses, sheep, cows, and hogs, are the chief ani-
 mals here. On the mountains, and in the woods,
 are prodigious numbers of apes, some of which are
 very large, of a black colour, and the features of their
 faces so distinct, as to resemble the human species with
 greater niceness than any others to be found in the uni-
 verse; but these are very seldom seen; and though the
 natives have often endeavoured to catch them, yet they
 are so cunning and alert, that they have baffled every
 machination they could project. These apes appear
 to be of the same species with two sent some years ago
 in a coasting vessel, as a present from a merchant of the
 rajah of the Carnatic dominions to the governor of
 Bombay, a particular description of which is thus
 given by Mr. Grose in his *Voyage to the East-Indies*:
 "They were, says he, scarcely two feet high, walked
 erect, and had perfectly a human form. They were
 of a fallow white, without any hair, except in those
 parts that is customary for mankind to have it. By
 their melancholy, they seemed to have a rational sense
 of their captivity, and had many of the human ac-
 tions. They made their bed very orderly in the cage
 in which they were sent, and, on being viewed, would
 endeavour to conceal with their hands those parts that
 modestly forbids manifesting. The joints of their knees
 were not re-entering like those of monkies, but saliant
 like those of men; a circumstance they have in com-
 mon with the Oran-outangs in the eastern parts of
 India, particularly in Sumatra, Java, and the Spice
 Islands, of which these seem to be the diminutives,
 though with nearer approaches of resemblance to the
 human species. But though the navigation from the
 Carnatic coast to Bombay is of a very short run, of not
 above six or seven degrees, whether the sea air did not
 agree

agree with them, or that they could not brook their confinement, or that the captain had not properly consulted their provision, the female sickening first died, and the male giving all the demonstrations of grief, seemed to take it to heart so, that he refused to eat, and in two days after followed her. The captain, on his return to Bombay, reporting this to the governor, was by him asked, What he had done with the bodies? He said, he had flung them overboard. Being further asked, Why he did not keep them in spirits? he replied, that he did not think of it. On this the governor wrote afresh to the merchant, desiring him to procure another couple at any rate, as he should grudge no expence to be master of such a curiosity. The merchant's answer was, He would very willingly oblige him, but that he was afraid it would not be in his power; that these creatures came from a forest about 70 leagues up the country, where the inhabitants would sometimes catch them on the skirts of it; but that they were so exquisitely cunning and shy, that this scarcely happened once in a century.

Hainan also abounds with various kinds of game, particularly deer and hares; also a great plenty of birds, as partridges, woodcocks, snipes, turtle-doves, and most sorts of water-fowl, all which are little inferior to those in Europe. They have likewise most sorts of fish in great abundance: among these is a little blue fish found among the rocks, which is so beautiful as to be esteemed of greater value than the golden fish; but they will live only a few days out of their natural element.

The natives of this island are short in stature, of a reddish complexion, and some of them greatly deformed. The men wear only a loose garment, reaching from the waist to the knees: it is made of calico, and the colour is either a deep blue, or quite black. The women wear a garment made of the same stuff, though different in form: it somewhat resembles a waistcoat, and reaches from the shoulders to the knees: and they are further distinguished from the men by streaks made on their faces with indigo. Both sexes braid their hair, and ornament their ears with rings; and their hats, which tie under the chin, are made of straw or rattan. Their chief weapons are bows and arrows, in the use of which they are not so expert as the inhabitants of Formosa. They have also a kind of hanger fastened with a girdle to their waist, which they generally use to clear the way in forests, or other woody places. They occupy the centre part of the island, which is very mountainous; and here they live independent, being subject only to their own laws and modes of government.

The natives are seldom seen by the Chinese, except when they make an attempt to surprize any of the neighbouring villages. This, however, seldom happens, and when it does, they are naturally such cowards, that half a dozen Chinese will defeat at least an hundred of them. Many of them are in the service

of the Chinese, who employ them to cultivate the lands, and take care of their cattle. Others of them are allowed to possess villages on the plain; and the principal part, as in Formosa, pay an annual tribute to the emperor of China.

THE PHILIPPINE ISLANDS.

THESE islands, which are about 1100 in number, lie in the Chinese sea (part of the Pacific Ocean) 300 miles south-east of China, from 5 to 19 deg: north, and from the 114th to 120th deg. of east longitude. Manila, or Luconia, the chief, is 400 miles long and 200 broad. They were discovered in the year 1521 by Francis Magellan, but no attempt was made either to subdue or settle them till the year 1564, under the reign of Philip II. when Lopez Delagalpes conquered and planted colonies in them, and gave them the name of Philippines, in honour of the prince who then filled the Spanish throne. The inhabitants consist of Chinese, Ethiopians, Malays, Spaniards, Portuguese, Pintados, or painted people, and Metes, a mixture of all these. No part of the world produces greater plenty of all the necessaries of life than these islands; nor any country afford a more beautiful prospect, the land being clothed with a perpetual verdure, and buds, blossoms, and fruits succeed each other during the whole year. Considerable quantities of gold are washed down from the hills by the rains, and found mixed with the sand in the rivers. The plains are full of buffaloes, horses, oxen, and goats; and the woods abound with deer, wild hogs, and monkeys. Among a great variety of birds, is that called the saligan, whose nest affords that dissolving jelly so much valued by the voluptuaries of Europe. The soil is so luxurious, that if a sprig of an orange or lemon tree be planted, it becomes in one year a fruit-bearing tree. The Spaniards have introduced here several of the European and American fruit-trees, which flourish as well as in their native soil. The cacao or chocolate-nut tree is now so common in these islands, that they have no longer any occasion to import that commodity from Mexico. The tree also supplies the natives with water; and there is also a kind of cane called vaxuco by the Spaniards, which, if cut, yields fair water sufficient for a draught, and there are plenty of them in the mountains, where water is most wanted.

The situation of these islands, particularly that of Manila, is remarkably advantageous; on the north it lies to the China, on the south the other islands on the oriental ocean, and on the west Malacca, Siam, Cochinchina, and other kingdoms and provinces of India.

Manilla, the capital of Luconia, situated on the south-east side of the island, is said to contain 3000 inhabitants. It is of an irregular form, and about 100 miles in circumference. Only small vessels can come

to Manila; the town is the seat of the bishop of St. Philip, and capable of 17600 English, under the command of a governor, who took it by force, suffered the same fate, and ran the same contract was, the prelate, and part of the ran made is carried down at Manilla, they carry to A change their callons that L world.

to Manila; but three leagues to the southward
of the town is the port of Cavite, defended by the
castle of St. Philip, by much the best fortrefs in the
island, and capable of receiving the largest ships. In
the year 1762, the city of Manila was reduced by the
English, under General Draper and Admiral Cornilth,
who took it by storm; but, from a principle of huma-
nity, suffered the archbishop, who was then viceroy,
to ransom the place for about a million sterling. The
contract was, however, ungenerously disowned, both
by the prelate and the court of Spain, so that the greater
part of the ransom is still unpaid. A very lucrative
trade is carried on with America, by annual ships,
laden at Manilla with the riches of the East, which
they carry to Acapulco in Mexico, where they ex-
change their cargoes for silver. It was one of these
alleons that Lord Anson took in his voyage round the
world.

Mindanao is, next to Luconia, the largest of the
Philippine Islands, but is not subject to Spain. The
inhabitants are of different tribes; those of the inland
parts are supposed to be the Aborigines, or Pagans,
who first possessed these islands; but the sea-coasts are
inhabited by Mahometans. It is very fertile, pro-
ducing most of the fruits common to the torrid zone.
It is said that both clove and nutmeg trees are found in
this island. This island is governed by one of their
princes, a Mahometan, whom they call sultan.

The **MOLUCCAS**, commonly called the **SPICE** or
CLOVE ISLANDS, lie in a cluster, and within sight of
one another, not being more than twenty-five leagues
south of the Philippines, between one degree south, and
two degrees north latitude, and in 125 degrees of east
longitude. They are five in number, viz. Bachian,
Machian, Motyr, Ternate, and Tydore. The Dutch
have a fort in Ternate, called Victoria; and another
in Machian, called Fort Orange.

None of these islands produce either corn or rice, so
that sago is the principal food of the inhabitants. Their
chief produce, besides the tropical fruits, consists in
cloves, mace, and nutmegs, which are here in prodigi-
ous plenty. These spices are monopolized by the
Dutch, with so much jealousy, that they annually de-
stroy great numbers of the trees, lest the inhabitants
should dispose of the superannuated spices to other
nations. They were discovered in the year 1511, by
Francis Magellan; and, after being subject to several
powers, are now governed by three princes subordinate
to the Dutch. Ternate, the largest of these islands, is
not above thirty miles in circumference.

AMBOYNA is one of the Moluccas, taken in the
largest sense of the word: it is the most considerable,
and in fact commands all the Moluccas. It is about
seventy miles in circumference, and defended by a
Dutch garrison of seven or eight hundred men, besides
several forts, for the protection of their clove planta-

tions: The Moluccas have been often called the gold
mine of the Dutch; and perhaps not improperly. The
produce of spices is amazing, and the profit remarkably
great; a pound weight of either nutmegs or cloves not
costing the company above a penny in the country, and
every one knows the price they fetch in Europe. The
nutmeg harvest is in July and August, but that of
cloves not till November and December.

When the Portuguese were driven out of Amboyna,
the spice trade was carried on by the English and Dutch
in conjunction: but the avarice of the latter was too
strong to be restrained, even by the ties of humanity.
They pretended, without the least foundation, that a
plot had been formed by the English, for making them-
selves masters of the island; and, in consequence of
this imaginary conspiracy, tortured in a most infernal
manner, and then murdered the English: a transaction
that will for ever remain a memorial of Dutch infamy.
This tragical event happened in 1622, and, ever since
that period, they have engrossed the whole spice trade
to themselves.

The **BANDA**, or **NUTMEG ISLANDS**, are six in
number, and lie between four and five degrees of south
latitude, and in 128 degrees of east longitude. Their
names are Lantor, Poloron, Rosingen, Pooloway, and
Gonapi. The largest of them is not above twenty miles
in circumference; though they are of the utmost con-
sequence to the Dutch, on account of the nutmegs
and mace, which grow here in such amazing quanti-
ties that they are enabled to supply all the markets of
Europe. The nutmeg, covered with mace, grows on
these islands only, and they are entirely subject to the
Dutch.

Besides the islands already mentioned, there are several
others in the neighbourhood, which would soon be
covered with forests of clove and nutmeg trees, were
not the Dutch very careful to destroy them; for there
are, in the islands of Banda and Amboyna, large flights
of doves, which swallow the nutmegs and cloves whole,
and void them, in the same state, on the adjacent islands,
and from these a vast number of young trees appear an-
nually. The Dutch have therefore declared war both
against the doves and the wild plantations of clove and
nutmeg trees. June and August are the months for
the great nutmeg harvest.

The island of **CELEBES**, or **MACASSAR**, is situated
under the equator, between the island of Borneo and
the Spice Islands, about 160 leagues from Batavia. It
is about 500 miles in length, and 200 in breadth, and
is, with very great reason, considered as the key of
the Spice Islands. Though this island is placed in the
midst of the torrid zone, the heat is rendered very sup-
portable by breezes from the north, and periodical rains.
It is very populous, and the natives are active, brave,
ingenious, and courteous to strangers, if not provoked.

Its chief produce is cotton, opium, and pepper: no country in the world produces a greater variety of poisons, and the natives are very well acquainted with their fatal effects. The Dutch have a fortified factory on the sea-coast of this island; but the internal parts are governed by three kings, the chief of whom resides in the town of Macassar. Happily for the Dutch, these princes are always at variance, for, otherwise, they might easily drive them out of the island. Vast numbers of Chinese are settled here, and carry on an extensive trade with various parts of India: they are very successful, and conduct their commercial affairs with a dexterity peculiar to themselves. The part of Jampoden is said to be the most capacious of any in that part of the world. In this, and indeed in almost all the Oriental islands, the inhabitants live in houses built upon large posts, and accessible only by ladders, which they pull up in the night time, for their security against venomous animals, and the frequent floods by which the low lands are laid entirely under water.

GILOLO and CERAM, two other spice islands, lying under the equator, are likewise fortified by the Dutch, who will sink any ships that attempt to traffic in these seas.

The SUNDA ISLANDS are situated in the Indian ocean, between eight degrees north and eight degrees south latitude, and between 93 and 120 degrees of east longitude; comprehending the islands of Borneo, Sumatra, Java, Bally, Lamboe, and Banca.

Borneo is situated under the equinoctial, and is thought to be the largest island in the world, being 800 miles long, and 700 broad. The flat country near the coast is overflowed great part of the year, which renders the air very unhealthy; and the inhabitants reside in towns built on floats, in the middle of their rivers. The inland parts are mountainous, and the air very healthy. The island produces rice, cotton, canes, pepper, camphire, and the fruits common to the torrid zone. Gold, and diamonds of a large size and excellent water, are found in the sand at the bottom of several rivers, washed down, probably, by the torrents, which descend with a frightful rapidity from the mountains. Among the different species of monkeys found in this island, is the oran-outang, or man of the woods, which is thought to resemble the human form more than any other irrational being. One of these creatures was dissected by Dr. Tyson, at Oxford.

The original inhabitants reside in the mountains, and make use of poisoned darts; but the sea-coasts are governed by Mahometan princes. The chief port of the island is Benjar-Massean, where a considerable trade is carried on with all the towns of India.

Java is situated to the southward of Sumatra, from which it is separated by the straits of Sunda. It is about 630 miles in length, and 200 in breadth. It produces pepper, indigo, sugar, tobacco, rice, coffee, cocoa-nuts, plantains, cardamoms, and all the tropical fruits in great plenty and perfection. The forests abound

with wild beasts of various kinds, as lions, tigers, elephants, rhinoceroses, buffaloes, and wild horses, with an infinite variety of serpents, some of which are of an enormous size.

This island is remarkably populous, the number of inhabitants having been computed at above thirty millions. There are several princes in it, of whom the most considerable are the emperor of Matran, who resides at Karafura, and the kings of Bantam and Japara. But the Dutch are absolute masters of the greater part of the island, and have erected here a kind of commercial monarchy, equal to any thing that has subsisted since the demolition of Carthage; unless that of the English East-India company in Bengal may be thought superior. The capital is Batavia, a large, flourishing, and populous city, situated at the mouth of the river Jucatra, and in the bottom of a very large commodious bay, forming one of the finest harbours in the world. The city is surrounded with a rampart 21 feet thick, lined on the outside with stone, and fortified with bastions. This rampart is environed with a ditch 135 feet in breadth, and generally full of water. The avenues to the city are defended with several forts, well furnished with brass cannon: no person is suffered to pass beyond these forts without a passport. The river Jucatra runs through the middle of the city, and forms fifteen canals of running water, all faced with free-stone, and the borders planted with rows of trees; over these canals are fifty-six bridges, besides those without the walls. The streets are all perfectly straight, and, in general, thirty feet broad. The houses are of stone, and resemble those in Holland.

The city is about a league and a half in circumference, and has five gates; but the number of houses and inhabitants are at least ten times greater in the suburbs than in the city. The public buildings are large and magnificent, and the arsenals and magazines are furnished with ammunition and warlike stores sufficient for many years. The citadel is a regular fortification, situated at the mouth of the river, and flanked with four bastions; two of which command the harbour, and the other two the town. In this castle the Dutch governor-general resides, in all the pomp of eastern magnificence. When he appears abroad, he is attended by his guards and officers, and with a splendour superior to that of any European potentate, except on solemn occasions. The government is admirably calculated to prevent the independency either of the civil or military power. A Dutch garrison of 3000 men constantly resides at Batavia, and about 15,000 troops are quartered in different parts of the island.

Both the city and suburbs are inhabited by natives of almost every nation in the world: the Chinese alone, residing in this island, have been computed at 100,000; above 30,000 of them lived in the city till the year 1740, when they were all massacred by the Dutch governor, without the least offence being proved against them. This massacre was of too infernal a nature to be defended by the Dutch themselves; and yet

garrison of 3000 men, and about 15,000 troops on the island. The island is inhabited by natives, and is the most civilized world: the Chinese have been computed at 100,000, who lived in the city till the year 1762, when all massacred by the Dutch, the offence being proved to be of too internal a nature to be punished by themselves; and yet

the wretch who was the instrument of this inhuman proceeding, had the assurance to embark for Europe on his arrival at the Cape of Good-Hope, he was apprehended by an order from the States, and sent back to Batavia, in order to be tried. He was accordingly embarked, but never reached that city: it was expected he was thrown overboard in his passage, in order to prevent any farther inquiry into an action detested by all mankind.

CEYLON, called by the inhabitants Lamea, the terrestrial Paradise, though not the largest, is generally allowed to be the richest and finest island in Asia. It is situated in the Indian Ocean, near Cape Comorin, from which it is separated by a very narrow strait. It is about 250 miles in length, and 200 in breadth. Besides the common tropical fruits, which are found here in great abundance, the island produces long pepper, cotton, ivory, silk, tobacco, ebony, musk, crystal, opete, sulphur, lead, iron, steel, cinnamon, gold, silver, and all kinds of precious stones, except diamonds. Fish, of almost every kind, are here in great plenty. It is well watered with rivers, and has many beautiful woods and groves. Animals of various kinds are found here, especially cows, buffaloes, goats, hogs, deer, hares, dogs, and other quadrupeds. The elephants of Ceylon are preferred to all others: but what has rendered this island remarkable is its cinnamon, which is the best in the world, and produced in amazing quantities. The trees have each of them three barks, which form the true cinnamon; those of a middling age and growth afford the best; and the body of the tree, which, when stripped, is white, serves for building and other uses: they grow in great profusion in every part of the island; but the best is found in what is called the cinnamon-field, a large tract of land, comprehending the whole west and southern coasts of the island. The Portuguese made themselves masters of the ports, and engrossed the cinnamon trade about the year 1520. Their tyrannical behaviour to the natives, induced them to have recourse to the Dutch for assistance: accordingly, in the year 1656, they drove out the Portuguese, but kept possession of their settlements, and in a manner shut up the king in Candy, his capital, situated on a mountain, near the centre of the island. They are so careful to engross the whole trade of the island, that they will not suffer any foreign ship to enter its ports.

In January 1782, Trincomalee, the chief sea-port of the island, was taken by the English, but soon afterwards retaken by the French, and by the last treaty of peace was restored to the Dutch.

The natives, who are called Cinglases, are a very offensive people, and are said to have had some notions of the principles of revelation many centuries before Christ. Some suppose that the fleets of Solomon sailed with the Cinglases, and that from them they derived their knowledge; while others think that they

owed it to the Jews, many of whom, it is said, were settled in the Hither Peninsula of India by Nebuchadnezzar. But, however that be, in the southern part of the island, about twenty leagues from the sea, is a vast plain, in the middle of which is a mountain, covered with a beautiful turf, whence proceeds a rock, which rises in a pyramidal form, near a quarter of a league in height, but so rugged, that it cannot be ascended but by means of an iron chain, which hangs from the top to the bottom. On the summit of this pyramidal rock, though it appears like a point when viewed from the plain below, is a terrace 200 paces in diameter, in the centre of which is a large and deep lake, full of exceeding fine water. Near the lake is a large stone, on which is the print of a man's foot, as perfect as if it had been taken in wax.

THE MALDIVIA ISLANDS were the first islands discovered by the European navigators on their arrival in the Indies. They form a vast and numerous cluster, but are very small; many of them are only little rocks just above the surface of the water: they extend from the equator to eight degrees of north latitude, and the most northern of them is not more than fifty leagues from Cape Comorin. Few Europeans, except the Dutch, visit these islands, where they carry on a very profitable trade, in a beautiful species of shells called Couries, which were formerly used as money by the negroes on the coast of Guinea in Africa. Among other vegetable productions in these islands, is a particular species of cocoa-tree, whose fruit is an excellent medicine in fevers: this tree grows to a large size. A writer of great credit and veracity declares, that the Maldivians have vessels of twenty or thirty tons burden, whose hulls, masts, sails, rigging, anchors, and cables, are all made from this tree. It also affords them oil for their lamps, fuel to dress their food, sugar, candied sweetmeats, and a pretty strong kind of cloth.

Besides the islands we have described, there are a great many small ones dispersed in the Indian and Chinese Ocean, &c. the description of some of which, as well as the soil, would prove but barren; however, as to those of them which are to be ranked among the remainder of the new discoveries, they will be found in the next chapter.

CHAPTER XIX.

ISLANDS off the ASIATIC COASTS, and various Ports discovered by the Captains COOK, CLERKE, GORE, KING, and other NAVIGATORS, not included in our first CHAPTER of NEW DISCOVERIES.

ACCORDING to our plan laid down, we come now to treat of such isles, as not being immediately within the track of those described under the first general

general head of New Discoveries, being observed at various times, and some only seen without being visited, we thought to class together in a separate arrangement.

We shall begin with KERQUELEN'S LAND, which was first seen by a French navigator, whose name it bears. It is situated in 48 deg. 41 min. south lat. and 76 deg. 50 min. east long. and was visited by Captain Cook in 1776. Having come to an anchor in the harbour, in order to procure water, and nearly completed their quantity, the commander allowed the ships crews (Resolution and Discovery) the 27th of December, to celebrate Christmas; in consequence of which, many of them went on shore, and made excursions into the country, which they found desolate and barren. In the evening, one of them presented a quart bottle to Captain Cook, which he had found on the north side of the harbour, fastened with some wire to a projecting rock. This bottle contained a piece of parchment, with the following inscription:

*Ludovico XV. Galliarum
rege, et de Boynes
regi a Secretis ad res
maritimas annis 1772 et
1773.*

Captain Cook, as a memorial of the British vessels having been in this harbour, wrote on the other side of the parchment as follows:

*Navis Resolution
et Discovery
de Rege Magnæ Britannia,
Decembris 1776.*

It was then put again into the bottle, accompanied with a silver two-penny piece of 1772, the mouth of the bottle being covered with a leaden cap, and placed the next morning in a pile of stones, erected for that purpose on an eminence, near the place where it was first found. Here Captain Cook displayed the British flag, and named the place Christmas-Harbour; but he forbore giving any new name to this desolate land:

"No place (says Mr. Anderson, who examined the country) hitherto discovered in either hemisphere, affords so scanty a field for the naturalist as this sterile spot. Some verdure indeed appeared, when at a small distance from the shore, which might raise the expectation of meeting with a little herbage; but all this lively appearance was occasioned by one small plant, resembling saxifrage, which grew up the hills in large spreading tufts, on a kind of rotten turf, which, if dried, might serve for fuel, and was the only thing seen here that could possibly be applied to that purpose. Another plant, which grew nearly to the height of two feet, was pretty plentifully scattered about the boggy declivities; it had the appearance of a small cabbage when it was shot into seeds. It had the watry acid

taste of the antiscorbutic plants, though it was dissimilar from the whole tribe. When eaten raw, was not unlike the New Zealand scurvy-grass, when boiled, it acquired a rank flavour. At this season none of its seeds were ripe enough to be brought home and introduced into our English kitchen-garden.

"Near the brooks and boggy places were found other small plants, which were eaten as salad; the like garden-crests, and very hot, and the other very mild. The latter is a curiosity, having not only male and female, but also androgynous plants. Some cereals grew pretty plentifully in a few small spots in the harbour, which was cut down for our cattle. In short, the whole catalogue of plants did not exceed eighteen, including a beautiful species of lichen, and several sorts of moss. Nor was there the appearance of a tree or shrub in the whole country.

Among the animals, the most considerable were seals, which were distinguished by the name of sea-bears, being the sort that are called the ursine-seal. They come on shore to repose and breed. At that time they were shedding their hair, and so remarkably tame, that there was no difficulty in killing them. No other quadruped was seen; but a great number of oceanic birds, as ducks, shags, petrels, &c. The ducks were somewhat like a widgeon, both in size and figure. A considerable number of them were killed and eaten. They were excellent food, and had not the least fishy taste. The Cape petrel, the small blue one, and the small black one, or Mother Carey's chicken, were not in plenty here; but another sort, which is the largest of the petrels, and called by the seamen Mother Carey's goods, is found in abundance. This petrel is as large as an albatross, and is carnivorous, feeding on the dead carcasses of seals, birds, &c. The greatest number of birds here were penguins, which consist of three sorts. The head of the largest is black, the upper part of the body of a leaden grey, the under part white; and the feet black: two broad stripes of fine yellow descend from the head to the breast: the bill is of a reddish colour, and longer than in the other sorts. The second sort is about half the size of the former; it is of a blackish grey on the upper part of the body, and has a white spot on the upper part of the head: the bill and feet are yellowish. In the third sort, the upper part of the body and throat are black, the rest white, except the top of the head, which is ornamented with a fine yellow arch, which it can erect as two crests. The shags here are of two sorts, viz. the lesser cormorant, or water-crow; and another with a blackish back and a white belly. The sea-swallow, the tern, the common sea-gull; and the Port Egmont hen, were also found here. Large flocks of a singular kind of white bird flew about here, having the base of the bill covered with a horny crust. It had a black bill and white feet, was somewhat larger than a pigeon, and the flesh tailed like that of a duck.

Many of the hills, notwithstanding they were of a
moderate height, were at that time covered with snow,
though answering to our June. It is reasonable to ima-
gine that rain must be very frequent here, as well from
the marks of large torrents having rushed down, as from
the appearance of the country, which, even on the hills,
was a continued bog or swamp.

The rocks consist principally of a dark blue, and
grey hard stone, intermixed with particles of glimmer,
or quartz. Some considerable rocks were also formed
of a brownish brittle stone."

PATERNOSTER ISLANDS, were so called from the
great number of rocks, which sailors have likened to the
heads with which the Roman Catholics tell their pater-
noster. They abound in corn and fruits, and are ra-
ther populous.

GEORGIA, a cluster of barren islands, about 54 deg.
30 min. south lat. and 36 deg. 30 min. west long.
One of them is between fifty and sixty leagues in
length. They contain nothing worth remarking.

ISLAND OF HANDSOME PEOPLE lies in 10 deg.
south lat. and 185 deg. east long. It is eighteen miles
in circumference, and was discovered by De Quiros in
1696. Notwithstanding the excessive heat of the cli-
mate, the natives are remarkably fair and handsome,
from whence the island had its name. They are co-
vered only from the waist downwards, with mats of
palm, and wear a mantle of the same on their shoul-
ders. Their canoes are trees hollowed out, and their
hatched houses stand together in clusters.

HOON OR HOORN ISLAND, is situated in 14 deg.
36 min. south lat. and 179 deg. east long. and was dis-
covered in 1616, by Shouten. The male natives of
this island are tall, well-made, and robust. They are
nimble runners, expert swimmers, and good divers.
Their complexion is a yellowish brown; and they
take great pleasure in dressing their hair, which is
black. Some tie it, others frize it. Some let it grow
down the waist, and tie it in five or six tails; and
others dress it right an end, standing up like hogs bris-
tles, ten or eleven inches long; but they do not suffer
the beard to grow. The women are short of stature,
deformed both in features and body, and rather in-
decent in their behaviour. Both sexes go naked, except
a piece of covering between their legs; and the women
rub their heads and cheeks with something red.

Their land produces spontaneously a great variety of
fruits, such as coconas, bananas, yams, &c. for they are
ignorant of cultivation. At low-water the women
catch fish, which is eaten raw. They have also some
hogs, but their pork is spoiled by the cookery.

PRINCE EDWARD'S ISLANDS, lying in 51 deg.
south lat. were discovered by two French navigators,
on their passage from the Cape of Good-Hope to the
Philippine Islands. They are two in number, and, as

they had no names in the French Chart of the Southern
Hemisphere, Captain Cook, when he saw them in
1776, gave them this appellation.

That which lay most to the south, appeared to be
about fifteen leagues in circuit, and the most northerly
about nine leagues. There are four others contiguous,
and which, from the names of the discoverers, are
called Marion and Crozet's Islands.

ADVENTURE-ISLAND, so called from the ship Ad-
venture, in which Captain Furneaux sailed to the
South-Seas, is situate in lat. 49 deg. 21 min. south, and
long. 147 deg. 29 min. west. The natives are de-
scribed as mild and cheerful, with little of that wild
appearance which savages in general have, but possess
neither genius nor activity.

RESOLUTION, a small island, so called by Captain
Cook, from his own ship the Resolution, lies in lat.
17 deg. 24 min. south, and long. 141 deg. 45 min.
west.

PALM-ISLAND is situated on the coast of New
South Wales, as are also the islands **SOLITARY**, **FUR-
NEAUX**, **MARIAS**, **CUMBERLAND**, **NORTHUMBER-
LAND**, and **DIRECTION**, so called by Captain Cook,
who first explored this coast, and thus denominated them.

The **PRINCE OF WALES'S ISLANDS** lie at the nor-
thern extremity of New Holland. They were observed
at a distance to abound with trees and grass, and were
known to be inhabited, from the smoke that was seen
ascending in many places.

The **BAY OF ISLANDS**, containing a cluster of little
isles, is situate on the coast of New Zealand: among
which are included those called **GANNET**, **BANKS'S**,
SOLANDER'S, **TRAF**, &c.

POTOE is an island situated about two leagues to the
westward of the Grand, or principal of the Ladronez.
It is rocky, and of small extent.

CENTRY-BOX-ISLAND lies about a league and an
half from the south point of Christmas-Harbour, in
Kerguelen's-Land; it was so called, from an opinion
of its resembling a centry-box in its figure.

SOLOR lies to the south of the Island of **CELEBES**,
in lat. 9 deg. south, and long. 123 deg. 55 min. east.
It contains nothing remarkable.

The **NICOBAR-ISLANDS** lie at the entrance of the
Gulph of Bengal. The natives there are tall and well-
proportioned, with long faces, black eyes, black lank
hair, and copper-coloured skins, and they are said to
be an harmless, good sort of people. They go naked,
except a covering about the waist. They have neither
temples nor idols, nor does there seem to be any great
superiority among them. They are excellent swim-
mers, and sometimes will overtake small vessels under
sail; live in little huts, having no towns, and the coun-
try is almost covered with wood. They have no corn,
but a fruit which serves them instead of bread, and
they catch plenty of fish. The largest of these islands,
which gives name to the rest, is about forty miles in
length, and fifteen in breadth, at the utmost.

PORTLAND-ISLAND lies to the southward of the Society-Isles; and was so called by Captain Cook, who discovered it on his first voyage, from its resemblance to that of the same name in the British Channel. Some parts of this island appeared to be cultivated, and pumice-stones in great quantities lying along the shore within the bay, indicated that there was a volcano in the country. High palings upon the ridges of hills were also visible in two places, which were judged to be designed for religious purposes.

BARE-ISLAND was so called by Captain Cook, as it appeared to be barren, and inhabited only by fishermen. It lies in lat. 39 deg. 45 min. south.

EAST-ISLAND lies in lat. 37 deg. 48 min. south. It appeared to Captain Cook, who discovered it on his first voyage, small and barren like the former.

WHITE-ISLAND is contiguous to the last-mentioned.

The **MAYOR AND COURT OF ALDERMEN**, a cluster of small islands lying in lat. 37 deg. 59 min. south, about twelve miles from the main, are high, and were also remarked for barrenness.

MERCURY-ISLANDS, a cluster of different sizes. The Bay is called also Mercury-Bay, and lies in lat. 36 deg. 47 min. south, long. 184 deg. 4 min. west, and has but a small entrance.

The **HEN AND CHICKENS**, are small islands situated in lat. 35 deg. 46 min. south.

POOR KNIGHTS. These form a cluster of islands, lying in lat. 36 deg. 36 min. south, on which were seen a few towns which appeared fortified; and the land round them seemed to be well peopled.

CAVALLES-ISLANDS, so called by Captain Cook, from the name of some fish the crew purchased of the Indians. These people were very insolent, using many frantic gestures, and throwing stones at the crew. Some small shot were fired, and one of them being hit, a precipitate retreat was the consequence.

THREE KINGS. The chief of these islands lies in lat. 34 deg. 18 min. south, and long. 187 deg. 48 min. west. Birds were shot upon it, which were very good eating, and resembled the geese of Europe.

HAMOTE, a little island in lat. 41 deg. south, near Queen-Charlotte's Sound.

ENTRY-ISLE, is an high island situated about nine or ten leagues from Cape Keamaroo, which lies in 41 deg. 44 min. south lat. and 113 deg. 30 min. west longitude.

ISLAND OF LOOKERS-ON, situated contiguous to the former, was so called by Captain Cook, because the natives could not be prevailed on to approach the ship, though they admired it.

MAGNETIC-ISLAND, so called by Captain Cook, because the compass did not travel well when the ship was near it. It is said to be high, rugged, rocky, and barren, yet smoke was seen in several parts about it: it was concluded not to be destitute of inhabitants.

THE SISTERS. These are two islands of very small

extent, plentifully stocked with wood, situate in the lat. of 5 deg. south, and long. 106 deg. 12 min. near south and north from each other, and encompassed by a reef of coral rocks, the whole four or five miles circuit.

CARACATOA is the southernmost of a cluster of islands lying in the entrance of the Straights of Sunda. Its southern extremity is situated in the lat. of 6 deg. 9 min. south, and long. 105 deg. 15 min. east. Its whole circumference does not exceed nine miles. The island consists of elevated land, gradually rising from the sea, and is entirely covered with trees, except a few spots cleared by the natives for the purpose of forming rice fields. The population of the island is inconsiderable. The coral reefs afford turtles in abundance, but other refreshments are very scarce there.

PULO-BALLY is an island about two miles round, and lies in the lat. of 00 deg. 30 min. south. There is good anchorage to the eastward of it in 12 and 13 fathoms: water, muddy ground. Fresh water and wood are here in plenty.

SCHOUTEN-ISLANDS, so called from Schouten, Dutch navigator, who discovered them in 1616, lie in lat. 00 deg. 46 min. south.

SELANG lies in only 50 min. of south lat. It is flat, or very high. It forms two harbours with the main land, an outer and an inner harbour. There is no danger in running into either, but what is plain to be seen. The inner harbour is about two miles broad, and three long, and the general depth ten fathoms water.

PULO-GAO lies in 18 min. south lat. and is an island of middling height. When plainly seen, it appears like the land of Europe, not being woody, as the islands in these parts generally are. The valley is said to have a rich soil, and many fago trees upon it. It is not inhabited, though travellers by water often put into the bay to pass the night, where they also sometimes employ several days in fishing.

PRINCES ISLAND lies in the western mouth of the Straights of Sunda. It abounds with vegetables of various kinds, deer, turtle, &c. Our India ships used to touch here to take in water, but they have omitted this practice some years since; though Captain Cook says the water is exceeding good, if filled towards the head of the brook, which circumstance perhaps was not always sufficiently attended to.

TOMOOUY is an island situated in 00 deg. 15 min. south lat. and, in shape, resembles a horse-shoe. On the island rises a hill, which takes up about three fourths of its compass, and there are plantations of tropical fruits and roots along the hill's side.

WAGLOL is a small flat island. At most of these islands, lives one or more of certain chiefs called Spingages, who repair on board such vessels as visit them, in order to beg presents. The dress of one of them is thus described: one half of the coat and long drawers was clouded red, white, and yellow; the other half

coat and long drawers
ellow; the other half
blue,

ue, white, and green, clouded also; not unlike the
chemical dreses of masquerades. His turban, which
is pinked, was made of coarse white calico. The
Mahometans upon these islands live mostly upon, fish
and sago bread. Sometimes they mix a cocoa-nut
sped down with the sago flower, and putting this into
thin Chinese iron pan, they keep stirring the mixture
in the fire, and eat it warm. They also eat the ordi-
ary white swallo, a root which is found every where
in the sand at low water; they eat it raw, cut up
small, and mixed with salt and lime-juice. They have
the following peculiar method of bleeding in this coun-
try. They put the rough side of a certain leaf, about
as large as a man's hand, on that part where they want
to extract the blood, then with the tongue they lick
the upper side of the leaf, and the under side is pre-
sently all over bloody. A particular kind of green fruit
grows in these parts; which the natives eat. It is as
long as the hollow part of a quill, and almost as small.
They call it ciry. This fruit is very good in a curry
stew, leaving a fine aromatic flavour on the palate.

The two clusters of islands Bo and POPO, lie nearly
in the same parallel of latitude, 1 deg. 17 min. south.
They are about five leagues asunder. Bo consists of six
or seven islands.

These islands, which have a good many inhabitants,
can supply plenty of cocoa-nuts, salt, and dried fish.
To the westward of the cluster, but contiguous to it,
are about nine or ten small low islands. To the east-
ward, on two islands, are two little hills, which, at a
distance, look like tea-cups turned upside down. Here
resides a rajah, and the isles are said to be well inha-
bited.

Here not only women often kill or burn themselves
with their deceased husbands, but men also, in honour of
their deceased masters, as authentic accounts inform us.
Those who determine on this, are not limited to time;
they name, perhaps, a distant day, and in the mean
while, their intention being made known, there is no
honour the natives can think of, but they pay to this de-
votion: he is carested wherever he goes. On the fatal
day, by the side of a great fire, a loose stage of boards
is erected; on this he dances, working himself up to a
fit. He then skips to the end of a plank, which tilting,
he falls headlong into the flames, and is consumed im-
mediately.

The north coast of the ISLAND of WAYGIOW, which
lies about half a degree to the northward of the equator,
is near fifteen leagues in length. The hill on Gibby
Mopine (a particular quarter of Waygiow) which,
from its shape, is called the Cock's-Comb, may be
seen about twenty leagues off. Some white spots ap-
pear on it. Opposite to the entrance of the harbour
are two little islands; one shaped like a sugar-loaf, the
other with a hillock on it. At the bottom of this hillock
is a piece of fresh water, where there is anchorage in
twelve fathoms sand. The two islands are connected
by a reef of coral rocks, dry at low water. There are

said to be 100,000 inhabitants upon the island, who
wage perpetual war with one another. OMAK harbour
lies in 00 deg. 10 min. north lat. Near this island two
fishes were taken, the heads of which were remarkable
for an horn that projected from between their eyes.
The horn was about four inches long, equal in length
to the head. Altogether the head was like that of an
unicorn. The natives called it Een Raw, that is the fish
Raw. The skin was black, and the body about twenty
inches long. Its tail was armed with two strong scythes,
with their points forwards on each side.

The ISLAND of ABDON lies in only 36 min. north
lat. It is about three miles round, and 200 feet high.
KONIBAR is about the same height and size; it is north
of Abdon. The rest of the sixteen islands that form
this cluster, are flat and low, except Aiow Babar, which
rises about 500 feet. There are said to be plantations
of yams, potatoes, sugar-canes, and other tropical pro-
ductions on Konibar.

The inhabitants of these islands have turtle in such
abundance, and other fish (especially cockles about the
bigness of a man's head) that they neglect agriculture.
When they want bread, they carry live turtle, and
their eggs, with dried fish, to Waygiow, which they
truck for sago, either baked or raw; nay, perhaps, go
to the woods and provide themselves, by cutting down
the trees.

SANGIR is an oblong island, extending from 3 deg.
30 min. to 4 deg. 30 min. north lat. It is broadest
towards the north, and tapers small towards the south.
About the middle of the west coast of the island is the
town, harbour, and bay of Taroona, opposite which,
on the east coast, is also a town and harbour, called Ta-
bookang. It abounds in cocoa-nuts, as do many islands
that lie near it. A fathom of small brass wire will
purchase 100 cocoa-nuts, an ordinary knife 300, and
a battel (60 lb.) of cocoa-nut oil may be had for four
knives here.

TULOUR, or TANNA LABU, lies in 4 deg. 45 min.
north lat. It is situated about seventy miles east of
the north part of Sangir. It is of middling height. The
inhabitants live on the sea-coast, and have their plan-
tations up the country.

SALIDABO-ISLAND lies southward of Tulour, be-
ing divided only by a narrow streight, about a mile
wide. It is not above eight or ten miles in circumfer-
ence, contains several villages, and is particularly well
cultivated.

KABRUANG lies to the south-east of Salidabo, and is
parted from it by a streight about four miles wide.
This island is in high cultivation, and also contains se-
veral villages.

TAGULANDA contains about 2000 inhabitants, who
are Pagans. On the island are many goats, some bul-
locks, and cocoa-nuts in abundance. The Dutch keep
here a corporal and two soldiers, also a school-master
for teaching the children the principles of Christianity.
Three progs, a kind of large chopping-knives, will
purchase

purchase a bullock, and a thousand cocoa-nuts may be had for one of them.

BANKA-ISLAND is near Tagulanda, and remarkable for a high hill. It has a harbour on its south-end, is pretty well inhabited, and abounds in cocoa-nuts, limes, nankas or jacks, turtle, other fish, and rats.

TELLUSYANG-ISLAND, that is, Harbour of Syang, is contiguous to Banka-Island. This harbour, which is said to be a good one, is on the south end of the island, which has a hill upon it. There are some wild cattle, but no other inhabitants. These islands are much frequented by cruisers, not only from Sooloo, but from Mindanao.

SOOLOO-ISLAND is situated in 6 deg. north lat. and 119 deg. east long. It is thirty miles long, twelve broad, and contains a great number of inhabitants. It is governed by a king of its own. It is well cultivated, and affords a fine prospect from the sea. Indeed, the island being rather small for its number of inhabitants, they study agriculture more than those on the adjacent ones, where land is not deemed so valuable. As they cannot depend on a crop of rice, not being sure of rain in due season, they cultivate many roots; the Spanish, or sweet potatoe; the clody, or St. Hillano yam; the China yam, both red and white; sending to Mindanao for what rice they consume. They have great variety of fine tropical fruits. Their oranges are full as good as those of China. They have also a variety of the fruit called jack, or naka; a kind of large cuttard-apple, named madang; mangoer; and a fruit they call bolona, which has a white inside, and is like a large plum or mango. They enjoy, in great abundance, a very innocent and delicious fruit, called lancey. The trees in the woods are loaded with this fruit, which is large, and ripens well. The Sooloos having great connexion with China, and many Chinese being settled among them, they have learned the art of engrafting and improving their fruits. Here is no spice tree but the cinnamon. Though this island, from its situation, enjoys perpetual summer, yet up the country it is always cool, especially under the shade of the toak tree, which are very numerous. This tree has a broad leaf, which, when bruised between the fingers, stains the hand red. The industrious Chinese gather these leaves, and the leaves of the fruit-tree called madang, to line the baskets of cane or bamboo, in which they pack up the Sooloo-root, which they export in great quantities from this place.

The Sooloos are not only neat in their clothes, but dress gaily. The men go generally in white waistcoats, buttoned down to the wrists, with white breeches, sometimes straight, sometimes wide. The women are handsome in general, and, by comparison, fair. Those of rank wear waistcoats of fine mullin, close fitted to their bodies; their necks, to the upper parts of the two breasts, being bare. From the waist downwards, they wear a loose robe, girt with an embroidered zone or belt about the middle, with a large clasp of gold, and

a precious stone. This being loose, like a petticoat comes over the drawers, and reaches to the middle of the leg, the drawers, which are of fine mullin, reaching to the ankle.

The sultanhip in Sooloo is hereditary, but the government mixed. About fifteen datoos, who may be called the nobility, make the greater part of the sultan's council. The title is hereditary to the eldest son, and they sit in council with the sultan. The sultan has two votes in this assembly, and each datoo has one. The common people of Sooloo, called tellimans, do not enjoy much real freedom. It is said that the haughty lords, when visiting their estates, will sometimes, with impunity, demand and carry off young women, whom they happen to fancy, to swell the number of their handles (concubines) at Sooloo. Indeed, the lower class groan under various kinds of tyranny. The nobles here are extremely dissolute. Those who have more than one wife, keep each in a separate house; but the circumstance is not very common, and their dissoluteness consists in their numerous concubines and intrigues; for here women have as much liberty in going abroad as in Europe.

The Sooloos have a very good breed of horses, and their women are very expert in riding. Their manner is to ride backwards and forwards the length of a broad street, upon sandy ground, forcing their horses on a quick trot, and checking them when they attempt to gallop. The horses accustomed to this, trot very fast. Riding is an exercise in use all over the island among women of fashion.

Here are wild elephants, the offspring (as is supposed) of those sent in former days from the continent of India as presents to the kings of Sooloo. Those animals avoid meeting with horned cattle, though they are afraid of horses. Sooloo has spotted deer, and abundance of goats and black cattle, but the people seldom milk their cows. They have very few sheep; but the wild hogs are numerous, and do much mischief by breaking down fences. After harvest the inhabitants hunt the elephants and wild hogs, endeavouring to destroy them. Of birds, there are here abundance of diminutive cocoaots, and small green parrots. At Sooloo, and the islands adjacent, the pearl-fishery has been famous for many ages. In the sea between Mindanao and Sooloo is a pearl-fishery not inferior to any in the Indies, either in point of colour or size. This, indeed, is the source of their wealth.

The Sooloos have in their families many slaves whom they purchase from the different cruisers. Sometimes they purchase whole cargoes, which they carry to Batavia, where, if the females are handsome, they are bought up for the Batavia market. The masters sometimes use their slaves cruelly, assuming the power of life and death over them. Many are put to death for trifling offences, and their bodies left above ground. An attempt of elopement here is scarcely ever forgiven.

being loose, like a petticoat, and reaches to the middle of each are of fine muslin, reach-

do is hereditary, but the fifteen datoos, who may be the greater part of the hereditary to the eldest son, and the sultan. The sultan is rich, and each datoo has his Sooloo, called tellimantoo, freedom. It is said that among their estates, will some command and carry off young men to fanly, to swell the number (cubines) at Sooloo. Indeed, other various kind of tyrannies, and especially those which are kept each in a separate place is not very common, and in their numerous concubines women have as much liberty as the people.

A very good breed of horses, and are used in riding. Their manner is to ride forwards the length of a long ground, forcing their horses to follow them when they are accustomed to this, trot very fast in use all over the island.

The offspring (as is supposed) comes from the continent of Java, and is of Sooloo. Those animals are cattle, though they are spotted deer, and abundant, but the people seldom make use of very few sheep; but they do much mischief. After harvest the inhabitants kill hogs, endeavouring to breed there are here abundance of small green parrots. At Sooloo, the pearl-fishery has been found in the sea between Mindanao, and is not inferior to any in the East Indies for colour or size. This, indeed, is the case.

The families many slaves who are used as different cruisers. Sometimes they carry to Borneo, which they carry to Borneo, and are handsome, they are used in the market. The masters formerly, assuming the power of the law, put many of their bodies left above ground, and the punishment here is scarcely ever

The state of Sooloo is important: the inhabitants are very powerful, not only most of the adjacent islands being under them, but great part of Borneo. They have the character of being treacherous, and of endeavouring always to supply by fraud what they cannot effect by force.

PANGATARRAN, lying a little to the southward of Sooloo, is a long flat island, has no fresh water, and is any good anchoring near, except in some few places. It abounds in cocoa-nuts and a fruit called nava.

RAMANCOR lies in lat. 9 deg. 25 min. north, and long. 579 deg. 45 min. east. It is about twenty-three miles in circumference, very sandy. A few villages, and a temple, are all the buildings to be seen here.

PULO-SAPATA is situated in lat. 10 deg. 4 min. north, and long. 109 deg. 10 min. east. It is elevated, and fertile.

PRATA lies in lat. 20 deg. north. Near the southern extremity of the island some of the crew of the Resolution imagined they saw from the mast-head several openings in the reef, which seemed to promise secure anchorage. The extent of the Prata shoal being about six leagues from north to south, may be accounted considerable.

MYO lies in lat. 1 deg. 23 min. north. TYFORY is a flat island not so large as Myo, and lies about W. by S. from it, distant five or six miles. When the Spaniards had the Moluccas, this place was inhabited; but the Dutch will not now permit any one to live here, lest the smuggling of spices should prove the consequence.

KARAKITA, PALLA, SIAO, and GRAVE, are the principal of a cluster of islands lying between the lat. of 4 and 5 deg. north. A school-maister, a corporal, and a few soldiers, are kept by the Dutch at Siao.

The RABBIT is a small rocky island with a few cocoa-nut trees upon it, and many rocks like sugar-loaves round it. It lies to the eastward of Karakita about four miles, and derived its name from the animal whose shape it is supposed to resemble.

SULPHUR-ISLAND, discovered by Captain Gore, is in 24 deg. 50 min. north latitude, and 140 deg. 56 min. east longitude. Its length is about five miles. The south point is an elevated barren hill, rather flat at the summit, and when seen from the west south-west, exhibits evident tokens of a volcanic eruption. The soil, earth, or rock, for it was difficult to distinguish which of these substances its surface was composed, displayed various colours; and it was imagined that a considerable part was sulphur, not only from its appearance, but from the strong sulphureous smell perceived in approaching the points. As the Resolution passed nearer the land than the Discovery, several of the officers of that ship thought they discerned fire proceeding from the top of the hill; these circumstances induced Captain Gore to bestow on this discovery the appellation of Sulphur-Island.

BURNEY'S-ISLAND is situated on the north-east coast of Asia, in 67 deg. 45 min. north latitude. The inland country about this part abounds with hills, some of which are of considerable elevation. Captain Cook observes, that the land (except a few spots on the coast) appeared to be covered with snow.

ST. LAWRENCE'S-ISLAND, according to the most accurate observations, lies in 63 deg. 47 min. north latitude, and 188 deg. 15 min. east. long. and is three leagues in circumference. The northern part of it may be discerned at ten or twelve leagues distance.

BERING'S-ISLAND, so called from the navigator who discovered it; lies in 58 degrees north latitude. KARAKINSKOI, MAIDENOI, ATAKA, and SHAIMEA, are all islands that lie contiguous, and very thinly, if at all inhabited, having scarcely any marks of cultivation.

GORE-ISLAND lies in about 64 deg. north lat. and 191 deg. east long. It is about thirty miles in extent, and appeared to our navigators to be barren and destitute of inhabitants, and received its appellation from Captain Cook, who discovered it in the course of his last voyage.

With regard to the language of all the Oriental islands, nothing certain can be said. Each island has a particular tongue; but the Malayan, Chinese, Portuguese, Dutch, and Indian words, are so frequent among them, that it is difficult for an European, who is not very expert in those matters, to know the radical language. The same may be almost said of their religion; for though its original is certainly Pagan, yet it is intermixed with many Mahometan, Jewish, Christian, and other foreign superstitions.

The sea which separates the southern point of the peninsula of Kamtschatka from Japan, contains a number of islands in a position from north-north-east to south-south-west, which are called the Kurile-Islands. They are upwards of twenty in number, are all mountainous, and in several of them are volcanoes and hot springs. The principal of these islands are inhabited; but some of the little ones are entirely desert and unpeopled. The forests in the more northern ones are composed of larch and pines; those to the southward produce canes, bamboos, vines, &c. In some of them are bears and foxes. The sea otter appears on the coasts of all these islands, as well as whales, sea horses, seals, and other amphibious animals. Some of the inhabitants of these islands have a great likeness to the Japanese in their manners, language, and personal appearance; others very much resemble the Kamtschadales. The northern islands acknowledge the sovereignty of the empire of Russia; but those to the south pay homage to Japan. The Kurilians discover much humanity and probity in their conduct, and are courteous and hospitable; but adversity renders them timid, and prompts them to suicide. They have a particular veneration

eneration for old age. Their language is agreeable to the ear, and they speak and pronounce it slowly. The men are employed in hunting, fishing for sea animals and whales, and catching fowl. The women have charge of the kitchen, and make clothes. In the northern islands they sew, and make different cloths of the thread of nettles. The southern islanders are more refined and polished than the northern, and carry on a sort of commerce with Japan, whither they export whale-oil, furs, and eagles feathers to sledge arrows with. In return, they bring Japanese utensils of metal and varnished wood, skillets, sabres, different stuffs, ornaments of luxury, tobacco, all sorts of trinkets and small wares.

The following account of the remarkable place subjoined, being more ample and curious than any we have seen in other Geographical Works, we presume it will be acceptable to our readers.

A Description of the DEAD SEA, and its Environs, in PALESTINE.

Extracted from Mariti's Travels into Syria, &c.

"THE name, Dead Sea, is of modern date, for the ancients called it the Lake Asphaltites, the Sea of Sodom, the Salt Sea, the Lake of Sirbon; and in our days the Arabs name it Bahheret-Lut; that is to say, the Sea of Lot.

"Josephus, who caused this lake to be measured, found that it was 580 furlongs in length, and 150 in breadth, which may make seventy-two and a half Italian miles one way, and eighteen and three quarters the other. It is 180 miles in circumference. The lofty mountains of the ancient country of the Moabites surround it on the eastern side, and discharge into it the waters of the Arnon and the Zered, which fall down their sides in long cascades. It is bounded on the west and south by high mountains also; some of which, composed of blackish rock, serve as barriers to the vast deserts of Judea; and the rest, clothed with verdant groves, form a part of Idumea. It is likewise on the west that the brook Kedron falls into this lake. The northern side is entirely open, and shews the delightful plains of Avlona, which bring as a tribute to the Dead Sea the rapid waters of the Jordan.

"We are informed, that this vast basin was covered formerly with fruit-trees, and abundant crops, and that from the bosom of the earth, buried under its waters, arose the superb cities of Sodom, Gomorrah, Adam, Zebolim, and Segor; all rendered illustrious by the presence of a king. There is nothing, therefore, in the universe, which is not subject to vicissitudes and changes.

"The air is pure, the fields are extremely verdant, and my eye was delighted with the limpidness of the water, which fell in sheets from the summits of the mountains. The sterility to which part of these plains

was condemned from the creation of the world, renders the contrast produced by the fertile appearance of Avlona much more agreeable. But how comes it that two travellers should differ so much in their ideas? It is, because a capuchin carries every where along with him the five senses of the faith, while I am endowed with those only of nature.

"I endeavoured here to explain a phenomenon which has engaged the attention of many others, as well as of myself. This vast basin, which is continually receiving the waters of different torrents, rivulets and streams, has no visible outlet. Do its waters, therefore, discharge themselves by subterranean passages into the Mediterranean, or Red-Sea, as is pretended; must we adopt the opinion of Arabian philosophers, who conclude, and not without some foundation, that they are dissipated by evaporation?

"The water of this lake is clear and limpid, but bitter and excessively salt. No kind of fish are produced in it; and those even which are sometimes carried thither by the rapidity of the Jordan, instantly die.

"The water of the Dead Sea is favourable to swimmers; but people, who cannot swim, may be drowned there as well as elsewhere.

"No plants of any kind grow in this lake. The bottom of it is black, thick, and fetid; and the earth in the neighbourhood is of the same colour, and as inflammable as coal.

"Branches of trees, which fall into it, become petrified in a little time by the force of the salt which adheres to them, and penetrates to the very pith of the wood. Some of these petrified branches, of which the curious are fond, may be procured at Jerusalem.

"It has been said, that the approach of this lake was mortal to birds; yet it is frequented by abundance of the feathered tribe, and particularly by swallows, which, with their light wings skim this liquid plain, and sport on its surface.

"On certain days in the year, this sea is covered with a black thick fog, which does not extend further than its shores; but when the rays of the sun acquire force, they soon dissipate this body of vapours.

"The Dead Sea produces a kind of bitumen, called the Jewish, which may be found floating on the water like large lumps of earth, and which, being driven by the winds to the eastern and western shores, adheres to them. It is then collected by the Arabs, and divided between them and the basha of Damascus, who purchases their shares of it for some pieces of money, or such stuffs as they use for clothing. This bitumen is a sulphurous substance, mixed with salt, which is gradually condensed by the heat of the sun. It is as brittle as black pitch, to which it has a great resemblance. It is combustible, and exhales, while burning, a strong and penetrating smell. The ancient Arabs used it for daubing over the bottoms of their vessels, and the Egyptians for embalming the bodies of their dead. The natives give this bitumen the name of *tamar*." A NEW,

CHAP. I.

General Account of this Quarter of the World.

THE third grand division of the globe, called AFRICA, is neither so fertile as the others, nor so populous as either Asia or Europe: it nevertheless abounds in riches, and might, by a proper degree of skill and industry, be rendered of much greater importance than it is at present. It is generally represented as bearing some resemblance to the form of a pyramid, the base being the northern part of it, which lies along the shores of the Mediterranean; and the point or top of the pyramid the Cape of Good-Hope. Africa is surrounded on every side with water, except where it joins to Asia by the isthmus of Suez, which separates the Mediterranean from the Red-Sea, and is only about sixty miles over. Being thus a peninsula, it has a prodigious extent of sea-coast, and is most advantageously situated for commerce; but navigation is neither esteemed nor cultivated by the inhabitants.

The utmost length of this country, from north to south, from Cape Bona in the Mediterranean, in 37 deg. north, to the Cape of Good-Hope, in 34 deg. 7 min. south lat. is 4,300 miles; and the broadest part from Cape Verd, in 17 deg. 20 min. to Cape Guardaluf, near the Straights of Babelmandel, in 51 deg. 20 min. lat. long. is 3,500 miles from east to west. It is bounded on the north by the Mediterranean, which separates it from Europe; on the east by the isthmus of

Suez, the Red-Sea, and the Indian-Ocean, which divides it from Asia; on the south, by the Southern Ocean; and on the west, by the great Atlantic Ocean, which separates it from America.

As the equator divides Africa almost in the middle, and the far greatest part of it is within the tropics, the heat is in many places almost insupportable to an European; it being there increased by the rays of the sun from vast deserts of burning sands. The coasts, however, and banks of rivers, such as the Nile, are generally fertile, and there most parts of the country are inhabited.

Africa is watered by several very noble rivers, of which the most considerable are the Niger and the Nile. The Niger falls into the Atlantic, or Western Ocean, at Senegal, after a course of 2800 miles: it increases and decreases as the Nile, fertilizes the country, and has grains of gold in many parts of it. The Nile, after dividing Egypt into two parts, discharges itself into the Mediterranean, after a prodigious course from its source in Abyssinia. The Gambia and Senegal are only branches of the Niger.

The most considerable mountains in Africa are the Atlas, a prodigious chain extending from the Western Ocean to the borders of Egypt. It owes its name to a King of Mauritania, a great astronomer, who used to observe the heavenly bodies from its summit; and from this circumstance the poets represent him as bearing the heavens on his shoulders. The Mountains of the Moon are still higher than Atlas: they extend from Abyssinia

to Monomotapa. Those of Sierra Leona, or the Mountains of the Lions, dividing Nigritia from Guinea, and a ridge of lofty mountains called the Mountains of God, from their being remarkably subject to tempests of thunder and lightning. The Peak of Teneriffe, which the Dutch make their first meridian, is about two miles high, in the form of a sugar-loaf, and is situated on an island of the same name, near the coast. Besides these, there are many others of great height and vast extent, whose bowels contain a profusion of the richest metals, and give rise to the many rivers that water the soil of this neglected country.

The most noted capes, or promontories in Africa, are Cape Verd, so called, because the land is always covered with green trees, and mossy ground: it is the most westerly point of the continent of Africa. The Cape of Good-Hope, so denominated by the Portuguese, when they first went round it in 1498, and discovered the passage in Asia, is the south extremity of Africa, in the country of the Hottentots, at present in the possession of the Dutch, and the general rendezvous of ships of every nation who trade to India, being about half way from Europe.

Babelmandel, which joins the Red Sea with the Indian Ocean, is the only strait in Africa.

As this continent stands as it were in the centre of the globe, and has thereby a much nearer communication with Europe, Asia, and America, than any of the other quarters has with the rest, its situation is consequently rendered extremely favourable for commerce. It is however the misfortune of Africa, that though it has 10,000 miles of sea-coast, with noble, large, deep rivers, penetrating into the very heart of the country, it should have no navigation, nor receive any benefit from them; that it should be inhabited by vast multitudes of people, ignorant of commerce, and of each other. At the mouths of the rivers are most excellent harbours, deep, safe, and calm, and sheltered from the wind, and capable of being made perfectly secure by fortifications; but quite destitute of shipping, trade, and merchants, even where there is plenty of merchandise. Though it comprehends a full quarter of the globe, is stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things delightful as well as convenient within itself, yet it seems to be almost entirely neglected, not only by the natives, who are quite unsolicitous of reaping the benefits which nature has provided for them, but also by the more civilized Europeans who are settled in it, particularly the Portuguese. That it abounds with gold, we have not only the testimony of the English, French, Dutch, and Portuguese, who have settlements on the coast, but that of the most credible historians.

In ancient times, this country contained several kingdoms and states, eminent for arts, for wealth, for power, and for the most extensive commerce. The kingdoms of Egypt and Ethiopia were particularly celebrated; and the rich and powerful state of Carthage extended her commerce to every part of the then

known world; even the British shores were visited by her fleets, till the Romans destroyed her navigation, ravaged her territories, and laid her capital in the dust. From that period both the arts and commerce in Africa declined. Agriculture was neglected, and the manufactures, for which the natives were once so famous, were no longer practised. Upon the decline of the Roman empire, in the fifth century, the northern parts of Africa were over-run by the Vandals, a barbarous and ferocious people from the north, who contributed more to the destruction of arts and sciences. They were driven out by the Saracens in the seventh century, and were afterwards succeeded by the Turks; and being of the Mahometan superstition, whose professed carried desolation with them wherever they came, the most of that once flourishing part of the world was completely ruined.

With respect to religion, the inhabitants of this continent may be divided into three sorts, Pagans, Infidels, and Christians. The first are the most numerous, possessing the greatest part of the country, from the Tropic of Cancer to the Cape of Good-Hope, and they are generally black. The Mahometans, who are of a tawny complexion, possess Egypt, and almost all the northern shores of Africa, or what is called the Barbary Coast. The people of Abyssinia, or the Upper Ethiopia, are denominated Christians, but retain many Pagan and Jewish rites. There are also some Jews on the north of Africa, who manage all the little trade carried on in that part of the country.

The inhabitants are unacquainted with ice, hail, or snow; and in these scorching regions, the natives would as soon expect that marble should melt, and flow in liquid streams, as that water by freezing should lose its fluidity, be arrested by the cold, and, ceasing to flow, become like the solid rock. They are but seldom blessed with rain, and depend on the overflowing of the rivers for the fertilization of the soil in many parts, while other regions are altogether sterile, and uninhabitable burning sands. The barrenness in several places, the brutality and savage disposition of the natives, and the ferocity of the innumerable wild beasts in most of the countries, evince, that the rays of the sun are here so fervid and powerful, as to dry and burn up the juices of the vegetable, and overheat the blood of the animal creation, so that the first are debilitated, and the latter rendered furious and ungovernable.

The most judicious geographers, and the learned in general, are much divided in their opinions respecting the modern divisions of Africa; the reason of which is, that scarcely any traveller has penetrated into the middle of the country; on these accounts, we must acknowledge our ignorance of the bounds, and even the names of several of the inland nations, which may be still reckoned among the unknown and undiscovered parts of the world; but according to the best accounts and surveys, Africa may be divided according to the following table, by inspecting which, the reader will find, at one view, an explanation of many particulars here omitted.

The principal kingdoms of Africa, and their supposed dimensions, being presented to the reader's inspection in the foregoing table, we shall now consider the whole country under three grand divisions: 1. Egypt. 2. The States of Barbary, stretching along the coast of the Mediterranean, from Egypt in the East, to the Atlantic Ocean, in the West: And, 3. That part of Africa, between the Tropic of Cancer and the Cape of Good-Hope. Though the last of these divisions is confessedly greater than the other two, yet the nations it contains being so little known, and so barbarous and uncivilized, we apprehend that they may, without impropriety, be ranged under one general head, especially as, like many barbarous nations, they are in most respects similar to each other.

C H A P. II.

E G Y P T.

Situation, Extent, Divisions, Climate, Soil, Mountains, Inhabitants, Government, Cities, &c.

THIS kingdom is situated between the 20th and 32d deg. of north latitude, and the 28th and 36th deg. of east long. It is about 600 miles in length, and 250 in breadth; bounded by the Mediterranean sea, on the north; by Abyssinia, or the Upper Ethiopia, on the south; and by the desert of Barca, and the unknown parts of Africa, on the west; and includes 140,700 square miles.

The whole country is distinguished by the northern and southern divisions; which are subdivided into Lower Egypt and Upper Egypt. The chief towns in Lower Egypt are, Grand Cairo, Bulac, Alexandria, Rosetta, Damietta. Upper Egypt has for its principal towns, Sayd or Thebes, and Cosnar.

The climate of Egypt is in general very unhealthy: the high rocks and mountains which encompass it on the east; and the sandy deserts of Lybia and Barca on the west, rendering it prodigiously hot, particularly in the months of April and May. They always reckon two summers in this kingdom; the first in March, April; and May, is the most unwholesome, because of the unequal weather, attended with violent and parching winds, which blow at that season; but in the second, viz. in June, July, and August, the weather is more settled, and the air much cooler. During the autumn and winter, Egypt is one of the most pleasant and delightful countries in the world.

The soil of this kingdom is luxuriant even to a proverb, owing to the annual overflowing of the Nile, for it seldom rains except in winter. The fertility of the soil is such, after the waters of this river begin to retire, that the labour of the husbandman is next to nothing. In October and May he throws his wheat and barley into the rich mud or slime which the Nile leaves be-

hind, without adding any manure, except mixing with it a little sand. He turns his cattle out to graze in November; and in about six weeks nothing can be more charming than the prospect which the face of the country presents, in rising corn, vegetables, and verdure every sort. Oranges, lemons, and fruits, perfume the air. The culture of pulse, melons, sugar-canes, and other plants which require moisture, is supplied small, but regular cuts, from cisterns and reservoirs. Dates, plantains, grapes, figs, and palm-trees, fruit which wine is made, are here plentiful. Sugar-canes are also produced in this country; and the meadows yield the richest pasture in the world, the grass being usually as high as the cattle. March and April are the harvest months; and they produce three crops; one of lettuce and cucumbers (the latter being the chief food of the inhabitants) one of corn, and one of melons.

The animals of Egypt seem to partake of the fecundity of the soil; for the cows it is said always bring two calves at a time, and sheep year twice in a year, having two lambs at the first and one at the second; a goat is often followed by four kids, which she has brought in six months. Oxen abound here, and 200,000 of these animals are daily employed by the inhabitants in raising water for the use of the fields and gardens. The Egyptian horses are held in great esteem, and a fine-breed of asses are likewise found here; also wild asses, camels, oxen, antelopes, tigers, and hyenas: but the most remarkable animals are the crocodile, the hippopotamus, or river horse; the chameleon, the ichneumon, or Egyptian rat, and a large species of ape, with a head somewhat resembling that of a dog, from which circumstance the Greeks gave it the appellation of cynocephalus. The crocodile is an amphibious animal, resembling a lizard. They have four short legs, with large feet armed with claws; their backs are covered with impenetrable scales, and they are commonly about twenty feet in length. These animals wait for their prey in the sedge, and other covert on the sides of the Nile, and often surprise travellers, who, deceived by the colour, take them for trunks of old trees. Their method of attacking a man, is, to beat him down, either with their fore paws or their tail. The natives have two methods of destroying them: the first is by a piece of flesh fastened on a hook, and thrown into the river by a rope, the other end of which is fastened to a stake; when the crocodile has seized the bait, they drag him to the shore, and easily dispatch him. The other is by striking them when asleep by the river side, under the belly, with a pole armed with a bearded point of iron, fastened to a stake; but this is a very dangerous method, and therefore less practised than the former. The hippopotamus is larger than an ox, which the hinder parts greatly resemble: the head is like that of a horse, and it has thick large feet, with prodigious claws. This is likewise an amphibious animal, and often leaves the Nile to feed in the meadows, but im-

mediately

ure, except mixing with
cattle out to graze in the
weeks nothing can be made
which the face of the country
vegetables, and verdure
og, and the animal uses it to turn up the earth.
e legs are short and black; the tail resembles that
e fox. The ichneumon is said to be of infinite use
Egypt, from its natural antipathy to the crocodile,
e eggs it destroys. The chameleon is not unlike
ard in shape, and changes colour as the spectator
ges his position.
Egypt abounds in birds both wild and tame, particu-
y, ostriches, eagles, hawks, and a prodigious num-
of water-fowl, among which are pelicans, flaming-
herons, &c. but those peculiar to the Nile are
ibis, the goose with golden feathers, the rice hen,
hen of Dinyat, and the sak-sak. The ibis is of
great service to the inhabitants as the ichneumon,
destroying the flying serpents, which the south wind
ges from the deserts of Lybia. At the proper sea-
of the year, these birds, by a peculiar instinct, are
to wait on the frontiers for these serpents, and de-
er them in their flight before they enter Egypt. The
and legs of this bird resemble those of a stork, and
usual food, besides serpents, are snails, locusts, and
er insects. The ostrich is of a prodigious size, and
rushed will strike with its legs like a horse.
Among the reptiles found in Egypt are the basilisk: or
atrice, and the asp, whose bite stupifies the pas-
ger, and throws him insensibly into a deep sleep,
ch puts a period to his existence.
The only river in Egypt is the Nile above-mentioned,
the annual inundation of which the fertility of the
east part of that kingdom depends. According to
best geographers, the time of this flux corresponds
ly with the rainy seasons between the tropics; for
y commence in the mountains about the beginning
May, and the waters of the Nile begin to swell
the middle of that month; so that there are fif-
days allowed for the course of the water from
iopia to Egypt. As a further proof that this inun-
ion is caused by the violent rains in Ethiopia, let it
bserved, that about a fortnight after they begin to
te, which happens in September, the river begins
sink in Egypt; and ten days after the rains are en-
ly ceased, which is about the beginning of October,
the Nile is reduced to its usual channel.
Though the river begins to swell in May, no public
ice is taken of it till the latter end of June, by
hich time it has generally risen about seventeen feet,
d then the public criers proclaim it through the can-
al and other cities, and continue to publish, in the
me manner, how much it increases every day, till
has risen to about thirty-four feet, when the dam
the Chali, or great canal at Bulak, which passes
rough the middle of Cairo, is cut down, by means
which the water is dispersed over all the lands.
hen the river is at its proper height, the inhabitants

celebrate a kind of jubilee, with all sorts of festivities.
When the water rises about forty-nine feet, it is a sign
of a plentiful year, but if it exceeds that height, it is
productive of infinite mischief; for besides sweeping
away the houses and drowning the cattle, it engenders
a great number of insects, which destroy the harvests.
The day on which the banks of the canal are cut is
observed as one of the greatest festivals in Egypt. The
basha always attends, accompanied by the great offi-
cers of state, and an innumerable concourse of people;
though we are told, the spectacle itself is not very mag-
nificent. This officer is very careful that the river is
arrived at its proper height before the canal is opened;
for if it wants but an inch of it when he orders the
dam to be cut down, and the year should afterwards
prove unfruitful, he is obliged to pay the Turkish em-
peror his tribute; but if this precaution is observed,
and the harvests prove unfavourable, no tribute can be
claimed by that prince, the produce being then scarce
sufficient to maintain the inhabitants.
In order to ascertain the daily increase of the water,
the gradual rise of it is very exactly measured, either by
wells sunk, or pillars erected and divided for that pur-
pose, and termed nilometers or mikyasas. That in
the castle of Old Cairo is a large square reservoir,
round which runs a handsome gallery, sustained by
twelve marble pillars, which form arches, with a
balustrade, for the convenience of those who look into
the water. In the midst of the basin, through which
a canal from the Nile passes, is an octagonal pillar of
white marble, divided into twenty-two equal parts, by
which the rising of the water is determined; and the
whole so accurately finished, that the water in the re-
servoir is always exactly on a level with that in the
river.
As it is impossible for the Nile, without assistance,
to overflow all the plains of Egypt, canals and trenches
have been cut with vast labour and expence, from one
extremity of the kingdom to the other, in order to
convey the water to every part; so that each town and
village has its canal, which is opened at proper times,
that the lands may be overflowed. By this method the
inhabitants are also supplied with water for every other
use, there being no more than two springs in the whole
country. In the Lower Egypt, at the height of the
Nile's flood, nothing is to be seen in the plains but the
tops of forests and fruit-trees, their towns and villages
being built upon eminences either natural or artificial,
so that the inhabitants at that time have no communi-
cation with each other but by boats.
When the country is all verdant, it is very pleasant
to sail up the Nile. A number of villages are scat-
tered along each side of the river. The houses are in-
deed low, and built of unburnt bricks; but inter-
mixed as they are with palm-trees, and pigeon-houses of
a singular form, they present to the eye of a stranger an
uncommon and pleasing prospect. Near several of these
villages are seen large heaps of the ruins of ancient cities.

The

The navigation of the Nile would be still more agreeable, were it not infested by pirates. But when a great number of people are on board a vessel, they keep on their guard; and discharge a few shots from time to time, to shew that they are provided with fire-arms; this keeps the villains in awe, and renders the passage less dangerous. There is much more danger in truitling to a Reis, or master of a vessel, with whom you are unacquainted, who may favour the robbers, and share their plunder. Whole villages are said to follow this trade; and for this reason the boats never stop in their neighbourhood.

The inhabitants on the banks of the Nile are very dexterous in the art of swimming, which they frequently exercise in stealing from the boats, if not with open force, yet with a degree of address and audacity worthy of the most noted pickpockets. The following is a recent instance of their subtily and boldness. The servants of a Pacha, newly arrived, caught one of them in the act, seized him, and brought him before the Pacha, who threatened him with instant death; but the rogue asked leave to exhibit one of his tricks, saying, that he hoped his dexterity might procure his pardon. He obtained leave. Then collecting several effects in the tent, he wrapped them up, coolly, in the mode in which the Egyptians wrap up their clothes when they are to pass a river. After playing some time with this parcel, he put it on his head, threw himself into the Nile, and, before the Turks were so far recovered from their surprize as to level their musquets at him, was safe on the opposite bank.

M. Niebuhr (from whom we have extracted the above particulars concerning this celebrated river) says, through all the Lower Egypt he saw no crocodiles in the two great branches of the Nile up which his company sailed; and adds, as the notion of the Egyptians, that in the Mikkias, near Cairo, there is a talisman, the virtue of which hinders those amphibious animals from descending lower in the river: but, respecting this circumstance our author very judiciously observes, that "the charm is not in the Mikkias, but in the population and cultivation of the country; for ravenous animals, whether of the sea or land, are soon intimidated by the frequent aspect of man. Men, too, in their anxiety to rid themselves of such destructive enemies, gradually thin their nurthers, and at length entirely exterminate them."

The Egyptians trade with the Arabs for coffee, drugs, frankincense, spices, calicoes, and other merchandise, formerly imported into Europe in prodigious quantities; but that branch of trade is now greatly declined. Most of the European powers have consuls in Egypt; ours reside at Cairo. Several English vessels arrive annually at Alexandria, some of which are laden on account of the owner; but the principal part are freighted by the Jewish, Armenian, and Mahometan traders.

It is difficult to ascertain the manufactures carried

on in Egypt; it is however known, that the inhabitants export great quantities of unmanufactured, as well as prepared flax, thread, cotton, calicoes, and leather of different kinds, which are landed at Suez, and thence sent to Europe. Their other productions for exportation are wax, sal ammoniac, saffron, fenna, and cassia. The internal traffick of the kingdom is chiefly carried on by caravans.

Egypt being inhabited by several different people, Turks, Arabs, Moors, Greeks, Jews, Franks, Copts, their stature, complexion, habits, &c. are consequently various. The Arabs are of a deep tan complexion, and are represented by the best authors as retaining the patriarchal mode of tending their herds, and many of them without any fixed place of abode. The Turks, who reside in Egypt, retain all their original pride and insolence; and wear the Turkish dress to distinguish themselves from the Arabs and Copts.

The Copts, who are the descendants of the original Egyptians, are an ill-looking slovenly people, immersed in indolence, and, in their complexions, they are more sun-burnt than swarthy or black. Their ancestors were Christians, and in general they still pretend to be of that religion; but Mahometanism is the prevailing worship among the natives. The Copts are generally excellent accountants, and many of them live by teaching the other natives to read and write.

The Arabs and Copts dress very plain, their dress being an upper garment of white linen, with a long cloth coat, either over or under it. The Copts and Arabs of the meaner kind content themselves with a linen or woollen wrapper, which they wear blanket-like, round their body. The dress of the men is tawdry and unbecoming; but their clothes are of silk, when they can afford it; and such of them as are not exposed to the sun, have delicate complexions and features. The Jews wear blue leather slippers, and other natives of the country red, and the foreign Christians yellow.

The occult sciences, or, as they were formerly termed, the black art, was supposed to have arrived to a higher degree in Egypt than in any other country whatever; and, even at present, jugglers, fortune-tellers, mountebanks, and travelling slight-of-hand men, flourish in that country; and their prognostications, whether fortunate or otherwise, are received with the greatest faith by the deluded Egyptians. The diversions and exercises of the inhabitants are much the same as those of Persia and other parts of Asia. The dancing, however, exhibited here, seem peculiar to that kingdom.

Egypt at present is not near so populous as formerly; its scarcity of inhabitants being principally owing to their being slaves to the Turks. They are, however, still numerous; but what has been said of the population of Cairo, as if it contained two millions, is a fiction. As most of the people live on the banks of the Nile, and the rest of the country is inhabited by

known, that the inhabitants manufacture, as well in calicoes, and leather, landed at Suez, and their other productions harmonious, saffron, and the annual traffick of the kingdom.

Several different peoples, Greeks, Jews, Franks, Arabians, habits, &c. are distinguished by the best authority, and mode of tending their business, any fixed place of abode. The Egyptians, and wear the Turkish habit, the Arabs and Copts, descendants of the original slovenly people, immersed in complexions, they are black. Their ancestors, and they still pretend to be the same.

The Copts are generally many of them live by trade and write. Their dresses very plain, their habit of white linen, with a turban or under it. The Copts are kind content themselves with a wrapper, which they wear roundly. The dress of the women is very simple; but their cloaths are rich; and such of them as have delicate complexions wear blue leather slippers, and red, and the foreign Copts,

as they were formerly supposed to have arrived from any other country where jugglers, fortune-tellers, and prognosticators, which received with the Egyptians. The diversions are much the same as in Asia. The dancing is here, seem peculiar to the

as so populous as formerly being principally owing to the Turks. They are, however, been said of the population had two millions, is a considerable live on the banks of the country is inhabited by Arabians.

of other nations, we cannot precisely ascertain its position in general.

With respect to their religion, we learn, from history, that the ancient Egyptians worshipped the planets, and several sorts of birds and wild beasts, among which were the crocodile, the ichneumon, and the ibis. Some of them adored even leeks and onions; but the general object of their worship was a large black ox, which they termed Apis. The Turks, Moors, and Arabs, settled in Egypt, are all Mahometans; and the two latter are strict observers of their religion: they rise very early, in order to be present at the public devotions, which are performed by break of day, and attend again at noon, at sun-set, and at the setting of the watch, when it begins to be dark. The bulk of the Mahometans are enthusiasts, and profess great veneration for a sect of people among them called *santo's*, or fellows who pretend to a superior degree of holiness, but are despised by the Turks as insolent hypocrites. Many of them will appear in the streets perfectly naked, and, in that manner, will intrude without any ceremony into the best houses, sit down to dinner, and leave the table when they are satisfied, no one daring to oppose them.

The Egyptian-Turks mind religious affairs very little; and it would be hard to say what species of Christianity is adopted by the Christian Copts, which are numerous here, but they profess to be of the Greek church, and enemies to that of Rome. In religious, and indeed many civil matters, they are under the jurisdiction of the patriarch of Alexandria, who, by the dint of money, generally purchases a protection from the Ottoman court. It is affirmed that Christianity was first planted here by St. Mark.

Egypt, in ancient times, was the seat of learning; the Greeks derived all their knowledge from this source. Geometry was invented in Egypt; and it is with great reason supposed, that Pythagoras acquired his knowledge of the true system of the world from the Egyptian priests. The Ptolemies are celebrated for the encouragement they gave to literature: to their munificence we owe the Septuagint translation of the scriptures; and they formed at Alexandria a library superior to any thing the world ever saw. But the first caliphs, who were the immediate successors of Mahomet, made war from conscience and principle upon all kinds of literature, except the koran; and hence it was that the valuable manuscripts contained in this most magnificent library were applied, for some months, in cooking their victuals, and warming their baths; and the same fate, through Mahometan bigotry and ignorance, attended upon the other Egyptian libraries of inestimable value. With regard to the architecture, sculpture, and painting, of the ancient Egyptians, sufficient specimens still remain to convince us, that they excelled every thing then known in the world; nor has the grandeur of their designs been ever equalled in any age or nation. But how is this country fallen! It once possessed the seat of eminence, and held the sceptre of learning: it

is now sunk into the abyss of ignorance, and exhibits a melancholy spectacle of the instability of human greatness; for the Turks have rivetted the chains of barbarous ignorance which the lower race of caliphs, who were the disgrace of human nature, imposed. Arithmetical calculations, adapted to the dispatch of business; the jargon of astrology, a few nostrums in medicine, and some foolish attempts to deceive the vulgar by a pretence to magic; now compose all the learning of Egypt.

Among the curiosities of Egypt are the pyramids, which are the most stupendous, though to appearance the most useless, structures ever raised by the hands of men: they are, to the number of twenty, dispersed about the Arabian desert. One of the three largest of them we shall give a particular description of here. It is situated on the top of a rock, in the desert above mentioned, about a quarter of a mile to the west of the plains of Egypt, above which the rock rises with an easy ascent upwards of 100 feet. Each side of this pyramid, at the base, is 693 feet; its perpendicular height 499 feet; but, if measured along the sloping side of the pyramid, it is equal to the breadth of the base. It covers an area of 480,249 square feet, which is equal to eleven acres of ground. The ascent to the top of this pyramid is by 207 steps placed on the outside, every step being the depth of one entire stone, and many of them thirty feet in length. On the north side, an artificial bank of earth is raised thirty-eight feet, and from this there is a narrow square passage, which leads into the pyramid. This passage is about three feet and a half high, three and a quarter broad, and extends, on a declivity, ninety-two feet and a half. It is so contracted towards the end, that the spectators are obliged to creep upon their bellies for a considerable distance, which at length brings them into a place somewhat larger, and inhabited by a prodigious number of large bats. On the left hand, adjoining to the entrance, is a stone eight or nine feet high, which, being climbed, leads to the entrance of the first gallery, an hundred and ten feet in length, five feet in height, and as many in breadth, the whole consisting of white polished marble. This gallery leads by a gentle ascent to a second, which is an hundred and twenty-four feet in length, twenty-six feet in height, and six broad. This is also of white polished marble, cut into vast squares, the junctures are so close, and exact as to be scarce discernible by the most curious eye; and on each side there are benches of the same materials. The passage from this gallery is through a small square hole into some closets, or little chambers, lined with Thebaic marble, which lead to a very noble hall or chamber, situated exactly in the centre of the pyramid. The floor, sides, and roof, of this room, are formed of exquisite tables of Thebaic marble. It is about thirty-four feet in length, seventeen in breadth, and nineteen and a half in height. From the top to the bottom of it there are but six ranges of marble, and the blocks which cover it are of a stupendous length, nine of them form-

ing the roof. In the middle of the hall is a marble chest seven feet long, supposed to be the tomb of Cheops, or Chemnis, king of Egypt, who is said to have founded the pyramid; but there is no appearance of a corpse having ever been laid in it.

At some distance from the above pyramid, and in the same deserts, are situated the mummy-pits, the shallowest of which are thirty-two feet deep. At the bottom are square openings or passages, ten or fifteen feet long, which lead into square arched rooms, in which the embalmed bodies lie, some of them in chests or coffins of wood, others in stone coffins, and others are only wrapped in pieces of linen cloth, gummed or glued together. With these mummies are usually found the figures of birds and beasts, and little images of several sorts, some of copper, others of stone, and others of different sorts of earth.

Near the largest pyramid stands what is usually called the sphinx, which, if entire, should resemble a woman in the upper part, and a lion in the lower. Nothing more of this figure, however, is discernible, than from the shoulders upwards, and yet it is near thirty feet in height. Many are of opinion, that it was hewn out of the rock on which it stands, and that there was never any more of it than what is now visible.

We must not omit another curiosity mentioned by all ancient and modern authors, which is a labyrinth near the banks of the Nile, said to have been contrived by King Psammiticus. The greater part of it is under ground, and contains, within the compass of one wall, twelve palaces and 1000 houses; the walls, pillars, and roofs, were of marble, and it is asserted that neither wood nor cement was used in the whole fabric. This labyrinth had only one entrance, and so many intricate turnings and windings, that it was impossible for a stranger to find his way without a guide; which occasions its name.

On a mountain near Olyut, are upwards of 1000 beautiful grottoes, one of which is large enough to contain six hundred horse. It is cut out of the rock with the chissel, and supported by vast square pillars of the same rock. Various apartments have been made, and are sunk in most of these caverns, and at the extremities of them are catacombs, hollowed, which contain a great number of mummies; formerly there were tombs adorned with sculptures in basso relievo, but these have been defaced by the Arabs. The obelisk, or needle, of Cleopatra, situated in Alexandria, consists of a single block of granite, sixty-three feet high, covered with hieroglyphics. This with another exactly similar, but now thrown down, are supposed to have stood at the entrance of the palace of that celebrated princess. The lake Mœris, which was dug by order of Herodotus Mœris, king of Egypt, in order to correct the irregularities of the Nile, was at once a curious, useful, and stupendous undertaking. Herodotus says, it was 450 miles in circumference, and, in most places, 300 feet in depth. But at present, according to the ob-

servation of Dr. Pucoccke, it is no more than fifty miles long and ten broad. In short, a volume would not be sufficient to describe the astonishing remains of ancient temples, palaces, statues, paintings, &c. so profusely scattered over great part of Egypt. Some of the ancient structures, particularly the palace of Memnon, still exhibit such specimens of grandeur as are not to be equalled in the whole world.

The custom of hatching chickens in ovens is common in Egypt, and now practised in some parts of Europe. The papyrus is one of the natural curiosities of this country; but we know not the manner of preparing it: the pith of it is a nourishing food.

No country in the world contains more inscriptions engraved on stones of the most durable nature, than Egypt; but the pains taken to inform us has been rendered fruitless by the imperfection of the mode of writing this people employed. Instead of characters expressive of the different sounds in their language, or signs marking each a syllable, with a determinate idea affixed to it, such as the Chinese use; the ancient Egyptians made use of emblems, to mark ideas somewhat referable to them, although by a very forced and distant analogy. This is what we, after the Greeks, call hieroglyphic writing.

M. Niebuhr makes the following judicious remarks on the subject: "I would willingly hope, says he, that the key to those mysterious writings of the ancient Egyptians may yet be recovered. Various learned men have displayed astonishing sagacity and penetration in decyphering inscriptions in unknown languages, when there has been a considerable quantity of characters for them to exercise their conjectures upon. Travellers should therefore collect as many as possible of the hieroglyphic characters, and publish them carefully, that we may thus be furnished with more points of comparison for these symbols through a greater variety of combinations."

"The study of the ancient language of Egypt would be equally necessary for this purpose. I suspect that the true nature of hieroglyphics has hitherto been mistaken, while all the symbolical figures and characters have been supposed to be of the same sort. After copying a considerable number of hieroglyphics from obelisks, sarcophagi, urns, and mummies, I thought I could also distinguish, in these smaller hieroglyphics, some marks of alphabetic characters, or at least of a mixed species of writing, bearing some resemblance to the alphabetical. Wherefore, by the study of the language of the Pharaohs, we may come, with more ease, to decypher these small characters."

The hieroglyphic inscriptions are found chiefly in Upper Egypt, where all the monuments, and even the walls, of those superb temples which are still standing, are covered over with inscriptions of this sort. They are no less common upon the tombs of the mummies at Sakara. The embalmed bodies have covers full of hieroglyphics; and the sepulchral urns are marked with them.

no more than fifty miles. Such as have been painted upon wood and which are in as good a state of preservation as those which are engraven upon stone. It is very probable, that in the caverns of Sakara, if these were examined, there are other more precious antiquities.

Since Egypt has been subject to the Turkish emperors, they have always governed it by a viceroy, under the title of the pacha or bashaw of Grand Cairo,

who is one of the greatest officers of the Ottoman empire.

But the kingdom is subdivided into twenty-four provinces, each of which is governed by a sangiac, or bey; so that the government of Egypt is both monarchical and republican, the governors of which are hereditary, and seem to be vested with sovereign power in their respective districts; the grand seignior having thought proper to indulge them in this respect, rather than hazard the revolt of so rich a province; and by this means the Egyptians have an inheritance in their own lands, a privilege enjoyed by few of the Turkish subjects besides themselves. It is the business of the viceroy to keep these petty princes, who are termed pachas, at variance with each other, which he never fails to do, and by that means prevents their uniting against the Porte, which has formerly been the case; and even the bashaws themselves had been known to revolt against their emperors.

The republican, or rather the aristocratical part of the government of Egypt consists of a divan, composed of the twenty-four sangiacs, beys, or lords. The head of them is called the sheikbelle, who is chosen by the divan, and confirmed by the bashaw. Every member of the sangiacs is arbitrary in his own territory, and exerts sovereign power; the major part of them reside at Cairo. If the grand seignior's pacha acts in opposition to the sense of the divan, or attempts to violate their privileges, they will not suffer him to continue in his post; the Porte is obliged to send another. They have an authentic grant of privileges; granted in the year 1517, in which year Egypt was conquered from the Mamelukes by the sultan.

The Turks always keep a numerous army of regular troops, and also a militia in Egypt, which serve merely as auxiliaries for the Ottoman troops; for the viceroy never ventures to employ them against the Arab or Egyptian beys already mentioned, many of whom have separate armies of their own. The regular forces are divided into about six or eight thousand, and the militia into between three and four thousand.

The grand seignior never imposes any severe taxes upon the Egyptians, lest such a measure should induce them to revolt; so that, except what the viceroy and his creatures extort from the people illegally, the whole revenue raised by the government does not amount to a million of our money, of which, it is said, two-thirds are spent within the kingdom; the remainder is remitted to the grand seignior's treasury.

The cities and principal towns in Egypt are so numerous, that it is impossible to describe even the most considerable of them, all therefore we can do is, to select such as are most worthy the attention of our readers.

Cairo, now Masra, the present capital of Egypt, is situated on the Nile, and consists of two cities, a mile distant from each other, viz. Old Cairo, and Cairo properly so called. The first of these is now reduced to a very small compass, not being more than two miles round; but the second, which is situated about a mile from the river, extends eastward near two miles to the mountains, and is about seven miles in circumference. It is said to have been formerly much larger, being then the centre of trade from the East-Indies. There are three or four very grand gates, erected by the Mamelukes, the workmanship of which is very good, and the architecture, though simple, has a magnificent appearance. The castle, said to have been built by Saladin, is situated on a rocky hill, which seems to have been separated by art from the mountain Jebel Duife. It is walled round, but being entirely commanded by an eminence on the east, it could make but a poor defence since the invention of cannon. The castle is at present parted into three divisions, which are occupied by the pacha, the janissaries, and the Assassins. The palace of the pacha is falling into ruins, and is unworthy of being the dwelling of the governor of a great province. But the Turkish pachas are in general ill lodged: they all know that they are not to be long in power, and no one cares for making reparations to accommodate his successor. The quarter of the janissaries is surrounded with strong walls, which are flanked with towers, and it has more the appearance of a fortress.

At the west end of the castle are the remains of very magnificent apartments, some of them covered with domes, and adorned with Mosaic pictures, formerly, perhaps belonging to the ancient sultans, but at present only used for weaving, embroidering, and otherwise preparing the hangings, every year sent to Mecca. The grand saloon, commonly called Joseph's Hall, is now entirely open, except on the south side; and, from an eminence near it, which, by the large and beautiful pillars of red granite with which it is adorned, seems to have been a terrace to the above saloon, there is a most delightful prospect of Cairo, the pyramids, and all the adjacent country.

The streets, like those of all the Turkish cities, are very narrow, the most spacious of them not exceeding one of our lanes in breadth; and they are pestered with jugglers and fortune-tellers. The houses, which are generally built round a court, have very little beauty on the outside, use only being there considered. Below they are of stone, and above of a sort of cage-work, sometimes filled up with unburnt bricks, having very few windows. The insides are much more regular: those belonging to the principal men have a saloon for common use, and another for state; and as they have four wives, each of them has a saloon, with the necessary

language of Egypt would be of little use for any purpose. I suspect that the hieroglyphics have hitherto been misinterpreted, and that the figures and characters are of the same sort. After consulting the hieroglyphics from observations on the mummies, I thought I should find some resemblance to the study of the language, with more ease.

As are found chiefly in the monuments, and even the inscriptions which are still standing, are of this sort. They are the same as the mummies, and have covers full of hieroglyphics, which are marked with the same characters.

3

cessary apartments. These have no communication with the other parts of the house, except the common entrance for the servants, and the private entrance of which the master keeps the key.

There are several magnificent mosques in and about Cairo; but the most celebrated, both with regard to the solidity of its building, and a certain grandeur and magnificence that strikes every spectator in a surprising manner, is the mosque of Sultan Hassan, built at the foot of the castle hill. It is very lofty, of an oblong square figure, crowned with a cornish all round, that projects a great way, and is adorned with a particular sort of grotesque carvings, after the Turkish manner. The entrance is very beautifully inlaid with several sorts of marble, and finely carved at top: formerly the ascent was by several steps, which are destroyed, and the door walled up, because, in times of public insurrections, the rebels made use of this mosque as an asylum, and place of defence. Cairo is commonly visited by the plague once in three or four years, when it rages with incredible violence, and carries off great numbers of the people, but always gradually declines in proportion to the swelling of the Nile. The conveniency of water-carriage renders this city a place of great traffick; so that all the country, particularly in the neighbourhood of the Nile, is supplied with merchandize of all kinds from Cairo.

One of the favourite diversions of the citizens is their dancing camels, which, when young, they place upon a large heated floor, the intense heat whereof makes the poor creature caper; and, being plied all the time with the sound of drums, the noise of that instrument sets them a dancing all their lives after.

In the neighbourhood of Cairo are several remarkable places: among others, the three villages of Bulak, Fostat, Geesh, which are all so near the city, that they may be reckoned suburbs to it.

Bulak, which was undoubtedly the Latopolis of the ancient Greeks, is at present a very considerable town, and the port of Cairo. All goods from Damietta and Rosetta, and all exports from Egypt by the Mediterranean, pass this way. For this reason, a large custom-house is established here; and a vast bazar, or covered market-place, called *kissarie*. Here are also magazines of rice, salt, nitre, and of various productions of Upper Egypt. Here is also a house belonging to the sultan, in which is kept the corn that he sends annually to Mecca and Medina.

Fostat, or *Masr-el-atik*, although greatly decayed, may still be considered as a town of the middle size. It has a custom-house, where the duties on goods from Upper Egypt are paid. In a large square, enclosed within a wall, government store up, in the open air, a considerable quantity of grain every year. Some authors speak of this as a granary built by the patriarch Joseph; but the wall is plainly of a later date than even the conquest of Egypt by the Arabians.

The old city of *Masr* is inhabited, at present, by

none but Christians. In it are to be seen several churches of the Greeks and Copts, with a convent of Monks of the latter nation. A grotto, under one of the Coptic churches, is regarded with high veneration, because it is supposed to have been the residence of the Holy Family, when they fled into Egypt. The Greeks have a church famous for a miracle of a singular nature:—fools recover their wits, upon being bound to a certain pillar of it.

Between this city and Cairo is an aqueduct, which was constructed in the beginning of the sixth century by Sultan Gari, and conveys water into the neighbourhood of the castle. Near the canal is a convent of Dervises, celebrated for the elegance of the building and the opulence of the foundation; and near the convent are large squares, in which the principal inhabitants of Cairo amuse themselves with military exercises.

The small village of Geesh stands on the fourth bank of the Nile, opposite to *Masr-el-atik*. Its origin is unknown. The heights around it, which have no doubt been raised by the accumulation of the dirt from the city, seem to bespeak its antiquity. M. Niebuhr found nothing remarkable about it, except some country houses belonging to rich inhabitants of Cairo and some manufactories.

Matara, a town, or rather village, about two leagues from the capital, is seated nearly on the ruins of the ancient Heliopolis. It is, however, more famous among the Christians for a sycamore whose trunk is said to have afforded shelter to the Holy Family, when they fled into Egypt. This sycamore should seem to have the power of renewing itself: for, of the crowds of fraudulent persons who visit it, each usually cuts off a piece, which he carries away a piece. This village was formerly famous for the cultivation of those trees which afford Egyptian balsam: but none of them is now to be seen here; the last died in the beginning of the seventeenth century. The Turks are not a people disposed to store so valuable a plant.

Four leagues eastward from Cairo is *Birket-el-Hadid* or the Pilgrim's Pool, a pretty considerable lake, which receives its water from the Nile. Upon its banks are several villages, and a great many ruinous country houses. There is nothing to render this place remarkable, except at the time of the setting out of the caravan for Mecca, when the pilgrims encamp near it for a few days; as they do also upon their return. On the 20th of May 1762, two days before the departure of the caravan, M. Niebuhr tells us, he had the curiosity to visit this camp, but found little about it worth viewing; that he saw indeed a very few elegant tents; but every thing else was shocking in its neatness, disorderly, and paltry.

Alexandria, (or Scandria, as the Turks and Arabians call it) the ancient capital of Egypt, was founded by Alexander the Great, and is situated forty miles west from the Nile, where it forms a spacious haven, in the

It was formerly a very magnificent city,
containing superb buildings, and noble walls, some of
which are said to be still standing. It was once, in
the degree, the emporium of the world, and, by
means of the Red Sea, furnished Europe, and many
parts of Asia, with the rich merchandizes and pro-
ductions of the East. Some stately ruins are still
visible, together with many pieces of porphyry, and
other fine marbles; but the greater part has been either
carried away, or employed in building the present
city, which is nothing more than an ordinary sea-port,
known by the name of Scanderoon. Mr. Niebuhr
observes, that the Mahometans in general, and espe-
cially the inhabitants of Alexandria, break down the
best monuments of antiquity, to employ the frag-
ments in the most wretched structures imaginable.
Whenever they are at a loss for materials for building,
they scruple not to dig up the foundation stones of the
ancient walls and palaces. If one happens to find a
beautiful column in his garden, he will rather make
use of it, than preserve it.

However, he says, there still exists one noble remain
of the city, which could neither be broken nor carried
away; this is the Obelisk of Cleopatra, not before
mentioned, and is a single piece of red granite. Although
part of its base be sunk into the earth, it still ap-
pears above-ground to the height of sixty-two feet;
the circumference of the base is seven feet and a half.
It is inscribed with some ancient characters, en-
compassed an inch deep; but the modern Egyptians
cannot read them.

Another monument, the famous pillar of Pompey,
which is a fine piece of antiquity, owes also its pre-
servation to its bulk. It was erected in ancient
Alexandria, but stands at present at the distance of a
league from the New-Town; and is said
to have been erected by Julius Cæsar, in memory of
his victory over that great man, who, escaping from
the battle of Pharsalia to the Egyptian coast, was there
treacherously murdered. The pillar consists of three
pieces of red granite; the whole, including the pes-
tal and foundation, being eighty-nine feet high,
and adorned with a capital of the Corinthian order.

New Alexandria owes its present state to the Arabs,
who enclosed it with a very thick wall, near fifty
feet high. This wall, which is becoming ruinous,
and a small fort upon the peninsula, with a garrison
of fifty soldiers, are all the means that the city pos-
sesses for its defence; but its governor depends on
the Pacha of Kahira, and, of consequence, not on
the aristocracy of the beys, but on the grand seignior.
The finest building in the city is a mosque, which,
at the time of the Greek empire, was a church dedi-
cated to St. Athanasius. It is very large, and orna-
mented with noble columns. A great number of
Greek manuscripts are still said to be preserved in it;
but, Mr. Niebuhr adds, that as no Christian dare ex-

amine any thing within a mosque, he saw only its
outside. Alexandria has fallen by degrees from its
ancient grandeur, population, and wealth. The filling
up of the branch of the Nile, upon which this city
stands, and which is now no longer navigable, is
what has chiefly contributed to its decline: it is
however cleansed from time to time, as it supplies the
city with soft water, which could no-where else be
obtained.

According to the tradition of the Arabs, when Alex-
andria was taken by the Saracens, it contained four
thousand palaces, as many baths, and four hundred
squares: even now the mosques, bagnios, &c. erected
within these ruins, preserve an inexpressible air of
majesty. This city still retains some trifling re-
mains of its former trade; but the inhabitants are,
in general, poor, ignorant, and indolent. Opposite
Alexandria is the small island of Pharos, whereon the
light-house, known by the same appellation, and
esteemed one of the Wonders of the World, formerly
stood. The mole which was built to form a com-
munication with the island of Pharos is 1000 yards in
length, and though near 2000 years old, such were
its excellent materials, as to resist in a great measure
the violence of winds and waves ever since. All the
parts of the city were magnificent in proportion, as
appears from their ruins, particularly the cisterns and
aqueducts.

Suez, which gives name to the isthmus that joins
Africa with Asia, is situated on the northern coast of
the Red-Sea. It was formerly a place of great trade,
but has been upon the decline ever since the Portu-
guese discovered a passage to the East-Indies by the
Cape of Good-Hope. Near this city the children of
Israel are supposed to have marched in their way
towards the Red-Sea. It is now a small city, and
gives name to the isthmus that joins Africa with
Asia.

Rosetta, called by the Arabs, Rashid, is a healthy,
pleasant, and populous city, is situated twenty-five
miles to the north-west of Alexandria, and at the
mouth of one of the branches of the Nile. It is two
miles long, and half a mile broad. The inhabitants
employ themselves in conveying the European mer-
chandizes, which are brought hither from Alexandria
to Cairo in boats. A vast number of vice-consuls
and factors reside here, in order to expedite all letters
and bills brought from Alexandria: those of any con-
sequence, are conveyed from hence by land, across the
deserts, to Cairo. Rosetta is recommended not only
for its beautiful situation, but delightful prospects,
which command the fine country, or island of Delta.
In the environs are many country-houses belonging
to christian merchants, with fine gardens, producing
the choicest fruits of the East. The Mahometan in-
habitants are also extremely civil and polite here.

Damiatta, supposed to be the ancient Pelusium,
is situated at the mouth of the eastern branch of

the Nile, about an hundred miles from Rosetta. It is an ill-built but large and populous city, containing about twenty-five thousand inhabitants, exclusive of strangers.

Bulaë is situated about two miles west of Cairo, to which city it is the port town, and a place of vast trade, containing about four thousand families. It is at this place that the banks of the Nile are annually cut, in order to fill the canals, as already mentioned.

Sayd, situated on the west banks of the Nile, 200 miles south of Cairo, and supposed to be the ancient Egyptian Thebes, is the capital of Upper Egypt, and was formerly one of the finest cities in the universe; but it is now very inconsiderable, and only remarkable for the amazing antiquities it contains, consisting of vast columns of marble and porphyry, which lie half buried in the ground, and statues and obelisks of a prodigious size, adorned with hieroglyphics.

Colliar is situated on the west coast of the Red Sea.

The general practice of strangers, who visit the three last-mentioned places, is, to hire a janissary, whose authority commonly protects them from the insults of the other natives.

A COMPENDIOUS HISTORY OF EGYPT.

EGYPT has long been a celebrated kingdom; it was peopled by Mizraim, the son of Ham, soon after the confusion at Babel, and has almost from its first settlement been celebrated by the historians of all nations. An uninterrupted series of kings filled the Egyptian throne, till the invasion of Cambyses II. king of Persia, in the year before Christ 520, when a period was put to that famous monarchy. Most of the superb structures, whose ruins are the admiration of modern times, were erected during the reigns of these princes descended from the line of the Pharaohs. After the conquest of Egypt by Cambyses, it continued a province of Persia, till the destruction of that empire by Alexander the Great, who, after wresting the Persian diadem from Darius, built the celebrated city of Alexandria, then the emporium of the rich merchandize of the Indies. On the death of Alexander, Egypt fell to the lot of Ptolemy, one of the generals of that great prince, when it once more became an independent kingdom. This event happened about 300 years before the Christian era. The line of the Ptolemies swayed the Egyptian sceptre between two and three hundred years, and were famous for their magnificence, and the encouragement they gave to learning. The celebrated library of Alexandria, said to contain 700,000 volumes, owed its origin to Ptolemy Philadelphus, the second prince of that dynasty. By his order also the Old Testament was translated from the Hebrew into Greek, and is well known to the learned under the name of the Septuagint. This dynasty terminated with the death of the celebrated Cleopatra; wife and sister to Ptolemy Dionysius, when

Egypt was reduced to a Roman province. In this it continued till the destruction of that empire by the Goths and Vandals. After this memorable period, namely, about the year 640, Omar subjected Egypt to the Mahometan power, and the caliphs of Babylon were sovereigns of the country till 870, when the Egyptians set up a governor of their own, named Ahmed Ebn Tolun, and hence it is called the dynasty or line of Tolun. This line continued till about the year 1170, and was succeeded by the Turkish line of caliphs, or kings of Egypt, the first of which was Syrachock, who being sent by the sultan with an army into Egypt, conquered the country, but assumed the regal authority himself.

Between the year 1150 and 1190, in the time of the Crusades, Egypt was governed by Noraddin, the Saracen sultan of Damascus, whose son, the famous Saladin, was so dreadful to those christian adventurers, and retook from them Jerusalem. He instituted the military corps of Mamelukes, like the janissaries of Constantinople, who, about the year 1247, advanced one of their own officers to the throne, and ever after chose their prince out of their own body. Egypt for some time made a figure under those illustrious usurpers, and made a noble stand against the growing power of the Turks, till Selim, the Turkish emperor, about the year 1517, gave the mamelukes several bloody defeats, and reduced Egypt to its present state of subjection to the Ottomans. But while this conqueror was settling the government of Egypt, great numbers of the ancient inhabitants withdrew into the deserts and plains, under one Zinganeus, from whence they attacked the cities and villages of the Nile, and plundered whatever fell in their way. Selim and his officers, perceiving that it would be a matter of great difficulty to extirpate those marauders, left them at liberty to quit the country, which they did in great numbers, and their posterity is known all over Europe and Asia by the name of Gipsies.

The late Dr. Smollett, speaking of Egypt, says, "It was from hence that the vagrant race called Gipsies came, and dispersed themselves into every kingdom of Europe and Asia. They were originally called Zinganeus, from their captain Zinganeus, who, when sultan Selim made a conquest of Egypt about the year 1517, refused to submit to the Turkish yoke, and retired into the deserts, where they lived by rapine and plunder, and frequently came down into the plains of Egypt, committing great outrages in the towns upon the Nile, under the dominion of the Turks. But being at length subdued, and banished Egypt, they agreed to disperse themselves in small parties into every country of the known world, and as they were natives of Egypt, a country where the occult sciences, or black art, as it was called, was supposed to have arrived to great perfection, and which in that credulous age was in great vogue with persons of all religions and persuasions, they found no difficulty to maintain themselves by pre-

ding to tell fortunes and future events." Many of
em, however, have of late been incorporated with
he adopted the manners and customs of the people
h whom they live.

The most important as well as the most recent event
pecting the history of this country, is the following:
few years ago, an attempt was made to deprive the
oman Porte of its authority over Egypt, by Ali Bey,
ose father was a priest of the Greek church. Ali
braced the Mahometan religion; and as he was pos-
sed of great ability and address, he soon became very
popular. However, a false accusation having been
de against him to the grand seignior, his head was
ered to be sent to Constantinople. Ali, being ap-
sed of the design, seized and put to death the mes-
ger who brought the mandate, and soon afterwards
nd means to put himself at the head of an army;
ing likewise advantage of the distressful and danger-
ous situation to which the Turkish empire was reduced,
the war it was engaged in with the Russians, he
lly ascended the throne of the ancient sultans of
gypt. But not content with that kingdom, he also
claim to Syria, Palestine, and that part of Arabia
hich had formerly been under the dominion of the
ient sultans. Accordingly he marched at the head
his troops to support these pretensions, and actually
ded some of the neighbouring provinces of Arabia
d Syria.

While Ali was employed in these great enterprises,
was not less attentive to the establishing a regular
m of government, and introducing order into a
untry that had been long the seat of anarchy and con-
sion. In like manner he extended his views to com-
erce; for which purpose he gave great encouragement
the christian traders, and took off some grievous and
ameful restraints and indignities to which they were
bjected by the arbitrary power of the governors.
With the same views, he wrote a letter to the republic
Venice, with the greatest assurances of his friend-
ip, and that their merchants should meet with all pos-
sible protection and safety. His great design was said
be, to make himself master of the Red Sea, to open
port of Suez to all nations, but particularly to the
uropeans, and to make Europe once more the great
ntre of commerce.

The conduct and views of Ali displayed an extent of
ought and ability that indicated nothing of the bar-
arian, and bespoke a greatness of mind capable of
unding an empire; but he was not finally successful.
However, for some time he proved extremely fortu-
ate: having assumed the titles and state of the ancient
ltans of Egypt, and being ably supported by Sheik
daher, and some other Arabian princes, who warmly
pported his cause. In almost all his enterprises against
e neighbouring Asiatic governors and bathas he like-
wise succeeded, and repeatedly defeated them; but he
as at length deprived of the sovereignty by the base
and ungrateful conduct of his brother-in-law, Mahom-

med Bey Aboudaab, who on the 7th of March 1773,
totally defeated his troops, wounded, and took him
prisoner: he afterwards died of his wounds, and was
buried at Grand Cairo.

Aboudaab for some time governed Egypt as Sheik
Ballet, and marched into Palestine to subdue Sheik
Daher; but after behaving with great cruelty to the
inhabitants of the places he took, he was found dead
in his bed one morning at Acire, supposed to be stran-
gled. Sheik Daher accepted the Porto's full amnesty,
and embraced the captain pacha's invitation to dine on
board his ship, when the captain produced his orders,
and the brave Daher, Ali Bey's ally, had his head struck
off in the 85th year of his age: thus forfeiting his life
in consequence of his own credulity, and the false assu-
rances of his treacherous enemies.

CHAP. III.

THE STATES OF BARBARY:

*Containing the Kingdoms of MOROCCO, FEZ, ALGIERS,
TUNIS, TRIPOLI, and BARCA.*

*Boundaries, Climate, Soil, Produce, Inhabitants, Animals,
Cities, Towns, Mountains, Rivers, &c.*

M O R O C C O .

THIS empire, which now comprehends the king-
doms of Morocco and Fez, is bounded by the
Mediterranean sea, on the north; by Tafflet, on the
south; by the river Mulvia, which separates it from
Algiers, on the east; and by the Atlantic ocean, on
the west; extending from 28 to 36 deg. north latitude,
and from 4 to 9 deg. west longitude from London. It
is about 500 miles in length, and 480 miles in breadth,
where broadest.

FEZ lies between the kingdom of Algiers, to the
east, and Morocco to the south: it is surrounded in
other parts by the sea. This country, now united to
Morocco, is about 125 miles in length, and nearly the
same in breadth.

ALGIERS, which was formerly a kingdom, is 480
miles in length from east to west, and from 30 to 100
miles in breadth. It is situated between 30 and 37 deg.
north lat. and between 1 deg. west, and 9 deg. east
long. being bounded on the east by the kingdom of
Tunis, on the north by the Mediterranean, on the
south by Mount Atlas, and on the west by the king-
doms of Morocco and Tafflet.

TUNIS, anciently the republic of Carthage, is in
length from north to south 220 miles, in breadth from
east to west 170, and bounded by the Mediterranean
on the north and east; by the kingdom of Algiers, on
the west; and by Tripoli, with part of Biledulgerid,
on

on the south. It extends from 33 deg. 30. min. to 37 deg. 12 min. north-lat. and from 8 deg to 11 deg. east long.

TRIPOLI, including Barca, is bounded by the Mediterranean sea, on the north; by the country of the Berberies, on the south; by the kingdom of Tunis, Biledulgerid, and a territory of the Gadamih, on the west; and by Egypt, on the east; extending along the coast about 1000 miles, exclusive of the creeks and projections of the shore.

We may with propriety consider the Barbary states as forming a great political confederacy, however independent each may be as to the exercise of its internal policy; and with respect to the manners and customs of the inhabitants in general, the difference is not greater than happens in the several provinces of the same kingdom.

The climate of Morocco, Fez, Algiers, and indeed all the other states, is extremely hot towards the south, but in general is tolerably healthy, being cooled by the sea-breezes, and defended by high mountains from the sultry south winds, which give them a temperature not to be expected from their situations so near the tropic. But in the rainy season, which begins in October, continues too long, it occasions pestilential fevers; and the north-west winds, which prevail in March, sometimes greatly affect the lungs and nerves, and injure the products of the earth. In other respects the sky is serene, and the air clear and wholesome. Fine springs are found in most moors, and also winding rivers, which for the most part have their source in Mount Atlas, and disembogue themselves in the Mediterranean sea, or Atlantic ocean.

Under the Roman empire, these states were justly denominated the garden of the world; and to have a residence there, was considered as the highest state of luxury. The produce of their soil formed those magazines which furnished all Italy, and great part of the Roman empire, with corn, wine, and oil. Though the lands are now uncultivated, through the oppression and barbarity the inhabitants labour under, yet they are still fertile, not only in the articles above specified; but in dates, figs, raisins, almonds, apples, pears, cherries, plums, citrons, Lemons, oranges, pomegranates, with plenty of roots and herbs in their kitchen-gardens. Excellent hemp and flax are produced on their plains; and persons who have lived there for some time assure us, that the country abounds with all the necessaries and luxuries of life; for the great people here find means to evade the sobriety prescribed by the Mahometan law, and drink freely of excellent wines and spirits of their own growth and manufacture. Great quantities of salt-petre and excellent salt have been produced in Algiers, and in several places of Barbary lead and iron have been found. Honey and wax are also produced here in great quantities.

The deserts in the states of Barbary abound with lions, tygers, leopards, hyznas, and monstrous fer-

rents; but neither the elephant nor the rhinoceros is to be found there. Camels and dromedaries, asses, mules, and kumrahs (a most serviceable creature) by an ass upon a cow, are their beasts of burden. Barbary horses were formerly very valuable, and though equal to the Arabian; and though their breed is now said to be decayed, yet some very fine ones are now then imported into England. Their cows are but small and give little milk. Their sheep and goats are very large; though the former yield but indifferent fleeces. Bears, porcupines, foxes, apes, hares, rabbits, ferrets, weasels, moles, chameleons, and all kinds of reptiles are found here. The apprehensions travellers through some parts of Barbary are under, of being bitten or stung by the scorpion, the viper, or the venomous spider, rarely fails to interrupt their repose, which is otherwise very agreeable and highly grateful to a traveller.

Eagles, hawks, quails, partridges, and all kinds of wild fowl, are found on this coast; and of the smaller birds, the cupla sparrow is remarkable for its beauty and the sweetness of its note, which is thought superior to that of any other bird; but it cannot live out of its own climate.

The seas and bays of Barbary abound with the most delicious fish of every kind, which were preferred to those of Europe by the ancients.

The principal mountains is that chain termed Mount Atlas, which runs the whole length of Barbary, from east to west, and passing through Morocco, terminates upon that ocean which separates the eastern from the western continent, and from this ridge of mountains has obtained the appellation of the Atlantic Ocean.

These mountains afford mines of exceeding copper; and it has been asserted, that the country contains mines of gold and silver, but none of them open at present.

The chief rivers are the Malva, which rises in the deserts, and, running from south to north, divides Morocco from Algiers; the Suz, the Rabbatta, the Ounirabil, the Larache, the Sebon, the Daroch, the Tensift, Peban, and the Gueron. All these have their source in the Atlas mountains, and fall into the Atlantic ocean.

As to their commerce and manufactures, an inland traffick is carried on by the inhabitants of this empire with Arabia and Negroland. To the former they send woollen manufactures, Morocco-leather, indigo, cochineal, and ostrich feathers; in return for which, they receive silks, muslins, and drugs. To Negroland they send salt, silk, and woollen manufactures, which they change for gold, ivory, and negroes, who are chiefly imported to recruit the emperor's black cavalry. The trade is conducted by caravans. The greatest part of their foreign commerce is carried on in English and French bottoms, for they have few vessels of their own except corsairs. Their exports consist in copper, Morocco-leather, hides, exceeding fine wool, ostrich feathers,

ers, barilla, soap, wax, honey, horses, gums, raisin,
ives, almonds, dates, and other fruits.

The commercial affairs of this empire, and, indeed, of
Barbary, are managed by Jews and Christians, set-
tled in those countries. The chief manufactures are
other, fine mats, embroidered handkerchiefs, sword
boots, and carpets. The Jews and Christians have,
beside, established those of silk and linen.

The natives of this empire, known by the appellation
Moors, are of a swarthy complexion; but from the
prodigious number of negroes imported thither from
Guinea, there are almost as many blacks as whites.
The Moorish women are, in general very handsome;
and not being exposed to the sun, like the men, remark-
ably fair. The Moors are said to be a covetous, inhospit-
able people, who commit every species of villany and
endeavour to acquire riches; yet such is the tyranny of their
government, that a man, when he has obtained the
wealth he so ardently sought, is obliged to conceal it, lest
he should become a prey to the rapacious emperor. But
the people who inhabit the hills, and are therefore little
acquainted with the vices of the court, or trade, appear
to be by far the most honest and free people in this
country; for the government, lest they should endeav-
our to disown its authority, treat them rather as allies
than subjects.

The Moors marry very young, many of their females
not being more than twelve years of age at their nup-
tials; so that they are sometimes grand-mothers when
they arrive at twenty-two, and are reckoned old at
thirty. As Mahometans, it is well known that their re-
ligion admits of polygamy to the extent of four wives;
and as many concubines as they please; but, if we ex-
cept the very opulent, the people seldom avail them-
selves of this indulgence, since it entails on them a vast
additional expence in house-keeping, and in providing
for a large family. Whatever institution is contrary
to truth and sound morality, will in practice refuse it-
self: nor is any further argument than this single ob-
servation wanting, to answer all the absurdities which
have been advanced in favour of a plurality of wives.

In contracting marriage, the parents of both parties
are the only agents; and the intended bride and bride-
groom never see each other till the ceremony is per-
formed. The marriage-settlements are made before
the cadi, and then the friends of the bride produce her
portion, or, if not, the husband agrees to settle a cer-
tain sum upon her, in case he should die, or divorce
her on account of barrenness, or any other cause. The
children of the wives have all an equal claim to the es-
tates of the father and mother; but those of the concu-
bines can each only claim half a share.

When the marriage is finally agreed upon, the bride
is kept at home eight days to receive her female friends,
who pay congratulatory visits every day. At the same
time, a talb attends upon her, to converse with her re-
spective to the solemn engagement on which she is about
to enter: on these occasions, he generally accompanies

his admonitions with singing a pious hymn, which is
adapted to the solemnity. The bride also, with her
near relations, go through the ceremony of being paint-
ed afresh.

During this process, the bridegroom, on the other
hand, receives visits from his male friends in the morn-
ing, and in the evening rides through the town accom-
panied by them, some playing on hautboys and drums;
while others are employed in firing volleys of musketry.
In all these festivities, the discharge of musketry forms
a principal part of the entertainment. Contrary to the
European mode, which particularly aims at firing with
exactness, the Moors discharge their pieces as irregu-
larly as possible, so as to have a continual succession of
reports for a few minutes.

On the day of marriage, the bride in the evening is
put into a square or octagonal cage, about twelve feet
in circumference, which is covered with fine white li-
nen, and sometimes with gauzes and silks of various
colours. In this vehicle, which is placed on a mule,
she is paraded round the streets, accompanied by her
relations and friends, some carrying lighted torches,
others playing on hautboys, and a third party again
firing volleys of musketry.

In this manner she is carried to the house of her in-
tended husband, who returns about the same time from
performing similar ceremonies. On her arrival, she is
placed in an apartment by herself, and her husband is
introduced to her alone for the first time, who finds her
sitting on a silk or velvet cushion, supposing her to be
a person of consequence, with a small table before her,
upon which are two wax candles lighted. Her shift,
or more properly shirt, hangs down like a train behind
her, and over it is a silk or velvet robe with close
sleeves, which at the breast and waist is embroidered
with gold: this dress reaches something lower than the
calf of the leg. Round her head is tied a black silk
scarf, which hangs behind as low as the ground. Thus
attired, the bride sits with her hands over her eyes,
when her husband appears, and receives her as his wife,
without any further ceremony; for the agreement made
up by the friends before, the cadi, is the only specific
contract which is thought necessary.

For some time after marriage, the family and friends
are engaged in much feasting, and a variety of amuse-
ments, which last a longer or shorter time, according
to the circumstances of the parties. It is often cus-
tomary for the man to remain at home eight days, and
the woman eight months after they are first married.
If the husband should have any reason to suspect that
his wife has not been strictly virtuous, he is at liberty
to divorce her and take another; and the woman is at
liberty to divorce herself from her husband, if she can
prove that he does not provide her with a proper sub-
sistence. If he curses her, the law obliges him to pay
her, for the first offence, eight ducats; for the second,
a rich dress of still greater value; and the third time
she may leave him entirely. He is then at liberty to

marry again in two months. A woman convicted of adultery, is purified with immediate death.

When any person dies, a certain number of women are hired for the purpose of lamentation, in the performance of which, nothing can be more grating to the ear, or more unpleasent, than their frightful moans, or rather howlings: at the same time, these mercenary mourners beat their heads and breasts, and tear their cheeks with their nails. The bodies are usually buried a few hours after death. Previous to interment, the corpse is washed very clean, and sewed up in a shroud, with the right-hand under the head, which is pointed towards Mecca: it is carried on a bier, supported upon men's shoulders, to the burying-place, which is always, with great propriety, on the outside of the town, for they never bury their dead in the mosques, or within the bounds of an inhabited place. The bier is accompanied by numbers of people, two abreast, who walk very fast, calling upon God and Mahomet, and singing hymns adapted to the occasion. The grave is made very wide at the bottom, and narrow at the top, and the body is deposited without any other ceremony than singing and praying, in the same manner as on their way to the grave.

They have no tombs in this country, but long and plain stones; and it is frequently customary for the female friends of the departed to weep over their graves for several days after their funeral.

When a woman loses her husband, she mourns four months and eight days, during which period she is to wear no silver or gold; and if she happens to be pregnant, she is to mourn till she is brought to bed. For the above time, the relations of her late husband are obliged to support her. We do not learn that any mourning is due from the husband for the loss of his wife; but it is customary, particularly among the great people, for a son to mourn for his father, by not shaving his head, or any part of his beard, and by not cutting his nails for a certain space of time.

It is observable, that how depraved soever the Moors may be in every other respect, they pay the greatest duty and respect to their parents, princes, and superiors. Their method of expressing reverence both to the Divine Being, and to man, is by pulling off their slippers, which they always leave at the door of the house, or mosque they enter; and when they attend their prince in the streets, they always follow him bare-footed.

The dress of the Moors consists of a linen shirt or drawers, over which they tie a silk or cloth vestment with a sash, and wear upon that a loose coat. Their arms and legs are always bare, but they have slippers on their feet, and persons of rank sometimes wear buskins. They shave their heads, on which they wear a turban, made either of silk or fine linen; and this they never pull off, either to their superiors or in their temples. The habit of the women is nearly similar to that of the men, only instead of a turban, they wear a round

cap made of fine linen: their drawers are much longer and larger; and when they appear in the streets, their faces are covered with a linen cloth, in the manner of a veil. The dead are always carried to the grave in their usual dress.

The religion of the natives is the Mahometan, from according to the tenets of Ali, while others adhere to those of Hamed, a modern sectarist, and an enemy to the ancient doctrine of the caliphs; but foreigners are allowed the free and open profession of their different religions; and even the slaves are indulged with churches, priests and chapels. Indeed religion, among the Moors, serves only as a cloak for villany, under which they commit the most atrocious crimes with impunity.

The language of these states varies according to the different parts of them: in some of the inland countries the ancient African is spoken, and in the sea-port towns a corrupt Arabic; besides which, the seamen are well acquainted with the dialect known in all the parts of the Mediterranean, by the appellation of *Lingua Franca*, which is a medley of living and dead languages, Italian, French, Spanish, &c.

With respect to the population of the empire of Morocco, its inhabitants were far more numerous than at present, if, as travellers say, its capital contained 100,000 houses, whereas it is thought not to contain now above 25,000 people; nor can we think that the other parts of the country are more populous, if it be true that their king or emperor has in his armies 80,000 foreign negroes, horse and foot.

The capital of Morocco, which gives name to the whole empire, is situated in 30 deg. 40 min. north lat. and 7 deg. west long. on an extensive and delightful plain, between two rivers, the Nephthi and the Agmed, and is watered by a third, the Tonfil. It was formerly a very large and splendid city, but now above one-third of it lies in ruins. Most of its magnificent structures are demolished, three baths only remaining. The royal palace is enclosed with a high wall, surrounded with a large ditch, and flanked with towers. The common houses are chiefly of mud, plastered over, and flat at the top. The Jews reside in a separate quarter of the town, walled in for that purpose. This city was formerly the residence of the court, which is now removed to Mequinez, in the kingdom of Fez, thirty miles distant from the capital.

FEZ, originally the capital of that kingdom, is situated in 38 deg. north lat. and 4 deg. west long. and nearly leagues north-east of Morocco. This city is esteemed the general magazine of Barbary, whither all European goods are brought and exchanged, and sent into the other provinces to be bartered for those of the country. It is computed to contain near 900,000 inhabitants, of which 5000 are Jews, who always act as brokers between the Christians and Mahometans. The mosques, baths, caravanseras, seraglios, colleges, warehouscs, and other buildings, are very numerous. Its mosques amount to 500; one of them magnificent beyond de-

It is said that the inns, excepting those to which
the Christians resort, are infamous brothels, where the
most wicked and unnatural crimes are suffered to be
perpetrated.

MEQUINEZ, supposed to be the ancient Gilda, and
now the chief residence of the Emperor of Morocco, is
34 deg. north. lat. and 6 deg. west long. situated on
a spacious plain on the river Sebti. The royal palace,
though much decayed, is still exceedingly superb: it
stands on an eminence, is about three miles in compass,
and surrounded with strong walls. The environs of
the city consist of fine parks, and olive-grounds.

ALGIERS stands in 36 deg. 30 min. north. lat. and
15 min. east long. and is situated upon the Me-
diterranean Sea, which washes it upon the north and
north-east sides. This city is not above a mile and a
half in circuit, though it is computed to contain near
200,000 inhabitants, 15,000 houses, and 107 mosques.

Their public baths are large, and handsomely paved
with marble. The prospect of it from the sea is very
beautiful, being built on the declivity of a mountain;
though the city has for several years braved some
of the greatest powers in Christendom, yet some affirm
it could make but a faint defence against a regular siege,
and that three English fifty-gun ships might batter it
about the ears of the inhabitants from the harbour. If
the Spaniards must have been very deficient either in
courage or skill. They attacked it in the year 1775
by land and by sea, but were repulsed with great loss,
though they had near 20,000 foot, and 2000 horse, and
seventeen king's ships of different rates, and 346
transports. In the year 1783, and the following, they
renewed their attacks by sea, in order to destroy
the city and galleys; but after spending a quantity of
ammunition, bombs, &c. were forced to retire, with-
out either its capture or demolition. The mole of the
harbour is 500 paces in length, extending from the
continent to a small island, where there is a cattle and
large battery. The ditch is twenty feet wide, and se-
ven deep; but at present it is almost choked up
with mud.

TUNIS, the capital of the kingdom of the same
name, is in 36 deg. 43 min. north lat. and 10 deg. 25
min. east long. at about the distance of 300 miles from
Algers. The situation of this city is exceedingly un-
healthy, from the marshes and lakes that surround it,
and the deficiency of fresh water. It has fortifications,
and is about three miles in circumference. The houses
are not magnificent, but neat and commodious, as is
the public exchange for merchants and their goods;
but, like Algers, it is distressed for want of fresh wa-
ter. This capital contains 10,000 families, and above
200 tradesmen's shops, and its suburbs consist of 1000
houses. The Tunisians are exceptions to the other
states of Barbary, for even the most civilized of the Eu-
ropean governments might improve from their man-

ners. Their distinctions are well kept up, and proper
respect is paid to the military, mercantile, and learned
professions. They cultivate friendship with the Euro-
pean states; arts and manufactures have been lately
introduced among them; and the inhabitants are said
at present to be well acquainted with the various la-
bours of the loom. A wonderful regularity reigns
through all the streets and city.

The genteeler part of the men are in general sober,
orderly, and clean in their persons, and their behaviour
polite and complaisant. The Tunisian women are ex-
cessively handsome in their persons; and though the
men are sun-burnt, the complexion of the ladies is very
delicate; nor are they less neat and elegant in their
dress; but they improve the beauty of their eyes by
art, particularly the powder of lead-ore, the same pig-
ment, in the opinion of Dr. Shaw, that Jezebel made
use of, when she is said to have painted her face,
2 Kings ix. 30. the words of the original being, that
she set off her eyes with the powder of lead-ore.

TRIPOLI was once the richest, most populous, and
opulent, of all the states on the coast of Barbary, but
it is now greatly reduced. It is bounded on the north
by the Mediterranean, on the south by Zaara, or the
Desert, on the east by Barca, and on the west by Tu-
nis and Biledulgerid. It extends along the coast about
700 miles, that is from 10 deg. 13 min. to 25 deg. 27
min. east long. The air is clear, but less healthy than
that of Tunis. The soil is the richest in Barbary; and
the vallies, where cultivated, produce large quantities
of corn, grapes, olives, dates, and the various fruits na-
tural to warm climates. The animals are the same as
those of Algers.

The capital city of Tripoli is but small, yet popu-
lous, and the natives, though barbarous, are flourishing.
Its situation is on a sandy soil, near the margin of the
sea; strong walls, defended by formidable ramparts,
and flanked by pyramidal towers, surround it. Here
are but two gates, the north gate towards the sea, and
the south gate towards the country; and the whole city
forms the figure of a crescent, the concave part of
which encloses the haven. At the extreme points of
the harbour, which is very commodious, are some mi-
litary works; those to the east are in bad condition, but
on the westward there is a strong castle well fortified.
The houses in general are very mean and low built,
and the streets narrow and crooked; yet some remain-
ing monuments of magnificence seem to confirm the
prevailing opinion of the inhabitants, that it was once
remarkable for the splendor of many of its public build-
ings. This city is distressed by the scarcity of corn, and
the want of sweet water.

The city of ORAN, lying upon this coast, is about a
mile in circumference, and is fortified both by art and
nature. It was a place of considerable trade, and the
object of many bloody disputes between the Spaniards
and Moors.

CONSTANTINA was the ancient Cirta, and one of the

the strongest cities of Numidia, being inaccessible on all sides except the south-west.

SALLEE, situate in 33 deg. 48 min. north lat. and 6 deg. 25 min. west long. is an ancient city mentioned by Ptolemy, and stands on the river Gueron, which divides it into two parts. It is defended by two castles, which communicate with each other, but the fortifications are irregular and ill-designed. All articles of commerce here pay a tenth part to the emperor.

TANGIER, situated about two miles within the Straights of Gibraltar, was given by the crown of Portugal as part of the dowry of Queen Catharine, consort of Charles II. of England. It was intended to be to the English what Gibraltar is now; and must have been a valuable acquisition, had not the misunderstandings between the king and his parliament occasioned him to blow up its fortifications, and demolish its harbour; so that from being one of the finest cities in Africa, it is now little better than a fishing town.

CEUTA, upon the same freight, almost opposite to Gibraltar, is still in the hands of the Spaniards, but often, if not always, besieged or blocked up by the Moors.

BARCA, the ancient Cyrene, and once famous for the temple of Ammon, is now truly a desert, scarce a town or cultivated spot of ground being to be found in the whole country. It is bounded on the north by the Mediterranean; on the south by Biledulgerid; on the east by Egypt; and on the west by Tripoli. It is about 200 miles in length, from north to south, and 160 in breadth, from east to west.

TETUAN, which lies within 20 miles of Ceuta, is now but an ordinary town, containing about 800 houses; but the inhabitants are said to be rich, and tolerably civilized.

Suz, Taflet, and Gfula, form no part of the states of Barbary, though the King of Morocco pretends to be their sovereign; nor is any thing particularly curious contained in them.

Zaara is divided by the Arabs into three parts, by the names of Cahel, Zohara, and Algar. It is a desert country, thinly peopled, and nearly destitute of both water and provisions. The soil is in general very dry and sandy, and the climate being exceeding hot, it is deficient of those essentials produced in more fertile countries.

The subjects of the Barbary states, in general, subsisting by piracy, are allowed to be bold, intrepid mariners, and will fight desperately when they meet with a prize at sea. They are, notwithstanding, greatly inferior to the English and other European states, both in the construction and management of their vessels. They are, if we except the Tunisians, void of all arts and literature.

The misery and poverty of the inhabitants of Morocco, who are not immediately in the emperor's service, is beyond all description. The chief furniture of their houses consists of carpets and mattresses, on which

they sit and lie. In eating, their slovenliness is shocking; but those who inhabit the inland parts of the country, are an hospitable, inoffensive people; and indeed it is a general observation, that the more distant the inhabitants of those states are from the seats of the government, their manners are the more pure. Notwithstanding their poverty, they have a liveliness about them, especially those who are of the Arabic descent, that gives them an air of contentment; and having nothing to lose, they are peaceable among themselves.

The Moors are supposed to be the original inhabitants, but are now blended with the Arabs, and both are cruelly oppressed by a handful of insolent, mining Turkish, the refuse of the streets of Constantinople. They are prohibited gold and silver vessels, and their meat, which they swallow by handfuls, is boiled or roasted to rags. Adultery in the women, before observed, is punished with death; but though the men are indulged with a plurality of wives and concubines, they commit the most unnatural crimes without fear of punishment.

With respect to the antiquities and curiosities to be met with in Barbary, the reader can scarcely doubt that the countries which contained Carthage and the pride of the Phœnician, Greek, and Roman world, are replete with the most curious remains of antiquity, but they lie scattered among barbarous and ignorant inhabitants. Some remains of the Numidian and Mauritanian splendor are still to be met with. They point out the situation of the celebrated cities of Carthage, the Julia Cæsarea of the Romans, nearly equal in splendor to Carthage itself; Hippo, Utica, and several others. The principal ruins of Carthage consist of spacious cisterns or reservoirs for holding water, together with considerable remains of the aqueduct by which the water was brought above thirty miles from the mountains to the city. About fifty miles to the south of Tunis, is still remaining a very considerable part of a Roman amphitheatre; it is of an oval form, three stories high, and would hold 30,000 spectators; but the city to which this noble ruin belonged is unknown. Nor are the ruins of classical antiquity the only ones found in this country. The caliphs of Bagdad have left many amazing monuments of their magnificence. Little can be said respecting the natural curiosities of this country; the principal are the rich lead mines in the mountains of Beni-Boo-Taleb; the prodigious salt pits, which take up an acre of six miles; a little to the southward of Arzew, the Tilet Mines, an entire mountain of salt, and the Hammam, or bath of Meregga. Dr. Shaw mentions several springs in this country, whose waters are so hot as to boil a large piece of mutton in a short time.

HISTORY OF THE STATES OF BARBARY.

FEW countries in the world have experienced greater vicissitudes of fortune than that at present known by the

their floventlines is thro' the inland parts of the offensive people; and in proportion, that the more distant are from the seats of these are the more pure. Not only they have a liveliness about the face of the Arabic descent; but their countenance; and having noble among themselves. It is to be the original inhabitants with the Arabs, and a handful of insolent, domineering of the streets of Constantinople; and gold and silver vessels; swallow by handfuls, in adultery in the women, and with death; but through a plurality of wives and the most unnatural crimes.

curiosities and curiosities to be leader can scarcely doubt remained Carthage and the Greek, and Roman works, and remains of antiquity; barbarous and ignorant of the Numidian and to be met with. These celebrated cities of Carthage, and the Romans, nearly equal Hippo, Utica, and the ruins of Carthage could be used for holding water, the ruins of the aqueduct by above thirty miles from Carthage. About fifty miles to the west, a very considerable city; it is of an oval form, and had 30,000 spectators; the ruin belonged to one of classical antiquity the city.

The caliphs of Bagdad, the monuments of their magnificence, the natural curiosities; the principal are the rich lead mine, i-Boo-Taleb; the profitable area of six miles; a new, the Tiblet Mines, and the Hammam, or baths, and several springs in this part as to boil a large piece

STATES OF BARBARY.

have experienced greater at present known by the name

of the States of Barbary. It is supposed to have been originally peopled from Egypt; but at what time, who led the first colony thither, are particulars that are not now known. Careful only of procuring pasture and water for their numerous flocks and herds, the inhabitants wandered from one place to another without forming any settlement, or erecting houses for their abode. About the year before Christ 891, Dido, the daughter of Pygmalion, king of Tyre, fled from her brother, at the head of a considerable colony, and built the famous city of Carthage, the capital of a republic celebrated for its riches and commerce. This republic continued in a state of opulence and power, at once the glory and terror of the neighbouring nations, about 700 years; when the fortune of the Romans prevailed, and the pride of Carthage was humbled in the dust. But through the power of Carthage was no more, the country flourished under the Roman government, and became one of the richest jewels in the imperial crown. Cultivated with a fertile soil, and a warm luxurious climate, the number of inhabitants rapidly increased, and several very magnificent cities, afterwards famous in history, were erected. The Christian religion was introduced here in the time of the apostles themselves, and continued till the fifth century, when the Vandals trampled on the Roman eagles, and put a period to the greatness of the African colonies.

These fierce invaders of Africa did not however long possess the country they had conquered: the Greek emperors drove out the northern barbarians, and reduced, in some measure, the arts and manufactures, in which, as well as religion, the ferocious Vandals had declared perpetual war. But this did not restore peace and tranquillity to these parts of Africa: they were alternately ravaged by the Moors and Vandals; and at last totally conquered by the caliphs of Bagdad, in the seventh century.

The religion of Mahomet was now established in Africa; the few remains of ancient greatness were destroyed by the bigotted followers of that impostor; and the country was divided among the chiefs of the caliph's army. Restless from nature, and infligated to conquest by the tenets of their religion, the Moors passed over into Europe, and reduced the greater part of Spain. Their victory now began to forsake their standards. They were several times defeated by the European armies, and at last, about the year 1492, totally driven out of Spain by Ferdinand and Isabella. The only asylum open to the Mahometan fugitives was Africa, where they settled among their friends and countrymen in the Barbary coast. This expulsion of the Moors occasioned a perpetual war between them and the Spaniards; and finding themselves incapable of defence against the Christians, they had recourse to the Turks for assistance. Accordingly the two famous brothers, Barbarossa, admirals of the Turkish fleet, were sent to Barbary. Success attended the Turkish forces; the Spaniards, who had made themselves masters of great part

of the country, were obliged to retire, and the Moors hoped to enjoy the happiness of freedom and peace. For some time they flattered themselves with a long series of prosperity, but their hopes were soon rendered abortive: they found that they had only exchanged one master for another, and that the yoke of their deliverer was full as heavy as that of the Spaniards. The emperor Charles V. made a noble attempt to reduce Algiers and Tunis. He succeeded with regard to the former; but, before he could conquer the latter, a dreadful storm destroyed the greater part of his fleet, then attending his army encamped in the neighbourhood of Algiers, and he was obliged to embark precipitately, just as that city was reduced to the last extremity. Since that time they have continued to carry on the trade of piracy against the Christians, and have lately shaken off the Turkish yoke.

The emperors of Morocco are the successors of the sovereigns of that country, called Xeriffs, whose power resembled that of the caliphs of the Saracens. Their history is hardly any thing else than a series of murders, and the most detestable crimes. Muley Moloc alone, in the long dynasty of the emperors, was a great prince. He gained a complete victory over the Portuguese, whose king, Don Sebastian, was killed in the action. They have always carried on a piratical war against Spain and Portugal, and often against the other European powers, who frequently condescend to purchase a peace with those imperious infidels, though their marine is truly despicable; nor does the crown of Great-Britain sometimes disdain to procure their friendship by presents, as in the year 1769.

CHAPTER IV.

OF THE SLAVE COAST.

NEGROLAND is situated between 10 and 11 degrees of north lat. and between 18 deg. west, and 28 deg. east long. being about 2576 miles in length from east to west, and 68 in breadth from north to south. It is bounded on the north by Zaara, on the south by Guinea, on the east by unknown countries, and on the west by the Atlantic ocean.

The Niger or Senegal, and the Gambia, are the most remarkable rivers, on which are several European settlements. The English trade to James Fort, and other settlements near and up the river Gambia, where they exchange their woollen and linen manufactures, their hardware and spirituous liquors, for the persons of the natives; a negro's wealth consisting in the number of his family, whom he sells like so many cattle, and often at an inferior price. By the treaty of peace in 1783, the river of Senegal, with its dependencies, were given up to France.

Next to the slave trade, gold and silver form the principal branches of African commerce. The Dutch, English,

English, and French, have their settlements for this purpose on the same coast.

GUINEA is distinguished into Upper and Lower. Considered as one country, it lies between 9 deg. 18 min. north, and 16 deg. 45 min. south lat. extending in length above 2500 miles along the sea-coast; but its breadth is not determined.

Besides gold, ivory, and slaves; this country affords indigo, bees-wax, gum-fenega, gum-tragacanth, and other gums and drugs.

Upper Guinea is divided generally into three parts, Malagueta, Guinea Proper, and Benin-Guinea Proper, contains the Tooth and Gold Coast; the former extends from Cape Palmas to the river Sueira da Casta, and the latter from thence to the river Volta.

Lower Guinea, or Congo, extends about 990 miles along the coast, from Cape Lopo to Cape Negro. This large country is divided into Loango, Congo Proper, Angola, and Benguela, and watered with many rivers, and would be very fruitful, if better cultivated. The mountains abound with gold, silver, and copper.

Poultry, oxen, cows, sheep, goats, elephants, tygers, leopards, civit-cats, &c. are very numerous here; and several sorts of corn and fruits very plentiful.

The inhabitants of this extensive territory agree with each other in many material circumstances: they are all of a black complexion, are idolaters in the worst sense of the word, and the governments every where monarchical. Despotism reigns, unlimited by laws, by customs, or by conscience. Learning is unknown, and the arts of peace were never practised among them. Some attempts have indeed been made by the Portuguese, and other European nations, to withdraw the veil of ignorance, and diffuse the rays of learning and religion over those poor deluded people; but all their endeavours have been hitherto abortive: ignorance still maintains her seat, and idolatry of the grossest kind is the established religion of this unhappy country.

Respecting the climate and produce of this part of Africa, it may be observed, that the fertility of a country so prodigiously extensive, might be supposed more various than we find it is; in fact, there is no medium here with regard to the advantages of soil; it is either perfectly barren, or extremely fertile; this arises from the intense heat of the sun, which, where it meets with sufficient moisture, produces the utmost luxury; and in those countries where there are few rivers, reduces the surface of the earth to a barren sand. Of this sort, are the countries of Anian and Zaara, which, for want of water, and consequently of all other necessaries, are reduced to perfect deserts, as the name of the latter denotes. In those countries, on the other hand, where there is plenty of water, and particularly where the rivers overflow the land part of the year, as in Abyssinia, the productions of nature, both of the animal and vegetable kinds, are found in the highest perfection and greatest abundance.

The annual British exports to Africa are estimated at

500,000l. sterling, including a considerable quantity that is annually exchanged with American and other foreign traders on the coast; about 50,000l. of this returned in ivory, gold-dust, gum, &c. The greater part of the profits of the slave-trade is raised on the sugar plantations. If by establishing factories, and encouraging civilization on the coast of Africa, and turning some of our West-Indian slaves to their original country, we tried to make up for our past treatment to the natives, and instructed the inhabitants in the culture of tobacco, indigo, &c. to barter with us for our manufactures, and supply us with those articles, in demand for which has been so advantageous to America, great would be our profits. Were Africa civilized, and could we obtain the affections of the natives, and introduce gradually our religion, manners, and language among them, we should open a market that would fully employ our manufacturers and seamen, and all probably, to the end of time; and, while we enriched ourselves, we should contribute to their happiness.

The east and west coast of Africa, from the tropic of Capricorn to the equator, are in the possession of the Portuguese. This immense tract they became masters of by their successive attempts, and happy discovery of the navigation of the Cape of Good-Hope. From the coast of Zanguebar, on the eastern side, they traded only for gold, ivory, and gums, but likewise for several other articles, as senna, aloes, civet, ambergis, and frankincense. There still remains a part of the western coast of Africa to be considered, where the Dutch have settlements. This part is inhabited by a very different people, and governed in a very different manner. Strangers at once, to the arts of civil life, and to the customs of the negroes, they continue under a kind of patriarchal government, and a few itinerant families form a nation.

SIERRA LEONE.

Climate. Productions in general. Persons, Manners, and Customs of the Natives.

THE climate of this country is in general very unwholesome, particularly in the mountainous parts, where, during four months in the year, it rains, thunders, and is so intolerably hot, that the people are obliged to keep close in their huts; and the air is corrupted in such a manner by the lightning, that all animal food is reduced in a few hours to a state of putrefaction. The flat open country, however, is not so bad; for though in summer the heat is excessive in the former part of the day, yet it is very temperate in the afternoon, from the refreshing breezes that generally blow from the south-west.

The banks of Sierra Leone are lined with mango grove trees, the leaves of which exactly resemble those

European laurel. The whole country abounds in millet and rice, which is the principal food of the natives. It also produces great plenty of oranges, lemons, bananas, Indian figs, ananas, pumpions, water melons, peas, potatoes, wild pears, white plums, and several sorts of pulse.

Here are the palm, the cocoa, and the cotton tree; on the mountains are abundance of palm and laurel trees. Indeed the whole abounds with trees of various sorts, so close together, that it may be called one continued forest.

They have a great plenty of deer, hogs, goats, and swine, which the natives sell to the Europeans for a small quantity of brandy, a liquor they prefer to all others.

In the mountains are great numbers of wild animals, elephants, lions, tigers, wild boars, and roe-bucks; apes of several sorts, and serpents, the latter of which are so large, that, it is said, they will swallow a wild whole. The apes, monkies, and baboons, are so numerous, that they make great destruction in the plantations.

In the woods are great numbers of birds of different kinds and plumage, as pigeons, parrots, paroquets, and guinea-hens, the latter of which are about the size of a pheasant, and are very beautiful; but it is difficult to catch them on account of the thicknes of the trees. They have also several other sorts of fowl; among which are white pelicans as large as swans, herons, curlews, plovers, and a bird called ox-eyes.

The bay and entrance of the river abound with a great variety of fish, as raies, thornbacks, and a fish called the old-wife. There are also gar-fishes, cavalloes, sharks, sword-fishes, dog-fishes, and one called the pipe-maker, having on each side the mouth pendants like a barbel, and the noise they make is something like that of a hog's grunting. Among the fish, however, caught here, the most common are old-wives, pilchard, the becune, the monk or angel-fish, and the mullet.

The great plenty of fish found in the bay and river of Sierra Leone, are of infinite service to the European ships, not only for provisions, but also for traffick; for the natives are so indolent, that they will not be at the trouble to catch them, but content themselves with what is left by the ebb tides among the rocks.

On the sides of the bay are great plenty of oysters, some of which are of such a size, that one of them would serve a moderate man for a meal; but they are so tough that to be scarce eatable, unless first boiled, and then fried in small pieces.

The trees that grow on the sides of the bay make excellent haunts for crocodiles; as also for the manatee, or sea-cow, which are here in great abundance.

The manatee, or sea-cow, is supposed by some to be an amphibious creature, but this opinion has been sufficiently confuted; for it is always found in large rivers or bays, and feeds upon sea-weeds that grow near

the shore. The skin is thick, rough, bare, and scarcely penetrable. The body is long, and the head very small in proportion to it. These animals have no teeth, but instead thereof two strong white bones, that run the whole length of both jaws. The nostrils resemble those of an horse. The eyes are fixed in the centre of the head. The breasts are placed between the arms, one under each, are of a convex form, and about a foot and a half in diameter. They are hard, rough, and wrinkled; and when they give suck, the teats are four inches long.

These animals keep together in large companies, and are very careful of their young. They bring them forth in autumn, and have but one at a time. The manatee has no voice or cry, and the only noise it makes is in fetching its breath. The fat, which lies between the cuticle and the skin, when exposed to the sun, has a fine smell and taste: it has also this peculiar property, that the heat of the sun will not spoil it, or make it become greasy. The taste is like the oil of sweet almonds, and the only effect it has on the body, is that of keeping it open. The fibres and lean parts are like beef, but more red and harsh, and may be kept a great while in the hottest weather without tainting. The fat of the young ones is like pork, and the lean greatly resembles veal. In the head are four stones of different sizes, which are somewhat like bones, and are used in medicine. They are said to be good against agues, and to cleanse the kidneys of gravel. Hoffman affirms they are exceeding useful in cases of epilepsy.

When the negroes catch these creatures, they go in a canoe, and paddle towards it with as little noise as possible, it being exceeding quick in hearing. As soon as they find themselves near enough, the man who is placed ready at the head of the canoe, strikes a harpoon fixed at the end of a long pole into it, and then lets go. The beast immediately makes toward the mangroves, and the water being shallow, they follow it close, and repeat the strokes till they have wearied it out, when they drag it ashore, and complete their conquest.

The inhabitants of Sierra Leone are not so black as those of the neighbouring countries; neither have they such flat noses or thick lips. The men are in general tall and well made, of a cheerful disposition, and not given to quarrel: the women are short and robust, owing to their being constantly employed in labour; for besides the business of housewifery, they work hard in tillage, make palm-oil, and spin cotton.

Their dress resembles that of the country in general. They are naturally temperate and sober; and though they are exceeding fond of brandy and other spirituous liquors, yet they never drink to excess, considering drunkenness as one of the greatest crimes that can be committed.

Their houses or huts are low, and thatched with straw: some are round, some square, and others are oblong; and most of them are ornamented in the front with

A

AUTHORITIES.

Longit. E. from London

with two wings of a spiral form. They are kept very clean, being swept at least once every day.

Their furniture consists of two or three earthen pots to boil their victuals in, a gourd or two to fetch palm wine, and half a gourd for a cup; a few earthen dishes, a basket or two for the wife to gather cockles in, and a knapsack for the husband, made of the bark of trees, to carry his provision when he goes abroad. Their bedsteads are made of billets of wood laid across each other, on which they lay a mat, and sleep without any covering.

Their weapons are swords, daggers, darts, bows and arrows. The points of their arrows are infected with the juice of a poisonous fruit, which is so inconceivably subtle and quick, that wherever it strikes, it is sure to prove fatal. Some of them have also guns, which they are very fond of, and use with great dexterity.

Their food consists chiefly of roots, herbs, fruits, cockles, and oysters; and their common drink is water. They plant about their houses gourds, potatoes, pom-pions, and tobacco, the latter of which they are very fond of, particularly in smoking.

They are very fond of dancing, and generally spend their evenings in that diversion. Their music consists of two or three drums, made of a hollow piece of wood, and covered with the skin of a kid.

Every town or village has one peculiar house, to which the women send their daughters at a certain age, who are there taught for a year to sing, dance, and perform other exercises, by an old man appointed for that purpose; and when the year is expired, he leads them to the market-place, where they publicly exhibit such performances as they have been taught at school. During this time, if any of the young men are disposed to marry, they make choice of those they like best, without regard either to birth or fortune. When the man has declared his intention, the parties are considered as actually married, provided the bridegroom can make some presents to the bride's parents, and to the old man who was her tutor.

When they bury their dead, they put into their graves all their best goods, and erect a roof over it, which they cover with linen cloth. The corpse is always attended to the grave by a number of people hired as mourners, who howl and cry in proportion as they are paid for their attendance.

ACCOUNT OF THE BRITISH ESTABLISHMENT AT SIERRA LEONE.

IT having been represented, by way of petition to the parliament of Great-Britain, that the establishing of a general trade and commerce from these kingdoms to and with the coasts of Africa, and from thence to and with the several inferior kingdoms and countries of that continent (not hitherto explored or traded with by Eu-

ropeans) would be highly beneficial to the manufactures and trading interests of these kingdoms; an act was accordingly obtained in the year 1791 (to have continuance for thirty-one years) "For establishing a company for carrying on trade between the kingdom of Great-Britain and the coasts, harbours, and countries of Africa; and for enabling the said company to hold by grant from his Majesty, his heirs and successors, and from the native princes of Africa, a certain district of land, commonly called *The Peninsula of Sierra Leone*, now vested in his Majesty, or belonging to the said princes, for the better enabling the said company to carry on the said trade."

As a foundation for this design, a great number of gentlemen, merchants, and other persons of great respectability and opulence, formed themselves into a society, and subscribed considerable sums of money; and having obtained the sanction and protection of parliament, were made a distinct and separate body corporate, for the establishing and carrying on the said trade by the name or style of *The Sierra Leone Company*; with power to raise, by subscriptions, a capital joint stock, not exceeding the sum of 500,000*l*.

This company are not permitted to borrow or obtain any money but by subscription; nor is it lawful for them, either directly, or indirectly, to deal or traffick in the buying or selling of slaves, or in any manner whatsoever to have, hold, appropriate, or employ any person or persons in a state of slavery in the service of the said company, which is set on foot with the most beneficent and laudable views, respecting the true interests and happiness of the native Africans.

And for the better ordering and managing the said company's affairs, thirteen directors (two of whom are to be appointed chairman and deputy-chairman) are to be annually chosen, who are to take an oath of fidelity to the trusts reposed in them; but that no person is to be chosen a director, unless he is possessed of one share at least in the capital joint stock of the company. Secretaries, agents, and servants, are also to take the proper oaths.

The said company have moreover "Full power, liberty, and privilege, to purchase of and from all kings, princes, and chiefs, or other powers having right to make sale thereof, so much land as shall include the whole tract or district so commonly called or known by the name of *The Peninsula of Sierra Leone* aforesaid, as the same is bounded on the north by the river Sierra Leone, on the south by the River Caramanca, on the east by the river Bunce, and on the west by the sea."

The act also provides, that nothing therein contained, shall extend to affect the rights of any other British subjects trading to Africa, so as to prevent or obstruct the ships or vessels belonging to British subjects from anchoring in Sierra Leone, or Caramanca rivers, or in any of the creeks, bays, or harbours within the limits specified in the said act, for the purpose of refitting and repairing as heretofore, &c.

We are all intended to be the main object of that class of all men, and the feelings of the act, and the effect of the doctrine, no doubt, they are educated, and the families of the Scotch, in the greatest of the characters, and the human mind, and the peril of that can

moreover "Full power, privilege and from all kingdoms and powers having right to land as shall include the commonly called or known of Sierra Leone situated to the north by the river Sierra River Caramanca, on the on the west by the sea." that nothing therein contains rights of any other British as to prevent or obstruct to British subjects from Caramanca rivers, or in harbours within the limits the purpose of settling and

We are assured that this settlement was planned, and intended to be conducted upon the purest and most valuable principles of philanthropy and benevolence; the main object being, the civilization and moralizing of that class of human beings, whose minds are, perhaps, of all others, the most rude and uncultivated: namely, the African blacks. The abominable traffick of buying and selling slaves, so shocking to all the feelings of mankind, and even the use of such slaves by the act expressly prohibited; but, on the other hand, the negro inhabitants of this colony being all free, and esteemed as brethren, will be taught the excellent doctrines and benign social duties of the Christian religion, and be trained up to become useful citizens; they being found in general equally susceptible of education and tuition with the rest of their more enlightened fellow-creatures.

In the beginning of the year 1792, a great number of families of free negroes, to the amount of 1400 souls, were carried from his Majesty's province of Nova-Scotia, in America, to settle in this place; and there the greatest reason to believe, from the very respectable characters engaged in this undertaking, and it is our present wish, that their joint exertions may and will be attended with the happiest effects: to that description of the human species, many of whom have, for a series of years, to gratify fordid avarice, been made to groan and perish under almost every invention of savage cruelty that can disgrace humanity.

C A F F R A R I A.

This vast tract of country is situated between Cape Negro, on the western coast of Africa, in 15 deg. 30 min. south lat. and the river del Spiritu Santo, or Malacca, on the eastern coast of this continent, in the lat. of 25 deg. south. The Cape of Good-Hope forms the southern extremity of Caffraria.

The air is very hot, and would be suffocating, if the heat was not mitigated by the winds which blow continually from the Southern Ocean. Violent storms also frequently arise, which, though they render the coast very dangerous, are absolutely necessary to the health of the inhabitants, who are always afflicted with pains in the head, if there happens to be a calm of any long continuance. The soil in the vallies is in general fertile, but there are very few vegetable productions peculiar to this country; but the fruits and plants of the torrid zone, as well as those of Europe, flourish exceedingly; and in the Dutch Company's settlements at the Cape, all kinds of fruit, cabbages, cauliflowers, potatoes, and other garden stuff and roots are found in great plenty; together with pine-apples, oranges, lemons, grapes, melons, &c. Every cottage has its vineyard, which yields wine enough for the family. They sow all manner of grain, oats and lentils excepted: in December it is all ripe, and then they begin their

harvest. In January they tread out the corn in the fields, and by the latter end of February it is all housed. The inland parts of the country are mostly filled with woods and forests.

The animals found here are lions, tygers, leopards, elephants, rhinoceroses, elks, zebras or wild asses, monkeys, and other common quadrupeds. A particular kind of eagles, called dung-birds, are found here: they will attack a horse or a cow in great flights, and making a hole in the belly of the beast with their beaks and talons, perfectly scoop out the inside, leaving only the bones and hide.

Caffraria is in general a mountainous country; but the three principal eminences are in the neighbourhood of the Cape, and called the Table-Hill, Lion-Hill, and Wind-Hill, which is likewise called the Sugar-loaf-Mountain, from its form. On the top of Table-Hill, are several fine springs of water, clear as crystal, and of an exquisite taste. On ascending this mountain, the eye is delighted with the view of its fertility, and every part of it is adorned with the most stately trees; while its top and sides are enamelled with a variety of flowers, the beauty and fragrance of which, perhaps, exceed any produced in Europe. Lion-Hill is separated from Table-Hill by a valley, and on it a hut is erected for the shelter of two centinels, who are always posted there to give notice to the fort at the Cape, when a vessel is making for the harbour. Wind-Hill is the lowest of the three, being shaped like a sugar-loaf, and abounds in excellent pasture. There are no navigable rivers in this country; but the brooks and rivulets, which descend from the mountains, tend greatly to the fertilization of the land.

The inhabitants, known by the name of Hottentots, are of a middling stature, with small limbs, but very seldom deformed. They esteem a flat nose as one of the essential parts of beauty, and therefore as soon as a child is born, they break the grille of its nose. Their eyebrows are large, their eyes black, their lips thick, their hair short, black, and curled, like that of Negroes; their teeth remarkably white, and their complexion rather tawny than black; but in order to darken it, they besmear their bodies all over with grease and foot, which gives them a very nauseous smell.

These people reside in different hordes or villages, on the banks of rivers, and near the forests, where they form so many distinct villages and independent republics. Their villages, called kraals, consisting of about twenty huts, are all circular; and the huts of which they are composed being covered with skins, are so very low, that a man must stoop very much, or crawl on his knees, to get into them. Some of these kraals contain upwards of 100, and sometimes 500 souls. These huts serve chiefly to contain provisions, and their implements of husbandry; the owner himself never occupying them, unless when it rains: at other times, he passes his leisure hours in sleeping at the door of his hut, where he lies on his belly, and exposes his back to the sun and the

weather, waking now and then to amuse himself with smoking a certain strong-scented herb, which hath much the same effect as our tobacco. All their furniture consists of two or three earthen vessels for dressing their victuals, which is generally herbs, flesh, or shell-fish. Though the Hottentots are, without exception, the nastiest and most indolent people in the world; yet such as confine themselves to the natural diet of their country, live to a great age: but many of them drink prodigious quantities of brandy, and other spirituous liquors, unknown among them till introduced by the Dutch, and this intemperance never fails to shorten their lives.

The employment of the natives is purely pastoral; their principal and almost only occupation being the care of their herds of sheep and kine. Of these each village or kraal hath one common herd; every inhabitant taking it in his turn to be herdsman. In order to prevent the inroads of beasts of prey, particularly wolves, and other furious animals that occasionally make excursions towards the Cape, and destroy the tame cattle; the herdsman goes or sends every day round his district, in order to discover if any beast of prey be lurking in that quarter. In which case, he assembles the whole village together, and makes his report; when a party of the stoutest among them arm themselves with javelins and poisoned arrows, and follow the person who may have discovered the beast, to the cave or covert where he is lodged. Here they arrange themselves in two lines; the herdsman entering the cave, and endeavouring to provoke the beast to follow him, where he is inevitably destroyed.

United among themselves by the bonds of fraternal concord, the inhabitants of the same village live in constant peace. But on the first injury that is offered them by any of the neighbouring tribes, they take a cruel revenge. The subject of their mutual complaints is generally the stealing of a sheep or cow, and sometimes only a suspicion of it; the consequences, however, when they determine on revenge, are usually very terrible; for they take all possible means, after having made this determination, to persuade the aggressors that the injury is forgotten; but no sooner do they find their dissimulation hath taken effect in the security of the enemy, than they fall suddenly upon them with poisoned weapons, sparing neither age nor sex, but rooting up at once the whole community. Such is the method of going to war among these people.

In this country, the care of household affairs belongs to the department of the females. The men, indeed, are the butchers, and prepare the meat for dressing; but the care of providing the vegetables is assigned only to the women. Accordingly, the mother of a family sets out in a morning, attended by such of her children as are able to follow her, carrying the rest in her arms or on her back. In this manner she searches the woods and river-sides for roots, pulse, or fruit; of which having gotten a sufficient quantity, she returns, lights a fire on a large stone before the cabin, and when the victuals are dressed, the husband sits down to his meal with the rest of the family.

The women are clothed with sheep-skins, as well as the men; wearing the woolly part of this mantle outwards in summer, and inwards during the winter. They wear one skin over their shoulders, the ends of which crossing each other before, and leaving their neck bare, another skin is fastened round their middle, and reaches down to their knees. Those of them who are ambitious to please, adorn themselves with necklaces of shells: for even in this country the sex have their charms, which they endeavour to heighten by ornaments as are peculiar to themselves, and would meet with little regard elsewhere. To this end, they grease their faces, necks, and all the naked parts of their bodies with mutton suet, in order to make them shine. They also braid or plait their hair, to give themselves an additional elegance. After a Hottentot lady has thus bedizened and tricked herself up, and thereby exhausted all the arts of her toilette, her pride is wonderfully elevated; while the splendor of her appearance gives her the highest degree of satisfaction, how unfavorable soever nature may have been to her with regard to shape and stature.

The Hottentots have neither temples, idols, nor any peculiar place of worship; they celebrate indeed several nocturnal dances, with singing, at the new and full moon; but these are performed near their huts, and seem to be rather pastimes, or merry meetings, than any thing relative to religious worship. They are attached to their own country and manners, and are enthusiasts for liberty, that all the attempts of the Europeans, particularly of the Dutch at the Cape of Good Hope, have been hitherto ineffectual for making the least impression on these savage mortals, or giving them the least inclination, or even an idea of the European manner of life. There is even an instance of a Hottentot, who had been taken from Caffraria by the Dutch while an infant, and being instructed in the customs, learning, and religion of the Europeans, became a proficient in literature; but on returning to his native country, he abandoned all the advantages of education, returned his European dress to his mailer, put on his sheep-skin mantle, and never more appeared among the Dutch.

The inhabitants of the Cape expose their female children in the forests, where they leave them either to starve, or be devoured by wild beasts. They use the same barbarous method with their old men, when they become useless and decrepit. This, however, is directly contrary to the advice, and without the consent of the chief men of the kraal. And here it may be proper to mention, that in every kraal the oldest man is always the first in order and dignity; and his advice is generally followed in affairs relative to the welfare of the whole, as he is supposed to have had most experience.

The principal place for commerce in Caffraria, is the CAPE OF GOOD-HOPE, which was first discovered by the Portuguese in 1493, but they never made any settlement. In 1600 the Dutch visited it, but many years after only touched at it, in their voyage

to and from provisions. Having repelled India companies due to them place, was ordered with all made the inhabitants of brass which, together were so charming hereby it was all liberty to certain quantities the natives, as dwelling-houses erected. the desert of Barca; to the south, by Zanguebar and Caffraria; to the east by the Red Sea and the eastern ocean; and to the west by Guinea, Nigritia, and Zaara.

Nubia is bounded by Egypt, on the north; by Abyssinia, on the south; by the coast of Abesh, on the east; and by Zaara and Nigritia, on the west. Its dimensions have not yet been ascertained by geographers, and the same uncertainty attends its government and religion; but among them are found Christians, Jews, Mahometans, and Pagans. This country is said to abound in gold, musk, sandal-wood, and ivory; here are also elephants, horses, camels, lions, and every other animal, both wild and tame, to be met with in the neighbouring country.

A B Y S S I N I A

Has now scarce any communication with other parts of the world; Abex, which extends itself along the western coast of the Red Sea, being in the possession of the Turks, and part of it surrounded with mountains. The inland parts are said to be exceeding fertile, being diversified with woods and plains well planted with palm-trees, dates, and cedars, and watered by several noble rivers, particularly the Nile. Abyssinia abounds with gold, silver, copper, and precious stones. Its animals are horses, zebras, elephants, camels, dromedaries, oxen, sheep, mules, asses, &c. here are also prodigious numbers of large locusts, which are excellent eating; flying and other serpents also are seen here, particularly one sort, which is so much of the colour of the dust in which it harbours, and on which it subsists, that it is not easily avoided, though its sting is attended with immediate death, both to man and beast.

In their persons the Abyssinians do not at all resemble the negroes of Guinea, the south part of Africa; having, on the contrary, regular features, and some of them being very handsome. The olive complexion is esteemed the finest by them, and next to that the jet black. They possess a vast share of vivacity and natural wit, are of a teachable disposition, and fond of learning, but enjoy very few opportunities of attaining it. Persons of rank among them wear vests made of silks, stuffs, or cotton; but the poor people have only a small piece of skin or coarse stuff, wrapped about their waists. In their eating they abstain from all things prohibited to the Jews, and their drink is mead, methuggin, and a liquor made from wheat or rice.

The Abyssinians exchange their gold, emeralds, and horses with the Turks, for silks, stuffs, calicoes, linens, and carpets. The Jews are said to be the only weavers and smiths among them; and as for other handicrafts, every man breeds up his children to the trade or profession that he uses himself. Their religion seems to be a mixture of Christianity and Judaism, greatly resembling that of the Copts of Egypt, both in its manner and form.

The power of the Abyssinian monarch was formerly unlimited, but at present he can transact no affairs of consequence without the concurrence of the grandees. He passes the principal part of the year in the field, attended by great bodies of horse and foot, with whom he makes a tour through different parts of his dominions; and on every occasion assumes great state.

Abex and Anian are bounded on the north and west by Egypt and Abyssinia; on the east by the Red Sea and the Indian, Ethiopic, or Eastern Ocean; and on the south by Zanguebar; extending from the fifth degree of north latitude to the twentieth.

Anian, situated upon the eastern ocean, is a fruitful barren desert. The air is exceeding hot, and the chief part of the inhabitants consist of some Arab tribes, that live in camps, for there are very few towns. The principal place in it is Adea.

Abex, situate to the northward of Anian, is in possession of the Turks, who keep strong garrisons in Saquem and Arquico, which are the two principal parts, and about 150 miles distant from each other. This country is in general a fruitful tract, abounding in most of the necessaries of life.

The history of this continent is at once imperfect and uninteresting. Probably these countries never afforded any events worthy being recorded. Buried in ignorance from the earliest ages, and separated from other nations by extensive deserts of burning sands, the ancients knew very little of the inhabitants of these countries. Some voyages were indeed made to their coasts; but all the intelligence they have transmitted to posterity, amounts to no more than that they were ignorant, rude, inhospitable people, and destitute of every particular that constitutes humanity, except the form. They considered them as a different species of beings, or at least, that a savage life during a long series of years had so impaired their faculties, that they were incapable of improvement. They still continue in the same deplorable ignorance, so that it is in vain to expect any historical monuments in this country.

It must be shocking to every reasonable mind to reflect, that upwards of 200 years the European nations have traded with Africa in human flesh, and encouraged in the negro countries wars, rapine, desolations, and murder, that the West-India islands may be supplied with that commodity. The annual exportation of poor creatures from Africa for slaves, hath exceeded 100,000, numbers of whom are driven down like sheep, perhaps 1000 miles from the sea-coast, who are generally inhabitants of villages that have been surrounded in the night by armed force, and carried off to be sold to our traders; and it appears, that from Santalpollonia to Athera, which is upwards of 250 miles, the police and punishment of all crimes are supported by the same trade.

This shameful practice is become so prevalent among the natives, that they who commit crimes or trespasses against their laws, are, at the decision of twelve elders,

ld for slaves for the use of their government, and the
support of their chiefs. Theft, adultery, and murder,
the highest crimes, and whenever they are detected,
subject the whole family to slavery. But any individual
condemned to slavery for the crime of his relation, may
be deemed his own person, by furnishing two slaves in his
room. When a man commits any of the above cardi-
al crimes, all the male part of his family are con-
demned to slavery; if a woman be guilty, the female
part is sold.

An English gentleman, who lately visited all the
chiefs of the negroes in our settlements, remarks to
the following effect: "While on the coast, I saw such
instances of cruelty relative to the slave trade, as made
my very bosom bleed. This traffick in crimes makes
the chiefs vigilant: nor do our planters, who purchase
slaves, use any pains to instruct them in religion, to
make them amends for the oppression thus exercised on
them. I am sorry to say, they are unnaturally averse
to every thing that tends to it; yet the Portuguese,
French, and Spaniards, in their settlements, succeed in
their attempts to instruct them, as much to the advan-
tage of the commerce as of religion. It is for the sake

of Christianity, and the advantages accompanying it,
that English slaves embrace every occasion of deserting
to the settlements of these nations." As the truth of
these remarks is confirmed by daily observation, it is
therefore certainly high time for the legislature to enact
laws for putting an end to this most infamous of all
trades, so disgraceful to the Christian name, and so re-
pugnant to the principles of our constitution. As a
means to remedy this evil, the negroes already in our
islands should be properly treated, made free, and en-
couragement given to their population. There are suf-
ficient numbers to cultivate the sugar plantations with-
out any future supply, and which would be more pro-
fitable to the planters; as well as the kingdom in gen-
eral. But we need say nothing further on this head, as
we find that some respectable, generous-hearted per-
sons, impressed with tender feelings for the miseries of
their fellow-creatures in this respect, have taken the
matter in hand, whose laudable endeavours and remon-
strances, aided by those of others of like benevolent
sentiments, we trust will be conducive to abolish this
nefarious traffick, and thereby avert the just vengeance
of Heaven, long impending over us on that account.

THE AFRICAN ISLANDS.

Situation, Extent, Produce, Inhabitants, Mountains, Rivers, Animals, &c.

THESE islands are very numerous; some of them are situated in the Eastern or Indian Ocean, and others in the Western or Atlantic. The chief of the former are Zoetra, Babel-Mandel, the Comora Islands, Madagascar, Bourbon, and Mauritius; but, besides these, a multitude of smaller islands, some of them hardly any thing more than a barren rock, are scattered in this immense ocean, particularly near the Equator, and on both sides of the Island of Madagascar, as will be perceived by consulting the map of Africa.

ZOESTRA, by some thought to be the Dioscorides of Ptolemy and Pliny, is situated in 12 deg. 10 min. north lat. and in 53 deg. 16 min. east long. about thirty leagues to the eastward of Cape Gardafu, on the most easterly point of the continent of Africa. It is eighty miles in length, and fifty-four broad, and has two good harbours, where formerly such European ships as had lost their passage to India used to take shelter. It is a populous and plentiful island, yielding most sorts of plants and fruits common between the Tropics; and also frankincense, gum-tragacanth, aloes, ambergris, dragon's-blood, and coral. The weather is exceeding hot, though there are several lofty mountains in the island, whose summits are perpetually covered with snow. The inhabitants came originally from Arabia, profess the Mahometan religion, and are governed by a sheik, who is probably tributary to the Turks.

BABEL-MANDEL is situated at the entrance of the Red-Sea, in 12 deg. 6 min. north lat. and in 44 deg. 30 min. east long. about forty-four miles from the Arabian and Abyssinian shores. Its situation rendered it of the utmost consequence, while the trade to India was carried on by the Red-Sea, the entrance of which it entirely commands; hence the long wars between the Abyssinians or Ethiopians, who contended with great fury for the possession of this island; but since the discovery of a passage to the Indies by the Cape of Good-Hope, the importance of the island has greatly declined, and it is now entirely abandoned. The island is of little value, being not five miles in circumference, and a barren, sandy spot.

The COMORA ISLANDS are Joanna, Mayotta, Mehillia, Anzezia, and Comora; situated between 10 and 14 deg. of south lat. and between 41 and 46 deg. of east long. They lie in the straight called the Channel of Mosambique, about midway between Madagascar and the continent of Africa. The principal island is Joanna, which claims a sovereignty over, and exacts tribute from the others. It is about thirty miles long, and fifteen broad, and affords plenty of provisions, and such fruits as are common to the torrid zone. The inhabitants are negroes of the Mahometan persuasion,

and entertain our seamen with great humanity. India ships bound to Bombay usually put in here for refreshments.

MADAGASCAR is the largest of the African Islands and is situated between 10 and 26 deg. of south lat. and between 43 and 51 deg. of east long. It lies about 300 miles to the eastward of the coast of Africa; near 1000 miles in length from north to south, and 250 in breadth from east to west. The sea rolls with great rapidity, and is exceeding rough between the island and the Cape of Good-Hope, forming a channel or passage, through which all European ships generally pass, unless prevented by storms, in their voyage to and from India.

Few islands in the world are more pleasant, fertile, and desirable than Madagascar. It is adorned with a pleasing variety of hills, vallies, woods, and open plains watered with numerous rivers, and the air is rendered cool and healthy by the constant breezes from the sea. It abounds in sugar, honey, vines, fruit-trees, vegetables of various kinds, valuable gums, corn, cattle, fowls, precious stones, iron, copper, tin, and some fishes.

The island of Madagascar was discovered in 1498 by Lawrence Almeyda; but the Persians and Arabs knew it from time immemorial, under the name of Sarandib. The whole island is divided into twenty-eight provinces, which are, Anossi, Manapani, in the Valley of Amhoule, Vohitzan, Wate-Manahore, Yoodre, Etomampo, Adohimouffy, Erenguranis, Vahin, Anghombes, Manacarongha, Mantatane, Antanarivony, Ghalemboule, Tamatave, Jahave, Voulou-Voulou, Adasoutchy, Manghabe, Adeimoutchy, Mandrayer, Ampatre, Carciboule, Mahafalbe, Houlouvey, Sima, Yoandrou, and Machicores.

The natives are called Malcagaches, or Madecasses. They are portly in their persons, and rise above the middle stature. The colour of their skin is different among one tribe it is of a deep black, and among another tawny: some have a copper-coloured tint; but the colour of the greater part is olive. All those who are black have woolly hair, like the negroes on the coast of Africa: those who have a complexion similar to that of the Indians and Mulattoes, have as look but as the Europeans. Their noses are not flat; they have a broad open forehead; their lips are thin; and their features are regular and agreeable.

These people generally display in their countenances a peculiar character of frankness and good-nature. They never shew a desire of learning any matters, but those which relate to the simplest wants of mankind; and this desire is always extremely moderate: they are very indifferent respecting knowledge which cannot be obtained without reflection. A general want of curiosity and a general apathy, renders every thing that requires attention insupportable to them. Sober, light, and active, they spend the greatest part of their lives in sleeping, and in amusing themselves.

A general want of civi-
em. Sober, light, and ac-
part of their lives in sleep-
es.

With respect to religion, they have neither mosques
or temples, and entertain a very imperfect notion of
Mahomet. They offer sacrifices of beasts and rice on
particular occasions, and many of them observe the
with sabbath. They have also some knowledge of
the principal events recorded in Sacred History, as the
creation of the world, the fall of man, the lives of
Noah, Abraham, Moses, and David; and hence some
have conjectured that they are descended from the Jews.
Perhaps the colony that first settled here were composed
of Arabians and Jews, who by a long promiscuous in-
course, have formed a religion partaking equally of
both. The Pagan inhabitants are idolaters, and, like
those on the continent of Africa, worship stocks and
stones. No historical accounts of this country are to
be depended on till the year 1642, when a French of-
ficer obtained permission from Cardinal Richlieu for
three years, exclusive of all others, to send ships and
traders to Madagascar, and the neighbouring islands, in
order to establish a colony, plantation, and commerce.
This gentleman erected a society for this purpose, under
the name of a French East-India Company, and the
grant was drawn out, with the addition of ten years
more privilege, or, in other words, extended to the
year 1661. In the interim, that is immediately subse-
quent to the making out of the grant in 1642, the first
ship was sent under the command of Captain Coquet,
who was going to load ebony at Madagascar, on the
account of himself and some private merchants; but
he and others to take with him two governors, whose
names were Pronis and Fouquenbourg, and twelve
other Frenchmen; these being commanded to land and
remain there, till the arrival of a ship from France,
which was to sail in November.

Coquet got to Madagascar in September, having, in
his way, anchored at the Isle of Bourbon, which he
took possession of in the name of the King of France;
sailing afterwards at the Isle of St. Mary, he did the
same; and arriving at the Bay of Antongil, in Mad-
agascar, he acted in a similar manner. Pronis and Fou-
quenbourg were at length landed in the port of St. Lucia,
in the province of Manghabei.

The expected ship from France arrived on the first
of April, in the ensuing year. It was named the St.
Lawrence, and was under the command of Capt. Giles
Belmont. This officer brought seventy men with him
to reinforce Pronis. The inhabitants, jealous that the
French would obtain too firm a footing in their coun-
try, meditated an opposition; but their intentions were
prevented, or at least delayed, by the prudent conduct
and timely presents of Pronis. Upon this success, Pro-
nis sent twelve men to penetrate into the province of
Matatan, six of whom were cut off by the natives, and
the rest compelled to retreat; and soon after Captain
Belmont's son, and six sailors, were murdered in the
province of Vohitbang. This opposition was owing to
the secret intrigues of the leading men in Anossi, who,
from their maritime situation, did not dare to offend

the French themselves, but stirred up the people of
other provinces to oppose and murder them upon all
occasions.

In 1644, Pronis thought proper to remove from St.
Lucia to the Bay of Thologare, where he began to
fortify himself; and having reduced almost the whole
province of Anossi by force of arms, he built Fort
Dauphin, the situation being excellent; the harbour
commodious and finely sheltered, and the entrance
very convenient for shipping of any burthen. Behind
the fort, he erected several other buildings, with large
enclosures, which produced various sorts of fruits,
kitchen herbs, &c.

In the year 1650 the fort took fire by some unfore-
seen accident, and was totally destroyed. Soon after,
however, it was rebuilt, and strongly garrisoned; the
French being always at variance, and frequently at war
with the natives.

In the year 1651, the celebrated French governor,
Flacourt, at the head of eighty Frenchmen, and a great
number of armed negroes, ravaged the country to a
considerable distance from the fort, carrying off great
quantities of cattle, and destroying all the houses and
huts in his way. This occasioned the natives to con-
ceive an extraordinary aversion to the French; and
what added to their dislike was, that whenever any pris-
oner fell into the hands of the French, they looked
upon them all in an equal light, and sold them indis-
criminately to the then Dutch governor of the island
of Mauritius, not making any distinction between
deceans or lords, freemen or slaves; or shewing any
greater respect to their ladies, when captives, than to
women of a lower rank. The French finding, at length,
that the idea of conquering Madagascar was chimerical,
and that the danger and expences of maintaining a co-
lony, and keeping up a fortress here, were not recom-
pensed by the profits accruing from the settlement,
thought proper at once to abandon the island, and all
projects relative to it.

MAURITIUS, or MAURICE-ISLAND, is situated in
20 deg. 15 min. south lat. and 56 deg. 8 min. east
long. It is of an oval figure, about 150 miles in cir-
cumference, and has the advantage of an excellent har-
bour, capable of holding fifty sail of the largest ships,
secure against all winds; the water is 100 fathoms
deep at the entrance. The climate is at once both
healthy and agreeable. The island is watered with
several rivers, and the finest ebony in the world grows
upon its mountains. The soil, though not remarkable
for its fertility, affords pasture sufficient for vast num-
bers of black cattle, deer, goats, and sheep. Rice, to-
bacco, and all kinds of tropical fruits are produced here
in plenty. This island was discovered by the Dutch in
1598, who gave it the name of Maurice-Island, in hon-
our of Prince Maurice their stadtholder. It continued
some time in their possession, but at present it belongs
to

to the French, who have given it the name of the Isle of France.

The ISLE of BOURBON is situated in 21 deg. 9 min. south lat. and in 54 deg. 19 min. east long. It is of an oval figure, and about ninety miles in circumference. It has no harbour, but several good roads, though these are not always sufficient to shelter ships against the furious storms which generally happen at the shifting of the monsoons. On the southern extremity of the island is a large volcano, which continually throws out prodigious quantities of flame, smoke, and a sulphureous lava, and appears dreadful in the night to mariners, as the adjacent sea is full of sunken rocks. The climate, though extremely hot, is very healthy, being constantly refreshed with cooling breezes from the sea. The hurricanes already mentioned are often dreadful; they seem to shake the very foundations of the island, while the inhabitants are smitten with terror. Brooks and streams of water are found in almost every part of the island, by which the soil is rendered extremely fertile in fruits and pasture. Tobacco flourishes here exceedingly, though not a native plant of the island. Many of the trees yield odoriferous gums and resins, particularly benzoin in great plenty. Aloes, white pepper, and all the tropical fruits abound here. The pastures feed great numbers of black cattle, goats, and hogs. The rivers are well stocked with fish, and the coast with land and sea tortoises. Ambergris, coral, and shells remarkable for their beauty, are found on the shore. The French, on their expulsion from Madagascar, in 1672, retired to this island, where they have now several considerable towns. A governor is also established here, and their East-India ships stop at this island for refreshments. There are a great many more small islands about Madagascar, and on the eastern coast of Africa, laid down in maps, but no description of them has yet been given.

Having thus described the principal islands in the Eastern or Indian Ocean, it remains that we pass round the Cape of Good-Hope, and survey those that are scattered in the Western, or Atlantic Ocean, that immense collection of water which separates Europe and Africa from America. The islands in the Atlantic Ocean are very numerous, but the principal are St. Helena, Ascension, St. Matthew, St. Thomas, Anaboa, Princes-Island, Fernandopo, Cape-Verd islands, Gorce, the Canariés, the Madciras, and the Azores.

ST. HELENA is situated in 16 deg. 4 min. south lat. and in 6 deg. 4 min. west long. It is a very high and steep rock, situated in the midst of the ocean, about twenty miles in circumference, and accessible only at the landing-place, in a valley on the east side of the island; but even here the waves dash with such impetuosity against the shore, that it is difficult landing;

and a battery of guns almost level with the water defends it. The only anchoring-place is in the road called Chapel-Valley Bay. Though the island appears at sea as a barren rock, the inland parts are agreeably diversified with vallies and plains, adorned with fruit-trees. The English plantations there afford potatoes, yams, plantains, bananas, kidney-beans, and Indian corn; but most part of the latter is generally destroyed by rats, so that the flour made use of there is wholly imported from England; and in a scarcity, they eat yams and potatoes instead of bread. Some bullocks, hogs, and plenty of poultry, are found on this island, which belongs to the English East-India Company, being given to them by Charles II. There are about 200 families upon it, who greatly resemble the English both in their persons and manners. The East-India homeward-bound ships take in water and fresh provisions here; in exchange for shirts, drawers, or any light clothes, pieces of calico, silks, muslin, arrack, sugar, &c. but the island is so small, and the wind so much against the outward-bound ships, that they very seldom see it. The Company's affairs there are managed by a governor, deputy-governor, and store-keeper, who have standing salaries allowed by the Company, besides a public table, well furnished, for the entertainment of all commanders, masters of ships, and principal passengers.

ASCENSION-ISLAND is situated in 17 deg. of west long. and the 7th of south lat. 600 miles north-west of St. Helena. It received its name from being discovered by the Portuguese on Ascension-day; and it is a mountainous, barren, uninhabited island, about twenty miles in circumference; but the East-India ships usually touch here, to furnish themselves with turtle, which are found in great plenty, and are very large, some of them weighing above 100 pounds each.

ST. MATTHEW is a small island lying in 6 deg. 1 min. west long. and 1 deg. 30 min. south lat. 300 miles to the north-east of Ascension-Island, and was discovered by the Portuguese, who planted and kept possession of it for some time, but afterwards deserted it. As this island has little in it to invite other nations to settle there, except a small lake of water, it now remains uninhabited.

ST. THOMAS, PRINCES-ISLAND, ANABOA, and FERNANDOPO, are all situated in the Gulph of Guinea, between Congo and Benin. They were first discovered by the Portuguese, and are now in possession of the Portuguese, and furnish their shipping with fresh water and provisions as they pass by. We are informed, there are 15,000 Negro Christians in St. Thomas's, instructed to read and write, who daily attend divine worship, clean and well clothed;

level with the water being-place is in the road though the island appears to be a single island parts are agreeably united, adorned with fruit trees, and there afford potatoes, kidney-beans, and Indian corn. The latter is generally destroyed by the use of there is whiting and in a scarcity, they eat bread. Some bullocks are found on this island. The East-India Company's ships II. There are about twenty islands that resemble the English manners. The East-India ships in water and fresh provisions, drawers, or any light goods, muslin, arrack, sugar, and the wind so much blows, that they very seldom are there are managed by a steward and store-keeper, who is appointed by the Company, besides a surgeon for the entertainment of the ships, and principal passengers.

situated in 17 deg. of west long. 600 miles north-west of the Cape from being discovered on-day; and it is a mountainous island, about twenty miles long. The East-India ships usually carry provisions with turtle, which are very large, some of these islands.

island lying in 6 deg. 30 min. south lat. 300 miles west of the Anonion-Island, and was discovered by the Portuguese, who planted and kept possession of it, but afterwards deserted it, so that afterwards invited other nations to settle. To invite other nations to settle, to make use of the lake of water, it now remains.

ISLAND, ANABOA, and others in the Gulf of Guinea, were first discovered by the Portuguese, and fresh water and provisions are abundant, there are 15,000 Negroes, instructed to read and write, and the worship, clean and well clothed.

is a circumstance which redounds greatly to the honour of the Portuguese government, at the same time that it reflects disgrace on our West-India legislatures, for their neglect in this particular.

CAPE DE VERD ISLANDS owe their appellation to a cape of that name on the African coast, near the river of Gambia, opposite to which they lie, at the distance of 800 miles, between 23 and 26 deg. west long. and 14 and 18 deg. north lat. They were discovered by the Portuguese in 1460, and are about twenty in number, of which the following are the chief, namely, St. Jago, Bravo, Fogo, Mayo, Bonavista, Sal, St. Nicholas, St. Lucia, St. Vincent, Santa Cruz, and St. Antonio, and are subject to the Portuguese; the others are barren rocks. The air in general is very hot, and some of them very unwholesome. Europeans, or their descendants, and negroes, inhabit these islands.

ST. JAGO is the largest, most fertile, and best inhabited of them all. It is 150 miles in circumference, and many parts of it are mountainous, and a great deal of the land is barren. Its produce is sugar, cotton, some Indian corn, cocoa-nuts, oranges, and other tropical fruits; but the plant of most consequence is madagascar, which grows in abundance among the cliffs. The woods and garden 'uff of all kinds abound here, as well as hogs and poultry. The monkeys in this island are esteemed handsomer than those of any other part of the world. They are exceeding small, and of a green colour, except their faces, which are black. The Portuguese viceroy resides in this island.

On the east side of the island stands BAYA, or BRAVA (famous for an action between an English and French squadron in a former war) it has a good port, and is seldom without ships; those outward-bound to Guinea, or the East-Indies, from England, Holland, and France, often touch here for fresh water and provisions.

MAYO, or MAY, and SAL, abound in salt, and the English trade with the inhabitants of the former for vast quantities of this commodity. The salt is made by the heat of the sun from the sea-water, which, at spring-tides, is received into a sort of pan, formed by a sand-bank, extending along the coast for two or three miles. The salt costs nothing but a small gratuity for carrying it together, wheeling it out of the pond, and carrying it on asses to the boats; the negro governor, however, expects a small present from every commander that loads with salt, and delights on being invited on board their ships. The English vessels, which annually resort hither to lade with salt, frequently amount

to 100, and there is generally a man of war to protect them. They likewise often take in a freight of asses, which they carry to Barbadoes, and other British plantations. The sea-water is so clear on this coast, that an English sailor, who dropped his watch, perceived it at the bottom, though many fathoms deep, and had it brought up by one of the natives, who are in general expert at diving. The inhabitants of this island, even the governor and priests, are all negroes, and speak the Portuguese language.

Fogo is remarkable for having in it a volcano, which continually emits sulphureous exhalations, and the eruptions and flame, like those of Mount-Etna; sometimes burst forth with such violence, that the adjacent parts are in a manner covered with pumice-stones.

The inhabitants of all these islands are Europeans, or descendants of families originally from Europe, and a great number of negroes: these latter, who inhabit the islands of Mayo, profess the Roman Catholic religion.

THE ISLAND OF GOREE is situated within cannon-shot of Cape-Verd, in 14 deg. 43 min. north lat. and 17 deg. 20 min. west long. It was so called by the Dutch, from an island and town of the same name in Holland. It is a small spot, not exceeding two miles in compass, but being deemed a place of importance, from its situation for trade so near Cape-Verd, it has therefore been a bone of contention between European nations. The Dutch first took possession of it; and from them the English took it in 1663; but the Dutch retook it in 1665; the French subdued it in 1677, and in their possession it remained till 1759, when the British arms being every where triumphant, it was reduced by Commodore Keppel, but restored to the French in 1763. It was retaken by the English in the war of 1774, but at the peace of 1783 was again restored to the French, in whose possession it now remains.

THE CANARIES, formerly called The Fortunate Islands, are situated between the 12th and 19th deg. of north lat. and between the 27th and 29th deg. of west long. they lie about 150 miles south-west of Morocco. They are seven in number, viz. Grand Canaria (or Great Canary, which gives name to all the rest) Palma, Hiero, Gomera, Teneriffe, Fuerteventura, and Lancerota. These islands were first discovered and planted by the Carthaginians; but when the Romans destroyed that republic, a stop was put to navigation, particularly on the western coast of Africa, and these islands were again buried in obscurity for many ages. At last, in 1405, they were once more visited by the Spaniards. When they first landed, the natives, who were very numerous, spoke a different language from any of the nations on the continent. They were robust,

active, and well skilled in the management of bows, arrows, and darts. They were also idolaters, worshipping the sun and stars. When they became acquainted with the Spanish language, they could give no account of their ancestors, or from what country they came. In their stature and complexion, they resembled the natives of the north of Africa, but they retained none of their customs, were masters of no science, nor did they know there was any country in the world besides their own. Having struggled for the preservation of their liberties till 1460, they were then forced to yield to the superior force of their invaders, who transported a great number of them into Spain, where they ended their days in slavery. Those who were suffered to remain on the island, endeavoured to secure their ancient estates by submitting entirely to the Spanish yoke, and are now remarkable for their probity and civility to strangers.

These islands enjoy a pure and temperate air, and the soil is so fruitful, that it frequently yields two crops in a year. They abound in the most delicious fruits, among which are grapes from whence that rich wine is made, known to us by the name of Canary, and of which it is said, that in time of peace 10,000 hogheads are annually exported to England. Cattle, &c. are very numerous here; and among the birds, are those little beautiful creatures that bear the country's name, and are now so common, and so much admired in Europe; but their wild notes in their native land far excel those sung by them when confined in a cage in a foreign country.

TENERIFFE is about fifty miles in length, and twenty in breadth. The country is fertile, though much incumbered with mountains, particularly that called the Peak, which, according to the accounts of some navigators, may be seen in clear weather at the distance of 120 miles. The Peak is an ascent in the form of a sugar-loaf, about fifteen miles in circumference, and, according to the account published in the Philosophical Transactions, near three miles perpendicular.

Its appearance at sun-set is very striking; when the sun was below the horizon, and the rest of the island appeared of a deep black, the mountain still reflected its rays, and glowed with a warmth of colour which no painting can express. There is no eruption of visible fire from it, but a heat-illness from the chinks near the top, too strong to be borne by the hand when it is held near them.

The air and climate are said to be remarkably healthful, and particularly adapted to afford relief in phtisical complaints. By residing at different heights in the island, such a temperature may be procured as is best suited to the constitution. Persons may continue where the air is mild and salubrious, as they may ascend till the cold becomes intolerable; but no person, it is said,

can live comfortably within a mile of the perpendicular height of the Peak after the month of August.

The road of Santa Cruz (says Captain Cook, who touched at this famous island in his last voyage) is situated on the south-east side of the island, before the town of the same name. It is said to be the principal road of Teneriffe for shelter, capacity, and the goodness of its bottom. The water to supply the ships, and for the use of the inhabitants of Santa Cruz, is derived from a rivulet that runs from the hills, which is conveyed into the town in wooden troughs, which were repairing at the time Captain Cook visited the island, fresh water was extremely scarce.

It might naturally be concluded, from the appearance of the country about Santa Cruz, that Teneriffe is a barren spot; Captain Cook was convinced, however, from the ample supplies his people received, that it not only produced sufficient to supply its own inhabitants, but also enough to spare for visitors. The wine is the chief produce of the island, beef may be had at about three-pence sterling a pound. The cows, however, are small, lean, and boney. Sheep, goats, hogs, and poultry, may be had on terms equally reasonable. A great variety of fruits are to be had in plenty; as pears, figs, grapes, mulberries, mulberries, &c. besides others that were not then in season. The pumpkins, potatoes, and onions, which grow here, are excellent.

On this island, Indian corn is produced and sold for about three shillings and six-pence per bushel. The fruits and vegetables are, in general, very cheap. Though the inhabitants are but indifferently supplied with fish by the adjoining seas, they are engaged in a considerable fishery on the coast of Barbary, and the produce of it sells at a very moderate price.

Voyagers assure us, that Teneriffe is a more eligible place than Madeira for ships to touch at which are bound on long voyages: but the wine of the latter is infinitely superior to that of the former. The difference of their prices is almost as considerable as their qualities; for the best Teneriffe wine was sold for 2s. a pipe, whereas a pipe of the best Madeira was worth considerably more than double that sum.

The country rises behind the town of Santa Cruz gradually to a moderate height; afterwards it continues to rise south-westward towards the celebrated Peak of Teneriffe. But our voyagers were much disappointed in their expectations with respect to its appearance, and particularly as to its height.

Eastward of Santa Cruz, the island appears perfectly barren. Ridges of high hills run towards the sea, between which are deep vallies, terminating at mountains that run across, and are higher than the former. Mr. Anderson went on shore to one of these vallies, intending to reach the top of the remoter hills; but time would not permit him to get further than their base. The lower hills produce great quantities of the *Euphorbia Canariensis*. The people on the spot imagine

juice to be so caustic as to corrode the skin; but Mr. Anderson convinced them to the contrary, by thrusting a finger into a plant full of it. The inhabitants dry bushes of euphorbia, and carry them home for fuel. The city of Santa Cruz, though not large, is well built. The churches have not a magnificent appearance without, but they are decent and tolerably handsome within. Almost facing the stone pier, which runs into the sea from the town, is a marble column, lately erected, decorated with human figures which reflect honour to the country.

The city of Laguna is situated about the distance of 15 miles from Santa Cruz. Mr. Anderson and three others took a view of it; but the sight of it did not redress them for their trouble, as the roads were very bad, and their cattle but indifferent. Though the soil is extensive, it hardly deserves to be dignified with the name of a city. There are some good houses, but the disposition of the streets is very irregular. Laguna is larger than Santa Cruz, but much inferior to it in appearance.

From Santa Cruz to Laguna, the road runs up a steep, barren hill; but lower down they saw some fig-trees and corn-fields. The corn, however, is not produced here without great labour, the ground being generally encumbered with stones. Nothing else presented itself deserving notice, except a few aloë plants growing on the side of the road.

In this island the laborious work is chiefly performed by mules, horses being scarce, and reserved for the use of the officers. Oxen are also much employed here. Some hawks and parrots were seen, which were natives of the island; as also the sea-swallow, sea-gulls, partridges, swallows, canary-birds, and blackbirds. There are also lizards, locusts, and three or four sorts of dragon-flies.

A gentleman of acknowledged veracity informed Mr. Anderson, that a shrub is common here, agreeing exactly with the description given by Linnaeus of the shrub, as growing in China and Japan. It is considered as a weed, and large quantities of it are cut out of the vineyards every year. The Spaniards, however, who inhabit the island, sometimes make use of it, and ascribe to it all the qualities of the tea imported from China. The same gentleman mentioned to Mr. Anderson another botanical curiosity, which is called the *impregnated lemon*. It is a distinct and perfect lemon enclosed within another. There is also a certain vine growing here, which is deemed an excellent remedy in phibical complaints.

From near the top of the Peak smoke continually issues; but they have had no earthquake or eruption since 1704, when the port of Garraclieca was destroyed, being filled up with the burning lava that flowed into it; and houses are now built where ships formerly lay at anchor.

A very considerable trade is carried on at Tenerife, 1000 pipes of wine being annually made there, which

is consumed in the island, or made into brandy, and sent to the Spanish West-Indies. Indeed, the wine is the only considerable article of the foreign commerce of Teneriffe, unless we reckon the large quantities of filtering-stones brought from Grand Canaria.

The inhabitants found here when the Spaniards discovered the Canaries, are no longer a distinct race of people, having intermarried with Spanish settlers: their descendants, however, may be known from their being remarkably tall, strong, and large-boned. The men are tawny, and the women are pale. The inhabitants of Teneriffe, in general, are decent, grave, and civil, retaining that solemn cast which distinguishes those of their country from others. The ancient inhabitants of this island were called Guanches. The origin of them is not certainly known, but their sepulchral caves are very remarkable. They had an uncommon veneration for the corpses of their ancestors, which were deposited in caves formed by nature in the rocks. They were preserved in goat-skins, bound round by belts of the same, so exactly and uniformly enclosing the body, as to excite admiration, each round being just proportioned to the part; and this method preserved the bodies. The eyes, which are closed, the hair, ear, nose, teeth, lips, and beard, are found entire. They are placed on wooden couches, which the natives had the art of rendering so hard, that they are impenetrable to iron. Some of the caves contained a or 300 bodies.

GRAND CANARIA, or GREAT CANARY, is about 150 miles in circumference. The capital, called Palma, is situated on the west side of the island; and has a castle, but its best defence is a vast number of sunken rocks, which render the approach to the shore very dangerous. It is an episcopal see; the inquisition, the supreme council, or assembly of the states of the seven islands, and several convents of monks, friars, and nuns, are established here.

PALMA is situated about fifty miles to the west of Teneriffe, and 200 west of the continent of Africa. It lies in 29 deg. north lat. and 18 deg. west long. It is about thirty miles long, twenty broad, and seventy in circumference. This island, besides sugar and wines, produces gun-dragon and pitch; pine-apples are also plentiful here. Poultry and animals are much the same here as in Canaria; except, indeed, among the animals, it particularly abounds with rabbits. It is subject to earthquakes; and in 1750, a large body of fire issued from a volcano in one of the mountains, and took its course with great rapidity to the town of Palma, from whence it spread to the sea, and there discharged itself.

On the north-east part is a lofty and spacious mountain called the Cauldron, from having a hollow in it. The descent within the cauldron, which proceeds gradually

dually from the summit, contains a space of about 30 acres, and on the declivity of the inside are several springs that form a stream which issues out from the extremity of the mountain. Near the sea shore, on the south side of the island is a medicinal well of hot water, and at a village called Uguar, is a cave, at the extremity of which is a curious grotto with the roof stuck with large flakes of slate stones, from between which constantly issues a flow of clear and wholesome water.

In the winter the air is so exceeding sharp up the mountain, that the inhabitants are obliged to keep fires burning night and day; whereas near the sea-side they only have them for cooking and other occasional purposes. In the months of July, August, and September, the heat near the sea shore is intolerable, while in the mountainous parts the air is pleasant and refreshing.

Their best vines grow in a soil called the Brenia, where it is said they make at least 12,000 casks of wine every year. The wines differ in their quality from those made in the other islands; but they are very rich, and have an excellent flavour. They have likewise great plenty of honey, and most kinds of fruit, the latter of which grow in such abundance, that they export great quantities of them to the other islands.

Palma, the principal town in this island, so called after its name, is tolerably large, and well inhabited. The houses are low, but spacious; and in one part of the town is a very handsome church. A considerable trade is carried on here in wines, which are exported to various parts, but particularly to the West-Indies.

There is another very neat town in this island, called St. Andrew's, where there are four engines for making sugar; but the land hereabouts is very poor, so that the inhabitants are supplied with grain, and other necessary articles, from the island of Teneriffe.

The chief port is called Palma; and is situated on the south side of the island. The road is about a quarter of a mile from the shore; and though it is open to the easterly winds, the ships ride with great safety.

The island of **HERO**, having neither spring, fountain, nor well, is said to have been formerly supplied with water by means of a particular species of trees, which yielded a large quantity in the night, when their tops were always enveloped in a cloud; but now the inhabitants save the rain-water in cisterns, and, when that fails, filtrate brackish water through sand.

GOMERA is situated to the west of Teneriffe, in 28 deg. north lat. and 18 deg. west long. from London. It is about 30 miles long, 20 broad, and 60 in compass. This is a very plentiful island, being watered by many rivulets that flow from the mountainous parts, and give fertility to the vallies beneath: besides this, water may be had in any part of the island, by digging to the depth of about six feet. The inhabitants have

great plenty of all the necessaries of life, particularly cattle, poultry, wine, roots, fruit, honey, and eggs. There is but one small town, near the sea-shore, called after the name of the island.

FUERTEVENTURA is about 24 leagues distant from Grand Canaria. It is about 65 miles in length, and a very unequal breadth, consisting of two peninsulas joined by an isthmus of 12 miles over. On the north side there is a haven called Chabras, and another which is very commodious, towards the west. Wheat, barley, kine, goats, and orchel, are found in this island, which belongs to the lord of Lancerota.

The island of **LANCEROTA**, or Langarote, lies in 28 deg. 40 min. north lat. and 13 deg. 5 min. west long. It is situated about 18 leagues south-east from Grand Canaria, and is nearly 32 miles long, and 10 broad. The whole island is parted in the middle by a ridge of rocks, on which feed goats, sheep, camels, genets, and asses.

The vallies are dry and sandy, resembling the fields in England; but they yield tolerable good barley and wheat: the first harvest being about April, and the second in September. The principal commodities are goats flesh and orchel, and the whole is an estate of the crown, belonging to the family of Herrera, the head of that family being always lord of Fuerteventura and Lancerota. The people, however, in both islands have the liberty of appeal to the king's judges in Grand Canaria. Boats go from hence weekly to Grand Canaria, Teneriffe, and Palma, laden chiefly with dried goats flesh, which is used in the manner of bacon, and is not bad eating.

This island was attacked in 1596, and taken by the English under the command of Leonidas, Earl of Cumberland, who, after ransacking it, departed from the island.

Lancerota is very high, and may be seen at a great distance, its appearance being black and barren. The principal port, which lies on the south-east side of the island, is called Porte de Naos, and the harbour is tolerably secure for small vessels; indeed, it is deemed the best belonging to the Canary Islands, and is much frequented for its conveniency in repairing and cleaning ships. This port is without any town, or indeed houses, except store-houses, magazines, and barracks for soldiers. The castle at the west end of the harbour is of no consequence, as a ship of force might easily batter it down. A channel divides Lancerota from the little island called Graciosa, which is uninhabited; and this channel is named the harbour of El Rio. Near this harbour is a salt-work in Lancerota, which turns to a tolerable account.

Kubicon, or Cayas, is the principal town of this island. It is about six miles from Porte de Naos, and is what

formerly called Lancerota. At present it contains
at 100 indifferent houses.

The inhabitants of this island chiefly use rain water,
which is caught in pits and cisterns adapted for that
purpose, as they have but few wells or springs. The
breed of horses has dwindled and degenerated in this
island, as well as in Fuerteventura. Asses are preferred
as they are there, and for the same reasons. The
oxen, indeed, in both these islands, are used not only
for carrying burthens and riding, but for ploughing up
the land; so that they are deemed of general utility.

The want of food here occasions a want of birds;
the deficiency of water, a deficiency of ducks,
geese, &c. The different appearance of the cattle, at
different seasons of the year, is very singular; for
during the verdure of the spring they are plump, fat,
and sleek; but in autumn, when the grass and herbage
withered by the heat of the sun, they resemble
wild geese, have scarce spirits to work, and their flesh is
not fit to eat.

A venomous creature infests either Lancerota or
Fuerteventura, except the black spider. This, how-
ever, is sufficient to terrify the people, as its sting is
extremely painful, and very dangerous.

The seas which intersect and surround these islands
afford the inhabitants plenty of fish, particularly cod,
which is finer than what is caught on the banks of New-
foundland; and a very singular fish, called the picudo,
which is the bite of which is as venomous as that
of a viper; yet, when dressed, it is pleasant and
wholesome food.

The MADEIRAS, which consist of three islands,
situated between the 17th and 18th deg. of west
longitude, and between the 32d and 33d of north lat. they
are about 100 miles north of the Canaries, and as many
miles west of Sallee in Morocco.

Mattera, the principal island of the three, which
is given name to the others, is about 75 miles in
length, 60 in breadth, and 180 in circumference.
Although there is some reason to suppose that this island
was not unknown to the ancients, yet it lay concealed
from many generations, till the Portuguese discovered it
in 1519, took possession of it, and are, even at this
time, almost the only people who inhabit it. Accord-
ing to some authors, John Machin, an Englishman,
discovered this island in 1344; but, allowing this to
be true, it is certain that the English never made any
settlement. At their first landing, the Portuguese,
finding the country little better than a thick forest, gave
the name of Madeira, or Mattera, and, in order to
render the land capable of cultivation, set fire to the
woods. It is now very fertile, yielding corn, sugar,
honey, wax, and the most delicious fruits; particularly
oranges, lemons, pomegranates, and grapes. It is said
that this was the first place in the west, where the sugar
manufacture was set on foot, and indeed the produce

exceeds that of every other country, being extremely
beautiful, and possessing a natural scent of violets: but
the Portuguese, finding that the profit on this article
began to decline, have destroyed the chief part of their
sugar canes, and planted vineyards, which produce fe-
veral sorts of excellent wines, particularly Madeira,
malmsy, and tent, of all which the inhabitants make
and sell prodigious quantities. It is said that no less
than 10,000 hogheads are annually exported, the chief
part of which go to the West-Indies, particularly Bar-
badoes, where the heat of the climate adds greatly to
its perfection: it is afterwards sent to England. Be-
sides numerous groves of cedar trees, with which the
whole island is adorned, it produces those which yield
dragon's blood, mastic, and other gums. It abounds
also with boars and other wild beasts, and with all
sorts of fowls. The inhabitants excel even those of
Genoa in making sweetmeats, marmalades, and per-
fumed pastes, and likewise in preserving citrons,
oranges, &c.

The people here trade among themselves by barter.
The ordinary food of the poorer people, in the time of
vintage, is little else than bread and rich grapes. Were
it not for this abstemiousness, the danger of fevers in
the hot seasons would be rarely avoided; therefore,
even the rich in the hot months are very spare in their
diet, and drink but moderately.

The people in general affect great gravity in their
deportment, and usually go clad in black; but they
cannot part from the spado and dagger, which even
servants wear; so that you may see a footman waiting
at table with a sword by his side, at least a yard long,
and a great basket hilt to it.

The houses in general are plain, as the inhabitants
put themselves to no great expence either in erecting
or furnishing them. The windows are latticed instead
of being glazed, and are secured by wooden shutters at
night.

In marriages, affection is never once thought of here;
the principal inquiries are into family, descent, and cir-
cumstances. The women are prohibited from marry-
ing Englishmen, unless they consent to change their
religion, and turn Roman Catholics.

Murder is very frequent here; on account of the great
number of places deemed sanctuaries, and the ease with
which a murderer can thereby screen himself from jus-
tice. But if the criminal person is taken before he can
fly to sanctuary, the punishment is only either banish-
ment or confinement, both which may be evaded by a
pecuniary composition.

The clergy here are exceeding numerous, and gene-
rally rich; but none who are descended from Moors or
Jews are admitted to take orders. The churches are
made repositories for the dead. The corpse is curiously
dressed and adorned; yet, in the interment, store of
lime is used, in order to consume the body with all ima-
ginable dispatch, which usually happens in a fortnight;
so that there is then room for another corpse. The

bodies of Protestants are not allowed to be buried, but must be thrown into the sea, unless a large sum of money is paid to the clergy, in which case they are permitted to be interred in consecrated ground.

The most considerable town in the whole island is situated at the bottom of a large bay, on the south part of it, and called Fonchial. It is defended towards the sea by a high wall and a battery of cannon, which, together with the large stones that cover the beach, and the violent surf that continually beats against it, renders the place very secure against the attacks of an enemy.

Of the other two islands, that called Porto Santo, which is only eight miles in circumference, lies at a small distance from Madeira, and is under the jurisdiction of the same bishop and governor. It is exceeding fertile, and abounds in excellent honey and wax. The other is scarce worthy notice, being not only of very small extent, but likewise entirely barren; for which reason the Portuguese have given it the expressive appellation of the Desolate Isle.

The AZORES, likewise called the Western Islands, are situated between the 25th and 32d deg. of west long. and between the 37th and 40th of north lat. lying almost in the mid-way between Europe, Africa, and America. They are nine in number, viz. Santa Maria, St. Miguel, Terceira, St. George, Graciosa, Fayal, Pico, Flores, and Corvo. They were discovered in the middle of the 15th century by Joshua Vanderberg, a merchant of Bruges in Flanders, who, in a voyage to Lisbon, was by stress of weather driven to these islands, which he found destitute of inhabitants, and called them the Flemish Islands. On his arrival at Lisbon, he boasted of this discovery, on which the Portuguese set sail immediately, and took possession of them, to whom they now belong, and were by them called Azores, from the great number of hawks and falcons which they found there.

The most considerable of these islands is St. Miguel, or St. Michael, being 100 miles in circumference. It is very fertile and populous, producing plenty of corn and wine, and containing upwards of 50,000 inhabitants, exclusive of ecclesiastics, monks, and nuns. Its

two principal towns and harbours are Ponta Delgada and Villa Franca. This island was twice invaded and plundered by the English in the reign of Queen Elizabeth.

All these islands have one or more harbours; but the best among them is in Terceira, which is very spacious, and guarded by two forts, that at the same time defend Angra, the capital. This city is the residence of the governor of the Azores, and the bishop. It also contains eight convents, several courts and offices, and five churches, besides the cathedral, and is a populous well built town.

Pico, which is nearly as large as St. Miguel, carries on a great trade in its excellent wines, and abounds with cedar, and a tough red wood, much valued, called Teixos.

The rest of the islands are equally fertile, and it may be observed of the Azores in general, that they enjoy a very clear and serene sky, with a salubrious air, but are subject to violent earthquakes, by which they have frequently suffered, and likewise by inundations. It is said that no poisonous or noxious animal breeds among them, and even if they are carried there, will expire in a few hours.

Before we take leave of Africa, it may be necessary to remark, what we have hinted before, that notwithstanding the amazing discoveries of Columbus, and in 1492, there still remain some countries, either absolutely unknown, or very superficially surveyed. It is however, certain, that the rivers in this quarter of the globe bring down large quantities of gold, and that the ancients drew prodigious riches from a country blessed with a variety of climates, some of them the finest in the world. But it must at the same time be acknowledged, that the moderns are acquainted only with the sea-coasts of Africa, and those very imperfectly; the internal parts being little known to us: nor have we any satisfactory accounts of their inhabitants, productions, or trade, which may in a great measure be ascribed to the rude and barbarous state wherein the natives have continued for a succession of ages, which together with the great danger that must attend penetrating into a country over-run with the most ferocious animals, render a complete survey of it absolutely impracticable.

BOOK IV.
AMERICA.

CHAP. I.

General Description of this Quarter of the World.

IN this third division of the terraqueous globe, several important objects present themselves to our consideration, namely, a description of the New World, comprehending the continent of America, the West-Indies, and various islands and places in the northern hemisphere.

Few discoveries have produced greater consequences than that of America, which, being separated from that of Europe, and the vast and boisterous oceans from the rest of the world, continued several thousand years unknown. Venice and Genoa had long possessed the valuable commerce of the East, then carried on by the Red Sea; and the consequence of that lucrative traffick, were become the greatest maritime powers of Europe; but though, by frequent voyages, several improvements had been produced in the practical part of navigation, and mathematical learning began to be esteemed in Europe; yet the knowledge of mankind was even then very imperfect, and hardly extended beyond their sensible horizon. However, from the subsequent relations, it will appear, that even the ages of ignorance are not destitute of men, whose geniuses, soaring far above the contracted sphere of their contemporaries, make discoveries in science thought impossible, and form designs which at once excite the envy and astonishment of

mankind. As this fertile and extensive country owes less to the hand of art, and more to that of nature than any other quarter of the globe; we shall therefore, previous to a geographical account of it, give our readers a circumstantial detail of its first discovery.

The 15th century seems to have been an æra allotted by Providence for changing the dispositions of mankind, and enriching the world with the most important discoveries; such as, the invention of printing, the making of gunpowder, the improvement of navigation, the revival of ancient learning, and the reformation of religion—events which will render that period famous to the latest posterity. It was towards the close of it, when Christopher Columbus, a native of Genoa, possessed of great knowledge, penetration, and skill in the mathematics, conceived the stupendous project of sailing westward to the Indies, and of opening to his country a new source of opulence and power. This noble proposal being rejected by the Genoese as chimerical, Columbus, stung with indignation and disgust, retired from his country, and applied to the court of France; but the French, with their usual levity and self-sufficiency, laughed at and ridiculed both the projector and his design. A similar application was made to Henry VII. of England; but the cautious politics of that prince prevented his embarking in a great but uncertain undertaking. He met with no better encouragement from the Portuguese, who, contenting themselves with creeping along the coast of Africa, and dis-

covering

covering one cape after another, had no thoughts of venturing boldly into the open sea, and of risking the whole at once. Columbus, however, whose spirit was too great to be broken by these repeated disappointments, at length applied to the court of Spain, where, after eight years attendance, he met with success, chiefly through the superior penetration and interest of Queen Isabella, who patronized the plan, and raised money upon her jewels to defray the expence of the expedition.

In the year 1492, Columbus set sail with three ships only, upon the most adventurous attempt ever undertaken by man; and in the fate of which the inhabitants of two worlds were interested. In this voyage, he had many difficulties to encounter with; the most affecting was, the variation of the compass, then first observed, and which seemed to indicate that the laws of nature were altered on an unknown ocean, and the only guide he had left was ready to forsake him; and his sailors, always discontented, now broke out into open mutiny, threatening to throw him overboard, and insisted on their return, but by his own firmness and perseverance, after a voyage of thirty-three days, he landed on one of the Bahama islands.

On Thursday, the 11th of October 1492, about ten at night, the admiral first discovered a light upon the island of Guanahani, or St. Salvador, as the admiral named it, in consideration that the light of it delivered both him and his men from perishing. About two in the morning, the ship called the *Pinta*, the best sailer of the three, and which, therefore, usually kept ahead of the admiral, gave the signal for land, which was seen with the naked eye, when they were scarce two leagues from the shore, by Roderick de Triana, one of the common seamen on board the *Pinta*, who had not, however, a reward that was promised to the first discoverer, it being adjudged that the admiral was the first, because he saw a light on the island the night before. The crew of the *Pinta* instantly sang the *Te Deum*, as a hymn of thanksgiving to God, and were joined by those of the other ships, with tears of joy, and transports of congratulation. This office of gratitude to heaven was followed by an act of justice to their commander: they threw themselves at the feet of Columbus, with feelings of self-condemnation mingled with reverence, and implored him to pardon their ignorance, incredulity, and insolence.

The day appearing, the ships came to an anchor very near the island, which they computed to be about fifteen leagues in length, and found it to be populous, well planted, and watered with a great lake, but generally flat, low land, without hills: the natives came down crowding to the shore, and seemed astonished at the sight of the ships; and the admiral believing there was no great danger to be apprehended from them, went on shore, richly dressed, in his boat, with the royal standard, and a naked sword in his hand; as did the other two captains in their boats with warlike

music and colours flying. They no sooner came ashore, but they kneeled down, gave God thanks for their success, and kissed the ground with tears of joy after which the admiral stood up, and having raised the royal standard, called the island by the name of St. Salvador, taking possession of it in the name of the Catholic majesties, with great solemnity; after which his people recognized him their admiral and viceroy, and swore to obey him during the voyage.

The Indians, in the mean time, stood gazing at the Spaniards, without attempting to oppose them, when they were thus taking possession of their country; and the admiral ordered some strings of glass-beads, and toys of small value, that made a glittering show, to be distributed amongst the natives; at which they seemed infinitely pleased, and immediately hung the beads about their necks, testifying, by all the signs imaginable, the value they set upon these presents. They were all perfectly naked, of a middle stature, and olive complexion, their features just, only their heads of the largest; their eyes black as well as their hair, which was generally cut short about their ears, though others wore it long, and tied up; some of them also had their bodies painted with a kind of vermilion, and others only painted their faces with it. The principal ornament about them was a thin gold plate, in the form of a crescent, which hung from the nose over the upper-lip, and on their arms were spears, pointed with the bones of fish. When the admiral returned to his ships, they followed him; some swimming, and others in their canoes, a vessel made out of the body of a turtle, some of which would hold forty men, and others more than two. When they came on board, they brought parrots and cotton-yarn, and all the merchandise they had to exchange for European trifles. They seemed to set a value upon every piece of broken glass or earthen-ware, jumping into the sea, and swimming to shore with such trifles, with abundance of joy. They admired nothing more than the swords, and bright arms of the Spaniards, being at that time perfectly ignorant of the use of iron.

The admiral demanding, as well as he could be signified, from whence they had their gold-plates, he pointed to the south and south-west, where they perceived the Spaniards to understand, there were several rich countries well furnished with that precious metal. The admiral rowed in his boats round the island, to discover if there was any thing worth settling there, being followed by the islanders every where, who seemed to love him and his people, as if they were come from heaven. From this island he failed to another of the Bahama islands, which he called St. Mary of Conception, and having viewed this, and several more of these islands, and found nothing to invite him to stay here, he took seven of the natives with him, and set sail for the Island of Cuba, which lies to the southward of the Bahama islands, arriving there on Sunday, the 28th of October: here they found some houses on the shore,

the people all fled up into the mountains on their
broach; whereupon two Spaniards and two Indians
ere sent up into the country to get intelligence; who,
urning again the 5th of November, reported they
elled about twelve leagues within the land, that
y came to a town consisting of fifty large timber-
uses, thatched, which contained about 1000 people;
o came with great respect, and kissed the two Spa-
rds feet, giving them boiled roots to eat. They
reated them also to remain in their country; and,
en they saw them resolved to return to their ships,
en they saw them resolved to return to their ships,
ould accompany their guests thither; for the two In-
s had informed the natives there was no danger to
eared from the Spaniards. There were several other
ns the Spaniards reported they had seen in their
ney, where they were hospitably entertained, and
the country was well planted with oaks, pines,
ns, and cotton-shrubs, and sown with Indian corn.
it being demanded of the natives, if they had any
or precious stones, they pointed towards the east,
imating, that in a great country, called Bohio, and
ch the Spaniards afterwards named Hispaniola,
ere was plenty of these things. Whereupon the cap-
tained determined to sail eastward, and taking twelve of
natives of Cuba, men, women, and children, with
the husband of one of the women, and father of
of the children, who had been carried on board,
e in a canoe to the ship, and desired he might also
with them, and not be parted from his wife and
children; whereupon the captain ordered him to be
en on board; and setting sail from Cuba the 5th of
ember, arrived the next day at the island of Bohio,
ur sixteen leagues to the eastward of Cuba; and
observing the country to resemble that of Spain in
particulars, he gave it the name of Hispaniola;
ed its principal port Nativity, built a fort, placed a
sion in it of thirty-three men, and then returned to
to give an account of his expedition.

The Spaniards court was then at Barcelona; he en-
d that city in triumph, and was received by the
with the utmost demonstrations of joy; and by
people with the loudest acclamations. He had the
our of publicly presenting the plan and of giving
account of his discoveries, to the king and queen of
in person. The Spaniards now were as eager
romote his designs, as they had before been dilatory.
et sail a second time, with a fleet of seventeen ve-
sels containing 1500 men. In this second voyage,
discovered Jamaica, and other islands; but the ad-
miration which first attended his actions, being changed
enry, his enemies prejudiced the court against him,
he was obliged to return to Europe to justify his
conduct.

After having cleared himself from the aspersions of
foes, he proceeded on his third, and most impor-
tant voyage; the success of which is thus described by
elegant pen of the learned Dr. Robertson. " On
1st of August 1498, the man stationed in the round

top surprised them with the joyful cry of land. They
stood towards it, and discovered a considerable island,
which the admiral called Trinidad, a name it still re-
tains. It lies on the north coast of Guiana, near the
mouth of the Orinoco. This river, though only of the
third or fourth magnitude in the New World, far sur-
passes any of the streams in our hemisphere. It rolls
towards the ocean such a vast body of water, and rushes
into it with such impetuous force, that when it meets
the tide, which on that coast rises to an uncommon
