of St. Paul's. It has beautiful cloisters, and 19 chapels in it, with the arms and monuments of great persons. Here is an elegant stone bridge over the river, with a key-wharf and custom-house; abundance of crosses and statues of the kings of England are dispersed in different parts of the city, and large remains of monasteries. Its town-hall for the assize is called the booth-hall. Under the bridge is a curious machine, which raises water to serve the town. The trade of this city is not now so considerable as heretofore.

Litchfield is thought to be the most considerable city in the north-west of England, except Chester. It stands in a valley, three miles south of the Trent, and is divided by a stream which runs into that river. The cathedral was founded in 1148; it was much damaged during the civil war, but was so completely repaired soon after the Restoration, that it is now one of the noblest Gothic structures in England.

Coventry is united with Litchfield in Staffordshire, as a bishopric. There are many traditional stories relating to this city, particularly that of lady Godiva, who, to obtain and perpetuate some privileges, rode naked through the streets, and an annual procession is still made through the town in commemoration of it. In the reign of Henry VIII. a stately cross was erected here by Sir William Holles, lord-mayor of London, in the middle of its spacious market-place, greatly admired for its workmanship. It was 66 feet high, adorned with the statues of most of the English kings as big as the life; but the stone it was built with being sandy and porous, it was so much decayed, that it was taken down some years since. The city is large and populous, but the buildings are old; and some of them, which are built with timber, project out so much, that in the narrow streets the tops of the opposite houses almost touch. The chief churches are St. Michael's and Trinity. The Protestant Dissenters are a considerable body here. The town-house is worth seeing, the windows being of painted glass, representing some of the old kings, &c. who have been benefactors to the city. Its chief manufactures are tanneries, and the weaving of ribbons.

The city of Chester is large, populous, and wealthy; it has a noble bridge, with a gate at each end, and twelve arches over the Dee, which falls into the sea. This city contains eleven parishes, and nine well-built churches. The streets are generally even and spacious, and, crossing one another in straight lines, meet in the centre. The walls were first erected by Edeldreda, a Mercian lady, in the year 908, and join on the south side of the city to the castle, from whence there is a pleasant walk round the city upon the walls, except where it is intercepted by some of the towers over the gates; and from hence there is a prospect of Flintshire and the Welsh mountains.

Warwick, on the Avon, the county town, stands on a situation remarkably rocky. It is of great antiquity, and may be approached by four ways, answering

to the points of the compass, and cut through rocks. These lead to four streets which meet in the centre of the town. The walls and cellars are made in the rock. It is supplied with water by pipes from springs half a mile off, and has a noble stone bridge of 12 arches over the Avon. Here is a castle, the principal ornament of the place, strong both by art and nature: the rock on which it stands is 40 feet from the river, but on the north side it is even with the town. From its terrace, which is above 50 feet perpendicular above the Avon, there is a prospect of the river, and a beautiful country beyond it. The apartments are well contrived, and many of them adorned with original pictures by Van Dyke, not inferior to some in the royal palaces. It was built originally by William the Conqueror. Near the town is Guy's Cliff, a high perpendicular rock, where Guy, Earl of Warwick, is said to have lived a hermit after his defeating the Danish giant Colbrand. His sword and other accoutrements are still shewn in the castle.

The city of Salisbury is large, neat, and well-built; it is situated in a valley, and watered by the river Avon on the west and south, and by the Bourne on the east. The streets are generally spacious, and built at right angles. The cathedral, which was finished in 1258, at the expence of above 26,000*l.* is, for a Gothic building, the most elegant and regular in the kingdom. It is in the form of a lantern, with a beautiful spire of free-stone in the middle, which is 410 feet high, being the tallest in England. The length of the church is 478 feet, the breadth 76 feet, and the height of the vaulting 80 feet. The church has a cloister, which is 150 feet square, and of as fine workmanship as any in England. The chapter-house, which is an octagon, is 150 feet in circumference, and yet the roof bears all upon one small pillar in the centre, so much too weak in appearance for the support of such a prodigious weight, that the construction of this building is esteemed one of the greatest curiosities in the whole country.

Bedford, a county town, is a clean, well-built, populous place. Here are five churches, of which the chief, and indeed the principal ornament of the town, was founded before the Norman conquest for secular canons. The buildings of this town are pretty good, and the streets broad. The north and south parts are joined by a stone bridge over the Ouse. A famous castle here was demolished in the reign of Henry VIII. and the site is now a bowling-green, reckoned one of the finest in England.

The city of Oxford stands on the conflux of the Charwell and Isis; the name seems to be derived from a Saxon word, which signifies a ford for the passage of oxen. It enjoys a sweet air, in a plentiful country, on a fine plain, and has every way a delightful prospect. The private buildings are neat, the public ones sumptuous, and the river navigable for barges.

Cambridge is so called from its situation on the banks of the Cam, which forms several islands on the

west side, and divides the town into two parts, which are joined by a large stone bridge. It is very ancient, being well known in the time of the Romans by the name of Camboritum. William the Conqueror built a castle here, of which the gatehouse is still standing, and used for the county gaol. The town is divided into 10 wards, has 14 parish churches, contains upwards of 1200 houses, for the most part irregularly built, and about 6000 inhabitants.

Bath took its name from some natural hot baths, for the medicinal waters of which this place has been long celebrated, and much frequented. In the spring this place is most frequented for health, and in the autumn for pleasure, when at least two-thirds of the company, consisting chiefly of persons of rank and fortune, come to partake of the amusements of the place. In some seasons there have been no less than 8000 persons at Bath, besides its inhabitants. Some of the buildings lately erected here are extremely elegant, particularly Queen's-Square, the North and South Parade, the Royal Forum, and the Circus.

Nottingham, reckoned one of the neatest places in England, has as good a trade as most inland towns. It stands pleasantly on the ascent of a rock overlooking the river Trent, which runs parallel with it about a mile to the south, and has been made navigable. It has three churches, a grand town-house built on piazzas, a fine spacious market-place with two crosses in it, and a gaol for the town and county; a manufactory for weaving frame stockings, and likewise for glass and earthen-ware.

Colchester, the chief town in the county of Essex, is a large populous place, on the river Colne, which passes through it, and is made navigable for small craft up to the Hithe, a long street, which may be called the Wapping of Colchester, where there is a convenient key; and at Vennoe, within three miles of it, is a good custom-house. This, and all the towns round it, are noted for making of baize, of which great quantities are exported. For the support of this trade, there is a corporation called Governours of the Dutch Bays-Hall; this town is also noted for excellent oylers. It is reckoned about three miles in circumference, has ten parish churches, and five meeting-houses. It had anciently a wall and a strong castle, build by Edward, son to king Alfred, about the year 912; but now few marks remain of either. It is supposed to have been anciently a Roman colony, many ruins, and some buildings of Roman brick, still remaining. The Queen's-Head in the market-place, is thought to be a Roman structure. St. John's-Abbey was erected by Eudo, steward to William Rufus, about the year 1097.

The royal dock-yards, where the men of war are built, repaired, and laid up, are astonishing. They are six in number, viz. Deptford, Woolwich, Sheerness, Chatham, Portsmouth, and Plymouth. The private structures for the officers are all of them well built, and many of them elegant: but the public buildings

ings are surprisngly large and stately. The warehouses,
or rather streets of warehouses and storehouses, for lay-
ing up the naval stores, are the most capacious, and
excel in number those of any other nation in the
world. The rope-walks for making cables and cord-
age, and the forges for anchors and other iron-work,
bear a proper proportion to the rest. The wet-docks,
canals, and ditches for keeping masts and yards of the
largest size, where they lie afloat in the water, to pre-
serve them, under the mast-houses; the boat-yards, an-
chor-yards, founderies, &c. are not easily described.
The stores themselves exceed all imagination; the sails,
the rigging, the cannon, bullets, bombs, small arms,
swords, cutlasses, half-pikes, and all the other furni-
ture of the ships out of commission, are laid up in these
cansals, each species in its respective buildings and
storehouses, and in those particular parts appropriated
to each ship; where they are deposited in such order,
that all, or any part, may be taken out on the most
emergent occasion, without the least confusion. Be-
sides these, there are prodigious warehouses for laying
up different species of furniture and stores for ships in
general, for the fitting out ships as soon as they are
built, or for supplying and repairing others, as occa-
sion may require. For this purpose, there are separate
and respective magazines of pitch, tar, hemp, flax,
tallow, or oakum, rosin, oil, sail-cloth, canvas,
cables, standing and running rigging ready fitted, and
carguage of all kinds not fitted; every species of ship-
chandlery necessaries, such as blocks, tackles, runners,
&c. with the boatswains, gunners, and carpenters
stores, anchors of all sizes, grappels, chains, bolts, and
spikes, wrought and unwrought iron, boats, spare masts
and yards, vast quantities of lead, nails, and other ne-
cessaries, too numerous to particularize here. All the
building-yards, docks, &c. for the use of the royal
navy, resemble well-regulated cities; and though the
business performed in them seems to be often in the
utmost hurry, yet such is the order constantly observed,
that there is not the least confusion among the work-
men.

The English commerce has been improving for a
long series of ages; but since the accession of queen
Elizabeth, it has made the most rapid strides towards
perfection. It was in that reign we began to settle
colonies in America, and watch the improvements of
the European nations with great attention. The Span-
iards and Portuguese were originally in possession of
the trade of both the Indies; but the oppressions of the
former induced the Dutch to throw off the yoke under
which they had long groaned, and, in conjunction
with the English, formed a plan of commerce superior
to any thing known before, and which has hitherto
been prosecuted with amazing success by both nations.

The exports of England consist in the different ar-
ticles of corn, cattle, butter, cheese, pork, beef, bis-
cuit, copper manufactured and unmanufactured, iron,
lead, tin, leather, copperas, pit-coal, alum, hops,

flax, saffron, hats, shoes, herrings, pilchards, salmon,
cod, oysters, liquorice, watches, ribbons, toys, wool,
broad-cloths, bays, kerseys, rushes, serge, fays, serizes,
tuffs, flannels, rugs, caps and stockings, cannons,
mortars, bombs, guns, pistols, swords, locks, spades,
knives, scissors, razors, and other edge-tools, coppers,
kettles, saucepans, pewter and other household uten-
sils of brass and iron. There is no maritime part of
the habitable globe, to which England has not extended
her commerce, and where her ships are not well known.
Russia, Sweden, Denmark, Norway, Hamburgh, Bre-
men, both sides of the Baltic, all the northern parts
of Germany, Holland, Flanders, Portugal, Spain, Sic-
ily, Italy, the Levant, the coast of Africa, the East
and West-Indies, and a vast variety of other places,
are served with the commodities of England; though
with some of those nations the balance of trade is not
in our favour.

The trade to the East-Indies is carried on by a set of
individuals, termed the East-India-Company. Their
exports to that part of the world consist in broad
cloths, and other articles of the woollen manufacture,
all sorts of hard-ware, lead, bullion, and quicksilver.
Their imports consist of gold, diamonds, raw silk,
drugs, tea, pepper, arrack, porcelaine or china-ware,
salt-petre for home consumption, wrought silks, mus-
lins, calicoes, cottons, and all the woven manufac-
tures of India, many of which they export again to
other countries, the consumption of them being pro-
hibited in England. The East-India-Company is one
of the richest and most flourishing in Europe.

We shall now proceed to give the reader a concise
view of the English trade to other countries, two-
thirds of which are supposed to be carried on in the
port of London.

England exports to Turkey, in her own bottoms,
woollen cloths, tin, lead, and iron, hard-ware, iron
utensils, clocks, watches, verdigris, spices, cochineal,
and logwood. She imports from thence raw silks, car-
pets, skins, dying drugs, cotton, fruits, medicinal drugs,
coffee, and some other articles. The balance of this
trade was formerly about 500,000*l.* annually in favour
of England; it was afterwards diminished through the
practices of the French, and is now at a very low ebb
with both nations.

To Italy, England exports various kinds of woollen
goods, poultry, leather, lead, tin, fish, and East-India
goods; and imports from thence raw and thrown silk,
wines, oil, soap, olives, oranges, lemons, pomgra-
nates, dried fruits, colours, anchovies, and other ar-
ticles of luxury; the balance of this trade is annually
about 200,000*l.* in favour of England.

The trade between England and Spain was formerly
much more considerable than it is at present, for they
have of late years set up woollen manufactures at home,
and are supplied from France with many necessaries
which they used to have from us.

The English trade to Portugal was once extremely
beneficial.

beneficial, but of late her ministry have changed their system, and have partly fallen in with the views of the house of Bourbon. Formerly England sent to that country almost the same kind of merchandize as to Spain, and they received in return vast quantities of wines, with oils, salt, dried and moist fruits, dyeing drugs, and gold coin; but they have of late years established courts which are inconsistent with the treaties between Portugal and England, and defraud the English merchants of great part of their capitals, which they find it impossible to recover. This is the treatment the English meet with from their once favourite ally, whose fleets and armies have repeatedly saved her from destruction.

Our open commerce with France is discouraged by very high duties, and many articles from that country are entirely prohibited; notwithstanding which, England sends to that rival country much tobacco, lead, tin, flannels, horns, and sometimes corn, and always much money at the long-run; and brings home, in a smuggling way, a much greater value in wines, brandies, brocades, linens, cambrics, lace, velvets, and many other prohibited fopperies, always very considerably to England's disadvantage.

To Flanders, England sends serges, flannels, tin, lead, sugars, and tobacco; and receives in return, laces, linens, cambrics, and other articles of luxury, by which England loses annually, upon the balance, 250,000l. sterling.

England sends to Germany cloths and stuffs, tin, pewter, sugars, tobacco, and East-India merchandize, and brings thence vast quantities of linen, thread, goat-skins, tinned plates, timbers for all uses, wines, and many other articles. Before the American war, the balance of this trade was thought to be 500,000l. annually to the prejudice of England; but that sum is now greatly reduced, as most of the German princes find it their interest to clothe their armies in English manufactures.

The trade with Denmark, Norway, Sweden, and Russia, we have observed, was formerly against England; but the balance was since much diminished by the great improvements of the American colonies, in raising hemp, flax, making pot-ash, iron works, and tallow, all which used to be furnished to her by the Northern powers.

The balance of trade with Poland may be estimated much in our favour. The goods exported thither by the way of Dantzic are many, and the duties upon them low. Many articles are sent there, for which there is at present no demand in other countries. Poland consumes large quantities of our woollen goods, hard-ware, lead, tin, salt, sea-coal, &c. and the export of manufactured tobacco is greater to Poland than to any other country.

England sends to Holland an immense quantity of many sorts of merchandize, such as all kinds of woollen goods, hides, corn, coals, East-India and Turkey merchandize, tobacco, rice, and other American pro-

ductions; and imports from thence fine linen, lace, cambrics, thread, tapes, incle, malder, boards, drugs, whalebone, train-oil, toys, and many other things, the English are supposed to have the balance much in their favour by this trade.

The trade to the coast of Guinea is at present open to all British subjects without restriction. England sends thither sundry sorts of coarse woollen and linen iron, pewter, brass, and hard-ware manufactures; lead shot, swords, knives, fire-arms, gunpowder, and glass manufactures. The returns are in gold-dust, gum-red wood, Guinea grains, ivory, dyeing and other drugs; and, besides drawing no money out of the kingdom, it lately supplied the American colonies with negro slaves, to the amount of above 100,000 annually.

England sends to Arabia, Persia, China, and other parts of Asia, much foreign silver coin and bullion, sundry woollen goods, lead, iron, and brass, and from those remote regions brings home muslins and cottons of many various kinds, calicoes, raw and wrought silk, chintz, teas, porcelain, gold-dust, coffee, saltpetre, and many sorts of drugs. A great quantity of those various merchandizes are re-exported to foreign European nations: by which means all the silver bullion carried out by England in this trade is very amply compensated.

It having been judged expedient, during the infancy of commerce with foreign parts, to grant exclusive charters to particular bodies or corporations of men in consequence of this, the East-India, South-Sea, Hudson's-Bay, Turkey, Russia, and Royal African Companies were formed and established; but though the trade to Turkey, Russia, and Africa is now laid open, yet the merchant who proposes to trade thither must become a member of the respective Company, be subject to their laws and regulations, and advance a sum on admission, for the purposes of supporting castles, forts, and defraying other incidental expences.

By the general account of England's foreign balance the exports have been computed at seven millions sterling, and the imports at five; of which above one million is re-exported; so that if this calculation be true, England gains annually three millions sterling by trade; but this is a point upon which the most experienced merchants and ablest calculators differ. It is reckoned, however, that our foreign trade does not amount to one-sixth part of the inland; the annual produce of the natural produce and manufactures of England amounting to above forty-two millions. The gold and silver of England is received from Portugal, Spain, Jamaica, the American colonies, and Africa; but great part of this gold and silver we again export to Holland and the East-Indies.

The following comparative view of shipping will give the reader an idea of the superiority of the English trade to that of all other countries, except Holland. If, then we divide Europe into twenty parts, Great Britain, &c. is computed to have six; the United

Provinces, six; the trading cities, one; Italy, and the Netherlands are employed in commerce of the kingdom, many are employed in commerce.

The prodigious quantities of commodities which are exported from every county of the kingdom, of our home manufactures, and of our foreign manufactures, the Phoenicians, the Romans knew.

They have ever since been the chief manufactures of that trade, and Devonshire especially in several manufactures is famous.

Down, but principally the following to the clothing trade: the, Buxton, Shropshire, in Somersetshire, Chippenham, Wiltshire, Warminster, Shaftesbury, Dorchester, in Dorsetshire, Minschington, in Devonshire. These towns are at a considerable distance from the sea, with a great number of houses, chiefly in the country, who perform the trade.

This noble manufacture is employed here is very ingenious trade, 2,350,000 acres.

This computation is an ancient inhabitant of the whole truth, the whole of the infinite number of plains of Wiltshire, indeed the cloth of their residence; trade was in it, want of wool for as the number of has been greatly increased of the cloth of the same time, clothiers are of the kingdom, ties of Northampton.

the trading cities of Germany and the Austrian Nether-
lands, one; France, two; Spain and Portugal, two;
Italy, and the rest of Europe, one. Above 800 large
vessels are employed in the coal trade only; and those
employed in coasting, or carrying goods from one part
of the kingdom to another, are computed at two
thousand, many of which are eighty or ninety tons
burthen.

The prodigious trade of England could not be sup-
ported, unless the sources which supply the necessary
commodities were equally great and inexhaustible.
Manufactures of various kinds are carried on in almost
every county of England. Cornwall supplies amazing
quantities of tin and copper, not only for the supply
of our home manufactures, but for exportation. The
Phoenicians traded thither for tin long before the
Romans knew any thing of Britain; and the mines
have ever since continued to produce very large quan-
tities of that metal, which is found only in Cornwall
and Devonshire; but copper and lead are found plen-
tifully in several counties of England. The woollen
manufacture is carried on in various parts of the king-
dom, but principally in the western counties, where
the following towns are almost wholly employed in the
clothing trade: viz. Frome, Pentford, Philip's-Nor-
th, Bidton, Shepton-Mallet, Castle-Carey, and Wim-
merston, in Somersetshire; Malmesbury, Castlecomb,
Chippenham, Caln, Devizes, Bradford, Trowbridge,
Wellsbury, Warminster, and Mere, in Wiltshire; Gil-
ingham, Shaftsbury, Beminstor, Bere, Sturminster,
Stoneborne, in Dorsetshire; Cirencester, Tetbury, Marsh-
field, Minching-Hampton, and Fairford, in Gloucester-
shire. These towns, as they in general stand at con-
siderable distances from one another, are interspersed
with a great number of villages, hamlets, and scattered
houses, chiefly inhabited by poor, but industrious people,
who perform the greater part of the spinning work of
this noble manufacture. The number of hands em-
ployed here is very great; the circuit where this pro-
digious trade is established, contains 788 parishes,
2,330,000 acres of land; and 374,000 inhabitants.
This computation is founded on the authority of the
ancient inhabitants, and is thought to fall short of the
truth, the whole country being extremely populous.

The infinite number of sheep fed upon the downs
and plains of Wilts, Dorset, and Hants, seem to have
induced the clothiers to choose the above district for
their residence; where, it was imagined, when this
trade was in its infancy, there could never be any
want of wool for carrying on their manufactures. But
as the number of sheep fed on these downs and plains
has been greatly lessened by converting many thousand
acres of the carpet ground into arable land; and at
the same time the manufacture greatly extended, the
clothiers are obliged to have recourse to other parts
of the kingdom for a supply, particularly to the coun-
ties of Northampton, Leicester, and Lincoln; and

several hundred packs are purchased weekly to supply
this prodigious consumption. They have also very
large quantities of wool from Kent, and often from
Ireland.

But though the above district is the principal, it is
not the only place where the woollen manufacture is
established; prodigious quantities of cloth, generally
of the coarser kind, being made in Yorkshire, Essex,
and other counties. Very large manufactures of ker-
seys and shalloons are established at Halifax in York-
shire; 100,000 pieces of the latter are said to be
worked up annually in that town only; and that the
manufacture of kerseys is much larger. Some idea
may be formed of the value of these manufactures
established at Halifax, and the adjacent towns, by
the cloth-market at Leeds, where between twenty and
thirty thousand pounds worth of kerseys, shalloons;
and other species of the woollen manufacture, are sold
every market, which is held twice a week. Pro-
digious quantities of bays and says are made at Col-
chester and the neighbouring villages. About twenty
years ago the returns of this manufacture amounted to
near thirty-thousand pounds a week; but it is now
considerably declined, though still of very great im-
portance.

A worsted manufactory was established at Norwich
in the reign of Edward III. and afterwards carried to
great perfection by the Flemings, who fled from the
duke of Alva's bloody persecution, and settled here in
the reign of queen Elizabeth. These foreigners in-
structed the natives in the art of weaving a great va-
riety of worsted-stuffs, as bays, says, serges, shalloons,
&c. in which they carry on a vast trade; and have
since established large manufactures of druggets, and
crapes, in which they return at least 100,000*l.* a year.
Here is also a stocking manufacture said to amount to
60,000*l.* a year.

Manchester is celebrated for its manufactures, par-
ticularly those of suttan, check, hats, and worsted
small wares. The quality of goods made here may be
imagined from the number of persons employed, who
are supposed to amount to above 80,000. A large
manufacture of serges is established at Exeter, and its
neighbourhood. It is now in a very flourishing con-
dition, and serges to near 100,000*l.* value, have been
weekly sold in the serge-market at Exeter.

The hard-wares for which England has been so long
famous, are made chiefly at Sheffield and Birmingham;
the former now carries on a large manufacture of plated
work; and the latter has improved several branches
of its trade.

The silk manufacture is principally carried on at
London and Canterbury, where it was originally estab-
lished. Spitalfields has been long famous for its
silk-weavers; and it is supposed that there are in that
small district near 10,000 inhabitants, chiefly em-
ployed in manufactures of various kinds. Prodigious
manufactures indeed of all kinds, that of wool ex-
cepted,

cepted, are carried on in London, particularly those of gold, silver, clocks and watches; the two former are equal at least to any in Europe, and the two latter far superior, when the commodities are executed by able workmen. Nottingham is celebrated for its stocking manufacture, which is not however confined to that place; Derby, and several towns in Gloucestershire, as well as Norwich, already mentioned, carry on an amazing trade in the same article. Coventry, Leicester, and many other large trading towns might be mentioned, but what has been observed may be sufficient to convey some idea of the manner how the vast foreign trade of England is supplied with goods for exportation. Several manufactures for making porcelain have been established in England, especially in the counties of Worcester and Derby, where the art is already carried to a very great degree of perfection. At Burslem, in Staffordshire, is a noble pottery in a very flourishing condition, near 10,000 hands being constantly employed. About twelve years since Mr. Wedgwood, the principal manufacturer, introduced what is called the cream-coloured ware, and since that time the increase has been very rapid. Large quantities are annually exported to Germany, Ireland, Holland, Russia, Spain, Portugal, the East-Indies, and some of the finest to France; but the largest orders come from North-America.

The locksmiths of Wolverhampton are reckoned the most ingenious in England; spurs, bridle-bits, stirrups, buckles, &c. are also made there in great quantities. The carpet manufactures at London, Exeter, Wilton, and Kidderminster, greatly exceed those of Turkey in the brilliancy of their colours; they are also very durable. Paper is likewise made in almost every part of the kingdom; this is also the case with hats, there being few towns in England without a manufacture of that kind. The parliament have, of late, given encouragement for reviving the beneficial manufacture of salt-petre.

The great and general utility of inland navigation has been long experienced in foreign countries. Holland by its many canals has the advantage of every other nation in Europe in respect to trade; and it is apprehended most of the inland parts of this kingdom are capable of enjoying equal, if not superior advantages. The navigation of several of the rivers in England were improved many years since; but there was no navigable canal in the kingdom, till the duke of Bridgewater, in the year 1739, began a noble work of that kind, from Wortley, an estate of his own, abounding in coal-mines, to Manchester, for the more easy conveying his coals to so considerable a market. The plan has been since greatly extended. And it is expected that the internal state of England will in a few years experience a considerable improvement, from the inland navigations which have been opened in many parts of it.

Having thus taken a view of the trade, commerce,

and manufactures of England, it remains that we add something with regard to the stocks. Though the word stock originally signified no more than a particular sum of money contributed to the establishing a fund for enabling a company to carry on a certain trade, by means of which the person became a partner in that commerce, and received a share of the profits in proportion to the money advanced; yet the term has been further extended, though improperly, to signify any sum of money which has been lent to the government, on condition of receiving an annual interest till the sum is repaid, and consequently makes a part of the national debt; because most of the money advanced to the government was done by the trading companies.

When the national funds were at first established the money borrowed was transferrable at any time either in whole or in part, from one person to another. This necessary clause of transferring stock, has given rise to that pernicious practice of stock-jobbing, which is one of the species of gaming so destructive to this country. The method is this: The persons concerned in this practice, make contracts to buy or sell for some settled price, at a certain distant time, a certain quantity of some particular stock. The contract being made, every art is made use of either to raise or lower such stock, by rumours and fictitious stories, that people may be induced to sell out in a hurry, and consequently cheap, if they are to deliver stock; or become unwilling to sell, and thence raise the price, if they are to receive stock. For the value of stock, as well as that of all other merchandize, will be always proportional to the number of buyers and sellers; if there are more of the former than the latter, a person who is indifferent about selling will not part with his property without a considerable profit to himself: on the contrary, if the sellers exceed the buyers, the value of stock will naturally fall in proportion to the impatience of those who are desirous of selling.

These contracts are generally made by persons who were never possessed of any real stock; so that when the time of delivery arrives, they only pay such a sum of money as makes the difference between the price mentioned in the contract, and that of the price of stock when the contract is fulfilled. The buyer is called the Bull, and the seller the Bear, in the polite language of Exchange-Alley. It will not be surprising that even false rumours should produce considerable effects in the price of stocks, when it is remembered that every thing which affects the hopes, the fears, and passions of the proprietors, so far as they regard the situation of public concerns, must raise or lower their current value. Public credit depends in a great measure on the supposed stability of the establishments of government: every incident, therefore, that proves unfavourable to the government, will have more or less effect on the public credit, which is the foundation of the stocks, and the security of the proprietors.

when any thing will endeavour to run the risk at a lower price than the commodity. The very reverse happens in favor of the stock. The word stock also signifies some particular sum of money which can be put to use already for a person to another value of one stock the produce per annum. But it is a stock of a trade of a thousand pounds for so much more of the same sum, not reckoned on at the same time much per annum. It is the profits of their trade. The first idea in queen Elizabeth's great alterations originally only 500,000 l. 5s. but the dividend to make profits to the company so that each be 739,782. 10s. profits of the company whole stock. when any thing of that kind happens, timorous people will endeavour to make sure of their own private fortunes, by turning their stock into specie; and, rather than run the risk of losing the whole, they will sell it at a lower price; for when the demand is small, and the commodity abounds, the market falls of course. The very reverse is the consequence when any incident happens in favour of the government.

The word stock is not confined to the national debt, it also signifies the capital of a company, raised for some particular purpose, and limited by parliament to some certain sum. When this fund is completed, no stock can be purchased from the company; but the shares already purchased may be transferred from one person to another. Hence we see the reason why the value of one stock is greater than that of another, because the produce per cent. is greater in some than in the others. But it must be observed, that the share in the stock of a trading company that produces any sum, a thousand pounds for instance, per annum, will not sell for so much money as a government annuity producing the same sum, because the security of the company is not reckoned equal to that of the government; and, at the same time, the continuance of their paying so much per annum is more precarious, as their dividends are, or ought to be, always proportional to the profits of their trade.

The first idea of the East-India-Company was formed in queen Elizabeth's time, but it has since undergone great alterations. Its shares, or subscriptions, were originally only 50l. sterling; and its capital only 250,000l. 5s. but the directors having a considerable dividend to make in 1676, it was agreed to join the profits to the capital, by which the shares were doubled, so that each became of 100l. value, and the capital 500,000l. 10s. to which capital, if 963,619l. 10s. the profits of the company to the year 1685, be added, the whole stock will appear to be, 1,703,402l. After the Revolution, a new company was erected, under the authority of parliament, and, after violent struggles between that and the old, they were both united, in the year 1702, by an indenture tripartite.

In the year 1708, the yearly fund of eight per cent, for two millions was reduced to five per cent, by a loan of 1,200,000l. to the public, without any additional interest; for which consideration, the company obtained a prolongation of its exclusive privileges; and a new charter was granted to them, under the title of "The United Company of Merchants trading to the East-Indies." A further sum was lent by the company in 1730, by which, though the company's privileges were extended for thirty-three years, yet the interest of their capital, which then amounted to 2,190,000l. was reduced to three per cent; and called the India three per cent. annuities; the proprietors of which, instead of a regular annuity, have a dividend of the profits arising from the company's trade: India bonds (erroneously denominated stock) are to be ac-

cepted, they being made payable at six months notice, either by the company or the possessor.

There are twenty-four directors of this company; their meetings are at least once a week; and out of their body are chosen several committees, who have the peculiar inspection of certain branches of the company's business; 2000l. is the qualification for a director. Formerly 500l. but now 1000l. entitles such a proprietor of stock, whether man or woman, native or foreigner, to be a manager, and gives a vote in the general council.

The company's amazing territorial acquisitions, and other causes, induced the legislature, to lay a restriction on their dividends for a certain time. From the report of the committee in 1773, appointed by parliament in India affairs, it appears that the India company, from the year 1708 to 1756, for the space of forty-seven years and an half, divided the sum of 12,000,000l. or above 280,000l. per annum, which, on a capital of 3,190,000l. amounted to above eight and a half per cent. the capital stock had also been increased 180,000l. In 1773, an act passed, for "establishing certain rules and orders, for the future management of the affairs of the East-India-Company, as well in India as in Europe," by which considerable alterations were made respecting qualifications for voting, the courts in India, the governors, judges salaries, &c. This was deemed an extraordinary act, adding an immense power and influence to the crown, without benefiting the company.

In November 1783, Mr. Fox, then Secretary of State, introduced a bill, the intention of which was, to vest the whole powers of the India-Company in seven Directors, by him named, who were to hold their offices four years, removable, like the twelve judges, by an address of either House of Parliament, and not by any other power; and for managing the commercial affairs of the Company, nine gentlemen, moved for and adopted in the same manner, were to assist them, subject to their control, and removable by them. The effect of this was, to vest in these seven Directors the whole influence of the offices of every kind in India, and at home, belonging to the Company; and many other means of influence. This bill passed the Commons; but as the Lords conceived it placed too dangerous a power in the hands of any men, and operated against the necessary power of the crown, they therefore threw it out by a majority of nineteen.

The parliament and administration of 1784 seemed disposed to be friendly to the company, whose interests had been greatly injured by their servants both at home and abroad. The nabobs, rajahs, and natives of India have been by turns harassed and despoiled under their management, and many parts of that fine country depopulated. The Company's governors abroad have guards of soldiers, and live in all the state of sovereign princes. These irregularities paved the way for a new bill, which passed at the close of the session 1784, by

which were intended three things: first, The establishing a power of control in this kingdom, by which the executive government in India is to be connected with that over the rest of the empire: secondly, The regulating the conduct of the Company's servants in India, in order to remedy the evils which have prevailed there: and, thirdly, The providing for the punishment of those persons who shall, nevertheless, continue in the practice of crimes which have brought disgrace upon the country. This famous bill has a plausible aspect, and various opinions have been formed concerning it: some contend that the principle and plan thereof are fair, equitable, and honourable; but the following protest, signed, PORTLAND, CARLISLE, DEVONSHIRE, CHOLMONDELEY, NORTHINGTON, was entered against it in the House of Lords: "Because we think the principle of the bill false; unjust, and unconstitutional: false, inasmuch as it provides no effectual remedy for the evils it affects to cure; unjust, as it indiscriminately compels all persons returning from India to furnish the means of accusation and persecution against themselves; and unconstitutional, because it establishes a new criminal court of judicature, in which the admission of incompetent evidence is expressly directed, and the subject is unnecessarily deprived of his most inestimable birthright, a trial by jury." This bill, like former ones, may be deposited among the archives of the councils of the governments in the East-Indies, to lie in oblivion, or be treated with contempt. Rapacity and violence, it is feared, will still predominate; the most upright may be overpowered by violence; or be sent home loaded with irons, to plead their cause for pretended crimes charged against them by the emissaries of powerful delinquents, whose peculations and rapacity they endeavoured in vain to repress.

The East-India-Company, finding a scarcity of small money in their settlements, have coined under the inspection of a Committee of Directors, a milled copper coin, with their arms stamped on it, which, though nearly the size of a farthing, is only a sixth part of that value.

AS the military affairs of the East-India-Company have of late become peculiarly interesting, we presume it will be deemed acceptable to our readers; and the public at large, if, with a view to render this part of our work more complete, we introduce here a compendious account of the late memorable war, in that quarter, with Tippoo Sultan (or Tippoo Saib), and the advantageous termination of it to the Company, by the bravery of the English forces. In order to this (without entering into the grounds, object, or expediency of this Indian war, respecting which the sentiments of the members in the British House of Commons were greatly divided) we shall give a particular detail of the most remarkable circumstances relating to it, as

they respect its actual commencement, progress, and period.

We may date the commencement of hostilities in this war from the engagement between the troops of the Rajah of Travancore, who were stationed in Cranganore, and for the defence of that fortress, with those of Tippoo Sultan on the 1st of May 1790. This event, which was expected by our government, and possibly concerted with them, was the signal for the most vigorous preparation for war on the part of the British. The grand Carnatic army assembled immediately in the southern provinces. The general plan of the campaign was to reduce the Coimbatore country and all the adjacent territory which lay below the Ghauts, or narrow passes between the mountains, and to advance by the Gijjelhety pass to the siege of Seringapatam, the metropolis of Mysore.

While such were to be the operations of the grand army under general Meadows, the Bombay army under general Abercrombie was to undertake the reduction of the country lying to the west of the Ghauts, and afterwards to co-operate with the main army, as circumstances might direct. In the mean time the safety of the Carnatic was secured by a force under colonel Kelly, and styled, from its position, the centre army, being stationed in the line between Madras and the passes leading to Mysore. The Poonah Mahrattas and the Nizam were respectively to penetrate the enemy's territory in the quarter bordering upon theirs; and Seringapatam was established as the common centre, where the whole force was to appear in a collective body.

The movements were executed with such dispatch that general Meadows joined the grand army at Trichinopoly on the 24th of May, and on the 26th this formidable body of finely appointed troops, amounting to 14,000 effective men, marched towards the Coimbatore country. The march, however, of Indian armies cannot be very rapid, as their baggage and provisions are mostly transported upon bullocks. It was therefore the 15th of June before general Meadows entered Tippoo's country; and the first place that surrendered to the British arms was the fort of Carroor, about forty-five miles from Trichinopoly, which was immediately evacuated on the appearance of the British general.

Extraordinary as it may appear, yet Tippoo took scarcely any measures to secure the country below the Ghauts, nor even to remove or destroy the grain in a territory which it was evidently not his intention to defend. Notwithstanding this circumstance, however, so inadequate is such a country to the supply of a considerable force as that of the British, that it was the 3d of July before the army was enabled to move from Carroor, after collecting all the supplies which the country afforded, and after putting the fort on the most tenable footing possible.

tiles to Daraporum. In this place they were fortu-
 nate enough to find a very seasonable and plentiful
 supply of grain. Here they learned that Tippoo had
 ascended the Ghauts, leaving at the foot of them,
 between Gajelhetty and Damicotta, a strong de-
 tachment of horse. On the 22d of July the army
 entered Coimbatore, which was also evacuated on
 their approach, though it contained a considerable
 quantity of grain, and some military stores. The
 smaller forts in the neighbourhood of Coimbatore
 were reduced by different detachments in a short time.
 An enterprize of more importance was also attempted
 during the halt of the army of Coimbatore. Soon
 after their arrival at that capital, colonel Floyd, with
 the cavalry, was dispatched towards Damicotta, about
 fifty miles to the north, in the hope of surprizing
 the detachment of cavalry, which, we have just in-
 timated, was stationed by Tippoo below the Ghauts;
 the colonel however only succeeded in capturing about
 fifty horse.

About the latter end of August, colonel Floyd was
 again sent to reduce Sattimungalum and Damicotta.
 The former was garrisoned by a battalion, and, having
 been intended as a depot, considerable quantities of
 provisions were collected there: it, however, surren-
 dered to colonel Floyd without the smallest resistance.
 Being soon after joined by a detachment under colonel
 Oulham, the whole body was computed to be nearly
 equal in strength to one wing of the grand army, but
 without its proportion of artillery. The station which
 this small army occupied after the capture of Satti-
 mungalum, was to the south of the Bowanny river,
 opposite that fortrefs. On the 12th of September,
 Tippoo Sultan descended the Gajelhetty Pass, and on
 the following day commenced a smart cannonade on
 colonel Floyd's detachment. During the night there-
 fore the Colonel thought it necessary to retreat to-
 wards Coimbatore, but during the whole of the suc-
 ceeding day, the 14th, found himself closely pressed
 by the enemy. The severest part of the conflict was
 in the evening near Showoor, when the Mysorean
 force was repulsed with equal valour and judgment on
 the part of the British.

General Meadows having received very early intel-
 ligence of Tippoo's motions, that commander lost no
 time in marching to the relief of colonel Floyd. On
 the 14th at night the general reached Vallady, while
 colonel Floyd was at Showoor about twenty miles to
 the eastward. By some unaccountable mistake, how-
 ever, the army continued to march to the northward,
 and did not join colonel Floyd till the 16th. The loss
 on this occasion amounted to 150 killed and near 300
 wounded, and six guns were left behind, on account
 of the loss of the draft cattle. After halting the whole
 of the 17th, in order to refresh colonel Floyd's detach-
 ment, general Meadows marched to the eastward to
 offer Tippoo battle; but in the mean time the Sultan
 had retreated to Sattimungalum, and the British gene-

ral, from want of provisions, was under a necessity of
 returning to Coimbatore.

The month was nearly ended before general Meadows
 was able to march again in quest of the enemy. The
 wary Indian, however, who never fights but at an
 advantage, was too cautious to be engaged by the
 manœuvres of the general. When the army arrived
 at any post in the evening, the usual report was, that
 Tippoo had quitted it early in the morning; and a
 general ignorance of his motions and designs seems
 indeed, for some time, to have pervaded the camp;
 and it was the 12th of October before any authentic
 intelligence could be gained. It then appeared that
 his object had been to attack Daraporum, which sur-
 rendered to his arms, and the British garrison fired
 in camp on the 17th, under an escort of Tippoo's
 troops, agreeably to the terms of capitulation. The
 garrison spoke in high terms of the honourable treat-
 ment which they had experienced from this prince,
 who has been usually characterized as a cruel and
 impleachable tyrant.

On the 20th Tippoo departed from Daraporum;
 and, probably desirous of placing the Bowanny river,
 which at this season is rough and swelling, between
 his army and the British, proceeded to Sattimungalum.
 He might also have a further view in taking this
 position, viz. to prevent the junction of general
 Meadows with the centre army. The British general
 left Coimbatore on the same day that Tippoo quitted
 Daraporum, but nothing worth recording occurred till
 the 7th of November, when colonel Floyd, who had
 been sent to reconnoitre, brought the intelligence that
 Tippoo had crossed the Cavery to the north-east, in
 the beginning of the month, and was apparently pro-
 ceeding to stop the progress of the centre army, now
 commanded by colonel Maxwell, the former com-
 mander, colonel Kelly, being dead.

After a fatiguing and dangerous march, and after
 taking possession of several forts in the Barramaul,
 colonel Maxwell, on the 3d of November, took a
 strong position at Caveripatam, where probably his
 intelligence led him to wait the approach of Tippoo,
 rather than risk his army in a less favourable position
 by daring to advance.

It afterwards appeared that the conjectures which
 had been formed with respect to the designs of the
 enemy, were well founded. On the 12th, 13th, and
 14th, Tippoo presented himself before colonel Max-
 well in line of battle; but finding the British com-
 mander too well prepared and too strongly posted, and
 conscious that his rear would certainly be pressed by
 the near approach of general Meadows, he retired in
 time to secure himself a favourable position for a timely
 retreat.

After several marches of the grand army in pursuit
 of the enemy;—on the 17th of November the two
 armies (the grand and the centre army) effected a
 junction at Poolampetty; and on the following evening,

as they were pursuing their route to the southward, they came unexpectedly in sight of the rear of the Mysorean army, the advance of which was probably at that moment entering the pass of Tapoor. The rear consisted of the prime of Tipoo's cavalry, drawn up in compact bodies, to favour the retreat of the main body. They were cannonaded and pursued to the foot of the pass, and apparently suffered some loss.

The united armies under general Meadows directed after this their course backwards by the straightest road to Trichinopoly, in order to refresh themselves, and obtain a supply; but the weather proved so unfavourable, that they did not arrive in its neighbourhood till the 8th of December. Here they learnt that Tipoo had arrived at Munfurput, on the banks of the Colaronee, opposite Trichinopoly, on the 28th of November, where he continued encamped till December 6th, but without making any attack upon Trichinopoly, deterred, most probably, by the swollen state of the river. And while such were the movements of general Meadows, a detachment from the Bombay army, under lieutenant-colonel Hartley, rendered effectual assistance to the rajah of Travancore, and on the 5th of December general Abercrombie, with the remainder of the forces from Bombay, arrived at Tellicherry, while colonel Hartley was ordered to Paniani, to keep the communication open between the two armies.

General Abercrombie's first object was the reduction of Cannanore, upon which he marched the 14th of December, and on the 17th the town and garrison surrendered, and the troops engaged not to serve against the British during the war. Colonel Hartley nearly about the same time obtained possession of Perokabad, the capital of the Malabar coast, and the enemy retreated to the Ghauts. These successes were followed, on the 27th, by the surrender of the posts of Barragurry and Cootahpoore, so that the whole district along the coast from Billipatam river to Cape Comorin was now in possession of the British and their allies.

On the 5th of January 1791, the army under general Meadows left Trichinopoly, and proceeded to the right towards Madras, where earl Cornwallis had arrived on the 13th of December. On the 12th of January the right wing of the grand army reached Velout, about eighteen miles from Madras, and on the 29th of the same month earl Cornwallis joined the grand army there, which early in February proceeded in two columns towards Vellore.

It was supposed, from the direction of the march, that his lordship meant to enter the Mysore territory by the Baramaul valley; and so completely was Tipoo deceived by this feint, that his whole attention was directed to the passes in that quarter. The real object, however, of the British general was, the pass of Muglee; and so judiciously had he taken his measures, that no interruption was given to the army till they had proceeded three days march to the westward beyond the pass. It was the 22d of February before the last of

the public stores, and the baggage of the army, were got safe over the pass. The succeeding day was a day of halt. The order of battle was then published, and the bullocks and elephants mustered; of the former 27,000 were found fit for service, and, of the latter, eighty accompanied the army.

On the 24th of February, lord Cornwallis proceeded for Bangalore. After three days march, some parties of the enemy's horse were discovered, which increased as the army advanced; and before the British reached within eighteen miles of Bangalore, they burnt all the adjacent villages, and destroyed the forage. When advanced within ten miles of the fortress, Tipoo's army appeared in excellent order, and, taking possession of the heights, cannonaded the British rear, while his cavalry made an unsuccessful attempt on the baggage.

On the 5th of March, the British general encamped before Bangalore. In the afternoon colonel Floyd with the cavalry, being dispatched to reconnoitre, was tempted to attack Tipoo's rear, which at first appeared to give way; but the enemy being strongly reinforced soon rallied, and compelled the colonel to retreat. On the following day the pettah or town was stormed and taken, with the loss of 100 men; it was found to contain a good supply of grain, forage, and fuel.

Three batteries were opened on the fort by the 12th, but they were too distant to effect a breach; on the 16th therefore, a new battery of nine guns was opened at 550 yards from the works. On the 17th, and again on the 21st, Tipoo drew out his army, but without effect. A breach of some extent was about this time effected, and on the evening of the 21st, the fort was stormed and taken with little loss on the side of the British, but with a dreadful carnage of the unresisting garrison. Not less than 1000 were massacred with the bayonet, and 300, mostly wounded, were taken.

Such is war in its very nature and spirit, that it necessarily destroys the moral feelings; and such are its inevitable consequences, that, however distinguished for humanity the commander may be, he generally finds himself, on such occasions, unable to restrain the intemperance and cruelty of his soldiers. The philosopher, in future and in better times, will peruse these melancholy details with a sigh, and will ask, By what authority men embark from a distant shore, for the express purpose of imbruing their hands in the blood of their offenceless fellow creatures?

After remaining at Bangalore till the 28th of March the army proceeded to the N. N. E. towards Chinnabalarabaram. Nothing of importance occurred till the 7th of April, when they were joined by a party of the Nizam's troops, in number from 14 to 16,000, but in a very bad and irregular state. On the 19th colonel Oldham joined the army, bringing with him a valuable supply of stores and provisions, and a reinforcement of about 700 Europeans, and 4,500 native troops. On the 25th earl Cornwallis declared his intentions of proceeding to Seringapatam; but it was

the 3d of May before the army could be sufficiently prepared for so considerable an enterprize, since the march was attended with every inconvenience that could result from a hilly country, heavy roads, and almost continual rain.

The army arrived on the 13th at Arakeery; whence they had a view of their great object the capital of Mysore, then only about nine miles distant. At the same time they observed a large body of troops crossing from the island of Seringapatam to the north side of the river Cavery, and taking a position in the front of the British, at the distance of about six miles. These troops, however, were then considered only as a large detachment, and not as the main body of Tippoo's army, as they really were, a part of them being obscured by the projecting base of a hill, which intervened between the two camps. Tippoo had only arrived at his capital four days before the appearance of lord Cornwallis at Arakeery. As his lordship had received certain intelligence that general Abercrombie had ascended the Ghauts on the Malabar side, the first object was, to form a junction, if possible, with that general. The whole of the 14th, therefore, was employed in endeavours to make a bad ford, which there was across the Cavery, fit for the transporting of artillery; but the depth of the river, and its uneven and rocky bed, obliged them to desist from the design.

On account of the difficulty of approaching the enemy's camp on the side of Arakeery, the British commander determined to march round the ridge of mountains on the right, to endeavour to surprize the Sultan in his camp. At eleven o'clock on the night of the 14th, the whole army was under arms; but the night proved most unfavourable for the purpose. The rain and the darkness, added to some misconception of orders, produced the most deplorable confusion and disorder; and when the day broke, instead of being near the object of their destination, they had only moved a few miles, and the rear of the line had but just passed their own piquets to the right.

At sun-rise, moving round the edge of the hills, the enemy's line was seen from a rising ground in the same strong position they had occupied the day before. Very low ground, intersected by a deep ravine, ran along their front, but a high ground beyond the ravine seemed to offer a fair opportunity of attacking their left flank with advantage. The first European brigade moved on to possess this height, and at the same time a body of the enemy's infantry moved from the left, and soon after a large body of troops and artillery advanced from the Mysorean camp, to occupy the height, which was also the object of the British.

From the superiority of their cattle, this detachment, commanded by Cummur-ud-Deen, gained its summit first, but the British were fortunate enough to prevent them from occupying another strong ridge, which, although lower than the first, was yet of material importance. The army was formed in two divi-

sions. The right, commanded by colonel Maxwell, marched to attack the height which had been pre-occupied by Cummur-ud-Deen, in the manner already related. The left was under the command of general Meadows, and the cavalry was placed out of gunshot, to be in readiness to embrace any advantage that might be presented.

Colonel Maxwell began the action by storming the height; in which having been eminently successful, the left division advanced to the attack of the enemy's main body, and it soon became general along the whole front. The success of colonel Maxwell proved fatal to Tippoo; for after leaving a sufficient force to occupy the height, that officer advanced rapidly to gain the Carigal height, close to the enemy's left flank, while the cavalry under colonel Floyd moved at the same time to attack their right. The consequence was, that Tippoo was obliged to give way, though his retreat was gradual and masterly. One gun only was taken on the field, and three others on the height, by colonel Maxwell. The enemy were pursued till the fire from the island batteries obliged the assailants to desist, and the following day lord Cornwallis encamped partly on the field of battle, and just out of the reach of the island batteries. The loss on the part of the British in this action was inconsiderable.

It is well known that lord Cornwallis was unable to take the advantage of this success, and the principal causes of his miscarriage may be reduced to two—the swelling of the river, and the weakness of the draft cattle, which prevented a junction with general Abercrombie, together with the want of provisions to support them during a protracted siege. After dispatching orders, therefore, to general Abercrombie (who had obtained possession of Periapatam) to return down the pass with all expedition, on the 26th of May, lord Cornwallis moved from his encampment near Seringapatam on his return to Bangalore, having previously destroyed his battering train, and removed every incumbrance.

On the 28th he was joined by the Mahrattas to the number of 30,000, whose movements had been doubtless accelerated by the news of Tippoo's defeat. As they brought with them, however, a supply of provisions, the difficulty of obtaining subsistence was for the present removed, and the combined armies moved slowly to the place of their destination. In their route they made themselves masters of several petty fortresses; and on the 18th of July Ousoor submitted to the British arms, and by reducing the forts in its neighbourhood, the Odealurgum and Ryacota passes were opened, through which it was his lordship's intention to obtain supplies in the ensuing campaign.

On the 30th of July, the combined forces encamped within six miles of Bangalore. General Abercrombie, after having also sacrificed his battering train, was compelled to lead back a sick and dispirited army over the almost inaccessible mountains which he had so lately

passed, with perhaps more difficulty, but with more ardent and inspiring expectations. While the British forces lay encamped near Seringapatam, a present of fruit had been sent from Tippoo to lord Cornwallis, and some overtures were made for the obtaining of a separate peace. The present was, however, returned with but little courtesy on the part of the British general, and the Sultan, it is said, was assured that no peace could be acceptable which was not to include the allies. Notwithstanding this disappointment, so solicitous was the monarch for obtaining peace, that lord Cornwallis had scarcely reached Bangalore than a vakeel was dispatched by Tippoo with full powers to treat.

From what cause the Sultan's mission was unsuccessful, we are not fully informed, but it was generally reported, that the forms of his reception, with which lord Cornwallis did not chuse to comply, and on which, he said, he was authorized to insist, put an end to the negotiation. It is to be lamented, that any instances should occur in the present age to give colour to the sarcastic observation of the democratic writers, that, in the eyes of princes and great men, the lives of their fellow creatures are frequently of less importance than the observation of some trivial etiquette, or some ridiculous and unmeaning ceremony.

Lord Cornwallis was not inactive during the winter months, but, on the contrary, omitted nothing which might contribute to the success of the ensuing campaign. The first object that engaged his attention, was to regulate the contract for bullocks in such a manner as to ensure a proper and adequate supply of cattle for every purpose during the continuance of the war; the next was, the reduction of the hill forts to the North East of Bangalore, which were so situated between that fortress and Gumunconda, as to interrupt the communication with the Nizam's army, and the supplies which might be collected in that quarter. The smaller forts surrendered upon summons, but Nundydroog, the capital of a large district, and built upon the summit of a mountain, 1700 feet in height, three-fourths of which were absolutely inaccessible, was enabled to stand a considerable siege.

From the 22d of September to the 18th of October, the brave garrison stood with heroic firmness. On that day, the breaches being rendered practicable, lord Cornwallis, with a view to intimidate the garrison, encamped within four miles of the fort; and it was determined to make the assault at midnight, in hopes of taking the garrison by surprise. The vigilance of the enemy, however, soon discovered the assailants, but their fire was not sufficiently well directed, to prevent the British soldiery from mounting the breach. The carnage which must have ensued was prevented partly by a number of the garrison escaping by ladders over a low part of the wall, but chiefly by the laudable exertions of captain Robertson, who commanded the storming party, and who, with a humanity which re-

flects the utmost honour on his character, from the moment he entered the fort, directed his whole attention to preserving order, and preventing the effusion of blood.

Colonel Maxwell was sent in the latter end of October with a detachment towards the Baramoul valley chiefly to disperse the plundering parties which intercepted the provisions. On the 31st, colonel Maxwell took a small mud fort, called Penagra, by storm; but we must regret that the same humanity was not exercised here as at Nundydroog; for out of a garrison of 900, not less than 150 were put to the sword. But at Kiltinahery the colonel met with a more serious resistance. The lower fort, including the pettah or suburb, was gained without much difficulty: but the garrison in the upper fort, alarmed perhaps at the fall of Penagra, defended it with a degree of heroism bordering on despair. Immense rocks and showers of stones were hurled down into the road; the scaling ladders were broken to pieces, and, after two hours vigorous assault, colonel Maxwell at length found it necessary to desist from the attempt.

In the mean time the Sultan was not wanting on his part in exertion and activity during this recess from the more important business of the war. Early in September a detachment was sent by him to lay siege to Coimbetore, which was most gallantly defended by lieutenant Chalmers, and the assailants were repulsed and forced to raise the siege. Not discouraged by this disgrace, Tippoo lost no time in dispatching his second in command, Cummern-nd-Deen Cawn, to reduce that place, where, for a while, he experienced the same vigorous resistance which had formerly saved the fortress. A detachment, however, under major Cuppage, which was sent by lord Cornwallis for the relief of Coimbetore, having been defeated by the Cawn, lieutenant Chalmers was under the necessity of capitulating on the 2d of November, and the garrison marched out with the honours of war, and were allowed to remain on their parole during the continuance of hostilities.

About eighteen miles to the west of Bangalore, lie the fortresses of Savendroog; it is situated on the summit of a vast mountain or rock, which is supposed to rise above half a mile in perpendicular height from the table or base of eight or ten miles in circumference. This immense mountain has a further advantage, in being divided at its summit by a chasm, which separates it into two hills, which having each their peculiar defences, form two citadels, capable of being maintained, independent of the lower works. The whole mountain is surrounded by a strong wall on every side; and in every part which was considered as accessible, cross walls and barriers are erected so as to give the whole an impregnable and stupendous appearance. This fortress was an object to the zeal, and perhaps to the ambition of lord Cornwallis, and lieutenant-colonel Stuart was dispatched for its reduction.

On the 10th of December the colonel encamped
 within three miles of the north side of the rock, the
 quarter which the chief engineer considered as the
 weakest. On the 17th he opened two batteries on the
 fortrefs—one at the distance of 1000, and the other of
 200 yards; but the wall being built of large stones,
 the lower tier of which was rivetted to the rock by
 iron clamps, but little impression was made. On the
 20th, therefore, a battery was opened within 250
 yards of the wall, which in the course of two days ef-
 fected a practicable breach. On the morning of the
 21st, at eleven o'clock, the assault was made, and in
 less than an hour the surprising exertions of the British
 artillery made them masters of 2 fortrefs, which had
 hitherto been considered as impregnable. On the 24th
 of December, Outredrog, another fortrefs, about twelve
 miles from the former, was also taken by storm.

About the same period several forts of less note were
 reduced by different detachments of the combined ar-
 my; and Gummundah was blockaded up by Hafez
 Jee, one of the Nizam's best generals. The place,
 however, was relieved on the 21st of December by
 Hyder Saib, the eldest son of Tippoo Sultan, who
 made prisoners Hafez Jee and a considerable part of
 the detachment.

General Abercrombie returned early in November
 by Tellicherry from Bombay, and immediately received
 orders from the governor-general to pursue the same
 plan of operations as in the preceding campaign. On
 the 5th of December, therefore, the general proceeded
 on his march through the Ghauts towards the Mysore
 country. The Mahratta force under Purseram Bhow
 was not inactive in the mean time, but was successful
 in the reduction of several forts situated on the rivers
 Tum and Budra, which opened to their occupation a
 fertile district, and were the means of affording very
 seasonable supplies.

Something of more importance was now to be
 expected from the combined force, which at this
 time acted in the territory of Mysore, and when the
 reduction of the capital was to be attempted, as the
 means of either crushing entirely the force of the
 enemy, or bringing him to such terms as might ensure
 a lasting peace; therefore, on the 1st of February 1792,
 the allied armies commenced their march, in the course
 of which nothing worth relating occurred, and on the
 5th they arrived within sight of Seringapatam, under
 the walls of which Tippoo was strongly posted to re-
 ceive them.

The Sultan's front line, or fortified camp, which
 was situated on the north side of the Cavery, behind a
 strong bound hedge, was defended by heavy cannon
 in the redoubts, and by his field train and army sta-
 tioned to the best advantage. To the front there ap-
 peared at least 100 pieces of cannon, and in the fort
 and island, which formed his second line, there were
 at least three times that number. The confederate
 army encamped at the distance of about six miles from

the Sultan. Their camp was separated in two divisions
 by a small stream, called the Lockarry river, which
 runs into the Cavery. The British army formed the
 front line; the reserve was stationed about a mile in the
 rear, where the Mahratta and Nizam's armies were
 also posted, but at a still further distance. But the Bri-
 tish commander did not suffer his troops to enjoy a
 long repose in this station; for,

On the 6th of February, general orders were issued,
 directing an attack upon the enemy's camp and lines
 that evening at seven o'clock. The right division,
 consisting of 3300 infantry, was commanded by general
 Meadows; the centre, consisting of 3700, by lord
 Cornwallis in person; and the left, which only
 amounted to 1700 men, by lieutenant-colonel Max-
 well. At eight o'clock the whole body was under
 arms; the evening was calm and serene, and the troops
 moved on by the light of the moon, in determined
 silence. While the columns were on their march, the
 camp left under the command of colonel Duff was
 struck, and the baggage packed; and this was the first
 notice communicated to the allies of the intended at-
 tack.

Their consternation is scarcely to be imagined, when
 they found that lord Cornwallis had proceeded on this
 desperate enterprize with a part of his infantry only,
 and unsupported by artillery; and Tippoo himself, it
 appears, had no apprehension of so early a visit, espe-
 cially as neither Purseram Bhow nor general Aber-
 crombie had yet joined. However, between the hours
 of ten and eleven at night, the centre column, within
 a mile of the bound hedge, touched upon the enemy's
 grand guard, or body of cavalry, who were coming
 with rockets, &c. to disturb the British camp. The
 cavalry galloped off to the lines, and left the rocket
 boys to harass the column, and endeavour to impede
 its march.

Perceiving themselves thus completely discovered,
 the column advanced with uncommon rapidity, and
 entered the lines in less than a quarter of an hour after
 the intelligence could have reached the enemy. The
 right column met with more impediments, and being
 led to a more distant point than was intended by lord
 Cornwallis, was considerably later in reaching the
 hedge than the centre column. It entered, however,
 about eleven, and the battle became general through-
 out the enemy's lines.

The right division, owing to its late arrival, and to
 its having attacked a redoubt which the commander in
 chief had intended to be passed by, gave time to the
 enemy to form, and suffered severely from grape and
 musket shot during a sharp contest, which lasted almost
 till day-break. The enemy at length completely gave
 way before the persevering valour of the British troops;
 and at day-break general Meadows found himself com-
 plete master of the field; but being entirely ignorant of
 the operations of the other columns, was unable to
 proceed. The main object of the centre column was,
 to

to gain possession of the island, into which it was their intention to pass along with the fugitives. After entering the lines, the front division of this column soon dispersed the enemy, and passing the Sultan's tent, which was hastily abandoned, pressed forward to the river in two divisions.

The first party, commanded by captain Monson, crossed the ford under the walls of the fort without opposition. They proceeded instantly to the east gate of the city, but found it shut, and the bridge drawn up; they therefore proceeded through the island to an extensive bazaar, or market-place, where they made a considerable slaughter of the enemy. This party was almost immediately followed by the other division under colonel Knox, which, however, instead of directing its course to the city, proceeded to the rajah's garden, and thence to take possession of the suburb Shaher Ganjam, the gates of which they forced open, and soon drove the enemy from all their batteries in that quarter. Another party under captain Hunter crossed the river, and stationed themselves in the rajah's garden; but as soon as their position was discovered, they were attacked by superior numbers of the enemy, so that captain Hunter was obliged precipitately to repass the river, and join lord Cornwallis, where his presence afterwards materially contributed to his lordship's safety. The centre division of this column advanced to the Sultan's redoubt, which they found abandoned, and afterwards co-operated with colonel Maxwell in the defeat of Tippoo's right wing.

Lord Cornwallis with the reserve remained close by that part of the bound hedge where the column had first entered; and here, two hours before day-break, he was joined by captain Hunter's party, who had but just time to change their cartridges, which were wet with crossing the river, before the whole party was attacked by a strong body of troops, part of Tippoo's centre and left, who, now recovered from their panic, rallied with redoubled resolution. The conflict was supported with inflexible courage on both sides, and it was near day-light before the enemy was finally repulsed. Lord Cornwallis then, apprehensive of being surrounded, repaired to the pagoda hill, where he was met by general Meadows, who was in motion to support his lordship.

The left division under colonel Maxwell was intended to attack the Carighat hill on the right of Tippoo's fortified camp, and thence to force their way into the island by the most practicable means. The hill, though strong both by nature and art, was gained by colonel Maxwell without much resistance. The column afterwards marched down towards the river, though much galled by a party who had sheltered themselves behind a bank, and by the firing from the right of Tippoo's line from behind the bound hedge. They crossed the ford with much difficulty, and soon joined the victorious parties, who had obtained possession of the eastern extremity of the island. The battle was

continued in different parts during the whole of the 7th. The most desperate conflict was at the Sultan's redoubt, which was defended by a small party of British under major Kelly, against three vigorous attacks, seconded by a heavy cannonading from the forts.

The troops of the enemy having quitted every post on the north side of the river, the camp was advanced on the succeeding days as near to the bound hedge as the guns of the fort would permit, and a chain of posts connecting along the northern and eastern faces of the fort, were formed, so as strongly to invest the capital of Mysore on its two principal sides. Thus pressed by the invaders in every quarter, his palace and beautiful gardens in the possession of the enemy, and his whole power reduced within the narrow limits of a citadel, the possession of which was even uncertain, the hitherto unsubdued spirit of the Sultan seems to have given way with his tottering fortunes; and peace almost upon any terms, appeared a desirable acquisition.

As a preliminary step towards an accommodation, he determined to release lieutenants Chalmers and Nash, who had been captured at Coimbatore. On the evening of the 8th of February these officers were introduced into the Sultan's presence. They found him in a small tent on the south glacis of the fort, very plainly dressed, and with few attendants. After acquainting them with their release, he asked Mr. Chalmers, if on going to the camp, he was likely to see lord Cornwallis; and on being answered in the affirmative, he requested that he would take charge of a letter to his lordship on the subject of peace. He affirmed solemnly that it never had been his wish or intention to break with the English; that from the first commencement of hostilities he had been extremely anxious for the restoration of peace. He expressed with that Mr. Chalmers would return with the answer, and concluded, by presenting him with two shawls and 500 rupees. Lieutenants Chalmers and Nash had been remarkably well treated while detained by Tippoo.

Notwithstanding the Sultan was thus anxiously endeavouring to restore tranquillity to his exhausted country, his mind was still fertile in the expedients and stratagems of war. By one master-stroke of policy, that of capturing the commander in chief, he hoped to effect his purpose in a shorter and more honourable mode than by the slow and precarious method of negotiation. On the 8th and 9th of February, small parties of his cavalry were observed to cross the Caveri at the ford near Arakeery (the station which lord Cornwallis had occupied in the preceding campaign) and on the morning of the 10th a considerable body of them got round the left wing undiscovered, and entered between the British camp and that of the Nizam. The allies, not suspecting these horsemen to be enemies, suffered them to pass on quietly; and on their asking some of the camp-followers for the burgher saib, or commander, these persons, supposing that the

horsemen only wished to communicate some intelligence to colonel Duff, the commanding officer of the artillery, pointed to his tent. The horsemen then drew their sabres, and galloped to the tent, but being fortunately perceived by a party of seapoy drafts and murrutis, who were encamped in the rear of the artillery park, and who formed with singular alacrity, and undaunted firmness, they were dispersed, and the attempt proved abortive.

The Bombay army under general Abercrombie, after a fatiguing march, and after having been in some degree harassed by detached parties of the enemy during their progress, joined lord Cornwallis on the 16th of February, and afforded a reinforcement of about 2000 Europeans and 4,000 native troops fit for duty. Preparations therefore were vigorously made on the 18th for the attack of the fort, not on the island side, which was deemed the strongest, but on the quarter facing the north, which appeared to lord Cornwallis most available; and trenches were immediately ordered to be opened, and batteries to be constructed with all expedition on that side. As it was proper, however, to draw off the attention of the enemy as much as possible from these operations, on the 19th a diversion was ordered to be made from the island, and an assault was projected on the enemy's cavalry, which was encamped on the south side of the river. Major Dalmeida and captain Robertson, with the 71st regiment and the 13th battalion of Bengal seapoys, were sent upon this enterprise. Captain Robertson with a party entered the camp undiscovered, and with the bayonet killed upwards of 100 troopers, and double that number of horses, and retired without molestation, and without the loss of a man.

In the mean time, a much more important operation was carried on during the night of the 19th, a parallel redoubt having been completed within a small distance of the walls of the fort, from which it was separated by the river. Day-light revealed to the enemy these formidable arrangements, and he lost no time in endeavouring to defeat their effect. He opened every gun he could bring to bear on the parallel, and continual parties of infantry to harass the troops, and interrupt the work. Finding these exertions to be vain, Tippoo next endeavoured to deprive the camp of its supply of water, by altering the course, and excavating a large canal, from which it had been hitherto supplied. To counteract this injurious operation, however, a party was detached under the command of captain Wahab, with pioneers to repair the embankment. They soon dislodged the enemy from their station, and as they had not been able to destroy much of the embankment, the damage was presently repaired, and the water restored to its accustomed channel.

The grand operation of the siege commenced on the 20th, by opening the trenches, and a heavy discharge from all the batteries; in the mean time, the Bombay army crossed the river, in order to invest the western

side of the capital. Some little resistance was made to general Abercrombie's establishing himself on that side of the river; but towards evening the party which opposed him was dispersed. General Abercrombie's force on the south side of the river consisted of three regiments of Europeans and six battalions of seapoys. His camp, strongly situated on the heights, was pitched just beyond the gun-shot of the fort. In consequence of the application through lieutenant Chalmers, lord Cornwallis agreed to receive vakeels or envoys to treat of peace.

On the 15th, 16th, 19th, and 21st, sir John Kennerly, and Mr. Cherry, assisted by vakeels from the Nizam's son, and Hurry Punt, the Mahratta chief, met the agents of the Sultan, but apparently little progress was made in the negotiation, so that the siege still continued without intermission; and on the 22d, general Abercrombie, conceiving it necessary to take possession of an evacuated redoubt and a grove, situated between his camp and the fort, the possession was warmly disputed by a detachment, chiefly consisting of dismounted cavalry; and though the British were in the end victorious, it was not till after the loss of 104 men killed and wounded.

On the 22d and 23d of February, during the nights, new works were erected, and two breaching batteries, one of twenty, and the other of twelve guns, would have been ready to open on the 1st of March. The Mahratta army, commanded by Purseram Bhow, and consisting of 20,000 horse, a body of several thousand infantry, and 30 pieces of cannon, was expected daily to join, as well as major Cuppage from the Coimbatore country, with 400 Europeans, and three battalions of seapoys. In the mean time, Tippoo had been compelled to send off all his cavalry, as well as his workmen and camp-followers, to Mysore. The British army was well supplied with every necessary, and that of the Sultan in want of every thing.

The monarch of Mysore was compelled, in this hopeless situation, to accept of whatever terms were offered by the British commander. Lord Cornwallis in this instance is supposed to have been actuated by motives of policy rather than by any doubt of success, in capitulating with Tippoo. The best informed persons on the politics of India have been averse to the annihilation of the Mysorean power; and it is generally supposed that the governor-general rather wished it to be humbled than destroyed. However this may be, preliminaries of peace were signed on the evening of the 23d of February, and on the following day there was an entire cessation of hostilities. The substance of the treaty was—

" I. That Tippoo was to cede one half of his dominions to the allied powers.

" II. That he was to pay three crores and thirty lacks of rupees.

" III. That all prisoners were to be restored.

" IV. That two of the Sultan's three eldest sons

were to become hostages for the due performance of the treaty."

The two princes, each mounted on an elephant, richly caparisoned, proceeded, on the 26th, from the fort to lord Cornwallis's camp, where they were received by his lordship with his staff. The eldest, Abdul Kalick, was about ten; the youngest, Mooza-ud-Deen, about eight years of age. The princes were dressed in long white muslin gowns, with red turbans richly adorned with pearls. Educated from infancy with the utmost care, the spectators were astonished to behold in these children all the reserve, the politeness, and attention of maturer years. The kindness with which they were received by the British commander appeared to afford them visible satisfaction. Some presents were exchanged on both sides; and the scene is described by an eye-witness (major Dirom) as highly interesting.

The definitive treaty was not finally adjusted till the 19th of March. The allies were probably exorbitant in their demands, and Tippoo and his courtiers appear to have exerted their utmost abilities, in artfully endeavouring to gain time, and to mitigate the terms of submission. Tippoo, however, at length gave a reluctant consent, as it is said, to the terms prescribed by lord Cornwallis, and the definitive treaty was delivered by the young princes, with great solemnity, into the hands of his lordship and the allies.

Thus happily terminated a war, the good policy of which was greatly questioned by some of the most competent judges of Indian politics, and the conduct of which, from a variety of unfortunate circumstances, disappointed, for a considerable time, the sanguine hopes of its warm supporters. It would, however, be unjust to withhold our approbation from lord Cornwallis in every thing that respects the conduct of the concluding campaign. Nothing that found judgment could devise, or activity effect, appears to have been omitted. We have reason to believe, also, that the humanity and goodness of his lordship were conspicuous during the whole of the enterprize; and his moderation and sound policy in the concluding scenes cannot be too highly extolled.

Having, in the foregoing historical description of the East-India-Company, shewn the peculiar benefits derived to Great-Britain and Ireland from their valuable trade and merchandise, we shall proceed to mention another great advantage to the commerce of England, namely, the BANK, which was instituted in the reign of king William III. under the sanction of parliament. It is founded on a transferrable fund, and deals by paper circulations on the credit of a large capital. The notes of this company are of the same value as the current coin of the kingdom, into which they may be changed whenever the possessor thinks proper. Here individuals may deposit their money in safety, receiving notes in exchange, which bear no interest it is true,

but are much more convenient than having large sums in specie, being more portable, and capable of a much easier mode of conveyance. A bank note of very considerable value can be sent to any part by the post; and to prevent the ill effects of robberies, they are usually cut in two, part being sent at one time, and part at another, which parts, when separated, are of no value, but on being joined again are as perfect as before. In order to put a more effectual stop to the designs of those who rob the mails, or by any other illicit method become possessed of their notes, the Bank issues a number of bills, called Bank-Post-Bills, which are made payable to the order of the person who takes them out, at a certain number of days after sight, which gives an opportunity to stop bills at the Bank if they should be lost, and prevents their being so easily negotiated by strangers as a common Bank-Note. Another great benefit attending Bank-Notes is, that if they are destroyed by time, or any other accident, the Bank will, on oath made of such accident, and security being given, pay the money to the person who was in possession of them at the time such accident happened.

There are three particulars wherein Bank-Notes differ from all kinds of stock. 1. They are always of the same value. 2. They are paid off without being transferred; and, 3. They bear no interest. On the other hand, stocks are a share in a company's funds, bought without any condition of having the principal returned.

Thirteen, or more directors compose a court for managing the affairs of this company, which are under the regulation of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general court, in the same manner as the East-India-Company.

The SOUTH-SEA-COMPANY had its origin from the following circumstances:—During the long war with France, in the reign of Queen Anne, the payment of the seamen in the royal navy being neglected, and they receiving tickets instead of money, were frequently obliged, by their necessities, to sell these tickets to avaricious men at a discount of 40l. and 50l. per cent. By these and other means, the debts of the nation unprovided for by parliament, amounting to 9,471,321l. fell into the hands of these usurers. Whereupon Mr. Harley, afterwards earl of Oxford, proposed a scheme to allow the proprietors of these debts and deficiencies 6l. per cent. per annum, and to incorporate them, in order to their carrying on a trade to the South-Sea, and they were accordingly incorporated under the title of "The Governor and Company of Merchants of Great-Britain trading to the South-Seas, and other parts of America, and for encouraging the Fishery," &c. But the design of creating this company was never carried into execution, nor any trade ever undertaken by them, except the Assiento, in pursuance of the treaty of Utrecht, for furnishing the Spaniards with negroes; of which this company was

deprived, upon receiving 100,000l. in lieu of all claims upon Spain, by a convention between the courts of Great-Britain and Spain in 1748, soon after the treaty of Aix-la-Chapelle. Some other sums were lent to the government in the reign of queen Anne, at six per cent; and in the third of George I. the interest of the whole was reduced to five per cent. and they advanced 100,000l. more to the government at the same interest. This company, by the statute 6 George I. were impowered to redeem all or any of the redeemable national debts; in consideration of which, the company had liberty to augment their capital, according to the sums they should discharge; besides other powers they were by the same statute invell'd with; and on the last-mentioned statute was executed the fatal scheme executed in the year 1720.

The company had at first set out with good success; and the value of their stock, for the first five years, had risen faster than that of any other company; and his majesty, after purchasing 10,000l. stock, had condescended to be their governor. Things were thus treated, when, taking advantage of the above statute, the South-Sea bubble was projected: the pretended design of which was, to raise a fund for carrying on a trade to the South-Sea, and purchasing annuities, &c. and to the other companies: proposals were then printed and distributed, shewing the advantages of the design, and inviting persons into it. The sum necessary for carrying it on, together with the profits that were to arise from it, were divided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein; and the better to carry on the deception, the directors engaged to make very large dividends; and actually declared, that every 100l. of original stock would yield 50l. per annum; which occasioned so great a rise of their stock, that a share of 1000l. was sold for upwards of 8000l. This was in the month of July; but before the end of September it fell to 150l. by which multitudes were ruined, and such a scene of distress occasioned, as is scarcely to be conceived. The consequence of this infamous scheme are too well known; most of the directors were severely fined, to the loss of nearly all their property; and though some of them had no hand in the deception, nor gained a farthing by it, yet it was insisted they ought to have opposed, and endeavoured to prevent it, as far as lay in their power.

Several regulations respecting the capital stock and accounts of this company were made by a statute of George II. when their stock amounted to 14,654,103l. Their annuities, &c. are now reduced to 3l. per cent. In every general court, each member having in his own name and right 500l. in trading stock, has one vote; if 2000l. two votes; if 3000l. three votes; and if 5000l. four votes. This company is under the direction of a governor, sub-governor, deputy-governor, and twenty-one directors; but no person is qualified to be governor, his majesty excepted, unless such

governor has, in his own name and right, 5000l. in the trading stock: the sub-governor is to have 4000l. the deputy-governor 3000l. and a director 2000l. in the same stock.

The South-Sea Company still continues to divide four per cent. on their present capital stock; which they are enabled to do from the profits they make on the sums allowed to them for the management of the annuities paid at their office, and from the interest of annuities which are not claimed by the owners.

No expedient could have been thought of, which would have so far contributed to the extension of trade, as the practice of INSURANCE, by which means every merchant can secure his cargo from the danger of seas and enemies. Insurance is performed in the following manner: when a person is disposed to insure the whole or any part of his cargo, he employs a broker, who, in a printed policy of insurance, specifies the name of the ship in which the cargo is embarked, the voyage upon which he is bound, the value of the merchandise, and the conditions of insurance. This he presents to different merchants who are willing to underwrite, and they subscribe their names for different sums, as they think proper, until the whole value is subscribed, receiving in the mean time the premium, each in proportion to the sum he has underwritten; after which, if the ship is cast away, or taken by the enemy, so that the cargo is lost, the proprietor has recourse upon the insurers, who are obliged to indemnify him, by paying the respective sums they subscribed.

Besides several private offices for insurance, where the above policies of private underwriters are duly entered and registered, there are two corporations, established for this purpose by act of parliament, by the titles of the Royal-Exchange-Assurance, and the London-Assurance. They have each an exclusive privilege against all other insuring societies for shipping and merchandize, but this does not interfere with any man's private right of insuring.

By a calculation made not many years ago of the number of inhabitants in London, they then amounted to 174,000.

It is ever to be lamented, that, after the conflagration in 1666, the city of London was not rebuilt agreeable to the magnificent, elegant, and useful plan of the great Sir Christopher Wren, which, through the insatiation of those times, was totally disregarded, and sacrificed to the mean and selfish views of private property: had that great architect's plan been followed, the metropolis of this kingdom would incontestably have been the most magnificent and elegant city in the universe, and of consequence must, from the prodigious resort of foreigners of distinction and taste, who would have visited it, have become an inexhaustible fund of riches to this nation.

The CONSTITUTION of England may properly be said to partake of monarchy, aristocracy, and democracy; for

for first, the executive power of the laws being lodged in a single person, they have all the advantages of strength and dispatch that are to be found in absolute monarchy: secondly, the king, and the lords spiritual and temporal, was to form an aristocracy; and thirdly, the House of Commons being freely chosen by the people from among themselves, make a democracy. These three bodies constitute the British parliament, which has the supreme disposal of every thing; and there can be no inconvenience attempted by either of the three branches, but will be withstood by one of the other two, each branch being armed with a negative power, sufficient to repel any innovation which it may think inexpedient or dangerous. In no other manner whatever could these three forms of government have been so prudently and so happily united. Our excellent constitution is so admirably contrived, that nothing can endanger or hurt it, but the destroying the equilibrium of power between one branch of the legislature and the rest.

The principal duty of the king is to govern his people according to law. And accordingly it is expressly declared, by the 12th and 13th statutes of William III. that "the laws of England are the birth-right of the people thereof; and all the kings and queens who shall ascend the throne of this realm, ought to administer the government of the same, according to the said laws; and all their officers and ministers ought to serve them respectively according to the same: and therefore all the laws and statutes of this realm, for securing the established religion, and the rights and liberties of the people thereof, and all other laws and statutes of the same now in force, are by his majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, by authority of the same, ratified and confirmed accordingly."

The original contract between king and people, is now couched in the coronation oath, and administered to every king or queen who shall succeed to the imperial crown of the realm, by one of the archbishops or bishops of the realm, in the presence of all the people; who, on their parts, also reciprocally take the oath of allegiance to the crown. The king engages, by his oath, to govern his people and dominions according to the statutes, laws, or customs agreed on in parliament.—To cause law and justice to be executed in all his judgments.—To maintain, to the utmost of his power, the laws of God, the true profession of the gospel, and the Protestant reformed religion; and to preserve to the bishops, clergy, and churches, all their rights and privileges.

One of the principal bulwarks of civil liberty, or of the British constitution, was the limitation of the king's prerogative by bounds so certain and notorious, that it is impossible he should ever exceed them, without the consent of the people on one hand; or without a violation of that original contract which expressly subsists between the prince and the subject, on the other.

The king, by virtue of his prerogative, may reject bills, make treaties, coin money, create peers, and pardon offences, at his pleasure; unless where the constitution hath expressly, or by evident consequence, laid down some exception or boundary, declaring that the prerogative shall go no further than to such an extent. But though the king may exercise these prerogatives, yet if the consequences of that exertion evidently tend to the disadvantage or dishonour of the kingdom, the parliament will call his advisers to a just and severe account. The king may, for instance, make a treaty with a foreign state, which shall bind the nation; and yet, when such treaties have been judged pernicious, impeachments have pursued those ministers by whose agency they were concluded. The king may also levy armies and fit out fleets, for the defence of his kingdom, the annoyance of his enemies, or the suppression of rebellions; grant commissions to his officers, both by sea and land, or revoke them at pleasure; dispose of all magazines, castles, &c. summon the parliament to meet, and, when met, adjourn, prorogue, or dissolve it; and may refuse his assent to any bill, though it has passed both Houses. He possesses also the right of choosing his own council; of nominating all the great officers of state, of the household, and the church; and, in fine, is the fountain of honour, from whom all degrees of nobility and knighthood are derived.

To endeavour at tracing the original institution of parliaments, would be attempting an impossibility, as all accounts which have been transmitted to us on that head are equally vague and unsatisfactory. General councils have been held in England, time immemorial, under the several names of michel-synoth, or great council; michel-gemot, or great meeting; and witten-gemote, or the meeting of wise men. It is, however, universally agreed, that the foundation of parliament, as it now stands, was laid in the great charter granted by king John, in the year 1215, wherein he promises to summon all archbishops, bishops, abbots, earls, and greater barons, personally; and all other tenants in chief under the crown, by the sheriffs and bailiffs; to meet at a certain place, after forty days notice, to attest aids and scutages when necessary.

The word parliament is derived from the French *parlement*, speaking or debating, and signifies no more than a place appointed for persons to meet and confer together. It was first applied to general assemblies of the states in France under Louis VII. about the middle of the twelfth century.

According to the present form of parliament, the king alone has the power of assembling it, which is done by his writ or letter issued out of chancery, by advice of the privy-council, at least forty days before it begins to sit; and this he is obliged to do every year, or oftener, if need be. The sitting of parliament must not be intermitted above three years.

The

The parliament consists of the king and the three estates of the realm, viz. the lords spiritual and temporal, who sit, together with the king, in one house; and the commons, who sit by themselves, in another.

The lords spiritual consist of the two archbishops of Canterbury and York, and twenty-four bishops, who hold, or are supposed to hold, certain parishes under the king. In the eye of the law, and in most acts of parliament, the lords spiritual are considered as a distinct estate from the lords temporal; but in practice they are generally blended together, under the one name of the lords: they intermix in their votes, and the majority of such intermixture binds both estates. The bishops, however, are not considered as peers of the realm, but merely lords of parliament. The lords temporal consist of all the peers of the realm by whatever title distinguished; dukes, marquises, earls, viscounts, or barons. Some of these sit by descent, as do all ancient peers; some by creation, as do all new-made ones; others by election, which is the case of the sixteen peers, who represent the body of the Scots nobility.

The commons consist of all such men of any property in the kingdom, as have not seats in the house of lords; every one of whom has a voice in parliament, either personally, or by his representatives. The counties are represented by knights, elected by the proprietors of lands; and the cities and boroughs are represented by citizens and burgesses, chosen by the mercantile part, or supposed trading interest of the nation. The number of English representatives is 513, and of Scots fifty-four, in all 558; and every member, though chosen for one particular district, when elected and returned, serves for the whole realm; his business not being confined to the advantage of his constituents only, but to that of the commonwealth; and to advise his majesty: therefore he is not bound to consult with, or take the advice of his constituents upon any particular point, unless he thinks it proper or prudent so to do.

The king, and these three estates, when assembled, form the great corporation, or body politic of the nation; and when they first come together, the king meets them, either in person, or by his representative, without which there can be no commencement of parliament. Each of these estates are equally necessary, the consent of all three being required to make any new law which is to bind the subject; therefore whatever is enacted for law by one, or by two of the three, is no statute, and no regard is due to it, unless in matters relating to their own privileges. But the parliament, considered as one body, has sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal. All mischiefs and grievances, operations and remedies, that transcend the

ordinary course of the laws, are within the reach of this high tribunal. It can regulate or new-model the succession to the crown; alter the established religion of the land; change and create afresh even the constitution of the kingdom, and of parliaments themselves; and, in short, do every thing which is not naturally impossible to be done. But, as terrible consequences might ensue from placing such unbounded authority in persons, who may prove incapable or improper to manage it, the law enacts that no one can sit in either house of parliament unless he be twenty-one years of age: that no member shall vote or sit in either house, till he hath in the presence of that house taken the oaths of allegiance, supremacy, and abjuration; and subscribed and repeated the declaration against transubstantiation, invocation of saints, and the sacrifice of the mass: and that no alien born out of the dominions of the crown of Great-Britain, even though he be naturalized, shall be capable of being a member of either house of parliament.

The high court of parliament, like every other court of justice, has its own peculiar law, which is founded on the following basis, viz. "that whatever matter arises concerning either house of parliament, ought to be examined, discussed, and adjudged in that house to which it relates, and not elsewhere." The privileges of parliament are indefinite; but amongst the most remarkable of them are, privilege of speech, of person, of domestics, and of lands and goods. Both houses of parliament have laws and customs peculiar to each; but those of the upper house are by far the most extensive, as are likewise its privileges. It is the highest court of judicature in the kingdom, and from its sentence there is no appeal.

The members of parliament have a right, and are constantly attended by the judges of the courts of King's-Bench, Common-Pleas, and such of the barons of the Exchequer as are of the degree of the coif, or have been made serjeants at law, as also by the masters of the court of chancery, for their advice in point of law, and for the greater dignity of their proceedings. Formerly the secretaries of state, the attorney and solicitor-general, and the rest of the king's council, being serjeants, used to attend the House of Peers, and to this day their regular writs of summons are issued out at the beginning of every parliament; but many of them having been of late years members of the House of Commons, their attendance is dispensed with. Every peer may, by licence obtained from the king, make another lord of parliament his proxy, to vote for him in his absence; and he has also a right, by leave of the house, when a vote passes contrary to his sentiments, to enter his dissent on the journals of the house, with the reasons for such dissent, which is usually styled his protest. All bills likewise that may in their consequences any way affect the rights of the peerage, are by the custom of parliament to have their first rise and beginning in the House of Peers, and to

suffer no changes or amendments in the House of Commons.

As to the peculiar laws and customs of the House of Commons, these consist principally in the raising of taxes, and the elections of members to serve in parliament. It always has been their indisputable right and privilege, that all grants of subsidies, and parliamentary aids, should begin in the lower house, and be first bestowed by them; though their grants are not to all intents and purposes effectual, until they have received the assent of the other two branches of the legislature; and so jealous are they of this valuable privilege, that they will not suffer the other house to exert any other power herein, but that of rejecting; not allowing them to make the least alteration or amendment to the mode of taxing the people by a money bill; which is the appellation given to all bills whereby money is to be raised upon the subject.

Previous to the entering upon, and for the more ready dispatch of business, each house has its speaker: that of the House of Lords, is the lord-chancellor, or some other nobleman appointed by the king's commission; but that of the House of Commons is chosen by its own members, and must be approved of by his majesty.

With respect to a bill, if the relief sought by it is of a private nature, a petition must be presented before it is brought into the house; which petition usually sets forth the grievance desired to be remedied, and is always presented by a member. Sometimes upon the mere petition, leave is given to bring in the bill; but, if it is founded on facts, which may be in their nature disputed, it is referred to a committee of members, who examine the matter alleged, and, according to their report, it is admitted or rejected: if the former, the persons directed to bring in the bill, in a competent time present it to the house, drawn out upon paper, with a number of blanks, where any thing occurs that is dubious, or necessary to be settled by the parliament itself. This is read a first time, and at a convenient distance a second time; and after each reading the speaker opens to the house the substance of the bill, and puts the question whether it shall proceed any further. The introduction of the bill may be originally opposed, as the bill itself may at either of the readings; and, if the opposition succeeds, the bill must be dropped for that session; as it must also, if opposed with success, in any of the subsequent stages.

If the bill obtains a second reading, it is committed, or referred to a committee, which, in matters of small importance, is appointed by the house; but, upon a bill of consequence, the house resolves itself into a committee of the whole house: the speaker then quits the chair, which is filled by another member, and sits and debates as a private member. In these committees the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled. After it has passed the

committee, the chairman reports it to the house, with such amendments as the committee have made; and then the house reconsiders the whole bill again, and the question is repeatedly put upon every clause or amendment. When the house have agreed or disagreed to the amendments of the committee, and sometimes added new amendments of their own, the bill is then ordered to be engrossed, that is, written in a strong gross hand, on one or more long rolls of parchment sewed together. When this is finished is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment upon the bill, which is called a rider. The speaker then again opens the contents; and, holding it up in his hands, puts the question, whether the bill shall pass. If this passes in the affirmative, the title to it is then settled, and one of the members is ordered to present it to the lords for their concurrence. Accordingly, being attended by several more members, he carries it to the bar of the House of Peers, and there delivers it to their speaker, who comes down from his wood-sack to receive it. Here it passes through the same forms as in the lower house, except that of engrossing; when, if it is rejected, no more notice is taken of it; but, if it is agreed to, the lords send a message by two masters in chancery, or by two of the judges, that they have agreed to the same; and the bill remains with the lords. But, if the upper house have made amendments in the bill, which sometimes happens, both amendments and bill are returned to the House of Commons to receive their concurrence. If the commons disagree to the amendments, a conference between some members, deputed from each house, usually follows, who generally adjust the difference; but if both houses remain inflexible, the bill is dropped. On the other hand, if the commons agree to the amendments, the bill is sent back to the lords by one of the members, with a message to acquaint them therewith.

When a bill begins in the House of Lords, it is, when of a private nature, referred to two of the judges, to examine and report the state of the facts alleged; to see that all necessary parties consent, and to settle all points of technical propriety; after which the same forms are observed as in the House of Commons. But when an act of grace or pardon is passed, it is first signed by the king, and then read once only in each of the houses, without any new engrossing or amendment.

When both houses have done with a bill, it is always deposited in the House of Peers to wait the royal assent; except in the case of a money-bill, which, after receiving the concurrence of the lords, is sent back to the House of Commons.

The royal assent to a bill may be given two ways: first in person; when the king comes to the House of Peers, in his crown and royal robes, and sending for

the commons to the bar, the titles of all the bills
 that have passed both houses are read, and his majesty's
 answers are declared by the clerk of parliament
 in Norman French, to the following effect: if he
 consents to a public bill, *le roy le veut*, "the king will
 it so to be;" if to a private bill, *soit fait comme il est
 désiré*, "be it as it is desired." If he refuses his con-
 sent, *le roy s'aviserà*, "the king will advise upon it."
 When he assents to a money-bill, *le roy remercie ses loyaux
 sujets, accepte leur benevolence, et aussi le veut*, "the
 king thanks his loyal subjects, accepts their benevo-
 lences, and wills it so to be." When an act of grace
 is passed, the clerk of parliament pronounces the grate-
 ful mode of the subjects in Norman French to the fol-
 lowing purport. *Les prelates, seigneurs, et communs, en
 ce present parlement assemblez, au nom de tous vos
 autres sujets, remercient très humblement votre majesté, et
 prient à Dieu vous donner en santé bonne vie et longue*.
 "The prelates, lords, and commons, in this present
 parliament assembled, in the name of all your other
 subjects, most humbly thank your majesty, and pray
 to God to grant you in health and wealth long to live."
 The second method whereby the king may give his
 assent, is by letters patent under his great seal, signed
 with his hand, and notified, in his absence, to both
 houses assembled together in the House of Lords. When
 a bill has received the royal assent in either of these
 ways, it is then, and not before, a statute, or act of
 parliament, and it cannot be altered, amended, dis-
 pensed with, suspended, or repealed, but in the same
 terms, and by the same authority of parliament.

Parliaments are subject to adjournments, prorogations,
 and dissolutions. An adjournment is only the con-
 tinuance of the session from one day to another, and
 is done by the authority of each house, separately,
 every day, and sometimes for a fortnight or a month
 together; but the adjournment of one house is no ad-
 journment to the other.

A prorogation is the continuance of parliament from
 one session to another; and is done by the royal autho-
 rity, expressed either by the lord-chancellor in his
 majesty's presence, or by commission from the crown,
 or frequently by proclamation.

A dissolution is the civil death of the parliament, and
 may be effected three ways: first, by the king's will,
 expressed either in person, or by representation; secondly,
 by the demise of the crown; and thirdly, by length
 of time. Under different monarchs this period has
 been extended and contracted; but as our constitution
 now stands, the parliament must expire at the end of
 every seventh year, if not sooner dissolved by the royal
 prerogative.

The laws of England have assigned the king a diversity
 of councils, in order to assist him in the discharge of
 his duties, and the exertion of his prerogative. Among
 these the first is the high court of parliament, already
 considered. The second are the peers of the realm,
 who are by their dignity hereditary counsellors, and

may be called together to impart their advice, in all
 matters of importance to the realm, either in time of
 parliament, or, when there is no parliament in being.
 And besides this general meeting, each individual peer
 of the realm has a right to demand an audience of
 the king, and to lay before him, with decency and
 respect, such matters as he judges of importance to
 the public weal. A third council belonging to the king,
 are his judges of the courts of law, with regard to all
 matters concerning the laws of England.

The principal council belonging to the king is his
 privy-council, generally called, by way of eminence,
 "The Council." The king's will is the sole constituent
 of a privy-counsellor, and this also regulates their
 number, which was formerly twelve. Afterwards it
 increased to so large a number, that it was found in-
 convenient for secrecy and dispatch; and accordingly
 king Charles II. in the year 1679, limited the number
 to thirty; fifteen whereof were to be principal officers
 of state, and the other fifteen composed of ten lords
 and five commoners, chosen by the king. At the
 same time the ancient office of lord president of the
 council was revived in the person of Anthony, earl of
 Shaftesbury. That office is still continued; but the
 number of counsellors has since been greatly aug-
 mented, and now continues indefinite. Privy-coun-
 sellors are made by the king's nomination, without
 patent or grant, and subject to removal at his dis-
 cretion. Every privy-counsellor, before he takes his
 seat at the council-board, must take the oath of office,
 in which are contained all the duties of his function,
 consisting of the seven following articles: 1. To ad-
 vise the king according to the best of his cunning and
 discretion. 2. To advise for the king's honour and
 the good of the public, without partiality through af-
 fection, love, meed, doubt, or dread. 3. To keep the
 king's counsel secret. 4. To avoid corruption. 5. To
 help and strengthen the execution of what shall be
 there resolved. 6. To withstand all persons who would
 attempt the contrary. And 7. To observe, keep, and
 do all that a good and true counsellor ought to do for
 his sovereign lord. The power of the privy-council
 consists in inquiring into all offences against the govern-
 ment, and in committing offenders to safe custody, in
 order to take their trial in some of the courts of law.
 But their jurisdiction does not extend to punishment,
 and the persons committed by them are entitled to
 their Habeas Corpus, equally with those committed by
 an ordinary justice of the peace. In this council the
 civil government is regulated, and every new measure
 of the administration proposed and planned. Here
 also all the appeals from Ireland and the plantations
 are determined. The privy-counsellors sit at the
 board bare-headed when the king presides in person.
 In all debates the lowest delivers his opinion first;
 and the sovereign, at last, by declaring his senti-
 ments, determines the question. A privy-counsellor,
 though a gentleman only, takes precedence of all
 knights

knights and younger sons of barons, and his person is held sacred.

Upon any unforeseen emergency, which the laws do not take cognizance of, the privy-council can supply the deficiency. And it has more than once, in times of the most urgent necessity, such as famine and the like, ventured to supersede the operations of the law, when no parliament was sitting. But in these cases, it is always necessary, at the first meeting of the parliament, to procure an act for the pardon and indemnification of all concerned in such illegal proceedings. It must also be remembered, that every privy-counsellor is responsible for his advice and conduct.

Besides the privy-council, there is another, called the Cabinet-Council, consisting of a select number of noblemen and ministers selected by the king, and in this council the capital affairs of government are determined. This council is unknown to the English constitution, notwithstanding its decrees are powerful and extensive.

The two secretaries of state are more official than any others of the privy-counsellors. They are intrusted with the most important secrets of government, some of which are improper to be communicated even to the privy-council. The number of secretaries of state has not been always the same; sometimes there have been three, and sometimes only one; as, for instance, during the American war, there was a third appointed to manage the affairs of that department. The office of secretary of state is separated into two divisions, called the northern and southern departments, one of the secretaries executing the business of the former, and the other that of the latter. The northern department comprehends the states of Germany, Prussia, Poland, Russia, Sweden, Denmark, Holland, Flanders, and the towns comprehended in the Hanseatic league. The southern contains France, Spain, Portugal, Italy, the Swiss Cantons, Constantinople, and all other states in the southern parts.

For the more regular and speedy conducting the multiplicity of affairs of government, one of the members of the cabinet-council is generally considered as first minister, though that name is unknown to the constitution of England, and consequently there is no office of that kind. A responsibility for all the transactions of government is however always annexed to the title, which renders it a post of great danger and difficulty.

The great officers of the crown take place next to the princes of the blood, and the two primates; they are nine in number, viz. the lord high steward, the lord chancellor, the lord treasurer, the lord president of the council, the lord privy-seal, the lord chamberlain, the lord high constable, the earl marshal, and the lord high admiral.

The lord high steward is the first officer of the crown, and his power so exorbitant, that it has long been

thought impolitic to trust it in the hands of any subject; so that it is now only exercised occasionally, to officiate at a coronation, or preside at the trials of peers. He bears in his hand a white rod, as the badge of his dignity; and as soon as the service for which he was created is finished, he breaks his rod, which terminates his office.

The lord chancellor presides in the court of chancery which is deemed a court of equity, where causes are determined according to the dictates of strict justice and reason. The salary of this great post amounts to above seven thousand pounds a year. Sometimes the post of lord chancellor is filled by another officer called lord keeper. There is no difference in authority, power, or precedence, between the lord keeper and lord chancellor, but there is a difference between them in creation. The lord keeper is created by the king delivering the great seal into his hands, and his taking the oath; but the lord chancellor has also a patent.

The lord high treasurer is invested with his office by receiving a white staff from the king; but, since the accession of the present royal family, the office has been put into commission, and the business of the revenue managed by five commissioners, called lords of the treasury; but the presiding commissioner is supposed to possess the whole authority of the lord high treasurer. The power of this officer is very great for he has, in fact, the public finances in his hands together with the letting leases of all the crown lands, and the gift of an amazing number of lucrative places.

The lord president of the council is created by letters patent under the great seal. He proposes all the business transacted at the council-board, and, when the king is absent, reports to him all the debates and proceedings. This is a place of great dignity, as well as difficulty.

The lord privy-seal is an officer of great trust; all charters, pardons, and grants, signed by the king, pass through his hands before they receive the confirmation of the great seal. He also seals warrants for pensions, and the payment of money in other affairs, which do not require the confirmation of the great seal. He is responsible if he gives the sanction of the privy-seal to any thing contrary to the laws of the land.

The office of lord chamberlain of England is hereditary in the duke of Ancafter's family. This officer has great power, and enjoys a considerable number of perquisites. He takes care to provide every necessary in the House of Lords during the time of parliament and the government of the whole palace, at Westminster, belongs to him. He issues warrants for preparing and furnishing Westminster-Hall for coronations and trials of peers; and the gentleman-usher of the black rod, with his deputies, are under his command. Upon solemn occasions, the keys of Westminster-Hall, the Court of Wards, and Court of Requests, are delivered to him. He is entitled to livery

and lodging in the king's court, to certain fees from the bishops when they do homage or fealty to the king, and also from all peers at their creation. At the ceremony of a coronation he receives forty ells of crimson velvet for his own robes. His majesty's night apparel also, together with the bed and furniture of the king's chamber, are his fees. At that ceremony he walks with a white staff in his hand.

The lord high constable was formerly an officer of the highest trust; he was commander of all the king's posts and garrisons, and took place of all other military officers in the field. A power so extensive as this, was thought too much for any subject to enjoy, and accordingly the post has not been filled since the attainder and execution of Stafford, duke of Buckingham, in the year 1521, except at coronations, when a lord high constable is created to assist at that splendid ceremony.

The post of earl marshal of England has long been hereditary in the duke of Norfolk's family. This office was formerly of great importance. The earl marshal, in time of war, was judge of all martial causes, which he decided according to the principles of the civil law. If the cause could not be decided by that method, it was left to a personal combat, which was attended with a vast variety of ceremonies, the regulation of which fell within the marshal's province. He still regulates all points of precedence according to the archives kept in the herak's office. He marshals the ceremony at the proclamation and coronation of kings, their marriages, interviews, festivals, and funerals.

The office of lord high admiral of England is now put into commission; the last who filled that post being George prince of Denmark, and husband to queen Anne. The admiralty of England is a board of direction, as well as execution, and independent even of the crown itself in its proceedings. The board of admiralty regulates the whole naval force of the realm, and either names all its officers, or confirms them when named; so that its power is very extensive. All proceedings in the court of admiralty are determined according to the maxims of the civil law; except trials for piracy, murder, and other capital offences, when the criminals are tried according to the laws of England, by witnesses and a jury; by a special commission of the king to the lord high admiral, some of the judges being always commissioners.

Courts of Law and Equity come next under consideration. The principal of these, and next in dignity to the parliament, is the Court of Chancery, instituted as a court of equity to mitigate, in many cases, the severity of the common law, and to relieve the subject from frauds, breaches of trust, and various other oppressions. The sole judge of this court is the lord high chancellor, or, in his absence, the master of the rolls. The proceedings of this court are carried on by bills, answers, and decrees, regulated on the

principles of conscience and equity. The lord chancellor is provided with twelve assistants; called masters in chancery; the principal of which is styled master of the rolls, because all the records of this court are committed to his care. The clerk of the crown likewise belongs to this court, he or his deputy being obliged always to attend on the lord chancellor as often as he fits for the dispatch of business.

The court of chancery is always open; and the lord chancellor has the power of granting an Habeas Corpus for a person sent to prison, provided sufficient reasons are alleged. This court also issues writs of summons for parliaments, charters, protections, safe-conducts, and patents for sheriffs; and in this court are sealed and enrolled all letters patent, treaties with foreign princes; all deeds touching the purchase of lands or estates, extents upon statutes, recognizances for payment of money, and securing contracts, commissions of appeal, and of oyer and terminer.

The highest court of common law in England, is the King's Bench, and is so called, because formerly the kings of England presided here in person. But this has for many years been laid aside, and the royal power vested in the lord chief justice of the King's Bench, styled, by way of eminence, the lord chief justice of England. He is created by a writ from the sovereign, and assisted by three inferior judges, constituted by letters patent; these are styled justices, or judges of the King's Bench. This court takes cognizance of every thing that concerns the loss of life or member of any subject, of treasons, felonies, breaches of the peace, oppression, mis-government, and, in a word, all matters determinable by common law, between the king and his subjects. It is also a kind of check upon all the inferior courts, their judges, and justices of the peace; has a power to rectify errors and mistakes in the sentences of inferior courts, except those of the Exchequer, its jurisdiction extending all over the kingdom; for the law presumes that the sovereign is always personally present. It has also a power to grant prohibitions in any cause depending either in the spiritual or temporal courts; and the House of Peers often directs to the lord chief justice, to issue out his warrant for apprehending persons under suspicion of high crimes.

The court of Common Pleas is held by another lord chief justice, styled lord chief justice of the Common Pleas, assisted by three other justices of this court, created by letters patent. All civil causes, real, personal, and mixed, litigated between subject and subject, are determined here. None but sergeants at law are suffered to plead in this court, which has also the power of issuing prohibitions, like that of the King's Bench.

The Exchequer is an ancient court of record, in which all causes touching the revenue and the rights of the crown, are heard and determined. The judges of

this court are the lord chief baron, and three other barons; but called, because formerly none but barons of the realm were allowed to be judges in this court. Besides these, there is also a curitor baron, who administers the oath to all high sheriffs, bailiffs, auditors, receivers, collectors, comptrollers, surveyors, and searchers of all the custom-houses in England. The Exchequer includes two courts, one of law, another of equity. All judicial proceedings at law are litigated before the barons; but the court of equity is held in the exchequer chamber, before the treasurer, chancellor, and barons. Besides the officers already mentioned, there belong to the exchequer, the king's remembrancer, who takes and states all accounts of the revenue, customs, excise, parliamentary aids, subsidies, &c. and the lord treasurer's remembrancer, whose business it is to make out processes against sheriffs, receivers of the revenue, and other officers.

The duchy chamber of Lancaster consists of the chancellor of the duchy as chief judge, assisted by the attorney of the duchy, and other officers. This court takes cognizance of all causes relative to the revenue of that duchy.

All these courts are held in Westminster-Hall, and opened at the four terms of Easter, Trinity, Michaelmas, and Hilary.

But though the principal courts are held in the capital, yet the country is not left without the means of obtaining justice without the expence of journies, &c. to Westminster-Hall. In order to this, England is divided into six circuits, and two judges allotted for each. Wales also is divided into two circuits, and the same number of judges assigned them; as has been already observed in the head relating to the divisions of England. These judges sit at the principal or some other convenient town in every county twice a year, to hear and determine causes, both civil and criminal.

There are also Courts of Conscience settled in many parts of England, for the relief of the poor, in the recovery or payment of small debts, not exceeding 40s.

In a well regulated state, it is not enough that proper judges and courts of law are established in the capital, and the counties visited twice a year by the judges; magistrates must also be appointed to reside in every district, in order to keep the peace and preserve good order and harmony in all parts of the kingdom. The principal of these officers are sheriffs, coroners, justices of the peace, constables, surveyors of the highways, and overseers of the poor.

The sheriff, or high-sheriff, is an officer of very great antiquity in this kingdom, as we may find observed in some accounts of the divisions of England. His power and duties are very extensive; both with regard to a judge, a keeper of the king's peace, a ministerial officer of the superior courts of justice, and the king's bailiff. In his judicial capacity he is to hear and determine all causes of forty shillings value and under, in his county court. He is to decide the elec-

tions of knights of the shire (subject to the control of the House of Commons) of coroners, and of voters; to judge of the qualifications of voters, and to return, such as he shall determine to be duly elected. As keeper of the king's peace, he is the first man in the county, during his office; and in order to this he may command all the people of his county to attend him, which is called the *posse comitatus*, or power of the county. In his ministerial capacity he is bound to execute all processes issuing out of the king's courts of justice; and carry all sentences into execution. As the king's bailiff, he must preserve the rights of the king within his bailiwick. He must seize to the king's use all lands devolved to the crown, by attainder or escheat; and levy all fines and forfeitures.

In each county, there are two coroners. This officer, in his ministerial character, is the sheriff's substitute. He is to inquire, by a jury of neighbours, how or by whom any person came by a violent death, and to enter it on record as a plea of the crown. Another branch of his office is, to inquire concerning shipwrecks, and certify whether wreck or not, and who is in possession of the goods. The coroner is chosen for life; but may be removed on promotion or for neglect, misbehaviour, &c.

The next species of magistrates, subordinate to the sheriffs, are justices of the peace; the principal of whom is the *custos rotulorum*, or keeper of the records of the county. As peace is the very end and foundation of civil society, the common law hath ever had special care and regard for the conservation of it. Accordingly a sufficient number of proper persons, in every county, are appointed by the king's special commission to keep the peace. Their power is very extensive; but the business of the office is so great and of such variety, that very few gentlemen of independent fortune care to engage in this troublesome service.

The power, office, and duty of a justice of peace depend on his commission, and on the several statutes which have created objects of his jurisdiction. His commission, first, empowers him singly to conserve the peace in suppressing riots and affrays, in taking securities for the peace, and in apprehending and committing felons and other inferior criminals. It also empowers any two or more of them to hear and determine all felonies and other offences, which are the grounds of their jurisdiction at the sessions; these are held every quarter at the county town, where a jury of twelve men, called the grand inquest of the county, are summoned to appear. The duty of this inquest is to inquire into the cases of all delinquents, and to pronounce them guilty or not guilty of their indictments; the justices then commit the former to prison, in order to take their trial at the next assizes, if the crime be great, if otherwise, they order the allotted punishment and discharge the latter. This short sketch of the duties will sufficiently indicate the great difficulty of performing the office; so that society is greatly oblig-

to such worthy views of their service. And makes any undue indulgence of law; and thim in the up among other p being sued for hand; and stop of sufficient am vicious or tyrann being severely p verdict against a jury, are entitle

Constables are king the peace constables, and is one at least in officers in every high-constable of two offices, that the high-constable and petty constables should for this they the government. are brought before to execute, most directed to of justices.

The constitution for the solid base are founded, and the destruction of may be reduced personal security right of private inviolate, our ci sense, must be p

1. The right son's legal and limbs, his body cause if either

2. The right of changing our please, without erer, unless by

former, is a rig laws of England cause; and whic discretion of the the laws. The shall be taken o ment of his pee lest any person an illegal court, in person, or by

candle, till they are unanimous in acquitting or condemning the prisoner; and should one of them happen to die before they have delivered their verdict, the prisoner is acquitted. Every juryman is invested with a solemn and awful trust: if he, without being convinced by the evidence, submits his opinion to that of any other juryman, or yields in compliance to the opinion of the judge; if he neglects to examine with the greatest care; if he questions the veracity of the witnesses, who may be of an infamous character; or, after the most impartial hearing, has the least doubt upon his mind, and yet joins in condemning the person accused; he will wound his own conscience, and bring upon himself the complicated guilt of perjury and murder.

When the jury have agreed in their verdict, and delivered it to the judge, he pronounces such sentence upon the offender as the law has prescribed. It seems therefore to be not only impertinent but injurious, for those who are employed to plead against a prisoner in criminal prosecutions, to declaim in a long and laboured harangue, on the heinousness of the offence supposed to have been committed, and to enumerate every minute and supposititious circumstance by which it is possible to accumulate aggravation.

Every sensible and patriotic person must be convinced, that trial by jury is a capital privilege, and at the same time so great a security to the liberty of the subject, that it is much to be regretted that persons of education, honour, and property, are often too ready to evade serving the office. By this means, juries frequently consist of ignorant and illiterate persons, who neither have knowledge enough to understand their right and the privileges of Englishmen, nor spirit enough to maintain them. No man should evade serving so important an office, when regularly called upon: and those who, from indolence or pride, decline discharging this duty to their country, seem hardly to deserve that security and liberty which the inhabitants of Britain derive from this invaluable institution.

Juries have always been considered as giving the most effectual check to tyranny; for in a nation like England, where a king can do nothing against law, they are a security that he shall never make the laws, by a bad administration, the instruments of cruelty and oppression. Were it not for juries, a corrupt nobleman might, whenever he pleased, act the tyrant, while the judge would have that power which is now denied to our kings.

By our happy constitution, which breathes nothing but liberty and equity, all imaginary indulgence is allowed to the meanest, as well as the greatest: the prisoner, when brought to trial, is freed from all bonds; not only the judges are supposed to be his counsel, but other counsel are allowed him; he may also try the validity and legality of the indictment, and set it aside if contrary to law. The racks and tortures that are cruelly and preposterously made use of in some part of Europe, to make a man accuse himself, are

here unknown, and none punished without conviction; but he who refuses to plead in his own defence. Nothing, in short, is wanting, in this country, to clear up the cause of innocence, and to prevent the sufferer from sinking under the power of corrupt judges and the oppression of the great.

In England, the sovereign has it not in his power to take away the liberty of the least individual, unless by some illegal act, of which he is accused or suspected upon oath, he has forfeited his right to liberty; or except when the state is in danger, and the representatives of the people think the public safety make it necessary that he should have the power of confining persons on such a suspicion of guilt; such as the case of a rebellion within the kingdom, when the legislature has thought proper to pass a temporary suspension of the Habeas Corpus act: but this seldom has been done but with great difficulty and caution, and when the national safety has absolutely required it. And indeed the rights of individuals are so attentively considered that the subject may, without the least danger, sue his sovereign, or those who act in his name, and under his authority: he may do this in open court, when the king may be cast, and be obliged to pay damages to his subject.

The laws of England are more merciful to criminals than those of any other country. The proceedings formerly, indeed, with regard to offenders who refused to plead to their indictments, were very cruel; but these are now abrogated by a late act of parliament, whereby all persons indicted for any crime, who shall refuse to plead, that is, to submit themselves to a lawful trial, are declared guilty of the offence of which they are accused, and sentence is accordingly to be pronounced against them.

All capital offences are, by the laws of England, included under high-treason, petty-treason, and felony. High-treason consists in plotting, conspiring, or taking up arms, against the sovereign, or in counterfeiting the current coin. Whoever is found guilty of the crime is styled a traitor, and punished by being drawn on a sledge to the place of execution, where, after the body has hung upon the gallows for some minutes, is cut down alive, the heart taken out and exposed to public view, and the entrails burnt: the head is then cut off, and the body quartered, after which the head is generally exposed on some public edifice: the criminal's lands and goods are forfeited, his wife loses her dowry, and his children both their estates and nobility. The sentence is the same to all traitors; but with regard to persons of quality it is generally changed into beheading, which is executed on a scaffold erected for that purpose.

Though the law has declared the counterfeiting the current coin to be high treason, yet the criminal is only drawn upon a sledge to the place of execution, and there hanged in the same manner as all other offenders guilty of felony.

If a child kills his father, a wife her husband; a clergyman his bishop, or a servant his master or mistress, the crime is petty treason, and the criminal is thrown upon a sledge to the gallows, and there hanged till dead. Women guilty of either petty or high treason, are sentenced to be burnt alive; but the rigour of the law was generally mitigated by strangling them before the fire reached their bodies, and is now superseded. One reason why women were not sentenced to be hanged for the above crimes, as the men are, is said to be, because, in that case their bodies must be dissected, and publicly exposed, which would be deemed indecent, and highly inconsistent with decency.

Felony includes murders, robberies, forgery, house-breaking, &c. These are all punished by hanging only, except murderers, who are hanged in twenty-four hours after sentence is past, and their bodies delivered to the surgeons in order to be dissected publicly. It is, however, common, in order to allow the criminal as much respite as possible, to bring on the trial on a Saturday, by which means he is not executed till Monday, Sunday not being considered as a day for public business.

The other punishments known in England are burning in the hand, transportation, imprisonment, whipping, fines, and standing on the pillory; and are inflicted for the crimes of manslaughter, chance-medley, shop-lifting, perjury, petty larceny, and libelling.

If a person strikes another in the king's court, so as to draw blood, the law condemns him to lose his right hand. If the blow be given in Westminster-Hall while the courts are sitting, the punishment is imprisonment for life, and forfeiture of all the offender's estate. Drunkards, vagabonds, and loose, idle, disorderly persons, are punished by being set in the stocks, paying a fine, or commitment to the house of correction.

With respect to marriages, the holiness of the matrimonial state is left entirely to the ecclesiastical law; the punishing or annulling incestuous or other unscriptural marriages, is consequently the province of spiritual courts. The first legal disability is a prior marriage, or having another husband or wife living; in which case, besides the penalties consequent upon it as a felony, the second marriage is to all intents and purposes void, polygamy being condemned both by the law of the New Testament, and the policy of all prudent states, especially in these northern climates. The second disability is want of age, which circumstance annuls the contract, on account of the imbecillity of judgment in the parties: the marriage of a boy under fourteen, or a girl under twelve years of age, is deemed imperfect: but the common law pronounces the marriage good, if the parties are *habiles ad matrimonium*. Another incapacity arises from want of consent of guardians. It has been lately thought proper to enact, that all marriages celebrated by licence (for banns suppose notice) where either of the parties is under twenty-one, not being a widow or widower, who are

supposed free, without the consent of the father, or, if he be not living, of the mother or guardians, shall be absolutely void. Much has been, and may be said, both for and against this innovation upon our ancient laws and constitution. On the one hand, it prevents the clandestine marriages of minors, which are often a terrible inconvenience to those private families where they happen; and, on the other, restrains upon marriages, especially among the lower classes, are evidently detrimental to the public, as well as prejudicial to religion and morality. The fourth legal disability is want of reason; without a competent share of which, neither the matrimonial nor any other contract can be valid. Upon the whole, we may collect, that, as the law now stands, no marriage is void by the temporal law, which is celebrated by a person in orders; in a parish church, or public chapel (or elsewhere, by dispensation); in pursuance of banns, or a licence; between single persons; consenting; of sound mind; and of the age of twenty-one years; or of the age of fourteen in males, and twelve in females, with consent of parents or guardians, or without it, in case of widowhood. In the times of civil war, all marriages were performed by the justices of the peace; and these marriages were declared valid in the succeeding reign, as the marriages of Quakers are at present.

Divorces are either total or partial. The total must be on account of consanguinity, affinity, or corporeal imbecillity; the issue of such marriages are bastards. The other kind of divorce is, when the marriage is just and lawful, but for some supervenient cause it becomes improper or impossible for the parties to live together; and in the case of intolerable ill temper, or adultery, in either party. In this case, the law allows alimony to the wife (except when for adultery, the parliament grants a total divorce, as has frequently happened of late years) which is an allowance made to the woman for her support, out of her husband's estate, and settled at the discretion of the ecclesiastical judge.

A woman in England, as soon as married, is, with all her moveables, at the will and disposal of her husband; nor can the alienate any thing without his consent; her necessary apparel is not her own property; nay, at the death of her husband, all the personal chattels she possessed at marriage, descend to his executor or administrator. She can make no contract without her husband's consent, no reply without him, in matters of law. On the other hand, he must pay the debts which she has contracted; and if she should injure any person by her tongue or trespass, he will be obliged to make satisfaction. Though our law in general considers man and wife as one person, yet there are some instances in which she is separately considered as inferior to him, and acting by his compulsion, such as in felonies, and other inferior crimes, committed by her, but not as to treason or murder. In the civil law, the husband and wife are considered as two distinct persons, and may have separate estates, contracts, debts,

and injuries; and therefore a woman may sue, and be sued, without her husband, in the ecclesiastical courts.

The authority of fathers is so absolute in England, that they may give away their unentailed estates from their own children, or bequeath their fortunes to any one child, in preference to all the rest. A youth of fourteen may choose his guardian, and consent to marriage; at twenty-one he is at age to make any contract, deed, or will, and to sit in parliament. The eldest son commonly inherits the landed estate, and the younger children are portioned from the goods and chattels; but in Kent, and some other places, the lands are, by the custom of gavel-kind, equally divided among all the sons.

The revenues of the British government, or, as they are commonly called, the royal revenues, are either ordinary or extraordinary. The king's ordinary revenue is such, as has either subsisted from remote time in the crown, or has been granted by parliament, in exchange for such of the king's inherent hereditary revenues, as were found inconvenient to the subject.

The king's ecclesiastical revenues consist in, 1. The custody of the temporalities of vacant bishoprics; from which he receives little or no advantage. 2. A corody or pension out of every bishopric; that is, to send one of his chaplains to be maintained by the bishop, or to have a pension allowed him, till the prelate promotes him to a benefice. This is now fallen into disuse. 3. Extraparochial tythes. 4. The first-fruits and tenths of all spiritual livings in the kingdom. Little or no profit arises to the revenue from these four branches, through the bounty of the crown to the church.

The ordinary temporal revenue of the king consists in, 1. The rents and profits of the demesne lands of the crown, which at present are reduced to little or nothing. 2. The hereditary excise, which formerly arose from the profits of the king's military tenures, and from the profitable prerogative of purveyance and pre-emption. 3. An annual sum of 7000*l.* issuing out of the stamp-duties imposed on wine-licences. 4. His forests, now wholly laid aside. 5. The profits arising from the king's ordinary courts of justice, &c.

These extraordinary grants are called by the synonimous names of aids, subsidies, and supplies, and are granted by the commons of Great-Britain assembled in parliament, who, when they have voted a supply to his majesty, and settled the quantum of that supply, usually resolve themselves into what is called a committee of ways and means, to consider of the methods necessary to be taken for raising the supply so voted. The resolutions of this committee, when approved of by a vote of the house, are generally considered as final and conclusive; for though the supply cannot be actually raised upon the subject till directed by an act of the whole legislature, yet no man will scruple to advance to the government any quantity of ready cash, on the credit of a vote of the House of Commons, though no law be yet passed to establish it.

There are two kinds of TAXES levied upon the subject, annual and perpetual. The usual annual taxes are, 1. The land-tax, or the ancient subsidy raised upon a new assessment. 2. The malt-tax, being an annual excise on malt, mum, cyder, and perry. The perpetual taxes are, 1. The customs or duties payable upon all merchandize exported and imported. 2. The excise duty, or inland imposition on sundry commodities. 3. The duty on salt. 4. The post-office, or duty for the carriage of letters; the annual amount of this revenue, from 1644 to 1744, gradually increased from 5000*l.* to 198,226*l.* and it is now, by increasing the duty in 1784, and abridging the franking, considerably augmented. 5. The stamp duties, almost innumerable. 6. The duties on houses and windows. 7. The duties on offices and pensions, with a variety of new taxes in 1784, such as, an additional tax on windows, the bill tax, &c. &c. After all charges of collecting and management are paid, the clear nett produce of the several branches of the revenue, old and new, is estimated to amount to about eleven millions sterling, with two millions and a quarter raised at an average by the land and malt-tax. How these prodigious sums are applied, is next to be considered.

The national debt owes its origin to the Revolution, when our new connections with the continental powers of Europe introduced a new system of foreign politics; for large sums being necessary to settle the establishment, and to maintain an expensive war on the continent, in order to reduce the exorbitant power of the French monarchy, which then threatened the liberties of Europe, it was not thought prudent to raise the sums necessary to defray the expences of one year, by taxes levied on the people, during that short period, lest the unusual weight of these taxes should create murmurs and disquiets in the nation. It therefore became necessary to anticipate the revenues of their posterity, by borrowing immense sums for the current service of the state, and to lay no more taxes on the subject than was necessary to pay the interest of the sums so borrowed, converting the principal debt into a new species of property, transferrable at any time, either in whole or in part, from one man to another. This system, which was borrowed from the state of Florence, laid the foundation of what is called the national debt; but a few long annuities created in the reign of Charles II. hardly deserve the name. This system has been so closely pursued, to the present time, that the capital of the funded debt at Midsummer 1775 was 129,860,000*l.* and the annual charge of it amounted to 4,219,234*l.* 7*s.* The ruinous American war was commencing at this time, and the execrable policy continuing of alienating the sinking fund, with the extravagancies in every department of government, and the manner of borrowing the money for supplies, have considerably increased it; for in the course of the said war, from 1776 to 1782, 46,550,000*l.* was added to the three per cent, and 26,750,000*l.* to the four per cents, making together

The quantity of property in the kingdom is greatly
increased in idea, when compared with former times;
but if we coolly consider it, not at all in reality. We
may indeed boast of large fortunes and quantities of
money in the funds; but where does this money exist?
It exists only in name, in paper, in public faith, in
parliamentary security. But what is the pledge which
the public faith has pawned for the security of these
debts?—The land, the trade, and the personal industry
of the subject, from which the money must arise that
supplies the public taxes. In these, therefore, and in
these only, the property of the public creditors does
really and intrinsically exist; and of course the land,
the trade, and the personal industry of individuals, are
diminished in their value just so much as they are pledged
to answer.

Time will unfold the future progress of our national
debt, and the calamities towards which it is carrying
us, if the most effectual measures are not adopted and
speedily pursued for a thorough reform. Indisputably
certain it is, that the present magnitude of our national
incumbrances very far exceeds all calculations of com-
mercial benefit, and is productive of the greatest incon-
veniences. In the first place, the enormous taxes that
are raised upon the necessaries of life, for the payment
of the interest of this debt, are prejudicial both to trade
and manufactures, by raising the price as well of the
artificer's subsistence, as of the raw material; and, of
course, in a much greater proportion, the price of the
commodity itself. Secondly, if part of this debt be
owing to foreigners, either they draw out of the king-
dom annually a considerable quantity of specie for the
interest; or else it is made an argument to grant them
innumerable privileges, in order to induce them to
reside here. Thirdly, if the whole be owing to our
own subjects, it is then charging the industrious subject,
who pays his share of the taxes, to maintain the indolent
creditor who receives them; but, which is the
principal injury, it weakens the internal strength of a
state, by anticipating those resources which should be
reserved to defend it in case of necessity.

In treating of the military and marine strength of
Great-Britain, it may be proper to observe, that in ab-
solute monarchies it is necessary to form a distinct order
for the profession of arms, but extremely dangerous in
a land of liberty. No man, in a free state, should take
up arms but with a view to defend his country and its
laws; he puts off the citizen when he enters the camp;
but it is because he is a citizen, and would wish to con-
tinue so, that he makes himself for a while a soldier.
Accordingly, the laws and constitution of this country
know no such state as that of a perpetual standing sol-
dier, bred up to no other profession than that of war,
nor had the kings of England so much as a guard about
their persons till the reign of Henry VII.

In the time of our Saxon ancestors, the military
force of this kingdom was in the hands of dukes and
heretocks. Alfred the Great first settled a regular mil-
litia in this kingdom; and, by his prudent manage-
ment, made all the subjects of his dominions soldiers.
Upon the Norman conquest, the feudal law was in-
troduced here in all its rigour, the whole of which is
built upon a military plan. All the lands in England
were divided into what were called knights-fees, amount-
ing to about 60,000; and, for every knight's fee, a
knight or soldier was obliged to attend the king in his
wars, forty days in a year; in which space of time,
before war was reduced to a science, the campaign was
generally finished, and a kingdom either conquered or
rendered victorious. By this means the king, without
the least expence, had an army of 60,000 men always
ready at his command. This personal service, how-
ever, in length of time, degenerated into pecuniary
commutations, or aids, till at last the whole feudal
system was abolished at the Restoration.

This abolition of the military tenures gave occasion
to ascertain the power of the militia; to recognize the
power of the crown to govern and command them,
and to put the whole into a more regular method of
military subordination. The present militia laws are
founded upon these statutes, with the addition of some
new regulations; the general scheme of which is to
discipline a certain number of the inhabitants of every
county, chosen by lot for three years, and officered by
the lord-lieutenant, the deputy-lieutenants, and other
principal landholders, under a commission from the
crown. They are not obliged to march out of their
respective counties, unless in case of invasion or actual
rebellion, nor in any case compellable to march out of
the kingdom. They are to be exercised at stated times,
and their discipline is in general very easy; but when
called out to actual service they are subject to the ri-
gours of martial law, as necessary to keep them in order
and proper subordination. This is the constitutional
security which our laws have provided for the public
peace, and for protecting the realm against foreign and
domestic violence. The legislature has indeed always
been jealous of standing armies; for king Charles II.
having kept up about 5000 regular troops by his own
authority, for guards and garrisons, which king James II.
by degrees increased to no less than 30,000, all paid
from his own civil list, the parliament was so offended,
that it was made one of the articles in the Bill of
Rights, That the raising up and keeping a standing army
in time of peace, unless it be with consent of parlia-
ment, is illegal.

For many years past it has been annually judged ne-
cessary by the legislature, for the safety of this king-
dom, the defence of the possessions of the crown of
Great-Britain, and the preservation of the balance of
power in Europe, to maintain annually, even in time
of peace, a standing body of troops, under the com-
mand of the crown; but these are, *ipso facto*, disbanded
every

every year, unless continued by parliament. Accordingly, an annual act of parliament passes, "To punish mutiny and desertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be dispersed among the several innkeepers and victuallers throughout the kingdom, and establishes a martial law for their government.

The land forces of Great-Britain maintained in time of peace do not usually exceed 40,000 in number, computing 18,000 in England and Scotland, 12,000 on the Irish establishment, and the remainder in garrisons abroad, at Minorca, Gibraltar, Nova-Scotia, Jamaica, and Antigua. In the war of 1756, however, the nation maintained above 100,000 soldiers, exclusive of marines, and an army of 50,000 Germans on the Continent; and since the American war, there have been in the pay of Great-Britain, natives and foreigners, 135,000 men, besides 42,000 militia.

The British infantry have always been distinguished by a species of courage and intrepidity peculiar to themselves; and the cavalry is beyond all doubt the best in Europe, whether we respect the beauty, size, spirit, and docility of the horses, or the strength, appearance, and gallantry of the dragoons. In a word, the British troops, both horse and foot, are composed of tall, strong, muscular, handsome men, in red uniforms, with facings of various colours, well clothed, armed, and accoutred; inferior to none in exercise and discipline, and superior to all others in martial and military appearance.

Sensible of the great utility of this body of men, the nation has taken care to provide for their support, when they are no longer fit for service. A weekly allowance is to be raised in every county for the relief of sick, hurt, and maimed soldiers: the Royal Hospital was founded wholly for such as are worn out in the defence of their country. A statute is generally enacted at the close of every war, by virtue of which, any officer or soldier that has been in the king's service, is at liberty to use any trade or occupation they are capable of, in any town in the kingdom, the two universities only excepted, notwithstanding any statute, custom, or charter to the contrary.

The maritime power of England has long been considered as our greatest defence and ornament, its ancient and natural strength, and the floating bulwark of the island; hence it is no wonder that the navy of England has for a long series of years engaged the attention of the legislature. The celebrated code of maritime laws, called the laws of Oleron, were compiled by Richard I. on the isle of Oleron on the coast of France, then possessed by the crown of England. A great variety of laws have been since made for the supply of the royal navy with seamen, for their regulation when on board, and to confer privileges and rewards on them during and after their service.

It has long been sincerely wished that some less offensive method than that of impressing could be devised

for manning the royal navy, because it is undoubtedly a gross violation of the rights of mankind, and falls entirely on a set of the bravest and most useful men in the kingdom. About the middle of king William's reign, a scheme was set on foot for a register of seamen to the number of 30,000, for a constant and regular supply of the king's fleet, granting great privileges to the registered men; and, on the other hand, inflicting heavy penalties, in case of their non-appearance when called upon; but this registry being judged to be rather a badge of slavery, it was abolished by a statute passed in the ninth year of queen Anne. Bounties are also generally offered to such as shall enter on board his majesty's fleet in time of war; but these bounties are too small to produce the desired effect, because there is a prodigious disparity between the wages allowed by the king and those given by the merchants, the former being only twenty-two shillings per month, and the latter fifty shillings, or three pounds. Another discouragement to seamen is the unequal division of prize money. On the footing it now stands, the common seamen can have little hopes of ever acquiring any considerable sum. The principal officers indeed are enriched; but the men, to whose valour and intrepidity the nation depends for preservation in the day of public danger, are almost forgotten in the division, though perhaps the greater part of them were forced from their wives and families, and deprived of their rights and liberties.

The discipline of the navy is subject to certain express rules, articles, and orders enacted by the authority of parliament. In these naval articles almost every possible offence is set down, and the punishment there annexed. In this respect the seamen have much the advantage over their brethren in the land service, whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. Yet from whence this distinction arose, and why the executive power, which is so properly limited with regard to the navy, should be so extensive with regard to the army, it is difficult to assign a reason, unless it proceeds from the perpetual establishment of the navy, which rendered a permanent law for their regulation expedient; and the temporary duration of the army, which subsisted only from year to year, and might therefore with less danger be subject to discretionary government. But, whatever was apprehended at the first formation of the mutiny act, the regular renewal of our standing forces at the beginning of every year, has made this distinction idle. For if we may judge of future events from past experience, the army is now firmly engrafted into the British constitution; with this singular fortunate circumstance, that any branch of the legislature may annually put an end to its legal existence, by refusing to concur in its continuance.

When a ship of war becomes old, or unfit for service,
the name is transferred to another, which is built, as
it is called, upon her bottom; but the name cannot be
changed without an act of parliament, while a single
beam of the old ship remains.

The Old Style, or Julian account of time, was ob-
served in England, till the year 1752, when the New
Style, or Gregorian account was adopted by public au-
thority, and eleven days taken out of the Calendar that
year in the month of September, by which it now
coincides with that observed in most parts of Europe.

The English traders, in numbring cod-fish, ling, and
haddock, reckon one hundred and twenty-four to the
hundred, and of herrings one hundred and twenty;
twelve hundred are given to the thousand, which con-
stitute a barrel, and twelve barrels make a last. In
counting furs, they reckon by the timber, which consists
of forty skins, five score only are allowed to the hun-
dred. Twenty-four sheets of paper make a quire,
twenty quire constitute a ream, ten ream compose a
bale. Twelve skins of parchment make a dozen, and
five dozen a roll. Ten hides are a dicker, and twenty
dickers make a last; but there are ten pair of gloves to
one dicker.

The gold coin of England consists of guineas, half-
guineas, and quarter-guineas, but these last have been
long since discontinued, though the people reckon by
pounds, which at present is an imaginary denomination.
The pound is equal to twenty shillings, and the guinea

amounts to twenty-one; besides the English pieces, the
gold coin of Portugal, called Joannes and Moldores, were
till lately taken by all the dealers in England. Crowns,
half-crowns, shillings, and sixpences, compose the silver
coin that circulates through Great-Britain and Ireland,
and for the convenience of retail, there is an immense
quantity of half-pence and farthings. The value of a
crown is five shillings; a shilling twelve pence; and
four farthings constitute one penny. No person, how-
ever, is obliged to receive copper money in payment of
any sum above one shilling. The pound, or twelve
ounces troy weight of gold, is divided at the mint into
forty-four guineas and a half; one ounce of gold is worth
fourteen ounces and one third of an ounce in silver; so
that the proportion of gold to silver in England is as
one to fourteen, and one third. Besides the coins we
have already mentioned, there are some five and two
guinea pieces of gold, as well as four-penny, three-
penny, two-penny, and penny pieces in silver; but these
are rather preserved as medals than used in circulation.

Of weights there are two sorts used in England;
namely, troy-weight and avoirdupois; to reckon by the
first, twenty-four grains of wheat make one penny-
weight sterling; twenty penny-weights make one ounce;
and twelve ounces constitute a pound. By this they
weigh bread, corn, gold, silver, jewels, and liquors.
But all other articles, such as haberdashery and grocery
ware, metals, wood, and tallow, are computed by avoi-
dupois, in which sixteen drachms make one ounce;
sixteen ounces one pound, twenty-eight pounds a quar-
ter, four quarters one hundred, and twelve hundred
one ton.

The English measures consist of the inch, foot, yard,
fathom, perch or pole, furlong, and mile. An inch is
equal to three barley-corns; twelve inches make one
foot; three feet are equal to one yard; two yards make
one fathom; sixteen feet and an half constitute one
perch, pole, or rod; forty poles make a furlong, and
eight furlongs make an English mile, amounting to
seventeen hundred and sixty yards, according to act of
parliament. An English acre consists of forty perches
in length, and four in breadth; and an hundred acres
are accounted an hide of land. There are also various
measures, both for liquids and solids. The smallest
measure for liquids is called a pint; two pints make
a quart; two quarts make a pottle; two pottles
make a gallon; eight gallons a firkin; two firkins a
kilderkin; two kilderkins a barrel, and twelve bar-
rels a last of ale; but in reckoning beer, nine gal-
lons are allowed to the firkin; two firkins to the kil-
derkin; two kilderkins to the barrel; one barrel and an
half to a hoghead; two hogheads to a pipe or butt;
and two pipes to a tun. The wine measures are smel-
ler than those of ale or beer, nearly in the proportion
of four to five; four gallons of beer measure are almost
equal to five gallons of wine. A runlet of wine holds
eighteen gallons; and half an hoghead contains thirty-
one gallons and an half; forty-two gallons go to the
tierce;

tierce; sixty-three to the hoghead; eighty-four to the puncheon; one hundred and twenty-six to the pipe; and two hundred and fifty-two to the tun.

For measuring dry commodities, such as grain, the gallon is between the wine and ale measure, holding as much as will weigh nine pounds thirteen ounces twelve drachms and an half of avoirdupois. Two of those gallons make a peck; four pecks a bushel; four bushels the comb, or curnock; two curnocks a quarter, seam, or ruff; and ten quarters a last; thirty-six bushels of coals constitute a chaldron.

The title of the king of England is,—By the grace of God, of Great-Britain, France, and Ireland, King, Defender of the Faith. Henry VIII. assumed the designation of Majesty, that he might be on a footing with the emperor Charles V. for before that time, Your Grace or Highness was always used; nor was it totally abolished till about the reign of queen Elizabeth.

The royal achievement (arms) borne by the reigning family is thus marshalled, quarterly: in the first grand quarter, Mars, three lions passant-guardant in pale, Sol, the imperial ensigns of England: these are impaled with the royal arms of Scotland, consisting of Sol, a lion rampant within a double tressure flowered and counter-flowered, with fleurs de lis, Mars. The second quarter contains the arms of France, namely Jupiter, three fleurs de lis, Sol. The third, for Ireland, exhibits Jupiter, an harp, Sol, stringed, Luna. In the fourth grand quarter is represented his present majesty's own coat of arms, being Mars, two lions passant-guardant, Sol, for Brunswick, impaled with Lunenburg, giving Sol, semée of hearts, proper, a lion rampant, Jupiter, having for ancient Saxony, Mars, an horse current, Luna, grafted in base; and in a shield surmount, Mars, the diadem, or a crown of Charlemagne; the whole surrounded with a garter, as sovereign of that order. Above the helmet, as the emblem of sovereign jurisdiction, is an imperial crown; the crest, a lion passant-guardant crowned with the like: the supporters, a lion rampant-guardant, Sol, crowned as the former; and an unicorn, Luna, gorged with a crown, and chained. The royal motto, assumed in the reign of Richard I. is, *Dieu et mon droit*, implying, "that the king of England holds his crown of God only." The table of the compartment is adorned with the rose and thistle intermingled, as the emblem of England and Scotland. The white rose was anciently the armorial bearing of the house of York; and the red, together with a port-cullis, that of the house of Lancaster. The thistle was very significant, when joined to its motto, *Nemo me impune lacessit*, None shall provoke me with impunity.

The eldest son of the king of England is born duke of Cornwall, and afterwards created prince of Wales, with letters-patent, by which the said principality and a certain revenue are granted to him. He bears the king's arms, with the addition of a label of three points,

charged with nine torteaux; his device being a coronet beautified with three ostrich feathers, inscribed *Iob dien*, signifying in the German language, "I serve."

All degrees of nobility are derived from the king, as their fountain; and he may institute what new titles he pleases. The right of peerage seems indeed to have been originally territorial; that is, annexed to lands, honours, castles, manors, and the like, the proprietors and possessors of which were, in right of those estates, allowed to be peers of the realm, and were summoned to parliament to do suit and service to their sovereign; and when the land was alienated, the dignity passed with it as appendant. Thus the bishops still sit in the House of Lords in right of succession to certain ancient baronies annexed, or supposed to be annexed, to their episcopal lands.

Peers are now created either by writ or by patent: for those who claim by prescription, must suppose either a writ or patent made to their ancestors, though by length of time it is lost. The creation by writ, or the king's letter, which is the more ancient method, is a summons to attend the House of Peers, by the style and title of that barony which the king is pleased to confer: that by patent is a royal grant to a subject of any dignity and degree of peerage.

The present nobility of England are at once numerous and wealthy; enjoy many honourable privileges, but possess no power incompatible with the rights and liberties of their fellow-subjects. The majority of them live with great magnificence, especially at their country-seats, which are indeed elegant palaces, adorned with beautiful gardens, ponds, parks, and plantations. No country in Europe can produce such a number of noblemen living in all the pomp of affluence and all the delights of independence, secured by the law from the arm of arbitrary power, and, in their turn, disabled by the law from exercising the rod of oppression. They are distinguished by the different titles of duke, marquis, earl, viscount, and baron; and, according to these degrees, take precedence of one another. But they are all equally peers of England, and all sit in the House of Lords, which is the supreme court of judicature in England.

The person of a peer is sacred from arrest, except in case of treason, felony, breach of the peace, condemnation in parliament, or contempt of the king. In these cases he cannot be tried but by a jury of peers: he cannot be impanelled on any jury of inquest: he cannot be bound to his good behaviour, nor obliged to swear in any court of justice, but only to declare upon his honour. In case of lawful absence, he can constitute a proxy to vote for him in parliament; a privilege which no commoner enjoys. He is exempted from all attendance at sheriffs turns and leets, where other subjects are obliged to take the oath of allegiance, as also from joining the *passé comitatus*, when it is raised by the sheriff to suppress routs and riots. He cannot be outlawed in any civil action, nor pressed

to death as a felon when convicted of murder, or of any other crime for which the law requires the death of the offender. The sons of peers, according to the rank they are entitled to, are styled either lords or gentlemen. The eldest son of a peer is styled the eldest son of the duke, or the eldest son of the earl, or the eldest son of the viscount, or the eldest son of the baron. The second son is styled the second son of the duke, or the second son of the earl, or the second son of the viscount, or the second son of the baron. The third son is styled the third son of the duke, or the third son of the earl, or the third son of the viscount, or the third son of the baron. The fourth son is styled the fourth son of the duke, or the fourth son of the earl, or the fourth son of the viscount, or the fourth son of the baron. The fifth son is styled the fifth son of the duke, or the fifth son of the earl, or the fifth son of the viscount, or the fifth son of the baron. The sixth son is styled the sixth son of the duke, or the sixth son of the earl, or the sixth son of the viscount, or the sixth son of the baron. The seventh son is styled the seventh son of the duke, or the seventh son of the earl, or the seventh son of the viscount, or the seventh son of the baron. The eighth son is styled the eighth son of the duke, or the eighth son of the earl, or the eighth son of the viscount, or the eighth son of the baron. The ninth son is styled the ninth son of the duke, or the ninth son of the earl, or the ninth son of the viscount, or the ninth son of the baron. The tenth son is styled the tenth son of the duke, or the tenth son of the earl, or the tenth son of the viscount, or the tenth son of the baron.

The sons of nobility have certain titles by courtesy,
according to the rank of their fathers; but the law
ranks them among the commons of England. Thus,
the eldest son of a duke is denominated marquis, or earl;
and the youngest sons are saluted by the appellation of
My Lord. The first son of a marquis or earl is de-
nominated lord of some barony belonging to his father,
and his brothers are likewise address'd by the title of
Lord John, or Lord William. The sisters enjoy the
honourable title of Lady, in the same manner; but this
courtesy is not extended to the younger children of
barons and barons.

The baronets of England were so called as being
denom'd an inferior kind of barons, in Latin *baronuli*,
baroncelli and *baronetti*, constituted in the room of the old
knights, to hold a middle place between the parliamen-
tary barons and the different orders of knights. They
were created by James the First, who bestowed this
hereditary honour as an encouragement to those of his
subjects who assisted in the reduction of the province
of Ulster in Ireland. No person could be admitted
into this order unless he was a gentleman by blood,
of unblemish'd morals, and possess'd a yearly revenue
of one thousand pounds in land; and the express con-
dition of his admission was, that he should maintain
sixty soldiers for three years on the military establish-
ment of Ireland. As an armorial badge of distinction,
he wears in a canton of his escutcheon a bloody hand,
the arms of Ulster. The number of baronets was,
at first, restricted to 200, but now it is enlarged with-
out limitation. The title of baronet is confer'd by
warrant under the great seal, and descends to heirs male:
like other knights, he is distinguished by the appel-
lative *Sir* prefixed to his Christian name in speaking
and writing. He takes precedence of all other knights,
except those of the garter, and baronets created in the
field of battle. He is entitl'd to an honourable place
in the king's army, near the royal standard; and his
eldest son, by virtue of a peculiar privilege when of
age, has a right to the honour of knighthood, when-
ever it shall be demanded. The wives of baronets are
knights, and take place before the wives of all knights
whatsoever.

There are two grand orders of knighthood in Eng-
land, namely, those of the GARTER and the BATH.
The order of St. George, or the garter, is one of the
most ancient and honourable institutions of lay knights
now extant. It was founded by Edward the Third.
The order of the garter is a college or corporation,
consisting of the sovereign and twenty-five companions,
twelve knights of the garter, of a dean, canons, petit
crosses, vergers, and other inferior officers; and of
twenty-six poor knights, who receive their mainte-
nance from the college, as a reward for military ser-
vice; and in consideration of the prayers they put up

for the sovereign and the twenty-five companions. The
intention of this charity is now however perverted, and
this allowance bestow'd on superannuated butlers and
serving men. There are other officers belonging to
the order of the garter, which is dedicated to St.
George, the tutel'ar saint and patron of England; such
as that of prelate of the garter, annexed to the bishopric
of Winchester; the chancellorship, veited in the bishop
of Salisbury; and the registry, belonging to the dean
of Windsor. There is a principal king at arms, called
Garter, whose province it is to marshal the solemnities
of feasts and installations: finally the usher of the
black rod is likewise usher of the garter. The seat of
the order is the castle of Windsor, consisting of the
chapter-house, the hall, and chapel of St. George. A
knight of this order is distinguished by a blue garter,
with a gold buckle worn on the left leg, and inscribed,
Honi soit qui mal y pense, signifying, *Shame to him who
thinks evil of, or puts a bad construction on, this order*;
by a silver star on the left breast, enamell'd with gold
and set with diamonds, hanging at the end of a broad
blue ribband that crosses the body from the left shoulder.
The greatest monarchs of Europe have been members
of this institution.

The order of the BATH was first instituted by Henry
IV. and took their denomination from bathing on the
eve of their admission. The order, which had grown
obsolete, was revived by king George the First, in the
year 1725, when eighteen noblemen, and as many
commoners were install'd knights of the bath with
great ceremony at Westminster. Their number is
limited to forty-six; and they are distinguished by a star
on the breast, and a broad red ribband worn like a belt
over the shoulder.

Knights bachelors, or *equites aurati*, so called from
their gilt spurs, were anciently gentlemen who dis-
tinguished themselves by their valour, and the honour
was in very high esteem: but the original institution
being perverted, it is now confer'd indiscriminately
upon gowndsmen, burghers, physicians, by the king's
lightly touching them on the right shoulder with a
drawn sword: accordingly the title has lost much of
its former dignity.

The gentlemen of England are comprehended under
the general denomination of esquires, or *armigeri*, the
title formerly given to those among the gentry who
acted as armour-bearers in war to the prince and prime
nobility. Though the right of this title is limited to
persons of a certain rank, such as the sons of barons,
and gentlemen whose ancestors have been always free,
and borne a coat of arms, mayors of towns, coun-
sellors at law, bachelors of divinity, law or physic;
yet it is indiscriminately given to all those who maintain
the appearance of gentlemen. The highest order of
plebeians are the freeholders, called *yeomen*, from the
Saxon word *gemani*, which signifies *common*. These
are the husbandmen and farmers, who hold lands and
tenements inheritable by a perpetual right to them and
their.

their heirs for ever. The next class of people are the merchants and traders, greatly and deservedly respected in England, on account of their riches as well as their profession, which contributes so essentially to the wealth and power of the nation.

A Comprehensive HISTORY of ENGLAND.

It would be a vain attempt to search into the origin of the ancient inhabitants of England; the whole is concealed under the veil of fiction and obscurity, over which the glimmering rays of uncertain tradition only diffuse a feeble and deceptive light. The most probable opinion, however, seems to be, that they came from the neighbouring continent of the Celts, or Gauls, that settled on the opposite shore, long before their country was known to the Romans. But from whatever source they derived their origin, the ancient Britons were a rude warlike people, living in hovels erected within the covert of thick and almost impenetrable woods. They painted their bodies with wood, and gave them a blueish or greenish cast, and had no other covering than the skins of beasts, casually thrown over them, without being shaped into any kind of garment; and they are said to have had the figures of animals and heavenly bodies on their skins. In their marriages, they were not very delicate, for they formed themselves into a kind of matrimonial clubs; twelve or fourteen men married as many wives, and each wife was common to them all; but her children belonged to the original husband. They sowed corn, though it is likely they lived chiefly on animal food and milk. They were amazingly dextrous in the management of their chariots; and, fought with lances, darts, and swords. Women sometimes led their armies to the field, and were recognized as sovereigns of their particular districts. They favoured a primogeniture or seniority, in their succession to royalty, but set it aside on the smallest inconveniency attending it.

Such were the ancient Britons, when Julius Cæsar, about fifty-two years before the Christian æra, invaded their country; and after a long and bloody war, England was reduced to a province of the Roman empire. But the spirit of freedom was not so easily subdued; the Romans were obliged to maintain their conquest by a military force, with which they gradually incorporated the flower of the British youth. This force was divided into different parties, and placed at convenient stations all over the province: the Roman governor, for the time being, was supreme ruler of the country.

During the long reign of Augustus Cæsar, the Britons lived rather as the allies than the tributaries of the Romans; but the communications between Rome and Great-Britain being then extended, the emperor Claudius Cæsar, about forty-two years after the birth of Christ, undertook an expedition in person, in which

he seems to have been successful against Britain. His conquests, however, were imperfect; Caractacus, and Boadicia though a woman, made noble stands against the Romans. The former was taken prisoner after a desperate battle, and carried to Rome, where his undaunted behaviour before Claudius gained him the admiration of the victors, and is celebrated in the histories of the times. Boadicia being oppressed in a manner that disgraces the Roman name, and defeated, disdained to survive the liberties of her country; and Agricola, general to Domitian, after subduing South-Britain, carried his arms northwards, where his successors had no reason to boast of their progress, every inch of ground being bravely disputed.

While the Romans remained in this island, they erected those walls, so often mentioned, to protect the Britons from the invasions of the Caledonians, Scots, and Picts. But in the year 426, the barbarous nations of the North, breaking into the Roman empire, rendered it necessary to recall the legions stationed in Britain: when the emperor Honorius renounced his sovereignty of the country, and released the inhabitants from their allegiance.

On the departure of the Roman legions, in which all the natives, whom they had intrusted with military knowledge, were incorporated, the island was left in a feeble and defenceless state. The Scots, a cruel and rapacious people, who inhabited the country to the northward of the Roman provinces, no sooner perceived the weakness of their southern neighbours, than they invaded their country, and committed the most dreadful outrages; the tracts of their irruptions were marked with blood and devastation; the northern parts of the once flourishing provinces of the Romans were totally wasted with fire and sword, and the wretched inhabitants, destitute at once of forces and general, capable of repelling the cruel ravages of their barbarous enemies, became an easy prey. Reduced to this dreadful state, the Britons had recourse to the Saxons, a warlike people of Scandinavia, for protection; offering to give, as a reward for their services, the Isle of Thanet, a small tract of land separated by a narrow channel from the county of Kent. The offer was accepted, and the Saxons, together with a great number of Angles, a people of Jutland, landed in England. The Britons, headed by these auxiliaries, were soon too strong for the Scots, who were defeated in several engagements, and driven back to their own country. These victories, however, were far from restoring peace to the harassed Britons: Hengist and Horsa, the two Saxon generals, looked with contempt on the small spot of land assigned them and their followers, as a reward for their services, and meditated the conquest of the whole island.

The first step towards this great design was easily accomplished by Hengist, who persuaded Vortigern, the British king, that, as his subjects understood very little of agriculture, it would be of infinite advantage to

 eat design was easily ac-
 persuaded Vortigern, the
 ets understood very little
 infinite advantage to

fertile a country, if he would suffer a number of Saxons
 to be sent for to cultivate the soil. Accordingly as
 many of those people embarked as sixteen ships would
 contain; but they had not long been in this island
 before they threw off the mask, and convinced the
 wretched Britons that they had inadvertently consented
 to their own destruction. The pretence assigned by
 the Saxons for commencing hostilities was, that Hen-
 gist's troops had not been rewarded according to agree-
 ment, and that they had an undoubted right to satisfy
 themselves. A long and terrible war ensued; a great
 number of battles were fought, in which the Saxons
 were generally victorious, and the Britons forced at
 last to retire into Wales. Having thus no enemy in
 the field to contend with, the victors divided England
 into seven kingdoms, termed the Saxon heptarchy;
 namely, Kent; South-Sex, or the South-Saxons;
 West-Sex, or the West-Saxons; East-Sex, or the
 East-Saxons; Northumberland; the East-Angles, and
 Mercia.

Soon after this establishment, Christianity, or rather
 Popery, was introduced into England by pope Gregory
 the Great. For that purpose, about the year 596, he
 sent over to England the famous Austin, the monk,
 who probably found no great difficulty in converting
 the king and his people; and also Sebert, king of the
 East-Saxons, who was baptized, and founded the ca-
 thedral of St. Paul in London. The monk then, by
 his master's order, attempted to bring the churches in
 Wales to a conformity with that of Rome, particularly
 as to the celebration of Easter; but finding a stout re-
 sistance on the part of the bishops and clergy, he per-
 suaded his Christian converts to massacre them, which
 they did to the number of 1200 priests and monks, and
 reduced the Britons, who were found in the heptarchy,
 to a state of slavery, which some think gave rise to the
 ancient villenage in England. Austin is accounted the
 first archbishop of Canterbury, and died in 605, as
 his convert Ethelbert did soon after. The pope, in
 Austin's time, supplied England with about 400 monks,
 and the Popish clergy took care to keep their kings
 and under the most deplorable ignorance, but
 magnified the power and sanctity of his holi-
 ness. Hence it was that the Anglo-Saxons, during
 their heptarchy, were governed by priests and monks;
 and, as they saw convenient, persuaded their kings
 either to shut themselves up in cloisters, or to under-
 take pilgrimages to Rome, where they finished their
 days; and such was the Papistical tyranny in these
 early times, that no less than thirty Anglo-Saxon kings,
 during the heptarchy, resigned their crowns in that
 manner, and among them was Ina, king of the West-
 Saxons, though in other respects he was a wise and
 brave prince. The contributions of those Anglo-Saxon
 kings to the see of Rome was unlimited; and Ethel-
 wald, king of Mercia, imposed an annual tax of a penny
 upon every house, which was afterwards known by the
 name of Peter's pence, because paid on the holiday

of St. Peter ad vincula, August 1. This tax was im-
 posed at first for the support of a college at Rome for
 the education of English youth, founded by Ina, king
 of Wexsex, under the name of Rome-scol, but in pro-
 cess of time the popes claimed it as a tribute due to
 St. Peter and his successors.

A black cloud of barbarous ignorance covered the
 whole country during the Saxon heptarchy. Continual
 wars among themselves, blended with the most shocking
 crimes, furnish the few historical transactions that have
 reached our time. These continual tumults and dis-
 orders hastened the destruction of the heptarchy, which
 was abolished by Egbert, the last king of the West-
 Saxons, who annexed the other six kingdoms to his
 own, about the year 819.

Egbert, the eldest branch of Cerdic, one of the Saxon
 chiefs who first arrived in England, and related to Birth-
 ric, king of the West-Saxons, was in his early youth
 obliged to leave his country to avoid the effects of that
 prince's jealousy. Fortunately for Egbert, Charlemagne,
 the most accomplished prince of his age, then swayed
 the sceptre of France. The prince found there a gene-
 rous protector, and under him he learned the arts of
 war and government. About the year 800, Birthric
 paid the debt of nature, and the West-Saxons earnestly
 solicited Egbert to return to his native land, and take
 possession of the crown of his ancestors. He imme-
 diately complied with their request, and no sooner found
 himself settled on the throne, than he took such
 measures as in a short time rendered him the sole
 monarch of the seven provinces of the heptarchy.
 Peace being thus restored, Egbert was solemnly crowned
 king at Winchester. Soon after he changed the name
 of his kingdom into that of Engle-land or England.

The Danes, who about the year 822 were a powerful
 people, had long infested the British seas, and made
 descents upon the coasts of Kent and Dorsetshire.
 Egbert marched against them, but from the sovereign
 contempt he entertained of these pirates, marched at
 the head of a small number of forces, and was de-
 feated. The Danes, however, did not long enjoy the
 fruits of their victory: for about two years after he
 attacked them with such impetuosity, that they were
 obliged to abandon the kingdom; nor did they ever
 venture to return till after his death, which happened
 in 838.

Ethelwolf, son of Egbert, proved a weak and in-
 dolent prince, without the least tincture of his father's
 virtues; he was scarcely seated on the throne, before
 the Danes appeared again upon the coasts, and the
 English being unable to oppose their ravages, they
 fixed themselves in the island, which soon became one
 continued scene of bloodshed and devastation. They
 however received a severe check from Athelstan, son
 to Ethelwolf, and his partner in the regal authority;
 but this was not sufficient to prevent their forming a
 settlement in the Isle of Thanet, where they employed
 themselves in collecting arms and force sufficient to

extend their settlements in England. It would naturally be supposed that Ethelwolf endeavoured to counteract the designs of his barbarous enemy; but so far was that indolent prince from taking the necessary precautions against the invaders of his kingdom, that he abandoned it to their ravages; and fired with the enthusiasm of monkish devotion, visited the pope at Rome, taking with him his youngest son, afterwards the Great Alfred.

Ethelwolf at his death, which happened in 857, divided his dominions between his two eldest sons (Athelstan being then dead), Ethelbald and Ethelbert, whose joint reign affords no transaction worthy to be recorded. Ethelbald died first; and Ethelbert, at his decease, named his brother Ethelred for his successor, pursuant to the will of his father, though two sons of his own were then living. During the reign of Ethelred, the Danes, notwithstanding the valiant efforts of the king, and his brother Alfred, made themselves masters of many of the finest counties in England, and were almost entirely masters of the sea-coast, when, by the death of Ethelred, Alfred ascended the throne. This event happened in 872.

Alfred came to the crown at a time when his kingdom was falling a prey to barbarous invaders, and his subjects worn out with frequent wars. Such was his courage and conduct, that, though during the struggle he had once entirely lost his dominions, and was reduced for a time to the servile state of a cow-herd; yet before his death, which happened in the year 900, he had not only recovered the crown, but added new lustre to it by his conquests over the Danes, whom he obliged to swear obedience to his government. Even the inhabitants of Wales, who had lived in a perpetual state of enmity with the Saxons, courted his protection. The virtues of this monarch justly acquired him the epithet of Great, and his excellent laws, that of "The Father of the English Constitution." One of the principal glories of his reign was that of giving birth to a maritime power in England. Convinced that the superiority of numbers in his enemies would always be against him, unless he could acquire the dominion of the sea, he carefully observed the manner in which the Danes constructed their vessels, and having made improvements upon their art, ordered a number of galleys to be built, some of which carried sixty rowers, and were, though more lofty and of greater bulk, swifter sailers than the Danish ships. He revived the use of juries, which had lain dormant for some time. He gave great encouragement to navigation and commerce, which, even in that early period, he brought to some degree of perfection. He introduced buildings of brick and stone, materials till then used only in erecting churches. His treatment of corrupt judges was truly exemplary; he caused several of them to be hung up by the sides of high roads, as an example to deter others from the like destructive practices. A scholar himself, he admired and rewarded those who

were fond of the sciences, and invited several learned men into his dominions. In a word, if Alfred were not the greatest, he may be justly esteemed equal to any other monarch that ever swayed the English sceptre, and has obtained the highest character from the historians of all ages.

Edward, commonly called the Elder, to distinguish him from Edward the Confessor, succeeded his father Alfred. This prince reigned twenty-seven years, during which he was engaged in several wars against the Danes, and was generally victorious. The king of Scotland also, who had entered into an alliance with these invaders, was glad to purchase a peace by consenting to hold his dominions in vassalage to the crown of England. Nor were the Danes and Scots the only enemies Edward had to contend with. In the year 900, an insurrection happened in Wales, headed by Leofred, a Dane, and Griffith ap Madoc, brother-in-law to the prince of West-Wales. These two, at the head of a formidable army, had advanced as far as Chester, before Edward was in a condition to oppose their progress; but coming up with them at Sherwood, a battle ensued, wherein Griffith was killed, Leofred taken prisoner, and their whole army put to flight. Edward having thus subdued all his enemies, turned his thoughts to the improvement of his conquests, and the well governing of his subjects. He enacted the most salutary laws, and took care to put them strictly in execution. Edward dying in 927, was succeeded by his eldest son,

Athelstan, at the beginning of whose reign the Danes once more renewed their barbarous ravages; and his whole reign was one continued scene of war with these restless invaders, the Scots, the English, and other neighbouring powers. These commotions, however, did not divert his attention from the welfare of his people. The encouragement of commerce seems to have been his chief delight. He also encouraged coinage; and we find by his laws, that archbishops, bishops, and even abbots, had then the privilege of minting money. He enacted many excellent laws, and one in particular, whereby every merchant who had, on his own account, made three voyages to the Mediterranean, was put upon the same footing with athane, or nobleman of the first rank. He died in 941, and, leaving no issue, was succeeded by his brother,

Edmund I. whose reign, and those of his successors, Edred and Edwy, were weak and inglorious, being either engaged in wars with the Danes, or disgraced by the influence of priests.

Edgar mounted the throne about the year 959, but like Ethred, his brother, he was the dupe of priests, particularly Dunstan. During his reign, which upon the whole was not inglorious, he ceded to the Scots all the territory north of Severus's wall, and revived the naval glory of England. He died in 975, and his eldest son,

Edward,

Edward, next ascended the throne; but by the in-
vices of his step-mother, Elfrida, was soon deprived
of both his crown and life; and in 978, was suc-
ceeded by

Ethelred, son to Elfrida. In his reign, the English
nation was, by the help of priests, over-run with bar-
barians, and the Danes had by degrees possessed them-
selves of the finest parts of England, and left Ethelred
in no condition to dislodge them. To get rid of them,
he agreed to pay them 30,000l. which was levied by
way of tax, and called Danegelt, being the first land-
tax in England. In 1002, they had made such terri-
ble ravages in the country, that Ethelred was obliged to give
way to a general massacre for their extirpation. But
whether this cruel design was executed entirely, or
only in part, is uncertain; it was however severely re-
proached by Swein, the Danish king, who in 1013 laid
the country waste with fire and sword, and even
obliged Ethelred, with his queen and two sons, to fly
into Normandy, where they remained till Swein paid
the debt of nature. Immediately after his death, not-
withstanding Canute had been proclaimed king of Eng-
land by the Danes, Ethelred returned; and having
forced Canute to retire into Denmark, was once more
crowned in his kingdom. Canute, however, soon col-
lected a numerous fleet, and in 1016 once more in-
vaded England. Just at that period Ethelred died, and
his son, Edmund II. surnamed Ironside (from his great
bodily strength) after fighting several battles with the
Danes, in order to prevent a further effusion of human
blood, consented to divide the kingdom with Canute.
This division was soon terminated by the death of
Edmund, who was assassinated by one of his courtiers;
hoping, by that cruel act, to ingratiate himself with
Canute: but that monarch no sooner found himself
firmly fixed on the throne of England, than he caused
the traitor's head to be struck off, as a just reward for
his horrid service.

Canute's reign was very favourable to the English,
whom he incorporated with the Danes, and treated
with the utmost tenderness. He was engaged in several
wars, which he always finished with honour, and at
the time of his death, which happened in 1039, the
nation enjoyed a profound peace. He left three sons,
Swein, Harold, and Hardicanute, who all succeeded
to the crown of England; but their behaviour was fo-
lial and detestable, that the very government of the
Danes became odious to the English; they therefore
on the demise of Hardicanute, which happened in
1042, restored the family of Ethelred to the throne,
in the person of Edward, commonly called the Con-
fessor.

Edward, for some time, suffered himself to be en-
tirely governed by earl Goodwin, whose daughter he
had married, and by whose arts he was placed on the
throne, in preference to Edward, son of Edmund II.
But the insolence of this nobleman and his sons arose
to such a pitch, that they were banished by the king,

who, however, afterwards thought proper to recall
and reinstate them in their power. Edward repulsed
the Danes, who had made a descent at Sandwich.
Siward, one of his generals, routed the Scots, and
killed their king, Macbeth. Alfgar, an English noble-
man, and Griffin, king of Wales, made an irpad into
England, and took and plundered Hereford, but were
at length totally routed by Harold, son to earl Good-
win; so that Edward, either in person, or by his
generals, obtained the victory over every power against
whom he directed his arms. This monarch collected
the laws of the Danes, Saxons, and Mercians, which
he digested into one body, and called it "The com-
mon law of England." Being like most of his pre-
decessors, a great friend to the monks; he founded
many religious houses, and rebuilt the Abbey at West-
minster, where he was buried in the year 1065. Edward
dying without issue,

Harold, son to earl Goodwin, was raised to the throne
in preference to Edgar Atheling, grandson to Edmund
Ironside, and the only surviving prince of the ancient
kings of England. Some authors assert, that Edward
had appointed William, duke of Normandy, his suc-
cessor, while others maintain it was only a pretence
made use of by William for invading England. How-
ever that be, he actually landed on the coast of Suffex,
in the year 1066, without opposition; Harold being
then employed in repulsing the Danes, who had made
fresh inroads into England. William was at the head
of forty thousand men, all veteran troops, and com-
manded by the bravest officers in Europe. He was met
by Harold, at Hastings, and a most dreadful engage-
ment ensued, wherein Harold was slain, and the con-
queror, with very little difficulty, ascended the English
throne.

William, in the beginning of his reign, gave the
English a flattering prospect of a just and mild ad-
ministration; but they soon found themselves deceived,
for, having given them cause of complaint in the par-
tiality shewn upon every occasion to the Normans,
they broke out into open rebellion, and endeavoured
to place Edgar Atheling upon the throne. The attempt
proved abortive; and William, in revenge for their
conspiracies, deprived them of all their possessions,
which he divided among the Normans, and such of the
English as had remained faithful to him. He abolished
the Anglo-Saxon laws, and introduced those of Nor-
mandy: built great numbers of forts all over the
country, and disarmed the old inhabitants: instituted
the curfew bell, which was rung every evening at
eight o'clock, and at the found of which the Anglo-
Saxons were obliged to extinguish their candles and
fires. He also seized the treasures belonging to their
monasteries, under pretence that the rebels had con-
cealed their most valuable effects in these religious
structures; imposed the tenure of knight's service
upon all lands held of the crown: caused a general
survey of all the lands in England to be made, and an
account

Account to be taken of the villas, slaves, and live stock, upon each estate; all which was recorded in Doom-day-Book. He would not suffer the English to hunt or fell timber in his forests, without leave first obtained from him. He obliged them to use the Norman language upon all occasions, and ordered it to be taught in schools. In a word, during his reign, England was treated in every respect as a conquered country. He died in the year 1087, and was succeeded by his second son,

William II. surnamed Rufus, who, pursuant to the will of his father, had disinherited Robert, his eldest son, for being concerned in a conspiracy against him. This engaged the two brothers in perpetual wars with each other: but the crusades to the Holy Land being set on foot about this time, Robert engaged in an expedition to Asia, and, having occasion for a sum of money to defray the necessary expences of this undertaking, he mortgaged his duchy of Normandy to the king of England for ten thousand marks of silver. William was continually engaged in subduing his rebellious subjects, and repelling the incursions of the Welsh and Scots; the latter of whom asserted the right of Edgar Atheling to the crown of England. These successive commotions obliged him to raise large sums of money, which he usually levied on the clergy, as most able to bear the burden: but these being the only historians of that age, they have loaded his memory with the crimes of rapaciousness and oppression. William's death happened in the year 1100, and the 44th year of his age, when, being on a hunting party, he was accidentally shot by one of his attendants. This monarch built part of the Tower of London, and Westminster-Hall: and in his reign happened the inundation which overflowed great part of earl Goodwin's estate in Kent, and formed those shallows, so well known by the appellation of the Goodwin-Sands. William II. having no issue, was succeeded by his younger brother

Henry, surnamed Beauclerk, on account of his learning, who, taking advantage of Robert's absence, seized upon the crown, to which he had no just pretensions during the life of his elder brother. Robert, on his return from the Holy Land, endeavoured to obtain his right, by invading England; but lost his duchy of Normandy, together with his liberty, in the attempt, and, after a long imprisonment, died in Cardiff-Castle. Henry was next engaged in a long but successful war against France; and afterwards subdued the Welsh, who had taken up arms against him. By a charter granted to his subjects, he confirmed several privileges they had enjoyed under the Saxon kings, and reformed the abuses which had crept into the court. In his reign, however, the clergy formed themselves into a kind of separate body, dependent on the pope only, which afterwards created great confusion in the nation. Henry died of a surfeit in the 78th year of his age, in 1135, having previously settled the succession on his daughter, the empress Matilda, or Maud, and her son Henry, by her second husband Geoffrey Plantagenet, earl of

Anjou; her first husband was Henry IV. emperor of Germany. But Matilda and her son being abroad at the time of Henry's death, the crown was claimed and seized by

Stephen, earl of Blois, son of Adela, fourth daughter to William the Conqueror. A dreadful civil war ensued, and the kingdom was torn to pieces by intestine divisions. The empress Matilda thought this a proper opportunity to assert her right, together with that of her son. Accordingly she landed in England in the year 1139, attended by no more than 140 men; but being continually reinforced by her friends as she advanced, she was soon in a condition of facing Stephen's forces, and several skirmishes happened between the two armies: at last, on the second of February 1141, a general engagement ensued, wherein the king's army was defeated, and himself taken prisoner. Matilda, however, having, by her folly and unbounded ambition, rendered herself odious to the greater part of the nation, particularly to the clergy, who, by this time had arrived at the most intolerable height of insolence, she was driven out of the kingdom, and Stephen re-instated on his throne. He did not long, however, enjoy the peace he thus acquired; Henry, son to the empress Matilda, considering Stephen as an usurper, applied to the king of Scotland, his great uncle, for assistance; and, being assured of the countenance of the clergy, he entered England, and the nation became once more a scene of anarchy and confusion. At length a peace was concluded between the two contending princes, whereby it was agreed that Stephen should enjoy the crown during his life, and Henry succeed to it after his decease. Though this accommodation was only precarious and imperfect, yet it was received with great joy by the English, who had bled at every pore during the late civil wars. Stephen dying in 1154,

Henry II. peaceably ascended the throne, and began his reign by sending all the foreigners, particularly the Flemings whom Stephen had called over to his assistance, out of the kingdom. The dreadful scenes of murder and confusion that had attended the civil wars, having convinced Henry that many forts and castles belonging to private persons were destructive of the public tranquillity, he demolished them all, except such as he thought necessary for the safety of his kingdom. He was a great encourager of trade and manufactures; incorporated several towns, and granted such power to the boroughs in England, that, if a bondman or servant remained in any of them a year and a day, he became a freeman by such residence. This law gave a severe blow to the feudal power of the barons. He revoked all the donations his predecessor had made, and resumed the crown lands which Stephen had alienated.

He endeavoured to curb the insolence of the clergy, particularly that of Becket, archbishop of Canterbury, and, by that means, embroiled himself with the see of Rome. The haughty prelate, finding himself supported by the pope, treated the king with the utmost insolence

and contempt, to such a pitch, that no one who will be an undacious priest, can gain, it was over-coming Henry, in intention, they were on the altar of h- is no doubt but delivered from thought proper to please the public in being privy to suffer his pretended martyr. and contempt, which raised the resentment of Henry to such a pitch, that he one day exclaimed—"Is there no one who will revenge his monarch's cause upon this audacious priest!" His exclamation was not made in vain, it was overheard by four knights, and without informing Henry, who was then in Normandy, of their intention, they came over to England, and slew Becket at the altar of his own church in Canterbury. There is no doubt but Henry was secretly pleased to be thus delivered from the overbearing churchman; but he thought proper to dissemble his satisfaction, and to appease the public resentment, which the supposition of his being privy to the murder had raised against him, he suffered himself to be scourged at the tomb of the pretended martyr.

Henry was the first who levied a tax on the moveables and personal estates of his subjects. He abolished the custom, which had been for some time practised by the kings of England, of repeating the ceremony of their coronation three times in a year. He introduced the use of glass windows into England, and stone arches in building: but, among all the excellent laws made by this monarch, none redounds more to his honour than that relative to shipwrecks, whereby the barbarous and absurd practice of forfeiting ships, which had been lost on the coast, was abolished, and, if either man or animal was found on board alive, the vessel and goods were restored to the owners.

This prince was engaged in perpetual wars with Scotland, France, Wales, and Ireland; the last he entirely conquered, and governed by an officer, to whom he gave the title of grand justiciary. He took William, king of Scotland prisoner, and obliged him to pay 100,000*l.* for his ransom; and, just before his death, concluded an honourable peace with France. But, notwithstanding Henry's great successes, his life was a continual scene of misery, occasioned by the successive rebellions of his sons, who did not scruple to act in concert with his avowed enemies. They were encouraged in these detestable practices by their mother, queen Eleanor, in revenge for the attachment shewn by Henry to other women, particularly the fair Rosamond. These repeated misfortunes at length broke the spirit of that great prince, and he died of grief in the year 1189. On the demise of his father,

Richard I. surnamed Cœur de Lion, ascended the throne, and distinguished the beginning of his reign by raising an army of 35,000 men, with whom, by the persuasion of the clergy, and for their own ends, he made a most magnificent but ruinous crusade to the Holy Land, where he took Acon and Acalon, and performed many other acts of valour. But, on his return to England, he was treacherously taken prisoner by Leopold, duke of Austria, who had served under him at the siege of Acon, where, being disgusted at an insult offered to his standard by this haughty monarch, he caused him to be seized as he was passing through his dominions, and thrown into prison. The emperor Henry VI. who also considered Ri-

chard as an enemy, on account of an alliance contracted by him with Tancred, king of Sicily, offered the duke a large sum of money if he would deliver the royal captive into his hands. Leopold readily consented; and, while England was distracted with intestine commotions, her king was confined in a dungeon by the faithless and avicious Germans. He continued in this dismal situation till the exorbitant sum of 300,000*l.* of our present money was paid for his ransom. This sum will appear still greater, when we consider that, at this time, an ox sold for 3*s.* which answers to 9*s.* of our money, and a sheep at 4*d.* or 1*s.*

Richard, at his return to his dominions, was received with universal joy by his subjects, but found every thing in the utmost confusion, by the treachery of his brother John, in whose favour France had invaded this kingdom. However, he seems to have held John in too much contempt to exert that revenge which he doubtless had in his power: his mind was fixed on more important objects; he listened to the overture of the emperor Henry VI. who, ashamed of the treatment he had insisted on Richard, now solicited his friendship and assistance against the king of France. War was accordingly declared against that monarch, but soon after terminated by a truce of five years; and the renewal of hostilities was prevented by the death of Richard, who was slain before the walls of the castle of Chalus. The viscount Limoges, owner of that fort, being a vassal of Richard, refused to deliver up a treasure he had discovered, and which Richard claimed as superior lord of the soil. This event happened in 1199, the 42*d.* of his age, and 10*th.* of his reign.

John seized the crown, and determined to defend it to the last extremity, and soon after basely murdered Arthur, the eldest son of his brother Geoffrey, who had the hereditary right. Philip, king of France, espoused the cause of that unfortunate prince, and cited the king of England to repair to France, and stand trial for that atrocious crime. John refused to obey the summons, and was declared guilty of felony and parricide; adjudged to forfeit to his superior lord all his seignories and fiefs in France. That inhuman act had rendered him detestable to the generality of his subjects, and, soon after, his pusillanimous conduct embroiled him with the barons, who detested his actions. Apprehensive of an invasion from France, and dreading the resentment of his nobility, instead of making the necessary preparations for securing his kingdom, he applied to the pope for protection. He even offered to become his tributary, as a proof of which he meantly laid his crown at the feet of Pandulph, the pope's legate. The church of Rome, sensible of John's weakness, now resolved to acquire unlimited power in England. In this design the pope was assisted by the clergy, who wished to render themselves entirely independent of the civil power; and therefore exerted their utmost efforts. England was now once more reduced to a deplorable state of anarchy and confusion. At length the barons pre-

vailed, and John was obliged to sign that foundation of all our liberties, so well known by the title of Magna Charta. But this being merely an act of compulsion, John complained to the pope of the violence imposed upon him, and his holiness immediately declared the charter to be null and void, as having been obtained by force.

John, in the mean time, privately levied a body of foreign forces, by whose assistance he, in his turn, triumphed over the barons, who, reduced to the most desperate extremity, offered to acknowledge Lewis, eldest son to the king of France, as their sovereign, provided he would assist them against their enraged monarch. The terms were accepted, and Lewis landed in England. John immediately assembled a considerable army, but passing from Norfolk into Lincolnshire, his road lay along the sea-shore, then overflowed at high water, and fixing on an improper time for his journey, he fell in the inundation, all his treasure, carriages, baggage, and regalia. This misfortune so deeply affected him, that he retired to the castle of Newark, where he died in 1216, in the 18th year of his reign, and 49th of his age; and, by his will, appointed his son Henry III. then a child of ten years old, to succeed him; and, during his minority, the earl of Pembroke was chosen protector of the kingdom. Though historians have charged John with being of an arbitrary, inconstant, and cruel disposition, yet it is evident, from the same relation, that he had great provocations from the clergy and the barons, who, in their turns, attempted to annihilate the royal prerogative. It must be acknowledged, at the same time, that, under John, the commons of England laid the foundation of all the wealth and privileges they now enjoy; and the commerce of England received a most surprising increase. He may be called the father of the privileges of free boroughs, which he established and endowed all over his kingdom; and that it was under him that the stone-bridge was finished across the Thames at London, as it stood some years ago. The city of London owes some of her privileges to him. The office of mayor, before his reign, was for life; but he gave them a charter to choose them a mayor out of their own body, and also to elect their sheriffs and common council, as at present, annually.

Henry was obliged to swear fealty to the pope, and renew that homage to which his father had subjected the kingdom; and his holiness, in return, acknowledged Henry's right to the crown of England. Lewis was now obliged to quit the kingdom, and renounce all pretensions to the crown. But the protector well knew that it was not sufficient for Henry to have no competitor for the throne, it was also necessary for him to gain the affections of his subjects: accordingly, a new charter of liberties, chiefly copied from that extorted by the barons from his father, was granted. It had been happy for Henry had the protector lived, by whose wife administration affairs once more flowed in their proper channels, and the independency of this country was once more restored; but Pembroke dying in 1219, he was

succeeded in the government by the bishop of Winchester and Hubert de Burgh, high justiciary. Their conduct was the reverse of that of their predecessor, and the barons again broke out into open rebellion. They, however, assured the king, when summoned to answer for their conduct, that they had no design against his sacred person, and that their sole motive for appearing in arms was to remove Hubert de Burgh from his office. Henry, at that time, refused to comply with their request; but, a few years after, Hubert was dismissed, and the government of the kingdom devolved entirely on the bishop of Winchester.

That prelate, who was a native of Poitou, persuaded Henry to admit a number of his countrymen, and other foreigners, to settle in England. In a short time all places of importance were bestowed upon them, and Henry was prevailed on to violate the great charter. He once more roused the barons, and the king was threatened with excommunication by Edmund, archbishop of Canterbury, and other prelates of England, if he did not dismiss the bishop of Winchester from his posts, and all foreigners from the kingdom. Henry thought proper to comply with both these injunctions, and the primate, who was in every respect equal to the task, was placed at the head of the government.

Henry's attachment to foreigners, however, still continued. He had married Eleanor, daughter to the count of Provence, and her relations and followers were promoted to the chief posts in the kingdom. The barons, finding all remonstrances ineffectual, entered into a confederacy, at the head of which was one Simon de Montfort, earl of Leicester. This struggle between the king and his discontented barons lasted a considerable time, but at length the latter conquered, and, in one decisive battle, the king and prince Edward, his eldest son, were taken prisoners at the battle of Lewes. Leicester and the barons now governed the nation; but prince Edward, having found means to escape, soon assembled an army, and coming to an engagement with the barons, killed Leicester, entirely defeated their forces, and replaced his father on that throne his rebellious subjects had so unjustly usurped. This battle was fought at Evesham, Aug. 4, 1265.

Edward afterwards undertook an expedition to the Holy Land; but, during his absence, England again became a scene of confusion; and Henry, worn out with age and grief, died in 1272, expiring in the arms of his favourite son, in the 64th year of his age, and 56th of his reign, which was uncomfortable and inglorious; and yet, to the struggles of this reign, the people in great measure owe the liberties of the present day. During the reign of Henry, the feudal tenures in England received a severe blow, by the knights and burgesses being allowed to form part of the legislature in a separate house, which is the present House of Commons.

Edward was proclaimed king of England immediately on the demise of his father. He invited all who held of his crown *in capite* to his coronation dinner, which com-

cluded (such was the custom) 450 hogs, 13 oxen, and 13 sheep, and was attended by a great number of nobles, who, during the ceremony, were employed to drink to the king, which, during the banquet, they themselves into the king's cup, and plundered, and, to proceed a great number of commissioners, who were sent into England, Ireland, and punished the commissioners except that numerous garrisons, and the king regulated the mint, and the king's officers were treated. He sent his sons; and passed the rest of his life in peace, and his estate was divided among his sons, who, after his death, without any dispute, succeeded to the crown. In the year 1272, prince Edward, who had been in the Holy Land, returned to England, and was proclaimed king of England, and his reign was distinguished by his victory over the king of France, and his conquest of Gascony, and his expedition to the Holy Land. He was succeeded by his son, Edward I., who was proclaimed king of England, and his reign was distinguished by his conquest of Wales, and his expedition to the Holy Land. He was succeeded by his son, Edward II., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Edward III., who was proclaimed king of England, and his reign was distinguished by his conquest of France, and his expedition to the Holy Land. He was succeeded by his son, Richard II., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Henry IV., who was proclaimed king of England, and his reign was distinguished by his conquest of France, and his expedition to the Holy Land. He was succeeded by his son, Henry V., who was proclaimed king of England, and his reign was distinguished by his conquest of France, and his expedition to the Holy Land. He was succeeded by his son, Henry VI., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Edward IV., who was proclaimed king of England, and his reign was distinguished by his conquest of France, and his expedition to the Holy Land. He was succeeded by his son, Richard III., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Henry VII., who was proclaimed king of England, and his reign was distinguished by his conquest of France, and his expedition to the Holy Land. He was succeeded by his son, Henry VIII., who was proclaimed king of England, and his reign was distinguished by his conquest of France, and his expedition to the Holy Land. He was succeeded by his son, Edward VI., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Mary I., who was proclaimed queen of England, and her reign was distinguished by her weakness, and her deposition by the barons. He was succeeded by his son, Elizabeth I., who was proclaimed queen of England, and her reign was distinguished by her strength, and her conquest of France, and her expedition to the Holy Land. He was succeeded by his son, James I., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Charles I., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, Charles II., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, James II., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, George I., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. He was succeeded by his son, George II., who was proclaimed king of England, and his reign was distinguished by his weakness, and his deposition by the barons. of (such was the luxury of the times) of a 78 bacon hogs, 450 hogs, 440 oxen, 430 sheep, 22,600 hens and capons, and 13 fat goats. Alexander III. king of Scotland, was at the solemnity, and let loose 500 horses, for any that could catch them, to keep them. As soon as the ceremony of his coronation was performed, Edward employed himself in correcting those abuses, which, during the preceding reigns, had introduced themselves into the kingdom. The nation was over- run with robbers, murderers, incendiaries, ravishers, and plunderers, who lived in open defiance of the laws; and, to proceed against such, the king appointed special commissioners, who were to travel through all the counties in England, inquire strictly into disorders of every kind, and punish them with the utmost severity. The commissioners executed their order with such vigour, that numerous gangs of disorderly people were soon dispersed, and the evil totally eradicated. Edward likewise regulated the coin, which at that time was greatly debilitated. He settled the privileges of the cinque ports; and passed the famous mortmain act, whereby all persons were restrained from giving, by will or otherwise, their estates to religious, and other societies that never die, without a special licence from the crown.

In the year 1276, Edward undertook an expedition against Lewellyn, prince of Wales, who, during the reign of Henry, had assisted the barons; and, on the accession of Edward, refused to perform the homage of a vassal. Lewellyn made the necessary preparations for defending his principality; but finding that the advantageous situation of Edward's army had cut off all supplies from his own, he was obliged to surrender at discretion, without having been able to bring the king to an engagement: a treaty was agreed to, and hostages delivered by Lewellyn for security of his future submission. The Welsh, however, could not long suffer the insolent treatment they received from the English, and once more had recourse to arms: but this last effort for the preservation of their liberties proved abortive. Lewellyn was slain, and his brother David, who succeeded to the title, never being able to collect an army sufficient to face Edward, flew from place to place, and was at last betrayed into the king's hands, who cruelly put him to a shameful death. The ancient race of their princes being thus extirpated, all the nobility in Wales submitted to the conqueror, and the laws of England, with the sheriffs, and other ministers of justice, were established in that principality. Edward created his son prince of Wales, and the eldest sons of the monarchs of England have ever since borne that title.

Edward was chosen arbiter between Robert Bruce and John Baliol, each of whom, on the death of Margaret, queen of Scots, in 1291, claimed the throne of that kingdom. Edward declared in favour of Baliol, who accordingly ascended the throne, and, pursuant to a promise he had previously made the king of England, did homage to Edward for his crown; but, repenting of so shameful a submission, he seized the opportunity

offered him, by a war breaking out between England and France, to exert his right of independence. With this view he entered into an alliance with France, but, unfortunately for him, a truce being soon after concluded between England and that nation, Edward had leisure to employ the whole force of his arms against Scotland, which he reduced to a province of England, and took Baliol prisoner. Impatient of submitting to the English yoke, the Scots resolved, if possible, to shake it off; and Edward, rendered furious by their frequent attempts, at last resolved to ruin their country so effectually, as to prevent every attempt of that nature for the future. He assembled a numerous army, which he conducted to Carlisle; but, while the necessary preparations were making to execute his intentions, he was seized with a disorder which put a period to his life in the year 1307, the 69th year of his age, and 35th of his reign. He ordered his heart to be sent to the Holy Land, with 30,000l. for the maintenance of what was called the Holy Sepulchre.

In his wars with France, Edward lost Guienne; for, though he had formed alliances against that nation with most of the princes of Germany and other powers, he had the mortification to reap no advantage from their assistance; and that every attempt to lessen, tended only to heighten, the glory of Philip.

This monarch gave great encouragement to foreigners, who traded with England; but he made the aggregate body of every particular nation, residing here, answerable for the crimes of each individual of their number. He regulated the forms of parliament, and their manner of granting aids towards the nation's defence, which differed very little from the present method: and, at the beginning of his reign, he proceeded with great rigour against the Jews, whom he expelled the kingdom, and seized upon their estates.

Edward II. succeeded his father, but fell far short of him in the government of his dominions. He was no sooner, as he supposed, master of himself and actions, than he recalled his favourite, Gaveston, son to a Gascon knight of some distinction. This young man had been established in the Prince of Wales's household by Edward I. in return for the services of his father; but finding he had insinuated himself into the affections of his son, in whom he was desirous of crushing his desire for favourites, which already seemed the ruling passion of his soul, he banished young Gaveston, and, on his death-bed, exacted a promise from the prince never to recall him. Happy had it been for Edward had he obeyed this injunction of his father; for the barons finding that, besides endowing his minion with the earldom of Cornwall, he was daily loading him with riches and honours, which rendered him insupportably insolent, they formed a party against him, at the head of which was Thomas, earl of Lancaster, cousin-german to the king.

The barons now repaired to the parliament-house armed, where they insisted upon the banishment of Gaveston,

Gaveston, and that he should take a solemn oath never to return into England. The king finding he must in some measure comply with this request, appointed his favourite lord lieutenant of Ireland; but, unable to bear his absence, he soon recalled him. The barons, however, obliged him once more to quit the kingdom; and, upon his returning again in 1312, the whole nation rose up in arms; upon which Edward placed Gaveston in the castle of Scarborough, then deemed impregnable. Gaveston, however, had neither courage nor conduct sufficient to defend it: he soon capitulated, and surrendered himself a prisoner to the barons. By the terms of capitulation it was agreed, that his life should be safe for two months; but the enraged barons no sooner found themselves masters of his fate, than they ordered his head to be struck off by the hands of the common executioner. The king was at first inconsolable, and denounced vengeance on the barons and nobility who had been accessory to the murder of his favourite; but upon their condescending to ask his pardon publicly on their knees, he forgave them every thing that was past.

While England was distracted with intestine broils, Robert Bruce recovered the greater part of Scotland, and, at the time of Gaveston's death, was besieging Stirling, the only fortress which remained in the hands of the English. Edward led a numerous army to its relief, but coming to an engagement with Bruce near Bannock-Burn, he was entirely defeated, and the greater part of his forces slain. After which, Robert conquered the English as often as he engaged them; laid all their provinces contiguous to his dominions under contribution, secured his crown, and gave a general peace to his kingdom.

The king, after the death of Gaveston, attached himself to Hugh Spencer, and was entirely governed by his counsels and those of his father. This once more gave the barons a pretence for rebellion, and both father and son were banished. But Edward having, by the assistance of the common people, obtained some advantages over the barons, he, at the instigation of his queen Isabella, a furious ambitious woman, recalled the Spencers; and numbers of the nobility fell victims to her cruelty. At length the Spencers themselves having given her cause of disgust, she formed a party, and publicly levied a body of troops in order to destroy those very favourites, to whom she was indebted for her power. All these schemes were concerted at the court of Philip the Fair, king of France, who was brother to Isabella, and whither she had retired, under pretence of taking her son to pay homage for Guienne and Ponthieu. There she was joined by numerous malcontents from England, and, among the rest, by Roger Mortimer, a Welsh baron, who had been condemned for high treason; but his sentence of death being changed into that of perpetual imprisonment, he found means to escape from the Tower, and took shelter in France. Here he was introduced to the queen of England, who first em-

ployed him as her counsellor, but soon becoming enamoured of his person, they publicly lived together in the most criminal intimacy. When affairs were ripe for execution, Isabella sailed for England, where, on her landing, she was joined by the nation in general, who supposed her only intent was to put an end to the power of the Spencers. Thus abandoned, Edward attempted to fly into Ireland, but being driven by contrary winds on the coast of South Wales, he endeavoured to conceal himself in the mountains; he was, however, soon discovered, and conducted to Kenelworth Castle, and the Spencers being also taken prisoners were both put to death.

The infamous queen now summoned a parliament in which sentence was passed upon the unfortunate but innocent Edward, whereby he was obliged to resign his crown in favour of his son. This point obtained, they wanted nothing to render the character of Isabella truly diabolical, but the murder of her deposed husband; and this by her contrivance, jointly with that of Mortimer was perpetrated on the 21st of September 1327, with every circumstance of brutality that the infernal spirits themselves could invent.

Edward III. at his accession to the throne, was only 14 years of age; so that the queen and Mortimer flattered themselves that the administration of affairs would for some years at least, be under their direction, and in order to secure their power, they planned and executed many popular measures. But Edward easily penetrated into their designs, and resolved to counteract them, when a proper opportunity should offer. He was surrounded by the emissaries of Mortimer, and was therefore obliged to act with the utmost caution; but having privately engaged the assistance of several persons of distinction, Mortimer was seized in his bed, and, after a short trial, condemned by the parliament to be hanged; which sentence was executed on a gibbet at the Elms, in the neighbourhood of London. The vile queen was confined for life to her own house at Risings, and her revenue reduced to 4000. per annum.

Edward being now at liberty to act for himself, proceeded with the utmost industry and judgment to redress all those grievances which had either proceeded from want of authority in the crown, or from the late abuse of it. Thieves, murderers, and criminals of all kinds were proteſted by the barons, for whom they had acted during the civil commotions. Edward saw the danger of this attempt, and, in order to render it successful, first exacted a promise from the peers, that they would break off all connections with such diabolical wretches. This point being gained, he issued writs to the judges, enjoining them to administer justice without paying regard to arbitrary orders from his ministers; and he proceeded with such rigour, that the public disorders of the peace of the kingdom were soon either exterminated or dispersed, their gangs broken, and a period put to their pernicious practices.

employed his forces against John Bruce, king of Scotland, who, on the death of Edward II. had committed dreadful ravages on the frontiers of England; but the great dowager and Mortimer thought it at that time most conducive to their safety to make peace with John; and, to render it more lasting, Isabella gave her daughter Joan in marriage to David, eldest son of Bruce. This consanguinity, however, did not affect Edward, who resolved to place Edward Baliol, son of that prince, who had been taken prisoner by Edward I. on the throne of Scotland, in opposition to his brother-in-law. He sent for him from Normandy, and promised him every assistance in the recovery of the Scottish crown, to which he had an undoubted right, provided he would, in return, become his vassal. Baliol consented, and, after several conflicts, drove David out of Scotland, where he was soon after crowned; but a profusion of blood was shed in endeavouring to fix him on the throne. The king of France dying without issue in 1327, Philip of Valois declared himself next male heir to that crown, but was opposed by Edward, who, notwithstanding he was well acquainted with the Salique law, which excludes all females or their descendents from ascending the throne of that kingdom, asserted his claim in right of his mother; and, when he found that Philip was acknowledged king of France, resolved to invade his kingdom. This war, on the part of Edward, was a continual scene of success, and he carried his victorious arms even to the gates of Paris. In 1340, he took the title of king of France, using it in all public acts, and quartered the arms of France with his own, adding this motto, "Dieu et mon Droit, God and my right." On the 19th of September 1356, was fought the famous battle of Poitiers, wherein the army of John, the French king, was defeated, and himself, with his son Philip, taken prisoners, by the English, under the command of Edward prince of Wales, commonly called the Black Prince, at that time only 16 years of age. This prince was the darling of his father, the admiration of all Europe, and the hope of England; but his early death prevented the enjoyment of that happiness with the prospect of which the nation fondly flattered themselves when he should ascend the throne. He died in 1372, while he was making a glorious campaign in Spain, where he reinstated Peter the Cruel on that throne. In 1360, Edward having reduced Calais, consented to a peace; whereby he was left in possession of several capital provinces in France, and John was to pay three millions of crowns in gold for his ransom.

The Scots, during the above war with France, taking advantage of the absence of Edward, recalled their king, David, who, returning with a body of chosen troops, marched into Northumberland, penetrated as far as Durham, which he took, and put all its inhabitants to the sword. He did not long enjoy the fruits of his invasion; Edward's queen, Philippa, marching against him at the head of a numerous army, obtained a com-

plete victory, and took David prisoner. He was conducted to London, and did not recover his liberty till the end of the war.

Edward III. instituted the order of the garter, now the first in England; and built the noble castle of Windsor. In his reign John Wickliffe, a secular priest, educated at Oxford, preached the doctrines of the Reformation, and made many disciples among all ranks of people, who were distinguished by the appellation of Wickliffites or Lollards. He was a man of parts, language, and piety; and has the honour of being the first person in Europe who publicly called in question those doctrines which had generally passed for certain and undisputed during so many ages. The doctrines of Wickliffe being derived from his search into the Scriptures, and into ecclesiastical antiquity, were nearly the same with those propagated by the reformers in the 16th century. But, though the age seemed strongly disposed to receive them, affairs were not yet fully ripe for this great revolution, which was reserved for a more free and inquiring period, that gave the finishing blow to Romish error and superstition in this and many other kingdoms of Europe. He had many friends in the university of Oxford and at court, and was powerfully protected against the evil designs of the pope and bishops, by John of Gaunt, duke of Lancaster, one of the king's sons, and other great men. Edward died in the year 1377.

Richard II. son to the Black Prince, succeeded his grandfather Edward, at the early age of 11 years. During his minority, the kingdom was governed by the duke of Lancaster, the duke of York, and the duke of Gloucester, his three uncles. In the beginning of his reign, the Scots defeated the English army, and this was followed by a three years truce. The French insulted the coasts of England, which induced Richard to carry his arms into France, but without success, and the war was at length terminated by a twenty-five years truce. Richard was soon after affianced to Isabel, daughter of Charles VI.

The king's unbounded attachment to favourites, which offended his ambitious uncles; the heavy taxes, particularly the poll-tax, imposed upon the people; and the doctrines of Wickliffe; rendered the nation a continued scene of confusion, during the whole reign of this weak prince. A rebellion broke out, headed by Ball, a priest, Wat Tyler, and Jack Straw, who, assembling 100,000 rabble, marched from Blackheath to London, where they committed great outrages, and became so formidable, that the king was obliged to enter into a conference with the arch-rebel in Smithfield; but the demands of these headstrong people were so insolent, and the menaces of their chief, in case of refusal, so daring, that Walworth, lord-mayor of London, who then attended the king, enraged at his audacity, struck him a violent blow on the head, which instantly deprived him of life, and, by the excellent conduct of the young king, the rebels soon after laid down their arms

without any further ill consequences. Happy had it been for Richard, if the same moderation which he possessed in the insurrection of Wat Tyler, had influenced every other action of his life. But Sir Michael de la Pole, lord chancellor, judge Tresilian, and Robert de Vere, earl of Oxford, created duke of Ireland, destroyed the pleasing prospect of happiness. These three worthless men possessed his entire confidence, which rendered them exceedingly obnoxious to parliament; and, notwithstanding the king's utmost efforts in their favour, they were attainted, and condemned to suffer as traitors.

The kingdom was brought by these factions to the brink of destruction, and the king sacrificed several noblemen to his safety, particularly the duke of Gloucester, who was insidiously imprisoned, and afterwards murdered at Calais. A quarrel soon after happened between the duke of Hereford, son to the duke of Lancaster, and the duke of Norfolk, which was to be determined by single combat between the parties; but, when the two champions appeared in the field, the king interposed, and, in order to prevent at once the present effusion of noble blood, and the future consequences of the quarrel, he ordered both the dukes to quit the kingdom, and retire to different nations.

Richard embarked for Ireland about this time, in order to revenge the death of his cousin, Roger, earl of Marche, the presumptive heir of the crown, who had lately been slain in a skirmish with the natives; and the nobility, thinking themselves materially affected by the injury done to Henry, duke of Lancaster, offered that nobleman the crown of England, if he would return and head the malcontents, who were by this time very numerous. This opportunity of gratifying his revenge and gaining the crown, was eagerly embraced by the duke, who soon found himself at the head of 60,000 men, and soon after reinforced by 40,000 more, under the duke of York, who had been left regent of the kingdom. Richard, having intelligence of this invasion and insurrection, immediately left Ireland, and landed at Milford-Haven with a body of 20,000 men; though he soon found them reduced to about 6,000, the rest having joined the duke. Thus abandoned, the king fled to the Isle of Anglesey, from whence he proposed to escape either into France or Ireland; but, being prevailed on to continue in the kingdom by the feigned concessions of Lancaster, he was soon after betrayed by Percy, duke of Northumberland, into the hands of his rebellious subjects, who conveyed him prisoner to London. A parliament was now assembled, and Richard, accused of oppression, tyranny, and misconduct, was deposed by the suffrages of both lords and commons, and ordered to be imprisoned in Pomfret-Castle in Yorkshire, where he died in 1399, in the 34th year of his age, and 23d of his reign. Historians universally agree that this unhappy monarch died an unnatural death, but differ as to the nature of it; some asserting that it was by assassination, while others suppose him to have perished by hunger.

Henry IV. was son of John of Gaunt, duke of Lancaster, fourth son of Edward III. and placed on the throne of England in prejudice to Edmund, earl of Marche, son of that Roger who was slain in Ireland, and who had been declared presumptive heir of his crown by Richard. The nobility flattered themselves that this glaring defect in his title would render him dependent upon them, but they soon found themselves disappointed. Though this occasioned some conspiracies against him, his prudence soon rendered them abortive, and he resolved to leave nothing unattempted to reduce the enormous power of the nobility.

Foreign powers considered the accession of Henry in no other light than that of an usurpation; some, however, from indolence, and others from interest, acknowledged his title to the crown of England. The king of France, highly incensed at the injury offered to Richard, resolved to revenge it, and even imprisoned the herald sent by Henry's ambassadors to demand a safe conduct for them to the French court; but being harassed by intestine divisions, political motives obliged him to accommodate affairs as soon as possible. Having recovered his daughter, widow to Richard, he laid aside his preparation for war, and renewed the truce between the two crowns.

These commotions induced the Scots to make incursions into England, and though Henry had taken possession of Edinburgh, he could not prevail on Robert III. to do him homage for his crown, nor force him to a battle. Finding therefore that his stay in Scotland was of no consequence, he returned to London and disbanded his army. But the next year, Archibald, earl of Douglas, having made an irruption into the northern counties of England, and committed great devastations, was overtaken on his return by the Percies, and a dreadful battle ensued, wherein the Scots were totally routed, and Douglas himself taken prisoner, together with a great number of the principal Scots nobility. The news of this victory being transmitted to Henry, he returned the earl of Northumberland, with the rest of his family, thanks for this important service; but, at the same time, required the noble prisoners to be delivered up to him. This gave disgust to the conquerors, who, in a short time after, broke out into open rebellion, and a battle was fought between the king, who commanded his own forces, and Henry Percy, surnamed Hotspur, at the head of the rebels. After a long and bloody contest, wherein Hotspur was slain, Henry proved victorious, and the earl of Northumberland having made the necessary concessions, the king thought proper to grant him a pardon: but the loss of his favourite son fell heavy on his mind. He soon after entered into a conspiracy with the earl of Nottingham and the archbishop of York; the whole, however, proved abortive; Nottingham and the prelate were taken prisoners, Percy fled into Scotland, and afterwards made some fruitless endeavours to excite an insurrection in the north of England, where he was slain in battle by Sir

Thomas Rokesby, sheriff of Yorkshire. About the same time Glendour, who had headed the Welsh in their rebellions, died; and Henry having by accident taken James, heir to the crown of Scotland, a child of nine years old, peace was entirely restored to the nation.

In the reign of this monarch the marine of England was considerably increased: the different orders of parliament, especially the commons, acquired their proper authority. Learning was at this time at a much lower state in England, and all over Europe, than it had been 200 years before. Bishops, when testifying synodally, were often forced to do it by proxy in the following terms, viz. "As I cannot read myself, N. N. hath subscribed for me;" or, "As my lord bishop cannot write himself, at his request I have subscribed." By the influence of the court, and the intrigues of the clergy, an act was obtained in the session of parliament 1421, for the burning of heretics, occasioned by the great increase of the Wickliffites or Lollards; and William Sawtree, the first martyr for this doctrine, was burnt alive. Henry IV. died in 1413, in the forty-sixth year of his age, and the thirteenth of his reign.

Henry V. who now ascended the throne, had signalled himself greatly during the wars carried on by his father; but on the restoration of peace, he associated himself with some infamous persons, who led him into every species of vice and outrage. During the last wills of his father, however, there seems to have been a thorough reformation in his conduct, and the annals of England do not contain a greater hero.

The beginning of his reign was distinguished by a conspiracy formed among the Wickliffites, who were every day increasing, and headed by Sir John Oldcastle, lord Cobham, who it was pretended had agreed to put himself at their head, with a design to overturn the government; but this appears to be a groundless accusation, suggested by the bloody zeal of the clergy: however, Henry endeavoured at first, by gentle conversations, to reconcile that nobleman to the Catholic faith; but finding he could not prevail, delivered him over to the ecclesiastical power, and he was condemned to the flames for his erroneous opinions. He, however, before the day appointed for his execution, found means to escape from the Tower, but was taken about four years after, hanged as a traitor, and his body burnt on the gibbet, pursuant to the sentence pronounced against him as a heretic. This rigour checked for a time the rapid progress which the Lollards had made since their first institution.

Henry having received an injunction from his father never to suffer the English to remain long in peace, resolved to follow the advice of Chichely, archbishop of Canterbury, and assert the right which Edward III. had formed to the crown of France. He first demanded that the provinces of Normandy, Anjou, Maine, and Brittany, should be resigned to him, which being refused by Charles VI. a war ensued. In 1415 Henry landed,

with his army, at Havre de Grace in Normandy, took Harfleur, and then defeated the French in the battle of Agincourt, where a great number of the principal nobility of France were left dead on the field, and many taken prisoners. After this engagement the conqueror subdued most part of France with the greatest rapidity.

The French king having been declared a lunatic, the administration of affairs was disputed between his brother, Lewis, duke of Orleans, and his cousin german, John, duke of Burgundy. This contest threw the whole nation into a ferment, which was artfully increased by Henry; who, taking advantage of these commotions, obliged the queen of France to give him her daughter Catharine in marriage; to declare him regent of France during her husband's life, and his issue successors to the French monarchy, in prejudice of the dauphin, her son. Accordingly, Henry made a triumphant entry into Paris, where he received the fealty of the French nobility, and the dauphin was formally professed. That prince, however, assisted by the Scots, left nothing untried for the recovery of his kingdom; but, in all probability, the attempt would have proved his destruction, had not death put a period to Henry's glory. Finding his last moments approach, he sent for his brother, John, duke of Bedford, the earl of Warwick, and a few more noblemen, whom he had honoured with his confidence, and conjured them to protect his infant son. He advised them never to give liberty to the French princes taken at Agincourt, till his son was of age; and never to make peace with that nation, unless, by the cession of Normandy, and its annexation to the crown of England, compensation was made for all the hazards and expence he had experienced in endeavouring to obtain the crown of France. He then left the regency of that kingdom to the duke of Bedford; that of England to his younger brother the duke of Gloucester; and the particular care of the infant king to the earl of Warwick. Having thus settled his worldly affairs, he dismissed all but his confessor, and soon after expired, in the thirty-fourth year of his age, and the tenth of his reign. This event happened in the year 1422. It appears that the ordinary revenues of the crown, during this monarch's reign, amounted only to 55,714*l.* a year, which is nearly the same with the revenues in the time of Henry III. 200 years before. The ordinary expences of government amounted to 52,507*l.* so that the king had a surplus only of 3,207*l.* for the support of his household, for his wardrobe, the expence of embassies, and other articles. This sum was not nearly sufficient even in time of peace; and to carry on his wars, this great conqueror was reduced to many miserable shifts: he borrowed from all quarters; he pawned his jewels, and sometimes the crown itself; he ran in arrears to his army, and was often obliged to stop in the midst of his career of victory, and grant a truce to the enemy: hence we may perceive, that the pension of a superannuated courtier of the present age exceeds the expences

even of this great king, and shews the simplicity and temperance of our predecessors three centuries ago.

Henry VI. an infant of nine months, was proclaimed king of France, as well as of England, and writs were issued in his name for calling a parliament. At this meeting very little regard was paid to the verbal appointments of the deceased king. The duke of Bedford was nominated protector, or guardian of England, but the parliament would not suffer him to assume the appellation of regent, which seemed to them a title of too great authority. As the state of affairs required that nobleman's presence in France, they invested his brother, the duke of Gloucester, with the same dignity during his absence; and, in order to limit the power which these princes might assume, they named a council, without whose advice and approbation no measure of importance could be determined. The young king, instead of being in the hands of Warwick, was committed to the care of Henry Beaufort, bishop of Winchester, his great uncle, who had the sole care of his education. Mean time, the duke of Bedford, resolving to complete the conquest of France, made every necessary preparation for that purpose, both by the exertion of arms, and by entering into new treaties with the principal nobility in that kingdom.

On the death of Charles VI. which happened soon after that of Henry V. many of the French secretly wished that the dauphin might ascend the throne. The army of that prince was re-inforced by considerable numbers of Scots; and Bedford being obliged to visit England, where business detained him near eight months, on his return to France had the mortification to find the English had suffered some defeats, and that numbers of the chief men in France had deserted to the interest of Charles, among whom was the duke of Brittany. The regent therefore immediately attacked his province, and reduced him to such extremities, that he once more renounced the French alliance, and promised to do homage for his duchy to Henry.

The duke now resolved on the siege of Orleans, a place rendered by its situation of such importance, that on the possession of it the entire conquest of France in a manner depended. Sensible of this, Charles placed a strong garrison in that important city, which was for some time vigorously defended, but was at last on the point of surrendering for want of provisions, when a phenomenon, scarcely to be paralleled in history, brought it unexpected relief. In the village of Domremi there lived a girl of about twenty-seven years of age, named Joan d'Arc, a servant at an inn, where she performed the common offices of an ostler. By frequently hearing the misfortunes of Charles, she began to pity him, and mistaking her desire of affording him assistance for a divine mission, she resolved, if possible, to procure admission to his presence, which after some difficulty was effected. On approaching the prince, she assured him that she was sent expressly from heaven to raise the siege of Orleans, and afterwards to

conduct him to Rheims, and cause him to be crowned in that city. Charles having consulted his friends, they either believed the girl inspired, or thought her enthusiasm might be a means of raising the drooping spirits of the French. A strong body of forces was immediately put under her command; and such was the panic with which the English were seized on her approach, that, instead of engaging, they suffered her to enter Orleans peaceably, with the convoy destined to relieve the garrison. Elated with her success, she resolved to attack the besiegers, who, dreading her supernatural influence, lost all their wonted courage and confidence. The forts, built by the English general round the city, were taken, with great slaughter, and at length the siege was raised, to the utter disgrace of the British army. The maid of Orleans, an appellation usually bestowed on this extraordinary woman, did not give her enemies time to recover from their delusion; she dispossessed them of several towns, and having again defeated their army, took Talbot, the general, prisoner. She then conducted Charles to Rheims, seizing upon all the cities which opposed her passage, and rendered the French as formidable to the English, as, a short time before, the English had been to the French. At last this extraordinary person fell into the hands of the English, who, contrary to every sense of justice, humanity, or reason, condemned her to be burnt as a witch.

Bedford flattered himself that the death of this heroine would have re-established Henry's interest in France, whether he caused the young king to be brought, and crowned at Paris. But it was beyond the power of a man to retrieve the affairs of the English. The French returned with joy to the allegiance they owed Charles as their rightful sovereign; and the duke of Burgundy, who had been a firm friend to the English ever since the beginning of this war, followed the current, and was reconciled to Charles. This defection was of the utmost importance at so critical a juncture, and was followed by a still greater blow to the English; the duke of Bedford paid the debt of nature at Rouen, a few days after he received the news of the duke of Burgundy's reconciliation with Charles VII. in the year 1435.

England was at this time in the utmost confusion, the king had married Margaret, daughter to the duke of Anjou, and titular king of Sicily, a woman of high spirit and implacable disposition. Gloucester lost all his authority in the government, Winchester who presided at the head of the treasury, had by his avarice ruined the interest of the nation both at home and abroad; and Richard, duke of York, lord-lieutenant of Ireland, whose claim to the crown of England was prior to that of Henry, being descended by the mother's side from Lionel, an elder son of Edward III. formed a party to assert that right, and soon after broke out into open rebellion.

order of the queen; who, taking advantage of Henry's
weakness, had seized the entire management of affairs,
appointed William de la Pole, duke of Suffolk, prime
minister; but he being soon after banished and murdered,
was succeeded by Edmund Beaufort, duke of Somerset,
a man odious to the English. About the same
time happened an insurrection of 20,000 Kentish men,
headed by one Jack Cade, who it was supposed had been
obliged to this precipitate undertaking by the duke
of York; for though it was easily suppressed, yet, dur
ing its continuance, the people in general discovered
their good wishes for that nobleman's family, and often
declared that they thought his title to the crown was
well founded. Soon after, the parliament hearing he
was on his return from Ireland, and supposing he
would appear at the head of an armed force, ordered
him not to land in England; but on his arrival they
were surprised to find he was only attended by his usual
retinue. This proceeding, however, induced his parti
sans to assert his claim more openly, while he himself
behaved with the utmost submission to Henry.

During a fit of illness of the king, in 1454, it was
necessary to appoint a protector; and the queen, being
unable to resist the York party, was obliged to acquie
sce, when the duke was named to fill that important
office by the parliament. This set the nation in a flame,
and Henry recovering, both parties prepared for action.
Soon after, a battle was fought at St. Alban's, in which
the Yorkists gained the victory, and took Henry pri
soner. This misfortune so disconcerted the king, that
he committed the whole authority of the crown into the
hands of Richard. Margaret, however, found means
to set her husband at liberty. Five years after, a second
battle was fought at Northampton, wherein the Lan
castrians were again defeated, and Henry a second time
made prisoner.

The duke of York had never hitherto made any
open pretensions to the crown; but in a parliament sum
moned immediately after the battle of Northampton,
he publicly asserted his claim, and submitted his rights
to the debates of the peers. After many deliberations,
it was enacted, that the king should possess the throne
during his life, and the duke of York succeed him, in
revelution of all Henry's issue. When Margaret, who,
with her infant son, had fled to Durham, heard of this
decision, she employed the flattering arts of assiduity,
solicitation, and address, qualities in which she excelled,
to gain the northern barons over to her interest, and, to
the allotment of her enemies, soon collected an army
of 20,000 men. At the head of this powerful body
she proceeded as far as Wakefield, and gave battle to
the duke of York, who had marched thither to meet
her. Margaret was victorious, and the duke of York was
slain in the engagement, and his forces cut to pieces.

Edward, now duke of York, exerted himself to
avenge the death of his father, and obtained several
advantages over the Lancastrians; notwithstanding
which, the queen advanced towards London, and hav

ing defeated the earl of Warwick at St. Alban's, set
Henry once more at liberty. Not daring to enter
London, where Edward was received with every demon
stration of joy, she retreated northwards, taking her hus
band with her. Edward now resolved to assume the title
and dignity of king, without waiting for the meeting
of parliament. He ordered his army to assemble in
St. John's Fields, where numbers of people attended,
and the right of Edward being explained in an hara
gue, pronounced to this mixed multitude, they were asked
if they would have Henry of Lancaster for their king?
To which they replied in the negative. It was then
demanded, whether they would accept of Edward, eldest
son of the late duke of York? When they expressed
their consent by loud acclamations of joy. This popular
election being finished, it was ratified by a great number
of bishops, lords, magistrates, &c. and the new king
was on the 5th of March 1461 proclaimed in London,
under the name of Edward IV. In the mean time the
king and queen retreated into the north, where Margaret
levied more forces; but Edward resolving to give her as
little time as possible, marched with the utmost expedi
tion against her. The two armies met at Towton, where
a most obstinate battle ensued. After a most bloody con
test, in which a great number of the nobility were slain,
victory at length declared in favour of Edward, who
pursuing the enemy with unrelenting fury, 40,000 men
were left dead on the field of battle.

Margaret and her husband were obliged to fly into
Scotland, where her high spirit, now broken by mis
fortunes, made such concessions to the Scots, as induced
them to assist her with a body of forces. At the head
of this little army she again entered England; and being
reinforced by considerable numbers in the northern coun
ties, she again ventured to face the victorious Edward,
but met with numberless defeats. Henry was taken
prisoner, and she, after enduring incredible fatigues,
escaped into France.

This civil war was carried on with greater animosity
than any perhaps ever known. Margaret was as blood
thirsty as her opponents; and when prisoners of either
side were made, their deaths were deferred only for a
few hours, especially if they were persons of rank.

Edward IV. (the late duke of York) being crowned
on the 29th of June, had some time before sent the
earl of Warwick to demand Bona of Savoy, the king
of France's sister, in marriage, in which embassy he
was successful, and nothing remained but the bringing
over the princess into England; but in the mean time
the king fell in love with, and privately married, Eliza
beth, the widow of Sir John Grey. When the secret
of Edward's marriage broke out, the haughty earl,
deeming himself affronted, returned to England in
flamed with rage and resentment, and, from being
Edward's sincere friend, became his most implacable
enemy: he, therefore, with the marquis of Montacute,
the archbishop of York, and the duke of Clarence,
concerted measures to dethrone the king, whom they

attacked in his camp at Nottingham, and made prisoner, but escaping from his confinement, and retiring to Holland, the earl of Warwick, and the French king, Lewis XI. declared for the restoration of Henry, who was replaced on the throne.

Edward, returning from Holland, advanced to London, under pretence of claiming his dukedom of York; but being received by the citizens into the capital, he re-ascended the throne, defeated and killed Warwick in the battle of Barnet, and made Henry once more his prisoner. A few days after, he routed a fresh army of Lancastrians, and made queen Margaret prisoner, together with her son prince Edward, whom the duke of Gloucester, Edward's brother, murdered in cold blood.

Edward, being thus settled on the throne, pursued the Lancastrians with unremitting fury, and numbers of all ranks were put to death. There was not one legitimate prince of that house left to assert its right, and the only person who could make any pretensions to the crown, was Henry, earl of Richmond, a descendent from John of Gaunt; he therefore became the great object of his vengeance. John, the first duke of Somerset, grandson of John of Gaunt, by a spurious branch, but legitimated by act of parliament, left, at his death, an only daughter, named Margaret, who married Edmund, earl of Richmond, half brother of Henry VI. his mother was Catharine of France, who, after the death of her first husband, Henry V. married Sir Owen Tudor, a private gentleman, by whom she had the above Edmund, afterwards created earl of Richmond. Edmund and Margaret had only one son, named Henry, (afterwards Henry VII.) who, after his father's death, inherited his title and estate; and though Margaret had two other husbands, not having children by either, he consequently, at her demise, was the only lawful heir of all her fortunes. This young nobleman escaped the fury of Edward by residing in France, under the protection of the duke of Brittany, to whose care he was committed by the earl of Pembroke, after the battle of Tewkesbury.

In 1474 the kingdom of England was in a deplorable situation. The king abandoned himself to the most luxurious indolence, in which he was imitated by his great men, who, to support their extravagance, became pensioners to the French king. The parliament seemed only to act as the executioners of Edward's bloody mandates. The best blood in England was shed on scaffolds, and even the duke of Clarence fell a victim to his brother's jealousy. Edward, partly to amuse the public, and partly to supply the vast expences of his court, pretended sometimes to quarrel, and sometimes to treat with France; but his irregularities put an end to his life in 1483, in the twenty-third year of his reign, and the forty-second of his age. Before his death he nominated his brother, the duke of Gloucester, regent, during the minority of his eldest son.

During the reigns of Henry IV. and Edward IV.

notwithstanding the turbulence of the times, there was an increase of the trade and manufactures of England, particularly the woollen. So early as 1440 a navigation act was thought of by the English, as the only means to preserve to themselves the benefit of being the sole carriers of their own merchandize; but foreign influence prevented Henry's passing the bill for that purpose. The invention of printing, which is generally supposed to have been imported into England by William Caxton, and which received some countenance from Edward, is the chief glory of his reign; but learning in general was then in a poor state in England; its chief ornaments were the famous Littleton, judge of the Common-Pleas, and Fortescue, chancellor of England, both of whom flourished at this period. The lord Tiptoft was also a great patron of learning, and seems to be distinguished as the first English nobleman who cultivated what are now called the Belles Lettres. The books printed by Caxton are mostly re-translations, or compilations from the French or Monkish Latin; but it must be acknowledged, at the same time, that literature, after this period, made a more rapid and general progress among the English, than it did in any other part of Europe.

The late king Edward IV. left two sons by his queen who had raised many of her obscure relations to the highest employments, and thereby given great offence to the chief nobility. Her eldest son, Edward V. was about thirteen; and his uncle and guardian, the duke of Gloucester, taking advantage of the queen's unpopularity among the great men, and being also possessed of an unbounded ambition, resolved to fix that crown on his own head, which was designed to adorn the brow of his nephew. Accordingly, he found means to bastardize the queen's issue, by act of parliament under the scandalous pretext of a pre-contract between their father and another lady. The duke was then declared guardian of the kingdom, and at last accepted of the crown, which was offered him by the Londoners, having first put to death all the nobility and great men whom he thought to be well affected to the late king's family. Whether the young king and his brother were murdered in the Tower, by his direction, is doubtful; the most probable opinion is, that they were clandestinely sent abroad by his orders, and that the elder died, but that the younger survived, and was the same who was well known by the name of Perkin Warbeck.

Richard III. had, however, so strongly prejudiced the minds of the English against him, as being the murderer of his nephews, that the earl of Richmond, who still remained in France, carried on a secret correspondence with the remaining friends of Edward IV. and, by offering to marry his eldest daughter, he was encouraged to invade England at the head of about 2000 foreign troops, which were soon joined by 7000 English and Welsh. A battle between him and Richard, who was at the head of 15,000 men, ensued at Bosworth-Field, in which Richard, after displaying

most astonishing acts of personal valour, was slain in the year 1485, having been first abandoned by a main division of his army, under lord Stanley and his brother.

The crimes of Richard have no doubt been much exaggerated by some historians, who have been silent respecting his good qualities. He is represented by other writers, as exemplary in his distributive justice. He kept a watchful eye over the great barons, whose oppositions he abolished, and was a father to the common people. He founded the society of heralds—an institution, which, in his time, was found necessary to prevent disputes among great families. During his reign, we have repeated instances of his relieving cities and corporations that had gone into decay. He was remarkable for the encouragement of the hard-ware manufactures of all kinds, and for preventing their being imported into England, no fewer than seventy-two different kinds being prohibited by one act. He was the first English king who appointed a consul for the superintendency of English commerce abroad; one Sprovzi being nominated for Pisa, with an allowance of the fourth part of one per cent. on all goods of Englishmen imported to, or exported from thence.

Henry VII. (lately the earl of Richmond) was now universally acknowledged king of England, and, according to agreement between him and the queen dowager, married the princess Elizabeth, eldest daughter to Edward IV. This marriage united the two houses of York and Lancaster, and put a final period to those dreadful contentions which had so often deluged England with the blood of its inhabitants. Henry, however, could not forget that the destruction of his family had been owing to partisans of the house of York, and, in consequence of this aversion, he committed the earl of Warwick, son to the duke of Clarence, and nephew to Edward IV. close prisoner to the Tower, without pretending to charge him with any other crime, than his propinquity to the house of York. The same motives prompted him to declare that he did not hold the crown in consequence of his alliance with Elizabeth, but by his own undoubted right. These unconquerable prepossessions in Henry gave great disgust to the nation, and several conspiracies were formed against him, particularly those of Lambert Simnel and Perkin Warbeck. Simnel was taken prisoner, and, after being employed in the king's kitchen, was made one of his falconers. Perkin was never proved to satisfaction to have been an impostor, either by Henry, or by James IV. king of Scotland, who had for some time kindly entertained him: at length, however, after various unfortunate adventures, he fell into Henry's hands, and was shut up in the Tower of London, from whence he endeavoured to escape with the innocent earl of Warwick, for which Perkin was hanged, and the earl beheaded. It is said, that Perkin made a confession of his impostures before his death; but if he did, it might have been extorted from him, either upon the hope of pardon, or the fear of torture.

The ruling passion of Henry was avarice: to this he sacrificed every other consideration. In 1499, Arthur, his eldest son, married the princess Catharine of Arragon, daughter to the king of Spain. Though the prince did not long survive his nuptials, Henry was so averse to the refunding of her dowry, that he obliged his second son, Henry, to marry his brother's widow; and notwithstanding the opposition of Warham, archbishop of Canterbury, the pope was prevailed on to grant a dispensation for that purpose. To the same vice in Henry may be attributed the little encouragement he gave to Columbus, who made him the first offer of discovering the West-Indies. This neglect was, however, somewhat extenuated, by the encouragement he gave to Cabot, who discovered North America. He was also desirous of improving the commerce of England, and often lent considerable sums of money, without interest, to such merchants whom he knew had not funds sufficient to accomplish the schemes they had formed. Henry died in 1509, in the fifty-second year of his age, and the twenty-fourth of his reign. At the time of his demise he was possessed of 1,800,000l. sterling, equal to five millions at present.

This monarch married his eldest daughter Margaret to James IV. king of Scotland—an union which in the next age produced remarkable events. He instituted a company, called Yeomen of the Guard, who were to attend continually near his person; and these, with little variation, have been ever since continued by his successors. This monarch also, in a great measure, destroyed the dangerous privileges assumed by the barons, in abolishing liveries and retainers, it being, till that time, in the power of every malefactor to screen himself from the law, by assuming a nobleman's livery, and attending his person. An act was likewise passed, by which the barons and gentlemen of landed interest were at liberty to sell and mortgage their lands without fines and licences for the alienation. This obstacle being removed, the estates of the barons soon became the property of the commons, but stripped of their dangerous privileges. The baronial power was thus imperceptibly undermined, and soon after fell to the ground. Several other acts of parliament were passed, relative to trade and navigation, which proved infinitely beneficial to the nation. The fine arts were far advanced in England during this reign.

Henry VIII. succeeding his father at the age of eighteen, ascended the throne amidst the universal acclamations of his people. They promised themselves a release from the odious passion of avarice, which had proved so oppressive to them in the last reign. They were not deceived: the young monarch possessed a liberality of temper bordering on profusion, and which, though sometimes misapplied, generally tended to the benefit of his subjects. He was brave without ostentation, and of a frank and candid disposition. Fond of study, and a friend to learning, he had made considerable progress both in philosophy and divinity, and

was thoroughly acquainted with music. To all these qualifications nature had given him a most engaging person; and people were so much prepossessed in his favour, that the vices of vehemence, ardour, and impatience, to which he was remarkably addicted, were considered as the faults of youth, which time would correct; but which, in the latter part of his life, degenerated into tyranny and cruelty. His pride was unbounded, and his flatterers took care to turn it to their own advantage. They engaged him deeply in the affairs of the continent, and he once made the necessary preparations for the conquest of France. But in all his wars he was the dupe of foreign powers, particularly of Ferdinand, king of Spain, and the emperor Maximilian.

This monarch's chief favourite was Thomas Wolsey, the son of a butcher at Ipswich, but afterwards a student at Magdalen-College, in Oxford. He was first introduced to court by Fox, bishop of Winchester, where his great talents and insinuating address soon recommended him to the particular notice of the king. His promotions were as great as they were rapid. From almoner of the household, he was made dean of Lincoln, then a member of the privy-council, soon after appointed prime-minister, then bishop of Lincoln, and afterwards archbishop of York. Francis I. king of France, raised him to the purple; Henry created him lord chancellor, and likewise obtained a commission from the pope, nominating him legate *à latere*. It is natural to imagine that such noble preferments were sufficient to satisfy the most unbounded ambition. That of Wolsey, however, did not stop here; he aspired to the pontifical chair, to which Charles V. had promised to raise him. Finding that emperor never intended to perform his promise, he persuaded Henry to abandon his alliance with Charles, and engage in a treaty with France, hoping by that means to reach the summit of his ambition, and seat himself in St. Peter's chair.

In 1521 Martin Luther, professor of divinity in the university of Wirtemberg, began to preach against the abuses which had crept into the church of Rome, and even called the authority of the pope in question. This doctrine, which in some particulars was the same with that of the Lollards, was readily embraced by the remains of that sect in England. Henry, in order to stop the rapid progress it was making among all ranks of people, wrote a Latin treatise "Of the seven Sacraments," against the principles of Luther; and the pope, as a reward for this service, conferred on him the title of "Defender of the Faith." Henry was not always actuated with the same zeal for the papacy; a disappointment soon after entirely changed his sentiments. From a friend, he became an enemy; he had for some time entertained many scruples with regard to the propriety of his marriage with Catharine, his brother's widow; and in order to remove them, had consulted the principal divines of the kingdom, all of whom declared that the contract was contrary to every law,

either human or divine. This unanimous opinion determined the king to solicit a divorce from the court of Rome. He was indeed excited to this measure by a much stronger motive than that of conscience; he had fallen in love with Anne Boleyn, a young lady belonging to the queen's court. Wolsey used his interest to obtain the divorce, hoping he should, by that means, revenge himself on Charles V. nephew to Catharine. That emperor interposed so effectually with Clement VII. who then filled St. Peter's chair, that he absolutely refused to annul the marriage of Henry with Catharine. This was the first cause of disgust the king conceived against Wolsey, who had represented the divorce as a thing easily obtained. Wolsey's enemies laid hold of this opportunity to ruin him. Their attempt succeeded: Henry soon after seized all his furniture, papers, and treasure, and even impeached him of high treason. This blow was too severe for the spirit of Wolsey to support; he died of grief at Leicester-Abbey, on the twenty-ninth of November 1530.

It is well known, that a perplexing, though not conjuncture of affairs, induced Henry at last to throw off all relation to, or dependence upon, the church of Rome, and to bring about a reformation; in which, however, many of the Romish errors and superstitions were retained. Henry never could have effected this arduous measure but for his despotic disposition, which broke out on every occasion. Upon a slight suspicion of the queen's inconstancy, and after a sham trial, he cut off her head in the Tower, and put to death some of her nearest relations, and in many respects he acted in the most arbitrary manner; his wishes, however reasonable, being too readily complied with in consequence of the shameful servility of his parliament. The dissolution of the religious houses, and the immense wealth that came to Henry, enabled him to give full scope to his sanguinary disposition; so that the best and most innocent blood in England was shed by his orders, and seldom any long time passed without being marked with some illustrious victims of his tyranny. Among others, was the aged countess of Salisbury, descended immediately from Edward IV. and mother to cardinal Pole; the marquis of Exeter, the lord Montague, and others of the blood royal, for holding a correspondence with that cardinal. Sir Thomas More, lord high chancellor, John Fisher, bishop of Rochelle, and Thomas Cromwell, a man who, from the lowest rank, had been raised by Henry to the highest posts, were also among the number of victims whom he sacrificed to his cruelty, either from religious or political motives.

Jane Seymour, daughter to a gentleman of fortune and family, was Henry's third wife: but she died in bringing Edward VI. into the world. His fourth wife was Anne, sister to the duke of Cleves; he disliked her so much, that he scarcely bedded with her, and obtaining a divorce, he suffered her to reside in England on a pension of 3000. a year. Catharine Howard, niece to the duke of Norfolk, whose head he cut off for ante-nuptial incontinency. His last wife was Catharine Parr, in whose possession she died, after she had narrowly escaped being brought to the stake for her religious opinions, which favoured the Reformation. Henry's cruelty increased with his years; nor did he, while thus persecuting the followers of Luther, spare the Catholics, many of whom suffered for denying his supremacy; and it was justly observed by a foreigner, at that time in England, that those who were against the pope were burnt, and those who were for him hanged. He also put the brave earl of Surrey to death without a crime being brought against him; and his father, the duke of Norfolk, must have suffered the next day, had he not been saved by Henry's own death, in the year 1547, in the fifty-sixth year of his age, and the thirty-eighth of his reign. He left at his decease three children, viz. Mary, by his wife, Catharine of Arragon; Elizabeth, by his second wife, Anne Boleyn; and Edward, by his third wife, Jane Seymour.

Henry's attention to the naval security of England is highly commendable; and it is certain that he employed the unjust and arbitrary power he frequently possessed in many respects, for the glory and interest of his subjects. Whatever were his religious motives, he could be candidly confessed, that had the Reformation been brought all the for... prescribed by the laws and the courts of justice, it probably never could have taken place, or at least not for many years; and without inquiring into his personal crimes, or failings, the attention he made of the church's property among his courtiers and favourites, and thereby refusing it from his hands, undoubtedly promoted the present greatness of England. Henry was a great encourager of learning and the arts; he gave a pension to Erasmus, who was himself a prodigy of learning; he brought to England, encouraged, and protected Hans Holbein, that excellent painter and architect; and in his reign gentlemen's houses began to resemble those of Italy for magnificence and regularity. He was a constant and generous friend to Cranmer; and though he was, upon the whole, rather whimsical than settled in his own principles of religion, he advanced and encouraged many who afterwards became the instruments of a more pure reformation. In his reign, the Bible was ordered to be printed in English; Wales was united and incorporated with England; and Henry took the title of king, instead of lord, of that principality.

Edward VI. ascended the throne at the age of nine years; but, agreeable to Henry's will, the regency devolved on sixteen executors, and twelve counsellors, who, after some disputes were settled, appointed the earl of Hertford, the king's uncle, protector. This nobleman was always a friend to the Reformation, and was promoted to it with all his power. He was assisted in this design by the young king, and archbishop Cranmer, but vehemently opposed by Gardiner, bishop of

Winchester, and Bonner, bishop of London. He however succeeded, and in a short time private masses were abolished, the cup was restored to the laity, all images were removed out of churches, the common prayer was corrected, and the Reformation confirmed by act of parliament. All these alterations, however, were not effected without great disturbances; the inhabitants of different counties took up arms, but, after several defeats, accepted of a general pardon.

Henry having earnestly recommended his executors to exert their utmost endeavours for uniting England and Scotland by the marriage of Edward with the young queen of Scots, the protector entered that kingdom at the head of a powerful army. This war, which was carried on with very little success, did not obtain the end proposed; the young queen was sent into France, and betrothed to the dauphin. During the protector's absence great divisions and cabals were formed in the English councils; and soon after his return, he had the mortification to see lord Seymour, his brother, who, on the death of Henry, had married the queen dowager, endeavour to supplant him. This breach was widened by the earl of Warwick, who was resolved to raise his own fortune on the destruction of both. He persuaded the protector to deprive his brother of the post of admiral, and commit him to the Tower as a seditious person. Soon after, on refusing the terms of reconciliation offered him, he was accused of high treason, tried, and beheaded.

England, in 1549, was one continued scene of confusion. The war still continued with Scotland; insurrections, occasioned by the enclosure of lands, had broke out in almost every county, and France, taking advantage of these domestic distractions, attempted to recover Boulogne, which Henry VIII. had conquered. The council, which alone could restore tranquillity, was divided in itself, and the protector became obnoxious to every other member. At length they proceeded to extremities against him; and Warwick, from his secret, became his open enemy. He was accused of several misdemeanors, and committed to the Tower, together with his principal friends and adherents. An entire change immediately took place in the council: Warwick enjoyed the chief authority, who thinking that this revolution in affairs had sufficiently humbled the spirit of Somerset, he re-admitted him into the council, and even formed an alliance between their families, by the marriage of his son, lord Dudley, with the lady Jane Seymour, Somerset's daughter.

Warwick was now created duke of Northumberland; but finding that Somerset often expressed his resentment for the disgrace he had suffered, he determined to destroy him. He was accused of a design to raise an insurrection in the north, and of having formed a conspiracy to murder the duke of Northumberland. His peers acquitted him of the first charge, but found him guilty of the second, and he was beheaded, pursuant to his sentence, upon Tower-Hill. The duke,

having now the sole management of the king, persuaded him by many plausible arguments, to change the order of succession established by Henry VIII. in favour of lady Jane Gray, daughter to the duke of Suffolk, and wife to Northumberland's fourth son. In 1553, the king granted his letters patent for this purpose, and in a few days after expired at Greenwich, at the early age of eighteen.

Northumberland immediately published Edward's will, and caused lady Jane to be proclaimed queen at London, where her title was recognized by the citizens; though on the approach of Mary with a powerful army, lady Jane was entirely abandoned, and Mary's right to the crown acknowledged with universal acclamations. The duke, finding his schemes frustrated, was among the foremost to own the title of that princess. This mean artifice was not sufficient to save his life: he was beheaded, together with the duke of Suffolk, lord Guilford Dudley, and lady Jane Gray. The execution of the two latter was hastened by the insurrection of Sir Thomas Wyatt, who having assembled about six thousand men; entered London, firmly persuaded that the inhabitants would rise in favour of lady Jane. The very contrary happening, he was totally disappointed: his forces were defeated, and he himself taken prisoner, and beheaded.

Mary (styled, by some, Mary the Bloody) was a bigotted Papist, and proceeded, like an infernal fury, to restore Popery to its former state in England; though, on her accession, she had firmly promised religion should remain on the same footing as in the time of her predecessor. Her first step was, to recall cardinal Pole, who had been banished by her father; and he, together with Bonner, bishop of London, and Gardiner, bishop of Winchester, were the chief agents who executed her bloody mandates. The torch of persecution blazed in every corner of the kingdom, and no less than five bishops, viz. Cranmer, Ridley, Latimer, Hooper, and Ferrar, twenty-one divines, eight gentlemen, eighty-four tradesmen, one hundred husbandmen, twenty-six wives, twenty widows, nine virgins, two boys, and two infants, perished in the flames. Even the princess Elizabeth escaped with difficulty, as her attachment to the Protestant religion was well known: in the beginning of her reign, Mary married Philip, son to the king of Spain, equally a bigot to the cause of Popery, and they jointly laboured to exterminate all those who refused to embrace the corrupt religion of Rome.

The queen, in 1557, signified her intention of taking part with Spain in the war that kingdom then carried on against France. This step was strongly opposed by the ministry; but the remonstrances and threatenings of Philip prevailed, and war was declared on the most trifling pretences. It was with great difficulty, however, that Mary found means to raise an army, nor was the war attended with the least advantage to England. On the contrary, the important town of Calais,

which had been in the possession of the English above two hundred years, was taken by the French. This loss occasioned alarming reflections on the queen's imprudence, who had thus sacrificed the welfare of her people, and exposed the nation to disgrace, merely to satisfy the capricious humour of her husband. These censures, together with the grief she felt for the loss of Calais, and her husband's resolution of settling forever in Spain, preyed so greatly on her spirits, that she was seized with a lingering fever, which put a period to her turbulent and sanguinary life in the year 1558, in the 42d year of her age, and 5th of her reign.

Elizabeth, daughter to Henry VIII. by Anne Boleyn, ascended the throne on the demise of her sister Mary, and the nation, with an universal joy, acknowledged her for their queen. She immediately notified her accession to foreign courts, and among the rest to Philip of Spain. That prince flattered himself with forming an alliance with Elizabeth he should be able to acquire that unbounded power in England, which he had vainly endeavoured to establish in the reign of her sister. He ordered his minister to pay her his compliments of congratulation, and at the same time to propose a marriage between them. Elizabeth received this proposal with a determined resolution to reject it; but gave so evasive an answer, that Philip flattered himself with the hopes of success, and actually sent an agent to Rome to solicit the necessary dispensation.

Elizabeth having resolved to make a thorough change in religion, ordered the Lord's prayer, the creed, the ten commandments, the litany, and the gospels to be read in English. At the same time some able divines were employed to review the liturgy of Edward VI. and to prepare the nation for its being used in the public service of the church. In a word, the queen exerted her utmost endeavours to extirpate Popery, by the gentlest methods, and was so happy as to enjoy the fruits of those endeavours during the whole course of a long reign.

Mary, queen of Scots, by her ill conduct having obliged her subjects to insist on her abdicating the throne in favour of her son James, then an infant, fled into England for protection, which had often been promised her by Elizabeth: but that politic princess, fearing the might create disturbances in the kingdom, to which she had set up a claim, kept her confined eighteen years, and at last brought her to a trial for being accessory to the murder of her second husband, lord Darnley, and of forming conspiracies against the government of England. No positive proof of guilt, however, could be produced against this unhappy princess; notwithstanding which she was condemned to lose her head, and the horrid sentence was executed in 1587.

Elizabeth's reign was for the most part employed in schemes against Philip, who no sooner found that his offers of alliance were rejected, than he became her avowed enemy. The most formidable attempt of Spain

was in the year 1588, Philip equipped a formidable Armada, consisting of near a hundred vessels, and over before used 13450 mariners, pieces of brass cannon, and at intervals, and terrible Medina Sidonia, the invincible Armada, commanded in the latter part of the Dutch fleet. The Spanish armament, on the 15th of July, and under the command of Drake, and several whose valour are put into the utmost performing any Philip. The armament promised their narrow seas, the English, their carnal executioners others taken. The intention for which, determine the north of Scotland, it was drove many of the Scotland, and others perished. The next year, the honour of Philip had been three Spaniards are said to have been taken. Elizabeth entered and for a series of years, from Philip, Earl of Leicester, in the Low Countries, yet her measures, that the upon Spain; and Drake, Raleigh, gallant and naval heroes, who enriched themselves they too the globe.

was

was in the year 1588, when, in order to invade Eng-
land, Philip equipped a powerful fleet, styled the In-
vincible Armada. It consisted of 130 vessels, of which
near a hundred were galleons, and much larger than any
ever before used in Europe. It carried 19,295 soldiers;
8,456 mariners; 2,088 galley slaves; and 2,630 large
pieces of brass ordnance. It was victualled for six
months, and attended by twenty smaller ships, called
carracks, and ten falves with six oars each. The duke
de Medina Sidonia was appointed admiral of this In-
vincible Armada, and the duke of Parma, who com-
manded in the Spanish Netherlands, was to join him
with an army of 30,000 foot, and 1,800 horse; but
the latter part of the scheme was frustrated, the English
and Dutch fleets blocking up the ports of Flanders.
The Spanish armament arrived in the channel on the
eighth of July, and were met by the English Squadron
under the command of lord Effingham, Sir Francis
Drake, and several other persons of distinction; by
whose valour and good conduct the enemy were soon
put into the utmost disorder, and rendered incapable of
performing any one part of the orders received from
Philip. The amazing size of their ships, from which
they promised themselves certain conquest, proved the
means of their destruction; for, unacquainted with the
narrow seas, they were at a loss how to manage them,
and, while their bulk exposed them to the fire of the
English, their cannon was placed too high to do any
material execution. Some were sunk, some burnt, and
others taken. The Spanish admiral, finding that the
intention for which he was sent was now entirely fru-
strated, determined to return to Spain by sailing round
the north of Scotland. After his fleet had passed the
Orkneys, it was overtaken by a violent storm, which
dove many of the Spanish ships on the western isles of
Scotland; and others on the coast of Ireland, where
they perished. Not one half of this formidable arma-
ment ever reached Spain, to the confusion and dis-
honour of Philip. Thus ended an expedition which
had been three years in preparing, and by which the
Spaniards are said to have lost 13,500 men, and eighty-
one ships of war, large and small.

Elizabeth entered into several treaties with the Dutch,
and for a series of time supported that people in their
struggle from Philip. She sent them her favourite, the
earl of Leicester, who acted as her general and viceroy
in the Low Countries. Though this nobleman behaved
well, yet her measures were so wisely taken and ex-
ecuted, that the Dutch established their independency
upon Spain; and then she sent forth her fleets under
Drake, Raleigh, the earl of Cumberland, and other
gallant and naval officers, into the East and West-
Indies, who enriched their country by the prodigious
treasures they took from the Spaniards in those parts of
the globe.

On the death of the earl of Leicester, Elizabeth
made choice of the young earl of Essex, as her chief
favourite, who was appointed to command the land

forces, in a joint expedition with the lord admiral
Howard, against Cadiz, which they took, destroyed
the ships in the harbour, and did other damage to the
Spaniards, to the amount of 20,000,000 of ducats.

The latter part of Elizabeth's reign was employed in
concerting means with Henry, king of France, for the
reduction of the house of Austria; and in suppressing
the rebellion in Scotland, which was chiefly fomented
and supported by the Spaniards. After humbling the
latter, she made the Irish feel the weight of her resent-
ment, and submit to her mercy. But even these fortu-
nate events administered but little satisfaction to Eliza-
beth, who in her old age grew distrustful, peevish, and
jealous. Though she had an attachment to the earl of
Essex, she seized him, by her capriciousness, into the
madness of taking arms, and then beheaded him. She
afterwards became a prey to the severest grief, which
in a few days had such an effect on her health, that
her death was every instant expected. In this distress-
ful situation, it was thought necessary, in order to pre-
vent a disturbance, that she should name her successor;
and, being asked the question, answered, James, king
of Scotland. This was her last act; and she soon after
expired without a groan, in the year 1603, in the 70th
year of her age, and 45th of her reign.

The successes of Elizabeth's reign have disguised her
internal government; for she was far from being a
friend to personal liberty, and was guilty of many
stretches of power against the most sacred rights of
Englishmen. The severe statutes against the Puritans,
debarring them of liberty of conscience, and by which
many suffered death, must be condemned. Through
the practices of the Spaniards with the Irish Roman
Catholics, she found great difficulty to keep that island
in subjection, and at the time of her death her govern-
ment there had gone into great disorder. We can
scarcely retain a stronger proof that the English began
to be tired of Elizabeth, than the joy testified by all
ranks at the accession of her successor, notwithstanding
the long inveterate animosities which had subsisted be-
tween the two kingdoms.

James I. was son to the unfortunate queen of Scots,
by her second husband, lord Darnley, and great grand-
son of Margaret, eldest daughter of Henry VII. Soon
after his accession, a conspiracy was discovered for sub-
verting the government, and to fix on the throne of Eng-
land Arabella Stuart, a near relation of the king, and
descended equally from Henry VII. Among the con-
spirators were several persons of distinction; particu-
larly the famous Sir Walter Raleigh. They were
all impeached and found guilty, but few executed:
Sir Walter was ordered into close confinement in the
Tower, where he remained for several years.

In 1609, a second plot was discovered of a much
more dangerous nature. The Papists had flattered them-
selves, that when James came to the throne their re-
ligion would be restored in this kingdom: but finding
all their hopes abortive, and that every law against
them

them was executed with the utmost severity, a few individuals determined to revenge the cause of all the rest. Catesby, Percy, and Fawkes, were at the head of this conspiracy, which was near a year and a half in concerting. They thought the surest method to extirpate their enemies at once, would be that of blowing up the Parliament-House with gunpowder, at the very time when the king and all the members were assembled. Nothing was omitted which could render this infernal contrivance secure; and the fatal catastrophe must have been inevitable, had it not been for a letter sent to lord Montague, a Catholic peer, advising him to absent himself from parliament on the first day of the session; for that a terrible blow was intended for every individual of it. This letter was shewn to his majesty, who immediately concluded, that the blow hinted at was to be given by gunpowder, and orders were issued for examining carefully all the vaults below the houses of parliament. The lord chancellor purposely delayed the search, till the day before the meeting of parliament, when on going into a vault underneath the House of Lords, he discovered great quantities of wood and faggots, which ordering to be removed, thirty-six barrels of powder were discovered concealed under them. Fawkes was found in the vault, and secured: matches and every thing proper for setting fire to the train being found in his pocket. He at first refused to discover his accomplices; but being sent to the Tower, and threatened with the rack, his courage failed him, and he made a full discovery of all the conspirators, who were apprehended, and most of them executed.

James's attachment to favourites has justly been censured by the writers of that and every succeeding age. His first was Robert Carr, a youth of twenty years of age, and of a good family in Scotland. James first knighted, and then created him viscount Rochester, honoured him with the order of the garter, gave him a seat in the privy-council, and, without assigning him any particular office, bestowed on him the supreme direction of all his business and political concerns. For a long time, by following the advice of Sir Thomas Overbury, he enjoyed, what is very rare, the favour of the prince, without being hated by the people; but having connected himself with the countess of Essex, a woman of an abandoned character, whom he intended to marry as soon as she could be divorced from her husband, the earl of Essex. Overbury remonstrated with him on the folly and danger of such a proceeding. Rochester was weak enough to reveal this conversation to the Countess, who, enraged at the interposition of Overbury, so much to her disadvantage, resolved on his destruction, and prevailed on Rochester to assist in her diabolical schemes. James committed him prisoner to the Tower, where the Countess caused him soon afterwards to be poisoned, which atrocious crime James pardoned, contrary to his solemn oath.

Some time before the murder of Overbury was discovered; Somerset's power at court began to give place to George Villiers, a youth of good family, who by his personal accomplishments had rendered himself agreeable to James, and was created his cup-bearer. Upon Somerset's disgrace, he acquired a still more unlimited power over James than his former favourite had ever enjoyed, so that riches and honours were lavished on him to excess.

In 1613, James married his eldest daughter, Elizabeth, to the elector palatine, whom he furnished with large sums of money, and raised a regiment of upwards of 2,000 men, to assist him in retrieving his affairs. Some time after, he entered into a treaty with the court of Spain, for giving the infanta in marriage to his second son, Charles, who, by the death of his elder brother, Henry, became heir apparent to the crown of England. Buckingham, who was almost as great a favourite with the prince as with the king, fell in with the prince's romantic humour, and, against the king's will, they travelled in disguise to Spain, where a most solemn farce of courtship was acted; but the prince returned without his bride, and had it not been for the royal partiality in his favour, the earl of Bristol, who was then ambassador in Spain, would probably have brought Buckingham to the block, for breaking off the treaty, after the Spanish court had consented to the match.

A treaty of marriage was now set on foot between Charles and Henrietta Maria, daughter to Henry IV. of France. In the midst of this negotiation, and the preparations making for restoring the Palatine to his electorate, James was seized with a tertian ague, which put a period to his life, in the year 1625, and in the 59th year of his age, having reigned over England twenty-two years.

Commerce and colonization owed great advantages to this prince, and he laid the foundations of great national benefits; but it is certain that he had no just ideas of the English constitution and liberties, which led him into many absurd disputes and jars with his parliament; and he with his ministers were continually inventing new ways to raise money, as by monopolies, benevolences, loans, and other illegal methods: among other expedients, he sold the titles of baron, viscount, and earl, at a certain price; made a number of knights of Nova-Scotia, each to pay such a sum; and instituted a new order of knights baronets, which was to be hereditary, for which each person paid 1095l. His pacific reign was a series of theological contests with ecclesiastical casuists, in which he proved himself more of a theologian than a prince, and his pedantry was extremely ridiculous. In 1617 he attempted to establish episcopacy in Scotland, but the zeal of the people baffled his design. His pusillanimous conduct respecting his son-in-law, the elector palatine, rendered him contemptible to his people, and has subjected his memory to the censure of every succeeding age. He formed a system of policy for attaching him-

self intimately to the court of Spain, that it might
assist him in recovering the Palatinate; and to this
system he sacrificed the brave Sir Walter Raleigh, on a
chance of having committed hostilities against the
Spanish settlements in the West-Indies. He was sen-
tenced to die in 1603, and beheaded on Tower-Hill
in 1618.

Without inquiring from what motive his love of peace
proceeded, it was eventually productive of many benefits
to England; and though his perpetual negotiations
have given rise to much satire against his person and
government, yet they were less expensive and destruc-
tive to his people than any wars he could have en-
gaged in. He restored to the Dutch their cautionary
towns, upon discharging part of the mortgage that was
upon them; but he procured from Spain at the same
time an acknowledgment of their independency. We
have already described the progress of the arts and
learning under his reign. He encouraged and em-
ployed that excellent painter, Sir Peter Paul Rubens,
as well as Inigo Jones, who restored the pure taste of
architecture in England; and in his reign, poetical
genius, though not much encouraged at court, arrived
at its vertical point. Mr. Middleton also at this time
projected conveying water into the city from Hert-
fordshire, by means of pipes, which is now called the
New River. By a curious calculation, lately made, it
appears, that the quantity of water supplied to the
metropolis by this conveyance amounts to no less than
47,000 tons daily.

Charles I. ascended the throne on the death of his
father, and immediately completed his marriage with
the princess Henrietta, a woman of a haughty, tur-
bulent spirit. By her insigations, joined to those of
his favourites, he entered into several measures which
at first caused murmurings among his subjects, and
afterwards gave them a pretence for breaking out into
open rebellion. At the very beginning of his reign,
Charles gave sufficient indications of his despotic
temper; and the commons, resolving to reduce the
prerogative of the crown, refused to furnish those aids
he demanded for carrying on the war against Spain,
without his making concessions in favour of the liberty
of the people. The king's great attachment to Buck-
ingham was another cause of disgust. At the earnest
solicitations of that nobleman, Charles sent a fleet to
the relief of the Hugonots, or French Protestants,
who were besieged in Rochelle. Buckingham's delay
at Portsmouth proved fatal to him, by giving an op-
portunity to one Felton, formerly a lieutenant of foot,
to assassinate him just as he was going to embark,
in 1628. However, the fleet sailed for Rochelle,
under the command of the earl of Lindsey, but was
obliged to return to England, without being able to
afford the Hugonots any relief.

The contentions between the king and parliament
were now become very serious. The commons de-
nied him the power of levying tonnage and poundage,

a custom which had been granted to his predecessors;
and at the same time refused to raise, by any other
means, the necessary supplies. Charles was soon re-
duced to the utmost distress, the commons not having
voted him money even for the expences of his household.
This neglect obliged him to have recourse to methods
unknown to the constitution of England: he levied
money upon salt, soap, and other necessaries of life,
alleging the example of his predecessors as an excuse
for his arbitrary conduct. These proceedings rendered
his government more and more detested. The severe
punishments inflicted on Burton a divine, Prynne a
lawyer, and Bastwick a physician, who, under pre-
tence of asserting the liberties of the people, had
blown the trumpet of sedition, increased the king's
unpopularity: and he was afterwards as much em-
broiled with his Scotch as with his English subjects.
Unfortunately for him, he had chosen archbishop Laud
for his spiritual guide, and, at the instigation of that
prelate, endeavoured to introduce the religion of the
church of England into Scotland, where the inhabi-
tants professed a strict presbytery. They immediately
formed secret connections with the malcontents in
England, invaded the kingdom, and obliged the king,
who was very ill served by his army in general, to con-
sent to an inglorious peace.

The first step of the commons, in the new par-
liament, was, to refuse Gardiner, recorder of London,
for their speaker, because he was chosen by the king,
and to advance Lenthall, a lawyer, to that high office.
They then impeached the earl of Strafford, who was
considered as chief minister, of having endeavoured
to change the form of government, and subvert the
ancient laws and liberties of the kingdom. Laud was
next impeached of high treason, and sent to the
Tower. Strafford was beheaded on the 22d of May
1641; and on the 10th of January 1645, archbishop
Laud was also brought to the block.

Charles now endeavoured to conciliate the affections
of his subjects, by popular acts. He passed the famous
Petition of Rights, and agreed to other demands made
by the commons: but these concessions came too late.
A rebellion broke out in Ireland, wherein many thou-
sand Protestants of that nation were massacred, with-
out distinction of age, sex, or condition, by the Papists,
and no pains were omitted to insinuate into the minds
of the public, that the king had secretly favoured this
conspiracy, from hatred to his English subjects. The
bishops were now expelled the House of Peers, and
committed to close custody, because they drew up a
protest against the proceedings of parliament, which
the king too hastily signed. Charles, finding that lenient
measures had no effect, suffered himself to be guided
by those who advised more violent methods. He ac-
cused lord Kimbolton and five commoners, viz. Mr.
Denzil Hollis, Sir Arthur Hazlerig, Mr. Hambden,
Mr. Pym, and Mr. Strode, of high treason; and the
house having refused to deliver them to his messenger,

he went in person to demand them; but they had made their escape, and taken shelter in London, where the citizens remained all night under arms, in order to protect them. This rash step was considered as an act of high treason against his people, and the commons would not listen to any terms of reconciliation. The city militia was raised, and the mobs grew so insolent that the king was obliged to retire to Hampton-Court, and from thence thought proper to retire to York, where he had the satisfaction of finding himself joined by the chief nobility and gentry. Thus supported, he refused his concurrence to a militia bill, which the commons had drawn up. Preparations for a civil war were now made on both sides. The two houses first levied a guard for themselves, and the county of York raised one of six hundred men for the king. Both houses then assembled an army; and the queen having disposed of the crown jewels in Holland, purchased a large quantity of arms and ammunition, part of which, after escaping many dangers, were safely received by the king. Before things came to the last extremity, the parliament sent conditions to their monarch on which they were willing to come to agreement; but took care they should be such as he could not, consistent with his honour or dignity, comply with. He then collected some forces, and advancing southwards, erected the royal standard at Nottingham. The earl of Lindsey was appointed his general, and next to him in command were the princes Rupert and Maurice, sons to the elector Palatine. The parliament, whose cause was favoured by London, and most of the trading towns and corporations, appointed the earl of Essex general of their forces. The first battle was fought on the twenty-third of October 1642, at Keinton, or Edge-Hill, in Warwickshire. Five thousand men were left dead on the field, and neither side had reason to boast an advantage, though, as is usual in such cases, both claimed the victory. After this battle, a treaty was set on foot between the king and parliament; but the demands of the latter, striking immediately at the root of all monarchical power, were rejected. For some time the king's affairs wore a favourable aspect, and the parliament was reduced to such distress, that they invited the Scots to come to their assistance, who immediately sent an army of 20,000 men.

During the winter of 1643, the king summoned all the members of both houses, in his interest, to meet at Oxford. The House of Peers was tolerably full. The House of Commons did not consist of half the number of that at Westminster; and the members of the latter prosecuted their animosities against the royalists with redoubled fury. About this time a set of men began to make some noise at Westminster, who styled themselves Independents, and were in fact equally enemies to the Presbyterians and the royalists. By the arts of Oliver Cromwell, their leader, the earls of Essex and Manchester were removed from the command of the

parliament's forces, to which Fairfax and some Independent officers were appointed. This was a fatal blow to the power of the Presbyterians. In the interim, the war raged with unremitting fury, and the king obtained several advantages, particularly in two battles fought at Newbury.

Nothing decisive happened till the second of July 1644, when prince Rupert, contrary to the advice of the marquis of Newcastle, engaged the parliament forces at Marston-Moor, and was totally defeated. From this time the king's affairs were, by mismanagement, rendered irretrievable. By degrees he lost all his towns and forts; and, on the 14th of June 1645, was himself defeated at Naseby, by Fairfax and Cromwell. He retired into Wales, where he remained for some time, and then marched to the relief of Chester from whence he went to Oxford, the only place where he thought he could be safe. The Scots were besieging Newark at the time when Charles arrived in their camp, and was received by them with all the exterior marks of duty and respect; but soon found that he had, in fact, only surrendered himself prisoner into their hands. They informed the English parliament of the king's arrival among them, but refused to deliver him up, unless their arrears, which they said amounted to two millions, were first paid. After numberless debates on this point, it was at last agreed that they should accept of 400,000*l.* and resign their unhappy monarch into the hands of his implacable enemies. Having taken the king's person out of the hands of the commissioners, they invested Cromwell with the supreme command, and set the parliamentary power at defiance. The Presbyterian members now found how necessary it was to come to an accommodation with the king, and several treaties were set on foot for this purpose, which, by the artifices of Cromwell, were all rendered abortive. After some consultation, Charles was resolved to trust to the generosity of Hammond, governor of the Isle of Wight; who was no sooner master of the king's person, than he confined him in Carisbroke-Castle, and informed Cromwell of the whole transaction. A treaty for accommodating matters was set on foot by the Independents, which would in all probability have succeeded, had not Cromwell, who dreaded the general disposition of the people for peace, carried him first to Hurst-Castle, and afterwards to London, where, after an extraordinary trial before a court of justice of their own erecting, his head was struck off before his own palace at Whitehall, Jan. 30, 1648-9, in the 49th year of his age, and 24th of his reign.

Some writers have concluded, that had Charles been restored to his throne, he would have become an excellent prince; he is, however, allowed to have had many virtues, and, notwithstanding the tyrannical nature of his government, his death was exceedingly lamented by great numbers.

had the address to get himself declared commander in
chief of the English army. Admiral Blake, and the
number English admirals, carried the terror of the Eng-
lish name by sea to all quarters of the globe; and
Cromwell, having now but little employment, began
to be afraid that his services would be forgotten, for
which reason he went, April 20, 1653, without any
ceremony, with about 300 musqueteers, and dissolved
the parliament, opprobriously driving all the members,
about an hundred, out of their house. He next an-
nihilated the council of state, with whom the executive
power was lodged, and transferred the administration
of government to about 140 persons, whom he sum-
moned to Whitehall, on the 4th of July 1653. This
assembly, however, after sitting about five months,
dissolved itself, and Oliver Cromwell was chosen pro-
tector. He was installed into this high office with
great ceremony and magnificence, by the title of, His
Highness the Lord Protector of the Commonwealth of
England, Scotland, and Ireland; a title under which
he exercised all the power that had been formerly an-
nexed to the royal dignity.

The Protector next proceeded to new-model the
government, and various were the schemes that were
proposed, established, and proved abortive; and it was
by his management of the army that he did every
thing. He was openly or secretly thwarted by people
of property all over England; and, however historians
have been dazzled with his amazing fortune and power,
it appears, from the best evidences, that, during the
continuance of his protectorate, he was perpetually
distressed for money to keep the wheels of government
going. The war with Holland, in which the English
were again victorious, still continued. Seven bloody
engagements at sea were fought in little more than the
space of one year; and in the last, which was decisive
in favour of England, the Dutch lost their brave ad-
miral Van Tromp.

Cromwell's wants at last led him into the error of
making part with France against Spain, in hopes that
the rich Spanish prizes would supply him with ready
money, and his expectations herein were not wholly
disappointed. He lent the French court 6,000 men,
and Dunkirk being taken by their assistance from the
Spaniards, he took possession of it. Finding that his
usurpation gave as much discontent to his own party,
as terror to the royalists, he had thoughts of renewing
the model of the constitution, and actually erected a
house of lords out of his own creatures. After a most
uncomfortable usurpation of four years, eight months,
and thirteen days, he died on the 3d of September 1658,
in the 60th year of his age.

Historians, in drawing a character of Cromwell, have
been imposed upon by his amazing success, and dazzled
by the lustre of his fortune; but when we consult his
secretary Thurloe's, and other state papers, the im-
pression in a great measure vanishes. No king ever
reigned, either in England or Scotland, more despotically.

in some respects than he did; yet no tyrant ever had
fewer real friends, and even these few threatened to
oppose him, if he should take upon him the title of
king, which he was very desirous of assuming.

In the year 1656, the charge of the public amounted
to 1,300,000*l.* of which 1,000,000 went to the support
of the navy and army, and the remainder to that of
the civil government. Next year the total charge or
public expence of England amounted to 2,326,989*l.*
The collections by assessments, excise, and customs,
paid into the exchequer, amounted to 2,362,000*l.* 4*s.*
So that, upon the whole, it appears that England, from
the year 1648 to the year 1658, was improved equally
in riches and power. The legal interest of money was
reduced from eight to six per cent. a sure symptom of
increasing commerce. The famous and beneficial naviga-
tion act, that palladium of the English trade, was
now planned and established; and afterwards confirmed
under Charles II. Notwithstanding all Cromwell's
faults, it must be allowed that he maintained the
honour of the nation much, and in many instances
interposed in favour of the Protestants abroad; and he
also paid some regard to men of learning, and the
education of youth.

Richard Cromwell, who succeeded his father as Pro-
tector, differed greatly from Oliver both as to spirit and
parts in the affairs of government. Being placed in his
dignity by those who wanted to make him the tool of
their own government, he was soon after driven, with-
out the least struggle or opposition, into obscurity.
Though the Presbyterians were very zealous in pro-
moting the restoration of Charles, that event was in
fact brought about by the general concurrence of the
people, who seemed to think that neither peace nor
protection were to be obtained, but by restoring the
ancient constitution of monarchy. Monk, commander
of the forces in Scotland, made this a pretence for
putting into execution a scheme he had long planned,
of restoring Charles. He was a man of military abili-
ties, but of no principles, except such as served his
ambition or interest: he protested against the violence
offered to parliament, drew together the several fea-
tered regiments, marched into England, took possession
of the capital, caused a new parliament to be assem-
bled, and recalled Charles from Spain. For these ser-
vices, he was loaded with honours and riches, created
duke of Albemarle, and confirmed in the command of
the army.

Charles II. mounted the throne in 1660, and soon
after married the princess Catharine of Portugal, with
whom he received a portion of 300,000*l.* together with
the two fortresses of Tangier in Africa, and Bombay
in the East-Indies. He endeavoured, in the first year
of his reign, to unite every party in an affection for
him and his country, seemed desirous to promote the
happiness of his people, and Presbyterians and loyalists
were equally admitted into his councils. But it was not
long before affairs put on a more displeasing aspect:

the king became at length entirely absorbed in pleasure and dissipation, to which he set no bounds: this led him into the most extravagant expences, and, together with his indolence, had the same pernicious consequences as despotism itself. He has been severely censured for selling Dunkirk for about 250,000*l.* to the French for supplying his necessities, after he had squandered the immense sums granted him by parliament: he was also so ill advised as to seize upon the money of the bankers, which had been lent him at eight per cent. and to shut up the Exchequer, which indefensible step he intended to justify by the necessity of his affairs. But even in this, his conduct was more defensible than in his secret connections with France, which were of the most scandalous nature, utterly repugnant to the welfare of the kingdom, and such as must ever reflect infamy on his memory; among other instances of his reprehensible conduct, may be mentioned his giving way to the popular clamour against the lord Clarendon, as the chief adviser of the sale of Dunkirk, and whom he sacrificed to the sycophants of his pleasurable hours, though he was a man of extensive knowledge and great abilities, and more honest in his intentions than most of his other ministers: this great man was, in 1667, impeached of high treason, and, to avoid the storm, retired into France, where he survived his disgrace only six years.

In 1665 the first Dutch war began, which was carried on with great resolution and spirit under the duke of York; but, through Charles's misapplication of the public money granted to carry on the war, the Dutch, taking advantage of his negligence, sent a large fleet of ships to ravage the coast of England, which accordingly sailed up the Medway as far as Chatham, where (and also at Upnor-Castle) they burnt several capital ships of war. Soon after, a treaty was concluded at Breda between England, Sweden, and the States-General, in 1667, called the Triple Alliance, for the preservation of the Spanish Netherlands against the arms of France.

In 1672, war was again declared against Holland, which had almost proved fatal to that republic, as the English fleet and army acted in conjunction with those of France. The duke of York commanded the English fleet; as did the duke of Monmouth, a natural son of Charles, 6000 English forces acting in conjunction with the English in the Netherlands; and all Holland must have fallen into the hands of the French, had it not been for the vanity of their monarch Louis XIV. who was in a hurry to enjoy his triumph in his capital, and some utterly unforeseen circumstances. All confidence was now lost between Charles and his parliament, notwithstanding the glory which the English fleet obtained by sea against the Dutch, with whom the popular clamour at length obliged him to make peace, in consideration of 200,000*l.*; and in order to remove the nation's fears, as much as possible, respecting the duke of York, he negotiated a marriage between Mary,

eldest daughter to the duke, and heir apparent to the crown of England, and the prince of Orange; which was concluded, October 23, 1677.

Charles continued to act in some instances very despotically. Complaining of the freedom taken with his prerogative in coffee-houses, he ordered them to be shut up, but in a few days after they were opened again: he exercised great rigour and severity against the Presbyterians, and all other nonconformists to episcopacy, which was established with a high hand in Scotland as well as England. His parliament addressed him, but in vain, to make war with France in the year 1677; for he was entirely devoted to that crown, whose money he regularly received as a pensioner, and hoped through its influence and power to be absolute: several of his great men had also salaries from the same court, and alleged the king's example in justification of this infamous practice.

The hatred of the commons to the French and Papists grew every day more violent; and many of the members of parliament were bent upon such a revolution as afterwards took place, and were secretly determining that the duke of York should never reign. In 1678 the famous Titus Oates, taking advantage of this disposition, alarmed the whole nation with the account of a plot which he pretended was formed by the Jesuits to murder the king, and introduce Popery into England. Nothing could exceed the improbability of this conspiracy, but the readiness with which the intelligence of it was received by the parliament; who, blinded by their prejudice, gave credit to the most glaring absurdities. Lord Stafford, at the time a very old man; Coleman, secretary to the duke of York; numbers of Jesuits, and several other Catholics, were publicly executed on the most perjured evidences. It was with difficulty that the queen herself escaped. The duke of York, against whom the heaviest of the storm was directed, thought it most prudent to retire from England; and the king, though convinced that the whole was an infamous imposition in order to prejudice the minds of the nation against his successor, was compelled by necessity to yield to the popular clamour. The conduct of some members in the House of Commons plainly demonstrated, that the chief end of this plot was, to exclude the duke of York from the throne. A bill for that purpose was some time after, actually brought into and passed that house; but was rejected by the peers.

All England was again in a flame; but the king, a well-timed adjournment of the parliament to Oxford seemed to recover the affections of his people to a very great degree. The duke of York and his party, however, made a scandalous use of their victory; for their part, they trumped up a plot of the Protestants for killing or seizing the king, and altering the government. This plot was as false as that charged upon the Papists; notwithstanding which, lord Russell, Algernon Sidney, and several other distinguished

stantants, suffered death on this occasion; Essex died in
prison, Hampden was fined 40,000l. and the king set
his foot upon all opposition. Even the city of London
was intimidated into the measures of the court, as
were almost all the corporations in the kingdom. The
duke of Monmouth, and the earl of Shaftesbury were
obliged to fly, and the duke of York returned in
triumph to Whitehall. Charles, it was thought, after-
wards repented of some of his arbitrary steps, and in-
tended to have recalled the duke of Monmouth, and
execute some measures for the future quiet of his realm,
but amidst all these excellent resolutions, he was seized
with a sudden fit, resembling an apoplexy; and though
he was recovered from it by bleeding, he languished
only for a few days, and expired February 6, 1685, in
the 55th year of his age, and 25th of his reign.

Charles left behind him no lawful issue; but the
descendants of his natural sons and daughters are now
amongst the most distinguished of the British nobility.
Though the principles and conduct of this prince were
in general unconstitutional to England, yet some of his
actions must be owned beneficial to the nation. He
confirmed the abolition of all the feudal tenures, in
lieu of which he received from the parliament a gift
of the excise for life; and in this act coffee and tea
were first mentioned. By his long residence, and that of
his friends, abroad, he imported into England the cul-
ture of many elegant vegetables, such as the cauliflowers,
asparagus, artichokes, and several kinds of
beans, peas, and salads. Under him, Jamaica, which
had been conquered by the English under the auspices
of Cromwell, was greatly improved, and made a sugar
colony. The Royal Society was instituted, and many
popular acts respecting trade and colonization were
passed. The trade of England was also incredibly in-
creased during his reign, and he entered into many
rigorous measures for its protection and support. He
carried the art of ship-building to the highest per-
fection; and the royal navy of England, at this day,
owes its finest improvements to his and his brother's
knowledge of naval affairs and architecture. Charles
loved, patronized, and understood the arts, more than
he encouraged or rewarded them, especially those of
English growth; but his neglect proceeded not from
narrow-mindedness, but indolence, and want of re-
flection. In his time, dissipated as it was, some reader
were found who could admire Milton as well as Dry-
den, and never perhaps were the pulpits of England so
well supplied with preachers. Our language was har-
monized, refined, and rendered natural, witness the
style of their sermons; and the days of Charles may
be called the Augustan age of mathematics and natural
philosophy. As to his religion, James, soon after
Charles's death, published to the world, that his
brother, notwithstanding his repeated professions of
regard to the Protestant faith, was a Papist, and died
such, of which there are now incontrovertible proofs.
The reign of this monarch has indeed been celebrated

for wit and gallantry, but both were coarse and in-
delicate: the court was a nursery of vice, and the
stage exhibited scenes of impurity.

England was visited with two dreadful calamities in
the late reign. In May 1665, a terrible plague broke
out in London, and raged for eleven months, in which
time it swept away, in the city only, upwards of 100,000
souls: and on the 2d of September 1666, a fire broke
out in the city, which in three days consumed eighty
churches, several city gates, and 400 streets; containing
13,000 dwelling-houses.

James II. now ascended the throne, though great
opposition was at first made to his accession: but the
declaration which he made to the privy-council, im-
mediately on the demise of his brother, of his reso-
lution to maintain the established government, both in
church and state, quieted the minds of the whole
nation; and the popular affection towards him was
increased by the early declaration he made in favour
of the church of England, which, during the reign of
Charles, had formerly pronounced all resistance to the
king to be unlawful. It was not long, however,
before his arbitrary notions of government began to
appear. The army and people supported him in
crushing an ill-concerted rebellion of the duke of
Monmouth, who pretended to be the lawful son of
Charles II. and, as such, had assumed the title of
king. That duke being beheaded July 15, 1685, and
some hundreds of his followers hanged, drawn, and
quartered, in the west of England, exhibiting a scene
of barbarity scarcely ever known in this country, in
which Jefferies and Colonel Kirke were the principal
instruments. James desperately resolved to try how far
the practice of the church of England would agree
with her doctrine of non-resistance: the experiment
failed, and in the end proved fatal to him. He made
the most provoking steps to render Popery the estab-
lished religion of his dominions. He arrogated to
himself a power of dispensing with the known laws;
instituted an illegal ecclesiastical court, openly received
and admitted into his privy-council the pope's emis-
saries, giving them more respect than was due to the
ministers of a sovereign prince. He sent an embassy
to Rome, and received at his court the pope's nuncio.
The encroachments he made upon both the civil and
religious liberties of his people, are almost beyond descrip-
tion, and were disapproved of by the pope himself,
and all sober Roman Catholics. His sending to prison,
and prosecuting for a libel, seven bishops, for pre-
senting a petition against reading his declaration against
liberty of conscience, alarmed his best Protestant friends.
The joyful news of their acquittal was however soon
conveyed from Westminster-Hall to those without,
from them to the city and army, and in a short time
spread throughout the kingdom.

Matters being brought to this extremity, many great
men in England and Scotland applied for relief to
William, prince of Orange, in Holland; a prince of

great abilities, and the inveterate enemy of Louis XIV. who then threatened to enslave Europe, inviting him to assist them by his arms in the recovery of their laws and liberties. This prince was the nephew and son-in-law of James, having married the princess Mary, that king's eldest daughter; and he at last embarked with a fleet of 500 sail for England, avowing it to be his design to restore to the church and state their due rights, and prevent the establishment of a despotic power. Upon his arrival in England, he was joined not only by the Whigs, but by many whom James had considered as his best friends; and even his daughter, the princess Anne, and her husband, George prince of Denmark, left him and joined the prince of Orange. James might still have reigned; but he was surrounded with French emissaries, and ignorant Jesuits, who wished him not to reign, rather than not restore Popery. They secretly persuaded him to send his queen and son, real or pretended, then but six months old, to France, and to follow them in person, which he did; and thus ended the reign of James in England, which event in English history is termed the Revolution, and took place in the year 1688.

William's chief object was, to humble the power of France, and his reign was spent in an almost uninterrupted course of hostilities with that power, which were supported by England at an expence she had never known before. The nation had grown cautious, through the experience of the two last reigns, and he gave his consent to the bill of rights, by which the liberties of the people were confirmed and secured; though the friends of liberty in general complained, that the bill of rights was very inadequate to what ought to have been insisted on, in a period so favourable to the enlargement and security of liberty, as a crown bestowed by the free voice of the people. England had never before this time been at so high a pitch of wealth and prosperity: her tonnage of ships was nearly doubled, both in the merchants service and royal navy, to what it had been a few years before: the increase of the customs, and the annual rental of England, was in the same proportion: no wonder, therefore, if a strong party, as well in the parliament as the nation, was formed against the government, which was continually increasing by the king's predilection for the Dutch.

The war with France, which, on the king's part, was far from being successful, required an enormous expence, and the Irish continued, in general, faithful to James: but many English, who wished well to the Stuart family, dreaded their being restored by conquest; and the parliament enabled the king to reduce Ireland, and to gain the battle of the Boyne. The marine of France proved superior to that of England, in the beginning of the war; but in the year 1692, that of France received an irrecoverable blow in the defeat at La Hogue. The continental war forced the parliament to open new resources for money. A land-tax

was imposed, and every subject's lands were taxed, according to their valuations given in by the several counties. Those who were the most loyal, gave the highest valuations, and were the heaviest taxed, and this profligate burden still continues; but the greatest and boldest operation in finances, that ever took place, was established in this reign, which was the carrying on of the war by borrowing money upon parliamentary securities, and which form now what are called the public funds: the chief projector of this scheme is said to have been Charles Montague, afterwards lord Halifax. On December 28, 1694, William lost his excellent queen, who died of the small-pox, in her 34th year: and, not being well supported in his war with France, he was forced, in 1697, to conclude the peace of Ryswick with the French king, who acknowledged his title to the crown of England.

In 1698, William was guilty of a very impolitic action, in agreeing to a treaty of partition with France with regard to the Spanish succession, in case Charles II. king of Spain, whose death was daily expected, should leave no issue. By this treaty the Spanish monarchy was to be divided between the houses of Bourbon and Austria; but Charles, who died in 1700, bequeathed his dominions to the duke of Anjou, second son to the Dauphin of France. The splendor of a crown was too great a temptation to be resisted by Louis; who, in open defiance of the treaty he had concluded with William, and the states-general, seized on the Spanish monarchy. This breach of faith was further aggravated by the insincerity of the French court, on the death of James II. which happened in September 1701. Soon after which, Louis gave orders, that the son of the deceased monarch should be proclaimed king of England, Scotland, and Ireland, by the name of James III.

William was no sooner informed of these proceedings, than he recalled his ambassador from Paris, and ordered the French resident here to leave the kingdom immediately. The parliament, which had been highly chagrined at the treaty of partition, and even impeached some of the ministry for advising it, approved of the just resentment of their monarch; and William received addresses from every part of the kingdom, promising to support his government against the pretender and all his enemies. Assured of the assistance of his people, the king now concluded alliances with several foreign princes against France, particularly with the emperor and Holland, usually styled the grand alliance. Land and sea forces were raised with the utmost expedition, and every thing was in the greatest forwardness for the declaration of war, when the king, whose health had been visibly declining for some time, received a fall from his horse, whereby his collar-bone was broken. The bone was set, and the physician began to flatter himself that his majesty would recover; but a defluxion having fallen upon his knee attended by several dangerous symptoms, he languished a few

a few days, and expired. This event happened on
the first of March 1702, in the 52d year of his age,
and the 14th of his reign.

The chief glories of this prince's reign were, the re-
servation and preservation of religion and public liberty; for,
under him, England suffered severely both by sea and
land; and the national debt, at the time of his death,
amounted to the unheard-of sum of 14,000,000l. With
respect to his disposition, he did not appear formed by
nature for popularity; his manners were cold and for-
bidding; he seemed also sometimes to lose sight of those
principles of liberty, for the support of which he had been
called to the throne; and, though he owed his royalty to
the Whigs, yet he often favoured the Tories. The former
had the mortification of seeing those who had acted the
most inimical to their party, and the free principles of
the constitution, particularly the marquis of Halifax,
the earl of Danby, and lord Nottingham, taken into
favour, and resume their places in the cabinet; and the
whole influence of government extended to silence all
reproaches into the guilt of those who had been the chief
instruments in the cruel persecutions of the past reign,
and to the obtaining such an act of indemnity as effectually
excused every delinquent from the just retaliation of in-
jured patriotism. Just before his death, he granted a com-
mission, under the great seal, to several peers, for passing
a bill for the attainder of the pretended prince of Wales.

Anne, princess of Denmark, was immediately, by
virtue of the act of settlement, proclaimed queen of
England; and, as it was suspected that she would de-
viate from the measures pursued by William, she took
the earliest opportunity of assuring her subjects and allies,
that she meant faithfully to adhere to the engagements
formed by that monarch. The two parties of Whig
and Tory now ran very high in England, and when it
came to be debated in council, whether England should
enter into the war as principals, or only as auxiliaries,
the Tories, headed by the earl of Rochester, the queen's
maternal uncle, advised the latter: but the Whigs, the
chief of whom were the dukes of Devonshire and Som-
erset, insisted upon the expediency of our acting as
principals; as the honour of the nation was immediately
concerned in fulfilling the engagements made by the
late king, which could not be done otherwise than by
entering into the quarrel as principals. The earl of Marl-
borough, who was competitor with Rochester for the
queen's favour, and, by the influence which his coun-
tels had over that princess, in a manner directed her
resolutions, declared himself of the same opinion. This
point being determined, war was declared against
France and Spain on the 4th of May 1702. The prince
of Denmark, husband to the queen, was created high
admiral of England, and the duke of Marlborough ap-
pointed general of the combined army.

A scene of almost uninterrupted success attended the
confederates, particularly the English, during the whole
course of this war; and gained the earl, who, for his
 eminent services, was created duke of Marlborough,

much honour. Several battles were fought, the prin-
cipal of which were those of Blenheim, Ramillies, and
Oudenarde. The battle of Blenheim happened in con-
sequence of the queen's generous resolution to save the
empire of Germany, which was in danger of being to-
tally ruined by the joint forces of France and Bavaria.
The States-General having embraced the same resolu-
tion, Marlborough marched with surprising rapidity
into Germany, at the head of the confederates, and
drove the French and Bavarians from the intrenchments
they had raised at Schellenberg, in order to prevent his
crossing the Danube. Having passed that river, and
being joined by a considerable body of forces under
prince Eugene, he attacked the French and Bavarians
at Blenheim, where they gained a very signal and com-
plete victory; marshal Tallard, the French general,
was taken prisoner, together with 13,000 men, and a
proportional number of cannon, artillery, and trophies
of war. The French were soon after driven out of Ger-
many, and all Bavaria conquered. About this time,
Sir George Rook reduced Gibraltar, which still remains
in our possession. Other advantages were also obtained
at sea.

The battle of Ramillies was fought on the 12th of
May 1706, with equal success. The loss of the French
amounted to near 40,000 men. After this victory, the
archduke of Austria, who disputed the crown of Spain
with the duke of Anjou, and had taken upon himself
the title of Charles III. was solemnly recognized by
the states of Flanders for their sovereign; and the allies
pursued their conquests with the utmost rapidity. Lor-
raine, Mechlin, Brussels, Antwerp, Ghent, Bruges,
Menin, Dendermonde, and Aeth, were all obliged to
surrender by the middle of September; and, soon after,
the army retired into winter quarters.

The engagement at Oudenarde happened on the 12th
of July 1708, when the French were once more totally
defeated. In this action the electoral prince of Hano-
ver, afterwards king George II. gave early proofs of his
martial disposition; for, having charged at the head of
the Hanoverian dragoons with great intrepidity, his
horse was shot under him, and one of his aides-de-camp
killed by his side. In this battle, between three and
four thousand of the enemy were left dead on the field,
and seven thousand were taken prisoners.

In 1709, France was reduced to such distresses, that
the pride of her aspiring monarch Louis being thereby
humbled, he determined to sacrifice all the calls of am-
bition, as well as the interest of his grandson, to obtain
a peace, and accordingly, about the middle of May,
conferences were opened for this purpose at the Hague.
Prince Eugene, Marlborough, and the Dutch pension-
ary Heinsius, were for continuing the war, and their
proposals to Louis were such as no monarch could,
consistent with his honour, accept: the conferences
therefore were broken off, and the allies resolved to be-
gin the campaign with the siege of Tournay. The
trenches were opened on the 27th of July, and the
town.

town soon after surrendered; but it was the second of September before the garrison capitulated. Mons was the next great object of the allies; but, before that siege could be effected, it was found necessary to drive the French army from their posts behind the woods of la Merte and Trainiere, in the neighbourhood of Malplaquet. This was attempted with success; but it proved the dearest victory the confederates ever purchased, having cost them above 18,000 men killed and wounded, and among the former were several officers of distinction. The end proposed by this engagement, however, was obtained, for Mons surrendered about the middle of November.

The affairs of the confederates were far from being equally successful in Spain. The queen had sent a fine army under the command of lord Galway, to assist Charles III. That general was joined by the Portuguese forces, and, at first, their attempts were attended with some success; but, in 1707, the English sustained a severe defeat in the plains of Almanza, chiefly through the cowardice of their allies.

The Tories, who were Marlborough's inveterate enemies, had long endeavoured to convince the queen that this war would, in the end, prove ruinous to the church and state; and accused the Whigs of not being very well affected to the former. Robert Harley, afterwards earl of Oxford, was at the head of this party, formed to ruin the duke. The people were taught to believe that the church was in danger, and, by that means, rendered clamorous. This was increased by a sermon preached at that time by Dr. Sacheverel, wherein he strenuously asserted the high notions of hereditary indefeasible right, passive obedience, and non-resistance. He was impeached by the commons, and found guilty by the lords, who passed a very mild sentence upon him. The honour and interest of the nation were now sacrificed to private court intrigues, managed by Mrs. Masham, a relation of the duchess of Marlborough, her benefactress, whom she had supplanted, and by Mr. Harley, afterwards earl of Oxford. To complete the triumph of the Tories, Marlborough was dismissed from all his employments, and the command of the army given to the duke of Ormond.

The new ministry having resolved to negotiate a peace with France, a congress was opened at Utrecht, on the 9th of January 1712, for that purpose. The preliminaries were soon settled between England and France, and, not long after, acceded to by all the princes who formed the grand alliance, the emperor excepted. That monarch determined to carry on the war against France, but was soon convinced he had undertaken what he was unable to support, and accordingly made a separate peace.

After the peace of Utrecht the queen was perpetually disturbed by the jarring of parties. When the change of the ministry had taken place in favour of the Tories, Oxford, at that time Mr. Harley, was created lord high treasurer, Sir Simon Harcourt appointed lord keeper,

and Mr. Henry St. John, afterwards lord Bolingbroke, nominated secretary of state. These three persons, though they had united in opposing the administration of the Whigs, were far from being united in their political sentiments; their views and pursuits were very different: it is therefore no wonder that they soon experienced an opposition more formidable than that they had so lately subdued. Each found his hopes disappointed, and an open rupture between them was the consequence. Nor did they set any bounds to their resentment; forgetting the respect due to their royal mistresses, who had distinguished them with the highest marks of her favour, they made use of the most bitter invectives against each other in her presence. This deeply affected her, and she removed the earl of Oxford from his office of lord high treasurer. The general confusion occasioned by this event, and the fatigue of attending a long cabinet council, had such an effect upon the queen's spirits, before greatly weakened by her bad state of health, that, on the 29th of July 1714, she was seized with a lethargic disorder, languished till the first of August, and then expired, in the 50th year of her age, and 13th of her reign. With her ended the line of the Stuarts, which, from the accession of James I. anno 1603, had swayed the sceptre of England 111 years, and that of Scotland 343 years, from the accession of Robert II. anno 1371. As queen Anne left no issue, she was succeeded by George, elector of Hanover, in pursuance of a statute passed in the 12th year of William III. for limiting the succession of the crown.

George I. mounted the throne with strong prepossessions against the Tories, whom he considered as enemies to the house of Hanover. A total change therefore immediately took place in the ministry. This avowed partiality greatly inflamed the minds of those who were already but too much discontented at the late changes, and the rejoicings on account of the coronation were interrupted in several places by disorderly rabbles, who committed numberless outrages. The Pretender, taking advantage of these commotions, caused a manifesto to be dispersed in England, setting forth his right to the crown. A rebellion soon after broke out in Scotland, under the earl of Mar, which might have been attended with very serious consequences, had not the death of Louis XIV. who had promised to support the young adventurer, happened at this crisis. In the mean time, several of the Scottish peers armed the clans in favour of George I. and the duke of Argyll having been appointed commander in chief of the forces in Scotland, engaged the rebels, under the earl of Mar at Sheriff-Muir, and totally defeated their whole army. This defeat did not however intimidate the insurgents. In the beginning of the year 1716, the pretender arrived in Scotland, and made his public entry into Perth. The duke of Argyll immediately marched to attack the rebels; but they did not wait his approach. They retreated with the utmost expedition to Montrose, where the chevalier, with some of his principal adherents,

went on board a small vessel, and passed over into France. The rebel army now found that their chiefs had abandoned them, upon which they immediately dispersed. During the rebellion in Scotland, an insur- rection happened in the West of England, where the pretender's friends were very numerous, but was sup- pressed almost as soon as formed, and several of the lead- ers punished with death.

A new parliament, consisting chiefly of Whigs, met, in 1715, at Westminster, when Henry, earl of Boling- broke, Robert, earl of Oxford, and James, duke of Ormond, were impeached of high treason; and the earl of Strafford of high crimes and misdemeanors. Lord Bolingbroke and the duke of Ormond retired into France; and lord Oxford was imprisoned for three years, when he regained his liberty.

Peace being restored to the kingdom, his majesty went over to the continent, in order to secure his German dominions from the attempts of Charles XII. king of Sweden, who had been incensed against George, as elector of Hanover, for purchasing Bremen and Verden of the Danes, which had been a part of the Swedish dominions. In 1718, a rupture happened between England and Spain, on account of the quadruple al- liance; and the English admiral, Sir George Byng, by the king's orders, defeated the Spanish fleet near Syra- cuse. France having joined the English in this war, it was soon ended, by the Spaniards delivering up Sar- dinia and Sicily, the former to the duke of Savoy, and the latter to the emperor. Charles had embraced the interest of the pretender, and even engaged to assist the malcontents in England with a powerful army. This confederacy being discovered, his Britannic majesty con- cluded a treaty with France and the States-General, known by the name of the Triple Alliance, in order to disappoint any attempts that might be made against his dominions. On his return to England he immediately ordered count Gyllebergh, the Swedish resident, into custody, and pursued such prudent measures, that the designs of Sweden were for that time rendered abortive. Charles, however, did not abandon his design; and he would, in all probability, have invaded England at the head of a powerful army, in conjunction with Peter, czar of Muscovy, had not death put an end to his life before the scheme was ripe for execution.

The year 1720 was rendered remarkable by the sud- den rise of the South-Sea stock. That company had been lately erected, and owed its rise to a scheme for carrying on an exclusive trade, and making a settle- ment in the South Seas. Accordingly, a plan was laid before the House of Commons, to increase their capital stock by redeeming the public debts, in consideration of certain advantages which were to be granted them. This plan occasioned many warm debates, but at length the company's offers were accepted. During the time this affair was depending in the house, South-Sea stock rose first to 150, and at last to 1000 per cent. The company's scheme might perhaps, at the beginning,

have been honestly intended, but, in the end, it proved of the utmost prejudice to some, and the entire ruin of others. The ministry themselves were accused of having been deeply concerned in this detestable scheme, though no notice was taken of the charge; but a bill was passed, by which the estates of the directors were con- fiscated, and only a bare sufficiency allowed for their support. The reader will find a more ample detail of this horrid scene of villany and fraud, in our account of the stock of this company, p. 639.

In 1722, a conspiracy was said to be formed against the king, and, after some contest, the Habeas Corpus act was suspended. The earl of Orrery, Dr. Atterbury, bishop of Rochester, and the lord North and Grey, were charged with high treason, and committed to the Tower; and, soon after, the duke of Norfolk. Several other persons were seized and imprisoned; and, though the facts alleged against them were never clearly proved, Atterbury was banished for life. Mr. George Kelly, an Irish clergyman, and Mr. John Plunket, were im- prisoned during his majesty's pleasure; and Mr. Chris- topher Layer, a young counsellor at law, put to death.

The courts of Spain and Vienna having entered into a treaty contrary to the interest of Great-Britain, the king, in order to counteract their designs, projected a defensive treaty between England, France, and Prussia, which was signed at Hanover on the 3d of September 1725. The real intent of this alliance was to secure his Britannic majesty's German dominions, though it was represented by the court party as having been con- tracted merely for the glory and advantage of this nation, the interest and honour of which was evidently sacrificed to that electorate. Catharine, empress of Russia, hav- ing consulted with the courts of Madrid and Vienna the most probable measures for placing the pretender on the throne of Great-Britain, they sent a fleet into the Baltic under the command of Sir Charles Wager, with orders to remonstrate with the empress on her conduct: that artful woman, however, disowned having the least knowledge of those proceedings, and the admiral, after continuing in the Baltic till the season was too far ad- vanced for the Russian fleet to make any successful at- tempt in favour of the pretender, returned to England. Sir John Jennings, with several ships of war, sailed at the same time as Sir Charles Wager, in order to insult the coast of Spain, and he so effectually executed his or- ders, that the panic extended even to Madrid. A third squadron, which sailed at this juncture for the West- Indies, under the command of rear-admiral Hofier, was not so fortunate. His orders were to watch the Spanish plate fleets; but the Spaniards having received intelli- gence of this design, before he could reach the Basi- limentos, had unladen the galleons, and carried the trea- sure, amounting to six millions and a half sterling, back to Panama. Hofier, however, continued cruising be- fore Porto Bello from the beginning of June till Christ- mas. But, during this interval, the admiral himself, and most of his crew, perished by epidemical diseases.

The management of the Spaniards was little better: they resolved to attempt the retaking of Gibraltar, and actually laid siege to that important fortress; but such care had been taken to put the place into a proper posture of defence, that, having lost 10,000 men, the enemy was obliged to abandon the enterprise.

While the chief powers in Europe were thus preparing for war, they were actually very desirous of peace. Lewis XV. undertook the friendly office of a mediator, and a congress was opened at Soissons for adjusting all differences between the contending nations. The king resolved to seize this favourable opportunity of visiting his German dominions; and accordingly, having appointed a regency, he embarked at Greenwich on the 2d of June 1717, and landed in Holland on the 7th. But, on the road to Hanover, he was suddenly seized with a paralytic disorder, which terminating in a lethargy, he was carried in a state of insensibility to Osnaburgh, where he expired on the 11th of the same month, being the 68th year of his age, and 19th of his reign, and was interred among his ancestors at Hanover.

As soon as this event was known in England, Sir Robert Walpole, at that time considered as first minister, immediately waited on the prince and princess of Wales with the melancholy intelligence; and, on the 15th of June, the prince was proclaimed king of England, by the title of George II. Considerable changes were at first expected in the ministry, but all the great officers of state continued in their places; Sir Robert Walpole kept possession of the treasury, notwithstanding a coolness had subsisted between him and George II. while prince of Wales. The principal members who opposed the measures pursued by Sir Robert, were Mr. Daniel Pultney, Mr. William Pultney, Mr. Shippen, and Sir William Wyndham. He filled all places of power, trust, and profit, and almost the House of Commons itself, with his own creatures; and was justly blamed for his unbounded love of peace, whereby he subjected the nation to the insults of foreign powers; but an attempt which, in 1733, he made in the House of Commons to introduce a general excise, was what gave the first shock to his power. There is no doubt but, had he been determined to have exerted his influence, the bill would have passed; but, finding that the nation in general was averse to it, he suffered the opposition to prevail, and the people testified their approbation by tokens of public rejoicing.

The measures of Sir Robert Walpole had for some time rendered him the object of popular resentment, which was now greatly increased by his giving offence to Frederick, prince of Wales. A motion had been made in the House of Commons for augmenting the prince's revenue. Sir Robert opposed it, and it was carried in the negative. The prince was now considered as the leader of the opposition; and Sir Robert began to fear the consequences, when Frederick, by an unhappy accident, incurred the displeasure of the king, who gave the prince to understand, that until he should

withdraw his confidence from those by whose instigation and advice he was encouraged in his disobedient behaviour, and return to his duty, he should not reside in the palace: at the same time signifying his pleasure, that he should leave St. James's with all his family, as soon as it could be done without prejudice or inconvenience to the princess, who now lay-in there. The prince, in consequence of this message, retired to Kew; but found his father's anger was not easily appeased, even his request to obtain admittance to the queen, his mother, to implore forgiveness, and receive her blessing in her last moments, was denied. That princess paid the debt of nature on the 20th of November 1737, and was regretted as a pattern of conjugal virtue, and a friend to all the learned of Europe.

In the mean time, the debates in parliament relating to the Spanish depletions in America, were carried on with uncommon ardour. Sir Robert adhered to his pacific system, and concluded a shameful compromise, under the title of a convention, which even his best friends could not defend; but at length, vigorous measures becoming necessary, war was declared against Spain on the 23d of October 1736. Vernon, a sworn enemy to the minister, having asserted in the House of Commons, that Porto Bello might be taken with six men of war, was sent with a fleet to the West-Indies. The admiral performed his promise: he took Porto Bello, situated on the Isthmus of Darien, with six ships only, and demolished all the fortifications by which it was defended. He, however, miscarried in another attempt he made against Carthagena; but the misfortune was chiefly owing to the general of the land forces.

The succeeding winter was one of the severest ever known in England. The river Thames was frozen over, and several trades exercised on the ice. The fruits of the earth were destroyed, trade was at a stand, and the price of provisions arose to an amazing height; even water was sold in the streets of London. In this season of distress many wretched families must have perished by cold and hunger, had not those of opulent fortunes been inspired with a remarkable spirit of humanity and compassion. Nothing can more redound to the honour of the English nation, than the instances of benevolence and well-conducted charity which were then exhibited.

The general election now coming on, the minister determined to try his strength in the House of Commons by a contested election; and had the mortification to find a majority of sixteen voices against him. On this decision he declared he would never more sit in that house. Accordingly, the parliament was adjourned by the king for sixteen days; and, during that interval, Walpole was created earl of Orford, and resigned his employments. After which, the new administration being settled; by dividing, after various removals, the power of the premiership between Mr. Pelham and his brother the duke of Newcastle, the prince of Wales attended by a numerous retinue of his adherents, waited

coming on, the minister in the House of Commons had the mortification against him. On this never more fit in that was adjourned by during that interval, Oxford, and resigned his the new administration various removals, then Mr. Pelham and his, the prince of Wales, of his adherents, waited

on his majesty, who received him very graciously, and ordered his guards to be restored.

About this time the affairs of Europe wore a threatening aspect. In the West-Indies the war, in 1741, proved unfortunate for England, through the fatal divisions between admiral Vernon and general Wentworth, who commanded the land troops; and it was thought that above 20,000 British seamen perished in the impudic attempt on Carthage, and the inclemency of the air and climate during other fruitless expeditions. The year 1742 had been spent in negotiations with the courts of Peterburgh and Berlin, which, though expensive, proved of little or no service to Great Britain; and that the victory of Dettingen left the French troops in much the same situation as before. A difference between the admirals Matthews and Lestock had occasioned the Spanish and French fleets to escape out of Toulon with inconsiderable loss; and soon after the French and English declared war against each other. The Dutch, England's natural allies, carried on a most lucrative trade during the war; nor could they be brought to act against the French till the people entered into associations and insurrections against the government. Their marine was in a miserable condition; and when they at last sent a body of troops to join the British and Austrian armies, which had been wretchedly commanded for one or two campaigns, they did it with so bad a grace, that it was plain they did not heartily embark in the war.

When the duke of Cumberland took upon himself the command of the army, the French, to the great reproach of the allies, were almost masters of the barriers in the Netherlands, and were besieging Tournay. The duke attempted to raise the siege, but, by the coldness of the Austrians, the cowardice of the Dutch, whose government all along held a secret correspondence with France, and misconduct somewhere else, he lost the battle of Fontenoy, and 7000 of his best men; though it is generally believed that his dispositions were excellent, and both he and his troops behaved with amazing intrepidity. To counterbalance such a train of misfortunes, admiral Anson returned this year to England with an immense treasure (about a million sterling) which he had taken from the Spaniards in his voyage round the world; and commodore Warren, with colonel Popperel, took the important town and fortress of Louisbourg in the island of Cape Breton, from the French.

Such was the state of affairs in Europe, when the pretender's eldest son, in 1745, landed in Scotland. His friends, on his first appearance, considered the attempt as desperate, as a scheme which nothing but the ardour of enthusiastic zeal could have projected, and the fury of wild ambition undertaken to execute; but he was deaf to all their arguments, and determined to proceed, whatever consequences might ensue. For some time fortune attended his standard; Sir John Cope was defeated at Preston-Pans, the pretender

entered England, took the city of Carlisle, and penetrated as far as Derby. The capital was now thrown into the utmost confusion, and the Jacobite party laid a deep scheme to distress the bank of England. The merchants immediately assembled, and agreed to take bank notes in payment: this preserved the public credit. The duke of Cumberland was appointed to command the army assembled in the neighbourhood of Litchfield. But the chevalier, finding himself fatally disappointed in his hopes of being joined by the English, retreated back into Scotland, where he defeated general Hawley, and burnt Fort Augustus.

The duke of Cumberland pursued the rebels, and, on the 16th of August, both armies met at Culloden. A fierce encounter ensued; but, in less than thirty minutes, the pretender's army was totally defeated, the field of battle covered with their dead bodies, and the young adventurer himself obliged to have recourse to flight for his safety.

This extinction of the rebellion did not however restore the peace of Europe. The war was carried on with great vigour in Flanders, and the island of Zealand threatened with a descent. This again roused the populace of Holland; and the States, in order to prevent the dreadful consequences of a tumult, declared the prince of Orange stadtholder, and proclaimed war against France. Notwithstanding these appearances, the Dutch never could be prevailed upon to act with vigour. The allies were defeated at Lauffeldt; and Bergen-op-Zoom was taken in a manner that has never been accounted for. In the mean time, the French marine and foreign trade were almost annihilated by the English, under the command of Anson, Warren, Hawke, and others.

A general peace now seemed necessary to all parties; and accordingly a definitive treaty was signed at Aix-la-Chapelle, on the 17th of September 1748. Soon after the conclusion of the peace, the boldest stroke of financing ever perhaps attempted in any government, was undertaken and executed with success. The last war had greatly increased the public debt, so that very large sums were obliged to be raised annually, to discharge the interest, which was then at four per cent. Mr. Pelham, who presided at the treasury board, was desirous, if possible, of lessening this annual sum. It was sufficiently evident, that great numbers of private persons in England had acquired immense fortunes during the war; and, consequently, that there was no want of money in the nation. He therefore took the resolution of reducing the interest of the national debt, from four to three and a half per cent. for seven years, and, after that time, to stand at three per cent.

This measure, however bold it might at first appear, was well founded. Very few chose to take their money out of the funds; and even some of them afterwards made interest with the minister to have it replaced on the conditions he had offered. Many improvements were also made by Mr. Pelham during this state of tranquillity, with regard to commerce, manufactures, and

the:

the fisheries. On the 20th of March 1750, Frederick, prince of Wales, paid the debt of nature. He was a magnificent patron of the arts, a friend to merit, and warmly attached to the true interests of his country. In the next session of parliament an act was passed for regulating the commencement of the year, and correcting the calendar, according to the Gregorian computation, which had been long adopted by most other nations in Europe. This was done by sinking eleven days in September 1752, and, from that time, beginning the year on the 1st of January. In 1753 was passed the famous act for preventing clandestine marriages. In the year 1754 died Mr. Pelham, who had for some time so worthily and wisely conducted the affairs of England, universally lamented.

When the treaty of Aix-la-Chapelle was signed, it was considered by every intelligent person as nothing better than an armed cessation of hostilities. The French were assiduous in repairing and augmenting their marine; they had laid an artful scheme for possessing themselves of the English back-settlements in North America, and for cutting off all communication between the British subjects and the Indians. Alarmed at these proceedings, the British ministry ordered a squadron of men of war, under the command of admiral Boscawen, to sail to the coast of Newfoundland, and observe the motions of the French fleet, then sitting out at Brest. Boscawen sailed about the latter end of April 1775, with eleven ships of the line, and one frigate, having a considerable number of land forces on board. He was soon after joined by admiral Holborne with six ships of the line and one frigate. A few days after the British fleet had reached the banks of Newfoundland, the French squadron appeared, but the fog prevented any pursuit, so that only two of them, the Alcide and the Lys, both of 64 guns, fell into the hands of the English; the rest of the fleet escaping up the river St. Laurence.

The spirit of the English nation had for some time been roused by the encroachments of the French in America. It was no sooner known that hostilities were begun, than the public poured their money into the funds of the government, and orders were issued for making reprisals both in Europe and America; and that all the French ships, whether outward or homeward bound, should be stopped and brought into the harbours of England. These orders were so effectually obeyed, that, before the end of the year 1755, above 300 of the richest French merchant ships, and above 8000 of their best sailors were sent into the British ports. This well-timed measure had such an effect, that the French had neither hands to navigate their merchantmen, nor to man their ships of war; for, about two years after, there were above 30,000 French seamen prisoners in England: so that the French name, instead of being the terror, now became the contempt of Europe.

While the enemy's trade was thus ruined in Europe, colonel Monckton, at the head of a body of troops

raised by the province of Massachusetts-Bay, drove the French from the forts they had erected in different parts of Nova-Scotia, and secured the tranquillity of the province. But general Braddock, who had been sent from England at the head of a body of troops, in order to drive the French from the forts they had erected on the Ohio, had, for want of taking the necessary precautions in passing through the woods, fallen into an ambuscade, where his army was cut to pieces, and himself slain in the contest. General Johnson was more fortunate; he totally defeated the French army near Crown Point, commanded by baron Dieskau, a German officer, who came over in the fleet which escaped admiral Boscawen. Johnson took a number of prisoners, among whom was Dieskau himself.

The French ministry, baffled in every attempt both in Europe and America, were determined to strike an important blow, and accordingly fitted out a formidable fleet at Brest, where they assembled a great number of transports. This nament at first filled the English with consternation, as it seemed to threaten a descent upon their coast. Six thousand men, furnished by the landgrave of Hesse Cassel, and twelve battalions of Hannoverian troops, arrived in England, and every necessary precaution was taken to render the attempt abortive. But it soon appeared that the preparations at Brest were only intended to cover the real design formed by the enemy. While the English were every day expecting an invasion, the French embarked a large body of troops at Toulon, and landed them in Minorca, where they besieged and took the castle of St. Philip, though bravely defended by general Blakeney, and took possession of the whole island. The loss of this place was more shameful than prejudicial to the kingdom; but the public outcry was such, that the king gave up Byng to public justice, and he was shot to death at Portsmouth for not doing all that was in his power against the enemy.

This sacrifice being found very insufficient to silence the complaints of the people, Mr. Pitt, long known as a bold and eloquent speaker, was placed at the head of affairs. He soon proved himself equal to the important post he filled, and, by his spirited measures, raised the depressed minds of his countrymen. About the same time, advices arrived from the East-Indies, which more than counterbalanced the loss of Minorca. The successes of colonel Clive in that part of the world were truly amazing. He defeated Suraja Dowla, nabob of Bengal, Bahar, and Orika, and placed Jaffer Ally Cawn in the ancient seat of the nabobs of these provinces. Suraja Dowla, who had embraced the French interest, and, at their instigation, had attacked the English settlements, was, a few days after his defeat by colonel Clive, taken prisoner by the son of the nabob, Jaffer Ally Cawn, and put to death. This event laid the foundation of the amazing extent of territory now possessed by the English in the East-Indies.

Among the several bold measures introduced by Mr. Pitt, was a new system of operations against France; a plan calculated at once to alarm and distress the enemy, and restore the spirits of the English. Despairing the threats of an invasion from the enemy, he planned an expedition for carrying the arms of England into France, and convincing the world, that the British forces are so far from fearing an attack, that they were desirous of seeking them in their own territories. The first expedition was designed against Rochfort, and the command of the land forces given to Sir John Mordaunt. The fleet, commanded by admiral Hawke, sailed from Spithead on the 8th of September 1757; but, for reasons best known to the officers of the army, no attempts were made to land on the coast of France; and, on the 6th of October, the admiral returned to St. Helen's. This disappointment, however, occasioned no murmurings against the minister: the people had too great an opinion of his virtue and intrepidity, to impute any part of the failure to him.

The French having sent a numerous army into the electorate of Hanover, large supplies were voted by the British parliament for the defence of his majesty's hereditary dominions, and the necessary methods taken for rendering the designs of the enemy abortive. The duke of Cumberland, who commanded an army of observation in that country, did every thing in his power to stop the progress of the French; but, being pressed by a force far superior to his own, he was obliged to abandon the enterprise, and signed a convention with the enemy at Closterseven: then the duke de Richlieu, who commanded the French, took possession of that electorate, together with its capital.

It having been found that the difficulties of maintaining an army on the continent, sufficiently numerous to defeat the enterprises of the enemy, were insurmountable, a treaty of mutual defence and alliance was concluded between his Britannic majesty and the king of Prussia, in consequence of which the parliament voted 670,000 pounds to the latter; together with near two millions per annum, for the payment of 50,000 of the troops of Hanover, Hesse-Cassel, Saxe-Gotha, Wolfenbuttel, and Buckburg. Prince Ferdinand, of Brunswick, a celebrated Prussian officer, was appointed general of this combined army, which soon after assembled to revenge the insults offered by the French to their country.

The French under Richlieu having violated the Convention, an army was formed at Stade, under the direction of prince Ferdinand, who determined to begin the operations of the campaign immediately, and, if possible, drive the French out of the electorate of Hanover. It was the latter end of November before the army began their march; but, notwithstanding the advanced season of the year, they soon drove the enemy out of Lunenburg, Zell, and the rest of the Brunswick dominions. Enraged at this reverse of fortune, Richlieu committed the most barbarous ravages on the innocent inhabitants, burning and

destroying all the villages and farm-houses that lay in his way. He reduced the suburbs of Zell to ashes, and even set fire to the orphan-house, by which infernal action a great number of poor innocent children perished in the flames.

Mean time the English repeatedly insulted the coasts of France; destroyed the stores and shipping at St. Maloes and Cherburg, and filled the whole French nation with the most dreadful alarms. At the close of these expeditions, the duke of Marlborough, who commanded the British forces, joined prince Ferdinand at the head of 12,000 veteran troops; and this number was afterwards increased to 25,000. Success almost constantly attended the standard of Prince Ferdinand; but, being opposed by an army always nearly double to his own, his victories were not attended with the advantages they would otherwise have produced. The most glorious battle ever fought in this, or, perhaps, any other age, was that of Minden; where about 7,000 English defeated above 80,000 regular troops of the enemy, in the open field.

The success of the British armaments were equal in every other part of the globe. The French settlement at Senegal, on the coast of Africa, was taken by captain Marth, and the island of Goree by commodore Keppel. The important fortrefs of Louiburg, in the island of Cape Breton, which had been restored to the French by the treaty of Aix-la-Chapelle, was again reduced by admiral Boscawen and general Ainhoert, and six French ships of the line taken. The war in the East Indies was also carried on with equal advantage. Admiral Pococke defeated the French fleet in two engagements, and forced them to abandon the coast of Coromandel. General Lally, commander of the French forces in India, undertook the siege of Madras. The place was accordingly invested, and a brisk cannonade continued for two days; but not being able to make any impression on the works, and the English receiving a reinforcement of 600 men, Lally thought proper to raise the siege, and retire to Pondicherry. This was immediately performed, but with such precipitation, that they abandoned 40 pieces of cannon, which the English carried into Madras.

The greatest efforts of the English were made in America. Three capital expeditions were planned, and carried into execution in the year 1759. The first was against the French islands in the West-Indies. The command of this expedition was given to commodore Hughes and general Hobson. The first attack was made upon the island of Martinique; but, failing in the attempt, they steered for Guadaloupe, which submitted to the English. The second expedition was against Quebec, the capital of Canada, situated on the river St. Laurence, and remarkably strong both by art and nature. The minister gave the command of the fleet to admiral Saunders, and that of the land forces to general Wolfe, a young officer, but one of the greatest military geniuses the world ever saw. Wolfe was op-

posed with far superior force by Montcalm, the best and most successful general the French had. Though the situation of the country which the British general was to attack, and the works the French threw up to prevent a descent of the English, were deemed impregnable, yet Montcalm never relaxed in his vigilance. Wolfe's courage and perseverance, however, surmounted incredible difficulties; he gained the heights of Abraham, where he fought and defeated the French army, but was himself killed, as was Montcalm; general Monckton, who was next in command, being wounded, brigadier-general (now lord viscount) Townshend, completed the French defeat, and reduced Quebec, which still remains in the hands of the English.

The third expedition was conducted by general Amherst. His orders were to reduce all Canada, and join general Wolfe on the banks of the river St. Laurence. The minister took care that Amherst should be well supplied with every necessary for rendering his expedition successful; in consequence of which, all the operations were carried on with such amazing facility, that there hardly appeared any chance for its miscarriage. Thus all Canada was conquered, and became a part of the British empire in North America.

France had so often felt the fatal effects of British valour, that she seemed now to act like a person of desperate fortune, and to venture all upon a single stake, by invading England in three different parts of the kingdom.

The preparations at Havre were soon rendered abortive by admiral Rodney, who bombarded the place, burnt the large magazines of stores, collected for the use of the troops destined for this expedition; destroyed a great number of the flat-bottomed boats; set the town on fire in several places, and so terrified the inhabitants, that they forsook their houses, and retired into the country for protection. Boscawen waited for a considerable time, and made use of various stratagems to draw the French admiral out of the port of Toulon; but all his attempts proving fruitless, and several of his ships being considerably out of repair, he retired to Gibraltar to refit. He did not however lose sight of the principal object, the preventing the French admiral from passing the Streights' mouth; but that commander, imagining that Boscawen had entirely abandoned his project, sailed with his squadron from Toulon, and reached the Streights' mouth; but being discovered by Boscawen's cruisers, he immediately gave the enemy chase; and after a gallant action, took the Centaur, the Temeraire, and the Modeste, all of seventy-four guns, and burnt the Ocean of 80, and the Redoubtable of 74: the rest of the squadron, consisting of seven ships of the line, and three frigates, made their escape in the night.

Sir Edward Hawke being driven by stress of weather from his station, the French admiral embraced the opportunity of sailing out of Brest with twenty-one sail of the line, and four frigates, in order to destroy the

smaller English squadron, commanded by captain Duff, before the larger could return to its assistance. Sir Edward Hawke being soon informed that the French squadron had put to sea, steered directly to Quiberon Bay, where he was persuaded the French fleet would rendezvous. About eight in the morning of the twentieth of November, the French fleet was discovered in chase of captain Duff's squadron; but Conflans no sooner perceived Sir Edward Hawke's fleet standing towards him, than he stood away with all the sail he could carry. Upon this Hawke threw out the signal to chase the flying enemy, in order to detain them till the headmost ships could be properly reinforced by the rest of the fleet; and the good conduct, together with the intrepidity of the English, rendered abortive the hopes the enemy had entertained of escaping. Sir Edward came up to the French admiral, and totally defeated his fleet. The Formidable, of eighty guns, was taken; the Thesee, of seventy-four, and the Superb, of seventy, were sunk; the Soleil Royal, of eighty, and the Hero, of seventy-four, were burnt. Seven or eight French men of war got up the river Villaine, after throwing their guns and stores over-board; and the rest of the fleet, consisting of five ships of the line, and three frigates, escaped in the night. Two English ships, the Effex, of sixty-four, and the Resolution, of seventy-four guns, ran upon a shoal, and were lost; but all their crews, and the greater part of their stores, were saved. This defeat almost annihilated the French navy, and obliged the ministry to lay aside all thoughts of invading England.

In the mean time Thurot escaped from Dunkirk, and sailing to the northward round the isles of Scotland, made a descent at Carrickfergus in Ireland; but on his return from thence he was met by captain Elliot, with a force inferior to his own. An engagement ensued, when Fortune declared for the English; the whole squadron of the enemy were taken, and Thurot himself killed in the action.

The war in Germany still continued as undecided as it was expensive, and all the belligerent powers seemed inclined to peace. A negotiation was accordingly set on foot, but proved abortive, as did many other projects of the same kind. While the thoughts of the public were engaged on this desirable event, George III. died suddenly at his palace at Kensington, in the seventy-seventh year of his age, and the thirty-fourth of his reign.

This prince enjoyed the peculiar felicity to see both party and the spirit of party entirely extinguished in his kingdoms. None of his predecessors on the throne of England lived to so great an age; few of them enjoyed so long a reign. He died at the very point of time when the terror of his arms, the power of his dominions, and the wisdom of his government, were raised almost to the summit of human acquisition; they were indeed at that height of prosperity and glory, never had been exceeded in the reign of the most for-

inate of his predecessors. Though his parts were neither lively nor brilliant, yet the whole of his conduct demonstrated that his judgment was at once both solid and comprehensive. He understood the interests of the other sovereigns of Europe, and was particularly acquainted with all the recesses of that political labyrinth, the system of Germany; and was, during his whole life, a zealous assertor of the liberties of that country, but could never separate an idea that there was any difference between his electoral and royal dominions. His temper was sudden and violent, but placable; nor did these starts of passion, though they influenced his behaviour for a time, make any impression on his conduct, which was always sufficiently deliberate and attentive both to his own interests and those of his people. He was plain and direct in his intentions; true to his word; steady in his favour and protection to his servants, and never changed them willingly. Having in a manner been compelled, by a violent faction, to part with a minister in whom he reposed an unlimited confidence, it afterwards became a matter of mere indifference to him by whom he was served in the affairs of his government. He hardly ever removed those who served more immediately about his person; they grew old with him, or died in their places. He was merciful in his disposition, but not to such a degree as to encourage offences against his government; nor did his affections, either public or private, ever interfere with the ordinary course of justice. In a word, he lived beloved, and died lamented.

George III. grandson of George II. ascended the throne when England was in the zenith of its glory. Being a native of England, which had for many years been governed by foreigners, the people were prejudiced in his favour: he was in the bloom of youth, in his person tall and comely, and at the time of his accession the most salutary unanimity and harmony prevailed among the people. The first acts of this young monarch's reign seemed to convince the public, that the death of his predecessor should not relax the operations of the war, which hitherto had been remarkably prosperous. Accordingly, in 1761, the island of Belleisle, on the coast of France, surrendered to his majesty's ships and forces under commodore Keppel and general Hodgson, as did the important fortrefs of Pondicherry in the East-Indies to colonel Coote and admiral Stevens. The operations against the French West-Indies still continued under general Monckton, lord Rollo, and Sir James Douglas; and in 1762, the island of Martinico, hitherto deemed impregnable, as likewise those of Grenada, St. Lucia, Grenadillas, St. Vincent, and others of less note, were subdued by the British arms.

Mr. Pitt, who had conducted the war against France with such wisdom and effect, having received authentic information of the hostile intentions and private intrigues of the court of Spain, proposed in council an immediate declaration of war against

that kingdom. *P.* asserted, that this was the time for humbling the whole house of Bourbon, and that if this opportunity was let slip, it might never be recovered; but he was over-ruled in the council, all the members of which, except his brother-in-law earl Temple, declared themselves of a contrary opinion. This great man now perceived his influence decline, and it was supposed he was supplanted by the earl of Bute, who had a considerable share in directing the education of the king, and had of course acquired an ascendancy in the royal favour. Mr. Pitt, however, convinced that nothing could be hoped for in a divided ministry; and being determined not to be responsible for measures he was no longer allowed to guide, resigned the seals, and lord Temple also gave up the post which he held in the administration. His majesty, sensible of the distinguished merit of this minister, made him an offer of any rewards in the power of the crown to bestow, and was pleased to settle a pension of 3000. a year upon Mr. Pitt for three lives, and a title was bestowed upon his lady and her issue. These advantages and honours had unquestionably been well deserved by his public services, but his acceptance of them greatly lessened his popularity, and many arts were employed to produce that effect. There prevailed in the nation a very considerable degree of discontent, on account of his removal from power; and it was extremely natural that the people should behold, with the utmost regret, the removal of a minister from the direction of public affairs, of whose abilities and integrity they had the highest opinion, and in the midst of a war which he had conducted with so much honour to himself and to his country, and in a manner which had excited the astonishment of Europe; and indeed it must be confessed, there was, in all his designs, a magnitude, and even a vastness, which was not easily comprehended by every mind, and which nothing but success could demonstrate to be reasonable.

On the resignation of Mr. Pitt, the earl of Egremont was made secretary of state, and the duke of Newcastle placed at the head of the treasury. The war, however, still continued to be carried on with vigour, and the plans were pursued that he had previously concerted. Accordingly, war was declared against Spain on the 4th of January 1762. The vitals of the Spanish monarchy were struck at by the reduction of the Havannah, the strongest and most important fort which his catholic majesty held in the West-Indies, after a siege of two months and eight days. About the same time the Hermione, a large Spanish register ship, valued at a million sterling, was taken by three English frigates, and carried into Gibraltar. This was followed by the reduction of Manila and the Philippic islands in the East-Indies, under general Draper and admiral Cornish, with the capture of the Trinidad, reckoned worth 3,000,000 of dollars.

These were dreadful shocks to the new alliance between France and Spain, and convinced both pow-
ers,

ers, that unless some methods could be taken to balance these advantages, a peace on any terms must be concluded. Accordingly they opened their last resource, which was an invasion of Portugal, on the most frivolous pretences. As this kingdom had for a long time been under the peculiar protection of the British arms, there was a necessity for our defending it. This greatly embarrassed the British ministry; but the forces sent to that kingdom found no difficulty in repelling the troops sent against it by the enemy. The only acquisition France made during this year was that of Newfoundland; which was soon recovered by general Amherst's forces, who made the French governor and the garrison prisoners of war.

About this time the negotiations for peace were resumed; and the enemy at last offered such terms as the British ministry thought admissible. The defection of the Russians from the confederacy against the king of Prussia, and his consequent successes, produced a cessation of arms in Germany, and in all other quarters; and on the 10th of February 1763, the definitive treaty of peace between his Britannic majesty, the king of France, and the king of Spain, was concluded at Paris, and acceded to by the king of Portugal, the ratifications were exchanged on the 10th of March at Paris; and the treaty having on the 18th been laid before the parliament, and received the approbation of a majority of both houses, the peace was solemnly proclaimed at Westminster and London on the twenty-second of the same month.

By this treaty, the extensive province of Canada, with the valuable islands of Newfoundland, Cape-Breton, and St. John, were confirmed to Great-Britain, together with the two Floridas, and the whole continent of North-America, on the north side of the Mississippi, except the town of New Orleans, and a small district round it. The islands of Grenada and the Grenadillas were also ceded to the English; and the French and Spaniards quitted their pretensions to the neutral islands of St. Vincent, Dominica, and Tobago. The settlement of Senegal on the coast of Africa was also ceded by the French. On the other hand, the Havannah was restored to Spain. The islands of Desirade, Martinique, Guadeloupe, and Mariegalante, were restored to France. The English gave up their claim to the neutral island of St. Lucia, granted the French the small islands of St. Pierre and Miquelon, on the coast of Newfoundland, and returned the island of Goree, on the coast of Africa. The article relating to the East-India company, and by it the French were put into possession of all the places they enjoyed before the war, on condition that they erected no forts, nor kept any forces in the province of Bengal. The city of Manilla was also restored to the Spaniards; and they consented that the English should enjoy the liberty of cutting logwood in the bay of Honduras, in America. The French restored the island of Minorca, and the English

that of Belleisle. At the same time it was mutually agreed, that a reciprocal restitution and oblivion should take place with regard to Germany, and the various places that had been taken during the war, should revert to their proper sovereigns, or those who possessed them before the troubles began. The same conduct was observed between the courts of Portugal, Spain, and France, every thing being placed upon the same footing as before the war.

Though the peace received the sanction of a majority of both houses of parliament, it was far from giving universal satisfaction to the people. The manner in which it was begun, and the precipitation with which it was concluded were condemned. The terms also were censured by many, as extremely inadequate to what might justly have been expected from the numerous victories and advantages which had been obtained against the enemy; and from this period various causes contributed to occasion a spirit of discontent throughout the nation.

On April 30, 1763, Mr. Wilkes's person and papers were seized by the king's messengers, on account of his being the author of the North-Briton, a periodical paper, which severely arraigned the conduct of administration, and represented the earl of Bute as the king's favourite, and the person from whom measures of government of a very pernicious tendency originated. The forty-fifth number contained strictures on the king's speech. He was forcibly carried before the secretaries of state, by whom he was examined, and afterwards committed close prisoner to the Tower, though he had objected to the warrant, as illegal, his name not being mentioned in it. He was prosecuted in the court of King's-Bench, for being the author of Number Forty-Five, which was also voted by parliament to be a false, scandalous, and seditious libel, and ordered to be burnt by the common hangman, the execution of which order met with great opposition from the populace, who wounded Mr. Harley, one of the sheriffs, and obliged him to take shelter in the Mansion-House. Mr. Wilkes was also prosecuted for causing to be printed an obscene and profane poem, called "An Essay on Woman," though only twelve copies of this piece had been printed, and it did not appear intended for publication. He was soon after expelled the house; and towards the end of the year 1764 he was outlawed.

Paul Bute in the mean time resigned his office, and was succeeded by Mr. George Grenville, who framed and caused to be passed the STAMP-ACT, which was productive of the most pernicious consequences to Great-Britain, by laying the foundation of a fatal and ruinous war. The alarm in England, on hearing of the commotions in America, which this offensive act occasioned, was so great, that the king thought proper to dismiss his ministers; and the marquis of Rockingham and his friends were appointed to the administration. In March 1766 the American stamp-act was repealed,

repeated, but at the same time another act was passed for securing the dependence of the American colonies on Great-Britain. On July 30, 1766, the ministry was again changed, the duke of Grafton being appointed lord-treasurer in the room of the marquis of Rockingham; and Mr Pitt, since created earl of Chatham, was made lord privy-seal.

Mr. Wilkes, who had for a considerable time resided in France, in order to escape the fury of his persecutions, came over to England in 1768. The parliament having been lately dissolved, he offered himself a candidate for London, but lost his election; he afterwards offered himself for the county of Middlesex, and was elected by a great majority on March 28. In May following he surrendered himself up, and was committed to the prison of the King's-Bench: on which account great disorders ensued; and one William Allen, a youth, being singled out, was pursued by the soldiers, and shot near his father's house in a manner which the occasion could in no respect justify. This affair made a great noise; and the odium of the transaction was rather increased than lessened by the pains the ministry took to suppress and vindicate the military. On the eighth of June Mr. Wilkes's outlawry was reversed; and on the eighteenth of the same month he was sentenced to pay a fine of 500l. and be imprisoned ten months, for re-publishing the North-Briton, Number Forty-five, and also to pay a fine of 500l. and be imprisoned twelve months, to be computed from the expiration of the term of his former imprisonment, for publishing the Essay on Woman. He complained to the house, by petition, of the injustice and illegality of the proceedings against him; but his complaints were voted frivolous and groundless. He was also again expelled, for being the author of some prefatory remarks on a letter he published, written by one of the secretaries of state, respecting the military being employed in St. George's-Fields.

Mr. Wilkes's popularity increased still more by the rigour of his persecutions, and the spirit and firmness he displayed throughout. He had been chosen alderman of London before his expulsion; and on February 16, 1769, he was without opposition re-elected member for Middlesex. The house declared his election void, by reason of his expulsion; he was, however, immediately re-elected by the freeholders, and the election again declared void by parliament. A new election being ordered, colonel Luttrell, in order to recommend himself to the court, vacated his seat, and became a candidate for Middlesex, in opposition to Mr. Wilkes. The latter, however, notwithstanding the whole weight of court-interest was against him, obtained a majority of near four to one, Wilkes having 1143, and Luttrell only 296 votes. The House of Commons, however, two days afterwards, resolved that Mr. Luttrell ought to have been chosen, and ordered the return to be amended, by erasing the name of Mr. Wilkes, and inserting that of Mr. Luttrell in its place. These pro-

ceedings excited a general discontent, and loud complaints were every-where made against them, as the rights of election were thought to be thereby grossly violated; petitions were, therefore, in very strong terms, presented to the throne, from different parts, complaining of this and other national grievances, in which the county of Middlesex, as the most immediately affected, took the lead.

In 1771 the term of Mr. Wilkes's imprisonment was expired; he was then chosen one of the sheriffs for London and Middlesex. The same year several printers were ordered to attend the house, being accused with inserting in their papers the parliamentary debates. One of them, who was apprehended in his own house by the messenger, refused to attend the summons, and caused the messenger to be carried by a constable to the Mansion-House, where the aldermen Wilkes and Oliver then were. The deputy-serjeant at arms, being also present, demanded, in the name of the speaker, that both the messenger and the printer should be delivered up to him. He was told, that the warrant, not being backed by a city magistrate, was invalid. The printer was therefore discharged; the messenger not having sufficient bail, a warrant was made out for his commitment to prison; and the serjeant's bail was accepted. The issue of this affair was, the lord-mayor Crosby, and alderman Cliver, both members of parliament, were a few days after committed to the Tower, by the authority of the house.

After these transactions, all future contest with Mr. Wilkes was studiously avoided. That gentleman was afterwards again chosen member for the county of Middlesex, in the subsequent parliament, and permitted quietly to take his seat there; in the year 1775 he executed the office of lord-mayor of the city of London, and hath since been elected to the lucrative office of chamberlain of that city. In the year 1783, after the change of lord North's administration, on Mr. Wilkes's motions, all the declarations, orders, and resolutions of the House of Commons, respecting his election for the county of Middlesex, were ordered to be expunged from the journals of that house, "as being subversive of the rights of the whole body of electors of this kingdom." It may be proper to mention here, that in consequence of Mr. Wilkes's manly and spirited contests with the government, general warrants were declared to be illegal, and an end was put to such warrants, and to the unlawful seizure, by state-messengers, of an Englishman's papers in his own house.

As the most material transactions respecting this country are involved in the late unhappy contest between England and America, we shall therefore close our history with an account of the rise and progress of the war between Great-Britain and her colonies, and the most remarkable military events during the course of it.

The unhappy divisions which had for several years subsisted between Great-Britain and the American colonies (exclusive of some disagreeable previous restrictions)

commenced on account of that unpopular act of the British legislature passed in 1765, "for laying a stamp-duty on the British colonies in America." The first commotions were in the province of Massachusetts-Bay, and more particularly at Boston, where the commissioners for enforcing the revenue acts, and collecting the monies arising therefrom, were badly received, and narrowly escaped with their lives. All persons, directly or indirectly, belonging to government, were looked upon with a suspicious eye; the cool and dispassionate were silent, and the commonalty declared they would not be taxed by the British parliament without their own consent, that is, without actual representation. Some of the commissioners were compelled, upon oath, to renounce at that time, and for ever, all concern with these taxes. The tax-gatherers were tarred and feathered; the ships, which carried over the stamps, were threatened with conflagration, unless they delivered up the exceptionable parts of their cargoes to be committed to the flames; and, in fine, anarchy succeeded amity, and mutual enmity usurped the place of reciprocal concord. The inhabitants of Boston, and some other parts of New-England, at length came to a determination, not to make use of any articles of British manufacture; and about the beginning of February 1768, the house of representatives gave their sanction to this resolution.

The most acrimonious disputes now took place between many of the inhabitants of New-England in general; most of the people of Boston in particular on the one part, and governor Barnard, with the loyalists, on the other. Aggravating things were said, ill-natured actions done, and libels were published by both parties. Thus a war of sentiments commenced before real hostilities; the obsolete terms of Whig and Tory were revived, and the souls of each faction were in arms, previous to any mutual exertions of their animosity.

In the middle of June 1768, the captain of a shallop waiting to run some wine, and ill-using the tide-waiter, the vessel was seized, and for better security put alongside of the Romney man of war. This occasioned a riot, when the comptroller and collector of the customs took refuge on board the said man of war. Government, however, in order to conciliate matters as much as possible, repealed the stamp-act; but still the Americans were dissatisfied, for they insisted, that though the act itself was repealed, yet the spirit of it remained, while a revenue was demanded from the colonies; besides which, other laws had been passed in England, one relative to quartering troops in the colonies, and another for suspending the legislative powers of New-York, which gave the Americans great umbrage. Unlawful meetings were continual; riots were frequent, and interested persons fomented the disputes. About the same time the governor directed the house of representatives at Boston to rescind a resolution concerning a circular letter to some of the other governments;

but they refusing, he dissolved the assembly on the third of August following.

It was at length determined to coerce the Americans, and a body of troops arrived there for that purpose, from Halifax, September 30, 1768, escorted by some ships of war. But the riotous proceedings of the Bostonians increasing, more troops were ordered to Boston, and a variety of altercations took place, not only between the governor and the people, but between General Gage and the latter.

In the beginning of the year 1769 many persons in the colony of New-York thought proper to adopt the sentiments of the Bostonians, and to engage in the political squabbles which were daily heightening in New-England. Other colonies soon after acceded to the combination, and in particular to the resolutions for the non-importation of the British manufactures, and East-India goods; and thus the fire of dissension increased with great rapidity, and the flame of discord blazed through the greatest part of the North-American continent.

The inhabitants of Boston now summed up a variety of grievances; among which complaints were these, "That the civil power was disregarded, and centinels placed in various parts of the town. That the negroes had been united to take away their masters' lives and property, and to repair to the army for protection. That some of the soldiers had attacked the magistrates of the town. That many soldiers had been repeatedly rescued from the peace-officers. That many persons had been wounded by the military; and that on the 5th of March 1770, eleven persons were either killed, or dangerously wounded."

These charges were either denied, or palliated by the other party, by the plea of the military being compelled to act as they did, and to defend themselves; and at the same time accusations, equally atrocious, were brought against the people of New-England. Some persons were tried for the murders, but none executed. Sir Francis Barnard having returned to England, the animosities and disputes still continued between the people and lieutenant-governor Hutchinson, who remained in his room.

Affairs thus remained, when about the middle of December 1773, some ships laden with tea, being at Boston (as a duty was to be paid) the people would not suffer it to be landed. The ships being refused a clearance by the governor, unless the cargoes were landed, and properly disposed of, a mob, dressed like Mohawk Indians, entered the three ships, which contained the tea, and were commanded by the captains Hall, Bruce, and Coffin, and emptied their cargoes, consisting of 342 chests of tea, into the water. This and other outrages occasioned the Boston-Port Bill, passed April 4, 1774, by which the town of Boston was proscribed and blocked up.

The people of New-England now began to form themselves into companies, practise the military arts, enter

assembly on the third

to coerce the American colonies there for that purpose, 1768, enforced by the proceedings of the courts were ordered to take place, not to the people, but between

1769 many persons insisted proper to adopt the resolution to engage in the non-importation in New-England after acceded to the resolutions for the non-importation of British manufactures, and the fire of dissension in the flame of discord of the North-American

summed up a variety of complaints were there regarded, and centinels down. That the negroes their masters' lives and property for protection. That of the magistrates had been repeatedly refused many persons had been killed, or dangerously

denied, or palliated by the military being compelled to defend themselves; and equally atrocious, were New-England. Some persons, but none executed, returned to England, the continued between the Hutchinson, who re-

about the middle of the ships being refused to leave the cargoes were, a mob, dressed like three ships, which commanded by the captains emptied their cargoes into the water. This the Boston-Port Bill, the town of Boston was

now began to form themselves into the military arts, enter

into solemn leagues and covenants, &c. Several other colonies followed the example, provincial assemblies were held, and a general congress established, to which deputies from the several provinces were invited.

After many bickerings and animosities between the patriots and provincials, and the martial parade of the latter, the next material transaction was the seizure of Fort-William and Mary, near Portsmouth, in New-Hampshire, by the provincial militia, in which they found 106 barrels of gunpowder, several cannons, shot, small arms, &c.

General Gage being informed that a great quantity of military stores were in the possession of the provincial troops, at the town of Concord, sent a detachment of troops, under the command of lieutenant-colonel Smith, and major Pitcairn, supported by another body, commanded by lord Percy, in order to seize or destroy them. This service was effectually performed, after some skirmishes; but on April 19, 1775, the troops were attacked at Lexington, on their return towards Boston, the provincials firing from behind stone-walls, hedges, bushes, &c. The loss of the king's troops on this occasion amounted to sixty-five killed, 170 wounded, and about twenty prisoners. The Americans were computed not to have lost more than sixty, including killed and wounded.

The provincials now invested the town of Boston; and the people of New-York, hearing of the action at Lexington, and the affair of Concord, rose in a tumultuous manner, entered the town-house, seized a great many stands of arms, appropriated to their own use the cargoes of two ships laden with military stores for general Gage, and then marched to the assistance of the Bostonians. They also not only continued to block up the town of Boston, but began to raise batteries on the heights of the peninsula of Charles-Town, in order to cannonade his majesty's troops. This brought on the action of Bunker's-Hill; for on the 17th of June 1775, a considerable body of troops, under the command of major-general Howe and brigadier-general Pigot, were sent to dislodge the provincials. This body of forces, with a proportionable quantity of artillery, made good their landing near Bunker's-Hill, under the protection of the ships of war, armed vessels, floating batteries, &c. and being soon after reinforced by another detachment, a desperate action commenced; in which the British troops were victorious, the provincial lines being forced, and themselves compelled to retreat, leaving behind several pieces of cannon and other military stores. The loss of the provincials in killed and wounded was very great; of the British troops, according to the return of general Gage, 226 were killed, and 113 were wounded, some of the latter dying soon after; and more than a proportional number of officers being included in both lists.

In the night of the twenty-third of August 1775, the cannon at New-York were seized upon, by order of Congress, though the Asia man of war, which lay

in the harbour, tried to prevent it, by cannonading the town. At the same time general Carleton was indefatigable, in putting the province of Canada into a proper state of defence; and the earl of Dunmore, governor of Virginia, having thought proper to take refuge on board a ship of war, harassed the coast, and made frequent descents upon the last-mentioned province, laying waste the country, carrying off or spiking up a great number of cannons, destroying vast quantities of military stores, belonging to the provincials, &c. &c. But on the other side, Fort St. John surrendered to the provincial forces, on the third of November 1775, and the garrison became prisoners.

On the eighteenth of November 1775, the regulars and provincials had a hot engagement, near Savannah in Georgia, in which the latter were defeated; and on the thirty-first of December, in the same year, the provincial general Montgomery, who had for some time laid siege to the city of Quebec, attempted to take it by storm. In this attempt, however, he was defeated and slain, with several of his officers, and about sixty private men, and 300 were taken prisoners. On January the fourth 1776, some ships of war destroyed the town of Norfolk in Virginia. While this dreadful havoc was going forward in America, several attempts were made in the British parliament by the duke of Richmond, Mr. Burke, Mr. Hartley, Mr. Wilkes, and others, to adopt some measures for bringing about a reconciliation; but no schemes for that purpose obtained the countenance of the government; and it was still hoped by the court and ministry, that the Americans might be subjugated by force. With this view, large bodies of Hessian troops were taken into the pay of Great-Britain, and the war continued to be carried on against the Americans with great ardour.

General Gage having been recalled, general Howe, who succeeded in the command, thought proper to evacuate the town of Boston, which he effected on the seventeenth of March 1776, and made good his landing, and capture of New-York. In June 1776, a battle was fought in Canada, between the regulars, under general Carleton, and the provincials, at a place called Three Rivers, when the latter were defeated, many of them being killed and wounded, and about 200 taken prisoners. In June 1776, an attempt was made on Charles-Town, South-Carolina, by Sir Peter Parker, at the head of a fleet of ships of war, and general Clinton, with a body of land forces; but it failed of success; and on the fourth of July following, the Congress declared the colonies "Free and Independent States."

After the king's troops were in possession of New-York, many skirmishes happened between them and the provincials, but nothing decisive, till October 1776, when the latter were defeated, in an action, which, from the place where it was fought, was termed the battle of the White Plains.

In the dispatches from general Howe, dated Nov. 30,

1776.

1776, besides an account of a variety of skirmishes, we are informed of the taking of Fort-Washington, and Fort-Lee, by the British forces, together with a great variety of military stores, and many prisoners. In December 1776, Rhode-Island was taken by general Clinton; about the same time lord Cornwallis took possession of East-Jersey, and general Lee was taken prisoner by a patrol, consisting of thirty British dragoons, commanded by lieutenant-colonel (since lord) Harcourt. Had general Howe pushed on at this time to Philadelphia after Washington, it hath been maintained there would have been an end of the contest, as this appeared to be the crisis of American danger; but Providence, directed it otherwise, and the general's orders from home are said to have prevented him. This gave way for volunteer reinforcements of gentleman, merchant, farmer, tradesman, and labourer, to join general Washington, who, in the night of the twenty-fifth of December, amidst snow, storms, and ice, with a small detachment, crossed the Delaware, and surprised a brigade of the Hessian troops at Trenton; he took upwards of 900 of them prisoners, with whom he repassed the river, having also taken three standards, six pieces of brass cannon, and near 1000 stand of arms.

Several skirmishes happened in the beginning of the year 1777, in the Jerseys, with various success. On the twenty-third and twenty-fourth of March, a great quantity of provisions, stores, &c. with barracks, store-houses, &c. belonging to the provincials, were destroyed by the king's troops at Peck's-Hill, upon the North River. The cruizers belonging to lord Howe, and commodore Hotham's fleet, continued to take many prizes. In Connecticut, on the twenty-seventh of April 1777, the king's troops destroyed a great quantity of stores at Danbury.

General Burgoyne, with the northern army, proceeded to Ticonderago, and Fort Independence, which he took possession of July 6, 1777, and found in them great quantities of stores and provisions, besides what he destroyed of both at Skeneborough; soon after, he took possession of Fort-Edward, which the provincials abandoned, and then proceeded to Saratoga, where they were strongly posted.

On the eleventh of September 1777, the troops, under the command of general Howe, had an engagement with the provincials on the heights of Brandywine, in which many were killed and wounded on both sides; 400 provincials were taken prisoners; but though the latter were defeated, and the action at first seemed of an indecisive nature, yet it occasioned Philadelphia to fall into the hands of the British troops. While general Howe was thus employed, an unsuccessful attack was made by the provincials on Staten-Island, for they were repulsed; and much about the same time general Clinton stormed and took Fort-Clinton and Fort-Montgomery.

On the sixteenth of October 1777, the provincials,

under the command of general Gates, having surrounded general Burgoyne's army at Saratoga, the latter thought proper to enter into articles of capitulation, by which himself and his troops, after laying down their arms, were to have a free passage to Great-Britain; but the congress, under various specious pretences, did not ratify the stipulation, but detained the men at Boston; and general Burgoyne came to England on his parole of honour.

In the latter end of the year 1777, several surts were taken by the troops and shipping, and many skirmishes happened on the banks of the Delaware, in order to keep up the communication with the army at Philadelphia. The provincials likewise evacuated their entrenchments at Red Bank. The French court seems to have thought this a favourable opportunity for lessening the power of Great-Britain; the Americans, during some part of the war, received considerable supplies of arms and ammunition from France. Some French officers entered into the American service; and on the sixth of February 1778, a treaty of alliance was concluded at Paris between the French king and the Thirteen United Colonies. The conduct of France towards Great-Britain occasioned hostilities to be commenced between the two nations, in which Spain afterwards took an active part against the English.

On the seventeenth of June 1778, the *Licorne* and *La Belle Poule*, two French frigates, were taken by admiral Keppel; and on the twenty-seventh of July, a battle was fought off Brest between the English and French fleets; the former, consisting of thirty capital ships, and the latter of thirty-two; of the English, 133 were killed in the action, and 373 wounded; the loss of the French is supposed to have been very great.

By a letter from general Howe, dated Philadelphia, May 11, 1778; that commander signified his intention to return to England, and to delegate the command of the British troops to general Clinton; he likewise informed the ministry of the ravages made by the British troops in the neighbourhood of Philadelphia, and of their having seized or destroyed great quantities of military stores, provisions, vessels, &c.

On the eighteenth of June, general Clinton (Sir William Howe having previously departed for England) pursuant to the instructions received from government, evacuated Philadelphia. He was attacked on his march by the provincials, whose principal object appeared to be the gaining possession of the British baggage; but in this they were disappointed, and every where repulsed, by means of the judicious manner in which general Clinton had disposed his troops. This failure occasioned a dispute between the provincial generals Washington and Lee, the termination of which we are unacquainted with.

The earl of Carlisle, Mr. Eden, and governor Johnstone, having been sent as commissioners from Great-Britain, to treat of a pacification with America, did not meet with that success which every true lover

of both countries earlier period were now regarded as the United-States, and speedily terminated in America, or this fleet, attempted in the Island; but had succeeded, it would have been a meeting with and finding the approaching the Island, and ever, competing being separated great difficulties.

of both countries wish for. The terms, which at an earlier period would have been accepted with gratitude, were now rejected with disdain; nor would the Congress enter into any treaty, unless the independency of the United-States of America was previously acknowledged, and the British forces withdrawn. Perhaps the speedy termination of this destructive war was in some measure impeded by the arrival of a French fleet in America, under the command of the Count d'Estaing. This fleet, in concert with an army of provincials, attempted in September 1779 the reduction of Rhode-Island; but the British troops behaved so well on the land side, that the provincials were repulsed, and compelled to retreat; at the same time the French fleet meeting with a warmer reception than they expected, and finding that lord Howe, with his fleet, was approaching them, quitted their design upon Rhode-Island, and attempted to escape. Lord Howe, however, compelled them to engage; but the two fleets being separated by a storm, the French squadron, with great difficulty, got into Boston in a very shattered condition.

At the close of the year 1779, several French ships of war and merchant ships were taken in the West-Indies, by a fleet commanded by Sir Hyde Parker. And Spain being brought, by the intrigues of the French court, to engage in the war against England; Sir G. B. Rodney, on the 8th of January 1780, captured seven Spanish ships and vessels of war belonging to the royal company of Caraccas, with a number of trading vessels under their convoy: he soon after engaged a Spanish fleet consisting of eleven ships of the line, and two frigates under Don Juan de Langara; of which four of the largest were taken, two driven on shore, and one of seventy guns blown up. But, to counterbalance this loss, the combined fleets of France and Spain, on the 8th of August, took five English East-Indiamen, and fifty merchant ships bound for the West-Indies, and carried them into Cadiz. But to return to America:

Sir Henry Clinton, on the 4th of May 1780, made himself master of Charles-Town, South Carolina; and on the 6th of August, earl Cornwallis obtained a very signal victory over general Gates in that province: but on the 10th of July the French landed 6000 men, commanded by the Count de Rochambeau, at Rhode-Island. Soon after this, major-general Arnold deserted the service of the Congress, and was made a brigadier-general in the royal service at New-York. This officer had concerted a scheme, with general Clinton, for delivering up to him his troops, and the post he commanded; which if it had taken place, the destruction of the whole American disciplined force, most of their best officers, with a loss of artillery, magazines and stores, must have been the immediate consequence. But the whole of this dangerous plot was detected by the capture of Major André, in the American lines, on his return to New-York, for which

he suffered death, though the Americans would have exchanged him for general Arnold. The fate of this young officer was much regretted by all persons on account of his many able qualities, which rendered him universally beloved and esteemed: he was only twenty-seven years old when he died; and though he had served but eight years, his merit promised to raise him soon to the highest honours. Besides his military talents, he was remarkable for a well-cultivated genius, which began to display itself in several fugitive pieces of his composition.

This year (1780) teemed with disturbances at home of a very singular nature, which originated from an aversion to some indulgences lately granted by parliament to the Papists, by a relaxation of the penal laws. Hereupon an association was formed, at the head of which was lord George Gordon; and a petition was prepared, said to be subscribed by more than 100,000 persons, to be presented to the house, complaining of the repeal of those laws. Lord George undertook to carry the petition; and accordingly gave the members of the Association public notice to meet him on Friday, June 2, in St. George's Fields, where near 40,000 people met his lordship, whom they accompanied, in martial parade, with blue cockades in their hats, to the house. The petition being postponed by the House of Commons till another day, irritated the profligate and abandoned part of the multitude to such a degree, that, dividing themselves into parties, in the course of the day several members of parliament were grossly insulted and ill-treated by the rabble; and in the evening, the Romish chapel in Lincoln's-Inn-Fields, and another in Warwick-Street, Golden-Square, were entirely demolished. On Sunday they destroyed a Popish chapel in Ropemaker's-Alley, Moorfields. On Monday they demolished a school and three dwelling-houses in the same place, belonging to the Romish Priests, with a valuable library of books, and a Mass-House in Virginia-Street, Ratcliffe-Highway; they also destroyed all the household furniture of Sir George Savile. On Tuesday evening they made a most daring and violent attempt to force open the gates of Newgate, in order to release the five rioters who had been confined there; and the keeper refusing to deliver up the keys, they set fire to his house, after burning his furniture in the street; soon after this, the prison was in flames: and great part of it consumed, by which means upwards of 300 prisoners escaped, many of whom joined the mob. The same night another party set fire to the house of lord Mansfield in Bloomsbury-Square, which was entirely consumed, together with a collection of pictures of great value, and many of the scarcest manuscripts in the possession of any private person in the world; besides all his lordship's notes on great law cases and the constitution of England, which was an irreparable loss to the public: the house of Sir John Fielding, that of Justice Cox, and several other private houses, were also destroyed about this time, be-

sides two other prisons. On Wednesday they destroyed by fire the King's-Bench and Fleet prisons. Two houses, one at the bottom of Holborn, and the other near the Bars, belonging to Mr. Langdale, an eminent distiller, were set fire to and consumed, as were the dwellings of many other persons professing the Roman Catholic faith; and, in short, every part of the metropolis exhibited violence and disorder, tumults and conflagrations. The rioters even made two attacks upon the Bank, and one upon the Pay-Office, but were repulsed by the soldiery, who were now through extreme necessity introduced into the city, and by whom many persons were on this occasion killed and wounded: three men were also shot dead upon Black-Friars-Bridge; the toll-houses of which were destroyed.

Upwards of 130 of these people were tried for these outrages in London and Southwark, many found guilty, but only twenty-seven of the principal actors were executed. Lord George Gordon, having been taken into custody, and committed to the Tower, as the instigator of these disturbances, was on the 5th of February 1781 tried in the Court of King's-Bench at Westminster for high-treason, and acquitted. If a timely exertion of authority and force had been made in the city during these extraordinary scenes, no doubt can be made that great part of the mischiefs which were afterwards perpetrated by a lawless banditti might have been prevented; but it is to be lamented, that for several days there was a most shameful inactivity in the Lord-Mayor of London, and in most of the other Magistrates of the metropolis, and its neighbourhood; and even the militia appeared to be panic-struck, and to be only attentive to the preservation of their houses, and of the royal palace. On the 20th of December following these internal commotions, a declaration of hostilities was published against Holland: this, in the present circumstances, was deemed a very rash, precipitate, and impolitic step. On the 3d of February 1781, admiral Rodney and general Vaughan seized on the island of St. Eustatia, belonging to the Dutch, and took possession of all the private property, goods, merchandise, and specie of the inhabitants, as well as the public and military stores, shipping, &c. The islands of St. Martin and Saba also surrendered; but the seizure of the private property at St. Eustatia was thought a very rigorous and shameful measure; altogether unprecedented among civilized nations, and disgraceful to the British name. On the 5th of August the same year a very bloody engagement was fought off the Dogger-Bank between the English and Dutch fleets, the former consisting of eight, and the latter of seven ships. Both squadrons claimed the victory. The English had 104 men killed, and 339 wounded; and the loss of the Dutch is supposed to have been much greater: a Dutch seventy-four gun ship sunk after the action. On the 27th of November the same year, Mr. Bouillé, the French Admiral, retook Eustatia with a small force.

While the war was carrying on at home with various success, the French made themselves masters of the island of Tobago; and the Spaniards of Pensacola, and the whole province of West Florida. On Monday 23 1781, earl Cornwallis obtained a victory (as it was called) over general Green's army at Guilford in North Carolina; but it was a hard fought battle, and the loss on both sides considerable. Some ravages were also committed in Virginia by the generals Phillips and Arnold, who destroyed much shipping, and about 8,000 hogheads of tobacco. None of these events at that time promised any speedy termination of the war; but next year the decisive blow was struck, which firmly established American Independence.

The army of lord Cornwallis now amounted to above 7000, all excellent troops; but such was their plundering and desolations on their route, and the order of the Americans, that his situation became at length very critical. Sir Henry Clinton was prevented from sending those succours to him which he otherwise would have done by his fears for New-York, against which he apprehended Washington meditated a formidable attack. This American general, by causing some letters to be intercepted, confirmed Sir Henry Clinton in his opinion, who, by being continually amused and deceived, was prevented from giving any assistance to lord Cornwallis, and also from forming any suspicion of the real designs of the enemy. At length, the English general receiving information that the Count de Grasse was expected every moment in the Chesapeake, with a large fleet to co-operate with Washington, now seriously attempted to reinforce lord Cornwallis, but without success. Presently the most effectual measures were adopted by general Washington for surrounding lord Cornwallis's army; and on the 30th of September it was closely invested in York-Town, and at Gloucester on the opposite side of the river, with a considerable body of troops on one side, and a large naval force on the other. The intrenchments were opened in two attacks above and below York-River, in the night between the 6th and 7th of October, with a considerable train of artillery. The works which had been raised by the English sunk under the weight of the enemies' batteries; the troops were much diminished by the sword and sickness, and greatly enfeebled by constant watching and fatigue; when all hope of relief failing, lord Cornwallis, on the 19th of October, surrendered himself and his whole army, by capitulation, to general Washington, prisoners of war. There were found in the ports of York and Gloucester 6000 regular troops, twenty-two pair of colours, 1500 seamen, 150 pieces of cannon of different calibres, of which seventy-five were brass, and eight mortars; about forty ships, one of them of fifty guns, which was burnt. Twenty transports were sunk, in which number was the Guadalupe frigate of twenty-four guns. The American return made the number of prisoners 7247, land and marine.

The

The capture of this army was too heavy a blow to
 be soon or easily recovered; it threw a gloom over the
 whole court and cabinet at home, and put a total
 period to the hopes of those who had flattered them-
 selves with the subjugation of the colonies by arms. The
 surrender of this second British army may be considered
 as the closing scene of the continental war in America:
 The immense expence of carrying it on so distant
 from the seat of preparations and power; the great
 accumulation of public debt it had brought upon the
 nation; the plentiful effusion of human blood it had
 occasioned; the diminution of trade, and the vast in-
 crease of taxes, were evils of such a magnitude, arising
 from this ever-to-be-lamented contest, as could scarcely
 be overlooked even by the most insensible and stupid.
 Our repeated disgraces and losses obliged the ministers
 to walk in a more moderate strain; and the parliament,
 on the 1st of March 1782, requested the king, in an
 address, to put a stop to any further prosecution of so
 offensive a war against the American colonies. In con-
 sequence of this application to the throne, with other
 concurrent causes, a complete revolution in the cabinet
 was effected March 27, 1782, under the auspices of
 the marquis of Rockingham, who was appointed first
 lord of the treasury; lord Shelburne and the Honour-
 able Charles Fox, secretaries of state; lord Camden,
 president of the council; lord Cavendish, chancellor
 of the Exchequer; admiral Keppel, first lord of the
 admiralty; and the duke of Richmond, master-general
 of the ordnance, &c.

Measures were immediately taken by the new minist-
 ry for effectuating a general peace; and Mr. Grenville
 was accordingly invested with full powers to treat at
 Paris with all the powers at war, and directed to pro-
 pose the independency of the Thirteen United Pro-
 vinces in America in the first instance. The new
 ministers also applied themselves to make some re-
 trenchment in the public expences, and to reform some
 of the various abuses they had complained of. A series
 of losses however still continued to agitate the minds of
 the people, so that peace became every day more de-
 sirable to the nation. January 18, 1782, the French
 took Nevis; on the 5th of February, the island of
 Minorca surrendered to the Spaniards: and on the 13th
 of the same month, the island of St. Christopher's was
 given up to the French. On the 12th of April a most
 obstinate engagement happened between the English
 fleet under admiral Rodney, and that of the French
 under the Count de Grasse, in their way to join the
 Spanish fleet at St. Domingo. The battle lasted with
 unremitting fury from seven o'clock in the morning
 till half past six in the evening, when victory declared
 in favour of the British flag. The Ville de Paris, of
 110 guns (a present from the city of Paris to the
 French king) commanded by Count de Grasse, with
 four others of the line, were captured, and another of
 the line sunk in the action. The Caesar, one of those
 taken, was blown up, and the whole crew, among

whom were fifty English seamen, perished. A few
 days after, two more of the same fleet, of sixty-four
 guns each, were taken by Sir Samuel Hood's Squadron.
 By this victory, the enemy's design against Jamaica was
 frustrated, and admiral Rodney's reputation and inter-
 est were greatly promoted: he received the public
 thanks of the British senate, and was further honoured
 by being created a peer of the realm. This glorious
 victory cost the English many brave officers and seamen,
 230 having been killed, and 759 wounded. Unhappily,
 the Ville de Paris, and most of the other ships taken
 by admiral Rodney, besides two of our own ships of
 the line, were lost at sea before they could reach
 England.

After this, the military operations were few and of
 little consequence. Negapatnam, a settlement in the
 East-Indies, and Trincomale, in the island of Ceylon,
 were taken from the Dutch by the British forces; but
 the French soon after receiving considerable succours
 from Europe, took Cuddalore, retook Trincomale,
 forced the British fleet in several actions, but none
 decisive, and enabled Hyder Ally to withstand with
 various success all the efforts of Sir Eyre Coote and
 his troops. On the 8th of May, the Bahama islands
 surrendered to the Spaniards. But the credit of the
 British arms was well sustained at Gibraltar, under
 general Elliot, the governor, and captain Curtis, who
 defeated the combined efforts of France and Spain. On
 the 13th of September at ten in the morning, the ten
 battering ships, or gun-boats, commanded by admiral
 Moseno, were stationed as near the fortrefs as possible,
 covered by the combined fleet. All things being ready,
 a general attack began, and the heavy pieces from the
 gun-boats were discharged with great rapidity. But
 the design of this grand project (on which their hopes
 of success principally depended) was soon rendered
 abortive. The brave general Elliot had caused furnaces
 to be made, in which having heated the balls till they
 were red hot, they were in that state fired against the
 enemy. This produced the total destruction of the
 floating batteries, and most of the assailants in them;
 for the balls entering their sides, set them on fire, and
 the whole blew up one after another, except three, which
 were burnt to the water's edge. Thus was this grand
 scheme totally frustrated by the distinguished courage
 and military prowess of the British commanders. The
 battering ships burnt before Gibraltar, carried 212 brass
 cannon, &c. the proportion of men on board them was
 thirty-six for each of the guns in use, exclusive of
 officers, and marines for working the ships. The gar-
 rison was in the month of October relieved by lord
 Howe, who offered battle to the combined force of
 France and Spain, though twelve sail of the line
 inferior.

On the death of the marquis of Rockingham, which
 happened on the first of July 1782, lord Shelburne was,
 without the knowledge of his colleagues, appointed
 first lord of the treasury. This gave great offence to
 Mr.

Mr. Fox, lord Cavendish, and others, who resigned their places. However, the duke of Richmond, general Conway, and others, continued to act with lord Shelburne, till under his auspices the preliminaries for a general peace were settled. Then the public beheld Mr. Fox, and even lord John Cavendish, coalescing with the old ministers, lord North particularly; embracing the very men whom they had driven from their seats, and threatened with impeachments; and continuing to join with them in reprobating the peace, as making too great concessions to the enemy, that they might storm the cabinet, drive lord Shelburne and his friends from it, and seat themselves, and the men they had despised, in their places. This accordingly happened; for on April 2, 1783, the duke of Portland was made lord treasurer, and Mr. Fox and lord North were the two secretaries of state. Every thing went on just as the coalition administration pleased, till Mr. Fox brought into parliament his famous bill for new regulating the government of the East-India-Company, and their commercial affairs and territories. This bill being rejected in the House of Lords on December 17, by a majority of nineteen, occasioned a great ferment in the cabinet and in both houses of parliament. The result was, the two secretaries were dismissed; and Mr. Pitt succeeded the duke of Portland as first lord of the treasury, bringing his friends into the respective departments, which formed the twentieth administration in the present reign. We shall not trouble our readers with a tedious and uninteresting detail of the many political squabbles and trivial altercations which ensued on the appointment of the new ministry just now mentioned, but proceed to lay before them an account of the preliminary articles of peace agreed on between the contending powers on the 20th of January 1783.

The preliminary articles of peace between his Britannic Majesty and the most Christian King, were twenty-three in number, and contained in substance as follows:

Great-Britain ceded to France, of her possessions before the war, the island of Tobago in the West-Indies, and the river of Senegal in Africa, with its dependencies and the forts on the river; and gave up a few districts in the East-Indies, as dependencies on Pondicherry and Karikal; it agreed also to restore the islands of St. Lucia, St. Pierre, and Miquelon, and the island of Goree, with Pondicherry, Karikal, Mahe, Chandernagore, and the Comptoire of Surat, in the East-Indies, which had been conquered from the French during the war. To prevent disputes about boundaries in the Newfoundland fishery, it was agreed, that the French line for fishing should begin from Cape St. John on the eastern side, and, going round by the north, should have for its boundary Cape Ray on the western side; and Great-Britain renounced every claim, by former treaties, with respect to the demolition of Dunkirk.—France, on the other hand, was to restore to Great-Britain the islands of Grenada, and the Grenadines, St. Christopher's, St. Vincent, Dominica, Nevis, and

Montserrat; and guaranteed Fort James, and the river of Gambia; agreeing that the rum trade should remain in the same condition as before the war, 1755. The allies of each state in the East-Indies were to be invited to accede to the pacification; but if they were averse to peace, no assistance was to be given them from either of the contracting parties.

The articles of peace with his Catholic Majesty specified, that Great-Britain gave up East-Florida to Spain, and also ceded West-Florida and Minorca, which Spain had taken during the war. To prevent all causes of complaint and misunderstanding for the future, it was agreed that British subjects should have the right of cutting and carrying away logwood in the district lying between the rivers Wallis or Belize, and Rio Hondo, taking the course of the said rivers for unalterable boundaries. Spain agreed also to restore the islands of Providence, and the Bahamas, to Great-Britain, in the same condition in which they were when conquered by the arms of Spain.

The articles of the treaty of peace with the United States of America specified, that the king of Great-Britain acknowledges, New Hampshire, Massachusetts-Bay, Rhode-Island, and Providence Plantations, Connecticut, New-York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North-Carolina, South Carolina, and Georgia, to be free, sovereign, and independent states, and for himself, his heirs and successors, relinquished all claims to the government, propriety, and territorial rights of the same, and every part thereof.

To prevent all disputes in future on the subject of boundaries between these states and the remaining provinces to Great-Britain, lines were very minutely drawn, which were properly noticed, as well as delineated on the map of the United States of America: and some favourable clauses were obtained for the loyalists. The navigation of the Mississippi, and also the Newfoundland fisheries, to remain open and free to both parties.

Great difficulties arose in the treaty with the Dutch, but at length it was stipulated that Great-Britain should restore Trincomale in the island of Ceylon, but the French had already taken it, and that the Dutch should yield to us the town of Negapatnam, with its dependencies in the East-Indies, with liberty to treat for its restitution on the point of an equivalent for the same.

By this treaty a period was put to a most calamitous war, in which Great-Britain lost the best part of her American colonies, and many thousand valuable lives, and expended or squandered nearly 150 millions of money. The address of thanks for the peace was carried in the House of Lords, by a majority of seventy-two to fifty-nine; but lost in the House of Commons by a majority of 224 to 208. The terms of the peace were to many a subject of great regret, and reprobated as highly injurious to the dignity and interests of the nation; but had the war continued, it would have

been necessary millions and millions would have millions according to the therefore, the avoidable ruin the terms of able, and ce or faction, the intrigue.

On July 1st his Britannic majesty's treaty consists of the English treaty, &c. 1783.

Spain. And, On Sept. 2nd, the treaty of commerce was agreed upon between his Britannic majesty and the king of Spain.

The 13th of January 1783, the definitive alliance between Great-Britain and Prussia and consist of six articles.

A disagreement between Great-Britain and the United States of America, on the subject of the boundaries of the British provinces in the year 1783, was the purpose of the treaty.

The principal articles of the treaty were directed to the Sound; and ratified with the king of Denmark on the 14th of February 1788, to secure the navigation of the Sound at the same time.

The Spanish expedition was sent to the amount of 100,000 men.

The Spaniards, on the 1st of August 1783, had long been in possession of the island of Minorca; and was dispatched to put an end to the war, which arrived in Madrid on the 1st of July following. The little fleet of the king, consisting of 12 ships of the line, 10 frigates, and 10000 men, was sent to the coast of Minorca, and the government of the island was put into the hands of the court of London. The government of the island was that measures were taken to prevent the Spaniards from capturing the coast, which was occupied by the

been necessary to have borrowed annually seventeen millions and a half, by which a million per annum would have been added to the taxes, and twenty-five millions at least to the capital of the public debt, according to the usual modes of funding. Considering, therefore, the true state of the nation, and the unavoidable ruinous consequences of protracting the war, the terms of the peace were advantageous and honourable, and could only be opposed by pride, ignorance, or faction, the effect of party rage, and ambitious intrigue.

On July 14, 1786, a convention between his Britannic majesty and the king of Spain was signed at London. It consists of sixteen articles, and grants full liberty to the English to cut and carry away logwood, mahogany, &c. from the Mosquito-Shore, belonging to Spain. And,

On Sept. 26, 1786, a treaty of navigation and commerce was agreed to, and signed at Versailles, between his Britannic majesty and the most Christian king. This treaty consisted of forty-seven articles, and the same was acceded to by the British parliament in 1787. And,

On the 13th of August 1788, a definitive treaty of defensive alliance was signed at Berlin between the king of Prussia and the king of Great-Britain. This treaty consists of six articles.

A disagreeable affair occurred in the year 1791, between Great-Britain and Spain, which had like to have been attended with very serious consequences; the grounds of the dispute were these: a small association of British merchants, resident in the East-Indies, had, early in the year 1786, formed the project of opening a trade to the north-western coast of America, for the purpose of supplying the Chinese market with furs. The principal point towards which these expeditions were directed was Port Nootka, or King George's Sound; and the adventurers, being in some degree satisfied with their traffic, took measures, in the year 1788, to secure to themselves a permanent settlement; at the same time that the shipping employed in this expedition was generally of two, and never exceeded the amount of four small vessels.

The Spaniards conceived some jealousy of the intrusion of the English into a part of the world which they had long been desirous of considering as their exclusive property; and, accordingly, a Spanish frigate of 26 guns was dispatched from the province of Mexico, in order to put an end to this commerce. The Spanish frigate arrived in May 1789, and captured two vessels in the following July, at the same time taking possession of the little settlement which had been formed upon the coast. This transaction was first notified to the English government by the Spanish ambassador resident at the court of London, who, at the same time, demanded that measures should be taken by the English government to prevent British subjects from frequenting these coasts, which were alleged to have been previously occupied by the subjects of Spain.

After much altercation respecting this business, and the preparation of an expensive armament on the part of Great-Britain, the court of Spain thought proper at length to consent to the satisfaction and indemnification demanded by Mr. Fitzherbert, the English ambassador to the Spanish court. Accordingly dispatches were sent, Nov. 4, 1790, from the said ambassador to the British court, containing an account, that a convention for terminating the differences which had arisen with that court, had been agreed upon by his excellency on the part of his Britannic majesty, and by the count de Florida-Blanca on the part of the Catholic king.

By this convention it was agreed:

I. That the buildings and tracts of land situated on the north-west coast of North America, or on islands adjacent, of which the British subjects were dispossessed in April 1789, shall be restored.

II. Reparation is to be made for all acts of hostility committed since April 1789, by the subjects of either nation; and in case any of them shall, since that period, have been dispossessed of their lands or property there, they shall be re-established in the possession, or a just compensation made.

III. The subjects of each nation shall not be molested, either in navigating, or carrying on their fisheries, in the Pacific Ocean, or in the South Seas, or in landing on the coasts of those seas, in places not already occupied, for the purpose of carrying on their commerce with the natives, or making settlements there.

IV. To prevent the navigation and fishery of the British in the Pacific Ocean, or in the South Seas, from being made a pretext for illicit-trade with the Spanish settlements, British subjects are not to navigate or carry on their fishery in these seas, within ten leagues from any part of the coasts already occupied by Spain.

V. Wherever the subjects of either nation shall have made settlements since April 1789, or shall hereafter make any, the subjects of the other shall have free access to carry on their trade without molestation.

VI. With respect to the east and west coasts of South America, and the islands adjacent, no settlement shall be formed by either nation in such parts as are situated to the south of those parts already occupied by Spain; but each party shall retain the liberty of landing, for the purposes of their fishing, and of erecting temporary buildings for those purposes.

VII. In all cases of complaint, or infraction of this convention, the officers of either nation, without previously committing any violence, shall make report of the circumstances to their respective courts.

VIII. This convention shall be ratified within six weeks from the date.

Dated Oct. 8.

(L. S.) ALLEYNE FITZ-HERBERT.

(L. S.) EL CONDE DE FLORIDA BLANCA.

In consequence of the decapitation of Louis XVI. the late king of France, on the 21st of January 1793, by order of the French convention; their hostile invasion of the neighbouring countries, together with a declaration of war denounced by the French republic against England and Holland in the February following; a coalition of several powers of Europe took place, in order to counteract the designs of France, and restore monarchy and the public tranquillity. The English sent over to Holland a considerable body of troops to the assistance of the Dutch, who, in concert with the Austrians, drove the French from their territories; and afterwards took Conde, Valenciennes, and other places, on the frontiers of France. The English also sent a powerful fleet, under lord Hood, against Toulon, which place the inhabitants delivered up to him, in trust for Louis XVII. when monarchy should be re-established in France on the same footing as in 1789, that is, by a limited government.

With respect to the events and termination of this war of the combined powers of Prussia, Austria, Holland, Russia, England, Spain, Portugal, &c. against the French republic; and for further satisfaction on this head, together with an ample account of the revolution in France, and the conduct of the French nation thereupon, we must refer our readers to the concluding part of their history.

With respect to our own country, whose constitution we venerate; whose welfare, from every motive of affection and interest, must lie nearest our hearts; we are perfectly satisfied, we cannot more religiously fulfil our duty towards it, than by wishing most fervently the return of peace. Our commerce requires it, our finances require it, the preservation of our constitution, which can only be endangered by public distress, requires it.

The soundest politicians that have directed the affairs of the British empire, Burleigh, Clarendon, Walpole, and Chatham, have all declared against continental wars, and continental connections and alliances: these have drained Britain of its wealth, and incessantly involved it in calamity and in blood; while the ungrateful house of Austria, our good friends of Hesse, or the other petty despots of Germany, have been the only gainers.

We can no longer consider France as formidable. Should she be able to resist the present attack of Austria and Prussia, it must be the utmost limit of her operations for a century to come; and we cannot, on the princi-

ples of sound policy, wish her totally annihilated in the scale of European politics. For what, then, is the blood and treasure of Britain lavished? The question we trust, will be calmly and rationally considered by the people, as well as the ministers; and we are not without hopes that, in a short time, we shall have to congratulate our fellow-citizens on the return, and permanent duration in future, of that wise and pacific system which has hitherto constituted the wealth, the happiness, the political consequence, and the real dignity of Great-Britain and her dependencies.

A GENEALOGICAL LIST of the ROYAL FAMILY of GREAT-BRITAIN.

GEORGE III. king of Great-Britain, France, and Ireland, elector of Hanover, and son of Frederick Lewis, was born June 4, 1738; succeeded his grandfather George II. on Oct. 25, 1760; married, Sept. 8, 1761, to the princess Charlotte of Mecklenburgh Stralitz, born May 16, 1744, by whom he has issue,

1. George, prince of Wales, born Aug. 12, 1762.
2. Frederick, duke of York, bishop of Osnaburgh, born Aug. 16, 1763; married, Sept. 29, 1791, Frederique Charlotte Ulrique Catherina, eldest daughter of the king of Prussia.
3. William-Henry, duke of Clarence, born Aug. 21, 1765.
4. Charlotta-Augusta-Matilda, Princess Royal, born Sept. 29, 1766.
5. Edward, born Nov. 2, 1767.
6. Augusta-Sophia, born Nov. 8, 1768.
7. Elizabeth, born May 22, 1770.
8. Ernest-Augustus, born June 5, 1771.
9. Augustus-Frederic, born Jan. 27, 1773.
10. Adolphus-Frederic, born Feb. 27, 1774.
11. Mary, born April 25, 1776.
12. Sophia, born Nov. 3, 1777.
13. Amelia, born Aug. 7, 1783.

THE KING'S BROTHER and SISTER.

1. Augusta, duchess of Brunswick, born Aug. 12, 1737.
2. William-Henry, duke of Gloucester, born Nov. 25, 1743; married, Sept. 6, 1776, Maria, countess-dowager of Waldegrave, by whom he has one son and two daughters.

Notwithstanding we have, in the preceding Geographical and Historical Descriptions of this Country, been as full and minute as our limits will permit, yet (as to works composed expressly on the subject, and giving ample, accurate, entertaining, and impartial Accounts of the various interesting Transactions and Events relating to Great-Britain and Ireland) we wish also to recommend to the perusal of our numerous readers the following excellent performances:

Boundaries and Extent, Climate, Produce, Rivers, Inhabitants, Cities, Mountains, Trade, History, &c.

WE have thought proper to assign a separate article to this principality, which, though politically annexed to England, is distinct from it in language and manners. This country was formerly of much greater extent than it is at present; but the Saxons having conquered all the plain country, obliged the ancient Britons to retreat westward; and, ever since that period, Monmouthshire and Herefordshire have been reckoned part of England. Wales is bounded on all sides by the sea and the Severn, except on the east, where it joins to the counties of Chester, Salop, Hereford, and Monmouth. Its length, from the southernmost part of Glamorgan-shire, to the extremity of Flintshire, is computed at 114 miles; and its greatest breadth, from the river Wye, east, to St. David's, in Pembrokeshire, west, is about 96 miles. It is situated between 51 and 54 deg. north lat. and between 2,41 and 4,56 deg. west long. and contains 7011 square miles. The divisions have already been given in the account of England: which see in p. 596.

The seasons are pretty much the same in Wales as in the northern parts of England, and the air is sharp, but wholesome. The soil, especially towards the north, is mountainous, but contains rich vallies, producing large crops of wheat, rye, and other corn. Vast herds of black cattle, for which this country is famous, sheep, deer, and goats, are fed on the mountains. Their cows are remarkable for yielding large quantities of milk. Their horses are remarkably small, but can endure vast fatigue. Here are mines of silver, copper, lead, and some iron; quarries of free-stone, and abundance of coal-pits. The crown has a certain, though small property, in the product of the silver and lead mines.

There are upwards of thirty rivers in Wales; the principal are the Clywd, Wheeler, Dee, Severn, Elwy, and Alen, which furnish Flintshire with great quantities of fish. This country likewise abounds in lakes; the chief are Lhyn, Tigid, or Pimble Meer; and Lhyn Sauedhan, or Brecknock Meer; the latter of which is so full of fish, that the inhabitants say, two-thirds of it is water, and the rest fish. At Holywell, a small town in Flintshire, is a mineral water, esteemed salutary in many disorders; it is an excellent cold-bath, and has been very beneficial to many who have used it.

The inhabitants of Wales are computed at about 900,000; and the land-tax, some years ago, brought in 43,752l. a year. The revenue accruing to the prince of Wales from this principality is about 8000l. per annum. The Welsh are, if possible, more jealous of their liberties than the English, and far more irascible; but their anger soon abates; and they are remarkable for their sincerity and fidelity. They are fond of carrying back their pedigrees to the most remote antiquity; but we have no criterion for the authenticity of their manuscripts, some of which they pretend to be co-eval with the incarnation: however, great part of their ecclesiastical history is certainly more ancient and better attested than that of the Anglo-Saxons. In most places of North Wales, they continue the ancient method of entertaining the company who come to their inns with the Welsh harp; and the novelty of this reception, joined to the agreeable wildness of the music, renders it generally very acceptable to strangers.

The Welsh clergy having refused to conform to the rites of the church of Rome, were all massacred by order of Augustine, who had been sent by the pope into England, in the reign of Ethelbert, king of Kent, to convert the nation to Christianity; and, after their pastors were gone, the inhabitants were easily overcome. At present, the established religion is conformable with that of the church of England, though there are many Romish superstitions still remaining, and numbers of families who yet profess that mode of worship. Most of the clergy are natives of the country, and, though they understand English perfectly well, yet the public

worship.

worship is frequently performed in Welsh, except in those towns where the English is the prevailing language. Most places in Wales are now blessed with free-schools, and the dark ignorance with which it was formerly over-run, is happily removed by the society for propagating Christian knowledge. Among the many methods put in practice for this purpose, are the circulating schools, which consist of persons nominated school-masters, who are appointed to travel from place to place, instructing the poor, both old and young, in reading, prayer, and in the tenets of the Protestant religion. This laudable society expends considerable sums in bibles, common prayers, and other religious books, which are distributed gratis to the colliers, &c. And we earnestly hope and believe that the late excellent institution of Sunday-Schools, by private subscriptions, in various parts of England, will have the happiest effects on the morals of youth, by infusing into them right principles, and rendering them useful members of the community. It is matter of astonishment, that the case of the lower clergy in Wales, many of whom are incapable of procuring themselves and families the necessities of life, has never been taken into consideration by this useful charity, and recommended to the attention of higher powers. The principality also contains great numbers of Protestant Dissenters. At Trevecha, in South Wales, the countess of Huntingdon instituted a seminary for training up students in divinity; here have been also several places of public worship erected, under that lady's patronage, where the reformed doctrines are preached both in Welsh and English, according to the principles of the Methodists.

This country was formerly famous for its poets and bards, among whom was Thalieffin, who flourished about the year 456, and part of whose works being repeated to Henry II. of England, were the means of discovering the burying-place of king Arthur and his wife. Learning suffered greatly in this country by the extirpation of the bards, whose poetical genius was supposed to raise in the inhabitants an enthusiastic warmth for independency, which, according to some authors, induced Edward I. to make a general massacre of them. Numbers of learned men flourished in Wales before the Reformation, particularly Giraldus Cambrensis; and, since that period, it has been rendered conspicuous by several divines and antiquaries. Among the former were Hugh Broughton, Hugh Holland, and Williams; archbishop of York, lord keeper in the time of Charles I. Among the latter were several gentlemen of the name of Lhuyd (Lloyd) particularly the author of the *Archæologia*; and Rowland, author of the *Mona Antiqua*. There is no doubt but learning was at a great height in Wales, when the English scarce knew the use of letters; though this is supposed to have consisted chiefly in the knowledge of the antiquity, language, and history, of their own country; but the scene was afterwards changed, and ignorance took full possession of the ancient Britons. Wickliffism took shelter in Wales when it

was persecuted in England; and, since the Reformation this country has produced several excellent antiquaries and divines. Some of the Welsh at present make a considerable figure in the republic of letters, and many of their clergy are excellent scholars. The purity of the Welsh language will evidently appear from the Paternoster, which here follows: "Ein Tad, yr hwn wyt yn y nefoddd, sancteiddur dy enw; deued dy deyrnas; bydded dy ewyllys ar y daear, megis y mae yn y nefoddd; dyro i ni heddyw ein barn beunyddiol; madden i ni ein dyledion, fel y maddenwn ni i'n dylediwy; ac nae arwain ni i brofedigaeth, eithr gwared i rhiag drwg; canys eiddot ti yw'r deyrnas, a'r gallu, a' gogoniant, yn eos oesoedd. Amen."

There are no cities or public edifices in Wales which are remarkable, either for populousness or magnificence we shall, however, describe some of the principal.

Beaumaris, the chief town of the isle of Anglesea, has two good streets, a handsome church, and a harbour.

Denbigh is a good town, and Wrexham has a very handsome church.

Cardigan has an elegant church, a county gaol, public hall, and a good harbour.

Caermarthen has a fine stone bridge over the Towy, and a very commodious quay.

Pembroke has two handsome bridges over Milford Haven, two churches, and a custom-house. Caermarthen and Pembroke are esteemed the two politest cities in Wales, and are inhabited by numbers of gentlemen and wealthy tradesmen.

Milford-Haven, in Pembrokeshire, is supposed to be one of the finest harbours in Europe; and notwithstanding many efforts have been made, and considerable sum granted by parliament to render it useful, it still remains neglected.

Haverfordwest is a handsome town, having three parishes, a commodious quay, a stone-bridge over the Doulgledye, a free grammar-school, a charity-school, custom-house, and an alms-house.

As the copper-mine, which is now working to such extraordinary advantage in Anglesea, engages much conversation, it may prove agreeable to our readers to receive some account of its nature and produce: the happy source of this national as well as private wealth is situated on an eminence called Paris Mountain, in the island of Mona, the ancient seat of the Druids in North Wales, at about eight miles distant from the Holyhead road, and two miles inland. The ore found here is the richest and most abundant in its produce of any mine of this metal that our country ever produced. It is found so near the surface of the earth, with so little labour and expence, that the proprietors are enabled to undersell all other dealers in this useful article. We have been under the necessity of importing yearly an immense quantity of this metal from Sweden before the discovery was made, which was a considerable loss to this country, the balance of trade being against us,

since the Reformation, excellent antiquaries, who at present make use of letters, and many scholars. The purity of the language appears from their old MSS. "Eiu Tad, yr hwaenly enw; dened dy deyr ddear, megis y mae yn in bara beunyddiol; madduwn ni i'n dyledigaeth, eithr gwared m'r deyrnas, a'r gallu, a'r men."

edifices in Wales which are distinguished by their greatness or magnificence are one of the principal objects of the title of Anglesey, some church, and a har-

nd Wrexham has a very

church, a county gaol, &c.

the bridge over the Tow

me bridges over Milford, a custom-house. Caernarvon is the two politest cities in the country, and is distinguished by numbers of gentlemen.

Wrexham, is supposed to be the most fertile in the country; but notwithstanding its fertility, and considerable commerce, it is still remain-

the town, having three parishes, a stone-bridge over the river, a school, a charity-school, &c.

It is now working to find out the nature and produce of the country, as well as private wealth, and the Paris Mountain, in the neighbourhood of the Druids in North Wales, distant from the Holywell.

The ore found here is not in its produce of a country ever produced.

of the earth, with so little labour, and the proprietors are enabled to do this useful article. The quantity of importing yearly from Sweden before it was a considerable loss, and trade being again us-

being obliged to purchase of the Swedes for ready money, and not by way of barter in goods. The proprietors have seven vessels of about 150 tons burthen, continually employed in conveying the copper, which is packed up in casks, in sheets, to a wharf they have below the Tower. All our men of war are sheathed with this copper. Not only the great part of Europe, but most other countries, are supplied with this article from Anglesey. The East-India Company exported, in the year 1789, upwards of sixty tons for China, and the demand has since increased. This celebrated mine is not only remarkable for its abundant produce, but for the superior quality of the mineral, being the purest of any upon the globe. The clear profit, upon an average for some years past, has been between 80 and 90,000l. annually. The principal proprietor is the earl of Uxbridge, son of the late Sir Nicholas Bailey. As this is become an important article of commerce and national wealth, it is greatly to be wished it may prove of long continuance; and, indeed, according to the present appearance, it promises to be of an almost inexhaustible duration.

This principality, we may observe, was, in ancient times, a far more populous and wealthy country than at present; and, though it contains no regular fortifications, yet many of its old castles are so strongly built, and advantageously situated, that they might be turned into strong forts by a little expence.

Every part of Wales abounds in Roman and British camps, walls, castles, and other antiquities. In the island of Anglesey are several rude monuments, called by the inhabitants Cromlechen. They are formed of a number of rough stones, set up on end, which serve as supports to one of several tons weight, laid on the summit. It is uncertain what was the original intent of erecting them, but they are supposed to have been sepulchres, either of the Druids, whose chief residence was in this island, anciently called Mona; or of princes and other distinguished persons. Rude monuments of the same nature are to be found in most of the counties in Wales, particularly in Brecknockshire, of which the most remarkable are a pillar about six feet high, two broad, and six inches thick, called the maiden stone; on one side of which are the figures of a man and woman, very badly executed: and St. Eltut's Hermitage, which is formed of four rough stones, of which three are fixed in the ground, and the fourth laid on the top for a cover. Ancient coins, both Roman and British, of gold and silver, and other metals, are frequently found in this principality; and, in 1692, a golden turquoise, consisting of three or four bars, about four feet in length, twisted together like a haband, was dug up in a garden near the castle of Harlech, in Merionethshire.

The prodigious mountains in Wales may be justly esteemed natural curiosities. Among the most remarkable of these are Snowdon-Hills, Penmaenmawr, and Moel y Wydhva. Snowdon-Hills are properly distinguished by their names, the tops being covered with snow most part of the year: one of these moun-

tains has been found, by trigonometrical mensuration, to be 1240 yards in perpendicular height. Penmaenmawr projects over the sea, to the great terror of the traveller, the high road being cut through the rock, and, though the side next the sea is guarded by a wall, yet the large pieces of rock which sometimes fall from the top, render it a very dangerous passage. From the summit of Moel y Wydhva may be seen, in a clear day, part of England, Ireland, and Scotland. These mountains are called the British Alps, and produce many animals which are to be found only on them and the Alps in Italy. Caerphili-Castle is another curiosity. This building, from its size and structure, is supposed to have been a Roman garrison, and is, without exception, the finest piece of ruins now remaining in Britain. Its dimensions seem to have been almost equal to those of Windsor-Castle; and one of the round towers, which overhangs its basis above nine feet, is esteemed as great a natural curiosity as the leaning tower of Pisa in Italy.

At Lhanfannam, in Flintshire, on the side of a rock, is a cave, in which are 24 seats, known by the name of Arthur's round table. In this country is also the famous well, called St. Winifred's-Well, the spring of which boils with vast impetuosity out of a rock, and is formed into a beautiful polygonal well, covered with a rich arch supported by pillars, and the roof is most exquisitely carved in stone: over the spring is also a chapel, a neat piece of Gothic architecture, but in a very ruinous state. King James II. paid a visit to the well of St. Winifred in 1686, and was rewarded for his piety by a present which was made him of the very shift in which his great grandmother Mary Stuart lost her head. The spring is supposed to be one of the finest in the British dominions, and, by two different trials and calculations lately made, is found to fling out about twenty-one tons of water in a minute: it never freezes, or scarcely varies in the quantity of water in droughts, or after the greatest rains; after a violent fall of which, it becomes discoloured by a wheyish tinge. Near Caermarthen may be seen several vast caverns, supposed to have been copper-mines of the Romans. At the same place is a fountain, which, like the sea, ebbs and flows twice in 24 hours: and on the coast of Pembroke-shire is a pool called Bosharston-Meer, which is supposed to be unathomable; and, by its violent noise, to have a subterraneous communication with the sea. The last curiosity we shall particularize is the dyke, near Knighton in Radnorshire, which Offa, the Mercian, threw up as a boundary between his subjects and the Britons.

With respect to commerce and manufactures, the Welsh are on a footing with many of the western and northern counties of England. Their trade is mostly inland, and they import numbers of black cattle, which afford excellent beef, into England. The town of Pembroke employs near 200 merchant ships, and its inhabitants carry on an extensive trade. In Brecknockshire are several woollen manufactures; and Wales carries on a great coal trade with England, and even

even Ireland. Denbigh is famous for gloves and tanned leather.

The tutelar saint of the Welsh is St. David, commonly called St. Taffy; his badge is a leek, worn in commemoration of him on the 1st of March, and for which various reasons have been assigned. The arms of the prince of Wales differ from those of England only by the addition of a label of three points: the motto is, "Ich Dien," I serve. His cap, or badge of ostrich feathers, was occasioned by a trophy of that kind which Edward the Black Prince took from the king of Bohemia, when he was killed at the battle of Poitiers.

HISTORICAL ACCOUNT OF WALES.

IT would be a vain and useless task to attempt to give the ancient history of Wales. We are, however, certain, that the love of independence was so strongly rooted in the breasts of the Britons, that they defended their country during a long series of years against all the force of the Romans; and even when the greater part of their country was subdued, and the soil drenched with the blood of its inhabitants, many of them retired to the mountains, where they bid defiance to the Roman arms.

The Saxons also attempted the conquest of this country, but penetrated no further than the counties of Monmouth and Hereford, which were afterwards considered as parts of England. The Welsh, however, were far from being subdued; they continued an independent people, and were still governed by their own princes and their own laws.

The first blow to the liberties of the Welsh was given about the year 870, when Roderic, king of Wales, divided his dominions among his three sons; these divisions were Demetia, or South Wales; Povesia, or Powis-Land: and Venodotia, or North Wales. This division gave rise to many wars, during which the kingdom of Povesia, or Powis-Land, was conquered, and part of it annexed to North Wales, and part to South; divisions which subsist even to this day.

Henry I. of England planted a colony of Flemings on the borders of Wales, about the year 1112, hoping that they would soon form a barrier to England. But, though the Welsh were unable to drive the Flemings from their settlements, they resisted, with remarkable intrepidity, several attempts made by the Norman kings of England to deprive them of their liberty. At last, their old and infirm prince Llewelin put himself under the protection of Henry III. to whom he did homage for his kingdom, in order to procure the assistance of that prince against his ferocious son Griffin, who had taken up arms against his father. This incident, which happened in 1237, furnished a pretence for considering Wales as a fief of England, and of making an entire conquest of that country.

On the death of that prince, his son Llewelin suc-

ceeded to the crown, who, disdaining the homage to which old Llewelin had submitted, Edward raised a formidable army at a prodigious expence, with which he penetrated as far as Flint, and, taking possession of the isle of Anglesey, he drove the Welsh to the mountains of Snowdon, and obliged them to submit to pay a tribute. The Welsh, however, made several efforts under Llewelin; but at last, in 1285, he was killed in battle. He was succeeded by his brother David, the last independent prince of Wales, who, falling into Edward's hands through treachery, was by him most barbarously and unjustly hanged; and Edward, from that time, pretended that Wales was annexed to the crown of England. It was about this time, probably, that Edward perpetrated the inhuman massacre of the Welsh bards. Perceiving that his cruelty was not sufficient to complete his conquests, he sent his queen, in the year 1282, to be delivered in Caernarvon-Castle, that the Welsh, having a prince born among themselves, might the more readily recognize his authority. This prince was the unhappy Edward II. and from him the title of prince of Wales has always descended to the eldest sons of the English kings. The history of Wales and England became now the same. The eldest sons of the kings of England have not only ever since held the titular dignity, but actually kept a court at Ludlow; and a regular council, with a president, was named by the crown, for the administration of all the affairs of the principality. This piece of policy was thought so necessary, that, when Henry VIII. had no son, his daughter Mary was created princefs of Wales. The kings of England have always found it their interest to soothe the Welsh with particular marks of their regard.

Situation, Extent, Boundaries, Divisions, Products, Rivers, Lakes, Inhabitants, Learning, &c.

THIS island is situated on the west side of England, between the parallels of 51 and 55 deg. 20 min. north lat. and 6 and 10 deg. west long. or between the middle parallel of the eighth clime, where the longest day is sixteen hours and a half, and the twenty-fourth parallel, or the end of the tenth clime, where the longest day is seventeen hours and a half. This kingdom is 290 miles in length, 172 in breadth, and contains an area of 31,966 miles; it also contains 11,067,712 Irish plantation acres, which makes 17,227,864 acres of English statute measure, and is said to bear proportion to England and Wales as eighteen to thirty. It is bounded on the north by the Deucaliedonian Sea; on the south and west by the Atlantic Ocean; and on the east by the Irish Sea, or St. George's Channel, which divides it from the western shores of Great-Britain. It is sixty miles

miles distant than twenty hund. Its name is Gallic towards ward.

Even more the divisions cuts, and of method is more time more a it. The province of the kingdom of Leinster, a city, IV. C.

I. The province and contains chief town, Wexford. 3. W. Longford; ditto. 7. West-Meath County; chief town, Drogheda. 11. K.

II. Ulster contains nine counties; chief town, Down Patrick. 4. Carrickfergus. 6. Tyrone; chief town, Enniskillen. 11. Lifford.

III. Munster contains six counties; chief town, Limerick; ditto. 6. W. IV. Connaught contains four counties; chief town, Sligo. 6. W. 11. Sligo; chief town, Sligo. 11. Sligo; chief town, Sligo.

The air of England in the north is more severe than in the south; there it is more violent winds, winter; and often prejudicial to the health. The soil is not so fertile as in the south; but it is not so barren as in the north; and it is not so cold as in the north; and it is not so hot as in the south.

The soil is not so fertile as in the south; but it is not so barren as in the north; and it is not so cold as in the north; and it is not so hot as in the south.

miles distant from Holyhead in Wales, but not more than twenty miles from the Mull of Galloway in Scotland. Its name is probably derived from a Phœnician or Gallic term, signifying the furthest habitation westward.

Even modern authors are not agreed with regard to the divisions of Ireland, some dividing it into five circuits, and others into four provinces; but as the latter method is more generally followed, and at the same time more ancient, we have thought proper to adopt it. The provinces are,

I. Leinster; its principal town, Dublin, the capital of the kingdom. II. Ulster; its chief place, Londonderry, a city. III. Munster; its chief place, Cork, a city. IV. Connaught; its chief town, Galway.

I. The province of Leinster is situated on the east, and contains twelve counties; viz. 1. Dublin; its chief town, Dublin. 2. Louth; chief town, Drogheda. 3. Wicklow; ditto. 4. Wexford; ditto. 5. Longford; ditto. 6. East-Meath; chief town, Trim. 7. West-Meath; chief town, Mullingar. 8. King's-County; chief town, Philipstown. 9. Queen's-County; chief town, Maryborough. 10. Kilkenny; ditto. 11. Kildare; chief towns, Naas and Athy. 12. Carlow; ditto.

II. Ulster province is situated in the north, and contains nine counties; viz. 1. Down; its chief town, Down Patrick. 2. Armagh; ditto. 3. Monaghan; ditto. 4. Cavan; ditto. 5. Antrim; chief town, Carrickfergus. 6. Londonderry; chief town, Derry. 7. Tyrone; chief town, Omagh. 8. Fermanagh; its chief town, Enniskillen. 9. Donegall; its chief town, Lifford.

III. Munster is situated in the south, and contains six counties; viz. 1. Clare; its chief town, Ennis. 2. Cork; ditto. 3. Kerry; chief town, Tralee. 4. Limerick; ditto. 5. Tipperary; chief town, Clonmell. 6. Waterford; ditto.

IV. Connaught is situated in the west, and includes five counties; viz. 1. Leitrim; chief town, Carrick on Shannon. 2. Roscommon; ditto. 3. Mayo; chief towns, Bullinrobe and Castlebar. 4. Sligo; ditto. 5. Galway; ditto.

The air of Ireland is nearly the same with that of England in the same latitudes, except in some parts where it is rendered more gross and impure by lakes, bogs, and marshes. The climate, however, is more temperate, it being cooler in the summer, and warmer in the winter than in England. It is more subject to violent winds, clouds, and rain, than to hard frosts in winter; and even in summer rain is very frequent, and often prejudicial to the fruits.

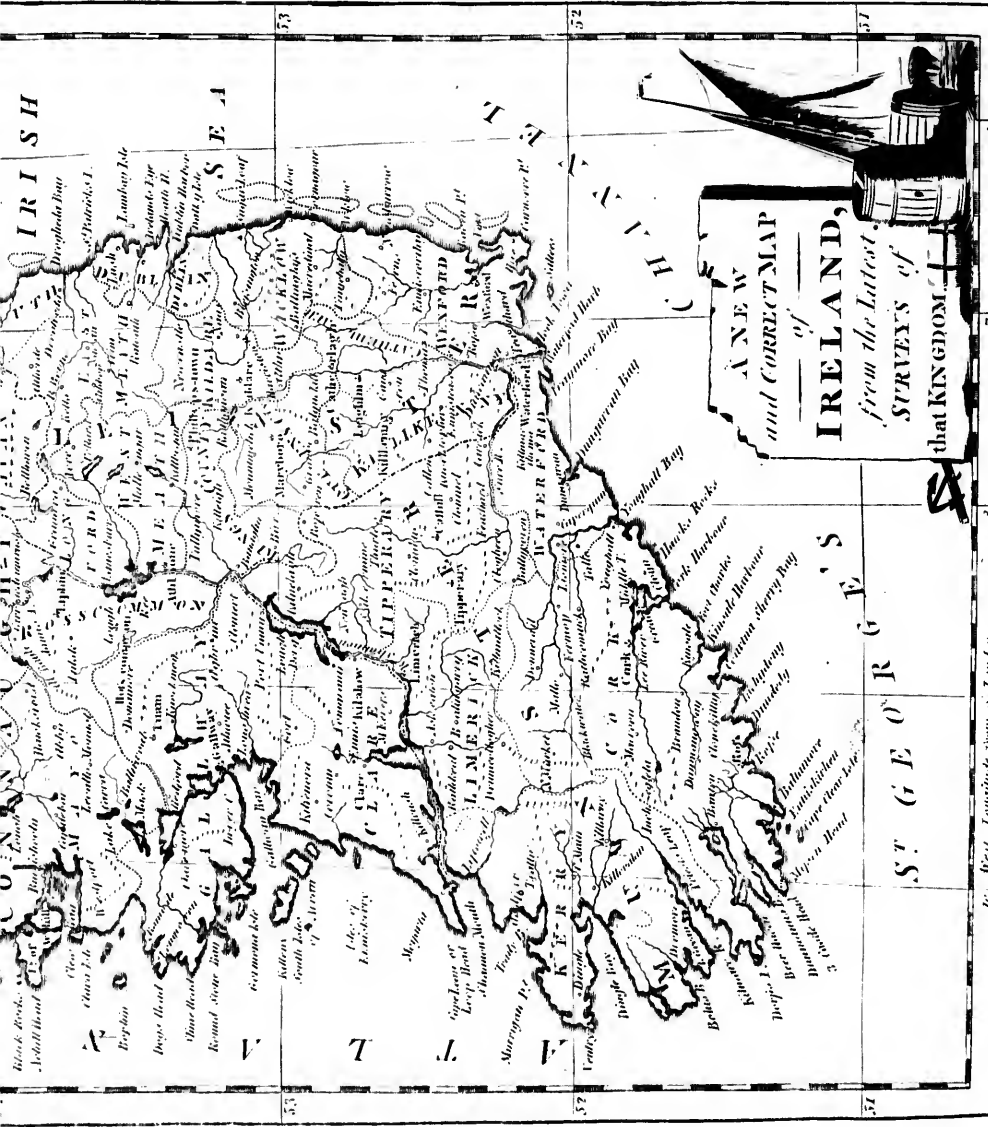

The soil is various; in some places it is so rich as to want no manure, and in others so barren, that no husbandry can render it fertile. In the county of Roscommon is a fine vale called Sheep-Walk, extending twenty-one miles in length, and remarkable for its fertility and fine pasture. The soil in many places is a

blackish earth, in some a blackish clay, and in others a mixture of earth, sand, and clay; but the red earth and chalky ground, so common in England, is not found in Ireland. In many parts of the kingdom, the upper stratum is good mould, but very thin, and nothing under it but stone. These parts, however, produce considerable crops of corn. Where the lands are not naturally fertile, the inhabitants have spared no pains in manuring them with the dung of animals, ashes of sea-weeds, mud, and sometimes lime, in order to enrich the soil. By these, and various other improvements lately made in agriculture, the lands in Ireland produce much larger quantities of corn, flax, artificial grasses, culinary vegetables, &c. than formerly. This happy change is in a great measure owing to a society established at Dublin for the improvement of various arts and manufactures, among which husbandry engages a very considerable share of their attention. The premiums offered by this society have introduced the cultivation of clover, trefoil, saintfoin, lucern, rye-grass, and various other vegetables for the food of cattle. Many unprofitable bogs have also been drained, and rendered excellent land. Pasture-land abounds in Ireland, where vast numbers of black cattle, hogs, and sheep, are reared and fed; and hence the inhabitants are able to supply the prodigious quantities of salt provisions, butter, &c. annually shipped off at Cork, and other parts of the kingdom, to foreign markets, which are the strongest proofs of the natural fertility of the soil. The Irish wool is very valuable, and great quantities of it are exported to England.

Among the uncultivated parts of Ireland are the large bogs, found in various parts of the kingdom. Some of these bogs are dangerous; they are generally covered with fine grass, and the soil so very spongy, that it will bear neither man nor beast. Some of them shake under foot in an alarming manner, but they may be often crossed with safety.

This country is greatly enriched with the numerous rivers, enchanting lakes, spacious bays, commodious havens, harbours, and creeks, with which it abounds. The Shannon is a very noble river, larger than any in England, but not navigable above fifty miles, on account of a ridge of rocks south of Killaloe, and stopping all navigation further up; but this might be remedied by a short canal, at the expence of ten or twelve thousand pounds, and communications might also be made with other rivers, to the great benefit of the nation. This river runs from north to south upwards of 300 English miles, spreading itself into many large and beautiful lakes of different extent, from five to fifteen miles, abounding with salmon, pike, &c. of a very large size; and some of the lakes are adorned with fertile and beautiful islands. The Lee rises in the county of Cork, below which city it falls into the sea, after an easterly course of above twenty-six miles. The Liffey rises in the county of Wicklow, and falls into the Irish sea below Dublin. The Boyne rises in the

W. West Longitude from 9. London

the King's County, and falls into the sea at Drogheda. The Barrow, Nore, and Suir, water the south part of the kingdom, and, after uniting their streams below Ross, fall into the channel at Waterford-Haven. The Bann, famous for a pearl and salmon fishery, rises in the county of Down, and falls into Lough-Neagh, in the county of Armagh.

There are also in Ireland a great number of lakes, or loughs, particularly in the provinces of Ulster and Connaught; though the Irish, like the Scots, frequently give the term lough to an inlet of the sea. Though those loughs, in the main, have but few properties that are not common with the like bodies of water in other countries; yet they have given rise to many fabulous accounts concerning the natives, which disgrace their true history. The great lake Neagh, between the counties of Antrim, Down, and Armagh, is remarkable for its petrifying quality. Many of these lakes contain large quantities of fish.

Here are a great number of spacious bays, havens, harbours, and creeks, which every where indent the coast, and render this country, beyond any other, the best fitted for foreign commerce. The most considerable are those of Carrickfergus, Strangford, Dundrum, Carlingford, Dundalk, Dublin, Waterford, Dungarvan, Cork, Kinfales, Baltimore, Glandore, Dunmanus, Bantry, Kinmare, Dingle, Shannon-mouth, Galway, Sligo, Donegal, Killebegs, Lough-Swilly, and Lough-Foyle, besides a great many barred havens, some of which have been much improved by acts of parliament, particularly that of Dublin.

Many of the roads of Ireland are now the finest in Europe. They are carried several miles in straight lines; to effect which, no expence has been spared to cut through mountains, and fill up vallies; in some places they are carried for many miles through the middle of bogs, which before were impassable. Add to this, that as there is no such thing as a heavy waggon in the country, the roads are hard and smooth, in some measure resembling the gravel walks in a garden.

The many rivers that water the plains of Ireland render it very susceptible of improvements, with regard to inland navigation; and the legislature, convinced of the great utility that must attend the communications between different places in the kingdom, by means of canals, have, at different times, granted large sums of money for carrying on these useful works. One of these canals is extended above sixty miles, from the river Shannon to the Liffey near Dublin. By this artificial navigation, a communication is opened from the channel to the Atlantic Ocean. In surveying the grounds for this canal, it was found necessary to carry it through a bog twenty-four miles over, which greatly increased the labour and expence of the undertaking, in strengthening the banks with additional works, to prevent them from falling in, to which they would otherwise have been very subject, from the spongy nature of the soil.

In this kingdom are several lofty chains, as well as

high mountains; and the Irish have these words which express the different degrees of their elevation and size, namely, knock, slieu, and bein or binn: knock signifies a low hill, unconnected with any other eminence; slieu denotes a craggy high mountain, gradually ascending, and continued in several ridges; a bein or binn means a pinnacle, or mountain of the first magnitude, ending in a sharp or abrupt precipice. The two last are often seen and compounded together in one and the same range. The mountains of Mourne and Iveagh, in the county of Down, are reckoned among some of the highest in the kingdom; of which Slieu Denard is calculated at a perpendicular height of 1056 yards. Many other mountains are found in Ireland, some of which contain veins of iron, lead, copper, minerals, coals, quarries of stone, slate, and marble.

About two miles from Kilkenny, in the neighbourhood of the park-house of Donmore, are a number of caves, as curious, perhaps, as any mentioned in natural history, except those of Antiparos in the Archipelago. After a difficult descent of about 100 feet, the entrance into this subterraneous world is gained. The appearance of the first cavern is uncommonly awful, and gives rise to an idea of a grand Gothic structure in ruins. The solemnity of this place is not a little increased by the gaiety of those scenes that present themselves on every side previous to our entering it; the floor is uneven, and stones of various sizes are promiscuously dispersed upon it; the sides are composed of ragged work, in some parts covered with moss, and in others curiously frosted; and from the roof, which is a kind of arch, several huge rocks project beyond each other, that seem to threaten ruin. The circumference of this cave is not more than 200 feet, and in height about fifty. Here is a small but continual dropping of water from the ceiling, and a few petrifications resembling icicles.

This place has its inhabitants; for immediately on entering into it, you are surprised with a confused noise, which is occasioned by a multitude of wild pigeons; hence there is a passage towards the left, where by a small ascent a kind of hole is gained, much like but larger than the mouth of an oven, which introduces to a place, where, by the help of candles, daylight being entirely excluded, a broken and surprising scene, of monstrous stones heaped on each other, conquered with various colours, inequality of rocks overhead, and an infinity of stactical stones, present themselves. Nature, one would imagine, designed the first cave as a preparative for what remains to be seen; but it the eye is familiarized with uncommon and awful objects, and the mind tolerably fortified against those ideas that result from a combination of appearances unthought of, surprising, and menacing. The spectator flatters himself that he has nothing to behold more awful, nor any thing more dangerous to meet, than what he finds in the first cavern; but he soon discovers his mistake; for the bare want of that light which

othing to behold more
dangerous to meet, than
; but he soon discover-
out of that light which
dressed

dresses nature with gaiety is alone sufficient to render
the second far more dreadful. In the first he fancies
rain frowns upon him from several parts, but in this
it is threatened from a thousand vast rocks rudely piled
on each other, that compose the sides which seem bend-
ing in, and a multitude of no smaller size are pendent
from the roof in the most extraordinary manner; add
to this, that by a false step one would be dashed from
precipice to precipice. Indeed, it would be matter of
much difficulty, or rather impracticable, to walk over
this apartment, had not nature, as if studious for the
safety of the curious, caused a sort of branches to shoot
from the surface of the rocks, which are remarkably
unequal, and always damp. These branches are from
four to six inches in length, and nearly as thick; they
are useful in the summits of the rocks to prevent slip-
ping, and in the sides are ladders to descend and ascend
with tolerable facility. This astonishing passage leads
to a place far more curious than any of the rest. On
entering into it, one is almost induced to believe him-
self situated in an ancient temple, decorated with all
expense of art; yet, notwithstanding the beauty and
splendor that catch the eye on every side, there is some-
thing of solemnity in the fashions of the place, which
must be observed by the most ordinary spectator. The
floor in some parts is covered with a crystalline sub-
stance; the sides in many places are incrustated with the
same, wrought in a mode not unlike the Gothic style of
ornament, and the top is almost entirely covered with
inverted pyramids of the like elegantly white and lucid
matter. At the points of these statelike strata are
perpetually hanging drops of pellucid water; for when
one falls, another succeeds; these pendent gems con-
tribute not a little to the brilliancy of the roof, which,
when the place is properly illuminated, appears as if
formed of the purest crystal.

Here are three extraordinary and beautiful congela-
tions, which, without the aid of a strong imagination,
may be taken for an organ, altar, and cross. The
former, except when strictly examined, appears to be a
regular work of art, and is of a considerable size; the
second is of a simple form, rather long than square;
and the third reaches from the floor to the roof, which
must be about twenty feet. These curious figures are
owing either to water that fell from the upper parts of
the cave to the ground, which coagulated into stone
from time to time, until at length it acquired those
forms which are now so pleasing; or to an exudation, or
exhalation, of petrifying juices out of the earth; or
perhaps they partake of the nature of spar, which is a
kind of rock plant. The former seems to be the most
probable supposition, as these figures in colour and con-
sistence appear exactly like the icicles on the top, which
are only seen from the wet parts of the caverns; and
in this place there is a greater oozing of water, and a
much larger number of petrifications, than in any
other. When this curious apartment has been suffi-
ciently examined, the guides lead you for a considerable

way through winding places, until a glimmering light
agreeably surprises. Here the journey of above a
quarter of a mile through those parts is ended; but
upon returning into the first cavern, the entrance into
other apartments, less curious indeed, but as extensive
as those we have described, offers itself. The passages
into some of these are so very low, that there is a neces-
sity of creeping through them; by these we proceed
until the noise of a subterraneous river is heard; further
than this none have ventured.

In the mountains of Wicklow are also some of those
deep vallies called glyn, very beautiful and picturesque,
together with some grand and astonishing water-falls.

There are few forests in Ireland; the chief lie in
Leinster and Ulster, the King's and Queen's-Counties,
and in those of Wexford and Carlow, Donegal, Far-
managh, along Lough-Earne, and in the north parts
of the counties of Tyrone and Down, wherein is some
good timber; and the oak is esteemed as good as any
of the English growth, and as fit for ship-building.
Some years ago the proprietors of many of the smelt-
ing-houses were obliged to relinquish them for want of
fuel; but some new plantations having been lately
made, and the growth of timber encouraged by the
patriotic Dublin society, it is hoped a sufficient quan-
tity will be raised.

The vegetable and animal productions of Ireland
nearly resemble those of England and Scotland. Some
of the meadows are covered with excellent grass; others
yield plenty of turf and peat, which are very service-
able for firing. Great quantities of hemp and flax are
raised in the northern parts of the kingdom. Bees
abound here, and vast quantities of wild honey are
found in caverns and trunks of trees. Wolves were
formerly very numerous here, but have long since been
destroyed by the wolf-dogs, which are much larger than
mastiffs, shaped like greyhounds, yet very gentle and
governable. Their herds of black cattle, flocks of
sheep, hogs, and also rabbits, are amazingly nume-
rous: one rabbit warren is affirmed to be forty miles
in length; they have geese and fowls of all kinds, and
a species of excellent hawks. The fish on the coasts
of Ireland are in greater plenty than on those of Eng-
land, and some of them larger and more excellent in
their kind. The assertion that venomous animals will
not live in Ireland, begins to lose credit, as numbers
of toads are found in that kingdom.

Most of the mines of Ireland have been discovered
in this century; some contain a mixture of silver and
lead; thirty pounds of lead ore is said to produce a
pound of silver; but the richest silver mine is at Wick-
low; two mines, one of copper, and another of lead,
have been discovered at Tipperary. Iron mines are
dispersed all over the kingdom; here are also quarries
of free-stone, some of a grey or ash-colour, and others
blue. There are quarries of fine slate and marble in
most of the counties. There is a peculiar species of
coal at Kilkenny, resembling the canal-coal of Lan-

cafter, very hard, of a bright black, burns freely, and emits little or no smoke; these qualities, with the fertility of the air and gravelly soil in that county, have given rise to the well-known proverb, that "Kilkenny contains fire without smoke, water without mud, and air without fog." There are few mineral waters in Ireland; the principal spring of this kind is situated on the banks of the Liffy, at the village of Leilip, seven miles from Dublin: but there is hardly a place without a holy well, the virtue of whose waters is the offspring of superstition.

Some authors fix the number of inhabitants in Ireland at two millions, others at two millions and a half; and in some debates in parliament about twelve years ago, it was asserted that they amounted to three millions. The following calculation, made in the year 1733, of the people in each province, may perhaps enable the reader to form some idea of the population of that kingdom:

Protestant Families.	Popish Families.
In Ulster.....62,62038,459
Leinster.....25,23892,424
Munster.....13,337106,407
Connaught.....4,29944,133
Total 105,494	Total 281,423

Allowing this calculation to be right, and that each family in the country consists of five persons, those in the city of Cork of seven, and those in Dublin of ten, the total of the whole will be 2,015,229 persons: though it must be observed that of late years the balance of numbers has greatly increased in favour of the Protestants.

The first settlers of Ireland are supposed to have been emigrants from different parts of the globe, and at different times. The Irish, in general, are a strong bodied people, nimble, active, of great softness and pliancy in their limbs, bold, haughty, ready of apprehension, cunning, hospitable, credulous, vain, full of resentment, and violent in all their affections.

The Papists, in consequence of a blind submission to their priests, are ignorant and superstitious. At home they are not remarkable for bravery, probably owing to the many legal disabilities they labour under, which lays a restraint both on their mental and bodily faculties; but when employed in the service of foreign princes, they generally distinguish themselves by their courage and fidelity. O or Mac, which signify grandson and son, usually precede their surnames, especially of the better sort.

These people are too justly accused of hard drinking, and are not supposed to have made a person welcome at their house, who is suffered to leave it sober. Some writers have accused the Irish of want of genius, and others have even gone so far as to call them a nation of blunderers; but it is plain they were either actuated

by partiality, or ignorant of proper distinction; for it is well known that Ireland has produced several men of unquestioned abilities; and at present the politer part of that nation do not yield the palm in any one respect to the English, of whose manners, language, dress and customs, they are true copyists.

The old, or mere Irish, as they are termed by the Protestants, are indeed a miserable race, inhabiting the most unpolished provinces of the kingdom, particularly Connaught. These poor people are without dispute the most ignorant; but at the same time appear to be the most oppressed people in Europe; being in a manner denied all the benefits common to a civilized people. Subjected even to a state of slavery by their tyrannical lords or leaseholders, their only wealth consists of a cow; sometimes, but very rarely, of a horse; a small number of poultry, and a spot for potatoes. Their food is coarse bread, potatoes, eggs, butter, milk, and sometimes fish; but seldom taste butcher's meat of any kind. They reside in miserable huts, termed by them cabins, built of clay and straw, which are generally divided in the centre by a partition of the same materials. In one part the family live and sleep promiscuously, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being appropriated for the reception of a cow, and such pieces of lumber as are not in immediate use. Their children, plump, roblust, and hearty, scarcely know the use of clothes, and are not ashamed to gaze upon strangers, or make their appearance in that primitive manner, upon the roads.

There is no doubt that many thousands, by living in this idle and deplorable state, have been lost to the community and to themselves, who if they had been properly educated, and instructed in the real principles of Christianity, and inured and encouraged to industry and labour, would have become useful members of society, and also added considerable strength to government. The Spaniards and French, particularly the latter, have not failed to avail themselves of the uncomfortable situation in which the Irish were at home, by alluring them to enter their service; and in this they have been assisted by priests and Jesuits, whose interest it was to infuse into the minds of their credulous disciples an aversion to the British government; but we have now the pleasing hopes of a happy reformation among these people, in consequence of the late laws passed by the parliament of Great-Britain in favour of Ireland, and from the number of English Protestant working-schools lately established over the kingdom; which institution will strike deeper at the root of Popery, than all the endeavours of the British monarchs to seduce them: since it must be admitted, that most of the enormities perpetrated, and the miseries suffered by the lower clafs of people, both in Ireland and England, chiefly spring from the want of a due attention to their education, and their gross ignorance of the first principles of religion.

The

The present inhabitants of Ireland are composed of three distinct classes of people; the old Irish, poor, ignorant, and depressed, who inhabit, or rather exist, upon the interior and western parts; the descendants of the English, who inhabit Dublin, Waterford, and Cork, and who gave a new appearance to the whole coast facing England, by the introduction of arts, commerce, science, and more liberal and just ideas of the true God and primitive Christianity; thirdly, the descendants of the Scots, who in the reign of James I. fled from that kingdom to avoid persecution, and were the first who introduced the present great source of Irish wealth, the linen manufactory.

The gentry and better sort of the Irish nation in general differ little in language, dress, manners, and customs, from those of the same rank in Great-Britain, whom they imitate. Their hospitality is well known, but in this they are sometimes suspected of more ostentation than real friendship. Their music is the bagpipe, but their tunes are generally of a very melancholy strain; though some of the latest airs are more lively, and, when sung by an Irishman, extremely diverting. The old Irish is generally spoken in the interior parts of the kingdom, where some of the old uncouth customs still prevail, particularly their funeral howlings. Their custom of placing a dead corpse before their doors, laid out upon a table, having a plate upon the body, to excite the charity of passers, is practised even in the skirts of Dublin, though one would wish to see it abolished. Their convivial meetings on Sunday afternoon, with dancing to the bagpipe, and more often quarrelling among themselves, is offensive to every stranger; but, as we observed before, these customs are chiefly confined to the more unpolished provinces of the kingdom, particularly Connaught, the common people there having the least sense of law and government of any in Ireland, except their tyrannical landlords, or leaseholders, who squeeze the poor without mercy.

The church of England and its discipline form the established religion of Ireland; but among the bulk of the people, in the most uncultivated parts, Popery, and that too of the most illiberal kind, is prevalent. The Irish Papists still retain their nominal bishops and dignitaries, who subsist on the voluntary contributions of their votaries. But even the blind submission of the latter to their clergy does not prevent Protestantism from making a very rapid progress in the towns and communities. This happy circumstance may in a great measure be ascribed to the great efforts which have been made, ever since the days of James I. in erecting free-schools for civilizing and converting the Irish Papists. The institution of the incorporated society for promoting the English Protestant working-schools, already mentioned, though of no older date than 1717, has been amazingly successful, as have many institutions of the same kind, in introducing industry and knowledge among the Irish; and no country in the

world can shew greater public-spirited exertions than have been made by the government of Ireland, since that time, for these laudable institutions; but many of the parliamentary grants of this kind have been unhappily trifled with and perverted. There are many sectaries in Ireland; particularly Presbyterians, Baptists, Quakers, and Methodists, all of whom are either connived at or tolerated.

There are four archbishoprics of the established church in Ireland, viz. Armagh, Dublin, Cathell, and Tuam: the bishoprics are, Clogher, Clonfert, Clonfert, Cork, Derry, Down, Dromore, Elphin, Kildare, Killaloe, Leighlin, Limerick, Meath, Olfory, Raphoe, Waterford, Kilmore, and Killala.

The Irish language is a dialect of the Celtic, and fundamentally the same with the Erse used by the Scots Highlanders, and not remarkably different from the Welsh. But it is now greatly altered from its original simplicity by provincial alterations, and the introduction of foreign words; and it is probable that in a few centuries the Irish will be considered as a dead language. The common people have a disagreeable tone in speaking, which diffuses itself even among the better sort who do not understand Irish.

Learning, the ancient Irish historians tell us, flourished in this country when the rest of Europe was overwhelmed with the gross ignorance. The old natives of Ireland also dispute the honour of the poems of Ossian with the Scots Highlands, insinuating that he was a native of Ireland: however this be, it is well known that the Irish still repeat many parts of his poems, which have been transmitted by tradition, from father to son, for many generations. With regard to writers, since the revival of learning, the Irish are nearly equal to those of their neighbours. They cannot indeed boast of a Newton, a Milton, or a Shakespeare; but, among a variety of other writers of that country, Usher, Leland, Swift, Steele, Farquhar, Bishop Berkeley, Parnel, Sterne, and Goldsmith, have done honour to literature.

The only university in Ireland is that of Dublin, denominated Trinity-College, which was founded and endowed by queen Elizabeth: It consists of two squares, in the whole of which are thirty-three buildings of eight rooms each. Three sides of one of the squares are of brick, and the fourth is a very superb library. The inside is beautiful and commodious, and embellished with the busts of several ancient and modern worthies. The new square, three sides of which have been built within about twenty years, by parliamentary bounty, and from thence called Parliament-Square, is of hewn stone; and the front of it, near the city of Dublin, is ornamented with pilasters, festoons, &c. The Provost's house has an elegant little front, entirely of Portland stone. The chapel, and the old hall, where college exercises are performed, are mean structures; but the new hall, in which the members of the college dine, is a fair and large room.

The

The original foundation of this seminary consisted only of a provost, three fellows, and three scholars: it has from time to time been augmented to twenty-two fellows, seventy scholars, and thirty sizers. The whole number of students is at present about 400, who are of three classes, fellow-commoners, pensioners, and sizers or writers. Of the fellows, seven are called seniors, and the annual income of these is about 700*l*. The provostship is supposed to be worth 3000*l*. a year. Trinity-College has a power of conferring degrees of bachelors, masters, and doctors in all the arts and faculties. The visitors are, the chancellor or vice-chancellor, and the archbishop of Dublin. In the museum of this university is a set of figures in wax, representing females in every state of pregnancy: they are done upon real skeletons, and are the labours of almost a whole life of a French artist.

Ireland has several free-schools for the instruction of youth, which are endowed both by public and private munificence. Many of these institutions were founded by James I. and queen Elizabeth; one by the first duke of Ormond, and another by Erasmus Smith, Esq; in the year 1748, the free-schools in Ireland amounted to 168, in which 3006 children were educated. But the most extensive and useful charity of this kind in Ireland, and perhaps in the universe, is the incorporated society for promoting English Protestant working-schools already mentioned. James I. made great efforts for this purpose; but this beneficial undertaking was not incorporated by charter till 1733, by George II. and the parliament of Ireland appropriates near 3000*l*. a year to the use of it, and the late king contributed 1000*l*. immediately, and 1000*l*. per annum towards its support. There is also a charitable institution in Dublin, termed a charter nursery, where the infants of the poor are received, fed, clothed, instructed, and taken very great care of, by proper persons appointed, till they are old enough to be sent to some of the above-mentioned schools: and there are other nurseries of the same kind in different parts of the kingdom.

The natural and artificial curiosities of Ireland are not so numerous as they are remarkable. The Irish gos-hawks and gos-falcons are celebrated for their shape and beauty: besides the shape and fashion of their body, they stand so erect, and delight the eyes with such an elegant form, that they give as it were a grandeur to the diversion of hawking. The Irish wolf-dogs, before mentioned, have been accounted presents worthy the acceptance of monarchs. The caves, gyls, and cataracts, already noticed, certainly deserve to be mentioned among the natural curiosities of this kingdom. But that which merits our greatest attention is the Giant's Causeway in the county of Antrim, about eight miles from Coleraine, which Dr. Pococke, a celebrated traveller and antiquary, has thus described: "I measured," says this learned writer, "the most westerly point at high water, to the distance of 360 feet from the cliff; but was told, that at low

water, it extended sixty feet further upon a descent, till it was lost in the sea. Upon measuring the eastern point, I found it 540 feet from the cliff; and saw as much more on it as of the other, where it winds to the east, and is, like that, lost in the water. The causeway is composed of pillars all of angular shapes, from three sides to eight. The eastern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright sides of the pillars, some of which are thirty-three feet and four inches high. Each pillar consists of several joints or stones, lying one upon another, from six inches to about one foot in thickness; and, what is very surprising, some of these joints are so convex, that their prominences are nearly quarters of spheres, round each of which is a ledge, which holds them together with the greatest firmness, every stone being concave on the other side, and fitting in the exactest manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally consist of about forty joints, most of which separate very easily, and one may walk along upon the tops of the pillars as far as to the edge of the water. But this is not the most singular part of this extraordinary curiosity; the cliffs themselves being still more surprising. From the bottom, which is of black stone, to the height of about sixty feet, they are divided at equal distances by stripes of a reddish stone, that resemble a cement, about four inches in thickness; upon this there is another stratum of the same black stone, with a stratum five inches thick of the red. Over this is another stratum ten feet thick, divided in the same manner; then a stratum of the red stone, twenty feet deep, and above that a stratum of upright pillars; above these pillars lies another stratum of black stone, twenty feet high; and, above this again, another stratum of upright pillars, rising in some places to the tops of the cliffs, in others not so high, and in others again above them; where they are called the chimneys. The face of these cliffs extends about three English miles."

The greatest artificial curiosities in Ireland are the tall, slender, round towers, called Pharos, built of lime and stone, and dispersed through various parts of the kingdom. They are supposed to have been erected by the Danes or Norwegians, as watch-towers or beacons.

Dublin, the capital of Ireland, is situated on the banks of the river Liffey, about seven miles from the sea, and at the bottom of a large bay of the same name. The whole extent of this city is about one-third of London, including Westminster and Southwark; and one fourth at least of the whole has been built within these forty years; more than 4000 houses having been erected in that short period of time. Those parts of the town that have been added since that time are substantially built, and the streets in general well laid out, especially on the north side the river, where the most considerable additions have been made.

The

The city is now adorned with many spacious and regular streets, particularly Sackville-Street, in the north-east part of the town, which, with some alterations and improvements, would have been one of the finest, perhaps, in Europe. The most elegant, and best finished piece of architecture in Dublin, is the lying-in-hospital. The view of Dublin from the top of any of their towers, is the most beautiful of any large city in the king's dominions, in a similar point of view, from the neatness of the blue slating with which the houses are universally covered. The bay below the city to the east, with the adjacent country, adds greatly to the beauty of the prospect.

The river Liffy, which runs through almost the centre of the city, from west to east, and contributes much to its health, is but small, not being more than one-fifth as wide as the Thames at London, consequently cannot be supposed capable of bringing up to the town-ships of above one hundred and fifty, or two hundred tons burden. Over this river there are five bridges, of which that called Essex-Bridge is well built, and a new Street is opened from the foot of this bridge to the castle, where the lord-lieutenant resides, and adds greatly to the beauty and utility of the city. A spacious and elegant Exchange has been lately erected; it is a handsome structure of white stone, richly embellished with semi-columns of the Corinthian order, a cupola, and other ornaments. There are two large and elegant theatres here, which are generally well filled, and serve as a kind of nursery to those in London. Here are summer entertainments also, in imitation of those in London. Adjoining to the lying-in-hospital, and belonging to it, is a large square piece of ground enclosed, and three sides out of four very prettily laid out in walks, plantations of shrubs, trees, &c. the fourth being taken up with one of the fronts of the hospital. The ground on the side opposite the hospital, being much higher than the rest, is formed into a fine hanging bank, with a slope of near thirty feet, on the top of which is laid out a grand terrace-walk, commanding a fine view of the hospital. On the upper side of this terrace, and nearly encompassed by the groves and shrubberies, is built a very pretty orchestra. This garden, the most agreeable about Dublin, is much frequented in fine summer evenings by the genteel company of the city; and though not so generally calculated for a musical entertainment as the gardens of Vauxhall, near London, yet there are some walks in it where the music has a very fine and pleasing effect.

A new and spacious square is erected in the neighbourhood of St. Stephen's Green; the houses are lofty, uniform, and carried on with stone as high as the first floor, which gives the whole an air of magnificence equal to any thing of the kind in Great-Britain, except at Bath. The parliament-house is a very elegant structure, and was finished in 1739, at the expence of 40,000*l*. The front of this superb pile is of the

Ionic order, and highly esteemed for its elegance; the portico, in particular, is perhaps, without a parallel. Nor are the internal parts destitute of beauties; and the manner in which the building is lighted, has been much admired. One of the greatest and most laudable undertakings this age can boast of, is the erecting a stone wall about the breadth of a moderate street in thickness, of a proportional height, and three miles in length, in order to form a pier for sheltering vessels in stormy weather.

The linen-hall is a fine building, erected at the public expence, and opened in the year 1728, for the reception of such linen cloths as are brought to Dublin for sale. It is entirely under the direction of the trustees for the encouragement of the linen manufacture of Ireland. By this national institution all frauds are prevented in this capital branch of trade, which finds employment for many thousands of the industrious poor, and is the source of such vast riches to the kingdom.

The barracks are pleasantly situated on an eminence near the river. They consist of four large courts, in which four battalions of foot, and one regiment of horse, are generally quartered. They are thought to form the largest and most complete pile of building of that kind in Europe, being capable of containing 3000 foot, and 1000 horse. The castle and city guards are relieved from hence daily.

The greatest defect of this large and populous city is, the almost total want of good inns for the accommodation of strangers and travellers. There are not above two or three that are barely tolerable. This may in some measure be accounted for by the long and sometimes dangerous passage from Chester and Holyhead to Ireland, which prevents the gentry of England, with their families, from visiting that island; but as it is now proposed to make turnpike-roads to Port-Patriek in Scotland, from whence the passage is short and safe, the roads of Ireland may by this means become more frequented, and good inns opened, especially when the rural beauties of that kingdom, which are wonderfully adapted to delight the imagination of the curious traveller, are more generally known. Dublin is the see of an archbishop, who has a handsome cathedral, and a chapter consisting of a dean, chanter, chancellor, treasurer, two archdeacons, and twenty-two prebendaries. Among other establishments for the good of this country, is the Dublin society, which hath been of considerable benefit to the kingdom, by distributing premiums to a very considerable amount yearly, for encouraging and promoting husbandry, and other useful arts and manufactures.

The chief magistrate, or mayor of Dublin, as in London, bears the title of Lord during his mayoralty. Every year the lord-mayor and twenty-four companies perambulate the city and its liberties. The provisions of this city are generally good, and at a reasonable price, liquors especially: the best spirits may be purchased at half the price they sell for in London.

Their wine is chiefly claret, the common price of which is two shillings the bottle; and the best the town affords may be had for two shillings and sixpence. The rates of hackney coaches and chairs are fixed here, as in London, for the different distances, or set-downs, as they are called. But here are two sorts of carriages peculiar to the place. The one is called a noddly, which is nothing more than an old cast-off one-horse chaise, or chair, with a kind of stool fixed on the shafts, just before the seat, on which the driver sits, over the rump of the horse, and drives you from one part of the town to another, at stated rates. Though this is neither a very safe nor easy vehicle, yet it is convenient for single persons, the fare being not much more than half that of a coach; and they will go to any part of the kingdom on reasonable terms. The other is called a chaise-marine, and is little more than a common car with one horse. They are used throughout the kingdom, for the conveyance of people on parties of pleasure, by the genteel as well as the common, and for the carriage of goods and merchandize of every kind, hay, corn, straw, dung, turf, &c. When used for parties of pleasure, a mat is laid on the level part for the commonalty, and a bed for the genteeler sort.

Besides the lying-in hospital already mentioned, here is another for lunatics, erected and endowed by the late celebrated Dr. Swift, a royal hospital for invalids, like that at Chelsea, besides others for patients of every kind. Dublin has eighteen parish churches, eight chapels, three for French, and one for Dutch Protestants, seven Presbyterian meeting-houses, one for Methodists, two for Quakers, and sixteen Roman Catholic chapels. Some of the churches have been lately rebuilt, and others are now rebuilding in a more elegant manner. In a word, the spirit of elegance and improvement has extended itself over this whole kingdom, as well as over England and Scotland, so that the works of ornament as well as public utility in Ireland, almost keep pace with those erec^ting great as they are, over the different parts of Gr. Britain. The number of inhabitants in this city are now computed at about 300,000.

Cork stands 129 miles south-west of Dublin, contains above 8,500 houses, and, next to the capital, is the largest, most opulent and populous in the kingdom; it is encompassed by walls, and likewise by the channel of the river Lee, over which it has bridges on all sides. This city is an episcopal see, and a place of great trade, situated fifteen miles up the river. The large vessels generally ride at a place called Pailage; but the smaller come up to the key. Its haven is deep, and well sheltered from all winds. The city, together with its liberties, makes a county, and is governed by a mayor, aldermen, and sheriffs. It has the most trade of any town in the kingdom, particularly in beef, pork, butter, and tallow, of which great quantities are exported to France, Holland, Flanders, and the American provinces; and many ships bound to the West-Indies, put in here

to victual. It formerly had several abbeys, and has now many handsome public structures, particularly a cathedral, custom-house, and two gates, one on the north, and the other on the south. Five miles below Cork, the channel of the river is divided into two by an island on which are several villages. Cork is nearly as large as Bristol, but infinitely better situated as to its navigation. The churches here are the neatest and most superb of any in the kingdom. There is likewise a very large and magnificent theatre, in which dramatic performances are exhibited by a company from Dublin, during the summer vacation at the capital. The houses in general are well built, but many of the streets are narrow.

Waterford is situated on the river Sure, and was originally built by certain pirates of Norway. Most of the houses are built with timber, and make a very indifferent appearance; but the cathedral is esteemed a very noble structure. The city carries on a very considerable trade, particularly with England, and ships of burden come up close to the key, which is excellently adapted to the purpose of loading and unloading goods. Waterford-Haven extends near eight miles and a half from north to south, almost in a straight line, the water all the way very deep and clear, and but little incumbered with rocks or sand. The city and its liberties make a distinct county. There is a citadel on the west side, and on the east a block-house and store-house.

Limerick is a handsome, populous, commercial, strong place, situated on both sides the Shannon, and contains 5,297 houses. It is a county town.

Kinsale is a neat, populous, and strong town, stands at the mouth of the river Bann, or Bandon, and is only inferior to Cork in point of trade. Proligious quantities of provisions are shipped off from hence to Flanders, Holland, France, and the West-Indies. The port is barred, but ships of any burden may enter the harbour at high-water. There is a light-house on a point of land called the Old Head of Kinsale, to direct ships in the night to the mouth of the river.

Galway is seated near a noble bay, which, running above thirty miles up into the country from the western ocean, has many harbours and roads on every side, and is sheltered by several isles at its mouth, between which are broad and deep channels called sounds. It is a very neat, strong, and flourishing city, and very advantageously situated for trade with France, Spain, and the West-Indies. The buildings, both public and private, are most of them of stone, and very elegant. The city is walled, and was once the see of a bishop, but is now within the archbishopric of Tuam. It carries on a considerable herring fishery, and is almost the only place upon the coast that has any foreign trade. The harbour is about two miles from the city, to which the goods are brought in lighters.

The other towns, though less considerable, are thus described: Carrickfergus (or Knockfergus) by some deemed the capital of the province, has a good harbour and

and cattle, but little commerce. Downpatrick has a
flourishing linen manufacture. Belfast is a large sea-
port and trading town at the mouth of the Lagen-
water, where it falls into Carrickfergus-Bay. Derry
(or Londonderry) stands in Lough-Foyl, and is a
strong little city, having linen manufactures, with some
commerce and shipping.

All this extreme part of Ireland is situated so near
to Scotland, that they are in sight of each others coasts.

Donegal (otherwise called Tyrconnel) the county
town of the same name, is a place of some trade; as
is likewise Enniskilling. The last mentioned places,
and many more less considerable ones, are chiefly and
most industriously employed in the manufacturing of
linen and linen thread, to the great benefit of the whole
kingdom.

The places already mentioned are the principal for-
tifications in the kingdom; but besides these there are
Culmore-Fort, Duncannon, Ross-Castle, Charlemont,
Maryborough, and Athlone.

The commerce and manufactures of Ireland nearly
resemble those of England. The Irish chiefly export
linen cloths, cambricks, lawns, hemp, flax, coarse rugs,
frizes, fine stuffs, ratteens, yarn, wool, beef, pork, raw
and tanned hides, calf skins dried, butter, cheese,
tallow, caudles, ox and cow horns, horse hair, ox hair,
some lead, copper ore, dried fish, salmon, herrings,
otter skins, goat skins, and rabbit skins; but the furs
of these are not so fine as those of England.

It is probable that the exports of Ireland will be
greatly increased by the late laws passed in favour of
the trade of that kingdom. The principal manufac-
tures of Ireland, and indeed the chief branch of its
commerce, consists of linen cloths, lawns, and cam-
bricks, to which great encouragement is given by the
British legislature. The manufacture of stuffs in Ire-
land is exceedingly beautiful, but the importation of
them into England is prohibited.

The Dublin Society for the encouragement of ma-
nufactures and commerce was incorporated in 1750.

Before we speak more particularly of the constitution
and government of Ireland, it is necessary to observe,
that as Scotland and England are now one and the
same kingdom, and yet differ in their municipal laws;
so England and Ireland are distinct kingdoms, and yet
in general agree in their laws.

After the conquest of Ireland by king Henry II. the
laws of England were received and sworn to by the
Irish nation, assembled at the council of Liffmore; and
as Ireland, thus conquered, planted, and governed,
continued dependent on England, it was thought ne-
cessary that it should conform to, and be governed by,
such laws as the superior state thought proper to pre-
scribe. But this state of dependence being almost for-
gotten, and ready to be disputed by the Irish nation, it
was thought proper, some years ago, to declare how
that matter stood: and therefore, by statute 6 Geo. I.
it is declared, " that the kingdom of Ireland ought to

be subordinate to, and dependent upon, the imperial
crown of Great-Britain, as being inseparably united
thereto; and that the king's majesty, with the consent
of the lords and commons of Great-Britain, hath power
to make laws to bind the people of Ireland."

This determination of the British parliament was,
however, far from being cordially received by the Irish
nation in general, many of whom disputed, more than
ever, the dependency of Ireland upon the parliament of
Great-Britain. After many struggles, perceiving their
own strength by means of their volunteer associations,
and encouraged and favoured by the several parties con-
tending for the administration in England, the Irish, in
the year 1782, obtained a formal repeal of the above
galling statute; which was considered as a renunciation,
on the part of Great-Britain, of every claim of legislation
over Ireland. Since this memorable period, the Irish
government, with respect to distributive justice, has
continued nearly the same with that of England.

Since the subjection of this island to England, it has
received viceroys under various appellations; but the
chief governor is at present generally styled the lord-
lieutenant. The appointment of this great officer is
entirely in the king's power. His jurisdictions and au-
thority are ample, and, in some degree, even royal;
but, at the same time, they are modified by the terms
of his commission; being in some restrained, and in
others enlarged, according to the monarch's pleasure, or
the exigencies of the times. The lord-lieutenant is
usually appointed for three years, but is often continued
much longer.

When any nobleman enters upon this great office, his
letters patent are publicly read in the council-chamber;
and, having taken the usual oath before the lord-chan-
cellor, the sword, which is to be carried before him, is
delivered into his hands, and he is seated in the chair of
state, attended by the lord-chancellor, the members of
the privy-council, the peers and nobles, the king at
arms, a serjeant at arms, and other officers of state. He
has a council composed of the great officers of the
crown, viz. the chancellor, treasurer, and such of the
archbishops, earls, bishops, barons, judges, and gen-
tlemen, as his majesty is pleased to nominate. When
a lord-lieutenant dies, or his place becomes vacant by
surrender, or departure out of the realm without leave,
by virtue of a statute made in the reign of Henry VIII.
the chancellor issues writs to the king's counsellors in
certain shires, to appear and make an election of another
to serve until the king sends a successor, and he is sworn
accordingly.

The parliament in Ireland, like that of England, is
the supreme court, convened by the king's writ, and
prorogued or dissolved at his pleasure. Till very lately
they were continued for the king's life; but, since the
accession of his present majesty, Irish parliaments have
been rendered biennial. It consists, as in England,
of a house of lords and commons, among the former of
which are many English peers, and commons of Great-

Britain;

Britain; some few are Papists, who, being properly qualified, are allowed to sit in this assembly; the number of commoners amount to about 300. The laws made by the parliament of Ireland are sent to England for the royal approbation, when, if approved of by the king and council, they pass the great seal of England, and are returned. Thus this parliament has power to make laws which are binding to the kingdom, raise taxes for the support of government, and for the maintenance of an army of 16,000 men, who are placed in convenient barracks in different parts of the kingdom. The representation of the people in the senate of Ireland is, in many instances, like that of England, partial and inadequate. If parliaments were more limited in their duration, it would be better for the public, and greatly promote national prosperity.

In Ireland, as in England, there are four terms held annually for the decision of causes; and four courts of justice, viz. chancery, king's-bench, common-pleas, and exchequer. In the first of these a single person presides under the name of the king's high chancellor, and keeper of the great seal. In the king's-bench and common-pleas are three judges each; and in the exchequer, the treasurer, the chancellor, and three barons. All these courts have their subordinate officers.

Here are also several inferior courts; such as, the exchequer chamber, where errors at law in the other courts are corrected; also judges of assize and gaol delivery for the trial of prisoners; a court of admiralty; courts of prerogative, and a consistory court; besides governors and justices of the peace, appointed by his majesty, in the several counties: the high sheriffs are now nominated by the lord-lieutenant.

The revenues of Ireland are computed to exceed half a million sterling, near 70,000*l.* of which is granted in pensions. The revenues are of two sorts, public and private. The public revenues of that kingdom arise from hereditary and temporary duties, of which the king is the trustee, for applying it to particular uses: but the private revenue is the unlimited property of the crown, and arises from the ancient demesne lands; from forfeitures for treason and felony; prisage of wines; light-house duties; and a small part of the casual revenue, not granted by parliament. Besides these, large sums are annually raised by the legislature for the noble purposes of improving their country. To their patriotic spirit the prodigious works carried on in that kingdom owe their origin. They have already constructed several noble canals for the benefit of inland navigation; built bridges, churches, and other public structures; made roads; given premiums for improvements in husbandry, and other useful arts; and largely assisted the useful design of Protestant working-schools. At the same time it must be observed, that the money necessary for these, and many other noble purposes, is raised in so easy a method, that the people are hardly sensible of the impost; no taxes are laid on their land, and few on any of the branches of their trade; their foreign commerce

is not clogged with innumerable duties, nor the necessities of life burdened with heavy taxes. In consequence of this, labour is cheap, and their manufactures are sent to market at a moderate price. They are in no fear of being undersold by foreigners, nor of being able to supply the orders of their correspondents. In a country like this, manufactures must flourish; and it will give pleasure to every ingenious mind to know, that the linens of Ireland are not excelled by any manufactured in Europe. A description of the ancient coins of Ireland, would be a needless undertaking, as they are now totally disused; the money of England is at this time the currency of that nation, with this difference only, that one of our shillings passes there for thirteen-pence, other pieces in the same proportion.

The land-forces now maintained in Ireland consist of 15,000 men, who have been often of singular service to England; and their military force has been gradually increased by the many volunteer associated companies which have been lately formed in that kingdom. The most uncultivated parts contain numbers of inhabitants that have very little sense either of divine or human laws, consequently regular forces are absolutely necessary for keeping them in order; witness the late insurrections of the White-Boys, and other banditti, who were intigated by their priests: though it must be confessed that many of the common people of Ireland have laboured under such oppressions as afforded them just grounds for discontent.

The history of this kingdom, like that of most other nations, is involved in fable and obscurity: it has been carried to a very remote antiquity, and may very justly be distinguished into the legendary and authentic. Some of their writers have presented us with a succession of wife and learned kings, commencing a few years after the deluge: others have given an uninterrupted succession of 197 kings of Ireland, to the year 1170; and even the more moderate Irish antiquaries carry their history up to about 500 years before the Christian era. But, as our limits will not permit us to enlarge on the dark and contested parts of their history, we shall only observe, that it was about the middle of the fifth century that St. Patrick introduced the knowledge of letters, and planted Christianity in Ireland. The soil was very friendly to religion, and afforded the monks at once a safe retreat, and sufficient leisure to pursue their studies. The invasion of the Danes and Norwegians, about the seventh century, destroyed the peace of this asylum; and it is highly probable, that the greatest part of the Irish coasts were afterwards peopled by the Normans and Danes, commonly called Easterlings, who built the cities of Dublin, Limerick, Waterford, Wexford, and Cork, and reduced as much of the adjacent country as was convenient for their purpose. But, as the rest of the kingdom offered nothing worth their contending for, the native Irish living mostly in caverns, and a few wretched houses made of hurdles, and

covered with straw and rushes, the Easterlings seemed satisfied with the sea-coasts, without attempting to extend their conquest to the inland parts of the country. Their numbers were indeed too inconsiderable to people the island, their manners too barbarous to civilize it, and their necessities too pressing to be gratified with so unavailing an acquisition.

It is, however, probable that these foreigners formed alliances with the natives, and resembled them in their manners. The fertility of the soil, the temperature of the air, the convenience of its harbours, which to other nations are the source of riches, were to the Irish matters of reproach. The fairest blessings of nature lay unimproved by ignorance, nourished by pride. Their healthful vigour was impaired by inactivity, and they seem to have been equally void of the virtues as well as the vices of mankind.

In the time of Henry II. of England there were five kings in Ireland. This prince, provoked at their piracies, and the assistance they gave his enemies, determined to subdue them. Accordingly, he applied to Adrian IV. who then filled St. Peter's chair, and obtained an ample bull for the conquest of Ireland. Soon after the pope's consent was obtained, a fair pretence offered for carrying this design into execution. Dermot Mac Murrough, king of Leinster, one of the most oppressive tyrants Ireland ever knew, invaded the territories of all his neighbours, and carried off the wife of O'Ruork, king of Meath. Fired with this indignity, the injured prince formed an alliance with Roderic, king of Connaught, and Dermot was driven out of Ireland. Thus distressed, he passed over to England, in order to implore the protection of Henry II. This event happened in the year 1167, while the English monarch was in Normandy, and prevented from assisting Dermot in person. He, however, recommended the cause of the Irish prince to several of his barons, particularly to Strongbow, earl of Pembroke, Robert Fitz-Stephen, and Morris Fitz-Gerald. Strongbow was a nobleman of unbounded ambition and large possessions in Wales, where his tenants were numerous, and the situation of his estate very convenient for passing over to Ireland. Strongbow therefore readily undertook to assist Dermot in the recovery of his country, on condition that the latter should give him his daughter in marriage, and leave him heir to his dominions. It was also agreed that Dermot should cede for ever to Fitz-Stephens and Fitz-Gerald the town of Wexford, with the two hundreds adjoining. The treaty being finished, the adventurers landed in Ireland, at the head of a small body of forces, and soon reduced the city of Wexford; and the city of Dublin afterwards surrendered upon capitulation, by which it was agreed that the city should continue in the possession of Hasculf, the Danish prince to whom it belonged.

These successes, which ought to have united, served to divide the Irish. Public spirit, the only cement of patriotic union, was to them unknown; dissensions,

inspired by revenge, envy, and avarice, prevailed among the chiefs, and Ireland fell a prey to the English; after a much less glorious struggle indeed, but by the same vices and mistakes which had before reduced Britain to a Roman province. Strongbow took the city of Waterford, drove the Danish prince from Dublin, and completed his marriage with Eva, the daughter of Dermot.

Henry, alarmed at these unexpected conquests in Ireland, and the death of Dermot, which happened soon after, resolved to visit that island in person. Accordingly he embarked his forces at Pembroke in Wales, on board 400 transports, in the autumn of the year 1171, and the next day landed in Ireland, about five miles from Waterford. All the Irish princes, except the king of Ulster, immediately repaired to Henry, and submitted to his government. Thus the king of England became master of Ireland, without shedding a drop of human blood, and in much less time than was sufficient to travel over it. Henry kept a magnificent court, and held a parliament at Dublin, where he parcelled out the cities of Ireland among his followers, settled a civil administration nearly resembling that of England, planted a colony from Bristol in that capital, and returned to England.

A few years after, Henry gave the title of lord of Ireland to his son John, who personally visited that island in 1185, attended by a company of Norman knights. But John and his giddy courtiers made a very ill use of their powers, and, by their imprudent behaviour, incurred the hatred of the people. Richard I. was too much taken up with the crusades to pay any great regard to the affairs of Ireland. King John, however, after his accession to the crown, endeavoured to make amends for his former behaviour to the Irish. He enlarged his father's plan, and laboured to establish a scheme of policy in that kingdom, upon the same footing as in England. For this purpose, he ordered sterling money to be struck at Dublin, according to the English standard; he issued a proclamation to render that money current in both kingdoms: he divided the island into counties; appointed sheriffs; ordered a fair copy of the English laws to be engrossed, and deposited in the exchequer at Dublin: he commanded the observance of the English laws and customs; erected courts of law on the same plan, and confined their proceedings to the same rules as those in England. But, notwithstanding these noble attempts to civilize the Irish, they were far from being sufficient to answer the intended purpose: the original inhabitants in many parts of the island were still governed by their own laws, and refused to conform to the customs of the English, or profit by their improvements. Their prejudices were greatly increased during the unsettled reign of Henry III. which gave them a very mean opinion of the English government; but we have no account of their disturbing the peace of their country during the life of his son Edward I.

During the reign of Robert Bruce in Scotland, the Irish seemed willing to transfer their allegiance from

the English to the Scottish crown, and Bruce sent his brother Edward, at the head of a considerable army, to assist them against the English. Edward defeated the enemy in several engagements, was actually crowned king at Dundalk, but miscarried in his attempt upon Dublin, and was afterwards defeated and slain in battle by Birmingham, the English governor. After this decisive action, the Irish submitted, and Edward II. in order to gain their confidence, governed them with great moderation, and passed several excellent acts for the benefit of their country.

Several of the succeeding kings of England pursued the same conduct with success; and many attempts were made to reduce the inhabitants to an entire conformity with the laws of England, but without success. Henry VIII. persuaded that the title of king would have a more powerful effect on the Irish than that of lord, passed an act of parliament, by virtue of which Ireland was erected into a kingdom. He was not deceived: the Irish, who had so long refused to acknowledge the authority to a lord, very readily paid a perfect submission to a king. Even O'Neil, who pretended to be the successor to the last paramount king of Ireland, swore allegiance to Henry, who created him earl of Tyrone.

The dominion of the English over Ireland was however still little more than nominal. The Irish princes and nobles, divided among themselves, readily paid the exterior marks of obedience to a power they were not able to resist; but, as no durable force was ever kept on foot to retain them to their duty, they often relapsed into their former state of independence. Too weak to introduce order and obedience among the rude inhabitants, the English power was only sufficient to check the growth of any enterprising genius among the natives: and, though it could bestow no true form of civil government, it was able to prevent the rise of any such form, from the internal combination or policy of the Irish.

Most of the English institutions also by which that island was governed, were to the last degree absurd, and such as no state before had ever thought of, for preserving dominion over its conquered provinces. The minds of the English, always engaged on the romantic scheme of subduing France, neglected all other enterprises, to which their situation so strongly invited them, and which would in time have acquired them an accession of riches, grandeur, and security.

The Irish seemed to have been very quiet during the reign of queen Mary; but they proved thorns in the side of queen Elizabeth. The perpetual disputes she had with the Roman Catholics, both at home and abroad, gave her great uneasiness; and the pope and the house of Austria always found new resources against her in Ireland. The Spaniards possessed themselves of Kinsale; and the rebellions of Tyrone, who baffled and defeated her favourite general, the earl of Essex, are well known. But what Essex did not, perhaps could not perform, was attempted with success by lord

Mountjoy, the first Englishman who gave a mortal blow to the practices of the Spaniards in Ireland, by whose suggestions and assistance the flames of rebellion were kept up in that kingdom. Mountjoy totally defeated the combined forces of the Spaniards and Irish before Kinsale, and took Tyrone prisoner. But this happening at a time when Elizabeth was under dreadful apprehensions from the Popish interest in Ireland, Tyrone was pardoned, in 1602, though he had always intended to bring him to condign punishment.

The island was now entirely reduced to obedience; but a more difficult task still remained, to civilize the barbarous inhabitants, to reconcile them to laws and industry, and to render their subjection durable and useful to the crown of England. James I. applied himself assiduously to this troublesome, but necessary business. He formed a steady, regular, well-concerted plan; and in the space of nine years made greater advances towards the reformation of that kingdom than had been done during the interval since the conquest was attempted. But such was the influence of the pope and the Spaniards, that the earls of Tyrone and Tyrconnel, and their party, planned a new rebellion, and attempted to seize the castle of Dublin; but their plot being discovered; their chiefs fled beyond the seas. They were not idle abroad; for in 1608 they instigated Sir Calim O'Dagharty to a fresh rebellion, by promising him speedy supplies of men and money from Spain. Sir Calim was slain in the dispute, and his adherents were taken and executed. The attainders of the Irish rebels, which passed in the reigns of Elizabeth and James, vested in the crown 511,465 acres in the counties of Donnegal, Tyrone, Coleraine, Fermanagh, Cavan, and Armagh; and enabled the king to make that Protestant plantation in the north of Ireland, which now, from the most rebellious province in the kingdom, is the most quiet and reformed. But those prodigious attainders, though apparently just and necessary, operated fatally for the English in the reign of Charles I. The Irish Roman Catholics in general were influenced by their priests, to hope not only to repossess the lands of their forefathers, but to restore the Popish religion in Ireland. They therefore entered into a deep and most detestable conspiracy for massacring all the English Protestants in that kingdom. This infernal scheme was originally formed in the year 1641 by Roger More, a gentleman of narrow fortune, but descended from an ancient Irish family, and much celebrated among his countrymen for valour and capacity. Perhaps this horrid scheme had never been thought of, had not the unhappy dissensions that then subsisted between Charles I. and his parliaments in England and Scotland, encouraged More to hope the present opportunity favoured the execution of this diabolical undertaking, which was perpetrated by the Papists with a degree of infernal cruelty that beggars all description, and might shock the breasts of all who have the least feelings of humanity. regard to the numbers who fell a sacrifice to wanton
barbarity, and frantic zeal; some make them amount
to 100,000; but others, and with more probability,
say 40,000.

The Irish did not, however, long escape unpunished;
Cromwell retaliated the cruelties they had exercised on
the innocent and peaceable English, on themselves,
broke their force and courage; and Ireton, his succes-
sor, totally subdued the island. Five millions of acres,
forfeited either by the Popish rebellion, or by their ad-
herents to Charles I. were divided partly among the
adventurers, who had advanced money to the parlia-
ment, and partly among the English soldiers, who had
appeared due to them. Examples of a more sudden and
violent change of property are scarce to be found in
history. The Irish having lately smarted so severely,
were quiet during the reign of Charles II. but soon
after the accession of James II. to the crown of Eng-
land, the most violent and precipitate methods were
taken to restore the Popish religion in Ireland. Tyr-
connel was vested with full authority, and carried over
with him as chancellor, one Fitton, a person lately
convicted of forgery and other crimes, but who com-
pensated for all his enormities by a headstrong zeal for
the Romish religion. The Catholics were also put in
possession of the council-table, of the courts of judi-
cature, and of the bench of justices. The Protestant
members were expelled from the parliament, and their
places supplied by Catholics; it is therefore no won-
der that this bigoted prince found shelter in Ireland,
after he had abdicated the throne of England, and was
even induced to hope that, by the assistance of his
Popish subjects, he should be able to recover the
throne of his ancestors. But the battle of the Boyne,
where his whole army was totally defeated by king
William, destroyed all these flattering ideas, and he was
obliged to have recourse to a foreign prince for pro-
tection.

In consequence of this defeat, most of the large
estates in Ireland were forfeited; and had the govern-
ment disposed of all the lands which fell into their
hands, the greater part of Ireland must have been peo-
pled with British subjects; but it was thought more
prudent to endeavour to conciliate the minds of the
Irish, than drive them to despair. It was also thought
proper to preserve a proper balance of interest between
the Catholics and Protestants in that kingdom; and ac-
cordingly, after the friends to the Revolution and the
Protestant religion were sufficiently gratified out of the
forfeited estates, the insurgents, on a proper submission,
were pardoned, and suffered to enjoy their fortunes,
and the protection of the British government.

These prudent and lenient measures have been at-
tended with the desired success. Ireland is now a very
respectable kingdom. Manufactures, especially those
of linen, are carried on with spirit and advantage. Im-
provements are daily made in agriculture, and other
useful arts. The inhabitants know their own interest

and importance. The Catholics are greatly lessened
with regard to numbers; and the rays of learning have,
in a great measure, dispersed the clouds of ignorance,
and dissipated the fury of blind enthusiastic zeal. Some
acts of parliament have been made in their favour;
salted beef, butter, pork, tallow, and other necessaries
of life, are occasionally permitted to be exported from
Ireland into any of the ports of Great-Britain. But
notwithstanding some laws and regulations had taken
place in favour of Ireland, the inhabitants of that
country were still found to labour under considerable
grievances, in consequence of sundry most unjust and
injudicious restraints of the parliament of England re-
specting their trade. In October 1779, both houses of
the Irish parliament presented addresses to his majesty,
in which they declared that nothing but granting Ire-
land a free trade could save it from ruin.

The members of the opposition, in the English par-
liament very strongly represented the necessity of an im-
mediate attention to the complaints of the people of Ire-
land, and of a compliance with their wishes. The ar-
guments on this side the question were also enforced by
the accounts which came from Ireland, that the vol-
unteer associations in that kingdom amounted to 40,000
men, unpaid, self-appointed, and independent of gov-
ernment, well armed and accoutred, daily improving
in discipline, and their number afterwards increased to
80,000. The British ministry appeared to be for some
time undetermined what part they should act in this im-
portant business: but the remembrance of the fatal ef-
fects of rigorous measures respecting America, and the
very critical situation of Great-Britain, at length in-
duced the British ministry to bring in such bills as were
calculated to afford commercial relief to the people of
Ireland. Laws were accordingly passed, by which all
those acts were repealed which had prohibited the ex-
portation of woollen manufactures from Ireland, and
other acts by which the trade of that kingdom to for-
eign countries had been restrained: and it was likewise
enacted, that a trade between Ireland and the British
colonies in America and the West-Indies, and the Brit-
tish settlements on the coasts of Africa, should be al-
lowed to be carried on in the same manner, and subject
to similar regulations and restrictions, with that carried
on between Great-Britain and the said colonies and set-
tlements. These laws in favour of Ireland were re-
ceived with much joy and exultation in that kingdom.

The commercial advantages afforded the Irish by the
acts above mentioned, have greatly contributed to pro-
mote the prosperity of their country; and, by the act
repealing the statute of 6 Geo. I. they are fully and
completely emancipated from the jurisdiction of the
parliament of Great-Britain: the appellate jurisdiction
of the British House of Peers in Irish causes was like-
wise given up. The last material event respecting this
country, is that, in the year 1783, the government, the
nobility, and the people of Ireland, vied with each other
in countenancing and giving an asylum to many families
of

of the Genoese, who were banished from their own country, and to others who voluntarily exiled themselves for the cause of liberty, not willing to submit to an aristocracy of their own citizens, supported by the swords of France and Sardinia. There is a convenient town building for the reception of these people, whose emigration thither will, by the manufactures they are engaged in, prove very beneficial to the country.

The order of St. Patrick was instituted Feb. 5, 1783, and the installation of the first knights was performed on the 17th of March following. It consists of the sovereign and fifteen other knights companions. The lord-lieutenant of Ireland for the time being officiates as grand-master of the order, and the archbishop of Armagh is the prelate, the archbishop of Dublin the chancellor, and the dean of St. Patrick the register of the order. The knights are installed in the cathedral of St. Patrick, Dublin. Their robes are splendid, and the badge is three crowns united together in a cross, with the motto round, *Quis separabit?* "Who shall separate?" 1783, fastened by an Irish harp to the crown imperial. The coat is encircled with a star of eight points. This is the only order of knighthood in Ireland.

Before we conclude the geography of the British dominions, it will be necessary to give a short description of the isles of Man, Jersey, Guernsey, &c. as they all enjoy some local privileges, and could not be comprehended under any of the foregoing general heads of the British dominions.

C H A P. XIII.

THE ISLE OF MAN.

Situation, Boundaries, Extent, Climate, Air, Soil, Produce, Cattle, Inhabitants, Government, Towns, &c.

THIS isle is situated in St. George's Channel, between England, Scotland, and Ireland, its distance from all three being nearly equal; a circumstance to which, according to some authors, it owes its present name, which they derive from the Saxon word *Mang*, which signifies among. It was formerly distinguished by several different appellations, as *Mona*, which seems to have been a general name with the ancients for any detached island; *Monocla*, *Monabia*, *Menavia*, *Eubonia*, and *Manaw*. Its length from north to south is about thirty miles; its breadth from east to west about twelve: the middle of the island lies in 54 deg. 16 min. north lat. and in 5 deg. 8 min. west long. It is divided into thirteen parishes, and has four towns, where the greater part of the trade of the island is carried on. The weather in this island is less variable than that of England, but the summers are shorter and cooler, and the winters more severe. The air is exceedingly pure and wholesome, and the soil, in the hilly parts, barren; but in the vallies and champaign

country very fruitful; these abound in corn, barley, oats, rye, hemp, flax, roots, pulse, and fine pasture.

This island abounds in a small breed of black cattle, and on the mountains are great numbers of hogs and sheep, which run wild, and are never housed; the meat of both is excellent. The horses which are bred in this island are very small, but swift and hardy. There are no foxes, badgers, otters, snakes, &c. and it is asserted, that a frog was not to be found in the place till some spawn was brought over from Ireland. Eagles, and a species of mottled hawks, inhabit the island; and, in a small island called the Calf of Man, separated from the Isle of Man by a narrow channel, an infinite number of sea-fowl harbour, among which are clark geese, or barnacles, and those delicious birds called puffins, said to breed in the holes of the rabbits, which for that time leave them to these strangers. The old ones leave their young all day, and fly to the sea, and, returning late at night with their prey, disgorge it into the stomachs of their young; by which means they become almost an entire lump of fat. In August they are hunted, as it is called, and no less than 5000 of these young fowl are generally taken every year; these are mostly eaten on the island, but many of them are pickled, and sent abroad as presents.

A ridge of mountains, which runs almost the whole length of the island, furnishes the inhabitants with excellent water, together with peat and turf for fuel.

The Isle of Man contains about 20,000 inhabitants; who are in general very peaceable, hospitable to strangers, and charitable to the poor. The lower class live in thatched huts, which they secure against the high winds, common to this place, by a contrivance made of ropes of straw; but the gentry reside in exceeding good houses, built of stone, and roofed with slate. Their method of improving their lands is by manuring them with sea-weed, lime, and marle, or sometimes by folding their sheep upon them, whereby they procure excellent crops of wheat, notwithstanding which the common bread of the country is made of oatmeal.

The curiosities of this island consist chiefly in Runic sepulchral inscriptions, written in the old Norwegian language; monuments of brass and large white stones; daggers and other instruments of brass, which have been found buried under ground, together with nails of pure gold.

At present its trade consists in black cattle, lamb's wool, fine and coarse linen cloth, hides, skins, honey, tallow, and herrings, of which the inhabitants formerly exported twenty thousand barrels annually to France and other foreign countries: and it is to be hoped that this fishery will now increase, the British parliament having lately given a very considerable sum of money for the encouragement of that useful undertaking.

The language used by the natives, is radically Erse, or Irish, with a mixture of Latin, Greek, Welsh, and English words. This composition is termed *Manks*: the New Testament and Common-Prayer have been

translated into this language. Strangers, being unacquainted with their laws and language, are forced to employ others to plead for them; and it is not long since they had any attorneys, consequently law-suits were determined without much charge.

The tenets of the church of England are professed by the inhabitants. Christianity was first planted here by St. Patrick about the year 440. The cathedral is dedicated to St. Germain, who was the first bishop of the Isle. There are 17 parish churches in the Isle of Man, and each of the market-towns has a chapel.

The bishop of Sodor and Man enjoys all the spiritual rights and pre-eminence of other bishops, but does not sit in the British House of Peers; his see never having been created into an English barony: One of the most excellent prelates who ever adorned the episcopal character, was Dr. Thomas Wilson, bishop of Man, who presided over that diocese upwards of 57 years, and died in the year 1755, aged 93. He was eminently distinguished for the piety and exemplariness of his life, his benevolence and hospitality, and his unremitting attention to the interests of the people intrusted to his care. He encouraged agriculture, established schools for the instruction of the children of the inhabitants of the island, translated some of his devotional pieces into the Mank language, to render them more generally useful, and founded parochial libraries in every parish in his diocese. Some of his notions respecting government and church discipline were not of the most liberal kind, but his failings were so few, and his virtues so numerous and conspicuous, that he was a great blessing to the Isle of Man, and an ornament to human nature. Cardinal Fleury had so much veneration for his character, that, out of regard to him, he obtained an order from the court of France, that no privateer of that nation should ravage the Isle of Man. The ecclesiastical courts are held by the bishop either in person, or by his vicars general; and the archdeacon in person, is his official. Ecclesiastical discipline is here maintained very strictly according to the canons; and the better to secure it, the bishop calls a convocation of his clergy, at least once a year, in order to inquire how the discipline of the church has been observed, and to make such constitutions as are necessary for its better government. In all the courts of this island, ecclesiastical and civil, both men and women, who are natives of the island, usually plead their own causes. There are no Papists natives of this island, nor Dissenters of any denomination, except Quakers. If the bishop's tenant is found guilty of a capital crime, for which he may be tried in the bishop's court, and by a jury of his tenants, he forfeits his lands to the bishop, but his person and moveables are at the king's disposal.

This island is under the immediate command of a governor, who resides at Castle-Town, and is appointed by his majesty. He has power over all officers, civil and military; and to him, as chancellor, there lies an

appeal in matters of right and wrong, and from him to the king in council.

The supreme court of the island, termed the Tingwald, is held on a hill near the centre of the island, in the open air, and consists of the governor, officers spiritual and temporal, the two deemsters, and twenty-four keys. The two deemsters are the temporal judges both in civil and criminal causes; and the twenty-four keys are persons so denominated from solving, or as it were unlocking, the difficulties of the laws. Their business is to make new laws, assist the deemsters in interpreting them, and to decide all difficult cases. In the tingwald every person has a right to present any uncommon grievance, and to have his complaints heard and redressed in the face of the whole country. All new laws, having first been agreed to by the governor, council, deemsters, twenty-four keys, and received the royal assent, are likewise published in this court.

The council of the Isle of Man consists of the governor, bishop, arch-deacon, the two vicars-general, the receiver-general, the comptroller, the bailiff, and the attorney-general.

This island is divided into six sheathings, each of which has its coroner, who, in the name of the sheriff, is intrusted with the peace of his district, by securing criminals, and bringing them to justice. A moor and a captain are likewise two officers belonging to every parish. The former of these, who are properly the king's bailiffs, are changed yearly, and obliged to be answerable for the rents in their respective divisions. The captains have the care of the militia or trained bands.

In this island, if a single woman prosecutes a single man for a rape, and he is found guilty, the deemster, or justice, delivers to the woman a rope, a sword, and a ring, which gives her the choice of having him hanged, beheaded, or, by marrying him, saving his life.

The principal towns are Castle-Town or Castle-Ruffin, Peele, Douglas, and Rainsea; all of which are situated on the sea-coast.

Castle-Town is the metropolis of the island, and derives its appellation from a beautiful old, but still entire castle, built of a coarse kind of marble. Here the governor and chief officers reside, the chancery is kept, and the assizes are held twice a year.

Peele was denominated Holm-Town by the Norwegians, from a small island adjacent to it, wherein stands the cathedral, at this time in ruins, except the chancel, which is kept in repair by the bishop. Thomas, earl of Derby, notwithstanding this isle was sufficiently strengthened by nature, surrounded it with a wall, towers, and other fortifications. Of late the town of Peele has been much enlarged, several excellent houses having been built by merchants settled there.

Douglas is the richest and most populous town in the whole island, has the best market, and enjoys the greatest trade. The harbour, which has a fine mole

extending into the sea, is esteemed one of the best in the three kingdoms. There is a free-school, and noble warehouses, vaults, and cellars belonging to the merchants.

Ramfea was formerly a very inconsiderable town, but its trade has increased considerably of late years. It is noted for a spacious bay, in which ships may ride safe from all winds, except the north-east, and the harbour is tolerable.

HISTORY OF THE ISLE OF MAN.

THE Isle of Man is a distinct territory from England, and is not governed by our laws; neither doth any act of parliament extend to it, unless it be particularly named therein, and then an act of parliament is binding there. Frequent mention is made in history of the kings of Man, but we can find no regular account of their succession. This island was formerly a subordinate feudatory kingdom, subject to the kings of Norway; then to king John and Henry III. of England; afterwards to the kings of Scotland, and then to the crown of England; and at length we find Henry IV. claiming the island by right of conquest; and disposing of it to the earl of Northumberland; upon whose attainder it was granted, by the name of the Lordship of Man, to Sir John de Stanley, by letters patent, 7th Henry IV. In his lineal descendants it continued for eight generations, till the death of Ferdinando, earl of Derby, A. D. 1594, when a controversy arose concerning the inheritance thereof, between his daughters and William his surviving brother; upon which, and a doubt that was started concerning the validity of the original patent, the island was seized into the hands of the queen (Elizabeth), and afterwards various grants were made of it by James I. all which being expired, or surrendered, it was granted afresh, in 7th James I. to William, earl of Derby, and the heirs male of his body, with remainder to his heirs general; which grant was the next year confirmed by act of parliament, with a restraint of the power of alienation by the said earl and his issue male. On the death of James, earl of Derby, A. D. 1735, the male line of earl William failing, the duke of Athol succeeded to the island, as heir general by a female branch.

In the mean time, though the title of king had been disused, the earls of Derby, as lords of Man, had maintained a sort of royal authority therein, by assenting to, or dissenting from laws, and exercising an appellate jurisdiction.

Yet, though no English writ or process from the court of Westminster was of any authority in Man, an appeal lay from a decree of a lord of the island to the king of Great-Britain in council: but the distinct jurisdiction of this little subordinate royalty being found inconvenient for the purposes of public justice,

and for the revenue (in affording a commodious asylum for debtors, outlaws, and smugglers) authority was given to the treasury, by stat. 12 Geo. I. c. 28. to purchase the interest of the then proprietors for the use of the crown; which purchase was at length completed in the year 1765, and confirmed by statutes 5 Geo. III. c. 26. and 30. whereby the whole island, and all its dependencies, so granted as aforesaid (except the landed property of the Athol family, their manorial rights and emoluments, and the patronage of the bishopric, and other ecclesiastical benefices), are unalienably vested in the crown, and subjected to the regulations of the British excise and customs.

CHAP. XIV.

THE ISLE OF WIGHT.

Situation, Extent, Climate, Soil, Produce, Chief Town, Ports, &c.

THIS delightful island is considered as part of the county of Southampton, and within the diocese of Winchester. It is situated over-against the coast of Hampshire, being separated from it by a channel, which varies in breadth from two to seven miles. Its greatest length, from east to west, is nearly twenty-three miles; and its breadth, from north to south, about thirteen. The purity of the air, the fertility of the soil, and the beauty and variety of the landscapes of the island, have obtained it the appellation of the garden of England. In the southern parts, the air is in general particularly healthy; the soil is various; but so great is its fertility, that it was long ago computed that more wheat was produced here in one year, than could be consumed by the inhabitants in eight; and under the great improvements of agriculture, and the additional quantity of land lately brought into tillage, its present produce is supposed to have more than kept pace with the increase of population. Through the middle of the island, a range of hills extends from east to west, which affords fine pasture for sheep. Every part of the island affords a great number of beautiful and picturesque prospects, not only in the pastoral, but also in the great and romantic style; of these beauties, the gentlemen of the island have availed themselves, as well in the choice of situation of their houses, as in their other improvements; some of their country-seats are very elegant; in short, the island itself is often visited by parties of pleasure on account of its delightful scenes. Domestic fowls and poultry are bred here in great numbers; and from this island the outward-bound ships and vessels at Spithead, the Mother-Bank, and Cowes, commonly furnish themselves with those articles.

There are thirty parishes in the Isle of Wight.

Most of the farm-houses are built of stone, and even the cottages appear neat and comfortable, having each a little garden belonging to it. According to a very accurate computation, made in the year 1777, the inhabitants then amounted to 18,024, exclusive of the troops quartered there.

Newport, which may be considered as the capital town, stands nearly in the centre of the island. The three principal streets extend from east to west, and are crossed at right angles by three others, all which are spacious, clean, and well paved. The river Medina empties itself into the channel at Cowes-Harbour, distant about five miles, and being navigable up the river, renders it commodious for trade.

There are several forts in this island, which were all erected about the thirty-sixth year of Henry VIII. when many other forts and blockhouses were built in different parts of the coast of England. Carisbrooke-Castle has been rendered remarkable by the confinement of king Charles I. who, taking refuge here, was detained a prisoner, from November 1647 to September 1648. After the execution of the king, this castle was converted into a place of confinement for his children; and his daughter, the princess Elizabeth, died in it.

C H A P. XV.

THE islands of JERSEY, GUERNSEY, ALDERNEY, and SARK, in the British channel, are all subject to England, and within the diocese of Winchester. They lie in a cluster in Mount St. Michael's Bay, between Cape La Hogue in Normandy, and Cape Frebelle in Brittany, Sark being four, Guernsey seven, and Alderney nine leagues from Jersey.

The island of JERSEY, which was known to the Romans, and by them called *Cæsarea*, is situated in 49 deg. 26 min. west lon. eighteen miles west of Normandy, and eighty-four miles south of Portland. It is about twelve miles in length, and eight in breadth. The rocks on the northern side form a natural and inaccessible fortification; but to the south the island is almost level with the water. The air is very salubrious; and the soil, particularly in the valleys, rich, fruitful, and well-cultivated; but there is no wood for firing. The higher land is generally appropriated for orchards, and great quantities of excellent cyder are made there. There are no animals in this island which are not found in England, but it is well stocked with black cattle and sheep. Fish and wild fowl of every kind abound there, and some of these are peculiar to the place. The Jersey honey is esteemed very delicious.

The whole island is divided into twelve parishes, and its capital town is St. Helier, which contains a number of exceeding good houses, and make an elegant appear-

ance. The people, who are about 20,000 in number, employ themselves in cultivating their orchards, and a manufacture of knit stockings and caps, wherein their commerce chiefly consists, though they carry on a considerable trade in fish to Newfoundland and the Mediterranean. Their language is French, but most of them intermix it with English words. The religion here, and likewise in the other three islands, is that of the church of England. The governor is appointed by the king, but the civil administration is vested in a bailiff, assisted by twelve jurats.

The property of this island formerly belonged to the Carterets, who were originally Normans; and Jersey, being the chief remains of the duchy of Normandy, depending on the kings of England, still preserves the ancient feudal forms, particularly the assembly of states, which is, as it were, a miniature of the British parliament, as settled in the reign of Edward the First.

GUERNSEY, which is likewise part of the ancient Norman patrimony, is thirteen miles and a half from south-west to north-east, and twelve and a half where broadest, east and west. It has an harbour, at St. Peter le Port, guarded by two forts, one called the Old-Castle, the other Castle-Cornet. The island is divided into ten parishes, to which there are but eight ministers, four of the parishes being united; and Alderney and Sark, which are appendages of Guernsey, having one apiece. Though this is a much more desirable spot, it is not so populous as Jersey, and consequently not so valuable, because less cultivated. It abounds, however, in cyder, and in most other respects resembles the island last described; but want of firing is the greatest inconveniency that both islands labour under. The number of inhabitants in this, and the islands of Alderney and Sark, are computed at 20,000; they speak the French language.

ALDERNEY is separated from Normandy, by a narrow strait, called the Race of Alderney, from the prodigious velocity of the current; otherwise it is safe, and has depth of water for the largest ships. This island, which is about eight miles in compass, has nothing in it remarkable but a fine breed of cows, many of which have been brought into England, where they are known by the name of Norman cows. It has a healthy air, and fruitful soil.

SARK is a very small island depending upon Guernsey, from which it does not differ in any thing material; the inhabitants are long-lived, and enjoy, from the products of nature, all the conveniences of life; their number is about 300.

THE ISLES OF SCILLY, anciently called the ST. LURES, are a cluster of dangerous rocks, to the number of 140, lying about thirty miles from the Land's-End in Cornwall, of which county they are reckoned a part. Some of these islands are well inhabited, and have large and secure harbours. These rocks being situated between the English channel and St. George's

channel,

channel, many ships and lives have been destroyed by them.

C H A P. XVI.

THE NETHERLANDS.

Situation, Extent, Divisions, Rivers, Animals, Produce, Population, Trade, Language, Learning, Religion, &c.

THESE provinces, which are seventeen in number, obtained the general name of Netherlands, Pais Bas, or Low Countries, from their situation in respect

of Germany. They were formerly part of Gallia Belgica, and afterwards of the circle of Belgium, or Burgundy, in the German empire. Their situation is between 2 and 7 deg. east long. and between 49 and 54 north lat. and extend, from north to south, 350 miles; the breadth, from east to west, is 300. Their boundaries are, the German sea, on the north; the British channel, on the west; Germany, on the east; and Lorrain in France, on the south.

The United Provinces are, properly speaking, eight; viz. Holland, Overysfel, Zealand, Friesland, Utrecht, Groningen, Guelderland, and Zutphen; but the two latter forming only one sovereignty, they are always considered as seven.

7. UTRECHT IN THE MIDDLE.

On the old Channel of the Rhine ..	Utrecht.
North of the Old Rhine	Amersfort.
South of the Old Rhine	Duerstardwyck.

The United Provinces, which are about ninety miles distant from the English coast, lie very low, having neither mountains, rising grounds, nor forests, to diversify the scene; and the country, when viewed from a tower or steeple, has the appearance of a continued marsh or bog, drained at certain distances by innumerable ditches.

In the southern parts, the climate does not differ

materially from that of England, but in the northern, the winter is generally very sharp, and the summer sultry hot; neither the excessive heat or cold, however, lasts above a month or six weeks. The air is foggy, moist, and would be very unwholesome, if not purified by the frost in winter, when the east wind usually blows for about four months, during which season their harbours are entirely frozen up. The soil is by nature unfavourable to vegetation, an obstacle which the industry of the inhabitants has in a great measure surmounted, in making canals, &c. to drain their lands; which, by this method, are rendered fit for pasture, and in many places for tillage.

The principal rivers are, the Rhine, one of the largest and finest rivers in Europe; the Maese, the Scheldt, and the Vecht. The first, we shall describe in our account of Germany. The Maese, after dividing itself into two branches, and again uniting these, falls into the north sea, below Rotterdam. The Scheldt, below Antwerp, divides itself into two branches, called the Western and Eastern Scheldt, the first separating Flanders from Zealand, and the other running north by Bergen-op-Zoom; and afterwards, east, between the islands of Beveland and Schowen, falls into the sea a little below. The Vecht runs from east to west through the province of Overysse, and falls into the Zuider sea. There are many smaller rivers that join these, and a vast number of canals. There are few good harbours in the provinces. The best are those of Rotterdam, Helvoetsluys, and Flushing. The harbour of Amsterdam, though one of the largest and safest in Europe, has a bar at the entrance of it, over which large vessels cannot pass, without being lightened or unloaded. Haerlem, the only lake in this country, has a communication with Amsterdam and Leyden, by means of canals.

The animals are much the same as those in England. The inhabitants buy lean cattle in Denmark and the north of Germany, which they fatten to a prodigious bulk; and the horses are larger than those of any other nation. They have a good breed of sheep, whose wool is highly valued; and it is said that in some places they have wild boars and wolves. Storks build and hatch in their chimnies; but, being birds of passage, they leave the country, together with their young, about the middle of August, and do not return till February. The fish found in the seas and rivers there, are the same as ours, though larger; but they have no herrings on their coasts: there are many excellent oyster beds about the islands of the Texel.

Very little corn is produced in these provinces; but in some parts they grow madder, tobacco, and a little fruit. Vast quantities of the latter are sent yearly from England, together with all kinds of roots and garden-stuff, particularly cauliflowers. The provinces, however, in general, abound with rich pastures, fine groves of trees, vegetables, though not in such perfection as those of England, and exceeding fine flowers.

A
New & Accurate
MAP
of
THE SEVEN UNITED
PROVINCES.

3 East Longitude from London

According to the best calculation, the Seven United Provinces contain 113 cities and towns, 1,400 villages, and about two millions of inhabitants, who are distinguished by the general appellation of the Dutch. They are usually tall and strong built; the women have good skins and tolerable features, but both sexes are very clumsy in their shapes, to which their dress contributes greatly, for the men wear coats without plaits, and their long pockets reach nearly to their arm-pits: the women have their petticoats, of which they wear a great number, no lower than the middle of their legs; their waists are excessively short, and on their heads they sometimes wear a plain round-ear cap, but frequently only a black ribband, tied in a particular manner: this, however, is not to be understood of the higher ranks of people, who imitate the French greatly in their method of dress and living. The manners of the people differ according to their situations in life. The gentry are polite and hospitable. The tradesmen are no otherwise honest than the law, or the discernment of the persons they deal with, obliges them to be so; for whenever they can evade the one, or impose upon the judgment of the other, they seldom fail to do it. The boors or husbandmen are exceedingly dull of understanding, impatient if treated harshly, but easily guided by gentle methods, and yielding to the conviction of plain reasoning, if they are allowed time to comprehend it. The seamen are a plain, rough, surly, ill-mannered people, seldom making use of more words than is necessary about their business. Every class, however, agrees in being exceedingly industrious and frugal, never spending the whole of their income, let it be ever so trifling. They are naturally phlegmatic, and seldom in a passion, except heated by liquor, or provoked by any one acting contrary to their interest, which is dearer to them than life; in every other respect, they are quiet neighbours, and peaceable subjects. Though a Dutchman, when drunk, is guilty of every act of brutality, and though they have been known to exercise the most shocking inhumanities abroad, from lucrative views, yet in their own country they are in general quiet and inoffensive. They are seldom seen to express any great emotions of joy or sorrow, and the passion of love is a thing talked of, but scarce ever felt by either sex; for they are so similar, that in displaying the dispositions of the men, those of the women are likewise delineated. The Dutch drink great quantities of spirituous liquors, wine, &c. and both men and women smoke tobacco. They are remarkable for cleanliness; and nothing can exceed the neatness of their houses, which is greatly owing to the necessity they are under of perpetually rubbing and scouring, from the moisture of the air, which causes metals to rust, and wood to mould, more than in any other country. The nobility, magistrates, and rich merchants, who have retired from trade, endeavour to rival each other in the beauty of their equipages, and the elegance of their houses and sur-

niture. Among the middling ranks of people, there is scarce any distinction between masters and servants, and it would be difficult for a stranger, at first sight, to know the one from the other.

No country can vie with Holland in the number of those inhabitants, whose lot, if not riches, is at least a comfortable sufficiency, and where fewer failures or bankruptcies occur. Hence, in the midst of a multitude of taxes and contributions, such as no other country experiences, they flourish and grow rich. From this systematic spirit of regularity and moderation, joined to the most obstinate perseverance, they succeeded in the stupendous works of draining their country of those immense deluges of water that had overflowed a considerable part of it during many ages, while at the same time they brought under their subjection and command the rivers and seas that surround them, by dykes of incredible thickness and strength, and made them the principal bulwarks on which they rely for the protection and safety of their territories against the incursions of an enemy. To this end, they have covered their frontiers and cities with innumerable sluices; by means of which, at the shortest notice, the most impetuous inundations are admitted, so that they become in a few hours inaccessible. Their remarkable frugality and perseverance has also enabled them, though labouring under the greatest difficulties, not only to throw off the Spanish yoke, but to attack that powerful nation in the most tender parts, by seizing her rich galleons, and forming new establishments in Africa, and the East and West-Indies, at the expense of Spain, and thereby becoming, from a despicable province, a most formidable enemy. The rise of their military and marine establishments was also equally wonderful, since, in their celebrated contention with Louis XIV. and Charles II. of England, they maintained no less than 150,000 forces, and upwards of eighty ships of the line. But a spirit of frugality is not now so universal among the Dutch as it was formerly: the rich traders and mechanics begin to adopt English and French luxuries in dressing and living; their nobility and high magistrates, who have retired from trade, rival those of any other part of Europe in their tables, buildings, furniture, and equipages; gaming is likewise practised among many of their fashionable ladies, and some of them discover more propensity to gallantry than was known here in former times.

The summer diversions of the Dutch differ little from those of the English; and in winter they shoot wild geese and ducks: they delight in skating, at which they are very expert; and it is amazing to see with what inconceivable velocity both men and women dart, or rather fly along upon the ice, having perhaps at the same time a load on their heads.

The usual way of passing from town to town in Holland is by covered boats, called treckscuits, which are dragged along the canals by horses on a slow uniform trot, so that passengers reach the different towns where they

they are to stop, precisely at the appointed instant of time. This method of travelling is exceedingly convenient to the inhabitants, and very cheap, but at the same time extremely dull and disagreeable. The principal people travel on the ice in sledges, which a man, placed behind, pushes along with great swiftness. These sledges ply on the rivers and canals, in the same manner as our boats on the Thames.

The inland navigation of the United Netherlands is of the greatest advantage to their trade. Almost every town enjoys the benefit of a navigable canal, which is now become the principal method of communication between one town and another. Among the many benefits derived from these canals may be reckoned that of sending goods into various parts of Germany and the Austrian and French Netherlands, from the principal trading towns of Holland, at a very small expence: some of the canals communicate with the Rhine, others with the Maese, and others with the Ems. Hence a very extensive inland commerce is carried on throughout this country; and the goods imported from foreign states, by the great trading towns of Rotterdam, Amsterdam, &c. are dispersed into various parts in large quantities; so that these provinces may be considered as one large mart of trade. The canals are lined for several miles together with elegant neat country-houses, seated in the middle of gardens and pleasure-grounds intermixed with figures, busts, statues, temples, &c. to the very water's edge: genteel families, in fine weather, spend much of their time in these little temples, smoking, reading, or viewing the passengers, to whom they appear to behave with complaisance and politeness. A treckscuit, in which goods are conveyed on these canals, is divided into two different apartments, called the roof and the ruin; the first for gentlemen, and the other for common people, who may read, smoke, eat, drink, or converse with people of various nations, dresses, and languages.

As to commerce and manufactures, the United Provinces are the grand magazine of Europe, and goods may be purchased here sometimes cheaper than in the countries where they grow. Their East-India-Company, which is the most opulent and powerful of any in the world, have had the monopoly of the fine spices for more than 100 years, and, till the late war with England, was extremely wealthy and powerful; but their commerce hath greatly suffered since that period. Their capital city in India is Batavia, which is said to exceed in magnificence, opulence, and commerce, all the cities of Asia. Here the viceroys appear in greater splendor than the stadtholder; and some of the Dutch subjects in Batavia scarcely acknowledge any dependence on the mother-country. Their India settlement on the Cape of Good Hope is extremely pleasant, healthful, and useful, being the grand rendezvous of the outward and homeward-bound ships of all nations.

The manufactures of Holland are as extensive as its commerce, and consist in fine linen, table damasks,

woollen-cloths, sail-cloth, paper, delft-ware, pots, tobacco-pipes, refined salt, sugar-works, oil-mills, cotton, silk, wax-bleaching, leather-dressing, hemp, and starch. Vast sums are amassed annually by their mills for sawing timber, used in building ships and houses; and great wealth is acquired by the herring, whale, and cod-fisheries, which they have wrested from the native proprietors, and in these the provinces of Holland and Zealand are chiefly concerned, and employ a vast number of ships; in the two first only, about 350 sail. The herrings cured there are preferable to those of any other nation; and, in a good season, the profits on this branch of trade only are said to amount to 2,000,000 of Holland guilders yearly, clear of all deductions. It is, however, thought that the riches and luxury of individuals have damped the general industry of the inhabitants, and that the Dutch commerce, navigation, manufactures, and fisheries, are not in the same flourishing state as they were in the beginning of this century.

The principal trading company in Holland is that to the East-Indies, incorporated in 1602. About the year 1660 the Dutch divided 40 per cent, and afterwards 60; the dividends are at present much reduced; but, in 124 years, the proprietors, on an average, divided yearly above 24 per cent. and, so late as in 1760, they divided 15 per cent. The Dutch West-India-Company was incorporated in 1621, and, in the year 1760, divided only two and a half per cent. The bank of Amsterdam is immensely rich, and under an excellent direction. According to Mr. Anderson, the cash bullion, and pawned jewels in this bank, amount to thirty-six millions sterling, though others say only thirty millions: this treasure is kept in the vaults of the stadthoufe.

The constitution of the United Provinces is a very intricate article. They all, indeed, form a general confederacy; and the statutes made in the assembly of the states, after they have acquired the necessary sanctions, become binding on all the inhabitants of the United Provinces. But, notwithstanding this particular, each province has a separate internal government, wholly independent of the others; but as these independent governments, considered separately, could not defend themselves against the attempts of a foreign enemy, they are formed into one collective body, by a certain number of deputies, or representatives, chosen by each, who constitute the legislative power, and are termed the States-General. Their power is, however, in some respects, limited; for, when a resolution is taken by the States, it has not the force of a law till it has received the approbation of every province, every city, and every republic in that province; nor are even a majority of voices in these different and subordinate assemblies sufficient, it must be unanimously approved, one dissenting voice being sufficient to render the whole abortive. But these tedious formalities are usually laid aside in times of imminent danger, when the approbation of the States-General is allowed to be sufficient.

Next in authority to the States-General is the Council of

of State, which consists of deputies from the several provinces. It is composed of twelve persons, of whom Holland sends three, Guelderland one, Zealand two, Utrecht one, Friesland two, Overyffel one, and Groningen two. In this council they do not vote by provinces, as in the States-General, but by personal voices, and every deputy presides in his turn. When the votes happen to be equal, the stadtholder has a decisive voice. The business of this council consists in preparing estimates, finding out ways and means for raising the public revenues, and other matters necessary to be laid before the States-General.

Subordinate to these two bodies is the chamber of accounts, which is likewise composed of provincial deputies, who audit all public accounts. The admiralty forms a separate board, and the executive part of it is committed to five colleges in the three maritime provinces of Holland, Zealand, and Friesland. In Amsterdam, which takes the lead in all public administrations, the magistracy is lodged in thirty-six senators, who are chosen for life; and every vacancy among them is filled up by the survivors. The same senate also elects the deputies to represent the cities in the province of Holland, in which the people neither choose their representatives nor their magistrates. Hence this country, in its government, may more properly be styled an oligarchy than a republic.

The power of the stadtholder is very limited, except when he appears at the head of an army. He is indeed president of the states of every province, and can, by his influence, procure such deputies to be sent to the assembly of the States-General as are friends to his interest, and may change the deputies, magistrates, and officers, in every province and city. To his office are annexed certain prerogatives, which vary in different provinces; but they may all be changed by the authority of the States-General. The appointment of the stadtholder from the States is 100,000 guilders, or 9,500l. sterling, besides which he has several principalities and large estates of his own.

The States of the provinces are styled Noble and Mighty Lords, but those of Holland Noble and Most Mighty Lords; and the States-General, High and Mighty Lords, or, the Lords the States-General of the United Netherlands, or, their High Mightinesses.

Justice is said to be no-where dispensed with more impartiality than in this country. Every province has its tribunal, to which, except in criminal causes, appeals lie from all the petty and country courts. The stadtholder has the power of pardoning condemned malefactors.

Christianity was first introduced into the Netherlands in the eighth century by St. Winifred. After that period, Popery continued to be preferred till the Reformation, when many of the people embraced Protestantism; which giving umbrage to the king of Spain, he issued orders to punish with death all those whom the church of Rome declared heretics. This occasioned

the total alienation of the seven Dutch provinces, the established religion of which, at this time, is the Presbyterian or Calvinism; but all persuasions and sects are tolerated; and the inhabitants of Holland live together as citizens of the world; their differences in opinion make none in affection, and they are associated together by the common ties of humanity and the bonds of peace, under the protection of the laws of the state, with equal encouragement to arts and industry, and equal freedom of speculation and inquiry. The Papists and Jews are very numerous: none but Presbyterians are admitted into any office or post in the government, except the army.

Low Dutch is the language of these provinces: it is compounded of the Teutonic, or ancient German, with several French and Latin words. We shall transcribe their Lord's prayer, as a specimen: "Onse Vader, die in de hemelin zyn uwen naam worde geheylight; uw'konin-gryk kome; uwe wille geschiede gelyck in den hemel zoo ook op den arden, ons dagelicks broot geef ons heeden ende vergeeft onse schulden gelyk ook wy vergeeven onso schuldenaaren: ende en laat ons meet in ver-soer kingemaer verstoff on van der hoosen. Amen." The sound of this language, to those who are ignorant of it, is harsh and unpleasing; but this is greatly softened by the accent and pronunciation of the more learned and polite. The higher ranks of people commonly speak English and French.

Many of the Dutch have distinguished themselves by their learning, and some even by their wit and ingenuity. They are famous for controversial divinity, which at one time insinuated itself so much into the state, that it had nearly proved fatal to the government. They boast of excellent writers in all branches of medicine, and numerous commentators upon the classics. Their Latin poems and epigrams are very common, and, about the year 1747, Van Haaren published some poems in favour of liberty. In the other departments of literature, the Dutch publications are mechanical, and arise chiefly from their employments in the church, universities, or state. The city of Haarlem dispenses the invention of printing with the Germans; and the magistrates keep in their town-house the first book printed by Colter, about the year 1440. Be that as it may, it is certain that the most elegant editions of the classics came from the Dutch presses of Amsterdam, Rotterdam, Utrecht, Leyden, and other towns.

Among the principal of the Dutch writers, are, Erasmus, Grotius, Boerhaave, Grævius, Burmann, and Van Haaren.

There are five universities in the United Netherlands, viz. Leyden, Utrecht, Groningen, Harderwicke, and Francker. Leyden is the oldest and largest in these provinces, and was founded in 1575. It enjoys many privileges, has a library well furnished, particularly with manuscripts; a physic-garden stocked with all kinds of plants, many of which have been brought from the Cape of Good Hope and the East-Indies; an anatomy-

hall, and an observatory. The professors, who are usually men of eminence, read public lectures four times a week, gratis; but every person who attends a course of private lectures, which lasts a whole year, pays about three guineas: the lectures are always in Latin. The professors wear gowns only when they preside at public disputations, read public lectures, or meet in the senate: their salaries are from one to two hundred pounds per annum. The students do not lodge in the university, but where they please in the town: they have no distinct habit, and all wear swords. The university of Utrecht was founded in 1636, and is in a very flourishing state, though it does not enjoy the privileges of most other universities, being entirely subordinate to the magistrates of the city. The number of students are computed at 2000. The university of Groningen was founded in 1615, and well endowed out of the revenues of the suppressed monasteries. The university of Harderwicke was only a *Schola illustris* till 1648, when it acquired its present title. The university at Francker was founded in the year 1585, and has a fine physic-garden. The students of all these colleges enjoy the privilege of not paying any tax for their wine and beer.

No oaths or religious tests are imposed in these universities; so that Roman Catholic parents, and even Jews, send their children here with as little scruple as Protestants. These seminaries of learning have each three or four divinity professors, as many of physic, and two or three of law; besides others of history, language, and eloquence, or the belles lettres; and others of philosophy, mathematics, the Greek and Roman antiquities, and the Hebrew and Oriental languages. The professors in the universities of Holland frequently become men of great learning and eminence; and, indeed, there is a laudable emulation between the states of the different provinces, which shall have the greatest men to adorn their universities, and this induces them to attract numbers of students from all parts of Europe to enrich their towns, and very liberal encouragement is given to able professors.

The external appearance of these universities is rather mean, and the buildings old; but these defects are amply compensated by the variety of solid and useful learning taught in them. There are abundance of youth, of the principal nobility and gentry, from most countries in Europe, at these seminaries of literature; and, as every one may live as he pleases, without being obliged to be profuse in his expences, or so much as quitting his night-gown for weeks or months together, foreigners of all ranks and conditions are to be seen here.

The force of example is strikingly exhibited at these seats of learning; for frugality in expence, order, a composed behaviour, attention to study, and assiduity in every thing, being the characteristics of the natives, strangers who continue among them soon adopt their manners and method of living. And, though the students are under no restraint, but live as they please, and study as much or as little as they think fit, yet they are

in general remarkable for their sobriety and good manners, and the diligence and success with which they apply themselves to their respective studies.

Amsterdam is the capital city of all the United Netherlands. It is built upon piles, and, next to London, is esteemed the most commercial city in the world. Among the public edifices, those most worthy notice are the stadhous, the exchange, the arsenal, the inn called the Three Waggon, the gymnasium illustre, the East and West-India houses, the Lombard and loan-bank, the theatre, the physic-garden, the chyrurgical and anatomical college, the naval storehouses, the docks, sluices, churches, hospitals, houses of correction, harbour, towers, warehouses, and weighing-houses. The beauty of the canals, and walks under them planted on their borders, in this and all the other cities in Holland, are admirable; and the neatness every-where observed within doors is particularly pleasing. This city, however, labours under two very great disadvantages, namely, the want of good air and water; notwithstanding which, it is greatly resorted to by strangers. The number of inhabitants is computed at 240,000, of which a great part are Papists and Jews.

Rotterdam is twenty-eight miles from Amsterdam, and next to it in commerce and wealth. Its streets are spacious and handsome. The principal public buildings are, the exchange, the East and West-India houses, the bank, the arsenal, and St. Laurence's church, near which stands a small house, where the famous Erasmus was born: its inhabitants are calculated at 56,000.

Leyden is a large and fine city, and celebrated for its university: here are also some fine churches, and several long, broad, and elegant streets. This city maintained a long and severe siege against the Spaniards in 1573.

Utrecht, nineteen miles from Amsterdam, and twenty-seven from Leyden, is a large populous city. The churches are magnificent; the other public buildings are the university and the town-house. The streams which run through several of the streets contribute greatly to the cleanliness and beauty of this town.

The Hague, though but a village, is one of the most considerable places in Holland, and is said to contain about 40,000 inhabitants: it is exceedingly beautiful, and situated upon the highest ground in the whole country, so that the air is more salutary than that of the other cities. It has neither gates nor walls, but is surrounded by a moat, over which there are a number of draw-bridges; and, being the residence of the stadtholder, it is likewise that of foreign ministers, and the resort of all persons of distinction who visit Holland. The streets and squares are spacious, particularly de Plaats, which is an open, airy place, in form of a triangle, and adorned with elegant buildings. An eminence, called the Vyverberg, is laid out into several fine shady walks, and, at the bottom, is the Vyver, a large basin of water. But the most celebrated part of the Hague is the Voorhout, which consists of a mall, and three spaces on each side for coaches, the whole

being in much the same taste as St. James's-Park. Here people of distinction take the air in their coaches.

Middleburg, the capital of Zealand, is fifty miles distant from Rotterdam. The public buildings are magnificent, and the streets broad and well-paved. The gates are eight in number, the harbour and city are strongly fortified: the latter contains thirty-three parishes, about 4000 houses, and near 26,000 inhabitants.

Leuwarden, the capital of Friesland, stands sixty miles north-east of Amsterdam. It is a large, well-built, and populous town: the streets are clean, the houses splendid, the bridges well paved, and the gardens pleasant: the churches, governor's palace, and the senate-house, are fine structures. This city and Francker choose their own magistrates.

Groningen, twenty-seven miles from Leuwarden, and eighty from Amsterdam, is the capital of the province of the same name. The town is large and populous, being the seat of the high colleges, containing twenty-seven streets: here are many fine houses, besides churches, three spacious market-places, and several public structures. Ships of considerable burden can come up to this city, by which means it enjoys a pretty good trade.

Deventer, in the province of Overijssel, stands forty-four miles from Utrecht: it is a neat, populous, well-built, and strongly-fortified city, containing several churches belonging to different sects. Five annual fairs are held here. Along the river side is a fine quay, adorned with rows of trees.

Nimeguen, in the province of Guelderland, is fifty-two miles distant from Amsterdam. It is a large ancient city, strongly fortified, and pleasantly situated. On the east side of it stands an old castle, and it also contains several churches belonging to different sects. The peace between the French and confederates was concluded here in 1678.

Amersfoort, in the province of Utrecht, seventeen miles distant from the city of that name, is an ancient and large town, but of no great strength, being commanded by a neighbouring hill. The buildings are in general very neat. They have three churches here, one of which is a large and stately fabric. They have likewise a public school, where several eminent persons have had their education.

There are but few natural and artificial curiosities in these provinces. In Overijssel, there are stones, the enormous size of which cause an equal astonishment in the spectator with those of Stonelenge upon Salisbury-Plain; and near Maeltricht, under a hill, there is a stone quarry, which is worked into a kind of subterraneous palace, supported by pillars twenty feet high. In Friesland, they have a species of bituminous earth, that takes fire in a surprising manner; and, in the sixteenth century, according to some historians, burnt the length of two leagues before it could be extinguished. Among the chief artificial curiosities may be placed the prodigious dykes, seventeen elis thick, with the mounds and

canals, made to protect them from those dreadful inundations from which they suffered greatly in the last century: these stupendous works excite the admiration of every beholder. Several museums, containing valuable antiquities and curiosities, are to be found in this country, particularly in the university of Leyden, where is to be seen a shirt made of the entrails of a man; also two Egyptian mummies, being the bodies of two princes of great antiquity, with all the muscles and tendons of the human body, curiously set up. In the city of Nimeguen are many Roman antiquities; and, in the church at Gouda, there are some exquisite paintings upon glass. At Saardam (famous for being the place where Peter the Great served his apprenticeship to ship-building, and laboured at that trade) the town-house is adorned with paintings; and there is a remarkable clock and dial, which cost 150,000 guilders.

The taxes in these provinces are so many, and so heavy, especially in Holland, that it is not without reason that a certain author asserts, that the only thing that has escaped taxation there is the air they breathe. The taxes consists of an almost general excise, a land-tax, a poll-tax, and hearth-money, so that the ordinary revenues of the republic are computed at between two and three millions sterling annually. Out of 100 guilders, the province of Holland contributes 58, and, consequently, above one-half of the whole public expences. For the encouragement of trade, the duties on goods and merchandize are said to be exceeding low. Notwithstanding the number and greatness of the taxes, every province is said to labour under very heavy debts, especially Holland, and the public credit is not in the most flourishing condition.

With respect to their land-forces in time of peace, they seldom exceed 40,000, and very often fall short of that number. They employ a great many foreigners, especially Swifs and Scots, in their service; and, in time of war, hire whole regiments of Germans. The chief command of the army is vested in the stadtholder, under whom is the field-marshal-general. In 1756, the expences of the army only amounted to 9,765,004 guilders. No nation in the world can fit out a more formidable fleet than the Dutch, having always vast quantities of timber prepared for building of ships, and such numbers of ship-carpenters and mariners: however, in time of peace, they usually have no more than thirty in commission, for the protection of their trade in the Mediterranean, and to convoy their homeward-bound Indiamen, &c. By the last accounts, their navy consists of one ship of 76 guns, three of 70, four of 68, five of 60, eight of 56, four of fifty, five of 44, nine of 40, and ten of 36 (forty-nine in all) besides vessels of inferior force: they have also many ships upon the stocks.

Every province being a sovereignty in itself, has consequently the right of coinage; but all the money must be of the same intrinsic value. The coins are as follow: a deut, worth about half a farthing; a grot

 forty-two pence; a rix-thaler, or rix-dollar, fifty-pence;
 a ducatoon, sixty-three pence. The gold ducat is
 worth about eight shillings and eight-pence; and the
 ruyder is almost equal to a guinea. Besides these, there
 are half and three guilder pieces, and half and quarter
 six-dollars.

One of the most ancient as well as powerful orders of
 Europe was that of the Teutonic knights, which is
 now divided into two branches; the first for Papiſts,
 and the other for Protestants. This branch have a house
 at Utrecht, where they transact their business. The
 ensign is a cross pattie, enamelled white, surmounted
 with another, black; above the cross is a ball twisted,
 white and black. It is worn pendant to a broad black
 watered ribband, which is worn about the neck. The
 same cross is embroidered on the left breast of the upper
 garment of each knight. The nobles of Holland, if
 they propose a son to be a knight, enter his name in the
 register, and pay a large sum of money to the use of the
 poor maintained by the order, and the candidate suc-
 ceeds in rotation, if he brings with him proof of his
 nobility for four generations on the father's and mo-
 ther's side.

With respect to the arms or ensigns armorial of the
 Seven United Provinces, or the States of Holland, they
 are, Or, a lion, gules, holding with one paw a cutlass,
 and with the other a bundle of seven arrows close bound
 together, in allusion to the several confederate provinces,
 with the following motto, *Concordia res parvæ crescunt*,
 i. e. "Small things increase by concord."

A SUCCINCT ACCOUNT OF THE PREROGA-
 TIVES OF THE STADTHOLDER.

THE ancient house of Nassau is divided into many
 branches, deriving their respective titles from the eleven
 counties of the principality of Nassau, in the Imperial
 Circle of the Upper Rhine. These are Dillenburgh,
 Dietz, Hadamar, Kerberg, Siegen, Idstein, Weilburgh,
 Wilbaden, Biellsteid, Otweiler, and Ullingen; Nassau
 being prefixed to each. Nassau was erected into a prin-
 cipality, in 1653, by the emperor Ferdinand II. This
 family has not only given a king to Great-Britain, in
 the person of the immortal William III. but also an
 emperor to Germany, in Adolphus, count of Nassau,
 in 1292. From Otho, count of Nassau, general of the
 Imperial army, in 926, to John III. in 1494, are four-
 teen descents; in which time, the counts of Nassau, by
 their matrimonial alliances, acquired large possessions in
 the Netherlands, Burgundy, &c. This John III. count
 of Nassau-Dillenburgh, left two sons, Henry and Wil-

liam, between whom his territories were divided.
 Henry, in 1515, married Claude de Chalons, only sister
 of Philibert de Chalons, prince of Orange, who was
 killed in 1530, at the battle of Pistoje, in Tuscany;
 and, leaving no issue, bequeathed his principality of
 Orange to his sister's only son René, or Renatus;
 who dying also without heirs, in 1544, left it to
 his cousin William, the son of William before men-
 tioned.

WILLIAM I. first Stadtholder, in 1579.

William I. count of Nassau-Dillenburgh, and, by
 his cousin René's will, prince of Orange, the illustrious
 founder of the Dutch republic, was born in 1533. In
 the general revolt of the Netherlands against the tyranny
 of Philip II. of Spain, he was the soul of that memo-
 rable contest; in which he was greatly assisted by his
 brothers Ludovic, Adolphus, Henry (all three slain in
 battle, without heirs) and especially by John, his second
 brother, to whom he gave part of his German domi-
 nion with the title of Count of Nassau-Dietz, and
 from whom the present prince of Orange is descended
 in a direct line. The third son of John was Ernest
 Casimir, born 1573; father of William-Frederic, born
 1613; father of Henry-Casimir, born 1657; father of
 John-William-Frizzo, born 1687, whom king William
 III. appointed heir to the house of Orange; father of
 William IV. born 1711; father of William V. born
 1748.

On the 29th of January 1579, by his powerful in-
 fluence, the memorable confederacy was formed at
 Utrecht, which laid the foundation of the republic of
 the United Provinces. This confederacy was composed
 at first of the states of Holland, Zealand, Gueldres,
 Friesland, and Utrecht only; but the provinces of
 Overyssel and Groningen acceded to it in the sequel.
 The situation of these provinces was then so critical,
 that they were represented under the figure of a ship
 without sails and rudder, with this inscription—*Incer-
 tum quo fata ferant*. But from amidst these storms a
 powerful republic was soon to emerge. The confede-
 rates agreed upon the same form of government that
 subsists at present. It was the union of several distinct
 powers, leagued together for their common safety,
 without detriment to the particular rights and sovereignty
 of either. Each province, without ceasing to be an
 independent republic, composed with the six others one
 same republic, with but one and the same interest.
 The States-General, consisting of deputies from every
 part of the confederacy, represent the Majesty of the
 State; but they are neither the lords nor the arbiters of
 it. They can agree upon nothing without the consent
 of the states of the provinces, who have no right to give
 it, till they shall have previously obtained the consent
 of the towns. Thus the splendor of the sovereignty is
 vested in the States-General, and the real and legislative
 authority in the towns only. It is true, that each pro-
 vince is wisely divested of the right of making war and
 peace,

peace, and of concluding separate alliances; but it was a political error to grant a negative voice to each town. If two thirds had been allowed to conclude for the whole body, there would have been more safety and energy in the government. Each province sends as many deputies to the States-General as it thinks proper; but this circumstance is not productive of inconvenience, as their deliberations are regulated, not by the votes of the deputation, but of the provinces. The duration of the deputies is not uniform: some deputies are chosen only for a year; others for a longer time; and some for life. Neither the governor, the captain-general, nor any military officer, have the privilege of sitting in the States-General. Each province presides a week by turn, being represented by its senior deputy. It was thought necessary to conclude these arrangements, by personally interesting the prince of Orange in the preservation of the edifice which he himself had constructed; and he was, therefore, unanimously elected stadtholder.

The dignity of stadtholder is not different from that of governor: the two names are synonymous. William had been stadtholder of Holland and Zealand under Charles V. and Philip II. He continued so, without opposition, from the commencement of the revolt; and the union of Utrecht invested him with the same dignity in the other provinces.

Besides the stadtholdership, William obtained the dignities of captain and admiral-general, which gave him the command in chief of the fleets and armies of the republic, with the disposal of all employments depending on them. All the naval and military officers were obliged to take an oath of allegiance to him, after having taken the same to the states of the province, and to the council of state. This council is composed of twelve deputies from the provinces; viz. one from Gueldres, three from Holland, two from Zealand, one from Utrecht, two from Friesland, one from Overijssel, and two from Groningen. Before the assemblies of the States-General were made residuary at the Hague, this council represented their authority in their absence, and was bound to convene them twice a year; but its functions are now confined to the regulation of military affairs, and the administration of the finances. Their decisions are made by a plurality of persons, not of provinces.

Nothing in the army could make William sensible of his dependence on the republic, but the presence of some deputies that accompanied him, and without whose advice he could undertake nothing of importance. The great offices of stadtholder, captain, and admiral general, have since become, as it were, inseparable.

The prince did not long enjoy this elevation; he was assassinated at Delft, in the fifty-first year of his age.

By his first wife, Anne of Egmont, countess of Buren (the oldest son of the prince of Orange being always count of Buren) he had one daughter, and a son named Philip-William, who being seized at the university of Louvain by the duke of Alva, was carried to Spain, where he was confined thirty years, before he was suf-

fered to return to the Netherlands: he died without issue in 1618. By his second wife, Anne, daughter of Maurice, elector of Saxony, he had a daughter, and one son, named Maurice. By his third wife, Charlotte of Bourbon, who had been a nun, he had six daughters. And by his last wife, Louisa de Coligni, he had Frederic-Henry.

MAURICE, second Stadtholder, in 1583.

Maurice, the second son of William, succeeded to the stadtholdership on the death of his father; to the dignity of captain and admiral-general, on the departure of the haughty and perfidious Leiceller; and to the principality of Orange, on the decease of his brother, prince Philip-William. He entered upon action when he was only seventeen years old.

"The life of this stadtholder," says a celebrated French writer, who was the idolator of his own kings, and a bitter enemy to the House of Orange, "was an almost uninterrupted series of combats, of sieges, and of victories. His camp became the universal military school of Europe; his pupils have supported, and even enhanced his reputation. Like Montecuculi, he possessed the art for little known of marches and encampments; like Vauban, the talent of rendering fortified places impregnable; like Eugene, the method of subsisting numerous armies in the most barren and desolated countries; like Vendôme, the good fortune to obtain from the soldiers more than he had a right to expect; like Condé, that instantaneous and unerring eye which decides the fate of battles; like Charles XII. the means of rendering his troops almost insensible to hunger, to cold, to fatigue; like Turenne, the secret, which now seems to be lost, of husbanding the lives of men. In the opinion of the chevalier Folard, Maurice was the greatest officer of infantry since the time of the Romans."

This is the eulogy of an enemy; but the glory of Maurice was sullied by his ambition. He aimed at an authority incompatible with the constitution of the republic. Being opposed in his views by the grand pensionary * Barneveldt, that virtuous citizen fell a victim to his resentment in 1619. Maurice died in 1625, at the age of fifty-eight, and was succeeded by his brother,

FREDERIC-HENRY, third Stadtholder, in 1625.

The great military talents of this prince rendered him worthy to be the successor of his illustrious brother.

* The great pensionary is the first minister of the states of the province of Holland; acting both as a speaker of the assembly, and a secretary of state. He likewise assists in the council of state, and is perpetual deputy of his province to the States-General. He is called pensionary (as are also the first ministers of the regency of each city, in the province of Holland) from receiving an appointment or pension.

Maurice

Maurice had compelled the Spaniards to consent to a
treaty of twelve years, that expired in 1621; under the
auspices of Frederic, they were happy to solicit as a fa-
vour, that they might be permitted to acknowledge the
independence of the republic. He died in 1647, aged
sixty-three years, leaving four daughters, and one son,
William, who succeeded him in all his dignities, of
which the five provinces had given him the survivorship
during the life-time of Frederic-Henry, in order to
acknowledge, in the person of the son, the great obli-
gations they were under to the father. It may be pro-
per to observe here, that, on the death of William I.
Maurice was declared stadtholder of five provinces only;
the other two, Friesland and Groningen, having elected
his cousin William-Lewis of Nassau-Dietz: but the
stadtholder of the five provinces was captain and admiral-
general of the whole.

WILLIAM II. fourth Stadtholder, in 1647.

This prince was only twenty-one when his father
died. "He united in his person," says the writer be-
fore quoted, "whatever was requisite to perpetuate the
glory of his house; regular, pleasing, and majestic fea-
tures; vigorous, active, and indefatigable; his access
easy; his manners captivating and popular; conversant
in the languages, as well as in history, poetry, and the
mathematics; with an experience, which his genius
and reflections had rendered more extensive than his
years. But his understanding was somewhat deficient
in justness, his heart in moderation, and his politics in
probity. His ambition too was without restraint, his
valour without prudence, and his soul without fortitude."

The conduct of this prince was such as might be ex-
pected from such a character. Being disgusted at a re-
solution which the province of Holland had taken, to
dismiss great part of the army, he suffered himself to be
swayed by violent counsels; and, under colour of a
power from the States-General to preserve the union,
and oppose whatever might disturb it, he not only im-
prisoned six lords of the states in the castle of Louves-
tein, but rashly marched an army against Amsterdam,
in order to seize and change the magistrates of that city.
This design being discovered by the Hamburgh post, who
happened to ride through the camp in the night-time,
unperceived, it was happily frustrated: but it cost him
the affections of the republic; and his mortification was
so great, that he retired to his seat near the Hague,
where, being seized by a fever, which was followed by
the small-pox, he died in the 25th year of his age. His
royal consort, the princess Mary, eldest daughter of king
Charles I. was so shocked at this event, that, eight days
after, she was delivered of a son, when she was but
seven months advanced in her pregnancy. This son was

WILLIAM III. fifth Stadtholder in 1672, and King of
Great-Britain in 1688.

William III. was born on the 4th of November 1650,
The inconsiderate conduct of the father was very detri-
mental to the interests of the son. By the influence of

the famous grand pensionary De Wit, who was the soul
of the republican party, the states published, in 1667,
the perpetual edict, by which the young prince and his
descendants were excluded for ever from the office of
stadtholder, which was declared to be abolished. But,
in 1672, when Louis XIV. invaded the United Pro-
vinces, the most violent commotions of the populace
compelled the states to repeal the perpetual edict, to
invest the prince of Orange with the offices of stadtholder,
and captain and admiral-general, and to declare
those dignities hereditary in his family. His adminis-
tration was so wise and just, that he acquired more ex-
tensive authority than any of his ancestors had exercised;
and it has been remarked of him, that he was only
stadtholder in England, but king in Holland.

William died in 1702, without issue, and appointed
John-William Frizo, prince of Nassau-Dietz, his sole
heir. This young prince, who was born in 1687, was
descended, as before observed, in a direct line, from
John, count of Nassau-Dietz, brother of William I.
He took the title of prince of Orange; but that title,
and the whole succession, were disputed by the king of
Prussia, who founded his claim as descended from
Louisa-Henrietta, daughter of Frederic-Henry, the se-
cond stadtholder, who had married Frederic-William,
elector of Brandenburg. In order to settle this dis-
pute (afterwards settled in 1733 by an equal partition)
the prince was repairing to the Hague to meet the king
of Prussia there, when he was unfortunately drowned,
in crossing an arm of the sea at Mardyke, on the 14th
of July 1711. The writer of this article crossing the
same passage near seventy years after (1778) was men-
tioning the circumstance to a friend, when an old, vene-
rable, weather-beaten Hollander, at the helm, ob-
served, that he remembered it well; that he was a lad
on board the ferry-boat, when this misfortune hap-
pened; that the prince, being in his chariot on account
of the rain, the tempest grew so violent, that, attempt-
ing precipitately to leave the chariot, he stepped with
one foot on the deck, and fell head-foremost into the
water. Three months after his death his consort was
delivered of a son,

WILLIAM IV. sixth Stadtholder, in 1747.

On the death of William III. the office of stadtholder
was again laid aside; and the republican party
carried their animosity against the house of Orange to
such an extreme, that they not only refused the young
prince his rank in the army, but unjustly deprived him
of his patrimonial possessions, the marquises of Flush-
ing and Terveere. However, in 1722, the province of
Gueldres elected him their stadtholder, notwithstanding
the remonstrances of the other provinces; and in 1747,
when the French no longer respected the territories of
the republic (the ally of Great-Britain, but neutral as a
principal) the same popular commotions as had hap-
pened in 1672, compelled the states of all the provinces
not only to invest him with the offices of stadtholder and

captain and admiral general, but to declare those dignities hereditary in his family, and even in the female and collateral branches.

On the 12th of June 1733, his serene highness was elected a knight of the garter, and was installed at Windsor, by proxy, on the 27th of August. On the 7th of November, he arrived at Greenwich in the *Fubbs yacht*, and was received with every demonstration of joy. Being seized soon after with an indisposition, he spent some time at Bath, for the recovery of his health; and, on visiting Oxford, that university conferred on him the degree of doctor of laws. On the 14th of March 1734, he was married to Anne, princess-royal of England; a bill for naturalizing him received the royal assent on the 21st of March; and, on the 22d of April, the illustrious pair embarked for Holland. The dowry of her royal highness was 80,000*l.* with an annuity of 5000*l.* for her life.

This excellent prince died of a quinsy, on the 11th of October 1751; leaving issue the princess Caroline, born February 28, 1743, and the count of Buren, born March 8, 1748. By the present constitution of the republic, the princess-dowager had the administration of affairs as *gouvernante*; during the minority of her son; and all the powers that her husband enjoyed devolved upon her, during that period.

WILLIAM V. the seventh Stadtholder, and Chief Governor in 1793.

The princess *gouvernante* after an administration of great wisdom and ability, died on the 12th of January 1759. Just before her royal highness expired, she gave a key to one of her court, desiring him to bring her a paper, which he would find in a place she named; which being brought accordingly, she signed it. This was her daughter's contract of marriage with the prince of Nassau-Weilburgh. She afterwards caused another paper to be brought to her, which she also signed; desiring that it might be delivered, according to its address, as soon as she should leave the world. This second paper was a letter to the States-General, in which she entreated all the confederates to consent to the marriage of her daughter, and not to make any change in the regulations she had made with respect to the tutelage of the young prince, and his education. These two papers being signed and sealed, she sent for her children, exhorting them to make a proper improvement of the education she had given them, and to live in good harmony; then embracing them with the utmost tenderness, she gave them her blessing. After this, she conversed with the greatest calmness with her principal courtiers, for a few hours, and then expired, in the 50th year of her age.

By her will, the king her father, and the princess-dowager of Orange, her mother-in-law, were appointed honorary tutor and tutors to her children; and prince Lewis, duke of Brunswick-Wolfenbüttele, field-marshal of the forces of the republic, acting tutor.

The morning after her royal highness's decease, the States-General and the states of Holland held an extraordinary assembly, in which they confirmed the regulations she had made. The prince of Brunswick was invited to assist in the assembly of the states of Holland, where he was received with all the respect possible, and took the oaths as representing the captain-general of the union. He was likewise invited to the assembly of the States-General, where a resolution was prepared by their high-mightinesses, whereby they agreed to the resolution of Holland. Every thing passed to the entire satisfaction of the people.

On the 8th of March 1766, his serene highness was declared of age. It was universally allowed, that the duke of Brunswick had fulfilled the duties of guardian with exemplary fidelity and care. The young prince endeavoured to evince his gratitude to the duke by the most expressive actions; nor were the States-General less mindful of his services; for the same day, they sent a solemn deputation to thank him. They did more; they charged their ambassador at Vienna, not only to thank their Imperial majesties, for permitting the duke to remain in the United Provinces, but to entreat them still to permit him to continue there, and not to abandon the young stadtholder, who might have occasion for his experience and advice. And the states of Holland, on their part, after having thanked the duke by their pensionary, begged him to accept, as a mark of their grateful sense of his services, of an appointment of 200,000 florins."

Harmony subsisted many years between his serene highness and the States-General. The events previous to the rupture with England, and in consequence of it, which have since interrupted that harmony, and, from an object of grateful respect, rendered the duke of Brunswick an object of persecution, are too recent in every memory to need recapitulation.

The power of the stadtholder is very limited, except when he appears at the head of an army. The most important prerogatives of this office are, 1. The power of pardoning criminals. 2. To be president of all the courts of justice, and to have his name placed at the head of their decisions. 3. To choose the magistrates of the towns from a certain number presented to him for his election; and, in more than one place, he had the entire disposal of employments. 4. To send in his name, and for his private interests, plenipotentiaries to foreign courts; and to give private audience to the foreign ambassadors to the States-General. 5. To enforce the execution of the decrees issued by the republic. 6. To be arbiter of the differences that might arise between the various communities, towns, or provinces. The appointment of the stadtholder from the states is 100,000 guilders, or 9,500*l.* sterling; besides which, he has several principalities and large estates of his own.

The hereditary stadtholder, William V. of Orange-Nassau, captain-general and admiral of the Seven United Provinces, was born in 1748, married, in 1767,

THE AUSTRIAN AND FRENCH NETHERLANDS.

Situation, Extent, Boundaries, Divisions, Climate, Soil, Productions, Mountains, Mines, Rivers, Commerce, Manufactures, Cities, Inhabitants; their Manners, Customs, Religion, Language, Learning, Government, Revenues, Forces, History.

THESE Netherlands are situated between the 2d and 7th deg. east long. and between the 49th and 51st of north lat. being 200 miles in length, and as many in breadth, containing the following provinces, viz. 1. Brabant. 2. Antwerp. 3. Malines. 4. Limburg. 5. Luxemburg. 6. Namur. 7. Hainault. 8. Cambresis. 9. Artois. 10. Flanders.

These provinces are bounded by the United Netherlands on the north; by Germany on the east; by Lorraine, Champagne, and Picardy in France, on the south; and by another part of Picardy, and the English sea, on the west. This country belongs to the Austrians, French, and Dutch, and the particular provinces and towns appertaining to each state will be found in the following divisions.

1. PROVINCE OF BRABANT.

SUBDIVISIONS.	CHIEF TOWNS.
Dutch Brabant	{ Boileduc..... } N. { Breda..... } { Bergen-op-Zoom } { Grave, N. E. } { Lillo..... } N. W. { Steenberghe..... }
Austrian Brabant	{ Brussels, E. } { Louvain..... } In the middle. { Vilvorden.. } { Landen..... }

Antwerp and Malines are provinces independent of Brabant, though surrounded by it, and subject to the House of Austria.

4. PROVINCE OF LIMBURG, S. E.

Chief Towns	{ Limburg, subject to Austria. } { Maastricht..... } { Dalem..... } Subject to { Fauquemont, or } the Dutch. { Valkenburg }
-------------------	---

5. PROVINCE OF LUXEMBURG, S. E.

SUBDIVISIONS.	CHIEF TOWNS.
Austrian Luxemburg.	Luxemburg.
French Luxemburg..	{ Thionville } S. E. { Montmedy }

6. PROVINCE OF NAMUR, in the middle, subject to Austria.

Chief Towns	{ Namur, on the Sambre and Maese. } { Charleroy, on the Sambre. }
-------------------	--

7. PROVINCE OF HAINAULT.

Austrian Hainault ...	{ Mons.. } { Aeth... } In the middle. { Enguien }
French Hainault	{ Valenciennes } S. W. { Bouchain... } { Condé..... } { Landrecy... }

8. PROVINCE OF CAMBRESIS, S. W.

Subject to France....	{ Cambray. } { Crevecoeur, S. of Cambray. }
-----------------------	--

9. PROVINCE OF ARTOIS, S. W.

Subject to France....	{ Arras, S. W. on the Scarpe. } { St. Omer, E. of Boulogne. } { Aire, S. of St. Omer. } { St. Venant, E. of Aire. } { Bethune, S. E. of Aire. } { Terouen, S. of St. Omer. }
-----------------------	---

10. PROVINCE OF FLANDERS.

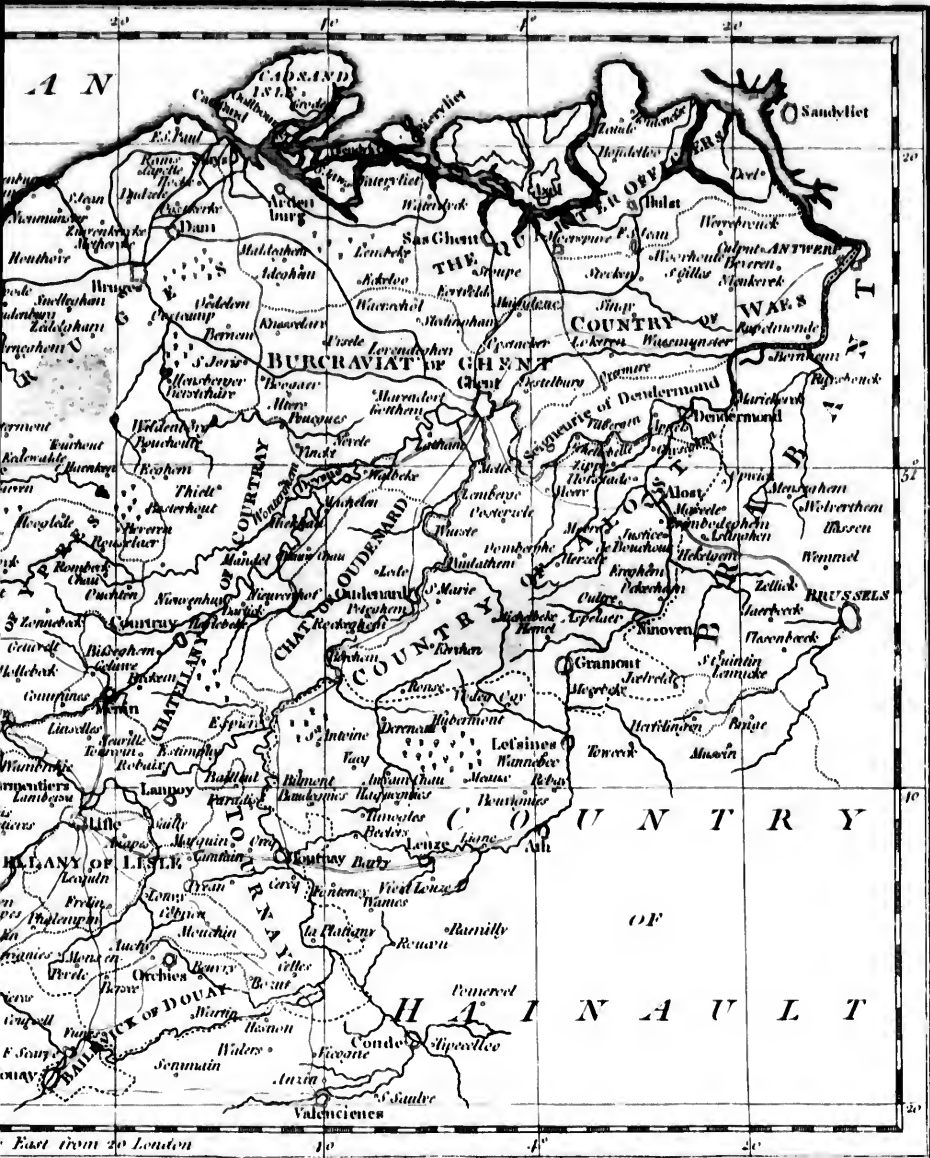

Dutch Flanders.....	{ Sluys, N. } { Axel, N. } { Hulst, N. } { Sas Van Ghent, N. } { Ghent, on the Scheldt. } { Bruges } { Ostend } N. W. near the sea. { Newport }
Austrian Flanders....	{ Oudenarde, on the Scheldt. } { Courtray } On the Lys. { Dixmude } { Ypres, N. of Lille. } { Tournay, on the Scheldt. } { Menin, on the Lis. }

The emperor has thought fit to divide the Austrian Netherlands into nine circles, in the same manner as Bohemia, and the other hereditary estates, and has appointed a captain over each circle, who is to have 4000 florins per annum: namely, for Brabant, the comte de Broghi; for the province of Limbourg and the duchy of Ruremonde, M. de Ransomel; for the marquisate of Antwerp and the lordship of Malines, the chevalier Van der

der Diltz; for the duchy of Luxemburg, M. de Berg; for the province of Namur, the viscount de Sandrouin de Villers de Lefse; for Dornik, Tonnois, and the retroceded part of Flanders, M. de Beelen; for Bruges and Oflend, Mr. Malrien; for Ghent and the rest of Flanders, Mr. Maroux; and for Hainault, the comte de Gorreguies.

SUBDIVISIONS.

CHIEF TOWNS.

French Flanders	{	Lille, W. of Tournay.
		Dunkirk, on the coast, E. of Calais.
		Donay, W. of Arras.
		Mardike, W. of Dunkirk.
		St. Amand, N. of Valenciennes.
		Gravelines, E. of Calais.

The climat: in the inland parts of these Netherlands is much more settled than ours, but their winters are usually more severe. The air is better than that of the United Provinces, except on the coasts of Brabant and Flanders, where it is exceedingly unwholesome. The soil differs according to the situation; for in some parts it is a deep rich mould, while others exhibit nothing but barren sands. The animal productions of these are the same as in the United Provinces; and the vegetable consist in corn, fruits, garden-stuff of all kinds, pasture, and prodigious quantities of flax, in the cultivating of which the inhabitants have rendered even the barren parts of their country profitable. This country in general is remarkable for breeding black cattle; and the province of Luxemburg abounds in corn, great part of which is sent to foreign markets.

There are a few inconsiderable mountains in the province of Limburg; excepting which, the whole country is a flat, interspersed now-and-then with some rising hills, which are generally covered with wood. Formerly there were several very large forests in this country, of which Ardennes was the principal, but now great part of them are turned into arable lands.

In the provinces of Luxemburg, Limburg, and Liege, are mines of iron, copper, lead, brimstone, and quarries of various kinds of marble; and in the province of Namur there are coal-pits, and a species of bituminous fat earth proper for fuel, with a great plenty of fossil nitre.

The principal rivers are the Maese, Scheldt, Sambre, Demer, Dyle, Nethe, Geet, Sagne, Ruppel, Lis, Scrype, Deule, and Dender. The most considerable of these, and into which all the rest fall, are the Maese and the Scheldt. The Scheldt has already been mentioned in the United Provinces. The principal canals are those of Brussels, Ghent, and Oflend. The first of these extends to the Scheldt, which is fifteen miles.

With respect to the trade and commerce of the Austrian Netherlands, we have to observe, that in ancient days these countries were the centre of the woollen manufactures, which are now the manufactures

of Great-Britain, originally derived from the Flemings, whose country was thereby rendered immensely rich and populous.

One of the principal branches of manufacture at present carried on in these provinces, is the lace known by the name of bone-lace, of which the finest and best of the kind in Europe is made at Brussels. The variety of it is very great; and we are told of lace made in that part of the country, which has been sold at from 50s. to 50l. sterling a yard: by which extraordinary improvements they have so far surpassed the French and Italians, and even the Venetians themselves, that those last have very little trade for their lace, though they were once justly famed for the finest in the world. The principal places for this manufacture are, Meehlin, Brussels, Louvain, Valenciennes, Antwerp, and the adjacent towns; and it employs a great number of people, especially women and children.

Fine thread is another of their manufactures, the great quantity of fine lace causing a great demand for fine thread, as their linens require a proportional quantity of linen yarn; and both these together constitute another manufacture of no little concern to the people.

Their manufacture of linen is very considerable, and consists of two sorts chiefly, viz. cambricks and lawns. Their cambricks are made so fine, as to have been sold at from twenty to thirty shillings per yard in these countries. They were formerly made only in the provinces of Artois and Cambresis, from which last they had their name of Cambricks; but the demand for them being so great of late years, the whole country has been scarcely large enough to carry on this manufacture, especially that part of it bordering on France, together with the great cities of Donay, Lille, Mons, Ypres, Ghent, and Bruges, and all the cities upon the Lower Scheldt; which manufacture also is of a magnitude greater than can be easily represented.

Another manufacture in which the Flemings are employed, is that of the woollen, which includes the tapeltry made at Arras, Dourlens, Donay, and the adjacent country; also some druggets and fine stuffs, made at Lille, and in the country near it: most of which are, however, consumed amongst themselves, though some go to France.

The exports of their manufactures are so considerable, that very good judges have estimated them at no less, in fine holler-thread, bone-lace, and linen (including their lawns and cambricks) than to the value of two millions sterling a year, from those provinces called the Austrian Netherlands, including part of the conquered provinces, as well as the district called Walloon Flanders, and the province of Artois. Nor in this account are there included their exports of tapeltry or woollen stuffs; of all which they export large quantities into France and Germany.

they export large quan-

ears much improved in
the

the manufacture of silk; for they not only make at present sufficient for their own use, but for exportation. These silks they make now chiefly at Lille, Brussels, and Antwerp; and this manufacture was greatly encouraged by the public, inasmuch that the Flemings, in the year 1725, began to caution the East-India Company, then attempted to be established at Ostend, to bring no more silks into the country, lest it should prove the means to supplant and destroy their own manufacture of silk, which employed so many thousands of their people.

Ship-building is a great article of trade; not that the Flemings, who have but two ports, can be supposed to build abundance of ships; nor indeed can they do it, having no place proper for it, or materials for the work; but by ships here is meant only galliots, hoys, lighters, bilanders, and such like vessels, all of which they call schips. Of those they have such great numbers, that there must be abundance of hands employed in building them, and especially in the constant repairing and refitting, which they are always wanting. In time of war it has been frequent to have seven or eight hundred of them brought together for carrying provisionary military stores, ammunition, and the like; and it is likely that they have not fewer than twenty thousand of this sort of vessels in the several provinces. All these are built within themselves; and it is no little trade they are obliged to carry on, for the supply of deals, timber, planks, masts, yards, anchors, iron work, and other materials for this business; besides pitch, tar, oil, hemp, &c.

When these things are considered, we need not wonder how all this great multitude of people, who inhabit these provinces, are employed and maintained. The carrying on such valuable manufactures must employ innumerable hands; and the quantity of goods they export must bring great returns home, as well in goods as money, by which the Flemings are far from being poor. On the contrary, they are generally well circumstanced, there being but few hands among them but what can earn their bread; the very children, even from five years old, being ordinarily employed.

Some Roman highways are yet entire; and ruins of temples and other buildings are found in many parts. In 1607 sixteen hundred gold pieces were found at Dendermonde, and proved to be a collection of ancient medals of Antoninus Pius, Aurelius, and Lucius Verus. The other curiosities of this country consist chiefly in their public edifices and churches, in many of which the paintings are exquisitely fine. Formerly there was not one of these but deserved a particular description, and volumes have been filled with this subject only.

At present their noble fortifications, public buildings, and trade, are greatly gone to decay. The following are now the most considerable.

Brussels gives name to the territory, and is the capital not only of Brabant but of the Netherlands, though only the second in rank. This city is well built and populous, and carries on a considerable trade all over

Europe in cambles, laces, and tapestries, which are manufactured here. The public buildings in general, particularly the palaces and courts of the several princes, counts, and other persons of distinction, together with the churches and cloisters, are large and magnificent. The inns or eating-houses here are equal to any in the world: a stranger may dine any time between twelve and three, on seven or eight dishes, for less than a shilling English. The wines also are very good and cheap; and, for sixpence English by the hour, you may have a coach to carry you to any part of the city.

Ghent, is the capital of Flanders, and one of the largest cities in Europe, being seven miles in compass within the walls. It abounds in monasteries, churches, hospitals, and market-places. The stadthouse and cathedral are grand structures; and under the latter is a noble crypta, or subterraneous church.

Antwerp is a large well built city, containing twenty-two squares, and above two hundred streets, which are all exceedingly spacious. Most of the houses are of free-stone, very high, with courts before, and gardens behind. The churches are exceedingly magnificent, particularly the cathedral, which has one of the finest steeples in the world: most of the pictures with which they are adorned are painted by Rubens, and Quintin Massys, the famous blacksmith. The stadthouse is very elegant, as is also the Exchange, which cost the city 300,000 crowns building. This town, from being once the emporium of the European continent, is now almost destitute of trade; the Dutch, soon after they threw off the Spanish yoke, having sunk vessels loaded with stone in the mouth of the Scheldt, and thereby shut up the entrance of that river to ships of large burden: the reader need not be informed by what motive this avaricious people were instigated to that cruel act.

Louvain, the capital of the Austrian Brabant, was formerly exceeding populous, but now there are meadows, vineyards, and gardens within the walls. The public buildings are very beautiful, particularly the stadthouse, the church of St. Peter, that belonging to the Jesuits, and the English convent for ladies. The great trade once carried on in this city is inconceivable; but at present it is only famous for brewing excellent beer.

The inhabitants of these Netherlands are supposed to amount to about a million and a half, and are distinguished by the appellation of Flemings. They are in general a heavy, blunt, honest people, and extremely indelicate in their manners. They differ, however, according to the situation of the places wherein they reside. Those which border on France resemble that people in their behaviour, dress, &c. while those who live near Holland imitate the Dutch. The Flemings were known formerly to fight desperately in defence of their country; they make, however, no great figure at present. They are ignorant, and fond of religious exhibitions and pageants.

The established religion here is the Roman Catholic, but every sect may live peaceably, and enjoy the free exercise of their persuasions, though not in a public manner. The inhabitants on the frontiers of Holland speak Dutch; as those who reside in the provinces subject to France use a very bad French: the rest are a mixture between both, and their language is a different dialect of the German from that of the Dutch.

They have three Universities, viz. Louvain, Douay, and St. Omer. The first was founded in 1426, by John IV. duke of Brabant, and enjoys great privileges, granted to it at different times by the dukes of that country and the popes. It consists of above forty colleges, and in the hall where the public exercises are performed, are three spacious rooms, where lectures are read every morning in divinity, law, and physic, to which the students in every college may resort. By a grant of pope Sixtus IV. this university has the privilege of presenting to all the livings in the Netherlands, which right they still enjoy, except in the United Provinces.

The archbishoprics are Cambrai, and Malines or Mechlin; the bishoprics are, Antwerp, Bruges, Ghent, Tournay, Arras, Ypres, Namur, Ruremunde, and St. Omer.

Very little can be said with respect to learning in these provinces. The most celebrated geniuses of these Netherlands were produced among the Jesuits, and their works treated chiefly on theology, the civil and canon law, and Latin poems and plays. Strada is celebrated as an excellent historian and poet. But the Flemings have long excelled in painting and sculpture, witness the works of Rubens and Vandyke; and Flamingo, or the Flemish models for heads, particularly those of children. Their painters and sculptors form a school by themselves.

The Austrian Netherlands are still considered as a circle of the empire, of which the archducal house, as being sovereign of the whole, is the sole director and summoning prince. This circle sends an envoy to the diet, but is not subject to the judicatories of the empire, though it contributes its share towards the impôts of it. The form of an assembly, or parliament for each province, is still kept up, and consists of the clergy, nobility, and deputies of towns, who meet at Brussels. Each province claims particular privileges, which are now of very trifling consequence, for little opposition is made to the will of the governor-general, who is appointed by the court of Vienna, and acts according to its dictates. The present governor is his serene highness Charles of Lorraine, brother to the late, and uncle to the present emperor of Germany.

Besides the governor-general, every province has its particular governor subject to him; and in each province, likewise, are courts of justice established for the trial of causes, where they are determined according to the civil and canon law.

We cannot ascertain the revenues of these Nether-

lands, and indeed it would be almost impracticable if attempted. It is certain that those of Austria do not defray the expences of the government; but those of France bring a considerable revenue to that crown. The ordinary revenues arise either from the demesne lands, or from the customs; but when there is an extraordinary tax to be raised, it is demanded of the states of the respective provinces, who seldom deny the necessary supplies, though the consent of every member is necessary to the grant.

The German, Dutch, and French coins, are all current in this part of the Netherlands.

The forces in the Austrian Netherlands were, by the treaty of Utrecht, to have been 30,000 in time of peace, and 40,000 during a war, whereof the Austrians were to maintain three-fifths, and the Dutch two, for the defence of the barrier; but both these powers are very deficient in their respective quotas. Most of the fortifications are demolished, and the garrisons rendered useless, by the present emperor. A lion sable, or, and langued gules, are the arms of Flanders.

With respect to their history, the seventeen provinces of the Netherlands were anciently called Gallia Belgica, and the greater part of them conquered by the Romans, in whose possession they continued till the northern nations broke into Italy, and put an end to the western empire. After being deserted by the Romans, they were possessed by the Goths, and other northern people, and the country divided into small governments, independent of one another. In this state they continued for some years; but at last, partly by marriage, and partly by conquest, they became annexed to the dominions of the duke of Burgundy.

The emperor Charles V. about the year 1543, united the seventeen provinces into one body, and ordered that they should for ever continue under the same prince, without being in the least separated or dismembered. Pursuant to this order, and at the unanimous request of the states of all the provinces, he published a perpetual and irrevocable edict, by which it was enacted, that in order to keep all those provinces under the same prince, the right of succession should always take place, both in a right and collateral line, notwithstanding the common laws of some provinces to the contrary. Charles even attempted to incorporate the Netherlands with the Germanic body, and to form them into a circle of the empire, under the title of the circle of Burgundy, in order to engage the princes of the empire to interest themselves in the preservation of these provinces. But the inhabitants of the Netherlands, always jealous of their liberty, were far from being pleased with their incorporation, and when summoned to pay their share of the expences of the empire, they refused the order; and the German princes, in return, declared they would take no part in the wars of Flanders, but would, for the future, consider those provinces as no part of the Germanic body.

As

As Philip of Austria and his son Charles were both born in the Netherlands, they entertained for these provinces that natural affection which most men have for their native country; and knowing how remarkably tenacious the inhabitants were of their liberties, and of the privileges granted them by former princes, they took care to preserve them, and even suffered the states, who are the proper guardians of the liberties of the people, to share, in some degree, the supreme authority with them. Happy had it been for both prince and people, if this generous conduct had been observed by succeeding princes; but Philip II. son to Charles V. had not the same affection for the Netherlands; nor did he possess those generous sentiments, with which his father laboured to inspire him. Born in Spain, he had no affection for the country of his ancestors; and when he removed from the Netherlands to take possession of the crown of Spain, he left the government in the hands of a weak woman, assisted by the proud and haughty cardinal de Glanville. This gave occasion to continual complaints; but Philip was deaf to their remonstrances; and, instead of making use of the mild and moderate measures of his ancestors, he had recourse to the most violent and cruel proceedings. The Spaniards whom he sent thither, being born and educated under a despotic government, jealous of the liberties, and envious of the riches of the people, trampled on their privileges, and treated them like slaves.

Exasperated at these proceedings, and preferring death to the loss of liberty, a general insurrection ensued, and the insurgents were headed by the prince of Orange, and the counts Hoorn and Egmont. The reformation of Luther was at that time gaining ground apace in many of the provinces, and all his disciples joined the malcontents. Alarmed at the progress of this rebellion, and determined, if possible, to crush the reformation in its birth, Philip established a kind of inquisition in the Netherlands, and many thousands of innocent persons were put to death by that infernal tribunal.

Several battles were fought between the contending parties, in one of which the malcontents were totally defeated, and the counts Hoorn and Egmont taken prisoners and beheaded. The prince of Orange had the good fortune to escape, and, retiring into Holland, prevailed upon that and several of the adjacent provinces to form a league for their mutual defence; and the treaty was accordingly signed at Utrecht in the year 1579. And though these revolters were at first thought so despicable as to be termed beggars by the court of Spain, yet their enemies soon perceived their mistake: a brave and hardy people, fighting for every thing that is dear to them, are never a despicable enemy. Headed by their own princes, and assisted by Elizabeth, queen of England, they defeated their tyrants, and forced the crown of Spain, about the year 1609, to declare them a free people, and they were afterwards acknowledged by all Europe to be an independent state, under the appellation of The United Provinces.

Since that period they have been considered as a powerful republic; and during the usurpation of Cromwell, and the reign of Charles II. their naval force was nearly equal to that of England, and far superior to that of any other power in Europe. When the house of Austria, which for some ages ruled over Germany, Spain, and part of Italy, with which they afterwards continued to carry on bloody wars, was become no longer formidable; and when the jealousy of the public was excited against the Bourbon family, which was favoured by the government of Holland, who had dispossessed the prince of Orange of the stadtholdership; the spirit of the people was such, that they revived it in the person of the prince, afterwards William III. king of Great-Britain; and during his reign, and that of queen Anne, they were principals in the grand confederacy against Louis XIV. king of France, and at length humbled the pride of that aspiring and despotic tyrant.

As to the other provinces of the Netherlands, they were not so fortunate, but were reduced by the duke of Alva to the obedience of Spain, by whom they were, however, in a great measure, restored to their ancient privileges; every province was allowed its great council or parliament, whose concurrence was necessary in making laws, or raising money for the use of the government.

Ten of these provinces, generally called the Low Countries, remained in possession of the Spaniards, till the duke of Marlborough, general of the allied army, gained the memorable victory of Ramillies in the year 1706; in consequence of which, Brussels, the capital, and great part of these provinces, acknowledged Charles VI. for their sovereign; and his daughter the late empress queen, by virtue of the pragmatic sanction, enjoyed the possession of them till the year 1741, when the French conquered them all, except part of the province of Luxemburg. They were, however, restored to their former sovereign by the treaty of Aix-la-Chapelle, in 1748, the French retaining only Artois, the Cambresis, part of Flanders, part of Hainault, and part of Luxemburg.

The late differences between the States-General and the emperor of Germany may probably be attributed to their separation from Great-Britain. The emperor complained of a violation of treaties subsisting between the states and his ancestors, and represented to them, that the shutting up the Scheldt had long been a submission not obligatory on the Austrian Low Countries; which right his Imperial majesty insisting on, a ship was sent out by his order, the captain and crew of which were expressly forbidden to submit to any detention or examination from any ships of the republic it might meet with on the Scheldt, or to make the least declaration at any of their custom-houses on that river. This ship, with another afterwards sent, were stopt in their passage up the Scheldt to Antwerp; which conduct the emperor considered as insulting his flag, and

as

as equivalent to a declaration of war on the part of the republic; he thereupon recalled his minister from the Hague, and made the necessary dispositions for assembling an army of 80,000 men in the Low Countries.

The Dutch, by their manifesto, pleaded, that by Art. XIV. of the treaty concluded at Munster, Jan. 30, 1648, it was agreed that the Scheldt should remain shut by their High Mightinesses. They likewise referred to several other treaties in vindication of their conduct, and particularly a convention, respecting Art. XVII. of the barrier treaty, signed Dec. 22, 1718, in which the cession of the lands and districts pertaining to the possession of the Scheldt was specially and expressly confirmed and made clear; and insisted, that they had, to the great detriment of the republic, fulfilled the engagements they had entered into for the preservation of the pragmatic sanction, and had assisted the house of Austria with all their forces. The manifesto, among other matters, also represents, that notwithstanding their high-mightinesses had often replied to several pretences alleged against them, it was insisted on the part of his Imperial majesty, in April 1784, that the guardship belonging to the republic, which had been stationed off Lillo since the peace of Munster, 1648, that is 136 years, should be removed, his majesty pretending that the Lower Scheldt, as far as Saftingen, belonged to him.

The negotiations between these two powers not producing the desired effect, and the republic avowing their determination to support what they deemed to be their incontrovertible right, great preparations were made for immediate hostilities against the Dutch; and several hundreds of the Imperialists, with some field-pieces, advancing towards the counter-camp of Lillo, the commanding officer of that place ordered the sluices to be opened Nov. 7, 1784, which effected an inundation that laid under water many miles of flat country around the forts on the Scheldt, to preserve them from an attack.

In the beginning of the year 1786, a treaty of accommodation was concluded between the parties; by which it appears, that the Scheldt is agreed to be open to the emperor for inland navigation, though shut towards the ocean in favour of Holland, according to the treaty of Munster. Each of the contracting parties are at liberty to make what regulations may be thought expedient for carrying on internal commerce. As the imports of the Dutch carried through the Imperial dominions are beyond all comparison greater than the exports made from the emperor's dominions into those of the United Provinces; consequently, should any dispute arise in future, the emperor will have an advantage of more than ten to one in his favour. Besides, the emperor may impose what duties he thinks proper on the Batavian vessels that shall sail through that part of the Scheldt which he commands; and the Dutch, in return, may lay what duties they please

upon the Imperial vessels sailing into any part of their territories.

In 1792 the French insisted on their right to the navigation of the Scheldt, in prejudice to the claim of the United Provinces; but they were at length obliged to give it up.

Since the commencement of the troubles on the Continent in 1792, a treaty of defensive alliance (consisting of ten articles) has been entered into between the king of Great-Britain and their noble and high-mightinesses the States-General, "for the good of both parties, and for the maintenance of their general and separate tranquillity." And

On the 16th of Nov. 1792, his Britannic majesty caused to be presented to the States-General, by his ambassador lord Auckland, a declaration, expressive of the desire of the king his master to cement and perpetuate the intimate union established between the two powers, for the maintenance of their own rights and security, &c. To which their high-mightinesses returned an immediate answer to the same effect.

CHAP. XVIII.

G E R M A N Y.

Situation, Extent, Boundaries, Divisions, Climate, Soil, Productions, Mountains, Rivers, Mineral Waters, Curiosities, Learning, Religion, Language, &c.

THE empire of Germany is situated between 45 and 55 deg. of north lat. and between 5 and 19 deg. of east long. It is about 600 miles in length, and 520 in breadth; and is bounded on the north by the German Ocean, Denmark, and the Baltic; on the east, by Poland and Hungary, including Bohemia; on the south, by Switzerland and the Alps, which divide it from Italy; and on the west, by France and the Low Countries, from which it is separated by the Rhine, the Maese, and the Moselle.

Germany is divided into nine circles, whereof three are in the north, three in the middle, and three in the south.

The northern circles contain..	{ Upper Saxony, Lower Saxony, Westphalia.
The circles in the middle	{ Upper Rhine, Lower Rhine, Franconia.
The southern circles.....	{ Austria, Bavaria, Swabia.

Brandenburgh in the middle, subject to its own elector the king of Prussia; chief towns Stendel, Berlin, Pottslam, Frankfort, and Custrin.

Saxony Proper, in the south, subject to its own elector; ch. towns Wittenburg, Bautzen, Gorlitz, Dresden, and Missin.

Thuringia landgrave West, ch. town Erfort, subject to the elector of Mentz.

The duchies of Saxe Meiningen, ch. town Meiningen; Saxe Zeits, ch. town Zeits; Saxe Altenburg, ch. town Altenburg; Saxe Weimar, ch. town Weimar; Saxe Gotha, ch. town Gotha; Saxe Eifnach, ch. town Eifnach; Saxe Saalfeldt, ch. town Saalfeldt; subject to their own dukes.

The counties of Schwartzburg, ch. town Schwartzburg; Belchingen, ch. town Belchingen; Mansfeldt, ch. town Mansfeldt; subject to their respective counts.

The duchies of Hall, middle, ch. town Hall, subject to Prussia; Saxe Naumberg, ch. town Naumberg, subject to its own duke.

The counties of Stolberg, ch. town Stolberg; Hohenstein, ch. town Northhausen.

Principality of Anhalt, ch. towns Dessau, Zerbst, Bernberg, and Kothen.

Bishopric of Saxe Hall, ch. town Hall.

Bishopric of Voigtland, ch. town Plawea; subject to the elector of Saxony.

Duchy of Merzberg, middle, ch. town Merzberg; subject to the elector of Saxony.

2. LOWER SAXONY CIRCLE.

Holstein duchy, north of the Elbe; ch. towns Keil, subject to Holstein-Gottorp; Meldorp and Glucitad, subject to Denmark; Hamburg and Lubec, Imperial cities.

Lauenburg duchy, ch. town Lauenburg; subject to Hanover.

Duchies of Brunswick Proper, ch. town Brunswick; Wolfenbuttle, ch. town Wolfenbuttle: counties of Rheinstein, ch. town Rheinstein; Blanckenburg, ch. town Blanckenburg; subject to the duke of Brunswick Wolfenbuttle.

Duchies of Calenberg, ch. town Hanover; Grubbenhagen, ch. town Grubbenhagen; Gottingen, ch. town Gottingen; subject to the elector of Hanover, king of Great-Britain.

Lunenburg duchy, ch. towns Lunenburg and Zell, subject to Hanover.

Bremen and Verden duchies, ch. towns Bremen, an Imperial city, and Verden; subject to Hanover.

Mecklenburg duchy, ch. towns Schwerin and Guf-trow.

Bishopric of Hildersheim, ch. town Hildersheim, an Imperial city; subject to its bishop.

Duchy of Magdeburg, ch. town Magdeburg; subject to the king of Prussia.

Duchy of Halberstadt, ch. town Halberstadt; subject to the king of Prussia.

3. WESTPHALIA CIRCLE.

North division. County of Embden, or E. Friesland, ch. town Embden, an Imperial city; subject to the king of Prussia: counties of Oldenburg and Delmenhorst, ch. towns Oldenburg and Delmenhorst; subject to the king of Denmark: Hoyer and Diepholt, ch. towns Hoyer and Diepholt; subject to Hanover.

Middle division. Bishopric of Munster, ch. town Munster; subject to its bishop: bishoprics of Paderborn and Osnaburg, ch. towns Paderborn and Osnaburg; subject to its bishop: county of Lippe, ch. town Lippe Pyrmont; subject to its own count: duchy of Minden and county of Ravensburg, ch. towns Minden and Ravensburg; subject to Prussia: duchy of Westphalia, ch. town Arensburg; subject to the elector of Cologne: counties of Tecklenburg, ch. town Tecklenburg; Ritberg, ch. town Ritberg; Schawenburg, ch. town Schawenburg; subject to their counts.

Western division. Duchy of Cleves, chief town Cleves; subject to the king of Prussia; duchies of Berg and Juliers, ch. towns Dusseldorf, Juliers, and Aix; subject to the elector palatine: county of Mark, ch. town Ham; subject to Prussia: bishopric of Liege, ch. town Liege; subject to its own bishop: county of Bentheim, ch. town Bentheim; subject to Hanover: county of Steinfort, ch. town Steinfort; subject to its count.

4. UPPER RHINE CIRCLE.

Landgraviate of Hesse-Cassel, ch. town Cassel; Hesse Marburg, ch. town Marburg; Hesse Darmstadt, ch. town Darmstadt; subject to their respective landgraves.

Hesse Homberg, ch. town Homberg; Hesse Rhinefeldt, ch. town Rhinefeldt; Hesse Wanfried, ch. town Wonfield.

Counties of Nassau Dillenburg, ch. town Dillenburg; Nassau Diets, ch. town Diets; Nassau Hadamar, ch. town Hadamar; Nassau Kerberg, ch. town Kerberg; Nassau Siegen, ch. town Siegen; Nassau Idstein, ch. town Idstein; Nassau Weilburg, ch. town Weilburg; Nassau Wisbaden, ch. town Wisbaden; Nassau Biellstein, ch. town Biellstein; Nassau Otweiler, ch. town Otweiler; Nassau Ufingen, ch. town Ufingen; each county subject to its own count, of the house of Nassau.

Territory of Frankfort, ch. town Frankfort on the Main, an Imperial city; a sovereign state.

County of Erpach, ch. town Erpach East; subject to its own count.

Bishopric of Spire, ch. town Spire, on the Rhine, an Imperial city; a sovereign state.

Duchy of Zwebruggen, or Deux-Ponts, ch. town Deux-Ponts, in the palatinate; subject to the duke of Deux-Ponts.

County of Catzenelboge, ch. town Catzenalbogen on the Lhon; subject to Hesse-Cassel.

Counties of Waldec, ch. town Waldec; subject to its own count: Solms, ch. town Solms; subject to its own count: Hanau, ch. town Hanau; subject to Hesse-

Abbey of Fuld, ch. town Fulda; subject to its abbot. Hirschfeldt, ch. town Hirschfeldt; subject to Hesse-Cassel.

5. LOWER RHINE CIRCLE.

Palatinate of the Rhine, on both sides that river, ch. towns Heidelberg on the Neckar, Philipsburg, Mannheim, and Frankendal on the Rhine; subject to the elector palatine.

Archbishops and electorates of Cologne, ch. town Cologne on the Rhine; Mentz, ch. towns Bonn on the Rhine, Mentz on the Rhine, and Aischaffenburg on the Maine; Triers, ch. town Triers on the Moselle; subject to their respective electors.

Bishopric of Worms, Worms on the Rhine, an Imperial city; a sovereign state.

Duchy of Simmeren, ch. town Simmeren; subject to its own duke.

Counties of Rhinegravestein, ch. town Rhinegravestein; Meurs, ch. town Meurs, subject to Prussia: Veldentz, ch. town Veldentz, subject to the elector palatine; Spanheim, ch. town Creutznach; Leymingen, ch. town Leymingen.

6. FRANCONIA CIRCLE.

Bishoprics of Wurtzburg, ch. town Wurtzburg; Bamberg, ch. town Bamberg; Aichstadt, ch. town Aichstadt; subject to their respective bishops.

Marquissates of Cullenbach, ch. town Cullenbach; Anspach, ch. town Anspach; subject to their respective margraves.

Principality of Henneberg, ch. town Henneberg.

Duchy of Coburg, ch. town Coburg; subject to its own duke.

Duchy of Hildburghausen, ch. town Hildburghausen; subject to its own duke.

Burgaviate of Nuremberg, Nuremberg, an Imperial city; an independent state.

Territory of the great master of the Teutonic Order, Mergentheim, ch. town Mergentheim.

Counties of Reineck, ch. town Reineck; Bareith, ch. town Bareith, subject to its own margrave: Papenheim, ch. town Papenheim, subject to its own count; Wertheim, ch. town Wertheim; Cassel, ch. town Cassel; Schwartzenburg, ch. town Schwartzenburg, subject to its own count; Holac, ch. town Holac.

7. AUSTRIA CIRCLE.

The whole circle belongs to the emperor, as head of the house of Austria.

Archduchy of Austria Proper, ch. town Vienna.

Duchies of Stiria and Cilley, ch. towns Gratz and Cilley; Carinthia, ch. towns Glagenfurt and Lave-

mund; Carniola, ch. towns Laubach, Zerknitz, Trieste, and St. Veits; Goritia, ch. town Gorits.

County of Tyrol, ch. town Inspruck.

Archbishops of Brixen and Trent, ch. towns Brixen and Trent, on the continent of Italy and Switzerland.

8. BAVARIA CIRCLE.

Duchy of Bavaria Proper, on the Danube, ch. towns Munich, Landshut, Ingolstadt, Donawert, and Ratfobon, an Imperial city; subject to the elector palatine, as successor to the late elector of Bavaria.

Palatinate of Bavaria, ch. towns Amberg and Sulzbach; subject to the elector of Bavaria.

Friessengen, ch. town Friessengen; subject to its own bishop.

Bishopric of Passau, ch. town Passau; subject to its own bishop.

Duchy of Neuburg, ch. town Neuburg on the Danube, subject to the elector palatine.

Archbishopric of Salzburg, ch. town Salzburg and Hallen; subject to its own bishop.

9. SWABIA CIRCLE.

Duchy of Wurtemberg, ch. towns Stutgard, Tübingen, and Hailbron, on or near the Neckar; subject to the duke of Wurtemberg Stutgard.

Marquissates of Baden, ch. towns Baden Durlach, on or near the Rhine; subject to their own respective margraves.

Bishopric of Augsburg, ch. towns Augsburg, an Imperial city, Hockstet and Blenheim, on or near the Danube; subject to its own bishop.

Territory of Ulm, Ulm on the Danube, an Imperial city; a sovereign state.

Bishopric of Constance, ch. town Constance on the lake of Constance; subject to its own bishop, under the house of Austria.

Principalties of Mindelheim, ch. town Mindelheim; Furlenburg, ch. town Furlenburg; Hohenzollern, ch. town Hohenzollern; subject to their respective princes.

Counties of Oeting, ch. town Oeting; Koningseck, ch. town Koningseck; Hohenrichburg, ch. town Gemund.

Baronies of Waldburg, ch. town Waldburg; Limpurg, ch. town Limpurg.

Abbies of Kempton, ch. town Kempton on the Iller; Buchaw, ch. town Buchaw; Lindau, ch. town Lindau, on the lake of Constance; Imperial cities.

Imperial cities or sovereign states; Nordlingen, Memmingen, Rotweil on the Neckar, and many more.

Black Forest and county of Rheinfield, ch. towns Rheinfield and Laullenburg; marquissate of Burgaw, ch. town Burgaw; territory of Brigaw on the Rhine, ch. town Friburg and Brifac; subject to the house of Austria.

subject to the house of

usive traç, the climate
ation of places. In the
north

north the air is cold, and the weather changeable, both which are unfavourable to vegetation; in the south it is much warmer, especially in winter; and in the centre of the country it is settled, temperate, and serene. Upon the whole, neither the climate nor air are materially different from those of England. The soil varies as much as the climate: in many parts it is exceedingly fruitful, being cultivated quite to the tops of the mountains, but in others it is bare and sterile; though there is no doubt but, with proper care, even this land might be turned to some advantage; and as agriculture is now making great progress in Germany, it will certainly not remain much longer in its present state, but the most barren parts must necessarily change to the advantage of the inhabitants.

There are few animals which are not to be found either in one part or the other of Germany; horses, oxen, cows, sheep, and goats form the domestic part of these; and in the forests are bears, wolves, lynxes, foxes, wild cats, wild goats, boars, of the legs of which hams are made, and sent to most parts of Europe, being esteemed great delicacies, and are preferred by many of the English to those of Westmoreland, &c. for grain and the delicacy of their flavour; badgers, martens, hares, rabbits, deer, and the chamols goat. A species of leopards and beavers are likewise found in Moravia. The glutton of Germany is said to be the most voracious of all animals.

There are a great variety of tame and wild fowl in Germany, viz. Turkeys, geese, ducks, pigeons, wild geese, wild ducks, swans, bustards, pheasants, wood-cocks, partridges, grouse, snipes, fieldfares, quails, otolans, spoon-bills, falcons, herons, hawks, larks and other singing birds, which are sent to all parts of Europe.

The rivers and lakes in Germany abound with salmon, pike, carp, trout, perch, roach, jack, flurgeon, barbel, eels, eel-pouts, crabs, &c. and in the Danube or Riter, are several fish, which seem to be of the salt-water-kind. Among the most remarkable of these is the hanson, which bears some resemblance to our flurgeon; but is almost as large as a crocodile, some of them being eighteen or twenty feet long: they are esteemed very delicate eating by the Germans; and it is said that shoals of them will assemble at the sound of a trumpet or horn.

The cultivated parts of this country yield corn, turkey-wheat, buck-wheat, rye, spelt, barley, oats, peas, beans, vetches or tares, lentils, chiches, millet, anise, cummin, hemp, flax, hops, tobacco, madder, wood, saffron, carthamus or bastard saffron, truffles, potatoes, and every species of culinary herbs and roots. The fruits produced there are apples, pears, plums, oranges, lemons, citrons, olives, figs, peaches, apricots, medlars, almonds, chestnuts, filberds, and walnuts. Vineyards are cultivated in different parts of Germany, according to which the wine varies in its flavour; but those held in the greatest esteem are the

Rhenish, Moselle, Franconian, Wecker, Hocker, and Muscadel. Austria likewise yields excellent wine, particularly Rhenish, and Moselle, which have a medicinal quality. Vast quantities of honey are produced in this empire.

There are many large tracts of mountains in Germany, among the most considerable of which are the Alps, that divide it from Italy, and those that separate Saxony, Bavaria, and Moravia from Bohemia. Great part of this empire, however, is a spacious plain, interspersed here and there with agreeable hills, which only tend to heighten the beauty of the scene.

Germany was formerly a very woody country, and there are still large forests remaining; but that called the Hercynian, which in the time of Cæsar was nine days journey in length, is now divided into woods, which go by particular names, and in many places it is quite destroyed. The trees produced in this country are oak, beech, pine, white and red fir, alder, ash, birch, lime-tree, asp, or black poplar, larch, plane-tree, chestnut, olive, and walnut. Vast quantities of pot-ash, pitch, and charcoal are made in different parts of this empire; and the mulberry-tree, particularly the white sort, is greatly cultivated in others, for the benefit of the silk manufacture.

No country in the universe boasts more noble rivers than Germany. The first of these which deserves our attention is the Danube. It rises in Swabia, on the borders of Alsace, in the Black Forest, and, taking its course eastward, it encircles the city of Ulm, where it begins to be navigable; then passing through Bavaria, and being increased by the conflux of several rivers, it passes on to Vienna, Presburg, and Gran; when, running south, it passes by Belgrade, where losing its first name, it acquires that of Ilser; after which continuing its way between Serbia and Wallachia, and between Moldavia and Bulgaria, it at last falls into the Euxine or Black Sea, after a course of 1620 miles, in which its windings are not included. This river is exceedingly wide and deep; and between Vienna and Belgrade fleets of men of war have engaged upon it. But its rapid current, and the three great cataracts it contains, interrupt the navigation in many places; notwithstanding which, its conveniency for carriage to all the countries through which it passes is inconceivably great.

The Rhine, which is the next considerable river in Germany, rises from two springs in the Alps, and runs north to the lake of Constance, then west to Basil, afterwards north between Swabia and Alsace, then passing through the Palatinate, the electorate of Cologne, and the duchy of Cleves, at last enters the Netherlands, five miles below Cleves, where it is very broad and swift. The navigation of this river, like that of the Danube, is interrupted by nine cataracts, the principal of which is at Shaffhausen in Switzerland, where the whole river falls from a height of seventy-five feet. The direct course of the Rhine is above 500 miles;

miles; it is generally one quarter, and in some places half a mile broad, and from one and a half to seven fathoms in depth. It is navigable to Basil in Switzerland, which is 400 miles, by long boats, with round bottoms, of a considerable burden, which commonly go at the rate of four miles in an hour, and in these passages are conveyed at the easy rate of one penny for five miles.

The Elbe rises out of the mountains near Hirschburgh in Silesia, upon the confines of Bohemia, through which it runs north-west in eleven different streams, and dividing the German dominions of the king of Great-Britain from Holstein, falls into the German sea below Hamburg, having traversed a winding course of about five hundred miles. The tide in this river runs ten miles above Hamburg, to which city it conveys vessels of considerable burden.

The Oder has its source in Moravia, and runs from south to north through Silesia and Brandenburg; then passing by Stettin, and dividing eastern from western Pomerania, after a course of about three hundred miles, it falls into the Baltic between Usedom and Wollin, in three currents, having in its way formed several islands. Canals are cut between this river and the Elbe, to the infinite advantage of trade in the electorate of Brandenburg; but there are several sand-banks in the Oder which in many parts impede the navigation.

The Weser rises in the mountains of Thuringen, and running north through Bremen, Minden, Hesse, and Westphalia, it falls into the sea forty miles below Bremen, and within twenty of the mouth of the Elbe, having run a course of about 250 miles. This river is not navigable for ships further than Brake, or Elsfleth, fourteen miles below Bremen.

The Aller springs in the duchy of Magdeburg, runs north-west through the duchy of Lunenburg in Lower Saxony, and passing by Zell, continues the same course till it falls into the Weser below Verden.

The Moselle has its source in the Paucillis, one of the single mountains of Lorraine, and, running north through that duchy, waters Toul and Metz; after which continuing its course north-east, through the electorate of Triers, it falls into the Rhine.

The other rivers of inferior note in Germany are the Spree, the Pene, the Ems, the Mein, and the Saar.

The most remarkable lake is that of Constance, which is about 40 miles long, and, in some places, 10 broad. It runs from south-east to north-west along part of the east side of Switzerland, which it separates from Swabia. The water of this lake is exceedingly clear. To this we may add the Czirnitz lake in Carniola. The lakes as well as the rivers of Germany abound in fish, the several species of which have been already mentioned.

Germany is supposed to produce more salutary springs and baths than any other nation in Europe. Moravia alone is said to contain thirty; and, within the limits

of the several circles, are reckoned a thousand springs of mineral waters only, some of which are hot, some cold, and others that are at different times both hot and cold. The mineral waters at Spa in Westphalia, are contained in five wells, but three of them are held in higher esteem than the other two, viz. Pouthon, Sauranaire, and Geroustere. These waters were known to the Romans, and are esteemed an excellent medicine in the gravel, sciatica, and all scorbutic disorders.

Pyrmont likewise, situated in the circle of Westphalia, is famous for its mineral-waters, which issue from several springs in the neighbourhood; and in the imperial city of Aix-la-Chapelle are a great number of mineral springs both hot and cold, which are all distinguished by particular names. The Emperor's Bath and Little Bath are so exceedingly hot, that they are always left to cool eight or ten hours before they are used; but the Rose Bath, the Poor's Bath, and that of St. Cornelle, are neither so hot nor so clear as the two former. The cold springs are all adjoining to the hot ones; and near the Emperor's Bath there is a fountain of warm water, of infinite use in all chronic diseases. These waters are all impregnated with sulphur, salt, nitre, salt-petre, and alum, and give relief in various kinds of maladies. They are at first disagreeable to the taste, and always offensive to the smell. There are two seasons of the year in which they may be drank. The first begins about the middle of May, and the second about the middle of August, and each continues six weeks. At these seasons the city is crowded with nobility and gentry from all parts of Europe. As there is no disease but what one or other of the medicinal waters of Embs, Wisbaden, Schwaback, Baden, and Wildungen are said to cure, or at least to mitigate, they are all frequented, to the great emolument of those places, most of which are remarkable for their neatness, cleanliness, and conveniences; inducements which, together with the diversions, draw numbers together, who, being in perfect health, have no other business there than to seek amusement. Catsbad and Baden baths have been described and recommended by many great physicians, and used with great success by royal personages. The mineral springs at Wildungen are reported to perform wonders in almost all diseases.

Most parts of Germany abound in mines; many of silver, quicksilver, copper, tin, iron, lead, sulphur, nitre, and virriol. In Austria, Bavaria, Silesia, and the Lower Saxony, are found salt-petre, salt mines, and salt pits; as likewise carbuncles, amethysts, jasper, sapphires, agate, alabaster, pearls of various kinds, rubies, and turquois stones. Quarries of curious marble, slate, chalk, ochre, alum, bitumens, and several other fossils, are found in Bavaria, Tirol, and Liege. In several places stones are dug out of the ground, bearing on them the representation of divers animals, trees, and sometimes even a human form may be distinguished. Coal-pits are found in most of the circles, which in

Havelburg. Saltzburg, which has for its suffragans the bishops of Friefinghen, Ratifbon, Passau, Chiemse, Seckau, Lavant, Brixen, Gurk, and Neustadt. Vienna is likewise by some authors accounted a suffragan to Saltzburg, while others make it an archbishopric of itself, dependent only on the pope. Bremen, whose suffragans are the bishops of Lubec, Ratsburg, and Schwerin.

Since the Reformation, the claims of temporal princes have rendered it necessary to secularize the following archbishoprics and bishoprics: Bremen, Verden, Magdeburg, Halberstadt, Minden, Osnaburg, and Lubec; the archbishoprics were converted into duchies, and the bishoprics into principalities. The houses of Hanover and Bavaria have an alternate claim upon Osnaburg, and it is now in the possession of prince Frederic, second son to the king of Great-Britain. The revenue of this bishopric amounts to about 30,000*l.* per annum.

The German language is a dialect of the Teutonic, without the least affinity to the Celtic, and is called High Dutch, being the mother tongue of the whole empire. It abounds with consonants, is extremely harsh to the ear, and varies so much in its dialect, that the people of one province seldom understand those of another. We shall here insert their Lord's prayer:

Unser Vater, der du bist im himmel, geheiligt werd dein name. Zukomme dein reich. Dein wille gesehe, wie im himmel also auch auf erden. Unser täglich brodt gib uns heute. Und vergib uns unser schuld, als wir vergeben unsern schuldignern. Und führe uns nicht in verführung. Sondern erlöse uns von dem bösen. Den dein is das reich, und die krafft, und die ewigkeit, en ewigkeit. Amen.

It is an unfavourable circumstance for German literature, that in most of the courts they speak French, and give it a decided preference: even the present king of Prussia has ordered the Philosophical Transactions of his royal society at Berlin, from the beginning of its institution, to be published in that tongue; by which some of the Germans think his majesty has cast a very undeserved reproach upon his native language. The court of Vienna, and a few others, prefer the Italian. Latin is likewise spoken very fluently by most of the nobility and gentry.

In Germany, the domestic diversions differ but little from those practised in England; they consist of billiards, cards, dice, fencing, and the like. In summer, the gentry visit the baths and other places of public resort. Their favourite field diversion is hunting; besides which, the Germans have bull and bear-baiting, and the like.

With respect to learning and learned men, it may justly be said, that no country has produced a greater variety of authors than Germany, and the inhabitants in general apply themselves with great alacrity to reading and study. No man can be a graduate in their universities, who has not published one dissertation at

least; by which means thousands of theses and dissertations are annually published, and books multiplied without end. The German authors are generally condemned for being extremely prolix, dry, and voluminous in all their writings, and entirely ignorant of the engaging art of enlivening their performances, by mixing the entertaining with the instructive. The fine arts have flourished tolerably well in Germany; and the inhabitants pique themselves upon being the first inventors of engraving, etching, and mezzotint.

Among their learned men, Stahl, Van Swieten, Storck, and Hoffman, have contributed greatly to the improvement of physic; Ruvinus and Dillenius, of botany; Heister, of anatomy and surgery; Newman, Patt, and Margff, of chemistry; and Leibnitz, Wolfius, Puffendorf, Zimmerman, Thomafius, Otto Van Guericke, Kepler, &c. have acquired fame by their philosophical writings. Rabener has immortalized his name by his satirical works. Gesner's *Idylls* and *Death of Abel* have been favourably received in the English translations. The late professor Gellert's elegant writings, which are much esteemed, seem particularly adapted to touch the heart, and inspire sentiments of morality and piety. Haller the famous physician, Hagedom, Lessing, Kleist, Gerstenberger, Klopstock, Ramber, and others, have excelled in poetry; and Schlegel, Crongh, Wieland, and Wiese, have distinguished themselves by their dramatic writings. Their romances are dry and uninteresting. In sacred literature, Raphaelis, Michaelis, and Walch, are famous; and some of the best editions of the Greek and Latin classics have been published by Cellarius, Burman, Taubman, Reiche, Enefti, Reimarus, Havercamp, and Heyne. Printing has been greatly improved in Germany, whose inhabitants are generally allowed to be the first inventors of great guns, and of gunpowder, in Europe, about the year 1320. This country has also produced some excellent painters, sculptors, and musicians; among the latter, may be named Handel, Bach, and Heise, of whom Handel is deservedly placed at the head; since it is acknowledged that he arrived at the sublime of music; though his ideas between music and sentimental expression were extremely defective.

The most celebrated public libraries are those of Vienna, Berlin, Halle, Wolfenbuttle, Hanover, Göttingen, Weymar, and the council library at Leipzig. There are thirty-six universities in Germany, of which seventeen are Protestant, seventeen Roman Catholic, and two mixed; besides a vast number of colleges, gymnasia, and Latin schools. Here are also many academies and societies for promoting the study of natural philosophy, the belles lettres, antiquities, painting, sculpture, architecture, &c. as the Imperial Leopoldine academy of the nature curiosi; the academy of science at Vienna, Berlin, Göttingen, Erfurt, Leipzig, Dillingen, Gießen, and Hamburg. The three younger sons of his Majesty George III. namely, prince Ernest Augustus

Augustus, were in tingen so by a governances o week, an extraordinary each. In converted (sum) into many. The Nunembur the Imper Augsburg, added.

of gunpowder, in this country has also distinguished themselves by their works, and may be named Handel, Handel is deservedly placed among the great men, though his ideas were extremely de-

libraries are these of the University of Göttingen, Hanover, Göttingen, and the Imperial library at Leipzig.

s in Germany, of which the most famous are the Roman Catholic, and the Protestant, and the number of colleges, gymnasia, and academies, are also many, and are chiefly directed to the study of nature, and antiquities, painting,

the Imperial Leopoldina; the academy of sciences, and the academy of arts, Erfurt, Leipzig, and the academy of arts, Erfurt.

The three younger sons of the emperor, namely, prince Ernest Augustus,

Augustus, Frederic Augustus, and Adolphus Frederic, were in the year 1786 sent to the university of Göttingen for education. Each of them is accompanied by a governor, a preceptor, and a gentleman; the expenses of their table were fixed at 600 crowns per week, and their different masters are allowed an extraordinary appointment of 1000 crowns per annum each. In 1734, his late Majesty King George II. converted this place (which was the ancient gymnasium) into an university. Its library is the best in Germany. There are academies for painting at Dresden and Nuremberg; a royal military academy at Berlin; and the Imperial Franciscan academy of fine arts is at Augsborg, to which the Latin society at Jena may be added.

In Germany, the most common silver coin is a six-shilling, worth about 4s. 6d. a German florin or guilder is worth about half a crown, and a gold ducat about 10s. A crown in specie is equal to an English crown, but a crown current only to 3s. 6d. A German mark is 1s. 6d. All princes and other powers in the empire, who possess gold and silver mines, have the privilege of coining money, as far as the quantity they yield; some in a larger, others in a smaller specie: but there are only three or four mints allowed in each circle, unless an estate of the empire has mines of its own, and wants to erect a mint near them. By the laws of the empire, each coin ought to pass an annual examination, when all the money should answer to the same standard as that of Leipsic. The German coin in general is neither sterling nor due weight, and, to the great disadvantage of the public, is allowed to be more clipped than that of any other country in Europe. The money of most nations in Europe will pass for near half its value, in Germany.

We should now proceed to a description of the cities, towns, ports, and other edifices in the German empire, with their revenues, and other peculiarities; but this being a very copious article, especially in Germany, our limits will therefore only permit us to mention some capital places belonging to it. But it will be necessary, first of all, to explain what is meant by Hans-Towns, and Imperial cities, as these titles have frequently occurred in the account of the constitution of the empire. The Hanseatic towns, then, were such as united by a league of neutral defence against their enemies, to support the liberties of commerce, and to protect each other against the impositions of foreign princes: Lubeck, Cologne, Dantzick, and Brunswick, were the four capitals of this league, and each of these had a college. These free cities were very much respected, on account of their wealth and trade; and their privileges were confirmed in France by Louis XI. Charles VIII. Lewis XII. and Francis I. but they have since lost a great part of them; and this confederacy is at present of little consideration to many of these towns.

Vienna, the capital of the whole archduchy of

Austria, is situated on the Danube. The city itself is of no great extent, being only three miles in circumference, but the suburbs are very large. It is well fortified, and nothing has been omitted by the princes of the house of Austria that could contribute to its strength, grandeur, and opulence. The streets, however, are narrow and dirty, and would render the air exceedingly unwholesome, were it not for the high winds which blow here most part of the year. Besides the churches and convents, the last of which have generally extensive gardens and walks, this city contains about 1200 houses, from four to seven stories high, eighty streets, and fifteen principal squares, in most of which are beautiful fountains, and magnificent monuments, erected by different emperors. The public buildings are very numerous, and the religious ones alone occupy a sixth part of the town. The imperial palace is a mean piece of architecture, but the emperor's library is a great literary rarity. The university in this city is endowed with large revenues and privileges, and divided into four classes, each of which has peculiar rules and immunities, viz. the Austrian class for the students of Austria, Italy, and other countries beyond the Alps; that of the Rhine for the western parts of the empire, France, Spain, and the Netherlands; that of the Hungarians, for Hungary, Bohemia, and other countries which speak Slavonic, and some parts of Germany; and lastly, that of the Saxons, for Saxony, Sweden, Denmark, the north parts of Germany, Great-Britain, and Ireland. In this city are many hospitals, in one of which, called the Burgher-Hospital, near 3000 persons are maintained. By means of the Danube, Vienna is supplied with provisions, and every other convenience, as well as luxuries of life, and being the residence of the imperial court, it is continually crowded with Greeks, Transylvanians, Slavonians, Turks, Tartars, Hungarians, Croats, Germans, Poles, Spaniards, French, Italians, and other foreigners, each in the habits of their respective countries. The number of its inhabitants, exclusive of these strangers, are said to amount to about 200,000.

The inhabitants of this city are remarkable for their luxurious manner of living: in the winter they frequent the operas; and when the Danube is frozen over, and the ground covered with snow, the ladies divert themselves in sledges of different forms, such as grasshoppers, tygers, swans, scallop-shells, &c. Here the lady sits dressed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap set off with plumes of feathers, ribbons, and bells. This diversion being chiefly taken in the night, their servants ride before the sledge with torches, and a gentleman sitting on the sledge behind, guides the horse. The destructive practice of gaming is more prevalent here than in any other town in the empire. His present Imperial majesty has greatly meliorated the condition of his Austrian subjects.

jects, given great encouragement to the Protestants, and suppressed many Popish religious houses, convents, &c.

Berlin, the capital of the Prussian dominions, is situated on the Spree, and is one of the finest and largest cities in Germany, but a place of no strength. It consists of five towns united together, and is the usual residence of the royal family, and the seat of the high colleges. Its streets and squares are spacious, and contain many fine palaces and other public buildings; but the most remarkable is the royal palace, which consists of a vast pile of buildings, wherein neither regularity nor uniformity have been attended to by the different architects employed in erecting it. It is adorned with most beautiful paintings and tapestry, and such a quantity of gold and silver plate, particularly the latter, as is not to be met with in any other court in Europe: besides which it contains a cabinet of rarities natural and artificial, a choice collection of medals, with a dispensary, and a very fine library. The manufactures in this city are numerous and well provided, and it abounds with churches, theatres, schools, libraries, and charitable foundations. Busching tells us, that in the year 1755 the number of its inhabitants, including the garrison, amounted to 126,661, and that in the same year there were employed in that capital no less than 443 silk looms, 149 half silks, 2858 looms for woollen stuffs, 453 for cotton, 248 for linen, 454 for lace-work, 39 frames for silk stockings, and 310 for worsted ones, besides manufactures of tapestry, gold and silver lace, and mirrors.

Dresden, the capital of the electorate of Saxony, is situated on both sides the Elbe, and is a very magnificent city, containing strong fortifications, superb palaces, public buildings, churches, and charitable foundations. The electoral palace was built in the sixteenth century; but having been greatly damaged by a fire which happened in 1702, it underwent a thorough repair, and great part of it was entirely rebuilt. In the inner court of it is a collection of rarities, called the Green Vault, that has scarcely its equal in Europe. It is divided into seven apartments, in the first of which are a great number of small brass models of the most famous statues and monuments extant, both ancient and modern; in the second are a variety of curious works in ivory; in the third, works of pure silver; in the fourth, gilt silver plate, and vessels of pure gold; in the fifth, precious stones, and curiosities formed out of them; in the sixth, the arms of the several Saxon countries, the crown, sceptre, imperial apple, and other pieces, which were used at the coronation in Poland; and in the seventh, some very rare jewels. This city is the academy of Germany for statuary, painting, enamelling, and carving. Here are manufactures for mirrors, and one of porcelain, but not equal to that carried on at Meissen in this electorate. It is impossible to enumerate the multitude of pieces of fine porcelain, both foreign and home made,

which are to be found in the Japanese palace near the white gate in Old Dresden; even the culinary vessels are made of this ware, and valued at a million of dollars. The foreign commerce of this city is carried on by means of the Elbe, over which it has a stately stone bridge of seventeen arches, that divides the city into the old and new towns. The number of inhabitants in the city and suburbs, which are very extensive, is supposed to be 110,000. The electorate of Saxony, reckoned the richest country in Germany, is said to contain 210 walled towns, sixty-one market-towns, and upwards of 2000 villages: its revenue amounts to 1,350,000l.

Hanover, the capital of that electorate, is situated on the river Leine, which divides it into the Old and New Towns. The streets are regular, broad, and well lighted, and contain about 1200 houses, many of which are built of timber and clay. The electoral palace being in 1741 destroyed by fire, was rebuilt with great magnificence.

Some manufactures are carried on in this city, and near it are the palace and elegant gardens of Herrenhausen. In the electorate are fifty-eight cities, and sixty market-towns, besides villages, containing about 750,000 people. The city and suburbs of Bremen contain about 50,000 inhabitants, and have a considerable trade by the Weser. The bishopric of Osnaburg lies between the Weser and the Ems. Its chief city has been long famous for the manufactures which go by its name, and for the best Westphalia hams. The other towns belonging to the electorate of Hanover have trade and manufactures; but these dominions have suffered greatly since the accession of the Hanover family to the crown of Great-Britain.

Breslau, the capital of Silesia, is situated at the conflux of the Oder and Ohlau. Including the suburbs, it is of great extent, having many large regular squares, broad streets, and public edifices, but the fortifications are very inconsiderable. In this city all sects of Christians, and even Jews are tolerated, but the magistracy of it is Lutheran. The buildings worthy notice are some of the churches, the bishop's palace, the Popish university, several of the monasteries and nunneries, and the exchange. There are also some good public libraries, two armories, a college of physicians, and a mint. Breslau is extremely populous, and the manufactures of Silesia, which are very considerable, principally centre there, so that several fairs are held annually in it, which occasions a great resort of Hungarian, Bohemian, Polish, and other foreign merchants. The revenue to his Prussian majesty is said to amount to near a million sterling.

The imperial town of Hamburg is situated on the Elbe, being almost in a circular form, and six miles in compass. This city, which is divided into the old and new towns, has six gates, and three entrances by water, viz. two from the Elbe and one from the Alster, which are strongly fortified with moats, ramparts,

baltions, and outworks. The ramparts are exceedingly
lofty, planted with trees, and of such a breadth as
to admit several carriages to go abreast. The public
offices, churches excepted, make no great appearance.
The cathedral is very ancient, and its tower leans as
if it would fall every instant, but on account of the
beauty and singularity of its architecture, it has not yet
been taken down. The Exchange at Hamburg is
very commodious, but far inferior to that of London.
The yard, arsenal, and o armories, are worthy the
inspection of a traveller. The trade of Hamburg is
very extensive, all the commodities and manufactures
of the several cities and states of Germany being
generally exported from thence. Its principal imports
are the woollen manufactures and other goods of Great-
Britain, to the amount of several hundred thousand
pounds annually. Its trade with Spain, Portugal, and
Italy, which is very considerable, is chiefly carried on
in English bottoms; and they employ fifty or sixty
ships every year in the whale-fishery. The inland
trade of this great city is quite equal to its foreign, and
exceeded by no country in Europe, except those of
London and Amsterdam.

Frankfort, a free and imperial city, and the usual
place of the election and coronation of the kings of
the Romans, is situated in a healthy, fertile, and de-
lightful country along the Maine, by which it is di-
vided into two parts, and both are computed to con-
tain about 3000 houses. It is of a circular form,
without any suburbs; but the streets are generally nar-
row, and the houses are mostly of timber and plaster,
and covered with slate; though here are some hand-
some private structures, of a kind of red marble, that
have the appearance of palaces. The fortifications are
regular and solid; the ditches are deep, and filled with
fresh water.

The natural and artificial curiosities of Germany are
very numerous. Near Blackenburgh are two rocks, ex-
actly representing two monks in their proper habits.
In Harts-Forest is a cave, of which the end has never
yet been discovered, though travellers have advanced
into it for near twenty miles. Near Hamelen, about
thirty miles from Hanover, there is likewise a cave,
at the mouth of which stands a monument, to com-
memorate the loss of 130 children, who are said to
have been swallowed up in this place in the year 1284.
In one part of Saxony, stones are dug up in a field,
which exhibit a lively representation, by fair copper
flukes, of fishes of divers sorts, frogs, and other ani-
mals, that abound in a neighbouring lake.

Among their artificial rarities, we may notice the
great tun at Heidelburgh, which holds 800 hogheads,
and is generally full of the best Rhenish wine. The
churches, palaces, castles, bridges, and other public
buildings in this empire are well worthy attention,
particularly the former, many of which are of Gothic
architecture, and strike the beholder with an idea of
sole magnificence: the cathedrals and churches are

adorned on the inside with a profusion of gold, silver,
diamonds, and other precious stones. The Imperial
library at Vienna is a great literary curiosity: it contains
upwards of 80,000 volumes, amongst which are many
valuable manuscripts in most of the oriental languages.

The situation of Germany being in a manner in the
centre of Europe; its vicinity to the sea, and its inland
navigation, all conspire to the advantage of its com-
merce. Besides the productions of their mines and
minerals, the exports of this empire consist in the fol-
lowing articles: corn, hemp, hops, flax, anise, cum-
min, saffron, madder, truffles, tobacco, lean cattle,
butter, cheese, honey, wax, wines, particularly the
Rhenish and Moselle; linen, stuffs, yarn, silk and cot-
ton stuffs, ribbons, toys, turnery wares in woods,
metals, and ivory; goat-skins, wool, timber, both for
ship-building and houses; cannon, bullets, bombs,
bomb-shells, iron-plates, and stoves; tin-plates, steel-
work, copper, brass-wire; hogs's bristles, mum, beer,
tartar, smalts, zaffer, Prussian-blue, printers-ink, mir-
rors, glasses, earthen-ware; the finest porcelain in the
world, and several other things.

After the revocation of the edict of Nantz by Louis
XIV. numbers of Protestant refugees settled in differ-
ent parts of Europe, and those which took shelter in
Germany introduced with themselves a great number
of manufactures into that empire. At present the inha-
bitants make velvets, silks, rich stuffs, stuffs half silk
and half cotton, variety of woollen stuffs and cloths, fine
and coarse linen, cheque linen, ribbons, lace, yarn,
thread, Silesia linen; canvas, sustians, table-linen, tick-
ing, fine and coarse woollen hose, and caps; gold and
silver galloon, embroidery, fine hats, tapestry, and Span-
ish rough and smooth leather. The manufactures of
paper, tobacco, wax, clock-work, guns, locks, tin-
plates, and white iron, are very considerable. The
artificers of Nuremburg are said to surpass those of any
other country in the working of steel, iron, brass, alab-
aster, and in toys of every kind. The Germans like-
wise excel in printing cottons, in dyeing, in making
fine lacquered works, mirrors, glass-ware; and the
porcelain of Meissen, in the electorate of Saxony, is
esteemed even preferable to that of China for the beauty
of its painting, and the fineness of the earth with
which it is made.

There are near 300. sovereign princes in Germany,
and every one of them arbitrary with regard to the
government of his own estates; but these princes form
a political confederacy, of which the emperor is the
head. Charles the Great, generally styled Charlemagne,
founded the German empire about the year 800, and
the imperial crown was hereditary in his family till the
extinction of his male issue, which happened in Janu-
ary 912. During this period the emperor was arbi-
trary, but then he consulted persons celebrated for
their abilities, and the rectitude of their conduct. On
the death of Henry IV. which happened in the year
1106, a constitution was formed, by which the right of

hereditary succession to the Imperial crown was abolished, and a free and voluntary election established.

About the middle of the thirteenth century, the chief princes of Germany assumed the title of electors; and, at the same time, appropriated to themselves the power of electing the head of the empire. The corporation, or body of estates over which the emperor presides, not in a dictatorial but executive capacity, consists of three classes, or colleges. The first of these is called the electoral college; the second, the college of princes; and the third, the college of imperial towns. The electoral college consists of nine members, all of whom have particular offices in the imperial court, and in them is vested the sole power of electing the emperor. They are ranked in the following order; viz. 1. The archbishop of Mentz, high-chancellor of the empire in Germany. 2. The archbishop of Treves, high-chancellor of the empire in France. 3. The archbishop of Cologne, high-chancellor of the empire in Italy. 4. The king, or rather elector of Bohemia, cup-bearer. 5. The elector of Bavaria, grand-ferver, or officer who serves out the feasts. 6. The elector of Saxony, grand-marshal of the empire. 7. The elector of Brandenburg (now king of Prussia) great-chamberlain. 8. The elector Palatine, great-steward. 9. The elector of Hanover, king of Great-Britain, arch-treasurer. Before the emperor calls a diet, it is necessary for him to have the advice of those members: the electors of Saxony and Bavaria have jurisdiction, the former over the northern, and the latter over the southern circles, during the vacancy of the Imperial throne.

The college of princes of the empire is composed of more members, but enjoys less power than that of the electoral. The members of this college are also divided into two classes, ecclesiastical and temporal. The ecclesiastical princes are as absolute as the temporal ones in their several dominions. The chief of these, besides the nine already mentioned, are the archbishop of Saltzburgh, the bishops of Bamburgh, Wirtzburgh, Worms, Spire, Munster, Strasburgh, Paderborn, Osnaburg, Lubbeck, &c. The chief of the secular princes are the landgrave of Hesse, the dukes of Brunswick, Wolfenbittel, Wirtemberg, Saxe-Gotha, Mecklenburgh, the marquises of Baden and Culmbach, with the princes of Nassau, Anhalt, Fursenburgh, and many others, who have all high titles, and are sovereigns in their own dominions. The free cities are likewise sovereign states; those which are imperial, or compose a part of the diet, bear the imperial eagle in their arms; those which are hanse-towns, have still great privileges and immunities, but they subsist no longer as a political body. Germany abounds with many abbots and abbees, whose jurisdictions are likewise absolute, some of them very considerable, and all of them chosen by their respective chapters.

The diet meets at Ratisbon, on the emperor's summons. This assembly, besides the election of an empe-

ror, makes laws, raises taxes, determines differences between the several princes and states, and can relieve subjects from the oppressions of their sovereigns.

But besides this general diet of the empire, there are yearly meetings of the states of one, two, or three of the circles that lie contiguous to one another, called from thence corresponding circles, of which there are three classes, the Upper Rhine, the Lower Rhine, and Westphalia; Upper and Lower Saxony; Franconia, Sraubia, and Austria. These assemblies take cognizance of the coin, the public peace, the magazines, fortifications, and commerce.

There are in Germany two supreme courts, erected for determining the great causes of the empire, arising between its respective members; namely, the imperial chamber, and the Aulic-council, or chamber of Vienna. The imperial chamber consists of fifty judges or assessors. The president and four others are appointed by the emperor; each of the electors choose one, and the other princes and states the rest. All causes may be brought into this court by appeal. The Aulic-council was originally nothing more than a revenue court of the dominions of Austria. But as the power of that family increased, the jurisdiction of the Aulic-council has been excluded; till at last, to the great disgust of the princes of the empire, it usurped upon the powers of the imperial chamber, and even upon those of the diet. It consists of a president, a vice-chancellor, a vice-president, a certain number of Aulic-counsellors, of whom six are Protestants, besides other officers, but the emperor is in reality the sole master. These courts decide all causes according to the laws and constitution of the empire, and the principles of the civil law.

After the votes of the diet are collected, and sentence pronounced, the emperor may, on an emergency, commit the execution of it to a particular prince or princeps, whose troops live at free quarter upon the estates of the delinquent party.

The constitution of the Germanic body is of itself a study of no small difficulty. It will be needless to enumerate the several checks that have from time to time been invented to abridge the imperial power, as it is certain that the ambition of the house of Austria has more than once rendered all these checks abortive, and even threatened the liberties of the empire, which have been saved by France; the house of Austria has also lately met with a powerful opposition from the house of Brandenburg, in consequence of the activity and martial spirit of his late Prussian majesty. It may be necessary, in this place, to inform the reader of the meaning of a term which has of late frequently occurred in the German history, namely, that of the pragmatic sanction. This is a provision made by the emperor Charles VI. for preserving the indivisibility of the Austrian dominions in the person of the next descendant of the last possessor, whether male or female. This provision has been often disputed by other branches of the house of Austria, who have been occasionally supported

ported by France from political views, though the
pragmatic sanction is strongly guaranteed by almost all
the powers of Europe. The late emperor, elector of
Bavaria, and the late king of Poland, attempted to
overthrow it, as being descended from the daughters of
the emperor Joseph, elder brother to Charles VI. The
court of Spain have likewise repeatedly opposed it.

In France, the lives and fortunes of the subjects
were entirely at the disposal of the grand monarch; but
few of the territories of the German princes are so
large as to be assigned to viceroys, to be oppressed at
pleasure by unfeeling officers; nor are they entirely
without redress when they suffer any grievance; they
may appeal to the general diet or great council of the
empire for relief. With respect to the burghers and
peasants of Germany, the former, in many places,
enjoy great privileges: the latter also, in some parts,
as in Franconia, Suabia, and on the Rhine, are gene-
rally a free people, or perform only certain services to
their superiors, and pay the taxes; whereas in the
marquisate of Brandenburg, Pomerania, Lusatia, Mo-
ravia, Bohemia, Austria, &c. they may justly be deno-
minated slaves, though in different degrees. The
subjects of the petty princes in Germany are generally
the most unhappy; for these princes usually affecting
the splendor and grandeur of the more powerful, in
the number and appearance of their officers and do-
mestics, in their palaces, gardens, pictures, curiosities,
guards, bands of music, tables, dress, and furniture,
are obliged, in order to support all this vain parade, to
lay enormous taxes and burdens on their subjects and
dependents.

With respect to the revenues of the empire, we
shall only make those of the emperor, and a few of
the most powerful electors, the subject of this article.
The annual income of the emperor is not more than
5 or 6000l. sterling, principally arising from some
inconsiderable fiefs in the Black Forest. The Austrian
revenues, the value of money in Germany being con-
sidered, appear immense, amounting to 7,000,000l.
sterling in Germany and Italy—a prodigious sum in
those countries. The revenues of the Prussian majesty
cannot easily be calculated, but they are computed at
half a million sterling per annum; and his father,
who never enjoyed the Siberian revenues, left above
seven millions in his coffers. The revenues of the
other princes of Germany are in proportion to those
already enumerated; but it is difficult, perhaps impos-
sible, in a country comprehending so many different
states, to make any computation that can be satisfac-
tory to the public. To behold the magnificence of
many of the German courts, a stranger is apt to con-
ceive very high ideas of the incomes of their princes,
which is chiefly owing to the high price of money in
that country, and, of course, the low price of provisions
and manufactures.

For maintaining the strength and forces of Germany,
and to provide for other contingencies, a constitution

was settled by Charles V. whereby every state of the
empire was to be taxed in proportion to its ability.
This tax, or quota, is entered into a public register,
called the matricula of the empire, and kept in the
office of the elector of Mentz; it contains the assess-
ments of men and money, which every prince and
state, who are members of the empire, is to advance,
when the imperial army takes the field. The contri-
butions in money are called Roman months, on account
of the monthly assessments formerly paid to the emper-
ors when they visited Rome; but those assessments are
subject to great mutability. However, upon a moderate
computation, the secular princes can bring into the
field 379,000 men, and the ecclesiastical 74,500; in
all 453,500; of those 90,000 are supposed to be fur-
nished by the emperor, as head of the house of
Austria.

By this computation, which is far from being exag-
gerated, it appears, that the emperor and empire form
the most powerful government in Europe, and that if
the whole force was properly directed under an able
general, Germany would have nothing to fear from
any of its ambitious neighbours; but the different inter-
ests pursued by the several princes of Germany render
the power of the emperor of little consequence, except
with regard to his own forces, which are indeed very
formidable. The late emperor's army, in 1775, was
computed to amount to 200,000 effective men.

The arms of the empire are a black eagle with two
heads, hovering with expanded wings, in a field of
gold; and over the heads of the eagle is seen the imperi-
al crown. On the breast of the eagle is an escutcheon
quarterly, of eight, for Hungary, Naples, Jerusalem,
Aragon, Anjou, Guelders, Brabant, and Barr. The
empress-dowager Eleanor, in 1662 and 1666, created
two orders of ladies, or female knights; and the order
of St. Theresa was instituted by the late empress-queen.

The emperors of Germany, as well as the kings of
Spain, confer the order of the *Golden Fleece*, as descended
from the house of Burgundy. This order was institu-
ted at Bruges, in Flanders, on the 10th of January
1429, by Philip duke of Burgundy, on the day of his
marriage with his third wife. It is supposed that he
chose the badge, it being the chief of the staple manu-
factures of his country. It consisted at first of thirty
knights, including the sovereign, who were of the first
families of the Low Countries, and it still continues
to be ranked with the most illustrious orders of knight-
hood in Europe. There are at present two branches
of it; the emperor is sovereign of the one, and the
king of Spain of the other; all the knights must prove
their noble descent from the 12th century. They
usually wear a Golden Fleece proper, pendent to a
broad plain red ribband round their necks; but on days
of ceremony, they wear the collar of the order, which
is composed of double steels, interwoven with flint
stones emitting sparks of fire, the whole enamelled in
their proper colours, at the end of which a golden
fleece

sleece hangs on the breast. The fusils are joined two and two, as if they were double BB's, the cypher of Burgundy, and the flint stones, the ancient arms of the sovereigns of that duchy, with their motto, *Anteferit quam flammâ micet*, "He prefers what shines with flame." The motto of the Order is, *Pretium non vile laborum*, "Not a mean reward of our labours."

We have already noticed the *Teutonic Order*, in our account of Orders in the Netherlands; and shall only add, that this order owed its origin to some religious Germans at Jerusalem, during the crusades, who assumed the title of the Teutonic knights, or brethren of the hospital of our Lady of the Germans at Jerusalem. Conrad, duke of Suabia, invited them into Prussia about the year 1230; they soon after conquered Prussia for themselves, and became one of the most powerful orders in Europe; but, by the order dividing against itself, they afterwards lost their power and possessions; and Albert, marquis of Brandenburg, grand-master of the order, on his abjuring Popery, abdicated the grand mastership, subdued Prussia, and expelled all the Papists who followed not his example. The members of this order must take the oath of celibacy.

It is not certainly known when the order of the *Red Eagle* was instituted. The margrave of Barceith is sovereign of it. The badge is a golden square medal enamelled white, on which is an eagle displayed red. It is worn pendent to a broad red watered ribband, edged with yellow, and worn scarf-wise. This order is commonly bestowed on general officers.

The *Order of Sincerity* was established in the year 1690, by John George, elector of Saxony, and Frederick III. elector of Brandenburg, in terminating their disputes, and as a confirmation and surety hereafter of their amity. The knights of this order wear a bracelet of gold: on one side are the names of the two princes, with this device—*Amitié sincere*, "Sincere Friendship;" on the other side are two armed hands, joined together, and placed on two swords, with two palm branches crossed with this motto—*Unis par jamais*, "United for ever."

The order of the *Noble Passion* was instituted in 1704, by John George, duke of Saxe Weissenfels, of which the duke is sovereign. The badge is a gold medal, enamelled white, on which is a star of eight points, gold, charged with a cross red, surmounted with an oval blue, on which are the letters J. G. in a cypher, the whole encircled with these words—*J'aime l'honneur qui vient par la vertu*, "I love the honour which comes by virtue." Each knight of this order is to contribute to the maintenance of the maimed or decayed soldiers in the service of the sovereign.

The order of the *Death's Head* was instituted in 1652, by the duke of Wirtemburgh, and revived in the year 1709, by his daughter Louisa-Elizabeth, widow of Philip, duke of Saxe-Mersburg. None but women of virtue and merit (birth and fortune not regarded) can be received into it; and the sovereign must be a princess

of that house. The badge of the order is a death's head, enamelled white, surmounted with a cross pattée black: above the cross pattée another cross composed of five javels, by which it hangs to a black ribband edged with white, and on the ribband these words—*Memento mori*, "Remember death," worn at the breast. They are to avoid gambling, theatrical amusements, and luxuries of all kinds.

The order of the *Chace* was instituted in the year 1702, by the duke of Wirtemburgh, and improved in the year 1719. The badge of this order is a gold cross of eight points enamelled red; in the spaces between the branches of the cross is an eagle displayed, red, and between the points of each traverse a bugle horn, and in the centre the letter W, and over it a ducal coronet enamelled in proper colours. It is worn pendent to a broad scarlet watered ribband, passing scarf-wise from the left shoulder to the right side. On the left side of the coat is a silver star embroidered, of the same figure as the badge, in the middle a green circle with the motto—*Amitié virtutisque fœdus*, "The bond of friendship and virtue." St. Hubert is the patron of this order; and the festival is held on his anniversary.

The order of *St. Hubert* was first instituted by a duke of Juliers and Cleves, in memory of a victory gained by him on St. Hubert's day, in 1447: it was afterwards revived in the year 1709, by the elector palatine. The number of counts and barons of the order, who enjoy the memorial lands annexed to it, is limited to twelve, but the number of princes and private gentlemen is not fixed. The elector palatine is grand-master of the order. The badge is a cross of eight points, from the angles issue rays, and in the middle of a circle is enamelled the figure of St. Hubert kneeling before a crucifix, placed between the horns of a stag standing in a wood, having in the centre this device in the Runic language—*Constans in fidelitate*, "Constant in fidelity," on a red ground. All the knights have either military employments or pensions; before admitted, they are to prove the nobility of their descent for four generations, and, on the day of reception, are to pay 100 ducats to the poor.

The order of *St. Rupert* was instituted in 1701, by the archbishop of Saltzburgh, in honour of the founder and patron of the see he held, and as the apollite of his country. It is composed of twelve knights, who are distinguished by a chain of gold round the neck, to which is pendent a badge, which is a cross of eight points enamelled blue; and in the centre the image of St. Rupert. This order is in good esteem, as the archbishop is the richest and most powerful prince in Bavaria, next to the elector.

The order of *St. George, the Defender of the immaculate Conception*, was instituted in the year 1729, by Albert, elector of Bavaria. The badge they wear is a star of eight points, and on the centre is enamelled the image of St. George on horseback slaying a dragon. The cross is enamelled blue edged with white. On days of cere-

f the order is a death's head with a cross pattée and another cross composed of a black ribband and a silver ribband these words— "In fide, justitia, et fortitudine." worn at the obsequies, theatrical amuse-

mony they wear the badge pendent to a collar composed of oblong plates with crowns at each end, and columns surmounted with globes, each column supported by two lions holding in their exterior paws two scymetars, the whole joined together with lozenge chains enamelled blue with white; on the oblong plates is this motto— "In fide, justitia, et fortitudine." The knights of this order are obliged to prove their nobility by father and mother for five generations.

The military and civil order of the *Golden Lion* was instituted by the present landgrave of Hesse-Cassel. The badge is an octagonal medal enamelled red, in the centre a lion rampant, gold, ducally crowned; it is pendent to a broad watered crimson ribband, worn scarf-wise. This order is mostly conferred on general officers.

The military *Order of Merit* was also instituted by the present landgrave; the badge (which is worn at the coat, pendent to a blue ribband edged with silver) is a gold cross of eight points enamelled white, and in the centre this motto—*Pro virtute et fidelitate*, "For virtue and fidelity."

THE HISTORY OF GERMANY.

WE learn from Tacitus, a Roman historian, that the ancient Germans were noble, magnanimous, and beneficent, without cherishing the dangerous ambition of increasing their dominions, by invading those of their neighbours, from whom they had received no injury. Their hospitality was remarkable; and their love of independence carried to an amazing height. Inspired with an unconquerable enthusiasm for defending their liberty, they nobly withstood the Roman power, even in its greatest height. At that time the Germans were so far from being formed into a single community, that they were divided into a vast number of small kingdoms, or commonwealths. They might indeed look upon themselves, in general, as a nation descended from the same stock, and thence have some laws in common to them all, either for supporting each other against foreign invaders, or for the preservation of a due balance of power, among their vast variety of commonwealths; but, in other particulars, each had its own form of government, laws, policy, and interest. But they were all equally fond of liberty, and avowed enemies of all kinds of invasion.

These noble principles induced them to behold with jealousy and detestation the daily encroachments made by the Romans on all their neighbours; and to lend their assistance to those nations who were threatened with the chains of slavery. Hence arose those wars and conquests, which ended in the reduction of their country. The artful Romans took the advantage of their being divided into a multitude of small republics; they fomented jealousies among some, and found means to

bribe others. Against some they used force; against others the arts of flattery. By this means they conquered gradually that power, which, when properly united, had defiance to the Roman legions. But though Germany was reduced to a Roman province, the inhabitants regained their liberty, when the power of the empire was divided; and made ample reprisals on their conquerors.

In this situation continued affairs to the year 800, when Charlemagne, or Charles the Great of France, one of those superior geniuses formed for changing the laws of kingdoms, and reforming the barbarous customs that prevail among mankind, was advanced to the Imperial throne on Christmas-Day. He was the son of king Pepin, and succeeded him in the kingdom of France when Desiderius, king of Lombardy, possessed that throne, who, having insulted the pope and clergy of Rome, and compelled them to part with a great deal of that power they had usurped, Charles invaded Lombardy, defeated and deposed Desiderius; and going afterwards to Rome, the pope, who looked upon him as his deliverer, declared him a patrician, a title equal almost to that of emperor; investing him with authority to confirm future popes, and grant the Italian bishops the investitures of their sees; after which the pope swore allegiance to him upon St. Peter's tomb. Charles, in return, gave the pope a power of constituting exarchs, or governors, over the provinces of Ancona, Bologna, Mantua, Modena, Parma, Ferrara, &c.

King Charles afterwards made a conquest of part of Spain; of the north of Germany, then denominated Saxony; and pope Adrian dying, Leo III. being elected pope, was confirmed in the chair by Charles the Great, as patrician of Rome; and, on Christmas-Day, 800 (as before observed) the pope and senate of Rome conferred the title of Roman emperor on king Charles, and crowned him in the church of St. Peter, the people saluting him emperor at the same time. This prince reigned 14 years, and died anno 814. The successors of Charlemagne did not long enjoy the honour of a throne founded by their great ancestor. In the year 880 the states of the empire assumed their original independence, and placed the Imperial crown on the head of Arnolph, king of Bohemia: and, since that period, Germany has been considered as an elective monarchy. The princes of the most powerful families in Germany, according to the prevalence of their interest and arms, have mounted the throne. The houses of Saxony, Franconia, and Suabia, have swayed the Imperial sceptre; but, in the year 1440, it passed to the house of Austria, who have ever since enjoyed it, except a short interval, when the duke of Bavaria, on the death of Charles VI. was placed on the throne: he did not long possess the Imperial dignity, but died of a broken heart, after a short and uncomfortable reign.

It would far exceed the bounds of this historical epitome to relate the events that happened during the reign

of these emperors: they consist chiefly of contests between them and the popes of Rome; and from these contests the famous factions of the Guelphs and Ghibelines, in the 13th century, had their rise; the former being attached to the popes, and the latter to the emperors; and these, by their virulence and inveteracy against each other, filled the empire with distraction for several centuries. Frederic III. duke of Austria, who ascended the Imperial throne in 1440, was very successful in his wars, and enjoyed the throne fifty-three years. He was succeeded by his son Maximilian I. who espoused the heirs of Charles, duke of Burgundy; and by this marriage, that duchy, together with the seventeen provinces of the Netherlands, were annexed to the house of Austria.

Charles V. the greatest prince that had filled the Imperial throne since Charlemagne, was elected emperor, on the death of his grandfather Maximilian, which happened in the year 1519. He was heir to the crown of Spain in right of his mother Joanna. During his reign the empires of Mexico and Peru in America were conquered, by which he became the sovereign of much larger and richer territories than any other prince in Europe. In his reign the reformation began in Germany. Charles violently opposed the followers of Luther, and a civil war broke out in the empire. This, together with the wars in which Charles was almost perpetually engaged against France, rendered his reign exceedingly troublesome. He was at first very fortunate, and is said to have been victorious in above thirty pitched battles which he fought in person: in the decline of life his good fortune began to forsake him; on which he abdicated the throne, and retired into a monastery, where he died about two years after. He was succeeded in the year 1558 by his brother Ferdinand I. who was very moderate with regard to the religious disturbances which still continued in Germany, and died in 1564, after having procured his son Maximilian to be elected king of the Romans.

Maximilian II. ascended the Imperial throne on the death of his father, without any new election, pursuant to the constitution of the empire. His reign was continually disturbed by internal commotions, chiefly on account of religion, and also invaded by the Turks; but he died in peace in 1576, and was succeeded by Rodolph, who obtained the Imperial sceptre on the death of his father: he was involved in a war with the Hungarians, and opposed by his brother Matthias. Perceiving that it would be in vain to endeavour to reduce the Hungarians to obedience while they were assisted by his brother, he therefore gave that kingdom, together with the duchy of Austria, to Matthias. This produced the desired effect, and Rodolph lived in peace the remaining part of his reign. On his death,

Matthias was elected emperor. During his reign the reformers were divided into two sects, called Lutherans and Calvinists, and opposed each other with so much fury, that the empire was threatened with a civil war.

But the ambition of Matthias, who had taken measures for exterminating both parties, reconciled them: At the same time, by persecuting the reformed in Bohemia, the people flew to arms, and threw the Imperial commissioners out of a window at Prague. This occasioned a dreadful war in that kingdom, which lasted thirty years. The persecution in Bohemia convinced both the Lutherans and Calvinists that nothing but a close union could prevent the destruction meditated by the emperor. Accordingly they formed a confederacy, called the Evangelical League, at the head of which was Frederic, the elector palatine, then the most powerful Protestant prince in Germany, and son-in-law to James I. of England. This was counterbalanced by a Catholic league.

Matthias dying in 1618, was succeeded in the Imperial throne by his cousin Ferdinand II. but the inhabitants of Bohemia refused to acknowledge him for their king, and offered their crown to the elector palatine, who was imprudent enough to accept it. While he continued at the head of the Evangelical League, he was very successful; but was not able to support the crown he had imprudently received. He was totally defeated at the battle of Prague, and deprived of his palatinate.

The Catholics considered this victory over Frederic as a prelude to the destruction of the Protestant cause in Germany; but their expectations were built on a sandy foundation. The reformers had still generals able to lead their armies, among whom were the margrave of Baden Dourlach, Christian duke of Brunswick, and the famous count Mansfield. Other Protestant princes also now perceived the necessity of joining their brethren, in order to support the religion they had embraced. Among these was Christian IV. king of Denmark, who was placed at the head of the Evangelical League. Christian engaged the Imperial army commanded by count Tilly, and was totally defeated. The Protestants were not however intimidated: they formed a fresh confederacy at Leipsic, at the head of which was the celebrated Gustavus Adolphus, king of Sweden. His victories succeeded each other with astonishing rapidity, and the house of Austria trembled for its power, when he was killed in the battle of Lutzen, in the year 1632. But the Protestant cause did not fall with Gustavus. The generals formed under his care pursued the plan he had formed, and the emperor was convinced that there was no other method of saving the house of Austria, than that of putting an end to the war. Accordingly a peace was concluded at Munster, in the year 1648. By this treaty the Protestant religion was established in all parts of Germany where it was professed; and the claims and pretensions of most of the princes and states of Europe were finally settled. Before this event happened, Ferdinand II. died, and his son Ferdinand III. was placed on the Imperial throne.

amiable princes of his time, so that he was at once hated
and dreaded by his subjects. Soon after his accession
to the Imperial throne, he found himself oppressed by
two powerful nations, France and Turkey. The
French took Alsace, and many other frontier places
of the empire from him; and the Turks, after over-
coming Hungary, laid siege to Vienna. Reduced to
this extremity, Leopold had recourse to John Sobieski,
king of Poland, for assistance. That prince, though
he had before received very indifferent treatment from
the house of Austria, marched at the head of a powerful
army against the Infidels, and, being joined by the
duke of Lorraine, attacked the Imperial general, and
beggars in their trenches, drove them from their
works, and totally defeated the grand Turkish army.
In the mean time, the French pursued their conquests
in so rapid a manner, that the other powers of Europe
were alarmed, and a grand confederacy, consisting of
the Empire, Great-Britain, the Dutch, and the north-
ern powers, was formed, in order to check the progress
of the French, and render abortive the ambitious and
chimerical plan contrived by Louis XIV. for founding
an universal monarchy. Though the arms of John
Sobieski had driven the Turks from their conquests,
the Hungarians, exasperated at the inhuman tyranny
of the emperor, and encouraged by the protection of
the Porte, were still in arms. At last a peace was con-
cluded at Ryfwick, in 1697; and, two years after, the
Turks consented to a peace, which was signed at Car-
lowitz in 1699.

Peace had not long taken place in Europe, when
Charles II. of Spain died, and, by his will, left his
dominions to Philip, duke of Anjou, grandson to
Louis XIV. who immediately seized the Spanish do-
minions, and proclaimed Philip king of Spain. This
acquisition in favour of the house of Bourbon alarmed
all the European powers; and a powerful confederacy
was again formed in order to humble the exorbitant
ambition of Louis XIV. The emperor claimed the
Spanish crown for his younger son Charles, as the law-
ful heir to those dominions. Accordingly Leopold in-
vaded Italy; and the allied army, consisting of British,
Dutch, and German forces, under the command of
the celebrated duke of Marlborough, opposed the French
in the Low Countries; where the armies of Louis
were constantly defeated. In the midst of this success,
Leopold died, and was succeeded in the Imperial throne
by his son

Joseph, who endeavoured to throw the whole burden
of the war on the English, though carried on solely for
his benefit. He was even suspected of having formed a
design to subvert the liberties of Germany; but before
he could carry his plan into execution, or even reduce
his Hungarian subjects to obedience, he was taken off
by death in 1711. Joseph dying without issue, was
succeeded by his brother,

Charles VI. the prince whom the confederates were
labouring to place on the throne of Spain, in opposition

to the duke of Anjou. A peace was concluded at
Utrecht in 1713, whereby the Spanish dominions in
Italy, and the Netherlands, were ceded to the emperor.
Charles now turned his whole force against the Turks,
and they were soon after totally defeated by prince Eu-
gene at the battle of Peterwaradin. The same general,
in the year 1717, obtained another victory over the
Infidels, before Belgrade; in consequence of which that
important city fell into the hands of the Imperialists.
Convinced, by these successive defeats, that the war,
if continued, must be attended with very disagreeable
consequences, the Turks offered to conclude a peace
with the emperor, and the treaty was accordingly
signed at Passarowitz in 1718. Charles, now free from
the embarrassments of war, employed his time in mak-
ing arrangements for securing and augmenting his he-
reditary dominions in Italy. Fortunately for him, the
crown of Great-Britain had devolved to the house of
Hanover, so that his connections with Geo. I. and II.
gave him a decisive weight in Europe.

In the year 1724, Charles, who had no male issue,
formed a design for settling his hereditary dominions
on his eldest daughter, the archduchess Maria Theresa.
But this plan did not interrupt his assiduity with regard
to his hereditary dominions. On the contrary, he
pursued his measure with so high a hand, that he gave
great offence to George I. and, about the year 1724, a
breach ensued between them. This contest might have
proved fatal to the repose of Europe, had not each of
the contending monarchs been principally attentive to
a favourite object, to the attainment of which every
other particular was to be sacrificed. That of the em-
peror was the settlement of his hereditary dominions on
his daughter; and the aggrandisement and safety of
Hanover possessed the chief place in the mind of the
British monarch. It is, therefore, no wonder that mu-
tual concessions in favour of these desirable acquisitions
should restore peace and harmony between the two
princes. The settlement Charles had made of his he-
reditary dominions on his daughter, was confirmed by
a diet of the empire, and, being guaranteed by the
principal powers of Europe, obtained the name of the
Pragmatic Sanction.

Charles, having obtained this great object of his at-
tention, turned his arms against the Turks; but his
famous general, prince Eugene, was now dead, and he
had no other capable of supplying his place. The In-
fidels were therefore generally victorious. The mea-
sures of the court of France being then pacific, he ob-
tained, by the mediation of that power, a much better
peace than he had reason to expect. By this treaty
Belgrade was ceded to the Porte, and the rivers Danube
and Saave made the boundaries between the two em-
pires on the south. On the 28th of October 1740,
Charles VI. died, and his eldest daughter,

Maria Theresa, some time before married to the duke
of Lorraine, was declared queen of Hungary and Bohemia,
and the lawful heiress of all the late emperor's
hereditary

hereditary dominions, agreeable to the pragmatic sanction.

But notwithstanding the above treaty had been guaranteed in the most solemn manner by different powers, several princes, on the death of Charles, set up claims in direct opposition to that treaty. The young king of Prussia, at the head of a powerful army, reduced great part of Silesia, under pretence that it had been long unjustly detained from his family. The king of Spain and the elector of Bavaria also claimed part of these estates, though they had never mentioned their pretensions in the time of Charles VI. The French, persuaded that a proper opportunity now offered for recovering what they had lost by the treaty of Utrecht, poured their armies into Bohemia, and threatened destruction to the house of Austria. Thus encompassed with armies, and in danger of falling a sacrifice to those very powers who had so lately guaranteed the pragmatic sanction, the archduchess determined to throw herself into the arms of her Hungarian subjects, though they had never shown any firm attachment to her family. Accordingly she summoned all the chiefs of that kingdom, and in a most pathetic speech recommended herself and her infant son to their protection. Touched with her youth and beauty, and enraged at the unjust proceedings of her enemies, the Hungarians promised to spend the last drop of their blood in her service. This fidelity of theirs to the late empress-queen, notwithstanding the provocations they had received from her house, will always be recorded to their honour. Affairs now began to wear a more pleasing aspect. A peace was concluded with the king of Prussia, and the Austrian generals drove the French out of Bohemia.

The duke of Bavaria was in the mean time placed on the imperial throne, under the title of Charles VII. but his dominions being conquered by the Austrian forces, he retired to Francfort on the Maine. His Britannic majesty George II. now declared in favour of the queen of Hungary, and defeated the French at the battle of Dettingen, in 1743. In the mean time Charles VII. was miserable on the imperial throne, and would have accepted peace from the queen of Hungary almost on any terms; but the haughtily, and indeed impolitically, refused every overture of accommodation, and seemed determined to be amply revenged for the injuries she had suffered. This obstinacy offered a pretence for the king of Prussia's entering Bohemia, under colour of supporting the imperial dignity. He was very successful in his invasion; but perceiving it was in vain to expect assistance from the French, notwithstanding their repeated promises, he abandoned all his conquests, and retired into Silesia. Soon after this retreat of his Prussian majesty, Charles VII. died of a broken heart, and the duke of Lorraine, then grand duke of Tuscany, and consort to the queen of Hungary, was placed on the imperial throne. This event happened in the year 1745.

The war was now transferred to the Low Countries, where the French were very successful under the command of count Saxe. The misfortunes which attended the allied army in Flanders retarded the operations of the empress-queen against the king of Prussia, and prince Charles of Lorraine being defeated by that monarch, a peace was concluded, by which Silesia was ceded to his Prussian majesty, and guaranteed by the king of Great-Britain. This peace was, however, of no long continuance; the king of Prussia discovered, or at least pretended to discover, a secret convention, by which the empress-queen, the empress of Russia, and the king of Poland, as elector of Saxony, had engaged to strip him of all his dominions, and divide them among themselves. His Prussian majesty therefore suddenly entered Saxony, drove the king of Poland out of his electorate, and took possession of Dresden. This irruption was however soon after terminated by a peace, under the mediation of the king of Great-Britain, by which the king of Prussia acknowledged the grand duke of Tuscany emperor of Germany. The war was still continued in the Low Countries, but was terminated, in the year 1748, by the treaty of Aix-la-Chapelle, which, however, did not put a period to the troubles of Germany for any long space of time, for it soon appeared the jealousy of the king of Prussia was not founded on imagination only.

The empress-queen and the empress of Russia, supported by France, kindled again the flames of war in the empire. The king of Prussia declared that he would oppose with all his power the entrance of the Russian forces into Germany, and his Britannic majesty protested against the French marching into that country. These two respectable powers thus agreeing in this fundamental principle, all former animosities were buried in oblivion, and the British parliament agreed to pay his Prussian majesty an annual subsidy of 670,000*l.* during the continuance of the war, the flames of which now broke out in Germany with greater fury and more destructive violence than ever.

The armies of his Prussian majesty, like an irresistible torrent, burst into Saxony, totally defeated marshal Brown at the battle of Lowositz, obliged the Saxon forces to lay down their arms, though almost impregnable fortified at Pirna, and caused the elector of Saxony to fly for protection to his regal dominions in Poland. The emperor now interposed his authority, and commanded the king of Prussia to desist immediately from troubling the repose of Germany. This imperial order being disregarded, his Prussian majesty was put under the ban of the empire, and the army of execution was ordered to be raised. The French poured their armies into Germany on one side, and the Russians on the other. Few histories afford an instance of conduct and intrepidity equal to that displayed by his Prussian majesty on this alarming occasion; it was indeed astonishing. He broke into Bohemia with inconceivable rapidity, and defeated near Prague

the Austrian prince Charles were killed, very left the Prussia immerse in; the in Colin by n the siege, and ever, was far he soon alter and the emp victory, seiz son. This of Hill mo Austrian arm ain, and the and totally d had advancee defeated by th

The parliament agreed to an annual subsidy of £1,000,000 for the use of the king of Prussia, the king of Prussia in Germany with violence than ever. The king of Prussia, like an iron, totally defeated the emperor of Russia, obliged the emperor of Russia, though almost blind, and caused the emperor of Russia to resign his regal dominions. The king of Prussia interposed his authority to Prussia to desist from the possession of Prussia. The king of Prussia regarded, his Prussian majesty, the emperor, and the king of Prussia to be raised. The king of Prussia on one side, few histories afford an example equal to that of the king of Prussia; his alarming occasion; broke into Bohemia defeated near Prague the

the Austrian army, commanded by marshal Brown and prince Charles of Lorraine. In this action 20,000 were killed, wounded, or taken prisoners. This victory left the city of Prague open, which the king of Prussia immediately besieged; but before he could reduce it, the greater part of his forces were defeated at Collin by marshal Daun, which obliged him to raise the siege, and retire to Eifenach. This defeat, however, was far from intimidating the Prussian monarch; he soon after attacked the combined army of France and the empire, at Rosbach, and obtained a complete victory, seized their baggage, and 164 pieces of cannon. This victory was soon after followed by another of still more importance; he attacked the grand Austrian army commanded by prince Charles of Lorraine, and the marshals Daun and Nadasti, at Lissa, and totally defeated them. By this time the Russians had advanced to Zorndorf, where they were also defeated by the Prussians.

We cannot undertake, in this compendium, to follow the armies of the contending powers in Germany through all the various scenes of action; let it suffice to say, that the greatest defeat his Prussian majesty received during the whole war, was by the Russians, near Francfort on the Oder. His affairs indeed now seemed desperate, but he had resources within himself that astonished all the world; he arose with new lustre after every defeat. He maintained a war against these formidable powers, till jealousy among the contending parties occasioned it to languish, and before the cause could be removed, the empress of Russia died on the 5th of January 1762. George II. had died on the 25th of October 1760.

These critical events saved the house of Brandenburg; nor were the Austrian generals themselves very forward to complete the destruction of Prussia. Already sufficiently haughty and despotic, it was thought very imprudent to increase the power of the court of Vienna. The new czar of Russia recalled his forces, and the English ministry had entered into a negotiation with France for putting an end to the troubles of Europe. This had a great effect on the belligerent powers in Germany; and on the 15th of February 1763, a definitive treaty of peace between the emperor and empress-queen of Hungary, and the king of Poland, elector of Saxony, on the one part; and the king of Prussia, on the other; was concluded at Hubertsburg near Leipzig; by which it was agreed that every thing should remain in the same state as at the beginning of this bloody war, which had proved fatal to many of the best generals in Europe; the king of Prussia lost above forty, among whom was the great marshal Keith, and general Schwerin. Marshal Brown fell in the battle of Prague, and Daun was dangerously wounded at Torgau.

The emperor died at Vienna in the year 1765, and his son Joseph, who had been crowned king of the Romans in 1764, succeeded to the imperial throne.

This prince was of a pacific and humane disposition, had discovered great talents for government, and given several pleasing instances of his ardent desire to render his subjects happy. He attended to their complaints in person, and redressed every grievance as soon as it was known. He visited his Italian dominions in person, and regulated many abuses which had crept into the government. He procured a personal interview with the late king of Prussia, though this did not prevent hostilities from being commenced between Austria and Prussia, on account of the succession to the electorate of Bavaria. The Austrian claims on this occasion were very unjust; but in the support of them, while the contest continued, the emperor displayed great military skill. Though vast armies were brought into the field on both sides, no very important action happened, and an accommodation at length took place.

The great good sense and noble disposition which seemed to predominate in the character of the late emperor, are strikingly exemplified in the following answer, which this illustrious prince gave to the inhabitants of Buda in Hungary, who, having derived the most important advantages from the transferral of several public offices to that city, which were before held at Presburgh, desired permission to erect a statue to his Imperial majesty, as a mark of their gratitude for the favour he had conferred upon them. The Hungarian deputies having laid their petition at the foot of the throne, the enlightened monarch, instead of acquiescing with their demand, wrote with his own hand the following answer at the bottom of the petition:

"When I shall have eradicated the prejudices which oppose themselves to the progress of reason, and they are replaced by a pure and well-directed zeal for the interests of our country, and the certain knowledge of what may be most advantageous to it:

"When every individual of the state shall make his happiness consist in contributing, according to his abilities, to the well-being, safety, and increase of the monarchy:

"When I shall see equity and good order reign in the tribunals—knowledge increase by the perfection of learning—the instruction of the people more attentively regarded—the discipline of the clergy more regular, and harmony firmly established between the civil laws and the precepts of religion:

"When the true interests and duties of lords to their vassals, and of vassals to their lords, shall no longer be misunderstood:

"When an augmented population—an improved agriculture—a patriotic industry—and manufactures brought to the utmost perfection, finding a ready sale and free circulation through all the provinces of this vast empire, shall produce a pure and fruitful stream of real wealth, which I so ardently desire, and which I trust will, one day be realized—then, perhaps, I shall deserve a statue—but such an honour is not due to me for having,

by the transferral of public offices to Buda, afforded to the inhabitants of that city the means of selling their wines at a higher price, and of raising the rents of their houses."

The late emperor Joseph expired on the 20th of February 1790, in the 26th year of his reign, and the 49th of his age. As king of Hungary and Bohemia, he was only in the 10th year. He succeeded to the imperial crown on the death of his father Francis on the 10th of August 1765; and to the hereditary dominions in the house of Austria on the death of his mother on the 29th of November 1780. He was twice married; first, to a princess of Parma; then to one of the princesses of the house of Bavaria; but having no issue by either of them, the succession devolved on his brother Peter Leopold Joseph, grand duke of Tuscany, now Leopold II. the present reigning emperor of Germany, who has united his forces with those of the other combined powers against the French republic. This war continued to be vigorously carried on by all parties in the beginning of the year 1794.

CHAPTER XIX.

THE KINGDOM OF PRUSSIA.

Extent, Boundaries, Divisions, Climate, Produce, Religion, Inhabitants, Government, Revenues, &c.

THE KINGDOM OF PRUSSIA, formerly called Ducal Prussia, belongs to the house of Brandenburg; and is quite distinct from Royal Prussia, which is subject to Poland. Its greatest length is about 160 miles, and its breadth about 112. To the north it is bounded by part of Samogitia; to the south, by Poland Proper and Masovia; to the east, by part of Lithuania; and to the west, by Polish Prussia and the Baltic.

The Borussi were the ancient inhabitants of this kingdom, and from them the present appellation of Prussia is evidently derived. Prussia, since the beginning of the present century, has become a very respectable power upon the continent of Europe; but as the territories of his Prussian majesty lie scattered in different parts of Germany, &c. it was thought proper to exhibit the whole in the following TABLE:

COUNTRIES NAMES.	Length.	Breadth.	Square Miles.	CHIEF CITIES.

Switzerland....	Neufchatel.....	32	20	320	Neufchatel.
Total.....			52,450	

Besides the above dominions, the present king of Prussia possesses great part of Silesia, which, under various pretences, he has wrested from Austria: he has also seized upon Thorn, with the countries on the Vistula, the Neister, and other territories contiguous to his own dominions, close to the walls of Dantzick.

The air of Prussia, being purified by frequent high winds, is tolerably wholesome: the winters are long and severe, and the autumns frequently wet and stormy. The soil, where cultivated, proves fruitful in corn and other commodities. The woods furnish the inhabitants with wax, honey, pitch, and a quantity of pot-ashes.

urified by frequent high : the winters are long e frequently wet and stormy. ves fruitful in corn and s furnish the inhabitants a quantity of pot-ashes. Here

Here is also a sort of manna, and a species of worm or insect called kermes, from which a beautiful red colour is extracted. Its animal productions are horses, sheep, deer, and game, bears, wolves, lynxes, wild boars and foxes. The rivers and lakes abound with fish; and amber, which is thought to be formed of an oil coagulated with vitriol, is found in pits on its coasts, towards the Baltic. Wood for fuel, and pit-coal, are very plentiful.

The present inhabitants of Prussia are the descendants of Germans, Lithuanians, and Poles, with a mixture of French, English, and Dutch. The number of persons, capable of bearing arms, are computed at upwards of 600,000, and, since the year 1719, it is supposed that about 34,000 colonists have removed thither from France, Switzerland, and Germany; of which, 17,000 were Saltzburghers. These emigrants have built 400 small villages, eleven towns, eighty-six seats, and fifty new churches, in that part of the country called Little Lithuania; they have likewise founded 1000 village-schools. The manners of the inhabitants, and their customs and diversions, differ but little from those of the other inhabitants of Germany, to which the reader is referred.

The established religion in Prussia is the reformed, according to the tenets of Luther and Calvin; but, through his majesty's wisdom and moderation, Papists, Antipodobaptists, and almost all other sects, are here tolerated. Schools for the instruction of youth are dispersed throughout the kingdom. There is an University at Koningsburg, founded by the margrave Albert in the year 1544, which has thirty-eight professors, exclusive of tutors: in the same city is a college, styled Collegium Fredericianum.

Koningsburg, which is the capital of the whole kingdom, stands in 54—43 N. lat. and 21—35 E. long. on the river Pregel, over which it has seven bridges. It is well built, contains about 60,000 inhabitants, a great number of elegant houses, and a variety of gardens both public and private, is well fortified, and has an exceeding good harbour, well furnished with ships. Here is also a magnificent palace, the greater part of which was built by the margrave Albert. It is a very extensive building, and in it most of the public offices, courts, and colleges are held. The gardens and parks belonging to it are likewise both spacious and beautiful; and near it is the Gallegium Fredericianum. In the year 1544, the above-mentioned Albert founded here a college, which has thirty-eight professors, exclusive of tutors. The other public buildings of note, are, the Exchange, and Town-House, both very stately. Here is also the citadel called Frederic's-Burg, built in the year 1657, which is a regular square, surrounded with broad ditches and the river Pregel. Besides the hospitals and alms-houses, here is a charitable fund, from which above eight hundred people receive weekly pensions. This city was formerly a Hanse-Town, and its trade is still very

considerable. In the year 1752, near five hundred ships arrived in this port.

Berlin may with justice be deemed one of the finest and largest cities of Germany. It is the royal residence, consists of five towns united together, but has received astonishing improvements of late years. The streets are handsome, long, and capacious; here are some very elegant squares, and many fine palaces. One of the principal public edifices is the royal palace, a prodigious pile, but irregular, as it was erected at different times, and by various architects. It is decorated with admirable paintings, and beautiful tapestry, and furnished with a greater quantity of plate than any other court in Europe. It contains likewise a fine cabinet of rarities, natural and artificial, an excellent collection of medals, a dispensary, and one of the finest libraries in Europe.

Thirty miles west of Koningsburg is Pilau, a town of considerable strength, with a fine harbour, both which are defended by a strong fort mounted with a great number of cannon. It is situated at the mouth of the bay or lake called Fresche-Hoff; and this peninsula is so delightful, that it is called the paradise of Prussia. Pilau is a place of good trade, and the larger vessels consigned to Koningsburg, deliver and take in their cargoes here, the Fresche-Hoff not having a sufficient depth of water to carry them up to Koningsburg. In the village of Wogram, not far from hence, the flur-greens are boiled and packed up, and cavier made of their roes, of which the greater part is exported to England.

The largest and most wealthy town in Prussia, next to Koningsburg, is Tilsit. It stands on the river Memel, and carries on a considerable trade, especially with Koningsburg. Here is a salt factory, and a castle; and in the neighbouring county, which is remarkably fertile, great numbers of cattle are bred, and excellent butter and cheese made.

For curiosities and antiquities, natural and artificial, see GERMANY.

The late king of Prussia, by an indefatigable attention to the commerce and manufactures of his kingdom, brought them into a very flourishing state: he derived an amazing revenue from this country, which about a century and a half ago was the seat of hours and barbarism. It is said that amber alone, of which Prussia has been considered as the native country, brings him in 26,000 dollars per annum. Besides amber, the exports of this country consist of variety of naval stores, linseed, hemp-seed, oatmeal, cavier, mead, fish, and tallow; and 500 ships, chiefly from Koningsburg, are said to be employed annually in the conveyance of these articles to foreign countries. The manufactures of Prussia consist principally in iron-work, copper and brass scroll, glass, paper, gun-powder, cloth, silk, linen, camblet, knit stockings, and other articles. The lakes and canals afford great conveniencies for transporting merchandize; and, for

its

its extent, the kingdom of Prussia has the most inland navigation of any other in Europe, the Netherlands excepted.—The principal rivers are the Vistula, the Pregel, the Memel, the Passage, and the Elbe.

The king of Prussia is absolute throughout his dominions, and, under him, the government is vested in a regency of four chancellors of state, viz. the great master, the great burgrave, the great chancellor, and the great marshall. There are also some other councils, and thirty-seven bailiwicks. The states of this kingdom consist of counsellors of state, and of deputies from the nobility and commons: his majesty has likewise erected a board for commerce and navigation, and there are several tribunals for the administration of justice.

The revenues of the king of Prussia arise principally from his demesnes, the duties of customs and tolls, and the subsidies granted annually by the several states. Since the accession of Polish or Royal Prussia, his revenues are greatly increased: the local situation of these additional territories was of vast importance, as they lay between his German dominions and his kingdom of Prussia; but this acquisition has rendered his kingdom compact, so that his troops may march from Berlin to Koningsburg without interruption, not to mention the benefit arising to trade and commerce by this means.

The Prussian military establishment is under the most excellent regulation. Every regiment has a particular district assigned it, where the young men proper for bearing arms are registered, till called upon to join their regiments, where, being incorporated with veterans, they soon become excellent soldiers. By this means, the king is never at a loss in forming his troops, or recruiting his army, which even in time of peace consists of about 180,000 of the best disciplined troops in the world, and, during the last war, that force was augmented to 300,000 men. But this great military force, however it may aggrandize the power and importance of the sovereign, is utterly inconsistent with the interests of the people; and in a country naturally so inadequate to it, has occasioned so great a drain from population, and such a withdrawing of strength from the labours of the earth, that the present king has endeavoured in some measure to save his own peasantry, by drawing as many recruits as he could from other countries.

The arms of the kings of Prussia are; Argent, an eagle displayed sable, crowned, Or, for Prussia. Azure, the imperial scepter, Or, for Courland. Argent, an eagle displayed, gules, with semicircular wreaths, for the marquisate of Brandenburg. To these are added the respective arms of the several provinces subject to the crown of Prussia. The four orders of knighthood are as follow:

1. The order of *Concord*, instituted by Christian Ernest, margrave of Brandenburg, in the year 1660, to distinguish the part he had acted in restoring peace

to many of the princes of Europe. The badge is a gold cross of eight points, enamelled white; in the centre a medal bearing two olive-branches passing saltier-wise through two crowns, and circumscribed with the word *Concordans*, "Agreeing." The cross is surmounted with an electoral crown, and worn pendent to an orange-coloured ribband. 2. The order of *Generosity*, instituted by Frederic III. elector of Brandenburg, and afterwards king of Prussia. The knights wear a cross of eight points enamelled blue, having in the centre this motto, *La Generosité*, "Generosity," pendent to a blue ribband. 3. The order of the *Black Eagle* was instituted by the same prince, on the day of his coronation, at Koningsburg, in the year 1700; the sovereign is always grand master, and the number of knights, exclusive of the royal family, is limited to thirty: none but sovereign princes can be admitted into this order, till after having been previously received into that of *Generosity*. The ensign of the order is a gold cross of eight points, enamelled blue, having at each angle a spread eagle, enamelled black, being the arms of Prussia, and charged in the centre with a cypher of the letters F. R. pendent to a broad orange ribband worn saltier-wise over the left shoulder; and a silver star embroidered on the left side of the coat, whereon is an escutcheon, containing a spread eagle, holding in one claw a chaplet of laurel, and in the other a thunderbolt, with this motto round it in gold letters, *Suum cuique*, "To every one his own." The knight-caps are of black velvet with white plumes. 4. The order of *Merit* was instituted by his late majesty, in the year 1740. The king is sovereign, and the number of knights unlimited. The ensign is a cross of eight points, enamelled blue, and edged with gold, having in the centre a cypher of the letters F. R. and in each angle an eagle displayed black; on the two upper points the regal crown of Prussia; on the reverse, the motto, *Pour le Merit*, "For Merit." The badge is worn round the neck, pendent to a black ribband, edged with silver. This order is conferred as the reward of merit of persons either in arts or arms, without distinction of birth, religion, or country.

THE HISTORY OF PRUSSIA.

The origin of the inhabitants of Prussia, like that of most other nations, is lost in the darkness of antiquity: we know, however, that in very early times the ancient Prussians were a very brave and warlike people, and refused to submit to the neighbouring princes, who, on various pretences, attempted to reduce them to slavery. In particular, they made a noble stand against the kings of Poland, and in the year 1163 the Polish monarch, Boleslaus IV. was by them defeated, and slain.

They remained Pagans in opinion, and independent in circumstances, till the time of the crusades, when the

the German knights of the Teutonic order, about the year 1090, attempted to convert them by force of arms. Several bloody wars ensued, in which the inhabitants of Prussia were almost extirpated by the zealous fury of the Teutonic knights; and the latter having ravaged the country with incredible barbarity, attempted to repopulate it with Germans.

In 1466 a treaty was entered into between Casimir, king of Poland, and the Teutonic knights, in which it was agreed, that the country now called Polish Prussia should continue a free province under the protection of the king, and that the knights should possess the remainder, on condition of acknowledging themselves vassals to Poland. This treaty was however soon broken, another series of bloody wars ensued, and the knights attempted to become independent of the Poles, but their attempts proved abortive.

In 1525, Albert, margrave of Brandenburg, and the last grand-master of the Teutonic order, concluded a peace, and entered into a treaty at Cracow, in which it was stipulated that the margrave should be acknowledged duke of the east part of Prussia, which on that account was called Ducal Prussia, but still it was to remain as a fief of Poland. In this manner the sovereignty of the Teutonic order ended in Prussia, after it had subsisted near 300 years.

In the year 1657, the elector Frederic William of Brandenburg, surnamed the Great, had Ducal Prussia confirmed to him; and by the conventions of Welau and Bromberg, it was freed from its vassalage to Poland, and Casimir, king of Poland, acknowledged its independency. The late king of Prussia, in his memoirs of the house of Brandenburg, says, that this Frederic William began his reign under the most desperate circumstances. "He was," says he, "a prince without territories, an elector without power, a successor without inheritance, and just in the flower of his youth; so age, which, exposed to the vivacity of passions, renders mankind almost incapable of direction; yet he gave marks of the most consummate wisdom, and of every virtue that could render him worthy of command. He regulated his finances, proportioned his expences to his revenues, and got rid of those ignorant or corrupt ministers who had contributed to the miseries of his people." And in another place this royal author, in speaking of the same prince, says, "Europe in him beheld a prince, whose actions displayed the noble soul, and the superior genius; one while tempered with prudence, another time bearing that character of enthusiasm which forces our admiration; a prince who constantly repaired his losses without foreign succours; who formed all his projects himself, and put them in execution; who by his wisdom retrieved a desolated country; by his policy and prudence acquired new territories; by his valour assisted his allies, and defended his people; a prince, in fine, who was equally great in all his undertakings." This great prince died April 29, 1688, of the dropsy.

Frederic William the Great was succeeded by his son Frederic, who was afterwards the first king of Prussia. This great titular alteration was chiefly owing to the influence of the Protestant powers; for as the reformed religion had been introduced into this country by the margrave Albert, and the electors were of that persuasion, the Protestant interest was made use of to raise Frederic to the dignity of a king, and he was accordingly soon acknowledged as such, not only by the empire of Germany, but by all the other powers of Europe. His grandson, the late king of Prussia, in the memoirs of his family, gives no very favourable picture of the virtues, or high opinion of the abilities of this prince; he, however, speaks warmly in praise of his own father, Frederic William, who succeeded Frederic, the first king of Prussia, in the year 1713. This prince certainly had great talents, and uncommon courage; but he too frequently exerted both at the expence of that magnanimity and humanity which ever ought to embellish the heart of a monarch. He amassed so much money during his reign, that at his death, which happened in 1740, he left behind him the enormous sum of 7,000,000l. sterling, a treasure which afterwards enabled his son and successor to pursue the most important plans, and which, joined to his sagacity, courage, and great military talents, raised him to be of the utmost consequence in the political scale of Europe.

Frederic III. the late king of Prussia, was born in 1712, married in 1733 to Elizabeth Christina, of Brunswic Wolfenbuttle, and began his reign, Jan. 31, 1740, so that he was twenty-eight years of age at the commencement of his reign.

This great prince died Aug. 17, 1786; aged seventy-four years, having reigned forty-six years, two months, and seventeen days. He left no issue, and was succeeded in the throne by Frederic William, his eldest brother's son, proclaimed king Aug. 19, 1786. Hath issue by his first consort Elizabeth Ulrica, of Brunswic Wolfenbuttle, Charlotte, born May 7, 1767, married to the duke of York. He was married July 14, 1769, to his second consort Frederica-Louisa, of Hesse-Darmstadt. His issue by her are, Fred. William, born Aug. 3, 1770. Fred. Charles Louis, born Aug. 3, 1773. Frederica Sophia Wilhelmina, born Nov. 18, 1774, married Oct. 1, 1791, to the hereditary prince of Orange. Fred. Charlotte Augustus, born May 1, 1780. Another prince, born Dec. 20, 1781, and another in July 1783.

It may not be improper here to observe, that nothing remarkable of the late king's early years hath been transmitted to us, except that he had, when very young, a taste for literature and the polite arts, and shewed a particular passion for French breeding and delicacy of manners, in opposition to the inelegant customs that prevailed in his father's court. After his accession to the throne, he improved the arts of peace, as well as of war, and distinguished himself as a poet,

philosopher, and legislator. We have already mentioned some of the principal transactions of his reign in our account of Germany. In 1789 he published a rescript, signifying his pleasure that no kneeling in future would be required in honour of his person, assigning for his reason, that this act of humiliation was due only to the Divinity. In 1789, near 2,000,000 crowns were expended by him in draining marshes, establishing factories, settling colonies, relieving distress, and in other purposes of philanthropy and policy, for the benefit of his subjects.

In the year 1786, not long before his death, he instituted two hospitals for the aged of both sexes, and of all countries; and he granted 500,000 rix-dollars for the new establishments forming in Western Prussia, besides 100,000 rix-dollars for cutting a new canal from the eastern parts of Brandenburg to Berlin.

CHAP. XX.

B O H E M I A.

Situation, Boundaries, Extent, Divisions, Climate, Mountains, Manufactures, People, Religion, Chief Towns, Revenue, &c.

THIS kingdom is situated between 48 and 52 deg. north lat. and between 12 and 19 deg. of east long. It is bounded on the north, by Saxony and Brandenburg; on the south, by Austria and Bavaria; on the east, by Poland and Hungary; and on the west, by the palatinate of Bavaria, comprehending, formerly, Bohemia Proper, Silesia, and Moravia. It is about 300 miles in length, from north to south, and 250, from east to west.

Bohemia Proper, W. is mostly subject to the house of Austria; its chief towns are Prague, Koningsgratz, E. Glatz, E. and Egra W. being in length 162 miles, and 142 in breadth, and containing an area of 12,060 square miles.

Silesia, E. mostly subject to the king of Prussia, has for its chief towns, Breslaw, Glogaw, N. Crossen, N. Jugendorf, S. Trowaw, S. subject to the house of Austria; and Teschen, S. also subject to Austria, being in length 196 miles, and in breadth ninety-two, and contains an area of 10,250 square miles.

Moravia, S. is entirely subject to the house of Austria; its chief towns are, Olmutz, Brin (middle), and Iglu, S. W. being in length 120 miles, and eighty-eight in breadth, and contains an area of 5,424 square miles.

The climate of Bohemia is rather unwholesome, owing, as is supposed, chiefly to the large woods with which it abounds. The soil is in general tolerably fertile, being well watered with rivers, particularly the Elbe, Muldaw, and Eger.

The mountains of Bohemia contain rich mines of silver, quicksilver, copper, iron, lead, sulphur, and salt-petre; in other respects, there is nothing remarkable in them. There are many wild beasts and deer in the forests and woods.

The chief manufactures of Bohemia are linen, copper, iron, and glass; the exports consist chiefly of cattle, corn, metals, precious stones, linen, and wines.

We have no certain account with regard to the number of people in Bohemia. About the middle of the last century they were computed at 3,000,000, but it is thought they are less numerous at present. They resemble the Germans in their persons and habits; the peasants are naturally brave, and more inclined to arms than arts; they are open and agreeable in conversation, but superstitious, and easily imposed upon by artful and designing men. There are no gentry in Bohemia; every lord is sovereign in his own estate, and every tenant a slave; but the present emperor has generously discharged the Bohemian peasants on the imperial demesnes, from the state of villenage in which they have been so long and so unjustly retained; and it will be happy if his imperial majesty's example should be followed by the Bohemian nobility, and their vassals be permitted to enjoy the rights of human nature.

The Bohemians were formerly the most intrepid asserters of civil and religious liberty; and accordingly, at the time of the reformation, nobly opposed the emperor, at the head of the imperial army; but animosities prevailing among their leaders, they were obliged, after making the most generous struggles for independency, to submit. Exasperated at their opposition, their despotic masters employed every method in their power to break the spirit of the Bohemians, in order to render them more submissive to an arbitrary government, and an ignorant, bigoted clergy. The customs and diversions of Bohemia are the same with those practised in Germany, already described.

The established religion of Bohemia is Popery. The Protestant religion was early planted here by John Hus and Jerome of Prague; but since the banishment of its professors in the year 1639, that religion has not been tolerated. A few years since a mysterious kind of Protestantism sprung up in Moravia, under the auspices of count Zinzendorff, and has been since propagated in various parts of the globe; they have still a chapel in London, and have obtained an act of parliament for a settlement in the plantations. The only archbishop in Bohemia is that of Prague; but there are three bishops under him; namely, those of Koningsgratz, Breslau, and Olmutz.

The proper language of Bohemia is the Slavonian, but the inhabitants generally speak German.

The only university in Bohemia is that of Prague; it was founded by the emperor Charles IV. and has generally 1400 students; but when the celebrated John Hus was rector of this seat of learning, it is alleged that their number amounted to 44,000.

Prague, the capital of Bohemia (in E. lon. 14. deg. 30 min. N. lat. 50) is one of the most magnificent cities in Bohemia, and so large in circumference, that the grand Prussian army could never completely invest it, so that, in case of a regular siege, it can make a vigorous defence. The bridge over the Moldaw is a noble structure. The streets are spacious, and well laid out, and many of the public structures large and magnificent; but the city is not very populous, considering its extent, the number of inhabitants being computed at only 70,000 Christians, and 30,000 Jews. The trade is not considerable, but the Jews carry on a large commerce in jewels.

Breslaw, the capital of Silesia, we have already described in our account of Prussia.

Olmutz, the capital of Moravia, in E. long. 16 deg. 45 min. N. lat. 49 deg. 40 min. situated on a navigable river called Morawa, is a neat, strong, and populous city. The streets are regular, and the public structures elegant. It is a bishop's see, which about the year 880 was filled by St. Cyril. Here are manufactures of woollen, iron, glass, paper, and gunpowder; and the inhabitants carry on a great trade with Hungary, Poland, Silesia, and Austria.

There are several other considerable places in Bohemia, some of which are fortified; but not remarkable either for strength, buildings, commerce, or manufactures.

The constitution of this kingdom was originally a limited and elective monarchy. But Ferdinand I. by his marriage with Anne, heiress of Bohemia and Hungary, annexing those kingdoms to the house of Austria, they have both become hereditary, and the governments despotic. The appearance of the old constitution is indeed still preserved, and is composed of the clergy, nobility, and representatives of towns, forming a kind of parliament. They meet every year at Prague; but never refuse to grant any thing their sovereign demands. This kingdom is frequently described as part of Germany, but with little reason, for it is not in any of the nine circles, nor does it contribute any thing to the forces or revenues of the empire, nor is it subject to any of its laws. The affairs of state are directed by a chancellor, who has under him a vice-chancellor, and several assessors and counsellors.

The revenues of Bohemia are said to amount to about 80,000*l.* a year; but they are in general whatever the sovereign is pleased to exact from the states of the kingdom, when they are annually assembled at Prague. The standing militia of the Austrian hereditary countries is 24,000, towards which Bohemia furnishes 9000. In times of war, these serve to fill up the marching regiments.

The Bohemian arms are, Argent, a lion gules, the tail moved, and passed in saltier, crowned langued, and armed, Or. For the orders of knighthood and coins, see GERMANY.

A SUCCINCT HISTORY OF BOHEMIA.

WE have very little account of these people during the early times. The Bohemian nobility used to elect their own princes, though the emperors of Germany sometimes imposed a king upon them, and at length usurped that throne themselves. In 1414, when Sigismund, king of Hungary, and afterwards emperor, filled the throne of Bohemia, the two celebrated reformers, John Huss, and Jerome of Prague, were burnt at Constance, though the emperor had given them his protection. This occasioned an insurrection in Bohemia; and the inhabitants of Prague threw three of the emperor's officers out of the windows of the council chambers, into a ditch which surrounds the city. The famous Zisca, assembling an army of 40,000 Bohemians, routed the emperor's forces in several engagements, and drove the Imperialists out of the kingdom. The death of Zisca was fatal to the Hussites, whose divisions among themselves enabled the emperors to keep possession of Bohemia; but being afterwards convinced, that unless they acted with more unanimity, their cause would soon be desperate; they accordingly formed a league, called the Union, and had once more recourse to arms, electing, in the year 1619, a Protestant king in the person of prince Palatine, son-in-law to James I. of England. The battle of Prague put a final period to Bohemian liberty; the elector Palatine was totally defeated by the emperor's generals, and obliged to seek refuge in Holland; and, during his exile, subsisted on a pension from the court of England. The Bohemians, after a war of thirty years duration, which almost desolated the whole empire, now remain subject to the house of Austria, who govern them by a despotic power, and grant more indulgences to the Jews, than to the Protestant subjects.

C H A P. XXI.

H U N G A R Y.

Situation, Extent, Boundaries, Divisions, Climate, Rivers, Mines, Produce, Inhabitants, Religion, Curiosities, History, &c.

THAT part of this country which now belongs to the house of Austria (for it formerly included Transylvania, Slavonia, Croatia, Morlachia, Servia, Walachia, and other countries) is situated between the 17th and 23d deg. of east long. and the 45th and 49th deg. of north lat. being about 300 miles in length, and 200 in breadth. It is bounded by Poland on the north, by Transylvania and Walachia on the east, by Slavonia on the south, and by Austria and Moravia on the west. This kingdom is usually divided into the Upper and Lower Hungary in the following manner:

Upper

Upper Hungary, North of the Danube.

CHIEF TOWNS.

Presburg, situate on the Danube.
 Newhausel, N. W.
 Leopoldstad, N. W.
 Chremnitz, N. W.
 Sheinnitz, in the middle.

 Waradin Great, E.
 Segedin, S. E.
 Agria, in the middle.
 Pest on the Danube; opposite to Buda.
 Temeswar.

Lower Hungary, South of the Danube.

CHIEF TOWNS.

Buda on the Danube.
 Gran on the Danube, above Buda.
 Komorra on the Danube, in the island of Schut.
 Raab on the Danube, opposite to the island of Schut.
 Attenburg, opposite to the island of Schut.
 Weissenburgh, or Alba Regalis, situated east of the lake called Platten Sea.
 Kanisba, S. W. of the Platten Sea.
 Five Churches, north of the river Drave.
 Temeswar.

The last of these provinces was formerly governed by an independent king, and has been considered as distinct from Hungary: it has been several times in possession of the Turks; but the Austrians gaining possession of it, incorporated it with the kingdom of Hungary in 1778. It has been divided into four districts, namely, Cladat, Temeswar, Werschez, and Lugos.

The climate in the southern parts of Hungary is very unhealthy, proceeding from the number of lakes, stagnant waters, and marshes, which infect the air; but in the northern parts, where it is exceedingly mountainous, it is much more salutary. The soil of the plain which extends from Presburg to Belgrade, a tract of 300 miles, is, without exception, as rich a soil as any in the universe.

The principal rivers in Hungary are the Danube, Drave, Save, Teyffe, Meristh, and Tames. There are several extensive lakes in the vallies between the Carpathian mountains, and all abound with fish. The Hungarian baths and mineral waters are esteemed superior in quality to any in Europe, and are very numerous. While the Turks were in possession of this kingdom there were magnificent baths erected at several places, especially at Buda; but these buildings have been suffered to decay since the expulsion of the Infidels.

The mines in Hungary have been famous for many centuries; but at present they are not worked with the same vigour as formerly. The long and destructive wars between the Turks and Christians have greatly affected the produce of the mines; many of the works being destroyed, most of the workmen were driven from their habitations, and others perished by the swords of the enemy. Several of the mines are, how-

ever, still worked, to the great emolument of the natives, and advantage of the government. Some of them produce gold, others silver, and many excellent copper. Vitriol, iron, orpiment, quicksilver, chrysolita, lapis calaminaris, and terra sigillata, are also very plentiful here. The Hungarian gold and silver formerly employed mint-houses, not only in Hungary, but in Germany, and on the continent of Europe.

The fertile tract above mentioned produces corn, grass, esculent plants, tobacco, saffron, asparagus, melons, hops, pulse, millet, buck-wheat, delicious wine, fruits of various kinds, peaches, mulberry-trees, chestnuts, and wool: the corn in particular is in such plenty, that it sells for one-sixth part of its price in England; and the wines, particularly Tokay, are preferable to those of any other country. The most remarkable animals are a fine breed of horses, generally of a mouse colour; and a particular breed of large rams near Presburg. Here are also buffaloes, horned or black cattle, asses, mules, bears, lynxes, stags, deer, chamois, goats, sheep, swine, &c. various kinds of wild fowl, such as partridges, woodcocks, moor-fowls, and likewise some birds.

The inhabitants of Hungary are descended from the ancient Hunns, Slavonians, and other northern nations, who were not able for a long time to drive the Romans out of the country, some of whose descendants are still to be distinguished in the inland parts, by their speaking Latin. Both Hungaries at present, exclusive of Transylvania and Croatia, are said to contain about two millions and a half of people. It is thought that, before the Turks were in possession of Constantinople, Hungary was one of the most powerful and populous kingdoms in Europe: and the Hungarians still value themselves on being descended from those heroes who formed the bulwark of Christendom against the bigoted fury of the Infidels. They are still a brave and magnanimous people: and their ancestors, even at the beginning of the present century, were so jealous of their liberties, that, rather than suffer the tyranny of the house of Austria, they have often submitted to that of Othman. In their persons they are well made: and their fur caps, their close-bodied coats, girded by a sash, and their cloak or mantle, which is so contrived as to buckle under one arm, that the right hand may be always at liberty, give them an air of military dignity. Their usual arms are a broad sword and a kind of pole-axe, besides their muskets and pistols. They shave their beards, but preserve their whiskers on their upper lips. The nobility affect great pomp and magnificence, and are greatly addicted to feasting and drinking. The women are esteemed handsome, and their dress gives them an air of dignity. When they go abroad, they generally wear short cloaks and a veil. Both men and women, in what they call the mine-towns, wear fur, and even sheep-skin dresses. They are in general indolent, and leave trade, manufactures, and agriculture, to strangers, many of whom, particularly Greeks and

molument of the government. Some of the most excellent, and many excellent, quicksilver, chrysolite, and many excellent, quicksilver, chrysolite, are also very gold and silver found only in Hungary, but not in any other part of Europe.

Wine produces corn, saffron, asparagus, buck-wheat, delicious peaches, mulberry-trees, a particular is in such part of its price in Tokay, are pre-eminently. The most renowned of horses, generally singular breed of large also buffaloes, horned stags, lynxes, stags, deer, &c. various kinds of woodcocks, snoot-fowls,

are descended from the other northern nations long time to drive the people of whose descendants in inland parts, by their said to contain about. It is thought that, of Constantinople, powerful and populous Hungarians still value from those heroes who som against the bigoted still a brave and mag-ellors, even at the be- were so jealous of their ty the tyranny of the n submitted to that of are well made; and ed coats, girded by a hich is so contrived as to ight hand may be ab- air of military dignity. ord and a kind of pole- pistols. They have whiskers on their upper omp and magnificence, ng and drinking. The, and their dress gives n they go abroad, they a veil. Both men and mine-towns, wear fur. They are in general in- dures, and agriculture, particularly Greeks and

Jews,

Jews, are settled in this country; the flatness of which renders travelling commodious, either by land or water. The diversions of the inhabitants are of the warlike and athletic kind. In the province of Temeswar, there are many faraons, or gypsies, supposed to be the real descendants of the ancient Egyptians; whom they are said to resemble in their features, in their manners and customs, and in their propensity to melancholy. The lascivious dances of Isis, the worship of onions, many remarkable superstitions and specifics practised by the Egyptians, with their method of hatching eggs by means of dung, are affirmed to be still in use among the female gypsies in Temeswar. The number of inhabitants in this province is about 450,000.

The religion established in this country is the Roman Catholic: for, though the Reformation was introduced higher in the 16th century, and made a considerable progress, the professors of it are now but barely tolerated, though much more numerous than the Papists. The Greeks and Jews are also very numerous, the latter of whom pay double taxes. The archbishopsrics are, Presburg, Gran, and Colocza: the bishoprics, Great-Waradin, Agria, Vespriin, Raab, and five churches.

The Hungarians being descended from Germans, Slavonians, and Walachians, it is no wonder they have a variety of dialects, one of which (used by the people called Zigdups) is said to approach near the Hebrew. The principal part speak German, and almost all, even of the common people, speak Latin, either pure or barbarous, so that it is still a kind of living language here.

Here are four universities, viz. Firnan, Buda, Raab, and Cacscham; the professors in all which are commonly Jesuits, who instruct the Roman Catholic youth in the arts and sciences. The Protestants are brought up at German and other universities; though even in Hungary they have their gymnasia and schools, but they are under several restrictions.

Among the natural curiosities of this country, are the rocks and caverns: the rock called Benikora is 3000 paces in perpendicular height. In a mountain near Szellitze, is a cavern, the aperture of which, fronting the south, is eighteen fathoms high and eight broad; its subterraneous passages consist entirely of solid rock, stretching away further south than has been yet discovered; as far as it is practicable to go, the height has been found to be fifty fathoms, and the breadth twenty-five: this cavern is said to be exceedingly warm in the depth of winter, and surprisingly cold in the hottest part of the summer: great numbers of hares, foxes, bats, owls, and other animals, take up their winter abode here.

The bridges, baths, and mines of Hungary, form its chief artificial curiosities. The bridge of Esbeck, built over the Danube and Drave, is, properly speaking, a continuation of bridges, five miles in length, fortified with towers at certain distances. This was an import-

ant pass during the wars between the Turks and Hungarians. Between Buda and Pest is a bridge of boats across the Danube half a mile long; and, about twenty Hungarian miles from Belgrade, are the remains of a bridge erected by the Romans, supposed at that time to have been one of the most magnificent in the world. Some of the churches are of admirable architecture, and several of the baths are exceedingly elegant.

The cities and public buildings have lost much of their ancient magnificence, but some of the fortifications are still very strong, and kept in good order. Presburg, though the capital of the kingdom, is neither large nor well-built, and is defended only by a double wall and ditch. Besides the cathedral, here are several Popish, and one Lutheran church, a Jesuits college, three convents, and two hospitals. On a hill above the town stands the castle, in which the regalia were kept, but have lately been removed to Vienna. The crown was sent in the year 1000, by pope Sylvester II. to Stephen, king of Hungary, and was made after that of the Greek emperors; it is of solid gold, ornamented with fifty-three sapphires, fifty rubies, one large emerald, and 333 pearls: besides these stones, are the images of the apostles and patriarchs. The pope added to this crown a silver patriarchal cross, which was afterwards inserted in the arms of Hungary. At the ceremony of the coronation, a bishop carries it before the king, who afterwards brandishes it towards the four cardinal points, to shew that he will defend his country against all its enemies. From the cross above-mentioned is derived the title of Apostolic King; the use of which was renewed under the reign of the empress-queen Maria Theresa. The sceptre and the globe of the kingdom are Arabian gold. The sword is two-edged, and rounded at the point. Firnan, on the river Tuna, is a handsome royal town, in which are a great number of churches and convents, and an academy of Jesuits. Czernnitz, capital of the county of Bars, is one of the chief of the mine towns. Schemnitz is the principal mine town in Hungary. Buda, formerly the capital of Hungary, retains little of its ancient magnificence, but its strength and fortifications; and the same may be said of Pest, which lies on the opposite side of the Danube. Raab, Gran, and Comorra, are likewise fortified cities. Tokay, already noticed for its excellent wines, is situated near the confluence of the Theisse and Bodragh. Great Waradin is a well-fortified city, and the see of a bishop, situated on the river Koros, 110 miles east of Buda.

The principal manufactures of Hungary are those of copper, brass, iron, and other hard-wares. The exports consist chiefly of wine, horses, cattle, metals, minerals, saffron, wool, and leather. The commerce is chiefly carried on by the Greeks and Jews.

The government of Hungary preserves the remains of many checks upon the regal authority; for which purpose they have a diet or parliament, a Hungary office, which has some affinity to our chancery, and is

held at Vienna; and a stadholder's council, which comes pretty near the British privy-council, but has a municipal jurisdiction, and is held at Presburg. Every royal town has its senate; and the sefan chais resemble our justices of the peace. Besides this, they have an exchequer, and nine chambers and other subordinate courts. The Hungarians have an utter aversion to the title of queen, and even called the late empress, king Therefa.

The emperor can at any time raise 50,000 Hungarians in their own country, but seldom draws out of it more than 10,000, which troops are well known to the world by the appellation of hussars. The Hungarian infantry are termed heydukes, and wear feathers in their caps according to the number of enemies they pretend to have killed. Both horse and foot are an excellent militia, very good at a pursuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle. The hussars are not near so large as the German horse, and therefore stand upon the short stirrups when they strike.

Hungary was formerly remarkable for its coinage; and in the cabinets of the curious are still extant a complete collection of the coins of their ancient kings; and numbers of curious Greek and Roman medals have been discovered in this country.

The ordinary revenues of this kingdom is said to exceed a million sterling, arising from the mines, duties on cattle, royal demefnes, salt-works, contributions, customs, &c.

THE HISTORY OF HUNGARY.

THE first account we have of this country is, that the Huns settled here in the third century, and gave it their own name; for, before that time, it was a part of the ancient Pannonia. It was at first divided into many small principalities: these at length united under one head, who was styled duke of Hungary. The last who enjoyed that title was Geysa, who, on being converted to Christianity, resigned his government to his son Stephen, in the year 1000. Stephen, on his ascending the throne, assumed the title of king; and is said to have governed his people with prudence and equity. Hungary however continued many years to be an elective kingdom, but generally in one family; and the constitution of the government to be a limited monarchy. In 1310, Charles-Robert ascended the throne of Hungary, and subdued Bulgaria, Servia, Croatia, Slavonia, and several other provinces, which he annexed to his own dominions; but some of these conquests were afterwards reduced by the Venetians. In the fifteenth century, the Turks invaded Hungary, when Ladislaus, an infant, filled the throne; but were bravely repulsed by the celebrated Hunniades, who continued regent of the kingdom during the minority of Ladislaus.

On the death of that prince, the Hungarians, in

1438, placed Matthias Corvinus, the son of Hunniades, on the throne, in gratitude for the great services that hero had done his country. Hungary was now almost a perpetual theatre of war between the inhabitants and the Infidels, with various success, till the year 1526, when Lodowick, king of Hungary, engaging Solyman, emperor of the Turks, with very unequal forces, was defeated and slain in battle. By this victory Solyman made himself master of great part of Hungary. John, waywode of Transylvania, ascended the throne on the death of Lodowick; but was soon after deposed by Ferdinand, brother to the emperor Charles V. Solyman restored John; and this contest occasioned a war between the German and Turkish emperors, which lasted near 200 years. In 1527, Ferdinand, archduke of Austria, was placed on the Hungarian throne; and the Austrians having been able, during a long series of years, to influence the elections in such a manner as to keep the crown in their family, it is now become an absolute hereditary monarchy.

C H A P. XXII.

TRANSYLVANIA, SCLAVONIA, CROATIA, AND HUNGARIAN DALMATIA.

General Description of these Countries.

AS we have no exact account of the extent and boundaries of these countries, it was judged most proper to include them under one description. Transylvania is bounded on the east by Moldavia and Wallachia; on the west by the Upper and Lower Hungary; on the north by Upper Hungary and Poland; and on the south by Wallachia. Its length is computed at 180 miles, and its breadth 120, and contains 14,400 square miles. This country is both mountainous and woody, and its produce, vegetables, and animals, are nearly the same with those of Hungary. The air is salutary and temperate; but their wine is inferior to the Hungarian. The forests are very extensive. The chief rivers are the Szamos, the Marro, and the Aluta. Here are several remarkable springs, gold, silver, copper, lead, iron mines, &c. and minerals, the produce of which they export into Hungary and other parts. All sects are tolerated in this country.

Hermanstadt, the chief city, and Kronstadt, are both large and well-fortified; as are Claufenburg and Weisenburg. The other large places are Sagefwar, Millenback, and Newmark. All sorts of provisions are very cheap, and excellent in their kinds. The seat of government is at Hermanstadt, and the governor is assisted by a council made up of Roman Catholics, Calvinists, and Lutherans. The diet, or parliament, meets by summons, and receives the commands of the sovereign, to whom of late they have been more devoted than formerly.

the son of Hunniades, the great services that Hungary was now almost in the hands of the inhabitants and, till the year 1526, by engaging Solyman, by unequal forces, was by this victory Solyman added the throne on the throne after deposed by emperor Charles V. Solyman's conquest occasioned a war with the Turks, which Ferdinand, archduke of Hungary, and during a long series of years in such a manner as to, it is now become an

formerly. They have a liberty of making remonstrances and representations when aggrieved. They owe not much more than a nominal subjection to the Austrians, who leave them in possession of most of their privileges. Their interior government still partakes greatly of the ancient feudal system, being composed of many independent states and princes. The number of inhabitants in this country is not ascertained; but as it is asserted they can bring 30,000 men into the field, it cannot be inconsiderable: its military force is at present reduced to six regiments of 1500 men each.

This principality is part of the ancient Dacia, the people of which were a fierce and warlike race, and very troublesome to the Romans. On the decline of their empire, it was first over-run by the Goths, and afterwards by the Huns. The various revolutions in their government prove their impatience under slavery; and, though the treaty of Carlowitz, in 1669, gave the sovereignty of Transylvania, as also of Slavonia, to the house of Austria, yet the natives enjoy what may be called a loyal aristocracy, which their sovereigns do not think proper to invade. In October 1781, on account of some oppressions charged on the nobility, near 16,000 assembled, and committed great depredations on those whose conduct had been blamed. Several had their palaces burnt, and were glad to escape with their lives. The malcontents were disappointed in their attempt on Clausenburg; and afterwards offered to separate and go home in peace, on condition of a general pardon, better treatment from the nobility, and a freedom from vassalage. By the wise and lenient conduct of the late emperor, these disturbances were happily quelled.

Hermanstadt is the only bishopric in this principality; and indeed the Transylvanians at present seem to trouble themselves little either about learning or religion, though the Roman Catholic is the established church, but Protestants are very numerous. Stephen I. king of Hungary, introduced Christianity here about the year 1000, and the country was afterwards governed by a Hungarian vaivod, or viceroy.

SLAVONIA is situated between the 16th and 23d deg. of east long. and the 45th and 47th of north lat. It is bounded by the Drave on the north; by the Saave on the south; by the Danube on the east; and by Kiria, in Austria, on the west; and is supposed to be about 300 miles in length, and 60 in breadth. The inhabitants are a mixed people, like those of Transylvania; and the country is equally fertile, but lies in a great measure unimproved.

The Slavonians, from their ignorance, perhaps, are zealous Roman Catholics, but there are several other sects. Here are two bishoprics; that of Pofega, which is the capital of the country; and Zagrab, which lies on the Drave. Esseck is a large and strong town, remarkable, as already observed, for a wooden bridge over the Drave, and adjoining marshes five miles long, and fifteen paces broad, built by the Turks. Waradin

and Peterwaradin are places noted in the wars between the Austrians and Turks.

This country was long subject to the Venetians, and afterwards to the Turks, who ceded the chief part of it to the house of Austria at the treaty of Carlowitz, and, in 1746, it was united to Hungary, by the late empress-queen.

The states hold diets of their own, and likewise send representatives to those of Hungary. A viceroy or ban presides over Slavonia, Croatia, and part of Dalmatia.

CROATIA is situated between the 15th and 17th deg. of east long. and the 45th and 47th of north lat. being about eighty miles in length, and seventy in breadth. The towns are all blended together, but Zagrab is supposed to be the capital; as to the manners, customs, &c. of the Croats, they are entirely similar to those of the Transylvanians. These people had formerly monarchs of their own, who styled themselves kings of Croatia and Dalmatia; and once this country was divided between the Hungarians and the Turks, but, at present, the greatest part of it is subject to the house of Austria, which, however, exercises very little power over it, except in what concerns the military arrangements; for the Croats are most excellent irregular troops, and are celebrated in modern history under the appellation of Pandours.

DALMATIA is situated in the upper part of the Adriatic Sea. In the fifteenth century the Venetians made themselves masters of it, but at present they only possess the chief maritime places; the other parts being divided among the Austrians, Turks, and Ragusians. This country is exceedingly mountainous; notwithstanding which, it is prodigiously fertile, for the hills are covered with olives, vines, and myrtles, and their bowels contain plenty of gold and silver ore. The plains produce great quantities of pasture, which feed vast flocks of sheep, and abundance of cattle. The language and customs of the people are Slavonic, and they profess the Roman Catholic religion. There is one archbishopric and five bishoprics in Dalmatia, viz. Zara, Zengh, Modrus, Fenen, Sebenico, and Tran. The principal town is Zara, which stands on a small peninsula, being divided from the land only by a deep ditch, into which the sea flows at high-water, under a draw-bridge: it is so well fortified as to be deemed impregnable; and the inhabitants pretend that the body of St. Simeon, who took the infant Jesus in his arms, lays in their cathedral, which is dedicated to that saint. There are several magnificent structures in Zara, particularly the archbishop's palace, convents, hospitals, the arsenal, magazines, and barracks. Segna is a royal free town, fortified both by nature and art, and is situated near the sea, in a bleak, mountainous, and barren soil. The bishop of this place is a suffragan to the archbishop of Spalatro. Ottoschatz is a frontier fortification on the river Gatzka. The governor resides in the old palace called the Royal Castle.

Under Dalmatia is included Morlachia, a country

XXII.

SLAVONIA, CROATIA, AND DALMATIA.

of these Countries.

Account of the extent and description. Transylvania, Moldavia and Wallachia, and Lower Hungary; Hungary and Poland; and on the north is computed at 1800 square miles. The air is salutary and animals, are nearly the same as in Hungary. The air is inferior to the Hungarian. The chief mountains, and the Aluta, mountains, gold, silver, copper, iron, and minerals, the produce of Hungary and other parts. All the mountains, and Kronstadt, are both in Transylvania and Wallachia, and Weiten, are Sageswar, Millen, and provisions are very abundant. The seat of government is at Pest, where the parliament, meets by the name of the Diet, and has been more devoted than formerly.

full of high mountains, being a part of the ancient Liburnia: it is about sixty miles in length, and eighty in breadth. The inhabitants are of Walachian extraction, and bear a perfect resemblance to that people in their manner of living, &c.

The people called Morlacks, or Moriacci, inhabit Morlachia, which lies among the inland mountains of Dalmatia, a country extending along the N. E. coast of the gulf of Venice. The abbé Fortis, who has published a volume of "Travels into Dalmatia," has related many curious and interesting particulars concerning them. With regard to their character, we are informed that they are much injured by their maritime neighbours. The inhabitants of the sea coast of Dalmatia tell many frightful stories of their avarice and cruelty: but these, in our author's opinion, are all either of an ancient date, or, if any have happened in latter times, they ought rather to be ascribed to the corruption of a few individuals, than to the bad disposition of the nation in general; and, though thievish tricks are frequent among them, he informs us, that a stranger may travel securely through their country, where he is faithfully escorted, and hospitably treated. The greatest danger is from the Haiduks, or Banditti, of whom there are great numbers among the woods and caves of these dreadful mountains on the confines. There, says our author, a man ought to get himself escorted by a couple of these "honest fellows;" for they are not capable of betraying him, although a banditti; and their situation is commonly more apt to raise compassion than diffidence. They lead their life among the wolves, wandering from one precipice to another, exposed to the severity of the seasons, and frequently languish in want of the necessaries of life, in the most hideous and solitary caverns: yet they very seldom disturb the tranquillity of others, and prove always faithful guides to travellers; the chief objects of their rapine being sheep and oxen, to supply themselves with food and shoes. Sometimes it happens, that, in their extreme necessity, the Haiduks go in parties to the shepherds cottages, and rudely demand something to eat; which they do not fail to take immediately by force if the least hesitation is made. It is seldom indeed that they meet with a refusal, or with resistance, as their resolution and fury are well known to be equal to the savage life they lead. Four Haiduks are not afraid to assault a caravan of fifteen or twenty Turks; and generally plunder and put them to flight. The greatest part of the Haiduks look upon it as a meritorious action to shed the blood of the Turks; to which cruelty they are easily led by their natural ferocity, inflamed by a mistaken zeal for religion, and the discourses of their fanatic priests.

As to the Morlacchi themselves, they are represented as open and sincere, to such a degree that they would be taken for simpletons in any other country; and, by means of this quality, they have been so often duped by the Italians, that *the faith of an Italian*, and *the faith of*

a dog, are synonymous among the Morlacchi. They are very hospitable to strangers; and their hospice is equally conspicuous among the rich and poor. The rich prepares a roasted lamb or sheep; and the poor, with equal cordiality, offers whatever he has; nor is this generosity confined to strangers, but generally extends itself to all who are in want. When a Morlack is on a journey, and comes to lodge at a friend's house, the eldest daughter of the family, or the new-married bride, if there happens to be one, receives and kisses him when he alights from his horse, or at the door of the house: but a foreigner is rarely favoured with these female civilities; on the contrary, the women, if they are young, hide themselves and keep out of his way.

The Morlacchi in general have little notion of domestic economy, and readily consume in a week as much as would be sufficient for several months, whenever any occasion of merriment presents itself. A marriage, the holiday of the saint, protector of the family, the arrival of relations or friends, or any other joyful incident, consumes of course all that there is to eat and drink in the house. Yet the Morlack is a great economist in the use of his wearing apparel; for, rather than spoil his new cap, he takes it off, let it rain ever so hard, and goes bareheaded in the storm. In the same manner he treats his shoes, if the road is dirty and they are not very old. Nothing but an absolute impossibility hinders a Morlack from being punctual; and, if he cannot repay the money he borrowed at the appointed time, he carries a small present to his creditor, and requests a longer term. Thus it happens sometimes, that from term to term, and present to present, he pays double what he owes; without reflecting on it.

Friendship, that among us is so subject to change on the slightest motives, is lasting among the Morlacchi. They have even made it a kind of religious point, and tie the sacred bond at the foot of the altar. The Slavonian ritual contains a particular benediction for the solemn union of two male or two female friends in the presence of the congregation. The male friends thus united are called Pobratimi, and the female Pofestrene, which mean half-brothers and half sisters. Friendships between those of different sexes are not at this day bound with so much solemnity, though, perhaps, in more ancient and innocent ages, it was also the custom.

From these consecrated friendships among the Morlacchi, and other nations of the same origin, it should seem that the *sworn brothers* arose; a denomination frequent enough among the common people of Italy, and in many parts of Europe. The difference between these and the Pobratimi of Morlachia consists not only in the want of the ritual ceremony, but in the design of the union itself: for, among the Morlacchi, the sole view is reciprocal service and advantage; but such a brotherhood among the Italians is generally commenced by bad men, to enable them the more to hurt and disturb society. The duties of the Pobratimi are, to assist each other in every case of need or danger, to revenge

the Morlacchi and their hospitality to the rich and poor. The sheep; and the poor, whatever he has; nor is it, but generally exact. When a Morlacchi goes to a friend's house, or the new-married one, receives and kisses the wife, or at the door of the house, is favoured with these attentions; the women, if they keep out of his way, have little notion of doing any thing in a week or several months, when they presents itself. A man, protector of the family, is, or any other joyful that there is to eat and drink, is a great economy; for, rather than let it rain ever in the storm. In the winter, if the road is dirty, nothing but an absolute necessity from being punctual; money he borrowed at the present to his creditor. Thus it happens sometimes, and present to present, without reflecting on it, is so subject to change among the Morlacchi, and of religious point, and of the altar. The secular benediction for the two female friends in the. The male friends thus the female Pusellime, half sisters. Friendships are not at this day, though, perhaps, in it, it was also the custom. Friendships among the Morlacchi, it should arise; a denomination common people of Italy.

The difference between Morlachia consists not only in honey, but in the design of the Morlacchi, the sole advantage; but such a is generally commenced the more to hurt and distress the Pobratimi are, to assist or danger, to revenge mutual

mutual wrongs, and such like. The enthusiasm is often carried so far as to risk and even to lose their life for the Pobratimi, although these savage friends are not celebrated like a Pylades. If discord happens to arise between two friends, it is talked of over all the country as a scandalous novelty; and there have been some examples of it of late years, to the great affliction of the old Morlacchi, who attributes the depravation of their countrymen to their intercourse with the Italians. Wine and strong liquors, of which the nation is beginning to make daily abuse, will of course produce the same bad effects as among others.

But as the friendships of the Morlacchi are strong and sacred, so their quarrels are commonly unextinguishable. They pass from father to son; and the mothers fail not to put their children in mind of their duty to revenge their father, if he has had the misfortune to be killed, and to shew them often the bloody skirt and arms of the dead. And so deeply is revenge rooted in the minds of this nation, that all the missionaries in the world would not be able to eradicate it. A Morlacchi is naturally inclined to do good to his fellow-creatures, and is full of gratitude for the smallest benefit; but implacable if injured or insulted.

A Morlacchi who has killed another of a powerful family, is commonly obliged to save himself by flight, and to keep out of the way for several years. If, during that time, he has been fortunate enough to escape the search of his pursuers, and has got a small sum of money, he endeavours to obtain pardon and peace; and, that he may treat about the conditions in person, he asks and obtains a safe conduct, which is faithfully maintained, though only verbally granted. Then he finds mediators; and, on the appointed day, the relations of the two hostile families are assembled, and the criminal is introduced, dragging himself along on his hands and feet, the musket, pistol, or cutlars, with which he committed the murder, hung about his neck; and, while he continues in that humble posture, one or more of the relations recites a panegyric on the dead, which sometimes rekindles the flames of revenge, and puts the poor prostrate in no small danger. It is the custom in some places for the offended party to threaten the criminal, holding all kinds of arms to his throat, and, after much entreaty, to consent at last to accept of his ransom. These pacifications cost dear in Albania; but the Morlacchi make up matters at a small expence; and every-where the business is concluded with a feast at the offender's charge.

The Morlacks, whether they happen to be of the Roman or of the Greek church, have very singular ideas about religion; and the ignorance of their teachers daily augments this monstrous evil. They are as firmly persuaded of the reality of witches, fairies, enchantments, nocturnal apparitions, and sorceries, as if they had seen a thousand examples of them. Nor do they make the least doubt about the existence of vampires; and attribute to them, as in Transylvania, the sucking

the blood of infants. Therefore, when a man dies suspected of becoming a vampire, or vukodlak, as they call it, they cut his hands, and prick his whole body with pins; pretending that, after this operation, he cannot walk about. There are even instances of Morlacchi, who, imagining that they may possibly thirst for children's blood after death, entreat their heirs, and sometimes oblige them to promise, to treat them as vampires when they die.

The boldest Haiduk would fly trembling from the apparition of a spectre, ghost, phantom, or such like goblins as the heated imaginations of credulous and prepossessed people never fail to see. Nor are they ashamed when ridiculed for this terror, but answer, much in the words of Pindar, "Fear that proceeds from spirits causes even the sons of the gods to fly." The women, as may naturally be supposed, are a hundred times more timorous and visionary than the men; and some of them, by frequently hearing themselves called witches, actually believe they are so.

A most perfect discord reigns in Morlachia, as it generally does in other parts, between the Latin and Greek communion, which their respective priests fail not to foment, and tell a thousand little scandalous stories of each other. The churches of the Latins are poor, but not very dirty; those of the Greeks are equally poor, and shamefully ill kept. Our author has seen the curate of a Morlack village sitting on the ground in the church-yard, to hear the confession of women on their knees by his side: a strange posture indeed! but a proof of the innocent manners of those good people, who have the most profound veneration for their spiritual pastors, and a total dependence upon them; who, on their part, frequently make use of a discipline rather military, and correct the bodies of their offending flock with the cudgel. Perhaps this particular is carried to an abuse as well as that of public penance, which they pretend to inflict after the manner of the ancient church. They moreover, through the silly credulity of those poor mountaineers, draw illicit profits, by selling certain superstitious scrolls and other scandalous merchandize of that kind. They write in a capricious manner on the scrolls called zapiz, sacred names which ought not to be trifled with, and sometimes adding others very improperly joined. The virtues attributed to these zapiz are much of the same nature as those which the Basilians attributed to their monstrously cut stones. The Morlacchi use to carry them sewed to their caps, to cure or to prevent diseases; and they also tie them for the same purpose to the horns of their oxen. The composers of this trumpery take every method to maintain the credit of their profitable trade, in spite of its absurdity, and the frequent proofs of its inutility. And so great has their success been, that not only the Morlacchi, but even the Turks near the borders, provide themselves plentifully with zapiz from the Christian priests, which not a little increases their income, as well as the reputation of the commodity.

The Morlacchi have also much devotion, and many of the ignorant people in Italy have little less, to certain copper and silver coins of the low empire; or to Venetian cotemporary pieces, which pass among them for medals of St. Helen; and they think they cure the epilepsy and such like. They are equally fond of a Hungarian coin called petizza, which has the virgin and child on the reverse: and one of these is a most acceptable present to a Morlack.

The bordering Turks not only keep with devotion the superstitious zapiz, but frequently bring presents and cause masses to be celebrated to the images of the Virgin; which is doubtless in contradiction to the alcoran; yet when saluted, in the usual manner in that country, by the name of Jesus, they do not answer. Hence, when the Morlacchi, or other travellers, meet them on the confines, they do not say, *Huaglian Iffus*, "Jesus be praised;" but, *Huaglian Bog*, "God be praised."

Innocence, and the natural liberty of pastoral ages, are still preserved among the Morlacchi, or at least many traces of them remain in the places further distant from our settlements. Pure cordiality of sentiment is not there restrained by other regards, and displays itself without any distinction of circumstances. A young handsome Morlack girl, who meets a man of her district on the road, kisses him affectionately, without the least vicious or immodest thought; and our author has seen all the women and girls, all the young men and old, kissing one another as they came into the church-yard on a holiday; so that they looked as if they had been all belonging to one family. He has often observed the same thing on the road, and at the fairs in the maritime towns, where the Morlacchi came to sell their commodities. In times of feasting and merriment, beside the kisses, some other little liberties are taken with the hands, which we would not reckon decent, but are not minded among them; and, when they are told of it, they answer, it is only toying, and means nothing. From this toying, however, their amours often take their beginning, and frequently end seriously when the two lovers are once agreed. For it rarely happens, in places far distant from the coast, that a Morlack carries off a girl against her will, or dishonours her: and, were such attempts made, the young woman would, no doubt, be able to defend herself: the women in that country being generally very little less robust than the men. But the custom is, for the woman herself to appoint the time and place of being carried off; and she does so in order to extricate herself from other suitors, from whom she may have received some love-token, such as a brass ring, a little knife, or such like tridles. The Morlack women keep themselves somewhat neat till they get a husband; but, after marriage, they abandon themselves totally to a loathsome dirtiness, as if they intended to justify the contempt with which they are treated. Indeed it cannot be said that even the young women have a grateful

odour, as they are used to anoint their hair with butter, which, soon becoming rancid, exhales no agreeable effluvia.

The unmarried women dress in the most complex and whimsical manner, in respect to the ornaments of the head; for when married they are not allowed to wear any thing else but a handkerchief, either white or coloured, tied about it. The girls use a scarlet cap, to which they commonly hang a veil falling down on the shoulders, as a mark of their virginity. The better sort adorn their caps with strings of silver coins, among which are frequently seen very ancient and valuable ones; they have moreover ear-rings of very curious work, and small silver chains with the figures of half moons fastened to the ends of them. But the poor are forced to content themselves with plain caps; or if they have any ornaments, they consist only of small exotic shells, round glass beads, or bits of tin. The principal merit of these caps, which constitute the good taste as well as vanity of the Morlack young ladies, is to attract and fix the eyes of all who are near them by the multitude of ornaments, and the noise they make on the least motion of their heads. Hence half-moons of silver, or of tin, little chains and hearts, false stones and shells, together with all kind of splendid trumpery, are readily admitted into their head-dresses.

In some districts, they fix tufts of various coloured feathers, resembling two horns, on their caps; in others, tremulous plumes of glass; and, in others, artificial flowers, which they purchase in the sea-port towns; and, in the variety of those capricious and barbarous ornaments, sometimes a fancy not inelegant is displayed. Their holiday-shifts are embroidered with red silk, and sometimes with gold, which they work themselves while they attend their flocks; and it is surprising to see how nicely this work is executed. Both old and young women wear about their necks large strings of round glass-beads, of various size and colour; and many rings of brass, tin, or silver, on their fingers. Their bracelets are of leather, covered with wrought tin or silver; and they embroider their stomachers, or adorn them with beads or shells. But the use of stays is unknown, nor do they put whalebone or iron in the stomacher.

A broad woollen girdle surrounds their petticoat, which is commonly decked with shells, and of blue colour, and therefore called *modrina*. Their gown, as well as petticoat, is a kind of serge; and both reach near to the ankle: the gown is bordered with scarlet, and called *sadak*. They use no *modrina* in summer, and only wear the *sadak* without sleeves over a linen petticoat or shift. The girls always wear red stockings; and their shoes are like those of the men, called *opanke*. The sole is of undressed ox-hide, and the upper part of sheep-skin thongs knotted, which they call *apute*; and these they fasten above the ankles, something like the ancient *colurnus*. The unmarried women,

women, even of the richest females, are not permitted to wear any other sort of shoes; though after marriage they may, if they will, lay aside the opanke, and use the Turkish slippers.

The girls keep their hair tressed under their caps, but when married they let it fall dishevelled on the breast; sometimes they tie it under the chin; and always have medals, beads, or bored coins, in the Tartar or American mode, twisted among it. An unmarried woman, who falls under the imputation of want of chastity, runs the risk of having her red cap torn off her head publicly in church by the curate, and her hair cut by some relation, in token of infamy. Hence, if any of them happen to have fallen into an illicit amour, they commonly of their own accord lay aside the badge of virginity, and remove into another part of the country.

Among the Morlacchi, nothing is more common than marriages concluded between the old people of the respective families, especially when the parties live at a great distance, and neither see nor know each other; and the ordinary motive of these alliances is the ambition of being related to a numerous and powerful family, famous for having produced valiant men. The father of the future bridegroom, or some other near relation of mature age, goes to ask the young woman, or rather a young woman of such a family, not having commonly any determinate choice. Upon this all the girls of the house are shewn to him, and he chooses which pleases him best, though generally respecting the right of seniority. A denial in such cases is very rare; nor does the father of the maid inquire much into the circumstances of the family that asks her. Sometimes a daughter of the master is given in marriage to the servant or tenant, as was usual in patriarchal times; so little are the women regarded in this country. On these occasions, however, the Morlacchi girls enjoy a privilege which ours would also wish to have, as in justice they certainly ought. For he who acts by proxy, having obtained his suit, is obliged to go and bring the bridegroom; and if, on seeing each other, the young people are reciprocally content, the marriage is concluded, but not otherwise.

In some parts it is the custom for the bride to go to see the house and family of the proposed husband, before she gives a definitive answer; and if the place or persons are disagreeable to her, she is at liberty to annul the contract: but if she is contented, she returns to her father's house, escorted by the bridegroom and nearest relations. There the marriage day is appointed; on which the bridegroom comes to the bride's house, attended by all his friends of greatest note, who on this occasion are called *svati*, and are all armed, and on horseback, in their holiday-clothes, with a peacock's feather in their cap, which is the distinctive ornament used by those who are invited to weddings. The company goes armed, to repulse any attack or ambush that might be intended to disturb the feast;

for in old times these encounters were not unfrequent, according to the records of many national heroic songs. The bride is then conducted to a church veiled, and surrounded by the *svati* on horseback; and the sacred ceremony is performed amid the noise of muskets, pistols, barbaric shouts and acclamations, which continue till she returns to her father's house, or to that of her husband, if not far off.

Each of the *svati* has his particular inspection, as well during the cavalcade as at the marriage-feast, which begins immediately on their return from church. The *parvinaz* precedes all the rest, singing such songs as he thinks suitable to the occasion. The *bariahtar* brandishes a lance with a silken banner fastened to it, and an apple stuck on the point; there are two *bariahtars*, and sometimes four, at the more noble marriages. The *starivvat* is the principal personage of the brigade; and the most respectable relation is commonly invested with this dignity. The *stacheo's* duty is to receive and obey the orders of the *starivvat*. The two *diveri*, who ought to be the bridegroom's brothers when he has any, are appointed to serve the bride. The *knum* corresponds to our sponsors; and the *komorgia*, or *sefkana*, is deputed to receive and guard the dowry. A *ciaous* carries the mace, and attends to the order of the march, as master of the ceremonies: he goes singing aloud, *Breberi, Davori, Dobrafrihia; Jara, Pico*; names of ancient propitious deities. *Buklia* is the cup-bearer of the company, as well on the march as at table; and all these offices are doubled, and sometimes tripled, in proportion to the number of the company.

The entertainment on the first day is sometimes made at the bride's house, but generally at the bridegroom's, whither the *svati* hasten immediately after the nuptial benediction; and at the same time three or four men run on foot to tell the good news; the first who gets to the house has a kind of towel, embroidered at the ends, as a premium. The *domachin*, or head of the house, comes out to meet his daughter-in-law; and a child is handed to her, before she alights, to care for it; and if there happens to be none in the house, the child is borrowed from one of the neighbours. When she alights, she kneels down, and kisses the threshold.—Then the mother-in-law, or in her place some other female relation, presents a corn-sieve, full of different kinds of grain, nuts, almonds, and other small fruit, which the bride scatters upon the *svati*, by handfuls, behind her back.

The bride does not sit at the great table the first day, but has one apart for herself, the two *diveri*, and the *stacheo*. The bridegroom sits at table with the *svati*; but in all that day, consecrated to the matrimonial union, he must neither unloosen or cut any thing whatever. The *knum* carves his meat, and cuts his bread. It is the *domachin's* business to give the toasts; and the *starivvat* is the first who pledges him. Generally the *buk-kara*, a very large wooden cup, goes round, first to the

(cont)

saint protector of the family; next to the prosperity of the holy faith; and sometimes to a name the most sublime and venerable. The most extravagant abundance reigns at these feasts; and each of the *svati* contributes, by sending a share of provisions.

The dinner begins, with fruit and cheese; and the soup comes last, just contrary to our custom. All sorts of domestic fowls, kid, lamb, and sometimes venison, are heaped in prodigal quantities upon their tables; but very rarely a Morlack eats veal, and perhaps never, unless he has been persuaded to do it out of his own country. This abhorrence to calves flesh is very ancient among the Morlacchi. St. Jerom, against Jovirian, takes notice of it; and Tomeo Marnavich, a Bosnian writer, who lived in the beginning of the last age, says, that the Dalmatians, uncorrupted by the vices of strangers, abstained from eating calves-flesh, as an unclean food, even to his days. The women relations, if they are invited, never dine at table with the men, it being an established custom for them to dine by themselves.

After dinner, they pass the rest of the day in dancing, singing ancient songs, and in games of dexterity, or of wit and fancy; and in the evening, at a convenient hour after supper, the three ritual heaths having first gone round, the *knum* accompanies the bridegroom to the matrimonial apartment, which commonly is the cellar or the stable, whither the bride is also conducted by the *diveri* and the *stacheo*; but the three last are obliged to retire, and the *knum* remains alone with the new married couple. If there happens to be any bed prepared better than straw, he leads them to it; and having untied the bride's girdle, he causes them both to undress each other reciprocally.

It is not long since the *knum* was obliged to undress the bride entirely; but that custom is now out of use; and, instead of it, he has the privilege of kissing her as often as he pleases, wherever he meets her; which privilege may possibly be agreeable for the first months, but must soon become very disagreeable. When they are both undressed, the *knum* retires, and stands listening at the door, if there be a door. It is his business to announce the consummation of the marriage, which he does by discharging a pistol, and is answered by many of the company. The next day the bride, without her veil and virginal cap, dines at table with the *svati*, and is forced to hear the coarse equivocal jests of her indelicate and sometimes intoxicated company.

The ancient Huns called the nuptial feast *drave*, but they are by our Morlacchi call'd *Jdravize*, from whence our Italian word *Jdravizzo* is undoubtedly derived. They continue three, six, eight, or more days, according to the ability or prodigal disposition of the family where they are held. The new-married wife gets no inconsiderable profit in these days of joy; and it usually amounts to much more than all the portion she brings with her, which often consists of nothing but her own clothes and perhaps a cow; nay,

it happens sometimes that the parents, instead of giving money with their daughter, get something from the bridegroom by way of price.

The bride carries water every morning, to wash the hands of her guests as long as the feasting lasts; and each of them throws a small piece of money into the basin after performing that function, which is a very rare one among them, excepting on such occasions. The brides are also permitted to raise other little contributions among the *svati*, by hiding their shoes, caps, knives, or some other necessary part of their equipage, which they are obliged to ransom by a piece of money, according as the company rates it. And, beside all these voluntary or extorted contributions already mentioned, each guest must give some present to the new-married wife at taking leave the last day of the *svavize*; and then she also distributes some trifles in return, which commonly consist in shirts, caps, handkerchiefs, and such like.

There is very little variation in the performance of the nuptial rites through all the vast country inhabited by the Morlacchi; and those in use among the peasants and common people of the sea-coast of Dalmatia, Istria, and the islands, differ but little from them. Yet among these particular varieties, there is one of the island *Zlarine*, near *Sebenico*, remarkable enough; for there the *stari^{svat}* (who may naturally be supposed drunk at that hour) must, at one blow with his naked broad sword, strike the bride's crown of flowers off her head, when she is ready to go to bed. And in the island of *Pago*, in the village of *Novoglia* (probably the *Gissa* of ancient geographers) there is a custom more comical, and less dangerous, but equally savage and brutal. After the marriage-contract is settled, and the bridegroom comes to conduct his bride to church, her father or mother, in delivering her over to him, makes an exaggerated enumeration of her ill qualities: "Know, since thou wilt have her, that she is good for nothing, ill-natured, obstinate," &c. On which the bridegroom, affecting an angry look, turns to the young woman, with an "Ah! since it is so, I will teach you to behave better;" and at the same time regales her with a blow or a kick, or some piece of similar gallantry, which is by no means figurative. And it seems in general, that the Morlack women, and perhaps the greatest part of the Dalmatians, the inhabitants of the cities excepted, do not dislike a beating either from their husbands or lovers.

The women in the neighbourhood of *Dernish* are obliged, during the first year after marriage, to kiss all their national acquaintances who come to the house; but after the first year they are dispensed from that compliment; and indeed they become so intolerably ratty, that they are no longer fit to practise it. Perhaps the mortifying manner in which they are treated by their husbands and relations is, at the same time, both the cause and effect of their shameful neglect of their persons. When a Morlack husband mentions his wife,

he always pardon wife m lodged sex-is that t country nature. wife must sleep on the floor near it. Our author often
lodged in Morlack houses, and observed that the female
sex is universally treated with contempt: it is true,
that the women are by no means amiable in that
country; they even deform and spoil the gifts of
nature.

Among us, where the ladies suffer so much, not-
withstanding all the care and circumspection used be-
fore and after labour, the pregnancy and births of these
women would be thought very extraordinary: since
a Morlack woman neither changes her food, nor in-
terrupts her daily fatigue, on account of her preg-
nancy; and is frequently delivered in the fields, or
on the road, by herself; and takes the infant, washes
it in the first water she finds, carries it home, and re-
turns the day after to her usual labour, or to feed her
stock. The little creatures, thus carelessly treated in
their tenderest moments, are afterward wrapt in mis-
erable rags, where they remain three or four months,
under the same ungentle management; and when that
term is elapsed, they are set at liberty, and left to crawl
about the cottage and before the door, till they learn to
walk upright by themselves; and at the same time ac-
quire that singular degree of strength and health with
which the Morlacchi are endowed, and are able, with-
out the least inconvenience, to expose their naked
breasts to the severest frosts and snow.

The infants are allowed to suck their mother's milk
while she has any, or till she is with child again; and
if that should not happen for three, four, or six years,
they continue all that time to receive nourishment from
the breast. The prodigious length of the breasts of the
Morlachian women is somewhat extraordinary; for it
is very certain, that they can give the nipple to their
children over their shoulders, or under their arms.
They let the boys run about, without breeches, in a
shirt that reaches only to the knee, till the age of
thirteen or fourteen; following the custom of Bollina,
subject to the Porte, where no haraz or capitation-
tax is paid for the boys till they wear breeches, they
being considered before that time as children, not
capable of labouring, or of earning their bread. On
the occasion of births, and especially of the first, all
the relations and friends send presents of eatables to
the woman in childbed, or rather to the woman de-
livered; and the family makes a supper of all those
presents together. The women do not enter the church
till forty days after child-birth.

While young, the Morlacchi pass their time in the
woods, attending their flocks and herds; and in that
life of quiet and leisure they often become dexterous
in carving with a simple knife: they make wooden
cups, and whistles adorned with fanciful bass-reliefs,
which are not void of merit, and at least shew the
genius of the people.

There is a people in this country and Carniola,

called Uscocs, a rough savage race, large-bodied,
courageous, and much addicted to rapine; they are also
noted for their agility, skipping like goats among the
mountains, from rock to rock: some of them live in
scattered houses, and others in large villages. Their
language is Walachian, and their religion the Greek,
or something like it. These people, being galled by
oppression, escaped out of Dalmatia; from which cir-
cumstance they obtained the name of Uscocs, from the
word *Scaco*, a *deserter*.

The duchy of Carniola, which is a subdivision of
Austria, in Germany, is bounded by the gulf of Ve-
nice to the west, by Sclavonia and Croatia to the east,
by Carinthia and Stiria to the north, and by the Adria-
tic Sea to the south. It is 110 miles long, 50 broad,
rather cold, but, at the same time, tolerably fertile.
The lower class of people speak the Sclavonian, or
Wendish language, the better sort German, but both
with a very indifferent dialect. The peasants are a very
hardy set of people, going barefoot in the midst of win-
ter, never covering their breasts from the inclemency
of the weather, and sleeping on a hard bench, without
bed or bolster. In the Upper and Lower Krain the
people wear long beards; and such as live by ex-
porting the commodities of the country on pack-horses
are called Samers, or, more properly, Saumers. The
states of Carniola consist of the clergy, the nobility,
knights, and royal towns. Christianity was first planted
in this country about the middle of the eighth century,
and, in the sixteenth, Lutheranism made a considerable
progress in it; but, excepting the Walachians or Usc-
ocs, who are of the Greek church, and style themselves
Staraverzi, i. e. Old Believers, all the inhabitants at
present are Roman Catholics. In the whole duchy are
three bishoprics, twenty-four cloisters, four command-
eries, and 134 parishes; but to the bishopric of Ley-
bach belong also many parishes in Stiria and Carinthia.
The number of inhabitants are supposed to amount to
140,000. The principal commodities exported from
hence are iron, steel, quick-silver, white and red wine,
oil of olives, cattle, sheep, cheese, linen, and a kind
of woollen stuff called Mahalan, Spanish leather, honey,
walnuts, and timber, together with all manner of wood-
work, as boxes, dishes, trenchers, spoons, sieves, &c.
Carniola was long a marquise or margravate; but, in
the year 1231, was erected into a duchy. The arms of
Carniola are an eagle crowned, in whose breast and ex-
panded wings is to be seen a diced crescent.

We shall here give a description of the surprising
lake in Carniola, called by the natives the Zirchnitzer-
See: This lake has such very remarkable qualities in
its filling and emptying, and the uses it is of to the
neighbouring people as so many and various, that no
historians from the oldest times, of which we have any
account, have omitted to name it; yet neither the
ancients nor moderns have well described it, nor is
there any explanation of its phenomena given in any
of our books of travels; wherefore it may be accept-

able to the curious reader, to have a full account both of its nature and origin, and the reasons of all its changes preserved here.

It was called by the ancients *Lugea Palus*, or *Lacus Lugeus*, the *Lugean Lake*; but it is now generally known by the name of *Zirchoitzer-Lake*, which it has from the town of *Zirknitz*, near which it is situated.

The basin of this lake is three miles and three quarters in length, its breadth is two miles in some places, and a mile and half in the narrowest, and its depth, when full of water, is thirty-five feet in the middle, and from that to twelve or fifteen feet in the shallows. It lies in a small flat, every way surrounded with vast mountains, running many miles into the country, several ways. There run at 24 times into this lake eight rivers; the two least are called *Bellebrech* and *Trefnez*, and are trifling; but the others are all large rivers. With all this vast supply of water the lake never runs over, but has two large holes, in at which the water runs, and is carried off under the mountains. Beside these there is a third course, or subterraneous passage, which probably communicates with them also.

All these come out together on the other side of the mountain, into which they are received, and form the river *Jesero*; this river, after it has run a mile above ground, enters a stony cavern, and running slowly under the hill, about four hundred yards, it comes out again, and running about a quarter of a mile above ground, after this plunges into the earth again, and having passed about half a mile, it falls down a precipice, and is dispersed through all the adjoining country. All the mountains hereabout are full of vast caverns, formed by nature, and ornamented by the same great hand, with a vast variety of figures, in the manner of those in the grotto of *Antiparos*, so elegantly described by some travellers. The number and size of the caverns give us great reason to believe there may be others yet larger, which we cannot arrive at; and as those which we know are sometimes dry, and sometimes full of water, we may rationally suppose the others to be subject to the same alterations. This fair supposition will account for all the changes of the *Zirchnitzer-Lake*, and the reader, we hope, will not think this previous account of the face of the country tedious, as it will be necessary to the history of the lake itself.

In the latter end of July, or beginning of August, this lake usually begins to sink, and the water is wholly gone out of it in about sixteen days; it then remains dry, till the middle of November, when it fills again. This is the common method, though not certain, for it sometimes fills three times a year. There are vast numbers of fish and fowl brought up with the water, and deserted at its going off, which afford a vast advantage to the six or seven neighbouring towns, who have a right to the profit. There are three islands in the lake, and several pits in its bottom, of different

breadths and depths. According to this difference in depth, these pits empty in different order of time, one after another, and give a much better opportunity of selling the fish, than if they all were to be taken at once. When the water begins to run off, the pit *Maljoberch* is emptied in three days; the church bell gives notice of this, and all the inhabitants, men and women, lay aside all other business, and with it all shame and modesty, and run into the pit naked as they were born. The water runs out at the bottom of this, and of the other pits, by holes too small to admit the fish, so they are all caught; half is given to the lord of the manor, and the other half is the people's.

The pit *Velkioberch* is empty three days after this; three hours after this the pit *Kamine* empties; one hour after this another; five days after that another large one empties, but the holes are so large at the bottom of this, that they are forced to use nets to take the fish, which would otherwise get out at them. A day and a half after this, another pit empties; twelve hours after this another empties; and three days after that, a very large one, called *Reschetto*; this is fished with nets, and often affords time for three hauls, as the water goes off; and by these they will sometimes get between twenty and thirty carts of fish.

A few hours after this there is another emptied; in this pit they fish under ground, for there is a great hole in the stone at the bottom, and the men go down at this with lighted torches into a vast subterranean cavern, the bottom of which is of hard stone, but is full of holes, like a sieve; these let the water out, and the fish are all taken.

The pits are eighteen in number, and thus gradually become empty, so that in the whole there is time for the making the most of the fishing; but though they empty so long after one another, yet when they once begin to let out the water at all, it is all run out to the last drop in the space of a few minutes, though some of them are eighty feet wide, and thirty or more deep. When the regular fishing is over, the church bells give the signal all over the neighbouring country, and the inhabitants of towns, many miles distant, run to the lake, and enter all stark naked, to look for fish among the weeds, and in the subterranean caverns, of which there are many which have ways into them through holes in the bottoms of the pits. This gleaning of the fish is free for every body.

Some of these caverns are of immense size, and when there is thunder or lightning, those are subject to terrible noises within; the fish also, while the pits are yet full of water, are sometimes so stunned with lightning, that they float to the surface, and are taken out in vast numbers; but they come to themselves when thrown into other water.

In one of the largest mountains near this lake, there are two vast caverns, which, though generally dry, yet when it thunders, generally pour forth out of their mouths a vast quantity of water, in form of a column,

e of immense size, and htning, those are subject e fish also, while the pits sometimes so stunned with the surface, and are taken they come to themselves r.

tains near this lake, there though generally dry, yet pour furth out of their ter, in form of a column,

of twelve or fourteen feet diameter, and to the height of as many feet; this throws into the lake with it a vast number of fish, and of wild fowl, as ducks and the like; and these at first are all blind, and very bald of feathers, and the people easily catch them in great numbers; but in about a fortnight they recover their sight, and have wings enough to fly with.

When one of these cascades of water has begun, the rest all follow, and it is a terrible, but pleasing sight, to see fifty of these columns of water tossed up from different openings in the mountains at once, and twice as many from the dry bottom of the lake itself.

The rivers that run constantly into this lake, while dry, are all received into the holes at the bottom, and never drown any part of it; but when the water is thus thrown up at many mouths at once, from some perpendicularly, from others obliquely, but from all in large columns, the whole lake will be filled in one day's time from being dry.

The first signal of the lake's filling, is a white vapour like a cloud, issuing out of the holes in the mountains; this is followed by thunder, lightning, and the most violent rains; and the Lake fills to a certain standard, and never higher.

The fowl are brought up with the water, and they resort from other places to it, from the neighbouring country for food, as long as the water remains in the lake. When it dries up, they have the vast advantage of the fishery, before described; as soon as that is all over, and the bottom is thoroughly dry, they pull up vast quantities of rushes there, which serve for many necessary uses of life, and are fine litter for their cattle. The soil of the water makes the land so rich, that in twenty days the whole bottom is covered with fine grass for hay; and after they have got this in, they plough it and sow millet, which quickly ripens, and yields a prodigious increase; but this is sometimes destroyed by the too early filling again of the lake; if not, as soon as this is got in, there is a fine pasture left for their cattle, and all the while it is on the ground, they have a vast quantity of quails among it: always when the bottom is dry there is fine hunting in it, the hares, deer, bears, and swine, coming down into it out of the woods and mountains, in great numbers.

The advantages this lake brings the neighbouring people are therefore infinitely greater than those of any other spot of ground in the world, and all these are brought on in the space of one year, thus successively one after the other.

The pike of this lake are found of thirty or forty pound weight, tench of six or seven pounds are very frequent, and cel-pouts of two or three pounds, very well tasted; there are crabs always found in great plenty in two of the pits, but none in any others, and they are not well tasted. The blind ducks being tossed up with the water may seem a very wonderful incident in other places, but there it is so common that no body regards it as a strange thing; and not only this lake,

but all the other places, where the water gushes out of the caverns in mountains thereabout in the same manner, afford more or less of them.

The true Account of the Filling of the LAKE.

The cause of these strange changes in the lake from full to dry, and all its other phenomena, may be accounted for in the following manner. There is under the bottom of this lake another subterranean one, with which it communicates by means of the holes in its bottom; and there are also many subterranean lakes in the mountain Javornick, whose surface is much higher than that of this lake. This upper lake is filled by some of those subterranean rivers, which we find are frequent in this country, and has an out-passage, which is big enough to carry what they usually bring into it; but when these thunder storms and violent rains come, the whole surface of the neighbouring mountains pour into these rivers all the water they receive; this is too much to be carried off by the common out-passage of the upper lake, and swelling it beyond its common surface, carries it up to places where there are holes in the rocks, by which all this mass of water is precipitately conducted into the subterranean lake, that lies under the bottom of the Zirchnitzer-Lake; and this water, when it has filled that lake, is thrown up through the holes in its top, and in the sides of the mountains in vast columns, to the height of the subterranean lake in the mountain Javornick. This must be the consequence of these accidents, according to the known laws of hydrostatics.

Such of these passages as have been level with the surface of the water in the lake of Javornick, bring away with the water the ducks of that lake, and these creatures are found in all the subterranean lakes of this country, covered but poorly with feathers, and their eyes being used only to so small a quantity of light as is in these darksome regions, when they are thrown up at once into broad day-light, are not able to bear it, but the creatures are blinded for some time, till custom makes it easy to them. Those passages which are wholly under water may throw up fish, though no ducks can belong to them, and many others too small to admit either ducks or fish, can throw up only water. Thus it is that the lake is suddenly filled, and that some of its feeding streams bring up only water, others water and fish, and others water, fish, and ducks.

The Account of the Emptying the LAKE.

When the lake has been thus filled, it must continue full as long as the other lakes which supplied it are in the same fulness; but as soon as the lake under the mountain Javornick, being no longer over-filled itself, descends below the channels, by means of which it supplied the lake under the Zirchnitzer-Lake, then the draughts from this under lake are greater than

than the streams into the upper lake can supply, consequently the Zirchnitzer-Lake sinks gradually, according to the excess of the water that runs out above that which comes in. Thus things are reduced to their natural state again, till a second land flood comes to over-fill the lake in Javornick, and so fill up in consequence the Zirchnitzer-Lake again; as the several pits in the bottom of this lake lie higher and lower, they are emptied regularly, one after another, according to this situation, the highest first; when this accidental quantity of water is carried off, all that the common supply of the rivers bring into it, is received in holes at the bottom, and running into the under lake, is discharged by the river Jesefero, in the country on the other side the mountain. All the ducks discharged up with the water, are bred in the lake under Javornick, they are all black, only that they have a white spot on the forehead, and they are well tasted, but too fat.

CHAPTER XXIII.

P O L A N D,

Extent, Boundaries, Situation, Divisions, Climate, Produce, Rivers, Animals, Inhabitants, Religion, &c.

THIS kingdom, before the late dismemberment, was very extensive, being 700 miles in length, and 680 in breadth; and (with the great duchy of Lithuania, anciently called Sarmatia, annexed) was bounded on the north by Livonia, Muscovy, and the Baltic sea; by Muscovy, or Russia, on the east; by Hungary, Turkey, and Little Tartary, on the south; and by Germany, on the west. The situation, between 46 and 57 deg. north lat. and between 16 and 34 deg. east long. This country is divided into the twelve following provinces; viz.

1. Courland (subject to Russia) 174 miles in length, and 80 in breadth, containing 4,114 square miles; its chief city, Mittaw.
2. Lithuania; 333 miles in length, 310 in breadth, contains 64,800 square miles; its chief city, Wilna. Most of this district is now possessed by Russia.
3. Podolia; 360 miles in length, 120 in breadth, contains 29,000 square miles; its chief city, Kaminiuk.
4. Volhinia; 295 miles in length, 150 in breadth; contains 25,000 square miles; its chief city, Lucko.
5. Great Poland; 208 miles in length, 120 in breadth; contains 19,200 square miles; its chief city, Gnesna.
6. Red Russia; 232 miles in length, 185 in breadth; contains 25,200 square miles; its chief city, Lemburg; this district is now chiefly subject to Austria.
7. Little Poland; 230 miles in length, 180 in breadth; contains 18,000 square miles; its chief city, Cracow; great part of this district is now subject to Austria.
8. Polesia; 186 miles in length, 97 in breadth; con-

tains 14,000 square miles; its chief city, Brestlic.
 9. Masovia, 152 miles in length, 90 in breadth; contains 8,400 square miles; its chief city, Warsaw.
 10. Samogitia, 155 miles in length, 98 in breadth; contains 8000 square miles; its chief city, Radium.
 11. Prussia Royal, or Polish Prussia; 118 miles in length, 104 in breadth; contains 6,400 square miles; and is now subject to Prussia.
 12. Polachia; 133 miles in length, 42 in breadth; contains 4000 square miles; its chief city, Bielh.

The name of Poland is derived from Polu, a Sclavonian word, implying a country proper for hunting, on account of its abounding with plains, woods, wild beasts, and every species of game. The climate of Poland is in general temperate, healthy, and more settled than those of such northern countries usually are: in the north parts, however, the air is exceedingly cold; and the Carpathian mountains, which separate Poland from Hungary, are covered with perpetual snow, which has even been known to fall in the height of summer. The soil is extremely rich and fruitful, and in many parts clays are found fit for making pipes and earthen-ware.

Poland is fertile in corn, great quantities of which are exported to other nations, it likewise produces hemp and flax: the pastures are rich beyond expression, so that the cattle grazing in them can hardly be seen for the height of the grass; all kinds of herbs and fruits are found here; and in many places there are vines, whose grapes are agreeable to the taste, but the wine made from them usually proves sharp. In the months of May and June a species of manna falls on the grass in the night; and in the morning is collected by the inhabitants, together with the dew, into sieves: the Poles esteem this production a great delicacy, and have various methods of dressing it. The interior parts of Poland contain forests, which furnish timber in such great quantities, that it is employed in house-building instead of bricks, stone, and tiles.

Here are mines of silver, copper, lead, iron, salt, and coals; Lithuania abounds in iron ochre, black agate, several species of copper and iron pyrites, and red and grey granite; false precious stones, and marine petrifications: other mineral productions are salt-petre, alum, talc, quicksilver, and lapis calaminaris; and on the sea-coast are found large quantities of amber. The water of many springs is boiled into salt.

The principal rivers in this kingdom are the Vistula or Weyfell, the Neister, Nieper or Borithenes, the Wiconen, the Bug, and the Dwina.

The chief lake which merits description, is Gopto, in the palatinate of Byzalty, or Brial, which is said to dye of a swarthy hue persons who work in it.

The forests of Poland afford shelter to a great number of wild horses, asses, oxen, boars, wolves, elks, deer, foxes, hares, and rabbits. Here are great numbers of uri, or buffaloes, the flesh of which, when salted, is eaten as a great delicacy by the Poles. Here

d shelter to a great num- ten, boars, wolves, elks, bbits. Here are great the flesh of which, when acy by the Poles. Here

in a kind of wolf resembling a hart, with spots on his belly and legs, and affords excellent furs.

The elk is very common in Prussia, Courland, Livonia, Norway, Poland, and other northern countries. It is as high, and every way as large as a horse, but its shape resembles that of a deer: its feet are broad and cloven, and its horns large, rough and broad, like those of a wild goat. Upon dissecting one of these animals, a vast number of large flies were found in its head, which had nearly devoured the brain. Towards winter these poor creatures are always attacked by these insects, which, through the passage of its ears find a way into its head, and there remain during that cold season: the humming of these vermin, and the continual torture occasioned by their feeding on the brain, subjects the elk to the epilepsy, when he is easily taken, which would otherwise prove a very difficult task. The flesh of this animal is eaten by the nobility, and esteemed a great delicacy.

The bohac resembles a Guinea-pig. These little animals dig holes in the ground, which they enter in October, and do not quit their lodgings till April, unless compelled to it for want of food; and in that case, they always set one or two as sentinels, who on the least appearance of danger give the alarm by making a very peculiar noise, which being understood by their companions, they all make a hasty retreat to their burrows, wherein they have separate apartments for their provisions, their lodging, and their dead; ten or twelve of them usually herding together in one hole. They are easily tamed, and in that state are very diverting.

The birds in Poland, which are very numerous, are such as have been already described in the other northern countries, except the quail, which is said to have green legs, and the flesh unfit for eating. Poland has no species of fish peculiar to itself; but its seas, rivers, and lakes abound in cod, ling, turbot, &c.

It is very difficult, if not impossible, to form an estimate of the number of inhabitants in a country of such vast extent as Poland, many of the remotest parts of which still continue to be little known, or in a very uncivilized state; but they were undoubtedly very numerous before the breaking out of the late war. Some have supposed Poland and Lithuania to contain 12,000,000 of inhabitants; and this calculation may not be exaggerated, when we consider that the Poles have no colonies, have sometimes enjoyed peace for many years together, and that no fewer than 2,000,000 of Jews are said to dwell there. Since the partition and dismemberment of the kingdom, the number is only 9,000,000, of which 600,000 are Jews. The provinces taken by Russia are the largest; those by the Austrians the most populous, and the Prussians are the most commercial. By the dismemberment of Poland, 5,000,000 of souls have been separated from their ancient kingdom; since the provinces seized by the Russians contain 1,500,000; those by the Austrians, 1,500,000; and those by the Prussians amount to about

860,000. The Poles, in their persons, are handsome and well shaped, with fair complexions; in their manners, brave, honest, hospitable, active, and hardy; the women are said to be of exemplary piety and virtue, both in their public and private conduct. These people are divided into three classes, namely, nobles, citizens, and peasants; the nobility are all on a level, except the difference that arises from the public posts they enjoy, and the only title they value is that of a gentleman of Poland. The nobles possess great privileges: they have a power of life and death over their tenants and vassals, pay no taxes, are subject to none but the king, may choose whom they please for their sovereign, and lay him under what restraint they think proper; and none but themselves, and the burghers of some particular towns, can purchase lands. Many of them enjoy estates from five to thirty leagues in extent, and are also hereditary sovereigns of cities with which the king has no concern. Some of them can raise eight or ten thousand men, and they have always a number of troops in their pay, who do duty night and day before their palaces, and in their ante-chambers, march before them when they go abroad, and particularly when they appear at the diet, many of them, on this last occasion, having 5000 guards and attendants: for their debates in this great meeting are often determined by the sword. It frequently happens that two Polish noblemen go to war with each other, when castles, forts, and whole cities are destroyed in the contest; though the affair, perhaps, which occasions all this havoc, has been before decided in a court of justice: but the sentence of the civil law has very little weight with men who are in possession of the whole power of the military. If a person accused of a crime, however capital, can fly to the house of a nobleman who will afford him his protection, he is safe; for no one dares to take him from thence by force: in short, it may be said, that a Polish grandee is the most independent of any person in any country; but if he once enters into trade, he forfeits his nobility, and every privilege thereto annexed.

The citizens of Poland resemble those of other places, but the peasants are undoubtedly the most wretched race of beings. The nobility style them their subjects, and if they sell an estate, dispose of them in the same manner they do the cattle, or any other part of it. If one lord kills the peasant of another, he is only obliged to make reparation by sending him another of equal strength and value. When a person of distinction intends to cultivate a spot of land, he causes a little wooden hut to be built near it, in which he settles a peasant and his family, giving him a cow, two horses, a certain number of geese, hens, &c. and as much corn as is sufficient to maintain him for the first year; and in return, the peasant is to improve the land for his own future subsistence, and the advantage of his lord. Thus are these poor creatures born and kept in a state of perpetual servitude, of which they never see the end, unless by the permission of their tyrants, from

whom they frequently suffer the most cruel and wanton insults. Sometimes these monsters proceed so far as to injure their wives and daughters, wrongs which must rouse the rage of every being but a Polish peasant, whose spirit, through oppression, is sunk into a state of total insensibility, scarce ever being heard to repine at his hard lot, or wish for a better; particularly, if his master feeds him well, thinking it impossible for a man to be miserable who has sufficient to eat; and in this case, they are always ready to sacrifice themselves and their families for their lords, whom they are taught to regard as a superior order of beings. Lately indeed, a few nobles of enlightened understandings have ventured to give liberty to their vassals. Zamoiski, formerly great chancellor, was the first who granted this freedom; and in 1760 enfranchised six villages in the palatinate of Masovia, and afterwards on all his estates. The event has shewed this act to be no less judicious than humane; conducive to the noble's own interests as well as the happiness of the peasants: for it appears, that in the districts in which this new arrangement hath been introduced, the population of the villages is considerably increased, and the revenues of their estates augmented in a triple proportion. Prince Stanislaus, nephew of the king of Poland, hath very lately enfranchised four villages near Warsaw, and hath not only freed his peasants from slavery, but condescends to direct their affairs. This conduct is truly laudable, and betokens better times to the lower class in this distressed country.

The Polish nobility assume great state upon all occasions, particularly in their equipages and manner of living. It is no unusual thing for the lady of a Polish grandee, on a common visit, to be attended by a coach and six, and a great number of domestics, among which are an old gentleman-usher, an old governante, and a dwarf of each sex to hold up her train: if it happens to be an evening visit, the grandeur of the scene is augmented by the number of flambeaux which surround her coach. When they sit down to table, a number of gentlemen wait upon them with the greatest respect, and these are usually some of the poor nobility, who, not daring to demean themselves by trade, are glad to earn a subsistence by thus servilely waiting on their equals in birth, though superiors in fortune. It generally happens, however, that this mode of life is rendered very easy to them, for their patron usually treats them with the greatest civility; permitting the oldest among them to sit down, with his cap off, at the same table with him, and giving the rest part of his meat, which they eat standing: they likewise all drink out of his cup, and have each a peasant boy kept to wait on them. At a Polish entertainment there are neither knives, forks, or spoons laid upon the table, but every guest brings them with him. When the company are all seated, the doors are shut, and not opened again till they have done eating; and the whole time of the repast, they are entertained with music, of which every nobleman keeps a

band. Bumpers are as much the fashion in Poland as in Ireland; and a stranger will find it as difficult to return sober from a feast in one country as the other.

The Polish dress is pretty remarkable. They cut the hair of their heads short, and shave their beards, leaving only large whiskers. They wear a vest which reaches down to the middle of the leg, and a kind of gown over it lined with fur, and girded with a sash, but the sleeves sit as close to their arms as a waistcoat. Their breeches are wide and make but one piece with their stockings. They wear a fur cap or bonnet; their shirts are without collar or wristbands, and they wear neither stock nor neckcloths. Instead of shoes, they wear Turkey leather boots with thin soles and deep iron heels bent like a half-moon. They carry a pole-ax and a sabre or cutlass by their sides. When they appear on horseback, they wear over all a short cloak, which is commonly covered with furs, both within and without. The people of fashion wear sables, and others the skins of tygers, leopards, &c. Some of them have 50 suits of clothes, exceeding rich, which descend from father to son. The habit of the women very much resembles that of the men, being a simple Polonaise, or long robe edged with fur; but some people of fashion, of both sexes, affect the French or English modes. The peasants, in winter, wear a sheep-skin with the wool inwards, and in summer a thick coarse cloth; but they wear no linen. Their boots are the rinds of trees wrapped about their legs, with the thicker parts to guard the soles of their feet. The women have a watchful eye over their daughters; and in the district of Samogitia, that they may know where they are, and what they are doing, make them wear little bells before and behind.

The houses in Poland consist entirely of a ground-floor, and the apartments are not joined to each other, but rather form a square court, on one side of which is the kitchen, the stable on the other, the dwelling-house on the third, and the gate in front. The inns of this country are nothing more than long stables built with boards, and covered with straw, without windows or furniture. At one end there is a chamber, which usually swarms with fleas and other vermin; so that travellers rather choose to lodge among the horses than go into it. They are obliged to carry provisions with them, and when foreigners want a supply, they inform the lord of the village, who immediately provides them with necessaries.

The usual diversions of the Poles are vaulting, dancing, hunting, skating, bull and bear-baiting, and riding; of which exercise they are so exceedingly fond, that they will not stir a hundred yards without their horses. They are so extremely hardy, that, if by chance they are benighted, they sleep upon the ground, in frost and snow, without any covering, except their usual clothing.

ious, tolerably well fortified, and contains both within and without the walls a considerable number of churches, palaces, and convents. The king usually keeps his court here, in a noble palace which forms a large square, surrounded with delicious gardens and groves. Here are likewise held the general diets, to which such multitudes of people resort, that great numbers are obliged to reside in tents. The ordinary diets are held at the royal palace; but during the interregnum, in a field, not far from the city, near the village of Wola. In the year 1746, was opened count Zaluzki's library, which is said to contain two hundred thousand volumes. Goods are brought to the city, by the Vistula and other rivers, and sent from thence to Dantzick. Here is a stately castle, and an arsenal; and near the city are two royal palaces, viz. Viaslow, and Viallanow.

The established religion in Poland is that of the church of Rome, carried to the highest pitch of enthusiasm: the Polish clergy being most illiterate bigots, and the monks some of the most profligate of mankind; and it is chiefly owing to the conduct and influence of the Popish clergy, that the peasants of Poland are so miserable. The monasteries in Poland are said to amount to 576, and the nunneries to 117, besides 246 seminaries or colleges, and 31 abbeys. There are in this country, great numbers of Lutherans, Calvinists, and members of the Greek church, who are all distinguished by the common name of dissidents, and, by the laws of that kingdom, are entitled to toleration and protection; but, owing to the bigotted spirit of the Popish clergy, who instill the same sentiments into their deluded followers, they live in a state of continual persecution. In the year 1724, a public massacre was made of the Protestants at Thorn, in open defiance of a treaty concluded at Oliva in 1660, and guaranteed by the principal powers in Europe, for which no satisfaction has been as yet obtained, and several other stipulations, made in their favour at different times, have been regarded with the same inattention: so that they have often suffered the most cruel outrages, while Jews, Turks, and other infidels, have been tolerated and encouraged. The Jews particularly are indulged with great privileges, and are so numerous, that their poll-tax is said to amount to near fifty-seven thousand rix-dollars annually. The principles of Socinus made a very early and considerable progress in Poland; which is no wonder, as before his time, it is computed, 32 congregations denied the doctrine of the Trinity. It is at length resolved, that all dissidents shall be tolerated, but to have no seat in the diet, senate, or permanent council, though they may sit in the inferior courts of justice.

The Polish language is a dialect of the Slavonic, being neither copious nor harmonious, but abounds in consonants, and many of the words have not a single vowel in them. The Lithuanians and Livonians talk a language peculiar to themselves, among which are found several corrupted Latin words; but the Russian and

German tongues are understood in the provinces bordering on those countries. The High Dutch and Latin are frequently spoke here, but very incorrectly.

In Poland are two archbishoprics, viz. Gnesna and Lemburg. The former of these is always a cardinal, and, during an interregnum, prince regent, or interrex of the kingdom. Gnesna has for its suffragans the bishops of Cracow, Cujavia, Culin, Liuke, Mednick, Pofna, Plosko, and Wilga; and those of Lemburg are the bishops of Cholm, Kaminiack, and Prenyzil.

There were three universities here, viz. Cracow, Pofna or Posen, and Wilna, but they are now almost entirely neglected. The first consists of eleven colleges, and has the superintendency of fourteen grammar-schools, which are dispersed through that city; in 1778, the number of students amounted to 600. That of Pofna is rather a Jesuits college than an university; Wilna was under the superintendency of the Jesuits; but since their suppression, the king hath established a committee of education, who appoint professors, and direct their salaries and studies.

Learning in Poland is in a very low state, notwithstanding several efforts have been made to raise it. The clergy, we have already observed, are illiterate bigots, consequently averse to the light of learning. The nobility despise it, placing their chief importance in the privileges of their rank; and the lower class are too wretched ever to think of study: of late, however, a taste for science has begun to spread itself among the nobles, and begins to be regarded as an accomplishment. This kingdom has formerly produced several great geniuses, particularly Copernicus, Vorstius, and some Protestant divines, who are highly received by the literati of Europe.

The natural curiosities of Poland are more numerous than the artificial. Under the mountains adjoining to Kiow, in the deserts of Podolia, are several grottoes containing a great number of human bodies, which, notwithstanding the time they must have lain there, are still entire: and among them are two princes in the habits they used to wear. These bodies are neither so hard nor so black as the Egyptian mummies, and no art having to all appearance been used for their preservation, this phenomenon is attributed to the nature of the soil, which in that part is dry and sandy. The salt mines may be justly placed among the natural curiosities of Poland.

A modern traveller has given us the following accurate description of those at Wielitka, which are situated within eight miles of Cracow: "These mines," says he, "are excavated on a ridge of hills at the northern extremity of the chain which joins to the Carpathian mountains: they take their appellation from the small village of Wielitka; but are sometimes called, in foreign countries, the mines of Cracow, from their vicinity to that city.

"Upon our arrival at Wielitka, we repaired to the mouth of the mine: having fastened three separate hammocks

hammocks in a circle round the great rope that is used in drawing up the salt, we seated ourselves in a commodious manner, and were let down gently, without the least apprehension of danger, about 160 yards below the first layer of salt: quitting our hammocks, we passed a long and gradual descent, sometimes through broad passages or galleries capable of admitting several carriages abreast; sometimes down steps cut in the solid salt, which had the grandeur and commodiousness of the staircase in a palace. We each of us carried a light, and several guides preceded us with lamps in their hands; the reflection of those lights upon the glittering sides of the mine was extremely beautiful, but did not cast that luminous splendor which some writers have compared to the lustre of precious stones.

"The salt dug from this mine is called *zlebna*, or green salt, for what reason I cannot determine; for its colour is an iron grey: when pounded, it has a dirty ash colour, like what we call brown salt: the quality improves in proportion to the depth of a mine; towards the sides and surface it is mixed with earthy or stony particles; lower down it is said to be perfectly pure, and requires no other process before it is used than to be pounded. The finest of this grey salt, however, is of a weak quality, when compared with our common sea salt; it is therefore, undoubtedly, by no means perfectly pure, but is blended with extraneous mixtures, though it serves very well for common purposes. Being almost as hard as stone, the miners hough it with pick-axes and hatchets, by a tedious operation, into large blocks, many of which weigh seven or eight hundred pounds: those large masses are raised by wind-lifts, but the smaller pieces are carried up by horses along a winding gallery, which reaches to the surface of the earth.

"Beside grey salt, the miners sometimes discover small cubes of white salt, as transparent as crystal, but not in any considerable quantity: they find likewise, occasionally, pieces of coal and petrified wood buried in the salt.

"The mine appears to be inexhaustible, as may easily be conceived from the following account of its dimensions: its known breadth is 1115 feet, its length 6691, and depth 743; and the best judges on the spot suppose, with the greatest appearance of probability, this solid body of salt to branch into various directions, the extent of which cannot be known: of that part which has been perforated, the depth is only calculated as far as they have hitherto dug; and who can tell how much further it may descend? The revenue arising from these and other salt-mines is very considerable, and formed part of the royal revenue before seized by Austria: the annual average profit of those of *Wielitka* was about 98,000*l.* sterling.

"Our guide did not omit pointing out to us what he considered as one of the most remarkable curiosities of the place—several small chapels excavated in the salt, in which mass is said on certain days in the year: one

of those chapels is thirty feet long, and twenty-five broad; the altar, the crucifix, the ornaments of the church, the statues of the saints, are all carved out of the salt.

"Many of the excavations, or chambers, from whence the salt has been dug, are of an immense size; some are supported with timber, others by vast pillars of salt, which are left standing for that purpose; several of vast dimensions are without any support in the middle. I remarked one of this latter sort in particular, which was certainly eight feet in height, and so extremely long and broad, as almost to appear amid the subterraneous gloom without limits. The roofs of those vaults are not arched, but flat. The immense size of the chambers, with the chapels above mentioned, and a few sheds built for the horses, which are foddered below, probably may give to the exaggerated accounts of some travellers, that those mines contain several villages inhabited by colonies of miners, who never see the light. It is certain that there is room sufficient for such purposes; but the fact is, that the miners have no dwelling under ground, none of them remaining below more than eight hours at a time, when they are relieved by others from above. In truth, those mines are of a most stupendous extent and depth, and are sufficiently wonderful without the least exaggeration. We found them as dry as a room, without the least damp, or moisture; observing only in our whole progress one small spring of water, which is impregnated with salt, as it runs through the mine.

"Such an enormous mass of salt exhibits a wonderful phenomenon in the natural history of this globe. Monsieur Guetard, who visited these mines with great attention, and who has published a treatise upon the subject, informs us, that the uppermost bed of earth at the surface immediately over the mines is sand; the second clay, occasionally mixed with sand and gravel, and containing petrifications of marine bodies; the third calcareous stone: from all those circumstances, he conjectures that this spot was formerly covered by the sea, and that the salt is a gradual deposit formed by the evaporation of its waters.

In the centre of the mountain called the Wonderful, frequently mentioned by modern geographers, is a spring of very clear water, which rises with a remarkable noise and vibration; and its ebullition or swelling increases or decreases with the moon. This spring, which is called by the inhabitants, *Ignis Fatuus*, never freezes by any degree of cold; and by holding a lighted torch over it, it immediately flames like spirits of wine, when the only way of extinguishing this fire is by brushing the surface of the water with brooms. Some years ago this fountain was set on fire by lightning, and the people neglecting to extinguish the flame, it communicated itself through subterraneous cataracts to a neighbouring wood, great part of which it destroyed by burning the roots of the trees, and it was three years before this conflagration entirely ceased; since which time watchmen have been appointed to prevent a repetition

dition of this accident. The water itself, and the slime which it deposits, are said to be highly beneficial in most disorders of the human body, and that, owing to them alone, the people who reside near this spring are seldom ill, and are remarkable for their longevity, few of them dying before they arrive at the age of an hundred, or an hundred and fifty. There have been found in the woods, both of Poland and Germany, certain beings which seemed divested of almost all the properties of humanity but the form. When taken, they generally went on all-fours, and were dumb; but some of them, it is said, by proper management, have attained to the use of speech. Probably, when the Tartars, and other barbarous nations, made inroads into Poland, the women were sometimes forced to leave their children exposed in the woods, where they might be nursed by bears and other wild beasts, otherwise it is difficult to account for their subsistence.

The most considerable cities in Poland are the following, viz.

Warsaw, situated 154 miles south-east of Dantzick, on the Vistula, and nearly in the centre of Poland. The kings usually reside here. The chief church, dedicated to St. John the Baptist, is very fine; as are the arsenals, castles, and palaces in that place, and other public-buildings. The streets are spacious, but ill paved; and the greatest part of the houses, particularly in the suburbs, are mean wooden hovels. The city, like the rest of this unhappy country, exhibits a strong contrast of wealth and poverty; it has little or no commerce, but is said to contain 70,000 inhabitants.

Cracow, situated on the conflux of the Vistula and Radawa, is very populous, and the largest and best built town in Poland, of which it is the capital: the houses are of free stone, four or five stories high, and covered with boards cut in the form of tiles. The public buildings are magnificent; among which are the cathedral of St. Stanislaus, the church of St. Mary, and 50 other churches, 17 religious houses in the castle, city, and suburbs, with the noble and well-built monasteries of the Jesuits and Dominicans. The suburbs occupy a vast space of ground. Near the city are some admirable salt mines, discovered in 1548; it is defended by walls, towers, and bastions; the garrison consists of 600 Russians. The commerce is inconsiderable.

Grodno, the largest town in Lithuania, next to Wilna, is situated on the river Nicmen, 160 miles north-east of Warsaw. Here is a fine palace, a castle, a college, a Jews synagogue, a Carmelite nunnery, three Greek, and nine Roman Catholic churches. Besides these, here are two other palaces, the one belonging to prince Radzivil, and the other to the Sapietian family. Very few of the streets of this city are paved; and a great part of the town was consumed by fire in the year 1753. It is a place of good trade, has a provincial diet, a court of judicature, &c. In 1776, the king established here several new manufactures of cloths, camblets, linen,

cotton, &c. and also an academy of physic and surgery.

Dantzick, the capital of Polish Prussia, is situated on the Vistula, and consists of the old and new town, with their suburbs. It is large, populous, and rich; and may well be considered as the chief mart and magazine of Poland, and one of the greatest granaries in the world; for so considerable is the trade of this city, that a whole fleet come hither every year to load with corn alone; and it is computed, that 265,000 lasts of Polish wheat are shipped from hence one year with another. Its houses are generally five stories high; and many of its streets are planted with chestnut trees. It has a fine harbour, and is still a most eminent commercial city, though it seems to be somewhat past its meridian glory; its trade getting into other channels, and daily diminishing. It is a republic, claiming a small adjacent territory, about 40 miles round it, which were under the protection of the king and republic of Poland. Its magistracy, and the majority of inhabitants, are Lutherans; although the Romanists and Calvinists are equally tolerated in it. This city is rich, contains 26 parishes, with several public buildings, convents, and hospitals. The inhabitants are computed at 150,000: they have often changed their masters, and have sometimes been under the protection of the English and Dutch; but have generally shewn a peculiar regard for the kingdom and republic of Poland, as being less likely to rival them in their trade, or abridge them of their valuable privileges, among which are those of coining money; gathering amber, and sending representatives to the general diet of Poland and the Prussian senate. Though strongly fortified, and possessed of 150 large brass cannon, it could not, through its situation, stand a regular siege, being surrounded with eminences. This city, as well as Thorn and Elbing, enjoy large and ample privileges, both civil and religious, very different from those of the rest of Poland, which they were permitted to retain when they put themselves under the protection of that kingdom, not being able any longer to endure the tyranny of the Teutonic knights.

The king of Prussia exempted this city, and that of Thorn, from the claims he had lately made in the neighbouring countries; notwithstanding which, he soon after thought proper to seize on the territory belonging to Dantzick, under pretence of their having formerly belonged to Polish Prussia. He next proceeded to possess himself of the port duties belonging to that city, and erected a custom-house in the harbour, where he laid arbitrary and insupportable duties upon goods exported or imported. Not satisfied with these oppressions, he caused custom-houses to be erected at the very gates of Dantzick, so that no persons could go in or out of the town, without undergoing a strict search. So lately as in 1784, it was blockaded by his troops, on various pretences; but by the interposition of the empress of Russia, and the king of Poland, they were withdrawn, and a negotiation carried on by deputies at

Warsaw, and concluded on the 7th of September, by which it was agreed, that the place and trade of the city should be restored to its former stability.

Thorn, an ancient city in Polish Prussia, is also situated on the Vistula. This town is defended by a double wall and moats, and is said to be the handsomest and best built in this country. The streets are broader, and the houses more elegant, than those at Dantzick. This city has shared the fate of that above-mentioned, and is now added to the dominion of the king of Prussia; law and justice giving place to the largest sword—*ratio ultima regum*.

Commerce, in this country, is entirely confined to the city of Dantzick, and the other towns on the Vistula and Baltic: some linen and woollen cloths, and hard-wares, are their principal manufactures, which are carried on in the interior parts.

Concerning the form of government in Poland, it is to be observed, that the Poles live under one head, who bears the title, and lives in the splendor becoming a king; but if you consider his power, as it is circumscribed within very narrow bounds, he is in effect no more than the prime or chief regent in a free commonwealth; since he can do nothing without the bounds of that authority which the laws of the land have given him, and the nobles take care to maintain.

The people elect the king on horseback; and in case there should be a refractory minority, the majority has no control over them, but to cut them in pieces with their sabres; but if the minority are sufficiently strong, a civil war ensues. The king, immediately after his election, signs the *pacta conventa*, by which he engages to introduce no foreigners into the kingdom or government; so that in fact, he is no more than president of the senate, which is composed of the primate, the archbishop of Lemburg, fifteen bishops, and 130 laymen, consisting of the great officers of state, the Palatines, and the Castellans; in all, 147.

The Polish diets are of two kinds, viz. either ordinary or extraordinary. The ordinary diets meet every second year, but the extraordinary diets only upon particular occasions when summoned by the king. They sit but six weeks, and the dissenting voice impedes the passing of any law, or coming to any final resolution concerning what had been proposed by the throne. Here are not only general diets, but dietines or provincial diets, and when the nobility enter into an association, either during an interregnum, or while the king is living, it is termed a confederacy. Indeed, to the great misfortune of the country, confederacies have been too frequent, as anarchy and confusion are usually their certain consequences.

The chief secular senators are, in number, 36, viz. 30 palatines, who are, properly, governors of provinces; three castellans, viz. of Cracow, Wilna, and Troki; and the starost of Samogitia. It is observed, that though the quality of castellan and starosta is infe-

rior to that of palatine, these four last-mentioned, possess almost the first rank among the lay senators.

The office of a palatine is, to lead the troops of his palatinate to the army, to preside in the assemblies of the nobility in his province, to set a price upon goods and merchandize, to see that the weights and measures be not altered, and to judge and defend the Jews. He has a vice-palatine under him, who must take an oath to him, and who ought to have an estate in land, which they call *Possessionatus*.

The castellans are the next in dignity to the palatines, and there are two sorts of them in the kingdom, who are usually distinguished by the title of great castellans, and petty or *sub-castellans*. The number of the former, both in the kingdom and duchy, amount to 39, and that of the latter to 49; and they are all senators, lieutenants, or deputies of the palatines; and heads of the nobility in their respective jurisdictions.

A king of Poland may nominate the great officers of state, but they are accountable only to the senate; neither can he displace them when once appointed: he also makes archbishops, bishops, &c. appoints judges and magistrates of provinces; and upon invasions or rebellions, can summon the nobility to his standard; he has all power to remit fines and capital punishments: but he can neither marry, nor divorce a wife, without consent of the republic; and if he marries after his coronation, the queen cannot be crowned without his asking their consent, nor even then, unless she be a Roman Catholic.

From the imperfect sketch above given of this motley constitution, we may discern the great outlines of a noble and free government. The precautions taken to limit the king's power, and yet invest him with an ample prerogative, are worthy of a wise people. The institutions of the diet and dietines, are favorable to public liberty, as are many other provisions in the commonwealth: but even in its best state, it has laboured under incurable disorders. The exercise of the *veto*, or negative vested in each member of the assembly, must nevertheless be destructive of order, and embarrassing to government; and appears to be founded upon Gothic principles, and that unlimited jurisdiction which the great lords, in former ages, used to enjoy all over Europe. The government of Poland cannot be otherwise improved than by the introduction of arts, manufactures, and commerce, which would in a short time render the common people independent on the nobility; and prevent the latter from having it in their power to annoy their sovereign, and to maintain those unequal privileges which are so prejudicial to the community.

Besides dismembering the best provinces of Poland, the partitioning powers have proceeded to change and fix the constitution and government, under pretence of amending it; confirming all its defects, and endeavouring to perpetuate the principles of anarchy and confusion. the provinces of Poland, succeeded to change and ment, under pretence of defects, and endeavour of anarchy and confusion accomplish their designs,

signs, they insisted upon the four following principal laws to be ratified; which was at last obtained. These were,

I. That "the crown of Poland shall be for ever elective, and all order of succession proscribed:" thus the exclusion of the king's male heirs removes the prospect of an hereditary sovereignty, and entails upon the kingdom all the evils inseparable to an elective monarchy.

II. That "foreign candidates to the throne shall be excluded, and, for the future, no person can be chosen king of Poland, excepting a native Pole of noble origin, and possessing land in the kingdom:" by which law, the house of Saxony, and all foreign princes who might be likely to give weight to Poland by their hereditary dominions, and restore its provinces and liberties, are set aside.

III. That "the government of Poland shall be for ever free, independent, and of a republican form:" thus confirming the *liberum veto*, and all the exorbitant privileges of the equestrian order, in their utmost latitude.

IV. "A permanent council shall be established, in which the executive power shall be vested:" in this council are to be admitted the equestrian order, hitherto excluded from the administration of affairs in the interval of diets, by which means the prerogatives of the crown are still further diminished.

It may be easily perceived, that this change of the constitution was intended by the partitioning powers to give a large scope to influence and faction over that part of the kingdom they had not seized, in order the more effectually to serve their own sinister purposes.

The revenue of the king of Poland is clear to himself, and sufficient to maintain him and his household with great splendor; for he pays no troops, not even his own body-guards; all the public expences being provided for by the senate; and all the officers of the household are Polish gentlemen, who serve without salary, in expectation of some office. The present king had one million and a half of florins (at 3s. 6d. each) settled upon him by the commission of state; and the income of his predecessors generally amounted to 1,400,000 sterling. The public revenues were collected chiefly from the crown-lands, the salt-mines in the palatinate of Cracow, now in Austrian Poland, which alone amounted to nearly 100,000 sterling; the rents of Marienburg, Dirschau, and Rogenhus, and of the government of Cracow, and district of Niepolomiez, besides ancient tolls and customs, particularly those of Elbing and Dantzick.

The greatest loss to Poland was Western Prussia, as by the dismemberment of that province the navigation of the Vistula depends entirely upon the king of Prussia. This was a fatal blow to the trade of Poland, since Prussia has laid such heavy duties on the merchandize passing to Dantzick, as greatly to diminish the trade of that town, and to transfer a considerable part of it to Me-

mel and Koningsburgh; so that Poland having, by the dismemberment, lost near half her annual income, it became necessary to new-model and increase the taxes, in order to supply this deficiency.

All the imports in 1775 amounted to 323,012l. the nett revenue of the king (which arises from his royal demesnes, starosties, and 74,074l. out of the treasury) is 194,500l. out of which he only pays his household expences and menial servants. The whole revenue is 443,938l. out of which if we deduct 194,500l. for the king's privy purse, there will remain the sum of 249,438l. for army, state officers, and all other charges.

Respecting the military strength of Poland, we have already observed, that the innate pride of the Polish nobility is so great, that they always appear in the field on horseback, and hence the principal force of the kingdom consists in cavalry; indeed, the infantry, which are generally hired from Germany, and soon dismissed, are seldom considered as any part of the Polish army. The nobility who have seized the reins of government, together with all the honours and emoluments of the state, have also undertaken to defend it, leaving all the rest of the nation to cultivate the lands. Hence the Polish cavalry are all gentlemen; and it is said that Poland can raise 100,000, and Lithuania 70,000 of such horsemen, including their servants, who always attend their masters on horseback in the field. This combined army, or rather two armies, consisting of Polish and Lithuanian cavalry, have each their grand general, entirely independent of each other. It has been already observed that the office of grand-marshal is the second in dignity, but the grand-general is superior in power, being confined only by the limits he prescribes to himself, nor is this authority ever suspended but when the king commands the army in person.

Besides these, there is a third army called the *pospolite*, consisting of all the nobility and their followers in the kingdom, except the starosts and generals of the frontier places. This army can be summoned by the king on extraordinary occasions; but he cannot keep them above six weeks in arms, nor are they obliged to march above three leagues beyond the frontiers of the kingdom.

A fourth army has been for some time maintained in Poland, consisting of infantry and light horse, generally called hussars. The latter are reckoned the finest and most showy body of troops in Europe. They wear defensive armour, and their horses are remarkably swift, so that they greatly harass the army of an enemy. But want of discipline has rendered the Polish troops, notwithstanding all their bravery, very incapable of facing an army of veterans belonging to the other powers of Europe in the field. Formerly indeed, especially under the command of the famous John Sobieski, they made a noble figure against the Turks, and proved the bulwark of Europe against all the attacks of the infidels: but the Saxon princes, who succeeded.

succeeded that hero; did not think it prudent to encourage the martial spirit of the Poles. On the contrary, they perpetually overawed them with their electoral troops. At the same time they neglected to introduce any reformation among them, either civil or military: the ignorance of the Poles suited better with their plan of subordination. This neglect, which was not felt for many years, has now been severely felt in this devoted kingdom.

A great variety of coins have been struck in Poland; but the following only are at present current in that kingdom, viz. the gold ducat of Poland, valued at 9s. 3d. the old silver dollar of Dantzick, 4s. 6d. the old rix-dollar of Thorn, 4s. 5d. the rix-dollar of Sigismund III. and Uladislav IV. 4s. 6d.

The Poles never had any order of knighthood before that of the Immaculate Conception, erected by Sigismund III. with some privileges above the rest of the gentry, who so much despised it, that the order soon came to nothing. King Augustus, in 1705, revived the order of the White Eagle, in remembrance of his happily meeting the diet in Lithuania, when the Swedes and Stanislaus thought to have intercepted him. This order was first instituted by Uladislav, in the year 1325. The badge is a white eagle, crowned with diamonds. He conferred it on several lords, but the senators are distinguished by wearing a golden cross, with a badge in the middle of it: the motto is, *pro fide regis, et lege*; "for the faith, the king, and the law."—His late majesty, on the 26th of September 1736 (which was the anniversary of his birth) created eight knights of a new order, in honor of St. Henry, of which he assumed the title of grand-master. The badge of this order is a red star with eight points, in the middle of which there is a representation of the emperor Henry, and upon each ray or point appears the electoral sword of Saxony. The star is appendent, by a silver string, to a ribband of crimson velvet. The present king, soon after his election to the crown in 1765, instituted the order of St. Stanislaus. The badge is a gold cross enamelled red, and in the centre of it a medallion with the image of St. Stanislaus enamelled in proper colours. It is worn pendent to a red ribband edged with white. The star of the order is silver, and in the centre is a cypher of S. A. R. (Stanislaus Augustus Rex) encircled with the motto, *Pre-mundo inciat*; "he stirs up by oppressing."

THE HISTORY OF POLAND.

THIS kingdom was originally inhabited by the Sarmatians, who were expelled by the Rus and Tartars. The government was, in process of time, divided between twelve palatines, who were sovereigns of so many districts, and independent of each other. About the year 700, one Cracus, either by force, or by consent of these petty princes, became sovereign of the whole,

and he it was that built the city of Cracow. The line of Cracus being extinct, Poland was again governed by twelve palatines, who agreed, in the year 760, to elect Lescus their sovereign, with the title of duke, which was retained till the year 999, when Boleslaus first assumed the title of king; and, about this time, Christianity was first established in Poland; since which it appears to have been an hereditary monarchy, his posterity succeeding to the throne for several generations, among whom was Casimir I. Boleslaus II. marrying Vicislava, the daughter and heiress of Red Ruffia, that province was united to Poland anno 1050. The kings of Poland, among whom was Casimir III. were absolute sovereigns until the reign of Lewis, anno 1370, but then the Poles insisted on limiting the prerogative, probably because Lewis was king also of Hungary, and they suspected he would favour his native country to their prejudice. Lewis being succeeded by his daughter and heiress, Hedwigis, anno 1382, she married Uladislav V. great duke of Lithuania, on condition he should become a Christian, and their issue should succeed both to the crown of Poland and the duchy of Lithuania, which have been united ever since. Uladislav, their son, succeeded them, who was also king of Hungary. This prince was killed in a battle with Amurath, the Turkish emperor, and, leaving no issue, was succeeded by his brother Casimir IV. between whom and the knights of the Teutonic order, who had been placed in Prussia by the pope, there were continual wars, until it was agreed, that the knights should remain possessed of Eastern or Ducal Prussia, the grand-master taking an oath of fealty to the king of Poland. In the reign of Sigismund II. the Russians invaded Livonia, then possessed by the Teutonic knights, who called in the Poles to their assistance; other provinces called in the Swedes, and these three powers contended for the dominion of Livonia many years. Henry of Valois, duke of Anjou, was elected king of Poland anno 1574; but his brother Charles, the French king, dying, he quitted Poland, and succeeded to the crown of France anno 1577. Stephen Batory, prince of Transylvania, was elected king of Poland on the abdication of Henry. In his reign the supreme courts of justice were first erected, before which time the king and council were the last resort in cases of appeal. Sigismund III. son of John, king of Sweden, was elected king on his renouncing Lutheranism, anno 1587. Uladislav, his son, succeeded him, anno 1632, and invading Russia, took the capital city of Moscow, and, in a treaty that ensued, he obliged the Russians to confirm the provinces of Smolensko and Zernigoff to Poland. Uladislav, leaving no issue, was succeeded by his brother John Casimir, anno 1648, though he was then a cardinal. In this reign, the old Cossacks, being obliged, renounced their allegiance to the Poles, and became subjects to the Russians and Turks. Charles Gustavus, king of Sweden, conquered Poland, but lost it again in six months; after which, John Casimir in-

racow. The line was again governed the year 760, to the title of duke, 9, when Boleslaus II. died, about this time, Poland; since which every monarchy, his for several generations. Boleslaus II. and heirs of Red Poland anno 1059. was Casimir III. sign of Lewis, anno limiting the prerogatives of the king also of Hungary, favour his native being succeeded by his, anno 1382, the Lithuanians, on confederation, and their issue of Poland and the ten united ever since. Casimir, who was also killed in a battle, and, leaving no issue, Casimir IV. between the two orders, who had there were continual knights should remain Prussia, the grand-duke of Poland. The Russians invaded Lithuania, who were; other provinces were powers contended many years. Henry of Poland succeeded to the crown, the French king, succeeded to the crown in Batory, prince of Poland on the abdication of the supreme courts of which time the king in cases of appeal. Sigismund of Sweden, was elected king of Prussia, anno 1587. him, anno 1632, and city of Muscov, and, in the Russians to confirm Zernigoff to Poland. succeeded by his brother, though he was then a Cossack, being distant to the Poles, and and Turks. Charles conquered Poland, but lost it, John Casimir introduced

an army of 30,000 Germans to defend the kingdom against the Swedes; but the Poles, suspecting he intended to render himself absolute, deposed him; whereupon he retired into France, and was made abbot of the abbey of St. Germain. Michael Wisnowiecki being elected in 1670, the Turks conquered Podolia in his reign, but were defeated by John Sobieski, who was elected king on the death of Wisnowiecki. This prince died after a glorious reign, in the year 1696, and the greatest anarchy and confusion succeeded. Confederacies were formed in support of different candidates, and the most horrid ravages were committed on the territories of each party. In the mean time, Poland was insulted by the Tartars, and its crown in a manner offered to the highest bidder. In 1693, Frederic Augustus, elector of Saxony, was placed on the throne, in opposition to the prince of Conti, who had been proclaimed king by the French faction; but, being unable to support his pretensions against the armies of Augustus, he retired into France; but it was not till the year 1712 that Augustus was fully confirmed on the throne, which he held upon precarious and disagreeable terms. The year after his accession, the Turks, by the peace of Carlowitz, restored the province of Podolia to Poland.

Augustus was not so fortunate in his alliances against Charles XII. of Sweden. He was defeated in several battles, and afterwards deposed by that monarch, who placed Stanislaus Leszczinski on the throne of Poland in 1704. That prince continued to enjoy the royal dignity till the year 1709, when Charles XII. being totally defeated at the battle of Pultowa, and obliged to take refuge among the Turks, Augustus was replaced on the throne of Poland by Peter the Great. The Poles were, however, so strongly attached to the interest of their countryman Stanislaus, that Augustus was obliged to maintain his authority by means of his Saxon forces. In the year 1725, his natural son prince Maurice, afterwards the famous count Saxe, was elected duke of Courland; but Augustus was not able to support him in his new dignity.

Augustus died in 1733, after doing every thing in his power to insure the succession of the throne of Poland to his son Augustus II. but Stanislaus being elected by a considerable party, with the primate at their head, Augustus found it necessary to support his pretensions with the sword. This brought on a war, in which the interest of Stanislaus was supported by the French. But Augustus entering Poland at the head of a powerful army, composed of Saxons and Russians, Stanislaus was obliged to retreat to Dantzick, from whence he afterwards, with great difficulty, escaped into France. Augustus, however, could not acquire the affections of his Polish subjects: so that when he was driven from his electorate by his Prussian majesty, he could obtain nothing more than shelter for himself and his friends; the Poles absolutely refusing to take any part in the war. Augustus died at Dresden in 1763, when count Stanislaus Poniatowski was unanimously chosen king by the name of Stanislaus Augustus.

He was born in 1732, and crowned king of Poland in 1764. While a private nobleman, he resided some time in London, and is a member of the Royal Society. As he was peculiarly favoured by the empress of Russia and some Protestant powers, the papers which he signed, at the time of his election, were deemed too favourable to the Protestants in general, and the Greeks in particular. Hence the army, which the empress of Russia had in Poland, gave a pretence for various confederacies to be formed against the king by the Roman Catholics; and the conspiring nobles at length were so unnatural as to throw off all allegiance to the sovereign, and to put themselves under the protection of the grand seignior. This mad step of some of the Polish nobles occasioned the Ottoman Porte to declare war against Russia, and to invade Poland with a powerful army. Since which time, that unhappy country has been a scene of confusion, rapine, horror, oppression, and bloodshed. Hurried on either by blind zeal, or mistaken bigotry, the confederates precipitated the ruin of their devoted country, and some of the neighbouring powers, invited by their incautious enthusiasm, took an advantage of this absurd civil war, and, under the mask of friendship, dismembered this once powerful kingdom.

So far was dissimulation used in the dismemberment, or partitioning of Poland, as the powers concerned think proper to term it, that they all expressly deny having had the least intention to seize any of the Polish provinces, or in anywise to divide that country. In the act of renunciation transmitted to the court of Warsaw in the year 1764, and sealed with the seal of the Russian empire, the empress of Russia says, "She did by no means arrogate, either to herself, her heirs and successors, or to her empire, any right or claim to the districts or territories which were actually in possession or subject to the authority of the kingdom of Poland, or great duchy of Lithuania; but that, on the contrary, her said majesty would guarantee to the said kingdom of Poland and duchy of Lithuania all the immunities, lands, territories, and districts, which the said kingdom and duchy ought by right to possess, or did now actually possess; and would at all times, and for ever, maintain them in the full and free enjoyment thereof, against the attempts of all and every person or persons who should at any time, or on any pretext, endeavour to dispossess them of the same."

The king of Prussia, in the same year, signed an act, in which he declared, "That he had no claims, formed no pretensions on Poland, or any part thereof; and that he renounced all claims on that kingdom, either as king of Prussia, elector of Brandenburg, or duke of Pomerania." In the same instrument, he guarantees the rights and territories of Poland against every other power whatever. The empress-queen of Hungary, likewise, in the year 1771, wrote a letter, with her own hand, to the king of Poland, in which she gave him the strongest assurances, "That her friendship for him and the republic was firm and unalterable; that

the motion of her troops ought not to alarm him, that she had never entertained a thought of seizing any part of his dominions, nor would even suffer any other power to do it." Yet these very sovereigns, so liberal in their professions of protection, and warm in their professions of friendship, are the persons who have jointly invaded the unhappy kingdom of Poland, distressed its inhabitants, seized on its most valuable revenues, dismembered its palatinates, duchies, &c. and partitioned out some of its richest cities and provinces among themselves. Such is the political faith of princes! and hence may be ascertained the dependence that is to be placed upon their most solemn promises.

Since these illusive declarations and fallacious professions were made and given, the partitioning powers published each a manifesto, in which they respectively laid claim to certain of the Polish territories. In these pretensions the king of Prussia shewed himself a deep politician, by contriving to lay claim to the most valuable share, and thereby obtaining the richest, most populous, and most commercial parts. It was in the year 1770 that these false and pretended friends threw off the mask, and began to avow their intentions. The Prussian consul, having received his political lesson, took occasion to quarrel with the magistrates of Dantzick, and having been palpably the aggressor, was, according to his instructions, the first to complain. The king of Prussia pretended to be highly offended: but instead of coming to an explanation, or hearing both parties, he determined to be at once judge, jury, and executioner; he, therefore, to make a decision, not by the sword of justice, but by the sword military, suddenly surprised the city with a strong body of troops, fined the magistrates 100,000 ducats for what he termed their insolence, seized upon 1000 men to recruit his army, and, having thus executed his intentions first, he began very calmly to argue the matter with the magistrates afterwards; and having coolly remonstrated with them on their imprudence, as he called it, told them to do so no more, and he would freely forgive them. Amazing condescension, and truly characteristic of the moderation of an arbitrary prince!

This, however, was a trifling prelude to what was to follow; for in the ensuing year, 1771, the Prussian troops entered Great Poland, and carried off from that province and its neighbourhood above 12,000 families; and, about the latter end of the same year, his Prussian majesty published an edict, commanding, under the most severe penalties, that all persons should take in payment for forage, provisions, corn, horses, &c. the money offered by his troops and commissaries. This money was either silver bearing the impresson of Poland, and worth only one-third of its nominal value, or ducats struck in imitation of Dutch ducats, but above seventeen per cent. inferior in value to the real ducats of Holland. With this very base money he bought up a sufficient quantity of forage and provisions to stock his magazines and supply his army for two years: and

the poor inhabitants, after having been thus obliged to part from their property much below its value, were, through necessity, compelled to come to repurchase corn from those magazines, and to pay good substantial money for it; for the Prussian commissaries absolutely refused to receive again the same coin which they had paid: from this curious, though not very honest manoeuvre, the king of Prussia cleared 7,000,000 of dollars. The country being thus stripped of money and provisions, the next plan of his Prussian majesty was, to clear it of its inhabitants. To increase the population of his own dominions, at the expence of Poland, had long been his aim. To this end he enacted, that every city, town, village, &c. in the places which his troops possessed, should furnish a certain number of marriageable young women, and the parents were ordered to give, as a portion, a feather bed, four pillows, a cow, two hogs, and three ducats in gold. This cruel order was rigorously executed. The parents were stripped, in the most tyrannical and oppressive manner, to supply extorted portions for the children ravished from their arms. The young women were inhumanly dragged from their parents, their friends, and their connections; and, being bound hand and foot, like criminals, were carried off, in spite of the lamentations of themselves and relations, in carts, waggons, &c. After this horrid exertion of arbitrary power, the exactions from the abbeyes, convents, cathedrals, nobles, &c. were so great and unreasonable, that the people of fortune fled from their estates, and retired into foreign countries, and the priests abandoned their churches. These exactions continued with unabated rigour, from the year 1771, to the time the treaty of partition was declared, and possession taken of the provinces wrested from Poland; when Polish Prussia, and some districts bordering upon Brandenburg, were allotted to the king of Prussia; almost all the south-eastern parts of the kingdom, with the rich salt-works of the crown, fell to the empress-queen of Hungary: and the empress of Russia took possession of a large territory about Mohilow.

Every person of good sense, moderation, and equity, will certainly consider the violent dismemberment and partition of Poland as the first great breach in the modern political system of Europe; and notwithstanding the destruction of a great kingdom, with the consequent disarrangement of power, dominion, and commerce, has been beheld by the other nations of Europe with the most astonishing indifference and unconcern, yet future ages will regard this unjustifiable measure with the greatest indignation; those who projected it with horror; and those who acquiesced in it with contempt. The courts of London, Paris, Stockholm, and Copenhagen, remonstrated against the usurpations, but made no attempt to oppose them; so that Poland was forced to submit, and the partition was ratified by their diet, held under the bribes and threats of the three powers. There was a majority of six in the senate; but, in the lower house, the assembly of nuncios, there was a balance.

lance of but one vote in favour of the measure, fifty-four against fifty-three. This is a very alarming circumstance, and shews that a most important, though not happy change, has taken place in that general system of policy, and arrangement of power and dominion, which had been for some ages an object of unremitting attention with most of the states of Europe.

REVOLUTION IN POLAND,

Which took Place in 1791.

EVERY person, whose attention has at all been directed to political events, must recollect with indignation the infamous dismemberment of Poland in the year 1773. From that period the republic has been reduced to a most humiliating state of servitude and dependence upon Russia. Notwithstanding the advances of Prussia were favourably received by the nation during Russia's contest with the Porte; yet the enlightened part of the Polish patriots flattered themselves with no advantages from Prussia, which were not to be paid by sacrificing the best interests of the republic; they determined, therefore, to make a wiser use of the interval of relief from foreign oppression, which they now enjoyed; and they found themselves warmly seconded in their views by the greatest part of the nation, when it appeared that the cession of Thorn and Dantzick to Prussia was the immediate object of that insatiable court.

Every nation must find its own support within itself; since, by depending on a foreign power, it will ever find its prosperity precarious, and its government contemptible. Poland wanted not indolence nor valour; but what she stood most in need of was unity, a constitution, an active and efficient government. Happily for her, she was at this time possessed of some men of the most rational abilities, and apparently of the most exalted patriotism. The king had indeed been elected by the Russian interest; but he has shewn that foreign obligations have not been able to eradicate from his breast an attachment to his country.

During the session of the diet many excellent decrees had been passed in favour of general liberty; and calculated to attach the citizens to the interests of their country: that of the 18th of April 1791, in particular, which secured to the freemen the rights which had been previously confined to the order of nobles, and which opened the door of nobility to the inferior orders, was a considerable advance in favour of human nature, in a nation which had so long been devoted to the slavish principles of the feudal system. The minds of the public were also prepared for the change, by the apprehensions which the designs of Prussia upon Thorn and Dantzick had excited, and by the just alarms, which agitated the people, of a future division of their territory. The new constitution, however, was suggested and prepared with the utmost secrecy and

caution; and but few were intrusted with the projected design.

On the memorable 3d of May 1791, at three o'clock in the morning, a select body of patriots assembled in the royal chamber; there, in presence of the king, they solemnly engaged never to separate till the intended revolution should be happily accomplished. The galleries of the hall, in which the diet was held, were crowded at an early hour, as if in expectation of some important event.

The session was opened by the king in person, instead of the marshal; and instead of recurring to the order of the day, which was a report on the finances, his majesty addressed the assembly on the general state of the nation; and observed, that "whatever assurances foreign powers might amuse them with, he had undoubted proofs that the alarming rumours which had been spread concerning a fresh dismemberment of the territories of the republic, rested upon too sure a foundation; and that the contending powers were about to terminate their differences at the expence of Poland. That one way remained, and but one, to secure the possessions of the republic, and to preserve the state from ruin; and that was, to give it such a constitution as might impart unity to its government, and attach the people to its support. That, with this view, a constitution had been prepared, principally founded on the English and American constitutions, and adapted as much as possible to the circumstances of the country; and he trusted that they would adopt this constitution.

A tumultuous debate ensued, after the reading of the constitution. The nuncios of Volhynia and Podolia protested against the proceeding. M. Suchorzowsky, who has been the author of the decree in favour of the citizens, threw himself at the feet of the throne, and besought his majesty, that he would not persist in his intention to make the crown hereditary. Others referred to the instructions of their constituents, and entreated that the further consideration of this business should be deferred to a future day; but this proposal did not meet with the sentiments of the majority. The king then, rising from his seat, respectfully called the bishop of Cracovia, and took a solemn oath to maintain the constitution: "He that loves his country," exclaimed his majesty, "let him follow me to the church, and repeat this oath at the foot of the altar." The king was attended to the church by all the nuncios, except between thirty and forty. Te Deum was sung; all the deputies present took the oath; and the new constitution was announced to the people by the firing of 200 pieces of cannon. It was reported that, on the preceding day, a foreign minister had distributed the sum of 50,000 ducats for the purpose of obstructing the revolution. The attempt, however, proved abortive; the most perfect tranquillity prevailed; and nothing but exclamations of joy was heard throughout Warsaw. Thus without bloodshed, and even without tumult, was effected a revolution honourable to those who projected it, and promising.

promising to be essentially conducive to the happiness of the people.

GENERAL OUTLINES OF THE

NEW POLISH CONSTITUTION.

" BY this new constitution, a full and free toleration is permitted to all sects and religions; the peasants, who were formerly in a state of the most abject vassalage, or rather slavery, are received under the protection of national law and government, and all contracts between the lords and vassals are declared equally binding. The sovereignty is declared to reside altogether in the will of the people; and three distinct powers are established in the government—the legislative, the executive, and the judicial. With respect to the first of these powers, the diet or legislature is to be elected every two years from the order of nobles, and is divided into two houses, namely, the house of nuncios and the senate; the former, however, possesses the pre-eminence, and every law which passes in it is immediately to be sent to the senate, where, if it is accepted, it becomes a law in full force: if supereded, it must be resumed at the next diet; and if a second time it passes the house of nuncios, the senate must submit to it.

" With respect to individuals the crown of Poland is hereditary, and elective as to families; and the house of Saxony is the family now (1791) chosen for the vacancy. To the king and his council is intrusted the execution of laws. The king's person is inviolable. He may pardon all criminals but state prisoners: he commands the forces, appoints commanders, patentees, officers, bishops, senators, ministers. But no minister or senator can sit in the house of nuncios.

" The judiciary power is thus divided: first, primary courts in each district or palatinate; second, courts of appeal in each of the three provinces. There are some other local inferior courts, and a comital tribunal for the trial of crimes against the state.

" Citizens in general are empowered to purchase landed estates; and, whoever purchases a village or township, paying 200 florins land tax, is ennobled. Thirty citizens are also ennobled at every diet. The army, the law, and the church, are all thrown open to the citizens. Perfect and entire liberty is proclaimed to all new settlers, whether foreigners, or emigrants returned from foreign parts."

The opposition which at first was made to the constitution, chiefly on account of the hereditary succession, soon began to subside. Count Braniki, grand-general of the kingdom, who at first had declared against the constitution, acceded to it, and signed it at the diet on the 5th; and the celebrated friend of liberty, Malackowiky, great chancellor of the crown, who on that event had resigned the seals, re-accepted them at the requisition of the diet, and accepted the office of minister of justice, and for the interior department. On

the 17th M. Goltz, chargé des affaires from the court of Berlin, announced his Prussian majesty's approbation of the new arrangement, though there has been some reason to suspect that this profession was not accompanied with much sincerity; which can only be ascertained by the future conduct of that prince.

The ready concurrence of the king of Poland in a measure adapted to promote the welfare of his people; and the animated support which he gave to the new constitution, evinced the goodness of his heart, and the liberality of his principles. But here our commendation must end: we cannot give to his Polish majesty the praise of political sagacity, of foresight, of activity, or even of courage. Lulled into a fatal security by the insidious professions of a court, noted for its perfidy, as well as for its versatile and selfish politics; a court which appeared to promote the revolution, while it meditated secretly the dismemberment of Poland; the unfortunate monarch appears to have neglected every means of defence; nor was even the hesitating and undecided conduct of Saxony sufficient to excite his vigilance. No alliances were formed, no preparations made for supporting with vigor the infant constitution. In the predicament in which Poland then stood, if Prussia was averse to forming a permanent and sincere alliance, or if the faith of Prussia could not be depended upon; if Great-Britain had been found impracticable, and determined to sacrifice her real interests and those of Europe to the ambition of Prussia, it was then the part of Poland to look forward to other connexions, to cultivate, if possible, the friendship of France, of Denmark, and of Sweden. Such a combination, founded upon the moderate principle of mutual defence, would have successfully resisted the most determined attacks of imperial plunderers.

Something of this kind ought to have been attempted; but the Polish ministry permitted itself to be amused by fruitless negotiations at the court of Dresden, by the vague professions of Prussia; nor was it even roused to action by the cool reception which its ambassador experienced from the haughty despot of Vienna.

This neglect, great as it was, was even exceeded by the indifference of the king as to the means of internal defence. While the discontented nobles, who from personal resentment, or disappointed ambition, manifested the most earnest hostility to the constitution; while these were openly received and encouraged at Petersburg, neither the standing force of Poland was properly organized, nor the militia embodied. Not a magazine was erected, nor an intrenchment thrown up to oppose the entrance of the enemy. It was all a dead calm, and the Russians appeared upon their frontiers before the diet had recovered from its surprize at the first hostile declaration of the empress.

the diet received the
of the inimical and
unjust

unjust intentions of Russia. He informed them, that without the shadow of pretence, this avowed enemy of the rights of mankind had determined to invade the territory of the republic with an army of 60,000 men. This formidable banditti, commanded by generals Soltikow, Michelson, and Kosakowski, was afterwards to be supported by a corps of 20,000, and by the troops then acting in Moldavia, amounting to 70,000. The king, however, professed that he was not discouraged, and declared his readiness to put himself at the head of the national troops, and to terminate his existence in a glorious contest for the liberties of his country. Then, and not before, the diet decreed the organization of the army, and its augmentation to 100,000. The king and the council of inspection were invested with unlimited authority in every thing that regarded the defence of the kingdom. Magazines were ordered to be constructed, when it was too late, and quarters to be provided for the army.

In consequence of these preparations, the diet and the nation rose, as one man, to maintain their independence. All private animosities were obliterated, all private interests were sacrificed; the greatest encouragements were held forth to volunteers to enroll themselves under the national standard, and it was unanimously decreed by the diet, that all private losses should be compensated out of the public treasury.

In 1792, Russia, seeing war declared between Austria and France, and finding herself likely to be called upon to fulfil her engagements with the former of those powers, avowed her intentions, in the month of May, to overturn the present constitution of Poland, and give it a form of government which might best suit herself. An official declaration was accordingly delivered to the Polish government on this subject, dated the 18th of May, and filling twelve pages, in the Polish, French, and Russian languages: It announces the entrance of the Russian troops on the territory of Poland, and the formation of a new confederacy. When the declaration of the court of Russia was read at the diet, the king immediately rose, and explained to the members how far he thought the republic menaced, and its independence wounded; and declared he thought there were but two ways left for the republic to choose out of, viz. whether they should go to war, or endeavour to keep the republic at peace by means of negotiation; if the last is resolved upon, the kings of Hungary and Prussia, and the elector of Saxony, should be requested to use their good offices. His majesty said, that with respect to himself, he should always be found, wherever he could, either by council or personally, to render most service to his country, without any regard to his own life. The king said, what hurt him most was, that for their critical situation they were indebted to Polanders by birth, who misrepresented every thing to the empress of Russia, and concluded by recommending the necessary arrangements to be immediately taken.

With respect to the declaration itself, it was in general considered as a tissue of falsehood and hypocrisy. It asserted, that this wanton invasion, which was evidently against the sense of almost every individual Polisher, was meant entirely for the good of the republic. It censured the precipitancy with which the new constitution was adopted, and ascribed the ready consent of the diet to the influence of the Warsaw mob. It represented the constitution as a violation of the principles on which the Polish republic was founded — complained of the licentiousness with which the sacred name of the empress was treated, in some speeches of the members; and concluded, by professing, that on these accounts and in behalf of the emigrant Poles, her imperial majesty had ordered her troops to enter the territories of the republic.

This declaration was no sooner delivered to the diet, than the Russian troops, accompanied by counts Potocki, Rzewuski, Branicki, and a few Polish apostates, appeared upon the frontiers, and entered the territories of the republic, in several columns, before the close of the month. The spirit manifested by the nobility was truly honourable. Some of them delivered in their plate to the mint. Prince Radzivil engaged voluntarily to furnish 10,000 stand of arms, and another train of artillery. The courage of the new and hastily embodied soldiers, corresponded with the patriotism of their nobles. Prince Poniatowski, nephew to the king, was appointed commander in chief, and though his force was greatly inferior to the enemy, it must be confessed that he made a noble stand. On the 5th of May, the enemy's Cossacks were repulsed, and pursued by the patrols of the republic to the very entrenchments. On the 26th, about one o'clock, the pickets of the republic discovered a large body of Don Cossacks approaching the outposts; and a squadron of cavalry, commanded by lieutenant Kwashniewski, supported by lieutenant Golejowski, with two squadrons more, in all about 300, marched out to meet them. They attacked the Cossacks with success, but pursued them with more valour than prudence, to the side of a wood, where they found themselves drawn into an ambuscade, and surrounded by 2000 horse, two battalions of chasseurs, and six pieces of cannon. The intrepid Poles bravely fought their way through the Russian line, and killed upwards of 200 of the enemy. The Poles, in this engagement, lost 100 men, and two officers; one of whom, lieutenant Kwashniewski, was wounded, and made prisoner. The remainder of the detachment reached their quarters in safety.

The history of man can scarcely furnish an instance of perfidy, meanness, and duplicity, equal to that which was manifested by Prussia on this occasion. By the treaty of defensive alliance, solemnly contracted between the republic of Poland and the king of Prussia, and ratified on the 23d of April 1790, it is expressly stipulated, "That the contracting parties shall do all in their power to guarantee and preserve to each other reciprocally

reciprocally the whole of the territories which they respectively possess. That, in case of menace or invasion from any foreign power, they shall assist each other with their whole force, if necessary;" and by the 6th article, it is further stipulated, "that if any foreign power whatever shall presume to interfere in the internal affairs of Poland, his Prussian majesty shall consider this as a case falling within the meaning of the alliance, and shall assist the republic according to the tenor of the 4th article," that is, with his whole force. Posterity will scarcely believe, or will believe with indignation after this, that on application to the court of Berlin, for the succours thus solemnly contracted for, the only answer they received, was—"That the treaty was dated previous to the new constitution, and that constitution establishing a new order of things, his Prussian majesty held himself absolved from his engagements." Of such value are treaties in the eyes of despotic princes! But what enhances the treachery, is this, that it is confidently asserted, that most of the obnoxious acts, of which the empress complains in her declaration against the Poles, were done by the influence and advice of Prussia; that the king of Prussia, when the constitution was proposed, never gave the smallest intimation that "the new order of things" would dissolve the alliance; and that so far from this being the case, our readers will find, that "on the 17th of May 1791, M. Goltz, chargé des affaires from the court of Berlin, formally announced his Prussian majesty's approbation of the new arrangement."

The great scene of action, in the beginning of the war, was the duchy of Lithuania; but the Russians had made little progress before the middle of the month of June. On the 10th of that month, general Judycki, who commanded a detachment of the Polish troops, between Mire and Swierzna, was attacked by the Russians; but, after a combat of some hours, he obliged them to retire with the loss of 500 men dead on the field; the general was desirous of profiting by this advantage, by pursuing the enemy, but was prevented by a most violent fall of rain. On the succeeding day, the Russians rallied again to the attack; and it then too fatally appeared, that the Poles were too young and undisciplined to contend with an inferior force against experienced troops and able generals. By a masterly manœuvre, the Russians contrived to surround their antagonists, at a moment when the Polish general supposed that he had obliged the enemy to retreat; and though the field was contested with the utmost valour by the troops of the republic, they were at length compelled to give way, and to retire towards Nielwiez.

Another engagement took place on the 14th near Lubar, on the banks of the river Sluez, between a detachment of the Russian grand army, and a party of the Polish cavalry, dispatched by prince Joseph Poniatowski, to intercept the enemy. The patriotic bravery of the Poles was victorious in this contest; but upon reconnoitring the force of the enemy, the prince found

himself incapable of making a successful stand against such superior numbers. He therefore gave orders to strike the camp at Lubar, and commenced a precipitate retreat. During their march, the Polish rear was harassed by a body of 4000 Russians, till arriving at Boruskowee, the wooden bridge unfortunately gave way, under the weight of the cavalry. The enemy, in the mean time, brought their artillery to play upon the rear of the fugitives, who lost upwards of 250 men. The Polish army next directed its course toward Zielime, where meeting, on the 17th, with a reinforcement from Zaslów, it halted to give battle to the enemy. The Russians were upwards of 17,000 strong, with twenty-four pieces of cannon, and the force of the republic much inferior. After a furious contest from seven in the morning till five in the afternoon, the Russians were at length obliged to retreat, and leave the field of battle in possession of the patriots. The Russians were computed to have lost 4000 men in this engagement, and the Poles about 1100.

The Poles, notwithstanding these exertions, were obliged gradually to retire before their numerous and disciplined enemies. Nielwez, Wilna, Minsk, and several other places of less consequence, fell into their hands one after another. On a truce being proposed to the Russian general Kochowski, the proposal was haughtily rejected; while the desertion of vice brigadier Rudnicki, and some others, who preferred dishonour to personal danger, proclaimed a tottering cause. The progress of the armies of Catharine was marked with devaluation and cruelty, while, such was the aversion of the people both to the cause and the manner of conducting it, that, as they approached, the country all around became a wilderness, and scarcely a human being was to be seen.

A series of little defeats happening in the mean time, to which the inexperience of the commanders, and the intemperate valour of new raised troops, appear to have greatly contributed, served at once to distress and to dispirit these defenders of their country. Prince Poniatowski continued to retreat, and on the 17th of July, his rear being attacked by a very superior force, it suffered a considerable loss, though the skill and courage of general Kosciuszko enabled him to make a most respectable defence. On the 18th, a general engagement took place between the two armies. The Russian line extended opposite Dubienka, along the river Bug, as far as Opalin. The principal column, consisting of 14,000 men, was chiefly directed against the division of general Kosciuszko, which consisted of 5000 men only. After a most vigorous resistance, in which the Russians lost upwards of 4000 men, and the troops of the republic only some hundreds, the latter was compelled to give way before the superior numbers of the enemy, and to retire further into the country. Thus was this unequal contest at length prematurely terminated.

haps, overpowered by his mental imbecility, and whose age and infirmities, probably, rendered him unequal to the difficulties and dangers which must attend a protracted war, instead of putting himself, according to his first resolve, at the head of his army, determined, at once, to surrender at discretion. On the 23d of July, he summoned a council of all the deputies at that moment in Warsaw. He laid before them the last dispatches from the empress, which insisted upon total and unreserved submission. He pointed out the danger of a dismemberment of the republic, should they delay to throw themselves upon the clemency of the empress, and, to entreat her protection. He mentioned the fatal union of Austria and Prussia with Russia; and the disgraceful supineness manifested by every other court in Europe. The combination formed by crowned heads against the rights and liberties of men, and the little spirit which was manifested for the maintenance of those sacred rights.

The intrepid and patriotic Malachowski, the princes Sapieha, Radzivil, and Soltan, were the four citizens who vehemently protested against these dastardly proceedings; and the following evening a company of gentlemen, from the different provinces, assembled for the same purpose. The assembly waited immediately on these four distinguished patriots, and returned them their acknowledgments for the spirit and firmness with which they had resisted the usurpations of despotism. The submission of the king to the designs of Russia was no sooner made known, than Poland was bereft of all her best and most respectable citizens. Malachowski, as marshal of the diet, and prince Sapieha, grand marshal of Lithuania, entered strong protests on the journals of the diet against these hostile proceedings, and declared solemnly that the diet legally assembled in 1788 was not dissolved.

A confederation was formed on the 2d of August, at Warsaw, of which the grand apostate, Potocki, was chosen marshal. The acts of this confederation were evidently the despotic dictates of Russia, and were calculated only to restore the ancient abuses, and to place the country under the aggravated oppression of a foreign yoke. By some succeeding transactions, it has appeared, that the unhappy country of Poland is to be converted into a province of Russia.

The king of Poland, deeply affected in being disappointed of carrying his beneficent views into execution, resolved, it is said, to retire from the supreme management of affairs; and even from the capital, where, in future he can experience nothing but mortification. He had determined, while a remnant of his army remained, to oppose with vigour the Russian forces; but his finances became so desperate, and his resources so precarious, that any further resistance must have been considered as the extreme of rashness and folly.—Some suspect that Holland had conspired with the other powers against this ill-fated monarch; as the expected loan from that country failed, which

would have prolonged the war another campaign. Thus deserted by his allies, disappointed in his hopes, and with an army reduced to 40,000 men, without magazines, and destitute of the means of continuing the war, an extraordinary council was convened. At this the prince primate assisted, and the council agreed, that as resistance was in vain, and as it would only augment the difficulties of the country, it was prudent to listen to the propositions of the empress, and that the king should accede to the counter-federation of Targowitz.

One of the stipulations made by the empress is, that Constantine Paulowitz, second son to the grand duke of Russia, shall succeed the present king of Poland.

Prince Constantine Paulowitz, was born on the 8th of May 1779; and his appointment will, no doubt, at any rate prevent the dread of a partition. The empress, after settling this affair, it is not impossible, may think of extending her territories more southward; and even her good friends and allies, Austria and Prussia, by their wavering actions, may one day be engaged in a war of her kindling.

The supineness of the king of Prussia, and his flagrant violation of his engagements, will not, however, in all probability, pass without a reward. Thorn and Dantzick, the possession of which he has long had in view, with some additional territory, will at least fall to his share in the partition. Austria too will scarcely be satisfied without a part; but to record the successful robberies of the imperial allies, will be the unpleasant duty of some future historian.

We cannot help remarking here, that at the very moment when Poland was surrendering its liberties to its despotic invaders, the generous sympathy of Great-Britain was evinced by a liberal subscription, supported by all the most respectable characters in the nation, of every party and of every sect, for the purpose of assisting the king and the republic to maintain their independence: and though the benevolent design was frustrated, the fact remains on record as a noble testimony of the spirit of Britons in the cause of freedom, of the indignation which fills every British heart at the commission of injustice, and of the liberality with which they are disposed to assist those who suffer from the oppression of tyrants.—Thus, in one instance, the concert of princes, as it is called, has proved fatally victorious over the cause of man. Thus the growing happiness of a respectable nation has been sacrificed to the personal ambition of three despotic sovereigns. Thus the citizens of a free republic are by one blow reduced to be the abject slaves of tyrants. Thus the balance of Europe, so much the theme of politicians, and perhaps so necessary to the permanent welfare of Europe, has been sacrificed to private and to selfish views, while those nations who have on former occasions devoted millions of lives, and expended countless sums in maintaining it, view with rigid tranquillity the fatal increase of despotic authority.

Be the real object of this combination what it may, it is such as no sound politician can observe with indifference. The precedent is fatal, the proceedings are ominous. If the object is ultimately the gratification of personal ambition in the parties concerned; if they have really, as some are disposed to believe, formed a secret agreement to divide among themselves, as suits their interest or their inclination, or as opportunity permits, the territory of Europe; if, as in the case of Poland, they may without a shadow of pretence, without a cause of complaint, without any legal claim or interest, invade and subjugate a country, merely because it is too weak to oppose them: then the citizens of free states have indeed cause to tremble; then the opulent part of every community have cause to fear for their possessions, since a respect for property never has been the creed of conquering despots: then the enlightened part of mankind may weep over the fate of their fellow-creatures; and every individual who would not wish to change the government under which he lives for the most tyrannical and oppressive, may have cause to imprecate the interposition of Providence, to put a stop to a system which threatens the subversion of all that is dear or valuable of temporal enjoyments.

The titles of the king are, king of Poland, great duke of Lithuania, duke of Russia, Prussia, Masovia,

Samogitia, Kiovia, Vollandia, Podolia, Podlachia, Livonia, Smolensko, Severia, and Czernichovia.

S W I T Z E R L A N D ;

AND THE COUNTRIES OF THE ALLIES OF THE SWITZERS.

Situation, Extent, Boundaries, Towns, Climate, Produce, Mountains, Inhabitants, Religion, Curiosities, Government, History, &c.

THIS country is situated between the 6th and 11th deg. east long. and between the 45th and 48th of north lat. being about 60 miles in length, and 100 in breadth. It is bounded, on the west, by France; on the south, by Italy; on the east, by the lake of Constance, Tirol, and Trent; and, on the north, by Alsace and Suabia, in Germany. The whole is divided into thirteen cantons; viz. Zurich, Berne, Lucerne, Uri, Schwytz, Unterwalden, Zug, Glaris, Basle, Fribourg, Soleure, Schaffhausen, Appenzel.

The following TABLE will give the dimensions and principal towns of each canton in Switzerland:

COUNTRIES NAMES.		Length.	Breadth	Sq. Miles.	CHIEF TOWNS.

Switzerland enjoys in general a healthy climate. The air, in winter, is exceedingly cold, both in the vallies and on the mountains; but during the summer it is delightfully cool in the latter, though sultry hot in the former. The inequality of the soil renders the same province very unequal in its seasons: sometimes the north side of a mountain will be clothed in all the horrors of winter, while the opposite is decked in the cheerful robes of summer: on one side of the mountains the inhabitants are often reaping, while they are sowing on another. The vallies are, however, warm, fruitful, and well-cultivated, and the summer months in this charming country are extremely delightful. The water is generally excellent.

The principal rivers are the Rhine, the Aar, the Ruis, the Inn, the Rhone, the Tesin, the Oglio, and the Lutschinen.

A very curious phenomenon presents itself to our observation with respect to the dangerous bridge over the last mentioned river Lutschinen, in the bailiage of Interlacken, and canton of Berne, in Switzerland. This river is formed by the junction of two streams: the one, called the Weiss Lutschinen, flowing through the valley of Lauterbrunnen; and the other called the Schwartz Lutschinen, which comes from the valley of Grindelwalde. Having left the fertile plains of Giffelg, and passed the village of Wilderfwyl, the breadth of the valley lessens, and continues to grow so narrow, that the stream of the Lutschinen can hardly force a passage. In the rainy season, the river forms a torrent, which rushes impetuously through the great masses of rock that obstruct its course, and, with inconceivable violence, forces from their beds the most enormous fragments. The road to Twey-Lutschinen and Lauterbrunnen is over this river, by a kind of

bridge, which, to a stranger to the country, exhibits a very terrific appearance. Suspended over a roaring torrent, and fixed against the sides of rocks that are almost in a leaning position, it exhibits the idea of a double danger. A huge vertical stone, raised in the middle of the river, supports some thick planks, so badly joined as to be neither steady nor solid; and these form a wretched insecure bridge, over which the country people daily pass, with a firm step and undaunted eye; a passage, which the traveller, unaccustomed to such strange communications, would tremble to attempt. From this place the river flows till it falls into the lake of Brientz.

The chief lakes are those of Geneva, Constance, Neufchatel, Biel, Brin, Thun, Zurich, Lucerne, and Brientz.

In the mountains are mines of iron, marble of various colours, crystal, spar, common gypsum, slate, sand-stones, chalk, mundic, terra sigillata, sulphur, salt-petre, rock-salt, and pit-coal.

The cattle and sheep in Switzerland are very numerous; and they have an exceeding good breed of horses. On the mountains are white and yellow foxes; hares, which turn white in winter; marmosets, and the Alpine mice, which are in reality a species of badger. Here are also the bouquetin and the chamois, whose activity in scouring along the steep and craggy rocks, and in leaping over the precipices, is hardly conceivable. The blood of both these animals is of so hot a nature, that the inhabitants of some of these mountains, who are much subject to pleurisy, take a few drops of it, mixed with water, as a remedy for that disorder: the flesh of the chamois is esteemed very delicious. Tame and wild fowl are very plentiful here; among the latter is a very large

The

kind of eagle; and the rivers and lakes are stored with fish. The mountains produce good timber and pasture; and in the vallies there are vast quantities of wheat, barley, oats, rye, spelt, flax, and hemp; also apples, pears, nuts, cherries, plums, and chestnuts; the parts towards Italy abound in peaches, almonds, figs, citrons, pomegranates, and grapes; in other parts, saffron is cultivated with good success. In a word, Switzerland produces sufficient for the subsistence of its inhabitants; and in order to provide against the scarcity which would be felt, if, from the sudden rains and tempests, to which the country is subject, or any other cause, the crops should fail, public granaries, well supplied with corn, are established in various places.

The mountains in Switzerland are many and stupendous: they not only divide almost every canton from each other, but the whole country is separated from Italy by a long chain of them, called the Alps, which must be crossed in order to pass from one place to the other; and accordingly there are four beaten roads over them, which in many parts will allow of no other method of travelling than on horses, asses, or mules. The feet of the mountains, and sometimes also the very summits, are covered with vineyards, corn-fields, meadows, and pasture-grounds. In winter, prodigious masses of ice and snow fall from these mountains, which is generally attended with considerable damage to the inhabitants.

There are several mineral waters and baths in this country; but the most excellent baths are those at Baden, which, Tacitus observes, were known even in the time of our Saviour: they are used for drinking as well as bathing, and are recommended for the cure of several disorders: the town of Baden owes its riches and grandeur to this bath, which is much resorted to by the gentry, from all parts of Switzerland.

At the distance of two leagues north from the town of Le Valais are the celebrated baths of Leuk, situated at the foot of Mount Gemmi, in a narrow profound vale, closed in on all sides by high mountains, leaving only a small entrance through a wood to the south. In the vale are five springs of warm mineral water, which are conveyed to divers baths in convenient houses for the use of the sick.

These baths are greatly frequented in summer: the water is clear, and without any colour; yet some of the springs are so hot, that they will boil an egg, or scald the feathers from a fowl. From the pretty village containing these baths, there is a way to pass to the canton of Berne, by ascending mount Gemmi; but it is uncommonly steep, and the declivity remarkably rugged: in short, if it had not been for facilitating the access to the baths for the inhabitants of Berne, no mortal could have thought of making this mount passable. The deep sighs that are occasioned by the fatigue of ascending it, has given its name to this rocky mountain. Little serpentine narrow roads, cut into the rock, in some

places defended by walls, in others by beams fastened cross-ways, to keep passengers from falling over, render travelling this way very dangerous, and impracticable for those who are subject to giddiness, or bleeding at the nose; who, upon fainting, would be liable to fall down a steep craggy road at the peril of life. An engineer measured the ascent of this mount, and found it to be one million and ten feet.

The thirteen cantons of Switzerland, according to the best computation, are supposed to contain about two millions of inhabitants. The men are generally tall, robust, well made, with bad complexions, owing chiefly to their laborious way of life, which exposes them to tempestuous and stormy weather. The women are usually handsome, well-shaped, sensible, and modest, yet frank and easy in their conversation and behaviour. They are a brave, honest, hospitable, industrious, hardy people; very friendly and humane, and always steadfast to their engagements. The gentry are much improved of late years, both in their conversation and behaviour; but they are generally haughty, and value themselves very highly on their privileges as citizens, or sharers in the government; and disdain the profession of trade and manufactures, for it is very difficult for a man to render himself of any consequence among them, either as an adept in his profession, or by possessing a superior genius. The merchants have great privileges, and many of them are very rich. The peasants, equally inured to arms and agriculture, are brave and laborious, making at once excellent soldiers and husbandmen. The state of matrimony is held in the highest esteem among the Switzers, and several privileges belong to such as enter into it. The women are generally very fruitful, and their country being but narrow, parents are obliged to send their sons to seek a support in foreign climates, and as they are usually of a martial spirit, and accustomed to arms from their youth, they most commonly enter into foreign service; those of the Popish cantons into the French and Spanish, and those of the Protestant into the pay of the States General, and of the Protestant princes in Germany. They are so tenacious of their rights and privileges, that they discourage foreigners from settling among them, which is a great detriment to the arts and manufactures. Sumptuary laws are in force in some parts, by which superb clothes, and ornaments of lace, gold, silver, and jewels, are prohibited both sexes; but, of late years, they have made some alterations in the ancient simplicity of their dress, in which they now conform more to the French taste: most of the men wear their own hair, and whippers. Their diversions are of the warlike and active kind, of which hunting seems to be that they most delight in. As to plays, gaming, and even balls, except at weddings, the magistrates of most of the cantons have thought proper to impose fines upon them, as tending towards an introduction of extravagance and luxury into the country.

The Switzers are in general a very enlightened nation;

tion; their common people are far more intelligent than the farie rank of men in most other countries; a taste for literature is very prevalent among those who are in better circumstances, and even amongst many of the lower rank; and a genuine and fruitful good-breeding is extremely conspicuous in the Swiss gentry. On the first entrance into this country, a traveller cannot but observe the air of content and satisfaction which appears in the countenances of the inhabitants: a general simplicity of manners, an open and unaffected frankness, joined with an invincible spirit of freedom, are their distinguished characteristics. With respect to domestic oeconomy, the cleanliness of the houses and of the people is peculiarly striking; in short, in all their manners, behaviour, and dress, some strong outlines may be traced which distinguish this happy people from the neighbouring nations, who labour under the oppressions of despotic government.

The two established religions in Switzerland are Calvinism and Popery, which differences formerly occasioned great commotions, but at present they are entirely subsided. Protestantism was introduced into this country by Zuing, or Zuinglius, and is professed in the cantons of Zurich and Berne, the towns of St. Gall, Geneva, Mulhausen, and Biel, the principality of Neuchatel, the greater part of Basil, Schaffhausen, the country of the Grisons, the Thurgau, Toggenburg, Glaris, and the Rhine valley, the frontiers of Appenzel, with a small part of Solothurn, and some places in the countries of Baden and Sargans. All the other parts of Switzerland profess the tenets of the church of Rome.

Several languages are spoken in Switzerland, but the most common is the German, and in that all public affairs are transacted. In the cantons bordering on Italy, the inhabitants speak a corrupted Latin, or Italian.

The Swiss are not celebrated for their extensive learning or deep erudition, though there are among them many learned men, but their knowledge is generally confined to divinity and law. Rousseau, whose works have been much admired in the present age, and who gave a surprising force to the French language, was a native of Geneva, where the laws instituted by Calvin for that city are held in high esteem. M. Bonnet, and Mess. de Saussure and de Luc will also be mentioned with applause to the latest posterity. Some Switzers have also distinguished themselves in the fine arts, particularly painting and engraving.

The only university in Switzerland, is that of Basil; it was founded in 1459, and has a curious physic-garden, well stocked with choice exotics. The library and museum belonging to it are very noble, and contain some valuable manuscripts, with an excellent collection of medals and paintings. In the cabinets of Erasmus and Amerbach, which also belong to this university, there are no less than 20 original pieces of Holbein; for one of which, representing a dead Christ, 1000 ducats have been offered. The colleges are those of

Zurich, Bern, Lausanne, and Geneva; besides which, there are gymnasiums, and scholæ illustres, in most of the cantons: they have also some societies for the improvement of the German language, and the sciences.

The natural curiosities of Switzerland are very numerous, but none are more deserving of notice than the glaciers, or ice-vallies, which, notwithstanding this appellation, are situated a considerable height above the contiguous rivers and lakes. The ascent to them is very steep, craggy, and slippery. These vallies are only frequented in July and August, when the ice is found to be eight feet thick, and in some places of such a height, that it seems to have been accumulating ever since the creation. There are also several wonderful hermitages in Switzerland; especially one, about two leagues from Fribourg, among woods and rocks, which conspire to form a most beautiful solitude. It consists of a chapel, oratory, steeple, hall, refectory, kitchen, rooms, stairs, cellar, well, and other conveniences, all hewn out of a rock, even to the chimney and steeple, though the latter is fifty-four feet in height. The astonishment, which this of itself may excite, will not be a little increased, when it is known to have been the labour only of a single man and a boy. Nature had indeed provided a fine spring, but the industrious architect had hewn little channels for bringing the water of the rock into small cisterns; and of earth brought from other places, he made a small kitchen-garden.— This edifice it is impossible to view without pleasure, but likewise a mixture of concern for the fate of its owner, a man of such contrivance and industry: in the year 1708, in carrying back some young people who came to visit him on the consecration of his chapel, he was drowned in the river Sane, running by the hermitage, on which river he used once a week to fetch necessaries from the town in a little boat.

At Lauffen, on the north-east part of the canton of Zurich, is a wonderful cataract of the Rhine, which falls from a height of between 40 and 50 cubits, with a noise that, in a calm night, may be heard at the distance of two leagues. And in the bailiwick of Interlaken and canton of Bern, in Switzerland, is Lauterbrunnen, a village, or rather collection of cottages, sprinkled, like those of Grindelwald, about the valley and accessible parts of the hills. Near the clergyman's house is the celebrated cataract of Staubbach, to view which is almost the only motive that induces a great number of travellers, every summer, to visit the valley of Lauterbrunnen. "This torrent," says Mr. Coxe, "rolls perpendicularly from so considerable a height, as to resolve itself into a fine spray; the greatest part of it falls clear of the overhanging mountain, during its whole descent: but the remainder dashes about half way against a projection from the rock, and flies off with great violence. The clergyman measured, a short time ago, its perpendicular height, and found it nine hundred and thirty feet. The sun shining in an opposite direction, a miniature rainbow was reflected toward the bottom of the fall: while

I stood

I stood at some distance, the rainbow assumed a semi-circular figure; as I approached, the extreme points gradually coincided, and formed a complete circle of the most lively and brilliant colours. In order to have a still finer view, I ventured nearer and nearer; the circle at the same time becoming smaller and smaller; and as I stood quite under the fall, it suddenly disappeared. When I looked up to the torrent, in this situation, it resembled a cloud of dust: and from this circumstance indeed it takes its name; Staubbach signifying, in the German language, a spring of dust. I paid for my curiosity, by being extremely wet; but then I had the satisfaction, at the same time, of seeing a rainbow in miniature: no uncommon phenomenon, as it may be observed in any cascade, upon which the sun shines directly in a certain position. In the present instance, however, it was some consolation to me, that the object happened to be peculiarly striking."

The engraved view exhibits the profile of this magnificent cascade. With such impetuous violence the torrent rushes down a precipice upward of nine hundred feet high, that its waters, in a manner, leave near two thirds of the rock dry, and do not reach, but at this distance, the lower projecting rocks which it covers with froth, rushing with a roaring noise into the basin below; accompanied by a tempest, occasioned by the violent agitation of the air, excited by the rapidity of this fall. The circular hillock, near the rainbow, at the foot of the rock, from the top of which we may contemplate this beautiful phenomenon, forms one of the sides of the reservoir. Above the great torrent, is seen another smaller fall, floating in the air, at the pleasure of the winds. This brook is named the Kupferbacklein, or Rivulet of Copper. The side of the rock, beyond that of Staubbach, is called Schneppf. At the extremity of it, which is almost perpendicular, a mass of rock overhangs, and from which rushes a considerable brook. On the opposite part of the landscape, is seen, at the extremity of the mount of the Virgin, an insulated conical point, called the Monk, from its exact resemblance to a monk's hood. In the distance appear mountains of snow and glaciers.

Among the other natural curiosities of this country may be reckoned two wells, one of which ebbs and flows once a day; and another which flows three months, and is dry the other three; and also the margarites, false diamonds, which are pieces of the purest crystal, and other stones, found in the mountains.

The most considerable city, and the capital of Switzerland, is Berne, standing on the river Aar. The houses are mostly built of white free stone, with piazzas, for sheltering the passengers from rain. This city and canton, it is said, forms almost a third of the Helvetic confederacy, and can, upon occasion, fit out 100,000 armed men.

Lausanne, capital of the Pais de Vaud, consists of steep ascents and descents; at the east side is a pleasant walk, with a beautiful view of the city, and of the

country round, which is a delightful variety of hills, vallies, corn-fields, meadows, vineyards, and woods. The great church, said to have been 200 years in building, is a noble Gothic structure.

Basil is the largest town in Switzerland, having 220 streets; and six market-places, or squares. It is situated in a fertile and delightful country, on the banks of the Rhine, and the confines of Alsace and the empire; the Rhine divides it into the Upper and Lower Town. The town-house, which stands on the river Birsac, is supported by very large pillars, and its large hall is finely painted by the celebrated Hans Holbein, who was a native of Basil, which is considered as one of the keys of Switzerland.

Zurich is far less considerable than Berne. The streets are neat, and houses well built, but not magnificent. In the arsenal is shewn the bow of the famous William Tell, with the cross-bow from which he struck the apple from his child's head; and in the library is a manuscript of excellent letters written by the unfortunate lady Jane Gray to the judicious reformer Bullinger, in elegant Latin and German. This town is fortified in the modern way, and has wide ditches faced with free-stone. The sumptuary laws are observed here.

Baden is an ancient town, situated on the Limmat; it is famous for its hot-baths: here are several churches and convents, and a council-house.

Geneva, though an associate of Switzerland, and under the protection of the Helvetic body, is an independent state and republic. It is a large, handsome, well-fortified place, containing 24,000 inhabitants, chiefly Calvinists; and is situated partly on an island in the Rhone, and partly on the banks on each side. The trade of this place is very considerable, it being a great thoroughfare from Germany, France, and Italy; and has a variety of manufactures and arts, particularly in the watch-making branch. Here are six churches, a guildhall, and an arsenal. This city (or rather its magistrates and council, the partisans of aristocracy) has been under the protection of France; in consequence of which, many of its valuable inhabitants left the place, and sought refuge and protection in Ireland, and other countries, which they have enriched with their useful manufactures.

For the entertainment as well as information of our readers, we shall here insert an account of the smallest republic in Europe. It is the village of Gersau, which is situated on the eastern branch of the lake of Schweiz, at the foot of Mount Rigi. Its territory is only six miles in length, and three in breadth; situated partly on a small neck of land at the edge of the lake, and partly lying upon the rapid declivity of the Rigi. It contains about 1200 inhabitants. They have their general assembly of burgeses, their landman, their council of regency, their courts of justice, and their militia; but there is not a single horse in the whole territory of the republic, as indeed may well be supposed; for the only way of arriving at the town is by

They have their their landaaman, their is of justice, and their gle horse in the whole eed may well be sup- aving at the town is by water,

water, excepting a narrow path down the steep sides of the mountain, which is almost impassable. Gerisau is composed entirely of scattered houses and cottages, of a very neat and picturesque appearance. Each dwelling is provided with a field or small garden. The inhabitants are much employed in preparing silk for the manufactures of Balle. This little republic is under the protection of the four cantons of Lucerne, Uri, Schwitz, and Unterwalden; and, in case of war, furnishes its quota of men. To the ambitious politician, who judges of government by extent of dominion and power, such a diminutive republic, thrown into an obscure corner, and scarcely known out of its own contracted territory, must appear unworthy of notice; but the smallest spot of earth on which true civil freedom is cultivated and flourishes, cannot fail to interest those who know the real value of liberty and independence, and are convinced that political happiness does not consist in great opulence and extensive empire.

With respect to manufactures, the principal are sunff and tobacco, linen of several sorts, lace, thread, silk and worsted stockings, neckcloths, cotton stuffs, gloves, handkerchiefs, silks of several sorts, gold and silver brocades, a variety of woollen manufactures, hats, paper, leather of all sorts, earthen wares, porcelain, toys, watches, clocks, and other hardwares, &c. The trade of Switzerland is greatly promoted by many navigable lakes and rivers. In some of the above manufactures, and in cheese, butter, sheep, horses, black cattle, hides, and skins, the exports are considerable; and as the imports are chiefly grain and salt, with some American and Asiatic goods, there is probably a large balance in their favour.

Before we give an account of the government and constitution of Switzerland, it may not be amiss to observe in general, that there is no part of Europe which contains, within the same extent of territory, so many independent commonwealths, and such a variety of different governments, as are collected together in this remarkable and delightful country; and yet with such wisdom was the Helvetic union composed, and so little have the Swifs, of late years, been actuated by the spirit of conquest, that, since the firm and complete establishment of their general confederacy, they have scarcely ever had occasion to employ their arms against a foreign enemy; and have had no hostile commotions among themselves that were not soon happily terminated: and, indeed, there is no country in which happiness and content more universally prevail among the people; for, whether the government be aristocratical, democratical, or mixed, a general spirit of liberty pervades and actuates the federal constitutions; so that even the oligarchical states, which are usually the most tyrannical, are here peculiarly mild; and the property of the subject is securely guarded against every kind of violation. A harmony is maintained by the concurrence of their mutual felicity; and their sumptuary laws, and equal division of their fortunes among their children, seem to ensure its con-

tinuance. But, to be more particular respecting the nature of the Swifs constitution:

In some of the cantons the government is aristocratical, and in others democratical. The former are those of Zurich, Berne, Lucerne, Basle, Friburg, Solothurn, and Schaffhausen; the other six are democratical. In the first, both the legislative and executive power is lodged in the burghers, or citizens of the capital of each canton; and in the latter the legislative power is lodged in the whole body of the people; and every male, above sixteen, whether master or servant, has a vote in making laws, and in the choice of magistrates.

The thirteen cantons are in fact so many independent states, only united by strict alliances for their mutual defence. This confederacy, considered as a republic, comprehends three divisions: first, the Switzers, properly so called; secondly, the Grisons, or the states confederated with the Switzers for their common protection; and, thirdly, those prefectures, which, though subject to the other two, by purchase or otherwise, preserve each its own particular magistrates.

In Switzerland, there are two kind of diets held; general and partial. The general diet, which represents the whole Helvetic body, usually sits at Baden, and consists of two deputies from each canton; besides which, the abbot of St. Gall, and the cities of St. Gall and of Bienne, send deputies as allies. When any controversy arises that may affect the whole confederacy, it is referred to the general diet, where each canton having a vote, every question is decided by the majority. The general diet assembles annually on the feast of St. John the Baptist, and seldom sits longer than a month. The partial or extraordinary diets are summoned according to the will of the respective states which constitute them.

The revenues of the different cantons cannot easily be ascertained, but it is supposed that those of Berne, which is the largest, amount to 300,000 crowns; those of Zurich to 150,000; and those of the other cantons in proportion to their produce and manufactures. Whatever remains, after the necessary expences of government are defrayed, is laid up in the treasury. The Swiffes are said to be possessed of 500,000l. sterling in the English funds, besides monies in other banks. Their revenues arise chiefly from the profits of the demesne lands; the tenth of the produce of all the lands in the country, the customs and duties on merchandize, some casual taxes, and the sale of salt; but this last article forms by far the most considerable part.

The Switzers maintain but few regular troops, and those are employed in the garrisons. Their internal strength (independent of the militia, which is esteemed the best in Europe) consists of 13,400 men, raised according to the population and abilities of each canton. Every burgher, peasant, and subject, is obliged to learn the use of arms, appear on the days appointed for shooting at a mark, furnish himself with proper clothing,

accoutrements, powder, and ball; and to be always ready for the defence of his country. The Swiss engage in the service of foreign princes or states, either as guards or in marching regiments. Such powers as are in alliance with the cantons, are, on paying them an annual subsidy, allowed to make levies there, when the inhabitants may enlist with their own consent, and with the concurrence of the magistracy, for what number of years they please; at the expiration of which they are always at liberty to return home. Thus the service of foreign princes forms a school for the young recruits of Switzerland, where, having perfectly learnt the art of war, they return to their native country able and experienced officers and soldiers, or die nobly in endeavouring to obtain those characters in the service.

The coins of Germany, France, and Italy, pass current in Switzerland, there being none peculiar to the country.

THE HISTORY OF SWITZERLAND.

THE Switzers and Grisons are the descendants of the ancient Helvetii, and were reduced under the Roman yoke by Julius Cæsar, who added their country to the province of Gaul. They continued under the Roman government till the time of Honorius and Valentinian II. when their country was conquered by the Burgundians and Germans; but their government was little more than nominal. About the year 635, part of Switzerland was given to Sigebert, count of Hapsburg, the founder of the house of Austria; and, in the year 1032, the rest of this country was given by Rodolph, the last king of Burgundy, to Conrad II. emperor of Germany, and, from that period, Switzerland was considered as part of that empire. This government continued about 300 years, during which period the Austrian governors exercised almost every species of oppression.

Wearied with continual acts of injustice, the Switzers applied to Albert I. for redress; but this petition was so far from procuring the removal of their grievances, that their hardships were increased. Gessler, the Austrian governor, exasperated at their laying their complaints before the emperor, exerted the most wanton tyranny. He even placed a hat upon the top of a pole, commanding the Switzers to pay the same respect to that mock representation of authority, as to himself. William Tell, a native of Berne, and one of the best marksmen of the age, beheld this instance of Gessler's malice with contempt; he paid no regard to the Austrian's ridiculous commands, and frequently passed the spot without taking the least notice of the hat. Exasperated at the disobedience of Tell, the tyrant condemned him to suffer death, unless he cleft an apple placed on his own son's head, who stood at a certain distance, with an arrow. Tell performed the task with amazing dexterity; and Gessler observing another arrow stuck in his belt, told him, he imagined a single arrow was all he could want on this occasion. Tell

nobly replied, "That arrow was intended to have pierced your heart, had the first unfortunately killed my son." Provoked at this reply, Gessler sent Tell to prison; but the Swiss escaping from his confinement, watched an opportunity, and shot the governor. It appears, however, that a plan had been for some time concerted by the principal persons of this distressed country, for the recovery of their liberty; and this action of Tell hastened its execution. They defeated the forces of Austria and France, an union of the cantons was formed, and they defended the liberty they had obtained with so much valour and intrepidity, that by the treaty of Munster, often called the treaty of Westphalia, concluded in 1648, their confederacy was declared to be a free and independent state.

Their union was effected in the following manner: Zurich, driven by oppression, sought first an alliance with Lucerne, Uri, Suisse, and Underwald, on the principles of mutual defence; and the frequent successes of their arms against Albert, duke of Austria, insensibly formed the grand Helvetic union. They first conquered Glaris and Zug, and admitted them to an equal participation of their rights. Berne united itself in 1353; Friburg and Soleure 130 years after; Basle and Schaffhausen in 1501; and, in 1513, Appenzel completed the confederacy, which repeatedly defeated the united powers of France and Germany; till, at the treaty of Westphalia in 1648, their mutual alliance was acknowledged as a free and independent state.

Since the year 1707, Neuchâtel hath been subject to Prussia, but the inhabitants are nevertheless free to serve any prince whatever, and not compellable to take an active part in his wars. The king may recruit among them, and name a governor; but he derives from them a revenue of only 5000l. yearly, great part of which is expended on the roads and other public works.

THIS kingdom, including Portugal, was anciently called Iberia, from the river Iberus; and Hesperia, from its situation, being the most western part of the continent of Europe. It lies between the 36th and 44th deg. of north lat. and between the 3d of east and 10th deg. of west long. Its greatest length, from east to west, is about 700 miles; and its greatest breadth, from north to south, about 480; being bounded by the Mediterranean on the east; by Portugal and the Atlantic Ocean on the west; by the Bay of Biscay and the Pyrenean-Hills on the north; and by the Straights of Gibraltar on the south.

Spain is now thrown into fourteen grand divisions, besides the islands belonging to it.

SPANISH ISLANDS, E.

Majorca, ch. town Majorca; Minorca, ch. town Citadella, Port Mahon; Yvica, ch. town Yvica.

The climate and air of Spain vary greatly in different parts. In the south, the heat is excessive during the months of June, July, and August, and would be almost insupportable, were it not for the cool breezes which blow off the mountains, but the remainder of the year is delightful and temperate. In the north, and near the sea-coast, the air in summer is much less sultry, and in winter very cold. If the natural luxury of the soil in Spain was seconded by the industry of her inhabitants, it would be the most fruitful country in Europe. In many places it produces fruit almost spontaneously, and formerly vast quantities of corn grew there, but at present there is a great scarcity of it, entirely owing to the want of tillage, and not, as some have asserted, to the barrenness of the soil: for, excepting some sandy deserts in the south, and the mountains in the north, it is exceeding rich, particularly in the plains and valleys; and were it not for the generous qualities of the soil, the vast number of inhabitants in this country, who neither toil nor spin for their food, could never be maintained.

The Spanish wheat is esteemed the finest in Europe; barley is produced there in great quantities, and very good: it is the common food for the horses and mules, oats and hay being very scarce in that kingdom, and there is not much flax or hemp. Besides the fruits which are produced in England, Spain yields citrons, lemons, oranges, almonds, raisins, prunes, olives, dates, figs, chestnuts, pomegranates, and capers. Valencia is famous for the growth of lemons; and in the kingdom of Arragon, the trees bear fruit three, and sometimes four times in a year. Grapes are cultivated in most parts with the greatest success, and produce some exceeding rich wines, among which are sack and sherry. Dr. Buschius says, that the inhabitants of Malaga, and the neighbouring country, export wines and raisins to the amount of 268,759l. sterling annually. Sugar-canes and saffron are cultivated in Granada; and the kingdom of Murcia abounds in mulberry-trees, for the sustenance of its silk-worms, which are said to produce 200,000l. worth of raw silk every year. The mountainous parts yield prodigious quantities of wild thyme, majoram, and other aromatic herbs, which renders the taste of their kids and sheep, that feed on them, of a most delicate flavour. Villa Franca produces the herb escuzonera, esteemed by the Spaniards an antidote against all sorts of poisons, and a certain cure in the plague; likewise the herb eustracia, which being soaked in warm wine, and the eyes washed with it, is very beneficial to the sight. Great quantities of the plant esparto are found on the rocky lands, of which they make ropes and other cordage; and upon the banks of the river Guadina, there grows a very extraordinary shrub called the laurel-rose, from the resemblance

 such a quality, that all animals die who happen to feed
 on them.

Spain is much infested with locusts: in 1754, La
 Mancha was covered with them, and the horrors of fam-
 ine attacked the fruitful provinces of Andalusia,
 Murcia, and Valencia. They have sometimes ap-
 peared in the air in such numbers as to darken the
 sky; the clear atmosphere of Spain has become gloomy,
 and the finest summer day of Estremadura has been
 rendered more dismal than the winter of Holland.
 Their sense of smelling is so delicate, that they can
 scent a corn-field or garden at a great distance, and
 which they will ravage almost in an instant. Mr. Dil-
 lon thinks that the country people, by destroying the
 eggs, might totally extirpate these formidable in-
 sects.

Andalusia is remarkable for a very fine breed of
 horses, esteemed the handfomest in Europe, and at the
 same time exceeding fleet and strong. The Spanish
 mules are very serviceable, and the asses of a prodigious
 size. The wild bulls of this kingdom have long
 been famous for their fierceness, and are chiefly bred
 in Andalusia. Chamois and other goats are found in
 Spain, as are stags, many species of deer, and vast
 quantities of game, but the only beasts of prey there
 are wolves. Here are great numbers of black cattle
 and sheep, the latter of which produce the finest wool
 in the world. The number of shepherds in Spain are
 computed to be about 40,000, who move regularly with
 their flocks every summer from south to north, along
 the mountains, which yield a great variety of sweet
 herbs and plants, and return again towards the winter.
 During this progress, large quantities of salt are dis-
 tributed among the sheep, and all possible care is taken
 both of their health and fleeces.

Most of the feathered race in Spain are birds of pas-
 sage, but two of them are worthy description, viz. the
 flamencoes, and the sea-cock. The first is about the
 size of a stork, but in its form seems a compound of
 the duck and the swan; the body is white, and the wings
 are spotted with a beautiful scarlet. The colour of the
 sea-cock is blue, or scarlet and blue, extremely brilli-
 ant, with scarlet crests and feet; they fly very slow, are
 good to eat, and, if taken young, may be brought up
 tame. The tame fowl are of various kinds, and very
 fine: and at Corga there is a particular breed of hens
 of a prodigious size.

Fish of all kinds, particularly anchovies, is very
 plenty in the seas; there are also great quantities in
 many of their lakes and rivers; and the port of Car-
 thagena, with some adjacent places, are noted for large
 shoals of herrings.

Many salutiferous springs are found in Granada, Se-
 ville, and Cordova. All the waters in Spain are pos-
 sessed of such healing qualities, that they are outdone
 by those of no country in Europe; and by enclosing and
 encouraging a resort to them, they grow every day more

and more in vogue, especially at Alhamar in Granada.
 The medicinal-waters of Spain are little known.

It would be almost impossible to particularize all the
 mountains in Spain, the whole country being inter-
 sected by them. The principal, and the highest, are
 the Pyrenees, near 200 miles in length, which extend
 from the Bay of Biscay to the Mediterranean, and di-
 vide Spain from France. The Aturian and Biscayan
 mountains are a considerable chain, which branch out
 from the Pyrenees, and, running westward, form the
 southern boundary of Biscay and Asturias. Near Gib-
 raltar is situated the famous mount Calpe, opposite to
 mount Abyla, in Africa: these two mounts were called
 Hercules' Pillars by the ancients. Among the moun-
 tains of Spain, Montserrat is particularly worthy the at-
 tention of the curious traveller, being one of the most
 singular in the world for situation, shape, and composi-
 tion. It stands in a vast plain, about 30 miles from
 Barcelona, and nearly in the centre of the principality
 of Catalonia. When this mountain is first seen at a
 distance, it has the appearance of an infinite number of
 rocks cut into conical forms, and built one upon
 another to a prodigious height, or like a pile of grotto-
 work, or Gothic spires. Upon a nearer view, each
 cove appears of itself a mountain, and the whole com-
 poses an enormous mass about 14 miles in circumfer-
 ence: the Spaniards compute it to be two leagues
 in height, but Mr. Swinburne estimates its height at
 only 3,300 feet. This wonderful mountain appears, at
 a distant view, to be the work of man; but on a nearer
 approach, the observer is convinced that it is the pro-
 duction of the God of nature.

The principal rivers in Spain are, the Ebro, the
 ancient Aberus; the Douro, formerly Durius; the
 Turo, formerly Guadalaviar; the Guadiana, formerly
 the Anas; the Tajo, the ancient Tagus; and the Bætis.
 Here is also the famous river Tinto, the qualities of
 which are very extraordinary: it rises in Sierra More-
 na, and has the name of Tinto given it from the tinge
 of its waters, which are as yellow as a topaz, harden-
 ing and putrifying the sand; in a most surprising man-
 ner. If a stone happens to fall in, and rests upon
 another, they both become in a year perfectly conglu-
 tinated and united. This river withers all the plants
 on its banks, as well as the roots of trees, which it
 dries of the same hue as the waters. No kind of ver-
 dure will spring up where it reaches, nor any fish live
 in its stream. It kills worms in cattle when given them
 to drink; but no animals will drink out of the river,
 excepting goats, whose flesh has nevertheless an ex-
 cellent flavour. These singular properties continue till
 other rivulets run into it, and alter its nature; for when
 it passes by Niebla, it is not different from other rivers,
 and falls into the Mediterranean sea, six leagues lower
 down, near Huelva.

The chief lakes are, 1. Bonaventa, which runs in
 the middle with such violence, that waves rise like those
 in the sea; it abounds with fish, particularly excellent

trout. 2. A lake on the top of the Pyrenees, of vast depth: it is asserted, that a stone slung into it, causes a prodigious vapour. 3. A lake near Antiquera, the waters of which are by the heat of the sun made into salt.

There are many bays belonging to this country, the chief of which are, Biscay, Ferrol, Corunna (commonly called the Groyne) Vigo, Cadiz, Gibraltar, Carthagena, Alicante, Altea, Valencia, Roses, Majorca, and Port Mahon in Minorca.

There were formerly mines of gold and silver in this kingdom, and the latter in such plenty, that Strabo observes, when the Carthaginians took possession of Spain, they found the domestic and agricultural utensils of that metal. There is no doubt, but that these mines are still in the country, but they have been entirely neglected since the Spaniards have been able to draw such immense quantities from America. Here are mines of lead, copper, and iron, the best of which is dug from the mountains of Biscay, and sent all over Europe, as exceeding any other in goodness. Here is also great plenty of sulphur, alum, calamine, vermilion, and quicksilver, of which they send large quantities to the West-Indies. Near the town of Cardona are mines of salt of various colours, which the inhabitants term fossil salt: it is dug out like stones, and grows very fast. At Antiquera, in the diocese of Malaga, are excellent salt-pits, and the water that runs from them is evaporated into salt, by the heat of the sun. Santa Maria, in the province of Andalusia, and Mengravia, are likewise famous for their mines of white salt. Many places in Spain are noted for beautiful marble, alabaster, granate, crystal, jasper, jet, agate, cornelian, and other stones.

The number of inhabitants in Spain has been computed, by one of their own writers, at 9,250,000. This kingdom was formerly one of the most populous in Europe, but has never recovered the blow given to it by the expulsion of the Moors, who, from motives of religion, were banished to the amount of 100,000. Other great causes of this depopulation are the great drains of people sent to America; the indolence of the natives, who do not provide food for their families; and the prodigious numbers of both sexes, who live in a state of religious celibacy; to which may likewise be added, the natural sterility of the women.

In their persons, the Spaniards are of a middle stature, rather lean, but well made, of an olive complexion, with black glossy hair, fine eyes, and expressive countenances. They have a natural gravity in their air, great coldness and reserve in their deportment, and are far from being communicative to strangers; but when once they are thoroughly acquainted, and have contracted an intimacy, they are conversible, social, and friendly. They have great probity and integrity of principle, and possess the highest notions of honour, even to excess, which is a still visible effect of their ancient love of chivalry, and was the animating spirit of

that enthusiasm. They persevere with great fidelity and zeal in their friendships; but are warm, vindictive, and implacable in their resentments. They are generous, liberal, magnificent, charitable, and religious; but their devotion too frequently degenerates into superstition.

The predominant foible of the people is pride, which at different periods has led them to form the wildest chimeras; such as, that the sun only rose and set in their dominions; that their language was the only one fit to address the Almighty in; that they were the peculiar favourites of heaven; and that wisdom, glory, power, riches, and dominion, were their sole monopoly. Though these lofty conceits are at present in some measure eradicated, it is owing to them that they are still possessed with the highest notions of nobility, family, and blood; for the mountaineer of Asturias, though a peasant, will plume himself as much upon his genealogy and descent, as the first grandee; and the Castilian, with his coat-armour, looks upon the Galician with sovereign contempt. This pride, however ridiculous in itself, is certainly productive of the most exalted qualities: for it inspires the possessors with generous, humane, and virtuous sentiments; and that a Spanish nobleman, gentleman, or trader, has been guilty of a mean action, is a thing seldom known. This, however, is not to be understood of the people that live on the coasts, who too often partake of all the bad qualities that are to be found in the refuse of other nations: for in these places there is an assemblage of French, Russians, Irish adventurers, and English smugglers, who being unable to live in their respective countries, mingle with the Spaniards, where they engage in all illicit practices, or enter into the Irish and Walloon guards in the Spanish service; and, during a war, many of them follow privateering with great success.

The Spaniards take great delight in the profession of arms, and to this darling passion, commerce, manufactures, and agriculture, have been always sacrificed. They bear all hardships with the most unremitting patience, and can endure heat, cold, and even hunger, with some degree of cheerfulness. They have courage and constancy for the most hazardous undertakings, and though naturally slow, yet, when once put in action, pursue their object with great warmth and perseverance; and as the inhabitants of several of the provinces, particularly Galicia, Granada, and Andalusia, have thrown aside their indolence, and employed themselves assiduously in agriculture and manufactures, it is to be hoped their example will be followed by all their countrymen; as industry is the only thing wanting to render Spain the most fruitful and opulent kingdom in Europe. The Spaniards have a natural turn for politics, study, and thoroughly understand the natural interests of their own country; and even the common peasants will sometimes make reflections on public transactions, which would have done honour to a senator.

some, but are more famed for their wit, vivacity, and politeness, than for their beauty. They are small and slender in their persons, on which they bestow a profusion of art, not only painting their faces, but likewise their necks, arms, and hands; and there is not a defect in nature, which they have not the secret of hiding, or at least of palliating; but these artifices thrive on their skin, and give them the appearance of old age long before they have attained it. The passion of jealousy, for which the men of this nation were formerly so remarkable, seems to be totally eradicated, or at least confined to very narrow bounds; for every married lady has her professed lover, who attends her with impunity.

The Spaniards formerly wore black cloaks, short jerkins, straight breeches, long Toledo swords, and mustachoes; but this dress is now chiefly confined to the lower ranks, that of the French court being introduced among the nobility, &c. They are very able-minded in eating and drinking; and their breakfast, which is usually chocolate, they frequently take in bed. Their dinners generally consist of beef, mutton, veal, pork, bacon, greens, &c. all boiled together; and they are very fond of garlic, chives, salads, and radishes. The men drink very little wine, and the women use water, or chocolate. They always take their siesta, or afternoon's sleep.

A ruling passion in this nation is gallantry, and they omit no expence in the gratification of it. A lover will frequently pass the night under the windows of his mistress, serenading her with the finest music in Spain; and to this passion may be attributed the amazing courage and agility which they exhibit at their bull-fights, where the ladies are always present, and by their looks animate their admirers to the most desperate acts of valour. This diversion, which is of Moorish original, is attended with infinite danger to the cavalier, who always attacks the bull on horseback, with a lance, and endeavours to subdue him; but if the animal defends himself so long that the spectators are tired, they bait him with dogs, and ham-string him. The dexterity with which the combatants manage their horses and arms is incredible, keeping sometimes a whole hour within a foot of the beast, without being touched; but if the bull insults him, by forcing his lance out of his hand, throwing off his hat, wounding his horse, or any of the company, he is obliged, by the rules of honour, to wound the beast in return, or die in the attempt, which is too often the case; for if his horse, terrified at the bull, refuses to advance, he must quit him, and engage on foot, in which situation he is still more exposed to the fury of the animal. If he is happy enough to come off conqueror, he receives the loudest acclamations of applause, and sometimes a reward from the hands of his favourite lady. The bulls used on these occasions are the wild ones, already mentioned to be bred in Andalusia, and kept for some time in stables, and fed for this purpose.

A very favourite diversion in Spain is dancing, from which even old age is not exempted; for it is no uncommon thing to see the grandmother, mother, and daughter, join in the same dance; but the continual round is commonly made in the morning, dinner at noon, and an airing in the evening. When they take these airings on gala or court days, all their attendants are dressed in laced liveries, with plumes of feathers in their hats. The number of servants kept by the grandees and persons of the first fashion in Spain, almost exceed credibility, for it is asserted, that they sometimes amount to four hundred. The theatrical diversions of this kingdom are very poor and insipid. The prompter is placed underneath the stage, with his head peeping through a trap-door, and he always performs his office loud enough to be heard by the audience. Their tragedies are for the most part ridiculous bombast, and the comedies are a jumble of religion and buffoonery, mingled together in a most whimsical and inconsistent manner.

It is pretended by the Spaniards, that Christianity was introduced into their country by St. James the apostle, four years after the death of our Saviour; and that St. Paul preached there in person. Admitting these assertions to be true, they have been so much the longer degenerating from the tenet delivered to them by those great pillars of the primitive church; and at this time, the religion is that of Rome, attended with all the horror of an inquisition, and clothed in its grossest errors, though these are now greatly lessened, by moderating the penalty of the inquisition, a tribunal disgraceful to human nature, but which is still in force against the Moorish and Jewish converts: the burning zeal, however, which distinguished their blood-thirsty ancestors above the rest of the Catholic world, hath lost much of its activity, and seems nearly extinguished; the power of the clergy having been much reduced of late years, and no sentence of the inquisition can be carried into execution without the royal authority. It is computed, that there are now, in the kingdom of Spain, 54,000 friars, 34,000 nuns, and 20,000 secular clergy, but as to real devotion and morality, they are no where less found than in Spain; ridiculous pomp and farcical parade having been long since substituted in its place. The churches are magnificently decorated, and, though the rest of the nation is poor, the clergy are immensely rich. Their avarice, which is insatiable, is gratified by every indulgence that could be granted them; their estates are exempt from all public burdens, and their commerce, which is very considerable, is free from all duties and imposts.

Before we conclude this article, respecting the people of Spain, it may be proper to take notice of an agreeable piece of intelligence received in Nov. 1793, from one of their settlements in the West-Indies; which is thus expressed:

"The following regulations have been recently adopted by the Spaniards at the Havannah, and

other

other places, for the gradual enfranchisement of slaves.

"As soon as the slave is landed, his name, age, price, &c. are inserted in a public register; and the master is obliged by law to allow him one working-day in every week to himself, besides Sunday; so that if the slave chooses to work for his master on that day, he receives the wages of a freeman for it; and whatever he gains by his labour on that day is so secured to him by law, that the master cannot deprive him of it.

"When the slave is able to purchase another working-day, the master is obliged to sell it to him at a proportionable price, namely, one fifth part of his original cost, and so likewise the remaining four days at the same rate, when the black is able to redeem them; after which he is to be absolutely free."

There are eight archbishoprics in Spain, viz. Toledo, Burgos, Compostella, Granada, Seville, Saragossa, Tarragona, and Valencia. Toledo has eight suffragan bishops; Burgos, four; Compostella, fourteen; Granada, two; Seville, two, and the Canary islands; Saragossa, six; Tarragona, seven; and Valencia, two. The archbishop of Toledo is styled the primate of Spain, is great chancellor of Castile, and hath a revenue of 100,000l. sterling per ann. but the Spanish court has now lessened the revenues of the church, by taxing them with pensions, donations to hospitals, premiums to societies of agriculture, &c.

The language of the Spaniards, like that of the Italians, is a corruption of the Latin, to which it very nearly approaches; but it is mixed with Arabic words and terminations introduced by the Goths and Moors. In some provinces they use a dialect of the old French or Gascon; and in Biscay, the language is said to be a dialect of the Gothic or Celtic, and to have some analogy with the Welsh and Irish. The Spanish language, however, has nearly retained its purity for upwards of 200 years, and is at present most majestic and expressive: it has been observed, that foreigners, who understand it the least, prize it the most; though it makes but a poor figure even in the best translations. Its affinity to the Latin may be seen by the following specimen of the Lord's prayer: "Padre nuestro, que estás en el cielo, santificado se el tu nombre; venga a nos al tu reyna; hagese tu voluntad, assien la tierra como en el cielo; el pan nuestro de cada dia da nos le oy; y perdona nos nuestras deudas passi como nos otros perdonamos a nuestros deudores; no nos dexes cair en la tentacion, mas libra nos de mal, porque tao es, le reyno, y la potencia, y la gloria, per los siglos. Amen."

Bigotry and indolence have been very prejudicial to the Spaniards, not only in religion, but in the arts and sciences, and have greatly retarded their improvement in literature; for to these only can be attributed the few learned men so extensive a kingdom has produced; especially as the Spaniards in general are possessed of ex-

cellent natural capacities. Among the men of literature, natives of Spain, the following are the principal: Isidore, bishop of Seville, and cardinal Ximenes Calderoni and Lopez de Vega, dramatic writers. Herrera, and de Solis, historians and antiquarians. Tostatus a divine, whose works are exceeding voluminous, and have long been neglected; and that excellent satirist, Cervantes, who, by his Don Quixote, in a great degree, eradicated the ridiculous spirit of knight-errantry out of his country. The author of this moral and humorous satire was born at Madrid in 1549, listed in a station little superior to that of a common soldier, and died neglected, after fighting bravely for his country at the battle of Lepanto, in which he lost his left hand. The works of Quevedo, and the other works of that author, comprised in three vols. 4to. are well known in this country. As a poet, he excelled both in the serious and burlesque style, and was happy in a turn of humour similar to that which we admire in Butler and Swift: besides his merit as a poet, he was well versed in the oriental languages, and possessed great erudition. He was born at Madrid in the year 1570. The Saracens introduced oriental poetry into Spain at a very early period; and the Spanish Jews afterwards made a considerable figure in literature; particularly, in 967, Rabbi Moses, and Rabbi Enoch, his son; likewise Rabbi Ezekias, who was put to death at Babylon in 1039. To these Jews the Spaniards are indebted for a curious version of the Hebrew books of the Old Testament, printed at Ferrara, in 1553, in a Gothic Spanish letter. The marquis of Villena, who died in 1434, was the author of that famous work the *Arte de la Gaya Ciencia*, comprehending a system of poetry, rhimes, and oratory: he also translated Virgil's *Aeneid* into Spanish verse. Juan de Mena, Juan de la Encina, Boscan, Ercila, Villegas, and other Spanish poets, also obtained great reputation in their own country. But Lopezele Vega, contemporary with our Shakespear, was the most distinguished dramatic poet of this nation.

The palaces, particularly the Escorial, and other public buildings, do honour to the Spaniards as architects and sculptors. Murillo has distinguished himself by his paintings; and here are others that excel in the polite arts, whose names have not reached this part of Europe.

In Spain there are twenty-four universities, of which the chief is that of Salamanca, founded by Alphonus IX. king of Leon, in the year 1200. It contains twenty-one colleges, most of which are well endowed, and very magnificent, particularly the public schools. In Marineus's time this university was supposed to have 7000 students, and always maintained 75 professors, who have noble salaries. Most of the noblemen in Spain send their sons to be educated at this university. The other 23 are those of Seville, Granada, Compostella, Toledo, Valladolid, Alcalá, Sigüenza, Valencia,

The principal cities and towns, &c. in Spain are the
 following:

Madrid, the capital of this kingdom, is situated in
 the centre of a large plain, on the banks of the little

river Manzanares, surrounded with mountains, and in
 the heart of Spain. The streets are wide, straight, and

handsome; the houses in general are lofty, and built
 with brick; but the windows are of lattice, except

those of the nobility, which are of glass. The royal
 palace stands on an eminence, on the west side of the

city, it is a spacious magnificent structure, consisting
 of three courts, and commands a very fine prospect.

Besides this, there are several noble palaces. Madrid
 also contains a great number of churches, convents,

and hospitals: among the last is one open for pa-
 tients of all nations and distempers, supported by a

large revenue. Here are three royal academies, one
 for the improvement of the Spanish language, another

for history, and another for medicine. There are two
 stately bridges over the Manzanares; and round the

Plaza-mayor, or grand square, are piazzas, with houses
 all uniform, and a continued line of balconies, for

viewing the bull-fights and other public shews exhib-
 ited there. At the east end of the city is the Strado,

a delightful plain, planted with regular rows of poplar
 trees, and watered with a great many fountains; here

the nobility and gentry take the air on horseback, or in
 their coaches, and the common people on foot. The

compass of the whole city is computed at about nine
 miles; it is well supplied with provisions of all

kinds, at reasonable rates; and the court, with the re-
 sidence of the quality, and the high colleges and offices

that are kept here, occasion a brisk trade.

The environs are very pleasant, and contain several
 royal seats, among which, the most magnificent is the

Efcorial, which takes its name from a village in the
 neighbourhood, above 22 miles north-west from Ma-
 drid. It is a spacious structure, built of curious white

speckled stone, with ornaments of various sorts of mar-
 ble, jasper, &c. It is said to have about 11,000 win-
 dows, and contains, besides the royal apartments and

offices, a most splendid church, in which are forty
 chapels, and as many altars, exceedingly rich; a con-
 vent of Jeronites, a college, several hospitals or infir-
 maries, and a noble library, containing a large and

choice collection of books in all languages and facul-
 ties. Here is likewise the burial-place of the kings
 and queens of Spain, called the Pantheon. In short,
 the whole forms so amazing an edifice, that it re-
 sembles more a town than a palace. The apartments

are decorated with an astonishing variety of paintings,
 sculpture, tapestry, ornaments of gold and silver, mar-
 ble, jasper, gems, and other curious stones, surpassing
 all imagination. Aranjuez, which is situated on the

royal palace, which is greatly admired, particularly for
 its noble gardens and surpassing water-works.

Toledo is situated on the Tagus, about 36 miles
 south of Madrid. It is an ancient, large, and well-

fortified city. Here are many stately edifices, squares,
 convents, churches, and hospitals: the cathedral is a

noble structure, built of a beautiful white stone, en-
 riched with sculpture; the roof of it is supported by

eighty-eight stately columns, and it has eight large
 beautiful gates of brass, with above thirty chapels,

some of them large enough to pass for churches. The
 treasure of this cathedral is of inestimable value, and

the annual revenue of about one hundred thousand du-
 cats. The jurisdiction, power, and grandeur of this

see, is inferior only to that of Rome. Here is also an
 university, a royal palace, and a court of inquisition.

There are three noble bridges over the river; and with-
 out the walls, on the north-side, are still to be seen the

ruins of a Roman amphitheatre; and under the city is
 a large common-sewer, which is also said to be a Ro-

man work.

Seville is situated 200 miles south-west of Madrid,
 and 57 from the mouth of the river, in the Guadal-

quiver. This city contains a great number of con-
 vents, churches, squares, hospitals, a royal palace,

which is now going to decay, an exchange, a custom-
 house, an university, and a cathedral, the largest and

finest in all Spain, and is esteemed inferior to none ex-
 cept St. Peter's at Rome. On the top of the high

tower is the statue of a woman, which turns with the
 wind like a weather-cock; 500 masses are said every

day in this cathedral. The archbishop has a revenue
 of 100,000 ducats. Here is a bridge of boats over the

Guadalquiver, which is navigable for large vessels forty
 miles from its mouth; all along the river are a great

many commodious quays, near which is also a stately
 tower, called the Golden Tower, which entirely com-

mands the river, city, and suburbs. This city car-
 ries on a great trade, and has many manufactures, par-
 ticularly of silk and silver-stuffs, earthen-ware, soap,

and salt; but their commerce has been declining for
 some years past. Here is a mint, which can coin in

one day seven hundred marks, each containing eight
 ounces of gold or silver. The compass of the city walls

is eight miles, and the number of its inhabitants is
 computed at 300,000.

Placentia is situated on the banks of the little river
 Xerte, about seventy miles south-west from Madrid,
 and one hundred and twenty-fourth from Mexico. This

is a well-built handsome city, it is defended by strong
 walls, and a castle; there are three bridges over the

river Xerte; it is a bishop's see, and takes its name
 from the delightfulness of its situation, in the midst of

La Vera de Placentia, or the orchard of Placentia,
 which is diversified with beautiful seats, villages, gar-
 dens, and groves of the finest citron, lemon, orange,
 and fig-trees.

Salamanca stands on the river Tormes, about 75
 miles,

miles north-west from Madrid; it is an ancient, large, rich, and populous city. Here is an university, and many magnificent palaces, convents, colleges, chapels, churches, hospitals, and squares. A Roman way leads from hence to Merida and Seville; and there is an old Roman bridge over the river Tormes. The most beautiful part of this city is the great square, built about 40 years ago. In this square the bull-fights are exhibited for three days, in the month of June.

Cadiz, which is supposed to have been built by the Tyrians, stands on an island, and is joined to the main land by means of the bridge Suaco, which is defended at both ends by redoubts, and other works thrown up of earth. The island, from Fort St. Catalina to the island of St. Pedro, is five miles long, and from the south-point near the latter to the north point, just by the above-mentioned bridge, almost two miles broad. Most of the streets are narrow, crooked, indifferently paved, and dirty. The houses are in general four stories high, handsomely built, and have each a quadrangular area. This city is computed to contain about 5000 houses, one parish church, twelve convents, and a Jesuits college, supposed, at the time it was inhabited by that order, to be the finest in all Andalusia. The population is estimated at 140,000 inhabitants, of which 12,000 are French, and as many Italians. Here is the royal audience of the Indies, or the Indian board of trade, which was formerly held at Seville. The adjacent country is extremely rural and pleasant.

The harbour and bay of Cadiz are very fine and spacious: the entrance is defended by Fort Matagorda, and Fort Pontal, the latter of which is situated opposite to it, upon a point of the neck of land on which the city is built. The entrance into the harbour is about five hundred fathoms broad, and the harbour itself about ten leagues in circuit, but, at ebb tide, great part of it lies dry. The only safe landing-place is on the south-west side, which is defended by a small fort called St. Catalina. The number of foreigners in Cadiz are said to amount to 50,000, who reside there for the sake of trade, and its common inhabitants are computed at 40,000.

Barcelona is situated on the Mediterranean, between the rivers Llobregat and Besos, at the foot of the mountain Monjoiu, on which are several forts, commanding the town and harbour. The city itself is well fortified, the streets spacious, in which are 15,000 houses, besides churches, colleges, hospitals, fountains, gardens, convents, an university, an academy of arts and sciences, founded in 1752, a court of inquisition, and the court of royal audience for Catalonia. The cathedral is a large and magnificent edifice, and there are a number of antiquities about the town, which prove it to have been a considerable place in the time of the Romans, when it was called Faventia. This city was formerly the residence of several Gothic kings, and was afterwards subject for a long time to counts of its own. It carries on a considerable trade, and the

country around is very fertile and delightful. The number of inhabitants is supposed to be nearly 150,000.

Valencia, 180 miles south-east from Madrid, is situated on, and has five bridges over the Guadalquivir. It is a large, handsome, populous, trading city, and has a port within two miles of it. It is the see of an archbishop, whose income amounts to 40,000l. sterling a year, and contains a tribunal or inquisition, a sovereign court of judicature, an university, and a flourishing woollen manufactory. Priests, nuns, and friars, of every garb, swarm in this city, whose inhabitants are reckoned to be 80,000.

Carthagenia is a famed sea-port in the province of Murcia, in Spain, on the Mediterranean, at the mouth of the river Guadalentin near Cape Palos, and about one hundred and eighty miles south-west from Madrid. Its harbour is defended by forty pieces of cannon; being one of the finest ports in the Mediterranean, and one of the three royal marine departments; the other two are Cadiz and Ferrol. It is a city, and the see of a bishop, who is suffragan to the archbishop of Toledo, and has a revenue of twenty-four thousand ducats per annum.

Carthagenia is announced at a distance by villages, farms, country-houses, and several pleasant walks. This city remained in the possession of the descendants of Aldrubal till the year 208 before Christ; when it was conquered by Publius Scipio and Caius Lælius. It was at that time governed by Nago, the last Carthaginian chief. Livy informs us, that, at the arrival of Scipio in Spain, Carthagenia was, after Rome, one of the richest cities in the world, and full of arms and soldiers. But, notwithstanding all its resources, Scipio took it, and delivered it up to pillage. He carried away with him sixty-four military banners, two hundred and seventy-six golden cups, and eighteen thousand three hundred marks of silver, besides vessels of the same metal; forty thousand measures of wheat, and an hundred and sixty thousand measures of oats. In a word, he acquired there such immense riches, that, the historian says, the city itself was the least thing the Romans gained by the expedition.

After this conquest Scipio set the great example of chastity and generosity, so much celebrated in that and the present age. We learn from history, that some soldiers brought him a young female captive of noble extraction, whose beauty attracted the eyes and admiration of the whole camp. Scipio, hearing that she had been promised in marriage by her parents, to Lucius, prince of the Celtiberians, and that the two lovers had a great affection for each other, sent for the young prince; restored to him the lady; forced him to take, as a marriage portion, the sum of gold her friends had brought for her ransom, and offered them, at the same time, the friendship of the Roman people.

mans; and there are still silver mines in the environs.
Philip II. had some of the silver melted, to estimate
the expence of working, and the produce. The lead
mines in the village of los Alumbres are very rich;
amethysts and other precious stones are found near
Cuevas de Porman; and, not far from Hellin, there is
a very considerable mine of sulphur. The country
round Carthagea was formerly called Campo Spar-
taria; and the appellation of Spartarians was also given
to the city, on account of the great quantities of *spar-
tum*, or Spanish broom, found in the plains and moun-
tains.

This city was totally destroyed in the wars of Atana-
gilda, with Agila king of the Goths in Spain: several
antique stones, with inscriptions, have been found
among the ruins. One of these is now in a garden
in the town of Espinardo, near Murcia. On one side
it has the stern of a ship, and on the other the figure
of Pallas, holding an olive branch; at her feet are a
cornucopia and the caduceus of Mercury. Cascales
attributes this monument to Julius Cæsar, and sup-
poses it to have been erected by him at the time he
formed the design of subjugating the world, and his
country.

On the land side, says Bourgoanne, Carthagea is
defended by a mountain formed by three hills; one
of which was formerly called Phesto, another Alesto,
and the third Chrono. In the middle of the city is a high
hill, with a fort, now almost in ruins: it was anciently
called *Mercurius Theutates*, from a temple erected there
in honour of that deity. The harbour is spacious, and
so deep that ships may moor close to the land. It is a
basin hollowed by nature, which seems to have shel-
tered it from the winds by several hills placed round
it at equal distances; so that, from the mole, nothing
but the entrance of the harbour and the basin are to be
seen. No port can be compared to this for safety and
regularity. Virgil, wishing to give, at the landing of
Æneas in Italy, the description of a port as perfect as
art and nature could make it, seems to have taken for
his model the harbour of Carthagea, *Est in secusu
longe locus: insula portum, &c.*

The entrance is defended by two redoubts which are
not yet fortified: the mole is protected by twelve
pieces of cannon. The arsenal is extremely large, and
provided with every thing that can facilitate the build-
ing and sitting out of ships. Every requisite is there
in such readiness, that a ship of the line may be got
ready for sea in three days. At the pleasure of the
builder the water fills the magnificent basons, which
serve as stocks, and the ship slides of itself into the
sea. Each ship has in this arsenal its particular store-
house, which contains all the rigging necessary to it:
the provision of small timber is considerable, but great
pieces are scarce as well as masts. It is said, that the
king of Spain, or his contractors, procuring timber and
rigging at the third hand, pay a fourth more than the
value for them. There are great numbers of workmen,

Moors, and galley-slaves, in the arsenal: they are di-
vided into companies, and distributed in the docks,
magazines, rope-yards, and forges.

Mr. Swinburne says, "Every feeling of humanity was
put to the torture, on his observing the extreme hard-
ships and sufferings of these slaves; of which he gives
the following narrative: the ships are hove down in a
dry dock, which, by reason of the back water, and
the springs which ooze through the marshy soil, would
never be clear of water, were it not for the fire engines:
continually going; and for the great pump, which is
plied without intermission by Spanish criminals and
Barbary slaves. Of the former they have eight hun-
dred; of the latter, six hundred. Most of these
wretches are kept at it sixteen hours out of the twenty-
four, by four hours at a time: some work only twelve,
and most of the Moors only eight hours. It is the
hardest labour in the world: ten men are set to each
pump, to the amount of above a hundred in the room
above-ground, and as many in a kind of a dungeon
below. In summer time scarce a day passes without
some of them dropping down dead at their work; and
even at the cool season of the year we have met every
day some of them carrying to the hospital. The des-
pair which seizes them is so outrageous, that, if they
can get within reach of a weapon, there are many in-
stances of their having plunged it into their own breast,
or that of some person near them, which answers the
same purpose, a speedy deliverance from all their woes
by death. As we were looking on them, a dirty little
keeper struck a fine tall Moor over the head, for leaving
his pump to beg of us. The Mussulman darted a look
of indignation at his tyrant, and resumed his work,
without saying a word, or shrinking from his blow.
On our leaving this house of sorrow, we met several
strings of galley slaves, going to relieve those at work,
or to fetch their provisions. The Moors had an *M* on
the sack-cloth which covers them, and the whole gang
were striking pictures of malady and despair. The
king allows them a pistreen a day, but I am afraid
they are defrauded of their allowance; for we saw them
making their dinner upon black bread, and horse-beans
boiled in salt-water. We returned quite melancholy
from this scene of woe. The only collection which
diminishes our compassion, is the atrociousness of the
crimes which have brought the Christians to the chain:
none are here who have not deserved death in fifty
thapes. One boy, of fifteen years old, is here for the
murder of his father and mother; and either murder,
sacrilege, or some such enormous and horrible offence,
have been perpetrated by almost all those who are con-
demned for life to this punishment." Swinburne, in his
travels, observes, that the severity exercised over the
Moorish captives is not so easily reconciled to the
principles of humanity, and the meek doctrine of
Christianity: retaliation does not seem a sufficient plea.
The same author, however, speaks highly of the ac-
commodations in this city. "We lodged, says he, at
the

the Golden Eagle, kept by a Frenchman, the *best cook* in the best inn we have met with in Spain."

This city is large, but has few good streets, and still fewer grand or remarkable buildings. The hospital is a large square house, round two courts, three stories high towards the sea, and only one towards the land: the architecture and method of laying out the plan are good; but the stone is of so soft and friable a texture, that the sea air has corroded it, and caused much of it to crumble away. Further east, at the foot of the summer-evening walk, is a small church, erected in honour of St. James, the patron of Spain, who is piously believed to have landed here when he came from Palestine to convert this country to Christianity.

Carthagea much resembles Plymouth: there are two dry docks, which were constructed by the late Don Jorge Juan. Here are two public walks: that of the Alameda is very long, and planted with double rows of white elms; that of Santa Lucia is near the harbour. The town is chiefly inhabited by officers of the army and navy, who are always obliged to wear their uniform; and none under the degree of captain are permitted to carry a cane. The port of Carthagea is the best in the kingdom, and not much inferior to any one in Europe. It is seated at the bottom of a small bay, five hundred paces in length, and about six or seven hundred at the mouth. The anchoring is very good: the bay abounds in fish, particularly mackerel. The air here is temperate in summer, and so mild in winter, that the roses blow as fine at Christmas as they do in England at Midsummer. Great quantities of fine wool are exported from this city.

Malaga, an ancient, large, well built, well fortified, and populous city, with a fine harbour on the Mediterranean, is 260 miles south of Madrid, and 75 south-west from Granada. The city is of a circular form, encompassed with a double wall, and defended by two castles: the houses are solid and lofty, and the streets well paved and level. So great is the exportation of wines, raisins, almonds, figs, lemons, oranges, and other fruits, from hence, besides wool and oil, that the duties on them are said to yield the king 800,000 ducats per annum. The harbour runs up into the town 530 common paces, with a good breadth, and four stairs to take water at, and 24 pillars of Jasper stone to fasten the ships to. The city is supposed to have been founded by the Phœnicians. The bishop is subject to the archbishop of Seville, and has a revenue of 20,000 ducats per annum.

Granada is situated at the conflux of the Xenil and Dauro, 180 miles south of Madrid. It stands in the midst of a fruitful country, has a fine air, is capacious and populous, being one of the largest cities in Spain, and containing upwards of 90,000 inhabitants. It is divided into four quarters, and has 12 gates, which are always open. It is an archbishopric, and contains 24 parishes, and 29 convents, with a church to each, 11 hospitals, and four colleges. The streets are narrow,

crooked, and badly paved, and the houses in general mean: here is an university, and a royal chancery. The amphitheatre, for bull feasts, is built of stone, and one of the best in Spain, and the environs of the city are still pleasing and healthful. Of 50,000 inhabitants, only 18,000 are reckoned useful; the surplus being made of clergy, lawyers, children, and beggars.

Bilboa, the capital of Biscay, is pleasantly situated on the banks of the river Ybaizabal, six miles from the sea, where it has a good port, and a great trade in iron, wrought and unwrought, wool, saffron, and chestnuts. This city contains about 800 houses, which are solid and lofty, and the streets well paved and level; and the water is so conveyed into the streets, that they may be washed at pleasure, which renders Bilboa one of the neatest towns in Europe. None are suffered to settle here, or in any part of the province, unless they can prove their descent from the ancient Gothic Christians, and that their blood is untainted with that of Jews or Moors.

Lurgos, the capital of Old Castile, is situated by the river Arlançon, 120 miles north of Madrid. It is a large, but not a fine city. The cathedral, built in the Gothic style, is one of the noblest and richest in Spain: the archbishop has a revenue of 40,000 ducats per annum, and the king is always the first of the canons. Among other convents, here is one for ladies of quality, called Las Huelgos, the revenue of which is said to be 80,000 ducats per ann. The abbess, who is generally a lady of one of the first families in Spain, has 17 other convents, 14 towns, and 50 villages subject to her: she has also the disposal of 12 commanderies, and takes place of all ladies, except those of the royal family.

Gibraltar being once a celebrated town and fortrefs of Andalusia, though at present in the possession of Great-Britain, claims our attention here from its situation. It was taken from the Spaniards by the confederate fleet of the English and Dutch, under the command of Sir George Rooke, in the year 1704, and, after many fruitless attempts to recover it, was confirmed to the English by the treaty of Utrecht in 1713; repeated attempts have been since made to wrest it from England, but without success: the last war made it more famous than ever, when it underwent a long siege against the united forces of Spain and France by sea and land, but was gallantly defended by general Elliot and his garrison, to the great loss, disgrace, and disappointment of the besiegers; though it must be granted, the place is by nature almost impregnable. Near 300 pieces of cannon of different bores, and chiefly brass, which were sunk before the harbour in the 10 floating batteries destroyed by the red-hot bullets, have been raised, and sold, and the money arising therefrom distributed among the garrison, as a reward for their toil and bravery. But of this siege, and its disastrous issue to Spain, we have already given a description in p. 699. It is a commodious port, and formed by nature for commanding

The Spaniards import principally from England dried and salted fish, meat, butter, cheese, beer, corn, rice, pepper, warlike and naval stores, particularly cables and anchors; cutlery-ware, watches, wrought brass and princes metal, mathematical instruments, toys, mahogany cabinet-work, wrought and unwrought tin, lead, leather, various kinds of silk and woollen stuffs, and broad cloths. They import from America gold, silver, cochineal, indigo, cocoa or chocolate-nuts, logwood, and other dyeing woods, sugar, tobacco, snuff, and other valuable American productions.

Spain formerly extended the chief part of her foreign European trade to England; but it is now one-third less than it was fifty years ago, owing in some measure to the establishment of some arts and manufactures in that kingdom since the above period. Unhappily, however, for themselves, they make gold and silver the chief branches both for their exports and imports. This trade is chiefly carried on from the port of Cadiz; and to this port other European nations send their merchandize to be shipped off in Spanish bottoms for America, secured under the name of Spanish factors; for the merchandize properly belonging to Spain forms the least part of the freight which these ships carry to America.

The merchants of England, Holland, France, &c. have agents and correspondents at Cadiz, who transact this business for them; and their great care is, to elude the duties laid on foreign merchandize sent in this manner to America; which, if paid, are so exorbitant, that the profits would sink very low; though at this time they seldom amount to less than 20 per cent. Spain has ineffectually endeavoured to prevent this contraband trade; but no measure taken for that purpose can succeed, till the inhabitants, by a proper exertion of industry, are enabled to supply their American possessions with merchandize of their own manufacture and produce.

The manufactures of Spain consist chiefly of silk, wool, copper, and hard-ware. The first of these is at present so greatly encouraged, that, we are told, above a million of people are employed in feeding, gathering, and curing silk-worms, and in spinning, weaving, and making all kinds of silks. Most of the laborious works in husbandry, manufactures, and handicrafts, are performed by the French, especially in the two Castiles.

The constitution and government of Spain are greatly altered from their ancient form; since, from being a free monarchy of hereditary succession in males and females, it is now the most despotic kingdom in Europe; and as, in the administration of its government, no proper attention is paid to the interests and welfare of the people, we may from hence easily account for the poverty which is so visible in most parts of the country. The cortes, or parliaments, were composed of representatives sent from the cities and towns, and the oldest member for Burgos always acted as speaker. The cortes

formerly possessed great privileges, and the legislative authority was so equally blended in the king and the estates, that no law could be made, repealed, or suspended, nor any money raised upon the subject, but with their common consent. But these cortes are now abolished, and Spain is become an absolute monarchy, the whole government being solely in the hands of the king, his ministers, and the councils, which are entirely at the devotion of the two former.

The privy-council is composed of a certain number of noblemen, nominated by the king; their business is, to prepare matters and to digest papers for the cabinet council, or *junto*, the members of which are likewise nominated by the king, and consist of the first secretary of state, and three or four more; and in these the direction of all the executive part of government may be said to reside. The council of war takes cognizance of military affairs only. The Spanish monarchs are declared out of their minority on the completion of their fourteenth year; and in regulating the succession, after the death of Charles II. a medium was observed between the Salic law and the ancient law of Spain, viz. that any male heir, however distant, should inherit before a female, who can have no right but after the extinction of every male branch.

The laws of Spain are compounded chiefly of the Roman civil law, the royal edicts, and, probably, certain provincial customs. The council of Castile is the highest law tribunal in the kingdom. In Galicia, Seville, Valencia, Barcelona, Saragossa, Majorca, and the Canaries, courts, called royal audiences, are established, who judge primarily in all causes within fifteen miles of their respective cities or capitals, and receive appeals from inferior jurisdictions. Besides these, there are many subordinate tribunals for the police, the finances, and other branches of business.

The tribunal of the Inquisition is established at Madrid, but there are inferior ones in the principal cities almost all over Spain; and these are the great state curbs whereby the people are held in such an implicit religious obedience, and preserve their boasted uniformity of the Roman Catholic faith. This infernal court was erected about the year 1251. Pope Innocent IV. authorized the Dominicans perpetual inquisitors; and, in 1265, Clement IV. confirmed these powers, and enlarged their privileges and tribunals. It was established in Castile by Ferdinand and Isabella, in the year 1557, and some time after extended all over Spain. Formerly this office only acknowledged the power of the pope, raising itself above that of kings, who were often bristled, humbled, and even punished by it. Their *Auto da Fé's*, or solemn acts of faith, used commonly to be exhibited when their princes came of age, or at their accession. But the power of this office is now greatly diminished; the officers belonging to it can carry no sentence into execution without the royal authority, and there has not been an *Auto da Fé* at Madrid for some years. Add to this, that some of the late

o this, that some of the
late

late popes, and the present, appearing to be in a good
degree protestantized, and divested of the superstition
and bloody zeal of their predecessors, are hopes
that the remaining errors and blind bigotry of that
corrupt church will continue to evaporate, and at length
give place to the light of reason, good sense, and the
precepts of divine revelation. The government of
Spanish America forms a system of itself, and is dele-
gated to viceroys and other magistrates, who are in
their respective districts almost absolute.—The towns
of Ceuta, Oran, and Masulquivir, on the coast of
Barbary in Africa; and the islands of St. Lazaro, the
Philippines, and Ladrones in Asia, are among the
foreign possessions of the crown of Spain.

The revenues arising to the crown from Old Spain
amount to five millions sterling per annum, which arise
chiefly from taxes on all kinds of goods, houses, lands,
timber, and provisions: besides which, a fifth of the
produce of all the silver mines in America belongs to
the king, but this part of his revenue is usually very
ill accounted for, and he seldom receives it without
part having been previously embezzled.

The gold coins in Spain are pistoles or doubloons,
worth about 17s. and double and quadruple, half and
quarter pistoles. The silver coins are reals de Plata,
worth about 6d. of our money; piastres, or pieces of
eight, worth about 4s. 6d. and half and quarter pieces
of eight, but these are not common. The brass money
consist of quartos and octavos, which answer to our
halfpence and farthings. The Spanish escudos, or
crowns and ducats, are imaginary coins, and both of
the value of about 6s. of our money. There are also
imaginary piastres and pistoles.

The land-forces of Spain, in time of peace, are
computed at about 80,000, but in time of war they
commonly amount to 100,000, or upwards. The marine
of that kingdom, at this time, exceeds 70 ships of the
line, owing to the great attention which has been paid
to it by the present monarch. There are watch-towers
from mile to mile, all along the coasts of Spain: these
are provided with lights and guards at night, so that
from Cadiz to Barcelona, and from Bilbao to Ferrol,
the whole kingdom, in case of an invasion, may be
soon alarmed.

The king of Spain formerly enumerated twelve king-
doms, and other places, to the amount of thirty-two,
in his royal titles; but this absurd custom is now only
occasionally contrived, and he is generally contented
with the appellation of His Catholic Majesty. The
custom, however, of giving a number of names to the
children of the royal family of Spain is still observed,
the prince who was born in June 1786, being the son
of the Infant Don Gabriel, by the Infanta Donna-
Mariana Victoria, was baptized by the names of Pedro-
Charles--Antonio--Raphael--Joseph--Janvier--Francis--
John--Nepomucene--Thomas--de--Villeneuve--Mark--colin--
Vincent--Ferrier--Rainfon--Peter--de--Alcantara--Ferdin-
and. The Spanish king is never crowned, but in-

augurated by the delivery of a sword. His signature
is, *I the King*. His eldest son is styled prince of Castile,
and his younger children of both sexes are called
infants or infanta's, by way of distinction.

The arms of the kings of Spain consist of a shield,
divided into four quarters, the uppermost of which on
the right hand, and the lowermost on the left, contain
a castle, Or, with three towers, for Castile; and in the
uppermost on the left, and the lowermost on the right,
are three lions, gules, for Leon; with three lilies in the
centre for Anjou. The armorial bearings are loaded
with the arms of all the kingdoms.

The higher nobility here consist of counts, marquises,
and dukes. The grandees, who have precedence of all
others, next the king and princes of the blood, are
named out of these. Like those of Portugal; they
have the privilege of being covered in the king's
presence, who styles them in his letters, Illustrious;
and, in speaking to them, or of them, their Eminences:
but there are others, besides the grandees, who are
covered in the king's presence, as cardinals, nuncios,
archbishops, the grand prior of Castile, and the
grand prior of Malta, the generals of the orders of
St. Dominic and St. Francis, ambassadors of crowned
heads, the knights of the golden fleece, and of the
three military orders of St. James, Calatrava, and
Alcantara, when the king assists at their respective
chapters, in quality of grand master. No grandee can
be apprehended for any crime, but by the express order
of the king, and they have many other privileges
besides these. The inferior nobility style themselves
cavalleros and hidalgos. The latter of these is ap-
plied to those who are unmixed with the Moorish
blood.

There are seven orders of knighthood in Spain; viz.

1. The order of the Golden Fleece, instituted in
1430, by Philip the Good, duke of Burgundy, and is
common now to the kings of Spain and the house of
Austria: it is generally conferred on princes and sove-
reign dukes; but the Spanish branch of it hath many
French and Italian nobility: there are no commanderies
or revenues annexed to it.

2. The order of St. James, or St. Jago de Compo-
stella, which is the richest of all the orders of Spain:
it was instituted in 1175, by Ferdinand II. king of
Leon. The badge is a cross of gold enamelled crim-
son, edged with gold, and worn round the neck, pen-
dent to a broad ribband; it is charged on the centre
with an escallop-shell white: it is only conferred on
persons of noble families.

3. The order of Calatrava, founded by Sancho III.
of Castile. Their badge is, a cross fleuri, red, worn
at the breast, pendent to a broad ribband, the whole
differing only in colour from the badge of Alcantara:
the ceremonial mantle is of white silk, tied with a
cord and tassels, like those of the Garter, and on the
left arm a cross fleuri embroidered, gules.

4. The order of Alcantara owes its institution to
Ferdinand

Ferdinand II. king of Leon. The badge is a gold cross, fleur-de-lis, enamelled green, and worn pendent to a broad ribband on the breast. This order is highly esteemed, and conferred only on persons of ancient and illustrious families. On days of ceremony, they wear a mantle of red silk, on the left side of which is embroidered, in silver, a star of five points.

5. The order of the Lady of Mercy, said to have been instituted about the year 1218. Women are also included in this order: the badge, which is common to both, is a shield per fess, red and gold; in chief, a cross pattée, white; in base, four pallets red, for Aragon, and the shield crowned with a ducal coronet.

6. The order of Montesa, instituted at Valencia, at the close of the 13th century, in the place of the Templars, whose possessions they enjoyed. The badge is a plain red cross, enamelled on gold, worn pendent to a broad red ribband, sash-wise, and a plain red cross embroidered on the left breast of the outer garment.

7. The order of Charles III. instituted by the present king in 1771, in commemoration of the birth of the infant. The badge is a star of eight points enamelled white, and edged with gold: in the centre of the cross is the image of the Virgin Mary, vestment white and blue. On the reverse, the letters C. C. with the number III. in the centre, and this motto, *Virtuti & Merito*, "To Virtue and Merit." The order is composed of four classes, variously distinguished. This order is conferred on none but persons of noble descent.

The history of Spain will be introduced at the end of our ensuing account of Portugal, as the events relative to both these kingdoms are so intimately blended and connected together, as not easily to admit of a separation with propriety. Charles III. the late king of Spain, was born in 1716, and succeeded to the throne in 1759. He died Dec. 1788, in the 73d year of his age, and 30th of his reign. He was the second son of Philip V. by the princess of Parma, and grandson of Louis XIV. of France. He left issue by his late queen, 1. Maria-Josepha, born in 1744. 2. Maria Louisa, born in 1745, married in 1765, to the archduke Leopold of Austria, great duke of Tuscany, and brother to the late emperor of Germany. 3. Philip-Anthony, duke of Calabria, born in 1747, but incapacitated from succeeding to the throne by a defect of understanding. 4. Charles-Anthony, prince of Austria, born in 1748, married in 1765, to Louisa-Maria-Theresa, princess of Parma. 5. Ferdinand-Antony, king of Naples, born in 1751, married in 1768, to the archduchess Mary Cardine-Louisa, sister to the then empress of Germany. 6. Gabriel-Antony, born in 1752, grand prior of the kingdom of Spain. 7. Anthony-Pascal, born in 1755. 8. Francis-Xavier, born in 1757. Don Lewis, the king's brother, is cardinal and archbishop of Toledo. Charles IV. succeeded his father Charles III. in Dec. 1788. He married, Sept. 4, 1765, princess Louisa of Parma. Their sur-

living issue are, Ferdinand Antony, present king of Naples, and Antony Paschal, born Dec. 31 1755. Spain, as well as Portugal, acceding to the grand confederacy of the other European powers against the French republic, joined their naval strength to that of England in that war.

P O R T U G A L.

Situation, Extent, Boundaries, Produce, Mountains, Rivers, Population, Inhabitants, Religion, Language, Learning, Cities and Towns, Curiosities, Commerce and Manufactures, Constitution and Government, Revenue, History, &c.

THIS kingdom is situated between the 7th and 10th degrees of west long. and between the 37th and 42d degrees of north lat. being about 300 miles in length and 100 in breadth. It is the most Western kingdom on the continent of Europe, being bounded on the south and west by the Atlantic ocean, and on the north and east by Spain. This is the Lusitania of the Romans; but the etymology of its present name is uncertain.

The kingdom of Portugal is usually divided into three parts, viz. the northern, middle, and southern provinces.

THE NORTH DIVISION CONTAINS

Entre Mino, chief town Braga; Douro, ch. towns Oporto and Viana; Tra los Montes, ch. towns Braganza, Miranda, and Villa-Real: containing 6814 square miles.

THE MIDDLE DIVISION CONTAINS

Beira, chief towns Coimbra, Guarda; Estremadura, ch. towns Lisbon, Ubes, and Leira: containing 12,640 square miles.

THE SOUTH DIVISION CONTAINS

Entre Tajo, chief town Eborá, or Evora; Guadiana, ch. towns Portalegre, Elvas, and Bira; Alentejo, ch. town Lagos; Algarva, ch. towns Faro, Tavora, and Silves: containing 8397 square miles.

The air in Portugal, especially about Lisbon, is reckoned soft and beneficial to consumptive patients; it is not so searching as that of Spain, being refreshed by breezes from the sea. The soil is not in general equal to that of Spain for fertility, especially in corn, which they import from other countries. Some places produce good pasture, but in general it is very coarse.

The fruits here are the same as in Spain, but not so highly flavoured. Herbs and flowers are very plentiful, from the odoriferous kinds of which great quantities of perfumed waters are distilled. They are particularly

tries. Some places
general it is very coarse.
e as in Spain, but not so
flowers are very plentiful,
of which great quan-
dified. They are par-
ticularly

ticularly attentive to the culture of their vineyards,
which yield excellent grapes. The cattle in the northern
parts are large and fine, but in the southern they are
small and lean, and are in general, as well as their
poultry, but indifferent eating. Their horses are brisk
and lively, but extremely slight. The fish on the coast
are very fine, and the birds resemble those of Spain.
Vast quantities of delicious honey are produced in this
country. Here are mines, but they are not worked;
also variety of gems, marbles, and mill-stones, and a
fine mine of salt-petre, near Lisbon.

The principal mountains in Portugal are those which
divide Algarva from Alentejo; those in Tralos Montes,
and the rock of Lisbon, at the mouth of the Tajo:
but they are for the most part barren.

The chief rivers of Portugal have been mentioned in
the account of Spain. The others are, the Mondego,
the Limia, Sadao, Vanga, Leca, Ave, Cavado, Ze-
zere, Alba, Goa, Laura, Canha, and Casa. The Tagus,
or Tajo, was celebrated for its golden sand. There
are also several remarkable lakes and springs in this
kingdom; some of them will absorb even the lightest
substances, as feathers, cork, &c. some are medicinal
and fanative, particularly one about 45 miles from Lis-
bon, and some hot baths are found in the province of
Algarva.

The number of inhabitants in Portugal, according to
the best calculation, amount to about two millions.
In 1732, the kingdom contained 3344 parishes,
1,742,230 lay persons, and about 300,000 ecclesiastics
of both sexes. The Portuguese are neither so tall,
nor so well made as the Spaniards. The ladies are of
an olive complexion, but, while young, exceedingly
handsome; and their eyes, which are black and spark-
ling, retain their brilliancy long after their other charms
are upon the decline. In their manners they are ex-
ceeding lively and witty, but at the same time possess
the nicest sense of female virtue and honour.

The Portuguese are generally accused of being
haughty, treacherous, and crafty in their dealings;
malicious, cruel, and vindictive in their tempers;
much given to avarice and usury, and the meaner sort
extremely addicted to thieving. This character, though
bad, may in a great measure be just, but charity obliges
us to suppose that it is not general, and that, among
such a number of inhabitants, many may be found,
whose sentiments and manners are an honour to their
country; for it is certain that no people whatever are
less beholden to the reports of historians and travellers
than the Portuguese. We will, however, hope that some
alteration will be made in their character by the ex-
pulsion of the Jesuits, and the diminution of the papal
influence among them. In their manner of living,
customs, and diversions, they nearly resemble the
Spaniards, but they are, if possible, more superstitious,
and affect greater state. They keep an incredible
number of domestics, for they never discharge any who
survive after serving their ancestors; but they exact a

eneration from them which falls little short of the
most abject slavery; and the ladies, in particular, are
treated by them with the same homage as is paid to
persons of the blood royal in other countries. The
houses, particularly those of the grandes, are furnished
in the richest and most superb taste; but the poorer
sort have scarcely any furniture at all, and sit always
cross-legged on the ground, like the Moors. Their
dresses, like that of the Spaniards, never used to vary
till very lately, particularly among the men; but now
both sexes conform greatly to the modes of France.
The ladies wear exceeding rich clothes, and when they
walk out, put on long veils over their heads, but
leave their faces uncovered. Both men and women
make great use of spectacles, and that often not so
much to assist their sight, as to give them an appear-
ance of wisdom and gravity.

The established religion in Portugal, and the only
one tolerated there, is Popery. Jews, however, are
found there in vast numbers, but they sometimes escape
the scrutiny of the inquisition with great difficulty, and
if they are unhappy enough to fall under its censure,
are treated with the utmost cruelty. The English Pro-
testants are permitted the exercise of their religion;
but they must be careful not to ridicule that of the
country, nor endeavour to make proselytes. The
power of his holiness, as well as that of the inquisition
in Portugal, have been very much contracted of late.

The only difference between the ecclesiastical go-
vernment of Spain and Portugal is, that about 20
years ago there was erected a patriarchate at Lisbon. The
patriarch is always a cardinal, and of the royal family.
The archbishoprics are those of Lisbon, Braga, and
Evora. The first of these has ten suffragan bishops,
including those of the Portuguese settlements abroad;
the second has ten; and the last two.

The Portuguese language does not differ materially
from that of Spain, only the pronunciation is harsher
to the ear. It is spoken on all the coasts of Africa
and Asia, as far as China, but mixed with the lan-
guages of the several nations in those distant regions.

The ancestors of the present Portuguese were cer-
tainly possessed of more true knowledge, with regard
to astronomy, geography, and navigation, about the
middle of the 16th century, and for some time after-
wards, than any other nation in the universe; but bi-
gotry has plunged them into a deplorable state of igno-
rance, from whence some weak efforts have of late
been made to extricate them: for it is universally al-
lowed, that this defect is not owing so much to the
want of genius as a proper education. It is, however,
to be feared, that while the papal power, and that of
the ecclesiastics continue at such a height, though greatly
inferior to what it was, real learning will make but a
small progress, notwithstanding the laudable endeavours
of a few enlightened minds.

The universities are those of Lisbon, Coimbra, and
Evora. The first of these is much inferior to the second,
9 U which

which was founded in the year 1291, by king Dennis, and consists of a rector, rector, or governor, a chancellor, with fifty professors, and other officers. The number of students are about 4000; and the buildings of the university are very magnificent. The university at Evora was founded in the year 1559, and is well endowed. There is also at Lisbon a college, where the young nobility are educated in the sciences, and every branch of polite learning.

The Portuguese antiquities chiefly consist in the remains of some Moorish castles, the Roman bridge and aqueduct at Coimbra, and the walls of Santarin, which are likewise supposed to have been built by the Romans. The principal natural curiosities are the lakes and fountains already described; to which we may add, the diamond the king is possessed of, which is perhaps the largest in the world, and was found at Brasil. The artificial curiosities are, the church and monastery near Lisbon where the kings of Portugal are buried, which are inexorably magnificent; and several monasteries in Portugal, dug out of the hard rock. The chapel of St. Roch is thought to be one of the finest and richest in the world: the paintings are mosaic work, so curiously wrought with stones of all colours, as to astonish the beholders.

The capital city of Portugal is Lisbon: it stands on seven hills, on the north side of the mouth of the river Tagus; it is the residence of its monarchs, the seat of the chief tribunals and offices of the metropolitan, the receptacle of the richest merchandize both of the East and West-Indies, and esteemed the greatest port in Europe, next to London and Amsterdam. Here is one of the finest harbours in the world, having water enough for the largest ships, and room sufficient to admit ten thousand sail, without being crowded.

The greatest part of Lisbon, and the chief of the palaces and public buildings, were destroyed by a dreadful earthquake, on November 1, 1755. All that part of the city which was demolished, is planned out in the most regular and commodious form. Some large squares and many streets are already built. The streets form right angles, and are broad and spacious. The houses are lofty, elegant, and uniform; and being built of white stone, make a beautiful appearance. The inhabitants of this city, before the earthquake, did not exceed 150,000. Here are still remaining some noble edifices and fine churches; among the latter, the most magnificent is the chapel-royal, the splendor of which is amazing. The cathedral is a vast Gothic structure, heavy and clumsy; it contains, however, great riches, and is finely adorned within. The king's principal palace is spacious and convenient, and stands on the river Tagus. The castle is large and ancient, has always a garrison of four regiments of foot, and, from its situation, commands the whole city, being in the centre of it upon one of the highest hills. Here is a noble university, and a large square, called Rosio, surrounded with magnificent buildings.

The city and sea-port of Oporto is, next to Lisbon, a place of the greatest opulence and trade in the kingdom. It is surrounded with walls and towers, and the streets are narrow and irregular, but well paved, the natural rock making part of the pavement in some places, and in others even the walls of the houses. The buildings, which are gracefully antique, are all of stone; and the churches, particularly the cathedral, are stately and magnificent. The harbour, which is much frequented by English vessels, is very commodious, but the entrance to it is rendered dangerous by rocks and sand-banks, called the Bar. From this place is carried on an extensive trade, particularly in wine, to England, from thence denominated Port; and the inhabitants of half the shops in the city are coopers.

The commerce of Portugal is very considerable, but particularly with England, from whence they have most of the woollen manufactures, with which they furnish their subjects in Asia, Africa, and America; and in return for which the English take the wines, salt, and fruit of Portugal. By several treaties the British merchants in that kingdom enjoy considerable privileges, which of late years have been greatly infringed by the creation of new companies, and other oppressive regulations; and, notwithstanding repeated complaints have been made from our court to that of Portugal, there has never been the least redress granted, or concession made.

Portugal, it is said, draws more profit from her Brasils, than Spain from both Mexico and Peru. The articles from thence are gold, diamonds, pearls, indigo, copper, tobacco, sugar, cocoa nuts, ginger, cotton, hides, gums, drugs, and dyeing woods. The king's fifth of the gold brought from Brasil, notwithstanding the vast contraband trade, is said to amount, one year with another, to about 300,000l. sterling; and the whole annual produce of that metal in Brasil is computed at near 2,000,000l.

The Portuguese have also very extensive plantations on the east and west coast of Africa, from whence they draw gold, ivory, ebony, and slaves sufficient to cultivate their sugar and tobacco plantations in Brasil.

The Azores, or Western Isles, the Madeiras, and the Cape de Verd islands, likewise all belong to Portugal. Goa is their chief settlement in the East-Indies, their other possessions there are Macao, Daman, Diu, &c.

The manufactures in Portugal consist chiefly of wool and silk, both which are inferior in beauty and goodness to those of Spain. They also make a little linen, a variety of straw work, and preserve and candy fruits to admiration.

The king of Portugal is absolute, though the appearance of liberty is still preserved in the meeting of the cortes, or states, already mentioned in Spain: but they have long since sold their parts in the legislature to the crown, and now only serve to record such acts of state as the court resolves upon; to declare the next heir to the crown, when the king is pleased to nominate

to is, next to Lisbon, and trade in the king- doms and towers, and the pavement in some walls of the houses. The cathedral, are much more commodious, but dangerous by rocks and from this place is carried to England; and the industry are coopers.

is very considerable, but from whence they have Africa, and America; they take the wines, by several treaties the dom enjoy considerable have been greatly in- vided companies, and other notwithstanding repeated from our court to that of the least redress granted,

Isles, the Madeiras, and Macao, Daman, Div, &c. consist chiefly of wool- len in beauty and good- ness also make a little linen, preserve and candy fruits

absolute, though the ap- proved in the meeting of mentioned in Spain: but in parts in the legislature serve to record such acts upon; to declare the next king is pleased to nomi- nate

nate him; or to ratify treaties with such foreign princes as may still deem their consent of any weight. The succession in Portugal may devolve to the female branch; and the late monarch, having no male issue, obtained a dispensation from the pope, and married his daughter to his brother Don Pedro.

The council of state, in this kingdom, is composed of an equal number of the clergy and nobility, with the secretary of state, and they dispose of all great preferments, both spiritual and temporal. A council of war regulates all military affairs; and the treasury courts, the finances.

The laws of Portugal are all contained in three small volumes, and are founded on the civil law and their particular customs. The council of the palace is the highest tribunal that can receive appeals; and the Casa da Supplicação is a tribunal from which no appeals can be brought. The Inquisition is established here, as well as in Spain. They have also one of these tribunals at Goa, but none at the Brasils; the power of the Portuguese inquisitions has, however, been of late greatly circumscribed.

The revenues of Portugal since the discovery of the Brasils, have been very considerable, and it is computed that they amount to three millions and a half annually. A considerable part of this arises from the customs and duties on goods exported and imported, which are usually farmed out by the crown, and are immensely high. Foreign merchandize pays twenty-three per cent. on importation, and fish from Newfoundland twenty-five per cent. Fish taken in the neighbouring seas and rivers pay twenty-seven per cent. and the tax upon land and cattle which are sold, is ten per cent. The duty upon snuff alone amounts to fifty thousand crowns; and the king draws a considerable revenue from the several orders of knighthood, of which he is always grand-master. The pope also, in consideration of the large sums he draws out of this kingdom, gives the king the money arising from indulgences and licences to eat flesh at times prohibited, &c.

The nobility of Portugal are not taxed but upon extraordinary emergencies, and then not very high. By the suppression of the Jesuits, and other useless religious orders and institutions, the king's revenue is greatly increased.

The king's titles are, " King of Portugal and the Algarves, on this side and the other side the sea of Africa; lord of Guinea, and of the navigation, conquests, and commerce, in Ethiopia, Arabia, Persia, India, &c." The king's eldest son is styled prince of Brasil." In the year 1749, pope Benedict XIV. dignified the king with the title of his Most Faithful Majesty.

The arms of Portugal are Argent, five escutcheons, azure, placed cross-wise, each charged with as many bezants as the first, placed saltier-wise and pointed, sable, for Portugal. The shield bordered, gules, charged with seven towers. Or, three in chief, and two in each flanch. The supporters are two winged dragons, and the crest a dragon, Or, under the two flanches, and

the base of the shield appears at the end of it; two crosses, the first fleur-de-luce, vert, which is for the order of Aviez, and the second patée, gules, for the order of Christ; the motto is changeable, each king assuming a new one; but it frequently consists of these words *Pro Rege et Grege.* " For the King and the People.

His Most Faithful Majesty, Peter III. late king of Portugal, died in July 1786, of an apoplexy, in the 69th year of his age. He was succeeded in the throne by his consort Maria Frances Isabella.

There are several orders of knighthood here, viz. 1. The order of Christ, founded in 1317, by Dennis I. of Portugal, the badge of which is a red cross within a white one, and the number of the commanderies 454. 2. The order of St. James, instituted in 1310; by the last-mentioned prince, the badge of which is a red sword, in the shape of a cross. A great number of towns and commanderies belong to this order. 3. The order of Aviz, or Aviez, instituted by Alphonsus Henriquez king of Portugal, in 1147, as a military and religious order, whose badge is a green cross, in form of a lily, and the number of its commanderies 49. Though these three orders are religious, yet the knights are at liberty to marry. 4. The order of St. John, which has also several commanderies.

THE HISTORY OF SPAIN AND PORTUGAL.

SPAIN, together with Portugal, anciently formed but one kingdom, supposed to have been first peopled from Gaul, to which it is contiguous; or from Africa, from which it is only separated by the narrow streight of Gibraltar. The Phoenicians sent colonies thither, and built Cadiz and Malaga. Afterwards, upon the rise of Rome and Carthage, the possession of this kingdom became an object of contention between those powerful republics; but at length the Roman arms prevailed, and Spain remained in their possession until the fall of that empire, when it became a prey to the Goths. These in their turn were invaded by the Saracens, who about the end of the 7th century had possessed themselves of the finest kingdoms of Asia and Africa; and not content with the immense regions that formerly composed great part of the Assyrian, Greek, and Roman empires, they crossed the Mediterranean, ravaged Spain, and established themselves in the southerly provinces of that kingdom.

The first Spanish prince, mentioned in the history of this country, was Don Pelago, who distinguished himself against these infidels (afterwards known by the name of Moors); and, about the year 720, took upon himself the title of king of Asturias. His successes animated other Christian princes to take arms likewise, and the two kingdoms of Spain and Portugal for many ages were perpetually embroiled in bloody wars. In the mean time every adventurer was entitled to the conquests he made upon the Moors, till Spain was at last divided into twelve kingdoms; and about the year 1095 Henry of Burgundy was declared, by the king of

of Leon, court of Portugal; but his son Alphonso threw off his dependence on Leon, and declared himself king. A succession of brave princes gave the Moors repeated overthrows in Spain, till about the year 1475, when all the Spanish kingdoms, Portugal excepted, were united by the marriage of Ferdinand king of Arragon, and Isabella the heiress and afterwards queen of Castile, who took Granada, and expelled the Moors and Jews, to the number of 170,000 families, out of Spain. This expulsion greatly depopulated the country of artists, labourers, and manufacturers; and the discovery of America (which happened a few years after) not only added to that calamity, but rendered the remaining Spaniards most deplorably indolent. To complete their misfortunes, Ferdinand and Isabella introduced the Popish inquisition, with all its horrors, into their dominions, as a safeguard against the return of the Moor and Jews.

Ferdinand was succeeded by his grandson Charles V. of the house of Austria, afterwards emperor of Germany. The extensive possessions of the house of Austria in Europe, Africa, and above all, America, from whence he drew immense treasures, began to alarm the jealousy of neighbouring princes, but could not satisfy the ambition of Charles; he was almost constantly engaged in foreign wars, or with his Protestant subjects in Germany, whom he in vain attempted to bring back to the Catholic church. At length, after a long and turbulent reign, he resolved to withdraw himself entirely from any concern in worldly affairs, in order that he might spend the remainder of his days in retirement and solitude. In consequence of this resolution he resigned Spain and the Netherlands to his son Philip II. but could not prevail on the princes of Germany to elect him emperor, which they conferred on Ferdinand, Charles's brother, dividing the dangerous power of the house of Austria with two branches. Spain, with all its possessions in Africa and the New World, also the Netherlands, and some Italian states, remained with the elder branch, whilst the empire, Hungary, and Bohemia, fell to the lot of the younger.

Philip II. inherited all his father's vices, but possessed few of his good qualities. He was austere, haughty, immoderately ambitious, and through his whole life a cruel bigot in the cause of Popery. He married Mary, queen of England, an unfeeling bigot like himself; and after her death he paid his addresses to her sister Elizabeth, but without success. His resentment on this occasion produced very disadvantageous wars with that princess, which occasioned the revolt and loss of the United Provinces. But in Portugal he was more successful. That kingdom, after being governed by a race of wise and brave princes, fell to Sebastian about the year 1557. Sebastian lost his life and a fine army, in a headstrong, unjust, and ill-concerted expedition against the Moors in Africa; and soon after Philip united Portugal to his own dominions, though the Braganza family of Portugal pretended to

a prior right. By this acquisition Spain became possessed of the Portuguese settlements in India, some of which she still retains.

The descendants of Philip proved to be very weak princes; but Philip and his father had so totally ruined the ancient liberties of Spain, that they reigned almost unmolested in their own dominions. Their viceroys, however, were at once so tyrannical and insolent over the Portuguese, that in the year 1640 the nobility of that nation, by a well concerted conspiracy, expelled their tyrants, and placed the duke of Braganza on the throne by the title of John IV. almost without bloodshed; and the foreign settlements also acknowledged him as their sovereign. A fierce war subsisted for many years between the two kingdoms, and all the efforts of the Spaniards to re-unite them proved vain, so that a treaty was concluded in February 1668; by which Portugal was declared to be free and independent, and has ever since been a distinct kingdom from Spain.

The kings of Spain, of the Austrian line, failing in the person of Charles II. who left no issue, Philip, duke of Anjou, second son to the dauphin of France, and grandson to Lewis XIV. mounted the throne, by virtue of his predecessor's will, in the name of Philip V. anno 1701; and after a long and bloody struggle with the German branch of the house of Austria, supported by England, he was confirmed in his dignity at the conclusion of the peace of Utrecht in the year 1713. And Lewis XIV. through a masterly train of politics, accomplished his favourite project of transferring the kingdom of Spain, with all its rich possessions in America and the East-Indies, from the house of Austria to that of his own family of Bourbon; an event which proved fatal to the commerce of Great-Britain; especially in the American seas, where a glaring partiality has been shewn to the French nation ever since, and renders the English being possessed of a port in the South-Seas of equal importance to that of Gibraltar, at the entrance of the Mediterranean, which serves as a curb on the united strength of France and Spain in Europe.

Philip, after a long and turbulent reign, which was disturbed by the ambition of his wife, Elizabeth of Parma, died in 1746, and was succeeded by his son Ferdinand VI. a mild and peaceable prince, who reformed many abuses, and was desirous of promoting the commerce and prosperity of his kingdom; but he died in 1759 without issue, through grief for the loss of his wife. Ferdinand was succeeded by his brother Charles III. the late reigning monarch of Spain.

The Portuguese could not have supported themselves under their revolt from Spain, had not the latter power been engaged in wars with England and Holland; and upon the restoration of Charles II. of England, that prince having married a princess of Portugal, prevailed with the crown of Spain, in 1668, to give up all pretensions to that kingdom. Alphonso, son to John IV. was their king of Portugal. He had the misfortune

tune to disagree with his wife and his brother Peter, and they uniting their interests, not only forced Alphonso to resign his crown, but obtained a dispensation from the pope for their marriage, which was actually consummated. They had a daughter; but Peter, by a second marriage, had sons, the eldest of whom was John, his successor, and father to his late Portuguese majesty. John, like his father, joined the grand confederacy formed by king William; but neither of them were of much service in humbling the power of France. On the contrary, they had almost ruined the allies, by occasioning the loss of the great battle of Almanza in 1707.

John died in 1750, and was succeeded by his son Joseph, who, in 1700, was attacked by some assassins, and narrowly escaped with his life. From this conspiracy is dated the expulsion of the Jesuits (who were supposed to have been deeply concerned in it) from all parts of the Portuguese dominions: Joseph having no son, his eldest daughter was married, by dispensation from the pope, to Don Pedro, her own uncle, to prevent the crown falling into a foreign family; and the next year 1761, she was brought to bed of a son, called the prince of Beira.

When the war broke out between England and Spain in 1762, the Spaniards, and their allies the French, pretended to force Joseph into their alliance, and to garrison his sea-towns against the English with their troops. The king of Portugal rejected this proposal, and declared war against the Spaniards, who, without resistance, entered Portugal with a considerable army, while a whole body of French threatened it from another quarter. But by the assistance of the English, an effectual stop was put to the invasion; and a peace was concluded at Fontainebleau in 1763.

Joseph died on the 24th of February 1777, and was succeeded by his niece Maria Frances Isabella, one of whose first acts was, the removing from power the marquis de Pombal, an event which excited universal joy throughout the kingdom, since his arbitrary and oppressive administration had rendered him odious to the people; though it has been alleged in his favour, that several of the public measures he had adopted were calculated to promote the real interests of the country.

Maria Frances Isabella, queen of Portugal, was born in 1734, and married her uncle Don Pedro in 1760; the king was born in 1717, and, with the queen, was joint sovereign of the Portuguese dominions; till his death, which happened in June 1786, aged 69. The prince of Brazil, heir apparent to the crown of Portugal, was born in 1761, and married in 1777 to his aunt Mary-Francisca Benedicte, born in 1746. The rest of the issue of the late king are, John Maria Joseph, born in 1767; Maria-Anna-Victoria, born in 1768; and Maria Clementina, born in 1774.

Charles III. of Spain was so warmly attached to the family compact concluded with the house of Bourbon, that two years after his accession he even hazarded his

American dominions to support it. War being declared between him and England, the latter took from him the famous port and city of Havannah, in the island of Cuba, and thereby rendered herself entirely mistress of the navigation of the Spanish plate fleets. Notwithstanding the success of the English, their ministry thought proper hastily to conclude a peace, in consequence of which; Havannah was restored to Spain.

In 1775 an expedition was concerted against Algiers by the Spanish ministry, which had a most unsuccessful termination. The troops, which amounted to upwards of 24,000, and who were commanded by lieutenant-general Conde de O'Reilly, landed about a league and a half from the city of Algiers; but were disgracefully beaten back, and obliged to take shelter on board their ships, having 27 officers killed, and 191 wounded, besides 501 rank and file killed, and 2088 wounded. In the years 1783 and 1784, they also renewed their attacks by sea to destroy the place; but after spending much ammunition, and losing many lives, were forced to retire without effecting their purpose.

After the late unhappy war between Great-Britain and her colonies had subsisted for some time, and France had engaged to assist the latter, the court of Spain was also prevailed on to commence hostilities against Great-Britain. The great object of the Spaniards was, the regaining Gibraltar, as it had always been a great mortification to them, that this important fortress should be possessed by the English: they accordingly closely besieged it both by sea and land.

For an account of the destruction of this formidable armada, and the Spanish gun-boats, by the garrison under general Elliot, the reader is referred to page 699.

CHAP. XXVII.

I T A L Y.

Situation, Extent, Boundaries, Divisions, Climate, Soil, Produce, Mountains, Seas, Springs, Population, Inhabitants, Religion, Government under the Pope, Curiosities, Italian States, History, &c.

THIS country is situated between the 7th and 10th deg. of east long. and 37 and 46th deg. of north lat. being about 600 miles in length, and in some places near 400 broad; but its form is so irregular, that in some parts the breadth does not exceed 25 miles. On the north, it is bounded by France, Switzerland, and Germany; on the east, by the gulf of Venice, or Adriatic sea; and on the south and west by the Mediterranean.

principality, ch. town Benevento; Citra, principality, ch. town Salerno; Molic, ch. town Bojano; Basilicata, ch. town Cerenza; Citra Calabria, ch. town Cosenza; Ultra Calabria, ch. town Reggio; Ultra Abruzzo, ch. town Aquila; Citra Abruzzo, ch. town Chieti; Capitulate, or Apulia, ch. towns Manfredonia, Lucca; Bari, ch. town Bari; Otranto, ch. towns Otranto, Brundisi, Tarenta.

SICILIAN ISLANDS.

Val de Mazara, ch. town Palermo; Val de Demona, ch. town Messina; Val de Noto, ch. towns Catania, Syracuse, Noto.

LIPARI ISLANDS, N. OF SICILY.

Lipari, Strombolo, Rotte, Panaria, Elicusa.

ISLANDS ON THE W. COAST OF ITALY.

Capri, Ischia, Penza, Giglio; Elbasits, ch. town Porto Longone, subject to Sicily; Piamosa, ch. town Porto Ferraro, subject to Tuscany; Capraria, Gorgona.

THE MILANESE, MANTUA, AND TUSCANY, POSSESSED BY THE HOUSE OF AUSTRIA.

Milanese—Milanese proper, ch. town Milan; Pavese, ch. town Pavia; Navarese, ch. town Navara; Comasco, ch. town Como; Lodese, ch. town Lodi; Cremonese, ch. town Cremona.

Tuscany—Florentina, ch. town Florence; Siennese, ch. town Sienna; Pisa, ch. towns Pisa, Leghorn, Piombino.

Mantua proper, ch. town Mantua.

Note.—The republic of Lucca is in Tuscany, and the principality of Massa Carara, subject to its own prince; also the coast del Presidii, subject to the king of Naples, the capital of which is Orbitello.

The duchies of Parma, Placentia, and Guastella, are subject to the duke of Parma, their chief towns are of the same name.

The Genoese territories contain the following:

Genoa proper, ch. town Genoa; Savona, territory, ch. town Savona; Vado, ter. ch. town Vado; Noli, territory, ch. town Noli; Final, territory, ch. town Final; Albenga, territory, ch. town Albenga; Oneglia (to Sardinia) ch. town Oneglia; St. Remo, territory, ch. town St. Remo; Ventimiglia, territory, ch. town Ventimiglia; Monaco, principality, ch. town Monaco; Rapallo, territory, ch. town Rapallo; Lavigna, ch. town Lavigna; Spezia, ch. town Spezia.

MODENA, DUCHY, SUBJECT TO ITS OWN DUKE.

Modena, ch. town Modena; Mirandola, ch. town Mirandola; Rhegio, ch. towns Rhegio, Borsello, Carpi.

THE REPUBLIC OF VENICE.

Venice, D. ch. town Venice; Paduan, ch. town

Padua; Veronese, ch. town Verona; Bresciano, ch. town Brescia; Cremasco, ch. town Crema; Bergamasco, ch. town Bergamo; Vincentino, ch. town Vicenza; Rovigno, ch. town Rovigno; Trevegiano, ch. town Treviso; Bellunese, ch. town Belluno; Friuli, ch. town Aquileia; Udinese, ch. town Udina; Itria, ch. town Cabo de Itria.

THE POPE'S TERRITORIES, OR THE PATRIARCHATE.

Campania di Roma, ch. towns Rome, Tivoli, Fregati, Ostia, Albano.

St. Peter's Patrimony, ch. towns Viterbo, Civita Vecchia, Bracciano, Castro, Orvietto, Aquapendente. Umbria, or Spoleto, ch. towns Spoleto, Narni, Terni, Perugia.

Ancona, marquisate, ch. towns Ancona, Loreto, Urbino, Pesaro, Semigalia.

Romania, ch. towns Ravenna, Rimini; Bolognese, ch. town Bologna; Ferrarese, ch. towns Ferrara, Comacchia.

Republic of St. Marino, ch. town St. Marino.

The island of Corfica is subject to the French, ch. towns Bastia and Bonifacio.

The island of Malta or Melita, is subject to the knights of St. John of Jerusalem; its chief town is Malta, or Valetta.

The air of Italy is very different; according to the different situations of the several countries contained in it. In those on the north of the Apennines it is more temperate, but in those on the south generally very warm. The air of the Campania of Rome, and of the Ferrarese, is unhealthy, which is owing to the lands not being duly cultivated, nor the marshes drained. That of the other parts is generally pure, dry, and healthy. In summer the heat is very great in the kingdom of Naples, and would be almost intolerable, if it was not somewhat alleviated by the sea-breezes.

The soil of Italy in general is very fertile, being watered by a great number of rivers. It produces a variety of vines, and the best oil in Europe; excellent silk in abundance, corn of all sorts, but not in such plenty as in some other countries; oranges, lemons, citrons, pomegranates, almonds, raisins, sugar, mulberry-trees without number, figs, peaches, nectarines, apricots, pears, apples, filberts, chestnuts, &c. Most of these fruits were at first imported by the Romans from Asia Minor, Greece, Africa, and Syria, and were not the natural products of the soil. The tender plants are covered in winter on the north-side of the Apennines, but on the south-side they have no need of it.

This country also yields good pasture, and abounds with cattle, sheep, goats, buffaloes, wild boars, mules, and horses. The forests are well stored with game, and the mountains yield not only mines of iron, lead, alum, sulphur, marble of all sorts, alabaster, jasper, porphyry, &c. but also gold and silver, with a great variety of aromatic herbs, trees, shrubs, and evergreens.

greens, as thyme, lavender, laurel, and bays, wild olive-trees, tamarinds, juniper, oaks, pines, &c. In fine, Italy well merits the appellation which it has obtained, viz. the Garden of Europe.

The chief mountains of Italy are the Apennines and the Alps; the former run the whole length of the country from north-west to south-east; the latter extend from the river Var near Nice, to the Adriatic. The principal river is, the Po, which rises in Piedmont, and disembogues itself into the Adriatic.

The seas of Italy are, the gulf of Venice, or the Adriatic sea; the seas of Naples, Tuscany, and Genoa; the bays or harbours of Nice, Villa Franca, Oneglia, Final, Savona, Vado, Spezzia, Lucca, Pisa, Leghorn, Piombino, Civita Vecchia, Gaeta, Naples, Salerno, Policastro, Rhegio, Quiace, Tarento, Manfredonia, Ravenna, Venice, Trieste, Itria, and Fiume; Cape Spartavento del Alice, Otranto, and Accona; and the Straight of Messina, between Italy and Sicily. The gulfs and bays in the Italian islands are those of Fiorenzo, Bastia, Tolada, Porto Novo, Cape Corsica, Bonifacio, and Ferro in Corsica; and the Straight of Bonifacio between Corsica and Sardinia. The bays of Cagliari and Oristagni; Cape de Sardinia, Cavello, Monte Santo, and Polo, in Sardinia. The gulfs of Messina, Melazzo, Palermo, Mazaro, Syracuse, and Catania; Cape Faro, Melazzo, Orlando, Gallo, Trapano, Pafaro, and Alessia, in Sicily; and the bays of Porto Ferraro, and Porto Longone, in the island of Elba. We have thought it necessary to give a particular account of the various seas, gulfs, and bays, in Italy, because, without a competent knowledge of these, neither the ancient Roman authors, nor the history nor geography of the respective countries, can be well understood.

Mineral Springs abound in many parts of Italy; some of them are hot, some warm, and many of sulphurous, chalybeate, and medicinal qualities, of use in many distempers. Several of the mountains contain mines that produce great quantities of emeralds, jasper, agate, porphyry, lapis lazuli, and other valuable stones; beautiful marble is also found all over the kingdom. The ridgy parts of Sardinia yield a great quantity of metals and minerals, as gold, silver, lead, iron, sulphur, and alum; curious crystals and coral are found on the coast of Corsica. Near Tivoli in Naples, a mill is erected for forging and fabricating iron and copper.

With respect to the population of Italy, the number of inhabitants, in the time of Pliny, was computed at 24,000,000; but as the modern Italians are in a great measure free from the unintermitting wars, and colonizations, which, till about two centuries ago, had almost depopulated their country, it may therefore not be thought extravagant, if we estimate them at 20,000,000; towards which, the king of Sardinia's subjects are reckoned at 2,300,000; the city of Milan, by the best computation, contains 300,000, and the duchy is proportionably populous; and population has no doubt been greatly promoted by the encouragement

which has been for some time given to agriculture and manufactures of all kinds. In their persons, the Italians are generally of a middling size, well proportioned, with black hair, thin faces, and expressive countenances. Their women are well shaped, and very amorous; inasmuch that the marriage ties, especially of the better sort are said to be very little regarded in Italy. Every wife has been represented to have her cisibee, or gallant, with whom she keeps company, and sometimes cohabits, with very little ceremony, and no offence is taken on either side: but this practice prevails chiefly at Venice, where parents, to prevent their sons marrying unsuitably, or contract diseases by promiscuous amours, hire mistresses for them for a month, or a year, or some determined time; and concubinage, in many places of Italy, is an avowed licenced trade: the Italian courtizans, or bona roba's, as they are called, make a kind of profession in all their cities; so little do they reflect on the impropriety of this and many other customs, that are considered as criminal in other countries professing Christianity: they are however affable, courteous, ingenious, sober, and ready-witted: but rather vindictive than brave, and more superstitious than devout.

The Italians are fond of greens, fruit, and vegetables of all kinds, which contributes to their contentment and satisfaction; and an Italian gentleman or peasant can be luxurious at a small expence, the people being in general temperate both in eating and drinking. Boiled snails, served up with oil and pepper, or fried in oil, and the hinder parts of frogs, are esteemed delicate eating. Kites, jack-laws, hawks, and magpies, are eaten here, even by the better sort of people; the Italian cooks, however, and the uncleanly manner of serving up victuals, which is for the most part of a very bad quality, are said to be very disgusting to an Englishman. In their dress, they conform to the fashions of the countries on which they border, or to which they are subject; but in general they affect a medium between the French volubility, and the solemnity of the Spaniards. They neither hunt, walk, ride, play at bowls, or take any other manly exercise, so much have they degenerated from those heroes whose descendants they without shame boast themselves to be, and on that very account look upon the rest of mankind with contempt. Masquerades, operas, and other musical entertainments, gaming, horse-races without riders, assemblies, and pompous religious exhibitions, are their only amusements.

We must not, however, omit a description of the Cocagna, which is a diversion relished by people of the first rank in the polished city of Naples, where they pretend to tell us that the very vagrants in the streets are instructed in history, and the human mind is refined by poetry, softened by music, and elevated by religion. The Cocagna is an entertainment given to the people four succeeding Sundays during the carnival. Opposite to the palace a kind of wooden amphitheatre is erected.

 This

This being covered with branches of trees, bushes, and various plants, real and artificial, has the appearance of a green hill. On this hill are little buildings, ornamented with pillars of loaves of bread, with joints of meat, and dried fish, varnished and curiously arranged by way of capitals. Among the trees and bushes are some oxen, a considerable number of calves, sheep, hogs, and lambs, all alive and tied to posts. There are, besides, a great number of living turkies, geese, hens, pigeons, and other fowls, nailed by the wings to the scaffolding. Certain heathen deities appear also occasionally upon this hill, but not with a design to protect it. The guards are drawn up in three ranks, to keep off the populace. The royal family, with all the nobility of the court, crowd the windows and balconies of the palace, to enjoy this magnificent sight. When his majesty waves his handkerchief, the guards open to the right and left; the rabble pour in from all quarters, and the entertainment commences. You may easily conceive what a delightful sight it must be to see several thousand hungry beggars rush in like a torrent, destroy the whole fabric of loaves, fishes, and joints of meat, overturn the heathen deities for the honour of Christianity, pluck the fowls, at the expence of their wings, from the posts to which they were nailed; and in the fury of their struggling and fighting for their prey, often tearing the miserable animals to pieces, and sometimes stabbing one another. It must be observed, that of late years the larger cattle have been previously killed.

The day here is reckoned from sun-set to sun-set, and their clocks are made to strike the 24 hours. The houses in Italy are far inferior to those in England for convenience, the accommodations at the inns very coarse and slovenly, and, which is the greatest evil of all, travellers are infested day and night with infinite numbers of gnats, fleas, bugs, and lice.

The Roman-Catholic religion is the only one established in Italy; but all sects, though not tolerated, are found there, provided they do not scoff at or insult the worship of the country.

The most solid foundations for the temporal power of the Papacy were laid by the famous Matilda, countess of Tuscany, and heiress to the greatest part of Italy, who bequeathed a large portion of her dominions to the famous pope Gregory VII. who, before his accession in 1073, was well known by the name of Hildebrand. The ignorance of the laity, and other causes, operated to the aggrandisement of the popes, and the extension of their authority, previous to the reformation. Ever since that era, the state of Europe has been such, that the Roman pontiffs have had more than one great weight in its public affairs, chiefly thro' the weakness and bigotry of temporal princes, who seem now to be recovering from their religious delusions; and the papal influence has received a considerable check from the wise conduct and moderation of the emperor of Germany.

The chief part of the religion of the Italians consists in an external observance and practice of ecclesiastical rites, ceremonies, and injunctions. An Italian, not enlightened by reflection and experience, will sooner commit adultery than eat any flesh meat on a Friday; but a foreigner, who wishes to pass for a Roman-Catholic, need only to affix to his window an attestation, by a physician, that his state of health requires a flesh meat diet; and he may, without any risk, eat flesh meat in Lent: such attestations may be purchased in coffee-houses in Florence. The ecclesiastical government of the Papists is centered in the popes and cardinals; the latter should be 70 in number, but it is seldom complete. They are always appointed by his holiness, who takes care to have a majority of Italians among them, that the chair may not be removed from Rome, as it was once to Avignon in France, the then pope being a Frenchman. When foreign prelates are to be promoted to the cardinalship, the pope regulates himself according to the nomination of the princes who profess the tenets of the church of Rome. His chief minister is styled the cardinal patron, and is generally a nephew, or some other near relation. In the consistory, which is a meeting of the pope and cardinals, the latter pretend to control the former in matters both spiritual and temporal, and they have even been known to prevail; but this rarely happens. The conclave is an assembly of the cardinals upon urgent occasions, particularly at the election of a pope; when it has been known, particularly in 1721, that animosities and disputes have run so high, that, forgetting they were to attend to divine inspiration in their proceedings, they came to blows with both their hands and feet, and threw the ink-stands at each other, thus transmuting the conclave, for a time, into a boxing-stage. The reign of a pope is seldom of long duration, being generally old men at the time of their election.

The pope, on his elevation to the chair, gives in his creed, which, respecting the inferior articles, is in substance as follows: That he firmly admits the apostolical and ecclesiastical traditions, and the constitutions of the church of Rome,—admits the Holy Scriptures in the same sense that holy mother church doth,—believes in seven sacraments, as instituted by Jesus Christ, and necessary to salvation, namely, baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage,—embraces all the determinations of the council of Trent, respecting original sin and justification,—professes, that in the mass there is offered to God a propitiatory sacrifice for quick and dead; that the bread and wine are transubstantiated into the very body and blood of Christ,—and that the cup is to be denied to the lay people,—that there is a purgatory,—that departed saints are to be worshipped and prayed to,—that they offer to God the prayers of the faithful, and their relics are to be revered,—that the images of Christ, the Virgin Mary, and other saints, are to be honoured and had in veneration,—that Christ left the power of indulgences, for

earned men, no coun-
and poets, both ancient
and

and modern, than Italy. Among the former of these, are Cicero, Virgil, Horace, Livy, Tacitus, and Lucan. After the reduction of the Roman empire, learning suffered a total eclipse; but since the revival of it, some Italians have succeeded in controversial learning, though they are chiefly celebrated by bigots of their own persuasion. Galileo, Torricelli, Malpighi, Borelli, and several others, have shone in the mathematics and natural philosophy. Strada, Fra. Paoli, Guicciardin, Bentivoglio, Davila, and Machiavel, have all been celebrated as excellent historians; and the latter yields the palm to few of his successors, either as a political or comic writer. Boccace has been esteemed as one of the most pure and correct writers with respect to style: he was a very natural painter of life and manners, but wrote in too licentious a spirit. Metastasio has acquired great reputation by his dramatic pieces set to music. Sannazaro, Pincatorius, Bembo, Vida, and some others, have distinguished themselves by the elegance, correctness, and spirit of their Latin poetry; as Tasso and Ariosto have for their Italian.

The painters, sculptors, architects, and musicians of Italy, have never yet been equalled by those of any other nation. Raphael, Titian, Julio Romano, Correggio, Caraccio, Veronese, and many more, remain unrivalled in the first of these arts, as Michael Angelo does in all three. Bramante, Bernini, with several more of their countrymen, carried sculpture and architecture to an amazing degree of perfection. Their professors of music, at the head of which stands Corelli, are almost innumerable, and most of them inimitable.

The universities in Italy are those at Rome, Venice, Florence, Mantua, Padua, Parma, Verona, Milan, Pavia, Bologna, Ferrara, Pisa, Naples, Salerno, and Perugia. Pisa hath forty-six professors.

The natural and artificial curiosities of Italy, both in ancient and modern times, are alike stupendous, great, and beautiful. Mount Vesuvius, five miles distant from Naples, is remarkable for its eruptions of fire from the top. Its height has been computed to be 3900 feet above the surface of the sea. The younger Pliny, who was a witness to what he wrote, has given a striking description of its ravages in the year 79. In 1631 it broke out with great fury, and spread desolation for several miles around. There was a still greater eruption in 1694, which continued near a month, when burning matter was thrown out with so much force, that some of it extended thirty miles, and a vast quantity of melted minerals, mixed with other matter, ran down like a river for three miles, carrying every thing before it. In 1707 another eruption happened, when such quantities of cinders and ashes were thrown out, that it was dark at Naples at noon-day. A violent eruption in 1767, when the ashes, or rather small cinders, showered down so fast at Naples, that the people in the streets were obliged to use umbrellas, or other coverings, to guard themselves from hurt. The

tops of the houses, and the balconies, were covered with these cinders; and ships at sea, twenty leagues from Naples, were also covered with them, to the great astonishment of the sailors. This is reckoned to be the twenty seventh eruption from that which destroyed Her. Museum in the time of Titus. In 1766, an eruption also happened, and another in 1779. The declivity of this mountain, towards the sea, is everywhere planted with vines and fruit-trees; and it has been observed, that the sulphureous and nitrous manure, which proceeds from this raging volcano, and the heat of its subterraneous fires, contribute not a little to the uncommon fertility of the circumjacent country, and to the profusion of fruits and herbage with which it is every where covered.

The other remarkable burning mountain is that of Ætna, in Sicily, of a circular form, and terminates in a cone; it is 10,954 feet in height, and has been computed to be sixty miles in compass. Its fiery eruptions have always rendered it celebrated in history: in one of these, which happened in 1669, fourteen towns and villages were destroyed, and there have been several terrible eruptions since that time. An earthquake, very destructive in its effects, commonly precedes the eruption from this mountain. In 1693, the port-town of Catania was overturned, and 18,000 people perished. The lower parts of the mountain are very fruitful in corn and sugar-canes; the middle abounds with woods, olive-trees, and vines; and the upper part is almost the whole year covered with snow. Mount Ætna is by the Italians called Monte Gibello, or Mongibello: it is so high, that it harbours many wild beasts.

The valley of Soltafara, between the lakes Agnano and Puzzeli, is remarkable for the vast quantities of sulphur that are continually forced out of the cliffs by subterraneous fires. The grotto del Cani is also noted for its poisonous steams, and is so called from their killing dogs that enter it, if forced to remain there. Scorpions, vipers, and serpents, are said to be very numerous in Apulia. To the natural curiosities of Italy, we may likewise add those vast bodies of snow and ice called glaciers and ice-vallies. Of these there are five, which reach almost to the plain of the vale of Chomouny, and are separated by wild forests, corn fields, and rich meadows; the whole affording a very romantic and striking appearance. These several vallies of ice, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite together at the foot of Mount Blanc; the highest mountain in Europe, and probably of the ancient world; its height, above the level of the sea, being 2391½ French toises, or 15,303 English feet.

A great variety of artificial curiosities, and monuments of antiquity, are to be found in the city of Rome only; among which are, the aqueducts and fountains; the Vatican, and the other palaces; the Campidolio, where the Roman senate resides; the Pila Militaria, of fine marble; the equestrian brass statue of

Marcus

Marcus Aurelius Antoninus; the marble monument of the emperor Alexander Severus; marble busts of the emperors and their consorts; three brick arches of the temple of Peace, built by the emperor Vespasian, and that of Concord; the Coliseum, or amphitheatre, built by the emperor Vespasian, in the construction of which 12,000 Jewish captives were employed; it is said to have contained 87,000 spectators seated, and 20,000 standing; the triumphal arch of Septimus Severus, of Titus, of Galienus, and the temple of Antoninus; some parts of the cloaca, maxima; the columna Antonina, representing the principal actions of Marcus Aurelius; the columna Trajani, or Trajan's Pillar; some fragments of the Basilica, or palace of Antoninus Pius, now the custom-house, and of Narva's forum; the mausoleum of Augustus, in the Strada Pontifici; the remains of the emperor Severus's tomb without St. John's Gate; the pyramid of Caius Cestus near St. Paul's Gate; the porphyry coffin of St. Helen, and the original statue of Constantine the Great, in the church of St. John of Lauran; a font of oriental granite, in the chapel of St. Giovanni in fonte, said to have been erected by Constantine the Great; an Egyptian obelisk near the church of St. Maria Maggiore; the stately remains of Dioclesian's baths; the celebrated pantheon; the obelisks of Sesostris and Augustus by the Clementine college; the church of St. Paulo fuori della Mura, said to have been built by Constantine the Great; the mausoleum of Adrian; Marcellus's theatre; the Farnese Hercules, of white marble, of a Colossean size and exquisite workmanship, in a court of the Farnese palace, and an admirable groupe cut out of one block of marble, in another court of the same place. Indeed it must be allowed, that no city in the universe equals Rome for the multiplicity of fine fountains, noble edifices, antiquities, curiosities, paintings, statues, sculptures, &c. The cloaca or catacombs, in the neighbourhood of Rome and Naples, were places where the Christians who never burned their dead, and such of the Pagan Romans as could not afford the expence of burning, were buried; they are long narrow alleys, scarcely broad enough for two persons to go abreast, but sufficiently high for the tallest man to stand upright. They extend a prodigious way under ground. On each side are three holes or cavities, each of which will contain the coffin of a full-grown person. The cave of Paulilippo is a broad, straight, subterraneous road, hewn through a mountain. Two holes on each side admit air and light. This cave is, at the entrance, 100 feet high, but diminishes; and the whole, which is paved with broad stones, is about half a mile long.

An inexhaustible mine of curiosities are daily dug out of the ruins of Herculaneum, a city lying between Naples and Vesuvius, which, in the reign of Nero, was almost totally destroyed by an earthquake; and afterwards, in the first year of the reign of Titus Vespasian, overwhelmed by a stream of the lava of Ve-

svivius. The streets and houses, in some places, were filled up with the melted lava to the height of sixty feet above the tops of the latter, and in others 110 feet. This lava, which is now of a very hard consistency, is composed of bituminous particles mixed with cinders, minerals, metallics, and vitrified sandy substances, which form a close and heavy mass. In 1713, upon digging into these parts, somewhat of this unfortunate city was discovered, and many antiquities were dug out; but the people of Italy being for the most part indifferent about objects of antiquity, the search was discontinued till the year 1736, when the king of Naples employed men to dig perpendicularly eighty feet, whereupon not only the city made its appearance, but also the river which ran through it. The temple of Jupiter was then discovered, and the whole of the theatre. In the temple was found a statue of gold, and the inscription that decorated the great door of entrance. In the theatre, the fragments of a gilt chariot of bronze, with horses of the same metal, likewise gilt: this had been placed over the principal door of entrance. Multitudes of statues, bustoes, pillars, paintings, manuscripts, furniture, and various utensils, were likewise found among the ruins of this city. The streets appear to have been quite straight and regular, the houses well built and uniform; some of the rooms were paved with mosaic, others with fine marbles, others again with bricks three feet long and six inches thick. The town of Pompeia was destroyed by the same eruption of Mount Vesuvius, which occasioned the destruction of Herculaneum; but the ruins were not discovered till near forty years after those of Herculaneum.

Each city and town of Italy contains many rarities in architecture, painting, and sculpture. St. Peter's church at Rome is thought to be the most astonishing, bold, and regular fabric in the universe. The height, from the pavement of the church to the top of the cross, is 593 palmi, or 405 French, and 433 English feet. In this church is a superb white marble monument of the countess Matilda. The house and chapel of Loreto is rich beyond imagination, notwithstanding the ridiculous romance which composes its history. The name Loreto is derived from Laurita, the lady in whose field the santa casa was pitched before the reformation; the number of pilgrims, who visited the holy house in a year, is said to have amounted to 200,000; but now they seldom exceed 40, or 50,000.

Every Italian state having a distinct form of government, trade, and interest, that the reader may be the better enabled to form an idea of the whole, we shall take a distinct view of each.

The king of **SARDINIA**, as duke of Savoy and prince of Piedmont, has always been considered as a powerful prince in Italy, of which he is called the Janus, or keeper, against the French. Turin, his capital city,

city, is elegant; but barren, very hard, his own field, in time foreign field. Britain, in Europe natural grandize what me

duke of Savoy and been considered as a hich he is called the ch. Turin, his capital city,

city, is strongly fortified, and ornamented with many elegant structures; it contains about 60,000 inhabitants; but the country of Savoy is mountainous and barren, and its natives, who are esteemed a simple, but very honest people, are forced to seek their bread all over the world. The king's ordinary revenue, besides his own family provinces, amounts to 500,000l. sterling at least, out of which he maintains 15,000 men in time of peace; but, during a war, when assisted by foreign subsidies, he can bring 40,000 men into the field. This prince has long been an ally of Great-Britain, for the preservation of the balance of power in Europe, and to that circumstance, in which also his natural interest consists, he principally owes his aggrandizement. The king being absolute, can levy what monies he pleases upon his subjects.

We have been favoured with the following biographical anecdotes of the prince royal of Sardinia:

" Charles-Emanuel-Ferdinand-Maria, heir to the throne of Sardinia, was born on the 24th of May 1751. He was educated under cardinal Gerdil, a most accomplished ecclesiastic, who inspired him with a sincere piety, and at the same time inculcated a love for letters into his youthful mind. It was he too, who banished from his bosom that hereditary attachment to military men, which has been so prejudicial to his family.

" The prince of Piedmont evinces the most dutiful respect for his father, and a sincere affection for his wife, his brothers, and his sisters. He is of a religious disposition, but there is nothing gloomy, sanguinary, or hypocritical in his devotion.

" His filial duty often forces him to conceal his aversion to the grandees who surround and often disgrace the throne; and he refuses to assist at the cabinet councils, as he has been taught by experience, that he possesses but little influence there.

" His majesty, one day finding himself embarrassed by the blunders of his ministers, communicated his chagrin to the heir apparent. — 'Sire, (replied the prince, at the same time producing his watch) behold this little piece of mechanism: it always goes well; and the reason is, because I always regulate it with my own hands.—The king was not insensible to the true meaning of this reply.

" It is always with great regret that his highness sees his father giving up the whole of his attention to the war department. When the Savoyards exclaim against the tyranny of their governors, it is the prince of Piedmont alone who prevents their cottages from being reduced to ashes; if it were not for this prince, Granet would be instantly dismissed from office; and this great minister, who is the friend of justice and of humanity, would be obliged to make way for some ignorant pretender.

" This prince, always occupied in doing good, shares but little in the pleasures of the court of Turin; the nobles, by way of ridicule, call him *Ilypocombice*; but is he not better entitled to the appellation of the *amiable*?"

Victor-Amadens-Maria, king of Sardinia and duke of Savoy, was born June 26, 1726; married April 12, 1750, to Maria-Antionetta-Ferdinauda, infanta of Spain; ascended the throne on the death of his father, February 20, 1773. Their issue are, 1. Charles-Emanuel-Ferdinand-Maria, prince of Piedmont, born May 24, 1751.—2. Maria-Josepha-Louisa, born Sept. 2, 1753; married to the count de Provence.—3. Maria-Theresa, born Jan. 31, 1756; married to the count d'Artois.—4. Anna-Maria-Carolina, born Dec. 17, 1757.—5. Victor-Emanuel-Cajetan, duc d'Aoste, born July 24, 1759.—6. Maurica-Joseph-Maria, duc de Montserrat, born Sept. 12, 1762.—7. Maria-Charlotta, born Jan. 17, 1764.—8. Charles-Joseph, duc de Génévois, born April 6, 1765.—9. Joseph-Benedict, comte de Maurienne, born Oct. 5, 1766.

The MILANESE, in the possession of the house of Austria, is a very formidable state; and formerly, when governed by its own dukes, gave law to Italy. Milan, its capital, is fortified with a wall and rampart; and has a citadel, in which is a foundery for cannon, and an arsenal furnished with arms for 12,000 men. The environs are very pleasant, being adorned with beautiful seats, gardens, orchards, &c. Here is a magnificent cathedral in the Gothic taste, which contains a very rich treasury, consisting chiefly of ecclesiastical furniture composed of gold, silver, and precious stones. The natives are fond of literary and political assemblies, where they converse almost on all subjects; their number is computed at about 250,000. The annual revenue of the duchy is above 300,000l. by which an army of 30,000 men is maintained. There are but few exports from hence; so that its revenue, unless the court of Vienna should pursue some other system of improvement, cannot be much bettered. The beggars here ask alms by holding out a dish in which is placed a human skull. The duchy of Mantua being now incorporated with the Milanese, the name of Austrian Lombardy is given to the whole province.

GENOA was once a very powerful republic, but is now greatly degenerated both in strength and opulence, though the spirit of trade still continues among all ranks. The capital, of the same name, is a most superb city, and contains some very magnificent palaces, particularly those of John Doria, the beneficent founder of the republic, and Durazzo. The chief safety of this republic consists in the jealousy of other European powers, because it would be a most valuable acquisition to any one of them. Its maritime power is dwindled down to six gallees. The common people are wretched beyond expression, as is the soil of its territory. Some parts near the sea are tolerably well cultivated. The city of Genoa contains about 150,000 inhabitants, among whom are many rich trading individuals. The government of this country is aristocratical, being vested in the nobility: the chief person is called the

doge, or duke, to which dignity no one can be promoted till he is fifty years of age. The doge gives audience to ambassadors; all orders of government are issued in his name, and he is allowed a body guard of 200 Germans. Every two years a new doge is elected, and the former is deemed incapable of holding the same post again till after five years. The empire of the sea was for many years disputed between this state and that of Venice.

We shall here introduce an affecting and accurate description of the galley-slaves of Italy: "Five sorts of wretches, says our author, are fattened indiscriminately to the chains; malefactors, smugglers, deserters, Turks taken by the corsairs, and *voluntary galley-slaves*. These latter are poor men, whom government get hold of, between hunger and death. They watch and wait for them in a narrow passage. These wretched beings, dazzled with a little money, do not perceive the galleys, and are enlisted into the servitude. Poverty and guilt are bound in the same chain; the citizen who serves the republic, suffers the same punishment with him who has betrayed it!

"The Genoese carry their barbarity still further: when the term of their inliffing is near expiring, they propose to lend a little money to these miserable creatures. Unhappy men are eager for enjoyment; the present moment alone exalts for them; they accept; but at a week's end nothing remains to them but regret and slavery; inasmuch that, at the expiration of that time, they are compelled to inlist again, to discharge their debt, and sell eight years more of their existence: thus do the greatest part of them consume, from inliffments to loans, and from loans to inliffments, their whole lives at the galleys, in the last degree of wretchedness and infamy: there they expire!

"We saw among them a Frenchman, a young man. In relating to us his misfortune, he shed tears. We made him a trifling present, and his tears flowed still more abundantly.—Let us escape from these sorrowful abodes, where we are unable to alleviate the miseries we lament. What abodes must those be where pity is of no avail!

"But what is that kind of prison in the corner?" said I to the man who conducted me. How low, damp, and dark it is! It consists nevertheless of two stories. What are those animals stretched out on the ground, and on the upper floor? They can scarcely crawl.—Those hideous heads, which peep out from beneath the blankets, are covered with long hair; their looks are stupid and ferocious. Do they eat nothing but this hard black bread?—Certainly not. Do they always continue lying?—Yes.—How long have they been here?—Twenty years.—How old are they?—Seventy.—What do you call them?—Turks.

"These miserable Turks are totally degraded from humanity. They are strangers to every thing but bodily

wants. They have worn out, in this sort of tomb, the small number of ideas and recollections they brought with them from nature and their country.

"The other Turks, who are not sixty years old, are chained under little niches opened at the distance of every six feet in a long wall, where they can scarcely sit or lie. There they respire the little air that is allowed them, or rather that they can steal.

"The Genoese, however, have given an example of toleration but little to be expected from them; they allow these Turks a mosque; the Protestants in France have no temples!

"Let us add one trait more to this picture of the galleys. I saw the wretches falling from bench to bench: covering, disputing, stealing even the fragments of aliments which the dogs in the streets had refused.

"Genoa, thy palaces are not sufficiently lofty, spacious, numerous, and brilliant!—we still perceive thy galleys!"

The republic of VENICE is one of the most celebrated in the world, on account of its constitution and the power it once possessed. It contains several fine provinces, on the continent of Italy, some islands in the Adriatic, and part of Dalmatia. The constitution was originally democratical, the magistrates being chosen by a general assembly of the people, and continued thus for 150 years; but, after various changes, a body of hereditary legislative nobility was formed, and a complete aristocracy at length established. The nobility are divided into six classes, amounting in the whole to 2500, each of whom, at 25 years of age, has a right to be a member of the grand council. These elect a doge, or chief magistrate, in a peculiar manner, by ballot. The doge is invested with great state, and with the emblems of supreme authority. He annually, on Ascension-day, espouses the Adriatic sea, by dropping into it a ring from his bucentaur, or state-berge, attended by those of all the nobility. But notwithstanding the insignia of royalty with which the doge is invested, he enjoys very little power, and is shut up in the city as a prisoner, while the government and laws are managed by different councils and nobles. The college, or signory, is the supreme cabinet council of the state, and also the representative of the republic: its power is very extensive. The council of ten takes cognizance of state crimes. But the tribunal of state inquisitors, which consists only of three members, and which is in the highest degree arbitrary in its method of proceeding, has the power of deciding without appeal on the lives of every citizen belonging to the Venetian state; the highest of the nobility, not excepting even the doge himself: they may seize suspected persons, and try and execute those whom they think worthy of punishment, when they think proper. Having keys to every apartment of the palace, they have liberty to penetrate

not afterwards responsible for their conduct while in
authority.

The city of Venice is situated on 72 islands at the
bottom of the north end of the Adriatic sea, and is
separated from the continent by a marshy lake of five
Italian miles in breadth, too shallow for large ships to
navigate, which forms its chief strength. This city
preserves the vestiges of its ancient magnificence, but is
in every respect degenerated, except in the passion which
its inhabitants still retain for music and mummery dur-
ing their carnivals. They have had, however, lately,
some spirited differences with the court of Rome, and
seem disposed to throw off their obedience to its head.
The grandeur and convenience of the city, particularly
the public places, the treasury, and the arsenal, are be-
yond expression. Over the several canals of Venice
are laid near 500 bridges, most of which are stone.
All the orders of Venetian nobility are dressed in black
gowns, large wigs, and caps which they hold in their
hands.

With respect to their persons, the Venetians are in
general tall and well-made, and many fine manly coun-
tenances are seen in the streets of Venice; they are
also a lively, ingenious people, extravagantly fond of
public amusements, with an uncommon relish for
humour. The women are of a fine style of counte-
nance, with expressive features, and are of an easy ad-
dress. The common people are remarkably sober,
obliging to strangers, and gentle in their intercourse
with each other. The diversions of the Venetians are chiefly
masquerading, especially during the carnivals, and other
festivals, when debauchery, riot, and licentiousness are
said to be carried to their greatest height; but this opi-
nion seems to exceed the truth: they have also ridottos,
operas, and plays, which are commonly wretched per-
formances. There are eight or nine theatres here, in-
cluding the opera houses. Great numbers of strangers
visit Venice during the time of the carnival. The
grand scene of all the shews and follies during the
festivals, is the square of St. Mark, in which bulls are
sometimes baited, and where, at such times, 15,000
people, it is said, often assemble. The inhabitants,
who are computed at 200,000, walk on foot, except
the principal ladies of fashion, who are carried in chairs,
the streets being too narrow, steep, and crooked, to admit
of wheel carriages.

The Venetians have still some manufactures in scar-
let cloth, gold and silver stuffs, and, above all, fine
looking glasses, all which bring in a considerable re-
venue to the owners; that of the last annually is said
to amount to 8,000,000 of Italian ducats, each val-
ued at 20d. of our money: out of this are defrayed
the expences of the state, and the pay of the army,
which, in time of peace, consists of 26,000 regular

troops, under the command of a foreign general, and
19,000 militia. Their fleet, which is but small, prin-
cipally consists of galleys, for curbing the insolencies
of the piratical states of Barbary. The Venetians are,
however, still reckoned the greatest naval power in Italy.

Here are two patriarchs, which preside over eccle-
siastical matters; the authority of one reaches over all
the provinces, but neither of them have much power;
and both of them are chosen by the senate: every reli-
gious sect, even the Mahometan and Pagan, excepting
Protestants, are tolerated here in the free exercise of
their religion. The inquisition is under great restric-
tions here.

The Venetian dominions consist of a considerable
part of Dalmatia, of four towns in Greece, and of
the islands of Corfu, Pachsu, Anipachsu, Santa Mau-
ra, Curzolari, Valli Compare, Cephalonia, and Zante.
Their territories in Italy contain, besides the du-
chy of Venice, the Paduanese, the peninsula of Ro-
vigo, the Veronese, the territories of Vicenza and
Brescia, the districts of Bergamo, Cremasco, and the
Marca Trurgiana, with part of the country of Friuli.
The subjects of the Venetian republic are not op-
pressed; the senate being sensible, that mild and gen-
tle treatment conduce more effectually than severity to
the welfare of the state and the happiness of individuals.
One of the smallest pieces of money at Venice is
called gazetta; and the first news-papers, published
there, on a single leaf, having been sold for that apiece,
news-papers were from thence styled gazettes.

The grand duchy of TUSCANY is now possessed by a
younger branch of the house of Austria, under the
title of grand duke of Tuscany. Its annual revenues
are, at present, computed at 550,000l. sterling; and it
is thought that the duchy of Tuscany can bring 30,000
men into the field. The inhabitants affect great state,
but do not esteem trade as beneath the first nobleman.
Accordingly, it is not uncommon for the gentry, and
even some of the nobility, to sell wine by retail from
their cellars. But the principal trade of this duchy is
carried on at Leghorn, a handsome town, and a free-
port, situated in the territories of Pisa, about thirty-
five miles south-west of Florence. The number of
inhabitants in Leghorn are said to be about 40,000,
among whom are reckoned 20,000 Jews, who live in a
particular quarter of the city, have a handsome syna-
gogue, and, though subject to very heavy taxes, are in
a thriving condition, the greatest part of the com-
merce of this city being carried on by these people.

Florence, the capital of Tuscany, is situated on the
river Arno, over which are four stone bridges, and de-
fended by a good citadel. The streets, in general, are
very narrow and crooked, are paved with a greyish
stone, and are tolerably clean. There are a great num-
ber of palaces, churches, convents, and hospitals: the
cathedral is a very noble edifice, the outside is entirely
built with polished marble, and enriched with exquisite
architecture

architecture and sculpture; and from the ball over the cupola, there is a delightful prospect of all the palaces, churches, monasteries, &c. within the walls, and of near two thousand villas without. By the church stands the much celebrated Campanile, or square steeple, which is one hundred and eighty feet high, all of fine marble, of several colours, and curiously wrought. The baptistery, or font, where all the children of the city are baptized, is well worthy attention. The rest of the churches in general are very beautiful, and contain many fine paintings and other pieces of art. This city was long possessed by the illustrious house of Medicis, who made it the repository of all that was valuable, rich, and masterly in architecture, literature, and arts, especially those of painting and sculpture. The celebrated Venus of Medicis, which has long been considered as the standard of taste in female beauty and proportion, stands in a room called the Tribunal, in a group of other ancient statues, some of which are said to be the works of Praxiteles, and other Greek masters. It is of white marble, and appears, from an inscription on the base of the statue, to have been the performance of Cleomenes, an Athenian, the son of Apollodorus. The duke has also several noble country seats, enriched and adorned in the same magnificent manner. The arsenal is a stately building, and well furnished with all sorts of weapons of war. Florence is adorned with seven fountains, six columns, two pyramids, and about an hundred and sixty public statues. The great piazza, or square, is very spacious and magnificent, with a noble fountain in the centre of it. The city is thought to contain 70,000 inhabitants. They deal, besides wine and fruits, in gold and silver stuffs. The inhabitants boast of the improvements they have made in the Italian tongue, by means of their Academia della Crusca: several other academies are now established in Florence. Since the accession of the archduke Leopold, brother of the present emperor, to this duchy, a great reformation has been introduced, both into the government and manufactures, to the great benefit of the finances. The other principal towns of Tuscany are Pisa, and Sienna, which are now much decayed.

LUCCA is a small republic, under the protection of the emperor, and situated on the Tuscan sea, in a most delightful plain. It is not above thirty Italian miles in circumference, but exceeding fruitful and populous. The inhabitants, who are said to amount to upwards of 120,000, are remarkable for their industry and love of liberty: being in full possession of freedom, they appear with an air of cheerfulness and plenty, seldom to be met with among their neighbours. They have improved their country into a beautiful garden, so that the annual revenue of the state amounts to 80,000l. sterling. They are under the protection of the house of Austria. Their capital, Lucca, is an ancient city

about three Italian miles in circumference. The houses, in general, are well built, the streets broad and well paved, but irregular, and the number of inhabitants about 40,000. Several manufactures, especially those of silk, are carried on here; and the finest oil of any in Italy is made in this republic.

ST. MARINO may be considered as a geographical curiosity, consisting only of a single mountain, and a few hillocks scattered round the bottom of it. The founder of this republic was a Dalmatian mason, called Marino, who, about the year 460, turned hermit, and chose this mountain for the place of his abode. His devotion and austerity soon gained him a great reputation for sanctity, and the princes of that country made him a present of the mountain. Many, out of veneration for the saint, settled there, and laid the foundation of a republic which still subsists, and bears the name of the saint. The town is situated on the summit of the mountain, and can be approached by one path only. It is under the protection of the pope, and the number of inhabitants are computed at 5000. The manners of this people are very inoffensive, and the government is in the hands of a council, composed of half nobles and half plebeians.

PARMA, PLACENTIA, and GUASTALLA, form at present one of the most flourishing states in Italy, for its extent. The present duke is a prince of the house of Bourbon, and son to the late Don Philip, the king of Spain's younger brother. The soil is remarkably fertile, produces the finest fruits and richest pasturage, and the country contains considerable manufactures of silk. The annual revenues are computed at 100,000l. sterling. Parma is supposed to contain 50,000 inhabitants, and Placentia about 28,000. Here is a bishop's see and an university; and some of its magnificent churches are painted by the famous Correggio. The cities of Parma and Placentia are enriched with magnificent buildings: but his Catholic majesty, on his accession to the throne of Naples, carried away with him many of the most remarkable pictures and moveable curiosities. The duke's court is thought to be the politest of any in Italy. This country was for some years past the seat of a bloody war between the Austrians, Spaniards, and Neapolitans.

MANTUA, formerly a rich duchy, is now much decayed. Its government is annexed to that of the Milanese. The capital is one of the strongest fortresses in Europe, and contains about 16,000 inhabitants, who claim Virgil as their countryman. By an order of the emperor in 1785, this duchy is incorporated with that of Milan into one province, and is now to be called Austrian Lombardy. It formerly brought to its own dukes 500,000 crowns a year.

solate within his own dominions; but a vassal of the empire, and under the protection of the house of Austria. The capital, also called Modena, is a large and populous, but not a handsome city. The ducal palace is a noble edifice, in which, among other fine pictures, the birth of Christ by Correggio, called la Notte de Felice, is greatly admired. Correggio was a native of Modena. Here is a college founded by St. Carlo Borromeo, in which between 70 and 80 young noblemen are maintained and instructed in the sciences and genteel exercises. This duchy was greatly wasted by the late belligerent powers of Europe, but is very improvable.

The ECCLESIASTICAL STATE, of which Rome is the capital, lies in the centre of Italy. Under the ancient Romans this spot was a terrestrial paradise. Here most of the beautiful villas of antiquity were situated, and every part of it cultivated with the most assiduous care; but Popish superstition, bigotry, and oppression, have rendered it thin of people, and ill cultivated: so that many of the luxuriant tracts are now become marshes and quagmires, whose putrid effluvia render the capital itself very unhealthy at some seasons of the year. Several of the popes have endeavoured to improve their country, and revive that spirit of industry which was so prevalent in former times, but their labours have proved abortive. Indeed the discouragement of industry and agriculture, seems to be interwoven in the very constitution of the papal government, which is vested in proud lazy ecclesiastics. This beautiful country is now a mere desert, and the wretched inhabitants must perish with want, did not the amazing fertility of the soil spontaneously afford them a scanty subsistence.

Though the pope is truly despotic, and possesses one of the most fertile countries in the world, the revenues of his territorial possessions do not amount to more than a million sterling annually. His accidental income indeed formerly far exceeded that sum; but this is now greatly diminished by the separation of the Protestant powers, and the measures lately taken by those that still profess the Romish religion, to prevent the great remittances of money to Rome; add to this, the almost total suppression of the order of Jesuits, from whom he drew vast supplies; so that the taxes upon provisions and lodgings furnished to foreigners, who annually spend immense sums in visiting his dominions, form, at present, the greater part of the pope's accidental revenues. From what has happened within these 30 years past, there is reason to believe that the pope's territories will be reduced to the limits which the houses of Austria and France shall please to prescribe.

The pope has his guards, or Sbirri, like other princes, and these, under proper magistrates, take care of the peace of the capital. The Campagna di Roma, in which the capital is situated, is under the im-

mediate inspection of his holiness; but the other provinces are governed by legates and vice-legates. He monopolizes all the corn in his territories, and has always a sufficient number of troops to keep the provinces in awe. Few manufactures are carried on in the Ecclesiastical State, consequently its exports are of little value. Formerly all the Christian powers of Europe trembled at the nod of the pope, but affairs have now taken a very different turn; and his power, which, as a temporal prince, has been for some years contemptible, will probably be still more abridged, by the ambitious projects of the house of Austria and other states. The present pope, who has taken the name of Clement XIV. very wisely disclaimed all intention of opposing the forces of the adjacent princes, with any other arms but those of prayers and supplications. The pope's ecclesiastical government has been already mentioned.

Rome, the capital of the Ecclesiastical State, is situated on the Tyber, ten miles from the Tuscan sea. In the magnificence of its buildings, the number of its monuments, curiosities, and antiquities, together with the singularity and importance of its historical events, it far surpasses any city in the world. It is the centre and repository as it were of all that is exquisite in painting, sculpture, and architecture. From an account taken in the year 1714, the number of its inhabitants was found to amount to 145,000. The Tyber runs through the city from north to south, forming an island.

In external splendor, and the magnificence of its temples and palaces, modern Rome is, at least, equal to, if it does not excel, the ancient. The number of the churches are computed at about three hundred, the noblest and most elegantly beautiful is St. Peter's, which for the harmony of its architecture, fineness and great variety of carved and gilt works, paintings, statues, &c. cannot be viewed without a pleasing astonishment. Before it is a spacious and magnificent piazza, in the middle of which is an obelisk of granite or black marble, brought from Egypt, and reared at a prodigious expence. It is eighty feet high, and the pedestal on which it stands is thirty; on the top of it is a brass gilt cross. The annual revenue belonging to this church is upwards of 20,000l.—The Pantheon, commonly called the Rotunda, though it has lost much of its pristine grandeur, is still one of the most entire structures of the ancients in Italy. The citizens of Rome are more polite than in any other place in Europe; and are said to be entirely free from that spirit of bigotry and persecution which prevails in other Roman-Catholic countries. Here is plenty of all sorts of provisions, and a great variety of excellent wines; but in Rome they are drunk very moderately, and generally mixed with water.

Bologna, the capital of the Bolognese, is the second city in the Ecclesiastical State. The number of its inhabitants is computed at upwards of eighty thousand.

The fortifications are very inconsiderable, being only defended by a strong, high brick wall, adorned with a great number of towers, at certain distances. There are many fine palaces, convents, and churches in Bologna, adorned with a prodigious variety of fine paintings, statues, &c. The palace where the governor resides, and the courts of justice are held, stands in the great market-place, and is 208 common paces in length. Here is an university, and a museum. The inns at Bologna are the best in Italy, and all kinds of provisions are very plentiful. The inhabitants of Bologna are more industrious than in other parts of Italy, and remarkably polite to strangers; the women enjoy a great share of liberty; and the nuns are particularly ingenious in making artificial flowers, and imitating all kinds of fruits.

Ferrara, Ravenna, Rimini, Urbino, Ancona, and many other cities, illustrious in former times, now exhibit a melancholy scene of ruin and devastation.

Loretto, never thought or heard of in times of antiquity, is now the admiration of the world, for the riches it contains, the prodigious resort of pilgrims, and other devotees, to pay their devotions; it having been industriously reported by the Romish clergy, that the Santa Casa, or Holy House, in which the Virgin Mary dwelt at Nazareth, was carried hither through the air by angels, towards the end of the thirteenth century, attended with many miraculous circumstances. The votive pieces and jewels in this holy house and treasury, are of immense value, being the offerings of princes, princesses, and other great personages: the riches contained in the treasury are valued at nine millions of six-dollars. Seventeen golden lamps are continually burning before the Virgin, and thirty-seven silver ones in the other parts of the house. The gold chains, rings, jewels, emeralds, pearls, and rubies, wherewith the image of the Holy Mother is, or was loaded, are of inestimable value; and the angels of solid gold, placed on every side, are equally enriched with the most precious diamonds. To the superstition of Roman-Catholic princes, Loretto is chiefly indebted for this mass of treasure. The pavement of this house is of square pieces of red and white marble, and the whole is cased on the outside with the finest marble, adorned with statues, sculptures, and pillars of the Corinthian order; and over all is a fine spacious church, to preserve it from the injuries of the weather. One hundred and twenty-three masses are daily said in this church, and the Santa Casa.

NAPLES and **SICILY**, or the Two Sicilies, comprehending the ancient countries of Samnium, Campania, Apulia, Magna-Grecia, and the island of Sicily, form the largest kingdom in Italy, containing about 32,000 square miles. This country is bounded on all sides by the Mediterranean and Adriatic, except on the north-west, where it terminates on the Ecclesiastical State.

The soil is very fruitful, and much better cultivated than in the Ecclesiastical State; and the annual revenues amount to about 750,000l. sterling. The clergy are very numerous; but their influence and revenues have been lately abridged.

The capital is Naples, said to be the first city for strength and neatness in Italy. It is most advantageously situated, having a delightful country on one side, and a noble bay of the Mediterranean on the other; with a spacious harbour, which is kept in good repair, and fortified with a mole, extending above a quarter of a mile into the sea, and having at the extremity a high lantern to direct ships safely into the harbour during the night. The bay is one of the finest in the world, being almost of a semicircular figure, about thirty miles in diameter, and three parts of it sheltered by a circuit of woods and mountains. The circumference of the city, including the suburbs, is not less than 18 Italian miles, and the number of inhabitants about 300,000. The streets are well paved, but they are not lighted at night, and in many places are disfigured by stalls, on which provisions are exposed to sale. The houses are of stone, flat-roofed, and generally lofty and uniform; but many of them have balconies, with lattice windows. Naples abounds with fine churches, convents, fountains, and palaces of the nobility, many of whom constantly reside here. The magnificence of many of the churches exceeds all imagination; the cathedral, though of the Gothic order, is a very grand, splendid edifice. The palace belonging to the king is very magnificent, and in the best style of architecture. Here is an university and two academies of wits, one of which is called Gli Ardente, and the other Gli Osi. The arsenal is thought to contain arms for fifty thousand men. There are five piazzas, or squares, in the city, appropriated to the nobility, viz. Capuana, Nido, Montagna, Porto, and Porta Nova. The inhabitants frequently walk on the tops of their houses in the evening, to breathe the cool air, after a hot sultry day; and from some of the religious houses, there are several delightful prospects. The climate is so mild and warm in winter, that plenty of green-pease, artichokes, asparagus, and other vegetables, may be had all the winter: the city is supplied with water by means of an aqueduct from the foot of Mount Vesuvius. The people use great quantities of snow instead of ice for cooling their liquors; and certain persons who farm the monopoly of it from the government, supply the city all the year round from a mountain about eighteen miles distant.

The kingdom of Naples is a fief of the Ecclesiastical State, and his Neapolitan majesty annually presents the pope with a palfrey as an acknowledgement of his vassalage; but notwithstanding this customary homage, his holiness has no civil power in this kingdom, nor is the inquisition established in Naples. The king's present revenues amount to above 750,000l. sterling per annum, but it is more than probable that, by the new-

venues of the clergy, his Neapolitan majesty's annual
income will considerably exceed a million sterling.
The exports of the kingdom are pulse, hemp, aniseed,
wool, oil, wine, chevic, fish, honey, wax, manna,
saffron, gums, capers, macaroni, salt, pot-ash, flax,
cotton, silk, and divers manufactures. The king has
a numerous, but generally poor nobility, consisting of
princes, dukes, marquises, and other pompous titles;
and his capital, by far the most populous in Italy,
contains, at least, 350,000 inhabitants; amongst which
are about 30,000 lazaroni, or blackguards, the greatest
part of whom, having no dwelling-houses, sleep in sum-
mer-nights under porticoes, piazzas, or wherever they
can find shelter; and in the winter season, which is
generally of several weeks continuance, and attended
with very heavy rains, they resort to the caves under
Capodi Monte, where they sleep promiscuously like
sheep in a fold: such as have wives and children, live
in the suburbs of Naples, near Pausilippo, in huts, or
in caves or holes dug out of that mountain. Some
of these wretched beings gain a livelihood by fishing,
others by carrying burthens to and from the shipping,
and many ply in the streets in order to be employed on
errands, or perform any labour they are capable of for
a very small recompence; but as they do not always
meet with employment, and what they gain not being
sufficient for their support, they are in some degree
relieved at the doors of the convents, by the soup and
bread distributed there.

Notwithstanding the lower class of people are so ex-
tremely indigent, there is a great appearance of wealth
amongst some of the great, many of whom are excel-
sively fond of splendor and shew, brilliant equipages,
numerous attendants, rich dresses, high-sounding titles.
A late traveller into these parts has made it appear that
luxury has within these few years advanced with gigan-
tic strides in Naples: "Forty years ago, says he, the
Neapolitan ladies wore nets and ribbands on their
heads as the Spanish women do to this day, and not
twenty of them were possessed of a cap: but hair plain-
ly dressed is a mode now confined to the lowest order of
inhabitants; and all distinction of dress between the wife
of a nobleman and that of a citizen is entirely laid
aside. Expence and extravagance are here in the ex-
treme. The great families are oppressed with a load of
debt; the working part of the community always
spend the price of their labour before they receive it:
and the citizen is reduced to great parsimony, and al-
most penury, in his house-keeping, in order to answer
these demands of external shew: short commons at
home whet his appetite when invited out to dinner;
and it is scarcely credible what quantities of victuals
he will devour. The nobility in general are well
served, and live comfortably, but it is not their custom
to admit strangers to their table; and the number of poor
dependents who dine with them, and cannot properly

be introduced into company, prevents the great families
from inviting foreigners; another reason may be, their
sleeping after dinner in so regular a manner as to un-
dress and go to bed; no ladies or gentlemen finish their
toilette till the afternoon, on which account they dine
at twelve or one o'clock. The great officers of state,
and ministers, live in a different manner, and keep
sumptuous tables, to which strangers and others have
frequent invitations."

The banditti of Naples are very numerous, and en-
joy the protection of the people of quality, have a great
number of asylums or places of refuge, and are punc-
tually paid for every murder they commit. But this
reward is but a trifle; and often the price fixed upon a
man's life, is only a couple of zechins (about 18s.)
I myself have seen such an act of horror. One night,
when the opera being ended, the avenues to the theatre
were full of people; two persons, one of them an of-
ficer, were the destined victims; they were suffered
very quietly to get into their carriage, and before the
coachman could drive off, on account of the great
crowds of people, two banditti approached at once the
doors of the carriage, aimed and thrust their daggers
into the breast of two found, unsuspecting persons,
and made them in a moment two dead corpses. The
day following a report was circulated all over the city,
that the profligate and ruthless son of a great minister
was the author of this more than savage assassination;
yet the deed had no further consequences.

It would be a mistake to consider these banditti as
monsters. Although they are so in our idea, yet they
themselves, justified by education, laws, and religious
notions, do not regard their *honest* profession in so black
a light. That they sin in committing murder, they
are perfectly sensible of, but it is only a sin of which
the next confession-seat will clear them. Thus they
have nothing to mind but their penitential acts, which
the father confessors order them to perform; and to
calculate the proportion between these, which mostly
consist in prayers and the blood-money they have
earned. As the greatest part of these crimes remain
unpunished, and such as are punished consist only in
sentencing the murderer to row the galleys for two or
three years, I do not know what should impress the
ignorant banditto with a proper sense of his infamous,
detestable profession. It being a more lucrative than
honest employ, and the reward being gained by idle-
ness, a circumstance so much attended to in this cli-
mate, they follow quietly their business, and continue
murdering with the greatest unconcern. But they
never forget to put their rosary in the same place which
hides the dagger, in order to atone immediately, by
muttering some Ave Marias for the most heinous
crimes they have committed. Having done this, the
banditti clear themselves of all sins, and only wait
for fresh opportunities of imbruing their guilty hands
with innocent blood.

The great number of those accidents made the people
of

of Naples so indifferent about them, that strangers are shocked at it. They speak here of a man that has been murdered, nearly in the same tone as we do of a person who accidentally falls down in our streets. If the murderer is not one of the banditti, but another person, who commits the deed for the sake of his own private interest, he may surely rely on the pity of the surrounding people, who will do every thing to facilitate his escape. From all sides re-echoes the word, *poverello*, (poor fellow) not to pity the person assassinated, but his assassin. What an immense contrast with England! where the life of the meanest plebeian is an object of general attention, where neither rank nor riches can save the murderer, and where even people of quality will hinder him from making his escape.

The banditti confess very often, go diligently to hear mass, observe most scrupulously their fasts, and invoke daily St. Januarius. Thus they suppose to fulfil every duty of religion, and to go with piety into salvation. A few years ago, a banditto, who had committed many murders, was brought to justice: he confessed his crimes without being asked, and added several other acts of horror, which had been concealed to that very moment. But upon being asked among other things, whether he had observed his fasts, he found himself affronted: he thought this question such an outrage, that he asked the judges with bitterness, "whether they did not look upon him as a Christian!"

One of the insects almost peculiar to the kingdom of Naples is the tarantula, or a kind of spider, with which it abounds. The persons bit by this insect are called by the Italians tarantolati. Few of such unhappy persons can bear the sight of black or blue; but seem delighted with red and green objects. They are also seized with an aversion to eating fruit or vegetables. A melancholy silence, and a fixed eye, are the first symptoms by which the bite of the tarantula discovers itself; and the music is immediately called in to rouse the patient to a violent motion, and by that means to promote perspiration and a copious sweat. The instruments chiefly used are the guitar, hautboy, trumpet, violin, and Sicilian kettle drum. The country people, who are more or less skilled in all these instruments, enforce the operation of their music by grimaces and odd gesticulations. The tarantolati, on their side, vigorously exert themselves, regulating their motions according to the music, till the venom is quite expelled. This exercise and cure sometimes takes up five or six days; not that they are kept continually dancing all that time, but when nature seems to be exhausted, the music is suspended, and the patient put to bed, well covered, and a sudorific cordial administered. It is remarkable, that the patient, on recovery, remembers nothing of what passed during the prevalence of the disorder; and that if the cure be not perfectly effected, and the poison entirely expelled, the same symptoms return the succeeding year, especially during

the summer heats; and some have laboured under this terrible disorder, at intervals, for ten, twenty, or thirty years.

In this kingdom there are still traces of the memorable town of Canne, as altars, cornices, gates, walls, vaults, &c. the scene of action also between Hannibal and the Romans, in which the latter were overthrown with the loss of 40,000 men, is still pointed out to travellers by the name of *pezzo di sangue*, or the field of blood.

TARANTO, a city that was once the rival of Rome, and inhabited by the Spartans, is now remarkable for little else than its fisheries.

The city, SORENTO is placed on the brink of steep rocks that overhang the bay, and enjoys a more delightful climate than any other place in the kingdom.

NOLA, fourteen miles from Naples, was once famous for its amphitheatres, and as the place where Augustus Cæsar died, but retains at present but few marks of its ancient splendor.

BRUNDISIUM, now BRINDISI, which anciently furnished a supply of oysters for the Roman tables, hath still a commodious harbour, but the buildings are poor and ruinous: it was reduced to a state of inactivity and poverty on the subjection of the Grecian empire to the Turks, and continues to be a very inconsiderable place.

BENEVENTO can boast of many remains of ancient sculpture: the arch of Trajan, one of the most magnificent vestiges of Roman grandeur out of Rome, erected in the year 114, is still in tolerable preservation here.

REGGIO is only remarkable for its Gothic cathedral. This city was destroyed by an earthquake before the Marston war, and was rebuilt by Julius Cæsar; part of the wall still remains, and suffered greatly by the earthquake in 1783; but only 126 persons lost their lives out of 16,000 that were in the place.

OPPIDO, an ancient city, was entirely ruined by the earthquake on Feb. 5, 1783, the greatest force of which seems to have been directed to that spot, Casal Nuova, and Terra Nuova. Most of the towns and villages, from Tropea to Squillace, were either totally or in part overthrown, and many of the inhabitants buried in the ruins: this dreadful earthquake extended its ravages to the space of seventy-two miles, but the towns and villages that have been utterly ruined by it, and the spots where the greatest mortality has happened, were within twenty-two miles of this city.

ISLANDS.

part of his Neapolitan ma- ce considered as the gra- till produces considerable quantities;

quantities; but agriculture is now much neglected, and, in consequence, its fertility greatly diminished. This island is divided from Italy by a narrow channel, called the Streight or Faro of Messina. It contains about 500,000 inhabitants, who carry on a very considerable trade, particularly in silk, both raw and manufactured. There are a great number of fine remains of antiquity here. Some parts of this island are remarkable for the beauty of its female inhabitants. Its capital is Palermo, a large, rich, and well-built city, situated at the bottom of a gulf of the same name. It is decorated with a great number of public structures, finely adorned, and is said to contain near 120,000 inhabitants. The two principal streets, and which cross each other, are very fine. This town carries on a considerable trade, and is said to be the only one in all Italy which is lighted at the public expence.

Messina is situated at the bottom of a spacious harbour, on the streight which separates Sicily from Calabria. The public structures are extremely grand, and the city was full of people till the year 1783, when near two thirds of the inhabitants were swept away by a dreadful pestilence. The ancient capital of Sicily was Syracuse, which was near twenty-two miles in circumference. It exhibited some few remains of its former grandeur, was a large well-built city, and contained many churches and convents, in general elegant structures, and carried on a considerable trade, till the earthquake in 1783. By that earthquake, as the account transmitted from thence informs us, a great part of the lower district of the city and of the fort was destroyed, and considerable damage done to the lofty uniform buildings called the Palazzato, in the shape of a crescent; but the force of the earthquake, though violent, was nothing at Messina or Reggio, to what it was in the plain; for of 30,000, the supposed number of inhabitants in the city, only 700 are said to have perished. The greatest mortality fell upon those towns and countries situated in the plain of Calabria Ultra, on the western side of the mountains Dejo, Sacro, and Caulone. At Casal Nuovo, the princess Gerace, and upwards of 4000 of the inhabitants, lost their lives; at Bagnara, the number of dead amounted to 3017; at Rocina and Palmi about 3000 each; Terra Nuova, about 1400; Seminari, still more. The sum total of the mortality in both Calabrias and in Sicily, by the earthquakes alone, according to the returns in the secretary of state's office at Naples, is 32,367; but it is believed, that including strangers, the number of lives lost must have been 40,000 at least.

SARDINIA, which gives a royal title to the duke of Savoy, is situated in the Mediterranean sea, about 150 miles west of Leghorn, and has seven cities or towns. It is about 160 miles in length from north to south, and 80 in breadth from east to west. The soil, where it is properly cultivated, is very fruitful, producing corn,

wine, and oil in great plenty, together with very fine fruits of various kinds; but it is in general so badly cultivated, that the revenues do not exceed 5000l. sterling a year. Its capital is Cagliari, the seat of a viceroy, an archbishop, and an univerfity. The cathedral is very magnificent, but the other buildings have little to boast, nor is the trade considerable, though the harbour is spacious. This island was formerly annexed to the crown of Spain; at the peace of Utrecht it was given to the emperor, and ceded to the house of Savoy in 1719.

CORSICA is situated a little to the north of Sardinia, from which it is separated by the streight of Bonifacio, about twenty miles in breadth. It is a very mountainous country, and partly overgrown with wood; but the low lands in some of the vallies yield plenty of corn, wine, figs, almonds, olives, oranges, citrons, and other fruits. The strenuous efforts which the natives of this island, for a number of years, made for the recovery of their liberty, have rendered them famous, but they were obliged at last to submit to the French. Many of the malecontents, however, are not yet reconciled to the government of their new masters. The number of inhabitants is about 120,000; but the trade of the island is inconsiderable. It has a good breed of cattle and horses, and the woods and forests abound with game; it is also plentifully supplied, both by sea and rivers, with fish. Bastia is the capital of the island, but has nothing remarkable.

The LIBONI, and other small islands on the coast of Italy, are now famous only for the ruins of antiquity with which they abound. Many of them are fruitful in corn and wine; and two of them, Hiera and Stromboli, have volcanoes.

CAPRI, or CAPREA, is much taken notice of for the noble ruins on it, the most considerable of which are at the very extremity of the eastern promontory. It is about four miles long, and one broad, and is situated at the entrance of the gulf of Naples, about three miles from the continent. This isle was the residence of the emperor Augustus, for some time; and afterwards of Tiberius, for many years. What chiefly recommended this island to Tiberius was its temperate healthful air, being warm in winter, and cool in summer; and the nature of its coast, which is so very steep, that a small number of men may defend it against a great army. The surface of the island was then cut into easy ascents, adorned with the emperor's and other palaces, and planted with a variety of groves and gardens. The rocks also underneath were cut into highways, grottoes, galleries, bagnios, and subterraneous retirements, which suited the brutal pleasures of that emperor;

peror; and were afterwards defaced or demolished by the Romans, in detestation of the lascivious unnatural scenes which had been acted there by Tiberius. It contains about 1500 inhabitants, who are exempt from all taxes: and belongs to the province of Lovoro, in the kingdom of Naples. There are several springs of fresh water in it; and in a delightful valley between the mountains, at the two extremities, stands a city of the same name with the island, which is the see of a bishop, whose revenue arises chiefly from the prodigious flights of quails that come thither at certain seasons, particularly in March, when vast quantities of them are sent to Naples, and sold for four-pence and five-pence per dozen. On this account, the bishopric is sometimes jocosely styled the bishopric of Quails.

ISCHIA, a small but pleasant ar- tile island, lies on the Neapolitan coast, about two miles from the Cape of Melissa, and 25 from Naples. Most of it is surrounded with high, craggy, and inaccessible rocks, which shelter it from winds, and defend it from invaders. Some parts of it are rich and delightful, yielding all manner of delicious fruits, and excellent wines; but others are as dismal and barren. It was anciently called Inarime; and was much subject to earthquakes, and the poets tell us, Jupiter laid the vanquished Titan or Typhon under it, and that the earthquakes are occasioned by his efforts to throw off the load. There are several hot baths and medicinal waters in it, with a number of pleasant towns and villages.

ELBA hath been from time immemorial celebrated for its mines. Virgil and Aristotle mention it. The fruits and wine of the island are very good; and the tannery, fishery, and salt produce a good revenue. Its situation about 10 miles south-west from Tuscany, is 80 miles in circumference, and contains 7000 inhabitants; it is divided between the king of Naples (to whom Porto Longone belongs) the great duke of Tuscany (who is master of Porto Ferrajo) and the prince of Piombino.

MALTA, though not properly one of the Italian islands, is generally comprehended, by geographers, in descriptions of them. It lies about sixty miles south of Cape Pallaro, the southern point of Sicily. It was called Melita by the ancients, and is of an oval figure, twenty miles long, and twelve broad. The air is clear and healthful, but excessive hot, when not cooled by the sea-breezes. The whole island is composed of a white soft rock, covered with a good vegetable earth, about a foot deep. It is exceedingly fertile, producing great quantities of cotton, indigo, oranges, lemons, olives, figs, and other fruits, and affords plenty of honey, wax, good pastures, pulse, roots, herbs, and garden-stuff; but not a sufficient quantity of corn, wine, or wood, to supply the consumption of the inhabitants, who are computed at sixty thousand. This island was

given by Charles V. to the knights of St. John of Jerusalem, on their being driven out of Rhodes by the Turks, which happened in the year 1530. Soon after their settlement in this island, they took the name of knights of Malta. The knights consist of eight nations, the chief of which are France, Italy, Spain, England, and Germany. They have commanderies, or estates, in most of the Roman-Catholic countries, and are said to amount to about three thousand. They carry on a perpetual war against the Turks, and are under vows of celibacy and chastity, but observe only the former. They are considered as the bulwark of Christendom against the Turks, on that side; nor have they ever degenerated from the military glory of their ancestors. They are governed by a grand master, who is elected for life: on his death, they suffer no vessel to go out of the island till another is chosen, to prevent the pope from interfering in the election: he is chosen out of the 16 great crosses, and his title is, The most illustrious and most reverent prince, the lord friar A. B. great master of the hospital of St. John of Jerusalem, prince of Malta and Gaza. They wear crosses of a particular form, and the grand master has a large golden key of the holy sepulchre pendent at his side. They are generally of noble families, and ranked according to their nation.

The capital of the island is called Valetta, or Malta: it is a handsome city, strongly fortified, and has an excellent harbour. The palace of the grand master, and the cathedral, dedicated to St. John, are spacious and elegant structures. The whole island, or rather rock, is so strongly fortified, that it is considered as impregnable by all the forces the Infidels can bring against it; and they have accordingly laid aside all thoughts of making themselves masters of the island. On the 8th of September there is an annual procession at Malta, in memory of the Turks raising the siege on that day (1653) after four months assault, leaving their artillery, &c. behind them.

THE HISTORY OF ITALY.

ITALY has been, from the earliest ages of historical narration, either the seat of empire, or the theatre of war. When Romulus, the leader of a few lawless and wandering banditti, settled here, and laid the foundation of Rome, 753 years before the Christian era, Italy was in the same situation as at present, divided into little kingdoms and states, all living in distrust, at least, if not in open war with one another. The Roman commonwealth changed the face of things, by reducing them all, and making herself the head and mistress of Italy. Her empire was extended over the greater part of the known world; but at last luxury and effeminacy effected what force had attempted in vain; the Goths, the Vandals, and other barbarous nations of the north broke in, and hastened her destruction.

Italy was continued magné. T and for so but, engag home, the fumed or states over

Italy

Italy was again divided into small principalities, and continued in the same state till the time of Charlemagne. The successors of that celebrated prince claimed, and for some time possessed, the sovereignty of Italy; but, engaged in wars abroad, and civil commotions at home, the governors of these principalities either assumed or purchased the sovereignty of the respective states over which they presided.

After various revolutions and changes of government, Savoy and Piedmont fell to the lot of the counts of Maurienne, the ancestors of the prince who now enjoys the crown of Sardinia, which he obtained by virtue of the quadruple alliance, concluded in 1718.

Genoa, as part of the ancient Liguria, continued under the dominion of the Romans, till the ruin of that empire by the Goths, and other northern people; after which it made a part of the kingdom of Lombardy, then of the German empire, and at length became a sovereign state. But it owes its present form of government entirely to the virtue of Andrew Doria; who, preferring the advantage of his country to his own, refused the sovereignty offered him, and rendered it a free state. There are few instances in history more surprising than the efforts made by the Genoese for the recovery of their liberty, when they drove the Austrian troops out of their capital in the year 1747.

Tuscany, anciently known by the names of Ombrina, Tyrrhenia, and Etruria, was subdued by the Romans about 455 years before the Christian era. It was possessed by the Ostrogoths in the fifth century, and afterwards by the Lombards, who were expelled by Charlemagne in the year 800. From that period it became subject to the German emperors till the year 1240, when the inhabitants were divided into two powerful parties, distinguished by the names of the Guelphs and Gibellines; the former supported the interest of the pope, and the latter that of the emperor. The violence of these parties occasioned a long civil war both in Tuscany and Germany. At last the Florentines, weary with a state of anarchy, formed themselves into a free state: but, about the middle of the fifteenth century, Cosmo de Medicis, who obtained the glorious title of The Father of his Country, assumed the supreme power; and his son Alexander de Medicis was created duke of Florence by the emperor Charles V. in the year 1531. He was succeeded by his cousin Cosmo II. the great patron of the arts, on whom pope Pius V. conferred the title of Grand duke of Tuscany, in the year 1570. This prince, under whose auspices the arts were revived in Italy, enriched his capital with the most beautiful works of ancient artists. Cosmo III. obtained from the emperor the title of royal highness; and, after a long and happy reign, died on the 31st of October 1723. He was succeeded in his dominions by his son John Gaston de Medicis, who dying without issue in 1737, was the last male heir of that family: Don Carlos, the present king of Spain, was therefore declared his successor;

and, by the consent of the grand duke, assumed the title of hereditary grand prince of Tuscany. But on the conclusion of the war, by which he acquired the kingdom of the Two Sicilies, it was stipulated by the treaty of Vienna, that the grand duchy of Tuscany should be given to Francis duke of Lorraine, in exchange for his hereditary dominions, which were ceded to France. Thus Tuscany was transferred from the Medici family to that of Lorraine. Leopold, brother to the emperor Joseph, was grand duke, under whose auspices commerce again flourished, and improvements in agriculture, and other useful arts, have been lately made in that country. All the princes of the house of Medici were merchants. Cosmo I. shared with the Venetians the immense profits of the Indian trade, before the Portuguese discovered a passage to Indostan, by the Cape of Good Hope. Convinced that commerce is not at all incompatible with nobility, his descendants cultivated it with the most assiduous care; and being always remarkable for their prudent œconomy, they were, beyond comparison, the richest princes in Italy. At the same time they were patrons of industry and arts, very attentive to what might promote the happiness of their subjects, and omitted nothing that had a tendency to engage foreigners of merit to settle among them.

We have already taken occasion to speak of the rise and decline of the papal authority; and therefore, to avoid repetition, shall only remark here, that ignorance, the parent of bigotry and superstition, joined with other causes, amazingly increased the power and tyranny of the Roman pontiffs; and ecclesiastical pride was carried to its greatest height. The pope claimed a divine power, which raised him as much above other princes, as those princes are above their people. This claim, together with the title of Holiness, founded on a long prescription, could not fail of exciting the highest veneration in the minds of an ignorant and bigotted people, who believed them real. Leo X. by encouraging learning, undermined the foundation of papal authority; and the reformation shook the structure. At present the temporal princes, who still profess the Roman-Catholic religion, seem to be shaking off the galling yoke their predecessors were subject to, and to be recovering from those pious delusions, which had for many centuries hoodwinked the greatest part of Christendom. The pope has sent a vehement memorial to most European courts against the conduct of the French convention in resuming Avignon, and the comtat of Venaisin; but the pontiff's memorials are now as little regarded as his bulls; and the papal power is falling with increasing velocity.

NAPLES was probably first peopled from Greece, and thence called Magna Græcia. In this state it continued till subdued by the Romans; and on the decline of that power, in the fifth century, the Eastern em-
peror

peror possessed himself of one part of the kingdom of Naples, and the Goths of the other. The Lombards dispossessed the Goths of their part, and continued masters of it, till they were driven out by Charlemagne, about the year 800. In the ninth and tenth centuries, the Saracens subdued part of Naples; but were expelled by the Normans under Tancred, who, with the assistance of the Greeks already settled there, established a most respectable monarchy, flourishing in arts and arms, while the rest of Europe was covered with the veil of monkish ignorance, and religious bigotry. The heirs of Tancred enjoyed the kingdom till the year 1166; when, by the intrigues of the Roman pontiff, the crown was transferred to the French, and the earl of Anjou placed upon the throne.

The posterity of the last-mentioned prince continued in possession of the crown till the year 1504, when they were driven out by the Spaniards, whose government was so oppressive, that the people revolted, and being headed by Masaniello, a young fisherman, their success was so alarming, that the haughty Spaniards were obliged to abolish the oppressive taxes, and to confirm the people in their former liberties. This revolt being terminated, the Spaniards continued in possession of Naples till the year 1707, when they were driven out by the Imperialists, and the kingdom of Naples was confirmed to the emperor Charles VI. by the treaty of Utrecht in 1713. But in the year 1734, the French, Spaniards, and Sardinians, joining in a war against the emperor, Naples was subdued, and Don Carlos, son to the king of Spain, placed on the throne; and a peace being concluded in 1736, that prince was acknowledged king of the Two Sicilies, by the emperor. In the year 1759, Don Carlos ascended the throne of Spain, and it being found that his eldest son was by nature incapacitated for reigning, he resigned the crown of Naples to his third son Ferdinand. This prince, now Ferdinand IV. was born in 1751, and married in 1765 to Maria-Carolina-Louisa, archduchess of Austria, sister to the emperor of Germany, by whom he hath issue, 1. Maria-Theresa-Caroline, born June 6, 1772; 2. Louisa-Maria-Amelia, born July 28, 1773; 3. Mary-Anne-Josepha, born 1775; 4. Francis Janvier, born 1777; and, 5. Mary-Christina, born in 1779.

With respect to the Milanese, that delightful country experienced various changes: the Viscontis were succeeded by the Guleozos and the Sforzas; but it fell into the hands of the emperor Charles V. about the year 1525, who gave it to his son Philip II. king of Spain. That crown kept possession of it till 1706, when the French were driven out of Italy by the Imperialists. In 1743 they were dispossessed of it; but when the emperor ceded Naples and Sicily to the late king of Spain, it returned to the house of Austria, whose viceroy now governs it.

Mantua was formerly governed by the family of Gonzaga, who adhering to France, the territory was forfeited, as a fief of the empire, to the house of Aus-

tria, in whose possession it now is, the last duke dying without male issue; but in 1748 Guastalla was separated from it, and made part of the duchy of Parma, whose first duke was natural son to pope Paul II. the duchy having been annexed to the holy see by pope Julius II. in 1545. The descendants of the Farnese family terminated in the late queen-dowager of Spain, whose son, his late Catholic majesty, obtained that duchy, which, together with Placentia, are now held by his nephew.

When the Goths, and other northern nations, invaded Italy in the fifth century, the inhabitants of Padua, and other cities on the continent, fled for safety to the neighbouring isles, and laid the foundation of the Venetian republic. Secluded by their situation from the continent, they turned their thoughts to trade and navigation, and soon became a very formidable power at sea. Their conquests were amazing; and being principally possessed of the lucrative commerce of the Indies, soon became the richest people of Europe. Envious of their success, and desirous of sharing in the treasures of the East, several leagues were formed against them by foreign powers, by which they were more than once reduced to the brink of ruin, but were always saved by the disunion of the confederates. The discovery of a passage to India, by the Cape of Good Hope, gave the first blow to their greatness, as it lost them the Indian trade. The Turks, by degrees, deprived them of their most valuable possessions on the continent; and so late as the year 1715, they lost the Morea. Since the peace of Passarowitz, concluded in 1718, the Venetians have wisely refrained from embarking in any of the contests that have drenched the fields of Europe with blood.

The principal armorial bearings and orders of knighthood in Italy are as follows:

The pope, as sovereign prince of the Ecclesiastical State, bears for his escutcheon, gules, consisting of a long head-cape, Or, surmounted with a cross, pearly and garnished with three royal crowns, and also St. Peter's two keys, placed in saltier.—Arms of Tuscany, Or, five roundels, gules, two, two, and one, and one in chief, azure, charged with three fleur-de-lis, Or.—The arms of Venice, azure,—a lion winged, sejant, Or, holding under one of his paws a book covered, argent.—Those of Genoa, argent, a cross, gules, with a crown closed for the island of Corsica; and for supporters, two griffins, Or.—Of Naples, azure, semée of fleur-de-lis, Or, with a label of five points, gules.—In Sardinia, there is an order of knighthood, called the Annunciade, or order of Annunciation, instituted in 1355 by Amadeus V. count of Savoy, in memory of Amadeus I. who bravely defended Rhodes against the infidels. The motto of this order is FERT, being the four initial letters of *Fortitudo ejus Rhodum tenuit*, "His bravery preserved Rhodes." The collar of the order is composed of golden roses, enamelled red and white, with lover's knots of the same. To the

end of the middle is pendent the badge, which consists of three chains of gold encircling an oval, and disposed in knots: on the oval is represented the salutation of the Virgin Mary. The order of the Holy Ghost was founded by pope Innocent III. about the year 1198. They have a grand-master, and profess obedience, chastity, and poverty. Their revenue is estimated at 24,000 ducats daily, with which they entertain strangers, relieve the poor, train up deserted children, &c. Their ensign is, a white patriarchal cross with twelve points sewed on their breast on the left side of a black mantle.—The order of St. George was instituted about the year 1460, by Frederic III. emperor of Germany, who dedicated it to St. George, tutelary saint and patron of Germany. The doge is perpetual grand-master. The badge, a plain cross enamelled, gules, pendent to a gold chain, and worn about their necks. The cross is also embroidered on their cloaks. The order of St. Mark is usually conferred by the doge of Venice on eminent persons, or such as have done some signal service to the republic; the pension annexed to it is 1000 ducats per annum. The badge is a medal of gold, pendent to a gold chain: on one side is the emblem of St. Mark, a winged lion sejant with elevated wings, holding in his sinister paw a drawn sword erect, and in his right an open book with the words, *Pax tibi, Marco Evangelista meus*, "Peace be with thee, my Evangelist Mark." On the reverse is the portrait of the reigning doge, with the image of St. Mark delivering a standard to him.—The order of St. Stephen was instituted in the year 1561, by Cosmo of Medicis, first grand-duke of Tuscany, in memory of a victory which secured to him the sovereignty of that province: he and his successors were to be grand-masters. The knights wear a red cross with right angles, orled, Or, on the left side of their habit, and on their mantle. It is a religious and military order; the knights are allowed to marry, and must make proof of their nobility of four descents.—The order of St. Lazarus was instituted in the year 1572, by Emanuel Philibert, duke of Savoy, who revived and united the obsolete order of St. Maurice to it; which was confirmed by the pope, on condition of maintaining two galleys against the Turks. The badge of the order is a cross pometté, white, upon a cross of eight points, green, and is worn pendent to a green ribband.—The order of St. Januarius was instituted in July 1738, by the late king of Spain when king of Naples. The badge of the order is a cross of eight points enamelled, white, edged with gold, and in the centre is a bishop, holding in his left hand a book and crozier, and below his waist is this motto, *In sanguine factus*, "The covenant is in blood:" on the reverse is a book, on which are two red pillars, surmounted with palms, enamelled in their proper colours. The knights wear a badge of the order, pendent to a broad red ribband worn scarf-wise, and a gold star of eight points with fleur-de-lis at the angles embroidered on their centre garment. They

must prove the nobility of their descent for four centuries: their number is limited to 30. St. Januarius is the patron.

The gold coins in Italy are, the sequin or chequin of Venice, worth 9s. 7d. The old Italian pistole, worth 16s. 7d. The double ducat of Genoa, Venice, and Florence, worth 18s. 7d.; and the single ducat of the same places, worth 9s. 3d. The silver coins are, the ducat of Venice and Naples, worth 3s. 4d. The new ducat of Venice, worth 1s. 8d. The ducat of Florence or Leghorn, worth 5s. 4d. The teston of Rome, worth 1s. 6d. The tarin, worth 8d. and the curlin, worth 4d.

CHAPTER XXIX.

TURKEY IN EUROPE.

Situation, Extent, Boundaries, Divisions, Climate, Produce, Mountains, Mines, Rivers and Lakes, Antiquities and Curiosities, Cities and Chief Towns, Islands belonging to it, &c.

THE European part of Turkey is situated between the 17th and 40th deg. of east long. and between the 36th and 49th of north lat. being about 1000 miles in length, and 730 in breadth. It is bounded by Russia, Poland, and Slavonia, on the north; by Circassia, the Black Sea, the Propontis, Hellespont, and Archipelago, on the east; by the Mediterranean on the south; and by the same sea, together with the Venetian and Austrian territories, on the west. Its divisions, subdivisions, and chief towns, are as follow:

On the north coast of the Black Sea, are the provinces of Crim and Little Tartary, the ancient Taurica Chersonese, ch. towns Precop, Brachiferia, Kassa; Budziac Tartary, ch. town Oczakow; containing 38,200 sq. miles.

North of the Danube are the provinces of Bessarabia, ch. towns Bender, Belgorod, containing 8000 sq. miles; Moldavia, anciently Dacia, ch. towns Jazy, Choczim, Falczin, containing 26,000 sq. miles; Wallachia, another part of the ancient Dacia, ch. town Tergovisc, containing 10,500 sq. miles.

South of the Danube are Bulgaria, the east part of the ancient Mysia, ch. towns Widin, Nicopoli, Siliftria, Scopia, containing 17,000 sq. miles; Servia, the west part of Mysia, ch. towns Belgrade, Semendria, Nissa, containing 22,570 sq. miles; Bosnia, part of the ancient Illyricum, ch. town Seraio, containing 8,640 sq. miles.

On the Bosphorus and Hellespont, Romania, anciently Thrace, ch. towns Constantinople, Adrianople, Philippopoli, containing 21,200 sq. miles.

South of mount Rhodope, or Argentum, the north part of ancient Greece, Macedonia, ch. towns Strymon, Contella, containing 18,980 sq. miles; Thessaly, now Janna, ch. town Salon, ch. containing 4650 sq. miles; Achaia and Bœotia, now Livadia, ch. towns Athens, Thebes, Lepanto, containing 3426 square miles.

On the Adriatic sea or Gulf of Venice, the ancient Illyricum, Epirus, ch. town Chimæra, containing 7955 sq. miles; Albania, ch. towns Burtinto, Durazzo, Dulcigno, containing 6375 sq. miles; Dalmatia, ch. town Zara, containing 4560 sq. miles; Ragusa republic, ch. towns Narenza, Ragusa, containing 430 sq. miles.

In the Morea, the ancient Peloponnesus, being the south division of Greece, are Corinthia, Argos, Sparta, Olympia, where the Games were held, Arcadia, and Elis, ch. towns Corinth, Argos, Napoli de Romania, Lacedæmon, now Mistra, on the river Eurotus, Olympia, or Longinica, on the river Alpheus, Modon, Coron, Partas, Elis, or Belvidere, on the river Peneus, containing 7220 sq. miles.

The air in this part of Turkey is naturally healthy, but the plague is frequently brought hither from Egypt, and commits terrible devastation among the inhabitants; this calamity is partly ascribed to the noxious vapours from the neighbouring countries, and partly from the indolence and uncleanness of the Turks, who, insatuated with the belief of predestination, take no measures to guard against its approach. The soil is beyond expression fertile, even in places where it has never been cultivated; and is adapted to both the purposes of agriculture and grassery. The seasons here are regular and pleasant, and have been celebrated from the remotest antiquity.

Thessaly, in Turkey, is famous for a fine breed of horses, which are equally remarkable for their service and their beauty. The black cattle, especially in Greece, are extremely large; but the goats are the most useful animals to the inhabitants, who make great use both of their milk and flesh. The neighbourhood of Bâbadâgi abounds in large eagles, the tails of which furnish the Turkish and Tartarian archers with the finest feathers for their arrows; and they are accordingly purchased at a prodigious price. In most of the districts of Greece, there are great numbers of partridges; and every part of Turkey in Europe produces plenty of tame fowl, and most species of game; but the Turkish Mahometans seldom eat much animal food. Most of the rivers likewise abound in fish. The natural luxuriance of the soil, with very little assistance from art, produces corn and other grain, excellent grass, coffee, pot and garden herbs of almost every kind, oranges, lemons, citrons, pomegranates, grapes of an uncommon sweetness, fine figs, olives, almonds, cotton, and various kinds of drugs, particularly rhubarb; all these productions are excellent in their kind.

The mountains in European Turkey have long been celebrated, but the principal part of them are now known by modern appellations. The mountains Olympus and Pindus, the latter of which is now called Mezzò Novo, separate Thessaly from Epirus. Parnassus, famed for being consecrated to the Muses, still retains its original appellation. Mount Athos, now called Monte Santo; extends the whole length of a peninsula, which is seven Turkish miles, and stretches a considerable distance into the sea. There are twenty-two convents on this lofty mountain, besides a great number of cells and grôttos, with the habitations of no less than 6000 monks and hermits; though the proper hermits, who live in grôttos, are not above twenty; the other monks are anchorites, or such as live in cells. Those Greek monks, who call themselves the inhabitants of the holy mountain, are so far from being a slothful people, that, besides their daily offices of religion, they cultivate the olive and vineyards, are carpenters, masons, stone-cutters, cloth-workers, taylors, &c. They also live a very austere life: their usual food, instead of flesh, being vegetables, dried olives, figs, and other fruit; onions, cheese, and on certain days, Lent excepted, fish. Their salts are many, and chiefly kept, which, with the healthfulness of the air, renders longevity so common on this spot, that many of them live above 100 years. This mountain is so exceeding high, that on the top, as the ancients tell us, the sun-rising was beheld four hours sooner than by the inhabitants of the coast. Besides these, there are the mountains Saha, Witôska, Staras, Plamina, and many others. Those situated near the sea are pleasant and fertile, while the more inland are cold and barren. This country contains mines of gold, silver, iron, lead, &c. and quarries of the most beautiful marble.

The chief rivers in this country are, the Danube; the Save; the Niefter; the Nieper, or Boristhenes; and the Don, or Tanais. There are, besides these, a number of less considerable rivers. The strait of the Hellespont, which joins the sea of Marmora with the Archipelago; and the Bosphorus of Thrace, or passage into the Black Sea, are famous in history.

Lago di Scutari, in the province of Albania; Lago di Plavé, and Lago di Holti, both of which have a communication through the river Zem with Santari; the Stymphalis, in the province of Morea, was famous for its harpies, and ravenous birds, which frequented it; and the Peneus, for being the source of the river Styx, which the ancient poets termed the river of hell; are the most remarkable lakes. Medicinal waters and baths are very numerous in Turkey.

European Turkey, particularly Greece, may be considered as the storehouse of antiquities. The temple of Minerva at Athens, the temple of the eight Winds, and the lantern of Demosthenes, are still entire. Just without the city stands the temple of Theseus, surrounded with fluted columns of the Doric order. The

ruins

ruins of Neptune's temple, and the theatre where the Isthmian games were celebrated, are still visible on the Isthmus of Corinth; as are the ruins of the temple of Apollo at Castri. On the south side of Mount Parnassus, are some marble steps that descend to a running water, supposed to be the celebrated Castalian spring; and the niches in the rock, where statues were formerly placed, are still discernible. But among all the antique curiosities of this country, there are none exceeds the famous cave of Jupiter Trophonius, which is a square room, with a bench on each side of it, cut out of a rock, in Livadia, the ancient Bozotia. At the further end of this cavern is a round hole, scarcely big enough for a man to creep through, which is supposed to be the place from whence the oracles of this deity were delivered to his votaries.

The following are the most remarkable cities and towns in this country; viz.

CONSTANTINOPLE, situated in 41 deg. N. lat. and 21 E. long. is the capital of the whole Turkish empire, and the residence of the grand seigniors, it was built by the emperor Constantine the Great, who, in 330, made it the seat of the eastern part of the Roman empire. It continued in this state till 1453, when, after having sustained a siege of fifty-four years, it was taken by the Turks. It stands like old Rome on seven hills, commanding a beautiful and extensive prospect; and is most delightfully and advantageously situated, in form of a triangle, on a point of land washed by the sea of Marmora and the Hellespont on the south; by the Thracian Bosphorus, or strait of Constantinople on the east; and on the north is a very large and commodious harbour, formed by a canal from the Straights, extending inland towards the north-west; thus it has a communication by water with most parts of the empire. This city is uncommonly large, and when viewed at a distance has the appearance of an amphitheatre: but the streets are badly paved, narrow, dark, steep, and slippery. The houses are mean, being built of wood and mortar; they are however crowded with inhabitants, the number being computed at 8 or 900,000, three-fourths of whom are Greeks and Armenians. Here are twenty-two gates, six of which are towards the land, and the rest towards the sea; but the fortifications are antique and ruinous. The finest buildings are either without the city near the harbour, or in the most retired parts within the walls. At the point of the triangle, near the canal and harbour, stands the imperial palace or seraglio; which, together with the gardens, takes up a mile and a half in circuit; and may be styled rather a collection of several palaces and apartments joined together, according to the taste of the different emperors, than an uniform structure. The wall which surrounds the seraglio is thirty feet high, having battlements, embrasures, and towers, in the style of ancient fortifications. There are nine gates belonging to it, but only two of them magnificent; and from one of these the Ottoman court takes the name

of the Porte, or the Sublime Porte, in all concerns of a public nature. The palaces of the present Turkish nobility have nothing remarkable on the outside, but within they are richly and elegantly decorated. The mosques, of which there are seven styled royal, are very handsome edifices. They stand singly, within a spacious enclosure, planted with lofty trees, and adorned with delightful fountains. Among these mosques the most magnificent is that of St. Sophia, once the metropolitan church of the Christians. It stands on an eminence opposite to the principal entrance of the imperial palace, and was built by the emperor Justinian, in the form of a Greek cross. This building is of such vast extent, that it is said an hundred thousand persons may, with ease, be contained in it at one time. It is two hundred and fifty-two feet long, and two hundred and twenty-eight broad. The dome, which covers almost the whole structure, rests externally on four prodigious towers, which have been added of late years to support it. The pavement, walls, and galleries, are all of marble, and it is likewise ornamented with a number of marble, porphyry, and Egyptian granite pillars; but there are no pictures or statues in either this or the other mosques. The annual revenue of St. Sophia is said to amount to thirty-two thousand pounds. The grand seignior repairs to it every Friday, but a Christian is scarce ever admitted. In this city are a great many Greek and Armenian churches, besides two or three for the Roman-Catholics, and one for the Lutherans, which was built by the Swedes.

There are some noble antiquities in and about Constantinople, particularly the ancient hippodrome, or place for horse-races. It is an oblong square, four hundred paces in length, and one hundred in width, adorned with three beautiful antique pillars, one of brass, and the other two of marble; one of the latter, which is of Theban marble, is of a quadrangular figure, terminating in a point, and filled with hieroglyphical inscriptions.

Security and good order reign in Constantinople in a very eminent degree; for upon a foreigner's taking a Janizary with him, he may view every part of the town unmolested. They likewise preserve the greatest decency in their mosques, no one presuming to hold discourse or shew the least mark of inattention. The circumference of this city, including the suburbs, is said to be twenty-four miles. The environs are extremely pleasant, especially along the Straights, being covered with towns, villages, seats, gardens, meadows, vineyards, and woods. The prospect from it is noble. The most regular part is the Besestien, enclosed with walls, where the shops of merchants are excellently ranged. This city has frequently suffered by fires, either owing to the narrowness of the streets, and the structure of the houses, or the arts of the Janizaries. In Aug. 1781, a fire broke out in the quarter near the harbour, which spreading into

other parts, about 10,000 houses were consumed, most of which had been rebuilt since the fire in 1782.

While Constantinople continued in the possession of the Greek emperors, it had no equal; it was the only mart in Europe for the rich commodities of the East; it abounded in riches, in arts, in beautiful structures, and in manufactures. It is now little more than the shadow of its ancient greatness; though still, with regard to its situation, one of the finest cities in the world.

Scutaris stands opposite to the seraglio, on the Asian side, at the distance of about a mile and a half: it is adorned with a royal mosque, and a pleasure-house of the grand seignior.

Adrianople, called by the Turks Edrene, is situated in a very fertile country on the river Maritz, by means of which, and other rivers, it carries on a very considerable traffic. The city is large, but the streets are remarkably dirty, the houses in general low, and built of wood and clay, a few indeed are of brick.

For the use of such of our readers as are acquainted with ancient history, we shall here describe the islands belonging to Turkey in Europe, being part of ancient Greece.

NEGROPONT, which was the ancient Eubœa, is situated on the eastern coast of Achaia, or Livadia, from which it is separated by a narrow channel, called the Euripus. It is about ninety miles in length, and twenty-five miles in breadth; and is supposed to have been formerly joined to the continent of Greece by an isthmus, as it is now by a bridge. This island produces corn, wine, oil, and fruit in great abundance, and some cattle. The principal places in it are Negropont, the capital, and Castell Rosso; the first has a very spacious harbour, where a fleet of galleys are generally kept in readiness to sail against the pirates and the Maltese. The tides on its coasts are very irregular, frequently flowing thirteen times in twenty-four hours, and ebbing as often.

STALIMENE, anciently Lemnos, is situated in the north part of the Ægean sea, opposite the strait of the Dardanelles, forming nearly a square of twenty-five miles in length and breadth. It yields an abundance of corn and wine; but its principal production is a mineral earth known by the appellation of Terra Lemnia, or Sigillata, from a seal the Turks put upon every piece that is sold to foreigners. Notwithstanding this drug is so positively asserted to be an earth, and dug in this island, it has been long known to be a vegetable production; and it has lately been discovered to be the pulp of the fruit of a tree called Baobab, growing near Senegal in Africa. The inhabitants sell this pulp, when thoroughly dry, to the Arabs, who distribute it into different parts of the Turkish empire, where it is made up in cakes, sealed, and exported to Europe, under the name of sealed earth, or earth of

Lemnos. The principal places in this island are Stalimene, the capital, and Cachino.

TENEDOS, about two leagues from the coast of the Lesser Phrygia, opposite to old Troy, is in general rocky and barren; but contains some fruitful vallies, and the Muscadine wines produced there are greatly esteemed. It has one large town of the same name with the island, and an harbour defended by two castles. This is the place to which the Greeks retired, and left the Trojans in a fatal security, as related by Virgil.

SCYRO, anciently Scyros, is situated about twenty-five miles from Negropont, is nearly sixty miles in circumference, and full of rugged barren rocks. It contains a small town of the same name, a safe harbour, several villages, and some quarries of marble.

LESBOS, or Mytilene, is a considerable island, situated to the south of Tenedos, opposite the coast of Lydia. It produces plenty of corn, wine, fruit, and figs; cattle also abound here. The capital is now called Castro, or Castri. It has an excellent harbour, defended by a strong castle, in which is kept a constant garrison. This island is famous for several remains of antiquity, and likewise for being the native place of a number of philosophers and poets, particularly the inimitable Sappho.

SCIO, formerly Chios, lies about eighty miles west of Smyrna, and is about an hundred miles in circumference. This island is in general mountainous and stoney, but produces excellent wine, oil, silk, and a variety of gums, particularly that called mastich, greatly used by the Turks. The chief town is Scio, which has an harbour and citadel, wherein a garrison is kept; and there are about thirty villages besides the capital, all well peopled. The number of the inhabitants is near 113,000, of whom 100,000 are Greeks, 10,000 Turks, and about 3000 Latins; who carry on manufactures of silk, velvet, and gold and silver stuffs. The women of this, and most of the other Greek islands, are remarkable for their beauty and symmetry, but not famous for chastity: even the Greek nuns are said to be sufficiently lavish of their favours. None the tragic poet, Theopompus the historian, and Theocritus the sophist, were all natives of this island. The inhabitants also contend with several other places for the honour of having Homer for their countryman; and they even shew strangers a little square house, at the foot of mount Epos, which they pretend was his school. The Greeks, residing on this island, pay a capitation-tax according to their rank.

SAMOS, almost opposite to Ephesus, on the coast of the Lesser Asia, is about 30 miles long, and 15 broad. It is exceedingly mountainous, a chain, consisting chiefly of white marble, running through the whole island; but they are covered with a staple of good earth, so that the country is very fertile, producing delicious Muscadine wine, silk, oil, fruits, honey, saffron, fine wool, an excellent sort of onions and garlic, various kinds of minerals and drugs, a fine red bole, emery,

oker, and a black inspid earth of great use in dyeing. The principal place in the island is Samos, which has a good harbour. This place gave birth to Pythagoras, and is now inhabited by between 12 and 14,000 Greeks, but subject to the Turks.

PATMOS, south of Samos, is a small barren and dreary island, only remarkable for having a convenient haven, and for being the place where, we are told, St. John wrote his Apocalypse. There is a convent dedicated to that apostle, and, near it, is his grotto, the entrance to which is about seven feet high, with a square pillar in the centre. On the top there is a cleft in the solid rock, through which the monks pretend the Holy Ghost dictated the Revelation to St. John.

DELLOS, the chief of the Cyclades islands, about which the rest form a circle, is situated south of the islands Mycone and Trife, north of Paros, and nearly midway between the continents of Asia and Europe, being about eight miles in circuit. It is now almost deserted, but was formerly very populous, and much frequented by strangers, on account of its being the birth-place of Apollo and Diana, who had both magnificent temples erected here, the ruins of which are still discernible.

PAROS is situated between the islands of Lucia and Melos, and is one of the smallest among the Cyclades. It is well cultivated, and produces wheat, barley, pulse, scamum, wine, cotton, cattle, and game. This island has always been celebrated for the beauty and inimitable whiteness of its marble ; and in the walls of Parochia, its chief town, there are fine marble columns lying on the ground ; besides which, there lie, in several parts of it, architraves, pedestals, and other exquisite pieces of carved marble, the remains of ancient Paros, on the ruins of which this town was built. It contains some good roads and harbours ; and is famous for being the native place of Phidias and Praxiteles, two of the greatest statuaries the world ever produced.

CERIGO, anciently Cythera, lies between Candia and the Morea : it is about sixty miles in circumference, but being rocky and mountainous, produces little corn, wine, or oil. This island was formerly consecrated to Venus, and considered as her favourite residence.

SANTORIN, formerly called Calista, and afterwards Thera, is one of the most southern islands in the Archipelago ; it is in a manner covered with pumice-stones ; notwithstanding which, through the industry of the inhabitants, it yields barley, wine, cotton, and some wheat. One third of the inhabitants, who are about 10,000 in number, are of the Latin church, and subject to a Popish bishop.

RHODES, situated between 28 deg. east lon. and 36 deg. 20 min. north lat. about 20 miles south-west of the continent of the Lesser Asia, is nearly 60 miles in length, and 25 in breadth : it abounds in fruits, excellent wines, and all manner of provisions, corn excepted, which the inhabitants are obliged to import from the adjacent country. The capital, of the same name, is still a handsome city, though much inferior

No. 43-

to what it was formerly : it enjoys a convenient port, dock, and arsenal, and a squadron of galleys is always kept there to cruise against the corsairs. Here stood the famous Colossus, justly esteemed one of the wonders of the world. It was erected at the entrance of the harbour, having a foot placed on each side of it, so that the ships sailed between its legs. This enormous image was one hundred and thirty-five feet high ; the thumbs were so large, that two men could hardly embrace them ; and the face represented the sun, to which it was dedicated. In one of the hands was placed a lantern, for the direction of mariners, during the night. Rhodes is even, at this time, the mart for all the merchandizes of the Mediterranean, particularly camblets, tapestry, cotton, silks, wine, wax, raisins, and soap. From the year 1301 to 1522, this island was subject to the knights of St. John of Jerusalem ; but, under Solyman the Magnificent, it was then reduced by the Turks, who obliged the knights to retire to Malta.

CANDIA, the ancient Crete, also called Hecatompolis, from its hundred cities, for which it was so renowned, is situated between 35 and 36 deg. of north lat. at nearly an equal distance from Europe, Asia, and Africa, and is about 200 miles long, and 60 broad. Many parts of it are mountainous, rocky, and barren, while others yield the most excellent wines, fruit, corn, honey, wax, silk, and wool. Mount Ida, so celebrated by the poets, stands in the centre of the island, and is covered a great part of the year with snow. Lethe, the river of oblivion, was likewise one of its rivers, but now nothing more than a torpid stream. Candia, the capital, possesses no remains of its former grandeur : however, it will always be famous for the siege it sustained from the Turks, who invested the town in 1645, but could not subdue it till 1669, and even then the garrison surrendered on the most honourable terms. During this siege the place had been stormed 56 times, in the course of which the Venetians lost upwards of 80,000 men, and the Turks, above 180,000. This island was formerly the seat of legislature to all Greece.

CYPRUS is situated in the Levant sea, about thirty miles distant from the coasts of Syria and Palestine. It is about 150 miles in length, and 70 in breadth. The soil, where properly cultivated, is very fruitful in corn, wine, oil, cotton, silk, and a great variety of game. The Venetians possessed themselves of it in the year 1480 ; but were driven out by the Turks, about the middle of the sixteenth century, who have been masters of it ever since. Richard I, king of England, subdued it in revenge for the treachery of its king ; after which the royal title was transferred to Guy Lusignan, king of Jerusalem, from whence it passed to the Venetians, who are still in possession of that empty honour. The present inhabitants are an assemblage of Turks, Jews, Greeks, and Armenians, with some few Latins, Cophts, Maronites, and Nestorians, who all enjoy the free exercise of their religion. Cyprus, while in the hands of the Christians, was a rich and populous island, but,

10 D

by

by the oppression of the Turks, it is depopulated and impoverished to such a degree, that the revenue arising from it does not exceed 1250*l.* per ann. Nicofia, the present capital, is a small but handsome town; and Famagusta, the ancient capital, has an exceeding good harbour. This island was formerly famous for the worship of Venus; and in the town of Paphos, then the seat of pleasure and corruption, though now dwindled into a little mean sea-port, are the remains of a magnificent temple, dedicated to that goddess. The present ladies of that island are not degenerated from their ancestors; they are still devotees to Venus.

The island of SAPIENZA, STRIVALI, CEPHALONIA, SANTA MAURA, ISOLA DEL COMPARE, the ancient ITHACA, the birth-place and kingdom of Ulysses, and several others of less note, are in the Ionian sea, belong to the Venetians, and are in general fruitful.

Zante and Corfu also belong to the Venetians; who are said to concern themselves very little about the welfare or government of them. The first has a populous capital of the same name, and carries on a considerable trade; and Corfu, the capital of the latter, is a place of great strength: all the rest of these islands are, in general, fruitful. The inhabitants of Zante are about 30,000, mostly Greeks, and of a more hospitable disposition than those of Corfu, whose number is estimated at 50,000.

CHAP. XXX.

FRANCE.

Situation, Extent, Boundaries, Divisions, Climate, Soil, Mountains, Rivers, Produce, Learning, Trade, Inhabitants, Cities, &c.

THIS extensive and powerful kingdom, being the nearest to England, claims our peculiar attention. Its name is taken from the Franks, a restless and enterprising German nation, who came from Franconia in the fifth century, conquered the Gauls, the ancient inhabitants; and the Roman force not being able to suppress them, they were permitted to settle in the country by treaty. It is situated between the 5th deg. of west, and 8th deg. east long. and between the 49d and 51st deg. of north lat. being nearly 620 miles in length, and 510 in breadth. It is bounded by Germany, Switzerland, and Italy, on the east; by the Bay of Biscay, on the west; by the English channel and the Netherlands, on the north; and by the Mediterranean and Pyrenean mountains which divide it from Spain, on the south.

The dimensions of the several parts of this kingdom, are distinctly specified in the following table of Mr. Templeman, who has thus divided it:

Ancient Division of FRANCE under the MONARCHY.

NAMES OF PROVINCES.	Length.	Breadth.	Sq. Miles.	PRINCIPAL CITIES.
Orleanois.....	230	180	22,950	Orleans.
Guienne.....	216	120	12,800	Bordeaux.

FRANCE, which is nearly a Square, is now divided by the National Assembly, into 83 Departments, including Corsica. Every Department is subdivided into Districts, in all 547; and each District into Cantons. The following are the Chief Towns of each Department, and also the Districts. The new Department of Savoy, which should form the 84th, is not added, as being at present uncertain whether it will continue its Connection with this Kingdom. The whole are described in the following

T A B L E.

Longitude East from London

The air of France, particularly that of the interior parts, is in general mild and wholesome; but it has been lately represented, by some, as not nearly so salubrious as is pretended; and it must be acknowledged that the French have been but too successful in giving the inhabitants of Great-Britain false prepossessions in favour of their own country: it must indeed be owned, that their weather is more clear and settled than that in England. In the northern provinces where the spring is chiefly of wood, the winters are intensely cold; but towards the south it is so mild, that many sickly and aged persons retire thither from England at that season, to avoid the rigour of our climate.

The quality of the soil varies greatly according to its situation. The upper part of Provence is adapted for the growth of corn; and the lower for high-flavoured fruits. The soil of Burgundy is so rich, that it has been called the mother of wine and corn; and Picardy, that of the national magazine for corn, flax, and fruit. Some of their fruits have a higher flavour than those of England; but neither the pasturage nor tillage are comparable to ours. The heats in many parts burn up the ground, so that it has no verdure, and the soil barely produces as much rye and chestnuts as are sufficient for the subsistence of the miserable inhabitants.

No nation is better supplied than France is with wholesome springs and water; of which the inhabitants make excellent use, by the help of art and engines, for all the conveniences of life. The French have of late endeavoured to supply the loss arising from their precarious title to their lands, by instituting academies of agriculture, and proposing premiums for its improvement, as in England; but these expedients, however successful they may be in particular instances, can never become of national utility in any but a free country, where the husbandman is sure of enjoying the fruits of his labour.

The principal mountains in France, or on its borders, are the Alps, which divide it from Italy; the Pyrenees, which divide it from Spain; Vauze, which divides Lorraine from Burgundy and Alsace; Mount Jura, which divides Franche Comté from Switzerland; and Mount Der, in the province of Auvergne. In Dauphiné there is that called the Inaccessible Mountain, being an inverted pyramid broader at the top than at the bottom; and Mount Bresier, situated near the Alps, often breaks out into flames.

The chief rivers in France are the Loire, the Rhône, the Garonne, and the Seine. The Loire rises in the Cevennes, and, running a course of north and north-west, falls into the Bay of Biscay, below Nantz. The Rhône rises in Switzerland, and flows in a south-west course to Lyons, after which it runs due south till it falls into the Mediterranean, being joined in its passage by the Saone, and other rivers of less note. The Rhône is always highest in summer, which is attributed to the melting of the snow upon the Alps. The Ga-

ronne has its source in the Pyrenees, and, after traversing a north-east course, falls into the Bay of Biscay, below Bourdeaux. The Seine rises in Burgundy, and, running to the north-west, falls into the English-Channel between Havre-de-Grace and Harfleur, having in its way visited Troyes, Paris, and Rouen.—Among the smaller rivers are the Saone; the Charente, which rises near Havre-de-Grace, and discharges itself into the Bay of Biscay; the Somme, which runs north-west through Picardy, and falls into the English-Channel below Abbeville; the Adour, which running from east to west through Gascoigne, falls into the Bay of Biscay below Bayonne; and the Var, which has its source in the Alps, and, running south, divides France from Italy, after which it falls into the Mediterranean west of Nice.—See a further account in our description of the cities, towns, &c.

There are few considerable lakes in France: there is one at Illaire, in Auvergne; a second at La Besles, which, if a stone is cast into it, makes a noise nearly as loud as thunder; and a third on the top of a hill near Alegre, which, according to vulgar report, is bottomless.

The number of navigable rivers with which France is watered, together with the noble canals by which these rivers are united, and the navigation extended, have been productive of advantages unknown in many other kingdoms, and reflect more honour on Louis XIV. than all his victories. The canal of Languedoc was begun in 1666, and completed in 1680; it was intended for a communication between the ocean and the Mediterranean, for the speedier passage of the French fleet; but though it was carried on at an immense expence, for 100 miles, over hills and vallies, and even through a mountain in one place, it has not answered that purpose. By the canal of Calais, travellers easily pass by water from thence to St. Omer, Graveline, Dunkirk, Ypres, and other places. The canal of Orleans is another noble work, and runs a course of eighteen leagues, to the immense benefit of the public, and the royal revenue. France abounds with other canals of the like kind, which render her inland navigation inexpressibly commodious and beneficial. The great use of these canals in Picardy will appear when it is observed, that the river Somme, which rises above St. Quentin, passes by that city, Ham, Peranne, Brai, Corbie, Amiens, Pequigny, Abbeville, and St. Valori, where it falls into the sea. The river Oise has its source in Thierache, passes by Guise, La Fere, Chauny, Noyon, Compeigne, Creil, Beaumont, Pontoise, and then discharges itself into the Seine above Conflans-Saint-Honore.

The most remarkable springs and mineral-waters are, 1. The fresh well near Vesaul in Burgundy, about 15 fathoms wide at the top, and 20 deep; but sometimes it is so agitated as to overflow instantaneously, and produce a rapid stream. 2. The burning spring at Sallenage. 3. A spring at the Roqueburne in Lan-

guedoc, on the waters of which swims a kind of oil,
of a very salutary nature, both in internal and external
applications. 4. A spring near Aigne in Auvergne,
which boils violently, and makes a noise resembling
that of water thrown on lime; it is insipid to the taste,
but of a poisonous quality, and the birds that drink of
it die immediately. The waters of Sultzbach in Al-
face are said to cure the palsy, weak nerves, and the
stone. At Bagueis, not far from Bareges, are several
wholesome minerals and baths, to which people resort
as to the English baths, at spring and autumn. Ferges,
in Normandy, is celebrated for its mineral-waters,
and those at St. Armand cure the gravel and obstruc-
tions.

France abounds in marble and free-stone; in Lan-
guedoc there are some veins of gold and silver, as well
as turquoise, the only gem this kingdom produces;
Alsace contains silver and copper; Brittany has mines
of iron, tin, lead, and copper; and in other parts are
found alabaster, jasper, coal, chalk, oker, &c. At
Berry there is a mine of oker, which serves for melt-
ing of metals, and for dyeing, particularly the best
drab cloths; in the province of Anjou are several
quarries of fine white stone; and at Laverdau, in Co-
minges, there is a mine of chalk.

The roots, herbs, and other vegetable productions of
France, are much finer than those of England, and con-
sequently their soups, salads, &c. are superior to ours.
The principal objects of cultivation among the French
are their vines, and the excellency of the wines they
produce is universally acknowledged, in particular the
wines of Champagne, Burgundy, Bourdeaux, Gascony,
and those called Hermitage, Frontinac, and Pontacke,
are much admired, not only for their pleasant taste, but
salubrious qualities.

Elm, ash, and oak, are produced in France, but the
latter is not so good as that which grows in England,
and the interior provinces are now greatly in want of
wood for fuel. Hemp and flax also abound in this king-
dom. The province of Gostmois yields great quantities
of saffron. At Rhé, Rochfort, and their vicinity, great
quantities of salt are made. The herb called kali, which
grows in Languedoc, furnishes abundance of pot-ashes,
and prunes and capers are produced near Bourdeaux and
Toulon. The French were formerly famous for hor-
ticulture, but they are at present far inferior to the
English, both in the management and disposition of
their gardens. The oppressed farmer had very little en-
couragement in France to apply himself to the practice
of agriculture; so that, even in plentiful years, the
lands yield little more than is necessary for the sub-
sistence of the inhabitants; and a bad harvest, especially
in time of war, is attended with the most distressing
scarcity.

The horses, black cattle, and sheep of France, are
far inferior to those of England, and the wool is not
so fine, but the hair and skin of the shamois, or moun-
tain goat, are superior to ours. There are few other

No. 43.

animals, either wild or tame, in France, but what
are common to England, wolves excepted; and these
ferocious creatures do a great deal of mischief, and are
much dreaded by those persons who reside near woods
or forests. It is here necessary to describe the wolf,
which is the largest and fiercest animal of the dog spe-
cies, and partakes somewhat of the nature of a dog.
He has a wild look, shining eyes, sharp teeth, short
neck, and a blackish colour. He bears hunger long,
has a howling voice, oblong blunt muzzle, short ears,
and a thick tail.

The marine productions of France and those of Eng-
land are alike; but the former are not so plentifully
supplied with salt-water fish, even on the sea-coasts.

The forests in France are very extensive, the chief of
which are, that of Orleans, which contains fourteen
thousand acres of wood, which are of various kinds,
such as oak, elm, ash, &c. The forest of Fontain-
bleau, nearly as large as that of Orleans; and one
near Morchismoir, wherein the trees are remarkably
tall and straight. The woods in this kingdom are also
very large and numerous, but are situated so far from
water carriage, that they are of very little utility,
which is of the utmost advantage to a nation where
wood forms the principal fuel; and, it is said, that the
internal parts of France begin to feel the want of firing
greatly.

Many calculations have been given by various writ-
ters, respecting the number of people in France: some
pretend they do not exceed thirteen millions; others
reckon them at fifteen millions; but they who com-
pute them at 20 millions, seem to be nearest the truth. It
has been supposed that France was much more populous
before the revocation of the edict of Nantes by
Lewis XIV. since which period great numbers of the
natives, particularly manufacturers, have left the king-
dom, and settled in foreign parts. This fatal step in
politics, together with the almost perpetual wars in
which that kingdom has been engaged, and the emi-
gration to her colonies, have drained France of great
numbers of her inhabitants.

The French, in their persons, are rather lower and
more slender than their neighbours; but they are well
proportioned, and very nimble and active. They are
of a fallow complexion; and the ladies more remark-
able for the sprightliness of their wit, than the charms
of their beauty.

"The genius and manners, says a late writer, of the
French, are well known, and have been the subject of
many able pens. A national vanity is their predomi-
nant character, and they are perhaps the only people
ever heard of who have derived great utility from a
national weakness. It supports them under misfor-
tunes, and impels them to actions to which true
courage inspires other nations. This character, how-
ever, is conspicuous only in the higher and middling
ranks, where it produces excellent officers; for the com-
mon soldiers of France have few or no ideas of heroism.

10 E

Hence

Hence it hath been observed, with great justice, of the French and English, that the French officers will lead if their soldiers will follow, and the English soldiers will follow, if their officers will lead. This same principle of vanity is of admirable use to the government, because the lower ranks, when they see their superiors elated, as in the time of a former war with England, under the most disgraceful losses, never think that they are unfortunate; thence proceeds the passive submission of the French under all their calamities. This national vanity is in nothing more discernible than in their writings, in which, when they mention the inhabitants of any other kingdom or state, they take care not to omit some compliment to their own superiority. They plume themselves upon their courtesy, and fancy that politeness is confined to the natives of their country only. They may be characterized as being well mannered, rather than well bred. They are indiscriminately complaisant and officious, but they seldom know how to adjust their behaviour to the situation and character of those they converse with. All is a repeated round of politeness, which for want of discernment becomes affected, often ridiculous, and always disgusting to sentimental people. The most abject flattery and dissimulation cost them nothing; they even value themselves upon them, as constituting the essence of politeness. Sincerity is therefore not to be expected in their plausible professions; nor is candour to be hoped for from their most solemn promises; though a very judicious and experienced writer has attempted to palliate this part of their character, with some appearance of reason: "The French, says he, have been censured for insincerity; but this is a fault which they possess in no greater degree than their neighbours; and the imputation is generally owing to their excess of civility, which throws a suspicious light upon their candour. In private life they have just as much virtue as other European nations, and have given as many proofs of generosity and disinterestedness; but this is far from being the character of their government, which has prepossessed the English against the whole nation; and when the French are no longer formidable, they will be no longer thought faithless."

No people bear the frowns of the world with a better grace; yet they cannot sustain prosperity with equal moderation; but upon the least elevation of fortune become intolerably vain, arbitrary, insolent, and imperious. In their lowest circumstances, they are capricious and litigious, and success increases and gives a keener edge to their captious temper. The women enjoy great freedoms, which are authorized by fashion; and even when they appear too licentious, the men are afraid to restrain them, lest their *politesse* should be called in question, and they should fall under the imputation of being narrow-minded. That modest deportment which is so much admired in other countries, is here deemed *rusticity*; and supposed to spring from the want of *knowing life*, or being early introduced into genteel

company. Hence the ladies are celebrated more for their sprightly wit, and degagé behaviour, than for their personal beauty. The peasantry, compared with those of England, may justly be deemed ugly and dirty; but, if they are not so handsome, they are livelier; and if they are not so neat, they are much merrier.

Many able writers have taken great pains in delineating the characters of the French; a very ingenious author of our own times, who wanted neither information nor abilities, has been very particular in describing the particularities observable among this people.

"The natural levity of the French, says this writer, is reinforced by the most preposterous education, and the example of a giddy people engaged in the most frivolous pursuits. A Frenchman is, by some priest or monk, taught to read his mother tongue, and say his prayers in a language he does not understand. He learns to dance and to fence, by the masters of these sciences. He becomes a complete connoisseur in dressing hair, and in adorning his own person, under the hands and instructions of his barber and valet de chambre. If he learns to play upon the flute or the violin, he is altogether irrisoluble. But he piques himself with being polished above the natives of any other country, by his conversation with the fair-sex. In the course of this communication, with which he is indulged from his tender years, he learns, like a parrot, by rote, the whole circle of French compliments, which are a set of phrases ridiculous even to a proverb; and these he throws out indiscriminately to all women without distinction, in the exercise of that kind of address which is there distinguished by the name of gallantry. It is an exercise, by the repetition of, which he becomes very pert, very familiar, and very impertinent. A Frenchman, in consequence of his mingling with the fair-sex from his infancy, not only becomes acquainted with all their customs and humours, but grows wonderfully alert in performing a thousand little offices, which are over-looked by other men, whose time has been spent in making more valuable acquisitions. He enters, without ceremony, a lady's bed-chamber while she is in bed, reaches her whatever she wants, airs her shift, and helps to put it on. He attends at her toilette, regulates the distribution of her patches, and advises where to lay on the paint. If he visits her when she is dressed, and perceives the least impropriety in her coiffure, he insists upon adjusting it with his own hands. If he sees a curl, or even a single hair amiss, he produces his comb, his scissors, and his pomatum, and sets it to rights with the dexterity of a professed friseur. He squares her to every place she visits, either on business or pleasure; and, by dedicating his whole time to her, renders himself necessary to her occasions. In short, of all the coxcombs upon the face of the earth, a French *petit-maitre* is the most impertinent; and they are all *petit-maitres* from the marquis, who glitters in lace and embroidery, to the barber's boy,

" I shall mention one custom more, which seems to carry human affectation to the very furthest verge of folly and extravagance; that is, the manner in which the ladies are printed and painted. It is generally supposed, that part of the fair-sex in some other countries make use of fard and vermilion for very different purposes, namely, to help a bad or faded complexion, to heighten the graces, or conceal the defects of nature, as well as the ravages of time. I shall not inquire whether it is just and honest to impose in this manner on mankind; if it is not honest, it may be allowed to be artful and politic, and shews at least a desire of being agreeable. But to lay it on as the fashion in France prescribes to all ladies of condition, who indeed cannot appear without this badge of distinction, is to disguise themselves in such a manner as to render them odious and detestable to every spectator, who has the least relish left for nature and propriety. As for the fard, or white, with which their shoulders and necks are plastered, it may be in some measure excusable, as their skins are naturally brown or fallow; but the rouge, which is daubed on their faces, from the chin up to their eyes, without the least art or dexterity, not only destroys all distinction of features, but renders the aspect really frightful, or at least conveys nothing but ideas of disgust or aversion. Without this horrible mask no married lady is admitted at court, or at any polite assembly, and it is a mark of distinction, which none of the lower classes dare assume."

The national vanity of the French induced them, till lately, to consider the English as barbarians; but late wars, and the unanimous suffrages of their best writers, have greatly contributed to obliterate this false idea, and they now consider the English in a very different light. It is, however, but justice to acknowledge that the French have given a polish to the ferocious manners, and even virtues, of other nations. It must also be observed, that the superior order of men among the French are of a very different way of thinking from those below them; they see with indignation the frivolous manners of both court and people, and heartily despise them. They think and act for themselves, are open to conviction, and examine things to the bottom. These men, during the war of 1756, saw the management of their armies, their finances, and fleets, with silent indignation, and their researches were favourable to the English. The conclusion of the peace of Fontenbleau, and the visits which they have since paid to England, have improved that good opinion; the courtiers themselves have fallen in with it; and, what some years ago would have been thought incredible, people of fashion in France now study the English language, and imitate them in their customs, amusements, dress, and buildings. They also both imitate and admire our writers; the names of Bacon, Locke, Newton, Milton, Pope, Addison, Hume, Robert-

son, Richardson, and many others of the last and present century, are sacred among the French of any education; and, to this truth, the writings of such men have equally contributed, with our military reputation, to raise the name of Great-Britain to that degree of esteem in which it has been held of late by foreign nations, and to render our language more universal, and even a necessary study among foreign nobility.

The continual fluctuation of the French fashions would render any peculiar description of their dress needless, and their perpetual caprices would make a minute detail impossible. It may, however, be said, that they have more invention in their dress than any of their neighbours, and their constantly changing their fashions is of infinite service to their manufactures. " When a stranger first arrives at Paris, says a neighbouring writer, he finds it necessary to send for the taylor, perquier, hatter, shoemaker, and every other tradesman concerned in the equipment of the human body. He must even change his buckles, and the form of his ruffles; and, though at the risk of his life, suit his clothes to the mode of the season. For example, though the weather should be ever so cold he must wear his *habit d'été* [summer suit] or *demi saison* [mid season] without presuming to put on a warm dress before the day which fashion has fixed for that purpose; and neither old age nor infirmity will excuse a man for wearing his hat upon his head either at home or abroad. Females are, if possible, still more subject to the caprices of fashion. All their sacks and negligés must be altered and new trimmed. They must have new caps, new laces, new shoes, and their hair new cut. They must have their taffeties for the summer, their flowered silks for the spring and autumn, and their satins and damasks for winter. The men too must provide themselves with a camblet suit trimmed with silver for spring and autumn, with silk clothes for summer, and cloth laced with gold or velvet for winter; and he must wear his bag-wig à la pigeon. This variety of dress is absolutely indispensable for all those who pretend to any rank above the mere vulgar. All ranks from the king downwards use powder; and even the rabble, according to their abilities, imitate their superiors in the fripperies of fashion. The common people of the country, however, still retain, without any material deviation, the old fashioned modes of dress, the large hat and most enormous jack boots, with suitable spurs; and this contrast is even perceivable a few miles from Paris. In large cities the clergy, lawyers, physicians, and merchants, generally dress in black; and it has been observed that the French nation, in their modes of dress, are in some measure governed by commercial circumstances. A Frenchman will sooner part with his religion than his hair. Even the soldiers in France wear a long queue; and this ridiculous soppery has descended, as I said before, to the lowest class of people. The boy who cleans shoes at the corner of a street has a tail of this kind

kind hanging down to his rump; and the beggar who drives an ass, wears his hair en queue, though perhaps he has neither shirt nor breeches."

The diversions of the French are much the same as those of the English, but they carry their gallantry to a much greater excess. Persons in high rank accomplish themselves in the academical exercises of dancing, fencing, and riding; in the practice of which they excel all their neighbours in skill and gracefulness; and indeed few of the common people are without some knowledge of those embellishments. They are fond of hunting; and the gentry have now left off their heavy jack-boots, their huge war-saddle, and monstrous curb-bridle, in that exercise, and accommodate themselves to the English manner. The landlords were as jealous of their game as they are in England, and equally niggardly of it to their inferiors.

The only religion established in France for many centuries past, was the Roman-Catholic, nor has any other been tolerated since the revocation of the edict of Nantes. In the southern parts of France, some of the clergy and magistrates have been as intolerant as ever; and the persecutions of the Protestants, or as they are called, Hugonots, who are very numerous in those provinces, have been continued till very lately. The French, however, would never admit that infernal tribunal, the inquisition, to be established in their country: and in many respects the king, clergy, and laity, have been more free and independent of the pope of Rome, than in other Roman-Catholic countries. The Papists themselves were divided into several sects, among whom the Jansenists, the Quietists, and the Bourignons, were the principal. The Gallican church has more than once attempted to shake off the yoke of the popes, and made a very great progress in the attempt during the reign of Lewis XIV. but it was defeated by the secret bigotry of that prince, who, while he was bullying the pope, was inwardly trembling under the power of the Jesuits, a set of dangerous ecclesiastics that is now exterminated from that kingdom. Upon the whole, the state of religion in France has long afforded a strong proof of the passive disposition of the natives, and the bigotry of their kings, who, in compliance to the pope, have deprived the state, as we have already hinted, of many thousands of its most useful inhabitants.

By the laws of the new constitution, no man is to be molested for his opinions, nor interrupted in the exercise of his religion. The territorial possessions of the Gallican church have been claimed as national property, and disposed of through the medium of a paper money called Assignats, for the creditors of the state; and the clergy made dependent upon pensionary establishments paid out of the national treasury; out of which are paid also the expences of worship, the religious, and the poor. All monastic establishments are suppressed; but the present friars and nuns are allowed to observe their vows, and nuns optionally to remain in their convents, or retire upon pensions.

The clergy are elected by the people, and take an oath to observe the laws of the new constitution: but many of those, called refractory priests, have, from a conscientious refusal of this oath, been ejected from their benefices, and many of the popular curates made bishops. The conforming clergy notify to the bishop of Rome their union in doctrine; but do not pay him fees, nor acknowledge any subordination to his authority; and he has in consequence threatened France with excommunication. They are supplied with lodgings upon their livings, whereon they are obliged to reside, and perform the duties of their office. They vote as active citizens, and are eligible to some lay-offices in the districts, but to no principal offices.

As France is now divided into nine metropolitan circles, there is a metropolitan bishop with a synod to each. The metropolitan bishop is confirmed by the chief bishop in his circle. To these synods, appeals are made from the bishops.

To each of the eighty-three departments, which form so many dioceses, a bishop is appointed; which appointment is made by the electoral assembly of the department, and confirmed by the metropolitan bishop, but must have held an ecclesiastical office fifteen years. The salaries are from 500l. to 840l. per annum. Each diocese has also a seminary, with three vicars, and a vicar-general to prepare students for holy orders, and these vicars constitute a council for the bishop.

The bishop chooses vicars of bishops from among such of the clergy of his diocese who have done duty ten years. The salaries are from 84l. to 250l. annually.

Those who are ministers of parishes, or curés in the districts, are confirmed by the bishop, and they must have been vicars to ministers five years. They have salaries from 50l. to 160l. per annum, and receive pensions when infirm.

The vicars of ministers are chosen by the minister from among the priests admitted in the diocese by the bishop, and receive annual salaries from 50l. to 100l. sterling.

There are in France more than two millions of Non-Catholics; and the Protestants, who are greatly increasing, are, in proportion to the Catholics, as one to twelve. There are already many regular congregations: such as German Lutherans, French and Swiss Calvinists, Bohemian Anabaptists, and Walloon or Flemish Dissidents, besides many chapels for the ambassadors. Many Jews also reside here.

The French language is formed out of that of the Gauls, Romans, and Franks, and is pretty generally understood throughout Europe, particularly by genteel people, whose education is deemed defective without it. It is not however so strong, expressive, and energetic, as the English, but seems best accommodated to dalliance, compliments, and common conversation. In speaking of the French and their language, the celebrated earl of Roscommon says,

"The weighty bullion of one sterling line,
Drawn to French wire, will thro' whole pages shine."

Dryden justly observes, that the French language has all the swiftness of a greyhound, but the English all the strength of a mauliff. A late traveller says, "there are two great difficulties which an impractised person is under here, the common speech; the one is from the rapid pronunciation of the natives, which always appears to be the case when the language is not familiar to us; the other from the idioms or forms peculiar to the language. There is no effectual cure for either, but frequent conversation with the French people of all classes on their own ground. Some of our countrymen go armed with a dictionary, and make their French as they want it; but such French is generally an awkward version of the English forms of speech, not intelligible to French people. An English gentleman of this class was at dinner in a public company, and his business requiring him to be gone as soon as decency would permit, he wanted to tell the French servant that "every body had done," with design that the things might be taken away: he consults his book, and finds that every body is *tout le monde*, and done is *fini*, which with his narrow English pronunciation was, *tout le monde est fini*. The waiter, who happened to be a lad of humour, took up the mistake, and cried out, *Misericorde! que ferons nous? Monsieur dit que tout le monde est fini*. "Mercy on us, what shall we do?—the gentleman says the world is at an end."

The Lord's prayer in French is as follows: *Nôtre Père qui es aux cieux, ton nom soit sanctifié. Ton regne vienne. Ta volonté soit faite en la terre comme au ciel. Donne nous aujourd'hui nôtre pain quotidien. Pardonne-nous nos offenses, comme nous pardonnons à ceux qui nous ont offensés. Et ne nous induis point en tentation, mais nous delivre du mal: car à toi est le regne, la puissance, et la gloire, aux siècles des siècles. Amen.*

With respect to learning and learned men, we may remark, that after the destruction of the Greek and Roman empire, by the barbarous nations of the north, and the still more ferocious followers of Mahomet, France, like most other nations of Europe, lay immersed in barbarism for more than twelve centuries. The poetry of these times consisted wholly in a childish jingle of words; and the human genius, instead of being engaged in the study of objects worthy of its faculties, was devoted to frivolous questions with regard to abstract and metaphysical essences. At the same time the state of slavery in which the far greater part of Europe lay, together with the ravages of superstition, at once the child and parent of ignorance, greatly contributed to debase the faculties of the human mind, and render the revival of learning a task of almost insurmountable difficulty. At last the invention of printing, and the encouragement of Francis I. the friend of learning, gave a new turn to the studies of the French; and the finished works of the ancients were read with

No. 43.

pleasure and admiration. Some progress was daily made in erudition, and the sparks of genius, which had long lain neglected, were kindled by the noble and manly flame of the ancients.

Many learned men appeared during this reign in France, and did honour to their country. The works of the two Stephens are universally known. Malherbe, trained up in the study of the excellent poets of antiquity, and taking nature for his guide, enriched the French poetry with new beauties and harmony. Balzac followed his example, and gave majesty to their prose. The society of Port Royal continued what Balzac had begun, and added purity and accuracy, which rendered the French language at once pleasing and nervous.

But the reign of Louis XIV. was the most splendid æra of literature in France. The encouragement he gave to learning, and the pensions he bestowed on learned men, will render his name immortal. Encouragement is never bestowed on men of genius in vain. The number of learned men was prodigious, and formed a brilliant constellation in the sphere of literature. Corneille, for many years a slave to false taste, became free at last, and discovered the laws of the drama by the strength of his own genius, rather than by his reading. Racine struck into a new track, introduced into tragedy a passion of tenderness known only on the stage of the ancients, and unfolded the artifices of the human heart in a strain of truth and elegance joined with sublimity. Both these writers are distinguished for the justness of their painting, the elegance of their taste, and their strict adherence to the rules of the drama. Moliere finely painted and ridiculed the follies of age, and greatly excelled the ancient comedy. La Fontaine, in his fables, rivalled Æsop; and Bossuet, Bourdelone, Flechier, and Massillon, carried the eloquence of the pulpit to a great degree of perfection.

The arts of eloquence are so connected with polite learning, that a turn for cultivating the one, leads to improve the other. While literature flourished in this manner, Poussin produced his paintings, and Puget his statues; Le Sueur painted the Chartreux, Le Brun the battles of Alexander, and Lulli invented a species of music adapted to the French language.

Sculpture is in general better understood in France than in most other countries of Europe. Their treatises on ship-building and engineering stand unrivalled; but in the practice of both they are outdone by the English. No genius has hitherto equalled Vauban in the theory or practice of fortification. The French were long our superiors in architecture, though now we bid fair to excel them in that art.

The universities in France are eighteen in number, viz. Paris, Orleans, Rheims, Poitiers, Bourdeaux, Angers, Nantz, Caen, Bourges, Montpellier, Cahors, Valence, Aix, Avignon, Dole, Perpignan, Pont à Mouson, and Orange. That of Paris is the principal, and is said to have been founded by Charlemagne: here all the arts and sciences are taught, particularly law, phy-

fic, and divinity: it consists of above forty colleges, of which the chief are those of the Sorbonne, Navarre, the faculty of physic, and of the four nations; lectures are read only in eleven of them. The head of this university is the rector, who is chosen every three months, but is sometimes continued four years. All the professors have settled salaries; and the whole income of the university is said to amount to about fifty thousand livres annually.

Besides these universities, there are colleges established in several parts of France; but all those literary institutions have suffered an irreparable loss by the expulsion of the Jesuits, who always made the languages, arts, and sciences, their particular study, and taught them throughout that kingdom: but as the extinction of this body of men will probably lessen the influence of superstition in France, there is reason to believe that the interests of real learning will, upon the whole, be promoted by that event.

There are eight academies in Paris, namely, three literary ones, the French academy, that of inscriptions, and that of the sciences; one of painting and sculpture, one of architecture, and three for riding the great horse, and other exercises of a military nature.

The progress of philosophy was much slower than that of polite learning in France. A bigotted clergy, convinced that it is their interest to keep mankind in ignorance, obstructed philosophy in its dawn, and almost prohibited men from thinking. Even the power of Louis XIV. and his noble establishments for the improvement of learning, were unable to remove the influence of the church. Some great men, however, broke through all restraint, and, like the sun through the mists of the morning, cast a pleasing light around them. Des Cartes had all the necessary qualifications for changing the face of philosophy. His discoveries in mathematics were of the greatest service, and now form the most solid and indisputable part of his glory; particularly his application of algebra to geometry, which will always prove a key to the deep researches of the higher geometry, and consequently to all the physico-mathematical sciences.

Pascal pursued the mathematical branches of philosophy with great success. His treatise on the cycloid discovers a prodigious force of genius; and that on the equilibrium of fluids, and the gravity of the air, has opened a new science to philosophers. Few men, either by their writings or lives, have done more service to religion, than this great man and the archbishop of Cambray.

Since the time of Louis XIV. several writers of eminence have appeared. At the head of these is justly placed the celebrated Montesquieu, who may be considered as the legislator of nations, and an honour to human nature. Buffon, in his Natural History, has followed the model of Plato and Lucretius; he has embellished his work with a majesty and sublimity of style suitable to the philosophical subjects he describes.

Maupepius has taught his countrymen to shake off the yoke of pedantry, and excels in the art of conveying the most abstracted ideas intelligibly. D'Alembert has united the talents of a fine writer with the precision of a geometer.

The writers on the *Belles Lettres* in France are exceedingly numerous, and their productions very agreeable. Voltaire and D'Argens are the most considerable. The former excels both in prose and verse; and no writer ever better understood the uncommon art of denoting every idea by the most proper and familiar term. He embellishes his works without ever mistaking the colouring; and has the happy talent never to rise above or sink below his subject.

The polite arts in general have not however made the same progress in France since the age of Louis XIV. as philosophy. The French have now no painter of note, except M. Greuse, who excels in portraits and conversation pieces; nor have their sculptors produced any piece equal to those that display the magnificence of Louis the Great. Music alone has made an amazing progress since that period. The enterprising and fruitful genius of M. Rameau, has erased the opprobrium thrown by foreigners on the French music. His distinguishing character is the having successfully studied the theory of music, discovered the principles of harmony and melody in the thorough bass, and by that means reduced to more certain and simple laws that which before was subject to arbitrary rules, or such only as blind experience dictates.

It would, perhaps, be thought unjust to the French, if we did not mention the prodigious work lately published at Paris, under the title of *Encyclopédie*, or a General Dictionary of Arts and Sciences, which is the most complete system of useful knowledge we are acquainted with. It is a noble collection of all the branches of human learning, and makes 28 volumes in folio. The plates belonging to this amazing work, with their explanations, make six volumes, and are executed in a very masterly manner. The different parts of the *Encyclopédie* were drawn up by the most able masters in each branch of literature, and the articles belonging to each are marked with particular letters, lists of which, with proper explanations, are prefixed to the work. But the whole was methodized and published by Mess. D'Alembert and Diderot.

The cities, towns, palaces, and sea-ports of France being too numerous to admit of particular descriptions of the whole, we shall therefore only particularize the most respectable, beginning with the capital.

PARIS, called in Latin *Lutetia*, *Parisiolum*, or *Parisiacum*, is situated in the isle of France (now called *Oise*) being both its metropolis, and also that of the whole kingdom. It lies in a spacious plain on the Seine. This is a very large, populous, and stately city, built of a circular form, and laid to be fifteen miles in circumference. The streets are very narrow, and the houses very high, many of them seven stories. The

houses are built of stone, and are generally mean, even to wretchedness, owing partly to their containing a different family on every floor.

Paris is divided into three parts; the city, the university, and that which was formerly called the town: the city (la cité) is old Paris; the university and the town are the new. Paris contains more works of public magnificence than utility. Its palaces are more showy; and some of the streets, squares, hotels, hospitals, and churches, more superbly decorated with a profusion of paintings, tapestry, images, and statues: but Paris, notwithstanding its boasted police, is greatly inferior to London in many of the conveniences of life. The Seine, which runs through the centre of the city, is not half so large as the Thames at London: it is too far distant from the sea for the purposes of navigation, and is not furnished, as the Thames, with vessels or boats of any sort: over it are many stone and wooden bridges, which have nothing to recommend them, except Pont Neuf, which has on it an equestrian statue of Henry IV.

The streets of Paris are generally crowded, particularly with coaches, which gives their capital the appearance of wealth and grandeur; though, in reality, there is more show than substance. The glittering carriages that dazzle the eyes of strangers, are mostly common hacks, hired by the day or week for the numerous foreigners who visit the city; and, in truth, the greatest part of the trade of Paris arises from the constant succession of strangers that arrive thither daily from every nation and quarter of the globe. This ascendancy over other nations is undoubtedly owing to the reputation of their language, their public buildings, the gobelins, or manufactures of tapestry, their libraries, and collections of paintings that are open to the public: the cheapness of provisions, excellency of the French wines, and, above all, the purity of the air and climate in France. With all these advantages, however, Paris will not bear a comparison with London in the more essential circumstances of a thriving foreign and domestic trade, the cleanliness of their streets, elegance of their houses, especially within; the plenty of water, and that of a better quality than the Seine, which is said to disagree with strangers.

In the houses of Paris, most of their floors are of brick, and have no other kind of cleaning than that of being sprinkled with water, and swept once a day. These brick floors, the stone stairs, the want of wainscoting in the rooms, and the thick party-walls of stone, are, however, good preservatives against fire, which seldom does any damage in this city. Instead of wainscoting, the walls are covered with tapestry or damask. It is reckoned to contain 919 streets, great and small, and upwards of 20,000 houses, besides religious structures, colleges, and halls; has had 52 parishes, 56 monasteries, inhabited by friars, 78 by nuns, and 800,000 inhabitants. As almost every French nobleman had a palace, or hotel, as they called it, in this respect Paris might be said to surpass any thing of that kind to be met with in London.

The chief ornament of the city of Paris is the Louvre, which was built or repaired under the reign of Philip Augustus, in the year 1214. It was a castle that stood without the city. Near it, on the banks of the river Seine, they built a large tower, called the Tower of the Louvre. It defended the river, together with another tower, that stood over-against it, named the Tower of Nelle. In this tower were sometimes kept the treasures of the French kings. It was pulled down when the foundations of what is called the Old Louvre were laid, under Francis I. His son Henry II. employed the most eminent and celebrated architects of his time to render this building as regular and magnificent as could be. What is called the Old Louvre consists of two sets of buildings, that form an interior angle, the fronts of which are adorned with very fine pieces of architecture. The whole building is three stories high. The first is of the Corinthian order, the second of the Composite, and the third of the Attic. The fore or outward courts are adorned with chamfered columns, and the other with pilasters of the same order with those columns. What is chiefly admired is the proportion of the windows of the second story, the eaves of which are adorned with a pediment alternately triangular and circular. The third story, of the Attic order, has also its particular ornaments, consisting in trophies of arms, in basso-relievo fixed to the window eaves, with other ornaments in the entablatures. In the hall of the hundred Switzers is a kind of gallery supported by four gigantic figures. This hall was formerly used for great entertainments; and queen Catherine de Medicis caused plays and interludes to be acted here for the diversion of the court. On one of the gates of the Louvre is engraved the following ostentatious inscription, "*Dum tetum implet Orbem*:" implying,

May this fam'd fabric stand until the day

That o'er the world its owner gains the sway :

which sufficiently hints what the French kings have constantly aimed at, an universal monarchy. Henry IV. built a gallery along the river side, quite to the Tuilleries, which is very long, and esteemed the finest in Europe: under it is the royal printing-house, and the lodgings of many curious artists in painting. Louis XIII. finished the front to the well, and built a large pavilion, in the form of a dome, in the middle, over the gate, which is supported by two rows of very large pillars of the Ionic order, and also adorned the architrave of the front to the court with fine sculptures. Louis XIV. bestowed great costs upon the east front, in the middle whereof is the east gate of the palace: here are forty columns of the Corinthian order, which support a large terrace, that is raised with a stately balustrade. The court, which is in the middle of that large building, is very near twenty-three perches square; the four sides of it are composed of eight pavilions, and eight sets of buildings, which surround that great court:

count: there are yet but about three parts of it built. The architecture, after the manner it is begun, is to consist of three orders of columns, with their pedestals; the first of the Corinthian, and the two others of the Composite order.—Louis XIV. who declared himself the protector of the French academy, gave that illustrious body an apartment in the Louvre to hold their assemblies in; as also to the academy of medals and inscriptions, and to the academy of sciences. The academy of architecture and painting meet in the old Louvre. In the gallery of the Louvre is the royal printing-house, established by cardinal de Richlieu. They printed there the memoirs of the royal academies of the sciences, and the Belles Lettres, the king's orders, the decrees of the council, and such books as the king pleased to have printed at his own expence. There is here also a mint where they stamped the king's medals, and likewise those of all the corporations and trading companies in the kingdom, which have every one of them their own emblems and proper mottos. No medals were suffered to be struck any where else than at the Louvre.

There is in the wardrobe of this palace a prodigious quantity of rich tapettry-hangings, both ancient and modern, the finest of which have been made in the reign of Francis I. Amongst them there are the battles of Scipio, and the triumphs of the same general; the history of Joshua, made after the designs of the famous Raphael; the history of Psyche; the acts of the apostles; the history of St. Paul, &c. Louis XIV. caused several tapettries with gold and silver to be made, after the designs of Le Brun. There are also here, in several rooms, a large quantity of ancient arms; amongst which are those which Francis I. wore at the famous battle of Pavia; and on his cuirass are still to be seen the marks of the blows he received before he surrendered to the Spaniards.

Poor women and maidens are allowed to sojourn in the hospital dedicated to St. Catherine, and are entertained three days, being attended by the nuns of St. Augustine. In the grand chatelet the sessions are held by the inferior courts of justice. Fort L'Eveque contains a mint and a prison, and is close to the spot where Henry IV. was stabbed by Ravilliac. St. German l'Auxerrois is termed the parish church royal, because the Louvre and Thuilleries are situated in its parish.

The Thuilleries, or Tuilleries, stands in a place where formerly they made tiles, called Tuiles in French, from whence that palace has its name. It is joined to the Louvre by a gallery which contains 108 models of fortresses that are executed with great accuracy: it consists of one range of building, with a pavilion at each end, and a dome in the middle: in the front is an handsome large space divided into three courts; the whole adorned with columns, pilasters, and other ornaments. Behind this palace are gardens, adorned with fine walks, planted with ever-greens, and other trees, and fine par-

terres; where are to be seen, the year round, all the flowers that are in season. It has also three fine fountains, with their basons, and a large octagonal canal. Towards the river is a fine terrace planted with three rows of trees. From this terrace is a most beautiful prospect over part of the city, and over the adjacent country. A beautiful walk opens on the banks of the river beyond the Thuilleries, which is composed of four rows of fine elms, that form three avenues, being together 120 feet broad. In the centre is a ring with trees planted round it in a circular manner, and at each end are iron gates.

The Bastille was a kind of fortress, consisting of eight large round towers, joined together by other strong buildings. In the year 1631 it was surrounded with ditches and baillions. It was a prison for state criminals, and for such as were taken up by lettres-de-cacher, that is to say, by warrants signed by the king, and sealed. In it the king kept a governor, a lieutenant, and an independent company of soldiers. This building was totally demolished by the populace at the beginning of the French revolution in 1789, an account of which is given at large towards the end of the History of France.

The palace of Luxemburg, also called the palace of Orleans, was built by queen Mary de Medicis, on the ruins of the old hotel or house of Luxemburg, which name it kept. It was finished in five or six years time, under the direction of James de Brosse; and is one of the most perfect and regular pieces of architecture in France. In this palace is a gallery of paintings, done by the famous Rubens, who spent two whole years on that work. The whole history of Mary de Medicis' life is here represented allegorically, in 24 large pictures, nine feet broad, and ten feet high, placed in the piers between the windows. The quarter called the University stands in the south of the islands of the palace, and of our Lady. It was formerly enclosed by a wall, and surrounded with ditches; but under the reign of Louis XIV. the wall was pulled down, and the ditches filled, to make it contiguous to the neighbouring suburbs. That of St. Germain is the most considerable, and is alone larger than the whole quarter called the University; but it is not so populous, because of the many monasteries, hospitals, large houses or hotels, and gardens that take up a great part of it. Adjoining to this suburb are that of St. Michael, which is but small; that of St. James, which is pretty large; and that of St. Marcean, which is larger still: the last of all, which is the nearest to the river on the east, is that of St. Victor, which is very large, but not built all over. The university was founded by Charles the Great, and is appropriated to the cultivation of the arts, sciences, &c. in general, and physick, law, and divinity in particular.

well are compelled to work, but the sick are tenderly nursed, and carefully supplied with every necessary. Different wards are respectively assigned for foundlings, sempstresses, idiots, prostitutes, &c. As this general hospital is appropriated to females only, the castle of Bicetre is a kind of counterpart, and appointed for the relief of similar necessities in the male sex; and likewise for another purpose, viz. the punishment of children who lead dissolute lives, or are undutiful to their parents.

In the year 1626, the royal physic-garden was first founded, by order of Louis XIII. and finished in 1631. There were at first four professors of botany, in the room of whom the king established, in 1671, two demonstrators of the plants, one of whom is obliged to make the analysis, or chemical demonstration of them. There is also a laboratory where they read lectures of chemistry, and a particular hall for anatomical demonstrations; and in the year 1712, there was another demonstrator added, whose office is to read lectures upon the *Materia Medica*. The king's first physician was director of this garden till the year 1718, when Dr. Chirac obtained that place; and after his death it was given to the secretary of state for the city and district of Paris.

The several following academies in Paris deserve to be particularly mentioned, viz. 1. The Academie Française, or French Academy, founded by cardinal Richieu, for the improvement of the French language, in such a degree as to reduce it to a determinate standard. It consists of forty members, who meet at stated times to superintend the institution, and promote the same by every probable means. 2. The Royal Academy of Inscriptions and Belles Lettres, instituted for the advancement of polite literature. In this academy ancient monuments are explained, and the transactions of the kingdom perpetuated by medals, inscriptions, &c. 3. The Royal Academy of Sciences, instituted in 1666, has its honorary members, pensioners, associates, and students. These apply themselves to the different branches of the mathematics and natural philosophy. 4. The Royal Academy of Painting and Sculpture, founded in 1643. The master-pieces of the painters and sculptors admitted into this academy are disposed in different halls, and marked with the names of the several artists. 5. The Royal Academy of Architecture was founded in 1671, but not authorized by letters patent before the year 1717. It is divided into two classes; the first is composed of 10 architects, a professor, and a secretary; and the second of 12 other architects. The professor, whose post, as well as the secretary's, is for life, is obliged to read public lectures on stated days in the hall of the Louvre. All these establishments relate to arts and sciences. There are others designed for the improvement of virtue, and promoting religion; such as the seminaries where young clerks and priests are taught the ceremonies of the church, and the duties and functions

No. 43.

of their calling. There are 10 of these seminaries at Paris, among which is one for English, and another for Irish priests; and most of the bishops have set up such seminaries in their dioceses.

The Parisians, as well as the natives of France in general, are remarkably temperate in their living; and to be intoxicated with liquor, is considered as infamous. Bread, and all manner of butchers' meat, and poultry, are extremely good in Paris; the beef is excellent; the wine they generally drink, is a very thin kind of Burgundy. The common people, in the summer season, live chiefly on bread, butter, grapes, and small wine. The Parisians scarcely know the use of tea, but they have coffee in plenty. The police of Paris is so well attended to, that quarrels, accidental mischief, or felonies, seldom happen; and strangers, from all quarters of the globe, let their appearance be ever so uncommon, meet with the most polite treatment. The streets are patrolled night and day by horse and foot; so judiciously stationed, that no offender can escape their vigilance. They likewise visit the publicans, who are not permitted to retain company, or sell liquor, after 12 at night. The public roads in France are under the same excellent regulations, which prevent robberies in that kingdom.

The neighbourhood of Paris is very pleasant, and contains a great number of towns, villages, &c. and some fine seats, some of them being situated on the edge of mountains that rise from the Seine, are extremely delightful. Among the last in this government are the royal palace of Meudon; that of the duke of Bourbon at St. Maur des Fosses; of the archbishop of Paris, near the conflux of the Seine and Marne, called Conflans; of the prince of Condé at Issy; of the count of Thoulouse at Rambouillet; and those called Maisons and Colaguy, the latter of which belongs to the duke of Maine.

Compeigne, on the Oise, 13 leagues north-west of Paris, is the place where the Maid of Orleans was taken prisoner by the English in 1430. Here is a palace, which was repaired by Louis XIV. and the gardens finely laid out. The trade of this place principally consists of corn, wool, and wool. At Villers Coteretz, a little town five leagues from Compeigne to the south-east, at the side of the forest of Reiz, is a fine palace formerly belonging to the duke of Orleans, and an abbey.

Soissons (now the department of Aisne) is situated seven leagues from Paris to the north-east, in a pleasant valley on the banks of the river Aisne, over which there is a stone bridge. The town is pretty large and well built, being the seat of a governor-general, and of an office of the finances, a salt-office, several courts of justice, and also of a bishop, who is suffragan to the archbishop of Rheims, and had the right to anoint the French kings during the vacancy of the archiepiscopal see, or in the archbishop's absence. It drives a great trade in corn, contains several abbeys, and other religions

10 G

gions

gious houses, with an old castle, and has an academy, whose object is the same as that of the French academy at Paris.

Verfailles is situated four leagues from Paris to the south-west; here Louis XIV. built a most magnificent palace, and adorned it with noble gardens: it stands on a rising ground in the middle of a valley surrounded with hills, having, on the side towards Paris, a fine avenue leading to it through the town, which it divides into the Old and New. The apartments of the palace abound with innumerable paintings, statues, antiques, &c. The chapel, built in 1699, is a most finished piece of architecture, sculpture, and painting. Every room in this noble palace has a particular name, taken from the chief subject painted on the ceiling.—As for instance, the hall or chamber of plenty, La Sale d'Abondance, because plenty and liberality are painted on the ceiling. Here are several pictures, as the Holy Virgin on a column of jasper, holding the infant Jesus in her arms, and surrounded below with several pilgrims, done by Poussin: the Virgin Mary and St. Joseph flying into Egypt, by Guido: the woman cured of a bloody-flux by our Saviour, done by Paul Veronese, &c. The hall of Venus has that goddess painted on the ceiling; she sits in a chariot drawn by doves; the gods and heroes, celebrated by the ancients, adorn her triumph. Here are the pictures of Nebuchadnezzar, who orders the forming of the gardens of Babylon; of Augustus, exhibiting a race of chariots in the Circus; of Alexander, marrying Roxana; and of Cyrus, reviewing his army. As the hall of war is dedicated to Bellona, the frieze is adorned with trophies, bucklers, and thunderbolts. Over the doors are trophies of gilt metal, under which are represented the four seasons, by proper figures and festoons, signifying that Louis XIV. has been a conqueror in all the seasons of the year. The ceiling of this hall is adorned with five pictures. The largest, which is in the middle, represents France holding a thunderbolt in one hand, and a buckler in the other. The four others are in the sides. In the first is Bellona in a violent passion. The second represents Germany doing her best but fruitless endeavours to defend the imperial crown. In the third, Spain seems to threaten France; but her soldiers are put to flight. The fourth shews Holland thrown back upon her lion. This room is also adorned with six heads of porphyry, representing as many Roman emperors; they are in bulls, with a drapery of gilt brass, and supported on pedestals of oriental alabaster.

The most sumptuous of all the rooms is the king's bed-chamber. The carvings are all gilt, on a white ground. The bed is placed in a kind of alcove, where are two figures of Fame, represented sitting: on the cupola, over the bolster, is France sitting, and seeming to watch for the preservation of the king. There are several other pictures in this chamber, and particularly one of Hagar in the desert, with her son, and an an-

gel. The furniture of the bed is of crimson velvet, embroidered with gold, and otherwise beautifully ornamented.

The gardens are not less magnificent than the palace. In descending from the terrace you meet with two basons, where there are several water-spouts; and in the middle of each a collection of fountains in the form of a wheat-sheaf, which rises 29 feet high. The borders of these basons are adorned each with eight groups of brazen figures, representing rivers and nymphs; and four others of the same metal, representing cupids, little nymphs, and genii. In two angles of the parterre are two other basons of marble. The water-spouts that come from them form two sheets of water exceedingly fine; and on the border of each of these basons are two groups of figures of animals, made of brass. From this parterre you see, in a kind of half-moon that is below it, the bason of Latona, round which are represented, in a group of three figures, Latona, Apollo, and Diana. Latona seems to complain to Jupiter of the cruelty of the peasants of Lycia, who are here represented metamorphosed into frogs, which throw a vast quantity of water upon the group. There are several other basons, with water-spouts, and other curious water-works, all adorned also with fine groups and statues of several kinds, which it would be too long to give a particular description of; we shall therefore confine ourselves to the famous canal. At one end of it is a bason of an octagonal figure, and 420 feet diameter; four of its sides are circular, three in straight lines, and the other joins with the canal; in two of the angles of this bason are two sea-horses, each of which carries a Triton on his back. The great canal is 32 fathoms broad, and 800 long, including the basons at each end. In the middle it is crossed by another canal, about 520 fathoms long. At the other end of the large canal is also a bason 200 fathoms long, and 100 broad. Upon this canal the court sometimes divert themselves in yachts and galleys. The orangery, or green-house, is a master-piece in its kind. It is exposed to the south, and contains first a large gallery, which is innermost, 408 feet long, and 32 feet broad, with 12 arched windows in the front; on each side of this gallery are two others, each 360 feet long. These galleries are adorned without with fine rows of columns; the innermost gallery has eight double columns of the Tuscan order, the two others have four columns each of four feet diameter. At the gate of the porch are two other columns of the same order, but much thinner. Before this green-house is a beautiful parterre, with a fine bason in the middle, where the water spouts out 40 feet high. It is adorned with four rows of columns, of the Tuscan order, groups of stone figures beautifully carved, vases, statues of white marble, &c. In the summer time this parterre seems to be a forest of orange and lemon trees, myrtles, laurels, &c.

Here

Here is a beautiful grove, which contains the laby-
rinth or maze, the several walks of which are so in-
terwoven with each other, that it is a difficult matter
to find the way out of it. At the entrance you meet
with two statues, the one of Æsop, and the other of
Cupid, holding a clue of thread in his hand. At
every turning of the avenues you meet with a beauti-
ful fountain, adorned with a basin of fine shell-work,
where they have represented, in the most natural man-
ner, one of Æsop's fables, the subject of which is ex-
pressed in four lines, engraved in gold letters on a thin
brass-plate with a black ground. In the garden are
statues, canals, groves, grottoes, fountains, and every
thing that can render it delightful and elegant. The
royal cabinet contains many fine medals, coins, paint-
ings, &c. In the park stands the beautiful palace of
Trianon, the outside of which consists wholly of variegated
marble, of exquisite workmanship. The garden-
s are large, and abound in statues and water-
works.

The late king's royal seat, called Marly, stands in a
park contiguous to Versailles, it has beautiful gardens
belonging to it. The engine here for raising water
from the Seine, to supply the reservoirs and water-
works; is equally grand and ingenious, and, with the
other water-works, cost immense sums; the water be-
ing conveyed over several hills to the great reservoir
here, and from thence to Versailles. St. Germain en
Laye, a town in the forest of Laye, is chiefly re-
markable for two castles, or royal palaces. The forest
and park, contiguous to the castles, are very beau-
tiful.

The town of Fontainebleau is situated in the mid-
dle of a forest of the same name, eleven leagues south
of Paris, and about one from the Seine. Its spaci-
ous royal castle or palace hath chiefly contributed to its
fame. Here are neat gardens, laid out with very good
taste; and besides the great fountain are many others,
which greatly adorn this charming seat. All the halls
or rooms of this palace are adorned with very fine
paintings and carvings. The greatest room of all is
that where plays are acted when the court is here.—
There is in that room a fine chimney, built by Henry
IV. in 1599; it is twenty-three feet high, and twenty
wide, and is adorned with four large Corinthian col-
umns of spotted marble, with basins and chapiters of
white marble: in the middle of the chimney is a table
of black marble, on which stands the Equestrian sta-
tue of Henry the Great: underneath are two baso-
relievos; the one representing the battle of Ivry, and
the other the surrender of the city of Metz. Two
marble statues placed on each side of this figure repre-
sent loyalty and peace: over-against the chimney is a
noble theatre for acting plays.

Fontainebleau was considerably increased under the
reigns of Henry IV. and Louis XIII. The latter
built the parochial church, which is adorned with fine
paintings: on each side of the great altar is a Corin-

thian column twenty feet high, and over it is a picture
of our Saviour curing the man sick of the palsy, ex-
quisitely done by Varin. This town is the seat of a
royal provostship, consisting of a provost, a commissary
of inquiries both in civil and criminal matters, a
king's attorney, and a recorder.

The districts of ARTOIS and PICARDY (now Som-
me) produce wine, grain, fruits, pasturage, and turf.
Picardy, the name of which is thought to be derived
from Picard, signifying a passionate wrangler, is
bounded on the east by Champagne; on the south by
the Isle of France; on the north by the Pais de Cal-
lais, Artois, and Hainault; and on the west by Nor-
mandy and the channel. Its rivers are the Somme,
which rises in the Vermandois, and falls into the chan-
nel; the Oise, in Latin Isara, which rises in Picardy,
and at Comblans falls into the Seine; and the Canche,
which rises in Artois, and falls into the sea at Sta-
ples. The other smaller rivers are the Lauthie, the
La Lis, the Aa, the Scarpe, and the Deule. This
province, in consequence of its flourishing manufact-
ures, its situation upon the sea, and its fisheries, is the
seat of a very extensive trade. Like most of the other
provinces, it had formerly its petty princes, dependent,
however, on the crown of France. For the administra-
tion of justice, here were many inferior courts subordi-
nate to the parliament of Paris.

Boulogne, on the mouth of the Lane, is only eight
leagues from the nearest coast of England. It is the
capital of a district called the Boulonnois, which en-
joys peculiar privileges of exemption from several
taxes; and has a governor independent of the gover-
nor-general of Picardy. The harbour cannot be en-
tered but at high-water, and is defended by a fort.—
The town is divided into Upper and Lower. The
bishop of Boulogne is suffragan to the archbishop of
Rheims. Here are a court of admiralty and other
courts, a strong citadel, and several convents. Near
this citadel is a mineral spring, called La Fontaine de
Fer, that is, the iron spring.

The town of Calais, is situated on the narrowest
part of the channel opposite to Dover, from which it
is distant about seven leagues, is the capital of the Pais
Reconquis, or Recovered County. It is pretty large,
and well fortified, but the harbour is of very difficult
and dangerous access. Here are a fine arsenal, and a ci-
tadel which commands the town, the harbour, and all
the adjacent country, several convents, and a fort,
whence all the country about the town may be laid un-
der water in twenty-four hours. By the Canal of Cal-
lais, the inhabitants have an easy communication with
Dunkirk, St. Omer, Gravelines, Ypres, &c. and in
time of peace a packet-boat passes regularly twice a
week between England and Calais. There are two
inconveniences which they who pass from Dover to
Calais would always wish to avoid: The first is, that
of losing the tide, and being obliged to take a French-
boat:

boat to get into the harbour; the other is that of landing so late as to be shut out of the town, and compelled to lodge in one of the houses that stand without it. The town of Calais makes a much handsomer appearance from the water than the town of Dover; its towers begin to become visible on reaching the middle of the straits. It has two piers of great length, which run parallel, and are both of timber.— One of them affords a very agreeable walk over a boarded floor, which, at several times of the day, but especially in a summer evening, is frequented by many genteel people of the place. On this pier a troop of servants from the several houses of accommodation, stand ready to receive the passengers at their landing, and conduct them, together with their baggage, according to their several destinations.

Artois, is one of the most fertile districts of the whole kingdom. It is 24 leagues long, and 12 broad, being bounded on the east by Hainault, on the north by Flanders, and on the west and south by Picardy. A considerable trade is carried on in the province in grain, flax, hops, wool, linen, &c. The states consist of the clergy, nobility, and commoners, who hold their seat at Arras.

CHAMPAGNE, or Upper Marne, (now in the department of the Ardennes) has Hainault and Liege on the north, Burgundy on the south, Luxemburg and Lorraine on the east, and the Isle of France and Picardy on the west. It is 160 miles long, in some places exceeds 140 in breadth, and is watered by the Seine, Maine, Aube, Aisne, and Maes. The air is pure, and the soil fertile. The few hills abound with mines, the vallies with mineral waters, and the forests with game. The province itself receives its name from its extensive plains. The trade consists in corn, wine, and iron; and the whole was under the jurisdiction of the parliament of Paris; except the territory of Sedan, which belonged to the parliament of Metz.

BURGUNDY (in the department of Yonne, Saonne and Loir, has Champagne on the north, Lyonnois on the south, Franche Comté on the east, and Nivernois and Bourbonnois on the west. Its length, from north to south, is about 45 leagues; and its breadth, from east to west, about 30. It is very fertile in corn, wine, fruit, and tobacco; being watered by the Seine, the Dehume, which falls into the Soane, the Brebince, or Bourbince, the Armançon, the Ouche, and the Tille. There are some noted mineral springs in it, with subterraneous lakes, and plenty of ochre. For a long time it had dukes of its own, subordinate to the crown of France; but Louis XI. at last, upon the failure of heirs male, seized upon it, and annexed it to his crown.

DAUPHINE (now the department of Ardeche), called also the Upper Alps, is bounded on the south by Provence, on the north by Bressé and the Rhône, on the

east by the Alps and Savoy, and on the west by the Rhône, which separates it from the Lyonnois and Languedoc. It had long princes of its own, who were styled dauphins du Viennois. At last Dauphin Humbert, having no children, made it over to Philip VI. of France, on condition that the inhabitants should still retain their privileges, that the province should be for ever incorporated with the crown of France, and that the king's eldest son should enjoy it, with the arms and title of Dauphin. In the year 1349, this agreement was fully executed. Dauphiné has a governor and parliament. Near two-thirds of the department are very barren and mountainous; but the mountains contain a variety of minerals, and, in some places, are covered with larch trees, which are very valuable, as they not only yield a very durable wood, but also manna, benzoin, and agarie, the last of which is used in physic and dyeing scarlet. The more level and fruitful part of the department is called Lower Dauphiné.— On the mountains are also found several sorts of wild animals, as bears, marmots, chamois goats, and other species of goats, called by the French, bouquetons, or chevrels, together with white hares, partridges, eagles, hawks, &c.

Grenoble, situated on the conflux of the Isere and Drac, in a plain at the foot of the mountains. It received its name from the emperor Gratian, son of Valentinian I. from whence it is called, in Latin, Gratianopolis. It is, however, much more ancient, was before called Cularo, and belonged to the Allobroges. It has been a bishop's see ever since the 4th century. The Delphinal council, established here in 1340, by Humbert II. dauphin of Viennois, was erected into a parliament in 1453, by king Louis XI. The governor and lieutenant-general of the province reside here, and had formerly seats in the parliament above the first president. This city is well-peopled, and commanded by a fort called la Balille. The Isere divides the city into two unequal parts. Here are no fine buildings, except the bishop's palace, which owes its beauty to cardinal le Camus, bishop of Grenoble; and is adorned by excellent paintings, representing our Saviour's life and passion, and by the picture of the bishop. The town was fortified by the chevalier de Ville. The skins and gloves of Grenoble are very much esteemed; but the woollen stuffs are but coarse.

PROVENCE (in the department of the Lower Alps) derives its name from the Latin Provincia, and is bounded to the south by the Mediterranean, to the north by Dauphiné; to the west by the Rhône, which separates it from Languedoc; and to the east by the Alps and the Var, which separate it from the dominions of the king of Sardinia. It is divided into the Upper and Lower, its length being about 42 French leagues, and its breadth about 30. The air and soil differ widely in the two divisions; for in the former the air is temperate, but in the latter extremely hot.

hot. The former yields good corn, apples, and pears, and abounds in cattle, but has little wine. On the contrary, the latter has plenty of wine, with orange, lemon, pomegranate, fig, palm, cypress, olive, mastic, medlar, and sea-cherry trees; but does not produce half the quantity of corn necessary for the inhabitants. This district yields also a kind of box, the fruit of which proceeds from the middle of the leaf, and continues all the year round. Of their wines, the Muscadel is the best. In the road and harbour of Toulon is caught a fish, enclosed in a stone, which must be broke before the fish can be come at; it is called a date, from its resemblance to that fruit. The taste of it is very agreeable; but, in general, the fish of the Mediterranean are inferior to those of the ocean. There is also a small bird in Provence, called becca-figo, that feeds only upon grapes and figs, and is delicate eating. Iron, black agate, copper, and lead, are found here. There are no considerable rivers in this district: the chief are the Durance, the Sourgé, the Largens (so called from the transparency of its water), the Lare, the Verdon, and the Var; the last of which divides France from Italy. The woods are numerous, and afford a great deal of timber for ship-building and other uses. Almost the whole trade from France to Italy, the Levant, and the greater part of Spain, is carried on from this part of the country.

Lyons is one of the finest and most considerable cities in Europe. It stands at the conflux of the Rhône and Soane, and had the Latin name of Lugdunum, from a place of the Gauls that stood upon a hill hereabouts, and was called Lugdun, i. e. the Hill of Ravens. There are still some remains of the stately buildings with which the Romans adorned this city, now the second of France, having two squares; in one of which is an equestrian statue of brass of Louis XIV. a beautiful town-house, a noble stone bridge over the Rhône, with two of wood, and one of stone, over the Soane, a great number of convents and churches, besides the cathedral, four suburbs, six gates, an exchange, an observatory, a public library, three hospitals, a mint, an arsenal well furnished with military stores, and having three forts. It is noted for manufactures of gold and silver stuffs, gold and silver laces, and silks of all sorts.

Rheims situated on the river Vesle, twenty-five leagues north-east of Paris, is one of the largest and most celebrated cities in the whole kingdom, and the see of an archbishop. The gate and portico of the cathedral are the most stately in the nation. Here is an university, founded about the middle of the sixteenth century, by Charles, cardinal of Lorraine. There are still some remains of antiquity here, particularly two triumphal arches, some causeways, and three gates, together with a great number of churches and convents, two commanderies, several hospitals, and courts of judicature.

Lille, in French Flanders, is thought to be the most

No. 43.

regular and strongest fortification in Europe, and was the master-piece of the famous Vauban. It is generally garrisoned with above 10,000 regulars; and, for its magnificence and elegance, it is called Little Paris. Its manufactures of silk, cambric, and camblets, are very considerable; and its inhabitants amount to about 100,000. Every reader is acquainted with the history of Dunkirk, which the French were obliged by the treaty of Utrecht to demolish, but is still a thorn in the side of the English, by being a harbour for their smugglers, and may now, by an article in a late treaty of peace, be put into what condition the French ministry may please. The road lies at the distance of two miles and a half from the town, about three from the new harbour of Mardyke, and is sheltered by the Brak, a sand-bank, extending parallel to the shore two leagues E. and W. The English forces, under the Duke of York, made an unsuccessful attempt to take this town in 1793. The rest of French Flanders, and its Netherlands, abound with fortified towns; which carry on very gainful manufactures.

Valenciennes, a strong, large, and well-built city of Hainault, in the French Netherlands, on the river Scheldt. It lies about five miles S. of Tournay, lat. 50—24 N. long. 3—23 E. It is defended by a citadel, and has also sluices that can lay the country under water. Here are considerable silk and linen manufactures, with an university. The French took it from the Spaniards in 1674. The Austrians besieged it in 1792, but were obliged to raise the siege; but it was since taken by the allied army of the Imperialists, and the British forces under the duke of York.

Rochelle, or La Rochelle, is situated on the sea-coast, two leagues from the isle of Rhé, and four from Oleron; it is a handsome town, with a fine port of a circular form, and strong fortifications. Here also are a mint, a chamber of commerce, an admiralty, and other courts, an academy of Belles Lettres, a sugar refinery, and a medical, botanical, and anatomical school. It is the see of a bishop, suffragan to Bourdeaux. The salt marshes affect the air of this place greatly. This city, being the chief seat of the reformed in France, suffered very much during the civil wars, and was often valiantly defended, and long possessed by that party, till at length Louis XIII. after a long and famous siege, made himself master of it in the year 1628, chiefly by the means of an admirable rampart, or bank of earth, which cardinal de Richlieu caused to be raised against it on the side of the Ocean. After it was taken, the king caused the walls and fortifications to be demolished, except only two towers, which defend the port: but Louis XIV. caused new and strong fortifications to be raised about it.

Bourdeaux, the capital of the whole government, stands on the banks of the Garonne, and is one of the most ancient and beautiful towns in France. This city, which, with its harbour, is defended by three forts, carries on a considerable trade with most parts of Eu-

rope; the tide rising so high in the river, that ships of great burden can come up to the quay. Here is an university, an academy of sciences and fine arts, a large Gothic cathedral, dedicated to St. Andrew, besides many other churches and convents, three seminaries, an exchange and mint, a parliament, an admiralty, various courts and offices, several public fountains, some remains of antiquity, and a manufacture of lace. Foreign Protestant merchants are indulged here in the private exercise of their religion.

Rochfort, a handsome new town, situated on the Charente, was built by Louis XIV. It is strongly fortified and furnished with all the necessary magazines, storehouses, &c. for shipping, together with a fine large dock, a victualling office, and hospital for sick and wounded seamen, a foundery, a manufactory of sail-cloth, and a marine academy. The harbour here is very convenient, and the river, which is well guarded with forts all the way to its mouth, is so broad and deep, that the largest ships may come up to the town without either danger or difficulty.

Brest is a small but strong town, situated on the north side of a large commodious bay and harbour, well defended by forts, and lined with fine quays, on which are built warehouses, filled with all sorts of naval stores and provisions for seventy sail of men of war; but the entrance to it is narrow and difficult, on account of the many rocks which lie under water. The road is large enough for five hundred men of war. Here is an arsenal, an academy for sea-officers, a court of admiralty, with a building for the slaves, and a strong garrison.

The city of Toulon, which is tolerably large, and the see of a bishop, is situated on the Mediterranean, and has a fine port. Both the town and harbour are strongly fortified; having on two sides of the former high hills, at a very small distance, of which that of St. Anne on the north east perfectly commands. The entrance of the port is so narrow, that two ships cannot go into it abreast. Here is an admiralty and other courts, a great many convents, an arsenal well furnished, a large rope-house with three arched walks, a cannon foundery, a general magazine, containing an immense quantity of stores, and a manufactory of coarse woollen cloth. In August 1793, Lord Hood, the British Admiral, obtained possession of the harbour, ships, and fortresses of Toulon, on certain conditions agreed on between the King of Great-Britain and the Royalists; but on December 20 following, he evacuated the same, after destroying ten of the enemy's ships of the line in the arsenal, with the mull-house, great store-house, hemp-house, and other buildings: the admiral also took possession of the Commerce de Marseilles, Puffant, and Pompée of the line; with the Pearl, Arethusa, and Topaze frigates, besides several large corvettes.

The city of Marseilles is situated on the coast of the Mediterranean sea, and is divided into the Old and

New; the former of which is but meanly built, but the latter is large, handsome, rich, and populous, with a safe and spacious harbour, which runs up far into the city, and is well secured and fortified. It is the see of a bishop; and all the trade which is carried on from the south of France, in a great measure, centres in this place. Here the galleys of France are laid up; and here likewise is a dock for building them. The principal public buildings of this place are a noble arsenal, a mint, an observatory, an academy of fine arts, several churches, and two abbeys.

Avignon, a large and beautiful city, and the see of an archbishop, is situated at the conflux of the Rhône and Sorgue, seven miles from Arles to the north, and fifteen from Aix to the north-west. Here is a papal palace, in which the vice-legate, or governor, resided; a stone bridge over the Rhône; a very handsome college; and an university, founded in the year 1303. No less than seven popes resided here successively, from the year 1307 to 1377. In the church of the Franciscans is the tomb of the beautiful and learned Laura, so much admired and celebrated by the immortal Petrarch. The grave having been opened in the time of Francis I. a leaden box was found in it, containing a medal, with a copy of verses written on parchment by Petrarch, in praise of his mistress. The Jews enjoy the free exercise of their religion in this city.

LANGUEDOC, now called Gard, is bounded to the south by the Mediterranean and Roussillon; to the north by Auvergne, Lyonnais, and Guienne; to the east by the Rhône; and to the west by Gascony. It is seventy leagues in length, and, where widest, thirty-two in breadth. The principal rivers are the Rhône, Garonne, Aude, Tarn, Allier, and Loire. The royal canal of Languedoc is upwards of 100 miles in length, six feet deep every-where, and the breadth about twenty fathoms. In some places it is carried under mountains, and in others over vallies, having all along sluices, dams, reservoirs, watercourses, and draw-bridges.

Several remarkable winds are observed in this department. That called the cers blows generally from the west along the southern coasts, and is very refreshing in summer: another, called autan, blows generally from the opposite quarter, and is hot and unwholesome: and a third, called bise, or the black, blows frequently in the valley through which the Rhône runs, very strong and cold. When the wind in this valley blows from the south, unattended with rain, it is no less unwholesome than the autan. From the coasts of Leucate to the Rhône, in the heat of summer, a sea breeze sets in, from ten in the forenoon to five in the afternoon, which cools the air, that would be otherwise almost insupportable. In a valley, at the foot of the Pyrenées, there is a sharp west or north-west wind, called the le vent de pas, which blows only in the

night, and generally, in the summer, through the
openings of the mountains; hence the people of the
valley are obliged to winnow their corn in the night.
A very remarkable custom prevails in this district, which
is that of treading out their corn by horses or mules,
according to the Eastern custom, frequently alluded to
in the scriptures. The states of the province consisted
of three orders, the clergy, nobility, and commons.
The coasts of Languedoc are not only dangerous, but
destitute of safe and good harbours. The exports con-
sist chiefly of wine, oil, dried chestnuts, raisins, wool-
len cloth, stuffs, silk, and corn. The common di-
vision of the department is into Upper and Lower.

The capital of the whole department is Thoulouse, si-
tuated on the Garonne, over which it has a stately bridge,
is one of the largest and most ancient cities in France;
yet, having little trade, it is neither populous or rich.

Montpelier, situated on an eminence, near the river
Lez, is the largest city in the department next to Thou-
louse, and the see of a bishop, suffragan to Narbonne.
It contains a citadel, university, physic-garden, and
royal academy of sciences: of the fifteen ordinary fel-
lows of the latter, three apply themselves to the mathe-
matics, three to anatomy, three to chemistry, three to
botany, and three to natural philosophy. The air of
this city is deemed remarkably salubrious: the houses
are handsome, but the streets narrow; and here is a
good trade in silks, woollens, wine, strong waters, ver-
digris, &c. Montpelier is pleasantly situated, and
commands many beautiful prospects. On the Pierou
there is a fountain, which, for simplicity and beauty,
excels most others: the water is brought from a
mountain five miles distant. The environs of this city
are planted with vines, olive, fig, and mulberry-trees;
the latter to nourish the silk-worms, which form the
most considerable object of trade. Another thing that
brings in a considerable revenue to this city is the dis-
tillation of waters of all sorts, of *liqueurs*, and syrups,
that are famous all over Europe. This place is much
resorted to by those of the English who labour under
disorders of the lungs; whom the reputed clearness of
its atmosphere, and fame of its physicians, have lured
in hopes of a cure. Besides its university, and schools
of medicine, Montpelier boasts a royal academy of
sciences, which is composed of six honorary members,
three physicians, three astronomers, three mathema-
ticians, three chemists, and three botanists. Rabelais
is said to have been of this university; and his gown
and cap are still preserved, with a kind of religious
veneration, and used in the ceremony of conferring
the degree of doctor. Balaruc, on the Thau, not far
from Montpelier, has some warm baths, the waters of
which will retain their heat at least eight hours.

FOIX is bounded on the west by Gascoigne, on the
east and north by Languedoc, and to the south by
Roussillon and the Pyrenean mountains. It is divided
into Upper and Lower. The former is mountainous,

but abounds in wood, iron, caverns, and mineral
waters; and the latter is fruitful in corn, wine, &c.

The principal places in Upper Foix are, Foix, the
capital, situated at the foot of the Pyrenean moun-
tains. It is the seat of the assembly of the states, has
an abbey, and is defended by a castle.

ROUSSILLON (now the Eastern Pyrenees department)
is bounded on the north by the Lesser Pyrenees, on
the south by the Greater, on the west by Cerdogne,
and on the east by the Mediterranean Sea. It is twenty
leagues long, and twelve broad, and rec... its name
from a Roman colony, called Ruscinus. The h t
here, in summer, is intense; but the soil is fruitful
in corn, wine, oil, millet, oranges, &c. Sheep, quails,
partridges, and pigeons abound; but cows and oxen are
scarce. The ground is ploughed by mules; and a
great deal of oil, with some corn, millet, and wool,
are exported from the county. It is watered by the
Tet, the Tec, and the Agly, which are, properly
speaking, only torrents, produced by the melting of
the snow on the mountains. It belonged formerly to
Spain, but was yielded for ever to France by the treaty
of the Pyrenees in 1659. Besides Roussillon, this de-
partment includes a part of Cerdagne.

The principal place in Roussillon is Perpignan, the
capital, situated on the river Tet, a league from the
Mediterranean, which, though not large, is populous,
well built, and strongly fortified. It is also the see of
a bishop, suffragan to Narbonne. Here are an uni-
versity, several convents, alms-houses, hospitals, and
churches, a noble cannon-foundery, a sut-office, a
mint, and a high court of justice, to which appeals lie
from all the interior courts. The remains of the old
town of Roussillon lie on the river Tet, not far from
Perpignan.

NAVARRÉ and BEARN. The boundaries of this
department are Labourd on the west, Bigorre on the
east, Gascoigne on the north, and the Pyrenean moun-
tains on the south. Navarre, included in this depart-
ment, is but a small portion of the ancient kingdom
of Navarre, which, having been seized upon by Ferdi-
nand, king of Arragon and Castile, this part alone was
restored, and became annexed to the crown of France.
It is only eight leagues in length, and five in breadth.
Navarre is barren and mountainous, and contains only
one place worth notice, viz. St. Jean-Pié-de-Port,
which is situated on the Nice, a league from the bor-
ders of Spain, and eight from Bayonne. It is well
fortified, and has a castle, commanding the pass of the
mountains.

GUYENNE and GASCONY, which is the largest depart-
ment in France, being sixty-five leagues in length, from
east to west, and fifty-six in breadth, from north to south,
is bounded on the south by the Pyrenean mountains;
on the north by Limousin, Angoumois, and Saintonge;

on the east by Languedoc and Auvergne; and on the west by the Ocean. This department is fruitful in corn, wine, fruits, hemp, tobacco, brandy, pines, and many other commodities. They have also medicinal springs, with copper, coal, and other mines, and quarries of marble of all colours. The chief rivers are the Garonne and Adour, both which discharge themselves into the Ocean.

Guyenne, properly so called, is bounded on the north by Saintonge, on the east by Perigord (now Dordogne), and Agenois, on the south by Bazadois and Gascony, and on the west by the Ocean; and contains the following places of note: Bourdeaux, the capital of the whole department, which stands on the banks of the Garonne, about twenty leagues from its mouth, and is one of the most ancient in France. It carries on a great trade with most parts of Europe, the tide rising to high in the river, that ships of great burden can come up to the quay. The city and harbour are defended by three forts. The finest parts of the former are the palace-royal near the harbour, and the suburb of Chatron. It is the see of an archbishop. Here are an university, an academy of sciences and fine arts, a large Gothic cathedral dedicated to St. Andrew, several other churches and convents, three seminaries, several public fountains, an exchange, a mint, a parliament, an admiralty, several other courts and offices, some remains of antiquity, and a manufactory of lace. About six leagues below the city is a watch-tower, or light-house, called La Tour de Cordouan. Foreign Protestant merchants are indulged here in the private exercise of their religion. Richard II. king of England, was born here in 1367.

An ingenious writer comments on this city in the following picturesque manner: "The favourable impression which Bourdeaux cannot fail to make on a stranger at his arrival is well confirmed by a residence in it. Pleasure seems to have as many votaries here as commerce; luxury and indolence reigning within the same walls, and that in the most extended degree. The air of courts is ever effeminate, seductive, and voluptuous. Commercial cities are usually marked by opposite manners, and the love of gain. Avarice, powerful in its influence over the human heart, swallows up and absorbs the more soft and melting passions. Here, however, these rules are entirely controverted. Dissipation and debauchery are more openly patronized, and have made a more universal and apparent conquest, than in half the capitals of Europe."

The neighbouring district called Bourdehois, is very fruitful, particularly in vines, chestnuts, and fig-trees.

Montaubon, on the Tarne, is a handsome well built town, eight leagues from Thoulouse, and under the jurisdiction of its parliament. The bishop is likewise suffragan to the archbishop of Thoulouse. Here were an academy of Belles Lettres, several convents, a manufactory of woollen stuffs, several inferior courts of justice, &c. This town sustained considerable damage

by a dreadful inundation of the river Tarne, which began on the 14th of November 1766, and laid 1200 houses in ruins. The particulars of this melancholy disaster are thus related: The fall of the houses began in the suburb of Sapiac. The noise occasioned by their tumbling was heard in the neighbouring suburb, with the cries of several persons who called out for help; but as the water surrounded entirely the suburb of Sapiac, it was very difficult going to the assistance of the unhappy inhabitants. The river, which was prodigiously swollen and rapid, was laden with a number of trees of an enormous size, that had been torn up by the roots, and carried down along with it; a circumstance which, joined with the darkness of the night, rendered the passage of boats very dangerous. These obstacles, however, did not intimidate a mariner, who, in spite of the entreaties and tears of his wife and children, ventured to cross the river, in order to save such as were on the point of perishing. His courage roused several of his fellow boatmen to imitate him; and by means of their help no one perished. The floods continued to increase, and redouble their alarms. The inhabitants of the city, separated from the suburb by a bridge, ran to the Ville Bourbonne. At seven o'clock of the morning of Tuesday, November 18, the floods began to abate, and their decrease continued till noon. Hope immediately began to spring up in every bosom, but was soon stifled by the fill of the greatest part of the suburb of Gasseras, adjoining to that of Ville Bourbonne; and it was perceived that all the houses, even those that were yet at a distance from the waters, were tottering, and rested only on a loose earth, which the waters had already undermined. At noon the swell began again, and was continually augmenting. The consternation was then universal. Orders were given to move off all the effects. Persons of all ranks were desired to assist in the removal; and all the carriages were engaged to make the removal the more speedily. The tribunals of justice opened their halls, the monks their convents and cloisters: the churches were also offered as repositories for the effects of the people. The inhabitants of Ville Bourbonne abandoned successively their houses; and the inhabitants of the city, with an earnestness which did honour to humanity, received their unhappy neighbours, and, with marks of true tenderness, endeavoured to alluage a grief which had no bounds. The inundation increased during the whole day, and continued still augmenting till seven in the morning of November 19, when the waters were thirty-two feet above the common water level. Such an extraordinary inundation occasioned sundry neighbouring villages to be entirely overflowed, and produced the greatest ravages. In the plains the buildings were overwhelmed, the grain washed away, the cattle drowned, and the greatest part of the inhabitants found their only safety in sudden flight, or in climbing high trees, where the horrors of famine were joined to the

dreadful spectacle of beholding their dwellings destroyed, and their effects carried away by the flood.

The town of Bayonne is the capital of the district of Labourd, which produces some fruits; it is a pretty large city near the sea, five leagues on the borders of Spain to the north, and 120 from Paris. Being one of the keys of the kingdom on the Spanish side, it is strongly fortified. Here are a citadel, with two forts, and other works; an admiralty, a mint, several convents, and the see of a bishop, who is suffragan to Auch, and has a revenue of 19,000 livres, out of which his taxation to Rome is only 100 florins. Bayonne is most agreeably situated at the conflux of two rivers, the Adour and the Nive. The first is scarce less considerable than the Thames opposite Lambeth; and across it is a wooden bridge, which joins the place to a suburb, called Le Fauxbourg du St. Esprit. The Nive, which is small, and rises in the Pyrenees, intersects the centre of the city, and resembles one of the canals in Holland. The entrance into the Adour, which is about four miles below the town, is rendered both difficult and hazardous, from the sands, which have collected and form a bar towards the mouth. It is, notwithstanding, a very agreeable place of residence, and furnishes, in profusion, all the requisites of life.

SAINTONGE and AGOUMOIS, or ANGOUMOIS, now Charente department, is twenty-five leagues long, twelve broad, and bounded on the east by Agoumois and Perigord, on the west by the Ocean, on the north by Poitou and Aunis, and on the south by the Garonne and Burdelois. The rivers are the Charante and Butonne; and the country abounds in grain, wine, saffron, fruit, salt, and mineral springs.

AUNOIS is bounded on the south and east by Saintonge, on the north by Poitou, and on the west by the Ocean. It is only ten leagues long, and about as many broad, being the smallest province in France; but is fertile in grain, pasturage, vines, &c. It has a good harbour, great quantities of salt, and lies within the jurisdiction of the parliament of Paris.

POITOU (now Vendee) is bounded on the north by Touraine and Anjou; on the south by Aunis, Saintonge, and Agoumois; on the east by La Marche and part of Berry; and on the west by the Ocean. It is forty-eight leagues long, and twenty-two broad. It belonged formerly to the kings of England; but being lost by Henry VI. was re-annexed to the crown of France. The rivers are the Sevre-Niortoise, Vienne, and Clain. The produce and commodities are corn, cattle, and woollen stuffs; and the whole was under the jurisdiction of the parliament of Paris.

The capital of the department is Poitiers, situated on the river Clain; it is large, and contains many churches, several abbeys, convents, and courts of justice, some remains of Roman antiquities, an university,

No. 44.

a mint, and manufactories of woollen caps, stockings, gloves, and combs. It is the see of a bishop, suffragan to the archbishop of Bourdeaux. In the year 1356, the French were defeated by the English, under Edward the Black Prince, near this town, and John, their king, taken prisoner.

BRITANNY, (Finisterre) is a peninsula, which borders on Normandy, Maine, Anjou, and Poitou, towards the east only, all the other parts being bounded by the sea. It is sixty leagues long, forty-five broad, and had its name from the Britons, who fled hither from the Saxons in the tenth century. It is watered by the Loire and Vilaine, and abounds in lead, pit-coal, wood, salt, butter, cattle, &c. has many good harbours on the coast, and contains abundance of seamen, fishermen, &c. The air is but indifferent. The province had a parliament of its own; and the people speak a jargon somewhat resembling the Welsh.

Rennes, the honorary capital of Bretagne, because the states assembled there, is situated at the conflux of the Isle and the Vilaine, about fourteen leagues from the sea, it is pretty large and populous, the seat of several courts, and also of a bishop, who is suffragan to Tours. Here were a number of convents and churches, besides the cathedral. Some of the principal streets are handsome, as the conflagration in the year 1720, which almost reduced the whole place to ashes, obliged the inhabitants to rebuild them. In one of the squares is a fine statue, in bronze, of Louis XV. It was erected by the province in 1744, soon after his recovery from that dangerous illness in Flanders, when he obtained the title of "Bien Aimé." Beneath the prince appears, on one side, Hegeya, the goddess of health, with her serpent and patera; and on the other is the genius of Bretagne kneeling on one knee, and in her countenance exultation and reverence finely marked. At the foot of the pedestal is an honorary inscription in Latin.

The city of St. Malo is small, but populous; it is situated on a little island (which is joined to the continent by a mole or causeway, at the head of which is a strong fort) on the northern coast of Brittany. Here are a court of admiralty, several fine monasteries and churches, and a large harbour, but of difficult access. For the defence of the town and harbour, there are several forts, and other works, with a good garrison.—The bishop is temporal lord of the city, and suffragan to the archbishop of Tours. The trade of the town is very considerable; in particular it sends a number of ships to the cod fishery; and, in time of war, fits out many privateers. The castle was built by the celebrated Anne of Bretagne, who annexed the duchy to the crown of France, by her marriage with Charles VIII. Being asked by the engineer, who constructed it, what plan she would chuse as its model, she replied, "My coach." It is so in effect. A large square area within constitutes the body; two small towers, in

10 I

the

the fore part, answer to the fore wheels of a carriage; as two others of superior size do to the hinder ones; a projection in front forms the pole; and an arched nich behind corresponds to the place where the laquais stand.

NORMANDY department, now called Calvados and Eure, extends from east to west 60 leagues, and from north to south about thirty leagues. It is bounded on the south by Maine, Perche, and Beauce; on the north by the British-Channel; on the west by Brittany; and on the east by the Isle of France and Picardy. It is fruitful in corn, flax, hemp, fruit, and pasturage; and abounds in wood, coals, cattle, madder, woad, mineral-waters, iron, copper, &c. The rivers are the Seine, Eure, Andelle, Rille, Dive, Lezon, Carentone, Aure, Antes, Arne, Drome, &c.

ROUEN, the capital of the department, stands on the north bank of the Seine, in a valley, almost surrounded with hills, 22 leagues from Paris to the north-west, is the seat of a parliament and admiralty, and of several other courts, offices, and churches; and also of an archbishop. In one of the towers of the cathedral is a bell of an enormous size. The bridge of boats over the Seine is a great curiosity, being paved like a street, and rising and falling with the tide. Besides other tombs of great persons in the cathedral, is that of John duke of Bedford, who was regent of France under our king Henry VI. The trade of this city is very considerable, the tide of flood rising so high, that vessels of above 200 tons can come up to it, though it is twelve leagues from the mouth of the river. In the place Aux Veaux, is a statue of the Maid of Orleans, kneeling before Charles VII. William I. furnished the Conqueror, died here. In one of the suburbs are several mineral springs.

CAEN is situated at the conflux of the Orne and Odon. Here are a castle, an university, an academy of sciences, and many churches and convents, with several courts and offices. It is a place of good trade. William the Conqueror was interred in the abbey of St. Stephen in this city, which he had founded.

CHERBURG, fourteen leagues north of Coutance, has a small commodious harbour, and, by the flowing of the waves, is every tide almost surrounded by the sea. This town was taken by the English in 1758, and the fortifications demolished, together with the famous bastion.

The little town of **Mont St. Michael**, with an abbey and castle, is built on a rock, in the middle of a sandy shore, which, at high-water, is overflowed. The abbey has been much resorted to by pilgrims. As this place is distinguished by some remarkable circumstances, we shall give the following ample and entertaining description of it, in the words of an ingenious traveller.

"This extraordinary rock (for it is no more) rises in the middle of the bay of Avranches. Nature has completely fortified one side by its craggy and almost

perpendicular descent, which renders it impracticable for courage or address, however consummate, to scale or mount it. The other parts are surrounded by walls, fenced with semilunar towers in the Gothic manner; but sufficiently strong, superadded to the advantages of its situation, to despise all attacks. At the foot of the mountain begins a street or town, which winds round its base to a considerable height. Above are chambers where prisoners of state are kept, and other buildings intended for residence; and on the summit is erected the abbey itself, occupying a prodigious space of ground, and of a strength and solidity equal to its enormous size; since it has stood all storms, in this elevated and exposed situation, during many centuries. I spent the whole afternoon in the different parts of this edifice: and as the Swifs, who conducted me through them, found he could not gratify my curiosity too minutely, he left no apartment or chamber un-
seen.

"The **Salc de Chevalerie**, or Knights-Hall, reminded me of that at Marienburg, in Polish Prussia.—It is equally spacious, but more barbarous and rude, because some hundred years prior in its erection. Here the knights of St. Michael used to meet in solemn convocation on important occasions. They were the defenders and guardians of the mountain and abbey, as those of the temple, and of St. John of Jerusalem, were to the holy sepulchre. At one end is a painting of the archangel, the patron of their order: and in this hall Louis XI. first instituted, and invested with the insignia of knighthood, the chevaliers of the cross of St. Michael.

"We passed on through several lesser rooms into a long passage, on one side of which the Swifs opened a door, and through a narrow entrance, perfectly dark, he led me, by a second door, into an apartment, or dungeon (for it rather merited the latter than the former appellation) in the middle of which stood a cage. It was composed of prodigious wooden bars; and the wicket, which admitted into it, was ten or twelve inches thick. I went into the inside. The space it comprised was about twelve or fourteen feet square; and it might be nearly twenty in height. This was the abode of many eminent victims in former ages, whose names and miseries are now obliterated and forgotten.

"There was, said my conductor, towards the latter end of the last century, a certain news-writer in Holland, who had presumed to print some very severe and sarcastic reflections on Madame de Maintenon, and Louis XIV. Some months after he was induced, by a person sent expressly for that purpose, to make a tour into French Flanders. The instant he had quitted the Dutch territories, he was put under arrest, and immediately, by his majesty's express command, conducted to this place. They shut him up in this cage. Here he lived upwards of 23 years; and here he, at length, expired. During the long nights of winter, continued

the

the man, no candle or fire was allowed him. He was not permitted to have any book. He saw no human face except the jailor, who came once every day to present him, through a hole in the wicket, his little portion of bread and wine. No instrument was given him with which he could destroy himself; but he found means at length to draw out a nail from the wood, with which he cut or engraved, on the bars of his cage, certain fleurs-de-lis, and armorial bearings, which formed his only employment and recreation.—These I saw, and they are, indeed, very curiously performed with so rude a tool.

"It is now fifteen years, said the Swifs, since a gentleman terminated his days in that cage. It was before I came to reside here. But there is one instance within my own memory. Monsieur de F——, a person of rank, was conducted here by command of the king. He remained three years shut up in it. I fed him myself every day; but he was allowed books and candle to alleviate his misery; and at length the abbot, touched with his deplorable calamities, requested and obtained the royal pardon. He was set free accordingly.

"The subterranean chambers, added he, in this mountain are so numerous, that we know them not ourselves. There are certain dungeons, called Oubliettes, into which they were accustomed anciently to let down malefactors guilty of very heinous crimes.—They provided them with a loaf of bread and a bottle of wine; and then they were totally forgotten, and left to perish by hunger in the dark vaults of the rock.—This punishment has not, however, been inflicted by any king in the last or present century.

"We continued our progress through the abbey.—He led me into a chamber, in one corner of which was a kind of window. Between this and the wall of the building was a very deep space, or hollow, of near an hundred feet perpendicular; and at the bottom was another window opening to the sea: it is called the Hole of Montgomeri. The history of it is this. In the year 1559, Henry II. king of France, was unfortunately killed at a tournament by the count de Montgomeri. It was not intended on that nobleman's part; and he was forced, contrary to his inclination, to push the lance against his sovereign, by his express command. He was a Hugonot; and having escaped the massacre of Paris and Coligny, made head against the royal forces in Normandy, supported by our Elizabeth with arms and money. Being driven from his fortresses in those parts, he retired to a rock, called the Tombelaine. This is another similar to the Mont St. Michael, only three quarters of a league distant from it, and of nearly equal dimensions. At that time there was a castle on it, afterwards demolished, and of which scarce any vestiges now remain. From this fastness, only accessible at low tides, he continually made excursions and annoyed the enemy, who never dared to attack him. He coined money, laid all the adjacent

country under contribution, and rendered himself universally dreaded. Desirous, however, to surprize the Mont St. Michael, he found means to engage one of the monks resident in the abbey, who promised to give him the signal for his enterprize, by displaying a handkerchief. The treacherous monk having made the signal, betrayed him, and armed all his associates, who waited Montgomeri's arrival. The chieftain came, attended by fifty chosen soldiers, desperate, and capable of any attempt. They crossed the sand, and having placed their scaling ladders, mounted one by one: as they came to the top, they were dispatched each in turn, without noise. Montgomeri, who followed last, at length discovered the perfidy, and escaped with only two of his men, with whom he regained the Tombelaine. They preserve, with great care, the ladders and grappling-irons used on this occasion. The count himself was at last besieged and taken prisoner, by the Marschal de Matignon, in 1574, at Domfront, in Normandy; and Catharine of Medicis, who detested him for his having been, though innocently, the cause of her husband's death, ordered him to be immediately executed.

"The church itself detained me a long time, and is matter of high curiosity. It rests on nine pillars of most enormous dimensions, which stand upon the solid rock. I did not measure them; but as far as the gloominess of the place would admit, I apprehend that each of them must be five-and-twenty feet in circumference. Besides these, there are two others, of much inferior size, which support the centre of the church, over which is the tower. If the prodigious incumbent weight be considered, and the nature of its situation, nothing less massy could sustain the edifice. They seem as if designed to outlive the ravages of time, and the convulsions of nature. The building was begun in 966, when Richard, the second duke of Normandy, began to erect the abbey. It was completed about the year 1070, under William the Conqueror; though many other additions were made by succeeding abbots.

"The treasury is crowded with relics innumerable, among which some few have a real and intrinsic value. There is a fine head of Charles VI. of France, cut in crystal, which drew my attention. They have got, heaven knows by what means, an arm of Edward the Confessor's; and they shewed me another of St. Richard, king of England. Who this faint and prince was, I confess, is beyond my comprehension. I am sure they could not term Richard I. so, unless his cruelty against Saladine wiped out all his sins, and canonized him. Richard II. has no better pretensions to sanctity. I do not mention him who fell at Bosworth: so that who this royal faint was, I must leave you to divine. As to the monks, they know nothing about it; but they were positive he was a king of England. An enormous golden cockle-shell, weighing many pounds, given to Richard, the second duke of Normandy,

Normandy, when he founded the abbey, is worthy remark.

"The refectory, cloisters, and cells of the monks, have been magnificent and spacious; but a vast sum of money is wanted to put the whole in repair, and reinstate what the lapse of ages has defaced and deformed."

HAVRE-DE-GRACE, which constitutes part of Upper Normandy, was under the jurisdiction of the parliament of that province. Havre-de-Grace, is a strong sea-port town at the mouth of the Seine, 12 leagues west of Rouen, well built, strongly fortified, has an excellent harbour, a good trade, is the seat of the department, and contains several courts of justice.—Harfleur, on the Lizard, eight leagues from Havre-de-Grace, has some concern in the cod and herring fisheries, by means of a small harbour; is defended by a castle, and contains manufactories of tanned leather, hats, laces, serges, linens, woollen cloths, &c.

MAINE (MAYENNE), PERCHE, and the county of Laval, are comprised in one.—Maine is bounded by Perche on the east, by Brittany and Anjou towards the west, by Touraine and Vendemois towards the south, and by Normandy to the north. It is 30 leagues long, 20 broad, fruitful in corn, wine, wood, pasture, &c. and contains some iron-works, slate, free-stone, quarries of marble, mineral-waters, &c. Its rivers are the Loire, Sarthe, Haine, and Mayenne; and this department, as well as Perche, was subject to the parliament of Paris.

Mans, the capital of the whole department, situated on the river Sarthe, is a very ancient city, and the see of a bishop, suffragan to Tours. There are many churches here, several convents, inferior courts of judicature, with a college, and salt-office.

That part of this department called Perche, is bounded on the east by Chartrain and Tiverais, on the west and north by Normandy, and on the south by Mayenne, being 15 leagues in length, and 12 in breadth. The country abounds in cattle, sheep, corn, flax, hay, mineral-waters, iron-mines, and cyder.

In this department is La Trappe, a celebrated abbey of Cistercian monks, who are remarkable for the austerities of their manners. It stands between the cities of Seez, Montagne, Verneuil, and Laigle, in a large vale surrounded with hills and forests, which seem designed to hide it from the rest of the world. It was founded in the year 1140, by a count of Perche. But the monks being, in process of time, fallen into a great remissness of manners and discipline, a very strict reformation was introduced in this abbey in the year 1662, by Armand John Bouthillier de Rance, the commendatory abbot.

Some particulars of their singular manner of living, and of the austerities which they practise, are thus poetically described:

"Here flocks the train to whom indulgent heav'n
"The precious gift of penitence has given;
"Who, cloyster'd here, feel heav'n's inspiring breath,
"Nor fear to triumph o'er eternal death.
"For this we strive; long e'er the morn appears
"We rise, we pray, we bathe the ground with tears;
"Then haste to labour, drain the putrid fen,
"Or break th' ungrateful ground of other men.
"Th' unheaded roots we gather yield us bread,
"The spring our beverage, and the earth our bed.
"When midnight hour to new devotion calls,
"We rise with awe, and bless those rev'rend walls,
"Where faints and martyrs kiss'd the chaf'ning rod,
"Despis'd the world, and rested on their God.
"Let pride unlock ambition's sanguine springs,
"And wadded nations curse despotic kings;
"No strong alarms this lone retreat infests;
"We live in peace, and peaceful sink to rest.
"Here pure religion tolls our only bell;
"Here true devotion warms each humble cell;
"Here contemplation clears the clouded eye,
"Expands the soul, and lifts it to the sky.
"Mean while, dear friend, my simple shroud I spread,
"And now prepare my last and welcome bed.
"Here, here, my friend, my plain rough coffin stands,
"Prepar'd and wrought by these laborious hands,
"It calms my spirits, drives vain thoughts away,
"And reconciles me to my kindred clay."

ORLEANNOIS (now Loire department) consists of several districts, and is bounded on the north by Normandy, on the east by Champagne and Burgundy, on the south by Nivernois and Berry, and on the west by Touraine and Maine; including Orleannois Proper, Chartrain, or Beauce Proper, Vendemois, Blaisois, Solagne, Demois, Perche Gouet, and Gationis Orleannois. The whole department was subject to the parliament of Paris.

Orleannois Proper abounds in cattle, game, and fish; yields grain, wine, fruit, and wood; and contains, the following places:—Orleans, the capital, not only of Orleannois Proper, but of the whole department, stands on the northern bank of the Loire, 20 leagues south of Paris. Over the river is a fine stone bridge, leading into a suburb on the south side of the river. It is one of the largest cities in the kingdom, and contains several inferior courts of justice, with an university, a public library, a stately Gothic cathedral, and a great number of other churches, some of which are collegiate; a public walk, planted with several rows of trees; some sugar-houses, a manufactory of stockings and sheep skins, and a seminary. It carries on a great trade in brandy, wine, spices, and several manufactures, which, with many other commodities, are conveyed from hence to Paris, and other places, by means of the Loire, and the canal which takes its name from the city. To the north of the city is a forest, the largest in the whole kingdom, formerly belonging to the duke of Orleans.

Ever since the year 1344 this city has been a dukedom and peerage, and usually an appendage of some prince of the blood. Louis XIV. gave it to his brother Philip, who begun and finished the canal, in whose family it still continues. The duties paid by vessels going up and down the canal amounts, in some years, to 150,000 livres. The bishop of this city is suffragan to the archbishop of Paris. On the 8th of May 1429, Orleans, then closely besieged by the English, was relieved by Joan of Arc, commonly called the Maid of Orleans; and the anniversary of that deliverance is still kept here. To perpetuate the memory of it, a monument of brass was erected on the bridge. In the Hotel de Ville is a portrait of the same extraordinary and immortal woman. It was done in the year 1581, and is the oldest extant. The painter seems to have drawn a flattering resemblance, and to have decorated her with imaginary charms. Her face, though long, is of exceeding beauty, heightened by an expression of intelligence and grandeur rarely united. Her hair falls loosely down her back. She wears a sort of bonnet enriched with pearls, and shaded with white plumes, tied under her chin with a fillet. About her neck is a little band; and lower down on her bosom a necklace, composed of small links. Her habit fits close to the body, and is cut or slashed at the arms or elbows. Round her waist is an embroidered girdle; and in her right hand she wields the sword with which she expelled the enemies of her country.

The following account of a remarkable execution at Orleans, as related by an ingenious traveller, may serve as a specimen of those dreadful spectacles:—"When we came to Orleans, we learnt that a criminal was to be broke alive at eleven o'clock that evening; and, in our rambles through the streets, saw the scaffold, wheel, and preparations for the execution. The papers of the condemnation were sold as last dying speeches are about the streets of London. By one of these I learnt, that the poor wretch was convicted of belonging to a troop of thieves that infested the forest of Orleans; and of conveying them provisions, arms, and necessaries. It was in this deputation of providing for his companions that he was surpris'd and taken. He had entered the city disguised as a peasant, and, after he had executed his commission, might have rejoined them in safety, had he not taken it into his head to brave the police by committing a daring robbery, and increasing the stores he meant to convey to them. But his unlucky star was in the zenith; for, after having robbed a house, and bound every person in it, he was seized as he was decamping with his booty. His sentence was to have the question ordinary and extraordinary, in order to oblige him to discover the haunts of his comrades; and afterwards to have, as the sentence ran, 'His arms, legs, thighs, and reins broken alive upon a scaffold, to be erected for that purpose, at the place of execution belonging to this city, and to remain on a wheel, with his face turned towards the heavens, till he expires.'

No. 44.

"When the time drew near for his tremendous sentence to be executed, I walked out with a gentleman, to see the procession of the criminal, intending to return as soon as the borreau (or executioner) was about to begin his office. My friend's imagination had already presented to him a picture sufficiently horrid; and as he had no inclination to heighten it with the reality, he staid at the auberge. The *place du Martroi* is a large square, capable of holding a vast concourse of people. However, I found it filled, though not thronged, with males and females, not only of the vulgar class, but some in embroidery and silks. They were walking in parties, as though they only came to enjoy the benefit of air and exercise. I was quite surpris'd to see a multitude of young girls, whose delicate nerves, I should have imagined, would have been agitated at even the recital of human misery, flocking to see the exposition of it, as if they expected a *feu d'artifice*.

"The scaffold was about 20 feet square; and raised 5 feet above the ground. The stake that supported one corner of it, appeared three feet above the boards, and had a common wheel of four feet diameter, fixed by the nave on it, as on its axis. We were examining this, when the borreau brought some ropes, and a triangular bar of iron, the instrument of terror. As soon as his torch was seen on the scaffold, the houses around were crowded at the windows, with spectators of all ranks and denominations. Soon after came the guards on horseback, with the criminal in a cart. He was lifted out by the borreau, having nothing on but his shirt, and was attended by two monks, with torches flaming in their hands. I then attempted to retire, but crowds were pressing on me behind, and I found it impossible, without danger of being trodden to death. The poor wretch who was to suffer I judged to be about 28 or 30 years of age. He did not wring his hands, or shew any marks of terror and contrition in tears or cries; but looked round on the spectators, in a manner that has often, I am persuaded, been falsely attributed to unconcern, and a hardened heart. But if I might judge by his countenance, though he looked round, he looked at nothing: his thoughts were harrowed up; and that vacant horror which appeared in his eyes, seem'd to shew that the faculties of the soul stood aloof from the body, even before the moment of their final separation.

"When the executioner had brought him to the middle of the scaffold, he proceeded to strip his shirt from his arms down to his waist, and then to bind him to a cross, as it appeared to me. It was plain what effect the torture of the question extraordinary had, as every joint was covered with blood, and he was incapable of walking. The question is not always the same; but by this I imagine that he had been stretched on a bed, till some of his veins and ligaments had burst. The monks now began to talk to him, and to repeat some prayers; and soon after turning from him began to sing, I suppose, a hymn. All this time I found myself violently agitated;

10 K

agitated; how, I cannot describe; my sensations were such as I never felt before. I accused myself of cruel curiosity, and whilst he was binding made another attempt to get at a distance, as I was close to the scaffold; but my companion told me I could not pass the hedge, and gave me a phial of liquor to drink, which he had taken the precaution to put in his pocket. Immediately as the monks turned their backs, the borreau caught up the bar, and finished his dreadful office of breaking the limbs, in less than a minute, without a single shriek from the poor criminal. The blows were as rapid as he could strike them, one on each leg, and each thigh, two on each arm, and two on the ribs. He then laid the mangled carcase on the wheel, which he brought forwards, and laid on the corner stake, which I mentioned as placed above the scaffold. Here, with his assistants, he folded each limb, so that every fracture appeared; and bound him in the manner in which he was to be exposed. The monks, after this, began to talk to him again; and what surprised me was, that he turned his head, and seemed able to attend, and to answer. In this situation I thought, according to his sentence, he was to be left to linger till he expired, from the anguish of his broken limbs; but the borreau had not yet shewn the compassionate part of his office; for soon after he brought a rope over the criminal's breast, and straining it, put, in a minute, a period to his life and misery.

"The morning we left Orleans we saw him exposed on the wheel, at the entrance of the forest, with seven or eight-and-twenty others, who had undergone the same punishment. This is an execution of which I never was before, nor ever will be again, a spectator."

NIVERNOIS (now the department of Nievre) within the jurisdiction of the parliament of Paris, was before the Revolution a dukedom and peerage. It is bounded on the south by Bourbonnois, on the north by Gatinois and Aurenois, on the west by Berry, and on the east by Burgundy, being about 20 leagues in extent both ways, as it is nearly of a circular form, and yielding corn, wine, fruit, wood, pit-coal, iron-ore, and mineral springs. The most barren and mountainous part of it is the district of Morvaot. It is watered by several rivers, of which three are navigable, viz. the Loire, the Allier, and the Yonne.—Nevers is the capital of the district, and takes its name from the rivulet Nievre, in Latin Niveris, which, with the Allier, falls near the town into the Loire. Here are several churches, convents, and courts of justice, with manufactories of glass, white-iron, and earthen-ware; and a stately stone bridge over the Loire. The bishop of this town is lord of three castles, and suffragan to Sens. About two leagues from hence, at the village of Ponges, in the road to Paris, is a noted mineral spring.

BOURBONNOIS (now Allier department) is bounded on the south by Auvergne (now Cantal) on the north by Berry and Nivernois, on the east by Burgundy and Forez, and on the west by Upper Marche (Creuse). It is 30 leagues long, 20 broad, fruitful in corn, wine, and pasture; and is watered by the Loire, Allier, and Cher. From its ancient dukes the late royal family of France are descended. This department had belonged to the prince of Condé, whose authority was very great; but causes of importance were referred to the parliament of Paris.

The capital, Moulins, on the Allier, received its name from the numerous mills in its vicinity. It contains several churches, convents, courts of judicature, manufactories of hardware, iron, steel, &c. and is, upon the whole, a handsome populous town. In the church belonging to the nuns of the Visitation is the magnificent tomb of duke Henry II. of Montmorency, who fell a sacrifice to the resentment of cardinal Richelieu; and near the town there is an admirable mineral spring.—Bourbon le Archambaud, five leagues west of Moulins, is remarkable for its mineral waters, hot and cold, and for stones resembling diamonds and cut glass, which are found in the rocks near the town.—Mont Lucan, near the Cher, with a stone bridge over that river, has several convents, churches, and courts of judicature, with a salt office and hospital; and a neighbouring market-town, named Neris, has some excellent hot baths.

LIONNOIS department (comprising Rhône and Loire) contains the provinces Lionnois, Forez, and Beaujolois; and is bounded to the north by Maconnois and Burgundy; to the south by Vivarais and Velais; to the east the Soane and the Rhône part it from Breille and Dauphiné; and to the west it terminates on Auvergne (Cantal). It produces corn, wine, and fruits, particularly excellent chestnuts, with pit-coal and mineral springs; and about four leagues from Lyons is a mine of copper and vitriol. Appeals lay from hence to the parliament of Paris. The principal rivers of the department are the Rhône, the Soane, and the Loire. Under the governor in chief, as in all the other provinces, were several sub-governors.—Lionnois, properly so called, is twelve leagues long, and seven broad. Anciently it was subject either to counts, or to the archbishop and chapter of Lyons.

AUVERGNE (now Pays de Dôme department) which is within the jurisdiction of the parliament of Paris, is bounded on the south by the Cevennes, on the north by Bourbonnois, on the east by Forez, and on the west by Limosin, Quercy, and La Marche. It is 40 leagues long, and 30 broad, and divided into Upper and Lower.

The rivers are the Allier, the Dargogne, and the Alagnon; the manufactures are silks, stuffs, cloths, laces, iron-works, paper; and the produce corn, wine, cattle, cheese, coals, &c.

In Upper Auvergne are:—St. Fluor, the capital, which is situated at the foot of Mount Cantal, one of the highest in Auvergne. It took its name from that of a bishop, who having come hither from Languedoc to preach the gospel towards the end of the fourth century, died, and was buried here. It is now the see of a bishop, who is lord of the city, though subject, in spirituals, to the archbishop of Bourges. Here is a considerable traffic in rye and mules, as well as in knives, carpets, and cloths.—Anrillac contains several convents, inferior courts of judicature, manufactories of tapestry and lace, a castle, &c.

In Lower Auvergne are:—Clermont, the capital of the whole province, situated near the mountain called Pui de Dommé, 14 leagues from St. Fleur to the north, betwixt the rivers Artier and Bedat. It was built by the emperor Augustus, and thence was anciently called Augustonemetum, or Augustonemofum. Here are several churches, besides the cathedral; many courts of justice, abbies, convents, &c. It is the see of a bishop, suffragan to the archbishop of Bourges. In the neighbourhood of the town are several petrifying springs; one of which, in the suburb of St. Allire, has formed a solid rock, and a kind of bridge, under which the rivulet of Piridaine passes.

Of this natural curiosity, and of the town itself, we have the following accurate and authentic account from an intelligent traveller: "The situation of Clermont is agreeable, on a little eminence, to which the access is gradual and easy. The place itself seems to have been built in an age the most barbarous. The streets are so narrow and winding, that no carriage can enter them, and the buildings correspond to the other parts; but, to compensate for the inconvenience, the suburbs are charming, and the houses modern and elegant. I visited, this morning, the petrifying spring which Charles IX. is said to have surveyed with so much wonder and pleasure. It is only a quarter of a mile from the town. In the course of ages it has formed a ridge of stone, or incrustation, not less than 16 feet in height, above 100 feet long, and, in some parts, near 10 in thickness. As it impeded, and, at length, totally stopped the current of a little rivulet which intersected its course, the inhabitants were obliged to dig a passage through it. The stream is now directed into another channel, and has begun to form a new bridge across the rivulet into which it falls."

LIMOSIN (now the department of Upper Vienne) is bounded on the east by Auvergne, on the west by Angoumois and Perigord, on the south by Quercy, and on the north by Poitou and La Marche. It is 25 leagues long, and near as many broad; the whole be-

ing divided into Upper and Lower. The upper parts are cold and mountainous, the lower warm and fruitful; the produce being rye, barley, buck-wheat, chestnuts, oxen, cows, horses, &c. also lead, tin, copper, iron, and steel. The rivers are the Vienne, the Vézère, and the Dordogne.—The government was superintended by a chief governor, a general-lieutenant, and two sub-governors; but the whole was under the jurisdiction of the parliament of Bourdeaux.

In Upper Limosin are:—Limoges, on the Vienne, 165 leagues south of Paris, the capital of the whole department, which contains three abbies and convents, is the seat of several courts of judicature, and the see of a bishop. Here are manufactories of paper, leather, and woollen cloths; four aqueducts, constructed by the Romans, and other remains of antiquity.—St. Leonard, on the Vienne, contains a chapter, and manufactories of paper and cloth; and St. Iriez, on the Isle, hath likewise a chapter, and some considerable iron-mines in the neighbourhood.—Chalus, a town and castle situated at the spring of the Tardouère, one of the rivers that fall into the Charente, is six leagues distant from Limoges to the north-west. This little city has the title of a county or earldom, and belonged formerly to the viscounts of Limoges.

It happened that a gentleman of Limosin found upon his estate a treasure, which had been buried there many ages before. It consisted of the statues of an emperor and his consort, sitting round a table with their children, the whole being of solid gold. Richard I. king of England, who was then master of Limosin, pretended that the treasure belonged to him as sovereign lord of the country where it was found. The gentleman was willing to give him part of it; but seeing that the king claimed the whole, he implored the protection of the viscount of Limosin, who gave him leave to take sanctuary in his castle of Chalus. Richard going to besiege the place, was wounded with an arrow shot by a cross-bow-man, and died of the wound April 6, 1199. There is a famous horse-fair kept here every year on St. George's day.

In Lower Limosin are:—Tulle, the capital, at the conflux of the Coureze and Solan. It is the see of a bishop, who is temporal lord of the town, and suffragan to the archbishop of Bourges. Here are several inferior courts of judicature, and convents.

LA MARCHE (now the department of Creuse) is bounded on the south by Limosin, on the north by Berry, on the west by Poitou, and on the east by Auvergne; being about 22 leagues from east to west, and eight or ten from north to south, and lying within the jurisdiction of the parliament of Paris. It is watered by the Vienne, the Cher, the Creuse, and the Gartempe; and is not only fruitful in corn, but produces wine. It was a dukedom and peerage, and, besides a chief-governor, had two sub-governors.—Gueret, the capital of the

the province, is situated in the Upper Marche, on the river Gartempe. Here are several inferior courts of justice, with a college, two convents, a priory, and an hospital. Anthony Varillas, the historian, was born, and founded a convent here.—Aubusson, on the river Creuse, has a manufactory of tapestry, and belongs to the duke de la Feuillade, whose surname is d'Aubusson.

BERRY (now Cher department) is bounded on the south by Bourbonnois and Marche, on the north by Orleannois, and on the west by Nivernois; its greatest length being about 35 leagues, and its breadth about 28. Its name, and that of its capital, Bourges, are derived from the ancient Bituriges, surnamed Cubi, to distinguish them from the other Bituriges, called Vibisci, who were those of Bourdeaux. The air of this department is temperate, and the soil fruitful, producing wheat, rye, wine, good fruit, a great deal of flax and hemp, and fine pasture, both for sheep and black cattle. Near Vierzon is a mine of ochre, and near Bourges are quarries of stone. Here are several rivers, the chief of which are the Loire, the Creuse, the Cher, the Large and Lesser Soudre, the Indre, the Orron, the Awrette, the Moulon, and the Evre. There is also a lake, called the lake of Villiers, which is pretty large.

TOURAINÉ (now Indre and Loire department) is bounded to the south by Berry and Poitou, to the north by the river Maine, to the west by Anjou, and to the east by Orleannois; its greatest breadth being 22 leagues, and its length 24. It is watered by several rivers, the chief of which are the Loire, the Cher, the Creuse, and the Vienne. The climate is very mild, and the soil, in general, fertile. In the country of Noyers are mines of iron and copper. This district had formerly counts of its own; but, in 1202, was united with the crown; and in 1356, was raised to a dukedom and peerage. It lay within the jurisdiction of the parliament of Paris, and, besides a chief governor, had a general lieutenant, and a sub-governor.—Tours, the capital of the department, which also takes its name from it, is situated on the Loire. Here is a fine bridge over that river, several inferior courts of justice, many churches and convents, a mint, a salt-office, an academy, and is the see of an archbishop. The cathedral is a fine building, containing a library, in which are some ancient manuscripts. This city is free, the people paying no taille, or tillage. In 737 Charles Martel defeated the Saracens near this place with a very great slaughter. Here is a silk and cloth manufactory.—At Amboise, a town situated at the conflux of the Amasse and Loire, Charles VIII. was born and died. The name of Hugonot had its rise in this town, wherein also the civil war broke out in 1561. Besides a salt-office, an hospital, and two churches, here are several convents and inferior courts of justice.—At Loches,

situated on the river Indre, seven leagues from Amboise, is a strong castle, in one of the subterraneous passages of which Louis Sforza, duke of Milan, was kept prisoner ten years. In one of the two cages also, which are kept in this castle, cardinal Balve, bishop of Algiers, was confined by Louis XII.—Chitton, on the Vienne, has four churches, and a number of convents. The celebrated Rabelais was a native of this town; and, A. D. 1189, Henry II. king of England, died in the castle here. Ten leagues south of Tours is La Haye, the birth-place of the great philosopher Des Cartes.

ANJOU (now the department of Mayne and Loir) which is 26 leagues long, and 24 broad, is bounded by Poitou to the south, by Maine to the north, by Touraine to the east, and by Bretagne to the west. It is fruitful, pleasant, well watered, and was within the jurisdiction of the parliament of Paris. Angers, the capital, situated on the Mayenne, is a large city, being the see of a bishop, suffragan to the archbishop of Tours. It contains, besides the cathedral, many churches, of which some are collegiate, a strong castle, several abbeys and convents, a salt-office, and a mint. Here also are several inferior courts of justice, a seminary, an academy, an university, and some remains of Roman antiquities. The first walls of the city were built by John, king of England, and duke of Anjou. The inhabitants are employed chiefly in bleaching wax and linen, refining sugar, and making camblets, serges, and fine woollen stuffs, striped with silk and gold. It is proverbially said of Angers, that, "It stands low, has high steeples, rich whores, and poor scholars."—At Chateau-Gontier, on the river Maïenne, are a castle, several churches and convents, with manufactories of linen cloth and serges, and mineral springs.—Saumur is a town on the south bank of the river Loire, over which it has a stone bridge, six leagues from Angers to the south. Here are a castle, several convents, churches, and inferior courts of justice, together with an university, and some trade in salt-petre, sugar, steel, iron-works, medals, rings, chaplets, and strings of beads. It was one of the cautionary towns given to the Protestants; and during the time of its being in their hands, the celebrated John Cameron, a Scotch divine, was for some time professor of divinity in the university. The district is called Saumurois; and the governor of that, as well as the town and castle, is independent of the governor of the department. While the town was in the hands of the Protestants it was opulent, but has declined since its being re-possessed by the Roman-Catholics.—At Doë, three leagues west of Saumur, is a fountain in the form of a horse-shoe, which is one of the greatest curiosities in France.

In addition to the Table of Departments given at the beginning of our description of this extensive country, and in order to render the whole as complete,

clear, and a new geography of the continent, printing the them.

clear, and intelligible as may be, we shall here subjoin a new geographical account of France, as divided by the constituent assembly, in 1791, into circles, comprising the several sees and departments belonging to them.

According to the present division, there are ten metropolitan circles, and eighty-three departments; each of the latter having an archiepiscopal or episcopal see. Of these metropolitan circles, and the dioceses in each, the following is an account:

I. CIRCLE OF THE COAST OF THE CHANNEL.

[The places marked thus * are newly created.]

Archiepiscopal See—**ROUEN**, in the Department of the Lower Seine.

<i>Episcopal Sees.</i>	<i>Departments.</i>
Bayeux	Calvados
Coutances	Manche, <i>Channel</i>
Seez	Orne
Eureux	Eure
Beauvais	Oise
Amiens	Somme
St. Omer	Pas de (<i>Straits of</i>) Calais

II. CIRCLE OF THE NORTH-EAST.

Archiepiscopal See—**RHEIMS**, in the Department of the Marne.

Verdun	Meuse
Nancy	Meurthe
Metz	Moselle
Sedan*	Ardennes
Soissons	Aisne
Cambray	The North

III. CIRCLE OF THE EAST.

Archiepiscopal See—**BESANÇON**, in the Department of the Doubs.

Colmar*	Upper Rhine
Straßburgh	Lower Rhine
St. Diez	Vosges
Vesoul*	Upper Saone
Langres	Upper Marne
Dijon	Cote d'Or
St. Claude	Jura

IV. CIRCLE OF THE NORTH-WEST.

Archiepiscopal See—**RENNES**, in the Department of Ille and Vilaine.

St. Brioux	North-Coast
Quimper	Finisterre
Vannes	Morbihan
Nantes	Lower Loire

No. 44.

Episcopal Sees.

Departments.

Angers	Mayenne and Loire
Mans	Sarthe
Laval*	Mayenne

V. CIRCLE OF PARIS.

Archiepiscopal See—**PARIS.**

Verfailles	Seine and Oise
Chartres	Eure and Loire
Orleans	Loiret
Sens	Yonne
Troyes	Aube
Meaux	Seine and Marne

VI. CENTRAL CIRCLE.

Archiepiscopal See—**BOURGES**, in the Department of the Cher.

Blois	Loire and Cher
Tours	Indre and Loire
Poitiers	Viennne
Chateauroux*	Indre
Gueret*	Creufe
Moullins	Allier
Nevers	Nyevre

VII. CIRCLE OF THE SOUTH-WEST.

Archiepiscopal See—**BOURDEAUX**, in the Department of the Gironde.

Luçon	Vendée
Saintes	Lower Charente
Dax	Landes
Agen	Lot and Garonne
Perignenx	Dordogne
Tulles	Correze
Limoges	Upper Viennne
Angouleme	Charente
St. Maixent*	Two Sevres

VIII. CIRCLE OF THE SOUTH.

Archiepiscopal See—**TOULOUSE**, in the Department of the Upper Garonne.

Auch	Gers
Oleron	Lower Pyrenées
Tarbes	Upper Pyrenées
Pamiers	Arriège
Perpignan	Eastern Pyrenées
Carcaffonne	Aude
Rodez	Aveiron
Cahors	Lot
Alby	Tarn

IX. CIRCLE OF THE MEDITERRANEAN.

Archiepiscopal See—**AIX**, in the Department of the Mouths of the Rhône.

Bastia	Corfica
--------	---------

<i>Episcopal Sees.</i>	<i>Departments.</i>
Frejus	Var
Digne	Lower Alps
Embrun	Upper Alps
Valence	Drôme
Mende	Lozere
Nismes	Gard
Montpelier	Hérault

X. CIRCLE OF THE SOUTH-EAST.

Archiepiscopal See—LYONS, in the Department of Rhône and Loire.

Clermont	Puy de Dôme
St. Fleur	Cantal
Puy	Upper Loire
Viviers	Ardeche
Grenoble	Isere
Belley	Ain
Autun	Saone and Loire

Each of the departments, as before noticed, is divided into districts, and each district into cantons. The first column that follows is a list of eighty-three departments in alphabetical order: the second column contains the names of the provinces or territories to which the countries included in each department formerly belonged. The departments marked thus * take their names from mountains; those marked thus † from their respective situations; this marked thus ‡ from a rock; and the others (the departments of Paris, Côte d'Or, and Corsica excepted) from rivers; as the departments of the Ain, of the Eure and Loire, of the Two Severs, &c.

<i>Departments.</i>	<i>Ancient Provinces.</i>

The natural curiosities of France consist chiefly in springs and subterraneous caverns.

A late traveller in France has given us the following picturesque and accurate description of the fountain of Vaucluse: "I arrived yesterday, says he, at Avignon. My first anxiety was to visit the fountain of Vaucluse. I think I still see, escaping from the mouth of a chain of mountains, as from the depth of a vast tube, a river which rises, rushes up, and instantly overflows with an impetuosity, a thunder, a boiling, a foam, with falls which never can be described either by the pen of the poet, or the pencil of the painter. Such is the fountain of Vaucluse. In an instant this river becomes calm; and may then be compared to a happy disposition, moderated by its native goodness, after the first transports of vivacity. It now changes its silver waves into waves of azure, and pours, and rolls, and diffuses them on a bed of emerald; but it soon divides itself into a multitude of little streams to meander through a charming valley. On quitting the valley, these rivulets unite, and all together take their course by a hundred different ways, to water, fertilize, and embellish, under the name of the Sorgue, the delightful country of Avignon. Vaucluse presents at once the most delightful scene, and the most singular phenomenon. But I must say with the poet,

"These streams, that sky, and yon enchanting vale,
"Touch not my heart like Petrarch's piteous tale.

The memory of Petrarch and of Laura animates every object, while it embellishes and renders enchanting the landscape."

Near Salins in Burgundy are several very remarkable caves, the extent of which taken all together is about 400 feet in length, and 60 in breadth. The descent into them is by 40 stone steps, and 20 of wood. At the bottom, by help of lighted torches, which each person carries with him, may be seen six springs of salt-water, and two of fresh, gushing out and running with great rapidity. These streams are kept separate by proper trenches, which conduct them into other vaults supported by large pillars, wherein are placed reservoirs for the reception of the salt-water, afterwards conveyed to the top by proper engines, and being put in pans, great quantities of salt are extracted from it. This water is observed to be most strongly impregnated in rainy weather; and is supposed to acquire its saline quality from some vast rocks of salt through which it passes in its subterranean course. At Baulme, twelve miles from Besançon, is a cavern, above three hundred feet under ground, wherein are a number of icicles, and in

the bottom a little river, which flows in the winter, but is frozen in the summer. In the forests of St. Aubin du Cormier in Bretagne, is a cave, through which runs a great torrent of water; and from another, situated at Nions, proceeds a violent wind. The cave of our Lady of Balm, in Dauphiné, is between four and five fathoms broad, and from five to eight feet deep; and, in the valley of Liberslat, in Alsace, is a cavern, out of which flows an oily liquor, which being distilled, and properly prepared, yields a most excellent salubrious oil. In the neighbourhood of Nismes, there is a subterraneous passage, which the vulgar inform us reaches to Arles, under the Rhône, being a distance of 20 miles.

The artificial curiosities of France consist chiefly in their canals, and public buildings. The former of these have already been described, and the others have been noticed in the account of its cities and principal towns.

France possesses several valuable remains of antiquity, many of which have been traced back even to the time of the Celts: and after Gaul was reduced by the Romans, they adorned it with numerous edifices, both civil and sacred, some of which are still very perfect. Triumphal arches are found in several parts of the kingdom, but the most entire is at Orange, erected on account of the victory obtained over the Cimbri and Teutones, by Caius Marius, and Lucilius Catulus. Nismes abounds in monuments of antiquity. The famous Pont du Gard was raised in the Augustan age by the Roman colony of Nismes, to convey a stream of water between two mountains for the use of that city, and is as fresh to this day as Westminster-Bridge: it consists of three bridges, or tiers of arches one above another; the height is 174 feet, and the length to 723. The moderns are indebted for this, and many other stupendous aqueducts, to the ignorance of the ancients, that all streams will rise as high as their sources.

The commerce and manufactures of France may be considered under two heads, viz. inland and foreign. This country, by her situation, the turn of her inhabitants for certain manufactures, and the happiness of her soil, must be always possessed of a great inland traffic, which in many particulars exceeds that of any other country in Europe, and is in a great measure carried on by their navigable canals.

The introduction of the silk manufacture to France took place so late as in the reign of Henry IV. and in that of his grandson Louis XIV. the city of Tours alone employed 8000 looms and 800 mills. The city of Lyons then employed 18,000 looms; but after the impolitic and unjust revocation of the edict of Nantes, the expulsion of the Protestants, and the ruinous wars maintained by France, they decreased to 4000; and their silk manufacture is now rivalled by that of England, where the French Protestants took refuge, and were happily encouraged. On the other hand, the

French woollen cloths and stuffs, more especially at Abbeville, are said to be now little inferior to those of Holland and England, assisted by the clandestine importation of English and Irish wool, and workmen from this country. This destructive traffic is principally carried on between Boulogne in France and Romney-Marsh in Kent.

The foreign trade of France may be said to extend itself all over the globe. That country is thought to be no great loser by its cession of Canada, and part of Louisiana at the late peace. But the most valuable part of Hispaniola in the West-Indies, which she possesses by the partiality and indolence of Spain, is a most improveable acquisition, and the most valuable of all her foreign colonies. In the West-Indies, she likewise possesses the most important sugar-islands of Guadelupe, St. Lucia, Tobago, St. Bartholomew, Defeada, and Marigalante. A small tract upon the Mississippi is the whole of what she possesses in North-America. Those belonging to her in the East-Indies are not very considerable; though had the genius of the French been more turned for commerce than war, they might have increased more territory and revenues than are now in possession of the English; but they over-rated both their own power and their courage, and their East-India company never made a considerable figure. Pondichery, &c. in the East-Indies, and St. Domingo in the West, were taken by the English in the year 1793.

At present the land-trade of France to Switzerland and Italy, is by way of Lyons; to Germany, through Metz and Strasburgh; to the Netherlands, through Lille; to Spain (a most profitable one) through Bayonne and Perpignan. As for her naval commerce, her ports in the channel and on the Western-Ocean are frequented by all the trading nations in Europe, to the great advantage of France, more especially respecting what is carried on with England, Holland, and Italy. The trade from her Mediterranean ports (more particularly from Marseilles) with Turkey and Africa, has long been very considerable. The negro-trade from Guinea supplies her sugar-colonies, besides the gold, ivory, and drugs got from that coast.

The articles of trade in France, are as follow: the wines of different districts, and the produce of those wines, viz. Bourdeaux, Nantes, Rochelle vinegar, and the lees. Fruit, such as prunes, prunelloes, dried grapes, pears, and apples, from Normandy; and oranges and olives from Languedoc and Provence. Fine lawns, thread, linens, stuffs, woollen cloths, sail-cloth, hemp, flax, linseed, silk, black and green soap, corn, for their inland trade; fine paper, paste-board, salt, salt-petre, rosin, oil, cork, kid-skins, almonds, perfumes, extracted oils, drugs, and chemical preparations, cambrics, silver and gold stuffs, embroideries, satins, sewing-silk, tapeltries, millinery-wares, crapes, laces, toys, plush hats, parchment, and hardware.

The manufactures of France are silks, as lustrings, alamodes, farcenets, broad, flowered, and brocaded silks, velvets, and gold and silver stuffs. Woollen manufactures in imitation of those of England, which are chiefly carried on in Normandy, Poitou, Languedoc, Provence, and Guienne. Fine linens, lawns, and lace are made in the inland parts; as is canvas in Normandy, sail-cloth at Vitry, and other places, and dowlasses at Morlaix. In Picardy and Paris are made exceeding beautiful and rich tapeltries, and Auvergne is famous for fine paper. Manufactures of soap are established chiefly in Provence; this is so considerable an article in their commerce, that when they have a scarcity of oil, they fetch a prodigious quantity from the Levant to supply the soap-makers. They have long obtained the secret from Spain of making that species of soap called Castile, of which they have established large manufactures at Marseilles and Toulon, and thereby deprived the Spaniards of that valuable branch of trade.

The constitution of France was formerly a limited monarchy; but the oppressions of the great landholders grew, by degrees, so irksome to the subjects, that they preferred the monarchical to the aristocratical government. But Richlieu, in the time of Louis XIII. gave aristocracy a mortal blow; and all the civil disputes in France, since that period, have been among great men for power and places, and between the kings and their parliaments.

The life and property of the subject were afterwards entirely at the mercy of the sovereign: he imprisoned whom he pleased, without being accountable to the laws, and, whenever he thought it necessary for his purpose, appointed what judges he deemed proper for the trial of offenders. The great officers of state took their oaths to him, which they formerly did to the parliament; and he appointed, removed, extended, or retrenched their authority as he pleased. The registering of the edicts, which formerly gave them the sanction or force of laws, at length became a mere matter of form. The parliaments indeed some years ago made a noble opposition to the king's command with regard to this particular, but this generally procured a temporary banishment: for, arbitrary as he was, he never ventured to inflict any further punishment than a slight banishment, or imprisonment, for their most provoking acts of disobedience: a tacit acknowledgment of the infirmity of the French constitution, and a proof that the people considered the parliaments as their natural guardians and protectors.

Before the revolution, distributive justice was administered in France by parliaments, chambers of accounts, courts of aid, presidial courts, generalities, elections, and other inferior courts. The parliaments were fifteen in number, namely, Paris, Thoulouse, Rouen, Grenoble, Bourdeaux, Dijon, Aix, Rheims, Pau, Metz, Besançon, Daway, Perpignan, Calmer, and Arras; but several of those parliaments are now united

justice was administered by chambers of accounts, generalities, The parliaments of Paris, Thoulouse, n, Aix, Rheims, rpignan, Calmer, iaments are now united

united into one, and that of Paris branched out into six. It was however the chief, and took the lead in all national business. It was divided into ten chambers. The grand chamber was chiefly appropriated to the trial of peers. The Tournelle took cognizance of all matters of property above 1000 livres in value. The Tournelle Criminelle received and determined appeals from inferior courts in criminal cases. Besides these three capital chambers, there were five of requests for receiving the depositions of witnesses, and determining causes, nearly in the same manner as our court of exchequer. In some provinces, the administration of justice was regulated by the civil law, and in others by their particular customs, so far as they were consistent with the king's edicts and declarations.

The chamber of accounts was the next court of judicature in France: here all matters of public finance were examined, treaties of peace and grants registered, and the vassalages due from the royal fiefs were received: the chambers were in number twelve, and held in the cities of Paris, Rouen, Dijon, Nantes, Montpellier, Grenoble, Aix, Pau, Blois, Lille, Aire, and Dole. The third court of judicature was the court of aid, where all matters that related to the royal revenue, and the raising of money, were determined. The fourth were the presidial courts, which were composed of judges for determining matters in appeal from magistrates of little towns and villages. The next court were the generalities, who proportioned the taxes to be raised in their districts, according to the sum that is appointed to be levied: they likewise took cognizance of matters relating to the crown-lands, and certain branches of the revenue. These courts are in number 23, each consisting of 23 persons, and they were distributed over the kingdom for the more convenient dispatch of business. The courts of elections, which were subject to those generalities, settled the smaller proportions of taxes that were to be paid by parishes and inferior districts, and how much each individual in the same was to pay: this was done by a collector, who returned the assessments to the court of generalities.

Besides the above courts, the French had intendants of justice, police, and finances, whose powers, when properly executed, were of great service to the peace of the community. They had likewise provosts, seneschalls, bailiffs, and a variety of other officers.

From this general review of France in its monarchical state, the reader will be apt to conclude, that she was the most powerful nation, and the people the most opulent and happy in Europe. The reverse, however, appears to be the constant state of that nation; since we do not find that in any former period they were more rich or more happy. In a country so extensive and fruitful, her government finds immense resources in men and money; but, as if the French councils were directed by an evil genius, these resources,

No. 44.

great as they are, have proved, by a wrong application, the ruin of the people. The most obvious causes of this national poverty originated from the ambition and vanity of their kings and leading men, which led them into schemes of universal dominion, the aggrandizement of their name, and the enslaving of Christendom. Their wars, which they sometimes carried on against one half of Europe, and in which they were generally unfortunate, led them into difficulties to which the ordinary revenues were inadequate; and hence proceeded the arbitrary demands upon the subject, under various pretences, in the name of loans, free-gifts, &c. When these failed, other methods, more arbitrary and unjustifiable were adopted, such as raising and reducing the value of money, as they thought proper, national bankruptcies, and other grievous oppressions, which gave the finishing stroke to public credit, and shook the foundations of trade, commerce, and industry; the fruits of which no man could claim as his property. When we also consider the motives of these wars, a desire to enslave and render miserable the neighbouring nations, that man must be devoid of humanity whose breast is not fired with indignation at the bare mention of the blood that has been spilt, the miseries and desolations that have been brought upon mankind, and the numerous places that have been sacrificed to their ambition and avarice. From the late attack upon Corsica, it appears that their own misfortunes have not taught them wisdom or humanity; for while they thus grasped after foreign conquest, their own country exhibited a picture of misery and beggary, unknown even to some of the most uncivilized of the adjoining kingdoms. To this we may add, that many of the taxes and revenues in France were let out, for a time, or farmed to the best bidder; and these harpies, the farmers-general, and their under-farmers and receivers, made no scruple of fleecing the people most unmercifully; and the residue, if any remained, went to satisfy the cravings of a numerous clergy, who in their turn were obliged, as well as the laity, to advance the government immense sums under various names.

The revenues of so despotic a government as that of France was during the monarchy, when the estates as well as lives of the people were subject to the will of the prince, cannot well be ascertained. The whole specie of France, in gold and silver, was computed in 1716 to be about 17,000,000 sterling; and though the crown was then doubly a bankrupt, being in debt about 100 millions sterling, or 2000 millions of livres, yet by seizing almost all the current money in the kingdom, and by arbitrarily raising or lowering the value of coins, in four years time the duke regent of France published a general state of the public debts, by which it appeared that the king scarcely owed 340 millions of livres. The reader is left to judge whether so great a reduction must not be the effect of the most absolute despotism, and the act itself deserves no better name than that of a national robbery. The French court

10 M

has

has not since that time blushed to own, as towards the conclusion of a former war, and also in 1769, that their king was a bankrupt; and, in order to recruit the royal finances, his ministers have pursued measures pretty similar to those practised by the regent above-mentioned.

The ordinary revenues of France, by some late calculations, amounted, during the monarchy, to above 12,000,000l. sterling. They arose from the demesnes; the taillé, or land-tax; the taillon, another sort of land-tax, which the nobility were obliged to pay as well as the commons; by aids, which we call customs on merchandize; by gabels, which is a tax upon salt; by a capitation, or poll-tax; by the tenths of estates and employments; by the sale of all offices of justice; by a tenth, or free-gift of the clergy; exclusive of their additional yearly sum of 12,000,000 of livres; and by confiscations and forfeitures.

The comptroller-general was the head of the officers of the finances; and for the management of the revenues, and the determination of all disputes relative to it, there were several tribunals and offices in different parts of the kingdom, of which one at Paris was the chief.

With respect to the present state of the revenue, we are informed, that on the 30th of December 1791, Mr. Lafont presented to the Assembly the following general estimate, from the particular estimate of the ministers, for the year 1792:

	Livres.
Appanage of princes.....	5,000,000
Foreign affairs.....	6,000,000
Marine and colonies.....	43,000,000
General administration.....	5,000,000
Public worship.....	81,000,000
Pensions to ecclesiastics.....	68,000,000
National assembly.....	5,000,000
Civil list.....	25,000,000
Bridges and roads.....	4,000,000
High national court, and court of appeal.....	450,000
Schools and academies.....	1,000,000
Interest of debts.....	20,000,000
Life annuities.....	100,000,000
Perpetual annuities.....	300,000,000
Besides the expences of the army.	

THE WAYS AND MEANS.

By land-tax, a tax on personal property, patents, stamps, &c. valued at 532,000,000 livres; the remaining sum to be provided for from the fund of extraordinary.

The extraordinary expences of the army, colonies, and public worship, would soon cease, and bring the expenditure on a level with the revenue.

The amount of the assessed taxes for the year 1792, are by some authors estimated only at 300,000,000 livres, equal to 12,500,000l. sterling; and with the

incidental taxes in all 15,500,000l sterling; near nine millions less than before the revolution, when the clergy and nobles were exempted.

All excises and excitemen, tythes, and game-laws, are now abolished, and the funds maintained at the public charge.

In the year 1788, before the revolution, the revenue was 20 millions and a half sterling; and its ordinary expenditure exceeded the revenue five millions and a half. In 1783 the public debt was £ 141,666,000.

There is no nation in Europe where the art of war, particularly that part of it relative to gunnery and fortification, is better understood than in France. Besides other advantages for learning it, there is a royal academy established purposely for training up five hundred young gentlemen at a time, in the several branches of this great art. The number of forces in France, even in time of peace, are seldom less than 200,000, the pay of these being little more than two pence halfpenny per day; in time of war, they are usually double that number; but those raised from the militia are very indifferent troops.—In the reign of Lewis XIV. the navy of France amounted to 100 ships of the line of battle, but it has not been so considerable lately. In the war of 1756 with England, their marine was almost totally destroyed; but since the peace they have been very assiduous in restoring it, and in the year 1769, it was said to consist of sixty-four ships of the line, including those of fifty guns, and twenty-five frigats, besides smaller vessels. The seamen in the maritime provinces of this kingdom were registered, and divided into classes, each class serves three or four years alternately, and those who were not in actual service, might enter on board merchant ships. Besides the seamen, an hundred independent companies were maintained to serve on board the ships of war as marines. After the commencement of hostilities in the war of 1774, between Great-Britain and France, the French navy was more formidable than at any preceding period.

Towards the close of the year 1791, the report of the minister states the ships in good condition to be 86 of the line, and, including those building, as follows:

Large first-rates.....	8
100 guns.....	5
80 guns.....	10
74 guns.....	67
64 guns.....	1
Total.....	91
Frigats.....	78

besides fire-ships, corvettes, galleys, and cutters.

There are in commission 28 of the line, and five frigates, and 80,000 seamen with officers registered, to man the fleet; but the French navy is at present without proper subordination.

If we reckon the loss the French navy sustained from the English at Toulon, the latter-end of 1793, its force may now consist of about 100 ships of the line, besides a great

sterling; near nine
ion, when the clergy

Under the revolution, the peace establishment of the
army for the year 1792 was:

Infantry.....	111,000
Cavalry.....	30,000
Artillery.....	11,000
Total.....	152,000

They call these troops of the line, and, along with
the volunteer national guards, they form an army at
present, on the frontiers, of 224,000 men.

Those termed the municipal army, or national guards,
are a kind of embodied militia for the interior defence
of the kingdom, and amount to between three and
four millions.

Besides the above, we may add the gens-d'armes,
an auxiliary body of troops for the protection of police
and laws.

The national assembly, desirous of establishing the
French constitution on the principles it has announced,
has abolished, irrevocably, those institutions which have
been deemed injurious to liberty and equality of rights,
such as royal titles, arms, nobility, orders, &c.

In France there is no longer any nobility, nor peer-
age, nor hereditary distinctions nor difference of orders,
nor feudal government, nor patrimonial jurisdiction,
nor any of the titles, denominations, and prerogatives,
which are derived from them; nor any of the orders
of chivalry, corporations, or decorations, for which
proofs of nobility were required, nor any kind of supe-
riority but that of public functioners in the exercise of
their functions. Royalty also, which was one branch of
the first constitution, is now abolished, and the un-
fortunate monarch put to death by his subjects.

The French gold coins were the old Louis-d'or,
worth 16s. 9d. and the new Louis, or guinea, worth
20s. The silver coins are the old ecu, or crown, worth
4s. 6d. and the new ecu, worth 5s. all these have the half
and quarter in proportion.—Accounts are kept in France
by livres, sols, and deniers; one livre is 20 sols, and
one sol 12 deniers. Their livres, by some late arrears,
have been reduced to half the value.

The king's titles were, Louis XVI by the grace of
God king of France and Navarre. His subjects, in
writing or speaking, called him Sir; foreigners called
him the Most Christian King; and the pope gave him
the appellation of The Eldest Son of the Church.
His arms were three fleurs-de-lis, Or, in a field argent,
supported by two angels in the habits of Levites, hav-
ing each of them a banner in his hand, with the same
arms. The motto is *Lilia non laborant neque vent*,
"Lilies neither toil nor spin." The son of the king
of France, and heir to the crown, was styled Dauphin;
the second son duke of Orleans, and the third duke of
Anjou. The eldest son of the Dauphin was the duke
of Burgundy, the second duke of Aquitaine, the third
duke of Berry, and the fourth duke of Provence.

The nobility consisted of four classes, viz. princes of
the blood, high nobility, ordinary nobility, and modern
nobility. He who was nearest to the crown, after the
king's children, was the first prince of the blood. A-
mong the higher nobility, the dukes and counts, peers
of France, had the precedence; they assisted at the
unction of a king, attended when he held a *lit de justice*,
or *bed of justice*, and enjoyed a seat in the parliament of
Paris. In this class were likewise included the knights
of the Holy Ghost, the governors of provinces, and
lieutenant-generals, with some other dukes, counts, and
marquises. The ordinary nobility were divided into
noblesse de race, and *noblesse de naissance*. The modern or
new nobility were those to whom the king had granted
letters of nobility, or on whom he had conferred some
places by which they became ennobled.

In this kingdom there were three orders of knight-
hood: first, that of St. Michael; secondly, that of the
Holy Ghost; and thirdly, that of St. Louis.

The order of St. Michael was instituted in 1469,
and was at first composed of thirty-six knights only;
but their number was afterwards increased to a hundred.
They wore a gold chain of double scalloped shells,
with a medal expressing a rock, on which is represented
St. Michael encountering the dragon. It is fallen into
disrepute, being conferred on artists, physicians, magis-
trates, &c.

The order of the Holy Ghost, which was founded in
1578, by Henry III. consisted of an hundred persons,
exclusive of the sovereign. Their ensigns were a gold
cross, with a white dove enamelled on the centre of
one side, and on the other the image of St. Michael,
which is appendant to a blue ribbon, passing from the
right side to the left; and on the left breast of their
coats is a silver cross, with a dove embroidered argent.
No person can be admitted a knight of this order, who
has not first belonged to St. Michael; and it is never
conferred but on princes of the blood and persons of
the highest rank. All were to be Papists, and, except
the 14 commanders, which consisted of cardinals, pre-
lates, and the officers of the order, were all to prove the
nobility of their descent for above 100 years. The
Dauphin was received into both orders on the day of
his birth.

The order of St. Louis was instituted by Louis XIV.
in 1693, and was designed as an encouragement and
reward to military merit. Accordingly there was scarce a
French officer, even subalterns, who did not wear it.
Its ensign is a gold cross enamelled, argent, and adorned
with golden lilies, having on one side a coat of mail
with the inscription *LUD. M. INSTITUT. 1693*, and
on the other a drawn sword, with a wreath of laurel at
its point, and the motto *Bell. virtutis præm.* Those
called the Grand Croix, wore it on a broad flame-
coloured ribbon over the shoulder, having also a gold
embroidered cross on their coat. The commanders
wore it in the same manner, but without the em-
broidered cross; and the other knights wore the cross
appendant

appendent to a narrow flame-coloured ribbon fastened to one of their button-holes. There are two chevaliers of the Grand Croix, four of the second class, and an unlimited number of ordinary knights.

HISTORY OF FRANCE.

THIS kingdom was called, by the Romans, Transalpine Gaul, or Gaul beyond the Alps, to distinguish it from Cisalpine Gaul, or Gaul on the Italian side of the Alps. It was probably peopled first from Italy; but, like other European nations, it soon became a desirable object to the Romans, and, after a very brave and resolute resistance, was annexed to their empire by Julius Cæsar, about 48 years before the birth of Christ.

Gaul continued in the possession of the Romans till the subversion of the empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who subdued but did not extirpate the ancient natives. The Franks, who gave it the name of France, or Frankenland, were a collection of several people inhabiting Germany, and particularly the Salii, who lived on the banks of the river Sale, and who cultivated the principles of jurisprudence better than their neighbours. The Franks, who were still mixed with the Salii, adopted one of the laws of that people, by which all females were excluded from the sovereignty, and is still known by the name of the Salic law among the French.

After the Franks and Burgundians had established their power, and reduced the original natives to a state of slavery, they parcelled out the lands among their principal leaders; and succeeding kings found it necessary to confirm their privileges, allowing them to exercise sovereign authority in their respective governments, until they at length assumed an independency, only acknowledging the king as their head. This gave rise to those numerous principalities which were formerly in France, and to the several parliaments there; for every province became, in its policy and government, an epitome of the whole kingdom; and no laws were made, or taxes imposed, without the concurrence of the grand council, consisting of the clergy and nobility. Thus the first government in France seems to have been a kind of mixed monarchy, and the power of their kings was extremely circumscribed and limited by the feudal barons. The same circumstances took place in other European nations, immediately after the dissolution of the Roman empire.

A French historian of credit informs us, that Clovis was the first Christian monarch of the French: that he began his reign in the year 481, and, after being baptized, introduced Christianity in the year 496; from which period the French history exhibits a series of remarkable events; and we find them generally engaged in domestic broils, or in foreign wars. The first race of their kings, prior to Charlemagne, found a

cruel enemy in the Saracens, who then over-ran Europe, and retaliated the barbarity of the Goths and Vandals upon their posterity. In the year 800, Charlemagne, king of France, who was the glory of that dark age in which he lived, made himself master of Germany, Spain, and part of Italy, was crowned king of the Romans by the pope, and thus became emperor.

Charlemagne, at his death, divided his empire by will among his sons, which proved fatal to his family and posterity. Soon after this, the Normans, a fierce, warlike people of Norway and Denmark, invaded and ravaged the kingdom of France, and, A. D. 900, obliged the French to yield up Normandy and Bretagne to Rollo their leader, who became a Christian, and married the king's daughter. This laid the foundation of the Norman power in France, which afterwards became of pernicious consequence to that nation; as from William the Norman, who conquered England, the animosities between that kingdom and France had their origin, and the contests proved for the most part injurious to the latter, notwithstanding their numbers, and the assistance they received from the Scots.

It hath been justly observed, that the rage of encroaching, which broke out about this time, was rather beneficial than otherwise to the French monarchs, as they took off many of their turbulent subjects, who were almost independent of their authority, and left them heirs to several of their nobles, who died in the Holy Land. But we shall pass over these dark ages, and proceed to the period, when the French began to extend their influence over Europe, and this brings us to the reign of Francis I. who was cotemporary with our Henry VIII. of England. This prince was a candidate for the empire of Germany, but lost the Imperial crown. Charles V. of the house of Austria, and king of Spain, being chosen in his stead. Francis made several capital expeditions into Spain, but in one, which he undertook against Italy, he was defeated at the battle of Pavia, taken prisoner, and obliged to agree to the most humiliating terms, in order to obtain his release. His breach of the terms by which he procured his enlargement occasioned continual wars against the emperor, till the death of Francis, which happened in 1547.

At this period, France was rather in a flourishing condition, and Henry II. son and successor of Francis I. was in general a very fortunate prince; for though he lost the battle of St. Quintin, against the English and Spaniards, yet he retook Calais from the former, who never after had any footing in France. He married his son the Dauphin to Mary queen of Scots, in hopes of uniting that kingdom to his own; but in this scheme he, or rather his country, was unfortunate, as may be seen in the history of Scotland. In 1559, he was killed at a tilting match by the count of Montgomery. He was succeeded by his son Francis II. who lived but two years; after whom his brother Charles IX. ascended the throne, who being then but eleven years of age,

and the Guises, with the concurrence of Catherine de Medicis the king's mother, taking upon them the administration, Anthony de Bourbon king of Navarre, the prince of Condé, and the Protestants, entered into a confederacy against the court, and a civil war ensued, in which the king of Navarre was killed on one side, and the duke of Guise on the other; but a peace was concluded soon after between the contending parties. The war was however renewed several times till the year 1571, when a treacherous peace was made with the Protestants, in order to destroy them by a massacre, which was put in execution at Paris, in the night of the 24th of August 1572, and immediately after in several other great towns; and a confederacy called the Holy League was entered into by the Papists of France and Spain for the extirpation of the Protestants. This project proved but too successful, though it was not completely executed till on St. Bartholomew's day, 1672. The heads of the Protestants were invited to the celebration of the nuptials between the young king of Navarre, a Protestant, and the French king's sister. The king himself, Charles IX. assisted in the massacre, in which the admiral Coligni fell. The signal for the inhuman slaughter of so many thousands was to be made by striking the great bell of the palace. At that dreadful knell the work of death was begun, and humanity recoils from the horrors of the fatal night of St. Bartholomew; yet the reader may expect, amidst the general carnage, that some few moments should be devoted to the fate of Coligni. He had not long retired to rest, when he was aroused by the noise of the assassins who had surrounded his house. A German, named Besme, entered his chamber; and the admiral, apprehending his intentions, prepared to meet death with that fortitude which had ever distinguished him. Incapable of resistance from the wounds he had received by two balls in a late attempt to assassinate him, he had scarce with an undismayed countenance uttered the words, "Young man, respect these grey hairs, and stain them not with blood," when Besme plunged his sword into his bosom, and with the help of his barbarous associates, threw the body into the court. The young duke of Guise contemplated it in silence; but Henry count d'Angoulême, natural brother to Charles, spurned it with his foot, exclaiming, "Courage, my friends; we have begun well, let us finish in the same manner." It is said that about 30,000 Protestants were murdered at Paris, and in other parts of France; and this brought on a fourth civil war. Though a fresh peace was concluded in 1573, with the Protestants, yet a fifth civil war broke out the next year, when the bloody Charles IX. died without heirs. About the same time the duke of Anjou, who was offered the sovereignty of the Netherlands, made his court to Elizabeth queen of England, to whom he seemed to give encouragement, either on political views, or to procure the Protestants some relaxation from persecution; but the queen, at length, discarded the duke,

No. 44.

which occasioned some severe reflections upon her inconstancy.

Henry III. king of Poland, succeeded to the kingdom of France, 1574, when pope Sixtus V. deposed the king of Navarre, and absolved his subjects from their allegiance on account of religion; and the king of France, Henry III. taking the part of the Protestants against the leaguers, was mortally wounded by one Clement, a friar, with a knife, which the king drew out of his body, and struck the assassin in the eye with the same knife, and he was soon knocked on the head by the king's servants.

Henry, king of Navarre, of the house of Bourbon, succeeding, the Protestants obtained an edict, called the edict of Nantz, 1589, in their favour, from Henry IV. whereby they were tolerated in the free exercise of their religion, in all parts of the kingdom except at Paris; but still, the king (Henry IV.) observing a great majority of his kingdom zealous Catholics, found himself under a necessity of declaring himself of that religion; nor could he preserve him from the malice of the monks; for Ravillac a friar stabbed him to the heart in his coach, in the streets of Paris, the 14th of May 1610, on presumption that he was still a Protestant. The king leaving his son Louis XIII. a minor of nine years of age, the queen his mother, Mary of Medicis, was made regent; during whose administration, great encroachments were made on the liberties of the people, notwithstanding the opposition that was made to those arbitrary measures by the parliament of Paris; but the Protestants, being most oppressed, stood upon their defence, and the kingdom was involved in another civil war. The king having taken some extraordinary ways to raise money, the parliament of Paris refused to concur in them, until his majesty went thither in person, with the princes of the blood, and terrified them into a compliance. Cardinal Richlieu, being advanced to the post of prime-minister, soon after put a final end to the liberties of France. He began by suppressing the Hugonots, and reducing all the towns they were possessed of, the last of which was Rochelle, which held out two years against the whole power of France, but was obliged to surrender the 8th of October 1628. This put an end to the civil wars, on account of religion, in France. Historians say, that during these wars above 1,000,000 of men lost their lives; that 150,000,000 livres were spent in carrying them on; and that nine cities, 400 villages, 2000 churches, 2000 monasteries, and 10,000 houses were burnt, or otherwise destroyed. He proceeded to insult the parliament of Paris, prohibiting them, in the king's name, to intermeddle in affairs of state: he then erected courts of justice to try by a special commission the peers that opposed his measures. Whereupon the dukes of Orleans and Montmorency had recourse to arms; but being defeated, Montmorency was taken prisoner, and executed as a traitor. This occasioned several conspiracies of the princes of the blood,

10 N

and

and the nobility, against the cardinal, which he however defeated, but very narrowly escaped being assassinated.

Louis XIV. son of Louis XIII. and of Anne of Austria, Infanta of Spain, was born the 5th of September 1638. He succeeded his father the 14th of May 1643, being then in the fifth year of his age: cardinal Richieu died just before the late king, and the queen-mother about the same time. The king being a minor, the queen his mother had the administration of the government, and made cardinal Mazarine, an Italian, her prime-minister. He had been introduced into the administration by Richieu, in the last reign, and followed his plan of continuing to enlarge the French frontiers in Flanders, Catalonia, Germany, and Italy; and imagining that Charles I. king of England was inclined to assist Spain, he fomented the rebellion against that prince, as Richieu had done, when he might easily have suppressed it. By the treaty of Westphalia, the bishoprics of Metz, Toul, and Verdun, were confirmed to France, with ten imperial cities in Alsace, among which were Landau, and the castle of Philipsburg in the palatinate.

The parliament of Paris beginning to resume their authority, and insisting on the banishment of the cardinal, as an enemy to the king and kingdom, the queen-mother and the cardinal engaged the prince of Condé and the army in their interest, and perfectly subdued the parliament; and because the prince of Condé seemed inclined to defend the rights and privileges of the peers, he was laid aside as soon as he had served the minister's turn, and the command of the army given to other generals; whereupon the prince of Condé quitted the kingdom, and commanded the Spanish army in Flanders.

Cardinal Mazarine entered into an alliance with Cromwell, as the likeliest means to support himself; and his forces having joined the cardinal's in Flanders, they besieged and took Dunkirk, which was put into the hands of the English, and the cardinal found himself obliged to submit to such terms as Cromwell insisted on; but the union between the protector and this French minister proved the ruin of the constitution in both kingdoms, and of the balance of power in Europe. In the year 1661 died cardinal Mazarine, when Louis XIV. took the administration of the government into his own hands.

Louis XIV. on the death of Mazarine, put the domestic affairs of his administration into the hands of Colbert, who formed new systems for the glory, commerce, and manufactures of France, all which were carried into execution with great assiduity. A late author very justly says, "To write the history of his reign, would be to write that of all Europe. Ignorance and ambition were the only enemies of Louis. Through the former, he was blind to every patriotic duty as a king, and promoted the interests of his subjects only that they might the better answer the purpose of his greatness; by the latter, he

embroiled himself with all his neighbours, and wantonly rendered Germany a dismal scene of devastation." His reign, which began splendidly, was, towards the close of it, one continued series of defeats and calamities; and he had the mortification of seeing those places taken from him, which, in the former part of his reign, were acquired at the expence of many thousand lives. He died on the first of September 1715, being succeeded by his grandson Louis XV. who, in the course of his reign, was styled the Well Beloved, which he lost some years before he died; he was detested and despised by his subjects, for his shameful and licentious attachments, and illiberal treatment of some of the worthiest men of the kingdom. Though the system of this prince was more pacific than that of his grandfather, yet the situation of affairs in Europe more than once embroiled him with the house of Austria. The intention of the French king was, to place his father-in-law, Stanislaus, on the throne of Poland. In this he failed, through the interposition of the Russians and Austrians; but Stanislaus enjoyed the title of king, and the revenues of Lorraine, during the remainder of his life. The connection between France and Spain forced the former to become principals in a war with Great-Britain; in the management of which the latter was so ill seconded by her allies, that it was finished by the peace of Aix-la-Chapelle in 1748. We have mentioned, in the history of England, the war so humiliating to France, and the chief events attending it, which was ended by the peace of Fontainbleau, in 1763. He died A. D. 1774, in the 64th year of his age, and 59th of his reign.

Louis XVI. the late unfortunate king of France, succeeded his grandfather, Louis XV. on the 10th of May 1774. Several regulations, highly favourable to the general interests of the nation, particularly the suppression of the musquetaires, took place soon after the accession of this monarch. But the most remarkable circumstance which attended the present reign, was the placing Mr. Neckar, a Protestant, and a native of Switzerland, at the head of the French finances, in 1776. Under the direction of this gentleman, a general reform took place in France, throughout every department in the revenue. When hostilities commenced between France and Great-Britain, in consequence of the former's taking part with the revolted British colonies in America, the people of France were not burdened with new taxes for carrying on the war; but the public revenue was augmented by his economy, improvements, and reformation that were introduced into the management of the finances. In consequence of this national frugality, the navy of France has also been raised to so great a height as really to become formidable to Great-Britain. But the beneficial measures pursued by Mr. Neckar were not calculated to procure him friends at court; the vain, the interested, and the ambitious, naturally became his enemies; and the king appears not to have possessed sufficient firmness

of mind to support an upright and able minister. He was therefore for a time displaced; and is said to have been particularly opposed by the queen's party. His removal, however detrimental to France, was probably a favourable circumstance for Great-Britain, as national economy, and wise counsels, must naturally render the former a more dangerous enemy to the latter, both in time of peace and war. In the year 1786 a treaty of navigation and commerce was concluded between the two courts of London and Versailles; and this concluded the transactions between the two kingdoms.

A GENEALOGICAL LIST OF THE ROYAL FAMILY OF FRANCE.

Louis XVI. the late unfortunate king of the French, was born Aug. 23, 1754, married April 19, 1770, to Marie Antoinetta, archduchess of Austria, who was born Nov. 4, 1755: Louis succeeded his grandfather, Louis XV. May 10, 1774, was crowned at Rheims, June 11, 1775; and beheaded January 21, 1793. The issue of Louis XVI. and Marie Antoinetta are,

1. Madame Maria Theresia Charlotta, born Dec. 19, 1778.
2. Louis Charles, born March 27, 1785.

BROTHERS AND SISTERS TO HIS LATE MAJESTY.

1. Louis-Stanislaus-Xavier, count de Provence, born Nov. 17, 1755; married May 14, 1771, Maria-Josepha-Louisa, daughter of the king of Sardinia, born Sept. 4, 1753.
2. Charles-Philip, count d'Artois, born Oct. 9, 1757; married Nov. 16, 1773, to Maria Theresia, daughter of the king of Sardinia, born Jan. 31, 1736; by whom he has issue:

Louisa-Antoine, born Jan. 24, 1778.

A princess, born Aug. 5, 1780.

4. Louisa-Maria, born 1737, who went into a convent of Carmelites, and took the veil in 1770.

A most remarkable change in the affairs and government of the French nation having taken place in the year 1789, which has engaged the attention and interference of the most considerable powers of Europe, our readers will, we doubt not, feel a real pleasure on our presenting them with

AN HISTORICAL REVIEW OF THE FRENCH REVOLUTION,

In its Commencement, Progress, and Effects.

IF we consider the government of France only as it discovered itself in practice, it appeared for the most part a perfect despotism, with no other restraint on the caprice of the monarch, than that which must every where exist, the patience and prejudices of the people. If, on the contrary, we examine it in the abstract, we find another power rising into proud competition with the monarch, and circumscribing his prerogatives, within narrow limits;—the power of the parliaments.

The ambition of the French government, which made it acquainted with liberty, in assisting the insurgents in America and Holland, kindled a spirit among the people, which could not well admit of the continuance of arbitrary power at home.

The dismissal of Monsieur Necker from the direction of public affairs, and succeeding ministers being endowed neither with his integrity nor abilities, the finances of the nation were on the point of being totally ruined. And when the edict for registering the loan at the conclusion of the year 1785, which amounted to the sum of three millions three hundred and thirty thousand pounds, was presented to the parliament of Paris, the murmurs of the people, and the remonstrances of the assembly, assumed a more legal and formidable aspect. The king, however, signified to the select deputations that were commissioned to convey to him their remonstrances, that he expected to be obeyed without further delay. The ceremony of the registering took place on the next day, but was accompanied with a resolution, importing, that public economy was the only genuine source of abundant revenue, the only means of providing for the necessity of the state, and restoring that credit which borrowing had brought to the brink of ruin. This proceeding was no sooner known, than the king required the attendance of the grand deputation of parliament: he erased from their records the resolution which had been adopted; and declared himself satisfied with Monsieur de Calonne, his comptroller-general and acting minister.

This gentleman, how gratified soever he might be by the support of his sovereign, could not but feel himself deeply mortified by the opposition of the parliament. An accurate inquiry into the state of the public finances had convinced him that the expenditure had far exceeded the revenues: to impose any new taxes, in the present situation was impossible; to continue the method of borrowing, was ruinous; and to have recourse only to economical reform, would be found wholly inadequate; therefore he hesitated not to declare, that it would be impracticable to place the finances on a solid basis, but by the reformation of whatever was vicious in the constitution of the state.

The

The minister, in order to give weight to this reform, was sensible that something more was necessary than royal authority; he perceived that the parliament was neither a fit instrument for introducing a new order into public affairs; nor would submit to be a passive machine for sanctioning the plans of a minister, even if these plans had perfect wisdom for their source.

The only alternative that seemed, under these circumstances, to remain, was, to have recourse to some other assembly, more dignified and solemn in its character, and that should consist in a greater degree of members from the various orders of the state, and the different provinces of the kingdom; but the true and legitimate assembly of the nation, the states-general, had not met since the year 1614. Another assembly had occasionally been substituted in the room of the states-general; this was distinguished by the appellation of the notables, or men of note, and consisted of a number of persons from all parts of the kingdom, chiefly selected from the higher orders of the state, and nominated by the king himself. This assembly had been convened by Henry IV. and again by Louis XIII. and was now once more summoned by the authority of the then reigning monarch; and the period appointed for their opening was the 29th of January 1787.

Monsieur de Calonne, though embarrassed by great difficulties, first met the assembly of the notables, and communicated his long-expected plan. He began by stating, that the public expenditure had for centuries past exceeded the revenues: that a very considerable deficiency had of course existed; and that at his own accession to office it was three millions three hundred and thirty thousand pounds. To remedy this evil, the comptroller-general recommended a territorial impost, in the nature of the English land-taxes; from which no rank or order of men were to be exempted; an inquiry into the possessions of the clergy, which hitherto had been deemed sacred, from their proportion of the public burdens: the various branches of internal taxation were also to undergo a strict examination; and a mortgage of the demesne lands of the crown presented a considerable resource.

Monsieur Neckar, before he retired from the management of the finances, had published his *Compte rendu au Roi*, in which France was represented as possessing a clear surplus of four hundred and twenty thousand pounds sterling. This performance had been read with avidity, and was considered as an era in the history of France. The credit of this statement was ably vindicated by M. de Brienne, archbishop of Toulouse, and by the count de Mirabeau, a still more formidable enemy to Calonne. His eloquence, however, might have successfully vindicated his system and reputation against the calculations of Brienne, and invectives of Mirabeau; but the genius of the comptroller-general sunk under the influence of the three great bodies of the nation. The grand and essential object of reform was, to equalize the public burdens,

and, by rendering the taxes general, to diminish the load of the lower and most useful classes of the people.

The ancient nobility and the clergy had ever been free from all public assessment; the crowds of new noblesse, who had purchased their patents, were by that shameful custom exempted, together with their posterity, from contributing proportionably to the expences of the state; the magistrates likewise throughout the kingdom enjoyed their share of exemptions: so that the whole weight of the taxes fell on those who were the least able to bear them. Thus the nobility, the clergy, the magistracy, were united against the minister, and the event was such as might be expected. The intrigues of these three bodies raised against him so loud a clamour, that, finding it impossible to stem the torrent, M. de Calonne not only resigned his place on the 12th of April, but, to avoid the storm of persecution, soon after retired to England.

In the mean time the notables proceeded in their inquiries: and it was now suggested, that an assembly of the states should be called, as the notables were not competent to impose a new tax. As the deliberations of the notables were not carried on in secret, this proposal was instantly circulated through the capital, and supposed to be a new discovery. The notables were soon after dissolved, without having accomplished any thing excepting the justification of M. Neckar. The stamp-act, however, was established, and a bed of justice was held by the king on the 5th of August 1787, at which the parliament of Paris was obliged to attend; and the edict was registered, notwithstanding their protest to the contrary. But the parliament, though defeated, were far from subdued; on the day after the king had held his bed of justice, they entered a formal protest against the concession that had been extorted from them. On the other hand, though every appearance of violence must have proved painful to the mild disposition of Louis, he could not consent to surrender, without a struggle, that authority which had been so long exercised by his predecessors.

Since the commencement of the present discontents, the capital had been gradually filled with considerable bodies of troops; and about a week after the parliament had entered their protest, an officer of the French guards, with a party of soldiers, went at break of day to the house of each individual member, to signify to him the king's command that he should immediately get into his carriage, and proceed to Troyes, a city of Champagne, about seventy miles from Paris, without writing or speaking to any person out of his own house before his departure. These orders were served at the same instant: and before the citizens of Paris were apprised of the transaction, the parliament were already on the road to the place of their exile.

The resentment of the whole nation, against the banishment of the parliament, rose to so great a height, that, after a month's absence, it was recalled. This was scarcely done, when they were required to register

lean;

a loan; at which they hesitated, notwithstanding all the manoeuvres of the minister. At last the king came to the house, and held what is called a royal session. The edicts were now registered; but the duke of Orleans protested, in the presence of the king, against the legality of the proceeding. The parliament protested against the legality of the session itself, but to no purpose. The duke of Orleans, with four others, were banished; the king called for the journals of the house, destroyed the protest, and forbade it to be inserted again. Great clamours were excited by the banishment of the duke of Orleans, and the other members of parliament; remonstrances were presented by the parliaments of Paris, Bourdeaux, and Rennes; but it was not till the spring of 1788 that the exiles were recalled.

Louis had now no alternative remaining, but to plunge his country into all the calamities of civil war, or to comply with the wishes of his people, and re-establish the states-general. In the first case, he must have expected to encounter the majority of the people, animated by the exhortations and examples of their magistrates: the peers of the realm had expressed the strongest disapprobation of his measures, nor could he even depend any longer on the princes of the blood; but what afforded most serious matter of alarm was, the spirit lately evidenced among the military, who, during the disturbances in the provinces, had reluctantly been brought to draw their swords against their countrymen; and many of whose officers, having recently served in America, publicly avowed their abhorrence of a despotic government.

Under these impressions, in the beginning of August, an arret was published, which fixed the meeting of the states-general to the first of May in the ensuing year, 1789; at the same time every step was taken to secure the favourable opinion of the public. New arrangements took place in the administration; and M. Neckar, whom the confidence of the people had long followed, was again introduced into the management of the finances. The torture, which by a former edict, had been restricted in part, was entirely abolished; every person accused was allowed the assistance of counsel, and permitted to avail himself of any point of law; and it was determined, that in future sentence of death should not be passed on any person, unless the party accused should, by a majority of at least three judges, be pronounced guilty.

At this time the eyes of all Europe were turned on the states-general, or national assembly, whose re-establishment, in the month of May 1789, presented a new era in the government of France.—By the revolution which took place in that year, France founded a new constitution, upon the principles that all men are free and equal in their rights, and that sovereignty resides in the nation. This constitution has been virtually overthrown by the abolition of the monarchical part of it, and by the subsequent condemnation and execution of the king; a deed of most singular atrocity, by which

No. 45.

the national convention have stamped eternal infamy upon their characters.

The moment of the meeting of the states-general was far from auspicious to the court, but abundantly so to the interests of the nation. The minds of the French had long been agitated by various rumours; the unanimity that had been looked for from the different orders of the states was extinguished by the jarring pretensions of each; and their mutual jealousies were attributed, by the suspicions of the people, to the intrigues of the court, who were supposed already to repent of the hasty assent that had been extorted. A death that pervaded the kingdom increased the general gloom and discontent; and the people, pressed by hunger, and inflamed by resentment, were ripe for revolt. The sovereign also, equally impatient of the obstacles he incessantly encountered, could not conceal his chagrin; the influence of the queen in the cabinet was again established, and was attended with the immediate removal of M. Neckar. This step, which evinced a total change of resolutions, and, which, from the popularity of the minister, was likely to produce a violent fermentation in every order of men, was followed by others equally injudicious. The states-general were driven into the Salle des Etats, where they held their meetings, by detachments of the guards, who surrounded them, and who waited only the orders of the court to proceed to greater extremities against the representatives of the nation, who were obnoxious to them.

These manifestations of vigour, had they been only sustained by instantly attacking and entering Paris, it is not to be doubted that, unprepared as it still was, and unwilling to expose the lives and properties of its citizens to the licentious will of an incensed soldiery, the capital would have been without difficulty reduced to obedience: but the delay which succeeded gave the inhabitants time to recover from their first emotions of surprise and apprehension. They saw the timidity and imbecility of the government, who, having founded the charge, dared not advance to the attack. They profited by this want of exertion; and, rapidly passing from one extreme to another, they almost unannouncedly took up arms against their rulers. Joined by the French guards, who, from a long residence in the capital, had been peculiarly exposed to seduction, and who at this decisive moment abandoned their sovereign, the Parisians broke through every obstacle by which they had hitherto been restrained.

By the accession of the French guards, the people had obtained a supply of arms and ammunition, and a considerable train of artillery; the shops of the armourers were ransacked for weapons, and the soldier-citizens were even trained to some appearance of discipline. The night of the 13th of July passed without any event of consequence: the morning discovered that, taking advantage of the darkness, the troops encamped in the Champs Elyées had moved off. The people, however, were ignorant of the causes of this removal, and an

10 U

immediate

immediate attack was expected. The national guard (for that was the name which the mixed band of soldiers and citizens now assumed) amounted to the number of 150,000 men; but the majority were still without arms. The marquis de la Salle was named commander in chief; the green cockade, which they had at first adopted, was changed for the since famous national colours, red, blue, and white; the new army was now more regularly officered; and various deputations were dispatched in quest of arms and implements of war. M. de Flelleles, the *prévôt des marchands* (or mayor) made many promises on this subject; but they all proved, like every part of his conduct, delusi e.—In the course of their inquiries after arms, a party of more than 30,000, conducted by M. Ethis de Corny, repaired to the *Hôtel des Invalides*.

M. Sombreuil, the governor, had received orders so early as on Sunday the 12th to hold himself in readiness for an attack, and his men had remained during the whole of Monday under arms, and on the morning of Tuesday he had permitted them to take a few hours rest. At this moment M. de Corny arrived; and on making known to the governor the object of his mission, he was answered, that the invalids had not any arms. M. Corny was re-conducted by M. Sombreuil to the gate; but it was no sooner opened than the multitude rushed in, like an irresistible torrent, and in a few minutes ransacked every part of the hôtel.—More than 30,000 muskets, and twenty pieces of cannon, were the fruit of this expedition. On the opposite side of the Seine a similar event occurred; there another party attacked the *garde-meuble de la couronne*, and procured from that ancient store an immense number of weapons of different kinds.

ATTACK AND CAPTURE OF THE BASTILLE.

LIKE the *Hôtel des Invalides*, the Bastille had from the first moment of the alarms in Paris been put in a state of defence. Fifteen pieces of cannon were mounted on the towers; and three field-pieces, loaded with grape and case-shot, guarded the first gate. An immense quantity of powder and military stores had been brought from the arsenal, and distributed to the different corps; the mortars had been exercised, the draw-bridge and gates strengthened and repaired; the house of the governor himself was fortified, and guarded by light pieces of artillery. The shortness of the time had not permitted him to be equally provident in laying in a sufficient store of provisions. The forces which the fortrefs included were chiefly foreigners.

On the morning of the 14th, several deputations had waited on the Marquis de Launay, the governor, to demand arms and peace: they were courteously received by him, and he gave them the strongest assurances of his good intentions. Indeed, it is said, that he was himself averse to hostile measures, had he not been

seduced by the perfidious counsels of the sieur Louis de .Blue, commander of the Swiss guards, by the orders of the baron de Bezenval, and by the promises of M. de Flelleles. The Swiss soldiers had even been engaged by an oath to fire on the invalids who were in the fortrefs, if they refused to obey the governor; and the invalids themselves, it is said, were intoxicated with a profusion of liquor which had been distributed among them.

M. de la Rosiere, a deputy of the district of St. Louis de la Culture, waited on the governor, about eleven o'clock in the morning, and was accompanied by a mixed multitude of all descriptions. He entered alone into the house of the governor, and the people remained in the outer court. "I come, Sir," said the deputy, "in the name of the nation, to represent to you, that the cannons which are levelled against the city from the towers of the Bastille, have excited the most alarming apprehensions, and I must entreat that you will remove them." The governor replied, "that it was not in his power to remove the guns, as they had always been there, without an order from the king; that he would, however, dismount them, and turn them out of the embrasures."

The deputy having with difficulty obtained leave from M. de Launay, major of the fortrefs, to enter into the interior court, summoned the officers and soldiers in the name of honour and their country to alter the direction of the guns, &c.—and the whole of them, at the desire even of the governor, engaged themselves by oath to make no use of their arms, unless attacked. M. de la Rosiere, after having ascended one of the towers with M. de Launay, went out of the castle, promising to engage the citizens to send a part of the national guard to do the duty of the Bastille in conjunction with the troops.—The deputy had scarcely retired, before a number of citizens approached the gate, and demanded arms and ammunition. As the majority of them were unarmed, and announced no hostile intention, M. de Launay made no difficulty of receiving them, and lowered the first draw-bridge to admit them. The more determined of the party advanced to acquaint him with the object of their mission: but they had scarcely entered the first court, when the bridge was drawn up, and a general discharge of musketry destroyed the greater part of these unfortunate people.

This apparent act of perfidy immediately raised the resentment of the people almost to phrensy. The instantaneous determination was, to storm the fortrefs; and the execution was as vigorous, as the resolution was daring. An immense multitude, armed with muskets, sabres, &c. rushed at once into the outer courts. A soldier of the name of Tournay climbed over the corps-de-garde, and leaped alone into the interior court. After searching in vain for the keys of the draw-bridges in the corps-de-garde, he called out for a hatchet —he soon broke the locks and the bolts; and being seconded by the efforts of the people on the other side,

the two draw-bridges were immediately lowered. The people lost no time in making good their station, where for more than an hour they sustained a most severe fire from the garrison, and answered it with equal vigour.

Several deputations from the Hôtel de Ville appeared, before the walls, during the contest, with flags of truce, intending to persuade the besieged to a peaceful surrender: but either they were not discovered amidst the general confusion, or, what is more probable, M. de Launay despaired of finding mercy at the hands of the populace, and still flattered himself with some delusive hope of deliverance. The guards, who now acted openly with the people, proved of most essential service; and, by the advice of some of the veterans of this corps, three waggons loaded with straw were set on fire under the walls, the smoke of which interrupted the view, and consequently intercepted the aim of the besieged; while the assailants, being at a greater distance, were able to direct their fire to the battlements with an unerring aim. In the mean time the arsenal was stormed, and a most dreadful havoc was prevented there by the prudence and courage of M. Humbert, who first mounted the towers of the Bastille: a hair-dresser was in the very act of setting fire to the magazine of powder, when M. H. whose notice was attracted by the cries of a woman, knocked the desperado down with the butt-end of his musket—next, instantly seizing a barrel of salt-petre which had already caught fire, he was happy enough to extinguish it, by turning it upside down.

An immense crowd, as if unconscious of danger, filled the courts of the fortrefs, in spite of the unre-mitted fire of the garrison, and even approached so near the towers, that M. de Launay himself frequently rolled large masses of stone from the platform upon their heads. Within, all was confusion and terror; the officers themselves served at the guns, and discharged their firelocks in the ranks. But when the governor saw the assailants take possession of the first bridge, and draw up their cannon against the second, his courage then was changed into despair, and even his understanding appeared to be deranged. He rashly sought to bury himself under the enormous mass, which he had in vain attempted to defend. While a turkey was engaged in distributing wine to the soldiers, he caught the match from one of the pieces of cannon, and ran to the magazine with an intention to set it on fire; but a subaltern of the name of Ferrand repulsed him with his bayonet. He then went down to the Tour de la Liberté, where he had deposited a quantity of powder: but here also he was opposed by the sieur Beguard, another subaltern officer, who thus prevented an act of insanity which must have destroyed thousands of citizens, and with the Bastille would have infallibly blown up all the adjacent buildings, and a considerable part of the suburb of St. Antoine.

De Launay at length proposed seriously to the garrison to blow up the fortrefs, as it was impossible that they

could hope for mercy from the mob. But he was answered by the soldiers, that they would rather perish, than destroy in this insidious manner such a number of their fellow-citizens. He then hung out a white flag, intimating his desire to capitulate; and a Swiss officer would have addressed the assailants through one of the loop-holes of the draw-bridge—but the hour was past, and the exasperated populace would attend to no offer of capitulation. Through the same opening he next displayed a paper, which the distance prevented the besiegers from reading. A person brought a plank, which was rested on the parapet, and poise'd by a number of others. The brave unknown advanced upon the plank; but just as he was ready to seize the paper, he received a musket shot, and fell into the ditch. He was followed by a young man of the name of Maillard, son to an officer of the chatelet, who was fortunate enough to reach the paper, the contents of which were—"We have twenty thousand pounds weight of gunpowder, and will blow up the garrison and all its environs, if you do not accept the capitulation."—M. Elie, an officer of the queen's regiment, who was invested with a kind of spontaneous authority, was for agreeing to terms; but the people indignantly rejected the very word Capitulation, and immediately drew up three pieces of artillery to the spot.

It being now perceived by the garrison that the great bridge was going to be attacked, they let down the small draw-bridge, which was to the left of the entrance into the fortrefs. Messrs. Elie, Hulin, Maillard, Reole, Humbert, Tournay, and some others, leaped instantly on the bridge, and, securing the bolts, proceeded to the door. In the mean time the French guards, preserving their habitual coolness and discipline, formed a column on the other side of the bridge, to prevent the citizens from rushing upon it in too great numbers. An invalid came to open the gate behind the draw-bridge, and asked the invaders what they wanted? "The surrender of the Bastille," they cried; and he permitted them to enter. The conquerors immediately lowered the great bridge, and the multitude entered without resistance: the invalids were ranged to the right, and the Swifs on the left hand, and their arms piled against the wall. They took off their hats, clapped their hands, and cried out "Bravo!" as the besiegers entered. The first moments of this meeting passed in peace and reconciliation: but some soldiers on the platforms, ignorant of the surrender, unhappily fired upon the people; who, suspecting a second act of perfidy, fell upon the invalids, two of whom (the unfortunate Beguard, who had prevented the governor from blowing up the Bastille, and another equally innocent) were dragged to the *Place de Grève*, and hanged.

M. de Launay, when seized, was not in an uniform, but in a plain grey frock: he had a cane in his hand, and would have killed himself with the sword that it contained, but the grenadier Arné wrested it out of his hand. He was escorted by Messrs. Hulin, Arné, Legris, Elie,

Elie, and some others, and every effort was exerted by these patriots to save his life, but in vain:—they had scarcely arrived at the Hôtel de Ville before his defenders were overpowered, and even wounded by the enraged populace, and he fell under a thousand wounds. M. de Lofme Sahrai, his major, a gentleman distinguished for his virtue and his humanity, was also the victim of the popular fury. The marquis de Pelleport, who had been five years in the Bastille, and during that time had been treated by him with particular kindness, interposed to save him at the risk of his life, but was struck down by a hatchet, and M. de Lofme was instantly put to death. The heads of the governor and the major were struck off, and carried on pikes through the streets of the city.

The rage of the populace would not have ended here—the invalids who defended the fortresses would all have been sacrificed, had not the humanity of the French guards interposed, and insisted on their pardon. The keys of the Bastille were carried to M. Biffot de Warville, who had been a few years before an inhabitant of these caverns of despotism; and a guard of 3000 men was appointed over the fortresses till the council at the Hôtel de Ville should decree its demolition. In the intoxication of success, the prisoners were forgotten; and as the keys had been carried to Paris, the dungeons were forced open—seven prisoners only were found, three of whom had lost their reason, having been detained there as state prisoners from the reign of Louis XV.

M. de Launay's fate involved that of M. de Fleffelles, the prévôt des marchands. He had been long suspected of a design to betray the people; and all his manoeuvres evidently tended to that point. In the pocket of M. de Launay a letter from him was discovered, which contained these remarkable words—"I will amuse the Parisians with cockades and promise! Keep your station till the evening—you shall then have a reinforcement." At the sight of this letter the unfortunate de Fleffelles was struck dumb—a voice was heard in the hall—"Be gone, M. de F. you are a traitor."—"I see," said he, "gentlemen, that I am not agreeable to you—I shall retire."—He hastened down the stairs; but as he crossed the Grève, accompanied by a number of persons to defend him, a young man, who had waited an opportunity, shot him with a pistol. His head was cut off, placed on a pike, and carried through the streets along with that of the governor.

There were found, in the prison of the Bastille the most horrible engines for putting to the severest tortures those unhappy persons whom the cruelty or jealousy of despotism had determined to destroy. An iron cage, about twelve tons in weight, was found with the skeleton of a man in it, who had probably lingered out a great part of his days in that horrid manion. Among the prisoners released by its destruction were major White a Scotfman, earl Mazarine an Irish nobleman, and the count de Lorges. The former appeared to have his intellectual faculties almost totally destroyed by the long

confinement and miseries he had endured; and by being unaccustomed to converse with any human creature, he had forgotten the use of speech. Earl Mazarine, on his arrival upon the British shore, eagerly jumped out of the boat, fell down on his knees, and, killing the ground thrice, exclaimed, "God bless this land of liberty!" The count de Lorges, at a very advanced period of life, being also liberated, was exhibited to the public curiosity in the Palais Royal, or royal palace. His filthy appearance, his white beard which extended to his waist, and, above all, his extreme weakness, resulting probably from suffering an imprisonment of thirty-two years, were objects highly calculated to operate upon the senses and passions of every beholder. It is indeed impossible not to participate in the exultation which a capital and a country so highly illuminated, and so long oppressed, must have experienced, at the extinction of this detestable and justly dreaded prison of state. With the Bastille expired the despotism of the French princes, which long proscription, submission, and arbitrary strength, seemed to render equally sacred and unassailable; which neither the calamities of the close of Louis XIV's reign, nor the profligacy and enormities of the succeeding regency, nor the state of degradation into which the monarchy sunk under Louis XV. had ever shaken.

This wonderful day was succeeded by a tumultuous night; and the songs of joy and triumph, which had celebrated the victory of the people, were converted into confused murmurs expressive only of anxiety and alarm. A report was spread that the troops were about to enter the city at the Barriere d'Enfer: thither the citizens crowded under the conduct of the French guards, and preceded by a train of artillery—the body of troops, however, that appeared in that quarter were dispersed by a single volley. The alarm-bells were then sounded; barricadoes were formed at the barriers; deep holes were dug in different parts, to prevent the approach of the cavalry; the tops of the houses were manned; a general illumination was ordered; and the silence of the night was interrupted by the discharges of artillery, and by the warning voice of the patroles—"Citizens, do not go to bed; take care of your lights; on this night we must see clearly."

The court regarded the first news of the taking of the Bastille as an impoſture of the popular party: it was, however, at length incontrovertibly confirmed. The first resolves of the cabal are said to have been desperate, and orders were issued to the commanders to push the projected plot with all possible vigour. In the dead of the night, marshal Broglio is said to have arrived to inform them, that it was impossible to obey the mandate he had received of investing the hall of the national assembly with a train of artillery, as the soldiers would not comply with his orders. "Pres then the siege of Paris," was the answer. The general replied, for the execution of that project, he could not depend on the army.

The only person in the palace, who was kept totally ignorant of these transactions, was the king. The duke de Liancourt, a distinguished patriot, who was then master of the wardrobe, saved the state: he forced his way in the middle of the night into the king's apartment, informed him of every circumstance, and announced to the count d'Artois that a price was set upon his head. The intelligence of the duke was supported by the authority of Monsieur, who accompanied him, and the king was immediately convinced that he had been deceived by evil counsels. Early the next morning the monarch appeared in the assembly, but without the pomp and parade of despotism. His address was affectionate and consolatory. He lamented the disturbances at Paris; disavowed all consciousness of any meditated attack on the persons of the deputies; and added, that he had issued orders for the immediate removal of the troops from the vicinity of the metropolises."

It is impossible to express the feelings of the assembly on this affecting occasion.—The tear of sympathy started into almost every eye.—An expressive silence first pervaded the assembly, which presently was succeeded by a burst of applause and acclamation.

The city of Paris, which had, from the 12th of July, been an unhappy scene of commotion, of terror, and of bloodshed, began on the 15th to assume some appearance of order and tranquillity. The livid and bloody heads were still carried about the streets as trophies of popular resentment: but on the morning of that day, a sensible citizen persuaded the multitude to listen to the voice of humanity, and they were thrown into the Seine. The electors at the Hôtel de Ville laboured incessantly in the organization of the civil establishment, and in the regulation of the city militia. The odious name of Prévôt was abolished; the more ancient and honourable appellation of Mayor was substituted in its place; and to this office M. Bailly, who had been president of the tiers état, was called by the unanimous voice of his fellow-citizens. We must not omit to notice, that the duc d'Orleans, having been elected president of the national assembly, had declined the honour, and that the venerable archbishop of Vienne had been chosen in his room. During the laborious sessions which succeeded the disgrace of M. Neckar, however, it was thought that his age and infirmities would scarcely allow him to exercise so difficult an office without the assistance of a younger person, and the marquis de la Fayette was unanimously nominated vice-president.

During the night, the troops which had assembled on the Champ de Mars had decamped, leaving their tents and the greater part of their baggage behind them: but a spectacle still more interesting to the citizens soon presented itself:—this was a deputation of eighty-four of the most distinguished members of the national assembly, accompanied by an immense crowd, who covered the road from Versailles to the capital, and loaded

them with blessings, and the most unequivocal proofs of prodigal affection. The surprise and exultation of these patriots must have been extreme, when they beheld more than 100,000 citizens transformed into soldiers, all of them armed and already trained to military discipline. On their arrival at the Hôtel de Ville, the marquis de la Fayette, count Lally Tolendal, the marquis Clermont Tonnerre, the duc de Liancourt, and the archbishop of Paris, addressed the people.—From this place they adjourned to the church of Notre Dame, where *Te Deum* was sung in celebration of the happy and cheerful return of peace accompanied with liberty. As they returned from the church, the acclamations of the populace were occasionally interrupted by the expression of two further demands, the wish of seeing their beloved sovereign in Paris, and the recall of the patriotic ministry. The deputies returned to Versailles in the evening.

To circumstances of such importance as those above related, it must be imputed that the public tranquillity, when interrupted, was not easily restored. The ministry, which had shewn themselves so inimical to the cause of the people, were not yet dismissed, nor had the troops yet evacuated the environs of Paris: two fresh regiments had arrived at St. Denis; a strange and unsuccessful attack had even been made on the Bastille, by a serjeant and two companies of guards; and a convoy of flour had been intercepted by the orders of a person well known. The night of the 15th, therefore, was spent with the same anxiety, and with the same warlike preparations, as the preceding; and in the morning a fresh deputation was sent to the assembly, entreating them to interest themselves in procuring the dismissal of the ministry and the recall of M. Neckar.

The assembly were on the point of voting a spirited address to the king, which had been proposed by Mirabeau, when they were informed that the ministers themselves had anticipated the wish of the assembly, by giving in their resignations. The same evening, a letter from his majesty to M. Neckar, inviting him to return, was read by the president. It was received with the loudest acclamations, and was seconded by an address from the assembly themselves to that upright minister, couched in the strongest terms of affection and respect. The king having at the same time intimated his intention of visiting Paris the following day, the assembly immediately decreed a deputation to convey this exhilarating intelligence, and to calm the disquietude that prevailed in the metropolis.

Those who really loved him were apprehensive for his safety; while others, who had been guilty of malversation were apprehensive for themselves. Rumours of projected assassinations were spread, and the least consequence that could ensue was supposed to be the detention of the sovereign in Paris. The king, however, with a degree of courage and patriotism which does honour to his character, remained immovable in his determination.

The

On the morning of the 17th he left Versailles, in a plain dress, and with no other equipage than two carriages with eight horses each; in the first of which he rode himself—a part of the national assembly, in their robes, accompanied him on foot: and the militia of Versailles composed his only guard till the procession arrived at the Seine, where they were relieved by the Paris militia, with the marquis de la Fayette at their head: and from this place the suite of the monarch amounted to about 20,000 men. The horse-guards led the procession; and these were followed by the city cavalry; some battalions of the French guards and other soldiers, who had fought in defence of the nation, succeeded; then the different companies and corporations; and M. de la Fayette, with a large body of militia, brought up the rear.

A quarter of an hour before the arrival of the king, whether from accident, or from some plot concerted by the enemies of liberty, a woman was shot by a musket-ball, from the opposite side of the river. The king looked pale and melancholy, and an expression of anxiety was even apparent in the faces of the national assembly. The progress was remarkably slow; and no shout was heard but “Vive la nation!”

At the Barriere des Conferences, the king was met by M. Bailly, who acted as mayor, with the other magistrates. On presenting the keys of the city, M. Bailly addressed his majesty in a short but elegant speech, the exordium of which was:—“These, Sir, are the keys which were presented to Henry IV. He came to reconquer his people; it is our happiness to have reconquered our king.” At the Pont Neuf the passage was lined by a numerous train of artillery; but in the true spirit of French gallantry, the mouths and touch-holes of the cannon were adorned with bouquets of flowers.

On their arrival at the Hôtel de Ville, the king solemnly confirmed the election of M. Bailly and the marquis de la Fayette; and on receiving the complimentary addresses of the mayor, the president of electors, count Lally Tolendal, &c. he exclaimed with an air of pathetic emotion, which scarcely allowed him utterance—“My people may always rely upon my affection.” He received from the hands of the mayor the national cockade; and when he shewed himself at the window with this badge of patriotism the joy of the people could be no longer restrained; the shout of *Vive le roi!* which had scarcely been heard in the former part of the day, filled the whole atmosphere, and resounded from one extremity of the city to the other. The return of the king to Versailles was a real triumph. The citizens, almost intoxicated with joy, surrounded his carriage; his countenance, which in the morning bore the aspect of melancholy, was now cheerful and smiling; and he appeared sincerely to partake in the general satisfaction of the people.

The dispersion of the ministry was the natural result of the royal visit to Paris. Marthal Broglio retired to Luxembourg; madame Polignac, in the habit of a

waiting-woman, took the route of Brussels; even the count d'Artois, with his family, withdrew during the stillness of the night, and was followed by the princes of Condé and Conti, the duke de Luxembourg, and others of the nobility. But of all who were connected with the court, none was more odious than M. Foulon, who had long been obnoxious to the people, for his unfeeling tyranny and his insatiable avarice. This unfortunate person had risen from a very low situation in life to the possession of immense riches.

In the war of 1755, he had been commissary to the army, and by his rapacity and extortions is said to have irretrievably dishonoured the French name in the provinces of Germany. He is said to have made a common boast of his depraved principles.—His favourite maxim was, that “that country would be best governed, where the common people should be compelled to feed upon grass;” and he had boasted, “that if ever it should be his good fortune to be minister, he would make the people of France live upon hay.” On the first news of the riots in Paris he had withdrawn himself from the public eye, and had caused a report of his death to be industriously circulated, and his funeral had even been performed in a manner suitable to his immense riches. In the mean time he had secretly retired to Very, an estate belonging to M. de Sartines, where he was in hopes of remaining concealed: but his character commanded no man's affection, and the general unfeelingness of his heart left him without a friend. His own vassals were the first to pursue and detect him; and on the 22d of July he was brought to Paris with a bundle of hay at his back, in allusion to the language which he is said to have employed in expressing his contempt for the people.

The committee at the Hôtel de Ville determined to send M. Foulon to the prison of the abbey St. Germain, where he might be detained till the return of tranquillity should afford him an impartial trial: but the immense crowd, which was assembled in the Place de Grève, resisted this determination. It was with difficulty M. Bailly could make himself heard, when he urged with all the eloquence of humanity the flagrant injustice of condemning a citizen to death without hearing him in his own defence.—The marquis de la Fayette took still more popular ground, by urging the detention of the criminal, in the hope of obtaining from him a discovery of his accomplices. To this demand the populace appeared to assent by their tokens of applause: but the unhappy Foulon, whether in testimony of his innocence, or by a mechanical movement, clapped his hands at the same time in approbation. A general exclamation was immediately raised:—“They are conniving at his guilt; they intend to save him.” He was not long after seized, and dragged under the fatal lamp-iron, which during the revolution the populace had employed as the instrument of their vengeance. Every circumstance of horror attended his execution: the rope, by which he was suspended,

broke

broke twice; and he was detained for a quarter of an hour in a half expiring state, before a new one could be procured. His head was cut off and placed upon a pike, with the mouth stuffed with hay, and was carried through the streets of Paris. He was seventy-four years of age when he was thus made the victim of popular fury.

The intendant of police, M. Berthier, who had married the daughter of M. Foulon, was implicated in the fate of his father-in-law, and was perhaps odious to the people from the exercise of his arbitrary and oppressive employment. He had been seized at Compeigne; and one of the electors, with 400 horse, had been dispatched to conduct him to Paris, where, on his arrival, he also was accused of speculation and extortion, of being the principal agent in regulating the movements of the camp at St. Denis, and of the still more unpopular crime of speculating in grain, and contributing to the general scarcity. Unhappily for him, he arrived in Paris the very evening in which the populace had imbrued their hands in the blood of his relation; his death was therefore inevitable. If however he did not suffer innocently, he sustained his unhappy fate with courage and dignity. During the greater part of the way he conversed tranquilly with M. Riviere, the elector who accompanied him. When he entered the city, however, the bloody head of his father-in-law was presented to him, and at this dreadful sight he is said to have turned pale, and to have lost his fortitude.

When interrogated at the Hôtel de Ville as to his conduct, he answered calmly: "That he had obeyed the orders of his superiors, and that the inspection of his papers would instruct them as to the extent of his guilt." It was determined to send him immediately to the abbey; but it was impossible to penetrate the concourse of people that surrounded the hôtel. It was in vain that M. Bailly opposed his utmost eloquence to the fury of the multitude; in vain the commander in chief prostrated himself on his knees to entreat that the popular cause should no more be defiled with blood. Numerous as his escort was, they were soon dispersed, and he was dragged to the fatal lamp-iron, where a new cord was already prepared for him.

Here despair inspired him with new courage; and snatching a bayonet out of the hands of one of the guards, he attempted to defend himself, if not from death, at least from ignominy.—He fell pierced with innumerable wounds.—A monster of inhumanity, a dragoon, plunged his hand into his reeking entrails, and tearing out his heart, and fixing it on the point of his cutlafs, carried it as a trophy through the streets. The head was also cut off, and carried about along with that of M. Foulon. It is said that the dragoon, who in this brutal manner tore out the heart of M. Berthier, did it in revenge for the death of a father: be this as it may, his comrades were so completely disgusted with the barbarity of the action, that they

determined to fight him successively till by his death they had removed the dishonour which it fixed upon their corps. He fought the same evening, and was killed.

The bodies of the marquis de Launay and of the major of the Bastille lay exposed in the Place de Grève for a number of hours, and neither their watches or any one of their valuables were even touched by the mob; and when M. Foulon was massacred, his pockets were full of money and bank-notes, which were taken carefully out by some of the mob, and deposited before the committee on the table of the Hôtel de Ville.

Every good citizen was filled with disgust and apprehension—they trembled lest they should have only exchanged one tyranny for another, and condemned in the strongest terms these gusts of inhumanity, these bloody proscriptions, these outrages against public justice. The marquis de la Fayette in particular was so much exasperated by this contempt of all authority, that he determined at once to resign his office of commander in chief: happily for France, the eloquence of M. Bailly had sufficient influence to prevail with him to resume the command.

An incident which occurred at Versailles contributed to excite a most unhappy commotion. On the first of October an entertainment (the first that was ever given in public at Versailles by that body) was given by the gardes-du-corps, or king's body guard, to the officers of the regiment of Flanders; and to augment the unpopularity of the circumstance, it was given in the royal saloon. Several of the officers of the national guard, with others of the military, were invited. At the second course, four toasts were given: "The king, the queen, the dauphin, and the royal family." "The nation" was proposed, but, according to a number of witnesses, expressly rejected by the gardes-du-corps. The king was just returned from hunting; and the queen, having been informed of the gaiety of the scene, persuaded his majesty to accompany her with the heir apparent to the saloon, which was now filled with soldiers—the grenadiers of Flanders and the Swiss chaf-seurs having been admitted to the dessert. The queen appeared with the dauphin in her arms, affectionate as she was lovely, and carried the royal infant through the saloon, amidst the exclamations and murmurs of the spectators. Fired with enthusiasm, the soldiers drank the health of the king, the queen, and the dauphin, with their swords drawn; and the royal guests bowed respectfully and retired.

It was not long before the entertainment, which had hitherto been conducted with some degree of order, became a scene of entire confusion. Nothing was omitted to inflame the passions of the military. The music played the favourite air—"O Richard, O my king! the world abandons thee;" the ladies of the court distributed white cockades, the anti-patriot ensign; and even some of the national guard, it is said, had the weakness to accept them.

The

The city of Paris, during these transactions, was afflicted with all the evils of famine. Either no bread was to be obtained, or bread of so bad a quality, that the populace, always mistrustful and suspicious, were not without their alarms of a criminal design upon the lives, or at least the health, of the inhabitants. Such was the state of things when the news arrived of the fatal banquet at Versailles. The circumstances which we have related were strangely magnified; and all the suspicions which were entertained respecting the design of dissolving the assembly, and carrying off the sovereign, were added in exaggeration.

Early on the morning of the memorable fifth of October, a woman sallied out from the quarter of St. Eustacia, and entering the corps-de-garde, and seizing a drum, paraded the adjacent streets beating an alarm, and exciting the people by clamours respecting the scarcity of bread. She was soon joined by a very numerous mob, chiefly of women, to the amount of 800, who proceeded to Versailles, where the king, upon hearing their complaints, signed an order for bringing corn from Senlis, and de Lagny, and for removing every obstacle which impeded the supply of Paris. This order being reported to the women, they retired with joy and gratitude.

No sooner was this band of Amazons dispersed, than it was succeeded by another. The national assembly continued sitting; but the session was tumultuous, and interrupted by the shouts and harangues of the Parisian fish-women, who filled the galleries; their address was mingled with affecting murmurs and complaints, the multitude crying out that they were actually starving, and that the majority of them had eaten nothing for upwards of twenty-four hours. The president, therefore, humanely ordered that provisions should be sought for in every part of the town, and the hall of the assembly was the scene of a miserable, scanty, and tumultuous banquet. Indeed such was the dreadful famine, that the horse of one of the gardes-du-corps, being killed in a tumult, he was immediately roasted by the mob, and greedily devoured.

The wretched multitudes who had travelled from Paris were exposed, almost famished, to the inclemencies of the weather in the open streets; within the castle all was trepidation; nothing was to be heard from without but imprecations, and the voice of enraged multitudes demanding the life of the queen and the gardes-du-corps. Towards midnight, however, all appeared tolerably still, and peaceable, when the beating of the drums, and the light of innumerable torches, announced the approach of the Parisian army.

At about half past five, the day began to break; and at this period crowds of women and other desperate persons, breathing vengeance and thirsting for blood, advanced to the castle, which, in the fatal security which the arrival of the Parisian militia inspired, was left unguarded in several places. Some of the iron gates were shut, and some left open. An immense

crowd found its way into the "cour des ministres," and immediately proceeded to the royal gate, which was shut, and a number of the invaders attempted to scale it. Another troop of ruffians proceeded to the chapel court, and another to that of the princes, and by both these avenues penetrated into the royal court. Some hasty dispositions of defence were made by a M. Aguesseau; the gardes-du-corps were soon under arms, and one man was wounded by them in the arm, and another shot dead. The crowd immediately mounted the grand stair-case, where one of the gardes-du-corps, M. Miomandre, endeavoured to dissuade them from their attempt; but he narrowly escaped with his life. M. Tardivet de Repaire hastened to the queen's apartment, in order to prevent the entrance of the banditti; but he was assailed by thousands, and stretched upon the ground. A villain with a pike attempted to pierce him to the heart; but he had the good fortune to wrest the weapon from his hand, with which he parried the attacks of his enemies, and at length effected his escape. M. Miomandre in the mean time made his way to the queen's apartment. He opened the door, and cried out to a lady whom he saw in the inner chamber—"Save the queen, madam, her life is in danger—I am here alone against two thousand tigers." He shut the door; and after a few minutes resistance was desperately wounded with a pike, and left for dead—though he afterwards recovered.

A quarter of an hour previous to this, the queen had been awaked by the clamours of the women who assembled upon the terrace; but her waiting woman had satisfied her by saying, "that they were only the women of Paris, who she supposed, not being able to find a lodging, were walking about." But the tumult approaching, and becoming apparently more serious, she rose, dressed herself in haste, and ran to the king's apartment by a private passage. In her way she heard the noise of a pistol and a musket, which redoubled her terror. "My friends," said she to every person she met, "save me and my children." In the king's chamber she found the dauphin, who had been brought there by one of her women; but the king was gone. Awaked by the tumult, he had seen from a window the multitude pressing towards the great stair-case; and alarmed for the queen, he halted to her apartment, and entered at one door in the moment she had quitted it by the other. He returned without loss of time; and having with the queen brought the prince's royal into the chamber, they prepared to face the multitude. In the mean time the noise and tumult increased, and appeared at the very door of the chamber.

Nothing was now to be heard but the most dreadful exclamations, with violent and repeated blows against the outer door, a pannel of which was broken. Nothing but instant death was expected by the royal company. Suddenly, however, the tumult seemed to cease—every thing was quiet; and a moment after a gentle

rap was heard at the door. The door was opened, and in an instant the apartments were filled with the Parisian guard. The officer who conducted them, ordered them to ground their arms. "We come," said he, "to save the king;" and turning to such of the gardes-du-corps as were in the apartments, "We will save you also, gentlemen; let us from this moment be united."

The national guard unfortunately arrived too late to prevent all the mischief. Two of the gardes-du-corps were murdered by the mob before the troops could be rallied, and their heads fixed on spikes served as the standards of this detestable banditti. From the first moment of the alarm the marquis de la Fayette had even exceeded his usual activity. He appeared in every quarter:—"Gentlemen," said he to the Parisian soldiers, "I have pledged my word and honour to the king, that nothing belonging to him shall receive injury. If I break my word, I shall be no longer worthy to be your commander." Captain Gondran, the officer who had driven the russians from the king's apartment, was not less conspicuous for his activity. The Parisians forced their way in every part through the almost impenetrable mafs—surrounded the gardes-du-corps, and placed them in safety under their own colours.

The banditti, whose great object is plunder, had already began to strip the palace, and to throw the furniture to each other out of the windows. M. Gondran pursued them from place to place, till the castle was at length completely cleared. Expelled from the palace, they repaired to the stables; but here a sudden stop was put to their depredations by M. Doazon, a farmer-general, and captain of the Paris militia. The horses were all recovered, and brought back in safety to their stalls. Disappointed at length in every view, they departed in a body to Paris; and left Versailles entirely free, and under the protection of the national guard. The most generous expressions of kindness and gratitude took place between the gardes-du-corps and the national guard. The former considered the others as their deliverers; while the latter evinced every inclination that they should in future form one united corps.

At length the royal family now ventured to shew themselves at a balcony, and received the most lively acclamations of respect from the soldiers and the people. But whether it had been planned by the popular party, or whether it was the immediate impulse of the multitude—but the former is most probable—at the first a single voice, or a few voices, exclaimed—"The king to Paris;" and this was instantly followed by an universal acclamation enforcing the same demand. After some consultation with the marquis de la Fayette, the king addressed them: "You wish me to go to Paris—I will go, on the condition that I am to be accompanied by my wife and children." He was answered by reiterated acclamations of *Vive le roi!*

The national assembly was convened before the king's departure; and, on the motion of M. Mirabeau, passed

No. 45.

a solemn decree, "that the assembly was inseparable from the person of the king." A deputation of one hundred members was also appointed to accompany the king to Paris. During the preparations for the journey, the gardes-du-corps changed hats and swords with the grenadiers and national guards, and both they and the regiment of Flanders desired leave to mix indiscriminately in the ranks. It was two o'clock in the afternoon before the procession set out. During the progress all was gaiety and joy among the soldiers and the spectators; and such was the respect in which the French nation still held the name and person of their king, that the multitude were superstitiously persuaded that the royal presence would actually put an end to the famine. On his arrival, the king was congratulated by the municipality, and declared his approbation of the loyalty which the city of Paris manifested.

As the spirit of the nation was so entirely averse to the principles of the high aristocratic party, numbers of them, particularly the king's two brothers, and some of the first rank and fortune, took refuge in foreign countries, where they applied themselves indefatigably to the purpose of exciting war against France.

The preparations for the general confederation proceeded, in the mean time, with considerable rapidity. The Champ de Mars, so famous for having been the rendezvous of the troops which in the preceding year were intended to overawe the capital, was chosen for this solemnity. This piece of ground, which is about 400 toises, or 800 yards in diameter, is bounded on the right and left by lofty trees, and commands at the further extremity a view of the military academy. In the middle of this vast plain an altar was erected for the purpose of administering the civic oath; and round it an immense amphitheatre was thrown up, of a league in circumference, and capable of containing four hundred thousand spectators. The entrance into the Champ de Confédération (as it was now called) was through triumphal arches. The king's throne was placed under an elegant pavilion in the middle, and on each side of it were seats for the members of the national assembly. Two thousand workmen were employed upon this immense labour; but the citizens of Paris, fearing lest the preparations should not be completed at the appointed period, flocked from every quarter to assist in the patriotic undertaking. Not only the military, but the clergy, and even the ladies lent their cheerful assistance. With astonishment strangers beheld the most delicate and elegant of the female sex dragging the wheel-barrow, or handling with willing but sometimes ineffective endeavours the weighty mallet or the spade. We further learn, that on the Friday before the 14th, his majesty went to view the works at the Campus Martius, and, like the emperor of China, lent a hand, not indeed to the plough, but to the shovel; he filled a wheelbarrow, and would have wheeled away the load, had not one of his attendants taken the burden

10 Q

off

off his hands.—One of the spectators remarked, The king was digging his own grave—at least, that of his late royal honours. The provincials, who came from the remotest parts of the kingdom to join in the confederation, emulated the citizens in the ardour and enthusiasm; and the work was completed, so as both with respect to time and manner to surprise every spectator.

At length the important 14th of July 1790 arrived. The national guards of the departments, distinguished by their respective standards, the battalions of infantry, and the different troops of cavalry, the marine of France, and the foreigners who served under its banners, being all arranged in military order, the king and the national assembly took a solemn oath to maintain the constitution; the armed citizens repeated it amongst the applauses of innumerable spectators. They swore to live free, or die; and this oath was taken on the same day through the whole extent of the kingdom.

On the 20th of June 1791, France was menaced with the convulsions of anarchy, and the horrors of civil war, by the escape of the king and queen, with their infant children, and Monsieur and Madame. To favour their escape, the royal family had obtained a passport through the medium of the Russian ambassador, in the name of a baroness de Kortz, with her suite, as travelling to Frankfort.

They travelled in the most private manner till they found themselves at a considerable distance from the capital, when they were furnished by Bouillé with detachments of dragoons, under the pretence of guarding some treasure for the pay of the soldiers. They proceeded without interruption for 156 miles, and were but a few leagues from the frontiers when they were arrested. At St. Menchoud, the post-master, a M. Drouet, who had formerly been a dragoon in the regiment of Condé.—He immediately recognised the queen, and was forcibly attracted by the resemblance of the king to his portrait on the assignat of fifty livres. He was confirmed in his suspicions, on seeing the detachment of dragoons relieved by a detachment of hussars, and determined to stop them; but, being alone, was prudent enough not to expose himself to the opposition of the soldiers. He suffered the carriage to pass, but mounted a swift horse, and took a cross-road to Varennes, which was their next stage. He communicated his suspicions to the post-master there, who had also formerly been a dragoon; and they concluded that the only mode of effecting their purpose was, to barricade the street and bridge over which the carriages must necessarily pass. Fortunately, on the bridge there stood at the moment a carriage loaded with furniture; they overset it, and called together the mayor, the procureur de la commune, and the commandant of the national guard, and in a few minutes the number of the patriots was increased to eight men.

The commandant and the procureur approached the principal carriage, and asked the names of the travellers. The queen petulantly answered, they were in haste, and produced the passport, which was thought a sufficient warrant by several persons; but the post-masters combated the opinion, on the ground of its not being countersigned by the president of the national assembly; and asked why a Russian baroness should be escorted by the military of France? It was determined therefore to stop the travellers; and as they entered the house of the procureurs, the king throwing off his disguise resumed his dignity.—“I am your king, it is true,” said he: “these are my wife and children. I charge you to treat us with that respect which the French nation have always manifested towards their sovereign.”

The national guard had now arrived in considerable numbers, and at the same moment the hussars, who endeavoured sword in hand to force the house where the king was; but were answered by the national guard, that they should never carry him off alive. The commandant of the national guard had placed at each end of the street two field-pieces, which however were not charged; but they were sufficient to intimidate the hussars, who, upon the commandant ordering the artillery-men to their posts with their matches in their hands, relinquished their object, and quietly surrendered the king to the custody of the national guard.

The assembly received the news of these transactions with inexpressible satisfaction. The perjured Bouillé was suspended from his functions; and orders were given for arresting him, and all who appeared to be concerned in the flight of the king; but Bouillé evaded for the present the axe of justice, by flying the kingdom. The assembly next appointed two commissioners to examine the inferior agents of the king's flight; and three commissioners, Messrs. Tronchet, d'André, and Dupont, were appointed to receive the declaration of the king and queen.

A considerable body of the national guard escorted the royal family to Paris; and their numbers were increased as they approached the metropolis. Messrs. Barnave, Pethion, and Latour-Maubourg had been dispatched to Varennes for the purpose of accompanying them back to Paris; and public tranquillity was so well preserved, that they entered the Thuilleries on the 25th without any disturbance, and with no apparent inconvenience but the fatigue of the journey. Monsieur and Madame, who had taken a different road, were more successful in effecting their escape, and arrived safe at Brussels on the 29d.

On the 3d of September 1791, the new constitution was established by the assembly; and though in some measure this of 1791 has been superseded by the subsequent acts of the French nation; yet as we presume the following review of it may be acceptable to our political readers, we therefore insert it here at large.

The

The French Constitution, as finally settled by the National Constituent Assembly, and presented to the King the 3d of Sept. 1791.

DECLARATION OF THE RIGHTS OF MAN, AND OF THE CITIZENS.

" THE representatives of the French people, formed into a national assembly, considering that ignorance, forgetfulness, or contempt of the rights of men, are the sole causes of public grievances, and of the corruption of government, have resolved to exhibit, in a solemn declaration, the natural, unalienable, and sacred rights of man, in order that this declaration, ever present to all the members of the social body, may incessantly remind them of their rights and of their duties; to the end that the acts of the legislative power, and those of the executive power, being able to be every moment compared with the end of all political institutions, may acquire the more respect; in order also that the remonstrances of the citizens, founded henceforward on simple and incontestable principles, may ever tend to maintain the constitution, and to promote the general good.

" For this reason, the national assembly recognizes, and declares in the presence, and under the auspices of the Supreme Being, the following rights of men and of citizens:

ARTICLE 1. " All men are born, and remain, free and equal in rights: social distinctions cannot be founded but on common utility.

2. " The end of all political associations is the preservation of the natural and imprescriptible rights of man: these rights are liberty, property, security, and resistance against oppression.

3. " The principle of sovereignty resides essentially in the nation: no body of men, no individual, can exercise an authority that does not emanate expressly from that source.

4. " Liberty consists in the power of doing every thing except that which is hurtful to another: hence, the exercise of the natural rights of every man, has no other bounds than those that are necessary to ensure to other members of society the enjoyment of the same rights: those bounds to be determined by the law only.

5. " The law has a right to forbid those actions alone, that are hurtful to society. Whatever is not forbidden by the law, cannot be hindered; and no person can be constrained to do that which the law ordaineth not.

6. " The law is the expression of the general will: all the citizens have a right to concur personally, or by their representatives, in the formation of the law: it ought to be the same for all, whether it protects, or whether it punishes. All citizens being equal in the eye of the law, are equally admissible to public honour, places, and offices, according to their capacity, and without any other distinction but that of their virtue, or their talents.

7. " No man can be accused, arrested, or detained, except in cases determined by the law, and according to the forms which the law hath prescribed. Those who solicit, dispatch, execute, or cause to be executed, arbitrary orders, ought to be punished; but every citizen that is summoned, or seized, in virtue of the law, ought to obey instantly—he becomes culpable by resistance.

8. " The law ought to establish such punishments only as are strictly and evidently necessary; and no person can be punished, but in virtue of a law established and promulgated prior to the offence, and legally applied.

9. " Every man being presumed innocent till such time as he has been declared guilty, if it shall be deemed absolutely necessary to arrest a man, every kind of rigour employed, not necessary to secure his person, ought to be severely punished by the law.

10. " No person shall be molested for his opinions, even such as are religious, provided that the manifestation of those opinions does not disturb the public order established by the law.

11. " The free communication of thought, and of opinion, is one of the most precious rights of man. Every citizen, therefore, may freely speak, write, and publish his sentiments; subject, however, to answer, for the abuse of that liberty, in cases determined by the law.

12. " The guarantee of the rights of men and citizens involves a necessity of public force. This force is then instituted for the advantage of all, and not for the particular utility of those to whom it is confided.

13. " For the maintenance of the public force, and for the expences of administration, a common contribution is indispensably necessary: this contribution should be equally divided amongst all the citizens, in proportion to their abilities.

14. " Every citizen has a right, by himself, or by his representatives, to decide concerning the necessity of the public contribution; to consent to it freely; to look after the employment of it; to determine the quantity, the distribution, the collection and duration.

15. " Society has a right to demand from every public agent, an account of his administration.

16. " That society in which the guarantee of rights is not assured, nor the separation of powers determined, has no constitution.

17. " Property being a right inviolable and sacred, no person can be deprived of it, except when the public necessity, legally ascertained, shall evidently require it, and on condition of a just previous indemnification.—The national assembly, desirous of establishing the French constitution on the principles which it has just now recognized and declared, abolishes, irrevocably, those institutions which are injurious to liberty, and equality of rights.—There is no longer any nobility, nor peerage, nor hereditary distinctions, nor difference of orders, nor feudal government, nor patrimonial jurisdiction, nor any of the titles, denominations, and prerogatives

privileges which are derived from them; nor any of the orders of chivalry, corporations, or decorations, for which proofs of nobility were required; nor any kind of superiority, but that of public functionaries in the exercise of their functions.—No public office is henceforth hereditary or purchasable.—No part of the nation, nor any individual, can henceforth possess any privilege or exception from the common rights of all Frenchmen.

“There are no more wardenships or corporations, in professions, arts, or trades.—The law recognises no longer any religious vows, nor any other engagement which would be contrary to natural rights, or to the constitution.”

FUNDAMENTAL PRINCIPLES GUARANTEED BY THE CONSTITUTION.

“THE constitution guarantees, as natural and civil rights:

1. “That all the citizens are admissible to places and employments, without any other distinction than that of virtue and talents.

2. “That all taxes shall be equally divided among all the citizens, in proportion to their abilities.

3. “That the same crimes shall be subject to the same punishments, without any distinction of persons.

“The constitution in like manner guarantees, as natural and civil rights, liberty to every man to go, stay, or depart, without being arrested, or detained, except according to the forms determined by the constitution.—Liberty to every man to speak, write, print, and publish his thoughts, without the writings being subjected to censure or inspection before their publication, and to exercise the religious worship to which he is attached.—Liberty to the citizens to assemble peaceably, and without arms, in complying with the laws of police.—Liberty to address to the constituted authorities, petitions signed by individuals.

“The legislative power can make no law which would attack, or impede the exercise of the natural and civil rights expressed in the present title, and guaranteed by the constitution; but as liberty consists only in the power of doing whatever neither injures the rights of another, nor the public safety, the law may establish penalties against acts, which, attacking either the rights of others, or the public safety, would be injurious to society.

“The constitution guarantees the inviolability of property, or a just and previous indemnity for that, of which public necessity, legally proved, shall require the sacrifice.

“Property, destined to the expence of worship, and to all services of public utility, belongs to the nation, and shall at all times be at its disposal.

“The constitution guarantees all the alienations which have been, or which shall be made according to the forms established by the law.

3

“The citizens have a right to elect or choose the ministers of their religions.

“A general establishment of public succour shall be created and organized for the education of deserted children, to relieve the infirm poor, and to procure work for the healthy poor, who have not been able to find it for themselves.

“A public instruction, common to all citizens, shall be created and organized, gratuitous with regard to those parts of tuition indispensable for all men, and of which the establishments shall be gradually distributed, in a proportion combined with the division of the kingdom.

“There shall be established national festivals, to preserve the remembrance of the French revolution, to keep up fraternal affection amongst the citizens, and attachment to the constitution, the country, and the laws.

“There shall be drawn up a code of civil laws, common to all the kingdom.”

OF THE DIVISION OF THE KINGDOM, AND THE STATE OF CITIZENS.

ART. 1. “THE kingdom is one and indivisible; its territory is divided into eighty-three departments; every department into districts; each district into cantons.

2. “Those are French Citizens, who are born in France, of a French father; who, having been born in France, of a foreign father, have fixed their residence in the kingdom; who, having been born in a foreign country, of a French father, have returned to settle in France, and have taken the civic oath. In fine, who having been born in a foreign country, being descended, in whatever degree, from a Frenchman or Frenchwoman who had left their country from religious motives, come to reside in France, and take the civic oath.

3. “Those who having been born out of the kingdom, of foreign parents, but reside in France, become French citizens, after five years of continued residence in the kingdom; if, besides, they have acquired immovable property, or married a Frenchwoman, or formed an establishment of agriculture or commerce, and if they have taken a civic oath.

4. “The legislative power may, from important considerations, naturalize a foreigner, upon no other condition than that of residing in France, and taking the civic oath.

5. “The civic oath is, *I swear to be faithful to the Nation, the Law, and the King; and to maintain, with all my power, the constitution of the kingdom, decreed by the National Constituent Assembly, in the years 1789, 1790, and 1791.*

6. “The quality of a French citizen is lost: 1st, By naturalization in a foreign country; 2d, By being condemned to penalties which involve the civic degradation, provided the person condemned be not re-in-

stated; 3d, By a sentence of contumacy, provided the sentence be not annulled; 4th, By an association with any foreign order of chivalry, or any foreign body, which shall suppose either proofs of nobility, or distinction of birth, or require religious vows.

7. "The law regards 'marriage' solely as a 'civil contract.' The legislative power shall establish for all the inhabitants, without distinction, the mode by which births, marriages, and deaths, shall be ascertained, and shall appoint the public officers, who shall receive and preserve the certificates of them.

8. "French citizens, considered with respect to those local relations which arise out of their association in cities, and in certain divisions of territory in the country, form the communities.—The legislative power may fix the extent and boundary of each community.

9. "The citizens who compose each community, have a right of choosing, for a time, according to the forms prescribed by the law, those among them, who, under the name of municipal officers, are charged with the management of the particular affairs of the community.—To the municipal officers may be delegated certain functions relative to the general interest of the state.

10. "The rules which the municipal officers shall be bound to follow in the exercise, both of the municipal functions, and of those which shall be delegated to them for the general interest, shall be fixed by the laws."

OF THE PUBLIC POWERS.

ART. 1. "The sovereignty is one, indivisible, inalienable, and belongs to the nation; no section of the people, nor any individual, can arrogate the exercise of it.

2. "The nation, from which alone flow all the powers, cannot exercise them, but by delegation. The French constitution is representative; the representatives are the legislative body and the king.

3. "The legislative power is delegated to a national assembly, composed of temporary representatives, freely chosen by the people, to be exercised by this assembly, with the sanction of the king, in manner afterwards determined.

4. "The government is monarchical; the executive power is delegated to the king, to be exercised under his authority, by ministers and other responsible agents, in manner afterwards determined.

5. "The judicial power is delegated to judges chosen for a time limited by the people."

OF THE NATIONAL LEGISLATIVE ASSEMBLY.

ART. 1. "The national assembly, forming the legislative body, is permanent, and consists of one chamber only.

2. "It shall be formed by new elections every two years. Each period of two years shall form one legislature.

No. 45.

3. "The dispositions of the preceding articles shall not take place with respect to the ensuing legislative body, whose powers shall cease the last day of April 1793.

4. "The renewal of the legislative body shall be matter of full right.

5. "The legislative body cannot be dissolved by the king."

NUMBER OF REPRESENTATIVES—BASES OF REPRESENTATION.

ART. 1. "The number of representatives to the legislative body is seven hundred and forty-five, on account of the eighty-three departments of which the kingdom is composed, and independent of those that may be granted to the colonies.

2. "The representatives shall be distributed among the eighty-three departments, according to the proportions of territory, of population, and of direct contribution.

3. "Of the 745 representatives, 247 are attached to the territory.—Of these, each department shall nominate three, except the department of Paris, which shall only nominate one.

4. "Two hundred and forty-nine representatives are attributed to the population.—The total mass of the active population of the kingdom is divided into 249 parts, and each department nominates as many of the deputies as it contains parts of the population.

5. "Two hundred and forty-nine representatives are attached to the direct contribution.—The sum total of the direct contribution of the kingdom is likewise divided into 249 parts; and each department nominates as many deputies as it pays parts of the contribution."

PRIMARY ASSEMBLIES—NOMINATION OF ELECTORS.

ART. 1. "In order to form a national legislative assembly, the active citizens shall convene every two years, in primary assemblies, in the towns and cantons. The primary assemblies shall form themselves, of full right, the second Sunday of March, if they have not been convoked sooner by the public officers established by law.

2. "To be an active citizen, it is necessary, first, To be born, or to have become a Frenchman; secondly, To be twenty-five years of age complete; to have resided in the city or canton during the time determined by the law; to pay, in any part of the kingdom, a direct contribution, at least equal to the value of three day's labour, and to produce the acquittance; not to be in a mental capacity, namely, that of a servant receiving wages; to be inscribed in the municipality of the place of his residence, in the list of the national guards;—to have taken the civic oath.

3. "Every six years the legislative body shall fix the minimum and the maximum of the value of a day's labour,

labour, and the administrators of the departments shall determine the rate for every district.

4. "None shall exercise the right of an active citizen in more than one place, nor employ another as his substitute.

5. "Those shall be excluded from the rights of an active citizen, who are in a state of accusation; who, after having been constituted in a state of failure, or insolvency, proved by authentic documents, shall not produce a general discharge from their creditors.

6. "The primary assemblies shall name electors in proportion to the number of active citizens residing in the town or canton.—There shall be named one elector for a hundred active citizens present, or not, in the assembly.—There shall be named two for 131 to 250; and so on in this proportion.

7. "No man can be named elector, if, along with the conditions necessary in order to be an active citizen, he does not join the following: First, In towns of more than 6000 inhabitants, that of being proprietor or life-renter of a property valued on the rolls of contribution, at a revenue equal to the local value of 200 days' labour; or of renting a house, valued on the same rolls, at a revenue equal to the value of 150 days' labour. Secondly, In towns below 6000 inhabitants, that of being proprietor, or life-renter of a property, valued on the rolls of contribution, at a revenue equal to the local value of 150 days' labour; or of renting a house, valued on the same rolls, at a revenue equal to the value of 100 days' labour. Thirdly, And, in the country, that of being proprietor or life-renter of a property, valued on the rolls of contribution, at a revenue equal to the local value of 150 days' labour; or of being a farmer of lands, valued on the same rolls, at the value of 400 days' labour. Fourthly, With respect to those who shall be at the same time proprietors or life-renters on one hand, and tax-men or farmers on the other, their powers on these different accounts shall be added together, to establish their eligibility."

ELECTORAL ASSEMBLIES—NOMINATION OF REPRESENTATIVES.

ART. 1. "The electors named in each department shall convene in order to choose that number of representatives, whose nomination shall belong to their department, and a number of substitutes equal to the third of the representatives.—The electoral assemblies shall form themselves, of full right, the last Sunday of March, if they have not been convoked sooner by the public officers appointed by law.

2. "The representatives and substitutes shall be chosen by an absolute majority of votes, and cannot be chosen but from amongst the active citizens in the department.

3. "All the active citizens, whatever be their condition, profession, or contribution, may be chosen representatives of the nation.

4. "Those, however, shall be obliged to decide

between one or other situation—Ministers, and other agents of the executive power, removable at pleasure; Commissioners of the national treasury; Collectors and receivers of direct contributions; Superintendents of the collection, or management of indirect contributions, and national domains; and those who, under any denomination whatever, are attached to the employ of the military or civil household of the king.—The administrators, sub-administrators, municipal officers, and commandants of the national guards, shall also be obliged to make a choice.

5. "The exercise of judiciary functions shall be incompatible with those of a representative of the nation, during all the continuance of the legislature.—The judges shall be replaced by their substitutes, and the king shall provide, by briefs of commission, for the replacing of his commissaries at the tribunals.

6. "The members of the legislative body may be re-elected to the next legislature; but not afterwards, till after an interval of one legislature.

7. "The representatives named in the departments shall not be representatives of a particular department, but of the whole nation; and their freedom of opinion cannot be controlled by any instructions either of the primary assemblies, or of the electors."

SESSION AND REGULATION OF THE PRIMARY AND ELECTORAL ASSEMBLIES.

ART. 1. "The functions of the primary and electoral assemblies are limited to the right of electing; and as soon as the elections are over, they shall separate, and shall not form themselves anew, till they shall be summoned.

2. "No active citizen can enter or vote in an assembly, if he is armed.

3. "No armed force can be introduced in the meeting, except at the express desire of the assembly, unless in the case of actual violence, when the order of the president shall be sufficient to call in the aid of public force.

4. "Every two years, there shall be drawn up in each district, lists by cantons of the active citizens; and the list of each canton shall be published and posted up two months before the meeting of the Primary Assembly. The protests which shall be made either against the right of citizens, named in the list, or on the part of those who shall affirm that they are unjustly omitted, shall be carried to the tribunals, to be there summarily decided upon.—The list shall serve to regulate the admission of citizens in the next Primary Assembly, in every point that shall not have been ascertained by a sentence pronounced before the sitting of the assembly.

5. "The Electoral Assemblies have the right of verifying the qualifications and powers of those who shall present themselves there; and their decisions shall be provisionally executed, with a reserve for the sentence

of

of the legislative body at the time of the verification of the powers of deputies.

6. "In no case, and under no pretext, shall the king, or any agents named by him, interfere in questions relative to the regularity of the convocations, the sitting of assemblies, the form of elections, or the political rights of citizens. Without prejudice, however, to the functions of the commissaries of the king, in the cases determined by law, where questions relative to the political rights of citizens ought to be carried to the tribunals."

MEETING OF THE REPRESENTATIVES IN THE NATIONAL LEGISLATIVE ASSEMBLY.

ART. 1. "The representatives shall assemble on the first Monday of May, in the place of the meeting of the last legislature.

2. "They shall form themselves, provisionally, into an assembly, under the presidency of the eldest, to verify the powers of the representatives present.

3. "As soon as these may be verified, to the number of 373 members, they shall constitute themselves under the title of the National Legislative Assembly; they shall name a president, vice-president, and secretaries, and enter upon the exercise of their functions.

4. "During the whole of the month of May, if the number of representatives present fall short of 373, the Assembly shall not perform any legislative act. They may issue an arret, enjoining the absent members to attend to their functions within fifteen days at furthest, under a penalty of 3000 livres, if they do not produce an excuse which shall be deemed lawful by the legislative body.

5. "On the last day of May, whatever be the number of members present, they shall constitute themselves a National Legislative Assembly.

6. "The representatives shall pronounce in a body, in the name of the French people, the oath, "to live free or die."—They shall then individually take the oath, "to maintain, with all their power, the constitution of the kingdom, decreed by the National Constituent Assembly, during the years 1789, 1790, and 1791; to propose or assent to nothing in the course of the legislature, which may at all tend to infringe it; and to be, in every respect, faithful to the Nation, the Law, and the King."

7. "The representatives of the nation are inviolable; they cannot be examined, accused, or adjudged at any time with respect to what they have said, written, or done, in the exercise of their functions of representatives.

8. "They may for a crime be seized in the act, or in virtue of an order of arrest; but notice shall be given of it, without delay, to the legislative body; and the prosecution shall not be continued, till after the legislative body shall have decided that there is ground for accusation."

OF THE ROYALTY, THE REGENCY, AND THE MINISTERS.

Of the ROYALTY and the KING.

ART. 1. "The royalty is indivisible, and delegated hereditarily to the race on the throne, from male to male, by order of primogeniture, to the perpetual exclusion of women and their descendants.—Nothing is prejudged respecting the effect of renunciations in the race on the throne.

2. "The person of the king is sacred and inviolable, his only title is 'King of the French.'

3. "There is no authority in France superior to that of the law. The king reigns only by it, and it is only in the name of the law that he can require obedience.

4. "The king, on his accession to the throne, or at the period of his majority, shall take to the nation, in the presence of the legislative body, the oath, 'To be faithful to the Nation, and to the Law; to employ all the power delegated to him, to maintain the Constitution decreed by the National Constituent Assembly in the years 1789, 1790, and 1791; and to cause the laws to be executed.'—If the legislative body shall not be assembled, the king shall cause a proclamation to be issued, in which shall be expressed this oath, and a promise to repeat it as soon as the legislative bodies shall assemble.

5. "If, one month after an invitation by the legislative body, the king has not taken this oath, or if after taking it he shall retract, he shall be deemed to have abdicated the royalty.

6. "If the king put himself at the head of an army, and direct the forces of it against the nation, or if he do not oppose, by a formal act, any such enterprise undertaken in his name, he shall be deemed to have abdicated.

7. "If the king, having gone out of the kingdom, do not return on the invitation of the legislative body, and within the delay fixed by the proclamation, which cannot be less than two months, he shall be deemed to have abdicated.—The delay shall commence from the day when the proclamation of the legislative body shall have been published in the place of its sitting; and the ministers shall be obliged, under their responsibility, to perform all the acts of the executive power, the exercise of which shall be suspended in the hands of the absent king.

8. "After abdication, express or legal, the king shall be in the class of citizens, and may be accused and tried like them, for acts posterior to his abdication.

9. "The particular effects which the king possesses at his accession to the throne, are irrevocably united to the domain of the nation; he has the disposition of those which he acquires on his own private account; if he has not disposed of them, they are in like manner united at the end of the reign.

10. "The

10. "The nation makes provision for the splendor of the throne by a civil list, of which the legislative body shall fix the sum at the commencement of each reign, for the whole duration of that reign.

11. "The king shall appoint an administrator of the civil list, who shall commence all suits for the king, and against whom all actions for debts of the king shall be carried on, and judgments given and executed. Sentences of condemnation, obtained by the creditors of the civil list, shall be executed against the administrator personally and his private fortune.

12. "The king shall have, independent of the honorary guard which shall be furnished him by the citizens, national guards of the place of his residence, a guard paid from the funds of the civil list. It shall not exceed 1200 foot, and 600 horse.—The degrees and rules of advancement shall be the same in it as amongst the troops of the line. But those who compose the king's guards, shall pass through all the degrees exclusively amongst themselves, and cannot obtain any in the army of the line.—The king cannot choose his guards, but among those who are at present in active service in the troops of the line, or amongst the citizens who have served a year in the national guards, provided they are residents in the kingdom, and that they have previously taken the civic oath.—The king's guards cannot be ordered or required for any other public service."

OF THE REGENCY.

ART. 1. "The king is a minor till the age of eighteen complete; and during his minority, there shall be a regent of the kingdom.

2. "The regency belongs to the relation of the king, who is the next in degree according to the order of succession to the throne, and who has attained the age of twenty five, provided he be a Frenchman resident in the kingdom, and not presumptive heir to any other crown, and have taken the civic oath.—Women are excluded from the regency.

3. "If a minor king have no relations who unite the above qualities, the regent of the kingdom shall be elected as is directed in the following articles:

4. "The legislative body shall not elect the regent

5. "The electors of each district shall assemble in the chief place of their district, after a proclamation, which shall be issued in the first week of the new reign, by the legislative body if convened; and if separated, the minister of justice shall be bound to make that proclamation in the same week.

6. "The electors shall name in every district, by individual scrutiny, and absolute plurality of votes, a citizen eligible, and resident in the district, to whom they shall give by the proces-verbale of the election, a special mandate, limited to the sole function of electing the citizen whom he shall judge in his heart and conscience the most worthy of being regent of the kingdom.

3

7. "The citizens having these mandates, elected in the districts, shall be bound to assemble in the town where the legislative body holds its seat, the fortieth day at furthest, counting from that of the advancement of the minor king to the throne; and they shall form there the electoral assembly, who shall proceed to the nomination of the regent.

8. "The election of the regent shall be made by individual scrutiny and absolute plurality of votes.

9. "The electoral assembly cannot employ itself, but relative to this election, and shall separate as soon as the election is finished.—Every other act which it shall attempt, is declared unconstitutional and of no effect.

10. "The electoral assembly shall make its president present the proces-verbale of the election to the legislative body, who, after having verified the regularity of the election, shall make it public over all the kingdom by a proclamation.

11. "The regent exercises, till the king's majority, all the functions of royalty, and is not personally responsible for the acts of his administration.

12. "The regent cannot begin the exercise of his functions, till after taking to the nation, in the presence of the legislative body, an oath, 'To be faithful to the nation, the law, and the king; and to employ all the power delegated to the king, and of which the exercise is confided to him during the minority of the king, to maintain the constitution decreed by the national constituent assembly, in the years 1789, 1790, and 1791, and to cause the laws to be executed.'—If the legislative body is not assembled, the regent shall cause a proclamation to be issued, in which shall be expressed this oath, and a promise to repeat it as soon as the legislative body shall be met.

13. "As long as the regent is not entered on the exercise of his functions, the sanction of the laws remain suspended; the ministers continue to perform, under their responsibility, all the acts of the executive power.

14. "As soon as the regent shall take the oath, the legislative body shall fix his allowance, which shall not be altered during his regency.

15. "If on account of the minority of the relation called to the regency, it has devolved to a more distant relation, or been settled by election, the regent who shall have entered on the exercise of it, shall continue his functions till the majority of the king.

16. "The regency of the kingdom confers no right over the person of the minor king.

17. "The care of the minor king shall be confided to his mother; and if he has no mother, or if she be married again at the time of her son's accession to the throne, or if she marry again during the minority, the care of him shall be delegated by the legislative body.—Neither the regent, nor his descendants, nor a woman, can be chosen as guardian of the minor king.

18. "In case of the king's insanity, notoriously admitted, legally proved, and declared by the legislative

body,

body, after three successive deliberations held monthly, there shall be a regency, as long as such incapacity continues."

OF THE ROYAL FAMILY.

ART. 1. "The presumptive heir shall bear the name of "Prince Royal." He cannot go out of the kingdom, without a decree of the legislative body, and the king's consent.—If he is gone out of it, and if, being arrived at eighteen years of age, he do not return to France, after being required by a proclamation of the legislative body, he is held to have abdicated the right of succession to the throne.

2. "If the presumptive heir be a minor, the relation of full age, and next in order to the regency, is bound to reside within the kingdom. In case of his going out of it, and not returning on the requisition of the legislative body, he shall be held to have abdicated his right to the regency.

3. "The mother of the minor king, having the care of him, or the guardian elected, if they go out of the kingdom, forfeit their charge.—If the mother of the presumptive heir, a minor, go out of the kingdom, she cannot, even after her return, have the care of her minor son, become king, but by a decree of the legislative body.

4. "A law shall be made to regulate the education of the minor king, and that of the minor heir presumptive.

5. "The members of the royal family called to the eventual succession to the throne enjoy the rights of an active citizen, but are not eligible to any places, employments, or functions, in the nomination of the people.—Excepting the places of ministers, they are capable of offices and employments in the nomination of the king; however they cannot be commanders in chief of any army or fleet, nor fulfil the functions of ambassadors, without the consent of the legislative body, granted on the proposition of the king.

6. "The members of the royal family, called to the eventual succession to the throne, shall add the denomination of French prince to the name which shall have been given them in the civil act, stating their birth; and this name can neither be patronymic, nor formed of any of the qualifications abolished by the present constitution.—The denomination of prince cannot be given to any other individual, and shall convey no privilege, nor any exception, to the common rights of all Frenchmen.

7. "The acts by which shall be legally stated the births, marriages, and deaths of the French princes, shall be presented to the legislative body, who shall command the deposit of them in their archives.

8. "No real apanage (in land) shall be granted to the members of the royal family.—The younger sons of the king shall receive, at the age of twenty-five, or on their marriage, an annuity, the amount of which shall be fixed by the legislative body, and which shall terminate with the extinction of their male heirs."

No. 45.

OF MINISTERS.

ART. 1. "To the king alone belongs the choice and revocation of ministers.

2. "The members of the present national assembly, and succeeding legislatures, the members of the tribunal of annulment, and those who shall serve in the high jury, cannot be advanced to the ministry, nor receive any offices, gifts, pensions, salaries, or commissions from the executive power, or its agents, during the continuance of their functions, nor during two years after having finished the exercise of them.—The same shall be the case with respect to those who shall be inscribed in the list of the high jury, during all the time that their inscription shall continue.

3. "No one can enter upon the exercise of any employ, either in the bureaux of ministers, or in those of the administrations of public power, without having taken the civic oath, and having verified his having taken it.

4. "No order of the king can be executed, if it be not signed by him, and countersigned by the minister or comptroller of the department.

5. "The ministers are responsible for all the offences committed by them against the national safety and the constitution;—First, For every attack on individual property and liberty;—Second, For every waste of the money allotted for the expences of their department.

6. "In no case can the written or verbal order of a king shelter a minister from responsibility.

7. "The ministers are bound to present every year to the legislative body, at the opening of the session, the state of the expences of their department; to give an account of the employment of the sums destined for that purpose, and to mention the abuses which may have crept into the different parts of the government.

8. "No minister in or out of place can be criminally prosecuted for any transaction of his administration, without a decree of the legislative body."

POWERS AND FUNCTIONS OF THE LEGISLATIVE NATIONAL ASSEMBLY.

ART. 1. "The constitution delegates exclusively to the legislative body, the powers and functions following:—

First, "To propose and decree laws: the king can only invite the legislative body to take an object into consideration.

Second, "To fix the public expences.

Third, "To establish the public contribution:—to determine their nature, quantity, duration, and mode of collection.

Fourth, "To divide the direct contribution amongst the departments of the kingdom—to superintend the employ of all the public revenue, and to demand an account of it.

Fifth, "To decree the creation or suppression of public offices.

10 S

Sixth,

Sixth, " To determine the quality, weight, impression, and name of the coin.

Seventh, " To permit or prohibit the introduction of foreign troops into the French territories, and of foreign naval forces into the ports of the kingdom.

Eighth, " To fix annually, after the proposition of the king, the number of men and ships of which the land and naval armies shall be composed; the pay and number of individuals of each rank; the rules of admission and promotion; the forms of enrolment and discharge; the formation of naval equipments; the admission of foreign troops, or naval forces into the service of France; and the pay of troops, in case of their being disbanded.

Ninth, " To regulate the administrative government, and the alienation of the national domains.

Tenth, " To prosecute before the high national court, the ministers and principal agents of the executive power, in what relates to their responsibility.—To accuse and prosecute before the same court, those who shall be charged with any attack or conspiracy against the general safety of the state, or against the constitution.

Eleventh, " To establish the laws, according to which marks of honour or decoration, purely personal, shall be granted to those who have rendered services to the state.

Twelfth, " The legislative body have the right to decree public honours to the memory of great men.

1. " War cannot be resolved on, but by a decree of the National Assembly, passed on the formal and necessary proposition of the king, and sanctioned by him.—In the case of imminent or commenced hostilities, of an ally to be supported, or a right to be preserved by force of arms, the king shall notify the same without delay to the legislative body, and shall declare the reasons of it.—If the legislative body be not sitting, the king shall assemble it immediately.—If the legislative body decide that war ought not to be made, the king shall immediately take measures to stop or prevent all hostilities, the ministers being responsible for delays.—If the legislative body find that the hostilities commenced are a palpable aggression on the part of ministers, or any other agent of the executive power, the author of the aggression shall be prosecuted criminally.—During the whole course of war, the legislative body may require the king to negotiate peace, and the king is bound to yield to this requisition.—On the immediate conclusion of war, the legislative body shall fix the time within which the troops levied above the peace establishment, shall be discharged, and the army reduced to its ordinary state.

3. " It belongs to the legislative body to ratify treaties of peace, alliance, and commerce, and no treaty shall have effect but by this ratification.

4. " The legislative body has the right of determining the place of its sittings, of continuing them as long as it shall think necessary, and of adjourning; at

the commencement of each reign, if it be not sitting, it shall be bound to meet without delay.—1st. It has the right of police in the place of its sitting, and to such extent around it as shall be determined.—ad. It has the right of discipline over its members; but it can pronounce no heavier punishment than censure, arrest for eight days, or imprisonment for three.—3d. It has the right of disposing, for its safety, and the respect that is due to it, of the forces which shall be placed, by its consent, in the city where it shall hold its sittings.

5. " The executive power cannot march, or quarter, or station, any troops of the line within thirty thousand toises of the legislative body, except on the requisition, or by the authority of that body."

HOLDING OF THE SITTINGS, AND FORM OF DELIBERATING.

ART. 1. " The deliberations of the legislative body shall be public, and the proceedings of its sittings shall be printed.

2. " The legislative body, may, however, on any occasion, form itself into a general committee.—Fifty members shall have a right to demand this.—During the continuance of the general committee, the assistants shall retire, the chair of the president shall be vacant, and order shall be maintained by the vice-president.

3. " No legislative act can be debated and decreed, except in the following form:

4. " The plan of a decree shall be read thrice, at three intervals, the shortest of which cannot be less than eight days.

5. The discussion shall be open after every reading; nevertheless, after the first or second reading, the legislative body may declare that there is reason for adjournment, or that there is no need for deliberation; in this last case, the plan of the decree may be introduced again in the same session.—Every plan of a decree shall be printed and distributed before the second reading of it can be commenced.

6. " After the third reading, the president shall be bound to propose it to deliberation; and the legislative body shall decide, whether they are qualified to pass a definitive decree, or would rather choose to postpone their decision, in order to gather more ample information on the subject.

7. " The legislative body cannot deliberate, if the meeting do not consist of at least two hundred members: and no decree shall be made, except by the absolute majority of votes.

8. " No plan of a law, which, after having been submitted to discussion, shall have been rejected after the third reading, can again be introduced the same session.

9. " The preamble of every definitive decree shall announce, first the dates of those sittings at which the three readings of the plan of the decree were made;

10. "The king shall refuse his sanction to decrees whose preamble shall not attest the observance of the above forms; if any of those decrees be sanctioned, the ministers shall neither put it to the seal, nor promulgate it, and their responsibility in this respect shall continue six years.

11. "Excepting from these regulations, decrees recognized, and declared urgent by a previous deliberation of the legislative body; but they may be modified, or revoked, in the course of the same session.—The decree by which a matter shall have been declared urgent, shall announce the reasons of it, and there shall be mention made of this previous decree in the preamble of the definitive decree."

OF THE ROYAL SANCTION.

ART. 1. "The decrees of the legislative body are presented to the king, who may refuse his assent to them.

2. "In the case of a refusal of the royal assent, that refusal is only suspensive.—When the two following legislatures which shall follow that in which the decree was presented, shall successively represent the same decree in the same terms in which it was originally conceived, the king shall be deemed to have given his sanction.

3. "The assent of the king is expressed to each decree, by the following formula, signed by the king: *The king consents, and will cause it to be executed.*—The suspensive refusal is thus expressed: *The king will examine.*

4. "The king is bound to express his assent, or refusal, to each decree, within two months after it shall have been presented.

5. "No decree to which the king has refused his assent, can be presented to him by the same legislature.

6. "The decree sanctioned by the king, and those which have been presented to him by three successive legislatures, alone have the force of a law, and bear the name and title of laws.

7. "There shall be, however, executed as laws, without being subjected to sanction, those acts of the legislative body which relate to its constitution as a deliberating assembly;—Its interior police, and that which it may exercise in the external space, which it shall have determined;—The verification of the powers of the members present;—The injunctions to absent members;—The convocation of the primary assemblies in case of delay;—The exercise of constitutional superintendence over the administrators, and municipal officers;—Questions of eligibility, or the validity of elections.—Exempting likewise from sanction, acts relative to the responsibility of ministers, and all decrees importing that there is ground of accusation.

8. "The decrees of the legislative body, concerning the establishment, prorogation, and collection of

public contributions, shall bear the name and title of laws; they shall be promulgated and executed without being subject to sanction, except with respect to those dispositions which should establish other penalties than pecuniary fines and constraints.—These decrees cannot be passed but after the observation of the formalities prescribed by the articles 4, 5, 6, 7, 8, and 9, relative to the Sittings, &c. in p. 898; and the legislative body shall not insert in them any dispositions foreign to their object."

CONNECTION OF THE LEGISLATIVE BODY WITH THE KING.

ART. 1. "When the legislative body is definitively constituted, it shall send a deputation to inform the king. The king may every year open the session, and propose the objects, which, during its continuance, he thinks ought to be taken into consideration; this form, however, is not to be considered as necessary to the activity of the legislative body.

2. "When the legislative body wishes to adjourn longer than fifteen days, it is bound to inform the king, by a deputation, at least eight days previous.

3. "A week, at least, before the end of each session, the legislative body shall send a deputation to the king, to announce to him the day on which it proposes to terminate its sittings. The king may, come, in order to close the session.

4. "If the king find it of importance to the welfare of the state, that the session be continued, or that the adjournment be put off, or take place only for a shorter time, he may send a message to this effect, on which the legislative body is bound to deliberate.

5. "The king shall convoke the legislative body, during the interval of its session, at all times when the interest of the state shall appear to him to require it, as well as in those cases which the legislative body shall have foreseen and determined, previous to their adjournment.

6. "Whenever the king shall visit the place of meeting of the legislative body, he shall be received and conducted back by a deputation; he cannot be accompanied into the inner part of the hall by any except the prince royal and the ministers.

7. "The president can in no case form part of a deputation.

8. "The legislative body shall cease to be a deliberating body whilst the king shall be present.

9. "The acts of correspondence of the king with the legislative body, shall be always countersigned by a minister.

10. "The ministers of the king shall have admission into the national legislative assembly; they shall have a place assigned to them; they shall be heard always when they demand it on objects relative to their administration, or when they shall be required to give information. They shall also be heard on objects foreign

reign to their administration, when the national assembly shall grant them liberty to speak."

OF THE EXERCISE OF THE EXECUTIVE POWER.

ART. 1. "The supreme executive power resides exclusively in the hands of the king.—The king is the supreme head of the general administration of the kingdom: the care of watching over the maintenance of public order and tranquillity is intrusted to him.—The king is the supreme head of the land and sea forces.—To the king is delegated the care of watching over the exterior security of the kingdom, and of maintaining its rights and possessions.

2. "The king names ambassadors and the other agents of political negotiations.—He bestows the command of armies and fleets, and the ranks of marshal of France and admiral.—He names two-thirds of the rear-admirals, one half of the lieutenant-generals, camp marshals, captains of ships, and colonels of the national gendarmierie.—He names a third of the colonels and lieutenant-colonels, and a sixth of the lieutenants of ships—the whole in conformity to the laws with respect to promotion.—He appoints, in the civil administration of the marine, the directors, the comptrollers, the treasurers of the arsenals, the masters of the works, the under-masters of civil buildings, half of the masters of administration, and of the under-masters of construction.—He appoints the commissaries of the tribunals.—He appoints the chief superintendents of the administration of indirect contributions, and the administration of national domains.—He superintends the coinage of money, and appoints the officers intrusted with this superintendence in the general commission and the mints.—The effigy of the king is struck on all the coinage of the kingdom.

3. "The king orders letters patent, brevets, and commissions, to be delivered to all the public offices that ought to receive them.

4. "The king orders a list of pensions and gratifications to be made out, for the purpose of being presented to the legislative body each session, and decreed, if there is reason for it."

OF THE PROMULGATION OF LAWS.

ART. 1. "The executive power is charged with ordering the seal of state to be put to laws, and causing them to be promulgated.—It is equally charged with causing to be promulgated and executed those acts of the legislative body which have no need of the sanction of the king.

2. "Two copies of each law shall be made, both signed by the king, countersigned by the minister of justice, and sealed with the seal of state. The one shall be deposited in the archives of the seal, and the other shall be sent to the archives of the legislative body.

3. "The promulgation of laws shall be thus expressed:

"N. (the king's name) by the grace of God, and

the constitutional law of the state, king of the French, to all present and to come, greeting. The national assembly has decreed, and we will and ordain as follows:—(Here a literal copy of the decree shall be inserted, without any variation.)—We command and ordain to all administrative bodies and courts of justice, to cause these presents to be transcribed on their registers, read and published, and posted up in their departments and respective place of resort, and executed as a law of the realm; in which we have signed these presents, to which we have caused the seal of the state to be put."

"If the king be a minor, laws, proclamations, and other acts proceeding from the royal authority during the regency, shall be conceived in these terms:—'N. (the name of the regent) regent of the kingdom, in the name of N. (the king's name) by the grace of God and the constitutional law of the state, king of the French, &c.'

5. "The executive power is bound to send the laws to the administrative bodies and courts of justice, to be certified that they are so sent, and to answer for it to the legislative body.

6. "The executive power cannot make any law, not even provisional, but merely proclamations, conformable to the laws, to ordain or enforce the execution."

OF THE INTERIOR ADMINISTRATION.

ART. 1. "There is in each department a superior administration, and in each district a subordinate administration.

2. "The administrators have no character of representation.—They are agents, chosen for a time by the people, to exercise, under the superintendence and the authority of the king, the administrative functions.

3. "They can neither interfere in the exercise of the legislative power, nor suspend the execution of the laws, nor assume any authority over judicial proceedings, nor over military regulations or operations.

4. "The administrators are essentially charged with the repartition of the direct taxes, and with the superintendence of the funds arising from all the contributions and public revenues in their territory.—It belongs to the legislative power to determine the rules and mode of their functions, both with respect to the objects above mentioned, as well as with respect to all the other parts of the interior administration.

5. "The king has the right of annulling such acts of the administrators of department, as are contrary to the law, or the orders he has transmitted to them.—He may, in case of obtrinate disobedience, or of their endangering, by their acts, the safety or peace of the public, suspend them from their functions.

6. "The administrators of department have also the right of annulling the acts of the sub-administrators of district, contrary to the laws or to the arrears of administrators of department, or to the orders which the latter

latter shall have given or transmitted.—They may likewise, in case of an obdinate disobedience on the part of the sub-administrators; or if the latter endanger, by their acts, the public safety or tranquillity, suspend them from their functions, with the reserve of informing the king, who may remove or confirm the suspension.

7. "The king, if the administrators of department shall not use the power which is delegated to them in the article above, may directly annul the acts of sub-administrators, and suspend them in the same cases.

8. "Whenever the king shall pronounce or confirm the suspension of administrators, or sub-administrators, he shall inform the legislative body. This body may either remove or confirm the suspension, or even dissolve the culpable administration; and if there be ground, remit all the administrators, or some of them, to the criminal tribunals, or enforce against them the decree of accusation."

OF EXTERNAL CONNECTIONS.

1. "The king alone can keep up foreign political connections, conduct negotiations, make preparations of war, proportioned to those of the neighbouring states; distribute the land and sea forces, as he shall judge most suitable, and regulate their direction in case of war.

2. "Every declaration of war shall be made in these terms: *By the king of the French, in the name of the nation.*

3. "It belongs to the king to resolve and sign with all foreign powers, all treaties of peace, alliance, and commerce, and other conventions, which he shall judge necessary for the welfare of the state, with a reserve for the ratification of the legislative body."

OF THE JUDICIAL POWER.

1. "The judicial power can in no case be exercised, either by the legislative body, or the king.

2. "Justice shall be gratuitously rendered, by judges chosen for a time by the people, instituted by letters patent of the king, who cannot refuse to grant them. They cannot be deposed, but for forfeiture duly judged; nor suspended, but for an accusation admitted.—The public accusers shall be named by the people.

3. "The tribunals cannot either interfere in the exercise of the legislative power, or suspend the execution of the laws, or undertake the administrative functions, or cite before them the administrators, on account of their functions.

4. "The citizens cannot be withdrawn from the judges whom the law alligis to them by any commission, or by any other attributions or evocations than those which are determined by the laws.

5. "The right of the citizens to terminate definitively their disputes by the way of arbitration, shall receive no infringement from the acts of the legislative power.

No. 46.

6. "The ordinary courts of justice cannot receive any civil action, until it be certified to them that the parties have appeared, or that the pursuer has cited the opposite party to appear before mediators, to endeavour to bring about a reconciliation.

7. "There shall be one or more justices of peace in the canton and in the towns. The number of them shall be determined by the legislative power.

8. "It belongs to the legislative power to regulate the number and extent of jurisdiction of the tribunals, and the number of judges of which each tribunal shall be composed.

9. "In criminal matters, no citizen can be tried, but on an accusation received by a jury, or decreed by the legislative body, in the cases where it belongs to it to pursue the accusation.—After the admission of the accusation, the fact shall be recognized and declared by a jury.—The accused shall have a right to refuse, as far as twenty jurors, without assigning reasons.—The jury which declares the fact, cannot be of fewer than twelve members.—The application of the law shall be made by judges.—The instruction of the process shall be public, and the assistance of counsel cannot be refused to the accused.—No man acquitted by a lawful jury, can be retaken or accused on account of the same fact.

10. "No man can be seized upon, but in order to be conducted before an officer of police: and no man can be arrested or detained, but in virtue of a mandate of the officers of police; of an order for personal arrestation by a tribunal; of a decree of accusation of the legislative body, in the cases where it belongs to it to pronounce; or of a sentence of imprisonment or detention for the sake of correction.

11. "Every man seized upon and conducted before an officer of police, shall be examined immediately, or at latest in twenty-four hours.—If it result from the examination, that there be no ground for blame against him, he shall be directly set at liberty: or if there be ground to send him to a house of arrest, he shall be conducted there with the least delay possible, and that in any case cannot exceed three days.

12. "No man arrested can be detained if he give sufficient bail, in all cases where the law permits a man to remain free under bail.

13. "No man, in the cases when detention is authorized by the law, can be conducted or detained any where, but in those places legally and publicly marked out as houses of arrest, of justice, or prisons.

14. "No guard nor jailer can receive or detain any man, but in virtue of a mandate, order of arrest, decree of accusation, or sentence, mentioned in the tenth article above, nor without transcribing them in his own register.

15. "Every guard or jailer is bound, and no order can release him from the obligation, to produce the person detained to the civil officer who superintends the police of the house of arrest, as often as it shall

10 T

be

be required of him.—The production of the person detained, cannot also be refused to his relations and friends, who bring an order from a civil officer, who shall be bound always to grant it, unless the guard or jailor produce an order from a judge, transcribed in his register, to keep the person arrested secret.

16. " Every man, whatever be his place or occupation, except those to whom the law confides the right of arrestation, who shall give, sign, execute, or make to be executed, an order to arrest a citizen; or whoever, even in the cases of arrestation authorised by the law, shall conduct, receive, or detain a citizen, in a place of detention not publicly and legally marked out; and every guard or jailor who shall act in opposition to the disposition of the above 14th and 15th articles, shall be culpable of the crime of arbitrary detention.

17. " No man can be taken up, or prosecuted, on account of the writings which he has caused to be printed or published, whatever be their subject, if he has not defiedly provoked disobedience to the law, outrage to the established powers, and resistance to their acts, or any of the actions declared crimes or offences by the law.—The censure of all the acts of the established powers is permitted; but voluntary calumnies against the probity of public officers, and against the rectitude of their intentions in the exercise of their functions, may be prosecuted by those who are the subject of them.—Calumnies or injurious sayings against any kind of persons, relative to the actions of their private life, shall be punished by prosecution.

18. " No man can be judged, either civilly or criminally, for acts of writing, printing, or publishing, except it has been recognised and declared by a jury, 1st, that there is an offence in the writing denounced: 2d, that the person prosecuted is guilty of it.

19. " There shall be, for the whole kingdom, one only tribunal of annulment, established near the legislative body. Its functions shall be, to pronounce—On demands of annulment of judgments given in the last resort by the tribunals;—On demands of being remitted from one tribunal to another, for lawful causes of suspicion;—On regulations respecting judges, and suits against a whole tribunal.

20. " In questions of annulment, the tribunal of annulment shall never take cognizance of the affair itself; but after having annulled the sentence which shall have been pronounced in a process, and in which the forms have been violated, or which shall contain an express contradiction to the law, it shall remit the original affair to the tribunal which ought to decide on it.

21. " When, after being twice annulled, a sentence pronounced by a third tribunal shall be attacked on the same grounds as at first, the question shall no more be judged by the tribunal of annulment, without having been submitted to the legislative body, who shall pass a decree declarative of the law,

to which the tribunal of annulment shall be bound to conform.

22. " Every year, the tribunal of annulment shall be bound to send to the bar of the legislative body a deputation of eight of its members, to present a state of the decisions passed; on the margin of each of which shall be placed a short account of the affair, and the text of the law which shall have determined the decision.

23. " A high national court, formed of the members of the tribunal of annulment, and of high jurors, shall take cognizance of offences committed by the ministers and principal agents of the executive power, of those crimes which attack the general safety of the state, after the legislative body shall have passed a decree for accusation.—It shall not be assembled but at the proclamation of the legislative body, and at the distance of thirty thousand toises at least from the place where the legislative body holds its meetings.

24. " The orders issued for executing the judgments of the tribunals, shall be conceived in these terms:—' N. (the name of the king) by the grace of God, and by the constitutional law of the state, king of the French, to all present and to come, greeting. ' The tribunal of ——— has passed the following judgment: ' [Here shall follow a copy of the judgment, in which shall be mentioned the names of the judges.] —' We charge and enjoin all officers, upon the present demand, to put the said judgment into execution, our commissaries of the tribunals to enforce the same, and all the commanders and officers of the public force to be assisting with their force, when it shall be legally required: in witness of which, the present judgment has been signed by the president of the tribunal, and by the register.'

25. " The functions of the king's commissaries in the tribunals, shall be, to require the observance of the laws in the judgments to be given, and to cause them to be executed after they are passed.—They shall not be public accusers; but they shall be heard on all accusations, and shall require, during process, regularity of forms, and, before judgment, application of the law.

26. " The king's commissaries in the tribunals shall denounce to the director of the jury, either officially, or according to orders given them by the king;—Offences against the individual liberty of citizens, against the free circulation of provisions and other objects of commerce, and against the collection of contributions:—Offences by which the execution of orders given by the king, in the exercise of the functions delegated to him, shall be disturbed or impeded;—Infringements on the laws of nations; opposition to the execution of judgments; and to all executive acts proceeding from established powers.

27. " The minister of justice shall denounce to the tribunal of appeal, by means of the king's commissary, and without prejudice to the rights of the parties interested,

interested, the acts in which the judges have exceeded the bounds of their power.—The tribunal shall annul these acts; and if they give ground for forfeiture, the fact shall be represented to the legislative body, which shall pass the decree of accusation if there be ground, and refer the parties informed against to the high national court."

OF THE PUBLIC FORCE.

1. "The public force is instituted to defend the state against external enemies, and to maintain internal order and the execution of the laws.

2. "It is composed,—Of the land and sea armies;—Of the troops specially destined for home service;—And, subsidiarily, of the active citizens, and their children of age to bear arms, registered in the roll of national guards.

3. "The national guards do not form a military body, or an institution in the state; they are the citizens themselves, called to assist the public force.

4. "The citizens can never embody themselves, or act as national guards, but by virtue of a legal requisition of authority.

5. "They are subject in this quality to an organization, to be determined by the law.—They shall be distinguished in the whole kingdom, by only one form of discipline, and one uniform.—Distinctions of rank and subordination subsist only relative to the service, and during its continuance.

6. "Officers are chosen for a time, and cannot again be chosen till after a certain interval of service as soldiers.—None shall command the national guard of more than one district.

7. "All the parts of the public force employed for the safety of the state from foreign enemies, shall act under the command of the king.

8. "No body or detachment of troops of the line can act in the internal part of the kingdom without a legal order.

9. "No agent of the public force can enter the house of a citizen, if it be not on purpose to execute the orders of police and of justice, or in cases formally provided for by the law.

10. "The requisition of the public force, in the internal part of the kingdom, belongs to the civil officers, according to the regulations provided by the legislative power.

11. "When any department is throughout in a state of commotion, the king shall issue, under the responsibility of ministers, the necessary orders for the execution of laws, and the re-establishment of order; but with the reserve of informing the legislative body, if it be assembled, and of convoking it, if it be not sitting.

12. "The public force is essentially obedient; no armed body can deliberate.

13. "The land and sea armies, and the troops destined to preserve internal security, are subjected to

particular laws, both for the maintenance of discipline, and for the manner of judgments, and the nature of punishments, on occasion of military offences."

OF PUBLIC CONTRIBUTIONS.

1. "Public contributions shall be debated and fixed every year by the legislative body, and cannot continue in force longer than the last day of the following session, if they are not expressly renewed.

2. "The funds necessary to the discharge of the national debt, and the payment of the civil list, can, under no pretext, be refused or suspended.—The salaries of the ministers of the Catholic religion, who are paid, preserved, elected, or named in virtue of the decrees of the national constituent assembly, form a part of the national debt.—The legislative body cannot, in any case, charge the nation with the payment of the debts of any individual.

3. "The accounts at full length of the ministerial department, signed and certified by the ministers or commissioners, shall be made public, by being printed at the commencement of the session of each legislature.—So shall also the state of receipts of the different taxes, and all the public revenues.—The state of receipt and expenditure shall be distinguished according to their nature, and shall express the sums received and disbursed, year by year, in each district.—The private expences of each department, and those relative to the tribunals, the administrative bodies and other establishments, shall also be made public.

4. "The administrators of department, and sub-administrators, can neither establish any public contribution, nor make any distribution beyond the time and the sums fixed by the legislative body; nor deliberate, or permit, without being authorized by it, any local loan to be charged to the citizens of the department.

5. "The executive power directs and superintends the collection and paying in of contributions, and gives all the necessary orders to this effect."

OF THE CONNECTION OF THE FRENCH NATION WITH OTHER NATIONS.

"The French nation renounces the undertaking of any war with a view to make conquests, and will never employ its forces against the liberty of any people.—The constitution no longer admits the Droit d'Aubaine.—Foreigners, whether settled in France or not, inherit the property of their parents, whether foreigners or Frenchmen.—They can contract, acquire, and receive, property situated in France, and dispose of it as well as any French citizen, in every mode authorized by the laws.—Foreigners in France are subject to the same criminal laws and regulations of police as French citizens, with a reserve for conventions agreed on with foreign powers. Their persons, effects, industry, and religion, are equally protected by the law."

OF THE REVISION OF CONSTITUTIONAL DECREES.

1. "The National Constituent Assembly declares, that the nation has an imprescriptible right to change its constitution; and nevertheless, considering that it is most suitable to the national interest to make use, only by means appointed by the constitution itself, of the right of reforming those articles which experience shall demonstrate the inconvenience of, decrees, that the assembly of revision shall proceed in the following manner:

2. "When three following legislatures shall have declared an uniform wish for the change of any constitutional article, the revision demanded shall take place.

3. "The ensuing legislature (that commencing in 1791) cannot propose the reform of any constitutional article.

4. "Of the three legislatures who shall successively propose any changes, the first two shall not occupy themselves relative to that object, but in the last two months of their last session, and the third at the end of its first annual session, or at the beginning of the second.—Their deliberations on that matter shall be subjected to the same forms as the legislative acts; but the decrees by which they shall have expressed their desires, shall not be subjected to the sanction of the king.

5. "The fourth legislature, augmented by two hundred and forty-nine members chosen in each department, by doubling the ordinary number which it furnishes for its population, shall constitute the assembly of revision.—These two hundred and forty-nine members shall be elected after the nomination of representatives to the legislative body shall have been terminated, and there shall be formed a separate *procez-verbale* of it.—The assembly of revision shall not be composed of more than one chamber.

6. "The members of the third legislature, who shall have demanded a change, cannot be elected in the assembly of revision.

7. "The members of the assembly of revision, after having pronounced all at once the oath, 'to live free or die,' shall individually swear, to confine themselves to decide on the objects which shall have been submitted to them by the unanimous wish of three preceding legislatures; and to maintain, in other respects, with all their power, the constitution of the kingdom, decreed by the National Constituent Assembly in the years 1789, 1790, and 1791; and to be in all faithful to the nation, to the law, and to the king.

8. "The assembly of revision shall be bound to occupy itself afterwards, and without delay, in the objects which shall have been submitted to its examination; and as soon as this task is finished, the two hundred and forty-nine new members, named over and above, shall retire, without taking a part in any case in the legislative acts."

"The French colonies and possessions in Asia, Africa, and America, although they make a part of the French empire, are not included in the present constitution.

"None of the powers instituted by the constitution have a right to change it in its whole, or in its parts, excepting the reforms which may be made in it by the mode of revision, conformably to the regulations contained in the articles respecting Revision of Constitutional Decrees.

"The National Constituent Assembly commits the deposit of it to the fidelity of the legislative body, of the king, and of the judges, to the vigilance of fathers of families, to wives and to mothers, to the attachment of young citizens, to the courage of all Frenchmen.

"The decrees passed by the national assembly, which are not included in the act of constitution, shall be executed as laws; and those interior laws which it has not altered, shall also be observed so long as they shall not be revoked or modified by the legislative power.

(Signed) VERNIER, President. POUGEARD, COUPPE, MAILLY, CHATEAURENARD, CHAILLON, AUBRY (Bishop of the Department of the Meuse) DARCIE, Secretaries."

On Sept. 3, 1791, the national assembly having heard the constitutional act above read, after approving of it, declared, that the constitution is finished, and that it can make no change in it; and that there shall be named immediately, a deputation of sixty members, to offer, the same day, the constitutional act to the king.

(Signed as before)

And on the 13th of the same month, the king, by a letter to the National Assembly, announced his resolution to accept the constitution; and on the following day he appeared in the assembly, introduced by a deputation of sixty members, and solemnly consecrated the assent which he had already given, concluding, with an oath, "To be faithful to the nation and to the law; and to employ the powers vested in him for the maintenance of the constitution, and the due execution of the law."

But since the death of the king, and the suppression of royalty, a committee has been appointed by the convention to draw up a new constitution, which has lately made its appearance; but whether it will be approved of by the representatives of the people, and, if it should, how long it will continue, are questions so extremely problematical, as in the present disturbed state of affairs, to render its insertion needless, if not improper.

Soon after this the second national council assembled, which was far inferior to the first in point of abilities.

About

About this time, the duplicity and undecided conduct of the emperor Joseph, and the refuge and protection afforded in the German empire to the emigrant princes, excited France to vigorous resolutions; and a celebrated manifesto, addressed to all states and nations, made its appearance. The forcible measures pursued had the effect of intimidating the German princes; and the emigrants were constrained to an ignominious dispersion and retreat from the frontiers: but the protection of the emperor and the Prussian king provided them with an asylum more remote and less obtrusive. Irresolution seemed to preside in the councils of the emperor, a monarch more distinguished for the mild virtues of peace than for the strenuous exertions of war. He had acknowledged the national flag; he had declared that he regarded the king of the French as absolutely free, while the league of Pilsnitz (which, as was avowed by the court of Vienna, was not only intended to secure Germany from such a revolution as France had experienced, but even to extinguish the dreaded source) and the protection afforded to the emigrants, were infallible proofs that the emperor could not be regarded as a friend. His sudden death, on the first of March 1792, excited great consternation among the aristocrats, and inspired the supporters of the constitution with joy and exultation. Another event, no less unexpected, happened on the death of the Swedish monarch, on the 29th of the same month. Fresh spirits were diffused through the nation; and the superstitious vulgar imagined, that, in the removal of the two chief foes of France in one month, they beheld the peculiar interposition of heaven.

In the subsequent negotiations between the national assembly and the court of Vienna, the young Hungarian King, excited by the influence of Prussia, began to exhibit more enmity and severer terms. At length, on the 5th of April, M. de Noailles, in his dispatches to the French minister for foreign affairs, explained the propositions of the imperial court—that satisfaction should be given to the German princes, proprietors of Alsace—that Avignon, which had been appropriated by France, should be restored to the pope—and that the internal government of France should be invested with sufficient efficiency, that the other powers may have no apprehensions of being troubled by France. Those terms produced a declaration of war against Francis I. king of Hungary and Bohemia, decreed by the assembly on the 4th of April, and ratified by the French king.

The beginning of the operations on the part of France was stained with defeat, and with the unpropitious murder of Theobald Dillon, who fell a prey to the suspicions and savage ferocity of some of the soldiers, who fled from the enemy, but attacked their general. The court of Vienna, had, in the beginning of July, published a declaration, explaining the cause of the war, and retorting on the French nation some

of the heavy charges contained in its declaration of war against the king of Hungary and Bohemia, now emperor of Germany.

On the 26th day of the same month, the Prussian monarch issued a concise exposition of the reasons which determined him to take up arms against France. He pleads his alliance with the emperor; and that, as sovereign of a German state, he was bound to interfere to prevent the violation of the rights of the German princes of Alsace and Lorraine, and the invasion of the territories of others: and he honestly concludes, by avowing that it is his intention to repress the too great liberty of France, which might afford a dangerous example to neighbouring countries.

At the same time the duke of Brunswick, general of the combined armies of Austria and Prussia, published at Coblenz a declaration to the inhabitants of France, conceived in the most haughty and presumptuous terms: he declared his intention of putting a stop to the anarchy which prevailed in France, and of restoring the king to his power; and yet he afterwards expresses his design not to interfere in the internal government! It is not necessary to dwell on the other insolent parts of this memorial, in which France is already regarded as a conquered country, and directions are given to the magistrates, national guards, and inhabitants at large: but the threat, that the city of Paris should be given up to military execution, in case the least outrage should be offered to the king, queen, or royal family, is as vain as it is arrogant.

We relate with pain the excesses of the night between the 9th and 10th of August. The alarm-bell sounded at midnight in every quarter of Paris, the generale was beat, and the citizens flew to arms. The palace of the Thuilleries was attacked by the multitude; and the king, queen, and royal family, were forced to take refuge in the hall of the national assembly. At first the Swiss guards (who were obnoxious to the people, and had been ineffectually proscribed by repeated decrees of the assembly, the king not being allowed to have a foreign guard) repelled the populace; but these being reinforced by the Marseillois and federates from Breis, bodies which the Jacobins seemed to have brought to Paris to balance the Swiss, and by national guards, the gates of the palace were burst open. The artillery joined the assailants; and the consequences were, that the Swiss guards were exterminated, and the palace ransacked, after a slaughter of about four hundred on each side.

Unhappily the month of September seemed pregnant with the total ruin of French freedom; but the three following months reversed the scene, and exhibited a series of success, on the part of France, perhaps unexampled in modern history. We cannot without inexpressible concern direct the attention of our readers to the prison scene, which occurred on the 2d and 3d of September. The horrid massacre of the defenceless prisoners, and other aristocrats, which took place at that

period, stamps an eternal disgrace on the Parisian populace, who, in their fury, spared not even that gentle sex which all civilized nations hold in the highest respect. The number of the slain has doubtless been exaggerated, as usual; yet supposing that, by the most moderate account, only two thousand perished, the enormity of the deed remains the same. Some extenuation might be offered for the affair of the 10th of August, in which a people, who supposed themselves betrayed to slavery, and all its evils, so recently experienced and shaken-off, assumed their revenge and their cause into their own hands; but no defence can be offered for this unnecessary crime. Had the combined armies besieged Paris, it is difficult to conceive what aid they could have found from two or three thousand aristocrats, and many of these secured in chains, and confined in prison.

In order to determine on the charges brought against the king, a national convention had been called. They met on the 24th of September; and on the first day of the meeting, the abolition of royalty in France was decreed by acclamation; and the following day it was ordered that all public acts should be dated the first year, &c. of the French republic. But hardly was this convention constituted, when a violent faction appeared, headed by Marat*, Roberespierre, and others, who have repeatedly degraded their transactions by their violence and fanaticism; and, being supported by the Jacobins and Parisian populace, have proved too powerful for the convention to punish as it wished. Repeated instances have proved that the convention was not free, but compelled to vote as the mob of Paris dictated, the moderation of the members being often obliged to yield to the indecent applauses and hisses of the gallery rabble.

The French arms were so rapid in their progress, and so great were the distresses in the combined armies, arising from a scarcity of provisions, from a long rainy season, and from a considerable mortality among the Prussians, estimated, by the French accounts, at one half, that the Prussians retreated from the dominions of France, and their example was soon followed by the Austrians.

* This furious zealot fell by the hand of female vengeance. Marie-Anne-Charlotte Corday, strongly impressed with the calamities which he had brought upon her country, took a journey to Paris, in July 1793, on purpose to put a period to his existence. Meeting Marat as he was coming from the Bath, and entering into conversation with him (more certainly to identify his person) she plunged a dagger into his breast; upon which he fell, and soon expired. Glorifying in having exterminated a monster, she delivered herself up to the officers of justice, and with the utmost firmness submitted to her fate, in having her head severed by the guillotine, in the 25th year of her age.

The invasion of Savoy was ordered, even at the very time that Paris was in the greatest danger. On the 1st of September, general Montesquieu entered the Savoyard territories, seized on the frontier posts and castles without resistance, and two days after took Montmelian. Chamberry and all Savoy soon followed; but the conquest, not being resisted, was productive of no military glory. The imprudence of the national convention, in permitting Savoy to incorporate itself with France, has created wonder.

After frequent declarations of the French, that they would enter into no war with any view to conquest, their conduct in this respect was absurd and impolitic. It subjected them to the merited reproach, that, under the pretence of liberty, they maintained the destructive maxims of their ancient government; and that their wishes to increase their territory, perhaps to subjugate Europe, remained the same. Admiral Truguet, commanding a squadron in the Mediterranean, captured Nice, Villa Franca, and the fortrefs of Montalban, belonging to the king of Sardinia.

Most people regarded the conquest of Savoy as a trifle; but when Custine began his acquisitions in Germany, every eye was turned to the rapidity and importance of his progress, till diverted by the wonders of Dumourier. Spire yielded to the French arms on the 30th of September, and Worms soon after followed; ample supplies of provisions and ammunition were found in these cities. Custine, pursuing his course along the left shore of the Rhine, next captured Mentz, and afterwards Frankfort. He was eager to proceed to Coblenz, that noted seat of the counter-revolutionists; but the Prussians and Austrians at length indicating a renewal of hostilities by garrisoning that town, and encamping in the adjacent country, he relinquished that design.

The next grand object was the conquest of the Austrian Netherlands. Dumourier had promised to pass his Christmas at Brussels; and what was regarded as an idle vaunt proved very modest; for that city was in his hands by the 14th of November. That able general, having entered the Netherlands on the first or second of that month, with an army of forty thousand men, since much increased, and with a most formidable train of artillery, the first five days were occupied with repeated engagements with the Austrian army commanded by the duke of Saxe-Teschchen, governor of the Austrian Netherlands, and by general Beaulieu, which however exceeded not twenty thousand. At length, on the 6th of November, a decisive battle was fought at Jamappes, which decided the fate of the Netherlands. The contest was very general; all the points of the enemy's flanks and lines were attacked at once; all the bodies of the French were in action, and almost every individual fought personally. The cannonade began at seven in the morning; Dumourier ordered the village of Carignan to be attacked, because he could not attempt the heights of Jamappes till he had

taken that village: at noon the French infantry formed in columns, and rapidly advanced to decide the affair by the bayonet. At two o'clock the Austrians retired in the utmost disorder, after an obstinate defence. Dumourier immediately advanced, and took possession of the neighbouring town of Mons, where the French were received as brethren.

The tidings arriving at Brussels, the court was struck with an indescribable panic; and instantly fled to Ruremonde, whence it was again to be driven by the arms of Miranda. Tournay surrendered to a detachment on the 8th of November. Dumourier, having refreshed his troops at Mons, advanced to Brussels, where, after an indecisive engagement between his van and the Austrian rear, he was received with acclamations on the 14th of that month.—Ghent, Charleroi, Antwerp, Malines, or Mechlin, Louvain, Ostend, Namur; in short, all the Austrian Netherlands, except Luxembourg, successively followed the example of the capital; and the conquests were not less rapid than those of Louis XIV.

The national convention having banished many of the priests, they came to England, and were received with great benevolence; this was followed by their decree against the emigrants, by which they are declared dead in law, their effects confiscated, and themselves adjudged to immediate death, if they return to France. Another decree of the 19th of November attracted the attention of every nation in Europe; it is in the following terms: "The national convention declare, in the name of the French nation, that they will grant fraternity and assistance to all those people who wish to procure liberty; and they charge the executive power to send orders to the generals, to give assistance to such people, and to defend citizens who have suffered, or are now suffering, in the cause of liberty." By this decree, and others of a similar tendency, a political crusade against all the powers of Europe, seems to be instituted.

Antwerp had no sooner yielded to the French arms, than, in order to conciliate the Belgians, the opening of the navigation of the Scheldt, shut up by the treaty of Munster in 1648, was projected, and ordered; notwithstanding this treaty, so far as it respects the shutting up of the navigation of that river, has been confirmed to the Dutch in succeeding treaties, guaranteed both by the courts of Versailles and London. The Dutch regarded this measure as injurious to their trade; for Antwerp might prove a dangerous rival to Amsterdam. The infraction of this treaty is one of the reasons which has induced the parliament of Great-Britain to oppose the unwarrantable pretensions of the French republic, and to join its forces with those of the allied powers, in defence of their common rights, and those of Europe in general.

On the 11th of December 1792, the memorable trial of the king commenced. The issue is well known. The firmness of this unfortunate monarch during his

trial, and at the place of execution, on the 21st of January 1793, increased the commiseration of every individual; and the insensibility, and callous indeed must be the person who does not partake of the sympathy which was felt through all Europe upon this transaction; and we must add, that the records of mankind exhibit no instance of crimes deliberately committed, attended with so many circumstances of wanton, unrelenting cruelty, and so evidently pernicious to the cause of the unfeeling perpetrators.

EXECUTION OF THE FRENCH KING.

An hour after Louis had been informed of the fatal doom, two municipal officers repaired to the queen's apartment, to signify what was to happen. The queen advanced towards the officers, with her hands uplifted, and cried, "O ye murderers! O ye murderers!" for near ten minutes—then in convulsive hysterical fits dropped down on the floor: having recovered herself, she looked with a staring, significant eye at the officers, who stood in a distant corner of the room—then turning round to the dauphin, she shed a flood of tears, embraced him, and exclaimed, "My dear son, I do not know what I am doing—let us never confound the innocent with the guilty."

Soon after, the queen, madame Elizabeth, the king's sister, and the dauphin, were conducted to the king's dining-room, where the unfortunate monarch embraced them with great serenity: the officers withdrew, and a scene ensued of tenderness and grief, which none but heaven and the parties present witnessed.

Two hours after, the municipal officers were called in, and the king expressed a desire of seeing his wretched daughter, who was in a separate apartment. His demand was granted, and he and his family, under a proper escort, went to the spot. She was that day fourteen years and thirty-three days old. It is said that she expired soon after the king left her, but that is not true, she being still living; her devoted royal father embraced her; she clung close to him—he bedewed her with tears—she was wrested from him, and remained insensible for some time, when she exclaimed, "O my father! O my tender father!" Paternal heroism made the king depart from his beloved daughter. Maternal feeling retained the queen and her sister-in-law with the dauphin, who said to Louis, "We will see you by-and-by—Adieu, husband! Adieu, brother! Adieu, father!" The king waited a kiss to them with his right hand, but they saw him no more! Arrived in his room, the monarch prostrated himself, and said prayers with his confessor Edgeworth, an English priest, otherwise called De Fermond, for an hour and upwards, after which he had his beard shaved, and his hair turned up in a curl from behind, without powder.

In a previous decree made by the national convention, the place for putting their inhuman sentence into execution,

execution, was to have been the Caroufel, fronting the palace of the Thuilleries. This was changed by the ministers, to whom all the arrangements were confided, to the Place de la Revolution, heretofore the Place de Louis XV. The guillotine, or fatal instrument of execution, was placed upon a scaffold, between the Champ Elysee and the pedestal, which was formerly ornamented with the magnificent equestrian statue of Louis XV. his grandfather.

On Monday morning, the 21st of Jan. the king left the Temple, the mournful procession set out a little after eight o'clock. The royal victim sat in the mayor's carriage, with his confessor by his side, praying very fervently, and two captains of the national guard-horse on the front seat. The carriage was drawn by two black horses, preceded by the mayor, general Lanterre, and other municipal officers. One squadron of horse, with trumpeters and kettle-drums, led the van of the melancholy convoy: three heavy pieces of ordnance, with proper implements, and cannoners, with lighted matches, went before the vehicle, which was escorted on both sides by a treble line of troopers.

The train moved on with a slow pace from the Temple to the Boulevards, which were planted with cannon, and beset with national guards, drums beating, trumpets sounding, and colours flying. The trotting and neighing of horses, the shrill found of the trumpet, and the continual beating of drums, pierced the ears of every body, and heightened the terrors of the awful scene.

The scaffold was high and conspicuous, and the houses surrounding the place of execution were full of women, who looked through the windows: the very slates which covered the roofs, were raised up for the curious and interred to peep through.

At twenty minutes after ten, the king arrived before the scaffold in the Square of the Revolution, which was covered with cannon, and crowded with cavalry. His confessor, Mr. Edgeworth, wanted to go up the steps of the scaffold with him, but this was rudely refused by colonel Santerre. Louis pulled off his stock, coat, and waistcoat, and, with his neck and breast bare, ascended the scaffold with intrepidity and undaunted fortitude; (it was only twenty minutes after ten o'clock) he wore a clean shirt and stock, white waistcoat, black florentine silk breeches, black silk stockings, and his shoes were tied with black silk strings.

Having taken leave of his confessor, who shed a thousand tears, he beckoned with his hand to be heard; the noise of the warlike instruments ceased for a moment; but soon after a thousand voices vociferated, with detestable ferocity, "No harangues!—No harangues!"—The unfortunate monarch wrung his hands, lifted them up towards heaven, and with agony in his eye and gesture, exclaimed, distinctly enough to be heard by those persons who were next the scaffold, "To thee, O God, I commend my soul!—I forgive all my enemies—I die innocent!" His head was immediately after severed

from his body; whereupon the people waved their hats in the air, exclaiming, "God save the nation!" and the body was immediately removed in a black coffin.

The short length of time in which he appeared on the scaffold, and the interval of the fatal blow, was no more than two minutes. Instantly the executioner lifted up his head, and amidst the flourish of trumpets, exclaimed, "Thus dies a traitor!" Some of the guards pushed forward to the scaffold, and dipped their pikes and their handkerchiefs in the blood, brandished their swords, and vociferated, "God save the Republic!—God save the Nation!"

The body was conveyed to the Thuilleries; the executioner cut off the hair imbrued in blood, which was sold for assignats, in small locks!—The guards, the federates, and others, again dipped their handkerchiefs in the gore, hoisted it on swords, pikes, and staves, and sold it; and the banditti mob carried it triumphantly through the streets till night, intoxicated, and hallooing—"Behold the blood of a tyrant."

The body was interred six hours after, in the church-yard De la Madelaine, adjacent to the place of execution, in a grave twelve feet deep, and filled with quick lime and mould, between the people who were stilled in the throng on the 19th of April 1770, when a brilliant illumination and fire-work were exhibited there in honour of his marriage, and the Swiss and other victims slain at the Thuilleries on the 10th of Angul.

Thus perished Louis XVI. king of France and Navarre, in the 39th year of his age. Thus one of the best of kings fell a dreadful sacrifice to the rage of the Brissots, the Marats, the Paines, and other disgraceful blots in the human creation! "The condemnation and execution of the king," said a great statesman in the British House of Commons, "is an act as disgraceful as any that history records; and I never can view, but with the greatest detestation, the injustice and inhumanity that has been committed towards that unhappy monarch. Not only were the rules of criminal justice, rules that more than any other ought to be strictly observed, overthrown; not only was he tried and condemned without any existing law to which he was personally answerable, and even contrary to laws that did actually exist; but the degrading circumstances of his imprisonment, the unnecessary and insulting asperity with which he had been treated, the total want of republican magnanimity in the whole transaction, added every aggravation to the inhumanity and injustice."

We shall continue our detail of the French transactions with another affecting account of

THE EXECUTION OF THE QUEEN OF FRANCE.

When, after the trial, the queen heard her sentence read, she did not shew the smallest alteration in her countenance, and left the hall without saying a single word to the judges or to the people. It was then

half past four o'clock in the morning, October 16. She was conducted to the condemned hole in the prison of the Conciergerie.

At five o'clock the generale was beat. At seven, the whole armed force was on foot; cannon were planted upon the squares, and at the extremities of the bridges, from the palace to the square de la Revolution. At ten, numerous patroles passed through the streets. At half past eleven in the morning, Marie Antoinette was brought out of the prison, dressed in a white deshabille. Like other malefactors, she was carried in a common cart to the place of execution: Her hair from behind was entirely cut off, and her hands were tied behind her back. Beside her deshabille, she wore a very small white cap. Her back was turned to the horse's tail. During her trial, she wore a dress of a black and white mixture. On her right was seated upon the cart the executioner; upon the left, a constitutional priest belonging to the Metropolitan church of Notre Dame, dressed in a grey coat, and wearing a bob-wig. The cart was escorted by numerous detachments of horse and foot. Henriot, Ronsin, and Boulanger, generals of the revolutionary army, preceded by the rest of their staff-officers, rode before the cart.

An immense number of people crowded the streets, and cried, "Long live the Republic!" The queen seldom cast her eyes upon the populace, and beheld with indifference the great armed force of 30,000 men, which lined the streets in double ranks. The sufferings which she sustained during her captivity had much altered her appearance, and the hair on her forehead appeared as white as snow. She kept speaking to the priest seated by her side. Her spirits were neither elevated nor depressed: she seemed quite insensible to the shouts of "Vive la Republique!" When she passed thro' the street called Rue St. Honoré, she sometimes attentively looked at the inscriptions of the words *liberty* and *equality* affixed to the outside of the houses. She ascended the scaffold with seeming haste and impatience; and then turned her eyes with great emotion toward the garden of the Thuilleries, the former abode of her greatness.

At half past twelve, the guillotine severed her head from her body. The executioner lifted and shewed the head from the four different corners of the scaffold.—The spectators instantly cried, "Long live the Republic!" The corpse was immediately after buried in a grave filled with quick lime, in the church-yard de la Madeleine, where her unfortunate consort was in like manner interred.

It will no doubt be acceptable to our readers, if we subjoin the following particulars relating to this unhappy princess:—Marie Antoinette, late queen of France, was the daughter of the emperor Francis I. who had succeeded his father, as duke of Lorraine; which duchy was ceded to France, and Tuscany was settled upon him in lieu of it. While Francis was duke of Lorraine, he married the archduchess Maria Theresa,

daughter of the emperor Charles VI. The emperor Charles, having no male issue, Maria Theresa succeeded to his hereditary dominions; and, in 1745, her husband Francis was elected emperor. Marie Antoinette was their eighth daughter, born at Vienna on the 2d of November 1755. She was married to the dauphin of France, the late king, on the 16th of May 1770. This marriage was attended with a very remarkable and melancholy circumstance. On Thursday the 30th of May, the grandest fire-works that ever were known were intended to have been exhibited, and in part were so, in the square of Louis XV. in honour of the marriage; but the disaster that followed dashed all the pleasure that could have been received from this most splendid spectacle. The astonishing multitude that had crowded to see the fire-works were blocked up on all sides, except one narrow street, through which they must all pass in order to disperse. Some obstruction happening in that street, and the people not knowing the cause, took fright, and every one pushing forward to get away, the confusion increased so fast, that one trampled over another, till the people lay in heaps; those who were undermost flatly pressed those who lay above them, in order to disengage themselves. The carnage was inexpressible. The accounts make the dead to amount to 1000, and the wounded to 2000 more. By some mistake in the engineer, the apparatus took fire; many hundreds were precipitated into the river in endeavouring to escape the flames; and the scaffold broke down which was erected for spectators, by which many more were killed. The superstitious in France said the affair was ominous. The dauphin, in the first transports of his grief, gave all the money allotted for his month's expences towards the relief of the sufferers, and in this he was followed by the dauphiness. His majesty was also greatly affected, and issued orders, that no expence might be spared to succour and assist the miserable. Louis XV. dying on the 10th of May 1774, the dauphin ascended the throne, by the name of Louis XVI.

We shall conclude this period of our work with some interesting remarks on the probable cause, together with the progress and present state, of the Revolution in France.

A variety of reflections naturally occur in reviewing the progress of the French revolution, and the conduct of the principal actors in those extraordinary scenes, which have attended it. The most intelligent persons have remarked, that no revolution which had liberty for its foundation or its pretext, was ever disgraced by so wanton an effusion of blood, by so many sanguinary executions, such inhuman massacres, so much rancour and persecution of every kind. To understand the nature and causes of these melancholy events, several considerations will demand our attention.

1. The revolution in France was at the first too suddenly effected. The change in the circumstances, habits,

bits, and opinions of the people was too violent, and they were too little prepared for the enjoyment of liberty. Had the court anticipated the assembling of the states-general by some salutary and useful reforms in favour of the people, they would not only have served to strengthen the connexion between the king and his subjects, and more firmly to attach the latter; but such a conduct would have been a proper initiatory process, and would have prepared all ranks of people to act as rational agents in the cause of freedom.

Had the king, by his own authority, abolished the odious tyranny of letters de cachet, the punishment of the rack, and every species of judicial cruelty, it would not only have endeared him to his subjects, but would have humanized them. Could he have ordered a revival of the judicial system, and, in particular, could he have established the trial by jury, it would have inured them to the practice of equity, and to the calm investigation of truth. If he had done in addition, what there is reason to believe he was not averse to, that is, if he had indulged the natural clemency of his temper in permitting a free toleration to religious opinions, he would have attacked the Protestants, and would have greatly lessened the acuteness of party animosity—and if he had favoured, to a certain degree, the liberty of the press, the free discussion of controverted points might have been advantageous to the cause of truth and moderation; while, on the contrary, the people, having been wholly unaccustomed to the liberty of the press, were not on their guard against its licentiousness, and were constantly imposed upon, and the dupes of the infamous journalists and their employers and adherents.

The court party appeared to have no system, no settled plan of proceeding, when the states-general assembled. They were undetermined what to retain or what to relinquish; whereas the plan of government ought to have been previously settled; every thing to be proposed to the states ought to have been well digested; and proper agents chosen to introduce each particular measure to the national assembly. On the contrary, nothing could be more absurd than the attempt, after the deputies of the nation were assembled in one common hall, and even while the metropolis was in a ferment, to restore or preserve the ancient regimen. With this unfortunate outset, the whole conduct of the king and of the court corresponded. The feast of the military at Versailles; the flight of the king; the obstinate exercise of his veto; all served to lay the designs of the court open to suspicion.

2. For a considerable time before the revolution, the French were the most profligate, corrupt, and unprincipled people in Europe. All of the higher orders were dissipated, they were consequently all venal. The lower classes were hardened by ignorance, by oppression, by the frequent horrid executions of which they were witnesses, and by other severities. The venality and corruption of some, who from time to time affected to

be the friends of the people, drew down a suspicion upon all of the higher orders; and the ferocity of the multitude, and their ignorance, and consequently want of principle, plunged them into excesses of the most fatal and sanguinary nature.

3. We have also to deplore, in connection with this circumstance, the irreligious principles which had unhappily made so fatal a progress in France. Nothing short of religion can impart an uniformity to the moral character. Where expediency is the only rule of conduct, the human mind will naturally indulge in too great a latitude on some occasions, especially where the passions are strongly interested. This perhaps, indeed, is the distinguishing circumstance which marks the two revolutions of America and of France. The Americans were possessed of a strong sense of religion; and consequently, though the instances of treachery which occurred among themselves were scarcely less numerous in proportion than those which happened among the French, the victims of popular fury were much fewer. They were under a necessity of defending themselves; but, independent of this circumstance, they could not forget that their religion taught them "to love their enemies:" but the majority of the French nation were either uninstructed in the truths of this religion, or had rejected its salutary restraints and precepts.

After all, if we would trace calamity to its source, we must be forced to confess, that the flimsy writings of the wretched caviller Voltaire have undone France. We venerate, and ever shall venerate, the cause of religious toleration. Every sect which acknowledges a future state of rewards and punishments is innoxious, if not respectable. But if this great foundation of morality is removed, there can be no dependence on the principle or integrity of the people. Let the Horsleys and the Priestleys freely indulge themselves in verbal contests concerning the disputed points of theology:—but let every impious scoffer, who presumes to aim his destructive shafts at any of the great doctrines of religion, be severely punished, and his writings strictly prohibited. No government can be safe, nor will it be possible to maintain order, or even common honesty among men, till this is established.

4. The league of Pilnitz, and the infamous conduct of the combined powers towards the republic of Poland, having, as already intimated, excited at once the apprehensions and the resentment of the French; it was no difficult matter to persuade the multitude that the court was immediately connected with the invaders; and this opinion was unfortunately countenanced by the publications of the combined powers, and particularly by the imprudent manifesto of the duke of Brunswick. The repeated dismissal of the popular ministers, and the obliquity of the king in other instances, confirmed the suspicion. Hence, and hence only, the republican faction were enabled to acquire so much credit with the people in the months of June, July, and August 1792.

The

The avowed hostility of this faction might have driven the court in its turn into hostile measures, without imputing actual treachery to Louis. For we must observe, that this is a matter still involved in impenetrable obscurity; and it is impossible to determine, from the state of the evidence, either the nature or the extent of the king's connexions with the counter-revolutionists. Thus far is certain, that Paris was crowded with the *ci-devant* noblesse, and other disaffected persons, on the 10th of August. The fatal rupture, and the dreadful carnage of that bloody day, let loose at once all the demons of discord. Every bad passion was put in motion—revenge, party-rage, the desire of plunder, all that is depraved and abominable in human nature, was predominant in the breasts of different individuals, and prepared the way for the still deeper horrors of the 2d and 3d of September, and for all the calamities which have since happened to the nation.

5. We must also take notice of another circumstance, which is, that the excessive population of France is greatly calculated to perpetuate violence and anarchy in that country. Independent of the frequent alarms of famine from this circumstance, it is impossible that there should not exist in every considerable city immense multitudes of indigent and desperate persons, who are always ready to promote every species of mischief and disorder, and who when once excited cannot easily be reduced to peace and subordination. This again constitutes another remarkable shade of difference between the American and the French revolutions.

The American armies were composed in general of settled and industrious people, of farmers and mechanics, most of whom had families; they consequently embraced the first opportunity to return to their peaceable employments and habitations, to fit every man under his own vine, and his own fig-tree; and they regarded the affairs of state no further than as they served to secure them in the peaceable possession and enjoyment of their property. Every man at the conclusion of the war had something to do; every man had business of his own to attract his attention.

Not so the rabble of Paris, of Lyons, of Marseilles—many of them have no regular employment, and the numbers of banditti are increased by the total stagnation of the commerce and manufactures of France. They can acquire more by plunder and confiscation, than by sober industry; and thus it becomes at once their interest to be turbulent, unruly, sanguinary, and capricious. The disorder and the violence are always increased by the numbers; and in proportion to the numbers collected together, the passions of the multitude are inflamed.

After the 10th of August, the Gironde party, in vain, affected a tone of moderation; and when they had obtained their wishes, they exhorted in vain the populace to return to order and obedience. They had excited the fatal concussion; they had taught the multitude to know their own strength; they had disturbed the gene-

ral tranquillity, and absurdly flattered themselves that a spirit of insurrection would be as easily quelled as it was excited. Without wishing, therefore, to depreciate their slender claim to merit in attempting to save the life of the king, we cannot but regard this party as the immediate authors of the calamities which have befallen their country since the overthrow of the monarchical constitution.

The massacre of the 10th of August was scarcely less atrocious than that of the 2d of September; and when these men sell the victims of the very means which they had employed, and were murdered in their turn by the very mob which they had formerly excited, though our religion teaches us to pity even the guilty, and to lament the shedding of human blood upon any occasion, yet, in the dreadful event, it was impossible not to discern something of retributive justice.

Besides this, the Gironde had something to charge themselves with for wantonly engaging their country in one vain and fruitless war after another; and on the whole, we think they have been a pernicious faction. They were, perhaps, less sanguinary and cruel than their ferocious successors, but in point of real principle we see little room for preference.

6. The popular societies instituted throughout the kingdom, for debating upon political subjects, and that of the Jacobins in particular, had been a most fatal means of promoting bad dispositions among the people. In the first dawn of French liberty, such institutions might have their use; but they should even then have been restrained within moderate bounds, and as soon as possible dissolved. These have afforded a constant asylum to the profligate; and in these every absurdity, every measure of sedition and of cruelty in the national councils, have originated.

The above recited circumstances appear to have been the principal causes which have operated to give to the French revolution that sanguinary and horrid character by which it has been too fatally distinguished; and which,

* It is with the greatest concern we record the following recent instances of the atrocities which the still existing sanguinary and merciless disposition of the French republicans has impelled them to commit towards their countrymen the Lionnois:

"On Friday December 20, 1793, a petition of the inhabitants of Lyons, imploring mercy, was presented to the convention, and referred to the committee of public welfare. The deplorable situation of these unfortunate people, may be somewhat better conceived from the following extract from this petition: 'Two commissions, the formidable instruments of the vengeance of the outraged republic, have been established: four hundred heads were struck off in one month, by virtue of their resolutions! Soon after, other judges appeared, who complained that the blood did not stream

in

which, as far as the circumstances may apply to other nations, may serve as a warning against hasty revolutions, and as a guide in the conducting of such plans of reformation as political exigences may seem to warrant or require, and as wisdom and moderation only can sanction and perpetuate.

The subjugation of France cannot be expected to result from any efforts used by the present combination, since it has been the uniform assertion of those who are best acquainted with the resources and the temper of the nation, that, whatever be the force of the external attack, she is invincible: and this sentiment derives some confirmation from the experience of two campaigns, unsuccessfully terminated.—On the restoration of peace, from whatever cause that may be effected, we look for a train of events very different from what the aspect of affairs at present may seem to promise.—The first circumstance which, in that case, we will venture to predict, is, that the present leaders will not long be able to retain their power. Whatever their abilities (and we must confess that they have displayed some energy, if not ability) they have not, even with a profligate and corrupted people, character enough to support their popularity long.

We think it highly probable that the experiment of establishing a republic will be continued for some time longer; but it will never be more than an experiment: and before many years the nation, wearied with faction and with contest, will certainly have recourse to some form of monarchy or aristocracy; and that that period would be hastened, were any one man particularly distinguished by his talents above his competitors to arise. No such has yet appeared; but it is amid the violence of political commotion that genius is

in sufficient abundance: and a revolutionary commission has been appointed. That new tribunal received orders to repair to the prisons, to judge in one and the same moment the great number of prisoners with which they were crammed. That commission punctually fulfilled its rigorous orders; and no sooner had it pronounced sentence than the cannon arrived, and a thunder of ease shot was discharged upon the condemned.—Struck by the fatal fire, the victims of the laws fell in heaps upon each other; and frequently, but mutilated, they were only half-killed by the first discharge. Those victims who had still breath left in them after that punishment, were dispatched with the sword or the musket. Even the pity of a weak and feeling sex has been construed into a crime: two women were dragged to the pillory, for having implored mercy for their fathers, husbands, and children!—All tears, all commiseration were rigorously forbidden. Nature has been forced to stifle her most generous emotions, under pain of death. Four thousand heads are now devoted to the same punishment, and will be struck off before the expiration of this day."

called into action, and it would be contrary to all historical precedent if, on this occasion, no one was to present himself.

We cannot possibly doubt, that the present legislators of France, have it ultimately in view to abolish Christianity, or the very idea of religion. But in this they will be disappointed. The people must have a religion; and as none so good as the Christian can be offered them, some form of that religion will be the predominant faith of the French people. The most probable conjecture is, that the zealous professors of some of the least moderate of the Protestant sects will insinuate themselves among them, and effect a religious revolution not less stupendous than that which they have experienced in their civil state. This very circumstance may hasten the political crisis to which we alluded in the preceding paragraph. The imprudent measures of the convention, in unsettling the faith of the nation, in the foolish expectation of establishing atheism, has just prepared the public mind for such a change; nor shall we be surprised to see, in the course of a few years, the disciples of Whitefield, of Wesley, or perhaps of Swedenborg, usurp that authority which is at present possessed by the atheistical chiefs of the republic.

As to the war in which this country is at present (1794) engaged with France—we are willing, in common candour, to acquit the British ministry of the atrocious charge of having at all entered into the views of the combined powers in the absurd project for a partition of France; and we believe the accusation to be a gross and unfounded calumny. This will not, we confess, apologize for the want of prudence in our ministry in departing from that system of strict neutrality which was so entirely essential to our prosperity. From this concession it will be evident that we think our ministry was precipitate in hastening a rupture with France; and indeed we do not find the reasons for those measures which involved us in hostilities well founded.

Two causes were assigned by the British minister for breaking with the French nation; but these were surely quite inconsistent with each other. The first was the atrocity and villany of their conduct; the second, the fear that their example might be followed in this country. Surely we are correct in saying these two reasons were perfectly inconsistent. The more atrocious the conduct of the French, the less the danger that any other nation should copy their example; and the truth is, that though every society is liable to be infested with a few enthusiasts and visionaries, the example of France has operated as a complete warning to Britain, and as a decisive antidote to the extension of democratic principles, which the successful example of America had perhaps rather promoted.

Were we permitted to scrutinize into the secrets of cabinets, we might possibly find that the motive of the English ministry in provoking, and that of the French in declaring war, was on each side a vain-glorious and

absurd hope of conquest. It is to be presumed, that both parties have learned a little wisdom from recent experience; and we should be happy to find that the result of that wisdom should be the re-establishment of peace. It is an insult upon common sense, to say there is no person with whom we can treat. No matter through what medium tranquillity is restored. Whoever is proclaimed by the public voice the agent of any people, with that person (whatever his moral character) it must be lawful to transact all necessary business, for promoting the welfare of the community, and the benefit and comfort of individuals.—We conclude therefore in earnestly recommending peace, by whatever means it may be achieved.

Let us leave the French to answer for their own sins. Whatever may be their code of faith, it is ours to believe in a providential Ruler, the avenger of injustice and of cruelty. A particular society does not trench on the divine prerogative, when it punishes individual crimes, committed in defiance of those laws which it has established for the security of its own members; but when one nation marches in warlike array to punish the sins of another nation, the attempt favours too much of Quixotism, and the only consequence is commonly the sacrifice of many innocent lives, and such as might have proved ornaments to their country.

Taking for granted the truth of all that has been alleged of the depravity of the French (and certainly we cannot be accused of any disposition to controvert it) still the question will not easily be answered, "What interest can Great-Britain have in the contest? What ultimate advantage are we to derive from it?" If the French are, as they are represented, "a worthless, depraved, and incorrigible people," are the blood and treasure of Britain to be lavished, are her manufactures and commerce to be sacrificed, for the purpose of fram-

ing a government for a people, who cannot upon these principles be worthy of the slightest exertion?

But, it will be said, "the whole nation is not to be blamed for the crimes of a faction; the majority may probably wish for a better arrangement."—Leave then the majority to reform their own government. "But the emigrants at least are deserving persons, and ought to be restored to their rights and property."—Bestow upon the emigrants but one half of the waste lands, which it is reported are shortly to be sold, and present them with but one half of one year's military expenditure, and you will do them a much more essential kindness than by instantly restoring them (were it even in your power) to their former situation, opulence, and grandeur.

To suppose that French principles can ever make an extensive progress in this country, is the grossest of absurdities; unless (which Heaven avert!) indeed the public distress should drive the people to desperation. We repeat it, the French have acted in such a manner, that the most despotic prince in Europe may slumber in security; since there is scarcely a people that would not be disposed to submit to the most oppressive mandates of authority, rather than fraternize with them, or imitate their dreadful example. In one word, it is not France for which we plead—we plead for ourselves. We plead for the sufferings of the poor, for the embarrassments of the manufacturer, for the lives of those who are most dear to us, for that blood which is much too precious to be shed in this fruitless, this thankless quarrel, this horrid and destructive war! which every lover of mankind must devoutly hope will be speedily and happily terminated, by an honourable and permanent peace; and that, by the over-ruling power and wisdom of Providence, the general advantage and benefit of contending nations, and distressed individuals, will take place of the miseries and devastations of war.

We reflect with unspeakable satisfaction on having been enabled, with the kind and united assistance afforded us, to fulfil the terms proposed at the beginning of this valuable work, which we have properly introduced by prefixing to our general SYSTEM OF GEOGRAPHY, circumstantial accounts of the NEW DISCOVERIES, made by various celebrated European navigators, which, we doubt not, will be peculiarly agreeable to our numerous readers. Great pains have been taken throughout to comprise a competent quantity of useful matter in a moderate compass, by avoiding tedious and antiquated details respecting places of trivial consequence to the judicious investigator of instruction and information;—at the same time that we have been extremely careful to insert a pleasing variety of RECENT DESCRIPTIONS of countries, handed down to us by voyagers and travellers of allowed credit,—we have moreover been happy to convey to our numerous readers the best and newest ideas of the present political state of France; and to close the whole with an accurate history of the remarkable REVOLUTION which has lately taken place in that kingdom;—which valuable and desirable acquisition has not hitherto appeared in any performance of this kind, and therefore presume it will prove highly acceptable to the public in general, and entitle us to the future countenance and encouragement of our generous friends, whose former favours we most gratefully acknowledge.

AN USEFUL GUIDE TO GEOGRAPHY AND ASTRONOMY.

P A R T I.

THE science of GEOGRAPHY consists in an accurate description of the earth, its surface, magnitude, and the positions of several parts of the surface of the terraqueous globe. This useful branch of knowledge, like all others of a practical nature, has advanced towards perfection by slow, and, in some periods, by almost imperceptible degrees; it cannot, however, be completely acquired without considering the earth as a planet, or as a body moving round another at a considerable distance from it. The other noble science, which treats of the planets and the rest of the heavenly bodies, is properly called ASTRONOMY, with an account of which, and of those celestial bodies, we have thought it necessary to begin this part of our work. The most conspicuous of these bodies is that glorious luminary the sun, the source of light and heat to the several planets which move round it; and which, together with the sun, as the centre, compose what is called by astronomers the solar system. The way, or path, in which the planets move round the sun, is called their orbit. There are six primary planets, each of which moves round the sun in its own orbit; these are, Mercury, Venus, the Earth, Mars, Jupiter, and Saturn. The two first, as they move within the orbit of the earth (being nearer the sun) are called inferior planets, or, perhaps with greater propriety, interior or inner planets: the three last, moving without the orbit of the earth, are called superior, or, perhaps more properly, exterior or outer planets. The earth moves round the sun in the same manner as these primary planets do. We shall now consider the figure and motion of the earth.

In the infancy of the world, the figure of the earth was unknown: it was generally supposed to be a plane, circular surface, terminated by the heavens; that this plane was of no remarkable thickness; and that the regions below it were the habitations of spirits. The heavens, above our earth, in which the sun, moon, and stars appeared to move daily from east to west, were conceived to be at no great distance from it; and to be only designed for its use and ornament; but several reasons, which it is needless to mention, concurred to render this opinion improbable. The figure of the earth is sufficiently ascertained, from the voyages of many navigators who have actually sailed round it; particularly, Ferdinand Magellan, who by his circumnavigation begun in 1519, and completed in 1524 days, demonstrated at once the sphericity of the globe, and the

existence of the antipodes, which had been so strenuously denied by the ignorant tongue of superstitious bigotry.

After thoroughly establishing the roundness of the earth, a way was naturally opened for the discovery of its motion: for while mankind considered it as a plane, they had but an obscure idea of its being supported, like a scaffolding on pillars, though they could not tell by what these latter were supported. This will evidently appear on considering that, if the earth did not move round the sun, not only that luminary, but all the stars and planets, must move round the earth. Philosophers have, by calculations founded on the most accurate observations, been able pretty nearly to discover the distances of the heavenly bodies from the earth, and from each other, in like manner as every person that knows the first elements of mathematics can measure the height of a steeple, or any object placed on it; hence it appears, that if we conceive the heavenly bodies to move round the earth, their velocity and motion must be inconceivably great, whereas all the appearances in nature may be as well explained by imagining the earth to move round the sun in the space of a year, which causes the vicissitudes of the seasons, and to turn on its own axis once in the 24 hours, which occasions the different appearances of day and night.

In order to have a right conception of these two motions of the earth, we may imagine a ball moving on a billiard-table, or bowling-green: the ball proceeds forwards upon the green or table, not by sliding along like a plane upon wood, or a slate upon ice, but by turning round its own axis, which is an imaginary line drawn through the centre or middle of the ball, and ending on its surface on two points called the poles. Now the motion of the earth round its axis is from west to east, and consequently the heavenly bodies appear to move from east to west; and as the former is performed in 24 hours, so the latter appears to be completed in the same time; and all the celestial objects seem to describe circles in the heavens, which are greater or less, according as they are nearer to or further from the centre of those motions, that is, from the two poles of the world; and as they all appear to finish their revolutions in the same time, their motions will be slower in proportion to the smallness of the circle they describe.

It may be necessary to observe, before we exhibit a table of the planets, that, besides the six above-named, there are others which are called secondary, because they move round the primary planets. The secondary planets

planets are ten in number, and go under the general name of moons, from their agreeing with our moons; of these, one moves round the earth, four round Jupiter, and five round Saturn. These secondary planets suffer four kinds of eclipses: 1. When they are within the shadows of their principal. 2. When the primary planet is between them and us. 3. When they are between their primary one and us; for then it is difficult to distinguish of two luminous points one from the other. 4. When they interpose between one another and our eye, so as to hide themselves from our sight.

In the solar system are observed two principal laws, which regulate the motions of all the planets. These laws are the following:

1. "The planets describe equal areas in equal times." That is, the vector radius, in equal portions of time, describes equal areas or portions of the space contained within the planet's orbit.

2. "The squares of the periodical times of the planets are as their mean distances from the sun." That is,

as the square of the time which any planet takes to describe its orbit, is to the square of the time taken by any other planet to run through its orbit; so is the cube of the mean distance of the former from the sun, to the cube of the mean distance of the latter from the sun.

These are the two famous laws of Kepler, a great astronomer, who flourished about the beginning of the seventeenth century, and who deduced them from a multitude of observations; but the first who demonstrated these laws, was the incomparable Sir Isaac Newton.

By the second law, the relative distances of the planets from the sun are known; and was the real distance of any one of them determined, the absolute distances of all the others would be obtained. By the transit of Venus over the sun in 1761, we now know the real distances of the planets from the sun much better than before; these, together with other necessary particulars for forming a competent idea of the solar system, are exhibited in the following table:

A TABLE of the Diameters, Distances, Periods, &c. of the Planets in the Solar System.

Names of the Planets.	Diameters in English Miles.	Mean Distances from the Sun, determined by the Transit of Venus, 1761.	Annual Periods round the Sun.	Diurnal Rotation on its Axis.	Hourly Motion in its Orbit.	Hourly Motion of its Equator.	Inclination of Axis to Orbit.

The fixed stars, though they do not constitute a part of the solar system, must be mentioned here, as they are of infinite use in the practice of geography. They are readily known from the planets, by their continually exhibiting that appearance we call the twinkling of the stars. They are observed never to change their situations with respect to each other, and hence they obtained the name of fixed stars; they shine by their own light; and there is the greatest reason to think they are suns fixed in the centres of other systems, having planets and comets revolving round them like our sun. They appear of various sizes, owing to their different distances. These sizes are generally distinguished into six or seven classes, called magnitudes, the largest and brightest are said to be of the first magnitude; those of the next class, or degree of brightness, are called stars

of the second magnitude, and so on to the last, or those just visible to the naked eye. But, besides these, there are scattered in every part of the heavens, a prodigious number of others, called telescopic stars, from their being invisible without the assistance of that instrument. Great part of the modern astronomy, indeed, owes both its rise and perfection to that admirable machine. The distance between the earth and the nearest fixed star is astonishing; the orbit of the earth is at least 160 millions of miles in diameter, yet this prodigious difference has no effect on the distance of the star, which appears so far from the earth when in the nearest as in the furthest point of its orbit. It has been computed, by some of the most able astronomers, that if a cannon ball continued to move with the same velocity as when first discharged from the piece, it would not reach the nearest

fixed

fixed star in less than 700,000 years; the distance therefore is too great for the power of the human understanding to conceive: it is bewildered and lost in the computation. Mr. Huygens takes Sirius, or the Dog-star, to be about 27,000 times as far from us as the sun is; and as the distance of the stars must be greater in proportion as they seem less, mathematicians have computed the distance of Sirius from us to be two billions and 200,000 millions of miles. The motion of light therefore, which, though so quick as to be commonly thought instantaneous, takes up more time in travelling from the stars to us, than we do in making a West-India voyage. A sound will not arise to us from thence in 50,000 years; which, next to light, is considered as the quickest body we are acquainted with; and the cannon-ball above-mentioned, flying at the rate of 480 miles in an hour, would not reach us in 700,000 years. Such indeed is the immense size of these heavenly bodies, and such their distance from us, that could we advance towards them 99 parts in 100 of the whole distance, and that there were but one hundredth part of the present distance remaining, they would appear very little larger to us than they do now; and if all the stars were to be extinct or annihilated this next night, we should not miss them till about six months after! for that stream of light flowing from them to our eyes, should the fountain be stopped, would be half a year before it would be run quite out, though it ran after the rate of above ten millions of miles in a minute; a motion almost as quick as thought itself.

The stars shine with their own native and unborrowed lustre, as the sun does; and since each particular star, as well as the sun, is confined to a particular portion of space, the stars must consequently be of the same nature with the sun; and it is not in the least probable that the Almighty, who always acts with infinite wisdom, and does nothing in vain, should create so many glorious suns, adapted to so many important purposes, and place them at such distances from one another, without proper objects near enough to be benefited by their influences: whoever imagines that they were created only to give a faint glimmering light to the inhabitants of this globe, must have a very superficial knowledge of astronomy, and a degrading opinion of the Divine Wisdom, whose works are, on the other hand, calculated to give us the most exalted ideas of the power and goodness of God! The milky way is crowded with infinite numbers of small stars, from whence, as is usually thought, its whiteness appears; which is a discovery entirely owing to the telescope; but whether the whiteness proceeds from the smallness of those numberless stars, their nearness to one another, or their immense distances, we cannot yet certainly determine, but must leave to time and future observations.

A sensible and discerning person, from what he already knows of the new system, will naturally be led to conclude, that all the rest are with equal wisdom

contrived, disposed, and provided with accommodations for rational inhabitants: for although there is an almost infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy running through, and connecting all the parts into one scheme, one design, one whole! What an august, what an elevated idea does the above specimen give us of the works of the Creator! Thousands of thousands of suns, multiplied without end, and ranged all around us, at immense distances from each other, attended by ten thousand times ten thousand worlds, all in rapid motion, yet calm, regular, and harmonious, invariably keeping the paths prescribed them; and these worlds peopled with millions of intelligent beings formed for endless progression in perfection and felicity!—If so much power, wisdom, goodness, and magnificence is displayed in the material creation, which is the least considerable part of the universe, how transcendently wise, great, and good must HE be, who made, upholds, and governs the whole! and how far are we yet from knowing the bounds of the starry world, or the thousandth part of his works!

The shepherds who attended their flocks in the delightful plains of Egypt and Babylon, were the first people who paid a particular attention to the fixed stars; they were induced to observe the situation of these celestial bodies, partly for the sake of amusement, and partly with a view to direct them in their travelling during the night. Being possessed of a fertile imagination, they divided the stars into different companies or constellations, and supposed each of them to represent the image of some animal, or other terrestrial object. The same thing is done by the peasants in our own country, who distinguish that great northern constellation, which the philosophers call *Ursa Major*, by the name of *Charles's Wain*; and fancy four of the stars contained in it to be the four wheels of the wagon, and the one three they suppose to represent the three horses that draw it; some of the country people also give this constellation the name of the *Plough*, the figure of which it in some measure resembles. The constellations, however, have in general retained the names given them by the ancients, and are reckoned 21 northern, and 12 southern; but the number of the northern have by the moderns been increased to 35, and of the southern to 31. There are, besides these, 12 signs or constellations in the *Zodiac*, of which we shall speak hereafter.

The most famous systems, or hypotheses, are the Ptolemaic, the Tychoenic or Brahean, and the Pythagorean or Copernican system.

The Ptolemaic system was so called from its inventor Claudius Ptolemaeus, a celebrated astronomer of Ptolemaea, in Egypt, and supposes the earth immovably fixed in the centre of the universe; and that the moon, the planets, and the stars, all move round it from east to west, once in twenty-four hours, in the following order: the Moon, Mercury, Venus, the Sun, Mars, Jupiter,

e Sun, Mars, Ju-
piter,

piter, Saturn, and the fixed stars. These were all sup-
posed to be fixed in separate crystalline spheres, and to
be included in another, called the primum mobile,
which gives motion to all the rest.

This system owed its origin to the sensible ap-
pearances of the celestial motions. It was taken for
granted, that the motions which those bodies appeared
to possess, were real; and not dreaming of any motion
in the earth, nor being acquainted with the distinctions
between absolute, relative, or apparent motion, the
philosophers were incapable of forming adequate ideas
of these particulars, and thence reduced to the necessity
of being misled by their own senses, for want of that
assistance which after-ages produced. It is easy to ob-
serve, they had no notion of any other system but
our own, nor of any other world but the earth on
which we live. They were persuaded that all things
were made for the use of man; that all the stars were
contained in one concave sphere, and, consequently,
at an equal distance from the earth; and that the pri-
mum mobile was circumscribed by the empyrean
heaven, of a cubic form, which they supposed to be
the blissful abode of departed spirits. But modern ob-
servations and discoveries have sufficiently shewn the
absurdity of this system, so that it is now abandoned
by all the learned, and hardly ever mentioned but to be
exploded. Even in the infancy of astronomy, it was
found insufficient to account for all the motions of the
heavenly bodies, without having recourse to such ab-
surd suppositions, that a novice in literature would be
ashamed to propose.

Tycho Brahe, a nobleman of Denmark, and one of
the most eminent astronomers of his time, proposed
another system to account for the motion of the heavenly
bodies. This was called the Brahean system. Un-
willing to admit of the motion of the earth, and con-
vinced that the Ptolemaic hypothesis could not be true,
he contrived another, different from any thing before
offered to the world. In this hypothesis, the earth is
supposed to be at rest in the centre of the universe, and
that the sun, together with the planets and fixed stars,
revolve about the earth in twenty-four hours; and at
the same time all the planets, except the moon, revolve
about the sun. But this was even more absurd than
that of Ptolemy, and accordingly was soon exploded.

The Pythagorean, Copernican, or true solar system,
which is now universally adopted by all the learned in
Europe, supposes the sun to be at rest in the centre of
the system, and that all the planets move round him in
the following order: Mercury, Venus, the Earth, at-
tended by her secondary, the Moon; Mars, Jupiter,
Saturn. These, together with the comets, form the
constituent parts of the solar system.

About the year 1610, Galileo, a Florentine, intro-
duced the use of telescopes, which discovered new
arguments in support of the motion of the earth, and
confirmed the old ones. Learned men in different
countries began to cultivate astronomy, and adopted

No. 46.

this hypothesis, and it would probably soon have been
universally received, had it not met with a formidable
opposition from an ignorant and bigotted clergy.
Nursed in the lap of indolence, and inveterate enemies
to every species of free and impartial inquiry, they
condemned the Copernican system under pretence of
its being repugnant to the sacred writings, and Galileo
was forced to renounce the Copernican system as a
damnable heresy. The thunder of the Vatican was
employed to silence the voice of reason, and the dread
of ecclesiastical censures almost deterred mankind from
thinking. At last, the happy reformation in religion
gave a fatal blow to superstitious tyranny; the rays of
learning broke through the night of ignorance, and
genuine philosophy triumphed over the chicanery of the
schools; mankind were now convinced, that the scrip-
tures were never intended to explain the systems of
philosophy, but to make us humane, virtuous, and
happy; that it is agreeable to the Great Author of our
being to contemplate his works, and display the won-
ders of his creating hand. From this fortunate æra
the sciences made rapid strides towards perfection, and
every day produced a discovery of some new truth, or
the detection of some ancient error. Proofs were mul-
tiple in confirmation of the Copernican system,
which is now established on a foundation not to be
shaken. The astonishing harmony which prevails
among the several parts prove it to have been the work
of a divine hand; and that nothing less than Infinite
Wisdom could have planned so beautiful a fabric.

After the blind prejudices of weak mortals were once
removed, noble discourses were made in all the branches
of astronomy. The motions of the heavenly bodies
were not only clearly explained, but the general law
of nature, according to which they moved, was dis-
covered and illustrated by the immortal Newton. This
law is called Gravity or Attraction, and is the same
by which any body falls to the ground, when disen-
gaged from what supported it. This same law, which
keeps the sea in its channel, and the various bodies
which cover the surface of this earth from flying off
into the air, operates throughout the universe, keeps
the planets in their orbits, and preserves the whole
fabric of nature from disorder and confusion. To be
somewhat more explicit concerning this point: by the
law of Gravity, or Gravitation, all heavy bodies have
a tendency towards the centre of our earth, in such an
over-proportion, that the centripetal force, by which
bodies tend thither, is almost 300 times greater than
that by which they are forced off by the earth's
motion round its axis, or the centrifugal force, as they
call it; and this all-wise provision keeps all things to-
gether on the surface of the earth; and which, when
exactly adjusted, keeps also every planet in its proper
circle, and at its due distance from the sun, or from its
primary one; and this is so universal a law, that it
prevails universally.

There have been perceived, in the expanse of the
universe,

10 Z

universe, many other bodies, belonging to the system of the sun, that seem to have much more irregular motions than the planets and stars above mentioned. These are the comets, that, descending from the far distant parts of the system with great rapidity, surprize us with the singular appearance of a train, or tail, which accompanies them; become visible to us in the lower parts of their orbits, and, after a short stay, go off to vast distances, and disappear. The ancients generally believed comets to be only meteors generated in the air, like those we see in it every night; and in a few moments vanishing; while some modern writers have placed them among the fixed stars. But subsequent observations, with good instruments, and the application of the laws of Motion and Geometry to astronomical inquiries, have now satisfied us almost to a demonstration, that they are a kind of planets, of solid and compact bodies, revolving in determinate periods round the sun: but the orbits of many of them are so very oblong, eccentric, or oval, as well as large and extended, that they can appear to us but very seldom.

That great comet, which appeared in 1680, went so near the sun, as to acquire a degree of heat above 2000 times as great as that of red-hot iron; and if its body was about the size of our earth, as it was judged to be, it will not be cooled again this million of years. This comet was seen before in our hemisphere, A. D. 1106; once before, about the year 532; and also 44 years before our Saviour's birth; and therefore they conclude the time of its periodical revolution round the sun to be 575 years. The time of the revolution of that comet, which appeared again in 1758, is 75 years; and another, which was calculated to be seen here again in 1789, makes its ellipsis round the sun in 129 years.

The middle distance of the great comet that appeared in 1680, was more than 5000 millions of miles from the sun; as its greatest distance was above twice as much; and yet its least distance was not above a 20,000th part of its greatest; so that in its whole revolution it would be subject to such extremities, as that its greatest degree of light and heat to its least, were above 400 millions to one: and yet notwithstanding this immense extension of its elliptic orbit, the great and all-wise Architect of the universe hath probably so adjusted the centrifugal and centripetal forces, that it doth not quite leave the sun, though it go so far from him, but returns again towards him, and revolves round him in a determinate period of years. None of the orbits of any of these comets yet known, are in or near the plane of the earth's ecliptic; and therefore, in their ascent from the sun, though heated never so much by him, yet it is thought they will not approach near enough to our earth to burn us, or affect us with any sensible heat. It ought, however, to be observed, that our earth was out of the way when this comet last past near her orbit; but it requires a more

perfect knowledge of the motion of the comet, to be able to judge if it will always pass by us with so little effect; for it may be here observed, that the comet, in one part of its orbit, comes very near to the orbit of our earth; so that, in some revolutions, it may approach near enough to have very considerable, if not fatal effects upon it.

There are, it is believed, at least 21 comets belonging to our system, moving in all manner of directions; and all those which have been observed, have moved through the ethereal regions, and the orbits of the planets, without suffering the least sensible resistance in their motions, which sufficiently proves that the planets do not move in solid orbs.

OF THE DOCTRINE OF THE SPHERE AND THE GLOBE.

The ancients were persuaded that the earth was spherical, but were not able to ascertain its dimensions; the solution of that problem was reserved for the moderns, who at length, after various researches, obtained satisfactory proofs that the earth was of a spherical figure: they observed, that the first part that appeared of a ship at sea, was the top of the mast; and, as she approached gradually, she seemed to rise by degrees out of the water, till the whole ship was visible; the same appearances, but in an inverted order, attended a ship sailing from the spectator, she seemed to sink gradually; beneath the surface of the sea, till at last she totally disappeared. It being evident that this could result from nothing but the spherical form of the earth, and as these phenomena required no apparatus, they sufficiently established its globular figure.

The body of the earth is named a sphere, with regard to astronomical speculations; through the centre of this a straight line is supposed to be drawn, from one opposite point of the surface to the other, which line is called a diameter. There are two points in the heavens, which always preserve the same situation; these points are termed celestial poles, because the heavens seem to turn round them. The motions of the heavens are imitated by the Artificial Sphere, through the centre of which a wire or iron rod is drawn, called an axis, whose extremities are fixed to the immovable points called poles. But in order to render the following definitions more easy to be conceived, it may be proper to remark, that both the celestial and terrestrial sphere is supposed to be concentric to the centre of the earth, and to have correspondent circles described on both spheres, and these circles are either greater or lesser.

Great circles are those which divide either the celestial or terrestrial sphere into two parts. Lesser circles divide the sphere into two unequal parts.

The poles of any circle are those points on the surface of the sphere equally distant from that circle. Every circle, whether great or small, has two poles, or centres,

centres, and from which all others drawn to the circumference are equal.

The axis of any circle is a right line supposed to connect the poles.

The celestial axis is that right line about which the heavens seem to revolve; and the two points where this axis cuts the celestial sphere, are called the north and south poles of the world.

The Equinoctial, Equator, or Equaller, is that great circle of the sphere, which is every where equally distant from the poles of the world; and, consequently, divides the heavens into two equal parts. It is so called, because when the sun appears to describe this circle, the days and nights are of an equal length to all the inhabitants of the earth. It is divided into 360 degrees.

The meridian, hour circles, circles of right ascension, or circles of terrestrial longitude, are those great circles which intersect each other in the poles of the world, and cut the Equinoctial at right angles.

The ecliptic is a great circle of the sphere intersecting the equinoctial in two opposite parts, and forming an angle with it equal to 23 degrees 29 minutes, the sun's greatest declination. It is generally divided into twelve equal parts called signs, beginning from one of its intersections with the equinoctial. It passes through certain constellations, distinguished by the names of animals, in a zone called the Zodiac, of which more hereafter.

The *Doctrine of the Globe* is designed to represent the different regions, countries, nations, islands, and cities, on the face of the earth, upon an artificial globe or ball, called the Terrestrial Globe, on which they are described in that order and figure that they really appear in on the face of the earth itself. With respect to the figure of the earth, though we have considered it as a spherical or globular body, yet it has been discovered that this is not its true figure, which Sir Isaac Newton undertook to determine, and, according to his calculations, the diameter at the poles, or axis of the earth, and the diameter of the equator, are to each other as 229 to 230; by which it appears that the figure of the earth is nearly that of a sphere or ball, though not perfectly so.

But as all conclusions resulting from questions of the most abstruse kind, will ever leave some doubt on the mind, whether every necessary circumstance has been taken into the account, and as this matter had occasioned much dispute between the philosophers of the last age, particularly between Sir Isaac Newton and Cassini, a French astronomer, who were the heads of two different parties; it was determined to refer the decision to actual mensuration; it being sufficiently known, that if the earth was a true sphere, all the degrees of the meridian must be equal; but every one of them of different lengths, if the figure was that of a spheroid. It was also known, that if the length of the degrees increased from the equator towards the poles, the figure was that of an oblate spheroid; but if they

increased from the pole towards the equator, the figure was a prolate spheroid, or something in the form of a lemon. Consequently if the length of a degree at the equator, and the length of another near the arctic circle could be accurately measured, both the form and dimensions of the earth might be determined to a degree of accuracy sufficient to answer all the purposes of navigation and geography. In 1736, the matter was put to trial by the king of France, who, desirous of having this interesting problem solved, sent one company of mathematicians into Lapland, and another into Peru, in order to measure the length of a degree of the meridian in these distant places. The former finished their task the same year, and found that the length of a degree of the meridian where it cuts the arctic circle, contained 57437 $\frac{1}{10}$, or 57438 toises nearly. The latter, who went to Peru, also finished their operations in 1736, and found that the length of a degree at the equator, was 56767 $\frac{1}{4}$, or almost 56768 toises. These mensurations not only confirmed the theory of Sir Isaac Newton, but also demonstrated, that he had determined the figure of the earth to a great degree of exactness; the two diameters being to each other nearly as 267 to 266 $\frac{1}{2}$; and since that time the earth has always been considered as more flat towards the poles than towards the equator. The *circumference of the earth* is computed at 25,038 English miles. This space, for the convenience of measuring is subdivided into 360 parts or degrees, each containing 60 geographical miles, or 69 $\frac{1}{2}$ English miles.

The *horizon* is represented by the upper surface of the wooden circular frame encompassing the globe about its middle. On this wooden frame is a kind of perpetual calendar, contained in several concentric circles; the inner one is divided into four quarters of 90 degrees each; the next circle is divided into the twelve months, with the days in each according to the new style; the next contains the twelve equal signs of the Zodiac, each being divided into 30 degrees; the next is the twelve months and days according to the old style; and there is another circle containing the 32 winds, with their halves and quarters. Although these circles are all on the horizon, yet they are not always placed in the same disposition. Geographers distinguish the horizon into the *rational* and *sensible*. The sensible horizon may be conceived to be made by any great plain on the surface of the sea, which seems to divide the concave orb of the stars, or the sky into two parts or hemispheres, the one above, the other below the level of the earth. The rational or real horizon, encompasses the globe, exactly in the middle; its poles are called the *zenith* and *Nadir*; the first exactly above our heads, and the other directly under our feet.

The *meridian* is a great circle, consisting of 360 degrees, which divides the globe into the east and west hemispheres; it lies directly north and south, passing through the poles of the equator, which it cuts at right angles: it is a changeable circle, being properly that part

part of the heavens, where the sun is at noon; so that every place on the earth has a different meridian, if we move east and west; but it remains the same, when we pass north or south.

The *Zodiac*, which is a broad circle cutting the equator obliquely, is designed to shew us what we called the sun's place for every day in the year; and therefore, is divided into 12 parts, which are distinguished by 12 eminent signs or constellations; and which, because they are intended to sign or mark out a particular place in the heavens where the sun is, or appears to be, every month, have been called the Twelve Signs of the Zodiac: each of these signs is divided into 30 equal parts or degrees, which makes up the whole 360: they are as follow:

Aries, γ , Taurus, σ , Gemini, Π , Cancer, σ , Leo, Ω , Virgo, ρ , Libra, ζ , Scorpio, μ , Sagittarius, \downarrow , Capricornus, ν , Aquarius, \equiv , Pisces, \times .

The *Cultures* are two great circles which are supposed to intersect each other at right angles in the poles of the world, and to pass through the solstitial and equinoctial points of the ecliptic. That which passes thro' the two equinoctial points, is called the equinoctial culture, and determines the equinoxes; and the other which passes through the poles of the ecliptic, is called the solstitial culture, because it determines the solstices.

The *Tropics* are two circles, supposed to be drawn on each side of the equinoctial, and parallel thereto.—That on the north side of the line is called the Tropic of Cancer, and the southern tropic has the name of Capricorn, as passing through the beginning of those signs. They are distant from the equinoctial $23^{\circ} 29'$, and are called tropics, because the sun appears, when in them, to turn backwards from his former course.

The *Polar Circles* are parallel to the equator, and at the same distance from the poles that the tropics are from the equator. The northern is called the Arctic, and the southern the Antarctic, because opposite to the former, from which it is distant only $23^{\circ} 30'$.

The surface of the earth is supposed to be divided into five unequal parts called *Zones*, each of which is terminated by two parallels of latitude. Of these five zones, one is called the torrid or burning zone; two are styled frigid or frozen; and two temperate: names adapted to the quality of the heat and cold to which their situations are liable.

The *Torrid Zone* is that portion of the earth over every part of which the sun is perpendicular at some time of the year. The breadth of this zone is forty-seven degrees; extending from twenty-three degrees and a half north latitude, to twenty-three degrees and a half south. The equator passes through the middle of this zone, which is terminated on the north by the parallel of latitude called the tropic of Cancer, and on the south by the parallel called the tropic of Capricorn. The ancients considered this zone as uninhabitable, on account of the heat, which they thought too great to be supported by any human being, or even by the vegetable

creation; but experience has long since refuted this notion. Many parts of the torrid zone are remarkably populous; and it has been found that the long nights, great dews, regular rains and breezes, which prevail in almost every part of the torrid zone, render the earth not only inhabitable, but also so fruitful, that two harvests a year are very common.

The *Frigid Zones* are those regions round the pole where the sun does not rise for some days in the winter, nor set for some days in the summer. The two poles are the centres of these zones, which extend from these points to twenty-three degrees and a half nearly; that is, they are bounded by the northern and southern parallels of latitude of sixty-six degrees and a half. The part that lies in the northern hemisphere is called the north frigid zone, and is bounded by a parallel called the arctic, or polar circle; and that in the southern hemisphere, the south frigid zone, and the parallel of latitude which bounds it, is called the antarctic, or polar circle.

The two *Temperate Zones* are the spaces contained between the tropics and polar circles. The greater part of Europe is situated in the northern temperate zone; the Cape of Good Hope in Africa, and Cape Horn in America, lie in the southern

The Europeans have not yet thoroughly discovered all these zones: they are best acquainted with the northern temperate, and torrid zones: their knowledge of the southern temperate and northern frigid zone is very scanty; and that of the southern frigid zone, still more so.

The term *Climate* is vulgarly bestowed on any country or region differing from one another, either in respect of the seasons, the quality of the soil, or even the manners of the inhabitants, without any regard to the length of the longest day. But, in a geographical sense, the word *climate* more properly implies a certain space upon the surface of the terrestrial globe, contained between two parallels; and so far distant from each other, that the longest day in one differs half an hour from the longest day in the other parallel. The difference of climates arises from the different inclination or obliquity of the sphere: the ancients took the parallel wherein the length of the longest day is twelve hours and three quarters for the beginning of the first climate: as to those parts that are nearer to the equator than that parallel, they were not accounted to be in any climate, either because they may, in a loose and general sense, be considered as being in a right sphere, though, strictly speaking, only the parts under the equator are so; or because they were thought to be uninhabited by reason of the heat, and were besides unknown. The ancients, considering the diversity there is in the rising and setting of the heavenly bodies, especially the sun, and, in consequence thereof, the difference in the length of the days and nights in different places, divided as much of the earth as was known to them into climates; and, instead of the method now in use, of setting down the

latitude of places in degrees, they contented themselves with saying in what climate the place under consideration was situated. According to them, therefore, what they judged the habitable part of the northern hemisphere was divided into seven climates, to which the like number of southern ones corresponded.

Some of the moderns reckon the different climates by the increase of half an hour in the length of the longest day, beginning at the equator, and going on till they come to the polar circle towards the pole; they then count the climates by the increase of a whole natural day, in the length of the longest day, till they come to a parallel, under which the day is of the length of fifteen natural days, or half a month; from this parallel they proceed to reckon the climates by the

increase of half or whole months, in the artificial day, till they come to the pole itself, under which the length of the day is six months. Those between the equator and the polar circles, are called hour-climates; and those between the polar circles and the poles, month climates.

A parallel is said to pass through the middle of a climate, when the longest day in that parallel differs a quarter of an hour from the longest day in either of the extreme parallels that bound the climate: this parallel does not divide the climate into two equal parts, but the part nearest to the equator is larger than the other, because the further we go from the equator, the less increase of latitude will be sufficient to increase the length of the longest day a quarter of an hour.

A TABLE of CLIMATES, according to RICCIOLUS, wherein the Effects of the Fraction are allowed for.

THE RISE AND PROGRESS OF NAVIGATION.

THE origin of this useful invention is referred, in scripture, to God himself, who gave the first specimen thereof in the ark built by Noah: for the rallery the good man underwent on account of his enterprise, shews evidently enough, that the world was then ignorant of any thing like navigation; and that they even thought it impossible. However, the Phœnicians, especially those of Tyre, are represented in history as the

No. 47.

first navigators. Tyre, whose immense riches and power are represented in such lofty terms, both in sacred and profane history, being destroyed by Alexander the Great, its navigation was transferred to Alexandria by the conqueror; and thus arose the navigation of the Egyptians, which was afterwards so cultivated by the Ptolemies, that Tyre and Carthage, which last was subdued by the Romans, were quite forgotten. At length Alexandria itself underwent the fate of Tyre and Carthage, being surpris'd by the Saracens, who, in spite of Heraclius, over-ran the northern coasts of Africa, &c. so

11 A

that

that Alexandria has ever since been in a declining state.

Upon the fall of the Roman empire, the more brave among the Franks in Gaul, the Greeks in Spain, and Lombards in Italy, were no sooner settled than they began to learn the advantage and utility of navigation and commerce, and the methods of managing them, from the people they had subdued; and in a little time some of them became able to give new instructions for the practice of it.

The people of Italy, and particularly those of Venice and Genoa, were the first restorers of navigation and commerce in the mariny islands in the bottom of the Adriatic; the Veneti, who dwelt along the coasts of that gulf, retired, when Alaric king of the Goths, and afterwards Attila king of the Huns, ravaged Italy.

Each of the 72 islands of the Adriatic continued a long time under their respective masters, as distinct commonwealths; the commerce becoming considerable, they began to think of uniting into a body; and it was this union, first begun in the sixth century, but not completed till the eighth, that laid the foundation of the future grandeur of the Venetians.

From the time of this union the fleets of merchantmen were sent to all the ports of the Mediterranean, and at last to Grand Cairo, a city built by the Saracens on the eastern bank of the Nile.

Thus they flourished till the famous league of Cambrai in 1528, when a number of jealous princes conspired to effect their ruin; which was the more easily accomplished by the Portuguese getting one part of the East-India commerce, and the Spaniards another.

Genoa, which had applied to navigation at the same time with Venice, disputed with it the empire of the sea. Jealousy soon began to break out, and, the two republics coming to blows, it was three centuries almost continued war, before the superiority was ascertained; when, towards the end of the 14th century, the fatal battle of Chiozza ended the noble strife. The Genoese, who till then had always had the advantage, had now lost all; and the Venetians secured to themselves the empire of the sea, and superiority in commerce.

About the same time that navigation was retrieved in the southern parts of Europe, a new society of merchants was formed in the north, who framed a new scheme of laws for the regulation of commerce, called still the usages and customs of the sea.

In examining the reasons of commerce passing successively from the Venetians, Genoese, and Hanse-towns, to the Portuguese and Spaniards; and from those again to the English and Dutch; it may be established as a maxim, that the relation betwixt commerce and navigation, or rather their union is so intimate, that the fall of the one necessarily draws after it that of the other.

Hence so many laws, &c. for its regulation; and

particularly that celebrated act of navigation in England, which is the standing rule, not only of the English among themselves, but also of other nations with whom they traffick.

Till this act, all nations were at liberty to import into England all kinds of merchandizes, and that on their own bottoms. But Cromwell particularly passed an act prohibiting the Dutch from importing any merchandizes, except those of their own growth, which were very few. The first parliament of Charles II. after the restoration, passed an act, bearing date from the first of December 1666, for the encouraging and increasing of shipping and navigation, which still subsists in its full latitude and vigour.

Latitude, in geography, is the distance of any place from the equator, measured in degrees, minutes, and seconds, upon the meridian of that place, and is either north or south, according as the place is situated either on the north or south side of the equator. The latitude of a place is always equal to the elevation of the pole above the horizon. The complement of latitude is always equal to the elevation of the equator above the horizon, or the angle intercepted between the plane of the equator and the plane of the horizon. The latitude of a place, or of a ship at sea, is found by taking the meridian altitude of the sun, or of a star whose declination is known.

Parallels of latitude are lesser circles of the sphere parallel to the ecliptic, imagined to pass through every degree and minute of the colures. They are represented on the globe by the divisions on the quadrant of altitude, in its motion round the globe, when screwed over the pole of the ecliptic.

The *longitude* of a place is an arch of the equator intercepted between the first meridian, and the meridian passing through the proposed place; which is always equal to the angle at the pole, formed by the first meridian, and the meridian of the place. The first meridian may be placed at pleasure, passing through any place, as London, Paris, Teneriffe, &c. but among us is generally fixed at London: and the longitude counted from it will be either east or west, according as they lie on the east or west side of that meridian. The difference of longitude, between two places upon the earth is an arch of the equator comprehended between the two meridians of these places; and the greatest possible is 180 degrees, when the two places lie on opposite meridians. Since the parallels of latitude always decrease, the nearer they approach the pole; it is plain, a degree upon any of them must be less than a degree upon the equator, in the ratio of the co-sine of the latitude to the radius. Hence, as the radius is to the co-sine of any latitude; so are the minutes of difference of longitude between two meridians, or their difference in miles upon the equator, to the distance of these two meridians on the parallel of that latitude, in miles; and by this theorem, is the following table:

In order to find the latitude and longitude of any place upon the terrestrial globe, we must bring the given place under that side of the graduated brazen meridian where the degrees begin at the equator, by turning the globe about: then the degree of the meridian over it shews the latitude; and the degree of the equator, under the meridian, shews the longitude. Thus Bristol will be found to lie in 51 degrees 28 minutes north latitude, and two degrees 30 minutes west longitude, and Dublin in 51 degrees 12 minutes north latitude, and six degrees 55 minutes west longitude.

The distance of places which lie neither south, east, north, nor west of each other, but in an oblique direction, may be readily measured by extending the compasses from one to the other, and then applying them to the equator. Example: Extend the compasses from Guinea in Africa to Brasil in America, and then apply them to the equator, and the distance will be 25 degrees, or 1500 miles, allowing 60 miles to a degree.

Quadrant of altitude is an appendage of the artificial globe, consisting of a lamina, or slip of brass, the length of a quadrant of one of the great circles of the globe, and graduated. At the end, where the division terminates, is a nut riveted on, and furnished with a screw, by means whereof the instrument is fixed on to the meridian, and moveable round upon the rivet, to all points of the horizon. Its use is, to serve as a scale in measuring of altitudes, amplitudes, azimuths, &c.

The hour-circle of a globe is a small brazen circle, fixed upon the brazen meridian, divided into 24 hours, having an index moveable round the axis of

the globe, which, upon turning the globe 15 degrees, will shew what places have the sun an hour before or after us.

GEOGRAPHICAL PROBLEMS.

PROB. I. *To rectify the globe for the latitude, zenith, and noon.* Set the globe upon an horizontal plane, with its parts, answering to those of the world; move the meridian in its notches, by raising or depressing the pole, until the degrees of latitude cut the horizon, then is the globe rectified for the latitude. Reckon the latitude from the equator towards the elevated pole, then screw the bevil edge of the nut belonging to the quadrant of altitude, and the rectification is made for the zenith: bring the sun's place found in the third problem, to the meridian: set the index to the twelve at noon, or upper twelve, and the globe is rectified for the sun's southing, or noon.

PROB. II. *To find the distance and bearing of any two given places on the globe.* Lay the graduated edge of the quadrant of altitude over both places, the beginning or 0 degree being on one of them, and the degrees between them shew their distance; these degrees multiplied by 60; give geographical miles, and, by 69½, give the distance in English miles nearly. Observe, while the quadrant lies in this position, what rhumb of the nearest fly runs mostly parallel to the edge of the quadrant, and that rhumb shews nearly the bearing required.

PROB. III. *To find the sun's place and declination on any day.* Seek the given day in the circle of months on

(716) 872-4503

on the horizon; and right against it, in the circle of signs, is the sun's place; by which means it will be found, that the sun enters Aries, March 20; Taurus, April 20; Gemini, May 21; Cancer, June 21; Leo, July 23; Virgo, August 23; Libra, September 22; Scorpio, October 23; Sagittarius, November 22; Capricorn, December 21; Aquarius, January 20; Pisces, February 18. Then seek the sun's place in the ecliptic on the globe, bring that place to the meridian, and the division it stands under is the sun's declination on the given day.—The ecliptic is readily distinguished from the equator on the globe, not only by the different colours wherewith they are stained, but also by the ecliptic's approaching towards the poles, after its intersection with the equator. The marks of the signs are also placed along the ecliptic, one at the beginning of every successive 30 degrees.

PROB. IV. *To find where the sun is vertical at any given time.*] Bring the sun's place, found for the given day, in the manner directed by the last problem, to the meridian; note the degree over it, and set the index to the given hour; then turn the globe till the index comes to twelve at noon, when the place under the said noted degree has the sun in the zenith at that time; and all the places that pass under that degree, by turning the globe round, will have the sun vertical to them on that day.

PROB. V. *To find, at any given time, all those places of the earth where the sun is then rising or setting; where mid. day, or mid. night.*] Find the place where the sun is vertical at the given time, according to the last problem, rectify the globe for the latitude of that place, and bring it to the meridian. Then all those places that are in the west half of the horizon, have the sun rising; and those in the eastern half have it setting. Those under the meridian above the horizon have the sun culminating, or noon; and those under the meridian, below the horizon, have midnight. Those above the horizon have day; those below it, have night.

PROB. VI. *To find any place on the globe whose latitude and longitude are given.*] Bring the given longitude, found on the equator, to the brazen meridian, and under the given latitude found on the meridian, is the place sought.

PROB. VII. *The latitude of any place, not within the polar circle, being given; to find the time of sun-rising and setting, and the length of the day and night.*] Rectify the globe for the latitude and the noon; bring the sun's place to the eastern side of the horizon, and the index shews the time of rising. The sun's place brought to the western side of the horizon, the index gives the setting; or the time of rising, taken from twelve hours, gives the time of setting. The time of setting being doubled, gives the length of the night. For instance, at London, on the 15th of April, the day is 13 hours and an half; the night ten and a half.

PROB. VIII. *To find the length of the longest and*

shortest days in any given place.] Rectify the globe for the latitude, bring the solstitial point of that hemisphere to the eastern part of the horizon, set the index to twelve at noon: turn the globe till the solstitial point comes to the western side of the horizon; the hours past over by the index give the length of the longest day, or night; and its complement to twenty-four hours gives the length of the shortest night or day.

PROB. IX. *A place being given in the Frigid or Frozen Zone, to find the time when the sun begins to appear at, or depart from, that place, also how many successive days he is present to, or absent from, that place.*] Rectify the globe for the latitude, turn the globe, and observe what degrees in the first and second quadrants of the ecliptic are cut by the north point of the horizon, the latitude being supposed north. Then find those degrees in the circle of signs on the horizon, and their corresponding days of the month, and all the time between those days the sun will not set in that place. Again, observe what degree in the third and fourth quadrants of the ecliptic will be cut by the south point of the horizon, and the days answering. Then the sun will be quite absent from the given place during the intermediate days; that day in the third quadrant shews when the sun begins to disappear, and that in the fourth quadrant shews when he begins to shine in the place proposed. Thus at the North Cape, in lat. 71. deg. N. the sun never sets from the 15th of May to the 28th of July, which is 74 days; and never rises from the 16th of November to the 24th of January, which is 69 days.

PROB. X. *To find what days the sun will be vertical at any given place in the torrid zone.*] Note the latitude of the given place on the meridian; turn the globe, and note what points of the ecliptic pass under the latitude noted on the meridian. Seek those points of the ecliptic in the circle of signs on the horizon, and right against them in the circle of months stand the days required. In this manner it will be found, that the sun will be vertical on the island of St. Helena on the 6th of November, and on the 4th of February; and at Barbadoes on the 24th of April, and the 18th of August.

PROB. XI. *The latitude, day of the month, and sun's altitude being given; to find the azimuth and hour of the day.*] Rectify the globe for the latitude, zenith, and noon. Turn the globe and quadrant until the sun's place coincides with the graduated edge of the quadrant. Then will that edge of the quadrant cut in the horizon the degrees of azimuth, reckoned from the north; and the index will shew the hour of the day.

PROB. XII. *The day and hour being given, to find those places on the globe, to which the sun is then rising, those to which he is then setting, those where it is noon-day, those which are actually enlightened, and those that are not.*] Find that place of the globe to which the sun is vertical at the given time, bring the same to the brazen meridian, and elevate the pole according to the latitude of the said place. The globe being fixed in this position, observe what places are in the western semi-circle of the horizon,

horizon, for there the sun is then rising; and those places in the eastern semicircle of the horizon have the sun then setting. Those places exactly under the brazen meridian have noon-day; and lastly, all those above the horizon are enlightened; but those below it are deprived of the sun at that time.

PROB. XIII. *The day of the month being given, to find the sun's place in the ecliptic.*] Look for the day of the month in the calendar upon the wooden horizon, and over-against it you will find the sign and degree of the ecliptic which the sun is in at that time.

PROB. XIV. *The day and hour being given, to find those places in the globe, to which the sun is in the meridian at that time.*] The pole being elevated according to the latitude of the given place, bring that place to the brazen meridian, and set the index of the horary circle to the hour of the day; then turn the globe till the index point to the uppermost XII, and having fixed the globe in that situation, all those places under the upper half of the brazen meridian have the sun in their meridian at that particular time; so that with them it is noon-day.

PROB. XV. *To find the distances between any two given places upon the globe; and to find all those places that are at the same distance from any given place.*] Lay the quadrant of altitude over the two given places, and the number of degrees intercepted between them being reduced into miles will be the distance required. Or you may take the distance between the two places with a pair of compasses, and, applying them to the equator, you will have the degrees of distance as before.—If you rectify the globe for the latitude and zenith of any place, and bring the said place to the meridian; then turning the quadrant of altitude about, all those places that are not by the same point of it are at the same distance from the given place.

PROB. XVI. *To find the Antæci, Periæci, and Antipodes of any place.*] Bring the given place to the brazen meridian, and having found its latitude, reckon the same number of degrees on the meridian from the equator towards the contrary pole, and where the reckoning ends is the place of the Antæci. Keeping the globe in the same position, set the hour index to twelve at noon; then turn the globe about till the index points to the lower twelve, and the place which lies under the meridian, having the same latitude with the given place, is that of the Periæci required.—As to the Antipodes, their place is found by counting 180 degrees upon the meridian from the given place, either north or south.

PROB. XVII. *To represent the appearance of the heavens at any time in a given place.*] Rectify the celestial globe for the latitude, zenith, and noon; and turn the globe till the index points at the given hour; then while those stars in the eastern half of the horizon are rising, those in the western are setting, and those in the meridian are culminating. The quadrant being set to any given star, will shew its altitude, and at the same time its azimuth,

No. 47.

reckoned in the horizon. Then by turning the globe round, it will readily appear what stars never set in that place, and those which never rise; those of perpetual apparition never go below the horizon, and those of perpetual absence never come above it.

PROB. XVIII. *To find the latitude and longitude of any star.*] Put the centre of altitude on the pole of the ecliptic, and its graduated edge on the given star; then the latitude is shewn by the degrees between the ecliptic and star; and the longitude by the degrees cut on the ecliptic by the quadrant.

PROB. XIX. *To find the declination and right ascension of a star.*] Bring the star to the meridian, the degree over it is the declination, and the degree of the equator under the meridian is the right ascension.

PROB. XX. *The day and hour of a lunar eclipse being known, to find all those places upon the globe in which it will be visible.*] Find where the sun is vertical at the hour of the eclipse, and bring that place to the zenith; then the eclipse will be visible in all those places that are under the horizon. But if the Antipodes to the place where the sun is vertical be brought into the zenith, the eclipse will be seen in the places above the horizon.—But observe, that an eclipse of the moon being sometimes of a long continuance, it may be seen in more than one hemisphere of the earth, as she will rise in several places after the eclipse begins.

Note. When an eclipse of the sun is central, if you bring the place where the sun is vertical at that time into the zenith, some part of the eclipse will be visible in most places within the upper hemisphere: but by reason of the short duration of solar eclipses, and the latitude which the moon commonly has at such times, there is no certainty in determining by the globe where those eclipses will be visible, and therefore recourse must be had to calculations.

NATURAL DIVISIONS OF THE EARTH.

The two grand divisions of the terraqueous globe, are land and water. The land is divided into continents, islands, peninsulas, isthmus's, promontories or capes, and mountains. The water is divided into oceans, seas, gulfs, straits, lakes, and rivers.

A *continent*, terra firma, or main land, is a very large tract of country, comprehending several contiguous empires, kingdoms, countries, and states: there are generally reckoned four continents, Europe, Asia, Africa, and America; but the latter is commonly divided into two parts, called North and South America. An *island* is a smaller tract of land, entirely surrounded with water, as Great-Britain. A *peninsula* is a district of country encompassed with water, except a small neck which joins it to some other land, as the *Moræa* in Greece. An *isthmus* is a narrow neck of land connecting some peninsula to another tract of country, and forming the passage between them; as the isthmus of Suez, which joins Africa to Asia, and the isthmus of Darien, which joins North and South America. A *promontory*, or *cape*,

11 B

is

is a head-land, generally of considerable height, stretching itself some distance into the sea; as the Cape of Good Hope. Coasts, shores, mountains, vallies, woods, deserts, plains, &c. are too well known to require description.

An *ocean* is a vast collection of waters bounded by the coasts of different countries. Geographers generally reckon three extensive oceans, viz. the Atlantic, the Pacific, and the Indian ocean. The Atlantic ocean lies between the continents of Europe and Africa on the east, and America on the west; it is usually divided into two parts, one called the North Atlantic ocean, and the other the South Atlantic, or Ethiopic ocean; that part of the North Atlantic ocean lying between Europe and America, is often called the western ocean: it is 3000 miles wide. The Pacific Ocean, or, as it is often called, the South-Sea, is bounded on the East by the western shores of America, and on the West by the eastern shores of Asia; it is computed to be 10,000 miles over. The Indian ocean washes the shores of the eastern coast of Africa, and the southern coasts of Asia; the Indian islands and New Guinea, bound it on the East; it is 3000 miles wide. A *sea*, properly speaking, is a lesser collection of waters than an ocean; as the Mediterranean sea, the Baltic sea, &c. A *gulf* or *bay* is a part of an ocean or sea contained between two shores, and is every where environed with land, except at its entrance; as the bay of Biscay: if a gulf be very small, it is called a creek, haven, station, or road for ships, as Milford-Haven. A *strait* is a narrow passage forming a communication between a gulf and its neighbouring sea, or joining one part of the sea or ocean with another; as the strait of Gibraltar, or that of Magellan. A *lake* is a collection of waters contained in some inland place, of a large extent; and every where surrounded by the land, having no visible communication with the ocean: as the lake of Geneva, and the lakes in Canada. As rivers, canals, brooks, &c. are to be met with in most countries, every person therefore has a clear idea of what is meant by these lesser divisions of water.

OF THE WINDS AND TIDES.

Air is a fine invisible fluid surrounding the earth on which we move, and extending to several miles above its surface; and that collection of it, together with the bodies it contains, circumscribing the earth, is called the atmosphere. A small volume of air is capable of expanding itself, so as to fill a very large space; and also of being compressed into a much smaller compass. Cold has the property of compressing the air, and heat of expanding it. Hence if any alteration be made in any part of the atmosphere, either by heat or cold, the neighbouring parts will be put in motion, and either expanded or compressed. Wind is a stream or current of air put in motion, and capable of very different degrees of velocity, and thence called a breeze, gale, or storm. Winds are either constant or variable, general

or particular. Constant winds are such as always blow the same way, at least for a considerable length of time. Variable winds are such as frequently shift, or change from one point of the compass to another. A general wind, is that which blows the same way over a large tract of the earth, the greater part of the year. A particular wind is that which blows in any particular place, sometimes one way and sometimes another.—The trade wind is a current of air, blowing continually from the east, on the Atlantic and Pacific Ocean, between 30 degrees north, and 30 degrees south latitude.—The cause of this constant wind is the action of the sun in his apparent motion from east to west.

In some parts of the Indian ocean another species of trade winds, called monsoons, prevail. These blow six months one way, and six months the contrary way. These phenomena flow from the same cause. For the air that is cool and dense, must force the warm and rarified air in a continual stream upwards, where it must spread itself to preserve an equilibrium; consequently the upper course or current of the air will be contrary to the under current; for the under current must move from those parts where the greatest heat is; and so, by a kind of circulation, the north-east trade wind below will be attended with a south-west wind above; and a south-east below, with a north-west above. Experience has sufficiently confirmed the truth of this proposition; the seamen always finding that as soon as they leave the trade winds, they immediately find a wind blowing in an opposite direction.—Between the fourth and tenth degrees of north latitude, and between the longitudes of Cape-Verd, and the easternmost of the Cape de Verd islands, is a tract of sea, which seems to be condemned to perpetual calms, attended with dreadful thunder and lightnings, and such frequent rains, that it has acquired the name of the Rains. This phenomenon seems to be caused by the great rarefaction of the air on the neighbouring coast, which causing a perpetual current of air to set in from the westward, and this current meeting here with the general trade wind, the two currents balance each other, and cause a general calm; while the vapours carried thither by each wind, meeting and condensing, occasions those frequent deluges of rain.

By the word *tide* is understood that motion of the water in the seas and rivers, by which they regularly rise and fall. The doctrine of the tides continued unknown till the latter end of the last century, when it was discovered by the illustrious and immortal Sir Isaac Newton, who explained it by his great principle of gravity or attraction. He demonstrated that this principle is universally diffused through the solar system: that the earth and moon gravitate towards, or attract each other; and both of them gravitate towards, or are attracted by the sun: also, that the gravitation of bodies towards the centre of the earth, will be less on those parts of its surface that are opposite to the sun and moon, than in the others; and this defect of gravitation or attraction

tion

tion in particular parts, is the true cause of the ebbing and flowing of the tide. If no such forces were exerted by the sun and moon, the oceans, being equally attracted towards the earth's centre on all sides by the force of gravity would continue in a state of perfect stagnation; but as these forces are really exerted, the waters in the oceans must rise higher in those places where the sun and moon diminish their gravity, or where the attraction of the sun and moon is greatest. Hence it follows that as the force of gravity must be diminished most in those places of the earth to which the moon is nearest, viz. in the zenith; therefore the waters in such places will rise higher, and consequently it will be full sea or flood in such places. From the same principles it follows, that the parts of the earth directly under the moon in the zenith, and those in the nadir, or those diametrically opposite, will have the flood or high water at the same time.

The tides are higher than ordinary twice every month, viz. about the time of the new and full moon; and those are called spring tides. When these two luminaries are in conjunction, or on the same side of the earth, they both conspire to raise the water in the zenith, and consequently in the nadir; and when the sun and moon are in opposition, that is, when the earth is between them while one makes high water in the zenith and nadir, the other does the same in the nadir and zenith. Twice in every month, the tides are less than ordinary; that is, about the times of the first and last quarters of the moon; and these are called neap tides: for in the quarters of the moon, the sun raises the water where the moon depresses it; and depresses where the moon raises the water; the tides are made therefore by the difference of their actions. The spring tides happen not precisely at the new and full moon, but a day or two after, when the attractions of the sun and moon have acted in the same direction for a considerable time. The reason that the greatest spring tides do not happen on the 21st of March, and the 23d of September, but in February and October, is, because the sun being nearest the earth in December, his influence is then strongest, and so must quicken the time of the greatest vernal tides; and being weakest in June, the time of the autumnal tides will necessarily be retarded. The neap tides happen a day or two after the quarters, when the force of the moon's attraction has been lessened by that of the sun's for several days together. The above-mentioned phenomena of the tides would happen uniformly, if the whole surface of the earth was entirely covered with water: but as this is not the case, there being, besides the continents, a multitude of islands lying in the way of the tide, which interrupts its course, therefore in many places near the shores a great variety of other appearances arise, besides those already enumerated; these cannot be explained, without considering the situations of the shores, straits, shoals, rocks, and other objects, by which they are in some measure produced. In some

bays, and about the mouths of rivers, the tides rise from 12 to 50 feet; but about small islands and head-lands in the middle of the ocean they rise very little. There are also certain currents, or settings of the stream by which ships are compelled to alter their course or velocity, or both, and submit to the motion impressed upon them by the current. That between Florida and the Bahama islands always runs from north to south: a current runs constantly from the Atlantic through the straits of Gibraltar, into the Mediterranean: and a current sets out of the Baltic sea, through the Sound or Strait between Sweden and Denmark, into the British channel, so that there are no tides in the Baltic. The knowledge of these currents is a necessary article of navigation; for if the current thwarts the course of a ship, then it not only lessens or augments her velocity, but gives her a new direction compounded of the course she steers, and the setting of the current.

A MAP is a plain or flat figure, representing the whole surface of the globe, or a part thereof, according to the rules of perspective. They are intended to shew us the forms and dimensions of countries, the courses of rivers, the situation of cities, towns, mountains, &c. They are distinguished into Universal and Particular. The first sorts are those which exhibit the whole surface of the earth, or the two hemispheres, and are commonly called Maps of the World: the last sort are those which represent some particular country or part thereof.—Those which represent only the seas, and sea-coasts, are properly called charts. The principal things required in a map are, 1. That all places have their just situation with regard to the chief circles of the globe, as the equator, meridian, parallels, &c. because on these depend many properties of regions, as well as celestial phenomena. 2. That the magnitudes of the several countries have the same proportion as on the surface of the earth. 3. That the several places have the same distances and situation with regard to each other, as on the earth itself. There is usually a scale of miles in some vacant part of a map, by which the distance of one place from another is easily found. As to maps of the world, the degrees of longitude are numbered on the equator, and those of latitude round each hemisphere from the equator to the poles. Rivers are described in maps by black lines, and are wider towards the mouth than towards the head or spring. Mountains are sketched on maps as on a picture. Forests and woods are represented by a kind of shrub; bogs and morasses, by shades; sands and shallows are described by dotted beds; the depth of the water, near harbours, is expressed by figures representing fathoms; and roads are usually denoted by double lines.

With respect to the cardinal points; the north is considered as the upper part of the map; the south is at the bottom, opposite to the north; the right hand is east, the face being turned to the north; and the left hand, opposite, is the west; unless the compass, or flower-de-luce, which is generally placed in some part

of a map, shews the contrary; for that always points to the north.

Parallels, or circles of latitude, are lesser circles of the sphere, conceived to be drawn from west to east, through all the points of the meridian, commencing from the equator, to which they are parallel, and terminating with the poles. They are called *parallels of latitude*, because all places lying under the same parallel have the same latitude. The outermost of the meridians and parallels are marked with degrees of latitude or longitude, by means of which, and the scale of miles, the situation, distance, &c. of places may be found, as on the artificial globe. If the places lie directly north or south, east or west, from one another, we have only to observe the degrees on the meridians and parallels, and, by turning those into miles, we obtain the distance without measuring.

We shall here give a table of the miles in use among the principal nations of Europe, in geometrical paces, 60,000 of which make a degree of the equator.

Note. The English statute mile is fourscore chains, or 1760 yards, that is, 5280 feet, or eight furlongs. The English marine league is three English miles.

The number of inhabitants computed at present to be in the known world, at a medium, taken from the most accurate calculations, are 953 millions, of which Asia contains 500, Europe 153, Africa 150, and America 150 millions.

PART II.

POLITICAL GEOGRAPHY.

Of the Origin, Laws, Government, and Commerce of Nations.

IN order to prepare our readers for entering upon the particular history of each country we describe, it was thought necessary to present them with a general view of the history of mankind, from the first ages of the

world, to the reformation of religion during the 16th century; wherein we shall give an account of the most interesting and important events which have happened among men, with their causes and effects. This undoubtedly constitutes the most useful branch of Political Geography; and it may not only be deemed a matter of high importance in itself, but indispensably requisite to the understanding the present state of commerce, government, arts, and manners in any particular country.

The best chronologers have placed the great event of the creation of the world in the year before Christ 4004; before which time, neither matter nor form of any thing appeared or existed. That the world was not eternal, has been fully determined by the sacred records, which have also ascertained the time of its creation with great precision; the Hebrew chronology being generally acknowledged to be of superior authority to the Julian, Samaritan, or Septuagint. The history of the patriarchs before the flood is very short, and principally confined to the creation of the world, and the fall of the first parents of mankind. The sacred historian has given us very few anecdotes of the inhabitants of those early times; and what is found in profane writers, is little more than a confused heap of the most palpable absurdities. It may however be gathered from the writings of Moses, that the world before the flood was extremely populous, that mankind had made considerable improvement in the arts, and were become immeasurably vicious, both in their sentiments and manners, insomuch that nothing could stop the torrent of impiety which prevailed. They were not only addicted to every vice, and in love with every species of iniquity, but laughed at the preaching of Noah, and set the threatened vengeance of heaven at defiance. Regardless of the predictions of the prophet, they even ridiculed his building an ark for the preservation of himself and descendants. But they were

soon fatally convinced of their error: a deluge of water, which continued a whole year, swept away all the human race, except Noah and his family. This dreadful catastrophe not only destroyed the inhabitants of the earth, which is supposed to have been more populous then than at present, but in a great measure affected the soil and atmosphere of the globe, gave them a form less friendly to the frame and texture of the human body: hence followed the abridgment of the life of man, and that formidable train of diseases which hath ever since made such havock in the world.

After the waters had subsided, and the surface of the earth was sufficiently dry, Noah, with his three sons, Shem, Ham, and Japhet, left the ark, and a new generation for peopling the earth was raised from the ruins of the former. The sacred writings have preserved an account of the posterity of Shem, but very little with regard to Ham and Japhet. The memory of all of them was, however, preserved among their respective

respective descendents. The name of Japhet, changed into Japetus, continued long famous among the western nations; and Ham was revered as a deity among the Egyptians, under the name of Jupiter-Ammon. The whole descendants of Noah remained some time in the plains of Shinar, afterwards called Babylonia, where they built a city, and a tower of enormous height as a land-mark, to prevent their being scattered abroad; or lost in the deserts of that wide and open country, then destitute of roads, and every natural accommodation: but their design was frustrated by the interposition of heaven. It was necessary, for peopling and cultivating the other parts of the world, that the sons of Noah should be dispersed, and separated from one another; this was effectually brought about by the confusion of their language: they no longer understood each other, and abandoned their design before the structure was finished. They then dispersed themselves into different parts of the world; and the various countries of the earth were gradually peopled by distinct families.

The new world abounded with wild beasts; and the great heroism of those times consisted in destroying them. Hence Nimrod acquired immortal fame; he became a mighty hunter, and chose Babel, or Babylon, for the place of his residence; there he fixed the seat of his kingdom, and founded there the first monarchy B. C. in the world. About the same time Assur, the second son of Shem, left Shinar, and built a city 2235 which he called Nine-veue, or Nineveh, which signifies, the habitation of his son. But though these kingdoms were founded so near the time of the deluge, we have no further account concerning them till several centuries after their foundation. The countries were indeed at that time very thin of people; and the descendents of Noah were dispersed according to their several languages and families; and therefore few remarkable transactions happened in the world. However, in Egypt, the four governments of Thebis, Theri, Memphis, and Tanis, began to assume some appearance of form and regularity.

As mankind began to multiply on the earth, and to separate into different communities, the tradition concerning the true God was obliterated or obscured. Ninus, the first Assyrian prince of whose actions we have any account, was a great and warlike prince. B. C. Warmed with ambition, and envying the success of his neighbours, he taught his subjects the use and exercise of arms, and inured them to martial discipline and dangers. War and destruction now laid waste the fertile provinces of Asia, and a final period was put to the peace which had hitherto prevailed among the nations. He added Babylon to his dominions, and laid the foundation of a powerful empire, which for many ages extended the yoke of slavery over the greater part of Asia. After the dispersion of Babel, Ham led a colony into Egypt; and it is plain, from the writings of Moses, that Abraham, who lived in the reign of Ninus, and was obliged by a dreadful

No. 47.

famine to retire out of Canaan into Egypt, found that kingdom in the zenith of power. The monarch was surrounded by a train of courtiers; the people were governed by laws; had abandoned a wandering life, and were settled in cities. It became very populous; and the rudiments of the arts were known; structures for elegance as well as use were erected in various parts of the empire; and a commerce far from inconsiderable was carried on by the descendents of Ham.

In process of time, Javan, the son of Japhet, and grandson of Noah, led his colony into Asia Minor, and established himself in the islands on the western coast of the continent. As their numbers increased, they extended their settlements; many of them passed over into Europe; and part of Greece became peopled in very early times. But as there was still room B. C. sufficient for others, and the country very fertile, 2022 a colony from Egypt, known in history by the name of Titans, penetrated into Greece, and established the policy and arts of their country. Internal jars and commotions, however, stopped the progress of improvement: war succeeded, and soon demolished the Titan kingdom. The descendents of Javan, before the arrival of the Titans, were rude and barbarous; they inhabited dens and caverns like wild beasts; the reasoning faculty was debased, and hardly any thing but the form remained to distinguish them from the brute creation. The little progress they had made in refinement under the Titan government was soon for B. C. 1829 gotten; and when the colonies headed by Ogyges and Inachus arrived in that country, the inhabitants had relapsed into their former state of barbarity. Inachus exerted all his power to collect the wandering Greeks, and form them into a regular society. He succeeded in some measure; but the histories of those times are so dark and confused, that it is impossible to withdraw the veil of obscurity, or advance any thing with certainty.

The history written by Moses, is the only one on which we can rely with regard to the transactions of those early ages. The sacred writer, in giving B. C. an account of the calling of Abraham, and the 1808 settlement of the family of Jacob in Egypt, has given us a series of very remarkable events, which need not be mentioned here, as they are universally known at this period, when very little of the history of other nations is come to hand: the improvements of mankind in the necessary arts of life were advanced to a great degree of perfection; but it should also be observed, that all the nations of the earth were far from being equal in their mental qualifications. Some of them were sunk into the abyss of ignorance and wretchedness; while others lived under civilized governments, and enjoyed all the benefits of a well-regulated society: Noah, who was acquainted with all the learning of the antediluvian patriarchs, disseminated these seeds of science among his offspring. But those who wandered far from their native residence, and were wholly em-

11 C

ployed

ployed in providing a subsistence for themselves and families, had neither time nor inclination to cultivate the tender shoots of knowledge: these were neglected and forgotten. While others, who continued near the Plains of Shinar, and long enjoyed the counsels and directions of their great ancestor, formed themselves early into regular societies, and wisely cultivated the arts of peace.

The antediluvian patriarchs were no strangers to agriculture; they were obliged to till the ground for their subsistence; and Noah himself was no sooner settled after the flood, than he planted a vineyard, which afforded a sufficient proof that the art of husbandry had been carried to some degree of perfection. Corn was cultivated in most parts of the east; the land of Canaan, where Jacob resided, produced large quantities: it was the principal food of the inhabitants; for when an unfruitful season had diminished the harvest, we find that Jacob was obliged to send to Egypt to purchase corn for the support of his family. Nor was the art confined to the cultivation of corn; the fig, the almond, and the olive-trees were well known in Palestine; and the present which Jacob sent to his son Joseph, consisted of balm, honey, myrrh, spices, nuts, and almonds. The cultivation of the ground gave rise to commerce; an exchange of commerce being the natural consequence of improvements. The shepherd will give a part of his flock for corn; and the husbandman is willing to exchange the produce of his fields for cattle. In this manner commerce must have been carried on in its infancy: it must have attained some degree of perfection before metals were introduced as the medium of trade; and yet this was the case so early as the days of Abraham, though the money then in use had not any stamp to ascertain either its value or fineness, but was delivered by weight. As commerce increased, this method was laid aside, and the pieces of silver were marked to ascertain their true value. It appears, that in the time of Jacob a regular commerce was carried on between Egypt and Arabia. The Ishmaelites and Midianites, to whom Joseph was sold by his brethren, were merchants going into Egypt with their camels loaded with spices, balm, perfumes, and other costly merchandize. This commerce was however only carried on by land, and must be distinguished from that carried on by sea. The former was known much sooner than the latter, though in all probability navigation was not unknown even to the antediluvians.

The inhabitants of Tyre were the first people who rendered navigation subservient to commerce. Situated in a barren soil, where agriculture could be of little advantage, they wisely endeavoured to render their situation more agreeable, by cultivating the arts of peace. Commerce opened the fairest prospect, and was pursued with great attention and success. The Tyrians were famous for their commerce even in the days of Abraham; and Jacob mentioned it in his last blessing

to his children. The arts will flourish wherever commerce is cultivated; nor can it be properly carried on without some knowledge of navigation and astronomy. In these early times the mariner's compass was unknown, so that the seamen had no other guide than the heavenly bodies, whose situations, positions, and revolutions were observed in very early times; astronomy being cultivated in the reign of Belus, and the Egyptian priests were assiduous observers of the stars. Greece was indebted to Egypt for the elements of the sciences: the celebrated philosophers of that country were instructed by the Egyptian priests, from whom also Pythagoras learnt the true system of the world. The Romans were indebted to the Greeks for many of the arts relative both to peace and war; and the inhabitants of Europe owe to the Romans their politeness and refinements. The origin of the sciences, therefore, has with great propriety been ascribed to Egypt.

Sesotria was one of the most celebrated kings of Egypt: during his reign, that kingdom arrived B. C. to an amazing height of power: it was adorned with the most splendid cities, and was extremely 1839. populous. This prince is said to have been possessed of 400 sail of large ships, with which he sailed down the Red Sea, subjugating all the islands and sea-coasts, as far as India: he had also an army of 600,000 foot, 24,000 horse, and 27,000 armed chariots. He conquered Ethiopia, Phœnicia, Syria, and all the Lesser Asia; passed over into Europe, where he subdued the Scythians and Thracians as far as the river Tanais. The successors of this great prince applied themselves to cultivate the arts of peace. They succeeded; and Egypt became the most flourishing kingdom then in the world. The number of inhabitants are said to have been no less than 27 millions; it had 18,000 cities; and the buildings were amazing; some of them are still considered with astonishment, particularly the pyramids.

During this period Europe was involved in the thickest cloud of ignorance. Fierce in their nature, and barbarous in their manners, the inhabitants lived in forests and caverns of the mountains: they sometimes fell a prey to wild beasts, and sometimes to the savage brutality of one another. Such were the ancestors of the Greeks, who afterwards became the patterns of politeness, and the great masters of every elegant art. But they owed their refinement and taste to the Egyptians, who now cultivated almost every species of literature with success. Cecrops landed in Greece at the head of an Egyptian colony, B. C. and laboured with the utmost assiduity to polish 1555. the manners, and reform the savage customs of the inhabitants.

They were, before his arrival, strangers to laws: even those relating to marriage were unknown. They propagated their species like the beasts of the forest, without forming the tender connexions that subsist in families, and which even the most savage nations cultivate

tivate and esteem. Cecrops built Athens, so called from Athene or Minerva, one of the Egyptian deities worshipped at Sais, the city from whence he came into Attica. The wife measures of Cecrops, B. C. for reforming the manners of the Greeks, were 1508. pursued by Cranaus, who succeeded him in the kingdom of Attica. The council of Areopagus, so long famous in history, was founded in the first year of his reign.

By the exertions of these wise princes to reform different parts of Greece, that country soon became celebrated for learning and the polite arts : the rough manners of the inhabitants were polished and refined by successive colonies from Egypt and Phoenicia ; the rudest people became civilized and accomplished ; and the arts, which had their birth in Asia, were cherished B. C. with the most tender care in Greece. But the number of petty states, into which the country 1522. was divided, rendered the inhabitants incapable of withstanding a powerful enemy. Amphictyon, one of those superior geniuses, who appear in the world for the benefit of the age in which they live, and the admiration of posterity, formed a plan for uniting all the states of Greece in one grand confederacy. His eloquence and address engaged twelve cities to unite together for their mutual preservation. Two deputies from each of these cities assembled twice a year at Thermopylae, and formed what was called the Amphictyonic council, after the name of its founder. Experience sufficiently proved how well the measures were concerted ; and Amphictyon, in order to give a greater lustre to the councils, committed to their care the temple at Delphos, with all its riches. This council was the great spring of action in Greece, while that country maintained her independence ; and it was owing to this union that all the attempts of the Persian emperors were rendered abortive.

This shoot gradually improved in a vigorous plant, and it cannot but be pleasant to observe its progress. The Athenians had no written laws ; a proper subordination had not yet been established. This was reserved for the great Solon, a man formed by nature for a lawgiver. He began with dividing the citizens into four classes, proportioned to their wealth ; the lowest were incapable of holding any public employment. They had, however, a voice in the general council of the republic, and in the assembly all affairs of importance to the state were finally determined. But lest the people should become too powerful, the senate and areopagus were provided to prevent an anarchy from taking place. The senate consisted of 400 members, each tribe of the Athenians choosing 100. In this assembly every important concern intended to be laid before the people was prepared. The areopagus was nothing more than a court of justice ; but its decrees were so equitable, and its members so remarkable for their virtue and integrity, that its power in the republic was very extensive. Such was the plan on which the great

Solon founded the republic of Athens ; and upon the same principles, with some variations, all the other states among the ancients were constituted.

Some remarkable particulars occurred in the republic of Sparta or Lacedaemon. The great Lycurgus B. C. was the legislator of the Spartans, and his laws 884. extended equally to peace and war. In order to insure the youth of Lacedaemon to hardship, all kinds of luxury, all the arts of elegance or entertainment, in short, every thing that had the least tendency to soften the mind, and relax the nerves, was absolutely proscribed at Sparta. The use of money was forbidden ; they lived at public tables on the coarsest fare ; the younger were taught to pay the utmost reverence to the more advanced in years ; and all ranks, capable of bearing arms, were daily accustom'd to the most painful exercises. Hence it happened, that war, which to all other nations became very fatiguing, was to the Spartans rather a relaxation than a hardship, and the behaviour of their troops was astonishing, and accompanied with a firmness and courage that was almost beyond conception or belief.

Let us now cast our eyes on Asia, and observe the events which happened in those empires of which we have long lost sight. Cyrus, the Persian, founded B. C. a new empire on the ruins of those of Babylon 536. and Assyria. He was one of the greatest princes that ever swayed an eastern sceptre, and extended his empire over the greater part of Asia. The era of this prince is extremely remarkable, since, besides delivering the Jews from their captivity, the history of the great nations of antiquity, which has hitherto engaged our attention, may be supposed to finish. During the reign of Cyrus, the Persians were a brave and warlike people, but luxury soon found its way into that country, effeminacy succeeded, and the Persians, who, under Cyrus, were almost invincible, were afterwards unable to face a handful of men, from the petty states of Greece. Mad with ambition, and the lust of universal empire, Darius led a numerous army into Greece. B. C. But the Persians had forgot to conquer. His army 520. consisted of no less than 100,000 foot, and 10,000 horse. This prodigious army was met in the plains of Marathon, by Miltiades, at the head of 10,000 Athenians ; and with this small army the Persians were put to flight. So great is the difference between an army enervated by luxury and depressed by tyranny, and forces animated by freedom and strengthened by virtue. Exasperated at the defeat of his father, Xerxes at the head of 2,100,000 men, entered Greece ; but B. C. he shared the same fate with Darius. He was 484. every where defeated both by sea and land ; reduced to the utmost extremity, and at last escaped to Asia in a fishing-boat. Such was the spirit of the Greeks ; and so well did they know, that wanting virtue, life is pain and woe ; that wanting liberty, even virtue mourns, and looks round for happiness in vain.

The

The limits we are confined to, will not suffer us to pursue the Persian history through its different periods; it will therefore be sufficient to observe, that though the Persian monarchs were masters of Asia and Egypt, yet as often as they carried their arms either against the Scythians or the Greeks, they were not only defeated, but found the utmost difficulty to defend themselves in Asia against the attempts of the latter, flushed with victory. The succeeding kings therefore, grown wise by the misfortunes of Darius and Xerxes, avoided an open war with the Greeks, contenting themselves with artfully fomenting dissensions among the Grecian states, and breaking their strength by assisting the weak against the powerful. Darius Codomanus, either B. C. 331: ignorant of this political stratagem, or disdainful to put it in practice, drew the whole power of Greece upon him; and an end was soon after put to the Persian empire by Alexander the Great, at the head of his Macedonian army.

The Persians were never remarkable for learning and the arts. Like the other inhabitants of the East, they were fond of the sublime. Their architecture was grand and noble. Their statues were gigantic, but proportion was often wanting, and the delicacy which the Greek sculptors afterwards gave to their works was unknown. The literati were divided into two sects, the Sabæans and the Magi. The former worshipped idols; maintained that the stars were gods, among whom the sun was chief, because he governed both the heaven and the earth. The Magi, on the contrary, rejected the worship of images, and adored the sun under the form of fire, as the supreme deity. Zoroaster, who flourished in the reign of Darius Hystaspes, reformed the religion of the Magi, rendering it more sublime and pure. He was so successful, that most of the nobles, and even the kings of Persia, embraced his tenets; and the Sabæan religion was but little regarded. The principal science cultivated in the Persian empire was astronomy; but they never carried it to any great degree of perfection. They were more assiduous in studying the ridiculous reveries of astrology, than in labouring to explain the phenomena of the universe. They were well acquainted with the face of the heavens, but never applied themselves to investigate the laws by which the motions of the heavenly bodies were regulated. Their philosophy was an absurd jargon of loose irregular thoughts, without the least foundation in nature. They were strangers to experiments, and never attempted to deduce causes from their effects.

While the Greeks continued to cultivate the virtuous principles they received from their great legislators, they were invincible; but their victories over the Persians rendered them proud and haughty; they quarrelled with one another, and weakened themselves by intestine division. Philip of Macedon (a country till this time little known, and less regarded) observed these commotions between the states of Greece, and, becoming important and powerful, resolved to turn them

to his own advantage. He artfully fomented their divisions; and when he had sufficiently exasperated them against each other, he became absolute master of Greece by the battle of Cheronææ. The Grecian states, having lost that virtue which formed the basis of their confederacy, would have fallen without a battle. The eloquence of Demosthenes was exerted in vain; his immortal Philippica had no power to inspire a people, already immersed in corruption and licentiousness, to a sense of their danger; they preferred luxury to virtue, and, dreading the chains of slavery less than a noble and timely exertion of their powers in the cause of liberty, they became an easy prey to the seductive arts of their insidious and aspiring foe.

The ambition of Philip, however, was not satisfied with the conquest of his country; he proposed to extend the boundaries of his empire far beyond the narrow limits of Greece. Accordingly, he made prodigious preparations for carrying on his designs against Persia; but died before they were completed. His son Alexander, who succeeded him on the throne, having no enemy to fear in Europe, passed into Asia at the head of 3000 foot and 5000 horse. With this handful of men, he conquered the whole force of Darius in three pitched battles, and overthrew the Persian empire: he afterwards penetrated into India, and reduced nations whose very name were then unknown in Europe. Soon after this rapid career of victory and success, Alexander died at Babylon in the flower of his age. His captains, preferring power to virtue, and riches to gratitude, sacrificed all the family of their master, and divided his conquests among themselves. But this was not effected without violent struggles and dissensions; and while discord reigned among the Grecian leaders, the Parthians made themselves masters of the countries to the east of the Euphrates, and laid the foundations of a kingdom which at length became very powerful.

Alexander's empire was divided into four kingdoms: the Macedonian, the Asiatic, the Syrian, and the Egyptian. The Macedonian kingdom, which fell to the lot of Antipater, continued about 150 years; during which interval, ten successive princes swayed the sceptre. Perseus, the last Macedonian king, was totally defeated by Emilius, carried to Rome in triumph, and died in prison; and the kingdom was reduced to a Roman province. The Asiatic kingdom, which fell to Antigonus, comprehended that country now called Natolia, together with some districts beyond Mount Taurus. This kingdom was afterwards divided into three parts, namely, the kingdom of Pergamus, the kingdom of Pontus, and the kingdom of Armenia. Attilus, the last king of Pergamus, appointed the Roman people his heir; and accordingly at his death, that country became part of the Roman dominions. The kingdom of Pontus continued in a very flourishing state till the reign of Mithridates, who carried

on an obstinate war with the Romans twenty-six years. He was defeated by Sylla and Lucullus; but still supported his independence, till he was totally vanquished by Pompey, who annexed his kingdom to the Roman state. The kingdom of Armenia fell with that of Pontus. Tigranes, the last monarch, who joined Mithridates against the Romans, was, with that prince, defeated by Pompey, and left his kingdom to the conqueror.

Seleucus Nicanor obtained the Syrian kingdom; his successors were called Seleucidae, who long held the sceptre with honour. After the extinction of that family, the throne was filled by Antiochus Deus, Antiochus the Great, Antiochus Epiphanes, and Tigranes. The last governed both Syria and Armenia; but being conquered by the Romans under Pompey, both kingdoms were reduced to the form of a Roman province.

The throne of Egypt was usurped by Ptolemy Lagus, one of Alexander's generals; and from him all his successors were called Ptolemies. That kingdom flourished under twelve princes for near 240 years. Among these, Ptolemy Philadelphus was the most famous. To him we owe the Septuagint translation of the scriptures. He founded the celebrated Alexandrine library, which consisted of near 700,000 volumes. He was remarkable for encouraging the arts. The literati flocked to the city of Alexandria as to the seat of the muses. The celebrated Cleopatra was the last who swayed the sceptre of Egypt. She was vanquished by Augustus, and Egypt underwent the same fate of the other kingdoms; it was added to the dominions of the Romans.

Greece, particularly Athens, produced, during this period, every thing great in the arts. The very names of illustrious men who flourished there in that age of literature, would be sufficient to fill a moderate volume. All the improvements made by other nations formed only the dawn of that glorious day which now shone in its meridian splendor. The Egyptians, and many of the Oriental nations, had raised structures, celebrated at once for their magnificence and magnitude; but it was the Greeks who first added proportion to greatness, and elegance to grandeur: the orders of architecture had their birth in Greece. The pieces of sculpture executed by Phidias, Polyclethus, Myron, Lysippus, Praxiteles, and Scopas, have rendered their names immortal. Apollodorus, Zeuxis, Parrhasius, Pamphilus, Timanthes, Apelles, Aristides, and Protagenes, displayed the power of the pencil, and made the world acquainted with the magic of painting. The art of composition was carried to the highest point of perfection. Homer, Eschylus, Sophocles, and Euripides, reached the true sublime in poetry. Prosaic writings acquired elegance and simplicity from the pen of Herodotus: Xenophon and Isocrates gave it cadence and harmony; but it was reserved for Thucydides and Demosthenes to display the full force of the Greek language.

No. 47.

Nor were the studies of the Greeks confined to the polite arts, the more severe exercises of mathematics and philosophy were cultivated with success. The names of Pythagoras, Euclid, and Archimedes, are sufficiently known. The three scholars of the great Socrates, Plato, Aristotle, and Xenophon, may, for strength of reasoning, justness of thought, and propriety of expression, be compared with the writers of any age or nation. It must however be confessed, that the Greeks were much better writers than philosophers. For though the operations of reason are prior to the first efforts of the imagination; yet the imagination when once at work proceeds much faster. It has the advantage of acting upon objects of its own creation; whereas reasoning being confined to the objects before it, is obliged to stop at every step, and often exhausts all its powers in fruitless researches. The universe and reflection are the most useful books of philosophers, and those were studied by the Greeks; but not taking experiments for their guide, they wandered into the regions of deception, and exhausted in subtle disputes that lively and penetrating genius which, if properly employed, would have enabled them to withdraw the veil from nature, discover the laws which regulate the universe, and form a system of morals for the general benefit of mankind. The statesmen and warriors of Greece were equally famous with those who applied their talents to the cultivation of the arts. The love of their country was deeply engraven on their minds, and rendered them superior to labour and fatigue. Their military virtue was eminently displayed in their wars against the Persians; of which the cause were the wife laws which Amphiarion, Solon, and Lycurgus had established among them.

Leaving this nation, whose history, both civil and philosophical, is as important as their territory was inconsiderable, we shall next turn our attention to the Roman affairs, which are still more interesting, as well on their own account, as from the relation in which they stand to those of modern Europe. Romulus, the founder of the Roman state, was of a very martial disposition; and the political state of Italy, divided into a number of small but independent districts, afforded a noble field for the display of his military talents. He was continually embroiled with one or other of his neighbours; and war was the only employment by which he and his companions expected not only to enrich themselves, but even to subsist: yet they never blended cruelty with their conquests; the people they subdued were not extirpated. Romulus established a maxim which afterwards rendered his successors masters of the world; he united the nations he conquered to the Roman state. By this prudent conduct he became stronger by every victory; and the number of his subjects was increased by every addition to his territories: he took care at the same time not to oppress the people he had conquered. He changed indeed the form of their government, but he

11 D

never

never imposed on them the yoke of slavery; they became members of a free state, and enjoyed all the privileges of his own people. The military discipline of his people always engaged the attention of Romulus; and he endeavoured to improve it by the experience of all the nations with whom he was at war. Whatever weapon, whatever motion, whatever stratagem he saw in use, or practised by the enemy, which was preferable to his own, he immediately adopted, and thought it no disgrace to learn wisdom and improvement from those he had conquered.

Romulus, though principally attached to war, did not altogether neglect the civil policy of his infant kingdom. Being himself no stranger to the art of government, he was sensible that no state could flourish without laws, and a proper subordination; that liberty without restraint would degenerate into anarchy; and that power without being nicely balanced, would terminate in tyranny. He was therefore desirous of securing liberty without licentiousness, and of placing the legislative power where it might not be abused to the prejudice of his subjects. Accordingly he instituted what was called the senate, a court originally composed of 100 persons, distinguished for their wisdom and virtue. He enacted laws for the administration of

B. C. justice, and for bridling the ferocious manners and passions of his followers. Under these institutions his infant state flourished in a most surprising manner: but gratitude was not one of the virtues of the first court of legislature; for Romulus, after a long reign spent in promoting the civil or military interests of his country, fell a victim to the treachery of the senate he had so lately founded, being, as it is thought, privately assassinated by some of its members.

Numa Pompilius, his successor, chiefly applied himself to cultivate the arts of peace; he instituted the religious ceremonies of the Romans, inspired the people with the highest veneration for an oath, which may be considered as the soul of military discipline; and added two months to the year, in order to render it more conformable to the course of the sun. Tullius Hostilius, Ancus Martius, Tarquinius Priscus, and Servius Tullius, the successors of Numa, laboured assiduously to promote the prosperity, and extend the power of Rome. But Tarquin the Proud, who murdered Servius Tullius, his father-in-law, and seized upon the throne, followed not the steps of his predecessors; he became a very cruel and infamous tyrant. He trampled on the laws of justice, and seemed pleased with the oppressions he heaped upon the people. He was at once the terror and detestation of Rome. The insolence of his son **B. C.** Sextus Tarquinius hastened his fate. He violated the chastity of Lucretia, a Roman lady, **510.** and by that flagitious act affronted the whole nation. Tarquin was hurled from the throne, and his whole family expelled from Rome. This violent convulsion put a period to the regal government.

There was a necessity for a power equal to that pos-

sessed by their kings to resist (for where) they placed in two consuls; who were nothing more than annual magistrates, though they enjoyed a sovereign authority. This form of government was wisely calculated to promote the grandeur of the Roman state. The short time allotted for the exercise of the consular power, animated them with a desire of signalizing their reign with some remarkable action; each laboured to eclipse the achievements of his predecessor; and the troops were continually led against some new enemy. It however required a considerable length of time before the Romans could make themselves masters of Italy, and they were more than once reduced to the brink of ruin, notwithstanding they were animated to deeds of valour by every motive that had a tendency to rouse the slothful, or inspire the brave. The citizens of Rome were all soldiers, who fought for their estates, their children, and their liberties. They all studied the **B. C.** art of war, and were all deeply interested in the **264.** fate of every battle. Those who turned their backs upon an enemy were branded with ignominy; while any who saved the life of a citizen, received a civic crown.

But the petty princes of Italy were far from being the only enemies the Romans had to contend with. They were opposed in their ambitious schemes of empire by foreign states, who more than once reduced them to the brink of ruin. Among these the republic of Carthage was the most powerful. This republic was in the zenith of its glory when Rome had hardly any territories. Carthage was celebrated for her commerce and riches; she had extended her trade and the terror of her arms over the greater parts of Europe and Africa that were then known. The islands of Sardinia and Corsica were both in her possession, and she had planted powerful colonies in Spain. She reigned the undisputed mistress of the sea, and threatened all the neighbouring nations with the yoke of slavery.

The growing power of Carthage was beheld with a jealous eye by the Romans, who feared for their conquest. A war ensued between the two **B. C.** states, and for some time the advantage was **262.** greatly on the side of Carthage; and had not luxury before found its way into that republic, Rome would have been no more. Fond of ease, and tenacious of power, the Carthaginians employed mercenaries to carry on their wars; while the armies of Rome were composed of citizens: the one served for pay only; the other fought for all that was dear to them. The Romans were convinced by the first war, which lasted twenty years, that Carthage could not be conquered while she remained mistress of the sea: her commerce must supply her with every necessary, and her **B. C.** fleet could at any time transport an army into **259.** Italy, and land them on any part of the coast. A Carthaginian vessel, which was wrecked on the territories of the Romans, served that assiduous people as a model. A fleet was soon fitted out; and the consul

Dulcius,

Duilius, who fought their first naval battle, was victorious. The Carthaginians were now roused from their slumber of security; they feared for their commerce, the true source of their peace, and the sinews of war. They began to tremble in their turn; and such was the spirit which then animated the Romans against their enemies, that Regulus, their general, being taken prisoner in Africa, was sent back on his parole to negotiate a change of prisoners. He maintained in the senate the propriety of that law, which cut off from those who suffered themselves to be taken, all hopes of being saved, and returned to a certain death, which, with the fortitude and magnanimity of a true patriot, he accordingly submitted to.

Though corruption had at this time widely diffused itself in Carthage, yet she was not altogether deficient in great men; among whom Hannibal was the most celebrated. An eternal antipathy to Rome had been instilled into his breast while an infant. His father Hamilcar, one of the great generals that had raised Carthage to her present state of power, took his son when a child, to the temple of Jupiter, where having ordered a solemn sacrifice to be offered up to that deity, he led his son to the altar, and asked him whether he was willing to attend him in his expedition against the Romans? The courageous boy not only consented to go, but conjured his father, by the gods present, to form him to victory, and instruct him in the art of conquering. To this Hamilcar joyfully consented, and caused him to swear upon the altar to be an irreconcilable enemy to the Romans.

Hannibal being, at 25 years of age, appointed general of the Carthaginian forces, determined to attack his enemies in the very heart of their country. He crossed the Ebro, the Rhone, and the Alps, and in a moment descended like a torrent upon Italy. The Romans now trembled for their capital. Scipio advanced to meet the Carthaginian general, and defeated. Hannibal pursued his victory, crossed the Po, and encamped at Placentia. The Roman consul appeared at the head of his army. Hannibal offered him battle, which he thought proper to decline. Terrified at the expedition of Hannibal's pursuit, and the ardour of the Carthaginian troops, he abandoned his fortified camp, crossed the Trebia, and posted himself on an eminence near that river. Hannibal followed him, and encamped in the sight of the Romans on an opposite bank. A battle ensued, and the Romans were again defeated. Hannibal now crossed the Appenines, passed into Etruria, and laid waste great part of that fertile country. Provoked at the rapid progress of the Carthaginian general, Flaminius, one of the Roman consuls, imprudently advanced to give him battle. The two armies met in a large field near the lake of Trasymene, and the Romans were a third time defeated. These repeated misfortunes filled the city of Rome with terror and astonishment. The inhabitants expected Hannibal would shortly visit their city: even the

aged flew to arms, and appeared on the battlements with the weapons taken from their enemies in former wars, and which had long been hung up as trophies in their temples.

Hannibal, instead of marching directly to Rome, imprudently moved towards the territory of Adria. The allies of Rome were alarmed. Sicily sides with the conqueror. Hieronymus, king of Syracuse, declares against the Romans, and almost all Italy abandons them. In this extremity Rome owes its preservation to the courage and conduct of three great men; among whom, Fabius Maximus was the first who contributed in a great measure to save Rome from destruction. He was chosen dictator in this alarming crisis, and led his troops against the Carthaginian general. Hannibal did every thing in his power to bring the dictator to a decisive engagement; but Fabius constantly declined the offer. Stratagems were used in vain: the Roman saw the snare, and carefully avoided it. He cut off the foraging parties of the Carthaginians; and perpetually harassed them in their march; the army of Hannibal was in danger of being destroyed without a battle. The recall of Fabius saved them from inevitable ruin. The new consuls Varro and Paulus wanted the abilities of Fabius; they determined to bring on a decisive engagement with the enemy. The two armies met in a large plain near the village of Cannæ. A dreadful battle ensued, in which the Romans were totally defeated. This was the greatest blow that people ever received; above forty-five thousand Romans, were left dead on the field of battle; and among them such a number of knights that Hannibal is said to have sent three bushels of their rings to Carthage.

Notwithstanding these misfortunes, Rome had still resources. The young Scipio revived the drooping courage of his country. Though then only twenty-four years of age, he led a powerful army into Spain, where both his father and uncle had lost their lives. But Scipio was not to be intimidated. He invested New Carthage, and took the city at the first assault. From Spain he passed into Africa, where the most powerful kings submitted to his arms. Carthage trembled in her turn, and saw with terror her armies defeated. Hannibal was recalled to defend his country; his conquests in Italy were abandoned, and the defence of Carthage was now the great object of that republic. But victory had now forsaken the standards of Hannibal. His forces were defeated: Carthage became tributary to Rome; and after the destruction of that powerful state, the Romans obtained victories with much less difficulty; there was no power able to contend for any length of time with their victorious armies.

The states of Greece, who had once more recovered their liberty, fell an easy prey to the Romans. Antiochus the Great sent an army to their assistance; but they were easily defeated; and

Antiochus

Antiochus himself was obliged to submit to an infamous treaty. But still the Romans pursued the maxims of Romulus, their great ancestor. They permitted the ancient inhabitants to possess their country, and respective estates: they did not even change the form of their government, and the conquered nations became the allies of the Roman people. They were however the most abject slaves, under the specious title of allies. Mithridates, king of Pontus, was not indeed so easily reduced. He had great resources. His people were strong and vigorous, inured to hardships and fatigue. Fond of liberty, and true lovers of their country, they for many years supported themselves against the veteran armies of Rome. But continual wars depopulated their country: defeat succeeded defeat, till at last Mithridates in a decisive battle with Pompey, lost at once his kingdom and his life.

In Africa the wars were bloody and of long continuance. Marius, one of the greatest generals of Rome, at last, by conquering Jugurtha, put an end to the quarrels that had long wasted that country: Numidia was reduced under the Roman yoke. The southern parts being thus conquered, Marius led his victorious legions towards the north. He crossed the Alps, and was fortunate in every attempt. The barbarous nations fled before him, and sought refuge in their forests and bogs. The Roman standards were displayed in the kingdoms of the Gauls, the Cimbri, the Teutones, and other barbarous nations beyond the Alps.

While Rome conquered the world, there subsisted an internal war within her walls. After the expulsion of her kings, Rome enjoyed but a partial liberty. The descendants of the senators, who were distinguished by the name of Patricians, were invested with so many disgusting privileges, that the people felt for their dependence, and were determined to shake off the yoke. They plainly perceived there was no other method of healing the wounds of the republic, but by committing the supreme power to the care of a single person. Dictators were therefore created, and intrusted with the royal power: but as soon as the time of office expired, the alarming convulsions of the state returned. Before the Romans were acquainted with the luxuries of foreign nations; before the tide of conquest had rendered them haughty, and the wealth of Asia, insolent; these struggles were never carried to extremities: but when the delicacies of foreign nations had banished frugality, and a deluge of corruption had swept virtue from the state, Rome became a prey to her own children. The love of their country was now to the Romans little more than a specious name; the better sort were too wealthy and effeminate to submit to the rigours of military discipline; the army was now no longer a band of citizens, the legions were composed of the refuse of the people. The soldiers recognized no other power than that of their general: under his banners they con-

quered, and for him they were always ready to sacrifice their lives: he might, whenever he pleased, lead them against the senate, nobles, or people. But the federal armies, required to be kept on foot for securing the numerous conquests, retarded the subversion of the republic. Jealousy, together with a desire to preserve their own independence, prompted them to watch the conduct of each other with the most assiduous attention. Marius would have been master of Rome, had not the soldiers of Sylla defeated his ambitious designs; but at length a general appeared, whose actions eclipsed the glory of all his cotemporaries.

Julius Cæsar, who planted the Roman eagles in Gaul, had nothing left to conquer but his country. Fired with the ambition of becoming master of the world, Cæsar passed the Rubicon, and sat down in the capitol of Rome. Pompey, the only general capable of opposing the conqueror of Gaul, was defeated at Pharsalia; and with him fell the liberty of the Roman state. The senate was no more; its shadow only subsisted; the power remained with Julius Cæsar. Rome received him as her master, and all the conquered nations laid their sceptres at his feet.

But the love of liberty still subsisted in the breasts of some of the citizens of Rome. Brutus and Cassius undertook to free their country from the power of a tyrant. Cæsar was stabbed in the senate-house, and the patriots took up arms in defence of their liberties. But they gained not over to their interest the legions who had learned to conquer under the banners of Cæsar. Their army was defeated at Philippi, and three tyrants triumphed at Rome. These wanted both the clemency and abilities of Cæsar; they rivalled him only in ambition. A triumvirate of dictators could not long subsist. Mark Antony, who alone had any pretensions to the military talents of Cæsar, was soon enervated by the pleasures of the Egyptian court; he preferred the charms of Cleopatra to the glories of conquest; and suffered Octavius, at the battle of Actium, to wrest from his hand the sceptre of the world.

At this period, Rome had no patriots left to support her falling liberties: some fell at the battle of Philippi, and the rest by the bloody proscription of the tyrannical triumvirate. Octavius, under the name of Augustus, took the title of emperor, and sat down unmolested on the throne of Cæsar. These distractions of the empire had no effect on the military discipline of the Roman legions; they were the undisputed masters of the world, when Rome was without a chief. And no sooner was Augustus established on the throne, than ambassadors from all parts of the known world crowded to pay him homage, or court his friendship. Deputies from the burning sands of Africa, the soft luxuriant plains of Asia, and the frozen regions of the North of Europe, met at Rome to proclaim Augustus emperor of the world. The tumults of war ceased in every kingdom;

kingdom; the sword of desolation was sheathed, and harmony succeeded to the discord of nations. Augustus shut the temple of Janus, and the Saviour of the world, the Prince of peace, was born.

Let us now, before we proceed to the history of the emperors that succeeded Augustus, consider the state of learning and the arts in this period of Roman greatness. In the infancy of the republic, and even long after the consular government was established, learning and the arts made very little progress at Rome. Agriculture and the cultivation of arms principally engaged their attention. An adequate idea may be formed of the little value they placed upon works of art by the edict of Mummius, who, having destroyed the city of Corinth, ordered the pictures painted by the most eminent artists of Greece to be carried to Rome, with this remarkable caution, that if any were lost in the passage, they should be obliged to make up the number. Nor were the sciences in more request at Rome. In the time of Cato the elder, some of the ablest philosophers of Greece coming to Rome, he ordered them to depart the city, lest the minds of the youth should be enervated by philosophy, and rendered too soft for military achievements. For a long series of years there were no written laws at Rome; those of Solon, brought from Greece, were the first that were known in that city. They were generally called the laws of the twelve tables, because they were written in twelve departments: they were afterwards corrected by various decrees of the senate, orders of the people, and edicts of the prætors; and in them was contained the civil law of the Romans.

After the downfall of Carthage, the Romans, having no enemy to fear from abroad, began to taste the sweets of security, and to cultivate the arts of peace. The curious remains of the Grecian magnificence, which were sent to Rome, inspired them with a desire of imitating the perfect models of the Greek artists. Whatever was elegant, curious, and beautiful, might be consulted without trouble or expence. But the Romans, though undoubtedly great artists, never equally finished the works of their masters. Eloquence had been long studied in Rome; but it did not reach its greatest height till Cicero appeared; but his orations are inferior to those of Demosthenes. Cicero gave to eloquence all the graces of which it is susceptible, without learning its solidity and gravity. He gave cadence and harmony to the Roman language, and enriched it with beauties before unknown: he was to Rome what Demosthenes had been to Greece, the glory of his country; they both carried eloquence to the highest perfection it ever attained.

The poetry of Virgil is equal to any thing produced by the Greeks, except the Iliad of Homer. Like the prose of Demosthenes, the verses of Virgil are inimitable. Horace, in his satires and epistles, had no model among the Greeks, and stands to this day unrivalled in that species of writing. Rome abounded in his-

No. 47.

torians; among whom, Livy possesses all the natural ease of Herodotus, and is more descriptive, more eloquent, and sentimental. Sallust is generally ranked with Thucydides, and some have not scrupled to consider him as the most excellent historian of antiquity. Tacitus did not flourish in the Augustan age; but he has acquired the greatest honour by his works, while they reflect ignominy on his country and human nature, whose corruption and vices he paints in the most striking colours. To write the life of Tiberius required the genius of Tacitus, who could unravel all the intrigues of the cabinet, assign the real causes of events, and withdraw the veil of deception, which concealed from the eyes of the public the real motives and springs of action.

The Romans never applied themselves greatly to philosophy. Lucretius, who delivered, in spirited versification, the opinions of Epicurus, is the only philosopher, except Cicero, whose writings have reached our times: a close and assiduous search into the operations of nature, was not perhaps agreeable to the genius of the Romans. In tragedy as comedy, the Romans never produced any thing that can bear the least comparison with the writers of Greece. The tragic poets hardly deserve to be mentioned. Plautus and Terence are justly placed at the head of the comic poets of Rome; but neither were possessed of the vis comica, or lively vein of humour, which is essential to comedy, and which distinguishes the writings of the comic poets of Greece.

We are now arrived at an æra which presents us with a set of monsters, under the name of emperors, who filled the throne of the Cæsars, and whose histories, a few excepted, disgrace human nature. The government of Rome soon degenerated into the most despotic tyranny: a people long celebrated for their liberty, were now reduced to the most abject state of slavery. The army was in reality the sovereign of Rome: and while the emperors inflicted the most inhuman cruelties on their subjects, they themselves trembled at the power of the legions: the emperors were at once the tyrants of the people and the slaves of the army. To keep the turbulent legions (who too well knew their own power) employed, they were led against the barbarous nations beyond the Alps. The Germans, the Britons, and other nations of the North, were subdued; and the Roman arts and learning were introduced among the nations of distant countries. But this required abilities and perseverance. Fond of their liberties, and strangers to every thing but the necessities of life, the ferocious inhabitants of the North long defended themselves against the power of Rome. In their struggles for liberty, their countries were laid waste, and famine assisted the Romans to plant their eagles in the countries inhabited by a barbarous people. Many kingdoms were depopulated; and the Romans marched to conquest through the blood of an innocent people, whose only crime was a love for their country: but conquest, which

11 E

raised

raised the Roman power to the summit of glory, proved at last its destruction. Its boundaries were extended to so enormous a distance, that the springs which gave motion to the political machine of government, lost their force.

The northern tribes of barbarians who had been increased by the inhabitants of more southern climes, driven from their country by the Roman legions, multiplied in so rapid a manner, that the barren mountains of the North could not afford them subsistence. They returned in colonies towards the south, in search of a more fruitful soil. The soft, delicious climate of Italy excited their desires; they poured like a torrent from the Alps into the plains, sweeping all before them. They pursued a very different maxim from the Romans: they sought for a settlement, and therefore extirpated the inhabitants. The most dreadful scene of blood and slaughter marked the route of the barbarians. Before them the country exhibited the most lovely prospect, smiling in all the beauties of nature, populous, and full of cities and villages; behind them, smoking deserts, without inhabitants, and without a farm. The sword of destruction was drawn, and the barbarians severely retaliated on the Romans the miseries their conquering legions had carried into other climes. Perhaps a more dismal scene was never exhibited since the earth was peopled: cotemporary authors, who beheld that scene of desolation, are at a loss for expressions by which to describe the horror of it: the Scourge of God, the Destroyer of Nations, are the dreadful epithets by which they distinguish the most noted of the barbarous leaders, who spared neither age, sex, nor rank; all were swept away by those cruel invaders, and fell together in one undistinguished carnage; even Rome itself fell a victim to barbarity and fury. These calamities beset the Roman empire between A. D. 395 and 571, when the establishment of the Lombards in Italy commenced.

A. D. 328. Constantine, the emperor, who had embraced Christianity, transferred the seat of the empire from Rome to Constantinople. By this impolitic measure, the western and eastern provinces were separated from each other, and governed by different sovereigns. The former was styled the western, and the latter the eastern empire. The withdrawing the Roman legions from the Rhine and the Danube to the east, threw down the barriers of the western empire, and laid it open to the northern invaders, who laid all the glories of the empire, vainly deemed immortal, in the dust. The ancient military discipline of the Romans was so efficacious, that it must have proved an overmatch for all their enemies, had it not been for the vices of their emperors, and the universal corruption of manners among the people. Satiated with the luxuries of the known world, the emperors were at a loss to find new provocatives. The most distant regions were explored, the ingenuity of mankind was exercised, and the tribute of provinces expended upon

one favourite dish. The tyranny and deplorable licentiousness of manners that prevailed under the emperors, or Cæsars, as they are called, could only be equalled by the barbarity of those nations who overcame them. With respect to the eastern empire, that stood firm, and for a considerable time defied all the attacks of the northern invaders; but at length the followers of Mahomet effected what the Goths and Vandals had attempted in vain: they reduced the whole empire, and the family of the Othmans filled the throne of Constantine.

A dreadful revolution in the republic of letters succeeded this change of inhabitants. A tedious night of Gothic barbarity overpread the countries once famous for their learning. The arts and sciences were forgotten; they seemed to be buried under the ruins of the empire. The schools and academies were levelled in the dust, the libraries burnt, and literature considered as pernicious to society. Error usurped the place of truth, and superstition was placed upon the throne of wisdom. Many of the clergy did not understand the breviary which they were obliged daily to recite; some of them could scarcely read it: in short, the human mind, neglected, uncultivated, and depressed, sunk into the most profound ignorance. Charlemagne, indeed, in the ninth century, made a noble attempt to dispel this cloud of Gothic barbarity; and Alfred the Great, in England, followed his worthy example; but all the endeavours of these princes were in vain: for the brutishness of the age was too powerful for the efforts and institutions of these champions of literature: so that the veil of darkness was again drawn over Europe, and ignorance resumed her sceptre.

Learning being thus driven from her favourite seat, took refuge in the plains of Arabia. The Mahometan princes grew polite in proportion as they grew powerful. The califs of Babylon, after a series of successful wars, spent their time in security, and revived the arts. The muses for a time fixed their seat on the banks of the Euphrates. Aaron Rachild was more respected than any of his predecessors, and was obeyed from Spain to the Indies. This prince revived the sciences, and cultivated the polite arts. The learned from all parts resorted to his court, where they were at once caressed and rewarded. Barbarism was banished from his extensive dominions, and her place supplied by politeness. Under his government the Arabians, who had before adopted the Indian method of computation by the nine figures and a cypher, brought the improvement into Europe. From them the Europeans learned the course of the stars, and the nature of eclipses. Benhoinai, the astronomer, translated the *Almagest* of Ptolemy from the Greek into Arabic; and made several astronomical observations, then of great importance. The calif Almamon caused a degree of the meridian to be measured, in order to determine the magnitude of the earth, above seven centuries before any thing of that kind was attempted in Europe.

Avicenna

Avicenna and Averroes, two celebrated physicians, translated the works of Aristotle into Arabic, when they were utterly unknown on this side of the Mediterranean. They cultivated physic and chemistry with great alacrity and success: the latter may be said to have been invented by the Arabians. The Christians were then instructed by the Mahometans.

A new species of government, now known by the name of the Feudal System, was introduced by the northern barbarians, who destroyed the Roman empire. The confederacies entered into by the inhabitants of the North, were rather military than civil, under different leaders, to whom they were strongly attached. When they established themselves in the empire, their chiefs distributed to the principal officers, under the burden of military service, a proportion of the conquered territories; and these made a new partition among their soldiers under the same tenure. These fiefs were substituted for pay, and were not considered as the property of their possessors. They were originally revokable at the pleasure of the grantor; but an attachment, which is naturally contracted for land, introducing the idea of property, the nature of these grants was insensibly altered; men were averse to relinquishing lands they had for some time cultivated, and for which they had acquired an affection. These fiefs were accordingly first changed into possessions for life, and afterwards became hereditary. The imprudence or weakness of sovereigns allowed themselves to be deprived of their territories. Their vassals rose in independence; and their subjects, who received protection from these, became more attached to them than to their sovereigns. A multitude of inferior vassals constituted a formidable body under the great tenants of the crown; and the advantages of this association were so great, that fiefs were considered as preferable to free possessions. Those, therefore, who were possessed of free lands, resigned them, either to the prince, or some powerful noble, in order to receive them back in the form of fiefs. The earls who administered justice (for the civil was not yet separated from the military power) finding their advantage in the fines and pecuniary emoluments resulting to them as judges, found means to render the judicial power hereditary in their families. Thus the official power of the magistrates was in a manner converted into fiefs, and the crown was weakened by new encroachments on its prerogatives. The sovereign, however, was still considered as the head of this vast fabric of political subordination. Obligated to protect his vassals, he had a title to demand their assistance, both for his own defence, and for that of the state. He summoned them to his court; and although their advice and concurrence was absolutely necessary in all matters of moment, yet their attendance, in consequence of his call, which, in one point of view, was a principal privilege, was, in another, considered as a burden, and a mark of their dependence. The inferior vassals were bound

to perform the same duties to the great barons, which these performed to the king; and thus a kingdom was considered as a great barony, and a barony as a small kingdom. It was the natural ambition of every baron to render his authority as independent of the crown as possible, and to acquire new force and authority over his particular vassals. The natural consequences of these Gothic institutions were jealousies, wars, and oppressions without number. The great baron took the advantage of granting his vassals the perpetual assistance they wanted, to acquire a despotic power over them. The manufacturer, and lower classes of men, languished under the most insupportable servitude; for valour and military qualities were then alone regarded.

An aristocracy, the most cruel mode of government, now prevailed, and stifled every principle of equity and of nature. The people perceived that they ought to exchange the dominion of several masters, for the limited administration of a single person. The European monarchs perceived the encroachment of the nobles, and the dreadful servitude of the subject. They saw the people were nothing better than slaves; and determined to support them against the tyranny of the barons. They declared, that as all men were born free, they should enjoy that liberty in reality as well as in name. But to effect this noble design, it was necessary to erect some intermediate power to counterbalance that of the barons, who enslaved the people, and aspired to give laws to the crown. A plan was therefore adopted, which fully answered the design. New privileges were conferred on towns, in consequence of which they became at once populous and rich. All marks of servitude were abolished; they were formed into bodies corporate, and governed by magistrates and a council, chosen by themselves. The very dawn of liberty roused all the powers of the human mind into action. A spirit of industry revived; commerce became an object of attention, and was cultivated with success by many of the powers of Europe. The invention of the mariner's compass greatly facilitated the communication between one nation and another, and consequently opened new sources of commerce.

The cities of Alexandria and Constantinople had long carried on a very considerable trade with Indostan; the precious commodities of India were not unknown in Europe. The Crusades, which robbed Europe of her inhabitants, were the cause of opening a trade between the states of Italy and the East. Venice became very powerful by her commerce: she for some time engrossed the commodities of India, and dispersed them all over Europe. The Genoese, by sending provisions to the crusaders along the coast of Asia Minor, became rich and powerful; at the same time they gained some knowledge of the Indian trade, which had been the great source of wealth to the Venetians. They opened a communication with the East, and became sharers in

the

the advantageous commerce of Indostan. By the riches they drew from this source, these two rival states became formidable to all the powers of Europe. At last the Portuguese discovered a passage to India by the Cape of Good Hope, and wholly engrossed the trade of the eastern parts of Asia. Delirious of continuing to his country some part of the eastern commerce, Christopher Columbus, a native of Genoa, proposed sailing to India by a western course. This offer, however, was rejected at Genoa, and Spain reaped the benefit of his discoveries. He failed in quest of the Indies, but he found a new world. Spain became mistress of a larger empire than that of Rome in the height of her glory.

The inhabitants of Europe now began to emerge out of that darkness in which they had been involved since the subversion of the Roman empire, a space of near twelve centuries. The invention of printing, the revival of learning, arts and sciences, history and philosophy, and, lastly the happy reformation of religion, all distinguish the 15th and 16th centuries as the first æra of modern history. The political principles and maxims then established, still continue to operate; and the ideas concerning the balance of power then introduced; or rendered general, still influence, in some degree, the councils of European nations, and happily concur in securing the different empires from the encroachments of their ambitious neighbours, who, in contending for universal monarchy, cannot fail to weaken their own force, and may at length render themselves incapable of defending their just possessions.

The partial conquests aspiring monarchs may make, will rather tend to oppose, than promote their designs. A prince may form a deliberate plan of destroying, by slow degrees, the rights of his subjects, and his successor may follow his example; but external conquests are always less solid than brilliant, and commonly occasion more fear than hurt. The aspiring prince, who, has unfortunately been a conqueror, is commonly reduced in the end to the last extremities by the alarms his conquests excite, and the confederacies they give occasion to. How contrary soever this doctrine may be to the prejudices and views of a victorious and powerful nation, it is nevertheless well established in the science of politics, and has been confirmed by experience and examples both ancient and modern.

The truth of the above assertion will appear in a great variety of lights, if we take a retrospective view of the conduct of the Grecian states when delivered from the terror of the Persian invasions. The most inconsiderable of these little societies imbibed the frenzy of conquest, and by this frenzy was reduced, in its turn, to the utmost misery and distress; a full illustration of this subject, the reader will find in Isocrates's Oration on the Peace. If there be occasion to mention modern examples, France affords a very striking one. The humiliating circumstances that ambitious monarch Louis XIV. was reduced to, are well known, the cause of which himself lamented on his death-bed; and the

nerves of that kingdom have been since strained so far beyond their strength, by an unbounded thirst of acquisition, that it seemed hardly possible they should recover their natural tone in the course of this century. In the war of 1756, the debility of their efforts shewed the grounds of the evil, and the inefficacy of a sudden and precipitate remedy: but has not the British cabinet greatly contributed to restore and augment the navy of France, by agitating a civil war with the North Americans? Who does not know that the house of Austria excited the terror of all Europe, before it excited the pity of Great-Britain! That family, which had once been the object of fear, became at length the object of compassion. Charles V. of the house of Austria, was possessed of territories which exceeded in riches and extent the most powerful empires of antiquity, but these were not sufficient to gratify the ambition of that monarch; and his whole reign exhibited a scene of hostility against his neighbours. One of his successors, the late empress-queen, and the representative of that family, was, however, upon the death of her father, not only stripped of her dominions, but reduced so low as to be in want of necessaries; and contributions were actually raised for her in Great-Britain, whose king, George II. engaged in her cause, and reinstated her upon the imperial throne, at the expence of this nation.—Great-Britain enjoyed, for a series of years, the greatest degree of prosperity and glory; which should have induced her to be more attentive to preserve so brilliant an existence; but as a great empire cannot be continued in a flourishing situation unless governed by moderation and wisdom; so the unhappy contest of Great-Britain with her colonies in America, through the folly, arrogance, or arbitrary designs of her then ministers of state, has plunged her into the greatest difficulties; her national debt has been augmented to an enormous sum, her taxes increased so as to become an almost insupportable burden, and her trade sensibly diminished. That this once flourishing kingdom may be again restored to her former splendor and tranquillity, in consequence of the late peace with America, and the other belligerent powers, is an æra more devoutly to be wished for, than expected.

PART. III.

OF RELIGION.

THE attention and capacity of mankind have in all ages been as it were on the stretch in order to form adequate conceptions of the Supreme Being; but experience has evinced all their inquiries concerning the Deity to be fruitless, for "who by searching can find out God?" Men, in general, being unable to elevate their ideas to all the sublimity of his perfections, have too often brought them down to the degrading level of their own ideas. This observation may be more directly applied to those nations whose religion was founded

found partly on their own natural feelings, the faint glimmerings of unenlightened reason, but more frequently the irregular passions of the human heart, and who had moreover received no light from heaven, respecting this important, this awful object.

In giving the history of religion, a proper distinction should always be attended to; we must separate what is human from what is divine; what had its origin by particular revelations, from what is the effect of general laws, and of the unassisted operations of the human mind. Hence we find, that the religion of the eastern nations was, in the most early ages, pure and luminous: it originated from a divine source, and was neither obscured nor disfigured by the caprice or inventions of men. But we find that in process of time these began to take effect, inasmuch that the ray of tradition was not only obscured; but totally obliterated from the minds of those tribes who separated at the greatest distance, and in the smallest numbers, from the more improved societies of men.

Depraved and ignorant as the generality of mankind were respecting the nature and perfections of God, their dependence upon, and obligations to him; yet the most barbarous nations have always paid their homages to some deity, although they have been under great mistakes in their notions and conclusions about him. In this situation, God selected to himself a peculiar people to be the depositaries of his laws and worship; but left the rest of mankind to form confused and erroneous hypotheses upon these subjects.

Polytheism, or the doctrine of a plurality of gods, was the most common religion of antiquity; and this prevailed the longest, and spread the widest. The ancient polytheism does not appear to be the fruit of philosophical speculations, nor of disfigured traditions, concerning the nature of the Divine Being; but to have arisen during the rudest ages of society, while the rational powers were feeble, and while mankind were subject to the tyrannical influence of passion and the wild dreams of imagination. Their religion, therefore, was founded solely upon sentiment; each tribe of men had not only their favourite heroes, but their gods likewise: those heroes who led them forth to battle, who had the chief rank in their councils, whose image was inscribed on their fancy, and whose exploits were impressed on their memory, enjoyed, even after death, an existence in the imagination of their followers and adherents. They had also two orders of gods, the propitious, and the hostile, the gods who were to be loved, and those who were to be feared.

The heathens had also a celebrated division of their gods into *dii majorum gentium*, and *dii minorum gentium*; that is, into the superior and inferior gods. Another division was taken from their place of residence; thus there were celestial, terrestrial, infernal, marine, and sylvan gods. They were also divided into animal and natural gods; the animal gods were mortals who had been raised to divinity by ignorance and superstition,

No. 48.

such as the heroes above-mentioned; and the natural gods, the parts of nature, such as the stars, the elements, mountains, rivers, &c. There were also deities who were supposed to preside over particular persons; some had the care of women in childbirth; others, the care of young children and young persons; and others were the deities of marriage. Each action, virtue, and profession had also its particular god: the shepherds had their Pan; the gardeners, their Flora; the learned, their Mercury and Minerva; and the poets, their Apollo and the Muses. The ancients, in general, made their gods subject to all the passions of men; they partook even of their partial affections, and in many instances discovered their preference of one race or nation to all others. They did not indeed eat and drink the same substances with men, but they lived on nectar and ambrosia; they had a particular pleasure in smelling the steam of the sacrifices, and they made love with a ferocity unknown in northern climates.

It is, however, thought by most learned men, that the Pagans acknowledged but one God; and that the many different divinities worshipped by them, were but attributes and actions of one and the same God. This may probably be true of the wiser heathens; and indeed there are many strong and beautiful passages in pagan authors, to prove that they acknowledged but one God. Anaxagoras, who flourished 430 years before the Christian æra, was the first, even in Greece, that publicly announced the existence of one Creator and Governor of the Universe. Pythagoras likewise taught the unity of God, and defined him to be a mind penetrating and diffusing itself through all the parts of the universe, from which all animals receive life; and Plato called God the being which is; and whenever he mentioned the Deity, it was always in the singular number.

But, of all others, the Christian religion is demonstratively of divine original, from the sublimity of its faith, excellency of its morals, and the purity of its precepts. It consists not in idle philosophical speculations, or perpetual grimace and affectation, but in a steady practice of the duties it requires, without the least view of recompense from men; it neither seeks their admiration, nor attempts to dazzle their eyes and deceive them: there is no religion which so much excites a man to the love and practice of virtue, and hatred of vice, or that prescribes greater rewards for the one, or punishments for the other. The religion, in regard to the practice of it, consists in the most exact imitation, that can possibly be conceived, of the infinite perfections of the Supreme Being: from hence we may derive that solid virtue, that power (resulting from a divine principle implanted in the mind) which it gives to subdue our passions, and that satisfaction which we receive from the observance of those laws which God has prescribed to mankind. The characters of Christianity are perfectly conformable to the attributes of the Divine Majesty. The moral part never

11 F

indulges

indulges the passions, it has no other view than the preservation and happiness of mankind; nor have the most inveterate enemies of the Christian faith ever invented any thing but what was much inferior to it, both in practice and speculation.

In time, however, Christianity became corrupted by the introduction of worldly maxims, very inconsistent with the precepts of its divine author, and by the ambition of the clergy; which at length occasioned the elevation and exorbitant claims of the bishop of Rome. The power of the pope, as universal bishop, and head of the church, or, in other words, the papal supremacy, owed its origin to the world of men; was procured by the basest means, by flattering a tyrant (Phocas) in his wickedness and tyranny; and, according to the judgment of Gregory the Great, was in itself antichristian, heretical, blasphemous, and diabolical. The bishops of Rome, by availing themselves of every circumstance which fortune threw in their way, slowly erected the fabric of their antichristian power, at first an object of veneration, and afterwards of terror, to all temporal princes. The causes of its happy dissolution are more palpable, and operated with greater activity. The scandalous lives of the Popish clergy, their ignorance, and tyranny, together with the desire natural to sovereigns, of delivering themselves from a foreign yoke; the op-

portunity of applying to national uses the immense sums which had been diverted to the service of the church in every kingdom of Europe, conspired with the ardour of the first reformers, and hastened the progress of the Reformation, which began by Luther in Germany in the year 1517, and took place in England in 1534; for when once the eyes of the public were opened, they could plainly perceive the unreasonableness of the claims of the church of Rome; that many of her doctrines were unscriptural, corrupt, and irrational, and after a very fair and impartial examination, most of her absurd mummeries and superstitions were justly condemned and exploded both by argument and ridicule. The services of the reformers in this respect, demand our admiration and gratitude; but, involved as they had been in the darkness of superstition, it was not to be expected but that they should still retain some errors, an attachment to some absurd doctrines, and too much of the intolerant spirit of the corrupt and arbitrary church from which they had separated themselves; but since, with all their defects, these pious and learned men were honoured in being the instruments, through Divine Providence, of bringing about an event highly favourable to the civil and religious rights of mankind, they have certainly a just claim to our veneration and esteem.

A NEW GENEALOGICAL and CHRONOLOGICAL ACCOUNT of the SOVEREIGNS of the WHOLE WORLD.

A S I A.

TURKEY. Selim II. grand signior, born in 1761; enthroned April 7, 1789.

TARTARY. The empress of Russia is supreme sovereign of the western part; and the Chinese are masters of the south and east parts.

CHINA. Kien-long, emperor.

INDIA. Ahmed-Abdallah, emperor, or great mogul.

ARABIA is annexed to the Turkish empire.

PERSIA. Kerim Khan, shah or emperor, crowned in 1763.

JAPAN. Tsinajor, emperor, being the last of whom we have any account.

When this monarch appears abroad, he is attended by 5 or 6000 of his guards; and he maintains an army of 20,000 horse, and 100,000 foot, probably with a view to keep his tributary princes or vassals in awe.

A F R I C A.

MONEMOTAPA. The sovereign is styled emperor.

SOFALA is subject to a king.

ZANGUEBAR is governed by a king.

BRAVA is under the dominion of a Mahometan sovereign.

WHIDAH, in Guinea, subject to an idolatrous king.
GOLD-COAST is divided into petty sovereignties, under their respective kings.

AGONNA, governed by a king.

GRAIN-COAST, subject to a king.

CONGO, in Lower Guinea, has a king.

ANGOLA, is subject to a king.

LOANGO is under kingly government.

JAGGAS country. Their sovereign is styled the Great Jagga.

ETHIOPIA, or **NEGROLAND**, is divided into petty kingdoms and states.

BURRE, near Sierra Leone, governed by a king.

ZAARA, or the **DESERT**. Chiefly occupied by illiterate and savage Arabs. The country is flat and barren, and the inhabitants Mahometans.

ABYSSINIA. Subject to a despotic and powerful emperor; a late sovereign was named David.

GALLAS. These people are distinguished into tribes, each governed by a chief.

ABEX. Is subject to a king.

NUBIA. Governed by a despotic monarch.

EGYPT.

EGYPT. Partly monarchical, being subject to the grand signor, whose viceroy is a pacha; and partly republican, and governed by the Mamluks and Sangiacs.

ALGIERS. Subject to a dey.

TUNIS. Governed by a bey.

TRIPOLI. Subject to a bey.

MOROCCO. Under the dominion of an emperor.

A M E R I C A.

SOUTH-AMERICA. Almost all its nations are governed by kings; under whom are appointed chiefs or caciques, as viceroys.

UNITED STATES of North America, being thirteen, are a sovereign and independent republic, of whom George Washington is president. They are under the government of Congress, composed of delegates from each state.

E U R O P E.

DENMARK AND NORWAY. **CHRISTIAN VII.** king of Denmark, born Jan. 29, 1749; hath issue by his late queen, Carolina-Matilda of England,

Prince Frederic, born Jan. 27, 1768.

Princess Louisa-Augusta, born July 7, 1771.

SWEDEN. **GUSTA VUS,** king of Sweden, born Jan. 21, 1746. Married Oct. 1766, to the Princess Sophia, Magdalene of Denmark, born July 3, 1746. Their issue,

Prince Augustus-Adolphus, born Nov. 2, 1778.

RUSSIA. **CATHARINE II** daughter of Christian-Augustus, prince of Anhalt Zerbit, born May 2, 1729; married Sept. 1, 1745, Peter III. grandson of Peter I. On his being deposed July 9, 1762, she was proclaimed sole Empress of all the Russias. Their issue,

Prince Paul Petrowitz, born Oct. 1, 1754, and a daughter. Paul is married, and has issue three children.

GREAT-BRITAIN AND IRELAND. **GEORGE III.** king of Great-Britain, France, and Ireland, and elector of Hanover, born June 4, 1738. Succeeded his grandfather king George II. on Oct. 25, 1760. Married Sept. 8, 1761, to the princess Charlotte of Mecklenburgh Strelitz, born May 16, 1744; crowned Sept. 22, 1761. His issue by the said princess are,

1. George, Prince of Wales, born Aug. 12, 1762.

2. Frederic, Duke of York, Bishop of Osnaburgh; born Aug. 16, 1763. Married Sept. 29, 1791, Frederique-Charlotte-Ulrique-Catharine, eldest daughter of the king of Prussia.

3. William Henry, Duke of Clarence, born Aug. 21, 1765.

4. Princess-Royal, Charlotte-Augusta-Matilda, born Sept. 29, 1760.

5. Edward, born Nov. 2, 1767.

6. Augusta-Sophia, born Nov. 8, 1768.

7. Elizabeth, born May 22, 1770.

8. Erneit-Augustus, born June 5, 1771.

9. Augustus-Frederic, born Jan. 17, 1773.

10. Adolphus-Frederic, born Feb. 24, 1774.

11. Mary, born April 25, 1776.

12. Sophia, born Nov. 3, 1777.

13. Amelia, born Aug. 7, 1783.

THE KING'S BROTHER AND SISTER ARE,

1. Augusta, Duchess of Brunswick.

2. William-Henry, Duke of Gloucester, Earl of Connaught, born Nov. 25, 1743; married Sept. 6, 1776, to Maria, Countess Dowager of Waldegrave, daughter of Sir Edward Walpole, K. B. by whom he has one son and two daughters.

HOLLAND. Prince WILLIAM, of Orange-Nassau, Stadtholder, born March 19, 1748; assumed the government, March 8, 1766; married Oct. 4, 1767, to Frederica-Sophia-Wilhelmina, sister to the king of Prussia, born Aug. 7, 1751. Their issue, William Frederic, born Aug. 2, 1771; married to the second daughter of the king of Prussia. William George-Frederic, born Feb. 15, 1774. Frederica-Louisa-Wilhelmina, born Nov. 28, 1770.

GERMANY. **LEOPOLD II.** Emperor of Germany, born May 5, 1747; crowned Aug. 9, 1790; married Aug. 5, 1766, to Mary Louisa, infanta of Spain, born Nov. 24, 1745; and have issue, Francis, married Aug. 14, 1790, to Maria-Teresa, eldest daughter of the king of Naples; Ferdinand (see TUSCANY), Charles, Alexander, Joseph, Antony, John, Ren-Joseph, Louis-Joseph, Rodolphus; Maria, Maria-Anne, Maria-Clementina, and Maria-Amelia.

The Emperor has living two sisters, an 'one brother, unmarried. Those married are, the Princess of Parma, the Queen of the Two Sicilies, the late Queen of France, the wife of the uncle of the elector of Saxony, and Prince Ferdinand, born June 1, 1754.

Archduke of Austria, married, 1774, the only daughter and heiress of the Duke of Modena, by whom he has issue two sons and two daughters.

Adolphus-Frederic IV. Duke of Mecklenburgh-Strelitz, born May 5, 1738, brother to the Queen of Great-Britain.

Charles-William-Ferdinand, Duke of Brunswick-Lunenburg, and late General in the king of Prussia's army, born Oct. 9, 1735; married Jan. 16, 1764, to the Princess Augusta of England, born Aug. 12, 1737, and has issue, three sons and three daughters.

PRUSSIA. **FREDERIC-WILLIAM,** king of Prussia, and elector of Brandenburg, born Sept. 25, 1744; proclaimed king, Aug. 19, 1786. Hath issue by his first consort, Elizabeth-Ulrica, of Brunswick-Wolfenbuttle, Charlotte, born May 7, 1767, married to the Duke of York. He was married July 14, 1769, to his second consort, Frederica-Louisa, of Saxe-Darmstadt. Hath issue by her,

Frederic-William; born Aug. 3, 1770. Frederic-Charles-Louis, born Aug. 3, 1773.

Frederica-Sophia-Wilhelmina, born Nov. 11, 1774; married Aug. 1, 1791, to the hereditary Prince of Orange.

Frederic-

Frederic-Christian-Augustus; born May 1, 1780.
Another Prince, born December 20, 1781; and another, in July 1783.

Queen-Dowager, Elizabeth-Christina of Brunswic-Wolfenbuttle, aunt to the present Duke, and sister of his present Prussian Majesty, as well as of the Queen-Dowager of Denmark, born Nov. 8, 1715.

Louisa-Amelia, of Brunswic-Wolfenbuttle, born Jan. 29, 1722; married Jan. 6, 1742, to William-Angustus-Prince-Royal, who died June 12, 1758. Their issue, the present King.

Frederica-Sophia-Wilhelmina, married to the present Prince of Orange.

POLAND. STANISLAUS-AUGUSTUS (formerly count Poniatowski) born Jan. 17, 1732, elected king Sept. 7, 1764.

SWITZERLAND. Every canton is absolute in its own jurisdiction; but those of Berne, Zurich, and Lucerne, with other dependencies, are aristocratical, or under the sovereignty of the nobles, with a certain mixture of democracy, where the sovereignty is lodged in the people, Berne only excepted. Those of Uri, Schwetz, Underwald, Zug, Glaris, and Appenzel, are democratical. Basil, though it has the appearance of an aristocracy, rather inclines to a democracy, or popular government.

SPAIN. CHARLES IV. King of Spain, born Nov. 11, 1748; succeeded his father Charles III. in Dec. 1788; married Sept. 4, 1765, to Princess Louisa of Parma, born Dec. 9, 1751, and has had issue, six children. The surviving issue are,

Ferdinand-Antony, present king of Naples. Antony Pascal, born Dec. 31, 1755. The other surviving issue of the late king is, Maria-Louisa (see TUSCANY.)

PORTUGAL. MARIA-FRANCES-ISABELLA, Queen of Portugal, born Dec. 17, 1734; married June 6, 1760, to the late king, her uncle, by whom she has issue,

John-Maria-Joseph-Louis, Prince of Brasil, born May 13, 1767; married to Charlotta-Joaquina, daughter of the Prince of Asturias, born April 25, 1775.

Marianna-Victoria, born Dec. 15, 1768; married to Gabriel-Antony, third son to the king of Spain.

Issue of king Joseph. Her present majesty, and two other daughters.

ITALY. Pope Pius VI. born Dec. 17, 1717; elected pope Feb. 15, 1775.

FERDINAND IV. king of Naples and both Sicilies, born Jan. 11, 1751; ascended the throne Oct. 4, 1759, on his father's becoming king of Spain; married April 7, 1768, to the Princess Mary-Caroline, a sister of the Emperor, born Aug. 13, 1752, by whom he has had issue eight children, of whom seven are living.
